TABLE OF CONTENTS

53d. MELANTHIACEAE Batsch 1802 (Bunchflower Family) [in LILIALES] .................................................................................. 115
55. ALSTROEMERIACEAE Dumortier 1829 (Peruvian-lily Family) [in LILIALES] ................................................................. 118
56. COLCHICACEAE A.P. de Candolle 1805 (Meadow Saffron Family) [in LILIALES] ............................................................... 118
59. SMILACACEAE Ventenat 1799 (Greenbrier Family) [in LILIALES] .................................................................................... 119
61. CUCURBITACEAE A. L. de Jussieu 1789 (Lily Family) [in LILIALES] .................................................................................. 120
62. ORCHIDACEAE A. L. de Jussieu 1789 (Orchid Family) [in ASPARAGALES] ................................................................. 127
67. HYPOXIDACEAE R. Brown 1814 (Stargrass Family) [in ASPARAGALES] ................................................................. 143
71. IRIDACEAE A. L. de Jussieu 1789 [in ASPARAGALES] .............................................................................................. 144
73. XANTHORRHOEACEAE R. Brown 18310 (Day-lily Family) [in ASPARAGALES] ............................................................ 151
74. AMARYLLIDACEAE J. St. Hilaire 1805 (Amaryllis Family) [in ASPARAGALES] .............................................................. 151
75a. ASPARAGACEAE A. L. de Jussieu 1789 (Asparagus Family) [in ASPARAGALES] ..................................................... 159
75b. RUSCACEAE M. Roemer 1840 (Ruscus Family) [in ASPARAGALES] ........................................................................... 160
75c. AGAVACEAE Endlicher 1841 (Agave Family) [in ASPARAGALES] ................................................................................. 163
75d. HOSTACEAE B. Mathew 1898 (Hosta Family) [in ASPARAGALES] ........................................................................ 165
75e. THEMIDACEAE Salisbury 1866 (Brodiaea Family) [in ASPARAGALES] ........................................................................ 165
75f. HYACINThACEAE Batsch 1786 (Hyacinth Family) [in ASPARAGALES] ................................................................. 165
76. ARECACEAE Schult 1832 or PALMAE de Jussieu 1789 (Palm Family) [in ARECales] ..................................................... 167
77. COMMELINACEAE R. Brown 1810 (Spiderwort Family) [in COMMELINALES] ...................................................... 169
78. HYPOXIDACEAE R. Brown 1810 (Bloodwort Family) [in COMMELINALES] .............................................................. 175
81. HAEMODORACEAE R. Brown 1810 (Blood Family) [in ASPARAGALES] ........................................................................ 175
86. CANNACEAE A. L. de Jussieu 1789 (Canna Family) [in ZINGIBERALES] ................................................................. 175
87. MARANTACEAE Petersen in Engler & Prantl 1888 (Arrowroot Family) [in ZINGIBERALES] ...................................... 176
89. ZINGIBERACEAE Martynov 1820 (Ginger Family) [in ZINGIBERALES] ........................................................................ 176
91. TYPHACEAE A. L. de Jussieu 1789 (Cattail Family) [in POALES] .................................................................................... 176
92. BROMELIACEAE A. L. de Jussieu 1789 (Bromeliad or Pineapple Family) [in POALES] ................................................... 176
94. AGAVACEAE C. Agardh 1822 (Yucca Family) [in ASPARAGALES] ................................................................. 180
95. ERIOCaulACEAE Antibiotis 1828 (Pipewort Family) [in POALES] ................................................................................ 183
96. MAYACEAE Kunth 1840 (Bogmoss Family) [in POALES] ..................................................................................... 185
98. JUNCACEAE A. L. de Jussieu 1789 (Rush Family) [in POALES] ............................................................................. 185
99. CYPERACEAE A. L. de Jussieu 1789 (Sedge Family) [in POALES] ............................................................................. 192
106. POACEAE (R. Brown) Barnhart 1895 or GRAMINEAE A. L. de Jussieu 1789 (Grass Family) [in POALES] .......... 267

SECTION 6: EUDICOTYLEDONAE (EUDICOTS) .......................................................................................................................... 362
106. STROPHILOPhyACEAE S. F. Gray 1821 (Hornwort Family) [in CATOPHYLLALES] ......................................................... 362
109a. FUMARIACEAE A. P. de Candolle 1821 (Fumitory Family) [in RANUNCULALES] .................................................. 362
109b. PAxVERACEAE A. L. de Jussieu 1789 (Poppy Family) [in RANUNCULALES] ......................................................... 362
111. LARDIZABALACEAE Decaisne 1839 (Lardizaba Family) [in RANUNCULALES] ...................................................... 367
112. MENISPERMACEAE A. L. de Jussieu 1789 (Moosseed Family) [in RANUNCULALES] ......................................... 367
113. BERBERIDACEAE A. L. de Jussieu 1789 (Barberry Family) [in RANUNCULALES] .................................................... 368
114a. HYDRASTIDACEAE Martino 1820 (Golden-seal Family) [in RANUNCULALES] .................................................. 370
114b. RANUNCULACEAE A. L. de Jussieu 1789 (Buttercup Family) [in RANUNCULALES] .................................................. 371
114c. NEJEBRACEAE Dumortier 1829 (Lotus-lily Family) [in PROTEALES] ....................................................................... 383
117. PLATANACEAE Dumortier 1829 (Plane-tree Family) [in PROTEALES] ........................................................................ 389
121. BUXACEAE Dumortier 1822 (Boxwood Family) [in BUXALES] ................................................................................... 390
127. ALTINGiACEAE Lindley 1846 (Sweet-gum Family) [in SAXIFRAGALES] ................................................................. 390
128. HAMAMELiACEAE R. Brown 1818 (Witch Hazel Family) [in SAXIFRAGALES] .......................................................... 391
131. ITTEACEAE J. Agardh 1858 (Sweetspire Family) [in SAXIFRAGALES] ............................................................................ 392
132. GROSSULARiACEAE A. P. de Candolle 1805 (Currant Family) [in SAXIFRAGALES] .................................................. 392
133. BORAGOACEAE A. L. de Jussieu 1789 (Saxifrage Family) [in SAXIFRAGALES] ....................................................... 392
134. CRASSULACEAE A. P. de Candolle 1825 (Stonecrop Family) [in SAXIFRAGALES] .................................................... 400
137. PENTHORACEAE Rydberg ex Britton 1901 (Ditch-stonecrop Family) [in SAXIFRAGALES] ....................................... 404
138. HALORAGACEAE R. Brown 1814 (Water-milfoil Family) [in SAXIFRAGALES] .......................................................... 404
140. VITACEAE A. L. de Jussieu 1789 (Grape Family) [in VITALES] ................................................................................ 406
141. KRAMERiACEAE Dumortier 1829 (Krameria Family) [in ZYGOPHYLLALES] .......................................................... 410
142. ZYGOPHYLLACEAE R. Brown 1814 (Cressote-bush Family) [in ZYGOPHYLLALES] .................................................. 410
144. EARACEAE Lindley 1836 or LEGRiNOSiACEAE A. L. de Jussieu 1789 (Legume Family) [in FabALES] ............ 411
146. POLYGALACEAE R. Brown 1814 (Milkwort Family) [in FABALES] ........................................................................... 461
147. ROSACEAE A. L. de Jussieu 1789 (Rose Family) [in ROSALES] .................................................................................. 464
150. ELAEAGNACEAE A. L. de Jussieu 1789 (Olaster Family) [in ROSALES] ........................................................................ 495
151. RHAMNACEAE A. L. de Jussieu 1789 (Buckthorn Family) [in ROSALES] ................................................................. 495
152. ULMACEAE de Mirbel 1815 (Elm Family) [in ROSALES] .......................................................................................... 499
153. CANNABACEAE Endlicher 1827 (Hops Family) [in ROSALES] .................................................................................. 500
154. MORACEAE Lindley 1847 (Mulberry Family) [in ROSALES] .................................................................................. 502
155. URTICACEAE A. L. de Jussieu 1789 (Nettle Family) [in ROSALES] ........................................................................ 504
157. FAGACEAE Dumortier 1829 (Beech Family) [in FAGALES] .................................................................................... 507
158. MYRiCACEAE Blume 1829 (Bayberry Family) [in FAGALES] .................................................................................. 518
159. JUGLANACEAE A. Richard ex Kunth 1824 (Walnut Family) [in FAGALES] ................................................................. 520
160. CASUARINACEAE R. Brown 1814 (Casuarina Family) [in FAGALES] ........................................................................ 523
162. BETULACEAE S. F. Gray 1821 (Birch Family) [in FAGALES] ................................................................................ 524
163. DORATiACEAE Darwin 1782 (Graft Family) [in CUCURBITALES] .............................................................................. 524
170. BEGONiACEAE C. Agardh 1824 (Begonia Family) [in CUCURBITALES] ................................................................. 532
172a. PARNSiACEAE Gray 1821 (Grass-of-Parnassus Family) [in CELASTRALES] .......................................................... 532
172b. CELASTRiACEAE R. Brown 1814 (Bittersweet Family) [in CELASTRALES] .......................................................... 533
175. OXALiDACEAE R. Brown 1818 (Wood-sorrel Family) [in OXALiDAlES] ................................................................. 536
181. RHiZOPHORiACEAE R. Brown 1814 (Red Mangrove Family) [in MALPHiGHiALES] ......................................................... 537

INTRODUCTION

The Flora

Floras serve as the basic reference of the plant biota of an area; they are critical tools that serve botanists, conservationists, ecologists, foresters, gardeners, agronomists, researchers, and the general public. In the nineteenth and early twentieth centuries, the botanical exploration of an area and writing a flora to summarize that information was seen as a basic societal need leading to the discovery of economically valuable information. Financial support for the research and writing of floras has waned in recent decades, though, as they have been increasingly regarded as “old science” and resources have shifted to areas of plant science seen as more “cutting edge.” Even in taxonomic research, the advent of molecular techniques has largely supplanted detailed taxonomic research (at generic levels and below) and the writing of floras, and the majority of papers in plant systematics now address phylogenetic relationships within a particular group of plants, and mostly at higher taxonomic levels. Traditional monographic taxonomy, with descriptions of taxa, keys to facilitate their identification, distribution maps, and assessments of habitat and relative abundance or rarity, has become increasingly rare.

Yet, paradoxically, the societal uses and needs for the translation of taxonomic information to a useable form, such as floras, have never been greater. Globalization of human societies and economies has meant that plants are regularly introduced far away from their regions of nativity, and many become established and can be either benign or cause economic and conservation damages. Increasing human utilization of land resources has fueled a biodiversity crisis, with many species now considered imperiled. In the United States and elsewhere, this has resulted in considerable governmental and nongovernmental activity focused on biodiversity inventory and conservation, “recovery” of endangered and threatened species, ecological studies and ecological restoration, and assessment and suppression of invasive exotics. All these activities require an accurate and sophisticated understanding of the flora of an area. These activities also generate new information about the taxonomy, distribution, and conservation status of components of a region’s flora which then needs to be incorporated into new iterations.

In the southeastern United States, the publication thirty-seven years ago of the Manual of the Vascular Flora of the Carolinas, by A.E. Radford, H.E. Ahles, and C.R. Bell (Radford, Ahles, & Bell 1968), was a landmark. In the decades since its publication, it has served as the primary reference for the identification of plants in the Carolinas, and throughout the southeastern United States (since most other states were not covered by comparable, recent references. The effort to research and write the Manual of the Vascular Flora of the Carolinas took about 11 years, and resulted in a series of publications, the Guide to Vascular Flora of the Carolinas (Radford, Ahles, & Bell 1964), the Atlas of the Vascular Flora of the Carolinas (Radford, Ahles, & Bell 1965), and finally the Manual itself (1968). Once published, the existence of “the Manual” helped generate an interest in and further studies of the flora of the region; since then, many additional species have been documented as part of the region's flora, additional alien species have become naturalized, new species have been described, monographs have given new taxonomic insights into groups, nomenclature accepted in 1968 has been found to be invalid, new and more reliable keys have been developed, and systematic treatments have changed and advanced. Increasingly, identification of the flora of our area (and other states of the Southeast and Mid-Atlantic) by academic researchers, agency personnel, and the interested public is hampered by the lack of an up-to-date flora. Without such a flora, identification must involve reference to herbaria and thousands of monographs, papers, and other floras – resources not readily available to many people who need them. The absence in the region of a single-source modern standard for the systematic treatment, nomenclature, and identification of the flora compromises scientific studies, ecological research, and agency inventory, management, and monitoring of ecosystem and species biodiversity.

Chapter 1 consists of a new treatment of the flora of the Carolinas, Virginia, and Georgia, to fill the need for a new standard reference to aid in the consistent identification of the flora of the region. While building on the tradition of the Manual, the Flora is not a revision or second edition; it takes some different approaches, has features the Manual lacks, lacks features the Manual has, and has an expanded geographic scope. At the present time, the Flora includes treatment of all species in the flora area of Delaware, Virginia, West Virginia, North Carolina, South Carolina, Georgia, northern Florida (the Panhandle and northeastern Florida, south to and including Dixie, Gilchrist, Columbia, Union, Bradford, Clay, and Duval counties), Alabama, Mississippi, Tennessee, Kentucky, the District of Columbia, and Maryland, and portions of the additional states of New Jersey (southern New Jersey, south of and including Monmouth and Burlington counties), and Louisiana (the Florida Parishes, east of and including West Feliciana, East Baton Rouge, Ascension, St. James, St. John the Baptist, St. Charles, Jefferson, and Plaquemines parishes) (see Figure 1.A.). Approximately 6800 taxa are keyed and treated, making the Flora a comprehensive resource for understanding the flora of all of the Southeastern United States east of the Mississippi River and south of the Ohio River and Mason-Dixon Line, excluding peninsular Florida.

Sources of information.

This new flora is based on all resources available: herbarium specimens, published literature, grey literature, Natural Heritage databases and rare species lists, and personal communication with a regional network of botanists and taxonomic experts. Herbarium specimens have been consulted at major institutions in the region.
INTRODUCTION

Figure 1.A. Map of the area covered by the Flora.

Criteria for inclusion of taxa.

One of the first challenges that the author of a flora encounters is to decide the criteria for the inclusion of taxa. The general rule in most floras can simply be summarized as “all native taxa and naturalized alien taxa,” but within this simplistic phrase hide many complicated issues, and floras often differ widely in the actual criteria and judgments that they apply (Pyšek et al. 2004; Palmer, Wade, & Neal 1995). In particular, coverage of alien species is very uneven in floras, and the frequent exclusion of many alien species from floras hampers ecological studies, conservation efforts, and efforts to minimize the ecological and economic impacts of invasive aliens.

The following categories of taxa are included and treated fully as “primary” species:

1. Native taxa documented from the Flora (Georgia, South Carolina, North Carolina, Virginia, West Virginia, Delaware, and northern Florida, Alabama, Mississippi, Tennessee, Kentucky, Maryland, District of Columbia, Maryland, eastern Louisiana, and southern New Jersey), whether extant or presumed extinct. Some authors, such as Isely (1990), have “excluded” taxa from a flora if they believed them to be extinct or extirpated. This philosophy seems poorly considered: these taxa may prove not to be extinct or extirpated and their inclusion in the Flora will facilitate possible rediscovery, even if never found again specimens of them in the herbarium need to be identified or confirmed, and their former existence in the region should be documented.

2. Alien taxa introduced by whatever means and demonstrably established and reproducing (sexually or vegetatively) as a component of the flora. Parallel to #1 above, established alien taxa which have been presumably eradicated (such as Striga asiatica in the Carolinas) are included, as their eradication may not have been effective, they may be reintroduced, specimens need to be identifiable using the Flora, and their former existence should be documented.

3. Alien taxa substantially cultivated in the Flora area as crops, such as Triticum aestivale, Zea mays, Vitis vinifera, and Pinus clausa. Such species are variably represented in herbaria, and are often included in floras only if one or more herbarium specimens indicate that the species is persisting, or has been collected around a dump or in the edge of a field “out of cultivation.” This seems an arbitrary criterion to apply to species which are among the most commonly seen and economically most important in a region, and may cover many thousands of acres or square miles in the region covered by the flora.

Additional categories of taxa are included and treated as “secondary” species:

1. Native taxa with uncertain documentation, this varying from literature reports not definitely verifiable with specimens (some of these old and some new), to sight reports regarded as probably correct. Taxa in this category are included as secondarily-treated taxa, and their imperfect documentation is described.

Species which have been reported from the Flora area but which are excluded for one reason or another are also listed and the reason for their exclusion mentioned or discussed.

Taxonomic philosophy. Taxonomic treatments generally follow recent monographic and revisionary work, but an effort has been made to provide a certain rough consistency of “splitting” vs. “lumping” across different taxonomic groups. As is generally true in recent treatments, generic and family concepts are often narrower than those used in the Radford, Ahles, and Bell (1968) Manual, based on new evidence, including (but not limited to) cladistic methods applied to morphologic and molecular data. Ironically, these results have often resulted in a validation of earlier, narrower generic (and familial) concepts espoused by J.K. Small, P.A. Rydberg, and others (see Weakley 2005 for extensive discussion). Varieties are less frequently recognized than by
INTRODUCTION

Fernald (1950), though a considerable number of species and infraspecific taxa “lumped” by Radford, Ahles, and Bell (1968) are recognized (generally following more recent monographic or revisionary work). Some taxa not formally recognized are discussed and characters for their recognition provided in the text, to draw attention to putative taxa that may warrant recognition after further evaluation.

Format and features.

Detailed keys. Keys have been subjected to rigorous testing in the field and herbarium by hundreds of users. To the degree feasible, keys are structured to emphasize characters that are readily observable and available for long parts of the year, such as vegetative characters; this is not feasible for all groups, of course. Multiple characters are provided. Terminology strives to be precise and not abstruse. Technical terms which do not significantly add meaning (for some genera, an introduction to morphological characters and terms used is provided as “Identification notes” preceding the key). Geographic distributions and habitats are sometimes included in the keys as pragmatic, useful, secondary “characters,” but are placed in brackets to indicate that they are not “true” characters. The keys include all species from the primary and secondary flora areas (North Carolina, South Carolina, Virginia, Georgia, Alabama, Mississippi, Tennessee, Kentucky, West Virginia, Maryland, Delaware, the District of Columbia, and parts of Florida, Louisiana, and New Jersey). In some cases, several alternate keys are provided. The primary emphasis of the keys is pragmatism – effective and efficient identification. For this reason, a key to a genus sometimes includes closely similar taxa not in the genus that may be mistaken for it. Another example is that the “family key” to ferns and fern allies is actually a key to genera, allowing an emphasis in the key on readily observable characteristics, rather than the technical characters often needed to distinguish fern families. Keys are based on herbarium specimens, though reference is made when characters based on pressed and dried specimens may differ. Some keys have been adapted from literature cited; where the adaptation is particularly close, credit is given to the source by specific citation.

Habitat. Information is provided about the habitat of the taxon. This information is largely from the field experience of the author, supplemented by information from other botanists, from herbarium labels, and from the literature. For species with wide ecological amplitudes, the habitat may be described simply and broadly (“a wide variety of upland forests”), while the habitat of more localized, specialized, or rare taxa may be described in considerable detail (“moist outcrops of calcareous metamorphic rocks, such as mylonite or marble, near waterfalls in humid escarpment gorges with high rainfall, at low elevations”).

Native status. The native or alien status is stated. Also, an asterisk prior to the species’ name indicates that it is considered alien throughout the primary flora area. Some past floras, including Radford, Ahles, and Bell (1968), were haphazard in their inclusion of this information, which is a very important attribute of each recognized taxon. If there is a question, it is mentioned or discussed. For aliens, an opinion is given as to whether the taxon is naturalized, persistent, waif, etc. in the primary flora area.

Flowering/fruiting dates. Flowering and fruiting dates are provided for the primary flora area. These are derived from herbarium specimens viewed by the author (collected from within the Flora area), from field observations by the author (within the Flora area), and from literature cited.

Distribution of species. A statement of the rangewide distribution of each taxon treated is provided. This is based on published distribution maps and distribution statements in other floras, amended and improved by additional herbarium specimens and published records (such as the “Noteworthy Collections” section in the journal Castanea). The distribution within the primary area is provided by state and physiographic province.

These distribution statements are being replaced by a map. The map shows distribution within the Flora area symbolically, with each state × physiographic province area, except that on the maps, the very small areas of the DC Piedmont, the DC Coastal Plain, and the DE Piedmont are not shown separately from the MD Piedmont, the MD Coastal Plain, and the MD Piedmont, respectively. The native/alien status of the taxon is shown by squares for native occurrence and triangles for alien occurrence. Note that some species have distributions including both alien and native distributions, so Dionaea muscipula for instance is native in the Coastal Plain of NC and SC, but alien in the Coastal Plain of FL. The abundance in that state × physiographic province area is shown by the symbol, an open symbol is rare, a symbol with a dot is uncommon, and a filled symbol is common.

In the lower right corner is a space designated for distributional information. If the species is endemic to the Flora Area, you will see "EN." If the species is alien, you will see the region of the world to which it is native. If the species is native but not endemic, you will see a compass rose. Eight arrows depict the native distribution of the taxon outside of the Flora area. Arrows can be long (common at least somewhere in that region), or short (only uncommon or rare in that region).

The regions to which the eight arrows point are:
N arrow -- ne. North America (PA and n. NJ north to the Canadian maritime provinces, west through QC to se. ON and e. and s. OH);
NW arrow -- nw. North America (w. OH, MI, w. ON, and NU west to AK, BC, and OR, north of and including n. MO, NE, WY, ID, and OR);
W arrow -- w. United States (the western “Southeast” of trans-Mississippi LA, AR, s. MO, OK, and e. TX), west to sw. United States;
SW arrow -- Mexico, Central America, and South America;
S arrow -- peninsular FL;
SE arrow (dashed to indicate oversea) -- West Indies (including Bahamas) and Bermuda;
E arrow (dashed to indicate oversea) -- Asia and/or Africa;
NE arrow (dashed to indicate oversea) -- Europe.

Figure 1.B: Sample distribution maps and distribution map key

**Literature.** Nearly all genera have citations to recent, pertinent systematic literature, as well as more limited citations to literature on ecology and population biology. The intent is to provide the user with access into more detailed literature, and to document the literature basis of the treatment followed in the *Flora*. About 2100 references have been consulted and are cited.

KEYS TO FAMILIES AND GENERA

ARTIFICIAL KEY TO THE GENERA AND FAMILIES OF LYCOPHYTES AND PTERIDOPHYTES

1 Plant a free-living gametophyte, consisting of filaments or thalli, generally a single cell thick, usually with abundant single-celled gemmae .............. Key A

1 Plant a sporophyte, consisting of a stem, rhizome, corm, or crown producing well-developed leaves, > 1 cell thick (except in Didymoglossum, Crepidomanes, Vandenboschia, and Hymenophyllum), generally reproducing by spores.

2 Plant aquatic, either floating and unattached, or rooting and largely submerged .........................................................Key B

2 Plant of various habitats, including wetlands, where sometimes growing in soils saturated or intermittently flooded, but not aquatic.

3 Leaves "fern-like," variously lobed or divided, ranging from pinnatifid to 4-pinnate.

4 Leaf blades (not including the petiole) small, < 30 cm long or wide (some species will key either here or in the next lead).

5 Epipetric or epiphytic, growing on rock, tree bark, walls, or over rock in thin soil mats or in small soil pockets .........................Key D

6 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key E

7 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key F

8 Leaf blades medium to large, > 30 cm long or wide.

9 Leaf blades small, < 30 cm long or wide.

10 Leaf blades (not including the petiole) small, < 30 cm long or wide (some species will key either here or in the next lead).

11 Epipetric or epiphytic, growing on rock, tree bark, walls, or over rock in thin soil mats or in small soil pockets .........................Key G

12 Epipetric or epiphytic, growing on rock, tree bark, walls, or over rock in thin soil mats or in small soil pockets, or on tree trunks ........Key H

13 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key I

14 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key J

15 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key K

16 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key L

17 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key M

18 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key N

19 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key O

20 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key P

21 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key Q

22 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key R

23 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key S

24 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key T

25 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key U

26 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key V

27 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key W

28 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key X

29 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key Y

30 Terrestrial, growing in soil, not associated with rock outcrops ......................................................................................Key Z

Key A – Pteridophytes reduced to thalloid or filamentous, free-living gametophytes

1 Gametophytes thalloid, ribbon-like and branched.

2 Gemmae absent or spathulate (> 1 cell wide) ................................................................. Hymenophyllum (HYMENOPHYLLACEAE)

2 Gemmae uniseriate (1 cell wide) .................................................................................... Vittaria (PTERIDACEAE)

Key B – Pteridophytes and lycophytes growing as floating or rooted aquatics

1 Plant with at least some leaves palmately or pinnately lobed or 1-4× pinnately divided (“fern-like”) and > 2 cm long............................. Ceratopteris (PTERIDACEAE)

2 Plant either a floating aquatic with leaves <5 cm long, or with clover-like or linear leaves.

3 Leaves < 1 mm long, reddish or green, without hairs on the upper surface................................. Azolla (SALVINIACEAE)

4 Leaves linear.

5 Plants corose or with short rhizomes; leaves numerous, undivided leaves ............................................... Isoetes (ISOETACEAE)

6 Plants with creeping rhizomes; leaves few, reduced to a winged petiole ........................................... Pilularia americana (MARSILEACEAE)

Key C – Lycophytes and pteridophytes with leaves not "fern-like"

(unlobed, variously awl-shaped, scale-like, or terete)

1 Stem obviously jointed; leaves scale-like, borne in a whorl at each of the distant joints; spores borne in a terminal strobilius with peltate scales ......................................................... Equisetum (EQUISETACEAE)

2 Stem not jointed; leaves scale-like or larger, but if scale-like not borne in whorls at distant joints; spores borne variously, but if in a terminal strobilius the scales not peltate.

3 Leaves solitary (though often the internodes very short from a thin, creeping rhizome); sporangia borne on a separate branch from the rhizome .................................................. Pilularia (MARSILEACEAE)

4 Leaves straight, arching, or flaccid, from a 2-3-lobed corm; sporangia borne in the expanded, hyaline leaf bases................................. Isoetes (ISOETACEAE)

5 Leaves not notably spiral-curved, from a short rhizome; sporangia borne in 2 rows at the tip of the linear fertile leaves ................................................................. Schizaea (SCHIZACEAE)

6 Leaves various (scale-like, awl-like, moss-like, or flat), but not linear and grass-like, mostly 1-10× as long as wide.

7 Leaves inconspicuous, reduced to a few nerveless scales (< 1.5 mm long), the internodes much longer than the leaves; sporangia yellowish, 3-locular, 1-2 mm in diameter; stems upright, repeatedly branched dichotomously .................. Psilotum (PSILOTACEAE)

8 Leaves either larger or, if scale-like, with nerves and longer than the internodes (the leaves thus overlapping); sporangia yellowish to brownish, 1-locular, < 1 mm in diameter; stems either subterranean or surficial rhizomes or erect or ascending (and sometimes dichotomously branched in whole or in part in Hyperzia, Diphasiastrom, and Dendrolycophodium).

9 Plant with leaves very numerous and overlapping along the creeping, ascending, or erect stems, the leaves usually scale-like or awl-like, 0.5-2 (~3) mm wide, typically acute, acuminate, or hair-tipped; sporangia either in terminal strobili (axillary to specialized, smaller leaves) or axillary to normal leaves.
KEYS TO FAMILIES AND GENERA

7 Sporangia borne in flattened or quadrangular strobili sessile at the tips of leafy branches; spores and sporangia of two sizes, the megaspore smaller and borne basally in the strobili .......................................................... Selaginella (SELAGINELLACEAE)

7 Sporangia borne in the axils of normal foliage leaves, or in strobili sessile at the tips of leafy branches or stalked on specialized branches with fewer and smaller leaves; spores and sporangia of one size.

8 Leafy stems erect, simple or dichotomously branched, the ultimate branches vertically oriented; sporophylls like the sterile leaves or only slightly reduced, in annual bands along the stem; vegetative reproduction by leafy gemmae near stem apex.............. Huperzia (LYCOPODIACEAE)

8 Leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae.

9 Leaves herbaceous, pale or yellow-green, dull, deciduous; leafy stems creeping; rhizome dying back annually to an underground vegetative tuber at apex; [of wetlands, mostly on moist or wet sands or peats].

10 Leaves of the prostrate stems 0.5-1.2 mm wide, ciliate-toothed or not toothed; leaves of the erect stem many, overlapping, spirally arranged; leaves of the strobili resembling leaves of the prostrate and upright stems in size and shape; upright stems 1.5-15 mm in diameter (including the leaves) .......................................................... Lycopodiella (LYCOPODIACEAE)

10 Leaves of the prostrate stems 1.3-2.1 mm wide, not toothed; leaves of the erect stem few, not overlapping, whorled; leaves of the strobili much reduced relative to the leaves of the prostrate and upright stems; upright stems 1.5-3 mm in diameter (including the leaves) .................................................. Pseudolycopodiella (LYCOPODIACEAE)

9 Leaves rigid, bright to dark green, shiny, evergreen; leafy stems mainly erect, treelike, fanlike, or creeping (if creeping, then the leaves with elongate, hyaline hair-tips); rhizome perennial, elongate, surficial or subterranean; [of uplands, mostly in moist to dry soils].

11 Branches 1-5 mm wide (including the leaves), compressed to quadrangular, with 4 ranks of leaves; branching of strobili stalks dichotomous ................................................................. Diphasiastrum (LYCOPODIACEAE)

11 Branches 4-12 mm wide, terete (to somewhat compressed in Dendrolycopodium obscurem), with 6 or more ranks of leaves; branching of strobili stalks (when present), pseudomonopodial (falsely appearing to have a main axis from which branches arise).

12 Strobili borne on elonagte, sparsely leafy peduncles borne at the tips of leafy, ascending branches; leaves with attenuate, hyaline hair-tips .................................................. Lycopodium (LYCOPODIACEAE)

12 Strobili sessile, borne directly above densely leafy portions of upright branches; leaves acuminate to acute.

13 Erect leafy stems 3-8 mm in diameter (including the leaves), treelike or fanlike, with a definite main axis; leaves acute at the apex; horizontal shoots subterranean, without winter bud constrictions ................................................................. Lycopodium (LYCOPODIACEAE)

13 Erect leafy stems 10 mm or more in diameter (including the leaves), branched 1-4 times sub-dichotomously; leaves with a 0.4-1.0 mm long stiff spine; horizontal shoots at or near the ground surface, with winter bud constrictions ................................................................. Spinulum (LYCOPODIACEAE)

6 Plant with leaves not as above (see below).

14 Plant with 1 (-several) leaves, the sterile leaf blade 0.3-24 cm long, ovate to lanceolate, entire-marginated, obuse, the longer fertile portion with 2 rows of sporangia somewhat imbedded in it................................. Ophioglossum (OPHIOGLOSSACEAE)

14 Plant with many leaves, generally 5 or more, not divided into separate sterile and fertile segments, the leaves either (a) small, 0.3-1.6 cm long, obovate, scattered along a very thin creeping rhizome, or (b) larger, (2-) 8-30 cm long, cordate at base, the tip long-attenuate (often proliferous, bearing a plantlet at the tip).

15 Leaf blades (2-) 8-30 cm long, cordate at the base, the tip long-attenuate, often proliferous (bearing a plantlet at the tip); spirally arranged; sorus in indusiate sori on the undersurface; leaf texture moderately thick; rhizome erect or ascending, 1.0-1.5 mm in diameter, the leaves clustered from its tip ................................................................. Asplenium rhizophyllum (ASPLENIACEAE)

15 Leaf blades 0.3-1.6 cm long, cuneate at the base, rounded at obtuse at the tip, not proliferous; sporangia solitary in a marginal pocket on the leaf; leaf texture very thin; rhizome creeping on the surface of rock or bark, 0.1-0.3 mm in diameter, the leaves scattered along it ................................. Didymoglossum pettersii (HYMENOPHYLLACEAE)

Key D – Small pteridophytes, epipetric or epiphytic, growing on rock, tree bark, walls, or over rock in thin soil mats or in small soil pockets

1 Leaves pinnatifid or bipinnatifid, most of the pinnia not fully divided from one another (the rachis winged by leaf tissue most or all of its length).

2 Leaves bipinnatifid, at least the lowest pinnia deeply lobed.

3 Leaves of a very delicate texture, 1 cell thick; sori borne in cups on the leaf margins; [of rock outcrops with high air humidity].

4 Rhizomes filiform, <0.5 mm in diameter, glabrous or with sparse light-colored hairs; indusium ("involucre") bivalve (deeply divided into 2 flaps); receptacle not exserted from between the deeply bilobed indusium................................................................. Hymenophyllum (HYMENOPHYLLACEAE)

4 Rhizomes moderately stout, 0.8-1.5 mm in diameter, densely clad with dark-colored hairs; indusium ("involucre") tubular or funneliform, sometimes slightly 2-lobed; receptacle long and whiplike, exserted from the mouth of the tubular (slightly bilobed) indusium ................................................................. Vandenboschia (HYMENOPHYLLACEAE)

3 Leaves of an herbaceous, subcoriaceous, or coriaceous texture, >1 cell thick; sori otherwise; [of various habitats, not strictly of moist sites].

5 Lowermost (and other) pinnia with numerous, rather even lobes ................................................................. Phegopteris (THELYPERIDACEAE)

5 Lowermost pinnia with a few, irregular lobes (the upper pinnia unlobed) ................................................................. Pteris multifida (PTERIDACEAE)

2 Leaves pinnatifid, the pinnia not lobed.

6 Leaf blades with a long-attenuate apex, blade unlobed for 1/3 its length; sori elongate .................................................. Asplenium (ASPLENIACEAE)

6 Leaves without a long-attenuate apex, blade lobed for most of its length; sori round.

7 Plants dwarf, the leaf blades < 5 cm long; [occurring only in permanently moist habitats, as in grottoes behind waterfalls] ................................................................. Microlycopodium (POLYPODIACEAE)

7 Plants larger, the leaf blades 7-30 cm long; [occurring on moist to dry habitats].

8 Leaf blade densely scaly on the lower surface; leaf segment margins entire; rhizome 1-2 mm in diameter ................................................................. Pleopeltis (POLYPODIACEAE)
8 Leaf blade scale-less on the lower surface; leaf segment margins denticulate; rhizome 3-6 mm in diameter.......................... Adiantum (PTERIDACEAE)

1 Leaves pinnate, pinnate-pinnatifid, 2-pinnate, or even more divided (the rachis naked for most of its length, often winged in the apical portion).

9 Leaves pinnate or pinnatifid.

10 Leaves of a very delicate texture, 1 cell thick; sori borne in cups on the leaf margins; [of rock outcrops with high air humidity].

11 Rhizomes filiform, <0.5 mm in diameter, glabrous or with sparse light-colored hairs; indusium ("involute") bivalve (deeply divided into 2 flaps); receptacle not exserted from between the deeply bilobed indusium.................................................................Hymenophyllum (HYMENOPHYLLACEAE)

12 Pinnae > 1 cm wide; leaves subcoriaceous to coriaceous; veins anastomosing, rejoining to form a netlike pattern.......................... Pteris (PTERIDACEAE)

13 Pinnae < 1 cm wide; leaves herbaceous to subcoriaceous; veins free, not rejoining.

14 Leaf undersurface densely covered with stellate and ciliate scales.................... Astrolepis sinuata ssp. sinuata (PTERIDACEAE)

15 Rachis green or tan; leaf margin modified into a false indusium, reflexed to cover the sori .......... Pteris viitata (PTERIDACEAE)

16 Leaf blade pentagonal or broadly triangular in outline, ca. 1/3 as long as wide.

17 Leaf blade pentagonal in outline, the terminal pinna by far the largest; rhizome 5-8 mm in diameter; indusia present, thick, persistent, and reniform; [introduced species, naturalized in moist ravines in SC].......................Arachniodes (DRYOPTERIDACEAE)

18 Sori on the undersurface of the leaf, marginal and more-or-less hidden beneath either the unmodified revolute leaf margin or under a modified, reflexed false indusium.

19 Sori on the undersurface of the leaf, away from the margins.

15 Rachis dark-brown or purple; leaf margin unmodified, though often revolute ..........................Pellaea (PTERIDACEAE)

16 Leaf blade elongate, mostly lanceolate, generally > 4× as long as wide (except in Adiantum capillus-veneris, with leaf blade only 1.5-3× as long as wide, but not notably triangular or pentagonal in outline).

17 Leaf blade pentagonal in outline, the basal pinnae by far the largest; rhizome ca. 1 mm in diameter; indusia absent; [native species of mountain peaks of n. NC and VA]..........................Gymnocarpium (CYSTOPTERIDACEAE)

18 Leaf blade broadly triangular in outline, 1.5-3× as long as wide, but not notably triangular or pentagonal in outline.

19 Leaf blade pentagonal or broadly triangular in outline, ca. 1/3 as long as wide.

20 Veins ending short of the margin; indusium attached under one side of the sorus, hoodlike or pocketlike, arching over the sorus; petioles glabrous or sparsely beset with scales, the petiole bases not persistent.......................Cystopteris (CYSTOPTERIDACEAE)

21 Sori continuous along the pinnule margins; leaves mostly dark-green or glaucous, often pubescent, coriaceous, tough, and stiff.

22 Leaves monomorphic, the fertile leaves obviously longer than the sterile and with narrow elongate ultimate segments ............. Cryptogramma (PTERIDACEAE)

23 Lower leaf surfaces covered with whitish powder, otherwise glabrous or sparsely pubescent..........................Argyrochosma (PTERIDACEAE)

24 Lower leaf surfaces pubescent (or glabrous in Cheilanthes alabamensis), never with conspicuous whitish powder..........................Cheilanthes (PTERIDACEAE)

Key E – Small pteridophytes, terrestrial, growing in soil, not associated with rock outcrops

1 Petiole branched once dichotomously, each branch bearing 3-7 pinnae in one direction only, the outline of the blade fan-shaped, often broader than long.................................Adiantum pedatum (PTERIDACEAE)

2 Petiole not branched dichotomously, the blade either longer than broad or triangular and about as wide as long.

3 Sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome).......................... Botrychium (OPHIOGLOSSACEAE)

4 Sporangia either borne on normal leaf blades or on specialized (fertile) leaves separate from the rhizome.

4 Leaves monomorphic, the sori borne on normal leaf blades ........................................Phegopteris (THELYTERIDACEAE)

5 Fertile leaf woody, with beak-like segments; pinnae margins entire, often wavy or the lowermost even somewhat lobed; pinnae mostly with obscure apices, tending to be borne opposite ........................................Onclea (ONOCLEACEAE)

6 Leaves dimorphic, the sori borne on leaves significantly different than normal leaves.

5 Fertile leaf stiff but herbaceous, the pinnae linear, not at all beak-like; pinnae mostly with acute apices, tending to be borne alternate..........................Woodwardia areolata (BLECHNACEAE)

2 Leaves pinnate, pinnate-pinnatifid, 2-pinnate, or even more divided (the rachis naked for most of its length, often winged in the apical portion).

6 Leaves broadly triangular in outline, about as broad as long; sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome).............Sceptridium (OPHIOGLOSSACEAE)
KEYS TO FAMILIES AND GENERA

6  Leaves lanceolate in outline, much longer than broad; sporangia either borne on normal leaf blades, on slightly dimorphic blades, or on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome).

7  Leaf blades 1-8 cm long; sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome). .............................................. Botrychium (OPHIOGLOSSACEAE)

7  Leaf blades 10-30 (-100) cm long; sporangia either borne on normal leaf blades or on slightly dimorphic blades.

8  Leaves dark green, subcoriaceous, evergreen.

9  Leaves 2 pinnate, the pinnules toothed ................................................................. Rumohra (DRYOPTERIDACEAE)

9  Leaves 1-pinnate, the pinnate toothed ................................................................. Polystichum (DRYOPTERIDACEAE)

8  Leaves light to medium green, herbaceous, deciduous to semi-evergreen.

10  Sori continuous along the midrib of the pinna .................................................... Blechnum (BLECHNACEAE)

11  Sori distinct.

11  Sori elongate; leaf blades somewhat dimorphic, the fertile larger and erect, the sterile smaller and prostrate, the larger leaf blades 2-4 (-6.5) cm wide ......................................................... Asplenium platyphyllum (ASPLENIAEAE)

11  Sori round; leaf blades monomorphic; the larger leaf blades 5-15 cm wide............... Thelypteris (THELYPTERIDACEAE)

Key F – Medium to large pteridophytes, epiphytic, growing on rock, walls, over rock in thin soil mats or in small soil pockets, or on tree trunks

1  Leaves vine-like, 0.3-10 m long, the branching dichotomous, 1 branch of each dichotomy terminating in a pair of pinnate, the pinnate often widely spaced (> 10 cm apart) ................................................................. Lycopodium (LYGODIACEAE)

1  Leaves not vine-like, 0.3-3 m long, the branching not as described above, the pinnate regularly and more-or-less closely spaced (mostly < 10 cm apart).

2  Leaves 1-pinnate-pinnatifid or less divided, the pinnate entire, toothed, lobed or pinnatifid.

3  Sori marginal, continuous, covered by a reflexed false indusium along the leaf margin; pinnate usually opposite, linear, not toothed or lobed ...................................................................................................................... Pteris vittata (PTERIDACEAE)

3  Sori neither marginal nor continuous, slightly to entirely covered by an elongate or roundish indusium (sometimes ciliate, toothed, or divided into narrow segments); pinnate usually at least in part alternate, mostly lanceolate, toothed, lobed, or pinnatifid.

4  Sori elongate, the indusium flap-like, attached along the side; leaf blades (if > 30 cm long) < 7 cm wide ................................................................. Asplenium platyphyllum (ASPLENIAEAE)

4  Sori circular or globular, the indusium peltate, reniform, or cuplike; leaf blades (if > 30 cm long) > 5 cm wide.

5  Leaves pinnatifid.

6  Larger leaves with > 25 pairs of segments, each 1.5-5 (-8) mm wide; [of ne. FL southward] Plecuma (POLYPODIACEAE)

6  Larger leaves with < 25 pairs of segments, (3-) 5-40 mm wide; [collectively widespread in our area.

7  Venation highly reticulate, with 3-4 rows of areoles between the midvein and the margin; rhizome 8-15 (-30) mm in diameter; leaf blade 10-50 cm wide ................................................................. Phlebodium (POLYPODIACEAE)

7  Venation free or with a row of areoles between the midvein and the margin; rhizome 3-6 mm in diameter; leaf blade < 9 cm wide ................................................................. Polypodium (POLYPODIACEAE)

5  Leaves 1-pinnate or more divided.

8  Leaves 1-pinnate, the pinnate toothed and each with a prominent lobe near the base on the side toward the leaf tip; indusia peltate (Cytromium and Polystichum) or reniform or crescent-shaped (Nephrolepis).

9  Leaves pale green, thin in texture; pinnate articulate to rachis, deciduous with age; thin, rhizome bearing elongate, thin, waxy stolons ................................................................. Nephrolepis (NEPHROLEPIDACEAE)

9  Leaves dark-green, subcoriaceous to coriaceous; pinnate not articulate and deciduous with age; rhizome not producing stolons.

10  Veins anastomosing, rejoining to form a netlike pattern; pinnate 4-25 pairs per leaf; [non-native, rarely naturalized] .................... Dryopteris (DRYOPTERIDACEAE)

10  Veins branching dichotomously, free, not rejoining to form a netlike pattern; pinnate 25-50 pairs on larger leaves; [native, common] ................................................................. Thelypteris (THELYPTERIDACEAE)

8  Leaves 1-pinnate-pinnatifid, the pinnate pinnatifid, generally lacking a prominent basal lobe; indusia either reniform or cuplike.

11  Vascular bundles in the petiole 3-7 ................................................................. Thelypteris (THELYPTERIDACEAE)

11  Vascular bundles in the petiole 2, uniting above.

12  Indusium reniform, arching over the sorus ............................................................. Thelypteris (THELYPTERIDACEAE)

12  Indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments ................................................................. Woodsia obtusa (WOODSIACEAE)

2  Leaves 2-pinnate or more divided, the pinnate divided to their midribs.

13  Sori marginal and borne on the underside of the false indusium; petioles and rachis shiny black or reddish-black, glabrous except at the very base of the petiole; pinnules fan-shaped or obliquely elongate .............................................. Adiantum (PTERIDACEAE)

13  Sori not marginal, borne on the underside of the leaf blade (if marginal, as in Pteridium and Dennstaedtia, borne on the underside of the leaf); petioles darkened only basally (if at all), rachis green, tan, or reddish; pinnules not notably fan-shaped or obliquely elongate.

14  Leaf blades pentagonal or broadly triangular in outline, ca. 1 x as long as wide.

15  Leaf blade pentagonal in outline, the terminal pinna the largest; sori submarginal, roundish, the indusium reniform; [alien, rarely naturalized] ................................................................. Arachniodes (DRYOPTERIDACEAE)

15  Leaf blade broadly triangular in outline, the basal pinna the largest; sori marginal, linear, indusium absent, protected by the revolute leaf margin and a minute false indusium; [native, common] ................................................................. Pteridium (DENNSTAEDTIACEAE)

14  Leaf blades elongate, mostly lanceolate, generally 4+ or more as long as wide.

16  Outline of leaf blade slightly if at all narrowed to the base, the widest point < 5 pinna pairs from the base, the lowestmost pinnae < 1/4 as long as the longest pinna; rhizomes long-creeping, the leaves scattered, forming clonal patches ................................................................. Thelypteris novohaleporossis (THELYPTERIDACEAE)

16  Outline of the leaf blade slightly if at all narrowed to the base, the widest point > 5 pinna pairs from the base, the lowestmost pinnae > 1/2 as long as the longest pinna; rhizomes short-creeping, the leaves clustered, not forming clonal patches (or with rhizomes long-creeping, leaves scattered, forming clonal patches in Dennstaedtia).
17 Rhizomes long creeping, leaves scattered, forming clonal patches; vascular bundles in the petiole 1, U-shaped (even in the lower petiole); sori very small, marginal in sinuses, the indusium cuplike, 2-parted, the outer part a modified tooth of the leaf blade; leaf blades conspicuously puberulent with sepaloid hairs..............................Dennstaedtia (DENNSTAEDTIACEAE)

17 Rhizomes short-creeping, the leaves clustered, not forming clonal patches; vascular bundles in the petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike in Woodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes.

18 Vascular bundles (3-) 5 (-7) in the petiole.................................................................Dryopteris (DRYOPTERIDACEAE)

18 Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

19 Leaves 25-65 cm wide, with whitish, straight, acicular hairs; [species adventive and weedy].................................................................Macrophyllum (THELYPTERIDACEAE)

19 Leaves 5-25 (-30) cm wide, with scales and minute glands (sometimes also with sepaloid hairs); [native species]

20 Leaves 1-pinnate-pinnatifid; indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments.......................................................Woodsia obtusa (WOODSIACEAE)

20 Leaves 2-pinnate-pinnatifid; indusium flapple or pocketlike, attached at one side of the sorus and arching over it.

21 Leaves 10-30 cm wide, the tip acute to acuminate; indusium flapple............................Athyrium (ATHYRIACEAE)

21 Leaves 4-9 cm wide, the tip long-attenuate; indusium pocketlike or hoodlike.................................Cystopteris bulbifera (CYSTOPTERIDACEAE)

Key G – Medium to large pteridophytes, terrestrial, growing in soil, not associated with rock outcrops

1 Leaves vine-like, 0.3-10 m long, the branching dichotomous, 1 branch of each dichotomy terminating in a pair of pinnate, the pinnate often widely spaced (> 10 cm apart)

2 Vine-like leaves scrambling or trailing; sporangia borne 6-12 per sorus .................................................Dicranopteris (GLEICHENIACEAE)

2 Vine-like leaves twining; sporangia borne singly, each subtended by an indusium-like flap......................Lygodium (LYGODIACEAE)

1 Leaves not vine-like, 0.3-3 m long, the branching not as described above, the pinnate regularly and more-or-less closely spaced (mostly < 10 cm apart).

3 Leaf blades broadly (about equilaterally) triangular, pentagonal, or flabellate in outline, 0.7-1.3× as long as wide.

4 Leaf blades flabellate or fan-shaped in outline, the petiole branched once dichotomously, each branch bearing 3-7 pinnae in one direction only.................................................................Adiantum pedatum (PTERIDACEAE)

4 Leaf blades pentagonal or broadly triangular in outline, the petiole not branched dichotomously.

5 Leaf blade pentagonal in outline, the terminal pinna the largest; sori submarginal, roundish, the indusium reniform; [alien, rarely naturalized]...............................................................................................................................Arachniodes (DRYOPTERIDACEAE)

5 Leaf blade broadly triangular in outline, the basal pinnae the largest; sori marginal, linear, indusium absent, protected by the revolute leaf margin and a minute false indusium (Pteridium), or sporangia borne in a stalked, specialized, fertile portion of the blade (Botrychium); [native, collectively common].

6 Sporangia borne in a stalked, specialized, fertile portion of the blade; texture of mature blades somewhat fleshy; plants solitary from a short underground rhizome with thick, mycorrhizal roots; [primarily of moist forests]............................Botrypus (OPHIOGLOSSACEAE)

6 Sporangia borne in marginal, linear sori, indusium absent, protected by the revolute leaf margin and a minute false indusium; texture of mature leaf blades hard and stiff; plants colonial from deep-seated rhizomes; [primarily of moist to dry woodlands and savannas].................................................................Pteridium (DENNSTAEDTIACEAE)

7 Leaves elongate in outline, mostly ovate, lanceolate, oblanceolate, or narrowly triangular, 1.5-10× or more as long as wide.

8 Leaf blade divided into sterile and fertile portions, the pinnate often widely spaced (> 10 cm apart).

8 Leaf blade divided into sterile and fertile portions, the pinnate often widely spaced (> 10 cm apart).

9 Rhizomes long-creeping, leaves scattered, forming clonal patches; vascular bundles in the petiole either 1, U-shaped (even in the lower petiole) or > 3; sori very small, marginal in sinuses, the indusium cuplike, 2-parted, the outer part a modified tooth of the leaf blade; leaf blades conspicuously puberulent with sepaloid hairs (Dennstaedtia); glabrous to puberulent with glandular trichomes (Hypolepis).

9 Rhizomes short-creeping, the leaves clustered, not forming clonal patches; vascular bundles in the lower petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike in Woodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes.

10 Vascular bundles (3-) 5 (-7) in the petiole.

10 Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

11 Indusia reniform; leaf blade (at least of larger leaves on mature plants) usually > 40 cm long.................................Dryopteris (DRYOPTERIDACEAE)

11 Indusia peltate; leaf blade < 40 cm long.....................................................................................Runohra (DRYOPTERIDACEAE)

12 Indusia reniform; leaf blade (at least of larger leaves on mature plants) usually > 40 cm long.................................Dryopteris (DRYOPTERIDACEAE)

12 Indusia peltate; leaf blade < 40 cm long.....................................................................................Runohra (DRYOPTERIDACEAE)

13 Leaves 2-pinnate-pinnatifid; indusium tubular or cuplike; leaves generally < 1 m long; petiole and rachis unarmed; [of n. GA and n. AL northward].................................................................Dennstaedtia (DENNSTAEDTIACEAE)

13 Leaves 3-4-pinnate-pinnatifid; indusium flapple-like; leaves generally > 1 m long; petiole and rachis with prickles; [of n. FL southward]............................................................................................................................Hypolepis (DENNSTAEDTIACEAE)

14 Rhizomes short-creeping, the leaves clustered, not forming clonal patches; vascular bundles in the lower petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike in Woodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes.

15 Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

15 Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

16 Veins free, simple or forked.................................................................................................Athyrium (ATHYRIACEAE)
KEYS TO FAMILIES AND GENERA

16 Leaves anastomosing. .......................................................... ............... Diplozium (ATHYRIACEAE)
17 Leaves 1-pinnate-pinnatifid or less divided, the pinnae entire, toothed, lobed or pinnatifid.
18 Fertile leaf woody, with head-like segments; pinnae margins entire, often wavy or the lowermost even somewhat lobed; pinnae mostly with obtuse apices, tending to be borne opposite. ......................................................... Osmunda (OSMUNDACEAE)
19 Fertile leaf stiff but herbaceous, the pinnae linear, not at all head-like; pinnae margins finely serrulate, otherwise slightly wavy or straight; pinnae mostly with acute apices, tending to be borne alternate. ............... Woodwardia areolata (BLECHNACEAE)
17 Leaves 1-pinnate or 1-pinnate-pinnatifid, the pinnae fully divided from one another (the rachis naked for most of its length, often winged in the terminal portion); leaves dimorphic or not.
19 Rhizomes long-creeping, leaves scattered, forming clonal patches.
20 Sori roundish, borne end to end along either side of the main veins; pinna lobes of sterile leaves with reticulate, chain-like venation along the central vein. ................................................................. Woodwardia virginica (BLECHNACEAE)
20 Sori roundish, borne away from the main veins; pinna lobes of sterile leaves with the lateral veins free and pinnately arranged (the lowermost lateral vein sometimes joining that of the adjacent pinna lobe just below the sinus, but the remainder of the lateral veins all free) ................................................................................................................... Thelypteris (THELYPTERIDACEAE)
19 Rhizomes short-creeping, the leaves clustered, not forming clonal patches (or rhizomes of both types, but leaves borne only in clusters on the short erect ones, in Matteuccia)
21 Plants moderately to very robust, the leaves typically 6-50 dm tall; leaves either strongly dimorphic, the fertile leaves very unlike the sterile, brown at maturity, borne as an interruption in the blade, with normal green pinnae above and below (Osmunda claytoniana), or the fertile pinnae very unlike the sterile, brown at maturity, borne as an interruption in the blade, with normal green pinnae above and below (Osmunda claytoniana), or the fertile pinnae towards the tip of the leaf and with sporangia entirely covering the lower surface (Acrostichum); rhizomes scaleless, petioles scaleless (except in the base in Matteuccia).
22 Leaves 1.5-5 m long; fertile pinnae with sporangia covering the lower surface; [of n. FL southward].................................
22 Leaves 0.6-2.5 m long; fertile portions otherwise.
23 Leaves strongly tapering to the base from the broadest point (well beyond the midpoint of the blade), the basalmost pinnae much < ½ as long as the largest pinnae ........................................... Matteuccia (ONOCLEACEAE)
23 Leaves slightly if at all tapering to the base, about equally broad through much of their length, the basalmost pinnae much > ½ as long as the largest pinnae.
24 Leaves hemidimorphic (juvenile leaves with only sterile pinnae, leaves bearing sporangia with sterile and fertile pinnae, the fertile pinnae borne mediately); photosynthetic pinnae lacking tufts of hairs. Osmunda (OSMUNDACEAE)
24 Leaves dimorphic (each leaf normally either completely photosynthetic or completely fertile); photosynthetic pinnae with tufts of reddish hairs near the junction with the rachis. Osmundastrum (OSMUNDACEAE)
25 Plants mostly less robust, the leaves 3-10 dm tall (except Dryopteris ludoviciana, D. celsa, D. goldiana, and Nephrolepis exaltata to 15 dm), leaves not at all or only slightly dimorphic, the fertile differing in various ways, such as having narrower pinnae (as in Dryopteris ludoviciana, Polystichum acrostichoides, Diplazium, and Thelypteris palustris) or the fertile leaves taller and more deciduous (as in Asplenium platyneuron and Dryopteris cristata), but not as described in the first lead; rhizomes and petioles variously scaly or scaleless, but at least the petiole and often also the rachis scaly if the plants over 1 m tall.
25 Sori elongate, the indusium elongate, attached along one side as a flap.
26 Petiole and rachis lustrous brownish-black; fertile leaves 2.8 (-12) cm wide. Asplenium platyneuron (ASPLENIACEAE)
26 Petiole and rachis green; fertile leaves 10-20 (-30) cm wide. Deparia (ATHYRIACEAE)
27 Leaves 1-pinnate-pinnatifid (the pinnae pinnatifid) .......................................................... ....................... Homalosorus (DIPLAZIOPSIDACEAE)
27 Leaves 1-pinnate (the pinnae entire)..........................................................................
28 Leaves 1-pinnate, the pinnae toothed and each with a slight to prominent lobe near the base on the side toward the leaf tip (except Nephrolepis exaltata); indusia peltate (Polystichum) or reniform or crescent-shaped (Nephrolepis).
29 Leaves pale green, thin in texture; pinnae articulate to rachis, deciduous; rhizome not producing stolons; [native, common] ... Polystichum (DRYOPTERIDACEAE)
28 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid, generally lacking a prominent basal lobe; indusia reniform.
30 Vascular bundles in the petiole 4-7.............................................................. Dryopteris (DRYOPTERIDACEAE)
30 Vascular bundles in the petiole 2, uniting above...................................................... Thelypteris (THELYPTERIDACEAE)

KEY TO THE GENERA AND FAMILIES OF GYMNOSPERMS

The gymnosperms are a likely artificial grouping of about 16 families, about 86 genera, and about 850 species. References: Kramer & Green (1990).

Standard Key to Families

1 Leaves pinnately compound................................................................. ZAMIACEAE
1 Leaves simple.
2 Leaves fan-shaped, dichotomously-veined, deciduous ......................................................... GINKGOACEAE
2 Leaves needle-like or scale-like, not dichotomously veined, evergreen (rarely deciduous).
3 Seeds 2-many, borne in a woody or fleshy cone (sometimes resembling a rather hard berry).
4 Foliage leaves needle-like or scale-like, alternate, opposite, or whorled; cone scales valvate or imbricate (if imbricate, the leaves scale-like and opposite) ................................................................. CUPRESSACEAE
4 Foliage leaves needle-like, alternate or fascicled; cone scales imbricate ................................................. PINACEAE
3 Seeds borne singly in a soft fleshy to leathery aril
5 Leaves opposite.................................................................................. CEPHALOTAXACEAE
KEYS TO FAMILIES AND GENERA

5 Leaves alternate to irregularly subopposite........................................................................................................... TAXACEAE

Key to genera of gymnosperms, emphasizing vegetative characters

1 Leaves 1-pinnately compound ............................................................................................................................ Zamia (ZAMIACEAE)

1 Leaves simple.

2 Leaves broad and fan-shaped, > 30 mm wide, with conspicuous dichotomous venation, seasonally deciduous................................. Ginkgo (GINKGOACEAE)

2 Leaves needle-like or scale-like, < 5 mm wide, evergreen (seasonally deciduous in Larix and Taxodium).

3 Leaves opposite or in whorls of 3.

4 Leaves linear, 15-45 mm long; mature female cones fleshy and berry-like, > 15 mm in diameter

5 Leaves without distinct midrib; 2 stomatal bands on the lower surface each ca. 0.5 mm wide; berry-like "cone" sessile................. Torreya (TAXACEAE)

5 Leaves with distinct midrib; 2 stomatal bands on the lower surface each ca. 0.5 mm wide; berry-like "cone" stalked.................. Cephalotaxus (CEPHALOTAXACEAE)

6 Branchlets not disposed in one plane, thus bushy and not fan-like; plants dioecious, male and female cones on separate plants; mature female cones fleshy and berry-like, with smooth surfaces, indehiscent; leaves opposite (decussate) or in whorls of 3............. Juniperus (CUPRESSACEAE)

6 Branchlets disposed in one plane, thus flattened and fan-like; plants monoecious, male and female cones on the same plant; mature female cones woody or leathery, with irregular surfaces, dehiscent; leaves opposite (decussate).

7 Leaves acute; female cones globose and woody, the hard scales peltate, not imbricate; ultimate branchlets (including the scale leaves) about 1 mm broad................................................................................................................. Chamaecyparis (CUPRESSACEAE)

7 Leaves obtuse; female cones ellipsoid and leathery, the pliable scales basally attached, imbricate; ultimate branchlets (including the scale leaves) about 1.5 mm broad

8 Branchlets flattened in vertical planes; seeds wingless; [planted tree, sometimes persistent] ......................................................... Platycladus (CUPRESSACEAE)

8 Branchlets flattened in horizontal planes; seeds winged; [native tree, but also sometimes planted] ...................................................... Thuja (CUPRESSACEAE)

3 Leaves alternate, or in fascicles of 2-5, or on short shoots in clusters of many leaves in apparent whorls.

9 Leaves borne in fascicles of 2-5 (basally bound by a scurious sheath) or on short shoots in clusters of many leaves in apparent whorls.

10 Leaves borne in short shoots in clusters of many (>10) leaves in apparent whorls.

11 Leaves evergreen; cones 6-12 cm long .............................................................................................................. Picea (PINACEAE)

11 Leaves deciduous; cones 1-2 cm long .............................................................................................................. Pinus (PINACEAE)

9 Leaves alternate.

12 Leaves 4-angled in cross-section ..................................................................................................................... Tsuga (PINACEAE)

12 Leaves distinctly flattened (2-sided) in cross-section.

13 Leaves very soft in texture, seasonally deciduous as twiglets ................................................................. Thuja (CUPRESSACEAE)

13 Leaves stiffer in texture, evergreen.

14 Leaves tapering from base to a long-acuminate tip .................................................................................... Cunninghamia (CUPRESSACEAE)

14 Leaves with parallel margins for most of their length, or widest near middle and gradually tapering to base and apex, the apex acute, obtuse, or retoxe.

15 Cone dry and brown at maturity.

16 "Cone" fleshy, red or purplish at maturity.

17 Leaves flexible, the tips pointed but not piercing to the touch; fleshy "cone" ca. 5 mm long, ca. 5 mm in diameter, red when ripe, the seed exposed at the top by a gap in the aril ......................................................... Taxus (TAXACEAE)

17 Leaves stiff, the tips piercing to the touch; fleshy "cone" 2.5-3 cm long, ca. 2 cm in diameter, dark green to purple when ripe, seed entirely surrounded by fleshy tissue......................................................... Torreya (TAXACEAE)
LI. LYCOPODIACEAE

THE FLORA

SECTION 1: LYCOPODIOPHYTA (CLUBMOSES)

LI. LYCOPODIACEAE Palisot de Beauvois 1802 (Clubmoss Family) [in LYCOPODIALES]

A family of 10-15 genera and about 400 species. Lycopodiaceae, along with Selaginellaceae and Isoetaceae, have now been shown to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). The division of North American Lycopodium into three or more genera has been strongly advocated by Wagner & Beitel (1992), Wagner & Beitel in FNA (1993), Haines (2003a), and nearly all other recent authors. The traditionally broad Lycopodium appears to include a number of natural groups which are strikingly different from one another and have constituted separate lineages for tens to hundreds of millions of years. These natural groups are separable by numerous morphological, developmental, and anatomical characters, karyotype, and inability to hybridize. Wagner & Beitel (1992) divide Lycopodium (sensu lattissimo) of our area into six genera in three subfamilies, as follows: Huperzia in Subfamily Huperzioidae, Lycopodium and Diphasiastrum in Subfamily Lycopodioidae, and Lycopodiella, Palhinhaea, and Pseudolycopodiella in Subfamily Lycopodielloideae. Haines (2003a) further divides Lycopodium (sensu lati) into three genera: Dendrolycopodium, Spinulum, and Lycopodium (sensu stricto). The reasoning behind this division is very strong, and it is here followed. Profound differences in anatomy, morphology, reproduction, gametophyte morphology, and karyotype support this separation. The chromosome numbers of our genera: Lycopodium (x=34), Diphasiastrum (x=23), Huperzia (x=67, 68), Lycopodiella (x=78), Lycopodium (x=34), Palhinhaea (x=55), Pseudolycopodiella (x=35), and Spinulum (x=34). Øllgaard in Kramer & Green (1990) and Wikström & Kenrick (2000) follow a somewhat broader coarse, recognizing three genera for our species (corresponding to the subfamilies of Wagner & Beitel 1992), and recognizing as sections the genera of Wagner & Beitel (1992). Øllgaard states that the "genera are very distinct, and also the sections within Lycopodiella and Lycopodium seem to represent ancient, independent evolutionary lines." Wikström & Kenrick (2000, 2001) suggest that the phylogenetic separation of Lycopodium (including Diphasiastrum) and Lycopodiella (including Pseudolycopodiella and Palhinhaea) occurred at least as long ago as the early Jurassic (208 million years before present), and the divergence of Huperzia from Lycopodium and Lycopodiella still longer ago. Based on this deep division between Huperzia and the other genera, some authors additionally advocate the recognition of Huperzia in a separate family, Huperziaceae, a suggestion which is by no means outlandish (though not followed here). References: Lellinger (1985); Mickel (1979); Wagner and Beitel (1992); Beitel (1979); Snyder & Bruce (1986); Wagner & Beitel in FNA (1993b); Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000, 2001); Øllgaard (1987); Haines (2003a). Key based in part on Haines (2003a).

1. Leafy stems erect, simple or dichotomously branched, the ultimate branches vertically oriented; sporophylls like the sterile leaves or only slightly reduced, in annual bands along the stem; vegetative reproduction by leafy gemmae near the stem apex; [subfamily Huperzioidae] ... .............................................................. 1. Huperzia

1. Leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae.

2. Leaves herbaceous, pale or yellow-green, dull, deciduous; principal leafy stems creeping (except erect and repeatedly branched in Palhinhaea); rhizome dying back annually to an underground vegetative tuber at apex; spores rugulate; [of wetlands, mostly in moist to dry soils]; [subfamily Lycopodielloideae].

3. Upright shoots repeatedly branched; strobili nodding at the ends of the branches; [known to occur from se. SC southward] ......... ................................. 3. Pseudolycopodiella

3. Upright shoots not branched; strobili erect on upright shoots; [widespread in our area].

4. Leaves of the prostrate stems 0.5-1.2 mm wide, ciliate-toothed or not toothed; leaves of the erect stem many, overlapping, spiral; leaves of the strobilus (sporophylls) resembling leaves of the prostrate and upright stems in size and shape; upright stems 1.5-15 mm in diameter (including the leaves) ................................................................. 4. Pseudolycopodiella

4. Leaves of the prostrate stems 1.3-2.1 mm wide, not toothed; leaves of the erect stem few, not overlapping, whorled; leaves of the strobilus (sporophylls) much reduced relative to leaves of the prostrate and upright stems; upright stems 1.5-3 mm in diameter (including the leaves) ........................................................................................................ 2. Lycopodiella

4. Leaves of the prostrate stems 0.5-1.2 mm wide, ciliate-toothed or not toothed; leaves of the erect stem many, overlapping, spirial; leaves of the strobilus (sporophylls) resembling leaves of the prostrate and upright stems in size and shape; upright stems 1.5-15 mm in diameter (including the leaves) ................................................................. 3. Pseudolycopodiella

5. Leaves rigid, bright to dark green, shiny, evergreen; principal leafy stems mainly erect, treelike, fanlike, or creeping (if creeping, then the leaves with elongate, hyaline hair-tips); rhizome perennial, elongate, surficial or subterranean; spores reticulate; [of uplands, mostly in moist soil]; [subfamily Lycopodielloideae].

5. Branches 1-5 mm wide (including the leaves), compressed to quadrangular, with 4 ranks of leaves; branching of strobilus stalks dichotomous ................................................................. 6. Diphasiastrum

5. Branches 4-12 mm wide, terete (to somewhat compressed in Dendrolycopodium obscurum), with 6 or more ranks of leaves; branching of strobilus stalks (when present), pseudomonopodial (falsely appearing to have a main axis from which branches arise).

6. Strobili borne on elongate, sparsely leafy peduncles borne at the tips of leafy, ascending branches; leaves with attenuate, hyaline hair-tips ............................................................................................ 8. Lycopodium

6. Strobili sessile, borne directly above densely leafy portions of upright branches; leaves acuminate to acute.

7. Erect leafy stems 3-8 mm in diameter (including the leaves), treelike or fanlike, with a definite main axis; leaves acute at the apex; horizontal shoots subterranean, without winter bud constrictions ...................................................... 5. Dendrolycopodium

7. Erect leafy stems 10 mm or more in diameter (including the leaves), branched 1-4 x sub-dichotomously; leaves with a 0.4-1.0 mm long stiff spine; horizontal shoots at or near the ground surface, with winter bud constrictions ...................................................... 7. Spinulum

I. Huperzia Bernhardi (Firmoss, Clubmoss)
A genus of about 10-15 species, north temperate and arctic (and tropical mountains of Asia). Within the Lycopodiaceae, *Huperzia* has "an isolated position", basal to the remainder of the family, and is sometimes separated in a separate family, the Huperziaceae (Haines 2003a). References: Wagner & Beitel in FNA (1993b); Haines (2003a)=Z; Öllgaard in Kramer & Green (1990); Wikström & Kenrick (2000).

**Identification notes:** Several hybrids are known from our area; they usually occur in intermediate habitats (such as in thin soil at the base of cliffs) and generally are found in proximity to both parents, but sometimes occur in the absence of one or both parents. Hybrids can be recognized by their intermediate morphology. In addition, *Huperzia selago* (Linnaeus) Bernhardi ex Martius & Schrank, Northern Firmoss, is circumboreal, ranging south in North America to NY, New England, and the Great Lakes region, and is disjunct to OH. It could easily occur as a disjunct in our area, and should be sought in the high mountains.

1. Leaves oblong-lanceolate, the apical portion toothed with 1-8 large, irregular teeth; leaves 6-15 mm long, 1.0-2.5 mm wide; stomates on lower leaf surface only (visible at 10×, or preferably 20-40×, magnification); spores 23-29 μm in diameter; [mainly of forest soils] ........................................... *H. lucidula*
2. Leaves spreading, 2-7.5 mm long, 0.6-0.8 (-1.0) mm wide, not toothed (though sometimes with minute, single cell bumps); stomates relatively many on the upper leaf surface (30-90 on each side of midrib); [of high to medium elevations].
3. Leaves dimorphic, those at the base longer and spreading wider from the shoot axis than those from the apical portion of the plant; gemma-bearing branches borne throughout the apical portion of mature shoots; lateral leaves of gemmae 0.5-1.1 mm wide .......................................................... *H. appressa*
4. Leaves relatively monomorphic; gemma-bearing branches, if present at all, borne in 1 pseudowhorl at the apex of seasonal growth; lateral leaves of gemmae 1.3-2.5 mm wide ........................................................................................................... *[H. selago]*

**Huperzia appressa** (Desvaux) A. Lóve & D. Lóve, Appalchian Firmoss. Rock outcrops at high elevations (very rarely at middle elevations), rarely also in seepage or along banks of small streams at high elevations, and in fens (on hummocks). June-August. N. QC and NL (Newfoundland) west to ON, MI, and MN and south along the Appalachians to w. NC, e. TN, and ne. GA. This species was named in 1992 as *H. appalachiana* (Beitel & Mickel 1992), but *H. appressa* (Desvaux) A. Lóve & D. Lóve is an older combination that applies to the same species (Haines 2003a). Though morphologically only subtly differentiated from the circumboreal *H. selago* (for distinctions see Beitel & Mickel 1992; Brunton, Wagner, & Beitel 1992; Haines 2003a), the case for the distinctness of *H. appressa* is confirmed by the production of sterile (abortive-spored) hybrids where it co-occurs with *H. selago.* [= Z = *H. appalachiana* Beitel & Mickel – FNA; K, = *Lycopodium selago* Linnaeus – RAB, S, W; = < *Lycopodium selago* Linnaeus var. appressum (Desvaux) Petrovic – C; F; > < *Lycopodium selago* var. selago – C, G]

**Huperzia × bartleyi** (Cusick) Kartesz & Gandhi [H. lucidula × porophila]. Rock outcrops. Reported for NC by Waterway (1986). This hybrid can be told from its parents by the presence of stomates on both surfaces of the leaf (unlike *H. lucidula*), but their marked lower density on the upper surface (unlike *H. porophila*). [= K, Z]

**Huperzia × protoporophila** A. Haines [H. appressa × lucidula]. Rock outcrops and cliff bases. Known from Chimney Rock Park, Rutherford County, NC (the lowest elevation occurrence of *H. appressa* in NC) and from Roan Mountain, Mitchell County, NC, and Grandfather Mountain, Avery County, NC. Expected at other cliff bases where the two parents are in proximity. This hybrid can be told from its parents by the presence of stomates on both surfaces of the leaf (unlike *H. lucidula*), but their marked lower density on the upper surface (unlike *H. appressa*). An additional useful character is the distribution of gemma-bearing branches: those of *Huperzia appressa* are abundantly distributed throughout the apical portion of mature plants, while those of the hybrid are confined to 1 or 2 pseudowhorls at the apex of annual growth (i.e., there are large gaps between the pseudowhorls of gemma-bearing branches). [= Z]

2. **Lycopodiella** Holub 1964 (Bog Clubmoss)

A genus of about 15-20 species, temperate and tropical. Additional research on this genus in our area is needed. Two fertile tetraploid species were recently named from MI (Bruce, Wagner, & Beitel 1991), and additional cryptic or semicryptic species
may be found in the Southeastern Coastal Plain. This group is variably treated as genus Lycopodiella, or as Lycopodiella section Lycopodiella (Øllgaard in Kramer & Green 1990, Wikström & Kenrick 2000). References: Wagner & Beitel in FNA (1993b); Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000); Haines (2002a, 2003a, 2003b)=Z. [also see Pseudolycopodiella]

**Identification notes:** Species of this genus are difficult to identify. They often grow together; it is not uncommon to find two or more species at a single site in the Coastal Plain. Hybrids occur. Juvenile plants, resprouting in spring or after fire, are especially difficult to identify. In contrast to the other species, Pseudolycopodiella caroliniana and, to a lesser degree, L. prostrata, are dorsiventrally flattened (or apparently distichous), but it seems that juvenile sprouts of all species are somewhat flattened.

1 Leaves of the horizontal shoots entire (rarely those toward the shoot apex with a few teeth); horizontal shoots, excluding the leaves, 0.5-0.9 (-1.0) mm in diameter; each horizontal shoot segment commonly producing a single upright shoot; [in our area, a plant of the Mountains] ..............

1 Leaves of the horizontal shoots toothed (except when inundated); horizontal shoots, excluding the leaves, 1.5-5.0 mm in diameter; each horizontal shoot segment producing 2-6 upright shoots; [collectively primarily of the Coastal Plain, with some disjunctions inland into the Piedmont and Mountains].

2 Fertile leaves (sporophylls) 2.9-5.0 (-5.2) mm long, appressed at maturity, entire or with short teeth < 0.3 mm long; stroboli 3-6 mm in diameter at maturity ..............................................................L. inundata

2 Fertile leaves (sporophylls) 5.5-9 mm long, spreading, with 1-8 teeth per margin, some or all of the teeth exceeding 0.3 mm in length; stroboli 10-20 mm in diameter at maturity.

3 Prostrate stems arching, not in contact with the ground (and rooting) all along their length, 8-11 mm wide (including leaves), the stem (striped of leaves) 2-4 mm in diameter; leaves of the prostrate stem of one size and shape, spreading to ascending, 3-7 mm long, 0.5-0.7 mm wide; erect stems many, equally spaced along the prostrate stems, progressively shorter and sterile toward the apex of the prostrate stems ..........................................................L. alopecuroides

3 Prostrate stems creeping, in contact with the ground (and rooting) all along their length, 12-19 mm wide (including leaves), the stem (striped of leaves) 1-2.2 mm in diameter; leaves of the prostrate stems dimorphic, spreading to reflexed, the upper leaves smaller (4-5 mm long, 0.4-0.6 mm wide) than the lateral leaves (7-8 mm long, 0.7-1.8 mm wide); erect stems few, clustered well behind the apex of the prostrate stems, mostly fertile and subequal in length ..............................................................L. prostrata

**Lycopodiella alopecuroides** (Linnaeus) Cranfill, Foxtail Clubmoss. Savannas, seepages, and other wet, sandy sites. July-September. Primarily Southeastern Coastal Plain: se. MA south to FL and west to e. TX, and disjunct in the Cumberland Plateau of KY, TN, and VA, the Allegheny Mountains of WV (Morton et al. 2004), the e. Highland Rim of TN, and in ME (Haines 2002a, 2003a, 2003b); s. Mexico south through Central America to n. South America; Cuba. [= FNA, K, Z; = Lycopodium alopecuroides Linnaeus – RAB; = Lycopodium alopecuroides Linnaeus – C, F, G, Md, S, W]

**Lycopodiella inundata** (Linnaeus) Holub, Northern Bog Clubmoss. Gravelly or sandy seepage areas, bogs. July-September. A circumboreal species, ranging south in the Appalachians to NC, where it was first found in 1986 (Weakley, in prep.). [= FNA, K, Z; = Lycopodium inundatum Linnaeus – C, Md, W, WV; = Lycopodium inundatum var. inundatum – F, G]

**Lycopodiella prostrata** (Harper) Cranfill, Featherstem Clubmoss, Prostrate Bog Clubmoss. Savannas, seepages. July-September. A Southeastern Coastal Plain endemic: se. NC south to FL and west to TX, with scattered occurrences disjunct inland (as in n. GA and n. AL). [= FNA, K; < Lycopodium prostratum – RAB; = Lycopodium prostratum Harper – C, S]

All pairwise combinations of sympatric species form fertile hybrids (only L. inundata and L. prostrata are entirely allopatric and not known to hybridize). The following hybrids should be expected where the parents grow together.

- Lycopodiella alopecuroides × appressa. [ = Lycopodiella ×copelandii (Eiger) Cranfill – K, Z; = Lycopodium ×copelandii Eiger]
- Lycopodiella alopecuroides × prostrata. [ = Lycopodiella ×brucei Cranfill – K; = Lycopodium ×brucei (Cranfill) Lellinger]
- Lycopodiella appressa × prostrata.

3. Pseudolycopodiella Holub 1983 (Carolina Bog Clubmoss)
A genus of about 12 species, sub-cosmopolitan. This group has often been treated as section of Lycopodium (or of Lycopodiella); it appears to warrant status as a genus separate from Lycopodiella. In addition to the morphologic distinctions, this species has considerable anatomical differences, a different base chromosome number than the four species of Lycopodiella (x = 35 vs. x = 78), and does not hybridize with Lycopodiella (Wagner & Beitel 1992). Øllgaard in Kramer & Green (1990) and Wikström & Kenrick (2000) retain it as Lycopodiella section Caroliniana. References: Wagner & Beitel in FNA (1993b); Haines (2003a)=Z; Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000).

Pseudolycopodiella caroliniana (Linnaeus) Holub, Carolina Bog Clubmoss, Slender Clubmoss. Savannas, seepages. July-September. This species occurs in se. North America, the West Indies, and is widespread in the Southern Hemisphere; in North America, it ranges from MA south to s. FL and west to e. TX. [= FNA, Z; = Lycopodium carolinianum Linnaeus – C, F, G, Md, RAB, S; > Lycopodiella caroliniana (Linnaeus) Pichi Sermolli var. caroliniana – K]

4. Palhinhaea Vasconcellos & Franco 1967 (Nodding Clubmoss)
A genus of 4 species, temperate and subarctic. This group is variously treated as the genus Palhinhaea or as Lycopodiella section Campylostachys (Øllgaard in Kramer & Green 1990, Wikström & Kenrick 2000). References: Wagner & Beitel in FNA (1993b); Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000).

Palhinhaea cernua (Linnaeus) Vasconcellos & Franco, Nodding Clubmoss, Staghorn Clubmoss. Wet savannas, ditches and other disturbed moist areas. This species is pantropical, occurring in both the Neotropics and the Paleotropics. Some of its occurrences in our area may be adventive. [= FNA; =? Lycopodiella cernua (Linnaeus) Pichi Sermolli var. cernua – K; = Lycopodium cernuum Linnaeus – S]

5. Dendrolycopodium A. Haines 2003 (Tree-clubmoss)
A genus of 4 species, temperate and subarctic. Haines (2003a) makes the case for this genus as distinct from Lycopodium s.s. and other relatives. References: Wagner & Beitel in FNA (1993b); Wagner, Beitel, & Moran (1989); Hickey (1977); Øllgaard in Kramer & Green (1990); Haines (2003a)=Z.

1 Leaves of the main vertical axis spreading (30-90° angle to stem) in the vicinity of the lower lateral branches, prickly to the touch; branchlets round in cross-section, the 6 ranks of leaves (2 lateral ranks, 2 adaxial ranks, and 2 abaxial ranks) equal in length and spreading to ascending. 

.......................................................................................................................... D. dendroideum

.......................................................................................................................... D. hickeyi

.......................................................................................................................... D. obscurum

Dendrolycopodium dendroideum (Michaux) A. Haines, Tree Ground-pine, Round-branch Clubmoss, Prickly Tree-clubmoss. Openings, grassy balds, high elevation spruce-fir and northern hardwood forests. July-September. The northernmost of the L. obscurum complex, ranging from n. QC and NL (Newfoundland) west to AK, south to s. NJ, w. NC, MO, MN, SD, CO, MT, ID, and WA; also in Asia. [= Z; < Lycopodium obscurum var. dendroideum (Michaux) D.C. Eaton – RAB, F, G, Md, WV; = Lycopodium dendroideum Michaux – F, G, Md, RAB, S; < L. obscurum – C] 

Dendrolycopodium obscurum (Linnaeus) A. Haines, Common Ground-pine, Flat-branched Clubmoss. Acidic forests.; July-September. NS and NB west to MI and WI, south to n. GA, ne. AL, s. IN, n. IL, and c. MN. [= Z; < Lycopodium obscurum Linnaeus – FNA, K; = Lycopodium obscurum var. obscurum – F, G, Md, RAB, W, WV; < L. obscurum – C, S]

6. Diphasiastrum Holub 1975 (Flat-branched Clubmoss, Running Cedar)

1 Foliage dark green, not glaucous; horizontal branchlets 2-4 mm wide (including the leaves); branchlets without conspicuous annual constrictions; rhizomes 0-1 cm deep (which can be determined by pulling up a single upright shoot – the depth to rhizome is approximately the length of the white portion of the vertical stem); abaxial rank of leaves shorter than lateral ranks (thus the branchlets flat in cross-section). .............................................................................................................................................. D. digitatum

1 Foliage blue-green, glaucous; horizontal branchlets 1-2 mm wide (including the leaves); branchlets with conspicuous annual constrictions; rhizomes (1-) 5-12 cm deep; abaxial rank of leaves as long as lateral ranks (thus the branchlets more-or-less square in cross-section).............. D. tristachyum

Diphasiastrum digitatum (Dillenius ex A. Braun) Holub, Common Running-cedar, Fan Ground-pine. Dry to mesic, usually acid forests and openings, especially common in disturbed sites, such as successional pine forests. July-September. NL (Newfoundland) west to MN, south to SC, GA, AL, MS, and AR. Hickey & Beitel (1979) and Holub (1975a & 1975b) explain the nomenclatural decision to accept the epithet over the more familiar 'flabelliforme.' [= FNA, Z; = Lycopodium flabelliforme (Fernald) Blanch – Md, RAB, S, WV; = Lycopodium digitatum Dillenius ex A. Braun – C, K, W; = Lycopodium complanatum Linnaeus var. flabelliforme Fernald – F, G]

Diphasiastrum ×habereri (House) Holub [D. digitatum × tristachyum]. Mt (KY, NC, VA, WV), Pd (VA): dry forests; rare. Known from widely scattered localities in our area; not always in close proximity to its parents. [= FNA, Z; = Lycopodium × habereri House – K; = L. ×habereri – WV, orthographic error] [not keyed; not mapped]

7. Spinulum A. Haines (Bristly Clubmoss)

A genus of 3 species, north temperate and subarctic. References: Wagner & Beitel in FNA (1993b); Wagner, Beitel, & Moran (1989); Hickey (1977); Ölgaard in Kramer & Green (1990); Haines (2003a)=Z.

Spinulum annotinum (Linnaeus) A. Haines, Stiff Clubmoss, Bristly Clubmoss. High elevation hardwood or coniferous forests. August-October. A circumboreal species, south in North America to n. NJ, MN, SD, NM, AZ, and OR, and in the Appalachians to WV, sw. VA, and e. TN (Blount County). Two varieties have been considered to reach our area in VA: var. acrifolium Fernald and var. annotinum. They are doubtfully distinct but need further study. This species was reported for NC by Lellinger (1985) and FNA, and is apparently indicated as occurring in NC on the range map in Mickel (1979); there is apparently no documentation for these reports, though the species occurs in Grayson County, VA, a county adjacent to NC. [= Z; = Lycopodium annotinum Linnaeus – C, FNA, K, W; > L. annotinum var. acrifolium Fernald – F, G, WV; > L. annotinum var. annotinum – F, G, Md, WV; > L. annotinum var. pungens (La Pylaie) Desvaux – WV]

8. Lycopodium Linnaeus 1753 (Running Clubmoss)

A genus of 5-10 species, mainly temperate and subarctic. The fractionation of Lycopodium has resulted in the creation of more natural genera, more comparable to those in other groups of plants. References: Wagner & Beitel in FNA (1993b); Wagner, Beitel, & Moran (1989); Hickey (1977); Ölgaard in Kramer & Green (1990); Haines (2002b, 2003a)=Z. [also see Dendrolycopodium, Diphasiastrum, Huperzia, Lycopodiella, Palhinhaea, Pseudolycopodiella, and Spinulum]

1 Strobili (1-) 2-5, borne on alternate "pedicels" branching from the central "peduncle"; leaves 4-6 mm, spreading to loosely ascending; upright shoots each usually bearing 3-6 branches.............................................................................................................................................. L. clavatum

1 Strobili 1 rarely 2, if then, the 2 strobili not on separate "pedicels," but sessile and paired at the top of the "peduncle"; leaves 3-5 mm long, ascending to appressed; upright shoots each usually bearing 3-6 branches.............................................................................................................................................. L. lagopus

Lycopodium clavatum Linnaeus, Running Clubmoss. Openings, balds, roadbanks, open forests. July-September. Circumboreal, south in e. North America along the Appalachians to NC and n. GA; also c. Mexico south through Central America to n. South America; West Indies. [= RAB, FNA, K, Md, W, Z; < L. clavatum – C, WV]; = L. clavatum var. clavatum – F, G, S]

L1. LYCOPODIACEAE

A family of a single genus and about 300 species. Isoetaceae, along with Selaginellaceae and Lycopodiaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). References: Jermy in Kramer & Green (1990).

Isoetes Linnaeus 1753 (Quillwort, Merlin's-grass)

Identification notes: Hybrids are possible between many combinations of species.

Key fragment to eastern granite outcrop species by Heafner et al. (in prep.)

1. Megaspores black or gray, leaves usually no more than 5.0 cm long.
2. Corms transversely oblong to oblong, roots dichotomously branched, phyllotaxy spiraled
   - I. melanospora

3. Corms horizontally elongate, roots fibrous and not dichotomously branched, phyllotaxy distichous
   - I. tegetiformans

1. Megaspores white, leaves to 18.7 cm long or longer.
2. Plants diploid (2n = 22); widespread from VA to AL in the Piedmont
   - I. piedmontana

3. Plants tetraploid (2n = 44); endemic to a few counties in the Piedmont of AL and NC
   - I. species 5 "analogous"

4. Velum covering 0-10% of the sporangium; leaves (7.9-) avg. 11.5 (-14.9) cm long; endemic to Franklin County, NC
   - I. species 6 "alabamensis"

5. Leaves (5.9-) avg. 9.3 (-14.2) cm long; endemic to Wake County, NC
   - I. species 4 "carolinae-septentrionalis"

 Isoetes acadiensis L. Kott, Acadian Quillwort. Freshwater tidal marshes. A tetraploid species (2n=44). [= FNA, K; < I. tuckermanii A. Braun – C, F, G]

 Isoetes boomii N. Luebke, Boom's Quillwort. Shallow water of slow-moving streams. Known from Laurens County, GA, AL, and FL. A hexaploid species (2n=66). [= FNA, K; < I. boomii – Z (also see I. georgiana)]

 Isoetes butleri Engelmann, Butler's Quillwort. Seepage areas on calcareous glades. Occurs in calcareous areas of the Midwest, extending east to c. TN, nw. GA (Jones & Coile 1988), and n. AL. A diploid species (2n=22), genotype=BB. [= C, F, FNA, G, K, S, Z]

 Isoetes engelmannii A. Braun. Usually in permanent water bodies with active current. A diploid species (2n=22). Apparently there are 2 cryptic taxa currently comined under the name I. engelmannii (Hoot, Napier, & Taylor 2004), genotype NN and genotype SS. [= K, Z; < I. engelmannii – RAB, C, G, FNA, W, WV (also see I. appalachiana, I. hyemalis, and I. valida); < I. engelmannii var. engelmannii – F, S]
**L3. ISOETACEAE**

**Isoetes flaccida** A. Braun var. *flaccida*. Winged Florida Quillwort. Springs, stream bottoms, river bottoms, ditches. S. GA and se. AL south to s. FL. A diploid species (2n=22). [= K, S; < *I. flaccida* FNA, Z]

**Isoetes georgiana** N. Luebke, Georgia Quillwort. Streams. Known only from GA (Colquitt, Dodge, Irwin, Tift, Turner, and Worth counties). A hexaploid species (2n=66). See Brunton & Britton (1996b) for additional information. Musselman (2001) indicates that this may be conspecific with *I. boomii*. [= FNA, K; < *I. boomii* – Z]

**Isoetes hyemalis** D.F. Brunton, Wintergreen Quillwort. Blackwater streams and sandy streambanks. Sc. VA south through e. and c. NC to GA, AL, and FL Panhandle (Nelson 2000), in the Coastal Plain and lower Piedmont. A tetraploid species (2n=44), apparently derived from 2 unknown or extinct species, X and Y (Hoot, Napier, & Taylor 2004). See Brunton, Britton, & Taylor (1994) and Brunton & Britton (1996a) for additional information on this species. [= K, Z; < *I. engelmannii* var. engelmannii – F, S]

**Isoetes lacustris** Linnaeus, Lake Quillwort. {hábitat}. July-September. A decaploid species (2n=110). [= FNA, C, K; > *I. macrospora* Durieu – F, G, W]

**Isoetes louisianensis** Thieret, Louisiana Quillwort. Small streams. S. AL, MS, and LA. [= FNA, K] {add to synonymy}

**Isoetes melanopoda** Gay & Durieu ex Durieu *ssp. melanopoda*. Blackfoot Quillwort. Floodplains. S. IN, IL, and MO south to ne. LA; probably represented eastward to c. TN and s. MS (the available material ambiguous) (Brunton & Britton 2006). [<*I. melanopoda* – FNA, K, C, G, Z]

**Isoetes melanopoda** Gay & Durieu ex Durieu *ssp. sylvatica*. D.F. Brunton & D.M. Britton, Eastern Blackfoot Quillwort. Clay soils in low woods, seeps on sandstone or granitic rocks, in NJ in clay-based depressions on Cape May. VA south (in the Piedmont and Coastal Plain) to sw. GA, s. and n. AL, and s. MS; disjunct in s. NJ. A diploid species (2n=22), genotype= PP. [<*I. melanopoda* – FNA, K, C, G, Z; <*I. melanopoda* – RAB (also see *I. melanospora, I. virginica, I. piedmontana*)]

**Isoetes piedmontana** (N.E. Pfeiffer) C.F. Reed, Piedmont Quillwort. In seepage on granitic flatrocks and on Altamaha grit. [= K, Z; <*I. melanopoda* – RAB; <*I. virginica* – C, F, FNA, G]

**Isoetes riparia** Engelmann ex A. Braun, Shore Quillwort. Tidal waters, lakes. A tetraploid species (2n=44), apparently derived from the southern *I. engelmannii* entity and *I. echinospora* (Hoot, Napier, & Taylor 2004). [<*I. riparia* – RAB, C, FNA (also see *I. saccharata*); >*I. riparia* var. riparia – G, K; >*I. riparia* var. amesiis (A.A. Eaton) Proctor – G, K; >*I. riparia* var. robbiisii (A.A. Eaton) Proctor – G; >*I. riparia* var. reticulata (A.A. Eaton) Proctor – G]

**Isoetes saccharata** Engelmann. Tidal waters, lakes. {disentangle from *I. riparia*} [= K; <*I. riparia* – C, FNA; =*I. riparia* var. palmeri (A.A. Eaton) Proctor – G]

**Isoetes species 1.** Pools on granite flatrocks. Forty Acre Rock, Lancaster County, SC. Being worked on by W.C. Taylor.
**L3. ISOETACEAE**

*Isoetes* species 4 “carolinae-septentrionalis”. Granite flatrocks

*Isoetes* species 5 “analogous”. Granite flatrocks.

*Isoetes* species 6 “alabamensis”. Granite flatrocks.

*Isoetes tegetiformans* Rury, Merlin's-grass. In shallow pools on granite flatrocks. Endemic to a few granite flatrocks in ec. GA (notably Heggies Rock), near the SC line. A diploid species (2n=22), genotype=TT. [= FNA, K, Z]

*Isoetes tenella* Léman, Spiny-spore Quillwort. In acid lakes, ponds, and rivers (submerged to emersed), tidal mud flats. Circumboreal, in North America from Greenland, NL (Labrador), and AK south to DE, n. OH, MI, WI, CO, and CA. South to PA and NJ (Kartesz 1999). [= K; = *I. echinospora* Durieu – FNA; > *I. echinospora* var. echinospora – F, G; > *I. echinospora* var. *muricata* (Durieu) Engelmann – C, F, G; > *I. echinospora* var. *braunii* (Durieu) Engelmann – G; > *I. muricata* Durieu] [syonymy incomplete]

*Isoetes tuckermanii* A. Braun, Tuckerman's Quillwort. South to MD (Kartesz 1999). A tetraploid species (2n=44), apparently derived from hybridization of a northern *I. engelmannii* entity and an unknown or extinct species, Z (Hoot, Napier, & Taylor 2004), genotype=NNZZ. [= FNA, K; < *I. tuckermanii* – C, F, G]

**L3. SELAGINELLACEAE** Willkomm 1854 (Spikemoss Family) [in SELAGINELLALES]

A family of a single genus (as currently broadly conceived) and about 700-750 species. References: Valdespino in FNA (1993b); Tryon (1955); Lellinger (1985); Buck (1977); Somers & Buck (1975); Jermy in Kramer & Green (1990). Key adapted in part from Valdespino in FNA (1993b).

*Selaginella* Palisot de Beauvois 1804 (Spikemoss)

As currently conceived broadly, a genus of about 700-750 species, cosmopolitan, but mostly tropical. It appears likely that *Selaginella* will be subdivided, based on morphology and molecular phylogenetic analyses (Soják 1992; Škoda 1997; Korall, Kenrick, & Therrien 1999). Selaginellaceae, along with Lycopodiaceae and Isoetaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). References: Valdespino in FNA (1993b); Tryon (1955); Lellinger (1985); Buck (1977); Somers & Buck (1975); Jermy in Kramer & Green (1990). Key adapted in part from Valdespino in FNA (1993b).

Sterile leaves dimorphic, in 4 ranks, the ventral pair spreading laterally, the dorsal pair ascending; leaves acute, mucronate, lacking a white or translucent apical hair-tip; fertile branch tips strongly differentiated (into strobili) from the sterile portions of the stem; [subgenus *Stachygynandrum* or genus *Lycopodioides*].

1 Main stems erect, the plants to 5 dm tall .......................................................... ................................................................................................................................. *S. braunii*

2 Main stems creeping or ascending.

3 Lateral leaves of the main stems 2.5-4 mm long, elliptic; lateral stems ascending or erect, 2-6 cm long; rhizophores (modified, leafless, root-producing shoots) borne on the upper side of the stem ........................................................................ *S. kraussiana*
L2. SELAGINELLACEAE

3 Lateral leaves of the main stem 1-2.5 (or to 3.6 in S. uncinata) mm long, ovate; lateral stems creeping (or the tips sometimes slightly ascending), 0.2-1 cm long; rhizophores auxiliary.
4 Margins of lateral leaves entire; lateral branches of the stems further branching 2-3 times ................................................................. S. uncinata
5 Margins of lateral leaves dentate-serrate; lateral branches of the stems further branching 1-2 times.

6 Apical hair-tip of the leaves twisted-contorted, 1.2-1.7 mm long (sometimes deciduous); strobili 3-6 mm long, 1.5-2 mm wide; leaves 0.15-0.3 mm wide, the marginal cilia absent, toothlike, or as much as 1/6 as wide as the leaf blade; budlike “arrested” branches present ................................................................. S. tortipila
7 Apical hair-tip of the leaves straight, 0.3-1.4 mm long (sometimes deciduous); strobili (5-) 10-35 mm long, 1-1.5 mm wide; leaves 0.2-0.45 mm wide, the marginal cilia 1/4-1/3 as wide as the leaf blade; budlike “arrested” branches present or absent.

Selaginella acanthonota Underwood, Spiny Spikemoss, Sand Spikemoss. Sandhills, Altamaha Grit glades. June-August. S. acanthonota ranges from se. NC south to s. FL, west to w. Panhandle FL. The complex comprising S. acanthonota, S. arenicola, and S. riddellii has been controversial. The complex ranges from se. NC south to s. FL and west to c. TX; see Tryon (1955) and Valdespino in FNA (1993b) for additional information on the complex. [= FNA, K; < S. arenicola – RAB; = S. arenicola Underwood ssp. acanthonota (Underwood) R. Tryon; = Bryodesma acanthonota (Underwood) Škoda]

Selaginella apoda (Linnaeus) Spring, Meadow Spikemoss. Seepages, bogs, spray cliffs, stream margins, wet meadows, marsh edges, wet spots in lawns, other moist habitats. June-October. S. ME, NY, OH, s. IN, AR, and e. OK south to FL, GA, AL, MS, LA, and e. TX; c. Mexico south to Guatemala. Often overlooked by vascular plant botanists as a moss or liverwort. S. ludoviciana of the Gulf Coast east to GA, and S. eclipes, more northern, are superficially very similar. [= C, F, FNA, G, K, Md, RAB, W, WV; = Diplostachyum apodum (Linnaeus) Beauvois – S; = Lycopodioides apodum (Linnaeus) Kuntze]

Selaginella braunii Baker, Treelet Spikemoss, Braun’s Spikemoss. Naturalized around graveyards or gardens; rare, introduced, native of China. [= FNA, K; = Lycopodioides species I]

Selaginella corallina (Riddell) Wilbur & Whitson, Riddell’s Spikemoss. Dry sands, granite outcrops, sandstone outcrops. E. and c. GA west to c. TX and s. OK. See Wilbur & Whitson (2005) for an explanation of the nomenclatural change. [= S. arenicola Underwood ssp. riddellii (Van Eseltine) R.M. Tryon – FNA, K; = Bryodesma arenicola (Underwood) Soják ssp. riddellii (Van Eseltine) Škoda]

Selaginella kraussiana (Kunze) A. Braun, Krauss’s Spikemoss, Mat Spikemoss. Naturalized around gardens or lawns; native of s. Africa. [= FNA, K; Lycopodioides species 2]

Selaginella ludoviciana (A. Braun) A. Braun, Gulf Spikemoss, Louisiana Spikemoss. Swamp margins, wet meadows. Gulf Coastal Plain from ne. FL and sw. GA west to e. L.A. [= FNA, K; = Diplostachyum ludovicianum (A. Braun) Small – S; = Lycopodioides ludovicianum (A. Braun) Kuntze]

Selaginella rupestris (Linnaeus) Spring, Rock Spikemoss. Granite flatrocks, other, mostly acidic, rock outcrops, occasionally on greenstone or calcareous shales. June-September. S. Greenland and NS west to BC, south to GA, AL, AR, OK, and WY. Valdespino in FNA (1993b) suggests that two or more cryptic or semicryptic species are present within what is currently called S. rupestris; additional study is needed. [= C, F, FNA, G, K, Md, RAB, S, W, WV; = Bryodesma rupestris (Linnaeus) J. Soják]

Selaginella tortilis A. Braun, Twisted-hair Spikemoss. Rock outcrops, mostly at high elevations. July-September. Endemic to the Southern Appalachians (rarely into the Piedmont) of NC, SC, and GA. Occurring close to TN and VA; it should be sought there. [= RAB, FNA, K, S, W; = Bryodesma tortilis (A. Braun) J. Soják]
* Selaginella uncinata (Desvaux ex Poiret) Baker, Blue Spikemoss. Moist forests; native of China. Introduced in sw. GA and other places in the Southeastern United States. [= FNA, K, Lycopodioides species 3]
SECTION 2: MONILOPHYTA (FERNS)

Family circumscriptions and sequence follow Christenhusz, Zhang, & Schneider (2011), with relatively minor modifications from Smith et al. (2006). References: Smith et al. (2006); Christenhusz, Zhang, & Schneider (2011).

**F4. EQUISETACEAE** Michaux ex de Candolle 1804 (Horsetail Family) [in EQUISETALES]

A family with a single genus and about 15 species. References: Hauke in FNA (1993b); Lellinger (1985); Mickel (1979); Hauke in Kramer & Green (1990); Des Marais et al. (2003).

*Equisetum* Linnaeus 1753 (Horsetail, Scouring Rush)

A genus of about 15 species, nearly cosmopolitan in distribution. References: Hauke in FNA (1993b); Lellinger (1985); Mickel (1979); Hauke in Kramer & Green (1990); Des Marais et al. (2003); Guillon (2004).

* *Equisetum × ramosissimum* Desfontaines ssp. *ramosissimum*, Branched Scouring Rush. Disturbed areas; native of the Old World, where it is widespread in Europe, Asia, and Africa. This species was apparently introduced long ago on ship's ballast to various old ports, such as Wilmington (New Hanover County, NC), Pensacola (Escambia County, FL) and New Orleans, LA. It is naturalized on the Wilmington waterfront, persisting in disturbed areas, such as in gravel along railroad tracks. Hauke (1979, 1984, 1992) discusses the occurrence of this species in North America. Ssp. *dehile* (Roxburgh) Hauke occurs in se. Asia and southern Pacific Islands; it is not known to be naturalized in North America. [= FNA; < *E. ramosissimum* – K; = Hippochaete ramosissima (Desfontaines) Farwell ssp. *ramosissima*]
Equisetum sylvaticum Linnaeus, Woodland Horsetail. Seepage swamps. Circumboreal, south in North America to MD, n. VA, ec. WV, OH, MI, WI, IA, WY, MT, and WA. [= C, FNA, K; > E. sylvaticum var. sylvaticum – F, G; > E. sylvaticum var. multiramosum Wherry – Md, WV]

F5. Ophioglossaceae (R. Brown) Agardh 1822 (Adder's-tongue Family) [in OPHIOGLOSSALES]

A family of 7-8 genera and about 75-115 species. The Ophioglossaceae is only distantly related to the leptosporangiate ferns; Kuo et al. (2011) and Pryer et al. (2004) indicate that it is most closely related to Psilotaceae. References: Wagner & Wagner in FNA (1993b); Wagner in Kramer & Green (1990).

1 Sterile portion of the leaf simple, unlobed; fertile stalks unbranched, the sporangia embedded in a linear spike

2 Sterile portion of the leaf blade pinnate, pinnatifid, or more divided; fertile stalks branched, the sporangia sessile or stalked.

3 Sterile portion of the leaf blade pinnate; plants usually < 20 cm tall; sterile blade fleshy in texture, 1-8 cm long

4 Botrychium

5 Sterile portion of the leaf blade 3-pinnate or even more finely divided; plants (9-)30-50 cm tall; sterile blade herbaceous in texture, 10-40 cm long

6 Botrypus

1. Ophioglossum Linnaeus 1753 (Adder's-tongue)

1 Underground stem globose, nearly spherical, 3-11 mm in diameter; fertile spikes commonly with a conspicuous, acute or attenuate sterile portion (apiculum) at its apex; sterile blade 1-4 cm long, 0.5-2.5 cm wide, borne horizontally near the ground

2 Sterile blade 0.1-1 cm wide, the polygonal venation areoles usually lacking both smaller areoles and free included veinlets

3 Large areoles of the sterile blade subdivided into smaller areoles, which lack free veinlets; sterile blade obtuse or acute.

4 Sterile blade ovate-lanceolate, the base obtuse to nearly truncate, broadest < 1/3 of the way from the base to the apex; primary areoles mostly > 2 mm wide, without included veinlets

5 Sterile blade elliptic, broadest near the middle, acute to attenuate at the base, pale green, dull, herbaceous in texture; basal frond sheath membranaceous and ephemeral; spores 50-60 pm in diameter

6 Sterile blade ovate, broadest below the middle, obtuse at the base, dark green, shiny, firm in texture; basal frond sheath leathery and tending to persist; spores 35-45 pm in diameter

Ophioglossum crotalophoroides Walter, Bulbous Adder's-tongue. Moist ditch banks and grassy roadside flats. March-September. E. NC (Dare County) south to FL and west to TX; also in Mexico, the West Indies, Central America, and South America. [= RAB, FNA, S, WH; > O. crotalophoroides var. crotalophoroides – K; > O. crotalophoroides var. nanum Osten ex de Lichtenstein – K]

Ophioglossum engelmannii Prantl, Engelmann's Adder's-tongue, Limestone Adder's-tongue. Dry barrens and glades over calcareous rocks, very rarely on granite. March-June. W. VA, IN, IL, KS, and AZ south to Panhandle FL and TX; also in Mexico and Central America. Ascribed to NC by Wagner & Wagner in FNA (1993b), the documentation unknown. [= C, F, FNA, G, K, S, WH]

Ophioglossum nudicaule Linnaeus f., Slender Adder's-tongue. Lawns and other moist, grassy areas. E. NC south to s. FL, west to TX; also in Mexico, the West Indies, Central America, South America, and Africa. First reported from NC by Thomas & Marx (1979). [= RAB, FNA, K, WH; > O. nudicaule E.P. St. John – S; > O. mononeuron E.P. St. John – S; > O. tenerum Mettenius – S]

Ophioglossum petiolatum Hooker, Long-stem Adder's-tongue. Maritime wet grasslands, moist ditch banks, and grassy roadside flats. March-November. Se. VA south to FL and west to TX and OK; also in the West Indies, Mexico, n. South America, and Asia. First reported for NC by Thomas & Marx (1979). Wagner & Wagner in FNA (1993b) suggest that this species is likely introduced in North America. [= RAB, FNA, K, WH; > O. floridanum E. St. John – S]
**Ophioglossaceae (F5)**

**Ophioglossum pusillum** Rafinesque, Northern Adder’s-tongue. Wet meadows, swamp edges. March-July. NS west to ND and BC, south to w. VA, n. IN, n. IL, and w. NE, w. WY, w. MT, and CA. [= FNA, K; = *O. vulgatum* Linnaeus var. pseudopodum (Blake) Farwell – C, F, WV; < *O. vulgatum* – G]

2. *Botrychium* Richard 1801 (Rattlesnake Fern)

**Botrychium virginianum** (Linnaeus) Holub, Rattlesnake Fern, Sang-find. In a wide range of fairly dry, mesic, and wet forests, cove forests, especially in nutrient-rich, moist bottomlands and slopes. April-June. NL (Newfoundland) and BC south to n. peninsular FL and CA, and Mexico south through Central America and n. South America; West Indies; Asia; Australia; scattered in Europe. [= *Botrychium virginianum* (Linnaeus) Swartz – RAB, C, FNA, G, K, W, WH, WV; = *B. virginianum* var. *virginianum* – F; = *Osmundopteris virginiana* (Linnaeus) Small – S]

3. *Sceptridium* Lyon 1905 (Grape Fern)

1 Sterile leaf 4-pinnate-pinnatifid, finely divided, the ultimate segments lacerate and linear, < 3 mm wide .......................................................... *S. dissectum*

2 Sterile leaf 2-pinnate to 4-pinnate, not finely divided, the ultimate segments ovate or oblong, > 8 mm wide.

3 Sterile pinnae entirely divided into short, round or acute pinnules; lateral pinnules with an incontinuous and poorly-developed central vein; plant producing 1 or 2 leaves per season.

4 Stalk of the basal sterile pinnae (10-) 15-70 mm long; roots irregularly ribbed, blackish; ultimate leaf segments fan-shaped, obovate, longer than wider, pinnately veined, the midrib weakly developed; sporulating August-October .............................................................. *S. jennanii*

5 Sterile pinna and pinnule apices obtuse to rounded; ultimate segments cuneate, rounded, or truncate at the base; ultimate segments remote or overlapping.

6 Sterile pinnae (or their terminal portion) elongate (the sides often nearly parallel), entire to shallowly lobed, not divided into pinnules; lateral pinnules with a conspicuous and well-developed central vein; plant producing 1 leaf per season.

5 Sterile pinna and pinnule apices obtuse to rounded (to somewhat acute); ultimate segments mostly ovate, narrow ovate, or oblong, mostly about 2x as long as broad or less; overwintering leaves green, not bronze .................................................... *S. oneidense*

6 Sterile pinnae and pinnule apices acute; ultimate segments mostly oblanceolate-oblong, often > 2x as long as broad; overwintering leaves bronze (or green if covered by leaves).

7 Sterile blade mostly 2-pinnate, the segments sharply serrulate or crenulate, ......................................................... *S. bibernatum*

8 Sterile blade mostly 3-pinnate (or more divided, those forms keyed above), the segments entire to obscurely serrulate or crenulate, .......................................................... *S. dissectum*

*Sceptridium bibernatum* (Savigny) Lyon, Southern Grapefern. Moist forests, clearings, old fields. August-October. MD, PA, s. IN, s. IL, and c. OK south to s. FL and e. TX. [= *Botrychium bibernatum* (Savigny) Underwood – RAB, C, FNA, K, S, W; = *B. dissectum* var. *tenuifolium* (Underwood) Farwell – F; = *B. dissectum* (Sprengel) Lyon – WH]

*Sceptridium dissectum* (Sprengel) Lyon, Cut-leaf Grape Fern, Dissected Grapefern. Moist forests, clearings, old fields. August-October. NS and QC west to ON and MI, south to Panhandle FL and e. TX; also in the West Indies. The two forms have caused much confusion. In our area, *forma obliquum* is much more common and widely distributed, often confused with *S. bibernatum*. *Forma dissectum* is fairly common in our area only in VA (rare in GA, NC, and SC), occurring primarily in the Mountains. The different distributions of the 2 forms suggest that further research is needed. [= *Botrychium dissectum* Sprengel – RAB, C, FNA, K, W, WV; = *B. dissectum* var. *dissectum* – F (also see *S. oneidense*); > *B. dissectum* var. *obliquum* (Muhlenberg ex Willdenow) Clute – G; > *B. dissectum* var. *dissectum* – G; > *B. dissectum* var. *dissectum* – S; > *B. obliquum* Muhlenberg ex Willdenow – S; < *B. dissectum* (Sprengel) Lyon – WH]

*Sceptridium jennanii* (Underwood) Lyon, Alabama Grapefern. Moist to dryish forests and disturbed areas. August-October. C. and sw. VA and w. KY south to Panhandle FL, s. AL, and e. LA; also in the West Indies. This species probably
arose as a hybrid between *B. biternatum* and *B. lunarioides* (Michaux) Swartz, followed by polyploidization, resulting in a fertile taxon functioning as a species. [= *Botrychium jennmani* Underwood – C, FNA, K, W, WH; = *B. alabamense* Maxon – RAB, S]

*Sceptridium lunarioides* (Michaux) Holub, Winter Grapefern. Old fields, pastures, young forests, granitic flatrocks, juniper-oak-blue ash woodlands over limestone. January-April. W. NC, e. TN, and s. SC south to n. FL, and west to e. TX and se. OK. Wagner (1992) proposes that *B. lunarioides* be treated in a new monotypic section, *Hiemobrychtium*, of *Botrychium*, subgenus *Sceptridium*. The species is hard to spot, and all the more difficult to find because of its phenology; the leaves appear in late fall and die by early spring. [= *Botrychium lunarioides* (Michaux) Swartz – RAB, FNA, K, WH; = *Holubiella lunarioides* (Michaux) Škoda; = *Botrypus lunarioides* Michaux]

*Sceptridium multifidum* (S.G. Gmelin) M. Nishida, Leather Grapefern. Grassy balds and high elevation meadows; moist forests. August-September. NL (Labrador) and AK south NJ, PA, OH (and in the mountains to VA and NC), IN, IL, IA, NE, CO, NM, and CA. [= *Botrychium multifidum* (S.G. Gmelin) Treviranus – C, FNA, K, W; > *B. multifidum* var. *multifidum* – F, G; > *B. multifidum* var. *intermedium* (D.C. Eaton) Farwell – F, G]

*Sceptridium oneidense* (Gilbert) Holub, Bluntlobe Grapefern. Moist or boggy forests, foodplain forests, bogs. July-October. Local in occurrence from NB, QC, and ON south to NC, TN, KY, IN, and WI. Recent studies by Warren Hauk suggest that *B. oneidense* may not be distinct from *B. dissectum*. [= *Botrychium oneidense* (Gilbert) House – RAB, C, FNA, K, W, WV; < *B. dissectum* var. *dissectum* – F (*forma oneidense* (Gilbert) Clute – embarrassingly transitional); = *B. multifidum* var. *oneidense* (Gilbert) Farwell – G]

**4. Botrychium** Swartz 1801 (Moonwort)

A genus of 25-30 species, nearly cosmopolitan, but primarily temperate and concentrated in North America and e. Asia. *Botrychium* as traditionally circumscribed to include *Botrypus* and *Sceptridium* is very heterogeneous (Hauk, Parks, & Chase 2003); I have here accepted the arguments of Hauk (1996), Hauk, Parks, & Chase (2003), and others recommending recognition of the anciently divergent and molecularly and morphologically distinctive segregates as genera. References: Wagner in Kramer 2003); I have here accepted the arguments of Hauk (1996), Hauk, Parks, & Chase (2003), and others recommending recognition of the anciently divergent and molecularly and morphologically distinctive segregates as genera. References: Wagner in Kramer

1 Sterile pinnae contracted at the base, thus cuneate or wedge-shaped; leaf blades pinnate to nearly simple, 1-6 cm long, 0.3-2 cm wide; pinna margins entire, the apices round. [section *Simplex*].................................................................*B. simplex* var. *simplex*

1 Sterile pinnae (or pinnules of 2-pinnate blades) not contracted at the base, thus oblong or elongate; leaf blades pinnate, pinnate-pinnatifid, or 2-pinnate, 1-8 cm long, 0.8-6 cm wide; pinna or pinnule margins entire, lobed, or incised, the pinna apices round, obtuse, or acute; [section *Lanceolatum*].

2 Sterile pinnae apices obtuse to round at the apex, their segments (and undivided pinnae) about as long as wide, round, obtuse, or truncate at the apex; leaf blade mostly short-petioled (rarely sessile), the petiole (0-) 1-3 cm long; leaf blade pinnate to pinnate-pinnatifid................. .................................................................*B. maticariaefolium*

2 Sterile pinnae acute at the apex, their segments (and undivided pinnae) at least twice as long as wide, mostly lanceolate, acute at the apex; leaf blade sessile, leaf blade pinnate-pinnatifid to 2-pinnate .................................................................*B. lanceolatum* var. *angustisegmentum*

*Botrychium maticariaefolium* (A. Braun ex Duwell) A. Braun ex W.D.J. Koch, Daisyleaf Moonwort. Dry to moist forests (often successional), old fields, grassy balds, northern hardwood forests. June-August. NL (Newfoundland) and AB south to w. NC, TN, KY, WV, OH, IL, WI, MN, and ND. [= FNA, K, W; = *B. maticariaefolium* – F, G, WV (orthographic variant); > *B. maticariaefolium* var. *maticariaefolium* – C]

*Botrychium simplex* E. Hitchcock var. *simplex*. Least Moonwort. Disturbed gravelly areas in spruce-fir forests, northern hardwoods forests, grassy balds. May-June. NL (Newfoundland) and BC south to NJ, VA, NC, MI, IN, WI, IA, SD, WV, CO, NM, UT, NV, and CA. Wagner & Wagner in FNA (1993b) discuss variation within *B. simplex*. Farrar & Wendel (1996) indicate that 3 varieties of *B. simplex* have strong genetic divergence, comparable to that usually distinguishing species. [= C, F, G; < *B. simplex* – FNA, K, W, WV]
F6. PSILOTACEAE Kanitz 1887 (Whiskfern Family) [in PSILOTALES]

A family of 2 genera and 4-12 species, pantropical and warm temperate. References: Lellinger (1985); Thieret in FNA (1993b); Kramer in Kramer & Green (1990)

**Psilotum** Swartz 1800 (Whiskfern)

A genus of 2-3 species, tropical and warm temperate. *Psilotum* lacks roots and true leaves. Other than the Australasian genus *Tmesipteris*, *Psilotum* has no close living relatives, and the 2 genera are usually considered to comprise a distinct class (Wagner 1977). The stem is chlorophyllose. Fungal cells interspersed in the outer layers of the rhizome aid in the absorption of nutrients. References: Lellinger (1985); Thieret in FNA (1993b); Kramer in Kramer & Green (1990).

**Identification notes:** The stiff, dichotomously-branched habit of *Psilotum* is unmistakable.

*Psilotum nudum* (Linnaeus) Palisot de Beauvois, Whiskfern. In moist bottomland forests, on soil, stumps, and tree bases, along building foundations (where introduced). April-September. S. SC south to s. FL, west to e. TX, disjunct (and apparently native) in ne. NC (Perry & Musselman 1994), rarely naturalized around buildings in c. NC; also in sw. United States and in the tropics of Central and South America, Africa, and Asia. [= RAB, FNA, K, S]

F8. OSMUNDACEAE Martinov 1820 (Royal Fern Family) [in OSMUNDALES]

1 Leaves hemidimorphic (juvenile leaves with only sterile pinnae, leaves bearing sporangia with sterile and fertile pinnae, the fertile pinnae either borne medially or terminally); photosynthetic (sterile) pinnae lacking tufts of hairs ................................................................. 2. Osmunda

2 Leaves dimorphic (each leaf either completely photosynthetic or completely fertile); photosynthetic (sterile) pinnae with tufts of reddish hairs near the junction with the rachis................................................................................................................................. 1. Osmundastrum

1. Osmundastrum C. Presl (Cinnamon Fern)

A monotypic genus, of the Americas and e. Asia. “When the rbcL trees, the fossil and morphological evidences are all taken into account, it can be concluded that the extant *Osmunda cinnamomea* has no closely related living species in Osmundaceae, and it has evolutionarily very static morphology with no significant modification for more than 200 million years. Thus we can call extant *Osmunda cinnamomea* a ‘living fossil’ “ (Yatabe, Kishima, & Murakami 1999); Metzgar et al. (2008) confirmed the opinion that cinnamon fern is an outlier and warrants generic status. References: Metzgar et al. (2008)=Z; Lellinger (1985); Whetstone & Atkinson in FNA (1993b); Kramer in Kramer & Green (1990); Yatabe, Nishida, & Murakami (1999).

**Identification notes:** Sterile plants of *Osmundastrum cinnamomeum* are sometimes confused with *Woodwardia virginica*, which also has rather coarse, pinnate-pinnatifid leaves and grows in similar wet, acid places. *Osmundastrum* is coarser (to 2 m tall, vs. to 1 m tall), has cinnamon tufts of tomentum present in the axis of the pinnae (vs. absent), has the rachis greenish and rather fleshy in texture (vs. brown and wiry), and bears fronds clumped or tufted from a massive, woody, ascending rhizome covered with old petiole bases (vs. fronds borne scattered along a thick, horizontal, creeping rhizome).

**Osmundastrum cinnamomeum** (Linnaeus) C. Presl, Cinnamon Fern. Bogs, peatlands, pocosins, wet savannas, floodplains, blackwater stream swamps, and other wetlands. March-May. NL (Labrador) west to MN, south to s. FL, c. TX; Mexico south through Central America to n. South America; West Indies; e. Asia. The species also occurs in e. Asia, where sometimes treated as a separate variety (but the combination is not available in *Osmundastrum*). The taxonomic significance of the densely glandular pubescent *Osmunda cinnamomea* var. *glandulosa* needs additional evaluation; it is reported from scattered locations in e. North America, including SC and VA. Because of its geographic incoherence it is here regarded as a form. [= Z; = Osmunda cinnamomea Linnaeus – RAB, FNA, G, S, W, WV; > Osmunda cinnamomea var. cinnamomea – C, F, K; > Osmunda cinnamomea Linnaeus var. glandulosa Waters – F, K]

2. Osmunda Linnaeus (Royal Fern, Cinnamon Fern, Interrupted Fern)

1 Leaves pinnate-pinnatifid, each pinna pinnatifid but not divided into distinct pinnules; spores borne on modified pinnae in the middle of the leaf blade; veins mostly 1-forked; [subgenus Claytonosorus]...................................................... 1. Hymenophyllum

2 Gametophytes only present, not in association with or in close proximity to filmy-fern sporophytes.

3 Gametophytes filamentous, no portion flattened and planar, forming felt-like mats ............................................................................................................... 4. Crepidomanes

4 Leaves stellate pubescent; rhizomes glabrous or with simple hairs; rhizomes densely covered with dark-colored hairs ............................................................................. 5. Didymoglossum

5 Rhizomes moderately stout, 0.8-1.5 mm in diameter, densely clad with dark-colored hairs; indusium ("involucre") tubular or funnelliform, sometimes slightly 2-lobed; receptacle long and whiplike, exerted from the mouth of the tubular (slightly bilobed) indusium ..................................................................................................................... 3. Vandenboschia

1. Hymenophyllum J.E. Smith 1793 (Filmy Fern)

As here broadly circumscribed, a genus of about 250-330 species, almost strictly tropical in distribution, but very rarely expending into humid north temperate regions. Sphaeroctinum C. Presl and other segregates are often recognized; these segregates may well be warranted. Iwatsuki in Kramer & Green (1990) takes a broad view of the genus, recognizing only Sphaeroctinum among the potential segregates. If this distinction is recognized, H. tunbrigense is in Hymenophyllum and H. tayloriae in Sphaeroctinum (the combination has not been made). References: Ebihara et al. (2006)=Z; Davison (1997); Raine, Farrar, & Sheffield (1991); Iwatsuki in Kramer & Green (1990); Morton (1968).

1 Sparophytes present.

2 Leaf blade with stellate hairs; [subgenus Sphaeroctinum] ............................................................. 2. Sphaeroctinum

3 Gemmae present; margin crenate, composed predominantly of cells with concave outer walls; archegonia and antheridia rare; plant forming sprawling, ribbon-like forms; branches filamentous to broad; proliferations abundant, arising marginally and centrally; [subgenus Sphaeroctinum] ................................................................................................................................. 1. Hymenophyllum

3 Gemmae absent; margin entire, composed predominantly of straight-sided cells; archegonia and antheridia common, often present on the same gametophyte; plant typically forming rosettes; branches always broad; proliferations few, always marginal; [subgenus Hymenophyllum] ........................................................................................................................ 2. Sphaeroctinum

Hymenophyllum tayloriae Farrar & Raine, Gorge Filmy Fern. Spray cliffs near waterfalls, permanently moist ceilings of grottoes in escarpment gorges with high rainfall. This species is endemic to the southern end of the Southern Appalachians (Transylvania, Jackson, and Macon counties, NC; Pickens and Oconee counties, SC; Rabun County, GA; Fentress, Scott, and Sevier counties, TN, and Lawrence, Franklin, and Lamar counties, AL). It was recently named (in honor of the first collector), following the demonstration that it represented a gametophyte distinct from the gametophytes of any (sporophytically) known species (Raine, Farrar, & Sheffield 1991), including H. tunbrigense, present in the close vicinity. Raine, Farrar, & Sheffield...
HYMENOPHYLLACEAE (F9)  

(1991) point out that "H. tayloriae is distinguished from the independent gametophytes of Vittaria appalachiana Farrar & Mickel by its 2-dimensional spathulate gemmae (those of V. appalachiana are uniseriate), rhizoid attachment only to marginal cells, yellow-green color, and glossy texture. Thallloid liverworts of similar size are generally more than one cell thick or have a distinct midrib, have notched apical meristems, and do not produce spathulate gemmae." An immature sporophyte, collected by Taylor in 1936, has stalked stellate hairs on the margins and midrib of the leaf and was the only sporophytic collection of the species until the recent discovery of additional juvenile sporophytes in AL (FNA 1993b). [= FNA, K, Z, = "a branching ribbon-like gametophyte with marginal rhizoids and small, ovate, plate-like gemmae several cells wide, of the genus Hymenophyllum" – RAB; = Sphaerocionium species 1]

Hymenophyllum tunbrigense (Linnaeus) J.E. Smith, Tunbridge Filmy Fern. Moist rock faces in an escarpment gorge with high rainfall. June-September. N. Mexico south through Central America to n. South America; SC; West Indies (Jamaica and Hispaniola); w. Europe; Africa; Australia and New Zealand. The occurrence of this filmy fern in the escarpment gorge of Eastatoe Creek and its tributaries (Pickens County, SC) is remarkable. Overall, H. tunbrigense is a "Gulf Stream plant," found in highly humid, climates in the West Indies, and the maritime west coast of the British Isles. H. tunbrigense somewhat resembles Chaconia flexuosa. This species may yet be found in NC in similarly rugged and humid escarpment gorges. It differs from T. boschianum in having the sporangia not extending beyond the deeply 2-lobed involucre (as opposed to having the sporangia exerted beyond the slightly bi-lobed, funnelform involucre). [= RAB, FNA, K, W, Z]

2. Didymoglossum Desvaux 1827

Didymoglossum petersii (A. Gray) Copeland, Dwarf Filmy Fern. On vertical faces of acidic rock outcrops in humid gorges, primarily of the Savannah River drainage, in the context of the very humid escarpment gorges on relatively dry rocks, not on rocks receiving substantial seepage or spray from waterfalls, also on outcrops of Altamaha Grit in the Coastal Plain, and on tree bark in swamps (in LA and MS). June-August. W. NC, nw. SC, sw and sc. TN, south to n. peninsular FL, c. AL, s. MS, and e. LA; disjunct in the Ozarks and Ouachitas of AR; Mexico (Chiapas, Veracruz, and Puebla) and Guatemala. This diminutive species is often overlooked, except by bryologists and hepaticologists; superficially, it does resemble a moss or liverwort more than a fern. It occurs on tree bark in some parts of its range. [= Z; = Trichomanes petersii A. Gray – RAB, FNA, K, S, W]

3. Vandenboschia Copeland 1938

A genus of 15-20 species, of the tropics and extending to north temperate areas of high humidity. References: Ebihara, Farrar, & Ito (2008)=Y; Ebihara et al. (2006)=Z; Ebihara et al. (2007); Iwatsuki in Kramer & Green (1990); Morton (1968); Dubuisson et al. (2003).

Vandenboschia boschiana (Sturm) Ebihara & K. Iwatsuki, Appalachian Filmy Fern. On rock outcrops, usually vertical or overhanging, usually in deeply shaded grottoes receiving seepage or spray from waterfalls. June-September. W. VA, s. OH, s. IN, s. IL south to w. NC and nw. SC, n. GA, n. AL, and ne. MS (Menapace, Davison, & Webb 1998); disjunct in the Ozarks of nw. AR; disjunct in Chiuhuahua, Mexico. See Belden et al. (2004) for more details on the first documented Virginia occurrence. [= Z; = Trichomanes boschianum Sturm – RAB, C, F, FNA, G, K, S, W, WV]

4. Crepidomanes C. Presl 1851

A genus of 30-40 species, tropical and extending to north temperate areas of high humidity; strictly Old World, except for our species. References: Ebihara, Farrar, & Ito (2008)=Y; Ebihara et al. (2006)=Z; Ebihara et al. (2007); Iwatsuki in Kramer & Green (1990); Morton (1968); Dubuisson et al. (2003).

Crepidomanes species 1, Grotto-felt, Appalachian Trichomanes, Weft Fern. On ceilings or back walls of grottoes, especially in humid gorges or near or behind waterfalls. Rather widespread in e. North America, from NH, VT, w. NY, OH, IN, and IL south to NC, nw. SC, n. GA, and n. AL. Crepidomanes species 1 cannot be morphologically distinguished from gametophytes of Vandenboschia boschiana or Didymoglossum petersii; the electrophoretic and phytogeographic evidence of Farrar (1992) leave little question, however, that it should be considered a distinct species. Although Farrar (1992) found that 30 of 30 populations of Trichomanes (s.l.) gametophytes "east of the Mississippi River that were not within or adjacent to sporophyte populations of T. boschianum or T. petersii" were "T. intricatum," the absence of sporophytes should be considered to
HYMENOPHYLLACEAE (F9)

provide only a presumptive or likely identification of gametophytes. Farrar (1992) also showed that independent gametophytes in AR were those of *Vandenboschia boschiana* and *Didymoglossum petersii*. Farrar (1992) points out the “intriguing possibility that somewhere in the Appalachian Mountains sporophytes of this species may yet exist.” Probably the most likely area in which to search for the sporophyte generation of *Crepidomanes species 1* is the escarpment gorge region of NC, SC, and GA near Highlands, NC, where topography, waterfalls, and the highest rainfall east of the Cascade Mountains combine to create microclimatic conditions that have favored the relict survival of numerous species of mosses, liverworts, and ferns. Any filmy-fern sporophyte which differs from known eastern North America species of Hymenophyllaceae should be investigated carefully. *Vittaria appalachiana* and *Hymenophyllum tayloriae* gametophytes differ from filamentous. Ebihara, Farrar, & Ito (2008) have recently reported that *Crepidomanes species 1* shares its chloroplast genome with the Asian triploid *Crepidomanes schmidtianum* var. *schmidtianum*; further studies are underway to determine the relationship of the two. (= *Trichomanes intricatum* Farrar – FNA, K; = "filamentous gametophyte, with spindle-shaped gemmae one cell wide but with the cells decreasing in size toward the apices, of the genus *Trichomanes*" – RAB; = *Vandenboschia species 1* – Z; ≈ *Crepidomanes schmidtianum* (Zenker ex Tasch.) K. Iwatsuki var. *schmidtianum* – Y]

F10. GLEICHENIACEAE C. Presl 1825 (Forking-fern Family) [in GLEICHENIALES]

*Dicranopteris* Bernhardi 1805 (Forking-fern)

* *Dicranopteris flexuosa* (Schrad) Underwood, Forked-fern. Wet pine flatwoods, moist disturbed areas; native in New World tropics. FL Panhandle (Bay and Franklin counties) and FL peninsula, s. AL (Mon Louis Island, Mobile County); West Indies; Mexico, Central America, and South America. [= FNA, K, S]

F13. LYGODIACEAE M. Roemer 1840 (Climbing Fern Family) [in SCHIZAEALES]

A family with a single genus and about 40 species, of tropical and temperate regions, particularly equatorial and south temperate. Sometimes included in the Schizaeaceae, but the relationship is remote and unclear. References: Nauman in FNA (1993b).

*Lygodium* Swartz 1800 (Climbing Fern)

A genus of about 40 species, mostly tropical, with a few temperate species.

1 Sterile pinnae pinnately divided into numerous serrate pinnules ............................................................................................................... *L. japonicum*

1 Sterile pinnae palmately lobed into 4-8 smooth to undulate lobes............................................................................................................... *L. palmatum*

* *Lygodium japonicum* (Thunberg) Swartz, Japanese Climbing Fern. Disturbed areas; native of Asia. June-September. The leaves (up to 30 m in length!) climbing into the canopy of trees in swamp forests and other wet habitats. (= RAB, FNA, K, S)

*Lygodium palmatum* (Bernhardi) Swartz, American Climbing Fern, Hartford Fern. Bogs, moist thickets, swamp forests, sandstone outcrops, roadside ditches and roadbanks, in strongly acid soils. July-September. NH, VT, NY and MI south to SC, n. Ga, and n. AL, widely scattered except in the Cumberland Plateau of KY, TN, and AL, where it is most common. Garrison (1992) discusses two forms of the species, "one with long appressed hairs scattered over the lower (abaxial) side of the sterile leaflets and the other relatively hair-free.” The two forms appear to be geographically differentiated, the pubescent form predominating south and west of Maryland, the glabrous form occurring primarily in the Northeast. Both forms are present in our area. Further research is needed to determine the taxonomic significance of this variation in pubescence. (= RAB, C, F, FNA, G, K, S, W, WV)

F14. SCHIZAEACEAE Kauffuss 1827 (Curly-grass Family) [in SCHIZAEALES]

A family of 3-4 genera and about 30 species (depending on circumscription). The Lygodiaceae is often combined with the Schizaeaceae. References: Wagner in FNA (1993b); Kramer in Kramer & Green (1990).
Schizaea J.E. Smith 1793 (Curly-grass Fern)

Schizaea pusilla Pursh, Curly-grass Fern. Moist, peaty oil in Coastal Plain bogs, often associated with Pseudolycodiella caroliniana, Drosera filiformis, and Chamaecyparis thyoides (though not in dense Chamaecyparis stands). May-July. In acid, boggy sites in DE, NJ, NY, NL (Newfoundland), NS, and NB; a similar or possibly identical plant is known from Peru. The leaves are filiform, 1-12 cm long. Spores of Schizaea have been identified in Pleistocene organic sediment from Singletary Lake (Bladen County, NC) and Rockyhock Bay (Chowan County, NC) (Whitehead 1963). Its native occurrence in our area as an extant species is plausible. See LeBlond & Weakley (2002) for further information on this species' occurrence in North Carolina. [= C, F, FNA, G, K]

F16. MARSILEACEAE Mirbel 1802 (Water-clover Family) [in SALVINIALES]

Identification notes: The raphe is the portion of the peduncle adnate to the sporocarp. The peduncle ends in a blunt tooth, the proximal tooth. Further up on the sporocarp is a second tooth, the distal tooth.

1 Leaves clover-like, the 4 cuneate, obovate or wedge-shaped leaflets borne at the summit of the petiole; sporocarps ovoid.......................... Marsilea
1 Leaves grass-like, linear, the leaf blade absent, the petiole narrowly winged; sporocarps spherical............................................................... Pilularia

Marsilea Linnaeus 1753 (Water-clover)

Identification notes: The raphe is the portion of the peduncle adnate to the sporocarp. The peduncle ends in a blunt tooth, the proximal tooth. Further up on the sporocarp is a second tooth, the distal tooth.

1 Leaves strongly bicolor (pale green towards the base of each of the 4 leaflets, darker green towards the tip); aquatic forms with a swollen air bladder just below the leaf................................................................. M. mutica
1 Leaves unicolored.
2 Roots present (1-3) between the nodes, as well as at the nodes.
  3 Distal tooth 0.3-0.8 mm long; sporocarps 3.5-5.0 mm long................................................................. M. minuta
  3 Distal tooth absent or < 0.2 mm long; sporocarps 4.5-6.0 mm long................................................................. M. quadrifolia
2 Roots present only at the nodes
  4 Distal tooth absent or a very low bump......................................................................................... M. macropoda
  4 Distal tooth 0.4-1.2 mm long, sharply acute to pointed, often hooked ...................................................... M. vestita

* Marsilea macropoda Engelmann ex A. Braun, Bigfooted Water-clover. [habitat]; native of s. TX and Mexico. Reported as introduced eastward in AL and c. and s. peninsular FL. [= FNA, K, Z]
* Marsilea minuta Linnaeus, Small Water-clover. Lakes and streams; native of the Old World. Known in North America from AL, FL, GA, and TN. [= FNA, Z; M. crenulata Desv.; M. crenata Presl]
* Marsilea mutica Mettenius, Nardoo, Australian Water-clover. Ditches, ponds; native of Australasia. Apparently spreading rapidly in VA. [= Z]
* Marsilea quadrifolia Linnaeus, European Water-clover. Shallow water of artificial impoundment; native of Europe. Not seen fertile in NC. Sold in garden stores as an aquatic to be grown in water gardens, and likely to be encountered more widely in the future. [= C, F, FNA, G, K]

Pilularia Linnaeus 1753 (Pillwort)

Identification notes: Pilularia lacks a leaf-blade, the 1-8 cm long petiole is narrowly winged, and looks a bit like an Isoetes or Juncus leaf. In vegetative condition, it may be recognized as a "fern" by the typical coiled ("fiddlehead") development of young leaves. The primary rhizome produces individual "fronds" at nodes, a short rhizome branch at each node also produces "fronds."

Pilularia americana A. Braun, American Pillwort. Vernal pools and seepage areas on granitic flatrocks, other ponds. This peculiar plant has a puzzling distribution, being known from several disjunct regions: WA to s. CA; NE and MO south to c. TX; SC, GA, TN, AL, and Mexico (Durango and Baja California Norte); similar plants, perhaps conspecific, occur in South America and Africa. The fragmented distribution may be at least partly explainable by the inconspicuous nature of the plant. First reported for SC in 1993 (J. Allison, pers. comm.). [= FNA, K, S]
F17. **SALVINIACEAE** Martinov 1820 (Floating Fern Family) [in SALVINIALES]

A family of 2 genera and about 16 species, all floating aquatics. *Azolla* is sometimes separated as a separate family, Azollaceae. References: Nagalingum, Nowak, & Pryer (2008); Nauman in FNA (1993b); Lumpkin in FNA (1993b); Schneller in Kramer & Green (1990).

1. Leaves < 1 mm long, reddish or green, without hairs on the upper surface. .................................................................................................... *Azolla*

1. Leaves 5-50 mm long, bright green, with obvious hairs on the upper surface. ..................................................................................... *Salvinia*

**Azolla** Lamarck 1783 (Mosquito Fern)

A small genus of about 6 species, floating aquatics, in tropical and warm temperate regions. Very un-fernlike, this floating aquatic looks superficially more like an aquatic liverwort. In some years and some places it occurs in great abundance, covering the surface of the water with a green or red mass of vegetation. *Azolla* has a symbiotic, nitrogen-fixing cyanobacterium, *Anabaena azollae* Strasburger. The nitrogen-fixing capabilities of *Azolla* have resulted in its use as a fertilizer, green manure, and livestock feed, much promoted in recent years, but used historically in Asian rice paddies for centuries (Lumpkin in FNA 1993b). References: Evrard & Van Hove (2004)=Z; Lumpkin in FNA (1993b).

1. Largest hairs on upper leaf lobe with 2 or more cells; megaspores densely covered with tangled filaments. ........................................ *A. caroliniana*

1. Largest hairs on upper leaf lobe with 1 cell; megaspores with raised angular bumps, visible through a sparse layer of filaments. ........... *A. filiculoides*

* Salvinia filiculoides* Lamarck. Freshwater lake; native of w. North America, south into Mexico, Central America, South America, e. Asia. This species is reported for e. GA from a freshwater lake on Sapelo Island, McIntosh Co. (Bates & Browne 1981), presumably as an accidental introduction. [= FNA, K; < *A. filiculoides* – Z]

Salvinia Séguier 1754 (Water Spangles)

1. Leaves 5–15 mm long; multicellular hairs of the upper leaf surface with 4 free, spreading branches (use 10× magnification). .. *S. minima*

1. Leaves to 50 mm long; multicellular hairs of the upper leaf surface with 4 branches joined at their tips, forming a cage-like structure (use 10× magnification). ................................................................. *S. molesta*

* Salvinia minima* Baker, Water Spangles. Quiet waters; probably introduced in our area from further south. [= FNA, K, Z; *S. auriculata* – S, misapplied]

* Salvinia molesta* D.S. Mitchell. Still waters of farm ponds, calcareous seepage ponds, and other situations; native of Brazil. *S. molesta* has been found at scattered sites in GA (Gwinnett and Lamar counties) (Carter, Baker, & Morris 2009), NC (Brunswick, Carteret, Craven, Cumberland, Duplin, Johnston, Jones, Lenoir, Mecklenburg, New Hanover, Onslow, Orange, Person, Pitt, Sampson, and Wake counties), SC (Colleton County), and VA (Shenandoah County), where it has been subjected to extermination efforts; it will likely be reintroduced (Anonymous 1999, D. Patterson, pers. comm.). This species is considered a noxious aquatic weed and has been reported from other southeastern states, such as TX and LA (Jacono 1999). Moran & Smith (1999) support the continued use of the name *S. molesta* for this species, as opposed to the ambiguous name *S. adnata* Desvaux. [= FNA, K, WH, Z; ? *S. adnata* Desvaux]

F30. **DENNSTAEDTIACEAE** Lotsy 1909 (Bracken Family) [in POLYPODIALES]

A family of about 16 genera and 370 species, of cosmopolitan distribution; the circumscription is very uncertain and controversial, however. References: Lellinger (1985); Cranfill in FNA (1993b); Kramer in Kramer & Green (1990).

1. Leaf blades broadly triangular in outline, about as broad as long, subcoriaceous; sori linear, confluent ........................................... *Pteridium*
DENNSTAEDTIACEAE (F30)

1 Leaf blades elongate in outline, at least 2× as long as broad, membranaceous; sori globular, separate
2 Leaves 2-pinnate–pinnatifid; indusium tubular or cuplike; leaves generally < 1 m long..............................................
3..............................Dennstaedtia
2 Leaves 3–4-pinnate–pinnatifid; indusium flap-like; leaves generally > 1 m long..............................................................Hypolepis

**Dennstaedtia** Bernhardi 1801 (Cuplet Fern)

A genus of about 45 species, of tropical to temperate distribution; *Dennstaedtia* is poorly known and of uncertain circumscription. Only *D. punctilobula* is temperate in distribution; anatomical evidence suggests that it is not closely related to tropical *Dennstaedtia*, and its separation from that genus may be warranted. References: Nauman & Evans in FNA (1993b); Kramer in Kramer & Green (1990).

**Identification notes:** *Dennstaedtia punctilobula* can be distinguished from other woodland ferns with deciduous fronds of similar size and shape (such as *Athyrium*, *Dryopteris*, and *Thelypteris*) by the following characteristics: leaves yellow-green or pale-green in color, with whitish-gray glandular trichomes, petioles silvery-pilose, leaves borne scattered (as clonal patches), sori tiny (< 0.5 mm in diameter).

* Dennstaedtia cicutaria (Sw.) T. Moore. Reported for AL by Kartesz (1999) on the basis of Dean’s (1969) mention of a plant of *D. rubiginosa* having been planted in Mobile. This report is rejected, as there is no evidence of naturalization. The species is native of tropical America. [= K; ? *D. rubiginosa* (Kaulfuss) T. Moore] [rejected; not keyed]

**Hypolepis** Bernhardi 1806 (Bramble Fern)

1 Stipe and rachis bearing numerous small prickles; [native, restricted to FL] ..............................................................H. repens
1 Stipe and rachis smooth, lacking prickles; [alien] ............................................................................................................H. tenuifolia

**Hypolepis repens** (Linnaeus) C. Presl, Creeping Bramble Fern. Swamps, wet hammocks. N. FL (Clay County) south to c. FL; West Indies; Mexico, Central America, South America. [= FNA, K, S, WH]

**Pteridium** Gleditsch ex Scopoli 1760 (Bracken)

A genus of 2–11 species, cosmopolitan in distribution. Bracken taxonomy remains provisional; the molecular work of Der et al. (2009) outlines a probable taxonomic structure for the genus. *Pteridium* is a notorious and nearly worldwide weed (though less consequential in our area than in many parts of the world), nearly impossible to eradicate because of its deeply subterranean rhizomes. Bracken fiddleheads are sometimes eaten, but they are poisonous and highly carcinogenic. Bracken is not favored by consequential in our area than in many parts of the world), nearly impossible to eradicate because of its deeply subterranean rhizomes. Bracken fiddleheads are sometimes eaten, but they are poisonous and highly carcinogenic. Bracken is not favored by consequential in our area than in many parts of the world), nearly impossible to eradicate because of its deeply subterranean rhizomes.

1 Leaf segment margins slightly to moderately pubescent; terminal (caudate) tip of the basalmost pinnule of the basal pinna (3-) avg. 12 (-28)% as long as the entire pinna; lower surface of rachis and costae shaggy pubescent; terminal segments of well-developed pinnules generally 2–4× as long as broad, about 3–8 mm wide.................................................P. aquilinum ssp. latiusculum
1 Leaf segment margins glabrous or sparsely pilose; terminal (caudate) tip of the basalmost pinnule of the basal pinna (16-) avg. 25 (-45)% as long as the entire pinna; lower surface of rachis and costae glabrous or sparsely pilose; terminal segments of well-developed pinnules generally 6–15× as long as broad, about 2–5 mm wide...................................................P. aquilinum ssp. pseudocaudatum

**Pteridium aquilinum** (Linnaeus) Kuhn ssp. latiusculum (Desvaux) Hultén, Eastern Bracken. Mainly in dry woodlands, forests, and heath balds, up to 1600 m in elevation. July-September. The species is nearly worldwide in distribution. NL (Newfoundland) west to MB, south to Panhandle FL, TX, and n. Mexico. The circumscription of ssp. *latiusculum* follows Thomson, Mickel, & Mehltreter (2008) in excluding Old World material included by many earlier authors. The relationship of the ‘*latiusculum*’ and ‘*pseudocaudatum*’ entities is discussed in detail by Speer & Hilu (1999) and Speer, Werth, & Hilu (1999).

**DENNSTAEDIACEAE** (F30)

*Pteridium aquilinum* (Linnaeus) Kuhn *ssp. pseudocaudatum* (Clute) Hultén, Tailed Bracken, Southern Bracken. Mainly in dry sandy woodlands, often locally abundant in sandhills and flatwoods. July-September. *Ssp. pseudocaudatum* is primarily distributed in the Southeastern Coastal Plain (where it is ubiquitous and abundant), but is reported north to MA, OH, IN, s. MI, and MO. [= *Z. = Pteridium aquilinum* (Linnaeus) Kuhn var. *pseudocaudatum* (Clute) Heller – RAB, C, F, FNA, G, K, W, WV; = *P. lattissiumum* (Desvaux) Hieronymus var. *pseudocaudatum* (Clute) Maxon – S]

**F31. PTERIDACEAE** E.D.M. Kirchner 1831 (Maidenhair Fern Family) [in POLYPODIALES]

A family of about 40 genera and about 1000 species. This family may be further subdivided, into families Adiantaceae (*Adiantum, Vittaria*), Sinopteridaceae (*Cheilanthes, Notholaena, Astrolepis, Pellaea*), Cryptogrammaceae (*Cryptogramma*), Pteridaceae (*Pteris*), and Parkeriaceae (*Acrostichum, Ceratopteris*). Here circumscribed to include Vittariaceae (see Smith et al. 2006). References: Lellinger (1985); Windham in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Kramer in Kramer & Green (1990); Crane (1997).

1 Gametophytes only present; [subfamily Vittarioideae].................................................................................................................. 10. Vittaria
2 Sporophytes present.
3 Sori round or oblong, distinct and separate along the pinnule margins; leaves bright-green, glabrous, herbaceous, delicate, and flexible; [subfamily Vittarioideae] ..................................................................................................................... 9. Adiantum
4 Plant aquatic or subaquatic, pale green, delicate .................................................................................................................. 3. Ceratopteris
5 Fertile pinnae with sori marginal; leaves < 0.5 m long; [subfamily Ceratopteridoideae]................................................................................................. 2. Acrostichum
6 Leaves essentially monomorphic.
7 Leaves 2-5-pinnate, the ultimate leaf-segments 1-4 (-8) mm long, more-or-less densely hairy (glabrous in *Cheilanthes alabamensis*) or covered on the undersurface with a whitish powder; [subfamily Cheilantheoidae] ................................................................................................. 5. Argyrochosma
8 Lower leaf surfaces pubescent (or glabrous in *Cheilanthes alabamensis*), never with conspicuous whitish powder. ................................................................. 6. Cheilanthes
9 Rachis brown-purple; [subfamily Cheilantheoidae] ................................................................................................. 8. Pellaea
10 Rachis green or tan; [subfamily Pteridoideae] ................................................................................................. 4. Pteris

**1. Cryptogramma** R. Brown 1823 (Parsley Fern)

*Cryptogramma stelleri* (S.G. Gmelin) Prantl in Engler, Slender Rock-brake. Limestone cliffs. NL (Newfoundland) and AK, south to c. PA, WV (Pendleton and Randolph counties), IL, IA, CO, UT, NV, and OR. [= FNA, C, F, G, K, WV]

**2. Acrostichum** Linnaeus 1753 (Leather Fern)

3. *Ceratopteris* Brongniart 1821 (Antler fern)

A genus of 3 species, widespread in tropical, subtropical, and warm temperate areas. References: Lloyd in FNA (1993b). Key based on FNA.

1 Sterile leaves simple, or palmately to pinnately lobed, or 1-4-pinnately divided, the pinnae (or veins) towards the base of the leaf opposite; petioles often inflated; sporangia with or without an annulus, the annulus with 0-10 (-40) indurated cells......................... *C. pteridoides*

1 Sterile leaves (1-) 2-3-pinnately divided, the pinnae towards the base of the leaf alternate; petioles usually not inflated; sporangia with an annulus, the annulus with 13-71 indurated cells.

2 Sporangia with 16 spores ....................................................................................................

2 Sporangia with 32 spores ....................................................................................................

* C. pteridoides (Hooker) Hieronymus. Ponds and lakes (natural and artificial). S. GA, FL, LA (including Florida parishes); West Indies; Central and South America; se. Asia. [= FNA, K, S, WH]

* C. richardii Brongniart. Lakes and ponds. Probably only introduced in the southeastern United States. West Indies; Central and South America; Africa. [= FNA, K]

* C. thalictroides (Linnaeus) Brongniart. Canals, swamps, ditches. Widespread in tropical and subtropical areas of America and Asia. Regarded by some authors as introduced in the se. United States. [= FNA, K; = *C. deltoidea* Benedict – S]

4. *Pteris* Linnaeus 1753 (Brake)

A genus of about 250-300 species, warm temperate and tropical. References: Nauman in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990).

1 Pinnae strictly simple, without lobes or pinnules; outline of leaf blade lanceolate, typically > 3× as long as wide......................... *P. vittata*

1 Pinnae (at least the basal ones) with 1-several lobes or pinnules; outline of leaf blade ovate to orbicular, typically nearly as wide as long

2 Pinnae of mature leaves not decurrent or only the terminal pinnae decurrent........................................................................

2 Pinnae of mature leaves decurrent in the upper half of the leaf onto the rachis........................................................................

* P. cretica Linnaeus, Common Cretan Brake. Limey rocks and soils. Pantropical, the original range unclear. Var. albolineata Hooker is sometimes recognized, seemingly differing only in the broad white central stripe on the pinnae (as opposed to solid green pinnae in var. *cretica*). [= Pycnodoria cretica – S; > *Pteris cretica* Linnaeus var. *cretica* – FNA, K; <]

* P. multifida Poiret, Spider Brake. Old walls with lime mortar; native of the Tropics. [= RAB, FNA, K; = Pycnodoria multifida (Poiret) Small – S]

* P. vittata Linnaeus, Ladder Brake. Old walls with lime mortar; native of e. Asia. [= RAB, FNA, K; = Pycnodoria vittata (Linnaeus) Small – S]

5. *Argyrochosma* (J. Smith) Windham 1987 (Powdery Cloak Fern)

A genus of about 20 species, of s. North America, Central America, South America, and the West Indies. Traditionally treated as a component of *Notholaena* (or sometimes *Pellaea*) (Tryon, Tryon, & Kramer in Kramer & Green 1990), but best recognized as a separate genus (Windham in FNA 1993b, Windham 1987, Gastony & Rollo 1998). Molecular studies show that this group is more closely related to *Pellaea* and *Astrolepis* than to *Notholaena*. References: Windham in FNA (1993b); Windham (1987); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998).

* Argyrochosma dealbata (Pursh) Windham, Powdery Cloak Fern. Limestone cliffs. IL, MO, and KS south to AR and TX; disjunct in sc. KY. [= FNA, K; = *Notholaena dealbata* (Pursh) Kunze – C, F, G; = *Cheilanthes dealbata* Pursh; = Pellaeca dealbata (Pursh) Prantl]

6. *Cheilanthes* Swartz 1806 (Lipfern)

A genus of about 150 species, primarily in the Western Hemisphere. References: Lellinger (1985)=Z; Windham & Rabe in FNA (1995b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998). [also see *Argyrochosma* and *Astrolepis*]

1 Leaf surfaces glabrescent; ["*Cheilanthes alabamensis* group"].

2 Rhizomes short-creeping, usually 4-7 mm in diameter; pinnule midveins green on the upper surface for most of their length; spores 32 per sporangium................................................................................................................. *C. alabamensis*
2. Rhizomes long-creeping, usually 1-3 mm in diameter; pinnule midveins black on the upper surface for most of their length; spores 64 per sporangium. ............................................................... C. microphylla

1. Leaf surfaces pubescent (tomentose, villous, or lanose).

3. Petiole and rachis with a mixture of flattened scales (in C. tomentosa these very narrow and superficially mistaken for hairs) and jointed hairs (as seen at 10× magnification); plants tufted, without creeping rhizomes; margins of leaf segments under-rolled, modified into a scarious flap (false indusium) that covers the sori; [subgenus Physapteris].

4. Leaf blade nearly glabrous above, appearing dark green; scales 0.2-1.0 mm wide, lanceolate; tomentum on the leaf under-surface white, tan, or silver-gray............................................................... C. castanea

4. Leaf blade-brown (at maturity, whitish when young) ......................................................................................... C. castanea

4. Leaf blade-brown above, appearing whitish or gray-green; scales ca. 0.1 mm wide, linear, nearly hair-like; tomentum on the leaf under-surface white, tan, or silver-gray............................................................... C. castanea

3. Petiole and rachis with hairs only (as seen at 10× magnification); plants mat-forming (with leaves scattered along creeping rhizomes) or tufted (without creeping rhizomes); margins of leaf segments under-rolled but not modified into a scarious flap, the sori more or less exposed at maturity; [subgenus Cheilanthes].

5. Petiole and rachis glabrous to sparsely pubescent with rather straight hairs; leaves 3-pinnate, with 7-12 (-15) pairs of pinnae, the lower surface lanose (the hairs curly); leaf blades 2.5-10 (-15) cm long; ultimate segments 1-3 mm long, beadlike ........................................ C. feei

5. Petiole and rachis rather densely pubescent with long jointed hairs; leaves 2-pinnate-pinnatifid (rarely to 3-pinnate), with 12-20 pairs of pinnae, the lower surface tomentose (the hairs straight or bent); leaf blades (4-) 8-24 cm long; ultimate segments 3-5 mm long, elongate ............................................................... C. lanosa

Cheilanthes alabamensis (Buckley) Kunze, Alabama Lipfern. Dry outcrops of limestone. June-September. VA, w. NC, s. MO, and OK south and west to n. GA, AL, TX, NM, se. AZ, and Mexico (south to Oaxaca). Considering morphology and chromosome number (sharing x = 29 with Pellaea, in contrast to x = 30 in the rest of Cheilanthes), it has been suggested that C. alabamensis and close relatives could be placed equally well in Pellaea, as P. alabamensis (Buckley) Baker ex Hooker, as done by Cranfill (1980). Windham & Rabe in FNA (1993b) suggest that C. alabamensis is uncomfortably placed in either Cheilanthes and Pellaea and that "it may constitute a natural group worthy of consideration as a distinct genus." A molecular analysis suggests that C. alabamensis and close relatives form a monophyletic group sister to the rest of Cheilanthes; this could be the basis for status as a separate genus or for inclusion in Cheilanthes (but not for inclusion in Pellaea) (Gastony & Rollo 1998). Our plants are apparently apogamous triploids. [= RAB, C, F, FNA, G, K, S, W, Z; = Myriopteris sp.]

Cheilanthes castanea Maxon, Chestnut Lipfern. Dry outcrops of sedimentary or metamorphic rocks (including calcareous shales and siltstones). June-September. Sw. TX to s. AZ and south into Mexico, with scattered disjunct occurrences in c. OK, n. AR, e. WV, and c. and w. VA (to be expected elsewhere in our area). The ultimate segments of the pinnules are roundish and closely spaced, so that they overlap the adjacent segments of the pinnule and the segments of the adjacent pinnule. These characters do not match some descriptions (such as in Z). Whether or not C. castanea is distinct from or merely a form of C. eatonii is controversial. The complex of the 2 taxa includes apogamous triploids and sexual tetraploids. [= W, WV, Z; < C. eatonii Baker – C, FNA, K; = Myriopteris sp.]

Cheilanthes feei T. Moore, Slender Lipfern. Dry outcrops of calcareous sedimentary rocks (dolostone). June-September. WI, MN SD, MT, AB, and BC south to AR, TX, NM, AZ, s. CA, and n. Mexico (Chihuahua and Coahuila); disjunct eastward in KY and w. VA. The only known site in our area is on a dolostone cliff in Pulaski County, VA, where disjunct about 450 km east of a population in Bullitt County, KY, and an additional 200 km from other populations in IL (Wieboldt & Bentley 1982, Porter & Wieboldt 1991). The species is an apogamous triploid of unknown parentage. [= C, FNA, G, K, W, Z; = Myriopteris sp.]

Cheilanthes lanosa (Michaux) D.C. Eaton, Hairy Lipfern. Dry outcrops of felsic or intermediate metamorphic and igneous rocks. June-September. CT, NY, PA, s. IL, MO, and KS south to FL, AL, MS, LA, and e. TX, and disjunct in WI and MN. Much the commonest lip-fern in our area, a sexual diploid, and the most "eastern" of a predominantly western genus. [= RAB, C, FNA, G, K, S, W, WV, Z; = C. vestita (Sprengel) Swartz – F; = Myriopteris sp.]

Cheilanthes microphylla (Swartz) Swartz, Southern Lipfern. Shell hammocks, limestone outcrops. Ne. FL south through FL; West Indies; Mexico through Central America to s. America; West Indies. [= FNA, K, S, Z; = Myriopteris sp.]

Cheilanthes tomentosa Link, Woolly Lipfern. Dry outcrops of intermediate or calcareous metamorphic, igneous, or sedimentary rocks (including sandstone outcrops in the Coastal Plain of GA and SC). June-September. Primarily Appalachian, from PA south to KY, GA, and AL, also at scattered localities from AR, OK, and KS south and west to NM, AZ, and Mexico (south to Veracruz). The species is an apogamous triploid. [= RAB, C, FNA, G, K, W, S, Z; = C. lanosa – F, misapplied; = Myriopteris sp.]

7. Astrolepis D.M. Benham & Windham 1992 (Star-scaled Cloak Fern)

A genus of about 8 species, of s. North America, Central America, South America, and the West Indies. This group of species has traditionally been placed either in Notholaena or Cheilanthes, but is best recognized as a separate genus, more closely related
to *Argyrochosma, Pellaea, and Cheilanthes* than to *Notholaena* (Gastony & Rollo 1998) References: Benham & Windham in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998).

1 Scales of the upper leaf surface dense and usually persistent; largest pinnae asymetrically lobed or entire; rare eastern disjunct known from AL. ............................................................................................................................................................................ *A. sinuata* ssp. *sinuata*

1 Scales of the upper leaf surface sparse and usually deciduous; largest pinnae usually symmetrically lobed; rare eastern disjunct known from GA. ............................................................................................................................................................................ *A. sinuata* ssp. *sinuata*

**Astrolepis integerima** (Hooker) D.M. Benham & Windham. Outcrops of Ketona dolostone. OK, NM, AZ, and NV south into Mexico; disjunct to c. AL (Bibb County); also disjunct in Hispaniola. This taxon is apparently an apogamous triploid derived from *Astrolepis coxisensis* (Goodding) D.M. Benham & Windham and an unknown taxon. [= FNA; = *Astrolepis ×integerima* – K; = *Cheilanthes integerima* (Hooker) Mickel; = *Notholaena integerima* (Hooker) Hevly; = *Pellaea* sp.]

**Astrolepis sinuata** (Lagasca ex Swartz) D.M. Benham & Windham ssp. *sinuata*, Wavy Cloak-fern. Granitic outcrops and boulders. OK, TX, NM, and AZ, south into Central and South America; West Indies; disjunct in GA. Its leaves are pinnate-pinnatifid, with 30-60 pairs of pinnae. [= FNA, K; < *Cheilanthes sinuata* (Lagasca ex Swartz) Domin; < *Notholaena sinuata* (Lagasca ex Swartz) Kaufuss; = *Pellaea* sp.]

8. **Pellaea** Link 1841 (Cliff-brake)

A genus of about 40 species, mostly in the Western Hemisphere. References: Gastony (1988); Gastony, Yatskievych, & Dixon (1992); Windham in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998); Heafner (2001). Key based in part on Heafner (2001). [also see *Artyrochosma, Astrolepis, Cheilanthes*]

1 Petioles terete, glabrous or pubescent; rhizome scales uniformly orangish-brown, entire.
2 Petioles and rachises sparsely to densely pubescent, dull; pinnae long-stalked, those toward the base of the leaf on stalks 5-15 mm long; [of a variety of substrates, including non-calcareous] . ............................................................................................................................................................................ *P. atropurpurea* ssp. *glabella*
1 Petioles slightly grooved or flattened, glabrous; rhizome scales with a blackish median stripe and pale brown margins, obscurely toothed.
3 Ultimate segments thin in texture, not strongly rolled, acute to acuminate at the apex, but lacking a mucro or cusp .................................................................................. *P. viridis*
3 Ultimate segments leathery, strongly rolled, mucronate at the apex.
4 Leaves oblong to elliptic in outline; pinnae either ternate toward the base of the leaf and simple toward the tip of the leaf, or all simple; [known from outcrops in the upper Piedmont of SC] ................................................................................................................................................ *P. ternifolia* ssp. *arizonica*
4 Leaves usually narrowly triangular in outline; pinnae usually pinnate toward the base, becoming ternate to simple toward the tip; [known from outcrops in Piedmont of NC] ......................................................................................................................... *P. wrightiana*

**Pellaea atropurpurea** (Linnaeus) Link, Purple Cliff-brake. Outcrops of limestone and other rocks (usually either calcareous or mafic), rarely on masonry walls (Weiboldt 1995). May-September. This species is an apogamously-reproducing triploid, either an allopolyploid derived from the hybridization of a sexually-reproducing diploid species and sexually-reproducing tetraploid, or an autopolyploid of an undiscovered or extinct species. Gastony, Yatskievych, & Dixon (1992) provide convincing evidence that modern *P. glabella* is not one of the parental taxa, as indicated by Lellinger (1985). *P. atropurpurea* is widespread in e. North America, from VT, NY, MN, SD, SK, and AB south to FL, AL, TN, AR, TX, NM, AZ, Mexico, and Guatemala. [= RAB, C, F, FNA, K, S, W, WV; = *P. atropurpurea* var. *atropurpurea* – G; = *P. ×atropurpurea*]

**Pellaea glabella** Mettenius ex Kuhn ssp. *glabella*, Smooth Cliff-brake. Dry, exposed outcrops of calcareous rocks (limestone, dolostone), rarely on masonry walls (Weiboldt 1995). May-September. The diploid, sexually-reproducing *P. glabella* ssp. *missouriensis* (Gastony) Windham is (so far as is known) restricted to MO; the apogamously-reproducing autotetraploid derivative, ssp. *glabella*, is more widespread, ranging from VT, ONT, and MN, south to VA, TN, KY, AR, OK, and n. TX. Two additional taxa (both western) have been variously treated as additional subspecies of *P. glabella* or as two subspecies of *P. occidentalis* (E.E. Nelson) Rydberg. [= FNA, K; = *P. glabella* var. *glabella* – C; = *P. atropurpurea* var. *bushii* Mackenzie – G; < *P. glabella* – F, S, W, WV]

**Pellaea ternifolia** (Cavanilles) Link ssp. *arizonica* Windham, Arizona Cliff-brake. On granitic outcrops. A remarkable disjunct from sw. United States and Mexico (south to Oaxaca) to w. SC; see Heafner (2001) for additional information. When discovered, it was believed that this was a SC record for *P. wrightiana* (Platt & Townsend 1996), but Heafner (2001) has demonstrated that this actually represents *P. ternifolia* ssp. *arizonica*. [= FNA, K]

* Pellaea viridis* (Forsskål) Prantl, Green Cliff-brake. Outcrop of Altamaha Grit; native of Africa. This species is naturalized on an Altamaha Grit outcrop in Coffee County, GA (J. Allison, pers. comm.). Various infraspecific taxa have been recognized in the native range. [= K; = *Cheilanthes viridis* (Forsskål) Swartz]
**Pteridaceae (F31)**

*Pellaea wrightiana* Hooker, Wright's Cliff-brake. South-facing outcrops of Carolina slate or granitic rock with infrequent nutrient-rich seepage. May-September. OK west to se. CO and sw. UT, south to TX, AZ, and n. Mexico (Coahuila, Chihuahua, Sonora, Baja California Norte, and Baja California Sur), with a few, remarkable disjunct occurrences in c. NC. *P. wrightiana* is apparently a sexually-reproducing allotetraploid derivative of hybridization between *P. ternata* (Cavanilles) Link and *P. truncata* Goodding. [= RAB, FNA, K]

9. **Adiantum** Linnaeus 1753 (Maidenhair Fern)

1 Petiole and rachises roughly pubescent; [rare introduction]..............................................................................................................*A. hispidulum*
1 Petiole and rachises glabrous; [collectively common natives].
2 Leaves longer than broad, pinnately divided, with a main central axis, not fanlike; ultimate segments rhombic, about as long as broad to slightly longer than broad.......................................................................................................................*A. capillus-veneris*
2 Leaves broader than long, dichotomously divided at the summit of the petiole, the two main branches pedately branched, fanlike; ultimate segments oblong, > 2× as long as broad.
3 Ultimate segments at middle of penultimate divisions usually > 3.2× as long as broad, the apices with sharply denticulate, angular lobes, these lobes separated by deep sinuses 0.6-4 mm deep; segment stalks 0.2-0.9 (-1.3) mm long; [disjunct in n. MD and se. PA on serpentine, from a generally more northern and western distribution].........................................................*A. aleuticum*
3 Ultimate segments at middle of penultimate divisions usually < 3× as long as broad, the apices with rounded, crenulate, or crenate-denticulate lobes, these lobes separated by shallow sinuses 0.1-2.0 (-3.7) mm deep; segment stalks 0.5-1.5 (-1.7) mm long .......*A. pedatum*

*Adiantum aleuticum* (Ruprecht) Paris, Aleutian Maidenhair. Serpentine barrens. NL and QC south at scattered sites to se. PA and MD (Paris in FNA 1993b); also in scattered locations in w. North America, from s. AK south to s. CA, AZ, and Mexico (Chihuahua). [= FNA, K; = *A. pedatum* Linnaeus ssp. calderi/Cody – C; = *A. pedatum* Linnaeus var. aleuticum Ruprecht – F]

*Adiantum capillus-veneris* Linnaeus, Venus’-hair Fern, Southern Maidenhair. Moist calcareous substrates, in the Coastal Plain on "marl" (coquina limestone) (NC and SC), on calcareous clay bluffs (GA), and adventive on lime mortar of old buildings and walls (as in Wilmington and Fayetteville, NC); in the Mountains and Interior Low Plateau on limestone or other calcareous sedimentary rocks. June-July. Widespread in e. North America largely southern in distribution, from e. NC, w. VA, MO, CO, UT, and CO south; also disjunct in SD and BC, and in Mexico, the West Indies, tropical and warm temperate portions of Central and South America, Eurasia, and Africa. There is some question whether North American plants are conspecific with those in the Old World (Paris in FNA 1993b). [= RAB, C, F, FNA, G, K, S, W]

*

*Adiantum pedatum* Linnaeus, Northern Maidenhair. Moist forests and cliffs, especially over calcareous or mafic rocks, sometimes in seasonal seepage. June-August. NS and NB west to ON and MN, south to GA, AL, MS, LA, and OK. [= RAB, FNA, G, K, S, W, WV; = *A. pedatum* ssp. pedatum – C; = *A. pedatum* var. pedatum – F]

10. **Vittaria** J.E. Smith 1793 (Shoestring Fern)

A genus of about 50 species, tropics and subtropics. References: Farrar in FNA (1993b); Farrar & Mickel (1991); Kramer in Kramer & Green (1990). Key adapted from Farrar in FNA.

1 Sporophytes present, the leaves linear, 10-60 cm long and 1-3 mm wide ..............................................................................................................*V. lineata*
1 Gametophytes only present.
2 Gemmae with 2-12 body cells (with at least some present with 2-3 body cells); end cells of gemmae often swollen and larger than the medial cells; rhizoid primordia often absent on 1 or both end cells, seldom present on medial cells; sporophytes apparently not produced...
2 Gemmae with 4-16 body cells; end cells of gemmae equal or smaller than the medial cells; rhizoid primordia regularly present on the end cells, as well as on some medial cells; sporophytes frequently produced (and small sporophytes often present in largely gametophytic colonies) .......................................................................................................................*V. appalachiana*

**Vittaria appalachiana** Farrar & Mickel, Appalachian Shoestring Fern, "Appalachian Gametophyte." Shaded grotoes, undersides of overhanging rock outcrops, especially in moist gorges or on spray cliffs in the vicinity of waterfalls, usually on felsic metamorphic rocks, such as mica schist, mica gneiss, granite gneiss, or metaquartzite, or on sandstone. This reduced species consists of "a branched, ribbon-like thallus one cell in thickness, usually differentiated into basal and upright branches; basal branches attached to the substrate by numerous short, brown rhizoids emanating from marginal and interior cells; upright branches terminating in the production of gemmae" (Farrar & Mickel 1991). The species is often overlooked or mistaken for a
liverwort; it is most often collected by bryologists and hepaticologists, and was first noted in 1824 by von Schweinitz, who considered it a \textit{Jungermannia}. Southern and Central Appalachians, south of the glacial boundary, from se. PA, sw. NY, and ne. OH south through c. TN and c. KY to n. GA, n. AL, and n. MS (Menapace, Davison, & Webb 1998). Although this species has been known for some time (often referred to as the "Appalachian Gametophyte"), it was only recently named formally (Farrar & Mickel 1991). A range of evidence (morphologic, electrophoretic, and developmental) indicates that it is not the gametophyte of any known \textit{Vittaria} sporophyte; instead, it is a distinct taxon, reproducing vegetatively by gemmae, having lost the capability of producing sporophytes. For additional information, see Farrar (1974), Farrar (1978), Gastony (1977), Farrar, Parks, & McAlpin (1983), and Pittillo et al. (1975). [\text{= FNA; = "a branching, ribbon-like gametophyte, with diffuse rhizoids and linear-shaped gemmae only one cell wide, of the genus \textit{Vittaria}" – RAB; = "thalloid, irregularly shaped gametophytes of a species of \textit{Vittaria}" – C; < \textit{V. lineata} (Linnaeus) Smith – WV}]

\textit{Vittaria lineata} (Linnaeus) Smith, Shoestring Fern. Epiphyte on the bark of \textit{Sabal palmetto}, but the northernmost native site (in Lincoln County, GA) was on rock. Se. GA and formerly ec. GA south to s. FL; c. Mexico south through Central America to n. South America; West Indies; introduced in e. SC (Beaufort and Jasper counties) on landscaping plants. Sporophytic plants have pendant linear leaves, 1-3 mm wide and up to 60 cm long, hence the common name. [\text{= FNA, K, S}]

\textit{Cystopteris} Bernhardi 1806 (Bladder Fern, Brittle Fern)

A genus of about 20 species, sub-cosmopolitan in distribution, primarily of temperate regions but also in montane to alpine settings in tropical regions. References: Hufler, Moran, & Windham in FNA (1993b); Hufler, Windham, & Ranker (1990); Kramer et al. in Kramer & Green (1990).

\textbf{Identification notes:} See \textit{Woodia} for suggestions on distinguishing between \textit{Cystopteris} and \textit{Woodia}, similar ferns often confused. Hybrids frequently occur where two or more species of \textit{Cystopteris} grow in proximity. The following hybrids may be anticipated in our area: \textit{Cystopteris bulbifera \times tennesseensis}, \textit{Cystopteris bulbifera \times tenuis} [\textit{= C. \timesillinoensis} R.C. Moran], \textit{Cystopteris fragilis \times tenuis}, \textit{Cystopteris protrusa \times tennesseensis}, \textit{Cystopteris protrusa \times tenuis} [\textit{= C. \timeswagneri} R.C. Moran].

1 Lowest pair of pinnae the longest, thus the leaf widest at the base; bulblets often present on the rachis; indusia, rachises, and veins with stalked glands (these sometimes sparse in \textit{C. tennesseensis}).

2 Leaf blade 10-55 cm long, usually 2-3× as long as the reddish to tan petiole; bulblets usually present, smooth, green, 2-3 mm in diameter, usually on the rachis and the midrib; spores 20-27 μ long.........................................................\textit{C. bulbifera}

2 Leaf blade 6-25 cm long, usually about 1× as long as the dark brown petiole; bulblets present or absent, deformed and scaly, dark, < 1.5 mm in diameter, on the rachis only; spores 25-35 μ long.........................................................\textit{C. tennesseensis}

3 Lowest pair of pinnae shorter than the second or third pair, thus the leaf widest above the base; bulblets never present; indusia, rachises, and veins eglandular.

3 Leaf blade (2.5-) 3-4× as long as wide; pinnae usually perpendicular to the rachis (or even reflexed); margins of pinnae serrulate, the teeth sharp; basal pinnules sessile, truncate to rounded at the base; indusium up to 1 mm long, lanceolate; pinnae usually perpendicular to rachis; [on rock outcrops] ..................................................................................................................................................................................\textit{C. fragilis}

3 Leaf blade 2-2.5 (-3)× as long as wide; pinnae usually at an acute angle to the rachis, curving toward the blade apex; margins of pinnae crenulate, the teeth sharp; basal pinnules short-stalked or sessile, rounded to cuneate at the base; indusium about 0.5 mm long, ovate to round; pinnae usually at an acute angle to the rachis; [on rock outcrops or forest floor].

4 Rhizome long-creeping, the apex extending only 1-5 mm beyond the last of the widely-spaced petioles (especially as seen from late spring to summer); rhizome covered with scales and tan to golden hairs; spores 20-32 μ long; leaves membranaceous in texture; basal pinnules conspicuously stalked; petiole green to tan, darkened at base; lowermost pinnules of each pinna deeply cut; [typically on forest floor, less commonly on rocks]........................................................................................................................................................ \textit{C. protrusa}

4 Rhizome short-creeping, the apex extending only 1-5 mm beyond the last of the closely-spaced petioles; rhizome covered with scales, lacking hairs; spores 32-42 μ long; leaves thicker in texture; basal pinnules slightly stalked or merely cuneate to the base; petiole dark brown; lowermost pinnules of each pinna slightly lobed; [often on rocks, less commonly on forest floor].................................\textit{C. tenuis}

\textit{Cystopteris bulbifera} (Linnaeus) Bernhardi, Bulblet Fern, Bulblet Bladder Fern. Moist outcrops and talus of calcareous rocks, rarely up to 1500 m elevation. May-August. NL (Newfoundland) west to MN, south to NC, nw. SC (Oconee County), nw. GA, AL, and AR; also disjunct in UT, AZ, NM, and TX. This species is a diploid involved in the reticulate evolution of \textit{Cystopteris} in e. North America. It is one parent of \textit{C. tennesseensis}. Its genome can be symbolized BB. [\text{= RAB, C, F, FNA, G, K, S, W, WV}]
**Cystopteris fragilis** (Linnaeus) Bernhardii, Fragile Fern, Brittle Fern. Cliffs, ascending in our area to 1650 m. June-September. Circumboreal, in North America ranging from NL (Newfoundland) west to AK, south to MA, CT, NJ, montane NC, VA, KY, MO, OK, TX, NM, and AZ. This species is a fertile allotetraploid, presumed to be derived from hybridization between C. reevesiana Lellinger and an extinct or currently undiscovered second parent (*C. hemifragilis*); its genome can be symbolized HHRR (Paler & Barrington 1995). *C. fragilis* appears to be a complex needing further study; additional entities may be found to warrant taxonomic recognition (see FNA for discussion). [= FNA, K, W; = C. fragilis var. fragilis – C, F, G, S, < C. fragilis (also see C. tenuis) – WV]

**Cystopteris prostrusa** (Weatherby) Blasdell, Lowland Bladder Fern. Rich woods or on moss- and soil-covered talus in boulderfields, occasionally on ledges of rock outcrops. April–June. NY and ON west to MN, south to GA, Panhandle FL (Washington County) (Wunderlin & Hansen 2006), AL, MS, LA, AR, e. KS, and IA. This species is a diploid involved in the reticulate evolution of *Cystopteris* in e. North America. It is one parent of *C. tennesseensis* and *C. tenuis*. Its genome can be symbolized PP. [= RAB, C, FNA, K, W; = C. fragilis var. prostrusa Weatherby – F, G, S]

**Cystopteris tennesseensis** Shaver, Tennessee Bladder Fern. Moist to dry outcrops of calcareous rocks, including coquina limestone ("marl") in the outer Coastal Plain. April–June. PA, KY, IL, WI, and IA south to NC, nw. GA, n. AL, AR, and OK. This species is a fertile allotetraploid derived from hybridization between *C. bulbifera* and *C. prostrusa*. Its genome can be symbolized BBPP. Haufler, Windham, & Ranker (1990) consider this a "successfully fledged and vigorous young species," adapted to a hybrid niche not successfully utilized by either parent. [= RAB, C, FNA, K, W; = C. *tennesseensis – WV]

**Cystopteris tenuis** (Michaux) Desvaux, Mackay's Bladder Fern. Moist outcrops and cliffs of metamorphic and sedimentary rocks, occasionally in moist soils near rock outcrops or moist soil banks. May–August. NL (Newfoundland) west to MN and NE, south to VA, IL, and MO, and in the mountains to NC, TN, and n. GA. This species is a fertile allotetraploid derived from hybridization between *C. prostrusa* and an extinct or currently undiscovered second parent (*C. hemifragilis*); its genome can be symbolized HHPP (Paler & Barrington 1995). [= FNA, K, W; = C. fragilis var. mackayi Lawson – C, F, G; < C. fragilis – WV]

![Cystopteris bulbifera](image1)

![Cystopteris prostrusa](image3)
![Cystopteris tennesseensis](image4)
![Cystopteris tenuis](image5)

**Gymnocarpium** Newman 1851 (Oak Fern)

A genus of about 8 species, north temperate in distribution. References: Pryer in FNA (1993b); Pryer & Haufler (1993)=Z; Pryer (1992); Kramer et al. in Kramer & Green (1990). Key based on FNA.

1 Sessile basal basiscopic pinnule of the proximal pinnae with basal basiscopic pinnulet shorter than the adjacent pinnule; pinnules of second pair sessile, with basal pinnules shorter than the adjacent pinnule (or second basal pinnae rarely stalked); spores 27–31 µm in diameter.................. G. dryopteris

1 Sessile basal basiscopic pinnule of the proximal pinnae with basal basiscopic pinnulet more or less equal in length to the adjacent pinnule; pinnules of second pair usually sessile, with basal pinnules more or less equal in length to the adjacent pinnule; spores 34–39 µm in diameter.................. G. appalachianum

**Gymnocarpium appalachianum** Pryer & Haufler, Appalachian Oak Fern. Moist, rocky forests, at medium to high elevations. June-September. Endemic to the c. and s. Appalachians (known from ne. WV, nw. VA, sc. PA, and disjunct in nw. NC and OH). Electrophoretic and morphologic analyses show that it is one of the diploid parents of the widespread allotetraploid *G. dryopteris*. In NC, it is limited to a single site, below the north-facing summit cliffs on Bluff Mountain, Ashe County, where seepage results in extensive ice formations which frequently persist until June. Karyotype = AA. [= FNA, K, Z; < G. dryopteris (Linnaeus) Newman – C, G, W, WV; < Dryopteris disjuncta (Ledebour) C.V. Morton – F]

Triploids are known from the mountains of VA. Their identity is uncertain; based on geography they are presumably *G. appalachianum × dryopteris* (AAJ), but could be *G. brittonii* (Sarvela) Pryer & Haufler [= G. disjunctum × dryopteris = AJJ]. Triploids can be distinguished by the presence of malformed spores, irregular in shape and size, often intermixed with large round spores (vs. all spores reniform and relatively uniform in size and shape). [*G. brittonii* (Sarvela) Pryer & Haufler – K]
A family of at least two genera and more than 720 species, of nearly cosmopolitan distribution. Murakami et al. (1999) conducted a molecular phylogenetic analysis of the Aspleniaceae, which confirmed that *Camptosorus* should be included in *Asplenium*, but suggested that *Phyllitis* is better separated from *Asplenium*. A later and more comprehensive study shows *Phyllitis* and *Camptosorus* to be deeply embedded in *Asplenium* (Schneider et al. 2004), a conclusion followed here. References: Kramer & Viane in Kramer & Green (1990); Schneider et al. (2004).

*Aspleniaceae* Linnaeus 1753 (Spleenwort)

*Asplenium* is a large, nearly cosmopolitan genus of more than 720 species, with centers of diversity in the Appalachians, Central America mountains, Andes, and Himalayas. References: Wagner, Moran, & Werth in FNA (1993b); Moran (1982); Taylor, Mohlenbrock, & Burton (1976); Murakami et al. (1999); Kramer & Viane in Kramer & Green (1990).

**Identification notes:** Several of the more frequently encountered sterile hybrids are included in the key and treated fully below. Others may be recognized by intermediate morphology and usual co-occurrence with both parents.

1 Leaves simple, unlobed (sometimes with a few, irregular forkings); veins free or anastomosing-areolate.
2 Leaf blades 0-3 mm wide, linear, forked or with a few toothlike projections ........................................... *A. septentrionale*
2 Leaf blades 10-40 mm wide, lanceolate, lance-attenuate, or oblong.
3 Leaf apex acute or obtuse, not attenuate, not producing plantlets at the tip; veins free.
4 Longer indusia of each frond avg. 1.2 cm long; leaves avg. 2.3 (-3.4) dm long; [native in TN, AL, and elsewhere, in natural limestone sinkholes] ............................................................... *A. sopolendrium var. americanum*
4 Longer indusia of each frond avg. 1.7 cm long; leaves avg. 3 (-6) dm long; [rarely introduced in North America, typically in artificial settings, such as wells] ............................................................... *A. tutwilerae*
5 Rachis dull green throughout its length, or at least toward the tip; leaves pinnatifid to tripinnate, the outline of the leaf blade narrowly to broadly triangular, widest at the base (or slightly above the base in *A. abscissum*).
6 Petiole dark throughout its length (from base to first leaflet).
7 Leaves bipinnate at the base, pinnate-pinnatifid above; spores normal ........................................... *A. bradleyi*
7 Leaves pinnate at the base, pinnatifid above; spores abortive (or normal in *A. abscissum*).
8 Spores abortive ........................................................................................................ *A. xchenoides*
8 Spores normal; [endemic as far as known to Hale County, AL] ............................................................... *A. tutwilerae*
6 Petiole partially or entirely green (darkened or not at its base).
9 Leaves pinnatifid or pinnate through most or all of their lengths.
10 Leaves pinnatifid, sometimes fully pinnate at the base; spores normal ........................................... *A. pinnatifidum*
10 Leaves pinnate (sometimes pinnate-pinnatifid at the base in *A. xtrudellii*); spores abortive (or normal in *A. abscissum*).
11 Spores normal ................................................................................................................ *A. abscissum*
11 Spores abortive ................................................................................................................ *A. xtrudellii*
9 Leaves bipinnate to tripinnate.
12 Petiole darkened toward the base; pinnules toothed, lacerate, pinnatifid, or pinnate; leaves bipinnate to tripinnate, the leaf blades lanceolate-ovate to lanceolate-oblong; ultimate leaf segments sessile or nearly so; [of acidic rocks] ........................................... *A. montanum*
12 Petiole entirely green; pinnules toothed; leaves bipinnate, the leaf blades ovate-triangular; ultimate leaf segments mostly stalked; [of calcareous rocks] ............................................................... *A. ruta-muraria var. cryptolepis*
5 Rachis shiny black or dark brown throughout its length; leaves pinnate, the outline of the leaf blade linear, lanceolate, or oblong, with more-or-less parallel sides for much of its length.
13 Pinnae orbicular to obovate-oblong, 1-2× as long as wide, the base more-or-less symmetrical (if auriculate, only slightly so and on the side of the pinna toward the base of the leaf); old leaf rachises often with persistent projections left from the disarticulation of the pinnate.
14 Main pinnae deeply lobed into 3-many segments (the leaves therefore pinnate-pinnatifid); [of FL] .................................... *A. verecundum*
14 Main pinnae merely toothed (the leaves therefore pinnate); [widispersed in our area].
15 Sori 4-6 (-9) per pinna, up to 2 mm long; rhizome scales up to 3 mm long; petiole relatively thin, shiny, coppery or bronze; pinnae mostly alternate, suborbicular, spaced more distantly, thinner in texture, set at a fairly oblique angle to the rachis, often slightly auriculate on the side of the pinna toward the leaf base; spores mostly 29-36 μ long; stomatic guard cells mostly 38-43 μ long; [mostly of noncalcareaeous rocks] ............................................................... *A. trichomanes ssp. trichomanes*
15 Sori 4-9 (-12) per pinna, up to 3 mm long; rhizome scales up to 5 mm long; petiole relatively thicker, blackish-brown; pinnae mostly opposite, oblong, spaced more closely, thicker in texture, set at a nearly right angle to the rachis, rarely at all auriculate; spores mostly 34-43 μ long; stomatic guard cells mostly 41-49 μ long; [of calcareaeous rocks] ...............................................................
Asplenium abscissum Wildenow, Cutleaf Spleenwort. Limestone sinkhole. Mexico, Central America, and n. South America; West Indies; nc. and c. FL peninsula; s. FL; n. AL. This species is a diploid, with chromosome complement AA. Found in Jackson County, AL in 2009 (Barger, pers. comm. 2009). [= FNA, K, WH] [add synonymy: S]

Asplenium bradleyi D.C. Eaton, Bradley’s Spleenwort. Dry outcrops of felsic sedimentary or metasedimentary rocks, such as sandstone, quartzite, or metarhyolite, at low to moderate elevations. April-October. VT, NJ, c. PA, OH, s. IL, and MO south to c. NC, e. GA, AL, TN, and AR. Its chromosome complement can be symbolized MMPP. The sterile hybrid has also been found in NC; its chromosome complement is MP. [= RAB, C, F, FNA, G, K, S, W, WV; = A. ×bradleyi]

Asplenium ×ebenoides R.R. Scott (pro species) [A. platyneuron × rhizophyllum], Scott’s Spleenwort. Moist outcrops of calcareous sedimentary rocks, such as limestone, dolostone, and on coquina limestone (shell marl), at low elevations. May-October. VT, NJ, c. PA, OH, s. IL, and MO south to e. VA, w. NC, nw. GA, c. AL, TN, and AR. A. ×ebenoides is a sterile hybrid (chromosome complement symbolized PR). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as A. tutwilerae. Populations of this taxon, especially if consisting of many individuals, should be checked for fertile spores. [= WV; = Asplenium ×ebenoides (R.R. Scott) Wherry – F; = Asplenium ebenoides (R.R. Scott) Wherry – G; < Asplenium ×ebenoides – K; < Asplenium ebenoides R.R. Scott – FNA, S]

Asplenium heterochroum Kunze, Bicolored Spleenwort. Fairly moist outcrops of calcareous sedimentary rocks, such as coquina limestone ("marl"). Se. and nc. GA (Jones & Coile 1988) south to n. FL; West Indies; s. Mexico (Chiapas, Veracruz), Belize. Its chromosome complement can be symbolized HHHH. [= FNA, K, WH; < A. heterochroum Kunze – S]

Asplenium heteroresiliens W.H. Wagner, Marl Spleenwort, Carolina Spleenwort, Wagner’s Spleenwort, Morzent’s Spleenwort. Fairly moist outcrops of calcareous sedimentary rocks, such as coquina limestone ("marl"), along small blackwater streams or larger rivers, at low elevations, and rarely also on old ruins made of tabby (a cement made from lime, sand, and oyster shells). April-October. Rare and scattered from se. NC to se. GA, sw. GA, and n. FL, on the Coastal Plain. This species is an apogamous (producing viable spores asexually) allopolyploid derived from hybridization of the sexual tetraploid H. heterochroum Kunze (of Florida and the West Indies) and the apogamous triploid A. resiliens. Its chromosome complement can be symbolized EEEHHH. [= RAB; = A. ×heteroresiliens – FNA, K, WH; < A. heterochroum Kunze – S]

Asplenium monanthus Linnaeus, Single-sorus Spleenwort. Moist calcareous situations, in the mountains in moist grottos of calcareous to semi-calcareous metamorphic rocks (such as mylonite or marble) near waterfalls in humid escarpment gorges with high rainfall, on limestone talus in collapsed sinkhole mouth, or on moist Coastal Plain limestone outcrops. April-October. Scattered in highly humid (montane or maritime) parts of the tropics, subtropics, and warm temperate areas, known from se. and sw. North America, the West Indies (Hispaniola and Jamaica), n. South America, Central America, Mexico, South Africa, Hawaii, and the Azores, Madeira Islands, Madagascar, and the Philippines. In the continental United States, it is known from widely scattered sites with humid and calcareous microhabitats: humid escarpment gorges in Transylvania County, NC and Oconee County, SC; moist limestone outcrops in n. peninsular and Panhandle FL (Nelson 2000); limestone talus in the collapsed mouth of a sinkhole in Jackson County, AL; and the Huachuca Mountains, Cochise County, AZ. Given the variability of A. monanthus throughout is widespread and scattered distribution, and its complex of related and closely similar species, our material deserves additional study to verify its true identity. [= RAB, FNA, K, W, WH]
m), but in the Piedmont to as low as 150 m. May-October. Primarily Appalachian: s. VT, MA, NY, OH, and KY south to c. NC, n. GA and AL; absent from the Ozarkian highlands. *A. montanum* is one of the diploid progenitors of the reticulately evolved Appalachian *Asplenium* complex; its chromosome complement is symbolized MM. It is one parent of *A. bradleyi*, *A. pinnatifidum*, and *A. ×rudelli* (and of other sterile hybrids). [= RAB, C, F, FNA, G, K, S, W, WV]

*Asplenium pinnatifidum* Nuttall, Lobed Spleenwort. Fairly moist to very dry outcrops of felsic sedimentary or (mostly low-grade) metamorphic rocks, such as sandstone, phyllite, and schist, at low to moderate elevations. May-October. NJ, se. PA, wc. PA, s. OH, IN, IL, and MO south to w. NC, c. GA (Jones & Coile 1988), AL, n. MS, AR, and e. OK. This species is a fertile allotetraploid derived from hybridization of *A. montanum* and *A. rhizophyllum*; its chromosome complement is symbolized MMRR. [= RAB, C, F, FNA, S, W, WV; = *A. pinnatifidum* var. *pinnatifidum* – G; = *A. pinnatifidum* – K]

*Asplenium platyneuron* (Linnaeus) Britton, Sterns, & Poggenburg, Ebony Spleenwort. Moist to dry soils of forests, woodlands, old fields; also on outcrops, especially of calcareous rocks and in mesic crevices, at low to moderate elevations; common. April-October. QC, ON, se. MN, IA, and se. CO south to FL, TX, NM, and AZ (and varieties or relatives reported from Central and South America). This species is one of the diploid progenitors involved in the reticulately evolved Appalachian *Asplenium* complex. It is one parent of *A. bradleyi* and *A. ×ebenoides* (as well as other sterile hybrids). *A. platyneuron* in general, and var. *platyneuron* specifically, is by far the most common of our *Asplenium* species, and the only one found characteristically away from rock. *A. platyneuron* var. *incisum* does not seem to warrant taxonomic recognition. Strikingly large plants of the outer Atlantic Coastal Plain and Gulf Coastal Plain have been named var. *bacculum-rubrum* (Featherman) Fernald; they are probably not worthy of taxonomic recognition. The leaves are often coarsely serrate-incised to pinnatifid and the larger leaves to (30-) 40-70 (-100) cm tall, with 25-50 pairs of pinnae. (= RAB, C, F, G, K; < *A. platyneuron* var. *incisum* – F, G, K; > *A. platyneuron* var. *bacculum-rubrum* (Featherman) Fernald – F, G, K; > *A. platyneuron* var. *incisum* (Howe ex Peck) B.L. Robinson – F]

*Asplenium resiliens* Kunze, Blackstem Spleenwort. Moist to dry outcrops of calcareous sedimentary or metamorphic rocks, such as limestone, dolostone, coquina, or marble, sometimes at low to moderate elevations except on outcrops of calcareous materials in otherwise acidic rocks, rarely on mortar or concrete, mostly at low to moderate elevations, but remarkably on Grandfather Mountain at over 1800 m. April-October. Sc. PA, KY, s. IL, MO, se. KS, OK, TX, CO, and s. NV south to FL, TX, AZ, and Mexico; West Indies; Central America and South America. This species is a triploid (EEE), unable to produce viable spores by sexual means, but producing spores apogamously. It is a parent species of the rare *A. heteroresiliens*. [= RAB, C, F, FNA, G, K, S, W, WH, WV]

*Asplenium rhizophyllum* Linnaeus, Walking Fern. Moist outcrops of calcareous sedimentary, calcareous metamorphic, or mafic metamorphic rocks, such as limestone, dolostone, calcareous siltstone, amphibolite, mostly at low to moderate elevations, rarely to 1500 m or higher. May-October. S. QC, ON and se. MN south to c. GA, AL, MS, AR, OK, and IA. This species, sometimes placed in the genus *Camptosorus* because of its strikingly different morphology from (most) other *Asplenium*, is one of the diploid progenitors of the reticulately evolved Appalachian *Asplenium* complex. It is a parent of *A. pinnatifidum* and *A. ×ebenoides* (as well as other sterile hybrids), both of which have inherited a limited ability to produce plantlets at the attenuate leaf-tip. It is closely related to *Asplenium sibiricum* of c. Asia. [= RAB, C, FNA, K, W; = *Camptosorus rhizophyllus* (Linnaeus) Link – F, G, S, WV]

*Asplenium ruta-muraria* Linnaeus var. *cryptolepis* (Fernald) Wherry, American Wall-rue. Moist to dry outcrops of calcareous sedimentary or metamorphic rocks, such as limestone, dolostone, or marble, at low to moderate elevations. May-October. *A. ruta-muraria* is a circumboreal species of Europe, Asia, and North America; in North America it ranges as var. *cryptolepis* from VT, s. ON and n. MI south to n. NJ, w. NC, nw. GA (Jones & Coile 1988), n. AL, TN, and AR. Var. *ohionis* is very likely only a form. The relationship of North American *A. ruta-muraria* (here distinguished as var. *cryptolepis*), a tetraploid, to the diploid and tetraploid subspecies of *A. ruta-muraria* present in Europe and e. Asia is uncertain. Given the prevalence of allopolyploidy in *Asplenium* and slight morphologic differences between American and European material, I prefer not to assume its identity to the European plants. In Europe *A. ruta-muraria* is an abundant plant of masonry, such as the defensive walls of towns and cities; it is very rarely seen on walls in North America, presumably because they are not old enough. [= WV; < *A. ruta-muraria* – RAB, C, FNA, W; > *A. cryptolepis* Fernald var. *cryptolepis* – F, S; > *A. cryptolepis* Fernald var. *ohionis* Fernald – F, S; > *A. ruta-muraria* var. *ohionis* (Fernald) Wherry – G; > *A. ruta-muraria* var. *cryptolepis* – G, K; > *A. ruta-muraria* var. *lanceolatum* Christ – K]

*Asplenium scolopendrium* Linnaeus var. *americanaum* (Fernald) Kartesz & Gandhi, American Hart’s-tongue Fern. Humid sinkholes. E. TN and n. AL, and in other habitats farther north in c. NY, n. MI, and ON; also in the West Indies (Haiti) and s. Mexico (Chiapas, Nuevo León, Oaxaca). It is also reported as naturalized in MD by Reed (1953). [= FNA, K; = *Phyllitis scolopendrium* (Linnaeus) Newman var. *americanaum* Fernald – C, F, G; < *Phyllitis scolopendrium* – S]

Asplenium septentrionale (Linnaeus) Hoffmann, Forked Spleenwort. Acidic rocks. Western North America south into nw. Mexico (Baja California), Asia, Europe; disjunct in WV (Hardy and Monroe counties). This very inconspicuous species is likely to be found at additional locations. Its chromosome formula is SSSS. [= FNA, K, S, W, Z; = Asplenium pinnatifidum var. minitriquetrum (Hayne) Schwantes – S]

Asplenium trichomanes Linnaeus. July-September. QC, ON, and MN south to GA and LA (much more common in sedimentary rock areas of the Appalachians than in the primarily acid-soil Blue Ridge and Piedmont). Ssp. trichomanes is a diploid of uncertain origin, presumably autotetraploid, but perhaps the result of the hybridization of two ecologically differentiated diploid races of A. trichomanes. [= FNA, K, W; < A. trichomanes – C, F, G, S]

Asplenium trichomanes Linnaeus ssp. trichomanes, Maidenhair Spleenwort. Moist outcrops of slightly to strongly calcareous sedimentary or metamorphic rocks and moderately to strongly mafic metamorphic and igneous rocks, such as limestone, dolostone, mafic and intermediate gneisses and schists, amphibolite, most typically in strong shade, as under overhangs. May-October. A. trichomanes as a whole is a complex species, with diploid, tetraploid, and hexaploid elements, occurring in North America, Europe, Australia, New Zealand, and Asia. Ssp. trichomanes is known to occur in Europe and North America (at least); in North America, it ranges from NL (Newfoundland) to AK, south to NC, c. GA (Jones & Coile 1988), c. AL, AR, OK, w. TX, Chihuahua, se. AZ, and w. OR. Ssp. trichomanes is a diploid, probably involved in the origin of ssp. quadrivalens. [= FNA, K, W; < A. trichomanes – RAB, C, F, G, S, WH, WV]

Asplenium ×trudellii Wherry (pro species) [montanum × pinnatifidum], Trudell’s Spleenwort. Moist outcrops of felsic sedimentary or metamorphic rocks, such as sandstone, phyllite, schist, at low elevations. May-October. This taxon is a sterile triploid hybrid (MMR) of A. montanum and A. pinnatifidum. It is considerably more common than most other sterile Asplenium hybrids, sometimes occurring without one or either parents. There are some reports that it can sometimes produce fertile spores. [= F, FNA, K, WH; = Asplenium pinnatifidum Nuttall var. trudellii (Wherry) Chute – G; = Asplenium trudellii Wherry – S; = ×Asplenosorus trudellii (Wherry) Mickel]

Asplenium tutwilerae B.R. Keener & L.J. Davenport, Tutwiler’s Spleenwort. Crevices of calcareous conglomerate. So far as is known, A. tutwilerae, the fertile allotetraploid of A. ×ebenoides, is limited to a single population in Hale County, AL. Its chromosome formula is PPRR. See Keener & Davenport (2007). [= A. ×ebenoides – K; < Asplenium ebenoides R.R. Scott – FNA, S]

F34. DIPLAZIOPSISIDACEAE X.C. Zhang & Christenhusz 2011 (Glade Fern Family) [in POLYPODIALES]

A family of 3 genera. References:

Homalosorus pycnocarpos (Sprengel) Pichi-Sermolli, Glade Fern. Very nutrient-rich, loamy or seepy forests, over calcareous sedimentary (such as limestone or dolostone) or mafic metamorphic or igneous rocks (such as greenstone or amphibolite). July-September. QC, ON, and MN south to GA and LA (much more common in sedimentary rock areas of the Appalachians than in the primarily acid-soil Blue Ridge and Piedmont). [= S, W, Z; = Diplazium pycnocarpos (Sprengel) M. Broun – FNA, K; = Athyrium pycnocarpon Sprengel – RAB, C, F, G, WH; = Diplaziosis pycnocarpa (Sprengel) M.G. Price]

F35. THELYPTERIDACEAE Pichi Sermolli 1970 (Marsh Fern Family) [in POLYPODIALES]

A family of 6-30 genera (generic circumscription especially controversial and problematic) and about 900 species. References: Smith in FNA (1993b); Smith & Cranfill (2002); Lellinger (1985); Mickel (1979); Smith in Kramer & Green (1990).

1 Leaf blades 7-25 (-30) cm long, triangular, < 2× as long as wide; rachis with adnate wings between the pinnae; sori without indusia; midribs of pinnae lacking an adaxial groove.................................................................................................................... Phlegopteris

1 Leaf blades (15-) 20-100 cm long, lanceolate, oblolly-lanceolate, or triangular, > 2× as long as wide; rachis without adnate wings between the pinnae; sori with reniform indusia; midribs of pinnae with an adaxial groove (adaxial groove lacking in Macrothelypteris).
THELYPTERIDACEAE (F28) 49

2 Midribs of the pinnae lacking an adaxial groove; leaf bipinnate to tripinnate .......................................................... Macrothelypteris
2 Midribs of the pinnae with an adaxial groove; leaf pinnate to pinnate-pinnatifid .......................................................... Thelypteris

Macrothelypteris (H. Itô) Ching 1963 (Maiden Fern)

* Macrothelypteris torresiana (Gauchaud-Beaupré) Ching, Mariana Maiden Fern. Disturbed areas, and increasingly invasive in natural habitats (especially in the southern parts of our area); native of the Asian and African tropics. Leonard (1972) discusses the history of this species in the southeastern United States. [= FNA, K, WH; = Dryopteris setigera Blume – S, misapplied; = Thelypteris torresiana (Gauchaud-Beaupré) Alston]

Phegopteris (C. Presl) Fée 1852 (Beech Fern)
1 Rachis wings absent between the two basal pinna pairs; rachis bearing on its lower surface numerous tan to brown, lanceolate scales (these mostly 6-12 cells wide at the base) and acicular hairs 0.3-1.0 mm long.................................................................P. connectilis
1 Rachis wings present between the two basal pinna pairs; rachis bearing on its lower surface relatively few, white to pale tan, narrowly lanceolate scales (these mostly 3-5 cells wide at the base) and hairs 0.1-0.25 mm long.................................................................P. hexagonoptera

Phegopteris connectilis (Michaux) Watt, Northern Beech Fern. Moist cliffs where wet by spray from waterfalls (at medium elevations), also on high elevation cliffs wet by seepage and in spruce-fir forests, northwards in cool ravines and on swamp borders. April-August. A circumboreal species, at its southern limit in North America in MD, WV, OH, IL, IA, MT, and OR; disjunct southwards in w. NC and e. TN, and in CO. Most of the occurrences in NC are at waterfalls in the escarpment gorges of Transylvania, Macon, and Jackson counties, near Highlands. The species is a triploid, reproducing apogamously. [= FNA, K, WV; = Thelypteris phegopteris (Linnaeus) Slosson – RAB, C, G, W; = Dryopteris phegopteris (Linnaeus) C. Christensen – F; = Phegopteris phegopteris (Linnaeus) Keyserling – S]

Phegopteris hexagonoptera (Michaux) Fée, Broad Beech Fern. Mesic to submesic forests. April-August. Widespread in eastern North America, from QC west to ON, WI, and MN, south to Panhandle FL and e. TX. [= FNA, K, S, WH, WV; = Thelypteris hexagonoptera (Michaux) Weatherby – RAB, C, G, W; = Dryopteris hexagonoptera (Michaux) C. Christensen – F]

Thelypteris Schmidel 1763 (Maiden Fern, Shield Fern, Marsh Fern)
A genus of about 875 species, cosmopolitan, perhaps warranting separation into various segregates. Thelypteris is a large and rather heterogeneous group, even with the removal of Phegopteris and Macrothelypteris. Our species fall into several subgenera, sometimes treated as genera: subgenus or genus Thelypteris (Th. palustris var. pubescens), subgenus or genus Parathelypteris (Th. noveboracensis, Th. similata), subgenus Cyclosorus or genus Christella (Th. dentata, Th. hispidula var. versicolor, Th. interrupta, Th. kunthii, Th. ovata var. ovata), and subgenus or genus Stegnogramma (Th. burki). The appropriate names, should the additional segregate genera be adopted, are listed in synonymy. References: Smith (1981); Smith in Kramer & Green (1990). [also see Macrothelypteris and Phegopteris]
1 Sori elongate; sporangia with hairs 0.1-0.2 mm long; [endemic to nc. AL]; [subgenus or genus Stegnogramma] .......................................................... T. burki
1 Sori round or slightly longer than wide; sporangia glabrous; [collectively widespread]
2 Leaves 5-15 (-20) cm wide; rhizome scales 1-4 mm long, lanceolate to ovate, glabrous, pale brown to golden brown, flexible and very thin.
3 Leaf blade broadest near the middle, gradually reduced to the base, the petiole < 1/3 the length of the blade; [of upland and wetland habitats]; [subgenus or genus Parathelypteris] .......................................................................................................................... T. noveboracensis
3 Leaf blade broadest near the base, the pinnate stopping abruptly, the petiole 2/3 to fully as long as the blade; [of wetland habitats]
4 Undersurface of blades without glands; lateral veins of sterile lobes forked once between the pinnule midvein and the margin; lower surface of costae with tan, ovate scales; lobes of fertile leaves revolute; indusia ciliate (rarely glabrous); [subgenus or genus Thelypteris] .......................................................................................................................... T. palustris var. pubescens
4 Undersurface of blades with minute, sessile, globular, golden to reddish glands; lateral veins of sterile lobes simple, not forked between the pinnule midvein and the margin; lower surface of costae lacking scales; lobes of fertile leaves plane to slightly revolute; indusia with minute glands along the margins; [subgenus or genus Parathelypteris] .......................................................................................................................... T. similata
2 Leaves (6-) 10-35 cm wide; rhizome scales 2-6 mm long, linear-lanceolate, usually minutely pilose, yellowish-brown to brown, stiff and rather thick; [subgenus Cyclosorus or genus Christella]
5 Basal veins from adjacent lobes of the pinna uniting below the sinus (between the sinus and the costa), with a united vein continuing to the sinus.
Lower surface of costae with tan scales; upper surface of costae glabrous or sparsely pubescent with hairs < 0.2 mm long; rhizomes long-creeping ..................................................  T. interrupta

Lower surface of costae lacking scales; upper surface of costae moderately to densely hairy with hairs > 0.3 mm long; rhizomes short-creeping.

 Rachises and petioles usually purplish; costae densely short-hairy on the lower surface, the hairs 0.1–0.2 mm long (about half as long as the costa width); widest point of the leaf usually 3–5 pairs of pinnae up from the base ...........................................  T. dentata

 Rachises and petioles usually tan; costae sparsely hairy on the lower surface, the hairs variable in length, most of them > 0.3 mm long and at least some > 0.5 mm long (the longer as long or longer than the costa width); widest point of the leaf usually 1–3 pairs of pinnae up from the base .................................................................  T. hispida var. versicolor

Basal veins from adjacent lobes of the pinna not meeting at all, or reaching the sinus at the same point, thus without a united vein to the sinus.

Upper surface of the costae and costules glabrous above (rarely minutely hairy), the hairs never > 0.2 mm long, eglandular ..................  T. ovata var. ovata

Upper surface of the costae and costules with at least a few stout hairs > 0.3 mm long; upper leaf surface pubescent to nearly glabrous, also glandular with stipitate glands.

Lowermost 1–2 pairs of pinnae distinctly shorter than the pair above (ca. ¼ as long); basal veins from adjacent lobes of the pinna always meeting .................................................................  T. hispida var. versicolor

Lowermost pair of pinnae equal to or very slightly shorter than the next pair above; basal veins from adjacent lobes of the pinna not meeting at all, or reaching the sinus at the same point .................................................................  T. kunthii

**Thelypteris burksiorum** J.E. Watkins & D.R. Farrar. Moist sandstone grottoes. A narrow endemic of nc. AL. Watkins & Farrar (2002, 2005) present evidence for its recognition as a species distinct from *Thelypteris pilosa* and discuss its likely evolution as an ancient relictual taxon. The appropriate combination for its recognition at the species level in *Stegnogramma* has not been made. (= *Thelypteris pilosa* (M. Martens & Galeotti) Crawford var. *alabamensis* Crawford – FNA, K; = *Stegnogramma pilosa* (M. Martens & Galeotti) K. Iwatsuki var. *alabamensis* (Crawford) K. Iwatsuki; = *Stegnogramma species 1*]

* Thelypteris dentata (Forsskål) E. P. St. John, Downy Maiden Fern, Soft Fern. Disturbed areas; native of tropical and subtropical Asia and Africa. [= FNA, K, S, WH; = *Christella dentata* (Forsskål) Brownsey & Jermy]

**Thelypteris hispida** (Decaisne) C.F. Reed var. versicolor (R. St. John) Lellinger, Hairy Maiden Fern. Moist forests, limesinks, and on soil in disturbed areas. E. SC south to s. FL west to e. TX. Other varieties occur in the West Indies, in tropical New and Old World. [= FNA, K, WH; = T. versicolor R. St. John – S; < *Christella hispida* (Decaisne) Holtum; = T. quadrangularis (Fée) Schelpe var. versicolor (R. St. John) A.R. Smith]

**Thelypteris kunthii** (Desvaux) C.V. Morton, Kunth's Maiden Fern, Southern Shield Fern. Coquina limestone (“marl”) outcrops, calcareous bluffs and sinkhole slopes, also adventive on and around coquina limestone (marl) riprap around small bridges and ditches and in suburban forests. May–August. Se. NC south to s. FL and west to c. TX; Mexico south through Central America into n. South America; West Indies. [= RAB, FNA, K, WH; < *T. normalis* (C. Christensen) Moxley – S; < *Christella normalis* (C. Christensen) Holtum]

**Thelypteris noveboracensis** (Linnaeus) Nieuwland, New York Fern. Mesic forests, bottomland forests, bogs, submese forests. May–August. NL (Newfoundland) and WI south to GA, AL, and AR. Distinctive in the leaves tapering about equally to both tip and base. [= RAB, C, FNA, G, K, S, W, WV; = *Dryopteris noveboracensis* (Linnaeus) A. Gray – F; = *Parathelypteris noveboracensis* (Linnaeus) Ching]

**Thelypteris ovata** R. P. St. John var. ovata, Oval Maiden Fern. On coquina limestone (“marl”) or in disturbed, calcareous areas. S. SC south to s. FL, west to s. AL; and in the Bahamas. Var. *lindheimeri* (C. Christensen) A.R. Smith occurs in TX, Mexico, Belize, Guatemala, and Jamaica. [= FNA, K; > *T. ovata* var. ovata – S, in a narrower sense; > *T. ovata* var. harperi (C. Christensen) R. P. St. John – S; < *T. ovata* – WH; = *Christella ovata* (R.P. St. John) Löve & Löve]

**Thelypteris palustris** Schott var. pubescens (Lawson) Fernald, Marsh Fern. Bogs, marshes (including freshwater tidal marshes), and bottomland forests. June–September. The species is circumboreal, occurring in n. Europe, n. Asia, and n. North America. Var. *pubescens* is the American variety, ranging from NL (Newfoundland) and MB south to s. FL and c. TX; c. Mexico (Michoacán, Distritio Federal), Bermuda, Cuba. [= C, FNA, G, K, S, W, WV; < *T. palustris* – RAB; = *Dryopteris thelypteris* (Linnaeus) Swartz var. *pubescens* (Lawson) A.R. Prince ex Weatherby – F; < *T. thelypteris* (Linnaeus) Nieuwland – S]

**Thelypteris simulata** (Davenport) Nieuwland, Bog Fern, Massachusetts Fern. In NC and WV in acid peat bogs at about 1000 meters in elevation, in DE, NJ, and VA in acid seepage swamps in the Coastal Plain. July–September. Northeastern, ranging from NS south to ne. VA (Accomack, New Kent, Northampton and Westmoreland counties) and n. WV (Tucker and Preston counties), and disjunct in NC (Alleghany and Avery counties) and WI. Discovered in NC in the 1980’s. Presently known in NC only from two sites. [= C, FNA, G, S, W, WV; = *Dryopteris simulata* Davenport – F; = *Parathelypteris simulata* (Davenport) Holtum]
L1. Lycopodiaceae

F36. Woodsiaceae Horter 1949 (Woodsia Family) [in POLYPODIALES]

A family of about 15 genera and 700 species, cosmopolitan in distribution, but concentrated in temperate and montane areas. References: Smith in FNA (1993b); Smith et al. (2006); Lellinger (1985); Kramer et al. in Kramer & Green (1990).

1 Sori round, indusia present or absent, if present cuplike or lateral (but not attached along a long side).
2 Leaves 2-pinnate to 3-pinnate (the pinnae at least 1-pinnate); sori elongate, 2-3× as long as wide, the larger sori generally curved and extending across the veins (except Diplazium esculentum).
3 Veins free, simple or forked..............................................................[see Athyrium in ATHYRIACEAE]
3 Veins anastomosing.................................................................[see Diplazium in ATHYRIACEAE]
2 Leaves 1-pinnate to 1-pinnate-pinnatifid (the pinnae entire or pinnatifid); sori elongate, 2.5-6× as long as wide, even the larger sori generally straight and not extending across the veins.
3 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid ......................................................................................[see Deparia in ATHYRIACEAE]
3 Leaves 1-pinnate, the pinnae entire...........................................................[see Homalosorus in DIPLOAZIOPSIDACEAE]
1 Sori round, indusia present or absent, if present cuplike or lateral (but not attached along a long side).
4 Leaf blades broadly triangular in outline, ca. 1× as long as wide; rhizome ca. 1 mm in diameter; indusia absent; [native species of mountain peaks of n. NC and VA]. ............................................................[see Gymnocarpium in CYSTOPTERIDACEAE]
4 Leaf blades lanceolate, oblone, or ovate in outline, 2× or more as long as wide; rhizome more than 2 mm in diameter.
5 Indusium attached under one side of the sorus, hoodlike or pocketlike, arching over the sorus; petioles glabrous or sparsely beset with scales, the petiole bases not persistent ..........................................................[see Cystopteris in CYSTOPTERIDACEAE]
5 Indusium attached under the sorus, cuplike (divided into 3-6 lanceolate to ovate lobes which surround the sorus from below) or of minute numerous septate hairs, which extend out from under the sorus on all sides; petioles often densely beset with scales, the petiole bases persistent .......................................................... Woodsia

Woodsia R. Brown 1810 (Woodsia, Cliff Fern)

A genus of about 30 species, of temperate and cool-temperate regions, widespread in the Northern Hemisphere, in montane tropical South America, and south temperate in Africa and South America. References: Windham in FNA (1993b); Kramer et al. in Kramer & Green (1990).

Identification notes: Woodsia species and Cystopteris species are all small ferns with thin-textured leaves, occurring primarily on or near rock outcrops; they frequently occur together or in proximity to one another and are often confused. Woodsia has the indusium divided into a series of scale-like or hair-like structures, attached below the costae; Cystopteris has an undivided indusium, pocket-like or hood-like, attached around one side of the sorus. Woodsia has persistent dark petiole bases; in Cystopteris the petiole bases are deciduous. Woodsia has the final veinlets not reaching the margin; Cystopteris veins do reach the margin.

1 Petioles with a distinct joint about 1-3 cm above the base, the petiole bases of former leaves forming a fairly even stubble; leaf blade lacking glands (though bearing both long sepalate hairs and pale linear scales); indusium of numerous filamentous segments. .................. W. ilvensis
1 Petioles lacking a joint, the petiole bases of former leaves disintegrating irregularly and forming an uneven stubble; leaf blade with stalked glands, at least below on the costa, costules, and veins (and also bearing nonglandular hairs and/or linear scales); indusium of 3-6 lanceolate segments.
2 Rachis with flattened, septate, white hairs and elongate stipitate glands; leaf blade with flattened, septate, white hairs and elongate stipitate glands ............................................................................ W. appalachiana
2 Rachis with scattered scales; leaf blade with sparse to dense stipitate glands ............................................................................. W. obtusa ssp. obtusa

Woodsia appalachiana T.M.C. Taylor, Appalachian Woodsia, Appalachian Cliff Fern, Mountain Woodsia. On cliffs of sandstone, shale, granite, granitic gneiss, and hornblende gneiss. June-September. Endemic to the Southern and Central Appalachians of VA, WV, NC, nw. GA, TN, and the Ozarks of AR. This species is similar to W. scopulina of the western mountains of AK south to CO and CA. The eastern plants have been variously treated as a full species, a subspecies or variety of W. scopulina, or as indistinguishable from W. scopulina (see synonymy). It now appears that W. appalachiana may be a rather cryptic but distinct element of a reticulate complex also involving W. scopulina ssp. scopulina (of the Rocky Mountains) and W. scopulina ssp. laurentiana. Windham (primarily of the Rocky Mountains but also disjunct eastward in ON and QC). Windham in FNA (1993b) treats these three entities as subspecies, and suggests that ssp. laurentiana is the allotetraploid derivative of hybridization of the eastern and western diploids. If this is indeed so, each of the 3 entities should be recognized at the species level. [= F, K; < W. scopulina D.C. Eaton – RAB, C, S, W; WV; = W. scopulina ssp. appalachiana (T.M.C. Taylor) Windham – FNA; = W. scopulina var. appalachiana (T.M.C. Taylor) Morton – G]

F38. ONOCLEACEAE  Pichi Sermolli 1970 (Sensitive Fern Family) [in POLYPODIALES]

A family of 4 genera and 5 species, of north temperate regions. The family as here circumscribed is monophyletic and sister to Blechnaceae (Smith et al. 2006). Christenhusz, Zhang, & Schneider (2011) prefer to combine the 5 species in the family into a single genus (Onoclea). References: Christenhusz, Zhang, & Schneider (2011); Smith et al. (2006)

1. Sterile leaves pinnate-pinnatifid, 6-25 dm tall, broadest toward the tip; fertile leaves 1-pinnate; veins free; rhizomes of 2 types, the slender, creeping rhizomes leafless, giving rise at intervals to extremely stout, vertical rhizomes which bear a cluster of many leaves ........... Matteuccia

Matteuccia Todaro 1866 (Ostrich Fern)

A monotypic genus, north temperate in distribution. Two other species formerly included in Matteuccia (or sometimes in Onoclea) are either better treated in the genus Pentarhizidium Hayata (Gastony & Ungerer 1997), or else the genera Pentarhizidium, Matteuccia, and Onocleopsis should be united into Onoclea (Christenhusz, Zhang, & Schneider 2011). References: Johnson in FNA (1993b); Kramer et al. in Kramer & Green (1990).

Matteuccia struthiopteris (Linnaeus) Todaro var. pensylvanica (Willdenow) C.V. Morton, Ostrich Fern. Alluvial forests and calcareous wetlands. The species is circumboreal; the North American var. pensylvanica ranges from NL (Newfoundland) west to AK, south to VA (Smyth and Craig cos.), MO, SD, and BC. The North American var. pensylvanica is separated from the Eurasian var. struthiopteris on the basis of its concolorous rhizome scales (vs. bicolorous scales) and less truncate pinna lobes. Matteuccia stores starch in its persistent petiole bases. [= FNA, G; < M. struthiopteris – C, K; = Pteretis pensylvanica (Willdenow) Fernald – F; = M. pensylvanica (Willdenow) Raymond – WV; = Onoclea struthiopteris (Linnaeus) Roth var. pensylvanica (Willdenow) B. Boivin]

Onoclea Linnaeus 1753 (Sensitive Fern)

Onoclea sensibilis Linnaeus var. sensibilis, Sensitive Fern, Bead Fern. Marshes, swamps, wet disturbed places. May-June. The species ranges from NL (Newfoundland) west to MN and CO, south to FL, TX, and CO; also in e. Asia. Var. sensibilis is North American; var. interrupta is Asian. The recognition of two varieties is supported by molecular evidence. Alternatively, species status is sometimes given (Gastony & Ungerer 1997). The specific epithet and common name refer to the fact that the fronds wither at the first touch of frost, not that they respond to touch. The peculiar fertile leaves (with their brown, beadlike, fertile pinnules) are collected for use in dried arrangements. The expanded, persistent petiole bases store starch. [< O. sensibilis – RAB, C, F, FNA, G, K, S, W, WV; = O. sensibilis – Z]

F39. BLECHNACEAE  (C. Presl) Copeland 1947 (Deer Fern Family) [in POLYPODIALES]

1. Veins of sterile leaves free; sori continuous .......................................................... Blechnum

Blechnum Linnaeus 1753 (Deer Fern)

1. Leaf blades usually < 5 dm long; leaves pinnate-pinnatifid in all or part; margins entire (to sparingly and irregularly serrulate) .......................................................... B. appendiculatum

B. appendiculatum

1. Leaf blades usually > 5 dm long; leaves pinnate throughout; margins serrulate ......................................................... B. serrulatum

B. serrulatum
**Blechnum appendiculatum** Willdenow, Hembali Fern. Moist forests. S. GA south to s. FL; West Indies; Central America, South America. Collected once in LA, on the west bank of the Mississippi River in bottomland hardwoods in Iberville Parish, LA. [= Z; = B. occidentale Linnaeus var. minor Hooker – FNA; < B. occidentale – K1, K2, S]

**Blechnum serrulatum** L.C. Richard, Swamp Fern, Marsh Fern. Vacant lots, bottomlands. Ne. FL south to FL peninsula; Mexico, Central America, South America; West Indies; Malesia and Australia. Introduced and established in e. SC (Beaufort and Jasper counties) via landscaping plants brought in from FL (P. McMillan, pers. comm. 2005). [= FNA, K1, K2, S, Z]

**Woodwardia** J.E. Smith 1793 (Chain Fern)

**Identification notes:** In sterile leaf, *Woodwardia areolata* is sometimes confused with *Onoclea*, but *W. areolata* has the pinnae generally alternate (vs. tending to be opposite), the pinnae generally acute or acuminate (vs. obtuse), and the pinna margin finely serrulate (vs. entire).

1 Sterile leaves pinnatifid, the pinnae 7-10 pairs per leaf, basally not distinct from one another, the rachis therefore winged by leaf tissue throughout its length, the pinnae merely finely serrulate .............................................................. *W. serrulata*

1 Sterile leaves pinnate-pinnatifid, the pinnae 15-20 pairs per leaf, fully distinct, the rachis therefore not winged by leaf tissue, the pinnae areolata (Linnaeus) K. Presl – S, WV

**Woodwardia areolata** (Linnaeus) T. Moore, Netted Chain Fern. Moist to wet, acid, organic soils, such as bogs, blackwater bottomlands, pocosins. May-September. NS west to MI and MO, south to s. FL and e. TX, primarily on the Coastal Plain. See Cranfill (1983) for a discussion of the geography and ecology of *W. areolata*. [= RAB, C, F, FNA, G, K, W, WH; = Lorinseria areolata (Linnaeus) K. Presl – S, WV]

**Woodwardia virginica** (Linnaeus) J.E. Smith, Virginia Chain Fern. Moist to wet, acid, organic soils, such as bogs, blackwater bottomlands, pocosins, sometimes in standing water, as in periodically flooded coastal plain depression ponds. June-September. NS west to MI and IL, south to s. FL and TX, and in Bermuda, primarily on the Coastal Plain. Sometimes confused when sterile with *Osmunda cinnamomeum* (which see for discussion). [= RAB, C, F, FNA, G, K, W, WH; = Anchistea virginica (Linnaeus) K. Presl – S]

---

**F40. ATHYRIACEAE** Alston 1956 (Lady Fern Family) [in POLYPODIALES]

References: Christenhusz, Zhang, & Schneider (2011).

1 Leaves 2-pinnate to 3-pinnate (the pinnae at least 1-pinnate); sori elongate, 2-3× as long as wide, the larger sori generally curved and extending across the veins (except Diplazium esculentum).

2 Veins free, simple or forked ............................................................................................................................ *Athyrium *

2 Veins anastomosing ..................................................................................................................................................................... *Diplazium *

1 Leaves 1-pinnate to 1-pinnate-pinnatifid (the pinnae entire or pinnatifid); sori elongate, 2.5-6× as long as wide, even the larger sori generally straight and not extending across the veins.

3 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid .................................................................................................................. *Deparia *

3 Leaves 1-pinnate, the pinnae entire .............................................................................................................................. [see Homalosorus in DIPLAZIOPSIDACEAE]

**Athyrium** Roth 1799 (Lady Fern)

A genus of about 180 species, cosmopolitan in distribution, but concentrated in e. and se. Asia. Kelloff et al. (2002) and Kellof & Werth (1998) support recognition of two taxa at either specific or infraspecific levels, based on morphology, allozymes, and spores. References: Kato in FNA (1993b); Kramer et al. in Kramer & Green (1990); Kelloff et al. (2002). [also see Deparia and Homalosorus]

**Identification notes:** *Athyrium* and *Deparia* superficially resemble *Dryopteris*, and they often grow together. *Athyrium* and *Deparia* have linear, flap-like sori (vs. rounded, reniform sori). Sterile individuals can be distinguished by the number of vascular bundles in the petiole (easily determined by breaking off a leaf and counting the vascular bundles, which will appear as thread-like, but flattened, strands). *Athyrium* and *Deparia* have 2, *Dryopteris* has 4-7.

1 Leaves variegated, silvery gray and gray-green; [alien] .................................................................................................................... *A. niponicum *

1 Leaves not variegated, bright green; [native, sometimes cultivated]
ATHYRIACEAE (F40)

1 Leaf blade widest near middle (the fourth or fifth pair of pinnae from the base the largest); margins of indusium toothed or ciliate (not glandular); rachis glandular; spores yellow or brown, finely papillose; petiole scales persistent, up to 1 cm long and 1.5 mm wide. A. angustum

1 Leaf blade widest near base (the second or third pair of pinnae from the base the largest); margins of indusium ciliate and glandular-ciliate; rachis eglandular; spores brown or dark brown, reticulate-wrinkled; petiole scales early deciduous, up to 5 mm long and 1 mm wide. A. asplenioides

Athyrium angustum (Willdenow) K. Presl, Northern Lady Fern. Moist forests, rock outcrops on grassy balds at high elevations. June-September. The occurrence of this northern species is not fully documented in NC or VA; it was found in the 1980's by Murray Evans on Hump Mountain, on or near the TN-NC border. NL (Newfoundland) and n. QC west to SK, south to w. NC, e. TN, OH, MO, and NE. Reported for VA by Kartesz (1999). [= S, WV; = A. filix-femina (Linnaeus) Roth ex Mertens var. michauxii (Sprengel) Fairw. – C, F, G; = A. filix-femina var. angustum (Willdenow) G. Lawson – FNA; = A. filix-femina ssp. angustum (Willdenow) Clausen – K, W]

* Athyrium niponicum (Mettenius) Hance, Japanese Painted Fern. Suburban woodlands, lawns; commonly planted as an ornamental, rarely naturalizing, native of Japan. This common suburban ornamental (forma picta) spreads locally from plantings; it seems only a matter of time before it begins to naturalize more widely

Deparia Hooker & Greville 1829

A genus of about 40-50 species, primarily in tropical to warm temperate Asia and Africa. References: Kato in FNA (1993b); Kramer et al. in Kramer & Green (1990).

Identification notes: Unlike Athyrium, Deparia has the costal groove not continuous with the rachis groove. In addition, Deparia has multicellular hairs on the leaf blades.

1 Leaf blade narrowed to base; petiole bases swollen, with 2 rows of teeth; [plant a common native species of moist forests]; [section Lunathyrium] ................................................................. D. acrostichoides

1 Leaves widest at the base; petiole bases not markedly swollen, lacking teeth; [plant an exotic species, rarely introduced and naturalized]; [section Athyriopsis] ............................................................................................................ D. petersonii

Deparia acrostichoides (Swartz) M. Kato, Silvery Spleenwort. Moist forests, cove forests. June-September. NS west to MN, south to NC, SC, n. GA, n. AL, and AR. D. acrostichoides is the only species native to the New World; it has several very closely related species in e. Asia (in section Lunathyrium). It stores starch in the swollen, persistent petiole bases. [= FNA, W; = Athyrium thelypteroides (Michaux) Desvaux – RAB, C, F, G, WV; = Diplazium acrostichoides (Swartz) Butters – S]

* Deparia petersonii (Kunze) M. Kato. Swamp forests, disturbed areas; native to se. Asia. Introduced and naturalized in the Southeast, including in c. and s. GA, AL, s. MS, and FL. [= FNA; = Deparia petersonii – K, orthographic variant; = Deparia japonica (Thunberg) M. Kato, misapplied; = Diplazium japonicum (Thunberg) Beddome, misapplied]

Diplazium Swartz 1800 (Twin-sorus Fern)

A genus of about 400 species, primarily tropical and north temperate in distribution. References: Kato in FNA (1993b); Kramer et al. in Kramer & Green (1990).

1 Leaves 2-pinnate; veins anastomosing ............................................................................................................ D. esculentum

1 Leaves 1-pinnate; veins free .......................................................................................................................... [see Homalosorus pygrocarpus in DIPLAZIOPSIDACEAE]

* Diplazium esculentum (Retzius) Swartz, Vegetable Fern. Moist disturbed areas; native of the Old World tropics. [= FNA, K]

F42. DRYOPTERIDACEAE Ching 1965 (Wood-fern Family) [in POLYPODIALES]

A family of about 40-45 genera and 1700 species, cosmopolitan in distribution, but concentrated in temperate and montane areas. Here circumscribed (following Smith et al. 2006) to exclude Onocleaceae and Woodsiaceae. References: Smith in FNA (1993b); Smith et al. (2006); Lellinger (1985); Kramer et al. in Kramer & Green (1990).
1 Leaf blades pentagonal in outline, ca. 1× as long as wide, the terminal pinna by far the largest; [introduced species, naturalized in moist ravines in SC].................................................................................................................................Arachniodes

1 Leaf blades lanceolate, oblone, or ovate in outline, 1.5× or more as long as wide.
2 Leaves 1-pinnate-pinnatifid to more divided, the pinnae pinnatifid or themselves fully divided, generally lacking a prominent basal lobe, light green to dark green, herbaceous to subcoriaceous; indusia reniform (Dryopteris) or peltate (Rumohra).
3 Indusia reniform; leaf blade (at least of larger leaves on mature plants) usually > 40 cm long.................................................................Dryopteris
3 Indusia peltate; leaf blade < 40 cm long .................................................................................................................................Rumohra

2 Leaves 1-pinnate, the pinnae toothed and each with a slight to prominent lobe near the base on the side toward the leaf tip, dark green, subcoriaceous to coriaceous; indusia peltate.
4 Veins anastomosing, rejoining to form a netlike pattern; pinnae 4-25 pairs per leaf; [non-native, rarely naturalized] ...............Cyrtomium
4 Veins branching dichotomously, free, not rejoining to form a netlike pattern; pinnae 25-50 pairs on larger leaves; [plant a common native species] .........................................................................................................................Polystichum

Arachniodes Blume 1828 (East Indian Holly Fern)

A genus of about 50-60 species, of tropical and warm temperate regions, and especially of Asia and America. References: Smith in FNA (1993b); Kramer et al. in Kramer & Green (1990).

* Arachniodes simplicior (Makeino) Ohwi, Simpler East Indian Holly Fern. Moist banks in forested creek ravine; native of Japan and China. Gordon (1981) discusses this interesting introduced population, apparently established for several decades at the time of its discovery, and likely originating from spores. [= FNA, K]

Cyrtomium K. Presl 1836 (Net-veined Holly Fern)

A genus of about 15 species, of temperate regions of Africa, Asia, and the Pacific Islands. Perhaps better treated as a portion of Polystichum; at the least, Cyrtomium is closely related to Polystichum. Both species in our area are apogamous tripliods. References: Yatskievych in FNA (1993b); MacDougal (1976); Kramer et al. in Kramer & Green (1990).

1 Leaf coriaceous, the upper surface dark green and shiny; pinnae 4-10 (-12) pairs per leaf, 1.5-3 cm wide, the margins coarsely toothed or undulate ......................................................................................................................................................................C. falcatum
1 Leaf less coriaceous, the upper surface pale green and dull; pinnae (8-) 10-25 pairs per leaf, 1-2 cm wide, the margins finely denticulate. ..............................................................C. fortunei var. fortunei

* Cyrtomium falcatum (Linnaeus f.) K. Presl, Asian Net-veined Holly Fern. Ditches, disturbed swamps, moist ravines, old mortar of brick walls; native of e. Asia. [= FNA, K, S; = Polystichum falcatum Linnaeus f.]
* Cyrtomium fortunei J. Smith var. fortunei, Fortune's Net-veined Holly Fern. Roadside banks, old mortar of brick walls; native of se. China. Two other varieties are recognized; neither appears to be naturalized in North America. Reported for Polk County, TN (D. Estes, pers. comm., 2010). [= FNA; < C. fortunei – K]

Dryopteris Adanson 1763 (Wood-fern, Shield-fern)

Identification notes: Dryopteris and Athyrium are often confused when not fertile; they can be easily distinguished by breaking off a leaf and counting vascular bundles (which will appear as thread-like strands). Dryopteris has 5 and Athyrium has 2. Many Dryopteris species will hybridize with one another to form sterile hybrids. Whenever two or more Dryopteris species are found growing together, there is a good chance that hybrids are present. Hybrids generally show intermediacy between the two parents, and have abortive sporangia or spores.

1 Leaves bipinnate-pinnatifid to trippinnate-pinnatifid (or to quadripinnate in the lower pinnae).
2 Leaves evergreen, the blades appearing more-or-less parallel-sided and minutely glandular-pubescent, especially on the indusium, rachis, and pinnae midribs; first basal-pointed pinnule of the basal pinna shorter than or equal to the next outermost basal-pointed pinnule; first basal-pointed pinnule of the basal pinna usually < 2× as long as the first tip-pointed pinnule of the basal pinna ...................... D. intermedia
2 Leaves deciduous, the blades appearing more or less triangular and lacking gland-tipped hairs (except occasionally on the indusium); first basal-pointed pinnule of the basal pinna longer than the next outermost basal-pointed pinnule; first basal-pointed pinnule of the basal pinna > 2× as long as the first tip-pointed pinnule of the basal pinna.
3 Leaf blade ca. 1× as long as the petiole; indusium occasionally glandular; first basal-pointed pinnule of the basal pinna 2.5-5× as long as the first tip-pointed pinnule of the basal pinna .................................................................................................................................D. campyloptera
3 Leaf blade 2× as long as the petiole; indusium glabrous; first basal-pointed pinnule of the basal pinna ca. 2× as long as the first tip-pointed pinnule of the basal pinna .................................................................................................................................D. carthusiana

1 Leaves pinnate-pinnatifid to bipinnate (or to tripinnate in the lower pinnae).
4 Sori marginal; leaves evergreen, gray-green, leathery in texture ...............................................................................................................................D. marginalis
4 Sori medial or submedial; leaves evergreen or deciduous, dark- to bright-green, thin to stiff in texture.
5 Leaves dimorphic, the deciduous, fertile leaves erect, 2-3× as long as the spreading, evergreen, sterile leaves, which form a winter "rosette"; fertile leaves linear-lanceolate in outline, generally 4-8× as long as wide; pinnae mostly 1.5-3× as long as wide, triangular; scales at base of petiole tan.
6 Fertile pinnae nearly in plane of the blade (like a closed Venetian blind); fertile leaves 12-20 cm wide .......................... *Dryopteris celsa*
6 Fertile pinnae usually twisted out of the plane of the leaf axes, often nearly to 90° (like an open Venetian blind); fertile leaves 8-12 cm wide .......................................................................................... *Dryopteris cristata*
5 Leaves not dimorphic, or only slightly so, deciduous (*D. goldiana*), evergreen (*D. ludoviciana*), or else with usually deciduous fertile and semi-evergreen sterile fronds (*D. celsa*); fertile leaves lanceolate to ovate in outline; generally 1.5-4× as long as wide; pinnae mostly 3-5× as long as wide; scales at base of petiole dark brown with tan margins.
5 Leaves evergreen, fertile only toward the tip, the fertile pinnae and segments narrower than the sterile and more widely spaced; scales at the petiole base light brown, not shiny .......................................................................................... *Dryopteris celsa*
7 Leaves deciduous or semi-evergreen, fertile throughout or nearly so, the fertile pinnae and segments not differentiated from sterile ones; scales at petiole base medium to dark brown, shiny or not.
8 Costa with bullate (blistered-appearing) scales abundant, usually dark; [rarely naturalized alien] ......................... *Dryopteris erythrosora*
8 Costa lacking bullate scales; [native, sometimes also cultivated] ........................................................................... *Dryopteris celsa*
9 Leaves deciduous with sori subterminal, touching the costule at maturity; leaf blade ovate to narrowly ovate, usually 1.5-3× as long as wide; abruptly tapering at the apex; scales at the petiole base dark brown, nearly black, with a narrow pale margin .............. *Dryopteris celsa*

*Dryopteris campyloptera* Clarkson, Mountain Wood-fern. Spruce-fir forests, northern hardwood forests. July-September. NL (Newfoundland) and n. QC to extreme n. PA, and from extreme s. PA south through e. WV and w. VA to e. TN and w. NC. This species is a fertile allotetraploid derived from hybridization of *D. intermedia* and the northern and western *D. expansa* (K. Presl) Fraser-Jenkins & Jermy, which does not (now) reach our area. The chromosome complement is symbolized EEII. [= RAB, C, K, S, W, WV; = *D. spinulosa* (O.F. Mueller) Watt var. *americana* (Fischer ex Kunze) Fernald – F; = *D. austriaca* (Jacquin) Woynar ex Schinz & Thellung var. austriaca – G]

*Dryopteris carthusiana* (Villars) H.P. Fuchs, Spinulose Wood-fern, Toothed Wood-fern. Acidic, organic-rich bogs, swamps, less frequently in moist rocky rich forests, and sloping rock outcrops. June-September. Irregularly circumboreal, in North America ranging from n. QC west to YT, south to NC, SC, ne. GA, TN, AR, NE, w. MT, and WA. This species is a fertile allotetraploid derived from hybridization of *D. intermedia* and "*D. semicristata*", a hypothetical species which may now exist. Its chromosome complement is symbolized IISS. [= C, F, K, W; = *D. spinulosa* (O.F. Mueller) Watt – RAB, S, WV; = *D. spinulosa* var. *spinulosa* – F; = *D. austriaca* (Jacquin) Woynar ex Schinz & Thellung var. *spinulosa* (O.F. Mueller) Fiori – G]

*Dryopteris clintoniana* (D.C. Eaton) Dowell, Clinton's Wood-fern, Broad Swamp Fern. Acid seepages, swampy forests, red maple swamps. NB, QC, and ON, south to DE, DC, MD (Somerset Co.), n. VA (Arlington and Fairfax counties), PA, OH, IN, and IL. This species is a fertile allohexaploid derived from hybridization of *D. cristata* and *D. goldiana*; its chromosome complement is symbolized GGLSS. [= FNA, C, G, K; = *D. cristata* (Linnaeus) A. Gray var. *clintoniana* (D.C. Eaton) Underwood – F]

*Dryopteris cristata* (Linnaeus) A. Gray, Crested Wood-fern. Bogs, swamp forests. July-September. Circumboreal, in North America from NL (Newfoundland) to s. SK and se. BC, south to NC, TN, OH, IN, n. IL, IA, NE, and ID; disjunct in c. GA, AL, and LA. This species is a fertile allotetraploid derived from hybridization of *D. ludoviciana* and "*D. semicristata*", a hypothetical species which may now exist. Its chromosome complement is symbolized LLSS. It has also served as a "parent species" of *D. clintoniana*, a fertile allohexaploid derived from *D. cristata × goldiana*. Thus, its genome constitutes two thirds of the genome of *D. clintoniana*. [= RAB, C, F, G, K, S, W, WV; = *D. cristata* var. cristata – F]

* *Dryopteris erythrosora* (D.C. Eaton) Kuntze, Autumn Fern, Japanese Red Shield-fern. Suburban woodlands; native of Japan, Korea, and China. Also recently reported as naturalizing in AR (Simpson, Crank, & Peck 2008).

*Dryopteris goldiana* (Hooker ex Goldie) A. Gray, Goldie's Wood-fern. Boulderfield forests, rich cove forests, seepage swamps, especially over calcareous sediments or mafic metamorphic or igneous rocks. June-September. NB west to s. ON and MN, south to nw. SC, n. GA, n. AL, TN, KY, IL, and IA. This species is one of the diploid "parent species" of the e. North American reticulately-evolved *Dryopteris* complex. Its genome (symbolized GG) forms half of the genome of the tetraploid *D. celsa*, and one third of the hexaploid *D. clintoniana*, which does not occur as far south as our area. [= RAB, C, F, FNA, K, S, W, WV; = *D. goldiana* ssp. *goldiana* – G]

*Dryopteris intermedia* (Muhlenberg ex Willdenow) A. Gray, Fancy Fern, Evergreen Wood-fern. Cove forests, other moist, rocky forests, over a variety of substrates. June-September. NL (Newfoundland) west to MN, south to n. GA and AR. This species is one of the diploid "parent species" of the e. North American reticulately-evolved *Dryopteris* complex. Its genome (symbolized II) forms half of the genome of the tetraploids *D. campyloptera* and *D. carthusiana*. [= RAB, C, FNA, K, S, W, WV; =
**Dryopteridaceae** (F42)

Dryopteris ludoviciana* (Kunze) Small, Southern Wood-fern. Blackwater swamp forests. June-September. A Southeastern Coastal Plain species: e. NC south to s. FL, west to s. AL, s. MS (Sorrie & Leonard 1999), and e. LA; disjunct in the West Gulf Coastal Plain of LA and AR, and possibly disjunct in sc. KY, the report old and somewhat uncertain. This species is one of the diploid "parent species" of the e. North American reticulately-evolved *Dryopteris* complex. Its genome (symbolized LL) forms half of the genome of the tetraploids *D. cristata* and *D. celsa*, as well as contributing one third of the genome of *D. clintoniana* indirectly (via its daughter species *D. cristata*). [= RAB, FNA, K, S]

Dryopteris marginalis* (Linnaeus) A. Gray, Marginal Wood-fern. Rock outcrops, boulderfield forests, other rocky forests. June-September. NL (Newfoundland) west to s. ON and MI, south to SC, c. GA, AL, TN, AR, and e. OK. *D. marginalis* has not participated in the reticulate evolution of *Dryopteris* in e. North America; it does, however, form sterile hybrids with some other species. [= RAB, C, F, FNA, G, K, S, W, WV]

*Polystichum* Roth 1799 (Holly Fern)

1 Leaves 1-pinnate; [common, native] ................................................................. *P. acrostichoides*
1 Leaves 2-pinnate; [rare, alien] ..................................................................... *P. polyblepharum*

Polystichum acrostichoides* (Michaux) Schott, Christmas Fern. Moist to dry forests and woodlands, especially slopes, ravines, and small stream bottomlands. June-September. NS west to MN, south to s. FL and e. TX; also in ne. Mexico (Nuevo León and Tamaulipas). One of the most familiar ferns in e. North America. Var. *lonchitoides* Brooks, allegedly endemic to WV, is of dubious taxonomic value. [= RAB, C, F, FNA, G, S, W, WV; > *P. acrostichoides* var. *acrostichoides* – K; > *P. acrostichoides* var. *lonchitoides* Brook – K]

* Polystichum polyblepharum* (Roemer ex Kunze) K. Presl, JapaneseTassel-fern. Moist ravines; native of e. Asia. Reported for AL as *P. braunii* (Spenner) Fée. {not yet keyed}

**Rumohra** Raddi 1819 (Leatherleaf Fern)

A genus of about 7 species, perennials, mainly tropical and Southern Hemisphere. References: Kramer et al. in Kramer & Green (1990).

**F44. Nephrolepidaceae** Pichi Sermolli 1975 (Sword Fern Family) [in POLYPODIALES]

*Nephrolepis* Schott 1834 (Sword Fern)

A genus of about 15-30 species, widespread in tropical and subtropical areas.
LYCOPODIACEAE

58

1 Pinnae 2.5-23 cm long; midleaf pinnae with veins densely pubescent on the upper surface; pinnae not distinctly auricled at base .................................................................................................................................................................................................................. N. biserrata

1 Pinnae 1-7.3 cm long; midleaf pinnae with veins glabrous on the upper surface; pinnae auricled at base on the side towards the leaf tip.

2 Scales on the upper surface of the rachis bicolored (pale but distinctly darker at the base); pinnae attachments spaced 5-12 mm apart; rhizomes bearing spherical tubers (not always present) ......................................................................................................................... N. cordifolia

2 Scales on the upper surface of the rachis concolored (pale to reddish brown throughout); pinnae attachments spaced 7-21 mm apart; rhizomes not bearing tubers ............................................................................................................................................................................................................... N. exaltata

* Nephrolepis biserrata (Schott) Schott, Giant Sword Fern. Disturbed suburban areas; native of the tropics and subtropics of both hemispheres. [= FNA, K, ? N. falcata (Cavannilles) C. Christensen]

* Nephrolepis cordifolia (Linnaeus) K. Presl, Narrow Sword Fern. Moist places; probably not native in FL. Pampropical, the original distribution obscure. [= FNA, K, S]

Nephrolepis exaltata (Linnaeus) Schott, Boston Fern. Epiphytic or terrestrial in a range of open to shaded moist habitats; in our area perhaps only introduced. Panhandle and ne. FL south to s. FL; West Indies; Central and South America; widely introduced elsewhere. [= FNA, S; > N. exaltata ssp. exaltata – K]

F48. POLYPODIACEAE Berchtold & J.C. Presl 1820 (Polypody Family) [in POLYPODIALES]

A family of about 35-40 genera and 500-700 species, cosmopolitan, especially tropical. Here circumscribed to include Grammitidaceae (including Micropylodium). References: Smith in FNA (1993b); Smith et al. (2006); Hennipman, Veldhoen, & Kramer in Kramer & Green (1990); Parris in Kramer & Green (1990).

1 Plants dwarf, the leave blades <5 cm long; [occurring only in habitats where the air is constantly humid and the substrate saturated, as in grottoes behind waterfalls]

1 Plants larger, the leave blades 7-90 cm long; [occurring in moist to dry habitats].

1 Pinnae 2.5-23 cm long; midleaf pinnae with veins densely pubescent on the upper surface; pinnae not distinctly auricled at base .......................................................... Micropolypodium

2 Pinnae 1-7.3 cm long; midleaf pinnae with veins glabrous on the upper surface; pinnae auricled at base on the side towards the leaf tip.

2 Leaf blade densely scaly on the lower surface; rhizome 1-2 mm in diameter; leaf segment margins entire ......................................................... Pleopeltis

2 Leaf blade scaleless on the lower surface; rhizome 3-15 (-30) mm in diameter; leaf segment margins denticulate (Polyodium) or entire (Plebodium, Pecluma).

3 Leaves pinnatifid, even the larger with < 25 pairs of segments, each 1.5-5 (-8) mm wide; [of ne. FL southward] .......................................................................... Pecluma

3 Leaves pinnatifid, even the larger with >25 pairs of segments, each 1-10 cm wide; ............................................................................................................ Phlebodium

4 Ventricle highly reticulate, with 3-4 rows of areoles between the midvein and the margin; leaf blade 10-50 cm wide ................................................................................................................................................................................. Polypodium

4 Ventricle free or with a row of areoles between the midvein and the margin; leaf blade <9 cm wide ...... ..........................................................................................................................................................................................................

Micropolypodium Hayata (Dwarf Polypody)

A genus of about 30 species, mainly of tropical America and e. and se. Asia. Mircropolyodium has traditionally been considered a part of a broadly circumscribed Grammitis, but has been re-circumscribed at the generic level by Smith (1992). Smith in FNA (1993b) states that our species “probably warrants generic status under the name Micropolypodium Hayata, a primarily neotropical genus with representatives in eastern Asia (Malaysia, China, Sikkim, Taiwan, and Japan).” References: Smith in FNA (1993b); Massey et al. (1983); Smith (1992) = Z.

Micropolypodium nimbatum (Jenman) A.R. Smith, Dwarf Polypody. On ceiling of grotto in spray cliff of waterfall in humid gorge. Sporophytes (juvenile only) have been found at only a single site in North America, in Macon County, NC. Gametophytes (and/or sporophytes) may be present at other spray cliffs in the escarpment gorges of sw. NC or adjacent SC and GA. Other than this disjunct temperate-zone occurrence, the species is known from Cuba, Jamaica, and Hispaniola. See Moran (1998) for an interesting discussion and overview of independent fern gametophytes in e. North America. [= Z = Grammitis nimbata (Jenman) Proctor – RAB, FNA, K]

Pecluma M.G. Price (Rockcap Fern)

1 Veins 1-forked; segments at base of blade abruptly reduced in size; [usually epiphytic] ................................................................................................................................................................................. P. plumula

1 Veins 2-4 forked; segments at base of blade gradually reduced to auricles; [usually terrestrial] ................................................................................................................. P. pilodon var. caespitosa

Pecluma plumula (Humboldt & Bonpland ex Willdenow) M.G. Price. Epiphytic on tree branches, less commonly on limestone, in hammocks and swamps. Ne. FL (Duval County) south to s. FL; West Indies, Mexico, Central America, and n. South America. [= FNA, K, Z; = Polypodium plumula Humboldt & Bonpland ex Willdenow – S]

Pecluma pilodon (Kunze) M.G. Price var. bourgeanae (E. Fournier) A.R. Smith. Terrestrial or on logs or tree bases in hammocks and swamps. Ne. FL (Duval County) south to s. FL; West Indies; Mexico and Central America. [= Z = Pecluma pilodon (Kunze) M.G. Price var. caespitosa (Jenman) Lelliger – FNA; = Polypodium pilodon (Kunze) M.G. Price ssp. caespitosum (Jenman) Windham – K; = Polypodium pectinatum Linnaeus – S]
Phlebodium (R. Brown) J. Smith 1841 (Golden Polypody)

A genus of 2-4 species, of tropical and subtropical regions of the Western Hemisphere. References: Nauman in FNA (1993b); Hennipman, Veldhoen, & Kramer in Kramer & Green (1990).

Phlebodium aureum (Linnaeus) J. Smith, Goldfoot Fern, Golden Polypody. Epiphytic on the old leaf bases of Sabal palmetto and in crotches and crevices of other trees, particularly Quercus virginiana, and rarely terrestrial on calcareous soils or masonry. E. SC (Beaufort, Jasper, and Charleston counties), e. GA (Camden, Chatham, and Glynn counties), south to s. FL, west to Panhandle FL (Wakulla County) (Kunzer et al. 2009). Found in Cape Romain National Wildlife Refuge (Charleston County, SC) in the late 1970s by Steve Bowling, where apparently native (S. Bowling, pers. comm. 2007); also introduced and apparently established in SC (Beaufort, Jasper, Charleston counties) via planting of palmettos from further south (P. McMillan, pers. comm. 2005). [= FNA, K, S; = Polypodium aureum Linnaeus]

Pleopeltis Humboldt & Bonpland ex Willdenow 1810 (Shielded-Sorus Polypody)

Pleopeltis polypodioides (Linnaeus) E.G. Andrews & Windham ssp. michauxiana (Weatherby) E.G. Andrews & Windham, Resurrection Fern, Scaly Polypody. On tree limbs and trunks (especially when leaning) and on rocks. June-October. Ssp. michauxiana ranges from se. MD, IL, MO, and se. KS, south to s. FL and TX; also in Mexico and Guatemala; recent studies suggest that it warrants specific status. Ssp. polypodioides ranges in the West Indies, Central America and South America. Four additional subspecies are tropical in Central America, South America, and Africa. [= FNA, K; < Polypodium polypodioides (Linnaeus) Watt – RAB; = Polypodium polypodioides (Linnaeus) Watt var. michauxianus Weatherby – C, F, G, W, WV; < Marginaria polypodioides (Linnaeus) Tidestrøm – S]

Polypodium Linnaeus 1753 (Polypody)

Identification notes: The two species are somewhat cryptic, and the relatively frequent triploid backcross makes field identification still more problematic. Individuals not identified to species may be referred to as "Polypodium virginianum complex."

[Note: three leads]

1 Leaf blade averaging 5.8 cm wide (range of 3.2-8.2 cm), widest at the base, thus the blade elongate- deltoid in outline; rhizome scales averaging 1.1 mm wide, mostly golden brown throughout; paraphyses (sporangiasters) usually > 40 per sorus (range of 25-120); leaves mostly lobed to apex, without an attenuate, unlobed tip ................................................................. P. appalachianum

1 Leaf blade averaging 4.5 cm wide (range of 3.0-5.8 cm); blade widest near the middle, thus the blade oblong to narrowly lanceolate in outline; rhizome scales averaging 1.5 mm wide, mostly brown, with a dark central stripe; paraphyses (sporangiasters) usually < 40 per sorus (range of 7-69); leaves mostly with an attenuate, unlobed tip ........................................................................................................................................... P. virginianum

1 Characters intermediate; spores abortive ................................................................. P. ×incognitum

Polypodium appalachianum Haufler & Windham [P. virginianum complex], Appalachian Rockcap Fern. Moist rocks at low to high elevations, especially in ravines, on north-facing outcrops, and in other moist sites. June-October. NL (Newfoundland) west to e. ON, south to n. GA and n. AL; nearly restricted to the Appalachian Mountains. Its chromosome complement can be symbolized as AA. It is one parent of P. virginianum. [= FNA, K, Z; < P. virginianum – RAB, C, F, S, W, WV; < P. vulgare Linnaeus var. virginianum (Linnaeus) Eaton – G]

Polypodium ×incognitum Cusick is the triploid hybrid [P. appalachianum × virginianum]. It is rather frequent; there is some evidence that it may reproduce successfully via apogamous spores. It is best recognized by the spores, which are irregular in size and shape. Morphologically, it tends to intermediacy between the two parents, but can closely resemble either. Its chromosome complement can be symbolized AAS. [Not mapped]

Polypodium virginianum Linnaeus [P. virginianum complex], Common Rockcap Fern. Moist rocks. June-October. Haufler and Windham (1991) indicate that the tetraploid cytotype (P. virginianum) of the P. virginianum complex is an allotetraploid derivative of the sterile hybrid of the diploid occurring in our area (P. appalachianum) and another diploid with a
boreal distribution (*P. sibiricum* Siplivinsky). Electrophoretic evidence supports this finding (Bryan & Soltis 1987, Haufler, Windham, & Rabe 1995). Thus, *Polypodium* in our area is another classic example of the reticulate evolution of pteridophytes, and the cytotypes must be treated as species and given names. Unfortunately, the two species are somewhat cryptic, and the relatively frequent triploid backcross makes field identification still more problematic. Individuals not identified to species may be referred to as "*Polypodium virginianum* complex." The chromosome complement of *P. virginianum* can be symbolized as AASS. [= FNA, K, Z; < *P. virginianum* – RAB, C, F, S, W, WV (also see *P. appalachianum*); < *P. vulgare* Linnaeus var. *virginianum* (Linnaeus) Eaton – G (also see *P. appalachianum*)]
GYMNOSPERMS

SECTION 3: ACROGYMNOSPERMAE (EXTANT GYMNOSPERMS)

The gymnosperms are a possibly artificial grouping of about 16 families, about 86 genera, and about 850 species. References: Kramer & Green (1990). The folk taxonomy of conifers in our area is an interesting, tangled story. The town of Spruce Pine, NC is apparently named for *Tsuga canadensis*. Spruce Pinnacle in Buncombe County, NC and Tamarack Post Office in Watauga County, NC and Tamarack Ridge in Highland County, VA are named for the abundance of *Picea rubens*. The generally used common name for *Juniperus* is "cedar," and *Chamaecyparis* is called "juniper."

G2. ZAMIACEAE Reichenbach 1837 (Sago-palm Family) [in CYCADALES]

A family of about 9-11 genera and 100-185 species, of tropical and warm temperate North America, Central America, South America, Africa, and Australia. References: Landry in FNA (1993b); Johnson & Wilson in Kramer & Green (1990); Jones (1993).

*Zamia* Linnaeus

*Zamia floridana* Alphonse de Candolle var. *umbrosa* (Small) D.B. Ward, Coontie. Maritime forests, pinelands. Se. GA (Camden and Glynn counties) south to FL. *Zamia floridana* var. *floridana* is more widespread in the FL Peninsula. Ward (2001), Landry in FNA (1993b), and Stevenson (1991) conclude that North American *Zamia* belongs to one of several *Zamia* species in the Western Indies. Ward (2001, 2009) concludes that *Z. floridana* is the correct name for this taxon, and that varietal status is warranted for the "*umbrosa*" entity. [= Y; < *Zamia integrifolia* Linnaeus f. in Aiton – FNA, Z; < *Z. pumila* Linnaeus – K, misapplied; = *Z. umbrosa* Small – S; < *Z. floridana* Alphonse de Candolle]

G3. GINKGOACEAE Engler in Engler & Prantl 1897 (Ginkgo Family) [in GINKGOALES]

*Ginkgo* Linnaeus 1771 (Ginkgo, Maidenhair Tree)

A monotypic genus, a tree, native of China. *Ginkgo* is famous as a "living fossil," known from fossils nearly 200 million years old which are nearly identical to modern plants; it may be extinct as a native plant. References: Whetstone in FNA (1993b); Page in Kramer & Green (1990).

*G. biloba* Linnaeus, Ginkgo, Maidenhair Tree. Frequently planted, rarely escaped to suburban woodlands and yards; native to se. China. As pointed out by Whetstone in FNA (1993b), *Ginkgo* is only weakly naturalized. [= C, FNA, K]

G7. PINACEAE Sprengel ex F. Rudolphi 1830 (Pine Family) [in PINALES]

1 Leaves borne in fascicles of 2-5 (basally bound by a scarious sheath) or on short shoots in clusters of many leaves in apparent whorls.  
2 Leaves borne in fascicles of 2-5 (basally bound by a scarious sheath); [subfamily *Pinioideae*]. .................................................................................................................................................................................................................................................................................................................................................................................................................................................................................*Pinus*
3 Leaves evergreen; cones 6-12 cm long ..........................................................................................................................................................................................................................................................................................................................................................................................................................................................*Cedrus*
4 Leaves deciduous; cones 1-2 cm long ..........................................................................................................................................................................................................................................................................................................................................................................................*Larix*
1 Leaves alternate; [subfamily *Abietoideae*].
4 Leaves 4-angled in cross-section .................................................................................................................................................................................................................................................................................................................................................................................................................................................................................*Picea*
5 Leaves distinctly flattened (2-sided) in cross-section.  
5 Leaves attached directly to twig; cones 4-15 cm long, erect ......................................................................................................................................................................................................................................................................................................................................................................................................................................................................................*Abies*
5 Leaves jointed, on short, persistent base; cones 1-3.8 cm long, pendant ......................................................................................................................................................................................................................................................................................................................................................................................................................................................................................*Tsuga*

*Abies* P. Miller 1754 (Fir) 
(by Alan S. Weakley and Derick B. Poindexter)

A genus of about 40-50 species, trees, of temperate regions of the Northern Hemisphere, south to Central America. Our 2 native species and other non-natives are grown as ornamentals, especially in the mountains. References: Hunt in FNA (1993b); Liu (1971)=Y; Page in Kramer & Green (1990).
1 Cones 3.5-8 cm long; [native, also planted]; [section Balsameae].
2 Bracts of the mature cones shorter than the scales or slightly exerted beyond the scales; stomatal rows (4-) 7 (-8) on each side of the midvein on the lower leaf surface (visible at 10× magnification); [plant of the Central Appalachians and north, native from Page and Madison counties, VA, northward] ...................................................................................................................................................... A. balsamea
2 Bracts of the mature cones longer than the scales and reflexed; stomatal rows (8-) 10 (-12) on each side of the midvein on the lower leaf surface (visible at 10× magnification); [plant of the Southern Appalachians, native from Grayson and Smyth counties, VA, southward] ..... ...................................................................................................................................................... A. fraseri

1 Cones 10-15 cm long; [alien, persistent from horticultural use and sparingly naturalized].
3 Juvenile-form leaves of young plants with rounded-retuse apices; leaf resin canals 2, marginal; cone bracts exerted and reflexed with elongate apical cusps; [section Abies] .................................................................................................................................................................................... A. alba
3 Juvenile-form leaves of young plants with spinose-bifid apices; leaf resin canals 2, median (and usually with up to 2 additional marginal canals); cone bracts exerted and erect with abrupt, short apical cusps; [section Momi] ........................................................................................................................................ A. firma

* Abies alba P. Miller, European Fir, Silver Fir. Naturalized in Highlands, NC (Macon Co.), from plantings made by Thomas G. Harbison in the late 1800's (J.D. Pittillo, pers. comm.). May; October. [= Y]
Abies balsamea (Linnaeus) P. Miller, Balsam Fir, Northern Balsam. High elevation forests and cliffs. April-May. NL (Newfoundland) and NL (Labrador) west to n. AB, south to NY, PA, MI, WI, and IA, and (disjunct) in the mountains to n. VA (known in our area as a native only from Page and Madison counties, VA). There has been considerable debate over the taxonomic status of some, especially southern, populations of A. balsamea, which show some transition in characters toward A. fraseri, and have been variously treated as A. intermedia Fulling, A. balsamea var. phanerolepis Fernald, or A. ×phanerolepis (Fernald) Liu. Variation in e. North American Abies is somewhat clinal, with the greatest geographical and morphological discontinuity between n. VA and s. VA. It seems best, therefore, to recognize A. fraseri as a species and A. balsamea as a species (which includes the clinal var. phanerolepis). The balsam woolly adelgid, an alien pest, is afflicting this species in Shenandoah National Park. [= C, FNA, K, W, Y, Z; > A. balsamea var. balsamea – F, G; > A. balsamea var. phanerolepis Fernald – F, G, WV; > A. ×phanerolepis (Fernald) Liu – Y; > A. intermedia Fulling]
* Abies firma Siebold & Zuccarini, Momi Fir. Naturalized from horticultural plantings near homesites. See Pointdexter (2010b) for detailed information on the naturalization of this fir in our area and its recognition.
Abies fraseri (Pursh) Poir, Fraser Fir, She Balsam, Southern Balsam. High elevation forests, from about 1500-2037 m. May-June; September-November. Southern Appalachian endemic, from Grayson and Smyth counties, VA (notably, Mount Rogers) south to e. TN and sw. NC; naturalizing on Brasstown Bald in GA, where planted. This species is threatened as a native species by a virulent alien pest, the balsam woolly adelgid, and environmental damage caused by pollution. Populations on Mt. Rogers and, to a lesser extent, Roan and Grandfather mountains, appear to be relatively healthy. A. fraseri is closely related to the northern Balsam Fir, A. balsamea, and may be a relatively recent derivative of it. During the 1970's and 1980's, the cultivation of Fraser Fir Christmas trees became an important part of the economy of the North Carolina mountains (especially Alleghany, Ashe, Avery, Mitchell, and Watauga counties). Most Christmas tree plantations are at 1000-1500 m in elevation; below 1000 m, Fraser Fir is very susceptible to a fungal root rot (Phytophthora), above 1500 m it grows too slowly to be profitable and is often "flagged" by winds, ruining its shape for commercial purposes. [= RAB, C, F, FNA, G, K, S, W, WV, Y, Z]

Cedrus Trew 1757 (Cedar)

* Cedrus deodara (Roxburgh ex D. Don) G. Don, Deodar Cedar. Frequently planted, rarely escaped to suburban woodlands. [= K]

Larix P. Miller 1754 (Larch)

A genus of about 10 species, trees, of cold temperate and boreal regions of the Northern Hemisphere. References: Parker in FNA (1993b); Page in Kramer & Green (1990).

1 Leaves 2.5-3 cm long; cones 2.3-5 cm long, with > 30 pubescent scales; twigs pubescent; [alien species rarely planted] ............... L. decidua
1 Leaves 1-2.5 cm long; cones 1.2-2 cm long, with 10-20 glabrous scales; twigs glabrous; [native species rarely south to MD and WV], ............... .......................................................................................................................................................... L. laricina

* Larix decidua P. Miller, European Larch. Forests; native of Europe. Planted as an ornamental and experimentally as a forest tree, persisting and sometimes escaping in the high mountains of NC. [= F, K]
**PINACEAE (G7)**

**Larix laricina** (Du Roi) K. Koch, Eastern Larch, Eastern Tamarack. Bogs and swamps. NL (Newfoundland), NL (Labrador), Keewatin, and AK, south to MD (Garrett County, WV (Preston County and Randolph counties), OH, IN, IL, MN, and British Columbia. [= FNA, C, F, G, K, WV]

**Picea** A. Dietrich 1824 (Spruce)

1 Cones 10-16 cm long; upper branches spreading to ascending, the lower drooping; outer bud scales without hairlike projections; [plant an alien, but widely planted as an ornamental and sometimes as an experimental timber plantation tree] .................................................. *P. abies*

2 Cones 2.5-4.5 cm long; upper branches ascending, the lower spreading; outer bud scales prolonged into minute hairlike projections; [plant native] .................................................................................................................. *P. rubens*

* Picea abies* (Linnæus) H. Karsten, Norway Spruce. Persisting and escaping from forestry plantations at moderate or high elevations, notably in e. WV, Great Smoky Mountains National Park (Kephart Prong), Mount Mitchell State Park, and the Biltmore Estate; native of n. Europe. [= FNA, K, WV]

**Picea rubens** Sargent, Red Spruce, He Balsam. Common to dominant in spruce and spruce-fir forests at high elevations, scattered in northern hardwood forests, heath balds, boulderfield forests, ridges, and rarely coves, also in bogs or swampy forests at lower elevations (down to about 1000 m), ranging in moisture tolerance from dry ridges (though these are often fog-bathed) to saturated peats, and sometimes planted and naturalized. May-June; October. NS and NB south (interruptedly) to w. NC and e. TN. *Picea mariana* (P. Miller) Britton, Sterns, & Poggenburg, Black Spruce, ranges south to s. PA and n. NJ, and has also been reported from bogs in our area: for NC (Small 1933) and for VA (Fernald 1950). These reports are apparently based on misidentifications of short-leaved, bog-inhabiting populations of *P. rubens*. Hardin (1971b) discusses the existence of these southern populations of *P. rubens* growing in bogs (notably Long Hope Valley, Ashe and Watauga counties, NC and Pineola Bog, Avery County, NC) with shorter than normal leaves (8-10 mm long vs. 12-15 mm long). He suggests that “this may be ecotypic, but one wonders whether the short leaves and bog habitat might reflect a few Black Spruce genes that have persisted since the Pleistocene.” Further study with modern electrophoretic and molecular techniques is warranted. [= RAB, C, F, FNA, G, K, W, WV; > *P. rubens* – S; > *P. australis* Small – S]

**Pinus** Linnaeus 1753 (Pine)

A genus of about 110 species, trees, of the Northern Hemisphere, south to Central America. The State Tree of North Carolina is the “Pine,” the species left artfully and politically ambiguous. References: Kral in FNA (1993b); Duncan & Duncan (1988); Gernandt et al. (2005); Price, Liston, & Strauss (1998); Richardson (1998); Page in Kramer & Green (1990).

**Identification notes**: Young saplings generally have shorter needles than larger saplings and mature trees; measurements in the key are those of mature trees. Seedlings have needles single, rather than fascicled.

1 Needles 5 in each bundle; each needle with 1 vascular bundle; [subgenus Strobus, section Strobus] ........................................................................................................ *P. strobus*

2 Needles 2-3 (-4) in each bundle; each needle with 2 vascular bundles; [subgenus Pinus]  ........................................................................................................ *P. palustris*

3 Needles in bundles of 3, or 2 and 3, or 3 and 4 (predominantly or at least substantially in 3’s); [subgenus Pinus, section Trifoliae, subsection Australes]  ........................................................................................................ *P. banksiana*

4 Needles in bundles of 2 and 3.

5 Needles 3-7 cm long; prickles on cones 1-3 mm long, slender (< 1 mm wide at base of prickle)  ........................................................................................................ *P. pungens*

6 Needles 17-30 cm long; cones (6) 12-15 cm long  .................................................................................. *P. elliottii var. elliottii*

7 Needles 5-12 cm long; cones 4-7 cm long  .................................................................................. *P. echinata*

8 Needles in bundles of 3 (rarely with a few 2’s), or 3 and 4.

9 Cones distinctly longer than broad when open or closed, 5-13 cm long; needles mostly (10-) 12-23 (-28) cm long, 0.7-1.5 mm wide; buds not resinous (or only slightly so); trunks not producing adventitious sprouts (epicormic sprouting)  .................................................................................. *P. taeda*

10 Cones about as broad as long, 3-6 cm long; needles (4-) 7-16 (-20) cm long, 1.5-2.0 mm wide; buds resinous; trunks commonly producing adventitious sprouts (epicormic sprouting), especially in response to fire.

11 Needles (10-) 16-20 (-21) cm long, persisting 3-4 years; cones serotinous; [trees of pocosins, savannas, and other wetlands of the Coastal Plain]  .................................................................................. *P. serotina*

12 Needles 4-7 (-10) (-15) cm long, persisting only 2 years; cones opening at maturity, not serotinous; [trees of ridges, slopes, bottomlands, and bogs of the Mountains and Piedmont]  .................................................................................. *P. rigida*

3 Needles in bundles of 2 only.

9 Needles slender to somewhat stout, 0.5-1.2 mm wide.

10 Needles 10-17 cm long; branches brittle; spring shoots usually with several nodes (several whorls of branches)  .................................................................................. *P. resinosa*

11 Needles 2-3 cm long, generally twisted; cones either opening at maturity, not serotinous, the scales bearing prominent, slender prickles 2-5 mm long, or serotinous and unarmed; [subgenus Pinus, section Trifoliae, subsection Contortae]

12 Needles 2-3.5 cm long, not twisted, curved; cones serotinous, unarmed; leaf sheaths < 2.5 mm long  .................................................................. *P. banksiana*
12 Needles 2-8 cm long, generally twisted, straight; cones opening at maturity, not serotinous, the scales bearing prominent, slender prickles 2-5 mm long; leaf sheaths > 2.5 mm long..............................................P. virginiana
11 Needles 5-13 cm long, twisted or not; cones opening at maturity or serotinous, the scales bearing prominent, short, stout prickles or minute, decussate prickles, and also with a faint to conspicuous horizontal ridge.
13 Anthers yellow; bark tight, closely ridged, not sloughing off, reminiscent of a hardwood; [native trees of mesic to fairly wet, fertile soils]; [subgenus Pinus, section Trifoliae, subsection Australes]..............................................P. glabra
13 Anthers yellow; bark tight, closely ridged, not sloughing off, reminiscent of a hardwood; [native trees of mesic to fairly wet, fertile soils]; [subgenus Pinus, section Trifoliae, subsection Australes]..............................................P. glabra
13 Anthers yellow; bark tight, closely ridged, not sloughing off, reminiscent of a hardwood; [native trees of mesic to fairly wet, fertile soils]; [subgenus Pinus, section Trifoliae, subsection Australes]..............................................P. glabra
9 Needles stout, 1.3-2.5 mm wide.
14 Needles 15-25 cm long; cones 8-22 cm long; [trees naturalized on barrier islands]; [subgenus Pinus, section Pinaster]..............................................................................................................P. pinastris
14 Needles 3-16 cm long; cones 3-9 cm long; [collectively widespread.
15 Needles 7-16 cm long; cones 4-6 cm long, each scale bearing a small depressed mucro; [introduced tree].
16 Buds light brown, resinous; [introduced tree, often planted inland].................................................................................P. nigra
16 Buds white, not resinous; [introduced tree, usually planted only on Coastal Plain barrier islands]; [subgenus Pinus, section Pinus, subsection Pinus].................................................................P. thunbergiana
15 Needles 3-6 (-8) cm long; cones either 6-9 cm long with each scale bearing a stout, woody spine, or 3-6 cm long and unarmed; [native tree of the Mountains and upper Piedmont or introduced trees south to MD and WV].
17 Cones 6-9 cm long with each scale bearing a stout, woody spine; [native tree of the Mountains and upper Piedmont]; [subgenus Pinus, section Pinaster].................................................................P. pungens
17 Cones 3-6 cm long, unarmed; [introduced trees south to MD and WV].
18 Needles 2-3.5 cm long; cone appressed upwards against the stem, strongly asymmetrical; leaf sheaths < 2.5 mm long; [subgenus Pinus, section Trifoliae, subsection Contortae]..................................................................................P. banksiana
18 Needles 3-7 cm long; cone reflexed downwards against the stem; leaf sheaths > 2.5 mm long; [subgenus Pinus, section Pinus, subsection Pinus].........................................................................................P. sylvestris var. sylvestris

Auxiliary Key to common pines of the Piedmont

1 Needles 12-25 cm long, predominantly in bundles of 3; winter buds > 1 cm long; cones 6-15 cm long, falling soon after releasing seed; bark plates thick, without crater-like blisters..................................................P. taeda
1 Needles 2-13 cm long, predominantly in bundles of 2; winter buds < 1 cm long; cones 3-7 cm long, persisting on trees for several years after releasing seed; bark plates thin, with or without crater-like blisters.
2 Needles 7-13 cm long, not twisted, or slightly so, in bundles of 2 (usually with some in bundles of 3), rather slender, < 1.0 mm wide; bark plates mostly > 4 cm wide, with crater-like blisters ca. 1 mm in diameter; winter buds not very resinous; 3-4 year-old twigs rough and flaking ..................................................................P. echinata
2 Needles 2-8 cm long, typically twisted, in bundles of 2, rather stout, often 1.0-1.2 mm wide; bark plates mostly about 2 cm wide, without crater-like blisters; winter buds very resinous; 3-4 year-old twigs smoothish to rough, but not flaking ......................................................P. virginiana

Pinus echinata P. Miller, Shortleaf Pine, Rosemary Pine, Yellow Pine. Dry rocky ridges and slopes, sandhills, old fields, forests, generally in rather xeric sites, but also occurring in mesic to even wet sites. March-April; September-October. Widespread in se. North America, north to s. NY, s. PA, s. OH, s. IL, s. MO, and e. OK, perhaps reaching its greatest importance in dry, sandstone landscapes, such as the Cumberland Plateau of WV, KY, TN, and AL, and the Ozarks and Ouachitas of AR, MO, and OK. [= RAB, C, F, FNA, G, K, S, WH, WV, Z]

Pinus elliottii Engelmann var. elliottii. Slash Pine. Native in wet pine flatwoods and maritime forests in GA and SC, extensively planted in GA, SC, and NC in silvicultural plantations on a wide variety of soils, many of them unsuitable for its successful growth. January-February; October-November. P. elliottii var. elliottii ranges from s. SC south to c. peninsular FL, west to e. LA; var. densa Little & Dorman is restricted to c. and s. peninsular FL. P. elliottii var. densa is perhaps better treated as a full species, P. densa (Little & Dorman) de Laubenfels & Silba. P. elliottii var. elliottii has been extensively planted throughout the Coastal Plain of GA, NC, and SC, where it now occupies tens of thousands of hectares. Superficially, P. elliottii resembles both P. palustris and P. taeda, with cone size and needle length intermediate. P. elliottii var. elliottii is sometimes difficult to tell from P. taeda; additional helpful characteristics are the seed cones on 1.5-3 cm long stalks (vs. essentially sessile), seed cones reddish-brown and glossy, appearing varnished (vs. brown and dull), needles thicker and a dark glossy green (vs. thinner and a yellowish green); bark prominently flaking off and revealing reddish patches (vs. not notably flaking off and not

P. banksiana

Cedrus deodora

Larix decidua

Larix laricina

Picea abies

Picea rubens

Pinus banksiana

**Pinus glabra** Walter, Spruce Pine, Walter’s Pine. Bottomland forests, rich, moist soils. March-April; September-October. SC south to n. FL and west to se. LA. This pine is unusual in growing in moist (even infrequently flooded), fertile habitats, usually mixed with bottomland hardwoods, and apparently rather shade tolerant, sometimes growing as an understory tree. [= RAB, FNA, K, S, WH, Z]

* **Pinus nigra** Arnold, Austrian Pine. Disturbed areas; native of Europe. [= C, F, FNA, G, K]

**Pinus palustris** P. Miller, Longleaf Pine, Southern Pine. Formerly throughout the Coastal Plain, Sandhills, and lower Piedmont, on a wide variety of soils (sandy, loamy, clayey, or peaty), from very dry to very wet conditions, in savannas, woodlands, and forests affected by relatively frequent natural (lightning caused) fires (likely augmented by native Americans), now reduced to less than a tenth of its former abundance by a variety of forces, including turpentining, timbering, free-range hogs, fire suppression, and "site conversion" by foresters to other trees, now extremely rare in VA and north of the Neuse River in NC, still occurring in some abundance in the outer Coastal Plain from Carteret County, NC south into GA, in the Bladen Lakes area of Bladen and Cumberland counties, and in the Sandhills of Harnett, Hoke, Scotland, Richmond, Moore, Anson, and Montgomery counties, NC and south into GA. March-April; September-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to se. TX; it extends slightly into the Piedmont in most states where it occurs, and further into the Piedmont and low mountains in GA and AL. "The species has been heavily exploited for timber and turpentine production, and it has been estimated that by 1930 only ten percent of its original volume of timber remained" (Price 1989); certainly much less now remains. Longleaf Pine is featured in the official NC State Toast ("Here’s to the land of the longleaf Pine…") and the highest honor that the Governor of North Carolina can bestow on an individual for service to the state is to appoint him or her to the honorary Order of the Longleaf Pine. A hybrid with P. taeda, P. × sondereggerti H.H. Chapman, occurs. [= RAB, C, FNA, K, WH; = P. australis Michaux f. – F, G, S]

[Pic: Pinus clausa

* **Pinus pinaster** Aiton, Maritime Pine, Cluster Pine. Planted and naturalized on barrier islands; native of Mediterranean Europe. *P. pinaster* is reported by Brown (1959) to be "introduced from Mediterranean region and planted on sand-flats in vicinity of Corolla, Currituck Banks, Bodie and Hatteras Island 1936-1940.... Now producing seeds and becoming naturalized near Cape Hatteras Lighthouse. More resistant to salt spray than native pines" (Brown 1959). Graetz (1973) discusses its use on the Outer Banks and concludes that it is "not as well adapted to inclement beach conditions as Japanese black pine." *P. pinaster* is conspicuous just south of Nags Head on NC Highway 12 (Dare County, NC), further south at Bodie Island Lighthouse (Dare County, NC), on Ocracoke Island (Hyde County, NC), and elsewhere. [= K]

**Pinus pungens** Lambert, Table Mountain Pine, Burr Pine, Hickory Pine. Dry ridges, cliffs, shale barrens, usually requiring fire for its reproduction, occurring at least up to 1550 m. May; September-October. A Central and Southern Appalachian endemic: n. NJ, through se. PA, w. MD, WV, w. VA, w. NC, and c. TN to nw. SC and ne. GA. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

**Pinus resinosa** Aiton, Red Pine. High elevation forests, in pine plantations, and persisting after silvicultural planting. This species is native as far south as WV (Pendleton and Hardcy counties) and PA (Luzerne, Wyoming, Tioga, and Centre counties). In WV, it is much more common as a plantation tree than as a native. [= C, F, FNA, G, K, WH]

**Pinus rigida** P. Miller, Pitch Pine. Primarily on dry ridges, more or less requiring fire for its reproduction, less commonly in peat soils of mountain bogs (and then often at elevations of 800-1000 m) and also scattered through a variety of forest types. May; September-October. S. Canada and s. ME south to n. GA. It is abundant near sea level in the Pine Barrens of NJ, but in NC is limited to the mountains and upper Piedmont; it is replaced in Coastal Plain fire-maintained wetland communities by the related *Pinus serotina*. [= RAB, C, F, FNA, G, K, S, W, WV, Z; = P. rigida ssp. rigida]

**Pinus serotina** Michaux, Pocosin Pine, Pond Pine, Marsh Pine. Peaty soils of pocosins, swamps of small blackwater streams. April; August (or at any time of year in response to fire). A Southeastern Coastal Plain endemic: s. NJ south to n. FL and se. AL, restricted to the Coastal Plain. A remarkable tree, well-adapted to fire by its serotinous cones and its ability to resprout needles from the branches, trunk ("epicormic sprouting"), or roots following fire. Extensive areas of peatland in the outer Coastal Plain are dominated by *P. serotina*, sometimes codominant with *Gordonia lasianthus*. Following fires which destroy all branches but do not kill the trees, epicormic sprouting results in entire forests of odd-looking cylindrical pines, the trunk thickly beset with needles, the outline of the tree a narrow cylinder 10-20 meters tall and less than 1 meter in diameter from base to summit. *P. serotina* is clearly a southern relative of *P. rigida*. It normally occurs in fire-maintained wetlands associated with ("downhill" from) *P. palustris*. On deep peats, *P. serotina* is stunted and of very irregular form; on mineral or shallower organic soils it can reach large size. Even when well-developed, the trunk is typically twisted and gnarled, helping to distinguish it from *P. taeda*. [= RAB, C, F, FNA, K, S, WH, Z; = P. rigida P. Miller ssp. serotina (Michaux) Clausen]

**Pinus strobus** Linnaeus, Eastern White Pine. Moist to dry forests, bottomlands, dry, rocky ridges in humid gorges. April; August-September. Widespread in ne. North America, south to VA, w. and (rarely) c. NC, nw. SC, n. GA, e. TN, KY, IN, n. IL, e. IA, and MN. *P. strobus* was probably the tallest tree in e. North America, reaching heights of 60-70 meters. It was a very important timber tree historically. In NC a notable relict and disjunct stand of *P. strobus* occurs on bluffs of the Deep River in
the eastern Piedmont of Chatham County; in VA *P. strobus* is widely but irregularly distributed in the lower Piedmont. 

*Pinus sylvestris* Linnaeus var. *sylvestris*, Scots Pine. Cultivated and sometimes escaped; native of Europe. Introduced and at least weakly naturalized south to MD (Kartesz 1999) and e. WV (Morton et al. 2004). [= FNA; < *P. sylvestris* – C, F, G, K]

*Pinus taeda* Linnaeus, Loblolly Pine, Old Field Pine. Forests, fields, pine plantations, much more abundant and widespread than formerly, occurring further west than as a native. March-April; October-November. Native from s. NJ, DE, and e. MD south to n. peninsular FL, west to e. TX and se. OK, primarily on the Coastal Plain, but inland to s. TN; this distribution now expanded by forestry plantation. Northward. See *P. elliottii* for additional characters to distinguish these two species. [= RAB, C, F, FNA, G, K, S, W, WH, Z]

*Pinus thunbergiana* Franco, Japanese Black Pine. Planted and persisting, sometimes appearing native, on barrier islands, native of Japan. Growing in maritime situations in its native land, this tree's strong resistance to salt spray is the reason for its horticultural use in our area. Following moderate storm events on the coast, *P. thunbergiana*'s needles remain green and undamaged, even when needles of *P. taeda*, native to such situations, are salt-killed. [= K: =? *P. thunbergii* Parlins]

*Pinus virginiana* P. Miller, Virginia Pine, Scrub Pine, Jersey Pine. Dry forests and woodlands, especially on slopes and ridges, also common in certain areas as a weedy successional tree on nearly any kind of site. March-May; September-November. Primarily a Central and Southern Appalachian endemic: s. NY, NJ, and PA, south through VA, WV, s. OH, s. IL, KY, TN, and NC to nw. SC, n. GA, n. AL, and ne. MS. A small, scrubby pine, occurring in very dense, monospecific stands in the upper Piedmont as a result of secondary succession of old fields. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

Tsuga Carrière 1847 (Hemlock)

1 Most of the leaves 8-13 mm long, those originating from the sides and lower surface of the twig spreading more or less distichously in a horizontal plane, normally sized, those borne on the upper surface of the twig more or less appressed, dwarf, mostly 1/6 to 1/2 as long as the adjacent lateral leaves, 1-3 (-6) mm long, the whitened undersurface (consisting of rows of stomata) exposed upward; leaf margins minutely serrulate; leaf apices obtuse to rounded; seed cones 12-25 mm long, the ovuliferous scales ascending, even at maturity .............. *Tsuga canadensis*

1 Most of the leaves 10-18 mm long, those originating from the sides and lower surface of the twig spreading more or less distichously in a horizontal plane, normally sized, those borne on the upper surface of the twig not appressed, spreading at a 60-90 degree angle from the twig, mostly 3/4 to fully as long as the adjacent lateral leaves, 8-15 mm long, the whitened undersurface (consisting of rows of stomata) not exposed upward; leaf margins entire; leaf apices minutely retuse (notched), truncate, or rounded; seed cones 20-38 mm long, the ovuliferous scales spreading at a right angle to the axis at maturity .............................................. *Tsuga caroliniana*
**PINACEAE (G7)**

A family of about 29 genera and about 130 species. Recent studies indicate that the separation of the Taxodiaceae from the Cupressaceae is not warranted, and they are here combined (Gadek et al. 2000; Brunsfeld et al. 1994). The subfamilial classification used here follows Gadek et al. (2000). References: Farjon (2005); Hart & Price (1990); Hardin (1971b); Watson & Eckenwalder in FNA (1993b); Page in Kramer & Green (1990).

1. Leaves alternate.
2. Leaves deciduous, flexible, < 2 cm long, parallel-sided, the apex short-acuminate; [subfamily *Cunninghamiioideae*]  

1. *Cunninghania* R. Brown 1826 (China-fir)

* Cunninghamia lanceolata* (Lambert) Hooker, China-fir. Suburban woodlands; commonly planted horticulturally, rarely naturalizing, native of China. A variety of forms are seen, some with dark-green, others with glaucous-blue foliage. [= K, Z; C. sinensis R. Brown]

2. *Taxodium* L.C. Richard 1810 (Bald-cypress)

A genus of 3 species, trees, of e. North America and Mexico. There has been much debate over whether the two taxa of *Taxodium* in our area should be treated as species or varieties, and if as varieties, the proper nomenclature. I agree with Godfrey (1988), in his preference "to recognize two species ... because it is my perception that the vast majority of trees (populations) are thus distinguishable." True intermediates appear to be non-existent, though the "mimicry" of the two species creates "pseudo-intermediates" that can cause difficulties in identification. Occasionally, the two species can be seen growing together, in "hybrid habitats," as at the junction of Lake Waccamaw and the Waccamaw River (Columbus County, NC); a few recognizable intermediates can be seen. See Lickey & Walker (2002) for a contrary argument supporting varietal status. Neufeld (1986) discusses the different architecture and ecophysiology of the two species. The only other species in the genus is *Taxodium distichum* var. *mexicanum* Gordon. *Taxodium ascendens* is most closely related to *Glyptostrobus* and *Cryptomeria*. References: Godfrey (1988)=Z; Duncan and Duncan (1988); Lickey & Walker (2002)=Y; Watson in FNA (1993b); Page in Kramer & Green (1990); Tsumura et al. (1999). Key adapted from Z.

1. Larger knees short, rarely > 4 dm tall, usually columnar or broad and mound-like, with thick, compact bark on top; leafy branchlets ascending from the twigs, secondly erect (the base often curving, the apical portion of the branchlet borne in a vertical plane), except on juvenile trees (which mimic *T. distichum*); leaves subulate, spirally arranged, not spreading laterally and featherlike (except on juvenile trees), ascending or appressed; leaves mostly 3-10 mm long (to 15 mm long on juvenile trees); bark thick (1-2.5 cm thick), furrowed, dark-brown, not exfoliating; [trees of isolated depressions (clay-based Carolina bays, depression ponds), wet savannas, pocosins and other wet peaty habitats, and, less commonly, blackwater swamps and natural lakes]  

1. *Taxodium ascendens*
3. **Thuja** Linnaeus 1753 (Arborvitaes)

**Thuja occidentalis** Linnaeus, American Arborvitae, Northern White Cedar, Flat Cedar. Dry limestone, dolostone, and calcareous sandstone cliffs, talus, and boulderfields, rarely in our area in calcareous swamps, also planted and persisting around old homesites and cemeteries (mainly in the Mountains). March-April; October. Se. VA (recently confirmed, J. Townsend, pers. comm. 2009) south to s. FL, west to e. LA; it is surely one of the most scenic trees of eastern North America. [= RAB, G, K, S, WH, Z; < *T. distichum* – F; = *T. distichum* var. *nuttans* (Aiton) Sweet]

**Thuja plicata** (D. Don) C. & S. Sarg, Pacific Yew. Forests of the coast of W. WA and B.C., west to e. CA; also planted and persisting around old homesites and cemeteries. March-April; October. B.C. south to s. OR, s. WA, and s. OR; in the Cascades south to SNW.

**Thuja plicata** var. **plicata** (D. Don) C. & S. Sarg, Ponderosa Yew. Same as above. March-April; October. B.C. south to s. OR, s. WA, and s. OR; in the Cascades south to SNW.

4. **Chamaecyparis** Spach 1841 (White Cedar)

**Chamaecyparis thyoides** (Linnaeus Britton, Sterns, & Poggenburg, Atlantic White Cedar, Juniper. Peat dome and streamhead pocosins, blackwater stream swamps, hillside seepages, in highly acidic, peaty or sandy soils. March-April; October-November. S. ME south to n. FL and west to s. MS. From NJ south it is strictly a tree of the Coastal Plain; northward it is often found in kettle-hole bogs. In SC and GA, *C. thyoides* is absent in the outer Coastal Plain, occurring primarily in the fall-line Sandhills. A prized timber tree, now much reduced in abundance, formerly used for cabinetry, boat-building, shingles, and other uses. The wood is valuable enough (and resistant enough to rot) to have been mined from bogs in NJ. NC has some of the largest remaining stands of Atlantic White Cedar, in areas of very difficult access, such as the interiors of major peat-domes and large peat-filled Carolina bays. The species is generally known as "juniper" in our area. [= RAB, C, F, FNA, G, K, S; > *Cupressus thyoides* Linnaeus]

5. **Juniperus** Linnaeus 1753 (Red Cedar, Juniper, Savin)

A genus of about 60 species, trees and shrubs, of temperate, boreal, and subtropical regions of the Northern Hemisphere. Various species of *Juniperus*, especially creeping species, are frequently used in landscaping. Molecular studies suggest that section *Juniperus* (*J. communis* var. *depressa* in our area) and section *Sabina* (*J. virginiana* in our area) are quite divergent (Adams & Demeke 1993). Small's (1933) recognition of the genus *Sabina* may prove to be warranted; some modern authors accept it (especially Europeans) and recent molecular evidence provides some support. References: Adams (2006b; 2006c)=Z; Adams in FNA (1993b); Adams (1986); Adams & Demeke (1993); Adams (1995, 2006a); Page in Kramer & Green (1990).

1 Leaves flat-acicular, 5-20 mm long, never scale-like, with a white line on the upper surface; leaves borne in whorls of 3, spreading at 45-90 degrees from the twig; female cone ("berry") axillary, maturing in 2-3 years; [section *Juniperus*] ............................ *J. communis* var. *depressa*

1 Leaves primarily scale-like, ca. 1-2 mm long, though acicular and 2-10 mm long on young trees and some lower branches of larger trees, without a white line on the upper surface (though generally somewhat glaucous); leaves of mature twigs borne in opposite pairs of 2, decussate (thus 4-ranked), appressed to the twig (leaves of immature twigs sometimes in whorls of 3, spreading at 10-45 degrees from the twig); female cones ("berries") terminal on short branches, maturing the first year; [section *Sabina*].
2 Female cones ("berries") 3-4 mm long; terminal twigs 0.75-0.90 mm wide (including the scale-like leaves); scale leaves 1.20-1.45 mm long, obtuse to acute; trees generally with rounded or flattened crowns, the lower branches often drooping. .....

*Juniperus communis* Linnaeus var. *depressa* Pursh, Ground Juniper, Mountain Juniper, Common Juniper. In thin soil around rock outcrops on mountain summits and Piedmont monadnocks and rocky bluffs (in GA and NC); high elevation old fields (in VA), xeric Coastal Plain sandhills (in SC and VA). March-April; fleshy cone maturing in second or third year. This species is circumpolar, widespread in n. North America, n. Europe, and n. Asia. Adams (2008a, 2008b, 2008c) recognizes 5 varieties in North America, all eastern North American plants belonging to var. *depressa*. In North America *J. communis* is primarily northern and montane, occurring nearly throughout Canada and AK, south in the Appalachians to n. GA, south in the Rocky Mountains to NM, AZ, and CA. Its berry is the juniper berry used as a spice, as well as the main flavoring of gin. It is sometimes planted as a landscaping plant. In e. North America, it is rare and scattered south of PA, MI, and WI, ranging south to se. VA south to c. peninsular FL, west to e. LA (Florida Parishes). Many individuals may be the basis of reports of var. *communis* from our area. Additional problems about the status of *Juniperus communis* in our area remain unresolved; variation in growth form, morphologic characters, and habitat suggest the possibility of the presence of several native taxa. See Coker & Totten (1945) for additional discussion. [= RAB, C, F, FNA, G, K, W, Z; < *J. sibirica* Burgsdorf – S; < *J. communis* – WV]

**Juniperus virginiana** Linnaeus var. *silicicola* (Small) E. Murray, Southern Red Cedar, Coastal Red Cedar. Maritime forests and scrub, hammocks, coastal shell middens and natural shell deposits, brackish marshes, and other sandy or peaty, circumneutral situations. January-February; October-November. Se. VA south to e. peninsular FL, west to e. LA (Florida Parishes). Many recent authors have treated this taxon as a species, but Adams (1986) and Adams in FNA (1993b) consider varietal status more appropriate; Adams (1995) suggests that the two may have diverged as recently as the Pleistocene. The two varieties are said to intergrade in GA, and in other areas the characters used to separate them seem variable or imperfectly correlated. Large individuals can be as much as a meter in diameter. [= FNA, K, Z; = *J. silicicola* (Small) L.H. Bailey – RAB; = Sabina silicicola Small – S = *J. virginiana* ssp. *silicicola* (Small) J. Silba; < *J. virginiana* – WH]

**Juniperus virginiana** Linnaeus var. *virginiana*, Eastern Red Cedar. In a wide variety of forests, pastures, old fields, roadsides, and fencerows, primarily upland, occurring most abundantly on circumneutral soils (including shrink-swell clays), derived from mafic or calcareous rocks. January-March; October-November. Var. *virginiana* ranges throughout e. United States. The wood is much used for fence posts and the traditional southern cedar chest (which takes advantage of the aromatic and moth-deterrent properties of cedar wood). [= C, F, FNA, G, K, Z; = *J. virginiana* – RAB, W, WV; = Sabina virginiana (Linnaeus) Antoine – S; < *J. virginiana* – WH; = *J. virginiana* ssp. *virginiana*]

6. **Platycladus** Spach 1842 (Chinese Arborvitae)

* *Platycladus orientalis* (Linnaeus) Franco, Oriental Arborvitae, Tree-of-life. Commonly planted, especially in graveyards, and rarely persisting and spreading to pastures, fields, and roadsides; native of Asia. [= FNA, K; = *Biota orientalis* (Linnaeus) Endlicher – S; = *Thuja orientalis* Linnaeus]

**G12a. CEPHALOTAXACEAE** Neger 1907 (Plum-yew Family) [in CUPRESSALES]

**Cephalotaxus** Siebold and Zuccarini ex Endlicher 1842 (Plum-yew)

* *Cephalotaxus harringtonia* (Knight ex J. Forbes) K. Koch, Plum-yew. Suburban woodlands; uncommonly grown horticulturally, rarely naturalizing in the vicinity of plantings (as in Chapel Hill, Orange County, NC, and Grottoes, Augusta County, VA), native of Asia. [= Z]
The genus consists of about 8 (or more) very closely related species, trees and shrubs, of temperate regions of the Northern Hemisphere. The species have been termed "discouragingly similar" by Hils in FNA (1993b). In e. North America, *T. canadensis* occurs in ne. North America, and *T. floridana* Chapman is endemic to Panhandle FL. *T. brevifolia* Nuttall, Pacific Yew, of BC and AB south to MT, ID, OR, and CA, has recently been widely publicized as the source of an anti-cancer drug, present in all species of the genus. *T. baccata* Linnaeus is native to Europe, and 3-4 additional species occur in Japan and e. mainland Asia (Price 1990). References: Hils in FNA (1993b); Spjut (2007a, 2007b)=Y; Farjon (1998)=Z; Page in Kramer & Green (1990).

1 Bud scales blunt, only slightly keeled. ....................................................................................................................................................*T. baccata*

1 Bud scales often acute, keeled.

2 Leaf undersurfaces with cuticular papillae along the stomatal bands; shrubs or small trees to 10 m tall; [of Panhandle FL]........*T. floridana*

2 Leaf undersurfaces usually lacking cuticular papillae along the stomatal bands; shrubs to 2 m tall (or trees in *T. cuspidata*); [of w. NC and VA northward, or naturalized from plantings].

3 Stomata in (4-)5-9 (-11) rows on each side of midvein; [native of ne. N. America, south to w. NC and VA]. .........................*T. canadensis*

3 Stomata in (7-)9-14 (-17) rows on each side of midvein; [alien] ......................................................................................................................*T. cuspidata*
SECTION 4: MAGNOLIIDS AND PRIMITIVE ANGIOSPERMS

3. CABOMBACEAE A. Richard 1828 (Water-shield Family) [in NYMPHAEALES]

A family of 2 genera and about 6 species, aquatic herbs, nearly cosmopolitan. This family is closely related to the Nymphaeaceae and may be best combined with it (Angiosperm Phylogeny Group 2003). References: Wiersema in FNA (1997); Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993); Les et al. (1999).

1 Plants with all leaves floating and peltate; plants coated with a layer of transparent, mucilaginous jelly; floating peltate leaves 3.5-11 cm long, 2-6.5 cm wide; [subfamily Hydroptilidae] ......................................................................................................................................................... Brasenia

Brasenia Schreber 1789 (Water-shield)

A monotypic genus, an aquatic herb, widely distributed in tropical and temperate regions of the Old and New World. References: Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: The elliptic, peltate, floating leaves and mucilaginous petioles make Brasenia unmistakable.

Brasenia schreberi J.F. Gmelin, Water-shield, Purple Wen-dock. Lakes, ponds, sluggish streams, floodplain oxbow ponds. June-October. NS west to MN, south to s. FL and TX; also from BC south to CA; also in tropical America and the Old World. [= RAB, C, F, FNA, G, GW, K, S, W]

Cabomba Aublet 1775 (Fanwort)

A genus of about 5 species, aquatic herbs, tropical and temperate regions of America. References: Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: Cabomba is sometimes mistaken for other, superficially somewhat similar aquatics, such as Ceratophyllum (Ceratophyllaceae), Utricularia (Lentibulariaceae), and Myriophyllum (Haloragaceae). Cabomba has the leaves opposite (rather than whorled), dichotomously divided (like Ceratophyllum), but the divisions lacking the marginal denticles of Ceratophyllum, and on a 1-3 cm long petiole (vs. sessile or on a petiole 0.2 mm long). Utricularia has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. Myriophyllum has the leaves pectinately rather than dichotomously divided.

Cabomba caroliniana A. Gray, Fanwort. Millponds, lakes, slow-moving streams. May-September. NJ west to OH, s. MI, and MO, south to FL and TX; sporadically introduced elsewhere from aquarium "throw-outs." C. caroliniana var. pulcherrima R.M. Harper, with purplish flowers and vegetative parts, occurs in the southeastern Coastal Plain; it needs further evaluation. GW imply that the purple pigmentation may be merely an environmental response to warm waters, and is not correlated with morphologic characters. [= RAB, C, F, FNA, G, GW, S; > C. caroliniana var. caroliniana – K; > C. caroliniana var. pulcherrima R.M. Harper – K; > C. pulcherrima (R.M. Harper) Fassett]

4. NYMPHAEACEAE R.A. Salisbury 1805 (Water-lily Family) [in NYMPHAEALES]

A family of 6 genera and about 75 species, aquatic herbs, cosmopolitan. References: Wiersema & Hellquist in FNA (1997); Schneider & Williamson in Kubitzki, Rohwer, & Bittrich (1993); Les et al. (1999).

1 Flowers nearly spherical, 2-5 cm in diameter; sepals 6 (in our species), petaloid, green to yellow, incurved; petals many, inconspicuous, scalelike or staminodial; leaves often of 2 types, the submersed leaves (when present) thinner in texture than the floating or emersed leaves; floating or emersed leaves having 60-90% of their surface area with vasculature derived from the midrib; rhizome with triwinged leaf scars; [subfamily Nymphaceseae] ......................................................................................................................................................... Nuphar

Nuphar J.E. Smith 1809 (Spatterdock, Yellow Pondlily)

A genus of about 16 species, aquatic herbs, of north temperate areas. Beal (1956) recognized 8 taxa of Nuphar in North America, which he treated as subspecies of the European N. lutea. Voss's (1985) statement (about the genus in Michigan) "our plants are quite easily distinguished ... and they are treated here as closely related species" applies equally (or better!) in our area. Recent treatments (see references) recognize multiple species. References: Beal (1956)=Z, Wiersema & Hellquist in FNA (1997); Padgett (1999)=Y; Padgett (2007)=X, Schneider & Williamson in Kubitzki, Rohwer, & Bittrich (1993). Key based in large part on FNA.
**NUPHAR LUTEUM** (Linnaeus) Sibthorp & J.E. Smith ssp. macrophyllum (Small) E.O. Beal – RAB, GW, W, Z; = Nuphar rubrodiscum (Small) Standley; = Nuphar lutea (Timm) E.O. Beal – K; = Nuphar lutea (Timm) E.O. Beal – Z

**NUPHAR MICROPHYLLA** (Persoon) Fernald. Lakes and ponds. June-September. NS, QC, and MB south to s. NJ, se. PA, MI, IL, and MN. [= C, FNA, X, Y; = Nuphar microphyllum – F, G; < Nuphar lutea ssp. pulmilla (Timm) E.O. Beal – K; < Nuphar pulmilla Timm; = Nuphar luteum ssp. pulmilla (Timm) E.O. Beal – Z]

**NUPHAR ORBICULATA** (Small) Standley. Quiet waters in blackwater swamps. May-October. A Southeastern Coastal Plain endemic: e. GA south to Panhandle FL and s. AL. [= FNA; = Nuphar lutea ssp. orbiculata (Small) E.O. Beal – K; > Nymphaea orbiculata Small – S; > Nymphaea bowbymica (Miller & Standley) Standley – S; = Nuphar advena (Aiton) Aiton f. ssp. orbiculata (Small) D. Padgett – X, Y; = Nuphar luteum ssp. orbiculatum (Small) E.O. Beal – Z]

**NUPHAR RUBRODISCA** Morong. Lakes and ponds. June-September. NB, QC, and ON south to NJ, PA, MI, and MN. [= FNA; = Nuphar × rubrodiscum Morong – C, X; = Nuphar × rubrodiscum Morong – F; = Nuphar rubrodiscum – G; = Nuphar lutea J.E. Smith ssp. rubrodiscum (Morong) Hellquist & Wiersema – K]

**NUPHAR SAGITTIFOLIA** (Walter) Pursh, Narrowleaf Pondlily, Bonnets. Blackwater streams, rivers, and lakes, in swift, sluggish, or stagnant water, extending downstream into freshwater tidal areas. April-October. Endemic to our area: e. VA south to ne. SC, very conspicuous and locally abundant on shallow bars along rivers such as the Northeast Cape Fear, Black, and Waccamaw, and forming dense colonies in Lake Waccamaw. Apparent hybrids with *N. advena* have been named *Nuphar ×interfluitans* Fernald. The submersed leaves have somewhat the texture and appearance of a thin leaf lettuce or the marine alga *Ulva*. This species appears to be closely related to *N. ulvacea* (Miller & Standley) Standley of blackwater rivers of Panhandle FL, another phytogeographic connection between se. NC and Panhandle FL. DePoe & Beal (1969) and Beal & Southall (1977) argue that this taxon and *N. advena* intergrade clinally, with *N. advena* inland and *N. sagittifolia* in the outer Coastal Plain, and that the two taxa are maintained by water temperatures. This ignores the fact that the two taxa often occur in close proximity to one another in both the inner and outer Coastal Plain. The frequency of so-called intermediates has also been exaggerated; few populations will present any difficulties in identification. I prefer to treat these taxa as species, with rare hybridization or introgression. Molecular data suggest that *N. sagittifolia* is more closely related to the boreal *N. variegate* than to *N. advena* (Padgett 2007). [= C, FNA, X; = Nuphar luteum (Linnaeus) Sibthorp & J.E. Smith ssp. sagittifolium (Walter) E.O. Beal – RAB, GW, Z; = Nuphar sagittifolium – F, G, orthographic variant; = Nuphar lutea J.E. Smith ssp. sagittifolia (Walter) E.O. Beal – K; = Nymphaea sagittifolia Walter – S]

NYMPHAEEACEAE

*Nuphar variegata* Durand in G.W. Clinton. Lakes and ponds. Widespread in ne. North America, south to DE, NJ, PA, OH, IN, IL, IA, and NE. May - September. [= C, FNA, X; = Nuphar variegatum – F, G; = Nuphar lutea ssp. variegata (Durand) E.O. Beal – K; = Nuphar luteum ssp. variegatum (Durand) E.O. Beal – Z]

*Nymphaea* Linnaeus 1753 (Waterlily)

1 Leaf margins sinuate-dentate ..........................................................N. capensis var. zanzibariensis
1 Leaf margins entire.
2 Petals blue ..................................................................................................N. elegans
2 Petals yellow or white (to pink).
3 Petals yellow; plants not producing stolons.
4 Petiole solid-colored; leaf length/width ratio (length measured from petiole attachment to tip of leaf, along midvein) (0.44-) avg. 0.56 (-0.71); two leaf lobes with rounded lobe tips; lower leaf surface reddish-purple ..........................................................N. odorata ssp. odorata
4 Petiole striped; leaf length/width ratio (-0.55-) 0.63 (-0.73); leaf lobes with pointed tips; lower leaf surface green.

* Nymphaea capensis* Thunberg var. zanzibariensis (Caspar) Conard, Cape Blue Waterlily. Ponds and canals; native of Africa. April-August. [= K, WH]

*Nymphaea elegans* Hooker, Tropical Blue Waterlily. Ponds, ditches, cypress swamps. April-August. FL west to TX, south into Mexico; Bahamas. [= K, WH]

*Nymphaea mexicana* Zuccarini, Banana Waterlily, Yellow Waterlily. Sluggish or stagnant waters; scattered in occurrence and possibly introduced from further south, but the introduction agents may well be wild ducks, such as canvasbacks. June-September. Ne. NC south to s. FL, west to TX, also in sw. United States and Mexico. [= RAB, FNA, K, Z; = Castalia flava (Leitner) Greene – S]

*Nymphaea odorata* W.T. Aiton ssp. odorata, White Waterlily. Ponds, sluggish waters. June-September. NL (Newfoundland) west to MB, south to FL and TX; also scattered in the w. United States. *N. odorata* is polymorphic, leading to the naming of numerous species, subspecies, and varieties (see synonymy for a few of the named entities). Wiesema in FNA (1997) recognize ssp. odorata (all of our plants) and ssp. tuberosa (Paine) Wiesema & Hellquist, more western and northern, but approaching our area (see below). Other named entities warrant further evaluation. *N. odorata* var. gigantea [= Castalia lekophylla Small] occurs on the Coastal Plain, and is considered to differ from *N. odorata* in its larger leaves (1.5-6 dm in diameter vs. 0.5-2.5 dm), larger flowers (mostly > 15 cm wide vs. mostly < 10 cm), and leaves upturned at the margins (vs. flat). *N. odorata* var. minor [= Castalia minor (Sims) Nyar] is considered to differ from *N. odorata* in its generally smaller size, leaves 5-11 cm in diameter, flowers mostly < 8 cm wide (vs. mostly > 9 cm wide); it may be merely a dwarfed form of extremely nutrient-limited waters of the Coastal Plain. [= FNA, K, Z; < N. odorata – RAB, WV; > < N. odorata var. odorata – C; > N. odorata var. odorata – F, G; > N. odorata var. gigantea Tricker – C, F, G; > N. odorata Schiv. stenopetalata Fernald – F; > Castalia odorata (W.T. Aiton) Wood – S; > Castalia minor (Sims) Nyar – S; > Castalia lekophylla Small – S]

7a. ILLICIACEAE A.C. Smith 1947 (Star-anise Family) [in AUSTROBAILEYALES]

*Ilicium* Linnaeus 1759 (Star-anise)

A genus of about 42 species, shrubs and trees, of temperate and subtropical se. Asia and se. North America (se. United States, Cuba, Haiti, and e. Mexico). References: Morris et al. (2007) studied the evolution of the genus and revised its sectional taxonomy; New World and Old World taxa form separate clades, treated as separate sections, our species being in section *Cymbostemon*. Vincent in FNA (1997); Morris et al. (2007); Keng in Kubitzki, Rohwer, & Bittrich (1993); Stone & Freeman (1968).
ILLICIACEAE

Illicium floridanum Ellis, Florida Star-anise. Acid ravines and small stream swamps. Sw. GA west to e. LA. Sparingly naturalized north of its native range from plantings, as along Black Creek, at Kalmia Gardens, Hartsville, Darlington County, SC (D. Hope, pers.comm. 2008). [= FNA, GW, K, S, WH]

Illicium parviflorum Michaux ex Ventenat, Swamp Star-anise, Yellow Anise-tree, Ocala Anise-tree. Cultivated and persistent; native of central peninsular FL. April-June. This species occurs in swampy forests, evergreen hammocks, and bayheads and is endemic to scattered localities in central FL; it is in the horticultural trade and has been introduced in various places, including sw. and se. GA and sc. SC (Aiken County) (H. Shealy and R. McCartney, pers.comm. 2008). [= FNA, K, S, WH]

7b. SCHISANDRACEAE Blume 1830 (Star-vine Family) [in AUSTROBAILEYALES]

A family of 2 genera and about 40-60 species, woody vines, of e. Asia and e. North America (only our single species). The family is most closely related to the Illiciaceae, Austrobaileyaceae, and Trimeniaceae. In APG III (2009), Schisandraceae is included in Illiciaceae, but the differences seem sufficient to keep them separate. References: Saunders (2001); Keng in Kubitzki, Rohwer, & Bittrich (1993).

Schisandra Michaux 1803 (Star-vine)

Schisandra glabra (Brickell) Rehder, Star-vine, Climbing-magnolia, Magnolia-vine. Rich slopes adjacent to bottomland forests, mesic "islands" surrounded by bottomlands, moist hammocks. May-June; July-August. Ne. NC (Martin County), sc. NC (Gaston County), n. GA, w. TN, e. and se. KY, and e. AR south to the FL Panhandle and LA; Mexico (Sierra Madre Oriental, Hidalgo). [= RAB, K, WH, Y, Z; = Schizandra coccinea Michaux – S, orthographic variant; = S. coccinea Michaux – W]

11. SAURURACEAE E. Meyer 1827 (Lizard's-tail Family) [in PIPERALES]

A family of 4 genera and 6 species, perennial herbs, of temperate e. and se. Asia (Saururus, Gymnotheca, Houttuynia), w. North America (Anemopsis), and e. North America (Saururus). One other member of the family occurs in North America: Anemopsis californica Hooker & Arnott, primarily of the sw. United States. References: Buddell & Thieret in FNA (1997); Wood (1971); Cheng-Yih & Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Meng et al. (2003).

Houttuynia Thunberg

{genus info}

* Houttuynia cordata Thunberg. Disturbed areas; moist suburban forests; native of e. Asia.

Saururus Linnaeus 1753 (Lizard's-tail, Water-dragon)

Saururus cernuus Linnaeus, Lizard's-tail, Water-dragon. Swamps, overthrow pools in stream floodplains, ditches, usually where water ponds seasonally or periodically. May-July; August-September. CT, s. QC, s. ON, and MI south to s. FL and e. TX. In swamps of the Coastal Plain, Saururus often is dominant in large patches. The elongate inflorescence, drooping at the tip, is distinctive, attractive, and the fanciful inspiration for the genus name, the specific epithet, and the common names. Thien et al. (1994) studied the reproductive biology of Saururus cernuus, and found that pollination was both by wind and by insects. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV]
ANGIOSPERMS

12. PIPERACEAE C.A. Agardh 1824 (Pepper Family) [in PIPERALES]

A family of about 5-8 genera and 3000 species, shrubs, herbs, trees, and vines, of tropical and subtropical areas. References: Tebbs in Kubitzki, Rohwer, & Bittrich (1993).

**Peperomia** Ruiz & Pavón 1794 (Peperomia)

1 Leaves opposite or whorled; stems pubescent ................................................................. P. humilis
1 Leaves alternate; stems glabrous .................................................................................. P. pellucida

* **Peperomia pellucida** (Linnaeus) Kunth, Pepper-elder, Man-to-man. Disturbed areas; introduced. P. pellucida has been collected escaped from cultivation in FL, LA, and GA (in the vicinity of Savannah). Boufford (1982) describes the species as showing "weedy tendencies" in the southeastern United States, where "first collected in 1957," and states that "it will be interesting to see if this plant will continue to expand its range". [= FNA, K, Z]

15. ARISTOLOCHIACEAE A. L. de Jussieu 1789 (Birthwort Family) [in PIPERALES]

A family of about 6-12 genera and 600 species, vines, shrubs, and herbs, of tropical, subtropical, and warm temperate regions. References: Barringer & Whittemore in FNA (1997); Ohi-Toma et al. (2006); Neinhuis et al. (2005); Huber in Kubitzki, Rohwer, & Bittrich (1993).

1 Acaulescent herb; calyx tube straight, radially symmetrical; stamens 12; [subfamily Asaroideae].
2 Leaves deciduous, pubescent, paired ........................................................................ Asarum
2 Leaves evergreen, glabrous, not paired ...................................................................... Hexastylis
3 Woody, twining vine; leaves 8-35 cm wide; [subtribe Isotrematinae] Isotrema
3 Low, erect or ascending herb; leaves 0.7-6.5 cm wide.
4 Leaf blade as wide as long, or wider than long; leaf venation palmate; [subtribe Aristolochiinae] Aristolochia
4 Leaf blade narrower than long; leaf venation pinnate; [subtribe Isotrematinae] Endodeca

**Aristolochia** Linnaeus 1753 (Birthwort)

A genus of about 300 species, herbs and vines, once Endodeca, Isotrema, and Pararistolochia are excluded (Huber in Kubitzki 1993). Recent work has clarified that Aristolochia s.l. comprises 4 main clades, each of which is distinctive molecularly, morphologically, and in karyotype. These can be (as here) recognized as genera, or alternatively as four subgenera, grouped into two genera (Aristolochia including Pararistolochia, and Isotrema including Endodeca), as suggested by Ohi-Toma et al. (2006). References: Barringer in FNA (1997); Ohi-Toma et al. (2006); Kelly & González (2003); Huber in Kubitzki, Rohwer, & Bittrich (1993). [also see Endodeca and Isotrema]

1 Plant an herb; flowers yellowish, < 2 cm across .............................................................. A. clematitis
1 Plant a woody vine; flowers brownish-purple and white, ca. 10 cm across .................. A. elegans

* **Aristolochia clematitis** Linnaeus, Birthwort. Disturbed areas; native of Europe. Naturalized in se. PA (Rhoads & Klein 1993) and MD (Barringer in FNA 1997). [= C, FNA, K]

* **Aristolochia elegans** Mast., Elegant Dutchman’s-pipe, Calico Flower. Disturbed areas; native of Brazil. [? A. littoralis Parodi – WH]

Houttuynia cordata  Saururus cernuus  Peperomia humilis  Peperomia pellucida  Aristolochia clematitis  Aristolochia elegans

**Asarum** Linnaeus 1753 (Wild Ginger)

ARISTOLOCHIACEAE

1. Calyx lobes 5-10 (-12) mm long, strongly reflexed, often more-or-less appressed back against the calyx tube, acute or acuminate, the tubular tips 0-4 mm long. .................................................. A. reflexum

2. Calyx lobes 10-35 mm long, spreading to ascending from the base, acuminate to caudate, the tubular tips 4-10 mm long. ................................................................. A. acuminatum

Asarum canadense Linnaeus, Common Wild Ginger. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA, WV): rich deciduous forests in circumneutral soils; common (uncommon in Piedmont of NC and SC, uncommon in VA Coastal Plain, rare in Coastal Plain in DE, NC, and SC). April-May. NB and QC west to MN, south to NC, AL, and n. LA. Taxa recognized at varietal or specific level in the past have recently often been ignored, but have some merit; they deserve further attention. [= S; < A. canadense var. canadense – C, G; < A. canadense – RAB, FNA, K, W; > A. canadense var. ambiguum (Bicknell) Farwell – F; > A. canadense var. canadense – F] [not yet mapped]

Asarum reflexum Bicknell. Mt (NC, VA?, WV?): rich deciduous forests in circumneutral soils; rare? April-May. CT west to s. MB, south to w. NC, KY, and MO. [= S = A. canadense Linnaeus var. reflexum (Bicknell) B.L. Robinson – C, F, G; < A. canadense – RAB, FNA, K, W; = A. reflexum Bicknell – S] [not yet mapped]

Endocera Rafinesque 1828 (Turpentine-root)

A genre of 2 (or more?) species, of eastern and sc. North America. This genus is morphologically distinctive within Aristolochia (in the broad sense), and forms a clade with Isotrema distinctive from Aristolochia s.s. (Ohi-Toma et al. 2006). References: Barringer in FNA (1997); Ohi-Toma et al. (2006); Kelly & González (2003); Neinhuis et al. (2005); Huber in Kubitzki, Rohwer, & Bittrich (1993).

Endocera serpentaria (Linnaeus) Rafinesque, Turpentine-root, Virginia Snakeroot. Dry to mesic forests, perhaps more restricted to mesic situations over acidic substrate, ranging into drier situations over calcareous or mafic substrates. May-June; June-July. CT and NY west to IL, MI, and MO, south to c. peninsular FL and TX. The tremendous variation in this species needs further study. Plants with sparingly pubescent, thin-textured, linear to lanceolate leaves have been called Aristolochia convolvulacea. These may represent merely morphologic extremes of a polymorphic complex; alternatively, some taxonomic recognition of such plants as distinct from A. serpentaria may be warranted. [= Aristolochia serpentaria Linnaeus – RAB, C, FNA, G, K, W, WH; > A. serpentaria var. hastata (Nuttall) Duchartre – F; > A. serpentaria var. serpentaria – F; > A. hastata Nuttall – S; > A. convolvulacea Small – S; > A. serpentaria – S]

Hexastylis Rafinesque 1825 (Heartleaf)

A genus of 10 species, herbs, of se. North America, very possibly best expanded to include Asian taxa treated in Heterotropa and Asiasarum. Barringer (1993) and Kelly (1997, 1998) have recently employed a broad definition of Asarum, including Hexastylis. Over the last half-century various students of the group (emphasizing a range of fields of evidence) have arrayed themselves for and against the recognition of Hexastylis as a genus distinct from Asarum. A cladistic analysis (Kelly 1997, 1998) showed distinctive clades which could be interpreted as evidence for the recognition of Hexastylis (including the Asian Heterotropa), though the author preferred to recognize 2 subgenera. I choose here to follow the more traditional (at least in our area) separation of Hexastylis from Asarum, until and unless stronger evidence is presented for their combination. Electrophotoec and morphologic studies currently in progress validate the species / varietal level taxonomy presented, insofar as results are available (R. Wyatt, pers. comm.). A difficult genus, Hexastylis is made more frustrating by the fact that nearly all diagnostic features relate to the shape and size of the fleshy and brittle calyx – characters which are difficult to describe and are largely lost when specimens are pressed. The difficulty of identifying herbarium specimens has sometimes been (apparently) used as a justification for reducing (often drastically, as in C) the number of taxa recognized. To those familiar with this genus in the field, however, the taxa here recognized form geographically distinctive populations. Size and (to a lesser degree) shape of individual flowers show considerable variation and can be altered by environmental factors; individual flowers or plants can be difficult to identify if taken out of context. Populations, however, are usually readily identifiable. References: Whitemore & Gaddy in FNA (1997); Gaddy (1987a)=Z; Blomquist (1957)=Y; Barringer (1993)=X; Gaddy (1987b); Gaddy in Wofford (1989); Sugawara (1987); Huber in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from FNA, Gaddy in Wofford (1989), and Gaddy (1987a).

Identification notes: The photograph (Figure 1) in Gaddy (1987a) of the flowers of all species other than H. arifolia and H. speciosa is highly recommended as an aid to identification. The calyx tube orifice is measured on the inside – the diameter of the opening. The width of calyx lobes is measured from sinus tip to sinus tip.

1. Style extension bifid to stigma; leaves triangular to ovate-sagittate or subhastate, portions of the sides of nearly all leaves straight or concave; leaves mottled, the paler areas between the veins

2. Calyx abruptly contracted near the middle, the lower portion narrowly cuplike, abruptly expanded into a much broader upper half; calyx tube with internal raised reticulations; calyx lobes spreading; [endemic near Montgomery, AL] ................................................................. H. speciosa

3. Calyx lobes erect, 2-4 mm long, 2-4 mm wide at base; [of the Mountains westward] ................................................................. H. arifolia var. ruthii
1 Style extension notched or divided at the apex, not bifid to the stigma; leaves rounded, with cordate base, all portions of the sides of the leaves convex; leaves mottled or unnotched, if mottled, the paler areas along the veins.

5 Inner surface of calyx lobes pilose with whitish hairs; plant rhizomatous, the rhizomes long-creeping

3 Calyx lobes spreading, 2.5-8 mm long, 3-9 mm wide at base; [of the Coastal Plain, Piedmont, and eastern Mountains].

4 Calyx tube 13-18 mm long, 6-10 mm wide; [of the Coastal Plain, Piedmont, and Mountains of s. VA, NC, SC, GA, and westward through AL and MS to se. LA].

4 Calyx tube 20-25 mm long, 10-12 mm wide; [of the lower Gulf Coastal Plain, of sw. GA, FL Panhandle, s. AL, s. MS, and se. LA].

Asarum arifolium (Michaux) Small var. callifolia (Small) Blomquist. Mesic forests. March-May. Sw. GA and Panhandle FL (?) west to se. LA, in the lower East Gulf Coastal Plain. [= FNA, K, Y, Z; = H. callifolia (Small) Small – S; = Asarum callifolium Small; < Asarum arifolium Michaux – WH; = Asarum arifolium Michaux var. callifolia (Small) Barringer – X]

Asarum arifolium (Michaux) Small var. ruthii (Ashe) Blomquist, Appalachian Little Brown Jug. Upland forests, ultramafic outcrop barrens, calcareous forests. March-June. A Southern Appalachian endemic: sw. VA, se. KY, w. NC, e. TN, n. AL, and n. GA. Perhaps warranting species status. At the Buck Creek olivine barren (Clay County, NC) this species carpets several hundred hectares, in association with Packera paupercula var. appalachiana, Thalictrum macrostylum, and Sporobolus heterolepis; various morphological differences, especially the rhizomatous habit, suggest that it may represent an undescribed taxon. [= C, FNA, K, W, Y, Z; < H. arifolia – RAB; = Asarum ruthii Ashe – F; = H. ruthii (Ashe) Small – G, S; = Asarum arifolium Michaux var. ruthii (Ashe) Barringer – X]

Endoedea serpentaria

Hexastylis arifolia (Michaux) Small var. ruthii, Appalachian Heartleaf. On acidic soils in deciduous forests with Kalmia latifolia and Rhododendron maximum. May-June. Endemic to the Cumberland Plateau of TN (Chester, Wofford, & Kral 1997) and KY, with a few disjunct populations in the Blue Ridge of NC and in the Ridge and Valley of sw. VA (Washington County) (J. Townsend, pers.comm. 2006). [= RAB, FNA, K, W, Y, Z; < H. virginica – C; < Asarum contractum (Blomquist) Barringer – X (also see H. rhombiformis); = Asarum contractum (Blomquist) Barringer]

Hexastylis lewisii (Fernald) Blomquist & Oosting, Lewis's Heartleaf. Upland forests (pine or oak), pocosin ecosystems. April-May. Endemic to the Piedmont of VA and the Piedmont and Coastal Plain of NC. [= RAB, FNA, K, Y, Z; < H. shuttleworthii – C; = Asarum lewisii Fernald – F]
**Isotrema** Rafinesque 1819 (Dutchman's-pipe)

A genus of about 50 species, of temperate and tropical Asia, se. North America, and Central America. References: Barringer in FNA (1997); Oh-i-Toma et al. (2006); Kelly & González (2003); Huber in Kubitzki, Rohwer, & Bittrich (1993).

1 Plant nearly glabrous; leaves abruptly pointed; calyx purple or brown; [of the Mountains] ..........................I. macrophyllum

1 Plant soft pubescent; leaves blunt; calyx yellow, with a purple mouth; [largely of west or south of the Appalachians, also locally spread from cultivation] ..........................I. tomentosum

17. MAGNOLIACEAE A.L. de Jussieu 1789 (Magnolia Family) [in MAGNOLIALES]

A family of about 7 genera and 223 species, trees and shrubs, tropical and warm temperate, of e. and se. Asia, and from e. North America south through West Indies and Central America to Brazil. References: Hardin (1972); Hardin & Jones (1989)=Z; Meyer in FNA (1997); Figlar & Nooteboom (2004); Frodin & Govaerts (1996); Nooteboom in Kubitzki, Rohwer, & Bittrich (1993); Kim et al. (2001).

A genus of 2 species, trees, relictually distributed, with 

- Magnolia
- Liriodendron

Liriodendron Linnaeus (Tulip-tree)

1 Leaves about as broad as long, (2-) 4 (-8)-lobed; fruit a 2-seeded, indehiscent samara; [subfamily Magnolioideae]............... Magnolia

2 Leaves longer than broad, not lobed (in some species the leaves auriculate-cordate basally); fruit a cone-like aggregate, each follicle dehiscing to reveal the scarlet seed, at first connected to the follicle by a thread-like strand; [subfamily Liriodendroideae]............... Liriodendron

Magnolia Linnaeus 1753 (Magnolia, Cucumber-tree)

A genus of about 130 species, trees and shrubs, of e. Asia (Himalayas and Sri Lanka to Japan and w. Malaysia) and America (e. North America to West Indies, Central America, and South America). Molecular phylogenetics show Magnolia virginiana and M. grandiflora as closely related in a New World primarily subtropical clade, M. macrophylla in a clade with its close relatives, M. fraseri and M. pyramidata together, M. acuminata as basal in a clade that is otherwise Asian (equivalent to subgenus Yulania), and M. tripetala grouped in another clade that is otherwise Asian (Azuma et al. 2001). The sections used follow Figlar & Nooteboom (2004). References: Tobe (1998)=Y; Spongberg (1998)=X; Frodin & Govaerts (1996)=V; Palmarola-Bejerano, Romanov, & Bobrov (2008)=U; Azuma, Thien, & Kawano (1999); Azuma et al. (2001); Figlar & Nooteboom (2004); Nooteboom in Kubitzki, Rohwer, & Bittrich (1993); Kim et al. (2001); Hunt (1998).

1 Leaves cuneate to rounded (subcordate) at base.

2 Leaves glaucous and finely appressed-pubescent beneath; buds and twigs pubescent; [subgenus Magnolia, section Macrophylla].

3 Conelike aggregate fruit (follicetum) 2.5-6.5 cm long, 1.5-4 cm in diameter; leaf blade 17-56 cm long; stamens 170-350; pistils 20-50; small tree (to 12 m tall); [of Panhandle FL]......................................................... M. pyramidata

4 Staminodium and petals absent; leaf blade 7-15 cm long; 1-2 large achenes; [of Piedmont, and Coastal Plain (especially brownwater rivers and mesic habitats in the Coastal Plain is surprising to people used to North America, south to Panhandle FL. An important timber tree in the Southern Appalachians. [= Z; M. pyramidata]]

3 Conelike aggregate fruit (follicetum) 5-8 cm long, 5-7 cm in diameter; leaf blade 50-110 cm long; stamens (300-) 350-580; pistils 50-80; medium to large tree (to 32 m tall); [widespread, but not of Panhandle FL]......................................................... M. virginiana

2 Leaves green and glabrous beneath; buds and twigs glabrous; [subgenus Magnolia, section Auriculata].

4 Staminodium and petals absent; leaf blade 7-15 cm long; 1-2 large achenes; [of Piedmont, and Coastal Plain (especially brownwater rivers and mesic habitats in the Coastal Plain is surprising to people used to North America, south to Panhandle FL. An important timber tree in the Southern Appalachians. [= Z; M. pyramidata]]

1 Leaves cuneate to rounded (subcordate) at base.

2 Leaves longer than broad, not lobed (in some species the leaves auriculate-cordate basally); fruit a cone-like aggregate, each follicle dehiscing to reveal the scarlet seed, at first connected to the follicle by a thread-like strand; [subfamily Liriodendroideae]............... Liriodendron

1 Leaves about as broad as long, (2-) 4 (-8)-lobed; fruit a 2-seeded, indehiscent samara; [subfamily Magnolioideae]............... Magnolia
5 Leaves evergreen, coriaceous in texture, glossy dark green above as if varnished, rusty tomentose or green beneath; [subgenus Magnolia, section Magnolia] .................................................................................................................................................. M. grandiflora

5 Leaves variably evergreen to deciduous, herbaceous or subcoriaceous in texture, medium green above with a slightly glossy or dull finish; glaucous or green beneath.

6 Leaves evergreen to deciduous, aromatic when fresh, 8-20 cm long, elliptic, strongly glaucous beneath; [subgenus Magnolia, section Magnolia] .................................................................................................................................................. M. grandiflora

7 Leaves evergreen; previous year's stems densely pubescent; mature leaves with pubescent midveins; flowers opening near sundown (2-5 hours later than var. virginiana); medium to large tree, to >20 m tall; [of the Gulf Coast and inland, north and east to s. SC (e. NC?)]. .................................................................................................................................................. M. virginiana var. australis

7 Leaves evergreen to deciduous (at least tardily); previous year's stems glabrous; mature leaves with few hairs along the midvein below; flowers opening mid-afternoon; shrub to multi-stemmed small tree, to 10 m (rarely to 15 m) tall; [of the Atlantic Coastal Plain and inland, south and west to s. SC and w. NC]. .................................................................................................................................................. M. virginiana var. virginiana

6 Leaf base cuneate-attenuate; leaf blade ovate or oblongate (broader toward the tip); buds either glabrous or sericeous.

9 Leaf blades 15-50 cm long; buds glabrous; [native]; [subgenus Magnolia, section Yulania, subsection Tulipastrum].. .................................................................................................................................................. M. tripetala

8 Leaf base rounded to subcordate (often cuneate to widely cuneate in M. acuminata var. subcordata); leaves 10-30 cm long, broader near the middle or toward the base; borne scattered along the twig; pubescent; [subgenus Yulania, section Yulania, subsection Tulipastrum]

Magnolia acuminata (Linnaeus) Linnaeus var. acuminata, Cucumber-tree, Cucumber Magnolia. Mesic to subseric forests, especially by means strictly) over mafic or calcareous rocks, up to at least 1550m (where growing with Betula alleghaniensis, Abies firser, Picea rubens, and Sorbus americana), ultramafic outcrop barren (where codominant with Pinus rigida and Quercus alba). April-June; July-August. S. ME, MY, c. IN, s. MO, and e. OK, south to c. GA, Panhandle FL, s. AL, s. MS, and w. LA. The recognition of two varieties is uncertain (see discussion below). [= C, F, G, V, W, X, Y; < M. acuminata – RAB, FNA, K, W, Z; = Tulipastrum acuminatum (Linnaeus) Small - S; = Tulipastrum acuminatum (Linnaeus) D.L. Fu var. 1] Magnolia ashei Weatherby, Ashe’s Magnolia. Moist to wet hammocks. Endemic to FL Panhandle. [= FNA, K, Z; = M. macrophylla Michaux var. ashei (Weatherby) D.L. Johnson - WH; = M. macrophylla ssp. ashei (Weatherby) Spongberg – V, Y] Magnolia fraseri Walter, Fraser Magnolia, Earleaf Umbrella-tree. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA): mesic forests; common (uncommon in upper Piedmont only, uncommon in WV). April-May; July-August. A Southern Appalachian endemic: KY and w. VA south through w. NC and e. TN to nw. SC, n. GA, and ne. AL. [= RAB, C, F, FNA, G, K, S, W, Z; = M. fraseri var. fraseri – V, X; = M. fraseri ssp. fraseri – Y] Magnolia grandiﬂora Linnaeus, Southern Magnolia, Bull Bay. Maritime forests, mesic Coastal Plain bluffs and flats, bottomlands, now also widely naturalized, spreading from cultivation into wet to mesic forests. April-June; September-October. The pre-Columbian range was apparently from sc. NC south to c. peninsula FL, west to c. TX, largely on the Coastal Plain, now somewhat expanded northwards and inland by naturalization from centuries of horticultural planting. Curtis (1860) states that "the northern limit of this tree is in Brunswick County, south of the Cape Fear; but it flourishes in cultivation through all the lower part of the State. " This is, of course, the classic "southern magnolia," along with live oak (Quercus virginiana), and bald-cypress (Taxodium distichum), one of the totem trees of the Deep South. [= RAB, C, FNA, GW, K, S, V, Y; Z; Magnolia s.s.] Magnolia kobus DC., Kobus Magnolia, Kobushi Magnolia. Suburban woodlands; native of Japan. [add to synonymy]
Magnolia pygmaea Bartram, Pyramid Magnolia. Mesic hammocks, mesic forests, especially of bluffs and ravines. April-May; August. A Southeastern Coastal Plain endemic; c. SC south to Panhandle FL, west to e. TX. Sometimes treated as a variety or subspecies of M. fraseri, to which it is clearly closely related, but the distributional and morphological differences are discrete and specific status seems warranted. [= RAB, FNA, K, S, WH, Z; = M. fraseri Walter var. pygmaea (Bartram) Pampinini – V, X; = M. fraseri Walter ssp. pygmaea (Bartram) E. Murray – Y]

Magnolia tripetala (Linnaeus) Linnaeus, Umbrella Magnolia, Umbrella-tree. Mesic forests, ravines. April-May; July-October. Centered in the Southern Appalachians, but avoiding higher elevations, and therefore occurring primarily "around" the Blue Ridge; ranging from sc. and sw. PA, s. OH, s. IN south to SC, GA, Panhandle FL (Tobe 2007), AL, and MS; also disjunct in the Ouachita Mountains of c. AR and e. OK. [= RAB, C, F, FNA, G, K, S, V, W, WH, WV, X, Y, Z; = Houpoëa sp. 1]

Magnolia virginiana Linnaeus var. australis Sargent, Southern Sweet Bay. Pocosins, bay forests, and swamps in the Coastal Plain, streamhead pocosins, swamps, and sandhill seeps in the Sandhills, bogs and peaty swamps in the Piedmont and Mountains. April-July; July-October. S. SC (se. NC?!) south to s. FL, and west to e. TX, rarely extending into adjacent, more interior provinces; disjunct in nw. Cuba. Magnolia virginiana was recently discovered in Cuba, the single population named as ssp. oviedoana A. Palmarola, M.S. Romanov, & A.V. Bobrov (Palmarola-Bejarano, Romanov, & Bobrov 2008), but based on molecular results of Azuma et al. (2011), it seems better to consider this population as part of M. virginiana var. australis. Morphological, molecular, and chemical studies have shown strong variation in M. virginiana in North America, but the patterns are not clear based on the limited current studies (Azuma, Thien, & Kawano 1999). Based on the studies of Azuma et al. (2011), Azuma, Thien, & Kawano (1999), Tobe (1998), and McDaniel (1966), the recognition of two varieties seems clearly warranted, with a strong genetic break occurring in SC (a secondary and less strong genetic break separates West Gulf Coastal Plain populations from more eastern populations) (Azuma et al. 2011). Additional study is needed to understand the exact distributions of the two taxa in the area of contact (SC and adjacent GA and NC), whether species status is warranted, as suggested by Azuma et al. (2011), and the correlation between morphological traits and genetic variation. [= F, Y; < M. virginiana – RAB, C, FNA, G, GW, K, S, V, W, WH, X, Z; = M. virginiana ssp. australis (Sargent) A.E. Murray – U]

Magnolia virginiana Linnaeus var. virginiana, Northern Sweet Bay. Pocosins, bay forests, and swamps in the Coastal Plain, streamhead pocosins, swamps, and sandhill seeps in the Sandhills, bogs and peaty swamps in the Piedmont. April-July; July-October. Se. MA south to w. NC, s. SC, and e. GA. [= F, Y; < M. virginiana – RAB, C, FNA, G, GW, K, S, V, W, WH, X, Z; = M. virginiana var. virginiana – U]

21. ANNONACEAE A.L. de Jussieu 1789 (Custard-apple Family) [in MAGNOLIALES]

Asimina Adanson 1763 (Pawpaw)

Identification notes: Hybrids are known between some of the pineland species, notably A. angustifolia × incana [= A. ×nashii Kral], and should be expected where two species are present.

1 Leaves herbaceous in texture, obovate, >6 cm wide, acute-acuminate at the apex; peduncles with bracts; flowers reddish-maroon; [shrubs and trees]; [collectively widespread in our area].

2 Flowering peduncles 3-8 mm long, the hairs tan to rusty; leaves 6-15 (-20) cm long; sepals 4-7 mm long; outer petals 10-13 mm long; fruit 15-25 mm long; plant a shrub to 15 m tall; [widespread in our area] .................................................. A. parviflora

2 Flowering peduncles (10-) 15-20 (-25) mm long, the hairs dark reddish-brown; leaves 15-35 cm long; sepals 8-12 mm long; outer petals 15-25 mm long; fruit (3-) 7-15 cm long; plant a tree to 15 m tall; [widespread in our area] .................................................. A. reticulata

1 Leaves coriaceous in texture, linear to oval, blunt at the tip (or acute-acuminate); peduncles lacking bracts; flowers maroon, pale pink, yellow, cream, or white; [shrubs to 1.75 m tall]; [of e. GA, very rarely e. SC, and southward].

3 Flowers borne on growth of the previous year, appearing before or with leaf expansion; leaves 1.5-4× as long as broad, 4-10 cm long, 1-6 cm long; flowers with a sweet odor.

4 Newly emergent leaf blades densely tomentose on both surfaces with pale blonde or tan pubescence; outer petals white to yellowish, inner petals yellowish with a deep yellow corrugated zone; [of dry pinelands] .................................................. A. incana

4 Newly emergent leaf blades densely tomentose on the lower surface with the hairs near the midrib reddish, the upper surface sparingly pubescent; outer petals white, inner petals white, yellowish, or pink, with a maroon or purple corrugated zone; [of wet pinelands] ........... .................................................. A. reticulata
3. Flowers borne on growth of the current year, appearing after leaf expansion; leaves 3-15× as long as wide, 4-20 cm long, 0.5-4 cm wide; flowers with a sweet or fetid odor.

5. Flowers terminal; pubescence of new growth, petiole, lower leaf surface and peduncle dense, tomentose, and bright red. \[= Asimina incana \]

5. Flowers axillary; pubescence sparser and/or tan to rusty red.

6. Outer petals maroon or red, 1.5-3 cm long; leaves erect and secund, 4-11 cm long, 1-4 cm wide, averaging 3-5× as long as wide; leaf tips obtuse, rounded, or rounded-emarginate (rarely somewhat acute); shrubs to 3 (-5) dm tall. \[= Asimina pygmaea \]

6. Outer petals yellowish-white or pale pink, 3-10 cm long; leaves erect and secund, or not, 5-15 (-20) cm long, 0.5-3 cm wide, averaging 6-15× as long as wide; leaf tips acute or obtuse; shrubs 10-17.5 dm tall.

7. Leaves widest at or shortly above the middle, mostly 10-15× as long as wide; leaf margins revolute; outer petals white; new growth pubescent, becoming glabrous with age. \[= Asimina floridana \]

7. Leaves widest near the tip, mostly 6-12× as long as wide; leaf margins slightly revolute; outer petals white or pink; new growth glabrous or very sparsely pubescent, becoming glabrous with age. \[= Asimina angustifolia \]

Asimina angustifolia Rafinesque, Slimleaf Pawpaw. Dry pinelands. Se. GA south to c. peninsular FL, west to about the Suwannee River in the e. Panhandle of FL. [= A. longifolia var. longifolia – FNA, X, Z; < Asimina angustifolia – K, WH, Y; < Pityothamnus angustifolius (Rafinesque) Small – S]

Asimina parviflora (Michaux) Dunal, Small-flowered Pawpaw, Small-fruited Pawpaw. Sandy or rocky, dry to fairly moist forests. April-May; July-September. Se. GA south to c. peninsular FL, west to se. TX, primarily on the Coastal Plain, but inland to sw. SC, n. GA, sc. TN, and n. MS. [= RAB, C, F, G, FNA, K, S, W, WH, X, Y, Z]

Asimina pygmea (W. Bartram) Dunal, Dwarf Pawpaw. Pine flatwoods, wet savannas. Se. GA south to c. peninsular FL. It is a dwarf shrub 2-3 dm tall of pine flatwoods, occupying wetter sites than the other "pineland pawpaws." [= FNA, GW, X, Z; = A. pygmea – K, WH, Y, orthographic variant; = Pityothamnus pygmeus (W. Bartram) Small – S]

Asimina triloba (Linnaeus) Dunal, Common Pawpaw, Indian-banana. Alluvial forests, other moist, nutrient-rich forests. March-May; August-October. NJ, w. NY, and s. ON west to s. MI and e. NE, south to Panhandle FL, s. LA, and ne. TX. [= RAB, C, F, G, K, S, W, WH, X, Y, Z]

22. CALYCANTHACEAE Lindley 1819 (Sweet-shrub Family) [in LAURALES]

A family of 4 genera and about 8 species, shrubs and trees, of temperate e. China, temperate e. North America, temperate w. North America, and tropical ne. Australia. References: Nicely (1965); Wood (1958); Li et al. (2004); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Calycanthus Linnaeus 1759 (Sweet-shrub)

A genus of 2-4 species, 1 or 2 of e. North America, 1 of w. North America, and 1 of China (the latter sometimes segregated as a separate genus, Sinocalycanthus). References: Johnson in FNA (1997); Kartesz in Kubitzki, Rohwer, & Bittrich (1993); Nicely (1965)=Z; Ferry & Ferry (1987)=Y.

1. Tepals pale yellowish-green; seeds ca. 6 mm in diameter, with short, curved hairs. \[= C. brokianus \]

1. Tepals reddish brown; seeds ca. 10 mm in diameter, with long, straighter hairs. \[= C. floridus \]

Calycanthus brokianus Ferry & Ferry, Brock’s Sweet-shrub. Moist slopes. Endemic to mesic hardwood forests in GA. Its taxonomic validity is uncertain and controversial. [= C. brokiana – K, Y, orthographic variant; < C. floridus Linnaeus var. floridus – FNA]

Calycanthus floridus Linnaeus, Sweet-shrub, Strawberry-shrub, Carolina Allspice, Sweet Bubby-bush. Forested slopes and streambanks. April-May; August-September. PA, WV, and KY, south to GA, mw. FL, AL, and s. MS. Two varieties have

**28. LAURACEAE** A.L. de Jussieu 1789 (Laurel Family) [in LAURALES]

A family of about 50 genera and 2500-3500 species, trees and shrubs, of tropical, subtropical, and (rarely) warm temperate regions. *Laurus nobilis* Linnaeus, Laurel, Bay, native to the Mediterranean region of Europe and the bay leaf of commerce; planted as an ornamental and spice, especially in warmer parts of our area, but is not known to escape in our area. References: van der Werff in FNA (1997); van der Werff & Richter (1996); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves evergreen; flowers perfect; [tribe Perseeae].

2 Leaves glabrous, bright green, with yellow callusities in the principal vein axils; crushed leaves with the odor of camphor .................................................. *Cinnamomum* Persea

2 Leaves pubescent to glabrate, dark green, without yellow callusities in the principal vein axils; crushed leaves with the odor of bay.................................................. *Cinnamomum*

1 Leaves deciduous; flowers imperfect; [tribe Laureae].

3 Some of the leaves with 1-2 (-5) rounded lobes; small to medium trees.............................................................................................. *Lindera*

3 None of the leaves lobed; medium to large shrubs.

4 Leaves 4-16 cm long, 2-6 cm wide, obovate, ovate, or broadly elliptic .............................................................................................. *Lindera*

4 Leaves 1.2-4 cm long, 0.5-1.5 (-1.9) cm wide, narrowly elliptic .............................................................................................. *Litsea*

**Cinnamomum** Schaeff 1760 (Cinnamon)

A genus of about 350 species, trees and shrubs, of e. and se. Asia, Oceania, and tropical America. References: Rohwer in Kubitzki, Rohwer, & Bittrich (1993); van der Werff in FNA (1997).

* Cinnamomum *camphora* (Linnaeus) J. Presl, Camphor tree. Disturbed areas, suburban woodlands, increasingly in natural forests; native of e. Asia. April-May. A serious invasive, especially southward. Reported as escaped and apparently naturalized in South Carolina by Hill & Horn (1997). In NC, reported for Moore County. [= FNA, K, WH; = Camphora *camphora* (Linnaeus) Karsten – S]

**Lindera** Thunberg 1783 (Spicebush, Benzoin)

1 Leaves typically with a thick, subcoriaceous texture (though sometimes thinner in texture if growing in shade), 4-8 cm long, 2-3.5 cm wide, narrowly obovate to oblanceolate, pubescent and strongly whitened below; leaves and bark aromatic, the odor lemony ................. *L. subcoriacea*

1 Leaves with a thin, membranous texture, 6-16 cm long, 2-6 cm wide, obovate, elliptic, or ovate, glabrous to pubescent below, but not strongly whitened; leaves and bark strongly aromatic, the odor spicy or like sassafras.

2 Leaf base cuneate; leaves widely obovate, plane (not rugose), with a short-acuminate apex, glabrous above, borne horizontally, spicy-fragnent when crushed; shrubs not colonial, often multi-stemmed from base, short to tall (to 5 m tall) ................................................. *L. benzoin*

2 Leaf base widely cuneate to rounded; leaves narrowly ovate, reticulate-rugose, with an acute apex, pubescent above, drooping, fragrant when crushed with an odor like sassafras; shrubs colonial, short (to 2 m tall) ................................................. *L. melissifolia*

**Lindera benzoin** (Linnaeus) Blume, Northern Spicebush. Rich alluvial forests, mesic forests on slopes with circumneutral soils, bottomlands, swamps. March-April; August-September. ME, s. ON, and MI, south to Panhandle FL and e. TX; disjunct in Edwards Plateau of c. TX. Where occurring on upland slopes, *L. benzoin* is an excellent indicator of base-rich soils, generally derived from calcareous sedimentary rocks or mafic metamorphic or igneous rocks. Some floristic treatments recognize two varieties based on whether the leaves and young twigs are pubescent (var. *pubescens*) or not (var. *benzoin*), but the varieties so recognized overlap broadly in distribution; it seems best to regard this as mere variation within the species. [= FNA, GW, RAB, W,
Lauraceae

84

Lindera melissifolia (Walter) Blume, Southern Spicebush, Pondberry. Wet flats and depressions, generally with pocosin shrubs. March-April; August-September. This species is southern in range, with a very scattered distribution in se. and c. NC, e. SC, e. & sw. GA, nw. FL, sw. AL (?), nw. MS, se. MO-AR, and se. AR-LA (recent collections unknown from FL and LA). It is nearly extirpated in NC, currently known only from three populations, in Sampson, Bladen, and Cumberland counties. A historic record from Orange County, NC (in the lower Piedmont), collected by Elisha Mitchell in 1820 and 1822, appears to be bonafide (McVaugh, McVaugh, & Ayers 1996). [= FNA, K, WH, Z; = L. melissaefolia – RAB, F, GW, orthographic variant; = Benzoin melissaefolium (Walter) Nees – S]

Lindera subcoriacea B.E. Wofford, Bog Spicebush. Peaty seepage bogs in headwaters of blackwater streams, in the sandhills and immediately adjacent Piedmont, with other pocosin shrubs. March-April; July-August. The overall range of this newly described species is still poorly known; it appears to be a Southeastern Coastal Plain endemic, ranging from se. VA (perhaps s. NJ) south to FL and west to LA. Occurring in our area primarily in a scattering of small populations in the fall line Sandhills of NC and SC, with an outlier or two in "Piedmont pocosins" just west of the Sandhills. Distinctive characteristics of sun-grown plants include the rounded apex of the leaf, the leaf strongly whitened beneath and borne in an ascending to even appressed position in relation to the twigs, and a typically fastigiate or virgate branching pattern, with multiple stems or branches ascending vertically and nearly parallel to one another. Shade plants have a different form. [= FNA, K, Z; = L. benzoin – WH]

Litsea Lamarc 1792 (Pondspice)

A genus of about 400 species, trees and shrubs, of warm temperate and tropical areas, especially se. Asia and Australia. The genus is very heterogeneous and probably needs division into more natural groups. References: van der Werff in FNA (1997); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

Litsea aestivalis (Linnaeus) Fernald, Pondspice. Margins of limesink ponds and Carolina bays, less commonly in wet depressions and wet stringers dominated by shrubs. March-April; May-June. A Southeastern Coastal Plain endemic: e. MD (Wicomico County) and se. VA (York and Isle of Wight counties) south to n. FL (and allegedly also in LA, based on an old and poorly labeled specimen). The fine, zigzag twigs are distinctive. It grows to 6 m tall, characteristically forming a rounded bush. [= RAB, F, FNA, GW, K, WH]

Persea P. Miller 1754 (Bay)

A genus of about 150-200 species, trees and shrubs, of Asia and America. The avocado is a member of this genus, Persea americana P. Miller. References: Wofford in FNA (1997); Godfrey (1988); Clewell (1985); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

1 Twigs densely rusty-pubescent; lower surfaces of leaves with longer, rusty, often crooked hairs, not appressed, especially evident along the midrib and principal veins; peduncles 4-7 cm long; leaves tending to be larger and more acute .......................................................
P. borbonia

Persea borbonia (Linnaeus) Sprengel, Red Bay. Dunes, maritime forests, in dry sandy soils on barrier islands, known only north to Carteret County, NC. May-June; September-October. E. NC (Carteret County) south to FL and west to se. TX; reports of the species north of NC are based on the inclusion of P. palustris in a broadly defined P. borbonia, or are simply in error, based on less hairy plants of P. palustris. This species is rare north of Florida and becoming rarer with the destruction of most maritime and near coastal upland forests for the construction of vacation homes and tourist accommodations. [= FNA, G, GW, K, WH; = P. borbonia – RAB, F (also see P. palustris). = Tamala borbonia (Linnaeus) Rafinesque – S; = P. borbonia var. borbonia]

Persea palustris (Rafinesque) Sargent, Swamp Bay. Swamps, pocosins, bay forests, maritime forests, generally in wet peaty soils, but also in fairly dry, sandy soils in maritime forests. May-June; September-October. A Southeastern Coastal Plain endemic: DE, e. MD, and se. VA south to FL and west to se. TX; also in the Bahamas. Though variable in amount of hairs on the leaves, the hairs of P. palustris are always of a distinctly different character than those of P. borbonia. [= C, FNA, G, GW, K, WH; = P. borbonia – RAB, F; = Tamala pubescens (Pursh) Small – S; = P. borbonia var. pubescens (Pursh) Little]

Sassafras Presl 1825 (Sassafras)

A genus of 3 species, trees, of temperate e. Asia (2 species) and e. North America (1 species). References: van der Werff in FNA (1997); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).
**Sassafras albidum** (Nuttall) Nees, Sassafras. A wide variety of forests, old fields, disturbed areas, fencerows. March-April; June-July. S. ME, s. ON, MI, and s. WI, south to c. peninsular FL, s. AL, s. MS, and se. TX. The original source of "root beer." [= RAB, C, FNA, G, K, W, WH; > S. albidum var. molle (Rafinesque) Fernald – F, WV; > S. albidum var. albidum – F, WV]
### SECTION 5: MONOCOTYLEDONAE (MONOCOTS)

#### 29. ACORACEAE Martinov 1820 (Calamus Family) [in ACORALES]

The family consists only of *Acorus*. Although traditionally treated as part of the Araceae, a wide variety of morphological, anatomical, and embryological evidence supports the segregation of the Acoraceae (Grayum 1987), a segregation additionally supported by molecular studies (Duvall et al. 1993, Chase et al. 1993). The spathe in *Acorus* is not morphologically equivalent to the spathe of the Araceae. References: Thompson in FNA (2000); Bogner & Mayo in Kubitzki (1998b).

*Acorus* Linnaeus 1753 (Calamus, Sweetflag)

1. Midvein of the leaves not well-developed, about equally as prominent as 1-5 well-developed lateral veins; mature fruits produced; vegetative leaves (0.3-) avg. 0.8 (-1.3) cm wide ...............................................................[A. americanus]

1. *Acorus americanus* (Rafinesque) Rafinesque, American Calamus, Sweetflag. Marshes, wet meadows, other wet areas, limey seeps. May–June. Widespread in ne. North America. This species is apparently a fertile diploid. Because this species has not generally been recognized in floras, its distribution is poorly known; additional distributional records should be expected and sought. [= FNA, K; < *A. calamus* Linnaeus – RAB, C, F, G, GW; < *A. americanus* – W]

* Acorus calamus* Linnaeus, European Calamus, Sweetflag. Marshes, wet meadows, other wet areas; native of Eurasia, now widespread in e. North America. May–June. The aromatic rhizome and leaves have been used medicinally and candied as a confection. Populations of *A. calamus* in our area are apparently sterile triploids introduced from Europe, though diploid and tetraploid populations of *A. calamus* are known from Asia. [= FNA, K;  < *A. calamus* Linnaeus – RAB, C, F, G, GW (also see *A. americanus*); < *A. americanus* – W]

#### 30. ARACEAE A.L de Jussieu 1789 (Arum Family) [in ALISMATALES]

A family of about 100-110 genera and about 3000-4000 species, herbs and reduced aquatic herbs, cosmopolitan, but mostly tropical and subtropical. The Lemnaceae is phylogenetically embedded in the Araceae, and is here included in it as subfamily Lemnoideae (Angiosperm Phylogeny Group 1998, 2003; Keating 2004). References: Thompson in FNA (2000); Cusimano et al. (2011); Mayo, Bogner, & Boyce in Kubitzki (1998b); Keating (2004); Serviss, McDaniel, & Bryson (2000); Landolt in FNA (2000); Landolt (1986); Landolt in Kubitzki (1999b); Les & Crawford (1999); Bown (2000).

1. Plant a floating aquatic (or stranded), the individual leaves <2 cm long; [subfamily Lemnoideae].

2. Fruits solitary; fronds with 1 or more nerves; reproductive pouche 1, terminal.

3. Fruits thick, globose, < 2 cm long. .........................................................[6. Wolffia]

4. Fruits flat, elongate and curved, 4-14 mm long. .........................................................[7. Wolffiella]

5. Roots (1-) 2-7 (-12) per frond; fronds with (3-) 5-7 nerves; fronds 1.5-3× as long as wide; all of the roots perforating the scalelike leaflet. ...............................................................[4. Lemma]

6. Roots (1-) 2-21 per frond; fronds with (3-) 5-21 nerves. ...............................................................[5. Landoltia]

7. Leaves simple.

8. Bulblets lacking at the petiole; spadix free from the spathe; [native, common in our area] .........................................................[13. Arisaema]

9. Bulblets present at base and summit of the petiole; spadix fused to the spadix; [alien, rare] .........................................................[14. Pinellia]

11. Leaves not peltate, either cuneate, rounded, cordate, or hastate.

12. Spatha absent or obscure; leaf blade 2-5× as long as wide, cuneate at the base, lanceolate or narrowly elliptic; leaf venation parallel; [subfamily Oronitioideae, tribe Oronitieae] ...............................................................[1. Oronitium]

13. Spatha present, surrounding the spadix, at least at its base; leaf blade 1-2.5× as long as wide, either hastate at the base (Arum, Pellandra, and Xanthosoma), or rounded (Symlocarpus), or cordate (Calla), broadly ovate in outline.

14. Spatha white; leaves cordate; plants from elongate rhizomes; [MD northward]; [subfamily Calloideae] .........................................................[8. Calla]

15. Spatha green or white; leaves hastate or rounded at base; plants from fibrous roots, a short thick rhizome, tuber, or a corm; [collectively widespread].

16. Leaves ovate, rounded or suborbicular at the base; spathe purple, or purple flecked with white; [subfamily Oronitioideae, tribe Symlocarpaeae] ...............................................................[2. Symlocarpus]

17. Leaves hastate at the base (somewhat arrowhead-shaped); spathe green or white; [subfamily Aroideae].
ARACEAE

13 Larger leaf blades > 5 dm long; longer petioles 10-20 dm long; [subfamily Aroideae, tribe Caladieae] ...... 9. Xanthosoma
13 Larger leaf blades < 5 dm long; longer petioles < 7 dm long.
14 Plant from a horizontal tuber; leaves variegated; [alien, of moist soils]; [subfamily Aroideae, tribe Areae] ........ 15. Arum
14 Plant from fibrous roots; leaves not variegated; [native, of wetlands]; [subfamily Aroideae, tribe Peltandreae] ........

...........................................................................................................................................................................
10. Peltandra

I. Orontium Linnaeus 1753 (Golden Club)

Orontium aquaticum Linnaeus, Golden Club, Bog Torches, Never-wet. Generally in peaty and stagnant water, such as beaver ponds, blackwater streams, swamps, pools in low pocosins, streambeds in the Piedmont, bogs and swamps in the mountains. March-April. MA and c. NY south to s. FL and west to LA, north in the inland to w. NC, KY, and WV, primarily but by no means strictly Coastal Plain. Fresh leaves are unwettable, silvery-glistening when forced under water. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV]

2. Symplocarpus R.A. Salisbury ex Nuttall 1818 (Skunk Cabbage)

3. Spirodela Schleiden 1839

4. Lemna Linnaeus 1753 (Duckweed)

1 Margin of fronds denticulate in the distal portion; fronds narrowed basally to an elongated, persistent, green stalk, the fronds therefore cohering in long, often branched chains of 3-50 fronds; fronds submerged (except when flowering or fruiting); [section Hydrophylla] ...

...................................................................................................................................................................................................................
L. trisulca

1 Margin of fronds entire; fronds rounded basally, with a very small white stipe soon decaying, the fronds therefore cohering in simple clusters of 2-5; fronds normally floating.

2 Fronds with (0-) 1 nerve; anthocyanin absent in fronds (fronds green); [section Uninerves].

3 Fronds 1-2× as long as wide; nerve indistinct to fairly prominent, reaching at most 2/3 of the distance from node to apex (nerve about as long as or shorter than the aerenchymatous portion of the frond); fruit 0.6-1.0 mm long.................................L. minuta

3 Fronds 1.3-3× as long as wide; nerve mostly prominent, reaching at least 3/4 of the distance from node to apex (nerve longer than the aerenchymatous portion of the frond); fruit 1.0-1.35 mm long.................................................................L. valdiviana

2 Fronds with 3-5 (-7) nerves; anthocyanin absent or present in fronds (fronds green or red).

4 Root sheath winged at the base; root tip sharply pointed; roots not longer than 3 cm long; anthocyanin absent in fronds; [section Alatae].

5 Seeds with 8-26 prominent ribs, brownish, falling from the fruit when ripe; fronds with only 1 papilla above the node, which is smaller than the papule at the apex; wing of the root sheath 1-2.5× as long as wide..............................L. aequinoctialis

5 Seeds with 35-70 obscure ribs, whitish, remaining in the fruit when ripe; fronds very often with 2-3 papilla above the node, which are larger than the papule at the apex; wing of the root sheath 2-3× as long as wide ..............................................L. perpusilla

**Lemma minor** Linnaeus, Common Duckweed. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps. Widespread in the Northern Hemisphere; scattered in the Southern Hemisphere, where perhaps in part introduced. [= FNA, K, WH, Y, Z; < L. minor – RAB, C, F, G, W, WV (also see L. obscura)]

**Lemma minuta** Kunth, Least Duckweed. Quiet waters, seeptages. Widespread in North America, Central America, and South America; more local in Europe and Japan. [= C, FNA, K, WH; = L. valdiviana Philippi var. abbreviata Hegelmann – F; = L. minuscula Herter – Y, Z]

**Lemma obscura** (Austin) Daubs, Little Duckweed. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps. NY west to MN and NE, south to s. FL, TX, Mexico, and the Bahamas. [= FNA, K, WH, Y, Z; < L. minor – RAB, C, F]

**Lemma perpusilla** Torrey, Tiny Duckweed. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps. QC west to MN, south to NC, TN, and TX. [= RAB, C, F, FNA, G, K, W, Y, Z]

**5. Landoltia** D.H. Les & D.J. Crawford (Duckmeat)

**6. Wolffia** Horkel ex Schleiden 1844 (Watermeal, Mud-mary, Rootless-duckweed)

1 Fronds globose to ovoid, 1-1.5× as deep as wide; thallus not brownish punctate above
2 Fronds 1.0-1.3× as long as wide, 0.4-1.2 mm wide ................................................................. *W. columbiana*
3 Fronds 1.3-2.0× as long as wide, 0.3-0.5 mm wide ................................................................. *W. globoa*
4 Root sheath not winged at the base; root tip mostly rounded; roots often longer than 3 cm long; anthocyanin present or absent in fronds; [section *Lemma*].
6 Plants forming small, olive-brown rootless turions, 0.8-1.6 mm in diameter, which sink to the bottom ..................... *L. turionifera*
7 Plants without distinct turions.
8 Fronds not reddish on the lower surface (or if so only slightly so and much less so than on the upper surface); greatest spacing of veins near the middle of the frond or towards its base .............................................................................................. *L. minor*
9 Fronds reddish on the lower surface (and more intensely so than on the upper surface); greatest spacing between the veins near the middle of the frond or its tip.
10 Fronds gibbous; fronds with very distinct papillae above the node and near the apex on the upper surface, but not between the node and the apex; seeds with 10-16 distinct ribs ......................................................................................... *L. obscura*
11 Fronds flat; fronds with mostly distinct papillae on the midline on the upper surface; seeds with 3-60 indistinct ribs ....................... ................................................................................................................................. *L. turionifera*

* Wolffia globosa (Roxburgh) den Hartog & Plas, Asian Watermeal. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; native of Asia. [= FNA]

7. Wolffiella Hegelmann 1895

1 Fronds (4-) 6-15 (-20)× as long as wide; angle of pouch 25-50° ........................................................................................................... W. gladiata
2 Fronds 1.5-8× as long as wide; angle of pouch 45-90° .......................................................................................................................... W. oblonga

Wolffiella gladiata (Hegelmaier) Hegelmaier, Mud-midgets. Ponds, ditches, beaver-ponds millponds. April-June. MA and n. IL (s. WI?) south to s. FL and TX; Mexico. [= FNA, K, WH, Y, Z; > Wolffiella floridana (Donnell-Smith) C. Thompson – RAB, C, F, G, GW, S; > W. gladiata – GW]

Wolffiella oblonga (Philippi) Hegelmaier. Quiet waters. N. peninsular FL, MS (?), LA, TX, south to Mexico, Central America, South America; West Indies. [= FNA, GW, K, WH]

8. Calla Linnaeus 1753 (Calla)

Calla palustris Linnaeus, Wild Calla, Water-arum. Swamps. A circumpolar species of seepage swamps, ranging south in North America to sw. PA, w. MD, n. IL, c. MN, and BC. [= C, F, FNA, G, K]

9. Xanthosoma Schott 1832

A genus of about 60 species, herbs, of tropical Central and South America. References: Mayo, Bogner, & Boyce in Kubitzki (1998b); Serviss, McDaniel, & Bryson (2000)=Z.

* Xanthosoma sagittifolium (Linnaeus) Schott, Elephant-ear. Ditches; native of tropical America. It can be seen in ditches adjacent to ornamental plantings; it is uncertain whether it can be considered naturalized in the more northern parts of our area. It is superficially similar to Colocasia, differing in its non-peltate leaves. [= K, WH, Z; = Xanthosoma sagittifolium – GW, orthographic error]

10. Peltandra Rafinesque 1819 (Arrow-arum)

**Identification notes:** *Peltandra* is often confused in vegetative condition with *Pontederia* and *Sagittaria*, superficially similar emergent aquatics with hasitate or sagittate leaves. *Peltandra* leaves have pinnate venation, a prominent midvein, a prominent vein running parallel to the leaf margin, and the hasitate lobes with rounded to acute apices. *Pontederia* leaves have parallel venation, lack a prominent midvein and a prominent vein parallel to the leaf margin, and have hastate lobes with broadly rounded apices. The leaves of sagittate species of *Sagittaria* have parallel venation, a prominent midrib, a vein at 90 degrees to the midrib at the junction of the main blade and each of the hastate lobes that forks, with at least one fork directed apically and at least one fork directed into the basal lobe, lack a prominent vein parallel to the margin, and have hastate-sagittate lobes with acuminate apices.

1 Spathe green at base, bright white above (the white portion merely a margin), flared open and therefore only loosely surrounding the spadix, succulent below, the white portion thin and herbaceous, the margins generally nearly entire and plane; fruits red; distal portion of leaf blade lacking broad, coarse veins similar to the midvein (all the veins alike and fine) .......................................................................................................................... *P. sagittifolia*

1 Spathe green (rarely with a narrow cream-colored or whitish margin up to 1.7 cm wide), tightly surrounding the spadix, thick and succulent throughout, the margins crisped; fruits green to dark purplish-green; distal portion of leaf blade often with several broad, coarse veins similar to the midvein, the remainder of the veins fine (sometimes the distal portion of the leaf with fine veins only) ........................................................................................................... *P. virginica*

*Peltandra sagittifolia* (Michaux) Morong, Spoonflower, White Arrow-arum. Pocosins of the outer Coastal Plain, sphagnum swamps. July-August. A Southeastern Coastal Plain endemic: e. NC south to c. peninsular FL and west to se. LA. The reduction of *P. sagittifolia* to a subspecies of *P. virginica* (Blackwell & Blackwell 1974) was based on confusion of true *P. sagittifolia* with forms of *P. virginica*. The two species are distinct. [= FNA, GW, K, WH; = *P. sagittaeolia* (Michaux) Morong – RAB (an orthographic variant); = *P. glauca* (Elliott) Fey – S; = *P. virginica* ssp. luteospadix (Fernald) Blackwell & Blackwell – Z]

*Peltandra virginica* (Linnaeus) Schott, Green Arrow-arum, Tuckahoe. Marshes, bogs, beaver ponds, pocosins, other stagnant, aquatic situations. May-June. ME, s. QC, and n. MI south to s. FL and e. TX. [= RAB, C, FNA, G, GW, K, S, W, WH; = *P. virginica* – F; = *P. luteospadix* Fernald – F; = *P. virginica* ssp. virginica – Z]

**11. Pistia**

Linnaeus 1753 (Water Lettuce)

*Pistia stratiotes* Linnaeus, Water Lettuce. Stagnant or slow-moving waters of rivers, sometimes cultivated in ponds, where it persists for a while (presumably eventually eliminated by cold winters). This floating aquatic, pantropicaly distributed, appeared in the Waccamaw River of SC (downstream from NC) in 1990 and 1991, apparently successfully overwintering (Nelson 1993). Further south it is variously and paradoxically considered as native and a noxious water-weed. Its occurrence as a naturalized component of GA’s flora is undocumented; it is at least present as a cultivated plant in water gardens and presumably escapes. The original distribution is unclear. [= FNA, GW, K, S, WH]

**12. Colocasia**

Schott 1832 (Elephant’s-ear, Taro, Dasheen)

* *Colocasia esculenta* (Linnaeus) Schott, Elephant’s-ear, Taro, Dasheen. Ditches, shores, bottomland hardwood forests; native of the Tropics. Frequently planted for its “tropical” appearance, becoming naturalized, for instance at Lake Waccamaw, Columbus County, NC, where it grows scattered along much of the shoreline, spread by fragments of rhizome. In our area, it is generally infertile. In the Tropics, *Colocasia* is a food crop cultivated for its rhizomes and shoots. The rhizomes are the source of “poi,” a starchy staple of the Hawaiian Islands. See Serviss, McDaniel, & Bryson (2000) for a discussion of various varieties cultivated in the southeastern United States, their identification, and their weediness. [= FNA, GW, K, WH; = *C. antiquorum* Schott – S; > *C. esculenta* var. antiquorum (Schott) Hubb. & Rehder – Z; = *C. esculenta* var. esculenta – Z]

**13. Arisaema**

Martius 1831 (Jack-in-the-pulpit, Indian-turnip)

A genus of about 150-170 species, of Asia, e. North America, e. Africa, and Arabia. Some of the taxa here recognized as subspecies of *A. triphyllum* might better be considered as species with relatively subtle morphological distinctions. They are broadly sympatric, and sometimes occur together in mixed populations with little sign of introgression or hybridization. *Ssp. triphyllum* is tetraploid and does not produce fertile seed when crossed with the other (diploid) subspecies (Treiber 1980). References: Thompson in FNA (2000); Huttleston (1981)=Z; Treiber (1980)=Y; Huttleston (1949)=X; Gusman & Gusman (2002)=Q; Renner, Zhang, & Murata (2004); Mayo, Bogner, & Boyce in Kubitzki (1998b). Key based on the references.

1 Leaf with (5-) 7-15 leaflets, arranged pedately on a semicircular axis; spadix 9-20 cm long, attenuate, long-exserted from the spathe; [section *Tortuosa*] ................................. *A. dracontium*

1 Leaf with 3-5 leaflets, arranged palmately; spadix 3.5-8 cm long, clavate or cylindrical and blunt, included in the spathe; [section *Pedatisecta*].

2 Leaves glaucous beneath at maturity; spathe flange 2-9 mm broad; spathe hood green, or green with purple stripes; sterile spadix (appendix) clavate or cylindrical.
3 Lateral leaflets (of primary leaf if more than one) 2-parted or 2-lobed (rarely unlobed); sterile spadix 1-3 mm in diameter, cylindrical, curved outward; spathe hood green ................................................................. *A. triphyllum ssp. quinatum*

3 Lateral leaflets (of primary leaf if more than one) undivided (rarely lobed); sterile spadix 4-10 mm in diameter, clavate, straight; spathe hood green, or green striped with purple ................................................................. *A. triphyllum ssp. tripheyllum*

2 Leaves green beneath at maturity (very rarely glaucous); spathe flange 1-3 mm broad; spathe hood green with white stripes, green with purple stripes, solid green, or solid purple; sterile spadix (appendix) cylindrical.

4 Spathe tube not fluted (rarely weakly fluted); spathe hood solid green or solid purple ......................................................... *A. triphyllum ssp. pusillum*

4 Spathe tube strongly fluted; spathe hood green with white or purple stripes ................................................................. *A. triphyllum ssp. stewardsonii*

*Arisaema triphyllum* (Linnaeus) Schott ssp. quinatum (Nuttall) Hultlestone, Southern Jack-in-the-pulpit, Preacher John. Mesic forests. March–April. Sc. NC, sw. NC, se. TN south to Panhandle FL and e. TX. This taxon is of uncertain validity; Treiber lumps it with ssp. pusillum, while Hultlestone recognizes it as a full species (Hultlestone 1949) or as a subspecies (Hultlestone 1981). This taxon is diploid (2n=28). [= K, Z; < A. triphyllum – RAB, FNA, W; = A. quinatum (Nuttall) Schott – GW, S, WH, X; < A. triphyllum ssp. pusillum – Q, Y; ? A. polymorphum Buckley]

*Arisaema triphyllum* (Linnaeus) Schott ssp. stewardsonii (Britton) Hultlestone, Bog Jack-in-the-pulpit. Bogs and peaty swamps. April-May. NS west to MN, south to w. NC, e. TN, and n. IN (Treiber 1980). This subspecies is the most northern, and also has the most distinctive habitat, being restricted to distinctly wet, peaty sites. This taxon is diploid (2n=28). [= K, Q, X, Y, Z; < A. triphyllum – RAB, FNA, GW, W; = A. triphyllum var. stewardsonii (Britton) G.T. Stevens – C, G; = A. stewardsonii Britton – F]

14. **Pinellia** Tenore 1839 (Pinellia)

* Pinellia ternata (Thunberg) Makino ex Breitenbach, Pinellia. Suburban woodlands; native of Japan. Introduced from Japan and rarely naturalized, at least in the northern portion of our area, as in DC, se. PA, NJ, and s. NY. [= C, F, FNA, G, K]

15. **Arum** Linnaeus 1753 (Arum)

* Arum italicum Linnaeus *ssp. italicum*. Arum. Suburban woodlands; native of Europe and n. Africa, weakly naturalizing from horticultural use. It has a large (>10 cm long) white spathe. Reported for Fairfax County, VA (Steuary 2010). [= Z; < *A. italicum* – FNA]
A family of 5 genera and about 30 species, of disjunct distribution in north temperate and subarctic areas, and in the Guayana Shield and northern Andes areas of n. South America. Reveal & Zomlefer (1998) place the Tofieldiaceae in the monotypic order Tofieldiales, only distantly related to the Liliaceae. Tamura in Kubitzki (1998a) treats this group as subfamily Tofieldioideae of the Nartheciaceae. References: Zomlefer (1997c, 1999); Tamura in Kubitzki (1998a).

1 Inflorescence 1-flowered; tepals yellow; seeds yellowish; [ endemic to Panhandle FL ] ............................................................... Harterocallis
1 Inflorescence a raceme or thryse; tepals white to pale cream (fading to yellowish on dried specimens); seeds brown; [ collectively widespread].
2 Bracts of the inflorescence large, spathelike, acuminate-aristate at the tip; tepals 9–17 mm long; stamens (6–) 9 (-12). ......................... Pleea
2 Bracts of the inflorescence minute; tepals 2.5–5 mm long; stamens 6.
3 Inflorescence a raceme (the flower pedicels attached to the scape singly); scape smooth; flowering (late August-) late September-October ................................................................. Tofieldia
3 Inflorescence a thryse (flower pedicels attached to the scape in groups of 3–7); scape scurfy-scarbrous; flowering June-August ... Triantha

Harterocallis McDaniel 1968 (Harper's Beauty)

Pleea Michaux 1803 (Rush-featherling)

Pleea tenuifolia Michaux, Rush-featherling. Locally abundant in wet savannas, pocosin margins, usually in peaty soil, locally abundant in a few counties in se. NC, rare inland (very rarely as far as Cumberland County, NC). September-October; October-November. A Southeastern Coastal Plain endemic: se. NC and ne. SC south to sw. GA, n. FL and s. AL, but apparently absent from s. SC and ne. GA. When in flower in wet savannas and powerline rights-of-way in Brunswick County, Pleea visually dominates areas up to hundreds of hectares. In sterile condition, it is recognizable by its leathery equitant leaves, bright red at their bases. [= RAB, FNA, GW, K, S, WH; = Tofieldia tenuifolia (Michaux) Utech – Z]

Tofieldia Hudson 1778 (Bog Asphodel)
A genus of about 7-8 species, of temperate to subarctic North America and Eurasia. There is controversy about the circumscription of Tofieldia.relative to the related genera Pleea and Triantha (here recognized, but sometimes subsumed into Tofieldia). Some believe that Tofieldia, Triantha, and Pleea should be treated together in a broadly circumscribed Tofieldia (Utech 1978, Zomlefer 1997c); others that all three should be treated separately (Ambrose 1980; Packer 1993; Cruden 1991). Packer in FNA (2002a) has recently recognized Triantha, Pleea, and Tofieldia as separate genera, a conclusion followed here in part because of the ancient, relictual nature of these units. References: Zomlefer (1997c)=Z; Packer (1993); Ambrose (1980); Utech (1978); Hitchcock (1944)=Y; Tamura in Kubitzki (1998a); Packer in FNA (2002a); Cruden (1991).

Identification notes: In sterile condition, Tofieldia glabra can be distinguished from Iris verna by its minutely upwardly-scarbrous margins (Iris has smooth margins).

Tofieldia glabra Nuttall, Carolina Bog Asphodel, White Asphodel. Savanna-pocosin ecotones, wet savannas, seepage bogs. (Late August-) late September-October; October-November. Endemic to the Coastal Plain (including Sandhills) of NC and northern SC; reports from GA are dubious. [= RAB, FNA, GW, K, S, Z]

Triantha (Nuttall) Baker (Bog Asphodel)
1 Perianth equal to or longer than the capsule; seeds with tails 1/2 or less as long as the body .......................................................... Tr. racemosa
1 Perianth shorter than the capsule; seeds with at least 1 tail equal to or longer than the body .......................................................... Tr. glutinosa

Triantha glutinosa (Michaux) Baker, Northern Bog Asphodel, Sticky Bog Asphodel. Bogs and seeps, especially over mafic or calcareous rocks. July-August; September-October. NL (Newfoundland) west to BC, south to w. NC, ne. GA (Jones & Coile 1988), WV, OH, n. IN, WI, MT, and OR. [= FNA, K, S, = Tofieldia racemosa var. glutinosa (Michaux) Ahles – RAB; = Tofieldia glutinosa (Michaux) Persoon – F, G, GW, W, WV; = Tofieldia glutinosa ssp. glutinosa – Y, Z; = Tofieldia glutinosa var. glutinosa – C]

Triantha racemosa (Walter) Small, Southern Bog Asphodel, Coastal Plain Bog Asphodel. Savannas, savanna-pocosin ecotones, seepage bogs, sinkhole ponds (dolines) in the mountains of VA. June-early August; late September-October. NJ south

**1** Pistils in a single whorl, borne on a flat receptacle; stamens 6; inflorescence compound, many of the primary nodes bearing whorled branches which in turn bear whorled branches or whorled flowers ................................................................. *Alisma*

**1** Pistils spiraled in several to many whorls, borne on a globose receptacle; stamens 6-many; inflorescence racemose (or in some species of both *Echinodorus* and *Sagittaria* somewhat compound, with the lowermost node or two bearing branches which in turn bear whorled flowers).

2 Achenes turgid, with ribs or ridges; flower whorls subtended by 3 bracts and additional bracteoles .................................................. *Echinodorus*

2 Achenes flattened, with winged margins and often also with irregular corky ornamentations on the faces; flower whorls subtended by 3 bracts, with no additional bracteoles .................................................................. *Sagittaria*

**Alisma** Linnaeus 1753 (Water-plantain)

1 Leaf blades 2.7-5× as long as wide (or even narrower on submerged leaves), tapering at the base; petals pink, 2.3-3.7 mm long; achene with a dorsal ridge flanked by two dorsal grooves ................................................................. *A. gramineum*

1 Leaf blades 1.3-2.5 (2.7)× as long as wide, rounded to subcordate at the base; petals white, either 1.8-2.5 mm or 3.8-4.5 mm long; achene with a single dorsal groove.

2 Petals 1.8-2.5 mm long, 1.4-2.0 mm wide .................................................................. *A. subcordatum*

2 Petals 3.8-4.5 mm long, 3.0-3.9 mm wide .................................................................. *A. triviale*

**Alisma gramineum** Lejeune, Grassleaf Water-plantain. In seasonally flooded areas in impoundments. June-August. This species is circumboreal, ranging in North America south to e. VA, NY, WI, MO, NM, and CA. The occurrence of this species in our area may be the result of dispersal by waterfowl; first reported for our area by Wieboldt et al. (1998). [= C, F, FNA, K; < *A. plantago-aquatica* Linnaeus var. *americanum* J.A. Schultes – G]

**Alisma triviale** Pursh, Northern Water-plantain. Marshes and swamps. NL (Newfoundland) west to AK, south to s. NJ, s. PA, OH, IN, AR, OK, NM, AZ, CA, and n. Mexico (and according to Fernald to MD and WV). [= C, F, FNA, K, WV; < *A. plantago-aquatica* Linnaeus var. *americanum* J.A. Schultes – G]

**Echinodorus** L.C. Richard ex Engelmann 1848 (Burhead)

1 Leaf blades 1-3 cm long, 0.2-2 cm wide; achenes 10-20 per head; stamens 6 or 9; petals 1-3 mm long; scape 5-10 cm tall, erect; [subgenus *Helanthium*] .................................................................................. *E. tenellus*

1 Leaf blades 5-20 cm long, 3-15 cm wide; achenes 40 or more per head; stamens ca. 21; petals 6-12 mm long, scapes 20-120 cm tall, erect or arching/reclining; [subgenus *Echinodorus*].

2 Scapes arching and rooting down at maturity; veins of the sepals papillose-roughened ........................................ *E. cordifolius* ssp. *cordifolius*

2 Scapes rigidly erect at maturity; veins of the sepals smooth.

3 Stamens 9-15; plants to 70 cm tall .................................................................. *E. berteroi*

3 Stamens 21; plants to 200 cm tall .................................................................. *E. floridanus*

**Echinodorus cordifolius** (Linnaeus) Grisebach; Creeping Burhead. Swamps, ditches, wet thickets, especially on base-rich substrates, such as over calcareous or mafic rocks. June-November. MD south to c. peninsular FL, west

**Identification notes**: Portions of this key (and treatment) are provisional. The taxonomy and best characters to use in the linear-leaved species is particularly problematic.

### 1. Leaf blades sagittate or cordate (at least some of the leaves on a plant with sagittate or cordate basal lobes; some species are keyed both here and below).

</table>

### 2. Leaf blades pubescent; [subgenus *Sagittaria*]

| 4 | Leaves primarily phyllodial, lanceolate or spatulate (sagittate leaves rare in the population and few on a given plant); flowers in 1-2 (-3) whorls; stamen filaments glabrous (use 10×); [native, of tidal marshes] | ![Species Image](image_url) |
| 5 | Leaves primarily sagittate (phyllodial leaves rare in the population and few on a given plant); flowers in 3-12 whorls; stamen filaments roughened with minute scales (use 10×); [either introduced aliens, sometimes in tidal marshes, or native, found in inland alkaline sites]. |

### 3. Sepals appressed in fruit; lower flowers perfect, the stamens either functional or not; stamen filaments mostly fewer than 15.......

| 6 | Leaves sagittate basally, emersed; stalks of the pistillate flowers not notably stout, ascending in fruit; stamens mostly fewer than 15 ....... |
| 7 | Beak of the achene lateral (at a right angle to the achene); bracts of the inflorescence 2-14 mm long, boat-shaped, obtuse or broadly acute. |

### 4. Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whorls above; inflorescence normally not bent; stamen filaments glabrous. |

| 8 | Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whorls above; inflorescence normally not bent at the lowest whorl of flowers; stamen filaments minutely roughened with minute scales | ![Species Image](image_url) |

### 5. Beak of the achene terminal (extending along the long axis of the achene); bracts of the inflorescence 1.4-2.3 cm in diameter, mostly of other habitats, commenctively widespread.

| 9 | Bracts of the inflorescence thick and herbaceous, 5-25 mm long, rounded at the tip; flowers in 2-4 whorls; achenes with facial resin-ducts; [of acidic, blackwater habitats of the Coastal Plain] | ![Species Image](image_url) |
| 10 | Bracts of the inflorescence papery and tan, 7-40 mm long, acuminate at the tip; flowers in 5-12 whorls; achenes without resin-ducts; [primarily of other habitats, commenctively widespread] |

| 11 | Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads 1.2-1.7 cm in diameter, orange, globe-like-depressed. |
| 12 | Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globular. | ![Species Image](image_url) |

### 6. Beak of the achene lateral (at a right angle to the achene); bracts of the inflorescence 2-14 mm long, boat-shaped, obtuse or broadly acute.

| 7 | Beak of the achene terminal (extending along the long axis of the achene); bracts of the inflorescence 5-40 mm long, either blunt or acuminate, not boat-shaped. |
| 8 | Bracts of the inflorescence papery and tan, 7-40 mm long, acuminate at the tip; flowers in 5-12 whorls; achenes without resin-ducts; [primarily of other habitats, commenctively widespread] |

| 9 | Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globular. |
| 10 | Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads 1.2-1.7 cm in diameter, orange, globe-like-depressed. | ![Species Image](image_url) |

### 7. Beak of the achene terminal (extending along the long axis of the achene); bracts of the inflorescence 2-14 mm long, boat-shaped, obtuse or broadly acute.

| 8 | Bracts of the inflorescence papery and tan, 7-40 mm long, acuminate at the tip; flowers in 5-12 whorls; achenes without resin-ducts; [primarily of other habitats, commenctively widespread] |
| 9 | Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globular. |

| 10 | Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads 1.2-1.7 cm in diameter, orange, globe-like-depressed. | ![Species Image](image_url) |

### 8. Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whorls above; inflorescence normally not bent; stamen filaments glabrous. |

| 9 | Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whorls above; inflorescence normally not bent at the lowest whorl of flowers; stamen filaments minutely roughened with minute scales. |
| 10 | Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whorls above; inflorescence normally not bent at the lowest whorl of flowers; stamen filaments minutely roughened with minute scales. | ![Species Image](image_url) |

### 9. Bracts of the inflorescence papery and tan, 7-40 mm long, acuminate at the tip; flowers in 5-12 whorls; achenes without resin-ducts; [primarily of other habitats, commenctively widespread].

| 10 | Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globular. |
| 11 | Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads 1.2-1.7 cm in diameter, orange, globe-like-depressed. |

| 12 | Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globular. |
| 13 | Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads 1.2-1.7 cm in diameter, orange, globe-like-depressed. | ![Species Image](image_url) |
ALISMATEACE

13 Leaves primarily phyllodial, lanceolate or spatulate (sagittate leaves rare in the population and few on a given plant); flowers in 1-2 (-3) whorls; stamen filaments glabrous (use 10× magnification); [of tidal marshes] .............................................................. S. spatulata

12 Sepals reflexed or at least widely spreading or, in lowest flowers, sometimes partially connate; [subgenus Sagittaria].

14 Plant generally with erect, emersed leaves with well-developed blades with firm texture, the blades lanceolate, elliptic, or ovate, 2-8 cm wide; stamen filaments roughened with minute scales .......................................................... S. platyphylla

10 Plants with all leaves phyllodial, if expanded at the summit, the expanded blade of weak texture, floating.

15 Leaves 2-10 (+30) cm long, 3-8 mm wide (sometimes with dilated tip to 20 mm wide); [of tidal, fresh to brackish waters] .............................. S. subalata

16 Leaves 30-300 (or more) cm long, either 1-3 or 7-14 mm wide; [of nontidal waters].

17 Leaves very variable from population to population, in swiftly flowing black water typically about 100 cm long and 1-3 mm wide, in more stagnant water (or when emersed by dropping water levels, typically with lax petioles and floating blades, the blades lanceolate, or elliptic, the base cuneate, rounded, or cordate; [of blackwater streams and ponds, MA south to FL, west to k AL] ................................. S. filiformis

18 Leaves 100-300 (or more) cm long, 7-14 mm wide; [of springs and spring-runs, endemic to FL] ......................................................... S. kurziana

11 Stalks of the pistillate flowers ascending or spreading in fruit, not notably stout; stamen filaments roughened with minute scales (except glabrous in S. engelmanniana and S. papillosa).

19 Stamen filaments linear, less than the anther, changing little in diameter from near base to near summit.

18 Leaves all phyllodial, without flattened blades; bracts of the inflorescence strongly papillose; [of s. MS westwards] .............. S. papillosa

17 Leaves with flattened blades; bracts of the inflorescence smooth, papillos, or longitudinally striate; [collectively widespread].

19 Bract of the inflorescence firm in texture, smooth; stamen filaments glabrous; [of estuarine areas and associated nontidal wetlands] ........... S. engelmanniana

20 Bracts of the inflorescence either papilllose or longitudinally striate-ribbed; stamen filaments roughened with minute scales; [of estuarine areas and associated nontidal wetlands].

23 Phyllodia of emersed flowering plants elongate (1/2-1× as long as scape), slender, emersed or laxly ascending and submersed in water; phyllodia of stranded flowering plants elongate (1/3-1× as long as scape, but may be shorter), relatively stiff; [of se. AL] ........................................................................................................ S. isoetiformis

24 Plants with corms and/or stolons, lacking coarse rhizomes.

25 Blades of emersed leaves lanceolate, narrowly spatulate, > 5 mm wide; [of Mountain and upper Piedmont bogs, swamp forests, and adjacent ditches] ................................................................. S. fasciculata

26 Achenes 1.5-2.0 (-2.5) mm long; achene faces with 3 or more keels and 2 or more resin ducts; inflorescence bracts connate for > 50% of length; [of se. NC and southward] ...................................................................................... S. isoetiformis

27 Abaxial wing of fruit entire; [plants collectively widespread].

28 Larger phyllodes 0.8-2.5 cm wide, the apices blunt (rarely acute); longer pistillate pedicels 2-5 (-6.5) cm long; median resin duct of mature achene linear, about as wide as the posterior duct (or ducts absent) ................................................................. S. weatherbiana

29 Inflorescence branched at the base (in at least some plants of a population); bracts of the inflorescence only slightly connate, the free tips narrowly triangular, 6-15 mm long ....................................................................... S. grassinea

25 Blades of emersed leaves linear (< 3 mm wide, rarely to 4 mm) or phyllodial; [coastal plain depression ponds and impoundments]

26 Achenes 1.5-2.0 (-2.5) mm long; achene faces with 3 or more keels and 2 or more resin ducts; inflorescence bracts connate for > 50% of length; [of se. NC and southward] ...................................................................................... S. isoetiformis

27 Abaxial wing of fruit scalloped or toothed; [plants of n. AL and nw. GA] ......................................................... S. secundifolia

28 Larger phyllodes 0.8-2.5 cm wide, the apices blunt (rarely acute); longer pistillate pedicels 2-5 (-6.5) cm long; median resin duct of mature achene linear, about as wide as the posterior duct (or ducts absent) ................................................................. S. weatherbiana

29 Inflorescence branched at the base (in at least some plants of a population); bracts of the inflorescence only slightly connate, the free tips narrowly triangular, 6-15 mm long ....................................................................... S. grassinea

Sagittaria chapmanii (J.G. Smith) C. Mohr. Chapman's Arrowhead. Limesink (doline) ponds with drawdown hydrology, mucky ditches. May-September. Se. NC south to s. FL, west to LA, AR, and TX (Sorrie & LeBlond 2008). First reported for SC by Nelson & Kely (1997), and for AR, LA, and TX by Sorrie & LeBlond (2008). Analyses of allozyme variation in the S. grassinea complex revealed great differentiation between S. grassinea, S. chapmanii, and S. platyphylla; S. grassinea and S. platyphylla appeared to be more closely related to one another than either was to S. chapmanii (Hauber & Legé 1999).
Therefore, it seems best to treat these three taxa at equal rank and at the species level. [= S; = S. graminea Michaux ssp. chapmanii (J.G. Smith) R.R. Haynes & C.B. Hellquist – FNA; = S. graminea Michaux var. chapmanii J.G. Smith – GW, K, WH, Y; = S. graminea Michaux var. chapmanii J.G. Smith – Z, orthographic variant]

**Sagittaria engelmanniana** J.G. Smith. Blackwater streambanks, sphagnum bogs, pocosins, beaver ponds. June-October. MA and NY south to n. FL and s. MS, primarily on the Coastal Plain. [= RAB, C, F, FNA, K, W, X; = S. engelmanniana ssp. engelmanniana – G, GW, Z]

**Sagittaria fascicularis** E.O. Beal, Bunched Arrowhead. Bogs, ditches adjacent to drained bogs, wooded seepage areas. May-July. Endemic to a several-county area in sw. NC and nw. SC, where most of its former habitat has been drained. [= RAB, FNA, GW, K, W, Y; = S. macrocarpa J.G. Smith – S, misapplied; < S. graminea Michaux var. macrocarpa (J.G. Smith) Bogin – Z, mostly misapplied]

**Sagittaria filiformis** J.G. Smith. Swiftly flowing water of blackwater rivers and streams, blackwater lake shores. May-September. As conceived here, probably ranging from MA south to FL and s. AL. The forms growing in swiftly flowing black water are remarkable and unlikely to be recognized as a Sagittaria unless in flower, with linear leaves over 100 cm long and only 1-3 mm wide, with 5-7 parallel ribbed veins, resembling S. kurziana. The proper taxonomic treatment and associated nomenclature to apply to these plants remains unclear (see synonymy). [= FNA, K; = S. subulata (Linnaeus) Buchenau var. graccilla (S. Watson) J.G. Smith – RAB, F, G, Z; = S. stagnorum Small – GW; < S. subulata – C, in part; > S. filiformis – S; > S. lorata (Chapman) Small – S; > S. stagnorum – S]

**Sagittaria graminea** Michaux. Marshes, ponds, tidal areas. May-November. NL (Newfoundland) and NL (Labrador) west to MN and SD, south to s. FL and c. TX; West Indies. [= S. graminea Michaux var. graminea – RAB, C, G, GW, K, WH, Y; > S. graminea – F; > S. eatonii J.G. Smith – F; = S. graminea ssp. graminea – FNA; > S. graminea – S; > S. cycloptera (J.G. Smith) C. Mohr – S; < S. graminea – W; < S. graminea var. graminea – Z (also see S. isoetiformis); = S. graminea – WV]

**Sagittaria isoetiformis** J.G. Smith. Pineland ponds, clay-based Carolina bays, other seasonally flooded depressions. June-September. Se. NC south to s. peninsular FL, west to s. MS (Sorrie & Leonard 1999). See Godfrey & Adams (1964) for additional discussion of this species. [= FNA, GW, K, S, Y; < S. teres – RAB, S, misapplied; < S. graminea Michaux var. graminea – Z]

**Sagittaria kurziana** Glück, Spring-tape. Spring-runs. Panhandle and n. peninsular FL. [= GW, K, S, WH; = S. subulata (Linnaeus) Buchenau var. kurziana (Glück) Bogin – Z]

**Sagittaria lancifolia** Linnaeus var. lancifolia. Marshes, swamps. May-June. E. SC south to s. FL, west to FL Panhandle; West Indies; n. South America. [= C; = S. lancifolia – RAB; = S. lancifolia ssp. lancifolia – FNA, GW, K, WH, Z; > S. angustifolia Lindley – S; > S. lancifolia – S, in a narrow sense]

**Sagittaria lancifolia** Linnaeus var. media Micheli. Freshwater to brackish tidal marshes, ditches. June-October. S. DE south to ne. FL, FL Panhandle, west to TX; scattered in Central America. If recognized as a species, this taxon is S. falcata. [= C; = S. falcata Pursh – RAB, F, G, S; = S. lancifolia ssp. media (Micheli) Bogin – FNA, GW, K, WH, Z]

**Sagittaria latifolia** Willdenow var. latifolia. July-October. Marshes, swamps, farm ponds, ditches, bogs. June-September, NS west to BC, south to tropical America (rare in the Appalachian region). In addition to the pubescence difference, var. latifolia and var. pubescens can be separated by the presence (var. latifolia) or absence (var. pubescens) of resin-ducts on the achene-faces. [= C, G, GW, W, Z; > S. latifolia var. latifolia – RAB, F; > S. latifolia var. obtusa (Engelmann) Wieand – RAB, F; > S. planipes Fernald – F; < S. latifolia – FNA, K, WH; > S. latifolia – S; > S. ornithorhyncha Small – S; > S. viscosa C. Mohr – S; = S. latifolia – WV]

**Sagittaria macrocarpa** J.G. Smith. Beaverponds, old millponds. Apparently endemic to the Coastal Plain of the Carolinas; potentially to be expected in e. GA. See Sorrie, Keener, & Edwards (2007) for detailed discussion. [< S. graminea Michaux var. macrocarpa (J.G. Smith) Bogin – Z, misapplied]

* **Sagittaria montevidensis** Chamisso & Schlechtendahl. Disturbed areas, marshes; native of South America. July. Most of the collections from the southeastern United States are old collections around major seaports, suggesting that this plant was introduced on the ballast of sailing ships. [= RAB, K, S, WH; = S. montevidensis ssp. montevidensis – FNA, GW, Z]
**ALISMATACEAE**

*Sagittaria praecox* Buchenau. Nipple-duct Arrowhead. Bogs, swamps, ditches, depressions. C. AR and se. OK south to s. LA and c. TX; rarely disjunct east of the Mississippi in se. LA and s. MS. [= FNA, GW, K] [add synonymy]

*Sagittaria spatulata* (J.G. Smith) Buchenau. Tidal marshes. May-September. NB south to e. NC along the coast. [= C, G; > Lophocarpus spongiosus (Engelmann) J.G. Smith – F; > S. calycina var. spongiosa Engelmann – K, WH; > S. monteviendensis Chamisso & Schlechtendahl ssp. spongiosa (Engelmann) Bogin – FNA, Z]

*Sagittaria subulata* (Linnaeus) Buchenau. Tidal marshes and mud flats. May-September. MA and NY south to n. peninsular FL and AL. [= FNA, GW, K, S, WH; > S. subulata var. subulata – RAB, G, Z; > S. subulata – C (also see S. stagnorum); > S. subulata var. subulata – F; > S. subulata var. natans (Michaux) J.G. Smith – F]

*Sagittaria teres* S. Watson. Ponds. MA south to s. NJ. [= C, F, FNA, G, K; > S. graminea Michaux var. teres (S. Watson) Bogin – Z]

*Sagittaria weatherbiana* Fernald. Fresh to brackish marshes, streambanks, pineland pools. April-June. Se. VA south to Panhandle FL. Isozyme studies by Hauber & Legé (1999) provide evidence that this taxon should be given species status; its genetic identity with var. *graminea* is low, and comparable to the difference between *S. graminea* (in the narrow sense) and *S. platyphylla.* [= F; > S. graminea Michaux var. weatherbiana (Fernald) Bogin – RAB, C, G, GW, K, WH, Y, Z; > S. graminea Michaux ssp. weatherbiana (Fernald) R.R. Haynes & C.B. Hellquist – FNA]

### 34. HYDROCHARITACEAE

1. Leaves basal, either elongate with parallel sides, or petiolate with a leaf blade.
2. Leaves differentiated into petiole and blade, the blade ovate to orbicular ................................................................. Limnobium
3. Leaves straplike, elongate, linear, the sides parallel and not differentiated into petiole and blade.
4. Leaves to 35 cm long; [saltwater].............................................................................................................................................. Thalassia
5. Leaves usually > 40 cm long; [freshwater]................................................................................................................................. Vallisneria
6. Leaves at or near the summit of the stem. Leaves at only 2-3 closely spaced nodes at the summit of the stem, appearing verticillate or whorled; leaves to 10 cm long; [saltwater].......................... Halophila
7. Leaves at many nodes along the stem, opposite or in whorls of 2-8, < 4 cm long; [freshwater]...
8. Leaves opposite or in whorls of 3-4 (no whorls with > 4 leaves).
9. Leaves slightly narrowed or straight-sided to base, sessile; perianth absent............................................................. Elodea
10. Leaves broadened and sheathing at base, narrowing upwards via “shoulders”; perianth absent.................................................... Najas
11. Leaves in whorls of (3-4) 8 (some or most whorls with 4 or more leaves).
12. Leaves mostly 2-3 cm long, finely toothed with slender, weak teeth on the margins and rarely also the midrib beneath; fresh leaves not noticeably rough to the touch; leaf whorls generally crowded on all stems; petals white, 9-11 mm long.............................................. Egeria
13. Leaves mostly 1-2 cm long, toothed with stout, sharp teeth on the margins and also on conical bases along the midrib beneath; fresh leaves noticeably rough to the touch; leaf whorls crowded on terminal portions of stems, remote on older stems; petals translucent, 2-5 mm long ........................................................................................................ Hydrilla
**Egeria** Planchon 1849 (South American Waterweed)

* **Egeria densa** Planchon, Brazilian Waterweed, "Elodea," "Anacharis." Ponds and stagnant water of streams or rivers; native of South America. May-November. This is the "Elodea" or "Anacharis" of the aquarium trade. [= RAB, FNA, GW, K, W, WH; = *Elodea densa* (Planchon) Caspary – F; = *Anacharis densa* (Planchon) Victorin – G; = *Philotria densa* (Planchon) Small & St. John – S]

**Elodea** Michaux 1803 (Waterweed)

1 Well-developed leaves (1-) avg. 2 (-5) mm wide, mostly 2-5x as long as wide; staminate spathe 4-8 (-15) mm long, the flower at anthesis on an elongated, very slender, flexuous stalk; sepals of pistillate flowers 2-4.5 mm long ................................................................. *E. canadensis*

1 Well-developed leaves (0.3-) avg. 1.3 (-2) mm wide, mostly 5-10x as long as wide; staminate spathe 2-3 mm long, the flower at anthesis separating from the spathe (and plant) at maturity; sepals of pistillate flowers 1-1.5 mm long ............................................................................ *E. nuttallii*

**Elodea canadensis** Michaux, Common Waterweed. Rivers, lakes, ponds, stagnant waters of streams. July-September. QC west to SK, south to NC, Panhandle FL, OK, NM, and CA. [= RAB, C, F, FNA, GW, K, W, WH; = *Anacharis canadensis* (Michaux) Planchon – G; = *Philotria canadensis* (Michaux) Britton – S (also see *E. nuttallii*)]

**Halophila** Thouars 1806 (Seagrass)

A genus of about 10 species, seagrasses, of tropical and warm temperate waters of the Caribbean Sea and the Indian/Pacific oceans.

**Halophila engelmannii** Ascherson ex Neumayer, Engelmann’s Seagrass. Estuarine waters. S. FL, west along Gulf Coast (MS, LA) to TX; Bahamas; West Indies. [= K, WH]

**Hydrilla** L.C. Richard 1814 (Hydrilla)

**Limnobium** L.C. Richard 1814 (Frog's-bit)

**Limnobium spongia** (Bosc) L.C. Richard ex Steudel, American Frog's-bit, Spongeplant. Swamps, marshes, ponds, pools. June-September. DE and MD south to s. FL, west to e. TX, north in the interior in the Mississippi Embayment to s. MO and s. IL; disjunct around the Great Lakes (as in n. IN and w. NY); also in tropical America. Often free-floating, the leaves with prominently large cells below. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Najas** Linnaeus 1753 (Naiad, Bushy-pondweed, Water-nymph)

Identification notes: Counts of leaf-teeth do not include the broadened, sheathing base of the leaf. Seeds are necessary for the identification of most species.

1 Plants dioecious; lower side of the midvein of the leaves prickly; [subgenus *Najas*] ................................................................. *N. marina*

1 Plants monocious; lower side of the midvein of the leaves smooth; [subgenus *Caulinia*].

2 Leaf-teeth multicellular, evident at 10× magnification, 7-15 per side; leaves becoming recurved late in the season; seed-coat pitted, the areoles distinctly wider than long, in ca. 12-18 ladder-like rows ........................................................... *N. minor*

2 Leaf-teeth unicellular, not evident at 10× magnification, > 20 per side (except 13-17 per side in *N. gracillima*); leaves spreading to ascending; seed-coat smooth or pitted, if present the areoles longer than wide or about as long as wide.

3 Seeds smooth, glossy, obovate, broadest above the middle; anthers 1-locular ................................................................. *N. flexilis*

3 Seeds pitted, dull, cylindric, fusiform, or elliptic, broadest at the middle; anthers 1- or 4-locular.

4 Style offset from the apex of the seed; anthers unilocular .................................................................................. *N. gracillima*

4 Style at the apex of the seed; anthers 4-locular ............................................................................. *N. guadalupensis var. guadalupensis*

*Najas flexilis* (Willdenow) Rostkovius & Schmidt, Northern Naiad. Lakes and rivers. July-August. NL (Newfoundland) west to ON, south to VA, MD, MO, and NE; also in the west from AB and SK south to OR and UT. [= C, F, FNA, G, K, S, W, WV, Z; = *Najas flexilis* – S, orthographic variant]

*Najas gracillima* (A. Braun ex Engelmann) Magnus, Slender Naiad, Bushy Naiad. Ponds and lakes. July-October. NS west to MN, south to NC, AL, and MO; disjunct in CA (where likely alien). Haynes (1979) reports that this species cannot tolerate pollution and is apparently declining in abundance. [= RAB, C, F, FNA, G, K, W, WV, Z]

*Najas marina* Linnaeus, Holly-leaf Naiad. Brackish or calcareous waters. [= C, F, FNA, G, K; = *Najas marina* – S, orthographic variant]

*Thalassia* Banks & Solander ex Koenig (Turtlegrass)

A genus of 2 species, seagrasses, of tropical and warm temperate waters of the Caribbean Sea and the Indian/Pacific oceans.

*Thalassia testudinum* Banks & Solander ex Koenig, Turtlegrass. Seagrass beds in estuarine waters. January-December. E. coast of c. peninsular FL to s. FL, north along the west coast of FL to the Panhandle, and in MS, LA, and TX. [= K, WH]

*Vallisneria* Linnaeus 1753 (Water-celery, Eelgrass)

1 Sepals 2-3 mm long; leaves 5-6 (-10) mm wide; leaves lacking red-purple longitudinal stripes .................................................. *V. americana*

1 Sepals 4-5.5 mm long; leaves 15-20 mm wide; leaves with red or purple longitudinal stripes .................................................. *V. neotropicalis*

*Vallisneria americana* Michaux, Vallisneria, Water-celery, Tapegrass, Eelgrass. Lakes, rivers, estuaries, sounds. July-October. NS and QC west to ND, south to FL, TX, NM, AZ; south into tropical America {or is this all or partly *V.*}
HYDROCHARITACEAE

Vallisneria neotropicalis Marie-Victorin, Large Water-celery, Large Eelgrass. Spring runs; other aquatic habitats. FL Panhandle, s. FL; Cuba. The distinctiveness of this taxon has been defended by Les et al (2008) on morphological and molecular grounds. [= Y, Z; < V. americana – FNA, GW, K, WH; ? V. americana var. americana – C; > V. americana – S; > V. spiralis Linnaeus – S]

35. SCHEUCHZERIACEAE F. Rudolphi 1830 (Scheuchzeria Family) [in ALISMATALES]

Scheuchzeria Linnaeus (Scheuchzeria, Pod-grass)

Scheuchzeria palustris Linnaeus var. americana Fernald, Pod-grass. Sphagnum bogs. NL (Labrador) and AK south to s. NJ, e. WV (Cranberry Glades, Pocahontas County), sc. PA (Rhoads & Klein 1993), IN, IL, IA, WA, WY, and CA. [= F; < S. palustris – C, FNA, G, WV; = S. palustris ssp. americana (Fernald) Hultén – K; = S. americana (Fernald) G.N. Jones]

37. JUNCAGINACEAE L.C. Richard 1808 (Arrowgrass Family) [in ALISMATALES]

Triglochin Linnaeus 1753 (Arrowgrass)

1 Pistils 6, all fertile; fruits 2-4.5 mm long; central axis between the carpels not winged; [of NJ northward] ......................... T. maritima
1 Pistils 6, 3 fertile and 3 sterile; fruits 1.2-2 mm long; central axis between the carpels broadly winged; [of DE and MD southward] ...... T. striata

Triglochin striata Ruiz & Pavón, Southern Arrowgrass. Brackish to nearly freshwater marshes. May-October. The species has an extensive range, occurring in tropical Central and South America, Africa, and Australia; in North America, it ranges from MD and DE south to s. FL and west to LA, and also on the west coast in CA and OR. [= F, FNA, G, WH; = T. striatum – RAB, C, GW, S, Z, orthographic variant]

38. ZOSTERACEAE Dumortier 1829 (Eelgrass Family) [in ALISMATALES]

Zostera Linnaeus 1753 (Eelgrass)

Zostera marin a Linnaeus var. stenophylla Ascherson & Graebner, Eelgrass. Estuarine waters. February-March. The species occurs in Eurasia and North America. Var. stenophylla is North American, and ranges south along the Atlantic coast to NC and allegedly to FL (though reports from that state are apparently not substantiated and may be based on misidentification of other aquatics). [= F, G, Y; < Z. marina – RAB, C, FNA, K, S, Z]
A family of 6-7 genera and about 100 species (if circumscribed, as here, to include Zannichellia), aquatic herbs, nearly cosmopolitan. Here circumscribed following recent molecular studies to include Zannichellia (Lindqvist et al. 2006; Angiosperm Phylogeny Group 2003, 2009). References: Haynes & Hellquist in FNA (2000); Haynes (1978); Les & Haynes (1996); Haynes, Les, & Holm-Nielsen in Kubitzki (1998b); Wiegleb & Kaplan (1998)=Z; Lindqvist et al. (2006). [including ZANNICHELLIACEAE]

1 Leaves opposite lobes .......................................................... Zannichellia
1 Leaves alternate.

2 Stipules not adnate, or adnate to the blade < ½ the length of the stipule; peduncle stiff, the flowering spike elevated above the water’s surface; submerged leaves translucent, flat; floating leaves present or absent ................................................................. Potamogeton
2 Stipules adnate to the blade for at least 2/3 the length of the stipule; peduncle flexible, the flowering spike submerged; submerged leaves opaque, channeled, stiff; floating leaves absent .................................................................................. Stuckenia

Potamogeton Linnaeus 1753 (Pondweed)

1 Stipular sheaths of submerged leaves adnate with leaf blade base, the tip usually projecting as a ligule .............................................. Key A
1 Stipular sheaths of submerged leaves free from the leaf blade base, or with only a few adnate, the ligule not obvious.

2 Submersed leaves broadly linear-oblong to lanceolate to elliptic or nearly orbicular, 10-58 mm wide (occasional stranded forms lack submersed leaves) ........................................................................................................... Key B
2 Submersed leaves linear, thread-like or ribbon-like, 0.1-10 mm wide ........................................................................................................ Key C

Key A

1 Leaves stiffish, conspicuously 2-ranked, auriculate-lobed to rounded at the junction with the stipule, with 20-60 fine veins .......... P. robbinsii
1 Leaves lax, not conspicuously 2-ranked, lacking basal lobes, with fewer than 20 veins.

2 Tips of submersed leaves acute; fruit 1-2 mm wide, the lateral keel with acute tips, beak minute ............................................................. P. diversifolius
2 Tips of submersed leaves obtuse; fruit 1.3-2.4 mm wide, the lateral keel with blunt tips, beak lacking .......................................................... P. spirillus
2 Tips of submersed leaves acute to long-tapering; floating leaves acute at apex.

4 Submersed leaves 0.1-0.6 mm wide, without obvious lacunae; floating leaves 3-7 veined ......................................................... P. bicupulatus
4 Submersed leaves 0.2-1 (-2) mm wide, with abundant lacunae; floating leaves 9-23 veined ......................................................... P. tennesseensis

Key B

1 Leaf margins conspicuously serrate; stem flattened; fruit beak 2-3 mm long; turions commonly formed, hard .................................. P. crispus
1 Leaf margins entire; stem terete; fruit beak < 1 mm long; turions rarely formed.

2 Submersed leaves clasping the stem; floating leaves absent.
3 Leaves orbicular to ovate, often lanceolate in soft water, 1-6 cm long, with 3-25 delicate veins; stipules deteriorating and deciduous, absent on lower portions of stem .................................................................................................................................................................................................. P. perfoliatus
3 Leaves ovate-lanceolate to narrowly lanceolate, 1.6-13 cm long, with 3-35 coarse veins; stipules disintegrating to persistent fibers, even on lower portions of stem .................................................................................................................................................................................................. P. richardsonii
2 Submersed leaves petioled or sessile, not clasping the stem; floating leaves absent or present.
4 Submersed leaves 19-49 veined, distinctly arculate ......................................................................................................................... P. amplifolius
4 Submersed leaves with fewer than 29 veins, not arculate.
5 Stems conspicuously black-spotted; submersed leaves crisped along the margin; floating leaves 15-21 veined ......................... P. pulcher
5 Stems inconspicuously spotted or lacking spots; submersed leaves flat along the margin; floating leaves 7-29 veined.
6 Submersed leaves with petioles 1-13 cm long.
7 Larger submersed leaves acute at the apex with a sharp awl-like tip; fruit gray-green to olive-green, with well-developed lateral ridges ......................................................... P. illinoensis
7 Larger submersed leaves acute at the apex but lacking a sharp awl-like tip; fruit red to reddish-brown, with maricate lateral ridges .................................................................................................................................................................................................. P. nodosus
6 Submersed leaves sessile.
8 Fruit reddish-brown, with obsolete or rounded keel; submersed leaves with (3-) 5-9 veins ................................. P. gramineus
1 Fruit with a prominent keel 0.2-1.2 mm broad; floating leaves present; lacunae prominent in submersed leaves.
2 Submersed leaves 3-13 veined; stipules of submersed leaves not adnate to the leaf base; floating leaves rounded at apex... *Potamogeton epihydrus*
2 Submersed leaves 1-3 (-7) veined; stipules of at least some submersed leaves adnate to the leaf base; floating leaves acute at apex...
   ..................................................................................................................................................................................................
   ..................................................................................................................................................................................................
1 Fruit with a keel < 0.2 mm broad; floating leaves absent or present; lacunae present in some species, but generally not prominent.
3 Floating leaves present, at least in some plants of the population.
4 Petiole junction with leaf distinctly pale in color; floating leaves ovate, oblong-ovate, cordate at base, rarely tapering... *Potamogeton natans*
4 Petiole junction with leaf lacking pale color; floating leaves elliptical, ovate-elliptical, or oblong-elliptical.
5 Floating leaves 7-12 mm wide, tapering at both ends; fruit apparently not produced... *Potamogeton variipes*
5 Floating leaves 10-20 (-30) mm wide, obtuse, round or tapering at the base; fruit often produced... *Potamogeton floridanus*
3 Floating leaves absent from all plants in the population.
6 Rhizomes obvious; peduncle 5-25 cm long; leaves thread-like, 0.1-0.5 mm wide... *Potamogeton confoveroides*
6 Rhizomes absent or not apparent; peduncle 0.3-7 cm long, often curved; leaves usually not thread-like, 0.1-5 mm wide.
7 Nodal glands absent.
8 Leaves 15-35 veined, > 2 mm wide; stem conspicuously flattened; peduncles terminal, usually straight... *Potamogeton strictifolius*
8 Leaves 3-5 veined, usually < 2 mm wide; stem terete; peduncles usually axillary, recurved.
9 Leaves acute, 3-5 (-7) veined, 0.3-1.5 (-2.3) mm wide; fruits 1-keeled, 1.4-2.3 (-2.7) mm long... *Potamogeton foliosus var. foliosus*
9 Leaves usually bristle-tipped, occasionally aciculate to blunt, 3 veined, 1-2.2 (-4) mm wide; fruits 3-keeled, 2.3-4 mm long...
   ..................................................................................................................................................................................................
   ..................................................................................................................................................................................................
8 Leaves 15-35 veined, > 2 mm wide; stem conspicuously flattened; peduncles terminal, usually straight... *Potamogeton strictifolius*
8 Leaves 3-5 veined, usually < 2 mm wide; stem terete; peduncles usually axillary, recurved.
9 Leaves acute, 3-5 (-7) veined, 0.3-1.5 (-2.3) mm wide; fruits 1-keeled, 1.4-2.3 (-2.7) mm long... *Potamogeton foliosus var. foliosus*
9 Leaves usually bristle-tipped, occasionally aciculate to blunt, 3 veined, 1-2.2 (-4) mm wide; fruits 3-keeled, 2.3-4 mm long...
   ..................................................................................................................................................................................................
   ..................................................................................................................................................................................................

Potamogeton amplifolius

Potamogeton bicupulatus
Fernald. Quiet waters. July-September. ME west to WI, south to VA (Augusta County) and se. TN. [= FNA, F, K, Z; = P. diversifolius Rafinesque var. trichophyllus Morong – C, GW]

Potamogeton confoveroides
Reichenbach, Alga Pondweed, Conferva Pondweed, Tuckerman's Pondweed. Acidic blackwater pools and streams. April-September. NL (Newfoundland) west to ON, south to NJ and PA; disjunct in se. NC and ne. SC (fall-line sandhills). [= RAB, C, F, FNA, G, K, Z]

* Potamogeton crispus

Potamogeton diversifolius

Potamogeton epihydrus
Rafinesque, Ribbonleaf Pondweed. Ponds. June-September. NL (Newfoundland) west to AK, south to GA, w. Panhandle FL, s. MS (Sorrie & Leonard 1999), LA, CO, and CA. [= RAB, C, FNA, K, S, W, WH, WV; > P. epihydrus var. epihydrus – F, G; > P. epihydrus var. natansii (Chamisso & Schlechtendahl) Fernald – F, G; < P. epihydrus – Z (also see P. tennesseensis)]

Potamogeton floridanus
Small, Florida Pondweed. Blackwater rivers. Apparently endemic to blackwater rivers of the Panhandle of FL. Considering the under-collection of Potamogeton, it should be sought elsewhere. [= FNA, S, WH; < P. natans – Z]

Potamogeton foliosus
**Potamogeton gramineus** Linnaeus, Variable Pondweed. Estuarine waters. Greenland and AK, south to sc. PA (Rhoads & Klein 1993), NJ, WV (Kartesz 1999), n. VA, MI, WI, CO, UT, and CA. Reported for VA (Fairfax County); specimen identification needing confirmation. [= C, FNA, G, K, WV, Z; > P. gramineus var. maximus Morong – F]

**Potamogeton illinoensis** Morong, Illinois Pondweed. Calcareous waters of streams, lakes, and ponds. May-September. QC west to NT and s. BC, south to s. FL, TX, Mexico, and CA. [= RAB, C, F, FNA, G, K, WV, Z; = P. angustifolius Berchtold & K. Presl – S; > P. heterophyllus Schreber – S; > P. lucens Linnaeus – S, misapplied]

**Potamogeton natans** Linnaeus, Floating Pondweed. Lakes and slow streams. June-September. NL (Newfoundland) west to AK, south to e. WV, w. NC, KS, NM, AZ, and CA. [= RAB, C, F, FNA, G, K, S, W; < P. natans – Z (also see P. floridanus)]

**Potamogeton nodosus** Poiret, Longleaf Pondweed, American Pondweed. Ponds, streams. May-September. ME and QC west to BC, south to Panhandle FL, TX, Mexico, and CA. [= RAB, C, F, FNA, G, GW, K, S, WV, Z; ? P. fluitans Roth – S; > P. oblongifolium Forster, proposed for nomenclatural rejection (Reveal et al. 2003)]

**Potamogeton oakesianus** J.W. Robbins, Oakes Pondweed. Lakes and streams. NL (Newfoundland) west to MN, south to VA, n. WV, and n. IL; apparently disjunct in MT, and BC, and possibly in s. AL (Sorrie, pers. comm.). [= C, F, FNA, G, K, W, Z]

**Potamogeton perfoliatus** Linnaeus, Perfoliate Pondweed, Redhead Grass. Ponds. June-October. NL (Newfoundland), NL (Labrador) west to MI, south to ne. NC, and n. OH; apparently disjunct in w. FL, c. peninsular FL, s. AL, and se. LA, and in SD. [= FNA, G, K, S, Z; > P. perfoliatus var. bupleuroides (Fernald) Farwell – RAB, F, GW, WH; > P. bupleuroides Fernald]

**Potamogeton pulcher** Tuckerman, Spotted Pondweed. Ponds, pools, ditches, streams. June-September. NS west to WI, south to n. peninsular FL and e. TX. [= RAB, C, F, FNA, G, GW, K, S, WH, WV, Z; = P. rotundifolium Forster, proposed for nomenclatural rejection (Reveal et al. 2003)]

**Potamogeton pusillus** Linnaeus var. pusillus. Acid and alkaline waters. May-September. NS west to AK, south to FL and Mexico. [= P. bertholdii Fieber – RAB; > P. pusillus var. pusillus – F; > P. pusillus var. minor (Bivona-Bernardi) Fernald & Schubert – F; = P. pusillus ssp. pusillus – FNA, K; < P. pusillus var. pusillus – C; < P. pusillus – G, GW, S, WH, Z; = P. pusillus – WV]

**Potamogeton richardsonii** (Bennett) Rydberg, Richardson Pondweed. Slow-moving, calcareous waters. NL (Labrador) west to AK, south to DE, MD, PA, n. OH, n. IN, n. IL, IA, NE, NM, AZ, and CA. [= C, F, FNA, G, K, Z]

**Potamogeton robbinsii** Oakes, Fern Pondweed. Muddy waters. August-September. NS and PE west to Keewatin and AK, south to n. VA, n. IL, s. MN, CO, UT, and CA; disjunct in s. AL. [= C, F, FNA, G, K, Z]

**Potamogeton spirillus** Tuckerman, Northern Snailseed Pondweed. Millponds, other quiet waters. May-September. NL (Newfoundland) west to MB, south to e. VA, n. OH, n. IA, and se. NE. [= C, F, FNA, G, K, WV, Z]

**Potamogeton strictifolius** A. Bennett, Straightleaf Pondweed. Calcareous waters. July-September. NL (Newfoundland) west to YT, south to w. VA, n. IL, WI, and n. UT. [= C, FNA, G, K, W, Z; > P. strictifolius var. strictifolius – F; > P. strictifolius var. rutiloides Fernald – F; > P. longiligulatus Fernald – F]

**Potamogeton ephryus**

**Potamogeton floridanus**

**Potamogeton foliosus** var. foliosus

**Potamogeton gramineus**

**Potamogeton lillii**

**Potamogeton illinoensis**
**POTAMOGETONACEAE**

*Potamogeton tennesseensis* Fernald, Tennessee Pondweed. Quiet or flowing water. Late May-September. PA and OH south to w. VA, and se. TN. [= F, FNA, K, W, WV; < *P. epihydrus* – Z]

**Stuckenia** C. Börner 1912 (Sago-pondweed)

**Zannichellia** Linnaeus 1753 (Horned Pondweed)

**Identification notes:** *Zannichellia* is sometimes confused with other aquatics, such as *Ruppia* and narrow-leaved *Potamogeton*. *Potamogeton* has at least some leaves alternate; *Zannichellia* and *Ruppia* are opposite-leaved. *Zannichellia* lacks the abruptly broadened sheath of *Najas*. Also, the seeds are flattened in *Zannichellia*, and toothed down one side; *Najas* has a cylindric or elliptic fruit. *Zannichellia* has longer leaves (3-10 cm long) than *Najas* (< 4 cm long).

*Zannichellia palustris* Linnaeus, Horned Pondweed. Fresh or brackish water. February-October. The species occurs throughout much of the world. [= RAB, C, FNA, G, GW, K, S, W, WV, Z; > *Z. palustris* var. major (Hartman) W.D.J. Koch – F; > Z. palustris var. palustris – F]

41. **RUPPIACEAE** Horaninow ex Hutchinson 1934 (Wigeon-grass Family) [in ALISMATALES]

**Ruppia** Linnaeus (Wigeon-grass)

**Identification notes:** Separable from superficially similar species of *Potamogeton* by the stipules adnate their entire length (vs. separate at least at the tip in *Potamogeton*).

42. **CYMODOCEACEAE** N. Taylor 1909 (Manatee-grass Family) [in ALISMATALES]

A family of about 5 genera and 16 species, estuarine aquatics, of tropical and subtropical (rarely temperate) waters. References: Kuo & McComb in Kubitzki (1998b); Haynes in FNA (2000); Green & Short (2003).

1 Leaves flat above the sheath; leaf tips 3-toothed; female plants with flowers with 1 pistil.......................................................... **Halodule**

1 Leaves terete or subterete above the sheath; leaf tips acicular; female plants with flowers with 1-2 pistils.............................................. **Syringodium**

**Halodule** Endlicher 1841 (Shoal-grass)
A genus of about 6 species, of tropical and subtropical regions of both hemispheres. References: Haynes in FNA (2000); McRoy & Helfferich (1977); Kuo & McComb in Kubitzki (1998b); Green & Short (2003)=Z.

**Halodule wrightii** Ascherson, Shoal-grass. Submerged in estuarine waters up to about 2 m deep, especially in Core and Pamlico sounds (North Carolina). E. NC (reported with unknown documentation from SC, not known from GA); FL west to TX, and south along shores of the Gulf of Mexico and Caribbean; also on the Pacific coast of Panama and Nicaragua. Haynes in FNA (2000) concludes that *H. beaudettei* is not taxonomically distinct from *H. wrightii* (the older name). Seagrasses (an informal group including species such as *Halodule wrightii*, *Zostera marina*, and *Ruppia maritima* in our area) are very important components of estuarine ecosystems, providing a large proportion of the primary productivity in such systems and providing shelter and nursery grounds for fish, shrimp, and other invertebrates. An estimated 80,000 hectares of seagrass beds are found in Pamlico and Core sounds, NC, most of that area having *Halodule* as the co-dominant or dominant species (Ferguson, Rivera, & Wood 1989). There is concern about the destruction of seagrass beds by pollution, dredging of waterways, and mechanical disturbance by fishing boats (Koch & Orth 2003; Green & Short 2003). [= FNA, S, WH, Z; > *H. beaudettei* (den Hartog) den Hartog – RAB, GW, K]

**Syringodium** F.T. Kützing in R.F. Hohenacker 1860 (Manatee-grass)

**Syringodium filiforme** F.T. Kützing in R.F. Hohenacker, Manatee-grass. Estuarine waters. Panhandle FL, peninsular FL, westward along the Gulf Coast, and in the West Indies. Syringodium is occasionally cast ashore in Georgia and the Carolinas following hurricanes, but there is no evidence that it grows in our area. [= FNA, WH, Z; = *Cymodocea filiformis* (F.T. Kützing in R.F. Hohenacker) Correll – GW, K; = *Cymodocea manatorum* Ascherson – S]

### 44. NARTHECIACEAE

E.M. Fries 1846 (Bog-aspodel Family) [in DIOSCOREALES]

**Aletris** Linnaeus 1753 (Colic-root, Stargrass)

1 Perianth white to creamy-white (rarely pinkish).
2 Perianth 6-10 mm long, cylindric at anthesis, 2-3× as long as broad, the perianth lobes narrowly deltoid (longer than broad); fruiting perianth markedly constricted above the middle .......................................................... *A. farinosa*..........
3 Perianth short-cylindric or campanulate at anthesis, 1-2× as long as broad, the perianth lobes not spreading; [flowering May-July] ..............

2 Perianth 4-6 mm long, campanulate at anthesis, ca. 1× as long as broad, the perianth lobes broadly deltoid (about as long as broad); fruiting perianth somewhat narrowed above the base .................................................................................................................. *A. obovata*..........
1 Perianth golden yellow (often faded in dried specimens).
3 Perianth short-cylindric or campanulate at anthesis, 1-2× as long as broad, the perianth lobes not spreading; [flowering May-July] ..............

3 Perianth long-cylindric at anthesis, 2.5-4× as long as broad, the perianth lobes spreading somewhat; [flowering March-May] ............. *A. lutea*

**Aletris aurea** Walter, Golden Colic-root. Pine savannas, seepage bogs, pine flatwoods. Mid May-July; August. S. MD south to ne. FL, Panhandle FL, west to e. TX and se. OK. Flowering several weeks later than *A. farinosa* when growing together. [= RAB, C, F, FNA, G, GW, K, S, WH, X, Y, Z]

**Aletris farinosa** Linnaeus, Northern White Colic-root, Mealy Colic-root, Stargrass. Pine savannas, pine flatwoods, seepage bogs, upland woodlands, roadbanks. Late April-early June; July-August. S. ME, s. ON, and se. MN south to s. GA, FL (Wunderlin 1998), LA, and TX, the only species of the genus not restricted (or nearly so) to the Coastal Plain. [= RAB, C, F, FNA, G, GW, K, S, WH, X, Z]

**Aletris lutea** Small, Yellow Colic-root. Pine savannas. E. GA (in immediate proximity to the SC border) south to s. FL, and west to e. LA (Weigant 2002); disjunct in w. LA (Sorrie & LeBlond 2008). The report by F of *A. lutea* Small as far north as se. VA is in error. A specimen collected in se. NC has recently been annotated as *A. lutea*, but it appears to be *A. farinosa*. [= FNA, GW, K, S, WH, X, Y, Z]

**Aletris obovata** Nash ex Small, Southern White Colic-root. Pine savannas. May-early June; August. Se. SC south to c. peninsular FL, west to e. Panhandle FL. Reported for MS (Kartesz 1999), but the report rejected (likely based on a misidentified specimen). [= RAB, FNA, GW, K, S, WH, X, Y, Z]
**Lophiola** Ker-Gawler 1814 (Golden Crest)

*Lophiola aurea* Ker-Gawler, Golden Crest. Wet savannas, bogs, marshes, ditches adjacent to these natural habitats. Late May-June; August-September. FL Panhandle and sw. GA west to e. LA; se. NC; n. DE (at least formerly) and s. NJ; disjunct in NS. Only a few populations remain in NC. [= C, FNA, K, S, Z; > *L. americana* (Pursh) Wood – RAB, F (the NJ-DE material), G, GW; > *L. septentrionalis* Fernald – F (the Nova Scotian material)]

**Narthecium** Hudson 1762 (Asphodel)

A genus of about 8 species, many narrow disjuncts, collectively with a very fragmented distribution in the temperate Northern Hemisphere. References: Small (1924)=Z; Zomlefer (1997b)=Y; Utech in FNA (2002a); Tamura in Kubitzki (1998a); Schumacher (1947)=X; Sorrie & Weakley (in prep.)=Q.

1 Tepals 4-6 mm long; capsule 10-14 mm long; pedicels stout, about as long as the subtending bracts; [Coastal Plain seeps and savannas]..........
2 Tepals 6-9 mm long; capsule 8-10 mm long; pedicels slender, distinctly longer than the subtending bracts; [Mountain bogs]...........

*Narthecium americanum* Ker-Gawler, Yellow Asphodel. Wet seepages or savannas. June-July; August-September. S. NJ and DE (where believed extirpated); disjunct in c. SC (where apparently extirpated, though still worth seeking in mucky seepages of the Sandhills of SC and NC). [= C, F, G, Q, X; < *Narthecium americanum* – RAB, FNA, GW, K, W, Y (also see *N. montanum*); = *Abama americana* (Ker-Gawler) Morong – S, Z]

*Narthecium montanum* (Small) C.H. Grey, Appalachian Yellow Asphodel. Bogs (apparently extinct). With the drainage of the bogs of East Flat Rock, Henderson County, this species was apparently extirpated. It is still possible that it will be relocated, in bogs in Henderson or Transylvania counties, NC. Small (1924, 1933) considered the NC mountain population a distinct species, based on its longer, more slender pedicels, larger sepals, petals, and stamens, and smaller capsules. Schumacher (1947), in the most thorough worldwide assessment of *Narthecium*, agreed, and Sorrie & Weakley (in prep.) concur, based on an herbarium analysis of the characters of all taxa in the genus. The morphological distinctions (and geographic disjunction) between *N. montanum* and *N. americanum* are as great or greater as those between most species recognized worldwide in the genus. [= F, Q, X; < *Narthecium americanum* – RAB, FNA, GW, K, W, Y; = *Abama montana* Small – S, Z]

**45. BURMANNIACEAE** Blume 1827 (Burmanna Family) [in DIOSCOREALES]

1 Floral tube terete; ovary 1-locular.................................................................................................................................................................*Apteria*
2 Floral tube 3-angled or 3-winged; ovary 3-locular..............................................................................................................................................*Burmannia*

**Apteria** Nuttall (Nodding Nixie)

*Apteria aphylla* (Nuttall) Barnhart ex Small, Nodding Nixie. Wet hammocks, bay swamps, other acid swamps, mesic forests. E. GA west to e. TX, south to c. South America, and in the West Indies. [= FNA, GW, K, S, WH]

**Burmannia** Linnaeus (Burmannia)
A genus of about 63 species, autotrophic or mycotrophic herbs, pantropical (to warm temperate). References: Lewis in FNA (2002a); Maas-van de Kamer in Kubitzki (1998a).

**Identification notes:** Both species of _Burmannia_ are very small and easy to overlook; they occasionally occur together.

1. Floral tube 3-winged, violet; flowers in a spicate cyme (solitary in depauperate individuals)................................................................. _B. biflora_
2. Floral tube obtusely 3-angled, greenish to creamy white; flowers in a capitulate cluster (solitary in depauperate individuals).............. _B. capitata_

**Burmannia biflora** Linnaeus, Violet Burmannia. Savannas, bogs, shores of Coastal Plain depression ponds. August-November. Se. VA south to FL, west to e. TX. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Burmannia capitata** (J.F. Gmelin) von Martius, White Burmannia. Savannas, bogs, shores of Coastal Plain depression ponds. July-November. E. NC south to s. FL, west to e. TX and se. OK; West Indies, Central America, and South America. [= RAB, FNA, GW, K, S, WH]

---

**46. DIOSCOREACEAE** R. Brown 1810 (Yam Family) [in DIOCOREALES]

A family of about 3-20 genera and 600-880 species, of tropical and warm temperate regions. References: Raz in FNA (2002a); Huber in Kubitzki (1998a).

**Dioscorea** Linnaeus 1753 (Yam)

A genus of about 575-850 species, vines, of tropical and warm temperate regions of the Old World and New World. Huber in Kubitzki (1998a) advocates the division of the large and unwieldy _Dioscorea_ into separate genera. _Dioscorea_ (broadly defined) has a wide variety of economic uses, especially in the tropics, where it is most diverse. Various species are cultivated for their edible tubers (yams, not to be mistaken for sweet potatoes, _Ipomoea batatas_, often referred to colloquially as "yams" in the southern United States), especially in Africa. Oral contraceptives were developed from extracts of _Dioscorea_. Many other uses are described in Al-Shehbaz & Schubert (1989). References: Raz in FNA (2002a); Al-Shehbaz & Schubert (1989)=Y; Ward (1977c)=Z; Huber in Kubitzki (1998a).

1. Leaves cordate-ovate, the sides of the leaves continuously convex; aerial tubers never present; perennial from rhizomes < 1.5 cm in diameter; [native species, usually of forests and woodlands]; [section Macropoda]
2. Stamine inflorescences usually of 1 large and 1-2 smaller secondary panicles in each axil (of upper stem leaves); filaments inwardly curved, ca. 0.4 mm long; anther lobes connate; tepals oblong; [of SC south]................................................................................................. _D. floridana_
3. Leaves halberd-shaped or sagittate, the sides with a concave portion ( _D. polystachya_ or continuously convex ( _D. alata, D. bulbifera_); aerial tubers often present in the leaf axils; perennial from large, vertically-oriented tubers; [non-native species, usually in disturbed areas, especially in bottomlands]; [section Enantiothylum]
4. Leaf margins sagittate, the sides continuously convex..................................................................................................................... _D. alata_
5. Stems terete.
6. Leaf margins halberd-shaped, the sides with a concave portion ............................................................................................... _D. bulbifera_
7. Leaf margins halberd-shaped, the sides with a concave portion ............................................................................................... _D. polystachya_

---

**Dioscorea floridana** Bartlett, Florida Wild Yam. Mesic to dry forests, swampy forests. June-July; August-November. SC south to n. FL, on the Coastal Plain. _D. floridana_ is "the most distinctive of North American species" (Al-Shehbaz & Schubert 1989). [= FNA, K, S, WH, Y, Z; > D. villosa Linnaeus var. floridana (Bartlett) Ahles – RAB; > Merione sp. 1]

**Dioscorea villosa** Linnaeus, Wild Yam. Moist forests and woodlands. April-June; September-November. NI, NY, s. ON, WI, MN, and IA south to n. FL and LA. Various specific and infraspecific taxa are here combined. Ward (1977c) states that "a recent study at Duke University by Shu-fun Au, unfinished due to the death of its author, tentatively recognized _D. hirticaulis_ and _D. floridana_ but combined all other entities without distinction under _D. villosa_." Further study is needed. Al-Shehbaz & Schubert (1989) indicate that the lectotype of _D. villosa_ has pubescent stems; nomenclatural changes are apparently needed, if varietal status of the 2 varieties of _D. villosa_ proves warranted. [= FNA, K, WH; > D. villosa var. villosa – RAB, C; > Dioscorea villosa

### 49. STEMONACEAE Engler 1887 (Stemona Family) [in PANDANALES]

*Croomia* Torrey 1840 (Croomia)

*Croomia pauciflora* (Nuttall) Torrey, Croomia. Moist bluff forests, often with beech and basswood. April-May. Wc. GA and n. AL south to Panhandle FL (Gadsden & Liberty counties; Wunderlin & Hansen 2008), and allegedly se. GA (Whetstone in FNA 2002, Jones & Coile 1988) and s. LA. [= FNA, K, S, WH, Z]

### 53a. TRILLIACEAE Lindley 1846 (Trillium Family) [in LILIALES]

*Trillium* Linnaeus 1753 (Trillium, Toadshade, Wake-robin)

A genus of about 50 species, of e. North America, w. North America, and e. Asia (especially se. North America). The genus *Trillium* in our area is difficult and complex. *Trillium* is now usually separated from the Liliaceae (along with Eurasian genera such as *Paris*) into the Trilliaceae (Zomlefer 1996, Kato et al. 1995, Kawano & Kato 1995, and others) or less drastically as part of the Melanthiaceae (Chase et al. 2000; Tamura et al. 2004). The traditional division of the genus into two well-marked subgenera, subgenus *Trillium*, the pedicellate trilliums, and subgenus *Phyllantherum*, the sessile-flowered trilliums, has been partly supported by molecular and morphological phylogenetic studies (Kawano & Kato 1995, Kato et al. 1995). These studies support the monophyly of subgenus *Phyllantherum*, but suggest that subgenus *Trillium* consists of several groups which are only rather distantly related (Kawano & Kato 1995, Kazempour Osaloo et al. 1999; Farmer & Schilling 2002). Most species are slow-growing perennials; seedlings, juveniles, and depauperate or "tired" plants are one-leaved ("monilliums"), recognizable by the similar color, texture and venation of the single leaf to the three leaves of mature plants. In some species, such as *T. pusillum*, individual plants remain in the single-leaf stage for long periods of time, and populations may consist largely of juvenile plants. References: Patrick (1986)=Z; Patrick (2007)=V; Freeman (1975)=Y; Case & Case 1997=X; Patrick in Wofford (1989); Case in FNA (2002a); Mitchell (1990); Kato et al. (1995); Kawano & Kato (1995); Tamura in Kubitzki (1998a); Zomlefer (1996); Farmer & Schilling (2002). Key adapted from Patrick (1986, 2007), unpublished keys of J.D. Freeman and S. Farmer, and other sources.

**Identification notes:** Teratological forms are frequent in some species, as, for instance, leaves, sepalis, and stamens in 2's or 4's, petals sepaloid, or sepals petaloid, and so forth. What are called "leaves" in *Trillium* are actually interpreted as bracts by some.

1 Leaves mottled with 2-3 different shades of green (very rarely the mottling not apparent); flower sessile; [subgenus *Phyllantherum*] ....... **Key A**
2 Leaves solid green; flower on a pedicel (the pedicel sometimes very short or essentially absent in some varieties of *T. pusillum*); [subgenus *Trillium*].
3 Petals relatively thick in texture, straight-margined, maroon or white, rarely yellow or green (if white, turning brown with age); stigmas thicker at base, tapering gradually toward tip, distinct; ovary purple-black, maroon, pink, or white, 6-angled; [*Erectum group*] ............. **Key B**
4 Petals relatively delicate in texture, wavy-margined, white to deep pink (if white, generally fading to pink with age); stigmas thin, uniform in thickness from base to apex, somewhat fused at the base into a short style; ovary greenish-white to white, 3- or 6-angled or-lobed............

**Key A** – trilliums with sessile flowers and mottled leaves (subgenus *Phyllantherum*)

1 Scape more-or-less decumbent in a gentle S-shape, the leaves lying on the ground, or nearly so; flower fragrance putrid; [*T. sessile* group].
2 Anther dehiscence extrorse (toward the outside of the flower); stamens about 0.25× as long as the petals; upper stem puberulent; petals 4-10 cm long; filaments 2-5 mm long.................................................................T. decumbens
3 Anther dehiscence introrse (toward the inside of the flower); stamens about 0.5× as long as the petals; upper stem glabrous; petals 2.5-5.5 cm long; filaments 1-2 mm long..................................................................................................................T. relicium

1 Sepals erect, straight, the leaves borne well above the ground (the leaf tips sometimes nearly touching the ground); flower fragrance various.
3 Sepals abruptly deflexed between and below the leaves, distinctly descending below the approximately horizontal plane of the leaves; filaments about as long or incurved anthers; [T. recurvatum group].

4 Anther connectives slightly incurved; filaments short, < ½ the anther length; [endemic to Kershaw and Richland counties in the inner Coastal Plain of SC]..................................................................................................................T. oostingii
4 Anther connectives strongly incurved; filaments long, > ½ the anther length; [primarily west of the Blue Ridge and south into the Gulf Coastal Plain, very rarely disjunct to the Mountains or upper Piedmont].

5 Leaves sessile or subsessile, borne in a descending or drooping manner (similar to the sepals); petals usually 4-7× as long as wide, strongly clawed..................................................................................................................T. lancifolium
5 Leaves distinctly petiolate, borne in an ascending manner (strongly contrasting in position with the strongly deflexed petals); petals usually ca. 2× as long as wide, attenuate to weakly clawed ..................................................................................T. recurvatum

3 Sepals erect, or spreading, usually borne at or above the approximately horizontal plane of the leaves; filaments much shorter than the upright anthers.

6 Petals spreading to horizontal, with 1-2 spiral twists (looking something like an airplane propeller); anther dehiscence extrorse (toward the outside of the flower); [T. sessile group].
6 Petals spreading to slightly spreading, not spirally twisted; anther dehiscence introrse (toward the inside of the flower), or latrose (toward the side).
7 Petals broadly spatulate, clawed, broadly rounded (though sometimes with an apiculus) at the tip; petals pale lemon-yellow (the claws greenish or maroon); flower fragrance clove-like; [of the Savannah River drainage, from sw. NC southeastward along the GA-SC border]; [T. sessile group].
8 Stigmas as long as the ovary or shorter; stamens < 0.5× as long as the petals; anther connectives prominently prolonged into a beak 1.0-5.0 mm long (beyond the anther sacs); [T. sessile group].
8 Stigmas as long as the ovary or shorter; stamens < 0.5× as long as the petals; anthers blunt, the connectives extended < 1.0 mm beyond the anther sacs.

9 Ovary elliptoid; leaves acute, the margins of the outer 1/3 more or less straight; leaf blade mottled with 3 or more shades of green, the palest shade forming a very conspicuous pale silvery-green streak along the midvein; [of the Coastal Plain and full-line area of GA, AL, and FL Panhandle]; [T. sessile group].
9 Ovary ovoid; leaves acute to acuminate, the margins of the outer 1/3 convex; leaf blade mottled with 2-3 shades of green, paler shades sometimes prominent along the midvein, but not as above; [collectively widespread in our area]; [T. maculatum group].
11 Petals < 4× as long as wide, elliptic-oblancoate to oblanceolate; [of inland provinces, rarely in the Coastal Plain].
12 Flower fragrance fruity-spicy, like green apples or Calycanthus (rarely musky); petals maroon, bronze, green, yellow; portions of ovary and stamens purplish during anthesis ..................................................................................................................T. cuneatum
12 Flower fragrance lemon-like; petals greenish-yellow darkening to yellow; ovary and stamens greenish-white during anthesis ..................................................................................................................T. luteum
11 Petals > 4.5× as long as wide, narrowly oblongate-spatulate to linear-oblancoate; [of the Coastal Plain, rarely further inland].
13 Ovary 3-angled at base of stigmas (rarely hexagonal); petals 7-17 mm wide, narrowly spatulate (appearing clawed); outer whorl of stamens broader, anther dehiscence introrse; flower fragrance faintly spicy-fragrant, banana-like; [of AL, n. FL, GA, and e. SC]. .................................................................................................................................T. maculatum
13 Ovary 6-angled; petals 3-8 mm wide, linear-oblancoate, narrowly elliptic, to linear-lanceolate (weakly or not clawed); flower fragrance putrid, like rotting meat; [of MS and LA].
14 Petals 3-5 mm wide; anther dehiscence introrse; anther connective extending 1-1.5 mm beyond the anther sacs............................T. foetidissimum
14 Petals 4-8 mm wide; anther dehiscence latrose; anther connective scarcely extending beyond the anther sacs............................T. ludovicianum

Key B – trilliums with unstalked leaves and pedicellar flowers, of the Erectum Group

1 Flowers held below the leaves (the pedicel declined below a horizontal plane).
2 Stamens far exceeding the pistil, filaments as long as the ovary or longer, at least partly maroon, the anther sacs yellow to maroon; ovary small, globose, 3-12 mm long, dark purplish black; flower fragrance pungent, rose-like; pedicel long, 3-13 cm long; petals strongly overlapping, usually white or whitish).............T. vacapi
2 Stamens at most 1.5× longer than the pistil, filaments shorter than the ovary, white (less commonly purplish), the anther sacs lavender to vivid purple (or albino); ovary white to pink or dull red, large, ovoid, 10-17 mm long; flower fragrance various; pedicel short to long, 1.5-12 cm long; petals not strongly overlapping, usually white (rarely maroon).
3 Pedicels short, 1.5-3 cm long.
4 Anthers 7.5 mm long or less, about as long as the filaments or shorter; petals narrowly elliptic to obovate, often scarcely larger than the sepals, delicate, occasionally margined in pink or green; [of damp forests of n. VA and northwards].........................T. cernuum
4 Anthers > 7.0 mm long or more, longer than the filaments; petals ovate to elliptic, much broader than the sepals; [of mesic forests of n. NC southwards] ..................................................................................T. rugelii
3 Pedicels long, 4-12 cm long.
TRILLIACEAE

1 Flowers held at or above the level of the leaves (the pedicel nearly horizontal, inclined above the horizontal, or erect).

2 Petals white to deep pink, lacking a red blaze; anther sacs yellow, dehiscence introrse; fruit a white to greenish-white, fleshy, irregularly

3 Sepals narrower than the petals, acute; anthers white to greenish-white between the anther sacs; leaves obtuse, acute, or acuminate; pedicel somewhat angled from the vertical.

4 Ovary obscurely 3-lobed; leaves < 5 cm long, blue-green, obtuse ..................................................................................................

5 Stamens far exceeding ovary height; filaments ca. ½ the length of the anthers; pollen creamy, yellow, or pale grayish purple; anthers and filaments also variable in color, mostly white, occasionally purplish; anthers mostly longer than the ovary and not appressed against it.......................................................T. species 2

6 Ovary globose, widest near the middle, black to purplish black; petals white, maroon, yellowish, or otherwise.

7 Stamens about as long as the ovary or slightly longer; filaments short, ca. 1/3 the length of the anthers; pollen creamy to pale yellow; filaments and anthers white, the anthers at least in part somewhat appressed against the ovary.................................................................T. species 2

8 Petals lanceolate to narrowly ovate or elliptic, spreading from base in the same plane as the sepals, rarely > 2× as broad as the sepals; sepals 0.5-0.8× as long as the pedicel. weakly sulcate-tipped (keeled and upturned near apex); flower fragrance unpleasant, musty..........

9 Sepals 0.2-0.4× as long as the pedicel; leaves broadly obovate; stamens 0.9-1.6× pistil height; flowers relatively small, petals only slightly longer than the sepals; sepals suffused with purple; petals usually maroon (rarely white); flower fragrance fungoid, like fresh mushrooms; [of sw. VA and nw. NC in our area] .............................................................................................................. T. sutchatum

Key C – trilliums with unmottled leaves and pedicellate flowers, of various affinities

1 Petals white with triangular red blaze (rarely entirely white or pinkish); anther sacs lavender to white, dehiscence extrorse; fruit a red berry; leaves long-acuminate; [of acidic sites in the Mountains, generally strongly associated with either Pinus, Tsuga, Picea, Rhododendron, or other heaths] .......................................................T. undulatum

2 Pedicel inclined above the leaves (rarely erect); sepals arcuate-recurved; anthers irregularly twisted outward; pollen egg-yolk yellow..........

3 Sepals about as broad as the petals or broader, obtuse; anthers purplish-green between anther sacs; pedicel erect through fruiting; [Trillium pusillum complex].

4 Ovary obscurely 3-lobed; leaves < 5 cm long, blue-green, obtuse ..................................................T. nivale

5 Stamens far exceeding ovary height; filaments ca. ½ the length of the anthers; pollen creamy, yellow, or pale grayish purple; anthers and filaments also variable in color, mostly white, occasionally purplish; anthers mostly longer than the ovary and not appressed against it.......................................................T. species 2

6 Ovary flask-shaped, broadest near the base, usually white to pinkish (sometimes darker); petals usually white to creamy white (maroon forma occasional)

7 Stamens about as long as the ovary or slightly longer; filaments short, ca. 1/3 the length of the anthers or shorter; pollen creamy to pale yellow; filaments and anthers white, the anthers at least in part somewhat appressed against the ovary.................................................................T. species 2

8 Petals white to deep pink, lacking a red blaze; anther sacs yellow, dehiscence introrse; fruit a white to greenish-white, fleshy, irregularly
dehiscent capsule; leaves obtuse to acute (somewhat acuminate in T. grandiflorum); [of less distinctly acidic sites, collectively widespread in our area].

2 Pedicel declined below the leaves (rarely erect); sepals arcuate-recurved; anthers irregularly twisted outward; pollen egg-yolk yellow..........

3 Sepals narrower than the petals, acute; anthers white to greenish-white between the anther sacs; leaves obtuse, acute, or acuminate; pedicel somewhat angled from the vertical.

4 Ovary sharply 6-angled (-winged); leaves > 5 cm long, green, acute to acuminate.

5 Petals obovate, tightly rolled at base, abruptly flared near the apex; leaves broadly elliptic, acuminate; style minute, < 1.0 mm long

3 Sepals about as broad as the petals or broader, obtuse; leaves obtuse; anthers purplish-green between anther sacs; pedicel erect through
fruiting; [Trillium pusillum complex].

6 Leaves with stomates on the upper surface, appearing farinose; [of n. GA] .............................................................................................................. T. pusillum var. 2 “georgianum”

7 Pedicels 10-56 mm long.

8 Pedicels (0-) 0.5-1 mm long; leaves (1.5-) 2-0.4 (-2.9) × as long as broad; leaves (14-) 15-20 (-22.5) mm wide; filaments (4.5-) 4.6-5.8 (-8) mm long; [of upland woods of Mountain of w. VA and e. WV] ..................................................T. pusillum var. monticulum

9 Anters (3.2-) 4.5-6 (-7) mm long; Stamens (5.7-) 8.4-10.9 (-12.5) mm long; Stigmas (1-) 2.1-3 (-5) mm long; Leaves elliptic; [of the outer Coastal Plain of e. MD, e. VA, and ne. NC] ...............................................T. pusillum var. 5 “palustris”

10 Pedicels (0.5-) 1.2-1.7 (-7) mm long; stamens (5.7-) 6.9-2 (-13.2) mm long; stigmas (1-) 1.2-2.5 (-4.7) mm long; leaves ovate; [of the upper Coastal Plain and Piedmont of ne. NC, se. VA, and Mountains of sw. VA].

11 Leaves horizontal to declining; sepals 0.9-1.1× as long as the petals.

12 Leaves narrower, (1.9-) 3-4.1 (-5.6)× as long as wide; pedicels (23-) 25-33 (-56) mm long; [of calcareous savannas and the swamps]

13 Leaves ovate, acute; Sepals (14-) 22-30 (-41) mm long, (4-) 6-11 (-17) mm wide, (2-) 3-4.3 (-5.6)× as long as wide; [generally of upland rocky slopes] ..................................................T. pusillum var. ozarkanum
**Trillium catesbaei** Elliott, Catesby’s Trillium, Bashful Trillium, Rosy Wake-robin. Bottomland forests, mesic slopes, cove forests. Late March–early June; July–August. NC. NC south to sw. GA and se. AL, north in the interior to n. AL and se. TN, centered in the Piedmont from NC to GA, but extending into the Mountains and Coastal Plain. This species is morphologically and genetically complex and may include several semi-cryptic taxa. Petals white to pink. [= RAB, FNA, K, S, V, W, X, Z]

**Trillium cernuum** Linnaeus, Northern Nodding Trillium. Moist rich woods, seepage edges, damp forests with *Fraxinus nigra* and *Ulmus americana*. Late April–May. NL (Newfoundland), Hudson Bay area, and se. SK south to n. VA, ne. WV, n. IN, n. IL, n. IA, and SD. Petals white, pink, maroon, or green. [= FNA, K, W, WV, X, Z; < *T. cernuum* – RAB, F, S (apparently also including *T. rugelii*); > *T. cernuum* var. cernuum – C, G; > < *T. cernuum* var. macranthum A.J. Eames & Wieggand – C, G]

**Trillium cuneatum** Rafinesque, Sweet Betsy, Purple Toadshade, Large Toadshade, Wedge-petal Trillium, Bloody Butcher. In rich soils of cove forests, moist slopes, and bottomlands, usually over mafic or calcareous rocks, locally abundant. Mid March–April; late May–June. Centered in the Southern Appalachians (but is more abundant in adjacent physiographic provinces), extending north to the Highland Rim of KY, west to the Interior Low Plateau of TN, south to the Coastal Plain of MS and AL, and east to the Piedmont of GA, SC, and NC. Petals maroon, yellow, green, or various intermediate shades. [= C, FNA, K, V, W, X, Y, Z; < *T. cuneatum* var. cuneatum – RAB; > *T. cuneatum* – F; > < *T. viride* Beck – F, misapplied with respect to NC material; < *T. viride* var. *luteum* (Muhlenberg) Gleason – G, misapplied (also see *T. luteum*); > *T. hugeri* Small – S; > < *T. underwoodii* – S, misapplied]

**Trillium decipiens** J.D. Freeman, Chattahoochee Trillium, Deceptive Trillium. Moist forests. Late January–early April. FL Panhandle (Jackson and Walton counties) and sc. AL east to ec. GA, and in Abbeville Co. SC (L.L. Gaddy, pers. comm. 2009). It is similar to *T. underwoodii*. [= FNA, K, V, WH, X, Y, Z]

**Trillium decumbens** Harbison, Decumbent Trillium. Moist forests. Mid-March–April. Se. TN (Chester et al. 1993) south and west to nw. GA and nc. AL, and disjunct in Houston County, in central GA Coastal Plain; it should be sought in extreme sw. NC, an extremely "under-botanized" area. [= FNA, K, S, X, Y, Z]

**Trillium discolor** Wray ex Hooker, Pale Yellow Trillium, Pale Trillium, Small Yellow Toadshade. Rich cove and bluff forests, restricted to the Savannah River drainage; rare. Late March–early May; June–July. Endemic to the Savannah River drainage of nw. SC, ne. GA, and sw. NC, occurring in the Blue Ridge and Piedmont. In NC it is restricted to a few sites along the Whitewater and Thompson Rivers. Petals pale yellow, with maroon or greenish claws. [= RAB, FNA, K, S, V, W, X, Y, Z]

**Trillium erectum** Linnaeus, Red Trillium, Purple Trillium, Stinking Willie, Stinking Benjamin, Wake-robin. Wooded slopes, usually at middle to high elevations. April–early June; July–August. NB, QC, and MI south to w. NC, nw. SC, n. GA, e. TN, IN, and sc. WI. Petals maroon, white, yellow, green, or various intermediate shades. [= C, K, V, W, X, Z; < *T. erectum* var. erectum – RAB, WV (also see *T. sulcatum*); < *T. erectum* – F, G, S (also see *T. sulcatum*); > *T. erectum* var. erectum – FNA; > *T. erectum* var. album (Michaux) Pursh – FNA]

**Trillium flexipes** Rafinesque, Bent White Trillium. Moist coves over mafic or calcareous rocks. April. E. PA, s. ON and s. MN south to w. NC, nw. GA, n. AL, n. MS, mostly west of the Blue Ridge, but scattered in the Blue Ridge of NC, and disjunct east of the Blue Ridge in DE, PA, and MD. Petals white or maroon. [= C, FNA, K, V, W, X, Z; < *T. erectum* var. vaseyi – RAB; = *T. gleasonii* Fernald – G; > *T. declinatum* (A. Gray) Gleason – S, misapplied; = *T. erectum* var. declinatum – WV]

**Trillium foetidissimum** J.D. Freeman, Stinking Wake-robin. Bluffs, ravines, bottomlands. Late February–early April. MS west to LA. [= FNA, K, X, Y, Z; < *T. ludovicianum* Harbison – S]

**Trillium grandiflorum** (Michaux) Salisbury, Large-flowered Trillium, White Trillium, Great White Trillium. Rich coves and mesic slopes, also less typically on ridges over "rich" rock types. April–May; July–August. S. QC, s. ON, MI, and MN, south to NJ, c. NC, nw. SC, n. GA, n. AL, s. IL, and IA. Petals white to pink. [= RAB, C, F, FNA, G, K, S, V, W, WV, X, Z]

**Trillium lancifolium** Rafinesque, Lanceleaf Trillium, Narrowleaf Trillium. Rich forests over marble, limestone, and other calcareous substrates, floodplain forests. Late March–April. Se. TN south through w. GA and AL to Panhandle FL and se. AL. Petals purple, green, or greenish-purple. Material previously referred to this species from Kershaw County, SC represents the newly described *T. oostingii*. [= FNA, K, V, WH, X, Y, Z; = *T. lancifolium* (S. Watson) Boykin ex Small – RAB, S]

**Trillium ludovicianum** Harbison, Louisiana Wake-robin. Floodplains, streambanks, ravine forests. Early March–April. MS west to LA. Reports of this species for AL are based on specimens of *Trillium species 3*. [= FNA, K, X, Y, Z; < *T. ludovicianum* – S]
**Trillium luteum** (Muhlenberg) Harbison, Yellow Trillium, Yellow Toadshade, Wax Trillium, Lemon-scented Trillium. Moist coves over mafic or calcareous rocks, locally abundant in the vicinity of the Great Smokies. Mid March-April; late May-June. Nearly endemic to the Southern Appalachians: w. NC, e. TN, nw. GA, and se. KY, allegedly disjunct in c. AL (planted and naturalized in Frederick County, VA). Petals yellow. [= C, F, FNA, K, V, W, X, Y, Z; = T. cuneatum var. luteum (Muhlenberg) Ahles – RAB; < T. viride Beck var. luteum (Muhlenberg) Gleason – G (also see T. cuneatum); < T. sessile – S, misapplied]

**Trillium maculatum** Rafinesque, Mottled Trillium, Spotted Trillium. Rich forests and floodplains, over calcareous materials such as coquina limestone ("marl") or on shell middens. Early February-mid April. S. SC south to n. FL, west to sc. AL. Petals maroon or yellow. [= FNA, K, V, WH, X, Y, Z; < T. viride – RAB, misapplied; < T. sessile – S, misapplied]

**Trillium nivale** Riddell, Snow Trillium, Dwarf White Trillium. Rocky, calcareous forests. Early March-early April. MA, sw. PA, MI, W, s. MN, and e. SD south to n. VA, KY, s. IN, s. IL, s. MO, and se. NE. Petals white to pink. [= C, F, FNA, G, K, WV, X, Z]

**Trillium oostingii** Gaddy, Wateree River Trillium. Rich bottomland forests. Somewhat similar to *T. lancifolium* and *T. recurvatum*. So far as is known, endemic to Kershaw and Richland counties, SC, along the Wateree River. With clawed, bicolored petals (the claw maroon and the blade green) and green sepals reflexed somewhat (in the same plane as the drooping leaves). See Gaddy (2008) for additional information. [previously misidentified as *T. lancifolium*]

**Trillium persistens** Duncan, Persistent Trillium. Acidic forests with hemlocks and heaths. April. Endemic to a short stretch of the Tallulah-Tugaloo river system in nw. SC and ne. GA. Petals white to pink. [= FNA, K, V, W, X, Z]

**Trillium pusillum** Michaux var. monticulum Bodkin & Reveal. Dry to dry-mesic forests and woodlands, moist forests along small mountain streams. Endemic to nw. VA, e. WV, and w. MD. NC. Var. monticulum Bodkin & Reveal has been controversial; see Cabe (1995) and Cabe & Werth (1995) for additional discussion of variation within *T. pusillum* in Virginia and elsewhere. Petals white to pink. [= T. pusillum – Z; < *T. pusillum* var. virginianum – C, K; < *T. pusillum* var. pusillum – FNA; = *T. pusillum* var. monticola Bodkin & Reveal – X, orthographic error; = *T. monticola* in prep.]

**Trillium pusillum** Michaux var. ozarkanum (Palmer & Steyermark) Steyermark. Dry to dry-mesic slopes, in NC under *Quercus coccinea* and *Kalmia latifolia*. Centered in the Ozarks of sw. MO, nw. AR, and e. OK; disjunct eastward at scattered localities in sc. KY, nc. TN, sw. NC, and s. MS. Petals white to pink. [= K, X; < *T. pusillum* – RAB, G, S, Z; < *T. pusillum* var. pusillum – FNA; = *T. ozarkanum* Palmer & Steyermark]

**Trillium pusillum** Michaux var. pusillum. Carolina Least Trillium, Carolina Dwarf Trillium. Ecotones of calcareous savannas and swamp forests in the lower Coastal Plain. Late March-May; June-July. Endemic to the outer Coastal Plain of e. NC and e. SC. *T. pusillum* is somewhat reminiscent of a tiny *T. grandiflorum*. The *T. pusillum* complex has a wide but very fragmented range, involving most of the Southeastern states. In addition to the taxa treated here, the complex includes *T. texanum* Buckley (of e. TX). The *T. pusillum* complex is currently undergoing study by Susan Farmer (Univ. of Tennessee); preliminary analysis shows that the published varieties are "good" and that the recognition of additional taxa is warranted. Petals white to pink. [= X; < *T. pusillum* var. pusillum – C, F, FNA, K; < *T. pusillum* – RAB, G, S, Z; = *T. pusillum* (sensu stricto)]

**Trillium pusillum** Michaux var. virginianum Fernald, Virginia Least Trillium, Virginia Dwarf Trillium. Bottomland forests along small streams in the upper Coastal Plain, bottomland forests, also mesic beech islands in swamp forests. Late March-May; June-July. Var. *virginianum* occurs in the Coastal Plain of se. VA. Petals white to pink. [= F, FNA, X; < *T. pusillum* – RAB, G, S, Z; < *T. pusillum* var. virginianum – C, K (also see var. monticulum); = *T. virginianum* (Fernald) C.F. Reed]
**TRILLIACEAE**

**Trillium pusillum** Michaux var. 1, Alabama Least Trillium. Swamps and floodplains. C. TN south to n. AL. Petals white to pink. Under study by Susan Farmer. [<* T. pusillum var. pusillum* – C, F, FNA, K; <* T. pusillum* – G, S, Z; = *T. pusillum var. alabamicum* – X (nomen nudum); = *T. alabamicum* in prep.]

**Trillium pusillum** Michaux var. 2, Georgia Least Trillium. Hardwood flatwoods. Endemic to n. GA. Apparently most closely related to *Trillium texanum*. Petals white to pink. Under study by Susan Farmer. [<* T. pusillum* – V; = *T. georgianum* in prep.]

**Trillium pusillum** Michaux var. 3, Aiken Least Trillium. Seepage bogs. Endemic to sc. SC. Petals white to pink. Under study by Susan Farmer. [<* T. pusillum*; = *T. telmacola* in prep.]

**Trillium pusillum** Michaux var. 4, Carolina Least Trillium. Swampy forests, bottomland forests along small streams in the upper Coastal Plain. E. NC (upper Coastal Plain and adjacent Piedmont), moist mafic areas in Grayson Co. VA. The Grayson County site is within a kilometer of the Alleghany County, NC border, and the plant may be found to also occur in nw. NC. Petals white to pink. Under study by Susan Farmer. [<* T. pusillum*; = *T. carolinianum* in prep.]

**Trillium pusillum** Michaux var. 5, Dismal Swamp Least Trillium. Swampy forests. E. MD south to ne. NC. Petals white to pink. Under study by Susan Farmer. [<* T. pusillum*; = *T. palustris* in prep.]

**Trillium recurvatum** Beck, Prairie Trillium, Prairie Wake-robin. Rich soils of cove over calcareous rock. W. OH west to s. MI, s. WI, and e. IA, south to c. TN, c. AL, c. MS, n. LA, and e. TX; disjunct in the Cumberland Plateau of e. TN, e. KY, and the Blue Ridge and w. Piedmont of NC. The two known NC occurrences (Catawba and Madison counties) appear to be native. Petals maroon or yellow. [= C, F, FNA, G, K, S, X, Y, Z]

**Trillium reliquum** J.D. Freeman, Relict Trillium. Rich forests on bluffs and ravine slopes. Mid March-late April. Known from two disjunct areas, along the Savannah River in the vicinity of Augusta, on the border of SC (Aiken County) and GA (Richmond counties), and along the Chattohootechee River in sw. GA (Clay and Early counties). [= FNA, K, V, X, Y, Z]

**Trillium sessile** Linnaeus, Sessile Trillium, Sessile Toadshade, Toad Trillium. Rich forests, in NC limited to very rich soils of natural levees and lower slopes along the Roanoke River. March-April. Primarily a species of the northern Midwest, *T. sessile* ranges from MD, w. PA, w. NY, s. MI, n. IL and n. MO, south to e. VA, ne. NC, c. TN, n. AL, and n. AR. The easternmost occurrences are disjunct populations east of the Blue Ridge, in MD, VA, and along the Roanoke River in ne. NC. Petals maroon or green. [= C, F, FNA, G, K, W, WV, X, Y, Z]

**Trillium simile** Gleason, Sweet White Trillium. Very rich soils of slopes and coves over mafic or calcareous rocks, often also in or near seepage. Late March-early May; June-July. A Southern Appalachian endemic: Blue Ridge of w. NC, nw. SC, e. TN, and n. GA. Petals white or very rarely maroon. [= FNA, K, S, V, W, X, Z; <* T. erectum* var. vaseyi – RAB]

**Trillium species 2** Amicalola Trillium. Rich forests. Under study by Tom Patrick and Susan Farmer. Also recently found in SC. [“Amicalola Trillium” – V]

**Trillium staminaeum** Harbison, Twisted Trillium. Floodplains, slopes, especially over limestone. Late March-mid May. C. TN (Chester et al. 1993) south to c. AL and e. MS. [= FNA, K, S, X, Y, Z]

**Trillium sulcatum** T. Patrick, Southern Red Trillium, Barksdale’s Trillium. Coves and moist slopes. April-May. Primarily a species of the sedimentary rock Appalachians, *T. sulcatum* ranges from s. WV, sw. VA, and e. KY south to nw. NC (where it enters the Blue Ridge), w. TN, mw. GA, and ne. AL. This species seems quite distinctive for its small, generally maroon flowers (with strongly sulcate sepals purplish as well), borne on very long pedicels. Petals maroon or white. [= C, FNA, K, V, W, X, Z; <* T. erectum var. erectum* – RAB, WV; <* T. erectum* – F, G, S]

**Trillium underwoodii** Small, Underwood’s Trillium. Moist forests. Late February-mid April. N. FL north to wc. GA and c. and s. AL. The only erect trillium with the stems typically < 2× as long as the leaves (though sometimes elongating later in the season). [= FNA, K, S, V, WH, X, Y, Z]
**TRILLIACEAE**

*Trillium undulatum* Willdenow, Painted Trillium, Striped Wake-robin. Acidic soils of ridges, slopes, and bog margins, mostly at high elevations and often associated with *Rhododendron*, *Tsuga*, *Pinus*, or *Picea*. Late April-May; late July-August. NB, e. QC, s. ON, and MI, south to w. NC, nw. SC, n. GA, e. TN, and ne. OH. Of all our species, this is the species best adapted to acidic soils. Petals white with a red blaze. [= RAB, C, F, FNA, G, K, S, V, W, WV, X, Z]

*Trillium vaseyi* Harbison, Sweet Trillium, Vasey’s Trillium, Sweet Beth. Cove forests, other rich forests. Late April-early June. This species is a Southern Appalachian endemic: w. NC and e. TN south to nw. SC, n. GA, and ne. AL. Perhaps the largest trillium species, with the stems to 7 dm tall. Petals maroon or white. [= FNA, K, S, V, W, X, Z; < *T. erectum* var. *vaseyi* (Harbison) Ahles – RAB (also see *T. simule* and *T. flexipes*)]

### 53b. XEROPHYLLACEAE Takhtajan 1994 (Beargrass Family) [in LILIALES]

*Xerophyllum* Michaux 1803 (Turkeybeard, Beargrass)

*Xerophyllum asphodeloides* (Linnaeus) Nuttall, Turkeybeard, Beargrass, Mountain-asphodel. Dry ridges and slopes in the mountains, primarily in dry, strongly acidic sites which burn periodically, such as pine/heath woodlands and forests, heath balds, and xeric oak forests, most of the populations in the Blue Ridge Escarpment, often associated with *Pinus rigida* or *P. pungens*, disjunct to similar sites on quartzite monadnocks of the upper Piedmont, in the Coastal Plain in acidic pinelands. May-June; July-August. In two disjunct areas; the Coastal Plain of s. NJ and DE, and the Southern Appalachians from w. VA and e. WV south to e. TN, w. NC, nw. SC, and ne. GA. Sterile plants resemble tussocks of a bunchgrass, but the leaf bases are white and flattened and are obviously not those of a grass. The leaves remain green throughout the winter. [= RAB, C, F, FNA, G, K, W, WV, Z]

### 53c. HELONIADACEAE J. Agardh 1858 (Swamp-pink Family) [in LILIALES]

1 Flowers white to cream; plants dioecious (individual flowers either male or female) ................................................................. *Chamaelirium*

1 Flowers pink; plants hermaphroditic (individual flowers perfect) ............................................................................................................. *Helonias*

*Chamaelirium* Willdenow 1808 (Devil’s-bit)

*Chamaelirium luteum* (Linnaeus) A. Gray, Devil’s-bit. Moist slopes, bottomlands, wet savannas. March-May; September-November. MA west to ON, OH, s. IN, and AR, south to FL and LA. The ecological amplitude and morphologic variability of this species is surprising; it needs additional, more careful, study. *C. obovate* Small (or other previously unnamed entities) may warrant recognition at some level. [= RAB, C, F, FNA, G, GW, K, W, WH, Z; > *C. luteum* – S; > *C. obovate* Small – S]

*Helonias* Linnaeus 1753 (Swamp Pink)

A monotypic genus, an herb of temperate e. North America. Although *Helonias* has traditionally been considered a monotypic genus, Takahashi & Kawano (1989) have suggested that the closely related *Heloniopsis* and *Ypsilandra* (both of e. Asia) may be congeneric. Perhaps better to be placed in the segregate family Heloniadaceae. References: Zomlefer (1997a)=Z; Utech in FNA (2002a); Tamura in Kubitzki (1998a).
**Helonias bullata** Linnaeus, Swamp Pink. Bogs, usually under dense shrubs in peaty soils, in the VA Coastal Plain in acidic sandy seepage swamps. April-May; June-July. S. NY and NJ to e. VA on the Coastal Plain, and from w. VA through w. NC to nw. SC and ne. GA (Jones & Coile 1988) in the Blue Ridge Mountains. The flowering scape elongates markedly in fruit, reaching 1 m in height. [= RAB, C, F, FNA, GW, G, K, S, W, Z]

---

**53d. MELANTHIACEAE** Batsch 1802 (Bunchflower Family) [in LILIALES]

A family of about 8 genera and 80 species, mostly temperate and northern hemisphere, but extending into South America (Peru). References: Dahlgren, Clifford, & Yeo (1985); Zomlefer (1997a)=Z; Zomlefer (1996, 2003); Tamura in Kubitzki (1998a); Tamura et al. (2004); Zomlefer et al. (2001).

1 Leaves 3, whorled at the summit of the stem; flowers 1 per plant, solitary and terminal. [see TRILLIACEAE]

2 Leaves many, not whorled at the summit of the stem; flowers many per plant, in spikes, racemes, or panicles. [see XEROPHYLLACEAE]

3 Main (basal) leaves elliptic, or obovate, the main veins parallel, all diverging at the base of the leaf and rejoicing at the apex; flowers white, pink, or cream. [see HELONIADACEAE]

3 Main (basal) leaves linear, linear, or oblong, the main veins parallel, all diverging at the base of the leaf and rejoicing at the apex; flowers white, cream, yellowish, greenish, or brownish.

4 Inflorescence a spike or raceme.

5 Inflorescence a spike; flowers white, cream, yellowish, or greenish. [Amianthium]

6 Basal leaves 1-3, 2-7 mm wide; capsule 7-9 mm long, 3-4 mm wide; bulb cylindrical. [Stenanthium densus]

6 Basal leaves many, 4-23 mm wide; capsule 5-7 mm long, 5-7 mm wide; bulb broadly ovoid. [Amianthium]

7 Inflorescence a spike or raceme. [Schoenocaulon]

7 Inflorescence axes scurfy-pubescent; seeds winged; leaves either linear or broader, < 14 cm wide. [Veratum]

8 Inflorescence axes glabrous; seeds not winged (though sometimes angled); leaves linear, < 2 cm wide. [Anticlea]

8 Leaves strongly keeled, (5-) 10-20 mm wide; plant colonial, from thick, hard, horizontal, short-creeping rhizomes covered with fibrous old leaf bases; inner tepals (petals) 7-17 mm long, distinctly clawed, acute-acuminate at the tip, bearing 2 glands well above the base. [Zigadenus]

9 Inner tepals (petals) 7-12 mm long, clavated, with a single bilobed gland borne well above the base; [of calcareous habitats in the Mountains] [Stenanthium]

9 Inner tepals 3-10 mm long, not clavated, with a single, unlobed gland borne near the base (this often difficult or impossible to see, consisting only of a greenish line at the very base of the tepal); [of acidic habitats of the Mountains, Piedmont, and Coastal Plain] [Zigadenus]

---

**Amianthium** A. Gray 1837 (Fly-poison)

---

**Anticlea** Kunth 1843 (Death-camas)

**Anticlea glauca** Kunth, White Death-camas. Limestone and dolostone woodlands, glades, cliffs, and outcrops. July-August; September-October. *A. glauca* is the more eastern component of a complex variously treated as two species or a single variable species, with or without recognized varieties or subspecies. *A. elegans* (in the broadest sense) ranges from QC and NY west to AK, south to n. OH, n. IN, n. IL, MO, IA, NM, AZ, and n. Mexico; disjunct in the mountains of w. VA, e. WV, and w. NC. Two taxa have often been recognized, at the specific, subspecific, or varietal level. The more eastern taxon (epithet "*glauca*" – see synonymy below) ranges from NB west to ND, south to w. NC, TN, and MO, and is distinguished by glaucous foliage, paniculate inflorescence, and tepals often purplish or brownish basally. The more western taxon (epithet "elegans"), occurring to the MN and MO, has the foliage greener, the inflorescence often only racemose, and the tepals yellow. [= Anticlea elegans (Pursh) Rydberg – Y; = Zigadenus elegans Pursh ssp. glauca (Nuttall) Hultén – K; = Zigadenus glaucus Nuttall – RAB, F, W, Z; = Zigadenus elegans var. glaucus (Nuttall) Precee – C; = Zigadenus elegans – FNA; = Zigadenus glaucus – G; = Anticlea chlorantha (Richardson) Rydberg – S, misapplied; = A. elegans ssp. glauca (Nuttall) A. Haines; = A. elegans var. glauca (Nuttall) Zomlefer & Judd]

Schoenocauleon dubium (Michaux) Small, Florida Feathershank. Dry pine savannas, sandhills, scrub. S. GA and n. peninsular FL south to s. peninsular FL. [= FNA, K, S, WH, Z]

Stenanthium (A. Gray) Kunth 1843 (Featherbells, Featherfleece)

1. Tepals obovate, the tip rounded-obtuse.
2. Inflorescence a raceme; flowers all bisexual; plants 3-10 dm tall; flowering April-early June; [of the Coastal Plain (in our area)] S. densus
3. Inflorescence a panicle of racemes; lower flowers of the inflorescence branches bisexual and fertile, the upper staminate or superficially perfect but the pistils nonfunctional (not producing fruits); plants 4-20 dm tall; flowering July-August; [of the Mountains of NC and VA and Coastal Plain of GA westward to LA] S. leimanthoides
4. Larger leaves to 15 mm wide, firm to coriaceous, strongly ribbed; panicle diffuse, the branches ascending, spreading, or drooping, the flowers scattered; perianth 3-8 (-10) mm long, whitish; capsules ovoid to urceolate, 6-9 mm long, deflexed; seeds 5-5.5 mm long; leaves mainly near the base, rapidly reduced upwards; plant to 1.9 m tall and the stem to 1 cm in diameter near its base; [of dry to moist upland forests].
5. Perianth 5-10 mm long; plant to 1.9 m tall, the stem 4-10 mm in diameter near the base S. gramineum var. gramineum
6. Perianth 3-4.5 (-5.0) mm long; plant to 1.0 m tall, the stem 1.5-5 mm in diameter near the base S. gramineum var. micranthum

Stenanthium densum (Desrousseaux) Zomlefer & Judd, Crow-poison. Pine savannas, pine flatwoods. April-early June; late May-July. Se. VA south to c. peninsular FL and west to se. TX, on the Coastal Plain. See Z. leimanthoides for discussion of the taxonomy of the 2 species. Z. densum is superficially very similar to Amianthium muscitoxicum; Z. densum has a conical capsule, 2× or more as long as broad (vs. about 1× as long as broad), a bladeless purple sheath, 3-8 cm long, enclosing the leaves at the base (vs. absent, the base leaves with blades), and basal leaves usually 1-3 in number, 3-6 (-10) mm wide (vs. mostly 4 or more in number, mostly 7-10 mm wide). [= Y; = Zigadenus densum (Desrousseaux) Fernald – RAB, C, GW, K, Z; < Zigadenus densus (Desrousseaux) Fernald – FNA, WH (also including S. leimanthoides); = Zigadenus densus – G (an orthographic variant); = Tricyanthus augustolius (Michaux) Small – S]

Stenanthium gramineum (Ker-Gawler) Morong var. gramineum, Common Featherbells. Moist forests, grassy balds, to 1700m in elevation. July-early September; August-October. PA west to IL and MO, south to ne. NC, Panhandle FL, and TX. [= F, K; < S. gramineum – RAB, C, FNA, G, S, WH, Z; < S. gramineum var. gramineum – WV]

**Veratrum Linnaeus 1753 (White-hellebore)**

A genus of about 30-55 species, herbs of temperate Northern Hemisphere. *Veratrum* is here interpreted broadly, including *Melanthium*, following the molecular phylogeny work of Zomlefer et al. (2003). A proposal to conserve the name *Veratrum* against *Melanthium* has been made but not yet ruled on (Zomlefer, Judd, & Gandhi 2010). References: Zomlefer (1997)=Z; McNeal & Shaw in FNA (2002a); Bodkin & Utech in FNA (2002a); Tamura in Kubitzki (1998a); Zomlefer et al. (2003).

1 Leaves all linear, 1-2 (-3) cm wide; tepals greenish white to creamy white (sometimes fading brownish); [section Fuscoveratrum]......................... **V. viride**

1 Leaves (at least the basal) oblanceolate to obovate or elliptic, 3-15 cm wide (the upper leaves sometimes linear); tepals yellowish green, green, or maroon.

2 Leaves strongly plicate, 6-15 cm wide; tepals pubescent, 8-13 mm long, 3-5 mm wide, with a conspicuous pair of glands near the base of the tepal blade (these sometimes more or less fused); filament free from the tepals; [section Veratrum]............................................................... **V. viride**

2 Leaves not at all or slightly plicate, 3-14 cm wide; tepals glabrous, 4-9 mm long, 1-3 mm wide (3-5 mm wide in *V. latifolium*), with either conspicuous (*V. latifolium*) or diffuse (*V. parviflorum* and *V. woodii*) glands; filament fused to the basal claw of the tepal; [section Fuscoveratrum].

3 Tepals 3-5 mm wide, the blade of the tepal abruptly narrowed to a claw, the blade nearly as wide as long, with undulate margins, and 2 conspicuous succulent glands; leaves 1-7 cm wide.......................................................... **V. species 1**

3 Tepals 1-3 mm wide, the blade gradually narrowed to the base, the blade much longer than wide, with entire margins, and with diffuse glandular areas; leaves 3-12.5 cm wide.

4 Tepals pale to olive green, 4-7 mm long; ovaries glabrous; leaves 4.5-14 cm wide; [common, of the Mountains in our area] ......................

4 Tepals dark maroon, 6-9 mm long; ovaries densely pubescent; leaves 3-10 cm wide; [rare disjunct in our area]................................. **V. parviflorum**

4 Tepals pale to olive green, 4-7 mm long; ovaries glabrous; leaves 4.5-14 cm wide; [common, of the Mountains in our area] ......................

**Veratrum species 1**, Crisp Bunchflower. Moist to dry forests. July-August; September-October. An Appalachian endemic: CT south to NC, SC, and n. GA. The basionym with priority is apparently *Melanthium hybridum*; the combination in *Veratrum* has not yet been made (Ward 2010; Weakley, in prep.). [= *Veratrum latifolium* (Desrousseaux) Zomlefer – Z; = Melanthium latifolium Desrousseaux – FNA, K, S]

**Veratrum parviflorum** Michaux, Mountain Bunchflower. Moist to rather dry forests, up to at least 1700 meters. July-early September; August-October. A Southern Appalachian endemic: e. and sc. WV and KY south to VA, NC, n. GA, and TN. [= RAB, C, G, W, S, Z; = Melanthium parviflorum (Michaux) S. Watson – F, FNA, K, WV]

**Veratrum virginicum** (Linnaeus) Aiton, Bog Bunchflower, Virginia Bunchflower. Savannas, bogs, seepage bogs, wet forests. June-August; August-October. S. NY, PA, OH, IN, IL, and IA south to c. peninsular FL and e. TX. This species is superficially quite similar to *Zigadenus glaberrimus*, which, in addition to characters given in the family key, has the stem glabrous (vs. pubescent in *M. virginicum*). [= WH, Z; = Melanthium virginicum Linnaeus – RAB, C, F, FNA, G, GW, K, W, WV; > Melanthium dispersum Small – S; = Melanthium virginicum – S]

**Veratrum viride** Aiton, White-hellebore, Indian Poke, Green Hellebore, Cornhusk Lily. Seeps, streambanks, wet boulderfields. June-August; July-September. QC and ON south in the mountains to NC, TN, and ne. GA. The closely related *V. eschscholtzii* A. Gray, sometimes treated as *V. viride* ssp. *eschscholtzii* (A. Gray) A. & D. Löve or *V. viride* var. *eschscholtzii* (A. Gray) Breitung, is western, ranging from AK to OR. This plant is strongly poisonous; an insecticide was formerly manufactured from the roots. [= RAB, C, F, G, W, S, WV, Z; < Z. densus – K; > V. viride var. *viride* – F, FNA; = V. viride ssp. *viride*]

**Veratrum woodii** J.W. Robbins ex Wood, Ozark Bunchflower, Wood's False-hellebore. Circumneutral soil of woodlands over mafic rocks (such as amphibolite) or other calcareous substrates, hammocks. July; September. Primarily Ozarkian, but...
MELANTHIACEAE extending in scattered populations eastwards as far as FL Panhandle (Gadsden and Liberty counties), sw. GA, nw. GA, sc. TN, nw. SC (Pickens County), and sw. NC (Polk County). [= C, F, G, Z; = Melanthium woodii (J.W. Robbins ex Wood) Bodkin – FNA, K; > V. intermedium Chapman – S]

Zigadenus Michaux 1803 (Death-camas)

As redefined, a monotypic genus of se. North America. A molecular systematics study by Zomlefer et al. (2001) gives strong support to a treatment recognizing Zigadenus as monotypic (Zigadenus glaberrimus), Anticlea (including for our area the former Zigadenus elegans ssp. glaucus), Stenanthium (including for our area Stenanthium spp. and the former Zigadenus densus and Z. leimanthoides). Zigadenus (as redefined) has a tentatively reported chromosome number of 2n=52 (Zomlefer & Smith 2002). References: Zomlefer (1997)=Z; Tamura in Kubitzki (1998a); Zomlefer et al. (2001); Schwartz in FNA (2002a). [also see Anticlea, Stenanthium]

Zigadenus glaberrimus Michaux, Large Death-camas, Snakeroot. Sandhill seepage bogs, pine savannas, pocosin edges. Late June-early September; August-November. Se. VA south to Panhandle FL, west to se. TX, on the Coastal Plain. [= RAB, C, F, NFA, GW, K, WH, Z; = Zygadenus glaberrimus – G, S (orthographic variant)]

55. ALSTROEMERIACEAE Dumortier 1829 (Peruvian-lily Family) [in LILIALES]

A family of 5 genera and about 170 species, perennial herbs, of Central and South America. References: Holmes in FNA (2002a).

Alstroemeria (Peruvian-lily, Alstroemeria)

A genus of about 60 species, perennials, of South America. References: Holmes in FNA (2002a).

* Alstroemeria pulchella Linnaeus f., Peruvian-lily. Disturbed areas, roadsides near plantings; native of Brazil. Naturalized in GA, FL, AL, MS, LA, and TX (Holmes in FNA 2002; Singhurst, Keith, & Holmes 2005). [= FNA, WH]

56. COLCHICACEAE A.P. de Candolle 1805 (Meadow Saffron Family) [in LILIALES]

As here circumscribed, a family of about 15 genera and about 250 species, nearly cosmopolitan. References: Vinnersten & Manning (2007); Dahlgren, Clifford, & Yeo (1985); Nordenstam in Kubitzki (1998a).

1 Plant acaulescent, from a tunicated bulb; [tribe Colchiceae] ................................................................................................................................................. Colchicum
1 Plant with leafy stem, from a rhizome or tuber.
2 Tepals red or orange, reflexed; leaves attenuate into a tendril-like tip; [alien]; [tribe Colchiceae] ........................................................................................................................................ Gloriosa
2 Tepals yellow, not reflexed; leaves acute to obtuse; [native]; [tribe Uvularieae] ................................................................................................................................ Uvularia

Colchicum Linnaeus 1753 (Meadow Saffron)

* Colchicum autumnale Linnaeus, Meadow Saffron, Autumn-crocus. Planted as an ornamental, at least long-persistent; native of s. Europe. September-October. [= C, F, G, K]

Gloriosa Linnaeus 1753 (Flamelily)

A genus of about 5 species, perennials, native of Africa and Asia.

* Gloriosa superba Linnaeus, Flamelily, Glory-lily. Disturbed areas; native of tropical Africa. [= FNA, K, WH]
**COLCHICACEAE**

1. Leaves perfoliate, the margins scarious but smooth; upper stems terete in cross-section, hollow; [section *Uvularia*].

2. Tepals glabrous within; leaves puberulent beneath (or rarely glabrate); leaves below the fork (0-) 1 (-2)................. **U. grandiflora**

2. Tepals conspicuously granular-papillose within; leaves glabrous and often glaucous beneath; leaves below the fork 2-4........**U. perfoliata**

1. Leaves sessile, the margins scarious and minutely papillose-denticulate; upper stems angled in cross-section, solid; [section *Oakesiella*].

3. Undivided portion of the style 0.5-1× as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; rhizome very short, with clustered, thickened roots................................................................. **U. puberula**

3. Undivided portion of the style 3-5× as long as the style branches; upper stem and lower leaf surfaces glabrous, usually also glaucous; rhizome elongate, with scattered, fibrous roots.

4. Pedicel bearing a sessile, leaf-like bract 5-17 mm below the flower; capsule sessile at base, conspicuously beaked at apex ... **U. floridana**

4. Pedicel bractless; capsule on a stalk 2-4 (-6) mm long, not beaked................................................................. **U. sessilifolia**

**Uvularia floridana** Chapman, Florida Bellwort. Alluvial forests, moist ravines. Mid March-early April. C. SC south to ne. FL, and Panhandle FL, west to c. MS, rare and local throughout its range. [= RAB, FNA, GW, K, WH, Z; = Oakesiella floridana (Chapman) Small – S]

**Uvularia grandiflora** J.E. Smith, Large-flowered Bellwort. Cove forests and other moist, rich, forested sites. Mid April-mid May; July-August. S. QC west to ND, south to w. NC, w. SC, n. GA, c. AL, MS, c. AR, and e. OK. [= RAB, C, F, FNA, G, K, S, W, WH, Z]

**Uvularia perfoliata** Linnaeus, Perfoliate Bellwort. Moist to fairly dry hardwood forests. April-early May; June-August. S. NH, s. ON, and c. OH, south to Panhandle FL and LA. [= RAB, C, F, FNA, G, K, S, W, WH, WV, Z]

**Uvularia puberula** Michaux, Carolina Bellwort, Appalacian Bellwort, Coastal Bellwort. Dry to moist upland, acidic forests, up to at least 1500m. Early April-Early May; August-October. Sometimes interpreted as having two varieties, the montane and Piedmont plants as var. *puberula* (leaves broader, rounded to slightly clasping at the base, firm in texture, obviously reticulate on the lower surface, the stem puberulent in lines on the ridges) and var. *nitida* (Britton) Fernald (leaves narrower, more cuneate, thin in texture, the reticulation of cross veins less evident, the stems glabrous); see Wilbur (1963b) and Uttal (1991). S. PA to GA in the Mountains and (more rarely) Piedmont, and from Long Island NY south to GA in the Coastal Plain and Sandhills. While Wilbur (1963b) chose not to recognize varieties, Uttal (1991) supports varietal recognition. The differences seem minor and variable, and poorly correlated with geography. [= FNA, K, W, Z; > *Uvularia puberula* Michaux var. *puberula* – C; Y; > *Uvularia puberula* Michaux var. *nitida* (Britton) Fernald – C; Y; = *U. pubica* (Walter) Fernald – RAB, WV, nomen dubium; > *U. pubica* var. *pubica* – F, G; > *U. pubica* var. *nitida* (Britton) Fernald – F, G; = Oakesiella puberula (Michaux) Small – S; = *Uvularia caroliniana* (J.F. Gmelin) Wilbur]

**Uvularia sessilifolia** Linnaeus, Straw-lily, Wild-oats. Moist hardwood forests, on slopes and mainly in bottomlands. Late March-early May; August-October. NS west to ND, south to Panhandle FL and n. LA. [= RAB, C, F, FNA, K, W, WH, WV, Z; = Oakesiella sessilifolia (Linnaeus) S. Watson – S]

**59. SMILACACEAE** Ventenat 1799 (Greenbrier Family) [in LILIALES]

A family of 3-12 genera and about 375 species, widespread in tropical, subtropical, and temperate regions. References: Holmes in FNA (2002a); Judd (1998); Conran in Kubitzki (1998a).

**Smilax** Linnaeus 1753 (Greenbrier, Carrionflower, Smilax)

A genus of about 300 species, woody vines and herbs, subcosmopolitan in temperate and tropical regions. Our deciduous species are a monophyletic group within *Smilax*, with a classic eastern North American - east Asian disjunction, and are treated as section Nemexia or subgenus Luiste (Wilbur 2004, Fu et al. 2005). *Smilax* berries and shoots provide important food sources for many

1 Stem woody, usually with prickles; ovules 1 per carpel; peduncles usually ≤ 3 cm long; [section Nemexia].
2 Plants erect, 0.2-1.0 m tall, even when well-developed with < 20 leaves [note that immature or depauperate individuals (nonflowering) of S. pseudochina, S. heracea, S. lasioneura, and S. pulverulenta often have this aspect]; tendrils absent or rudimentary; peduncles usually few (usually 1-4), the lowest often from bract axis.
3 Leaves glabrous and glaucous beneath, thick in texture, base cordate, tip acute or acuminate; lowest peduncle from a leaf axil (very rarely from bract axis), upper peduncles from leaf axils; leaves 5-7, clustered together near the summit of the stem .........S. biltmoreana
4 Leaves pubescent and green (or glaucous) beneath, usually thin in texture, base cordate, truncate, or rounded, tip acuminate, acute, or obtuse; lowest peduncles from axils of bracts below the lowest leaves, upper peduncles also often from bracts (the uppermost often from leaf axils); leaves either clustered together near the summit of the stem or well distributed.
5 Leaves relatively many, (7-) 10-13 (-20), often well distributed in the upper half of the stem, notably reduced in size from lower to upper, mostly with the base cordate and the tip acuminate; berry 3-5 seeded ...
6 Leaves few, usually 4-8, usually clustered together near the summit of the stem (rarely well distributed), about the same size, mostly with the base ovate (to subcordate), the tip acute to obtuse; berry 2-3 seeded.................................S. hugeri

2 Plants vine-like, climbing or sprawling, to 3 m tall, when well-developed with > 30 leaves; tendrils present and numerous; peduncles usually many, from leaf axils.
5 Leaf bases hastate, the leaf margins straight or concave in outline; longest fruiting pedicels < 2× as long as the fruit; anthers equaling or longer than the filaments; perianth 1.5-2.5 mm long; leaves glabrous and glaucous beneath.............................................................S. pseudochina

4 Leaves, usually 4-8, usually clustered together near the summit of the stem (rarely well distributed), about the same size, mostly with the base ovate (to subcordate), the tip acute to obtuse; berry 2-3 seeded.................................S. hugeri

8 Leaves bright green and shiny beneath; fruit black, not glaucous; peduncles 1-2 (-3)× as long as the subtending pedicels ...

9 Lower surfaces of leaves strongly glaucous .................................................................S. glauca

10 Prickles of the stem fewer, broad-based and awl-like or catclaw-like, green, brown, or black.
11 Midvein (as seen on the lower surface) much more pronounced than the principal lateral veins, which are scarcely raised; leaves evergreen, thick, coriaceous.................................S. laurifolia

12 Leaves mostly ovate, oblong, pandurate, or hastate, the base cordate, truncate, rounded, or cuneate, the tip rounded to acute; berries various in color.
13 Margin of the leaf blade prominent, orbiculate, thickened as a marginal vein (this appearing as a thickening, a visible vein, or an apparent revolute margin); leaves with 1-3 seeds.

14 Inflorescence pedicule (stalk of the umbel) as long as or shorter than the subtending leaf pedicel; stems and prickles glabrous; leaves evergreen; berries usually with 2-3 seeds; [generally of xeric or less commonly mesic sands].................................S. aureulata

15 Margin of the leaf blade thick, sometimes revolute; berries with (1-) 2-4 seeds.

16 Berries blue-black; perianth green; leaves semi-evergreen to evergreen, margins of mature leaves generally not revolute, the margins of the leaves and the petioles often with minute, flabellate, tooth-like projections; berries with (1-) 2-3 seeds; [a wide variety of habitats] ...............................................................................................................................S. bona-nox

17 Berries bright red; perianth brownish-yellow; deciduous, margins of mature leaves usually revolute, the margins of the leaves and the petioles lacking minute, flabellate, toothlike projections; berries with 2-4 seeds; [swamp forests, bogs, often where submersed for at least part of the year] ..................................................................................S. watleri

**Smilax auriculata** Walter, Dune Greenbrier. Dunes on barrier islands, dry sandy openings in maritime forests or sandhills (northwards, as in the Carolinas, limited to sites near the near the coast). May-July; October-November (and persisting). E. NC (Dare County) south to s. FL and west to LA; Bahama Islands. [= RAB, FNA, CK, K, S, WH, Y]

**Smilax biltmoreana** (Small) J.B.S. Norton ex Pennell, Biltmore Carriornflower. Dry forests (such as dry pine ridges and chestnut oak forests) and moist forests. April-May; August-October. The species is apparently limited to to NC, SC, and GA, primarily in the Blue Ridge Escarpment region, with disjunct occurrences in Panhandle FL, s. AL, and se. KY. [= FNA, K, W, Y, Z; = Smilax eicirrata (Engelmann ex Kunth) S. Watson var. biltmoreana (Small) Ahles – RAB; < S. eicirrata – G, WH; = Nemexia biltmoreana Small – S]
**SMILACACEAE**

**Smilax bona-nox** Linnaeus. Catbrier, Tramp's-trouble. In a wide variety of upland and wetland habitats. Late April-May; September-October. MD and MO south to s. FL and TX, and also in Mexico. [= RAB, C, F, FNA, GW, K, S, W, WH, Y; > S. bona-nox var. hastata (Wildenow) Alphonse de Candolle – F; > S. bona-nox var. exauriculata Fernald – F; > S. bona-nox var. hederifolia (Beyrich) Fernald – F; > S. bona-nox var. bona-nox – F]

**Smilax ecirrata** (Engelmann ex Kunth) S. Watson. Forests. Mid May-early June; August-September. N. OH MI, WI, and s. MN south to w. VA, TN, s. IL, MO, and e. OK. [= K, Y, Z; > S. ecirrata – C, F, FNA, WV, orthographic variant; < S. ecirrata – G; = Nemexia ecirrata (Engelmann ex Kunth) Small – S]

**Smilax glauca** Walter, Whiteleaf Greenbrier, Wild Sarsaparilla. In a wide variety of upland and wetland habitats. Late April-early June; September-October (and persisting). NJ, e. PA, OH, IN, MO, and KA, south to c. peninsular FL and TX, and also in Mexico. [= RAB, C, FNA, GW, S, W, Y; > S. glauca var. glauca – F, G, K, WV; > S. glauca var. leurophylla Blake – F, G, K, WV]

**Smilax herbeca** Linnaeus, Common Carrionflower. Moist deciduous forests. May-June; August-October. Centered in the Appalachian Mountains, from QC and ME west to OH, south to AL, GA, and TN. Young, non-flowering plants closely resemble *S. bitilmoreana*. [= F, FNA, K, W, WV, Y, Z; = S. herbacea var. herbacea – RAB, C, G; = Nemexia herbacea (Linnaeus) Small – S]

**Smilax hispida** Rafinesque, Bristly Greenbrier, Hellfetter. Moist to wet forests. CT, NY, MN, and NE south to s. FL and TX. Wilbur (2003) discusses the complicated nomenclatural problems involving this plant and concludes that *S. hispida* Raf. is the correct name. [= RAB, C, G, S, WV; = S. tannoides Linnaeus – FNA, GW, K, W, WH, Y, misapplied; > S. tannoides var. hispida (Muhlenberg) Fernald – F; > S. tannoides var. tannoides – F; > S. hispida var. australis Small – S; > S. hispida var. hispida – S]

**Smilax lasioneura** Hooker, Midwestern Carrionflower. Moist deciduous forests, hammocks, bluff forests, pine-oak hickory submesic forests, perhaps only or primarily over mafic rocks. April-May; August-September. ON and MT south to w. VA (?), w. NC, Panhandle FL, OK, and CO. Material from VA is ambiguous. [= F, FNA, K; = S. herbacea var. lasioneura (Hooker) Alphonse de Candolle – C, G; = Nemexia lasioneura (Hooker) Rydberg – S; = S. lasioneura – WH, Y, orthographic variant]

**Smilax laurifolia** Linnaeus, Blaspheme-vine, Bamboo-vine. Pocosins, swamp forests, mountain bogs in sw. NC. July-August, September-October of the second year (and persisting). Primarily a Southeastern Coastal Plain species: NJ south to s. FL, west to w. TN, AR, and e. TX, and also in the Bahamas Islands and Cuba. [= RAB, C, F, FNA, GW, K, S, W, WH, Y]

**Smilax leptanthera** Pennell. Moist forests. See Pennell (1916) for additional information. Treated as valid and rare by GAHP. [= Nemexia leptanthera (Pennell) Small – S; < S. pseudochina] {investigate}

**Smilax pulverulenta** Michaux. Moist deciduous forests. May-June; August-October. Se. NY, se. and sc. PA, IN, MO, and e. KS south to NC, TN, and AR. [= F, FNA, K, W, WV, Y, Z; = S. herbacea var. pulverulenta (Michaux) A. Gray – RAB, C, G; = Nemexia pulverulenta (Michaux) Small – S]

**Smilax pumila** Walter, Sarsaparilla-vine, Dwarf Smilax. Mesic to dryish hammocks and bluffs, northward primarily in maritime-influenced mainland forest, with *Magnolia grandiflora* and *Tilia americana var. caroliniana*. October-November; January-April (and persisting). Ne. SC (within a few hundred miles of Brunswick County, NC) to c. peninsular FL and west to TX. It occurs on Collins Neck, along the NC-SC border, in maritime-influenced forests with southern affinities, now largely destroyed by golf-course development. This unusual *Smilax* is sometimes cultivated as an ornamental ground-cover. [= RAB, FNA, K, S, WH, Y]

**Smilax rotundifolia** Linnaeus, Common Greenbrier, Bullbrier, Horsebrier. In a wide variety of upland and wetland habitats. April-May; September-October (and persisting). NS and s. ON south to n. FL and e. TX. [= RAB, C, F, FNA, GW, K, S, W, WH, WV, Y; > S. rotundifolia var. quadrangularis (Muhlenberg ex Wildenow) Wood]

**Smilax smallii** Morong, Jackson-brier. Bottomland forests. June-July; April-June of the next year. Ne. NC (se. VA?) to c. peninsular FL, west to s. AR and e. TX, primarily on the Coastal Plain. Unless the name *S. smallii* is conserved, it must be replaced by the older *S. maritima* Alph. Wood. [= RAB, FNA, G, GW, K, W, WH, Y; = S. lanceolata Linnaeus – S, misapplied; = S. maritima Alph. Wood]
**Smilax walteri** Pursh, Coral Greenbrier, Red-berried Swamp Smilax. Swamp forests, bogs, often where submersed for at least part of the year. Late April-May; September-November (and persisting). NJ south to c. peninsular FL and west to TN, AR, and TX. In its relatively narrow leaves, *S. walteri* can resemble *S. smallii*. *S. walteri* has a thicker-textured leaf, and is almost always rounded at the base rather than cuneate. [= RAB, C, F, FNA, G, GW, K, S, W, WH, Y]

61. **LILIACEAE** A.L. de Jussieu 1789 (Lily Family) [in LILIALES]

As here interpreted narrowly, the Liliaceae constitutes about 11 genera and 550 species, of the Northern Hemisphere. There has been much recent investigation and re-interpretation of evidence regarding the upper-level taxonomy of the Liliaceae, with strong suggestions that the broad Liliaceae recognized by Cronquist (1981) is artificial and polyphyletic. Cronquist (1993) himself concurs, at least to a degree: "we still await a comprehensive reorganization of the lilies into several families more comparable to other recognized families of angiosperms." Dahlgren & Clifford (1982) and Dahlgren, Clifford, & Yeo (1985) synthesized an early phase in the modern revolution of monocot taxonomy. Since then, additional research, especially molecular (Duvall et al. 1993, Chase et al. 1993, Bogler & Simpson 1995, and many others), has strongly validated the general lines (and many details) of Dahlgren's arrangement. The most recent synthesis (Kubitzki 1998a) is followed as the basis for familial and generic taxonomy of the lilies and their relatives (see summary below). References: Angiosperm Phylogeny Group (1998, 2003, 2009); Tamura in Kubitzki (1998a). [also see AGAVACEAE, ALLIACEAE, ALSTROEMERIACEAE, AMARYLLIDACEAE, ASPARAGACEAE, COLCHICACEAE, HEMEROCALLIDACEAE, HOSTACEAE, HYACINTHACEAE, HYPOXIDACEAE, MELANTHIACEAE, NARTHICEAEC, RUSCACEAE, SMILACACEAE, THEMIDACEAE, TOFIELDIACEAE, TRILLIACEAE]

Our "liliaceous" genera (members of orders placed in the Lilianae) are therefore divided as shown below, largely following Kubitzki (1998a) and some more recent molecular analyses.

**ALISMATALES**
- TOFIELDIACEAE: Harperocallis, Pleea, Tofieldia, Triantha.

**LILIACEAE**
- ALSTROEMERIACEAE: Alstroemeria.
- COLCHICACEAE: Colchicum, Uvularia.
- HELONIADACEAE: Chamaelirium, Helonias. (or to be included in MELANTHIACEAE)
- LILIACEAE: Clintonia, Erythronium, Lilium, Medeola, Prosartes, Streptopus, Tulipa.
- MELANTHIACEAE: Amianthium, Anticlea, Schoenocaulon, Stenanthium, Veratrump, Toxicoscordion, Zigadenus.
- SMILACACEAE: Smilax.
- TRILLIACEAE: Trillium. (or to be included in MELANTHIACEAE)

**ASPARAGALES**
- AGAVACEAE: Camassia, Manfreda, Schoenolirion, Yucca. (or to be included in ASPARAGACEAE)
- AMARYLLIDACEAE: Allium, Crinum, Galanthus, Habranthus, Hymenocallis, Leucojum, Lycoris, Narcissus, Nothoscordum, Sternbergia, Tristagma, Zephyranthes. [including ALLIACEAE]
- ASPARAGACEAE: Asparagus.
- HOSTACEAE: Hosta. (or to be included in ASPARAGACEAE)
- HYACINTHACEAE: Hyacinthoides, Hyacinthus, Muscari, Ornithogalum. (or to be included in ASPARAGACEAE)
- HYPOXIDACEAE: Hypoxis.
- IRIDACEAE: Alophia, Calydoarea, Crocus, Crocosmia, Gladiolus, Herberia, Iris, Nemastylis, Sisyrinchium.
- RUSCACEAE: Convallaria, Liriope, Maianthemum, Nolina, Polygonatum. (or to be included in ASPARAGACEAE)
- XANTHORHOEACEAE: Hemerocallis. (or to be split, and then in HEMEROCALLIDACEAE)

**DIOCOSOREALES**
- BURMANNIACEAE: Apteria, Burmannia.
- DIOSCOREACEAE: Dioscorea.
- NARTHICEAEC: Alcetris, Lophiara, Narthecium.

**PANDANALES**
- STEMONACEAE: Croomia.

1 Leaves basal; flowers on a leafless scape; tepals yellow or white.
2 Flowers in an umbel at the summit of a leafless scape; fruit a berry; [subfamily Medeoloideae]..........................................................Clintonia
2 Flowers solitary and scapose; tepals yellow or white; fruit a capsule; [subfamily Lilioideae]..........................................................Erythronium
1 Leaves on a stem; flowers not scapose; tepals orange, red, rose, yellow, or white.
3 Leaves whorled at 1 node or more.
**Clintonia Rafinesque 1819**

1. Flowers yellow; berry blue (rarely to whitish-blue); leaf margins glabrous or slightly ciliate; [mostly of high elevations].............. *C. borealis*
2. Flowers white (often marked with purple); berry black; leaf margins copiously retrorsely ciliate, the cilia 2-4 mm long; [plants of middle elevations] .......................................................... *C. umbellulata*

---

**Erythronium Linnaeus 1753** (Trout Lily)

Identification notes: Stolons are white shoots produced from the bulb. Most run horizontally, either underground or along the ground surface but beneath leaf litter. Flowering individuals often produce no stolons. The stolon characters in the key below are those of non-flowering individuals and refer to horizontal stolons only.

1. Perianth white (sometimes pinkish or bluish).................................................................................................................. *E. albidum*
2. Perianth yellow.
3. Petals lacking auricles at base; capsule and ovary distinctly indented (umbilicate) at apex (or rarely truncate in *E. umbilicatum* ssp. monostolum, or the ovary when young not yet displaying the apical indentation); mature capsules usually reclining on ground, with the apex downward; stolons 0-1 per bulb; anthers usually lavender, brown, cinnamon, or purple (sometimes yellow).
4. Horizontal stolons 0 per bulb; flecking on perianth segments absent to slight; perianth margins entire, smooth; stigma lobes short; pale spot on adaxial side of perianth segments usually present, small to medium, usually white; [of lower to mid elevations, widespread in our area].................................................................................................................. *E. umbilicatum* ssp. umbilicatum
5. Perianth white or pinkish; stolons more or less developed; capsule 1 per bulb; capsule and ovary reclining on ground, the apex oriented horizontally or ascending; stolons usually 1-2 per bulb; anthers usually yellow (rarely brown or lavender).
6. Capsule distinctly beaked at the apex; petals with well-developed auricles at the base, these encircling a filament ............... *E. rostratum*
7. Capsule truncate, rounded, or apache at the apex; petals with small auricles at the base, which do not encircle a filament.
8. Capsule apiculus absent or poorly developed .............................................................................................................. *E. americanum* ssp. americanum
9. Capsule apiculus well developed. ................................................................................................................................. *E. americanum* ssp. harperi

---

**Erythronium americanum** Ker-Gawler *spp. americanum*, American Trout Lily. Moist bottomland or slope forests, especially over mafic rocks. February-April; April-May. NB west to ON and MN, south to sc. NC, c. TN, AR, and OK. It is much rarer than *E. umbilicatum* in NC. *E. americanum* is a tetraploid (2n = 48); Parks & Hardin suggest the possibility that it is an allotetraploid involving *E. rostratum* and *E. umbilicatum* as parents. *E. americanum* is larger-flowered, more graceful, and later-blooming (by 1-2 weeks) than *E. umbilicatum* ssp. umbilicatum, where they co-occur. [= FNA, GW, K, Y, Z; < *E. americanum* – RAB, F, G, S (also see *E. umbilicatum*); < *E. americanum* – C, W, WV]

**LILIACEAE**

**Erythronium rostratum** W. Wolf, Beaked Trout Lily. Moist bottomland or slope forests. C. TN, MO, and se. KS, south to c. AL, wc. LA, and se. OK. [= FNA, GW, K, Y, Z; < *E. umbilicatum* – C, W]

**Erythronium umbilicatum** Parks & Hardin ssp. *monostolum* Parks & Hardin, Southern Appalachian Trout Lily. High elevation coves, slopes, and grassy balds, moist forests. March-May; April-June. Ssp. *monostolum* is endemic to the high mountains of NC and TN. It approaches the VA border and should be sought, especially in the Grayson Highlands area. *E. umbilicatum* ssp. *monostolum* is a diploid (2n = 24). [= FNA, GW, K, Y, Z; < *E. americanum* – RAB, F, G, S; < *E. umbilicatum* – C, W]

**Erythronium umbilicatum** ssp. *umbilicatum* Roemer & Schultes, May Apple. Moist bottomland or dry upland habitats. February-April (May?); April-June. VA and e. WV south through NC, SC, and e. TN to c. GA, e. AL, and Panhandle FL. *E. umbilicatum* ssp. *umbilicatum* is a diploid (2n = 24). Mathew (1992) suggests the possibility that an earlier name, *E. nuttallianum* Roemer & Schultes, may apply to this taxon; the two locations mentioned on the type, Pennsylvania and Albany, NY, are outside the known range of the species, however. [= FNA, GW, K, Y, Z; < *E. americanum* – RAB, F, G, S; < *E. umbilicatum* – C, W, WH, WV]

**Lilium** Linnaeus 1753 (Lily)

1 Dark bulblets produced in many leaf axils; [exotic] ................................................................. *L. lancifolium*

1 Dark bulblets never produced; [native (except *L. longiflorum* and *L. philippinense*), though some species also cultivated].

2 Flowers white; leaves narrowly linear or lanceolate; [exotic].

3 Leaves lanceolate; plants < 1 m tall; perianth parts 13-18 cm long, glabrous at the base (internally) ................................... *L. philippinense*

3 Leaves linear; plants 1-3 m tall; perianth parts 18-25 cm long, papillose at the base (internally) ........................................... *L. longiflorum*

4 Flowers erect, facing upwards; tepals clawed.

5 Leaves all alternate; [of the Coastal Plain].................................................................................. *L. catesbaei*

5 Leaves (at least some of them) whorled or verticillate; [of the Mountains] ............................. *L. philadelphicum* var. *philadelphicum*

4 Flowers nodding or declined, facing downwards or to the side; tepals narrowed to the base, but not clawed.

6 Leaves ob lanceolate to obovate, alternate and whorled, in many plants 50% or more of nodes bearing a single leaf; flowers 1-4 (rarely more), nodding to pendant, fragrant ................................................................. *L. michauxii*

6 Leaves lanceolate or narrowly elliptic, not broader distally, alternate and whorled, in most plants 10-30% of nodes bearing a single leaf; flowers 1-30+, oriented variously, not fragrant.

7 Flowers at maturity campanulate (tepals with somewhat recurved tips); style and stamens included or barely exserted.

8 Flowers 3-4 cm in diameter; pistil 3-4 cm long; tepals 3-5.5 cm long, deep red, mucronate by extension of the midrib, reflexed < 45 degrees from the flower axis, the terminal third of the tepals generally incurved; anthers 4-6 mm long, completely included within the perianth when viewed from the side; [high elevations in the Blue Ridge of w. NC, ne. TN, and sw. VA].

9 Perianth yellow (rarely orange to red); mid-stem leaves 5-10 cm long as wide .......... *L. canadense* var. *canadense*

9 Perianth orange to red; mid-stem leaves 2-5 cm long as wide .......... *L. canadense* var. *editorum*

10 Style reddish, more-or-less the same color as the tepals; [west of the Blue Ridge] .............. *L. michiganense*

10 Style pale green, strongly contrasting with tepals; [Blue Ridge and eastward and southward].

11 Leaves 7-26 cm long, oriented horizontally, with the tips downward-arching; leaf whorls 6-24; plants 1.2-2.8 m tall; inflorescences (1-) 5-22 flowered, tepals orange to reddish; [Mountains, Piedmont, and Coastal Plain] .......... *L. superbum*

11 Leaves 2-16 cm long, ascending or more or less horizontal, but with the tips not downward-arching; leaf whorls 1-12; plants 0.6-2.0 m tall; inflorescences 1-4 (-7) flowered, tepals yellow to orange (to dusky red); [Coastal Plain].

12 Leaf whorls 1-5; petals yellow to yellow-orange; [East Gulf Coastal Plain] ................. *L. iridollae*

12 Leaf whorls 1-12; petals orange to dusky red; [seepage bogs and margins of tree-shrub streamheads in se. VA, c. NC, and c. SC] ........................................................................................................ *L. pyrophilum*

**Lilium** Linnaeus var. *canadense*, Yellow Canada Lily. Wet meadows. June-July; late July-September. Apparently ranging from NB to NC, mostly east of or in the Appalachians; the range is obscured by different interpretations of var. *canadense* and var. *editorum*, by spread from cultivation, and by collections of cultivated plants not clearly so indicated.

*Lilium canadense* Linnaeus var. *editorum* Fernald, Red Canada Lily.  Wet meadows, forest openings.  June-July; late July-September.  According to Adams & Dress (1982), who emphasize tepal color in distinguishing the infraspecific taxa, ranging from NB west to s. ON, south (mostly in and west of the Appalachians) to n. GA and n. AL.  Wherry (1946) and Fernald (1950) emphasize leaf shape, and secondarily flower color, restricting var. *editorum* to a range from PA west to s. IN, south to AL.  There has been considerable confusion between *L. canadense* var. *editorum* and *L. grayi*, and populations in sw. VA appear to show some intergradation between the two.  [= F, WV; < *L. canadense* – RAB, C, FNA, G, GW, S; = *L. canadense* ssp. *editorum* (Fernald Wherry – K, W, Y, Z]

*Lilium grayi* S. Watson, Gray's Lily, Roan Lily.  Bogs, seepages, grassy balds, moist forests, and wet meadows, at medium to high elevations.  June-July; August-September.  A Southern Appalachian endemic: sw. VA, nw. NC, and ne. TN.  Clearly related to *L. canadense* (especially through the somewhat intermediate *L. canadense* var. *editorum*).  *L. grayi* appears to be adapted for pollination by Ruby-throated Hummingbirds (Adams & Dress 1982).  See *L. canadense* var. *editorum* for additional comments.  The two most important strongholds for this rare lily (each with thousands of individuals) are the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County, TN), where it was first found, and Long Hope Valley (Watauga and Ashe counties, NC).  Otherwise, it tends to occur in very small, isolated populations in bogs, wet pastures, and seeps.  In addition to the characters in the key, *L. grayi* can be distinguished in sterile condition from the 2 more common species of the Mountains by leaves, which are widest near the midpoint, typically 4-6× as long as wide (vs. distinctly wider towards the apex in *L. michauxii*, and widest near the midpoint but typically 10× or more as long as wide in *L. superbum*).  Certainly one of our most beautiful wild plants!  [= RAB, C, F, G, K, S, W, Y, Z]

*Lilium iridollae* M.G. Henry, Panhandle Lily, Pot-o’-gold Lily.  Bogs.  Panhandle FL west to s. AL.  [= FNA, GW, WH; < *L. iridollae* – K (also see *L. pyrophilum*))

* *Lilium lancifolium* Thunberg, Tiger Lily.  Disturbed areas, trash heaps; native of Asia.  The more familiar name, *L. tigrinum*, must be rejected in favor of the older *L. lancifolium* (Ingram 1968).  [= C, FNA, K; = *L. tigrinum* Ker-Gawler – F, G, WV]

* *Lilium longiflorum* Thunberg, Easter Lily.  Disturbed areas, persistent from cultivation.  [= FNA, K]

*Lilium michauxii* Poiret, Carolina Lily.  Dry upland forests, ridges, slopes, and ridges.  July-August; September-October.  S. VA, e. TN, n. AL, c. MS, and e. LA south to s. SC, Panhandle FL, s. AL, s. MS, and s. LA.  [= C, F, FNA, G, GW, K, W, WH, WV, X, Y, Z; = *L. michauxii* – RAB; = *L. michauxii* (Farwell) Boivin & Cody]

*Lilium michiganense* Farwell, Michigan Lily.  Wet prairies and calcareous hardwood flatwoods.  ON and MN south to e. TN, KY, nw. GA, AL, AR, and e. OK.  [= C, F, FNA, K; < *L. superbum* – G; = *L. canadense* Linnaeus ssp. michiganense (Farwell) Boivin & Cody]

*Lilium philadelphicum* Linnaeus var. *philadelphicum*.  Wood Lily.  Grassy balds, moist to wet meadows (especially in thin soils over rock), open woodlands.  June-July; August-October.  The species ranges from ME west to BC, south to NC, nw. GA (Jones & Coile 1988), KY, IL, IA, NE, and NM.  Var. *philadelphicum*, distinguished by the leaves whorled at 3-6 nodes, 10-15 (-25) mm wide, the capsule 2.5-3.5 (-5) cm long, is eastern and mainly Appalachian, ranging from ME and s. ON south to NC, GA, and KY.  Var. *andinum* (Nuttall) Ker-Gawler, distinguished by the leaves whorled at 1-2 nodes, 3-10 mm wide, the capsule 4-8 cm long, is western, ranging from OH, MN, and BC south to NM.  [= C, F, G, K; < *L. philadelphicum* – RAB, FNA, S, W, WV; = *L. philadelphicum* ssp. *philadelphicum* – Y]

*Lilium philippinense* Baker, Philippine Lily.  Escaped from cultivation; native of the Philippines.  July-August.  This species is introduced at various locations in the Southeast, including FL and LA (Kartesz 1999), and has been documented from Richmond Co. NC (B.A. Sorrie, pers. comm.).  In North America there has been confusion between this species and *L. formosanum* A. Wallace.  [= FNA, K, WH]

Superficially, this plant is somewhat similar to *L. michauxii*, in its one to several, nodding flowers with recurved tepals, relatively few whorls of leaves, and relatively few leaves per whorl. In addition to the character used in the key, this plant differs from *L. michauxii* in the following ways: flowers not fragrant or only slightly so (vs. flowers strongly fragrant), leaves generally widest near the middle (vs. widest towards the tip), leaves only slightly paler below and lacking a pronounced waxy sheen (vs. leaves strongly bicolored, the lower surface much paler and with a waxy sheen), and habitat in sphagnous, peaty bogs (vs. in xeric to mesic, sandy to loamy soils). [= FNA, X; < *L. michauxii* – RAB (misapplied to these plants); < *L. iridollae* M.G. Henry – K, misapplied]

**Lilium superbum** Linnaeus, Turk’s-cap Lily, Lily-royal. Cove forests and moist forests, moist ravines, blackwater stream swamps, Coastal plain bogs. July-August; September-October. MA and s. NY south to ne. NC, Panhandle FL, and c. MS, southwards primarily in the Appalachians, but extending across the Piedmont to the Coastal Plain of VA and ne. NC, and with a similarly odd extension south of the southern terminus of the Appalachians into the Coastal Plain of GA, w. FL, AL, and MS. The plants of blackwater swamps of se. VA and ne. NC are very narrow-leaved and yellow-tepaled; this form, atypical in habitat, range, and morphology has been referred to speculatively as "*Lilium* species 1." Further study is needed to determine whether it is a distinct taxon (species, or variety of *L. superbum*) or only a form. [= C, F, FNA, GW, K, RAB, S, WH, WV, X, Y, Z; < *L. superbum* – G (also see *L. michiganense*)]

**Medeola** Linnaeus 1753 (Indian Cucumber-root)

**Identification notes:** *Medeola* is sometimes mistaken (when sterile) for *Isotria*; *Medeola* has a wiry stem, floccose-pubescent, *Isotria* a fleshy, glabrous stem.

**Medeola virginiana** Linnaeus, Indian Cucumber-root. Moist forests, usually with acidic soils. Mid April-mid June; September-October. QC and ON west to MN, south to GA, Panhandle FL and LA. The tuber is white, crisp, tasting cucumber-like, usually about 5 cm long and 5 mm in diameter. Bell (1974) describes patterns of vegetative growth. Flowering plants have a second, smaller whorl of leaves; the flowers are borne on recurved pedicels beneath the top whorl of leaves. In fruit, however, the pedicels are ascending or erect, bringing the fruits above the top whorl. When the berries are ripe, the leaves of the upper whorl become scarlet at the base, presumably acting as an attractant to animals. [= C, F, FNA, GW, K, RAB, S, WH, WV]

**Prosartes** D. Don 1839 (Fairybells, Mandarin)

A genus of 6 species, of temperate e. North America, w. North America, and e. Asia. Dahlgren, Clifford, & Yeo (1985) suggest that American species of *Disporum* are generically distinct from Asiatic species and should be segregated in the genus *Prosartes*, a distinction made as long ago as 1839. Asian *Disporum* species lack the distinctly reticulate venation of our plants, have strictly glabrous foliage (vs. pubescent), have spurred tepals (vs. unspurred), blue or black berries (vs. red or straw-colored), tripartite stigma (vs. not), and other differences (Jones 1951). Further study of generic limits by Shinwari et al. (1994) shows that the separation into *Prosartes* of the American species often assigned to *Disporum* is clearly warranted, based on morphological and karyological grounds. *Prosartes* is much more closely related to *Streptopus* than to (Asian) *Disporum*; (Asian) *Disporum* is more closely related to *Uvularia*. References: Johnson (1968)=Z; Shinwari et al. (1994)=Y; Jones (1951); Tamura, Utech, & Kawano (1992); Utech in FNA (2002a); Tamura in Kubitzki (1998a).

1 Fruit glabrous, ellipsoid, weakly triangular in cross-section, the surface smooth and shiny, red when ripe; tepals greenish, unspotted; leaves relatively many and small; leaf glabrous on the surface above (except for sparsely pubescent on the midrib and main veins), densely pubescent on the midrib below, sparsely pubescent on the surface below; leaf pubescence weak, often twisted or curled apically (as seen at 10-20× magnification), the leaf therefore very soft to the touch. 

**Prosartes lanuginosa** (Michaux) D. Don, Yellow Mandarin, Yellow Fairybells. Deciduous forests, especially coves. April-May; August-September. Primarily an Appalachian species: NY and s. ON south to n. GA (Jones & Coile 1988) and AL. [= FNA, K, Y; = *Disporum lanuginosum* (Michaux) Nicholson – RAB, C, F, G, S, W, WV, Z]

**Prosartes maculata** (Buckley) A. Gray, Spotted Mandarin, Nodding Mandarin. Nutrient-rich deciduous forests, especially cove forests. April-May; July-August. AL, n. GA, KY, MI, w. NC, OH, TN, w. VA, and s. WV; its distribution is rather fragmented, and the species is considered rare or uncommon in every state in its range. The fruits are more reminiscent of *Uvularia* than of *Prosartes lanuginosa*. [= FNA, K, Y; = *Disporum maculatum* (Buckley) Britton – RAB, C, F, G, S, W, WV, Z]
**Streptopus** Michaux 1803 (Twisted-stalk)

1 Leaf margins and nodes not coarsely ciliate; leaves strongly cordate-clasping; fruit ellipsoid ..............................

   *S. amplexifolius* var. *amplexifolius*

1 Leaf margins and nodes coarsely ciliate; leaves sessile to somewhat cordate-clasping (especially the lower leaves of robust individuals); fruit globose

   *S. lanceolatus* var. *lanceolatus*

**Streptopus amplexifolius** (Linnaeus) A.P. de Candolle var. *amplexifolius*, White Mandarin, Pagoda-bells. Moist forests and seepages at high elevations. Late April-early June; late July-September. Fassett recognized seven varieties, the plants in our area being var. *americanus*. The species ranges from Greenland and NL (Labrador) to MN, south (in the mountains and disjunctly) to NC, and in the west from AK (and Kamchatka) south to AZ, in Japan, and in the Alps in Europe. [= K; < *S. amplexifolius* – RAB, FNA, W; > *S. amplexifolius* var. *americanus* J.A. & J.H. Schultes – C, F, G, Z; < *Tortipes amplexifolius* (Linnaeus) Small – S]

**Streptopus lanceolatus** (Aiton) Reveal var. *lanceolatus*, Eastern Rose Mandarin, Eastern Twisted-stalk. Moist forests at high elevations. Late April-early June; late July-September. Fassett (1935) recognized four varieties in *S. roseus*. Reveal (1993c) determined that the correct name for the species widely known as *S. roseus* is *S. lanceolatus* (Aiton) Reveal, and he transferred Fassett's varieties. Fassett (and Reveal) considered *S. lanceolatus* var. *lanceolatus* [*S. roseus* var. *perspectus* Fassett] to range from s. NL (Labrador) west to MI, south to NJ and PA, and in the mountains to w. NC, e. TN, and ne. GA (Jones & Coile 1988). *S. lanceolatus* var. *longipes* (Fernald) Reveal [*S. roseus* var. *longipes* (Fernald) Fassett] is midwestern, from s. ON and nw. PA west to MI, WI, MN, and s. MB. Var. *curvipes* (Vail) Fassett is western, ranging from AK to se. BC and nw. OR. Var. *roseus* was considered to be a Southern Appalachian endemic, differing from var. *perspectus* only in having the pedicel-peduncles entirely glabrous (vs. ciliate with few to many multicellular hairs). The number of hairs on the peduncles varies constantly, and recognition of two varieties in e. North America does not appear warranted; all of our material is then *S. lanceolatus* var. *lanceolatus* [*S. roseus* var. *roseus* (in a broader sense)], which does differ significantly from the more western varieties. [< *S. roseus* – RAB, S, W, WV; > *S. roseus* var. *roseus* – C, F, G, Z; > *S. roseus* var. *perspectus* Fassett – C, F, G, Z; < *S. lanceolatus* – FNA; > *S. lanceolatus* var. *lanceolatus* – K; > *S. lanceolatus* var. *roseus* (Michaux) Reveal – K]

**Tulipa** Linnaeus 1753 (Tulip)

* *Tulipa sylvestris* Linnaeus, Tulip, Dutch-lily. Very commonly cultivated; native of w. Asia. "Occasionally naturalized in moist meadows, fields and roadsides" in se. PA (Rhoads & Klein 1993) and MD (Kartesz 1999). [= FNA, K]

**62. ORCHIDACEAE** A.L. de Jussieu 1789 (Orchid Family) [in ASPARAGALES]

A family of about 800 genera and 19,000 species, perennial (rarely annual), mycotrophic herbs and vines. Only a small minority of orchid species worldwide are terrestrial rather than epiphytic; only *Epidendrum magnoliae* in our flora shows the common epiphytic habit. References: Luer (1972) and Luer (1975)=L; Correll (1950)=X; Romero-González, Fernández-Concha, Dressler, Magrath, & Argus in FNA (Williams & Williams (1983); Brown (2003); Homoya (1993); Correll (1937); Pridgeon et al. (1999a, 1999b, 1999c).

**Identification notes**: Flowering plants are necessary for use of the key to genera.
1 Plant terrestrial, growing on the branches or trunks of trees in swamps ................................................................. Epidendrum
1 Plant terrestrial, growing on soil.
2 Leaves absent at flowering, or with a solitary leaf with a purplish undersurface withering at about the time of flowering.
3 Flowers with a spur ........................................................................................................................................................
3 Flowers without a spur.
4 Flowers white, the lip, sepals, and petals all predominantly white ........................................................................ Spiranthes
4 Flowers pink, greenish, yellowish, or purplish, the lip sometimes white or marked with white, the sepals and petals colored.
5 Flower solitary; lip strongly bearded ......................................................................................................................... Arethusa
5 Flowers in spikes or racemes; lip not bearded.
6 Lip with 2 fleshy ridges near the base; pollinia 4; plants mycorrhizal and never with leaves ...................................... Corallorhiza
6 Lip with 3-7 ridges near the base or extending most of the length of the lip; pollinia 4 or 8; plants either mycorrhizal and
never with leaves, or with a plicate winter leaf withering shortly before flowering.
7 Plants with a plicate winter leaf withering shortly before flowering (the withered remnant usually detectable); pollinia 4;
veins of the petals and sepals not strikingly different in color than the intervein areas; lip with 3 ridges .......................... Aplectrum
7 Plants never with leaves and saprophytic; pollinia 8; veins of the petals and sepals strikingly different in color than the
intervein areas; lip with 5-7 ridges ................................................................................................................................ Hexalectris
2 Leaves present at flowering (Cleistesiopsis with a foliaceous bract at the summit of the stem).
8 Leaf solitary.
9 Leaf basal.
10 Flower with a spur .......................................................................................................................................................... Platanthera
10 Flower without a spur.
11 Flower solitary; leaf plicate .......................................................................................................................................... Arethusa
11 Flowers in a raceme or spike.
12 Flowers relatively large, pink, to rarely white, the lip oriented upwards ................................................................. Calopogon
12 Flowers relatively small, white, the lip oriented downwards .................................................................................. Platanthera
9 Leaf cauline.
13 Flower solitary (4), pink (rarely nearly white); [subfamily Vanilloideae; tribe Pogonieae].
14 Sepals brown to purple, linear or narrowly oblanceolate, 3-6.5 cm long, about 5 mm wide; leaf coriaceous .......... Cleistesiopsis
14 Sepals pink (rarely white), elliptic or oblanceolate, 1.3-2.7 cm long, 3-11 mm wide; leaf herbaceous ......................... Pogonia
15 Flowers in spikes or racemes, 5-many, reddish, yellowish, or greenish.
16 Flower without a spur; petals, sepals, and lip 1-3 mm long ......................................................................................... Malaxis
15 Flower with a spur; petals, sepals, and lip 3-25 mm long ............................................................................................ Platanthera
8 Leaves 2-many
16 Lip inflated, pouch-like or slipper-like, 2-6 cm long ................................................................................................. Cypripedium
16 Lip not inflated, or if so, then 0.3-1.1 cm long.
17 Leaves basal (sometimes with bladeless sheaths upwards on the stem).
18 Leaves plicate.
19 Lip oriented upwards; flowers pink to white ............................................................................................................ Calopogon
19 Lip oriented downwards; flowers greenish, purplish-brown, or yellowish................................................................. Liparis
20 Leaves obovate to oblanceolate, > 10× as long as wide; plant 1-3 dm tall ................................................................. Pteroglossaspis
20 Leaves linear-lanceolate, > 10× as long as wide; plant 1-3 dm tall ............................................................................. Platanthera
18 Leaves smooth, often creased at the midrib, but not plicate.
21 Lip with a spur.
22 Flowers bicolored, the lip white, the sepals and petals pink; leaves 2 ................................................................. Galearis
22 Flowers not bicolored, the lip, petals, and sepals similarly colored; leaves 2-5.
23 Lip deeply divided into 3 linear segments; leaves 3-5 .................................................................................................................................. Habenaria
23 Lip entire; leaves 2 .............................................................................................................................................. Platanthera
21 Lip without a spur.
24 Leaf blades ascending.
25 Leaf blades more-or-less horizontally oriented, flat against the ground or 1-2 cm above it.
25 Lip oriented upwards ........................................................................................................................................ Goodyera
25 Lip oriented downwards.
26 Leaves variegated with white; lip sacculate ................................................................................................................ Goodyera
26 Leaves green, not variegated; lip not sacculate .......................................................................................................... Liparis
24 Leaf blades ascending.
27 Leaves linear to lanceolate, 2-4 ......................................................................................................................................... Spiranthus
27 Leaves elliptic to ovate, 2.
28 Lip broadest near its apex ........................................................................................................................................... Liparis
28 Lip broadest near its base, tapering to the apex ........................................................................................................ Malaxis
17 Leaves cauline.
29 Leaves plicate; lip sacculate ..................................................................................................................................... Epipactis
29 Leaves smooth, often creased at the midrib, but not plicate; lip not sacculate.
30 Leaves whorled, terminating the stem ....................................................................................................................... Isotria
30 Leaves alternate or opposite, not terminating the stem.
31 Leaves 2, opposite, near the middle of the stem ........................................................................................................... Listera
31 Leaves (2-) 3-many, alternate, variously distributed on the stem.
32 Lip without a spur; leaves 0.8-8.0 cm long.
33 Leaves ovate, 0.8-2.0 cm long .................................................................................................................................. Triphora
33 Leaves linear or narrowly lanceolate, 1-8 cm long.
32 Lip with a spur; leaves linear, lanceolate, or narrowly elliptic, 5-40 cm long (at least the larger > 5 cm long, except in
Platythelys, with lanceolate to ovate leaves 1.5-6.5 cm long).
34 Leaves 1.5-6.5 cm long, with inflated tubular sheaths; plants from creeping rhizomes ................................. Platythelys
34 Leaves 5-40 cm long, sessile; plants from fleshy or fusiform roots.
35 Lip divided into 3 linear divisions, the divisions not further divided, fringed, or eroded ................................. Habenaria
**ORCHIDACEAE**

<table>
<thead>
<tr>
<th>Page 129</th>
</tr>
</thead>
</table>

35 Lip not divided into 3 divisions, or divided into 3 divisions but the divisions not linear.  
36 Spur saccate, 2-3 mm long, the orifice minute ......................................................... **Coeloglossum**  
36 Spur elongate and slender, 4-50 mm long, the orifice larger ........................................... **Platanthera**

*Aplectrum* Torrey 1818 (Puttyroot, Adam-and-Eve)

**Identification notes:** Like *Tipularia*, *Aplectrum* has a single, overwintering leaf, purplish on the underside, and withering prior to the appearance of the flowering stalk; they are readily separable by leaf shape, texture, and veining (see *Tipularia*).

**Arethusa** Linnaeus 1753 (Dragon's-mouth, Bog-rose, Arethusa)

A monotypic genus (Sheviak & Catling in FNA 2002). References: Sheviak & Catling in FNA (2002a); Correll (1950)=X.

**Identification notes:** The combination of the following characters serves to separate *Arethusa* from other, vaguely similar, genera: flowers magenta, solitary and scapose, the lip descending, the other 2 petals and 3 sepals erect or ascending. *Calopogon* has a leafy stem, the inflorescence a raceme, the lip crested but oriented upwards. *Pogonia* has solitary, pale pink flowers, with a descending, bearded lip, but the stem has a well-developed, flat leaf, 1-2.5 cm wide, the flower is subtended by a well-developed, leaf-like bract, and the 2 lower sepals are spreading-descending. *Cleistesiopsis* has 3 brown to purplish brown sepals.

*Arethusa bulbosa* Linnaeus, Dragon's-mouth, Bog-rose, Arethusa. Bogs. May-June. NL (Newfoundland) and NL (Labrador) west to SK, south to NJ, DE, IN, and MN, and to NC and SC in the mountains, rare south of ME, MI, and MN. The lanceolate, plicate leaf (15-30 cm long, 2-4 mm wide) develops after flowering, the flowering plant thus consisting (aboveground) of the solitary scape only. The lip is crested with fimbriate ridges, marked with yellow and purple. [= RAB, C, F, FNA, G, GW, K, L, S, W, X]

**Bletilla** Reichenbach f.

A genus of 9 species, of temperate e. Asia. References: Correll (1950)=X.

* Bletilla striata* (Thunberg) Reichenbach f., Urn Orchid. Lawns, roadsides; native of China. Known only from Escambia County, FL. [= FNA, K, WH]  

**Calopogon** R. Brown 1813 (Grass-pink)

**Identification notes:** The lip is oriented upwards.

1 Petals wider towards the tip than towards the base; lip usually as wide as or wider than long; flowers strongly fragrant ............... **C. multiflorus**  
1 Petals equal or narrower towards the tip than towards the base; lip usually narrower than long; flowers scentless or mildly fragrant.  
2 Leaf appressed to the inflorescence during flowering; flowers < 1 cm apart; flowers not fragrant; flowers on same plant opening simultaneously ................................................................. **C. barbatus**  
2 Leaf not appressed to the inflorescence during flowering; flowers > 1 cm apart; flowers faintly to distinctly fragrant; flowers on same plant opening nearly simultaneously to sequentially.  
3 Lateral sepals 10-15 mm long, falcate, widely spreading .............................................................. **C. pallidus**  
3 Lateral sepals 15-28 mm long, weakly falcate to straight.

1 Flowers of each plant opening nearly simultaneously; dilated distal portion of middle lip lobe usually much narrower than long, triangular to broadly rounded; stigma typically flat against column surface; corns elongate, forked ........................................... **C. oklahomensis**

4 Flowers of each plant opening sequentially; dilated distal portion of middle lip lobe usually much wider than long, typically anvil-shaped; stigma at angle to column surface; corns globose to elongate, not forked............................... **C. tuberosus** var. *tuberosus*

Calopogon oklahomensis D.H. Goldman, Oklahoma Grass-pink. Pine savannas, prairies. E. SC south to s. GA, west to e. TX, north in the eastern Great Plains to MN. [= FNA, Y, Z]

Calopogon tuberosus (Linnaeus) Britton, Sterns, & Poggenburg var. tuberosus, Common Grass-pink. Savannas, sandhill seeps, floating peat mats, in the Piedmont and Mountains in bogs. April-July. Var. tuberosus occurs from NL west to MT, south to s. FL and e. TX, also in Cuba and the West Indies. Var. simpsonii (Chapman) Magrath occurs in peninsular FL, Cuba, and the West Indies. [= FNA, K, L, WH, Y, Z; = C. pulchellus R. Brown – F, G, RAB, X; < C. tuberosus – C, GW, W; = Limodorum tuberosum Linnaeus – S]

Cleistesiosis Pansarin & F. Barros 2008 (Spreading Pogonia, Rosebud Orchid)

A genus of 3 species, endemic to e. North America. As traditionally circumscribed, Cleistes was a genus of about 55 species, primarily of tropical America. The circumscription of this genus has been uncertain (Cameron & Chase 1999; Cameron et al. 1999; Pridgeon et al. 1999c). North American "Cleistes" is not closely related to South American Cleistes (which includes the type of the genus), and two alternative treatments are possible: the North American species can be housed in a separate genus, or alternatively, Pogonia, Isotria, and N. American "Cleistes" could be combined into Pogonia (a generic disposition popular many decades ago). Pansarin & de Barros (2008) favor the former idea, and have named the new genus Cleistesiosis. References: Pansarin & de Barros (2008)=Y; Catling & Gregg (1992)=Z; Brown & Pansarin (2009)=V; Gregg & Catling in FNA (2002a); Gregg (1991); Correll (1950)=X.

1 Column 21-29 mm long; lip (26-) 34-56 mm long, the basal 3/4 of the central keel of the lip with 1-3 parallel, continuous low ridges; sepals (31-) 40-56 (-65) mm long; petals 27-53 mm long; distance between median leaf and floral bract 9-20 cm; fresh flower with daffodil-like odor........................................................................................................... C. divaricata

1 Column 13-19 mm long; lip 21-33 (-38.5) mm long, the basal 3/4 of the central keel of the lip with 5-7 discontinuous and irregular ridges; sepals (24-) 30-40 (-55) mm long; petals 21-36 mm long; distance between median leaf and floral bract 3-16 cm; fresh flowers with strong vanilla odor ............................................................................................................. C. bifaria

2 Fresh flowers odorless; [of the Mountains and Piedmont] ........................................................................................................ C. bifaria

2 Fresh flowers with strong vanilla scent; [of the Coastal Plain]........................................................................................................... C. oricamporum

Cleistesiosis bifaria (Fernald) Pansarin & F. Barros, Appalachian Small Spreading Pogonia. Moist to fairly dry meadows, dry ridgetops under pines (where seasonally moist). May-July. WV south through w. VA, e. KY, w. NC, and e. TN to w. SC, n. GA and n. AL. Catling & Gregg (1992) make a convincing case for the recognition of Cleistesiosis bifaria and C. divaricata as specifically distinct (as Cleistes), based on differences in morphology, range, phylogeny (in the sympatric portions of their ranges), and floral fragrance. [= V; < Cleistesiosis bifaria – Y; < Cleistes bifaria (Fernald) Catling & Gregg – FNA, K, Z; < Cleistes divaricata – RAB, C, G, GW, L, S, W, X; < Cleistes divaricata var. bifaria Fernald – F; < Cleistes divaricata var. bifaria – WV, misspelling; < Pogonia bifaria (Fernald) P.M. Brown & Wunderlin – WH]

Cleistesiosis divaricata (Linnaeus) Pansarin & F. Barros, Large Spreading Pogonia. Pine savannas. May-mid June. S. NJ to sw. GA and ne. FL, in the Coastal Plain; reports from more inland (non Coastal Plain) areas are based on a taxonomic concept of C. divaricata including C. bifaria, and reports from the East Gulf Coastal Plain (west of ne. FL) are based on C. oricamporum. [= V; Y; = Cleistes divaricata (Linnaeus) Ames – FNA, K, Z; < Cleistes divaricata – RAB, C, G, GW, K, L, S, W, X (also see Cleistes bifaria); = Cleistes divaricata var. divaricata – F; = Pogonia divaricata (Linnaeus) R. Brown – WH]

Cleistesiosis oricamporum P.M. Brown, Small Coastal Plain Spreading Pogonia. Savannas, sandhill seeps. May-July. Se. NC to e. peninsular FL and west to e. LA. Catling & Gregg (1992) make a convincing case for the recognition of Cleistesiosis oricamporum (including C. oricamporum) and C. divaricata as specifically distinct (as Cleistes), based on differences in morphology, range, phylogeny (in the sympatric portions of their ranges), and floral fragrance. The co-occurrence of C. divaricata and C. oricamporum at such sites as the Green Swamp, Brunswick County, NC, where phylogenically separated, supports their taxonomic status. Where co-occurring, C. oricamporum flowers on average about 10 days before C. divaricata. Recent studies (Smith et al. 2004) suggest the probability that montane and Coastal Plain populations of "C. bifaria" represent 2 different species, a suggestion formalized by Brown & Pansarin (2009). [= V; < Cleistesiosis bifaria – Y; < Cleistes bifaria (Fernald) Catling & Gregg – FNA, K, Z; < Cleistes divaricata – RAB, C, G, GW, K, L, S, W, X; < Cleistes divaricata var. bifaria Fernald – F, WV; < Pogonia bifaria (Fernald) P.M. Brown & Wunderlin – WH]

Coeloglossum Hartman 1820 (Frog Orchid, Long-bracted Orchid)
Usually regarded as a monotypic genus, of north temperate regions of the Old and New World. However, Coeloglossum is probably not distinct from Dactylorhiza Necker ex Nevski; Coeloglossum is the older name, but Dactylorhiza has been accepted for nomenclatural conservation. The taxonomic and nomenclatural outcome is uncertain. References: Sheviak & Catling in FNA (2002a); Bateman, Pridgeon, & Chase (1997)=Z; Pridgeon et al. (1997, 1999b); Correll (1950)=X.

Coeloglossum viride (Linnaeus) Hartman var. virescens (Muhlenberg ex Willdenow) Luer, Long-bracted Frog Orchid. Moist woods. April-June. The species is circumboreal; var. virescens is e. Asian and North American, in e. North America south in the Appalachians to NC. It is generally more "southern" than the typic var. viride, which is more completely circumboreal, widespread in n. Eurasia and far northern North America. [= K, L, W = Habenaria viridis (Linnaeus) R. Brown var. bracteata (Muhlenberg ex Willdenow) Reichenbach ex A. Gray – RAB, C, F, G, X; < Coeloglossum viride (Linnaeus) Hartman – FNA = Coeloglossum bracteatum (Muhlenberg ex Willdenow) Parlato – S; < Dactylorhiza viridis (Linnaeus) R.M. Bateman, Pridgeon, & M.W. Chase – Z]

Corallorrhiza Gagnebin 1755 (Coralroot)

A genus of about 15 species, distributed in north temperate regions of the Old and New World. The closest relative of Corallorrhiza in our flora is Aplectrum (Freudenstein 1992). The mycotrophic nature of Corallorrhiza is well established, but the exact means of the transfer of nutrients from the fungal hyphae to the orchid is not yet understood. References: Freudenstein (1992, 1997, 1999)=Z; Magrath & Freudenstein in FNA (2002a); Correll (1950)=X.

1 Lip with two lateral teeth or lobes; lateral sepals spreading to down-curved.
   1 Lip without lateral teeth or lobes (though sometimes erose or minutely toothed near its apex); lateral sepals arching, upcurved, or forward-directed.
   2 Sepals 1-veined. ............................................................................................................. C. trifida
   2 Sepals 3-veined.
    3 Middle lobe of lip expanded slightly or not at all distally, the ratio of the width of the dilated part to the base of the mid-lobe < 1.5; floral bracts averaging 0.5-1.0 mm long.......................................................................................................................... C. maculata var. maculata
    3 Middle lobe of the lip distinctly expanded, the ratio of the width of the dilated part to the base of the midlobe greater than 1.5; floral bracts averaging 1.0-2.8 (-4.5) mm long.......................................................................................................................... C. maculata var. occidentalis

Corallorrhiza bentleyi Freudenstein. Dry-mesic to mesic forests, especially near roadsides. The species was recently named and was known (at the time of publication) only from a single population (Freudenstein 1999). This species is now known from about 15 populations in e. WV (Monroe and Pocahontas counties) and w. VA (Giles, Alleghany, and Bath counties). It is most closely related to C. involuta Greenman of Mexico, a component of the C. striata Lindley complex of w. and n. North America. [= FNA, Z]

Corallorrhiza maculata (Rafinesque) Rafinesque var. maculata, Eastern Spotted Coralroot. Moist forests, northern hardwood forests. July-August. Var. maculata is irregularly distributed in much of North America, primarily northern, from NL (Newfoundland) QC, and MN south to PA, OH, and IN, and south in the Appalachians to ne. GA, in the west from BC south to s. CA, s. AZ, and s. NM. Var. mexicana (Lindley) Freudenstein ined. is restricted to Mexico. [= FNA, Z; < C. maculata – RAB, C, F, G, K, L, W, WV, X; < Corallorrhiza maculata – S, orthographic variant]

Corallorrhiza occidentalis (Rafinesque) Rafinesque var. occidentalis (Lindley) Ames, Western Spotted Coralroot. Forests. May-July. Var. occidentalis (Lindley) Ames has a distribution similar to var. maculata, except that in the east it ranges south only to PA, s. ON, and WI, with disjunct populations in e. WV (Pocahontas County; Morton et al. 2004) and VA. [= FNA, Z; < C. maculata – RAB, C, F, G, K, L, W, WV, X; < Corallorrhiza maculata – S, orthographic variant]

Corallorrhiza odontorhiza (Willdenow) Poiret, Autumn Coralroot. Forests. August-October. The cleistogamous form is the more common, and is widespread in n. North America, from ME, NY, s. ON, MI, and MN south to SC, e. GA, ne. FL, e. AL, n. MS, c. AR, and e. OK. The chasmogamous form is less common, and is scattered in ne. United States and adjacent Canada, in ON, CT, PA, MI, IA, IN, DC, NC, and TN, and in Mexico (Chiapas, Distrito Federal, Guerrero, Hidalgo, Jalisco, México, Michoacán, Morelos, Oaxaca, Puebla, Sonora), Guatemala, and Nicaragua. It may be recognized as a variety; see synonymy. [= RAB, C, F, G, L, W, WH, WV, X; > C. odontorhiza var. pringlei (Greenman) Freudenstein – FNA, K, Z; > C. odontorhiza var. odontorhiza – FNA, K, Z; = C. odontorhiza odontorhiza – S, orthographic variant; > C. pringlei Greenman]
**Cypripedium** Linnaeus 1753 (Lady's-slipper)

1 Plant scapose, with 2 basal leaves; pouch-like lip of flower with a longitudinal fissure, pink (rarely nearly white); [section *Acaulia*] ............................................................ C. acaule

1 Plant caulescent, with (2) 3-7 leaves alternate on the stem; pouch-like lip of flower with a rounded orifice, yellow or pink (rarely white).

2 Pouch-like lip of flower pink and white (rarely all white); lateral petals and dorsal sepal white, not twisted, obtuse to acute; [section *Obstipetala*] ........................................................................................................................................ C. reginae

2 Pouch-like lip of flower yellow or white; lateral petals and dorsal sepal brown, purplish brown, or yellow, slightly to strongly twisted, acuminate-attenuate; [section *Cypripedium*] ........................................................................................................................................ C. candidum

3 Pouch-like lip of flower bright yellow, pale yellow, or rarely white, (2.0-) 2.2-6.3 cm long (if pale yellow or white, then > 4 cm long); orifice margin rounded-obtuse on the apical margin; [of various habitats].

4 Dorsal sepal 3.5-5.0 cm wide; pouch orifice 2.7-4.5 cm long; pouch-like lip 4.5-6.3 cm long, pale yellow or creamy white; plants robust, typically 5-8 dm tall................................................................. C. kentuckiense

4 Dorsal sepal 1.5-2.9 cm wide; pouch orifice 0.5-1.3 cm long; pouch-like lip (2.0-) 2.2-5.8 cm long, medium to rich yellow; plants not robust, typically 2-5 (-6) dm tall.

5 Pouch-like lip 2.2-3.4 cm long; sepal and lateral petals usually densely and minutely spotted with dark reddish brown or purple, thus appearing uniformly dark ................................................................. C. parviflorum var. parviflorum

5 Pouch-like lip (2.0-) 3.0-5.8 cm long; sepal and lateral petals unmarked (greenish-yellow), or more often streaked, blotched, striped or reticulately marked with dark reddish brown or purple (but generally not extensively blotched) ................................................................. C. parviflorum var. pubescens

**Cypripedium acaule** Aiton, Pink Lady's-slipper, Moccasin-flower. Dry to mesic, acid forests and woodlands, often under pine or other conifers. April-July. NL (Newfoundland) west to n. AB, south to NC, SC, GA, TN, n. IN, and MN. [= RAB, C, F, FNA, G, K, L, W, WV, X; *Fissipes acaulis* (Aiton) Small – S]

**Cypripedium candidum** Muhlenberg ex Willdenow, White Lady's-slipper. Calcareous barrens and bluffs. NY and NJ west to ND, south to w. VA, nw. and se. AL, and MO. [= C, F, FNA, G, K, L, X]

**Cypripedium kentuckiense** C.F. Reed, Kentucky Yellow Lady's-slipper. Sandy ravine bottoms and springhead seeps along small streams. First reported for our area by Weldy et al. (1996). *C. kentuckiense* C.F. Reed is similar to *C. parviflorum* var. pubescens and, in addition to the site discovered in e. VA, reaches AL, e. TN (Franklin and Scott counties, Cumberland Plateau) and e. KY. Case et al. (1998) studied isozymes of *C. kentuckiense* and related *Cypripedium spp.*; the recognition of *C. kentuckiense* as a species was supported. [= C, FNA, K, Y, Z; often included in a broad concept of *C. calceolus*, *C. pubescens*, or *C. calceolus* var. pubescens by most earlier authors]

**Cypripedium parviflorum** Salisbury var. parviflorum, Small Yellow Lady's-slipper. Mesic forests, seepy forests over amphiboline, other habitats. April-June. VT, NY, OH, IN, IL, MO and KS, south to NC, GA, AL, AR, and OK. The exact range, abundance, and habitats of this variety in our area are obscure, because of confusion with the more northern var. *makasin* (Farwell) Sheviak and small-flowered forms of var. *pubescens*. See Sheviak (1994) for a discussion of why North American plants of yellow lady's-slipppers are recognized as a species distinct from the European *C. calceolus* Linnaeus. [= FNA, Y, Z; *C. calceolus* Linnaeus var. pubescens – RAB, G, X; *C. parviflorum* – K, S, WV; *C. calceolus* var. parviflorum (Salisbury) Fernald – C, F, L, W]

**Cypripedium parviflorum** Salisbury var. pubescens (Willdenow) Knight, Large Yellow Lady's-slipper, Whippoorwill Shoes. Rich mesic forests. April-June. NL (Labrador) and AK south to GA, AL, MS, NM, and AZ. [= FNA, Y, Z; *C. calceolus* Linnaeus var. pubescens (Willdenow) Correll – RAB, G, X (also see *C. parviflorum* var. parviflorum); *C. pubescens* Willdenow – K, S, WV; *C. calceolus* var. pubescens (Willdenow) Correll – C, F, L, W]

**Cypripedium reginae** Walter, Showy Lady's-slipper. Queen Lady's-slipper. Over circumneutral to basic rocks, or (allegedly) in mossy wet forests under *Rhododendron*. May-June. NL (Newfoundland), ON and SK south to NC (?), GA, TN, AR, and ND. The native occurrence of this species in NC is questionable; the only definite specimen from the state is from an implausible habitat for the species (highly acid humus under rhododendron). [= RAB, C, F, FNA, G, K, L, S, W, WV, X]
**Epidendrum** Linnaeus 1759 (Green-fly Orchid)

A genus of about 1000 species, of tropical (and rarely subtropical) America. References: Hágsater in FNA (2002a); Pridgeon et al. (2005); Correll (1950)=X.

**Epidendrum magnoliae** Muhlenberg, Green-fly Orchid. Epiphytic on limbs of trees, especially *Magnolia grandiflora*, *Quercus virginiana*, and *Taxodium* spp., in blackwater river swamps and mesic hardwood hammocks, usually on relatively horizontal limbs mixed with *Pleopeltis polypodioides*, also rarely in crevices of Altamaha Grit outcrops. July-October. The northernmost epiphytic orchid: se. NC south to c. peninsular FL, west to LA; also in ne. Mexico. It is locally rather common, but rarely seen as it occurs primarily in blackwater swamps, on upper limbs of *Taxodium*, *Nyssa*, and other trees, typically mixed with *Pleopeltis*. See Correll (1936) for additional discussion of this species at its northern limit. Hágsater (2000) indicates that *E. magnoliae* Muhlenberg has nomenclatural priority over *E. conopseum* R. Brown. [= FNA; = *E. conopseum* Aiton f. – RAB, L, WH, X; > *E. conopseum* var. conopseum – K; = *Amphiglossit conopsea* (Aiton f.) Small – S]

**Epipactis** Zinn 1757 (Helleborine)

* **Epipactis helleborine** (Linnaeus) Crantz, Broad-leaved Helleborine. Forests; native of Europe. June-September. This species has been collected a handful of times in various parts of the mountains, some of the colonies dating back to the early 1960's; it has become common in ne. United States and se. Canada. [= C, F, NGA, K, L, WV, X; = *E. latifolia* (Linnaeus) Allioni – G]

**Eulophia** R. Brown ex Lindley 1823

A genus of about 215 species, pantropical (Romero-González in FNA 2002). References: Romero-González in FNA (2002a); Correll (1950)=X. [also see *Pteroglossaspis*]

**Eulophia alta** (Linnaeus) Fawcett & Rendle, Wild Coco. Flatwoods, swamps. S. GA south through the FL peninsula into the West Indies, Mexico, Central America, and South America. [= FNA, GW, K; = *Platypus altus* (Linnaeus) Small – S] [add X to synonymy]

**Galearis** Rafinesque 1833 (Showy Orchis)

A genus of 3-6 species, of e. North America and e. Asia. References: Sheviak & Catling in FNA (2002a); Pridgeon et al. (1999b); Correll (1950)=X.

**Goodyera** R. Brown 1813 (Rattlesnake Orchid)

A genus of about 55-100 species, widespread in distribution but primarily Northern Hemisphere. References: Kallunki in FNA (2002a); Pridgeon et al. (1999c); Correll (1950)=X.

1. Leaves blue-green, the upper surface variegated with white, the midrib broadly whitened (1-3 mm wide), the remainder of the network of white variegations narrow (< 0.5 mm wide), generally lacking any internal variation in color, the outlines of the variegations smooth; inflorescence cylindric, not secund or one-sided.................................................................................................................. **G. pubescens**

1. Leaves dark green, the upper surface variegated with pale green, the midrib only irregularly and narrowly pale green, most of the network of pale green variegations broad (0.5-1 mm wide), with a dark green center line (thus the variegations appearing double), the outlines of the variegations finely and irregularly toothed; inflorescence secund, primarily one-sided, or loosely spiraled.

2. Lip narrowly saccate (th pouch much longer than deep), with an elongate recurved apex.................................................................................................................. **G. repens**
Goodyera pubescens (Willdenow) R. Brown, Downy Rattlesnake-orchid. Dry to moist forests and woodlands. June-August. NB west to ON and MN, south to Panhandle FL, MS, and AR. One of the commonest of orchids in much of its range. [= RAB, C, F, FNA, G, K, L, W, WV, X; = Peramium pubescens (Willdenow) MacMillan – S]

Goodyera tesselata Loddiges, Checkered Rattlesnake-plantain. Mixed deciduous and pine woods. NL (Newfoundland) and MB south to NJ, MD, PA, n. OH, MI, WI, and MN. Probably an allopolyploid, derived from G. oblongifolia × repens. [= FNA, C, F, G, K, L, X]

Habenaria Willdenow 1805 (Longspur Orchid, Habenaria)

A genus of about 600 species, tropical and subtropical in the Old World and New World. References: Sheviak in FNA (2002a); Pridgeon et al. (1999b); Correll (1950)=X. [also see Coeloglossum, Platanthera]

1 Lip and lateral petals toothed .............................................................................................. H. floribunda
2 Lip or lateral petals divided into linear segments. ................................................................. H. quinqueseta
2 Spur 4-10 cm long; [terrestrial, though in moist habitats] .................................................... H. quinqueseta
2 Spur 0.4-1.4 cm long; [aquatic or semi-aquatic in marshes and swamps] ................................ H. repens

Habenaria floribunda Lindley, Mignonette Orchid. Rich, moist hardwood hammocks. Ne. FL south to s. FL; West Indies, Mexico, Central America, South America. [= WH; = H. odontotetala Reichenbach f. – FNA, K; = Habenella odontotetala (Reichenbach f.) Small; = Habenella floribunda (Lindley) Szlachetko & Kras-Lapinska] {add X to synonymy}

Habenaria quinqueseta (Michaux) A. Eaton, Long-horned Habenaria, Michaux’s Orchid. Wet pine flatwoods, moist hardwood hammocks, Altamaha Grit outcrops, ditches. August-October. SC south to s. FL, west to se. TX. [= FNA, K, WH; = H. quinqueseta var. quinqueseta – L; < H. quinqueseta – RAB, GW, S, X]

Habenaria repens Nuttall, Water-spider Orchid, Floating Orchid. Blackwater swamps, pools, banks of creeks and rivers. April-November. NC south to FL and west to TX; West Indies, Mexico, Central America, and n. South America. Reported from se. VA. [= RAB, FNA, GW, K, L, S, WH, X]

Hexalectris Rafinesque 1825 (Crested Coralroot)

Hexalectris spicata (Walter) Barnhart, Crested Coralroot, Brunetta. Dry forests and woodlands, especially over mafic or calcareous rocks, such as diabase, gabbro, calcareous siltstone, and dolomite (though sometimes in distinctly acid situations), shell middens. April-August. MD, OH, and MO south to s. FL and w. and s. TX. The yellow and purple flowers borne on a brown stem present a very peculiar color combination. [= V; = H. spicata var. spicata – FNA, Y, Z; < H. spicata – RAB, C, F, G, K, L, S, W, WH, WV, X]

Isotria Rafinesque 1808 (Whorled Pogonia, Five-leaves, Fiveleaf Orchid)
A genus of 2 species, of e. North America. Cameron & Chase (1999) indicate that *Isotria* should perhaps be included in a more broadly circumscribed *Pogonia* (as was often done prior to 1922). References: Mehrhoff & Homoya in FNA (2002a); Correll (1950)=X.

**Identification notes:** Sterile *Isotria* is sometimes confused with *Medeola*. *Medeola* has a wiry-textured stem, with floccose hairiness, at least towards the base. *Isotria* has a flesher stem, lacking hairs.

1 Sepals 12-30 mm long, greenish-brown; lip 10-15 mm long; pedicel of fruit (0-) 5-10 (-15) mm long; plant glaucous, the stem whitish-green. .................................................................................................................................................................................. *I. meleoloides*  

1 Sepals 35-60 mm long, purple-brown; lip 20-25 mm long; pedicel of fruit (12-) 20-55 mm long; plant scarcely glaucous (if all), the stem generally purplish. .................................................................................................................................................................................. *I. verticillata*  

*Isotria meleoloides* (Pursh) Rafinesque, Small Whorled Pogonia, Little Five-leaves. Moist forests, in the mountains and upper Piedmont usually with *Pinus strobus*. May-June. Widespread (but very local) in ne. North America, from s. ME and MI south to c. and e. WV, w. VA, w. NC, e. TN, and n. GA. The reproductive biology of this species was studied by Vitt & Campbell (1997). Van Alstine et al. (1996) discuss the habitats of known occurrences in Virginia. [= RAB, C, F, FNA, G, K, L, W, X; = *I. affinis* (C.F. Austin) Rydberg – S; = *Pogonia affinis* C.F. Austin]  

**Liparis** L.C. Richard 1817 (Wide-lip Orchid, Twayblade)

A genus of about 250-350 species, cosmopolitan. References: Magrath in FNA (2002a); Correll (1950)=X.

1 Lip (8-) 10-12 mm long, pale purple; pedicels 11-18 mm long, equal to or longer than the capsule. ............................................................................................................................................................................. *L. liliifolia*  

1 Lip 4-5.5 mm long, yellowish-green; pedicels 3-7 mm long, shorter than the capsule. ............................................................................................................................................................................. *L. loeselii*  

**Liparis loeselii** (Linnaeus) L.C. Richard, Fen Orchid, Loesel's Twayblade, Bog Twayblade, Yellow Wide-lip Orchid. Seepages at moderate to high elevations in the mountains, mucky bay swamps (dominated by *Persea palustris* and *Magnolia virginiana*) at about sea level on the Outer Banks, and other moist, seepy habitats, especially over mafic or calcareous rocks. May-July. NS and QC west to NT and BC, south to ne. NC (Dare County), sw. NC, AL, AR, KS, NE, and WA. [= RAB, C, F, FNA, G, GW, K, L, S, W, WV, X]

**Listera** R. Brown 1813 (Twayblade)

A genus of about 25 species, boreal, north temperate, and south temperate (Magrath & Coleman in FNA 2002). Recent studies suggest that *Listera* may be best included in *Neottia* Guettard. References: Magrath & Coleman in FNA (2002a); Correll (1950)=X.

1 Lip usually cleft about one-third its length, the two lobes oblong, with rounded apices. ............................................................................................................................................................................. *L. smallii*  

1 Lip usually cleft about two-thirds its length, the two lobes linear, with acute apices.

2 Lip 6-10 mm long, lacking prominent teeth near the base (but with 2 vertically-oriented lobes); pedicels and raceme axis glandular-puberulent; sepals and petals 1-2 mm long. .......................................................................................................................................................................................... *L. australis*  

2 Lip 3-5 mm long, with 2 prominent teeth near the base, these diverging horizontally; pedicels and raceme axis glabrous; sepals and petals 1-3 mm long. .......................................................................................................................................................................................... *L. cordata var. cordata*  

**Listera australis** Lindley, Southern Twayblade. Swamps, second terraces in floodplain forests, wet woods under *Rhododendron maximum*. February-July. Mainly a Southeastern Coastal Plain species, from NJ south to wc. peninsular FL (Kunzer et al. 2009) and west to e. TX, but also scattered inland of the Coastal Plain and north into VT and s. Canada. [= RAB, C, F, FNA, G, GW, K, L, WH, X; = *Ophrys australis* (Lindley) House – S; = *Neottia bifolia* (Rafinesque) Baumbach]  

**Listera convallarioides** (Swartz) Nuttall. Attributed to NC by Correll (1950); this record of this far-northern species is almost certainly an error. [= *Neottia convallarioides* (Swartz) Richard] (rejected; not keyed)

**Malaxis** Solander ex Swartz 1788 (Adder's-mouth)

1 Leaves 2-5; lip oriented upwards, erect, entire, obtuse to acuminate ................................................................. ***M. spicata***
1 Leaf solitary; lip oriented downwards, deflexed, 3-lobed (the central lobe smaller than the 2 lateral lobes).
2 Pedicels 3-5 (-5.8) mm long (even in plants with inflorescences over 80 mm long); basal lobes of the lip prominent, 0.75-1.1 mm long, usually 1.5-2 (-2.5)× as long as the apical lateral lobes and > 0.6× as long as the length from the base to the tip of the mid-lobe; inflorescences loosely flowered above, the lower flowers withering slowly ................................................................. ***M. bayardii***
2 Pedicels (4-) 5-10 (-13) mm long (and > 5 mm long in plants with inflorescences > 45 mm long); basal lobes of the lip not prominent, 0.4-1.1 mm long, mostly < 1.5× as long as the apical lateral lobes and < 0.6× as long as the length from the base to the tip of the mid-lobe; inflorescences densely flowered above, the lower flowers soon withering ................................................................. ***M. unifolia***

**Malaxis unifolia** Michaux, Green Adder's-mouth. Bogs, moist forested slopes, in the Sandhills in longleaf-oak-hickory forests. June-August. NL (Newfoundland) and FL west to MN, IA, MO, e. OK, and e. TX; also in Mexico, Cuba, the West Indies, and Central America. [= F, FNA, K, Z; < *M. unifolia* – RAB, C, G, GW, L, S, WH, WV, X (also see *M. bayardii*)]

**Mesadenus** Schlechter 1920

A genus of 7 species, of tropical and subtropical s. North America, West Indies, Central America, and South America. References: Ackerman in FNA (2002a); Correll (1950)=X.

**Mesadenus lucayanus** (Britton) Schlechter, Gray Ladies'-tresses. Shell middens, dry calcareous hammocks. Late December-March. Ne. FL (Duval County) south to s. FL; West Indies; e. Mexico and n. Central America. [= F, FNA, K, Z; < *Spiranthes polyantha* Reichenbach f. – L, WH] [add to genus key; add X to synonymy]

**Platanthera** L.C. Richard 1817 (Fringed Orchid, Fringeless Orchid)

A genus of about 200 species, largely of the temperate northern hemisphere, extending south into tropical Central America and tropical se. Asia. The recognition of *Gymnadeniopsis* as separate from *Platanthera* is uncertain at this time; originally named by Rydberg, its recognition was acknowledged as possibly warranted by Sheviak in FNA (2002a) and embraced by Brown (2006a).
Three of our species would belong to Gymnadeniopsis: *P. clavellata*, *P. integra*, and *P. nivea*. References: Sheviak in FNA (2002a); Correll (1950)–X; Reddoch & Reddoch (1993); Pridgeon et al. (1999b).

Identification Notes: Hybrids are frequent and are not keyed; they are generally intermediate in characters and are generally found in mixed populations of the two parents.

1. Lip entire, finely toothed, or eroded (neither fringed nor deeply divided into 3 lobes).
2. Leaves basal, 1 or 2, orbicular, (5-)8-25 cm wide, prostrate on the ground, the stem naked or with a few bladeless bracts..............*P. orbiculata*
3. Leaves cauline, 1-10 or more, mostly lanceolate, 1-5 cm wide, ascending, the stem with at least 1 (usually several) bladeless leaves.
4. Lip 11-15 mm long; spur mostly 40-50 mm long.............*P. integrilabia*
5. Lip 2-8 mm long; spur 4-23 mm long.
6. Large stem leaves usually 1, rarely 2, near the middle of the stem; raceme 2-9 cm long, 2-3.5 cm in diameter; lip without a tubercle on the upper surface near the base, also lacking lateral auricles near the base..............................*P. clavellata*
7. Lip 1-5 mm long; spur 5-10 mm long, about 1× as long as the ovary; lip descending and thence curved back towards the stem, narrowed at its base to a very short isthmus (the section between the base and the fringed portion); lip fringing short and relatively coarse; [of NL (Newfoundland) west to MI and IL, south to GA].
8. Lip segments deeply and compoundly lacerate; isthmus of the lip slender, about 4× as long as wide; spur 21-35 mm long, 2-3× as long as the lip, orifice round (the pollen sacs collectively close together); spur 12-20 mm long
9. Lip segments moderately to deeply fringed; isthmus of the lip stout, about 2× as long as wide; spur 20-26 mm long, ca. 1.25× as long as the lip; orifice round; flowering mid June-early July........................................................................*P. grandiflora*
10. Lip segments deeply and compoundly lacerate; isthmus of the lip slender, about 4× as long as wide; spur 21-35 mm long, 2-2.5× as long as the lip; orifice angled at top; flowering mid July-early August........................................................................*P. shriveri*

*Platanthera blephariglottis* (Willdenow) Lindley, Small White Fringed Orchid. See pages, sandhill-pocosin ecotones. July-September. NL (Newfoundland) west to MI and IL, south to GA. Following Brown (2006b), it seems best to recognize the two white-fringed orchids as separate species; they are morphologically distinctive, and where they co-occur their blooming time is offset. [= *Platanthera blephariglottis* (Willdenow) Lindley var. *blephariglottis* – FNA, K, L; < *Habenaria blephariglottis* (Willdenow) Hooker var. *blephariglottis* – RAB, X; < *Habenaria blephariglottis* var. *blephariglottis* – F (possibly misapplied); < *Habenaria blephariglottis* – GW; = *Blephariglottis blephariglottis* (Willdenow) Lindley – S (possibly misapplied); < *Platanthera blephariglottis* (Willdenow) Lindley – W; = *Blephariglottis albiflora* Raf.]

*Platanthera chapmanii* (Small) Luer, Chapman's Orange-fringed Orchid. Pine savannas. S. GA and n. FL; e. TX. Previously generally confused with the hybrid between *P. ciliaris × cristata* (F × *chapmanii*); see Folsom (1984) and Brown (2004) for details. [= FNA, K, WH; = *Blephariglottis chapmanii* Small – S] [synonymy incomplete]

*Platanthera ciliaris* (Linnaeus) Lindley, Yellow Fringed Orchid. Savannas, moist roadbanks, meadows, pastures, bogs. July-September. NH, MI, MO, and OK south to c. peninsular FL and TX. *P. ciliaris* is probably our most common and least habitat-specific *Platanthera*. [= FNA, K, L, W, WH; = *Habenaria ciliaris* (Linnaeus) R. Brown – RAB, C, F, G, GW, VW, X; = *Blephariglottis ciliaris* (Linnaeus) Rydberg – S]

*Platanthera clavellata* (Michaux) Luer, Small Green Wood Orchid. See pages, bogs, swamps, other wet places. June-September. NL (Newfoundland) and ND south to Panhandle FL and TX. [= FNA, K, L, W, WH; = *Habenaria clavellata* (Michaux)
Platanthera conspicua (Nash) P.M. Brown, Large White Fringed Orchid. Savannas, seepages, sandhill-pocosin ecotones. July-September. NC south to c. peninsular FL, west to TX. Brown (2006b) and Sheviak in FNA (2002a) clarify the taxonomy of this complex; previous studies (such as Hardin 1961) used different characters, and interpreted the white-fringed orchid taxa differently. (= Platanthera blephariglottis (Willdenow) Lindley var. conspicua (Nash) Luer – FNA, K, L, WH; < Habenaria blephariglottis (Willdenow) Hooker var. blephariglottis – RAB, X; = Habenaria blephariglottis var. conspicua (Nash) Ames – C, F; < Habenaria blephariglottis – GW; = Blephariglottis conspicua (Nash) Small – S)

Platanthera cristata (Michaux) Lindley, Crested Fringed Orchid, Golden Fringed Orchid. Savannas, bogs, moist roadsides. June-September. P. cristata is more limited to the Coastal Plain than the related P. ciliaris, ranging from s. MA south to FL and west to TX, and also inland in KY, TN, AR, SC, and NC. (= FNA, K, L, W, WH; = Habenaria cristata (Michaux) R. Brown – RAB, C, F, G, GW, X; = Blephariglottis cristata (Michaux) Rafinesque – S)

Platanthera flava (Linnaeus) Lindley var. flava, Southern Rein Orchid, Southern Gypsy-spike. Shaded wet places, such as swampy forests. March-September. VA, IN, IL, MO, and OK, south to c. peninsular FL and TX; remarkably disjunct in s. NS, where it occurs associated with other disjuncts from the Southeastern Coastal Plain. See Homoya (1993) for additional discussion of the two varieties of P. flava. (= FNA, K, L; = Habenaria flava (Linnaeus) R. Brown var. flava – RAB, C, F, G, X; < Habenaria flava – GW; > Perularia scutellata (Nuttall) Small – S; > Perularia bidentata (Elliot) Small – S)

Platanthera grandiflora (Bigelow) Lindley, Large Purple Fringed Orchid, Plume-royal. Bogs, seepages, moist places at high elevations. June-early July. NL (Newfoundland) and ON south to NJ, OH, and MI, and south in the mountains to w. NC and ne. GA. Blooming 3-4 weeks earlier than either P. psycodes and P. shriveri when they grow in proximity. If Orchis fimbriata Aiton is conspecific, the correct name is P. fimbriata (Aiton) Lindley. (< FNA, K, L, W; < Habenaria psycodes (Linnaeus) Sprengel var. grandiflora (Bigelow) A. Gray – RAB, C, G, X; < Habenaria fimbriata (Aiton) R. Brown – F, WV; < Blephariglottis grandiflora (Bigelow) Rydberg – S; = Platanthera fimbriata (Aiton) Lindley)

Platanthera integra (Nuttall) A. Gray ex Beck, Golden Fringeless Orchid, Yellow Fringeless Orchid. Savannas in the Coastal Plain, bogs in the Mountains and Piedmont. July-September. Essentially endemic to the Southeastern Coastal Plain, ranging from s. NJ south to FL and west to se. TX, with disjunct occurrences in TN (Eastern Highland Rim) and in bogs at low elevations of the Blue Ridge of NC. It is apparently now extirpated in the Mountains and Piedmont of NC. (= FNA, K, L, WH; = Habenaria integra (Nuttall) Sprengel – RAB, C, F, G, GW, X; = Gymnadeniopsis integra (Nuttall) Rydberg – S)

**Phalanthera leucophaea** (Nuttall) Lindley, Prairie Fringed Orchid. Damp calcareous meadows. May-July. ME west to NE, south to w. VA, nw. PA, c. OH, c. IN, IL, MO, and OK. [= FNA, K; = Habenaria leucophaea (Nuttall) A. Gray var. leucophaea – C; = Habenaria leucophaea (Nuttall) A. Gray – G, X; = Blephariglottis leucophaea (Nuttall) Farwell]

**Phalanthera nivea** (Nuttall) Luer, Snowy Orchid, Bog-spike. Wet savannas. May-September. Essentially a Southeastern Coastal Plain endemic, *P. nivea* ranges from s. NJ and DE (at least formerly) south to FL and west to TX, disjunct in Coffee County, TN (Eastern Highland Rim). This species is even more irregular than most *Phalanthera* in its flowering, whole populations sometimes not flowering for a number of years. The flowers are so white as to seem illuminated from within. This species was once locally abundant in the outer Coastal Plain of the Carolinas and further south; Correll (1950) describes "large colonies of this species which form a blanket of white over the landscape." Also see the picture in B.W. Wells' *Natural Gardens of North Carolina.* [= FNA, K, L; = Habenaria nivea (Nuttall) Sprengel – RAB, C, F, G, GW, WH, X; = Gymnadeniopsis nivea (Nuttall) Rydberg – S]

**Phalanthera orbiculata** (Pursh) Lindley, Large Round-leaved Orchid, Dinner-plate Orchid. Moist hardwood forests, especially over amphibolite. June-September. NL (Newfoundland) and NL (Labrador) west to AK, south to PA (and in the mountains to NC and TN), OH, IN, MN, SD, and OR. Reddoch & Reddoch (1993) have shown that *P. orbiculata* differs from *P. macrophylla* at the species level. Pollination is by night-flying moths, likely noctuids. [= FNA; = Habenaria orbiculata (Pursh) Lindley – RAB, WV; = Habenaria orbiculata var. orbiculata – C, F; < Habenaria orbiculata – G, W, X (also see *P. macrophylla*); = Platanthera orbiculata var. orbiculata – K, L; = Lysias orbiculata (Pursh) Rydberg – S]

**Phalanthera shriveri** P.M. Brown, Shriver’s Purple Fringed Orchid, Shriver’s Frilly Orchid. Seepages, northern hardwoods forests, roadbanks. Mid July-August. SW. PA south through e WV and w. VA to nw. NC. See Brown, Smith, & Shriver (2008) for additional information. [= FNA, K, L, W; < Habenaria psycodes (Linnaeus) Sprengel var. grandiflora (Bigelow) A. Gray – RAB, C, G, X; < Habenaria fimbriata (Aiton) R. Brown – F; < Blephariglottis grandiflora (Bigelow) Rydberg – S; = Blephariglottis shriveri (P.M. Brown) Baumback & Lökel]

**Platyzelys** Garay (Jug Orchid)

A genus of about 9 species, of the New World tropics and subtropics. References: Ackerman in FNA (2002a); Correll (1950)=X.

**Platyzelys querceticola** (Lindley) Garay, Jug Orchid. Wet hammocks and swamps. Late July-September. N. FL south to s. FL, west to AL(?), MS, and LA; Mexico; West Indies; Central America; South America. [= FNA, K; = Erythrodes querceticola (Lindley) Ames – L, X; = Physurus querceticola Lindley – S; ? P. latifolia (Linnaeus) Garay & Ormerod – WH] {add to genus key}

**Pogonia** Antoine Laurent de Jussieu 1789 (Rose Pogonia, Pogonia)

A genus of 3 species, of temperate e. North America and e. Asia. Cameron & Chase (1999) indicate that molecular analyses indicate that there may be merit in the traditional broad circumscription of *Pogonia* to include *Isotria* and N. American taxa of *Cleistes*; alternatively, North American "Cleistes" can be segregated as *Cleistesiopsis*, as done here. References: Catling & Sheviak in FNA (2002a); Correll (1950)=X.

**Pogonia ophioglossoides** (Linnaeus) Ker-Gawler, Rose Pogonia, Snakemouth, Beardflower, Ettercap, Addermouth. Savannas, bogs, especially in open peaty or gravelly situations. March-June. NL (Newfoundland) and MB south to s. FL and TX. [= RAB, C, FNA, G, GW, K, L, S, W, WH, WV, X; > P. ophioglossoides var. ophioglossoides – F]

**Ponthieva** R. Brown 1813 (Shadow Witch)

A genus of about 30-53 species, of tropical and warm temperate America. References: Ackerman in FNA (2002a); Pridgeon et al. (1999b); Correll (1950)=X.

**Ponthieva racemosa** (Walter) C. Mohr, Shadow Witch. Bottomlands, floodplains, moist ravines, nearly always over calcareous rock ("marl" or coquina limestone). September-October. Se. VA south to s. FL and west to se. TX; disjunct in the Eastern Highland Rim, TN, and south into Central and South America. The basal rosette of leaves, white (suffused with green) flowers in fall, and habitat are distinctive. [= RAB, C, F, FNA, G, GW, K, S, WH, X; = P. racemosa var. racemosa – L]
**ORCHIDACEAE**

**Pteroglossaspis** Reichenbach filius 1878 (Wild Coco)

A genus of 7-10 species, of s. North America, Cuba, Colombia, and tropical Africa (Romero-González in FNA 2002).

References: Romero-González in FNA (2002a); Correll (1950)=X.

**Identification notes:** The long (to 7 dm), plicate leaves are distinctive among our orchids. Small individuals can be mistaken for *Calopogon* when not in bloom. *Pteroglossaspis* differs, however, in having the stem covered from node to node by a succession of sheaths (vs. the sheaths much shorter) and in having the leaves 2-3 on a separate shoot emerging from the corm before the bloom-stalk (vs. leaf 1, on the bloom-stalk).

**Pteroglossaspis ecristata** (Fernald) Rolfe, Spiked Medusa, Smooth-lipped Eulophia. Mesic pinelands with blackjack oak, other sandhills and dry-mesic to mesic longleaf pinelands. June-September; July-November. Se. NC south to FL, west to LA; West Indies (Cuba). One of the rarest orchids in our region. [= FNA, K, WH; = *Eulophia ecristata* (Fernald) Ames – RAB, L, X; = *Triorchos ecristatus* (Fernald) Small – S]

**Sacoila** Rafinesque 1838

A genus of ca. 10 species, of the tropics and subtropics. References: Brown & Catling in FNA (2002); Correll (1950)=X.

**Sacoila lanceolata** (Aublet) Garay var. *lanceolata*. Pine flatwoods, road shoulders. April-June. Ne. and Panhandle FL south to s. FL; West Indies, Mexico, Central America, South America. [= FNA, WH; = *Stenorrhynchos lanceolata* (Aublet) L.C. Rich var. *lanceolata* – K; = *Spiranthes lanceolata* (Aublet) Léon var. *lanceolata* – L; < *Stenorrhynchos orchisoides* (Swartz) L.C. Richard – S] {add to genus key; add X to synonymy}

**Spiranthes** L.C. Richard 1817 (Ladies'-tresses, Pearl-twist, Spiral Orchid)

A genus of about 30-40 species, mainly north temperate, but with species scattered in other areas. The *Spiranthes* flora of our region is still rather poorly understood, and the treatment here will undoubtedly change further. References: Sheviak & Brown in FNA (2002a); Luer (1975); Sheviak (1991); Pridgeon et al. (1999c). Key adapted largely from Sheviak & Brown in FNA (2002a); Correll (1950)=X. [also see *Sacoila*]

**Identification notes:** Flowering plants are necessary for identification of the species.

1 Rachis of inflorescence with all hairs not glandular, tapering to a pointed tip; [flowering March-September] .................................................. S. vernalis
2 Rachis of inflorescence either glabrous or with some or all hairs gland-tipped, capitate or clavate.
3  Lip bright yellow or orange-yellow, with greenish veins; sepals and petals pure white; [flowering May-July] .................................................. S. lucida
4  Lip either white, or lip yellowish and lacking greenish veins; sepals and petals creamy, ivory, yellow, or greenish; [collectively flowering February-December].
5  Rachis glabrous; flowers gaping from near middle, the tubular portion < 3 mm long; lip pure white; [flowering June-September] ...... .......................................................... S. tuberosa
6  Rachis pubescent or glabrous; flowers gaping only from beyond the middle, the tubular portion > 3 mm long; lip white, creamy, yellow, or centrally green; [collectively flowering February-December].
7  Inflorescence with 3 or 4 flowers per cycle of spiral, the spiral usually tight and obscure, but then with 3 or 4 secondary ranks of flowers evident; [collectively flowering August-December]

**Key A**

1 Petals ca. 6 mm long; lower portion of stem with recurved-spreading leaves
2 Rostellum and viscidium absent; sepals 3.5-5 mm long .......................................................... S. ovalis var. erostellata
2 Rostellum and viscidium present; sepals 4-6.1 mm long.......................................................... S. ovalis var. ovalis
1 Petals 7.5 mm long or longer; leaves wholly basal, or lower portion of stem with recurved-spreadimg blades, or leaves absent at flowering.
3 Lip only slightly or not at all differentiated from the petals; buds often failing to open (but setting seed through agamospermy); column normal, or abnormal or aborted; leaves usually absent at flowering......................................................... S. cernua
4 Basal callus of the lip relatively short and conic, a wide as high, and usually < 1 mm long; lateral sepals free and spreading, often over the top of the flower; leaves absent at flowering; [of dry calcareous barrens of the Ridge and Valley and westward, in the Ridge and Valley of sw. VA and nw. GA, and westward] .......................................................... S. magnicamporum
4 Basal callus of the lip 1-2 mm long; lateral sepals more or less appressed (very rarely spreading over the top of the flower); leaves present at flowering; [of various dry to wet sites, collectively widespread in our area].
5 Upper margin of the lateral sepals obviously separated from the adjacent margin of the dorsal sepal, the separation abrupt at the base (commonly by about 1 mm); lip strongly curving from the claw (the resulting angle 20-60 degrees), cuneate at the base; perianth creamy, yellowish, or greenish white; [of upland, dry to mesic sites] ..................................................... S. ochroleuca
5 Upper margin of the lateral sepals touching (or nearly so) the adjacent margin of the dorsal sepal, or only gradually separated with distance from the base; lip not strongly curving from the claw (angle < 30 degrees), cordate to truncate at the base; perianth white to creamy or ivory, the center of the lip ivory to pale yellowish or rarely greenish; [primarily of wet sites, such as bogs, fens, marshes, bottomland swamps].
6 Plants to about 30 cm tall, not colonial; leaves comparatively slender, flaccid-membranaceous with thickened midrib, the peridiole of the basal leaves < 6 mm wide; leaves wholly basal or the lower sheaths with ascending-spreadimg blades; perianth usually 8-11 mm long; lip membranaceous to fleshy, < 7 mm long; [widely spread in our area].
7 Lateral sepals spreading to appressed, not widely diverging, 3.8-10 mm long; lip ovate to oblong-quadrate, lacking a distinct basal dilation; [flowering late November-December} .......................................................... S. longilabris
7 Lateral sepals spreading to appressed, not widely diverging, 3.8-10 mm long; lip ovate to oblong-quadratet, lacking a distinct basal dilation, white or creamy centrally; inflorescence usually with several spiral cycles (rarely nearly secund); [flowering February-November].
8 Lip with lacerate-dentate tip; leaves usually linear, > 30° as long as wide, persistent and present at flowering; [flowering May-August].
9 Lip with undulate to crisped tip; leaves lanceolate to ovate or obovate, < 30° as long as wide, either persistent and present at flowering, or withering prior to flowering.
10 Plants comparatively large and stout, the perianth 5-10 mm long, white to yellowish, the lip often darker centrally but not green or greenish yellow; leaves ascending, relatively slender, not ovate or obovate, present at flowering; rachis conspicuously and densely glandular-pubescent; [flowering August-November].
11 Flowers comparatively large and stout, the perianth 5-10 mm long, leaves strictly basal, spreading and ovate or obovate; rachis glabrous or densely but minutely glandular-pubescent; [flowering February-September].
12 Rachis densely pubescent; flowers yellowish to pale greenish yellow, the lip centrally yellow; [flowering February-April]; [of s. SC southward and westward] ......................................................................................................................................................... S. brevilabris
13 Rachis densely pubescent; flowers yellowish to pale greenish yellow, the lip centrally yellow; [flowering February-September]; [collectively widespread in our area].
14 Flowers yellowish to pale greenish yellow; lip yellow centrally .......................................................... S. floridana
15 Flowers white, lip green centrally.
16 Leaves oblanceolate, withering at anthesis; lateral sepals spatulate, green at base; flowering February-May................. .. S. eatonii
16 Leaves ovate to obovate or elliptic, spreading, present or absent at anthesis; lateral sepals acuminate, white throughout; flowering July-September.
17 Flowers densely arranged on the spike (ratio of spike length in mm: flower number < 2.3); entire plant essentially glabrous; leaves usually absent at anthesis; [flowering earlier, mostly July] ..................................................... S. lacera var. gracilis
18 Flowers laxly arranged on spike (ratio of spike length in mm: flower number = or > 2.3); inflorescence capitately-pubescent; leaves usually persisting through anthesis; [flowering later, mostly August-September] ............................................ S. lacera var. lacerca

_Spiranthus brevilabris_ Lindley, Short-lipped Ladies’-tresses. Pine savannas. Late February-April. Se. SC south to s. FL, west to se. TX. [= FNA, K, WH; = S. gracilis (Bigelow) Beck var. brevilabris (Lindley) Correll – GW; = S. brevilabris Lindley var. brevilabris – L] 

_Spiranthus floridana_ (Wherry) Cory, Florida Ladies’-tresses. Wet savannas, other moist sites. April-May. A Southeastern Coastal Plain endemic: se. NC south to c. peninsular FL and west to TX, a Southeastern Coastal Plain endemic. [= FNA, K, WH; = S. brevilabris Lindley var. floridana (Wherry) Luer – L; = S. gracilis (Bigelow) Beck var. floridana (Wherry) Correll – RAB, GW, X; = _Ibidium floridanum_ Wherry – S] 

_Spiranthus lacerca_ (Rafinesque) Rafinesque var. gracilis (Bigelow) Luer, Southern Slender Ladies’-tresses. Fields, meadows, pastures, woodlands. August-September. NS, MI, WI, and KS south to GA and TX. [= C, FNA, K, L, W; = S. gracilis
**Spiranthes lacinia** (Small) Ames, Lace-lip Ladies'-tresses. Pond cypress depressions and savannas, swamps. May-August. A Southeastern Coastal plain endemic: NJ south to s. FL and west to se. TX. [= RAB, C, FNA, K, L, WH, X; = S. lacera – F, GW; = Ibidium laciniatum (Small) House – S]

**Spiranthes longilabris** Lindley, Giant Spiral Orchid. Wet pine savannas. Late October-December. A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to e. TX. [= RAB, FNA, GW, K, L, WH, X; = Ibidium longilabre (Lindley) House – S]

**Spiranthes lucida** (H.H. Eaton) Ames, Shining Ladies'-tresses. Sunny seepage over amphibolite or other basic rock, moist banks and shores. June. Widespread in ne. United States, south to NC, e. TN, sc. TN (Chester et al. 1993), c. AL, MO, and KS. The species was reported for NC by Fernald (1950) and by Small (1933), but was not treated by RAB; its occurrence in NC was verified in 1992 by its discovery in a seepage area in Ashe County. [= F, FNA, G, K, L, W, WV, X; = Ibidium plantagineum (Rafinesque) House – S]

**Spiranthes lucerna** Sheviak, Great Plains Ladies'-tresses. Grassy barrens and glades over limestone. Primarily in the Great Plains, from ND south to TX, east (often as widely disjunct populations) to sw. ON, se. PA, sw. VA (Ludwig 1999), KY, w. TN (Jones 2006), and nw. GA. [= C, FNA, K, L; < S. cernua – G; < S. cernua var. cernua – F, X]

**Spiranthes magnicamporum** Sheviak, Giant Spiral Orchid. Wet pine savannas. Late October-December. A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to se. TX. [= RAB, FNA, GW, K, L, X; = Ibidium magnicamporum (Sheviak) Rydberg – S]

**Spiranthes ovalis** Lindley var. erostellata Catling, Oval Ladies'-tresses. Swamp forests, bottomland forests, hammocks, ravine forests. August-November. Var. erostellata is fairly widespread in se. North America, ranging from sc. PA, MI, and IL south to Panhandle FL, s. MS, and s. LA. Var. ovalis is limited to AR, LA, and TX, differing in having a viscidium and rostellum. See Catling (1983b) for further information about this variety and its biology. [= C, FNA, K, W, WH; < S. ovalis – RAB, F, G, GW, L, WH, X; = Ibidium ovalae (Lindley) House – S; ? S. montana Rafinesque]

**Spiranthes ovalis** Lindley var. ovalis. Oval Ladies'-tresses. Swamp forests, mesic ravines. October-November. GA, TN, AR, and TX, south to n. peninsular FL and LA. [= FNA, K, WH; < S. ovalis – GW, L, X; = Ibidium ovalae (Lindley) House – S]

**Spiranthes praecox** (Walter) S. Watson, Grass-leaved Ladies'-tresses, Giant Ladies'-tresses. Savannas, swamps, bogs. March-July. A Southeastern Coastal Plain endemic: NJ south to s. FL and west to TX. [= WH; < S. praecox – RAB, C, F, FNA, G, GW, K, L, W, X (also see S. sylvatica); < Ibidium praecox (Walter) House – S (also see S. sylvatica)]

**Spiranthes sylvatica** P.M. Brown, Woodland Ladies'-tresses, Pale Green Ladies'-tresses. Live oak hammocks, other woodlands. Late March-early May. VA south to c. peninsular FL, west to e. TX. [= WH; < S. praecox – RAB, C, F, FNA, G, GW, K, L, X; = Ibidium praecox (Walter) House – S]

**Spiranthes vernalis** Engelmann & A. Gray, Spring Ladies'-tresses. Savannas, bogs, marshes, fairly dry fields. March-July (early September in the mountains). MA to s. FL, and west to TX and SD, also in Mexico and Central America. [= RAB, C, F, FNA, G, GW, K, L, WH, X; = Ibidium vernalume (Engelmann & A. Gray) House – S]
**Tipularia** Nuttall 1818 (Cranefly Orchid)

A genus of 3 species; the other species of the genus are e. Asian (1 in Japan and 1 in the Himalayas) (Catling & Sheviak in FNA 2002). References: Catling & Sheviak in FNA (2002a); Correll (1950)=X.

Identification notes: The leaves are present during the winter, withering before the flowering stalk appears, the plant thus occasionally mistaken for one of the saprophytic orchids. The leaves are usually purple underneath, a characteristic shared with *Aplectrum*, but *Tipularia* leaves are ovate, < 10 cm long, and are not notably plicate along the veins (vs. *Aplectrum*, with leaves narrowly elliptic, 10-20 cm long, and notably plicate along the very prominent, white, cartilaginous veins).

*Tipularia discolor* (Pursh) Nuttall, Cranefly Orchid. In a wide variety of mesic to rather dry forests. July-September. Se. MA, s. NY, OH, IN, and s. MI south to n. peninsular FL and TX. Along with *Goodyera pubescens*, *Tipularia* is one of the commonest orchids in e. North America. [= RAB, F, FNA, G, K, L, W, WH, WV, X; = T. unifolia (Muhlenberg) Britton, Sterns, & Poggenburg – S]

**Triphora** Nuttall 1818 (Three Birds Orchid)

A genus of about 25 species, of e. North America, the West Indies, and Central and South America (Medley in FNA 2002). References: Medley in FNA (2002a); Brown & Pike (2006)=Z; Correll (1950)=X.

1 Flowers yellow, erect, not opening fully, the lip uppermost ............................................................... *T. rickettii
1 Flowers pink to white, nodding, opening fully, the lip lowermost .................................................... *T. trianthophoros

**Triphora rickettii** Luer. Upland hardwood hammocks. Late July-August. Ne. FL (Columbia County) south into wc. Peninsular FL. Sometimes treated as a disjunct component of the Mexican *T. yucatanensis*. [= L, WH, X; < *Triphora yucatanensis* Ames – FNA, K]

**Triphora trianthophoros** (Swartz) Rydberg var. *trianthophoros*, Three Birds Orchid, Nodding Pogonia, Nodding Ettercap. Humid forests and swamps, rhododendron thickets, especially on rotten logs or on humus. July-September. The species is widespread (but scattered) in e. North America, and south into Central America. Var. *trianthophoros* occurs from ME and ON west to WI, south to c. peninsular FL and e. TX; disjunct in nc. Mexico; var. *mexicana* (S. Watson) P.M. Brown occurs from Mexico south to Central America. The recently named var. *texensis* P.M. Brown & R.B. Pike needs additional evaluation. The flowers are extremely ephemeral, making the species very difficult to locate. The correct spelling of the epithet is “trianthophoros.” [= *Triphora trianthophora* (Swartz) Rydberg var. *trianthophora* – Z, orthographic variant; = *T. trianthophora* ssp. *trianthophora* – FNA, orthographic variant; < *T. trianthophora* – RAB, F, G, GW, K, L, S, W, WV, X; < *T. trianthophoros* – WH]

**Zeuxine** Lindley 1826 (Soldier Orchid)

A genus of about 26 species, of tropical and subtropical Old World (introduced elsewhere). References: Ackerman in FNA (2002a); Correll (1950)=X.

* Zeuxine strateumatica (Linnaeus) Schlechter, Lawn Orchid, Soldier Orchid. Lawns; native of Asia. [= FNA, GW, K, L, WH] {add X to synonymy}
A family of about 7-9 genera and 100-220 species, herbs, subcosmopolitan (though not well distributed in the northern hemisphere of the Old World, and especially diverse in South Africa). The recognition of Hypoxidaceae at the family level is supported by a variety of authors, on morphologic and molecular grounds (see Judd 2000 for summary). References: Nordal in Kubitzki (1998a); Herndon in FNA (2002a); Judd (2000).

**Hypoxis Linnaeus 1759 (Stargrass)**

| 1 Leaves glabrous, or with a few trichomes near the base; seeds black. | H. curtissii Rose in Small, Swamp Stargrass. Swamp forests, alluvial forests, water courses, wet hammocks. March-June; May-July. E. NC south to e. peninsular FL, west to e. TX. [= FNA, K, WH, Z; = H. hirsuta (Linnaeus) Coville var. leptocarpa (Engelmann & A. Gray) Fernald – RAB; < H. curtissii – C, G; = H. leptocarpa (Engelmann & A. Gray) Small – GW, S].
| 2 Leaves filiform, 0.3-1.2 mm wide, stiff; seeds pebbled (the exposed portion of each cell rounded); floral bracts 1-7 (-12) mm, > 2× as long as the pedicels; ovaries densely pubescent; [of Coastal Plain pinelands] H. juncea |
| 3 Leaves over 2 mm wide, soft and flexible; seeds coarsely muricate (the exposed portion of each cell pointed-conical); floral bracts (1-) 2-20 (-80) mm; ovaries sparsely to densely pubescent; [collectively widespread]. | H. rigida Chapman, Savanna Stargrass. Wet pine savannas. April (-later, especially in response to fire); May-June. (= H. hirsuta var. hirsuta – C, G, K] |
| 4 Pedicels usually >2× as long as the bracts; seeds black; [collectively widespread]. | H. sessilis Linnaeus, Glossy-seed Stargrass. Wet pine savannas. April-May (-later, especially in response to fire); May-June. (= H. longii Fernald – C, F, G; > H. sessilis – C, F, G] |
| 5 Leaves flattened, > 1 mm wide; seeds coarsely muricate (the exposed portion of each cell pointed-conical); [widespread] H. sessilis |
| 6 Anthers < 2 mm long; tepals longer than the pedicels; floral bracts longer than the pedicels; seeds black, pebbled with round pebbling (the exposed portion of each cell rounded). | H. rigida |
| 7 Tepals 1.5-2× as long as ovaries; seed coats iridescent ............................................................................................................. H. hirsuta var. hirsuta – RAB; < H. hirsuta – C, G, K] |
| 7 Tepals 1.5-2× as long as ovaries; seed coats not iridescent ............................................................................................................. H. hirsuta var. hirsuta – RAB; < H. hirsuta – C, G, K] |

71. IRIDACEAE A.L. de Jussieu 1789 (Iris Family) [in ASPARAGALES]
IRIDACEAE

1 Inflorescence an umbellate 1-sided cyme; plants from rhizomes or bulbs; flowers actinomorphic.

4 Leaves planar; plants from rhizomes (or indistinct) or a bulb (in Iris xiphium).

5 Style branches broad, petaloid, terminating in paired crests .................................................. Iris

5 Style branches not broad or petaloid.

6 Tepals 16-35 mm long, orange or red; seeds 4-6 mm in diameter........................................... Iris domestica

6 Tepals 6-15 mm long, blue, purple, lavender, pink, magenta, white, or yellowish-white; seeds 0.6-1.3 mm in diameter ................. Sisyrinchium

4 Leaves plicate; plants from bulbs.

7 Tepals unequal, the inner whorl < ½ as long as the outer whorl ................................................... Herbertia

7 Tepals nearly equal in length.

8 Style recurved, with 3 flat branches that are < 2 mm long ...................................................... Calydorea

8 Style straight, each of the 3 branches further divided into slender lobes

9 Style branches divided for ca. ½ their length; style arms arching over or between the anthers; tepals dark purple .......... Alophia

9 Style branches divided nearly to base; style arms extending horizontally between the anthers; tepals blue, white in the center ...... Nemastylis

Alophia Herbert (Propellor-flower)

Alophia drummondii (Graham) R.C. Foster, Propellor-flower. E. LA (and MS?) west to TX and OK; Mexico; Guyana. [= FNA, K; = Herbertia drummondii (Graham) Small]

Calydorea Herbert 1843 (Ixia)

A genus of about 8 species, of warm temperate and tropical America. The circumscription relative to Nemastylis is uncertain. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

Calydorea coelestina (Bartram) Goldblatt & Henrich, Bartram's Ixia. Pine flatwoods. Endemic to ne. FL (Chafin 2000); the single GA record is by P.O. Schallert, notoriously sloppy with his location data, and is therefore best discounted unless additional information comes to light. [= FNA, K; = Salpingostylis coelestina (Bartram) Small – S; = C. caelestina – WH, orthographic variant; = Nemastylis coelestina (Bartram) Nuttall; = Sphenostigma coelestinum (Bartram) R.C. Foster; = Ixia coelestina Bartram]

Crocosmia Planchon 1851 (Montbretia)

A genus of 8-9 species, herbs, native of sub-Saharan Africa. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Dunlop (2004); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

* Crocosmia ×crocosmiiflora (V. Lemoine) N.E. Brown [C. aurea × pottsii], Montbretia. Disturbed areas, ditches, especially in moist to wet sites, including salt marshes; the parents of the hybrid both native to sub-Saharan Africa. Late June-July. Reported for Lowndes and Thomas counties, GA (Carter, Baker, & Morris 2009). [= FNA, K, WH; = C. ×crocosmiflora – RAB, orthographic variant]

Crocus Linnaeus 1753 (Crocus)

* Crocus tomasinianus Herbert, Woodland Crocus. Disturbed areas, long-persistent after cultivation around house-sites. Reported as rarely naturalizing in DE (McAvoy & Bennett 2001). {not yet keyed}

Crocus vernus (Linnaeus) Hill, Dutch Crocus. Disturbed areas, long-persistent after cultivation around house-sites. [= K] {not yet keyed}

Freesia Ekloen ex Klatt 1865 (Freesia)

A genus of about 255 species, largely of Africa. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Rudall in Kubitzki (1998a). Key based on FNA.

1 Inner tepals 60-70 mm long ................................................................. G. ×gandavensis
1 Inner tepals < 60 mm long.
2 Tepals white, cream, orange, or red; perianth tube plus dorsal sepal 60-95 mm long ............................................. G. dalenii ssp. dalenii
2 Tepals pink, reddish, or light purple, with white markings on the outer 3 tepals.
3 Anthers 10-13 mm long; capsules oblong, 18-24 mm long; seeds winged ..................................................... G. communis
3 Anthers ca. 15 mm long; capsules globose, 10-12 mm long; seeds not winged ........................................... G. italicus

* Gladiolus dalenii Van Geel ssp. dalenii. Sometimes cultivated, rarely persisting or spreading; native of s. Africa. Introduced in AL and LA. [= FNA]

* Gladiolus ×gandavensis Van Houtte [G. dalenii × oppositiflorus]. Commonly cultivated as ornamentals, rarely persisting or weakly spreading, native of s. Africa. Goldblatt suggests that as many as 5 species are involved in the origin of the large-flowered garden gladiolus. [= RAB, FNA, K, WH; > G. hortulanus L.H. Bailey – S; > G. dalenii Van Geel]

* Gladiolus italicus P. Miller. Sometimes cultivated, rarely persisting or spreading; native of Eurasia. Introduced in TN. [= FNA, K; > G. segetum Ker-Gawler – S]

Herbertia Sweet 1827 (Pleat-leaf Iris)

Herbertia lahue (Molina) Goldblatt, Prairie-nymph. Prairies and marshes. AL and FL west to TX; central South America. [= FNA, WH; > H. lahue ssp. caerulea (Herbert) Goldblatt – K; > H. caerulea Herbert – S]

Iris Linnaeus 1753 (Iris, Flag, Blackberry-lily)

Identification notes: the petals are usually erect, smaller than the petaloid sepals (which are brightly colored, generally reflexed, and marked with a "signal"). The styles are also petaloid, arched over the sepals, and 2-cleft at the tip (except in I. domestica).

1 Plant from an ovoid bulb; [subgenus Xiphium] ................................................................. I. xiphium
1 Plant from short to elongate rhizomes.
2 Style branches not broad, petaloid, or crested; seeds black, shiny, in a blackberry-like cluster (the seeds exposed at maturity by dehiscence of the papery to chartaceous capsule walls) ..................................................................................... I. domestica
2 Style branches broad, petaloid, terminating in paired crests; seeds tan to brown, in a capsule.
3 Sepal "signal" (see above) of multicellular hairs (the "beard"), along the midrib of the claw and the base of the blade; [subgenus Iris].
4 Spathes green (or purplish) and herbaceous, with scarious margins ..................................................... I. germanica
4 Spathes scarious, silvery-white ................................................................................... I. pallida
IRIDACEAE

3 Sepal "signal" consisting of contrasting color, ridges, small unicellular hairs, and/or a cockskel-like crest; [subgenus Limniris].
5 Rhizome branches cordon-like, with scale-like leaves, enlarging at the apex to produce vegetative leaves, additional branches, and flowering stems.
6 Stems 30-80 cm tall; leaves 30-60 cm long, 0.2-0.7 cm wide; cordlike portions of rhizomes to 4 dm long; [of wetlands]; [section Linniris, series Prismaticae]..........................I. prismatica

IRIS

1 Stems 2-15 cm tall; leaves 10-45 cm long, 0.3-2.5 cm wide; cordlike portions of rhizomes to 2 dm long; [of dry to mesic uplands].
7 Sepals not crested; leaves 3-13 mm wide, blue-green, straight or nearly so; flowers strongly fragrant; rhizomes deeply buried (not easily "pulled" out); [generally of dry and acid soils]; [section Limniris, series Versica]........................................................................I. cristata

IRIS fulva*

* Iris fulva

IRIS

1 Stems 4-10 dm tall, usually with 1-2 well-developed branches; capsule 4-7 cm long......................I. virginica var. virginica

IRIS

1 Perianth dull copper or orange-brown (or dark yellow) (fading in nature or drying in the herbarium to a bluish or purplish color); petals spreading or declining.........................I. fulva

IRIS

1 Petals 1-2 cm long; [section Linniris; series Tripetalae]..................................................................................I. tridentata

IRIS

1 Petals 2-9.5 cm long.
10 Stems slender; [section Lophiris; series Sibirica]..................................................................................I. pseudacorus

IRIS

11 Spathe scarious at flowering time; capsule 2-3.5 cm long.................................................................I. sibirica

IRIS

12 Capsules 3-angled or nearly round in cross-section; [section Linniris; series Laevigatae].
13 Perianth yellow..........................................................I. pseudacorus

IRIS

13 Perianth blue-violet (rarely white).
14 Flowers 8-15 cm in diameter; leaves 0.5-1.5 cm wide; [alien, cultivated, rarely escaped]......................I. ensata

IRIS

14 Flowers 6-8 cm in diameter; leaves 1-4 cm wide; [native].
15 "Signal" a greenish-yellow, papillate patch, surrounded by an area of heavily veined purple-on-white; [of VA northward]..........................................................I. versicolor

IRIS

15 "Signal" a bright yellow, pubescent patch.
16 Plants to 10 dm tall, usually with 1-2 well-developed branches; capsule 7-11 cm long..............I. virginica var. shrevei

IRIS

16 Plants to 6 dm tall, little or not at all branched; capsule 4-7 cm long..............................I. virginica var. virginica

IRIS

19 Capsules 2.5-3.5 cm long, hexagonal in cross-section, 3 sides flat, the alternating sides with 2 rounded ridges separated by a shallow groove .................I. hexagona

IRIS

20 Capsules 6-10 cm long, slightly to strongly hexagonal in cross-section.
20 Capsules with 6 broad rounded lobes, dehiscent..........................................................I. giganticaerulea

IRIS

20 Capsules with 6 sharp, winglike ridges, dehiscent..........................................................I. savannarum

IRIS

Iris brevicaulis

IRIS cristata

Aiton, Dwarf Crested Iris. Moist forests, rich woods, roadbanks. April-May; June-July. MD west to IN and MO, south to NC, AL, MS, AR, and e. OK. [= RAB, C, F, FNA, G, K, W, WV; = Neubeckia cristata (Aiton) Alefani – S]

* Iris domestica

* Iris ensata

Thunberg, Japanese Iris. Roadsides; cultivated and rarely escaped, native of Japan, n. China, and Sakhalin. Also reported from se. PA (Rhodes & Klein 1993). [= K; I. kaempferi Siebold ex Lamark]

IRIS fulva

* Iris germanica

Linnaeus, German Iris, Fleur-de-Lys. Roadsides, old homesites, ditches; cultivated and rarely persistent or escaped, native of Europe. April-May. [= RAB, C, F, FNA, G; > I. flavescens Delile – K; > I. ×germanica – K]

IRIS giganticaerulea

**Iris hexagona** Walter, Anglepod Blue Flag. Swamps. May-June. SC south to s. FL. [= RAB, FNA, GW, S, WH; = *I. hexagona* var. *hexagona* – K; > *I. hexagona* – S]

* Iris pallida* Lamarck in J. Lamarck et al., Sweet Iris. Cultivated and persistent around buildings in GA and elsewhere (FNA). [= F, FNA, K]

**Iris prismatica** Pursh ex Ker-Gawler, Slender Blue Iris, Slender Blue Flag. Bogs and marshes. May-June; June-July. NS south to GA, disjunct in w. NC (Henderson County) and sc. TN (Coffee County). [= RAB, C, FNA, G, GW, K, S, W; > *I. prismatica* var. *prismatica* – F; > *I. prismatica* var. *austrina* Fernald – F]

* Iris sanguinea* Hornemann ex Donn, Japanese Iris. Roadsides, cultivated and rarely escaped; native of Japan, n. China, Korea, Japan, and w. Russia. [= K]

* Iris savannarum* Small. [habitat]. GA and AL south to s. FL. [= FNA, S; = *I. hexagona* Walter var. *savannarum* (Small) R.C. Foster – K; > *I. kimballiae* Small – S; > *I. alabamensis* Small – S]

* Iris sibirica* Linnaeus, Siberian Iris. Cultivated and escaping or persisting near plantings; native of Eurasia (c. and e. Europe west to Lake Baikal). [= FNA, K]

**Iris verna** Linnaeus var. *smalliana* Fernald ex M.E. Edward, Upland Dwarf Iris. Dry, rocky or sandy woodlands and forests. April-May; June-early August. Sc. PA and WV south to w. NC, e. TN, n. GA, se. GA, Panhandle FL, and AL. [= RAB, F, FNA, K, W, WH, WV; > *I. verna* – C, G; < *Neubeckia verna* (Linnaeus) Alefani – S]

**Iris verna** Linnaeus var. *verna*, Coastal Plain Dwarf Iris, Sandhill Iris. Longleaf pine sandhills, dry, rocky forests and woodlands. March-May; May-June. MD south to se. SC and e. GA, primarily on the Coastal Plain, but extending into the Piedmont. [= RAB, F, FNA, K; < *I. verna* – C, G; < *Neubeckia verna* (Linnaeus) Alefani – S]

**Iris versicolor** Linnaeus, Northern Blue Flag, Poison Flag. Marshes, swamps, shores. May-July. Reported as occurring as far south as VA in C, F, and W. [= C, FNA, G, K, S?, W]

**Iris virginica** Linnaeus var. *virginica*, Southern Blue Flag. Marshes, swamps, streams. April-May; July-September. Se. VA south to c. peninsular FL, west to e. TX, north in the interior to w. TN; disjunct in sc. TN. [= C, F, K; < *I. virginica* – RAB, FNA, W; > *I. virginica* – G, S]

* Iris xiphium* Linnaeus, Spanish Iris. Disturbed areas; native of Spain and Portugal. [= K]

**Nemastylis** Nuttall 1835 (Celestial-lily)

A genus of about 5 species, herbs, of s. North America and Central America. The circumscription relative to *Calydorea* is uncertain. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

**Nemastylis geminiflora** Nuttall, Prairie Celestial, Prairie Pleatleaf. Prairies. MO and e. KS south to w. LA and TX; disjunct eastward in AL and MS. [= FNA, K; *Ixia acuta* Bartram; *Nemastylis acuta* Herbert]
IRIDACEAE

Sisyrinchium Linnaeus 1753 (Blue-eyed-grass, Irisette) by A.S. Weakley & B.A. Sorrie

A genus of about 80 species, herbs, of the Americas. Sisyrinchium is a very difficult genus, with a number of taxonomic questions remaining in our area. References: Cholewa & Henderson in FNA (2002a); Hornberger (1991)=Y; Bicknell (1896, 1899a, 1899b); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

Identification notes: For fully successful identification, it is necessary to collect underground parts; fibrous remains of leaves, and rhizomes (if any), are critical characters.

1 Perianth with tepals campanulate basally, flaring distally; annual; plants usually <2 dm tall; tepals lavender, pink, white, magenta, or yellow, and rhizomes (if any), are critical characters. For fully successful identification, it is necessary to collect underground parts; fibrous remains of leaves, and rhizomes (if any), are critical characters.  

2 Stems with 3-6 nodes; tepals yellow basally; mature capsules broadly fusiform or elliptical, uniformly light brown; [of MS to TX]..............  

S. minus

2 Stems with 1-2(-3) nodes; tepals with maroon blaze near base; mature capsules globose, tan with purple sutures; [widespread] ..............  

S. rosulatum

1 Perianth with tepals abruptly spreading in a plane; perennial, plants usually >2 dm tall; tepals blue, violet, or white.  

3 Inflorescences paired (each inflorescence composed of 1-5 flowers, their pedicels emanating from within 2 chartaceous scales; thus, there are 2 pairs of scales within the 2 outer, leaflike, green spathe bracts); outer spathe bract connate 0-1 mm.  

4 Stems 1.3-3.4 mm wide, obviously winged; base of plant without fibrous remains of leaves; [of the Piedmont and Mountains]..............  

S. albidum

4 Stems 0.5-1.0 mm wide, wiry, not or scarcely winged; base of plant with numerous fibrous remains of leaves; [of the Coastal Plain].....  

S. capillare

3 Inflorescences solitary, not paired (within the 2 green spathe bracts there is only one pair of chartaceous scales); outer spathe bract connate 2-6 mm (except 0-1 mm in S. campestre).

5 Stems simple, unbranched (rarely branched).  

6 Spathes bracts connate 0-1 mm..................................................S. campestre

6 Spathes bracts connate >1 mm.  

7 Base of plant with fibrous remains of leaves................................S. sagittiferum

7 Base of plant without fibrous remains of leaves  

8 Spathes bracts equal or subequal, outer bract up to 4.2 mm longer than inner; [coastal sw LA-s TX]...........................S. biforme

8 Spathes bracts distinctly unequal, outer usually >6 mm longer than inner; [southern Appalachians and northward].  

9 Stems (1.5-)2-4 mm wide, obviously winged; spathe bracts green, rarely purplish; capsules 4-6.8 mm long; [northern, extending south to n. VA].................................S. montanum

9 Stems 1-2 mm wide, narrowly winged; spathe bracts purple on margins at least (often throughout); capsules 3.2-5.5 mm long; [northern, extending south to GA and e. AL]........................................S. mucronatum

5 Stems branched, with 1-5 nodes.  

10 Stems with 2-5 nodes, the branching dichotomous; tepals white, recurved at maturity; [of escarpment region of sw. NC and nw. SC].  

S. dichotomum

10 Stems with 1-3 nodes, the branching uneven; tepals blue to violet, oriented in a plane; collectively widespread.

11 Plant bases with fibrous remains of leaves (usually abundant).  

12 Main stems 0.5-2.1 mm wide (usually <2 mm wide).  

13 Stems mostly 1.5-2.1 mm wide, scabrous; plants drying dark brown or blackish; spathe bracts 15-20(25) mm long............S. fuscatum

13 Stems 0.5-1.2 mm wide, not scabrous; plants drying pale brown or greenish brown; spathe bracts 12-14(15) mm long .......S. rufipes

12 Main stems 1.5-6 mm wide (usually >2 mm wide).  

14 Stems and leaves shiny, especially in life; stems mostly 3-6 mm wide; mature capsules mostly 5.5-8 mm long; [of FL and sw. GA]..........................................................S. xerophyllum

14 Stems and leaves dull; stems 1.5-4.5 mm wide; mature capsules 2.5-6 mm long; [widespread].  

15 Stems and branches smooth on margins; stems mostly 2.3-4.5 mm wide; plants dry dull green or brownish green; [widespread] ..........................................................S. nashii

15 Stems and branches scabrous on margins at least distally; stems 1.5-3.0(-3.5) mm wide; plants dry dark brown or blackish; [of the Coastal Plain].  

16 Stems mostly 2.0-3.0(-3.5) mm wide; mature capsules 4-6 mm long; [of e. MD northward to sw. Nova Scotia]..............S. arenicola

16 Stems mostly 1.5-2.1 mm wide; mature capsules 2.5-4 mm long; [of se. VA to se. LA]..........................S. fuscatum

11 Plant bases without fibrous remains of leaves  

17 Main stems usually >2 mm wide.  

18 Spathes bracts connate 2.5-4 mm; spathe bracts and stems with abundant white spicules or papillae, sometimes these +/- flattened like lenticels; stems 1-2.8 mm wide; leaf blades scabrous........................................S. pruinosa
Sisyrinchium albidum Rafinesque. Woodlands, savannas, mesic sandhills, open limestone barrens. March-May; May-June. S. NY west to s. WI, south to Panhandle FL and e. TX. [= C, F, FNA, G, K, Y; < S. albidum – RAB, W, WH (also see S. capillare); > S. albidum – S; > S. scabrellum E.P. Bicknell – S]

Sisyrinchium arenicola E.P. Bicknell. Sandyland Blue-eyed-grass. Sandy habitats. A Coastal Plain endemic: MA to e. MD (Caroline Co.). [= F; < S. fuscatum – FNA]

Sisyrinchium atlanticum E.P. Bicknell. Atlantic Blue-eyed-grass. Dry, sandy or rocky places. March-June; June-August. NS and ME west to OH, IN, and MO, south to s. FL and LA. [= C, F, FNA, GW, K, S, Y; = S. mucronatum var. atlanticum (E.P. Bicknell) Ahles – RAB; < S. angustifolium – WH]

Sisyrinchium campesrte E.P. Bicknell. Prairie Blue-eyed-grass. Prairies. MI and SD south to MS and NM. [= FNA, K] [add to synonymy]

Sisyrinchium corymbosum E.P. Bicknell. Pinelands. Se. GA and ne. FL west to s. AL. See Ward (2005a) for its resurrection. [= S. atlanticum Bicknell – FNA, K; < S. angustifolium – WH]

Sisyrinchium dichotomum E.P. Bicknell. White Irisette, Isothermal Irisette. Dry to mesic woodlands and forests, usually over mafic rocks (such as amphibolite), at low to moderate elevations (400-1000 m) in the Blue Ridge escarpment. May-June; June-August. Endemic to Henderson, Polk, and Rutherford counties, NC, and Greenville County, SC. [= FNA, K, W]

Sisyrinchium fuscatum E.P. Bicknell. Xeric to dry soils of pine barrens, Carolina bay rims, sandhills, fluvial sand ridges. Late April-June; June-October. E. VA south to n. FL, west to LA. [= RAB, F, G, GW; < S. fuscatum – C, FNA, K; > S. fuscatum – S; > S. incarnatum E.P. Bicknell – S; < S. nashii – WH]

Sisyrinchium langloisii Greene. {habitats}. AR and OK south to w. LA and s. TX; disjunct eastwards in AL, GA, MS, TN, and nw. GA. [= FNA; < S. langloisii – K (also see S. pruinosum)]

Sisyrinchium miamiense E.P. Bicknell. {habitats}. Ne FL and s. GA south to s. FL and west to s. MS. [= FNA, K; < S. angustifolium – WH] [add S to synonymy]

Sisyrinchium minus Engelmann & A. Gray. {habitats}. E. LA west to c. TX. Reported for NC (Sida 1962) and MS {check}. [= K] [add to synonymy]

Sisyrinchium montanum Greene var. crebrum Fernald. {habitat in our area not known}. May-July. NL (Newfoundland) and ON south to NY. The status of this taxon in our area is not clear. S. montanum var. crebrum is reported for VA by F, and S.
**IRIDACEAE**

*Sisyrinchium montanum* Greene var. *montanum*. Reported for n. WV (Harmon, Ford-Wernzt, & Grafton 2006). {rejected; not keyed; not mapped} [= C, F, FNA, K; < *S. angustifolium* – G]

*Sisyrinchium nashii* E.P. Bicknell, Nash’s Blue-eyed-grass. Woodlands and forests. April-June. NC and TN (sw. VA?) south to s. FL and MS. [= FNA, K, W; > *S. fibrosum* E.P. Bicknell – S; < *S. nashii* – WH]

*Sisyrinchium pruinosum* E.P. Bicknell. {habitats}. AR south to w. LA and AR, disjunct at scattered localities eastwards in e. LA, MS, AL, and so. TN. [= FNA; < *S. langloisii* – K] {add to synonymy}

*Sisyrinchium rosulatum* E.P. Bicknell, Lawn Blue-eyed-grass, Fairy-stars. Lawns, roadsides. April-May; May-June. Se. VA south to FL, west to e. TX. [= RAB, FNA, GW, K, S, WH, Y; > *S. exile* E.P. Bicknell]

*Sisyrinchium xerophyllum* Greene, Florida Blue-eyed-grass. Xeric sands. S. GA south to s. peninsular FL; also alleged to occur in NC (FNA) but this report does not seem plausible. [= FNA, K, S, WH]

---

**73. XANTHORRHOEACEAE** R. Brown 1810 (Day-lily Family) [in ASPARAGALES]

**Hemerocallis** Linnaeus 1753 (Day-lily)

1 Flowers tawny-orange (or many variants thereof), not fragrant; inner tepal margins wavy .............................................................. *H. fulva*

1 Flowers lemon-yellow, fragrant; inner tepal margins planar ........................................................... *H. lilioasphodelus*

* *Hemerocallis fulva* (Linnaeus) Linnaeus, Orange Day-lily, Tawny Day-lily. Commonly cultivated, frequently escaping to forests, streambanks, suburban woodlands, lawns, waste places; native of Asia. Late May-early July. [= RAB, C, FNA, GW, K, S, WH, Y; > *H. fulva* var. *fulva* – F; > *H. fulva* var. *kwanso* Regel – F]

* *Hemerocallis lilioasphodelus* Linnaeus, Yellow Day-lily, Lemon Day-lily. Roadside, bottomlands, less commonly cultivated, only rarely escaping; native of Asia. May-July. [= C, FNA, K, Z; = *H. flavum* (Linnaeus) Linnaeus – F, G, WH]

---

**74. AMARYLLIDACEAE** J. St. Hilaire 1805 (Amaryllis Family) [in ASPARAGALES]

A family of about 59 genera and 850 species, nearly cosmopolitan (especially diverse in the tropics). Here circumscribed to include the Alliaceae following the recommendation of APG III (2009). References: Dahlgren, Clifford, & Yeo (1985); Müller-Doblies & Müller-Doblies (1996); Meerow & Snijman in Kubitzki (1998a); Fay & Chase (1996); Rahn in Kubitzki (1998a). [also see AGAVACEAE and HYPOXIDACEAE]
AMARYLLIDACEAE

1 Ovary superior; [subfamily Allioideae].
2 Inflorescence a solitary flower; flowers blue, lavender, or white; fresh plant with an onion odor; [tribe Gillesieae] .................. 3. Tristagma
2 Inflorescence an umbel; flowers white, greenish white, cream, pink, or magenta-purple; fresh plant with or without an onion odor.
3 Tepals 2-9 mm long; ovary 3-celled, each with 1-2 ovules; fresh plant with an onion odor; [tribe Allieae] .................. 1. Allium
3 Tepals 10-15 mm long; ovary 3-celled, each with 6-10 ovules; fresh plant usually without an onion odor; [tribe Gillesieae] ...
1 Ovary inferior; [subfamily Amaryllidoideae].
4 Corona present (a fused tubular or flattened petaloid structure in the center of the flower, above the tepals).
5 Filaments fused with the corona; corona membranous in texture, distinctly thinner than the tepals; flowers white; [native, of riverine or tidal shores and marshes]; [tribe Hymenocallideae, subtribe Hymenocallidinae] .................. 12. Hymenocallis
5 Filaments not fused with the corona; corona membranous in texture, but similar to the tepals (in texture, though sometimes of a different color); flowers usually at least partly yellow or orange (sometimes purely white); [alien, naturalized in primarily upland and disturbed habitats]; [tribe Narcisseae, subtribe Narcissinae] .......... 8. Narcissus
4 Corona absent.
6 Flowers red; stamens about 2× as long as the tepals; [tribe Lycoidae] .................................................. 5. Lycorts
6 Flowers white, yellow, copper, or white-pink; stamens shorter than or about as long as the tepals.
7 Flowers yellow to copper.
8 Tepals apiculate at the tip, especially the outer 3 tepals; scape hollow; [tribe Hippeastreae, subtribe Zephyranthinae] ........
9 Tepals 3-16 cm long, white or sometimes white-pink.
10 Tepals spreading, separate, the perianth rotate; inflorescence a several-flowered umbel terminating the stem; leaves arranged spirally; leaf margins finely toothed; [tribe Amaryllideae, subtribe Crininae] .............. 4. Crinum
10 Tepals ascending, overlapping, the perianth tubular; inflorescence of a single flower; leaves arranged disjunctively; leaf margins smooth; [tribe Hippeastreae, subtribe Zephyranthinae] ............................. 11. Zephyranthes
9 Tepals 0.4-2.5 cm long, white, with small green or yellow spots; [tribe Galanthinae] ............................................... 6. Galanthus
11 Inner 3 tepals distinctly shorter and blunter than the outer 3 tepals ......................................................... 7. Leucojum
11 Inner 3 tepals and outer 3 tepals of similar size and shape .............................................................

1. Allium Linnaeus 1753 (Onion, Garlic, Leek, Ramps, Chives)

1 Leaves appearing before the flowers and withering before anthesis; leaves lanceolate to elliptic (the margins not parallel for most of the length), mostly > 2 cm wide; [subgenus RhiZideae].
2 Leaves (1.5-) 2-4 (-4.5) cm wide, without a distinct petiolar base, the basal portion white; flowers (6-) 10-18 (-25) per umbel (fruits often fewer by abortion); spathe bracts 1-2 cm long; fruiting pedicels (8-) 10-15 (-18) mm long .................. 10. Habranthus
2 Leaves (3-) 5-8 (-9) cm wide, with a distinct petiolar base, the petioles usually red or pink; flowers (15-) 30-55 (-63) per umbel (fruits often fewer by abortion); spathe bracts 2-3 cm long; fruiting pedicels (10-) 15-25 (-30) mm long ................ A. tricoccum
1 Leaves present at flowering; leaves linear (the margins parallel for most of the length), mostly < 2 cm wide.
3 Leaves cylindric (round or channelled-indented in cross section), hollow.
4 Stem stout, usually > 10 mm in diameter; peduncles with a distinct swollen portion .... .................................. 7. A. cepa
5 Stems clustered, 1-3 dm tall; pedicels shorter than the flowers .......... A. schoenoprasum var. schoenoprasum
5 Stems solitary, 3-10 dm tall; pedicels longer than the flowers .................. A. vineale
3 Leaves variously flattened or keeled (flat or V-shaped in cross section), not hollow.
4 Stem leafy for half its length; leaves 1.5-4.5 cm wide; [subgenus Allium].
5 Inflorescence of flowers only .......................................................... 5. A. ampeloprasum
6 Inflorescence of bulblets (and often flowers as well).
8 Leaves 2-4 mm wide; bulbs simple at maturity; involucral bracts 2 ............................................ 8. A. oleraceum
8 Leaves 6-12 mm wide; bulbs compound at maturity (with separable cloves); involucral bract 1 .................................. 7. A. sativum
6 Stem scapose, leafy only at its base; leaves < 1.4 cm wide; [subgenus Ameerallium].
7 Inflorescence erect, the peduncle not bent.
10 Ovary or capsule crested with projections about 1 mm long; tepals acuminate.
11 Spathae bracts usually 5-nerved; ovary crests contorted, ascending; tepals reflexed; leaves 3-10 mm wide .. A. cutibertii
11 Spathae bracts 1-nerved; ovary crests plane, flattened, spreading; tepals spreading; leaves 1-2 mm wide .......... A. speculæ
10 Ovary or capsule not crested with projections; tepals acute.
12 Inflorescence partly or entirely of bulblets .............................................................. A. canadense var. canadense
12 Inflorescence entirely of normal flowers .............................................................. A. canadense var. mobilense
9 Inflorescence nodding, the peduncle bent 30-150 degrees in its uppermost several cm (at least in bud) – in A. stellatum becoming erect in flower or fruit.
13 Flowers stellate, the tepals spreading; scape nodding in bud, becoming erect in flower or fruit; bulb ovoid .......... A. stellatum
13 Flowers urceolate, campanulate, to nearly rotate, the tepals strongly to slightly incurved; scape nodding in bud, flower, and fruit; bulb elongate.
14 Perianth urceolate, deep magenta-purple; tepals obtuse; [plants of moderate to high elevations in the Mountains] ................. A. allegheniense
14 Perianth campanulate to nearly rotate, pink, pale pink, or nearly white; sepals acute (obtuse in A. oxyphilum); [of moderate to low elevations in the Mountains, Piedmont, and Coastal Plain].
Allium allegheniense Small, Allegheny Onion. In thin soils around outcrops, generally of mafic rocks (such as amphibolite or hornblende gneiss) or calcareous rocks, primarily at moderate to fairly high elevations (1000-1600m). July-August; October. Known from w. NC, w. VA, and e. WV, possibly more widespread. Although not recognized by most recent authors, A. allegheniense seems distinctive enough in morphology, ecology, and distribution to warrant taxonomic recognition at some level; additional study is needed. [= K, S; < A. cernuum – RAB, C, FNA, G, W]

* Allium burdickii (Hanes) A.G. Jones, Narrow-leaf Ramps, White Ramps. Northern hardwood forests, primarily at higher elevations than A. tricoccum, perhaps also in cove forests and rich mountain slopes. June; August. Only recently determined to be a separate taxon, A. burdickii is apparently rare in our area. It blooms about a month earlier than A. tricoccum. See Jones (1979) for more details and discussion. Largely sympatric with A. tricoccum, it is somewhat more northern and midwestern, ranging from ME west to ND and south to NJ, and in the Mountains to (?) w. VA. All material ascribed to A. burdickii in w. NC and c. TN appears to be A. tricoccum. [= K, W; = A. tricoccum var. burdickii Hanes – C, FNA; < A. tricoccum – F, G]

* Allium canadense Linnaeus var. mobilense (Regel) Ownbey. Dry woodlands. Mid April-May; Late May-June. S. SC south to ne. FL and Panhandle FL, west to TX. This taxon is perhaps better treated as a distinct species. [= RAB, FNA, K, WH; > A. microscordion Small – S; = A. mutabile Michaux – F; > A. arenicola Small – S; A. canadense ssp. mobilense (Regel) Traub & Ownbey]

* Allium cepa Linnaeus, Garden Onion. Persisting from gardens, or appearing around compost or trash piles; native to c. Asia. May-June; July. [= RAB, C, FNA, G; > A. cepa var. cepa – K]

* Allium cernuum Roth, Nodding Onion. Generally in open woodlands or around outcrops of shale, mafic, ultramafic, or calcareous rocks, in the mountains at low elevations. June-early August; August-October. NY, MI, MN, and BC, south to GA and AZ; the distribution is oddily fragmented into largely Rocky Mountain, Ozarkian, and Appalachian segments, and it is quite possible that cryptic taxa are involved. See discussion of A. oxyphilum at end of genus. [= S; < A. cernuum – RAB, C, F, FNA, G, W (also see A. allegheniense and/or A. oxyphilum); > A. cernuum var. cernuum – K]

* Allium cuthbertii Small, Cuthbert's Onion. Sandhills, granite domes and flatrocks, in NC in thin soils around rock outcrops, receiving nutrient-rich seepage and occurring with many strict calciphiles. May-June; June-July. The bright emerald green ovary of the fresh flowers is striking and distinctive. Two morphological forms occur in our area, probably warranting taxonomic recognition. Typical A. cuthbertii occurs on xeric Coastal Plain sands from c. SC south through GA and AL to ne. FL; the perianth is white and the plants 1.5-3.5 dm tall. In NC, a peculiar form of A. cuthbertii is apparently limited to a series of unusual granitic domes in the Brushy Mountains of Alexander and Wilkes counties; these plants are more robust (4-8 dm tall), and the perianth is always pink. [= RAB, FNA, K, S, W, WH]

Allium oxyphilum Wherry. Shale barrens. Endemic to WV (Greenbrier, Mercer, Monroe, and Summers counties). Although there has been much discussion of its taxonomic status, it is apparently distinct from A. cernuum. It should be expected...
AMARYLLIDACEAE

154

in VA, although the outcrops of suitable shales are quite limited (Bartgis, pers. comm.; Wieboldt, pers. comm.).  [= K; < A. cernuum – C, F, FNA, G, W]

* Allium sativum Linnaeus, Garlic.  Gardens, trash heaps, fields; commonly cultivated, rarely occurring as a waif or persistent in gardens, native of Eurasia.  [= C, F, FNA, G, K, Z]

* Allium schoenoprasum Linnaeus var. schoenoprasum, Chives.  Disturbed areas, native of Eurasia.  June-August.  [= C, F, G; < A. schoenoprasum – FNA, K]

Allium species 1, Savanna Onion.  Wet savannas over coquina limestone (marl).  Late August-early October; late September-November.  This remarkable Coastal Plain relative of A. cernuum was first discovered in 1981 by Steve Leonard in Pender County; it has since been found in similar sites in Onslow and Brunswick counties, always associated with other endemic species of primarily montane genera, such as Thalictrum cooleyi and Parnassia caroliniana.  It appears to warrant taxonomic status.

Allium stellatum Nuttall ex Ker-Gawler, Glade Onion, Prairie Onion.  Limestone glades.  July-September.  ON and SK south to n. AR and e. TX; disjunct east of the Mississippi in c. TN.  [= C, F, FNA, G, K]

* Allium vineale Linnaeus, Field Garlic.  Lawns, pastures, other disturbed places; native of Eurasia.  Late May-June; June-August.  This is the common weed, often known as "onion grass".  [= RAB, C, F, FNA, G, S, W; > A. vineale ssp. vineale – K; > A. vineale var. vineale – Z; > A. vineale var. capsuliferum Koch – Z; > A. vineale var. compactum (Thuill.) Coss. – Z]

2. Nothoscordum Kunth 1843 (Grace Garlic, False Garlic)

1 Leaves 1-4 (-5) mm wide; tepals distinct or only slightly connate at the base; flowers 3-6 (-10) per umbel; flowers not fragrant .... N. bivalve

1 Leaves 4-12 mm wide; tepals connate up to 1/3 of their length; flowers 10-20 per umbel; flowers fragrant (similar to cocoa) .......... N. gracile

Nothoscordum bivalve (Linnaeus) Britton, Grace Garlic, False Garlic.  Around granite flatrocks, in glades and barrens of various kinds, in open woodlands, and also weedy in fields and along roadsides.  Mid March-mid May, and again in September-October; May-June, and again in October-November.  SE VA west to s. OH and KS, south to c. peninsular FL, TX, and South America.  An onion-like plant, but generally lacking the odor of onion.  [= C, F, G, K, S, W, WH, Z; = Allium bivalve (Linnaeus) Kuntze – RAB]

* Nothoscordum gracile (Aiton) Stearn.  Disturbed areas, lawns; native of South America.  [= FNA, K; = Nothoscordum borbonicum Kunth – WH, Z, misapplied?; = Allium inodorum Aiton – RAB; = N. fragrans (Ventenat) Kunth – S]

3. Tristagma Poeppig (Star-of-Bethlehem)

4. **Crinum** Linnaeus 1753 (Swamp Lily, String Lily)

**Identification notes:** *Crinum* can be distinguished vegetatively from *Hymenocallis* by its spiral (vs. distichous) leaf arrangement and leaf margins finely toothed (vs. entire).

1. Leaves 7.5-12 cm wide; umbels 20-100-flowered .................................................................................................................... *C. asiaticum*
2. Leaves 1-5 (-7) cm wide; umbels 2-13-flowered.

3. Umbels 2-5-flowered; perianth white; [native] .............................................................................................. *C. americanum* var. *americanum*
4. Umbels 8-13-flowered; perianth usually at least in part reddish; [exotic].

5. Flowers pedicellate; bulb 6-8 cm in diameter .................................................................................................................... *C. bulbispermum*
6. Flowers sessile; bulb 12-15 cm in diameter ............................................................................................................. *C. zeylanicum*

**Crinum americanum** Linnaeus var. *americanum*. Swamp-lily, String-lily. Swamp forests. June-October. Se. NC south to s. FL and west to TX. Var. *traubii* (Moldenke) R.S. Hannibal is endemic in se. TX. [= FNA; < *C. americanum* – GW, K, S, WH]

* *Crinum zeylanicum* (Linnaeus) Linnaeus. Milk-and-wine Lily. Disturbed areas, escaped or persistent from cultivation; native of Sri Lanka and w. India. [= FNA, K, WH]

5. **Lycoris** Herbert 1819 (Magic Lily)

* *Lycoris radiata* (L'Héritier) Herbert, Magic Lily, Surprise Lily, Hurricane Lily. Frequently cultivated, sometimes persistent for long periods of time, especially in lawns around older homes; native of e. Asia. September-October. Leaves and flowers are not present at the same time. Reported as “established as waifs over past decade in lawn” in Jackson County, NC by Pittillo & Brown (1988). [= RAB, K, WH]

6. **Galanthus** Linnaeus 1753 (Snowdrop)

* *Galanthus nivalis* Linnaeus, Snowdrop. Persistent after cultivation; native of s. and c. Europe. February-March. [= F, FNA, K, Z]

7. **Leucojum** Linnaeus 1753 (Snowflake)
**Amaryllidaceae**

1. Seeds black; flowers (1-) 2-5 (-7) per stem, flowering March-April; tepals 10-22 mm long. ......................................................... *L. aestivum*
2. Seeds pale; flowers 1 (-2) per stem, flowering January-March; tepals 15-25 mm long. ................................................................. *L. vernum*

**Leucojum vernum** Linnaeus, Spring Snowflake. Persistent after cultivation; native of Europe. January-March. [= FNA, K, WH]

### 8. Narcissus Linnaeus 1753 (Daffodil, Jonquil, Narcissus, Buttercup)

**Identification notes:** The familiar flower consists of 6 tepals spreading in more or less a plane, and a fused, tubular, corona. The hypanthial tube is below the perianth lobes. Other taxa are under cultivation and may be expected as persistent or escaped in our area. Manuals of cultivated plants and the extensive horticultural literature on *Narcissus* (such as the references listed above) should be consulted by those interested in more information on members of this genus.

1. Perianth lobes 10-15 mm long; corona 3-5 mm long; leaves and stems cylindrical, hollow; umbel (or spathe, or stem) with 1-10 flowers ........... .................................................................
2. Perianth lobes 20-50 mm long; corona 5-50 mm long; leaves and stems flattened, solid; umbel (or spathe, or stem) with 1-4 flowers.
3. Hypanthial tube (below the tepals) parallel-sided (though sometimes suddenly expanded at its apex); corona < 10 mm long, usually wider than high; corona < 0.5x as long as the perianth lobes; corona rarely undulate; umbel (or spathe, or stem) with 1-10 flowers; stamens of 2 distinct lengths.
4. Corona rim red, contrasting with the white or yellow corona; umbel (or spathe, or stem) with 1 flower..............................
5. Corona of a single color, all white or yellow; umbel (or spathe, or stem) with (1-) 2-8 (-20) flowers.
6. Umbel (or spathe, or stem) with (2-) 3-8 (-20) flowers; pollen fertile.
7. Umbel (or spathe, or stem) with 1 flower; corona usually conspicuously darker in color than the tepals; leaves somewhat glaucous, > 8 mm wide; stem distinctly 2-edged
8. Umbel (or spathe, or stem) with (1-) 2-4 flowers; corona and tepals the same color; leaves green, < 8 mm wide; stem nearly terete

**Narcissus bulbocodium** Linnaeus, Hoop-petticoat Daffodil. Grassy roadsides, established; native of Eurasia. March. [= Y, Z]

**Narcissus ×incomparabilis** P. Miller (pro sp.) [poeticus × pseudonarcissus], Nonesuch Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadides, woodland borders, and disturbed areas; native of Europe. March-April. [= C, FNA, K, Z; = N. incomparabilis – RAB, F, G]

**Narcissus jonquilla** Linnaeus, Jonquil, Apodanthus Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadides, woodland borders, and disturbed areas; native of Europe. March-April. [= RAB, C, F, FNA, G, K, Z]

**Narcissus ×mediolatus** P. Miller (pro sp.) [poeticus × tazetta], Primrose-peerless. Cultivated as an ornamental, persistent and naturalized in lawns, roadides, woodland borders, and disturbed areas; native of Europe. March-May. [= FNA, K, Z; = N. tazetta × poeticus – RAB]

**Narcissus ×odoratus** Linnaeus (pro sp.) [jonquilla × pseudonarcissus], Campernelle Jonquil, Sweet-scented Jonquil. Cultivated as an ornamental, persistent and naturalized in lawns, roadides, and disturbed areas; native of Europe. [= FNA, K, Z]

**Narcissus ×papyraceus** Ker Gawler, Paper-white Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadides, and disturbed areas; native of Mediterranean Europe. [= FNA, K, Z]

* Narcissus tazetta* Linnaeus, Bunch-flowered Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, and disturbed areas; native of Mediterranean Europe. [= FNA, K, Z]

9. *Sternbergia* Waldst. & Kit. 1805 (Winter Daffodil)

* Sternbergia lutea* (Linnaeus) Ker-Gawler ex Sprengel, Winter Daffodil, Lily-of-the-field. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; native of Europe. This species has yellow, *Crocus*-like flowers, in the autumn. [= K]

10. *Habranthus* Herbert (Copper-lily)

A genus ca. 30 species, perennial bulbous herbs, of s. North America and South America.

* Habranthus tubispathus* (L’Hér. ex Traub, Rio Grande Copperlily. Road shoulders, lawns, disturbed areas; native of s. Brazil. Reported for Coastal Plain of AL (Woods & Diamond 2006), GA (Carter, Baker, & Morris 2009), and FL. [= FNA, K]

A genus of about 70 species, from s. North America and the West Indies south to s. South America. References: Flagg, Smith, & Flory in FNA (2002a); Meerow & Snijman in Kubitzki (1998a). Key adapted in part from FNA.

1 Stigma 1, capitate; perianth either 3-5 cm long or (7.3-) 9-14 (-16) cm long; stamen filaments either 1-2 cm long or 0.2-0.5 cm long; leaves up to 5 mm wide.

2 Perianth yellow. ........................................................................................................................................................................Z. citrina

2 Perianth white (to pinkish).

3 Perianth 3-4.5 cm long; perianth tube shorter than the spathe; perianth tube shorter than the filaments .........................Z. candida

3 Perianth (7.3-) 9-14 (-16) cm long; perianth tube longer than the spathe; perianth tube longer than the filaments ...............Z. chlorosolen

4 Stigmas (trifid); perianth (4-) 4.3-9.5 (-11) cm long; stamen filaments (1.5-) 1.6-4.4 (-4.7) cm long; leaves up to 8 mm wide.

4 Stamen filaments 0.1-0.2 mm long; perianth tube 3-4 (-4.7) cm in length, the stigmas included ...........................................Z. drummondii

5 Anthers 3-6 (-8) mm long. .........................................................................................................................................................Z. grandiflora

5 Anthers 13-22 mm long. .........................................................................................................................................................Z. simpsonii

6 Style and stigma as long as or shorter than the anthers; perianth segments erect-ascending at full anthesis, (4-) 4.3-8.5 (-10) cm long.. .........................................................................................................................................................Z. atamasca

6 Style and stigma extending beyond the anthers; perianth segments spreading at full anthesis, (5.5-) 6.6-9.5 (-11) cm long.

7 Mature leaves concave, 3-8 mm wide; perianth tube (0.8-) 1-2 (-2.1) cm long; filaments > 1.5× as long as the perianth tube........Z. treatiae

7 Mature leaves grooved, 1-4 mm wide; perianth tube usually (1.7-) 2-3 (-3.1) cm long; filaments < 1.5× as long as the perianth tube.........................................................................................................................................................Z. atamasca

*Zephyranthes atamasca* (Linnaeus) Herbert, Common Atamasco-lily. Bottomland forests and adjacent road shoulders, wet meadows. Late March-April; May-June. Se. and sc. VA south to n. FL, west to s. MS. [= FNA; = Z. atamasca – RAB, C, F, G, GW, orthographic variant; = Zephyranthes atamasca var. atamasca – K, WH; = Atamosco atamasca (Linnaeus) Greene – S, orthographic variant]

*Zephyranthes candida* (Lindley) Herbert. Cultivated, persistent or spreading from cultivation; native of South America. Late September-October. [= RAB, FNA, K, WH; = Atamosco candida (Lindley) Small – S]

*Zephyranthes chlorosolen* (Herbert) D. Dietrich. Prairies and other moist to dry habitats. May-October. [= FNA; = Cooperia drummondii Herbert – GW, S; = Cooperia chlorosolen Herbert – K]
**Zephyranthes citrina** Baker, Yellow Zephyr-lily, Citron Rain-lily. Disturbed areas; native of South America. [= FNA, K, WH]

**Zephyranthes drummondii** (Herbert) D. Don, Ceboletta. Disturbed areas; native of TX and Mexico. [= FNA, WH; = Cooperia pedunculata Herbert – K]

**Zephyranthes grandiflora** Lindley. Disturbed areas; native of Mexico. [= K, SE]

**Zephyranthes simpsonii** Chapman, Florida Atamasco-lily. Dry to dry-mesic sandy soils (usually with admixture of shell hash) of coastal fringe sandhills or mainland maritime forests, usually associated with *Quercus hemispherica*, on barrier islands or within about 10 km of the ocean (NC, SC), pine flatwoods (FL, GA). April-May; May-June. Se. NC (Brunswick and Columbus counties) and ne. SC (Horry and Georgetown counties); s. GA, c. and s. peninsular FL. The disjunct populations in NC and SC may differ from *Z. simpsonii* (sensu stricto) of s. GA and c. and s. peninsular FL, and need additional study. [= RAB, FNA, GW, K, WH; = *Atamusco simpsonii* (Chapman) Greene – S]

**12. Hymenocallis** Salisbury 1812 (Spider-lily)

**Identification notes:** *Hymenocallis* can be distinguished vegetatively from *Crinum* by its distichous (vs. spiral) leaf arrangement and leaf margins entire (vs. finely toothed).

1 Ovules 4-8 per locule; ovary 14-30 mm long, 6-15 mm wide; [FL].
2 Corona 6-9 cm wide .......................................................................................................................... *H. rota*  
2 Corona 3-6 cm wide.  
3 Tepals white ........................................................................................................................................ *H. godfreyi*  
3 Tepals yellowish-green to pale green.  
4 Flowers 1 per inflorescence; tepals ascending, equal to or shorter than the perianth tube; [ne. FL south to s. FL] ......................................... *H. palmeri*  
4 Flowers 2 per inflorescence; tepals spreading, nearly always longer than the perianth tube; [Panhandle FL].  
5 Leaves strongly glaucous; tepals to 16 cm long; plants in loose to dense clumps; [east of the Apalachicola River (Liberty County, FL)] .................................................................................................................. *H. henryae* var. *glaucifolia*  
5 Leaves green to slightly glaucous; tepals to 13 cm long; plants singly or in loose clumps; [west of the Apalachicola River (Bay, Gulf, and Walton counties, FL)] .................................................................................................................. *H. henryae* var. *henryae*  

1 Ovules 1-3 (-4) per locule; ovary 7-15 mm long, 5-10 mm wide; [collectively more widespread].
6 Staminial cup >4.5 cm long; [rocky river shoals of the Piedmont of SC, GA, and AL] ......................................................................................... *H. coronaria*  
6 Staminial cup <4.5 cm long; [Coastal Plain, Piedmont floodplains, and the GA Ridge and Valley].  
7 Leaves oblongolate, slightly to distinctly wider toward the tip.  
8 Leaves not coriaceous, distinctly glaucous; scape bracts 4-7 cm long, the tip long-acuminate; bulbs non-rhizomatous; [of moist but not mucky habitats] .................................................................................................................. *H. occidentalis* var. *occidentalis*  
8 Leaves coriaceous, not glaucous; scape bracts 3-4 (-6) cm long, the tip acute; bulbs rhizomatous; [of wet habitats].  
9 Scape bracts 3-4 (-6) cm long, the tip acute; leaves distinctly wider towards the tip; bulb 3-6 cm long, 1.5-5 cm wide .................................................................................................................. *H. choctawensis*  
9 Scape bracts 4-5 cm long, the tip acuminate; leaves slightly wider towards the tip; bulb 4.5-7.5 cm long, 2.5-5.5 cm wide .................................................................................................................. *H. gholsonii*  
7 Leaves liguliform, not wider toward the tip, the margins parallel throughout.  
10 Flowers (3-) 5-12 per inflorescence ........................................................................................................... *H. liriosme*  
10 Flowers 1-3 (rarely more) per inflorescence.  
11 Staminial cups rotate at full anthesis; leaves chiefly arching low, often appearing prostrate; [of s. GA south into FL]  
11 Staminial cups funneliform at full anthesis but gradually spreading in time; leaves suberect to erect; [of se. NC south to FL].  
12 Perianth segments 5.0-6.5 cm long; leaves 1.5-4 dm long ............................................................................. *H. pygmaea*  
12 Perianth segments (6-) 7-11.5 cm long; leaves 3-7 dm long  
13 Scape bracts narrowly lanceolate, 2.5-5 cm long, 7-12 mm wide; [NC south to ne. FL] ................................................................. *H. crassifolia*  
13 Scape bracts lanceolate, 3-4.5 cm long, 10-15 mm wide; [lower Ochlockonee River, Panhandle FL] .................... *H. franklinensis*  

**Hymenocallis choctawensis** Traub, Florida Panhandle Spiderlily, Choctaw Spiderlily. Floodplains. GA (floodplain of the Ochlockonee River) and Panhandle FL west to LA. [= FNA, K, WH, Z; = *Hymenocallis sp. ?* – GW]
Hymenocallis coronaria (LeConte) Kunth, Shoals Spiderlily, Cahaba Lily. Rocky river shoals, usually with Justicia americana and Podostemum ceratophyllum. Mid May-July; July-September. SC south and west to AL. Notable stands of this spectacular plant occur at Landsford Canal State Park (on the Catawba River south of Rock Hill, SC), on the Saluda River (SC), on the Savannah River below I-20 (GA-SC border), and on the Cahaba River (Bibb County, AL). [= FNA, Z; H. occidentalis (LeConte) Kunth – RAB, S, misapplied; < Hymenocallis sp. ? – GW; H. caroliniana (Linnaeus) Herbert – K, misapplied]

Hymenocallis franklinensis G. Lom. Smith, L.C. Anderson, & Flory, Cow Creek Spiderlily. Slightly brackish river margins. Endemic to the Ochlockonee River (Franklin and Wakulla counties) in the FL Panhandle. [= FNA, WH, Z; < Hymenocallis sp. ? – GW] [synonymy incomplete]

Hymenocallis godfreyi G. Lom. Smith & Darst, Godfrey’s Spiderlily, St. Marks Marsh Spiderlily. Brackish marshes. Endemic to Wakulla County in the FL Panhandle. [= FNA, K, WH, Z; < Hymenocallis sp. ? – GW] [synonymy incomplete]

Hymenocallis henryae Traub var. henryae, Henry’s Spiderlily, Green Spiderlily. Cypress depressions and wet pine flatwoods. Endemic to Bay, Gulf, and Walton counties in the Panhandle of FL. [= FNA, WH, Z; < Hymenocallis sp. ? – GW; < H. henryae – K] [synonymy incomplete]

Hymenocallis liriosme (Rafinesque) Shinners, Western Marsh Spiderlily; Louisiana Marsh Spiderlily. Swamps, bottomlands, ditches. March-May. AR and OK south to s. AL and TX. [= FNA, Z; < Hymenocallis sp. ? – GW; < H. liriosme – K]

Hymenocallis occidentalis (LeConte) Kunth var. occidentalis, Hammock Spiderlily, Woodland Spiderlily. Mesic soils of slopes and floodplain forests, gabbro glades and other calcareous upland flats. NC west to AR and LA. Var. eulae (Shinners) G. Lom. Smith & Flory is endemic in the West Gulf Coastal Plain. [= FNA, WH, Z; < Hymenocallis sp. ? – GW; < H. occidentalis – S, WH; = H. caroliniana (Linnaeus) Herbert – K, misapplied]

Hymenocallis palmeri S. Watson, Alligator-lily. Cypress swamps; wet pine flatwoods, disturbed wet areas. From ne. FL (Bradford and Duval counties) south to s. peninsular FL. [= FNA, WH, Z; < Hymenocallis sp. ? – GW; < H. palmeri S. Watson – K] [synonymy incomplete]

Hymenocallis rotata (Ker Gawler) Herbert, Spring-run Spiderlily. Spring-runs. Endemic to FL, in the Panhandle (Wakulla County) and n. peninsular FL (Alachua, Columbia, and Duval counties southward to c. peninsular FL). [= FNA, K, WH, Z; < Hymenocallis sp. ? – GW] [synonymy incomplete]
A family of a single genus and 170-300 species, widespread in Europe, Africa, Asia, and Australia (introduced elsewhere). References: Dahlgren, Clifford, & Yeo (1985); Kubitzki & Rudall in Kubitzki (1998a).

**Asparagus** Linnaeus (Asparagus)

1. Cladophylls flattened, ca. 2 mm wide........................................................................................................**A. aethiopicus**
2. Cladophylls filiform, <0.7 mm wide.
3. Flowers in 1-3-flowered axillary racemes; berries 6-10 mm long, red; erect herb (sometimes arching in age)................................**A. officinalis**
4. Flowers in 1-4-flowered terminal umbels; berries 4-5 mm long, purplish-black; scrambling vine .................................................**A. setaceus**

75b. RUSCACEAE M. Roemer 1840 (Ruscus Family) [in ASPARAGALES]

As here circumscribed, a family of about 28 genera and 500 species, of North America, Central America, Europe, and Asia. The Convallariaceae has been supported by molecular studies (Judd 2003, Bogler & Simpson 1995). Molecular studies show that *Nolina* is much more closely related to *Convallaria, Polygonatum*, etc. than to the Agavaceae (*Yucca* and *Manfreda* in our flora), with which it has often been associated. References: Bogler & Simpson (1995); Bogler in Kubitzki (1998a); Yeo in Kubitzki (1998a); Conran & Tamura in Kubitzki (1998a); Yamashita & Tamura (2000).

1. Plant with an upright stem with alternate leaves.
2. Shrubs; "leaves" (actually phylloclades) coriaceous, evergreen, glossy; [exotic, rarely naturalized]; [tribe *Ruscaceae*] .................... **Danae**
3. Herb; leaves herbaceous, deciduous, dull or slightly glossy; [native]; [tribe *Polygonatae*] .................................................... **Malanthemum**
4. Inflorescence terminal, a raceme or panicle; tepals separate ............................................................................................. **Convallaria**
5. Inflorescence of 1-several axillary flowers; tepals fused ................................................................................................. **Polygonatum**

1. Plant tufted, the leaves essentially basal (although the sheathing bases form a 'false' stem in *Convallaria*).
2. Leaves 2-3, narrowly elliptic; tepals fused, white or greenish; [tribe *Convallarieae*] ............................................................... **Convallaria**
3. Leaves many, linear; tepals separate (or fused basally), white or violet.
4. Fruit dehiscent, dry and capsular; inflorescence a panicle or raceme, to 15 dm tall; [natives, of longleaf pine woodlands of SC, GA, and FL]; [tribe *Nolineae*] ............................................................................. **Nolina**
5. Fruit indehiscent, quickly exposing berry-like seeds with a fleshy seed coat; inflorescence spike-like, to 4 dm tall; [aliens, naturalized from horticultural plantings]; [tribe *Ophiopogoneae*].
6. Flowers erect, the pedicel strict; ovaries superior ....................................................... **Liriope**
7. Flowers nodding, the pedicel recurved; ovaries inferior or half-inferior.......................... **Ophiopogon**

*Convallaria* Linnaeus 1753 (Lily-of-the-Valley)

1. Leaf blades averaging 10-15 cm long, 3-5 cm wide; rhizomes short-creeping, the "individual" plants spaced closely (typically 5-10 cm apart); flowering scape < ½ as long as the leaves; longer bracts of the inflorescence 4-10 mm long; [introduced, persistent around old home sites and other plantings].......................................................................................................................... **C. majalis**
2. Leaf blades averaging 15-35 cm long, 5-13 cm wide; rhizomes absent or long-creeping, the individual plants spaced widely (usually at least 15 cm apart); flowering scape < ½ as long as the leaves; longer bracts of the inflorescence 8-20 mm long; [native, of forests of the Mountains and upper Piedmont] .............................................. **C. majuscula**

*Convallaria majalis* Linnaeus, European Lily-of-the-Valley. Persistent after cultivation; native of Eurasia. April-May; July-August. [= F, K, W, WV; = *C. majalis* var. *majalis* – RAB, FNA; < *C. majalis* – C, G, S, Z (also see *C. majuscula*)]

*Convallaria majuscula* Greene, American Lily-of-the-Valley. Mountain forests, particularly in rocky woodlands or forests on or near ridgetops under northern red oak at about 1000 to 1500 m elevation, sometimes at lower elevations (down to at least 700 m) and under Quercus montana. April-June; August. Endemic to the Southern Appalachians: WV and VA through NC and TN to ne. GA (Jones & Coile 1988) and nw. SC. Cronquist's (1991) statement that Southern Appalachian plants "may reflect an early escape of a different phase of the species from cultivation" cannot be discounted; there is no doubt that *C. majuscula* is both native and taxonomically distinct, at a varietal level at least. Utech in FNA (2002a) states that our plants are more closely related to the Asian taxon, variously treated as *C. keiskei* Miquel or *C. majalis* var. *keiskei* (Miquel) Makino, than to the European *C. majalis* s.s. As best as can be determined, Rafinesque's name *Convallaria montana* does not apply to this species. [= K; = C.
**RUSCACEAE**

---

**Danae** Medikus (Alexandrian Laurel, Danaé)

A monotypic genus, a shrub, of sw. Asia.

* Danae *racemosa* (Linnaeus) Moench, Alexandrian Laurel. Suburban forests; rare, uncommon in cultivation, rarely escaping to suburban forests; native of sw. Asia. The "leaves" are actually odd structures called phylloclades, and represent modified stems.

---

**Liriope** Loureiro 1790 (Liriope, Lilyturf)

A genus of 8 species, herbs, of e. and se. Asia. References: Nesom (in prep.)=Y; Conran & Tamura in Kubitzki (1998a); Judd (2003)=Z. Key based on Y.

1 .......................................................... .................................................................................................................. *L. muscari*

1 .......................................................................................................................................................... *L. spicata*

* Liriope *muscari* (Decaisne) L.H. Bailey, Liriope, Big Blue Lilyturf. Commonly planted, rarely persistent and escaping, but locally abundant; native of China, Japan, and Taiwan. [= K, Y, Z]

* Liriope *spicata* Loureiro, Creeping Lilyturf. Commonly planted, rarely persistent and escaping; native of {}. [= Y, Z; = L. *spicatum* – K, orthographic variant]

---

**Maianthemum** G.H. Weber ex Wiggers 1780 (Mayflower, Solomon's-plume)

A genus of about 28 species, herbs, of n. Europe, e. Asia, North America, and Central America. The inclusion of the traditional *Smilacina* in *Maianthemum* will cause considerable consternation; LaFrankie’s (1986) reasoning, however, seems very strong, and has been additionally supported by more recent evidence (Conran & Tamura in Kubitzki 1998a). The only consistent difference between the two previously accepted genera is whether the flowers are dimerous (*Maianthemum*) or trimerous (*Smilacina*). LaFrankie cites research that shows that the dimerous flowers of *Maianthemum (sensu stricto)* are the result of reduction from trimerous flowers, as indicated by vestigial vascular traces. Consideration of the many close similarities, particularly as compared to similar genera such as *Proseratex, Polygonatum, Streptopus,* and *Clintonia,* may convince the skeptical (see LaFrankie 1986 and Therrian 1956). As an example, the fruits of *M. canadense* and *M. racemosum* are closely similar in form, coloration, and size; much more similar than the fruits of our 2 species of *Proseratex.* References: LaFrankie (1986)=Z; Judd (2003)=Y; LaFrankie in FNA (2002a); Conran & Tamura in Kubitzki (1998a).

1 Flowers in a terminal panicle ............................................................................................................................ *M. racemosum* ssp. *racemosum*

1 Flowers in a simple raceme.

2 .......................................................................................................................................................... *M. canadense*

2 Perianth segments 6 (flowers 2-merous); leaves (1-) 2 (-3) .......................................................................................................................................................... *M. stellatum*

**Maianthemum canadense** Desfontaines, Canada Mayflower, False Lily-of-the-valley. Moist forests, especially at high elevations. Mid May–early July; August–September. NL (Labrador) and NL (Newfoundland) west to NT, south to MD, NC, n. GA (Jones & Coile 1988), KY and SD. Two varieties have been described, but their recognition is not strongly supported. Var. *canadense,* with leaves glabrous beneath, the margins entire or minutely crenulate, cross-veins of the leaf well-developed, is widespread in the distribution of the species. Var. *interius* Fernald has the leaves pubescent beneath, the leaf margins distinctly ciliate, and cross-veins obscure; it is not known from our area, but extends east and south as far as MA, NY, and OH. Further study of these varieties is needed. Weller (1970) reports equivocal results on the recognition of varieties, based on a study in n. MI. [= RAB, FNA, K, W, WV, Y, Z; > Maianthemum *canadense* Desfontaines var. *canadense* – C, F, G; = Unifolióum *canadense* (Desfontaines) Greene – S]

**Maianthemum racemosum** (Linnaeus) Link ssp. *racemosum,* Eastern Solomon's-plume, False Solomon's-seal. Forests. Mid April–June; August–October. The species ranges from NS west to BC, south to GA, FL Panhandle, and AZ. A variety of chromosome races are known (2n = 36, 72, 144). The eastern ssp. *racemosum* is tetraploid; ssp. *amplexicaule* (Nuttall) LaFrankie is diploid and more western; these are perhaps more appropriately treated as species. Under the generic name *Smilacina,* two varieties had been described for our area, *Smilacina* *racemosa* var. *racemosa* and *S. racemosa* var. *cylindrica* Fernald, the former larger in nearly all respects and more northern than the latter, smaller, and more southern form (see F for
Nolina 1803 (Beargrass)

Nolina atropurpurea Bartlett, Florida Beargrass. Pine flatwoods and savannas. Endemic to Panhandle FL (Liberty and Franklin counties) and e. peninsular FL (St. Johns and Brevard counties). [= FNA, K, S, WH, Z]

Ophiopogon Ker-Gawler (Mondo Grass)

* Ophiopogon japonicus (Thunberg) Ker-Gawler, Mondo Grass, Black Mondo. Suburban forests; native of China, Taiwan, Japan, and Korea. [= K, Y]

Polygonatum P. Miller 1754 (Solomon's-seal)

A genus of about 57 species, of temperate Eurasia and North America (most diverse in e. Asia). The P. biflorum complex is in need of further study. References: Ownbey (1944)=Z; Judd (2003)=Y; Utech in FNA (2002a); Eigsti (1942); Therman (1950, 1953); Kawano & Iltis (1963); Conran & Tamura in FNA (2002a); Eigsti (1942); Therman (1950, 2003); Kawano & Iltis (1963); Conran & Tamura in Kubitzki (1998a).

Polygonatum biflorum (Walter) Elliott var. biflorum, Small Solomon's-seal. Moist to dry forests. April-June; August-October. CT, NY, and s. ON west to ME, NE, and IN, south to n. FL and s. AL. In addition to the varieties recognized for our area, P. biflorum includes two additional varieties: var. melleum (Farwell) R. Ownbey of MI and ON, and var. necopinum R. Ownbey from the Black Hills of SD. The complex needs additional study. See var. commutatum for discussion of its distinction from var. biflorum. [= Z; < P. biflorum – RAB, C, FNA, W, WH, Y; = P. biflorum – F, G, WV; < P. biflorum var. commutatum (J.A. & J.H. Schultes) Morong – K; < P. commutatum (J.A. & J.H. Schultes) A. Dietrich – S]

There has been a wide divergence of opinion regarding the merits (and practicality) of distinguishing this taxon from typical *P. biflorum*, and the characters considered most reliable; the two taxa may differ in chromosome number and geographical distribution; they are not, however, always readily distinguished morphologically. I prefer to recognize this taxon as a variety. See references for additional discussion.

---

**75c. AGAVACEAE** Endlicher 1841 (Agave Family) [in ASPARAGALES]

A family of about 25 genera and 640 species, herbs and rosette shrubs, of temperate and tropical America. The placement of *Camassia*, *Schoenolirion*, and *Hastingsia*, sometimes grouped as Hyacinthaceae subfamily Chlorogaloideae, is uncertain; they are probably better placed in the Agavaceae, a position supported by molecular, serological, and biogeographic evidence. References: Verhoek & Hess in FNA (2002a); Bogler & Simpson (1995, 1996); Verhoek in Kubitzki (1998a).

1 Plants with erect woody stems; leaves cauline .................................................................................................................................................. *Yucca*

1 Plants acaulescent; leaves in basal rosettes.

2 Margins of leaves fraying into coarse, whitish, curly fibers; tepals about 4 cm long; leaves stiff and > 15 mm wide ......................... *Yucca*

2 Margins of leaves entire, not fraying; tepals < 2 cm long; leaves stiff and wiry (and < 5 mm wide), herbaceous, or fleshy.

3 Leaves oblong-acute, 2-9 cm wide, 2-10× as long as wide, fleshy .................................................................................................. *Manfreda*

3 Leaves linear, 0.3-1.8 cm wide, 20-100× as long as wide, herbaceous or wiry.

4 Leaves narrowly linear, 3-5 mm wide, wiry and grasslike; inflorescence a diffuse panicule; perianth segments 2-4 mm long, white...... ................................................. [Nolina – see RUSCACEAE]

4 Leaves linear, 2-18 mm wide, herbaceous; inflorescence a raceme; perianth segments 13-18 mm long, blue or nearly white.

5 Perianth segments 13-18 mm long, blue or nearly white ........................................................................................................ *Camassia*

5 Perianth segments 5-7 mm long, white, cream, or yellow .......................................................................................... *Schoenolirion*

**Camassia** Lindley 1832 (Wild Hyacinth, Quamash Lily, Camas Lily)

A genus of 6 species, of North America. The family placement of *Camassia* is uncertain; there is increasing evidence that the affinities of *Camassia* are with the Agavaceae, rather than the Hyacinthaceae (Fay & Chase 1996, Bogler & Simpson 1996, Speta in Kubitzki 1998a). References: Ranker & Hogan in FNA (2002a); Speta in Kubitzki (1998a).

**Camassia scilloides** (Rafinesque) Cory, Wild Hyacinth, Quamash Lily, Eastern Camas Lily. Moist forests, over circumneutral soils, in GA, VA, and WV on limestone, in NC on slopes and natural levees along the Roanoke River, in SC over gabbro. April–May. W. PA and s. ON west to s. WI and e. KS, south to nw. GA (Jones & Coile 1988) and TX, nearly entirely west of the Blue Ridge, with only a few disjunct occurrences in the Piedmont and Coastal Plain. [= RAB, C, F, FNA, G, K, W; = Quamasia hyacintha (Rafinesque) Britton – S]

**Manfreda** Salisbury 1866 (False-aloe)

**Manfreda virginica** (Linnaeus) Salisbury ex Rose, Rattlesnake-master, Eastern False-aloe. Granite flatrocks, diabase glades, xeric woodlands over mafic or calcareous rocks, sandhill woodlands. Late May–August; August–October. E. SC, c. NC, sw. VA, w. WV, s. OH, s. IN, s. IL, and MO south to c. peninsular FL and TX. [= FNA, K, W, WH; = Agave virginica Linnaeus – RAB, C, F, WV; > *M. tigrina* (Engelmann) Small – S; > *M. virginica* – S; = Polianthes virginica (Linnaeus) Shimer]

**Schoenolirion** Torrey ex Durand (Sunnybell)

1 Inflorescence with 1-6 branches; leaves without fleshy bases, withering to a persistent fibrous crown.........................................S. albilorum
1 Inflorescence rarely branched; leaves with fleshy bases, not fibrous.
2 Perianth golden-yellow ...........................................................................................................................................................................S. croceum
2 Perianth white .........................................................................................................................................................................................S. wrightii

Schoenolirion albilorum (Rafinesque) R.R. Gates, White Sunnybell. Wet pinelands, cypress depressions, Hypericum depressions, wet hammocks. E. GA south to s. FL and west to AL. [= FNA, K, WH; = S. elliottii Feay ex A. Gray – GW; = Oxytria albiflora (Rafinesque) Pollard – S]

Schoenolirion croceum (Michaux) Wood, Yellow Sunnybell. Wet pine savannas, bogs, seepage slopes, seepages on granite flatrocks. April-May; May-June. SC (and allegedly NC) south to ne. FL, west to se. TX; and in c. TN on limestone glades (Chester et al. 1993). The occurrence in NC in "wet pinelands" in Richmond County referred to in RAB has not been relocated or further documented. [= RAB, FNA, GW, K, WH; = Oxytria crocea (Michaux) Rafinesque – S]

Schoenolirion wrightii Sherman, Texas Sunnybell. Seepage over sandstone. April-early May. N. AL; w. LA and e. TX. [= FNA, K; = Oxytria texana (Scheele) Pollard – S]

Yucca Linnaeus 1753 (Yucca, Adam's-needle)

1 Leaf margins fraying into filamentous threads or fibrils; plant acaulescent (or essentially so); fruit erect.
2 Inflorescence branches glabrous; tepals 5-7 cm long; leaves 2-6 cm wide, stiff, the apex acute-acuminate to obtuse, often concave upward at the apex, the marginal fibrils usually elongate (to 20 cm long).........................................................Y. filamentosa
2 Inflorescence branches scurfy-pubescent; tepals 3-5 cm long; leaves 1.5-4 cm wide, pliable, the apex attenuate-acuminate, not notably concave, the marginal fibrils usually short (to 4 cm long).
3 Leaves 1.5-4 cm wide, abundantly filamentous-margined; [widespread].................................................................Y. flaccida
3 Leaves 1-3 cm wide, sparingly filamentous-margined; [mainly west of the Mississippi River, rarely in the Florida parishes of c. LA]............

.................................................................Y. louisianensis
1 Leaf margins not fraying, minutely notched-serrulate or entire, and hyaline; seeds ca. 1 mm thick, marginless ........................................Y. aloifolia
3 Leaf margins entire, smooth, hyaline-brown or hyaline-tellow; seeds ca. 1 mm thick, marginless.
4 Leaf blades recurved, flexible; fruits generally erect, 2.5-4.5 cm long; [of NC south to FL].........................................................Y. gloriosa
4 Leaf blades rigid, straight; fruits pendent, 5.5-8 cm long; [of GC south to FL].........................................................................................Y. recurvifolia

Yucca aloifolia Linnaeus, Spanish Dagger. Dunes. June-early July; October-December. Se. VA south to s. FL and west to LA. [= RAB, FNA, K, S, WH]

Yucca flaccida Linnaeus, Curlyleaf Yucca, Spoonleaf Yucca. Woodlands, forests, dunes, roadsides, disturbed areas. Late April-early June; September-October. S. NJ south to GA, west to MS; escaped from cultivation over a broader area of e. United States. [= FNA, F, S, W, WV; = Y. flaccida var. flaccida – RAB; < Y. flaccida var. – C, G, K (also see Y. flaccida); > Y. concava Haworth – S; > Y. filamentosa – S]

Yucca gloriosa Linnaeus, Mound-lily Yucca, Spanish Bayonet. Dunes, shell middens, also regularly cultivated and often persistent or weakly escaped around old housesites inland. (April-) October; November-December. E. NC (Dare County) south to ne. FL and w. peninsular FL (Sorrie & LeBlond 2008). [= RAB, K, S; = Y. gloriosa var. gloriosa – FNA; < Y. gloriosa – WH]

Yucca recurvifolia Salisbury, Curve-leaf Yucca. Dunes, dry sandy soils. GA west to w. LA. [= S; = Y. gloriosa Linnaeus var. recurvifolia (Salisbury) Engelmann – FNA; < Y. gloriosa – WH]
75d. HOSTACEAE  B. Mathew 1988 (Hosta Family) [in ASPARAGALES]

A family of a single genus, of about 25 species, of temperate e. Asia. This family is closely related to the Agavaceae, and its inclusion there may prove warranted. References: Kubitzki in Kubitzki (1998a).

Hosta Trattinick 1812 (Hosta, Plantain-lily)

A genus of about 25-40 herbs, of temperate Asia, widely cultivated (since at least the 8th century), and with numerous cultivars. References: Kubitzki in Kubitzki (1998a); Utech in FNA (2002a). Key based on Utech in FNA (2002a).

1 Flowers long-tubular, to 13 cm long, white, fragrant ..............................................................................................................................................H. plantaginea

2 Leaves lanceolate to oblanceolate, 4-5.5 cm long, blue or purplish, not fragrant; flowers purplish violet; anthers purple ...............................................................

2 Flowers campanulate to urceolate, 4-5.5 cm long, blue or purplish, not fragrant.

2 Leaves lanceolate to oblanceolate, 10-17 cm long, 5-7.5 cm wide, with 5-6 lateral veins on each side of the midvein; flowers purplish violet; anthers purple ..............................................................................................................................................H. lancifolia

2 Leaves ovate to cordate, the blade 20-30 cm long, 15-20 cm wide, with 7-9 lateral veins on each side of the midvein; flowers bluish purple; anthers spotted purple ............................................................................................................................................................H. ventricosa

* Hosta lancifolia Engler, Narrowleaf Plantain-lily. Widely planted as a shade ornamental, rarely persistent; "native" of Japan (probably only of garden origin). [= FNA, K]

* Hosta plantaginea (Lamarck) Ascherson, Fragrant Plantain-lily. Widely planted as a shade ornamental, rarely persistent; rare, native of China. [= FNA, K]

* Hosta ventricosa (Salisbury) Stearn, Blue Plantain-lily. Widely planted as a shade ornamental; rare, native of China. [= FNA, K]

75e. THEMIDACEAE Salisbury 1866 (Brodiea Family) [in ASPARAGALES]

Dichelostemma Kunth 1843

* Dichelostemma congestum (Smith) Kunth. Disturbed areas; native of Pacific northwestern North America, cultivated and apparently escaped in the Piedmont of nc. GA (Jones & Coile 1988). {further investigate} [= FNA, K; = Brodiaea congesta Smith]

75f. HYACINTHACEAE Batsch 1786 (Hyacinth Family) [in ASPARAGALES]

A family of about 67 genera and 900 species, herbs, nearly cosmopolitan. References: Speta in Kubitzki (1998a); Pfosser et al. (2003). [also see AGAVACEAE]

1 Tepals united into a perianth tube longer than the free portion; [subfamily Hyacinthoideae, tribe Hyacintheae].

2 Perianth tube <2 × as long as the lobes; corolla spreading and open at the mouth ..............................................................................................................................................Hyacinthus

2 Perianth tube >2 × as long as the lobes; corolla contracted at the mouth ..............................................................................................................................................Muscari

3 Tepals white, with a greenish stripe on the outer surface, separate; bracts 0-1 per flower; [subfamily Ornithogaloideae] ..............................................................................................................................................Ornithogalum

3 Tepals blue (less commonly white or pink), separate or fused at the extreme base; bracts either 0-1 or 2 per flower; [subfamily Hyacinthoideae, tribe Hyacintheae].

4 Bracts 2 subtending each flower ..............................................................................................................................................Hyacinthoides

4 Bracts 0-1 subtending each flower

5 Tepals connate basally for more than 1/10 of their length ..............................................................................................................................................Chionodoxa

5 Tepals separate ........................................................................................................................................................................................................Scilla
**HYACINTHACEAE**

166

**Chionodoxa** Boissier 1844 (Glory-of-the-snow)

* **Chionodoxa luciliae** Boissier, Glory-of-the-snow. Lawns, disturbed areas; native of w. Turkey. April-May. [= FNA, K]

**Hyacinthoides** Heister ex Fabricius 1759 (Bluebell)

1 Racemes erect; perianth campanulate; anthers blue ............................................................................................................................ *H. hispanica*

1 Racemes pendant at apex; perianth tubular; anthers cream ................................................................................................................ *H. nonscripta*

* **Hyacinthoides hispanica** (P. Miller) Rothmaler, Spanish Bluebell. Persistent after cultivation; native of Europe. [= FNA, K, Y, Z; = Endymion hispanicus (P. Miller) Chouard]

* **Hyacinthoides nonscripta** (Linnaeus) Chouard ex Rothmaler, English Bluebell. Persistent after cultivation; native of Europe. [= K, Z; = Scilla non-scripta (Linnaeus) Hoffmannsegg & Link – C, G; = Scilla nonscripta (Linnaeus) Hoffmannsegg & Link – F; = Hyacinthoides non-scripta – FNA, Y, orthographic variant; = Endymion nonscripta (Linnaeus) Garcke]

**Hyacinthus** Linnaeus 1753 (Hyacinth)

* **Hyacinthus orientalis** Linnaeus, Hyacinth. Persistent after cultivation; native of w. Asia. [= K, Z]

**Muscari** P. Miller 1754 (Grape-hyacinth)

1. Raceme 10-20 cm long; pedicels of the terminal flowers > 5 mm long; flowers brown (the lower and fertile) and blue (the upper and sterile); leaves flat, mostly 8-20 mm wide ................................................................................................................................................................. *M. comosum*

1. Raceme 1-5 cm long in flower (somewhat longer in fruit); pedicels < 5 mm long; flowers all blue to blue-black; leaves flat, channeled, or terete, mostly 1-8 mm wide.

2. Leaves flat or channeled, 3-8 mm wide; corolla nearly spherical, the lobes strongly recurved ................................................................................................................................. *M. botryoides*

2. Leaves nearly terete, 1-3 mm wide; corolla ellipsoid-ovoid, distinctly longer than wide, the lobes erect.

3. Perianth of lower (fertile) flowers bright blue ................................................................................................................................................................. *M. armeniacum*

3. Perianth of lower (fertile) flowers deep blackish-blue or -purple ................................................................................................................................................................. *M. neglectum*

* **Muscari armeniacum** Leichtlin ex Baker, Garden Grape-hyacinth, Armenian Grape-hyacinth. Cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; native of Mediterranean e. Europe and w. Asia. March-April; May-June. [= FNA, K, Z]

* **Muscari comosum** (Linnaeus) P. Miller, Tassel Grape-hyacinth. Cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; native of Europe. March-April; May-June. [= C, F, FNA, G, K, Z]
HYACINTHACEAE

**Ornithogalum** Linnaeus 1753 (Star-of-Bethlehem)

1. Lower pedicels < 1 cm long, about as long as the upper pedicels (and shorter than the perianth segments); leaves mostly 8-15 mm wide; scape 2-5 dm tall................................................................................................................................................................................................... *O. nutans*

2. Lowest pedicels 2-6 cm long, longer than the upper pedicels (and longer than the perianth segments); leaves mostly 2-5 mm wide; scape 1-3 dm tall .................................................................................................................................................................................................. *O. umbellatum*

**Scilla** Linnaeus 1753 (Squill)

*Scilla siberica* Haworth, Siberian Squill. Suburban woodlands; native of Russia. [= FNA, K, Z]

76. ARECACEAE Schultz 1832 or PALMAE de Jussieu 1789 (Palm Family) [in ARECALES]

A family of about 190 genera and 2000 species, trees and shrubs, of tropical and subtropical regions of both hemispheres. Cold-hardy palms in other genera are sometimes planted in thje southern parts of our area, particularly near the coast. References: Zona in FNA (2000); Dransfield & Uhl in Kubitzki (1998b).

1. Leaves pinnate (with a well-developed central axis, the leaf blade much longer than wide); [introduced species]; [subfamily Arecoideae, tribe Cocoeae].

2. Petiole with spines; leaflets 44-80 per leaf side, glaucous; fruit 1.8-3.5 cm long .................................................................................................................. *Butia*

3. Petiole unarmed; leaflets 75-100 per leaf side, green; fruit 20-30 cm long .................................................................................. *Cocos*

1. Leaves palmate or costapalmate (lacking a central axis or with a short central axis, the leaf blade about as long as wide; [native species]; [subfamily Coryphoideae, tribe Coryphaeae].

3. Petioles armed with sharp recurved teeth; [subtribe Livistoniinae]

4. Petiolar spines > 2 mm long; tree (trunk erect) .................................................................................. *Livistona*

4. Petiolar spines 0.5-2 mm long; shrub (trunk prostate or leaning) .................................................................................. *Serenoa*

5. Petioles smooth, unarmed (leaf sheaths with long needle-like spines in *Rapidophyllum*).

5. Petioles and lower leaf surfaces more or less silvery pubescent; leaf sheaths bearing long (10-50 cm) needle-like spines; [subtribe Thrinacininae] .............................................................................................................. *Rapidophyllum*

5. Petioles and lower leaf surfaces green and glabrous; leaf sheaths without spines; [subtribe Sabalinae] .............................................................................................................. *Sabal*

*Butia* (Beccari) Beccari 1916 (Butia)

* Butia capitata* (Martius) Beccari, Brazilian Butia, South American Jelly Palm, Pindo Palm. Widely planted in the outer Coastal Plain of se. NC, e. SC, e. GA, and FL; native of s. Brazil and Uruguay. It persists and can appear naturalized in apparently semi-natural situations.

*Cocos* Linnaeus 1753 (Coconut Palm)

A monotypic genus, the single species now pantropical. References: Zona in FNA (2000).

* Cocos nucifera* Linnaeus, Coconut Palm. Coconut palm rarely reaches our shores as propagules (coconuts, which may germinate and live briefly), but it is not established; native region unknown, but probably tropical islands of the western Pacific (now pantropical). Photographic evidence has been supplied from as far north as Bear Island, Onslow County, NC, 11 June 1996 (Dave Owen, pers. comm. and photograph). [= FNA, K, S, WH]

*Livistona* R. Brown 1810 (Fan Palm)

*Rhapidophyllum* H. Wendl. & Drude ex Drude 1876 (Needle Palm)

*Rhapidophyllum hystrix* (Pursh) H. Wendl. & Drude ex Drude, Needle Palm. Moist to wet soils of small blackwater stream swamps, especially where underlain with coquina limestone ("marl"), hydric hammocks and rich, wetland-upland transitions. Se. SC (Beaufort and Jasper counties) south to c. peninsular FL, and west to s. MS. Becoming somewhat popular as a hardy palm that can be grown in the Southeast, well north of its natural range. [= FNA, GW, K, S, WH, Z]

*Sabal* Adanson 1763 (Palmetto)

Identification notes: The hastula is the midrib of the leaf, as seen on the upper (adaxial) surface.

1 Tree, with erect trunk (though young plants appear as trunkless shrubs, similar in habit to *S. minor*); leaves 15-30 per plant; hastula 5.3-18 cm long, acute to acuminate; margins of leaf segments with filamentose fibrils; leaf segment apices 2-cleft .................................................. *S. palmetto*

1 Shrub, with subterranean, rhizomatous "trunk" (very rarely emerging as much as 1 meter from the ground); leaves 4-10 per plant; hastula 0.8-4.7 cm long, obtuse to acute; margins of leaf segments with or without filamentose fibrils; leaf segment apices 2-cleft (*S. etonia*) or entire (*S. minor*).

2 Margins of leaf segments with filamentose fibrils; hastula acute; fruits 9.0-15.4 mm in diameter; segment apices 2-cleft; [of dry sandy habitats] ................................................................................................................................. *S. etonia*

2 Margins of leaf segments without filamentose fibrils; hastula obtuse; fruits 6.4-9.7 mm in diameter; segment apices generally entire; [of moist to wet habitats] ................................................................................................................................. *S. minor*

*Sabal etonia* Swingle ex Nash, Scrub Palmetto. Florida scrub. Late May-July. Endemic to FL (Clay County, FL south to Miami-Dade County, FL, primarily on the Lake Wales Ridge but also on coastal and intermediate ridges). See Zona & Judd (1986) for extensive information about the ecology and distribution of this species. [= FNA, K, S, WH, Y, Z]

*Sabal minor* (Jacquin) Persoon, Dwarf Palmetto. Swamps, maritime forests, low moist woods, especially in calcareous soils developed from shell limestone (marl). May-July; September-November. Ne. NC (Currituck County) south to e. peninsular FL, west to e. TX, c. TX, se. OK, and s. AR; disjunct in Nuevo León (Goldman 1999). This palm reaches its northern limit at Monkey Island, Currituck County, NC (L. Musselman, J. Boggs, pers. comm., 2006). No other New World palm has a native range extending so far north. [= RAB, FNA, GW, K, WH, Z; > S. minor – S; > S. deeringiana Small – S]
Sabal palmetto (Walter) Lodolges ex J.A. & J.H. Schultes, Cabbage Palmetto. Maritime forests, marsh edges, and other near-coastal communities. July; October-November. Native from se. NC south to s. FL, west to w. Panhandle FL, and in the West Indies in Cuba and the Bahamas; planted beyond that range, especially on the Gulf Coast. This palm is the state tree of South Carolina and is common and conspicuous (both as a native tree and in plantings) along the South Carolina coast; it currently reaches its northern limit as a native species in Brunswick County, NC, where it is a conspicuous part of the forest on Smith Island complex (Bald Head Island, Middle Island, Bluff Island). It is planted elsewhere (and further north) on the coast. Periodic disturbance by hurricanes helps maintain populations of Sabal palmetto, which survives winds and flooding that topple or kill Quercus virginiana. Curtis (1883) reports that "Cape Hatteras is, or was, the northern limit of this Palm... It is to be deeply regretted, however, that a reckless indifference to the future, which has been charged as a characteristic of Americans, is likely to efface, at no very distant time, every vestige of this interesting ornament of our coast. The inner portion of the young plant is very tender and palatable, somewhat resembling the Artichoke and Cabbage in taste (hence its name of Cabbage Tree), and is often taken for pickling, and the stock is ruined by the process. Thus for a pound or two of pickles, no better either than many other kinds, the growth of half a century is destroyed in a moment, and posterity left to the wretched inheritance of vain mourning for the loss of the greatest beauty of our maritime forest." [= RAB, FNA, GW, K, S, WH, Z]

Serenoa Hooker f. 1828 (Saw Palmetto)

Serenoa repens (Bartram) Small, Saw Palmetto. Pine flatwoods and maritime forests. May-July; October-November. Se. SC (in maritime forests in Charleston and Colleton counties, and in spodosolic flatwoods in Beaufort and Jasper counties) south to s. FL and west to e. LA. Serenoa forms extensive clonal patches, connected by underground rhizomes, and is a dominant plant in many parts of FL, in pine flatwoods or scrub. [= RAB, FNA, GW, K, S, WH]

78. COMMELINACEAE R. Brown 1810 (Spiderwort Family) [in COMMELINALES]

A family of about 41 genera and 650 species, herbs, of tropical and warm temperate regions of both hemispheres. References: Faden in FNA (2000); Faden in Kubitzki (1998b); Tucker (1989).

1 Spathes absent; inflorescence open and repeatedly branched; [tribe Tradescantieae].........................................................Gibasis
2 Spathes single, or paired; inflorescence compact, unbranched.
3 Spathe fold then pointed, and scale-like, scarious, and inconspicuous, not closely subtending and surrounding the flower pedicels; petals equal, in both size and coloration.
4 Leaves linear, < 20° as long as wide; petals bright pink (rarely white); [tribe Tradescantieae].................................Cuthbertia
5 Fertile stamens 3, alternating with 3 staminodia; petals pink to purplish or bluish; [tribe Commelinae] ...............Murdannia
6 Fertile stamens 0-6, all fertile; petals white; [tribe Tradescantieae]..............................................................Callisia

Callisia Loebling

1 Leaves 15-30 cm long, 2.5-5 cm wide; stems ascending.................................................................C. fragrans
2 Leaves 1-3.5 cm long, 0.5-1.4 cm wide; stems creeping.
3 Inflorescences pedunculate; flowers on pedicels; capsule with 3 locules .........................................................C. cordifolia
4 Inflorescences sessile; flowers sessile or nearly so; capsule with 2 locules .........................................................C. repens
**Callisia cordifolia** (Swartz) E.S. Anderson & Woodson. Disturbed area? Native from n. peninsular FL to s. FL; Mexico, the West Indies, and n. South America. Reported for nw. GA (Faden in FNA 2000). [= FNA, K; *Tradescantia cordifolia* (S. Watson) Small – S = *Tradescantia cordifolia* Swartz]

* Callisia fragrans (Lindley) Woodson, Basketflower. Disturbed areas; native of Mexico. February. [= FNA, K]
* Callisia repens (Jacquin) Linnaeus. Disturbed areas; native of tropical America. [= FNA, K, WH]

---

**Commelina** Linnaeus 1753 (Dayflower)

1 Spaths with margins free to the base; [introduced species, usually in weedy habitats],
2 Spaths generally whitish or pale green toward the peduncle, with contrasting dark green veins; middle petal white or paler than the others; capsules with 2 locules (the third aborting); seeds rugose foveate-recticulate.................................................. *C. communis*
2 Spaths lacking contrasting veins; middle petal about the same color as the others; capsules with 3 locules; seeds reticulate or smooth to faintly alveolate.
3 Spaths not at all to slightly falcate (the lower margin straight or very nearly so); upper cyme usually vestigial (rarely well-developed and 1-flowered); seeds smooth to faintly alveolate; peduncles of the spathes with hairs to 0.5 mm long................................. *C. caroliniana*
3 Spaths usually distinctly falcate (the lower margin curved); upper cyme in larger spathes usually well-developed and 1-severalflowered; seeds deeply reticulate; peduncles of the spathes with hairs to 0.1 mm long .................................................. *C. diffusa*

--

**Commelina benghalensis** Linnaeus, Tropical Spiderwort, Bengal Dayflower. Fields; native of tropical Asia and becoming a serious weed. This annual, pantropical weed is well established in FL and s. GA (Faden 1993). Spot infestations have been reported in NC (Wayne County), SC (Edgefield County), and MS as well. "This annual species can be recognized by: its funneliform spathes that are often clustered; relatively broad leaves that frequently have red hairs at the summit of the sheath; and cleistogamous flowers that are borne at the base of the plant and are usually subterranean (in addition to normal, aerial, funnelform spathes that are often clustered; relatively broad leaves that frequently have red hairs at the summit of the sheath; and cleistogamous flowers that are borne at the base of the plant and are usually subterranean."

--

**Commelina communis** Linnaeus, Common Dayflower. Gardens, bottomlands, disturbed ground; native of the Old World. May-October. Var. *communis* and var. *ludens* are sometimes distinguished (see synonymy): var. *communis* has flowers with larger petals pale blue and sterile anthers completely yellow, var. *ludens* has larger petals intense violet blue and sterile anthers with a brownish-purple spot. [= RAB, C, FNA, GW, S, W, X, Y; > *C. communis* Linnaeus var. *ludens* (Miquel) C.B. Clarke – F, G, K, WV, Z; > *C. communis var. communis* var. – F, G, K, WV, Z]

**Commelina erecta** Linnaeus var. *angustifolia* (Michaux) Fernald, Sand Dayflower. Dunes and dry sand flats on barrier islands, sandhills, other dry sandy sites, shale barrens, other dry rocky sites. June-October. E. NC south to s. FL, west to TX, and north and west in the interior to IA, n. NE, CO, and NM. Contrary to the specific epithet, *C. erecta* var. *angustifolia* is a
trailing plant, the stems as long as 1.3 m. The taxonomy and distribution of the two varieties here recognized need further study. [= C, F, FNA, G, K, WV, X; < C. erecta – RAB, W, Y, Z; > C. angustifolia Michaux – S; > C. crispa Wooton – S]

Commelina erecta Linnaeus var. erecta, Erect Dayflower. Dry openings and woodlands, especially in thin soil around rock outcrops, streambanks, riverbanks, mesic forests. June-October. PA west to MO and e. KS, south to FL and TX. [= C, F, FNA, G, K, X; < C. erecta – RAB, W, Y, Z; = C. erecta – S]

* Commelina gambiae C.B. Clarke. Disturbed areas. A West African species first collected in North America in 1976 (Manatee County, FL), is immediately distinguishable from our species by its peach-colored flowers and fused spathes. Faden (1993) reports that it “appears to be spreading rapidly,” but whether it can spread significantly northward from peninsular FL is questionable. [= FNA; = Commelina nigricana Bentham var. gambiae (C.B. Clarke) Brenan – K, Y]

Cuthbertia Small 1903 (Roseling)

A genus of 3 species, herbs, of se. North America. There seems ample reason for recognizing Cuthbertia as distinct from Tradescantia, based on the single spathes (vs. paired), glabrous filaments (vs. hairy), differently shaped anther connectives, etc. Hunt (1983, 1986) has treated Cuthbertia as a section of Callisia Loefling, a decision followed with little additional comment or discussion by Tucker (1989). While this course may be warranted, the authors advocating it have presented little evidence to support it. Hunt (1986), in discussing a number of small tropical genera which he also reduces to sections of Callisia, states “this leaves two alternatives: to recognize numerous (perhaps 10) genera of 1-2 species, or to experiment with an amplification and sectionalization of Callisia, which I find the lesser of the two evils.” He mentions that “the succulent habit ... is a principal unifying feature of the enlarged genus as a whole, reflecting the concentration of its species in tropical seasonal habitats, often on rocks.” Cuthbertia is endemic to se. North America (a separate and more northerly distribution than the remainder of a broad Callisia), is only slightly succulent, occurs primarily in sandy habitats, and has a different base chromosome number (x=6) than some components of a broad Callisia. Until and unless a more compelling case is presented for the inclusion of Cuthbertia in Callisia, I prefer a more conservative and traditional maintenance of Cuthbertia, which is also more in line with the philosophy on the circumscription of genera. References: Faden in FNA (2000); Tucker (1989)=Z; Giles (1942); Giles (1943); Lakela (1972); Faden in Kubitzki (1998b).

1 Leaves loosely spreading, the leaf blades 4-15 mm wide (as wide as or wider than the opened, flattened sheaths)..........................C. rosea
2 Leaves erect or ascending, the blade 1-5 mm wide (narrower than the opened, flattened sheaths)

Cuthbertia erecta Small, Grassleaf Roseling. Sandhills. May-July. Cuthbertia erecta includes 3 morphologically distinguishable cytological races, occupying different (but partially overlapping) ranges (Giles 1942, Giles 1943, Tucker 1989). The predominant race is tetraploid, occupying the outer Coastal Plain of VA, NC, and SC, middle Coastal Plain of NC and SC, fall-line sandhills of SC, and south into FL. The diploid race is endemic to the fall-line sandhills of NC and ne. SC, a distribution similar to those of Pyxidanthera brevifolia, Liatris cokeri, and Lycopus cokeri. Rare haploids have been found at scattered sites in SC and FL. The tetraploid race averages about 25% larger than the diploid in most vegetative and floral characters, and is reported to exhibit a greater ecological amplitude (Giles 1942, 1943). [= S; = Tradescantia rosea Ventenat var. graminea (Small) E.S. Anderson & Woodson – RAB, C, F, G; = Callisia graminea (Small) G. Tucker – FNA, K, WH, Z]

Cuthbertia graminea Small, Grassleaf Roseling. Sandhills, scrub, dunes. FL peninsula; disjunct in Gulf County in the FL Panhandle. [= S; = Callisia ornata (Small) G. Tucker – FNA, K, WH, Z; = Tradescantia rosea Ventenat var. ornata (Small) E.S. Anderson & Woodson]

Cuthbertia rosea (Ventenat) Small, Common Roseling. Sandhills, other dry woodlands. May-July. MD south to peninsular FL, west to s. AL. [= S; = Tradescantia rosea Ventenat var. rosea – RAB; = Callisia rosea (Ventenat) D.R. Hunt – FNA, K, WH, Z]

Gibasis Rafinesque 1837 (Bridal-veil)

* **Gibasis pellucida** (M. Martens & Galetti) D.R. Hunt, Tahitian Bridal-veil. Disturbed areas; native of Mexico. April-October. [= FNA, WH; = G. schiedeana (Kunth) D.R. Hunt]

| 1 | Flowers solitary or in 2-4-flowered racemes borne in the upper leaf axils; capsules 8-10 mm long; seeds ca. 3 mm long; pedicels much longer than the capsule; .............................. M. keisak |
| 1 | Flowers in stalked cymose racemes borne terminally or the uppermost leaf axil; capsules 4-5 mm long; seeds 1.0-1.5 mm long; pedicels about as long as the capsule; ..................................................... M. nudiflora |

* **Murdannia nudiflora** (Linnaeus) Brenan. Moist sands, ditches, wet disturbed places; native of Asia, now widespread in the tropics and subtropics of both hemispheres. May-October. This species apparently arrived in the se. United States earlier than *M. keisak* (S, for instance, treats this species and not *M. keisak*), but is distinctly less common. [= FNA, GW, K, Z; = Anelilema nudiflorum (Linnaeus) Sweet – RAB, S]

**Tradescantia** Linnaeus 1753 (Spiderwort)

[also see *Callisia* and *Cuthbertia*]

| 1 | Leaves purple; flowers nearly sessile; petals clawed, the claws fused basally; stamens epipetalous......................................................... **T. pallida** |
| 1 | Leaves green; flowers distinctly pedicelled; petals neither clawed nor connate; stamens not adnate to the petals. ....................................................... **T. fluminensis** |
| 2 | Plant sprawling, rooting at the nodes; leaves > 4 cm long, > 5× as long as wide; [exotic] ............................................................................................................. **T. ernestiana** |
| 2 | Plant erect or ascending, not rooting at the nodes; leaves > 4 cm long, > 5× as long as wide; [native]. ................................................................. **T. subaspera** |
| 3 | Leaf blades of the upper stem constricted at their bases to a narrower subpetiolar sheath, the opened sheath narrower than the leaf blade; leaf blades 6-27 cm long, 1.0-5.0 cm wide, mostly > 10× as long as wide; stomates much more abundant on the lower leaf surface than on the upper, giving the lower surface a much paler color. ................................................. **T. virginitana** |
| 4 | Pedicels 2.0-3.2 cm long; sepals 9-16 mm long ................................................................................................................................................. **T. rosalena** |
| 5 | Pedicels 1.0-1.7 cm long; sepals 4-10 mm long ................................................................................................................................................. **T. hirsuticaulis** |
| 6 | Leaves glaucous to subglaucous, puberulent; sepals, pedicels, and ovary puberulent with glandular hairs only; pedicels 1.2-2.5 cm long ................................................................................................................. **T. roseolens** |

| 8 | Sepals, pedicels, and ovary pubescent with glandular hairs only (use 10× magnification); leaves glabrous or pilose at the junction of the blade and the sheath (or pilose throughout in *T. hirsuticaulis*). ................................................................................................................................................. **T. roseolens** |
| 9 | Plants distinctly glaucescent; leaves 5-45 cm long, arcing, at an acute angle to the stem ................................................................................................................. **T. ohiensis** |

**Tradescantia ernestiana** E.S. Anderson & Woodson. Dry woodlands. Primarily Ozarkian (AR, MO, OK, disjunct east to nw. GA and ne. AL, and west to n. TX (Faden in FNA 2000).  
[= FNA, K, Y, Z; < T. pilosa J.G.C. Lemaire – S]
* Tradescantia fluminensis da Conceição Vellozo, Wandering Jew. Disturbed areas, lawns, vacant lots, moist suburban woods, along streams; native of tropical America. Reported for Beaufort Co. SC (Daniel C. Payne 2009, pers. comm.). [= FNA, K, WH, Z]

Tradescantia hirsuticaulis Small, Hairy Spiderwort. Dry rocky woodlands, and rock outcrops (especially granitic flatrocks and domes). April-June. W. NC and wc. TN south to sc. SC, s. GA, s. AL, and sc. MS; disjunct in AR, e. OK, and nw. LA. There is some question about the validity of this species. [= RAB, FNA, K, W, Y, Z]

Tradescantia pallida (Rose) D.R. Hunt, Purplequeen, Purpleheart, Wandering Jew. Disturbed areas; native of Mexico. [= FNA, K, WH]

Tradescantia paludosa E.S. Anderson & Woodson. Swamps and bottomlands. March-May. Coastal Plain of AL and FL (?), west to TX and AR. [= FNA, K, Y, Z; = T. ohiensis var. paludosa (E.S. Anderson & Woodson) D.T. MacRoberts]

Tradescantia roseolens Small, Sandhill Spiderwort. Dry sandy woodlands. May-June. SC south through GA to c. peninsular FL, west to AL. [= RAB, FNA, K, WH, Y, Z; = T. longifolia Small – S]

Tradescantia subaspera Ker-Gawler, Wide-leaved Spiderwort. Dry to mesic woodlands and forests, hammocks. June-July. Nc. NC, w. VA, WV, OH, IN, IL, and MO, south to NC, SC, sw. GA, Panhandle FL, and AL. Two questionable varieties are sometimes recognized. Var. subaspera may be distinguished by the stem conspicuously zigzag above, except on depauperate or juvenile plants (vs. the stems straight or only slightly zigzag), uppermost lateral cymes sessile or short-pedunculate (vs. pedunculate throughout), uppermost internodes very reduced, crowding the upper leaves (vs. internodes less reduced), leaves much broader than the sheath (vs. only slightly broader), and its generally greater size than var. montana. T. subaspera var. montana ranges from sw. VA and c. WV south to nw. SC, n. GA, and se. TN, with disjunct occurrences in c. AL and Panhandle FL. Var. subaspera ranges from WV west to n. IL, south to se. TN, ne. AR, and s. MO, with disjunct occurrences in NC. [= RAB, FNA, W; > T. subaspera var. montana (Shuttleworth ex Britton) E.S. Anderson & Woodson – C, F, G, K, WV, Y, Z; > T. subaspera – C, F, G, K, WV, Y, Z; < T. pilosa J.G.C. Lemaire – S]

80. PONTEDERIACEAE Kunth 1816 (Pickerelweed Family) [in COMMELINALES]

A family of about 9 genera and 33 species, primarily of the tropics, but with some temperate representatives. References: Rosatti (1987a); Cook in Kubitizki (1998b); Horn in FNA (2002a).

1 Inflorescence with >50 flowers; fruit 1-seeded, indehiscent; leaves lanceolate to ovate, 1.5-10× as long as wide, the base cordate, truncate, or cuneate. ................................................................. Pontederia

2 Inflorescence with <30 flowers; fruit 10-200-seeded, capsular; leaves either reniform, 0.5-1.5× as long as wide, the base cordate or rounded, or narrowly linear, 20-50× as long as wide, the base attenuate.

1 Leaves coriaceous; petioles expanded into air-filled floats or not; perianth lobes 1.3-3.7 cm long. ................................................................. Eichhornia

2 Leaves membraneous; petioles never expanded into air-filled floats; perianth lobes 0.4-1.0 cm long. ................................................................. Heteranthera

Eichhornia Kunth 1842 (Water Hyacinth)

A genus of 7-8 species, native of tropical America and Africa, but now introduced widely in warm regions. References: Cook in Kubitizki (1998b); Horn in FNA (2002a).
### Pontederiaceae

1. Plants rooted; stems elongate, with leaves spaced and alternate; petioles not inflated.......................................................... *E. azurea*
2. Plants floating (or stranded by dropping water levels); stems short, with leaves in a rosette with very short internodes; petioles inflated............

*Eichhornia azurea* (Swartz) Kunth, Rooted Water-hyacinth. Ditches, rivers; native of tropical America. June-October. [= FNA, K, WH]

*Eichhornia crassipes* (Martius Solms-Laub, Water Hyacinth. Ponds, ditches, sluggish water, native of tropical America. June-September. *E. crassipes* is "generally considered the world's most serious aquatic weed" (Rosatti 1987). Originally native to tropical South America. *E. crassipes* is now a widespread naturalized weed throughout the tropics and subtropics. In the northern part our area, water hyacinth is rare, probably not long persisting. Further south, it can be an aggressive aquatic weed. [= RAB, C, F, FNA, G, GW, K, Z = *Piaropus crassipes* (Martius) Rafinesque – S]

#### Heteranthera Ruiz & Pavón 1794 (Mud-plantain)

1. Leaves narrowly linear, 20-50× as long as wide, the base attenuate; flowers solitary, the corolla yellow; stamens and anthers all alike.......................................................... *H. dubia*
2. Leaves reniform, 0.5-1.5× as long as wide, the base cordate; flowers 1-several, the corolla white or pale blue; stamens and anthers dimorphic.

#### Heteranthera dubia* (Jacquin) MacMillan, Water Stargrass. Streams, rivers. Late July-October. QC west to WA, south to Cuba and Central America, but rare or absent in much of the se. United States. The attribution of this species to SC is in error (as by Kartesz 1999), based on a misidentified specimen (C. Horn, pers. comm.). [= RAB, F, FNA, GW, K, W, WV; = *Zosterella dubia* (Jacquin) Small – C, G, S]

#### Heteranthera limosa* (Swartz) Willdenow. Wet ditches, other wet areas. KY, MN, SD, and CO, south to AL, MS, LA, TX, and AZ; Mexico, Central and South America, West Indies. East to TN, KY, AL (Diamond & Woods 2009), and FL (Kartesz 1999); it is attributed to VA in Small (1933), but the documentation is not known. [= FNA, C, F, G, K, S, Z]

#### Heteranthera multiflora* (Grisebach) Horn. In shallow, stagnant water in floodplains, or emerged on mud. June-October. IL west to NE, south to MS; also on the Atlantic Coastal Plain from NJ south through PA to ne. NC; also in South America (Brazil, Paraguay, Argentina, and Venezuela). [= C, FNA, K, Z]

#### Heteranthera rotundifolia* (Kunth) Grisebach. Ponds. Midwestern, as a rare disjunct east to c. KY (Larue County) (Medley 1993); Central and South America, West Indies. [= FNA, C, K, Z]

#### Pontederia Linnaeus 1753 (Pickerelweed)

1. Floral tube villous when young, essentially glabrous to sparsely glandular in maturity; leaves primarily ovate to triangular-lanceolate, 2.2-21 cm wide, the base generally cordate or truncate (rarely cuneate)................................. *P. cordata var. cordata*
1. Floral tube persistently pubescent with short glandular hairs; leaves lanceolate, 0.4-8.3 cm wide, the base generally cuneate to truncate..........

*P. cordata var. lancifolia*
**PONTEDERIACEAE**

*Pontederia cordata* Linnaeus, Heartleaf Pickerelweed. Marshes, pond-shores, lake-shores. May-October. NS west to MN, south to FL and TX; s. Brazil, Argentina, Paraguay, and Uruguay. The recognition of infraspecific taxa in *Pontederia cordata* is controversial and requires additional study. *P. cordata* exhibits tristyly, an interesting breeding system. Each plant has one of 3 types of flowers: (a) a short style, 3 medium and 3 long stamens, (b) a medium style, 3 short and 3 long stamens, or (c) a long style, 3 short and 3 medium stamens. [= GW, Z; < *P. cordata* – RAB, C, FNA, K, W; = *P. cordata* – F, G, S, WV]

*Pontederia cordata* Linnaeus var. *lancifolia* (Muhlenberg ex Elliott) Torrey, Lanceleaf Pickerelweed. Marshes, pond-shores, lake-shores. May-October. S. MA (alleged to occur as far north as ME, but these reports may be entirely based on misidentifications of var. *cordata*) to s. FL, west to e. TX, mostly on the Coastal Plain, with a few records around the Great Lakes; Cuba; s. Brazil, Argentina, Paraguay, and Uruguay. A third variety of *P. cordata*, var. *ovalis* (Martens in Roemer & Schultes) Solms in A.P. de Candolle, is restricted to South America. [= GW, Z; < *P. cordata* – RAB, C, FNA, K, W; = *P. lanceolata* Nuttall – F, G, S]

81. **HAEMODORACEAE** R. Brown 1810 (Bloodwort Family) [in COMMELINALES]

A family of about 14 genera and 100 species, herbs, of semicosmopolitan distribution, but centered in Australia. The Haemodoraceae is primarily a family of the Southern Hemisphere; *Lachnanthes* is the only member native to e. North America. *Lophiola* has often been treated in the Haemodoraceae; recent evidence, however, indicate that it is better placed in the Nartheciaceae (or Liliaceae *sensu lato*); see *Lophiola* (Nartheciaceae) for additional details. References: Robertson (1976)=Z; Simpson in Kubitzki (1998b); Robertson in FNA (2002a). [also see **MELANTHIACEAE**]

*Lachnanthes* Elliott 1816 (Redroot)

Identification notes: A very distinctive plant when in flower, with its densely woolly inflorescence and flowers. When not in flower, recognizable by its equitant (iris-like) base and bright red roots.

*Lachnanthes caroliniana* (Lamarck) Dandy, Redroot. Wet savannas, pocosin edges, shores of Coastal Plain depression ponds (and similar ponds in the mountains of Virginia), ditches, wet disturbed ground. June-early September; September-November. The range is almost strictly on the Coastal Plain, and rather disjunct: s. NS, from MA to DE, from se. VA south to s. FL and west to LA, with inland disjunctions in w. VA and se. TN (Coffee County); Cuba. The correct spelling of the specific epithet has been disputed; the original spelling was "caroliana," but Gandhi (1999) argues convincingly that this is a correctable typographic error. [= RAB, C, FNA, GW, W, Y; = *Lachnanthes carolina* – K, WH, Z, orthographic variant (correctable typographic error); = *L. tinctoria* (J.F. Gmelin) Elliott – F, G; = *Gyrotheca tinctoria* (J.F. Gmelin) Salisbury – S]

86. **CANNACEAE** A.L. de Jussieu 1789 (Canna Family) [in ZINGIBERALES]

*Canna* Linnaeus 1753 (Canna)

Identification notes: The petals are generally sepaloid (sometimes brightly colored); the showy, colored portions of the flower are the staminodes.

1 Flowers not tubular at the base (or with a short tube to 2 cm long); petals erect; [alien, cultivated and persistent] ......................... *C. ×generalis*
2 Flowers tubular at the base; petals reflexed; [native or cultivated]; 

1 Flowers yellow; capsule 5-6 cm long, ellipsoid (longer than broad); leaves glaucous; [native] ...................................................... *C. flaccida*
2 Flowers red, orange, or mixed red-and-yellow; capsule 1.5-3 cm long, globose or subglobose (about as long as broad); leaves green; [alien, cultivated and persistent] ................................................................. *C. indica*
**87. MARANTACEAE** Petersen in Engler & Prantl 1888 (Arrowroot Family) [in ZINGIBERALES]

A family of about 31 genera and 550 species, herbs and vines, nearly pantropical (absent from Australia), and rarely extending into subtropical and warm temperate regions. References: Kennedy in FNA (2000); Andersson in Kubitzki (1998b).

*Thalia* Linnaeus 1753 (Thalia)

1. Flowers crowded on the rachis, the zigzag internodes 2-3 mm long; leaves pilose at the base on the upper surface; bracts of the inflorescence white-pruinose .......................................................... *T. dealbata*
2. Flowers separated on the rachis, the zigzag internodes 5-10 mm long; leaves glabrous at the base on the upper surface; bracts of the inflorescence green or purple, not pruinose .......................................................... *T. geniculata*

*Thalia dealbata* Fraser ex Roscoe, Powdery Thalia, Powdery Alligator-flag. Swamp forests, wet ditches, brackish marshes. May-September; June-October. Ne. SC south to GA, west to TX and OK, north in the Mississippi Embayment to w. KY, s. IL, and se. MO. [= RAB, FNA, GW, K, S]

*Thalia geniculata* Linnaeus, Lilies, Bent Thalia, Bent Alligator-flag. Ponds, sloughs, marshes. AL, FL, LA, south through Central and South America; West Indies; w. Africa. [= FNA, GW, K, S, WH]

**89. ZINGIBERACEAE** Martynov 1820 (Ginger Family) [in ZINGIBERALES]

A family of about 50 genera and 1200 species, herbs, of tropical and subtropical areas, especially se. Asia.

1. Inflorescence terminal on short stems with scale leaves, distinct from the main leafy stems .......................................................... *Curcuma*
2. Inflorescence terminal on long stems with normal, well-developed leaves .................................................................................. *Hedychium*

*Curcuma* Linnaeus 1753 (Hidden Lily)

A genus of about 80 species, rhizomatous herbs, native of the Old World tropics.

*Curcuma zedoaria* (Bergius) Roscoe, Zedoary, White Turmeric. Disturbed areas; native of se. Asia. [= K, WH]

*Hedychium* J. König 1783 (Ginger-lily)

A genus of about 40 species, rhizomatous herbs, native of the Old World tropics.

*Hedychium coronarium* J. König, White Ginger-lily. Disturbed areas, commonly cultivated, rarely persisting and spreading; native of India. [= K, WH]

**91. TYPHACEAE** A.L. de Jussieu 1789 (Cattail Family) [in POALES]

1 Inflorescences headlike, globular
1 Inflorescences spike-like, cylindrical

---

**Sparganium** Linnaeus 1753 (Bur-reed)

A genus of about 14 species, wetland and aquatic herbs, primarily circumboreal in arctic and temperate regions, but also in the tropics of Asia, and temperate Australia. References: Kaul in FNA (2000); Thieret (1982)=Z; Beal (1960)=Y; Crow & Hellquist (2000b)=X; Kubitzki in Kubitzki (1998b).

1 Stigmas 2; fruits truncate at apex, obpyramidal, very abruptly beaked, 4-8 mm broad
1 Stigmas 1; fruits rounded or acuminate to a beak at the apex, elliptic, fusiform, or obovate, 1-3 (-4) mm broad.
2 Pistillate heads (primarily those upward) supra-axillary (borne distinctly above the axes of the subtending leaf-like bracts); tepals lacking subapical dark spot.
2 Pistillate heads (all) axillary (borne in the axes of the subtending leaf-like bracts) or several on axillary branches which lack leaf-like bracts; tepals with prominent subapical dark spot.
3 Mature fruits dull, finely pitted, the body 3-5 mm long; fruiting heads 1.5-2.5 cm in diameter; branches of the inflorescence with 0-3 pistillate heads (in addition to staminate heads); stigma 0.8-1.9 (-2.8 in the Coastal Plain) mm long
3 Mature fruits shiny, smooth, the body 5.5-7 mm long; fruiting heads 2.5-3.5 cm in diameter; branches of the inflorescence with 0 (-1) pistillate heads (in addition to staminate heads); stigma 1.5-3 mm long

---

**Sparganium americanum** Nuttall, American Bur-reed. Streams, marshes, ponds, pools, often submerged. May-September. NL (Newfoundland) west to MN, south to c. peninsular FL and c. TX. Beal (1960) discusses the interesting variation in *S. americanum*, perhaps worthy of taxonomic recognition. The "Appalachian Race" has stigmas 0.6-0.9 mm long, inflorescence branches 0-3, and relatively narrow leaves; in our area it is montane in distribution, and in general is Appalachian, Ozarkian, and northern. The "Coastal Race" has stigmas 1.5-2.8 mm long, 2-5 inflorescence branches, and relatively wide leaves; in our area it is primarily of the Coastal Plain, disjunct to the mountains of NC and SC south of the Asheville Basin (like many Coastal Plain taxa), and in general is nearly limited to the Coastal Plain, ranging from MA south to FL, west to e. TX, and north in the interior to sc. TN, s. IN, and s. MO. The "Ubiquitous Race" is intermediate, with stigmas 1.0-1.4 m long; it occurs throughout the range of the species. The pattern is suggestive of imperfect evolutionary separation of two taxa. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV, X, Y, Z]

---

**Sparganium androcladum** (Engelmann) Morong. Marshes, shores. May-September. ME and QC west to MN, south to se. VA, s. WV, e. TN, s. MO, and ne. OK. [= C, F, FNA, G, K, W, WV, X, Y, Z]

**Sparganium emersum** Rehmann, Greenfruit Bur-reed. Bogs, stream margins. May-September. NL (Newfoundland) and c. QC west to s. AB and WA, south to w. NC, IN, IA, CO, and CA; Eurasia. [= FNA, X; > S. chlorocarpum Rydberg – RAB, C, F, G, W, WV, Y, Z; > S. chlorocarpum var. acaule (Beeby) Fernald – F; > S. angustifolium Michaux – K, misapplied; > S. acaule (Beeby) Rydberg; > S. emersum var. acaule (Beeby) A. Haines]

**Sparganium eurycarpum** Engelmann ex A. Gray, Giant Bur-reed. Marshes, shores. NS west to BC, south to w. VA, n. WV, IN, OK, CA and Baja California; e. Asia. Its attribution to more southern localities in some older sources (such as FL according to Small) is believed to be in error. [= C, F, FNA, G, K, S, W, WV, X; = S. erectum Linnaeus ssp. stoloniferum (Graebner) C.D.K. Cook & M.S. Nicholls]

---

**Typha** Linnaeus 1753 (Cattail)

A genus of 8-13 species, wetland herbs, cosmopolitan. References: Ward (2007a)=Z; Smith in FNA (2000); Kubitzki in Kubitzki (1998b). Key adapted from FNA.

1 Pistillate bracteoles absent, or if present then narrower than stigmas and generally not evident at spike surface; stigmas ovate to lanceolate, persistent on mature spikes; pistillate spikes green in flower when fresh, in fruit mostly 19-36 mm thick; carpodia concealed among pistil hairs; compound pedicels on denuded axis 0.6-3.5 mm; staminate scales colorless to brown.
2 Pistillate bracteoles absent; stigmas ovate to ovate-lanceolate, often blackish when dry; [add] ...............
2 Pistillate bracteoles present (but generally evident only at 20-30×) after removal from spike, resembling perigonal hairs, with brown, enlarged tips narrower than stigmas; stigmas lanceolate, brown when dry; pistillate spikes usually separated from staminate spikes by gap,
Typha angustifolia Linnaeus, Narrowleaf Cattail. Brackish to fresh waters of marshes and swamps, usually tidal, and also inland in non-tidal wetlands (where probably only introduced). May-July; June-November. NS west to ND, south to SC, FL (?), LA, and TX (?); Eurasia. Stuckey & Salamon (1987) consider T. angustifolia an invasive alien in North America, but later studies suggest that it was native at least in coastal areas of NE and Mid-Atlantic North America, and has expanded its range westwards in recent decades (Shih & Finkelstein 2008). [= C, F, FNA, G, GW, K, RAB, W, WH, WV, Z; = T. angustifolia – S (also see T. domingensis)]

Typha domingensis Persoon, Southern Cattail. Brackish to nearly fresh waters of marshes and swamps, usually tidal. June-July; July-November. DE south to s. FL, west to TX; north inland to NE and UT; and south into tropical America; Eurasia; Africa; Oceania. [= C, F, FNA, G, GW, K, RAB, Z; = T. domingensis – S]

Typha ×glauca Godron (pro sp.) [angustifolia × latifolia], Hybrid Cattail. Fresh to brackish waters of lakes, ponds, and rivers. May-July; June-November. Both C and K apply this name to two different hybrids: T. angustifolia × latifolia and T. domingensis × latifolia. The name properly applies to T. angustifolia × latifolia (Smith in FNA 2000). [= GW, Z; = T. glauca Godron – RAB, F; = T. ×glauca – C, K]

Typha latifolia Linnaeus, Common Cattail. Fresh waters of ponds, lakes, ditches, marshes, including in tidal freshwater marshes. May-July; June-November. NL (Newfoundland) west to AK, south to FL, TX, CA, and Mexico; Central America; South America; Eurasia. [= C, F, FNA, G, GW, K, RAB, S, W, WH, WV, Z]

Typha angustifolia
Typha domingensis
Typha ×glauca
Typha latifolia

92. Bromeliaceae A.L. de Jussieu 1789 (Bromeliad or Pineapple Family) [in POALES]

A family of about 56 genera and 2600 species, herbs, shrubs, and trees, of the New World tropics and subtropics (very rarely warm temperate). References: Luther & Brown in FNA (2000); Smith & Till in Kubitzki (1998b).

Tillandsia Linnaeus 1753 (Spanish-moss)

A genus of about 540 species, herbs, of s. North America south to s. South America. References: Luther & Brown in FNA (2000); Smith & Till in Kubitzki (1998b). Key based in part on FNA.

1 Leaves distichous; inflorescence 1-2 (-3) flowered.
2 Plants in dense, more or less spherical clusters; inflorescence scapose, exerted from the cluster; corolla violet.................................................. T. recurvata
3 Plants in elongate, pendulous festoons; inflorescence sessile; corolla yellowish green..................................................... T. usneoides

1 Leaves spiral in a rosette; inflorescence > 3-flowered.
3 Leaves narrowly linear, 1-5 mm wide.
4 Leaves densely and coarsely lepidote, appearing gray; floral bracts rose; corolla violet.................................................. T. bartramii
4 Leaves finely lepidote, appearing green or reddish; floral bracts green or reddish; corolla lavender................................. T. setacea
BROMELIACEAE

3 Leaves broader, 10-35 mm wide.
5 Scape 10-35 cm long; floral bracts imbricate, covering all of the rachis, or nearly all................. T. fasciculata var. densispica
5 Scape 20-30 cm long; floral bracts widely spaced, leaving much of the rachis exposed at anthesis............................... T. utriculata

Tillandsia bartramii Elliott, Bartram's Air-plant. On tree branches in bayswamps, tidal swamp forests, and mesic hardwood bluffs. E. GA south through FL; disjunct in Tamaulipas. In five counties in e. GA, as far north as Liberty County (Jones & Coile 1988), and reported for SC as extirpated (Kartesz 1999). [= FNA, K, WH; T. myriophylla Small – S]

Tillandsia fasciculata Swartz var. densispica Mez, Quill-leaf Airplant. Branches of trees, especially evergreen oaks. Se. GA south through FL, and in the West Indies, Mexico, and Central America. [= FNA, K, WH; < T. fasciculata – S]

Tillandsia recurvata (Linnaeus) Linnaeus, Ball-moss, Bunch-moss. On tree branches in maritime forests. Se. GA (Duncan 1985) south to s. FL; LA to AZ and south through Mexico, Central America, and South America; West Indies. Introduced in e. SC (Beaufort, Jasper, Charleston, Georgetown counties) via landscaping plants (Gramling 2010; P. McMillan, pers. comm. 2005). Outside of our area, this species also occurs on rock cliffs and is frequent on powerlines. [= FNA, K, WH; Diaphoranthema recurvata (Linnaeus) Beer – S]

Tillandsia setacea Swartz, Wild-pine, Pine-needle Airplant. In tree branches, especially on hardwoods, in mesic bluff forests. Se. GA south to s. FL; West Indies; Mexico and Central America. [= FNA, K; = T. tenusfolia Linnaeus – S, misapplied]

Tillandsia usneoides (Linnaeus) Linnaeus, Spanish-moss. Branches of trees, especially in swamps, but elsewhere where air humidity is high enough, often even in dry forests (near Wilmington, NC Tillandsia is abundant on Quercus laevis in an extensive dry sandhill area which receives frequent fog from the Cape Fear, Brunswick, and Northeast Cape Fear rivers). April-June. S. MD (historically), se. VA south to s. FL, west to TX and Mexico; Central and South America, West Indies. T. usneoides is the only member of a very large genus to occur north of s. GA. The epithet 'usneoides' refers to its resemblance to the common lichen Usnea. [= RAB, C, F, FNA, G, K, WH; = Dendropogon usneoides (Linnaeus) Rafinesque – S]

94. XYRIDACEAE C. Agardh 1823 (Yellow-eyed Grass Family) [in POALES]

A family of 5 genera and about 325-350 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). References: Kral in FNA (2000); Kral in Kubitzki (1999b).

Xyris Linnaeus 1753 (Yellow-eyed Grass)

A genus of about 300 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). This "technical" genus is known well by only a few botanists, and additional undescribed taxa are possible. References: Kral in FNA (2000); Ward (2007b)=V; Bridges & Orzell (2003)=X; Kral (1966a)=Z; Kral (1983b, 1999); Kral in Kubitzki (1999b). Key adapted from X, GW, and Z.

Identification notes: In vegetative condition, Xyris is often confused with other monocots with equitant leaves, such as Iris spp. (Iridaceae), Lachnanthes caroliniana (Haemodoraceae), and Tofieldia spp. (Tofieldiaceae).

1 Keel of the lateral sepals shortly ciliate-seabrid (or sometimes entire in X. brevifolia, and then the bract tips purplish-tinged).
2 Plants small, usually < 30 cm tall; principal leaves usually < 10 cm long; mature spikes < 1 cm long when mature.
3 Leaves filiform, with expanded brownish lustrous bases, usually exceeding the sheath of the scape; [plants of s. AL and the FL Panhandle].......................... X. isoetifolia
3 Leaves linear, the bases not expanded, shorter than, equaling, or slightly exceeding the sheath of the scape; [plants collectively more widespread].
4 Keel of the lateral sepals straight to slightly curved, remotely ciliate or entire; spikes broadly ovoid to subglobose, the bracts loose, bicolored, the distal portions maroon or purplish and often with erose margins.............................. X. brevifolia
4 Keel of the lateral sepals strongly curved, densely ciliate; spikes lance-ovoid to ovoid, the bracts entire, not purple-tinged, and lacking erose borders.
5 Plants perennial, and its leaves ascending, green with a distinct brown patch at the base; fruiting spikes ovoid, blunt, somewhat 2-edged from the strongly keeled outer bracts................................................................. X. drummondii
5 Plants annual; leaves flabellate arranged, spreading to recurved against the substrate, usually maroon; fruiting spikes often elongated and acute, not 2-edged................................................................. X. flabelliformis
2 Plants large, usually > 30 cm tall; principal leaves > 10 cm long; mature spikes > 1 cm long when mature.
6 Leaves ascending, twisted, strongly grooved; spikes ovoid, the bracts and lateral sepals with a small tuft of short, reddish-brown hairs; bases of leaves abruptly expanded, pinkish or purplish (dark brown in age), the outermost leaves often scale-like, the plant base therefore appearing bulbous; [of the Mountains, Piedmont, and Coastal Plain] X. ambigua

6 Leaves spreading, not twisted or only slightly so; spikes narrowly ovoid, ellipsoid, or oblong; bracts and sepals without a small apical tuft of hairs; bases of leaves white to variegated, white to variegated, tan, pink, purplish, maroon, or dark brown, the outermost leaves not scale-like, the plant base not appearing bulbous; [typically of the Coastal Plain, rarely disjunct inland].

7 Seeds lustrous, translucent, broadly ovoid; spike pale brown or tan, the scales loosely imbricate; plant bases pinkish, purplish, or tan, with dark longitudinal striations on the inner leaf bases; leaves 3-20 mm wide; petal blades obovate, 6-7 mm long, opening in early morning, usually closing by mid-day ................................................................. X. stricta

7 Seeds lustrous, purplish; spike pale brown or tan, the scales loosely imbricate; plant bases pinkish, purplish, or tan, with dark longitudinal striations on the inner leaf bases; leaves 3-20 mm wide; petal blades obovate, 6-7 mm long, opening in early morning, usually closing by mid-day ................................................................. X. ambigua

8 Seeds lustrous, translucent, broadly ovoid; spike pale brown or tan, the scales loosely imbricate; plant bases pinkish, purplish, or tan, with dark longitudinal striations on the inner leaf bases; leaves 3-20 mm wide; petal blades obovate, 6-7 mm long, opening in early morning, usually closing by mid-day ................................................................. X. ambigua

9 Leaves narrowly linear to filiform, 0.5-2.0 (-2.5) mm wide, not twisted (or scarcely so); leaf bases expanded, lustrous, hard, tan to brown, neither bulbous nor deeply set in the substrate; spikes ovoid or ellipsoid, 4-15 mm long.

9 Leaves broader, (1.5-) 2.0-25 mm wide, strongly twisted to straight, the leaf bases either not expanded, lustrous, hard, and tan to brown, or, if so, then the base also either bulbous and/or deeply seated in the substrate; spikes narrowly lanceolate, ellipsoid, to broadly ovoid, 4-40 mm long.

10 Leaves filiform, terete or elliptic in cross-section, 0.5-1.0 mm wide, without a paler, hardened margin; scale bases broad as or broader than the leaf blades; scales smooth-edged to denticulate, not curled away from the head, the head thus appearing smooth; staminodia beardless ................................................................................................. X. baldwiniana

10 Leaves linear, flattened in cross-section, 1-2 (-2.5) mm wide, with a pale, hardened margin; scale bases usually narrower than the leaf blades; scales ragged-lacerate, the tips curling away from the head, giving it a ragged appearance; staminodia bearded .................................................................................. X. elliottii

11 Keel of the lateral sepals irregularly lacerate or fimbriate, or if entire then the bract tips not purplish.

12 Leaves strongly twisted, 2-5 mm wide; leaf bases hardened, swollen, bulbous, dark lustrous brown; scale ridges smooth; petal blades white or yellow; [of moist to dry pinelands] ................................................................................................................................. X. caroliniana

12 Leaves not twisted or slightly twisted, 3-25 mm wide; leaf bases either soft, not swollen, not bulbous, and pale green (X. fimbriata) or somewhat hardened and bulbous, deep red (X. panacea); scale ridges strongly scabrous or smooth; petal blades yellow; [of aquatic to very wet peaty, mucky, or wet ponds, marshes, or other wetlands].

13 Leaves 5-25 mm wide; scale ridges well-developed, strongly scabrous; flowers open 1:00-3:00 p.m. EDT; [widespread] ................................................................................................................................. X. fimbriata

13 Leaves 3-5 (-8) mm wide; scale ridges poorly-developed, smooth; flowers open 11:30-4:00 p.m. EDT; [endemic to Wakulla County, FL] .......................................................................................................... X. panacea

14 Lateral sepals longer than and exserted from the subtending bract; spikes 5-15 cm tall.

15 Leaf blades 1-2 (-3) mm wide, 6-30 cm long; spikes 10-16 mm long; seeds 0.4-0.6 mm long; [endemic to Panhandle FL and s. AL] ................................................................................................................................................. X. longisepala

15 Leaf blades 5-15 mm wide; (20-) 30-50 (-60) cm long; spikes 10-20 (-25) mm long; seeds (0.6-) 0.7 (-0.8) mm long; [more widespread in our area] ................................................................................................. X. smalliana

15 Leaf blades 1-2 (-3) mm wide, 6-30 cm long; spikes 10-16 mm long; seeds 0.4-0.6 mm long; [endemic to Panhandle FL and s. AL] ................................................................................................................................................. X. longisepala

16 Scapes flexuous, usually spirally twisted; upper portion of leaf blades conspicuously twisted; plant bases pinkish, purplish, or dark brown, bulbous or deeply set in the substrate.

17 Plant forming a rather dense tuft; scale bases < 50 cm long; scale diverging at a 10-20° angle; seed surface farinose; of ne. FL southward] ................................................................................................................................. X. calcicola

18 Base of plant deeply set in the substrate, without distinct outer scale leaves; leaf bases not noticeably expanded, the plant base therefore not bulbous; leaves smooth, 2-4 mm wide; petal blades ca. 3 mm long. ....................................................... X. chapmani

18 Base of plant shallowly set on the substrate, often with short, black outer scale leaves; leaf bases noticeably expanded, the plant base therefore appearing bulbous; leaves either smooth and 5-10 mm wide, or scabrous and 2-10 mm wide; petal blades ca. 5 mm long.

19 Leaf and scape surfaces prominently papillose or tuberculate-scabrid; petal blades suborbicular, yellow; seeds narrowly ovoid or narrowly ellipsoid, ca. 1.0 mm long. ................................................................................................. X. scabrifolia

19 Leaf and scape surfaces smooth (or scabrous only along margins and ridges); petal blades obovate, white or yellow; seeds ovoid or ellipsoid, 0.5-0.6 mm long.

20 Seeds translucent; leaf margins smooth; [plants of acidic sites of the Coastal Plain] ........................................................................................................................................................................ X. platylepis

20 Seeds transversely ovoid; leaf margins slightly scabrous; [plants of calcareous seeps and fens of the Ridge and Valley] ovoid or ellipsoid, about 1.5× as long as wide, with lines of very fine papillae, not farinose .................................................................................................................. X. diffusum

21 Summit of the scape distinctly flattened and broad relative to the spike; scape ridges 2-3, the 2 most prominent comprising the flattened edge of the scape.

22 The 2 principal scape ridges noticeably and abruptly flattened and winglike below the spike, their combined width (on fresh material) broader than the scape proper; fruitsing spikes mostly 8-15 cm long; seeds 0.8-1.0 mm long, dark when ripe, fusiform to narrowly elliptic, 2.3× as long as wide, with lines of very fine papillae, these however obscured by a farinose covering .................................................................................................................. X. iridifolia
XYRIDACEAE

Summit of the scape nearly terete or somewhat flattened, much narrower than the spike; scape ridges several (usually > 3), at least on the mid to lower portion of the scape.

23 Seeds farinose, very dark; surfaces of leaves tuberculate-scarbid, the leaves strongly ascending, linear, generally > 10 cm long; leaves generally dull-colored.

24 Mature spikes ovoid, sharply acute; plants solitary or in small clumps; leaves 10-30 (-50) cm long, 1.5-6.0 mm wide, dark maroon or purplish at the base .......................................................... X. floridana

24 Mature spikes ovoid to ellipsoid, acute to obtuse; plants typically in large dense tufts; leaves 20-50 cm long, 3-12 mm wide, the older ones with dark-brown to gray bases, the younger with tan bases .................................. X. serotina

23 Seeds translucent, not farinose; surfaces of leaves smooth (or sparsely tuberculate-scarbid in X. curtissii, which also has leaves linear-curved and generally < 10 cm long); leaves generally a bright yellowish-green above the base.

25 Leaves ascending to erect, 5-60 cm long, 2-5 (-15) mm wide; scapes (0.5-) 1.0-1.5 (-2.0) mm wide; mature spikes 7-15 (-25) mm long; fertile bracts 5-7 mm long; leaf bases tan to brown (very rarely pinkish); old flowers often persisting on spikes, drying blackish .......................................................... X. jupicai

25 Leaves spreading-recurved to erect, 3-10 (-13) cm long, 1-4.5 mm wide; scapes 0.4-0.6 (-0.7) mm wide; mature spikes 3-7 (-12) mm long; fertile bracts 3-5 mm long; leaf bases various; old flowers fugacious, not persisting on spikes.

25 Leaves spreading-recurred to ascending, 2-4.5 mm wide; leaf bases pinkish or purplish; spikes 3-5 (-7) mm long, often abruptly acute; seeds 0.4-0.5 mm long, yellowish-amber.......................................................... X. curtissii

26 Leaves ascending to erect, 1-2 mm wide; leaf bases tan to brown; spikes 3-7 (-12) mm long; blunts; seeds 0.3-0.4 mm long, reddish-brown to brown.................................................. X. species 1

Xyris ambiguus Beyrich ex Kunth. Wet savannas and flatwoods, pinelands, edges of depression ponds. June-August. Se. VA south to s. FL, west to AL and ec. TX, primarily on the Coastal Plain; also West Indies (Cuba), and Mexico south into Central America. [= RAB, C, F, FNA, G, K, W, WH, X; < X. ambiguus – GW, S, Z (also see X. louisianica)]

Xyris baldwiniana J. A. Schultes. Grassleaf Yellow-eyed Grass. Wet savannas, seepage bogs, sandhill seeps, wet savanna ecotones. June-July. Se. NC south to n. peninsular FL, west to s. AR and ec. TX, primarily on the Coastal Plain; also s. Mexico and Central America. [= RAB, FNA, GW, K, S, WH, X, Z]

Xyris brevifolia Michaux. Shortleaf Yellow-eyed Grass. Wet sands of pinelands, especially seasonally wet, open, white sands of spodosol longleaf pine flatwoods (Leon series soils), margins of Carolina bay sandrims. June-August. Se. NC south to s. FL, west to s. AL and w. FL; West Indies and South America. [= RAB, FNA, GW, K, W, WH, X, Z]

Xyris calciola E. L. Bridges & Orzell. Limestone Yellow-eyed Grass. Wet calcareous savannas and flatwoods. August-November. C. and s. peninsular FL; disjunct in ne. FL (Baker County; Wunderlin & Hansen 2008). See Bridges & Orzell (2003) for detailed information. [=WH, X]

Xyris chapmanii E. L. Bridges & Orzell, Chapman's Yellow-eyed Grass. Sandhill seepage bogs in areas of copious lateral seepage in deep muck soils. Se. NC south to Panhandle FL, west to e. TX. This taxon is abundantly distinct from X. scabrifolia. [=WH, X; < X. scabrifolia – FNA, K, Z]

Xyris curtissii Malme, Curtiss's Yellow-eyed Grass. Savannas. July-August. Se. VA south to ne. FL, FL Panhandle, and west to s. AR and ec. TX, primarily on the Coastal Plain; disjunct in s. NJ and Central America (Belize). [= RAB, G, WH; = X. difformis Chapman var. curtissii (Malme) Kral – C, FNA, GW, K, X, Z; > X. bayardii Fernald – F; > X. curtissii – F; = X. neglecta Small – S]

Xyris difformis Chapman. Savannahs, roadside ditches, pond margins, other wet habitats. August-October. New England and s. Canada south to n. peninsular FL and ec. TX. [= X, WH; = X. difformis Chapman var. difformis – C, FNA, GW, K, Z; < X. difformis – RAB, F, S, W (also see X. curtissii)]

Xyris drummondii Malme, Drummond's Yellow-eyed Grass. Wet pine flatwoods, ditches. Se. GA south to ne. FL, west to Panhandle FL and s. MS. [= FNA, GW, K, WH, X, Z]

Xyris elliottii Chapman, Elliott's Yellow-eyed Grass. Margins of drawdown zones of clay-based Carolina bays, limesinks and flatwoods swales, wet savannas. May-June. E. SC south to s. FL, west to s. AL; West Indies; South America. [= RAB, FNA, GW, K, S, WH, X, Z; > X. elliottii var. elliottii; > X. elliottii var. stenotera Malme]

Xyris fimбриata Elliott, Giant Yellow-eyed Grass. In mucky or sandy soils of upland depression ponds, also along sandhill streams, impoundments and in deep muck of sandhills seepage slopes often just below the zone occupied by Xyris chapmanii. September-October. Se. VA south to e. FL, west (interruptedly) to se. TX; disjunct in s. NJ, DE, and c. TN. [= RAB, C, F, FNA, GW, K, S, WH, X, Z]

Xyris flabelliformis Chapman, Savanna Yellow-eyed Grass. Wet sands of pinelands, especially seasonally wet, open, white sands of spodosol longleaf pine flatwoods (Leon series soils), margins of Carolina bay sandrims. May-June. Se. NC south to s. FL, west to se. LA, on the Coastal Plain. [= RAB, FNA, GW, K, S, V, WH, X, Z]

Xyris grandis Chapman, Grand's Yellow-eyed Grass. In mucky or sandy soils of upland depression ponds, also along sandhill streams, impoundments and in deep muck of sandhills seepage slopes often just below the zone occupied by Xyris chapmanii. September-October. Se. VA south to c. peninsular FL, west (interruptedly) to se. TX; disjunct in s. NJ, DE, and c. TN. [= RAB, C, F, FNA, GW, K, S, WH, X, Z]

Xyris jupicai Chapman var. jupicai. Savannas, roadside ditches, pond margins, other wet habitats. August-October. New England and s. Canada south to n. peninsular FL and ec. TX. [= X, WH; = X. jupicai Chapman var. jupicai – C, FNA, GW, K, Z; < X. jupicai – RAB, F, S, W (also see X. curtissii)]

Xyris malmei Chapman, Malme's Yellow-eyed Grass. Wet savannas, seepage bogs, sandhill seeps, wet savanna ecotones. June-August. Se. VA south to s. FL, west to AL and ec. TX, primarily on the Coastal Plain; also West Indies (Cuba), and Mexico south into Central America. [= RAB, C, F, FNA, GW, K, S, WH, X, Z]

Xyris neglecta Chapman, Neglect's Yellow-eyed Grass. Wet savannas, seepage bogs, sandhill seeps, wet savanna ecotones. June-August. Se. VA south to s. FL, west to AL and ec. TX, primarily on the Coastal Plain; also West Indies (Cuba), and Mexico south into Central America. [= RAB, C, F, FNA, GW, K, S, WH, X, Z; < X. neglecta – C, FNA, GW, K, Z; < X. neglecta – WH, X, Z]

Xyris pallescens (C. Mohr) Small. Yellow-eyed Grass. In mucky or sandy soils of upland depression ponds, also along sandhill streams, impoundments and in deep muck of sandhills seepage slopes often just below the zone occupied by Xyris chapmanii. September-October. Se. VA south to e. FL, west (interruptedly) to se. TX; disjunct in s. NJ, DE, and c. TN. [= RAB, C, F, FNA, GW, K, S, WH, X, Z]
**Xyris floridana** (Kral) E.L. Bridges & Orzell, Florida Yellow-eyed Grass. Savannas, wet pine flatwoods, ditches. August. Se. NC south to s. FL, west to se. LA; Central America. [= WH; = Xyris diffinis Chapman var. floridana Kral – FNA, GW, K, Z]

**Xyris iridifolia** Chapman, Irisleaf Yellow-eyed Grass. Marshes, upland pond margins, blackwater river channels, floodplain pools, other wet habitats. July-September. Se. VA south to ne. FL and FL Panhandle, west to c. TX; disjunct in c. TN and Mexico. [= RAB, C, GW, S, Z; = X. laxifolia Mart. var. iridifolia (Chapman) Kral – FNA, GW, K, WH, X]

**Xyris isoetifolia** Kral. Bogs, savannas, and depression pond margins. Endemic to FL Panhandle and s. AL. [= FNA, GW, K, WH, X, Z]

**Xyris jupicai** L.C. Richard. Ditches, various wet habitats. July-September. NJ south to s. FL, west to TN, AR, se. OK (Singhurst, Bridges, & Holmes 2007), and TX; Mexico, Central America, South America, West Indies. Sometimes weedy and considered by some to be adventive from further south. At least some populations in our area are native and may additionally be worthy of taxonomic recognition as distinct from "true" *X. jupicai* (P. McMillan, pers. comm., 2003). [= RAB, C, GW, K, S; > X. elata Chapman – G, S; > X. communis Kunth – S; > X. caroliniana – G, S, misapplied]

**Xyris longisepala** Kral. Depression pond margins. Endemic to FL Panhandle and s. AL. [= FNA, GW, K, WH, X, Z]

**Xyris louisianica** E.L. Bridges & Orzell. Pine savannas, bogs, ditches and disturbed areas. FL Panhandle and GA west to se. TX. [= K, WH, X; = X. stricta Chapman var. obsocura Kral – FNA; < X. ambigua – GW, S, Z]

**Xyris panacea** L.C. Anderson & Kral, St. Marks Yellow-eyed Grass. Mucky depression ponds. Late June-early October. Endemic to FL Panhandle (Wakulla County). See Anderson & Kral (2008) for additional details.

**Xyris scabrifolia** R.M. Harper, Roughleaf Yellow-eyed Grass. Sandhill seepage bogs and wet pine savannas. Sc. and se. NC south to Panhandle FL, west to s. AL and s. MS; disjunct in sw. LA-se. TX. *X. chapmanii* is a taxon distinct from *X. scabrifolia*. [= GW, S, WH, X; < X. scabrifolia – FNA, K, Z (also see *X. chapmanii*)]

**Xyris serotina** Chapman. Depression meadows, ultisol savannas (Lynchburg/Rains complex or Eulonia/Oketee), ditches. September. Se. NC south to c. peninsular FL, west to s. MS, in the Coastal Plain. [= RAB, FNA, GW, K, S, WH, X, Z]

**Xyris smalliana** Nash, Small's Yellow-eyed Grass. Pond margins, ditches. July-August. S. ME south to s. FL, west to s. MS; disjunct to se. TX; s. Mexico south into Central America; West Indies (Cuba). [= RAB, C, FNA, GW, K, S, W, WH, X, Z; > X. congdonii Small – F; > X. smalliana – F; > X. smalliana var. smalliana – G; > X. smalliana var. olneyi (Wood) Gleason – G]

**Xyris spathifolia** Kral & Moffett, Ketona Yellow-eyed Grass. Seeps over dolomite. See Kral & Moffett (2009) for additional information. {not yet keyed}

**Xyris species 1.** Wet savannas and pond margins. July-September. Currently known only from Sandhills Region and inner Coastal Plain of NC and SC, and outer Coastal Plain of NC.

**Xyris stricta** Chapman. Depression ponds, depression meadows, borrow pits, ultisol savannas and ditches. July-September. SC south to ne. FL and Panhandle FL, west to s. MS and se. LA. Reported for our area by Kral (1966b). P. McMillan (pers. comm.) reports this species from a number of locations in the outer Coastal Plain of NC and SC. [=GW, K, S, WH, X, Z; = X. stricta var. stricta – FNA]

**Eriochara** Linnaeus 1753 (Pipewort)

A genus of about 400 species, of tropical and warm temperate regions (few in cold temperate areas). References: Kral in FNA (2000); Kral (1966c)=Z; Gomes de Andrade et al. (2010); Stützel in Kubitzki (1998b). Key based on Kral in FNA (2000).

1 Receptacle and/or base of flowers copiously hairy; some or most of perianth parts with chalk white hairs; heads overall appearing white, 5-20 mm in diameter when in full flower or fruit.

2 Heads hard (much flattened by a plant press, and easily compressed when fresh between finger and thumb); leaves dark green, the tip acute to obtuse; scape sheaths shorter than most leaves; involucral bracts straw-colored, the apex acute; receptacular bracteoles pale, the apex narrowly acuminate; pistillate flower petals adaxially glabrous; terminal cells of club-shaped hairs of the perianth whitened, the basal cells often un congested and transparent.

3 Leaves to 2 cm wide, with rounded tip; heads 13-20 mm in diameter; [of the East Gulf Coastal Plain, known from Panhandle FL and s. AL.].................................................................E. decangulare var. decangulare

4 Mature heads 5-10 mm in diameter; leaves 5-30 cm long; petals of staminate flowers conspicuously unequal; [plants primarily of seasonally flooded ponds].........................................................E. compressum

5 Stamens 6; pistil 3-carpellate...............................................................................................................E. cinereum

6 Heads 4-10 mm in diameter when in full flower or fruit; outer involucral bracts usually reflexed, obscured by bracteoles and flowers.

7 Inner involucral bracts, receptacular bracts, and sepals darkened, usually gray to nearly black; young heads dark; seeds very faintly reticulate, not papillose; [of the North American]

8 Heads 3-4 mm in diameter when in full flower or fruit; outer involucral bracts neither reflexed nor obscured by bracteoles and flowers.

9 Bracts straw-colored, greenish, or light gray to gray, dull, the margins often erose or lacerate, the apex blunt to obtuse; [of moist acidic sites].................................................................E. koernickianum

10 Bracts narrowly ovate to oblanceolate, the apex acute; bracts and perianth parts (except sometimes the petals) glabrous; seed conspicuously pale-reticulate.................................................................E. ravenelii

**Eriocaulon** Linnaeus 1753 (Pipewort)

A family of about 10 genera and 1100 species, of tropical and warm temperate regions (few in cold temperate regions), especially America, and most diverse in n. South America. References: Kral in FNA (2000); Kral (1966c)=Z; Stützel in Kubitzki (1998b).

1 Scape pubescent (in our species, or very rarely nearly glabrous), 6-40 cm tall at maturity; leaves lacking obvious air spaces; roots fibrous or spongy, not septate; petals 3 or absent; stamens 2-3, the anthers yellow at maturity.

2 Scape pubescent with eglandular hairs; roots fibrous, branched, dark; heads white, gray, or brown; leaves bright green, tapering gradually through most of their lengths, herbaceous in texture .................................................................Lachnocaulon

3 Scape pubescent with glandular hairs (or a mixture of glandular and eglandular hairs); roots spongy, unbranched, pale; heads yellowish-tan or gray; leaves bluish green, narrowly linear to the abruptly flared base, stiff in texture .................................................Syngonanthus

4 Stamens 4; pistil 2-carpellate.

5 All bracts of staminate and pistillate flowers straw-colored or pale with grayish midzone, sepals of pistillate flowers basally pale, darkening toward the tip to grayish, gray-green, or gray-brown; heads (young and mature) pale; seeds faintly rectangular-reticulate, often papillate in lines; [of the se. Coastal Plain]..................................................................................................................E. lineare

6 Heads 3-4 mm in diameter when in full flower or fruit; outer involucral bracts neither reflexed nor obscured by bracteoles and flowers.

7 Bracts straw-colored, greenish, or light gray to gray, dull, the margins often erose or lacerate, the apex blunt to obtuse; [of tidal waters and large natural lakes of the outer Coastal Plain]..................................................................................E. parkeri

8 Bracts narrowly ovate to oblanceolate, the apex acute; bracts and perianth parts (except sometimes the petals) glabrous; seed conspicuously pale-reticulate.................................................................................................................................................................E. ravenelii

9 Bracts narrowly ovate to oblanceolate, the apex acute; bracts and perianth parts (except sometimes the petals) glabrous; seed conspicuously pale-reticulate.................................................................................................................................................................E. ravenelii
Eriocaulon aquaticum (Hill) Druce, Seven-angled Pipewort. Ponds, lakes. July-October. NB and NL (Newfoundland) west to ON and MN, south to e. NC, VA, AL, and IN; also Great Britain and Ireland. The name E. septangulare is invalid. E. aquaticum is the correct name if the species is interpreted to include both northern European and northeastern North American plants. If North American plants are distinct from European, the correct name is E. pellucidum. [= C, FNA, K; > E. pellucidum Michaux – RAB; = E. septangulare Withering – F, G, GW, W, Z, invalid name]

Eriocaulon compressum Lamarck. Ponds, lakes, other depressions, wetter places in pine flatwoods and pine savannas. April-October. NJ south to s. FL, west to e. TX. [= RAB, C, F, FNA, G, GW, K, S, WH, Z]

Eriocaulon decangulare Linnaeus var. decangulare, Common Ten-angled Pipewort. Wet savannas and pine flatwoods, bogs, seasonally flooded ponds. June-October. NJ south to s. FL, west to sw. AR and e. TX; Mexico, Central America. [= FNA, K; < E. decangulare – RAB, C, F, G, GW, S, W, WH, Z]

Eriocaulon decangulare Linnaeus var. latifolium Chapman ex Moldenke, Panhandle Pipewort. Seepage bogs. Restricted to Panhandle FL, s. AL, and s. MS. It appears to warrant taxonomic status, but needs additional study. [= FNA, K; < E. decangulare – GW, S, WH, Z]

Eriocaulon koernickianum van Heurck & Müller of Aargau, Dwarf Pipewort. Seepage areas on granite flatrocks. W. AR and e. OK south to e. TX; disjunct in c. GA. See Watson et al. (2002) for information on variation within the species. [= FNA, K; = E. kornickianum – GW, orthographic variant]

Eriocaulon lineare Small. Seepage bogs. Sw. GA south to c. peninsular FL, west to s. AL. It has been reported for NC (Kral in FNA 2000), but this is apparently in error. Kral & Sorrie (1998) proposed the conservation of the name E. lineare, but this course was accepted by Brummitt (2005). [= FNA, GW, K, S, WH]

Eriocaulon nigrobracteatum E.L. Bridges & Orzell, Dark-headed Hatpins. Seepage bogs. Endemic to the FL Panhandle (Bay, Calhoun, and Gulf counties). [= FNA, K, WH] [not yet keyed]

Eriocaulon parkeri B.L. Robinson, Estuary Pipewort. Natural lakes, tidal marshes. ME and QC south to e. NC. [= C, F, FNA, G, GW, K, Z]

Eriocaulon texense Körnick, Texas Hatpins. Sandhill seepage bogs, Altamaha Grit outcrops. Sc. NC south to w. Panhandle FL, west to e. TX. [= FNA, GW, K, WH, Z]

Lachnocaulon Kunth 1841 (Bogbuttons)

A genus of 7 species, herbs, of se. North America and Cuba. Based on work of Gomes de Andrade et al. (2010), Lachnocaulon is likely to be included in the large and primarily neotropical genus Paepalanthus Martius. References: Kral in FNA (2000); Kral (1966c)=Z; Gomes de Andrade et al. (2010); Stützel in Kubitzki (1998b).

1 Trichomes at the tips of the receptacular bracts milky white, opaque, the head therefore appearing gray to white, obscuring the brown color of the bractlets.

2 Mature heads 4-7 mm across; seeds obviously longitudinally striate (as seen at 10× magnification).................................................................L. anceps

2 Mature heads 3.5-4.0 mm across; seeds not obviously longitudinally striate, the striations obscure and very fine (not visible at 10× magnification).................................................................L. beyrichianum

1 Trichomes at the tips of the receptacular bracts translucent, the head therefore showing the brown color of the bractlets.

3 Scape with ascending hairs.........................................................................................................................................................L. minus

3 Scape glabrous.

4 Leaves 0.5-1 (-2) cm long; head light brown, usually globose; carpels 2......................................................................................................L. digynum

4 Leaves 2-3 cm long; head reddish- or dark brown, usually elongate-cylindric; carpels 3..............................................................................L. engleri
**Lachnocaulon anceps** (Walter) Morong, Common Bogbuttons. Moist to dry sands, moist peats, in pinelands, sometimes locally abundant in open disturbed areas where competition has been removed. May-October. S. NJ south to s. FL, west to se. TX; disjunct in ec. TN; West Indies (Cuba). [= RAB, C, F, FNA, GW, K, WH, Z; > L. anceps – S; > L. floridanum – S; > L. glabrum Körnick – S]

**Lachnocaulon beyrichianum** Sporleder ex Körnick, Southern Bogbutton. Upper margins of Coastal Plain doline ponds (sometimes under scrub oaks), flatwoods. May-September. Se. NC south to Panhandle FL and s. peninsular FL. [= FNA, GW, K, S, WH, Z]

**Lachnocaulon digynum** Körnick, Pineland Bogbutton. Pine savannas, bogs. Panhandle FL and s. AL west to TX. [= FNA, GW, K, S, WH, Z]

**Lachnocaulon engleri** Ruhland, Engler’s Bogbutton. Pondshores, pine savannas. N. FL peninsula south to s. FL; Panhandle FL and s. AL. [= FNA, GW, K, S, WH, Z]

**Lachnocaulon minus** (Chapman) Small, Brown Bogbutton. Upper margins of Coastal Plain doline ponds, other pineland situations. May-October. N. FL peninsula south to s. FL; Panhandle FL and S. AL. [= RAB, FNA, GW, K, WH, Z; > L. minus – S; > L. eciliatum Small – S]

**Syngonanthus** Ruhland 1900 (Yellow Hatpins)

A genus of about 200 species, primarily of tropical America, but some in Africa and Madagascar; ours is the only temperate species. References: Kral in FNA (2000); Kral (1966c)=Z; Gomes de Andrade et al. (2010); Stützel in Kubitzki (1998b).

**Syngonanthus flavidulus** (Michaux) Ruhland, Yellow Hatpins, Bantam-buttons. Pine savannas, pine flatwoods, borders of pineland ponds, and adjacent ditches. May-October. Se. NC south to s. FL, west to s. MS. [= RAB, FNA, GW, K, S, WH, Z]

---

**Mayaca** Aublet 1775 (Bogmoss)

A genus of 4-10 species, of tropical to warm temperate America and Africa. References: Thieret (1975); Stevenson in Kubitzki (1998b).

**Mayaca fluviatilis** Aublet, Bogmoss. Cp (FL, GA, NC, SC): marshes, streams, swamp forests, shores of natural lakes, seepage areas, in saturated soil or variously submersed; common. May-July. Se. NC south to c. peninsular FL, west to se. TX; West Indies; Central America to South America. The two species previously recognized appear to be only different growth forms, induced by different hydrologic conditions. [= FNA, GW, K, WH, Z; > M. aubletii Michaux – RAB, S; > M. fluviatilis – RAB, S]

---

**Juncus** Linnaeus 1753 (Rush)

(by B.A. Sorrie and W.M. Knapp)

A genus of about 250-300 species, herbs, of cosmopolitan distribution. Drábková et al. (2003) indicate that *Juncus trifidus* may not be part of *Juncus*, and may be as closely related to *Luzula*. References: Brooks & Clemants in FNA (2000); Kirschner et al. (2002b, 2002c)=Y; Bridges & Orzell (2008); Clemants (1990); Balslev in Kubitzki (1998b); Zika (2003)=Z, Drábková et al. (2003); F; GW; RAB. The key based, in part, on those references.
subgenus *Juncus*, section *Juncus*: acutus ssp. leopoldii, roemerianus
subgenus *Juncus*, section Graminifoli*: filipendulius, marginatus, biflorus, longii, repens
subgenus *Juncus*, section *Iridofili*: polycyphatus
subgenus *Juncus*, section *Oxypodium*: acuminatus, brachycephalus, brevicaudatus, caesariensis, canadensis, megacephalus, militaris, nodosus, paludosus, pelocarpus, subcaudatus, torreyi, trigonocarpus, validus var. validus
subgenus *Agathryon*, section *Tenaigea*: bufonius var. bufonius
subgenus *Agathryon*, section *Steirochloa*: gerardii, coriaceus, [brachyphyllus], georgianus, secundus, dichotomus, tenuis, anhelatus, interior, dudleyi
subgenus *Agathryon*, section *Juncotypus*: gymnocarpus, [filiformis], inflexus, effusus var. solutus, pylaei, balticus
UNCERTAIN placement (perhaps not even a *Juncus*): tridens

Identification Notes:
For identification of most rushes, it is important to collect plants with mature capsules and seeds. Stamen number is often a diagnostic character and can be determined after anthesis by counting the number of persistent filaments located behind the tepals. Care must be taken to collect specimens with unjured heads, especially for the group of rushes in Key D; the long beaks of the capsules are often fragile and easily broken off.

1. Inflorescence appearing lateral; inflorescence bracteolate appearing to be a continuation of the culm. .............................. Key A
2. Leaf blades cotyledonate (sometimes obscure in dried specimens; if so, rest leaf on hard surface and run fingernail over it lengthwise).
   1. Flowers borne in heads (glomerules) of 2-6 flowers per head; leaves spine-tipped; single bracteole subtending glomerule present at base of pedicel; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. acutus ssp. leopoldii
   2. Capsule 3.5-5 mm long, obviously longer than the tepals ......................................................... J. roemerianus
   3. Flowers borne singly on branches of inflorescence; leaves not spine-tipped; each flower subtended by two bracteoles in addition to bracteole (of the pedicel); [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. coriaceus
   4. Capsule < 3.5 mm long, shorter than or nearly equaling the tepals ......................................................... J. gymnocarpus
   5. Heads spherical or nearly so, usually 15-60 flowered ......................................................... J. gymnocarpus
   6. Heads turbinate to hemispherical, 3-15 flowered; [subgenus *Juncus*, section *Oxypodium*] ................................. J. filiformis
   7. Culms well spaced along creeping rhizomes.
   8. Rhizomes 1.5-2 mm diameter; culms 1 mm diameter; inflorescence 3-12 flowered; [boreal, south to ne. WV] ............... J. filiformis
   9. Rhizomes 2-4 mm diameter; culms 1.5-2.5 mm diameter; inflorescence 8-30+ flowered; [rare montane plant in NC and SC] ............... J. gymnocarpus
   10. Anthers shorter than filaments ......................................................... J. balticus var. littoralis
   11. Culms cespitose or tufted on short branching rhizomes.
   12. Capsules 3-4 mm long; stamens 6; [rare alien in piedmont and mountains of VA] .............................................. J. inflexus
   13. Capsules 1.5-3.2 mm long; stamens 3; [widespread native].
   14. Stems finely grooved, with 25-30 striations just below inflorescence, soft, easily compressed; perianth 1.9-2.8 mm long, sepals
      equaling petals ......................................................... J. effusus ssp. solutus

1. Inflorescence appearing terminal; inflorescence bracteolate not appearing to be a continuation of the culm.

   2. Leaf blades septate; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. filiformis
   3. Mature seeds distinctly tailed with elongate appendages at each end (may be obscure in J. subcaudatus), seeds 0.7-2.5 mm long;
      [subgenus *Juncus*, section *Oxypodium*] ................................. J. pelocarpus
   4. Flowers in heads (glomerules) of 2 or more, individual flowers not subtended by two bracteoles (in addition to the bracteole
      of the pedicel); [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. longii
   5. widest leaf blade (2.6-) 3.1-4.5 (-5.4) mm wide; sheath of lowest leaf (3.2-) 4.3-7.8 (-9.7) cm long; tallest culm (27.2-) 50.8-81.2
      (-100.7) cm; anthers (0.5-) 0.6-1.0 (-1.3) mm long, exserted; stem base (3.4-) 5.8-9.6 (-12.0) mm wide ........................................ J. biflorus

KEY A

1. Flowers borne in heads (glomerules) of 2-6 flowers per head; leaves spine-tipped; single bracteole subtending glomerule present at base of
   pedicel; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. acutus ssp. leopoldii
2. Capsule 3.5-5 mm long, obviously longer than the tepals ......................................................... J. acutus ssp. leopoldii
3. Flowers borne singly on branches of inflorescence; leaves not spine-tipped; each flower subtended by two bracteoles in addition to bracteole
   (of the pedicel); [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. coriaceus
4. Capsule < 3.5 mm long, shorter than or nearly equaling the tepals ......................................................... J. gymnocarpus
5. Heads spherical or nearly so, usually 15-60 flowered ......................................................... J. gymnocarpus
6. Heads turbinate to hemispherical, 3-15 flowered; [subgenus *Juncus*, section *Oxypodium*] ................................. J. filiformis
7. Culms well spaced along creeping rhizomes.
8. Anthers shorter than filaments ......................................................... J. balticus var. littoralis
9. Rhizomes 1.5-2 mm diameter; culms 1 mm diameter; inflorescence 3-12 flowered; [boreal, south to ne. WV] ............... J. filiformis
10. Rhizomes 2-4 mm diameter; culms 1.5-2.5 mm diameter; inflorescence 8-30+ flowered; [rare montane plant in NC and SC] ............... J. gymnocarpus
11. Anthers longer than filaments ......................................................... J. gymnocarpus
12. Culms cespitose or tufted on short branching rhizomes.
13. Capsules 3-4 mm long; stamens 6; [rare alien in piedmont and mountains of VA] .............................................. J. inflexus
14. Capsules 1.5-3.2 mm long; stamens 3; [widespread native].
15. Stems finely grooved, with 25-30 striations just below inflorescence, soft, easily compressed; perianth 1.9-2.8 mm long, sepals
   equaling petals ......................................................... J. effusus ssp. solutus

KEY B

1. Flowers borne in heads (glomerules) of 2 or more, individual flowers not subtended by two bracteoles (in addition to the bracteole at the base
   of the pedicel); [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*]; [plants of brackish habitats]; [subgenus *Juncus*, section *Juncus*] ................................. J. acutus ssp. leopoldii
2. Perianth 6-10 mm long; plant aquatic, submerged and sterile or emersed/s trenched and fertile; stems weak, creeping, mat-forming
   ......................................................... J. filiformis
3. Heads < 6 mm long; plant of uplands or wetland margins, never submerged; stems erect, never creeping or mat-forming.
4. Infructescence usually congested, (1.8-) 2.4-4.7 (-6.4) cm long; greatest distance between adjacent rhizome cataphylls (5.3-) 6-10.5
   (-13.0) mm; rhizome width (measured between adjacent cataphylls) (0.8-) 1.0-1.4 (-1.9) mm ........................................ J. longii
5. Heads 1-5 (-10) per culm; [calcareae glades inland, east to GA and TN] .............................................. J. filiformis
6. Heads > 9 per culm; [collectively widespread].
1 Leaves terete, not at all flattened; [subgenus Agathryon, section Tenageia] ........................................... J. bufonius

6 Plants perennial, with coarse roots or persistent leaf bases.

7 Leaves narrowly elliptic in cross-section.

8 Auricles 3-6 mm long at summit of leaf sheath.

9 Capsules < 3/4 length of perianth, borne broadly spaced along the usually diffuse branches of the inflorescence .......... J. anthelatus

3 Plants strictly cespitose, without any short, hard, knotty rhizomes; tepals lanceolate .................................. J. compressus

2 Leaves with complete septae; heads about 12 mm diameter; tips of dehisced capsules split; [subgenus Agathryon, section Steirochloa] ........................................... J. brachycephalus

5 Inflorescence narrow, the branches erect; mature capsules dark brown; heads 2-7 flowered................................. J. brevicaudatus

KEY C

1 Culms and leaves scabrid, gray-green or blue-green; seeds 2.0-2.5 mm long.......................................................... J. caesariensis

2 Seeds 1.2-2.2 mm long, seed body < ½ length of seed.

3 Mature capsules 3.0-4.0 mm long, < 1.5 mm longer than perianth, light reddish brown to light brown; heads 5-50 flowered......................................................... J. canadensis

4 Perianth usually 2.5-3.5 mm long; flowers not secund; capsules ellipsoid or narrowly so; restricted to granite flatrocks.

11 Leaf blades flat.

12 Perianth obtuse apically; capsule chestnut brown or darker; [alien, ranging south to MD].................................. J. dichotomus

6 Mature capsules pale tan or darker; [of prairies and plains, east to KY, se TN] ..................................................... J. subcaudatus

8 Auricles 3-6 mm long at summit of leaf sheath.

9 Capsules < 3/4 length of perianth, borne broadly spaced along the usually diffuse branches of the inflorescence .......... J. anthelatus

3 Plants strictly cespitose, without any short, hard, knotty rhizomes; tepals lanceolate .................................. J. compressus

2 Leaves with complete septae; heads about 12 mm diameter; tips of dehisced capsules split; [subgenus Agathryon, section Steirochloa] ........................................... J. brachycephalus

5 Inflorescence narrow, the branches erect; mature capsules dark brown; heads 2-7 flowered................................. J. brevicaudatus

5 Inflorescence open, the branches widely spreading; mature capsules dark straw colored; heads 5-20 flowered........ J. subcaudatus

9 Heads oblong or oblanceolate; mature capsule 3.0-4.5 mm long.......................................................... J. diffusissimus

1 Mature capsules 2 mm or more longer than perianth, 4.0-5.2 mm long.......................................................... J. diffusissimus

Juncus acutus Linnaeus ssp. leopoldii (Parlatore) Snogerup. Sandy soil at edge of salt marsh. Reported for se. GA by Jones & Coile (1988) and Kartesz (1999), but not by FNA. The distribution in GA is documented by a correctly-identified specimen at Herbarium GA. [= FNA, K, Y] [not yet keyed]

**Juncus caesariensis** Coville, New Jersey Rush. Sphagnum seepages in the Coastal Plain of VA, seeps and bogs at low to moderate elevations in the Mountains of NC. July-October. Found in 1992 from a seepage bog in Clay County, NC, and in 1993 from a bog in Henderson County, NC, where associated with northern disjuncts. Rare throughout its range, it is known only from several sites in NJ, MD, VA, NC, and NS (Newell & Newell 1994). The scabrid leaf blades and large seeds quickly separate this species from the other long-tailed rushes. It should be looked for along seepage slopes and bogs in the fall-line sandhills and the outer Coastal Plain. [= C, F, FNA, G, K, Y]

**Juncus canadensis** J. Gay ex Laharpe, Canadian Rush. Lake, pond and stream margins, swamps, bogs, seepage slopes, wet meadows, ditches. July-October. NL (Newfoundland) to MN, south to c. peninsular FL, TN, and LA. _J. canadensis_ is here treated as a single, polymorphic species. Fernald and others have described up to 5 forms and varieties of _J. canadensis_, based on variation in flower and capsule size (from 2.5 mm to nearly 4.0 mm), shape of the glomerules (densely flowered and subglobose to few-flowered and turbinate), and structure and size of the inflorescence (congested to open). Further study is necessary to determine whether any of these taxa should be recognized. [= RAB, C, FNA, G, K, S, WH, WV, Y; > _J. canadensis_ var. _canadensis_ – F; > _J. canadensis_ var. _euroauster_ Fernald – F]

* _Juncus capitatus_ Weigel. Reported for n. AL (Kartesz 1999); rejected by Kral et al. (2010). [= K] [rejected; not keyed]

* _Juncus compressus_ Jacquin. Disturbed ground, ditches, in saline or alkaline soils; native of Europe. NS to ON, south to MD, PA, w. NY, MI, WS, and sporadically distributed westward in high elevations. [= FNA, C, F, FNA, G, K, Y]

* _Juncus conglomeratus_ Linnaeus. Low, marshy or peaty places; native of Europe. July-September. Reported for WV and northwards. [= C, K; < _J. effusus_ – FNA; = _J. effusus_ Linnaeus var. _conglomeratus_ (Linnaeus) Engelmann – F]

**Juncus debilis** A. Gray, Weak Rush. Marshy shores, stream and pond margins, along puddles in wet, disturbed clearings, ditches. May-August. RI to MO, south to n. FL and e. TX; Honduras. [= RAB, C, F, FNA, G, K, S, WH, Y]

**Juncus dichotomus** Elliott. Often in disturbed, open, wet areas, ditches, wet meadows. June-October. MA to c. peninsular FL, west to OK and TX; Central America. The character used to separate _J. platyphyllus_ (Wiegand) Fernald from _J. dichotomus_ (flat leaf blade vs. terete leaf blade) does not appear to be reliable; leaf blades from culms in the same clump may vary from flat to slightly involute to completely terete. [= FNA, GW, W, WV, Y; > _J. dichotomus_ – RAB, F; > _J. platyphyllus_ (Wiegand) Fernald – RAB, F; = _J. tenuis_ var. _dichotomus_ (Elliott) A. Wood – C; > _J. dichotomus_ var. _dichotomus_ – G, K, S; > _J. dichotomus_ var. _platyphyllus_ Wiegand – G, K, S]

**Juncus diffusissimus** Buckley, Diffuse Rush, Slim-pod Rush. Low, wet open areas, ditches, margins of ponds and streams. May-September. Mostly Coastal Plain from se. VA to c. peninsular FL, west to e. and nc. TX; also s. IN to MO, KA, OK, TN, and KY. [= RAB, C, F, FNA, G, K, S, WH, WV, Y]

**Juncus ephriamii** Coville, Ephemeral Rush. Marshes of ponds and lakes, depressions in savannas and flatwoods, wet, disturbed clearings, roadside ditches. May-September. Coastal Plain, DE to c. peninsular FL, west to se. TX. Capsules of _J. ephriamii_ are similar in shape to _J. acuminatus_, but the presence of tubiferous roots, shorter perianth (2.0-2.5 mm long vs. 2.5-3.5 mm) and fewer-flowered glomerules (3-8 flowered vs. 5-many flowered) clearly distinguishes _J. ephriamii_ from _J. acuminatus_. [= RAB, C, F, FNA, G, K, S, WH, Y; > _J. ephriamii_ var. _ephrilii_ – K; > _J. ephriamii_ var. _polyanthesmus_ C. Mohr – K]

**Juncus effusus** Fernald ex Wiegand, Diffuse Rush. Wet meadows, ditches, alkaline soils. July-September. Coastal Plain, DE to c. peninsular FL, west to se. TX; also nw. VA, w. PA, w. WV, n. MI, and n. MN. [= C, F, FNA, G, K]
**Juncus filipendulus** Cowille. Texas Plains Rush. Prairies, limestone barrens. KY, TN, and AL west to OK and TX. [= FNA, GW, K, S, Y]

**Juncus greenei** Oakes & Tuckerman, Greene’s Rush. Pine barrens, other dry, open sandy sites. June-July. NB west to MN, south to s. NJ, n. OH, n. IN, n. IL, and IA. [= C, F, FNA, G, K]

**Juncus gymnocarpus** Cowille, Seep Rush. Bogs, seeps, streambanks. July-September. Local, mountains of e. PA, w. NC, e. TN, nw. SC and ne. GA, Coastal Plain of se. AL, s. MS (Sorrie & Leonard 1999), and w. Panhandle FL. In the Appalachians, *J. gymnocarpus* is scattered in mountain bogs and seeps throughout the mountain region; it reaches its most general occurrence in the escarpment gorge region of Transylvania, Macon, and Jackson counties, NC, where it also occurs along streambanks, especially in the vicinity of waterfalls. [= RAB, C, F, FNA, G, K, S, W, WH, Y]

**Juncus interior** Wiegang. Prairies, disturbed sites. OH west to SK, south to e. TN, AL (Sorrie & LeBlond 2008), MS (Sorrie & LeBlond 2008), LA, TX, and NM. Also reported for VA and NC (Kartesz 1999); the NC report is based on a misidentified specimen. [Further investigate] [= FNA, G, S, W, Y; > J. interior var. interior – K; < J. tenuis Willdenow var. tenuis – C; < J. tenuis – GW]

**Juncus longii** Fernald. Usually in very wet, often inundated sites, bogs, ditches, rooting in clay or peat. June-August. MD south through VA, NC, SC to s. MS, mainly in the Coastal Plain; disjunct inland in boggy sites, as in w. NC, nc. GA, TN, and n. AL (Knapp & Naczi 2008, more extensive distributions are based on misattribution). See Knapp & Naczi (2008) for clarification of the *Juncus marginatus* complex. [= RAB, F, K; < J. biflorus – C, G; < J. marginatus – FNA, GW, Y (also see J. biflorus and J. longii); = J. aristulatus Michaux var. aristulatus – S]

**Juncus marginatus** Rostkovius. Weat meadows, bogs, generally throughout in wet, sandy or peaty soil. June-September. NS to ON, MI, and NE, south to s. peninsular FL and TX; disjunct in CA and in South America. See Knapp & Naczi (2008) for clarification of the *Juncus marginatus* complex. [= RAB, C, G, K, S, W, WV; > J. marginatus var. marginatus – F; > J. marginatus var. setosus Cowille – F; < J. marginatus – FNA, GW, WH, Y (also see J. biflorus and J. longii); > J. marginatus var. setosus (Cowille) Small – G]

**Juncus militaris** Bigelow, Bayonet Rush. Lakeshores, shallow streams. NS to MD, DE, and ne. PA; inland near the Great Lakes; disjunct at Phelps Lake, Washington County, NC (Sorrie & LeBlond 2008). [= C, F, FNA, G, K, Y]

**Juncus nodatus** Cowille. Shallow water, marshes, sloughs, savannas, bogs. KY west to KS, south to TN, AL, w. Panhandle FL, MS (Sorrie & LeBlond 2008), LA, and TX. [= FNA, C, G, GW, K, Y; ? J. robustus, preoccupied] [synonymy incomplete]

**Juncus nodosus** Linnaeus. Swamps, streamsidies. July-August. NL (Newfoundland) to BC, south to DE, w. VA, WV, IN, MO, TX, and CA. [= C, F, FNA, G, WV, Y; > J. nodosus var. nodosus – K]

**Juncus paludosus** E.L. Bridges & Orzell. Hardwood swamps, cypress swamps and stringers with seasonally flowing water, adjacent ditches. April-May; May-July. Ne. FL and e. FL Panhandle south to s. FL. See Bridges & Orzell (2008) for more detailed information.

**Juncus pelocarpus** E. Meyer. Ditches, along pond and stream margins, seepage slopes, disturbed open areas, sea-level fens, interdunal swales, Atlantic white-cedar swamps. July-October. NL (Labrador) west to MN, south to DE, e. VA, n. IN; se. VA to SC; FL Panhandle and s. AL. The seaptae along the narrow leaf blades of *J. pelocarpus* are often difficult to detect. More southern populations (from VA southwards) are more robust and have sometimes been separated as *J. abortivus*, but variation appears to be clinal. [= FNA, WH, Y; > J. pelocarpus – K; > J. pelocarpus var. pelocarpus – C, F, G; > J. abortivus Chapman – RAB, F, GW, K, S; > J. pelocarpus E. Meyer var. crassicaudex Engelmann – C, F, G]
**Juncus polycephalus** Michaux, Many-headed Rush. Sandy pond margins, ditches, savannas. July-September. Coastal Plain, NC to s. FL, west to e. TX. [= WH = Juncus polycephalus – RAB, F, FNA, GW, K, S, Y, orthographic variant]

**Juncus pylaiei** LaHarpe, Common Rush. Moist soil, marshes, margin of streams, ponds, lakes and swamps, low meadows (overlooked and probably more widespread and common than shown). June-September. Throughout eastern North America, south to NC and SC. [= C, K, Y, Z; < J. effusus – RAB, FNA, GW, K, WH; > J. effusus var. costulatus St. John – F; > J. effusus Linnaeus var. pylaiei (LaHarpe) Fernald & Wiegand – F; < J. effusus Linnaeus var. solutus Fernald & Wiegand – G]

**Juncus repens** Michaux, Creeping Rush. Streams, ponds, lakes, ditches, wet depressions in flatwoods, cypress savannas. June-October. DE to s. FL, west to TX, north into OK and TN; Mexico (Tabasco); Cuba. This species commonly forms dense mats – a useful field character. [= RAB, C, F, FNA, G, GW, K, S, WH, Y]

**Juncus roemerianus** Scheele, Black Needle Rush. Coastal tidal marshes, forming dense stands at and above mean high tide, above the Spartina alterniflora zone. January-June; May-October. MD to s. FL, west to se. TX. See Eleuterius (1977) for additional information on this species. [= RAB, C, F, FNA, G, GW, K, S, WH, Y]

**Juncus scirpoides** Lamarrk var. **scirpoides**. Wet, open, disturbed areas, ditches, sandhill pocosin ecotones and seepage bogs, savannas and wet pine flatwoods, wet meadows. June-October. S. NY to s. FL, mostly Coastal Plain and Piedmont; west to TX; IN to MI, MO, OK. [= F, S; < J. scirpoides – RAB, C, FNA, GW, K, WH, WV, Y]

**Juncus secundus** Beauvois ex Poir. Dry fields, rock outcrops. June-October. ME to IN, south to e. OK, n. AL, and n. GA. [= RAB, C, F, FNA, GW, K, S, WH, WV, Y]

**Juncus subcaudatus** (Engelmann) Coville & Blake, Somewhat-tailed Rush. Bogs, mossy woods and other wet places. July-October. NS to NY, southwest to MO and southeast to GA. *J. subcaudatus* is one of the more difficult rushes to identify. Although it is grouped with *J. canadensis*, *J. brevicaudatus*, and the other long-tailed rushes, its seeds lack distinct, long appendages. In general appearance it matches *J. acuminatus* quite well; mature seed size and mature capsule size (*J. subcaudatus* capsules are generally well exerted above the perianth, while *J. acuminatus* capsules are equal to only slightly exerted above the capsule) need to be examined in order not to confuse the two taxa. [= RAB, C, FNA, GW, K, S, WH, Y; > J. subcaudatus var. subcaudatus – F, K]

**Juncus tenuis** Willdenow, Path Rush. Dry or moist soil along roadsides and paths, fields. June-September. NL (Labrador) west to AK, south to FL, TX, CA, and n. Mexico; Central and South America; introduced widely around the world. *J. tenuis* as it is here treated includes *J. tenuis* var. *williamsii* Fernald, which has a more congested inflorescence with arched to recurved inflorescence branches. [= FNA, Y; < J. tenuis – RAB, GW, K, S, WH; > J. tenuis var. tenuis – C; > J. tenuis var. tenuis – F, WV; > J. tenuis var. williamsii Fernald – F]

**Juncus trifidus** Linnaeus, Highland Rush. Rock crevices at high elevations, on greenstone, mica schist, amphibolite, hornblende gneiss, and quartztic sandstone. June-September. The species is circumboreal, occurring in arctic-alpine situations in n. Europe and n. North America where it ranges from NL (Newfoundland) to QC, south to s. New England and NY; disjunct in VA (Stony Man, Page County) and NC (Craggy Pinnacle, Craggy Dome, and Craggy Gardens, Buncombe County; Eagle Cliff, Mitchell County; Three Top Mountain, Ashe County), and WV (North Fork Mountain, Pendleton County). As with many circumboreal species of polymorphic nature, there is disagreement over the recognition of infraspecific taxa. *Var. monanthos* (Jacquin) Bluff & Fingerhuth or ssp. *monanthos* (Jacquin) A. Scherson & G. Graebner has often been applied to e. North American *J. trifidus*, but should apply (if considered valid at all) only to *J. trifidus* of limestone areas of Europe. Although Hämét-Ahti (1980) correctly showed that Appalachian *J. trifidus* (from acidic and mafic gneisses and schists) does not belong to *J. monanthos* (*J. trifidus* ssp. *monanthos*, *J. trifidus* var. *monanthos*), her treatment of Appalachian plants as ssp. *carolinianus* Hämét-Ahti has been controversial. This treatment follows Clements (1990), who concludes that the primarily vegetative characters used to separate Appalachian plants from the European (blade lengths and relative positions) are too variable to warrant recognition of subspecies or varieties in the taxon. Further study is warranted. [= Y; < J. trifidus – FNA, S; > J. trifidus var. monanthos (Jacquin) Bluff & Fingerhuth – RAB, F, GW, misapplied; > J. trifidus ssp. *carolinianus* Hämét-Ahti – C, K]
**Juncus trigonocarpus** Steudel. Seepage slopes, bogs, along stream margins, ditches. July-October. Coastal Plain, NC to FL Panhandle, west to e. TX. Young *J. trigonocarpus* and *J. canadensis* are often confused; once mature, however, the two can usually be separated by capsule color alone. Although *J. canadensis* capsules reddish-purple tone of *J. trigonocarpus*. Seed and capsule size are also distinct for the two taxa. [= RAB, FNA, GW, K, S, WH, Y]

---

**Luzula A.P. de Candolle 1805 (Wood-rush)**

1 Flowers borne singly; inflorescences branched or unbranched; [subgenus *Pterodes*].

2 Inflorescences simple, with an occasional pedicel branching from the base of a flower; apical appendages of seeds 0.6-1.5 (-2.1) mm long; seed/appendage length ratio 1.0-2.8 .................................................................L. acuminata var. *acuminata*

3 Inflorescences usually branching, the pedicels commonly paired; apical appendages of seeds 0.4-1.1 mm long; seed/appendage length ratio 1.0-2.8 .................................................................L. acuminata var. *carolinae*

4 Seeds 1.1-1.7 mm long; caruncle 0.2-0.5 mm long; plants not producing basal bulblets ........................................L. multiflora var. *multiflora*

**Luzula echinata** (Small) F.J. Hermann, Spreading Wood-rush. Forests, bogs. Se. MA, se. NY PA, WV, and IA south to GA, AL, MS, and e. TX. March-August. [= C, FNA, GW, K, RAB, WV, Z; > L. echinata var. echinata – F; > L. echinata var. mesochorea F.J. Hermann – F; = L. campestris (Linnaeus) A.P. de Candolle var. echinata (Small) Fernald & Wiegand – G; = Juncoides echinatum Small – S; < L. multiflora – W]

**Luzula multiflora** (Ehrhart) Lejeune var. *multiflora*. Forests. March-August. Circumboreal, in North America from NL (Newfoundland), ON, SK, and BC, south to NC, GA, AL, MS, MO, MT, and OR; Eurasia; Costa Rica. [= F, WV; < L. multiflora – C, RAB; = L. campestris (Linnaeus) A.P. de Candolle var. multiflora (Ehrhart) Celak – G; = L. multiflora ssp. multiflora var. multiflora – K; = L. multiflora ssp. multiflora – FNA, Z; < L. multiflora – W]

---

**99. CYPERACEAE** A.L. de Jussieu 1789 (Sedge Family) [in POALES]

A family of about 100 genera and 5000 species, mostly herbs, cosmopolitan. References: Ball, Reznicek, & Murray in FNA (2002b); Tucker (1987); Goetghbeur in Kubitzki (1998b).

1 Achene enclosed in a perigynium (a sac-like structure); [subfamily Caricoideae, tribe Cariceae] ................................................................. *Carex*

1 Achene not enclosed in a perigynium.
2 Scales obviously and strongly distichously imbricate; spikelets aggregated into spikes or heads; [subfamily Cyperoideae].
3 Inflorescence axillary; leaves predominantly cauline, conspicuously 3-ranked; perianth bristles subtending the achene 6-9; [tribe Dacilichaeae].................................................................................................................................Dacilichium
4 Inflorescence terminal, more-or-less scapos (though immediately subtended by leafy bracts); leaves predominantly basal, not 3-ranked; perianth bristles absent (Cyperus and Kylinga) or present (Schoenus); [tribe Cyperaeae].................................................................................................................................Schoenus
5 Perianth bristles present...........................................................................................................................................................................Kyllinga
6 Scales spirally imbricate; spikelets not usually aggregated.

Bolboschoenus Palla 1905 (Bulrush)

A genus of about 10-16 species, herbs, cosmopolitan. The distinction of this genus from Schoenoplectus is uncertain and controversial; it is generally accepted in the Old World, and generally not in the New World. References: Smith in FNA (2002b); Strong (1994)-Z, Goethegeber in Kubitzki (1998b).

1 Ventral summit of leaf sheaths truncate or concave, the nerves destined for the leaf margins diverging gradually..................................................B. maritimus ssp. paludosus
2 Ventral summit of leaf sheaths convex, the nerves destined for the leaf margins diverging abruptly, making a nearly right-angle bend.
3 Bristles mostly equaling to surpassing the distinctly trigonous achene..............................................................................................B. fluviatilis
4 Bristles shorter than to equaling the lenticular or plano-convex achene.
3 Inflorescence relatively open, with (10-) 15-50 spikelets; bristles persistent .......................................................... B. novae-angliae
3 Inflorescence relatively congested, mostly with 5-20 spikelets; bristles more or less caducous............................................ B. robustus

Bolboschoenus fluitatilis (Torrey) Sojak, River Bulrush. Tidal and river marshes. June-early July; July-August. NB west to SK, BC (Vancouver Island) and WA, south to VA, KY, TN, s. AL, OH, IN, KS, AZ, and CA; Asia; Australia and New Zealand. [= FNA; > Scirpus fluitatilis (Torrey) A. Gray – C, F, G; > Schoenoplectus fluitatilis (Torrey) M.T. Strong – K, Z]

Bolboschoenus maritimus (Linnaeus) Pall. sps. paludosus (A. Nelson) T. Koyama, Alkali Bulrush, Salt-marsh Bulrush. Marshes. Interruptedly circumboreal, south in North America to VA, NY, MN, MO, OK, TX, and Mexico. [= FNA; > Scirpus maritimus var. maritimus – C; > Scirpus maritimus var. fernaldii (Bicknell) Beetle – F (also see Bolboschoenus novae-angliae); = Scirpus maritimus var. fernaldii (Bicknell) Beetl – G; = Scirpus maritimus Linnaeus; = Schoenoplectus maritimus (Linnaeus) Lye – K, Z]

Bolboschoenus novae-angliae (Britton) S.G. Smith, Salt-marsh Bulrush. Fresh to brackish tidal marshes, ditches. Late June-July; July-September. ME to GA. Probably a hybrid derivative of Bolboschoenus fluitatilis and B. robustus, but its distinctiveness and ecological behavior suggest that it should be treated as a species; see Schuyler (1975) and Cronquist (1991) for additional discussion. [= FNA; > Scirpus cylindricus (Torrey) Britton – C, K, Beal (1977), illegitimate name; < Scirpus maritimus var. fernaldii (Bicknell) Beetle – F; = Scirpus robustus Pursh var. novae-angliae (Britton) Beetl – G; = Schoenoplectus novae-angliae (Britton) M.T. Strong – K, Z]

Bolboschoenus robustus (Pursh) Sojak, Salt-marsh Bulrush. Brickish marshes. Late May-June (-September); late June-September. Along the coasts, from NS to s. FL, west to TX, and into tropical America; also in CA. [= FNA; > Scirpus robustus Pursh – RAB, C, F, GW, S, W, WH; = Scirpus robustus var. robustus – G; = Schoenoplectus robustus (Pursh) M.T. Strong – K, Z]

A genus of about 100 species, herbs, of tropical and warm temperate areas, concentrated especially in tropical Africa and tropical South America. References: Kral (1971)–Z; Kral in FNA (2002b); Goetheheuer in Kubitzki (1998b).

1 Spikelets sessile, the inflorescence therefore a capitate cluster (sometimes a few spikelets pedicellate, but the pedicels not generally longer than the spikelets, the inflorescence still appearing glomerate).

2 Inflorescence bracts widened abruptly at its base, the widened portion prominently fimbriate-pectinate; perennial, culms 10-50 cm tall; achenes 1-1.3 mm long, tan or brown (when ripe); spikelet scales 0.7-1.8 mm long, with obtuse to rounded apices.

3 Inflorescence bracts widened abruptly at its base, the widened portion prominently fimbriate-pectinate; perennial, culms 10-50 cm tall; achenes 0.8-1.2 mm long, transversely rugose; spikelet scales usually greenish or pale brown, dull, puberulent...

4 Achenes very finely papillose and waxy, gray or dark greenish-brown (when ripe); spikelet scales 0.7-1.8 mm long, with obtuse to rounded apices.

5 Annual, to 1-2(-3) dm tall; inflorescence a simple (rarely compound) umbel of few (3-9) lance-ovoid spikelets; longest involucral bract seldom exceeding the inflorescence; leaf margins usually hispidulous.......................................................... B. ciliatifolia

5 Perennial, to 1.5-4 dm tall; inflorescence a compound (rarely simple) umbel of many (8-30) oblong or lance-linear spikelets; longest involucral bract commonly exceeding the inflorescence; leaf margins usually distinctly tuberculate-seabrid.............................. B. coarctata

* Bulbostyly barbata (Rottbøll) C.B. Clarke, Old World Hairsedge. Sandy fields; native of the Old World tropics. July-October. [= RAB, FNA, GW, K, W, WH, Z; = Stenophyllus barbatus (Rottbøll) Britton – S]

Bulboschoenus capillaris (Linnaeus) Kunth ex C.B. Clarke, Common Hairsedge. Thin soils on rock outcrops, especially granite domes and granite flatrocks (but also on mafic rocks, such as diabase), sandy soils, fields, bogs (in FL). July-October. ME to MN, south to Panhandle FL and TX, and west to AZ and CA, also in Mexico, Central America, the West Indies, and s. Asia. This species frequently has a mixture of long and very short culms, the short culms only a few cm long and thus nearly hidden amongst the leaves. [= RAB, C, F, G, GW, W, WH, Z; > B. capillaris var. capillaris – F; > B. capillaris var. crebra Fernald – F; > B. capillaris var. isopoda Fernald – F; = B. capillaris sps. capillaris – K; = Stenophyllus capillaris (Linnaeus) Britton – S]

Bulboschoenus ciliatifolia (Elliot) Fernald, Savanna Hairsedge. Moist to wet sands of savannas, roadsides, disturbed areas. July-October. Se. VA south to s. FL and west to s. AL. Kral (1971) describes this plant as occurring in generally wetter habitats and being much weedier than B. coarctata. The sympatry of this taxon and B. coarctata suggests that they are best recognized as species. [= F, G; = Bulboschoenus ciliatifolia (Elliot) Fernald var. ciliatifolia – C, F, GW, K, Z; < B. ciliatifolia – RAB, WH (also see B. coarctata); = Stenophyllus ciliatifolius (Elliot) C. Mohr – S]

Bulboschoenus coarctata (Elliot) Fernald, Elliot's Hairsedge. Sandhills, usually associated with longleaf pine and wiregrass. July-October. Se. VA south to s. FL and west to e. TX, north in the interior to sw. TN; Cuba. [= F, G; = Bulboschoenus ciliatifolia
A genus of about 2000 (or more) species, herbs, cosmopolitan, especially temperate and boreal. References: Mackenzie (1931-1935)=M; Ball & Reznicek in FNA (2002b); Goetghebeur in Kubitzki (1998b); Frye & Lea (2001). Key to sections adapted closely from FNA.

Key to the sections of Carex

1 Spike 1 per culm, all flowers attached to the main stem in a terminal spike ............................................................... Key A

1 Spike 2 or more per culm (some flowers in lateral spikes)

2 All flowers staminate .................................................................................................................................................. Key B

2 At least some flowers pistillate.

3 Stigmas 2; achenes flat or biconvex in cross-section (lenticular) .............................................................................. Key C

3 Stigmas (2-) 3 (-4); achenes trigonous or tereete in cross-section.

4 Body of perigynium pubescent, scabrous, hispid, or papillose (if papillose, the papillae longer than wide) .............. Key D

4 Body of perigynium glabrous or papillose (if papillose the papillae shorter than wide).

5 Bracts sheathless or with sheath < 4 mm long (rarely longer, and then the sheath shorter than the diameter of the stem) .... Key E

5 Bracts (at least the lower) with sheath > 4 mm long (and longer than the diameter of the stem) ... Key F

{not complete at this time}

Key A

1 Leaf blades 20-60 mm wide, without a midrib (with 40-100 parallel nerves all of equal prominence), leathery, the apex obtuse; leaf margin scarious, minutely crisped-ruffled (feeling scaberulous to the touch). ................................................................. C. fraseriana

1 Leaf blades 0.5-25 (-52) mm wide, with a midrib, herbaceous, the apex acute; leaf margin various (smooth or scabrous, but not as described below).

2 Spike entirely staminate

3 Culms distinctly red or purple at the base .................................................................................................................. C. picta in Section 41: Pictae

3 Culms yellow to brown or black, without red or purple coloration.

4 Culms shorter than the leaves; widest leaf blades > 2 mm wide ........................................................................ Section 44: Phyllostachyae

4 Culms longer than the leaves; widest leaf blades < 2 mm wide ............................................................................... C. exilis in Section 11: Stellulatae

2 Spike pistillate or with both pistillate and staminate flowers.

5 Stigmas 2; achenes lenticular ................................................................................................................................... C. exilis in Section 11: Stellulatae

5 Stigmas 3; achenes trigonous.

6 Perigynia pubescent near the tip ............................................................................................................................ C. picta in Section 41: Pictae

6 Perigynia glabrous.

7 Spikes gynecandrous; beak of perigynium with apical teeth > 0.3 mm long ........................................................ C. squarrosa in Section 34: Squarrosae

7 Spikes androgyneous or entirely pistillate; beak of perigynium with apex entire, emarginate, or with teeth < 0.2 mm long.

8 Lower pistillate scales > 10 mm long .......................................................................................................................... Section 44: Phyllostachyae

8 Lower pistillate scales < 10 mm long.

9 Perigynium beak > 2 mm long, as long as or longer than the perigynium body .................................................. Section 44: Phyllostachyae

9 Perigynium beak < 2 mm long, or if more, thentapering to the perigynium body and shorter than the body.

10 Perigynia > 4× as long as wide ........................................................................................................................ C. pauciflora of Section 38: Leucoglochin

10 Perigynia < 4× as long as wide ........................................................................................................................... Section 46: Leptocephalae

Key B

1 Widest leaves 4-8 mm wide; inflorescences more-or-less capitate (occasionally with the lowermost 1 or 2 spikes separated) ................................................................. C. kobomugi in Section 8: Macrocephalae

1 Widest leaves 1-4 mm wide; inflorescences ovoid to cylindric .................................................................................. Section 10: Divisae
Key C

1 Perigynia pubescent, not papillose ............................................................................................................. Section 39: Acrocystis
1 Perigynia glabrous, papillose or not. ........................................................................................................ Section 39: Acrocystis
2 Lateral spikes usually pedunculate; lowestmost inflorescence bracts sometimes with sheath; peduncles with prophyll at base.
3 Pistillate scales (at least the lower) long-awned ..................................................................................... Section 13: Phacocystis
3 Pistillate scales obtuse to acuminate or cuspidate. 
4 Perigynia smooth; style persistent on the achene .................................................................................. Section 30: Viscariae
4 Perigynia often papillose over most of the surface; style deciduous ........................................................ Section 13: Phacocystis
2 Lateral spikes sessile; bracts sheathless; peduncles without (or rarely with) a prophyll
5 Perigynia papillose (visible at 20× magnification).
6 Terminal spike staminate, androgyneous, or gynecandrous (if gynecandrous, the stamine flowers more numerous than the pistillate); lateral spikes at least 2× as long as wide ......................................................... Section 13: Phacocystis
6 Terminal spike staminate or gynecandrous (if gynecandrous, the pistillate flowers more numerous than the pistillate); lateral spikes not much longer than wide ........................................................................ Section 9: Glareosae
5 Perigynia smooth.
7 Terminal spike gynecandrous; lateral spikes gynecandrous or pistillate.
11 Margins of perigynia flat, at least in the upper ⅓, flat portion (measured at the tip of the achene and base of beak) > (0.1-) 0.2 mm wider
12 Achenes rounded at apex (style dehiscing at the surface of the achene); style conspicuously enlarged at the base .................................................. Section 10: Deweyanae
12 Achenes with short apiculus formed by the persistent base of the style; style not conspicuously enlarged at base .................................................. Section 12: Ovaes
11 Margins of perigynia rounded, or with flat portion < 0.1 mm wide.
13 Margins of perigynia rounded or with a very narrow rounded edge; achenes nearly filling the perigynium bodies .................................................................................................................................................. Section 9: Glareosae
13 Margins of perigynia sharply edged or narrowly winged; achenes distinctly perigynium than the perigynium bodies.
9 Perigynia mostly > 2× as long as wide, widest near the base ........................................................................ Section 1: Vulpinae
9 Perigynia mostly < 2× as long as wide, widest near middle.
10 Inflorescences usually branched, at least at the base, usually with > 15 spikes; pistillate scales usually yellow or brown, sometimes with hyaline margins, 3-veined .................................................................................................................................................. Section 3: Multiflorae
10 Inflorescences unbranched or with 1 or 2 short branches at the base, with < 15 spikes; pistillate scales greenish hyaline, 1-veined ........................................................................................................ Section 4: Phaestoglochin
7 Terminal spike androgyneous (rarely entirely stamine or entirely pistillate); lateral spikes androgyneous, stamine, or pistillate.
8 Sheath fronts of lower cauline leaves transversely rugose.
9 Perigynia mostly ≥ 2× as long as wide, widest near the base .................................................................. Section 1: Vulpinae
9 Perigynia mostly ≤ 2× as long as wide, widest near middle.
18 Inflorescences in fruit 1-1.5× as long as wide .......................................................................................... Section 12: Ovaes
18 Inflorescences in fruit 1.5-2 (or more)× as long as wide.
15 Lowermost perigynia in each spike spreading ..................................................................................... Section 11: Stellulatae
16 Lowermost perigynia in each spike ascending or erect. 
15 Lowermost perigynia in each spike ascending or erect.
16 Perigynium serrulate on the margins of the upper body and lower beak .................................................. Section 10: Deweyanae
8 Sheath fronts of lower cauline leaves smooth (or very weakly and indistinctly transversely rugose).
17 Fronts of leaf sheaths dotted red, brown, or yellow.
18 Perigynia widest near the base; culms usually > 1 mm wide .................................................................. Section 1: Vulpinae
18 Perigynia widest near the middle; culms usually < 1 mm wide.
19 Plants densely cespitose, with short rhizomes; pistillate scales acute to acuminate .................. Section 2: Heleoglochin
19 Plants loosely cespitose, sometimes with long rhizomes; pistillate scales (at least the upper) obtuse ................................................................................ Section 3: Multiflorae
17 Fronts of leaf sheaths not dotted, red, brown, or yellow.
20 Upper leaves of culms with front of sheaths green-veined, not differentiated from the rest of the sheath ................................................................................ Section 5: Holarrhenae
20 Upper leaves of culms with front of sheaths whitish-hyamine band extending at least ⅓ the length of the sheath.
21 Perigynia with flat, winglike margins ≥ 0.1 mm wide; plants long-rhizomatous, not cespitose, sometimes forming large colonies .................................................. Section 7: Ammoglochin
21 Perigynia without a flat margin, or with a flat margin < 0.1 mm wide; plants short-rhizomatous or inconspicuously rhizomatous, cespitose or not, sometimes forming large colonies.
22 Plants colonial from long rhizomes ......................................................................................................... Section 6: Divisae
22 Plants cespitose.
23 Spikes not consistently androgyneous, the terminal either entirely stamine or pistillate, the lateral spikes irregularly pistillate, or stamine, or mixed ............................................................................................................. Section 11: Stellulatae
23 Spikes consistently androgyneous, occasionally some of the lateral spikes entirely pistillate.
24 Perigynium widest near the base, tapering from base to beak ................................................................ Section 1: Vulpinae
24 Perigynium widest above the base, often abruptly beaked ................................................................ Section 4: Phaestoglochin

Key D

1 Pistillate spikes all from the base of the plant .......................................................................................... Section 39: Acrocystis
1 Pistillate spikes all or in part borne on the elongate, aboveground stem.
2 Bracts of the lowermost non-basal spike with well-developed sheath > 4 mm long.
3 Beak of perigynium with distinct teeth ≥ 0.6 mm long .......................................................................... Section 29: Carex
3 Beak of perigynium entire, notched, or with indistinct teeth < 0.6 mm long.
4 Bracts of the lowermost non-basal spike bladeless, or with a blade < 2 mm long.
1 Leaf sheath fronts yellow, thickened, and not fragile at the top; leaf blades papillose adaxially (at 25× magnification)........... *C. laevivaginata*

2 Leaf sheath fronts smooth.

3 Larger perigynia 6-8 mm long; leaves to 12 mm wide........................................................................................................... *C. crus-corvi*

4 Larger perigynia 3-5 mm long; leaves to 7 mm wide.  

5 Plants with at least some pellisolate spikes basal; culms much shorter than the leaves........... *C. acrocydanus*

6 Plants with most pellisolate spikes on obvious elongated stems; culms shorter than or longer than the leaves.

7 Larger leaves > 2 cm long, longer than the sheaths ......................................................... *C. acrocydanus*

8 Larger leaves bladeless or with blades < 1 cm long and also shorter than the sheaths.........................

2 Bracts of the lowermost non-basal spike sheathless or with sheath < 4 mm long.

10 Perigynium < 10 mm long.

12 Perigynium beak with 2 teeth > 0.6 mm long ................................................................. *C. scabrata*

13 Terminal spike gynandroecious or pistillate ................................................................. *Porocystis*

14 Leaf sheaths and blades glabrous.

19 Achene tip with persistent, enlarged, circinate style base.................................................... *C. caryophyllea*

19 Achene tip with at most a short apiculus.

22 Plants with at least some pellisolate spikes basal; culms much shorter than the leaves........... *C. acrocydanus*

23 Leaf blades, at least towards the tip, M-shaped in cross-section when young, the upper surface usually with 2 marginal veiins more prominent than the midvein; staminate spikes 1-4.......................... *C. acrocydanus*

24 Plants with at least some pellisolate spikes basal; culms much shorter than the leaves........... *C. acrocydanus*

25 Upper leaves with blades > 2 cm long, longer than the sheaths ........................................ *C. acrocydanus*

26 Perigynia 2-3-veined; beak < 0.5 mm long................................................................. *C. acrocydanus*

27 Outer perigynia with 2 marginal veins; beak > 0.7 mm long.............................. *C. acrocydanus*

28 Perigynia distinctly 20-30-veined; beak < 0.5 mm long ................................................... *C. acrocydanus*

29 Perigynia veinless except for 2 marginal veins; beak > 0.7 mm long.......................... *C. acrocydanus*

30 Plants forming large clonal colonies..............................................................................

31 Short peduncles of pistillate spikes > 1 cm long; perigynia > 3× as long as wide, tapering gradually to the base........

32 Perigynia > 10 mm long.

33 Perigynium beak with 2 teeth > 0.6 mm long ................................................................. *C. acrocydanus*

34 Perigynia strongly 12-30-veined. 

35 Leaf blades V-shaped in cross-section when young, the upper surface lacking 2 marginal veins more prominent than the midrib; staminate spike 1..............................

36 Plants with at least some pellisolate spikes basal; culms much shorter than the leaves........... *C. acrocydanus*

37 Upper leaves with blades > 2 cm long, longer than the sheaths ........................................ *C. acrocydanus*

38 Upper leaves bladeless or with blades < 1 cm long and also shorter than the sheaths.........................

39 Perigynia veinless except for 2 marginal veins; beak > 0.7 mm long..............................

40 Plants forming large clonal colonies..............................................................................

6 Perigynia (4-) avg. 4.7 (-5) mm long, the beak < 2.5 mm long; larger leaves mostly 4-10 mm wide; perigynium scales acuminate to cuspidate; [widespread in our area] ............................................................ C. stipata var. stipata

Key 1b

1 Beak of the perigynium shorter than the body.
2 Perigynia somewhat abruptly contracted into a beak ca. 0.5 × as long as the perigynium body; ventral surface of the perigynium with several incomplete veins basally; culms sharply triangular and narrowly winged, somewhat spongy and easily crushed; dorsal leaf sheaths green; ventral leaf sheaths with scattered red dots, and transversely rugose; [normally of shaded locations] ............................. C. conjuncta
2 Perigynia tapering into a beak, much shorter than the perigynium body; ventral surface of the perigynium with several inconspicuous complete veins; culms inconspicuously triangular to roundish, not winged, neither spongy nor easily crushed; dorsal leaf sheaths dark blue-green with conspicuous white dots; ventral leaf sheaths not transversely rugose; [normally of sunny locations] ........................................................................................................ C. oklahomensis

1 Beak of the perigynium as long as, or longer than, the body.
3 Ventral leaf sheath margins with orange-red dots; achene ovate-lanceolate; perigynium wall adhering to achene............... C. crus-corvi
3 Ventral leaf sheath margins without orange-red dots; achene broadly ovate to ovate-orbicular; perigynium wall not adhering to the achene (or only slightly so).
4 Ventral leaf sheaths not transversely rugose, more or less concave at the apex and not prolonged upward past the base of the blade, friable
4 Ventral leaf sheaths transversely rugose, more or less convex at the apex and prolonged upward past the base of the blade, friable.
5 Perigynia (5-) avg. 5.4 (-6) mm long, the beak > 3 mm long; larger leaves mostly 8-17 mm wide; perigynium scales cupulidate to short-awned; [mostly of the Coastal Plain and lower Piedmont] ........................................................................................................ C. stipata var. maxima
5 Perigynia (4-) avg. 4.7 (-5) mm long, the beak < 2.5 mm long; larger leaves mostly 4-10 mm wide; perigynium scales acuminate to cuspidate; [widespread in our area] ........................................................................................................ C. stipata var. stipata

[26b] Section 2: Heleoglochin (Paniculatae)

1 Inflorescence 7-15 cm long, the basal 3-9 branches well-separated from one another; perigynia broadly obovoid, 1.3-1.5× as long as wide; sheaths concave at the mouth; leaves 3-8 mm wide; [of swamps of the Coastal Plain and lower Piedmont] ............................. C. decomposita
1 Inflorescence 2-8 cm long, the basal 1-5 branches indistinct to slightly separated; perigynia ovoid to lance-ovoid, ca. 2× as long as wide; sheaths prolonged beyond the blade; leaves 1-3 mm wide; [of Mountain wetlands in VA (and TN?) and northward];
2 Inner band of leaf sheath whitish (and red-dotted); basal branches of inflorescence overlapping; perigynium not concealed by the scales ....
2 Inner band of leaf sheath strongly copper-colored (and also red-dotted); basal branches of inflorescence often weakly separated; perigynium nearly or completely concealed by the scales................................................................. C. praerat

[26c] Section 3 – section Multiflorae
A section of 7 species, of North America (including Mexico). References: Standley in FNA (2002b). Key based on FNA.

1 Perigynia red-dotted ................................................................................................................................. C. triangularis
1 Perigynia not red-dotted.
2 Perigynia golden yellow or yellowish-brown at maturity ..................................................................................... C. annectens
2 Perigynia dull yellow-green or pale brown at maturity.
3 Leaves longer than the flowering stem; perigynia 2.0-3.2 mm long, 1.3-1.8 mm wide, the beak 1/3-1/2 the length of the body........
3 Leaves shorter than the flowering stem; perigynia 3.2-4.0 mm long, 2.0-2.6 mm wide, the beak ca. 1/3 as long as the body.
4 Awn of pistillate scales 1-3 mm long; adaxial surface of perigynia with 3-5 nerves; [native, of wet pine savannas of se. SC, GA
southward................................................................. C. fissa var. aristata
4 Awn of pistillate scales 0.5-1.5 mm long; adaxial surface of perigynia lacking nerves; [introduced in our area from sc. United States,
of disturbed sites]............................................................................................................................... C. fissa var. fissa

[26d] Section 4 – section Phaestoglocrin (Bracteosae)

1 Sheaths loose, membranaceous, and fragile on the ventral side, sepal-nodulose and usually mottled or striped with green and white on the dorsal side.
2 Bodies of pistillate scales 1.5-2.5 mm long, 1.1-1.8 mm wide, mostly < ½ as long as the perigynia, apex obtuse to acuminate to shortly awned.
3 Basal internodes of the inflorescence usually < 1 cm long, and usually < 2× as long as the spikes; bodies of perigynia with wing < 0.1 mm wide ................................................................................................................ C. cephaloidea
3 Basal internodes of the inflorescence usually > 2 cm long, at least 2× as long as the spikes; bodies of perigynia with wing 0.1-0.2 mm wide ................................................................................................................ C. sparganioides
2 Bodies of pistillate scales 2.2-4.4 mm long, 1.2-2.4 mm wide, mostly > ½ as long as the perigynia, apex acuminate to awned.
4 Fronts of leaf sheaths yellow or brownish, thick, firm, the back often white-spotted................................................. C. aggregata
4 Fronts of leaf sheaths white, hyaline, fragile, the backs not white-spotted.
5 Perigynia 4-5 mm long, 2× as long as wide; perigynia nerveless or very obscurely nerved on the dorsal face... *C. gravida* var. *gravida*
6 Perigynia 3.4-5 mm long, 1.3–1.5× as long as wide; perigynia strongly few-nerved on the dorsal face... *C. grava var. lunelliana*
1 Sheaths tight on the ventral side, neither septate-nodulose nor mottled with green and white on the dorsal side.
7 Beak of perigynium smooth; pistillate scales acuminate, early deciduous.
8 Average perigynium width ≥ 1.3 mm; average spongy portion of the perigynium ≥ 1.1 mm long; perigynium base distinctly nerved, bulging on the ventral surface, making the perigynium biconvex in cross-section; perigynium 2-2.5× as long as wide; perigynium gradually narrowed to a short beak; leaves 1-3 mm wide.......................... *C. trifolium*
8 Average perigynium width < 1.3 mm; average spongy portion of the perigynium < 1.1 mm long; perigynium base nerveless, flattened on the ventral surface, making the perigynium planoconvex in cross-section; perigynium ca. 3× as long as wide; perigynium narrowed to a conspicuous beak; leaves 0.75-1.5 mm wide........................... *C. texensis*
7 Beak of perigynium serrulate; pistillate scales obtuse, persistent.
9 Plants with creeping rhizomes, the culms arising scattered along the rhizome; *C. gravida* 4-5× as long as wide.............. *C. socialis*
10 Widest leaves 0.9-1.7 mm wide; base of fertile culm 0.7-1.4 mm wide.
11 Base of perigynium cuneate to rounded; distance from base of perigynium to base of achene 0.1-0.5 mm; [primarily of the Mountains in our area].......................... *C. appalachica*
10 Widest leaves 1.7-3.0 mm wide; base of fertile culm 1.4-2.2 mm wide.
12 Stigmas 0.03–0.06 mm thick, straight to slightly twisted; widest leaves < 2.0 mm wide; perigynia 3-7 (-8) per spike... *C. radiata*
12 Stigmas 0.07-0.10 mm thick, mostly coiled; widest leaves > 1.7 mm wide; perigynia (6)-7-14 (-20) per spike.............. *C. rosea*
6 Perigynia not conspicuously corky-thickened at base (except corky-thickened in the rare alien, *C. spicata*, which has perigynia 4.0-5.5 mm long); perigynia ascending to spreading at maturity; perigynia (3)-4-8-40 per spike; leaves 1-5 mm wide.
13 Inflorescence ovoid in outline, the spikes densely aggregated, nearly indistinguishable except by the projecting setaceous bracts which subtend each spike.
14 Perigynia 1.3-1.7× as long as wide, widest near the broadly rounded, truncate, or even subcordate base.............. *C. leavenworthii*
14 Perigynia 1.6-2.5× as long as wide, widest just below the middle, the base broadly cuneate to rounded.
15 Pistillate scales (excluding the awns) shorter than the perigynium body; culms not greatly exceeding the leaves... *C. cephalephora*
15 Pistillate scales (excluding the awns) as long as or exceeding the perigynium body; culms much exceeding the leaves.......................... *C. mesochorea*
13 Inflorescence spicate-racemose; the individual spikes readily distinguishable (often separated by an exposed internode of the axis).
16 Pistillate scales brown or reddish-purple; [alien, sparsely naturalized in our area].
17 Roots and basal sheaths brown to black; perigynia not corky-thickened at base; ligule blunt, wider than long .......... *C. divisa*
17 Roots and basal sheaths purplish-tinted; perigynia corky-thickened at base; ligule acute, longer than wide............... *C. spicata*
16 Pistillate scales green, hyaline, or pale tan; [native in our area (except *C. australis* and *C. muricata* ssp. *lamprocarpus*), common and widespread in our area];
18 Spikes with 5-10 perigynia; pistillate scales brown with green-veined center.......................... *C. muricata* ssp. *lamprocarpus*
18 Spikes with 8-20 perigynia; pistillate scales scarious-white (rarely brown) with green-veined center.
19 Perigynia ascending, nerveless on the ventral surface; scales awned, the awns 1.5–4 mm long; lowest inflorescence bract elongate, the free portion 1-5 cm long.......................... *C. australis*
19 Perigynia spreading, either nerved or nerveless on the upper (ventral) surface; scales acuminate or with an awn to 1.5 (-2.0) mm long; lowest inflorescence bract short, delicate, the free portion 0.5-2 cm long.
20 Perigynia 3.0-3.5 mm long, nerveless on the upper (ventral) face.......................... *C. muehlenbergii* var. *enervis*
20 Perigynia 3.5-4.0 mm long, nerved on both faces.......................... *C. muehlenbergii* var. *muehlenbergii*

[26h] Section 5 – section Holarrheneae (Intermediae)

One species.............................................................................................................................................................................. *C. sartwellii*

[26i] Section 6 – section Diviseae

1 Beak of the perigynium 1/5 to 1/3 as long as the body; spikes 2-7; [alien, naturalized primarily in brackish to salty coastal habitats]... *C. divisa*
1 Beak of the perigynium 1/3 to 1/2 as long as the body; spikes 5-15; [alien, naturalized primarily inland along highways treated with salt]...... .......................................................... *C. praegracilis*

[26j] Section 7 – section Ammoglochin (Arenariae)

A section of 14 species, of temperate Northern Hemisphere. References: Reznicek in FNA (2002b). Key based closely on FNA

1 Perigynia thin-margined and prominently winged at base of beak; pistillate scales usually longer than perigynia; terminal spike usually stamine; [alien in maritime situations].......................................................... *C. arenaria*
1 Perigynia thin-margined, lacking a prominent, expanded wing; pistillate scales shorter than to nearly equalling the perigynia; terminal spike usually pistillate or androgynous; native, inland]........................................... *C. siccata*
[26k] Section 8 – section Macrocephalae

One species............................................................................................................................................................................. C. kobomugi

[26m] Section 9 – section Glareosae (Heleonastes)

A section of 20-25 species, circumboreal, but extending in montane areas to South America, New Zealand, and Australia. References: Toivonen in FNA (2002b).

1 Spikes (1-)2 (-3); perigynia 1.5-5 mm long.
   2 Leaves 0.3-0.8 mm wide, filiform-involute; ligules 0.3-0.8 (-1.2) mm long; inflorescences 14-32 mm long; spikes 2-3 per inflorescence; 
      terminal spike with 1-3 perigynia per spike; [south to PA and s. NJ] ..................................................... C. billingsii
   2 Leaves 0.8-1.9 mm wide, flat or thinly M-shaped; ligules 0.5-1.9 mm long; inflorescences (14-)23-55 mm long; spikes (2-)3-4 per 
      inflorescence; terminal spike with (1-)2-6 perigynia per spike; [south to w. NC] ..................................................... C. trisperma

1 Spikes 4-9; perigynia 5-30 per spike; 1.7-2.5 mm long.
   3 Perigynia (10-)15-30 per spike; perigynium without ventral nerves (or the nerves very obscure); spike at maturity somewhat bristly 
      appearing in silhouette because of the perigynium bracts. ................................................................................................. C. brunnescens var. sphaerostachya
   3 Perigynia 5-10 (-15) per spike; perigynium ventrally nerves; spike at maturity nearly smooth in silhouette (the perigynium bracts strongly 
      appressed)

2 Perigynium beak smooth-margined (use at least 10× magnification) .............................................................................................................
2 Perigynium beak serrulate on margin  (use at least 10× magnification).

3 Widest leaf 2.8-4.4 mm wide; culms 1.0-1.6 mm thick at mid-height; plants densely to loosely cespitose, the rhizome 
   internodes 0.2-20 mm long; [of swamp forests and other wetlands, widespread in our area] ...................................
3 Widest leaves 0.8-2.7 mm wide.

4 Culms 15-60 cm tall; inflorescence 3-5 (-7) cm long, all but the lowest spikes approximate, the lowest spikes 0.5-2.5 cm apart..........
   .................................................................................................................................................................................. C. canescens var. canescens
4 Culms 30-90 cm tall; inflorescences 6-12 (-15) cm long, the lower and middle spikes well-spaced, the lowest spikes 2-5 cm apart..........
   .................................................................................................................................................................................. C. canescens var. disjuncta

[26n] Section 10 – section Deweyanae

A section of 8 species, of North America and e. Asia. References: Naczi (1990); Naczi in FNA (2002b).

1 Widest leaf (1.3-)1.5-2.9 (-3.1) mm wide; culms (0.5-)0.6-1.0 (-1.1) mm thick at mid-height; plant densely to loosely cespitose, the rhizome 
   internodes 0.2-20 mm long; [of swamp forests and other wetlands, widespread in our area] ..........................................
1 Widest leaf 2.8-4.4 mm wide; culms 1.0-1.6 mm thick at mid-height; plants densely cespitose, the rhizome internodes 0.2-1.0 (-8.5) mm 
   long; [of seeps and bogs in the Blue Ridge and Blue Ridge Escarpment region] ..................................................... C. bromoides ssp. bromoides

2 Leaves 0.8-1.9 mm wide, flat or thinly M-shaped; ligules 0.5-1.9 mm long; inflorescences (14-)23-55 mm long; spikes (2-)3-4 per 
   inflorescence; terminal spike with (1-)2-6 perigynia per spike; [south to w. NC] ..................................................... C. trisperma

5 Terminal spikes partly or entirely pistillate; anthers 0.6-2.2 (-2.4) mm long.
5 Terminal spikes entirely staminate; anthers (1.0-)1.2-2.2 (-2.4) mm long ...

6 Terminal spikes without a distinct narrowed base of staminate scales, the staminate portion < 1 mm long ............ C. sterilis
6 Terminal spikes with a distinct narrowed base of staminate scales 1.0-16.5 mm long.

7 Lower perigynia 2.0-3.0 mm wide. .................................................................................................................................................
    8 Lower perigynia mostly 1.1-1.6× as long as wide; perigynia mostly 2.1-3.0 mm wide .................................................. C. atlantica
    8 Lower perigynia of spikes (1.5-)1.7-3× as long as wide; perigynia mostly 1.2-2.0 mm wide .......................................... C. ruthii

3 Widest leaves 2.8-5.0 mm wide.

5 Terminal spikes entirely staminate; anthers (1.0-)1.2-2.2 (-2.4) mm long ............................................................... C. sterilis
5 Terminal spikes partly or entirely pistillate; anthers 0.6-2.2 (-2.4) m long.

6 Terminal spikes without a distinct narrowed base of staminate scales, the staminate portion < 1 mm long ............ C. sterilis
6 Terminal spikes with a distinct narrowed base of staminate scales 1.0-16.5 mm long.

7 Lower perigynia 2.0-3.0 mm wide. .................................................................................................................................................
    8 Lower perigynia mostly 2.8-4.8 mm long; lower perigynia (1.7-)1.8-3.6× as long as wide; perigynia beaks 0.95-2.0 mm 
       long, mostly 0.45-0.85× as long as the perigynium body ................................................................. C. echinata ssp. echinata
    8 Lower perigynia mostly 1.9-3.0 mm long; lower perigynia 1.0-2.0 (-2.2)× as long as wide; perigynia beaks 0.4-0.95 mm 
       long, mostly 0.2-0.5× as long as the perigynium body.

9 Perigynia mostly nerveless over the achene on the adaxial surface; beak of perigynia conspicuously setulose-serrulate; 
   perigynia often more-or-less convexly tapered from widest point to the beak, thus forming a weak shoulder; [of 
   calcareous sites, in our area restricted to the Mountains of VA] ................................................................. C. interior

9 Perigynia mostly 1-1.9-nerved over the achene on the adaxial surface; beak of perigynia more sparsely serrulate, with 
   definite spaces between the often single teeth; perigynia more-or-less cuneate or concavely tapered from widest point to 
   the beak, not forming a shoulder; [of a variety of situations, not generally calcareous].

10 Widest leaves 1.6-2.7 mm wide; infructescence mostly 18-45 mm long; [widespread in our area] ....................... C. atlantica
10 Widest leaves 0.6-1.6 mm wide; infructescence mostly 8-20 mm long; [primarily of the Coastal Plain in our area, 
   widely scattered elsewhere] ................................................................................................................................. C. howei

[26o] Section 11 – section Stellulatae

A section of ca. 15 species, semicosmopolitan (except Africa). References: Reznicek & Ball (1980); Reznicek in FNA (2002b). Key based on Reznicek & Ball (1980).

1 Spikes usually solitary; leaves involute; anthers 2.0-3.6 mm long; [rare disjuncts in Coastal Plain bogs].......................... C. exilis
1 Spikes 2-8; leaves flat or folded; anthers 0.6-2.2 (-2.4) mm long.

2 Perigynium beak smooth-margined (use at least 10× magnification) ................................................................................................. C. seorsa
2 Perigynium beak serrulate on margin (use at least 10× magnification).

3 Widest leaves 0.8-2.7 mm wide.

5 Terminal spikes entirely staminate; anthers (1.0-)1.2-2.2 (-2.4) mm long ............................................................... C. sterilis
5 Terminal spikes partly or entirely pistillate; anthers 0.6-2.2 (-2.4) m long.

6 Terminal spikes without a distinct narrowed base of staminate scales, the staminate portion < 1 mm long ............ C. sterilis
6 Terminal spikes with a distinct narrowed base of staminate scales 1.0-16.5 mm long.

7 Lower perigynia 0.9-2.0 mm wide. .................................................................................................................................................
    8 Lower perigynia mostly 2.8-4.8 mm long; lower perigynia (1.7-)1.8-3.6× as long as wide; perigynia beaks 0.95-2.0 mm 
       long, mostly 0.45-0.85× as long as the perigynium body ................................................................. C. echinata ssp. echinata
    8 Lower perigynia mostly 1.9-3.0 mm long; lower perigynia 1.0-2.0 (-2.2)× as long as wide; perigynia beaks 0.4-0.95 mm 
       long, mostly 0.2-0.5× as long as the perigynium body.

9 Perigynia mostly nerveless over the achene on the adaxial surface; beak of perigynia conspicuously setulose-serrulate; 
   perigynia often more-or-less convexly tapered from widest point to the beak, thus forming a weak shoulder; [of 
   calcareous sites, in our area restricted to the Mountains of VA] ................................................................. C. interior

9 Perigynia mostly 1-1.9-nerved over the achene on the adaxial surface; beak of perigynia more sparsely serrulate, with 
   definite spaces between the often single teeth; perigynia more-or-less cuneate or concavely tapered from widest point to 
   the beak, not forming a shoulder; [of a variety of situations, not generally calcareous].

10 Widest leaves 1.6-2.7 mm wide; infructescence mostly 18-45 mm long; [widespread in our area] ....................... C. atlantica
10 Widest leaves 0.6-1.6 mm wide; infructescence mostly 8-20 mm long; [primarily of the Coastal Plain in our area, 
   widely scattered elsewhere] ................................................................................................................................. C. howei
A section of ca. 85 species, largely North American, but also occurring in Central and South America and Eurasia. References: Mastroguseppe et al. in FNA (2002b); Rothrock, Reznicek, & Hipp (2009); Rothrock, Reznicek, & Ganion (1997). Key closely adapted from FNA.

1 Pistillate scales uniformly as long or longer than the mature perigynia, usually concealing the beaks (though not necessarily the bodies), apex obtuse to acuminate, not awned.

2 Perigynium beak cylindrical, unwinged, lacking serrations for ca. 0.4 mm below the apex ......................................................... *C. ovalis*

3 Principal leaves stiff, more-or-less glaucous, often bearing auricles at the base, the summit of the sheaths truncate, prolonged 1-4 mm beyond the collar; flat margins of perigynia 0.5-0.8 mm wide; achenes 1.0-1.2 mm wide; [of maritime dunes and shores] .............. *C. silicea*

4 Perigynia ascending to spreading, strongly and evenly veined on the adaxial face, finely granular-papillose; spikes (3-) 7-15, the uppermost usually densely aggregated............................... *C. argyrantha*

5 Pistillate scales (excluding the awns, if present) shorter than the perigynia at least in the middle portions of the spikes, the apical portion of the pistillate scales narrower than the perigynia bracts and not completely covering them, the apex awned in some species.

6 Perigynia 2.6-4.0 × as long as wide, the bodies lanceolate, 1.2-2.0 mm wide................................................................. *C. scoparia* var. *scoparia*

7 Perigynium body obovate, often with conspicuous “shoulders”; leaves 2.5-6 mm at widest..................................................... *C. alata*

8 Perigynium body elliptic, suborbicular, or weakly obovate; leaves 1.3-4.2 mm at widest.

9 Scales with reddish-brown margins; perigynia reddish-brown, (3.8-) 4.0-5.5 mm long, conspicuously veined on the outer side

10 Beaks ascending, < ½ the length of the lance-ovate to weakly obovate perigynium body; lateral spikes with acute staminate bases mostly < 2 mm long; [of tidal marshes] ................................................................. *C. suberecta*

11 Perigynium narrowly to broadly ovate, widest below mid-body.

12 Perigynium beak appressed-asceding, triangular; pistillate scales obtuse; styles straight ................................................. *C. tribuloides* var. *sangamonensis*

13 Lower perigynia of each spike appressed-ascending to somewhat spreading (at a 30-75 degree angle); spikes subglobose to ovate-oblong; pistillate scales evident, 2.0-3.0 mm long

14 Inflorescences usually flexible, nodding at the tip, the lower spikes usually separated; perigynia usually 15-40, spreading at a 40-75 degree angle to the spike axis; leaf sheaths firm or friable at the summit ................................................................. *C. projecta*

15 Perigynia 3.0-4.0 mm long, 2.2-2.8 (-3) × as long as wide ................. *C. tribuloides* var. *tribuloides*

16 Perigynium body ovate, elliptic, or orbicular, widest towards the base or near the middle (excluding the beak).

17 Perigynium thick, winged to the base; leaf sheaths with more-or-less rounded edges, not distinctly expanded towards the apex; leaves 1-4.5 mm wide (except in *C. normalis*); vegetative shoots usually inconspicuous, with relatively few leaves clustered at the tip.

18 Perigynium beak spreading, slender; pistillate scales acute; styles sinuous at base ..................................................... *C. cristatella*

19 Achenes 0.6-0.9 mm wide; perigynia veinless or 1-3 veined; styles straight ............................................. *C. longii*

20 Achenes 0.6-0.9 mm wide; perigynium veinless or 1-3 veined on the inner face, these faint or basal only; inflorescences < 3.0 cm long ................................. *C. bebbii*

21 Perigynium ovate to broadly ovate, the wing margin 0.4-0.8 mm wide, 0-6 veined on the inner face............ *C. molestula*

22 Perigynia broadly elliptic or nearly orbicular, the wing margin 0.4-0.8 mm wide, 4-7 veined on the inner face .............. *C. normalis*

23 Inflorescences on tallest culms compact, 1.5-3 × as long as wide, erect, the spikes overlapping, the lowest internode of the inflorescence 1.6-1.7 (-2.5) mm, ¼ to ½ (-¾) of the length of the inflorescence

24 Achenes 0.9-1.3 mm wide; perigynia often 3-veined on the inner face; inflorescences 12-60 mm long

25 Perigynia broadly elliptic or nearly orbicular, the wing margin 0.4-0.8 mm wide, 4-7 veined on the inner face.............. *C. normalis*

26 Perigynium ovate to broadly ovate, the wing margin 0.25-0.45 mm wide, 4-7 veined on the inner face .............. *C. normalis*

27 Inflorescences on tallest culms compact, 1.5-3 × as long as wide, erect, the spikes overlapping, the lowest internode of the inflorescence 1.6-1.7 (-2.5) mm, ¼ to ½ (-¾) of the length of the inflorescence

28 Perigynium narrowly to broadly ovate, widest below mid-body. ................................. *C. festucacea*
23 Sheaths smooth, often whitish-mottled; perigynium beak spreading, exceeding the pistillate scales by 0.7-1.6 mm; beak and shoulders of perigynia greenish to yellowish or greenish brown at maturity. 

...C. normalis

23 Sheaths, at least some, papillose near the collar (at magnification of 30×), not prominently whitish-mottled; perigynium beak appressed or ascending in spikes, exceeding the pistillate scales by 0.0-0.8 mm; beak and shoulders of perigynia straw-colored to reddish-brown at maturity. 

...C. tenera var. tenera

11 Perigynia > 2 mm wide.

24 Spikes either shorter than 12 mm or longer and with either rounded bases or tips or both; perigynium body ovate, elliptic, orbicular, or obovate, or lanceolate (if lanceolate, then shorter than 6 mm long); vegetative culms conspicuous or not.

25 Perigynium bodies obovate, widest towards the tip; leaf sheaths green-veined adaxially nearly to the summit, or with a narrow Y-shaped hyaline area.

26 Achenes 0.75-1.2 (-1.3) mm wide.

26 Achenes 1.3-1.8 mm wide .....................................................................................................................................................

27 Inflorescences erect, 1-4.5 cm long; spikes slightly separated to congested .........................................................C. albolutescens

27 Inflorescences arching or nodding, 2.3-8.4 cm long; spikes widely separated. .........................................................C. silicea

25 Perigynium bodies lanceolate, ovate, elliptic, orbicular, or reniform, widest at the middle or towards the base; leaf sheaths various, some with prominent hyaline band near the apex adaxially.

28 Plants clumping; vegetative culms numerous, conspicuous, strongly 3-ranked, with 15-35 leaves when fully-developed; achenes 1.6-2 × as long as wide; larger spikes with 5-25 (-30) perigynia. 

...C. hyalina

28 Plants clumping; vegetative culms few, inconspicuous, usually with fewer than 15 leaves, not strikingly 3-ranked; achenes 1-1.6 (-1.7) × as long as wide; larger spikes with 15-80 perigynia.

29 Perigynia finely granular-papillose (as seen with 30× magnification), the body reniform to orbiculate, 0.6-0.9 × as long as wide; 3.5-4.5 (-4.9) mm wide; lowest peristome scale obtuse-rounded ..................C. reniformis

29 Perigynia smooth, the body broadly ovate, elliptic, orbicular, or slightly obovate, (0.7-) 0.9-1.7 × as long as wide, 1.5-6.1 mm wide; lowest peristome scales obtuse to acuminate-awned.

30 Perigynia bodies narrowly ovate adaxially near the summit; inflorescences dense to somewhat open, erect, the lowest internode usually < 8 (-12) mm long

31 Perigynia with acute bases, 2.0-2.8 mm wide; beak appressed, > 2/5 × the length of the body; broadest leaves 1.5-2.5 mm wide; [of sw. VA northward].................................C. subrecta

31 Perigynia with rounded bases, 3.0-4.4 mm wide; beak spreading, ca. ⅓ × the length of the body; broadest leaves 2-5 mm wide; [of FL] ...............................................................................................................C. vexans

32 Perigynia body narrowly ovate, greenish; pistillate scales with green midstripe, hyaline or pale margins (rarely brown tinged); leaves 2.5-6.5 mm wide, the sheaths green mottled, with mouth truncate, and prolonged to 2 mm distal to base of the leaf blades

...C. normalis

32 Perigynia body broadly ovate, broadly elliptic, or orbiculate, yellowish to tan brown; pistillate scales greenish or dark brown; leaves 1.5-4 (-5) mm wide, the sheaths usually evenly colored, with mouth concave.

33 Perigynia strongly 4-8-veined over the achene adaxially, (4.5-) 5.1-5.5 mm long; pistillate scales usually (1.0-) 1.4-2.3 mm shorter than the perigynia; anthers (2.4-) 2.8-4.2 mm long............C. bicknellii

33 Perigynia veinless or faintly 1-5 (-7)-veined adaxially. 

34 Perigynia strongly and evenly 4-8-veined over the achene adaxially, (4.5-) 5.1-5.5 mm long; pistillate scales usually 1.0-2.1 mm long.........................C. festucaea

34 Perigynia (5.6-) 6.0-7.1 mm long; beak (1.2-) 1.5-2.1 (-2.3) mm long; pistillate scales (3.6-) 3.9-5.0 mm long, obtuse to acute. 

...C. opaca

36 Achenes 2.5-4.2 mm long, 1.5-2.3 (-2.5) mm wide, mostly 2-4 (-6) veined adaxially. 

...C. festucaea

36 Achenes (1.6-) 1.7-2.2 mm long, (1.2-) 1.4-1.8 mm wide; perigynia 3.2-5.5 mm long, 2.5-3.6 mm wide, veinless or faintly 1-5 (-7)-veined adaxially.

37 Perigynia 3.2-4.8 (-5.2) mm long; beak 0.8-1.5 mm long; pistillate scales 3.3-4.0 (-4.3) mm long, acute; achenes 1.0-1.3 (1.4) × as long as wide.......................................................C. brevior

37 Perigynia (5.6-) 6.0-7.1 mm long; beak (1.2-) 1.5-2.1 (-2.3) mm long; pistillate scales (3.6-) 3.9-5.0 mm long, obtuse to acute. 

...C. opaca

38 Achenes of larger perigynia broadly oblong to nearly orbicular, 1.35-1.8 mm wide, 1.0-1.3 (1.4) × as long as wide; perigynia 3.0-3.5 (-3.8) mm wide, 1.8-2.5 mm long; pistillate scales 3-3.4 mm long, obtuse to acute. 

...C. normalis

38 Achenes of larger perigynia ellipsoid to narrowly oblong, 0.9-1.3 mm wide, 1.3-1.6 × as long as wide; pistillate scales (2.5-) 3.0-3.6 mm long, 1.4-1.7 mm wide; perigynia (2.5-) 3.0-3.5 (-3.6) mm wide, 2.0-2.5 mm long; pistillate scales 2.8-3.0 mm long, acuminate. 

...C. opaca

39 Perigynia strongly 4-6-veined over the achene adaxially, broadly ovate to broadly elliptic, (or rarely nearly orbicular), the bodies (2-) 2.3-3.2 mm long, (0.9-) 1.0-1.6 × as long as wide; pistillate scales mostly obtuse, about as long as to 0.7 (-0.9) mm shorter than the subtended perigynium (flattened and measured separately)........C. molestiformis

(add C. cumulata, C. hyalina)

[26r] Section 13 – section Phacocystis (Cryptocarpaceae and Acutae)
CYPERACEAE

A section of 70-90 species, cosmopolitan. References: Standley, Cayouette, & Bruederle in FNA (2002b); Standley (1983); Bruederle & Fairbrothers (1986); Bruederle, Fairbrothers, & Hanks (1989). Key based in part on C.

1 Lowest spike erect or ascending.
   2 Lower sheaths scabrous, reddish-brown, the sheath fronts (ventral faces) with prominent veins forming a persistent network; lower sheaths usually bladeless................................................................................................................................. C. stricta
   2 Lower sheaths glabrous, the sheath fronts (ventral faces) not forming a persistent network; lower sheaths usually with leaf blades.
      3 Perigynia evidently nerved on both faces .............................................................................................................................. C. emoryi
      3 Perigynia not nerved, or very faintly nerved.
        4 Longest bracts overtopping the spikes; perigynia flattened, elliptic to obovate; pistillate scales acute to obtuse, generally shorter than the perigynia ................................................................................................................................. C. aquatilis
        4 Longest bracts shorter than the spikes; perigynia inflated, obovate; pistillate scales acuminate, longer than the perigynia ... C. haydenii

1 Pistillate scales awnless, the sides black or deep purple-brown ................................................................................................................................. C. torta
1 Pistillate scales awned, the sides medium brown.

2 Lowest pistillate spike erect, sessile or with a peduncle up to 1 cm long; perigynia white-glaucous, rather distinctly 6-8 nerved; achenes as
   above to an abrupt beak; lowest bract of the infructescence 1.7-6.2 dm long.

2 Basal leaves with well-developed blades; basal sheaths brown; perigynia glabrous; [of moist, usually calcareous habitats of the Coastal
   Plain] ...................................................................................................................................................................................... C. chapmanii

1 Awn of the pistillate scale tapering gradually into the scale; perigynium 2-ribbed, and also distinctly and evenly nerved between the ribs; [of
   swamps and marshes] ......................................................................................................................................................... C. joorii
1 Awn of the pistillate scale emerging from a retuse notch in the apex of the scale; perigynium 2-ribbed, obscurely nerved between the ribs; [generally of acid seepages, pocosins, and blackwater situations, often associated with Pinus serotina].

2 Lowest pistillate spike drooping, on a peduncle 1-4 cm long; perigynia reddish-glaucous, lacking nerves; achenes slightly longer than wide ................................................................................................................................. C. glaucescens
2 Lowest pistillate spike erect, sessile or with a peduncle up to 1 cm long; perigynia white-glaucous, rather distinctly 6-8 nerved; achenes as
   wide as long ................................................................................................................................................................................. C. verrucosa

A section of 14 species, of temperate parts of North America and Eurasia, and montane Central America and South America. References:
Rothrock & Reznicek in FNA (2002b).

1 Perigynia with a distinct beak, 1.0-2.2 mm long.
   2 Basal leaves with well-developed blades; basal sheaths brown; perigynia glabrous; [of moist, usually calcareous habitats of the Coastal
      Plain] ...................................................................................................................................................................................... C. chapmanii

**[26bb] Section 19 – section Laxiflorae**

| 1 | Perigynia with 8-18 veins, 2-3 conspicuous, narrowly cuneate basally; perigynium beak short and usually abruptly bent; foliage dark green; bracts surpassing the staminate spike | C. leptonervia |
| 1 | Perigynium with (22-) 25-32 veins, all of which are conspicuous (the central one slightly more distinct); perigynium beak various; foliage various; bracts various. | | |
| 2 | Perigynium with a short, bent beak, usually abruptly bent to one side. | | |
| 3 | Spikes loosely flowered, most perigynia not overlapping. | | |
| 4 | Bracts very broad, 5-20 mm wide; basal leaves very wide, up to 40 mm wide; plant glaucous; basal sheaths purple or brown | C. albicans |
| 4 | Bracts narrow, 2.5-6 mm wide; basal leaves narrow, 3-8 mm wide; plant green; basal sheaths purple, often weathering to brown | C. ormostachya |
| 3 | Spikes densely flowered, the perigynia overlapping. | | |
| 5 | Basal sheaths purple when fresh, weathering to brown; uppermost bract rarely overtopping the staminate spike; staminate spike usually long-stalked | C. gracilescens |
| 5 | Basal sheaths brown; uppermost bract overtopping the staminate spike; staminate spike sessile or short-stalked | C. manhartii |
| 6 | Widest bract of the uppermost lateral spike 0.5-3.4 mm wide | C. bicornis |
| 6 | Widest bract of the uppermost lateral spike (2.9-) 3.2-8.3 mm wide | C. kraliana |
| 2 | Perigynium tapering to a straight or slightly curved beak (or a long, curved beak in C. radfordii) (note: some beaks may curve in pressing). | | |
| 7 | Perigynia beaks long (to 1.5 mm long) and excurred; basal sheaths green, white, and brownish striped; [ endemic to the escarpment gorge area near the SC-NC-GA tricorner] | C. radfordii |
| 7 | Perigynia beaks straight or slightly curved; basal sheaths either purple, wine-red, or brownish, not prominently green-and-white striped; [collectively widespread in our area]. | | |
| 8 | Basal sheaths purple or wine-red (may weather to brown in C. gracilescens). | | |
| 9 | Spikes densely flowered, the perigynia overlapping | C. gracilescens |
| 9 | Spikes loosely flowered, the spikelets not overlapping. | | |
| 10 | Mature leaf blades of sterile shoots 4.5-6 (-6) mm wide, green; culms green, chalky red at base (best seen in fresh material); pistillate spikes (3-) 5-7 (-8) flowered; staminate spike on a peduncle 0-1 cm long | C. manhartii |
| 10 | Mature leaf blades of sterile shoots (6-) 7-10 mm wide; glaucous; culms glaucous, bright red at base (best seen in fresh material); pistillate spikes (4-) 7-11 (-15) flowered; staminate spike on a peduncle 2-3 (-6) cm long | C. purpurifera |
| 8 | Basal sheaths brown, not purple or wine-red. | | |
| 11 | Mature perigynia obovoid. | | |
| 11 | Mature perigynia fusiform. | | |
| 13 | Spikelets overlapping, densely flowered; staminate spike more-or-less obscured; plant green | C. crebriflora |
| 12 | Spikes scattered, loosely flowered; staminate spike prominently exserted; plant usually glaucous | C. laxiflora |
| 12 | Spikes scattered, the staminate prominent and exceeding the uppermost bract. | | |
| 14 | Spikes densely flowered; perigynium beaks curved; lowest spike exserted on a long, arching, peduncle | C. styloflexa |
| 14 | Spikes loosely flowered; perigynium beaks straight; lowest spike on a short, erect or ascending, peduncle | C. striatula |

**[26cc] Section 20 – section Granulares**

A section of ca. 6 species, of temperate North America south through Mexico to Central America. References: Cochrane & Naczi in FNA (2002b). Key based on FNA.

| 1 | Plants with long-creeping rhizomes, the culms therefore mostly solitary; terminal spike and uppermost lateral spike usually overlapping. | | |
| 2 | Staminate scales with apex obtuse to rounded; widest leaves 1.8-3.0 (-4.4) mm wide; perigynium beak 0.1-0.3 mm long; [widespread] | C. crowei |
| 2 | Staminate scales with apex acute to awned; widest leaves 2.8-8.3 mm wide; perigynium beak 0.3-0.9 mm long; [of Panhandle FL and AL westward] | C. microdonta |
| 1 | Plants with short rhizomes, the culms therefore clumped; terminal and uppermost lateral spike usually overlapping. | | |
| 3 | Leaves green; longest bract of uppermost lateral spike 1.6-4.6 (-7.1) cm long; perigynia (1.6-) 1.9-3.6 as long as thick; [of the Coastal Plain] | C. gholsionii |
| 3 | Leaves glaucous (rarely green); longest bract blade of uppermost lateral spike 4.1-15.8 cm long; perigynia 1.4-2.2 (-2.4)× as long as thick; [widespread] | C. granularis |

1 Basal sheaths purplish, sometimes mixed with brown.

2 Widest leaf blade 3-6 mm wide; peduncles of lateral spikes usually drooping .................................................. C. austrocaroliniana

3 Bracts of middle and basal portions of culms with blades 2.1-9.2 cm long; perigynia 5.0-6.6 mm long; longest (per plant) lateral spike with 4-9 perigynia .................................................................................................................. C. careyana

4 Widest leaf blade 10-25 mm wide; peduncles of lateral spikes usually erect or spreading.

5 Basal sheaths brownish, lacking any purple coloration.

6 Foliage usually bright green; longest (per plant) terminal spike 0.6-2.0 (-2.3) cm long; widest leaf blade 5.3-8.3 mm wide .......... C. laxiculmis var. copulata

7 Terminal spikes (1.0-) 1.2-2.7 mm wide; staminate scales acute, those from the the middle region of the staminate spike 3.6-5.5 mm long; vegetative shoots shorter than or slightly taller than the culms, the tallest vegetative shoot 0.5-1.3 (-1.8) × as tall as the tallest culm.

8 Terminal spike usually surpassing the bract blade of the distalmost lateral spike; longest (per plant) peduncle of terminal spike (6.3-) 8.1-15.9 cm long; widest leaf blade 2.0-2.9 (-3.5) mm wide; each perigynium face 7-10-nerved. C. digitalis var. macropoda

9 Perigynia 2.5-3.3 mm long, the apex barely excurred .............................................................. C. digitalis var. digitalis

10 Perigynia 3.2-4.2 mm long, the apex noticeably excurred .......................................................... C. digitalis var. floridana

11 Perigynia spirally imbricate; longer lateral spikes with (6-) 8-13 perigynia; peduncles of proximal spikes usually erect, the longest (per plant) peduncle (7.0-) 15-42 (-9) mm long; bract blade of distalmost lateral spike 5.6-17 (-26) × as long as wide; loosely or densely cespitose; [primarily of the Coastal Plain in our area, though extending rarely into the Piedmont and Mountains] .................................................. C. abscondita

12 Perigynia distichously imbricate; longer lateral spikes with 4-8 (-9) perigynia; peduncles of proximal spikes usually drooping or nodding, the longest (per plant) peduncle (28-) 44-84 (-91) mm long; bract blade of distalmost lateral spike (12-) 17-51 × as long as wide; densely cespitose; [primarily of the Mountains and Piedmont] ................. C. cumberlandensis

1 Culm bases brown.

- C. hitchcockiana
- C. brysonii
- C. flaccosperma
- C. glaucodea
- C. pigra
- C. conoidea
- C. impressinervia
- C. grisea
- C. amphibola

1 Culm bases purple-red.

- C. ouachitana
- C. godfreyi
- C. grisea
- C. amphibola
- C. corrugate
- C. bulbostylis
- C. paeninsulae
- C. oligocarpa
- C. calcifugens
- C. edwardsiana
1 Perigynia tapering toward the base, obtusely trigonous in cross-section, usually pubescent proximally, the apex constructed to a distinct beak (nearly beakless in *C. planispicata*), the perigynia closely enveloping the achene at maturity.

2 Leaf-sheaths hispidulous; perigynia broadly all above the middle; basal sheaths brownish.

3 Leaves glaucous, usually papillate abaxially; pistillate scale margins entire; perigynia 3.7-5.1 mm long, 1.5-1.8 mm wide; [of the Cumberland Plateau of n. AL] .......................................................... *C. brysonii*

4 Basal sheaths greenish-white or light tan; old leaf bases persistent as brownish fibrils; perigynium beak obscure, essentially absent..........................  

5 Leaf-sheaths glabrous; perigynia broadly near the middle; basal sheaths purple, greenish-white, or light tan.

6 Widest leaf (5.1-) 6.2-11.1 (-13.5) mm wide; foliage glaucous; pistillate scales awnless or short-awned, the awns 0-0.9 (-1.9) mm long.

7 Perigynia (4.0-) 4.2-5.5 (-6.0) mm long, (2.0-) 2.1-2.7× as long as wide; achene stipes (0.2-) 0.3-0.5 (-0.6) mm long; pistillate spikes (5.0-) 5.9-8.0 (-9.6) mm wide; achene beaks vertical to slightly bent, usually bent 0-30° from the vertical .......................................................... *C. flavocarpa*  

8 Widest leaf (2.0-) 2.5-3.3× as long as wide; widest leaf (3.0-) 3.5-6.5 mm wide; achene beak (0.3-) 0.4-0.7 mm long; longest pistillate spikes with (5-) 7-14 perigynia .......................................................... *C. planispicata*  

9 Axis of inflorescence and pistillate spike peduncles glabrous; perigynia 2.5-4 mm long .......................................................... *C. conoidea*  

An axis of inflorescence and pistillate spike peduncles smooth; perigynia 3-6 mm long.  

10 Plants densely to loosely cespitose; culm purple-red coloration extending (3.5-) 4.0-9.6 cm up from base; widest leaves 2.4-6.5 mm wide; perigynia either distichously or spirally imbricate; achene stipe either 0.2-0.4 or 0.6-0.8 (-0.9) mm long.

11 Purple-red coloration extending (3.4-) 4.0-7.3 cm up from base; widest leaves 2.4-4.0 (-5.3) mm wide; perigynia spirally imbricate; achene stipe (0.2-) 0.3-0.6 mm long.  

12 Perigynia (2.5-) 2.9-4.8 (-5.2) mm long, (2.0-) 2.5-3.1× as long as wide ..........................................................  

13 Widest leaves 3.3-5.6 (-8.0) mm wide; achene stipe (0.3-) 0.4-0.6 mm long .......................................................... *C. roanensis*  

4 Leaf sheaths glabrous on the hyaline ventral portion; largest leaves 3-9 mm wide .......................................................... *C. gracilis*

1 Perigynia densely white-villosous apically, glabrous basally; achene body 2.0-2.7 mm long, long-stipitate .................................................. C. dayacarpa

[26ml] Section 27 – section Hirtifoliae

One species ................................................................................................................................. C. scabrata

Identification notes: All species of this section in our area form large clonal colonies by rhizomes.

1 Perigynium body pubescent.
   2 Culms central, with the withered remains of the previous year’s leaves at the base; basal sheaths of fertile culms not at all or only slightly reddened; [of the Coastal Plain] .......................................................... C. striata var. striata
   2 Culms lateral, with bladeless sheaths at the base; basal sheaths strongly reddened; [collectively widespread in our area].
   3 Beak of the perigynium soft, translucent, the teeth obscure; peduncle of staminate spike 0.2-2 cm long; [of the Piedmont and Coastal Plain in our area] ................................................................. C. vestita
   3 Beak of the perigynium stiff, opaque, the teeth well-developed; peduncle of staminate spike (0.8-) 2-9 cm long; [of the Mountains in our area].
   4 Leaves folded along the midrib, appearing 0.7-2.0 (-2.2) mm wide; culms obtusely trigonous, usually smooth; base of pistillate bracts often auriculate, forming a V-shaped mouth; middle staminate scales narrowly acute ........................................... C. lasiocarpa var. americana
   4 Leaves more-or-less flat or M-shaped, (1.8-) 2.2-4.5 (-6) mm wide; culms acutely trigonous, often scabrous on the angles; base of pistillate bracts with a short, truncated process at mouth; middle stamine scales obtuse and short-awned, or acute ............. C. pellita

1 Perigynium body glabrous.
   5 Widest leaves 1.5-5 (-6) mm wide; culms 8-90 cm tall; inflorescences 2.5-35 (45) cm long.
   6 Inflorescence rachis with rounded, smooth angles; lowermost pistillate spikes usually strongly overlapping; [introduced, in coastal sands] ..................................................................................................................... C. pumila
   6 Inflorescence rachis with sharp, scabrous angles; lowermost pistillate spikes overlapping not at all or slightly; [native, in acidic Coastal Plain wetlands] .......................................................... C. striata var. brevis

1 Perigynium body glabrous.
   5 Widest leaves 1.5-5 (-6) mm wide; culms 40-135 cm tall; inflorescences 15-60 cm long.
   7 Perigynia 3.0-4.5 mm long; [exotic species] ........................................................................................................ C. acutiformis
   7 Perigynia 4.8-7.8 mm long; [native species].
   8 Longest ligules 2-10 (-12) mm long, < 2 × as long as wide; culms central, with the withered remains of the previous year’s leaves at the base; perigynia obscurely 10-15-veined; [of the Coastal Plain] ................................................................. C. hyalinolepis
   8 Longest ligules 13-40 (-56) mm long, much longer than wide; culms lateral, with bladeless sheaths at the base; perigynia usually strongly 14-28-veined; [of the Mountains in our area] ................................................................. C. lacastris

[26pp] Section 29 – section Carex

1 Perigynia glabrous; leaf blades finely papillose on the lower surface (and also usually long-pubescent); vegetative culms hollow, spongy (flattened when pressed) ............................................................ C. atherodes
1 Perigynia pubescent; leaf blades glabrous or pubescent abaxially, but not papillose; vegetative culms hard.
   2 Leaf blades pubescent; [rare introduction] ................................................................................................................. C. hirta
   2 Leaf blades glabrous; [native] .............................................................................................................................. C. trichocarpa

[26qq] Section 30 – section Vesicariae [including 52 - Pseudocyperae]

A section of ca. 45 species, semicosmopolitan. Following Reznicek & Ford in FNA (2002b), this section is circumscribed to include the traditionally recognized section Pseudocyperae. References: Reznicek & Ford in FNA (2002b). Key adapted from Reznicek & Ford in FNA (2002b).

1 Pistillate scales with a prominent, scabrous awn (the body of the scale often ciliate as well).
   2 Plants extensively colonial from elongate, creeping rhizomes; staminate scales acute to acuminate, essentially smooth-margined except at the very tip; perigynia 7-11-nerved ......................................................... C. schweinitzii
   2 Plants densely to loosely cespitose, the rhizomes connecting individual culms in a clump < 10 cm long; staminate scales (at least some of them) with a distinct, scabrous awn; perigynia 6-25-nerved.  
   3 Perigynia 6-12-nerved, the nerves separate nearly to the beak apex; perigynium bodies broadly ellipsoid to more or less globose, (1.8-) 2.0-4.2 mm wide; achenes rough-papillate.
   4 Spikes 9-14 (-15) mm thick; widest leaves 2.4-4.0 (-5) mm wide; spikes usually 2.5-3.5× as long as wide; perigynia 4.8-6.6 (-7.6) mm long, the beaks usually 0.7-1.3× as long as the body.  
   4 Spikes (12-) 15-22 mm thick; widest leaves (4.0-) 4.5-13 mm wide; spikes usually < 2.5× as long as wide if < 15 mm thick; perigynia (6-) 6.5 (-10.8) mm long, the beaks 0.6-0.9× as long as the body ........................................ C. baileyi
   5 Perigynia 12-25-nerved, the nerves for 2 prominent laminars) confluent at or below the middle of the beak; perigynium bodies ellipsoid to lance-ovoid, 1.1-2.2 mm wide; achenes smooth.
   5 Mature perigynia spreading or ascending when mature; perigynia round in cross-section; teeth of the perigynium beak 0.3-0.9 mm long, straight. ......................................................................................................................... C. hysterica
   5 Mature perigynia reflexed when mature; perigynia obscurely trigonous; teeth of the perigynium beak 1.3-2.1 (-2.8) mm long, strongly outcurved ....................................................... C. comosa

1 Pistillate scales smooth-margined, obtuse to acuminate, awnless (rarely the lowermost scales awned in C. utriculata).
6 Leaves filiform-involute, wiry, (0.5-) 1-3 (-3.2) mm wide; stems round or obtusely trigonous in cross-section, smooth; [rare, in high
elevation bogs in the Mountains].

6 Leaves flat, U-, V-, or W-shaped in cross-section, the widest 1.5-12 (-15) mm wide; stems round to trigonous, often scabrous-angled;
[collectively widespread].

7 Achenes asymmetrical, deeply indented or invaginated on one face; widest perigynia (4.0-) 4.5-7 mm wide; beaks 2.4-4.8 mm long,
smooth .............................................................................................................................................................................. C. tuckermanii

7 Achenes symmetrical; widest perigynia (2-) 2.5-3.5 (-4.5) mm wide; beaks 1.4-2 (-4.8) mm long, scabrous or smooth.

8 Perigynium beaks finely scabrous (at least near the tip and on the teeth), 2.4-4.2 (-4.8) mm long; widest leaves 1.8-4.3 (-5) mm wide.

...................................................................................................................................................................................... C. bullata

8 Perigynium beaks smooth, 1-4.5 mm long; widest leaves 1.5-15 mm wide.

9 Pistillate spikes globose or short ovoid; [plants of the Coastal Plain from e. NC southward].

9 Pistillate spikes cylindric, ca. 20-150-flowered; [plants collectively of the Mountains, from nw. NC northward].

10 Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bract on the lower part of the stem) (2.5-) 3-9x
as long as the inflorescence; staminate spike often 1, slightly (if at all) elevated above the summit of the crowded pistillate
spikes; perigynia reflexed ........................................................................................................................................................... C. retorsa

10 Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) 0.5-2.5x as
long as the inflorescence; staminate spikes 2-4 (-5), well elevated above the summit of the crowded pistillate spikes; perigynia
spreading or ascending.

11 Plant colonial from long-creeping rhizomes; widest leaves (4.5-) 5-12 (-15) mm wide; ligules about as long as wide; basal
sheaths usually spongy-thickened and often tinged with reddish-purple ........................................................................................................ C. utriculata

11 Plant cespitose; widest leaves 1.8-6.5 mm wide; ligules longer than wide; basal sheaths not spongy-thickened and often
[26rr] Section 31 – section Lupidinae

A section of 6 species, of e. North America. References: Reznick & Ball (1974); Reznick in FNA (2002b); Uttal (1971). Key adapted in part
from Reznick & Ball (1974) and Reznick in FNA (2002b).

1 Sheath of uppermost leaf absent or <1.5 (-2.5) cm long; beak of perigynia 1.5-4.2 mm long; achenes with elliptic or obovate sides.

2 Perigynia rhombic-ovoid, cuneate to the base, 8-35 per spike, radiating in all directions and therefore forming a globular spike...... C. grayi

2 Perigynia lanceoloid to ovoid, convex to the base, 1-12 (-20) per spike, ascending to spreading (the lowest sometimes slightly reflexed)
and therefore forming an ovoid to obovoid spike.

3 Perigynia 3-5 mm wide at the widest point; achenes broadest above the middle, with a pronounced shoulder rounding abruptly to the
tip; [of high elevations in our area, generally in spruce-fir or northern hardwoods forests] .............................................................................................................................................................................. C. intumescens var. fernaldii

3 Perigynia 5-8 mm wide at the widest point; achenes broadest at the middle, smoothly rounded to the tip; [plants of the Coastal Plain from e. NC southward].

1 Sheath of uppermost leaf usually >1.7 cm long; beak of perigynia 4.5-10 mm long; achenes with rhombic or nearly triangular sides.

4 Achenes as wide as long or longer, widest near the middle; perigynia spreading at right angles to the rachis............. C. gigantea

4 Achenes as wide as long or longer, widest near the middle; perigynia ascending.

5 Angles of the achenes smoothly curved, not pointed or knobbed; achenes 1.7-2.6 (-2.8) mm wide, distinctly longer than wide.

6 Staminate peduncle (3-) 6-18 cm long, usually exceeding the uppermost perigynium by 2-12 cm; plants loosely colonial by long slender
rhizomes .............................................................................................................................................................................. C. lupuliformis

6 Staminate peduncle 0.5-6 (-7) cm long, shorter than to exceeding the uppermost pistillate spike by < 2 cm; plants solitary or loosely
cespitose in small clumps connected by stout, short rhizomes ........................................................................................................ C. lupulina

[26ss] Section 32 – section Rostrales (Folliculatae)

A section of 5 species, of e. North America and e. and se. Asia. References: Reznick in FNA (2002b). Key based on FNA.

1 Perigynia 6.4-10.7 mm long, 2.6-3.9x as long as wide .............................................................................................................................................................................. C. turgescens

1 Perigynia (8-) 10.5-15.6 mm long, 4.7x as long as wide.

2 Widest leaf blades 1.6-3.5 (-4.2) mm wide; bract sheaths concave at the apex; [of MD northward] .................. C. michauxiana

2 Widest leaf blades (3.5-) 5-18 mm wide; bract sheaths truncate to convex at the apex; [collectively widespread in our area].

3 Pistillate scales usually awned (rarely merely cuspidate); pistillate scales (including the awn, if present) 0.5-1.2x as long as the
perigynium; widest leaves of vegetative shoots 8-18 (-21) mm wide; pistillate spikes normally not staminate at apex (rarely with a few
staminate flowers); [primarily of the Mountains and Piedmont] .............................................................................................................. C. folliculata

3 Pistillate scales acute or long-acuminate (rarely short-awned); pistillate scales (including the awn, if present) 0.3-0.6x as long as the
perigynium; larger leaves mostly 4-12 mm wide; pistillate spikes normally staminate at apex; [primarily of the Coastal Plain] ............ C. lonchocarpa

[26tt] Section 33 – section Collinsiae

One species.............................................................................................................................................................................. C. collinsii
A section of 4 species, of e. and c. North America and temperate South America. References: Ford in FNA (2002b). Key based on FNA.

1 Terminal spike usually entirely staminate; pistillate scales with an awn equaling or surpassing the perigynium; achenes 1.2-2.1 mm long.
2 Pistillate scales 0.4-0.9 (-1.1) mm wide, the body wide and translucent; staminate scales 0.9-1.6 mm wide, tightly imbricate in the spike; plants colonial, long-rhizomatous.......................... C. aureolensis
3 Pistillate scales 0.1-0.4 mm wide, the body narrow and indistinct; staminate scales 0.3-0.8 mm wide, irregularly imbricate with spreading tips; plant cespitose, short-rhizomatous............................................................... C. frankii
1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.9-2.5× as long as wide; style persistent, strongly kinked at the base; spikes 1-2 (-3) per stem........................................ C. squarrosa
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem.......................... C. typhina

A section of 38 species, subcosmopolitan in temperate and boreal regions. References: Crins & Rettig in FNA (2002b); Rettig (1988); Cusick (1992); Rettig & Crins (1996); Werier (2006); Sorrie et al. (in prep.); Poindexter et al. (in prep.). Key based in part on Rettig (1988), Werier (2006), C, and M.

1 Leaves of flowering stems flat, the widest 3.3-5.0 mm wide .......................................................... C. distans
1 Leaves of flowering stems channelled or involute, the widest 1.0-3.5 (-4.3) mm wide ......................................................... C. extensa
1 Leaves of flowering stems channeled or involute, the widest 1.0-3.5 (-4.3) mm wide ......................................................... C. extensa
1 Leaves of flowering stems channeled or involute, the widest 1.0-3.5 (-4.3) mm wide ......................................................... C. extensa
1 Leaves of flowering stems channeled or involute, the widest 1.0-3.5 (-4.3) mm wide ......................................................... C. extensa

1 Pistillate scales 0.4-0.9 (-1.1) mm wide, the body wide and translucent; staminate scales 0.9-1.6 mm wide, tightly imbricate in the spike; plants colonial, long-rhizomatous.......................... C. aureolensis
3 Pistillate scales 0.1-0.4 mm wide, the body narrow and indistinct; staminate scales 0.3-0.8 mm wide, irregularly imbricate with spreading tips; plant cespitose, short-rhizomatous............................................................... C. frankii
1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.9-2.5× as long as wide; style persistent, strongly kinked at the base; spikes 1-2 (-3) per stem........................................ C. squarrosa
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem.......................... C. typhina

1 Perigynia (2.0-) 2.3-2.6 (-3.0) mm long, ovoid-ellipsoid to narrowly obovate (occasionally subglobose), distinctly papillose; pistillate scales often subequal to longer than the body of mature perigynia; lowest proximal pistillate bract shorter or longer than the staminate spike; style persistent, generally straight, or slightly curved; lowest proximal pistillate bract usually longer than the staminate spike; leaves generally exceeding the culms; [of the se. Coastal Plain] ......
.......................... C. lutea

1 Pistillate scales coppery brown; terminal (staminate) spike 6-24 mm long; pistillate spikes 2-5 per culm; culms 1-8 dm tall; [of calcareous
2 Pistillate scales yellowish green; terminal (staminate) spike 12-21 mm long; pistillate spikes (1-) 2-5 per culm; culms 1-5 dm tall; [of acid
2 Pistillate scales yellowish-green; terminal (staminate) spike 12-39 mm long; pistillate spikes 1-5 per culm; culms 1-12.5 dm tall; [either of calcareous savannas of the Coastal Plain of NC, or of acid situations in NJ and northward]

1 Spikes borne above the middle of the primary culm, but also with pistillate spikes borne on short or elongate peduncles from the sheathed base of the culm (referred to as subradical or basal spikes).
2 Culms usually delicate and flexuous; subradical pistillate spikes born on slender elongate peduncles, not densely aggregated at the base of the plant; terminal staminate spikes almost always with at least one approximate pistillate spike.
3 Perigynia (2.2-) 2.6-3.1 (-3.2) mm long, subglobose to obovoid, occasionally papillose (view at 45x); pistillate scales often shorter than the body of mature perigynia; staminate spike 3.5-5.9 (-6.7) mm long; lowest proximal pistillate bract “flag-like”, usually exceeding the staminate spike; leaves generally broader, 0.9-2.6 (-3.2) mm wide [north temperate, arctic-boreal] .............. C. deflexa var. deflexa
3 Perigynia (2.0-) 2.3-2.6 (-3.0) mm long, ovoid-ellipsoid to narrowly obovate (occasionally subglobose), distinctly papillose; pistillate scales often subequal to longer than the body of mature perigynia; lowest proximal pistillate bract shorter or longer than the staminate spike; style persistent, generally straight, or slightly curved; lowest proximal pistillate bract usually longer than the staminate spike; leaves generally exceeding the culms; [of the se. Coastal Plain] ......
.......................... C. pauciflora

1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem.......................... C. typhina

1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem.......................... C. typhina

1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem.......................... C. typhina

1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem.......................... C. typhina

1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
4 Terminal staminate spike 6-11 (-16) mm, some culms with staminate spikes elevated above to sessile subsessile pistillate spikes; perigynia ovoid-ellipsoid to subglobose; perigynium body pubescent with short trichomes and minute papillae; lowest proximal perigynial bract usually shorter than the staminate spike; leaves shorter than to exceeding the culms; [of the Southern Appalachian Mountains and ne. US].....................................................................................................................Carex species 2

2 Culms rhizomatous; subradical pistillate spikes borne on rigid, often short peduncles and densely aggregated at the base of the plant; terminal staminate spikes often alone or associated with a pistillate spike.

5 Perigynia (2.2-) 2.3-3.2 (-3.3) mm long, beaks (0.4-) 0.5-0.9 mm long; young leaves long, thin and flexuous............................................ C. umbellata

5 Perigynia (3.0-) 3.1-4.7 mm long, beaks (0.9-) 1.0-2.1 mm long; young leaves variable.

6 Perigynium body pubescent; young leaves long, thin and flexuous ................................................................. C. rugosperma

6 Perigynium body essentially glabrous, with a few hairs on the angles of the beak; young leaves short, broad and rigid .......... C. tonsa

1 Spikes all borne close together above the middle of the primary culm (i.e., lacking additional basal spikes originating from the same sheaths); some taxa may exhibit naturally short individual culms (e.g., C. emmonsii, C. nigromarginata, C. reznickii).

7 Body of the perigynium (excluding the beak and the contracted base) subglobose to obovoid, usually about as wide as long.

8 Plants cespitose (often loosely so from thin rhizomes in C. deflexa var. deflexa); leaves 0.9-4.7 mm wide; perigynium body pubescent.

9 Perigynium occasionally papillate (mainly at the base of the beak); lowest proximal perigynial bract often exceeding the terminal staminate spike; widest leaves typically less than 3.0 mm wide................................................................. C. deflexa var. deflexa

9 Perigynium distinctly papillate; lowest proximal perigynial bract usually shorter than the terminal staminate spike; widest leaves usually more than 3.0 mm wide.

10 Perigynium 0.1-0.2 (-0.3) mm long; perigynia 2.5-4.1 mm long, (1.2-) 1.4-1.6 (-2.0) mm wide, about as long as the perigynia; plants loosely cespitose; [widely distributed].............................................................. C. communis var. amplisquama

10 Perigynium 0.1-0.2 (-0.3) mm long; perigynia 2.5-4.1 mm long, (1.2-) 1.4-1.6 (-2.0) mm wide, about as long as the perigynia; plants densely cespitose, the culms erect, arching at the tips; [of nw. SC, sw. NC, and adjacent GA].............................................................. C. communis var. communis

8 Plants with long rhizomes, forming cespitose patches; leaves 1.0-3.0 (-3.5) mm wide; perigynium body pubescent to nearly glabrous.

11 Beak of perigynium (0.2-) 0.6-1.0 (-1.2) mm long; perigynium body 2.2-3.4 mm long, 1.0-1.8 mm wide, pubescent and papillate; [widely distributed in our area]................................................................. C. pennisylvanica

11 Beak of perigynium (1.0-) 1.2-1.6 (-2.6) mm long; perigynium body 3.1-4.6 mm long, 1.0-1.3 (-1.5) mm wide, pubescent or nearly glabrous, with or without papillae; [of the Mountains of sw. VA, w. NC, and nw. SC northwards].

12 Beak of the perigynium averaging 1.5 mm long, the orifice oblique; leaves mostly 1.1-1.3 mm wide; perigynium pubescent primarily near the summit, at the base of the beak, papillae usually not distinguishable; male spikes <15 mm long; [of WV southwards]................................................................................................................................. C. lucorum var. austrolucorum

12 Beak of the perigynium averaging 1.3 mm long, the beak split more-or-less equally; leaves mostly 1.5-2.8 mm wide; perigynium pubescent over the body, papillae usually distinguishable; male spikes >15 mm long; [of MD, NJ, and PA northwards]................................................................. C. lucorum var. lucorum

7 Body of the perigynium (excluding the beak and the contracted base) ellipsoid, distinctly longer than wide or thick, often also wider than thick, and slightly trigonous.

13 Plants with conspicuously long rhizomes, forming cespitose patches; perigynia typically papillate [collectively of the Coastal Plain and, less commonly, Piedmont].

14 Achene body (1.4-) 1.5-1.7 (-2.0) mm long, biconvex, trigonous, or both; fertile culms 7-17 cm tall, usually much shorter than the leaves; basal sheaths usually very fibrillose; pistillate scales (2.7-) 3.0-3.7 (-4.2) mm long.............................................. C. floridana

14 Achene body (1.1-) 1.2-1.3 (-1.4) mm long, trigonous; fertile culms 20-43 cm tall, equaling or exceeding the leaves; basal sheaths usually not fibrillose; pistillate scales (2.3-) 2.6-3.0 (-3.4) mm long................................................................. C. physorhyncha

13 Plants cespitose (sometimes loosely so from slender rhizomes in C. novae-angliae); perigynia papillate not evident to rather conspicuous [collectively widespread in our area].

15 Pistillate scales usually shorter than the body of the mature perigynia they subtend, perigynia without easily discernable papillae, lowermost 2 pistillate spikes remote, several separated by >7 mm, staminate spike often elevated above pistillate spikes; leaves thin, delicate 0.7-1.5 mm wide................................................................................................................................. C. novae-angliae

15 Pistillate scales mostly longer than the body of the mature perigynia they subtend, perigynia with discernable papillae, lowermost 2 pistillate spikes overlapping, usually separated by <7 mm, staminate spike often closely associated with pistillate spikes; leaves various.

16 Achene body (1.3-) 1.4-1.6 (-1.7) mm long; fertile culms mostly 2-20 cm tall.

17 Culms usually variable in length, (4.5-) 6.6-38 (-51) cm tall; widest leaf (1.9-) 2.3-4.5 mm wide; at least some pistillate scales often with reddish to purplish/black color below the distal tip extending laterally from near the margin to the green or brown longitudinal mid-stripe on either side of midvein................................................................. C. nigromarginata

16 Achene body (1.3-) 1.4-1.6 (-1.7) mm long; fertile culms mostly 2-20 cm tall.

17 Culms usually variable in length, (4.5-) 6.6-38 (-51) cm tall; widest leaf (1.9-) 2.3-4.5 mm wide; at least some pistillate scales often with reddish to purplish/black color below the distal tip extending laterally from near the margin to the green or brown longitudinal mid-stripe on either side of midvein................................................................. C. nigromarginata

18 Scales of the median portion of the staminate spike with a weak to moderately prominent midrib usually not extending to the tip, and minute teeth rarely present on the midrib (visible at 15× or greater); perigynium teeth mostly 0.2-0.3 mm long; staminate spike 8.4-11.1 mm long; culms erect to ascending, equaling or exceeding the leaves, the inflorescence typically conspicuous; pistillate scales with green midrib, hyaline margins, and usually reddish-tinted; [mostly of loamy or clayey soils of the Piedmont and Mountains]................................................................. C. albicans

18 Scales of the median portion of the staminate spike either with a strong, prominent midrib extending to the tip (or even aristate), and with minute teeth usually present on the midrib (visible at 15× or greater); perigynium teeth mostly 0.15-0.25 mm long; staminate spike 5.0-8.5 mm long; culms lax or weakly ascending, often shorter than, curving under, and more-or-less hidden by the leaves; pistillate scales with green midrib, hyaline margins, and only rarely reddish-tinted; [mostly of acid, sandy soils of the Coastal Plain]......................................................................................................................... C. emmonsii
[26ddd] Section 41 – section Pictae

1 Pistillate scales short-awned................................................................................................................................. C. pedunculata
1 Pistillate scales acute .................................................................................................................................................. C. richardsonii

[26fff] Section 42 – section Mitratae (Praecoces)

A section of ca. 20 species, of Europe, e. Asia, and Australia. References: Standley in FNA (2002b).

1 Plants monoecious, with 3-8 spikes per stem; leaf blades 4-8 mm wide, glaucous on the upper surface; [of the East Gulf Coastal Plain, east to sw. GA and Panhandle FL] ...................................................................................... C. baltzellii
1 Plants dioecious, with a single unisexual spike per stem; leaf blades 2-4.5 mm wide, green on the upper surface; [of areas west of east c. TN and ne. GA] ........................................................................................................... C. picta

[26ggg] Section 43 – section Albae

A section of 4 species, north temperate. References: Ball in FNA (2002b).

One species........................................................................................................................................................................ C. eburnea

[26kkk] Section 44 – section Phyllostachyae

1 Achenes subglobose, 1-1.5× as long as wide; staminate scales more or less truncate.
   2 Tallest culm 3.2-9.1 cm high, 15-32% of plant height; terminal spike with 4-8 perigynia; wider leaves with hyaline margins 0.05-0.2 mm wide; hyaline margins of distal pistillate scales 0.05-0.3 mm wide; perigynium beak 30-38% (-43%) of perigynium length; [of calcareous glades in w. VA and north and west of our area] ................................................................. C. juniperorum
   2 Tallest culm 9.0-41 cm high, 39-86% of plant height; terminal spike with 1-4 perigynia; wider leaves with green margins; hyaline margins of distal pistillate scales 0.3-0.7 mm wide; perigynium beak 34-53% of perigynium length; [of rich forests or rocky calcareous glades and woodlands].
   3 Longest (per plant) staminate portion of terminal spike (4.9-) 5.8-13.5 mm long; proximalmost staminate scale in terminal spike 1.1-1.8 (-2.1) mm long, 13-26 (-35)% of length of staminate portion of terminal spike; perigynium beaks (1.9-) 2.3-3.9 mm long, 39-53% of perigynium length; shoot bases lacking red-purple; [of rich mesic forests widespread in our area, especially VA] ....................... C. jamesii
   3 Longest (per plant) staminate portion of terminal spike 3.4-5.6 (-6.2) mm long; proximalmost staminate scale in terminal spike (1.9-) 2.1-3.3 mm long, (35-) 44-77% of length of staminate portion of terminal spike; perigynium beaks 1.4-2.3 (-2.5) mm long, 34-44% of perigynium length; shoot bases tinged with reddish-purple; [of c. TN and c. KY and westward] ......................................................... C. timida
   1 Achenes ellipsoid, 1.5-2.0× as long as wide; staminate scales obtuse to acute.
   4 Tallest culm 0.18-0.38× as tall as plant; perigynia (7.0-) 7.5-10.8 mm long; perigynium beaks (3.6-) 4.1-6.4 mm long; culms erect; peduncles usually erect to spreading; [of the East Gulf Coastal Plain, east to sw. GA and Panhandle FL] ............................................. C. superata
   4 Tallest culm 0.41-0.87× as tall as plant; perigynia 4.5-8.0 mm long; perigynium beaks 1.7-4.3 mm long; culms erect to spreading; peduncles usually widely spreading to nodding.
   5 Longest staminate portion of terminal spikes 12.7-25.6 mm long; perigynia 5.8-8.0 mm long; perigynium beaks 2.5-4.3 mm long; achenes (2.4-) 2.6-3.4 mm long ................................................................. C. basiantha
   5 Longest staminate portion of terminal spikes 4.9-5.7 (-6.5) mm long; perigynia 4.5-5.7 (-6.5) mm long; perigynium beaks 1.7-2.6 (-2.8) mm long; achenes 1.8-2.6 mm long ................................................................. C. wildenowii

[26mmm] Section 46 – section Leptocephalae (Polytrichoidae)

A monotypic section, of North America and the West Indies. References: Cochrane in FNA (2002b).

1 Perigynia 3.4-4.9 (-5.4) mm long; pistillate scales white ................................................................. C. leptalea var. harperi
1 Perigynia 2.5-3.5 mm long; pistillate scales pale brown, with green midrib .............................................. C. leptalea var. leptalea

Section 47 – “Cymophyllus”

Carex abscondita Mackenzie. Rich bottomlands and other forests. April-June. MA south to Panhandle FL, west to TX and OK, and scattered inland. See C. magnifolia for discussion of the two taxa. Naczi (1999b) reports a chromosome number of n =
24. [<C. abscondita – RAB, K (also see C. cumberlandensis and C. magnifolia); <C. abscondita – C, G, M, S, W (also see C. cumberlandensis); <C. abscondita – FNA, WH (also see C. magnifolia); >=C. abscondita var. abscondita – F; >=C. abscondita var. rostellata Fernald – F]

*Carex acidicola* Naczi (section *Griseae*). Mesic forests. Ne. GA and c. AL south to sw. GA (Naczi, Bryson, & Cochrane 2002). [= FNA] [not yet keyed; *Griseae*]

*Carex aestivaliformis* Mackenzie. Wet meadows (VA), upland submesic forests (GA). Considered by some to be a hybrid, but with little known documentation or evidence for or against its alleged hybrid status; further study is needed. [= C, G, M = C. x aestivaliformis – F, FNA, K]

*Carex aggregata* Mackenzie. Rich forests and woodlands. May–June. NY, ON, MN, and SD, south to nc. NC, n. AL, s. MS, and OK. Other useful characters include: culms relatively smooth; pistillate scales sharp-pointed, the tip reaching to about the base of the perynium; and perigynia nerveless. [= F, FNA, K = C. sparganioides Muhlenberg ex Willdenow var. aggregata (Mackenzie) Gleason – G, C, G]

*Carex albotubusculus* Schweinitz. Low fields, bottomlands. May–June. MA, NY, WI, and MO, south to Panhandle FL and TX. [= C, F, FNA, K, W; <C. albotubusculus – RAB, G, GW, W (also see C. longii); C. striominea misapplied]

*Carex alorpoecoida* Tuckerman. Seasonally saturated situations, typically over calcareous substrates. NS west to SK, south to DC, MD, WV, KY, TN, and IA (Standley in FNA 2002b). [= FNA, K] [synonymy incomplete; not yet keyed; *Vulpinae*]

*Carex amphibola* Steudel. Moist loamy forests, bottomlands, slopes, uplands. [distribution and abundance in our area needing additional herbarium investigation] May–June. MA, s. ON, MI, IL, MO, and OK, south to GA, AL, MS, LA, and TX. [= RAB, FNA, G, M, S; = C. amphibola var. amphibola – F, K; <C. amphibola – GW]

*Carex aquatilis* Wahl. Aquatic Sedge. Mountaintop ponds (with *Dulichium arundinaceum*, *Vaccinium macrocarpon*, *Juncus canadensis*, and *Utricularia spatulata*), maerif fen at high elevation. NL (Newfoundland) west to ND, south to NJ, s. PA, OH, IN, IA, and NE; disjunct in w. VA (Augusta County) and nw. NC (Ashe County); n. Eurasia. First reported for VA by Wieboldt et al. (1998). [= G; >C. aquatilis Wahlendberg var. substricta Kükenthal – C, FNA; >C. aquatilis var. altior (Rydberg) Fernald – F; ?>C. aquatilis var. aquatilis – K; >C. substricta (Kükenthal) Mackenzie – M]
Carex arcata  W. Boott, Black Sedge, Drooping Woodland Sedge. Northern hardwood and spruce forests, bog edges. NL (Newfoundland) west to MN, south to PA, w. VA, nw. NC (Long Hope Valley, Ashe County), and OH. First reported for VA (Highland County) by Fleming & Ludvig (1996). [= FNA, K, G, K, M]

* Carex arenaria  Linnaeus, Sand Sedge. Moist to dry sandy hammocks; probably introduced from Europe. May-June. Fernald (1950) considers this plant native in se. VA, and populations of it in Carolina Beach State Park, New Hanover County, NC, certainly appear native. In North America, known from DE south to se. NC south to n. peninsular FL, Panhandle FL, west to e. TX, and north to nw. GA, c. TN, and c. AR. [= FNA, K, G, K, M]

Carex bicknellii Britton. Prairie-like openings and barrens over gabbro. ME west to SK, south to DE, OH, MO, OK, and NM; disjunct in nc. SC. First reported for South Carolina by Hill & Horn (1997). [= FNA; = C. bicknellii var. bicknellii – K; < C. bicknellii – C, F, G, (also see C. opaca)]

Carex billingsii (O.W. Knight) C.D. Kirschkbaum. Wet, boggy areas. NL (Newfoundalnd) and ON south to s. NJ (Ocean County), PA, and MI. See Kirschkbaum (2007). [= C. trisperma Dewey var. billingsii O.W. Knight – C, F, FNA, G, K, M]

Carex biltmoreana Mackenzie, Biltmore Sedge. In thin soils on medium to high elevation granitic domes and other sloping rock outcrops, often dominant in thin-soil herbaceous mats, but also occurring in adjacent woodlands under open to nearly closed canopy of Quercus spp., Fraxinus americana, Carya glabra, and Juniperus virginiana var. virginiana. May-June. Endemic to sw. NC, nw. SC, and ne. GA (Rabun and Towns counties). This distinctive endemic sedge may be recognized by its robust size (culms to a meter tall, to 5 mm in diameter at the base), habit (large clumps on sloping rock outcrops), and restricted habitat (in periodic seepage on exfoliation domes). Once considered very rare, C. biltmoreana proves to be limited to a narrow range and distinctive habitat, but regularly present and even locally dominant on the 50-100 granitic domes within 100 km of Brevard, NC. It often occurs with other endemic species, such as Houstonia longifolia var. glabra, Krigma montana, Pycnanthemum montanum, and Packera miliefolium. An excellent illustration appears in Massey et al. (1983). [= RAB, FNA, K, M, S, W]

Carex brevior (Dewey) Mackenzie ex Lunell. Dry forests and margins. May-June. MW west to BC, south to GA, c. TN, MS, TX, Tamaulipas, and AZ. [= F, FNA, G, K, W; < C. festucacea – RAB, GW; < C. brevior – C (also see C. molestiformis); < C. festucacea Schkuhr ex Willdenow var. brevior (Dewey) Fernald]

Carex bromoides Willdenow ssp. bromoides, Common Brome Sedge. Swamp forests, bogs, seeps, hydric hammocks, other wetlands. May-July. Ssp. bromoides ranges from NB west to e. MN, south to c. peninsular FL and e. TX, and disjunct in Mexico. Naczi (1999b) reports a chromosome number of n = 32-34. [= FNA, K; < C. bromoides – RAB, C, F, G, GW, M, S, W, WH]

Carex bromoides Willdenow ssp. montana Naczi, Blue Ridge Brome Sedge. Mountain bogs in the Blue Ridge, seepages in the Blue Ridge Escarpment. June-July. Ssp. montana is known only from sw. VA, w. NC, and nw. SC. This taxon needs further study in order to better understand its habitats and distribution. Naczi (1999b) provided additional evidence for its recognition, in the form of different chromosome numbers (n=30-31 for ssp. montana and n=32-34 for ssp. bromoides). [= FNA, K; < C. bromoides – RAB, C, F, G, GW, M, S, W]

Carex brunnescens (Persoon) Poiret var. brunnescens. Reported for our area by FNA. [= F; < C. brunnescens – RAB, C, G, M, S, W; = C. brunnescens ssp. brunnescens – FNA, K] [rejected; not keyed]

Carex brunnescens (Persoon) Poiret var. sphaerostachya (Tuckerman) Kükenthal, Brown Sedge. Grassy balds, bogs, moist forests at moderate to high elevations. June-July. The species is circumboreal, in North America ranging south to NJ, OH, MI, and MN, south to w. NC, nw. SC, e. TN, and n. GA. Var. sphaerostachya is apparently the only infraspecific taxon (of four) to reach our area. See Gaddy (1981) for the report of this species in SC. [= F; < C. brunnescens – RAB, C, G, M, S, W; = C. brunnescens ssp. sphaerostachya (Tuckerman) Kalela – FNA, K]

Carex breyonii Naczi, Bryson’s Sedge. Mesic forests. Endemic to the Cumberland Plateau of n. AL. See Naczi (1993) for additional information. [= FNA, K]

Carex bulbosylis Mackenzie. Moist deciduous forests. April-May. MS west to TX and OK; disjunct in sw. TN. Reports for GA in Jones & Coile (1988) are probably based on misidentifications. [= FNA, K; = Carex amphibola Steudel var. globosa (L.H. Bailey) L.H. Bailey] [add to synonymy]

Carex bullata Schkuhr ex Willdenow. Bogs. May-June. NS south to GA, primarily on the Coastal Plain, but with scattered occurrences inland (as in AR and the Eastern Highland Rim of sc. TN). [= RAB, C, F, FNA, GW, K, M, S; > C. bullata var. bullata – G; > C. bullata var. greenii (Boéckler) Fernald – G]

* Carex calcifugens  Naczi.  Rich bluff forests, evergreen maritime forests.  Se. NC south to Panhandle FL.  See Naczi, Bryson, & Cochrane (2002).  [= FNA]  [not yet keyed; synonymy incomplete; section Griseae]

Carex canescens  Linnaeus var. canescens, Silvery Sedge.  Acidic bogs, swamps, often in disturbed areas.  June.  NL (Newfoundland) west to MN, south to VA, NC, SC, OH, and IN.  [= RAB, F, G; < C. canescens – C, M; = C. canescens ssp. canescens – FNA, K]

Carex canescens  Linnaeus var. disjuncta  Fernald, Silvery Sedge.  Bogs, swamps, often in disturbed areas.  June.  NL (Newfoundland) west to MN, south to VA, NC, SC, OH, and IN.  [= RAB, F, G; < C. canescens – C, M; = C. canescens ssp. disjuncta (Fernald) Toivonen – FNA, K]

Carex careyana  Torrey ex Dewey, Carey's Sedge.  Nutrient-rich moist forests, mostly over calcareous rocks.  May-June.  NY west to MI and IA, south to sw. NC, AL and MO.  Naczi (1999b) reports a chromosome number of n = 34.  [= C, F, FNA, G, K, M, S, W]

* Carex caryophyllea  Latourrette, Spring Sedge.  Disturbed areas; native of Eurasia.  [= C, F, FNA, G, K, M]

Carex castanea  Wahlenberg, Chestnut Sedge.  Calcareous sites.  NL (Newfoundland) west to MB, south to NY, WI, MI, and MN.  The alleged disjunct occurrence in TN cited in FNA is in error.  [= C, F, FNA, G, K, M]  [rejected; not keyed]

Carex cephaloidea  (Dewey) Dewey.  Basic forests.  NB, ON, and MN south to MD, OH, IN, IL, and IA.  [= F, FNA, G, K, M; = C. sparganioides Muhlenberg ex Willdenow var. cephaloidea (Dewey) Carey – C, G]

Carex cephalophora  Muhlenberg ex Willdenow.  Deciduous forests.  May-July.  ME west to MN, south to Panhandle FL and TX.  [= F, FNA, G, K, M, S; < C. cephalophora – RAB, W (also see C. mesochorea); = C. cephalophora var. cephalophora – C, G]

* Carex chapmannii  Steudel, Chapman's Sedge.  Edges of calcareous pine savannas, calcareous slopes and bottomlands, mesic hammocks, stream terraces.  April-May.  Se. NC south to c. peninsular FL, on the Coastal Plain; allegedly disjunct in nc. TN (Chester et al. 1993).  The affinities of this species are questionable; it is usually placed in section Paniceae, but may actually belong to Laxiflorae.  [= RAB, FNA, K, S; = C. chapmannii – M, WC, orthographic variant; = C. styloflexa Buckley var. fusiformis (Chapman ex Dewey) Wieand]

Carex cherokeensis  Schweinitz, Cherokee Sedge.  Moist, rich, calcareous forests.  May-June.  Se. NC, nw. SC, sw. NC, nc. TN, se. MO, and OK, south to n. peninsular FL, Panhandle FL, and west to e. TX and se. OK; disjunct in the Mountains of VA, where perhaps introduced (Belden et al. 2004).  [= RAB, FNA, G, K, M, S, W, WH]

* Carex collinsii  Nuttall, Collins's Sedge.  White cedar (Chamaecyparis) bogs and pocosins in the Coastal Plain, bogs in the southwest mountains of NC (where associated with other Coastal Plain disjuncts).  June-July.  RI to wc. GA on the Coastal Plain, disjunct in the mountains of nw. NJ, PA, sw. NC, and possibly TN (Chester et al. 1993).  C. collinsii is a very distinctive species, the slender perigynia teeth are reflexed 180 degrees (thus appressed back against the perigynium).  [= RAB, C, F, FNA, G, K, M, S, W; = C. collinsiae – GW, orthographic error]

[= FNA, K; = *C. amplisquama* F.J. Hermann – W]

Carex communis L.H. Bailey var. communis. Dry woodlands and forests. May-June. PE west to MN, south to n. SC, c. GA (Jones & Coile 1988), and AR. [= FNA, K; = *C. communis* – RAB, C, F, G, M, S, W]

Carex comosa F. Boott, Bottlebrush Sedge, Bristly Sedge. Swamps, marshes. April-June. QC west to MN, south to s. FL and LA; also in w. North America. [= RAB, C, F, FNA, G, GW, K, M, S, WH]

Carex complanata Torrey & Hooker. Forests. May-June. NJ and s. PA south to n. peninsular FL and Panhandle FL, west to TX and MO; apparently disjunct in AZ. [= F, FNA, K, M, S; = *C. complanata* var. complanata – C, G; < *C. complanata* – RAB, GW, W, WH (also see *C. hirsutella*)]

Carex conoidea Schkuhr ex Willdenow, Field Sedge. Seepage and fen over mafic rocks (amphibolite). May-June. NL (Newfoundland) west to MN, south to nw. NC (Ashe Co. and Alleghany Co.) and MO. First found in NC by a party led by Asa Gray in 1841; recently located at a second site by D.B. Pointdexter. [= RAB, C, F, FNA, G, K, M, S]

Carex crawei Dewey, Crawe’s Sedge. Dry calcareous barrens. QC west to BC, south to NJ, w. VA, c. TN, AL, and AR. First reported for VA by Ludwig (1999). Naczi (1999b) reports a chromosome number of n = 30. [= C, F, FNA, G, K, M, S]

Carex crinita Lamarck var. brevicriniis Fernald. Swamps, wet forests. May-June. MA south to FL, west to TX, north in the interior to KY and MO. [= C, F, FNA, K; < *C. crinita* Lamarck var. crinita – RAB, G, GW; < *C. crinita* – M, S; < *C. crinita* – W (also see *C. gynandra* and *C. mitchelliana*)]

Carex crinita Lamarck var. crinita. Swamps, wet forests, bogs. May-June. NL (Newfoundland) west to MN and AB, south to GA, TN, and AR. [= C, F, FNA, K; < *C. crinita* Lamarck var. crinita – RAB, G, GW; < *C. crinita* – M, S; < *C. crinita* – W (also see *C. gynandra* and *C. mitchelliana*)]

Carex cristatella Britton, Crested Sedge. Grassy balds, bogs, wet meadows. May-June. VT west to SK, south to NC, KY, MO, and KS. See Fox, Godfrey, & Blomquist (1952) for the first report from NC. [= RAB, C, F, FNA, G, K, W]

Carex crus-corvi Shuttleworth ex Kunze, Crowfoot Sedge, Ravenfoot Sedge. Swamp forests, especially over calcareous substrates. May-June. Se. VA south to Panhandle FL, west to TX, north in the interior to IN, s. ON, MI, and MN. [= RAB, C, FNA, G, GW, K, M, S; > *C. crus-corvi* var. crus-corvi – F; > *C. bayardii* Fernald – F; > *C. crus-corvi* var. virginiana Fernald]

Carex cryptolepis Mackenzie. Acid, boggy sites. June-August. NL west to MN, south to NJ, NY, NJ. [= FNA, K]

[synonymy incomplete; section Ceratocystis]
**CYPERACEAE**

*Carex cumberlandensis* Naczi, Kral, & Bryson, Cumberland Sedge. Rich, mesic, deciduous or mixed forests. May; June. Sw. PA, s. OH, s. IL south to c. NC, c. SC, c. GA, sc. AL, e. MS, and w. TN; disjunct in nw. AR. [= FNA; < *C. abscondita* – RAB, C, G, K, M, S, W; < *C. abscondita var. abscondita* – F]

*Carex cumulata* (Bailey) Fernald. Dry to wet acid barrens and glades. NL west to SK, south to NJ, PA, IN, and IL. [not yet keyed; synonymy incomplete; not yet mapped; section *Ovales*]

*Carex dasyacarpa* Muhlenberg, Velvet Sedge. Maritime forests, hammocks, other sandy forests. May–June. E. SC south to n. peninsular FL, west to MS. Ssp. *C. dasyacarpa* var. *dasyacarpa*: rich forests; common in DE and WV. April–June. ME west to WI, south to FL and e. TX. Naczi (1999b) reports a chromosome number of n = 24. [= FNA; K; = F, FNA, G, K, M, S, W, WH (also see *C. digitalis var. floridana*)]

*Carex deflexa* Hornemann var. *deflexa*. Seepage at high elevations; rare. Greenland west to AK, south to MA, n. NY, n. MI, and n. MN; apparently disjunct in the high mountains of WV. Var. *boottii* L.H. Bailey of w. North America is of variable taxonomic treatment, included within *C. deflexa*, treated as variably distinct, or as a full species. [= FNA; < C, F, G, K, M]

*Carex diandra* Schrank, Lesser Tussock Sedge. Swamps, bogs, especially over limestone. Circumboreal, south in North America to w. MD, PA, TN, OH, IL, CO, CA; also reported from TN on the basis of a destroyed specimen. [= C, F, FNA, G, K, M]

*Carex digitalis* Willdenow var. *digitalis*. [Infraspecific taxa need separating: Cp (DE, FL), Pd (DE), Mt (WV).] [Mt, Pd, Cp (GA, NC, SC, VA): rich forests; common in DE and WV. April–June. ME west to WI, south to FL and e. TX. Naczi (1999b) reports a chromosome number of n = 24. [= FNA; K; < *C. digitalis* – RAB, C, F, G, M, S, W, WH] [not yet mapped]

*Carex distans* Linnaeus. Disturbed areas. Introduced in MD and PA; native of Eurasia. [= FNA, K]

*Carex ehrenwe F. Boott, Bristle-leaf Sedge. Calcareous cliffs, bluffs, and outcrops. May. NL (Newfoundland) west to AK, south to w. VA, w. NC, nw. SC, c. AL, n. AR, NE, s. AB, and s. BC; early reports of this species from TX are from a recently described species, *C. mckittrickii* Fernald. Sw. PA, s. OH, s. IL south to e. NC, south to SE, west to MI, south to FL and TX. Naczi (1999b) reports a chromosome number of n = 24. [= F, FNA, K; < *C. digitalis* – RAB, C, F, G, M, S, W, WH; < *C. digitalis var. asymmetrica* Fernald – F, K; < *C. digitalis* – RAB, C, G, M, S, W, WH]

*Carex flexuosa* (F. Boott) Reznicek occurs in w. North America is of variable taxonomic treatment, included within *C. deflexa*, treated as variably distinct, or as a full species. [= FNA; < C, F, G, K, M]

*Carex eburnea* Mackenzie – M, S; = *C. eburnea* var. *angustata* (Carey) Carey ex Gleason – RAB, G, misapplied; = *C. echinata* var. *echinata* – C; > *C. muricata* var. *cephalantha* (L.H. Bailey) Wiegand & Eames – G; = *C. angustifolia* Mackenzie – M, S; > *C. angustifolia* – F; > *C. cephalantha* (L.H. Bailey) Bicknell – F; < *C. muricata* – W]

*Carex elliottii* Schweinitz & Torrey, Elliott's Sedge. Bogs. May–June. E. NC south to c. pen. FL and west to s. AL. [= RAB, FNA, GW, K, M, S, WH]
**Cyperaceae**

*Carex emoryi* Dewey in Torrey. Seepages, ditches, other wetlands. May-June. NY and ND south to w. VA, s. IL, n. AR, and TX. [= F, FNA, K, M; = *C. stricta* Lamarck var. *elongata* (Böckeler) Gleason – G]

*Carex exilis* Dewey, Coastal Sedge. Peaty seepage bogs. May-June. NL (Newfoundland) and NL (Labrador) west to ON and n. MN, south to NJ, DE, MD, NY, and n. MI; disjunct southward in sc. NC and in se. MS / sw. AL. The southern occurrences are remarkably disjunct from the Canadian, northern Coastal Plain, and Great Lakes distribution. [= RAB, C, F, FNA, G, K, M]

* Carex extensa * Goodenough, Long-bracted Sedge. Salt marshes, introduced around seaports; native of Europe. [= C, F, FNA, G, K, M]

*Carex festucacea* Schkuhr ex Willdenow, Fescue Sedge. Bottomland forests. May-June. VT west to MN, south to GA, Panhandle FL, AL, MS, LA, and TX. [= C, F, FNA, K, WH; < *C. festucacea* – RAB, GW; = *C. festucacea* – G (also see *C. straminea*)]

*Carex fissa* Mackenzie var. *aristata* Hermann, Hammock Sedge. Wet savannas, roadside banks and ditches. Extreme se. SC (Jasper Co.), s. GA (Clinch County) (Carter, Baker, & Morris 2009; Sorrie 1998b) south to c. peninsular FL, west to FL Panhandle and s. MS (Bryson et al. 1996). The SC distribution is documented by a voucher (Crins 9848 & D. Brunton) at MICH. Probably a species distinct from *C. fissa*. [= FNA, GW, K, WH; < *C. fissa* – M]

* Carex fissa * Mackenzie var. *fissa*. Disturbed areas, introduced at old railroad stockyard, well-established; native of sc. United States (MO and KS south to TX). See Simmons, Strong, & Parrish (2008) for additional information about the VA occurrence. [= FNA, Gi; < *C. fissa* – M]

*Carex flaccosperma* Dewey. [distribution and abundance needing additional herbarium investigation] May-June. Se. VA south to Panhandle FL, west to TX, north in the interior to s. MO. [= FNA, G, K, M, S; < *C. flaccosperma* – RAB, C, GW, WH (also see *C. glaucodea* and/or *C. pigra*); = *C. flaccosperma* var. *flaccosperma* – F]

*Carex flexuosa* Muhlenberg ex Willdenow. Dry to moist upland forests, openings, granitic domes, rock outcrops. May-July. NL (Newfoundland) west to MN, south to VA and MO, and in the Appalachian Mountains to w. NC and e. TN. [= M, S; = *C. debilis* var. *rudgei* L.H. Bailey – RAB, C, F, G; = *C. debilis* var. *rudgei* L.H. Bailey – FNA; = *C. debilis* – GW, W]

*Carex floridana* Schweinitz, Florida Sedge. Mesic hammocks, dry hammocks, maritime forests. March-May. E. NC (se. VA?) south to c. peninsular FL, west to TX. [= FNA, K, M, S; = *C. nigromarginata* Schweinitz var. *floridana* (Schweinitz) Kükenthal – RAB, F, WH]

*Carex foenea* Willdenow, Hay Sedge. NL (Labrador) and NL (Newfoundland) west to YT, south to CT, NY, s. NJ, PA, MI, and ID. [= C, FNA; > *C. aenea* Fernald – F, M; < *C. ciccata* – G, K, misapplied; < *C. foenea* – M]

*Carex folliculata* Linnaeus. Bogs, boggy forests, high elevation forests (spruce-fir). May-July. NL (Newfoundland) west to WI, south to NC and e. TN. [= FNA, K, M, S, W; = *C. folliculata* var. *folliculata* – RAB, C, F, G; < *C. folliculata* – GW (also see *C. lomchocarpa*)]

*Carex frankii* Kunth. Bottomland forests. May-July. W. NY and s. ON west to MI and se. NE, south to GA, AR, and OK. [= FNA; < *C. frankii* – RAB, C, F, G, GW, K, M, S, W (also see *C. aureolensis*)] [not yet mapped]
Carex fraseriana Ker-Gawler, Fraser's Sedge, Lively-leaf Sedge. Cove forests, mostly rather acidic and associated with Rhododendron maximum, at moderate elevations. May-July. A Southern and Central Appalachian endemic: w. MD and s. PA south through w. VA and WV to NC, e. TN, nw. SC, and n. GA (Jones & Coile 1988). This species is a peculiar plant, often considered a relic species most closely related to Carex, but recent molecular evidence suggests that it is embedded within Carex and is best considered a component of that genus. The foliage slightly resembles some of the broader-leaved species of Carex (such as C. platyphylla or C. plantaginea) or genera of the Liliaceae; immediately distinctive, however, are the minutely undulate-scarb erulous leaf margins. The odd leaves may be derived evolutionarily from leaf sheaths (Reznicek in FNA 2002b).

Kartesz & Gandhi (1991) have shown that the Ker-Gawler's epithet fraseriana/fraserianus has priority over Andrews's fraseri. [= Cymophyllus fraserianus (Ker-Gawler) Kartesz & Gandhi – FNA, K; = Cymophyllus fraseri (Andrews) Mackenzie – RAB, C, F, G, S, W; = Carex fraseri Andrews – WV]

Carex ghoslonii Naczi & Cochrane, Gholson's Sedge. Moist calcareous forests, especially marl flats and bottomlands over coquina. E. NC south to c. peninsular FL, west to s. AL. See Naczi, Bryson, & Cochrane (2002). [= FNA, WH; presumably included in the concept of C. granularis by authors before 2002]

Carex gigantea Rudge, Giant Sedge. Swamps, bottomland forests, cypress depressions. June. DE south to s. FL, west to e. TX, north in the interior to nw. GA (Jones & Coile 1988), IN and OK. [= RAB, C, F, FNA, G, GW, K, M, S, WH]

Carex glaucescens Elliott, Blue Sedge, Southern Sedge. Blackwater swamps, pocosins, wet pine savannas, seepage bogs, depression ponds, pondcypress savannas, other acid and peaty situations. July-September. E. MD south to c. peninsular FL, west to e. TX; disjunct in nw. GA (Jones & Coile 1988) and c. TN. [= RAB, C, F, FNA, G, GW, K, M, S, WH]

Carex glaucodea Tuckerman ex Olney. [distribution and abundance needing additional herbarium investigation]. May-June. MA and ON west to s. IN and MO, south to NC, sc. TN, and AR. [= FNA, K; < C. flaccosperma – RAB, C, GW; < C. flaccosperma Dewey var. glaucodea (Tuckerman ex Olney) Kükenthal – F; < C. glaucodea – G, M, S]

Carex gracilis Steudel. Moist, nutrient-rich forests, calcareous hammocks. May-June. VT and s. QC west to WI, south to SC, AL, LA, and e. TX; disjunct in sw. GA and Panhandle FL. Naczi (1999b) reports a chromosome number of n = 17, 19, 20. [= RAB, F, FNA, K, M, S, WH; < C. gracilis – C (also see C. ormostachya); = C. laxiflora var. gracillima F. Boott – G]

Carex gracillima Schweinitz, Graceful Sedge. Moist ravine and slope forests, floodplains of rivers and large creeks. April-June. NL (Newfoundland) west to MB, south to n. GA, AL, and AR. [= RAB, C, FNA, G, K, M, W; > C. gracillima var. gracillima – F]

Carex granularis Muhlenberg ex Willdenow. Moist, nutrient-rich forests, especially bottomlands, mostly over calcareous rocks (limestone, dolostone, coquina limestone) or mafic rocks (diabase. May-June. ME and QC west to SK, south to GA, OK, and ne. TX. C. haleana Olney [= C. granularis var. haleana (Olney) Porter] is alleged to differ primarily in its more slender perigynia (1.0-1.5 mm wide vs. 1.5-2.5 mm) (see F and M for additional information). Here interpreted to include C. haleana Olney. Naczi (1999b) found little correlation between the morphological and cytological variability of C. granularis, and also little correlation of that variability with geography; he concluded that there was little support for recognition of infraspecific taxa. [= RAB, C, FNA, G, GW, K, S, W; > C. granularis var. granularis – F; > C. granularis var. haleana (Olney) Porter – F; > C. granularis – M; > C. haleana Olney – M]

Carex gravis L.H. Bailey. Fields. ON west to SK, south to TN, MS, AR, TX, and NM, rarely introduced eastward. Two varieties or species (see synonymy) are sometimes distinguished: var. gravis with perigynia 4-5 mm long, 2× as long as wide, nerveless or very obscurely nerved on the dorsal face, and var. lunelliana, with perigynia 3-4.5 mm long, 1.3-1.5× as long as wide, strongly few-nerved on the dorsal face. Steury (1999) reported var. lunelliana as new to MD (Calvert County). [= FNA; > C. gravis var. gravis – C, F, G, K; > C. gravis L.H. Bailey var. lunelliana (Mackenzie) F.J. Hermann – RAB, C, F, G, K; > C. lunelliana Mackenzie – M; > C. gravis – M]

Carex grisea Wahlenberg. {habitats, distribution and abundance in our area needing additional herbarium investigation} May-June. NB west to MN and SD, south to VA, TN, MS, LA, and TX. [= FNA, K; < C. grisea – RAB, G, M, S (also see C. corrugata and/or C. godfreyi); < C. amphibola – C, GW; ? C. amphibola var. turgida]

Carex gynandra Schweinitz. Mountain bogs, swamp forests, seepages. May-June. NL (Newfoundland) west to MN, south to WI, n. VA, w. NC, n. GA, e. TN, OH, and WI. This is the most montane and northern element of the C. crinita complex, and the usual one encountered in the Mountains of our area. [= C, FNA, K, M, S; = C. crinita Lamarck var. gynandra (Schweinitz) Schweinitz & Torrey – RAB, F, G, GW; < C. crinita – W]

Carex haydenii Dewey. Wet meadows, wet prairies. NL (Newfoundland) and QC west to SD, south to s. PA, MD (C. Frye, pers. comm. 2000), IL, and IA. [= C, F, FNA, G, K, M]

Carex hirsutella Mackenzie. Forests. May-June. ME, s. ON, and IA, south to GA and ne. TX. [= F, FNA, K, M, S; = C. complanata Torrey & Hooker var. hirsuta (L.H. Bailey) Gleason – C, G; < C. complanata – RAB, GW, W]

Carex hirtifolia Mackenzie. Nutrient-rich, though often rather dry, forests and woodlands. May-June. NB west to MN, south to MD, sw. VA, c. TN, KY, MO, and e. KS. [= C, F, FNA, G, K, M, W]

Carex hitchcockiana Dewey. Rich moist forests, especially over limestone, other calcareous, or mafic rocks. June-July. MA west to MN, south to NC, sc. TN, and AR. [= C, F, FNA, G, K, M, W]

Carex hormathodes Fernald. Freshwater and slightly brackish tidal marshes. NL (Newfoundland) south to ne. NC, along the coast. [= F, FNA, K, M; = C. straminea Willdenow ex Schkuhr var. invisa W. Boott – C, G]

Carex howei Mackenzie, Howe's Sedge. Bogs and seepages. May-June. NS west to MI and nw. IN, south to c. peninsular FL and e. TX, predominantly (but by no means strictly) on the Coastal Plain. See C. atlantica for discussion of the relationship between the two taxa. [= RAB, F, G, GW, M, S, W; = C. atlantica var. capillacea (L.H. Bailey) Cronquist – C; = C. atlantica L.H. Bailey ssp. capillacea (L.H. Bailey) Reznicek – FNA, K, WH]

Carex hystericina Muhlenberg ex Willdenow, Porcupine Sedge. Calcareous marshes and wet meadows. June-July. NB west to BC, south to w. VA, sc. TN, w. TX, and n. CA. [= C, FNA, G, K; = C. hystricina – F, M, W, orthographic variant]

Carex impressinervia Bryson, Kral, & Manhart. Moist forests. April-May. Sc. NC south to AL and west to MS, apparently very rare and widely scattered. See Bryson, Kral, & Manhart (1987) for additional information on this species. [= FNA, K]

Carex interior L.H. Bailey, Inland Sedge. Calcareous seepage areas. May-June. NL (Newfoundland) and NL (Labrador) west to s. AK, south to w. VA, n. AR, n. AZ, and n. CA; disjunct in Mexico (Chihuahua). [= C, F, FNA, G, K, M, W]

Carex intumescentes Rudge var. fernaldii L.H. Bailey. Spruce-fir forests, northern hardwood forests, grassy balds. June-July. NL (Newfoundland) west to MB, south to NY, n. PA, MI, MN, and, at higher elevations in the Appalachians, to w. VA, w. NC, and e. TN. See Uttal (1971) and Reznicek & Ball (1974) for different views on the validity of this variety. [= F, < C. intumescentes – RAB, C, FNA, G, GW, K, M, S, W]
Carex intumescens Rudge var. intumescens. Bogs, wet forests. May-July. NS west to WI, south to c. peninsular FL and e. TX. (= F; < C. intumescens – RAB, C, FNA, G, GW, K, M, S, W, WH)

Carex jamei Fernald. J. Sedge, Rudge's Sedge. Mesic forests, slightly acidic to circumneutral. MD, OH, and IN south to Panhandle FL and TX. (See Naczi, Bryson, & Cochrane (2002). [= FNA; variously included in the concepts of other species in sect. *Laxiflorae* by authors before 2002)

Carex lacustris Wildenow, Lakeshore Sedge. Marshes, swamp forests. QC west to SK, south to e. VA, w. VA, and NE. (= C, FNA, K; C. lacustris var. lacustris – G)

Carex lasiocarpa Ehrhart var. americana Fernald, Slender Sedge. In shallow water of alkaline spring seep, on hummocks in acidic basin marsh, and at high elevation fen over amphibolite. A circumboreal species; var. lasiocarpa is Eurasian, var. americana ranges from NL west to AK, south to NJ, WV, MD (C. Frye, pers. comm. 2000), VA, nw. NC, IA, CO, UT, and n. CA. First reported for VA by Wieboldt et al. (1998). Found for the first time in NC in the valley of Long Hope Creek (Ashe County, NC), in July 1999 by A.S. Weakley and P.D. McMillan. (= C, F, G, K; = C. lasiocarpa ssp. americana (Fernald) Hultén – FNA; < C. lasiocarpa – M, W)

Carex laeviculmis Schweinitz var. copulata (L.H. Bailey) Fernald. Mesic forests. April-June. VA, ON, and WI south to NC, AL, and AR. Var. copulata (L.H. Bailey) Fernald, has sometimes been considered the hybrid *C. digitalis × laeviculmis*; current evidence suggests that it is not a hybrid but is not consistently separable from *C. laeviculmis* (Manhart 1984). Naczi (1999b) reports chromosome numbers for the two varieties, n= 22, 23, 25 for var. *laeviculmis*, and n = 23-24 for var. *copulata*; normal pairing further suggests that var. *copulata* is not a hybrid. (= FNA, K; < C. laeviculmis – RAB, G, K, S, W; = C. ×copulata (L.H. Bailey) Mackenzie – F, M)

Carex laeviculmis Schweinitz var. laeviculmis. Rich slope or alluvial forests. April-June. S. ME west to s. WI and s. IA, south to NC, nw. GA (Jones & Coyle 1988), n. AL, and MO. (= FNA, K; < C. laeviculmis – RAB, G, S, W; = C. laeviculmis – F, M)

Carex laxiflora Lamarck. Bottomland and other nutrient-rich forests. May-June. Varieties have been recognized; their appropriate disposition is uncertain. Var. *laxiflora* ranges from ME and s. QC west to WI and IN, south to NC, TN, and AL; allegedly also in s. Mexico. Var. *serulata* F.J. Hermann has been reported for our area by Hill & Horn (1997). Its range is stated by F to be NY and PA to MI, IN, and TN. It differs in being distinctly scabrous (vs. smooth to scaberulous), and in having the bract sheaths with serrulate angles (vs. entire or erose angles). (= RAB, C, FNA, M, W; > C. laxiflora var. *serulata* F.J. Hermann – F, K; > C. laxiflora var. *laxiflora* – F, K; < C. laxiflora var. *laxiflora* – G; ? C. heterosperma Wahlenberg – S)

Carex lepalea Wahlenberg var. harperi (Fernald) Weatherby & Griscom. Bogs, seeps, blackwater bottomlands, usually in saturated conditions with *Sphagnum* spp. May-June. NJ south to c. peninsular FL, west to TX, inland in the interior to IN and MO. Var. *harperi* is considered to differ from the typic variety in its larger perigynia, larger spikes, more aristate pistillate scales,
and more southern range; it needs additional study.  [= F, G; < C. leptalea – RAB, C, GW, M, S, W, WH; = C. leptalea ssp. harperi (Fernald) W. Stone – FNA, K; = C. harperi Fernald]

**Carex leptalea** Wahlenberg var. leptalea.  Bogs, seeps, usually in saturated conditions with Sphagnum spp.  May-June.  NL (Labrador) west to AK, south to NC, TN, MO, SD, NM, and CA.  [= F, G; < C. leptalea – RAB, C, GW, M, S, W; = C. leptalea ssp. leptalea – FNA, K]

**Carex leptalea** (Fernald) Fernald.  Nutrient-rich forests, such as rich, seepy northern hardwoods forests.  May-June.  NL (Newfoundland) west to MN, south to NJ, PA, IN, and WI, and in the Appalachians south to NC and SC (L.L. Gaddy, pers.comm., 2009).  [= RAB, C, F, FNA, G, K, M, S, W]

**Carex lucorum** Willdenow ex Link var. austrolucorum J. Rettig, Appalachian Woodland Sedge.  Xeric to mesic wooded slopes, usually in oak forests and northern hardwood forests.  *C. lucorum* var. *austrolucorum* is endemic to the Southern Appalachians, ranging from sw. VA and s. WV south through w. NC and e. TN to nw. SC and ne. GA.  It has been reported from further north, in sc. WV (Boone County) (Cusick 1996).  Var. *lucorum* differs in having the leaves broader (mostly 1.5-2.8 mm wide vs. mostly 1.1-1.3 mm), the beak averaging shorter (1.3 mm vs. 1.5 mm), chromosome number n = 20 (vs. n = 13), and various details of flavonoid chemistry and achene micromorphology (see Rettig 1988 for details).  While the two taxa can be difficult to tell apart on morphological grounds, they are clearly separate taxa.  *C. lucorum* var. *austrolucorum* was first reported for South Carolina by Hill & Horn (1997).  [= FNA, K; < C. pensylvanica Lamarck var. distans Peck – RAB, F, G (the name misapplied as to our plants); < C. lucorum – C, M, S; < C. pensylvanica – W; = C. lucorum ssp. austrolucorum (J. Rettig) A. Haines]

**Carex lucorum** Willdenow ex Link var. lucorum.  Northern Woodland Sedge.  Moist forests.  NB west to MN, south to MD (Cecil County; C. Frye, pers. comm. based on specimen at DOV) and PA.  [= FNA, K; < C. pensylvanica Lamarck var. distans Peck – RAB, F, G (the name misapplied as to our plants); < C. lucorum – C, M, S; < C. pensylvanica – W; = C. lucorum ssp. lucorum]

**Carex lupuliformis** Sartwell ex Dewey, False Hop Sedge.  Wet forests, swamps, riverbanks, especially around ponds.  June-July.  VT and QC west to se. WI, south to s. FL and e. TX.  [= RAB, C, F, FNA, G, K, M, S, WH; < C. lupulina – GW]

**Carex lupulina** Muhlenberg ex Willdenow, Hop Sedge.  Bottomland forests.  June-September.  NS west to MN, south to ne. FL and e. TX.  [= RAB, C, FNA, G, K, M, S, WH; < C. lupulina – GW (also see C. lupuliformis); > C. lupulina var. lupulina – F; > C. lupulina var. pedunculata A. Gray – F]

Carex lutea LeBlond, Golden Sedge. Wet savannas shallowly underlain by coquina limestone, with open canopy of Taxodium ascendens, Pinus palustris, and Liriodendron tulipifera. May. Endemic to Pender and Onslow counties, NC, where associated with other narrow endemics, such as Thalictrum cooleyi and Allium species 1, and other rare species, such as Plantago sparsiflora, Parnassia caroliniana, Rhynchospora thornei, and others. See LeBlond et al. (1994) for additional information. [= FNA, K]

Carex magnifolia Mackenzie. Bogs, acid swamps. April-May. E. NC south to FL, and disjunct in mountain bogs with Coastal Plain affinities, as in Henderson County, NC. C. magnifolia differs morphologically from C. abscondita in its larger perigynia, longer leaves, and much more strongly glaucous leaves; it has a more southern distribution and occurs in wetter, boggier habitats. Manhart (1984) found that it differed chemically from C. abscondita. Further study is needed to verify its taxonomic status. [= M, S; < C. abscondita – RAB, FNA, K]

Carex manhartii Bryson, Blue Ridge Purple Sedge, Manhart's Sedge. Cove forests and montane oak-hickory forests, mostly at medium to fairly high elevations, especially over mafic rocks (such as amphibolite) and calcareous rocks (such as marble), but occurring on more acidic substrates as well. April-May. Endemic to w. NC, sw. VA, nw. SC, ne. GA, and se. TN, in the Blue Ridge Mountains. Once considered very rare, this species is now known to be locally common in portions of sw. NC and adjacent ne. GA. For more information on the Virginia occurrence, see Belden et al. (2004). [= FNA, K, W; < C. purpurifera Mackenzie – RAB, M, S]

Carex meadii Dewey, Mead's Sedge. Prairies, on low, moist clayey soils over mafic rocks (such as diabase) or calcareous rocks. May-June. NJ west to MI and SK, south to nc. NC, GA, AR, sw. LA, and TX. The species forms large clonal patches with a distinctive bluish cast at the time of flowering and fruiting. Naczi (1999b) reports a chromosome number of n = 28. [= RAB, C, F, FNA, G, K, M, S, W]

Carex michauxiana Böckeler, Michaux's Sedge. Bogs, seeps, usually in Sphagnum. NL (Labrador) and MB south to MD, MI, and MN. Closely related to an e. Asian species. [= C, F, FNA, G, K, M] {add to synonymy}

Carex microdonta Torrey & Hooker. Limestone glades, calcareous prairies. AL and Panhandle FL west to MO, KS, OK, TX, NM, and AZ. [= FNA, K, M, S]

Carex michelliana M.A. Curtis, Mitchell's Sedge. Swammy woodlands and forests. May-June. Se. MA west to PA and KY, south to Panhandle FL, n. AL, and sc. TN. This species has a scattered distribution throughout its range, and is apparently rare. Bruderle, Fairbrothers, & Hanks (1989) and Bruderle (1999) provide additional information about this species. Allozyme studies suggest that C. michelliana is less closely related to C. gynandra, C. crinita var. crinita, and C. crinita var. brevicrinis than they are to one another. [= c, F, FNA, K, M, S, WH; = C. crinita Lamarck var. michelliana (M.A. Curtis) Gleason – RAB, G, GW; < C. crinita – W]

Carex molesta Mackenzie ex Bright, Troublesome Sedge. Calcareous soils. NH west to ND, south to VA, AL, MS, and OK. [= F, FNA, G, K; < C. brevior (Dewey) Mackenzie ex Lunell – C]

Carex molestiformis Reznicek & P.E. Rothrock. {habitat}. Known distribution is w. VA, WV, KY, TN, MO, AR, and OK. [= FNA, K; < C. brevior (Dewey) Mackenzie ex Lunell – C, G] {synonymy incomplete}
Carex muehlenbergii Schkuhr ex Willdenow var. enervis W. Boott. [Habitats]. NH west to MN and NE, south to GA, AL, MS, and TX. [= FNA, K; < C. muehlenbergii – RAB, W; < C. muehlenbergii var. muehlenbergii – C; = C. muehlenbergii var. enervis – F, G, orthographic variant; = C. plana Mackenzie – M, S]

Carex muehlenbergii Schkuhr ex Willdenow var. muehlenbergii. Dry to dry-mesic hammocks, [additional habitats]. ME, ON, and MN south to Panhandle FL and TX. [= FNA, K; < C. muehlenbergii – RAB, W, WH; < C. muehlenbergii var. muehlenbergii – C (also see var. enervis); = C. muehlenbergii var. muehlenbergii – F, G, orthographic variant; = C. muehlenbergii – M; < C. muehlenbergii – S (also see C. austrina)]

* Carex muricata Linnaeus ssp. lamprocarpa Čelakovský. A European alien, with known occurrences south to e. PA (Rhoads & Klein 1993) and MD. [= FNA; < C. muricata – C, K]

Carex muskingumensis Schweinitz. Floodplain forests. ON and MN south to KY, TN, AR, and OK. [= C, F, FNA, G, K, M]

Carex nigromarginata Schweinitz, Blackedge Sedge. Dry woodlands and forests. March-May. DE and NJ west to WI, south to SC, GA, and TX. [= C, FNA, K, M, W; = C. nigro-marginata var. nigro-marginata – G; = C. nigro-marginata – S]

Carex novae-angliae Schweinitz, New England Sedge. Moist forests. NL (Newfoundland) and ON, south to e. PA, n. WV, and WI. [= C, F, G, K, M; < C. novae-angliae – FNA]

Carex oblitata Steudel. Swamps and other wet habitats. NY (Long Island) and NJ south to sc. GA, west to w. LA, mostly on the Coastal Plain, but extending much less commonly inland to the Piedmont and Mountains. [= M, S; = C. venusta Dewey var. minor Böckler – C, F, G, K; < C. venusta – RAB, FNA, GW, W]

* Carex oklahomensis Mackenzie, Oklahoma Sedge. Seepages, disturbed wetlands; probably adventive from farther west. Se. MO west to KS, south to AR, and ne. TX; disjunct (and apparently adventive) in various scattered sites east of the Mississippi River, as in AL, MS, GA, w. NC (Graham County) and w. VA (Giles County). First reported for VA by Wieboldt et al. (1998). See Bryson & Rothrock (2010) for further discussion; they consider that this species is “introduced during highway and reservoir construction or maintenance in contaminated hay, grass seeds or on construction, maintenance, and mowing equipment.” [= F, FNA, K, M; < C. stipata – S; = C. stipata Muhlenberg ex Willdenow var. oklahomensis (Mackenzie) Gleason – G]

Carex oligosperma Michaux. Bogs and seeps at high elevations. NL (Newfoundland) west to NT, south to CT, c. PA, n. IN, WI, and MN; disjunct in ne. OH, WV (Hardy County) and NC (Ashe, Avery, Mitchell, and Watauga counties). [= C, F, FNA, G, M; > C. oligosperma var. oligosperma – K]

* Carex opaca (F.J. Hermann) P.E. Rothrock & Reznicek. Introduced at old railroad livestock yard, well-established; native of sc. United States. Native range in prairies, IL and KS south to MS, AR, and OK. [= FNA; = C. bicknellii Britton var. opaca F.J. Hermann – K; < C. bicknellii – M]

Carex ormostachya Wiegand, Necklace Spike Sedge. Northern hardwood forests. S. Canada south to ME, MA, PA, w. VA (Augusta County), n. OH, MI, and WI. [= F, FNA, K, M; < C. gracilescent – C; = C. laxiflora var. ormostachya (Wiegand) Gleason – G]

Carex ouachitana Kral, Manhart, & Bryson, Ouachita Sedge. Dry to dry-mesic slope and ridge forests. Disjunct in ne. TN and sc. KY from the Ouachita Mountains of sw. AR and se. OK. [= FNA, K] {not yet keyed; synonymy incomplete; Griseae}
* Carex ovalis Goodenough. Grassy balds, disturbed areas; native of Eurasia. Known to range in North America from NL (Newfoundland) and NY south to w. NC and ne. TN. The records reported in RAB and elsewhere of C. aenea are actually misidentified material of this species (A.A. Reznicek, pers. comm. 2005). [= FNA; K = C. aenea – RAB, misapplied (based on misidentified material); < C. leporina Linnaeus = C, F, G, misapplied; ? C. tracyi Mackenzie]

Carex oxylepis Torrey & Hooker. Bottomlands, calcareous forests. May-June. VA, KY, IL, MO, and OK south to c. peninsular FL and TX. A distinction is sometimes made between var. oxylepis and var. pubescens. Var. oxylepis is widespread in the Southeast; var. pubescens is more restricted, from KY and s. IL south to AL and MS. [= RAB, C, F, FNA, G, GW, M, S, W; > C. oxylepis var. oxylepis – K; > C. oxylepis var. pubescens J.K. Underwood – K]

Carex paeninsulae Naczi, E.L. Bridges, & Orzell, Peninsula Sedge. Mesic hammocks. Endemic to FL peninsula, north into ne. FL (Suwanee and Duval counties). [= FNA] [not yet keyed; Griseae]

Carex pallescens Linnaeus, Pale Sedge. Grassy balds at high elevations, other grassy openings. June-July. Circumboreal (in ne. North America and n. Eurasia); in North America ranging from NL (Newfoundland), QC, and MN, south to w. NC, e. TN, and MI. C. pallescens is reported to occur on Big Bald, Unicoi County, TN, immediately adjacent to the NC line (Churchill et al. 1992). [= C, FNA, G, K, M, W; > C. pallescens var. neogaea Fernald – F]

Carex pauciflora Lightfoot, Few-flowered Sedge. Bogs. Circumboreal, south in North America to NY, WV (Grant, Randolph, and Tucker counties), WI, MN, and WA. [= C, F, FNA, G, K, M]

Carex pedunculata Muhlenberg ex Willdenow var. pedunculata, Longstalk Sedge. Nutrient-rich dry to mesic forests, usually over calcareous or mafic rocks. April. Var. pedunculata ranges from NL (Newfoundland), SK, and ND, south to NJ, w. VA, sw. NC, nw. GA (Dade County) (Jones & Coile 1988), n. AL, c. IN, c. II., and n. IA. Var. erythrobasis (Léveillé & Vaniot) Koyama occurs in Korea. It may well prove that these two widely disjunct taxa should be recognized at the species level. [= FNA; < C. pedunculata – C, F, G, K, M, W; = C. pedunculata ssp. pedunculata]

Carex pellita Muhlenberg. Wet meadows. NB west to BC, south to w. VA, w. TN, AR, and CA. McClintock & Waterway (1994) discuss the distinctiveness of C. pellita and C. lasiocarpa, as well as the misapplication of the name C. lanuginosa to the species now properly called C. pellita. [= C, FNA, K; = C. lanuginosa Michaux – F, M, misapplied; = C. lasiocarpa Ehrhart var. latifolia (Böckler) Gilly]

* Carex pendula Hudson, Pendulous Sedge. Disturbed areas; native of Europe. Introduced in VA (FNA, Kartesz 1999). [= FNA, K]

Carex pennsylvanica Lamarck. Dry to moist woodlands and forests, grassy balds, shale barrens, rock outcrops. April-June. ME west to s. MB and ND, south to SC, n. GA, TN, and AR. [= FNA; K = C. pennsylvanica var. pennsylvanica – RAB, C, F, G; = C. pennsylvanica – M, S, orthographic variant; < C. pennsylvanica – W (also see C. lucorum var. austrolocorum)]

Carex physorhyncha Liebmann ex Steudel, Bellow’s-beak Sedge. Dry woodlands. Se. VA south to ne. FL and FL Panhandle, west to AR, OK, TX, and Mexico. [= RAB, F, M, S, W; = C. albicans Willdenow ex Sprengel var. australis (L.H. Bailey) J. Rettig – FNA, K, WH]

Carex pigra Naczi, Lazy Sedge. Moist forests, bottomlands. May-June. Se. VA west to se. and sc. TN, south to FL, s. AL, and ne. MS. See Naczi (1997) for additional information. [= FNA; K; < C. flaccosperma – RAB, G, GW, WH; < C. flaccosperma Dewey var. glaucodea (Tuckerman ex Olney) Küchenthal – F; < C. glaucodea – S]

Carex planispicata Naczi. Rich to fairly acid mesic forests, on slopes and floodplains. C. NJ west to s. IN, se. MO, and se. OK, south to c. GA, s. MS, and se. TX. See Naczi (1999a) for additional information. [= FNA; = C. grisea Wahlenberg var. rigida (L.H. Bailey) Fernald – F, K]
Carex plantaginea Lamarck, Plantainleaf Sedge. Rich cove forests, mostly over mafic or calcareous rocks, montane alluvial forests. April-May. NB west to MN, south to MD, NJ, VA, NC, ne. GA (Jones & Coyle 1988), c. TN, c. TN, KY, and s. IN. [= RAB, C, F, FNA, G, K, M, S, W]

Carex platyphylla Carey, Broadleaf Sedge. Rich cove forests, mostly over mafic or calcareous rock. April-June. ME and s. QC west to WI, south to NC, e. TN, and MO. Naczi (1999b) reports a chromosome number of n = 35. [= RAB, C, FNA, G, K, M, S, W]

Carex polymorpha Muhlenberg, Variable Sedge. Dry, acidic ridgetop forests. May-June. ME south to MD, VA, and WV. Standley, Dudley, & Brueulerle (1991) studied genetic variability in this species. [= C, FNA, G, K, M]

* Carex praegracilis W. Boott, Freeway Sedge. Medians of interstate highways; native of w. North America. May-June. This species is apparently spreading through ne. North America as the result of the winter salting of highways. [= C, FNA, G, K, M]

Carex praeria Dewey ex Wood, Prairie Sedge. Calcareous wetlands. QC west to YT, south to NJ, w. VA, OH, NE, MT, and BC. [= C, FNA, G, K, M]

Carex prasina Wahlenberg. Rich forests, especially in seepage. May-June. ME, ON, and WI south to GA, MS, and AR; in nearly all TN counties adjacent to NC and VA. [= RAB, C, F, FNA, G, GW, K, M, S, W]

Carex projecta Mackenzie. Moist forests. May-June. NL (Newfoundland), NL (Labrador), and SK south to NC, IN, IL, and IA. [= RAB, C, F, FNA, G, K, M]

* Carex pumila Thunberg. Open disturbed sand flats; native of Asia. May. See Reznicek (1993) for additional information. [= FNA, K; > C. hirta – RAB, misidentification]

Carex purpurifera Mackenzie, Limestone Purple Sedge. Moist, rich cove forests, at low elevations, over calcareous or mafic rocks. May-June. W. VA and KY south to n. GA and n. AL, mostly west of the Blue Ridge Mountains, but with scattered disjunct populations on calcareous or mafic sites in the Blue Ridge. Naczi (1999b) reports a chromosome number of n = 17-19. [= C, FNA, K, W; < C. purpurifera – RAB, M, S (also see C. manhartii); = C. laxiflora var. purpurifera (Mackenzie) Gleason – G]

Carex radfordii Gaddy, Radford’s Sedge. Very nutrient-rich, moist cove forests in the Blue Ridge Escarpment region, over calcareous or mafic rocks (especially along the Brevard Fault). May-June. Endemic to the Blue Ridge Escarpment of sw. NC, nw. SC, and ne. GA. See Gaddy (1995) for additional information. Naczi (1999b) reports a different chromosome number for C. radfordii (n = 23) than for the related C. purpurifera (n = 17, 18, 19). [= FNA, K]

Carex radiata (Wahlenberg) Small. Mesic to wet-mesic forests. May-June. NS west to MB, south to SC, AL, LA, and OK. [= C, FNA, K; < C. rosea – RAB, G, W; = C. rosea – F, M, S, misapplied]

Carex reniformis (L.H. Bailey) Small, Kidney Sedge. Floodplain forests (including blackwater), marshes, ditches, other wet areas. VA, IL, and OK south to FL Panhandle and TX. [= RAB, C, F, FNA, G, GW, K, S, WH]

Carex retroflexa Muhlenberg ex Willdenow. Dry to mesic forests. ME, MI and IA, south to n. peninsular FL and TX. See Downer & Hyatt (2003). [= F, FNA, K, M, S; < C. retroflexa – RAB, W (also see C. texensis); = C. retrosa var. retroflexa – C, G]

Carex retrorsa Schweinitz. Bottomland forests and nutrient-rich moist forests. NB and BC, south to n. NJ, sc. PA, IL, UT; reported, apparently erroneously, for DE and MD. [= C, FNA, G, K, M] [not yet mapped]

Carex reznicekii Werier, Reznicek’s Sedge. Moist, forested slopes. RI, NY, PA, KY, and MO, south to SC, sw. GA, se. AL, n. MS and AR. To be expected in Panhandle FL and in WV. See Werier (2006) for detailed information. [add to synonymy; section Acrocystis]
Carex richardsonii R. Brown, Richardson’s Sedge. Dry, rocky forests. VT west to AB, south to DC, MD, OH, IN, IA, and SD. This species ranges south to DC (according to C). [= C, FNA, G, K, M]

Carex roaensis F.J. Hermann, Roan Mountain Sedge. Cove forests, moderate to high elevation oak forests, northern hardwood forests. May-June. Sw. PA, w. VA, and e. WV south through e. KY, e. TN, w. NC to se. TN and nw. GA (Smith & Waterway 2008; Smith et al. 2006). See Smith & Waterway (2008), Smith et al. (2006), and Hermann (1947) for additional information; closely related to C. virescens. First reported for VA by Wieboldt et al. (1998). [= FNA, K, W]

Carex rosea Schkuhr ex Willdenow, Rosy Sedge. Dry to dry-mesic hardwood forests. May-June. NS west to MB, south to FL, Panhandle and TX. [= C, FNA, K; < C. rosea – RAB, G, W, WH (also see C. appalachica and C. radiata); = C. convoluta Mackenzie – F, M, S; ? C. flaccidula Steudel]

Carex rugosperma Mackenzie, Parachute Sedge. Old fields, shallow soils of rock outcrops, exposed forest margins. {Distribution and habitats in our area obscure} PE west to MN, south to MD, VA, IN, IL, and MO. See C. umbellata for discussion. Reported for South Carolina by Hill & Horn (1997). [= G, M; < C. umbellata – RAB, C, W; = C. umbellata – F, misapplied; = C. tonsa (Fernald) Bicknell var. rugosperma (Mackenzie) Grass – FNA, K]

Carex sartwellii Dewey, Sartwell’s Sedge. Wetlands. QC west to BC, south to MD, PA, OH, IN, IL, MO, CO, and ID. [= FNA, C, F, G, M; > C. sartwellii var. sartwellii – K]

Carex schweinitzii Dewey ex Schweinitz, Schweinitz's Sedge. Bogs. June. VT west to n. MI, south to NJ (and MO?); disjunct in NL (Newfoundland). The distribution of this species is local and fragmented. The alleged occurrences of C. schweinitzii in w. NC are based on misidentification of C. utriculata. [= C, F, FNA, G, K, M, S]

Carex scoparia Sckuhr ex Willdenow var. scoparia. Bogs, swamp forests, marshes, seepy ledges, ditches. May-June. NL (Newfoundland) west to BC, south to GA, MS, and CA. Var. tesselata Fernald & Wiegd is endemic to NB and ME. [= F, FNA, K; < C. scoparia – RAB, C, G, GW, W]

Carex seorsa Howe. Acidic swamp forests. May-June. MA south to GA and Panhandle FL in the Coastal Plain, scattered inland westward to NY, OH, MI, IN, AR, and TN. [= RAB, C, FNA, G, GW, K, M, S, W]

Carex shortiana Dewey, Short's Sedge. Calcareous bottomlands and meadows. May-June. PA, s. ON, IL, and IA, south to w. VA, e. TN, AR, and OK. [= F, FNA, G, K, M, W]

Carex siccata Dewey, Bronze Sedge. Dry upland habitats. May-July. ME and NT south to NJ, OH, IL, MN, and AZ. [= C, FNA, G, M; < C. siccata – k (also see C. foenea); = C. foenea Willdenow – F, misapplied]

Carex silicea Olney, Seabeach Sedge. Beaches and shores. NL (Newfoundland) south to VA, along the coast. [= C, F, FNA, G, K]

Carex socialis Mohlenbrock & Schwegman. Blackwater and brownwater swamp forests and bottomlands. Se. and sc. NC south to e. GA, west to e. TX, and north in the interior to s. IN, s. IL, and sc. MO. [= C, FNA, K]

**Carex species 1**, Canebrake Sedge. Canebrakes and acid swamps. February-May. Coastal Plain, from se. VA to Panhandle FL, west to w. LA. [C. nova-angliae Schweinitz – FNA; = Carex "austrodeflexa", in prep.] (section Acrocystis)

**Carex species 2**, Blue Ridge Sedge. Seepages over various substrates along the Blue Ridge Escarpment, including opn fen-like wetlands. Early April-early June. A Southern Blue Ridge endemic, from sw. VA through w. NC to ne. GA (Rabun County). Under study by D.B. Poindexter and T.F. Wieboldt. (section Acrocystis)

**Carex species 3**, Smoky Mountain Sedge. Seepages at moderate to high elevations. Endemic to the Great Smoky Mountains National Park. Under study by D. Estes. (not yet keyed; section Phacocystis)

*Carex spicata* Hudson. Fields and lawns; native of Europe and w. Asia. Reported as south to s. NJ, n. DE, c. MD. VA reports said to be erroneous in FNA. [= C, F, FNA, G, K, M]
Carex suberecta (Olney) Britton, Prairie Straw Sedge. Fens, calcareous wetlands. ON and MN south to sw. VA, WV, OH, IN, IL, AR, and TX. \[= C, F, FNA, G, K\]

Carex superata Naczi, Reznicek, & B.A. Ford. Calcareous forests and woodlands. April-June. Sc. NC, nc. SC, sw. VA, sc. KY, and ne. MS, south to Panhandle FL and s. AL. Reported for sw. VA (as C. wildefnii var. megarrhyncha) by Wieboldt et al. (1998). \[= FNA, K, WH; < C. wildefnii – RAB, F; < C. wildefnii – C, G, M, S (also see C. baviantha and C. wildefnii) and orthographic variant; < C. wildefnii Schkuhr ex Willdefnii var. megarrhyncha Hermann\]

Carex swanii (Fernald) Mackenzie. Nutrient-rich forests, woodlands, and openings. May-June. NS, s. MI, s. WI, south to nw. SC and ne. AR. \[= RAB, C, F, FNA, G, K, M, S, W\]

* Carex sylvatica Hudson. Pastures, lawns; native of Europe. \[= C, F, FNA, G, K, M\]

Carex tenax Chapman. Longleaf pine sandhills. May-June. Sc. NC south to Panhandle FL, west to MS; also in sw. LA and se. TX. \[= RAB, FNA, K, M; ? C. validior Mackenzie – S\]

Carex tenera Dewey var. tenera, Slender Sedge. Low forests. NS west to BC, south to VA, NC, n. GA, ne. TN, MO, KS, WY, and OR. Var. echinodes (Fernald) Wiegand is restricted to the northern Midwest. \[= F, FNA; < C. tenera – RAB, C, G, K\]

Carex tetanica Schkuhr, Rigid Sedge. Moist forests. May-June. MA west to MN, NE, and AB, south to NJ, VA, and NC. \[= RAB, C, F, FNA, K, M; = C. tetanica var. tetanica – G\]

Carex thornei Naczi (section Griseae). Mesic deciduous forests, often in the upper floodplain. Endemic to the drainage of the Apalachicola/Chattahoochee and Flint in s. GA and s. AL south to Panhandle FL. See Naczi, Bryson, & Cochrane (2002). \[= FNA\] {not yet keyed}

Carex timidula Naczi & B.A. Ford. Calcareous, dry to mesic woodlands and forests. East to AL, TN, and KY. Related to C. jamesii and C. juniperorum, from which it was separated by Naczi & Ford (2001). \[= FNA; < C. jamesii – C, F, G, K, M\]

Carex tonsa (Fernald) Bicknell, Shaved Sedge. Xeric disturbed areas, old fields. \{distribution and habitats in our area obscure\}. QC west to AB, south to VA, IN, and WI. See C. umbellata for discussion. \[= F, G, K, M; < C. umbellata – RAB, C, W; = C. tonsa var. tonsa – FNA, K\]

Carex triangularis Böckler. Moist forests, ditches, other wet sites. April-June. SC and GA west to KS and TX. \[= RAB, F, FNA, G, K, M, S; < C. vulpinoida var. vulpinoida – C; < C. vulpinoida – GW\]

Carex tribuloides Wahlenberg var. sangamonensis Clokey. Bottomland forests. May-June. OH, IL, and KS, south to SC, AL, LA, and TX. \[= FNA, G, K; < C. tribuloides – RAB, C, F, GW, W\]

Carex tribuloides Wahlenberg var. tribuloides. Bottomland forests. May-June. NB west to MN and NE, south to c. peninsular FL, GA, TN, MO, and KS. \[= FNA, G, K; < C. tribuloides – RAB, C, F, GW, W\]

Carex trichocarpa Muhlenberg ex Willdenow. Wet meadows, marshes. May-July. QC west to MN, south to DE, nw. NC, WV, IN, and MO. \[= RAB, C, F, FNA, G, K, M\]

Carex trisperma Dewey. Three-seeded Sedge. Bogs and swamps at high elevations (in NC and VA), usually growing in living Sphagnum, in shaded situations under shrubs or trees in montane wetlands, northward in bogs at low elevations. June. NL (Labrador) west to SK, south to NJ, MD, OH, n. IN, IL, and MN; and in the mountains to w. NC and WV. See Kirschbaum
(2007) for additional information about \( C. \) trisperma and \( C. \) billingsii. \([= C. \) trisperma var. trisperma – C, F, FNA, G, K, M; < C. trisperma – RAB, W]\)

**Carex tuckermanii** F. Boott. Calcareaous swampy forests and wet meadows. NB and MN south to WV, sc. PA, NJ, MD, and IL. A reported for Alleghany County, NC appears to be erroneous. \([= C, F, FNA, K; = C. \) tuckermani – G, M, orthographic variant]\)

**Carex turgescens** Torrey, Pinebarren Sedge. Sandhill seepage bogs, streamhead pocosins, pocosin-sandhill ecotones, canebrakes, cypress domes and stringers, in highly acidic, sandy-peaty soils. May-June. Sc. NC south to Panhandle FL, west to se. LA, a Southeastern Coastal Plain endemic. \([= \) RAB, FNA, GW, K, M, S, WH]\)

**Carex umbellata** Schkuhr ex Willdenow, Parasol Sedge. Old fields, other habitats. \{distribution and habitats in our area obscure. NL (Newfoundland) west to SK, south to VA, TN, IL, and MN. It seems very possible that southern members of the \( C. \) umbellata complex may not correspond to the taxa "distinguished" in the northeastern United States. \( C. \) tonsa, \( C. \) rugosperma, and \( C. \) umbellata are circumscribed by various authors in different ways. This group needs critical study. \([= \) FNA, G, K, M; < \( C. \) umbellata – RAB, C, W (also see \( C. \) rugosperma and \( C. \) tonsa); = \( C. \) abdita Bicknell – F]\)

**Carex utriculata** F. Boott, Beaked Sedge. Wet meadows. Boreal American, ranging south to DE, w. VA, nw. and sw. NC, ne. TN (Johnson County), IN, NE, NM, and CA. Recently verified for NC. \([= \) C, FNA, K; = \( C. \) rostrata Stokes var. utriculata (F. Boott) L.H. Bailey – G; < \( C. \) rostrata – M, misapplied as to our material; = \( C. \) schweinitzii – RAB, by misidentification]\)

**Carex venusta** Dewey. Bay swamps, peat bogs, mossy wetlands, and other wet habitats. Se. VA south to Panhandle FL, on the Coastal Plain. \([= \) M, S; = \( C. \) venusta var. venusta – C, F, G, K; < \( C. \) venusta – RAB, FNA, GW, W, WH (also see \( C. \) oblitata)]\)

**Carex verrucosa** Muhlenberg. Pocosins, wet pinelands, pond cypress ponds, domes, and stringers. July-September. Se. NC south to south to s. FL, west to w. LA and e. TX. \([= \) RAB, FNA, GW, K, M, S, WH; = \( C. \) glaucescens Elliott var. androgyna M.A. Curtis]\)

**Carex vesicaria** Linnaeus, Inflated Sedge. Bogs. Circumboreal, ranging south in North America to DE, w. VA, nw. NC, KY, IN, MO, NM, and CA. \([= \) FNA, G; > \( C. \) vesicaria var. vesicaria – C, F, K; > \( C. \) vesicaria var. monile (Tuckerman) Fernald – F, K; > \( C. \) vesicaria – M; > \( C. \) monile Tuckerman]\)

**Carex vestita** Willdenow. Low forests. April-May. S. ME south to se. VA and nc. NC. \([= \) RAB, C, F, FNA, G, K, M]\)

**Carex vexans** F.J. Hermann, Florida Hammock Sedge. Marshes, distches, swamps, hydric hammocks. E. Panhandle FL south to s. FL. \([= \) FNA, K, WH; < \( C. \) alata – S]\)

**Carex virens** Muhlenberg ex Willdenow. Nutrient-rich forests, woodlands, and openings. May-June. S. ME, NY, and s. MI, south to e. VA, w. NC, nw. SC, and MO. \([= \) RAB, C, F, FNA, G, K, M, S, W]\)

**Carex vulpinoidea** Michaux. Wet sites. NL (Labrador) west to BC, south to FL, TX, Sonora, and CA. \([= \) RAB, F, FNA, G, M, S, W; < \( C. \) vulpinoidea var. vulpinoidea – C, K; < \( C. \) vulpinoidea – GW (also see \( C. \) annectens and \( C. \) triangularis)]\)

**Carex wildenowii** Schkuhr ex Willdenow. Calcareaous mesic forests, but also in more acidic dry-mesic upland oak forests. May-June. MA, VT, NY, s. ON, and c. IN, south to nc. SC, n. AL, and s. IL; disjunct in c. AR. Naczi (1999b) reports chromosome numbers of \( n = 31, 39. \) \([= \) FNA, K; < \( C. \) wildenowii – RAB, F, W (also see \( C. \) basiantha and \( C. \) superata); < \( C. \) wildenovii – C, G, M, S (also see \( C. \) basiantha and \( C. \) superata) and orthographic variant]\)
**Cyperaceae**

*Cyperus* Linnaeus 1753 (Umbrella Sedge)

A genus of about 500-550 species, herbs, of tropical and warm temperate areas. References: Goetghhebeur in Kubitzki (1998b); Tucker, Marcks, & Carter in FNA (2002b). [also see *Kyllinga*]

This treatment is closely adapted from Tucker, Marcks, & Carter in FNA (2002b) and other sources. It needs substantial customization and revision prior to publication. Key lead 4 in the main key is problematic.

1 Inflorescences unbranched (the spikes sessile); spikelets 1-2-flowered; rachilla not or only slightly elongate; scales conspicuously keeled; lowest 2 scales of spikelet greatly reduced .......................................................... [see *Kyllinga*]

2 Stigmas 2; achenes lenticular.

3 Achenes dorsiventrally flattened, borne with a flattened face toward the rachilla; [subgenus *Juncellus*] .................................................. Key A

4 Spikelets borne in digitate clusters (rarely singly), or in umbellate or glomerulate heads; [subgenus *Pychnostachys*] .......................... Key C

5 Rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a cartilaginously thickened section of the rachilla (and its wings); [subgenus *Diclidium*] ............................................................. Key D

6 Rachilla continuous, or articulate only at the base; [subgenus *Cyperus*] .................................................................................................... Key E

---

**Carex** Dewey, Wood's Sedge. Moist slopes and cove forests over mafic rocks (such as amphibolite), ultramafic rocks (such as olivine), or felsic rocks. May-June. NY west to MB, south to NC, nw. SC, n. GA, and MO. This species forms clonal patches reminiscent of *C. pensylvanica*, but has perigynia glabrous and filled by the achene at maturity; the foliage also has a paler green cast. It has probably been much overlooked in the past. Naczi (1999b) reports chromosome numbers of n = 22, 26. [= RAB, C, F, FNA, K, M, W; = *C. tetanica var. woodii* (Dewey) Wood – G]

**Cladium** P. Browne (Sawgrass, Twig-rush)

1 Plants 1-3 m tall, coarse, from short rhizomes, forming dense tussocks; leaves 3-15 dm long, 5-12 mm wide, stiff and flat (or broadly V-shaped), the margins and midrib (beneath) harshly serrate (saw-toothed); inflorescence a narrow panicle 3-9 dm long, the branches bearing several fascicles of spikelets; achene base broadly rounded to truncate; [of tidal freshwater to brackish marshes or outer coastal plain calcareous savannas] .................................................................................................................................................................C. jamaicense

2 Stigmas 3; achenes trigonous.

3 Achenes laterally flattened, borne with an edge toward the rachilla; [subgenus *Pycreus*] ................................................................. Key A

4 Spikelets borne in spikes on a conspicuous rachis.

5 Rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a cartilaginously thickened section of the rachilla (and its wings); [subgenus *Diclidium*] ............................................................. Key D

6 Rachilla continuous, or articulate only at the base; [subgenus *Cyperus*] .................................................................................................... Key E

---

**Cladium jamaicense** Crantz, Sawgrass. In circumneutral to alkaline situations, including brackish marshes, and rarely somewhat inland in savannas underlain by coquina limestone. July-October. Se. VA south to s. FL, west to e. TX, and in the West Indies. This is, of course, the famous sawgrass which dominates many square miles in the Everglades of s. FL (where somewhat inland in savannas underlain by coquina limestone, with scattered and disjunct occurrences southward in VA, NC, SC, GA, and a cartilaginously thickened section of the rachilla (and its wings); [subgenus *Diclidium*] .......................... Key D

5 Rachilla continuous, or articulate only at the base; [subgenus *Cyperus*] .................................................................................................... Key E
Key A – subgenus Juncellus – stigmas 2; achenes lenticular; achenes dorsiventrally flattened, borne with a flattened face toward the rachilla

1 Plants 1-3 (-6) dm tall; leaf blades 0-7 cm long ....................................................................................................................... C. laevigatus
1 Plants to 10 dm tall; leaf blades 20-40 cm long ....................................................................................................................... C. serotinus

Key B – subgenus Pycreus – stigmas 2; achenes lenticular; achenes laterally flattened, borne with an edge toward the rachilla

1 Scales 2-keeled in the lower third to half (bicarinate).
2 Scales folded in half their entire length (conduplicate).

1 Scales with excurved awn 0.3-0.5 mm long; stamens 0-2; achenes ca. 0.6 mm long ........................................................................ C. pumilus
3 Achenes oblong with a truncate apex, subcylindric, only slightly compressed laterally.
4 Scales firm, oblong, closely imbricate, thus the spikelets appearing smooth-margined to the unaided eye; perennial or annual, 5-75 cm tall.
5 Scales 1.5-2.4 mm long, 1.0-1.4 mm wide; achenes 0.8-1.2 mm long, 0.4-0.6 mm wide ............................................................... C. polystachyos
6 Scales 2.5-3.0 mm long, 1.6-1.9 mm wide; styles 0.3-0.5 mm long; stigmas 2.2-3.1 mm long .............................................................. C. diandrus

Key C – subgenus Pyenostachys – stigmas 3; achenes trigonous; spikelets borne in digitate clusters (rarely singly), or in umbellate or glomerulate heads

1 Scales folded in half their entire length (conduplicate).
2 Plant a perennial.
3 Achenes with a granular or papillose surface; leaves often bladeless; bracts 2 (-3).
4 Scales 2.5-3.0 mm long, 1.6-1.9 mm wide; styles 0.6-1.0 mm long; stigmas 1.0-1.5 mm long .............................................................. C. bipartitus
5 Achenes with a smooth surface; leaves with blades; bracts 3-5.
6 Scales yellow or yellowish brown; culms 15-75 cm tall ............................................................................................................. C. lanceolatus
7 Plants perennial from slender rhizomes ............................................................................................................................... C. sanguinolentus
8 Leaves bladeless; inflorescence bracts ca. 20, borne horizontally; stamens 3 ................................................................. C. involucratus
9 Leaves with leaf blades; inflorescence bracts 2-10, borne variously; stamens 1 (-2).
10 Scales sharply 3-angled, the faces concave, the angles harshly scabrous; leaf blades and inflorescence bracts with conspicuous cross-veins.
11 Plants from fibrous roots.  

12 Achenes narrowly ellipsoid to linear, about 3-6× as long as wide.
14 Longest bract erect (appearing as a continuation of the culm); spikelets red-tinged ................................................................. C. reflexus
15 Achenes linear, 1.2-1.4 mm long, 0.2 (0.3) mm wide, about 5-6× as long as wide; style 0.5-0.8 mm long; stigmas 0.6-1.0 mm long ....................... C. pseudovegetus
13 Achenes broadly ellipsoid, about 2-2.5× as long as wide (the stipe or cuneate base typically conspicuous).
16 Annual; longest inflorescence bract erect or strongly ascending; anther ca. 0.5 mm long .......................................................... C. acuminatus
17 Scales declined 3-45 degrees from the rachilla; achenes with a stipe ...................................................................................... C. eragrostis
18 Scales declined (45-) 60-90 degrees from the rachilla; achenes cuneate at the base ................................................................. C. ochraceus
Key D – subgenus *Diclidium* – stigmas 3; achenes trigonous; spikelets borne in spikes on a conspicuous rachis; rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a section of the rachilla (including its wings)

1  Tip of each scale not reaching above the base of the next distal scale on the same side of the rachilla, and usually ending short of it; achene linear oblong, 1.5-2.0 mm long, about 3× as long as wide.......................................................... *C. odoratus* var. *engelmannii*
1  Tip of each scale reaching above the base of the next distal scale on the same side of the rachilla; achenes ellipsoid, obovoid-oblong, or slenderly obovoid, 1-1.5 mm long, about 2× as long as wide .......................................................... *C. odoratus* var. *odoratus*

Key E – subgenus *Cyperus* – stigmas 3; achenes trigonous; spikelets borne in spikes on a conspicuous rachis; rachilla continuous, or articulate only at the base

1  Upper scales of the spikelet with a straight or excruciating mucronate or cuspidate apex 0.4-1.2 mm long.
2  Floral scales persistent, appressed, 2.6-3.9 mm long; spikelets nearly cylindrical in ×-section; rachilla winged.......................... *C. retroflexus*
2  Floral scales deciduous, spreading, mostly < 3 mm long; spikelets quadrangular in ×-section; rachilla wingless, or wings < 0.4 mm wide.
3  Plant a rhizomatous perennial, culms single.......................................................... *C. schweinitzii*
3  Plant an annual, culms several, cespitose.
4  Achenelets linear, 0.8-1.6 (-1.9) mm wide.
5  Spikelet 1.2-1.6 mm wide; scales deciduous; rachilla persistent, wingless or very narrowly winged, not clasping achenes ......... *C. distans*
6  Spikelet 0.8-1.3 (-1.9) mm wide; scales persistent; rachilla breaking into segments with a scale and achene attached, the wing prominent and clasping the achenes
9  Tip of each scale not reaching above the base of the next distal scale on the same side of the rachilla, and usually ending short of it; achene linear oblong, 1.5-2.0 mm long, about 3× as long as wide .......................................................... *C. odoratus* var. *engelmannii*
9  Tip of each scale reaching above the base of the next distal scale on the same side of the rachilla; achenes ellipsoid, obovoid-oblong, or slenderly obovoid, 1-1.5 mm long, about 2× as long as wide .......................................................... *C. odoratus* var. *odoratus*
7  Spikelets linear, 0.8-1.6 (-1.9) mm wide.
8  Spikelet 1.2-1.6 mm wide; scales deciduous; rachilla persistent, wingless or very narrowly winged, not clasping achenes ......... *C. distans*
8  Spikelet 0.8-1.3 (-1.9) mm wide; scales persistent; rachilla breaking into segments with a scale and achene attached, the wing prominent and clasping the achenes
9  Tip of each scale reaching above the base of the next distal scale on the same side of the rachilla, and usually ending short of it; achene linear oblong, 1.5-2.0 mm long, about 3× as long as wide .......................................................... *C. odoratus* var. *engelmannii*
9  Tip of each scale reaching above the base of the next distal scale on the same side of the rachilla; achenes ellipsoid, obovoid-oblong, or slenderly obovoid, 1-1.5 mm long, about 2× as long as wide .......................................................... *C. odoratus* var. *odoratus*
7  Spikelets oblong-ovate to linear-oblong, (1.5-) 2.0-3.0 (-4.0) mm wide.
10 Spikelets strongly compressed, >2× as wide as thick (in cross-section); scales spreading or appressed.
11 Scales obovate-oblanceolate, notched at the tip; styles < 0.1 mm long.
12 Rachilla wingless; scales scarcely mucronate .......................................................... *C. iria*
12 Rachilla narrowly winged; scales distinctly mucronate .......................................................... *C. microiria*
13 Scales elliptic to oblong or ovate, acute to obtuse, not notched at the tip; styles 0.3-1.3 mm long.
13 Rachilla with hyaline, whitish, or straw-colored wings 0.2-0.5 mm wide.
14 Culms terete (at least toward the base), nodose-septate; inflorescence bracts 2 (-4), all erect; leaf blades generally absent ........
.................................. *C. articulatus*
14 Culms trigonous, not nodose-septate; inflorescence bracts 3-7, horizontal, ascending, or reflexed; leaf blades present.
15 Scales persistent; rachilla persistent; elongate stolons up to 15 cm long present, bearing tubers.
16 Scales purplish red to reddish brown, with green midveins; base of culm indurate; stolons wiry, springy when dried ........
.................................. *C. rotundus*
16 Scales yellowish brown to brown; base of culm soft; stolons spongy, flexible when dried.
17 Style and stigma combined < 4.2 mm long .................. *C. articulatus* var. *levanticus*
17 Style and stigma combined > 4.2 mm long .......................................................... *C. articulatus* var. *macrostachyus*
18 Scales deciduous; rachilla deciduous; rhizomes up to 5 cm long present, not bearing tubers.
19 Achenes coarsely punctate; spikelets borne in spikes on a conspicuous rachis; rachilla continuous, or articulate only at the base
22 Rachis (to which the spikelets are attached) glabrous; achenes 1.5-2.0 mm long; spikes subglobose to broadly ovoid; [of upland sites, of NC northward] .......................................................... *C. houghtonii*
23 Anthers 0.3-0.6 mm long. 24 Spikelets with 5-22 scales .......................................................... *C. pilosus*
23 Anthers 0.8-1.0 mm long .......................................................... *C. filiculmis*
24 Spikelets 2.5-3.8 mm long, usually fitting loosely over the mature achenes, the margins spreading or loosely clasping it; spikelet with 5-22 scales .......................................................... *C. pilosus ssp. lupinus*
24 Spikelets 1.8-2.5 mm long, usually fitting tightly over the achenes, the margins tightly clasping it; spikelets with 3-7 scales .......................................................... *C. pilosus ssp. macilentus*
10 Spikelets subterete or quadrangular, 1-1.5× as wide as thick (in cross-section); scales appressed.
25 Scales deciduous; rachillas persistent; rachilla wings deciduous, but remaining firmly attached at the base even after the achenes fall; spikelets with (6-) 12-20 (-40) scales ......................................................... C. erythrorhizos
25 Scales persistent; rachillae either deciduous (the mature spikelets generally falling as a single unit from the rachis) or persistent; rachilla wings persistent; spikelets with 2-8 scales.
26 Spikelets reflexed (some of the uppermost spreading to ascending).
27 Culms glabrous; leaves and inflorescence bracts nearly glabrous ................................................................. C. hystricinus.
27 Culms (at least the upper portion) scaberulous or puberulent; leaves and inflorescence bracts puberulent on the upper surface.
28 Inflorescence rays scaberulous; leaves and inflorescence bracts pubescent on the upper and lower surfaces; culm obtusely trigonous to nearly terete............................ C. plukenetii
28 Inflorescence rays smooth (or with a very few hairs); leaves and inflorescence bracts pubescent on the upper surface and on the midvein only on the lower surface; culm sharply 3-angled.............................................................. C. retrofractus
26 Spikelets ascending to spreading (some of the lowermost reflexed).
29 Spikelets cylindrical, 2-5× as long as wide.
30 Spikelets ellipsoid, 2-3× as long as wide; spikelets with 1-2 (-3) fertile scales......................................................... C. aggregatus
30 Spikelets lancilobate to linear, 4-10× as long as wide; spikelets with 3-8 fertile scales.
31 Scales greenish to light brown, the tips overlapping the lower 1/4 to 1/3 of the next scale ................................ C. strigosus
31 Scales reddish brown or tawny, the tips barely reaching the base of the next scale ............................................. C. thyrsiflorus
29 Spikelets ovoid, globose, or obovoid, 1-2× as long as wide.
32 Scales >4 mm long; achenes >2 mm long.
33 Spikelets ellipsoid to obovoid. ........................................................................................................................................
C. echinatus
33 Spikelets subquadangular, the terminal scale elongate, forming a subulate tip to the spikelet; leaves and inflorescence bracts 3-6 mm wide, smooth............................................... C. hystricinus
34 Spikelets subterete, the terminal scale not elongate, the spikelet therefore acute; leaves and inflorescence bracts mostly >10 mm wide, scabrous on the upper surfaces.
35 Spikelets dense, with 50-90 spikelets, each with 3-6 (-7) fertile scales; achenes conspicuously falcate-curved, 3-4× as long as wide ................................................................. C. lancastriensis
35 Spikelets loose, of 13-75 spikelets, each with 4-8 (-11) fertile scales; achenes straight, 5-6× as long as wide
...................................................................................................................... C. refractus
32 Scales <4 mm long; achenes <2 mm long.
36 Spikelets with parallel sides, mostly > 25 mm long; spikelets quadrate.
37 Spikelets narrowly ellipsoid, 1.5-2.0 mm wide ........................................................................................................ C. tetragonos
37 Spikelets linear, 0.5-1.0 mm wide ...................................................................................................................... C. thyrsiflorus
36 Spikelets with curved (convex) sides, mostly < 20 mm long; spikelets compressed.
38 Scales ascending; achenes oblong-fusiform, gradually narrowed to both ends ................................................... C. ovatus
38 Scales pressed; achenes elongate, abruptly constricted at the tip.
39 Spikelets tight, globose, oblong, or oblong-cylindrical; spikelets subterete in cross-section, with 1-3 (-4) fertile scales; scales straw-colored or brown on the sides.
40 Scales (3.5-) 4.0-7.0 mm long; spikelets subterete in cross-section, with 3-8 (-9) fertile scales; scales straw-colored or brown on the sides.
41 Spikelets club-shaped, the terminal scale elongate, forming a subulate tip to the spikelet; leaves and inflorescence bracts 3-6 mm wide, smooth............................... C. echinatus
41 Spikelets obtuse-rounded or subquadangular, the terminal scale elongate, forming a subulate tip to the spikelet; leaves and inflorescence bracts 3-6 mm wide, smooth.
42 Spikelets subterete, the terminal scale not elongate, the spikelet therefore acute; leaves and inflorescence bracts mostly >10 mm wide, scabrous on the upper surfaces.
43 Spikelets dense, with 50-90 spikelets, each with 3-6 (-7) fertile scales; achenes conspicuously falcate-curved, 3-4× as long as wide ................................................................. C. lancastriensis
43 Spikelets loose, of 13-75 spikelets, each with 4-8 (-11) fertile scales; achenes straight, 5-6× as long as wide
...................................................................................................................... C. refractus
39 Spikelets linear, 0.5-1.0 mm wide ...................................................................................................................... C. thyrsiflorus
40 Spikelets oblong to oblong-cylindrical; spikelets 2.2-4.0 (-4.5) mm long; scales firm, brown or straw-colored, 1.8-2.6 mm long; achenes 1.2-2.0 mm long ................ C. retrorsus

Cyperus acuminatus Torrey & Hooker ex Torrey. Wetlands, especially over limestone. IL west to ND, south to w. LA, TX, and n. Mexico; disjunct from WA to s. CA; disjunct eastward at scattered localities in VA, NC, GA (Eechols 2007), TN, KY, and OH (where probably native), and NY and NH (where probably introduced). [= C, F, FNA, G, GW, K, W]

Cyperus aggregatus (Willdenow) Endl.ich. Disturbed areas in ports, apparently introduced on ballast, perhaps only a waif and no longer present; native of tropical America. [= FNA, K, WH; = C. cayennensis (Lamarck) Britton – S; = C. flavus (Vahl) Nees; = C. huarmensis (Kunth) M.C. Johnston, misapplied]

Cyperus alopecuroideus Rottboll. Disturbed wet areas; native of Old World tropics. Reported for FL in FNA and for MS in Kartesz (2010). [= FNA, WH] [not yet keyed]

Cyperus articulatus Linnaeus. Marshes, especially tidal. July-September. Se. SC south to s. FL west to e. TX, and south into tropical America. [= RAB, FNA, GW, K, S, WH]

Cyperus bipartitus Torrey. Low fields, ditches, marshes, along streams. July-October. ME and QC west to MN and WA, south to FL (Wakulla County) (Kunzer et al. 2009), GA, LA, TX, NM, AZ, and CA. [= C, FNA, GW, K, W; ? C. rivularis Kunth – RAB, F, G, S, WV]

Cyperus compressus Linnaeus. Sandy fields, disturbed areas. July-September. Pantropical and warm temperate, north in North America to s. NY, s. OH, s. IL, and e. TX. [= RAB, C, F, FNA, G, GW, K, S, W, WH]

Cyperus croceus Vahl. Savannas, pine flatwoods, disturbed areas. July-October. NJ and MO south through the New World tropics. [problems in circumscription; check specimens] [= C, FNA, WH; = C. globulosus Aublet – F, G, GW, W, misapplied; >
Cyperus cuspidatus Kunth. Sandy fields, disturbed areas. July. S. SC south to FL, west to LA; New World tropics. [= RAB, FNA, GW, K, S, WH]

Cyperus dentatus Torrey. Toothed Flatsedge. Low sandy areas. July-October. NS and QC south to e. SC; disjunct inland in WV, s. TN, and nw. IN. [= RAB, C, F, FNA, G, GW, K, S, W]

Cyperus diandrus Torrey. [Habitat]. ME west to ND, south to VA, c. TN, n. AL, IL, MO, and IA. [= C, F, FNA, G, GW, K, S, W]

Cyperus digitatus Roxburgh. Disturbed wet areas. Pantropical, north in North America to FL Panhandle, LA, and TX. [= FNA] {not yet keyed; add to synonymy}

* Cyperus distans Linnaeus. Marshes; probably introduced from tropical America. July-September. [= RAB, FNA, K, S, WH]

Cyperus distinctus Steudel. Marshes, wet flatwoods, wet hammocks, ditches. July-September. E. SC south to Panhandle FL and s. FL; se. LA; Bahamas (New Providence Cay). [= RAB, FNA, GW, K, WH]

Cyperus drummondii Torrey & Hooker in Torrey. Flatwoods ponds, savannas, coastal prairies, ditches, disturbed depressions. June-September. SC south to Panhandle FL, west to e. TX; West Indies; Central America; South America. Reported for several counties in the GA Coastal Plain (Carter, Baker, & Morris 2009). Reported for SC, GA, FL, AL, MS, LA, and TX (USDA Plants 2009). [= FNA, WH; = C. virens Michaux var. drummondii (Torrey & Hooker in Torrey) Kükenthal; < C. virens – GW, K, RAB, S]

Cyperus echinatus (Linnaeus) Wood. Sandy woodlands, forests, and fields. July-September. CT and NY west to s. OH, IL, and se. KS, south to n. FL, TX, and ne. Mexico. [= C, FNA, K, WH; = C. ovariis (Michaux) Torrey – RAB, G, GW, S, W, WV; > C. ovariis var. ovularis – F; > C. ovariis var. sphaericus Böckler – F]

Cyperus elegans Linnaeus. Royal Flatsedge. FL. July-August. FL, AL, MS, TX, and NM, south to South America. [= FNA, WH] {not yet keyed; add to synonymy}

* Cyperus enteririanus Böckler. Bottomland hardwood forests, coastal grasslands, marshes, vacant lots, disturbed areas; native of temperate South America. Established from E. GA south to s. FL and west to e. and s. TX. Rosen, Carter, & Bryson (2006) and Carter, Baker, & Morris (2009) discuss the spread of this noxious weed in the Southeastern United States. [= FNA, K, WH]

Cyperus filiculmis Vahl. Sandy or rocky woodlands, forests, and fields. July-October. Se. MD south to s. peninsular FL, west to e. TX. [= FNA, RAB, WH; < C. lupinus ssp. lupinus – K (also see C. lupinus]

**Cyperus fraternus** Kunth. Disturbed depressions, ditches. Reported for several counties in the GA Coastal Plain (Carter, Baker, & Morris 2009). [C. reflexus – FNA; = *C. reflexus* Vahl var. *fraternus* (Kunth) Kunze] [add synonymy; not yet keyed; not yet mapped]

**Cyperus granitophilus** McVaugh, Granite Flatsedge. Granitic flatrocks, rarely on diabase flatrocks and Altamaha Grit glades. Sc. VA south to ec. AL in the Piedmont; disjunct in se. and c. TN on sandstone and limestone and in sc. GA on Altamaha Grit. [= FNA, GW, K; < *C. aristatus* Rottbøll – G, RAB, W; < *C. inflexus* Muhlenberg – F, S]

**Cyperus grayi** Torrey. Dry soils. July-September. NH south to GA and Panhandle FL (Liberty County) (Sorrie & LeBlond 2008). [= RAB, C, FNA, K, W; = *C. grayii* – G, orthographic variant; > *C. grayii* – F; > *C. filiculmis* var. *oblitus* Fernald & Griscom – F]

**Cyperus houghtonii** Torrey, Houghton's Flatsedge. Dry upland sites. July. MA, VT, and QC west to MN, south to w. VA, WV, ne. NC, and nw. IN. [= RAB, C, F, FNA, G, K, W]

**Cyperus hystricinus** Fernald. Dry woodlands and forests. July-September. NJ south to n. FL, west to e. TX, mostly on the Coastal Plain. [check specimens of this and relatives – discrepancy between mapped and stated ranges] [= C, FNA, K, S, WH; < *C. retrofractus* – RAB, W, misapplied; = *C. retrofractus* (Linnaeus) Torrey var. *hystricinus* (Fernald) Kükenthal – F, G]

**Cyperus laevigatus** Linnaeus. Brackish marshes; native of sw. North America and New World tropics. [= RAB, FNA, K; > *C. laevigatus* – S; > *C. careyi* Britton – S]

**Cyperus lancastriensis** Porter ex A. Gray. Dry woodlands, forests, and fields. July-September. NJ west to WV, OH, and MO, south to GA and AR. [= RAB, C, F, FNA, G, K, S, WH, WV]

**Cyperus lanceolatus** Poiret. Wet places. Se. GA and ne. FL west to LA and c. TX (?), south into the Neotropics; also Africa. [= FNA, GW, K, WH; ? *C. densiflorus* Link – S]

**Cyperus lanceolatus** Porter ex Steudel. Limestone ponds, low pinelands. July-September. Se. NC south to s. FL, west to w. LA. Sorrie (1998b) reports it for e. GA (Glynn County). [= RAB, FNA, GW, K, S, WH]

**Cyperus ligularis** Linnaeus, Swamp Flatsedge. Brackish marshes, beaches, disturbed wetlands. FL and AL south into Mexico, Central America. South America; Africa. [= FNA, WH] [not yet keyed; add to synonymy]
**Cyperus lupulinus** (Sprengel) Marcks var. *lupulinus*. Dry sterile soils. MA and VT west to MN, south to NC, n. SC, TX; disjunct in ID, WA, and OR. [= *C. lupulinus* ssp. *lupulinus* – FNA, K; < *C. filiculmis* Vahl – RAB, W; < *C. lupulinus* – C, WH; = *C. filiculmis* Vahl var. *filiculmis* – F, G, WV; > < *C. filiculmis* – S; > *C. martindalei* Britton – S]

**Cyperus lupulinus** (Sprengel) Marcks var. *macilentus* (Fernald) A. Haines. Dry sterile soils. ME, QC, and MN south to w. VA, w. NC, nw. GA, and MO. [= *C. lupulinus* ssp. *macilentus* (Fernald) Marcks – FNA, K; < *C. filiculmis* Vahl – RAB, S, W; = *C. filiculmis* Vahl var. *macilentus* Fernald – F, G, WV; > < *C. lupulinus* – C]

**Cyperus ochraceus** Vahl. Marshes, ditches, wet disturbed areas. Se. GA (Jones & Coile 1988), s. FL, s. AL, s. MS, LA, TX, south into Mexico, Central America, and South America. [= FNA, GW, K, S, WH]

**Cyperus odoratus** Linnaeus var. *engelmannii* (Steudel) R. Carter, S.D. Jones, & J. Wipff. Alluvial and other damp to wet soils. July-October. North-central and northeastern North America, MA west to s. ON, MN and NE, south to se. NC and MO. Distribution in our region is poorly known. [= *C. engelmannii* Steudel – RAB, F, G, GW; < *C. odoratus* – C, WH; > *C. ferruginescens* Böckler – RAB, F; > *C. ferax* L.C. Richard – S; > *C. longispicatus* J.B.S. Norton – S; > *C. speciosus* Vahl – S]

* Cyperus ovatus* Baldwin. Sandy beaches, maritime forests, and pinelands. July-October. Se. NC south to s. FL, west to s. AL. [= FNA, K; ? *C. retrorsus* Chapman var. *cylindricus* (Elliott) Fernald & Griscom; > *C. retrorsus* var. *deeringianus* (Britton ex Small) Fernald ex Griscom – RAB, F, G, GW, S; < *C. odoratus* – C, WH; > *C. retrorsus* var. *deeringianus* (Britton ex Small) Britton ex Small – S]

* Cyperus oxylepis* Nees ex Steudel. Disturbed wet areas, marshes, salina areas; native of South America. See Bryson et al. (1996). [= FNA, GW, K, WH]

**Cyperus planifolius** L.C. Richard. Brackish marshes. Se. GA (Jones & Coile 1988) south to s. FL; West Indies; Central and South America. [= FNA, GW, K, WH; ? *C. brunneus* Swartz – S]

**Cyperus pluekenetii** Fernald. Sandhills, sandy woodlands, and dry, disturbed areas. July-October. NJ, KY, MO, and se. OK, south to c. peninsular FL and e. TX. [= RAB, C, F, FNA, K, W, WH; = *C. retrofractus* var. *retrofractus* – G, misapplied; = *C. retrofractus* – S, misapplied]

* Cyperus prolifer* Lamarck. Pond shores, marshes; native of tropical e. Africa. July-August. Also reported for se. VA (Kartesz 2010). [= FNA, WH; ? *C. isocladus* Kunth]

**Cyperus pseudovegetus** Steudel, Marsh Flatsedge. Marshes, ditches, depressions. July-October. NJ and MA, west to s. IL, s. MO, and OK, south to FL and TX. [= RAB, C, FNA, G, GW, K, S, WH; = *C. virgenes* – F, misapplied]

* Cyperus pumilus* Linnaeus. Disturbed wet areas; native of the Old World, occurring in n. FL and se. GA. [= FNA, GW, K, WH]

* Cyperus reflexus* Vahl. Disturbed wet areas; native of sw. United States south to tropical America. July-August. [= FNA, WH]

Cyperus retroflexus Buckley. Cropped fields, damp disturbed areas. July-September. AL west to NM, south to Mexico. [= FNA, K]

Cyperus retrofractus (Linnaeus) Torrey. Dry sandy or rocky woodlands and fields. July-September. NJ west to s. OH, and se. MO, south to GA. AL, and AR. [= C, FNA, K, WH; = C. dipsaciformis Fernald – RAB, F, S, W; = C. retrofractus (Linnaeus) Torrey var. dipsaciformis (Fernald) Kükenthal – G]

Cyperus rotundatus Buck. Pinebarren Flatsedge. Dry woodlands, forests, and rock outcrops. July-October. S. NY south to FL, west to TX, mostly on the Coastal Plain, but north in the interior to KY and se. OK. [= C, FNA, G, GW, W, WH; = C. rotundatus Buck var. rotundatus – RAB, K; > C. rotundatus Buck var. rotundus – F; > C. rotundatus Buck var. nashii (Britton) Fernald – F; > C. retrofractus – S; > C. nashii Britton – S; > C. retrofractus – S]

* Cyperus sanguinolentus Vahl. Ditches, disturbed wet areas; native of Asia, known in North America from e. GA west to LA. See Carter & Bryson (2000) for detailed information. [= FNA; > Cyperus louisianensis Thieret – K]

Cyperus schweinitzii Torrey, Sand Flatsedge. Sandy soils. VT, MA, MN, and Albert, south to s. NJ, e. PA, n. KY, OH, MO, TX, NM, UT, and Mexico. It occurs in se. PA (Rhoads & Klein 1993) and NJ. [= FNA, C, F, G, K]

Cyperus surinamensis Rottboll. Marshes, pond edges, disturbed wet areas. September-October. Se. SC south to s. FL, west to KS, OK, TX, and south into Mexico and tropical America. [= RAB, FNA, GW, K, S, WH]

Cyperus tetragonos Elliott, Four-angled Flatsedge. Maritime forests and dunes, edges of brackish marshes. July-September. E. NC south to s. FL; FNA treats C. pringlei of AZ and NM as conspecific, but this seems unlikely. [= RAB, FNA, K, S, WH]

Cyperus thyrsiflorus Junghuhn. Swamps and streambanks. Se. GA and FL peninsula west to se. TX; West Indies; South America. [= FNA, K, WH; = C. hermaphroditus Jacquin Standley – S, misapplied]

Cyperus virens Michaux. Marshes and ditches. July-September. Se. NC south to c. peninsular FL, west to TX; Mexico to Argentina. [= FNA, WH; < C. virens – GW, K, RAB, S]

Dulichium Persoon (Threeway Sedge)

**Identification notes:** The combination of the distichous *Cyperus*-like spikelets and numerous, distinctly 3-ranked, short, caulin leaves makes *Dulichium* distinctive.

**Eleocharis** R. Brown 1810 (Spikerush)
[by Bruce A. Sorrie and Alan S. Weakley]

**Identification notes:** "Scale" refers to the flower scales. "Sheath" refers to leaf sheaths. "Bristle" refers to perianth bristles.

**subgenus Eleocharis**

acicarius, radicans

---

1 Culms producing vegetative proliferations rather than normal fertile spikelets ................................................................. **Key A**

---

Achenes with several distinct longitudinal ribs or low ridges, the intervening spaces with abundant, very narrow, horizontally elongate cells; [subgenus *Scirpidium*] ........................................................................................................................................ **Key C**

---

Achenes without longitudinal ribs, the surface smooth, granular, or honeycomb-like (*E. tortilis* and *E. tuberculosa* have indistinct ribs, but intervening cells are honeycomb-like, not thin horizontally; *E. tricosata* has 3 keel-like ribs, but achene surface appears granular).  
4 Achenes lenticular or biconvex; styles 2-branched ................................................................................................. **Key D**  
4 Achenes trigonous or nearly terete; styles 3-branched ................................................................................................. **Key E**

---

**Key A** – spikerushes proliferating vegetatively, with no fertile spikelets present

---

1 Each culm producing secondary or tertiary whorls.

---

Achenes lenticular or biconvex; styles 2-branched ................................................................................................. **Key D**  
4 Achenes trigonous or nearly terete; styles 3-branched ................................................................................................. **Key E**
1 Culm transversely nodose-septate (appearing jointed), about 5-9.5 mm in diameter.

2 Achenes with longitudinal rows of enlarged linear cells separated by obscure longitudinal lines; perianth bristles narrow and weak, rudimentary to equaling achene; [widespread in our area]........................................................................................................................................E. equisetoides

2 Achenes with longitudinal rows of enlarged rectangular cells separated by distinct longitudinal lines; perianth bristles broad and stout, exceeding achene; [of Panhandle FL and s. AL]........................................................................................................................................E. interstincta

1 Culms not transversely nodose-septate, 1-5.5 mm in diameter.

3 Spike 3-5 mm in diameter, to 5 cm long, rounded to obtuse at the tip, densely flowered, the flowers (scales) 50-100 per spike, arranged in obvious spiral rows; culm 2-5 mm in diameter; [of estuarine and riverine marshes, or brackish interdune swale ponds on barrier islands].

4 Culms 2-4 mm in diameter, sharply 3-4-angled when fresh; tube base confluent with the summit of the achene.................E. elongata

4 Culms 2-4 mm in diameter, sharply 3-4-angled when fresh; tube base distinctly constricted, forming a "waist"..............E. quadrangulata

3 Spike 1-2 mm in diameter, to 2.5 cm long, sharply pointed at the tip, loosely flowered, the flowers (scales) 10-25, few enough that the spiral arrangement is not readily apparent; culm 0.5-1.5 (-2) mm in diameter; [of limesink (doline) ponds and Carolina bay lakes of the mainland].

5 Achenes body 0.8-1.5 mm long; scales mostly ca. 3.5 mm long; culms terete when fresh .........................................................E. margaretiae

5 Achenes body 1.5-2.5 mm long; scales mostly ca. 5 mm long; culms 3-angled when fresh .........................................................E. robusta
Cyperaceae

**Eleocharis bicolor**

MO; disjunct in DE. [= F, FNA, K, S; Carolina by Hill & Horn (1997). = C, F, FNA, G, GW, K, S; Newfoundland, NU, and AK south to GA, TX, CA; Mexico, Central America, n. South America, Eurasia. Reported for South Carolina by Hill & Horn (1997).]

Torrey, White Spikerush. Brackish marshes. July-September. MD south to s. FL, west to TX and CA; Mexico, Central America, South America, Asia, Africa. Reported for South Carolina by Hill & Horn (1997).

**Eleocharis albida**

Svenson ex Small. Bogs, pine savannas. NC south to FL, west to TX, north in the interior to TN and MO; disjunct in DE. [= F, FNA, K, S; = E. microcarpa Torrey – RAB, C, G, GW]

**Eleocharis brittonii**

Svenson ex Small. Bogs, pine savannas. NC south to FL, west to TX, north in the interior to TN and MO; disjunct in DE. [= F, FNA, K, S; = E. microcarpa Torrey – RAB, C, G, GW]
**Eleocharis cellulosa** Torrey. Cp (GA, NC, SC): fresh to brackish interdune swale ponds on barrier islands; rare (NC Rare). July-September. E. NC south to s. FL, west to TX and Mexico; also in the West Indies, Bermuda, and Central America (Nicaragua). See Gaddy & Rayner (1980) for the report of this species in SC and Carter, Baker, & Morris (2009) for discussion of its occurrence in GA. [= RAB, FNA, GW, K, S]

**Eleocharis confervoides** (Poiret) G. Tucker. Cp (GA): submersed in lakes and ponds; rare. GA and FL; West Indies; Central and South America; Asia; Africa; n. Australia. This taxon, often segregated into the monotypic genus Websteria, is widely distributed in tropical and subtropical regions of both hemispheres. Its retention in Eleocharis is supported by a molecular phylogenetic study (Roalson & Friar 2000). [= Websteria confervoides (Poiret) S. Hooper – FNA, GW, K; = Websteria submersa (C. Wright) Britton – Scirpus confervoides Poiret]

**Eleocharis elliptica** Kunth. Mt (VA, WV): calcareous prairies, fens, shores, riverside scours; rare. NL (Labrador) west to BC, south to PA, NJ, WV, TN, IA, and ID. [= F, FNA, K, WV; = E. tenuis (Wildenow) J.A. Schultes var. borealis (Svenson) Gleason – C, G]

**Eleocharis elongata** Chapman. Cp (GA, NC): quiet waters of limesink (doline) ponds; rare (NC Rare). July-August. Sc. NC south to FL, west to s. AL, s. MS, and TX (Sorrie & Leonart 1999); Jamaica, Mexico, Central America, South America. [= FNA, GW, K, S]

**Eleocharis engelmannii** Steudel, Engelmann Spikerush. Cp (DE, NC, SC, VA), Pd (DE, GA, NC, VA), Mt (VA, WV): freshwater shores, marshes, disturbed wet places; uncommon (rare in WV)). July-September. MA, ON, and British Clumbia south to GA, MS (Sorrie & LeBlond 2008), TX, and CA. [= RAB, F, FNA, G, K, S, WV]

**Eleocharis equisetoides** (Elliott) Torrey, Horsetail Spikerush. Cp (DE, GA, NC, SC, VA): quiet waters of limesink (doline) ponds, natural lakes, borrow pits, ditches, artificial millponds; uncommon (rare in DE and VA). June-September. MA south to e. peninsular FL, west to se. TX; also near the Great Lakes from NY west to MI and MO. [= RAB, C, F, FNA, G, GW, K; < E. equisetoides – C]

**Eleocharis erythropoda** Chapman. Cp (GA, NC, VA), Pd (DE, GA, NC, VA), Mt (VA, WV): streambanks, marshes, ponds, swamps; rare. July-September. NS and AK south to NC, MS, TX, AZ, and OR. [= RAB, FNA, GW, K; < E. palustris – C; > E. calva Torrey – F, G, S, WV, invalid name]

**Eleocharis flavescens** (Poiret) Urban. Cp (DE, FL, GA, NC?, SC?, VA?): Coastal Plain ponds, pools; rare. June-September. DE or VA (?) south to FL, west to se. OK and TX; also scattered in the Rocky Mountain states; West Indies; South America. [= K; > E. flavescens var. flavescens – C, FNA, G; > E. flavescens – RAB, F, GW]

**Eleocharis geniculata** (Linnaeus) Roemer & J.A. Schultes. Cp (SC), [GA?, NC?,]: marshes; rare. July. Widespread but scattered across much of the United States; West Indies, Central America, South America, Asia, Africa. [= F, FNA, G, GW, K; > E. caribaea (Rottboll) S.F. Blake – RAB, C, S]

**Eleocharis halophila** (Fernald & Brackett) Fernald. Cp (DE, NC, VA): brackish marshes; rare. July. NL (Newfoundland) to NC, along the coast. [= RAB, F, G, K; < E. palustris – C; < E. uniglumis (Link) Schultes – FNA; = E. uniglumis var. halophila Fernald & Brackett]

**Eleocharis intermedia** J.A. Schultes, Matted Spikerush. Mt (VA, WV): muddy calcareous seepage areas; rare. NS west to MN, south to VA, TN, and IL. The fruiting culms are of widely different lengths, the lowermost sprawling and much shorter than the longer. [= C, F, FNA, G, K, WV]

**Eleocharis interstincta** (Vahl) Roemer & J.A. Schultes. Ponds, borrow pits. May-September. S. AL and Panhandle FL south to s. FL and west (interruptedly) to OK and TX; Bahamas and West Indies; Mexico, Central America, e. South America. [= FNA, GW, K; < E. equisetoides – S]

**Eleocharis melanocharpa** Torrey, Black-fruited Spikerush. Cp (DE, GA, NC, SC, VA), Mt (VA): Coastal Plain ponds, cypress meadows, sinkhole ponds in the Shenandoah Valley; uncommon (rare in DE, NC, and VA). July-September. MA south to n. peninsular FL, west to s. MS; disjunct in e. TX, s. MI, and n. IN (Sorrie & Leonart 1999). [= RAB, C, F, FNA, G, GW, K, S]
Eleocharis microcarpa

Eleocharis microcarpa Torrey var. microcarpa. Cp (SC): wet pine savannas, Coastal Plain bogs; rare. June-September. SC south to FL, west to LA; West Indies. [= F, FNA; < E. microcarpa – RAB, C, G, GW, K; = E. microcarpa – S]

Eleocharis nigrescens (Nees) Steudel. Cp (SC): pond margins, flatwoods; rare. SC to FL; West Indies, Mexico; South America; Africa. [= FNA, GW, K; ? E. setifolia (A. Richard) Raynal; < E. microcarpa – RAB, ? E. carolina Small – S]

Eleocharis olivacea Torrey var. reductiseta (Schuyler & Ferren) Schuyler & Ferren. Tidal rivers. Endemic to s. NJ (as far as is known). [= K; < E. flavescens (Poiret) Urban var. olivacea (Torrey) Gleason – C, FNA, G; < E. olivacea – F]

Eleocharis palustris (Linnaeus) Roemer & J.A. Schultes, Small's Spikerush. Cp (DE, VA), Pd (DE, VA), Mt (NC, WV), {SC}: marshes; common (uncommon in VA and WV, rare in NC). June-September. NL (Labrador) west to AK, south to FL, TX, CA, and Mexico; Eurasia. As discussed by Smith et al. in FNA (2002b), variable in geographically correlated ways and probably warranting recognition of varieties or segregate species. E. smallii is sometimes separated as the eastern North American member of the north temperate E. palustris complex. [= FNA, G, K; < E. palustris – RAB, C; > E. smallii Britton – F, GW, WV; > E. palustris var. palustris – F; > E. palustris var. major Donder – F]

Eleocharis parvula (Roemer & J.A. Schultes) Link ex Bluff, Nees, Little-spike Spikerush. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (VA): tidal brackish and freshwater marshes, shallow waters of managed impoundments; common (rare in GA, NC, SC, and VA). July-September. NS, NL (Newfoundland), and MI south to FL and LA; BC south to CA; Mexico, Central America, South America, Eurasia, Africa. [= RAB, FNA, G, GW, K; = E. parvula var. parvula – C, F]

Eleocharis radicans (A. Dietrich) Kunth, Rooting Spikerush. Cp (VA), Mt (WV): {habitat}; rare (VA Rare). Widely scattered in North America; n. Mexico, West Indies, Central America, South America. [= C, F, FNA, G, GW, K]

Eleocharis robbinisi Oakes, Robbins Spikerush. Cp (DE, GA, NC, SC, VA), Mt (VA): quiet waters of limesink (doline) ponds, natural lakes; uncommon (rare in GA, NC, SC, VA). July-August. NS and NB west to ON, south to s. MS (Gorrie & Leonard 1999); also near the Great Lakes, from NY west to IN, WI, and MN. [= RAB, C, F, FNA, G, GW, K]

Eleocharis rostellata (Torrey) Torrey, Beaked Spikerush. Cp (DE, NC, VA), Mt (WV)?, {GA?, SC}: brackish and freshwater tidal marshes; uncommon (rare in NC and VA). July-September. ME, ON, and BC south to FL, TX, CA and Mexico; West Indies. Reported for WV (Harmon, Fort-Werntz, & Grafton 2006). [= RAB, C, F, FNA, GW, K]

Eleocharis tenuis (Willdenow) J.A. Schultes var. pseudoptera (Weatherby ex Svenson) Svenson. Pd (DE), {NC, VA}: bogs; common (rare in NC and VA?). June-September. NS, QC and IN south to NC, GA, and LA. [= C, F, FNA, GW, K; < E. tenuis – RAB; = E. elliptica Kunth var. pseudoptera (Weatherby ex Svenson) L. Harms; = E. capitata (Linnaeus) R. Brown – S]

Eleocharis tortilis (Link) J.A. Schultes, Twisted Spikerush. Cp (DE, GA, NC, SC, VA): wet pine savannas, Coastal Plain seepage bogs, seeps, pocosin ecotones; common. July-September. NJ south to FL, west to TX, inland to TN and AR. [= RAB, C, F, FNA, GW, K]

**Eriophorum** Linnaeus (Cottongrass, Cottonsedge, Bogwool)

1. Foliaraceous bracts (subtending the head of spikelets) 2 or 3, spreading, the inflorescence therefore appearing terminal.
2. Blade of the uppermost leaf on the stem much shorter than its sheath ........................................................................................................ E. gracile
3. Blade of the uppermost leaf on the stem as long as the sheath or longer .......................................................................................... E. tenellum
1. Foliaraceous bract (subtending the head of spikelets) solitary, erect, appearing as a continuation of the culm, the inflorescence therefore appearing lateral.
3. Scales (subtending the flower) prominently 3-7-nerved ................................................................................................................ E. virginicum
3. Scales (subtending the flower) 1-nerved ................................................................................................................................ E. viridicarinatum

**Eriophorum gracile** W.D.J. Koch ex Roth, Slender Cottongrass. Bogs and open swamps. Circumboreal, in North America from NL (Labrador) west to AK, south to s. PA (Rhoads & Klein 1993), s.NJ, w. MD (C. Frye, pers comm. 2000), DE (McAvoy & Bennett 2001), OH, IN, IL, MN, CO, UT, NV, and CA. [= C, F, FNA, G; > E. gracile var. gracile – K]

**Eriophorum tenellum** Nuttall, Conifer Cottongrass. Bogs. June-September. NL (Newfoundland) west to MN, south to s. NJ, se. PA (Rhoads & Klein 1993), IL, and MI. [= C, FNA, G, K; > E. tenellum var. tenellum – F]

**Eriophorum virginicum** Linnaeus, Tawny Cottongrass. Peaty sites, limited in habitat throughout the region, occurring in the Mountains in bogs and fens, in the Piedmont (formerly) in bogs, in the fall-line sandhills in burned-out pocosins, in the Coastal Plain in pocosins, acidic seeps, and peat-burn pools. June-September. NL (Labrador) and NL (Newfoundland) west to ON and MN, south to se. NC, sw. NC, e. KY; disjunct in se. GA at Okefenokee Swamp. Very variable in size, from 5-15 dm tall, with heads ranging from 1-6 cm in diameter, the larger plants primarily in the Coastal Plain and the smaller in the Mountains. [= RAB, C, F, FNA, G, GW, K, S, W, WV]

**Eriophorum viridicarinatum** (Engelmann) Fernald, Darkscale Cottongrass. Bogs. May-August. NL (Newfoundland and Labrador) west to AK, south to s. NJ, PA, OH, IN, IL, MN, ND, WY, ID, and WA; reported by Small (1933) for further south, apparently in error. [= C, FNA, K; = E. viridi-carinatum – F, G, orthographic variant]
Cyperaceae

3 Plants diminutive annuals, the culms 1-6 (-15) cm tall.
4 Achene cylindrical, 2-4× as long as wide, curved like a tiny banana; inflorescence bracts 1-2 cm long. F. perpusilla
5 Plants small to large annuals or perennials, the culms 6(+) 15-150 cm tall.
6 Achene obovate, 1-1.5× as long as wide, not curved; inflorescence bracts 4-10 cm long. F. vahlii

7 Plants to medium-sized or robust perennial, the culms generally 5-15 dm tall, either cespitose, with a hardened base, and deeply set in the substrate, or rhizomatous, the rhizomes either slender or thick
8 Plant cespitose, lacking rhizomes; bases of leaves hard, leathery, dark brown, deeply set in the substrate, the base of the plant generally 5-15 cm below the ground surface; achene (1.3-) 1.5-2 mm long. F. castanea
9 Plant rhizomatous, the rhizomes either thick and knotty or slender and scaly (rarely with both); bases of leaves often somewhat thickened, hardened, and brownish, the base of the plant not especially deeply set; achene 0.8-1.2 (-1.3) mm long.
10 Plant a robust perennial to 15 (-20) dm tall, with elongate, slender, scaly, pale-to-reddish rhizomes (excavate carefully); leaves usually flat or keeled, 2-5 mm wide; stem usually flattened and scabrous-edged above; ligule a line of short, pale hairs. F. caroliniana
11 Plant a medium-sized perennial to 10 dm tall, rhizomatous, the rhizomes short, thick, and knotty (rarely also with slender rhizomes); leaves usually involute, ca. 1 mm wide; stem usually terete or oval in cross-section, smooth; ligule absent or poorly developed. F. puberula
12 Plant small to medium-sized annual or perennial, the culms to 8 dm tall, neither rhizomatous (except F. breviginata) nor with a hardened base deeply set in the substrate.
13 Spikelets pale, usually solitary (-3) on the scape (and thus appearing somewhat like an Eleocharis). F. schoenoides
14 Spikelets dark, usually in a compact inflorescence. F. tomentosa
15 Face (one side) of the achene with 15 or more longitudinal rows of rounded pits, the achene margin noticeably paler. F. dichotoma
16 Face (one side) of the achene with 13 or fewer longitudinal rows of rectangular pits, the achene margin not noticeably paler.
17 Plant a perennial; leaves spreading, 2-5 mm wide; achenes lacking warts. F. dichotoma
18 Plant a perennial; leaves spreading, 1-4 mm wide; achenes with or without warts. F. annua
19 Achenes with a few low warts on the edges; primary rays of umbel spreading or ascending, the inflorescence generally longer than broad; leaves relatively soft. F. decipiens
20 Achenes lacking warts or with warts scattered over the entire surface; primary rays of umbel spreading or ascending, the inflorescence therefore often as broad as long or broader; leaves relatively hard, broad (averaging 2 mm wide), and spreading subdistichously. F. annua

3. *Fimbristylis annua* (Allioni) Roemer & J.A. Schultes. Wet, disturbed areas, thin soils of rock outcrops; variously interpreted as entirely alien or partly native. July-September. SE. PA, WV, s. IN, s. IL, MO, e. KS, south to n. peninsular FL, s. TX, s. AZ, and south through Mexico to Central and South America; West Indies; Eurasia, Africa, etc. [= C, FNA, G, GW, K, W, Z; F. dichotoma – RAB; F. baldwiniana (J.A. Schultes) Torrey – F, S]

3. *Fimbristylis autumnalis* (Linnaeus) Roemer & J.A. Schultes. Moist to wet disturbed areas. June-October. ME west to MN and SD and south to s. FL and TX; New World tropics. [= RAB, C, FNA, G, GW, K, W, Z; > F. autumnalis var. autumnalis – F, S; > F. autumnalis var. macrorhiza (Michaux) Fernald – F, W; > F. autumnalis var. galdens (Nees) Kunth – s]

3. *Fimbristylis caroliniana* (Lamarck) Fernald. Brackish or alkaline sands of marsh edges and dune swales, less typically in savannas or pine flatwoods. July-September. NJ south to s. FL and west and south to TX and the Yucatan Peninsula; West Indies. This species often grows in proximity to *F. castanea*, which, however, occupies the brackish marsh itself. [= C, FNA, G, GW, K, W, Z; < F. spadicea (Linnaeus) Vahl – RAB; > F. harperi Britton ex Smillie – S]

3. *Fimbristylis castanea* (Michaux) Vahl. Brackish marshes and dune swales. July-September. NY (Long Island) south to s. TX and adjacent Mexico; Yucatan peninsula; West Indies. Replaced in most of the New World tropics by the related *F. spadicea*. [= C, F, FNA, G, GW, K, S, Z; < F. spadicea (Linnaeus) Vahl – RAB]

3. *Fimbristylis decipiens* Kral. Wet, disturbed areas. July-September. E. NC south to n. FL and west to e. TX. [= FNA, GW, K, Z]

* *Fimbristylis dichotoma* (Linnaeus) Vahl. Wet, disturbed areas; presumably introduced, probably native of Asia. July-September. The species is now pantropical and subtropical. [= FNA, GW, K, Z; < F. dichotoma – RAB (also see *F. annua* and *F. tomentosa*); F. diphylla (Retzius) Vahl – S]

* *Fimbristylis littoralis* Gaudichaud. Disturbed wet ground; native of Asia. July-September. Kral (1971) suggests that it may have been introduced into se. United States early, in association with rice. In North America, now ranging from Central America and the West Indies north to NC, KY, and AR. The name *F. miliacea* has been rejected as a nomen ambiguum (Brummitt 2005). [= K; = F. miliacea (Linnaeus) Vahl – RAB, C, FNA, GW, S, W, Z, misapplied?]

* *Fimbristylis perpusilla* R.M. Harper ex Small & Britton, Harper's Fimbry. Drawdown zones of natural depression ponds or exposed banks of blackwater rivers. July-September. The "range" consists of geographically scattered and "irregularly apparent"
populations, usually on the drawdown zones of natural ponds or rivers, in the Coastal Plain from DE and e. MD south through e. VA, se. NC, and ne. SC, to sw. GA, disjunct in the Cumberbland Plateau of se. TN (Wofford & Jones 1988) and KY (Boone & Chester 2009). See Leonard (1981a, 1981b, 1987) for the first reports of the species in SC and NC. The species characteristically occurs on dry to moist banks exposed in summer by falling water levels, often with other diminutive annuals, such as Hemicharpa micrantha, Oldenlandia uniflora, Juncus repens, Lindernia dubia, Eleocharis baldwinii, and Eragrostis hypnoides. At known locations it does not appear every year; presumably it is present in a seedbank which germinates only under favorable hydrologic (and other?) conditions. [= C, FNA, GW, K, S, Z]

_Fimbristylis puberula_ (Michaux) Vahl var. _puberula_. Savannas, pine flatwoods, bogs, wet meadows or prairie-like areas, granite outcrops. July-September. Var. _puberula_ ranges from Long Island, NY south to s. FL and west to TX, KS, and NE; var. _interior_ (Britton) Kral ranges from NE south to TX and west to NM and AZ. [= C, FNA, K, Z; < _F. spadicea_ (Linnaeus) Vahl – GW, W; ? _F. drummondii_ (Torrey & Hooker) Böckler – F; > _F. puberula_ – GW, S; > _F. anomala_ Böckler – S)

* _Fimbristylis schoenoides_ (Retzius) Vahl. Disturbed wetlands; native of Asia. Reported for sw. GA (Jones & Coile 1988) and also occurs in se. GA (B. Sorrie, pers. comm.). Also recently reported for Ocracoke Island, Hyde County (Sorrie & LeBlond 2008). [= FNA, GW, K]

1 Sheaths of leaves glabrous, the largest leaf blades 0-2 (-5) cm long; plant strongly rhizomatous, the culms usually about 10 cm apart. 
2 Blades of culm leaves <5 cm long; spikelets mostly lance-ovoid, sessile in terminal clusters and also often with additional sessile or peduncled clusters lower on the culm; involucral bract longer than the spikelets. _F. pumila_ (Torrey) Sprengel, Dwarf Umbrella-sedge. Depression ponds, savannas, ditches, other wet habitats. July-September. Ranging north to NC, e. TN, and AR. [= FNA, GW, K; < _F. dichotoma_ – RAB]

* _Fimbristylis vahlii_ (Lamarck) Link. On exposed silty or clayey sediments. July. Primarily from MO south to MS and e. TX, but with scattered outliers as far away as NJ, SC (?), IL, and KS; also in western United States, Mexico, Central America. Note that the basis of the SC record is uncertain, and may be based on a misidentification of _F. perpusilla_. [= RAB, C, F, FNA, G, GW, K, S, Z]

_Fuirena_ Rottbøll (Umbrella-sedge)

1 Sheaths of leaves sparsely to densely hirsute, the largest leaf blades 10-15 cm long; plant more-or-less cespitose, annual or perennial, if perennial the rhizomes short and cornlike, the culms usually arising together.
2 Perianth bristles no longer than the achene stipe (not nearly reaching halfway up the achene body), without barbs (sometimes very finely toothed, the teeth ascending); blades of the perianth scales with a blunt or short-apiculate apex. _F. breviseta_ (Coville) Coville, Chapman's Umbrella-sedge. Pond margins. Panhandle FL and sw. GA west to e. TX. Possibly a hybrid derivative of _F. breviseta_ and _F. scirpoidea_. [= FNA, GW, K, S, Z]

_Fuirena breviseta_ (Coville) Coville in R.M. Harper, Short-bristled Umbrella-sedge. July-October. Carolina bays, savannas, ditches, other wet habitats. A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX, primarily in the outer Coastal Plain. [= C, F, FNA, G, GW, K, S; < _F. squarrosa_ – RAB]

_Fuirena longa_ Chapman, Chapman's Umbrella-sedge. Pond margins. Panhandle FL and sw. GA west to e. TX. Possibly a hybrid derivative of _F. breviseta_ and _F. scirpoidea_. [= FNA, GW, K, S, Z]

_Fuirena pumila_ (Torrey) Sprengel, Dwarf Umbrella-sedge. Depression ponds, savannas, ditches, other wet habitats. July-October. Primarily a species of the Southeastern Coastal Plain, ranging from se. MA south to s. FL and west to TX, and also disjunct in the lowlands around the Great Lakes (as in n. IN and s. MI). [= RAB, C, F, FNA, G, GW, K, Z; = _F. squarrosa_ – S, misapplied]
**Fuirena scirpoidea** Michaux, Southern Umbrella-sedge. Natural lakes, pineland depression ponds, wet savannas. July-October. A Southeastern Coastal Plain endemic: se. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009) and FL, west to se. TX, also in Cuba and apparently disjunct (or introduced?) in ne. NC and s. IL. Kral's (1978a) report of this species from ne. NC, where disjunct from the main body of the range in the deep South, needs further investigation. [= C, FNA, G, GW, K, S, Z]

**Fuirena simplex** Vahl var. *aristulata* (Torrey) Kral. Moist open areas. July-October. MO and NE south to w. KY, e. LA, and c. TX. [= FNA, K, Z; < *F. simplex* – GW]

**Fuirena squarrosa** Michaux, Hairy Umbrella-sedge. Savannas, seepages, streamhead pocosins, ditches, bogs, other wet habitats. July-October. NY (Long Island) south to n. FL, west to c. TX, inland to w. NC, w. TN, KY, s. AR, and se. OK, mainly on the Coastal Plain, but less strictly limited to it than our other species. [= C, F, FNA, G, GW, K, W, Z; < *F. squarrosa* – RAB; = *F. hispida* Elliott – S]

**Isolepis** R. Brown (Club-rush)

A genus of about 60 species, herbs, subcosmopolitan in distribution. Since *Isolepis* is more closely related to *Cyperus* than to *Scirpus*, in which it has often been included, its separation from *Scirpus* is clearly warranted. The generic delimitation of *Isolepis* in relation to *Ficinia* and *Scirpoides* is uncertain. References: Smith in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 Achenes 1.0-1.5 mm long; scales in middle of spikelet 1.8-2.0 mm long, with a short awn ................................................................. 1. carinata
1 Achenes 0.7-0.9 mm long; scales in middle of spikelet 1.0-1.2 mm long, mucronate ................................................................. 1. pseudosetacea

**Isolepis carinata** Hooker & Arnott ex Torrey. Moist soils adjacent to granitic flatrocks, seepage areas, ephemeral pools, moist sandy sites, low fields, ditches. May-June. C. NC, TN, and se. KS south to Panhandle FL and c. TX; also in CA. [= FNA, K; = *Scirpus koilolepis* (Steudel) Gleason – RAB, C, F, G, GW, WH; = *S. carinatus* (Hooker & Arnott ex Torrey) A. Gray – S (not *S. carinatus* Sm.); = *I. koilolepis* Steudel]

**Isolepis pseudosetacea** (Daveau) Gandoger. Altamaha grit outcrops, moist soils. E. GA (Carter, Baker, & Morris 2009) west to sw. MO, AR, and c. TX. This species often grows intermixed with *I. carinata* and may be more widespread in our area. [= FNA; ? *Isolepis molesta* (M.C. Johnston) S.G. Smith – K; ? *Scirpus molestus* M.C. Johnston]

**Isolepis setacea** (Linnaeus) R. Brown. On waste and ballast at Camden, NJ and Philadelphia, PA in the 1800s. [= FNA, K] {not keyed or mapped}

**Kyllinga** Rottbøll (Greenhead Sedge)

1 Scale keel winged, laciniate; anthers ca. 2 mm long ................................................................. **K. squamulata**
1 Scale keel smooth or denticulate; anthers 0.2-1.1 mm long.

2 Plant a rhizomatous perennial, mat-forming, the culms arising singly along the rhizome; anthers 0.8-1.1 mm long.  
3 Achenes 1.0-1.2 (-1.3) mm long; scale keel denticulate or smooth; stamen 2 (rarely 1); longest inflorescence bract erect .......... **K. brevifolia**
3 Achenes 1.5-1.8 mm long; scale keel smooth; stamens 2-3; longest inflorescence bract horizontal to slightly reflexed .......... **K. gracillima**

2 Plant a cespitose annual or perennial, the culms arising clumped; anthers 0.2-0.5 mm long.

4 Mature achene purple black, with stipe and apiculus contrasting light in color; achene obovate, 0.7-0.8 (-0.9) mm wide; scale keel denticulate or smooth .............................................................................................................. **K. odorata**
4 Mature achene uniformly tan or light brown, not bicolor; achene oblong, 0.4-0.6 (-0.7) mm wide; scale keel denticulate (very rarely smooth) ................................................................................................................................. **K. pumila**

**Kyllinga gracillima** Miquel, Asiatic Greenhead Sedge. River sand bars, tidal marshes, tidal shores, moist soils of pastures and ditches; apparently introduced and native of e. Asia. See Bryson et al. (1996). *K. gracillima* Miquel (1866) appears to be the oldest valid combination in the genus *Kyllinga*, predating *K. brevifolioides* (Thieret & Delahoussaye) Tucker. Its distribution in North America is still somewhat obscure (because of confusion with *C. brevifolia*), but it is currently known from scattered locations in NC, SC, VA, CT, PA, MD, TN, AL, GA, NJ, DE, AR, MS, and KY. Reported for SC by Hill & Horn (1997), as *K. brevifolioides*.

1 Spikes 2.5-10 (-12) mm long; anther ca. 0.5 mm long; stigmas 3................................................................. *L. maculata*

1 Spikes 2-5 (-8) mm long; anther 0.1-0.25 mm long; stigmas 2.

2 Culms 7-35 cm long; longest involucral bract spreading to reflexed; achenes 3.5-5× as long as wide........................................ *L. microcephala*

2 Culms 1-20 cm long; longest involucral bract more or less erect; achenes 1.5-2.5× as long as wide.

3 Scales about as long as the achene, with long awns.............................. *L. aristulata*

3 Scales reduced, shorter than the achene, awnless........................................ *L. micrantha*

**Lipocarpha R. Brown**

**Oxycaryum Nees**

**Cyperaceae**

*Rhyzchospora* Vahl 1805 (Beaksedge, Beakrush)

(by Richard J. LeBlond)

**Identification notes:** Measurements and descriptions of the achene are of the achene body only, not including the tubercle, unless otherwise indicated.

---

### Key to groups

1. Spikelets 2-4 mm long, borne several to many in clusters, none of the spikelets on slender stalks; achene 1.3-2.2 mm long, 0.9-1.7 mm wide

   2. Inflorescence bracts several, foliaceous, basally bright white, reflexed to horizontally spreading; [subgenus Diplstylae; section Polycestae, section Longirostres and Polycephalae]

   3. Spikelets in 1-4 globose clusters; tubercle 3-5 mm long; leaf blades 2-8 mm wide; [section Polycestae] ................................................................. R. tracyi

   4. Spikelets in > 4 paniculate or corymbose clusters; tuberol 10-23 mm long; leaf blades 6-20 mm wide; [section Longirostres].

   2. Longest bristles shorter than the achene.

   3. Achene 5.0-6.0 mm long, 2.8-3.3 mm wide ................................................................. R. corniculata var. corniculata

   4. Achene 4.5-5.3 mm long, 2.4-2.8 mm wide ................................................................. R. corniculata var. interior

   5. Longest bristles longer than or equaling the achene.

   4. Plants cespitose; primary clusters with 10-50 (rarely 7 or fewer) densely clustered spikelets; achene (4.5- 5-6 mm long ................. R. macrostachya

   5. Plants rhizomatous; primary clusters with 1-6 loosely clustered spikelets; achene (3.5-) 4.0-4.8 mm long.

   6. Bristles 2-8 mm long, the central bristle longest on one face, shortest or absent on the other........................................ R. careyana

   7. Bristles 7-12 mm long, essentially of equal length.................................................. R. inundata

### Key B - beaksedges with basally-white bracts (White-bracted Sedges) [subgenus Diplstylae; section Diplostylae; section Dichromena]

1. Inflorescence bracts 3-6 (-7); basal bract (1.4-) 2-5 mm wide, the white portion (2.5-) 9-25 mm long, tapering gradually into the green portion; rhizomes slender, straight, (0.6-) 0.7-1.7 (-2.1) mm in diameter; achene 1.0-1.2 mm wide; tubercle broadly truncate on achene........... R. colorata

   1. Spikelets 2-10 mm long, borne several to many in clusters, none of the spikelets on slender stalks; achene 1.3-2.2 mm long, 0.9-1.7 mm wide

   2. Leaves 2-4 mm wide, slightly involute (V-shaped in ×-section); achene 2.0-2.2 mm long; [FL only] ........................................ R. pinetica

   3. Leaves 0.8-1.5 mm wide, strongly involute (and often appearing superficially terete); achene 1.3-1.8 mm long; [more widespread] ............ R. plumosa
Key D - beaksedges with bristles retrorsely barbed (at least distally) or antrorsely barbed and straplike (flattened) [subgenus Diplistylole; section Albae]

1 Bristles 8-25, retrorsely barbed distally, antrorsely barbed proximally; spikelets white, turning tan with age.  
2 Spikelets with 2-3 florets; bristles 6-12; achene 1.6-2.1 mm long, 0.9-1.3 mm wide. ............................................................... R. alba
3 Spikelets 1-fruited, the solitary achene terminating the axis; clusters 1-7, globose to turbinate.  
4 Clusters globose to turbinate; achene (measured from base of bristles) 1.3-1.8 mm long, 0.65-0.95 mm wide; tubercle 0.7-1.6 mm long.  
5 Clusters turbinate to hemispheric (rarely subglobose), the lowest spikelets usually spreading-ascending to spreading; larger leaves < 2 mm wide; achene 1.6-1.8 mm long; tubule 1.0-1.6 mm long. ................................................................. R. chalarocephala
6 Clusters globose to subhemispheric, the lowest spikelets usually reflexed; larger leaves > 2 mm wide; achene 1.3-1.6 mm long; tubercle 0.7-1.2 mm long. ................................................................. R. microcephala
7 Clusters globose to hemispherical; achene (measured from base of bristles) 1.8-2.6 mm long, 1.1-1.8 mm wide; tubercle 1.4-2.4 mm long.  
8 Achene 1.1-1.2 mm wide, 1.8 mm long. ........................................................................ R. cephalantha var. attenuata
9 Achene 1.2-1.8 mm wide, 2.1-2.6 mm long. ........................................................................ R. cephalantha var. cephalantha

Key E - beaksedges with bristles smooth, or antrorsely barbed and filiform, or absent, the achene surface smooth, minutely pitted, or finely striate  [subgenus Diplistylole; sections Chapmaniae, Fasciculares, and Fuscae]

1 Bristles 12; [section Fasciculares] ...................................................................................... R. baldwinii
2 Bristles 6 or fewer.  
3 Leaves with a short taper at the tip, blunt to acute, but not long-acuminate; achene surface minutely pitted near the margin; [section Chapmaniae].  
4 Basal leaves 4-6 mm wide, ciliate, rosulate; scales acuminate, the midrib ciliate; bristles 6, < ½ the length of the achene ........ R. ciliaris
5 Largest basal leaves 2.5-3 mm wide, ciliate, not rosulate; scales aristate, the midrib eciliate; bristles 3-4, 1 or more equaling or exceeding the tubercle ........................................................................ R. solitaria
6 Leaves long-acuminate at the tip; achene surface smooth or finely striate.  
7 Bristles absent or 1-3 rudimentary; scales white to pale tan (or pale reddish-brown in R. brachychaeta); [section Chapmaniae].  
8 Inflorescence composed of (1-) 2-3 tubinate to ellipsoid clusters; spikelets pale reddish-brown, (2.7-) 3-3.5 mm long; achenes usually 2 per spikelet. ........................................................................................... R. brachychaeta
9 Inflorescence composed of 1 (-2) hemisphaerically to broadly turbinate cluster(s); spikelets white to pale brown, either 2-2.5 (-3) mm or (3.5-) 4-5.5 mm long; achenes 1 per spikelet.  
10 Base of plant not bulb-like, not enclosed in bladeless sheaths; spikelets 2-2.5 (-3) mm long; achene 1.0-1.2 mm long, 0.8-1.0 mm wide ................................................................. R. chapmanii
11 Base of plant bulb-like, enclosed in bladeless sheaths; spikelets (3.5-) 4-5.5 mm long; achene 1.4-1.8 mm long, 1.2-1.5 mm wide ................................................................. R. pallida

4 Bristles present (if rudimentary, then 4-6); scales tan, rufous, or brown.  
5 Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (smooth in R. species 1).  
6 Inflorescence of 1 (-2) hemisphaerically to broadly turbinate cluster(s); spikelets white to pale brown, either 2-2.5 (-3) mm or (3.5-) 4-5.5 mm long; achenes 1 per spikelet.  
7 Achene narrowly elliptic or narrowly obovoid, 1.2-1.5 mm long by 0.6-0.7 mm wide, twice as long as wide; tubercle 0.8-1.2 mm long. ........................................................................................... R. curtissii
8 Achene broadly elliptic to obovoid or pyriform, < 2½ as long as wide; tubercle 0.4-1.5 mm long.  
9 Leaves 2-4 (-5) mm wide; stipe subtending achene 0.5-1.0 mm long ................................................................. R. crinitiss
10 Leaves 0.2-1.5 (-2) mm wide; stipe subtending achene < 0.4 mm long.  
11 Leaves to 1.5 (-2) mm wide; achene 1.0-1.7 mm long, 0.9-1.1 mm wide; tubercle 0.5-1.5 mm long.  
12 Culms solitary to loosely cespitose by slender rhizomes; terminal internode straight; clusters turbinate to ovoid; achene 1.0-1.3 mm long, uniformly medium to dark brown; tubercle 0.7-1.5 mm long; bristles usually of two lengths, some equaling the tubercle, and some equaling or shorter than the achene. ................................................................. R. fusca
13 Culms solitary to cespitose, without slender rhizomes; terminal internode often arched; clusters corymbose to hemispheric; achene 1.3-1.7 mm long, pale to reddish-brown, often translucent centrally, with a distinctly thickened wire-like margin; tubercle 0.5-1.0 mm long; all bristles more-or-less equaling the tubercle ................................................ R. harperi
11 Leaves filiform, <1 mm wide; achene 0.8-1.3 mm long, 0.6-0.9 mm wide; tubercle 0.4-0.8 mm long.
13 Culms without rhizomes; spikelets 2.5-4 mm long; achene translucent centrally; tubercle 0.4-0.6 mm long...R. filifolia
13 Culms with delicate rhizomes; spikelets 5-7 mm long; achene uniformly opaque; tubercle 0.6-0.8 mm long......R. pleiantha
6 Achene > 1 mm wide (except 0.8 mm wide in R. fernaldii with a blackish surface), suborbicular or broadly ellipsoid; tubercle margin smooth or roughened but not setose; [section Fasciculares].
14 Achene 0.8 mm wide, 0.9-1.0 mm long, blackish..................................................R. fernaldii
14 Achene 1.1-1.7 mm wide, 1.3-2.0 mm long, brown to dark brown.
15 Tubercle 1.0-2.6 mm long, long-attenuate to subulate..............................................R. gracilenta
15 Tubercle 0.2-0.8 mm long, triangular to triangular-attenuate or with a strap-like beak.
16 Bristles rudimentary to ½ as long as the achene body.
17 Larger leaves to 4.5 mm long; floral fascicles 1-2; tubercle 0.2-0.5 mm long......R. debilis
17 Larger leaves 2-4 mm wide; mature culms to 13 dm long; floral fascicles (1-2) 2-4; tubercle 0.4-0.7 mm long..............R. fascicularis
6 Bristles > ½ as long to exceeding the achene body.
18 Basal leaves filiform to (rarely) 1.3 mm wide, the longer approaching length of culm; tubecele narrowed above the base into a strap-like beak.................................................................R. wrightiana
18 Basal leaves 1.3-4 mm wide, all much shorter than the culm; tubecele triangular to triangular-attenuate.
19 Longer bristles equaling to exceeding the achene body; achene body elliptic, 1.1-1.3 mm wide; tubecele triangular-attenuate; larger basal leaves 1.3-2.5 mm wide....................................................R. distans
19 Longer bristles < ½ as long to rarely exceeding achene body; achene suborbicular, 1.2-1.5 mm wide; tubecele triangular; larger basal leaves 2-4 mm wide..............................................................R. fascicularis

Key F – beaksedges with bristles smooth, or antrorsely barbed and filiform, or absent,
the achene surface transversely ridged, rugose, or honeycombed-reticulate
[subgenus Diplolystylae; sections Globulares, Harveyae, Mixtae, Psilocarya, Pusillae, Rariflorae]

1 Brusters absent (or apparently so at 10x); achene 0.5-0.7 mm wide; tubecele 0.1-0.2 mm long, skull-cap like; [section Pusillae].
2 Achene including tubecele 1.0-1.2 mm long, the achene surface evidently reticulate and obscurely transversely ridged, the body ellipsoid;
bristers present, white, barely visible at 20x, the longest shorter than the achene body ........................................R. thorpei
2 Achene including tubecele 0.6-0.9 mm long, the body obovoid; bristers absent.
3 Achene surface smooth, faintly reticulate, not transversely ridged...............................................................R. divergens
3 Achene surface rough, distinctly transversely ridge..........................................................R. pusilla
1 Bristers present or absent; if absent, then the achene > 1 mm long or > 0.7 mm wide, and tubecele triangular to subulate.
4 Culms and leaves filiform.
5 Achene including tubecele 1.0-1.2 mm long; tubecele minute, skull-cap-like; [section Pusillae]............................R. thorpei
5 Achene including tubecele 1.5-2.9 mm long; tubecele triangular to triangular-acuminate; [section Rariflorae].
6 Brusters subequaling to exceeding the tubecele; tubecele 0.75-1.4 mm long.........................................................R. stenophylla
6 Brusters shorter than the achene body; tubecele 0.3-1.0 mm long.
7 Achene 1.3-1.6 mm long, 0.9-1.4 mm wide; tubecele 0.3-0.6 (-0.75) mm long; bristers 1-3/2/4-5/ as long as achene body...........R. rariflora
7 Achene 1.6-1.8 mm long, 1.35-1.5 mm wide; tubecele 0.6-1.0 mm long; bristers 2/3 to nearly as long as achene body.............R. species 2
4 Culms stouter; leaves wider, not filiform.
8 Achene faces flat or concave; when one face is concave, the opposite face is sometimes slightly convex (slightly biconvex R. decurrens
and R. microcarpa are keyed here for convenience).
9 Achene at least twice as long as wide, elliptic-oblong; tubecele subulate, 0.8-1.2 mm long; [section Mixtae]..............R. inexpansa
9 Achene < twice as long as wide, obovate; tubecele triangular, 0.2-0.9 mm long.
10 Longer bristers exceeding the achene body.
11 Achene ±2.2 mm long, ±1.8 mm wide; tubecele ±0.9 mm long; [section Globulares].............................................R. punctata
11 Achene 0.8-1.2 mm long, 0.7-1.2 mm wide; tubecele 0.2-0.5 mm long; [section Mixtae].
12 Larger leaves (3-) 4-6 mm wide; bristers exceeding tubecele; achene faces flattened..............................R. elliottii
12 Larger leaves 1-3 (-4) mm wide, bristers half as long as achene to equaling tubecele; achene faces slightly convex........R. microcarpa
10 Longer bristers shorter than to equaling achene body, or absent.
13 Larger leaves 4-5 mm wide; achene 1.4-1.6 mm wide; tubecele 0.6-0.8 mm long, abruptly rising from a flaring basal collar;
[section Globulares]..................................................................................................................R. compressa
13 Larger leaves 1-3 (-4) mm wide; achene 0.7-1.3 mm wide; tubecele 0.15-0.5 mm long, without a flaring basal collar; [section Mixtae].
14 Bristers rudimentary or absent..........................................................R. perplexa
14 Bristers one-half as long to equaling achene.
15 Achene 1.3-1.8 mm long, 0.9-1.2 mm wide, the faces flat with 10-12 transverse ridges.................................R. torreyana
15 Achene 0.8-1.4 mm long, 0.7-1.2 mm wide, the faces slightly biconvex with 6-12 transverse ridges.
16 Clusters elongate; achene 1.0-1.4 mm long, 0.8-1.0 mm wide, narrowly obovate to elliptic, averaging 8-12 transverse
ridges; most tubercle bases convexly seated on the achene summit and somewhat decurrent along the achene margins,
the tubercle surface often whitish-waxy........................................R. decurrens
16 Clusters usually compact; achene 0.8-1.2 mm long, 0.7-1.2 mm wide, suborbicular to elliptic, averaging 6-7 transverse
ridges; most tubercle bases flat across the achene summit, not decurrent, the tubercle surface usually dark, not waxy......R. microcarpa

8 Achenes biconvex or tumid.
17 Achene 1.4-4.2 mm long, 1.2-3.6 mm wide, the summit with a thickened bony to crustaceous rim surrounding the base of the
tubecele; [section Harveyae].
18 Achene lenticular and transversely ridge, ±1.4 mm long, ±1.2 mm wide

19 Leaves 4-8 mm wide; achene 3.0-4.2 mm long, 3.0-3.6 mm wide

19 Leaves 2-4 mm wide; achene < 2.7 mm long and < 2.5 mm wide

20 Achene 2.0-2.7 mm long, 2.0-2.5 mm wide

20 Achene 1.5-1.8 mm long, 1.4-1.7 mm wide

17 Achene 0.7-1.8 mm long, 0.7-1.5 mm wide, the summit without a textured rim surrounding the base of the tubercle (if the base of the tubercle is rim-like, then it is distinguished from the summit of the achene by a constriction or articulation).

21 Bristles absent; achene 0.7-1.0 mm long; [section Psilocarya].

22 Scales broadly ovate, obtuse to sub-acute; achene strongly transversely ridged; tubercle depressed, broader than long; style not persistent

22 Scales lance-ovate, acute; achene weakly transversely ridged; tubercle triangular-lanceolate, as long as broad or longer; style usually persistent

21 Bristles present (occasionally detached in R. decurrens and R. milacea with achenes 1.0-1.4 mm long).

21 Bristles not exceeding the achene body.

24 Cluster branches flexuose; bristles one-half as long as the equaling the achene (or longer in R. microcarpa); achene slightly biconvex, 0.8-1.4 mm long, 0.7-1.0 (-1.2) mm wide; [section Mixtue].

25 Clusters elongate; achene narrowly obovate to elliptic, averaging 8-12 transversed ridges; most tubercle bases convexly seated on the achene summit and somewhat decurrent along the achene margins, the tubercle surface often whitish-waxy.

25 Clusters usually compact; achene suborbicular to elliptic, averaging 6-7 transversive ridges; most tubercle bases flat across the achene summit, not decurrent, the tubercle surface usually dark, not waxy

21 Bristles exceeding the achene body.

24 Cluster branches stiff; bristles ⅔ or less as long as the equaling the achene (or longer in R. microcarpa); achene slightly biconvex, 1.0-1.6 mm wide; tubercle conical-attenuate, the edges somewhat concave; [section Globulares].

26 Larger culm leaves to 5 mm wide; achenes (1.2-)avg. 1.45 (-1.85) mm long, (1.1-) avg. 1.4 (-1.75) mm wide; achene surface alveoli longitudinally narrow; tubercle 0.3-0.7 mm long, base 0.6-1.0 mm wide

26 Larger culm leaves to 3 mm wide; achenes (1.0-)avg. 1.3 (-1.5) mm long and wide; if achene surface alveoli longitudinally narrow, then tubercle 0.2-0.4 mm long and base 0.5-0.7 mm wide (R. globularis).

27 Longer bristles ⅔-⅓× the length of the achene; achene surface alveoli longitudinally narrow (typically 0.02-0.05 mm wide between the longitudinal walls), the latitudinal walls raised into horizontal ridges; tubercle 0.2-0.4 mm long, the base 0.5-0.7 mm wide

27 Longer bristles ½-⅓× the length of the achene; achene surface alveoli nearly as wide as long (typically 0.05-0.1 mm wide between the longitudinal walls); the latitudinal walls obscurely or not at all raised into horizontal ridges; tubercle 0.35-0.7 mm long, the base 0.7-0.9 mm wide

28 Primary branches of the inflorescence spreading at right angles from the culm, each spikelet or small cluster on slender spreading or reflexed stalks; [section Mixtue].

29 Spikelets 6-9 mm long; [section Mixtue]

29 Spikelets < 5 mm long.

30 Tubercle 0.4-0.8 mm long, the edges setose or uneven with waxy or crusty irregular protuberances; [section Mixtue].

31 Achene obovate to suborbicular, 1.2-1.6 mm wide, latitudinal alveoli walls strongly raised into transverse ridges

31 Achene slenderly obovoid, 0.8-1.0 mm wide, latitudinal alveoli walls weakly or not at all raised into transverse ridges

30 Tubercle 0.2-0.5 mm long, the edges smooth.

32 Spikelets 3.5-4 mm long; bristles exceeding the tubercle; achene 1.3-1.5 mm long, 1.2-1.3 mm wide; [section Globulares]

32 Spikelets 2.5-3 mm long; longer bristles about equaling the tubercle; achene 0.8-1.2 mm long, 0.7-1.2 mm wide; [section Mixtue].

33 Inflorescence occupying the upper ⅓-⅔ of the culm, the lowest 2-4 nodes barren

33 Inflorescence occupying ⅔-⅔ of the length of the culm, the lowest pair of nodes above the base

Rynchospora alba (Linnaeus) Vahl, Northern White Beaksedge. Mountain bogs and fens, peaty situations in the Coastal Plain, such as low pocosins in peat domes or large Carolina bays, and floating peat mats in limesink (doline) ponds and bay lakes, possibly also in seepage bogs with abundant Sphagnum, generally occurring in the most open, harshest, and peatiest areas. July-October. Circumboreal, in North America from NL (Labrador) west to AK, south to SC, TN, IL, SK, ID, and CA; disjunct in se. GA (Charlton Co., at the Okefenokee Swamp) (Williges & Loftin 1995), s. AL (Escambia Co.; specimen at CLEMS), and the mountains of Puerto Rico. [= C, F, FNA, G, GW, K, RAB, W, WV, Y, Z = Rynchospora alba – S]

Rynchospora baldwinii A. Gray, Baldwin's Beaksedge. Wet savannas, seepages. July-August. Se. NC south to s. FL and west to LA. [= C, FNA, K, GW, RAB, WH, Y, Z = Rynchospora baldwinii – S]

Rynchospora brachychaeta C. Wright. Cypress ponds, other depressions. E. SC south to Panhandle FL and s. AL and s. MS; Cuba. Reported for SC (McMillan 2007). Kral in FNA considers this species possibly adventive, but McMillan (2007) provides good reasons for considering it native in our area. [= FNA, K, Y, Z = Rynchospora brachychaeta – S] [not yet keyed]

Rynchospora caduca Elliott, Angle-stem Beaksedge. Savannas, hardwood swamps, other wet areas. July-September. E. and c. VA south to s. FL and west to TX, OK, and AR, north in the interior to sc. TN. This species is found at a few sites in the mountains of GA. See notes under R. milacea. [= C, F, FNA, G, GW, K, RAB, W, WH, Y, Z = Rynchospora caduca – S; > Rynchospora pattula A. Gray – S]

Rynchospora capillacea Torrey. Calcareous wetlands. NL (Newfoundland) west to SK, south to sw. VA, ne. TN, and n. AR. [= C, F, FNA, G, K, Y, Z]
Rhynchospora capitellata (Michaux) Vahl, Brownish Beaksedge. Bogs and fens, seepages, and wet rock outcrops in the Mountains and upper Piedmont, also in wet habitats in the Coastal Plain of ne. NC and e. VA. July-September. Widespread in e. North America, south to ne. GA. The only common beaksedge in the Mountains of our area. A somewhat similar species, R. knieskernii, occurs north of our area, but should be looked for here; they are discussed at the end of this genus. Sorrie (2000) has clarified the relationships and distinctions of this taxon with R. leptocarpa. [= C, F, G, W, WV, Y; < R. capitellata – FNA, GW, K, RAB, Z; = Rhynchospora capitellata – S]

Rhynchospora careyana Fernald, Carey's Horned Beaksedge. Limesink (doline) depression ponds and in intermittently flooded depression meadows. July-September. Apparently ranging from se. NC south to FL, but the range poorly known because of confusion with R. inundata, from which it is perhaps not specifically distinct. [= FNA, K, Y; < R. inundata – RAB, WH; < R. corniculata – GW (listed in synonymy under R. corniculata in GW, but would actually key to R. inundata); = Rhynchospora careyana – S]

Rhynchospora cephalantha A. Gray var. attenuata Gale, Small Bunched Beaksedge. Savannas, sandhill seeps, openings in streamhead pocosins. July-October. The range of this variety is poorly known; is reported by Z from NC, SC, AL, and MS. Recent collections from MD and VA extend the range. See discussion in Sorrie et al. (1997). [= Y; < R. cephalantha – C, FNA, GW, K, RAB; = Rhynchospora axillaris – S]

Rhynchospora cephalantha A. Gray var. cephalantha, Common Bunched Beaksedge. Savannas. July-October. S. NJ south to s. FL and west to LA. Often weedy, this species occurs commonly along wet roadsides, powerline corridors, and the like. [= Y; < R. cephalantha – C, FNA, GW, K, RAB, WH; > R. cephalantha var. cephalantha – F, G, Z; > R. cephalantha var. pleiocephala Fernald & Gale – F, G, Z; = Rhynchospora axillaris (Lamarck) Britton – S]

Rhynchospora chapmanii M.A. Curtis, Chapman's Beaksedge. Savannas, seepage bogs, sandy margins of limesink (doline) ponds, and other wet, acid habitats. July-September. Se. NC south to s. FL and west to e. LA; Belize, Nicaragua. [= FNA, GW, K, RAB, WH, Y, Z; = Rhynchospora chapmanii – S]

Rhynchospora ciliaris (Michaux) C. Mohr, Fringed Beaksedge. Savannas, sandhill seeps. July-September. Se. NC south to s. FL and west to LA. [= FNA, GW, K, RAB, WH, Y, Z; = Rhynchospora ciliaris – S]

Rhynchospora colorata (Linnaeus) H. Pfeiffer, Narrowleaf Whitetop Sedge. Wet savannas, ditches, dune swales. May-September. Primarily a Southeastern Coastal Plain endemic: se. VA south to FL and west to TX; Mexico (Tabasco, Chiapas, Yucatán), West Indies, Belize, Guatemala, Costa Rica, Venezuela. [= C, FNA, K, WH, Y; = Dichromena colorata (Linnaeus) H. Pfeiffer – F, G, GW, RAB, S]

Rhynchospora compressa Carey ex Chapman. Savannas. S. SC south to Panhandle FL, west to e. LA. This species was reported for SC (Kartesz 1999), based on the South Carolina Plant Atlas (http://cricket.biol.sc.edu/herb); McMillan (pers. comm.) states that the record is in error, based on a misidentified specimen. The species occurs in sc. GA (Jones & Coile 1988) and has since been found in SC by McMillan (2003). [= FNA, GW, K, WH, Y, Z; = Rhynchospora compressa – S]

Rhynchospora corniculata (Lamarck) A. Gray var. corniculata, Short-bristle Horned Beaksedge. Pondcypress savannas in Carolina bays, swamp forests, other wetlands. July-September. Var. corniculata ranges from DE south to FL and west to LA, extending north into KY and MO; also in the West Indies. Var. interior, possibly not worth recognition, is distinguished by a shorter and narrower achene, the summit barely broader than the base of the tubercle, and occurs in the Mississippi drainage. [= C, F, G; < R. corniculata (Lamarck) A. Gray – FNA, GW, K, RAB, WH, Y; < Rhynchospora corniculata – S]

Rhynchospora crinipes Gale, Alabama Beaksedge. Sand-clay bars and peaty stream banks of blackwater streams. July-September. Sc. NC (Sorrie et al. 1997) through sc. GA to FL Panhandle, west to s. AL; very scattered in occurrence. This very rare species is related to R. filifolia, but is a coarser plant, readily distinguishable by characters of the achene, culm, and leaves. Anderson (1988) discusses its systematics, habitat, and rarity. [= FNA, GW, K, WH, Y, Z]

Rhynchospora curtissii Britton. Pine flatwoods and bogs. An East Gulf Coastal Plain endemic, in Panhandle FL, AL, and s. MS (Sorrie & Leonard 1999); also reported from SC by Kral (1996) and for NC and SC by Kartesz (1999), but specimens so annotated are misidentified. [= FNA, GW, K, WH, Y, Z; = Rhynchospora smallii – S]

Rhynchospora debilis Gale, Savanna Beaksedge. Savannas, sandhill seeps. July-September. Se. VA south to n. peninsular FL and west to se. TX (Brown & Marcus 1998). Like a small version of R. fascicularis, often with several ascending, cespitose culms, each terminated by a single glomerule. [= C, F, FNA, GW, K, RAB, WH, Y, Z]

Rhynchospora decurrens Chapman, Swamp-forest Beaksedge. Swamp forests and river marshes, especially along blackwater rivers. July-August. Se. NC south to c. peninsular FL and west to s. MS (Sorrie & Leonard 1999). [= FNA, GW, K, RAB, WH, Y, Z; = Rhynchospora decurrens – S]

Rhynchospora distans (Michaux) Vahl. Savannas and limesink ponds. June-September. Se. VA south to s. FL and west to s. MS (Sorrie & Leonard 1999); West Indies. Appearing to merge with R. wrightiana on the outer Coastal Plain of NC. [= Y; = Rhynchospora fascicularis (Michaux) Vahl var. distans (Michaux) Chapman – F, K, Z; < R. fascicularis – FNA, G, GW, RAB, WH; = Rhynchospora distans – S]

Rhynchospora divergens Chapman ex M.A. Curtis, White-seeded Beaksedge. Wet savannas, especially in exposed sands. May-September. Se. NC south to s. FL and west to se. TX; Bahamas, Mexico (Chiapas), Belize. R. divergens, R. pusilla, and R. thornei are all small, grass-like plants, very similar in appearance to one another. [= FNA, GW, K, RAB, WH, Y; = Rhynchospora divergens – S]

Rhynchospora elliottii A. Dietrich, Elliott's Beaksedge. Savannas, ditches, other wet habitats, often weedy. July-September. Se. NC south to c. peninsular FL and west to e. TX. The achenes are typically flat or concave on one face, and flat or slightly convex on the other. See note under R. microcarpa. [= FNA, GW, K, WH, Y; = R. schoenoides (Elliott) Wood – RAB, Z; = Rhynchospora schoenoides – S]

Rhynchospora fascicularis (Michaux) Vahl, Fascicled Beaksedge. Savannas, limesink ponds, ditches. June-September. Se. VA south to s. FL and west to se. TX; West Indies. [= Y; = Rhynchospora fascicularis (Michaux) Vahl var. fascicularis – F, K, Z; < R. fascicularis – FNA, G, GW, RAB, WH; = Rhynchospora fascicularis – S]

Rhynchospora fernaldii Gale, Fernald’s Beaksedge. Pine flatwoods. S. GA south to s. FL, west to s. MS. [= FNA, GW, K, WH, Y, Z]

Rhynchospora filifolia A. Gray, Threadleaf Beaksedge. Sandy shores of limesink (doline) depressions, especially at the lower margin, savannas. July-September. S. NJ south to c. FL and west to e. TX; Cuba, Mexico (Tabasco), Belize, Nicaragua. [= C, F, FNA, G, K, RAB, WH, Y, Z; < R. filifolia – GW; = Rhynchospora filifolia – S]

Rhynchospora galeana Naezi, W. Knapp, & Gerry Moore, Short-bristle Beaksedge. Wet savannas. July-September. Se. NC south to s. FL and west to s. MS; West Indies. This species will colonize disturbances (roadsides, powerline corridors), but not aggressively. The leaf tips of R. galeana are acute and minutely serrulate, while those of the closely related R. oligantha are blunt and smooth; these characters are, however, often difficult to determine. See Naezi, Knapp, and Moore (2010) for discussion of the need to replace the name R. breviseta because of an earlier-named Asian species. [= R. breviseta (Gale) Channell – FNA, GW, K, RAB, WH, Y (later homonym); < R. oligantha – F; < Rynchospora oligantha – S; = R. oligantha A. Gray var. breviseta Gale – Z]

Rhynchospora globularis (Chapman) Small, Globe Beaksedge. Sandy or peaty depressions, wet ditches, powerline corridors, savannas. June-September. Apparently ranges from DE south to s. FL and west to c. TX and OK; north in the interior to nc. TN; also allegedly in n. CA. Both R. globularis and R. pinetorum tend to produce shorter plants with smaller glomerules than R. recognita. Occasional achenes of R. globularis exhibit the wide alveoli of R. pinetorum near the base or summit, with little or no horizontal ridging, but centrally have narrow alveoli with pronounced horizontal ridges. The opposite condition occasionally occurs in R. pinetorum achenes, with narrow alveoli and horizontal ridging basally or at the summit, but wide alveoli and little or no ridging centrally. [= Y; < R. globularis – RAB, W; = C, F, FNA, G, K, WH, Z; < R. globularis var. globularis – GW; = Rynchospora globularis – S]
Rhynchospora glomerata (Linnaeus) Vahl var. glomerata. Clustered Beaksedge. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): savannas, bogs, other wet habitats; common (in Piedmont, rare in DE). July-September. Var. glomerata ranges from s. NJ south to ne. FL, FL Panhandle, and west to e. TX, and inland in KY, TN, AR, and KS. Var. angusta Gale occurs in AR, LA, and e. TX. It is distinguished primarily by a narrower and longer gynophore. [= Y, Z; < R. glomerata – C, F, FNA, G, GW, K, RAB, W, WH; < Rhynchospora glomerata – S]

Rhynchospora gracilenta A. Gray, Slender Beaksedge. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC, VA): savannas, bogs; uncommon (rare in Piedmont and Mountains). July-September. NJ south to ne. FL, FL Panhandle, and west to e. TX, north in the inland to nc. TN and AR; Cuba, Mexico (Chiapas), Belize, Nicaragua. [= C, F, FNA, G, GW, K, RAB, W, WH, Y, Z; = Rhynchospora gracilenta – S]

Rhynchospora harperi Small, Harper's Beaksedge. Cp (DE, FL, GA, NC, SC): peaty limesink depression ponds (dolines), from standing water to the upper margins of the pond-shore; rare. July-September. Se. NC south to sc. peninsular FL and west to s. AL and s. MS (Sorrie & Leonard 1999); disjunct in DE and MD; disjunct in Belize. See Nelson (1993) for first SC record, and LeBlond (1997) for additional information on the species, especially its distribution. [= FNA, K, WH, Y, Z; < R. filifolia – GW; = Rhynchospora harperi – S]

Rhynchospora harveyi W. Booth, Harvey’s Beaksedge. Cp (FL, GA, NC, SC, VA), Mt (GA, NC), Pd (NC): savannas in the Coastal Plain, seepage bogs in the Sandhills, bogs in the Mountains and Piedmont; rare. July-August. Se. VA south to ne. FL, FL Panhandle, and west to TX and OK, and north in the interior to nc. TN and MO. [= C, F, G, GW, K, RAB, W, Y, Z; = R. harveyi var. harveyi – FNA; = Rhynchospora harveyi – S; < R. harveyi – WH]

Rhynchospora indianolensis Small. Cp (AL): roadside ditches; rare. Coastal Plain of TX; recently also found in s. AL. Kral in FNA mentions that R. indianolensis may be conspecific with the Cuban R. scutellata. [= FNA; = Rhynchospora indianolensis; < R. scutellata Grisebach] [add to synonymy; not yet keyed]

Rhynchospora inexpansa (Michaux) Vahl, Nodding Beaksedge. Wet savannas, streamhead pocosins where frequently burned, usually in peaty situations, often weedy, colonizing disturbances. July-September. Se. VA south to ne. FL, FL Panhandle, and west to e. TX and AR; West Indies. [= C, F, FNA, G, GW, K, RAB, WH, Y, Z; = Rhynchospora inexpansa – S]

Rhynchospora inundata (Oakes) Fernald, Narrow-fruit Horned Beaksedge. In water of limesink dolines and clay-based Carolina bays; usually found in shallow water or at the lower margins of pond-shores, typically producing large colonies. July-September. Apparently ranging from e. MA south to s. FL and west to e. TX (the range, however, obscured by confusion with R. careyana) (Singhurst, Mink, & Holmes 2010). The relation of this species to R. careyana and to more northern entities of R. inundata remain unresolved. [= C, F, FNA, G, GW, K, RAB, WH; = Rhynchospora inundata – S]

Rhynchospora knieskernii Carey. Pinelands. Moist sandy/peaty swales. Endemic in NJ and DE. It has been reported, in error, from SC. [= C, F, FNA, G, K, Y, Z]

Rhynchospora latifolia (Baldwin ex Elliott) W.W. Thomas, Broadleaf Whitetop Sedge. Wet savannas. May-September. A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to se. TX; disjunct in sc. TN (Coffee County). [= FNA, K, Y; = Dichromena latifolia Baldwin ex Elliott – GW, RAB, S]

Rhynchospora leptocarpa (Chapman ex Britton) Small. Seepage bogs, pocosins, especially in openings. E. NC south to ne. FL, Panhandle FL, west to se. LA. In the Coastal Plain. It appears that R. leptocarpa is a valid species, a southeastern Coastal Plain relative of the more northern and montane R. capitellata (Sorrie 2000). Its occurrence in NC is reported by Sorrie et al. (1997). (= WH, Y; < R. capitellata – FNA, GW, K, RAB, WH, = Rhynchospora leptocarpa – S)

Rhynchospora macra (C.B. Clarke) Small, Southern White Beaksedge. Sphagnum bogs in frequently-burned streamhead pocosins, and in sandhill seepage bogs. July-September. Sc. NC south to ne. FL, FL Panhandle, and west to se. TX; Nicaragua, Puerto Rico. R. macra is a robust southern relative of R. alba. Like R. alba and R. pallida, it has scales which are at first bright white, “fading” in age to a medium tan or light brown. These three species are thus superficially most distinctive (from other Rhynchospora) in June, July, and August. The occurrence of this species in NC and SC is discussed by Sorrie et al. (1997). [= FNA, GW, K, WH, Y, Z; = Rhynchospora macra – S]
Rynchospora macrostachya Torrey ex A. Gray, Tall Horned Beaksedge. Marshes, swamps, upland depression ponds, other wetlands. July-September. E. MA south to ne. FL and west to e. TX, north in the interior to sc. TN, s. MI, MO, and KS; disjunct (historically) in s. ME. This is most readily distinguished from R. corniculata, R. inundata, and R. careyana by the large glomerules composed of numerous spikelets. The recognition of varieties does not seem to be warranted. [= C, FNA, G, GW, K, RAB, WH, Y; > R. macrostachya var. colophophila Fernald & Gale – F; > R. macrostachya var. macrostachya – F; = Rynchospora macrostachya – S]

Rynchospora microcarpa Baldwin ex A. Gray, Southern Beaksedge. Swamp forests, clay-based Carolina bays. July-August. E. NC south to s. FL and west to TX; West Indies (Cuba, Puerto Rico), Bahamas, Belize. This species is easily confused with R. elliottii and R. perplexa. R. elliottii is distinguished by leaves 4-6 mm wide, bristles longer than the tubercle, flattish achene faces, and a tubercle that is longer than broad. R. microcarpa and R. perplexa have leaves 1-3 mm wide and tubercles as broad as long or broader. In R. microcarpa, the achene is biconvex and the bristles are half as long as the achene to equaling the tubercle. In R. perplexa, the achene faces are flattish and the bristles are absent or rudimentary (< \( \frac{1}{2} \) as long as the achene). [= F, FNA, GW, RAB, WH, Y, Z; < R. microcarpa – K (also see R. sulcata); > Rynchospora edisoniana Britton in Small – S; > Rynchospora microcarpa – S]

Rynchospora microcephala (Britton) Britton ex Small, Small-headed Beaksedge. Savannas, sandhill-pocosin ecotones. July-October. S. NJ south to s. FL and west to MS; Cuba. [= C, F, FNA, G, GW, K, RAB, WH, Y, Z; = Rynchospora microcephala – S; = R. cephalantha A. Gray var. microcephala (Britton) Kükenthal]

Rynchospora milieicola (Lamarck) A. Gray, Millet Beaksedge. Swamp forests, including maritime swamp forests. July-August. Se. VA south to s. FL and west to LA; West Indies. The inflorescence branches of R. mixta and (less commonly) R. caduca can spread at right angles from the culm, superficially resembling R. milieicola. The three can be separated by tubercle length: the tubercle of R. milieicola is 0.2-0.4 mm long, while those of R. mixta and R. caduca are 0.4-0.9 mm long. [= C, F, FNA, G, GW, K, RAB, WH, Y, Z; = Rynchospora milieicola – S]

Rynchospora nitens (Vahl) A. Gray, Short-beak Beaksedge. Wet savannas, limesink (doline) ponds, ditches, disturbed wet areas, often weedy. July-August. Primarily a Coastal Plain endemic: MA south to s. FL and west to se. TX; lowlands around the Great Lakes; West Indies, Belize, Nicaragua. [= C, FNA, K, WH, Y; = Psilocarya nitens (Vahl) Wood – F, G, GW, RAB, S]

Rynchospora oligantha A. Gray, Feather-bristle Beaksedge. Wet savannas, sandhill-pocosin ecotones, sandhill seepage bogs, sea-level fens, usually in rather peaty, acid places. July-August. S. NJ south to ne. FL, Panhandle FL, and west to se. TX; Belize, Nicaragua. The leaf tips of R. oligantha are blunt and smooth, while those of the closely related R. galeana are acute and minutely serrulate; these characters are often difficult to determine, however. Considered to be absent between NC and NJ prior to its discovery in e. VA (Fleming & Ludwig 1996). [= C, FNA, GW, K, RAB, WH, Y; < R. oligantha – F, G (presumably including R. galeana); < Rynchospora oligantha – S; = R. oligantha var. oligantha – Z]

Rynchospora pallida M.A. Curtis, Pale Beaksedge. Savanna-pocosin and sandhill-pocosin ecotones, peaty seepage bogs, usually growing in or near Sphagnum. July-September. Long Island, NY south through NJ to nc. SC, primarily in NJ and NC. Like R. alba and R. macroa, it has scales which are at first bright white, “fading” in age to a medium tan or light brown. These three species are thus superficially most distinctive (from other Rynchospora) in June, July, and August. The bristle characters separate the three species easily. See Nelson (1993) for first SC record. [= C, F, FNA, G, GW, K, RAB, Y, Z; = Rynchospora pallida – S]

Rynchospora perplexa Britton in Small, Pineland Beaksedge. Savannas, sandhill seepage bogs. July-September. E. NC south to ne. FL, FL Panhandle, and west to TX, and north in the interior to ec. TN; West Indies. Var. virginiana Fernald, alleged to be endemic to se. VA, is alleged to differ in several characters, including larger spikelets (2.5-3.0 mm long vs. 2.0-2.5), the
achene tubercles broadly rounded at the tip (rather than deltoid and acute). Also see note under *R. microcarpa.* [= C, FNA, G, GW, K, RAB, WH, Y, Z; > *R. perplexa* var. *perplexa* – F; > *R. perplexa* var. *virginiana* Fernald – F; > *Rynchospora perplexa* – S]

*Rynchospora pinetorum* C.B. Clarke, Pinebarren Beaksedge. Sandhills, scrub, other dry sandy pinelands. May-November. Ne. FL and e. Panhandle FL south to s. FL; Cuba. [= FNA, K, Y; = *Rynchospora intermedia* (Chapman) Britton – S; = *Rynchospora intermedia* (Chapman) Britton – WH, Z]

*R. globularis* – WH

*R. perplexa* – F

R. globularis

*R. globularis* – WH

*R. perplexa* – F

*Rynchospora pinetorum* Small, Small’s Beakrush. Wet calcareous savannas, maritime wet grasslands. June-September. FL west to MS (Sorrie & Leonard 1999) and LA, apparently disjunct to se. NC and ne. SC, and also in the West Indies. See note under *R. globularis.* [= Y; = *R. globularis* (Chapman) Small var. *pinetorum* (Small) Gale – FNA, GW, K, Z; = *Rynchospora pinetorum* – S; < *R. globularis* – WH]

*Rynchospora pleiantha* (Kükenthal) Gale, Coastal Beaksedge. Sandy margins of limesink depression ponds (dolines), typically in shallow water or at the lower margins of pond-shores. July-September. Se. NC south to c. peninsular FL, and Panhandle FL, west to se. AL; also in Cuba. [= FNA, GW, K, RAB, WH, Y, Z; = *Rynchospora fusca* – S, misapplied]

*Rynchospora plumosa* Elliott, Plumed Beaksedge. Savannas, sandhill-pocosin ecotones, especially where the sandy surface dries out in summer (on spodosols such as the Leon soil series). July-August. NC south to s. FL and west to se. TX; West Indies (Cuba), Belize, Honduras, Nicaragua. *R. semiplumosa* of s. GA and n. FL needs additional evaluation but is included here. [= FNA, GW, K, RAB, WH, Y; > *Rynchospora plumosa* – S; > *Rynchospora semiplumosa* A. Gray – S] [add Z synonymy]

*Rynchospora punctata* Elliott, Pineland Beaksedge. Wet savannas, pitcherplant bogs. S. GA south to ne. FL. [= FNA, GW, K, WH, Y, Z; = *Rynchospora punctata* – S]

*Rynchospora pusilla* Chapman ex M.A. Curtis, Dwarf Beaksedge. Wet savannas, especially in exposed wet sands of disturbed ground, such as roadsides. June-September. E. NC south to s. FL and west to e. TX; West Indies, Mexico (Tabasco, Chiapas), Belize, Guatemala, Nicaragua. *R. pusilla, R. divergens,* and *R. thornei* are all small, grass-like plants, very similar in appearance to one another. [= FNA, GW, K, WH, Y; = *R. intermixta* C. Wright – RAB; = *Rynchospora intermixta* – S]

Rhynchospora species 3. Mt (GA): Coosa Valley prairies; rare. Under study by Jim Allison. {not yet keyed or mapped}

Rhynchospora thornei Kral, Thorne’s Beaksedge. In open sands in savannas underlain by marl, and nearby roadsides, moist limestone barrens and prairies (GA). Known from about 35 locations, in Coastal Plain of NC, SC, GA, ne. FL, Panhandle FL, and AL; also in Ridge and Valley region of AL and GA, and Black Belt region of AL. R. thornei, R. divergens, and R. pusilla are all small, grass-like plants, very similar in appearance to one another, and they frequently co-occur. Recently discovered in SC (Georgetown Co.) by McMillan (2003). [= FNA, K, WH, Y]

Rhynchospora tracyi Britton, Tracy's Beaksedge. Cypress savannas and graminoid-dominated depressions, in small, clay-based Carolina bays or shallow limesink ponds (dolines), typically in shallow water or at the lower margins of pond-shores. June-September. A Southeastern Coastal Plain endemic: s. NC south to s. FL, west to s. MS (Sorrie & Leonard 1999); disjunct in sw. LA; West Indies, Belize. [= FNA, K, GW, RAB, WH, Y; < R. tracyi – S]

Rhynchospora wrightiana Böckler, Wright's Beaksedge. Wet savannas. July-September. Se. VA south to c. FL and west to s. AL; West Indies. Appearing to merge with R. fasciculardis var. distans on the outer Coastal Plain of NC. Leaves are most frequently filiform and < 1 mm wide; rarely flat and to 1.3 mm wide. [= FNA, GW, K, RAB, WH, Y, Z; < R. wrightiana – S (also see R. brachychaeta)]

Schoenoplectus (Reichenbach) Palla 1888 (Bulrush)

A genus of about 50 species, herbs, cosmopolitan in distribution. Micromorphologic and anatomic studies have confirmed earlier opinions based on morphology that Schoenoplectus is not closely related to Scirpus (Strong 1994, Smith 1995, Schuyler, pers. comm.). Most investigators now also favor the separation of Bolboschoenus from Schoenoplectus (Pignotti & Mariotti 2004). References: Strong (1994)=Z; Smith (1995)=Y; Smith in FNA (2002b); Goetghebeur in Kubitzki (1998b); Pignotti & Mariotti (2004). [also see Bolboschoenus]

1 Main involucral bracts 2-8, spreading and foliaceous (the inflorescence thus appearing terminal); rhizomes bearing ovoid tubers; bristles persistent on the achene; achenes 2.5-5.5 mm long (including body and apiculus) .........................................................[Bolboschoenus]

1 Main involucral bract 1 (rarely with an additional 1-2 lateral bracts), erect or terete or triangular, appearing as a continuation of the culm (the inflorescence thus appearing lateral, though in some species the longer inflorescence branches may overtop the bract); rhizomes not bearing tubers; bristles falling from the achene; achenes 1.0-4.5 mm long (including body and apiculus).

2 Spikelets on stalks of varying lengths, at least some clearly not sessile.

3 Culms distinctly triangular in cross-section, more sharply so above than below, nearly terete near the base; [section Malacogeton] \[
\]

3 Culms terete throughout, or obscurely triangular above; [section Schoenoplectus].

4 Spikelets appearing dull gray-brown, the scales copiously covered with red-brown dots (as seen at 10×) 6-15 mm long; lower and middle scales (3.0-) 3.5-4.0 mm long; culms firm, not easily compressed .........................................................S. etuberculatus

4 Spikelets appearing reddish-brown, the scales not obviously dotted (as seen at 10×), 6-11 mm long; lower and middle scales (2.0-) 2.5-3.0 (-3.5) mm long; culms soft, easily compressed.

5 Perianth bristles plumose; spikelets acute; culms obscurely triangular near the inflorescence ........................................S. californicus

5 Perianth bristles retrorsely barbed; spikelets obtuse; culms terete throughout their length ........................................S. tabernaemontani
2 Spikelets all sessile, in a cluster at one point (rarely with 1 or 2 short branches to 5 mm long).
6 Spikelet solitary; leaves numerous; plant usually aquatic, the culms and leaves flaccid, supported by the water; [section Malacogoton]...
8 Spikelets (1-)2-several; leaves 1-4; usually of wet places, but the culms stiff and erect, not floating.
7 Rhizomatos perennial; culms triangular in cross-section, usually 5-20 dm tall
8 Leaves elongate, > ½ as long as the culms; achenes trigonous; styles 3-branched; [section Malacogoton]..............S. torreyi
8 Leaves short, < ½ as long as the culms; achenes plano-convex; styles 2 (-3) branched; [Schoenoplectus pungens complex of section Schoenoplectus].
9 Sides of the culm strongly concave, wing-angled; culms 3-10 mm in diameter; main involucral bract 1-2.5- (6) cm long; spikelet scale with apical notch 0.1-0.4 mm deep..............................................S. americana
9 Sides of the culm flat, slightly concave, or slightly convex; culms 1.5-6 mm in diameter; main involucral bract (1-)3-20 cm long; spikelet scale with apical notch (0.3-)0.5-1.0 mm deep.
10 Spikelets 3-35; achenes 1.9-2.6 mm long, biconvex; styles 2-fid.................................................................S. deltarum
10 Spikelets 1.5-10(-10); achenes (2.0-)2.5-3.5 mm long, biconvex or trigonous; styles 2-3-fid........S. pungens var. pungens
7 Cespitose annual or perennial; culms terete, 1.5-6 dm tall.
11 Perianth bristles absent; achenes 1.2-1.5 mm long, transversely rugose; [section Supini].
12 Achenes biconvex to obscurely trigonous, the faces convex..........................S. erectus ssp. raynalli
12 Achenes biconvex with a planar or concave area on the adaxial surface .....................................................S. hallii
13 Culms 2-3 mm thick, acutely triangular in ×-section.
13 Culms 1.2-2 mm thick, cylindrical in ×-section.
14 Achenes 1.75-2.0 mm long, unequally biconvex (rounded on both faces, but less so on one than the other), rounded-ovobate, broadly cuneate at the base, rounded at the apex..........................S. purshianus
14 Achenes 1.5-1.8 mm long, planoconvex (nearly flat on 1 face), obovate, cuneate at the base, subtruncate at the apex..............S. smitii

*Schoenoplectus americanus* (Persoon) Volk ex Schinzian & R. Keller, Olyn Threesquare. Tidal freshwater to brackish marshes. Late May–June; June–September. NS west to WA, south to South America. Schuyler (1974) discusses the need to replace the name *S. olneyi* (as traditionally applied) with *S. americanus*, traditionally applied to what must now be called *S. pungens*. Because of this nomenclatural change, the interpretation of much some information and records is now uncertain. [= FNA, K, Z; = Scirpus americanus Persoon – C, WH; = Scirpus olneyi – RAB, F, G, GW, S]

*Schoenoplectus californicus* (C.A. Meyer) Soják, Giant Bulrush, Southern Bulrush, Tule. Marshes. SC south to s. FL, west to TX, and extending s. into the New World tropics; on the west coast, from CA southward. [= FNA, K; = Scirpus californicus (C.A. Meyer) Steudel – GW, S, WH]

*Schoenoplectus deltarum* (Schuyler) Soják, Delta Bulrush. Brackish marshes and other wetlands. AL and FL west to KS and TX. [= FNA, K; = Scirpus deltarum Schuyler]

*Schoenoplectus erectus* (Poiret) Pallal ex J. Raynal ssp. raynalli (Schuyler) K. Lye. Sandy or peaty, seasonally wet soils (such as on pond shores). September–October. Apparently ranging from SC south to c. peninsular FL and sw. GA; also in the tropics of both hemispheres. [= FNA, K: < Scirpus hallii A. Gray – RAB, misapplied; ? Scirpus erismaniae Schuyler – GW; = Scirpus erectus Poiret var. raynalli (Schuyler) B.F. Hansen & Wunderlin – WH; < Scirpus erectus Poiret]

*Schoenoplectus etuberculatus* (Steudel) Soják, Swamp Bulrush, Canby’s Bulrush. Beaver ponds, on peat in small depression ponds, in flowing blackwater streams. July–August; August–September. DE south to c. peninsular FL and west to e. TX (the distribution rather discontinuous); substantially more disjunct in s. MO and RI. The hybrid *S. etuberculatus × subterminalis* has been collected in Hoke Co, NC and Lexington County, SC; it has sterile, malformed achenes. [= FNA, K, Z; = Scirpus etuberculatus (Steudel) Kuntze – RAB, C, F, G, GW, S, WH]

*Schoenoplectus hallii* (A. Gray) S.G. Smith, Sharpshale Bulrush. Pond shores in peaty sands. It has also been reported for our area by RAB, and is apparently included in our area by C, as Scirpus supinus Linnaeus var. hallii (A. Gray) A. Gray, and by others; at least some of these reports are misidentifications of the similar *S. erectus*. It is reported for sw. GA by Jones & Coile (1988) and Smith in FNA (2002b). It is very similar to *S. erectus*, differing in having the spikelet scales yellow brown (vs. reddish brown) and achenes concave on the ventral surface (vs. bulging on the ventral surface). [= FNA, K; = Scirpus supinus Linnaeus var. hallii (A. Gray) A. Gray – C; = Scirpus hallii A. Gray]

*Schoenoplectus heterochaetus* (Chase) Soják, Slender Bulrush. Fresh marshes and lakes. June–August. VT and QC west to AB, south to NY, PA, w.KY, TX, and CA. [= FNA, K; = Scirpus heterochaetus Chase – C, F, G]

* *Schoenoplectus mucronatus* (Linnaeus) Pallal, Rough-seed Bulrush. Ponds, ditches, ricefields, disturbed wet ground; native of Eurasia. Weed (native of Eurasia in rice fields and other disturbed situations, known from old collections in PA, NJ, NY and more recently from VA (Virginia Botanical Associates 2009), KY, and TN. [= FNA, K; = Scirpus mucronatus Linnaeus]
**Schoenoplectus pungens** (Vahl) Palla var. pungens, Common Threesquare, Chairmaker's Rush, Swordgrass. Marshes, rocky river beds. Mid May-June; June-September. The species is circumboreal, ranging in North America from NL (Newfoundland) west to AK, south to South America; var. pungens is widespread. This taxon has traditionally had the name *Scirpus americanus* applied to it; this name, however, is properly applied to the traditional *Scirpus olneyi*. *Schoenoplectus pungens* (or *Scirpus pungens*) becomes the correct name for this plant (Schuyler 1974). [= FNA, K, Y; < *Scirpus americanus* – RAB, F, G, GW, S, W, WV, misapplied; = *Scirpus pungens* Vahl var. pungens – C; < *Scirpus pungens* – WH; < *Schoenoplectus pungens* – Z]

*Schoenoplectus purshianus* (Fernald) M.T. Strong, Bluntscale Bulrush. Marshes. Late June-August; July-October. ME west to MN, south to NJ, DE, ne. VA, PA, n. OH, and IL. Reported from mountains of sw. VA. The varieties recognized by Smith in FNA (2002b) are of uncertain value; all three are in or approach our area. Var. smithii (south to DE, NJ, and PA) has perianth bristles absent or rudimentary. Var. levisetus (with a historic occurrence in VA) has 1-4 perianth bristles, much shorter than to equaling the achene, the bristles smooth or sparsely retrorsely barbed. Var. setosus (with records from NC, DE, and MD) has 4-6 perianth bristles, as long as or longer than the achene, and densely retrorsely barbed. [= K, Z; = *Scirpus smithii* A. Gray – C, F; ? *Scirpus smithii* var. smithii – G; > *Schoenoplectus smithii* var. smithii – FNA; > *Schoenoplectus smithii* var. setosus (Fernald) S.G. Smith – FNA; > *Schoenoplectus smithii* var. levisetus (Fernald) S.G. Smith – FNA]

*Schoenoplectus subterminalis* (Torrey) Soják, Swaying Rush, Water Bulrush. Beaver ponds, bogs, blackwater creeks, in highly acid water. May-June; June-August. NL (Newfoundland) west to s. AK, south to se. NC, nc. SC, MO, UT (?), and n. CA (the distribution discontinuous, especially southwest). The hybrid *S. etuberculatus × subterminalis* has been collected in Hoke Co, NC and Lexington County, SC; it has sterile, malformed achenes. [= FNA, K, Z; = *Scirpus subterminalis* Torrey – RAB, C, F, G, GW, S, W]

*Schoenus Linnaeus 1753* (Blacksedge, Bogrush)

A genus of about 100 species, herbs, mainly of Australia and Malesia. References: Goetgheweir in Kubitzki (1998b). **Schoenus nigricans** Linnaeus, Blacksedge, Black Bog-rush. Marshes, calcareous bogs, wet flatwoods, always with either calcareous or saline influence. April-July. Panhandle FL, TX, CA and AZ south into Mexico; West Indies; Old World tropics and subtropics. [= FNA, GW, K, S, WH]

*Scirpoides* Scheuchzer ex Séguier (Round-headed Bulrush)

*Scirpoides holoschoenus* (Linnaeus) Soják, Round-headed Bulrush. Ore piles; probably only a waif, native of Eurasia. [= J; = *Scirpus holoschoenus* Linnaeus]
A genus of about 20 species, herbs, of circumboreal distribution, also with species in Australia, Malaysia, and South America. The complex of species including *S. atrovirens, S. georgianus, S. hattorianus, S. flaccidifolius* are difficult to identify, and some have doubted their validity. Although further work on this group is needed, they do generally appear to behave as biological species despite their morphological similarity. Schuyler (1967) writes that "the remaining species in the key differ in minute characteristics and often the most satisfactory means of identification is by carefully comparing specimens of them. Despite the close morphological similarity of these species, their characteristics are reasonably constant even in areas where they coexist and occasionally hybridize." References: Whittmore & Schuyler in FNA (2002b); Schuyler (1967)=Z; Strong (1994)=Y. Key adapted from C, FNA, GW, and Z. [also see Bolboschoenus, Isolepis, Oxycaryum, Schoenopectus, and Trichophorum]
**Cyperaceae**

**Scirpus ancistrochaetus** Schuyler, Northeastern Bulrush. Mountain ponds. July-September. VT, MA, and NY south to PA, e. WV, and w. VA. See Bartgis (1992) and Schuyler (1962) for additional information on this species. [= FNA, K, Z; < S. atrovirens var. atrovirens – C]

**Scirpus atrovirens** Fernald. Bogs, wet meadows. Late June-early July. NL (Newfoundland) and NL (Labrador) west to NT and BC, south to n. NJ, WV (Grant, Hampshire, Harrison, Pendleton, Pocahontas, Randolph, and Tucker counties), IL, IA, SD, WY, and WA. [= FNA, F, K, WV; < S. cyprium (Linnaeus) Kunth – C, G]

**Scirpus atrovirens** Willdenow, Black Bulrush. Marshes. July-September. NL (Newfoundland) west to MN, south to GA and TX; disjunct in AZ. [= FNA, K, Z; < S. atrovirens – RAB, GW, S, W; < S. atrovirens var. atrovirens – C, F, G, WV]

**Scirpus cyprium** (Linnaeus) Kunth, Woolgrass Bulrush. Marshes, ditches, beaver ponds, disturbed wet ground. (July-) August-September. NL (Newfoundland) west to BC, south to c. peninsular FL, e. TX, and OR. The varieties may be worthy of recognition. [= RAB, FNA, GW, K, W, WH; < S. cyprium – C; > S. cyprium var. cyprium – F, WV; > S. cyprium var. pelius Fernald – F, WV; > S. rubricosus Fernald – F, WV; > S. rubricosus Wildenow – G, S; > S. eriophorum Michaux – S, S]

**Scirpus divaricatus** Elliott. Swamp forests. July-September. Se. VA south to Panhandle FL, west to e. TX, s. TN, and s. MO. [= RAB, C, F, FNA, G, GW, K, S, WH, Z]

**Scirpus flaciddifolius** (Fernald) Schuyler, Reclining Bulrush. Bottomlands. July-September. Endemic to se. VA and ne. NC. Ludwig (1993) found the following characters to be most useful in distinguishing *S. flaciddifolius* from *S. georgianus* growing in the same region: bristles 1.2-1.4 mm long (vs. absent or mostly < 0.2, rarely to 1.0 mm long in *S. georgianus*), spikelets 1.5-2.1 mm wide (vs. 1.1-2.2 mm wide), spikelets 3-9 (-12) per glomerule (vs. 4-23), and inflorescence rays 5.5-17.9 cm long (vs. 3.5-13.5 cm long). Bristle length was the only character which consistently separated the 2 species; other characters showed overlapping values of possibly statistical value. [= FNA, K, Z; < S. atrovirens var. atrovirens – C; = S. atrovirens Wildenow var. flaciddifolius Fernald – F]

**Scirpus hattorianus** Makino, Northern Bulrush. Seepages, ditches, marshes, mostly at moderate to high elevations. July-September. NL (Newfoundland) to w. ON and WI, south to MD, NC, OH, and IN. [= FNA, K, Z; < S. atrovirens – RAB, GW, W; < S. atrovirens var. atrovirens – C, F, G, WV]

**Scirpus lineatus** Michaux. Swamp forests over coquina limestone ("marl"). May-July. Se. VA south to c. peninsular FL, west to LA. Reported for a single county (Tucker County) in WV (Harmon, Ford-Wernitz, & Grafton 2006). [= C, FNA, GW, K, WH, Z; = S. fontinalis R.M. Harper – RAB, F, S; > S. fontinalis var. virginiana Fernald – G]

**Scirpus longii** Fernald. Marshes. NS south to s. NJ. Also reported as occurring in e. NC by Radford, Ahles, & Bell (1968) and Fernald (1950); this report is in error. [= FNA, C, F, G, K]

**Scirpus microcarpus** J. & K. Presl. Marshes. NL (Newfoundland) and NL (Labrador) west to AK, south to n. NJ, e. WV (Monongalia, Pocahontas, Randolph, and Tucker counties), KY, IL, IA, NE, NM, AZ, and CA. [= FNA, C, K; > S. rubrotinctus Fernald – F, G, WV]

**Scirpus pallidus** (Britton) Fernald, Cloaked Bulrush. Marshes. ON west to BC, south to WI, MO, TX, NM, AZ, OR; apparently disjunct (probably introduced) in se. PA (Rhoads & Klein 1993) and NJ (Kartesz 1999). [= F, FNA, K; = S. atrovirens Wildenow var. pallidus Britton – C, G]

**Scirpus pedicellatus** Fernald. Marshes. NL (Newfoundland), ON and MN south to n. NJ, OH, c. KY, and MO. [= F, FNA, K; < S. cyprium (Linnaeus) Kunth – C, G]

**Scirpus pendulus** Muhlenberg. Mt (GA, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, FL, NC, SC, VA): wet ground over limestone, diabase, or other circumneutral rocks; rare. June-July. ME west to MN, SD, and CO, south to NC, ne. FL, NM, and n. Mexico. [= C, FNA, GW, K, W, WH, Z; = S. lineatus – RAB, F, G, S, WV, misapplied]
**Cyperaceae**

**Scleria** P.J. Bergius 1765 (Nutrush)

(by Richard J. LeBlond)

A genus of about 250 species, herbs, pantropical, and locally extending into warm temperate regions. This treatment attempts to recognize the stablist and most distinctive *Scleria* entities. Intermediate and otherwise difficult-to-classify specimens are occasionally encountered within some species groups, suggesting hybridization or incomplete speciation. This is particularly true within the *S. ciliata/pauciflora* group (here boldly treated as four species and two varieties). This complex genus likely will continue to challenge and exasperate those who study it. References: Kessler (1987)=Z; Fairey (1967)=Y; Reznicek, Fairey, & Whittemore in FNA (2002b); Core (1936); Goethgebeur in Kubitzki (1998b).

**Identification notes**: *Scleria* superficially resembles *Rhynchospora* in the field, but mature specimens are readily recognized by the terete white, gray, or black bony achenes. Hardened achenes are necessary for reliable identification to species. In the key, achene length includes hypogynium when present. The scale character applies only to the ultimate bracteate structure clasping the achene.

1 Base of achene without hypogynium (a circular, angular, lobed, or tuberculate disk differing in texture and structure from the achene body), the achene base constricted, pitted, and/or ribbed, but appearing as a continuation of the achene body.

2 Inflorescence of 2-9 sessile clusters along an axis up to 13 cm long, the individual spikelets 2-5 mm long; bracts (at least above proximal cluster) setaceous.

3 Plants perennial with rhizomes; leaf blades usually pubescent, 1.5-5 mm wide; bract and scale margins long-ciliate; spikelets 4-5 mm long; achenes smooth .......................................................... *S. distans

4 Plants annual with fibrous roots; leaf blades glabrous, 0.5-2 mm wide; bract and scale margins ciliate; spikelets 2-3 (-4) mm long; achenes reticulate-papillate to reticulate-verrucose .......................................................... *S. verticillata

5 Inflorescence of a single cluster, the individual spikelets 4-10 mm long; bracts foliaceous.

6 Triangular base of achene lacking pits in the three concave sides; achene 3-4 mm long .......................................................... *S. baldwinii

7 Triangular base of achene with a pair of pits on each of the three sides; achene 2-3 mm long .......................................................... *S. georgiana

1 Base of achene with hypogynium.

5 Achenes body smooth (often longitudinally ribbed); hypogynium with 0, 8, or 9 tubercles.

6 Hypogynium with 8 or 9 minutely papillate tubercles ................................................................................................................ *S. oligantha

7 Minutely papillate portion of hypogynium continuous, not divided into separate tubercles.

8 Plants cespitose to short-rhizomatous; sheaths brown or straminous to reddish, glabrous to glabrate on the ventral surface except for a pubescent and usually thickened summit; inflorescences terminal and lateral; achenes 2.0-3.3 mm long; (1.12-)1.25 (-1.38)× as long as wide; hypogynium with flat and apically rounded papillae; [of wet to mesic pinelands] .......................................................... *S. triglomerata

9 Plants long-rhizomatous or cespitose; sheaths purple to reddish, the ventral surface uniformly pubescent; inflorescences terminal only or terminal and lateral; achenes 2.5-4.0 mm long; (1.35-)1.45 (-1.54)× as long as wide; hypogynium surface with laterally flattened and apically triangular-acute to acuminate papillae; [often on coastal hammocks, oak woods near saltwater, and blackwater swamps] .......................................................................................................................... *S. flaccida

10 Plants usually cespitose; inflorescence terminal and lateral (a few culms in a clump can be terminal only); hypogynium surface with laterally flattened and apically triangular-acute to acuminate papillae; often resembling shards of glass or porcelain; [of coastal hammocks, oak woods near saltwater, and blackwater swamps] .......................................................................................................................... *S. triglomerata

11 Plants usually long-rhizomatous; inflorescence terminal only; hypogynium surface with laterally and apically rounded papillae; [mostly of dry to dry-mesic pinelands and barrens] .......................................................................................................................... *S. nidda

5 Achenes body smooth, rarely pubescent (most often from apparent abortion or abnormal development); hypogynium with 3 tongue-shaped lobes, or 3 or 6 tubercles.

10 Hypogynium of 3 tongue-shaped lobes appressed to the underside of the achene (appearing nearly bract-like); achene reticulate, the pits generally squarish or rectangular and arranged regularly in rows, rarely smooth (apparently by abortion or anomalous development).

11 Achenes pubescent (occasionally becoming glabrate); lower lateral inflorescences on long, filiform, usually drooping peduncles; bract of the uppermost lateral inflorescence usually reaching from 1/3-3/4 the length of the terminal internode; terminal internode 6-30 cm long .......................................................... *S. mucilenbergii

12 Achenes glabrous; lower lateral inflorescences sessile or on short-erect peduncles; bract of the uppermost lateral panicle usually reaching 3/4 the length of to exceeding the terminal internode; terminal internode 3-8 cm long .......................................................... *S. reticulatis

13 Achenes 1.5-2 mm long, the hypogynium with 6 paired but distinctly separate tubercles.

14 Culms, leaves, and bracts copiously villous-ciliate with spreading hairs 0.5-1 mm long .......................................................... *S. pauciflora* var. *caroliniana

15 Culms, leaves, and bracts glabrous or sparsely hirtellous, but not copiously villous-ciliate .......................................................... *S. pauciflora* var. *pauciflora*

12 Achenes 2.0-3.6 mm long, the hypogynium with 3 tubercles, these often 2-lobed, the lobes united (becoming separate in *S. distans* 1 with achenes smooth and > 2.5 mm long).

13 Achenes 2.0-2.5(-3) mm long; 1.5-2.0(-2.3) mm wide; larger leaves 1-3.5 mm wide; culms, sheaths, blades, and bracts glabrous to moderately pubescent or ciliate.

14 Culms and/or sheaths hairy; blades and bracts ciliate; plants of loamy sands (e.g., ultisols) .......................................................... *S. ciliata* var. *ciliata*

15 Culms, sheaths, blades, and bracts glabrous; plants of sandy soils (e.g., spodosols) .......................................................................................................................... *S. ciliata* var. *grabra*

14 Achenes 2.6-3.6 mm long, 2.0-2.6 mm wide; larger leaves 3-7 mm wide; culms, sheaths, blades, and bracts moderately to densely pubescent and/or ciliate; plants usually of loamy soils (e.g., ultisols and alfisols).

16 Herbage pubescent between as well as along primary sheath and adaxial leaf surface nerves and culm angles; most pistillate scales pubescent with appressed hairs 0.1 (-0.2) mm long, the keel similarly pubescent or ciliate with hairs (0.1-)0.2 mm long;
Scleria baldwinii (Torrey) Steudel, Baldwin's Nutrush. Cp (FL, GA, NC, SC): wet savannas, under Pinus serotina, P. palustris, and/or Taxodium ascendens; uncommon (rare in GA, NC, and SC). June-July. Se. NC south to s. FL and west to se. TX; also in Cuba and the Bahamas (Sorrie & LeBlond 1997). S. baldwinii is a more robust plant, with larger achenes, than S. georgiana. [= RAB, FNA, K, GW, WH]

Scleria ciliata Michaux var. ciliata, Hairy Nutrush. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC), (FL): wet to dry sandy thickets and flatwoods, typically on sandy soil; frequent, rare in the mountains, rare in VA (VA Rare). May-August. VA south to FL, west to MO and TX, and in the West Indies, Mexico, and Central America. [= FNA, S, Y, < S. ciliata – RAB, C, F, G, GW, W; < S. ciliata var. ciliata – K, WH] [not yet mapped]

Scleria ciliata Michaux var. glabra (Chapman) Fairey, Smooth Nutrush. Savannas and flatwoods. NC south to FL, west to TX. S. ciliata var. curtissii (Britton) Kessler (= S. pauciflora Muhl. ex Willd. var. curtissii (Britton) Fairey) is currently of uncertain taxonomic standing. It is distinguished by its reticulate, non-papillose achenes, but such a condition has been observed in achenes with the hypogynium lobing of both S. ciliata and S. pauciflora (as suggested by the synonymy), and may only represent a form or condition. [= FNA, K; > S. brittonii Core ex Small – S; < S. ciliata – RAB, C, F, G, GW, W; < S. ciliata var. glabra – K, WH; > S. ciliata var. curtissii (Britton) Kessler – Z; > S. pauciflora Muhl. ex Willd. var. curtissii (Britton) Fairey – K] [not yet mapped]

Scleria distans Poiret in J. Lamarck et al., Riverswamp Nutrush. Moist sandy or peaty soil of pine savannas and flatwoods, boggy areas, and wet openings along roads. May-October. GA south to s. FL west to TX; West Indies; Mexico, Central and South America; Africa. [= FNA, WH; < S. nitida – GW, K, S, Y, Z, misapplied]

Scleria elliottii Chapman, Broad-leaved Hairy Nutrush. Savannas, flatwoods, pine-oak woodlands, meadows, bogs, and clay-based Carolina bays, typically on loamy sands. May-September. VA south to FL, west to TX, MO, OK. The descriptions of S. elliottii in S and of S. ciliata Michaux var. elliottii (Chapman) Fernald in F do not include the entity here treated as S. species 1. [= S; < S. ciliata Michaux var. elliottii (Chapman) Fernald – F, FNA, Y; < S. ciliata var. ciliata – K, WH; < S. ciliata – RAB, C, G, GW, W] [not yet mapped]

Scleria flaccida Steudel, Flaccid Nutrush. Blackwater swamps, coastal hammocks, oak woods and thickets near saltwater. Scattered along the outer Coastal Plain from se. VA to s. FL and west to LA. This is a poorly known species, with more locations likely to be found upon re-examination of S. triglomerata and S. nitida specimens. The often pendulous and capillary lateral peduncles suggest S. oligantha, another swamp species. S. oligantha is most readily separated by its 8-9-lobed hypogynium with minute rounded papillae. [= F; < S. triglomerata Michaux – RAB, C, F, G, GW, K, S, WH; < S. nitida – G]

Scleria georgiana Core, Georgia Nutrush. Pine savannas, cypress savannas, depression meadows, mostly on the outer Coastal Plain. June-August. E. NC south to s. FL, west to TX; and in the West Indies, Central and South America. See note under S. baldwinii. [= RAB, FNA, GW, K, WH; < S. gracilis Elliott – S (name preoccupied)]

Scleria lithosperma (Linnaeus) Swartz. Wet pine savannas. S. FL and s. LA south into Mexico, Central America and South America; West Indies; tropical Asia and Africa. [= FNA, GW, S, WH] [not yet keyed]

Scleria muehlenbergii Steudel, Pitted Nutrush. Open wet sand, pine savannas and flatwoods, depression meadows, cypress savannas, limesink ponds, bogs. June-September. NY (Long Island), NJ, and NC south to FL, west to TX, north in the interior to MO and IN; also in the West Indies, Bahamas (Sorrie & LeBlond 1997), Mexico, and Central America. S. muehlenbergii is adapted to a variety of freshwater wetland habitats, while S. reticularis is primarily restricted to the drawdown zones of limesink (doline) ponds and clay-based Carolina bays. Also see notes under S. reticularis. In normal specimens, the achene reticulation ridges are sharp-edged and steeply sloped (compare S. reticularis). The achene pubescence is often tawny, and achenes
appearing superficially glabrous often have a tawny residue under magnification. [= FNA, K; \( S. reticularis \) Michaux – RAB, C, GW, W, WH; \( S. muehlenbergii \) – F, orthographic variant; \( S. reticularis \) var. pubescens Britton – G; \( S. setacea \) Poiret – S]

**Scleria nitida** Willdenow, Shining Nutrush. Cp (DE, FL, NC, SC, VA), Mt (NC, SC, VA), Pd (DE, NC, SC, VA) {FL, GA?}: dry sandy or rocky soil of pine/scrub oak woodlands, ridgetop forests at lower elevations in the Mountains such as pine/oak heaths, and heath balds; uncommon (rare in DE). May-October. MA, VA, and KY south to FL, west to LA and MO (also see note under \( S. triglomerata \)). [= F; < \( S. nitida \) – G; < \( S. triglomerata \) Michaux – RAB, C, FNA, GW, K, S, W, WH] [not yet mapped]

**Scleria oligantha** Michaux, Few-flowered Nutrush. Dry to moist forests and woodlands, swamp forests. June-September. NJ and MO south to c. peninsular FL and TX, also in Puerto Rico, Mexico, and Central America. The long, filiform, arching lateral peduncles are distinctive. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Scleria pauciflora** Muhlenberg ex Willdenow var. caroliniana A. Wood, Carolina Nutrush. Cp (GA, NC, SC, VA?): savannas; uncommon. June-September. NH west to MI, south to n. FL, TN, and MO. [= F, FNA, G, K; < \( S. pauciflora \) – RAB, C, GW, S, WH] [not yet mapped]

**Scleria pauciflora** Muhlenberg ex Willdenow var. pauciflora, Papillose Nutrush. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): wet to dry pine flatwoods, pine savannas, depression meadows; common (rare in WV). June-September. NJ west to KS, south to FL and TX, also in Cuba. Typification of \( S. pauciflora \) is controversial and unresolved at this time (Fairey & Whittemore 1999). [= F, FNA, G, K; < \( S. pauciflora \) – RAB, C, GW, S, WH] [not yet mapped]

**Scleria reticularis** Michaux, Netted Nutrush. Limesink ponds, clay-based Carolina bays. June-September. MA south to FL, west to TX, north to IN, MI, and WI. Reports from Mexico are based on \( S. muehlenbergii \). See notes under \( S. muehlenbergii \). In normal specimens, the achene reticulation ridges are soft-edged and obliquely sloped. Occasional stipitate-capitate fungal growth on the achene has been mistaken for pubescence (a condition perhaps restricted to herbarium specimens), apparently contributing to the unwarranted agglomeration of this distinctive taxon and \( S. muehlenbergii \). There is controversy about typification of the name \( S. reticularis \) (Camelbeke, Reznicek, & Goetghhebeur 2003). [= F, FNA, K, S; < \( S. reticularis \) – RAB, C, GW, S, WH] (also see \( S. muehlenbergii \)) = \( S. reticularis \) var. reticularis – G]

**Scleria species 1**, Smooth-seeded Hairy Nutrush. Wet savannas shallowly underlain by coquina limestone in the Coastal Plain, and apparently in diabase glades and barrens in the Piedmont. May-September. Currently known only from Granville, Onslow, and Pender counties, NC. In the Coastal Plain, it is associated with other narrow endemics such as *Thalictrum cooleyi*, *Allium species 1*, and *Carex lutea*.

**Scleria triglomerata** Michaux, Tall Nutrush. Wet to mesic flatwoods, savannas, and hardwood forests. May-September. VT and ON west to MN, south to s. FL and TX. \( S. triglomerata \) sensu lato also occurs in Puerto Rico and Mexico, and may include \( S. nitida \) and \( S. flaccida \). [= F, G; < \( S. triglomerata \) – RAB, C, FNA, GW, K, S, WH, WV]

**Scleria verticillata** Muhlenberg ex Willdenow, Savanna Nutrush. Wet calcareous savannas of the outer coastal plain, freshwater marshes and maritime wet grasslands on barrier islands influenced by salt spray and shell deposits, wet calcareous or mafic fens or seepages in the mountains, calcareous grasslands. July-September. MA and ON west to MN, south to FL and TX, also in the West Indies, Mexico, Central and South America. This species is a distinct calciphile, with only scattered occurrences in most of our area. The roots are strongly fragrant. [= RAB, C, F, FNA, GW, K, S, WH]

**Trichophorum Persoon (Deergrass)**

A genus of about 10 species, herbs, primarily circumboreal, but with disjunct occurrence in montane tropical Asia and montane tropical South America. *Trichophorum* has long been recognized as distinct from *Scirpus* by many authors (especially in Europe and Asia). Molecular and other studies have clearly confirmed that these species are more closely allied to *Eriophorum* than to *Scirpus*, and their removal from *Scirpus* creates a more natural classification (Strong 1994). *Trichophorum* resembles *Eriophorum* in most morphologic characters, and shares with it a generally boreal and north temperate distribution. *Trichophorum alpinum* (Linnaeus) Persoon demonstrates previous confusion over the affinities of the group; it has been variously treated (by those who do not recognize *Trichophorum*) as *Eriophorum alpinum* Linnaeus or *Scirpus hudsonianus* (Michaux) Fernald. References: Crins in FNA (2002b); Strong (1994)=Z; Goetghhebeur in Kubitzki (1998b).

1 Culms terete or nearly so, smooth; [in our area] of moderate to high elevation cliffs

1 Culms sharply triangular in cross-section, the angles scabrous; [plants of low to moderate elevation forests, woodlands, and bluffs]
and on alpine summits, disjunct (from NY) to about a dozen sites in the Southern Appalachians of w. NC, e. TN, sw. SC, and ne. GA (Jones & Coile 1988). The disjunct southern occurrences are certainly relics of a more widespread distribution during the Pleistocene. Reported for South Carolina by Hill & Horn (1997) and Hill (1999). [<*Trichophorum cespitosum* – K; > *Scirpus cespitosus* var. *callosus* Bigelow – RAB, F, G; < *Scirpus cespitosus* Linnaeus – C, W; < *Trichophorum cespitosum* – FNA, orthographic variant; < *Scirpus cespitosus* – S; ? *Baeothryon cespitosum* (Linnaeus) A. Dietrich].

*Trichophorum planifolium* (Sprengel) Palla. Woodlands, bluffs, forests. ME west to ON, south to sc. VA, e. WV, KY, OH, and se. MO. See Crins (1989a) for an interesting discussion of this species. [= FNA, K, Z; = *Scirpus verecundus* Fernald – C, F, G, W; WV; = *Scirpus clintonii* – S, misapplied]

106. **POACEAE** (R. Brown) Barnhart 1895 or **GRAMINEAE** A.L. de Jussieu 1789 (Grass Family) [in POALES]

A family of about 670 genera and 10,000 species, herbs (and some shrubs and trees), cosmopolitan. References: Flora of North America Editorial Committee (2003a, 2007a)=FNA; Hitchcock and Chase (1950)=HC; Blomquist (1948). Key to genera adapted in large part from FNA.

[note: only a small portion of the key to genera complete]

### Key to tribes

1 Plant a shrub or tree (the culms perennial, woody, to 25 m tall), with complex branching systems from the upper nodes; leaves strongly dimorphic, those of the main culm sheathing, those of the branches or culm tips pseudopetiolate ........................................... **Key A**: **Bambuseae**

1 Plant an herb (the culms annual, not truly woody, to 5 m tall), lacking complex branching systems from the upper nodes; leaves not dimorphic, none of them pseudopetiolate.

7 [to be continued]

#### Key A – **tribe Bambuseae**

Key based on Stapleton (2007).

1 Rhizomes pachymorph, having root-bearing internodes thicker than the culm; culms usually in single clumps .................. **Bambusa**

1 Rhizomes leptomorph, root-bearing internodes thinner than the culm; culms solitary or in many connected clumps.

2 Mid-culm branches consistently 2, unequal, rarely with a smaller central third branch .................. **Phyllostachys**

2 Mid-culm branches not consistently 2, initially 1-9.

3 Dwarf bamboos, < 1(-1.5) m tall.

4 Leaf blade margins more or less bleached in winter, terminal blade often angled from shoot axis, blades usually not variegated ........

4 Leaf blade margins not or only slightly bleached in winter, terminal blade parallel to shoot axis, blades often variegated...........

.......................................................... [**Sasa**]

.......................................................... [**Pleioblastos**]

3 Medium-stature to tall bamboo, > 1 m tall.

5 Mid-culm branches initially 5-9 ................................................. **Pleioblastos**

5 Mid-culm branches initially 1-3(-5).

6 Mid-culm branches (1-)2-7; branches and leaves small to medium relative to culm size; [native] ........................................... **Arundinaria**

6 Mid-culm branches 1(-3); branch and leaves often very large relative to culm size; [alien].

7 Leaf blade margins bleached in winter, terminal blade often deflexed from shoot axis; culm buds initially closed .......... [**Sasa**]

7 Leaf blade margins not bleached in winter, terminal blade parallel to shoot axis; culm buds initially open or closed ...........

.......................................................... [**Pseudosasa**]
**Key B – tribe Oryzeae**

1. Lemma margins free; plants perennial.
2. Plants either < 1 m tall or a floating aquatic with lax stems to 1.5 m long ................................................................. *Luziola*
3. Plants 1-4 m tall, emergent, the stems stout, not lax ................................................................. *Zicianiopsis*
4. Spikelets either pistillate or staminate, the upper branches of the panicle with pistillate spikelets, the lower branches with staminate spikelets; caryopses terete ................................................................. *Zizania*
5. Spikelets bisexual; caryopses laterally flattened.
6. Glumes absent and also lacking glume-like sterile florets subtending the floret; lemmas and paleas pectinately ciliate-hispid on the margins; [native] ................................................................. *Leersia*
7. Glumes absent or greatly reduced, glume-like sterile florets subtending the fertile floret; lemmas and paleas glabrous or pubescent, but not pectinately ciliate hispid on the margins; [introduced] ................................................................. *Oryza*

**Key C – tribe Brachelytreae**

One genus ............................................................................................................................................................................................................ *Brachelytrum*

**Key D – tribe Diarrheneae**

One genus ............................................................................................................................................................................................................ *Diarrhena*

**Key E – tribe Meliceae**

1. Lemmas awned, the awns 8-15 mm long; calluses hairy; [of VA, WV, KY, and northward] ................................................................. *Schizachne*
2. Lemmas unawned; calluses glabrous; [collectively widespread in our area] ................................................................. *Glyceria*
3. Lower glumes 3-7-veined; [plants of mesic to dry habitats] ................................................................. *Melica*
4. Lower glumes 1-veined; [plants of wetlands] ................................................................. *Piptatherum (racemosum)*
5. Lower glumes 2-8 mm wide, not twisted at the base; awns 50-120 mm long ................................................................. *Nassella (necessana)*
6. Lower glumes 5-12 mm long; awns 7-15 mm long ................................................................. *Oryzopsis*
7. Lower glumes 8-10 mm wide; the base twisted so that the abaxial surface is uppermost; awns 7-15 mm long ................................................................. *Piptochaetium*
8. Lower glumes 1-3 mm wide; awns 15-120 mm long; expanded at the base; convolute and wrapping around the caryopsis such that the margins strongly overlap; awns 15-120 mm long ................................................................. *Piptatherum (canadense)*

**Key F – tribe Stipeae**

1. Plants not cespitose, the main leaves cauline ............................................................................................................................................................................................................ *Zizania*
2. Plants cespitose, the leaves basally disposed.
3. Leaves > 4 mm wide; awns either 7-15 or 40-120 mm long.
4. Leaves 4-10 mm wide, the base twisted so that the abaxial surface is uppermost; awns 7-15 mm long ................................................................. *Oryzopsis*
5. Leaves 2-8 mm wide, not twisted at the base; awns 50-120 mm long ................................................................. *Nassella (necessana)*
6. Leaves < 4 mm wide; awns 5-120 mm long ................................................................. *Piptaderum (racemosum)*
7. Palea flat, shorter than or equal to the lemma; lemma margin convolute or not overlapping; [alien and native species, rare in our area] ................................................................. *Melica*
8. Palea grooved, longer than the lemma; lemma margins involute, fitting into the paleal groove; [native species, collectively widespread in our area] ................................................................. *Glyceria*
9. Lemmas smooth, the margins separated and parallel their entire lengths at maturity; awns 5-25 mm long; [native species, of WV northward] ................................................................. *Piptatherum (canadense)*
10. Lemmas papillose and also often pubescent, particularly on the veins, convolute and wrapping around the caryopsis such that the margins strongly overlap; awns 15-120 mm long ................................................................. *Nassella (necessana)*

**Key G – tribe Brachypoideae**

One genus ............................................................................................................................................................................................................ *Brachypodium*

**Key H – tribe Bromaeae**

One genus ............................................................................................................................................................................................................ *Bromus*

**Key I – tribe Triticeae**

1. Spikelets 2-7 at all or most nodes.
2. Spikelets 3 at each node ............................................................................................................................................................................................................ *Hordeum*
3. Spikelets 1 at each node ............................................................................................................................................................................................................ *Secale*
4. Spikelets 3 at all or most nodes.
Agropyron, Elymus, Pascopyrum, Aegilops, Triticum, Thinopyrum

Key J – tribe Pooeae

Key K – tribe Arundineae

Molinia, Phragmites, Arundo

Key L – tribe Cynodonteae

Uniola, Distichlis (incl. Monanthochloe), Tridens, Triplasis, Leptochloa, Dinebra, Eragrostis, Eleusine, Dactyloctenium, Sporobolus, Calamovilfa, Muhlenbergia, Chloris, Eustachys, Gymnopogon, Cienium, Cynodon, Spartina, Bouteloua, Tragas, Zoysia

Key M – tribe Danthonieae

Cortaderia, Danthonia

Key N – tribe Aristideae

One genus............................................................................................................................................................................................................Aristida

Key O – tribe Centothecae

One genus.............................................................................................................................................................................................................Chasmanthium

Key P – tribe Paniceae

[partial key only]

1 First glume 5-7.5 mm long, nearly as long as sterile lemma; fertile lemma 1/3 length of sterile lemma .........................Phanopyrum
2 First glume shorter, or if this long, then at most 3/4 length of sterile lemma; fertile lemma > ½ the length of the sterile lemma.

2 Sterile palea indurate and expanding the spikelet at maturity, as long as sterile lemma; outer surface of the distal palea with compound papillae ..................................................................................Steinchisma
3 Sterile palea membranous, not expanding the spikelet at maturity, usually shorter than sterile lemma or absent; outer surface of the distal palea lacking compound papillae ................................................................................Panicum

Digitaria, Anthenantia, Allotherops, Amphicarpum, Opismenues, Echinochloa, Saciolepis, Dichanthellium, Panicum, Megathysus, Phanopyrum, Brachiaria, Melinis, Urochloa, Eriochloa, Pennisetum, Cenchrus, Setaria, Stenotaphrum, Steinchisma, Asnoquus, Paspalum, Reimarochloa

Key Q – tribe Andropogoneae

Add to genus key: Elionurus, Hackelochloa.

1 Leaves ovate-lanceolate, 2-10 cm long, 2.5-7× as long as wide; plants weak-stemmed annuals, branching, decumbent, rooting at the lower nodes; [alien weeds].
2 Leaves cordate-clasping at base; spikelets not paired, unaccompanied by a vestige ..........................................................Arthraxon
3 Leaves tapering to a broadly cuneate base; spikelets paired (one of the pair sometimes vestigial) ........................................Microstegium
4 Spikelets embedded in the thickened rachis (the inflorescence thus like an ear of corn), or fitting into grooves in the thickened rachis (the inflorescence thus cylindrical and resembling a rat's tail), or the pistillate inflorescences enclosed in a hard, beak-like, pearly-white, modified bract.
5 Spikelets unisexual, with male and female spikelets in separate inflorescences or in different parts of the same inflorescence.
6 Internode narrower than and more-or-less enclosed by the female spikelet. .................................................................Coix
7 Internode broader than and more-or-less enclosing the female spikelet.
8 Racemes of mixed sex (female below, male above) ............................................................................................................Tripsacum
9 Racemes of single sex .................................................................................................................................................................Zea
10 Spikelets, or at least one of each pair, bisexual.
POACEAE

270

7  Pedicels fused to the internode; [coarse alien grass of disturbed habitats].......................... Rottboellia
7  Pedicels free from the internodes; [either a native coarse grass of pinelands or prairie-like areas, or a short alien grass of lawns and disturbed areas].
8  Sessile spikelet smooth or pitted; culms 50-200 cm tall; [native grass of pinelands or prairie-like areas].................. Coelorachis
8  Sessile spikelet with pectinate margins; culms 5-40 cm tall; [alien grass of lawns and disturbed areas]..................... Eremochloa
3  Spikelets not embedded or fitting into grooves in the rachis, the rachis slender (the spikelets visibly separate and often pedicelled).
9  Pedicelled spikelet similar to the sessile spikelet, both fertile.
10 Spikelets falling in pairs together with sections of the disarticulating rachis................................................................. Saccharum
10 Spikelets falling separately from the persistent rachis.
11 Panicle contracted, spikeletile; glumes membranous................................................................................................. Imperata
11 Panicle loose; glumes cartilaginous or coriaceous ........................................................................................................ Miscanthus
9  Pedicelled spikelet differing from the sessile in shape and sex (sometimes represented only by a pedicel).
12 Spikelets awned, the awn 10-20 cm long.
13 First glume lacking glands; panicle open, the branches 5-8 cm long................................................................. Chrysopegon
13 First glume with a row of punctate, concave glands; panicle contracted, spikeletile .................................................................................................................................................. Heteropogon
12 Spikelets awned or not, if awned the awn < 5 cm long.
14 Inflorescence a panicle, the branches not subtended by sheaths.
15 Pedicelled spikelet represented by pedicel only; apex of sheath bearing 2 auricles 1-10 mm long; [native].......... Sorghastrum
15 Pedicelled spikelet present, staminate; apex of sheath truncate; [alien]................................................................. Sorghum
14 Inflorescence of 1-13 digitate (whorled) racemes borne at the summit of a peduncle, the peduncle subtended by a raceme sheath.
16 Racemes 1 per peduncle and raceme sheath ................................................................................................................ Schizachyrium
16 Racemes 2-13 per peduncle and raceme sheath.
17 Pedicels of the pedicelled (reduced or absent) spikelets terete or slightly flattened and grooved on one side only........
........................................................................................................................................................................................... Andropogon
17 Pedicels of the pedicelled (reduced or absent) spikelets strongly flattened and grooved on both sides, the central portion thin or membranous......................................................... Bothriochloa

Aegilops Linnaeus 1753 (Goatgrass)

Aegilops cylindrica Host, Jointed Goat Grass. Disturbed areas; native of Mediterranean Europe and w. Asia. [= C, F, FNA, G, HC, K, Z]

* Aegilops triuncalis Linnaeus var. triuncalis, Barbed Goatgrass. Disturbed areas; native of Mediterranean Europe east to w. and c. Asia. Known from MD. [= FNA; < A. triuncalis – HC, K]

* Aegilops ventricosa Tausch, Swollen Goatgrass. Disturbed areas; native of Mediterranean Europe. Known from DE. [= FNA]

Agropyron Gaertner 1770 (Crested Wheatgrass)

Agrostis Linnaeus 1753 (Bentgrass)
A genus of about 220 species, primarily temperate. References: Harvey in FNA (2007a); Tucker (1996) – Z. [also see Lachnagrostis and Polygroen]

1 Palea 1/2-3/4 as long as the lemma, 0.6-1.2 mm long; plants introduced, often (though not always) in disturbed habitats; plants flowering June-October; [subgenus Agrostis.]

2 Ligule mostly 0.5-2 mm long, truncate; panicle branches naked towards the base, diffuse when in fruit, the spikelets well-separated. [subgenus Agrostis.]

2 Ligule mostly 2.5-6 mm long, acute, rounded, or truncate; panicle branches (some of them) with spikelets near the base, the spikelets usually agglomerated.

3 Leaves 3-8 mm wide; inflorescence triangular-ovoid, the branches widely spreading at maturity, usually reddish; plant with rhizomes, without stolons. [subgenus Agrostis.]

4 Leaves mostly 1-3 mm wide; inflorescence narrowly ovoid, the branches ascending at maturity, usually tan; plant without rhizomes, with or without stolons. [subgenus Agrostis.]

1 Palea < 2/5 as long as the lemma, 0-0.5 mm long; plants native, typically in more or less natural habitats; plants flowering March-November; [subgenus Y.]

4 Lemma usually awned (sometimes unawned), the awn inserted near the tip, 4-10 mm long, straight, very delicate and flexuous; annual, flowering April-June. ................................................. A. eliottiana

4 Lemma awned or not, the awn (when present) inserted either near the middle of the lemma or near the apex, 0-6 mm long, straight or bent, neither delicate nor flexuous; perennial, flowering March-November.

5 Lemma with a (2-) 3-5 mm long, geniculate awn.

6 Anthers 1.0-1.5 mm long; spikelets 1.7-3.0 mm long; plant loosely cespitose, with stolons to 25 cm long. [subgenus P.]

6 Anthers 0.5-0.8 mm long; spikelets 2.0-4.0 mm long; plant densely cespitose. [subgenus P.]

5 Lemma awnless or with a 0-3 mm long awn, this often straight (rarely geniculate in A. scabra).

7 Spikelets 1.2-2 mm long; anthers 0.3-0.6 mm long; lemma never awned; plants flowering March-July. ................................................. A. hyemalis

7 Spikelets 1.8-3.5 (-3.7) mm long; anthers 0.3-1.5 mm long; lemma awnless or awned; plants flowering June-November.

8 Leaves (at least the basal) mostly involute, 1-2 (-3) mm wide; panicle branches mostly forking well beyond the middle; anthers 0.4-0.8 mm long. ................................................. A. scabra

8 Leaves flat, 2-6 mm wide; panicle branches mostly forking at or below the middle; anthers 0.3-1.2 mm long.

9 Lemma 1.8-3 mm long, minutely but copiously scabrous (at 20× or more); anthers 0.7-1.2 mm long; spikelets 2.3-2.7-3.5 (-3.7) mm long, usually clustered near the tips of the branchlets; panicle branches scabrous; culms to 15 dm tall; [of wet savannas and other wet habitats of the Coastal Plain] ................................................. A. altissima

9 Lemma 1.4-2 mm long, glabrous; anthers 0.3-0.6 mm long; spikelets (1.8-) 2.2-2.7 (-3.2) mm long, usually not clustered near the tips of the branchlets; plant glabrous to scabrous; culms to 10 dm tall; [of various habitats, nearly throughout our area] ................................................. A. perennans

Agrostis eliottiana J.A. Schultes, Elliot's Bentgrass, Southern Bentgrass. Dry soils of barrens, fields, and rock outcrops. April-June. MD west to s. OH, and e. KS, south to Panhandle FL (Gadsden County) and c. TX. [= RAB, C, F, FNA, G, HC, K, S, W, WH, Z]

Agrostis exarata Triunis, Spike Bentgrass. Disturbed areas; native of w. North America, a waif in e. North America. Reported for very widely scattered sites in e. North America, including Leslie County, KY (Kartesz 2010). [= FNA] [not keyed or mapped]

Agrostis hyemalis (Walter) Britton, Sterns, & Poggenburg, Ticklegrass, Small Bentgrass. Roadside, other disturbed habitats. March-July. ME west to WI, south to FL and TX. [= F, FNA, K, WH, WV, Z; < A. hyemalis – RAB (also see A. scabra); = A. hyemalis var. hyemalis – C, G; = A. hiemalis – GW, HC, orthographic variant; < A. hiemalis – S, W, orthographic variant (also see A. scabra var. scabra)] (FL)

Agrostis perennans (Walter) Tuckerman, Upland Bentgrass. Woodlands, forests, roadsides. August-October. NL (Newfoundland) west to MN, south to n. FL and TX; c. Mexico south to c. South America. [= HC, WV, Z; < A.

*Aira* Linnaeus 1753 (Hair Grass)

1. Panicle dense and spike-like, 0.5-4.1 cm long, 0.3-0.7 cm wide, the branches short and appressed to ascending. ................................................. *A. praecox*
2. Pedicels usually 1-2× as long as the spikelets; lemma of the lower floret and the upper floret with an awn 2-4 mm long ............................................. *A. caryophyllea*

* *Aira caryophyllea* Linnaeus, Silver Hair Grass. Fields, roadides, disturbed areas; native of Europe. May. [= RAB, C, G, HC, WH, Z; = Arias caryophyllea var. caryophyllea – FNA; = Aspris caryophyllea (Linnaeus) Nash – S]

*Aira elegans* Willdenow ex Kunth, Elegant Hair Grass. Fields, roadsides, disturbed areas; native of Europe. May-June. [= RAB, G, HC, K; = *Aira elegans* var. elegans Schar – C, Z; = *Aira caryophyllea* var. caryophyllea (Mertens & W.D.J. Koch) Mutel – FNA; = Aspris caryophyllea (Host) A.S. Hitchcock – S]

* *Aira praeox* Linnaeus, Early Hair Grass, Spike Hairgrass. Fields, roadsides, disturbed areas; native of Europe. Reported for NC by Burk (1961), and recently collected in the NC Sandhills (B. Sorrie, pers.comm. 2004). [= C, G, HC, K, Z]

**Alloteropsis** J. Presl 1828

A genus of 5-8 species, annuals and perennials, native of tropical Asia and Australia. References: Hall in FNA (2003a).

* *Alloteropsis cimicina* (Linnaeus) Stapf, Bugseed Grass. Disturbed areas; native of se. Asia. Naturalized in FL Panhandle and ne. FL. [= FNA, WH]

Linnaeus 1753 (Foxtail Grass)

1. Glumes 4-6 mm long, acute or acuminate.
2. Glumes with hairs < 1.0 mm long on the keel, merely scabrous towards the tip. ................................................................. *A. myosuroides*
3. Glumes with hairs 1.0-1.5 mm long on the keel, including towards the tip. ................................................................. *A. pratensis*

*Alopecurus aequalis* Sobolewski var. aequalis, Short-awn Foxtail Grass. Wet swales, wet meadows, ditches, shores. Circumboreal, south in North America to NJ, w. VA, IN, MO, and CA. [= F, K; < *A. aequalis* – C, G, HC]

*Alopecurus arundinaceus* Poiret, Creeping Meadow Foxtail. Pastures, disturbed areas. Native of Eurasia. Reported for Bell County, KY (Kartesz 2010). [= FNA] (not keyed or mapped)
**Alopecurus geniculatus** Linnaeus, Water Foxtail Grass. Disturbed areas; native of Eurasia. [= C, F, G, HC; > A. geniculatus var. geniculatus – K]

**Alopecurus myosuroides** Hudson, Slender Foxtail Grass. Moist fields; native of Europe. April-May. [= RAB, C, F, G, HC, K, S, WV, Z]

**Ammophila** Host 1809 (Beach-grass)

1 Ligule 10-35 mm long ........................................................................................................ .......................
2 Ligule 1-4.6 mm long ........................................................................................................ .......................................

**Ammophila arenaria** (Linnaeus) Link, European Beach-grass. Dunes, disturbed areas; native of Europe. Introduced in MD and PA (Kartesz 1999). [= C, F, FNA, HC, K]

**Ammophila breviligulata** Fernald, American Beach-grass. Dunes. August-September. NL (Newfoundland) south to about Cape Hatteras, Dare County, NC, and on shores around the Great Lakes; planted further south. As a native grass, Ammophila ranged south only to NC, where it was rare; it is now commonly planted ("sprigged") in the Carolinas as a sand-binder and is now common south into SC. [= K; < A. breviligulata – RAB, F, G, HC, S; = A. breviligulata ssp. breviligulata – FNA; ? A. breviligulata – C, Z]

**Amphibromus** Nees 1843

**Amphibromus scabrivalvis** (Trinius) Swallen var. scabrivalvis, Rough Amphibrome. Disturbed areas; native of South America. Established in Tangipahoa Parish, LA. [= FNA; < Amphibromus scabrivalvis – K; < Helictotrichon scabrivalve (Trinius) G. Tucker]

**Amphicarpum** Kunth 1829 (Peanut-grass)

1 Leaf blades hirsute with pustular-based hairs on both surfaces, the margins ciliate (and also slightly cartilaginous-thickened; [of moist to wet, peaty or sandy-peaty soils]) ............................................................................................................ A. amphicarpon
2 Leaf blades glabrous, the margins cartilaginous-thickened; [of seasonally flooded natural ponds] ................................................................................. A. muhlenbergianum

**Amphicarpum amphicarpon** (Pursh) Nash, Pinebarrens Peanut-grass. Wet, peaty, open soils, especially peat-burns in pocosin edges, primarily in the outer Coastal Plain, responding strongly to fire. August-October. An Atlantic Coastal Plain endemic, scattered and rather rare, from e. MA to GA. If one carefully excavates young plants in spring or summer, they will generally be found to be connected to the remnants of the previous year’s subterranean spikelet. [= FNA; = Amphicarpum pusillii Kunth – RAB, C, F, G, GW, HC, K; = Amphicarpum amphicarpon (Pursh) Nash – S]
Amphicarpum mühlenbergianum (J.A. Schultes) Hitchcock, Florida Peanut-grass, Blue Maiden-cane. Natural depression ponds, flatwoods ponds, clay-based Carolina bays. August-October. A Southeastern Coastal Plain endemic: FL and s. AL north to se. NC, rare north of s. GA. First found in NC in the late 1980's by M. Boyer. [= RAB, FNA, GW, HC; = A. mühlenbergianum – K, orthographic variant; = Amphicarpum floridanum Chapman – S]

Andropogon Linnaeus 1753 (Broomedge, Bluestem)

A genus of about 100-110 species, mainly tropical. [also see Bothriochloa and Schizachyrium]

The difference between this treatment and that in RAB may cause some users to react with skepticism, dismay, or alarm, but I am confident that it represents a much truer description of the genus. Campbell's work (1983, et seq.) has greatly clarified the taxonomy of Andropogon in e. North America. Great confusion and disagreement were previously the rule in dealing with the A. virginicus-A. glomeratus complex. Campbell's careful morphologic work has provided workable technical characters which distinguish the taxa he recognizes.

I have generally followed Campbell (1983, et seq.) in his circumscriptions of taxa. I disagree, however, with his strongly morphologic species concept and the basis for his decisions regarding the rank of the taxa (species, variety, and "variant," an informal, English name for a subvarietal entity). Campbell bases the rank recognition of taxa on their "morphologic distance" from one another, as determined by the sum of non-matching characters out of 33 characters analyzed. In general, he regards species as separated by a morphologic distance of 9 or more, varieties by 6 or more, and variants by 3 or more. Such an approach fails to take into account additional evidence of the ecological preferences, geographic distributions, reproductive isolation, evolutionary pathways, and population biology of the taxa.

Evidence presented by Campbell (1983) is useful in determining a more meaningful assignment of taxonomic rank. For instance, he states that "there are ample opportunities for gene flow between taxa because they frequently grow together and flower at the same time of day and (mostly) at the same time of year. I have observed two taxa growing within one to three meters of one another over our hundred years. In only five of these opportunities for hybridization were there plants whose intermediate morphology suggested that they were hybrids. In the rare instances where hybridization does take place, there are few mature hybrid individuals. I have found only twelve putative hybrid individuals in the five localities where hybridization is suspected. The parents outnumber these hybrids by between five and one hundred or more to one." In discussing A. virginicus var. glaucus (here treated as A. capillipes) he states "the drylands variant ... produces generally shorter raceme sheaths, racemes, and spikelets; its flowers are more frequently chasmogamous, and unlike the wetlands variant, it has no hairs below the raceme sheath. In addition, it grows in better-drained soil and has a narrower geographic range ... I have seen these taxa growing within one to three meters of one another at three localities in northwestern Florida. At only one of these was there difficulty in classifying any individual: a single plant on a slope between a bog inhabited by the wetlands variant and a roadside lined with the drylands variant..."

Some additional examples would be Campbell's discussion of several closely related taxa in the A. glomeratus complex.

"Andropogon glomeratus var. glomeratus and the robust variant of var. pumilus have inflorescences so similar in shape that most previous workers have united them and have overlooked the differences between them. The robust variant is taller, usually with rather smooth sheaths and with shorter, more ciliate, and darker ligules, narrower raceme sheaths, and lower glume keels that are scabrous below the middle. Although both taxa grow in wet sites, the robust variant is weedyer, shows a greater tolerance for drier conditions and various soil types, and has a wider geographic range." His discussion of A. glomeratus var. glaucopis and var. hirsutior is also worth repeating. "Often the two grow together in populations of thousands of individuals. Because they grow together so frequently and are morphologically so alike, the possibility that they are not distinct taxa but merely genetic segregates of one another has been carefully considered. Based on observations of several hundred seedlings grown from seeds from both taxa (growing together in nature), there is no evidence for [mere] genetic segregation. The glaucousness/greenness and pubescence/glabrousness of the stem sheaths are discernible in the seedlings within a few weeks of germination."

Taxa differing in numerous morphologic characters, with different (though overlapping) geographic ranges, with different ecological preferences (often rather narrowly segregated by hydrology), and (when they do occur in proximity to one another) showing little or no sign of introgression or hybridization are probably better treated as biological species. Thus, I have treated a number of Campbell's varieties as species. Several of his "variants" also seem to warrant taxonomic recognition, at varietal or specific rank; in fact, he subsequently elevated several (Campbell 1986). References: Campbell (1983)=Z; Campbell in FNA (2003a). Key adapted in part from Z.

Identification notes: A thorough understanding of the architecture of the inflorescences of Andropogon is necessary in order to identify them successfully. The parts will be described, beginning from the apex of a branch of the inflorescence. Spikelets occur in pairs, the sessile spikelet (usually just referred to as the spikelet) and the pedicellate spikelet, which is usually vestigial or absent (except in A. gerardii) and sterile (except in A. gerardii, where it is staminate). The first or lower glume of the sessile spikelet has two keels, and the presence and location of antorse prickles (scabrousness) is an important character in the A. glomeratus complex. The length of the sessile spikelet is an important character; it should be measured exclusive of theawn, borne at the apex of the lemma. Awn length is also a useful taxonomic character. The pedicellate spikelet is borne on the pedicel, which is attached at the base of the sessile spikelet and typically angles away from it at about a 45 degree angle. The rachis internode extends from the base of one sessile spikelet to the next sessile spikelet above, breaking apart (upon dehiscence) just below the next spikelet and remaining attached to the sessile spikelet below. The dispersal unit consists of a sessile spikelet sitting in the V shape
formed by (on one side) the pedicel and pedicelled spikelet; sessile spikelets > 7 mm long; [section Andropogon] A. gerardii

1 Pedicellate spikelet stamine, as large as the sessile, fertile spikelet; sessile spikelets > 7 mm long; [section Leptopogon]

2 Leaves strongly glaucous (often near ly white with a powdery wax that can be rubbed off on the fingers), glabrous.

2 Leaves green (to somewhat glaucous, but never powdery white), pubescent or glabrous.

3 Ligules (0.9-) 1.5 (-2.0) mm long, with ciliations 0-0.2 mm long; leaf blades usually (33-) avg. 40 (-75) cm long; pubescence beneath raceme sheaths moderate to dense; raceme sheaths (2.0-) 2.4-3.6 (-4.4) cm long, (1.3-) 2.0-2.5 (-3.0) mm wide..............A. glaucopsis

3 Ligules (0.2-) 0.4 (-0.5) mm long, with ciliations 0.3-1.2 mm long; leaf blades (12-) avg. 19 (-38) cm long; pubescence beneath raceme sheaths absent to dense; raceme sheaths (2.1-) 2.9-4.3 (-6.0) cm long, (2.7-) 3.1-3.8 (-5.5) mm wide.

4 Summit of branchlet below attachment of raceme sheath pubescent with hairs 2-4 mm long; raceme sheaths (2.4-) 3.2-4.8 (-6.0) mm long; spikelets (3.0-) 3.5-3.9 (-4.4) mm long; racemes (1.5-) 2.0-3.0 (-4.0) cm long; leaves 2.5-6.5 mm wide, averaging 5 mm; upper floret lemma awn 0.2-2.1 mm long, averaging 1.4 mm.......

4 Summit of branchlet below attachment of raceme sheath glabrous; raceme sheaths (2.1-) 2.6-3.8 (-4.9) cm long; spikelets (2.6-) 3.2-3.5 (-3.9) mm long; racemes (1.4-) 1.7-2.4 (-3.2) cm long; leaves 2-5 mm wide, averaging 3.5 mm; upper floret lemma awn 0.6-1.5 mm long, averaging 1.1 mm..........................A. capillipes var. 2 ["dryland variant"]

5 Many or all peduncles longer than the subtending raceme sheaths before senescence (but in some forms with the raceme sheaths strongly exserted); culms mostly > 1 m tall (to 1.4 m tall).........................A. elliottii

5 Upper culm sheaths distinctly broadened and strongly overlapping, often largely hiding the raceme sheaths before senescence (but in some forms with the raceme sheaths strongly exserted; culms mostly > 1 m tall (except A. perangustatus, A. tracyi, and small forms of A. virginicus).

6 Many or all peduncles longer than the subtending raceme sheaths at maturity, racemes then fully exserted above the apex of the raceme sheath.

7 Inflorescence branches arching outwards in pronounced curves; racemes (1.2-) 1.5-2.1 (-2.6) cm long; awn (0.2-) avg. 0.7 (-1.1) cm long; spikelets (4.1-) 4.4-4.6 (-5.0) mm long..............................A. brachystachyus

7 Inflorescence branches erect; racemes (2.2-) 2.6-6.0 cm long; awn 0.5-2.0 cm long; spikelets (4.3-) 4.9-6.5 (-7.5) mm long.

8 Lower glumes more or less folded; stamens 1; racemes (2.2-) 2.6-4.5 (-6.3) cm long; awn (0.5-) avg. 0.8 (-1.6) cm long; spikelets (4.3-) 4.9-5.4 (-6.1) mm long..............................A. arctatus

8 Lower glumes flat; stamens 3; racemes 3-6 cm long; awn 1-2 cm long; spikelets (4.5-) 5-6.5 (-7.5) mm long......................................A. ternarius var. ternarius

9 Inflorescences with (2-) 4-7 (-13) racemes; raceme sheaths (4.1-) 5.3-8.0 (-10-1) mm wide; hairs of the rachis internode and pedicel yellow-tawny when dry...

9 Inflorescences with 2-5 (-7) racemes; raceme sheaths (1.5-) 2.0-4.8 (-6.3) mm wide; hairs of the rachis internode and pedicel gray to whitish when dry.

10 Postflowering peduncles < 10 mm long.

11 Culm sheaths antirously scabrous (often hisrate as well); leaf blades usually > 35 cm long.

12 Ligules (0.6-) 0.8 (-1.3) mm long (usually < 1 mm long), with ciliations 0-2.9 mm long; raceme sheaths (1.5-) 2.0-2.5 (-3.0) mm wide (usually < 2.5 mm wide); keels of first glume often scabrous below the middle..............A. tenue

12 Ligules (0.6-) 1.2 (-2.2) mm long (usually > 1 mm long), with ciliations 0-3.0 mm long; raceme sheaths (2.0-) 2.4-3.4 (-4.7) mm wide (usually > 2.5 mm wide); keels of first glume scabrous only above the middle, smooth below.

13 Inflorescences oblong to obpyramidal; spikelets (3.8-) 4.1-4.4 (-5.0) mm long; anthers usually not marcescent within spikelet; mature peduncles (4-) 11-35 (-60) mm long (usually some of them > 10 mm long)...........................................A. glomeratus var. glomeratus

13 Inflorescences (linear to oblong; spikelets (3.4-) 3.6-3.8 (-4.6) mm log; anthers usually marcescent within spikelets; peduncles (2-) 3-5 (-8) mm long...........................................A. glomeratus var. hirsutior

11 Culm sheaths not scabrous (often hisrate); leaf blades < 35 cm long (except in A. glomeratus var. pumilus).

14 Leaves glabrous.

15 Ligules (0.8-) 1.1 (-1.5) mm long, with ciliations 0-0.1 mm long; basal leaves often filiform, < 1.5 mm wide, strongly erect........................A. perangustatus

15 Ligules (0.2-) 0.5 (-0.8) mm long, with ciliations 0.2-1.3 mm long; basal leaves usually > 2 mm wide, soon arching.
Andropogon arctatus Chapman, Florida Bluestem. Pinelands, rarely moist disturbed ground. This curious record from Pamlico County, NC (the specimen at GH, collected by Randolph and Randolph in 1922, annotated as A. arctatus by Campbell) is likely a waif. The species is native to pinelands from n. FL west to w. Panhandle of FL and adjacent s. AL, south to s. FL. [= FNA, HC, K, S, orthographic variant]

Andropogon brachystachyus Chapman, Shortspike Bluestem. Moist to wet pinelands, natural pond margins, bogs, disturbed roadsides. Se. SC (McMillan et al. 2002) south to FL, south to e. FL. Panhandle. A. brachystachyus is considered by some to range north to NC. [= FNA, K, Z; = A. brachystachyus – GW, HC, S, orthographic variant]

Andropogon capillipes Nash var. 1. Wetland White Bluestem. Wet savannas, ditches adjacent to savannas, depressional wetlands. September-October. S. NJ south to s. FL and west to e. TX; also in the Bahamas (Sorrie & LeBlond 1997). Campbell (1983) informally describes two "variants" of this species (which he treats at the varietal level, as A. virgínicus var. glaucus). A. capillipes is clearly a species distinct from A. virgínicus; moreover, the substantial morphological and ecological differences between Campbell’s two "variants" (which he describes as nearly always sharply distinct, even when growing in close proximity) warrant recognition as good species, or at least as varieties. [<A. virgínicus – RAB; < A. virgínicus var. glaucus Hackel – F, FNA; < A. capillipes – GW, HC, K, S; = A. virgínicus var. glaucus "wetlands variant" – Z; = A. virgínicus var. dealbátus Mohr ex Hackel]

**Andropogon floridanus** Scribner, Florida Bluestem. Longleaf pine sandhills. September-October. S. GA west to FL Panhandle, south to s. FL. Reported for e. and s. GA (FNA, Jones & Coile 1988).  [= FNA, HC, K, S]  [not yet keyed]

**Andropogon gerardii** Vitman, Big Bluestem, Turkeyfoot. In a wide variety of habitats, usually rather dry, such as sandhills, glades, cliffs, and rock outcrops, in the Piedmont in woodlands, former prairie-like sites, woodlands, open forests, and river-scour grasslands, in the Mountains in glades, riverside scour areas, and rarely in grassy balds, ascending to at least 1600 m over mafic rocks (on Old Field Bald, Watauga and Ashe counties, NC). July-October. QC west to SK, south to FL and AZ. Some favor treating eastern taxon should be known as taxon should be recognized at the specific level, but the appropriate combination has not been made.  [= FNA, K, Z; A. glomeratus (Walter) Britton, Sterns, & Poggenburg]

**Andropogon glaucopsis** Elliott, Chalky Bluestem. Wet savannas, pine flatwoods, ditches, wet disturbed sites. September-October. Se. VA south to c. peninsular FL and west to e. TX. The extent of the western Gulf Coastal Plain distribution (to the West Gulf Coastal Plain of w. LA and e. TX) is based on specimens (at BRIT) and sight records (B. Sorrie, pers. comm.). Although sometimes included in the past in either A. glomeratus or A. virginiensis, this species is distinctive and easily recognized in the field (even from a car at 60 m.p.h.) by the combination of blue color, height of well over 1 m (taller than the other glaucous bluestems), and semi-bushy inflorescence.  [= GW, K; < A. virginicus – RAB; = A. virginicus var. glaucopsis (Elliott) A.S. Hitchcock – F, HC; = A. glomeratus var. glaucopsis (Elliott) A.S. Hitchcock – FNA, Z; < A. glomeratus - S]

**Andropogon glomeratus** (Walter) Britton, Sterns, & Poggenburg var. glomeratus. Swamps, wet savannas, pine flatwoods, wet disturbed sites. September-October. S. MA south to c. peninsular FL and west to s. MS, primarily on the Coastal Plain, but scattered inland to w. PA, WV, c. KY, c. TN and AR.  [= FNA, K, Z; < A. virginicus – RAB; = A. virginicus var. abbreviatus (Hackel) Fernald & Griscom – C, F, G, GW, WV; < A. glomeratus – HC, S, W]

**Andropogon glomeratus** (Walter) Britton, Sterns, & Poggenburg var. hirsutior (Hackel) C. Mohr. Wet savannas, pine flatwoods, adjacent ditches, other wet disturbed sites. September-October. E. MD south to c. peninsular FL west to se. LA. This taxon should be recognized at the specific level, but the appropriate combination has not been made.  [= FNA, K, Z; < A. virginicus – RAB; 7. A. virginicus var. glaucopsis (Elliott) A.S. Hitchcock – G, misapplied; = A. virginicus var. hirsutior (Hackel) A.S. Hitchcock; < A. glomeratus – HC, S]

**Andropogon longiberbis** Hackel, Longbeard Bluestem. Dry sandy soils of sandhills and dunes. September-October. Se. NC south to s. and w. FL, and in the Bahamas.  [= FNA, HC, K, S, Z]

**Andropogon perangustatus** Nash, Narrow-leaved Bluestem. Clay-based Carolina bays and boggy wetlands. August-October. E. VA south to c. peninsular FL, east to e. TX. Growth form, general appearance, and habitat (dense bluish tussocks with very narrow leaves and long ligules, growing in wet areas such as clay-based Carolina bays) make A. perangustatus readily recognizable.  [= HC, S; = A. gyrans Ashe var. stenophyllus (Hackel) C.S. Campbell – FNA, K, Z; = A. elliottii Chapman var. stenophyllus (Hackel) D.B. Ward]

**Andropogon tenuispatheus** (Nash) Nash. Maritime wet grasslands, brackish marsh edges, moist disturbed sites. September-October. Se. VA and c. OK south to s. FL and w. TX, also south into Central America and the Caribbean.  [< A. virginicus – RAB; = A. glomeratus (Walter) Britton, Sterns, & Poggenburg var. pumilus Vasey ex Dewey – FNA, K, Z ("robust variant"); < A. glomeratus – HC, S]

**Andropogon ternarius** Michaux var. ternarius, Splitbeard Bluestem. Dry to moist soils. September-October. Var. ternarius ranges from DE west to KY and s. MO, south to FL and TX. Var. cabanisii (Hackel) Fernald & Griscom is endemic in s. and c. peninsular FL.  [= FNA, K, Z; < A. ternarius – RAB, C, G, W; > A. ternarius var. ternarius – F; > A. ternarius var. glaucescens (Scribner) Fernald & Griscom – F; = A. ternarius – HC, S]

**Andropogon tracyi** Nash, Tracy's Bluestem. Dry sandy or clayey soils of sandhills, disturbed sites. September-October. E. NC south to s. FL and west to MS.  [= FNA, HC, K, S, Z]

**Andropogon virginicus** Linnaeus var. virginicus, Old-field Broomstraw, Broomsedge, "Sedge Grass", "Sage Grass". Old fields, roadbanks, disturbed sites. September-October. MA west to MI and e. KA, south to FL and e. TX, and in the Caribbean and Central America. Campbell (1983) recognized 3 "variants" within *A. virginicus var. virginicus*; the "deceptive variant" he later (1986) described formally as var. *decipiens* (see above). The "old-field variant" is the common "variant" in our area, occurring abundantly throughout the state. It has green stem internodes and the leaves usually pubescent, at least on the margins near the collar. The "smooth variant" is known only from the Coastal Plain and is apparently rare in our area, known from NC and SC (Berkeley and Marion counties; P. McMillan, pers. comm.). It has glaucous stem internodes and glabrous leaves. It is unclear whether the "smooth variant" warrants taxonomic recognition. [= FNA, K, Z ("oldfield variant" and "smooth variant"); < A. virginicus – RAB, S, W; < A. virginicus var. virginicus – C, WV; < A. virginicus var. virginicus – G, HC (also see var. *decipiens*); >= A. virginicus var. virginicus – F; >= A. virginicus var. tetrastachyus (Elliot) Hackel – F]

**Anthenantia** Palisot de Beauvois 1812 (Silkyscale)

1 Leaves weakly if at all geniculate and auriculate at junction of blade and sheath, ascending to erect (lacking a sharp bend outward at the summit of the sheath), medium green; blade (3-) 4-8 (-10) mm wide, the proximal margins glabrous or sometimes ascending pilose-ciliate; pigmentation of leaves, spikelets and their trichomes variously reddish or purplish; fertile lemma red-brown to nearly black, leaf tip with a very short taper to a blunt or rounded apex; lower sheaths crowded and keeled (therefore distichous) ......................................................**A. rufa**

2 Hairs on the apex of the bisexual florets < 0.5 mm long, or sometimes with some longer hairs and then these distributed only near the midrib .................................................................**A. hirtum**

3 Annual, geniculate; ligules 0.5-2 mm long; glumes glabrous; leaves 1-2 mm wide .................................................................**A. nitens**

1 Leaves strongly geniculate and auriculate at junction of blade and sheath, spreading, usually squarrose (with a sharp bend outward at the summit of the sheath), yellowish green; blade 4-10 (-15) mm wide, the proximal margins ciliate at least basally with ascending strumose-hirsute cilia; pigment of leaves, spikelets and their trichomes usually with little or any red; fertile lemma brown; leaf tip with a long taper to a sharp apex; lower sheaths not crowded, keeled, or distichous .................................................................**A. villosa**

**Anthenantia rufa** (Nuttall) J.A. Schultes, Purple Silkyscale. Wet savannas in the outer Coastal Plain, seepage bogs and moist sandhill-pocosin ecotones in the fall-line sandhills. September-October. Se. NC south to n. FL and west to w. LA. *A. rufa* inhabits much wetter habitats than the similar *A. villosa*, and is more typical of the outer Coastal Plain. Plants without culms are reminiscent of the Liliaceae. [= FNA, Y; = *Anthaenantia rufa* – RAB, GW, HC, K, S, Z, orthographic variant]

**Anthenantia villosa** (Michaux) Palisot de Beauvois, Green Silkyscale. Sandhills, especially in submesic swales. September-October. Se. NC south to s. FL and west to e. TX. *A. villosa* is found in drier habitats than *A. rufa*, most typically in upland swales in the sandhills. Kral (2004) has segregated a new species, *A. texana* Kral, of the w. Gulf Coastal plain, previously confused with *A. villosa*. [= Y; < *Anthoenantia villosa* – RAB, HC, K, S, Z, orthographic variant; < *Anthenantia villosa* – FNA]

**Anthoxanthum** Linnaeus 1753 (Vernal Grass)

A genus of about 50 species (as here circumscribed to include *Hierochloe*), perennials and annuals, of temperate, boreal, and arctic regions. Tucker (1996), Soreng et al. (2003), and Allred & Barkworth in FNA (2007a) all include *Hierochloe* into a more broadly circumscribed *Anthoxanthum*. References: Allred & Barkworth in FNA (2007a); Tucker (1996)=Z; Soreng et al. (2003)=Y.

1 Glumes subequal; lowest 2 florets stamine

2 Hairs on the apex of the bisexual florets< 0.5 mm long, or sometimes with some longer hairs and then these distributed only near the midrib .................................................................**A. nitens**

1 Glumes unequal, the lower shorter than the upper; lowest 2 florets sterile.

3 Annual, erect; ligules (1-) 2-3 mm long; glumes villose throughout or at least on the keel; leaves 2-5 mm wide ..................................................**A. odoratum**

Anthoxanthum hirtum (Schrank) Y. Schouten & Veldkamp, Hairy Holygrass, Sweetgrass, Vanilla Grass. Fens, wet calcareous meadows, high elevation pastures and openings, saltmarsh edges (DE). April-August. A circumboreal species and subspecies, widespread in n. Eurasia and n. North America, ranging south in North America to NJ, MD, PA, OH, IN, IL, IA, SD, CO, UT, NM, and CA, with several disjunct occurrences in North Carolina, in Long Hope Valley, Ashe County, the Nantahala River Bogs, Macon County, and Pond Mountain, Ashe County. The report by S ("recorded by Chapman from Statesville, N.C.") can be discounted; the record reflects a collection made in the mountains by Mordecai E. Hyams, a botanist and herb trader based in Statesville. Belden et al. (2004) document the first occurrence in Virginia. The sweet, vanilla-like odor of this grass is responsible for various folk uses – by Native Americans for making fragrant baskets, in Scandinavia strewn on church floors on festival days. [= FNA; < Hierochloe odorata (Linnaeus) Palisot de Beauvois – C, F, G, HC, WV; > H. hirta (Schrank) Borbás ssp. arctica (J. Presl) G. Weimarck – K; < Torresia odorata (Linnaeus) A.S. Hitchcock – S; < Anthoxanthum nitens (Weber) Y. Schouten & Veldkamp – Z; ? Anthoxanthum nitens (Weber) Y. Schouten & Veldkamp spp. nitens – Y; > H. odorata var. fragrans (Willdenow) Richter (the North American plants)] {revise Y and Z synonymy}

Anthoxanthum nitens (Weber) Y. Schouten & Veldkamp spp. nitens, Vanilla Sweetgrass. Wet meadows, marshes, roadsides; sometimes interpreted as native in ne. North America and sometimes as an introduction from Europe. NL (Labrador) south to DE; n. Europe. [= FNA; < Hierochloe odorata (Linnaeus) Palisot de Beauvois – C, F, G, HC] [add Y and Z synonymy]

Apera Adanson 1763 (Windgrass)

Identification notes: The awns must be dry and relatively mature to assume their characteristic positions (immature awns and moist mature awns are erect and parallel). It is sometimes useful to dry a collection unpreserved. Beware, however, that drying followed by dispersal can take place very quickly under the right conditions (such as the dashboard of a hot car)!

1 Plant a perennial, forming dense tussocks, the leaves primarily basal, usually very numerous, mostly > 3 dm long, 0.5-1.5 mm wide, almost always tightly involute; flowering only in the growing season following fire.

2 Base of blade and collar (and often the upper sheath) with conspicuous tuft of woolly to villous pubescence (sometimes deciduous on foliage more than a year old); leaves usually glabrous above the basal 2 cm of the blade; [of s. SC south] .......... A. beyrichiana

2 Base of blade, collar, and upper sheath lacking a conspicuous tuft of woolly to villous pubescence; leaves with 2 lines of villous pubescence on either side of the midrib on the lower surface extending nearly or entirely the length of the blade (sometimes deciduous on foliage more than a year old); [of n. SC and NC] .................................................................................................................... A. stricta

1 Plant an annual or perennial, forming small tufts (or solitary), the leaves primarily cauline, usually few, mostly < 3 dm long (if as long as 3 dm then > 2 mm wide), flat to slightly folded, but not wiry; flowering not strongly triggered by fire.

3 First glume 3-7 nerved.

4 Central awn of the lemma (8-) 12-65 (-70) mm long, the lateral awns as long or nearly so .......................................................... A. oligantha

4 Central awn of the lemma (9-) 12-25 (-30) mm long, the lateral awns 1-4 mm long (or even lacking) ................................................. A. ramosissima

3 First glume 1-2-nerved.

5 Central awns spirally coiled at the base (above the awn column), like a corkscrew, 1/3 to 3 full turns (when dry).

6 Lateral awns 5-13 mm long, spreading ...................................................... A. basiramea

6 Lateral awns 1-4 mm long, erect

7 First glume 1/2 to 2/3 as long as the second glume; lemma 6-11 mm long, glabrous to scaberulous ................................................. A. curtissii

5 Central awns straight to curved (or contorted at the base).
8  Lateral awns < \( \frac{1}{3} \) as long as the central awn.  
9  Inflorescences 15-25 cm wide; loosely cespitose perennial, unbranched upwards.  
A. patula  
9  Inflorescences 1-6 cm wide; annuals, much branched above the base.  
A. adscensionis  
10  Awns terete at the base.  
A. basiramea  
11  Lemmas 8-22 mm long; central awn curved ca. 180 degrees at the base.  
A. ramosissima  
11  Lemmas 2.5-10 mm long; central awn curved ca. 90 degrees at the base.  
A. longespica var. geniculata  
12  Central awn (8-) 12-27 mm long; lateral awns 10-18 mm long.  
A. longespica var. longespica  
12  Central awn mostly 1-10 (-14) mm long; lateral awns 0.5-8 (-10) mm long.  
A. longespica var. geniculata  
8  Lateral awns > \( \frac{1}{3} \) as long as the central awn.  
13  Sheaths lanose or floccose (the hairs kinked and intertwined); nodes of the panicle axis with tufts of lanose or floccose hairs.  
A. lanosa  
13 Sheaths glabrous to pilose (the hairs straight and usually appressed, not intertwined); nodes of the panicle axis glabrous or pilose.  
A. spiciformis  
14  Awn column (the connivent awns twisted together) or lemma beak (slender, narrowed, and twisted portion of lemma body below the awns) 7-30 mm long; lemma body (including the beak, if present) separated from the awns (or awn column) by an articulation zone, the awns (or awn column) disarticulating at maturity from the lemma.  
15  Panicle spiciform, broadest near the middle, dense, the spikelets overlapping strongly; awns (10-) 20-30 mm long, borne at the summit of a twisted lemma beak 7-30 mm long; culms simple or with very few branches; plants perennial.  
A. tuberculosa  
16  Panicle almost corymbiform, broadest above the middle, open, the spikelets overlapping only slightly; awns 30-40 mm long, not including the 8-15 mm long column formed by the twisting together of the 3 awn bases; culms often much-branched; plants annual.  
A. gynes  
17  Plants tufted, not rhizomatous; basal sheaths not shredding into persistent fibers; [collectively of various habitats].  
18  Spikelets borne singly at each node of the main axis, the inflorescence thus a spike or raceme.  
A. mohrii  
18  Spikelets 2 or more per node of the main axis at most nodes (a few nodes may have single spikelets), often with side branches present as well, the inflorescence thus a panicle (less commonly a raceme).  
A. virgata  
19  First glume 1/3-\( \frac{1}{2} \) the length of the second glume.  
A. gyrans  
19  First glume > \( \frac{1}{3} \) the length of the second glume.  
A. purpurascens  
20  Central awn 15-40 mm long; first glume prominently 2-keeled, (8-) 9-14 mm long when mature.  
A. palustris  
20  Central awn 8-25 mm long; first glume either 1-keeled and 6-14 mm long, or weakly 2-keeled and 5.5-9 (-10) mm long when mature.  
21  Central awn about 2× as thick as the lateral awns, divergent to reflexed; first glume 1-keeled or weakly 2-keeled; [moist to wet habitats].  
22  Basal internode of the culm 0.3-0.6 mm wide; most nodes of the inflorescence with 1-2 spikelets; all awns spreading, the central spirally twisted basally and often contorted by as much as 180 degrees (best seen in fresh material); central awn 15-20 mm long, lateral awns 11-16 mm long, the ratio of the lateral:central awn length 0.69-0.80; lemma callus beard 0.6-1.0 mm long.  
23  Culms 5-8 (-10) dm tall and 1-4 mm in diameter near the base; awns 8-15 mm long; panicle branches > 4 cm long; callus ca. 1.0 mm long.  
A. condensata  
23  Culms mostly > 10 dm tall and 3-6 mm in diameter near the base; awns 8-15 mm long; panicle branches > 4 cm long; callus ca. 1.0 mm long.  
A. basiramea var. basiramea – C  
24  First glume 1-4 mm longer than the second glume (rarely about equal to it); awns 15-25 mm long, straight or slightly contorted at the base; leaf blades 1-3 mm wide, usually curling.  
A. purpurascens  
24  First glume shorter than or about equal to the second glume; awns 12-18 mm long, spirally contorted at the base; leaf blades about 1 mm wide, usually not curling.  
A. tenusiptica  

* Aristida adscensionis Linnaeus, Sixweeks Three-awn. {habitat in our area unknown}; native of w. United States. Reported for SC (FNA). {further investigate}  
* Aristida basiramea Engelmann ex Vasey, Forktip Three-awn. Sandy soils; probably introduced, native of msw. United States. ME and ON south to SC (FNA), FL (Wunderlin & Hansen 2003), AL, TX, and CO (FNA).  
* Aristida beyrichiana Trinius & Ruprecht, Southern Wiregrass. Sandhills, savannas, from very dry to seasonally saturated soils. September-November. S. SC south to s. FL, west to s. MS. See Peet (1993) for discussion of the taxonomy and ecology of this species; also see comments under A. stricta, which also apply here. Ward (2001) proposes varietal status for A. stricta and A. beyrichiana.  
* Aristida condensata Chapman, Big Three-awn. Dry sandy soils of sandhills. August-October. Sc. NC south to s. FL, west to s. MS (Sorrie & Leonard 1999).  
* Aristida curtissii (A. Gray ex S. Watson & Coulter) Nash, Curtiss's Three-awn. Roadsides, disturbed areas, bare eroding soil. August-October. ME west to WY, south to n. FL, AR, OK, and CO, perhaps largely or entirely adventive in our area. See Z for a discussion of the rationale for reducing A. curtissii to a variety of A. dichotoma. C reduces it to a variety of the more western A. basiramea Engelmann ex Vasey. For now, and for simplicity, I prefer to retain the two as species.

Aristida gyrans Chapman, Corkscrew Three-awn. Dry pinelands. E. GA and w. Panhandle FL, south to s. FL. In Bryan, Long, and Montgomery counties in e. GA (Sorrie 1998b), and in wc. GA (J. Allison, pers. comm.). [= FNA, HC, K, S]

Aristida oligantha Michaux, Prairie Three-awn. Roadsides, fields, disturbed areas. August-October. VT west to SD, south to FL and TX, scattered elsewhere as a weed. [= FNA, GW, HC, K, S]

Aristida patula Chapman ex Nash, Tall Three-awn. Dry to moist sandy soils of pond margins, pinelands, dunes. Endemic to FL Panhandle (Dixie, Franklin, Gadsden, Leon, Taylor, and Wakulla counties) (Wunderlin & Hansen 2006) and peninsula. [= FNA, GW, HC, K, S]

Aristida purpurascens Poiret, Arrowfeather. Dry habitats, especially in dry sandy soils. August-October. MA west to WI and KS, south to FL and TX. In the Sandhills occurring in two forms, one green, the other strongly glaucous-blue. [= RAB, C, G, HC, S, W, WV; > A. purpurascens var. purpurascens – F; > A. purpurascens var. minor Vasey – F; = A. purpurascens var. purpurascens – FNA, K, Z]

* Aristida purpurea Nuttall var. longiseta (Steudel) Vasey, Red Three-awn. Disturbed areas; adventive from further west. August-October. Also reported from NC, but the collection is from a Soil Conservation Service test nursery, and there is no evidence of naturalization. [= C, FNA, K, Z; > A. longiseta var. robusta Merrill – F; = A. longiseta Steudel – G, HC]

Aristida rhizomorpha Swallen, Florida Three-awn. Wet pine flatwoods. FL endemic, north to Baker, Duval, and Nassau counties. [= FNA, HC, K]
**Aristida simpliciflora** Chapman, Southern Three-awn, Chapman's Three-awn. Wet pine savannas. Sw. GA west through the FL Panhandle and c. AL to s. MS (Sorrie & Leonard 1999), and south into c. peninsular FL; also in se. NC, where apparently disjunct (it should be searched for in SC). *A. simpliciflora* was believed to be a Gulf Coastal Plain endemic until found by R. LeBlond in 1999 in wet savannas in se. NC (Green Swamp savannas, Brunswick County; Old Dock Savanna, Columbus County; and The Neck Savanna, Pender County). It is reported for sw. GA (Jones & Coile 1988, Kartesz 1999). Harper also reports it for c. GA. [= FNA, HC, K, S, Z]

**Aristida spiciformis** Elliott, Bottlebrush Three-awn, Spike Three-awn. Wet pine savannas and seepage areas. August-October. E. SC (McMillan et al. 2002) south to FL, west to MS. Allred (1986) also reports this species from NC, but the documentation is unknown to me. [= RAB, FNA, HC, K, S, Z]

**Aristida stricta** Michaux, Carolina Wiregrass, Pineland Three-awn. Coastal Plain pinelands of nearly all sorts, ranging from the driest white-sand sandhills to seasonally saturated pine savannas dominated by a mixture of longleaf pine and pond pine, largely or entirely replaced in the wettest savannas by *Sporobolus teretifolius*, *Sporobolus pinetorum*, *Muhlenbergia expansa*, *Ctenium aromaticum*, and *Calamovilfa breviflora*; also in Piedmont areas adjacent to the Coastal Plain and formerly supporting fire-maintained longleaf pine woodlands. September-November. Ne. NC (south of Albemarle Sound and the Roanoke River), south to ne. SC (Lee and Kershaw counties). *A. stricta* was the keystone species of much of the upland Coastal Plain of the Carolinas. Its flammable foliage facilitated the spread of lightning-set fires that maintained the biologically rich pine savanna, sandhill, and pine flatwood ecosystems once widespread in our area. Though still locally common in parts of the Sandhill region and in portions of Brunswick, Pender, Onslow, and Carteret counties, NC, *A. stricta* is much rarer than formerly. The conversion of vast acreages of former pinelands to agriculture, pine tree farms, and developed areas has taken its toll over the years. In the twentieth century, suppression of fire has also led to the destruction of *A. stricta*. More recently, pine-straw raking is leading to the serious decline of *A. stricta* in its few remaining strongholds on public lands. *A. stricta* has little tolerance for ground disturbance. See Peet (1993) for discussion of the taxonomy and ecology of this species. Ward (2001) proposes varietal status for *A. stricta* and *A. beyrichiana*. [= K, Y; < *A. stricta* – RAB, FNA, GW, HC, S, V, Z (also see *A. beyrichiana*); = *A. stricta* var. stricta – X]

**Aristida tenuispica** A.S. Hitchcock, Southern Arrowfeather. Sandy habitats. August-October. NC south to FL and west to MS. [= HC, S; = *A. purpurascens* Poiret var. tenuispica (A.S. Hitchcock) Allred – FNA, K, Z]

**Aristida tuberculosa** Nuttall, Seabeach Needlegrass. Sandhills, coastal dunes (in VA), other dry, sandy habitats such as sandy roadsides. August-October. Se. NH south to NJ and disjunct in e. VA in the outer Coastal Plain; from sc. NC south to Panhandle FL and west to s. MS (Sorrie & Leonard 1999), mostly in the inner Coastal Plain; and also near the Great Lakes in sw. MI, n. IN, n. IL, s. WI, se. MN, and e. IA. The curious trimodal distribution is unexplained. [= RAB, C, F, FNA, G, HC, K, S, Z]

**Aristida virgata** Trinius. Moist to wet savannas, mountain bogs (Henderson Co., NC), other moist habitats. August-October. S. NJ south to FL, west to TX, primarily on the Coastal Plain. [= RAB, C, F, G, GW, HC, S; = *A. purpurascens* Poiret var. virgata (Trinius) Allred – FNA, K, Z]

Allred (1986) reports the collection of several additional non-native species from our area, including *A. divaricata* Willdenow from sw. United States (from a Soil Conservation Service test nursery in Chapel Hill, NC) and uncertainly identified material of an Australian species (from a wool-combing mill at Jamestown, Berkeley County, SC). There is no evidence that either are naturalized.

---

**Arrhenatherum** Palisot de Beauvois 1812 (False Oatgrass)

A genus of about 6 species, perennials, of the Mediterranean region and e. Asia. References: Hatch in FNA (2007a); Tucker (1996)–Z.

1 Base of culm consisting of a series of adjacent (moniliform) corms 5-10 mm in diameter ............................................*A. elatius* var. bulbosum
1 Base of culm not swollen or cormose, 2-4 mm thick ........................................................................................................*A. elatius* var. elatius

* **Arrhenatherum elatius** (Linnaeus) J. & K. Presl var. bulbosum (Willdenow) Spenner, Tuber Oatgrass, Onion Couch. Habitat in our area not known; native of Europe. This variety was apparently cultivated for the edible tubers in Bronze Age

**Arthroxan** Palisot de Beauvois 1812 (Basket Grass)

Identification notes: Sometimes confused (especially before flowering) with *Microstegium*, but *Arthroxan* has distinctly cordate-clasping leaves, which *Microstegium* lacks. Also very similar to *Oplismenus*.

* Arthroxan hispidus (Thunberg) Makino var. hispidus, Basket Grass. Moist ditches, bottomlands, disturbed areas; native of se. Asia. September-October. Like *Microstegium*, *Arthroxan* appears to be steadily increasing its abundance in our area. [= FNA, Y; < A. hispidus – C, GW, K, Z; > A. hispidus var. cryptatherus (Hackel) Honda – RAB, F, G, HC, W]

**Arundinaria** Michaux 1803 (Cane)

A genus of 3 species, woody grasses (bamboos), native of se. United States. *Arundinaria* was much reduced by the foraging of free-range livestock in the eighteenth and early nineteenth centuries and by fire suppression in the late nineteenth century and throughout the twentieth century. "Canebrakes," large areas dominated by cane, were described in many historical accounts and apparently occupied large parts of the landscape of the Coastal Plain, also occurring in the Piedmont and low Mountains. References: Ward (2009c)=V; Clark & Triplett in FNA (2007a); Tucker (1988)=Y; McClure (1973)=Z; McClure (1963); Judziewicz et al. (2000)=X; Triplett, Weakley, & Clark (2006)=Q. The key is adapted from Q.

1 Primary branches with 0-1 compressed basal internodes (in the basalmost 1 cm or so); culm internodes usually sulcate (with a groove extending upwards from the node, sometimes partly obscured by the branch); culm leaves deciduous; culms to 10 m tall; rhizomes lacking air canals; foliage leaf blades 0.8-1.3 cm wide.................................................................A. gigantea

1 Primary branches with 2-5 compressed basal internodes (in the basalmost 1 cm or so); culm internodes usually terete; culm leaves persistent to tardily deciduous; culms to 4 m tall; rhizomes with or without longitudinal air canals (visible in cross-section as a cylinder of hollow canals 1 mm or less from the outer surface); foliage leaf blades 0.8-2 cm wide.

2 Foliage blades chartaceous, deciduous, abaxial surfaces pilose or glabrous, weakly tessellate; primary branches usually < 35 cm long, basal nodes of primary branches not developing secondary branches; top knot blades 12-22.5 cm long; rhizomes with or without air canals............................................................................................................................................A. appalachiana

2 Foliage blades coriaceous, persistent, abaxial surfaces densely pubescent or glabrous, strongly tessellate; primary branches usually > 50 cm long, basal nodes of primary branches developing secondary branches; top knot blades 20-30 cm long; rhizomes with air canals..........

............................................................................................................................................A. tecta

**Arundinaria appalachiana** Triplett, Weakley, & L.G. Clark, Hill Cane. Dry to moist forests on slopes. Noted as distinctive as long ago as 1900 by R.M. Harper, W.C. Coker, W.W. Ashe, and C.D. Beadle, this distinctive plant of the Appalachians has only recently been described as a species (Triplett, Weakley & Clark 2006). The short plants (often only knee-high, though sometimes head-high) on mountain slopes south of Asheville are autumn-deciduous, whereas both our other species are evergreen. [= FNA, Q, V; < A. gigantea (Walter) Walter – RAB, GW; < A. gigantea ssp. tecta (Walter) McClure – K, X, Z; < A. tecta – HC, S, Y; = A. tecta var. decilia Beadle in L.H. Bailey]

**Arundinaria gigantea** (Walter) Muhlenberg, Giant Cane, River Cane. Swamps, floodplain. April-July. S. OH south to FL and e. TX. There has been much confusion about the recognition of one, two, or several taxa of cane in the Southeastern United States. This species reaches heights of 6-7 (-10) m and is supposed to flower only once every 40-50 years. *A. macrospora* Michaux is controversial, sometimes considered to be a synonym of *A. gigantea* or to represent hybridization or introgression between *A. gigantea* and *A. tecta*. [= F, FNA, HC, K, S, WV, Y; < A. gigantea – RAB, C, GW (also see A. tecta); = A. gigantea ssp. gigantea – K, Z; > A. gigantea ssp. gigantea – X; > A. gigantea (Walter) Muhlenberg ssp. macrospora (Michaux) McClure – X; = A. macrospora (Michaux – V)]

**Arundinaria tecta** (Walter) Muhlenberg, Switch Cane, Small Cane. Savannas, pocosins, canebrakes, generally (but not solely) in wetlands. April-July. Primarily a Southeastern Coastal Plain endemic: e. MD to FL and s. AL. *A. tecta* is a smaller plant than *A. gigantea* (normally 1-2 m tall, but reaching heights of up to 4 m where fire-suppressed), and flowers more frequently, supposedly every 3-4 years (Tucker 1988), probably actually in response to fire. [= FNA, Q; < A. gigantea (Walter) Muhlenberg – RAB, C, GW; < A. tecta – F, HC, S, Y; < A. gigantea ssp. tecta (Walter) McClure – K, X, Z; = A. gigantea (Walter) Muhlenberg – V]
**Arundo** Linnaeus 1753 (Giant Reed)

* **Arundo donax** Linnaeus, Giant Reed. Disturbed areas; native of the Old World. September-October. Horticultural forms with leaves transversely striped white and green have been treated as var. versicolor, but are better considered as only a form or cultivar. [= RAB, F, FNA, K, S; > *A. donax* var. *donax* – HC; > *A. donax* var. versicolor (P. Miller) Stokes – HC]

**Avena** Linnaeus 1753 (Oats)

1 Florets disarticulating from the glumes at maturity (the glumes remaining attached to the plant); lemmas pubescent with brown hairs; lemmas with long bent awns; callus bearded with hairs up to ¼ as long as the lemmas.................................................................**A. fatua**

1 Florets not disarticulating from the glumes at maturity; lemmas glabrous or scabrous (rarely sparsely strigose); lemmas unawned or with relatively straight awns; callus glabrous ......................................................................................................................................................**A. sativa**

* **Avena fatua** Linnaeus, Wild Oats. Disturbed areas; native of Europe and c. Asia. {needs herbarium checks; no records shown on VA Atlas}. [= C, F, FNA, G, HC, K]

* **Avena sativa** Linnaeus, Oats. Fields and disturbed areas, commonly cultivated; native of Middle East. May-June. An important crop, but apparently only a weed until transported from the Middle East to the moister central Europe, where cultivated beginning about 3000 BP (Hancock 2004). [= RAB, FNA, G, HC, K, S, W, Z; > *A. sativa* var. orientalis (Schreber) Alefeld – F; > *A. sativa* var. *sativa* – F]

**Avenella** Koch ex Steudel 1840 (Hairgrass)

**Avenula** (Dumortier) Dumortier 1868

* **Avenula pubescens** (Hudson) Dumortier, Downy Oatgrass. Disturbed areas; native of Eurasia. [= *Avenula pubescens* ssp. pubescens – FNA; > *Avenula pubescens* ssp. laevigata (Schur) Holub – FNA; = *Helictotrichon pubescens* (Hudson) Bess. ex Pilger – C, HC, K; = *Avena pubescens* Hudson – F, G]

**Axonopus** Palisot de Beauvois 1812 (Carpet Grass)

A genus of ca. 100 species, primarily tropical and subtropical. Phylogenetic studies suggest that *Axonopus* may be included in *Paspalum*. References: Barkworth in FNA (2003a).

1 Spikelets 4-6 mm long……………………………………………………………………………………………………………………………………**A. furcatus**

1 Spikelets 1.5-2.8 mm long.

2 Spikelets 1.5-2.2 mm long; leaf blades mostly 8-10 mm wide……………………………………………………………………………………**A. compressus**

2 Spikelets 2.2-2.8 mm long; leaf blades mostly 2-4 (-6) mm wide…………………………………………………………………………**A. fissifolius**
Axonopus compressus (Szwarcz) Palisot de Beauvois, Southern Carpet Grass. Lawns; probably introduced. Reported for VA by HC. Sometimes used as a lawn grass in the deep South. [= FNA, HC, K, S; Paspalum]

Axonopus fissifolius (Raddi) Kuhl., Common Carpet Grass. Sandy forests, roadides, lawns. June-October. VA south to FL, west to TX and OK, and extending into tropical America. [= FNA, K; ? A. affinis Chase – RAB, GW, HC, W; = Paspalum fissifolium Raddi]

Axonopus furcatus (Flügge) A.S. Hitchcock, Big Carpetgrass. Sandy forests, bottomlands, roadides, lawns. July-October. Se. VA south to FL, west to TX and AR. [= RAB, C, F, FNA, G, GW, HC, K, S; = Paspalum furcatus Flügge]

Bambusa Schreber 1789 (Bamboo)

A genus of ca. 100 species, trees and shrubs, native to tropical and subtropical Asia. References: Stapleton in FNA (2007a).

1 Culm leaves with auricles absent or very small and rounded; basal internodes not swollen, not much longer than those above. .................................................................................................. B. vulgaris

* Bambusa multiplex (Loureiro) Raeuschel ex Schultes & Schultes, Hedge Bamboo, Dwarf Bamboo. Disturbed areas; native of se. Asia. Reported as naturalized or persistent in portions of the southeastern United States, including GA, FL Panhandle, and FL peninsula. [= FNA, HC]

* Bambusa vulgaris Schrad ex J.C. Wendland, Common Bamboo. Disturbed areas; native of tropical Asia. Reported for SC (Kartesz 1999). (investigate) [= FNA, HC, K]

Bothriochloa Kunze 1891 (Beardgrass, Cane Bluestem)

1 Sessile spikelets 4.5-8.5 mm long

2 Rachises 5-10 cm long, with many branches ......................................................... B. barbinodis

2 Rachises usually < 5 cm long, with 3-8 branches ..................................................... B. hyrida

3 Sessile spikelets 3.4-5.4 mm long.

3 Pedicellate spikelets much shorter than the sessile spikelets.

4 Panicles reddish when mature; hairs below the sessile spikelets sparse and ca. ¼ as long as the spikelets, not obscuring the spikelets. .................................................................................................................................................. B. bladhii

4 Panicles silvery-white or tannish when mature; hairs below the sessile spikelets dense and > ½ as long as the spikelets, somewhat obscuring the spikelets

5 Panicles 9-20 cm long; sessile spikelets 3-4× as long as thick; leaves basally disposed; culm usually < 2 mm in diameter. .............................................. B. laguroides ssp. torreyana

5 Panicles 4-12 (-14) cm long; sessile spikelets 4-6× as long as thick; leaves evenly distributed on the culm; culm usually 2-4 mm in diameter.......................................................... B. longipaniculata

3 Pedicellate spikelets about as long as the sessile spikelets.

6 Rachises longer than the branches .............................................................................. B. bladhii

6 Rachises shorter than the branches.

7 Lower glumes of the sessile spikelets with a dorsal pit ........................................... B. pertusa

7 Lower glumes of the sessile spikelets without a dorsal pit ....................................... B. ischaemum var. songarica

* Bothriochloa barbinodis (Lagascay Segura) Herter, Cane Bluestem, Pinhole Bluestem. Disturbed areas; native of w. United States. [= FNA, K; > Bothriochloa perforata (Trinius ex E. Fournier) Herter – Z; = Andropogon barbinodis Lagasca y Segura – HC; > Bothriochloa barbinodis (Lagascay Segura) Herter var. perforata (Trinius ex E. Fournier) Gould; > Andropogon perforatus Trinius ex E. Fournier]

* Bothriochloa bladhii (Retzius) S.T. Blake, Australian Bluestem. Disturbed areas; native of subtropical Asia and Africa. Reported from e. TN (according to specimen cited by FNA and Z) and Alachua County, FL (immediately south of our area). [= FNA, K, WH, Z] (synonymy incomplete)

* Bothriochloa longipaniculata* (Gould) Allred & Gould, Longspike Silver Bluestem. Disturbed areas; native of LA to TX, south to Mexico and Panama. [= FNA, K]

* Bothriochloa pertusa* (Linnaeus) A. Camus, Pitted Bluestem. Disturbed areas; native of Eurasia. Introduced at scattered sites in e. North America, including FL, LA, MD, and MS (FNA, Kartesz 1999). [= FNA, K, Z; = *Andropogon pertusus* (Linnaeus) Willdenow – HC] [FL] [synonymy incomplete]

---

**Bouteloua** Lagasca y Segura 1805 (Gramina)

1 All spikelets unisexual, plants usually dioecious; [introduced species].......................................................... *B. dactyloides*

2 Panicle branches deciduous; disarticulation occurring at the base of the branch (the branch therefore falling whole); spikelets 2-3 per branch, appressed to the branch; [native species of limestone habitats, also with introduced populations]; [subgenus *Bouteloua*] ..........

3 Panicle branches extending beyond the base of the terminal spikelets ...................................................... *B. gracilis*

**Bouteloua curtipendula** (Michaux) Torrey var. *curtipendula*, Side-oats Grama. Dry rocky slopes and bluffs over calcareous rocks (such as limestone) or ultramafic rocks (such as serpentine), limestone glades. July-September. S. CT west to MT, south to VA, e. TN, nw. GA, AL, Panhandle FL (Gadsden County), TX, AZ, and CA; also in Central and South America. The older literature refers to *B. curtipendula* as introduced in SC, but the single specimen documenting its occurrence there appears to be from experimental plantings at Clemson University; there is apparently no evidence of its establishment. *B. curtipendula* occurs on serpentine in the Piedmont of GA (Allison, pers. comm.). Var. *caespitosa* Gould & Kapadia is cespitose rather than rhizomatous and occurs in sw. United States. [= C, FNA, K, Y; < *B. curtipendula* – RAB, F, G, HC, S, W, WV]

**Brachyelytrum** Palisot de Beauvois 1812 (Shorthusk)

1 Lemmas hirsutulous or minutely scabrous, the longest hairs (0.06-) 0.08-0.14 (0.2) mm long (not evident at 10×); lemma (0.7-) 0.8-1.2 (-1.4) mm wide; widest leaf blade (8-) 10-14 (-16) mm wide; second glume (0.6-) avg. 1.2 (-3.0) mm long; [Mountains] .................. *B. aristosum*

2 Lemmas hirsute with hairs (0.2-) 0.4-0.8 (0.9) mm long (easily seen at 10×); lemma (0.8-) 1.1-1.5 (-1.8) mm wide; widest leaf blade (9-) 11-17 (-20) mm wide; second glume (0.2-) avg. 2.2 (7.0) mm long; [widely distributed in our area] ...................... *B. erectum*

**Brachyelytrum aristosum** (Michaux) Trelease in Branner & Coville, Northern Shorthusk. Moist forests, mostly at moderate to high elevations, such as northern hardwoods and spruce-fir. July-August. NL (Newfoundland), QC, ON, and MN south to n.

* Brachypodium sylvaticum (Hudson) Palisot de Beauvois ssp. sylvaticum, Slender False Brome. Roadside and yards; native of Europe. [= FNA; < B. sylvaticum – HC, K]

Briza Linnaeus 1753 (Quaking Grass)

1 Plant perennial; ligules ca. 0.5 mm long...................................................................................................................... B. media
1 Plant annual; ligules 3-13 mm long............................................................................................................................... B. maxima
2 Spikelets 10-20 mm long............................................................................................................................................. B. minor
2 Spikelets 2-7 mm long................................................................................................................................................ B. minor

* Briza maxima Linnaeus, Greater Quaking Grass. Disturbed areas; native of the Mediterranean region. Reported in e. GA (Jones & Coile 1988). [= FNA, KI] [synonymy incomplete]

Bromus Linnaeus 1753 (Brome-grass)

1 Lemmas compressed and strongly keeled (the whole spikelet thus strongly laterally flattened); first glume 3-9-nerved; [section Ceratochloa] . ................................................................................................................................................................. B. kalmii
1 Lemmas rounded or weakly keeled (the whole spikelet therefore terete to somewhat laterally flattened); first glume either 3-5-nerved or 1-3-nerved.
2 First glume 3-5 nerved (at least 3 nerves well-developed).
   3 Lemma awn 2-3 mm long; plant perennial; [native species of dry woodlands]; [section Bromopsis] ................................................................................................................................................................................ B. commutatus
   3 Lemma 3-12 mm long or (0-6 mm long in B. secalinus); plant annual; [introduced species of disturbed habitats]; [section Bromus].
   4 Panicle compact, the lateral branches erect or ascending, the pedicels < 10 mm long (shorter than the spikelets)
   5 Lemmas 3-5 mm wide; inflorescence ovoid in outline .................................................................................................. B. hordeaceus ssp. hordeaceus
   5 Lemmas 1.5-2 mm wide; inflorescence obvoid in outline .................................................................................................. B. scoparius
   4 Panicle relatively open, the lateral branches erect, ascending, or spreading, the pedicels > 15 mm long (longer than the spikelets)
   6 Margins of the lemmas involute in fruit, wrapping around the grain, exposing the rachilla ............................................................................................................................................................................. B. secalinus
   6 Margins of the lemmas gaping, overlapping in fruit.
   7 Panicle branches erect or ascending, relatively stiff and straight ................................................................................... B. racemosus
   7 Panicle branches spreading (at least the lower), either relatively stiff and straight, or flexuous and lax.
   8 Panicle branches stiff; lemma awns 5-12 mm long, straight ...................................................................................... B. commutatus
   8 Panicle branches flexuous and lax; lemma awns 7-15 mm long, flexuous ................................................................................... B. japonicus
2 First glume 1 (-3) nerved (only 1 nerve well-developed).
POACEAE

9 Longer lemma awns 10-60 mm long; plants annual; [introduced species of disturbed habitats]; [section Genea].
10 Panicle dense, spikelet-like .................................................. *B. rubens*
10 Panicle open, not spikelet-like.
11 First glume 13-20 mm long; second glume 20-30 mm long; lemma awns 35-60 mm long ...................... *B. rigidus*
11 First glume 5-14 mm long; second glume 8-17 mm long; lemma awns 10-30 mm long.
12 First glume 7-14 mm long; second glume 9-17 mm long; lemma awns 18-30 mm long .......................... *B. sterilis*
12 First glume 5-7 mm long; second glume 8-11 mm long; lemma awn (7-) 10-17 mm long .................... *B. tectorum*
9 Longer lemma awns 1-6 (8-) mm long; plants perennial; [native and introduced species, collectively disturbed and natural habitats]; [section Bromopsis].
13 Plants with creeping rhizomes, forming clonal colonies; both surfaces of leaves glabrous or glabrescent ............... *B. inermis*
13 Plants not strongly rhizomatous, the stems solitary or tufted; surfaces of leaf blades usually pubescent (sometimes sparsely so).
14 Pedicels erect or ascending, mostly shorter than the spikelet; leaves 2-3 mm wide; [introduced, of disturbed habitats] ....... *B. erectus*
14 Pedicels ascending at first, later arching-drooping, mostly longer than the spikelet; leaves 4-15 mm wide; [native, mostly of forests]
15 Lemmas glabrous (or very minutely pubescent) on the back, hairy along the lower margins with long hairs ........... *B. ciliatus*
15 Lemmas uniformly hairy over the entire back-surface (or rarely entirely glabrous).
16 Culms with 10-20 leaves, often weak and leaning or reclining; junction of sheaths and base of leaf blades with 2 well-developed flanges prolonged into auricles or divergent spurs; second glume primarily 5-nerved; flowering late, with anthesis August-October ................................................................. *B. laitiglumis*
16 Culms with 6-10 leaves, erect; junction of sheaths and base of leaf blades lacking flanges or auricles; second glume primarily 3-nerved; flowering earlier, anthesis from May-August.
17 Underleaf surfaces lacking a conspicuous satiny sheen; summit of sheath opposite the ligule lacking a conspicuous tuft of hairs .................................................................................................................. *B. nottowayanus*
17 Underleaf surfaces lacking a conspicuous satiny sheen; summit of sheath opposite the ligule lacking a conspicuous tuft of hairs .................................................................................................................. *B. pubescens*

* **Bromus arvensis** Linnaeus. Disturbed areas; native of Europe. Reported as introduced for nc. GA (Jones & Coile 1988), for VA, MD, PA, and NJ (Kartesz 1999), and for KY (Campbell 2007). [= C, F, FNA, HC, K] {not yet keyed}

* **Bromus ciliatus** Linnaeus. Fringed Brome. Seepage areas, edges of fens, moist areas near high elevation creeks, grassy balds, high elevation woodlands, mostly over mafic or calcareous rocks. July-August. Widespread in n. North America: NL (Labrador) to AK, south in the east to PA, and in the mountains to NC. Known in NC only from Bluff Mountain and Long Hope Valley, Ashe and Watauga counties, and Roan Mountain, Mitchell County. [= RAB, C, FNA, G, HC, S, W, WV, X, Y; > Bromus ciliatus var. ciliatus – F, K; = Bromopsis ciliata (Linnaeus) Holub]

* **Bromus commutatus** Schrader. Hairy Chess, Meadow Brome. Disturbed areas; native of Europe. May-June. The relationship and relative distribution of this species and *Bromus racemosus* is poorly known for our area. See *Bromus racemosus* for further comments. [= C, F, FNA, HC, K, S, WV, X, Y; < Bromus commutatus – RAB (also see *Bromus racemosus*); < Bromus racemosus – G, W]

* **Bromus erectus** Hudson. Short-branchered Brome. Disturbed areas; native of Europe. [= C, F, FNA, G, HC, K, S, WV, X; = Bromopsis erecta (Hudson) Fourrier]

* **Bromus inermis** Leysser, Smooth Brome, Hungarian Brome. Disturbed areas; native of Europe. June-July. [= RAB, C, FNA, G, HC, S, W, WV, X, Y; > Bromus inermis var. inermis – F; > Bromus inermis ssp. inermis var. inermis – K; = Bromopsis inermis (Leysser) Holub]
POACEAE

* **Bromus kalmii** A. Gray, Kalm Brome, Canada Brome. Forests and woodlands, shale woodlands and barrens, grassy ridgetop oak forests. ME west to SD, south to VA, and IA. Distinctive for its few leaves (usually 3-4) clustered near the base, the spikelets large and approximate to one another in a narrow, nodding panicle. [= C, F, FNA, G, HC, K, X]  

* **Bromus latiglumis** (Shear) A.S. Hitchcock, Riverbank Brome, Auricled Brome, Hairy Woodbrome. Alluvial soils along rivers. August-October. Widespread in NE North America, from ME to MT, south to NC and OK. Flowering many weeks later than co-occurring *B. pubescens*. In NC apparently only along large rivers flowing west through the Appalachians into the Mississippi River drainage, notably the New and the French Broad. [= F, FNA, G, HC, K, X; < *Bromus purgans* Linnaeus – RAB; = *Bromus altissimus* Pursh – C; < *Bromus latiglumis* – Y (also see *Bromus nottowayanus*)]

* **Bromus nottowayanus** Fernald, Satin Brome, Nottoway River Brome, Virginia Brome. Moist forests, especially along small stream bottoms. June-August. The range of this species is poorly known, owing to confusion between it, *B. pubescens* and *B. latiglumis*. It is apparently known from MD, VA, and NC, west to TN, IL, IN, MO, and AR. McKenzie & Ladd (1995) report on the biology and taxonomy of this species. [= C, F, FNA, HC, K, X; < *Bromus purgans* Linnaeus – RAB; < *Bromus latiglumis* – Y; = *Bromopsis nottowayana* (Fernald) Holub]

* **Bromus pubescens** Muhlenberg ex Willdenow, Common Eastern Brome, Canada Brome. Mesic forests, generally on rocky slopes. May-August. Widespread in e. North America: s. ON west to AB, south to FL and AZ. [= C, FNA, K, W, X, Y; < *Bromus purgans* Linnaeus – RAB; < *Bromus latiglumis* – Y, misapplied (also see *Bromus nottowayanus*); = *Bromus purgans* Linnaeus – F, G, WV, misapplied; > *Bromus purgans* var. *purgans* – HC; > *Bromus purgans* var. *laeviglumis* (Scribner ex Shear) Swallen – HC; = *Bromus laeviglumis* – S, misapplied (?); = *Bromopsis pubescens* (Muhlenberg ex Willdenow) Holub]

* **Bromus racemosus** Linnaeus, Smooth Brome. Disturbed areas; native of Europe. May-June. The relative distribution, abundance, and habitats in our area of this species and *B. commutatus* poorly understood. Additional characters are as follows (from Stace 2010): lemmas 7-9 mm long (vs. 7.5-11 mm long in *B. commutatus*), anthers 1.5-3.5 mm long (vs. 1.3-2.5 mm long), spikelets 10-18 mm long (vs. 15-30 mm long), all panicle branches <4 cm long (vs. some panicle branches > 4 cm long). [= C, F, FNA, HC, K, X; < *Bromus commutatus* – RAB; < *Bromus racemosus* – G, W (also see *Bromus commutatus*)] [not yet mapped]

* **Bromus rubens** Linnaeus, Foxtail Chess, Red Brome. Waste areas near wool-combing plants, other disturbed areas; native of Mediterranean Europe. The SC occurrences come from areas around wool-combing plants, and were likely introduced on wool from w. United States, where this European species is well-established. Reported introduced in VA and MD (Kartesz 1999) as *B. madritensis*. [= C, FNA, G, X; ? *Bromus madritensis* Linnaeus – F, misapplied; < *B. rubens* – K; < *B. madritensis* Linnaeus – K; = *Bromus madritensis* ssp. *rubens* (Linnaeus) Husnot]

* **Bromus scoparius** Linnaeus, Broom Brome. Disturbed areas; native of s. Europe. [= FNA, K] [add to synonymy]

* **Bromus squarrosus** Linnaeus, Squarrose Brome. Reported for KY and NJ (Kartesz 1999). Native of Eurasia. [= FNA, K] [not yet keyed]

Calamagrostis Adanson 1763 (Reed-grass)

A genus of about 230 species, north and south temperate. References: Marr, Hebd, & Greene in FNA (2007a); Tucker (1996)=Z; Greene (1980). Key based on FNA.

1 Callus hairs > 1.3× as long as the lemma; rachilla prolonged beyond the palea; [rare introduction from s. NJ northwards] .............................................. *C. epigejos*

1 Callus hairs < 1.2× as long as the lemma; rachilla not prolonged beyond the palea; [natives, sometimes weedy, widespread].

2 Awns attached on the upper 2/5 of the lemmas, 0.5-2 mm long, straight .......................................................................................... *C. coarctata*

2 Awns attached on the lower 1/5 of the lemmas, 0.9-6 mm long, straight or bent.

3 Awns usually exerted, (2.8-) 3-6 mm long; callus hairs 0.3-0.7× as long as the lemma.

4 Leaves (1-) 2-3 (-4) mm wide; plant densely tufted, delicate, culms 10-55 (-60) cm tall, with 2-3 nodes; [high elevation rock outcrops and glades] .......................................................................................... *C. cainii*

4 Leaves (2-) 3-8 (-12) mm wide; plant rhizomatous or loosely tufted, coarse, culms (60-) 75-120 cm tall, with 3-5 nodes; [low to moderate elevation forests and woodlands].

5 Leaves glaucous above and below, leaf collars glabrous ........................................................................................................... *C. porteri* ssp. insperata

5 Leaves glaucous above, dark green below; leaf collars with prominent tufts of hairs ........................................................................... *C. porteri* ssp. porteri

3 Awns usually not exerted, 0.9-3.1 (-4) mm long; callus hairs (0.5-) 0.7-1.2 (-1.5)× as long as the lemma.

6 Callus hairs < 1 mm long, 0.2-0.3× as long as the lemma ........................................................................................................... *C. pickeringii*

6 Callus hairs > 1 mm long, (0.5-) 0.7-1.2 (-1.5)× as long as the lemma

7 Glumes smooth (or scabrous on the keel only); awns stout, readily distinguished from the callus hairs ........................................................................................................... *C. stricta* ssp. inexpansa

7 Glumes scabrous on the keel and often also the surface; awns delicate, difficult to distinguish from the callus hairs.

8 Spikelets 2.5-4 mm long; lemmas usually shorter than the glumes; glumes rounded to broadly keeled, with raised midveins; glume apices usually acute, rarely acuminate .......................................................... *C. canadensis* var. canadensis

8 Spikelets 2-3 mm long; lemmas usually about as long as the glumes; glumes rounded, midveins not raised; glume apices acute ........................................................................................................... *C. canadensis* var. macouniana

Calamagrostis cainii A.S. Hitchcock, Cain's Reed-grass. High elevation rocky summits. July-September. Endemic to a few mountain-tops in the Southern Appalachians, *C. cainii*, once thought to be endemic to Mount LeConte, TN, was discovered at two sites in NC in 1989 and 1990 – Mount Craig, Yancey County, and Craggly Pinnacle, Buncombe County (Wiser 1991). This species is more likely to be mistaken (especially superficially) for an *Agrostis* than for any of the other *Calamagrostis* in our area, but is distinguishable by its larger spikelets (5-6 mm long, rather than 1.3-2 mm) and the presence of a callos beard. [= FNA, HC, K, W, Z]

Calamagrostis canadensis (Michaux) Palisot de Beauvois var. canadensis, Bluejoint, Canada Reed-grass. Wet meadows along streams, high elevation openings, such as grassy balds and cliff bases. August. Widespread and common across n. North America, reaching its southern limit in the east in w. NC, e. TN (Chester et al. 1993), and ne. GA (Rabun Bald, Rabun County). [= FNA, G, HC, K; < C. canadensis – RAB, C, S, W, WV, Z; > C. canadensis var. canadensis – F; > C. canadensis var. robusta Vasey – F]

Calamagrostis canadensis (Michaux) Palisot de Beauvois var. macouniana (Vasey) Stebbins. Bottomlands. NL (Newfoundland) and AB south to NJ, PA, VA?, OH, w. KY, IL, MO, NE, WY, OR. Reported for VA (FNA), the documentation unknown. Reported south to NJ and KY only (Kartesz 1999). [investigate] [= F, FNA, G, HC, K; < C. canadensis – C, Z; = C. macouniana (Vasey) Vasey]

Calamagrostis coarctata Eaton, Nuttall's Reed-grass. Savannas, bogs, and other wet sites. July-October. ME and NY south to n. GA (Jones & Coile 1988), AL, and LA, primarily on the Coastal Plain. The replacement of the familiar name *C. cinnoides* is necessary for nomenclatural reasons (Kartesz 1999); a proposal may be made to conserve the name *C. cinnoides* (Barkworth, pers. comm., 2009). [= K; = C. cinnoides (Muhlenberg) W.P.C. Barton – RAB, C, F, FNA, G, GW, HC, S, W, WV, Z; = C. coarctata Eaton – K]

* Calamagrostis epigejos (Linnaeus) Roth, Bushgrass, Feathertop. Disturbed areas; native of Eurasia. [= C, G, FNA; = C. epigejos – HC; > C. epigejos var. epigejos – F, K2; > C. epigejos var. georgica (K. Koeh) Grisebach – F, K2]

Calamagrostis pickeringii A. Gray, Pickering's Reed-grass. Bogs. NL west to ON, south to NY and s. NJ. [= C, F, FNA, G, HC]
POACEAE

Calamagrostis porteri A. Gray ssp. porteri. Porter’s Reed-grass. Dry to dry-mesic forests, forest edges, cliff bases. NY to AL, in the Appalachians, with disjunct populations s. MO and w. AR; it was first reported from NC by Ware (1973). This species is typically sterile unless disturbed by fire or mechanically; it is therefore probably more common than collections indicate. In addition to the key characters above, it can be distinguished from C. canadensis by its having leaf sheaths pubescent at the summit (Matthews & Radford 1985). [= FNA, K; = C. porteri – C, HC, W, WV; ? C. porteri – G, Z]

Calamagrostis porteri A. Gray ssp. insperata (Swallen) C.W. Greene. Rock outcrops; rocky woodlands. OH and MO south to TN and AR. [= FNA, K; = C. insperata Swallen – C, HC]

Calamagrostis stricta (Timm) Koeler ssp. inexpansa (A. Gray) C.W. Greene. Mt (WV): [habitat]. NL (Newfoundland) and NL (Labrador) west to AK, south to NY, OH, n. WV (Preston and Randolph counties), IA, AZ, and CA; ne. Asia. [= FNA, K; < C. stricta – C; ? C. neglecta (Ehrhart) Gaertner, Mey., & Scherb. var. neglecta – F; = C. inexpansa A. Gray – G, HC]

Calamovilfa (A. Gray) Hackel ex Scribner & Southworth 1890 (Sandreed)

A genus of 5 species, of e. and c. North America. Reeder & Ellington (1960) studied various anatomic features of Calamovilfa, and determined that its closest relative was Sporobolus. A molecular phylogenetic study of Sporobolus and closely related genera suggests that Calamovilfa should be included in Sporobolus (Ortiz-Diaz & Culham 2000). References: Thieret in FNA (2003a); Thieret (1966)=Z. Key based in part on Thieret in FNA (2003a).

Identification notes: Superficially somewhat similar to Sporobolus pinetorum, S. floridanus, and S. curtissii (herbarium specimens of the two species have been regularly confused), Calamovilfa is distinguished by its leaves tapered to either end and long-acuminate (vs. parallel-margined and abruptly acute in Sporobolus) and tendency to form larger, clonal patches (Sporobolus forms wiregrass-like bunches or clumps). In flower or fruit, the Calamovilfa can be distinguished by characters of the spikelet, by vegetative characters, or by its coarser, generally taller culms, with the panicle branches usually spreading (rather than always ascending in Sporobolus). The three have very similar bases, unlike any other grasses in our area — the lower leaf sheaths are indurated and shiny, forming a hard, polished, knotty, and fire-proof covering over the short-creeping rhizome. Aristida stricta has a somewhat similar base, but less indurated, less creeping, and with an unpolished appearance. Calamovilfa brevipilis also has a cartilaginous, pale yellow annulum surrounding the outer (abaxial) surface of the juncture of the sheath and leaf, a structure not visible in the other species. Positive identification in sterile condition is not difficult.

1 Panicles narrow, the branches appressed-ascending; [Coastal Plain of FL] ............................................................................................... C. curtissii
1 Panicles broad, the branches ascending-spread; [either of the Coastal Plain of SC northwards, or of the interior].

2 Spikelets 6.0-7.4 mm long; glumes acute to acuminate, usually arcuate; lemmas 5.5-7.0 mm long, usually arcuate; [river scour areas in the rocky inland parts of the South] ........................................................................................................................................................... C. arcuata
2 Spikelets 4.0-5.8 mm long; glumes acute, straight; lemmas 4.0-5.4 mm long, straight; [pineland habitats of the Coastal Plain of SC northwards] ........................................................................................................ C. brevipilis

Calamovilfa arcuata K.E. Rogers, Cumberland Sandreed. Riverside scours. Ouachita Mountains of w. AR and e. OK; Cumberland Plateau of TN (Morgan and Cumberland counties), KY (McCrea County), and AL (Blount County). [= FNA, K]

Calamovilfa brevipilis (Torrey) Scribner, Pinebarren Sandreed. Savanna-pocosin ecotones, sandhill seepage bogs, pocosins, boggy powerline rights-of-way. June-October. A "bimodal endemic", with two areas of distribution: Pine Barrens of NJ and the Coastal Plain (very rarely lower Piedmont) of e. NC, n. SC, and s. VA. Var. heterolepis Fernald, no longer considered valid, refers to the NC-SC-material; var. calvipes Fernald, no longer considered valid, refers to the VA material. Like Aristida stricta, this grass is dependent on fire for flowering (it will also sometimes flower in response to mowing or other disturbance). Suppression of the natural fire regime has led to its substantial decline and the severe contraction of its range in the Southeast, since fire exclusion in its seepage or ecotone habitat leads to rapid invasion by shrubs and competitive elimination of Calamovilfa and many other herbs. [= RAB, C, FNA, G, GW, K, S, Z; > C. brevipilis var. brevipilis – F, HC; > C. brevipilis var. heterolepis Fernald – HC; > C. brevipilis var. calvipes Fernald – F, HC]

Calamovilfa curtissii (Vasey) Scribner, Curtiss’s Sandreed. Moist pinelands and edges of natural ponds. FL Panhandle and e. peninsular FL. C. curtissii is a closely related sibling species of C. brevipilis. [= FNA, GW, HC, K, S, Z]
POACEAE

Cenchrus Linnaeus 1753 (Burgrass, Sandspur)

A genus of about 16 species, primarily tropical and subtropical. References: Stieber & Wipff in FNA (2003a); Ward (2010b)=Y; Crins (1991)=Z. Key based in part on FNA.

Identifications note: Spikelets of Cenchrus are subtended by an involucre of spines and/or bristles which are (in most of our species) fused into a bur. Bristles are narrow-based and somewhat flattened (not terete) in cross-section, at least basally.

1 Panicle branches short, erect or ascending; spikelets 5-18 mm long, with 2-8 (-11) flowers.
2 Spikes in a single whorl, subtended by numerous smaller, narrower, free outer bristles.
3 Spines fused at the base only, the lower surfaces with 1-3 grooves..........................Cenchrus bisonii
4 Rachis internodes 0.8-1.7 mm long; most of the outer bristles equal to or slightly longer than the flattened inner bristles (spines)..........................Cenchrus echinatus
5 Rachis internodes 2-4 mm long; most of the outer bristles much shorter than the flattened inner bristles (spines)..........................Cenchrus longispinus
6 Rachis internodes 0.8-1.7 mm long; the lower surfaces not grooved.
7 Spines slender, 45-75, 3.5-7 mm long; spikelets 6-8 mm long..............................C. incertus
8 Spines stout, 6-10 (-40), 2-5 mm long; spikelets 3.5-6 mm long..............................C. nitidum
9 Spikes slender, 4-12 mm long, 2-3 mm wide; spikelets 6-8 mm long..............................C. latifolium

* Cenchrus biflorus Roxburgh, Indian Sandbur. Disturbed areas, ballast; native of Africa and s. Asia. Reported from ballast in Mobile, AL; perhaps only a waif. [= FNA, HC]
*? Cenchrus brownii Roemer & J.A. Schultes. Disturbed areas, maritime grasslands. Se. United States (NC, GA, AL, and FL); West Indies, Central America, n. South America. The sole known NC specimen was collected in 1885 by Gerald McCarthy in NC “in locis navalibus et vastis.” [= FNA, K, WH, Y; ? C. viridis Sprengel – HC, S, misapplied]
Cenchrus echinatus Linnaeus, Southern Sandspur, Bristly Sandspur, Hedgehog Grass. Fields, roadsides, disturbed areas. June-October. NC (and DC?) south to FL, west to CA, south into the tropical America. The basis for the record for w. VA in FNA is not clear. [= RAB, C, FNA, HC, K, S, WH, Y, Z]
Cenchrus gracillimus Nash, Sandhill Sandspur. Longleaf pinelands, other sandy habitats. N. FL, s. and e. GA, s. AL, and s. MS; West Indies (Cuba, Jamaica). [= FNA, HC, K, S, WH, Y]
Cenchrus incertus M.A. Curtis, Coastal Sandspur. Fields, roadsides, disturbed areas. July-October. VA south to FL, west to AR and KS, south into tropical America. Ward (2010b) argues convincingly that the name C. spinifex is very uncertainly applied to our species and should not be taken up. [= RAB, C, F, G, HC, S, Y, Z; = C. spinifex Cavanilles – FNA, K]
Cenchrus longispinus (Hackel) Fernald, Northern Sandspur, Common Sandspur. Fields, roadsides, disturbed areas, lawns. June-October. ME west to OR, south to FL, TX, and CA. [= RAB, C, F, FNA, K, W, Z; = C. pauciflorus Bentham – G, HC, S, WV, misapplied]
* Cenchrus myosuroides Kunth. Roadsides, disturbed areas; native of further south. December. SC south to FL, west to TX, south into the West Indies and other parts of tropical America. [= RAB, FNA, HC, K, S, W, WH, Y, Z]

Chasmanthium Link 1827 (Spanglegrass, Spikegrass)

1 Panicle branches elongate, pendulous; spikelets (15-) 20-40 mm long, with 6-20 flowers..........................C. latifolium
2 Fully-developed spikelets 12-18 mm long, 8-12 mm wide.
3 Axils of the spikelets and panicle branches glabrous; empty lemmas 9 (-12); [se. NC south to c. peninsular FL and e. FL Panhandle]..........................C. nitidum
3 Axils of the spikelets and panicle branches with a tuft of long hairs; empty lemmas 2-4; [w. FL Panhandle west to e. LA (Florida parishes)] ............................................................................................................................................................................................  C. ornithorhynchum

2 Fully-developed spikelets 4-9 mm long, 3-7 mm wide.

4 Collar (junction of leaf and sheath) glabrous or nearly so; leaves 3-7 mm wide .................................................. C. laxum

4 Collar (junction of leaf and sheath) pilose; leaves 6-12 mm wide.

5 Inflorescence with divergent branches; [outer Coastal Plain calcareous sites from SC southwards] .....................  C. sessiliflorum var. 1

5 Inflorescence with appressed branches; [more widespread in our area] .................................................. C. sessiliflorum var. sessiliflorum

Chasmanthium latifolium (Michaux) Yates, River Oats, Fish-on-a-pole. Riverbanks, streambanks, bottomland forests, seepages and glades over mafic or calcareous rock, usually in nutrient-rich soils. June-October. NJ, OH, IL, and KS south to FL and TX. [= C, FNA, GW, K, W, Z; = Uniola latifolia Michaux – RAB, F, G, HC, S, WV]

Chasmanthium laxum (Linnaeus) Yates, Slender Spikegrass. Savanna-pocosin ecotones, sandhill-pocosin ecotones, moist hardwood swamps, other moist habitats. June-October. Widespread in se. North America, north to s. NY, KY, and OK. See C. sessiliflorum for comments on the suggestion that these two taxa are only varietally distinct. [= C, FNA, GW, K, W, Z; = Uniola laxa (Linnaeus) Britton, Sterns, & Poggenburg – RAB, F, G, HC, S; = Chasmanthium laxum var. laxum]

Chasmanthium nitidum (Baldwin) Yates, Shiny Spanglegrass. Blackwater swamp forests. September-November. A Southeastern Coastal Plain endemic: se. NC south to c. FL and west to se. AL. [= FNA, GW, K, Z; = Uniola nitida Baldwin – RAB, HC, S]

Chasmanthium ornithorhynchum (Steudel) Yates, Birdbill Spikegrass. Blackwater swamp forests. S. AL and w. FL Panhandle west to e. LA (Florida Parishes). Also reported for NC and SC (FNA 2003a). {investigate} [= FNA, GW, K, W, Z; = Uniola ornithorhyncha Steudel – S]

Chasmanthium sessiliflorum (Poiret) Yates var. 1, Coastal Hammock Longleaf Spikegrass. Calcareous hammocks. August-October. An additional taxon warrants recognition: it is characterized by divergent panicle branches and occurs in outer Coastal Plain calcareous sites (J. Allison, pers. comm.). [< Chasmanthium sessiliflorum (Poiret) Yates – C, FNA, GW, K, Z; < Uniola sessiliflora Poiret – RAB, F, G, HC; < Uniola longifolia Scribner – S; < Chasmanthium laxum (Linnaeus) Yates var. sessiliflorum (Poiret) L. Clark]

Chasmanthium sessiliflorum (Poiret) Yates var. sessiliflorum, Longleaf Spikegrass. Moist hardwood forests, swamps, other moist habitats. August-October. Widespread in se. North America, north to se. VA, TN, AR, and OK. This species and C. laxum are morphologically somewhat similar, but their treatment as varieties of a single species is completely unwarranted. They frequently co-occur (especially on the Gulf Coastal Plain), growing side by side, and show no sign of intergradation. [< Chasmanthium sessiliflorum – C, FNA, GW, K, W, Z; < Uniola sessiliflora Poiret – RAB, F, G, HC; < Uniola longifolia Scribner – S; < Chasmanthium laxum (Linnaeus) Yates var. sessiliflorum (Poiret) L. Clark]

Chloris Swartz 1788 (Finger-grass, Chloris)

A genus of 55-60 species, annuals or perennials, mainly tropical and Southern Hemisphere. References: Barkworth in FNA (2003a). [also see Eustachys]. Key based partly on C.

1 Inflorescence verticillate, typically the panicle branches in 2-5 verticils; perennial; fertile lemma inconspicuously appressed-pilose; spikelets not imbricate ............................................................................................................................................................................................  C. verticillata

1 Inflorescence digitate, the panicle branches in a single verticil at the apex of the culm; annual; lemma conspicuously long-ciliate; spikelets imbricate .......................................................................................................................................................................................................................  C. virgata

* Chloris barbata Swartz, Swollen Windmill-grass. Cp (SC): disturbed areas, waste areas near wool-combing mills; rare, native of West Indies, e. Mexico, Central America, and South America. [= FNA, K1, K2] [FL] [not yet keyed]

* Chloris verticillata Nuttall, Windmill-grass. Cp (DE), Mt (VA, WV), {SC}: disturbed areas, bottomland fields; uncommon (rare in SC, VA, and WV), native of further west. [= C, F, G, HC, K]

* Chloris canterae Arechavaleta var. canterae, Paraguayan Windmill-grass. Cp (GA): disturbed ground; rare, native of Paraguay. The epithet was originally spelled “canterae,” but should be corrected to the genitive “canterae” by the provisions of the ICBN. [= K2; = C. canterei Arechavaleta var. canterae – K1; < C. canterae – HC, orthographic variant] [not yet keyed]

* Chloris canterae Arechavaleta var. grandiflora (Rosengurtt & Izaguirre deArtucio) D.E. Anderson, Paraguayan Windmill-grass. Cp (SC): waste areas near woof-combing mills; rare, perhaps only a waif, native of Paraguay. [= K2; = C. canterei Arechavaleta var. grandiflora (Rosengurtt & Izaguirre deArtucio) D.E. Anderson – K1; < C. canterae – HC, orthographic variant] [not yet keyed]

* Chloris coccullata Bisch. Cp (FL, SC): waste areas near woof-combing mills, other disturbed areas; rare, perhaps only a waif, native of sc. United States and Mexico. [= K1] [not keyed]

* Chloris divaricata R. Brown. Cp (SC): waste areas near woof-combing mills; rare, perhaps only a waif, native of {}. [= K1] [not keyed]

* Chloris gayana Kunth, Rhodes Grass. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, perhaps only a waif, native of Africa. [= F, HC, K1, S] [not keyed]

* Chloris pectinata Bentham. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of {}. [= HC, K1] [not keyed]

* Chloris truncata R. Brown, Stargrass. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of Australia. [= HC, K1] [not keyed]

Chrysopegon Trinius 1820 (Goldbeard)

A genus of about 26 species, tropical and subtropical, all species except C. pauciflorus native to the Old World. References: Hall & Thieret in FNA (2003a); Veldkamp (1999).

Chrysopegon pauciflorus (Chapman) Bentham ex Vasey, Florida Goldbeard, Florida Rhaphis. Cp (FL, NC): sandhill; rare (NC Watch List), perhaps only introduced. FL and Cuba; its occurrence in se. NC (at Carolina Beach State Park) is plausible either as a native, disjunct occurrence or as an introduction. [= FNA, HC, K; = Rhaphis pauciflorus (Chapman) Nash – S]

Cinna Linnaeus 1753 (Woodreed)

1 Spikelets (3.5-) 4-6 (-7.5) mm long; glumes firm, subherbaceous, rather dull, hyaline only narrowly and marginally, the upper glume prominently 3-nerved.---------------------------------------------------------------C. arundinacea

1 Spikelets (2-) 2.5-4 (-5) mm long; glumes (at least the first and sometimes the second as well) glistening, hyaline except the midrib, the upper glume 1-nerved (very rarely 3-nerved) ........................................................................................................C. latifolia

Coelorachis Bronnriottie 1831 (Jointgrass)

A genus of about 20 species, widespread in the Old World and New World tropics and subtropics. Generic circumscription has been controversal and uncertain. References: Allen in FNA (2003a); Veldkamp, Koning, & Sosef (1986)–Z.

1 Culms round in cross-section ..............................................................................................................................................................C. cylindrica

1 Culms compressed-keeled in cross-section.

2 Lower glume with rectangular pits ...................................................................................................................................................C. tesselata

2 Lower glume smooth or with transverse ridges.

3 Lower glume smooth. ......................................................................................................................................................................C. tuberculosa

Coelorachis rugosa (Nuttall) Nash, Wrinkled Jointgrass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA): limesink ponds (dolines), depression meadows, clay-based Carolina bays, wet savannas, disturbed areas (such as seeps in powerline rights-of-

* Coix lacryma-jobi Linnaeus, Job's-tears, reported for se. PA by Rhoads & Klein (1993), TN (Thieret in FNA 2003a), and NJ (Kartesz 1999). [= FNA, K]

Coleataenia Grisebach 1879

1 Glumes and sterile lemmas not keeled along midvein; apices of fertile lemmas glabrous; panicle < 1 cm wide, 3-12 cm long; leaf blades 4-19 cm long, 1-4 mm wide, involute at maturity; culms wiry................................................................. C. tenera
2 Plants with rhizomes; fertile lemma 1.6-4 mm long.
3 Rhizomes short, usually < 3 cm long; leaves 20-50 cm long, 4-18 mm wide; spikelets 2.5-3.9 mm long, acuminate; first glume with 3-5 green nerves......................................................................................................................... C. anceps ssp. anceps
4 Rhizomes elongate, often > 4 cm long; leaves 10-30 (40) cm long, 2-10 mm wide; spikelets 2.2-2.8 mm long, acute to short-acuminate; first glume with 1-3 green nerves.............................................................. C. anceps ssp. rhizomata
2 Plants with hard crowns, lacking rhizomes; fertile lemma 1.2-1.6 mm long.
4 Ligule of white hairs 0.5-3 mm long; culms to 1 m long; cauline blades 2-8 mm wide, usually pilose adaxially near the base; spikelets 2.0-4.0 mm long.
5 Ligules 1-3 mm long; spikelets 2.0-2.7 mm long, 2.5-4× as long as wide, often obliquely set on the pedicels................................................ C. longifolia ssp. longifolia
6 Ligules 0.5-1.5 mm long; spikelets 2.4-4.0 mm long, 3.5-5× as long as wide, erect on the pedicels............. C. longifolia ssp. combsii
3 Plants with hard crowns, lacking rhizomes; fertile lemma 1.6-4 mm long.
5 Ligules 1-3 mm long; spikelets 2.0-2.7 mm long, 2.5-4× as long as wide; leaf blades 4-12 mm wide, usually glabrous; spikelets 1.6-2.8 mm long.
6 Spikelets 2.4-2.8 mm long, long-acuminate, usually < 0.7 mm wide; fertile lemma often conspicuously stipitate................................................ C. species 1 ssp. elongata
7 Culms to 1 m long; mature panicle ½ to nearly as wide as long, the branches ascending to spreading; spikelets 1.6-2.2 mm long........ C. species 1 ssp. rigidula
6 Spikelets 1.6-2.5 mm long, short-acuminate, usually > 0.7 mm wide; fertile lemma estipitate to short stipitate.
7 Culms to 1 m long; mature panicle ½ to nearly as wide as long, the branches ascending to spreading; spikelets 2.0-2.5 mm long........ C. species 1 ssp. 1

Coeleataenia anceps (Michaux) Soreng ssp. anceps, Beaked Panic Grass. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, FL, NC, SC, VA), [GA]; moist sandy woods, swamps, sloughs, roadside, fields, waste places; common. June-October. NJ w. to IL, s. to FL and TX. The sheaths of ssp. anceps are glabrous to pilose, while those of ssp. rhizomata are often villous; the leaves of ssp. rhizomata also tend to be hairy. [= V; = Sorengia anceps (Michaux) Zuloaga & Morrone ssp. anceps – X; = Panicum anceps Michaux var. anceps – RAB, F, G, Z; = P. anceps – C, GW, K, W; = P. anceps ssp. anceps – FNA; = P. anceps – HC, S, WV]

Coeleataenia longifolia (Torrey) Soreng ssp. combsii (Scribner & C.R. Ball) Soreng, Combs Panic Grass. Cp (DE, FL, GA, NC, SC, VA); pond shores, depression meadows, cypress savannas, marshes, low woods; uncommon (rare in DE and VA). July-October. Scattered on the outer Coastal Plain from se. MA, NJ, se. VA, se. NC, c. SC, c. GA, and FL, west to se. LA. First glumes of ssp. combsii typically are longer than 1.5 mm long, while those of ssp. longifolia are shorter than 1.5 mm long. [= V; = Sorengia longifolia (Torrey) Zuloaga & Morrone ssp. combsii (Scribner & C.R. Ball) Zuloaga & Morrone – X; = Panicum longifolium Torrey var. combsii (Scribner & C.R. Ball) Fernald – RAB, F, G; = P. rigidulum Bosc ex Nees ssp. combsii (Scribner & Ball) Freckmann & Lelong – FNA; = P. rigidulum Bosc ex Nees var. combsii (Scribner & C.R. Ball) Lelong – K, Z; < P. longifolium – C; = P. combsii Scribner & C.R. Ball – HC, S]
POACEAE

Coleataenia longifolia (Torrey) Soreng ssp. longifolia, Long-leaved Panic Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC, VA): wet sandy or peaty soils of bogs, savannas, pond shores, depression meadows; common (uncommon in Piedmont, rare in Mountains). July-October. NS, NH, MA, PA, and IN south to FL, west to TX. See note under ssp. combusi. [= V; = Sorengia longifolia (Torrey) Zuloaga & Morrone ssp. longifolia – X; = Panicum longifolium Torrey var. longifolium – RAB, G; = P. rigidulum Bosc ex Nees ssp. pubescens (Vasey) Freckmann & Lelong – FNA; = P. rigidulum Bosc ex Nees var. pubescens (Vasey) Lelong – K, W, Z; < P. longifolium – C, GW; = P. longifolium var. longifolium – F; > P. longifolium var. pubescens (Vasey) Fernald – F]

Coleataenia species 1 in prep. spp. in prep., Dense Panic Grass. Cp (DE, FL, GA, NC, SC, VA): marshes, meadows, low woods, ditches, stream and pond shores, freshwater tidal shores; uncommon. September-October. Coastal Plain south from se. MA to FL, west to se. TX and AR; West Indies. Usually readily identified by its tall stature and compact inflorescence, somewhat resembling a large MA to FL, west to se. TX and AR; West Indies. Usually readily identified by its tall stature and compact inflorescence, somewhat resembling a large

Cortaderia Stapf 1897 (Pampasgrass)

Crypsis Aiton (Pricklegrass)

Ctenium Panzer 1813 (Toothache Grass)

1 Spikelets with numerous glands in rows on the back of the second glume; plant short-rhizomatous (nearly eesiposite); [widespread in the Coastal Plain].......................................................... Ctenium aromaticum

1 Spikelets with very few or no glands on the back of the second glume; plant rhizomatous (the rhizomes slender and scaly); [see GA and ne. FL]........................................................................................................ Ctenium floridanum

Ctenium aromaticum (Walter) Wood, Toothache Grass, Orange Grass. Cp (FL, GA, NC, SC, VA): wet savannas, pocosin-savanna ecotones, seepage bogs, sandhill-pocosin ecotones, sandhill seeps; common (rare in VA). June-August (or later in response to late summer fires). Southeastern Coastal Plain endemic: se. VA south to FL and west to LA and e. TX (Singhurst, Keith, & Holmes 2005). The entire plant is aromatic and numbs the mouth, tongue, and lips when chewed, hence the specific epithet and common names. Like many species of the longleaf pine ecosystem, toothache grass generally flowers only following
fire (MacRoberts & MacRoberts 1992). Sterile clumps can be recognized by the rather broad, bicolor leaves (bluish on the upper surface, bright green on the lower surface). [= RAB, C, F, FNA, G, GW, HC, K; = Campulus aromatics (Walter) Trinius – S]

POACEAE

2 Lemma awn 4-10 mm long; glumes 9-13 mm long.......................... D. compressa

2 Lemma awn 11-18 mm long; glumes 11-19 mm long.

3 Sheaths villous; lemmas membranaceous in texture, villous on the back and sides; awn twisted at base several times, forming an awn column 2-5 mm long ............................................................... D. sericea

3 Sheaths glabrous; lemmas membranaceous in texture, villous only on the margins and towards the base; awn twisted at base a single time, forming a loose awn column 0.5-1.5 mm long.......................... D. epilis

Danthonia epilis Scribner, Bog Oat-grass. Cp (NC, SC, VA), Mt (AL, GA, NC, TN, VA?), Pd (NC): peaty bogs in the Coastal Plain and Mountains, seeps around rock outcrops in the Piedmont and Mountains, granitic domes; rare. April-June. The range is apparently bogs in pinelands from NJ to SC, in mountain bogs in NC, VA (?), and GA, in seepage in the Cumberland Plateau and Blue Ridge of TN and AL. This taxon appears to be valid, with a distinct range, habitat, and variety of morphologic characters separating it from D. sericea, but further study is needed. Material from the mountains seems to differ from Coastal Plain material. RAB’S description of the habitat as “dry woods, rare; pied. of N.C.” appears to be in error. Blomquist listed the taxon (as a variety) for bogs in the mountains of SW. NC. It has since been found in bogs in the Sandhills region of NC and in seepage bogs in the adjacent Piedmont. [= F, HC, K, S; = D. sericea var. epilis (Scribner) Blomquist – RAB, C; < D. sericea Nuttall – FNA]

Danthonia sericea Nuttall, Silky Oat-grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, KY, NC, SC, TN, VA), Ip (KY, TN): dry woodlands, especially common in sandy soils in the Coastal Plain, dry oak, oak-pine, and pine forests in the Piedmont and low Mountains; common (uncommon in the Mountains and Interior Low Plateau, rare in DE). April-June. Primarily a Coastal Plain species northwards, ranging from e. MA south to FL and west to LA. [= F, HC, K, S, W; = D. sericea var. sericea – FNA] [AL, LA, MS]

Deschampsia Palisot de Beauvais 1812 (Hairgrass)

A genus of about 20-40 species, perennials and annuals, north and south temperate. References: Barkworth in FNA (2007a); Tucker (1996)=Z. [also see Avenella]

1 Awn 4-8 mm long, geniculate, exserted beyond the tips of the glumes; lemmas minutely scabrous, dull; leaf blades involute, appearing filiform (rounded in cross-section); ligule 0.5-3 (-5) mm long; [section Avenaria] .................................................................................. [see Avenella]

1 Awn 2-3 mm long, straight or nearly so, scarcely (or not at all) exserted beyond the tips of the glumes; lemmas smooth, shiny; leaf blades flat or folded at the midvein (V-shaped in cross-section); ligule 3-10 (-17) mm long ............................................................. D. cespitosa ssp. glauca

Deschampsia cespitosa (Linnaeus) Palisot de Beauvois ssp. glauca (Hartman) Hartman, Tufted Hairgrass. Mt (NC, VA, WV), Ip (KY): thin soil of rock outcrops or barrens over calcareous mafic, and ultramafic rocks (such as serpentinitized olivine, amphibolite, limestone, and dolostone), seepages; rare. June-July. D. cespitosa is a complex species, with a complicated polymorphic and aneuploid series, variously subdivided (or not) by various taxonomists. As a whole, D. cespitosa is circumboreal, ranging south in North America to NJ, sw. NC, WV, c. KY, IL, MN, and AZ. Ssp. glauca is the most widespread American subspecies, and extends the farthest south. Other subspecies occur farther north and in Eurasia. In our area, D. cespitosa is at its southern limit and is a rare species limited to barrens and outcrops over mafic or ultramafic rocks. Barkworth in FNA (2007a) states that there is no legitimate name available for this taxon. [= K; = D. cespitosa var. glauca (Hartman) Lindman f. – RAB, F, WV; < D. cespitosa ssp. cespitosa – FNA; < D. cespitosa var. cespitosa – C, Z; < D. cespitosa var. cespitosa – G; < D. cespitosa var. cespitosa – HC; = D. cespitosa ssp. cespitosa – FNA; < D. cespitosa var. cespitosa – FNA; D. cespitosa var. cespitosa – FNA; < D. cespitosa var. cespitosa – W] * Deschampsia elongata (Hooker) Munro, Slender Hairgrass. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of w. North America. [= FNA, HC, K] {not keyed}

Desmazeria Dumortier 1822

* Desmazeria rigida (Linnaeus) Tutin, Fern Grass. Cp (FL, SC): waste areas around wool-combing mills, other disturbed areas; rare, perhaps only a waif, native of Mediterranean Europe. [= FNA, K; = Catapodium rigidum (Linnaeus) Domy – Z; = Scheropoa rigida (Linnaeus) Grisebach]

Diarrhena Palisot de Beauvois 1812 (Beakgrain, Twingrass)
Depending on circumscription, a genus of either 2 species of perennial grasses of e. North America, or of ca. 6 species of e. North America and e. Asia. References: Brandenburg in FNA (2007a); Brandenburg, Estes, & Collins (1991)=Z. Key from Z.

1 Callous pubescent on all mature lemmas except the first; lemmas widest below the middle and gradually tapering into a cusp at the apex, those of the first floret 7.1-10.8 mm long; mature fruit 1.3-1.8 mm broad, gradually tapering into a broad, blunt beak .............. D. americana

1 Callous glabrous on all mature lemmas; lemmas widest near or above the middle and more-or-less abruptly contracted into a cusp at the apex, those of the first floret 4.6-7.5 mm long; mature fruit 1.8-2.5 mm broad, abruptly contracted into a bottle-like shaped beak.............. D. obovata

\textbf{Diarrhena americana} Palisot de Beauvois, Eastern Beakgrain. Ip (KY, TN), Mt (GA, NC, TN, VA, WV): rich moist forests, usually over calcareous rocks; rare (in NC and VA, rare in TN Mountains). July-August; August-October. W. VA and WV west to IN, south to TN, sw. NC, and nw. GA. (Jones & Coile 1988); disjunct in MO. This species forms large clonal patches. [= K, Z; = Diarrhena americana var. americana – C, G, WV; < Diarrhena americana – F, HC, W; < Diarina festucoides Rafinesque – S]

\textbf{Diarrhena obovata} (Gleason) Brandenburg, Western Beakgrain. Mt (WV), Pd (VA), Ip (KY, TN): alluvial forests, other moist forests; rare. July-August; August-October. Sw. PA and IN west to SD, KA, south to w. VA, e. TN, and ne. TX. First reported for VA by Fleming & Ludvig (1996). The floodplain of the Potomac River (in Fairfax County, VA) has a number of disjuncts of species with more midwestern affinities, including Diarrhena obovata, Erigeria bulbosa, Valeriana pauciflora, and Erythronium albidum (Fleming & Ludvig 1996). [= K, Z; = Diarrhena americana var. obovata Gleason – C, G, WV; < Diarrhena americana – F, HC, W; < Diarina festucoides Rafinesque – S]

(by Richard J. LeBlond)

A genus of 70-100 species, perennials, of temperate and tropical America. References: Gould and Clark (1978)=Z; Freckmann (1911)=Y; Lelong (1984)=X; LeBlond (2001)=Q; Davidsie and Polh (1992); Hansen & Wunderlin (1988); Hitchcock & Chase (1910); Freckmann & Lelong (2002). The treatment of \textit{Dichanthelium} sect. \textit{Lanuginosa} (=D. \textit{acuminatum} group) is based closely on Y. The contributor must take responsibility for the treatment of sect. \textit{Angustifolia} (including \textit{D. hirsuta}), sections \textit{Dichotoma} and \textit{Ensifolia} (the \textit{D. dichotomum} group), and for sect. \textit{Lancearia}. Other treatments are based largely on Z.

"We admit that our failure to distinguish the several named taxa ... was born of despair!" – Godfrey & Wooten (1979).

"The recognition of only four species and six varieties in this complex [\textit{sabulorum}] to which almost 50 species names have been applied admittedly is somewhat arbitrary and certainly not entirely satisfactory." – Gould & Clark (1978).

\textbf{Identification notes:} \textit{Dichanthelium} has often been treated as subgenus \textit{Dichanthelium} of \textit{Panicum}. It is most readily (though not consistently) separated from \textit{Panicum} by the following combination of features: plants producing over-wintering rosettes of leaves often shorter and broader than the culm leaves; plants producing simple culms with terminal panicles in spring, the culms branching and producing panicles only on branches in the summer and autumn.

Perhaps the most complex and confusing genus in our region, \textit{Dichanthelium} requires careful collection and close observation of several characters to determine to which taxon a specimen belongs, or at least to which taxa it seems most closely aligned. A taxon that is distinct in one part of its range may be indistinguishable from another taxon elsewhere. This is particularly true of Coastal Plain species adapted to natural (and now human) disturbances. Although hybridization is frequently suspected in \textit{Dichanthelium}, documentation of natural hybrids is rare.

When collecting specimens in the field, mature spikelets are essential. This is determined by examining the usually whitish fertile lemma, which is firm and plump at maturity. Immature spikelets often are longer than mature ones (they shorten as they fatten); only mature spikelet length is used in the various manuals and keys. It is also important to note whether a plant is in its “vernal” or “autumnal” flowering phase before collecting. “Vernal” plants produce panicles only at the summits of the culms (typically April-June). “Autumnal” plants produce panicles from leafy axillary branches below the summit (typically July-September). The autumnal panicles in most species are much smaller than the vernal panicles (and often hidden by fascicled leaves), but the spikelets are the same. When collecting autumnal plants, it is important to select specimens still possessing their vernal leaf blades and panicles, even though these will likely be senescent. It is also important to collect the whole plant, with the basal rosette intact (whether senescent or of current year’s growth). When several plants are growing together, compare the culm, leaf, and spikelet features for differences; \textit{Dichanthelium} taxa are gregarious.

When analyzing the character of the culm internodes and nodes, look at the first elongate internode above the base (the lowest internode is often very short and uncharacteristic). Determining whether a node is bearded is often difficult. A bearded node usually is characterized by pubescence that is longer and of a different orientation or structure than that of the internodes and sheaths. Nodes with short pubescence generally are not regarded as bearded. Lower nodes are more likely to be bearded than upper nodes. Some internodes are described as “crisp-puberulent.” This condition is characterized by a dense covering of minute hairs mostly less than 0.1 mm long, and usually crimped or curved. Glanular hairs or protuberences are often intermixed. When analyzing sheaths, look at those on the lower half of the culm. Senescent vernal sheaths often lose their pubescence (though in some species hair papillae are evident). All references in the key to sheath glabrousness or pubescence is without regard to the presence or absence of marginal hairs (cilia). A sheath that is glabrous except for marginal cilia is called glabrous. All culm leaves should be analyzed for blade characters; in general, the key relies on the size and character of the vernal blades. A “cordate” blade is one where the basal lobes of the blade extend outward and partially surround the culm when the culm is enclosed by the sheath. As with sheaths, references in the key to blade glabrousness or pubescence is without regard to marginal cilia. The ligule is an important diagnostic character for many \textit{Dichanthelium} taxa; at least three ligules per specimen should be examined before making conclusions about its structure and length. Ligules form a distinct ring from a cartilaginous base at the inner summit of the sheath; in some species the ligule is membranous, but in most it is pubescent. Care must be taken to distinguish the pubescence of the ligule from any pubescence emanating from the inner surface of the blade base, and from marginal cilia. Ligules of senescent vernal leaves frequently lose their integrity. Spikelet shape as well.
as length should be determined only from mature spikelets. Measure the length from the base of the first glume (usually at an articulation) to the apex of the second glume or sterile lemma (whichever is longer). A micrometer is essential for determining the length of spikelets, first glumes, ligules, and various pilosity features. Sometimes one-tenth of a millimeter is all that separates two Dichanthelium taxa.

Certain characters, particularly node bearding, cordate/non-cordate blade bases, and ligule length, can be quite variable, and an effort has been made to account for this variability in the key. Nonetheless, some specimens just won't "fit," and the road not taken may have to be reconsidered.

1 Plants densely tufted, often cushion-forming; leaves basally disposed, the blades ascending or spreading-ascending, not forming a distinct rosette of basal leaves shorter than the culm leaves; autumnal culms branching basally or from the lower nodes .......................................................... Key A

2 Spikelets 3.3-5.2 mm long.  .......................................................... Key B
3 Spikelets 0.8-3.2 mm long.
4 Lower culm internodes hairy .......................................................... Key F
5 Lower culm internodes glabrous .......................................................... Key G
3 Spikelets 2.1-3.2 mm long.
5 Larger culm blades 13-25 mm wide .......................................................... Key C
6 Culm nodes (at least the lower) bearded .......................................................... Key D
6 Culm nodes not bearded, the lowermost sometimes puberulent or sparsely hairy .......................................................... Key E

Key A - Plants densely tufted, often cushion-forming; leaves basally disposed, the blades ascending or spreading-ascending, not forming a distinct rosette of basal leaves shorter than the culm leaves; autumnal culms branching basally or from the lower nodes

1 Spikelets 2.4-4.5 mm long.
2 Nodes, internodes, and sheaths glabrous; blades 4-13 cm, 5-8 mm, the surfaces smooth, glabrous; spikelets 2.4-2.9 mm long, glabrous; not known to produce axillary (autumnal) inflorescences .......................................................... [D. nudicaule]
2 Nodes bearded or otherwise pubescent; internodes and sheaths variously pubescent to glabrate; blades 6-35 cm, 2-5 mm, one or both surfaces scabrous and often pubescent; spikelets 1.7-4.5 mm long, glabrous or pubescent; plants produce axillary (autumnal) inflorescences.
3 Spikelets 2.8-3.8 (-4.5) mm long, the second glume and sterile lemma pointed or beaked and extended beyond the summit of the fertile lemma; first glume 1.2-2 mm long .......................................................... D. depauperatum
3 Spikelets 1.7-2.8 mm long, the second glume and sterile lemma blunt or broadly pointed, not extending beyond the summit of the fertile lemma; first glume 0.7-1.2 mm long .......................................................... D. linearifolium
1 Spikelets 0.9-2.3 mm long.
4 Longer blades > 6 cm; if only 6 cm, then sheaths retrorsely long-pilose (D. laxiflorum).
5 Spikelets 1.2-1.5 mm long, glabrous .......................................................... [D. dichotomum var. glabrefolium]
5 Spikelets 1.7-2.3 (-2.8) mm long, pubescent.
6 Longer blades 10-35 cm long, 2-4 mm wide; sheaths glabrous to variously pilose, but not conspicuously retrorsely long-pilose; nodes variously pubescent to glabrate; spikelets 1.7-2.3 (-2.8) mm long .......................................................... D. linearifolium
6 Longer blades 6-18 cm long, 7-12 mm wide; sheaths conspicuously retrorsely long-pilose; nodes bearded with retrorse or spreading hairs; spikelets 1.9-2.3 mm long .......................................................... D. laxiflorum
4 Longer blades 1.5-6 cm; sheaths glabrous or pubescent, but not retrorsely long-pilose.
7 Blades 1-3 mm wide, glabrous, ciliate or basally ciliate; spikelets 0.9-1.4 mm long.
8 Spikelets pubescent, 1.2-1.4 mm long; blades involute, often falcate, 2.5-6 cm long .......................................................... [D. chamaelonche ssp. breve]
8 Spikelets glabrous, 0.9-1.2 mm long; blades flat, not falcate, 1.5-4 (-5) cm long .......................................................... D. chamaelonche ssp. chamaelonche
7 Blades 1-3 mm wide; spikelets 1.1-2.1 mm long (if < 1.5 mm, then blades either pubescent on one or both surfaces or ciliate to the apex).
9 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous .......................................................... D. strigosum var. leucoblepharis
9 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.
10 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-1.8 mm long .......................................................... D. strigosum var. glabrescens
10 Blades pilose, at least abaxially; spikelets 1.1-1.6 mm long .......................................................... D. strigosum var. strigosum

Key B - Spikelets 3.3-5.2 mm long

1 Nodes (at least lower) densely bearded with retrorse hairs; spikelets 3.7-5.2 mm long.
2 Ligule 2.5-4 mm long; internodes pubescent with long ascending or spreading hairs; blades 8-15 cm long, 10-25 mm wide; first glume 1.8-2.5 mm long .......................................................... D. ravenelli
2 Ligule 0.4-0.9 (-1.3) mm long; internodes glabrous to puberulent; blades 7-12 cm long 12-40 mm wide; first glume 1.5-2.2 mm long; .......................................................... D. boscii
1 Nodes glabrous, pubescent, or sparsely pilose; spikelets (2.4+ 3.3-4.2 mm long.
3 Ligule 1.6-3 mm long; blades 4-9 mm wide, > 10× as long as wide .......................................................... D. oligosanthes var. oligosanthes
3 Ligule 0.3-1.5 mm long; if larger blades < 9 mm wide and mostly 15× or more as long, then ligule 0.5-1 mm long (D. fusiforme).
4 Larger blades 2-6 (-8) mm wide, mostly 15× or more as long as wide; spikelets fusiform to elliptic, acute, basally constricted .......................................................... D. fusiforme
4 Larger blades 6-35 mm wide, mostly 10× or less as long as wide; spikelets broadly elliptic to obovate, rounded to sub-acule, not basally constricted.
5 Spikelets strongly papillose-hispid with spreading hairs 0.5-1 mm long; blades papillose-hispid .......................................................... [D. leibergii]
5 Spikelets glabrous to pubescent with hairs < 0.5 mm long; blades glabrous, scabrous, or pubescent.
6 Ligules 1-1.5 mm long; blades 5-10 cm long by 6-15 mm wide, glabrous or pubescent, basally rounded; spikelets glabrous to pubescent .......................................................... D. oligosanthes var. scribnerianum

</tbody>
</table>
Culms rarely exceeding 1 m, without a viscid band below the nodes; blades various.

Sheaths retrorsely pilose with hairs 2-3 mm long; basal leaves usually numerous, ascending, similar in size and shape to the culm leaves; culms branching only at the base; spikelets usually not more than twice the culm leaves at nodes in age. 

Culms internodes glabrous to sparsely pilose; culm nodes bearded with long retrorse hairs; blade surfaces glabrous to velvety-pubescent. 

Culms internodes, at least the lower, strigose, pilose, or villous; culm nodes bearded with ascending or spreading hairs; blade surfaces glabrous or variously hairy. 

Lower and often mid-culm nodes bearded with spreading, stiffish, and short-to-long hairs; mid-culm blades usually 15-20 x or less as long as wide. 

Blades stiff, often longitudinally ribbed, at least the lower villous or strongly pilose on the abaxial surface, and usually strongly pilose at least basally on the adaxial surface. 

Spikelets 2.5-3.1 mm long; lower culm blades usually glabrous adaxially except for long hairs at or near the margin (appearing ciliate), appressed-pubescent abaxially. 

Spikelets 2.1-2.6 mm long; lower culm blades usually sparsely appressed-pubescent on both surfaces, ciliate or ciliate at the base only. 

Lower nodes bearded with erect-ascending, soft, and long hairs; mid-culm blades usually 20 x or more as long as wide. 

Spikelets 2.9-4.0 mm long, fusiform to elliptic, acute, basally constricted; first glume 1.4-2.6 mm long. 

Spikelets 1.5-3.1 mm long, obovate to elliptic-obovate, obtuse to sub-acute, not basally constricted; first glume 0.6-1.5 mm long. 

Spikelets 1.5-2.2 mm long; first glume 0.6-0.8 mm long; longer caudine blades 4-8 cm, 2.5-5 mm wide, <20 x as long as wide; lower caudine leaves glabrous to sparsely pilose abaxially; autumnal leaves involute. 

Spikelets 1.5-2.1 mm long; first glume 0.7-1.5 mm long; longer caudine blades 7-12 (-15) cm, 3-6 mm wide, <20 x as long as wide; lower caudine leaves often abaxially (especially in *D. species 1=arenicoloides*); autumnal leaves involute or flat. 

Spikelets 4-8 mm wide, averaging 15-20 x as long as wide; autumnal blades flat; spikelets 2.3-3.1 mm long; first glume 0.8-1.5 mm long. 

Spikelets 3-4 (-5) mm long, averaging >20 x as long as wide; autumnal blades usually involute; spikelets 2.1-2.5 (2.8) mm long. 

Spikelets (3.0-3.2) 3.8 mm long, fusiform, pointed at summit, attenuate at base, with both glumes attached 0.3-0.5 mm below sterile lemma; the autumnal spikelets 3.5-3.8 mm wide, the lower and mid-culm blades of similar width; autumnal blades involute. 

Spikelets 1.8-3.1 mm long, obovate, blunt, and the base not attenuate except in *D. species 1=arenicoloides* with autumnal spikelets 2.3-3.1 mm long; longer vernal blades 2-8 mm wide, the lower usually wider and often shorter than mid-culm blades; autumnal blades involute or flat. 

Longest vernal blades to 16 cm, widest vernal blades 4-8 mm, usually longitudinally wrinkled; vernal and autumnal spikelets 2.3-3.1 mm long; autumnal blades flat, the larger to 9 cm × 2-4 mm. 

Longest vernal blades to 6 (D. aciculae) or 12 (D. species 1=arenicoloides) cm long, 2-5 mm wide, not noticeably wrinkled; vernal spikelets 1.5-2.8 mm long, autumnal spikelets either 1.5-2.3 (D. aciculae) or 2.3-3.1 (D. species 1=arenicoloides); autumnal blades involute, the larger to 6 cm × 1.5 mm. 

Longest vernal blades to 6 (-8) cm, widest vernal blades 2-5 mm; vernal and autumnal spikelets 1.7-2.3 mm long, blunt, not attenuate, the glumes attached <0.2 mm below sterile lemma; first glumes 0.6-0.9 mm long; larger autumnal blades to 3 cm by 1 mm. 

Longest vernal blades to 12, widest vernal blades 3-4 (-5) mm; vernal spikelets 2.1-2.8 mm long; autumnal spikelets 2.3-3.1 mm long, pointed, attenuate, the glumes attached 0.3-0.5 mm below sterile lemma; first glumes 0.7-1.5 mm long; larger autumnal blades to 6 cm by 1.5 mm. 

Key E - Spikelets 2.1-3.2 mm long, longer culm blades < 13 mm wide, culm nodes not bearded, the lowermost sometimes puberulent or sparsely pilose

1 Ligule 1.6-4 mm long. 

2 Ligule < 1.5 mm long. 

Blades, at least the lower, cordate or subcordate at the base, mostly 6-12 mm wide. 

3 Spikelets obpyriform when viewed dorsally, strongly plano-convex when viewed laterally, usually markedly reddish-purple basally; sterile lemma papillose. 

4 Internodes crisp-puberulent; ligules 0.3-0.4 mm long, ciliate; larger culm blades 4-8 (-11) cm long, 5-10 (-12) mm wide, broadest near the base; spikelets 2.1-2.7 mm long; first glumes 0.7-0.9 mm long. 

5 Ligule 0.3 mm long, ciliate; larger culm blades 5-25 mm wide; spikelets 2.2-3.7 mm long; first glumes 0.6-2.6 mm long. 

6 Ligule about 0.5 mm, ciliate; larger culm blades 6-13 mm wide; spikelets 2.3-3 mm long; first glumes 0.5-1 mm long. 

Blades tapering to the base, 2-12 mm wide. 

6 Ligule a stramineous to light brown membrane, with or without terminal ciliations; peduncle antorsely scabrous but not hairy.
7 Panicle rachis smooth, pellucid-punctate; first glume 0.3-0.6 (-0.8) mm long, as broad as or broader than long, truncate to obtuse; larger leaves 10-25 cm long, 8-15 mm wide; ligule 0.5-1.3 mm long; lowest elongate culm internode > 2 mm in diameter; lowest nodes usually glabrous or pubescent .................................................. D. scabriusculum
7 Panicle rachis scabrous or smooth, not pellucid-punctate; first glume 0.5-1.1 mm long, longer than wide, rounded to acute; larger leaves 3.5-12 cm long, 3-9 mm wide; ligule 0.1-0.6 mm long; lowest elongate culm internode < 2 mm in diameter; lowest nodes retrorsely bearded or glabrous.
8 Lowest nodes usually retrorsely bearded; ligules (0.1-) 0.3-0.6 mm long; largest vernal blades 7-12 cm long, (4.5-) 6-9 mm wide; panicle peduncle scabrous; spikelets ovate-lanceolate, acute, 2-0.2 mm long; first glume lanceolate, blunt to acute; fertile lemma smooth ................................................................. D. species 9 (=cryptanthum)
8 Lowest nodes usually glabrous; ligules 0.1-0.2 (-0.3) mm long; largest vernal blades 3.5-7 cm long, 3-6 mm wide; panicle peduncle smooth; spikelets elliptic, blunt to acute, 1.6-2.2 mm long; first glume ovate to rotund, rounded to acute; fertile lemma papillose.................................................. D. lucidum
9 Leaves basaly disposed, usually matted or cushion-forming, larger than the mid and upper culm leaves; blade margins uniformly papillose-ciliate; culms branching only at the base, 0.5-3.5 dm tall; internodes glabrous or sparsely pubescent .......................................................... D. strigosum var. leucocepharts
10 Blades of mid-culm leaves typically long and stiff, acuminate, linear or narrowly lanceolate, usually > 10× as long as wide, only 2-5 mm wide when < 8 cm long.
11 Vegetative parts glabrous (spikelets pubescent, lowest internodes and sheaths sometimes sparsely pubescent, blades and sheaths sometimes ciliate); mature panicles less than ¼ as wide as long, the branches erect-ascending, the spikelets often subsecond; autumnal blades 4-10 cm long, involute, <2 mm wide; spikelets 1.8-2.2 mm long........ D. aciculare ssp. neanthurum
11 Vegetative parts pubescent, at least in the lower portion of plant; mature panicles usually more than half as wide as long, the branches spreading-ascending, the spikelets not noticeably subsecond; autumnal blades 1-6 cm long, involute and <2 mm wide in D. aciculare ssp. aciculare and D. species 1=arenicoloides; or to 9 cm long, flat and 2-4 mm wide in D. angustifolium; spikelets 1.5-3.1 mm long.
12 Spikelets (3.0-) 3.2-3.8 mm long, fusiform, pointed at summit, attenuate at base, with both glumes attached 0.3-0.5 mm below sterile lemma, the autumnal spikelets 3.5-3.8 mm long; larger vernal blades 3-6 mm wide, the lower and mid-culm blades of similar width; autumnal blades involute................................................................. D. species 8 (=fusiforme)
12 Spikelets 1.8-3.1 mm long, obovate, blunt, and the base not attenuate (except in D. species 1=arenicoloides with autumnal spikelets 2.3-3.1 mm long); larger vernal blades 2-8 mm wide, the lower usually wider and often shorter than mid-culm blades; autumnal blades involute or flat.
13 Longest vernal blades to 16 cm, widest vernal blades 4-8 mm, usually longitudinally wrinkled; vernal and autumnal spikelets 2.3-3.1 mm long; autumnal blades flat, the larger to 9 cm by 2.4 mm.............................................. D. angustifolium
13 Longest vernal blades to 6 (D. aciculare ssp. aciculare) or 12 (D. species 1=arenicoloides) cm long, 2-5 mm wide, not noticeably wrinkled; vernal spikelets 1.5-2.8 mm long, autumnal spikelets either 1.5-2.3 (D. aciculare ssp. aciculare) or 2-3.1 (D. species 1=arenicoloides); autumnal blades involute, the larger to 6 cm by 1.5 mm.
14 Longest vernal blades to 12 cm, widest vernal blades 3-4 (-5) mm; vernal spikelets 2.1-2.8 mm long; autumnal spikelets 2.3-3.1 mm long, pointed, attenuate, the glumes attached 0.3-0.5 mm below sterile lemma; first glumes 0.7-1.5 mm long; larger autumnal blades to 6 cm by 1.5 mm.................................................. D. species 3=leucoblepharis
14 Longest vernal blades to 6 (-8) cm, widest vernal blades 2-5 mm; vernal and autumnal spikelets 1.7-2.3 mm long, blunt, not attenuate, the glumes attached <0.2 mm below sterile lemma; first glumes 0.6-0.9 mm long; larger autumnal blades to 3 cm by 1 mm................................................................. D. aciculare ssp. aciculare
10 Blades of mid-culm leaves lanceolate, thin or firm but not stiff, usually < 10× as long as wide, usually 7 mm or more wide when as much as 8 cm long.
15 Spikelets 2.9-3.8 mm long, broadly elliptic, rounded at the summit, with broad and thick nerves................................................................. D. oligosanthes var. scribnerianum
15 Spikelets 2.1-2.9 mm long, elliptic or obovate, rounded or pointed at the summit, the nerves often raised, but not broad and thick.
16 Culm internodes and sheaths glabrous or sparsely pilose.
17 Spikelets strongly plano-convex when viewed laterally, obpyriform when viewed dorsally, 2.2-2.6 mm long; fertile lemma and palea papillose; first glume and base of second glume usually strongly reddish-purple.......................... D. species 2 (=webberianum)
17 Spikelets biconvex to elliptic when viewed laterally, variously shaped but not obpyriform when viewed dorsally; fertile lemma and palea smooth or reticulate (or papillose in D. lucidum with weak and sprawling culms and spikelets 1.7-2.3 mm long); first and second glume various.
18 Culms tending to be stiffly erect; blades erect or erect-spreading, broad, usually but not always tapering from just below the middle to both ends, often yellowish green; plants not or only sparingly branched in age, not developing leafy fascicles of reduced leaves and inflorescences................................................................. D. boreale
18 Culms not stiffly erect; leaves usually spreading, broad or narrow, dark to bright green; plants often freely branched in age, becoming top-heavy with a mass of fascicled, reduced leaves and inflorescences.............................................. D. dichotomum group
16 Culm internodes crisp-puberulent (sparsely so in D. species 2 (=webberianum); sheaths puberulent or glabrous.
19 Spikelets elliptic, sub-acute to pointed, greenish or faintly purple-tinged basally.......................... D. commutatum var. ashei
19 Spikelets strongly plano-convex when viewed laterally, obpyriform when viewed dorsally, broadly rounded, usually markedly reddish-purple basally.
20 Fertile lemma and palea papillose; spikelets 2.2-2.6 mm long; lower culm blades 6-12 mm wide, glabrous.................. D. species 2 (=webberianum)
20 Fertile lemma and palea smooth (minutely reticulate but not papillose); spikelets (1.8) 1.9-2.2 (-2.3) mm long; lower culm blades 4-8 mm wide, glabrous, glabrate, or puberulent (especially abaxially)........ D. species 3 (=lancearium)

Key F - Spikelets 0.8-2.0 mm long, lower culm internodes variously hairy
1 Longer hairs of ligule 2-5 mm long.
   Ligule without a distinct ring of short hairs in front of the long hairs.
2 Blades of mid-culm leaves linear or narrowly lanceolate, stiff, acuminate, often involute, 4-10 cm long, 2-5 mm wide; spikelets 1.3-1.7 mm long.................................................. D. aciculare ssp. aciculare
3 Blades of mid-culm leaves lanceolate, thin or firm but not stiff, length and width various, less than 15× as long as wide.............................. D. aciculatum group

2 Ligule with a distinct ring of short hairs in front of the long hairs.
4 Peduncle, panicle axis, and sheaths puberulent with hairs 0.1 mm long; larger blades 3-6 cm long, 3-5 mm wide; spikelets 1.3-1.7 mm long................................................................. D. meridionale
4 Peduncle panicle axis hairs > 0.1 mm long; sheaths and internodes densely clothed with straight retrorse (occasionally spreading to spreading-ascending) hairs often > 4 mm long................................................................. D. villosissimum var. villosissimum

1 Longer hairs of ligule < 2 mm long.
5 Culm leaves basally crowded, ascending, usually matted or cushion-forming, larger than the mid and upper culm blades.
6 Sheaths variously pubescent or glabrous, but not conspicuously retrorsely long-pilose; longer blades 2-6 cm long and 1-8 mm wide; spikelets 0.9-2.1 mm long.
7 Blades 1-4 mm wide, glabrous, the margins eciliate or basally ciliate; spikelets 0.9-1.5 mm long, glabrous; autumnal form branched from lower and mid nodes as well as from basal nodes.
8 Blades 1.5-4 (-5) cm long; spikelets 0.9-1.2 mm long .................................................. D. chamaeleonche
8 Blades 4-12 (-20) cm long, some at least 7 cm long; spikelets 1.2-1.5 mm long........ D. dichotomum var. glabroflorum
7 Blades 2-10 mm wide, pubescent or glabrous, the margins coarsely papilllose-ciliate throughout; spikelets 1.1-2.1 mm long, glabrous or pubescent; autumnal form branched from basal nodes only.
9 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous ............................................. D. strigosum var. leucolepharis
9 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.
10 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-2.1 mm long........... D. strigosum var. glabrecens
10 Blades pilose, at least abaxially; spikelets 1.1-1.6 mm long; blade surfaces pubescent .................................................. D. strigosum var. strigosum

3 Basal leaves rosette-forming, usually much smaller than the culm leaves, not matted or cushion-forming; culms branching at the mid and upper nodes in age.
4 Blades of mid-culm leaves typically long and acuminate, linear or narrowly lanceolate, usually 10-20× as long as wide, only 2-5 mm wide when < 8 cm long.
5 Spikelets (glandular-) papilllose-pubescent; blades 1-3 (-5) mm wide; first glume 0.8-1.0 mm long; culms to 4 dm tall ................................................................. D. aciculare ssp. neantherum
6 Spikelets glabrous; blades 3-8 mm wide; first glume 0.3-1.1 mm long; culms to 10 dm tall.
7 Blades 3-8 mm wide; panicle (8-) 20-40 mm wide; first glume 0.6-1.1 mm long, blunt to acute...................... D. dichotomum group
8 Leaves 3-5.5 mm wide; panicle 2-5 mm wide; first glume 0.3-0.4 mm long, truncate to obtuse....................... D. hirstii

Key G - Spikelets 0.8-2.0 mm long, lower culm internodes glabrous

1 Ligule 1-5 mm long.
2 Ligule 1-2 mm long; sheaths sparsely to moderately spreading short-pilose; internodes glabrous; nodes retrorsely bearded; leaves 1-4 cm long, 2-5 mm wide; spikelets 1.2-1.4 mm long................................................................. D. species 10 (=curtifolium)
2 Ligule (1.5-) 2-5 mm long; sheaths glabrous to variously pubescent; internodes glabrous or pubescent; nodes glabrous, or bearded with ascending, spreading, or tangled hairs; leaves 3-10 cm long, 3-10 mm wide; spikelets 0.8-1.9 mm long................................. D. aciculatum group
1 Ligule < 1 mm long.
3 Basal leaves rosette-forming, usually much smaller than the culm leaves, not matted or cushion-forming; culms branching at the mid and upper nodes in age.
4 Blades of mid-culm leaves typically long and acuminate, linear or narrowly lanceolate, usually 10-20× as long as wide, only 2-5 mm wide when < 8 cm long.
5 Spikelets (glandular-) papilllose-pubescent; blades 1-3 (-5) mm wide; first glume 0.8-1.0 mm long; culms to 4 dm tall ................................................................. D. aciculare ssp. neantherum
6 Spikelets glabrous; blades 3-8 mm wide; first glume 0.3-1.1 mm long; culms to 10 dm tall.
7 Leaves 3-8 mm wide; panicle (8-) 20-40 mm wide; first glume 0.6-1.1 mm long, blunt to acute...................... D. dichotomum group
8 Leaves 3-5.5 mm wide; panicle 2-5 mm wide; first glume 0.3-0.4 mm long, truncate to obtuse....................... D. hirstii
4 Blades of mid-culm leaves lanceolate, mostly 10+ or less as long as wide, usually 7 mm or more wide when as much as 8 cm long.
7 Spikelets elliptic, oblong, or obovate; lower culm blades 3-12 (-15) mm wide, thin, tapered to the base; plants often freely branching in age, becoming top-heavy with a mass of fascicled, reduced leafy branches and inflorescences. **D. dichotomum group**
7 Spikelets broadly elliptic to suborbicular; lower culm blades 6-30 mm wide, thickish, broad, and cordate to subcordate at the base; plants sparingly branched in top-heavy with fascicled, reduced leafy branches and inflorescences.
8 Spikelets 0.9-1.2 mm long; longer blades 6-8 cm long, erect to erect-ascending. **D. erectifolium**
8 Spikelets 1.2-1.9 mm long; longer blades 8-20 cm long, ascending or the uppermost erect. **D. sphaerocarpon**
9 Mid-culm blades 6-11 (-14) mm wide, the uppermost 3-9 cm long. **D. sphaerocarpon var. sphaerocarpon**
9 Mid-culm blades, at least some, 15-30 mm wide, the uppermost 10-15 cm or more long. **D. polyanthus**
3 Basal leaves similar to or larger than the mid and upper culm leaves, often matted or cushion-forming; culms branching at the base (also at mid and upper nodes in **D. chamaeleonche** vars. and **D. dichotomum var. glabrifolium**).
10 Longer blades > 6 cm; if only 6 cm, then sheaths retrorsely long-pilose (**D. laxiflorum**).
11 Spikelets 1.2-1.5 mm long, glabrous. **D. dichotomum var. glabrifolium**
11 Spikelets 1.7-2.3 (-2.8) mm long, pubescent.
12 Longer blades 6-18 cm long by 7-12 mm wide; sheaths conspicuously retrorsely long-pilose; nodes bearded with retrorse or spreading hairs; spikelets 1.9-2.3 mm long. **D. laxiflorum**
12 Longer blades 10-35 cm long by 2-4 mm wide; sheaths glabrous to variously pilose, but not conspicuously retrorsely long-pilose; nodes variously pubescent to glabrate; spikelets 1.7-2.3 (-2.8) mm long. **D. linearifolium**
10 Longer blades 1.5-6 cm; sheaths glabrous or pubescent, but not retrorsely long-pilose.
13 Blades 1-3 mm wide; sheaths retrorsely long-ciliate, glabrous.
14 Spikelets pubescent, 1.2-1.4 mm long; blades involute, often falcate, 2.5-6 cm long. **D. chamaeleonche ssp. breve**
14 Spikelets glabrous, 0.9-1.2 mm long; blades flat, not falcate, 1.5-4 (-5) cm long. **D. chamaeleonche ssp. chamaeleonche**
13 Blades 3-8 mm wide; spikelets 1.1-2.1 mm long (if < 1.5 mm, then blades either pubescent on one or both surfaces or ciliate at the apex).
15 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous. **D. strigosum var. leucoblepharis**
15 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.
16 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-2.1 mm long. **D. strigosum var. glabrescens**
16 Blades pilose, at least abaxially; spikelets 1.1-1.6 mm long. **D. strigosum var. strigosum**

Key to the Dichanthelium acuminatum group

1 Internodes glabrous.
2 Ligule 1.2 mm long; sheaths glabrous; leaves 1-3 cm long, 2-5 mm wide; spikelets 1.2-1.4 mm long. **D. species 10 (=urtifolium)**
2 Ligule (1.5-2.5) mm long; sheaths glabrous to variously pubescent, but not spreading short-pilose; nodes glabrous or pubescent, but not bearded; leaves 4-11 cm long, 4-8 mm wide.
3 Panicles 8-12 cm long, ½-½½ as wide, bearing 250 or more spikelets; spikelets 1.4-1.6 mm long; ligule (1.5-2.3) mm long. **D. spretum**
3 Panicles 3-8 cm long, > ½ as wide, bearing < 200 spikelets; spikelets 1.1-1.6 mm long; ligule 2-5 mm long; larger blades 4-10 cm long.
4 Internodes glabrous to pubescent (especially lower); larger vernal blades usually longer than 6 cm, the basal margin prominently long-ciliate (1.5-2.1) mm long; spikelets 1.1-1.7 mm long; longer hairs of ligule usually more than 3 mm; plants often yellowish-green. **D. acuminatum var. lindheimeri**
4 Internodes glabrous (the lowest rarely slightly pubescent); larger vernal blades usually shorter than 7 cm, the basal margin cilia inconspicuous or absent; spikelets 1.1-1.5 mm long; longer hairs of ligule often less than 3 mm long; plants often purplish-green. **D. longiligulatum**

5 Peduncle, panicle axis, and/or sheaths of vernal culms puberulent with hairs 0.1 mm long, sometimes also pubescent with longer hairs, but never grayish-villous; larger blades 2-7 cm long, 2-7 mm wide.
6 Spikelets 0.8-1.1 mm long; blades 2-4.5 cm long, 2-5.5 mm wide; sheaths sparsely puberulent, lacking papillose-based longer hairs. **D. wrightianum**
6 Spikelets 1.1-1.7 mm long; mid-culm blades generally 3-7 cm long and 3-7 mm wide; sheaths with some papillose-based hairs 2 mm or more long.
7 Larger mid-culm blades 4-7 cm long, 4-7 mm wide, glabrous to sparsely pubescent adaxially; ligule 1-5 mm long; spikelets 1.1-1.5 mm long. **D. leucothrix**
7 Larger mid-culm blades 3-6 cm long, 3-5 mm wide; ligule with a ring of hairs < 1 mm and scattered longer hairs to 4 mm; spikelets 1.3-1.7 mm long. **D. meridionale**
5 Peduncle, panicle axis, and sheaths of vernal culms glabrous, or pilose, or grayish-villous with some shorter hairs 0.2-0.5 mm long, but never puberulent with hairs 0.1 mm long; larger blades 4-12 cm long, 4-12 mm wide.
8 Sheaths and internodes of vernal culms gray-villous with a dense, tangled, or matted mixture of slender hairs 2-4 mm long, variously ascending, spreading, and retrorse, papillose or non-papillose, often with shorter hairs beneath; blades velvety-pubescent on abaxial surface, the margins ciliate for half or more their length. **D. acuminatum var. acuminatum**
8 Sheaths and internodes of vernal culms puberulent, pubescent or papillose to hispid with ascending straight hairs, but never grayish-villous; blades glabrous to variously pilose abaxially, but not velvety-pubescent, the margins ciliate or ciliate only below the middle.
9 Spikelets 0.8-1.1 mm long; blades 2-4.5 cm long, 2-5.5 mm wide. **D. wrightianum**
9 Spikelets 1.1-2.0 mm long; blades 3-12 mm long, 3-12 mm wide.
10 Peduncle, panicle axis, and/or sheaths glabrous; sheaths lacking hairs or papillae, at least near mid-length. **D. acuminatum var. lindheimeri**
10 Peduncle, panicle axis, and internodes puberulent, pubescent, or pilose; sheaths puberulent, pubescent, or pilose.
11 Blades 5-12 cm long, 6-12 mm wide; spikelets 1.5-2.0 mm long; peduncle, panicle axis, and sheaths variously pilose, but lacking puberulent hairs 0.1 mm long. **D. acuminatum var. fasciculatum**
11 Blades 3-7 cm long, 3-7 mm wide; spikelets 1.1-1.7 mm long; puberulent hairs 0.1 mm long often present on peduncle, panicle axis, or sheaths.
1. Lower cauline nodes bearded, the hairs usually retrorse.

2. Spikelets glabrous.

3. Ligule an eciliate membrane; leaves 3.5-7 cm long by 3-6 mm wide.................................................. \**D. species 11***

4. Ligule ciliate; leaves either 1.5-4 (-5) cm long by 1-5 mm wide, or 5-12 cm long by 1-15 mm wide.

5. Spikelets 1.2-1.4 mm long; sheaths spreading-pilose; vernal cauleal blades 2-5 mm wide; ligule 1-2 mm long; node beard hairs usually spreading or reflexed; internodes glabrous.................. \**D. species 10 (=curtifolium)**

6. Spikelets 0.9-1.2 mm long; sheaths glabrous; vernal cauleal blades 1-2 (-3) mm long; ligule < 1 mm long; node beard hairs and often only partially encircling the node; internodes glabrous or puberulent.......................... \**D. chamaeleonche**

7. Spikelets 1.4-2.3 mm long; vernal cauleal blades 5-12 cm long and 3-15 mm wide; internodes and sheaths glabrous.

8. Usually all culm nodes bearded; internodes glabrous, or middle and upper internodes and peduncle sparsely to moderately spreading short-hairy, sometimes also glandular; upper as well as lower vernal sheaths and both surfaces of cauleal blades pubescent, often densely so; spikelets (1.5-) 1.8-2.2 mm long; [of dry rocky or sandy basic soil and barrens]........................................ \**D. annulum***

9. Often only lower culm nodes bearded; internodes glabrous; at least middle and upper cauleal blades glabrous; spikelets 1.4-2.8 mm long; [mostly of wet acid soils and mesic to dry woodlands].

10. Spikelets (2.0-) 2.2-2.8 mm long; first glume 0.5-1.3 mm long; fertile lemma 1.8-2.3 mm long; lowest vernal cauleal blades pubescent at least abaxially.................................................. \**D. mattramuskeetense***

11. Spikelets 1.7-2.2 mm long; first glume 0.6-0.9 mm long; fertile lemma 0.7-1.0 mm wide.................................. \**D. dichotomum var. nitidum***

12. Spikelets 1.4-1.9 mm long; first glume 0.3-0.6 (-0.8) mm long; fertile lemma 0.6-0.8 mm wide............................. \**D. dichotomum var. ramulosum***

13. Spikelets pubescent.

14. Spikelets 1.2-1.4 mm long; sheaths spreading-pilose; vernal cauleal blades 1-4 cm long and 2-5 mm wide; ligule 1-2 mm long............. \**D. dichotomum var. curtifolium***

15. Spikelets 1.4-2.2 mm long; first glume 0.3-0.9 mm long; fertile lemma 1.4-1.7 mm long; lowest vernal cauleal blades glabrous.

16. Blades neither involute (except apically) nor falcate, 1-7 cm long, 1.5-7 mm wide, about 10× as long as wide; lower internodes glabrous or sparsely pilose, but not strigose; spikelets 1.1-1.7 mm long; culms 15-60 cm long.

17. Blades 1-3 (-5) cm long, 1.5-3 (-4) mm wide, the cartilaginous margins typically gray-green to white-beige and about 0.1 mm wide; spikelets 1.2-1.5 mm long; culms to 40 cm long.................. \**D. ensifolium***

18. Blades 2-7 cm long, 3-6 mm wide, the cartilaginous margins typically white-beige and about 0.2 mm wide; spikelets (1.2-) 1.4-1.7 mm long; culms to 60 cm long.................................................. \**D. tenue***

19. Spikelets glabrous.

20. Blades mostly basally disposed, strongly ascending, much larger than the 2-3 remote middle and upper cauleal leaves of fertile culms; spikelets 2.4-2.9 mm long; culms branch from basal and lower nodes, but are not known to produce autumnal inflorescences ...... \*D. nudicaula*

21. Cauline leaves mostly basally disposed, strongly ascending, much larger than the 2-3 remote middle and upper cauleal leaves of fertile culms; spikelets 2.4-2.9 mm long; culms branch from basal and lower nodes, but are not known to produce autumnal inflorescences ...... \*D. nudicaula*

22. Spikelets 0.9-1.5 mm long; vernal blades 1-4 mm wide.

23. Blades 1-3 (-5) cm long, 1.5-3 (-4) mm wide, about 10× as long as wide; autumnal plants cushion-forming.................. \**D. chamaeleonche var. chamaeleonche***

24. Spikelets 1.2-1.5 mm long; blades 1-12 (-20) cm long; autumnal plants not cushion-forming.

25. Blades 4-12 (-20) cm long (the longer at least 7 cm), 2-4 mm wide, 20-30 (-50) times as long as wide........................................ \*D. ensetifolium*

26. Spikelets 1.4-2.6 mm long; vernal blades 3-15 mm wide (if spikelets < 1.6 mm long and vernal blades < 5 mm wide, then larger blades > 5 cm long in \*D. caudalumescens").

27. Widest vernal cauleal blades 7-15 mm wide; upper sheaths often gluttonous-warty; spikelets 2.1-2.6 mm long, some or most acute to beaked, second glume and sterile lemma extending 0.3-0.5 mm beyond fertile lemma in at least some spikelets..............
21 Widest vernal cauline blades 3-10 mm wide; upper sheaths not glutinous-warty; spikelets 1.4–2.3 mm long, blunt to subacute, second glume and sterile lemma often equal to or shorter than fertile lemma, or extending < 0.3 mm beyond it.

22 Ligule an eliicate membrane; largest vernal blades 3-6 cm long, usually 10-15 × as long as wide .................. D. species 11

22 Ligule crisped, largest vernal blades 5-12 cm long, usually 15-20 × as long as wide.

23 Spikelets 1.4-1.8 mm long; first glume 0.3–0.8 mm long; fertile lemma 1.3-1.5 mm long; mature vernal panicles usually short-exserted with ascending branches; fresh foliage bluish-glaucous ........................................ D. caerulescens

23 Spikelets 1.7-2.3 mm long; first glume 0.6-1.1 mm long; fertile lemma 1.6-1.9 mm long; mature vernal panicles exserted with spreading branches; fresh foliage not bluish-glaucous.

24 Vernal cauline blades spreading to deflexed, flexuous; [of wet-mesic to dry woods and thickets] .........................

................................................................. D. dichotomum var. dichotomum

24 Vernal cauline blades stiffly erect; [of wet pine savannas and open swamps] .................... D. dichotomum var. roanokeense

**Dichanthelium aciculare** (Desvaux ex Poiret) Gould & Clark. Needle Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA): sandy woods and fields; common (uncommon in GA, NC, and SC Piedmont, rare in VA Piedmont, rare in DE Coastal Plain). May-October. NJ south to n. FL, west to TX and OK, also in West Indies and n. South America. Blades typically are strongly involute. Can be confused with autumnal forms of *D. ovale* var. *addisonii*, which has vernal blades 5-10 mm wide. Plants referable to *Panicum chrysopsidifolium* by HC have ligules <1 mm long; blades 5-10 cm long and 3-5 mm wide; densely villous nodes, internodes, sheaths, and blades; and villous, obovate spikelets 1.9-2.2 mm long. This entity needs further study. [= Panicum aciculare Desvaux ex Poiret – RAB, F; < P. aciculare – C; = P. aciculare ssp. aciculare – FNA; > P. aciculare – G, HC, S; > P. chrysopsidifolium Nash – G, HC, S; > P. benettense M.V. Brown – HC, S; < D. aciculare – K, Z]

**Dichanthelium aciculare** (Desvaux ex Poiret) Gould & Clark *ssp. neantherum* (Grisebach) Freckmann & Lelong, Nerved Witch Grass. Maritime wet grasslands, Piedmont prairie-like barrens. May-November. Disjunct in se. and central NC, se. SC, GA, FL, MS, e. TX, AR, Bahamas, Cuba, and Belize. Can occur with the similar-appearing *D. caeruleans*, from which it differs by having spikelets that are longer (1.8-2.2 mm vs. 1.4-1.8), rounded summits vs. obtuse to sub-acute, and pubescent vs. glabrous; longer first glumes (0.8-1.0 mm vs. 0.3-0.8); leaves 15× or more as long as wide vs. 10-15×; and a nearly strict panicle. FNA gives a spikelet length of 2-2.8 mm, well beyond the length of spikelets on specimens we have seen. Although FNA provides no synonymy, it appears that its concept of *ssp. aciculare* has been reduced to *Dichanthelium caeruleans* ssp. *iteratedum*. We have observed plants of this entity from the Piedmont of NC match descriptions of *Panicum ovimum*, known from dry to moist open ground and prairies in e. TX, MS, and AR when last recognized (HC). Both of these taxa are treated here as synonyms of *ssp. neantherum*. [= FNA; > Panicum neantherum Grisebach – RAB, HC, S; > P. ovimum Scribn & J.G. Smith – HC, S; > P. pinetorum Swallen – HC, S; < D. aciculare – K, Z]

**Dichanthelium acuminatum** (Swartz) Gould & Clark *ssp. fasciculatum* (Torrey) Focke, Slender-stemmed Witch Grass. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): open or cut-over woods, thickets, fields, meadows, and shores, frequently on disturbed soils; common (uncommon in GA, NC, SC, and VA Coastal Plain). May-August. NL (Newfoundland) south to FL, west to CA, north to s. BC. Typically much less pilose than var. *acuminatum*, the hairs usually papillate. Plants referable to *Panicum glutinosum* var. *fasciculatum* Fernald may be a hybrid of var. *fasciculatum* with *D. scoparium*. Known only from se. VA, they are described as having culms 7-9 dm high; elongate internodes with cinereous puberulence and black, warty, viscous glands; villous nodes; glutinous-warty and scabrous sheaths and blades; ligule 4-5 mm long; minutely puberulent panicle axis; spikelets ellipsoid, subacute, 1.7-1.8 mm long, pubescent; first glume subacute, 0.6-0.7 mm long. [= Y; < Panicum lanuginosum Elliott – RAB; > P. lanuginosum var. fasciculatum (Torrey) Fernald – C, F, G; > P. lanuginosum var. tennesseensis (Ashe) Gleason – C, G; > P. lanuginosum var. implicatum (Scribner) Fernald – C, F, G; = D. acuminatum ssp. fasciculatum (Torrey) Freckmann & Leong – FNA; > P. implicatum Scribn – HC, WV; > P. hauchoecae Ashe var. hauchoecae – HC, S; > P. hauchoecae var. fasciculatum (Torrey) Hubb. – HC; > P. tennesseensis Ashe – HC, S; > P. hauchoecae var. silvicola Hitchcock & Chase – S; < D. acuminatum var. acuminatum – K, Z; < D. acuminatum var. implicatum (Scribner) Gould & Clark – K, Z; > P. hauchoecae Ashe – WV; > P. acuminatum Swartz var. fasciculatum (Torrey) Leong – X; > P. acuminatum var. uncipilum (Trinius) Leong – X]
POACEAE

Dichanthelium angustifolium (Elliott) Gould, Narrow-leaved Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA), sandy pinelands and fields; common (rare in Mountains, rare in DE and VA). May-October. NJ south to FL, west to AR and e. TX. Vernal blades typically are flat (often involute distally). Can be confused with D. consanguineum, which has spreading-pilose nodes and blades 10-15× as long as wide; D. angustifolium blades typically are 20× or more as long as wide. Plants with involute blades to 8 cm long, spikelets 2.1-2.5 mm long, and first glumes 0.7-1.1 mm long are referable to Panicum species 1=arencioideae. They are transitional to D. aciculare. [= Panicum angustifolium Elliott – RAB, F, G; < P. aciculare Desvaux ex Poiré – C; = D. aciculare ssp. angustifolium (Elliott) Freckmann & Lelong – FNA; > P. angustifolium – HC, S; > P. arencioideae Ashe – HC, S; < D. aciculare – K, Z]

Dichanthelium annulum (Ashe) LeBlond, Ringed Witch Grass. Pd (DC, MD, NC, SC, VA), Cp (DC, NC, Mt (VA): dry sandy or rocky soil of open woods, dry grasslands, and barrens, and glades over serpentine, limestone, calcareous shales, and other high pH dry soils; rare. May-October. NJ, IN, and MO south to AL and MS, primarily in the Appalachian Province with very few occurrences in the Coastal Plain. One of the more distinctive taxa within the D. dichotomum group by morphology, habitat, and range. Plants from se. MA with all leaves pubescent, glabrous internodes, and spikelets 2.2-2.5 mm long were described as Panicum annulum var. glabrescens, but belong to D. mattamuskeetense. [= Q; < P. dichotomum Linnaeus – RAB, C, GW; = Panicum annulum Ashe – F, HC, S; = P. annulum var. annulum – G; > D. dichotomum ssp. mattamuskeetense (Ashe) Freckmann & Lelong – FNA; < D. dichotomum (Linnaeus) Gould – K, Z; > P. dichotomum var. mattamuskeetense (Ashe) Lelong – X]

Dichanthelium boreale (Nash) Freckmann, Northern Witch Grass. Pd (GA, NC, VA), Mt (GA, NC, VA): open woods and grassy slopes, usually in moist soil; rare. April-September. NL (Newfoundland) and ON south to NC, GA, and AR. Our plants are =Panico bicknellii, regarded as a "putative hybrid" (along with =P. calliphyllum) by FNA, which cites WV as the southern limit of D. boreale. [= K, Z; > Panicum bicknellii Nash – RAB, F, HC, S; > P. boreale Nash – C, F, G, HC; > P. calliphyllum Ashe – F, HC; > D. boreale – FNA; > P. bicknellii var. bicknellii – G; > P. bicknellii var. calliphyllum (Ashe) Gleason – G]

Dichanthelium caerulescens (Hackel ex Hitchcock) Correll, Blue Witch Grass. Cp (NC, VA): marshes, swamps, wet pinelands, maritime grasslands, damp sandy soil; rare. June-October. NJ to NC, and from FL to LA, also in the Bahamas and West Indies. Not treated by FNA, where it presumably would have been placed in synonymy with D. dichotomum ssp. roanokense. [= Q; < Panicum dichotomum Linnaeus – RAB, GW; > D. caerulescens Hackel ex Hitchcock – F, HC, S; > D. dichotomum ssp. roanokense – FNA; < P. roanokense Ashe – G; > D. dichotomum var. dichotomum – K, Z; > Panicum dichotomum var. roanokense (Ashe) Lelong – X]

Dichanthelium chamaeleonche (Triinus) Freckmann & Lelong ssp. chamaeleonche, Carpet Witch Grass. Cp (GA, NC, SC, VA): moist pine savannas and flatwoods, pineland pondshores; uncommon (rare in VA). April-September. SE. VA south to FL, west to LA, also in Cuba and Belize. Internodes can be glabrous or pubescent, and nodes glabrous, pubescent, or bearded, but the glabrous spikelets 0.9-1.2 mm long are diagnostic. The concept of this taxon in FNA (as ssp. chamaeleonche) appears to include D. dichotomum var. glabriofolium (see descriptions of Floridian D. chamaeleonche ssp. breve and D. dichotomum var. glabriofolium). [= Panico chamaeleonche Triinus – RAB, G, GW, HC, S; > P. extensifolium Baldwin – C; > D. chamaeleonche ssp. chamaeleonche – FNA; > D. dichotomum (Linnaeus) Gould var. extensifolium (Baldwin) Gould & Clark – K, Z; = P. chamaeleonche var. chamaeleonche – X]

Dichanthelium clandestinum (Linnaeus) Gould, Deer-tongue Witch Grass. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (NC, VA): shaded to filtered woodlands, ditches and low areas, and often in moist sandy soil; common (uncommon in GA, NC, and SC Coastal Plain). May-October. NS and QC south to n. FL, west to IA, KA, and TX. [= FNA, K, Z; = Panicum clandestinum Linnaeus – RAB, C, F, G, HC, S, WV, X]

Dichanthelium commutatum (Schultes) Gould var. commutatum, Variable Witch Grass. Cp (FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): low, shaded, moist woodlands and woodland edges, and dry, thin, often rocky woods and thickets; common. May-October. ME south to FL, west to MI, MO, OK, and TX, also in Mexico. Plants with spikelets 3.0-3.7 mm long, first glumes half or more as long, and with broadly linear leaves about 10× as long as wide have been recognized as ssp. equilaterale by FNA, and Panicum equilaterale by HC and S, but intermediates occur throughout the NC to FL portion of the range of specimens bearing the equilaterale name. [= Panicum commutatum Schultes – RAB, C; > P. commutatum var. commutatum – F, G; > P. commutatum – HC, S, WV; > P. mutabile Scribner & Smith ex Nash – F, G, HC, S; > D. commutatum ssp. commutatum Freckmann & Lelong – FNA; > D. commutatum ssp. equilaterale (Scribner) Freckmann & Lelong – FNA; > D. commutatum ssp. joori (Vasey) Freckmann & Lelong – FNA; < D. commutatum – K; > P. joori Vasey – HC, S; < D. equilaterale – HC, S]
**POACEAE**

*Dichanthelium consanguineum* (Kunth) Gould & Clark, Kunth's Witch Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): moist or dry sandy soils of pinelands; common in the Coastal Plain, uncommon in the Piedmont (rare in VA). April-September. Occasional from VA south to FL, west to TX and IN. Often not easily separated from *D. angustifolium* and *D. ovale*. It is distinguished from *D. angustifolium* by spreading-hirsute nodes and leaves 10-15× as long as wide (*D. angustifolium* has beardless nodes, or nodes bearded with erect-ascending soft hairs, and longer leaves 20× or more as long as wide). *D. consanguineum* is distinguished from *D. ovale* by having strongly pilose upper blade surfaces (*D. ovale* upper blade surfaces are glabrous or with a few blade hairs basally). The hairs of *D. consanguineum* frequently are strongly papillate. [= FNA, K, Z; = Panicum consanguineum Kunth – RAB, C, F, G, HC, S]

*Dichanthelium dichotomum* (Linnaeus) Gould var. dichotomum. Forked Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): wet-mesic to dry woods, thickets, and woodland openings; common (rare in VA Coastal Plain). May-October. S. Canada and MI south to FL and TX. Plants with bearded nodes and larger leaves are referable to *Panicum dichotomum* var. barbulatum (here included) but intermediates abound. [= Q; < Panicum dichotomum Linnaeus – RAB, C, GW; > P. dichotomum var. dichotomum – F, WV; > P. dichotomum var. barbulatum (Michaux) Wood – F, WV; > D. dichotomum ssp. dichotomum – FNA; > P. dichotomum – G; > P. dichotomum – HC, S; > P. barbulatum Michaux – HC, S; > D. dichotomum var. dichotomum – K, Z; > P. dichotomum var. dichotomum – X]

*Dichanthelium dichotomum* (Linnaeus) Gould var. nitidum (Lamarck) LeBlond, Shining Witch Grass. Cp (GA, NC, SC, VA), Pd (NC), Mt (SC, VA): moist sandy or peaty soil of wet pine savannas and pocosin ecotones, wet meadows near the coast, swamps, and marshes; uncommon (rare in Mountaint and Piedmont, rare in VA). PA and NJ south to FL, west to MO and TX; also the Bahamas (Sorrie & LeBlond 1997) and West Indies, and Mexico to Venezuela. [= Q; < Panicum dichotomum Linnaeus – RAB, C, GW; > P. nitidum Lamarck – F, HC, S; > D. dichotomum ssp. nitidum (Lamarck) Freckmann & LeLorgne – FNA; > P. nitidum var. nitidum – G; > D. dichotomum var. dichotomum – K, Z; > P. dichotomum var. nitidum (Lamarck) Wood – X]

*Dichanthelium fusiforme* (Hitchcock) Harvill, Spindle-fruited Witch Grass. Cp (GA, NC, SC, VA): dry to moist sand of open pine and pine/oak woods and clearings; rare. May-September. SC. VA south to FL, west to MS, also in West Indies, Mexico, Central America, and Venezuela; most much abundant in FL. Autumnal blades often flat. The autumnal form of *D. fusiforme* is distinguished from the vernal blades of the former are missing. They are best separated by ligule length (0.5-1.1 mm in fusiforme, 1.5-3.5 mm in oligosanthes) and the more attenuated ends of the fusiforme spikelet. [= Panicum fusiforme Hitchcock – RAB, F, G, HC, S; > P. aciculare Desvaux ex Poiré – C; = D. aciculare sp. fusiforme (Hitchcock) Freckmann & LeLorgne – FNA; > D. aciculare – K, Z]

*Dichanthelium hirsutii* (Swallen) Kartesz, Hirsut's Witch Grass. Cp (DE, GA, NC): pond-cypress savannas and limesink depressions; rare. June-September. This distinctive species is known from only seven sites: two in NC, one in DE, two in NJ (one not seen since 1992), and two historical populations in GA. Described in 1961 (Swallen 1961), it is treated by some taxonomists as the *D. aciculare* group and by others as part of the *D. dichotomum* group; its affinities appear to lie with the former. See Schuyler (1996) for a discussion of the taxonomic distinctiveness of this species. The occurrence of this species in NC is documented in LeBlond & Sorrie (2001). [= K; < Panicum aciculare Desvaux ex Poiré – C; > D. dichotomum ssp. roanokense (Ashe) Freckmann & LeLorgne – FNA]

*Dichanthelium laxiflorum* (Lamarck) Gould, Open-flower Witch Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): open or shaded woodlands, often in moist soil; common. April-September. MD south to FL, west to TX, north to IN, also in Mexico, Central America, and West Indies. [= FNA, K, Z; = Panicum laxiflorum Lamarck – RAB, C, F, G; > P.
Dichanthelium leucothrix (Nash) Freckmann, Rough Witch Grass. Cp (GA, NC, SC), Pd (GA, NC, SC, VA): wet sandy, peaty, or mucky soil of pinelands; uncommon (rare in Piedmont). May-October. S. NJ south to FL, west to TX, also in TN, West Indies and n. South America. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguish this taxon, *D. meridionale*, and *D. wrightianum* from other members of the *D. acuminatum* group. [= K, Y; = Panicum leucothrix Nash – RAB, F, G, HC, S; = P. leucothrix – C; = D. acuminatum ssp. leucothrix (Nash) Freckmann & Lelong – FNA; = P. spretum ssp. leucothrix – GW; = P. acuminatum var. leucothrix (Nash) Lelong – X; = D. acuminatum (Swartz) Gould & Clark var. implicatum (Scribner) Gould & Clark – Z]

Dichanthelium lucidum (Ashe) LeBlond, Bog Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): wet meadows, sphagnum swamps, bogs, wet woods, sphagnum seepage meadows, baygalls; common (uncommon in Mountains). May-October. MA and MI south to FL and TX. Vernal culms soon recline, producing a tangled mass. The papillate fertile lemma is diagnostic. Rarely, entire populations of *D. lucidum* can have eiliate ligules composed of a membrane 0.1-0.3 mm long. Even rarer are plants within these populations with retrorsely bearded nodes. Both conditions may reflect introgression with another taxon, possibly within the *dichotomum* complex, or with *cryptanthum* in section *Clandestina*. [= Q; = Panicum dichotomum Linnaeus – RAB, C, GW; = P. lucidum Ashe – G, S; = P. lucidum var. lucidum – F, HC; = P. lucidum var. opacum Fernald – F, HC; = D. dichotomum lucidum (Freckmann & Lelong) Gould & Clark – FNA; = D. dichotomum var. dichotomum – K, Z; = P. dichotomum var. lucidum (Ashe) Lelong – X]

Dichanthelium meridionale (Ashe) Freckmann, Matting Witch Grass. Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): dry to damp sand of shores and woods; common (uncommon in GA, NC, SC, and VA). May-October. Sw. NS and MA to MN, south to e. NC, n. GA, and n. AL. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, *D. leucothrix*, and *D. wrightianum* from other members of the *D. acuminatum* group. [= K, Y; = Panicum lanuginosum Elliott – RAB, F; = P. leucothrix Nash – C; = P. meridionale var. albemarlense (Ashe) Fernald – F; = D. acuminatum (Swartz) Gould & Clark spp. implicatum (Scribner ex Nash) Freckmann & Lelong – FNA; = P. meridionale Ashe – G; = P. meridionale – HC, S, WV; = P. albemarlense Ashe – HC, S, WV; = P. acuminatum Swartz var. unciphyllum (Trinianus) Lelong – X; = D. acuminatum var. implicatum (Scribner) Gould & Clark – Z]

Dichanthelium ovale (Elliott) Gould & Clark var. ovale, Oval-flowered Witch Grass. Cp (GA, NC, SC, VA): dry to damp sandy, peaty soil of swamps; common (rare in GA, NC, SC, VA). May-October. NY to WI, south to FL and e. TX. Infrequent over most of its range except FL. In our region, the *D. ovale* double ligule character is more evident in var. *ovale*, with var. *addisonii* often having only a single ligule about 1 mm long. Plants referable to *Panicum malacaon* have spikelets 3-3.2 mm long with a first glume attached conspicuously below the second glume and sterile lemma, and half or more as long as the spikelet; leaves 3-5 mm wide, puberulent beneath, and puberulent to glabrous above. It needs further study. Also see note under *D. consanguineum* regarding *D. ovale*. [= K, Z; = Panicum ovale Elliott – RAB, X; = D. ovale ssp. ovale – FNA; = P. ovale – HC, S; = P. malacaon Nash – HC, S; = P. ovale ovale – X]
POACEAE

Dichanthelium polyanthus (Schultes) Mohlenbrock, Small-fruited Witch Grass. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): damp to dry soil of open woods and ditches; common (absent from the outer Coastal Plain south of the Neuse River, NC). June-October. VA to s. IL, south to GA and e. TX. [= FNA; = Panicum polyanthus Schultes – RAB, C, F, G, GW, HC, S, WV; = D. sphaeroacapron (Elliott) Gould var. isophyllym (Scribner) Gould & Clark – K, Z]

Dichanthelium scoparium (Lamarck) Gould, Velvet Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): moist sandy soil of woodland openings and ditches; common (uncommon in Mountains). May-October. MA and MI south to FL and TX, also in Mexico and West Indies. The dense, velvety pubescence of the internodes, sheaths, and blades of this taxon, combined with the viscid band below the nodes, are diagnostic. See note under D. acuminate var. fasciculatum regarding Panicum glutinosacum. [= FNA, K, Z; = Panicum scoparium Lamarck – RAB, C, F, G, GW, HC, S]

Dichanthelium species 1 (=arenicolioides), Sandy Woods Witch Grass. Cp (GA, SC, NC), Pd (NC): in open sandy soil of pinelands and dunes, primarily near the coast; possibly uncommon, but long overlooked. May-September. NC south to FL and west to TX and AR; also in West Indies, Central America, and n. South America. Should be sought in VA. Autumnal form strongly resembling D. aciculare but with larger spikelets and longer first glumes. Vernal cauleine leaves are longer than those of D. aciculare but of similar width. Panicile branches often ascending. [= Panicum arenicolioides Ashe – HC, S; < D. aciculare (Desvaux ex Poiret) Gould & C.A. Clark ssp. angustifolium (Elliott) Freckmann & Lelong – FNA; < D. aciculare – K, Z]

Dichanthelium species 3 (=lancearium), Nash's Witch Grass. Cp, Pd (GA, NC, SC, VA): moist pine savannas and flatwoods, moist to dry openings in maritime forests, dry pine and oak sandhills; common (uncommon in Piedmont, rare in VA Piedmont and Coastal Plain). May-September. Se. VA to FL, west to e. TX, also in West Indies and Central America. This and D. portoricense appear to intergrade in our region, and =lancearium is treated as part of D. portoricense ssp. patulum in FNA, whose concept of ssp. patulum includes Panicum webberianum (D. species 2 here) and P. patentifolium, both of which appear to merit recognition (= "Panicum lancearium" as a species and =p. patentifolium as at least a variety). [= Panicum lancearium Trinius – RAB, C, G; > P. lancearium var. lancearium – F; > P. lancearium var. patulum (Scribner & Merrill) Fernald – F; < D. portoricense (Desvaux ex Hamilton) B.F. Hansen & Wunderlin ssp. patulum (Scribner & Merrill) Freckmann & Lelong – FNA; > P. lancearium – HC, S; > P. patulum (Scribner & Merrill) Hitchcock – HC, S; < D. sabulorum (Lamarck) Gould & Clark var. patulum (Scribner & Merrill) Gould & Clark – K, Z; < P. portoricense Desvaux ex Hamilton var. nashianum (Scribner) Lelong – X]

Dichanthelium species 9 (=cryptanthum), Hidden-flowered Witch Grass. Cp (NC, SC): wet meadows and ditches, streamside openings; rare. May-September. NC (or NJ?) to MS (or TX?) (previous concepts of this taxon and its range are unclear). In the field, this taxon can be mistaken for D. yadkinense; it is readily distinguished by its scabrous peduncle and membranous ligules. [= Panicum cryptanthum Ashe – F, HC, S; < P. scabriusculum Elliott – RAB, C, GW; < D. scabriusculum (Elliott) Gould & Clark – FNA, K, Z; = P. scabriusculum var. cryptanthum (Ashe) Gleason – G]

Dichanthelium splagunlica (Nash) LeBlond, Peaty Witchgrass. Cp (FL, GA): edges of cypress swamps, in sphenoglossum bogs, moist shady places; rare (but poorly known). May-October. GA (Chatham, Camden, Lanier counties) (Carter, Baker, & Morris 2009) to FL; should be sought in se. SC. Treated in synonymy with Panicum dichotomum by RAB, but no specimen is known from the Carolinias. This species is similar to D. lucidum in appearance, and differs most readily by its larger pubescent spikelets with smooth fertile lemma and palea. [= Q; < Panicum dichotomum Linnaeus – RAB; < D. dichotomum (Linnaeus) Gould ssp. lucidum (Ashe) Freckmann & Lelong – FNA; = P. splagunlica Nash – HC, S; < D. dichotomum var. dichotomum – K, Z; < P. dichotomum var. lucidum (Ashe) Lelong – X]

Dichanthelium spretum (Shultes) Freckmann, Eaton's Witch Grass. Pd (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): wet sands and peats of bogs, savannas, meadows, and shores; rare (rare in NC and VA, common in DE Coastal Plain). May-September. ME south to n. FL, LA and e. TX. Intermediate forms between this taxon and D.
POACEAE

longiligulatum occur. [= K, Y; = Panicum spretum Schultes – RAB, C, F, G, HC, S; = D. acuminatum (Swartz) Gould & Clark ssp. spretum (Schultes) Freckmann & Lelong – FNA; < P. spretum – GW; = P. acuminatum Swartz var. densiflorum (Rand & Redfield) Lelong – X; = D. acuminatum var. densiflorum (Rand & Redfield) Gould & Clark – Z]

**Dichanthelium strigosum** (Muhlenberg) Freckmann var. **glabrescens** (Grisebach) Freckmann, Hairless Witch Grass. Cp (GA, NC): low, open sandy pinelands and hammocks; rare. May-October. CA and FL west to LA; disjunct in se. NC; also in West Indies, Belize. Included in synonymy with *Panicum strigosum* by RAB, but no specimen from the Carolinas had been found prior to discovery of a population in Onslow County in 2009. [= K; = D. strigosum ssp. glabrescens (Grisebach) Freckmann & Lelong – FNA; < Panicum strigosum Muhlenberg – GW; RAB; = P. polycaulon Nash – HC, S; = D. leucolepharis (Trinius) Gould & Clark var. glabrescens (Grisebach) Gould & Clark – Z]

**Dichanthelium strigosum** (Muhlenberg) Freckmann var. **leucoblepharis** (Trinius) Freckmann, Dwarf Witch Grass. Cp (GA, NC, SC), Mt (GA, NC, SC): sandy, acidic soils of pinelands; uncommon (rare in Mountains). May-October. NC south to FL, west to TX, also in Mexico. [= K; = Panicum ciliatum Elliot – RAB, HC, S; = D. strigosum ssp. leucoblepharis (Trinius) Freckmann & Lelong – FNA; = P. strigosum Muhlenberg var. leucoblepharis (Trinius) Lelong – X; = D. leucolepharis (Trinius) Gould & Clark var. leucoblepharis – Z]

**Dichanthelium tenue** (Muhlenberg) Freckmann & Lelong, White-edged Witch Grass. Ct (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): weedy to sandy soil pineland savannas, flatwoods, bogs, and meadows; common (uncommon in Piedmont, rare in Mountains). May-October. NJ south to FL, west to TX; also in Mesoamerica and Cuba. This treatment of *D. tenue* includes plants from northern Alabama formerly recognized as *Panicum concinnius*, with spikelets 1.2-1.4 mm long but otherwise possessing the characters of *D. tenue*. [= FNA; = Panicum tenue Muhlenberg – RAB, C; > P. tenue – F, HC, S; > P. albomarginatum Nash – F, HC, S; > P. trilobum Nash – F, G, HC, S; < P. ensifolium Baldwin – G; > P. concinnus Hitchcock & Chase – HC, S; < D. dichotomum (Linnaeus) Gould var. tenue (Muhlenberg) Gould & Clark – K, Z]

**Dichanthelium villosissimum** Freckmann var. **villosissimum**, White-haired Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): dry sandy soil of open woods and prairies; common (uncommon in VA). April-September. MA south to FL, west to TX, also in Mexico and Mesoamerica. Appearing to be related to *D. ovalis* based on such characters as the double ligule. [= K, Y; = Panicum villosissimum Nash – RAB, C, HC, S, WV; = P. villosissimum var. villosissimum – F, G; = D. ovalis (Elliot) Gould & Clark var. villosissimum (Nash) Freckmann & Lelong – FNA; = P. ovalis Elliot var. villosissimum (A. Gray) Lelong – X; < D. acuminatum (Swartz) Gould & Clark var. villosum (A. Gray) Gould & Clark – Z]

**Dichanthelium wrightianum** (Scrubine) Freckmann, Wright's Witch Grass. Cp (DE, GA, NC, SC, VA): limesink ponds and meadows, cypress savannas, pine savannas, bogs; uncommon (rare in DE and VA). May-September. MA south to FL, west to TX, also in Cuba and Mesoamerica. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, *D. meridionale*, and *D. leucothrix* from other members of the *D. acuminatum* group. [= FNA, K, Y; = Panicum wrightianum Scrubine – RAB, C, F, G, HC, S; < P. spretum Schultes – GW; = D. acuminatum (Swartz) Gould & Clark var. wrightianum (Scrubine) Gould & Clark – Z]

**Dichanthelium yadkinense** (Ashe) Mohlenbrock, Spotted-sheath Witch Grass. Pd (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): floodplain forests, thickets, bottomlands, and swamps, often on alluvial deposits; common (uncommon in Coastal Plain, uncommon in Mountains, uncommon in VA, rare in DE). May-October. NJ and MI south to GA and TX, also in Mexico. Sheaths often with wart-like glands. This taxon resembles *D. species 9* (= *cryptanthum*), from which it differs most readily by its hairy ligule (vs. membranous) and smooth peduncle (vs. antrorsely scabrous). [= Q; < Panicum dichotomum Linnaeus – RAB, GW; = P. yadkinense Ashe – C, F, G, HC, S, WV; = D. dichotomum ssp. yadkinense (Ashe) Freckmann & Lelong – FNA; < D. dichotomum var. dichotomum – K, Z; = P. dichotomum var. yadkinense (Ashe) Lelong – X]

**Dichanthelium chamaeleonchae** (Trinius) Freckmann & Lelong ssp. breviflorum (Hitchcock & Chase) Freckmann & Lelong, Short Witch Grass, endemic to c. and s. FL, primarily near the east coast. [= FNA; = Panicum breviflorum Hitchcock & Chase – HC, S; = D. dichotomum (Linnaeus) Gould var. breviflorum (Hitchcock & Chase) Gould & Clark – K, Z; = P. chamaeleonchae Trinius var. breviflorum (Hitchcock & Chase) Lelong – X]

**Dichanthelium dichotomum** (Linnaeus) Gould var. glabrescens (Nash) Gould & Clark, Smooth-leaved Witch Grass, endemic to peninsular FL, mostly near the west coast. Like *D. chamaeleonchae* ssp. breviflorum, this taxon appears to be more closely related to *D. chamaeleonchae* than to *D. dichotomum* or *D. ensifolium*. [= K; = P. dichotomum Nash – HC, S; < P. chamaeleonchae Trinius var. chamaeleonchae – X]

**Dichanthelium leibergii** (Vasey) Freckmann, Leiberg's Witch Grass. NY and PA west to AB, ND, and KS. [= FNA, K, Z = Panicum leibergii (Vasey) Scrubine – C, F, G, HC, S]

**Dichanthelium malacophyllum** (Nash) Gould, Soft-leaf Witch Grass. KY and TN west to KS and TX. Primarily a plant of cedar glades and dry calcareous soils. Reported from SC by FNA, but source of record has not been identified. [= FNA, K, Z = Panicum malacophyllum – F, G, HC, S]

**Dichanthelium nudaclavae** (Vasey) B.F. Hansen & Wunderlin. Cp (AL, FL, MS): bogs, wet pine savannas; rare. W. FL Panhandle and s. AL west to MS. [= Q; = Panicum nudaclavae Vasey] {add synonymy}

**Dichanthelium villosissimum** (Vasey) Freckmann is shown as occurring in SC and MS on the range map in FNA, but the source of these records is not known for this plant primarily of dry prairies in the Upper Midwest. It is not treated here.

**Dichanthelium xanthophysum** (A. Gray) Freckmann, Slender Witch Grass. Mt (WV): {habitats}; rare. NS and ME west to SK, south to PA, ne. WV, and SD. [= FNA, K, Z = Panicum xanthophysum A. Gray – C, F, G, HC, WV]

**Digitaria** Haller 1768 (Crab Grass)
A genus of about 200 species, primarily in the tropics and subtropics. Most of our species occur primarily in disturbed situations; their original distributions and habitats are now obscure. References: Wipff in FNA (2003a); Webster (1987) = Z; Wipff & Hatch (1994) = Y; Wipff (1996b) = X; Webster (1980).

1 Inflorescence an open panicle; spikelets long-pedicellate, borne singly at the ends of long panicle branches; [section Pennatae] .......................................................... D. cognata var. cognata

1 Inflorescence of 2- several spike-like racemes borne digitately or in close proximity near the summit of the culm; spikelets sessile or short-pedicellate, borne more-or-less closely spaced along the racemes.

2 Rachis of each raceme narrow, trigonous, only slightly (if at all) winged.

3 Spikelets 4.2-5.9 mm long .......................................................... D. insularis

3 Spikelets 1.3-3.6 mm long.

4 Spikelets in 2s on the middle portions of the primary branches, the pedicels not adnate; upper lemmas gray, yellow, and/or purplent when immature, purple at maturity .......................................................... D. texana

4 Spikelets in groups of 2-5 on the middle portions of the primary branches, the longer pedicels often adnate to the primary branch for a portion of their lengths; upper lemmas brown when immature, dark brown at maturity.

5 Spikelets 1.7-2.2 mm long; plants 3-10 dm tall; racemes to 10 cm long; upper sheaths glabrous, lower sheaths glabrous to sparsely pilose .......................................................... D. filiformis var. filiformis

5 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose .......................................................... D. villosa

2 Rachis of each raceme broad (0.5-1 mm wide), winged, the wings as wide as or wider than the rachis proper.

6 Lower sheaths glabrous; second glume 0.75-1× as long as the first glume (which may be ; fertile lemma dark brown or black at maturity (or pale brown or gray in D. longiflora)

7 Hairs of the spikelet minutely capitate; second glume ca. 1× as long as the first glume; spikelets 1.7-2.3 mm long ............... D. ischaemum

7 Hairs of the spikelet not minutely capitate; second glume 0.75× as long as the first glume; spikelets 1.2-1.7 mm long................. .............................................................................. D. violascens

6 Lower sheaths pilose; second glume 0.3-0.6× as long (to 0.8× as long in D. ciliaris) as the first glume; fertile lemma white, tan, or grayish-brown at maturity.

8 Spikelets 1.5-1.8 mm long, villous with crinkled hairs; pedicels glabrous, terete in cross-section ................................. D. serotina

8 Spikelets (1.7-) 2.4-4.1 mm long, glabrous, scabrous, or pubescent with straight hairs; pedicels scabrous, 3-angled in cross-section; [section Digitaria].

9 Spikelets (1.7-) 2.5-3.4 mm long, leaf blades pilose on the upper surface ........... D. sanguinalis

9 Spikelets 2.6-4.1 mm long, averaging 3.1 mm long or longer; leaf blades glabrous except for a few hairs on the upper surface at the base.

10 Lower lemma of the sessile spikelet with 5 equidistant nerves; lowermost inflorescence node glabrous or pubescent with hairs < 0.4 mm long; apex of the first glume rounded to truncate .......................................................... D. bicornis

10 Lower lemma of sessile spikelet with the lateral nerves crowded to the margins; lowermost inflorescence node pubescent with hairs > 0.4 mm long; apex of the first glume acute. ........................................................................ D. ciliaris

Digitaria ciliaris (Retzius) Köler, Southern Crab Grass. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): sandy fields, roadsides, disturbed areas; common. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K, Z]

Digitaria ciliaris (Retzius) Köler, Southern Crab Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): sandy fields, lawns, roadsides, disturbed places; common. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K, Z]

Digitaria ciliaris (Retzius) Köler, Southern Crab Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): sandy fields, lawns, roadsides, disturbed places; common. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K, Z]

Digitaria ciliaris (Retzius) Köler, Southern Crab Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): sandy fields, lawns, roadsides, disturbed places; common. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K, Z]
**Digitaria texana** A.S. Hitchcock, Texas Crabgrass. Cp (VA): disturbed areas; rare, native of coastal Texas. Established in City of Virginia Beach, VA (VBA 2007). Also reported for St. Johns County, FL, adjacent to our area. [= FNA, HC, K] [add to synonymy]

**Digitaria eriantha** Steudel ssp. *pentzii* (Stent) Kok, Pangola Grass. Cp (FL): pastures; rare, native of Africa. Introduced in n. FL (Wunderlin & Hansen 2003, 2006). [= FNA; < *D. eriantha* – K; = *D. pentzii* Stent] [not yet keyed; add to synonymy]

**Digitaria horizontalis** Wildenow, Jamaican Crabgrass. Reported for SC on the basis of a specimen at NCU (Kartesz 1999). [check specimen] [= FNA, K] [not yet keyed; add to synonymy]

**Digitaria longiflora** (Retzius) Persoon, Indian Crabgrass. Cp (FL): lawns, roadsides, pastures; uncommon, native of Asia and Africa. Alachua, Dixie Duval, and Holmes counties southward to s. FL. [= FNA, K] [not yet keyed]

**Digitaria nuda** Schumacher. Cp (FL): disturbed areas; rare, native of Africa. In our area, known only from Columbia County, FL. [= FNA, K; *Syntherisma nuda* (Schumacher) A.S. Hitchcock] [not yet keyed; add to synonymy]

**Dinebra** Jacquin 1809 (Viper Grass)

**Dinebra retroflexa** (Vahl) Panzer, Viper Grass, native of Africa and s. Asia, has been collected as a waif in Mecklenburg County, NC (Mellichamp, Matthews, & Smithka 1987). [= FNA, K] [not keyed]

**Distichlis** Rafinesque 1819 (Saltgrass)

**Identification notes:** When sterile, *Distichlis spicata* is easily confused with *Sporobolus virginicus*, with which it sometimes occurs. *Distichlis spicata* is generally a coarser plant, and lacks long hairs around the collar of the sheath; *Sporobolus virginicus* is more delicate, and typically has long hairs on either side of the collar.

1 Leaf blades < 1.5 cm long, subulate; plant colonial by surficial stolons (rarely rhizomatous); pistillate and staminate inflorescence with 1 spikelet; [FL and other subtropical shores]

---

**Distichlis littoralis** (Engelmann) H.L. Bell & Columbus, Shoregrass, Key Grass. Cp (FL): brackish shores; rare. From n. peninsular FL (Taylor and Dixie cos. on the west coast and Volusia County on the east coast) southward. Also known from coastal sw. LA (Cameron Parish) and TX southward. [= *Monanthochloa littoralis* Engelmann – FNA, K, S, WH]

**Distichlis spicata** (Linnaeus) Greene, Saltgrass, Spike Grass. Cp (DE, FL, GA, NC, SC, VA): coastal marshes and shores, especially common in hypersaline flats (where infrequent tidal inundation is followed by evaporation); common. June-October. Two varieties (or subspecies or species) have often been recognized: var. *spicata* ranging along the Atlantic coast from NS and PE south to tropical America, and var. *stricta* (Torrey) Scribner widespread in saline situations in western North America. These do not appear to warrant taxonomic recognition (Barkworth in FNA 2003a). [= RAB, FNA, GW, K, S; > *D. spicata* var. *spicata* – C; > *D. spicata* – F, G, HC; > *D. spicata* ssp. *spicata*]

**Echinochloa** Palisot de Beauvois 1812 (Barnyard-grass, Jungle-rice)

A genus of 4-5- species of the tropics and warm temperate regions. References: Michael in FNA (2003a). Key based in part on C.

1 Panicle elongate, the branches few, distant, unbranched, and short, to 2 (-3) cm long; spikelets awnless; leaves 3-6 (-9) mm wide

---

**E. colomum**

2 Lower sheaths glabrous; fertile lemma 1.5-2.5× as long as wide.

---

**E. crus-pavonis** var. *crus-pavonis*

3 Inflorescence nodding; awns 4-29 mm long

---

**E. crus-pavonis** var. *crus-pavonis*

4 Second glume and sterile lemma hairy or scabrous to nearly glabrous, the hairs usually not papillose-based; fertile lemma obtuse or broadly acute, with a thin, membranous (later withering) tip set off from the body by a line of minute hairs.
5 Panicle fairly open, the branches erect, appressed, or spreading; spikelets green or purple-tinged, awnless or with a well-developed awn (to 25 mm long); leaves 5-15 mm wide; plants mostly 3-7 dm tall. E. crusgalli var. crusgalli
5 Panicle very crowded, the branches appressed to slightly spreading, the tips often incurved; spikelets purplish-brown, awnless (or with awn to 2 mm long); leaves mostly 15-30 mm wide; plants mostly 7-15 dm tall. E. frumentacea

Second glume and sterile lemma usually with stout, papillose-based hairs on the veins; fertile lemma acuminate, abruptly narrowed to a firm, persistent tip.

6 Spikelets < 3.5 mm long, not including the awn (if present); sterile lemma awnless or with an awn to 6 (10) mm long. E. pungens
6 Spikelets > 3.5 mm long, not including the awn (if present); sterile lemma usuallyawned (rarely awnless), the awn 6-25 mm long. E. pungens

* Echinochloa crusgalli* (Linnaeus) Palisot de Beauvois var. *crusgalli*, Barnyard-grass. Cp (DE, FL, VA), Pd (DE, VA), Mt (VA, WV), {GA, NC, SC}: disturbed areas; common. July-October. [= C, G; < *E. crusgalli* – RAB, GW, WV (also see E. muricata); = *E. crus-galli* – K, orthographic variant; < *E. crusgalli* – F, FNA; < *E. crus-galli* ssp. crus-galli = S (also see E. muricata)]

Echinochloa cruspavonis (Kunth) J.A. Schultes var. *cruspavonis*. Cp (FL, VA), {AL, MS} July-October. [= *E. crus-pavonis* – HC; = *E. crus-pavonis* var. crus-pavonis – FNA, K, orthographic variant]

Echinochloa muricata (Palisot de Beauvois) Fernald var. *microstachya* Wiegang, Barnyard-grass. Mt (VA, WV), {GA, NC, SC, VA}: habitat; uncommon in WV {rarity}. July-October. [= C, FNA, K; < *E. crusgalli* – RAB, GW, WV; = *E. pungens* (Poir) Rydberg var. microstachya (Wiegang) Fernald & Griscom – F; = *E. microstachya* (Wiegang) Rydberg – G; < *E. crusgalli* ssp. crus-galli = S]

Echinochloa muricata (Palisot de Beauvois) Fernald var. *muricata*, Barnyard-grass. Cp (DE, FL, NC, VA), Pd (DE, VA), Mt (VA, WV): interdune wetlands, {other habitats}; common. July-October. [= C, FNA, K, WV; < *E. crusgalli* – RAB, GW, WV; = *E. pungens* (Poir) Rydberg var. pungens – F; = *E. pungens* var. ludoviciana (Wiegang) Fernald & Griscom – F; = *E. muricata* – G; < *E. crusgalli* ssp. crus-galli = S]

Echinochloa walteri (Pushr) Heller. Cp (DE, FL, GA, NC, SC, VA), Pd (GA), Mt (WV): marshes; common (rare in WV), July-October. MA south to FL, west to TX on the outer Coastal Plain; also inland from OH west to WI, south to w. WV, MO, and AR. [= RAB, C, F, FNA, GW, HC, K, S, W]

Eleusine Gaertner 1788 (Yard Grass)

A genus of about 9 species, native to Africa and South America. References: Hilu in FNA (2003a). Key based on FNA.

1 Panicles with 1-3 branches, attached in a single digitate cluster....................................................... E. tristachya
1 Panicles with 4-20 branches, 1-2 of these attached below the terminal digitate cluster.
2 Lower glumes 2-3-veined; panicle branches 3-5.5 mm wide; ligule 0.2-1 mm long, ciliate with hairs 1-2 mm long. E. coracana ssp. africana
2 Lower glumes 1-veined; panicle branches 5-7 mm wide; ligule 1-2 mm long, ciliate with hairs 1-2 mm long. E. frumentacea

* Eleusine tristachya* (Lamarck) Lamarck. Cp (SC): in waste areas of wool-combing wills; rare, native of South America, perhaps only a waif in our area. Reported as introduced in additional, scattered states in e. United States, including VA (Kartesz 1999, but apparently in error), NJ (Hilu 1980) and AL (Small 1933). [= FNA, K, S]

Elionurus Humboldt & Bonpland ex Willdenow 1805 (Balsamscale)

A genus of about 150 species, semicosmopolitan in temperate regions. The genus, as now circumscribed, includes all allopolyploid taxa with at least one chromosome complement contributed from *Pseudoroegneria*. North American *Elymus* are allopolyploids of *Pseudoroegneria* and *Hordeum* (Helfgott & Mason-Gamer 2004). Reference: Barkworth, Campbell, & Salomon in FNA (2007a); Campbell (2000); Church (1967); Tucker (1996)=Z; Barkworth (1997)=X. This treatment largely follows Barkworth, Campbell, & Salomon in FNA (2007a).

**Identification notes:** Measurements of the spike include the awns, but measurements of spikelets and its components do not. Rachis internodes should be measured near the middle of the spike. Glume widths are measured at the widest point, or if the widest point is not apparent, at about 5 mm above the glume base.

1 Spikelets solitary at each node (occasionally paired at the lowest nodes); glumes and lemmas awned or unawned; plants cespitose to strongly rhizomatous.

2 Plants strongly rhizomatous; [common and weedy introduced species]; [section Elytrigia] .................................................................................................................. *E. repens* GA

3 Spikelets 20-30 mm long; anthers 3-6 mm long; rachis internodes hirtellous below the spikelets; [very rare introduction, reported for c. GA] .................................................................................................................. *E. semiostatus*

4 Lemma awns 15-40 mm long, longer than the body of the lemma .................................................. *E. trachycaulus* ssp. subsecundus

5 Spikelets 8-25 mm long; anthers 0.8-3 mm long; rachis internodes glabrous below the spikelets; [rare natives of glades and barrens].

6 Lemma awns 1-13 mm long, shorter than the body of the lemma.................................................. *E. trachycaulus* ssp. trachycaulus

7 Spikelets 2-3 (-5) at each node; glumes and lemmas usually unawned; plants usually cespitose, occasionally short-rhizomatous.

8 Both glumes (including their awn) either 0.3-3 mm long and subulate or 1-2 mm long and differing in length by > 7-5 mm, 0.1-0.6 mm wide, tapering from the base, with 0-1 distinct veins, persistent; rachis internodes 4-12 mm long, ca. 0.5 mm thick at the narrowest section.

9 Spikelets appressed; lemma awns straight or curving; glumes sometimes absent, but usually 1-20 mm long, 0.1-0.6 mm wide, with a distinct vein; spikes erect or nodding .......................................................... *E. svensonii*

10 Spikelets widely spreading to horizontal; lemma awns straight (rarely slightly curving); glumes 0-3 mm long, with no distinct veins (rarely 1 glume to 20 mm long, 0.2 mm wide); spikes usually erect.

11 Glumes basale flat, thin, and evidently veined, or indurate for < 1 mm, the bodies not exceeding the adjacent (usually 8-15 mm long) lemmas; lemma awns usually curving outward; spikes usually nodding to pendent; internodes (2-) 4-12 mm long.

12 Glumes 0.5-1.6 mm wide; lemma awns 15-40 (-50) mm long; paleas acute; rachis internodes 2-5 (-7) mm long; blades (3-) 4-15 (-20) mm wide, pale green, usually glabrous or scabridulous above .............................................................. *E. canadensis* var. canadensis

13 Glumes 0.3-0.8 mm wide; lemma awns 15-25 (-35) mm long; paleas narrowly truncate; rachis internodes 5-8 (-12) mm long; blades 8-24 mm wide, dark green, usually thinly pilose above .............................................................. *E. wiegiadui*

14 Glumes bases flat, indurate, and lacking evident veins for 0.5-4 mm, the bodies (unless indistinct from the awns) exceeding the adjacent (usually 6-12 mm long) lemmas; lemma awns straight; spikes erect or nodding; internodes 2-5 mm long (to 7 mm in *E. sp. 1*).

15 Glumes persistent, 0.2-1 mm wide, with 2-4 veins, the basal 0.5-2 mm essentially straight; lemmas rarely glabrous; spikelets with 1-3 (-4) florets; spikes nodding, exerted.

16 Blades glabrous to scabrous; spikelets usually 1-2 cm long; lemmas 6-10 mm long .................................................. *E. riparius*

17 Blades glabrous to scabrous, pale dull green; spikes 7-25 cm long; internodes usually 3-5 mm long; spikelets with 2-3 (-4) florets; lemmas usually scabrous, 7-14 mm long, 1.5-5 mm longer than the acute paleas; flowering usually late June to late July.................

18 Blades viviparous, dark glossy green; spikes 4-12 cm long; internodes usually 2-3 mm long; spikelets with 1-2 (-3) florets; lemmas usually villous, 5.5-9 mm long, 0.1-1.5 mm longer than the obtuse paleas; flowering usually very early June to early July .................

19 Glumes least 0.7-2.3 mm wide, with (2-) 3-5 (-8) veins, the basal 1-4 mm clearly bowed-out; lemmas often glabrous; spikelets with (2-) 3-5 (-6) florets; *Elymus virginicus* complex.

20 Spikes with 9-18 nodes; internodes 4-7 mm long; blades usually lax, dark glossy green under the glaucous bloom; auricles 2-3 mm long, blackish at maturity; flowering usually in mid-May to mid-June .............................................................. *E. macgregoriı*

21 Spikes with 15-30 nodes; internodes 3-5 mm long; blades lax, or often ascending and involute, pale dull green; auricles 0-2 mm long, brownish at maturity; flowering usually in mid-June to late July.

22 Spikelets (and usually also the foliage) pubescent; spikes usually 6-12 cm long; lemmas 6-10 mm long .................................................. *E. glabriiflorus* var. australis

23 Spikelets (and usually also the foliage) glabrous to scabrous; spikes usually 9-16 cm long; lemmas 7-13 mm long.................................................. *E. glabriiflorus* var. glabriiflorus

24 Spikelets 0.7-2 cm wide (including the awns), exerted or sheathed; lemma awns 1-15(20) mm long; spikelets appressed to slightly spreading; blades usually glabrous to scabridulous.

25 Lemma awns 1-3(5) mm long; blades often ascending, somewhat involute, those higher on the stiffly erect culms broader and more persistent; flowering usually in early July to mid-August................................. *E. curvus*

26 Lemma awns 5-15(20) mm long; blades usually spreading or lax, not markedly broader or more persistent towards the culm summit; flowering usually in mid-June to late July.

27 Spikelets glaucous, hispidulous to villous-hirsute, often intermediate in exsertion; glumes indurate in the lowest 1-2 mm; ligules and auricles usually absent; flowering usually early July to mid-August................................. *E. virginicus* var. intermedius

28 Spikelets green to glaucous, usually glabrous to scabrous, partly included in the sheath to fully exerted; ligules and auricles often present; flowering usually mid-June to mid-July.

29 Spikes partly sheathed; glumes 1-2.3 mm wide, strongly indurate and bowed-out in the lowest 2-4 mm; plants usually green to yellowish-brown; nodes mostly covered.................................................. *E. virginicus* var. virginicus
POACEAE

17 Spikes usually exerted; glumes (0.5-) 0.7-1.5 (-1.8) mm wide, moderately indurate and bowed out in the lowest 1-2 mm; plants usually glaucous, sometimes reddish-brown at maturity; nodes often exposed.
18 Culms usually 3-8 dm tall, with 4-6 nodes; blades 2-9 mm wide, becoming involute; spikes 3.5-11 cm long, strongly glaucous; glumes usually indurate in the lowest 1-2 mm.......................... E. virginicus var. halophilus
18 Culms usually 7-10 dm tall, with 6-8 nodes; blades 3-15 mm wide, flat; spikes 4-20 cm long, pale green or glaucous; glumes indurate only in the lowest 1 mm.......................... E. virginicus var. jeunus

Elymus curvatus Piper, Awnless Wild-rye. Ip (KY, TN); moist bottomlands and slopes; rare. NY and QC west to BC and WA, south to s. OH, KY, c. TN, OK, and n. TX. [= FNA; < E. virginicus Linnaeus – C; = E. submucifolius (Hooker) Smyth & Smyth – K; = E. virginicus Linnaeus var. submucifolius Hooker – F; < G; < E. virginicus var. virginicus – S]
* Elymus elymoides (Rafinesque) Swezy ss. brevilolius (J.G. Smith) Barkworth. Mt (KY): [habitat]; rare. [= FNA] [synonymy incomplete]

Elymus hystrix Linnaeus var. bigelowiana (Fernald) Bowden, Northern Bottlebrush Grass. Mt (NC): high elevation forests, rare. [< Hystrix patula Moench – RAB, G, WV; < Elymus hystrix – C, FNA; = Hystrix patula var. bigelowiana (Fernald) Deam – F; = E. hystrix var. bigelowiana – K, orthographic variant; < Hystrix hystrix (Linnaeus) Millsap – S]

* Elymus repens (Linnaeus) Gould, Quackgrass, Dog-grass, Witchgrass. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, VA): roadsides, disturbed areas, pastures; uncommon, probably introduced from Europe (sometimes considered to be partially native along the coast). June-August. [= FNA, K, X; = Elytrigia repens (Linnaeus) Neveski – C; Z; = Agropyron repens (Linnaeus) Melis de Beavoulois – RAB, G, HC, S, W, WV; > Agropyron repens var. repens – F; > Agropyron repens var. subalatum (Schröber) Römer & J.A. Schultes – F]

* Elymus semistatus (Nees ex Steudel) Meldr. Reported for c. GA by Jones & Cole (1988), as Agropyron semistatum Nees ex Steudel, but FNA states that known reports from North America are based on misidentifications. [= FNA, K; = Agropyrum semistatum Nees ex Steudel]

* Elymus trachycaulus (Link) Gould ex Shinners ssp. subsecundus (Link) A. & D. Löve, Bearded Wheatgrass. Mt (WV): glades, barrens, open woodlands; rare. June-August. NL (Newfoundland) west to AK, south to MD, WV, KY, MO, NM, AZ, and CA. [= FNA, K; < Agropyron trachycaulus (Link) Malte ex H.F. Lewis var. glaucum (Pease & Moore) Malte – F; G; = Agropyron subsecundum (Link) A.S. Hitchcock var. subsecundum – HC; < Agropyron subsecundum (Link) A.S. Hitchcock – WV]

* Elymus trachycaulus (Link) Gould ex Shinners ssp. trachycaulus, Slender Wheatgrass. Mt (NC, VA, WV): glades and barrens, over serpentine, etc.; rare. August. Greenland, NL (Labrador), Keewatin, NU, YT, and AK, south to w. NC, OH, IN, IL, MO, TX, Mexico and CA. [= FNA, K; < Agropyron trachycaulus (Link) Malte ex H.F. Lewis – RAB, W, WV; < Elymus trachycaulus – C; > Agropyron trachycaulus var. novae-angliae (Scriber) Fernald – F; > Agropyron trachycaulus var. ciliatum (Scriber & J.G. Smith) Gleason – G; < Elymus trachycaulus var. trachycaulus – HC]

Elymus wiegandi Fernald, Northern Riverbank Wild-rye. South to sc. PA and NJ; reported for nc. KY (Kartesz 2010). [= C, F, FNA, K; < E. canadensis – G]

Elymus villosus Muhlenberg ex Willdenow, Downy Wild-rye. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, NC, SC, VA), [GA]: moist forests; uncommon. QC, ON, MN, ND, and WY south to GA, AL, MS, and TX. [= RAB, C, F, FNA, G, GW, K, W, WV; < E. strigus Willdenow – S]

Enteropogon Nees 1836

* Enteropogon prieurii (Kunth) W.D. Clayton. Cp (NC): on ballast at Wilmington, New Hanover County, NC; rare, native of Africa, probably only a waif. Also reported from Mobile, Baldwin County, AL (Hitchcock & Chase 1950). [= K; = Chloris prieurii Kunth – S]

Eragrostis Wolf 1776 (Lovegrass)

A genus of about 350 species of temperate and tropical areas. References: Peterson in FNA (2003a); Koch (1978); Peterson & Harvey (in prep.)=Z. Key adapted from Peterson & Harvey (in prep.).

1 Plants cespitose or geniculate or mat-forming annuals, lacking innovations or buds in the lower sheaths.

2 Plants without short or thick rhizomes; florets articulating whole....................................................................................E. spectabilis

3 Caryopsis with a deep to shallow groove along the adaxial surface.

4 Caryopsis dorso-ventrally compressed, flattened parallel to the side of the embryo, translucent, light brownish...............E. curvula

5 Caryopsis laterally compressed, flattened on the side perpendicular to the embryo, or cylindric, opaque (rarely translucent), usually redbrown.

6 Lateral veins of the lemmas conspicuous, often greenish, the lemmas strongly keeled.................................E. trichodes

7 Lateral veins of the lemmas inconspicuous and hardly evident, the lemmas sometimes weakly keeled.

8 Stomens 3.

9 Spikelets 4-8.2 (-10) mm long .................................................................E. curvula

10 Leaf blades 25-60 cm long, 3-8 (-11) mm wide; lemmas 1.6-2.4 mm long; spikelets 1.0-1.7 mm wide ..............E. hirsuta

11 Panicle 15-45 cm wide, open, diffuse, broadly ovate to obovate in outline, the panicle branches capitillary; pedicels 0.5-35 (-50) mm long, longer than or shorter than the spikelets.

12 Spikelets with widely spreading pedicels, the lower pedicels all generally longer than the spikelets; disarticulation of the lemmas only, the paleas persistent .............................................................E. elliottii

13 Spikelets with appressed pedicels, lower pedicels of each branch shorter than the spikelets; disarticulation usually of the whole floret..............................................................................................................E. refracta

14 Spikelets 0.7-2.4 mm wide; glumes 0.3-2.2 mm long; lemma 1.5-2.5 mm long, the apex acute (sometimes acuminate)........................E. bahiensis

15 Spikelets 2.4-5 mm wide; glumes 1.4-4 mm long; lemma 2-6 mm long, the apex acuminate to attenuate..................E. secundiflora var. oxylepis

1 Plants cespitose, geniculate or mat-forming annuals, lacking innovations or buds in the lower sheaths.

16 Paleas prominently ciliate-pectinate on the keels, the hairs 0.1-0.8 mm long.

17 Paleas open, cylindrical to narrowly ovate, usually 1-8 cm wide.

18 Spikelets (1.0-) 1.5-3.5 mm long, 0.9-1.4 mm wide, 4-12-flowered; lemmas 0.7-1.1 mm long, membranous, the apex truncate to obtuse................E. amabilis

19 Caryopsis with a deep to shallow groove along the adaxial surface.

20 Spikelets 4-5 (-10) mm long, 5-11 (-15)-flowered; pedicels ascending, somewhat appressed along the branches.

21 Spikelets ovate to oblong in outline, >1.4 mm wide; lower glume 1.2-2.3 mm long......................E. mexicana ssp. mexicana

22 Spikelets linear to linear-lanceolate, <1.5 mm wide; lower glume 0.7-1.7 mm long .....................E. mexicana ssp. virens

23 Spikelets (1.4-) 1.8-2.5 mm long; 2-6 (-7)-flowered; pedicels erect, spreading along the branches.

24 Panicle 10-45 (-55) cm long, 2/3 or more the height of the plant; pedicels 4-5 (-25) mm long; glandular pits absent below the nodes, branches, and rachis............................................................E. capillaris

25 Panicle 4-20 cm long, < ½ the height of the plant; pedicels 1.5-5 mm long; glandular pits often present below the nodes, branches, and rachis ..........................................................E. frankii

26 Panicle 10-45 (-55) cm long, 2/3 or more the height of the plant; pedicels 4-5 (-25) mm long; glandular pits absent below the nodes, branches, and rachis ............................................................E. capillaris

27 Caryopsis not grooved on the adaxial surface.

28 Panicle 10-45 (-55) cm long, 2/3 or more the height of the plant; pedicels 4-5 (-25) mm long; glandular pits absent below the nodes, branches, and rachis ............................................................E. capillaris

29 Caryopsis not grooved on the adaxial surface.
23 Plants with glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicels, and/or on the midveins of the lemma and palea.

24 Spikelets (1.7-)2-4 mm long, 3-6-flowered .......................................................... \textit{E. frankii}

25 Spikelets 0.6-1.3 mm wide; pedicels 1-10 mm long, flexuous and delicate, appressed or spreading ........................................ \textit{E. pilosa}

26 Spikelets 1.1-4 mm wide; pedicels 0.2-4 mm long, straight and rigid, mostly spreading.

27 Inflorescence and glandular areas of spots or rings on the rachis below the panicle branch bases, the blades often shiny or yellowish; stamens 3; blade margins lacking crateriform glands .................................................. \textit{E. barrelieri}

28 Inflorescence sometimes with glandular areas of spots or crateriform pits on the rachis below the panicle branch bases, the glands usually dull and greenish-gray to straw-colored; stamens 2; blade margins sometimes with crateriform glands .......................................................... \textit{E. minor}

29 Spikelets 3-6-flowered. .................................................................................. \textit{E. pilosa}

30 First glume 0.3-0.6 (-0.8) mm long, <0.5× as long as the lowest lemma; spikelets 0.6-1.3 mm wide; panicle branches usually whorled at the lowest 2 nodes .......................................................... \textit{E. frankii}

31 Pedicels appressed or rarely diverging up to 20 degrees from the branches .......................... \textit{E. pectinacea var. miserrima}

\textit{Eragrostis barrelieri} Daveau, Mediterranean Lovegrass. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, native of Mediterranean Europe. Also reported for e. TN (Chester et al. 1993). [= FNA, HC, K, Z]

\textit{Eragrostis eliottii} S. Watson, Elliot's Lovegrass. Cp (FL, GA, NC, SC): ulitsox wet pine savannas, maritime wet grasslands, inland edges of brackish marshes, inland edges of freshwater tidal marshes, calcareously-influenced wet pine savannas; rare. September-October. NC south to FL, west to TX. [= RAB, FNA, GW, HC, K, S, Z]

?? \textit{Eragrostis japonica} (Thunberg) Trininius, Pond Lovegrass. Cp (FL, GA, SC): moist or wet sandy areas; rare. SC and TN south to Central America, South America, and West Indies; Old World tropics; Perhaps introduced from the Old World.
POACEAE

320

**Eragrostis** lugens Nees, Mourning Lovegrass. Cp (FL, NC, SC, VA), Pg (GA, NC, SC, VA): marshes, roadways, low fields; rare, introduced (NC Watch List). June-October. Perhaps only introduced from further south and west. [= RAB, FNA, HC, K, S, W, Z]

Eremochloa Büse 1852 (Centipede Grass)

**Identification notes:** In the autumn, the inflorescences make this grass readily recognizable at a distance: a short, tight lawn grass with a reddish aspect.

* Eremochloa ophiuroidea* (Munro) Hackel, Centipede Grass. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC): lawns, roadways, sometimes weedy in more natural sites; common (rare in VA), native of se. Asia. Now very commonly planted as a lawn and roadside grass in the Coastal Plain from se. NC southward. Stalter & Lamont (1996) report the VA occurrence of this species. [= RAB, FNA, HC, K]

Eriochloa Kunth 1816 (Cup Grass)

1. Lemma of fertile floret with an awn >0.2 mm long; second glume awned; panicle compact, the raceme-like lateral branches close together and ascending-appeased, of irregular lengths; spikelets 8-16 on a typical, primary branch.........................................................E. contracta

2. Spikelets 2.0-2.5 mm wide .................................................................E. villosa
3. Spikelets 1.1-1.8 mm wide.

1. Lemma of fertile floret lacking an awn; second glume not awned; panicle open, the raceme-like lateral branches remote and divergent, the lowermost longest, the upper gradually reduced in length to the apex (E. acuminata var. acuminata, E. michauxii var. michauxii) or the panicle compact (E. villosa); spikelets 12-40 on a typical, primary branch.

2. Spikelets 2.0-2.5 mm wide .................................................................E. acuminata var. acuminata
3. Perennial, 5-25 dm tall; spikelets 1.3-1.8 mm wide ...........................................E. michauxii var. michauxii

* Eriochloa acuminata (J. Presl) Kunth var. acuminata. Cp (GA, SC), Pd (GA): disturbed areas, waste areas near wool-combing mills; rare, presumably native of further south. Reported for scattered locations in GA (Jones & Coile 1988, as E. gracilis). Reported for NC (Kartesz 1999), but the specimen basis is of cultivated material. [= FNA, K, Y, Z; = E. gracilis (Fournier) A.S. Hitchcock var. gracilis – HC] * Eriochloa villosa (Thunberg) Kunth, Chinese Cupgrass. Mt (VA), Pd (DE): fields, meadows, other disturbed areas (open edge of railroad bed); rare, native of e. Asia. See Belden et al. (2004) for additional information about the first occurrence in Virginia. [= C, FNA, HC, K, Y]

Eriochloa punctata (Linnaeus) Desvaux ex Hamilton, Louisiana Cupgrass. Cp (GA): marshes, creek banks; rare. MS west to TX, and south into the New World Tropics; reported for e. GA (FNA). [= FNA, HC, K] {not yet keyed; synonymy incomplete}

* Eustachys Desvaux 1810 (Finger-grass)

1. Lateral nerves of the fertile lemma glabrous; culms stout, 7-15 dm tall; spikes 8-16 (-20), 7-12 cm long..............................................E. glauca
2. Lateral nerves of the fertile lemma pubescent; culms slender, 3-10 dm tall; spikes 1-20, 2.5-9 cm long.

2. Keel of the fertile lemma appressed brownish-ciliate; spikes 1-6; [native].
3. Spikes 5-10 cm long; spikelets >3 mm long ..................................................E. floridana
4. Spikes 2.5-6 cm long; spikelets <2.5 mm long ..................................................E. petraea
2. Keel of the fertile lemma glabrous; spikes 7-20; [aliens, in disturbed situations].
4. Spikelets >2.4 mm long; sterile floret oblanceolate, acute ..................................E. distichophylla
4. Spikelets <2.1 mm long; sterile floret widely cuneate, truncate ..........................E. retusa

Eustachys petraea (Swartz) Desvaux, Dune Finger-grass. Cp (FL, GA, NC, SC): dune slacks and sand flats, sometimes in disturbed areas; common (uncommon north of GA). (May-)June-October. NC (Dare County) south to FL and west to TX. [= FNA, K, Z; = Chloris petraea Swartz – RAB, GW, HC, S]

* Eustachys caribaea (Sprengel) Herter, Chickenfoot Grass. Cp (GA): disturbed areas; rare, native of South America. [= FNA, K; = Chloris caribaea – HC, misapplied] {add to synonymy; not yet keyed}

Festuca Linnaeus 1753 (Fescue)

1 Leaves 0.2-3 mm wide, often involute.
2 Plant loosely tufted, often rhizomatous; basal sheaths disintegrating into fibers; spikelets 6-13 mm long.................\textit{F. rubra} ssp. \textit{rubra}
2 Plant tufted, lacking rhizomes; basal sheaths persistent, remaining firm and entire; spikelets 3-9 mm long.
3 Lemmas 2.3-4.0 (-4.4) mm long, awnless, or with a minute projection to 0.4 mm long; anther 1.5-2.2 (-2.5) mm long; spikelets 3.0-6.0 (-6.5) mm long.........................\textit{F. filiformis}
3 Lemmas 3.8-5.5 mm long, with an awn 0.5-2.5 mm long; anther (2.3-) 2.5-3.0 mm long; spikelets 5.5-9.0 mm long....\textit{F. trachyphylla}

\textit{Leaves 3-12 mm wide, flat.}

4 Larger lemmas 5.5-10 mm long; leaf blades auriculate at the base; anthers 2-4 mm long. \[\text{see \textit{Schedonorus}}\]
4 Larger lemmas 3.3-5.2 mm long; leaf blades not auriculate at the base; anthers 0.8-1.5 mm long; [subgenus \textit{Subulatae}, section \textit{Obtusae}].
5 Ligules 2-9 mm long; [raw introduction] \[\text{not mapped}\] \textit{F. thurberi}
5 Ligules 0.1-1.5 (-2) mm long; [common natives].
6 Principal lowermost panicle branches with 2-7 spikelets scattered along the outer half; spikelets narrowly ovate, 2-4 mm wide...........\textit{F. paradoxa}

\textit{Festuca thurberi} Vasey. Cp (SC): waste areas near wool-combing mills; rare (possibly only a waif), native of sw. United States (NM, CO, WY, and UT). [= FNA, K]

\* \textit{Festuca trachyphylla} (Hackel) Krajina, Hard Fescue. Pd (DE, GA, NC, VA), Mt (NC, VA, WV), Cp (NC, SC, VA): meadows, pastures, disturbed areas; uncommon (rare in DE), native of Eurasia. May-June. The nomenclatural debate about the application of the name \textit{F. trachyphylla} is summarized in Darbyshire & Pavlick (1997). [= C, K, Y, Z; ? \textit{F. ovina} – RAB, S, W, WV, in a broad sense (misapplied as to our material); < \textit{F. ovina} \textit{var. ovina} – F, G, HC; < \textit{F. ovina} \textit{var. duriuscula} (Linnaeus) W.D.J. Kock – F, G, HC, misapplied as to our material]

Glycera R. Brown 1810 (Mannagrass)

A genus of about 40 species, nearly cosmopolitan. References: Barkworth & Anderton in FNA (2007a); Tucker (1996)=Z. [also see \textit{Torreyochloa}]

1 Spikelets 10-40 mm long, linear, subterete, 5-15\(^\times\) as long as wide, terete or nearly so in cross-section; [section \textit{Glyceria}].
2 Lemma (6-) 7-8.5 (-10) mm long, acute to acuminate; palea longer than the lemma, extending 1.5-3 mm beyond the lemma apex.................\textit{G. acutiflora}
2 Lemma 2.4-6.0 mm long, obtuse to notched; palea about as long as the lemma (ranging from shorter than the lemma and included, to projecting up to 1.5 mm beyond the lemma apex).
3 Lemma (3.5-) 4.0-6.0 mm long, the apex with 1-2 strongly developed lobes, and also often toothed between the lobes; leaf blades 2-12 cm long; primary panicle branches 1.5-9.5 cm long.................................\textit{G. declinata}
3 Lemma 2.4-4.8 mm long, the apex rounded or with a few poorly developed rounded teeth; leaf blades 18-32 cm long; primary panicle branches 3-17 cm long.

Glyceria arkansana Fernald, Arkansas Mannagrass. Swamps. IL south to LA and AR; disjunct in w. NY. The VA report is in error. The appropriate treatment of this taxon needs further investigation. [= F, HC, K, Z; < G. septentrionalis – C, G; = G. septentrionalis A.S. Hitchcock var. arkansana (Fernald) Steyermark & Kučera – FNA]

* Glyceria declinata de Brébisson. Cp, Pd (SC), Mt (NC): disturbed moist areas; rare. Native of Europe. Documented for Allegheny County, NC (D. Poindexter, pers. comm. 2009) [= FNA] [check for additional synonymy]

* Glyceria elata (Nash) M.E. Jones. Pd (GA): {habitat unknown}; rare, native of w. North America. Reported for GA by FNA; presumably a chance introduction. [= FNA] [add synonymy]

Glyceria laxa (Scribn) Scribn, Lax Mannagrass. Mt (NC, VA, WV), Cp (DE): bogs; rare. June-August. PE south to NC, mostly Appalachian. Though often described as a hybrid of G. canadensis and either G. striata var. striata and/or G. grandis var. grandis, G. laxa ranges south of the distribution of both G. canadensis and G. grandis var. grandis. It is best considered as a species, perhaps of hybrid origin. [= F, G, K, WV; = G. canadensis (Michaux) Trinius var. laxa (Scribn) A.S. Hitchcock – RAB, FNA, HC; = G. laxa – C; < G. canadensis – GW]

* Glyceria nutata Chevallier, Marked Mannagrass. Reported for TN (FNA). [= FNA] [add synonymy]

Glyceria nubigena W.A. Anderson, Smoky Mountain Mannagrass. Mt (NC, TN): moderate to high elevation seepages in the Great Smoky Mountains, sometimes in areas appearing dry (such as heath balds), nearly endemic to Great Smoky Mountains National Park; rare. June-July. Endemic to the Great Smoky Mountains of w. NC and e. TN. G. nubigena has nearly the same range as R. nudicaulis, but is more restricted to seepage. The distinctions and relationship between this taxon and G. grandis need further investigation. [= RAB, FNA, HC, K, W, Z]

Glyceria obtusa (Muhlenberg) Trinius, Coastal Mannagrass. Cp (DE, NC, SC, VA), Mt (VA): blackwater swamp forests, wet meadows, freshwater marshes; common (uncommon in NC, SC, VA). June-September. NS south to SC, on or near the Coastal Plain; disjunct to w. VA in Shenandoah Valley sinkhole ponds. [= RAB, C, F, FNA, G, GW, HC, K, W; Z = Panicularia obtusa (Muhlenberg) Kuntze – S]

Glyceria striata (Lamarck) A.S. Hitchcock var. striata, Fowl Mannagrass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): wet meadows, seepages, bogs, marshes, swamp forests; common. April-June. NL
A genus of about 15 species, in temperate and tropical areas of the Americas. References: Smith in FNA (2007b); Smith (1971)=Z.

Identification notes: When sterile, Gymnopogon is sometimes confused with Dichanthelium. Gymnopogon differs in having the sheaths conspicuously overlapping (vs. not overlapping in Dichanthelium) and leaves that are definitely cordate-clasping and of stiff texture (only a few Dichanthelium have this combination).

1 Awn of the lemma 4.5-12 mm long; inflorescence branches with spikelets distributed from the tip nearly to the base; leaves 5-15 mm wide; [Coastal Plain, Piedmont, and Mountains]. ……………………………………………………………………………………………………………………G. ambiguus

1 Awn of the lemma 0.8-1.6 (-3.5) mm long; inflorescence branches with spikelets distributed from the tip nearly to the base (G. chapmanianus) or to roughly the midpoint, the basal portion naked (or some branches rarely with a few spikelets) (G. brevifolius); leaves 2-8 mm wide; [Coastal Plain and lower Piedmont].

2 Spikelets 1-flowered; first glume 2.3-3.7 mm long……………………………………………………………………………………………………………G. brevifolius

2 Spikelets 2-4-flowered; first glume 3.8-5 mm long……………………………………………………………………………………………………………G. chapmanianus

Hainardia W. Greuter 1967 (Thintail)

A genus of 1 species, an annual, native of Europe. References: Smith in FNA (2007a); Tucker (1996)=Z.

Heteropogon Persoon 1806 (Tanglehead)

A genus of about 10 species, pantropical and extending into subtropical and warm temperate areas. References: Barkworth in FNA (2003a).

* Heteropogon melanocarpus (Elliott) Elliott ex Bentham, Sweet Tanglehead. Cp (FL, GA, NC, SC): sandy roadsides, disturbed areas; rare, probably naturalized from further south (or even from the Old World). September-October. The species is widespread in the Old World and New World tropics, north in North America to se. NC. [= RAB, FNA, HC, K, S]

Holcus Linnaeus 1753 (Velvet Grass, Soft Grass)

1 Plant not rhizomatous; upper culm internodes velvety-villous; lemma awn 1-2 mm long, recurved as a hook …………………………………………H. lanatus

1 Plant strongly rhizomatous; upper culm internodes glabrous; lemma awn 3-5 mm long, straight or geniculate………………H. mollis ssp. mollis
Hordeum Linnaeus 1753 (Barley)

1 Rachis remaining intact at maturity; leaves 5-12 mm wide, with well-developed auricles; [section Hordeum]..........................H. vulgare
   1 Rachis disarticulating at maturity; leaves 1-5 mm wide, not auriculate (except in *H. murinum ssp. leporinum*).
   2 Perennial; glumes 25-150 mm long; [inters ectional hybrid derivative of section Sibirica and section Critesion] .......H. jubatum ssp. jubatum
   2 Annual; glumes 7-22 (-28) mm long.
   3 Leaves auriculate; glumes of the central spikelet (in the triad) with ciliate margins; [section Hordeum]..............H. murinum ssp. leporinum
   3 Leaves not auriculate; glumes of the central spikelet (in the triad) with scabrous margins; [section Critesion]......................H. pusillum

* Hordeum vulgare* Linnaeus, Barley. Cp (FL, NC, SC, VA), Pd (NC, SC, VA), Mt (VA): cultivated fields, commonly cultivated, rare as a waif, native of Eurasia. May-June. A diploid taxon. The original wild form is often treated as *H. vulgare* ssp. spontaneum and the cultivated, non-shattering derivative as ssp. *vulgare* (Hancock 2004). The wild form was used as a food source since at least 19,000 years ago, and ssp. *vulgare* developed by 8,500 years ago. [= RAB, C, F, K, Z; > *H. aegiceras* Nees ex Royle – G; > *H. vulgare* var. *vulgare* – G, HC; > *H. vulgare* var. *trifurcatum* (Schlechtendahl) Alefeld – G, HC; > *H. vulgare* ssp. *vulgare* – FNA; > *H. vulgare* ssp. spontaneum (K. Koch) Thellung]

* Hordeum brachyantherum* Nevski ssp. brachyantherum is reported for sc. PA (Rhoads & Klein 1993) and also is apparently known from specimens from GA (Sorrie, pers. comm.). A tetraploid taxon. [= FNA, K; ? *Critesion brachyantherum* (Nevski) Barkworth & D.R. Dewey] {not yet keyed}

Imperata Cirillo 1792 (Cogongrass, Satintail)

A genus of about 8-9 species, of tropical, subtropical, and warm temperate areas of both hemispheres. References: Gabel in FNA (2003a); Ward (2004c)=Z; Hall (1998)=Y.

* Imperata cylindrica* (Linnaeus) Palisot de Beauvois, Cogongrass, Brazilian Satintail. Cp (FL, GA, SC): grassy roadside; common (rare north of FL), introduced from the tropics. See Nelson (1993) for first report from SC. An extremely aggressive and dangerous weed, now well-established and rapidly invading fire-maintained Coastal Plain areas (such as longleaf pine and slash pine flatwoods and longleaf pine clayhills) on the Gulf Coastal Plain of FL, AL, and MS. Hall (1998) argues that *I. cylindrica* and *I. brasilensis* are not distinct. The only character considered to separate them is that *I. brasilensis* has 1 anther and *I. cylindrica* has 2. Ward (2004c) treats the 2 taxa at varietal level. Both putative taxa are present in the Gulf Coast area of FL, GA, AL, and LA. [= Y; > *I. cylindrica* – FNA, HC, K; > *I. brasilensis* Trinius – FNA, HC, K, S; > *I. cylindrica* var. *cylindrica* – Z; > *I. cylindrica* var. *mexicana* (Ruprecht) D.B. Ward – Z]

Koeleria Persoon 1805 (Junegrass, Koeleria)

[also see Rostraria]

A genus of about 60 species, north and south temperate. References: Standley in FNA (2007a)

*Koeleria macrantha* (Ledebour) J.A. Schultes, Junegrass. Pd (DE): South to DE, MD, PA, KY, AL, LA, TX, and Mexico. [= FNA, K; < *K. pyramidata* (Lamarck) Palisot de Beavois – C]
Lachnagrostis Trinius 1820

* Lachnagrostis filiformis (G. Forst.) Trinius, Pacific Bentgrass. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, native of Australia. [= FNA; = Agrostis avenacea J.F. Gmelin – K]

Lagurus Linnaeus 1753 (Hare's-tail Grass)

* Lagurus ovatus Linnaeus, Hare's-tail Grass. Cp (FL, NC): on ballast, other disturbed areas; rare, native of Mediterranean Europe. April-June. [= RAB, FNA, HC, K, Z]

Leersia Swartz 1788 (Cutgrass)

1 Lower panicle branches alternate (rarely opposite); spikelets 2.2-5.0 mm long, 0.8-4.0 mm broad; stamens 2 or 6.  
2 Spikelets suborbicular-falcate, 3.0-4.0 mm broad, < 2× as long as broad; principal leaf-blades 10-15 mm wide; stamens 2 ...... L. lenticularis
2 Spikelets narrowly elliptic-falcate, 1.0-2.0 mm broad, > 2× as long as broad; principal leaf-blades usually < 7 mm wide; stamens 2 or 6.
3 Spikelets 3.8-4.7 mm long, 1.5-2.0 mm broad; panicle branches short, bearing spikelets nearly to their bases; stamens 6 ...... L. hexandra
3 Spikelets 2.2-3.5 mm long, 0.8-1.2 mm broad; panicle branches long, filiform, the longer ones bearing spikelets only in their upper half; stamens 2 ................................................................. L. virginica

Leersia hexandra Swartz, Southern Cutgrass. Cp (FL, GA, NC, SC, VA): clay-based Carolina bays, limesink ponds, lakes, pools, usually in places where periodically or seasonally inundated; uncommon (rare in VA). June-August. Panropical, ranging north in North America to MD, TN, and TX. This species is considered a serious weed in the Old World and New World tropics; in our area, however, it is uncommon and not weedy. [= RAB, C, F, FNA, G, GW, HC, K, Z; = Homalocenchrus hexandra (Swartz) Kuntze – S]

Leersia lenticularis Michaux, Catchfly Cutgrass. Cp (FL, GA, NC, SC, VA): floodplain forests and swamps; uncommon. September-October. Se. VA south to ne. FL and Panhandle FL, west to e. TX, north in the interior to IN and MN. [= RAB, C, F, FNA, G, GW, HC, K, Z; = Homalocenchrus lenticularis (Michaux) Kuntze – S]

Leersia oryzoides (Linnaeus) Swartz, Rice Cutgrass. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); marshes, riverbanks, pond-shores; common. August-October. NS west to BC, south to Panhandle FL and CA; also in Europe and e. Asia. [= RAB, C, F, FNA, G, GW, HC, K, WV; = Homalocenchrus oryzoides (Linnaeus) Pollich – S]

Leersia virginica Willdenow, White Grass, White Cutgrass. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); floodplain forests, swamps, streambanks; common. August-October. QC west to MN and SD, south to c. peninsular FL and TX. [= RAB, C, FNA, G, GW, HC, K, WV; = Homalocenchrus virginicus (Willdenow) Britton – S]

Leptochloa Palisot de Beauvois 1812 (Sprangletop, Feathergrass)

A genus of about 30 species, pantropical and extending into warm temperate areas. The circumscription of Leptochloa has been controversial; many earlier authors have preferred to separate Diplachne as a separate genus. References: Snow in FNA (2003a); Snow (1998); Cronquist (1991).

1 Spikelets 1-2.5 mm long, with 2-4 flowers; sheaths sparsely pilose with long, pustular-based hairs ..................... L. panicoides
1 Spikelets 3.5-10 mm long, with 5-12 flowers; sheaths glabrous (rarely slightly scabrous).
2 Lemmas 2-3 mm long, the apex obtuse to truncate, with the midrib often extended as a mucro .......................................... L. uninervia
2 Lemmas 3-5 mm long, the apex acuminate or awned.
3 Lemmas acuminate; leaf blades 3-10 mm wide ................................................................. L. paniceoides
3 Lemmas awned; leaf blades 1-3 mm wide.
4 Low sprawling grasses, < 5 dm tall; lemma awns (1-) 2.5-5 mm long; first glume 2.5-3.5 mm long; second glume 4-7 mm long......... ............................................................... [L. fascicularis var. maritima
4 Taller grasses, usually 5-10 dm tall; lemma awns 0.5-2.5 mm long; first glume 1.3-3.4 mm long; second glume 2.2-5 mm long.
5 First glume 2.3-3.4 mm long; second glume 3.4-5.0; lemmas 4-5 mm long, with an awn 0.5-2.5 mm long ......................... [L. fascicularris var. acuminata]
5 First glume 1.3-2 mm long; second glume 2.2-3.5; lemmas 3-4 mm long, with an awn 0.5-1 mm long ......................... [L. fascicularris var. fascicularris
Leptochloa fascicularis (Lamarck) A. Gray var. fascicularis, Bearded Sprangletop. Mt (WV), Pd* (NC*), Cp* (SC*): bed of artificial impoundment, brackish habitats, disturbed areas; rare, adventive from further west. September. Widespread in e. North America, primarily west of the Appalachians (adventive further east), and extending into South America. Reported (as L. fascicularis) for SC by Nelson & Kelly (1997). [= C, G; < L. fascicularis – RAB, GW, HC, S; < L. fusca (Linnaeus) Kunth ssp. fascicularis (Lamarck) N. Snow – FNA, K; = Diplachne fascicularis (Lamarck) Palisot de Beauvois – F]

Leptochloa fascicularis (Lamarck) A. Gray var. maritima (Bicknell) Gleason, Salt-meadow Grass. Cp (DE, NC, VA): fresh to brackish marshes, overflow flats, other disturbed brackish habitats; common (rare in NC and VA). August-October. Along the coast from s. NH south to se. NC. This taxon appears to warrant status as a species separate from L. fascicularis. [= C, G; < L. fascicularis – RAB, GW, HC, S; = Diplachne maritima E.P. Bicknell – F; < L. fusca (Linnaeus) Kunth ssp. fascicularis (Lamarck) N. Snow – FNA, K; = Leptochloa maritima (E.P. Bicknell) LeBlond & Sorrie ined.]

* Leptochloa panicoides (J. Presl) A. Hitchcock & Chase, Amazon Sprangletop. Pd (VA), Cp (GA): drawdown habitats on lake margins; rare, native of South America. Belden et al. (2004) discuss the VA occurrences along the banks of the Roanoke (Staunton) River at Kerr Reservoir. Also reported for e. GA in the Coastal Plain (Sorrie, pers. comm.). [= C, FNA, G, GW, HC, K; < Diplachne halei Nash – F; ? Diplachne floribunda Doell – S; = Diplachne panicoides (J. Presl) McNeill]

* Leptochloa decipiens (R. Brown) Stapf ex Maiden ssp. peacockii (Maiden & Betché) N. Snow. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= K] {not keyed}

* Leptochloa divaricatissima S.T. Blake. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= K] {not keyed}

* Leptochloa dubia (Kunth) Nees. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. Also reported for NC by Kartesz (1999), but the documentation indicates that it was cultivated at a Soil Conservation Service test nursery in Chapel Hill, Orange County. [= FNA, HC, K] {not keyed}

* Leptochloa fascicularis (Lamarck) A. Gray var. acuminata (Nash) Gleason. Reported as adventive in PA and along highways in WV from halophytic habitats of w. United States (Cusick 1994). [= C, G; < Diplachne acuminata Nash – F; < L. fascicularis – HC; < L. fusca (Linnaeus) Kunth ssp. fascicularis (Lamarck) N. Snow – FNA, K; = L. acuminata (Nash) Mohlenbrock} {not keyed}

* Leptochloa panicaceae (Retzius) Ohwi ssp. mucronata (Michaux) Nowack. Cp (LA, MS), Pd* (GA*): {habitats}; rare. [= K] {not yet keyed; add to synonymy}

* Leptochloa virgata (Linnaeus) Palisot de Beauvois, Tropical Sprangletop. Cp (SC): waif at wool-combing mill; rare, introduced, probably not established. [= FNA, HC, K] {not keyed}

Linnodea L.H. Dewey 1894

Linnodea arkansana (Nuttall) L.H. Dewey. Cp (AL, FL, LA, MS, SC*): hammocks, moist forests (Panhandle FL westward), waste at wool-combing mill, probably not established (SC); rare, introduced, native of sc. United States (w. FL, c. and s. AL, west through MS, LA, and AR to OK, TX, and adjacent Mexico). [= FNA, HC, K, S, Z; = Cinna arkansana (Nuttall) G. Tucker – Y]

Loliurn Linnaeus 1753 (Rye-grass, Darnel, Fescue)

1 Inflorescence paniculate (spikelets borne on branches off the central axis) ................................................................. [see Schedonorus]

1 Inflorescence spike-like (spikelets sessile on the central axis).

2 Glumes (12-) 15-25 mm long, subcorymbose, equaling or surpassing the uppermost lemma (therefore the length of the spikelet); florets 4-9 per spikelet; annual .......................................................... L. temulentum

2 Glumes 4-12 mm long, herbaceous, shorter than the lemmas (therefore shorter than the spikelet); florets (2-) 5-22 per spikelet; annual or perennial.

3 Lemmas (at least the upper) awned, the awns to 15 mm long; florets 11-22 per spikelet; annual or perennial. . . . L. perenne var. aristatum

3 Lemmas awnless; florets (2-) 5-10 per spikelet; perennial .......................................................... L. perenne var. perenne

* Loliurn perenne Linnaeus var. aristatum Willdenow, Italian Rye-grass, Annual Rye-grass. Cp (GA, NC, SC, VA), Pd (NC, SC), Mt (NC, SC, VA, WV), {FL}: fields, roadsides, pastures, disturbed areas; common (rare in VA), native of Eurasia. April-

**Lolium temulentum** Linnaeus ssp. temulentum, Darnel. Pd (GA, NC, VA), Cp (FL, NC, VA), {SC}: fields, roadsides, pastures, disturbed areas; common (rare in FL and VA), native of Eurasia. May-June. [= FNA; < L. temulentum – RAB, C, F, HC, S, Z; > L. temulentum var. leptochaetum A. Braun – G; > L. temulentum var. macrochaetum A. Braun – G; > L. temulentum ssp. temulentum – K]

**Luziola** Antoine Laurent de Jussieu 1789 (Southern Water Grass)

1 Culms prostrate; leaves conspicuously clustered towards the apex of the culms, floating, 1-5 (-8) cm long; pistillate inflorescence an inconspicuous axillary raceme, 1.1-3.5 cm long, with 2-5 florets ...............................................................L. bahiensis

1 Culms suberect to erect; leaves scattered along the culm, not floating, > 6 cm long; pistillate inflorescence an axillary panicle, 2-21.5 (-58) cm long, with 18-250 (-350) florets.

2 Pistillate florets 2-3.5 mm long; achenes striate .......................................................................................................................................

2 Pistillate florets 2.5-5 mm long; achenes smooth ....................................................................................................................................

**L. bahiensis** (Steudel) Hitchcock. Cp (AL, FL, MS): streams and riverbanks; rare. Apparently native (Anderson & Hall 1993), but considered native of South America by some authors. [= FNA, HC, K, X]

**L. fluitans** (Michaux) Terrell & H. Robinson var. fluitans, Southern Water Grass. Cp (GA, NC, SC), Pd? (GA?): aquatic in water of natural lakes, overflow of streams, and other stagnant waters; rare (NC Watch List). August-October. Var. fluitans ranges from ne. NC to c. FL and west to e. TX; var. oconnerii (Guzman M.) G. Tucker occurs in the highlands of w. Mexico (Tucker 1988). A very unusual grass, truly aquatic, with flexuous stems and unwettable, floating leaves. In addition to floating leaves (helpful in the field but not in the herbarium!), other useful characters include two secondary blade nerves on either side of the midvein and virtually as prominent as the midvein, and which extend onto the sheath where they occur with another 5 or so strong nerves; often with cilia 0.5-1 mm long at the summit of the ventral face of the sheath (an unusual place); and a hyaline ligule about 1 mm long on the same plane as the sheath (i.e., free from the base of diverging blades). [= FNA, Y, Z; < L. fluitans – K, X; < Hydrochloa carolinensis Palisot de Beauvois – RAB, GW, HC, S]

**Megathyrsus** (Pilger) B.K. Simon & S.W.L. Jacobs 2003 (Guinea Grass)

**Melica** Linnaeus 1753 (Melic)

1 First glume oblong, 6.5-10 mm long, 2-4× as long as wide, acute to obtuse at the apex, about the same length and width as the second glume; inflorescence with 0-1-5 branches from the lower nodes only; fertile lemmas 2; leaves 1-6 mm wide; [common, widespread in our area] ....

1 First glume broadly ovate, 5-8 mm long, 1.5-2× as long as wide, obtuse to rounded at the apex, shorter and broader than the second glume; inflorescence with 2-10 (or more) branches from most nodes; fertile lemmas 2-3; leaves 3-12 mm wide; [rare, Mountains of NC and VA, northwards and westwards] ...........................................................................................................................................

**M. mutica** Walter, Two-flower Melic. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): forests and woodlands, including coastal fringe and maritime forests; common (rare in WV). April-May. MD west to IN and IL, south to FL and TX. [= RAB, C, F, FNA, G, HC, K, S, W, WV, Z]

**M. nitens** (Scribner) Nuttall ex Piper, Three-flower Melic. Mt (GA, NC, VA, WV): rocky upland woodlands, barrens, and glades, over calcareous rocks (such as limestone, calcareous shale); rare. May-June. PA west to s. MN and NE, south to nw. GA and TX. [= RAB, C, F, FNA, G, HC, K, W, WV, Z]

**POACEAE**
**Melinis** Palisot de Beauvois 1812 (Natalgrass)

* Melinis repens* (Willdenow) Zizka ssp. repens, Rose Natalgrass. Cp (FL, GA, PD, GA), Mt (GA): disturbed areas, roadsides, railroad embankments, other disturbed areas; common (rare north of FL), native of Africa. Reported for several s. GA counties (Carter, Baker, & Morris 2009); the report for NC by Kartesz (1999) is an error. [= FNA; < M. repens – K; ? Rhynchelytrum roseum (Nees) Stapf & C.E. Hubbard ex Bews – HC; < Rhynchelytrum repens (Willdenow) C.E. Hubbard]

**Microstegium** Nees in Lindley 1836 (Sasa-grass, Japanese-grass)

* Microstegium vimineum* (Trinius) A. Camus, Japanese Stilt-grass, Flexible Sasa-grass, Japanese-grass. Pd (DE, GA, NC, SC, NC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA): disturbed areas, colonizing moist, rich soil, especially in floodplains; common (uncommon in DE Coastal Plain), native of tropical se. Asia. The following chronological synopsis of flora accounts of *Microstegium* is perhaps instructive: not treated by Small (1933), "local" (Fernald 1950), "rarely introduced and possibly not established" (Gleason & Cronquist 1952), "sporadically naturalized" (Godfrey & Wooten 1979), "a rapidly spreading pernicious invader on moist ground, too common" (Wofford 1989). RAB report it from fewer than 1/3 of the counties of the Carolinas (in 1968); it is now undoubtedly in every county, an abundant weed in most of them. This species has become a very serious pest, now ranking as one of the most destructive introduced plants in our area, forming extensive and dense patches, sprawling over and eliminating nearly all other herbaceous plants. Eradication is very difficult, and considering its obvious colonizing abilities, only temporary. Hunt & Zaremba (1992) document the continuing northern expansion of *Microstegium* into NY and CT. Redman (1995) discusses its habitat preferences in MD and DC. Koyama (1987) reports it as "common as undergrowth of forests" in Japan, part of its native distribution. [= RAB, C, FNA, GW, K, W; = Eulalia viminea (Trinius) Kunze – G; > Eulalia viminea var. viminea – F; > Eulalia viminea var. variabilis Kunze – F; > M. vimineum var. vimineum – HC; > M. vimineum var. imberbe (Nees) Honda – HC]

**Milium** Linnaeus 1753 (Wood-millet, Millet-grass)

* Milium effusum* Linnaeus var. *cisatlanticum* Fernald, American Wood-millet, Millet-grass. Mt (NC, VA, WV): forests at high (or rarely moderate) elevations; rare. June. A circumboreal species, ranging in North America south to w. NC (Swain County), e. TN (Sevier County), w. VA, WV, OH, IN, IL, and MN. The American plants are sometimes segregated as var. *cisatlanticum* Fernald (Fernald 1950b). Though considered "probably accidentally introduced and established" in NC by Radford, Ahles, & Bell (1968), the native origin of this northern species is more plausible; the only known occurrence in NC (not recently seen) is in the Great Smoky Mountains National Park. [= FNA, K, Y; < *M. effusum* – RAB, C, F, G, HC, W, WV, Z; = M. effusum ssp. *cisatlanticum* (Fernald (A. Haines – X)]

**Miscanthus** Andersson 1855 (Eulalia)

References: Barkworth in FNA (2003a).

**Muhlenbergia** Schreber 1789 (Muhly)

A genus of about 176 species, of North America south to Andean South America, and e. and se. Asia. *Muhlenbergia* is a large and diverse genus, recently reclassified by Peterson, Romaschenko, & Johnson (2010); the subgenera used here follow that classification. References: Peterson, Romaschenko, & Johnson (2010); Pohl (1969); Gustafson & Peterson (2007)=Y; Morden & Hatch (1989)=Z; Peterson in FNA (2003a).

1. Panicle open and diffuse, > 4 cm broad, the spikelets borne on slender or capillary pedicels longer than the lemmas.
2. Plant with rhizomes, the rhizomes prominent, creeping, and covered with imbricate scales; culms and sheaths strongly compressed at base, the leaves distichous; spikelets 1.5-2 mm long; [subgenus incertae sedis] ................................................................................................. *M. torreyana*
2. Plant without rhizomes, tufted with erect culms (a "bunchgrass"); culm and sheaths terete, the leaves not distichous; spikelets 1.5-5 mm long (excluding awns, if present).

3. Spikelets 1.5-2 mm long, awnless; [subgenus *Pseudosporobolus*]………………………………………..*M. uniflora*.

4. Spikelets 2.5-5 mm long (excluding awns), awned or aawnless; [subgenus *Trichochloa*]………………..*M. expansa*.

5. Lemma awn (2-) 3-3.5 mm long; glume bodies (0.3-) 0.7-1.7 (-2.4) mm long, > ½ as long as the lemma body, one or both glumes sometimes awned; spikelets usually purple (when fresh); basal sheaths usually very fibrous …………………………………………..*M. expansa*.

6. Lemma awn (2-) 3-3.5 mm long; glume bodies (0.3-) 0.7-1.7 (-2.4) mm long, > ½ as long as the lemma body, one or both glumes sometimes awned; spikelets usually purple (when fresh); basal sheaths rarely strongly fibrous.

7. Lemma awn (2-) 3-3.5 mm long; first glume awnless (or rarely with an awn to 3.2 mm long), second glume awnless (or rarely with an awn up to 5.0 mm long), pales aawnless; lemma lacking setaceous teeth flaming the awn; flowering late August-October; [widely spread in our area, particularly in rocky, clayey, or sandy glades, barrens, and woodlands with prairie affinities]…………………………………………………………*M. capillaris*.

8. Lemma awn (8-) 12-26 (-35) mm long, first glume awn (0.5-) 1.7-(-10) mm long, second glume awn (1-) 5-19 (-25) mm long, palea awn-tipped; lemma with two setaceous teeth flaming the awn, the teeth 0.5-2.5 (-4.7) mm long; flowering October-November; [sandy maritime situations on barrier islands of the outer Coastal Plain]………………………………………..*M. sericea*.

9. Lemma awn 1-11 mm long; spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide) ………………………………………………………………………………………………..*M. capillaris*.

10. Lemma awn 1-11 mm long; spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide) ………………………………………………………………………………………………..*M. sericea*.

11. Lemma awn 1-11 mm long; spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide) ………………………………………………………………………………………………..*M. sericea*.

12. Lemma awn 1-11 mm long; spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide) ………………………………………………………………………………………………..*M. sericea*.

13. Lemma awn 1-11 mm long; spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide) ………………………………………………………………………………………………..*M. sericea*.
**Muhlenbergia expansa** (Poiret) Trinius, Savanna Hairgrass. Cp (FL, GA, NC, SC, VA): pine savannas, pine flatwoods, mesic areas in sandhill-pocosin ecotones; common (rare in VA). September-October. Sc. VA south to FL, west to e. TX (nearly exactly the range of *Pinus palustris*). An important part of the grassy component of many longleaf pine savannas, *M. expansa*’s flowering is stimulated by fire, and, lacking fire, it may be found in large populations in solely vegetative condition. It can be distinguished in sterile condition from other savanna bunchedgrasses (*Sporobolus teretifolius*, *S. pinetorum*, *S. florid anus*, *S. curtissii*, *Aristida stricta*, and *A. beyrichiana*) by the following characteristics: old leaf bases fibrous and curly (rather than hardened and cartilaginous) and ligules 1-3 mm long (rather than 0.2 to 0.5 mm long). The open panicle somewhat resembles that of several species of similar habitat which often co-occur with *M. expansa* – *Sporobolus teretifolius*, *S. pinetorum*, *S. curtissii*, *S. florid anus*, and *Calamovilfa brevipilis*, but the panicle of *M. expansa* is capillary, flexuous, and fragile, tending to break up over the winter (vs. fine-textured but not capillary, the branches rigid and ascending, more likely to persist over the winter in relatively intact condition). The vegetative characters listed above and under *Calamovilfa brevipilis* are also useful. See *M. capillaris* for a discussion of recent studies on the *M. capillaris* complex. [= RAB, F, FNA, GW, HC, S, Y; = *M. capillaris* var. trichopodes (Elliott) Vasey – C, K, Z]

**Muhlenbergia frondosa** (Poiret) Fernald, Smooth Wirestem Muhly. Mt (GA, KY, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (KY, NC), Ip (KY): moist forests and disturbed areas; common (uncommon in GA, NC, VA, WV, rare in Piedmont, rare in NC Coastal Plain, rare in KY). September-October. This species is widespread in e. North America, south to ne. GA and west into the Plains. [= RAB, C, F, FNA, G, GW, HC, K, W, WV; = *M. mexicana* – S, misapplied]

**Muhlenbergia glabriflora** Scribnr, Clay-pan Muhly. Ip (KY, TN), Cp (KY, WV), Pd (NC, VA): open oak flatwoods, other open habitats, in clacey soils; rare. October-November. VA and NC west to IA, MO, AL, and TX, local and apparently rare in all of that range. In NC, only known from one collection, that from Durham County in 1936, with vague habitat data. F describes the habitat as "dry excreted or baked soils, prairies, gravelly or rocky slopes," Pohl (1969) as "mostly on low ground, in shade on heavy clay soils." [= C, F, G, HC, K; = *M. glabriflora* – FNA, orthographic variant]

**Muhlenbergia glomerata** (Willdenow) Trinius, Spiked Muhly. Mt (NC, VA): fens and seeps over mafic (amphibolite) or ultramafic (olivine) rocks; rare. August-October. This species is widespread in e. North America, nearly throughout the United States and s. Canada. [= RAB, C, F, G, HC, K, W, WV; > *M. mexicana* var. *filiformis* (Torrey) Scribnr – FNA; > *M. mexicana* var. *mexicana* – FNA; > *M. foliosa* (Roemer & J.A. Schultes) Trinius – S]

**Muhlenbergia schreberi** J.F. Gmelin, Nimblewill, Dropseed. Mt (GA, KY, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Ip (KY): bottomland and other moist forests, dry forests, disturbed areas; common (uncommon in FL). August-October. This species is widespread in e. United States. [= RAB, C, F, FNA, GW, HC, K, S, W, WV; > *M. schreberi* var. *schreberi* – G; > *M. schreberi* var. *palustris* (Scribnr) Scribnr – G; > *M. palustris* Scribnr – S]

**Muhlenbergia sericea** (Michaux) P.M. Peterson, Dune Hairgrass, Sweet Grass. Cp (FL, GA, NC, SC): maritime dry grasslands, maritime wet grasslands, interdune swales, low dunes, sometimes edges of freshwater or brackish marshes, apparently limited to the barrier islands (sometimes in close proximity with *M. capillaris*); uncommon, though sometimes locally abundant (SC Rare). October-November. This species is a very conspicuous part of the Outer Banks flora in the autumn, especially showy and abundant beside Rodanthe (Chicamacomico) and (Kinnakeet), Dare County, NC, and also abundant on Ocracoke Island, Hyde County, NC. The capillary pedicels and awns of its purple inflorescences are so light as to be moved by the slightest breeze. By December or January they fade to tan, but remain showy. This grass is a major component of baskets made in the Low Country of SC by the Gullah, who call it "sweet grass." I agree with Curtis (1843), Blomquist (1948), Pinson & Batson (1971), Gould (1975), and others who consider *M. sericea* (as *M. filipes*) a species distinct from *M. capillaris*. Its range is from NC (slightly north of Oregon Inlet, Dare County, south of Nags Head) south to FL and west to TX, primarily on barrier islands. In addition to a discussion of its relationship to *M. capillaris*, Pinson and Batson (1971) and Morden & Hatch (1989) provide descriptions, not elsewhere available. See *M. capillaris* for a discussion of recent studies on this complex. (= RAB, F, G, HC, K, W; < *M. capillaris* – RAB, GW; > *M. capillaris* var. *filipes* (M.A. Curtis) Chapman ex Beal – HC, K, S, Z; = *M. filipes* M.A. Curtis)

**Muhlenbergia tenuiflora** (Willdenow) Britton, Sterns, & Poggenburg, Slender Muhly. Mt (GA, KY, NC, CA, WV), Pd (DE, GA, NC, VA), Ip (KY), (SC): moist forests and disturbed areas, up to at least 1400 meters; uncommon (rare in DE, GA, NC, and SC Piedmont, rare in DE and VA Piedmont). August-October. NH, WI, and NE south to GA, AL, MS, and OK. Two varieties are sometimes recognized: var. *tenuiflora*, with lemma awn 4-11 mm long and the sheaths and stems retrorsely hirsute, especially around the nodes, and var. *varfullis* (endemic to the Southern Appalachians), with lemma awn 1-4 mm long or absent, and the sheaths and stems glabrous or nearly so. The validity of the varieties needs further assessment. [= RAB, F, FNA, G, HC, K, S, W, WV; > *M. tenuiflora* var. *tenuiflora* – C; > *M. tenuiflora* var. *varfullis* (Scribnr) Pohl – C]

**Muhlenbergia toreyiana** (J.A. Schultes) A.S. Hitchcock, Pinebarren Smokegrass. Cp (DE, GA, NC), Ip (TN), (KY?): in the Coastal Plain in moist soils of depression meadows and clay-based Carolina bays, often under or near *Taxodium ascendens*, in the Interior Low Plateau and Cumberland Plateau in moist grassy oak savannas; rare. August-November. NJ to GA in the Coastal Plain, and disjunct in KY (‘and TN; currently known to be extant only in NJ, NC, and TN. It was first discovered in NC in 1987. Although it rarely flowers except following fire, it can be recognized in sterile condition by its forming clonal patches
with evenly spaced, upright, blue-green tufts, each tuft a flattened stem with 5-10 ascending-erect, rather stiff, usually conduplicate leaves, the summit of each sheath with a pronounced cartilaginous thickening, easily felt by running the flattened stem from base to apex between thumb and forefinger. [C, F, FNA, G, HC, K; = Sporobolus torreyanus (J.A. Schultes) Nash – S]

**Nassella** (Trinius) Desvau 1846

1 Florets 1.5-2.5 mm long; leaves 0.2-0.6 mm wide, stiff and tightly convolute ................................................................. *N. trichotoma*

1 Florets 3.4-13 mm long; leaves 1.8 mm wide, flat or convolute.

2 Crown (surrounding the base of the awn) as wide or wider than long, the rim with hairs <0.5 mm long; floret widest just below the the crown...................................................................................................................................................[N. neesiana]

2 Crown longer than wide, the rim with hairs 1-2 mm long; floret widest near or only slightly above the middle.

3 Florets 6.5-13 mm long; crown usually flaring at the tip; awns 40-90 mm long..........................................................................*N. leucotricha*

3 Florets 6-8 mm long; crown parallel-sided; awns 30-50 mm long............................................................................................[N. n. manicata]

* **Nassella leucotricha** (Trinius & Ruprecht) Pohl, Texas Needlegrass. Cp (SC): waste areas near wool-combing mill; rare, native of sc. United States and Mexico. [= FNA; = Stipa leucotricha Trinius & Ruprecht – HC]

* **Nassella trichotoma** (Nees) Hackel ex Arechavaleta, Serrated Tussockgrass. Cp, Pd (NC, SC): fields; rare, native of South America, perhaps extirpated as a noxious weed. [= FNA; = Stipa trichotoma Nees]

* **Nassella manicata** (E. Desv.) Barkworth, Andean Tussockgrass. Reported from MS; perhaps only a waif. [= FNA; = Stipa manicata E. Desv.]

* **Nassella neesiana** (Trinius & Ruprecht) Barkworth, Uruguayan Tussockgrass. Known only from old collections on ballast from Mobile, AL. [= FNA; = Stipa neesiana Trinius & Ruprecht]

**Neeragrostis** Bush 1903

A monotypic genus of warm temperate North America and tropical Central America and n. South America. References: Peterson & Harvey (in prep.)=Z.

**Neeragrostis reptans** (Michaux) Nicora. Mt (WV): shores and wet flats; rare. Reported for scattered locations as far east as c. TN by Chester et al. (1993), as well as in WV, KY, and possibly GA (Kartesz 1999). [= K, Z; = Eragrostis reptans (Michaux) Nees – C, F, G, GW, HC]

**Opismenus** Palisot de Beauvois 1807 (Woods-grass, Basket-grass)

1 Leaf sheaths and culm axis glabrate to pilose (usually sparsely, but dense at sheath summit) with hairs <1.5 mm long; hairs on leaf surfaces similarly long; leaves 1.5-6 cm long; longest leaves with acute to acuminate tip (but not long-acuminate); lemma (7-) 9-11-veined ............... *O. hirtellus ssp. setarius*

1 Leaf sheaths and culm axis pilose with hairs 3-5 mm long; hairs on leaf surfaces similarly long; leaves 2.5-10 cm long; longest leaves with long-acuminate tip; lemma 7-veined.................................................................................*O. hirtellus ssp. undulatifolius*

* **Opismenus hirtellus** (Linnaeus) Palisot de Beauvois ssp. *setarius* (Lamarche) Mez ex Ekman, Woods-grass. Cp (FL, GA, NC, SC), Pd (GA, SC): hammocks, maritime forests, shell middens, moist forests; common (uncommon in GA, NC, and SC). August-October. *O. hirtellus* is widespread in tropical and subtropical areas of the New and Old World; ssp. *setarius* ranges from e. NC south to FL, west to AR and TX, and south through the Caribbean and Central America to central South America. Scholz (1981) recognizes many other subspecies. This species is undoubtedly native in our area, occurring in undisturbed habitats in natural communities entirely devoid of alien species; the basis of Gould's (1975) assertion that *Opismenus* is "introduced or adventive in the United States" is unknown. Superficially, *Opismenus* resembles *Arthraxon*, but has the leaves only slightly cordate at the base (vs. strongly cordate-clasping). Crins (1991) favors treating *O. setarius* as a taxonomically unrecognized component within a polymorphic *O. hirtellus*. [= FNA, K, Y; = O. setarius (Lamarche) Roemer & J.A. Schultes – RAB, HC, S; < O. hirtellus (Linnaeus) Palisot de Beauvois – Z]

* **Opismenus hirtellus** (Linnaeus) Palisot de Beauvois ssp. *undulatifolius* (Ard.) U. Scholz. Mt (VA): moist forests; rare, but locally abundant. Native to the Eastern Hemisphere (Asia and perhaps also native in s. Europe), has been reported as an
introduction in Baltimore Co., MD (Peterson et al. 1999). It can be expected to spread. [≡ FNA, K, Y; < O. hirtellus (Linnaeus) Palisot de Beauvois – Z]

* Opilisnenum burmannii (Retzius) Palisot de Beauvois. Collected in peninsular FL just south of our area and may eventually appear farther north (Davis, Judd, & Perkins 2006). [not keyed]

**Oryza** Linnaeus 1753 (Rice)

* Oryza sativa Linnaeus, Rice. Cp (GA, NC, SC, VA?): marshes, impoundments; rare, of only sporadic occurrence outside of cultivation, native of Asia. October. Perhaps the single most important food crop in the world, developed as a crop in Asia and cultivated at least since 10,000 years BP (Hancock 2004). Rice was an important crop before the Civil War in SC, GA, and extreme se. NC. Most rice planted today in our area is in waterfowl impoundments. [≡ RAB, C, FNA, G, GW, HC, K, S, X, Y, Z]

**Oryzopsis** Michaux 1803 (Ricegrass)

**Oryzopsis asperifolia** Michaux, Rough-leaved Ricegrass, Whiteseed Mountain-ricegrass. Mt (VA, WV): high elevation pine-oak/heath barrens and woodlands; rare. NL (Newfoundland) west to BC, south to w. VA (Rockingham County), WV, n. IN, SD, NM, and UT. This grass forms large cespitose clumps, the leaves evergreen and somewhat bicolored (green on the upper surface, bluish on the lower). [≡ C, F, FNA, G, HC, K, WV]

**Panicum** Linnaeus 1753 (Panic Grass)

(contributed by Richard J. LeBlond)

[INTRODUCTION: Describe differences between Panicum, Dichanthelium, Urochloa (=Brachiaria), and Paspalidium (now in Setaria), all of which are treated as Panicum in RAB. Describe collection methods and character analysis.] [also see Dichanthelium, Megathyrsus, Panopyrum, Setaria, Steinchisma, and Urochloa]

There has been considerable controversy over the generic limits of Panicum. In its broader recent conceptions, it has been considered to include (in our area) taxa sometimes and variously segregated as Brachiaria, Dichanthelium, Erichloa, Paspalidium, Panopyrum, Steinchisma, and Urochloa. All were originally recognized based on morphological characteristics, to which have recently been added anatomical, chemical, and other evidence. Crins (1991) recognizes Erichloa, Urochloa (including Brachiaria), Paspalidium, and Panicum as genera, with Panicum subdivided into subgenera Panicum, Agrostoides, Dichanthelium, Panopyrum, and Steinchisma. We prefer to recognize most of the segregates as genera, pending further analyses, since there is little evidence related to one another than they are to other genera recognized in the Paniceae. Panopyrum and Dichanthelium are the only segregate groups with C4 photosynthesis. Erichloa and Urochloa (including Brachiaria) have C4 photosynthesis, with PEP-cck decarboxylation. Panicum and Setaria (Paspalidium) have C3 photosynthesis, with NAD-me or NADP-me decarboxylation. Steinchisma, in addition to its unusual expansion of the palea, apparently has a peculiar photosynthetic pathway, described by Crins (1991) as "intermediate between" C3 and C4 photosynthesis; "the leaves have Kranz anatomy, but there are fewer organelles than usual in the outer sheath."

We agree with Hansen & Wunderlin (1988) that "Dichanthelium is as 'good' a grass genus as many others (e.g. Brachiaria, Sacciolepis, and many more in other tribes)." Despite arguments to the contrary, there is little doubt that Dichanthelium is a natural group. Zuloaga, Ellis, and Morrone (1993) argue against the recognition of Dichanthelium as a genus, preferring to treat it as a subgenus under Panicum. They state, however, "within Panicum, Dichanthelium can be distinguished at the subgeneric level by the following set of characters: lax inflorescences; ellipsoid to obovoid spikelets; upper glume and lower lemma usually 7-11 nerved; upper anthecium apiculate or shortly crested, and simple papillae on the lemma and palea. Anatomically, all species are readily distinguishable from each other, and the combined genus would be very large, indeed. References: Lelong (1986)=Z; Zuloaga & Morrone (1996)=Y; Freckmann & Lelong in FNA (2003a); Haines (2010)=X.

1 Spikelets tuberculate.
2 Lower lemmas tuberculate-hispid; spikelets 3.2-4.0 mm long; [of dry to mesic prairies and pinelands].................................**P. brachyanthum**
2 Lower lemmas warty; spikelets 1.7-2.2 mm long; [of wetlands]..................................................................................**P. verrucosum**
1 Spikelets smooth, not tuberculate.
2 Panicle < 2 cm wide at maturity.
3 Spikelets > 4.5 mm long; first glume > 2.4 mm long; ligule 4-6 mm long; [of coastal dunes]; [subgenus Panicum, section Repentia]........................................................................................................................................................................ P. amarum var. amarum
4 Spikelets < 4 mm long; first glume < 2.1 mm long; ligule < 2 mm long; [not of coastal dunes].
5 Blades involute, 1.5-4 mm wide; culms wiry................................................................. [see Coleataenia]
6 Blades flat, the larger 6-20 mm wide; culms stout.
7 Panicles constricted, 0.3-1.6 cm wide; spikelets subsessile to short-pedicelled; summit of fertile palea not enclosed by fertile lemma......................................................................................................................... P. hemitomon
8 Panicles > 1 cm wide; spikelets short to long-pedicelled; summit of fertile palea enclosed by fertile lemma ............................................................ [see Coleataenia]
9 Lower primary panicle branches in whorls of 4-7 at the nodes, stiffly spreading, naked on the proximal ½, the axis strongly pilose; lower culm internodes appressed papilllose-pubescent; first glume acuminate, ½ as long as spikelet; fertile lemma chestnut brown at maturity.............................. P. bergii
10 Plants without the above combination of characters.
11 Plants from a cluster of fibrous roots, without rhizomes or hard knotty crowns, annual.
12 First glume 1/5 to 1/4 length of spikelet, broadly rounded to truncate; sheaths usually glabrous; nodes glabrous; [subgenus Panicum, section Dichotomiflorum]
13 Spikelets oblong-lanceolate, (2.0-) 2.4-3.6 mm long, widest below middle, tapering to acuminate tips, second glume and sterile lemma firm, subcoriaceous; most pedicels < 3 mm long and shorter than spikelets.... P. dichotomiflorum var. dichotomiflorum
14 Spikelets ovoid to slenderly ellipsoid, 1.6-2.3 mm long, widest at middle with acute tips, second glume and sterile lemma thin, submembranous; some to many pedicels > 3 mm long and longer than spikelets ........ P. dichotomiflorum var. puritanorum
15 Plants with rhizomes or hard knotty crowns, perennial.
16 Plants with hard crowns, lacking rhizomes; fertile lemma 1.2-1.6 mm long........................................................................................................................................................................ [see Coleataenia]
17 Plants with rhizomes; fertile lemma 1.6-4 mm long.
18 Rhizomes about 1 cm thick with pubescent scale-like leaves; lower portion of culm hard, nearly woody......... P. antidotale
19 Rhizomes less than 1 cm thick with glabrous scale-like leaves; culms not woody.
20 First glume truncate apically.......................................................................................... P. repens
21 First glume acute to obtuse.
22 Culms slightly compressed below; ligules 0.5 mm long or less; spikelets subsessile and subsecund, usually some obliquely bent above the first glume; fertile lemma 1.8-2.2 mm long.................................................................................................................................................. [see Coleataenia]
23 Culms terete; ligules 1-6 mm long; spikelets pedicelled and not at all secund, essentially straight; fertile lemma 2.4-4 mm long; (subgenus Panicum, section Repentia)
24 Rhizomes elongate, or if short, then culms horizontally divergent at base, densely clumped...
25 Rhizomes elongate, or if short, then culms horizontally divergent at base, loosely clumped.......................... P. virgatum var. virgatum
Panicum amarum Elliott var. amarulum (A.S. Hitchcock & Chase) P.G. Palmer, Southern Seabeach Grass. Cp (DE, FL, GA, NC, SC, VA), Mt* (WV*): coastal dunes and shores, sandflats, and sandhills; common (uncommon in WV, rare in FL, GA, NC, SC, VA). July-November. NJ s. to FL and West Indies, w. to TX and Mexico; restricted to the Coastal Plain except for WV (where apparently introduced). Although well-marked variations of var. amarulum and var. amarum are quite distinctive, only the number and structure of first glume nerves appears to be a constant over the range of the two taxa (Palmer 1975). Primarily a coastal plant, var. amarulum has been found in the Sandhills of NC (Richmond Co.). Blomquist 1948 says this taxon "does not seem to grow naturally in North Carolina." [= K, Z; = Panicum amarulum A.S. Hitchcock & Chase – RAB, C, F, G, HC, S, WV; = Panicum ssp. amarulum (A.S. Hitchcock & Chase) Freckmann & Lelong – FNA; not Panicum]

* Panicum bergii Arechavalea, Berg's Panic Grass. Cp (GA): ditches and shallow, sporadically flooded depressions in grasslands; rare, native of South America. Reported for SC, GA (AL), Kartesz (1999), and sc. TX. [= FNA, GA, HC, K, S; > Panicum pilocomaense Hackel; Panicum s.s.]

Panicum capillare Linnaeus, Old-witch Grass, Tumbleweed, Tickle Grass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, VA): open sandy or stoney soil, fields, roadsidens, waste places, often weedy in cultivated soil; common (rare in SC). August-November. E. to Canada, s. to FL and TX; Bermuda. Plants formerly known as Panicum capillare var. occidentale Ryding, ranging from British Columbia south to NJ, WV, KY, TX, and CA, are distinguished by long-acuminate spikelets 2.5–4 mm long that are mostly subsessile or short-pedicelled. In our region, Panicum capillare has short-acuminate spikelets 1.8–2.8 mm long, mostly on long pedicels. [= RAB, K, S, WV, Z; < Panicum capillare – C, Y (also see P. gattingeri); > Panicum capillare var. capillare – F, HC, W; > Panicum capillare ssp. capillare – FNA; > Panicum capillare var. agrestis Gatterer – G; Panicum s.s.]

Panicum dichotomiflorum Michaux var. dichotomiflorum, Spreading Panic Grass, Fall Panic Grass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): marshy shores, exposed wet soils, alluvial deposits in floodplain forests, spoil banks, ditches; common. July-October. E. Canada west to BC, south to FL and TX; also in the Bahamas (Sorrie & LeBlond 1997). Plants with geniculate bases, enlarged lower nodes and sheaths, and panicles with included peduncles and divergent branches have been recognized as var. dichotomiflorum var. geniculatum (A.S. Hitchcock & Chase) Freckmann & Lelong – FNA; > Panicum dichotomiflorum var. dichotomiflorum – F, G, W; > Panicum dichotomiflorum var. dichotomiflorum ssp. dichotomiflorum – FNA; > Panicum dichotomiflorum var. dichotomiflorum – HC; Panicum s.s.]

Panicum dichotomiflorum Michaux var. puritanorum Svenson, Puritan Panic Grass. Cp (DE, VA): wet sands and peats of seasonally exposed pond and lake shores; rare. July-October. NS, NH, and NY south to DE (Sorrie & LeBlond 2008) and VA; IA and IL. Plants from DE northward typically have slender culms 0.3–6 dm long and leaves 1–8 mm wide. Plants with floral characters of var. puritanorum but with nominate-like stout culms 0.8–2 m long and leaves 7–25 mm wide occur in bottomlands in se. VA, and have been recognized as Panicum dichotomiflorum var. imperiorum Fernald. For the time being they are placed here based on floral characters (they will key here), but need further study. [= F, G, K; < Panicum dichotomiflorum – C; > Panicum dichotomiflorum var. imperiorum Fernald – F; > Panicum dichotomiflorum ssp. puritanorum (Svenson) Freckmann & Lelong – FNA; > Panicum dichotomiflorum var. puritanorum – HC; Panicum s.s.]

Panicum gattingeri Nash, Gattinger's Panic Grass. Mt (NC, VA, WV), Pd (NC, VA), C (GA): damp or dry, usually calcareous sandy soils of fields, roadsidens, shores, and cultivated ground; common in Mountains, uncommon in Piedmont (rare in VA). August-October. NY, sw. QC, and MN south to NC, TN, GA, AL, and AR. [= RAB, F, HC, K, S, WV; < Panicum capillare – C, Y; > Panicum capillare var. sylvaticum Torrey – W; > Panicum philippicum var. campestre Gattinger – G, W; > Panicum philippicum var. pilocomaense Hackel; Panicum s.s.]

Panicum hemitomon J.A. Schultes, Maidencane. Cp (DE, FL, GA, NC, SC, VA), Mt (VA): lake, pond, and river shores, swamp borders, marshes, ditches, often in shallow water; common (rare in VA). June-July. Coastal Plain from s. NJ south to FL, west to TX; also TN; South America. Often forming dense colonies in the low margin and shallow waters of limesink ponds. [= RAB, C, F, FNA, G, HC, K, S, WV, Z; not Panicum]

Panicum lithophilum Swallen, Flatrock Panic Grass. Pd (GA, NC, SC), Mt (NC): soil islands on granitic flatrocks and domes; rare. August-October. Restricted to granite outcrops in NC, SC, and ec. GA. There is some question about the distinctness of this taxon from Panicum philippicum. Zuloaga & Morrone (1996) did not consider it separable from Panicum philippicum. [= RAB, HC, K; > Panicum philippicum Bernhardi ex Trinius spp. lithophilum (Swallen) Freckmann & Lelong – FNA; < Panicum capillare Linnaeus var. sylvaticum Torrey – W; > Panicum philippicum – Y; Panicum s.s.]

* Panicum miliaceum Linnaeus ssp. miliaceum, Broomcorn Millet, Proso Millet, Hog Millet. Cp (DE, FL, VA), Mt (VA), Pd (DE, VA): planted in wildlife food plots, sometimes persistent or self-sowing; common (rare in FL, NC, and VA), introduced, native of Eurasia. July-October. [= C, F, FNA, G, HC, K, S, Y; Panicum s.s.]

* Panicum philippicum Bernhardi ex Trinius, Woodland Panic Grass. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, VA): glades, barrens, dissected pondshores, riversides, or other rocky or dry sandy soil of open woods and roadsidens; common (uncommon in WV, rare in DE and SC). NSW west to WI, south to GA and e. TX. Plants formerly known as Panicum tuckermanii Fernald, ranging from se. Canada south to s. VA and OH, are distinguished by included or short-exserted
peduncles less than one-third as long as the panicles. [= RAB, C, G, K, S, WV; > P. philadelphicum – F, HC; > P. tuckermanii Fernald – F, HC; = P. philadelphicum Bernhardi ex Trinius ssp. philadelphicum – FNA; < P. capitillare Linnaeus var. sylvaticum Torrey – W; < P. philadelphicum – Y (also see P. lithophilum); = P. philadelphicum var. philadelphicum – X; Panicum s.s.]

* Panicum repens Linnaeus, Torpedo Grass. Cp (FL, GA, NC, SC): ditches, roadbanks, disturbed coastal sands, in areas where ship's ballast was deposited; common (uncommon in GA, rare north of GA), native of Europe. First reported for NC by Leonard (1971b); reported for numerous counties in the GA Coastal Plain (Carter, Baker, & Morris 2009). [= FNA, GW, HC, K, S; Panicum s.s.]

Panicum virgatum Linnaeus var. cuneense Grisebach, Blunt Panic Grass. Cp (DE, FL, GA, NC, SC, VA): dry to wet sandy pinelands; uncommon. June-October. Coastal Plain from MA to FL, west to MS; also in MI; West Indies. [= F, HC, S; < P. virgatum – RAB, C, FNA, G, GW, W, Z; < P. virgatum var. virgatum – K]

Panicum virgatum Linnaeus var. spissum Linder, Tufted Switchgrass. Cp (DE): gravelly or sandy fresh to brackish shores and swamps; rare. E. Canada south to PA, MD, and DE (Kartesz 1999). [= F, HC, K; < P. virgatum – C, FNA, G; not Panicum]

Panicum virgatum Linnaeus var. virgatum, Switchgrass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, SC, VA, WV): dry or wet sandy soils of pinelands, fresh and brackish marshes, shores; common (uncommon in Mountains). June-October. Sw. QC and ND south to FL and TX, west to NV; Bermuda; Central and South America. [= F, HC, S; < P. virgatum – RAB, C, FNA, G, GW, W, W, Z; < P. virgatum var. virgatum – K; not Panicum]

* Panicum miliaceum Linnaeus ssp. ruderale (Kitagawa) Tzvelev, Panic Millet. [= FNA, K; = P. miliaceum ssp. spontaneum (Kit.) Tzvelev – C; < P. miliaceum – F, G, HC; Panicum s.s.] (not yet keyed)

Parapholis C.E. Hubbard 1946 (Sickle Grass)

* Parapholis incurva (Linnaeus) C.E. Hubbard, Sickle Grass, Hard Grass, Thin-tail. Cp (DE, NC, VA): sandy and muddy flats, brackish or salt marshes; rare, native of Europe. [= RAB, C, FNA, HC, K, Z; = Pholiurus incurvus (Linnaeus) Schinzius & Thellung – F, G; ? Lepturus filiformis (Roth) Trinius]

Pascopyrum A. Löve 1980 (Wheatgrass)

* Pascopyrum smithii (Rydberg) A. Löve, Western Wheatgrass. Mt (GA): disturbed areas; rare. Reported for ne. GA (Rabun County) by Jones & Coile (1988), as Agropyron smithii Rydberg. It is also reported for TN and KY (Kartesz 1999). [= FNA, K; = Elytrigia smithii (Rydberg) Nevski – C; = Agropyron smithii Rydberg – F, G, W]

Paspalum Linnaeus 1759 (Paspalum, Crown Grass, Beadgrass)

(by Alan S. Weakley & Richard J. LeBlond)

1 Spikes solitary, not associated with rudimentary spikelets or naked pedicels.
2 Panicles usually composed of a terminal pair of branches, sometimes with 1 (-5) additional branches below the terminal pair.
3 Upper glumes pubescent on the back or margins.
4 Spikelets 1.3-1.9 mm long; upper glumes pilose along the margins .............................................................. [P. conjugatum]
5 Spikelets 2.4-3.2 mm long; upper glumes sparsely pubescent on the back .......................................................... P. distichum
3 Upper glumes glabrous.
5 Spikelets elliptic,acute or acuminate at the tip ................................................................................................. P. vaginatum
5 Spikelets ovate to broadly elliptic, obtuse to broadly acute at the tip.
6 Spikelets 1.9-2.3 mm long; leaf blades flat ...................................................................................................... P. minus
6 Spikelets 2.5-4.0 mm long; leaf blades flast or longitudinally folded ................................................................. P. notatum
2 Panicles with 1-70 branches, if > 1, the branches arranged racemously.
7 Panicle branches 7-70, the axes extending beyond the outermost spikelets; panicle branches disarticulating at maturity .......... P. fluitans
7 Panicle branches 1-6, terminating in a spikelet; panicle branches persistent.
8 Upper florets olive to dark brown .................................................................................................................... P. scrobiculatum
8 Upper florets pale to tan.
9 Axes of panicle branches not broadly winged, 0.6-1.3 mm wide.
10 Spikelets orbicular, 2.8-3.2 mm wide ........................................................................................................... P. laeve var. circulare
10 Spikelets slightly longer than broad, 2.0-2.5 mm wide .................................................................................. P. laeve var. laeve
9 Axes of panicle branches broadly winged, 1.8-3.3 mm wide.
11 Spikelets 3.2-4.0 mm long; upper lemmas with a few short hairs at their tips .................................................. P. acuminatum
11 Spikelets 1.7-2.1 mm long; upper lemmas glabrous .......................................................... P. dissectum
1 Spikelets paired, or at least the second nonfunctional spikelet represented by a naked pedicel.
12 Spikelets 1.0-1.3 mm long .................................................................................................................. [P. paniculatum]
12 Spikelets 1.3-4.1 mm long
13 Margins of upper glumes and lower lemmas pilose.
14 Panicle branches 2-7; spikelets 2.3-4.0 mm long .................................................................................. P. dilatatum
14 Panicle branches (4-10) 30; spikelets 1.8-2.8 mm long ......................................................................... P. urvillei
13 Margins of upper glumes and lower lemmas neither ciliate-lacerate, winged, nor pilose (if pubescent, the hairs not pilose).
15 Upper florets olive to dark brown.
16 Panicle branches 10-28 (or more).
17 Plants annual; axes of panicle branches broadly winged, the wings about as wide as the central portion; [common native].
17 Plants perennial; axes of panicle branches narrowly winged, the wings narrower than the central portion; [rare exotics].
18 Axes of panicle branches 0.5-1.2 mm wide; spikelets 1.1-1.8 mm wide .................................................. P. conspersum
18 Axes of the panicle branches 1.0-1.7 mm wide; spikelets 1.8-2.4 mm wide .................................................. P. virgatum
19 Plants annual.
20 Spikelets 1.3-1.8 mm wide, broadly elliptic to orbicular, glabrous; panicles with 1-10 (-28) branches, the axes 0.7-2.3 mm wide .......................................................... P. boscianum
20 Spikelets 1.7-2.4 mm wide, broadly obovate, shortly pubescent; panicles with 1-5 branches, the axes 0.8-1.3 mm wide .......................................................... [P. convexus]
19 Plants perennial.
21 Plants cespitose, rhizomes poorly developed; culms 10-20 dm tall; panicle branches ascending, divaricate, or reflexed.
22 Leaves 7-18 mm wide ......................................................................................................................... P. conspersum
22 Leaves 2.5-4 mm wide ......................................................................................................................... P. plicatum
21 Plants not cespitose, rhizomatous; culms 1-1.5 dm tall; panicle branches ending in a tuft of leaf blades
23 Rhizomes long, evident ......................................................................................................................... P. nicorae
23 Rhizomes short, indistinct ..................................................................................................................... P. plicatum
20 Spikelets 1.3-1.8 mm wide, broadly elliptic to orbicular, glabrous; panicles with 1-10 (-28) branches, the axes 0.7-2.3 mm wide .......................................................... P. boscianum
20 Spikelets 1.7-2.4 mm wide, broadly obovate, shortly pubescent; panicles with 1-5 branches, the axes 0.8-1.3 mm wide .......................................................... [P. convexus]

23 Rhizomes long, evident ......................................................................................................................... P. nicorae
23 Rhizomes short, indistinct ..................................................................................................................... P. plicatum

24 Lower lemmas with well-developed cross-ribs over the veins; upper glumes absent .................................................. P. malacophyllum
24 Lower lemmas not ribbed over the veins; upper glumes present.
25 Panicles with 1-15(-100) branches.
26 Plants annual; upper glumes and lower lemmas rugose ............................................................................... [P. racemosum]
26 Plant perennial; upper glumes and lower lemmas glabrous.
27 Plant rhizomatous; panicle branch axes 0.9-1.2 mm wide; panicle branches often arcing .......................... P. intermedium
27 Plant cespitose; panicle branch axes 0.3-0.6 mm wide; panicle branches straight.
28 Panicle branches spreading to reflexed (rarely ascending); leaf blades 10-23 mm wide; axes of panicle branches 0.3-0.4 mm wide ................................................................................................................. P. corystaphiun
28 Panicle branches erect to ascending; leaf blades 4.9-6.1 mm wide; axes of panicle branches 0.5-0.6 mm wide ................................................................................................................................. [P. quadriflorum]
25 Panicles with 1-15 branches.
29 Spikelets 1.3-2.5 mm long.
30 Upper glumes (and usually also the lower lemmas) shortly pubescent.
31 Lower glumes present .......................................................................................................................... [P. langel]
31 Lower glumes absent.
32 Panicles both terminal and axillary, the axillary panicles partially or completely enclosed by the subtending leaf sheath .......................... [see Key A]
32 Panicles all terminal .......................................................................................................................... P. caespitosum
30 Upper glumes and lower lemmas glabrous.
33 Panicles both terminal and axillary, the axillary panicles partially or completely enclosed by the subtending leaf sheath .......................... [see Key A]
33 Panicles all terminal.
34 Upper panicle branches spreading to ascending .................................................................................. P. monostachyum
34 Upper panicle branches spreading to ascending.
35 Upper glumes and lower lemmas 5-veined ......................................................................................... P. caespitosum
35 Upper glumes and lower lemmas 3-veined.
36 Lower sheaths villous or hirsute ........................................................................................................... P. praecox var. curtisianum
36 Lower sheaths glabrous or sparsely papillose pubescent ....................................................................... P. praecox var. praecox
29 Spikelets 2.5-4.1 mm long.
37 Spikelet pairs barely if at all imbricate; lower glumes usually present .................................................. P. bifidum
37 Spikelet pairs imbricate; lower glumes absent or present.
38 Upper glumes pubescent; lower lemmas usually pubescent.
39 Lower glumes present .......................................................................................................................... [P. langel]
39 Lower glumes absent .......................................................................................................................... P. pubiflorum
38 Upper glumes glabrous; lower lemmas usually glabrous.
40 Upper florets golden brown .................................................................................................................. P. floridanum
40 Upper florets pale to tan.
41 Terminal panicle branches erect ........................................................................................................ P. monostachyum
41 Terminal panicle branches spreading to ascending.
42 Plants decumbent, rooting at the lower nodes; spikelets obovate to elliptic .................................................. P. pubiflorum
42 Plants rhizomatous; spikelets orbicular to elliptic.
43 Spikelets 2.9-4.1 mm long; 1.9-3.1 mm wide, suborbicular to elliptic; upper glumes 5-veined; leaf blades flat .......................................................................................................................... P. floridanum
1 Leaves glabrous to glabrate (if glabrate, also see var. stramineum in couplet 8).
2 Blades not especially crowded toward the base, erect, ascending or spreading, 2-20 mm wide; spikelets 1.6-2.6 mm long, pubescent or glabrous.
3 Blades 3-8 mm wide; spikelets 1.6-1.9 mm long, pubescent, subacute; [of GA and FL southward] .................. P. propinquum
4 Plants erect to spreading; blades 3-20 mm wide; spikelets 1.7-2.6 mm long; [of NJ to TX] .............. P. setaceum var. ciliatifolium
4 Plants stiffly erect; blades 2-6 mm wide; spikelets 2.0-2.6 mm long; [of GA and FL] .................. P. setaceum var. rigidifolium

Paspalum acuminatum Raddi, Brook Paspalum, Canoe Grass. Pd (GA): wet areas, often disturbed; rare, possibly only adventive in our area. C. GA and ne. TX south to s. FL and s. TX, south through the New World tropics to s. South America. [= FNA, HC, K]

Paspalum caespitosum Flügge. Cp (AL, FL): pinelands, hammocks; rare. S. AL and n. FL south to s. FL; West Indies, Mexico and Central America. [= FNA, GW, HC, K, S]

Paspalum conjugatum Bergius, Sour Paspalum. Cp (AL, FL, LA, MS): disturbed areas, forest edges; uncommon. Ne. FL, FL Panhandle, and s. AL west to e. TX, south in the New World tropics; Old World tropics. [= FNA, HC, K, S] [synonymy incomplete]

* Paspalum conspersum Schrad., Scattered Paspalum. Cp (GA): roadsides, other disturbed areas; rare, native of Mexico south to South America. [= FNA] [synonymy incomplete]

* Paspalum corysteum Trinius, Emperor Crown-grass. Cp (FL), Pd (NC): disturbed areas; rare, native of South America. [= FNA, K] [synonymy incomplete]

Paspalum distichum Linnaeus, Joint Paspalum, Knotgrass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC): brackish and freshwater marshes; uncommon (rare in VA). June-August. NJ, KS, and WA south to s. FL, s. TX, s. CA and through the New World and Old World tropics. [= RAB, C, F, FNA, G, HC, K, S, W, Y; < P. distichum – GW (also see P. vaginatum); = P. paspaloides (Michaux) Scribner]

POACEAE

**Paspalum setaceum** Michaux var. *stramineum* (Nash) D. Banks, Yellow Sand Paspalum. Cp (FL, GA, NC): dry sandy soils; rare. June-September. Ml west to MT, south to LA, and NM; scattered eastwards, especially near the coast, perhaps at least in part as introductions. [= C, FNA, Z; < *P. setaceum* – RAB, GW, K, W; = *P. ciliatifolium* Michaux var. *stramineum* (Nash) Fernald – F, G; = *P. setaceum* Nash – HC, Y]

**Paspalum setaceum** Michaux var. *supinum* (Bosc ex Poiret) Trinian. Cp (FL, GA, NC, SC, VA?): sandy soils, old fields; uncommon. June-September. E. NC (e. VA?) south to s. FL, west to s. MS. Also reported for the Coastal Plain of Virginia by Tatnall (1946); needing confirmation of the specimen identification. [= F, FNA, Z; < *P. setaceum* – RAB, GW, K, W; = *P. supinum* Bosc ex Poiret – HC, S]

**Paspalum setaceum** Michaux var. *villosissimum* (Nash) D. Banks. Cp (FL): sandy pine flatwoods and fields; uncommon. N. FL (very near GA) south to s. FL; Cuba. [= FNA, Z; < *P. setaceum* – GW, K; < *P. dhille* Michaux – HC; = *P. villosissimum* Nash – S]

* Paspalum vaginatum* Swartz, Sand Knotgrass, Seashore Crown Grass. Cp (FL, GA, NC, SC), Pd (NC): brackish marshes, rarely inland in disturbed places; rare. July. NC south to s. FL, west to s. TX, southward through the New World tropics; Old World tropics. [= RAB, FNA, HC, K, S, Y; < *P. distichum* – GW]

* Paspalum virgatum* Linnaeus, Talquezal. Cp (GA): disturbed areas; rare, native of Mexico, Central America, and South America. [= FNA, K] [synonymy incomplete]

* Paspalum convexus* Flügge, Mexican Paspalum. Disturbed areas. MS, LA, and e. TX, native of tropical America. [= FNA, K] [synonymy complete] *Paspalum denticulatum* Trinian. Cp (AL): wet disturbed areas; rare. FL, AL, LA, TX southward. [synonymy incomplete; not yet keyed] *Paspalum panicum* Linnaeus, Arrocillo. Disturbed areas, native of tropical America. Ec. MS and sw. FL. [= FNA, K] [synonymy incomplete]

* Paspalum quadrisarium* Lamarck, Tussock Paspalum. Disturbed areas. S. MS. Native of South America. [= FNA] [synonymy incomplete]

* Paspalum racemosum* Lamarck, Peruvian Paspalum. Disturbed areas. MS and other widely scattered localities in North America, native of n. South America. [= FNA, K] [synonymy incomplete]

**Pennisetum** L.C. Richard ex Persoon 1805

A genus of 80-130 species, perennials and annuals, mainly of the tropics and subtropics. References: Wipff in FNA (2003a). Key adapted from FNA.

1 Primary bristles (immediately subtending each spikelet) scabrous.
2 Panicles with 9-16 fascicles per cm of length; plants 0.3-1.2 m tall .................................................................................................................................*P. alopecuroides*

1 Primary bristles conspicuously long-ciliate.
3 Spikelets 9-12 mm long ..................................................................................................................................................................................*P. villosum*

3 Spikelets 2.5-7 mm long.
4 Fascicles not disarticulating from the racemes; fascicles 33-160 per cm of inflorescence; panicles 4-200 cm long; leaves 7-70 mm wide. ....................................................................................................................................................*P. glaucum*

4 Fascicles disarticulating from the racemes at maturity; fascicles 8-37 per cm of inflorescence; panicles 2-32 cm long; leaves 2-13 mm wide.
5 Spikelets 4.5-7 mm long; leaves 2-3.5 mm wide, folded or conduplicate and superficially appearing even narrower; rachis pubescent. .................................................................................................................................*P. setaceum*

5 Spikelets 2.5-5.6 mm long; leaves 2-13 mm wide, flat; rachis scabrous.
6 Inner bristles fused for < ¼ of their length; many outer bristles exceeding the spikelets; terminal bristles 10.5-23 mm long, noticeably longer than the other bristles in the fascicle ........................................................................................................*P. ciliare*

6 Inner bristles fused for ½-¾ of their length; outer bristles not exceeding the spikelets; terminal bristles 2.9-6.5 mm long, usually not noticeably exceeding the other bristles in the fascicle ...........................................................................*P. setigerum*

* **Pennisetum alopecuroides** (Linnaeus) Sprengel, Chinese Fountaingrass. Cp (DE), Pd (DE, VA), Mt (VA): disturbed areas; rare, native of e. Asia. [= FNA, HC, K]

* **Pennisetum ciliare** (Linnaeus) Link, Buffelgrass. Cp (FL): disturbed areas; rare, native of Africa. Known in our area from ne. FL, s. AL, e. TN, and ec. MS. [= FNA, HC; = *P. ciliare var. ciliare* – K; = Cenchrus ciliaris Linnaeus]

* **Pennisetum glaucum** (Linnaeus) R. Brown, Pearl Millet. Cp (FL), Mt (VA, WV), Pd (VA), {GA, NC, SC}: disturbed areas; common, native of the Old World. [= RAB, FNA, HC, K, WH; ? Chaetochloa lutescens (Weigel) Stuntz – S; = Setaria glauca (Linnaeus) Palisot de Beauvois – WV]

* **Pennisetum setigerum** (Vahl) Wipff. Cp (FL): disturbed areas; rare, native of Africa. Known in our area from ne. FL and ec. MS. [= FNA; = *P. ciliare* (Linnaeus) Link var. *setigerum* (Vahl) Leke – K; = Cenchrus setigerus Vahl]

Phalaris Linnaeus 1753 (Canary-grass)

1 Perennial, with scaly rhizomes; inflorescence either obviously paniculate, 7-25 cm long, with ascending to appressed branches, the main branches of the inflorescence apparent, the inflorescence outline thus appearing lobed, or densely spikelike, 1.5-15 cm long.
  2 Glumes broadly winged; fertile lemmas ovate-lanceolate, densely pubescent............................................................................................ P. aquatica
  2 Glumes not winged; fertile lemmas narrowly lanceolate, glabrous to sparingly pubescent ...
  1 Annual, without rhizomes; inflorescence densely spikelike or almost capitate, 1-9 cm long, the branches not apparent, the inflorescence outline a single ovoid, ellipsoid, or lanceolate form.

3 Spikelets borne in clusters, the lower 4-7 spikelets in each cluster with a staminate terminal floret........................................................................................................... P. paradoxa
  3 Spikelets borne singly; all spikelets with a bisexual terminal floret.
    4 Keels of the glumes broadly winged (the wing ca. 1 mm wide); sterile florets 2.0-4.5 mm long............................................. P. canariensis
    4 Keels of the glume narrowly winged (the wing < 0.5 mm wide); sterile florets 0.5-2.5 mm long.
      5 Sterile floret 1............................................................................................................................................................................. P. minor
      5 Sterile florets 2.
        6 Nerves of the glumes scabrous; panicle cylindric in outline, 6-18 cm long; glumes 3.5-4.0 mm long; sterile florets 0.5-1.5 mm long.......................................................................................................................... P. angusta
        6 Nerves of the glumes not scabrous; panicle narrowly ovate in outline, usually 2-6 cm long; glumes 5-6 mm long; sterile florets 1.5-2.5 mm long.......................................................................................................................... P. caroliniana

* Phalaris angusta * Nees ex Trinian. Cp (FL, GA, SC): waterfowl impoundments, marshes; uncommon, native of tropical America, perhaps native in LA and TX. [= GW, FNA, HC, K, Z]

**? Phalaris arundinacea ** Linnaeus, Reed Canary-grass, Ribbon Grass. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): moist forests, moist disturbed areas, bogs; common (rare in VA Coastal Plain). June. NL (Newfoundland) west to AK, south to NC, TN, AR, NM, CA; Mexico; Eurasia. A variegated form, P. arundinacea forma variegata (Parn.) Druce, is cultivated for ornament, as Ribbon Grass. [= RAB, C, F, FNA, GW, K, S, W, WV, Z; > P. arundinacea var. arundinacea – G, HC; > P. arundinacea var. picta Linnaeus – G, HC]

* Phalaris canariensis * Linnaeus, Birdseed Grass, Canary-grass. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (VA, WV): disturbed areas; rare, native of Mediterranean Europe. Also reported for other scattered states in e. North America, including peninsular FL (Kartesz 1999). [= FNA, HC, K] [synonymy incomplete]

* Phalaris minor * Retzius, Lesser Canary Grass. Cp (SC): waste areas near wool-combing mills; rare, native of Mediterranean Europe. Also reported for other scattered states in e. North America, including peninsular FL (Kartesz 1999). [= FNA, HC, K] [synonymy incomplete]

* Phalaris paradoxa * Linnaeus, Mediterranean Canary Grass. [NC]: [habit]; rare. Reported for NC, MD, NJ, and PA (Barkworth in FNA 2007a; Kartesz 1999). [= FNA, K; > P. paradoxa var. paradoxa – HC; > P. paradoxa var. praemorsa (Lamarck) Coss. & Durieu – HC] [synonymy incomplete]

Phanopyrum (Rafinesque) Nash 1903 (Phanopyrum)

Phleum Linnaeus 1753 (Timothy)

1 Spikelets 2.0-3.6 (-3.8) mm long, including the 0.2-1.0 (-1.2) mm long awns; panicle 3-6 (-6.7) mm wide; leaves 2-6 mm wide; ligule usually acute............................................................................................................................................................................. P. pratense ssp. bertolonii
1 Spikelets 3.5-4.5 mm long, including the (0.8-) 1.0-2.0 mm long awns; panicle 5-10 mm wide; leaves 3-9 mm wide; ligule usually obtuse ........................................................................................................ P. pratense ssp. pratense

Phragmites Adanson 1763 (Common Reed)

1 Panicle diffuse and partially drooping, with lower lateral branches naked for 1-4 cm; leaf blades of lower stem leaves abscising from the sheaths by mid-season; leaves lightly scabrous on lower surface; culms stout, to 20 mm in diameter, smooth and glossy; [native on the Gulf Coast, from FL and GA westward, and southward into the tropics].................................................................P. karka

1 Panicle erect and relatively compact, with lower lateral branches spikelet-bearing to base
2 Ligules 0.4-0.9 mm long; lower glumes 2.5-5.0 mm long; upper glumes 4.5-7.5 mm long; leaf blades of lower stem leaves abscising from the sheaths caducous with age; culms exposed in the winter, smooth and shiny; [native south to WV and VA].........................................................P. americanus
2 Ligules 1.0-1.7 mm long; lower glumes 3.0-6.5 mm long; upper glumes 5.5-11.0 mm long; leaf sheaths caducous with age; culms exposed in the winter, smooth and shiny; [native on the Gulf Coast, from FL and GA westward, and southward into the tropics].................................................................P. pratense

Phragmites americanus (Saltonstall, P.M. Peterson, & Soreng) A. Haines, American Reed. Freshwater marshes. New England westward. [= V; < P. australis ssp. americanus] Saltonstall, P.M. Peterson, & Soreng – FNA, X, Y, Z; < P. australis – C, K; < P. communis Trinius – RAB, G, HC; < P. communis var. berlandieri (Fournier) Fernald – F]

* Phragmites (Cavanilles) Trinius ex Steudel, Common Reed. Brackish and freshwater Marshes, dredge-spoil deposit islands, ditches. August-October. Nearly worldwide in distribution. Fox, Godfrey, & Blumquist (1948) report its first collection in NC (in 1948). In most of our area, reed is of relatively recent introduction, reported from only nine counties in RAB, but now becoming a serious weed in coastal areas, where it aggressively colonizes freshwater and brackish marshes, excluding the native species. [= V; < P. australis ssp. americanus – X, Y; = Phragmites australis (Cavanilles) Trinius ex Steudel var. australis – FNA; Z; < P. australis – C, GW, K; < P. communis Trinius – RAB, G, HC; < P. communis var. communis – F; < P. phragmites (Linnaeus) Karsten – S]

Phyllostachys Siebold & Zuccarini 1843 (Bamboo)

A genus of about 50 (or more) species, native of mainly temperate e. Asia. References: Stapleton & Barkworth in FNA (2007a); Duncan & Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.

1 Internodes at the base of principal culms dissimilar in length, the lowermost internode 1-12 cm long, the next 3 internodes distinctly longer, with nodal junctions mostly straight across.................................................................P. aurea
1 Internodes at the base of principal culms all similar in length, mostly 4-8 cm, with nodal junctions oblique
2 Groove on internode (above the branch) yellowish-green, the rest of the culm dull greenish.........................................................P. aureosulcata
2 Groove on internode (above the branch) the same color as the rest of the culm.
3 Internodes of principal culms densely velvety; outer surface of culm sheaths with abundant erect brown hairs; lowest internode of principal culms ca. 5 cm long; culms pale green astrift, becoming gray with accumulated waxy powder in age..................P. heterocyla
3 Internodes of principal culms glabrous or slightly hairy; outer surface of culm sheaths lacking erect brown hairs; lowest internode of principal culms ca. 8.5-12 cm long; culms various (see below, but not as described in first lead).
**POACEAE** 343

4 Largest culms to 15 cm in diameter and 25 m tall; upper culm sheaths with auricles; outer surface of culm sheaths usually with a green streak down the middle, flanked by streaks of purple and buff; culms medium to dark glossy green at first (some cultivars golden yellow or yellow streaked), remaining so in age. .................................................................*P. bambusoides*

4 Largest culms to 3.2 (-4) cm in diameter and 10 m tall (rarely taller); upper culm sheaths with or without auricles; outer surface of culm sheaths variously streaked, spotted, or mottled with brown or red (but not as above); culms pale green to green at first, usually becoming purple spotted, gray, or yellow in age.

5 Lowest internode of principal culms ca. 8.5 cm long; culm sheaths with auricles, usually sparsely pubescent with erect, pale hairs, usually pinkish-brown at maturity, marked with numerous brown spots near the tip; culms green at first, usually becoming speckled and then more-or-less completely darkened with purplish spots (remaining green in some cultivars). ...........................................*P. nigra*

5 Lowest internode of principal culms ca. 12 cm long; culm sheaths lacking auricles, glabrous, usually green to buff at maturity, striped and marginally bordered with red; culms pale green at first, becoming gray to yellowish in age. ............*P. rubromarginata*

*Phyllostachys aurea* Carrière ex A. & C. Rivière, Golden Bamboo, Fishpole Bamboo. Cp (DE, FL?, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (VA): suburban woodlands; uncommon (rare in VA Mountains), native of China and Japan. Not known to flower in our area. This is the usual large bamboo cultivated and naturalizing in our area, forming dense stands, up to 15 m tall. [= RAB, FNA, HC, K, Y, Z]

*Phyllostachys aureosulcata* McClure, Yellowgroove Bamboo. Cp (SC), Pd (VA), Mt (WV), {GA}: cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= K, WV, Y, Z]

*Phyllostachys bambusoides* Siebold & Zuccarini, Giant Timber Bamboo. Cp (NC, SC), Pd (NC, SC), Mt (NC, SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= FNA, HC, K, Y, Z]

*Phyllostachys nigra* (Loddiges) Munro, Black Bamboo. Pd (SC), Pd (VA), Mt (WV): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China and Japan. [= K, WV, Y, Z; > *P. nigra* var. *henonis* (Mif.) Stapf – WV]

*Phyllostachys rubromarginata* McClure. Pd (SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= K, Y, Z]

*Phyllostachys meyeri* McClure is reported as introduced in FL, NC, and SC (Kartesz 1999). {investigate} [= K] {not yet keyed}

A number of other species are sometimes cultivated in our area, and may be encountered. Bamboos are seriously under-represented in herbaria, since they rarely flower and are impractical to press. All of the species above should be anticipated in other physiographic provinces and states than those listed.

**Piptatherum** Palisot de Beauvois 1812

1 Glumes 2.5-3.5 mm long; lemmas glabrous; [alien] .............................................................................................................................*[P. miliaceum]*

1 Glumes 3-8 mm long; lemmas evenly pubescent; [native].

2 Leaves primarily cauline, the basal leaves < 2 cm long or merely represented by sheaths; leaves 8-16 mm wide; florets 4.5-7.5 mm long. .................................................................*P. racemosum*

2 Leaves primarily basal, the basal leaves 4-45 cm long; leaves 0.5-1.8 mm wide; florets 2.2-4.5 mm long. .......................................................................................................................... ...........................................................................

3 Awns absent or < 2 mm long, caducous ..........................................................................................................................................

3 Awns 5-15 mm long, persistent, 1-2× geniculate ...........................................................................................................*P. racemosum*

3 Awns absent or < 2 mm long, caducous ..........................................................................................................................*P. pungens*

**Piptatherum canadense** (Poiret) Dorn, Mountain Ricegrass. Mt (WV): sandy barrens on quartzite; rare. NL (Newfoundland) west to BC, south to n. NY, MI, and WI; disjunct at Panther Knob, Pendleton County, WV. [= K; = Oryzopsis canadensis (Poiret) Torrey – C, F, G, HC, WV]

**Piptatherum pungens** (Torrey ex Sprengel) Dorn. Mt (WV): {habitat}; {abundance}. NL (Labrador), NU, and YT south to NJ, WV, IN, IL, IA, SD, and CO. [= K; = Oryzopsis pungens (Torrey ex Sprengel) A.S. Hitchcock – C, F, G, HC]

**Piptatherum racemosum** Ricker ex A.S. Hitchcock, Blackseed Ricegrass. Mt (VA, WV), Pd (DE): calcareous woodlands and forests; common (rare in DE and WV). QC and ON west to ND, south to w. VA, e. TN (FNA), sc. KY, sc. MO, and e. NE. [= K; = Oryzopsis racemosa (Smith) Ricker ex A.S. Hitchcock – C, F, G, HC, W, WV]

**Piptochaetium** J. Presl 1830 (Needlegrass)

A genus of about 27 species, of temperate North and South America, and montane tropical South America (Cialdella & Giussani 2002). References: Barkworth in FNA (; Cialdella & Giussani (2002).

1 Florets 7-13 mm long; awns 40-75 mm long; [widespread in our area] .............................................................................................................................*P. avenaceum*

1 Florets 13.5-22 mm long; awns 62-120 mm long; [endemic to FL] .............................................................................................................................*P. avenacioides

Pleioblastus Nakai 1925

A genus of about 20 species, shrubs, native of China and Japan.

* Pleioblastus simonii (Carrière) Nakai. Reported for GA (Kartesz 1999). [investigate] [= Arundinaria simonii (Carrière) A. & C. Rivière – K]

Poa Linnaeus 1753 (Bluegrass)

1 Plants with well-developed rhizomes; perennial.
2 Upper stems strongly flattened; [section Tichopoa]..........................P. compressa
3 Upper stems terete or nearly so.
4 Lower nodes of the panicle with 1-3 branches; [section Madropoa]..........................P. cuspidata
5 Lower nodes of the panicle with 4 or more branches; [section Poo]..........................P. pratensis

1 Plants lacking rhizomes; perennial or annual.
2 Upper stems strongly flattened; [section Tichopoa]..........................P. compressa
4 Lower nodes of the panicle with 1-3 branches; [section Madropoa]..........................P. cuspidata
5 Lower nodes of the panicle with 4 or more branches; [section Poo]..........................P. pratensis

1 Plants dioecious, the florets perfect; lemmas and glumes scarios and silvery; [rare introduction in our area]; [section Dioecopoa]..............P. arachnifera
2 Plants not dioecious, the florets perfect; lemmas and glumes not notably scarios and silvery; [collectively common and widespread in our area].

3 Lower nodes of the panicle with 4 or more branches; [section Arenariae].........P. bulbosa
4 Upper stems terete or nearly so.
5 Lower nodes of the panicle with 4 or more branches; [section Arenariae].........P. bulbosa
6 Lower nodes of the panicle with 1-3 branches; [section Madropoa]..........................P. cuspidata
7 Lower nodes of the panicle with 4 or more branches; [section Poo]..........................P. pratensis

1 Plants with well-developed rhizomes; perennial.
2 Upper stems strongly flattened; [section Tichopoa]..........................P. compressa
3 Upper stems terete or nearly so.
4 Lower nodes of the panicle with 1-3 branches; [section Madropoa]..........................P. cuspidata
5 Lower nodes of the panicle with 4 or more branches; [section Poo]..........................P. pratensis

8 Annual.
9 Marginal veins of the lemma glabrous.
10 Nodes of the panicle mostly with 4-8 branches; lemmas pubescent or scarios on the keel.
11 Sheaths glabrous; ligule 0.7-2.2 (-3.0) mm long; [section Sylvestres]..........................P. alsodes
12 Sheaths scarios; ligule (2.5-) 3-7 mm long; [section Pandemos]..........................P. trivialis

8 Annual.
9 Marginal veins of the lemma glabrous.
10 Nodes of the panicle mostly with 4-8 branches; lemmas pubescent or scarios on the keel.
11 Sheaths glabrous; ligule 0.7-2.2 (-3.0) mm long; [section Sylvestres]..........................P. alsodes
12 Sheaths scarios; ligule (2.5-) 3-7 mm long; [section Pandemos]..........................P. trivialis

9 Marginal veins of the lemma glabrous, at least basally.
13 Lower nodes of the panicles mostly with (1-) 2-3 branches.
14 Ligule truncate, 0-1 mm long; first glume 1.7-2.2 mm long, second glume 2.0-2.8 mm long; anthers 0.5-0.7 mm long; [section Oreatos]..........................P. paludigena
15 Ligule rounded-ovate, 1-2 mm long; first glume 2.5-3.5 mm long, second glume 3.0-3.8 mm long; anthers 1.1-1.4 mm long; [section Sylvestres]..........................P. saltuensis

8 Annual.
9 Marginal veins of the lemma glabrous, at least basally.
10 Nodes of the panicle mostly with (1-) 2-3 branches.
11 Ligule truncate, 0-1 mm long; first glume 1.7-2.2 mm long, second glume 2.0-2.8 mm long; anthers 0.5-0.7 mm long; [section Oreatos]..........................P. paludigena
12 Ligule rounded-ovate, 1-2 mm long; first glume 2.5-3.5 mm long, second glume 3.0-3.8 mm long; anthers 1.1-1.4 mm long; [section Sylvestres]..........................P. saltuensis

Poa alsodes A. Gray, Woodland Bluegrass. Pd (DE, NC, VA), Mt (NC, VA, WV): rich forests; common (uncommon in NC, VA, and WV Mountains, rare in NC and VA Piedmont). May-June. NS west to SD, south to NC and IL; also in w. United States. [= RAB, C, F, FNA, G, HC, K, S, W, WV, Z]

A genus of about 18 species, annuals and perennials, of tropical and warm temperate regions. References: Barkworth in FNA (2007a); Tucker (1996)=Z.

1 Inflorescence verticillate, the rachis visible between the verticils; glumes 1.6-2.3 mm long, without awns; spikelets disarticulating near base of pedicel; stoloniferous perennial..........................................................P. viridis

1 Inflorescence dense, cylindrical, and spike-like; glumes 2-3 mm long, with prominent awns 3.5-7 mm long; spikelets disarticulating near apex of pedicel; annual.

2 Glumes deeply lobed, the awn borne between the lobes; glume ciliate-fringed; lemma 0.4-0.7 mm long, awnless.................................

2 Glumes slightly notched at the tip, the awn borne from near the tip; glume not ciliate-margined; lemma 0.7-1.1 mm long, awned.................................

................................................................................................................

................................................................................................................

................................................................................................................

................................................................................................................

................................................................................................................

Poa infirma Kunth. Cp (SC): disturbed areas; rare, native of South America. [investigate] [= FNA, K] [not yet keyed; synonymy incomplete]

* Polypogon Desfontaines 1798

Poa languida Hitchcock, Drooping Bluegrass. Mt (VA): ultramafic outcrop woodlands, barrens, and glades; rare. April-May. VT and MA west to MN, south to PA, w. VA, KY, and IA. See comments under P. saltuensis. [C, F, G, HC, W; = P. saltuensis Fernald & Wiegand ssp. languida (Hitchcock) A. Haines – FNA; Y; < P. saltuensis – K]

Poa nemoralis Linnaeus, Wood Bluegrass. Pd (DE, VA), Mt (NC, VA): disturbed areas, sandy creek bottoms; uncommon (rare in VA), native of Europe. [= C, F, FNA, G, HC; < P. nemoralis ssp. nemoralis – K]

Poa paludigena Fernald & Wiegand, Bog Bluegrass. Mt (NC, VA, WV), Pd (DE): bogs, especially in deep shade under shrubs; rare. April-May. NY west to MN, south to PA, w. NC, and IL. This species withers and disintegrates shortly after flowering; its ephemeral habit may be responsible for its being overlooked in our area for many years. [= C, F, FNA, G, HC, K]

Poa saltuensis Fernald & Wiegand, Bob Bluegrass. Mt (NC, VA, WV): northern hardwood forests, ultramafic outcrop woodlands, barrens, and glades; rare. April-May. NL (Newfoundland) west to MN, south to PA, w. VA, and w. NC. The NC occurrences (on serpentinized olivine barrens) reported as introduced to GA (Small 1933). [= FNA, G, HC, K, S; var. maritimus

Poa saltuensis ssp. saltuensis. Variants: 1 Inflorescence verticillate, the rachis visible between the verticils; glumes 1.6-2.3 mm long, without awns; spikelets disarticulating near base of pedicel; stoloniferous perennial..........................................................P. viridis

1 Inflorescence dense, cylindrical, and spike-like; glumes 2-3 mm long, with prominent awns 3.5-7 mm long; spikelets disarticulating near apex of pedicel; annual.

..........................................................P. maritimus var. saltuensis – F; = P. saltuensis ssp. saltuensis – FNA, Y; < P. saltuensis – K (also see P. languida)

Poa trivialis Linnaeus ssp. trivialis, Rough Bluegrass. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA), Mt (NC, SC, VA): moist forests, disturbed areas, bottomlands; common (rare in VA Coastal Plain), native of Europe. April-June. [= FNA; < P. trivialis – RAB, C, F, G, GW, HC, K, S, W, WV, Z]

Poa wolfii Scribner. Mt (NC): moist rich forests; rare. OH west to MN, south to c. TN, n. AR, and NE; disjunct easterly w. NC. The NC occurrence is based on material from Great Smoky Mountains National Park (Haywood County) (K. Langdon, pers. comm.. 2006). The alleged VA occurrences are in error. [= C, F, G, HC, K, S, W, WV, Z]

* Polypogon Desfontaines 1798

A genus of about 18 species, annuals and perennials, of tropical and warm temperate regions. References: Barkworth in FNA (2007a); Tucker (1996)=Z.
* **Polypogon viridis** (Gouan) Breistr., Water Bent-grass. Cp (SC): introduced on ballast around old ports, probably not persistent; rare, native of the Old World. Distinguished from *Agrostis* in having the spikelet falling as a whole, disarticulating below the glumes. [= FNA, K, Z; = *Agrostis viridis* Gouan – C; > *Agrostis verticillata* Villars – F; > *Agrostis semiverticillata* (Forskål) C. Christensen – G, HC]

**Pseudosasa** Makino ex Nakai 1925 (Arrow Bamboo)

A genus of about 36 species, native of China, Japan, and Korea. References: Stapleton in FNA (2007a); Duncan & Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.

* **Pseudosasa japonica** (Siebold & Zuccarini ex Steudel) Makino ex Nakai, Arrow Bamboo. Cp (FL, VA): cultivated as an ornamental, persistent or spreading from plantings; uncommon, native of Japan. [= FNA, HC, K, Y, Z; > *Sasa japonica* (Siebold & Zuccarini ex Steudel) Makino]

**Puccinellia** Parlatore 1848 (Alkali Grass, Goosegrass)

<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>* Puccinellia fasciculata (Torrey) Bicknell, Eastern Alkali Grass, Saltmarsh Goosegrass. Cp (DE, VA): salt or brackish marshes; rare. NS south to VA, Europe; and in sw. United States. The native or introduced status of this species in ne. North America is controversial. [= C, F, FNA, G, HC, K]</td>
</tr>
</tbody>
</table>

* **Puccinellia maritima** (Hudson) Parlatore, Seaside Alkali Grass, Seaside Speargrass. Salt marshes and ballast near ports. Introduced south to se. PA (Philadelphia), NJ (Camden), and DE, especially on ballast. [= C, F, FNA, G, HC; > *P. americana* Sorensen – K] {synonymy incomplete}

**Reimarochloa** A.S. Hitchcock 1909

A genus of about 4 species, of the New World tropics. References: Barkworth in FNA (2003a).

**Reimarochloa oligostachya** (Munro ex Bentham) A.S. Hitchcock. Cp (FL): moist hammocks, wet grasslands; rare. Ne. FL (Duval County) and s. AL south to s. FL; Cuba. [= FNA, HC, K]

**Ripidium** Trinius 1820 (Ravenna-grass)

References: Hodkinson et al. (2002).

* **Ripidium ravennae** (Linnaeus) Trinius, Ravenna-grass, Plume-grass. Cultivated as an ornamental and rarely escaping or persisting; native of s. Europe. In sw. GA, TN, and MD (Kartesz 1999), DC (Steuery 2004a), FL (Wunderlin & Hansen 2006). [= *Saccharum ravennae* (Linnaeus) Linnaeus – FNA, K; > *Erianthus ravennae* (Linnaeus) Palisot de Beauvois – F; > *Erianthus ravennae* var. ravennae – HC; > *Erianthus ravennae* var. purpurascens (Anderss.) Hackel – HC]

**Rostraria** Trinius 1820

**Rostraria cristata** (Linnaeus) Tzvelev. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, introduced, native of Europe. It also occurs at scattered other sites in eastern United States, such as on ballast in se. PA (Rhoads & Klein 1993), and reported for MD, AL, and FL (Kartesz 1999). Not keyed. [= K; > *R. cristata* var. *cristata* – FNA; > *R. cristata* var. *glabriflora* (Trautvetter) Dogan – FNA; = *Lophochloa cristata* (Linnaeus) Hylander; = Koeleria phleoides (Villars) Persoon – HC; ? Koeleria Gerardii (Villars) Shinners]

**Rothoebia** Linnaeus f. 1782 (Itch-grass)

A genus of about 5 species, native to tropical Asia and Africa. References: Wipff in FNA (2003a); Wipff & Rector (1993)=Z.

**Rothoebia cochinchnensis** (Loureiro) W.D. Clayton, Itch-grass. Cp (FL, GA, NC, VA): disturbed ground; uncommon (rare north of FL), native of tropical se. Asia. August-October. This grass, considered a noxious weed, was found in at least 13 GA counties by 1985 (Duncan 1985; Carter, Baker, & Morris 2009), on a farm in Robeson County, NC in 1984, and in cornfields in Westmoreland County, VA in 2007. [= FNA, K, Z; = *Rothoebia exaltata* Linnaeus f. – HC; = *Manisuris exaltata* (Linnaeus f.) Kuntze – S]

**Saccharum** Linnaeus 1753 (Plume Grass)

A genus of uncertain circumscription at this time. Clayton & Renvoize (1986) pointed out that the "traditional division [of *Saccharum*] into awned (*Erianthus*) and awwless species seems wholly artificial," Hodgkin et al. (2002) developed molecular evidence which suggests that our species are not congeneric with *Saccharum*, however. Further study is needed, but likely our native southeastern species will be merged into *Miscanthidium* Stapf, while the introduced *S. ravennae* will be placed in the genus *Rigidium* Triñius (Hodkinson et al. 2002). Sugarcane (*Saccharum officinarum* Linnaeus, *S. sinense* Roxburgh, *S. barbieri* Jeswiet, *S. spontaneum* Linnaeus, and cultivars and hybrids derived from those four species) is cultivated further south, notably in FL and LA. References: Webster in FNA (2003a); Webster & Shaw (1995)=Z; Gandhi & Dutton (1993); Hodgkin et al. (2002). [also see *Rigidium*]

1 Lowermost inflorescence node densely hairy; callus hairs (ring of hairs beneath the spikelet) (7-) 9-25 mm long, equal to or longer than the spikelet; stem appressed-pubescent below the inflorescence, on the internodes as well as the nodes.  
2 Lemma awn flattened and spirally twisted at base; callus hairs 9-14 mm long, silvery or tinged with purple; leaves usually glabrous on the upper surface at maturity; [of moist to dry sites, rarely in wetlands] ................................................................. **S. alopecuroides**  
3 Lemma awn nearly terete, straight or slightly flexuous; callus hairs (7-) 15-20 (-25) mm long, tawny or brown; leaves usually pilose on the upper surface at maturity; [of moist to wet sites, rarely in uplands] ................................................................. **S. giganteum**  
4 Awn of the lemma of the upper floret flattened at the base, either spiraled or not; spikelets straw-colored or purplish; spikelet pair homomorphic; the upper lemma 0.9-1.0× as long as the lower lemma; lemma of the lower floret typically 3-nerved.  
5 Awn of the lemma of the upper floret basally spiraled, 15-22 mm long; lemma of the upper floret bifid, the tooth on either side of the lemma 2.0-2.5 mm long. ................................................................. **S. brevibarbe var. brevibarbe**

**Saccharum brevibarbe** (Michaux) Persoon var. *brevibarbe*, Short-bearded Plume Grass. Cp (NC): marshes, ditches; rare. September-October. MS, AL, and TN west to TX, AR, and OK; disjunct in e. NC. [= FNA, K, Z; < *Erianthus brevibarbis* Michaux – RAB, C, G, GW, S (also see *S. coarctatum*); > *E. brevibarbe* – F; > *Erianthus coarctatus var. elliotii* Fernald – HC; > *Miscanthidium species 3*]

**Saccharum brevibarbe** (Michaux) Persoon var. *contortus* (Elliott) R. Webster, Bent-awn Plume Grass. Cp (DE, FL, GA, NC, SC, VA); Pt (GA, NC, SC, VA), Mt (GA, NC, SC, VA): open woodlands and forests, woodland borders; common (rare in Mountains, rare in DE, FL, and VA). Late July-October. DE and MD south to Panhandle FL, west to TX and AR, with scattered occurrences north to TN. [= FNA, K, Z; = *Erianthus contortus* Elliott – RAB, C, F, G, GW, HC, S, W; = *Saccharum contortum* (Elliott) Nuttall; = *Erianthus brevibarbis* Michaux var. *contortus* (Elliott) D.B. Ward; = *Miscanthidium species 4*]
POACEAE

Saccharum giganteum (Walter) Persoon, Sugarcane Plume Grass, Giant Plume Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA); Mt (GA, NC, SC, VA): marshes, ditches; common (rare in Mountains). September-October. NY south to FL, west to se. TX and AR; inland in TN and KY. [= FNA, K, Z; = Erianthus giganteus (Walter) Palisot de Beauvois – RAB, C, G, GW, HC, W; > Erianthus giganteus var. giganteus – F; > Erianthus giganteus var. compactus (Nash) Fernald – F; = Erianthus saccharoides Michaux – S; = Miscanthidium species 6]

Sacciolepis Nash 1901 (Cupscale)

1. Annual, cespitose; spikelets 2.5-3.5 mm long; [rare alien] ................................................................. S. indica
1. Perennial, from creeping stolons; spikelets (3-) 4-5 mm long; [common native] ........................................... S. striata

* Sacciolepis indica (Linnaeus) Chase, Indian Cupscale. Cp (FL, GA, NC, SC): low fields, ditches; uncommon (rare north of FL); native of India. October. [= RAB, FNA, GW, HC, K]

* Sacciolepis striata (Linnaeus) Nash, American Cupscale. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC): marshes, interdune swales, ditches, swamps; common (rare in Piedmont and Mountains, rare in DE). July-October. S. NJ south to FL, west to e. TX and OK, nearly limited to the Coastal Plain, but occasionally inland as in w. NC and TN; also native in the West Indies and n. South America. [= RAB, C, F, FNA, G, GW, HC, K, W]

Sasa Makino & Shibata 1901

Schedonorus Palisot de Beauvois 1812 (Meadow Fescue, Tall Fescue)

A genus of perennials, native of Eurasia. The correct generic placement of the introduced species Schedonorus arundinaces (= Festuca elatior; = Festuca arundinacea; = Lolium arundinaceum) and S. pratense has been disputed. The traditional placement in Festuca has been defended by Aiken et al. (1997); Darbyshire (1993) transferred them to Lolium; and Soreng & Terrell (1998) place them in the genus Schedonorus. References: Darbyshire in FNA (2007a); Darbyshire (1993)=X; Aiken & Darbyshire (1990)=Y; Tucker (1996)=Z; Soreng & Terrell (1998)=V. Key based in part on C and Y.

1. Auricles ciliate (sometimes only very sparsely so – check several at 10-20× magnification); spikelets with 3-6 (-9) florets; old sheaths pale straw-colored, often remaining intact; internodes of the rachilla antrorsely scabrous .............................................................. S. arundinaces
1. Auricles glabrous; spikelets with (2-) 4-10 (-12) florets; old sheaths brown, decaying to fibers; internodes of the rachilla glabrous (smooth) or nearly so............................................................... S. pratensis

* Schedonorus arundinaces (Schreber) Dumortier, Tall Fescue, Alta Fescue. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, roadsides, pastures, disturbed areas; common (uncommon in FL), native of Eurasia. May-July. [= FNA, V; < Festuca elatior Linnaeus – RAB, F, S, W, WV, misapplied; < Festuca arundinacea Schreber – HC, Y; = Festuca elatior Linnaeus – C; = Festuca elatior var. arundinacea (Schreber) Wimmer – G; < Festuca pratensis Hudson – GW; = Lolium arundinaceum (Schreber) Darbyshire – K, X, Z; ? Schedonorus phoenis (Scopoli) Holub]

* Schedonorus pratensis (Hudson) Palisot de Beauvois, Meadow Fescue. Mt (VA, WV), Pd (DE), Cp (DE): fields, roadsides, pastures, disturbed areas; common (rare in DE), native of Eurasia. May-July. [= FNA, V; < Festuca elatior Linnaeus – F, S, W, WV, misapplied; = Festuca pratensis Hudson – C, Y; = Festuca elatior var. pratensis (Hudson) A. Gray – G; < Festuca pratensis Hudson – GW; = Festuca elatior – HC, misapplied; = Lolium pratense (Hudson) Darbyshire – K, X, Z]

Schizachne Hackel 1909 (False Melic)

Schizachyne purpurascens (Torrey) Swallen, Purple Outgrass, False Melic. Mt (VA, WV): moist, rocky northern hardwood and spruce forests; rare. NL (Newfoundland) west to AK, south to MD, w. VA, WV, KY, IL, NM, and Mexico; also in ne. Asia. May-July. [= F, FNA, G, HC, K, WV; > S. purpurascens var. purpurascens – C]

Schizachryum Nees 1829 (Little Bluestem)

Schizachyrium littorale (Nash) Bicknell. Seaside Little Bluestem. Coastal dunes and maritime dry grasslands, often with Uniola paniculata, Panicum amarum, and other dune plants. August-October. E. MA south to NC (or SC?), and inland on the shores of the Great Lakes. In NC, S. littorale is present and abundant on dunes of barrier islands from Shackleford Banks, Carteret County south to Brunswick County, near the SC border, and entirely absent from the Outer Banks (from Cape Lookout, Carteret County, north through Hyde County to Dare County). Reported for FL for ne. FL (Duval County) and Panhandle FL (Franklin County). [= FNA, GW, K; < Andropogon scoparium Michaux – RAB; = S. scoparium var. littorale (Nash) Gould – C, Z; = Andropogon scoparius Michaux var. littorales (Nash) A.S. Hitchcock – F, G; = Andropogon littoralis Nash – HC, S; < S. scoparium (Michaux) Nash ssp. littorale (Nash) Gandhi & Smeins – Y]

Schizachyrium maritimum (Chapman) Nash. Coastal dunes and grasslands. AL, FL west to e. LA. [= FNA, GW, K; = Andropogon maritimus Chapman – HC, S] [add to synonymy]

Schizachyrium niveum (Swallen) Gould, Pinescrub Bluestem, is reported for Lowndes Co. in sc. GA (Kral 1973), but the report has been discounted by later authors (Wipff in FNA 2003a). [= FNA, K; = Andropogon niveus Swallen – HC, S] [not keyed or mapped]

Schizachyrium sanguineum (Retzius) Alston var. hirtiflorum (Nees) Hatch, Hairy Crimson Bluestem. Pine flatwoods, sandhills, disturbed sandy sites. Sw. GA and FL west to AZ and south through Central America to South America; West Indies. [= FNA, K; = Andropogon hirtiflorus (Nees) Kunth – HC, S; < S. sanguineum var. brevipedicellatum (Beal) Hatch]

Schizachyrium scoparium (Michaux) Nash var. hirtiflorum (Hackel) Gould, Pinehill Bluestem. Various open habitats. KY, AR, and TX, south to Panhandle FL, AL, MS, and LA. [= FNA, K; = Andropogon scoparius Michaux var. divergens Hackel; = Andropogon divergens – HC; < Andropogon scoparius – S]

Schizachyrium scoparium (Michaux) Nash var. scoparium, Common Little Bluestem. In a wide range of moist to dry habitats. (June-) August-October. NB west to AB, south to FL and Mexico. One of the most ubiquitous plants in the modern landscape of our area, occurring throughout in the majority of habitats. This species is extremely variable, some of the variability correlated with habitat and geography; the recognition of infraspecific taxa is warranted. [= C, FNA, Z; < Andropogon scoparius Michaux – RAB (also see S. littorale); = S. scoparium – GW; > Andropogon scoparius var. scoparius – F, G, HC; > Andropogon praematurus Fernald – F, G; > Andropogon scoparius var. polycladus Scribner & Ball – F; > Andropogon scoparius var. frequens F.T. Hubbard – F; = S. scoparium var. scoparius – K, Y; < Andropogon scoparius – S, W, WV]

Schizachyrium scoparium (Michaux) Nash var. stoloniferum (Nash) J. Wipff, Creeping Little Bluestem. Fall-line sandhills in the inner Coastal Plain, perhaps in other dry habitats, the habitat and range in our area requiring further study. August-October. SC and GA south to FL and west to MS. See Wipff (1996a) for additional discussion. [= FNA, K, Z; = S. stoloniferum Nash – GW; = Andropogon stolonifer (Nash) A.S. Hitchcock – HC, S; < S. scoparium ssp. littorale (Nash) Gandhi & Smeins – Y]
**Sclerochloa** Palisot de Beauvois 1812 (Hard Grass)

* Sclerochloa dura* (Linnaeus) Palisot de Beauvois, Hard Grass, Fairground Grass. Mt (VA, WV), {GA}: athletic fields, lawns; rare, native of Mediterranean Europe. In VA, known from a single site and doubtfully persisting (VBA 2007). Also reported from GA, MD, MS, and TN (Kartesz 1999). [= C, HC, K, Z]

**Secale** Linnaeus 1753 (Rye)

* Secale cereale* Linnaeus, Rye. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields; commonly cultivated, uncommonly persistent or volunteering after cultivation, native of Eurasia. May-June. An important crop, cultivated for at least 8000 years. The lemmas have awns 2-6 cm long. [= RAB, C, F, FNA, G, HC, K, Z; reported from GA, MD, MS, and TN (Kartesz 1999).]

**Setaria** Palisot de Beauvois 1807 (Foxtail Grass)

1 None of the spikelets subtended by a stiff bristle.
2 Spikelets 2.2-2.4 mm long; glumes and sterile lemma not papery ................................................................. *S. geminata* var. *geminata*
3 Spikelets 2.8-3.0 mm long; glumes and sterile lemma papery ................................................................. *S. geminata* var. *palmifolia*
4 Annual; leaves 10-25 mm wide ............................................................................................................. *S. paludivaga*
5 Perennial; leaves 2-8-30 mm wide ........................................................................................................... *S. verticillata*
6 Perennial, noticeably rhizomatous.
7 Panicle 3-8 (10) cm long; plant from knotty rhizomes; [native, common (sometimes weedy)] ................ *S. parviflora*
8 Panicle 5-25 cm long; plant from thick rhizomes; [alien, rare]................................................................. *S. sphaecelata*
9 Bristles 1-3 (rarely 6) below each spikelet.
10 Bristles antrorsely scabrous.
11 Upper lemmas smooth and shiny (occasionally with obscure rugosity)
12 Culms to 1 m tall; spikelets ca. 3 mm long; [alien, of ruderal sites] ......................................................... *S. italica*
13 Upper lemmas distinctly transversely rugose, dull.
14 Upper lemmas coarsely rugose; leaves 4-7 mm wide; [native, occasionally with obscure rugosity] ................................................................. *S. corrugata*
15 Upper lemmas finely rugose; leaves 4-25 mm wide; [alba, generally of ruderal sites].
16 Panicles densely spiciform; rachises not visible, villous. ................................................................. *S. viridis* var. *major*
17 Panicles arching and drooping from the base; spikelets 2.5-3.0 mm long................................. *S. faberi*
18 Panicles 10-20 cm long; culms 10-25 dm tall; leaves 10-25 mm wide ............................................. *S. viridis* var. *viridis*
19 Panicles 3-8 cm long; culms 2-10 dm tall; leaves 4-12 mm wide ......................................................... *S. viridis* var. *viridis*
Setaria viridis (Forskål) Veldkamp var. paludivaga (A.S. Hitchcock & Chase) R.D. Webster, Alligator Grass, Paspalidium. Cp (FL, GA, SC): in shallow water; rare. December. S. SC south to FL, west to TX; also in Central and South America. This taxon is sometimes considered an introduction from the Old World, but its occurrence in undisturbed wetlands remote from extensive human activity suggests that it is native. \(=\) Panicum paludivagum A.S. * Setaria verticillata (Linnaeus) Palisot de Beauvois, Hooked Bristlegrass. Mt (VA, WV), Pd (DE), Cp (DE): disturbed areas; common (uncommon in VA, rare in WV), native of Europe. \(=\) FNA, G, K, WV; \!<\! Setaria verticillata var. verticillata – C, F, HC; \!<\! Chaetochloa verticillata (Linnaeus) Lamson-Scribner – S; \!<\! Setaria verticillata \(-\) Z*

Setaria adhaerans (Forskål) Chiovenda. Cp (AL): disturbed areas; rare. Distributed widely throughout the tropics and subtropics, in North America from s. AL west to CA (perhaps only adventive in portions of that distribution). \(=\) FNA, K, Z [synonymy incomplete]*

* Setaria verticilliformis Dumortier. Reported for NJ, PA, MD, and AL (FNA 2003a, Kartesz 1999). \(=\) FNA, K; \!<\! Setaria verticillata (Linnaeus) Palisot de Beauvois var. ambiguus (Guss.) Parlatore – C, F, HC; \!<\! Setaria viridis (Linnaeus) Palisot de Beauvois var. ambiguus (Guss.) Coss. & Durieu – G; \!<\! Chaetochloa ambiguus Guss. – S; \!<\! Setaria verticillata \(-\) Z*

* Setaria viridis (Linnaeus) Palisot de Beauvois var. major (Gaudin) Pospichal, Giant Green Foxtail. Reported as introduced in TN, MD, and PA (Kartesz 1999). \(=\) C, FNA, G, K, Z; \!<\! Setaria viridis \(-\) RAB, HC*

**Sorghastrum Nash 1901 (Indiangrass)**

A genus of about 18-20 species, of tropical and subtropical America and Africa, rarely extending into temperate areas. References: Hall (1982)= Z; Dávila Aranda & Hatch in FNA (2003a). Key adapted from Z.

1 Awns 10-22 (30) mm long, once-geniulate; plants rhizomatous; surfaces of the glumes tan to slightly brown basally; ligule 2-10 mm long, prominently auricled. \(=\) S. nutans

1 Awns 16-46 mm long, twice-geniulate; plants cespitose; surfaces of the glumes brown; ligule 1-5 mm long, truncate.

2 Axis of the panicle straight, erect, the bractlets appressed to ascending, the spikelets drooping-secund; spikelets 0.8-1.2 mm wide ............ \(=\) S. secundum

2 Axis of the panicle arching, usually strongly so, the bractlets ascending to spreading, the spikelets not drooping-secund; spikelets 1.1-1.8 mm wide.

3 Axis of the panicle straight, with the branches distributed no more than 180 degrees around the axis (as viewed from above) ............ \(=\) S. apalachicolense

3 Axis of the panicle arching, with the branches distributed through 360 degrees around the axis (as viewed from above) \(=\) S. elliottii

**Sorghastrum apalachicolense** D.W. Hall, Apalachicola Indian Grass, Open Indian Grass. Flatwoods and sandhills. July-August. Panhandle FL west to s. MS (Sorrie & Leonard 1999). It may well occur as well in GA. \(=\) K, Z; \!<\! S. elliottii – FNA**

**Sorghastrum elliottii** (C. Mohr) Nash, Slender Indian Grass. Woodlands and forests, river-scar areas, including oak-hickory forests and woodlands over mafic rocks. September-October. MD south to FL and west to TX, inland to TN, AR, and OK, mainly on the Coastal Plain, but extending inland to other physiographic provinces. \(=\) RAB, C, F, G, HC, K, W, Z; \!<\! S. elliottii – FNA (also see S. apalachicolense)**
**Sorghastrum nutans** (Linnaeus) Nash, Yellow Indiangrass. Xeric and mesic woodlands and forests of a, WV wide variety, powerline rights-of-way, roadbanks. September-October. ME and QC west to s. MB, south to c. peninsular FL, TX, UT, AZ, and Mexico. Along with *Andropogon gerardii*, *Schizachyrium scoparium*, and *Panicum virgatum*, *Sorghastrum nutans* is one of the dominant grasses of the tall-grass prairie. It is also common in a variety of open habitats (natural and altered) in the forested landscape of eastern North America. [= RAB, C, F, FNA, G, HC, K, S, W, WV, Z, = *S. avenaceum* (Michaux) Nash]

**Sorghastrum secundum** (Elliott) Nash, Lopsided Indiangrass. Sandhills. September-October. S. SC south to s. FL and west to s. AL (Sorrie & Leonard 1999). [= RAB, FNA, HC, K, S, Z]

*Sorghum* Moench 1794 (Sorghum, Milo, Johnson Grass)

A genus of about 25 species, of tropical and subtropical Old World (1 species in Mexico). References: Barkworth in FNA (2003a); de Wet (1978)=Z.

1 Rhizomatous perennial; leaves 1-2 cm wide................................................................. *S. halepense*
1 Fibrous-rooted annual; leaves (2-) 3-5 cm wide.
2 Inflorescence dense, compact; plants 0.5-1.3 m tall......................................................... *S. bicolor var. bicolor*
2 Inflorescence open, with spreading branches; plants 1.0-3.0 m tall.................................. *S. bicolor var. drummondii*

* *Sorghum bicolor* (Linnaeus) Moench var. *bicolor*, Sorghum, Milo, Broomcorn, Sorgo. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (VA): cultivated, rarely persistent; common in cultivation, rare as an escape. October. [= C; *< Sorgum vulgare* Persoon – RAB; *< Sorgum vulgare* – F, orthographic variant; *< S. vulgare* var. *vulgare* – HC; = *S. bicolor* ssp. *bicolor* – FNA, K; < *Holcus sorghum* Linnaeus – S]

* *Sorghum bicolor* (Linnaeus) Moench var. *drummondii* (Nees ex Steudel) Mohlenbrock, Shattercane. Cp (FL, GA, NC, SC, VA): cultivated, rarely persistent; common in cultivation, rare as an escape. October. This is the taller variety with open inflorescences, usually sporadically present in sorghum fields. [= C; *< Sorgum vulgare* Persoon – RAB; *< Sorgum vulgare* – F, orthographic variant; *< Sorgum bicolor* ssp. *drummondii* (Nees ex Steudel) de Wet – FNA; = *Sorgum vulgare* Persoon var. *drummondii* (Nees ex Steudel) Hackel ex Chiovenda – HC; = *Sorghum bicolor* ssp. *drummondii* (Nees ex Steudel) de Wet & Harlan – K; < *Holcus sorghum* Linnaeus – S]

*Spartina* Schreber 1789 (Cordgrass)

1 Leaves with smooth or slightly scabrous margins; spikelets glabrous or nearly so; [of salt to brackish coastal marshes]........................... *S. alterniflora*
1 Leaves with strongly scabrous margins; spikelets scabrous, at least on the keel; [of brackish to fresh marshes, or inland or upland].
2 Plants strongly cespitose, forming large clumps with numerous basal leaves and culms; leaves involute; culms 0.5-2 m tall; [of s. SC southward].
3 Spikes 3-16 per inflorescence, appressed to ascending; leaves 3-7 mm wide, involute or somewhat flat toward the bases.......................... *S. bakeri*
3 Spikes (6-) 15-75 per inflorescence, tightly appressed; leaves 1.5-4.5 mm wide, strongly involute ..................................................... *S. spartinae*
2 Plants with elongate rhizomes, forming large clonal patches, the culms arising singly; leaves involute or flat; culms either 0.5-3.5 m tall; [collectively widespread in our area].
4 Spikes 1-9 per inflorescence; culms 0.5-1 m tall; leaves 0.5-4 (-7) mm wide, usually involute when fresh................................. *S. patens*
4 Spikes 5-70 per inflorescence; culms 1-3.5 m tall; leaves 5-20 mm wide, usually flat when fresh.
5 Second glume acute, not awned; first glume averaging ca. 1/2 as long as the lemma; spikes (6-) 20-50 (-more) per inflorescence; [of fresh to brackish coastal marshes]................................................................. *S. cynosuroides*
5 Second glume with an awn 3-10 mm long; first glume averaging ca. 7/8 as long as the lemma; spikes (5-) 7-27 per inflorescence; [of fresh marshes, either inland or coastal]................................................................. *S. pectinata*

*Spartina alterniflora* Loiseleur, Saltmarsh Cordgrass, Smooth Cordgrass. Salt marshes. August-October. NL (Newfoundland) south to FL, west to TX; e. South America; introduced in n. Europe. *S. alterniflora* is the dominant plant (often essentially a monoculture) of intratidal salt marshes in our area. [= RAB, C, FNA, GW, K, WH; *< S. alterniflora* var. *alterniflora* – F, G, HC, S; = *S. alterniflora* var. *glabra* (Muhlenberg ex Bigelow) Fernald – F, G, HC, S; = *S. alterniflora* var. *pilosa* (Merrill) Fernald – F, G, HC]

*Spartina bakeri* Merrill, Sand Cordgrass. Brackish marshes, marsh edges, wet coastal hammocks, under *Sabal palmetto*, *Quercus virginiana*, and *Juniperus virginiana* var. *silicicola*. June. Se. SC south to s. FL, west to Panhandle FL. Along with *S. spartinae*, distinctive among our species in its densely clumped growth form. [= FNA, GW, HC, K, S, WH]
**Spartina cynosuroides** (Linnaeus) Roth, Giant Cordgrass. Brackish and freshwater tidal marshes, especially along margins of tidal creeks. June-September. MA south to FL, west to e. TX. [= RAB, C, FNA, G, GW, HC, K, S, WH; > *S. cynosuroides var. cynosuroides* – F]

**Spartina patens** (Aiton) Muhlenberg, Small Saltmeadow Cordgrass, Salt Hay, Marsh-hay Cordgrass. Dunes, sand flats, upper edges of marshes, maritime wet grasslands, overwash flats. June-September. NL (Newfoundland) south to FL, west to TX. *Var. monogyna* has spikelets 7-10 mm long (vs. 9-13 mm); second glume acute to obtuse (rarely acuminate) (vs. acuminate); spikes (2-) 4-9 per inflorescence (vs. 1-4); second highest leaf blade on the stem (1-) avg. 2 (-5) dm long (vs. 0.5-2 dm); plants to 15 dm tall (vs. to 8 dm); culms to 6 mm in diameter at base (vs. to 3 mm). Whether var. *monogyna* is worthy of recognition is a matter of debate; there appear to be morphological differences correlated with geography and, according to some authors, habitat, but positive identification to variety is sometimes difficult. [= RAB, C, FNA, GW, K, S, WH; > *S. patens var. patens* – F, G, HC; > *S. patens var. monogyna* (M.A. Curtis) Fernald – F, G, HC]

**Spartina pectinata** Link, Prairie Cordgrass, Slough Grass. Banks of rivers and lakes, spray cliffs below waterfalls, rocky or sandy flood-scorched riverside grasslands, tidal freshwater (oligohaline) marshes, calcareous oak flatwoods and prairies. July-September. NL (Newfoundland) west to WA, south to ne. NC, sw. NC, AR, TX, and NM. [= RAB, C, F, FNA, G, GW, HC, K, W, WV; > *S. pectinata var. pectinata* – F; > *S. pectinata var. suntieei* (Farwell) Fernald – F; > *S. michauxiana* A.S. Hitchcock – S]

**Spartina spartinae** (Trinius) Merr. ex A.S. Hitchcock, Gulf Cordgrass. Brackish marshes and inland saline situations. AL and FL west to TX. [= FNA, GW, HC, K, S, WH]

![Spartina spartinae](image)

**Sphenopholis** Scribner 1906 (Wedgegrass)

1. Spikelets 5-9.5 mm long; second lemma with an awn 3.5-7 mm long................................................................. *S. pensylvanica*
2. Spikelets 1.5-5 mm long; second lemma awnless, or with an awn up to 3.5 mm long.
3. Lower leaf blades mostly < 10 cm long, flat, 2-8 mm wide................................................................. *S. filiformis*
4. Lower leaf blades mostly < 10 cm long, flat, 2-8 mm wide.
5. First glume ½-⅓ as wide as the second glume; second lemma strongly scabrous................................. *S. nitida*
6. First glume less than ¼ as wide as the second glume; second lemma smooth to slightly scabrous.
7. First lemma unawned.
8. Panicle open; second glume 3-6× as long as wide, acute at the tip; lowermost rachilla internode 0.8-1.0 mm long ....... *S. intermedia*
9. Panicle densely cylindrical; second glume 2-3× as long as wide, rounded or truncate at the tip; lowermost rachilla internode 0.7-0.9 mm long................................. *S. obtusata*

**Sphenopholis filiformis** (Chapman) Scribner. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC); pine savannas, sandy woodlands; common (uncommon north of FL, rare in VA). April-May. Se. VA south to n. peninsular FL, west to e. TX. [= RAB, C, F, FNA, K, S, WH, Z]

**Sphenopholis intermedia** (Rydberg) Rydberg, Slender Wedgegrass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA); moist nutrient-rich forests; uncommon (rare in DE, GA, NC, SC, and VA). May-June. NL (Newfoundland) west to c. AK, south to Panhandle FL, c. TX, and AZ. Perhaps better treated at the varietal level. [= RAB, F, FNA, K, S, WV; = *S. obtusata* (Michaux) Scribner var. *major* (Torrey) K.S. Erdman – C, Z; < *S. intermedia* – G (also see *S. pallens*); < *S. obtusata* – GW, W, WH]

**Sphenopholis nitida** (Biehler) Scribner. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); moist forests, bottomlands; common (uncommon in FL and WV). April-May. MA west to IL, south to n. peninsular FL and TX. [= RAB, C, F, FNA, K, W, SH, WH, Z; > *S. nitida var. glabra* (Nash) Scribner – G; > *S. nitida var. nitida* – G]

**Sphenopholis obtusata** (Michaux) Scribner, Prairie Wedgegrass. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); forests, roadsides, disturbed areas; common (uncommon in Mountains). April-May. ME west to MN and BC, south to s. FL, TX, c. Mexico, and s. CA. [= RAB, FNA, G, K, S, WV; = *S. obtusata var. obtusata* – C, Z; > *S. obtusata var. obtusata* – F; > *S. obtusata var. pubescens* (Lamson-Scribner & Merrill) Lamson-Scribner – F; < *S. obtusata* – GW, W, WH (also see *S. intermedia*)]

**Sphenopholis pallens** (Biehler) Scribner (pro sp.) [S. obtusata × *pensylvanica*]. Cp (NC, SC, VA); ditches, wet forests; rare. Seemingly not always with its parents. May. [= C, K; = *S. pallens* – RAB, F, S; < *S. intermedia* (Rydberg) Rydberg – G]

**Sphenopholis pensylvanica** (Linnaeus) A.S. Hitchcock, Swamp-oats. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, NC, SC, VA); bogs, ditches, wet forests; uncommon (rare in DE). April-June. MA west to OH and se. MO, south to n. peninsular FL and LA. [= C, FNA, K, WH, Z; = *Trisetum pensylvanicum* (Linnaeus) Palisot de Beauvois ex Roemer & J.A. Schultes – RAB, F, G, S, WV; = *S. pensylvanica* – GW, orthographic variant]

---

**Sporobolus** R. Brown 1810 (Dropseed)

---

**POACEAE**

1 Inflorescence an open panicle, > 2 cm broad, the branches ascending to spreading.

2 Branches of the panicle verticillate, whorled; spikelets 2.5-4 mm long......................................................\textit{S. junceus}

3 Spikelets 1.5-2.5 (2.7) mm long.

4 Panicle branches bare of spikelets in the lower \(\frac{1}{4}\)-\(\frac{1}{3}\) of their length ......................................................\textit{S. cryptandrus}

4 Panicle branches bearing spikelets to the base .............................................................................................................\textit{S. domingensis}

3 Spikelets 4-6.5 mm long.

5 First glume scaberulous, acuminate or awn-like; spikelets dark gray; base of plant relatively fibrous; grain spherical; [of rocky barrens of the Mountains of NC and VA].................................................................................................................................\textit{S. heterolepis}

5 First glume glabrous, acute to acuminate; spikelets purplish fading tan; base of plant smooth and hard, made up of the indurated leaf bases; grain oblong (when present, usually abortive); [of pine savannas and seeps of the Coastal Plain of NC, SC, and southward].

6 Leaves terete or subterete (wiry), oval in cross-section, sometimes irregularly channelled for portions of their lengths (never with any portion above the sheath flat), < 1 mm wide, tending to senesce and turning tan in autumn, the margins generally smooth; culms (including the inflorescence) (2-) 4-7 (-10) dm tall; culms (from base to first inflorescence branch) 1.5-5 dm tall; first glume averaging about 0.7\* as long as the second glume (though variable, ranging from 0.5-0.75\*)(......................................................\textit{S. teretifolius}

6 Leaves flat (folded when dry), plane or V-shaped in cross-section, with free margins their entire length, 1.2-2 (2.7) mm wide, tending to remain green into the winter (at least until December), the margins scabrous (except in \textit{S. curtissii}); culms (including the inflorescence) 3-22 dm tall; culms (from base to first inflorescence branch) (4-) 6-10 dm tall; first glume averaging 0.75-1\* as long as the second glume (though variable, collectively ranging from about 0.6-1.2\*).

7 First glume averaging 0.95-1.1\* as long as the second glume (though variable, ranging from 0.8-1.3\*); pedicels mostly 1-3 mm long (a few sometimes as long as 10 mm long), appressed; culms (including the inflorescence) 3-7 dm tall; inflorescence branches stiffly ascending; leaves 0.5-1.5 mm wide (or to 2.0 mm wide when unburned), mostly 1.5-4 dm long (rarely to 5 dm long), smooth on the margins; [of e. SC southward].................................................................................................................................\textit{S. curtissii}

7 First glume averaging 0.6-0.9\* as long as the second glume (though variable, collectively ranging from about 0.6-0.95\*); pedicels mostly 4-15 mm long, spreading; culms (including the inflorescence) (3-) 7-16 (-22) dm tall; inflorescence branches initially ascending, later loosely ascending to spreading; leaves 1.2-10.0 mm wide, mostly (3-) 4-8 dm long, upwardly scabrous on the margins; [of e. NC southward].

8 Leaves (2.0-) 3-10 mm wide, pale bluish-green (often with some yellowish leaves as well); first glume averaging 0.75-0.9\* as long as the second glume (though variable, ranging from 0.6-0.95\*); culms (including the inflorescence) usually 12-22 dm tall; inflorescence usually 3.5-5 dm long; [of e. SC southward].................................................................................................................................\textit{S. floridanus}

8 Leaves (2.0-) 3-10 mm wide, pale bluish-green (often with some yellowish leaves as well); first glume averaging 0.6-0.8\* as long as the second glume (though variable, collectively ranging from 0.6-0.8\*); culms (including the inflorescence) usually 6-12 (-18) dm tall; inflorescence usually 2-3.5 dm long; [of e. NC south to e. GA] .................................................................................................................................\textit{S. pinetorum}

9 Plant a rhizomatous or tufted perennial; most inflorescences exerted to partly enclosed; inflorescence 5-15 cm long.

9 Plant creeping extensively by slender rhizomes; leaf blades cauline, distichous, to 12 cm long ......................................\textit{S. virginicus}

10 Spikelets (1.3-) 1.6-2.8 mm long; grain falling free of the lemma and palea; lemma glabrous ........................................\textit{S. neglectus}

10 Spikelets 2.3-5.5 mm long; grain falling enclosed in the lemma and palea; lemma strigose (use 10\* or more) or glabrous.

11 Lemma and palea shorter than the glumes; palea usually shorter than the lemma; lemma glabrous or strigose with hairs < 0.2 mm long; spikelets 2.3-3.3 (-3.8) mm long; floret (lemma, palea and enclosed grain) 1.6-3.3 (-3.8) as long as wide ........\textit{S. ozarkanus}

11 Lemma and palea longer than the glumes; palea usually longer than the lemma; lemma strigose with hairs > 0.2 mm long; spikelets 2.8-5 mm long; floret (lemma, palea and enclosed grain) 2.2-5.7 (-7.5) as long as wide ........\textit{S. vaginiflorus}

12 Plant a rhizomatous or tufted perennial; most inflorescences exerted to partly enclosed; inflorescence 5-15 cm long.

12 Plant creeping extensively by slender rhizomes; leaf blades cauline, distichous, to 12 cm long ......................................\textit{S. virginicus}

13 Spikelets 1.5-2.2 mm long; first glume 0.5-0.8 mm long; leaves primarily basal.

14 Panicle branches appressed, 0.5-2 cm long in the middle of the inflorescence; second glume acute, > \(\frac{1}{3}\) as long as the spikelet ...... \textit{S. indicus}

14 Panicle branches ascending, 2-8 cm long in the middle of the inflorescence; second glume truncate or broadly obtuse, < \(\frac{1}{3}\) as long as the spikelet. .................................................................................................................................\textit{S. pyramidalis}

15 Lemma pubescent, usually conspicuously shorter than the palea; pericarp loose when moist..............................\textit{S. clandestinus}

15 Lemma glabrous, about as long as the palea; pericarp gelatinous when moist.

16 Culms (1.4-) 2.0-5.0 mm thick; terminal sheath (1.3-) 1.5-6.0 mm wide; panicles with 12-35 primary branches, crowded, dense ......................................................\textit{S. compositus var. compositus}

16 Culms 1.0-2.0 (-2.5) mm thick; terminal sheath 0.8-0.2 (-0.5) mm wide; panicles with 8-18 primary branches, lax, loosely flowered .................................................................................................................................\textit{S. compositus var. drummondii}

\* \textit{Sporobolus airoides} (Torrey) Torrey, Alkali Sacaton. Waste areas near wool-combing mills; introduced from w. North America, not known to be established or persistent. [= FNA, HC, K] [not keyed]

\textit{Sporobolus clandestinus} (Biehler) A.S. Hitchcock, Rough Dropseed. Glades, barrens, and thin soil of woodlands, also in dry sands. September-October. This species is widespread in e. United States. Wipf & Jones (1995) recommend reducing this taxon to a variety under \textit{S. compositus}, because of its morphologic similarity. While \textit{S. clandestinus} and \textit{S. compositus} are undoubtedly closely related, I prefer to retain the two as species. [= RAB, C, FNA, F, G, HC, K, S, W, Z; = \textit{S. compositus} (Poiret) Merrill var. clandestinus (Biehler) J. Wipf & S.D. Jones]

\textit{Sporobolus compositus} (Poiret) Merrill var. compositus, Tall Dropseed. Diabase glades and barrens, limestone glades and barrens, disturbed areas over diabase or calcareous rocks. September-November. This species and variety are reported for NC in...
a recent revision of the \textit{S. asper} group (Riggins 1977); little is known about the occurrence of this species in NC. The general range is centered in the Plains, but extending east into ne. United States. The name \textit{S. compositus} has nomenclatural priority over the more familiar \textit{S. asper} (Kartesz & Gandhi 1995). [= FNA, K; \textit{S. asper} (Michaux) Kunth var. \textit{asper} – C, G, HC, Z; \textit{S. asper} – F, S, WV]

\textbf{Sporobolus compositus} (Poiret) Merrill var. \textit{drummondii} (Trinius) Kartesz & Gandhi. Glades, barrens, roadsides, disturbed areas. East to the Ridge and Valley province of e. TN (Chester et al. 1993), occurring over limestone, and allegedly to GA (Kartesz 1999). It could very likely occur in sw. VA, as it is in Hawkins County, TN, immediately adjacent to VA (Chester et al. 1993). [= FNA, K; \textit{S. asper} (Michaux) Kunth var. \textit{drummondii} (Trinius) Vasey – C; Z; \textit{S. drummondii} (Trinius) Vasey – F; S; \textit{S. asper} var. \textit{hookeri} (Trinius) Vasey – G, HC, misapplied]

\textbf{Sporobolus cryptandrus} (Torrey) A. Gray, Sand Dropseed. Floodplains, shores, disturbed areas; native west of the Appalachians, introduced eastward. C. and w. North America. This species is reported for NC by HC, F, and S. [= C, FNA, G, K, HC, S, WV; \textit{S. cryptandrus var. cryptandrus} – F]

\textbf{Sporobolus curtissii} (Vasey ex Beal) Small ex Scribner, Curtiss's Dropseed. Moist, gummy-clay flatwoods. September-November. E. SC south to c. FL. First positively documented for our area in 1993. Earlier attributions of \textit{S. curtissii} to NC and SC were apparently based on misapplication or confusion with \textit{S. teretifolius} and/or \textit{Sporobolus pinetorum}. \textit{S. curtissii} differs from other "bunchgrass" \textit{Sporobolus} of our area in having the spikelets short-pedicelled and appressed against the panicle branches (as opposed to long-pedicelled and spreading in \textit{S. teretifolius} and \textit{Sporobolus pinetorum}). [= FNA, HC, K, S, Y]

\textbf{? Sporobolus domingensis} (Trinius) Kunth, Coral Dropseed. Cp (GA): coastal sands?; rare, uncertain whether native or introduced. Se. GA south to s. FL; West Indies, Mexico. The e. GA record (Glynn County) is at Univ. of Georgia (Sorrie, pers. comm.). [= FNA, HC, K, S]

\textbf{Sporobolus chapmanii} (Chapman, Florida Dropseed. Cp (FL, GA, SC): wet savannas; uncommon (rare in SC). June-September. Se. SC south to ne. FL, west to Panhandle FL. First positively documented for SC in 1995. Earlier attributions of \textit{S. floridana} to NC and SC were apparently based on misapplication or confusion with \textit{Sporobolus pinetorum}. [= FNA, K, Y; \textit{S. floridana} – GW, HC, S (also see \textit{S. pinetorum}); the inclusion of \textit{S. floridana} in RAB was based on a misidentification of \textit{S. pinetorum}]

\textbf{Sporobolus heterolepis} (A. Gray) A. Gray, Prairie Dropseed. Mt (GA, NC, VA), Ip (KY): barrens, glades, and prairies under mafic, ultramafic, and calcareous rocks (olivine, serpentinite, limestone); rare. August-September. The primary distribution of \textit{S. heterolepis} is in the Plains, with outliers east to nw. GA (Jones & Coile 1988), c. TN (Estes & Beck 2005), w. NC, w. VA, se. PA, ne. United States, and adjacent Canada. [= RAB, C, F, FNA, G, HC, K, W, Y]

\textbf{Sporobolus neglectus} Nash, Barrens Dropseed. Ip (KY), Mt (VA, WV): dry rocky barrens and outcrops, over calcareous rocks (such as limestone or dolomite); uncommon (rare in VA and WV). August-September. ME west to ND, south to NJ, w. VA, TN, LA, and TX; apparently disjunct in WA and AZ. \textit{S. ozarkanus}, \textit{S. neglectus}, and \textit{S. vaginiflorus} form a still very poorly understood complex. [= C, F, FNA, G, HC, K, S, W]

\textbf{Sporobolus ozarkanus} Fernald, Ozark Dropseed. Ip (KY), Pd (NC), Mt (VA): limestone glades, diabase glades; rare. September-October. KY west to KS, south to e. TN, AR, and TX; disjunct in c. NC. In Granville County, NC, it is associated (on glades of diabase, a mafic rock) with other taxa with affinities to midwestern glades and prairies: \textit{Solidago rigidag}, \textit{Solidago ptarmicoides}, \textit{Baptisia australis} var. \textit{aberrans}, \textit{Symphyotrichum depauperatum}, \textit{Silphium terebinthinaceum}, \textit{Parthenium auriculatum}, \textit{Ruella humilis}, and others. \textit{S. ozarkanus}, \textit{S. neglectus}, and \textit{S. vaginiflorus} form a still very poorly understood complex. [= C, F, G, HC, K; = \textit{S. vaginiflorus} (Torrey ex A. Gray) Wood var. \textit{ozarkanus} (Fernald) Shinners – FNA, K]

\textbf{Sporobolus pinetorum} Weakley & P.M. Peterson, Carolina Dropseed, Savanna Dropseed. Cp (GA, NC, SC): wet savannas, savanna-pocosin ecotones, sandhill-pocosin ecotones, and extending upslope into mesic flatwoods or loamy or clayey shelves in the fall-line sandhills; uncommon (rare in GA and SC). June-September (and into December in response to growing-season fire). The identity of this taxon has been obscure; it is now clear that it is a previously unrecognized species, endemic to NC, SC, and adjacent e. GA. RAB included it in their concept of \textit{S. teretifolius}, though it does not key well (keying imperfectly to either \textit{S. floridana} or \textit{S. heterolepis}); in S and HC, it will key to \textit{S. floridana}, but the leaves are much narrower. Additionally, \textit{S. floridana} is a taller and coarser plant, the culms often averaging about 1.5 meters in height and 2-3 mm in diameter (vs. 1 meter high and 1 mm in diameter for \textit{Sporobolus pinetorum}). In wet savannas of Columbus County, NC, \textit{S. species 1} occurs with true \textit{S. teretifolius} (the two codominant over many hectares!), and the two taxa are manifestly distinct. The leaves of \textit{S. pinetorum} are not terete; after lengthy drought in the field (or dry on an herbarium sheet), the leaves become tightly folded to involute and can appear wiry. Like many Southeastern pineland grasses, \textit{S. pinetorum} flowers only following...
fire. In vegetative condition it may be distinguished from *Aristida stricta* and *A. beyrichiana*, with which it often grows, by the leaf pubescence (*S. pinetorum* with scaberulous margins, best felt by running a finger along the margin near the base, from apex toward base, *A. stricta* and *A. beyrichiana* not scaberulous, and with a sparse line of pilose hairs running more or less the length of the leaf in *A. stricta* and sometimes in *A. beyrichiana*) and base (much more indurated and polished in *Sporobolus* than in *Aristida*).  [= FNA, K, Y; > *S. teretifolius* – RAB, misapplied; > *S. floridanus* – RAB, misapplied; < *S. floridanus* Chapman – HC, S]

*Sporobolus pyramidalis* Palisot de Beauvois, West Indian Dropseed.  Cp (FL): pine flatwoods, beaches; rare.  FL Panhandle ( Wakulla County), FL peninsula; West Indies.  The original distribution disputed, possible introduced.  [<*S. jacquemontii* Kunth – FNA; = *S. indicus* var. *pyramidalis* (Palisot de Beauvois) Veldkamp – K; ? *S. berteroanus* (Trinius) A.S. Hitchcock & Chase – S]

*Sporobolus teretifolius* R.M. Harper, Wireleaf Dropseed.  Cp (AL, GA, NC, SC): wet savannas, pitcherplant bogs; rare.  July-September (and later in response to growing-season fire).  Very similar vegetatively to *Aristida stricta*. *S. teretifolius* can be distinguished by its tuft of hairs at the base of the otherwise glabrous blade (as opposed to line of pilose hairs the length of the blade in *A. stricta*).  This very rare species is known only from se. NC, ne. SC, s. GA, and se. AL (Houston County).  Many of the counties reported for this species in RAB actually are based on misidentified specimens of *S. pinetorum*.  In a few very wet savannas of Columbus and Brunswick counties, NC, *S. teretifolius* is dominant or codominant over many hectares.  Like many savanna grasses, *S. teretifolius* generally flowers only following fire.  [= FNA, HC, K, S, Y; < *S. teretifolius* – RAB (also see *S. pinetorum*)]

*Sporobolus virginicus* (Linnaeus) Kunth, Seashore Dropseed, Coastal Dropseed.  Cp (FL, GA, NC, SC): salt marshes, tidal mud flats, and low dunes in the outer Coastal Plain; common (rare north of FL).  September-October.  Se. NC along the coast to TX, in the West Indies and into n. South America (its alleged occurrence in se. VA is apparently incorrect). *Sporobolus virginicus* is similar in aspect and growth form to *Distichlis spicata*, with which it occurs in tidal flats. *Sporobolus virginicus* is more delicate, and typically has long hairs on either side of the collar of the sheath; *Distichlis spicata* is generally a coarser plant, and lacks long hairs around the collar of the sheath.  [= RAB, C, F, FNA, G, WH, HC, K, S]

*Sporobolus compositus* (Poiret) Merritt var. *macer* (Trinius) Kartesz & Gandhi.  [= FNA]  [not yet keyed]

* Sporobolus diandrus* (Retzius) Palisot de Beauvois.  [= FNA]  [not yet keyed]

* Sporobolus fimbriatus* (Trinius) Nees.  Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, introduced from Africa.  [= FNA, HC, K]  [not keyed]

* Sporobolus flexuosus* (Thurb. ex Vasey) Rydberg.  Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, introduced from sw. United States and n. Mexico.  [= FNA, HC, K]  [not keyed]

* Sporobolus tenuissimus* (Martius ex Schrank) Kunze.  Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of the tropical Old World and New World.  [= FNA, K]  [not keyed]

* Sporobolus weightii* Munro ex Scribner, Giant Sacaton.  Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, introduced from sw. United States.  [= FNA, HC, K]  [not keyed]

**Steinchisma** Rafinesque 1830 (Gaping Panic Grass)

**Steinchisma hians** (Elliott) Nash, Gaping Panic Grass.  Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, WV*): stream, pond, and lake shores, low woods, cypress-gum ponds, floodplains, marshes, ditches, seepage slopes; common (uncommon in Coastal Plain, rare in Mountains).  May-October.  Se. VA south to FL, west to TX and OK, and south through Mexico and Central America to Colombia; also in s. South America.  The species occurs nearly throughout e. United States.  It has been interpreted as native or introduced in our area; its original range is probably now impossible to determine.  Sauer (1972) maps it as widespread along the coasts of s. North America, Central America, South America, the West Indies, Africa, Australia, and sw. Pacific Islands.  In our area it is certainly now more frequently encountered as a lawn or roadside grass than in anything that could be construed as a natural habitat.  The other 6 species in the genus are Asian, or on islands of the sw. Pacific or Indian Oceans.  [= RAB, FNA, HC, K, S, WH, Z]

**Stenotaphrum** Trinius 1820 (St. Augustine Grass)

A genus of about 7 species, tropical and subtropical.  References:  Allred in FNA (2003a); Sauer (1972)=Z.

**Stenotaphrum secundatum** (Walter) Kunze, St. Augustine Grass, Carpet Grass.  Cp (FL, GA, NC, SC, VA*): brackish marshes, roadides, lawns; common.  July-October.  A pioneer species of beaches and shores, *S. secundatum* was known from the Carolinas prior to 1800.  It has been interpreted as native or introduced in our area; its original range is probably now impossible to determine.  Sauer (1972) maps it as widespread along the coasts of s. North America, Central America, South America, the West Indies, Africa, Australia, and sw. Pacific Islands.  In our area it is certainly now more frequently encountered as a lawn or roadside grass than in anything that could be construed as a natural habitat.  The other 6 species in the genus are Asian, or on islands of the sw. Pacific or Indian Oceans.  [= RAB, FNA, HC, K, S, WH, Z]
**Thinopyrum** (Prat) Å. Löve 1980

1 Plants rhizomatous; lemmas 7.5-10 mm long; lateral veins slightly shorter than and less prominent than the midvein............ *Th. intermedium*
2 Plants cespitose; lemmas 9-12 mm long; lateral veins of the glumes about as long as and as prominent as the midvein............ *Th. ponticum*

**Thinopyrum intermedium** (Host) Barkworth & D.R. Dewey. Pd (GA): waif in railroad yards; rare, native of Europe and w. Asia. Tucker (1996) states that the record is as a waif in railroad yards. [= K, Z; > *Thinopyrum* spp. *intermedium* = FNA; = *Elytrigia intermedia* (Host) Nevski; = *Agropyron intermedium* (Host) Palisot de Beauvois – HC] {add to synonymy}

**Thinopyrum ponticum** (Podpéra) Barkworth & D.R. Dewey, Tall Wheatgrass. Cp (SC): waste areas near wool-combing mills; rare, native of Europe and w. Asia, not known to be established or persistent. [= FNA, K; ? *Agropyron elongatum* (Host) Palisot de Beauvois] {add to synonymy}

**Torreyochloa** G.L. Church 1949 (Pale Mannagrass)

A genus of 4 species, with a classic Tertiary moist temperate disjunct pattern; *Torreyochloa* is distributed in e. North America and e. Asia. References: Davis in FNA (2007a); Davis (1991)=Y; Tucker (1996)=Z.

1 Leaf blades 1-3 mm wide; anthers 0.2-0.5 mm long ................................................................................................................. *T. pallida var. fernaldii*
2 Leaf blades 4-8 mm wide; anthers ca. 1 mm long ................................................................................................................. *T. pallida var. pallida*

**Torreyochloa pallida** (Torrey) Church var. *pallida*, Pale Mannagrass. Mt (GA, NC, VA, WV), Cp (DE, NC, VA), Pd (SC, VA): bogs, mucky wetlands such as old beaver-ponds, pools in cypress swamps, drawdown shores of natural ponds; common (rare in GA, NC, SC, VA, and WV). June-July. The species as a whole is widespread in e. North America. Var. *pallida* ranges from NS west to MN, south to e. VA, se. NC (Columbus County), nw. NC (Avery County), and nw. GA (Jones & Coile 1988). Var. *paniciflora* (J. Presl) J.J. Davis is distributed in w. North America. Intermediates occur between the varieties. [= FNA, K, Y, Z; < *Glyceria pallida* (Torrey) Trinius – RAB, GW, HC, W; < *Puccinellia pallida* (Torrey) Clausen – C; = *G. pallida* – F, WV; = *G. pallida var. pallida* – G; = *Panicaria pallida* (Torrey) Kuntze – S]

**Tragus** Haller 1768 (Burggrass)

* Tragus *racemosus* (Linnaeus) Allioni, Stalked Burggrass, Texas Burggrass. Mt (VA), Cp (NC): roadsides, disturbed areas, on ballast near old seaports; rare, native of Mediterranean Europe and w. Asia. [= HC, C, F, FNA, G, K; = *Nazia racemosa* (Linnaeus) Kuntze – S] {not keyed}

* Tragus *australianus* S.T. Blake, Australian Burggrass. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of Australia. [= FNA, K] {not keyed}

* Tragus *benteronianus* J.A. Schultes, Spiked Burggrass. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of Africa and Asia. Also reported from chrome ore piles at Newport News, VA. [= FNA, K] {not keyed}

* Tragus *heptaneuron* W.D. Clayton. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of tropical Africa. [= FNA, K] {not keyed}

**Tridens** Roemer & J.A. Schultes 1817 (Triodia, Redtop, Tridens, Fluffgrass)

1 Panicle dense and spike-like, > 4× as long as wide, the branches ascending to appressed.
2 Plants from elongate rhizomes; lemma 4-5 mm long; spikelet 7-9 mm long.................................................................................... *T. carolinianus*
3 Plants cespitose; lemma 2.5-3 mm long; spikelet 4-6 mm long ........................................................................................................ *T. strictus*
1 Panicle open and spreading, < 4× as long as wide, the branches well-developed and spreading-ascending to reflexed.
3 Spikelets 4-5 mm long; 2.5-3.5 mm wide .................................................................................................................. *T. ambiguus*
4 Spikelets 6-8 mm long; 1.5-2.2 mm wide.
4 Primary pulvini densely pubescent, the hairs encircling the base of the panicule branch; secondary pulvini pubescent; spikelets mostly on pedicels 3-20 mm long; main branches of the inflorescence stiffly spreading ........................................................................ *T. chapmanii*
3 Primary pulvini glabrous to sparsely pubescent, tufted only in the axil (the upper surface of the panicule branch); secondary pulvini glabrous; spikelets on pedicels mostly < 3 mm long; main branches of the inflorescence spreading, ascending or drooping............ *T. flavus*
**Triplasis** Palisot de Beauvois 1812 (Sandgrass)

**Identification notes:** The foliage of both of our species has a sour taste.

1. Lemma awn 4.5-8 mm long; culm internodes appressed pilose or puberulent; perennial..........................*T. americana*
2. Lemma awn 0.5-1.5 mm long; culm internodes glabrous to minutely scaberulous; annual (or rarely perennial)......*T. purpurea* var. purpurea

**Triplasis americana** Palisot de Beauvois, Southern Sandgrass. Cp (FL, GA, NC, SC): open sandy areas; common. August-October. A Southeastern Coastal Plain endemic: NC south to s. FL, west to e. LA. [RAB, FNA, HC, K, S]

**Triplasis purpurea** (Walter) Chapman var. *purpurea*, Purple Sandgrass. Cp (DE, FL, GA, NC, SC, VA): dunes, maritime dry grasslands, open sandy areas; common. September-October. NH south to s. FL, and west to TX, along the coast; also around the Great Lakes, and in central United States. Var. *caribensis* R.W. Pohl is in the New World tropics. [FNA; < *T. purpurea* var. purpurea – RAB, C, F, G, HC, K; > *T. intermedia* Nash – S; > *T. purpurea* – S]

**Trisetum** Linnaeus 1759 (Gama Grass)

A genus of about 12 species, tropical and subtropical American. References: Barkworth in FNA (2003a); DeWet, Harlan, & Brink (1982)=Z.

**Trisetum dactyloides** (Linnaeus) Linnaeus var. *dactyloides*, Gama Grass. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA< WV), Cp (DE, FL, GA, NC, SC, VA): road sides, moist areas, disturbed areas, moist riverbanks; common (un common in VA, rare in WV). Late May-November. *T. dactyloides* is widespread in e. North America north to MA, MI, IA, and NE, ranging south into tropical Central and South America; var. *dactyloides* is North American. This important species of moist and wetland areas in the Great Plains is generally seen in disturbed habitats in our area; its original habitats in our area (if indeed it was native in the flora area) are poorly understood. [FNA, Z; < *T. dactyloides* var. occidentale* – RAB, C, G, HC, K; > *T. intermedia* Nash – S; > *T. purpurea* – S]

**Trisetum** Persoon 1805 (Oat-grass)

A genus of about 75–85 species, north and south temperate. References: Rumely in FNA (2007a); Randall & Hili (1986)=Z; Tucker (1996)=Y. [also see *Sphenopholis*]

**Trisetum spicatum** (Linnaeus) K. Richter, Alpine Oat-grass, Spike Trisetum. Mt (NC, VA): mountain cliffs at high elevations on metabasalt; rare. June-August. A circumboreal species, widespread and common in arctic and alpine areas, south in e. North America to New England, NY, and, rarely, PA, and disjunct to Hawksbill Mountain, Page County, VA (where extant) and Roan Mountain, Mitchell County, NC (where not seen since the nineteenth century). The species is also known from the West Indies, Mexico, and s. South America. *T. spicatum*, as broadly treated here, following Randall & Hili (1986), is polymorphic and consists of several ploidies. [C, FNA, HC, K, S, Y, Z; > *T. spicatum* var. *mollis* (Michaux) Beal – RAB, F, G; > *T. triflorum* (Bigelow) Löve & Löve ssp. *molle* (Michaux) Löve & Löve – W; > *T. spicatum* var. *maidenii* (Gandoger) Fernald – F]

**Triticum** Linnaeus 1753 (Wheat)

* * Triticum aestivum * Linnaeus, Bread Wheat. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields; frequently cultivated, rarely persistent or volunteering following cultivation, native of Eurasia. May-June. One of the most important crops in the world. The lemmas can either be awnless or with long awns (to 8 cm long). [FAB, C, F, FNA, G, HC, K, WH, Z]

**Uniola** Linnaeus 1753 (Sea Oats)

A genus of 2 species. The only other species of the genus ranges from Baja California south along the Pacific Ocean to Ecuador; other species previously treated in *Uniola* have been shown to be only distantly related and are now treated as *Chasmanthium*. References: Yates in FNA (2003a); Yates (1966a, 1966b)=Z. [also see *Chasmanthium*]

* * Uniola paniculata * Linnaeus, Sea Oats. Cp (DE*, FL, GA, NC, SC, VA): abundant on unforested primary and secondary dunes on barrier islands, and on dry to mesic sand flats and interdune swales; common (rare in DE and VA). June-November. Se. VA south to FL and west to TX and Mexico; West Indies. This is the most important sand-binding grass on ocean dunes from NC south, playing a critical role in primary succession on dunes. It is against the law in NC to pick or destroy *Uniola paniculata*. [FAB, C, F, FNA, G, HC, K, S, WH, Z]

**Urochloa** Palisot de Beauvois 1812 (Para-grass, Signal-grass)

1 Spikelets suffused with purple, borne in pairs (or threes) in each row .......................................................... *U. mutica*
2 Spikelets green, borne singly in each row.
   1 Upper half of second glume and first lemma with evident transverse veins connecting the longitudinal veins; spikelets 3.5-4.7 mm long........*U. platyphylla*
   2 Upper half of second glume and first lemma without evident transverse veins, or with very obscure cross-veins; spikelets either 2-4 mm or 5-6 mm long.
   3 Spikelets 2-4 mm long ............................................................................................................ *U. ramosa*  
   3 Spikelets 5-6 mm long ............................................................................................................ *U. texana*

* * Urochloa mutica * (Forskål) Nguyen, Para-grass. Cp (SC): margin of pond; rare, native of Africa. August. [FNA, K, Z; * Panicum purpurascens * Raddi – RAB, HC; * B. purpurascens * (Raddi) Henard – GW; = Brachiaria mutica (Forskål) Stapf]
* * Urochloa platyphylla * (Munro ex Wright) R. Webster, Broadleaf Signal-grass. Cp (FL, GA, NC, SC, VA), Pd (GA, SC, NC, VA), Mt (VA): disturbed wet or seasonally moist areas; rare, apparently native of South America. E. NC south to FL, west to TX, north in the interior to AR, OK, and se. MO; also in MD (Terrell & Reveal 1996). [FNA, K, Y, Z; = Brachiaria platyphylla (Munro ex Wright) Nash – RAB, GW, HC; B. extensa (Chase) S]
* * Urochloa ramosa * (Linnaeus) Nguyen, Broadnoot Millet, Dixie Signalgrass. Pd (GA, SC, NC, VA), Cp (FL, GA, NC, SC, VA): disturbed areas; rare, native of tropical Africa and Asia. This species has apparently been widely planted for wildlife food and erosion control in southeastern states. [FNA, K, Y, Z; = Panicum ramosum Linnaeus – HC; = Brachiaria ramosa (Linnaeus) Stapf]
* * Urochloa texana * (Buckley) R. Webster, Texas Millet, Texas Signalgrass. Cp (FL, GA, NC, SC, VA), Pd (GA, SC, NC, VA), Mt (GA, NC, SC, VA): disturbed areas, fields, gardens; uncommon (rare in VA), native of TX. First reported for South Carolina by Hill & Horn (1997). [K, Y, Z; = Panicum texanum Buckley – RAB, C, HC, S; = Brachiaria texana (Buckley) S.T. Blake]

* * Urochloa aderspa * (Trinius) R. Webster. Cp (FL): moist, sunny, disturbed areas; rare, apparently native of s. FL, the West Indies, and Argentina. Reported from AL, FL peninsula and Panhandle (FNA), and chrome ore piles in Newport News, VA (Reed 1964). [FNA, K] [not keyed; add to synonymy]

* * Urochloa fusca * (Swartz) B.F. Hansen & Wunderlin var. * reticulata * (Torrey) B.F. Hansen & Wunderlin, east to GA (Kartesz 1999). [FNA, K, Y, Z; = Urochloa fasciculata (Sw.) R. Webster – K; = Panicum fasciculatum Swartz – HC] [not yet keyed; synonymy incomplete]

* * Urochloa piligera * (Muell. ex Bentham) R.D. Webster. Cp (FL): roadsides; rare, native of Australia. Reported for Escambia County in the FL Panhandle (Kunzer et al. 2009). [WH] [not yet keyed; synonymy incomplete]
* * Urochloa plantaginea * (Link) R. Webster. Cp (FL, GA): Reported for s. GA (Jones & Coile 1988), as Brachiaria plantaginea, and for Escambia County in the FL Panhandle (Kunzer et al. 2009). [FNA, K, Y, Z; = Brachiaria plantaginea (Link) A.S. Hitchcock] [not yet keyed; synonymy incomplete]

* * Urochloa repta * (Linnaeus) Stapf. Cp (GA): [FNA, K] [not yet keyed; synonymy incomplete]

* * Urochloa villosa * (Lamarck) Nguyen, Hairy Signalgrass. Reported from chrome ore piles in Newport News, VA (Reed 1964); native of tropical Asia and Africa. [FNA, K] [not keyed; add to synonymy]

**Vulpia** C.C. Gmelin 1805 (Annual Fescue)
POACEAE

A genus of about 30 species, north and south temperate. References: Lonard in FNA (2007a); Tucker (1996)=Z. Key based in part on C.

1 First glume < ½ as long as the second glume ...................................................... V. myuros
1 First glume > ½ as long as the second glume.
2 Lemma pubescent; lowest lemma 2.5-3.5 mm long; grains 1.5-2 mm long ......................................................... V. sciurea
2 Lemma glabrous or scabrous; lowest lemma 2.7-7 mm long; grains 1.7-3.3 mm long.
3 First glume 1.7-4.5 mm long; lemma awns 3-12 mm long; spikelets with 4-7 loosely imbricate florets; rachilla internodes mostly 0.9-1.1 mm long. ......................................................... V. bromoides
3 First glume 3.5-5 mm long; lemma awns 0.3-6 (-9) mm long; spikelets with 5-11 (-more) closely imbricate florets; rachilla internodes mostly 0.5-0.7 mm long.
4 Spikelets 4-5.5 (-6.5) mm long; awn of the lowest lemma 0.3-3 mm long ........................................ V. octoflora var. glauca
4 Spikelets 5.5-10 (-13) mm long; awn of the lowest lemma 3-9 mm long ........................................ V. octoflora var. octoflora

Vulpia octoflora (Walter) Rydberg var. glauca (Nuttall) Fernald, Northern Six-weeks Fescue. Mt (WV), Cp (DE), Pd (DE), {Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA)}: fields, roadsides, disturbed areas; common (in FL and WV), native of Eurasia. May-June. [= C, FNA, K, Z; = Festuca octoflora Linnaeus – RAB, G, HC, S, W, WV]

Vulpia octoflora (Walter) Rydberg var. aristulata (Torrey ex L.H. Dewey – G; = Festuca octoflora var. aristulata – Z)

Vulpia octoflora, Southern Six-weeks Fescue. Mt (WV), Cp (DE), {Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA)}: fields, roadsides, disturbed areas; common (in FL, WV), rare in WV. April-June. S. ME west to NC, south to GA, AR, TX, and CA. [= C, FNA, K; < Festuca octoflora Walter – RAB, GW, S, W, WV; = Vulpia octoflora var. tenella (Willdenow) Fernald – F; = Festuca octoflora Walter var. tenella (Willdenow) Fernald – G, HC; < Vulpia octoflora – Z]

Zea Linnaeus 1753 (Corn, Maize)

1 Pistillate spikelets (kernels) borne on a spongy rachis (cob) in rows ...................................................... Z. mays ssp. mays
1 Pistillate spikelets embedded in a hardened rachis.
2 Annual............................................................ [Z. mays ssp. mexicana]
2 Perennial from creeping rhizomes ........................................................................................................ Z. perennis

* Zea mays Linnaeus ssp. mays, Corn, Maize. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): very commonly cultivated, rarely volunteering in old fields or around trashpiles; common in cultivation, rare as a short-lived escape. June-October. Zea is one of the most important cultivated plants in the world, originating in Mexico, probably from Zea mays ssp. parviglumis Iltis & Doebly. It was initially cultivated in sw. Mexico (before 8000 BP), spreading to the sw. United States before 5000 BP, and to the e. United States by 2000 years BP. At the time of European contact, Zea mays ssp. mays was an important staple crop from s. Canada south to s. South America (Hancock 2004). [= FNA, K; < Z. mays – RAB, F, HC, S]

* Zea perennis (A.S. Hitchcock) Reeves & Manglesdorf, Mexican Teosinte. Cp (SC): disturbed areas; rare, apparently established at least formerly. Z. perennis was considered by HC to be "established on James Island, S.C." [= K; = Euchlaena perennis A.S. Hitchcock – HC]

* Zea mays (Schrader) Kuntze ssp. mexicana (Schrader) H.H. Iltis, Chalco Teosinte, Nobogame Teosinte. Reported for AL (Kartesz 1999) and FL (Hansen & Wunderlin 2006). HC state that this taxon is "occasionally cultivated in the Southern States for green forage" and is similar to Z. perennis, except in being, like Z. mays ssp. mays, a coarse annual. It is considered to be an ancestor of Zea mays. [= FNA; = Z. mexicana (Schrader) Kuntze – K; = Euchlaena mexicana Schrader – HC, S]

Zizania Linnaeus 1753 (Wild-rice)

1 Lemmas of the pistillate spikelets flexible and chartaceous, dull, bearing short scattered hairs, these not or only slightly more dense toward the tip ...................................................... Z. aquatica var. aquatica
1 Lemmas of the pistillate spikelets stiff and coriaceous, lustrous, glabrous with lines of short hairs, the tips usually more hairy ................. Z. palustris var. palustris
**Zizania aquatica** Linnaeus var. *aquatica*, Southern Wild-rice. Cp (DE, FL, GA, NC, SC, VA), Pd (DE): freshwater marshes, usually tidal; common (uncommon in NC, rare in Piedmont). May-October. Var. *aquatica* ranges from ME west to WI, south to FL and LA; var. *brevis* Fassett is restricted to the St. Lawrence River in QC. *Zizania* was formerly an important food for Amerindians; it is now gathered as a specialty grain, commanding high prices. [= C, F, FNA, G, HC, K, X, Y, Z; < Z. *aquatica* – RAB, GW, S]

**Zizaniopsis** Döll & Ascherson 1871 (Giant Cutgrass)

**Identification notes**: Superficially similar to *Zizania* in its habitat and large size, *Zizaniopsis* may be distinguished by its very different inflorescence and by its stout horizontal rhizomes (*Zizania* is annual or perennial, but not rhizomatous).

**Zizaniopsis miliacea** (Michaux) Döll & Ascherson, Giant Cutgrass, Southern Wild-rice, Water-millet. Cp: brackish and freshwater marshes; common. May-July. MD south to FL, west to TX, north in the interior to MO, and disjunct in w. Mexico. The other species of the genus are South American. [= RAB, C, F, FNA, G, GW, HC, K, S, Y, Z; = Zizania *miliacea* Michaux]

**Zoysia** Willdenow 1801 (Zoysia, Temple-grass)

A genus of about 11 species, perennials, of tropical, subtropical, and temperate Asia. References: Anderson in FNA (2003a). Key closely following FNA.

1 Leaves < 0.5 mm wide; racemes with 3-12 spikelets; peduncles included to extending < 1 cm beyond the sheaths of the flag leaves .........................

.................................................................................................................................................................................................................................................................................................................................................

1 Leaves 0.5-5 mm wide; racemes with 10-50 spikelets; peduncles extending (0.3-) 1-6.5 cm beyond the sheaths of the flag leaves.

2 Pedicels 1.6-3.5 mm long; spikelets ovate, 1.1-1.4 mm wide; culm internodes 2-10 mm long; blades ascending..............................

Z. *japonica*

2 Pedicels 0.6-1.6 mm long; spikelets lanceolate, 0.6-1.0 mm wide; culm internodes 5-40 mm long, all plants with at least some internodes > 14 mm long; blades spreading at nearly 90 degree angles .................................................................................................................................

Z. *matrella*

* Zoysia *japonica* Steudel, Japanese Lawngrass, Korean Lawngrass, Zoysia. Cp (AL, LA), Mt (WV): used as a lawngrass, persisting or spreading; rare, native of Japan. Reported for VA (Kartesz 1999). [= C, FNA, HC, K]

* Zoysia *matrella* (Linnaeus) Merrill, Zoysia, Manila Temple-grass. Cp (AL, FL), Pd (GA): used as a lawngrass, persisting or spreading; rare, native of the Philippines. [= FNA, HC, K; = Z. *matrella* var. *matrella* – K]

* Zoysia *pacific* (Goudswaard) M. Hotta & Kuroki, Mascarene-grass, Korean Velvetgrass. Cp (LA), Mt (WV): used as a lawngrass, persisting or spreading; rare, native of e. Asia. [= FNA; ? Z. *tenuifolia* Willdenow – HC; > Z. *tenuifolia* Willdenow – K; > Z. *matrella* var. *pacific* Goudswaard – K]
SECTION 6: EUDICOTYLEDONAE (EUDICOTS)

107. CERATOPHYLLACEAE S.F. Gray 1821 (Hornwort Family) [in CERATOPHYLLALES]

*Ceratophyllum* Linnaeus 1753 (Hornwort, Coontail)

**Identification notes:** *Ceratophyllum* is sometimes mistaken for other, superficially somewhat similar aquatics, such as *Cabomba* (Cabombaceae), *Utricularia* (Lentibulariaceae), and *Myriophyllum* (Haloragaceae). *Cabomba* has the leaves opposite (rather than whorled), dichotomously divided (like *Ceratophyllum*), but the divisions lacking the marginal denticles of *Ceratophyllum*, and on a 1-3 cm long petiole (vs. sessile or on a petiole 0-2 mm long). *Utricularia* has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. *Myriophyllum* has the leaves pinnately rather than dichotomously divided.

1. Largest leaves forking 1-2× (count branching-nodes from the base of the leaf to the tip of the most-forked division); leaves coarse-textured, stiff, the marginal denticles usually strongly raised on a broad base of green tissue; achene margin wingless, with 2 basal spines or tubercles (these rarely absent), otherwise entire (lacking marginal spines) .........................................................*

2. Largest leaves forking 3-4× (count branching nodes from the base of the leaf to the tip of the most-forked division); leaves fine-textured, flaccid, the marginal denticles not raised on a broad base of green tissue, sometimes obscure or obsolete; achene margin winged, with 2-20 lateral spines 0.1-6.5 mm long (occasionally spineless), with 2 basal spines (these rarely absent).

2. Achene body (excluding the spines) 3-4.5 mm long; first leaves of the plumule simple; [Coastal Plain, NC southward] ..........*

2. Achene body (excluding the spines) 4.5-6 mm long; first leaves of the plumule forked; [widespread] ........................................

*Ceratophyllum australe* Griseb. Ponds, pools, slow-moving streams. May-September. Se. NC south to s. FL and Panhandle FL, and in the West Indies; also in s. Mexico, Central America, n. South America, with apparent disjunctions in c. South America and the Galapagos Islands. Les treats this taxon as a subspecies of the Old World *C. muricatum*. Because of their allopatic distribution on separate continents and relative morphological distinctiveness (as shown by Les), I prefer to recognize them at the species level. [= *Ceratophyllum muricatum* Chamisso ssp. *australe* (Grisebach) Les – FNA, K, Z; *C. muricatum* Chamisso – GW (also see *C. echinatum*)]

*Ceratophyllum demersum* Linnaeus, Coontail. Ponds, pools, slow-moving streams. May-September. NL (Newfoundland) west to AK, south to s. FL, TX, CA, and south through the West Indies and Central America to South America. [= RAB, C, F, FNA, G, GW, K, W, S, Z]

*Ceratophyllum echinatum* A. Gray in Torrey & A. Gray. Ponds, pools, slow-moving streams. May-September. NL (Newfoundland) west to ON and n. MN, south to c. peninsular FL and e. TX; also in BC, WA, and OR. [= RAB, C, F, FNA, G, K, S, Z; *C. muricatum* Chamisso – GW (also see *C. australe*); *C. submersum* Linnaeus var. *echinatum* (A. Gray) Wilmot-Dear]

109a. FUMARIACEAE A.P. de Candolle 1821 (Fumitory Family) [in RANUNCULALES]

This family includes 15-20 genera and 500-600 species, herbs, mostly north temperate. The Fumariaceae are often now subsumed into the Papaveraceae (Lidén 1981, 1986; Lidén et al. 1997; Judd, Sanders, & Donoghue 1994), but the option remains to recognize the two monophyletic clades as families: Papaveraceae s.s. and Fumaricaceae (including Pteridophyllum and Hypecoum). References: Wang et al. (2009); Stern in FNA (1997); Hill (1992); Lidén (1986, 1981); Lidén et al. (1997); Lidén in Kubitzki, Rohwer, & Bittrich (1993).

1. Corolla with the 2 outer petals spurred or saccate at their bases; [tribe Corydaleae].

2. Ultimate leaf segments 1-4 mm wide; plants with basal leaves only .................................................................*

2. Ultimate leaf segments 5-70 mm wide; plants of reproductive age with cauline leaves.

3. Ultimate leaf segments 5-10 mm wide; herbaceous vine with cauline leaves (acauluscent in its first year, and appearing to be an herb); [native] .................................................................*

3. Ultimate leaf segments 20-70 mm wide; herb with basal and cauline leaves; [alien, cultivated and rarely persistent or naturalized] ......

1. Corolla with only 1 outer petal spurred or saccate at its base.

4. Ovary and fruit subglobose, with 1 seed; [tribe Fumariaceae] .................................................................*

4. Ovary and fruit elongate, with several to many seeds; [tribe Corydaleae].

5. Flowers pink, the petals tipped with yellow; biennial; stem erect, 3-8 (-10) dm tall; capsules erect, 25-35 mm long ..........*

5. Flowers yellow; annual; stem erect, decumbent, or prostrate, 1-3 (-4) dm tall; capsules erect, ascending, divergent, or pendent, 10-20 (-25) mm long .................................................................*

*Adlumia* Rafinesque ex A.P. de Candolle 1821 (Climbing Fumitory)

*Corydalis* P. Miller 1805 (Corydalis)

A genus of about 400 species, herbs, of temperate regions of the Northern Hemisphere (especially China and the Himalayas). References: Stern in FNA (1997); Ownbey (1947) = Z; Lidén in Kubitzki, Rohwer, & Bittrich (1993). [also see *Capnoides*]

1 Fruits pendent or divergent; spurred petal 7-9 mm long; pedicels 6-15 mm long; seeds 2-2.5 mm wide, with a narrow, acute ring-margin ........................................... *Corydalis aurea* (Aiton) Greene ex Britton, Sterns, & Poggenburg, Alleghaney-vine, Cliff-Harlequin, Climbing Fumitory. Cliffs, talus, rocky slopes, rich stream-bottom forests, cool rocky forests. June-September. QC west to WI and MN, south to n. DE, w. NC, TN, and IN. [= RAB, C, F, FNA, G, K, S, W] 

2 Capsules mostly 15-20 mm long, ca. 1.0 mm in diameter, strongly constricted between the seeds at maturity; inflorescence long, usually far exceeding the poorly-developed upper leaves; ultimate leaf segments 0.5-1.5 (-3.0) mm wide; seeds < 1.5 mm wide; plant slightly to strongly glaucous; [of sandy soils of the outer Coastal Plain] ......................................................... *Corydalis micrantha* (Linnaeus) Persoon – RAB, C, F, FNA, G, K, W, WV, Z

2 Capsules mostly 10-15 mm long, 1.5-2.0 mm in diameter, slightly or not at all constricted between the seeds at maturity; inflorescence relatively short, barely (if at all) overtopping the upper leaves; ultimate leaf segments 1.0-2.0 (-4.0) mm wide; seeds > 1.5 mm wide; plant green to slightly glaucous; [of circumneutral rock outcrops of the upper Piedmont and Mountains] ............................................. *Corydalis halei* (Rafinesque) A. P. de Candolle – S

*Corydalis aurea* Willdenow. Reported as occurring as far south and east as MD, WV (?), and PA (Kartesz 1999, Kartesz 2010). No definitive documentation is known for this species in our area. [= G, K; = *Corydalis aurea* var. aurea – C; F; = *Corydalis aurea* ssp. aurea – FNA; = *Capnoides aureum* (Willdenow) Kuntze – S] [not keyed; not mapped; rejected as a component of our flora] 

*Corydalis cristallina* Engelmann. A species of the sc. United States, *C. crystallina* was collected in 1930 from an oat field at the Georgia Experiment Station in Laurens County. Presumably it was a one-time contaminant in seed and is a waif. Not considered a component of the flora of our area. [= FNA, F, G, K] [not keyed; not mapped; rejected as a component of our flora]

*Corydalis flava* (Rafinesque) A. P. de Candolle, Short-spurred Corydalis. Rich moist forests, especially alluvial forests, glades and outcrops over mafic rocks (such as greenstone). March-April; May-June. S. CT, NY, and s. ON west to SD, south to NC, AL, LA, and OK. [= RAB, C, F, FNA, G, K, W, WV, Z; = *Capnoides flavulum* (Rafinesque) Kuntze – S]

*Corydalis micrantha* (Small) Fernald & Schubert, Short-spurred Corydalis. Sandy roadsides and disturbed areas. March-April; May-June. N.C. south to FL, west to TX, and inland north to MO and OK. F and S recognized it as a species distinct from *C. micrantha*; Ownbey reduced it to a subspecies, citing inadequate morphological differences and some alleged intermediates in OK and MO. The two taxa appear readily separable on morphological, ecological, and geographical grounds; species status seems warranted. [= F; = *Corydalis micrantha* (Engelmann ex A. Gray) A. Gray var. *australis* (Chapman) G. B. Ownbey – RAB, FNA, K, Z; = *Corydalis micrantha* (Engelmann ex A. Gray) A. Gray var. *australis* (Chapman) Shinners – C; < *Corydalis micrantha* – G; = *Capnoides halei* Small – S]

*Corydalis micrantha* (Engelmann ex A. Gray) A. Gray, Slender Corydalis. Circumneutral rock outcrops and adjacent glades and woodlands. April, June. *C. micrantha* (in the narrow sense) is primarily midwestern, ranging from IL, WI, MN, and SD south to AR, TX, and OK, with disjunct outliers in e. TN and w. NC. Ownbey (1947) had no records of Southern Appalachian populations of *C. micrantha*, and considered “ssp. micrantha” to range no further east than IL and MO; RAB included montane populations in ssp. *australis*, stating "this is the only [subspecies] in our range.” Morphologically, however, these populations closely resemble *C. micrantha*; their association in the Brushy Mountains with other species disjunct from western or prairie ranges (*Anemone berlandieri*, *Arabis pycnocarpa*, *Pellaea wrightiana*) provides phytogeographic corroboration. [= F; = *Corydalis micrantha* ssp. micrantha – FNA, K, Z; = *Corydalis micrantha* var. micrantha – C; < *Corydalis micrantha* – G; = *Capnoides micranthum* (Engelmann ex A. Gray) Britton – S]

*Capnoides* P. Miller 1754 (Rock Harlequin)

*Capnoides semprevirens* (Linnaeus) Borkhausen, Rock Harlequin, Tall Corydalis, Pink Corydalis, Pale Corydalis. Rock outcrops, especially granitic exfoliation domes, but also quartzite, greenstone, and sandstone. April-August; May-July. NL (Newfoundland) west to AK, south to NJ, PA, in and near the mountains to ne. GA, n. OH, n. IN, MN, MT, and BC. [= S; = *Corydalis semprevirens* (Linnaeus) Persoon – RAB, C, F, FNA, G, K, W, WV, Z]
Dicentra Bernhardi 1833

1 Flowers pink, in panicles; rootstock lacking bulblets; ultimate leaf segments generally 3-parted, each part 2-5 mm wide at base, gradually tapering to the tip.
2 Reflexed portions of the outer sepals 4-8 mm long; [native and cultivated] .......................................................................................... D. eximia
3 Flowers white or yellowish (very rarely pinkish), in racemes; rootstock with bulblets; ultimate leaf segments not generally 3-parted, about 1 (-3) mm wide, with parallel sides for most of their length, then tapering suddenly to the tip.

Fumaria Linnaeus 1753 (Fumitory)

1 Corolla (9-) 10-14 mm long, creamy white (to reddish); fruiting pedicels deflected downwards; fruit smooth when dry .................. F. capreolata
2 Corolla 4-8 (-9) mm long, white to pink or purple; fruiting pedicels ascending; fruit rugose or verrucose when dry.
3 Corolla (6-) 7-8 (-9) mm long, dark pink to purple; raceme borne on a peduncle ..........................................................................

Lamprocapnos Endlicher 1850 (Asian Bleeding Heart)

A monotypic genus, a perennial herb of e. Asia. References: Lidén et al. (1997); Stern (1961)=Z.

Identification notes: Lamprocapnos differs from other "bleeding hearts" (the native Dicentra eximia and the western American Dicentra formosa ssp. formosa) in its leafy stem, the inflorescence borne terminally or opposite a leaf, the leaves much less finely divided, and the flowers about as broad as long (vs. much longer than broad in Dicentra eximia and Dicentra formosa).

* Lamprocapnos spectabilis (Linnaeus) Fukuhara, Bleeding Heart, native to e. Siberia, Korea, and n. China, is frequently cultivated and may persist or weakly naturalize. It is reported for KY (Kartesz 1999, Kartesz 2010) and various ne. United States. [= K; = Dicentra spectabilis (Linnaeus) Lemaire – Z]
A family of 23 genera and about 230 species, mainly herbs (some shrubs and small trees), largely north temperate in distribution. References: Kiger in FNA (1997); Wang et al. (2009); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

1. **Argemone** Linnaeus 1753 (Prickly-poppy)

1. Flowers white to pink; latex white or nearly clear .......................... 5. *Sanguinaria*
2. Flowers yellow to cream; latex yellow .......................................................... 4. *Macleaya*

**Argemone albiflora** Hornemann var. *albiflora*, Carolina-poppy, White Prickly-poppy. Sandy roadsides and disturbed areas. April-May (sporadically later). This species is apparently native to the southeastern United States, presumably including portions of our area, south to s. FL, but the native range is unclear. *Var. texana* (G.B. Ownbey) Shinners occurs in TX, AR, and LA. The species’ weediness suggests, however, that it may be merely adventive in our area. [= *A. albiflora ssp. albiflora* – FNA, K; < *A. albiflora* – RAB, C, WH; < *A. alba* Lestib. f. – G, S, misapplied]*

2. **Papaver** Linnaeus 1753 (Poppy)

**Identification notes:** Other species are cultivated and may be found in our area persistent, escaped, as waifs, or as naturalized populations.

1. Upper cauline leaves not clasping the stem; [section *Papaver]* ................................................................................................. *P. somniferum*
2. Upper cauline leaves clasping the stem.  
3. Capsules oblong to clavate, sparsely setose-pubescent; [section *Argemoneidium*].  
4. Capsules obovoid-ellipsoid to subglobose, densely setose with strong hairs .............................................................................. *P. argemone*
5. Ovaries and capsules glabrous.  
6. Flowers > 10 cm across; perennial; [section *Macrantha*] ............................................................................................................. *P. orientale*
7. Flowers < 10 cm across; annual; [section *Rhoeodium*].  
8. Capsule 2-3× as long as broad, stigmatic lobes 5-9 .................................................................................................................. *P. dubium*
9. Capsule 1-1.5× as long as broad; stigmatic lobes 8-15 .................................................................................................................. *P. rhoesu*
* **Papaver argemone** Linnaeus, Prickly Poppy. Disturbed areas; native of Europe and sw. Asia. Reported from PA (Rhoads & Klein 1993, Kiger & Murray in FNA 1997), VA (probably only from cultivation), and MD (Kiger & Murray in FNA 1997). [= FNA]
* **Papaver hybridum** Linnaeus, Rough Poppy. Disturbed areas; native of Eurasia. May-June. [= RAB, FNA, K, Z]

**3. Glaucium P. Miller 1754 (Horned-poppy)**

A genus of about 23 species, annual and perennial herbs, of temperate Europe and w. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993). Key based on FNA.

1 Basal leaves few, glabrate to moderately pubescent; blades of distal leaves not distinctly clasping stem; petals orange to reddish orange, usually with blackish basal spot; capsules straight to slightly curved, pubescent or glabrate ......................................................

**4. Macleaya R. Brown 1826 (Plume-poppy)**

**5. Sanguinaria Linnaeus 1753 (Bloodroot)**

*Sanguinaria canadensis* Linnaeus, Bloodroot, Red Puccoon. Moist nutrient-rich forests. March-April; April-May. NS west to MN and MB, south to Panhandle FL and OK. Fernald recognizes two varieties – var. *rotundifolia*, more southern and the primary form in our area, is considered to have leaves less lobed than the more northern var. *canadensis*; leaf shape variability within populations makes it impractical to recognize infraspecific taxa. [= RAB, C, FNA, G, K, S, W; > S. canadensis var. *canadensis* – F; > S. canadensis var. *rotundifolia* (Greene) Fedde – F]

**6. Chelidonium Linnaeus 1753 (Greater-celandine)**

7. *Stylophorum* Nuttall 1818 (Celandine-poppy)

*Stylophorum diphyllum* (Michaux) Nuttall, Celandine-poppy, Woods-poppy. Moist forests over calcareous rocks (such as limestone). March-April. S. QU, w. PA, s. MI, and WI, south to sw. VA, e. TN, nw. GA, sc. TN, and AR; introduced elsewhere from horticultural use. [= C, F, FNA, G, K, S, W, WV]

8. *Eschscholzia* Chamisso 1820 (California-poppy)

* Eschscholzia californica* Chamisso ssp. californica, California-poppy. Roadsides, disturbed areas; native of w. North America. May-August. [= FNA, K; < Eschscholtzia californica – RAB, F, orthographic variant]

111. *LARDIZABALACEAE* Decaisne 1839 (Lardizaba Family) [in RANUNCULACEAE]

A family of about 8 genera and 35 species, shrubs and vines, primarily Asian, but also in s. South America. References: Thieret & Kartesz in FNA (1997); Wang et al. (2009); Cheng-Yih & Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

*Akebia* Decaisne 1837 (Akebia)

* Akebia quinata* (Houttuyn) Decaisne, Five-leaf, Five-leaf Akebia, Chocolate-vine. Escaped from cultivation to roadbanks, suburban woodlands, and floodplains; native of Japan, China, and Korea, potentially invasive and difficult to eradicate. April-June; June-July. [= RAB, C, F, FNA, K]

112. *MENISPERMACEAE* A.L. de Jussieu 1789 (Moonseed Family) [in RANUNCULACEAE]

A family of about 72 genera and 450 species, vines, shrubs, trees, and herbs, ot tropical, subtropical, and warm temperate areas. References: Rhodes in FNA (1997); Wang et al. (2009); Hoot et al. (2009); Kessler in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves asymmetrically peltate (the stem attached 1-5 mm in from the leaf margin); stamens 12-24; petals 6-9; fruit bluish-black; [tribe Menispermeae] ...................................................................................................................................................................................

1 Leaves not peltate, usually cordate (the stem attached at the leaf margin); stamens 6 or 12; petals 6 or 0; fruit red or bluish-black.

2 Leaves 3-7-lobed, the sinuses usually deep, the lobes acute; stamens 12; petals 0; fruit bluish-black, 13-25 mm long; [tribe Tinosporeae] ...

2 Leaves entire or 3-lobed, the sinuses always shallow, the lobes (if present) broadly rounded; stamens 6; petals 6; fruit red, 5-8 mm long; [tribe Tiliacoreae] ...................................................................................................................................................................................

*Cocculus* A.P. de Candolle 1817 (Coralbeads, Snailseed)

*Cocculus lyonii* (Pursh) A. Gray, Cupseed, Lyonia-vine. Floodplain forests, wet hammocks. May-June. Se. SC, e. TN, se. KY, s. IN, s. IL, MO, and e. KS, south to se. GA, Panhandle FL, s. AL, s. MS, s. LA, and e. TX. [= C, F, FNA, G, K, S, WH]
MENISPERMACEAE

*Cocculus carolinus* (Linnaeus) A.P. de Candolle, Coralbeads, Carolina Moonseed, Snailseed, Red Moonseed. Moist to dry forests and thickets, especially where calcareous, also weedy in landscaping. June-August. VA south to FL, west to TX, north in the interior to s. IN and MO. Its occurrences in VA may be primarily adventive. [= RAB, C, F, G, K, W, WH; *Epibatrum carolinum* (Linnaeus) Britton – S]

Menispernum Linnaeus 1753 (Moonseed)

113. BERBERIDACEAE A.L. de Jussieu 1789 (Barberry Family) [in RANUNCULALES]

As broadly defined here, a family of about 15 genera and 650 species, herbs and shrubs, of the temperate Northern Hemisphere and Andean South America. There has been much debate and study of whether the Berberidaceae should be recognized as a broadly defined unit, or split into a variety of segregate families (such as Podophyllaceae, Epimediaceae, Nandinaceae, Leonticaceae). Based on molecular studies, Kim & Jansen (1996, 1998) conclude that division of the Berberidaceae into segregate families is not warranted. References: Whetstone, Atkinson, & Spaulding in FNA (1997); Wang et al. (2009); Stearn (2002); Kim & Jansen (1996, 1998); Ahrendt (1961); Locote & Estes (1989b); Meacham (1980); Locote in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves ternately compound; [subfamily Nandinoideae].
2 Plant a shrub, with multiple leaves; flowers white .............................................................................................................................. 1. Nandina
2 Plant an herb, with 2 leaves; flowers greenish or maroonish .............................................................................................................. 2. Caulophyllum

1 Leaves simple (though sometimes variously lobed or divided into segments).
3 Plant a shrub; leaves not peltate, simple or 1-pinnately compound; flowers yellow; [subfamily Berberidoideae] ......................... 3. Berberis
3 Plant an herb; leaves peltate, 2-parted or radially lobed; flowers white; [subfamily Podophylloideae].
4 Plant acaulescent; flower solitary and scapose; leaf segments 2; fruit a capsule ................................................................................. 4. Jeffersonia
5 Flowers cymose or umbellate; stamens 6; berry globose, 8-12 mm long, 2-4 seeded; larger leaves with only 2 clefts that extend > halfway to the peltate center of the leaf (thus the leaf divided into 2 halves, the other sinuses shallow) ..................................................... 5. Diphypleia
5 Flower solitary; stamens 12-18; berry ovoid, 25-70 mm long, many-seeded; larger leaves with 5 or more clefts that extend > halfway to the peltate center of the leaf (thus the leaf fairly evenly divided into multiple lobes) ..................................................... 6. Podophyllum

1. *Nandina* Thunberg 1781 (Nandina, Sacred-bamboo)

A monotypic genus, a shrub, native of Japan, China, and India. Here treated as a monotypic genus in the Berberidaceae, *Nandina* seems to have only a general kinship to the Berberidaceae (see Ehdai & Russell 1984, Locote & Estes 1989b, Meacham 1980) and should perhaps be placed in its own monotypic family. References: Whetstone, Atkinson, & Spaulding in FNA (1997); Ehdai & Russell (1984); Locote in Kubitzki, Rohwer, & Bittrich (1993).

* Nandina domestica Thunberg, Nandina, Sacred-bamboo. Forests and woodlands in suburban areas, commonly planted, increasingly escaping and naturalizing; native of China. May-June; October-November. *Nandina* has numerous cultivated forms, and is widely planted in the Piedmont and Coastal Plain of our area, especially southward. Leaflet shape varies in cultivated forms from broadly ovate to linear. [= RAB, FNA, K]

2. *Caulophyllum* Michaux 1803 (Blue Cohosh)

*

1 Carpels (in flower) 3.5-5 mm long, averaging 4 mm; style 0.8-1.5 mm long; sepals 6-9 mm long, usually purple; terminal leaflets (5-9) 7-9 (-10) cm long; (4-) 5-7.5 (-8) cm wide; main inflorescence with 4-18 flowers; first leaf 2-terinate or 3-terinate..............................*C. giganteum*
1 Carpels (in flower) 1.3-2.8 mm long, averaging 2 mm; style 0.3-1.0 mm long; sepals 3-6.5 mm long, yellow, yellow-purple, or green; terminal leaflets (3-) 5-7 (-8) cm long; (2-) 3.5-6.5 (-10) cm wide; main inflorescence with 5-70 flowers; first leaf 3-terinate or 4-terinate..............................*C. thalictroides*

**Caulophyllum giganteum** (Farwell) Loconte & Blackwell, Northern Blue Cohosh. Rich forests. April-May; July-August. *C. giganteum* is more northern in distribution than *C. thalictroides*, ranging south to VA, nw. NC, ne. and nc. TN (Chester, Wofford, & Kral 1997), and c. KY. This species blooms about 2 weeks earlier than *C. thalictroides* where they grow together. The combination of sympatry, morphologic distinctness, and phenologic separation of the two taxa argues for recognition at the species level. [= FNA, K, W, Y, Z; < *C. thalictroides* – RAB, F, G, S; = *C. thalictroides* var. giganteum Farwell – C]

**Caulophyllum thalictroides** (Linnæus) Michaux, Common Blue Cohosh, Green Vivian. Rich forests. April-May; July-August. NS, QC, ON, and MB, south to GA, AL, AR, and OK. [= FNA, K, W, Y, Z; < *C. thalictroides* – RAB, F, G, S (also see *C. giganteum*); = *C. thalictroides* var. thalictroides – C]

3. *Berberis* Linnæus 1753 (Barberry)

A genus of 400-600 species, shrubs, of North America, South America, Asia, Europe, and n. Africa. Many authors favor the inclusion of *Mahonia* in *Berberis*. It appears that *Mahonia* is a paraphyletic grade basal to *Berberis* (in the narrow sense) (Kim, Kim, & Landrum 2004). References: Whittmore in FNA (1997); Loconte in Kubitzki, Rohwer, & Bittrich (1993); Kim, Kim, & Landrum (2004).

**Identification notes:** Other species of *Berberis* are used horticulturally in our area. Though none appear to be established at this time, the possibility of encountering species other than the three treated above should be kept in mind. *B. julianae* Schneider is especially commonly planted in hedges and landscaping.

1 Leaves 1-pinnately compound, > 10 cm long, not fascicled on short spur shoots; stems not spiny; leaves evergreen.
2 Bud scales deciduous, 3-8 mm long; leaflet blades 1-3-veined from base.....................................................*B. repens*
2 Bud scales evergreen, 11-44 mm long; leaflet blades 4-6-veined from base.
3 Leaflet blades with 2-7 teeth per side, each tooth 3-8 mm long; leaflets very thick and stiff..............................................................*B. bealei*
3 Leaflet blades with 6-13 teeth per side, each tooth 1-2 (-3) mm long; leaflets thickish, but flexible when fresh........................................*B. nervosa*
1 Leaves simple, < 6 cm long, fascicled on short spur shoots; stems spiny; leaves deciduous or evergreen.
4 Leaves entire; flowers solitary or 2-4 in umbels; spines mostly simple; [section *Tschonoskyanae*]..................................................*B. thunbergii*
4 Leaves bristly-serrate; flowers 5-many in racemes (sometimes the racemes umbelliform); spines mostly trifurcate (some simple or bifurcate).
5 Leaves deciduous, herbaceous; leaf teeth tipped with weak bristles; fruits red, not pruinose
6 Leaves with 1-9 (20) bristles on each margin, the bristles 3-6 mm apart; berries ovoid (6-9 mm long, 6-7 mm broad), 5-10 (rarely more) in an often umbellate raceme; petals notched at apex; [section *Canadenses*]..................................................*B. canadensis*
6 Leaves with 18-36 bristles on each margin, ca. 2 mm apart; berries ellipsoid (8-10 mm long, 4-5 mm broad), 10-20 in a raceme; petals obtuse at apex; [section *Vulgares*]..................................................*B. vulgaris*

* Berberis bealei Fortune, Leatherleaf Mahonia, Chinese Mahonia, Holly-grape. In deciduous forests in suburban areas, spread from plantings; native of China. December-March; May-July. Naturalizing widely in the southeastern United States, including (at least) AL, DE, GA, FL, NC, and SC. [= FNA, WH; = Mahonia bealei (Fortune) Carrière – RAB, K]

* Berberis canadensis P. Miller, American Barberry, Allegheny Barberry. Rocky woods, forest openings, glades, usually over mafic rocks (such as diabase) or calcareous rocks (such as limestone), sometimes along fence-rows in sw. VA (presumably spread by birds). April-May; September-October. A broad Southern Appalachian-Ozarkian endemic, not occurring in Canada (the epithet a misnomer): scattered and local in VA, WV, KY, TN, NC, SC, AL, GA, MO, IL, IN, and sc. PA (where apparently now extirpated). Along with *B. vulgaris*, *B. canadensis* has been subjected to organized eradication programs because of its serving as an alternate host for wheat rust (*Puccinia graminis*). [= RAB, C, F, FNA, G, K, S, W]

* Berberis julianae Schneider, Evergreen Barberry. Seeding down and escaping locally near horticultural plantings; native of China. First reported for NC by Pittillo & Brown (1988). [= K; = *B. julianae*, orthographic variant]
**BERBERIDACEAE**

* Berberis repens Lindley, Creeping Oregon Grape. Suburban woodlands; native of nw. North America. [= FNA; = Mahonia repens (Lindley) G. Don – K] [add to synonymy]

* Berberis thunbergii A.P. de Candolle, Japanese Barberry. Rich forests, old fields; native of Japan. March-April; May-September. This species is immune to wheat rust; it is probably now the most commonly encountered barberry in our area. [= RAB, C, F, G, K, S, W]

* Berberis vulgaris Linnaeus, European Barberry, Common Barberry. Disturbed areas; native of Europe. April; September. This species, once widely cultivated and established in North America, serves as an alternate host to wheat rust and has been subjected to eradication programs for over half a century. It may no longer occur in our area. [= C, F, FNA, G, K]

4. Jeffersonia W. Barton 1793 (Twinleaf)

A genus of 2 species, the only other species of the genus is native to e. Asia (eastern Russia, Korea, Manchuria). The closest North American relatives of *Jeffersonia* are *Achlys* and *Vancouveria* of the Pacific Northwest. References: George in FNA (1997); Stearn (2002) = Y; Loconte & Estes (1989b); Loconte in Kubitzki, Rohwer, & Bittrich (1993).

* Jeffersonia diphylla* (Linnaeus) Persoon, Twinleaf. Moist and extremely nutrient-rich forests, generally over calcareous or mafic rocks (including limestone, dolostone, amphibolite, greenstone, etc.) or very rich alluvium. March-April; May. The species is widespread in ne. United States, south to MD, NC, and AL. It is somewhat suggestive of *Sanguinaria* in both foliage and flower. [= RAB, C, F, G, K, S, W, WV, Y]

5. Diphylleia  Michaux 1803 (Umbrella-leaf)

* Diphylleia cymosa* Michaux, Umbrella-leaf, Pixie-parasol. Seepages and brook-banks, sometimes away from brooks or seeps in northern hardwood or cove hardwood forests (but then usually in subterranean seepage), primarily at moderate to high elevations. May-June; July-August. A narrow Southern Appalachian endemic: high mountains of w. NC and e. TN, extending a short distance into ne. GA, nw. SC, and sw. VA. [= RAB, C, F, G, K, S, W, Y, Z]

6. Podophyllum Linnaeus 1753 (May-apple)

A genus of 2 species (or ca. 14 if *Dysosma* is included), herbs, one in e. North America, the other in e. Asia. The obvious morphological kinship of *Podophyllum*, *Diphylleia*, and *Hydrastis* is corroborated by alkaloid chemistry. References: George in FNA (1997); Shaw (2000, 2002) = Z; Loconte in Kubitzki, Rohwer, & Bittrich (1993).

* Podophyllum peltatum* Linnaeus, May-apple, American Mandrake. Rich forests, bottomlands, slopes, pastures. March-April; May-June. NS west to MN, south to Panhandle FL and TX. The ripe fruits are edible; the rest of the plant contains a variety of alkaloids, and is poisonous-medicinal. Compounds from *Podophyllum* are used in wart removal, and show anti-viral and anti-cancer promise. [= RAB, C, F, G, K, S, W, WV; > P. peltatum var. peltatum – Z; > P. peltatum var. annulare J.M.H. Shaw – Z]

114a. HYDRASTIDACEAE Martinov 1820 (Golden-seal Family) [in RANUNCULALES]

A family of 2 genera and 2 species, perennial herbs, of temperate e. North America and Japan. In chemistry, morphology, and anatomy, *Hydrastis* shows some relationship to *Podophyllum* and *Diphylleia* of the Podophyllaceae (often included in the Berberidaceae). Though usually placed in the Ranunculaceae, Tohe & Keating (1985) present evidence from morphology, anatomy, embryology, palynology, chemistry, and cytology that suggests that *Hydrastis* is best recognized as a monotypic family. They contend that "*Hydrastis* represents a reliclual primitive group which very early diverged from a common ancestral stock of the Ranunculaceae, Berberidaceae and probably of Circaeasteraceae, and that *Hydrastis* has evolved in its own evolutionary line parallel with other lines leading to the modern representatives of these families." In recent papers on
classification of the flowering plants, Thorne (1992) and Reveal (1993a) have also accepted Hydrastidaceae as a distinct family. Toke in Kubitzki & Bayer places Hydrastis with Glaucesis Siebold & Zuccarini in a bigeneric Hydrastidaceae. References: Tamura in Kubitzki, Rohwer, & Bittrich (1993); Wang et al. (2009); Toke in Kubitzki & Bayer (2002).

I. Hydrastis Linnaeus 1759 (Golden-seal)

Hydrastis canadensis Linnaeus, Golden-seal. Mesic, very nutrient-rich forests, with circumneutral soils, over calcareous or mafic rocks such as limestone, amphibolite, and dolostone, sometimes forming large colonies after canopy disturbance such as logging. April; May-June. VT and MN south to w. and c. NC, n. GA, TN, and AR. Exploited for the herbal trade (and still often used as a home remedy in more remote parts of the mountains), though too rare in our area to support economically significant wild collection. The root is bitter in taste and contains several alkaloids. Reported for SC (P. McMillan, pers.comm. 2002). [= RAB, C, F, FNA, G, K, S, W, WV]

114b. RANUNCULACEAE A.L. de Jussieu 1789 (Buttercup Family) [in RANUNCULACEAS]

A family of about 62 genera and 2450 species, herbs, shrubs, and vines, primarily of temperate and boreal regions. Classification of subfamilies and tribes follows Wang et al. (2009); Keener (1977); Tamura in Kubitzki, Rohwer, & Bittrich (1993); Whittemore & Parfitt in FNA (1997); Wang et al. (2009); Tobe in Kubitzki & Bayer (2002). [also see HYDRASTIDACEAE]

Key A

1 Shrub or vine; leaves compound (or sometimes some to most of them simple in Clematis).
2 Leaves opposite, distributed along the usually branched, clambering stem; sepals 4, white to blue or purplish, 10-50 mm long; wood not yellow; [subfamily Ranunculoideae, tribe Anemoneae] ................................................................. 16. Clematis
3 Leaves alternate, clustered together at the top of the usually unbranched, erect stem; sepals 5, maroon, 2-5 mm long; wood yellow; [subfamily Coptidoideae] ........................................................................................................................................ 1. Xanthorhiza

Key C

4 Plants in flower .......................................................................................................................................................................................
5 Plants in fruit .........................................................................................................................................................................................

Key D

4 Plants in  flower .......................................................................................................................................................................................
4 Plants in  flower .........................................................................................................................................................................................

Key A

1 Flowers bilaterally symmetrical, the upper sepal hooded or spurred; [tribe Delphinieae].
2 Upper sepal hooded or helmet-shaped; petals hidden by the sepal; perianth blue or creamy white; stems weak, clambering, reclining, vining, or ascending in a curve ................................................................. 7. Aconitum
3 Upper sepal spurred; petals at least partly exerted from the sepal; perianth blue, pink, white, or greenish; stems strong, erect, normally straight
4 Annual; pistil 1; petals 2, connate; leaf lobes < 1.5 mm wide................................................................................................................................. 8. Consolida
5 Perennial; pistil 3 (-5); petals 4, separate; leaf lobes > 2 mm wide................................................................................................................................. 9. Delphinium

Key B

1 Flowers radially symmetrical, no perianth parts spurred or hooded (except the 5 sepal spurred in Myosurus).
3 Petals present, white or yellow, larger and more conspicuous than the sepal; sepal present, green; [in other words, with a second, green, less conspicuous periand perianth whorl below the largest and colored perianth whorl; note that some Anemone have a calyx-like involucre of 3 bracts subtending each flower]; [tribe Ranunculeae].
4 Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a Plantago inflorescence)................................................................................................................................. 19. Myosurus
5 Basal leaves various, but not as above; receptacle globose to sub-cylindric, mostly < 1 cm long
6 Sepals 3 (-4); petals 7-12; achenes pubescent, beakless; leaves simple, coriaceous, unlobed; [introduced garden plants]....... 18. Ficaria
7 Sepals (3-) 5 (-6); petals typically 5-9 (10 in some "doubled" forms); achenes smooth or variously ornamented with spines, papillae, or tubercles, sometimes also pubescent; leaves various, usually not at once simple, coriaceous, and unlobed; [native or introduced]....... 20. Ranunculus
8 Sepals 3-5 mm long, caducous; stamens white and showy; [tribe Ranunculeae] ................................................................. 17. Trautvetteria
9 Sepals 6-40 mm long, not caducous; stamens not notably white and showy.
10 Leaves opposite, distributed along the stem; style plumose; [tribe Anemoneae] ........................................................................... 16. Clematis
7 Leaves all basal, or with a few alternate or whorled involucrate leaves on the stem; style not plumose.
8 Sepals white, bluish, or blue; basal leaves 3-5 (-7)-lobed; [tribe Anemonieae] .......................... 15. Anemone
8 Sepals yellow, green, or whitish (sometimes marked with purple); basal leaves unlobed, or palmately cleft into 5-11 (-many) segments.
9 Leaves cordate-reniform, unlobed; sepals bright yellow; petals absent; [native, of bogs and marshes]; [tribe Calthaeeae] .......................... 14. Caltha
9 Leaves palmately or pedately lobed or divided; sepals green, greenish, dull yellow, or whitish; petals modified into tubular nectaries; [introduced, rarely persistent or escaped from cultivation].
10 Sepals 5-8, much longer than wide, yellow; cauleine leaves absent, except for the involucre which immediately subdend the flower; [tribe Cimicifugeae] .......................... 12. Eranthis
10 Sepals 3-5, nearly as wide as long, green or maroon; cauleine leaves present; [tribe Helleboraeae] .......................... 11. Helleborus

Key B

1 Fruit a follicle, each carpel with 2 or more ovules.
2 Leaves cordate-reniform, toothed, not lobed or divided; [tribe Calthaeeae] .......................... 14. Caltha
2 Leaves variously palmately or pedately lobed or divided.
3 Carpels 1-3, plants 3-30 dm tall; [native, except Consolida]; [tribe Delphineae].
4 Stems weak, clambering, reclining, or vining .......................... 7. Aconitum
5 Annual; leaf lobes < 1.5 mm wide; [exotic] .......................... 8. Consolida
5 Perennial; leaf lobes > 2 mm wide; [native] .......................... 9. Delphinium
3 Carpels 3-6; plants 1-5 dm tall; [introduced, rarely persistent or escaping].
6 Cauleine leaves absent, except for the involucrre which immediately subdends the fruit; [tribe Cimicifugeae] .......................... 12. Eranthis
6 Cauleine leaves present; [tribe Helleboraeae] .......................... 11. Helleborus
1 Fruit an achene (or dehiscent utricle in Trautvetteria), each carpel with 1 ovule.
7 Leaves opposite, distributed along the stem; style plumose; [tribe Anemonieae] .......................... 16. Clematis
7 Leaves all basall, or with a few alternate or whorled involucrate leaves on the stem; style not plumose.
8 Basal leaves linear to linear-spulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a Plantago inflorescence); [tribe Ranunculeae] .......................... 19. Myosurus
8 Basal leaves various, but not as above; generally long-petiolate, with an expanded, cordate, 3-lobed, or palmately-lobed blade; receptacle globose to sub-cylindric, mostly < 1 cm long.
9 Fruit a dehiscent utricle; cauleine leaves alternate; [tribe Ranunculeae] .......................... 17. Trautvetteria
9 Fruit an achene; cauleine leaves opposite or whorled (or alternate in Ranunculus).
10 Cauleine leaves opposite or whorled, or reduced to 3 sepal-like involucral bracts immediately subdendting the flower; sepals absent (but in “Hepatica” mimicked by the bracts); [tribe Anemonieae] .......................... 15. Anemone
10 Cauleine leaves alternate; sepals present; [tribe Ranunculeae]
11 Achenes pubescent, beakless; leaves simple, cordate, unlobed; [introduced garden plants] .......................... 18. Ficaria
11 Achenes smooth or variously ornamented with spines, papillae, or tubercles, sometimes also pubescent; leaves various, usually not at once simple, cordate, and unlobed; [native or introduced] .......................... 20. Ranunculus

Key C

1 Leaflets linear, < 1.5 mm wide.
2 Flowers bilaterally symmetrical; [subfamily Ranunculoideae, tribe Delphineae] .......................... 8. Consolida
2 Flowers radially symmetrical.
3 Aquatic; [native]; [subfamily Ranunculoideae, tribe Ranunculeae] .......................... 20. Ranunculus
3 Terrestrial; [alien].
4 Flower lacking involucrre; pistils simple; [subfamily Ranunculoideae, tribe Adonideae] .......................... 6. Adonis
4 Flower closely subtended by a finely dissected involucrre; pistils compound; [subfamily Ranunculoideae, tribe Nigelleae] .......................... 10. Nigella
1 Leaflets broader, rounded, lobed, or toothed.
5 Leaves all cauline, opposite; stems somewhat woody at base; [subfamily Ranunculoideae, tribe Anemonieae] .......................... 16. Clematis
5 Leaves basal and cauleine, the cauleine alternate (or with opposite or whorled involucral bracts).
6 Petals present, conspicuous
7 Flowers danging; petals red, orange with yellow, or blue, spurred; [subfamily Thalictridoideae] .......................... 3. Aquilegia
7 Flowers not danging; petals yellow, not spurred; [subfamily Ranunculoideae, tribe Ranunculeae] .......................... 20. Ranunculus
6 Petals absent or inconspicuous (soon deciduous or altered into a nectary-bearing clavate structure); sepals sometimes petaloid and conspicuous.
8 Sepals petaloid, conspicuous, white (or tinged with pink or green).
9 Involucrre absent, all leaves on the stem alternate; petaloid sepals 5-10, white; [subfamily Thalictridoideae] .......................... 4. Enemion
9 Involucrre of opposite or whorled, leaflike bracts present; petaloid sepals 4-7, 5-20 (-30), white, cream, rose, or green.
10 Basal leaves with 3-5 leaflets, these toothed or incised; petaloid sepals white, cream, rose, or green; [subfamily Ranunculoideae, tribe Anemonieae] .......................... 15. Anemone
10 Basal leaves with > 3 leaflets; these with 0-3 rounded lobes at the tip; petaloid sepals white to pale pink; [subfamily Thalictridoideae] .......................... 5. Thalictrum thalictroides
8 Sepals absent, or inconspicuous in comparison to the stamens or pistils.
11 Leaflets 3; flower solitary; [subfamily Coptidoideae] .......................... 2. Coptis
11 Leaflets many; flowers many, in a panicle or raceme.
12 Inflorescence a raceme; [subfamily Ranunculoideae, tribe Cimicifugeae] .......................... 13. Actaea
12 Inflorescence a panicle; [subfamily Thalictridoideae] .......................... 5. Thalictrum
Key D

1 Fruit a follicle or capsular (or fleshy and berrylike in some Actaea).

2 Mature leaves > 3 dm wide; [subfamily Ranunculoideae, tribe Cimicifugae] ................................................................. 13. Actaea

3 Leaflets linear; [aliens].

4 Flowers in a raceme, not subtended by an involucre; fruit follicular, each with a 1-2 mm long beak; [subfamily Ranunculoideae, tribe Delphinieae] .................................................................................................................. 8. Consolida

5 Flower solitary, subtended by a finely divided involucre; fruit a spherical capsule-like structure composed of 5 or 10 partially connate follicles, each follicle terminated by a linear beak 13-20 mm long; [subfamily Ranunculoideae, tribe Nigelleae] ... 10. Nigella

6 Leaflets broad, rounded; [mostly natives].

7 Follicles borne on stipes, forming an umbel-like cluster; rhizomes yellow or orange; [subfamily Coptidoidae] ............... 2. Coptis

8 Follicles sessile; rhizomes brown or tan; [subfamily Thalictroideae].

9 Follicles 15-31 mm long, with beaks 7-18 mm long ................................................................. 3. Aquilegia

10 Follicles 3.5-6.5 mm long, with beaks 1.5-3 mm long ........................................................................ 4. Enemion

1 Fruit an achene.

7 Leaves divided into numerous linear segments, all of which are < 1 mm wide.

8 Plant aquatic (if leaves divided into numerous linear segments); [subfamily Ranunculoideae, tribe Ranunculeae] ........... 20. Ranunculus

9 Plant terrestrial; [subfamily Ranunculoideae, tribe Anemoneae] ................................................................. 6. Adonis

10 Leaf segments rounded or cleft, > 1 mm wide.

11 Leaves cauline, opposite; [subfamily Ranunculoideae, tribe Anemoneae] ................................................................. 16. Clematis

12 Leaves basal and/or cauline, cauline leaves (if present) alternate (leaflike involucral bracts sometimes present and opposite or whorled).

13 Leaflike involucral bracts present, opposite or whorled.

14 Achenes not ribbed or veined on lateral surfaces; leaf texture moderate to distinctly thick and leathery; [subfamily Ranunculoideae, tribe Anemoneae] ................................................................. 15. Anemone

15 Achenes conspicuously ribbed or veined on lateral surfaces; leaf texture thin, delicate; [subfamily Thalictroideae] ........... 5. Thalictrum thalictroides

16 Leaflike involucral bracts not present.

17 Leaflets 3-many, if many the leaflets typically with teeth, or sharp lobes; [subfamily Ranunculoideae, tribe Ranunculeae] .... 20. Ranunculus

18 Leaflets many, unlobed or typically with 3-9 rounded lobes; [subfamily Thalictroideae] .............................................. 5. Thalictrum

1. Xanthorhiza Marshall 1785 (Yellowroot)

Identification notes: An unmistakable plant, the woody stems usually about knee-high and unbranched, bearing a cluster of pinnate leaves near the tip, and the rhizomes with a bright yellow, staining, bitter-tasting alkaloid.

Xanthorhiza simplicissima Marshall, Yellowroot, Brook-feather. Streambanks and riverbanks. March-May; May-June. NY and se. PA (where only naturalized, according to Rhoads & Klein 1993), south to SC, sw. GA, w. FL, and AL. [= RAB, C, F, S; = Xanthorrhiza simplicissima – S, orthographic variant]

2. Coptis Salisbury 1807 (Goldthread)

Coptis trifolia (Linnaeus) Salisbury var. groenlandica (Oeder) Fassett, Goldthread, Goldenroot. Bogs. May-June. The species ranges from Greenland west to AK, south to NJ, nw. NC, n. IN, IA, and BC; and in e. Asia. Var. groenlandica is the variety in e. North America, northeast to Greenland, and in southern parts of nw. North America; var. trifolia is Alaskan and e. Asian. Whether the varieties are worth recognition is somewhat questionable. Coptis had been reported for NC by many floras (for instance, C, F, G, and S), but the documentation was unknown; its presence in NC has now been confirmed by P. McMillan. The species is distinctive, with neatly trifoliolate leaves, small white flowers on scapes, and yellow roots. [= C; = C. groenlandica (Oeder) Fernald – F, WV; = C. trifolia ssp. groenlandica (Oeder) Hultén – G; < C. trifolia – FNA, K, S]

3. Aquilegia Linnaeus 1753 (Columbine)

Identification notes: When in leaf, somewhat easily mistaken for Thalictrum or Enemion; look for old fruits.

1 Flowers red and yellow; [add other characters]; spurs straight; [native, common] ................................................................. 13. Actaea

1 Flowers blue, purple, mauve, pink, white, or red and yellow; spurs hooked; [alien, rare] ...................................................... 11. C. trifolia
Aquilegia canadensis Linnaeus, Canada Columbine, Eastern Columbine. Forests, woodlands, rock outcrops, especially (though by no means entirely) on calcareous or mafic substrates. March-May. NS, QC, ON, MB, and SK south to Panhandle FL, s. AL, w. TN, c. AR, and se. OK; disjunct in Edwards Plateau, TX. One of our most familiar wildflowers. Disjunct populations in the deep South, in limestone on sw. GA and FL Panhandle, have been described as A. australis or A. canadensis var. australis; they need additional study. [= RAB, C, FNA, G, K, S, W; > A. canadensis var. canadensis – F, Z; > A. canadensis var. coccinea (Small) Munz – F, Z; > A. canadensis – S; > A. australis Small – S; > A. coccinea Small – S; > A. canadensis var. australis (Small) Munz – Z]

* Aquilegia vulgaris* Linnaeus, European Columbine. Disturbed areas; native of Europe. Many varieties have been named; there seems little utility in trying to apply these names to the cultivated plants rarely persistent in our area. [= RAB, C, FNA, G, K; > A. vulgaris varieties – Z]

4. **Enemion** Rafinesque 1820 (Isopyrum)

**Identification notes:** *Enemion* is somewhat superficially similar to the much more common *Thalictrum thalictroides*, with which it sometimes grows, but can be distinguished by the following characters: fruit a follicle (vs. fruit an achene), petaloid sepals 5 (vs. 5-10, usually some at least of the flowers on a plant with 6 or more).

**Enemion biternatum** Rafinesque, Isopyrum, False Rue-anemone. Rich forests, either on natural levees with very nutrient rich sediments or on slopes with underlying mafic rocks. March-April; May. Mainly west of the Appalachians, W. NY, s. ON and MN south to TN and AR; disjunct in the Piedmont and Coastal Plain of VA, NC, and SC, and the FL Panhandle. [= FNA, K; = *Isopyrum biternatum* (Rafinesque) Torrey & Gray – RAB, C, F, G, S]

5. **Thalictrum** Linnaeus 1753 (Meadow-rue)

**Identification notes:** *Thalictrum thalictroides* is superficially similar to *Enemion biternatum*, but can be distinguished by the following characters: fruit an achene (vs. fruit a follicle), petaloid sepalas 5-10 (vs. 5).

1 Sepals petaloid, conspicuous, white (or tinged with pink or green); leaflike involucral bracts present, opposite or whorled; inflorescence an umbel; [section *Anemonella*]...........................................................................................................................................................................................................

1 Sepals absent, or inconspicuous in comparison to the stamens or pistils; leaflike involucral bracts not present; inflorescence a panicle, corymb or raceme.

2 Fruit (achene) scimitar-shaped, borne on a stipe 1.5-4 mm long; flowers perfect; [section *Physocarpum*].

2 Fruit (achene) not scimitar-shaped, not borne on a stipe; flowers unisexual (or sometimes a few or more bisexual).

3 Achene straight on the upper surface, 2.5-4 mm long, borne on a stipe 2.5-4 mm long; inflorescence branches flexuous and divergent at acute angles; [fairly widespread in our area, on a wide variety of moist substrates, especially in the Mountains] .......................

3 Achene straight on the upper surface, 2.5-4 mm long, borne on a stipe 2.5-4 mm long; inflorescence branches flexuous and divergent; [of sandstone rockhouses of Cumberland Plateau of AL, TN, and KY] .........................................................................................................................

4 Leaflets of the stem leaves linear to narrowly lanceolate, oblanceolate or elliptic, (3-) 5-10 (-25) mm long as wide; [section *Leucocoma*] ...........................................................................................................................................................................................................

4 Leaflets of the stem leaves ovate, obovate, or suborbicular, 0.7-3 (-5) mm long as wide.

5 Most of the leaflets with (3-) 4-6 (-9) lobes or teeth; [section *Heterogamia*].

6 Cauline leaf subtending the lowest flowering branch sessile; plant flowering May-July; achenes borne on a 0.7-2.5 mm long stipe.

6 Cauline leaf subtending the lowest flowering branch with a petiole 3-7 cm long; plant flowering March-April; achenes nearly sessile, the stipe non-existent or <0.3 mm long.

7 Largest leaflets < 15 mm wide; stems 10-40 cm tall, reclining ..................................................................................................................

7 Largest leaflets > 15 mm long; stems 30-80 cm tall, erect .....................................................................................................................

8 Leaflet undersurfaces, peduncles, and achenes with stipitate glands or papillae.

9 Anthers 1-3.6 (-4) mm long; stigmas 1.5-4.7 (-6) mm long ...........................................................................................................................................................................................................

9 Anthers 1-3.6 (-4) mm long; stigmas 1.5-4.7 (-6) mm long .................................

Thalictrum cooleyi Ahles, Cooley's Meadowrue, Savanna Meadowrue. Ecotones between calcareous savannas and adjacent swamp forests, shallowly underlain by coquina limestone ("marl"), generally within a few meters of Taxodium ascendens and Liriodendron tulipifera. Late June-early July; August-October. The species is endemic to two small areas, centered around Maple Hill (Pender and Onslow counties, NC) and Old Dock (Columbus and Brunswick counties, NC), with a small disjunct population in Panhandle FL (Walton County), and a small number of ambiguous populations in sw. GA (Dougherty and Worth counties); the GA populations are assigned here for now but may well represent a new taxon. It is associated with a number of other narrow endemic species. The leaflets of basal leaves (winter rosettes) are much broader, resembling the leaflets of other Thalictrum species in length/width ratio. Leaves produced from May on have the very narrow leaves typical of the species. Park (1992) found that Th. cooleyi has the highest chromosome number known in the genus, 2n = 210, a ploidy level of 30× compared to the base chromosome level of 7 in Thalictrum. [= RAB, FNA, GW, K, WH, Z]

Thalictrum coriaceum (Britton) Small, Appalachian Meadowrue, Maid of the Mist. Rich forests. May-July. A Southern and Central Appalachian endemic: MD, VA, and WV south through w. KY and e. TN to w. NC and ne. GA. The roots are bright yellow. A preliminary study concluded that Th. stelecanum B. Boivin is not distinct from Th. coriaceum (Park 1988); further study is needed. Th. stelecanum is alleged to differ in the following ways (and others): plant with long, cordlike rhizomes (vs. stout caudex), terminal leaflets mostly wider than long (vs. mostly longer than wide), achenes curved, 4-6 mm long (vs. less curved, 2.5-4.4 mm long). Park found these characters (and others) to be variable and to occur together within populations. It ranges from s. PA south through MD, e. WV, w. VA to nw. NC. [= RAB, FNA, K; > T. coriaceum – C, F, G, W, WV; > T. stelecanum B. Boivin – C, F, G, W, WV; > T. coriaceum – S; > T. caulephyloides Small – S]

Thalictrum dasycarpum Fischer & Avé-Lallemant, Purple Meadowrue. Forest, woodlands, and prairies. June-July. QC and YT south to PA, KY, TN, AL, MS, LA, TX, NM, AZ, and WA. It has been reported for scattered localities in VA (Harvill et al. 1992). Park (1992) and FNA do not document the occurrence of Th. dasycarpum in VA; substantiation is needed. [= FNA, K] {synonymy incomplete}

Thalictrum debile Buckley, Trailing Meadowrue. Moist to wet forests over limestone. Nw. GA west to e. MS. [= FNA, GW, K, S]

Thalictrum hepaticum Greene, Appalachian Tall Meadowrue. Seepage areas. May-July. PA south to n. GA and se. TN, strictly or primarily in the Appalachians. Plants tentatively placed here have been problematic. Keener (1981) reduced Th. hepaticum Greene to a variety of Th. pubescens, and discussed their distinction. Park (1992) contends that these plants are, indeed, glandular puberulent, and should therefore be reduced to synonymy under Th. revolutum, stating "these are not given varietal status [under Th. revolutum] since this morphological variation in anthers is not correlated with a continuous geographic range. As indicated above, I have located specimens from Georgia, North Carolina, Tennessee, and Pennsylvania which fit the description." As mapped by Keener (1981) Th. pubescens var. hepaticum (Greene) Keener appears as an endemic to the Southern Appalachians; if extended to Pennsylvania, the distribution is still very restricted (and in a phytogeographically plausible manner) compared to either Th. revolutum or Th. pubescens. This entity appears to be closer to Th. pubescens in leaflet shape, sepal length, anther length, and stigma length, and to Th. revolutum in leaflet and petiolule vestiture. More study is needed; the taxon is here provisionally accepted in order to draw attention to the problem. [= T. pubescens var. hepaticum (Greene) Keener – W; < T. polygamum Muhlenberg ex Sprengel – RAB, F, G, S, nomen nudum; < T. pubescens – C, GW, K, WV, < T. revolutum – FNA]

Thalictrum macrostylum Small & Heller, Small-leaved Meadowrue. Moist places, perhaps associated with circumneutral soils, moist to dry ultramafic outcrop barrens (over olivine), tidal freshwater marshes. May-August. Se. VA south and west

**Thalictrum mirabile** Small, Rockhouse Meadowrue. Wet sandstone cliffs, primarily in the Cumberland Plateau (and especially associated with sandstone rockhouses). KY south through TN to n. AL and nw. GA (and additionally cited in FNA as occurring in w. NC). A delicate relative of *T. clavatum*, the inflorescence appears sparser because of the shorter and narrower achenes borne on longer stipes. [= FNA, GW, K, S]

**Thalictrum pubescens** Pursh, Common Tall Meadowrue, Late Meadowrue, King-of-the-meadow. Bogs, marshes, wet forests. May-July. NL (Labrador), NL (Newfoundland), and ON south to GA, SC and MS. [= T. pubescens var. pubescens – W; < *Th. polygonum* Muhlenberg ex Sprengel – RAB, F, G, S, nomen nudum; < T. pubescens – C, GW, K, W, Z; < T. pubescens – FNA]

**Thalictrum revolutum** DC, Skunk Meadowrue. Mesic to dry forests, woodlands, and barrens, over hornblende, greenstone, dolostone, and serpentinitized olivine. May-July. QC and ON south to n. FL, LA, and TX, and scattered southwest to CO, NV, and AZ. The species is normally stipitate-glandular or papillose, but can be glabrous, as accounted for in the key. [= RAB, C, F, G, GW, K, S, W, WH, WV; < *T. revolutum* – FNA]

### 6. Adonis Linnaeus 1753 (Adonis)

### 7. Aconitum Linnaeus 1753 (Monkshood, Aconite)

1. Flowers white, creamy white, or yellowish; basal leaves numerous, large, usually 10-20 cm across, on long, stout petioles; roots fascicled; [section *Lycocotonum*] .............................................................................................................................................................................. *A. reclinatum*

2. Terminal lobe of petal > 2 mm wide; follicles glabrous .................................................................................................................................................................................. *A. acutidens*

3. Spur < 12 mm long; upper bracteoles overlapping the flower, attached 1-4 mm below the flower ........................................................................................................... *C. orientalis*

4. Consolida (A.P. de Candolle) S.F. Gray 1821 (Annual Larkspur)

1. Lower bracts of the inflorescence unlobed or the single lowermost bract with 3 lobes; pistil glabrous; follicle 8-17 mm long.

2. Terminal lobe of petal > 2 mm wide; follicles pubescent ............................................................................................................................. *C. pubescens*

3. Spur < 12 mm long. More than 2 of them with 3 or more lobes; pistil densely pubescent; follicle 12-25 mm long.

4. Lower bracts of the inflorescence unlobed or the single lowermost bract with 3 lobes; pistil pubescent; follicle 12-25 mm long.
RANUNCULACEAE

3  Spur > 12 mm long; upper bracteoles not overlapping the flower, attached 4-20 mm from the flower.
4  Inflorescence with 3 or fewer branches; stems glabrous to sparsely puberulent; follicles 12-25 mm long ............................. C. ajacis
4  Inflorescence with 3 or more branches; stems pubescent; follicles 10-15 mm long ......................................................... C. pubescens

* Consolida ajacis* (Linnaeus) Schur, Rocket Larkspur. Roadside, fields, waste places, disturbed ground; native of Europe. [= FNA, K; = Delphinium ajacis Linnaeus – RAB, F, G, S, WV; = Delphinium ambiguum Linnaeus – C; = Consolida ambigua (Linnaeus) P.W. Ball & Heywood in Heywood & P.W. Ball – W]

* Consolida orientalis* (Gay) Schrödinger, Oriental Larkspur. Disturbed areas, perhaps only a waif after cultivation; native of s. Europe, n. Africa, and w. Asia. [= FNA, K;? C. hispanica (Willk. ex Costa) Greuter & Burdet]

9. *Delphinium* Linnaeus 1753 (Larkspur)

1  Follicles divergent; raceme 0.5-2 (-3) dm long; flowering plants 2-9 (-13) dm tall; flowering March-May; [section Diedropetala; subsection Grumosa].
2  Stems (4.5-) 6-9 (-13) dm tall; flowers (sepals) deep blue; lower stem pubescent; [in sunny or semi-sunny situations, apparently endemic to n. AL] ................................................................................................. D. alabamicum
2  Stems 2-6 dm tall; flowers (sepals) deep bluish purple, pink, or white; lower stem glabrous or nearly so; [usually in deep shade, widespread in our area] ....................................................................................................... D. tricolor
1  Follicles erect; raceme > 3 dm long; flowering plants 5-20 dm tall; flowering May-September.
3  Seeds wing-margined, the surfaces smooth; stem below the inflorescence glabrous; flowering plants 8-20 dm tall; flowering July-September; [section Diedropetala; subsection Exaltata] .................................................................................. D. exaltatum
3  Seeds with prominent transverse ridges; stem below the inflorescence pubescent; flowering plants 2-10 (-15) dm tall; flowering May-July; [section Diedropetala; subsection Firescens].
4  Basal leaves usually present at anthesis; flowers (sepals) white; stems 2-4 (-7) dm tall; ultimate segments of midcauline leaves 5-12 in number; 2-4 mm wide ......... D. carolinianum ssp. calciphilum
4  Basal leaves absent at anthesis; flowers (sepals) blue to purple (rarely white); stems (3-) 6-10 (-15) dm tall; ultimate segments of midcauline leaves 12-25 in number, 0.5-1.5 mm wide ......................... D. carolinianum ssp. carolinianum

* Delphinium alabamicum* Kral, Alabama Larkspur. Limestone prairies and glades. Endemic to c. and n. AL and nw. GA. [= FNA, K]

* Delphinium carolinianum* Walter ssp. calchiphilum M.J. Warnock, Glade Larkspur. Limestone glades. KY south through e. and c. TN to ne. AL and nw. GA. [= FNA, K; < D. virescens Nuttall – C, G; < D. carolinianum var. carolinianum – F; < D. carolinianum – S; < D. virescens var. virescens var. virescens – Z; < D. carolinianum Walter ssp. virescens (Nuttall) R.E. Brooks]

* Delphinium carolinianum* Walter ssp. carolinianum, Prairie Larkspur, Carolina Larkspur, Blue Larkspur. Rocky woodlands, granite outcrops, Altamaha Grit outcrops, blackland prairies, moist sandy woodlands associated with longleaf pine. May-July. IL west to MO, south to LA and TX, with disjunct occurrences eastward in SC, GA, Panhandle FL (Gadsden County), TN, and MS. The flowers are a pale to medium blue. This species has been reported for NC (by C) and “north to Va.” (by F and S). I know of no documentation for its past or present occurrence in NC or VA, but its presence in those states is plausible. [= FNA, K; = D. carolinianum Walter – C, G, WH, Z; < D. carolinianum var. carolinianum – F; < D. carolinianum – S]

* Delphinium exaltatum* Aiton, Tall Larkspur. Dry to moist soils over calcareous (such as dolostone, especially Elbrook Formation) or mafic rocks (such as amphibolite, metagabbro, greenstone, and diabase), usually in the open (as grassy balds) or on forest edges in partial sun. July (low elevations) - September (high elevations). Sw. PA and OH southwest to MO and c. TN, and south to the Mountains of VA and the Mountains and Piedmont of NC. The flowers are a pale to medium blue. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

* Delphinium tricolor* Michaux, Dwarf Larkspur. Rich, moist forests, especially over mafic or calcareous rocks, less commonly (as along the Roanoke River in ne. NC) on very fertile alluvial deposits. March-May. Sw. PA and MN south to NC, nw. GA, AL, and OK. The flowers are variable in color, usually a deep bluish violet, but ranging through pink to pure white. [= RAB, C, F, FNA, G, K, S, W, WV, Z]
10. Nigella Linnaeus 1753 (Fennel-flower)

* Nigella damascena Linnaeus, Love-in-a-mist, Fennel-flower. Cultivated in gardens, rarely persistent or escaping; native of s. Europe. [= C, F, FNA, G, K]

11. Helleborus Linnaeus 1753 (Hellebore, Christmas-rose)

Identification notes: Other species of Helleborus are increasingly being cultivated; all have the potential to naturalize.

1 Primary leaves of mature (fertile) plants all cauline; leaf segments <1.5 cm wide, flowers <3 cm across, >9 per inflorescence .............. H. foetidus
1 Primary leaves of mature (fertile) plants basal (the stem with reduced, bracteal leaves subtending the inflorescence); leaf segments >3 cm wide, flowers >4 cm across, (1-) 3 (-5) per inflorescence ................................................................. H. viridis

Helleborus foetidus Linnaeus, Stinking Hellebore. Cultivated in gardens, seeding down and spreading locally near plantings; native of Europe. December-March. [= K2]

* Helleborus viridis Linnaeus, Green Hellebore, Christmas-rose. Mt (VA, WV), Pd (NC): cultivated in gardens, seeding down, rarely escaped or persistent; rare, native of Europe. December-May. [= C, F, FNA, G, K1, K2, S, WV]

12. Eranthis Salisbury 1808 (Winter-aconite)

13. Actaea Linnaeus 1753 (Baneberry)

Identification notes: In rich coves, Actaea occurs with and is sometimes mistaken for (especially when in vegetative condition) various other superficially similar genera, including Astilbe (Saxifragaceae), Aruncus (Rosaceae), Caulophyllum (Berberidaceae), Angelica and Ligusticum (Apiaceae), Aralia (Araliaceae), and others. The curious evolutionary convergence of leaf morphology (to a 2-3-ternately compound form) of a large number of unrelated genera of Appalachian cove forests is interesting.

1 Plant with leaves only present.
2 Terminal leaflet deeply cordate, mostly >12 cm wide, with 7-9 major veins arising palmately from the base; principal leaves with 3-9 (-17) leaflets; [section Oligocarpae] ........................................................................................................................................ A. rubifolia
Actaea pachypoda

Eliott, White Banberry, Dolls'-eyes, White Cohosh. Rich cove forests and slopes. April-May; August-October. QC and MN south to c. GA, FL Panhandle, s. AL, s. MS, e. LA, and OK. = RAB, F, FNA, K, W, Z; = A. alba (Linnaeus)

Actaea racemosa

Actaea rubifolia

(Kearney) Kartesz, Appalachian Black-cohosh. Rich cove forests over calcareous rocks (limestone or dolostone). August-October. Sw. VA south to e. TN; disjunct in s. IL, w. KY, and nw. TN. This species is alleged by C (1991) to occur in NC, but this is probably an error, based on confusion with Cimicifuga cordifolia Pursh, now considered a form of Actaea racemosa. For this reason, the name Actaea cordifolia used by Compton, Culham, & Jury (1998) does not apply to this taxon. Actaea rubifolia is related to Actaea elata (Nuttall) Prantl of nw. North America. = K; = Cimicifuga rubifolia Kearney – C, FNA, S, W; > C. racemosa var. cordifolia (Pursh) A. Gray – F; misapplied in part; > C. racemosa var. racemosa – F; < C. racemosa – G (also see C. rubifolia); > Actaea racemosa Linnaeus var. racemosa – K, Z; > Actaea racemosa Linnaeus var. dissecta (A. Gray) J. Compton – K, Z

Actaea rubra

14. Calthta Linnaeus 1753 (Marsh Marigold, Cowslip)

Caltha palustris Linnaeus var. palustris, Marsh Marigold, Cowslip. Bogs, wet meadows, seepage swamps, brookbanks. April-June. Caltha palustris is circumboreal, widespread in n. Eurasia and n. North America, south in e. North America to e. VA, w. NC, ne. TN, WV, IN, IL, IA, and NE. Caltha palustris is polymorphic; one or more additional varieties (some of them sometimes recognized as separate species) are more northern. Eastern North American material is apparently uniformly 2n=32 (Keener 1977). = G, GW, K; < C. palustris – RAB, C, F, FNA, S, W; C. palustris var. flabellifolia (Pursh) Torrey & A. Gray

15. Anemone Linnaeus 1753 (Anemone)

A genus of about 140-200 species (depending on circumscription), perennial herbs (rarely shrubs), of Eurasia, North America, Central America, South America, and Africa. Hoot, Reznicek, & Palmer (1994) discuss the phylogeny of Anemone, and also
suggest that *Hepatica* be included within it. References: Dutton, Keener, & Ford in FNA (1997); Keener, Dix, & Dutton (1996); Tamura in Kubitzki, Rohwer, & Bittrich (1993); Steyermark & Steyermark (1960)=Z; Ziman et al. (2004)=Y.

1 Basal leaves lobed but not fully divided into 3 or more leaflets; [subgenus *Anemodium*].
2 Leaves lobed, and also toothed and variously cleft; leaves not variegated; [section *Anemodium*]................................. *A. canadensis*
3 Leaves 3-7 lobed, the lobes acute, the primary sinuses deep, over halfway to the petiole (the middle lobe 70-90% of the total length of the leaf blade); involucral bracts acute ................................................................. *A. acutiloba*
4 Leaves 3-lobed, the lobes broadly rounded, the primary sinuses less deep, about halfway to the petiole (the middle lobe 50-70% of the total length of the leaf blade); involucral bracts obtuse................................................................. *A. americana*

1 Basal leaves compound, fully divided into 3 or more leaflets.
4 Stem branched, 4-11 dm tall, bearing 2 or more flowers; involucral bracts petiolate; [subgenus *Anemone*; section *Anemone*; group *Multipeda*].
5 Base of involucral bracts usually truncate to subtruncate, sometimes reniform or cordate, terminal leaflets deep green, margins proximally concave- to straight-sided, distally incised, thinly pubescent; anthers typically < 0.8-1.2 (-1.5) mm long; heads of achenes more or less ovoid-cylindric, 8-10 (-11) mm in diameter ................................................................. [*A. virginiana var. alba*]
6 Base of involucral bracts cordate or reniform, rarely subreniform, terminal leaflets light green, margins proximally mostly straight- to convex-sided, variously lobed or serrate, variously pubescent; anthers typically > (0.9-) 1.1-1.5 (-1.7) mm long; heads of achenes ovoid to ovoid-cylindric, (9-) 10-12 (-14) mm in diameter ................................................................. *A. virginiana var. virginiana*

4 Stem unbranched, 0.5-4 dm tall, bearing 1 flower.
6 Sepals (5-) 8-20, cream-white, violet, blue, pink, or green; involucral leaves sessile; [subgenus *Anemone*; section *Anemone*; group *Coronaria*].
7 Stem densely pubescent above and below the involucr; involucre above the midpoint of the stem at anthesis; plant from a globose, vertically oriented bulb; involucral leaflets linear, (1.5-) 3-6 cm long, 1-4 (-6) mm wide; achene bodies > 2.7-3.5 mm long ....................

A. berlandieri
8 Sepals 5 (8), white; involucral leaves petiolate, the leaflets ovate, obovate, elliptic, lanceolate, or oblanceolate 2-8 cm long, 8-30 mm wide; [subgenus *Anemonantha*, section *Anemonantha*, series *Quinquefoliae*].
9 Ovaries and achenes with hairs 0.1-0.2 mm long; terminal leaflet broadest at or below the middle (lanceolate or ovate), serrate or serrate only above the middle; sepals 15 mm or more long ........................................................................................................... *A. lancifolia*
10 Ovaries and achenes with hairs 0.5-1.0 mm long; terminal leaflet broadest at or above the middle (elliptic, oblanceolate, or obovate), serrate only above the middle; sepals < 15 mm long.
11 Achene bodies 2.5-3.0 mm long; lateral leaflets of radical leaves toothed only (rarely lobed); terminal leaflet usually broadest at the middle; styles 0.5-1 mm long; sepals about 8 mm long .................................................................................................................... *A. minima*
12 Achene bodies 3.0-4.5 mm long; lateral leaflets of radical leaves lobed or cleft (sometimes only toothed); terminal leaflet usually broadest above the middle; styles 1-2 mm long; sepals 6-15 mm long........................................................................................................... *A. quinquefolia*

*Anemone americana* (A.P. de Candolle) H. Harv, Round-lobed Hepatica, Round-lobed Liverleaf. Moist forests. February-May. NS, s. QC, s. ON, and MB south to Panhandle FL, AL, MS, and AR. The two taxa of "Hepatica" seem entirely distinct in our area; they are described as hybridizing freely or merging indistinguishably in other parts of their ranges. They are also both closely related to the European *H. nobilis* P. Miller. Steyermark & Steyermark (1960) chose to treat the three entities as varieties of *H. nobilis*. I prefer to retain them at the specific level. [= FNA, WH, WH; = Hepatica americana (A.P. de Candolle) Ker-Gawler – RAB, C, F, G, W, WV, = Hepatica nobilis P. Miller var. obtusa (Pursh) Steyermark – K, Z, = Hepatica hepatica (Linnaeus) Karsten – S]

*Anemone berlandieri* Przetl, Eastern Prairie Anemone, Ten-petal Anemone. Thin, circumneutral soils around rock outcrops, calcareous hammerocks (in FL). March-April. *A. berlandieri* and *A. caroliniana* have been much confused in florals; see Joseph & Heimbarger (1966) for clarification. *A. berlandieri* is primarily a species of midwestern prairies, occurring from n. AR and s. KS south through OK to c. LA and s. TX; disjunct eastwards in AL, c. GA, n. FL, c. NC, c. SC, and sc. VA. It reaches its northeastern limit (and only VA occurrence) at calcareous mudstone cliffs on the Banister River in Pittsylvania County, VA; it is scattered in the Piedmont of NC on a variety of rock types, including mafic meta-argillite and plagioclase-rich granite. [= FNA, K, WH, < A. caroliniana Walter – RAB, C, F, G, S, W; ? A. heterophylla Nuttall ex Torrey & Gray; < A. decapetala Arduino, misapplied (a South American species)]

*Anemone blandia* Schott & Kotschy, Greek Anemone. Reported by Harvill et al. (1992) from Madison County, VA and for Faquier County, VA by Shetler & Orli . It is not known whether this species is established in our area. [make sure this is not a misidentified specimen of *A. berlandieri* – see FNA p. 140] [= FNA, K] [not yet keyed; not mapped; rejected]

*Anemone candelensis* Linnaeus, Canada Anemone. Moist forests. May-August. QC west to AB, south to MD, w. VA, s. WV, e. TN (Chester, Wofford, & Kral 1997), KY, MO, and NM. [= C, F, FNA, G, K, W]

*Anemone caroliniana* Walter, Prairie Anemone, Carolina Anemone. Clayey soils of post oak and blackjack oak woodlands (firedell soils), wet woodlands. Ranging primarily in the Midwest, north in the Southeast to disjunct locations in c. and sc. GA, c. SC, c. TN (Chester, Wofford, & Kral 1997), and sc. NC. [= FNA, K, < A. caroliniana Walter – RAB, C, F, G, S, W (also see A. berlandieri)]

Identification notes: Additional species of Clematis, of Asian or European origin, are cultivated as ornamentals and might be encountered.

1 Flowers numerous, in compound cymose-paniculate inflorescences; sepals white; filaments glabrous; [subgenus Clematis].

2 Flowers perfect, with 5-10 carpels; anthers 1.5-3 mm long; leaf margins entire (rarely cleft); leaflets (3-) 5 (-7); [alien, in disturbed areas].

3 Leaves 3-foliolate; pistillate flowers with 18-35 carpels ........................................................................................................ C. virginiana

4 Leaves (most or all of them) simple, sessile or subsessile; plant an erect herb to 7 dm tall; [subgenus Clematis].

5 Leaves glabrous and glaucous beneath, the uppermost completely pinnate and tendril-bearing ........................................ C. addisonii

6 Leaves of flowering material soft-pubescent beneath, the largest 3.5-11 cm wide, with stomates on the lower surface only; leaves of flowering material usually light green with the secondary and tertiary veins forming prominent reticulations on the upper surface. [of shale barrens and calcareous woodlands of W. VA] ........................................................................ C. ochroleuca

7 Stems and leaves usually densely sericeous-woolly; leaf blades 0.2-2.5 (-3.5) cm wide, not notably reticulate on the upper surface; [of wet pinelands of N. FL southwards] ................................................ C. baldwinii

8 Sepals tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of W. VA and WV].

9 Leaf blades 0.2-2.5 (-3.5) cm wide, not notably reticulate on the upper surface; [of wet pinelands of n. FL southwards] ........................................................................................................ C. baldwinii

10 Leaf blades 3.5-11 cm wide, prominently reticulate on the upper surface; [of shale barrens of W. VA and WV].

11 Sepals thin in texture, 3-5 cm long, soft-villous, neither apically recurved nor with broad, strongly crisped margins; leaves 3-foliolate; [subgenus Atractogene] ........................................................................................................ C. occidentalis var. occidentalis

12 Sepals thick in texture, 1-3 cm long, short-sericeous, apically recurved; leaves 1-11-foliolate; [subgenus Viorna].
12 Lower surface of leaves glaucous and glabrous (rarely with a few scattered hairs).
13 Plant an erect or ascending herb; lower leaves simple, upper leaves simple to 2-6-foliolate; [of dry limestone glades, endemic to VA] ......................... C. addisonii
13 Plant a climbing vine; all leaves generally compound, often 6-10-foliolate; [of various habitats, ranging from NC south].
14 Leaf blade thin in texture; secondary and tertiary veins not prominently reticulate. [C. glaucoaphylla
14 Leaf blade leathery in texture; secondary and tertiary veins prominently reticulate; [in the Ridge and Valley of eastern TN and westward] ......................... C. versicolor

12 Lower surface of leaves not glaucous, pubescent (rarely nearly glabrous).
15 Plants erect, to 2-3 (-5) dm tall, forming clonal patches by underground rhizomes; leaflets linear-lanceolate, averaging ca. 10+ as long as wide .............................................................. C. sociatis
15 Plants viny, sprawling or climbing, the stems usually over 1 m long, not rhizomatous-clonal; leaflets generally broader.
16 Leaves coriaceous, the secondary and tertiary veins forming prominent reticulations on the upper surface.
17 Leaf blade coarsely reticulate-veined, the ultimate closed areoles mostly > 2 mm long in the longer dimension, the tertiary and quaternary veins not prominently raised; achene beak sparsely pubescent to silky, with ascending or appressed hairs.............. C. pitcheri var. pitcheri
17 Leaf blade finely reticulate-veined, the ultimate closed areoles mostly < 2 mm long in the longest dimension, the tertiary and quaternary veins often prominently raised; achene beak plumose, with spreading hairs .............................................. C. reticulata
16 Leaves membranous, the secondary and tertiary veins forming faint, indistinct reticulations on the upper surface.
18 Sepals 2.5-5 cm long, the tips widely spreading, the upper margins thin, crisped, to 6 mm wide; peduncles usually without bracts ......................................................... C. crispa
18 Sepals 1.5-3 cm long, the tips either abruptly and shortly recurved (C. viorna) or spreading to short-reflexed (C. morefieldii), the upper margins not thin or crisped, to 2.5 mm wide; peduncles usually with bracts.
19 Stems with cobwebby pubescence; bracts near the base of the peduncle; sepals densely silky-pubescent on the outer surface, pinkish-green; [limestone habitats of n. AL and se. TN] .......................................................... C. morefieldii
19 Stems glabrous to sparsely pilose; bracts well above the base of the peduncle; sepals sparsely pubescent on the outer surface, pale lavender to purple; [widespread in our area] .................................................................................. C. viorna

Clematis albica S. Watson. Calcareous flatwoods. E. MO, s. MO, nc. KS and sc. NE; disjunct in the Ridge and Valley of nw. GA (Floyd County) and se. TN; Hamilton County. See Anonymous (2003) and Horn & Shaw (2007) for additional information. [= FNA, K; = Coriflora albica (S. Watson) W.A. Weber]

Clematis baldwinii Torrey & A. Gray, Pine-hyacinth, Flatwood Clematis. Wet pine flatwoods. April-August. Ne. FL south to s. FL. [= FNA, GW, WH; = Clematis baldwinii var. baldwinii – K2; = Clematis baldwinii var. lattisscula R.W. Long – K2; = Viorna baldwinii (Torrey & A. Gray) Small – S; = Coriflora albica (Torrey & A. Gray) W.A. Weber] [not yet keyed]

Clematis catesbyana Pursh, Coastal Virgin's-bower, Satin-curts. Dunes and interdune swales with abundant shell hash, calcareous woodlands and thickets, calcareous hammocks. July-September. Se. VA south to c. peninsular FL and west to LA, and inland especially in calcareous parts of c. TN and n. AR and s. MO, as well as in the Ridge and Valley of VA and disjunct at Linville Caverns, McDowell County, NC, where on dolomite in a geologic window in the Blue Ridge. [= C, FNA, GW, K, WH; = Clematis ligusticifolia Nutall – RAB, misapplied; = Clematis catesbyana – S; = Clematis micrantha Small – S]

Clematis coactilis (Fernald) Keener, Virginia White-haired Leatherflower. Shale barrens, shaly woodlands, dry calcareous barrens and woodlands. May-June. Endemic to w. VA (Botetourt, Craig, Giles, Montgomery, Pulaski, Roanoke, and Wythe counties). [= C, FNA, K, Wh; = Clematis albica (Wherry) var. coactilis Fernald – F; = Coriflora species I]

Clematis crispa Linnaeus, Marsh Clematis, Southern Leatherflower, Blue Jasmine. Marshes, swamps, floodplain forests, disturbed wet or moist areas. April-August. Widespread in Southeastern United States, FL to TX, north to se. VA and s. IL. [= RAB, C, F, FNA, G, GW, K, Wh; = Viorna crispa (Linnaeus) Small – S; = Coriflora crispa (Linnaeus) W.A. Weber]

Clematis fremontii S. Watson. Calcareous flatwoods. E. MO, s. MO, nc. KS and se. NE; disjunct in the Ridge and Valley of nw. GA (Floyd County) and se. TN (Hamilton County). See Anonymous (2003) and Horn & Shaw (2007) for additional information. [= FNA, K; = Coriflora fremontii (S. Watson) W.A. Weber]

Clematis glaucoaphylla Small, White-leaved Leatherflower. Wet hammocks, habitat in our area poorly known, also probably in dry woodlands or openings over calcareous rocks, according to RAB in "rich woods". May-September. Widespread in Southeastern United States, from se. TN and OK, south to FL Panhandle and LA, but apparently rare and poorly known. Previous attributions of this species for NC, SC, KY, and (perhaps) VA appear to be based on misidentifications. [= RAB, C, F, FNA, G, GW, K, WH; = Viorna glaucoaphylla (Small) Small – S; = Coriflora glaucoaphylla (Small) W.A. Weber]

Clematis morefieldii Kral, Morefield's Leatherflower. Limestone habitats. Endemic to nc. AL and se. TN. See Estes & Fleming (2006) for additional information. [= FNA, K; = Coriflora morefieldii (Kral) W.A. Weber]
RANUNCULACEAE

**Clematis occidentalis** (Hornemann) A.P. de Candolle var. occidentalis, Purple Clematis, Mountain Clematis. Rocky slopes over mafic rocks (greenstone, amphibolite), known positively in NC only from amphibolite peaks in Ashe County. May-June. Var. occidentalis is widespread in NE. North America, from NB west to w. ON, south to NJ, DE, OH, nw. IL, and ne. IA, and in the mountains to w. VA and w. NC. Two other varieties occur in the Rocky Mountains. Fernald's var. cacuminis, published under *C. verticillaris*, described plants from the mountains of VA and NC; it is apparently merely a form based on material in early flower (Pringle 1971). [= FNA, K; < *Clematis verticillaris* A.P. de Candolle – RAB, G; < *Clematis occidentalis* – C, W; > *Clematis verticillaris* var. verticillaris – F; > *Clematis verticillaris* A.P. de Candolle var. cacuminis Fernald – F; < *Atragene americana* Sims – S]

**Clematis ochroleuca** Aiton, Curlyheads. Dry woodlands and woodland borders, generally over mafic or calcareous rocks, such as diabase, gabbro, or calcareous siltstone. April-June. Primarily Piedmont: C. MD south to ec. GA; disjunct on Long Island, NY. [= RAB, C, F, FNA, G, K, W; = *Viorna ochroleuca* (Aiton) Small – S; = *Coriflora ochroleuca* (Aiton) W.A. Weber] **Clematis pitcheri** Torrey & A. Gray var. pitcheri, Bellflower Leatherflower. Limestone glades and barrens. April-October. IN, IL, IA, and e. NE south to w. KY, c. TN, ne. MS, AR, TX, and NM. [= FNA, K; < *Viorna pitcheri* (Torrey & A. Gray) Britton – S]

**Clematis reticulata** Walter. Dry, sandy woodlands, such as longleaf pine sandhills and dry hammocks. May-August. Se. SC south to c. peninsular FL, west to TX, and north in the interior to TN and AR. [= RAB, FNA, K, WH; = *Viorna reticulata* (Walter) Small – S; = *Coriflora reticulata* (Walter) W.A. Weber]

**Clematis versicolor** Small ex Rydberg, Pale Leatherflower. Calcareous barrens. June-August. Sc. KY, c. TN, nc. AL; Ozarks and Ouachitas of s. MO, n. and c. AR, and e. OK south into c. TX. [= FNA, K; = *Viorna versicolor* (Small ex Rydberg) Small – S; = *Coriflora versicolor* (Small ex Rydberg) W.A. Weber]

**Clematis viorna** Linnaeus, Northern Leatherflower, Vase-vine. Mesic forests, woodlands, thickets, especially over mafic rocks. May-September. PA, IL, and MO south to GA, AL, MS, and AR. [= RAB, C, F, FNA, G, K, W; > *Viorna beadlei* (Linnaeus) Small – S; > *Viorna flaccida* (Small) Small – S; > *Viorna gattingeri* (Small) Small – S; > *Coriflora viorna* (Linnaeus) W.A. Weber; > *Coriflora beadlei* (Small) W.A. Weber]

* **Clematis virginiana** Linnaeus, Virgin's-bower. Moist forests, thickets, and openings. July-September. Noca Scotia, ON and MB, south to c. peninsular FL and TX. Vegetatively, this species can be distinguished from *C. viorna* and *C. crispa* (the other common and widespread species in our area) by its leaves with three relatively symmetrical leaflets (vs. leaves with 3-many irregular leaflets). [= RAB, C, FNA, GW, K, S, WH; ? *C. virginiana* var. virginiana – G]

* **Clematis vitalba** Linnaeus, Traveler's Joy. Disturbed areas, persistent after cultivation; native of e. Asia. Reported for Baltimore County, MD (Kartesz 2010). [= FNA, K2] [not yet keyed]

**Clematis viticaulis** Steele, Millboro Leatherflower. Shale barrens and shaly woodlands. May-June. Endemic to w. VA (Augusta, Bath, and Rockbridge counties). [= C, F, FNA, G, K, W; = *Coriflora viticaulis* (Steele) W.A. Weber]

* **Clematis viticella** Linnaeus, Italian Clematis. Disturbed areas, persistent after cultivation; native of Europe. Reported for TN (Pringle in FNA 1997). [= FNA, K; *Viticella viticella* (Linnaeus) Small] [not yet keyed]

1 Basal leaves deeply (over halfway to nearly all the way to the petiole) 5-9-lobed, the lobes oblanceolate, membranous (to fairly stiff when growing in an exposed setting), each lobe further divided into 2-4 lobules, the margin regularly crenate/dentate, venation highly reticulate; cauline leaves unlobed to shallowly 3-5-lobed, lobes deltoid; [endemic to Ridge and Valley of TN].................................................................................................................................................... T. caroliniensis

Trautvetteria caroliniensis (Walter) Vail, Tassel-rue, False Bugbane. Streambanks, seepages, grassy balds, moist forests, swamp forests, very rarely in calcareous longleaf pine savanna ecotones. Late May-July. Sw. PA and KY to GA, AL, and Panhandle FL, primarily in the Southern and Central Appalachians, disjunct on calcareous sites in AR (Sundell et al. 1999), e. TX (Floden 2011), IN, IL, and MO. The discovery of this species in the edge of a calcareous savanna (Camp Branch Savanna, Brunswick County, NC) in the outer Coastal Plain was surprising; the small population has since apparently been destroyed by intensive silvicultural practices. T. nervata Greene, named from the Coastal Plain of s. GA, needs additional evaluation (Floden 2011); the type specimen is striking in its deeply and multiply divided leaf segments. [= G, S, Z; < T. caroliniensis – RAB, F, FNA, GW, W, WV; = T. caroliniensis var. caroliniensis – C, K; > T. nervata Greene

Trautvetteria species 1. Dolomitic fens. Endemic (so far as known) to Claiborne County, ne. TN.

18. Ficaria Schaeffer 1760 (Lesser Celandine)

1 Leaves up to 8 cm long and 9 cm wide; petioles up to 28 cm long; petals 17-26 mm long, 4-15 (-18) mm wide; achenes 3-5 mm long, 2-3.5 mm wide.
2 Stem robust and erect; bulbils absent in leaf axils after flowering; petals 9-15 (-18) mm wide......................F. verna ssp. chrysocephala
2 Stem rather robust, but straggling; bulbils present in leaf axils after flowering; petals 4-12 mm wide......................F. verna ssp. ficariformis
1 Leaves up to 4 cm long and 4 cm wide; petioles up to 15 cm long; petals 6-20 mm long, 2-9 mm wide; achenes 2.5-3.5 mm long, 1.7-2.2 mm wide.
3 Leaves crowded at base with few on short stems; petiole to 10 cm long; petals 2.5-6 mm wide......................F. verna ssp. calthifolia
3 Leaves less crowded at base and more numerous on the elongating stem; petiole to 15 cm long (at least some on a plant > 10 cm long); petals 2-9 mm wide.
4 Bulbils not present in leaf axils after flowering; achenes well-developed; petals 4-9 mm wide......................F. verna ssp. fertilis
4 Bulbils present in leaf axils after flowering; achenes poorly developed (rarely fertile, and then only several per flower); petals 2-5 mm wide

**385**

- C, F, FNA, G; ‹ R. ficaria var. bulbifera Marsden-Jones – K; = Ranunculus ficaria Linnaeus ssp. ficariiformis (F.W. Schultz) Rouy & Foue. – Z]  

19. **Myosurus** Linnaeus 1753 (Mousetail)

**Myosurus minimus** Linnaeus, Mousetail. Usually in disturbed areas, such as fields in floodplains. March-May. The species is circumboreal and also found in various places in the Southern Hemisphere. Widely distributed in North America, Eurasia, and the Southern Hemisphere. A number of subspecies have been described; if these are recognized, our material is the typic ssp. minimus. The pre-Columbian occurrence of Myosurus in our area is uncertain; it may well be an alien, early introduced from sc. North America. [= RAB, C, F, FNA, G, GW, K, S; > M. minimus ssp. minimus – Z]

20. **Ranunculus** Linnaeus 1753 (Buttercup, Crowfoot, Spearwort)

A genus of about 600 species, perennial and annual herbs, nearly cosmopolitan (most diverse in temperate and boreal regions of the Northern Hemisphere). The subgenera are distinctive and have often been recognized at the generic level; two are represented in our area (after removal of Ficaria as a separate genus). Distributions given in many works (including Harvill et al. 1992) for the *R. hispidus* complex are apparently garbled by differences in taxonomic concepts. I am here following Duncan's (1980) taxonomic entities, though some of his varieties as species. References: Whittemore in FNA (1997); Duncan (1980)=Z; Keener (1976)=Y; Keener & Hoot (1987)=X; Paun et al. (2005); Tamura in Kubitzki, Rohwer, & Bittrich (1993).

**Identification notes**: Mature or relatively mature achenes are necessary for the identification of some species. Shape and pubescence of the receptacle is also a frequently used taxonomic character, best judged by stripping off the achenes.

1 Petals dull, white; achenes roughly transverse-ridged; plants aquatic, the leaves finely dissected to merely shallowly lobed; [native, occurring in circumboreal waters]; [subgenus *Batrachium*] ................................................................................................................. Key A
2 Petals shiny, yellow (sometimes fading or bleaching to white); achenes usually not transverse-ridged (though often variously ornamented); plants aquatic or terrestrial, the leaves various; [native or introduced, occurring in various habitats]; [subgenus *Ranunculus*].
3 Cauline leaves all simple, mostly lanceolate, either entire, denticulate, or serrate, but not lobed or deeply divided; [native, occurring in marshes or other wetlands]; [section *Flammula*] ............................................................................................................................... Key B
4 Cauline leaves (at least most them) lobed, divided, or compound; [native or introduced, occurring in various habitats].
5 Basal leaves mostly deeply parted or compound, the cauline leaves generally similar but smaller and often less divided; achenes various, 1-5 mm long, with or without pronounced marginal rims; petals 1.5-6.5 mm long; [native, occurring in mesic to dry forests and woodlands, and also (especially *R. abortivus*) weedy]; [section *Epirotes*] .................................................................................................................. Key C
6 Basal leaves not divided, mostly cordate, reniform, or ovate (and merely toothed), distinctly unlike the deeply divided cauline leaves; achenes turgid, ovoid, 1-2.5 mm long, without pronounced marginal rims; petals 1.5-6.5 mm long; [native or introduced, occurring in various habitats]; [section *Echinella*] ............................................ Key D
7 Achenes markedly spiny, papillose, or tuberculate (the protuberances few and small in *R. sardous*, keyed both here and below); [introduced, usually weedy and in disturbed habitats]; [section *Echitella*] .................................................................................. Key E
8 Achenes smooth (rarely pubescent or papillose); [native or introduced, occurring in various habitats].
9 Achenes turgid, 1-1.5 (-2) mm long, the marginal rims scarcely or not at all evident, the achenes corky-thickened at their bases for dispersal by floating; [of mucky marshes or ditches, or aquatic in pools]; [section *Hecatonia*] .................................................................................. Key F
10 Achenes moderately turgid or flattened, 1.5-3.8 mm long, with a pronounced (at 10× or more) marginal rim appearing as a differentiated border or flange, more-or-less flattened, and separated from the central bulge of the achene by a concavity or even a groove, the achenes not coryck-thickened at their bases; [of mostly terrestrial or in bottomland forests]; [section *Ranunculus*] ......... Key G

**Key A – subgenus *Batrachium* (White Water Crowfoots)**

1 Leaves floating, shallowly lobed; receptacles glabrous ............................................................ *R. hederaceus*
2 Leaves firm (not collapsing when removed from water); free petals much shorter than the dilated stipular base; leaves usually much shorter than the internode above; achene beaks 0.7-1.5 mm long .... *R. longirostris*

**Key B – subgenus *Ranunculus*, section *Flammula* (simple-leaved buttercups) (Spearworts)**

1 Petals 1-3 (-5), 1-2 mm long, about as long as the sepals; annual .................................................. *R. pusillus*
Key C – subgenus Ranunculus, section Epirotes

1 Petals 4-5.9, distinctly longer than the sepals; annual or perennial.
2 Cauline leaves 6-14 cm long; sepals 4-7 mm long; achene beak 1.0-1.3 mm long ...................................................... R. ambiguens
2 Cauline leaves 1-6.5 cm long; sepals 1.5-4 mm long; achene beak 0.1-0.6 mm long.
3 Cauline leaves linear, < 1 mm wide; achenes 1.2-1.6 mm long .......................................................... R. flammula var. reptans
3 Cauline leaves ovate to lanceolate, 4-24 mm wide; achenes 0.8-1.0 mm long ...................................................... R. lasticculus

Key D – subgenus Ranunculus, section Echinella

1 Flowers sessile, opposite the petioles; sepals 3; petals 3 ........................................................................................................ R. platensis
1 Flowers pedunculate, axillary; sepals usually 5; petals usually 5.
2 Petals 1-2 (-3) mm long; receptacles glabrous ................................................................................................. R. parviflorus
2 Petals (3-) 4-12 mm long; receptacles pubescent.
3 Achenes bodies 1.5-3 mm long, 30-60 per head; achene beak ca. 0.5 mm long; achene with conical protuberances or short spines, to 0.16 mm long; achene beak 0.1-0.5 mm long.
4 Achenes with a few conical protuberances; petals 5-12 mm long; plant sparsely to densely hirsute; achenes 30-40 per head .............. R. sardous
4 Achenes with numerous short spines; petals (3-) 4-5 mm long; plant with a few, widely scattered, long hairs; achenes 40-60 per head..
5 Achenes 3-5 mm long, 4-20 per head; achene beak 1.5-3.0 mm long; achene conspicuously spiny, the longer spines mostly 0.30-0.85 mm long.
5 Achenes 4-9 per head, in a single whorl; achene margins spiny, as also the faces; beak of the achene 2.5-3 mm long.............. R. arvensis
5 Achenes 10-20 per head, in several whorls; achene margins smooth, the spines restricted to the faces; beak of the achene 1.5-2.5 mm long............................................................. R. micranthus

Key E – subgenus Ranunculus, section Hecatonia

1 Petals 6-14 mm long; achene body 1.3-2.5 mm long, the beak 0.7-1.5 mm long; plants with submersed leaves dissected into numerous linear segments; [aquatic] ........................................................................................................... R. flabellaris
1 Petals 2-4 (-5) mm long; achene body 0.8-1.2 mm long, the beak 0-0.1 mm long; plants without distinctive, dissected submersed leaves; [terrestrial or semi-aquatic] .................................................................................. R. scleratus var. scleratus

Key F – subgenus Ranunculus, section Ranunculus

1 Petals 2-6 mm long, about as long as the sepals.
2 Basal leaves simple; achene beak strongly hooked ................................................................. R. recurvatus var. recurvatus
2 Basal leaves 3-foliate; achene beak straight or nearly so.
3 Petals 4-6 mm long, 3.5-5 mm wide; achene beak 1.0-1.2 mm long; [WV northwards] .................................................................. R. macounii
3 Petals 2-4 mm long, 1.25 mm wide; achene beak 0.6-0.8 mm long; [widespread] ......................................................................... R. pensylvanicus
1 Petals 5-15 mm long, (1.3-) 1.5× or more as long as the sepals; achene beak straight, flexuous, slightly curved, or hooked, 0.2-3.0 mm long.
4 Achene beaks recurved or hooked, the stigmatic surface elongate, along the upper (curved) side of the style (beak) (visible at 10×): [introduced, usually weedy in disturbed habitats].
5 Stems erect, not rooting at the nodes ................................................................. R. repens
5 Stems erect, not rooting at the nodes.
6 Petals 5-8 mm long; plant a soft-based annual; achene face usually with at least a few conical protuberances (if examined carefully at 10× or more) ................................................................. R. sardous [of section Echinella]
6 Petals 8-16 mm long; plant a cormose or hard-based perennial; achene face truly smooth.
7 Sepals spreading; stems not cormose-thickened at the base; larger leaves appearing (3-) 5-parted, all of the segments sessile; plant to 12 dm tall ................................................................. R. acri
7 Sepals tightly reflexed; stems cormose-thickened at the base; larger leaves pinnately 3-5-parted; terminal segment long-stalked; plant to 6 dm tall ........................................................ R. bulbosus
4 Achene beaks straight or slightly curved, flexuous, the stigmatic surface limited to the tip of the style (beak); [native, normally in more-or-less natural habitats].
8 Larger leaves mostly pinnately 3-7-foliate, the terminal leaflet larger than the lateral leaflets, the leaflets (especially the terminal) often further cleft or lobed, the blade usually longer than wide in outline, the segments often rather narrow; naked receptacle conical, tapering gradually to the apex (the region of stamina attachment as thick as the region of gynoecial attachment, which tapers through all or nearly all of its length, best seen by stripping off the achenes); rhizome regenerating totally each growing season, producing both fibrous and (at the end of the growing season) tuberous roots (1.3-4.9 mm in diameter); [rare in our area, in calcareous, mafic, or ultramafic sites with prairie affinities] ............................................................................... R. fascicularis
8 Larger leaves mostly palmately 3-foliolate, the terminal leaflet about the same size as the lateral leaflets, the leaflets sometimes further cleft or lobed, the blade usually as wide as long or wider; naked receptacle clavate or ellipsoid (the region of staminal attachment distinctly narrower than the region of gynoecial attachment, thus forming a waist, from which the gynoecial region expands and then tapers to the apex); rhizome regenerated partially each growing season, producing uniform, fibrous roots (up to 3.0 mm in diameter); leaves usually simple and ovate, or trifoliate with ovate leaflets; [collectively widespread in our area].

9 Achenes wide-margined (wider portions of the margin 1/4 to 2/3 as wide as the achene body); plants colonial, sending out stolons (by the time of fruiting) which root at the nodes, forming new plants; sepal reflexed at full anthesis ......................... R. carolinianus

9 Achenes narrow-margined (wider portions of the margin 1/8 or less as wide as the achene body); plants usually erect or repent by the time of fruiting (if repent sometimes forming adventitious roots at the nodes, but not generally developing new plants); sepal spreading at full anthesis (sometimes reflexed later).

10 Plants repent; aerial shoots 50-80 (-91) cm long at time of fruiting; [generally of swamps and marshes] ..................... R. caricosus

10 Plants erect; aerial shoots 14-45 (-60) cm long at time of fruiting; [generally of upland habitats] ......................... R. hispidus

Ranunculus abortivus Linnaeus, Kidneyleaf Buttercup. Low fields, disturbed areas, bottomlands, lawns, roadsides. (February-) March-June. NL (Labrador) to AK, south to FL, TX, and CO. A common weed in shady and sunny places. [= RAB, FNA, GW, K, S, W, WV, Y; > R. abortivus var. abortivus – C, F, G; > R. abortivus var. indivisus Fernald – F]

Ranunculus allegheniensis Brittton, Allegheny Buttercup, Mountain Crowfoot. Cove forests, rich forested slopes. April-June. MA west to OH, south to w. NC and ne. TN, an Appalachian endemic. [= RAB, C, F, FNA, GW, K, S, WV, Y]

Ranunculus bulbosus Linnaeus, Bulbous Buttercup. Fields, roadsides, disturbed areas; native of Europe. April-June. [= RAB, C, FNA, GW, K, S, W, WV, Y; > R. bulbosus var. bulbosus – F; > R. bulbosus var. dissectus Barbey – F; > R. bulbosus var. valdepabens (Jordan) Briquet – F]

Ranunculus caricosus Greene, Northern Swamp Buttercup, Marsh Buttercup. Swamplands and marshes. April-August. NB west to s. MB, south to n. NJ, n. OH, and s. MO; reports of this species further south are probably in error. This species is octoploid (n = 32); the remainder of the R. hispidus complex is tetraploid. [= R. hispidus Michaux var. caricosus (Greene) T. Duncan – C, FNA, K, Z; > R. septentrionalis Poiré – GW, W, Y; misapplied; > R. septentrionalis var. caricosus (Greene) Fernald – F; > R. septentrionalis var. pterocarpus Linnaeus Benson – G; > R. septentrionalis var. septentrionalis – F, G]

Ranunculus carolinianus A.P. de Candolle, Carolina Buttercup. Swamp forests, wet woodlands, open marshy wetlands. April-August. NY west to s. ON, WI, and MN, south to n. peninsular FL, LA, and e. TX. This species is tetraploid (n = 16). [= RAB, F, G, GW, W, WV, Y; = R. hispidus Michaux var. nitidus (Chapman) T. Duncan – C, FNA, K, Z; > R. palmatus Elliott – S; > R. septentrionalis – S]

Ranunculus fascicularis Muhlberg ex Bigelow, Thick-root Buttercup, Early Buttercup. Wet flats with prairie affinities (with Camassia scilloides), rocky barrens and glades over mafic rocks (such as gabbro or diabase), ultramafic outcrop barrens (over olivine), limestone barrens. March-June. MA and NY west to s. ON, MN, and se. MB, south to c. NC, ne. SC, sw. GA, and e. TX; occurrences which are both south of New England and east of the Appalachians are scattered and disjunct. This species is tetraploid (n = 16). [= C, FNA, GW, K, S, W, Y, Z; > R. fascicularis var. fascicularis – F, G]

Ranunculus flabellaris Rafinesque, Yellow Water Crow-foot. Pools in floodplains of small stream swamps, other stagnant or slowly moving waters. March-May. ME west to BC, south to ne. NC, KY, IN, IL, LA, OK, UT, and CA. [= RAB, C, F, FNA, G, GW, K, Y; = R. delphinifolius Torrey ex Eaton – S]

Ranunculus flammula Linnaeus var. reptans (Linnaeus) E. Meyer, Creeping Spearwort. Shallow water. Circumboreal, south in North America to NJ, WV, MI, MN, and WV. [= FNA; = R. flammula Linnaeus var. filiformis (Michaux) Hooker – C, G, K; = R. reptans Linnaeus var. reptans – F]

Ranunculus harveyi (A. Gray) Brittton. Forests and prairies. IN, IL, MO, and OK south to TN, AL, and LA. [= C, F, G; = R. harveyi var. harveyi – FVA, GW, K; < R. harveyi – C, F, G]
**Ranunculus hederaceus** Linnaeus, Ivy-leaved Water Crowfoot. Longstalked Crowfoot. Coastal brackish marshes, other circumneutral marshes. April-June. Se. PA south to SC on the Coastal Plain; disjunct in NL (Newfoundland); also in Europe. Perhaps questionable whether native in North America. [= RAB, C, F, FNA, G, GW, K, Y]

**Ranunculus hispidus** Michaux, Hairy Buttercup. Rich moist forests, creekbanks, mesic to dry woodlands and forests, bottomlands. March-June. MA and VT west to s. ON, n. IL, and se. KS, south to e. and c. NC, s. GA, s. AL, AR, and ne. OK. This species is tetraploid \((n = 16)\). [= RAB, GW, S, W, Y; \(= R. hispidus\) var. hispidus – C, FNA, K, Z; \(> R. hispidus\) var. falsus Fernald – F; \(> R. hispidus\) var. marilandicus (Poiret) L. Benson – G; \(> R. hispidus\) var. eurylobus L. Benson – F, G, WV]

**Ranunculus laxicaulis** (Torrey & A. Gray) Darby, Coastal Plain Spearwort. Marshes. April-June. DE south to sw. GA, west to TX, inland in the interior to w. TN, s. IN, s. IL, and KS, almost entirely on the southeastern Coastal Plain. \(R. subcordatus\) E.O. Beal, allegedly endemic to NC, is conspecific with \(R. laxicaulis\). [= RAB, F, FNA, G, K, W; \(? R. texensis\) Engelmann – C; \(> R. laxicaulis\) – GW, Y; \(? R. subcordatus\) E.O. Beal – GW, Y; \(? R. oblongifolius\) Elliott – S, misapplied]

**Ranunculus longirostris** Godron, White Water Crowfoot. Submerged in streams. Sw. QC west to SK, ID, and OR, south to DE, VA, KY, nc. TN, AL, AR, TX, NM, and AZ. [= C, F, GW, K, WV, Y; \(< R. aquatilis\) Linnaeus var. diffusus – FNA; \(? R. circinatus\) Sibthorp – G; \(< Batrachium trichophyllum\) – S, misapplied]

**Ranunculus macounii** Britton. Bogs, marshes. June. NL (Newfoundland) west to AK, south to MI, IA, TX, NM, AZ, CA; disjunct in WV. [= C, F, FNA, G, K, WV]

**Ranunculus micranthus** Nuttall, Small-flowered Buttercup, Rock Buttercup. Rich forests. April-June. MA west to SD, south to e. VA, e. NC, sc. TN, WV, OH, and OK. [= RAB, C, FNA, G, GW, K, S, W, WV, Y; \(> R. micranthus\) var. micranthus – F; \(> R. micranthus\) var. delitescens (Greene) Fernald – F]

**Ranunculus muricatus** Linnaeus. Ditches and marshes; native of Europe. April-June. [= RAB, FNA, GW, K, S, X, Y]

**Ranunculus pensylvanicus** Linnaeus f., Bristly Buttercup. Wet meadows, floodplans. NL (Newfoundland) west to AK, south to s. PA (Rhoads & Klein 1993), DE, DC, MD (Whittemore in FNA 1997), WV, OH, n. IN, n. IL, MN, and AZ; also in ne. Asia. [= C, FNA, G, K, WV]

**Ranunculus platensis** Sprengel. Lawns, ditches; native of South America. [= FNA, GW, K, X, Y]

**Ranunculus pusillus** Poiret, Low Spearwort. Marshes, ditches, other wet habitats. April-June. MA west to SD, south to e. VA, c. NC, sc. TN, WV, OH, and OK. [= RAB, C, FNA, G, GW, K, S, W, WV, Y; \(< R. aquatilis\) Linnaeus var. diffusus – FNA; \(? R. circinatus\) Sibthorp – G; \(< Batrachium trichophyllum\) – S, misapplied]

**Ranunculus recurvatus** Poiret var. recurvatus, Hooked Buttercup, Hooked Crowfoot. Bottomland forests, cove forests, swamps, mesic slope forests. April-June. ME and QC west to MN, south to sw. GA, MS, and OK. Var. tropicus (Grisebach) Fawcett & Rendle occurs in Puerto Rico {and elsewhere?}. [= FNA, K; \(< R. recurvatus\) – RAB, C, G, GW, S, W, Y; \(> R. recurvatus\) var. recurvatus – F, WV; \(> R. recurvatus\) var. adpressipilis Weatherby – F, WV]

**Ranunculus repens** Linnaeus, Creeping Buttercup, Meg-many-feet. Low meadows, disturbed areas; native of Europe. [= RAB, FNA, G, GW, K, S, W, Y; \(< R. repens\) var. repens – C, F, WV; \(> R. repens\) var. degeneratus Schur – C; \(> R. repens\) var. glabratius A.P. de Candolle – C, F; \(> R. repens\) var. pleniflorus Fernald – F, WV]

**Ranunculus sardous** Crantz, Sardinian Buttercup, Hairy Buttercup. Low fields, disturbed areas; native of Europe. April-July. [= RAB, C, F, FNA, G, GW, K, X, Y]

**Ranunculus sceleratus** Linnaeus var. sceleratus, Cursed Buttercup, Meg-many-feet. Marshes, ditches, and stream margins. June-September. The species is circumboreal, ranging south in North America (partly introduced, at least southward) to n. FL, LA, TX, and CA. Var. sceleratus is widespread and the only variety in e. North America; var. multifidus occurs in w. North America. The epithet is often misspelled "sceleratus." [= C, F, FNA, G, K; \(< R. sceleratus\) – RAB, GW, S, W, Y]
**RANUNCULACEAE**

*Ranunculus trichophyllus* Chaix var. *trichophyllus*, White Water Crowfoot. Submerged in water of acidic streams. *R. trichophyllus* is circumboreal, ranging south in North America to NJ, VA, nc. TN, PA, MN, SD, NM, AZ, and CA. Var. *trichophyllus* ranges south to the southern limit of the species. This taxon was reported as far south as NC by G and S; the documentation is unknown and the species was not treated by RAB. The more northern var. *calvescens* W. Drew, with the receptacle glabrous or with a few scattered hairs (vs. hirsute with tufted hairs), ranges south to PA and MI. [= C, F, K, < *R. aquatilis* Linnaeus var. *diffusus* Withering – FNA; < *R. trichophyllus* – WV, Y; ? *R. aquatilis* Linnaeus var. *capillaceus* (Thuill.) A.P. de Candolle – G; ? *Batrachium flaccidum* (Persoon) Ruprecht – S]

* Ranunculus trilobus Desfontaines. Fields, roadsides, ditches; native of sw. Europe. [= FNA, K, X, Y]

**116. NELUMBONACEAE** Dumortier 1829 (Lotus-lily Family) [in PROTEALES]

* Nelumbo Adanson 1763 (Lotus-lily, Lotus, Sacred-lotus, Sacred-bean)

Identification notes: *Nelumbo* can be immediately distinguished in vegetative condition from the other "pads" (*Nymphaea*, *Nuphar*, and *Nymphoides*) by its peltate leaves, and from the peltate *Brasenia* by the much larger size and roundness of the leaves.

1 Petals yellow; mature fruits (“nuts”) usually < 1.25× as long as wide ............................................................................................................ *N. lutea*
1 Petals pink or white; mature fruits (“nuts”) usually > 1.5× as long as wide .......................................................................................... *N. nucifera*

* Nelumbo lutea* Willdenow, Yonkapin, American Lotus-lily, Yellow Lotus, Yockernut, Water-chinquapin, Pond-nuts. Ponds, natural lakes. June-September. NY and s. ON west to MN and IA, south to s. FL and e. TX, and south into the West Indies and Mexico. [= RAB, C, F, FNA, G, GW, K, S, W, WV; *N. pentapetala* (Walter) Fernald]

**117. PLATANACEAE** Dumortier 1829 (Plane-tree Family) [in PROTEALES]

* Platanus Linnaeus 1753 (Plane-tree, Sycamore)

Identification notes: The exposed white inner bark on the middle and upper trunks make *Platanus* recognizable at long distances, especially in winter.

* Platanus occidentalis* Linnaeus, Sycamore, Plane-tree. Riverbanks and alluvial forests, streambanks, sometimes weedy on rocky roadcuts. April-May; September-November. S. ME west to s. ON, MI, and MN, south to w. FL and TX. One of the largest trees in e. North America, and probably the largest that is widespread in the Piedmont of our area. *P. palmieri* Kuntze, sometimes treated as *P. occidentalis* var. *palmieri* (Kuntze) Nixon & Poole ex Geerinck but better interpreted as a species (Grinn & Denk 2010), occurs from central TX south into Coahuila. [= Y; = *P. occidentalis* var. *occidentalis* – Z; < *P. occidentalis* – RAB, C, FNA, G, GW, K, S, W, WV; > *P. occidentalis* var. *occidentalis* – F; > *P. occidentalis* var. *glabrata* (Fernald) Sargent – F]
121. BUXACEAE Dumortier 1822 (Boxwood Family) [in BUXALES]

A family of 5 genera and about 100 species, mainly shrubs, mainly of the Northern Hemisphere. References: von Balthazar, Endress, & Qiu (2000); Channell & Wood (1987); Köhler in Kubitzki, Bayer, & Stevens (2007).

1 Plant a woody shrub; leaves opposite, < 1 cm wide .............................................................. Buxus
1 Plant a suffrutescent herb; leaves alternate, 1.5-7 cm wide ....................................................... Pachysandra

Buxus Linnaeus 1753 (Boxwood)

A genus of about 50-90 species, shrubs, of tropical to temperate areas of Europe, Africa, West Indies, Central America, and e. Asia; Köhler in Kubitzki, Bayer, & Stevens (2007).

* Buxus sempervirens Linnaeus, Boxwood. Persistent for decades at abandoned homesites; native of Europe. Popular for hedges and landscaping; also cultivated in the Mountains for wreathing. [= K]

Pachysandra Michaux 1803 (Pachysandra)

A genus of 4-5 species, 1 of e. North America, the others of e. Asia, suffruticose herbs and shrubs. References: Robbins (1968)=Z; Köhler in Kubitzki, Bayer, & Stevens (2007).

1 Leaves subcoriaceous, semi-evergreen, pubescent, mottled with several shades of green (more apparently so at some seasons than others); [native plant of rich forests] ................................................. P. procumbens
1 Leaves coriaceous, evergreen, glabrous, dark green; [cultivated alien plant, rarely persistent] ................................................. P. terminalis

Pachysandra procumbens Michaux, Mountain Pachysandra, Allegheny-spurge. Moist rich woods. March-April; July-August. C. KY south to w. NC, nw. SC, w. GA, Panhandle FL (Jackson County only), AL, MS, and e. LA (on loess in the Tunica Hills). Its distribution (and, for that matter, that of the genus as a whole) appears to be relictual and to reflect a poor ability to disperse itself and colonize new territory. Channell & Wood (1987) refer to P. procumbens as a "nonaggressive if not 'senile' species with a very low evolutionary potential." The only locations for this species in NC are in Polk County, NC, which has other notable disjunctions of species which normally occur west of the Blue Ridge (Veratrum woodii, Smilax lasioneura). [= RAB, C, F, G, K, S, W, WH, Z]

* Pachysandra terminalis Siebold & Zuccarini, Pachysandra, Japanese-spurge. Persistent after cultivation, and spreading vegetatively to adjacent forests; commonly cultivated, rarely persistent to naturalized, native of China and Japan. This species is a popular ground-cover, difficult to eradicate once well-established. [= RAB, C, F, G, K, Z]

127. ALTINGIACEAE Lindley 1846 (Sweet-gum Family) [in SAXIFRAGALES]

A family of 2 genera and about 12 species, trees, of e. Asia, Indomalaysia, e. North America, Central America, and e. Mediterranean. Various molecular studies show that Liquidambar is better separated from the Hamamelidaceae (Hoot, Magallón, and Crane 1999). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Hoot, Magallón, and Crane (1999).

Liquidambar Linnaeus 1753 (Sweet Gum)

A genus of 4-5 species, trees, north temperate, of e. North America, Central America (Mexico to Nicaragua), e. Asia (s. China, Taiwan, Vietnam), and e. Mediterranean (Turkey, Rhodos, Cyprus). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Li & Donoghue (1999).
**Liquidambar styraciflua** Linnaeus, Sweet Gum, Red Gum. Swamp forests, floodplains, moist forests, depresional wetlands, old fields, disturbed areas. April-May; August-September. CT west to s. OH, s. IL and OK, south to s. FL, TX, and Guatemala. One of the most spectacular of our trees in the fall; a single tree often has a mixture of green, yellow, orange, dark red, bronze, and purple leaves. The sap was previously gathered as a source of chewing gum. The bark is one of the favorite foods of beavers. Although sometimes thought of as a small and weedy tree, *Liquidambar* reaches its greatest abundance and size in Coastal Plain swamp forests, where it can reach 2 meters in diameter. Along with such species as *Pinus taeda*, *Quercus phellos*, and others, *Liquidambar* is a good example of a primarily bottomland tree which has proven to be an excellent colonizer of disturbed uplands. [= RAB, C, F, FNA, G, GW, K, S, W, WV]

### 128. HAMAMELIDACEAE R. Brown 1818 (Witch Hazel Family) [in SAXIFRAGALES]

A family of ca. 27 genera and ca. 87 species, trees and shrubs, tropical to temperate, and especially e. Asian. References: Meyer in FNA (1997); Endress in Kubitzki, Rohwer, & Bittrich (1993).

**Fothergilla** Murray in Linnaeus 1774 (Witch-alder)

**Identification notes:** *Fothergilla major* often occurs with *Hamamelis virginiana*, with which it is easily confused in vegetative condition; a reliable character is the base of the lateral veins (marginal in *Fothergilla*, included in leaf tissue in *Hamamelis*). Most of the cultivated material of *Fothergilla*, including the best known cultivar ‘Mount Airy,’ are *Fothergilla ×intermedia* Ranney & Fantz, a pentaploid hybrid of tetraploid *F. gardenii* and hexaploid *F. major* (Ranney et al. 2007; Darke 2008).

1 Leaves stellate-pubescent above, up to 6 cm long and 5 cm wide (the largest < 5.2 cm wide); stamens 12-24; capsules 6.5-10-5 (-13) mm long, the persistent hypanthium 3.4-5 mm long; seeds 4.8-6.3 mm long; [of wet savannas, pocosins, and pocosin margins of the Coastal Plain] ..................................................................................................................................................................................................................

**Fothergilla gardenii** Linnaeus, Coastal Witch-alder. Wet savannas, pocosins, and pocosin margins. March-May; September-October. Se. NC (and allegedly se. VA) south to Panhandle FL and s. AL. An ornamental prized for its small size and attractive fall color. [= RAB, F, FNA, GW, K, Z; > F. gardeni – S, orthographic variant; > F. parvifolia Kearney – S]

**Fothergilla major** (Sims) Loddiges, Large Witch-alder. Dry ridgetop forests of middle elevation ridges in the mountains, especially along the Blue Ridge Escarpment, summits and upper slopes of Piedmont monadnocks, north-facing bluffs in the lower Piedmont. April-May; July-October. C. NC west to ne. TN, south to nc. GA and nc. AL; disjunct in AR. [= RAB, FNA, K, S, W, Z; > F. monticola Ashe]

### Hamamelis Linnaeus 1753 (Witch-hazel)

HAMAMELIDACEAE

1 Outer surface of calyx scarlet; petals 7-14 mm long, red or reddish (often yellow-tipped), flowering late December to early February; leaves 12-24 cm long, 5-17 cm wide, densely stellate-pubescent below, usually with 11 lateral veins (6 on one side of the leaf, 5 on the other); [plants of pineland ravines in s. AL and s. MS]............................................................................................................................................ H. ovalis

1 Outer surface of calyx yellow; petals 6-8 mm long, yellow, flowering October-January; leaves 3.7-16.7 cm long, 2.5-13 cm wide, glabrous to densely stellate-pubescent beneath, usually with 9 or 10 lateral veins (5 on one side of the leaf, 4-5 on the other); [plants widespread in our area]

2 Stellate trichomes of the leaves moderately dense to dense, averaging 0.09 mm across, with 7-11 rays; leaves (3.6-) avg. 6.4 (-10.3) cm long, (1.8-) avg. 4.1 (-6.2) cm wide; petals 7-15 mm long, 0.5-0.8 mm wide; [e. SC south to Panhandle FL, west to se. LA in the Coastal Plain] ................................................................................................................................................................................................................................................. H. virginiana var. henryae

2 Stellate trichomes of the leaves sparse to moderately dense, averaging 0.16-0.40 mm across, with 3-6 (-8) rays; leaves (4.7-) avg. 9.9 (-14.0) cm long, (3.9-) avg. 6.6 (-9.2) cm wide; petals 15-20 mm long, 1 mm wide; [widespread in our area] ... H. virginiana var. virginiana

Hamamelis ovalis S.W. Leonard, Running Witch-hazel, Southern Red Witch-hazel, Bigleaf Witch-hazel. Dry-mesic pineland ravines. Late December-early February. Originally believed to be possibly endemic to se. MS (Perry County) (Leonard 2006), but recently found in s. AL (Keener & Webb, in prep.). [= X]

Hamamelis virginiana Linnaeus var. henryae Jenne ex C. Lane, Small-leaved Witch-hazel. Sandhill margins, xeric hammocks, streamheads, November-January. E. SC (Horry and Hampton counties), s. GA, and Panhandle FL west to se. LA. Though cited in Lane (2005) as var. henryi, the honoree is collector Mary G. Henry; thus the honorific epithet should be corrected to the feminine. Additional study is needed of these small-leaved Coastal Plain populations. [< H. virginiana – FNA, GW, K, S, WH; = H. virginiana var. henryi Jenne ex C. Lane – Y, Z, orthographic error]

Hamamelis virginiana Linnaeus var. virginiana, Northern Witch-hazel. Moist to dryish forests. October-December, October-November (of the following year). QC and NS west to n. MI and MN, south to FL and TX. The bark is still gathered in large quantities in the Southern Appalachians, as the source for witch hazel liniment. The name "witch-hazel" alludes to its superficial resemblance to Corylus, the true hazel, and to its " perverse" habit of flowering in the fall, as it drops its leaves. [= Y, Z; < H. virginiana – RAB, C, FNA, G, GW, K, S, WH, WV; > H. virginiana var. parvifolia Nuttall – F; > H. virginiana var. virginiana – F]

131. ITEACEAE J. Agardh 1858 (Sweetspire Family) [in SAXIFRAGALES]

A family of 1 genus and about 27 species, shrubs, of e. and se. Asia (about 25 species), e. North America (1 species), and sub-Saharan Africa (1 species). References: Kubitzki in Kubitzki, Bayer, & Stevens (2007).

Itea Linnaeus 1753 (Virginia-willow, Sweetspire, Tassel-white)

A genus of about 27 species, shrubs and trees, all but 2 (ours and 1 in sub-Saharan Africa) are in e. and se. Asia. The closest relative of our species is I. japonica Oliver, of Japan. Variously treated in a very broadly-conceived Saxifragaceae (RAB, F, G, GW, W), a less comprehensive Grossulariaceae (C, K), a narrow Escalloniaceae, or a very narrow (single genus) Iteaceae (S), the relationships of Itea remain problematic. Recent molecular data suggest that the relationship between Itea and other woody "saxifragaceous" genera (including Escallonia) is only distant (Morgan & Soltis 1993). Itea is here conservatively treated in a narrow Iteaceae. References: Morin in FNA (2009); Spongberg (1972); Morgan & Soltis (1993); Bohm et al. (1999); Kubitzki in Kubitzki, Bayer, & Stevens (2007).

Identification notes: Sometimes confused needlessly with Clethra, whose much more coarsely serrate, obovate leaves contrast with the serrulate, elliptic leaves of Itea. Also often confused with Eubotrys racemosa in vegetative condition.

Itea virginica Linnaeus, Virginia-willow, Sweetspire, Tassel-white. Moist forests and thickets, especially along the banks of small streams. May-June. S. NJ south to s. FL and west to e. TX and OK, north in the interior (especially in the Mississippi Embayment) to s. IL and se. MO. [= RAB, C, F, FNA, K, G, GW, S, W, WH

132. GROSSULARIACEAE A.P. de Candolle 1805 (Currant Family) [in SAXIFRAGALES]

A family of one genus, of the northern hemisphere and montane South America (Andes). The familial distinction from the Saxifragaceae is supported by recent molecular data, though the affinities of Grossulariaceae and Saxifragaceae (sensu stricto) are closer than those of many other groups traditionally included in the Saxifragaceae, such as Parnassia, Lepuropetalon, and Penicillus (Morgan & Soltis 1993). References: Weigend in Kubitzki, Bayer, & Stevens (2007).

Ribes Linnaeus 1753 (Currant, Gooseberry)

A genus of 150-200 species, temperate, of the Northern Hemisphere and montane South America. The genus is separated into distinctive subgenera, these sometimes maintained as full genera (as by S). Of the species treated here, the currents (subgenus Ribes) include R. americanum, R. aureum var. villosum, R. glandulosum, R. lacustre, R. nigrum, R. rubrum, and R. triste. The gooseberries (subgenus Grossularia) include R. curvatum, R. cynosbati, R. echinellum, R. hirtellum, R. missouriense, R.
rotundifolium, and *R. ova-crispa*. The dried "currants" commonly available in stores are actually raisins made from a small variety of grape, and have nothing to do with *Ribes*. A molecular study suggests that recognition of *Grossularia* as a genus distinct from *Ribes* is not warranted, though it does form a monophyletic group nested within *Ribes* s.l. (Senters & Soltis 2003; Weigend, Mohr, & Motley 2002). References: Morin in FNA (2009); Sinnott (1985)=Z; Weigend, Mohr, & Motley (2002); Spongberg (1972); Schultheis & Donoghue (2004); Senters & Soltis (2003); Weigend in Kubitzki, Bayer, & Stevens (2007). Key adapted from C, F, and Z.

1 Flowers solitary or in corymbs of 2-4; pedicels not jointed just beneath the ovary or fruit, the fruit not disarticulating at maturity and thus the fruit shed with the entire pedicel; stems generally with (0-)1-3 nodal spines and sometimes also with internodal bristles (especially on young, vigorous growth) (though these sometimes absent or nearly so in some species); [subgenus *Grossularia*].

2 Ovary and fruit glabrous.

3 Stamens (at full anthesis) 3-4.5 mm long, about equaling the calyx lobes............................................................. *R. hirtellum*

4 Calyx tube white; stamens 9-12 mm long; nodal spines 1-3 per node, 7-18 mm long, stout......................................................... *R. missouriense*

5 Stamens (at full anthesis) 6-12 mm long, exerted well beyond the calyx lobes.

6 Calyx lobes 7.5-9 mm long; stamens 6-7.5 mm long.................................................................................................................. *R. curvatum*

7 Fruit hispid; stamens 1-2 mm long; pedicels 7-25 mm long; pedicels 5-16 mm long; [of native habitats of the Mountains].......

8 Ovaries and fruits glabrous or with sessile glands; fruits black when mature .................................................. *R. glandulosum*

9 Stems (especially young, vigorous growth) with internodal bristles and sometimes internodal spines; racemes spreading to drooping; fruit purple or black when mature................................................................. *R. lacustre*

10 Lower leaf surface with scattered golden glands; fruit black when mature (except sometimes in *R. aureum var. villosum*).

11 Bracts of the pedicels 0.5-2 mm long; ovaries and fruits with sessile glands; fruits black when mature ..................... *R. nigrum*

12 Bracts of the pedicels 3-10 mm long; ovaries and fruits glabrous; fruits black, red, brown, or orange when mature.

13 Hypanthium narrowly tubular, 6-20 mm long; fruits black (rarely red, orange, brown, or yellow) when mature; sepals golden yellow................................................................. *R. aureum var. villosum*

14 Pedicels stipitate-glandular; petals reddish purple; anther sacs almost adjacent, the connective much narrower than the sacs; erect shrub [cultivated and sometimes persisting or escaping].... R. rubrum

15 Pedicels stipitate-glandular; petals reddish purple; anther sacs almost adjacent, the connective much narrower than the sacs; declining or ascending shrub; [native].................................................................................... *R. triste*

Auxiliary Key to widely distributed native *Ribes* of the Mountains

1 Leaves usually 5-10 cm long and wide, serrate or doubly serrate with sharp teeth; plants usually without nodal spines; inflorescence a raceme of 4-15 flowers; pedicel jointed below the fruit............................................................. *R. glandulosum*

2 Ovary with glabrous hairs which become stiff spines on the mature fruit; leaf bases cordate to deeply cordate (rarely truncate or cuneate), the angle of leaf tissue mostly 190-230°, moderately to sparsely silvery-pilosely beneath, usually on the surface as well as on the veins and in the vein axes; stamens at full anthesis equaling the petals .................................................. *R. cynosbati*

3 Leaves usually 5-10 cm long and wide, serrate with rounded teeth; plants usually with nodal spines; inflorescence a raceme of 1-4 flowers; pedicel not jointed below the fruit.

4 Ovary and fruit glabrous; leaf bases rounded or cuneate (rarely truncate or cordate), the angle of leaf tissue mostly 130-170°, glabrescent to sparsely pubescent beneath (mostly on the veins and in the vein axes); stamens at full anthesis exceeding the petals....... *R. rotundifolium*

*Ribes americanum* P. Miller, American Black Currant. Moist forests, marl marshes. April-June. NS west to AB, south to w. VA, WV, e. and nc. KY (Clark et al. 2005), ne. TN, IN, NE, and NM. [= C, F, FNA, G, K, W, WV]

*Ribes aureum* Pursh var. *villosum* A.P. de Candolle, Buffalo Currant. [habitats]. MA, ON, MN, ND, and MT south to MD, TN, AR, TX, and NM; the original eastern extent unknown because of occasional cultivation and naturalization. It is reported as occurring as a native species as far east as Montgomery County in ne. TN (Chester, Wofford, & Kral 1997). [= FNA, K, = *R. odoratum* H. Wendland – C, F, G, WV]
Ribes curvatum  Small, Granite Gooseberry. Rocky upland forests. E. TN, AR, and OK south to GA, AL, LA, and TX. Also reported for NC by Sinnott (1985); the specimens came from cultivated plants in a botanist's garden, so there is no evidence that *R. curvatum* is a native or naturalized component of NC's flora. [= FNA, K; = Grossularia curvata (Small) Coville & Britton – S]

Ribes echinellum  (Coville) Rehder, Miccosukee Gooseberry. Mesic, nutrient-rich forests. March-April; June-September. This species has a remarkable range, known only from a small area of McCormick County, SC and the vicinity of Lake Miccosukee, Jefferson County, FL. Godfrey (1988) has a detailed description of *R. echinellum*. Catling, Dumouchel, & Brownell (1998) discuss its pollination biology. [= FNA, K, WH; = Grossularia echinella Coville – S]

Ribes glandulosum  Grauer, Skunk Currant, Mountain Currant. Periglacial boulderfields, high elevation seeps, spruce-fir forests. May-June; June-September. NL (Newfoundland) west to AK, south to VT, MI, MN, and BC, and in the Appalachians south to w. NC and e. TN. [= RAB, C, F, FNA, G, K, S, W, WV]

Ribes hirtellum  Michaux, Northern Gooseberry. Rocky forests. NL (Newfoundland) west to AB, south to WV (Tucker County), n. NJ, s. PA, OH, IN, IL, IA, and NE. [= C, FNA, K; > R. hirtellum var. hirtellum – F, G]

Ribes lacustre  (Persoon) Poiret, Bristly Black Currant, Spiny Swamp Currant. Forests, acid swamps. May-June. NL (Labrador) to AK, south to MA, PA, w. VA, TN (allegedly), n. OH, MI, MN, SD, CO, UT, and CA. Reported for AL (FNA). The alleged documentation for the inclusion of *R. lacustre* in the flora of VA is a sterile specimen at WILLI that is not definitely identifiable (Wieboldt, pers. comm.). [= C, F, FNA, G, K, W, WV]

Ribes missouriense  Nuttall, Missouri Gooseberry. Forests, rock outcrops. April-June; May-July. W. WV, sw. OH, IN, WI, MN, and e. ND south to KY, e. TN (Roane and Grainger counties), s. IL, MO, n. AR, and KS, with scattered occurrences (perhaps escapes from cultivation) in CT, NJ, PA, MD, VA, and WV. [= C, F, FNA, G, K, WV, Z; = Grossularia missouriensis (Nuttall) Coville & Britton – S]

* Ribes nigrum  Linnaeus, Garden Black Currant, Cassis. Disturbed areas; native to Europe. Cultivated in ne. United States, rarely as far south as our area (in MD and NJ according to FNA); it may escape. [= C, F, FNA, G, K]

* Ribes rubrum  Linnaeus, Garden Red Currant. Persistent from cultivation and escaped to adjacent fence-rows and disturbed areas; native of Europe. [= FNA, K; > R. sativum Syme – C, F, G, WV]

Ribes triste  Pallas, Swamp Red Currant, Wild Red Currant. Boggy forests, seepage wetlands. May-July. NL (Labrador) west to AK, south to MD, WV (Mineral, Pocahontas, and Randolph counties), OH, MN, SD, MT, ID, and OR. [= C, F, FNA, G, K, WV]

1 Leaves serrate, the teeth sharp; fruit conic-lanceolate, tapering gradually, 4-5 mm long .................................................

2 Stem erect, the leaves mostly or entirely basal, alternate (stem leaves opposite in Mitella); leaves long-petioled, > 4 cm long (except short-petioled or sessile and sometimes < 4 cm long in Micranthes).

3 Basal leaves short-petioled or sessile, the petioles 0-1× as long as the blade; basal leaves cuneate or rounded at the base; leaf venation predominantly pinnate.

4 Corolla bilaterally symmetrical, the 3 upper petals distinctly clawed (the petal blade with a cordate or truncate base) and with 2 yellow spots, the 2 lower petals smaller, cuneate, and not spotted zygomorphic; leaf margins coarsely dentate ................................................................. Hydatica

7 Seeds winged, 1.3-1.5 mm long; leaves cleft < ½ way to base; hypanthium fused to the pistils only at their bases; stems normally with several petiolate leaves much like the basal leaves (though typically somewhat smaller)................................................................. A. bibernata

8 Stems normally with several petiolate leaves much like the basal leaves (though typically somewhat smaller); ovary with 2 locules; leaves cleft > ½ way to base.

9 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base...............

10 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

11 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

12 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

13 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

14 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

15 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

16 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

17 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

18 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

19 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

20 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.

21 Stems with only very reduced sessile bracts unlike the basal leaves; ovary with 1 locule; leaves cleft < ½ way to base; ovary with 2 locules; leaves cleft > ½ way to base.
SAXIFRAGACEAE

**Boykinia** Nuttall 1834 (Boykinia)

A genus of 7 species, herbs, of e. Asia, e. North America, and w. North America, a classic relictual distribution. The other species are distributed primarily in the Pacific Northwest or Rocky Mountains, with several endemics in Japan and an endemic in the unglaciated portions of AK and e. Siberia. References: Gornall in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007)

**Identification notes:** Sometimes mistaken in vegetative condition for **Trautvetteria**, which is a coarser plant, often occupying similar habitats.

**Chrysosplenium** Linnaeus 1753 (Golden-saxifrage)

**Heuchera** Linnaeus 1753 (Alumroot)

1 Calyx glandular-villous, white or pink, often with green-tipped lobes, 1.3-3.3 mm long, 1.1-2.9 mm in diameter; free hypanthium 0.1-0.4 mm long; petals linear or ob lanceolate, 2-3× as long as the calyx lobes, glabrous; plants flowering (June-) July-October.

2 Leaves with widely to narrowly triangular lobes and triangular teeth; petals linear, often coiled; seeds echinate; internodes of flora branches 0.3-2.9 mm long.

3 Leaves deeply and sharply lobed, the terminal lobe wider than long; bracts of the inflorescence oblong to spatulate, at least the lower ones toothed; [of the Alleghenies, Cumberlands, and Interior Low Plateau] .................................................. **H. villosa** var. macrorhiza

4 Petioles and peduncles more-or-less villous, the hairs 0.7-2.5 mm long; leaf blades slightly to fairly densely villous above and below, at least on the veins; [of ec. TN, KY, s. WV, sw. VA, w. NC, n. GA, n. AL, s. MO, s. IL, and s. IN] .................................................. **H. parviflora**

5 Free hypanthium > 2 mm long; calyx weakly to strongly zygomorphic; calyx subglobose, campanulate or tubular.

6 At the onset of anthesis stamens exserted 0.2-1.5 mm beyond the calyx and styles included or exserted up to 1.1 mm beyond the calyx; calyx subglobose ............................................................ **H. americana**

7 Petioles densely hisrurate; free hypanthium (1.1-) avg. 1.5 (-1.9) mm long .......................................................... **H. hirsuticaulis**

8 Petioles glabrous, short-pubescent, or scantly hisrurate; free hypanthium either (0.6-) avg. 1.1 (-1.5) mm long or (1.5-) avg. 1.7 (-1.9) mm long.

9 Stigmas included within the calyx (the calyx lobes extending 1.3-5.3 mm beyond the stigma tips); calyx tubular; calyx lobes and petals inflexed, closing the mouth of the flower .............................................. **H. longiflora**

10 Calyx 2.8-4.5 mm long, subglobose; [of the Piedmont of sc. VA southward to SC] .................................................. **H. caroliniana**

11 Flowers smaller, with greenish or purplish-green petals; [of lower elevations on circumneutral or subacidic substrates] .................. **H. alba**
**Heuchera alba** Rydberg. Quartzitic outcrops at high elevations. July-September. Further study of *H. alba* Rydberg is needed; its recognition as distinct from *H. pubescens* is probably warranted (R. Bartgis, pers. comm.). It apparently differs from *H. pubescens* in its larger flowers with white, exerted petals (vs. greenish or purplish-green petals), and occurs at higher elevations (usually over 1000 m) on acidic substrates, such as quartzitic sandstones (vs. at lower elevations on circumneutral or subacidic substrates). [= FNA, K, WV; < *H. pubescens* – C, F, S, W, Z; < *H. pubescens* var. brachyandra Rosendahl, Butters, & Lakela – F, G, Y]

**Heuchera americana** Linnaeus, American Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. April-August. CT and NY west to s. ON, n. IN, s. IL, and sc. MO south to c. GA, c. AL, n. MS, n. LA, and ne. TX. *H. americana* is the most widespread species of *Heuchera* in e. North America. Within the range of *H. caroliniana*, *H. americana* is nearly absent. [= C; > *H. americana* var. americana – F, G, WV; = *H. americana* var. americana – FNA, K, Z; < *H. americana* – RAB, W; > *H. americana* var. heteradenia Fernald – F; > *H. americana* var. subtruncata Fernald – F; > *H. americana* var. brevipetala Rosendahl, Butters, & Lakela – G, Y; > *H. calycosa* Small – S; > *H. curtisi* – S; > *H. lancipetalal* Rydberg – S; > *H. americana* var. typica – Y; > *H. americana* var. calycosa (Small) Rosendahl, Butters, & Lakela – Y]

**Heuchera caroliniana** (Rosendahl, Butters, & Lakela) E.F. Wells, Carolina Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. April-June. Endemic to the Piedmont of sc. VA, NC, and nc. SC; first found in VA (Henry County) by T.F. Wieboldt in 2002 (Belden et al. 2004). [= FNA, K, Z; = *H. americana* Linnaeus var. caroliniana Rosendahl, Butters, & Lakela – Y; < *H. americana* – RAB, S]

**Heuchera hirsuticaulis** (Wheelock) Rydberg. River bluffs (GA), bluffs and outcrops. S. MI west to n. IL and sw. MO, south to c. TN, nw. AR, and ne. OK; disjunct in e. GA (Screven County). Considered by Wells (1984) to represent fertile hybrids between *H. americana* americana and *H. richardsonii*; here regarded as a stabilized taxon, with numerous occurrences beyond the distribution of one or the other alleged parent. East to w. KY (Medley 1993), w. and c. TN (D. Estes, pers. comm. 2008), and e. GA (Screven County specimens at NCU). [= *H. americana* Linnaeus var. hirsuticaulis (Wheelock) Rosendahl, Butters, & Lakela – FNA, K, Z; > *H. americana* var. hirsuticaulis (Wheelock) Rosendahl, Butters, & Lakela – F, Y; > *H. americana* var. interior Rosendahl, Butters, & Lakela – F, Y] [add to synonymy, C, G, S]

**Heuchera hispida** Pursh, Purple Alumroot. Calcareous rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. April-June. S. PA south through MD, WV, and VA to nw. NC. This species is intermediate between *H. americana* and *H. pubescens*; it is almost certainly of hybrid origin. The treatment of this hybrid derivative of *H. americana* and *H. pubescens* as *H. americana* var. *hispida* (a variety of one parent) seems undesirable. Since it partly replaces its parents within its range, occurs in populations away from one or both parent, and is not strictly intermediate, it seems best to accord it species status. [= F, G, S, WV, Y; < *H. americana* – RAB, W; = *H. hispida* Pursh – C; = *H. americana* var. *hispida* (Pursh) E.F. Wells – FNA, K, Z]

**Heuchera longiflora** Rydberg, Long-flowered Alumroot. Rich shaded forests and woodlands over calcareous rocks such as limestone, dolostone, or calcite-cemented shales, silts, or sandstones, in circumneutral soils. May-June. *H. longiflora* is nearly limited to sedimentary rocks, occurring in e. and c. KY, s. OH, sw. WV, sw. VA, ne. TN, w. NC, and c. AL (?). In NC, it occurs primarily in the sedimentary window around Hot Springs, and is possibly limited to Madison, Buncombe, and Haywood counties. Wells (1984) calls it "most distinctive", "characterized by a unique combination of floral characters: long, tubular calyx, deeply included styles, inflexed calyx lobes and petals that close the mouth of the flower obliquely, and horizontal orientation of the flowers." [= C, F, FNA, G, K, W, WV, Z; < *H. pubescens* – RAB, misapplied; > *H. longiflora* – S; > *H. aceroides* Rydberg – S; > *H. scoparia* Rydberg – S; > *H. longiflora* Rydberg var. aceroides (Rydberg) Rosendahl, Butters, & Lakela – Y; > *H. longiflora* var. typica – Y]

**Heuchera parviflora** Bartling, Cave Alumroot. Shaded cliff bases, usually under overhangs, on grotto floors, behind waterfalls where humidity is high but not in the spray zone, nearly always in deeply shaded situations where little or no direct sunlight falls. July-September. An uncommon species throughout its range (ec. TN, KY, s. WV, sw. VA, w. NC, n. GA, n. AL, s. MO, s. IL, and s. IN). *H. parviflora* is probably most common in the gorge and waterfall country of sw. NC and in the Cumberland Plateau of TN and KY. In deeply shaded sites, it is often the only vascular plant present. The closely related species *H. puberaul* Mackenzie & Bush [*H. parviflora* var. *puberaul* (Mackenzie & Bush) E.F. Wells] occurs in s. MO and ne. AR, with scattered disjunct sites as far east as c. KY, c. TN, and s. IN. [= RAB, S, W; = *H. parviflora* var. *parviflora* – C, FNA, K, Z; > *H. parviflora* var. *parviflora* – F, G; > *H. parviflora* var. rugelii (Shuttleworth) Rosendahl, Butters, & Lakela – F, G, WV, Y; > *H. parviflora* var. typica – Y]

**Heuchera puberaul** Mackenzie & Bush. Shaded cliff bases, usually under overhangs, on grotto floors, behind waterfalls where humidity is high but not in the spray zone, nearly always in deeply shaded situations where little or no direct sunlight falls. C. KY (Medley 1993), s. IN, s. IL, and s. MO south to n. AL and c. AR. [= F, G, Y; = *H. parviflora* Bartling var. *puberaul* (Mackenzie & Bush) E.F. Wells – FNA, K, Z]
Heuchera pubescens Pursh, Marbled Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic or circumneutral. May-July. Primarily a species of the Ridge and Valley Province of PA, MD, WV, and VA. *H. pubescens* ranges south to only a few locations in the southern Piedmont of NC. See discussion under *H. alba*. The report in RAB of the occurrence of *H. pubescens* in Madison County is apparently erroneous; Wells (1984) shows *H. pubescens* reaching its southern limit just south of the VA border, and not occurring at all in KY, TN, or the mountains of NC. She found the bract characters used in the key in RAB to be unreliable. Reported by Hill & Horn (1997) for South Carolina {report needs verification}. [= FNA, K, WV; *H. villosa* var. typica – Y] *H. pubescens – C, S, W, Z (also see *H. alba*); > *H. pubescens* var. brachyandra Rosendahl, Butters, & Lakela – F, G, Y; > *H. pubescens* var. pubescens – F; > *H. pubescens* var. typica – Y] {not keyed; not mapped; rejected as a component of the flora}

Heuchera villosa Michaux var. macrorhiza (Small) Rosendahl, Butters, & Lakela, Giant Alumroot. Cliffs, riverbanks. July-October. S. WV, s. OH, and s. IN south through c. KY and c. TN to n. AL and ne. MS. This taxon has usually been disregarded in recent years, but is recognized by Chester et al. (1997). In its purest form, this plant seems to be very distinct from typical *H. villosa*, and actually may be more closely related to *H. arkansana*. The existence of intermediates and intergrades with *H. villosa* var. villosa muddies the taxonomic waters, however, and the overall best treatment seems to be at the varietal level. Some intermediates occur in the primary area, as in w. VA. [= G; < *H. villosa* var. villosa – C, FNA, K, Z; > *H. villosa* var. macrorhiza – F, WV, Y; = *H. macrorhiza* Small – S; > *H. villosa* var. intermedia Rosendahl, Butters, & Lakela – F, WV, Y] *H. villosa* Michaux var. villosa, Crag-jangle, Rock Alumroot. In crevices of rock outcrops, or in thin soil over boulders, a characteristic component of the flora of high elevation cliffs and summits (to at least 1920 m), not particular about the rock type, occurring on a wide range of rock types in our area, including felsic gneisses and schists, mafic gneisses, granites, quartzites, and others, probably the most acidophilic of our species of *Heuchera*. Late June-October. W. VA and s. WV south through w. NC and e. TN to nw. SC, n. GA, ne. AL (primarily a Southern Blue Ridge endemic). In the Ozarks of AR it is replaced by the related *H. arkansana* Rydberg [H. villosa var. arkansana (Rydberg) E.B. Smith] with shorter and narrower inflorescence, shorter pedicels, and larger flowers. [= G; < *H. villosa* – RAB, W; < *H. villosa* var. villosa – C, FNA, K, Z; > *H. villosa* var. villosa – F; = *H. villosa* – S; > *H. villosa* var. typica – Y; >< *H. villosa* var. intermedia Rosendahl, Butters, & Lakela – F, Y] *H. villosa* Michaux var. villosa, Cliff Saxifrage. In crevices in exposed rock outcrops at high elevations, other rock outcrops (moist to rather dry), periglacial boulderfields, rocky seeps. June-August. Mostly an inhabitant of the Ridge and Valley Province of PA, MD, WV, and VA. In seepage on granite. Endemic, so far as is known, to Pickens County, SC. Under study by Patrick McMillan. {not yet keyed; not mapped}

Hydatica Necker ex Gray 1821 (Appalachian Saxifrage)

Hydatica petiolaris (Rafinesque) Small, Cliff Saxifrage. In crevices in exposed rock outcrops at high elevations, other rock outcrops (moist to rather dry), periglacial boulderfields, rocky seeps. June-August. A Southern Appalachian endemic: nw. VA, WV, and KY south to e. TN, w. NC, sw. SC, and ne. GA. The orange anthers are an attractive contrast to the white petals (the three upper with two yellow spots each). [= S, Y; = *Micranthes petiolaris* (Rafinesque) Bush – FNA, Z; = Saxifraga michauxii Britton – RAB, C, F, G, GW, K, W, WV] *Hydatica petiolaris*. In seepage on granite. Endemic, so far as is known, to Pickens County, SC. Under study by Patrick McMillan. {not yet keyed; not mapped}

Micranthes Haworth 1812 (Saxifrage)

A genus of about 60-75 species, perennials, mostly of north temperate, boreal, and arctic regions of North America, South America, and Eurasia. As shown by molecular data, *Saxifraga*, as often broadly defined, is polyphyletic, and all of our species either belong in *Micranthes* (Soltis 1995, Soltis et al. 1996, Mort & Soltis 1999), or with further separation into *Micranthes* and *Hydatica*. Soltis et al. (1996) demonstrate that *Micranthes* is closely allied with *Heuchera, Mitella, and Tiarella*, less closely related to *Astilbe, Boykinia, Sullivantia*, and *Chrysothamnus*, and least closely related to the bulk of *Saxifraga*. References:

1 Larger leaf blades oblanceolate, 4-10× as long as wide.
2 Leaf margin entire to crenate; petals greenish-white, lacking yellowish spots .......................................................... *M. pensylvanica*
3 Leaf margin coarsely serrate; petals white, either 3 or 5 of them with yellowish spots.
4 Leaves with mostly 12-40 teeth per side; pubescence of the leaves and scapes mostly nonglandular; corolla radially symmetrical; filaments strongly clavate; [mostly of shaded seepages and brook-banks]. .......................................................... *M. micranthidifolia*
5 Leaves mostly with 4-8 teeth per side; pubescence of the leaves and scapes mostly gland-tipped; corolla bilaterally symmetrical, the 3 upper petals distinctly clawed (the petal blade with a cordate or truncate base) and with 2 yellow spots, the 2 lower petals smaller, cuneate, and not spotted; filaments filiform; [mostly of rock outcrops and seepages, often exposed, but sometimes shaded]....................... [Hydratica petiolaris]

**Micranthes**

*Micranthes careyana* (A. Gray) Small, Carey Saxifrage. Moist rock outcrops and cliffs, often under overhangs, often in moist soil at the base of a vertical or overhanging rock outcrop. May-June. A Southern Appalachian endemic: e. TN and nw. NC south to sw. NC and se. TN. Lanning (2009) has clarified the taxonomy of the *M. careyana / caroliniana* complex through molecular and morphological study. [= FNA, S, Z; = Saxifraga careyana A. Gray – RAB, C, F, G, GW, K, W]

*Micranthes micranthidifolia* (Haworth) Small, Branch-lettuce. Wet soils of seepages, in the beds of high elevation brooks, brookbanks; rocky seepages. May-June. A Southern and Central Appalachian endemic: e. PA and WV, south to e. TN, w. NC, nw. SC, and ne. GA. This plant is gathered in considerable quantities as a spring green in the mountains of our area, and can sometimes be seen for sale in local grocery stores. The common name refers to the plant's habitat; "branches" are mountain streams. [= FNA, S, Z; = Saxifraga micranthidifolia (Haworth) Steudel – RAB, C, F, G, GW, K, W, WV]

*Micranthes pensylvanica* (Linnaeus) Haworth, Swamp Saxifrage. Mountain bogs, mucky seeps. April-June. ME west to MN, south to e. VA, c. and w. NC, and MO. [= FNA, Z; = Saxifraga pensylvanica Linnaeus – RAB, C, F, K, W, WV; > S. pensylvanica ssp. pensylvanica – G]

*Micranthes texana* (Buckley) Small, Texas Saxifrage. Granite outcrops. Found in 1980 by Jim Allison on a small granite outcrop in McDuffie County, GA. It is uncertain whether its occurrence in GA represents a natural disjunction or a freak introduction (J. Allison, pers. comm.). [= FNA, S, Z; = Saxifraga texana Buckley – F, G, K]

**Mitella Linnaeus 1753** (Miterwort)

As traditionally circumscribed, a genus of about 20 species, herbs, of cold temperate e. North America, w. North America, and e. Asia. Soltis (2007) and Okuyama, Pellmyr, & Kato (2008) indicate that *Mitella* as currently circumscribed is polyphyletic and is
likely to be divided; our species will remain in Mitella. References: Soltis & Freeman in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007).

Mitella diphylla Linnaeus, Two-leaved Miterwort. Moist rich forests, especially in the Mountains, and especially rocky. April-June. QC west to MN, south to e. VA, w. NC, nw. SC, ne. GA, nw. GA, and MO. The fringed petals will reward a close look. [= RAB, C, F, FNA, G, GW, K, S, W, WV]

Sullivantia Torrey & A. Gray 1842 (Sullivantia)

Sullivantia sullivantii (Torrey & A. Gray) Britton, Sullivantia. Moist limestone cliffs. June-August. S. sullivantii has a very scattered, relictual distribution, known from w. VA (Russell County), e. KY, ne. TN (Claiborne County), s. OH, IL, sw. WI, ne. IA, se. MN, and MO. [= C, F, FNA, G, K, Z]

Tiarella Linnaeus 1787 (Foamflower)

A genus of 3-6 species, perennial herbs, of temperate North America and e. Asia. References: Jog in FNA (2009); Lakela (1937)=Y; Spongberg (1972)=Z; Wherry (1940, 1949)=X; Fernald (1943)=V; Soltis in Kubitzki, Bayer, & Stevens (2007).

Tiarella cordifolia Linnaeus. Moist forests, cove forests, rock outcrops. April-June. NS west to ON and WI, south to w. NC, nw. SC, sw. GA, AL, MS, and MO. Several taxa have been recognized (or not) in eastern North American Tiarella. The characters used to recognize additional species or varieties are often missing on herbarium sheets and also seem to be imperfectly correlated. T. wherryi (or var. collina) is alleged to differ from T. cordifolia s.s. in lacking stolons (vs. having stolons), capsules 6-10 mm long and round-tipped (vs. 8-12 mm long and subacuminate), and lower fruiting pedicels 6-10 mm long (vs. 7-13 mm long). Whether or not to recognize several taxa within what is here treated as T. wherryi, and at what level, has been controversial; see Lakela (1937), Wherry (1940, 1949), Fernald (1943), and Spongberg (1972) for discussion. Further study is needed. [> T. cordifolia – F, V, WV, Z; > T. cordifolia var. cordifolia – RAB, C, G, K; = T. cordifolia – FNA, S, W; > T. macrophylla Small – S (type a combination of Heuchera and Tiarella); > T. cordifolia var. typica – Y; > T. wherryi Lakela – F, V, Z; > T. cordifolia Linnaeus var. collina Wherry – RAB, C, G, K; > T. cordifolia var. collina – X; > T. wherryi – X, Y; > T. cordifolia var. austrina – K, X, Y]

134. CRASSULACEAE A.P. de Candolle 1825 (Stonecrop Family) [in SAXIFRAGALES]

A family of about 34-35 genera and 1100-1410 species, succulent shrubs and herbs, nearly cosmopolitan, but with centers of diversity in s. Africa and Mexico. References: Moran in FNA (2009); Thiede & Eggl in Kubitzki, Bayer, & Stevens (2007).

1 Leaves connate at the base, opposite; flowers solitary in the axils of leaves; flowers 3-4-merous; [subfamily Crassuloideae] Crassula

1 Leaves distinct, whorled or alternate; flowers in terminal cymose inflorescences; flowers 4-5 (-8)-merous.

2 Petals distinct or at most basally connate; leaves entire, crenate, or serrate, but not bearing plantlets along the margin; [subfamily Sempervivoideae].

3 Plants with spheroidal basal rosettes consisting of dozens or more spirally arranged leaves; flowers 8-16-merous [tribe Umbiliceae] Sempervivum

3 Plants with or without basal rosettes (if rosettes present, these not as above); flowers 4-6-merous

4 Perennials without rosettes, the stems 0.5-10 dm tall (dying back in winter to the rootstock); leaves large, relatively thin in texture, usually 5-25 times as wide as thick, often crenate; flowers pink, purple, white, or greenish.

5 Flowers 5-merous, bisexual; flowering stems 2-10 dm tall, from an underground, tuberous base; average leaves 3-11 cm long, 1-5 cm wide; ovaries attenuate at the base; [tribe Telephieae] Hylocomium

5 Flowers 4 (-5)-merous, usually unisexual and then the plants dioecious; flowering stems 0.5-4 dm tall, from axils of brown scale-leaves clothing a stout rootstock at least in part exposed aboveground; average leaves 1-5 cm long, 0.4-1.5 cm wide; ovaries not attenuate at the base; [tribe Umbiliceae] Diamorpha

4 Perennials or annuals with or without rosettes, the stems < 2 dm tall (the perennials with stems persistent through the winter); leaves smaller, flat or terete, relatively thicker, entire; flowers white or yellow; [tribe Sedeeae].

6 Carpels united basally (to about 1/3 their length); petals cuculate, initially partly enclosing 4 of the 8 stamens; follicles dehiscing by a tear-shaped valve on the abaxial (lower) surface; stem and leaves normally red; [of granitic flatrocks of the Piedmont of NC and SC] Sedum

6 Carpels free; petals flat, never enclosing any of the 8 anthers; follicle dehiscing by a longitudinal slit along the adaxial (upper) suture; stem and leaves normally green, sometimes somewhat pink or reddish; [collectively of various habitats, including granitic flatrocks of GA, NC, SC, and VA] Rhodiola

Bryophyllum Salisbury 1805
CRASSULACEAE

**Crassula** Linnaeus 1753

1 Seeds rugulose; leaves 2-6 mm long, the apex acute; sepals 0.5-1.5 mm long...................................................................................... *C. aquatica*

1 Seeds with sharp-pointed papillae; leaves 1.5-3 mm long, the apex acute; sepals 0.4-0.6 mm long .............................................. *C. drummondii*

**Crassula aquatica** (Linnaeus) Schönland, Pygmyweed. Tidal marshes and shores, artificial lake. Occurring in tidal marshes and shores, south to MD and se. PA, and also in GA and AL (Kartesz 1999, FNA). [= FNA, K; = *Tillaea aquatica* Linnaeus – GW; = *Tillaeastrum aquaticum* (Linnaeus) Britton – S]

* Crassula drummondii* (Torrey & A. Gray) Fedde. Waste area around wool-combing mill, perhaps merely a waif; native of sc. United States. [= FNA, K; = *Tillaea drummondii* Torrey & A. Gray]

**Crassula longipes** (Rose) Bywater & Wickens. {AL, GA}. {K} {not yet keyed; synonymy incomplete}

**Diamorpha** Nuttall 1818 (Elf-orpine)

**Diamorpha smallii** Britton ex Small, Elf-orpine. In very thin soil (generally less than 2 cm deep) of vernally wet depressions on granite flatrocks and other granitic outcrops. April-May; May-June. Primarily limited to granitic flatrocks of the Piedmont, ranging from sc. VA to ec. AL, and on sandstone from se. TN south into c. AL. This species is both one of the most typical and one of the most interesting of the dozens of species endemic (or largely so) to granite flatrocks of the southeastern Piedmont. See Wilbur (1988a) for a thorough discussion of the muddled nomenclatural history of this remarkable species, as well as for a detailed summary of systematic and ecological information. [= FNA, GW, K, Z; = *Sedum smallii* (Britton ex Small) Ahles – RAB, W; = *Diamorpha cymosa* (Nuttall) Britton ex Small – Y; > *Diamorpha cymosa* – S; > *Diamorpha smallii* – S]

**Hylotelephium** H. Ohba 1977 (Live-for-ever)

1 Petals 2× as long as the sepals; nectaries wider than long; flowers fertile; [native] ........................................................................... *H. telephioiodes*

1 Petals 2.5-4× as long as the sepals; nectaries longer than wide; flowers sterile (rarely fertile); [introduced].

2 Flowers white or greenish; cymes lax, subcorymbose; leaves not markedly reduced upward from base of plant upward ....... *H. erythrostictum*

2 Flowers deep pink to purple; cymes densely subglobose; leaves typically strongly reduced in size from base of plant upward ............

..........................................................................................................................................................................................................

* Hylotelephium erythrostictum* (Miquel) H. Ohba, Garden Orpine, Live-for-ever. Disturbed areas; native of Europe. August-September, September-October. [= FNA, K; = *Sedum spectabile* Boreau – RAB, misapplied; = *Sedum ×erythrostictum* – C; ? *Sedum alboroseum* Baker – F, G, Z]

**Hylotelephium telephioiodes** (Michaux) H. Ohba, Allegheny Live-for-ever. Rock outcrops, mostly at high to moderate elevations, ascending to 2000 m. July-September; August-October. Essentially a Central and Southern Appalachian endemic, *H.*
Rhodiola rosea Linnaeus (Roseroot)

A genus of about 200 species, of cold temperate and boreal areas of the northern hemisphere. Thiede & Eggli (2007) place Rhodiola in a separate tribe from Sedum s.s. References: Moran in FNA (2009); Clausen (1975)=Z; Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007).

Rhodiola rosea Linnaeus, Roseroot. High elevation rocky summits. July-August; August-September. Circumboreal, widely distributed in northern Europe, Asia, and North America, south in e. North America to e. PA and thence disjunct to Roan Mountain (Mitchell County, NC) and Grandfather Mountain (Avery County, NC), where nearly (if not completely) extirpated. Dwarfed, high elevation forms of Rhodiola rosea; they are perhaps readily distinguished only in flower or fruit. [= FNA, K; = Sedum rosea (Linnaeus) Scopoli – Z; = Sedum rosea (Linnaeus) Scopoli var. rosea – C; < S. rosea var. rosea – F; < S. rosea – RAB, G, W; > Rhodiola roanensis Britton – S; > Sedum rosea (Linnaeus) Scopoli var. roanense (Britton) Berger]

Identification notes: Other species of Sedum are grown as ornamentals, especially in rock gardens; some are aggressive and rather weedy and can be expected eventually to become a naturalized part of our flora.

</table>
8 Plants perennial; sepals 2-9 mm long; petals 4-9 mm long; [of outcrops of various rocks, not as above]; [section Ternata].
9 Leaves of flowering stems with width/thickness ratio of >2.0; seeds averaging 0.8 mm long; leaves pale green or bluish green, sometimes with a glaucous coating; [of MD south through VA and WV to sc. and sw. NC].................................S. glaucophyllum
9 Leaves of flowering stems with width/thickness ratio of <1.7; seeds averaging 0.7 mm long; leaves green or gray-green, but not glaucous; [of se. TN south into AL and GA]...............................................................................................................................

* Sedum album Linnaeus, White Stonecrop. Disturbed areas; native of Eurasia. Introduced and naturalized as far south as se. PA and WV. [= C, F, G, K, Z; = Oreoosedum album (Linnaeus) Grulich]

Sedum glaucophyllum Clausen, Cliff Stonecrop. Rock outcrops, usually basic and/or sedimentary. Endemic to the Central and Southern Appalachians (extending into the Piedmont), known from MD, WV, VA, and NC (reports for GA are based on confusion with S. nevii). This species is complex, with several ploidies and morphologies represented, some at least showing geographic integrity and perhaps worthy of taxonomic recognition. Material in sw. NC (south of the Asheville Basin) has been identified as polyploid and differs in many ways from more typical S. glaucophyllum, in some ways suggesting the similar and closely related S. nevii A. Gray (known from nearby TN and AL). Further study is needed of this group. [= C, F, G, K, S, W, WH, Y, Z; < S. nevii A. Gray – RAB, G, S]

* Sedum lineare Thunberg. Margin of granitic flatrock; native of e. Asia. Duncan (1985) discusses the establishment of this species in Columbia County, GA. [= FNA, K, Z]

* Sedum mexicanum Britton, Mexican Stonecrop. Dry, disturbed areas; native of Mexico or perhaps e. Asia. [= FNA, WH]

Sedum nevii A. Gray, Nevius's Stonecrop. Gneiss rock outcrops on river bluffs. Endemic to se. TN (Polk County, just west of Cherokee County, NC) (Chester, Wofford, & Kral 1997), nc. and ec. AL, and wc. GA (where it occurs on gneiss outcrops along the Chattahoochee River in Muscogee and Harris counties), and reported for s. WV (Greenbrier County) by Harmon, Ford-Werntz, & Grafton (2006). [= FNA, K, W, Y, Z; < S. nevii – S (also see S. glaucophyllum)]

Sedum pusillum Michaux, Puck's Orpine. In very thin soil (generally less than of vernally wet depressions on granite flatrocks, often in mats of the moss Hedwigia ciliata. March-April; April-May. Endemic to granite flatrocks of the southeastern Piedmont, from sc. NC south to wc. GA. Superficially rather similar to Diamorpha smallii, and historically confused with it (see Wilbur 1988 for details). Wyatt (1983) discusses the reproductive biology of this species. [= RAB, FNA, GW, K, S, Z; = Tetrorum pusillum (Michaux) Rose]

* Sedum rupestre Linnaeus. Disturbed rock outcrops; native of Europe. Reported for nc. GA (Jones & Coile 1988), as S. reflexum Linnaeus. [= FNA; = S. reflexum Linnaeus – C, K, misapplied; = Petrosedum reflexum (Linnaeus) Grulich, misapplied]

* Sedum ternatum Michaux, Mountain Stonecrop. Moist forests, coves, bottomlands, shaded rock outcrops. April-June; May-July. NJ west to IA and AR, south to nw. GA and AL. [= RAB, C, F, FNA, G, K, S, W, WV, Y, Z; = Clausenellia ternata (Linnaeus) A. & D. Löve]

Sempervivum Linnaeus 1753 (Hen-and-chickens, Houseleek)

A genus of 40-100 species, perennials, of Eurasia. References: Lis in FNA (2009).

* Sempervivum tectorum Linnaeus, Hen-and-chickens, Houseleek. Disturbed areas, cultivated as a rock garden and potted plant, rarely persistent; native of Europe. S. tectorum is reported for VA by Massey (1961) as “escapes from cultivation;” the documentation of this is unknown, but the record has been perpetuated by Kartesz (1999), Lis in FNA (2009), and others. [= FNA, C, F, K]
A family of one genus and 2 species, herbs, of e. North America and e. Asia. Penthorum has been variously placed in the Crassulaceae, Saxifragaceae, or in the Penthoraceae. Haskins & Hayden (1987) concluded that Penthorum was best treated in a monogeneric Penthoraceae, a conclusion based on extensive anatomical evidence. Among those who do not favor a monotypic family, there is nearly evenly divided opinion between the Crassulaceae and Saxifragaceae; this in itself perhaps supports segregation in the Penthoraceae. Molecular evidence supports the recognition of the Penthoraceae, and suggests closer affinities with the Haloragaceae than with either the Crassulaceae or the Saxifragaceae (Morgan & Soltis 1993). References: Thiede in Kubitzki, Bayer, & Stevens (2007); Freeman in FNA (2009).

**Penthorum** Linnaeus 1753 (Ditch-stonecrop, Penthorum)

A genus of 2 species, herbs, of e. North America and e. and se. Asia. The only other species in the genus is *P. chinense* Pursh, of e. Russia, China, Korea, and Japan. References: Freeman in FNA (2009); Haskins & Hayden (1987)=Z; Thiede in Kubitzki, Bayer, & Stevens (2007).

**Penthorum sedoides** Linnaeus, Ditch-stonecrop, American Penthorum. Shores, drawdown areas, moist forests, floodplain forests, moist disturbed areas, ditches. June-October. NB west to MB, south to Panhandle FL and TX; introduced from BC south to OR. [= RAB, C, F, FNA, G, GW, K, S, W, WV, Z]

**138. HALORAGACEAE** R. Brown 1814 (Water-milfoil Family) [in SAXIFRAGALES]

A family of 8-9 genera and about 150 species, aquatic and wetland herbs, but also shrubs and trees, cosmopolitan but centered in the Southern Hemisphere, especially Australia. The family has sometimes spelled "Haloragidaceae." References: Kubitzki in Kubitzki, Bayer, & Stevens (2007).

**Myriophyllum** Linnaeus 1753 (Water-milfoil)

**Identification notes:** Stranded plants of *M. heterophyllum* and *M. humile* (and perhaps others) produce leaves that are reduced in size. Leaves and bracts become pectinate or pinnate, so that plants resemble *M. pinnatum*. Such plants are the source of nearly all inland records of *M. pinnatum* in the VA-NC-SC-GA area. *M. heterophyllum* usually flowers and fruits when stranded and may be distinguished from *M. pinnatum* by its much denser disposition of leaves and bracts, and by its dull red fruits obscurely tuberculate (vs. tan or pale brown fruits strongly tuberculate). From stranded *M. humile*, *M. heterophyllum* may be distinguished by leaves and bracts which are clearly whorled and much more densely disposed. *M. humile* differs from *M. pinnatum* by its wholly alternate leaves and bracts, and by its smooth fruits.

**Myriophyllum** Linnaeus 1753 (Water-milfoil)

(contributed by B.A. Sorrie and A.S. Weakley)
HALORAGACEAE

4 Leaves strictly alternate; flowers/fruits on submersed stems (forma capillaceum) or on emersed stems with pinnatifid or pinnate leaves (forma natans); [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. humile

3 Flowers/fruits in erect spikes emersed from water, flowers/fruits subtended by bracts much smaller than the normally submersed leaves. 4 Uppermost flowers/fruits alternate; leaves alternate or whorled or both; [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. humile

6 Bracts much shorter than floral internodes, varying from pinnate to entire; fruit surface smooth or papillose ......................... M. laxum

5 Bracts usually longer than floral internode, pinnatifid to pinnate; fruit surface strongly tuberculate .................................... M. pinnatum

7 Bracts usually > 2× as long as pistillate flowers; stems drying brown, pale brown, or reddish.

8 Bracts throughout inflorescence pinnatifid to pinnate; winter buds scattered along stem, elavate, falling by early winter; [of DE and northward]; [subgenus Myriophyllum; subsection Myriophyllum; subsection Isophylleae] ................................................. M. verticillatum

405

Alternate key

1 Leaves reduced to small scales or absent; stems short, erect from substrate; [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. tenellum

1 Leaves well-developed, pinnately divided with filiform segments; stems elongate, suspended in the water column and/or floating.

2 Flowers/fruits produced in axis of submersed leaves; [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. humile

2 Flowers/fruits produced in axis of emersed leaves or on emersed shoots with bracts (reduced bracteal leaves).

3 Emerged shoots with feathery leaves about same size and shape as submersed leaves; flowers/fruits rarely produced; [widespread alien] [subgenus Myriophyllum; section Pectinatum] ................................................................. M. aquaticum

3 Emerged shoots with bracts subtending flowers/fruits; these bracts much different in shape than submersed leaves. [stranded plants may produce bracts and leaves of similar size and shape, but these not feathery].

4 All flowers/fruits alternate; fruits smooth; [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. humile

4 All flowers/fruits opposite or whorled (or the lower opposite and the upper alternate in M. pinnatum).

5 Bracts usually longer than the internodes; [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. humile

5 Bracts usually shorter than the internodes.

6 Leaves whorled or pseudo-whorled; fruits with low bumps ................................................................. M. heterophyllum

6 Leaves strictly alternate; fruits strongly tuberculate ................................................................. M. pinnatum

7 All bracts pinnatifid to pinnatatifid; [subgenus Myriophyllum; section Myriophyllum; subsection Isophylleae] ................................................. M. verticillatum

7 Bracts vary from entire to pinnate.

8 Leaves alternate, pseudo-whorled, or both; plain green; [of se. VA and southward]; [subgenus Brachytheca; section Tessaronia; subsection Spondylastrum] ................................................. M. laxum

8 All leaves whorled, grayish green; [collectively widespread]; [subgenus Myriophyllum; section Myriophyllum; subsection Myriophyllum];

9 Midstem leaves with 11 or fewer segments on each side of rachis; leaves rounded at apex; stem diameter more-or-less uniform; stem tips usually green; winter buds produced; [native, of DE and northward] ................................................. M. sibiricum

9 Midstem leaves with 12 or more segments on each side of rachis; many leaves appear truncate or clipped at apex; stem diameter below inflorescence is up to 2× the diameter of lower stem; stem tips usually reddish; no winter buds; [widespread alien].

................................................. M. spicatum

Myriophyllum heterophyllum Michaux, Southern Water-milfoil. Ditches, slow-moving waters of rivers and streams, pools, ponds. April-July. NY west to ON and MN, south to FL and TX. [= RAB, C, F, G, GW, K, S, WV, X, Y, Z]

Myriophyllum humile (Rafinesque) Morong. Millponds, slow-moving water of streams. NS west to MN, south to DE, MD, VA, and IL. [= C, F, G, K, X, Y, Z]

Myriophyllum laxum Shuttleworth ex Chapman, Loose Water-milfoil. Limesink depression ponds (dolines), spring-runs, rarely also in lakes. June-October. Se. VA south to n. FL, s. AL, and s. MS (Sorrie & Leonard 1999). M. laxum and M. heterophyllum both have reddish submersed stems and present difficulties in identification when in sterile condition. M. laxum has a total of 7-15 (-17) segments per leaf, vs. (15-) 17-31 (-37) segments in M. heterophyllum. Documented for VA by a 1922 specimen from Princess Anne County at GH (Sorrie, pers. comm.). [= RAB, GW, K, X, S, Y]

**Myriophyllum sibiricum** Komarov, Common Water-milfoil. Quiet circumneutral to alkaline waters. NL (Labrador) west to AK, south to VA, WV, IL, MO, NM, and CA; also in n. Eurasia. [= C, G, K, X, Z; > *M. exalbescens* Fernald – F, Y]

**Myriophyllum tenellum** Bigelow, Leafless Water-milfoil. Natural lakes (Carolina bay lakes), typically growing on the sandy bottoms in water 1-2 meters deep. NL (Newfoundland) west to MN, south to PA and NJ, and disjunct south to a few occurrences in NC; report from Virginia Beach, VA is false. [= C, F, G, K, X, Y, Z]

**Myriophyllum verticillatum** Linnaeus. Quiet waters. A circumboreal species, south in North America to DE, MD, n. WV, IN, NE, TX, and CA. [= C, G, K, X, Y, Z; > *M. verticillatum* var. pectinatum Wallroth – F]

**Proserpinaca** Linnaeus 1753 (Mermaid-weed)

1. Bracteal (emersed) leaves serrate; submersed pectinate leaves with 8-14 pairs of divisions 5-30 mm long; fruits 2.3-6.0 mm wide.
2. Fruit 2.3-4.0 mm wide, acutely angled, not winged, the sides of the capsule more-or-less planar. .......... *P. palustris* var. *crebra*
3. Leaves with a flattened rachis 1-4 mm wide, the 7-12 pairs of divisions 2.0-3.5 mm long; fruits 2.3-3.6 mm wide. .......... *P. pectinata*
4. Leaves with a filiform rachis (midrib) 0.2-1.0 mm wide, the 4-9 pairs of divisions 2.0-7.5 mm long; fruits 2.0-2.8 mm wide. .......... *P. intermedia*

**Proserpinaca intermedia** Mackenzie, Intermediate Mermaid-weed. Wet places. July-September. NS to SC on the Coastal Plain; disjunct in sc. TN. This taxon is intermediate in morphology between *P. palustris* and *P. pectinata*; whether it warrants species status is unclear. If merely a rarely produced first-generation hybrid, it should be treated as a hybrid binomial (*P. ×intermedia*); if it forms independent, self-reproducing populations, it should probably be treated as a species. [= RAB, C, F, G, K, Z; < *P. palustris* – GW, S]

**Proserpinaca palustris** Linnaeus var. *amblyogona* Fernald. Swamps. Occurs east to KY, TN, and GA. [= C, F, G, K; < *P. palustris* – GW, S] {not yet keyed}

**Proserpinaca palustris** Linnaeus var. *palustris*, Coastal Mermaid-weed. Wet places, swamp forests. June-October. MA (?) to FL and west to LA, on the Coastal Plain. [= C, F, G, K, Z; < *P. palustris* – RAB, S, W, WH; < *P. palustris* – GW (also including *P. intermedia*)]

**Proserpinaca pectinata** Lamarck, Feathery Mermaid-weed. Bogs, savannas, ditches, other wet places. June-October. NS south to s. FL and west to w. LA, mostly on the Coastal Plain, but scattered inland as well, as in c. TN. [= RAB, C, F, G, GW, K, S, WH, Z]

**140. VITACEAE** A.L. de Jussieu 1789 (Grape Family) [in VITALES]

A family of about 14 genera and 750-850 species, vines (rarely small trees or herbs), of tropical, subtropical, and temperate regions of the Old and New Worlds. References: Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).
**Ampelopsis** Michaux 1803 (Peppervine)

A genus of about 25 species, woody vines, of temperate and subtropical America and Asia. Perhaps to be split based on molecular phylogenetics, with section **Leeaceifoliae** (**A. arborea** and **A. megalophylla**) elevated to a new genus (Soejima & Wen 2006). References: Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

1 Branches and leaves distinctly fleshy, the leaves > 1 mm thick when fresh; leaves 3-foliolate. ................................................................. **Parthenocissus**
1 Branches and leaves herbaceous; leaves simple, 3-, 5-, or many-foliolate.
2 Leaves simple, sometimes shallowly or deeply 3-5(-7)-lobed. .......................... **Cissus**
3 Tendrils not twining, terminating in adhesive disks............................................ **Ampelopsis**
4 Petals separate at their tips, falling individually; pith continuous through the node. ................................................................. **Ampelopsis**
4 Petals connate at their tips, falling together; pith interrupted by a diaphragm at each node (except continuous in **V. rotundifolia**) .............. 

**Ampelopsis** aconitifolia Bunge. Planted as an ornamental, rarely escaping to suburban woodlands; native of n. China. [= K]

**Ampelopsis arborea** (Linnaeus) Koehne, Peppervine. Swamp forests, marshes, wet thickets, moist to wet maritime forests. June-October. Se. VA (and MD?) south to s. FL, west to TX and n. Mexico, north in the interior to s. IL and sw. WV. [= RAB, C, F, G, GW, K, S, W, WH, WV]

**Ampelopsis brevipedunculata** (Maximowicz) Trautvetter, Porcelain-berry. Thickets and disturbed areas, native of ne. Asia. June-July; September. [= RAB, C, F, K; < **A. heterophylla** (Thunberg) Siebold & Zuccarini – S; = **A. heterophylla** (Thunberg) Siebold & Zuccarini var. brevipedunculata (Maximowicz) C.L. Li]

**Ampelopsis cordata** Michaux, Raccoon-grape, False-grape. Moist forests, bottomlands, and thickets, particularly where disturbed. May-July. E. VA south to Panhandle FL, west to TX, north in the interior to s. OH, s. IN, s. IL, MO, and NE; also introduced at scattered sites inland. [= RAB, C, F, G, GW, K, S, W, WH]

**Ampelopsis megalophylla** Diels & Gilg. Bigleaf Peppervine. Planted in the Southeast, and has the potential to naturalize; native of China. Reports of its occurrence as naturalized in MS are based on Cayratia (S.W. Leonard, pers. comm., 2006). [not mapped; rejected as a component of our flora]

**Cayratia** A.L. de Jussieu 1818 (Bushkiller)

A genus of 50-63 species, woody and herbaceous vines, of the Old World tropics and subtropics. References: Kriens & Richardson (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

**Cayratia japonica** (Thunberg) Gagnepain, Bushkiller, Sorrel Vine. Disturbed areas, suburban woodlands; native of temperate and subtropical se. Asia. July-August. Reported for NC from several suburban areas, as in Forsyth County (Kriens &
Richardson 2006) and Mecklenburg County (J. Matthews, pers. comm., 2007). Also reported as naturalized in AL (Hansen & Goertzen 2006), MS, LA, and TX. [= K]

**Cissus** Linnaeus 1753

A genus of about 350 species, woody vines, herbaceous vines, and rarely shrubs, of tropical and rarely warm temperate areas. References: Wen in Kubitzki, Bayer, & Stevens (2007).

*Cissus trifoliata* (Linnaeus) Linnaeus, Marine-ivy. Coastal hammocks, dunes, disturbed coastal areas, the more northerly occurrences introduced. Se. SC (Jasper County) south through GA, FL, and west along the Gulf Coast to TX, AR, and Mexico. [= K, S, WH; > C. incisa (Nuttall) Des Moulins – GW, S]

**Parthenocissus** Planchon 1887 (Virginia-creeper, Woodbine)

1 Leaves 3-lobed to 3-foliolate; [introduced ornamental, rarely escaped]................................................................. *P. tricuspidata*
2 Inflorescence with a well-developed (zigzag) central axis, the dichotomous branches very unequal, the inflorescence therefore paniculiform; tendrils many-branched, usually with numerous adhesive disks (though young shoots may not have the disks yet formed); leaves usually dull above; [widespread in our area]................................................................................................. *P. quinquefolia*
3 Mature leaves glaucous beneath (the glaucescence sometimes rather obscured by pubescence); nodes usually not glaucous; nodal diaphragms usually > 2 mm in diameter .......................................................... *V. aestivalis var. aestivalis*
4 Mature 3-4 seeded berries > 9 mm in diameter; mature leaves slightly to strongly arachnoid-pubescent beneath; nodes usually not glaucous; nodal diaphragms usually > 2 mm in diameter .......................................................... *V. rotundifolia var. rotundifolia*

**Vitis** Linnaeus 1753 (Grape)

1 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small and coarsely toothed, never deeply lobed; [subgenus *Muscadinia*].
2 Mature fruits < 10 mm in diameter; infructescences with 12-30 berries; leaf blades 4-8 cm long; [of s. GA southward]........................ *V. rotundifolia var. rotundifolia*
2 Mature fruits > 12 mm in diameter; infructescences with 2-8 (-12) berries; leaf blades usually > 6 cm long; [widespread in our area]........ *V. rotundifolia var. monsoniana*
3 Mature leaves glaucous beneath (the glaucescence sometimes rather obscured by pubescence); nodes often glaucous; [series *Aestivales*].
4 Mature 3-4 seeded berries > 9 mm in diameter; mature leaves slightly to strongly arachnoid-pubescent beneath; nodes usually not glaucous; nodal diaphragms usually > 2 mm in diameter .......................................................... *V. aestivalis var. aestivalis*
Vitis aestivalis Michaux var. aestivalis, Summer Grape. Forests and woodlands, mostly upland. May-June; September-October. MA west to MO and IA, south to s. FL and e. TX. [= RAB, C, F, G, K, WV, Y, Z; = V. aestivalis – S; < V. aestivalis – GW, W, WH; > V. riparia Sm.; > V. simpsonii Munson]

Vitis aestivalis Michaux var. bicolor Deam, Silverleaf Grape. Forests and woodlands, mostly upland. May-June; September-October. ON and MN south to n. GA and n. AL. [= Z; = V. aestivalis var. argentinifolia (Munson) Fernald – RAB, C, F, G, K, WV; = V. bicolor Le Conte – S; < V. aestivalis – GW, W]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. cinerea, Graybark Grape, Pigeon Grape. Hammocks, most forests. VA (?), w. KY, wc. TN, IN, and WI, south to Panhandle FL (Okaloosa County), sc. AL and TX. [= RAB, C, F, G, K, WH, Z; = V. cinerea labruscana var. floridana Munson, Florida Grape. Hammocks, floodplain and other moist forests. Late May-June; August-October. Se. VA south to s. FL, west to s. MS. [= RAB, C, F, G, K, WH, Z; = V. simpsonii Munson – S, Y; < V. cinerea – GW, W]

Vitis labrusca Linnaeus, Fox Grape. Forests and woodlands, wet, moist, and dry. May-June; September-October. ME west to s. MI, south to n. GA, n. AL, and n. MS. [= RAB, C, GW, K, S, W, Z; > V. labrusca var. labrusca – F, G; > V. labrusca var. subedentata Fernald – F, G]

* Vitis labruscana L.H. Bailey [aestivalis × labrusca], Concord Grape. Commonly cultivated as a table grape. It is sometimes persistent after cultivation. [= K; = V. labruscana L.H. Bailey – F] {not keyed; not mapped}

Vitis mustangensis Buckley, Mustang Grape. {habitats}. {Dates}. AR and s. OK south to s. LA and s. TX; disjunct in sc. AL. [= K] {add to synonymy; not yet keyed}

Vitis palustris Vahl, Red Grape, Cat Grape, Catbird Grape. Floodplain forests, riverbanks. Mid June-late June; late July-October. IN, sw. VA (Townsend, pers. comm., 2009), c. TN (Chester, Wofford, & Kral 1997), sc. GA (Jones & Coile 1988), and FL Panhandle west to MO, OK, and TX. [= C, F, G, GW, K, S, WH, Y, Z]

Vitis riparia Michaux, Riverbank Grape. Forests and woodlands, mostly moist to wet. April-June; August-September. NB west to se. SK, south to VA, NC, c. and w. TN, n. MS, LA, and e. TX, and in the Pacific Northwest. [= RAB, C, G, GW, K, Z, W, WV; > V. riparia var. riparia – F]
**VITACEAE**

*Vitis rotundifolia* Michaux var. munsoniana (Simpson ex Munson) M.O. Moore, Munson Grape, Bullace Grape. Floodplain forests, banks of blackwater rivers. Late April-May; late July-September. Sc. GA and s. AL south to s. FL. [= K, Y, Z; = Muscadina munsoniana (Simpson ex Munson) Small – S; < V. rotundifolia – WH; = Vitis munsoniana Simpson ex Munson]

*Vitis rotundifolia* Michaux var. rotundifolia, Muscadine, Scuppernong. Forests, swamps, dunes. May-June; August-October. DE west to s. WV, KY, and MO, south to FL and TX. Cultivars of this species are popular in the Southeastern United States as table grapes and the source of a distinctive wine. [= K, Y, Z; = V. rotundifolia – RAB, C, F, GW, W, WV; = Muscadina rotundifolia (Michaux) Small – S; < V. rotundifolia – WH]

*Vitis rupestris* Scheele. Along streams and in riverbank scour areas, especially in calcareous areas. April-June; August-September. MD, WV, sw. PA west to MO, south to VA, c. TN, and n. AR. [= C, F, K, W, S, WV, Z]

*Vitis vinifera* Linnaeus, European Wine Grape. Increasingly cultivated in our area, especially in VA and NC, now significant wine-producing areas. [= K] (not keyed)

**141. KRAMERIACEAE** Dumortier 1829 (Krameria Family) [in ZYGOPHYLLALES]

A family of a single genus and about 15-18 species, herbs, shrubs, and trees, of warm (and usually dry) parts of s. North America, Central America, South America, and the West Indies. References: Robertson (1973); Simpson et al. (2004); Simpson in Kubitzki, Bayer, & Stevens (2007).

*Krameria* Loefling 1758 (Ratany)

*Krameria lanceolata* Torrey, Trailing Ratany, Sandspur. Sandhills. AR, TX, and s. KS west to se. CO, se. AZ, Chihuahua, and Coahuila; disjunct eastward in the Coastal Plain of Panhandle FL, peninsular FL, and GA (east to Bulloch, Bryan, Evans, and Emanuel counties, GA). [= K, WH, Z; > K. spathulata Small – S]

**142. ZYGOPHYLLACEAE** R. Brown 1814 (Creosote-bush Family) [in ZYGOPHYLLALES]

A family of about 22-27 genera and 230-285 species, trees, shrubs, and (rarely) herbs, of tropical and subtropical regions of the Old and New Worlds. References: Sheahan in Kubitzki, Bayer, & Stevens (2007).

1 Fruit with tubercles, at maturity separating into 10 mericarps ................................................................................................................................. **Kallstroemia**

1 Fruit with spines, at maturity separating into 5 mericarps ................................................................................................................................. **Tribulus**

**Kallstroemia Scopoli 1777**

1 Ovary and fruit glabrous (rarely strigose) ................................................................................................................................. **K. maxima**

1 Ovary and fruit pubescent ................................................................................................................................................................. **K. pubescens**

*Kallstroemia maxima* (Linnaeus) Hooker & Arnott, Greater Caltrop. Disturbed areas, dunes; native status uncertain. SC south to FL; West Indies; Mexico (Sinaloa and Tamaulipas) south through Central America to northern South America (Venezuela, Colombia). Early collections from Charleston (Stephen Elliott) and Savannah suggest the likelihood of introduction via ballast. [= RAB, K, S, WH, Z]

*Kallstroemia pubescens* (G. Don) Dandy, Caribbean Caltrop. Disturbed areas; native of tropical America. [= WH]
**KEY A**  – woody legumes (trees, shrubs, or woody vines)

1. Leaves unifoliolate or trifoliolate, or reduced to phylloidi spines.
2. Tree; leaves unifoliolate and > 5 cm wide; [subfamily Caesalpinioideae, tribe Cercideae] 

**Key B**

3. Leaves palmately or pinnately compound.
4. Leaves pinnately compound.
5. Leaves trifoliolate.

**Key C**

**Key D**

7. Leaves all reduced to phylloidi spines; flowers axillary; calyx 10-15 mm long ............................................................................. *Erythrina*

**Key E**

8. Leaves with angulated or flanged green twigs; leaves palmately trifoliolate, unifoliate, or reduced to spine-tipped phyllodes; flowers bright yellow; [introduced, usually of roadsides or as remnants of cultivation]; [tribe Genisteae, subtribe Genistinae].

**Key F**

9. Shrubs with normal lamina, either unifoliolate or trifoliolate; flowers in terminal racemes; calyx 3-6 mm long.

**Key G**

10. Leaves odd-pinnate; legume 4-15 cm long; seeds brown; [tribe Millettieae] .................................................................................... *Wisteria*
9 Trees or shrubs.
11 Leaves 2-<even-pinnate; [subfamily Mimosoideae]
  12 Inflorescence cylindrical, elongate, bicolor; (the basal flowers sterile, with pink staminodes, the upper fertile, yellowish); [tribe Mimoideae]................................................................................................................................................................................................. Dichrostachys
  12 Inflorescence spherical or hemispheric, as wide as long, all the flowers fertile and of the same color.
     13 Stamens connate at the base; inflorescence pink, 2.5-5 cm in diameter; [tribe Ingeae]
     14 Petioles with glands; leaves with >4 pinnae pairs, each pinna with >10 pinnule pairs; inflorescence 2.5-5 cm in diameter........
 .................................Albizia
     14 Petioles lacking glands; leaves with 2 pinnae pairs, each pinna with <8 pinnule pairs; inflorescence 5-7 cm in diameter........
 .................................Calliandra
  13 Stamens free; inflorescence orange or yellowish-white, 1.0-2.2 cm in diameter.
  15 Inflorescence yellowish-white, 1.8-2.2 cm in diameter; stamens 10; [tribe Mimoseae]..............................................Leucaena
  15 Inflorescence orange, 1.0-1.3 cm in diameter; stamens many; [tribe Acacieae].........................................................Vachellia
11 Leaves otherwise.
15 [subfamily Papilionoideae].
  16 Leaves glandular-punctate; corolla of only 1 petal; inflorescence a spike; shrubs; [tribe Amorpheae].................................Amorpha
  16 Leaves not glandular-punctate; corolla of 5 petals; inflorescence a raceme or panicle; trees or shrubs.
     17 Leaflets alternate on the rachis; leaflets 4-15 (-20) cm long; [tribe Sophoreae].................................................................Chadratis
     17 Leaflets opposite on the rachis; leaflets (1-) 2-5 (-6) cm long.
     18 Flowers in an upright, stiff raceme or panicle; flowers creamy white with some blue; [tribe Sophoreae]....................Maackia
     18 Flowers in dangling racemes; flowers white or pink.
     19 Leaflets with persistent linear stipels; [tribe Robinieae].........................................................................................Robinia
     19 Leaflets lacking stipels; [tribe Sophoreae]..............................................................................................................Styphnolobium
  15 [subfamily Caesalpinioideae].
  20 Leaves all 2-pinnate, or a mixture of 2-pinnate and 1-pinnate on the same plant; shrub or tree; [tribe Caesalpineae].
  21 Leaves a mixture of 1-pinnate and 2-pinnate..........................................................Gleditsia
  21 Leaves all 2-pinnate.
     22 Leaves petiolate; leaflets 20-70 mm long..............................................................Gymnocladus
     22 Leaves subsessile (the pinnae simulating 1-pinnate leaves); leaflets 1-5 mm long......................................................Parkinsonia
  20 Leaves all 1-pinnate (or appearing so in Parkinsonia); herb, shrub, or tree.
     23 Shrub with prominent glands on the leafstalk; [tribe Cassieae].................................................................Senna
     23 Tree or shrub (if a shrub, then lacking prominent glands on the leafstalk); [tribe Caesalpineae].
     24 Leaflets 13-45 mm long; tree; leaves 1-pinnate ..........................................................Gleditsia
     24 Leaflets 1-5 mm long; shrub; leaves actually 2-pinnate, but subsessile, the pinnae simulating 1-pinnate leaves................Parkinsonia

Key B – herbaceous legumes with palmate leaves with 4 or more leaflets

Lupinus, Orbexilum, Pediomelum, Psoralidium, Zornia

Key C – herbaceous legumes with bipinnate leaves

1 Stamens > 10 ..................................................................................................................................................................................Acaciella
1 Stamens 10 or fewer,
  2 Petiole with 1-several glands; stems ascending to erect; flowers greenish-white ...................................................................Desmanthus
  2 Petiole without glands; stems prostrate to weakly arching; flowers pink-purple, yellow, or greenish-yellow.
     3 Flowers pink-purple; legume ribbed, the ribs with prickles ......................................................................................Mimosa
     3 Flowers yellow to greenish-yellow; legume not ribbed or prickly......................................................................................Neptunia

Key D – pinnate plus

Aeschynomene, Apios, Arachis, Astragalus, Chapmannia, Chamaecrista, Cicer, Clitoria, Dalea, Galactia, Glottidium, Glycyrrhiza, Lathyrus, Lens, Lotus, Pisum, Securigera, Sesbania, Tephrosia, Vicia

Key E – unifoliolate

Alysicarpus, Baptisia, Crotalaria, Lupinus, Orbexilum, Pediomelum, Rhynchosa, Scorpiurus

Key F – pinnately trifoliolate

Acmispon, Amphicarpaea, Canavalia, Centrosema, Clitoria, Cullen, Dalea, Desmodium, Erythrina, Galactia, Glycine, Indigofera, Lablab, Lespedeza, Lotus, Macroptilium, Medicago, Melilotus, Mucuna, Orbexilum, Pediomelum, Phaseolus, Rhynchosa, Stylosanthes, Strophostyles, Trifolium, Vigna

Key G – palmately trifoliolate
**Acmispon, Baptisia, Crotalaria, Kammerowia, Medicago, Orbexilum, Pediomelum, Thermopsis, Trifolium**

*Acmispon* Rafinesque 1832 (American Bird’s-foot-trefoil, Prairie-trefoil)

**Acmispon* helleri* (Britton & Rose) A.A. Heller, Carolina Prairie-trefoil. Dry woodlands and openings, originally probably limited to prairie-like sites (fire-maintained, post oak-blackjack oak savannas), generally on clayey soils, now primarily seen on roadbanks, along railroads, and in powerline rights-of-way, where mowing and bush-hogging have replaced fire as the force keeping the habitat open, sunny, and suitable for this plant of prairie affinities. (June-) July-August (-September).  

*Acmispon* hystrix* (Britton) F.E. & E.G. Clements var. americanus* (Beard & Cartwright) – C, I, SE, Z

**Abrus Adanson 1763 (Precatory Bean)**

* Abrus precatorius* Linnaeus, Precatory Bean, Rosary Pea, Crab’s Eye, Jequirity. Native of the Paleotropics, and apparently reported for GA, AL, and AR by Isely (1998) and Kartesz (1999), but this is actually based on mislabeling in Map 64 in Isely (1998). The species does occur in peninsular FL, south of our area. The beautiful black-and-red beans have been traditionally used for jewelry and rosaries; they are extremely poisonous, though, and should be used with caution.  

**Acaciella Britton & Rose 1928 (Acacia)**

**Acaciella hirta** Britton & Rose, Prairie Acacia. Sandhills, disturbed sandy areas. W. LA, AR, and MO west to KS, OK, and TX; disjunct in e. Panhandle FL and n. peninsular FL. [= S = *Acacia angustissima* (P. Miller) Kuntze var. *hirta* (Nuttall)] B.L. Robinson – I, K, SE, WH; = *Acacia hirta* Nuttall]

**Aeschynomene Linnaeus 1753 (Joint-vetch)**

Aeschynomene americana Linnaeus var. americana, Shyleaf. Moist, disturbed sites. S. GA (Jones & Coile 1988, SE), s. AL, s. LA south to Central America; West Indies; se. Asia. [= I, SE, Y; < A. americana – K, WH]

Aeschynomene histrix Poiret var. incana (Vogel) Bentham. Disturbed areas; native of tropical America. Probably introduced on ship’s ballast at Pensacola in the 19th century, but seemingly established as it was recollected in Escambia County, FL, in 1985 (Isely 1990). [= K, WH; = A. histrix var. incana – SE, orthographic variant]

Aeschynomene indica Linnaeus, Southern Joint-vetch Marshes, ditches, disturbed wetlands. July-October. Apparently native to se. North America, from NC west to AR, south to s. FL and TX, now widespread in the tropics and subtropics of the Old World and New World. Perry, Ware, & McKenney-Mueller (1998) discuss the occurrence of this species in VA. [= GW, I, K, SE, WH, Y, Z; < Ae. virginica – S]

Aeschynomene virginica (Linnaeus) Britton, Sterns, & Poggenburg, Northern Joint-vetch, Sensitive Joint-vetch. Fresh to brackish tidal marshes and adjacent ditches, fields, and disturbed areas. July-October. NJ to ne. NC. Generally not weedy in most of its range, but in NC (now) found mostly in weedy situations, such as ditches or fields hydrologically connected to tidal waters. See Tyndall, Holt, & Lam (1996) and Belden & Van Alstine (2003) for additional information on habitat, population biology, and survey techniques. See Baskin et al. (1998) for additional information about seed germination and viability. [= RAB, C, F, G, I, K, SE, Y, Z; < A. virginica – S (also see A. indica)]

Aeschynomene viscidula Michaux, Sticky Joint-vetch. Dry sandy areas, such as sandhills, dry pinelands, and barrier islands. From s. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009; SE), panhandle FL, s. AL, s. MS, and s. TX south to s. FL; tropical America. [= I, K, SE, WH, Y; = Secula viscidula (Michaux) Small – S]

Albizia Durazzini 1772 (Silktree)

1 Leaflets 7-15 mm long; bark of mature trees smoothish, with small wart-like bumps ................................................................. A. julibrissin

1 Leaflets 15-30 mm long; bark of mature trees rough, with plates ........................................................................................................ A. kalkora

* Albizia kalkora (Roxburgh) Prain, Kalkora Mimosa. Naturalizing in suburban areas; native of e. Asia (Japan, Korea, Taiwan). Documented by herbarium specimens at DUKE and NCU. Apparently hybridizing with A. julibrissin (W. Cook, pers. comm.).

Alysicarpus Necker ex Desvaux 1813 (Alyce Clover)

* Alysicarpus ovalifolius (Schumacher) J. Léonard, Alyce Clover. Disturbed areas; native of the Old World Tropics, planted as a forage crop (at least formerly), and rarely naturalized. The VA occurrence is from chrome ore piles in Newport News – presumably a waif. It is possible that A. vaginalis (in the strict sense) is represented in our area as well. It differs from A. ovalifolius in having a densely congested inflorescence (with rachis internodes shorter than the flowers) vs. a lax inflorescence with the flowers much shorter than the rachis internodes. [= WH; < Alysicarpus vaginalis (Linnaeus) A.P. de Candolle – I, K, SE]
Amorpha Linnaeus 1753 (Indigo-bush, Leadplant)

1 Short shrubs, usually 0.3-1 (-1.5) m tall; petioles 1-15 (-20) mm long, usually shorter than the width of the contiguous leaflets (except in A. confusa); leaflets usually slightly or conspicuously revolute.

2 Leaflet mucros mostly swollen apically; plant usually glabrous or sparsely pubescent.

3 Upper portions of the plant (stems and leaves) glabrous; calyx tube glabrous to sparsely or densely minutely strigillose; fruit glabrous; [of s. GA southward].........................................................................................A. herbacea var. floridana, of s. GA and FL.

4 Leaflet mucros mostly swollen apically; plant usually glabrous or sparsely pubescent.

5 Calyx lobes (0-) 0.2-1.2 mm long (thus distinctly shorter than the calyx tube); racemes 5-20 (-25) cm long.

6 Calyx lobes obsolete to very small, (0-) 0.2-0.6 (-0.8) mm long; plants glabrous to glabrate; leaflets usually not mucronate, the midrib commonly panicled), 1 (-4) per flowering branch, (2-) 3-5 (-6) cm long; flowering April-May .............................................A. georgiana.

7 Foliage remaining green when dried; leaflets (7-) 9-23 (-31) per leaf, dull to somewhat shiny above; [widespread in our area] .................................................................A. fruticosa.

8 Foliage blackening when dried; leaflets (7-) 9-15 (-19) per leaf, usually shiny above; [of s. SC and southward].........................A. nitens.
Amorpha nitens  Boynton, Dark Indigo-bush.  Sandy woodlands, rocky slopes, bottomland forests.  April-June.  S. SC south to GA, west to LA, north in the interior to w. KY, s. IL, AR, and e. OK.  First reported for SC by Nelson & Kelly (1997).  [= I, K, S, SE, Y]

Amphicarpaea Ellriott ex Nuttall 1818 (Hog-peanut)

A genus of 5-6 species, of e. and se. Asia, North America, and montane Africa.  It now appears that 2-3 semi-cryptic taxa should be recognized in what has traditionally been considered a single species of Amphicarpaea (Callahan 1997, Parker 1996).  The genus name has been corrected to Amphicarpaea from the frequently used Amphicarpa.  References:  Callahan (1997)=Y; Parker (1996)=Z; Isely (1998)=I.

Identification notes:  Producing inflorescences of two types, one with chasmogamous flowers and aerial legumes, the other with cleistogamous flowers and subterranean legumes.

1  Petiole 3.5-5.3 cm long; petiolule of the terminal leaflet (not including the rachis extending from the point of connection of the lateral leaflets to the joint marking the beginning of the petiolule of the terminal leaflet) 1.0-1.4 mm long; terminal leaflet 4.2-5.2 cm long .......................................................... A. bracteata var. bracteata

1  Petiole 6.0-6.8 cm long; petiolule of the terminal leaflet 1.7-1.9 mm long; terminal leaflet 5.5-6.1 cm long ................ A. bracteata var. comosa

Amphicarpaea bracteata (Linnaeus) Fernald var. bracteata, Hog-peanut.  {Mt, Pd, Cp (DE, GA, NC, SC, VA, WV) {FL}: dry to moist forests, thickets; common (rare in FL?).  July-September; August-October.  {The distributions and habitats of the two varieties in our area require herbarium and field investigation}.  [= K; = Amphicarpa bracteata var. bracteata – F, G, orthographic variant; < Amphicarpaea bracteata – C, I, SE, WH; < Amphicarpa bracteata – RAB, orthographic variant; < Falcata comosa (Linnaeus) Kuntze – S]

Amphicarpaea bracteata (Linnaeus) Fernald var. comosa Fassett, Hog-peanut.  {Mt, Pd, Cp (DE, GA, NC, SC, VA, WV): dry to moist forests, thickets; common.  July-September; August-October.  {The distributions and habitats of the two varieties in our area require herbarium and field investigation}.  [= K; = Amphicarpa bracteata var. comosa – F, G, orthographic variant; < Amphicarpaea bracteata – C, I, SE, WH; < Amphicarpa bracteata – RAB, orthographic variant; < Falcata comosa (Linnaeus) Kuntze – S]

Anthyllis Linnaeus 1753 (Kidney-vetch)

Anthyllis vulneraria Linnaeus, Kidney-vetch.  Disturbed areas; native of Mediterranean Europe.  June-August.  [=I, K2]

Apios Fabricius 1759 (Groundnut)

1  Petiole 20-58 mm long; flower deep maroon to pale maroon and white; style glabrous; legume 6-10 (-12) cm long; seed 5-6 mm long; tubers several in a chain, each 2-10 cm in diameter ........................................................................................................................................ A. americana
**FABACEAE**

1 Legume 70-75 mm long; flower pale green and rose-purple; style bearded; legume 12-15 (-18) cm long; seed 7.2-11.0 mm long; tuber 1, 15-20 cm in diameter. ............................................................................................................................................. *A. priceana*

**Astragalus** Linnaeus 1753 (Peanut)

A genus of about 60 species, annual and perennial herbs, native of South America (especially Brazil). References: Isely (1998)=I.

1 Petiole 5-10 cm long; corolla 1.1-5 cm long; annual ............................................................................................................................................. *A. hypogaea*

1 Petiole 2.5-3.5 cm long; corolla 1.8-2 cm long; perennial ............................................................................................................................................. *A. prostrata*

**Astragalus** Linnaeus 1753 (Milkvetch)

A genus of 2300-2500 species, herbs and shrubs, most diverse in arid regions of w. North America and w. and c. Asia. The habitats of the southeastern species may be characterized as rocky or sandy, "relictual islands" of aridity in the generally moist landscape of eastern North America. References: Barneby (1964)=Z; Isely (1998)=I.

1 Legume pilose with > 1 mm or more long; stems conspicuously pubescent, the hairs spreading and simple; plants decumbent, spreading, or ascending, the stems 0.5-4 dm long.

2 Corolla 14-19 mm long; leaflets (5-) 7-15; legume unilocular; calyx lobes equaling or longer than the calyx tube [of dry sandy habitats from SC south] ............................................................................................................................................. *A. tennessensis*

2 Corolla 8-12 mm long; leaflets (5-) 7-15; legume unilocular; calyx lobes equaling or longer than the calyx tube [of dry sandy habitats from w. VA northward] ............................................................................................................................................. *A. villosus*

1 Legume glabrous; stems glabrous or inconspicuously pubescent, the hairs appressed, simple or dolabriliform; plants erect with stems (3-) 4-15 dm long, or decumbent with stems 1-3 dm long (A. *distortus* var. *distortus* and *A. bibullatus*).

3 Plants erect, stems (3-) 4-15 dm long; legume straight to moderately curved.

4 Lower stipules connate; pubescence dolabriliform; legumes 1-1.5 cm long, 4-5 mm in diameter; [typically of dry to mesic soils]. [.......................... *A. canadensis* var. *canadensis*]

4 Lower stipules free; pubescence simple; legumes either longer or wider (2-3 cm long and 4-6 mm in diameter in *A. michauxii*, 1.5-2.0 cm long and 8-18 mm in diameter in *A. neglectus*); [typically of notably dry, either rocky or sandy, soils].

5 Leaves with 21-31 coriaceous to somewhat fleshy leaflets, many of the leaflets alternate or subopposite; legumes 2-3 cm long, 4-6 mm in diameter; [of dry sandy habitats from NC south] ............................................................................................................................................. *A. michauxii*

5 Leaves with 11-23 thin-textured leaflets, all of the leaflets usually opposite; legumes 1.5-2 cm long, 8-18 mm in diameter; [of rocky calcareous habitats from VA north] ............................................................................................................................................. *A. neglectus*

3 Plants decumbent or ascending, stems 1-5 dm long; legume either dry and strongly curved (about 90 degrees), or globose and initially fleshy.

6 Legume globose, 1.3-2 cm in diameter, initially fleshy; corolla 18-25 mm long; [of calcareous glades of c. TN] .................. *A. bibullatus*

6 Legume lanceolate, 1.2-2.5 cm long, 4-7 mm wide, strongly curved; corolla (7-) 8-15 mm long; [of shaley habitats from w. VA northward or of dry sandy sites in FL and possibly adjacent GA].

7 Leaflets mostly 1-2× as long as wide, typically noticeably notched at the tip; mature legume reticulately textured; corolla 8-11 mm long; [of dry sandy sites in FL and possibly adjacent GA and s. MS] ............................................................................................................................................. *A. obcordatus*

7 Leaflets mostly 2-3.5× as long as wide, truncate or shallowly notched at the tip; mature legume lacking a reticulately textured surface; corolla 9-15 mm long; [either of shaley habitats from w. VA northward or of woodlands and prairies from MS westward]

8 Keel 7-9.5 mm long; legume usually 3-4× as long as wide, often curved 90°, grooved along sutures on both sides ................................................................. *A. distortus* var. *distortus*

8 Keel 6-7 mm long; legume usually 2.5-3.5x as long as wide, nearly straight or curved < 90°, grooved only along one suture ................................................................. *A. distortus* var. *engelmannii*

**Astragalus canadensis** Linnaeus var. *canadensis*, Canada Milkvetch. Forests, woodlands, streambanks, rocky slopes and bluffs. June-August; July-October. Ranging through much of North America, from QC and Hudson Bay west to BC, south to GA, TX, CO, and Utah; also apparently in Siberia. The other varieties occur further west. See Barneby (1964) for a detailed
discussion of taxonomic and nomenclatural problems involving *A. canadensis*. Barneby comments that "the eastern mountain race [in the Appalachians] is commonly distinguished from var. *canadensis* of the Mississippi Valley and northward by a narrower and more open flowering and fruiting raceme, and the flowers at the same time are relatively small. There is something to be said in favor of recognizing an eastern montane variety, so long as we confine its distinguishing characteristic to a loose raceme." The distribution, as mapped by Barneby, is suggestive of a composite map of 2 (or more) different taxa, one of them being centered in the Southern and Central Appalachians (extending out into nearby provinces). F and G separate var. *carolinianus*, basing the distinction, however, on a different set of characters, and considering var. *canadensis* to range south to VA (at least). Further study is needed; it seems we may have in our area 2 taxa worthy of distinction at the varietal level. [= I, K, SE, Z; < *A. canadensis* – RAB, C, W; > *A. canadensis* var. *canadensis* – F, G; > *A. canadensis* var. *carolinianus* (Linnaeus) M.E. Jones – F, G; > *A. carolinianus* Linnaeus – S]

*Astragalus distortus* Torrey & A. Gray var. *distortus*, Ozark Milkvetch, Bent Milkvetch. Shale barrens and other dry, shaley places. May-July. *A. distortus* is interpreted by Z (and followed by C and SE) to consist of 2 varieties: var. *distortus*, occurring in the s. Midwest from IL, MO, and OK south to MS, LA, and AR, and disjunct in n. and sc. VA, e. WV, and w. MD, and var. *engelmannii* (Sheldon) M.E. Jones, of TX and ne. LA. The two varieties seem fairly readily distinguishable morphologically in the Midwest. Appalachian var. *distortus* complicates the issue, since it approaches var. *engelmannii* in flower size and matches it in ovule number. The Appalachian plant, with a combination of morphologic characters not matching the two named varieties and far allopatric from them might better be considered a distinct variety. Further study is needed. [= C, I, K, SE, Z; < *A. distortus* – F, G; = *Holcophacos distortus* (Torrey & A. Gray) Rydberg – S]

*Astragalus distortus* var. *engelmannii* (Sheldon) M.E. Jones. {habitats}. AR, TX, and w. LA; disjunct eastward in MS (NatureServe 2007). [= I, K, SE, Z]

*Astragalus michauxii* (Kuntze) F.J. Hermann, Sandhills Milkvetch, Michaux's Milkvetch. Sandhills. Late April-June; June-October (and persisting). Sc. NC south through SC to GA, a Southeastern Coastal Plain endemic (reports from AL and FL are in error). "The Michaux milk-vetch is greatly isolated from any member of the genus morphologically similar" (Barneby 1964). [= RAB, I, K, SE, Z; = *Tium michauxii* (Kuntze) Rydberg – S]

*Astragalus neglectus* (Torrey & A. Gray) Sheldon, Cooper Milkvetch. Dry calcareous woodlands and barrens, over dolostone and limestone. June-September. Se. ON west to se. SK and ne. ND, south to w. NY, ne. PA, c. PA, n. OH, s. MI, se. WI, and e. SD; disjunct in w. VA and e. WV (Wieboldt et al. 1998). [= C, I, K, SE, Z]

*Astragalus obcordatus* Elliott, Florida Milk-vetch. Sandhills. S. MS south to c. peninsular FL. Reported for s. GA, but no specimen documentation is known (Barneby 1964). [= I, K, SE, WH, Z; = *Phaca obcordata* (Elliott) Rydberg ex Small – S]

*Astragalus villosus* Michaux, Bearded Milkvetech, Southern Milkvetech. Sandhills and other dry, sandy places. May-June; June-August. A Southeastern Coastal Plain endemic: s. SC south to Panhandle FL, west to s. MS. This species is described by Barneby (1964) as "a lowly but delightful little astragalus." [= RAB, I, K, SE, WH, Z; = *Phaca intonsa* (Sheldon) Rydberg ex Small – S]

*Baptisia* Ventenat 1808 (Wild Indigo)

Identification notes: Many of our species hybridize when they grow in proximity. They are generally recognizable (especially in context with their parents) by their intermediate morphology. Additional hybrids have been created by plant breeders and may be found in cultivation.

1 Leaves 1-foliolate, sessile or perforate.
2 Leaves perfoliately; plant glabrous; [widespread, from s. SC southward].................................................................B. perfoliata
3 Leaves sessile; plant glabrous or densely cobwebby pubescent; [narrow endemics of GA and FL].
4 Plant cobwebby-pubescent; leaves ca. 1× as long as wide, cordate at base; corolla 9-11 mm long, yellow; [of e. GA (Brantley and
Wayne counties)]..................................................................................................................................................B. arachnifera
3 Plant cobwebby-pubescent; leaves ca. 1× as long as wide, rounded to broadly cuneate at base; corolla 12-15 mm long, pale yellow to green; [of
the FL Panhandle (Franklin, Gadsden, Leon, Liberty, and Wakulla counties)].....................................................B. simplicifolia
1 Leaves 3-foliolate, petiolate or sessile.
2 Flowering or fruiting pedicels bracteolate; corolla 11-14 mm long
5 Calyx lobes as long as the calyx tube ..............................................................................................................................B. lecontei
5 Calyx lobes much > the calyx tube.
6 Plant glabrous; [of ne. FL (Clay and St. Johns counties)] .........................................................................................B. calycosa
6 Plant tomentose to hirsute; [of FL Panhandle (Escambia, Holmes, Okaloosa, Santa Rosa, and Walton counties)]..............B. hirsuta
4 Flowering or fruiting pedicels lacking bracteoles larger (except B. tinctoria).
7 Plants in flower.................................................................................................................................................................Key A
7 Plants in fruit............................................................................................................................................................................Key B

Key A – flowering Baptisia
1 Flowers lavender or blue.
2 Leaflets 2-4 (-5) cm long, mostly < 10 mm wide (if wider, then < 4 cm long); leaflets mostly oriented in a vertical plane; fertile stems
usually 0.4-1.0 m tall, the leafy branches horizontally spreading; racemes 1.25-2.5 (-4) dm long, rather densely flowered; pedioles 0-4 (-12)
mm long; [of diabase and limestone glades, barrens, and woodlands]. .................................................................B. australis var. abercans
2 Leaflets 4-6 (-9) cm long, mostly > 12 mm wide; leaflets not oriented in a vertical plane; fertile stems usually 1-1.5 m tall, the leafy
branches ascending; racemes 2-4 (-5) dm long, rather sparsely flowered; pedioles 20-40 (-40) mm long; [of flood-scoured riverside
cobblebars and rock outcrops, also frequently cultivated and sometimes persistent or escaped]..............................B. australis var. australis
3 Flowers white or cream-white.
4 Flowering pedicels 18-30 mm long, subtended by persistent bracts 10-25 mm long and 7-10 mm wide; flowers cream-white (to
pale-yellow).
5 Pedioles of median leaves 4-10 mm long..........................................................................................................................B. bracteata
5 Pedioles of median leaves 2-4 mm long
6 Leaves and stems glabrous; leaflets 1.5-2.5× as long as wide .....................................................................................B. leucophaea var. laevicaulis
6 Leaves and stems pubescent; leaflets (1.5-) 2.5-5× as long as wide .............................................................................B. leucophaea var. leucophaea
4 Flowering pedicels 3-10 mm long, subtended by caducous bracts 4-7 mm long and 1-2 mm wide; flowers white.
7 Calyx 4.5-6.5 mm long; corolla 13-16 (-18) mm long; pedioles 5-10 (-20) mm long .........................................................B. albenscens
7 Calyx 7-8 mm long; corolla 20-25 mm long; pedioles (of the lower leaves at least) 10-20 mm long.
8 Legume usually 15-20 (-30) mm in diameter, thin-walled and brittle; [of NC south through GA to FL and AL].................B. alba
8 Legume usually 10-12 (-15) mm in diameter, rigid and tough; [of c. TN, c. KY, and MS westward] .............................B. leucantha
3 Flowers yellow.
9 Flowering pedicels 14-18 (-30) mm long, subtended by persistent bracts 10-25 mm long and 7-10 mm wide; flowers pale-yellow (to
cream-white).
10 Pedioles of median leaves 4-10 mm long.........................................................................................................................B. bracteata
10 Pedioles of median leaves 2-4 mm long
11 Leaves and stems glabrous; leaflets 1.5-2.5× as long as wide .....................................................................................B. leucophaea var. laevicaulis
11 Leaves and stems pubescent; leaflets (1.5-) 2.5-5× as long as wide .............................................................................B. leucophaea var. leucophaea
9 Flowering pedicels 2-10 mm long, subtended by caducous bracts 2-10 mm long and 1-2 mm wide; flowers bright yellow.
12 Leaflets mostly 1-2.5 (-4) cm long, 1.5-2× as long as wide; the petioles 0-1 mm long; corolla 12-16 mm long; racemes numerous,
terminating most of the branches. .................................................................................................................................B. tinctoria
12 Leaflets mostly 4-9 cm long, 1.5-4× as long as the petioles 2-10 mm long; corolla 20-28 mm long; racemes solitary (-3) (B.
cineria) or numerous (B. lanceolata).
13 Inflorescences of many-flowered cylindrical racemes; stipules persistent or caducous.
14 Plant persistently cinereous-pubescent stipules (some of them at least) persistent..........................................................B. cinerea
14 Plant puberulent when young, soon glabrate to glabrous; stipules caducous; [of MS westward] ............................B. sphaerocarpa
15 Inflorescence of solitary axillary flowers or flowers in clusters of 2-4 in axils or terminal racemes; stipules caducous.
15 Petioles 2-3 mm long; leaflets 1.25-2× as long as wide; [of LA, AR, TX, and OK] ................................................B. nuttalliana
15 Petioles 4-10 mm long; leaflets 1.7-5× as long as wide; [of SC, GA, FL, and AL]. .........................................................B. lanceolata var. lanceolata
16 Leaflets 3-5× as long as wide, usually < 1.5 cm wide; flowers usually solitary or in clusters of 2-3; fruits broadly ellipsoid or
subspheroidal, < 2× as long as wide; [se. SC south through GA Coastal Plain to ne. FL] .........................B. lanceolata var. lanceolata
16 Leaflets 1.7-3.2 (-5×) as long as wide, the larger typically > 2 cm wide; flowers in racemes of (1-) 3-10 flowers; fruits
usually ellipsoid, often > 2× as long as wide; [FL Panhandle, s. AL, and c. peninsular FL] ............B. lanceolata var. tomentosa
{add B. megacarpa to key}

Key B – fruiting Baptisia
1 Legume 5-11 mm in diameter.
2 Legume cylindric, 20-30 (-35) mm long, 7-9 mm in diameter, yellow-brown, leathery in texture ........................................B. albenscens
2 Legume globose or subspheroidal, 7-25 mm long, 5-11 mm in diameter, black, woody in texture.
3 Leaflets mostly 1-2.5 (-4) cm long.................................................................................................................................B. tinctoria
3 Leaflets 3.5-10 cm long.
Echinacea laevigata

Unmistakable for its simple leaves and dense "cobwebby" pubescence.

Eastern plants referrable to Baptisia australis for separating it from typical Baptisia alba, B. leucantha, B. leucophaea var. laevicaulis, B. australis var. aberrans, B. australis var. australis

Baptisia alba (Linnaeus) Ventenat, Thick-pod White Wild Indigo. Dry woodlands, roadsides. May-July; June-October. NC south to n. peninsular FL, west to AL. B. leucantha (see below) is a western sibling, treated as either a species or a variety. In fruit, it is easily separated from Baptisia albescens and other Baptisia by its nearly spheroidal legume. B. alba and B. albescens have been nomenclaturally confused; Isely (1986a) corrects the application of the epithet "alba." [= S, WH; = B. alba var. alba – I, K, SE; = B. pendula Larisey – RAB; = B. lactea (Rafinesque) Thieret var. ovobata (Larisey) Isely – C (by implication), X, Y; = B. lactea var. pendula (Larisey) B.L. Turner – Q; > B. pendula var. pendula – Z; > B. pendula var. ovobata Larisey – Z]

Baptisia albescens Small, Narrow-pod White Wild Indigo, Spiked Wild Indigo. Dry woodlands, pine flatwoods, roadsides. May-July; June-October. SC to n. FL, e. AL and e. TN. The fruits are unlike any of our other species in being cylindrical, about 3× as long as the diameter, and yellowish-brown (rather than black) when mature. [= I, K, S, SE, WH; = B. alba – RAB, C, F, G, Q, W, X, Y, misapplied; > B. alba – Z; > B. albescens – Z]

Baptisia arachnifera Duncan, Hairy Rattleweed, Hairy Wild Indigo. Sandhills. Endemic to GA (Wayne and Brantley counties). Unmistakable for its simple leaves and dense "cobwebby" pubescence. [= I, K, Q, SE, X, Y]

Baptisia australis (Linnaeus) R. Brown var. aberrans (Larisey) M. Mendenhall, Eastern Prairie Blue Wild Indigo, Glade Wild Indigo. Glades, barrens, and open woodlands over limestone (or other calcareous rocks) and diabase (or other mafic rocks), in areas that were formerly barrens, barrens, glades, or oak savannas. April-May, June-August, C. and SE, TN, NW, GA, and C. NC (and possibly also s. KY and SC. VA). Blue-flowered Baptisia from mafic glades, barrens, and former prairies and oak savannas in NC has proven problematic to taxonomists. Larisey (1940a) treated B. australis and B. minor as separate species, and placed eastern plants resembling B. minor in B. minor var. aberrans Larisey, but without providing very satisfying characters for separating it from typical B. minor of nw. North America. RAB apparently (though tacitly) included B. minor within B. australis. Isely (1981, 1990) treated blue-flowered Baptisia as B. australis var. australis and var. minor, regarding var. minor as reaching its eastern limit in MO (the two varieties thus allopatric), and stating that "sporadic collections within the range of australis have the pods and some of the vegetative characters of var. minor... most of these collections are from dry or sterile habitats, e.g., cedar glades, that var. australis typically does not inhabit" (Isely 1990). His treatment of australis and minor at the varietal level remains largely based on the existence of minor carnations within his concept of the range of australis. NC plants from glade-like sites are morphologically more similar to midwestern prairie B. minor, occur in similar habitats, and grow with a large number of other plants with midwestern phytogeographic affinities, such as Eryngium yuccifolium var. yuccifolium, Echinacea laevigata (an eastern sibling of E. purpurea), Solidago ptarmicoides, Solidago rigida ssp. glabrata (an eastern sibling of S. rigida ssp. rigida), Silphium terebinthinaceum, and others. The affinities of these plants seem to be with B. minor; "shoeorning" them into the more eastern B. australis, which they do not resemble in morphology, habitat, or (indeed) range is not a desirable disposition. Eastern plants referable to B. minor do, however, as noted by Larisey and Isely, differ from midwestern plants in leaflet size and shape, branching, and pod shape; they are best treated as an eastern, reliculat variety in the complex, B. australis var. aberrans Larisey. Mendenhall (1994a, 1994b) found that the "aberrans" entity warranted taxonomic recognition, and indeed that it is less closely related to B. australis s.s. and B. minor than they are to one another; she chose to treat the three entities as varieties under B. australis. For now, the best treatment seems to be to follow Mendenhall, and acknowledge the existence of three varietal entities, with the phylogenetic affinities uncertain. The range of B. australis var. minor is thus largely midwestern, from se. NE, s. MO, and e. and c. KS south to w. AR, e. and c. OK, and ne. TX. [= K, X; = Baptisia minor Lehmann var. aberrans Larisey – Z; < B. australis (Linnaeus) R. Brown – RAB, S; < B. australis var. australis – I, Q, SE; < B. australis var. minor (Lehmann) Fernand – C, G; < B. minor – F]

Baptisia australis (Linnaeus) R. Brown var. australis, Tall Blue Wild Indigo, Steamside Blue Indigo. Riverbank scour areas, gravel bars, and disturbed areas (where persisting from cultivation). April-June; June-August. Native to w. and n. VA, w. MD, WV, w. PA, e. and c. KY, ne. TN, se. IN, and s. OH, and possibly native to other states, the original range somewhat obscured by its frequent cultivation. [= C, G, K, X; = B. australis – F, W, Z; < B. australis – RAB, S; < B. australis var. australis – I, Q, SE]
Baptisia bracteata Elliott, Creamy Wild Indigo. Sandhills, other dry woodlands. March-April; May-June. Ne. AL northwest through n. GA and n. SC to w. NC. The more western B. leucophaea Nuttall is better treated as a species than as B. bracteata var. leucophaea (Nuttall) Kartesz & Gandhi (Mendenhall 1994b). [= RAB, Q, S, W, X, Z; = B. bracteata var. bracteata – C, I, K, SE]

Baptisia calycosa Canby, Florida Wild Indigo. Dry pinelands. Endemic to ne. FL (Clay and St. Johns counties) and also reported for Lowdes County, GA (Kartesz 2010) (this record needing confirmation). [= Q, S, Z; = B. calycosa var. calycosa – I, K, SE, WH, Y] {synonymy incomplete: X}

Baptisia cinerea (Rafinesque) Fernald & Schubert, Carolina Wild Indigo. Sandhills, other dry sandy woods. Late April-June; June-July. Though common in the Coastal Plain of the Carolinas, B. cinerea is a narrow endemic, ranging only from s. VA south to s. SC. The large, yellow flowers are very showy. In fall, the leaves do not drop, but stay attached to the stems, the whole plant turning an ashy gray; these dried plants are conspicuous through the following winter. The report in Jones & Coile (1988) of B. cinerea in GA is in error; the specimen is of B. lanceolata. [= RAB, C, F, G, I, K, Q, SE, X; = B. villosa auct. non (Walter) Nuttall – S, Z]

Baptisia hirsuta Small, Hairy Wild Indigo, Panhandle Wild Indigo. Dry pinelands. Endemic to FL Panhandle (Escambia, Holmes, Okaloosa, Santa Rosa, and Walton counties) and adjacent AL (Covington County). May; June-September. [= Q, S, Z; = B. calycosa Canby var. villosa Canby – I, K, SE, WH, Y] {synonymy incomplete: X}

Baptisia lanceolata (Walter) Elliott var. lanceolata, Gopherweed. Sandhills. April-May; June-November. S. SC south to ne. FL and sw. GA, a Southeastern Coastal Plain endemic. Small (1933) alleges that B. lanceolata ranges north to NC, but no documentation is known. The plant is reminiscent of B. cinerea, but forms larger, bushier plants and is separable by characters in the key. [= I, K, Q, SE, X; < B. lanceolata – RAB, S, WH; = B. lanceolata – Z]

Baptisia lanceolata (Walter) Elliott var. tomentosa (Larisey) Isely. Sandhills. Panhandle FL and adjacent s. AL; disjunct in c. peninsular FL. Two forms have been recognized, the "narrow-leaved form," endemic to the Apalachicola Lowlands portion of the FL Panhandle, and the "typical form," occupying the FL Panhandle, s. AL, and disjunct in c. peninsular FL (Isely 1981). Mendenhall (1994b) included broad-leaved and narrow-leaved forms of var. tomentosa in her study, which provided some support for the taxonomic recognition of these unnamed entities. [= I, K, SE, Y; = B. lanceolata var. elliptica (Small) B.L. Turner – Q; = B. elliptica Small – S; < B. lanceolata – WH; > B. elliptica var. elliptica – Z; > B. elliptica var. tomentosa Larisey – Z]

Baptisia leucantha Torrey & A. Gray. Woodlands, prairies, roadsides. W. MY, MI, WI, MN, and e. NE, south to AL, MS, LA, e. TX, and sw. OK; alleged by S to occur in NC, presumably based on misinterpreted material of B. alba. [= S, X; = Baptisia alba var. macrophylla (Larisey) Isely – I, K1, K2, SE; = B. lactea (Rafinesque) Thieret var. lactea – C, Q, Y; > B. leucantha var. leucantha – Z; > B. pendula Larisey var. macrophylla Larisey – Z]

Baptisia leucophaea Nuttall var. leucophaea. Pinelands, woodlands. April-May. Nw. IN west to s. MN and e. NE, south to w. KY, c. MS, c. LA, se. LA (Turner 2006), and e. TX. [= B. bracteata var. leucophaea – I, K2, SE; < B. leucophaea var. leucophaea – F, G, Q; < B. bracteata Muhlenberg ex Elliott var. leucophaea (Nuttall) Kartesz & Gandhi – K1; = B. bracteata var. glabrescens (Larisey) Isely – Y; < B. leucophaea var. glabrescens Larisey – Z]

Baptisia leucophaea Nuttall var. laevicaulis A. Gray ex Canby. Pinelands, coastal prairies. April-May. < [B. bracteata Muhlenberg ex Elliott var. laevicaulis (Nuttall) Kartesz & Gandhi – K1; = B. bracteata var. laevicaulis (A. Gray ex Canby) Isely – I, K2, SE; < B. bracteata var. glabrescens (Larisey) Isely – Y; < B. leucophaea var. glabrescens Larisey – Z]

Baptisia megacarpa Chapman ex Torrey & A. Gray, Apalachicola Wild Indigo, Bigpod Wild Indigo. Moist floodplains and lower slopes. Late April-early June; June-July. E. Panhandle FL and sw. GA west to se. AL. [= I, K, Q, S, SE, WH, X, Y; > B. megacarpa – Z; > B. riparia Larisey var. riparia – Z; > B. riparia var. minima – Z]

Baptisia nuttalliana Small. Woodlands and prairies. S. AR and se. OK south to se. LA (Florida parishes) and se. TX. [= I, K1, K2, Q, S, SE, Y, Z] {synonymy incomplete}
Baptisia perfoliata (Linnaeus) R. Brown ex Aiton f., Catbells, Gopherweed. Sandhills. April-May; May-July. S. SC to e. GA; disjunct in e. peninsular FL (Orange and Osceola counties); disjunct in wc. AL (Sumter County) (Keener 2007), a Southeastern Coastal Plain endemic. [= RAB, I, Q, SE, X, Y, Z]

Baptisia sphaerocarpa Nuttall. Woodlands and prairies. S. MS west to se. MO, e. OK, and e. TX. [= I, K; > B. sphaerocarpa – Z; > B. viridis Larisey – Z] {synonymy incomplete}

Baptisia tinctoria (Linnaeus) Ventenat, Honesty-weed, Rattleweed. Sandhills, pine flatwoods, xeric woodlands, ridges, woodland edges, and roadbanks. April-August; July-November. Widespread in eastern United States, from NY and MN south to GA. The most widespread and common of our species of Baptisia, B. tinctoria is readily recognizable from its small, yellow flowers, small leaflets, and small fruits. The taxa synonymized need further investigation. [= RAB, C, I, K, Q, SE, W, X; > B. tinctoria var. projecta Femald – F, G, Z; > B. tinctoria var. tinctoria – F, G, Z; > B. tinctoria var. crebra Femald – F, Z; > B. tinctoria – S; > B. gibbesii Small – S]

Calliandra Bentham 1840

A genus of about 135 species, trees and shrubs, of the New World tropics and subtropics. References: Isely (1998)=I.

* Calliandra haematocephala Hasskarl, Powderpuff Tree. Disturbed areas; native of South America, cultivated in the souther part of our area and allegedly persistent or spreading. [= I, WH]

Canavalia deCandolle 1825

A genus of about 50 species, perennial or annual herbs or vines, pantropical. References: Isely (1998)=I.

Canavalia rosea (Swartz) deCandolle, Baybean. Ocean beaches. Pantropical, north to Dixie County on the west coast and Volusia County on the east coast of FL. [= I, K, SE, WH; ? Canavalia lineata (Thunberg) deCandolle – S, misapplied]

Centrosema (A.P. de Candolle) Bentham 1837 (Spurred Butterfly Pea)

Identification notes: Centrosema and Clitoria are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large “standard” is lowermost. They are often confused; the following key includes both genera for easy differentiation.

1 Leaflets 5-7-foliolate; [rare alien] .................................................................................................................. Clitoria ternatea var. ternatea
1 Leaflets 3-foliolate.
2 Calyx tube 10-13 mm long, much longer than the lobes; bracteoles 3-7 mm long, not enclosing the calyx tube; legume 3-5 cm long, 5-7 mm broad; standard 4-6 cm long, not spurred. .......................................................... Clitoria mariana var. mariana
2 Calyx tube 4-5 mm long, shorter than or about as long as the lobes; bracteoles 5-12 mm long, partly enclosing the calyx tube; legume 6-12.5 cm long, 3-6 mm broad; standard 2.5-3.5 cm long, spurred near the base.
3 Lower calyx lobe 5-8 mm long, subulate to lanceolate; upper (bifurcate) calyx lobe 3-4 mm long; bracteoles 5-7 mm long; stems to 3 m long; [of n. FL southward] .................................................................................................................. Centrosema arenicola
3 Lower calyx lobe 8-11 mm long, subulate; upper (bifurcate) calyx lobe 7-8 mm long; bracteoles 8-12 mm long; stems to 1.5 m long; [widespread in our area] .............................................................................................................. Centrosema virginianum
**Cercis** Linnaeus 1753 (Redbud)

1 Flowering pedicels 10-20 mm long; flowers (11-) 12-14 mm long .................................................................[**C. chinensis**]

1 Flowering pedicels 6-8 mm long; flowers 8-13 mm long.

2 Leaves this, dull above (sun leaves slightly coriaceous, slightly glossy above); legumes 9-14 (-18) mm wide; flowers 8-11 mm long ..........

..................................................................................................................................................[**C. canadensis** var. **canadensis**]

2 Leaves coriaceous, glossy above; legumes (11-) 13-17 (-20 mm wide; flowers (9-) 10-13 mm long .............[**C. canadensis** var. **texensis**]

---

**Chamaecrista** Moench 1794 (Partridge-pea)

1 Corolla 0.8-1.0 cm in diameter, the larger petals 4-7 (-8) mm long; functional stamens 5-8.

2 Petiole pilose with hairs 1-2 (-3) mm long; petiolar gland cylindric or clavate; functional stamens 5-8; leaflets 5-6× as long as wide ...........

..................................................................................................................................................[**C. nictitans** var. **aspera**]

2 Petiole incurved-puberulent with hairs 0-0.8 mm long; petiolar gland stalked-cupuliform or stalked-discoid; functional stamens 5; leaflets 3-5× as long as wide .................................................................[**C. nictitans** var. **nictitans**]

1 Corolla 2.5-3.5 cm in diameter, the larger petals 15-20 mm long; functional stamens 10.

3 Perennial from a horizontal woody root or crown; stems clustered .................................................................[**C. deeringiana**]

3 Annual from a taproot; stems solitary.

4 Pods 6.5-10 mm wide; seeds 4.7-6.3 mm across; [of tidal marshes in e. VA] ..........................................................[**C. fasciculata** var. **macrosperma**]

4 Pods 3-5 (-6.5) mm wide; seeds (2.6-) 3.2-4.8 mm across; [widespread geographically and ecologically] .................................................................[**C. fasciculata** var. **puberula**]

5 Surface of leaflets pubescent; [from w. Panhandle FL and s. AL westward] ..........................................................[**C. fasciculata** var. **brachiata**]

5 Surface of leaflets glabrous; [collectively widespread in our area].

6 Petiolar gland depressed, 1.5-2.5 mm wide, raised at both ends; pods 6-10 cm long; plant usually glabrous or glabrescent, to 24 dm tall ...........

..................................................................................................................................................[**C. fasciculata** var. **brachiata**]

6 Petiolar gland not depressed, <1.5 mm wide; pods 4-6 cm long; plant usually pubescent, to 10 dm tall ...........

..................................................................................................................................................[**C. fasciculata** var. **fasciculata**]

---

**Chamaecrista deeringiana** Small & Pennell, Florida Senna. Sandhills, dry longleaf pine woodlands, disturbed sandy areas. June-July. Sw. and w. GA (Jones & Coile 1988) south to Panhandle FL and west to s. MS (Sorrive & Leonard 1999); disjunct in s. FL. [= I, K, S, SE, Y, Z; < **C. fasciculata** (Michaux) Greene – WH]

**Chamaecrista fasciculata** (Michaux) Greene var. **I.** Dunes, sandy disturbed areas. s. AL west to e. and s. TX. [= I; < Chamaecrista fasciculata var. **I.** = K; > Chamaecrista littoralis Pollard – S; > Chamaecrista mississippienis (Pollard) Pollard ex Heller – S; < Chamaecrista fasciculata var. **I.** – Y; = Cassia fasciculata Michaux var. **puberula** (Greene) J.F. Macbride (variants 1, 2, and 3) – SE, Z; > Chamaecrista puberula Greene] {synonymy incomplete}

**Chamaecrista fasciculata** (Michaux) Greene var. **brachiata** (Pollard) Isely. Fields, disturbed areas. E. GA south to s. FL, west to w. Panhandle FL. [= I, SE; < Chamaecrista fasciculata var. **brachiata** var. **I.** – K; = Cassia fasciculata var. **brachiata** (Pollard) Pullen ex Isely – X, Z; = Chamaecrista brachiata Pollard – S; < Chamaecrista fasciculata – WH, Y]
**Chamaecrista fasciculata** (Michaux) Greene var. fasciculata, Common Partridge-pea. Fields, disturbed areas, fencerows, and a wide range of other habitats. June-September; July-November. MA west to MN, south to s. FL and Mexico. See discussion of the *Chamaecrista fasciculata* complex under var. macrosperma. [<*Cassia fasciculata* Michaux – RAB, W; < *Chamaecrista fasciculata* – C, WH, Y; > *Cassia fasciculata* var. fasciculata – F, G, X; > *Cassia fasciculata* var. robusta (Pollard) J.F. Macbride – F, G, X; > *Chamaecrista robusta* Pollard – S; = *Chamaecrista fasciculata* var. fasciculata (variant 1, variant 2, and typical variant) – Z; > *Chamaecrista fasciculata* var. fasciculata – I, SE (also see var. macrosperma); < *Chamaecrista fasciculata* var. fasciculata – K (also see var. brachiata); > *Cassia fasciculata* var. littoralis (Pollard) J.F. MacBride – X]

**Chamaecrista fasciculata** (Michaux) Greene var. macrosperma (Fernald) C.F. Reed, Tidal-marsh Partridge-pea. Freshwater tidal marshes. Endemic to e. VA (Rappahannock, Mattaponi, Pamunkey, Chickahominy, James, and Appomattox Rivers and their major estuarine tributaries) and MD. Isely (1975) did not recognize this taxon formally, but treated it informally as "variant 1," commenting (incorrectly) that it is "apparently a local, saline-adapted ecotype." Irwin & Barneby (1982) treated *C. fasciculata* as a very polymorphic species in which it was impractical to recognize infraspecific taxa, concluding "a student of tropical *Chamaecrista* has the choice of accepting as a fact of life that sort of infraspecific variability that inspired the dissection of *C. fasciculata* or of retreating to the position of Britton & Urban who, driven by logic rather than sense, found a species in every particular combination of gland and hairiness that fell in their way. But in passing over the observed variation as taxonomically insignificant, it is well to bear in mind that its cause and its biological significance remain a mystery." Botanists familiar with var. macrosperma in the field contend that it shows a cohesion in morphologic characters, ecology, and distribution that is biologically and taxonomically significant; it warrants varietal status. [= K; < *Chamaecrista fasciculata* – C, S, Y; = *Cassia fasciculata* var. macrosperma Fernald – F, G; < *Chamaecrista fasciculata* var. fasciculata – I, SE; = *Cassia fasciculata* var. fasciculata "variant 1" – Z]

**Chamaecrista nictitans** (Linnaeus) Moench var. aspera (Muhlenberg ex Elliott) Irwin & Barneby, Southern Sensitive-plant. Savannas, pinelands, disturbed sandy soils. June-October; July-November. Var. aspera ranges from se. SC south to s. FL. [= I, WH; = *Cassia aspera* Muhlenberg ex Elliott – RAB, X, Z; = *Chamaecrista nictitans* ssp. nictitans var. aspera (Muhlenberg ex Elliott) Irwin & Barneby – K, SE, Y; = *Chamaecrista aspera* (Muhlenberg ex Elliott) Greene – S]

**Chamaecrista nictitans** (Linnaeus) Moench var. nictitans, Common Sensitive-plant. Forests, woodlands, disturbed areas, pine savannas, and a wide variety of other habitats. June-October; July-November. *C. nictitans* is widely distributed in e. North America, and (depending on the scope of what is included in it) south into South America. Var. nictitans ranges throughout se. United States, north to MA, NY, OH, and KA. [= I, WH; < *Cassia nictitans* Linnaeus – RAB, W, X, Z; < *Chamaecrista nictitans* – C; > *Cassia nictitans* var. nictitans – F, G; > *Cassia nictitans* var. hebecarpa Fernald – F, G; = *Chamaecrista nictitans* ssp. nictitans var. nictitans – K, SE, Y; > *Chamaecrista procmumbens* (Linnaeus) Greene – S; > *Chamaecrista multipinnata* Pollard – S]

**Chapmannia** Torrey & A. Gray 1838 (Alicia)

A genus of about 7 species, perennial herbs, shrubs and trees, of tropical America and Africa, most closely related in the Southeastern flora to *Stylosanthes* and the introduced *Arachis* (Lewis et al. 2005). References: Isely (1998)=I.

**Chapmannia floridana** Torrey & A. Gray, Alicia. Longleaf pine sandhills, scrub. N. FL (Clay County) south to s. FL. [= I, K, S, WH]

**Cicer** Linnaeus 1753 (Chick Pea, Garbanzo)

Cladrastis Rafinesque 1824 (Yellow-wood)

A genus of about 6 species, trees, of the se. United States and montane regions of Japan and China. Cladrastis is the only member of the tribe Sophoreae in our area, with the exception of the cultivated (and weakly, if at all, established) Styphnolobium and Maackia; additionally Sophora tomentosa Linnaeus var. truncata Torrey & A. Gray closely approaches our area in n. peninsular FL. References: Duley & Vincent (2003)=X; Isely (1981)=Z; Isely (1998)=I; Rudd (1972)=Y.

Cladrastis kentukea (Dumont de Courset) Rudd, Yellow-wood. Mountain forests, Piedmont bluffs, especially on calcareous or mafic rocks (introduced only in the Piedmont of NC). April-May; July-August. This small to large tree has a native range primarily in the Southern Appalachians (mostly on the west side), the Ozarks, and limestone regions in-between (such as c. TN), ranging from s. OH, s. IN, and s. MO south to sw. NC, sc. SC, n. GA, AL., c. AR, and e. OK, but is cultivated more widely. As discussed by Wyatt (1985), the SC occurrence on Fall Line bluffs of the Savannah River is an interesting disjunction, apparently relictual. Yellow-wood is a distinctive tree, distinguished by its smooth silvery-gray bark, peculiar leaves with alternate leaflets, and pendent panicles of white flowers. The genus Cladrastis has 4 other species, all of temperate e. Asia. [= K, W, X, Y; = C. latex (Michaux f.) K. Koch – RAB, C, F, G, I, S, SE, Z]

Clitoria Linnaeus 1753 (Butterfly Pea, Pigeonwings)

Identification notes: Centrosema and Clitoria are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large "standard" is lowernest. They are often confused; see key under Centrosema.

</table>
* Crotalaria incana* Linnaeus, Shake-shake. Disturbed areas; native of Africa. Also in peninsular FL, from Alachua County southward. \[= I, K, S, SE, WH\]

* Crotalaria lanceolata* E. Meyer, Lanceleaf Rattlebox. Sandy fields, roadsides, other disturbed areas; native of Africa. July-October; August-November. \[= RAB, I, K, SE, WH\]

*Crotalaria maritima* Chapman, Low Rattlebox, Rabbitbells. Sandy forests and woodlands, roadsides. E. SC south to s. FL, and west to e. LA, endemic to the Southeastern Coastal Plain. \[= S, X; = Crotalaria rotundifolia Walter ex J.F. Gmelin var. rotundifolia – Z; < C. rotundifolia – C, I, K, SE, WH, Y; < C. angulata – RAB, F, G, apparently misapplied\]

*Crotalaria ochroleuca* G. Don, Slenderleaf Rattlebox. Roadsides and sandy fields; native of Africa. July-August; August-October. All naturalized southeastern US material appears to be \(C. ochroleuca\), not \(C. brevidens\) var. intermedia (M. Woods, pers. comm., 2011). \[= I, K, SE, WH; ? C. intermedia – RAB, misapplied; ? C. brevidens Bentham var. intermedia (Kotschy) Polhill, misapplied\]

*Crotalaria purshii* A.P. de Candolle, Coastal Plain Rattlebox, Pursh's Rattlebox. Mesic to dry pinelands, sandy openings, roadsides. May-July; July-September. A Southeastern Coastal Plain endemic: se. VA south to n. FL, c. peninsular FL, and west to e. LA, with scattered locations inland. \[= RAB, C, G, I, K, S, SE, W, WH; > C. purshii var. purshii – F; > C. purshii var. bracteolifera Fernald – F\]

* Crotalaria retusa* Linnaeus, Rattleweed. Disturbed areas; native of the Old World tropics. July-September; August-October. \[= RAB, F, G, I, K, S, SE, WH\]

*Crotalaria rotundifolia* Walter ex J.F. Gmelin, Low Rattlebox, Rabbitbells. Sandy forests and woodlands, roadsides. Se. VA south to c. peninsular FL, west to se. LA; also widespread in Mexico. \[= X; = Crotalaria rotundifolia Walter ex J.F. Gmelin var. vulgaris Windler – Z; < C. rotundifolia – C, I, K, SE, WH, Y; < C. angulata – RAB, F, G, misapplied; = C. rotundifolia – S\]

*Crotalaria sagittalis* Linnaeus, Common Rattlebox. Woodlands, woodland edges, openings, fields. June-August; July-September. MA and VT west to s. MI, s. WI, and c. MN, south to c. SC, s. AL, s. MS, TX, Mexico and Central America; West Indies. \[= RAB, C, G, I, K, S, SE, W, WV; > C. sagittalis var. sagittalis – F; > C. sagittalis var. oblonga Michaux – F\]

* Cullen* Medikus 1787

* Cullen americanum* (Linnaeus) Rydberg, Scurf-pea. Waste areas around wool-combing mills, other disturbed areas, perhaps only a waif; native of the w. Mediterranean region (a misnomer). There are other (older) reports from other southeastern states, including FL and MS. \[= I, S; = C. americana – K1, K2, SE, orthographic variant\]

* Cullen corylifolia* (Linnaeus) Medikus, Malaysian Scurf-pea. On ships ballast, probably only a waif; native of s. Asia \[= K1, K2\] {add to synonymy; not yet keyed}

* Cytisus* Desfontaines 1798 (Broom)

A genus of about 165 species, herbs and shrubs, of temperate and tropical America, especially dry areas and most diverse in Mexico. References: Barneby (1977)=Z; Ward (2004c)=Y; Isely (1998)=I. Key adapted from SE.

Dalea Lucanus 1758 (Prairie-clover)

D. carnea (Michaux) Poiret = Petalostemon carneus (Michaux ex Willdenow) Michaux – I, SE, WH, Z; = Petalostemon candidus Michaux – S

D. candida Michaux ex Willdenow, White Prairie-clover. Limestone glades and barrens. Late May-August. WV, KY, IN, WI, MN, and SK south to nw. GA, e. TN, w. AL, sc. MS, s. LA, and ne. TX. [= I, SE (excluding D. occidentalis); = D. candida var. candida – C, K, Z; = Petalostemon candidum (Michaux ex Willdenow) Michaux – F, G; = Petalostemon candidus (Michaux ex Willdenow) Michaux – S]

**Dalea foliosa** (A. Gray) Barneby, Cedar Glade Prairie-clover. Calcareous glades. Late June-September. C. TN, n. AL, IL, and OH (?). [=C, I, K, SE, Z; = Petalostenum foliosum A. Gray – F, G; = Petalostemum foliosum A. Gray – S]

**Dalea pinnata** (J.F. Gmelin) Barneby var. trifoliata (Chapman) Barneby. Sandhills, dry to moist longleaf pine flatwoods. September-November. E. GA (near the Savannah River) south and west to w. Panhandle FL, s. AL, and s. MS. [=I, K, SE, WH, Z; < Kuhnistera pinnata (J.F. Gmelin) Kuntze – S; = Petalostemon pinnatus (J.F. Gmelin) Blake ssp. trifoliatus (Chapman) Wemple]

**Dalea purpurea** Ventenat var. purpurea, Purple Prairie-clover. Prairies, glades, and open woodlands. NY and ON west to BC, south to KY, TN, n. AL, c. MS, TX, and NM. [=C, I, K, SE, Z; = Petalostemon purpureum (Ventenat) Rydberg – F, G; < Petalostemon purpureus (Ventenat) Rydberg – S]

---

**Desmanthus Willdenow 1806 (Bundleflower)**

**Desmanthus illinoensis** (Michaux) MacMillan ex B.L. Robinson & Fernald, Bundleflower, Prairie Mimosa. Prairies, marsh edges, disturbed areas. June-July; August-November. OH, MN, and ND south to Panhandle FL, TX, and NM; with scattered adventive occurrences east and west of the native distribution. [=RAB, C, F, G, I, K, SE, W, WH, Z; = Acuan illinoense (Michaux) Kuntze – S; = Mimosa illinoensis Michaux]

---

**Desmodium Desvaux 1813 (Tick-trefoil, Tick-clover, Beggar's-ticks, Stick-tights)**

A genus of about 300 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan (but lacking from Europe). In our area, Desmodium is a complex genus. Some of the species in our area are confusing and can be identified only with difficulty. References: Isely (1998)=I; Krings (2004). Key based on SE, C, RAB, F, and Krings (2004). Some parts adapted with little change from SE. Some parts, especially Key D, will likely be substantially revised, based on additional herbarium and field testing. [also see Hylodesmum]

1. Longest calyx lobes shorter than the calyx tube; stipe of the loment 4-20 mm long, about 3× or more as long as the calyx; mature leaves without stipels at the base of the petiolules of the leaflets; leaves subverticillate at the top of the stem (alternate in D. pauciflorum); stamens monadelphous; lower margin of the loment incised to the upper suture. [Key A]

2. Leaflets narrow, the terminal leaflet < 10 mm wide, and also 4-12× as long as wide, typically thick and strongly reticulate; petioles of midstem leaves 1-10 (-15) mm long; [primarily of the Coastal Plain and lower Piedmont (rarely Mountains) in our area] 

[Key A]
2 Leaflets broader, the terminal leaflet > 15 mm wide, or < 4× as long as wide, typically thin and not reticulate; petioles of midstem leaves various, but > 15 mm long if leaflet proportions are narrow; [collectively widespread in our area].

3 Stems trailing vine-like along the ground, and/or the plants stoloniferous-rhizomatous .................................................. Key B

3 Stems erect or ascending, not vine-like.

4 Stipules persistent (most or all of the stipules persisting through the year), 4-20 mm long, ovate to amplexicaul-clasping (to lance-attenuate, and if so, generally longer than 8 mm long, except in D. floridanum); leaflets 1.5-3× as long as wide ......................... Key C

4 Stipules caducous (most or all of the stipules falling soon after expansion of the leaves), 2-6 (-8) mm long, mostly linear-subulate or lance-attenuate (in some species narrowly ovate to triangular); leaflets 1-8 (-10)× as long as wide.......................... Key D

Key A: Desmodium with very narrow leaflets

1 Petioles (0-) 1-3 (-4) mm long, the leaves thus subsessile; leaflets 5-10 mm wide, strongly pubescent on the lower surface .... D. sessilifolium

1 Petioles 3-15 mm long, the leaves thus obviously petiolate; leaflets 2-5 (-8) mm wide, glabrate or inconspicuously puberulent on the lower surface.

2 Loment segments flat to distinctly concave along the upper (suture) margin; [of dry to mesic habitats] ........................................ D. strictum

2 Loment segments slightly convex along the upper (suture) margin; [of boggy, wet, or mesic habitats] .................................... D. tenuifolium

Key B: Desmodium with trailing stems or stoloniferous-rhizomatous habit

1 Flowers in axillary clusters; leaflets broadly obovate, 0.5-1 cm long ................................................................. D. triflorum

1 Flowers in axillary or terminal racemes; leaflets rotund, broadly ovate, broadly elliptic, or narrowly elliptic, the larger > 1 cm long.

2 Flowers either in axillary racemes or in terminal panicles; leaflets mostly 0.9-2.0× as long as wide.

3 Stipules ovate, persistent, slightly to strongly clasping at the base, 6-12 mm long.

4 Leaflets ovate, 1.2-1.9× as long as wide; flowers white to yellowish; loment uncinate-puberulent only along the sutures ...........

4 Leaflets ovate, 0.8-1.1× as long as wide; flowers blue-purple; loment uncinate-puberulent over the surface ............... D. rotundifolium

4 Stipules lanceolate to linear (or delate in D. humifusum), usually quickly deciduous, not clasping at the base, 2-8 mm long.

5 Terminal leaflet 1.4-2.0× as long as wide, 3.0-7.0 cm long; loment segments 6-8 mm long; stipules 4-8 mm long, ovate to lance-acuminate ................................................................. D. humifusum

5 Terminal leaflet 0.9-1.2× as long as wide, 1.5-2.3 cm long; loment segments 4-5 mm long; stipules lanceolate, 1-5 mm long .......... D. lineatum

Key C

1 Loment segments nearly symmetrical along the axis of the loment (the isthmi more or less equal above and below, thus each segment diamond-shaped, rounded-diamond-shaped, or essentially elliptical), each segment 3-3.5 mm long; annual from a taproot; [of NC and southward] ............................................................................................................................................... D. tortuosum

1 Loment segments asymmetrical along the axis of the loment (the isthmi deeper below than above; thus each segment triangular, rounded-triangular, or semi-circular), each segment 5-11 mm long; perennial; [collectively widespread in our area].

2 Corolla 6-7 mm long; loment with 2-4 segments, each 5-7 mm long; lower leaves often 1-foliolate; [of sc. SC and southward] ..........

2 Corolla 8-13 mm long; loment with 4-6 segments, each 6.5-11 mm long; lower leaves usually 3-foliolate; [collectively widespread in our area].

3 Stem densely spreading pilose (at least the upper stem) and also uncinate-puberulent; loment segments 6.5-10 mm long .... D. canescens

3 Stem glabrous or uncinate-puberulent; loment segments 9-11 mm long

4 Leaves glabrous or nearly so ............................................................................................................................... D. cuspidatum var. cuspidatum

4 Leaves evidently pubescent ............................................................................................................................... D. cuspidatum var. longifolium

Key D

1 Corolla 8-11 mm long; petioles mostly 1-8 mm long; [plants of the Mountains of VA and possibly NC] ......................... D. canadense

1 Corolla 3-8 (-9) mm long (or 8-10 mm long in D. laevigatum); petioles mostly longer, mostly 10-60 mm long (except D. ciliare and D. obtusum); [plants collectively widespread in our area].

2 Loment with 1-3 segments, rounded below.

3 Leaflets cincereous on the lower surface; corolla 6-7 mm long; loment with 3 (-4) segments ........................................... D. nutallii

3 Leaflets not cincereous on the lower surface; corolla 3.5-6 mm long; loment with 1-2 (-3) segments; ["Desmodium ciliare group"]

4 Leaflets 3-5.5× as long as wide .................................................. D. ciliare

4 Leaflets 1.2-3.5× as long as wide.

5 Terminal leaflet usually distinctly longer and narrower than the lateral leaflets; stem (near the middle) sparsely to densely unci nate-puberulent .............. D. obtusum

5 Terminal leaflet similar to the lateral leaflets; stem (near the middle) glabrous to pilose, or also with some uncinate-pubesce nece.

6 Petioles 3-13 (-5) mm long; pedicels 3-8 mm long; stem glabrous; leaflets sub-appressed pubescent (to glabrate) ............ D. ciliare

6 Petioles 10-25 mm long; pedicels 8-15 mm long; stem glabrous (to sparsely uncinate-puberulent); leaflets glabrous or with only a few scattered hairs .................. D. marilandicum

2 Loment with 3-5 segments, mostly obtusely angled below.
7 Leaves densely villous on the lower surface; stem densely pubescent with uncinate or non-uncinate hairs.

8 Leaflets 1.5-2.0 (2.2)- as long as wide; loment usually curved (the upper margin convex); loment with 2-4 segments; loment segments 4-5 mm long ................................................. D. nuttallii

9 Leaflets 1.0-1.5 (1.9)- as long as wide; loment straight; loment with (3-) 4-5 (-6) segments; loment segments (4-) 5-8 (-9) mm long ................................................................. D. viridiflorum

7 Leaves glabrous to moderately appressed-villous on the lower surface; stem glabrate, pilose or uncinate pubescent.

9 Bracts (subtending clusters of 2-3 flowers) usually villous; plants moderately to densely villous; loment usually incurved (the upper margin convex); loment with 2-4 segments, each segment 4-5 mm long ................................................................. D. laevigatum

10 Corolla 8-10 mm long; pedicels usually 10-15 (-20) mm long; stems and leaves glabrous; leaflets distinctly pale on the lower surface .............................................. D. cuspidatum

11 Leaflet lower surface glabrous, except for the conspicuous uncinate pubescence on the veins; stems and petioles glabrous or pubescent ......................................................... D. paniculatum var. epetiolatum

12 Leaflets (2.5-) 3-8 (-10)- as long as wide; leaflet pubescence usually sparse, of straight, appressed hairs < 0.5 mm long (or sometimes of longer spreading hairs); leaflets usually lacking uncinate pubescence on either surface; mid-stems glabrous or glabrate, the pubescence usually uncinate pubescence.

13 Loment segments rounded on the lower margin (thus semicircular to gibbous); leaflets subulate to short-petiolate; [plant restricted to Coastal Plain] ................................................. D. paniculatum var. paniculatum

14 Loment segments angled on the lower margin (thus triangular to sub-rhombic); leaflets long-petiolate; [plant widespread in our area] ................................................. D. paniculatum var. paniculatum

12 Leaflets 1.5-3 (-4)- as long as wide; leaflet pubescence usually evident, of spreading hairs > 0.5 mm long; leaflets usually with uncinate pubescence on the veins of the upper surface; mid-stems pubescent, either pilose or with uncinate pubescence (if not, evidently pubescent on the petioles).

13 Stem and petiole pubescence sparsely to densely uncinate-puberulent; upper surface of leaflets commonly uncinate-puberulent on the veins ........................................... D. glabellum

14 Stem and petiole pubescence pilose; upper surface of leaflets occasionally uncinate-puberulent on the veins ............................................................... D. perplexum

Desmodium canadense (Linnaeus) A.P. de Candolle, Showy Tick-trefoil, Canadian Tick-trefoil. Marl marshes, Thuya swamps, springs, seeps, hay meadows, streambanks. July-September; August-October. QC and NS west to AB, south to n. VA, sw. VA, NC (?), c. WV, MO, and OK. Small (1933) reports this species for NC; the documentation is not known. [= C, F, G, I, K, SE, W, WV; = Meibomia canadensis (Linnaeus) Kuntze – S]

Desmodium ciliare (Muhlenberg ex Willdenow) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. MA west to IN, MO, and se. KS, south to s. FL and TX; also in Cuba. [= RAB, C, G, I, SE, W, WH, WV; > D. ciliare var. ciliare – F, K; > D. ciliare var. lancifolium Fernald – F, K; = Meibomia ciliaris (Muhlenberg ex Willdenow) Blake – S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. cuspidatum, Toothed Tick-trefoil. Fields, woodland borders, disturbed areas. June-August; August-October. VT and MA west to MI and WI, south to FL Panhandle and OK. [= C, F, G, I, K, SE; < D. cuspidatum – RAB, I, W, WH, WV; = Meibomia grandiflora (A.P. de Candolle) Kuntze – S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. longifolium (Torrey & A. Gray) Schubert. Forests and woodlands. OH west to MN and NE, south to GA and ne. TX. [= C, F, G, K, SE; < D. cuspidatum – RAB, I]

Desmodium fernaldii Schubert, Fernald's Tick-trefoil. Sandhills, dry flatwoods, woodland borders. June-September; August-October. Se. VA south to s. SC (and maybe e. GA and n. FL); Isely (1998) states that reports from the Gulf Coast are based on "glabrate forms of D. glabellum," and also suggests that D. fernaldii is only weakly differentiated from D. glabellum. [= RAB, C, F, G, I, K, SE, W, WH; < Meibomia rhombifolia Vail – S (also see D. floridanum)]

Desmodium floridanum Chapman, Florida Tick-trefoil. Sandhills, other dry sandy habitats. June-September; August-October. Se. SC south to s. FL. [= RAB, I, K, SE, WH; < Meibomia rhombifolia Vail – S (also see D. fernaldii)]

Desmodium glabellum (Michaux) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. ME west to WI and NE, south to n. peninsular FL and TX. [= RAB, F, I, K, SE, WH, WV; < D. glabellum – C (also see D. perplexum); = Meibomia paniculata (Linnaeus) Kuntze – S, in part; = Meibomia pubens (Torrey & A. Gray) Rydberg – S (also see D. paniculatum var. paniculatum); < D. paniculatum var. dillenii (Darlington)]
Desmodium marilandicum (Linnaeus) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. MA west to MI and MO, south to n. peninsular FL and TX. [= RAB, C, F, G, I, K, SE, W, WH, WV; Meibomia marilandica (Linnaeus) Kuntze – S]

Desmodium nuttalli (Schindler) Schubert. Fields, woodland borders, disturbed areas. July-September; August-October. NY west to IN, south to n. peninsular FL, Panhandle FL, and AR. [= RAB, F, I, K, SE, W, WH, WV; D. viridiflorum (Linnaeus) Kuntze – S (also see D. viridiflorum)]

Desmodium obtusum (Muhlenberg ex Willdenow) A.P. de Candolle. Dry pine woodlands, fields, woodland borders, disturbed areas. June-September; August-October. MA west to MI, south to Panhandle FL and TX. [= RAB, I, K, SE, W, WH; D. rigidum (Elliott) A.P. de Candolle – C, F, G, WV; Meibomia rigidida (Elliott) Kuntze – S]

Desmodium paniculatum (Linnaeus) A.P. de Candolle var. epetiolatum Schubert. Pine savannas and flatwoods, bogs. June-September; August-October. Var. epetiolatum ranges from se. VA south to se. NC or e. SC. It may reflect hybridization between D. paniculatum var. paniculatum and another species. Further study is needed. [= F, I, K, SE; D. paniculatum – RAB, C; D. paniculatum var. paniculatum – W]

Desmodium paniculatum (Linnaeus) A.P. de Candolle var. paniculatum. Fields, woodland borders, disturbed areas. June-September; August-October. S. ME west to s. ON, MI, and NE, south to s. FL and TX. [= RAB, F, I, K, SE, WH, WV; Meibomia paniculata (Linnaeus) Kuntze – S; Meibomia pubens (Torrey & A. Gray) Rydberg – S (also see D. glabellum); D. paniculatum var. paniculatum – W]

Desmodium perplexum Schubert. Fields, woodland borders, disturbed areas. July-September; August-October. [= RAB, F, I, K, SE, WH, WV; D. glabellum – C; Meibomia dillenii (Darlington) Kuntze – S; D. paniculatum var. dillenii (Darlington) Isely – W]

**Desmodium tortuosum** (Swartz) A.P. de Candolle. Fields, woodland borders, disturbed areas. July-August; August-October. E. NC south to s. FL, west to TX; perhaps only introduced in the southeastern United States. [= RAB, I, K, SE, WH; = *Meibomia purpurea* (P. Miller) Vail – S]

**Desmodium triflorum** (Linnaeus) deCandolle. Lawns, roadsides; native of the Old World tropics. Reported for Escambia County, FL Panhandle (Kunzer et al. 2009). [= I, K, SE; = *Sagotia triflora* (Linnaeus) Duchassaing & Walpers – S] [add to synonymy]

**Desmodium viridiflorum** (Linnaeus) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. DE south to c. peninsular FL, west to TX, and inland to w. VA, w. NC, n. TN, and AR. [= RAB, F, I, K, SE, W, WH; < *D. viridiflorum* – C, G (also see *D. nuttallii*); < *Meibomia viridiflora* (Linnaeus) Kunze – S (also see *D. nuttallii*)]

*Dichrostachys* (de Candolle) Wight & Arnott (Sickle Bush)

* *Dichrostachys cinerea* (Linnaeus) Wight & Arnott ssp. africana Brenan, African Sickle Bush, Kalahari Christmas Tree. Disturbed areas; native of Africa. [= K2; < *D. cinerea* – I, SE]

*Erythrina* Linnaeus 1753 (Coral Bean)

A genus of about 120 species, trees, shrubs, and perennial herbs, of tropical and subtropical regions of the Old and New World. References: Isely (1998)=I.

1 Leaflets not lobed; [cultivated tree, persistent].................................................................................................................................................. *E. crista-galli*
1 Leaflets hastately lobed; [native herb or shrub]........................................................................................................................................ *E. herbacea*

* *Erythrina crista-galli* Linnaeus, Coral Tree. Cultivated, disturbed areas, roadside ditches; native of South America. [= I, K, SE; = *Microipteryx crista-galli* (Linnaeus) Walpers – S]

*Erythrina herbacea* Linnaeus, Coral Bean, Cardinal-spear. Maritime forests, dry sandy woodlands, sandhills in the outer Coastal Plain. May-July; July-September. Se. NC south to FL, west to se. TX, and south to e. Mexico (Tamaulipas and e. San Luis Potosi). [= RAB, I, K, SE, WH; > *E. herbacea* – S; > *E. arborea* (Chapman) Small – S]

*Galactia* P. Browne 1756 (Milkpea)

**Identification notes:** Definite identification of the taxa from key lead 4 on is problematic. Note also that the traditional application of *G. regularis* and *G. volubilis* is reversed.

1 Leaves with (5-) 7 (-9) leaflets; flowers white ........................................................................................................................................ *G. elliottii*
1 Leaves with 3 leaflets; flowers white, pink, red, or purple.
2 Plant erect, with 4-6 (-8) leaves.................................................................................................................................................. *G. erecta*
2 Plant prostrate, trailing, or twining, generally with numerous leaves.
3 Legumes villous with hairs 1-1.5 mm long; corolla when fresh bright reddish purple and white (drying dark on herbarium specimens); stems villous with hairs > 0.5 mm long ........................................................................................................................................ *G. mollis*
3 Legumes glabrous, or pubescent with hairs < 1 mm long; corolla pink to pink-purple (drying pale or the petals dropping on herbarium specimens); stems glabrate to villosulous with hairs < 0.5 mm long.
4 Inflorescences generally exserted, (2-) 4-15 (-20) cm long, the flowers well distributed along half or more of the length of the inflorescence axis; flower buds generally 5-8 mm long; corolla 8-12 (-14) mm long; plants twining (rarely trailing) .......... *G. regularis*
4 Inflorescences short or exserted, if exserted then the flowers generally from nodes crowded into the upper half of the axis; flower buds 5-10 mm long; corolla (11-) 12-16 (-18) mm long; plants trailing or twining.
5 Internodes short, 1-2 cm long, the stem thus appearing leafy; inflorescences with 1-3 flowers (or also with solitary axillary flowers); [plants of Coastal Plain of SC southward] .......... *G. minor*
5 Internodes generally longer; inflorescences with 1-3 or more flowers; [plants collectively widespread in our area].
6 Stems glabrescent to conspicuously pubescent with spreading hairs < 0.5 mm long; leaflets 1.5-3.5 (-4) cm long, the underside with hairs 0.4-0.7 mm long; [plants of e. GA southward] ................................................. G. floridana
6 Stems antorse- or retrorse-strigose; leaflets 1.5-5 (-7) cm long, the underside strigose with hairs < 0.3 mm long; [plants widespread in our area] ........................................................................... G. volubilis var. volubilis

*Galactia erecta* (Walter) Vail, Erect Milkpea. Sandhills. May-July; July-September. Se. NC south to Panhandle FL, west to e. TX. [= RAB, I, K, S, SE, WH, Y, Z]

*Galactia floridana* Torrey & A. Gray, Florida Milkpea. Sandhills and other xeric sands. S. GA south to s. FL, west to s. MS. [= Y; < G. floridana – I, K, SE, Z (also see G. volubilis var. fasciculata); = G. floridana var. floridana – S; < G. volubilis – WH]

*Galactia mollis* Michaux. Sandhills. May-July; July-September. Se. NC south to c. peninsular FL, west to Panhandle FL and se. AL. [= RAB, I, K, S, SE, WH, Y, Z]

*Galactia volubilis* (Linnaeus) Britton var. volubilis. Sandhills, other dry forests and openings. June-August; July-October. NJ and s. PA west to c. AR, south to s. FL and L.A. Var. baltzelliana D.B. Ward & D.W. Hall and var. fasciculata (Vail) D.B. Ward & D.W. Hall are localized endemics of the FL Peninsula. Duncan (1979) describes additional forms of this taxon (which he treated under the name *G. glabella*) that he considered to potentially warrant description as varieties or species; they need further study. [= Y; < G. regularis (Linnaeus) Britton, Sterns, & Poggenburg – RAB, C, F, G, I, K, SE, WH (misapplied); > G. regularis – S, misapplied; > G. brevipes Small – S; > G. brachypoda Torrey & A. Gray – S; < G. glabella Michaux – Z]

*Genista* Linnaeus 1753 (Dyer's Greenweed)

*Gleditsia* Linnaeus 1753 (Honey Locust, Water Locust)

**Identification notes:** The hybrid *Gleditsia ×texana* Sargent (pro sp.) [*G. aquatica × triacanthos*] occurs occasionally in the area of range overlap of its parents. It is intermediate between its parents.

1 Legume ovate, 3-5 (-8) cm long and 1-3-seeded; foliage glabrous (or slightly puberulent when young); [trees of frequently flooded swamps, often with *Taxodium*, rarely planted and escaped] ................................................. *G. aquatica*
1 Legume elongate, 20-40 cm long and multi-seeded; foliage puberulent (even in age); [trees of moist to dry forests, frequently planted and escaped in disturbed areas] ....................................................................................................................... *G. triacanthos*
Gleditsia aquatica Marshall, Water Locust. Swamp forests. April-May; July-November. E. SC south to c. peninsular FL, west to TX, and north in the interior to IN, IL, and MO; occasionally cultivated north of its native range. [= RAB, C, F, G, GW, I, K, S, SE, WH, Y, Z]

Gleditsia triacanthos Linnaeus, Honey Locust. Woodlands, forests (generally bottomland), fencerows, often planted as a street tree. April-May; July-November. Native distribution is believed to be from w. NY west to se. SD, south to Panhandle FL and TX (west of the Blue Ridge); its occurrence over much of our region appears to be as an adventive. The trunks are normally beset with lengthy, branched thorns, but thornless trees are encountered (and are usually favored for horticultural planting). [= RAB, C, G, GW, I, K, S, SE, W, WV, Y, Z]

Glycine Willdenow 1802 (Soybean, Soya)

* Glycine max (Linnaeus) Merrill, Soybean. Abundantly cultivated, rarely persisting as a waif; native of e. Asia. July-October. One of the most important legume crops in the world. [= RAB, F, I, K, SE]

Glycyrrhiza Linnaeus 1753 (Licorice)

Gymnocladus Lamarck 1785 (Kentucky Coffee-tree)

* Gymnocladus dioicus (Linnaeus) K. Koch, Kentucky Coffee-tree, Kentucky Mahogany. Native in rich bottomland and slope forests, also in disturbed areas, persistent and weakly spreading from horticultural plantings. April-June; August-November (and persistent). The original native range has been obscured, perhaps PA west to se. SD, south to w. VA, TN, n. AL, and OK. [= RAB, C, F, G, I, K, S, SE, WV, Y, Z]

Hylodesmum H. Ohashi & R.R. Mill 2000

A genus of ca. 15 species, perennial herbs, mainly of e. Asia and e. North America. This group has often been included in Desmodium as a section or subgenus, but is now shown to be amply distinct in morphology and also to form a monophyletic group based on molecular analysis. References: Raveill (2006); Ohashi & Mill (2000)=Z.

1 Stems dimorphic, the flowering stem normally lacking leaves (rarely with leaves), the sterile stem with a subverticillate cluster of 3-7 leaves near the top; pedicels 10-20 mm long .................................................................................................................................................... H. nudiflorum
1 Stems monomorphic, bearing both leaves and flowers, the leaves either subverticillate or not; pedicels 2-10 mm long.
2 Leaves subverticillate, clustered; leaflets conspicuously and strongly acuminate, 5-10 cm long; flowers usually distinctly pink or pink-purple; inflorescence 3-8 dm long, elongate, large, and conspicuous, much exceeding the leaves.................. H. glutinosum
2 Leaves alternate, scattered; leaflets acute to slightly acuminate, 3-7 cm long; flowers white; inflorescence 1-2 dm long, small and inconspicuous, often partly obscured by the leaves ........................................................................................................ H. pauciflorum

**Indigofera** Linnaeus 1753 (Indigo)

A genus of about 700 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan in tropical and warm temperate regions. References: Isely (1998)=I.

1 Leaflets borne alternately or irregularly on the rachis.

2 Stipules subulate, < 1.5 mm wide; legumes divergent to deflexed, spaced on the rachis; flowers 6-10 per inflorescence.

3 Stem pubescence strigose-appressed.

4 Legume 7-9 mm long, ovoid, not falcate, indehiscent, with 2-3 seeds; corolla 6-9 mm long; [native species].

5 Corolla 5-6 mm long or 15-18 mm long; [introduced species].

6 Legume 15-20 mm long, strongly falcate.

7 Legume 28-36 mm long, slightly falcate.

8 Stipules deltate to lanceolate, 2-3 mm wide; legumes deflexed, crowded on the rachis; flowers many per inflorescence.

9 Stipules subulate, < 1.5 mm wide; legumes divergent to deflexed, spaced on the rachis; flowers 6-10 per inflorescence.

10 Leaflets borne opposite on the rachis.

**Indigofera caroliniana** P. Miller, Wild Indigo, Carolina Indigo. Sandy forests and woodlands, including sandhills and sandy maritime forests. June-August; July-October. E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. [= RAB, I, K1, K2, S, SE, WH]  

* **Indigofera hirsuta** Linnaeus, Hairy Indigo. Sandy disturbed areas, such as wildlife "food fields"; native of the Old World tropics. First reported for SC by Nelson & Kelly (1997). Also known from other scattered locations in the Southeast, such as s. MS (Leonard, 2006, pers.comm.) and AL (Diamond & Woods 2009). [= I, K1, K2, SE, WH]

**Indigofera miniata** Ortega var. leptosepala (Nuttall ex Torrey & A. Gray) B.L. Turner. Dunes, dry disturbed areas. S. KS south to s. TX, disjunct eastwards in FL and (?) GA (where reported by Chapman 1883). [= I, SE, WH; < I. miniata – K1, K2; = I. leptosepala Nuttall ex Torrey & A. Gray – S]

* **Indigofera suffruticosa** P. Miller, West Indian Indigo. Disturbed areas, dry sandy woodlands, formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in our area; native of the New World tropics, including s. FL. [= I, K1, K2, S, SE, WH; ? I. anil Linnaeus]

* **Indigofera tinctoria** Linnaeus, African Indigo. Formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in our area; native of Africa. Both this species and *I. suffruticosa* were cultivated as an important export crop in the Coastal Plain of GA, SC, and (less so) NC in the seventeenth and eighteenth centuries. [= I, K1, K2, S, SE, WH]

**Kummerowia** Schindler 1912 (Korean-clover, Japanese-clover)

A genus of 2 species, annual herbs, native to temperate e. Asia. *Kummerowia* differs from *Lespedeza* in its annual habit (vs. perennial), conspicuous stipules (vs. not conspicuous), inflorescence branching pattern (see Akiyama & Ohba 1985), and leaflets with striate, parallel, lateral veins (vs. with reticulate lateral veins). It is now generally regarded as distinct from *Lespedeza* at the generic level, though they are closely related. References: Akiyama & Ohba (1985)=Z; Isely (1998)=I. Key based closely on SE.

Lablab Adanson 1763 (Hyacinth-bean)

* Lablab purpureus (Linnaeus) Sweet, Hyacinth-bean. Disturbed areas; native of Africa. Cultivated and rarely may escape or persist as a waif in disturbed areas; it is reported from se. PA (Rhoads & Klein 1993). [= I, K, SE; = Dolichos lablab Linnaeus]

Lackeya Fortunato, L.P. Queiroz, & G.P. Lewis 1996

Lackeya multiflora (Torrey & A. Gray) Fortunato, L.P. Queiroz, & G.P. Lewis. Alluvial forests, prairies. S. GA and FL Panhandle west to e. TX, north in the interior to w. TN and w. KY. [= Z; = Dioslea multiflora (Torrey & A. Gray) C. Mohr – C, G, I, K, S, SE; = Galactia mohlenbrockii R.H. Maxwell – WH]

Lathyrus Linnaeus 1753 (Wild-pea, Vetchling)

**FABACEAE**

437

**Lathyrus japonicus** Willdenow, Beach Pea. Beaches. Circumboreal, south in eastern North America to NJ (or NC?) and the shores of the Great Lakes. Reported from ocean beaches in Dare County (NC), but without adequate documentation. [= I; > *L. maritimus* (Linnaeus) Bigelow var. *pellitus* (Fernald) Gleason C, G; > *Lathyrus japonicus* Willdenow var. *pellitus* Fernald – F, K1; < *L. japonicus* – I; > *L. japonicus* var. *maritimus* (Linnaeus) Kartesz & Gandhi – K2]

* **Lathyrus pratensis** Linnaeus, Meadow Pea. Disturbed areas; native of Eurasia. Reported for VA on the basis of "personal communication" (Kartesz 1999). [investigate] [= C, F, I, K]

**Lathyrus pusillus** Elliott, Tiny Pea. Open areas in bottomlands, disturbed areas. April-July. E. VA, MO and KS, south to FL Panhandle and TX. [= RAB, F, G, I, K, SE, WH]

* **Lathyrus tuberosus** Linnaeus, Tuberous Vetchling. Disturbed areas; native of Europe. Introduced in e. TN (Chester, Wofford, & Kral 1997), WV (Strausbaugh & Core 1978), and KY. [= C, F, G, I, K, SE, WV]

**Lens** P. Miller (Lentil)

* **Lens culinaris** Medikus, Lentil. Disturbed areas; native of Mediterranean Europe and w. Asia. {MD, NJ}. [= I, K1, K2]

**Lespedeza** Michaux 1803 (Lespedeza)

A genus of about 40 species, perennial herbs and shrubs, of temperate regions of e. Asia and e. North America. References: Clewell (1966a)=Z; Clewell (1966b)=Y; Isely (1986b)=X; Akiyama (1988)=Q; Clewell & Stickel (1990); Isely (1998)=I. Key based primarily on Z and SE. [also see *Kummerowia*]

**Identification notes:** Many species of *Lespedeza* hybridize, and most combinations may occur in our area. Some of the hybrids have been named in the past as varieties or species. Hybrids generally occur in mixed populations with both parents and can usually be identified by their intermediate morphology (identification much easier in the field where context is apparent than in the herbarium). See Isely (1990) and Clewell (1966a) for additional hints about identification of hybrids.

1 Plants annual; stipules ovate to ovate-lanceolate, conspicuous; leaflets with striate, parallel, lateral veins .................................................[Kummerowia]
1 Plants perennial, stipules subulate, setaceous, or lanceolate, not conspicuous; leaflets with reticulate lateral veins, joining before reaching the margin.

2 Leaflets distinctly widest toward the tip, 3-5× as long as wide, the base and apex very differently shaped (the base narrowly cuneate, the tip rounded, truncate or even retuse); racemes reduced, with 2-3 flowers, shorter than the subtending leaves; [plants alien] L. cuneata

3 Midrib of leaflets distinctly excurrent as a spinose bristle 0.5-1.5 mm long; [plant a rare introduction] L. virginiana

4 Midrib of leaflets not excurrent, or only as an obscure mucro, not at all spinose; [plants native].

5 Pubescence of the stem spreading (piloose) L. procumbens

6 Calyx of legumes produced from cleistogamous flowers 1/4-1/3 as long as the pod; stems usually lacking axillary leaves; keel subequal to the wings, or shorter; stipules 2-4 (-5) mm long L. repens

7 Plants in flower.

8 Coral primarily white or cream (often with a purplish throat).

9 Raceme peduncles short (shorter than the subtending leaf), the inflorescence itself barely if at all exceeding the subtending leaf; calyx lobes 6-10 mm long; leaflets either narrower or wider (see below).

10 Leaflets 4-8 (-10)× as long as wide......................... L. angustifolia

11 Leaves closely strigose on both surfaces with hairs 0.2-0.5 mm long, silvery when fresh; leaflets 1-2 cm long; petiole of midstem leaves not generally > 1 cm long, about the same length as the rachis; [plants of the Coastal Plain and, in NC and SC, the lower Piedmont] L. hirta var. curtissii

12 Peduncles of the racemes of chasmogamous (petaliferous) flowers longer than the subtending leaves; keel > 1 mm longer than the wings.

13 Stems to 7 dm long, not bushy-branched; petioles of medial leaves 0.5-2 cm long; chasmogamous panicles with 4-7 flowers; corolla 6-8 mm long; chasmogamous legumes glabrate or incompletely strigulose, 5-7 mm long; [native] L. capitata

14 Calyx lobes longer than the calyx tube (at least the lowest lobe); corolla (10-) 12-15 mm long; leaflets 2-3 × as long as wide; racemes erect or strongly ascending; stems many per crown, purplish when young L. thunbergii

15 Upper surface of the leaflets glabrate, or strigose above only, at least some of the hairs (especially those on the veins below) > 0.5 mm long, green or grey (to somewhat silvery) when fresh; leaflets 1.5-4 (-5) cm long; petiole of midstem leaves 1-1.5 (-2) cm long, much exceeding the rachis; [plants widespread in our area] L. virginica

16 Leaflets (4-) 5-7× as long as wide ......................................................... L. stuevei

17 Leaflets of average, mid-stem leaves > 4× as long as wide (L. capitata keyed here and below).

18 Petioles of mid-stem leaves 1-3 mm long L. virginica

19 Leaflets 4-8(-10)× as long as wide; pubescence of the stems and leaflets usually not silvery-cinereous L. angustifolia

20 Leaflets (2-) 2.5-5 (-8)× as long as wide; pubescence of stems and leaflets usually silvery-cinereous L. capitata

21 Central axis strongly dominant, branches divaricate, irregular; stems slender, wiry L. frutescens

22 Stems 10-30 dm tall, 1-many from the base; medial leaf petiole 2-4 cm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section Macrolespedeza].

23 Calyx lobes equal to or shorter than the calyx tube; corolla 8-15 mm long; chasmogamous legumes strigose, 7-8 mm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section Macroplega]

24 Leaflets (1.3-) 1.8-3 (-3.5)× as long as wide.

25 Upper surface of the leaflets pubescent; pubescence of the stem appressed or spreading; leaflets 1.3-7× as long as wide, L. curtissii

26 Upper surface of the leaflets glabrous; pubescence of the stem appressed or spreading; leaflets 1.3-7× as long as wide, L. virginica
Lespedeza angustifolia (Pursh) Elliott, Narrow-leaved Lespedeza. Sandhill-pocosin ecotones and dry to moist savannas, mountain bogs. August-October; September-November. MA south to c. peninsular FL, west to s. MS, essentially a Southeastern Coastal Plain endemic, rarely disjunct inland to w. NC, c. GA, and ec. TN (Chesser, Woford, & Král 1997). [= RAB, C, G, I, K, S, SE, W, WH, Y, Z; L. angustifolia – F; L. hirta var. intercursa Fernald – F]

Lespedeza hirta (Linnaeus) Hornemann var. curtissii (Clewell) Isely, Silvery Lespedeza. Sandhills and dry to moist savannas. August-October; September-November. Se. VA south to s. FL, west to Panhandle FL and se. AL, barely extending onto the Piedmont in NC, SC, and GA. Clewell (1966a) discusses apparent intergrades between the two varieties in s. NJ. [= C, I, SE, X; L. hirta – RAB, G, S, WH; = L. hirta var. appressipilis Blake – F (as to intent, but not the type); = L. hirta ssp. curtissii Clewell – K, Y, Z]

Lespedeza hirta (Linnaeus) Hornemann var. hirta. Hairy Lespedeza. Woodlands and woodland borders. August-October; September-November. S. ME and s. ON west to MI, n. IL, c. MO, and OK, south to c. peninsular FL and TX. [= C, I, SE, X; L. hirta – RAB, G, S, WH, WH, Y, Z; L. hirta var. hirta – F; L. capitata var. calycina (Schindler) Fernald – F; = L. hirta var. curtissii – K, Y, Z]

Lespedeza stuevei Nuttall, Velvet Lespedeza. Woodlands and woodland borders. July-September; August-November. MA south to n. peninsular FL, west to c. and n. TX, north in the interior to. NC, TN, s. IN, s. IL, c. MO, and ne. KS. [= RAB, C, F, G, I, K, SE, W, WH, Y, Z; = L. stuevei – S, orthographic variant]

FABACEAE

Leucaena Bentham 1842 (Leadtree, *Leucaena*)

* Leucaena leucocephala* (Lamarck) de Wit ssp. *leucocephala*, Leadtree, Leucaena, Jumbie-bean. Disturbed areas; native of the New World tropics. E. GA (Kartesz 1999, voucher at UGA), south into FL and the New World tropics. [= Z; *L. leucocephala* – I, K, SE, WH; < *L. glauca* (Linnaeus) Bentham – S, misapplied]

Lotus Linnaeus 1753 (Birdsfoot-trefoil)

A genus of about 120-130 species, annual and perennial herbs and shrubs, of temperate Eurasia. New World taxa often referred to Lotus are not closely related to *Lotus*, and should be segregated (Degtjareva et al 2006; Allan & Porter 2000). References: Isely (1981)=Z; Isely (1998)=I; Degtjareva et al. (2006); Allan & Porter (2000); Grant & Small (1996). [also see *Acmispon*]

1 Leaves 3-foliolate; the upper commonly 1-foliolate; flowers solitary in leaf axils; [native annual herbs] ......................... [see *Acmispon helleri*]

2 Calyx tube 2.8-3.5 mm long; corolla usually 10-14 mm long; leaflets of the medial leaves mostly 1.5-2.5 (-5)x as long as wide ............

3 Legumes 27-42 mm long, 8.1-8.5 mm wide; plants to 7 dm tall; living plants grey-green; [of se. NC south to s. FL, west to s. MS] ............

4 Hairs of the petioles 0.5-1 (-1.5) mm long; corolla blue; plants 8-15 dm tall; [of FL Panhandle] ...........................................

5 Corolla yellow; plant annual; [alien] ................. [see *L. villosus*]

6 Leaflets 5-9, linear, 5-9x as long as wide; plant perennial; [native or alien].

7 Stem short; leaves clustered, nearly whorled; leaflets narrow; racemes long exerted; flowers small; [plants of e. GA southward and westward] ................................................ [see *L. perennis* ssp. *gracilis*]

8 Leaflets 7-11, oblanceolate, 3-5x as long as wide; plant perennial; [native]

9 Leaves palmately compound; leaves and stems deciduous, dying back in winter; plant inconspicuously pubescent.

5 Corolla blue; plant perennial or annual; [native or alien].

6 Leaflets 5-9, linear, 5-9x as long as wide; plant annual; [alien] ................. [see *L. angustifolius*]

7 Stem short; leaves clustered, nearly whorled; leaflets narrow; racemes long exerted; flowers small; [plants of e. GA southward and westward] ................................................ [see *L. perennis* ssp. *gracilis*]

8 Leaflets 7-11, oblanceolate, 3-5x as long as wide; plant perennial; [native]

9 Leaves palmately compound; leaves and stems deciduous, dying back in winter; plant inconspicuously pubescent.

5 Corolla blue; plant perennial or annual; [native or alien].

6 Leaflets 5-9, linear, 5-9x as long as wide; plant annual; [alien] ................. [see *L. angustifolius*]

7 Stem short; leaves clustered, nearly whorled; leaflets narrow; racemes long exerted; flowers small; [plants of e. GA southward and westward] ................................................ [see *L. perennis* ssp. *gracilis*]

8 Leaflets 7-11, oblanceolate, 3-5x as long as wide; plant perennial; [native]

9 Leaves palmately compound; leaves and stems deciduous, dying back in winter; plant inconspicuously pubescent.
**Lupinus angustifolius** Linnaeus, Narrowleaf Lupine. Fields, disturbed areas; native of Mediterranean Europe. [= I, K, WH]

**Lupinus cumulicola** Small. Sandhills and scrub. Peninsular FL. [= K, S; < *L. diffusus* – I, SE, WH]

**Lupinus diffusus** Nuttall, Blue Sandhill Lupine. Sandhills, sandy roadsides. March-May; June-July. Se. NC south to s. FL, west to s. MS. I concur with Duncan & McCartney (1992) in recognizing *L. cumulicola* Small of peninsular FL as distinct from *L. diffusus*. [= RAB, K, S; < *L. diffusus* – I, SE, WH]

**Lupinus luteus** Linnaeus, Yellow Lupine. Disturbed areas; native of Mediterranean Europe. [= I, K, SE, WH]

**Lupinus perennis** Linnaeus ssp. *gracilis* (Nuttall) Dunn, Southern Sundial Lupine. Sandhills and sandy or dry rocky roadsides. E. GA (immediately across the Savannah River from SC), south to n. FL and west to s. AL. The validity of this taxon is uncertain; the differences may be only clinal. [= K, SE; < *L. perennis* – RAB, C, G, WH; = *L. perennis* var. *gracilis* (Nuttall) Chapman – I; = *L. nuttallii* S. Watson – S]

**Lupinus villosus** Willdenow, Pink Sandhill Lupine. Sandhills, sandy roadsides. April-May; June-August. Se. NC south to n. FL, west to se. LA. [= RAB, I, K, S, SE, WH]

**Lupinus westianus** Small, Gulf Coast Lupine. Coastal dunes, sandhills. Endemic to Panhandle FL. The related *L. aridorum* McFarlane ex Beckner is endemic to sand pine scrub in the central FL peninsula. [= *L. westianus* var. *westianus* – I, K, WH; < *L. westianus* – S]

### Maackia

Ruprecht & Maximowicz 1856 (Maackia)

A genus of about 8 species, trees and shrubs, of e. Asia.

### Macroptilium

(Bentham) Urban 1928

**Macroptilium lathyroides** (Linnaeus) Urban. Disturbed areas; native of tropical America. [= I, K, SE, WH; = *Phaseolus lathyroides* Linnaeus]

### Medicago

Linnaeus 1753 (Medick, Bur-clover)

A genus of about 80 species, annual and perennial herbs, of Eurasia and Africa. References: Isely (1998)=I. Key based largely on SE.

1. Legume 1-seeded, reniform, black at maturity; corolla 2-3 mm long ................................................................. *M. lupulina*
2. Legume several-seeded, spirally coiled or falcate, tan to dark brown; corolla 3-11 mm long.
3. Plants perennial, mostly erect or ascending; 2-8 (-10) dm tall; corolla 6-11 mm long, violet, yellow, or varicolored; legumes spineless.
4. Legume falcate; corolla yellow ................................................................. *M. falcata*
3 Legume spiral; corolla violet or varicolored (rarely yellow).......................................................................................................................... M. sativa

2 Plant annual, mostly prostrate or ascending, 1-6 dm tall; corolla 3-6 mm long, yellow; legumes spiny (except lacking spines in M. orbicularis).

4 Stipules entire or slightly dentate (M. minima) or the base only of the stipule lacerate (M. laciniata); plants pilose (M. minima) or glabrous (M. laciniata).

5 Stipules lacerate at the base; plant glabrous.............................................................................................................................................. M. laciniata

5 Stipules entire or slightly dentate; plant pilose ............................................................................................................................................. M. minima

4 Stipules lacerate; plants glabrous or sparsely pubescent.

6 Legume lacking spines; stipules deeply lacerate, the sinuses extending nearly to the base........................................................................ M. orbicularis

6 Legume spiny; stipules either deeply lacerate (M. polymorpha) or shallowly lacerate (M. arabica).

7 Leaflets 0.7-1.1× as long as wide, usually marked with a central dark spot; leaflet tip usually strongly notched; stipules shallowly lacerate, the sinuses extending < ½ way to the base ........................................................................................................................................ M. arabica

7 Leaflets 1-2× as long as wide, not marked with a central dark spot; leaflet tip not strongly notched, stipules deeply lacerate, the sinuses extending > ½ way to the base ........................................................................................................................................ M. polymorpha

* **Medicago laciniata** (Linnaeus) P. Miller. Waste areas around wool-combing mills; rare, native of Europe, perhaps merely a waif. [= F, I, K]

**Melilotus** P. Miller 1754 (Melilot, Sweetclover, Sourclover)

1 Corolla white .................................................................................................................................................................................. M. albus

1 Corolla yellow.

2 Corolla 2-3.5 mm long; fruits < 3 mm long ............................................................................................................................................. M. indicus

2 Corolla > 4 mm long; fruits > 3 mm long ............................................................................................................................................. M. officinalis

* **Melilotus albus** Medikus, White Melilot, White Sweetclover. Fields, roadsides, disturbed areas; native of Eurasia. April-October. M. albus and M. officinalis, nearly identical except in flower color, are apparently incompatible (Isely 1998); they should not be synonymized, as was done by Kartesz (1999). Other differences useful in the determination of faded herbarium specimens are given by Isely (1998): corolla 3.5-5 mm long, the wing petals about as long as the keel (M. albus) vs. corolla 5-7 mm long, the wing petals generally longer than the keel (M. officinalis). [= I, WH, Z; = M. alba – RAB, C, F, G, S, SE, WH, WV, orthographic variant; < M. officinalis – K]

* **Melilotus sulcatus** Desfontaines, Mediterranean Sweetclover. Reported for AL by Kartesz (2010) based on misidentified specimens. {not keyed; not mapped; rejected as a component of our flora}
FABACEAE

Mimosa Linnaeus 1753 (Mimosa)

A genus of about 500 species, herbs, shrubs, trees, and vines, of tropical, subtropical, and warm temperate areas, especially America. Barneby (1991) and Beard (1963) argue that there are no characters which serve to separate Schrankia from Mimosa.

Identification notes: Unmistakable in our flora for its bipinnate leaves, with tiny (2-4 mm long) leaflets, responding to touch by closing.

1 Plant unarmed............................................................................................................... M. strigillosa
1 Plant armed.
2 Pinnae (1-) 2 pairs per leaf................................................................................................ M. pudica
2 Pinnae 6-16 (-22) pairs per leaf.
3 Woody shrubs, to 4 m tall ................................................................................................................................................................. M. pellita
3 Sprawling vines.
4 Leaflets without apparent secondary veins; pinnae 4-8 (-11) pairs per leaf ................................................................. M. microphylla
4 Leaflets with evident (sometimes weakly so) secondary veins; pinnae 3-5 (-6) pairs per leaf.................. M. quadrivalvis var. floridana

Mimosa microphylla Dryander, Eastern Sensitive-briar. Dry woodlands and forests, especially sandhills, disturbed areas. June-September; August-November. DE, WV, and MO south to FL and e. TX. A form with smaller fruits (3-5 cm long vs. 5-12 cm long) has been variously treated as a species [Leptoglottis chapmanii – S, Schrankia chapmanii] or a "recurrent fruit-form genotype" [phase brachycarpa of Isely (1973)]. [= K; = Mimosa quadrivalvis Linnaeus var. angustata (Torrey & A. Gray) Barneby – C, I, WH, Y; = Schrankia microphylla (Dryander) J.F. Macbride – RAB, F, G, W; = Schrankia microphylla (Dryander)J.F. Macbride var. microphylla – SE; > Leptoglottis microplatoehtshilla (Dryander) Britton & Rose – S; > Leptoglottis chapmanii Small ex Britton & Rose – S; > Schrankia microphylla "phase brachycarpa" – Z; > Schrankia chapmanii (Small ex Britton & Rose) F.J. Hermann]

Mimosa pudica Linnaeus, Sensitive Plant, Shameplant. Disturbed areas; perhaps only a waif in our area. [= I, K, S, SE, WH]

Mimosa quadrivalvis Linnaeus var. floridana (Chapman) Barneby, Florida Sensitive-briar. Xeric sandhills and other dry, sandy habitats. A Southeastern Coastal Plain endemic: GA south into FL. This taxon is distinct at the specific level from M. quadrivalvis and nomenclatural adjustments are forthcoming (Flores-Cruz et al. 2004). [= I, K, WH, Y; = Leptoglottis floridana (Chapman) Small ex Britton & Rose – S; = Schrankia microphylla (Dryander) J.F. MacBride var. floridana (Chapman) Isely – SE]

Mimosa strigillosa Torrey & A. Gray, Powderpuff Mimosa. Floodplain forests, open wet areas. A Southeastern Coastal Plain endemic: e. GA south to FL, west to TX. It might be expected in se. SC (see SE, Y, Z). [= I, K, S, SE, WH, Y, Z]

Mucuna Linnaeus 1763 (Velvetbean)

* Mucuna pruriens (Linnaeus) A.P. de Candolle. Velvetbean, Bengal Bean, Florida Bean. Disturbed areas, fields, cultivated and sporadically established in disturbed areas; native of se. Asia. [= I, SE; > M. pruriens var. pruriens – K; > Stizolobium deeringianum Bort – S; > M. deeringiana (Bort) Merrill]

Neptunia Loureiro 1790 (Neptunia)

1 Leaflets 9-15 pairs per pinna; stipules 2-4 mm long; all flowers perfect, with functional stamens; stipe of fruit 4-14 mm long. \( \ldots N. \text{ lutea} \)

1 Leaflets (12-25 pairs per pinna; stipules 4-10 mm long; flowers in the lower part of the inflorescence with flattened staminodes; stipe of fruit 2.5 mm long. \( \ldots N. \text{ pubescens var. pubescens} \)

Neptunia lutea (Leavenworth) Bentham, Yellow Neptunia. Savannas, prairies, roadsides. AL west to OK and TX. [= I, K, S, SE, Z]

Neptunia pubescens Bentham var. pubescens, Tropical Neptunia. Savannas, sandhills, scrub, prairies, roadsides. AL and FL west to TX and south to Argentina. [= I, K, SE, Z; > N. floridana Small – S; < N. pubescens – WH; > Neptunia pubescens var. floridana (Small) B.L.Turner]

Orbexilum Rafinesque 1832 (Scurfpae, Sampson’s-snakeroot)

Orbexilum lupinellum (Michaux) Isely, Lupine Scurfpea. Sandhills. May-July; July-October. This peculiar species is a Southeastern Coastal Plain endemic, ranging from sc. and se. NC, south to c. peninsular FL, s. AL, and e. GA. The very peculiar leaves, palmately 5-7-foliolate, make the species unmistakable. First reported for SC by McMillan et al. 2002. [= K; = Psoralea lupinellus Michaux - RAB; = Orbexilum lupinellus – I, SE, WH, Z, orthographic variant; = Rhytidomene lupinellus (Michaux) Rydberg – S]

Orbexilum macrophyllum (Rowlee in Small) Rydberg, Bigleaf Scurfpea. Wooded slopes of mountain on Blue Ridge escarpment, precise habitat not known (probably nutrient-rich dry woodlands). June; July-August? This species was discovered on 18 June 1897 and subsequently collected on 8 June 1899 by E.C. Townsend, somewhere on the double peak of Tryon Mountain and White Oak Mountain, Polk County, NC, a phytogeographically interesting area with disjunct, endemic, and relictual species largely of midwestern affinities. It is currently presumed to be extinct, following a number of unsuccessful attempts to relocate it. Isely (1990) states that the assignment of “this distinctive species” to Orbexilum is "reasonably assumptive," since fruits have never been seen. [= I, K, S, SE, Z; = Psoralea macrophylla Rowlee in Small – RAB, W]

Orbexilum onobrychis (Nuttall) Rydberg, Lanceleaf Scurfpea. In nutrient-rich, open or semi-open areas. June-July; August-October. Primarily a species of prairies and prairie-like areas of OH and KY west to se. IA and e. MO. O. onobrychis also occurs (at least formerly) as a rare disjunct in the mountains of w. NC, nw. SC, w. VA, and e. TN. The only report for NC was in the 1800’s. [= G, I, K, S, SE, Z; = Psoralea onobrychis Nuttall – RAB, F, G, W]
Orbexilum pedunculatum (P. Miller) Rydberg var. pedunculatum, Western Sampson's-snakeroot. Open woodlands. May-July; July-September. Var. pedunculatum, the western and more widespread variety, occurs primarily west of the Blue Ridge, with scattered occurrences in and east of the Blue Ridge. Its range is s. OH, s. IN, s. IL, c. MO, and se. KS, south to sw. NC, sc. SC, sw. GA, s. AL, l. LA, and e. TX. [= C, I, K, SE, Z; = Psoralea psoralioides (Walter) Cory var. eglandulosa (Elliott) F.L. Freeman – RAB, F, G, GW, W; = Orbexilum pedunculatum – S]

Orbexilum pedunculatum (P. Miller) Rydberg var. psoralioides (Walter) Isely, Eastern Sampson's-snakeroot. Savannas, open woodlands. May-July; July-September. Var. psoralioides, the eastern variety, occurs primarily on the Atlantic Coastal Plain, ranging from e. VA to ne. FL and Panhandle FL, inland to the Piedmont of NC and SC. [= K; = Psoralea psoralioides (Walter) Cory var. psoralioides – RAB, F, G, GW; = Orbexilum pedunculatum var. gracile (Torrey & A. Gray) Grimes – C, I, SE, Z; = Orbexilum gracile (Torrey & A. Gray) Rydberg – S; < Orbexilum pedunculatum – WH]

Orbexilum simplex (Nuttall ex Torrey & Gray) Rydberg. Prairies, open woodlands. AR and OK south to s. AL, MS, e. and w. LA, and e. TX; perhaps disjunct in IL. [= I, K, S, SE, Z]

Orbexilum stipulatum (Torrey & Gray) Rydberg. Rocky limestone glade. So far as is known, once endemic to Rock Island in the Ohio River, Jefferson Co., KY, and now presumed extinct because of near obliteration of the only known site by dam-building and industrial construction (Baskin, Isely, & Baskin 1986). [= C, I, K, SE, Z; = Orbexilum stipulatum Torrey & Gray – F, G]

Orbexilum virgatum (Nuttall) Rydberg, Slender Leather-root. Sandhills. Se. GA (or SC?) south to ne. FL. A collection by Curtiss is labeled as from South Carolina. [= I, K, S, SE, WH, Z; = Psoralea virgata Nuttall]

Parkinsonia Linnaeus 1753 (Jerusalem Thorn)

* Parkinsonia aculeata Linnaeus, Jerusalem Thorn, Retama, Horse-bean, Mexican Palo Verde. Disturbed areas; native of sw. North America. May. Rarely established or spread from cultivation in our area, more commonly so in much of FL. [= I, K, S, SE, Y, WH, Z]

Pediomelum Rydberg 1919 (Buckroot, Prairie-turnip)

1 Flowering calyx 1.5-2.5 mm long, the legume exserted out of it at maturity; leaves 3-5-foliolate; [of MS and KY and westward]; [former genus Psoralidium] .............................................................................................................................................................................. P. species 1

1 Flowering calyx 7-10 mm long, the legume mostly included within it even at maturity; leaves (1-) 3-7 foliolate; [of TN and AL and eastward].

2 Plants caulescent, 1-2 dm tall; leaves (4-) 5-7-foliolate; [plants of calcareous glades of the Interior (nw. GA, TN, n. AL)]; [subgenus Disarticulatum] .............................................................................................................................................................................. P. subacaulis

2 Plants caulescent, 3-10 dm tall; leaves (1-) 3 (-5)-foliolate; [plants of sandhills of the Coastal Plain and rocky woodlands of the lower Piedmont]; [subgenus Pediomelum].

3 Inflorescence loose (much of the axis exposed); leaflets (1-) 3; leaflets < 2× as long as wide, petiolules 5-9 mm long; [of longleaf pine sandhills of the Coastal Plain] .............................................................................................................................................................................. P. canescens

3 Inflorescence congested (the axis usually concealed); leaflets 3 (-5); leaflets > 2× as long as wide, petiolules 1.8-3 mm; [of rocky woodlands of the lower Piedmont] .............................................................................................................................................................................. P. piedmontanum

Pediomelum canescens (Michaux) Rydberg, Buckroot, Eastern Prairie-turnip, Hoary Scurfpea. Sandhills. May-July; July-October. A southeastern Coastal Plain endemic: se. VA south to c. peninsular FL, Panhandle FL, and s. AL. This uncommon species tends to occur as very widely scattered individuals in sandhill habitats, rarely with more than a few seen at a time. It is related to P. esculentum (Pursh) Rydberg, the "prairie potato," prized by early travelers across the prairies for its edible tubers. An interesting collection label (by R.E. Wicker, collected in 1942, the specimen at NCU) mentions both the edible tubers and the characteristically sparse population structure of the species. "Not uncommon near Pinehurst in ... open places in sandy pine woods... but usually only one plant at a time. Tuber hard, dark brown, about size of a medium-sized Irish potato, somewhat ventral-elongated with roots coming from pointed base. Internal pure white, apparently almost entirely starch... Mr. Wicker says that he rather likes to take a bit of it and chew when fresh, has a rather condiment taste, but does not think it well to eat..."

Because of its rarity, P. canescens should not (of course) be eaten. Because of its habit, that of a very bushy, tumbleweed-like
plant, it superficially most closely resembles various *Baptisia* species, but it is easily separated by its rather dense and soft pubescence (our *Baptisia* are all glabrous or rather inconspicuously puberulent, except the very unifoliolate *B. arachnifera*). [= C, I, K, S, SE, WH, Y; Z = *Psoralea canescens* Michaux – RAB, F, G]

**Pediomelum species 1**, Gray Scurf-pea. Prairies. KY to MT, south to TX and n. Mexico; disjunct in MS. A recent study (Egan & Crandall 2008) shows that this species belongs in *Pediomelum*, not *Psoralidium*; the new combination has not yet been made. [= *Psoralidium tenuiflorum* (Pursh) Rydberg – C, I, K, SE; Z = *Psoralea tenuiflora* Pursh – F, G]

**Pediomelum subcaule** (Torrey & A. Gray) Rydberg, Nashville Breadroot. Limestone glades. E. TN and nw. GA west to c. TN and nw. AL. [= I, K, SE, Z; *P. subacutus* – S, orthographic variant]

---

**Phaseolus** Linnaeus 1753 (Bean)

1 Raceme axes slender, flexuose; [plants native perennials]; [section *Paniculati*; subsection *Volubili*].
2 Stems climbing and twining on other vegetation; leaflets 3-10 cm long, usually not lobed and only slightly reticulate; [plants of various habitats].
3 Corolla 1.5-2 cm long, scarlet red or bright lavender; racemes exserted; plants twining; [section *Coccineae*].
4 Legumes distinctly flattened at maturity, 15-20 mm wide; corolla usually greenish white; [section *Paniculati*; subsection *Volubili*].

---

* **Phaseolus lunatus** Linnaeus, Lima Bean. Frequently cultivated (both commercially and in home gardens), rarely found as a wild; native of tropical America. [= I, K, S, SE, WH, Y, Z; *P. limensis* Macfadyen – F]

**Phaseolus sinuatus** (Nuttall) Torrey & A. Gray, Sandhills Bean. Sandhills. July-September; August-October. Sc. NC south to s. FL, west to s. MS, a Southeastern Coastal Plain endemic. Freytag & DeBouck (2002) describe *P. sinuatus* and *P. polystachios* as being “very distinct and there seems to be no intergradation,” yet treat them as only subspecifically distinct; I choose to recognize them as species. Not easy to distinguish in sterile condition from *Strophostyles*. [= RAB, I, S, SE, W; = *P. polystachios* (Linnaeus) Britton, Sterns, & Poggenburg var. *sinuatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – K, WH; = *P. polystachyus* ssp. *sinuatus* (Nuttall) Freytag – Y; = *P. polystachyus* var. *sinuatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – Z]

* **Phaseolus vulgaris** Linnaeus, Garden Bean, Green Bean, Snap Bean, String Bean, Kidney Bean, Pole Bean, Bush Bean. Frequently cultivated (both commercially and in home gardens), rarely found as a wild; native of tropical America. [= C, F, G, I, K, S, SE; > *P. vulgaris* var. *vulgaris* – F; > *P. vulgaris* var. *humilis* Alefeld – F; < *P. vulgaris* var. *vulgaris* – Z]

---

**Pisum** Linnaeus 1753 (Pea)

* Pisum sativum * Linnaeus, Pea, Garden Pea, English Pea. Commonly cultivated in home gardens, rarely found as a waif; native of w. Asia and Mediterranean Europe. March-May. [= I, K, SE, WH; > *P. sativum var. sativum* – F; > *P. sativum var. arvense* (Linnaeus) Poiret – RAB, F]

**Rhynchosia** A.P. de Candolle 1879 (Snoutbean)

1 Leaves trifoliolate (rarely with a few lowermost leaves unifoliolate, these generally withering before flowering and fruiting).

- **Rhynchosia** A.P. de Candolle 1879 (Snoutbean)

2 Plant prostrate, trailing, usually with many leaves; stipels absent; [plant very rare in our area, probably introduced] .................. *R. michauxii*

3 Plant trailing or twining; pubescence of the lower leaf surface mostly restricted to the veins.

- **Rhynchosia** cytisoides (Loureiro) A.P. de Candolle

4 Calyx 14-25 mm long; inflorescence (including peduncle) 5-25 cm at anthesis, elongating further in fruit, with flowers scattered; [MS and w, TN westward] ................................................................. *R. minima*

5 Calyx 8-14 mm long; inflorescence (including peduncle) 1-2 cm long at anthesis, elongating to 4(-8) cm, the flowers tightly packed; [collectively widespread in our area].

- **Rhynchosia** reniformis

6 Pubescence of petiole of mostly incurved hairs 0.2-0.4 mm long; terminal leaflet 1-3(-3.5) cm long; plants generally trailing; [of ne. FL southward] ................................................................. *R. reniformis*

- **Rhynchosia** difformis

7 Terminal leaflet elliptic 1.6-2.5× as long as wide; plants erect. ................................................................. *R. difformis*

- **Rhynchosia** tomentosa

* Rhynchosia cinerea * Nash, Sandhill Snoutbean. Sandhills, scrub. Ne. FL (Columbia County) south to s. FL. [= I, K, S, SE, WH, Y]

**Rhynchosia latifolia** Nuttall. Pinelands and woodlands, roadsides. May-July. W. TN s. MO, and OK south to c. MS, s. LA, and se. TX. [= I, K2, SE]

**Rhynchosia michauxii** Vail. Sandhills, dry hammocks, disturbed areas. June-August; August-October. Se. NC (one record) and e. GA (one record) south to s. peninsular FL, west to Panhandle FL. The disjunct sites are of uncertain origin. [= I, K, S, SE, WH; = R. americana (Houston ex P. Miller) M.C. Metz – RAB (the identification as *R. americana* based on misidentification of the specimen)]

**Rhynchosia tomentosa** (Linnaeus) Hooker & Arnott. Dollarweed. Sandhills. June-September; August-October. Se. NC south to s. FL, west to e. TX; disjunct (introduced?) in e. TN (Chester, Wofford, & Kral 1997). [= RAB, K, SE, WH, Y; = R. simplicifolia (Walter) Wood – S]

**Rhynchosia mollissima** (Elliott) S. Watson. Hammocks, dry pine flatwoods, coastal sands. E. GA, south to s. FL, west to s. TX. The species also occurs in the Old World, and the New World distribution is sometimes considered a result of introduction. [= I, K, SE, WH, Y; = Dolicholoma mollissima (Linnaeus) Medikus – S]

**Rhynchosia minima** (Linnaeus) A.P. de Candolle. Hammocks, dry pine flatwoods, coastal sands. E. GA, south to s. FL, west to s. TX. The species also occurs in the Old World, and the New World distribution is sometimes considered a result of introduction. [= I, K, S, SE, WH, Y; = R. hispida (Elliott) Torrey & A. Gray – I, K, SE, WH, Y; = R. mollissima (Elliott) S. Watson – S]

**Rhynchosia reniformis** A.P. de Candolle, Dollarweed. Sandhills. June-September; August-October. Se. NC south to s. FL, west to e. TX; disjunct (introduced?) in e. TN (Chester, Wofford, & Kral 1997). [= RAB, K, SE, WH, Y; = R. simplicifolia (Walter) Wood – S]

**Rhynchosia tomentosa** (Linnaeus) Hooker & Arnott. Xeric woodlands and forests, sandhills, edges, open areas. June-August; August-October. SE south to n. peninsular FL, west to LA, and north in the interior to e. and c. TN. [= Rhynchosia tomentosa (Linnaeus) Hooker & Arnott var. tomentosa – C, I, K, SE, WH, Y; < R. tomentosa – RAB, F, G, W; > R. erecta (Walter) A.P. de Candolle – S; > R. intermedia (Torrey & Gray) Small – S]

**Robinia** Linnaeus 1753 (Locust)

A genus of 5-8 species, shrubs and trees, of e. and sw. North America. The Southern Appalachians are a center of diversity of *Robinia*, with active hybridization, introgression, and formation of local (sterile) races involved; a fully satisfying taxonomic treatment of such a situation is not possible. Isely & Peabody’s (1984) treatment seems a reasonable approach, and I have largely followed it here, differing in the rank of some of the taxa. References: Isely & Peabody (1984)=Z; Ashe (1922)=Y; Isely (1998)=I.

Identification notes: The key is differently structured than that in RAB or SE; it is presented as an alternative. This treatment may be altered substantially prior to publication. A variety of hybrids (including some cultivars) are known, including the following: Robinia ×longiloba Ashe (pro sp.) [R. hispida × viscosa], known from NC and SC; Robinia ×margaretae Ashe (pro sp.) [R. hispida × pseudoacacia], known from NC, SC, and GA; Robinia ×umbigua Poir (pro sp.) [R. pseudoacacia × viscosa], known from NC; Robinia hartwigii × hispida, known from Whiteside Mountain, Jackson County, NC; Robinia hartwigii × viscosa, known from Whiteside Mountain, Jackson County, NC.

1 Corolla white, 1.5-2.0 cm long; peduncles, pedicels, and calyces velvety-puberulent, the hairs neither glandular nor hispid; plant a small to large tree...........................................................................................................................................................................R. pseudoacacia

1 Corolla pink to pink-purple (rarely white or nearly so), (1.5-) 2.0-2.5 cm long; peduncles, pedicels, and calyces glandular-pubescent, hispid, or short-stalked to sessile glands; plant a shrub to small tree.

2 Twigs and leafstalks conspicuously hispid with hairs 1-5 mm long, these stiff, thick-based, and typically persistent several years.

3 Plants fruited abundantly; shrubs 0.6-2 (-3) m tall; leaflets relatively broad, mostly 1.2-1.8× as long as wide;... R. hispida var. fertilis

3 Plants sterile (rarely fruited scantly); shrubs 0.5-1.5 m tall; leaflets relatively narrow, mostly 1.8-2.5× as long as wide;... R. hispida var. hispida

2 Twigs and leafstalks either viscid with sessile or short-stalked glands, or densely glandular-pubescent (the hairs 0.5-2 mm long), or tomentulose, or sparsely hispid with weak, non-persistent hairs.

4 Leaflets usually 13-21, permanently but inconspicuously appressed-pubescent beneath; bracts (evident only before anthesis) aristate; plants never with long, hispid pubescence.

5 Twigs and peduncles finely glandular-pubescent with hairs 1 (-2) mm long; plants abundantly pod-forming....................... R. hartwigii

5 Twigs and peduncles viscid with sessile or short-stalked glands (the racemes sometimes with some glandular pubescence); plants sterile or forming pods.................................................. R. viscosa

4 Leaflets usually 9-13, initially appressed-silky but later glabrate beneath; bracts (evident only before anthesis) not aristate; plants with or without sparse long, hispid pubescence.

6 Plants fruited abundantly; shrubs 1-3 m tall ................................................................. R. hispida var. kelseyi

6 Plants sterile (rarely fruiting scantly); shrubs or small trees, 0.4-3 (-8) m tall.

7 Shrubs or small trees, 1-3 (-8) m tall, much branched, the stems and branches relatively straight, the nodes usually lacking spines; leaflets 1.5-3 cm long................................................................. R. hispida var. rosea

7 Shrubs, 0.4-1 m tall, little branched, the stems and branches typically zigzag (bent at each node), the nodes usually with spines; leaflets 1-2 (-3) cm long................................................................. R. nana
Robinia hartwigii Koehne, Granite Dome Locust, Highlands Locust, Hartwig's Locust. Forests and outcrop edges on high elevation granitic domes, also clearings. June-July; August-September. Apparently endemic to several mountains within a 5 km radius of Highlands, NC. While certainly related to and apparently hybridizing with R. viscosa, R. hartwigii seems worthy of recognition as a species. The original spelling (in Koehne 1913) is "hartwigii;" it is not clear why the variants (see synonymy) arose. [= RAB, S; = R. viscosa var. hartwegii (Koehne) Ashe – K, orthographic variant; = R. viscosa var. hartwegii – SE, Z; < R. viscosa – W; = R. viscosa var. hartwegii – Y, orthographic variant]

Robinia hispida Linnaeus var. fertilis (Ashe) Clausen, Arnot Bristly Locust. Woodlands and forests. May-June; July-August. Apparently endemic to the Southern Appalachians of w. NC and e. TN. A horticultural selection of var. fertilis, the Arnot Bristly Locust, is used as a soil binder. [= C, F, K, SE, Z; < R. hispida – RAB; > R. fertilis Ashe – S; > R. grandiflora Ashe – S, Y; > R. pedunculata Ashe – S; < R. hispida – W]

Robinia hispida Linnaeus var. kelseyi (Cowell ex Hutchinson) Isely, Kelsey's Locust. Mountain woodlands, introduced elsewhere. April-July; July-October. Traditionally considered an endemic originally restricted to w. NC, but SE and Z suggest that var. kelseyi may have been only of horticultural origin. [= K, SE, Z; = R. kelseyi Cowell ex Hutchinson – RAB, G, S, Y; < R. hispida – W]

Robinia hispida Linnaeus var. rosea Pursh, Boynton's Locust. Mountain woodlands. April-July. Originally distributed from w. NC and e. TN south to nw. SC, n. GA, and ne. AL, now occasionally found outside that range as an escape from cultivation. [= C, K, SE, Z; = R. boyontii Ashe – RAB, G, S, Y; < R. hispida – W]

Robinia viscosa Ventenat, Clammy Locust. Mountain forests and woodlands, roadsides, disturbed areas, rare in wild, uncommon as an escape. May-July; July-August. Originally a Southern and Central Appalachian endemic, ranging from PA south through w. MD, w. VA, e. WV, w. NC, and e. TN, to n. GA and n. AL, now much more widespread as an escape from cultivation. Reported for GA Coastal Plain (Marion County) (Carter, Baker, & Morris 2009). [= RAB, F, G, S, WV; = R. viscosa var. viscosa – C, K, SE, Y, Z; < R. viscosa – W (also see R. hartwigii)]

Scorpiurus Linnaeus 1753 (Scorpion’s-tail)

A genus of 2-4 species, herbs, of Mediterranean Europe west into w. Asia.

* Scorpiurus muricatus Linnaeus. Disturbed areas; native of Mediterranean Europe. [= K] {add synonymy}

Securigera A.P. de Candolle 1805 (Crown-vetch)
A genus of about 12-13 species, annual and perennial herbs, of Eurasia. This genus is sometimes included in Coronilla, but is apparently better separated (Isely 1998). References: Isely (1998)=I.

1 Corolla white and pink; perennial; [common alien, planted and established]..........................................................S. corymbosa

*Securigera securidaca* (Linnaeus) Degen & Dörfler. Disturbed areas; native of Europe. Reported by Small (1933); rejected by Isely (1990) on the basis of no material seen to document the occurrence. This taxon's status as part of our flora is uncertain. [= I, SE, = Bonaveria securidaca (Linnaeus) Reichenbach – S; = Coronilla securidaca Linnaeus – K]

*Securigera varia* (Linnaeus) Lassen, Crown-vetch. Roadbanks, woodland borders; native of Europe. This species, generally known as *Coronilla varia*, is now widely used to stabilize road-cuts. [= I; = Coronilla varia Linnaeus – RAB, C, F, G, K, SE, W, WH, WV]

Senna P. Miller 1754 (Senna, Sicklepod, Wild Coffee)

1 Racemes spike-like, 3-6 (-10) dm long; legume winged; [section Senna, series Piacea] .....................................................S. alata

2 Racemes not spike-like, <3 dm long; legume not winged; [section Chamaefistula].

2 Plant a shrub, 1-3 m tall; gland between the lowest pair of the acute or acuminate leaflets; [plants aliens, barely established in the vicinity of cultivation]; [section Chamaefistula, series Coluteoideae].

3 Gland between the lowest pair of leaflets only; leaflets 3-5× as long as wide.......................................................S. corombose

4 Glands between each pair of leaflets; leaflets 2-3× as long as wide, acuminate.....................................................S. septemtrionalis

5 Plant an herb, 0.1-1.5 m tall; gland near the base of the petiole (except in *S. occidentalis* which has leaflets rounded to emarginate at the apex); [plants natives, or aliens generally well-established and weedy].

4 Leaflets obovate, the apex rounded to emarginate, 1.3-2× as long as wide; gland between the lowest pair of leaflets; [section Chamaefistula, series Trigonolliodeae] .................................................................S. obtusifolia

4 Leaflets ovate or narrowly elliptic, the apex acute or acuminate, 2-3.5× as long as wide; gland near the base of the petiole.

5 Leaflets 1.5-3.0 cm wide, in 3-6 pairs; racemes with 1-5 flowers; [section Chamaefistula, series Bassiglandulosae] ..................S. occidentalis

6 Leaflets 0.7-2.0 cm wide, in 6-10 pairs; racemes with 5-10 (-25) flowers; [section Temperate]........................................S. hebecarpa

6 Legume 5.5-8 mm wide, with broad, nearly square segments, usually pilose initially, the hairs up to 0.8-2 mm long (sometimes glabrate); ovary lanate with hairs to 1 mm long; ovules 10-15 (-18); petiolar gland broadest above the middle...........................................S. varia

6 Legume 8-11 mm wide, with narrow segments (much shorter than broad), glabrous (or with a few hairs, these < 0.6 mm long); ovary striagulose with hairs to 0.5 mm long; ovules 20-25 (-30); petiolar gland usually broadest at or below the middle..............S. corymbosa

* Senna alata* (Linnaeus) Roxburgh, Emperor's Candlesticks, Candlestick Plant. Disturbed areas; native of tropical America. September-November. Planted and slightly naturalized from s. AL and FL west to OK and TX. [= I, K, SE, WH, Y; = Cassia alata Linnaeus – Z]

* Senna corymbosa* (Lamarck) Irwin & Barneby. Cultivated as an ornamental, rarely persistent or spreading to disturbed areas; native of South America. August-September. reported for AL (Diamond & Woods 2009). [= I, K, SE, WH, Y; = Adipera corymbosa (Lamarck) Britton & Rose – S; = Cassia corymbosa – X, Z]

*Senna hebecarpa* (Fernald) Irwin & Barneby, Northern Wild Senna. Open wet habitats, moist forests. July-August; August-November. MA and s. NH west to s. WI, south to sc. NC, e. TN, s. IN, and c. IL. [= C, I, K, SE, Y; = Cassia hebecarpa Fernald – RAB, G, W, X, Z; > C. hebecarpa var. hebecarpa – F, WV; > C. hebecarpa var. longipila E.L. Braun – F, WV; = Ditremexa marilandica (Linnaeus) Britton & Rose – S, misapplied]

*Senna liguistrina* (Linnaeus) Irwin & Barneby, Privet Wild Senna. Hardwood hammocks, wet disturbed habitats. N. peninsular FL south to s. FL; Central America; West Indies. [= I, K2, SE, WH; = Cassia liguistrina Linnaeus; = Peiranisia bahamensis (P. Miller) Britton & Rose - S] [not yet keyed; add X, Y, Z synonymy]

* Senna marilandica* (Linnaeus) Link, Maryland Wild Senna. Dry to moist forests, especially on greenstone and diabase barrens and rocky woodlands, thickets, woodland borders, sometimes somewhat weedy. July-August; August-November. S. MA and s. NY west to c. NE, south to c. peninsular FL and c. TX. [= C, I, K, SE, WH, Y; = Cassia marilandica Linnaeus – RAB, F, G, W, WV, X, Z; = Ditremexa medigeri (Shafer) Britton & Rose – S]

* Senna obtusifolia* (Linnaeus) Irwin & Barneby, Sicklepod, Coffeeweed. Fields (especially soybean fields), disturbed areas; probably native of the New World Tropics. July-September; August-November. The species is now pantropical. [= C, I, K, SE,
WH, X, Y; = *Cassia obtusifolia* Linnaeus – RAB, W, Z; *Cassia tora* Linnaeus – F, G, misapplied; *Emelista tora* (Linnaeus) Britton & Rose – S, misapplied

* Senna septemtrionalis* (Viviani) Irwin & Barneby. Disturbed areas; native of the tropics, probably originally from tropical America, perhaps not truly established, though Isely (1990) states that “the weedy nature of this species suggests that it is almost certainly somewhat established.” [= I, K, Y; = *Cassia laevigata* Willdenow – Z]

Sesbania Adanson 1760 (Rattlebox, Sesan)

A genus of about 50-60 species, annual herbs, perennial herbs, shrubs, and trees, of tropical, subtropical, and less commonly warm temperate regions of the Old and New World, here circumscribed to include *Glottidium*, following Lewis et al. (2005).

1 Corolla 8-9 mm long; legume flat; leaves with 8-13 pairs of leaflets ................................................................. *S. vesicaria*

1 Corolla 9-25 mm long; legume quadrangular or 4-winged; leaves with 10-35 pairs of leaflets.

2 Legume quadrangular in cross-section, the corners not winged, 15-20 cm long, 0.3-0.5 cm wide; corolla 10-15 (-20) mm long, yellow, often marked with purple; leaves with 15-35 pairs of leaflets; [plant a robust herb, to 4 m tall] ................................................................. *S. herbacea*

2 Legume quadrangular or conspicuously 4-winged longitudinally, 3-8 cm long, 0.5-1.5 cm wide; corolla 9-25 mm long, yellow, orange, or scarlet; leaves with 10-20 pairs of leaflets; [plant a shrub, to 4 m tall].

3 Legume quadrangular or slightly flanged, 0.5-0.7 cm wide; corolla 9-12 mm long................................................................. *S. virgata*

3 Legume conspicuously 4-winged longitudinally, 1-1.5 cm wide; corolla 13-25 mm long.

4 Corolla yellow; pedicels 0.5-1.0 cm long; legume blunt or abruptly acuminate to a beak ................................................................. *S. drummondii*

4 Corolla orange or red; pedicels 0.5-1.2 (-1.5) cm long; legume acuminate or tapering to a beak ................................................................. *S. punicea*

*Sesbania drummondii* (Rydberg) Cory, Rattlebox, Poison-bean. Disturbed areas, spoil, marsh edges, ditches. Native on the Gulf Coast west to s. TX and Mexico, the exact eastern edge of the native range uncertain, perhaps w. FL Panhandle. First reported for GA and SC by Townsend et al. (2000), where clearly introduced. [= GW, I, K1, K2, SE, WH; = *Daubentonia drummondii* Rydberg – S]

*Sesbania punicea* (Cavanilles) Bentham, Rattlebox, Scarlet Wisteria-tree, Purple Sesban. Ditches, wet fields, marshes, ponded wetlands, wet pinelands; presumably native of South America. June-October; August-November. [= GW, I, K1, K2, SE, WH; = *Daubentonia punicea* (Cavanilles) A.P. de Candolle – RAB, S]

*Sesbania vesicaria* (Jacquin) Elliott, Bladderpod, Bagpod. Ditches, marshes, disturbed wet areas. July-September; August-November. The original native distribution of *S. vesicaria* is uncertain; its distribution is from ne. NC south to s. FL, west to e. OK and se. TX, and Isely (1998) states that it is unknown from outside the United States; occurrences in provinces inland of the Coastal Plain seem to represent introductions into artificial wetlands (such as ditches). [= GW, K2, WH; = *Glottidium vesicarium* (Jacquin) R.M. Harper – RAB, I, K1, S, SE]

*Sesbania virgata* (Cavanilles) Poiret. Disturbed areas; native of South America. June-October; August-November. [= I, K1, K2, SE, WH]

*Sperostyles* Elliott 1823 (Sand Bean, Woolly Bean, Wild Bean)

1. Legumes 2-4 cm long, permanently pubescent; corolla 5-8 mm long; leaves permanently pubescent on the upper surface; seeds glabrous......

..............................................................................................................................................................................................................

*S. leiosperma*

1. Legumes 3-8 cm long, glabrate at maturity; corolla 8-15 mm long; leaves usually glabrate on the upper surface; seeds pubescent.

2. Bracteoles (immediately subtending the calyx) 2-3 mm long, equaling or exceeding the calyx tube; leaflets usually prominently 3-lobed; terminal leaflet 2.5-3.5 cm wide; plant an annual..............................................................................................................................................

*S. helvola*

2. Bracteoles (immediately subtending the calyx) 0.5-1.0 (-1.5) mm long, shorter than the calyx tube; leaflets not lobed; terminal leaflet 0.3-2.0 cm wide; plant a perennial..............................................................................................................................................

*S. umbellata*

Strophostyles helvola (Linnaeus) Elliott, Annual Sand Bean. Coastal dunes, beaches, dry sandy woodlands, disturbed areas. June-September; August-October. QC west to MN and SD, south to n. peninsular FL and e. TX. See Isely (1986b) for a discussion of the orthography of the epithet. [= RAB, C, G, S, WH, WV; = *S. helvula* (Linnaeus) Elliott – K, SE, W, Z, orthographic variant; > *S. helvola* var. helvola – F; > *S. helvola* var. missouriensis (S. Watson) Britton – F]

Strophostyles leiosperma (Torrey & A. Gray) Piper, Small-flowered Sand Bean. Prairies, glades, barrens, sand bars, disturbed areas. June-September; August-October. IN, WI, MN, and ND, south to FL Panhandle, AL, MS, LA, TX, NM, and AZ; also scattered eastward presumably as introductions. This species is native east to KY and TN; it should be sought inland in prairies, glades, and barrens with midwestern affinities. [= C, F, G, K, SE, WH, Z; = *S. pauciflora* (Bentham) S. Watson – S]

Strophostyles umbellata (Muhlenberg ex Willdenow) Britton, Perennial Sand Bean. Dry sandy or rocky woodlands, disturbed areas. June-September; August-October. S. NY west to s. IN, s. MO, and KS, south to c. peninsular FL and s. TX. [= RAB, C, F, G, K, S, SE, W, WH, Z; > *S. umbellata* var. umbellata – F; > *S. umbellata* var. paludigena Fernald – F]

Stylosanthes Swartz 1788 (Pencil-flower)

Stylosanthes biflora (Linnaeus) Britton, Sterns, & Poggenburg, Pencil-flower. Sandhills, dry to moist (but not wet) pine savannas and flatwoods, dry forests, woodlands, woodland borders, glades, barrens, rock outcrops. June-August; July-October. S. NY west to OH, s. IL, and KS, south to c. peninsular FL and e. TX. The large, adnate stipules are distinctive. Variation in this species (see synonymy) needs additional study. [= RAB, C, I, K, SE, W, WH, WV; > *S. biflora* var. biflora – F, G; > *S. biflora* var. hispidissima (Michaux) Pollard & Ball – F, G; > *S. riparia* Kearney – G, S; > *S. riparia* var. riparia – F; > *S. riparia* var. setifera Fernald – F; > *S. biflora* – S]

Styphnolobium Schott 1830 (Pagoda Tree)

1. Flowers in terminal panicles; leaflets 13-17 per leaf.............................................................................................................................................................

*S. affine*

1. Flowers in axillary racemes; leaflets 9-15 per leaf.............................................................................................................................................................

*S. japonicum*

Styphnolobium affine (Torrey & A. Gray) Walpers, Eve’s Necklace. Woodlands, disturbed areas. April-June. SW, AR and OK south to sw. LA and c. TX; disjunct eastwards in se. LA. [= K2; = Sophora affinis Torrey & A. Gray]

* Styphnolobium japonicum (Linnaeus) Schott, Pagoda Tree. Cultivated ornamental, rarely persistent; native of China. Reported as "slightly escaped" in the United States by Isely (1981), but all specimens seen are from cultivated plants. Also reported for VA, MD, PA, and OH (Kartesz 1999). [= Y; = Sophora japonica Linnaeus – I, K, Z]

Tephrosia Persoon 1807 (Goat’s-rue)

Corolla bicolor, the standard yellow and the wings pink; racemes terminal; stamens erect; stamens monadelphous; leaves with (9-)13-23 (-37) leaflets.

Inflorescence reduced, foliaceous, flowers solitary or in small clusters overtopped by leaves; plants < 25 cm tall; leaflets generally < 10 mm long and < 5 mm wide; [restricted to the West Gulf Coastal Plain of sw. GA, adjacent FL and westward]. ...........................................T. mohrii

Inflorescence terminal, not foliaceous and overtopped by leaves; plants > 25 cm tall; leaflets generally > 10 mm long and > 5 mm wide; [widespread in our area]. .................................................................T. virginiana

Corolla unicolored, initially white or pink, darkening in age to a dark maroon or purple; racemes opposite the leaves (the uppermost appearing terminal); stems decumbent or ascending; stamens diadelphous; leaves with (3-)5-23 (-27) leaflets.

Upper stamen fused with the staminal sheath for part or most of its length (submonadelphous); leaves with (9-)13-23 (-27) leaflets; [plants from s. AL westward] ......................................................................................................................................................................................................T. onobrychoides

Upper stamen completely separate from the staminal sheath (diadelphous); leaves with (3-)5-17 (-19) leaflets; [plants collectively widespread in our area].

Inflorescences with 1-7 several reduced leaves, mainly borne terminally on the principal axis or branches; bracts generally deciduous.

Inflorescences lacking leaves (sometimes with 1 reduced leaf), mainly borne leaf-opposed; bracts persistent.

Petiole 1-4× as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence strongly flattened (2-angled, or rarely, 3-angled) in cross-section; leaflets averaging 25 mm long and 12 mm wide .................................................................................................................................T. florida

Petiole 1/3-1× as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence terete or inconspicuously 2-4-angled in cross-section; leaflets averaging smaller.

Leaves with (3-)5-7 leaflets; petiole 0-5 mm long; stem and fruit hairs < 0.5 mm long .........................................................T. chrysophylla

Leaves with (7-)9-17 (-19) leaflets; petiole 2-15 mm long; some stem and fruit hairs > 0.5 mm long.

Inflorescence with 1-3 (-5) nodes; plants inconspicuously pubescent with gray hairs (the hairs appressed or spreading, short to fairly long); leaflets (3-)avg. 5-6 (-7) mm wide, mostly acute; [plants of the Coastal Plain of NC and SC] ....................T. hispidula

Inflorescence with 2-20 nodes; plants conspicuously tawny long-pilose with rusty brown hairs; leaflets (6-)avg. 8 (-12) mm wide, mostly obusate; [plants widespread in our area]. .................................................................T. spicata

Tephrosia chrysophylla Pursh, sprawling Goat's-rue. Sandhills. E. GA s. to s. FL, and west to s. MS. Rather frequent hybrids between T. chrysophylla and T. florida are intermediate in morphology and have been found in AL< FL, GA, and MS; they have been given a hybrid binomial, T. ×intermedia (Small) G.L. Nesom & Zarucchi, replacing later name T. ×floridana (Vail) Isely, which has been in regular use in the southeastern United States (Neson & Zarucchi 2009). [= I, K, SE, WH, Y; = Cracca chrysophylla (Pursh) Kuntze – S]

Tephrosia cinerea (Linnaeus) Persoon, Ashen Hoary-pea. Disturbed areas; native of South America. Reported from an 19th century ballast collection from Mobile, AL. [= I, K2, SE] {not keyed; not mapped; rejected as a component of our flora}

Tephrosia hispidula (Michaux) Persoon. Pine savannas and other pinelands. May-August; July-October. E. NC (se. VA?) south to c. peninsular FL, west to se. LA, a Southeastern Coastal Plain endemic. Fernald (1950) reports this species from se. VA. [= RAB, F, I, K, SE, WH, Y; = Cracca hispidula (Michaux) Kuntze – S]

Tephrosia onobrychoides Nuttall. Dry pinelands. S. AL, n. AR, e. OK, south to s. LA, and sc. TX. [= I, K, SE, Y; = Cracca onobrychoides (Nuttall) Kuntze – S]

Tephrosia rugelii Shuttleworth ex B.L. Robinson. Sandhills. Ne. and Panhandle FL (Jefferson County) south to s. FL. [= I, K, SE, WH; = Cracca rugelii (Shuttleworth ex B.L. Robinson) A.A. Heller – S]

Tephrosia spicata (Walter) Torrey & A. Gray. Woodlands. June-August; July-October. S. DE south to s. FL, west to w. LA, north in the interior to se., sc., and sw. TN and se. KY. [= RAB, C, G, K, SE, WH, WH, Y; > T. spicata var. semitonsa Fernald – F; > T. spicata var. spicata – F; = Cracca spicata (Walter) Kuntze – S]

Tephrosia virginiana (Linnaeus) Persoon, Virginia Goat's-rue. Sandhills, other pinelands, xeric and/or rocky woodlands and forests, outcrops, shale barrens and other barrens, dry roadbanks. May-June; July-October. S. NH west to WI, se. MN, and c. KS, south to c. peninsular FL, c. TX, and nw. TX. [= RAB, C, I, K, SE, W, WV; > T. virginiana var. glabra Nuttall – F, G; > T. virginiana var. virginiana – F, G; < T. virginiana – I, SE, WH, Y (also see T. mohrii); = Cracca virginiana Linnaeus – S; = T. virginiana var. virginiana – Z]

Thermopsis R. Brown ex Aiton & Aiton f. 1811 (Golden-banner)

1 Legumes erect or strongly ascending, densely villous; stipules clasping, those of the principal leaves (20-) 35-65 mm long, 10-30 mm wide; pedicels 2-3 mm long; plants mostly 6-20 dm tall, strict or few-branched..............................\textit{T. villosa}

1 Legumes spreading to ascending, glabrate or pubescent; stipules not clasping, those of the principal leaves 12-25 (-32) mm long, 1-5 mm wide; pedicels 4-20 mm long; plants mostly 3-10 dm tall, branched.

2 Plants from a single woody rootstock, mostly 5-10 dm tall; calyx glabrous or very sparsely pubescent, often also glaucous, the lobes often only 1-1.5 mm long; pedicels glabrate, (4-) 7-20 mm long (as long as or longer than the bracts); racemes terminal or lateral; plants flowering (late) May-

2 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m]..............................\textit{T. fraxinifolia}

1 Flowers bright yellow (fading brown); [section \textit{Chroosemium}].

2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long; petiolule of the terminal leaflet ca. 1 mm long.\\n
1 Flowers not bright yellow.

4 Flowers borne on distinct pedicels, (1-) 2-10 mm long, these often curving or reflexing in age; flowers white, fading pink with age in most species; [native and alien species]; [section \textit{Lotoidea}].

5 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.

6 Calyx lobes narrowly triangular, about as long as the calyx tube; pedicules axillary along the stolons; stipules scarious-membranaceous; [plant an abundant introduced weed]..............................\textit{T. repens}

6 Calyx lobes subulate, distinctly longer than the calyx tube; pedicules terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].

7 Pedicule terminal, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long.\\n
7 Pedicule terminal at tip of erect flowering branches, subtended by a pair of opposite or subopposite, short-petioled leaves; pedicels (2-) 4-8 mm long..............................\textit{T. stoloniferum}

5 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).

Trifolium carolinianum additional information, see Collins & Wieboldt (1992). [not yet keyed]

J.L. Collins & Wieboldt. Limestone glades. In c. TN (Chester, Wofford, & Kral 1997). For August. [not yet keyed]

Of Mediterranean Europe and w. Asia. Reported for SC (Kartesz 1999), based on specimen at NCU. [not yet keyed]

* FABACEAE

4 Flowers sessile or on very short pedicels (usually < 1 mm long); flowers pink, purplish, white, or scarlet; [alien species].

12 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.

13 All flowers with petals; fruiting heads enlarging, becoming a reddish brown, pubescent ball ca. 2 cm in diameter, remaining aerial; [section Viscaria] ................................................................. T. fragiferum

14 Heads not subtended by a pseudo-involucre of leaves or expanded stipules.

15 Flowers white (fading pink), 7-8 mm long; calyx tube both externally glabrous and 20-nerved (externally pubescent, or 10-nerved, or both).

16 Flowers 4-6 mm long. 15 Flowers red, pink-purple, or bicolor, either 11-20 mm long or 4-6 mm long; calyx tube not both externally glabrous and 20-nerved (externally pubescent, or 10-nerved, or both).

17 Stipules gradually tapering to a longer slender tip, longer than the fused part; calyx densely hispate; stem soft pubescent with deflexed to spreading hairs; [section Lactuca] .......................................................................................................................................................................................... T. hirtum

18 Heads axillary, sessile, in the axils of subtending leaves; calyx tube glabrous (except for a few hairs at apex); [section Lotoidea].......................... T. pratense

19 Calyx not bladdery-inflated in fruit; corolla orientation normal (standard uppermost). 18 Heads terminal or axillary; calyx tube pubescent.

20 Inflorescence subsessile to shortly peduncled; head spherical in fruit .......................................................................................................................... T. arvense

21 Calora 3-6 mm long; [section Trifolium] .............................................................................................................................. T. arvense

22 Corolla crimson, 10-13 (-15) mm long; floral bracts absent; heads 1-1.5 (-2) cm in diameter; [section Trifolium].................. T. incarnatum

23 Calora white, 15-18 mm long; floral bracts present; heads 2.5-3 cm in diameter; [section Mistyllus]............ T. vesiculosum

* Trifolium angustifolium Linnaeus, Narrowleaf Clover. Waste areas near wool-combing mills, perhaps only a waif; native of Mediterranean Europe and w. Asia. Reported for SC (Kartesz 1999), based on specimen at NCU. [= I, K] [not yet keyed]

* Trifolium cernuum Brotero, Nodding-head Clover. Waste areas near wool-combing mills, perhaps only a waif; native of Mediterranean Europ and n. Africa. [= K] [not yet keyed]

* Trifolium depauperatum Desvauvar. Depauperatum. Cowbag Clover, Balloon-sack Clover, Poverty Clover. Waste areas near wool-combing mills, perhaps only a waif; native of w. North America (BC south to CA). [= I, K] [not yet keyed]

* **Trifolium fragiferum** Linnaeus, Strawberry Clover. Disturbed areas; native of Middle East. Introduced in c. GA (Jones & Coile 1988) and reported from an old collection from se. PA (Rhoads & Klein 1993). [= C, F, G, I, K, SE]

* **Trifolium glomeratum** Linnaeus, Cluster Clover. {habitat}; native of Mediterranean region. Also reported for SC by Kartesz (1999), but the specimen is actually *T. cernuum*. [= I, K1, K2, S, SE]

* **Trifolium gracilentum** Torrey & A. Gray. Waste areas near wool-combing mills, perhaps only a waif; native of w. North America. [> *T. gracilentum* var. *gracilentum* – K1, K2] {not yet keyed; add synonymy}

* **Trifolium lappaceum** Linnaeus, Lappa Clover. Disturbed areas; native of Mediterranean Eurasia and Africa. April-August. [= RAB, I, K, S, SE, WH]

* **Trifolium medium** Linnaeus, Zigzag Clover. Reported as introduced in MD and NJ (Kartesz 1999; Kartesz 2010). Native of Europe. [= K] {not keyed; rejected as a component of our flora}

* **Trifolium michelianum** Savi, Big-flower Clover. Disturbed areas; native of Mediterranean Europe. [> *T. michelianum* var. *balansae* (Boiss.) Ponert – K2] {not keyed}

* **Trifolium spumosum** Linnaeus, Pink Clover. Disturbed areas; rare, native of Mediterranean Europe. [= K, WH] {not yet keyed}

* **Trifolium stoloniferum** Muhlenberg ex Eaton, Running Buffalo-clover. Dry upland woodlands and prairies. WV, OH, n. IN, IL, MO, and e. KS, south to KY and AR, now extirpated from significant portions of its range. [= C, F, G, I, K, S, SE, WV]

* **Trifolium subterraneum** Linnaeus, Subterranean Clover. Disturbed areas, waste areas near wool-combing mills; native of Europe, Asia, and n. Africa. Reported for NC and SC by Isely (1990); reported for Piedmont of GA by Jones & Coile (1988), and collected in MS (Stone County) (S.W. Leonard, pers. comm. 2007). [= I, K, SE]

**Trifolium virginicum** Small, Kates Mountain Clover, Shale-barren Clover. Shale barrens, other rock outcrops. May-June. Sc. PA through w. MD south to w. VA and e. WV. [= C, F, G, I, K, SE, W, WV]

---

**Ulex** Linnaeus 1753 (Gorse)

* **Ulex europaeus** Linnaeus, Gorse, Furze. Disturbed areas; native of Europe. June. Not cited in Harvill et al. (1992), but naturalized in sandy soils in York County, VA. Also reported from WV and PA. [= C, F, G, I, K, SE]

---

**Vachellia** Wight & Arnott 1834 (Acacia)

1 Leaves with 2-4 (-6) pairs of pinnae; each pinna with 10-20 pairs of leaflets ..........................................................**V. farnesiana** var. *farnesiana*

1 Leaves with 10-15 (-20) pairs of pinnae; each pinna with 20-30 pairs of leaflets .........................................................**V. macracantha**

* **Vachellia macracantha** (Humboldt & Bonpland ex Willdenow) Seigler & Ebinger, Apopanax, Longspine Acacia. Planted as an ornamental and rarely naturalized; native of further south in FL. [= X; = *Acacia macracantha* Humboldt & Bonpland ex Willdenow – I, K, SE, WH, Z]

---

**Vicia** Linnaeus 1753 (Vetch, Tare)

1 Inflorescence nearly sessile, of 1-4 flowers clustered in the leaf axil; [alien species].

2 Leaves with 2-6 leaflets, succulent; leaflets 3-7 cm long; legume with pectinate sutures ..................................................**V. narbonensis**

2 Leaves with 4-20 leaflets, not succulent; leaflets 0.3-3.5 cm long; legume not pectinate (except *V. lutea*).

3 Corolla 5-6 mm long; leaves with 4-6 (-8) leaflets ..............................................................................................................**V. lathyroides**

3 Corolla 10-30 mm long; leaflets 6-16 (-20).

4 Calyx lobes conspicuously unequal; legumes pilose with pustulate-based hairs .............................................................**V. lutea**

4 Calyx lobes more or less equal; legumes glabrous at maturity, or very finely pubescent with non-pustulate-based hairs.

5 Calyx lobes all shorter than the calyx tube; corolla yellow, often streaked with purple, 25-30 mm long ................. **V. grandiflora**

5 Calyx lobes (at least the longer) about as long as the calyx tube; corolla pink, purple, lavender, white, or creamy yellow, 10-25 (-30) mm long.

6 Standard pubescent dorsally; corolla 15-25 (-30) mm long, creamy yellow to purple; legume pubescent, with a basal stipe ....... .................................................................**V. pannonica**

6 Standard glabrous; corolla 10-25 (-30) mm long, pink, purple, lavender, or whitish; legume glabrous, sessile.

7 Calyx 7-11 (-12) mm long; corolla pink-purple to whitish, 10-18 mm long; leaflets 4-10× as long as wide .................

..........................................................................................................................**V. sativa** ssp. nigra
Inflorescence pedunculate, of 2-20 flowers along a well-developed raceme; [alien and native species].

Peduncles 1-10 mm long; raceme axis 2-10 mm long, with 2-7 (-10) flowers.

Plant a robust annual, 10-20 dm tall; tendrils absent; leaves 2-4-6 leaflets; leaflets 5-10 cm long; corolla 20-30 mm long.

Plant a trailing perennial, 3-10 dm tall; tendrils present; leaves 8-16 leaflets; leaflets 2-3.5 cm long; corolla 10-15 mm long.

Peduncles usually >10 mm long; raceme axis usually >10 mm long, with (1-2) many flowers.

Corolla 10-25 mm long.

Stipules dimorphic, one of each pair entire, the other palmately lacerate; flowers 1 (-2) per inflorescence.

Flowers 15-22 (-25) mm long; legumes with a basal stipe 2-5 mm long; leaves with 8-16 leaflets.

Flowers 8-16 (-18) mm long; legumes with a basal stipe 1-3 mm long; leaves with 8-22 leaflets.

Calyx swollen on one side; plant an annual; inflorescence secund.

Calyx not swollen on one side; plant a rhizomatous perennial; inflorescence not secund.

Flowers white to lavender, the keel spotted; legumes 4-5 mm wide; inflorescence not second.

Flowers blue-violet or purple; legumes 6-8 mm wide; inflorescence generally second.

Corolla 2-5.8 (-10) mm long.

Plant a rhizomatous perennial.

Leaves with 2-4 (-6) leaflets; [plants of s. SC southward, native, of the Coastal Plain].

Legumes 2.5-3.0 cm long; leaflets 1.5-4.5 cm long, oblong to linear, 8-20x as long as wide.

Legumes 0.8-1.5 cm long; leaflets 1-1.5 cm long, usually elliptic, 2-4 (-10) times as long as wide.

Leaves with 10-25 leaflets; [plants collectively widespread in our area, native or alien].

Flowers white to lavender, the keel spotted; legumes 4-5 mm wide; inflorescence not second.

Flowers blue-violet or purple; legumes 6-8 mm wide; inflorescence generally second.

Plant an annual.

Legume symmetrically rounded at the apex; inflorescence with 1-2 (-4) flowers.

Legume asymmetrically acute at the apex; inflorescence with 1-15 flowers.

Leaves with 2-4 leaflets; legume glabrous to inconspicuously puberulent.

Leaves with (8-) 10-20 leaflets; legume glabrous or finely pubescent; leaves with 2-4-6 leaflets.

Legume finely hisrute; calyx 2-2.5 mm long; corolla 2.5-4.5 mm long.

Legume glabrous; calyx 2.8-3.7 mm long; corolla 4.5-8 mm long.

Racemes (2-) 4-9 (-12) flowered; corolla blue-purple; leaves with (4-) 8-12 (-14) leaflets.

Racemes 1-6-flowered; corolla pinkish-white or lavender; leaves with (6-) 12-14 (-18) leaflets.

Vicia acutifolia Elliot, Fourleaf Vetch. Pond margins, pine flatwoods, ditches. April-May; May-June. Se. SC south to s. FL, west to e. Panhandle FL. [= RAB, GW, I, K, S, SE, WH]

Vicia americana Willdenow var. americana, American Vetch, Purple Vetch, Tare. Moist soils. May-June. Var. americana ranges from QC west to AK, south to w. VA, s. WV, MO, OK, TX, Mexico. Var. minor Hooker occurs in w. North America. The report for AL (Woods & Diamond 2006) has been shown to be a misidentification (Spaulding, pers. comm.). [= C, F, G, I, SE = f. americana ssp. americana – K; < f. americana – W, WV]

* Vicia artuculata Hornemann, Monantha Vetch, Oneflower Vetch. Perhaps only cultivated; native of Europe. [=I, K, SE]

Vicia floridana S. Watson, Florida Vetch. Moist soils of hammocks, ditches, roadbanks. E. GA (McIntosh Co.) south to c. peninsular FL. [= GW, I, K, S, SE, WH]

Vicia ludoviciana Nuttall ssp. leavenworthii (Torrey & A. Gray) Lassetter & Gunn. Woodlands, prairies, dunes, disturbed areas. MS and MO west to NM and TX. In our area is Race 2 (“louisianica” race) of ssp. leavenworthii (Isely 1998). [= I, K, SE] {add to synonymy}

Vicia ludoviciana Nuttall ssp. ludoviciana, Louisiana Vetch. Woodlands, prairies, dunes, disturbed areas. AL and Panhandle FL west to OR and CA. In our area is Race 1 (“ludoviciana” race) of ssp. ludoviciana (Isely 1998). [= I, K, SE; = V. ludoviciana – WH] {add to synonymy}

* Vicia lutea Linnaeus, Yellow Vetch. Disturbed areas; native of Europe. [= I, K, SE]

* Vicia pannonica Crantz, Hungarian Vetch. Disturbed areas; native of Europe. Introduced in c. GA. Reported for NC (Isely 1998). {investigate} [= I, K, SE]

* Vicia sativa Linnaeus ssp. nigra (Linnaeus) Ehrhart, Narrowleaf Vetch. Disturbed areas; native of Mediterranean Europe. March-June; May-July. [= I, K, SE; = V. angustifolia Linnaeus – RAB, C, S, W; = V. sativa var. angustifolia (Linnaeus) Ehrhart; > V. angustifolia var. angustifolia – F, G, WV; > V. angustifolia var. segetalis (Thuill.) Ser. – F, G, WV; > V. angustifolia var. uncinata (Desv.) Rouy – F]

* Vicia sativa Linnaeus ssp. sativa, Common Vetch. Disturbed areas; native of Mediterranean Europe. April-June; May-July. [= I, K, SE; = V. sativa – RAB, C, G, S; > V. sativa var. sativa – F; > V. sativa var. linears Lange – F]

* Vicia sepium Linnaeus, Bush Vetch, Wild Tare. Disturbed areas; native of Europe. Introduced south to WV and in e. PA (Rhoads & Klein 1993). [= C, G, I, SE; > L. sepium var. sepium – F, K]

* Vicia tetrasperma (Linnaeus) Schreber, Slender Vetch, Smooth Tare, Lentil Vetch. Disturbed areas; native of Europe. April-June; May-July. [= RAB, C, G, I, K, S, SE, WH; > V. tetrasperma var. tetrasperma – F; > V. tetrasperma var. tenuissima Drace – F]

Vigna Savi 1824 (Cow Pea)

A genus of about 100-150 species, annual and perennial herbs, pantropical, rarely extending into warm temperate regions. References: Isely (1998)=I; Maréchal, Mascherpa, & Stainier (1978)=Z.
1 Corolla yellow, 1.5-1.7 cm long; leaves somewhat fleshy-thickened; [plant native or introduced in maritime situations]; [section *Vigna*] ..........................................................

1 Corolla pink to purple, 1.5-2.5 cm long; leaves herbaceous; [plant a cultivated introduction]; [section *Catjang*] .......................................................... *V. unguiculata*

**Vigna luteola** (Jacquin) Bentham, Wild Cow Pea. Edges of freshwater tidal marshes, beaches, hammocks, disturbed areas, railroad embankments, low fields, in the outer Coastal Plain. July-September; August-October. Se. NC south to s. FL, west to se. TX, and in the New World tropics. Often weedy in appearance, and its nativity at a particular location difficult to judge. [= RAB, GW, I, K, Z; ? V. repens (Linnaeus) Kuntze – S; = V. marina (Burmarrd) Merrill (the correct name according to some authors, based on uncertain typification)]

* *Vigna unguiculata* (Linnaeus) Walpers, Black-eyed Pea, Field Pea, Cow Pea. Cultivated in commercial and home gardens, rarely persistent or occurring as a waif in disturbed areas; native of tropical Africa or Asia. June-August; July-September. [= RAB, I, K; ? V. *sinensis* (Linnaeus) Savi – F, S; > *V. unguiculata* var. *unguiculata* – Z]

---

**Wisteria** Nuttall 1818 (Wisteria)

**Identification notes:** Twining direction can be determined by looking at (or imagining) the vine twining around a branch or pole. Look at the pole or branch from the base (from the direction from which the vine is growing). If the vine is circling the branch or pole in a clockwise direction, that is dextrorse; if counterclockwise, that is sinistrorse. Identification of the two alien species and their hybrids is uncertain. Genetic sorting of morphological characters and horticultural selection mean that morphology is only poorly correlated with genetic origin. Trusty et al. (2007) found that 24 of 25 individuals tested from scattered sites around the Southeast showed genetic admixture (sometimes complicated) between *W. floribunda* and *W. sinensis*. Probably the great majority of material in the Southeast could be called *W. ×formosa*; the below key may work poorly or not at all for some material encountered.

1 Legume and ovary glabrous; pedicels 5-10 (-15) mm long; standard reflexed near the middle; seeds reniform; leaflet margins plane; leaflet apices acute to slightly acuminate; [native species of swamps and bottomland forests and thickets] ........................................................................... *W. frutescens*

1 Legume and ovary velvety pubescent; pedicels 15-20 mm long; standard reflexed at the base; seeds lenticular; leaflet margins undulate; leaflet apices acute to strongly acuminate; [introduced species, naturalized in a wide variety of situations].

2 **Standard 16-18 mm long, 16-18 mm wide; leaflets (7-) 13-17 (-19) per leaf; racemes to 72 cm long, with 25-170 flowers opening nearly simultaneously; vine twining clockwise (dextrorse; from lower left ascending to upper right) .......................................................... *W. sinensis*

2 Standard 20-23.5 mm long, 23-25 mm wide; leaflets (7-) 9-11 (-13) per leaf; raceme to 33 cm long, with 25-95 flowers opening nearly simultaneously; vine twining clockwise (dextrorse; from lower left ascending to upper right). ........................................................................... *W. floribunda*

3 **Auricles of the standard’s callosity 0.7-0.8 mm long; leaflets 7-17 per leaf; racemes to 36 cm long.** ....................................................................................... *W. ×formosa*

3 **Auricles of the standard’s callosity 1.1-1.2 mm long; leaflets (11-) 13-17 (-19) per leaf; racemes to 132 cm long, with the 50-170 flowers opening successively from base to the tip of the inflorescence, those at the base withering before those at the tip have opened.** ........................................................................... *W. floribunda*

**Zornia** J. F. Gmelin 1792 (Zornia)

Identification notes: The palmately 4-foliolate leaves are unique in the flora of our area.

**Zornia bracteata** Walter ex J.F. Gmelin, Zornia. Flatwoods, sandhills, sandy roadsides. June-August; July-October. Se. VA south to s. FL, west to TX and e. Mexico, endemic to the Southeastern Coastal Plain. [= RAB, C, F, G, K, S, SE, WH]

---

### 146. POLYGALACEAE

R. Brown 1814 (Milkwort Family) [in FABALES]

A family of 17-21 genera and 800-1000 species, trees, shrubs, woody vines, and herbs, nearly cosmopolitan, but most diverse in tropical and subtropical areas. References: Miller (1971b); Eriksen & Persson in Kubitzki, Bayer, & Stevens (2007).

**Polygala** Linnaeus 1753 (Milkwort)

Identification notes: *Polygala* has a distinctive flower structure which can be confusing. The corolla consists of 3 fused petals, partly fused into a tubular form, and also fused with the stamens. The lower petal is called the keel; it is usually boatlike, and also lacerate, fringed, or lobed at its tip. The calyx is 5-lobed, the lobes usually of 3 distinct sizes. The two lateral sepals are called wings; they are generally large and petaloid (colored like petals). The upper sepal is usually the next largest; the two lower sepals are usually the smallest.

1. Fresh flowers orange, yellow, greenish-yellow, or greenish white (if greenish white, then the inflorescence a terminal many-branched cyme); [subgenus *Polygala*, series Decurrentes].
2. Inflorescence a dense pom-pom-like raceme, terminating leafy branches.
   3. Fresh flowers lemon-yellow or greenish yellow; subulate bracts of the inflorescence 2-4 mm long; plants 5-80 cm tall; lobes of lower petal (keel) 0.5-1.1 mm long.
   4. Racemes ca. 1.5 cm in diameter; flowers bright orange (rarely individual plants within a population with bright yellow flowers); plants 5-40 cm tall; [widespread] ..............................................................................................................................................................
   5. Fresh flowers cream-white to greenish-white; [of GA southward] ..............................................................................................................................................................
5. Fresh flowers bright yellow; [collectively widespread in the Coastal Plain of our area].
   6. Plants 4.5-12 dm tall, the stem solitary; basal leaves 3.5-14 cm long, linear-lanceolate, about 15-20× as long as wide, persistent as a basal rosette; stem leaves linear-subulate, sharp-tipped, much reduced from the basal leaves, becoming bractlike upward; seeds pubescent, 0.5-0.7 mm long ...............................................................
   7. Plants 1-4 dm tall, the stems 1-several from the base; basal leaves 3-7 cm long, spatulate, about 10× as long as wide, usually not persistent after flowering; stem leaves narrowly spatulate to linear, blunt-tipped, only slightly reduced from the basal leaves; seeds pubescent, 0.5-0.7 mm long...............................................................
11. Seeds hirsute; pedicels ⅓-⅓ as long as the fruit; raceme peduncles 0.5-4 cm long ...........

---

**Z. ambigua** Michx. 1803 (Milkwort)

- Leaves few, clustered near the tip of the stem; wings 13-20 mm long; stamens 6; [of moist soils of forests in the Mountains]; [subgenus *Chamaebuxus*] ..............................................................................................................................................................
- Leaves many, evenly distributed along the stem, or not at least strongly clustered near the tip; wings < 10 mm long; stamens 8; [collectively of a wide variety of habitats, but generally not as above, either in more open, drier, or non-montane habitats].
- Racemes 3-6 mm in length, pointed in outline.
- Racemes 2-5 cm long, becoming interrupted below through persistence of the fruits on the axis; wings equaling the fruit............
- Racemes 0.5-1.5 cm long, the fruits falling promptly, thus the inflorescence compact and truncate below; wings shorter than the fruit.
- Seeds finely pubescent; pedicels ⅗-⅗ as long as the fruit; raceme peduncles 0.5-4 cm long ..................
- Seeds hirsute; pedicels ⅗-⅗ as long as the fruit; raceme peduncles 2-7 cm long ..................
Polygala ambigua Nuttall, Loose Milkwort. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): fields, woodlands, openings; uncommon. June-September. ME west to MI, south to GA, AL, and OK. Through most of its range P. ambigua has wings 1.3-1.7 mm long; plants from se. VA south to SC and from the Ozarks have wings 2.0-2.6 mm long. These plants have been named as a variety of P. verticillata, var. dolichoptera Fernald. They may warrant taxonomic recognition, but need additional study, including resolution of our Coastal Plain plants and those of the Ozarks. [= C, G, K, S; = P. verticillata Linnaeus var. ambigua (Nuttall) Wood – RAB; > P. verticillata var. ambigua – F, WV; > P. verticillata var. dolichoptera Fernald – F, WV; < P. verticillata – W]

Polygala baldwinii Nuttall var. baldwinii, White Milkwort, Baldwin's Milkwort. Cp (FL, GA): wet pine savannas; uncommon (rare in GA). E. GA south to s. FL, west to s. MS; e. TX; Cuba; the Bahamas (Andros Island). Var. carteri (Small) R.R. Smith & D.B. Ward occurs in s. FL. [= GW; Z; < Polygala baldwinii – K, WH; = Pilostaxis baldwinii (Nuttall) Small – S, orthographic variant; = Pilostachya baldwinii (Nuttall) Small]

Polygala cruciata Linnaeus var. aquilonia Fernald & Schubert, Northern Drumheads. Cp (DE), Mt (NC, SC, VA, WV): bogs, damp or wet soil in openings; uncommon (rare in DE). June-October. ME west to MN, south to e. VA, w. NC, n. AL, and TN. [= F, K; < P. cruciata – RAB, C, G, GW, S, W, WV; = P. cruciata ssp. aquilonia (Fernald & Schubert) A. Haines – Y]

Polygala cymosa Walter, Tall Pinebarren Milkwort. Cp (DE, FL, GA, NC, SC): pond-cypress savannas, Coastal Plain depression ponds, clay-based Carolina bays, other sites with seasonally flooded hydrology; common (rare in DE). May-July. E. NC south to s. FL, west to s. MS; disjunct in s. DE. [= RAB, C, F, G, GW, K, WH, Z; = Pilostaxis cymosa (Walter) Small – S; = Pilostachya cymosa (Walter) Small]

Polygala grandiflora Walter var. grandiflora, Showy Milkwort. Cp (GA, NC, SC): sandhills, dry sandy soils of roadsides and fields; uncommon (NC Rare). May-July. S. NC south to s. FL, west to s. MS. [= K; < P. grandiflora – RAB, WH; > Asemeia grandiflora (Walter) Small – S; > Asemeia cumulicola Small – S; < Polygala violacea Aublet [investigate]]
Polygala hookeri Torrey & A. Gray, Hooker's Milkwort. Cp (FL, GA, NC, SC): pine savannas; rare (NC Rare). June-August. Sw. GA and adjacent Panhandle FL, west to s. MS, disjunct in se. NC and ne. SC. [= RAB, GW, K, S, WH]

*Polygala nana* (Michaux) A.P. de Candolle, Dwarf Milkwort, Candyroot. Cp (FL, GA, SC), Pd (GA, SC), Mt (GA, NC): longleaf pine flatwoods, other open moist areas; common (rare in NC and SC). E. GA south to s. FL, west to e. TX, with scattered populations inland to n. SC, w. NC, nw. GA, n. AL, c. TN (Chester, Wofford, & Kral 1997), and ne. MS. This species is primarily a Coastal plain species of the deeper south; *P. nana* may be introduced in parts of our area. [= RAB, GW, K, WH; = Pilostachya nana (Michaux) Rafinesque; = Pilostachya nana (Michaux) Rafinesque]

*Polygala nuttallii* Torrey & A. Gray, Nuttall's Milkwort. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, VA), Mt (VA): pocosins, pine savannas, also in depression ponds (in Augusta and Rockingham counties, VA); common (uncommon in GA, NC, SC, and VA, rare in Mountains, rare in FL). In June-August. MA south to ne. FL and e. Panhandle FL; disjunct inland in w. VA, c. TN (Chester, Wofford, & Kral 1997), sc. KY, and allegedly c. AR. [= RAB, C, F, G, GW, K, W, WH]

*Polygala polyantha* Walter var. obtussata Chodat, Northern Bitter Milkwort. Mt (VA, WV), Pd (VA): woodlands and woodland borders; uncommon. May-July, June-July. ME west to MI and MN, south to n. WA, OH, c. IN, c. IL, and IA. [= C, F, G, WV; < P. polyantha – RAB, K, S, WH]

*Polygala ramosa* Elliott, Short Pinebarren Milkwort, Low Pinebarren Milkwort. Cp (FL, GA, NC, SC, VA), Mt (NC): wet savannas, pocosin margins, bogs; common (rare in DE and VA). June-September. S. NJ south to s. peninsular FL, west to e. TX, disjunct inland (as in Henderson County, NC). [= RAB, C, F, G, GW, K, WH, Z; = Pilostachya ramosa (Elliott) Small – S; = Pilostachya ramosa (Elliott) Small]

*Polygala senega* Linnaeus var. latifolia Torrey & A. Gray, Seneca Snakeroot. Mt (VA, WV), Pd (DE), Mt (GA, NC, SC), Pd (NC, SC, VA): woodlands, openings, especially over calcareous or mafic rocks; uncommon (rare in NC and WV)). May-June. DE, PA, and MN, south to NC, TN, and MO. Truth-Nare & Nacci (1998) studied the two varieties of *P. senega* and concluded that the taxa should be recognized at the specific level. The relative distributions, habitats, and phenology of the two taxa need assessment for our area. [= F, G, WV; < P. senega – RAB, C, K, S, WH]

*Polygala senega* Linnaeus var. senega Linnaeus, Seneca Snakeroot. Mt (WV), Mt (GA, NC, SC, VA), Pd (NC, SC, VA): woodlands and openings, especially over calcareous or mafic rocks; uncommon (rare in NC). April-May. QC west to AB, south to n. GA, TN, AR, and SD. The relative distributions, habitats, and phenology of the two taxa need assessment for our area. [= F, G, WV; < P. senega – RAB, C, K, S, WH]

*Polygala verticillata* Linnaeus var. isocycla Fernald, Whorled Milkwort. Cp (FL), Mt (WV), Mt (Pd, Cp (DE, GA, NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. June-September. The validity and relative distributions, habitats, phenology of the two varieties need additional assessment in the herbarium and the field.) VT west to MB, south to Panhandle FL (Kunzer et al. 2009), s. FL, and TX. [= C, F, G, K, WH, WV; < P. verticillata var. verticillata – RAB; = P. verticillata – S, apparently misapplied; < P. verticillata – W]

*Polygala verticillata* Linnaeus var. verticillata, Whorled Milkwort. Mt (WV), Mt (Pd, Cp (DE, GA, NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. June-September. The validity and relative distributions, habitats, phenology of the two varieties need additional assessment in the herbarium and the field.) ME west to MI, south to w. VA, w. NC, and TN. [= C, F, G, K, WV; < P. verticillata var. verticillata – RAB; = P. pretzii Pennell – S; < P. verticillata – W]

**POLYGALACEAE**

*Polygala crenata* C.W. James. Cp (FL, GA): wet pine flatwoods, bogs, bayheads; uncommon (rare in GA). FL Panhandle and AL west to TX; reported for GA (Sorrie, pers. comm.). [= GW, K, WH] [not yet keyed; synonymy incomplete]

*Polygala leptocaulis* Torrey & A. Gray, Swamp Milkwort. Cp (FL): bogs and pond margins; rare. Ne. and Panhandle FL west to e. TX; Mexico, Central America, and South America; Cuba. [= GW, S, WH; = P. tenella Willdenow]

*Polygala leptostachys* Shuttleworth ex A. Gray, Georgia Milkwort. Cp (FL, GA): sandhills; rare (GA Special Concern). Ne. FL south to c. peninsular FL, west to sw. GA (Jones & Coile 1988), s. AL (Sorrie & LeBlond 2008), s. MS (Sorrie & Leonard 1999). [= K, S, WH] [not yet keyed; synonymy incomplete]

*Polygala setacea* Michaux, Coastal Plain Milkwort. Cp (FL, GA): pine flatwoods and bogs; uncommon. E. GA and Panhandle FL south to s. FL. Reported by Small (1933) as occurring north to NC and west to s. MS (apparently an error). [= GW, K, S, WH] [not yet keyed; synonymy incomplete]

**147. ROSACEAE** A.L. de Jussieu 1789 (Rose Family) [in ROSALES]

A family of about 85-95 genera and 2000-3000 species, trees, shrubs, and herbs, nearly cosmopolitan, but mainly boreal and temperate. References: Potter et al. (2007); Eriksson et al. (2003); Kalkman in Kubitzki (2004); Erter (2007).

Subfamily Rosoideae

_Filipendula_

_Supertribe Rosoideae_

_Rosa_

_Rubus_

_Tribe Sanguisorbeae: Agrimonia, Poterium, Poteridium, Sanguisorba_

_Tribe Potentilleae: Potentilla, Alchemilla, Aphanes, Dasiphora, Drymocallis, Fragaria, Sibbaldia_

_Tribe Coluria: Geum_

Subfamily Spiraeoideae

_Tribe Amygdaleae: Prunus_

_Tribe Neilliae: Neillia, Physocarpus_

_Tribe Spiraeae: Aruncus, Spiraea_

_Supertribe Kerriodae_

_Tribe Kerrieae: Kerria, Neviusia, Rhodotypos_

_Supertribe Pyrodae_

_Gillenia_

_Tribe Pyreae: Amelanchier, Aronia, Chaenomeles, Cotoneaster, Crataegus, Cydonia, Eriobotrya, Malus, Photinia, Pyracantha, Pyrus, Raphiolepis, Sorbus_

1 Herbs or subshrubs (if woody at base, then < 3 dm tall).
2 Leaves simple........................................................................................................ Key A
3 Leaves compound (at least the lower and better developed) ................................. Key B
1 Trees, shrubs, or woody vines (with arching "canes" or climbing, arching, or scrambling stems).
2 Leaves simple.......................................................... Key C
3 Leaves compound .......................................................... Key D

**Key A – Herbs and subshrubs with simple leaves**

1 Leaves crenate, unlobed; inflorescence of a solitary flower; [tribe Rubeae] ................................................................. **R. dalibarda**
2 Leaves 3-many lobed; inflorescences cymose.
3 Leaf blades 0.3-1.0 cm long and wide, deeply 3-lobed, each lobe further lobed or deeply toothed; petals 0; [tribe Potentilleae]........... **Aphanes**
4 Leaf blades 3-8 cm long and wide, 3-lobed, each lobe toothed; petals 5; [tribe Colurieae] ................................................. **Geum lobatum**

**Key B – Herbs and subshrubs with compound leaves**

1 Leaves 2- to 3-ternately compound; [tribe Spiraeae] ................................................................................................. **Aruncus**
2 Principal leaves, either simply pinnately compound or simply palmately compound, with (5-) 7-many leaflets (stem leaves sometimes 3-foliolate, especially in _Geum_).
3 Principal leaves with leaflets of markedly disparate shape and size (large leaflets alternating with much smaller leaflets, or a large terminal leaflet and much smaller lateral leaflets).
4 Lateral leaflets alternating between small and large, the terminal leaflet similar in size and shape to the larger lateral leaflets; terminal leaflet < 3 cm wide; hypanthium either conical or turbinate, armed with hooked bristles, the pistils 2, or hemispheric, the pistils > 5.
5 Leaves glabrous or sparsely pubescent beneath; flowers many in racemes; hypanthium conical or turbinate, armed with hooked bristles, the pistils 2; [tribe Sanguisorbeae] ....................................................... **Agrimonia**
6 Leaves silvery sericeous beneath; flowers solitary and axillary; hypanthium hemispheric, the pistils > 5; [tribe Potentilleae]............. **Potentilla anserina**
7 Leaflets variable in size and shape, usually the terminal leaflet much larger than any of the lateral leaflets; terminal leaflet 3-20 cm wide; hypanthium either saucer-shaped or hemispheric to conical; pistils 5 or more.
8 Pistils 5-15, in a circle on a saucer-shaped hypanthium, ripening into upright fruits that resemble follicles but are indehiscent; corolla white or pink; plant 10-20 dm tall; [tribe Ulmarieae] .............................................................................. **F. ulmaria**
9 Pistils many, densely covering the hemispheric to conical hypanthium, ripening into achenes terminated by the persistent style; corolla white, cream, pale yellow, bright yellow, lavender, maroon, or purple; plant 2-10 dm tall; [tribe Colurieae] ............... **Geum**
1 Ovary superior; fruit dehiscent (aggregate of follicles, or capsule) or indehiscent (drupe, or aggregate of drupelets).  
7 Foliage and stems viscid-pubescent with brownish hairs; inflorescence a cyme; petals 5, cream-colored; [tribe Potentilleae] ................................................................. Drymocallis
8 Leaves pinnatifid (each leaflet incised nearly to the midvein); stamens 2 or 4 per flower ................................................ Pterocarya
8 Leaves entire, except for 3 (-5) teeth at the apex; [Mountains]; [tribe Potentilleae] ................................................................. Potentilla
11 Principal leaves 5-7 (-9)-foliolate; [tribe Potentilleae] .............................................................................................................. Potentilla indica
2 Principal (basal-most) leaves palmately compound, with 3-7 (-9) leaflets.  
10 Principal leaves subsessile, 3-foliolate; fruit of follicles; leaves cauline; [tribe Gilleneae] ................................................................. Gillene
10 Principal leaves distinctly petiolate, the petiole often longer than the leaflets, 3-7 (-9)-foliolate; fruit of achenes; leaves basal and cauline.
11 Principal leaves 3-foliolate.  
12 Plants in flower.
13 Petals yellow.
14 Pistils 2-6; [tribe Colurieae] ................................................................................................................................................. Colurie
14 Pistils (10-) numerous; [tribe Potentilleae] ................................................................................................................................. Potentilla
13 Petals white (or slightly pinkish).
15 Calyx lobes not subtended by bractlets; [tribe Rubieae] .............................................................................................................. Rubus pubescens
15 Calyx lobes subtended by 5 sepaloid bracts; [tribe Potentilleae].
16 Leaves evenly serrate with many serrations; [widespread].
16 Leaves with 3 (-5) teeth at the apex, otherwise entire; [Mountains] .................................................................................. Sibbaldia
12 Plants in fruit (or sterile).
17 Leaves entire, except for 3 (-5) teeth at the apex; [Mountains]; [tribe Potentilleae] ................................................................. Sibbaldia
17 Leaves evenly serrate or crenate, each well-developed leaflet with 7 teeth.
18 Calyx lobes not subtended by bractlets.
19 Fruit an aggregate of dry, non-adherent achenes; leaflets obtuse at apex; [tribe Colurieae] ..................................................... Geum
19 Fruit an aggregate of fleshy, adherent drupelets; leaflets acuminate at apex; [tribe Rubieae].
18 Calyx lobes subtended by 5 sepaloid bracts; [tribe Potentilleae].
20 Fruit an aggregate of dry achenes........................................................................................................................................ Potentilla
20 Fruit an accessory fruit of achenes borne on the surface of a fleshy, red receptacle.
21 Fresh fruit reddish inside; leaflets serrate, 2.5-12 cm long; sepaloid bracts narrowing to apex, untoothed .......... Fragaria
21 Fresh fruit whitish inside; leaflets crenate, 2-4 cm long; sepaloid bracts widest at apex, 3-5-toothed .... Potentilla indica

Key C – Shrubs and trees with simple leaves

1 Ovary superior; fruit indehiscent (aggregate of follicles, or capsule) or indescent (drupe, or aggregate of drupelets).
2 Leaves opposite; [tribe Kerrieae] ................................................................................................................................................. Kerria
2 Leaves alternate.
3 Corolla yellow; stems arching, green; [tribe Kerrieae] .............................................................................................................. Kerria
3 Corolla white to pink or rose; stems not arching and green.
4 Leaves large, > 10 cm wide, palmately lobed; fruit an aggregate of drupelets; [tribe Rubieae].
4 Leaves smaller, < 7 cm wide, not lobed, or pinnately lobed; fruit a drupe, a capsule, or an aggregate of follicles.

{Exochorda, Neillia, Neviusia, Physocarpus, Prunus, Rhodotypos, Spiraea]

1 Ovary inferior; fruit indescent (pome); [tribe Pyraeae].  
9
9

{Amelanchier, Aronia, Chamaemelum, Crataegus, Cydonia, Erionotrya, Malus, Photinia, Pyracantha, Pyrus, [Rhaphiolepis]}

Key D – Shrubs and trees with compound leaves

1 Leaflets < 5 mm wide, entire; densely-branched shrub to 1 m tall; flowers yellow; [tribe Potentilleae] ......................................................... Dasiphora
1 Leaflets > 10 mm wide, serrate or crenate; shrubs, trees, or woody vines (see below); flowers white, pink, or purplish (rarely yellow in Rosa).
2 Leaves pinnately compound, generally with > 11 leaflets; inflorescence a terminal panicle or corymb with numerous (> 100) flowers, the petals white and < 4 mm long; fruit a pome or follicle; upright tree or shrub with unarmed stems.
3 Inflorescence an panicle; fruit a follicle; shrub, to 2 m tall; [tribe Sorbarieae] ...................................................................................... Sorbaria
3 Inflorescence a corymb; fruit a pome; tree, generally > 2 m tall; [tribe Pyraeae] ...................................................................................... Sorbus
2 Leaves palmately or 1-pinnately compound, generally with < 11 leaflets; inflorescences axillary or terminal panicles or corymb with few (<15) flowers, the petals white, pink, or purplish (rarely yellow) and > 6 mm long; fruit a hip or aggregate of drupelets; arching or upright shrubs or climbing or sprawling woody vines, the stems usually armed with prickles.
4 Fruit a hip, developing from a globose to urceolate hypanthium, enclosing the ovaries and achenes, except for the apical orifice; leaflets usually acute to obtuse at the apex; leaflet margins crenulate or serrulate; [tribe Rosae] ............................................ Rosa
4 Fruit an aggregate of druplets, developing from a flatish or hemispheric hypanthium, with the ovaries and druplets exposed; leaflets usually acuminated at the apex; leaflet margins serrate or doubly serrate; [tribe Rubeae].................................................**Rubus**

*Agrimonia* Linnaeus 1753 (Agrimony)

1 Stem and inflorescence axis lacking sessile or short-stalked glistening glands (but with spreading or ascending non-glandular hairs).

2 Stipules deeply incised, half-ovate; hirsute hairs of the stem 3 mm or longer; 0-1 pair minor leaflets between major; mature fruiting hypanthium as broad as long or broader; hypanthium ridges rarely with eglandular hairs.........................**A. microcarpa**

3 Glistening glands of the stem and inflorescence axis only sessile.

4 Lower inflorescence rachis with mostly erect hirsute eglandular hairs ca. 2 mm long; minor leaflets rarely only one pair between all major leaflet pairs; roots merely fibrous..............................................**A. gryposepala**

5 Mid-cauline leaf with 5-7 major leaflets; stipule proximally incised or nearly entire .................................................................**A. striata**

6 Major leaflets obovate to elliptic, apex obtuse to acute; flowers mostly alternate along inflorescence axis; [Coastal Plain pinelands; c. SC south to c. peninsular FL and west to e. TX].........................................................**A. incisa**

**Agrimonia gryposepala** Wallroth, Common Agrimony. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE): mesic forests, thickets, marshes, bogs, wet meadows, wet forests; common (uncommon in DE and WV, rare in GA). July-August; July-October. ME and ON west to MT, south to NJ, w. NC, e. TN, IN, and KS; also in CA and NM. [= RAB, C, F, FNAG, K, S, W, Y, Z]

**Agrimonia incisa** Torrey & A. Gray, Pineland Agrimony. Cp (FL, GA, NC?, SC): pinelands, disturbed areas associated with pinelands; rare. July-early September. E. SC south to c. peninsular FL and west to e. TX (also reported from NC, but no specimen has been seen). [= RAB, C, FNA, K, S, WH, Y, Z]

**Agrimonia microcarpa** Wallroth, Low Agrimony. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC, VA, WV): dry to moist forests; petioles usually at least 10 mm; [bottomlands, marshes; CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico]..........................................................**A. platycarpa** Wallroth – S

**Agrimonia parviflora** Aiton, Southern Agrimony. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): marshes, bottomland forests, wet pastures; common (rare in DE Coastal Plain). July-September; July-October. CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico. [= RAB, C, FNA, G, K, S, W, Y, Z]

*Amelanchier Medikus 1789

(Serviceberry, Sarvis, Shadbush, Juneberry, "May Cherry", "Currant")

1 Inflorescences 1-3 (-4)-flowered; leaves imbricate in bud, bases cuneate; petioles 2-10 (-15) mm; [WV northward] ..................**A. bartramiana**

2 Inflorescences usually 4-many-flowered; leaves conduplicate in bud, bases truncate or rounded to cordate (rarely cuneate); petioles usually at least 10 mm; [collectively widespread].
2 Margins of mature leaves with 2-6 teeth per cm; lateral leaf veins or their forks usually extending into teeth (as readily visible without magnification); ovary summit densely lanuginose. 
3 Petals 6-10 mm; hypanthium campanulate .......................................................... A. humilis
3 Petals 11-18 mm; hypanthium saucer-shaped ...................................................... A. sanguinea
2 Margins of mature leaves with 4-6 (-10) teeth per cm; lateral leaf veins mostly becoming indistinct near margin and not entering teeth; ovary summit glabrous, sparsely pubescent, or densely lanuginose.
4 Ovary summit densely lanuginose; expanding leaves densely tomentose below.
5 Petals 2.6-5.8 mm long, 1-3 mm wide, sometimes andropetalous; plants cespite; primary stems tending to be stiffly erect ................. A. nantucketensis
5 Petals 2.6-10 mm long, 2.5-4 (-5) mm wide, not andropetalous; plants rhizomatous and in loosely scattered colonies; stems straggling-ascending................................. A. spicata
4 Ovary summit glabrous or sparsely pubescent; expanding leaves glabrous to densely tomentose below.
6 Plants rhizomatous, shrubs 0.2-2.5 m tall; petals 2.6-7.7 mm long.
7 Petals 2.6-5.8 mm long, 1-3 mm wide, sometimes andropetalous; leaves elliptic to oblanceolate or oblong-elliptic; sepals ± recurving. .......................................................... A. nantucketensis
7 Petals 5.9-7.7 mm long, 2.6-3.6 mm wide, rarely andropetalous and much narrower than sterile stamens; leaves elliptic or oval to oblong or often obovate; sepals spreading; petals 10-20 mm long. ...................................................... A. obovata
6 Plants not rhizomatous, shrubs to 8 m tall or trees to 20 m tall; petals (6-) 8-20 mm long.
8 Inflorescences erect; petals 6-12 mm.
9 Young leaves at flowering half-expanded and unfolded, green, abaxially densely tomentose; proximal flowering pedicels 0.5-2 cm long; sepals erect or loosely spreading .............................................. A. canadensis
9 Young leaves at flowering half-expanded or more and unfolding, often reddish, and sparsely pubescent or glabresecent abaxially; proximal flowering pedicels 1-1.5 cm long; sepals ascending to recurving .............................................. A. intermedia
8 Inflorescences drooping; petals 10-20 mm long.
10 Young leaves at flowering folded, green or brownish, and densely tomentose below; proximal flowering pedicels 0.8-1.7 cm long; pomes maroon-purple, insipid. ......................................................................................... A. arborea
10 Young leaves at flowering unfolding, reddish, and glabrous (or nearly so) below; proximal flowering pedicels 1.5-3 cm long; pomes blackish purple, sweet. ......................................................................................... A. laevis

Amelanchier bartramiana (Tausch) M.J. Roemer, Oblong-fruited Serviceberry. Mt (WV): (habitat); rare. May-August; July-September. NL (Labrador) west to MN, south to PA, WV, WI, and MI. [= C, F, FNA, G, K]

Amelanchier humilis Wiegand. Mt (WV): rocky, calcareous areas; rare. QC west to ND, south to montane MD, WV, WI, and ML. [= FNA, K; < A. sanguinea var. sanguinea – C, G; > A. humilis var. humilis – F]

Amelanchier intermedia Spach. Mt (NC), {VA}: moist to wet areas; rare. May-June; June-August. NL (Newfoundland) west to MN, south to VA, w. NC, and ML. [= F, FNA, < A. canadensis (Linnaeus) Medikus – C, G; = A. ×intermedia – K]

Amelanchier laevis Wiegand, Smooth Serviceberry. Mt (GA, MD, NC, SC, TN, VA, WV), Pd (DE, NC, VA), C (DE, MD, VA), Ip (AL, KY, TN): forests, balds; common (uncommon in DE, rare in Coastal Plain of VA, rare in Piedmont of NC). April-May; June-July. NS west to MN, south to VA, w. NC, w. SC, AL, w. TN, and IA. [= C, FNA, G, K, W, S, Z; > A. arborea var. laevis – RAB; > A. laevis var. laevis – F]

Amelanchier sanguinea (Pursh) A.P. de Candolle, Roundleaf Serviceberry, New England Serviceberry. Mt (GA, NC, VA, WV), Pd (VA), C (VA): (VA); rare in w. NC and NC Mountains, rare in VA Piedmont, rare in VA Coastal Plain. April-May; May-June. ME west to MN, south to w. NC, TN, n. AL, and IA. [= RAB, F, FNA, S, W, Z; = A. sanguinea var. sanguinea – C, G, K]

Amelanchier spicata (Lamarck) K. Koch, Dwarf Serviceberry. C (NC, SC, VA), Pd (NC, VA), Mt (VA, WV), {GA}; dry, acidic, rocky sites; uncommon. March-April; May-June. NL (Newfoundland) west to ND, south to w. NC, w. SC, GA, AL, WI, and MI. [= RAB, C, FNA, G; = A. stolonifera Wiegand – F, K, S, W, Z]

Aphanes Linnaeus 1753 (Parsley-piert)

A genus of about 20 species, herbs, of tropical and temperate Old World. Aphanes has usually been accepted by Europeans as distinct from Alchemilla, but Kalkman (in Kubitzki 2004) retains it (with some doubt) in Alchemilla, as a subgenus and Eriksson
et al. (2003) and Gehrke et al. (2008) include it in *Alchemilla* based on molecular evidence. *Aphanes* appears to be monophyletic and is morphologically distinctive; Gehrke et al. (2008) prefer a broad circumscription of *Alchemilla* to naming an additional monophyletic clade of African species as a separate genus. References: McNeill & Erter in FNA (in press); Robertson (1974)=Z; Kalkman in Kubitzki (2004); Eriksson et al. (2003).

1 Fruiting hypanthium > 2 mm long; leaf blades 7-10 mm long and wide................................................................. *A. arvensis*
1 Fruiting hypanthium < 2 mm long; leaf blades 3-5 mm long and wide................................................................. *A. australis*

**Aphanes arvensis** Linnaeus. Cp (DE) disturbed areas; rare, native of Europe. April-June. Also reported for SC and TN by Kartesz (1999), but the only documentation consists of generalized range maps published in Hultén & Fries (1986); rejected as a component of those state’s flora without additional documentation. [= C, FNA, K; = *Alchemilla arvensis* (Linnaeus) Scopoli – F, G]

**Aphanes australis** Rydberg, Parsley-piert. Pd (GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA), Mt (NC, SC, VA, WV); lawns, fields, pastures, roadsides; common (uncommon in Piedmont of VA and Mountains of NC and VA, rare in DE, FL, and WV), native of Europe. Late March-May. This plant is inconspicuous and often overlooked. [= FNA, S; = *Aphanes microcarpa* (Boissier & Reuter) Rothmaler – C, K, WH, ms; misapplied; = *Alchemilla microcarpa* Boissier & Reuter – RAB, F, G, W, Z, misapplied; = *Aphanes inexpectatus* W. Lippert]

*Aronia* Medikus 1789 (Chokeberry)

A genus of 3 species, of e. North America (south into Central America). *Aronia* has sometimes been treated as a component of *Sorbus* or *Prunus*. More recently, Robertson et al. (1991) have included *Aronia* in *Photinia*. Kalkman in Kubitzki (2004) agrees that *Aronia* and *Photinia* should be combined, but points out that *Aronia* is the older name and therefore must be used for the combined genus. Guo et al. (2011) separate *Photinia, Aronia*, and *Paurthieae*. References: Guo et al. (2011)=V; Pankhurst in FNA (in press); Hardin (1973)=Y; Robertson (1974)=Z; Robertson 1991=X; Kalkman in Kubitzki (2004).

**Identification notes:** All our species of *Aronia* can be distinguished from other shrubs in our flora by the presence of several dark (usually purplish-black) trichomes on the upper surface of the midrib, mostly toward the base of the leaf.

1 Lower surfaces of leaves, twigs, and inflorescence rachis glabrous; fruit black ................................................................................................. *A. melanocarpa*
1 Lower surfaces of leaves, twigs, and inflorescence rachis pubescent; fruit bright red or dark purple.

2 Fruit dark purple; leaves sparsely pubescent beneath ........................................................................................................ *A. arbutifolia*
2 Fruit bright red; leaves densely pubescent beneath ........................................................................................................ *A. prunifolia*

**Aronia arbutifolia** (Linnaeus) Persoon, Red Chokeberry. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA): bogs, pocosins, wet savannas, swamps, other wet habitats; common. March-May; September-November. NL (Newfoundland) south to c. peninsular FL and west to TX, mainly in the Coastal Plain, but extending inland in the south to WV and KY. [= C, FNA, G, GW, S, V, W; = *Sorbus arbutifolia* (Linnaeus) Heynhold var. arbutifolia – RAB; = *Pyrus arbutifolia* (Linnaeus) Linnaeus f. – F, Z; = *Photinia pyrifolia* (Lamarck) K. Robertson & J.B. Phipps – K, WH, WV, X]

**Aronia prunifolia** (Marshall) Rehder, Purple Chokeberry. Pd (DE?, NC, VA), Mt (NC, VA, WV), Cps (DE?, VA): balds, bogs, seepages, swamp forests; uncommon, rare south of VA (NC Watch List). April-May; September-October. Widespread but local in ne. North America, south to NC, FL?, and OH. While apparently originating as a hybrid between our other two species, *A. prunifolia* exists in populations independent of the two parent species, apparently reproducing successfully. It seems best to treat a now independent lineage such as this as a separate taxon. [= C, G, GW, V; = *Sorbus atropurpurea* var. atropurpurea (Britton) Schneider – RAB; = *Aronia floribunda* (Marshall) Rehder – FNA; = *Pyrus floribunda* Lindley – F, WV, Z; = *Aronia atropurpurea* Britton – S; < *A. melanocarpa* – W; = *Photinia floribunda* (Lindley) J.B. Phipps – K, X]

*Aruncus* Linnaeus 1758 (Goat’s-beard)

**Identification notes:** *Aruncus dioicus* can be distinguished from the superficially closely similar *Astilbe biternata* by the following characteristics: trichomes of foliage not glandular (vs. glandular in *Astilbe*), stamens 20 (vs. 10), carpels 3-4 (vs. 2), seeds < 1.5-2 mm long (vs. ca. 4 mm long), terminal leaflets usually unlobed (vs. terminal leaflets usually trilobed).

1 Follicles 2.5-3.5 mm long .......................................................................................................................... *A. sylvester*
1 Follicles 1.5-2.0 mm long.

2 Follicles semi-ovoid, strongly convex on the back, about 1/2 as thick (measured radially) as long; leaves somewhat lustrous, the lower surface glabrous to sparsely pubescent................................................................. *A. dioicus var. dioicus*
2 Follicles nearly cylindric, about 1/3 as thick (measured radially) as long; leaves dull, the lower surface pubescent.

**Aruncus dioicus** (Walter) Fernald var. *pubescens* (Rydberg) Fernald, Midwestern Goat's-beard. Mt (WV): moist, nutrient-rich forests and woodland borders?; rare. May-June; June-September. W. VA, KY, and IL west to IA, south to TN, AR, and OK. The validity of this variety and its attribution to our area (by G, K, and S) need further evaluation. Robertson (1974) states that the "two varieties intergrade completely, and it is questionable whether they should be maintained." [= C, F, FNA, K, Z; < *A. dioicus* – W; = *A. pubescens* Rydberg – S]

* Aruncus sylvester Kosteletzky ex Maximowicz is attributed to our area by Small (1933). This European species is occasionally cultivated in e. North America. [= C, G; = *A. dioicus* var. *vulgaris* (Maximowicz) Hara – FNA, K; = *A. aruncus* (Linnaeus) Karsten – S]

**Crataegus** Lindley 1821 (Flowering Quince)

* *Chaenomeles speciosa* (Sweet) Nakai, Flowering Quince. Pd (NC), Cp (VA), Mt (WV): frequently persisting and rarely spreading from horticultural plantings to suburban woodlands; rare, native of China. January-April. The "fruiting" or Common Quince, *Cydonia oblonga* P. Miller, native of the Caucasus, is widely cultivated in Europe and formerly in e. North America. It has fallen out of favor, and is now rarely cultivated in our area. [= C, FNA, K]

**Crataegus** Linnaeus 1753 (Hawthorn, Haw, Thornapple)

(Contributed by R. Lance)

**Identification notes:** SUBSTANTIAL CHANGES TO THIS TREATMENT ARE PENDING. All references to leaves and petioles pertain to foliage on short shoots (floral shoots), unless otherwise specified.

1 Leaf bases cordate, truncate, rounded, or very abruptly contracted from a rounded base .................................................... Key A
2 Leaf base acute to cuneate.
3 Leaves eglandular, or if glandular then twigs relatively straight, not conspicuously geniculate ........................................ Key B
4 Leaves conspicuously glandular on petiole and teeth, especially when young; twigs and branchlets geniculate .......................... Key C

**Key A – hawthorns with leaf bases cordate, truncate, rounded, or very abruptly contracted from a rounded base**

1 Primary lateral veins of lobed leaves run to sinuses of lobes, as well as to points of lobes.
2 Leaves thin, dull, hairy at least on petiole, deeply laciniate; fruit oblong ................................................................. *C. marshallii*
3 Leaves subcoriaceous, glossy, glabrous, often 3-lobed; fruit globose ........................................................................... *C. phaenopyrum*

**Key B – hawthorns with leaf bases subcordate**

1 Leaves and petioles longer, glandular or not, but twigs not geniculate.
2 Leaf blades on terminal shoots often > 9 cm long.
3 Petiole eglandular, pubescent or tomentose; leaf veins distinct on adaxial surface, slightly sunken ................................... *C. mollis*
4 Leaf blades longer than wide; calyx lobes evenly serrate .................................................................................. *C. coccinea*
5 Leaf blades often as wide as long; calyx lobes deeply and irregularly serrate ............................................................... *C. dilatata*
6 Petiole glandular, sparsely hairy or glabrous; leaf veins not as conspicuous ......................................................... *C. lepida*
7 Petiole eglandular, pubescent or tomentose; leaf veins distinct on adaxial surface, slightly sunken ................................... *C. mollis*
8 Lobe tips acute or obtuse, not reflexed; young leaves hairy or glabrous; leaves firm.
9 Fruit calyx sessile; leaves may bear hairs when young; stamens usually 10 ............................................................... *C. iracunda*
10 Fruit calyx elevated; leaves glabrous; stamens usually 20 .............................................................................. *C. pruinosa*
11 Lobe tips acuminate, often reflexed; young leaves searate adaxially; leaves thin.
12 Stamens 5 to 10 .......................................................................................................................................................... *C. macrosperma*
13 Stamens 15 to 20 ....................................................................................................................................................... *C. schuettei*
1 Leaves mostly widely elliptic or broadly obovate, base acute to short-cuneate.

2 Leaves sharply-toothed and shallowly lobed.

3 Leaves sparsely hairy to glabrous ................................................................. C. alleghaniensis

4 Leaves with short, blunt teeth, mostly unlobed.

5 Leaves > 2 cm long; twigs very slender; thorns mostly < 2 cm ................................................................. C. lepida

6 Fruit yellow ................................................................................................................................................. C. flavia

7 Fruit red.

8 Branches mostly ascending and crooked ........................................................................................................... C. visienda

9 Branches recurved or drooping ........................................................................................................................... C. visienda

Key B – hawthorns with acute to cuneate leaf bases; leaves conspicuously glandular on petiole and teeth; and twigs and branchlets geniculate

1 Leaves mostly ovate or broadly elliptic.

2 Leaves not as above, or pyrenes > 4 mm long.

3 Leaves thin, dull yellow-green, usually pubescent at least abaxially; pedicels tomentose ........................................ C. aprica

4 Leaves > 3 cm long; calyx lobes foliaceous, deeply toothed; spines slender ............................................................ C. anisophylla

5 Fruit small, usually < 8 mm, calyx elevated ........................................................................................................... C. senta

6 Fruit yellow-green; hairs scattered along veins of abaxial side, esp. when young; fruit 10-15 mm diameter........... C. aemula

7 Fruit firm, glossy or bright green, with hair tufts in abaxial main vein axils; fruit usually < 10 mm diameter. ...... C. viridis

8 Leaves toothed along most of margin.

9 Leaves obscurely toothed to entire on margin, especially lower half of blade .............................................................................................................................. C. viridis

10 Leaves not widely obovate; lobes acute or lacking; calyx lobes elongate.

11 Leaves mostly ovate or broadly elliptic.

Key C – Leaves eglandular, or if glandular then twigs relatively straight, not conspicuously geniculate

1 Leaves spatulate or oblanceolate, < 13 mm wide; petiole winged to base; pyrenes < 4 mm long ........................ C. spatulata

2 Leaves not as above, or pyrenes > 4 mm long.

3 Inflorescence simple, 1 to 5-flowered; fruit > 1 cm diameter, mature in late spring ................................. C. aestivalis

4 Inflorescence compound, 5 to 20-flowered; fruit usually < 1 cm, mature in autumn. ................................. C. aestivalis

5 Petiole and leaf undersides pubescent to tomentose ........................................................................................... C. aestivalis

6 Leaves thin, dull yellow-green, usually pubescent at least abaxially; pedicels tomentose ........................................ C. aprica

7 Leaves mostly < 3 cm long; calyx lobes foliaceous, deeply toothed; spines slender ............................................................ C. anisophylla

8 Leaves commonly > 3 cm long and with not above combination of characters.

9 Leaves mostly obovate, with rounded lobes and blunt teeth; calyx lobes broadly triangular .......................... C. margarettae

10 Leaves not widely obovate; lobes acute or lacking; calyx lobes elongate.

11 Leaves mostly ovate or broadly elliptic.

12 Petiole and leaf undersides glabrous or sparsely hairy ............................................................................. C. aprica

13 Petiole and leaf undersides pubescent to tomentose .................................................................................. C. mollis

14 Petioles eglandular.

15 Leaves not widely obovate; lobes acute or lacking; calyx lobes elongate.

16 Leaves mostly ovate or broadly elliptic.
13 Leaf veins impressed axially, prominent abaxially; leaves dull green.
14 Leaves pubescent abaxially; branches dark gray; fruit usually <12 mm; calyx and fruit stem hairy.................C. collina
14 Leaves sparsely hairy to glabrous abaxially after maturity; branches ashy gray; fruit 12-22 mm; calyx and fruit stem glabrous................................................................................................................C. punctata
15 Leaf veins obscure; leaves lustrous.
15 Leaves, petioles, pedicels hairy.................................................................C. berberifolia
15 Leaves, petioles, pedicels glabrous.............................................................C. crus-galli
9 Petioles glandular (3 or more glands visible).
16 Leaves distinctly hairy or pubescent abaxially.
17 Leaves lobed 1/3-2/3 to midrib on terminal shoots; fruit calyx elevated ............................................................C. intricata
17 Leaves shallowly lobed to unlobed on terminal shoots; fruit calyx sessile.
18 Leaves thin; inflorescence simple, 3 to 5-flowered; stamens usually 30 or more..................C. triflora
18 Leaves firm; inflorescence compound, > 5-flowered; stamens 20 or fewer.
19 Leaves shallowly lobed on terminal shoots, usually > 5 cm wide.................................C. harbisonii
19 Leaves unlobed, most < 5 cm wide.
20 Leaf veins slightly impressed axially; fruit calyx deeply glandular-serrate; petiole conspicuously glandular......
20 Leaf veins distinctly impressed axially; fruit calyx remotely serrate to entire; petiole sparsely glandular........
..........................................................................................................................................................C. ashei
21 Stamens 5-10.............................................................................C. intricata
21 Stamens 15-20.
22 Leaves shallowly lobed on terminal shoots (1/4-1/3 to midrib), usually unlobed on floreal shoots..............C. mendoza
22 Leaves shallowly to moderately lobed on all shoots.
23 Leaves mostly ovate-lanceolate.................................................................C. sargentii
23 Leaves ovate or widely ovate.
24 Twigs short; petiole often winged 1/2 its length; fruit often 10 mm or more in diameter..................C. pallas
24 Twigs elongate; petiole winged 1/3 or less of length; fruit usually <10 mm in diameter............C. pulcherrima

Crataegus aemula Beadle, Rome Hawthorn. Cp, Pd (GA, SC): upland hardwood and pine-hardwood forests, over sandstone, calcareous rock or circumneutral clay soils; uncommon (but may be locally abundant). April, September. Nw. GA and ne. AL. principally, disjunct in McCormick Co, SC. Related to C. iracunda Beadle, but foliage of C. aemula differs in having frequent rounded bases, thin texture, yellow-green coloration. Fruits are lustrous light red, 12-18 mm diameter. C. aemula has been shown to be triploid, possibly apomictic, producing a high percentage of fertile seed with little seedling variation. The possibility of its being of hybrid origin between C. iracunda Beadle and C. collina Chapman has been suggested. [= K, Q, X; < C. macrosperma – S]

Crataegus aestivalis (Walter)Torrey & A. Gray, Mayhaw, Eastern Mayhaw. Cp (GA, NC, SC): swamp forests, generally where flooded for much of the year, often flowering and fruiting while standing in water, often associated with Taxodium distichum, Nyssa aquatica, Nyssa biflora, and Planera aquatica; uncommon but sometimes locally abundant; occasionally growing as groves or stands in ‘mayhaw flats’. March-April; June-July. Se. NC south to n. FL and se. AL. A historic record of C. aestivalis in VA appears to be based on a single specimen collected 22 July 1934 by M.L. Fernald & B. Long, in Princess Anne County; this specimen is actually C. crus-galli. A related species, C. opaca Hooker & Arnott, occurs west of the range of C. aestivalis, in similar habitats. Plants with copious growth of reddish pubescence on the leaf undersides are included under C. rugula. The fruits of all three species are traditionally gathered for preserves, pies, and jelly. See Phipps (1988) for extensive additional discussion of C. aestivalis and relatives. [= K, Q, X; < C. aestivalis – S]

Crataegus alabamensis Beadle, Alabama Hawthorn. Pd (GA, SC, NC). Cp (GA, NC, SC): sandhills, upland pine and pine-oak forests, rocky woodlands, xeric or subxeric habitats with sandy or well-drained clay soils; uncommon. April; August-September. E. NC, c. SC south to n. FL, west to c. MS. Often reaching treelike proportions (4-8 m tall, trunk 10-30 cm diameter). Some local genotypes may produce palatable fruit to 22 mm in diameter. The typical form of C. alabamensis has pubescent foliage and tomentose inflorescence parts, but the similar C. floridana, C. attrita, and C. teres are progressively more glabrate, in this order; they may be interpreted as separate species as in Phipps & Dvorsky (2008). [= X; < C. flava Aiton – RAB, K, S; > C. aduncu Beadle - Q; > C. attrita Beadle – Q; > C. floridana Beadle - Q; > C. teres Beadle – Q]

Crataegus alleghaniensis Beadle, Allegheny Hawthorn. Mt, Pd (GA, NC, SC), Cp (GA, SC); upland pine and pine-oak forests, disturbed woodlands, rocky bluffs and slopes; uncommon. April; August-September. W. and sc. NC to c. SC, c. GA, west to c. AL, ne. MS, e. TN. A variable species if broadly considered, displaying leaf and flower characters which suggest intermediacy between members of series Intricatae and Apricae. The stamen counts can vary from 10 in typical C. alleghaniensis, 12-17 in C. ignava and C. extraria, and 20 in C. cullasagensis, C. agrestina, and C. frugiferas. A narrower view might hold some of this synonymy to specific levels. [= X; < C. flava Aiton – RAB; > C. americana – Q; > C. ignava Beadle – K, Q; >C. extraria Beadle – K, Q; > C. impar Beadle – K,Q; > C. cullasagensis Ashe – Q; > C. agrestina Beadle – Q; > C. miru Beadle – Q; > C. frugiferas Beadle (= C. rigens Beadle) – Q]

Crataegus anisophylla Beadle. Cp (GA): upland pine forests, pine-oak scrub, sandhills, disturbed woodlands, roadsides, abandoned fields; uncommon. Late March-April; late August-September. Late March-April; late August-September. Se GA to c. peninsula FL, west to s. AL. This is a poorly understood taxon among the group of hawthorns often categorized under C. flava Aiton in many earlier floral treatments. Related to C. lassa Beadle. [= X; < C. anisophylla – Q; > C. viaria Beadle – Q; > C. cullasagensis Ashe – Q; > C. punctata Beadle – K, Q; > C. versuta Beadle – K, Q; > C. resina Beadle – K, Q; < C. flava – S]

Crataegus aprica Beadle, Sunny Hawthorn Min, Pd, Cp (GA, NC, SC) {VA?}: upland pine forests, pine-oak forests, mixed hardwood forests over rocky or sandy substrates, abandoned fields, roadsides; common. Late March-April; September.
NC south to s. GA and n. FL, west to e. AL and e. TN. This species is most common in the southern Appalachians of NC and SC and extending to the sandhills region of SC. The 10 stamens separate this species from the closely related and similar C. sororia, and both these taxa have long been included under the collective name of C. flava Aiton in many earlier treatments (see discussion of C. flava) [=W, X, Phipps 2007; < C. flava Aiton – RAB; > C. aprica – Q; > C. shallottii Ashe]

_Crateagus berberifolia_ Torrey & Gray var. berberifolia, Barberry Hawthorn. Pd, Cp (GA, NC, SC, VA): mixed hardwood and pine forests of uplands, usually in subxeric to xeric habitats, especially over basic to calcareous soils; common. April-May; August-October. C. VA south to n. FL, west to MO, most common in LA, s. AR. Closely related to C. crus-galli and differing primarily from that species by the consistent pubescence or stiff hairs on foliage, twigs, floral and fruit parts. 10-stamened forms of the normally 20-stamened C. berberifolia have been called C. engelmannii Sargent, which see below. [= C, K, Q, S, X]

_Crateagus berberifolia_ Torrey & Gray var. engelmannii (Sargent) Eggleston Pd, Cp (GA, NC, SC): mixed hardwood and pine forests of uplands, usually in subxeric to xeric habitats, especially over basic to calcareous soils; common. April-May; August-October. Similar to the typical variety in most respects except for the presence of 10 stamens. Appears most common in MO and AR, mixed sporadically with the species eastward to e. TN, c. NC. [> C. engelmannii Sargent – Q; > C. berberifolia var. engelmannii (Sargent) Eggleston; > C. torva Beadle – Q; > C. sinistra Beadle – Q]

_Crateagus boytonii_ Beadle, Boynton Hawthorn. Mt, Pd (GA, NC, SC, VA): upland forest understories, pastures, rock outcrops, shrubby thickets; uncommon. W. VA south to c. GA, west to n. MS, n. to IL, KY, and WV. April-May; September-October. Related to C. intricata Lange, from which C. boytonii differs chiefly in having an abundance of broadly ovate to deltoid leaves 5-8 cm long and 3-5 cm wide, more robust thorns, and more treelike habit (4-6 m tall, less prone to develop root suckering and multiple stems). [= Q, X; < C. flabellata – RAB; > C. boytonii – F, G, orthographic variant; < C. intricata Lange – C, K]

_Crateagus brachycanthana_ Sargent & Engelmann, Blueberry Hawthorn. Cp (GA): open pinelands; rare (GA Special Concern). April; September. In sw. GA, one historic record, disjunct from a main range further west (primarily LA and e. TX). The only eastern hawthorn bearing black fruit, appearing blue due to an exterior waxy bloom. [= K, Q, S, Y, X]

_Crateagus buckleyi_ Beadle. Buckley Hawthorn. Mt, Pd (GA, NC, SC): upland pine and hardwood forests, rock outcrops; uncommon. April-May; August-October. W. NC, w. SC, n. GA west to n. AL, north to e. TN (and perhaps WV and VA). Most similar to C. boytonii Beadle, but with purplish anthers, more glandular-serrate calyx lobes, russet fruit, and smaller leaves (3-6 cm long x 2-4 cm wide). [= Q, X; < C. flabellata – RAB; < C. intricata Lange – C, K]

_Crateagus calpodendron_ (Ehrhart) Medikus, Pear Hawthorn. Mt (VA, NC), Pd (GA, NC, SC): mixed hardwood forests, open slopes, wooded ravines, streamsidey, especially over basic or calcareous rocks; uncommon. April-March; June; September-October. From a generally northern limits extend the Appalachian region and adjacent Piedmont of VA to n. GA, c. AL, n. MS and AR. Often found as a solitary specimen, or in very small local populations. One of the latest hawthorns in our area to flower. Fruit production appears scant in its southern range. [= RAB, C, K, S, W, X; > C. calpodendron var. calpodendron – F, G; > C. calpodendron var. microcarpa (Chapman) Palmer – F, G; > C. calpodendron var. globosa (Sargent) Palmer – F, G; > C. chapmani Beadle – Q; > C. somentosa Du Roi]

_Crateagus coccinea_ Linnaeus, Scarlet Hawthorn. Mt, Pd (NC, VA): deciduous forest understories, pastures, upland thickets; rare; May; October. Distributed southward along the Appalachian Plateau from a predominantly northern range. The combination of large, pubescent leaves (9-12 cm long) on terminal shoots, evenly toothed calyx lobes, and 5-10 stamens per flower are distinctive. C. coccinea may attain treelike proportions, to 10 m tall. [= RAB, C, X; < C. pennsylvanica W.W. Ashe – F, G; > C. pedicellata Sargent – K, W]

_Crateagus collina_ Chapman, Hillside Hawthorn. Mt (GA, NC, SC, VA), Pd (GA, NC, SC): hillside forests and young woodlands, especially over calcareous rocks; uncommon. March-April; August-October. Sw. VA west to KS, south to c. GA, s. AL, c. MS, AR and OK. Closely allied to C. punctata Jacquin, but more widespread in range and habitat tolerance across the Southeast. The fruits rarely reach 12 mm in diameter, whereas those of C. punctata often range from 12-23 mm. C. collina occupies sub-xeric uplands in the Appalachian Region and is tolerant of lowland floodplains in GA, AL, TN. It is one of the earliest hawthorns to flower in spring. Foliage may be conspicuously pubescent in some local genotypes. [= S, W, X; > C. collina var. collina – F, G; > C. collina var. collicola (W.W. Ashe) – F, G; > C. collina – Q; > C. ingens Beadle – Q; > C. amnicola Beadle – Q; < C. punctata Jacquin – RAB, C]

_Crateagus colonica_ Beadle. Cp, Pd (GA,NC, SC): scrublands, roadsides, xeric woodlands with sandy soils; uncommon. Late March-April; August-September. Se. & sc. NC south and west to e. GA, perhaps to n. FL. A poorly understood taxon, appearing closely related to C. integra Beadle, but with smaller flowers and fruit and an abundance of long thorns (2-5 cm). The thorniness of the plants combined with the obovate, nearly entire-margined leaves and pyriform-shaped fruit is usually diagnostic. A similarly thorny entity but with leaves distinctly serrated is C. pexa Beadle (see C. munda Beadle).

_Crateagus crassifolia_ Beadle, Crayton Hawthorn. Mt (GA, NC, VA): wooded slopes, roadsides, streamsidey; rare. Late April-May; September. Sw. VA, w. NC to n. GA, n. AL, possibly e. TN. A poorly known taxon, appearing most closely related to C. intricata Lange, but unique in its combination of 20 stamens and distinctly pubescent foliage and inflorescence parts. Alternatively, this hawthorn could be assigned varietal status within C. intricata, but it has not been published as such in any floral treatments. [= Q]

_Crateagus crus-galli_ Linnaeus var. crus-galli, Cockspur Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA): pastures, thickets, disturbed woodlands and forests, fencerows; common. April-May; September-October. Ranges throughout the eastern US, except c. and s. peninsular FL. C. crus-galli sometimes forms extensive local colonies and likely apomictic clonal populations. Variation occurring in this wide-ranging species, mostly in size and shape of leaves and minor flower and fruit characters, has accounted for an extensive synonymy, with most earlier names applied by Charles Sargent. Plants having 3 to 5 styles and as many pyrenes have been alternatively placed under C. reverchonii Sargent, these also exhibiting a tendency to have smaller, more often suborbicular leaves (see C. reverchonii). Typical forms of C. crus-galli tend to have 1 to 2 styles and pyrenes, and...
with a range of leaf shapes from narrow to nearly suborbiculate. [= C, W, X; < C. crus-galli – RAB; > C. crus-galli – K; > C. macra Beadle - Q; > C. regalis Beadle var. regalis – F; > C. albens Beadle – Q; > C. arborea Beadle – K; > C. canbyi Sargent; > C. crus-galli var. crus-galli – F, G; > C. crus-galli var. exigua (Sargent) Eggleston – G; > C. crus-galli var. macra (Beadle) Palmer – F; G; > C. crus-galli – S]

**Crataegus crus-galli** Linnaeus var. pyracanthifolia (Aiton) Sargent. Cp (GA, NC, SC, VA): bottomland forests, swamp borders, lowlands; uncommon though at times locally abundant. April-May; October. DE south to n. FL, west to MO, e. TX. The narrow leaves may be glabrous or pubescent on the abaxial side, varying as local genotypes. [ > C. crus-galli var. pyracanthifolia (Aiton) Sargent – F, G; > C. limnophylla Sargent – K; > pyracanthoides Beadle var. arborea (Beadle) Palmer – G; > C. pyracanthoides Beadle – Q]

**Crataegus dispar** Beadle, Aiken Hawthorn. Cp (FL, GA, SC), Pd (GA, SC): upland pine or pine-oak forests, usually of sub-xeric to xeric conditions, in well-drained clay or sandy soils; uncommon.  Late March-April; September.  Nc & sc SC, n. GA, wc. AL. serrated, tomentose leaves, often pale bluish-green in color.  [= K, Q, X; > sub-xeric to xeric conditions, in well-drained clay or sandy soils; uncommon.  Late March-April; September.  Nc & sc SC, n. GA, wc. AL.]

**Crataegus flava** Aiton, Yellow Hawthorn. Cp (FL, GA, SC), Pd (SC, GA): dry woodlands; rare. A problematic taxon, originally described from a plant under cultivation in Europe, and assumed native from central SC s. to n. FL; few naturally-occurring plants have been located in the Southeastern US which match closely the type specimen. The likelihood of the type of **Crataegus flava** being of hybrid origin, involving members of the *Apricaceae* or *Intricatae* series seems probable. Unfortunately, the name **Crataegus flava** Aiton and the ambiguous taxon which it historically represents has been widely misapplied and confused for more than a century. It is included here due to its persistent inclusion in several floral treatments in the past. [= F, K; > C. <disperma Ashe – K]

**Crataegus dodgei** Ashe, Dodge Hawthorn. Mt (NC) {VA ?}; mesic hardwood forests, streamside thickets, pastures; rare. May; September-October. A northern species predominately of the Great Lakes Region, east to CT, sporadic southward in the Appalachians to WV and possibly e. TN, w. VA, with one collection in Ashe Co, NC. [= C. mercerensis Sargent]

**Crataegus flava** Aiton, Yellow Hawthorn. Cp (FL, GA, SC), Pd (SC, GA): dry woodlands; rare. A problematic taxon, originally described from a plant under cultivation in Europe, and assumed native from central SC s. to n. FL; few naturally-occurring plants have been located in the Southeastern US which match closely the type specimen. The likelihood of the type of **Crataegus flava** being of hybrid origin, involving members of the *Apricaceae* or *Intricatae* series seems probable. Unfortunately, the name **Crataegus flava** Aiton and the ambiguous taxon which it historically represents has been widely misapplied and confused for more than a century. It is included here due to its persistent inclusion in several floral treatments in the past. [= F, K; > C. <disperma Ashe – K]

**Crataegus inferior** Beadle var. integra Beadle – Q; > C. integrum Beadle – K; > C. integrum Beadle – Q; > C. audens Beadle – Q

**Crataegus intricata** Lange var. boyontoni (Beadle) Kruschke, Boyonton Hawthorn. Mt, Pd (GA, NC, SC, VA): upland forest understories, pastures, rock outcrops, shrubby thickets; uncommon. W. VA south to c. GA, west to n. MS, n. to IL, KY, and WV. April-May; September-October. **Crataegus intricata** differs from typical **C. intricata** by having an abundance of broadly ovate to deltoid leaves 5-8 cm long × 3-5 cm wide, and more robust thorns. [= Q, X; < C. flabellata – RAB; > C. boyontoni – F, G; orthographic variant; < C. intricata Lange; > C. intricata var. boyontoni (Beadle) Kruschke – C, K]

**Crataegus intricata** Lange var. intricata, Entangled Hawthorn. Mt, Pd (GA, NC, SC, VA): pastures, wooded hills, rock outcrops, thickets; common. Late April-May; August-October. Widespread range from northern states s. to c. SC, c. GA, c. AL, n. MS, west to AR and OK. Broadly defined, a variable species incorporating many minor forms and potentially apomictic local clones. The basic defining characters are the presence of 10 stamens with pale anthers, hard greenish or ruddy-blushed fruits with an elevated calyx, and glabrous, slightly glandular foliage. Leaf shape is highly variable. Some variants commonly having yellow fruits are **C. fortunata** Sargent and **C. straminnea** Beadle, conspicuous pubescence is seen in **C. bitimoreana** Beadle and **C. craytonii** Beadle, and shallowly lobed leaves often occur in **C. rubella** Beadle; these have been treated as varieties here (except for **C. craytonii**), but have been variously interpreted in other floras. Typically, **C. intricata** exhibits a shrubby habit, and may form colonies by root sprouts. It is most common in the Appalachian region. [= C, K, S, W, X; < C. flabellata – RAB; > C. intricata var. intricata – F, G; > C. foetida Ashe]

**Crataegus intricata** Lange var. bitimoreana (Beadle), Biltmore Hawthorn. Mt, Pd (GA, NC, SC, VA): wooded hills, rock outcrops, thickets; uncommon. Late April-May; September-October. VT south to c. GA, west to AR, MO. The leaf shape is variable, but the hairiness of its vegetative and floral parts, as well as the normally deeply glandular-serrate calyx lobes make this taxon fairly distinctive among the *Intricatae* series. [ > C. bitimoreana Beadle – F, G; Q; > C. confusa Sargent – F; C. villicarpa Sargent – F]

**Crataegus iracunda** Beadle, Red Hawthorn. Pd, Pd (GA, PA, NC, SC, VA): swamps, bottomlands, moist slopes; wooded hills; uncommon (though locally abundant). April-May; September-October. Southern range limits appear to extend south to c. SC,
GA, AL (and possibly MS). A difficult species to distinguish vegetatively, appearing most closely allied to *C. macroperasma* Ashe. The typically scabrous young leaves, 10 pink to purplish stamens, and firm-textured fruit with sessile calyx can vary among some local populations of *C. iracunda* to the extent that it may be confused with *C. schweitei*, *C. pruinosa*, or *C. boyntonii*. [= K, X; < *C. flabellata* (Bosc) K. Koch – RAB; C – C. iracunda var. iracunda – F, G; > C. iracunda var. silicicola (Beadle) Palmer – F, G; > C. iracunda – Q; > C. silicicola Beadle – Q; > C. drymophila Sargent; > C. populnea Ashe – F, G; > C. riparia Ashe; > C. sectilis Ashe; > C. shollate Ashe]

**Crataegus lassa** Beadle, Sandhill Hawthorn. Cp, Pd (GA, NC, SC): pine forests, oak-pine scrub, upland scrublands, xeric woodlands, especially in deep sand and soils of rapid drainage; common. Here *C. lassa* is broadly defined to include a wide range of minor species, most described by Beadle. Late March-April; August-September. *C. lassa* is most often shrubby in habit (2–4 m tall), with a rounded or open crown reaching close to the ground, commonly with multiple stems. [= X; < *C. flava* Aiton – RAB; > < *flava* – K; > *lassa* – Q; > *lousa* Beadle – Q; > *laxa* Beadle – Q; > *flugula* Beadle – Q; > *integra* Beadle – Q; > *dolosa* Beadle – Q; > *inops* Beadle – Q; > *meridiana* Beadle – Q; > *colonica* Beadle – Q; > *invisida* Beadle – K, Q; > *pulla* Beadle – Q; > *egens* Beadle – Q; > *pearsonii* Ashe – K, Q; > *michauxii* Persoon – Q, S]

**Crataegus lepida** Beadle. Cp (GA): xeric, sandy soils of open pinelands, wiregrass-dominated roadside and forest edges, oak-pine scrub; uncommon. Late March-April; August-September. S. GA south to c. peninsular FL. Allied to *C. munda*, *C. lepida* is distinctive in bearing a preponderance of oval to orbicular, 1–2 cm leaves. [= X; > *lepida* – Q; > *condigua* Beadle – K, Q]

**Crataegus macroperasma** Ashe, Fanleaf Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA): mesic or subxeric hardwood forests, wooded slopes, rock outcrops, pastures, thickets, mountain balds and rocky summits; common. April–early May; September–October. VA south to c. GA, west to n. LA, W. KY, and WV. *C. macroperasma* is often confused with *C. pruinosa* (Wendl.) K. Koch and *C. iracunda* Beadle, due to similar leaf shape, but *C. macroperasma* appears consistent in its adaxially scabrous young leaves, 5–10 stamens, and soft-textured mature fruit. The pyrenes are not unusually large (5–8 mm), despite the name. [= K, W, X; < *C. flabella* (Bosc) K. Koch – RAB; > *flabella* – C; > *macroperasma* var. macroperasma – F, G; > *macroperasma* var. roanensis (W.W. Ashe) Palmer – F, G; > *macroperasma* – Q; > *brainerdii* – C, misapplied to material in our area; > *roanensis* Ashe – Q; > *macroperasma* – S]

**Crataegus margarettae** Ashe. Mt (VA): mesic hardwood forests, streamside thickets, pastures; rare. April-May; September-October. WV [TN, W. VA] west to MO, IO, north to WI and ML. *C. margarettae* is related to the wide-ranging *C. chrysocarpa* Ashe, but is distinctive in its widely obovate to nearly orbicular leaves, rounded or obtuse lobes, cuneate base, and petals often as long as the blade. [= C. margaretta – Q, S, X; > C. margaretta var. margaretta – F, G; > C. margaretta var. brownii (Britton) Sargent – F; > C. margaretta var. brownii – G (orthographic variant); < C. chrysocarpa Ashe – C; > C. chrysocarpa – K, Q; = C. margarettae – K, orthographic variant]

**Crataegus marshallii** Eggleston, Parsley Hawthorn, Parsley Haw. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): swamp forests (especially over calcareous soils), alluvial forests, dry and mesic upland slopes (especially over mafic or calcareous rocks). April–early May; September–October. Se. VA south to c. peninsular FL, west to c. TX, and north in the interior to sc. TN, n. AL, n. MS, w. TN, s. IL, sc. MO, n. AR, and sc. OK (Phipps 1998); common. *C. marshallii* is distinctive and immediately recognizable among *Crataegus*, by its deeply lobed leaves, small flowers, and small fruits (4–6 mm long by about 3 mm wide, with only 1–3 pyrenes). [= RAB; > C. F, G, K, S, W, X, Y; = *C. apifolia* (Marshall) Michaux – Q]

**Crataegus mendoza** Beadle. Cp, Pd (GA), [SC]: mesic hardwood forests, mixed pine-hardwood forests, upland wooded hills over calcareous substrates and well-drained clays; uncommon. Lower Piedmont and upper Coastal Plain of sc. SC, WC. GA, ne. and c. AL, and c. and s. MS. April; September. Allied to *C. pulcherrima* Ashe, and perhaps only a variety of it, *C. mendoza* is distributed well northward and eastward beyond the bulk of the range of *C. pulcherrima*. Related *C. venusta* Beadle and *C. australis* Beadle occur in central AL. [= K, N, Q, S, X]

**Crataegus mollis** Scheele, Downy Hawthorn. Mt (VA), Pd (GA): mesic forests, alluvial forests, wooded uplands over basic or calcareous soils; rare in our area. Late March-April; September-October. The unusual occurrence of this species in the Mountains of VA is atypical of the majority of the range, which is north and west of VA and AL; ME to ND, s. to s. TX, e. to nw. GA. *C. mollis* shows wide variability in size and shape of leaves and fruit, but the tomentose young petioles and pubescent leaf undersides are consistent. The fruits of some local genotypes can reach 24 mm diameter, among the largest of the genus in the U.S. *C. mollis* often reaches treelike dimensions, to 10 m tall and trunk diameters to 30 cm. [= C, S, X; > *C. mollis* var. mollis – F, G; > *C. mollis* – K, Q; > C. cibaria Beadle – Q; > C. gravida Beadle – Q; > C. cibils Ashe; > C. meridionalis Sargent – K; > C. albicans W.W. Ashe – S]

**Crataegus mundia** Beadle. Mt, Pd, Cp (GA, NC, SC): xeric or subxeric forests, scrublands, disturbed woodlands; uncommon. Late March-April; September-October. NC south to n. FL, west to s. and c. AL. *C. mundia* as here considered includes in synonymy several shrubby taxa, with small (1–3 cm), predominately spatulate leaves, slender geniculate twigs, and inflorescences of 1 to 3 (<5) flowers. [= X; < *C. flava* Aiton – RAB; W; > *munda* – K, Q; > *geniculata* Ashe – Q; > C. yadkinensis Ashe – Q; > *pexa* Beadle – Q; > *invicta* Beadle – K, Q; > C. floridana Sargent – S]

**Crataegus pallens** Bealle. Mt (NC): subxeric forests, slopes, rock outcrops, especially over mafic or calcareous substrates; rare. Late April-May; September-October. W. NC, e. TN, ne. AL, and perhaps n. GA. *C. pallens* is allied to *C. intricata* Lange, as well as exhibiting characters of the native affixed with *C. pulcherrima* Ashe. The oblong-ovate leaves with 2 to 3 pairs of straight-sided lobes, 15-20 stamens, yellowish oval fruit, dark furrowed bark, and somewhat twiggy crown atop these multi-stemmed shrubs is here considered diagnostic. A closely related taxon, *C. pinetorum* Beadle (Pineland Hawthorn), of ne. AL and uncertain distribution beyond, exhibits subglobose reddish fruit on pedicels 1–2 cm. [= X; < *C. flabella* – RAB; < *C. intricata* Lange – K, S]

**Crataegus phaeophyrum** (Linnaeus f.) Medikus, Washington Hawthorn. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): upland forests, floodplain forests, pastures, thickets, disturbed areas; uncommon (though locally abundant). May–early June; September-October. One of our most distinctive hawthorns, and commonly cultivated across the eastern U.S. Native range presumed to be PA s. to FL, w. to IL, MO, MS; naturalized populations originating from widespread cultivation may be
involved in parts of this range, and expansions elsewhere. [= RAB, C, G, K, W, X; > C. youngii Sargent – F; > C. phaenopyrum – F, S; > C. populifolia – S]

**Crataegus pruinosa** (Wendl.) Koch, Frosted Hawthorn. Mt, Pd (NC, SC, GA, VA), Cp (NC, SC, GA): upland forests, pastures, rock outcrops, mountain summits and balds, floodplain forests; uncommon (though locally abundant). April-May; September-October. Broadly defined, a variable species with many closely related taxa here considered synonymous. This species may occur as a loose shrub or tree, or become colonial in regularly disturbed areas. The presence of a waxy bloom on the mature fruit (pruinosa) is not a dependable trait, and fruits can vary from green to bright red, glaucous or not. Foliage and floral parts are usually entirely glabrous on plants in our area. [= C, S, W, X; < C. flabellata – RAB; > C. pruinosa var. pruinosa – F, G; > C. pruinosa var. delawarensis (Sargent) Palmer – F, G; > C. rugosa – F, G; > C. pruinosa – K; > C. arcana Beadle – K, Q; > C. rustica Beadle – Q; > C. vicinalis Beadle – Q; > C. gattingeri Ashe – Fe; > C. gattingeri var. gattingeri – Gt; > C. gattingeri var. rigidica Palmer – Gt; > C. georgiana Sargent – Q]

**Crataegus pulcherrima** Ashe, Beautiful Hawthorn. Cp (GA), Mt (GA): upland hardwood forests and hardwood-pine mixtures, ravines, mesic slopes, especially over iron-rich soils and rolling terrain with soils high in clay or loam content; uncommon (though locally abundant). Se, GA, c. Panhandle FL, west to LA (and perhaps e. TX), north to c. MS and n. AL. April; September-October. Defined broadly, C. pulcherrima includes many closely related species described by Beadle, most not clearly distinct and here considered synonymous. Some may deserve varietal status following further study. Foliage of C. pulcherrima display a consistency of evenly-lobed leaves with straight, parallel primary veins and obscure secondary venation. The inflorescences are compound, with 20 stamens per flower; fruits are usually small (5-10 mm diameter), with dense flesh; bark of main trunk brown, furrowed. [= X; > C. pulcherrima – K, N, Q; > C. macilenta Beadle – Q; > C. lenis Beadle – Q; > C. ancisa Beadle – K, Q; > C. opinia Beadle – N, Q; > C. inanis Beadle – K, Q; > C. illustris Beadle – Q; > C. incilis Beadle – N, Q; < C. intricata Lange – S]

**Crataegus punctata** Jacquin, Dotted Hawthorn. Mt. (VA, NC): high elevation forests, balds, rock outcrops; uncommon (though locally abundant). The majority of range is north of our area, with southern limits along the higher Appalachian elevations of NC, TN (perhaps n. GA), and west to KY, MO, and IL. May; September-October. C. punctata is considered here distinct from C. collina, which has a wider Southeastern range and habitat tolerance. C. punctata, often in company with C. macro sperma, comprises the majority of hawthorn forests, "orchards," and thickets seen in the high elevations of the North Carolina Blue Ridge, in openings and disturbed Picea rubens and Abies fraseri forests. [= K, Q, W, X; < C. punctata – RAB, C; > C. punctata var. punctata – F, G; > C. punctata var. aurea Aiton – F, G; > C. punctata var. canescens Britton – F, G; > C. punctata var. paustica (W.W. Ashe) Palmer – F, G; ? C. punctata – S]

**Crataegus sargentii** Beadle, Sargent's Hawthorn. Pd (GA): mesic upland forests over calcareous or circumneutral substrates; rare. W. GA, c. and n. AL (and perhaps se. TN). April; September. C. sargentii displays intermediate characteristics between the range of variation seen in C. intricata and that of C. pulcherrima. It is also on the northern range limits of the latter group. Although this might suggest hybrid origin, the genetics of C. sargentii has not been carefully investigated. Fruit production is usually scanty in C. sargentii, and seed viability appears to be very low. [= K, Q; > C. sargentii – N, Q; > C. eximia Beadle – N, Q; > C. silva Beadle – N, Q; > C. gilva Beadle – N, Q; < C. intricata Lange – S]

**Crataegus schuetzei** W.W. Ashe, Schuette's Hawthorn. Mt (VA, NC): mesic hardwood forests; uncommon (though may be locally abundant). April-May; September-October. C. schuetzei occupies a range predominately north of our area, in NH, NY, WI, n. IL, n. WV; known to extend s. to w. NC (and perhaps also to e. TN and n. GA), but the extent of distribution is poorly understood. Closely related to C. macro sperma. Foliage of juvenile shoots of C. schuetzei in w. NC often are laciniate, with deep, acute sinuses nearly reaching the midrib. [= K, Q; < C. flabellata (Bosc) K. Koch – RAB, C; > C. basilica Beadle – F, G, Q, W]

**Crataegus senta** Beadle. Mt (NC), Cp (SC) (GA?): upland hills, disturbed forests, pastures; uncommon. W. NC and c. SC (perhaps south to GA and n. FL). April-May; September. C. senta appears to be one of the most northerly distributed hawthorns allied closely to the group to which C. alabamensis Beadle, C. lassa Beadle, and C. lactuca Small belong. The drooping branches, red fruit, and small, sharply 3-lobed or 3-pointed, obovate leaves are distinctive. [= Q, X; < C. flava Aiton – RAB, K, S, W; > C. pentasperma Ashe]
