**Crataegus spathulata** Michaux, Littlehip Hawthorn. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): bottomland forests, extending upslope to drier sites or on calcareous or calcareous substrates; uncommon in NC, common southward. April-May; September-October. E. NC south to Panhandle FL, west to e. TX, north in the interior to w. NC, c. TN, s. MO, and e. OK (Platts 1998). This species is distinctive for its small spattulate leaves (tending to be trilobed) and thin, flaking bark (multicolored green, brown, and brownish gray). [= RAB, C, F, G, K, Q, S, W, X, Y]

**Crataegus succulenta** Schrader ex Link, Fleshy Hawthorn. Mt (NC, VA): high elevation rocky summits, mesic forests, high pastures, especially over basic soil or mafic substrates; rare. May; October. Widespread across the northern U.S. states, extending s. along the Appalachians to WV, w. VA, w. NC, and s. in the interior to MO. An attractive species, with bright red fruit, obovate to orbicular leaves with reticulate venation, widely spreading branches, and numerous long thorns (5-9 cm long). [= RAB, C, K, S, W, X; > C. succulenta var. succulenta – F, G; > C. succulenta var. neofluvialis (Ashe) Palmer – F, G; > C. neofluvialis Ashe – Q; > C. vernans Ashe]

**Crataegus triflora** Chapman, Threeflower Hawthorn. Mt, Pd, Cp (GA): wooded ravines and slopes under mesic forests, limestone outcrops, flatwoods, prairies; rare. April-May; September-October. Nw. and wc. GA, west to AL, MS, LA; (possibly in TN?). Usually a multi-stemmed shrub 1-3 m tall, but occasionally to 6 m. C. triflora produces some of the largest flowers in the genus (to 3 cm diameter), though frequently only 3 flowers borne per inflorescence; occasional vigorous plants may bear 3-5 flowers per inflorescence. The orange-red, soft fruit is palatable and may reach 22 mm diameter. [= K, W, X; > C. triflora – Q, U; > C. austromontana Beadle – Q, U]

**Crataegus uniflora** Muenchhausen, Oneflower Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA): upland forests, disturbed lands, roadsides, rock outcrops, often in xeric or sub-xeric conditions; common. April-May; September-October. PA and NJ south to n. FL, w. to e. TX, OK, and MO. Normally a shrubby species, 0.5-2 m in height, though local forms may reach 4 m, particularly in

**ROSACEAE** 475
Crateagus visinda Beadle. Pd, Cp (GA, NC, SC): upland pine and pine-oak forests, disturbed lands, wooded hills with clay or sandy soils, often in xeric or sub-xeric conditions; uncommon. April; late August-September. Central & upper Coastal Plain of NC south to n. FL, west to s. & e. MS, n. AL, and nw. GA. C. visenda is related closely to C. aprica Beadle, but the foliage tends to have a higher percentage of nearly orbicular blades and branches are more recurved or drooping. Often attaining the dimensions of a small tree (4-8 m tall and with a trunk 7-20 cm diameter).
**Drymocallis** Fourier ex Rydberg 1908 (Drymocallis, Wood-beauty)

A genus of about 30 species, best segregated from *Potentilla*. Molecular phylogenetic studies indicate that this genus is more closely related to *Alchemilla, Aphanes, Dasiphora, Fragaria, Sibbaldiopsis*, and other genera outside our area than to *Potentilla* (Eriksson et al. 2003). References: Ertter in FNA (in press); Ertter (2007)=Z; Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

**Drymocallis arguta** (Pursh) Rydberg, Tall Drymocallis, Tall Wood-beauty. Mt (VA, WV): greenstone barrens, other barrens; rare. QC west to NT, south to w. VA, IN, MO, and AZ. Reported for e. TN by Gattinger (1901); the documentation unknown. [= FNA, Z; = *Potentilla arguta* Pursh – F, G, WV; > *P. arguta* var. *arguta* – C; > *P. arguta* ssp. *arguta* – K]

**Eriobotrya** Lindley 1821 (Loquat)

**Exochorda** Lindley 1858 (Pearlbush)

**Filipendula** P. Miller 1754 (Queen-of-the-Prairie)

1 Lateral leaflets lobed and toothed; flowers pink; fruit straight; rootstock with long subterranean runners; [native plant of wetlands, also sometimes cultivated]; [section Albicoma].............................................................................................................................................................................. *F. rubra*  
2 Lateral leaflets merely coarsely toothed; flowers white; fruit twisted; rootstock short, without runners; [introduced species, sometimes cultivated, rarely naturalized, native of ec. China. Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). Also reported for L.A. [= FNA, K, WH]

**Filipendula ulmaria** (Hill) B.L. Robinson, Queen-of-the-Prairie. Mt (NC, VA, WV), Pd (VA): bogs, wet meadows, over mafic or calcareous rocks; rare. June-July; July-September. PA west to n. IL and MN, south to WV, w. VA, w. NC, e. TN (Roane County, fide Gattinger 1901), and MO (reports from GA appear to be unsubstantiated). The closest relatives are the other two members of section *Albicoma*: *F. palmata* (Pallas) Maximowicz and *F. angustifolia* (Turezaninow) Maximowicz, both of ne. Asia. [= RAB, C, F, FNA, G, GW, K, S, W, WV, Y, Z]  
* Filipendula ulmaria* (Linnaeus) Maximowicz, Meadowsweet, Queen-of-the-Meadow. Mt (WV): disturbed areas; rare, native of Europe. Cultivated and sometimes escaped or persistent. It is reported for KY, WV, PA, and NJ (Kartesz 1999). [= FNA, WY, Y; > *F. ulmaria* var. *ulmaria* – C, F, G; > *F. ulmaria* ssp. *ulmaria* – K]

**Fragaria** Linnaeus 1753 (Strawberry)

1 Fruit (at least the larger on a plant) usually > 1.5 cm thick; petals 10-15 mm long; leaves evergreen; [cultivated, rarely persistent].......................... *F. xananassa*  
2 Fruit 1-1.5 cm thick; petals 3-10 mm long; leaves deciduous (at least tardily so); [native].  
3 Achenes set in pits on the mature receptacle; calyx lobes appressed to the developing fruit (after petal drop); petals (5-) 7-10 mm long; principal lateral veins diverging from the midrib of the leaflet at an angle of ca. 30 degrees; terminal tooth of leaflets > ½ as wide as the adjacent teeth, as long as or surpassing them in length............................................................................................................. *F. virginiana*  
3 Achenes superficial on the mature receptacle; calyx lobes spreading to reflexed from the developing fruit (after petal drop); petals 3-7 mm long; principal lateral veins diverging from the midrib of the leaflet at an angle of ca. 45 degrees; terminal tooth of leaflets < ½ as wide as the adjacent teeth, and surpassed by them in length.  
4 Long hairs of the petioles and peduncles spreading to retrorse............................................................................................................. *F. vesca* var. *americana*  
4 Long hairs of the petioles and peduncles ascending to appressed............................................................................................................. *F. vesca* var. *vesca*
**Fragaria ×ananassa** ThUILler (pro sp.) **[chiloensis × virginiana]**, Garden Strawberry, Cultivated Strawberry. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): gardens, persistent on garden edges; commonly cultivated; rare. An octoploid garden hybrid of the two octoploid species, *F. chiloensis* and *F. virginiana*. [= RAB, F, FNA; = *F. ×ananassa* var. *ananassa* – K; = *F. ×ananassa* var. *ananassa* – C; WV; = *F. chiloenis* Duchesne var. *ananassa* – G]

**Fragaria vesca** LINnaeus var. **americana** Porter. Mt (NC, VA, WV), Pd (DE), Cp (DE, VA): woods, fields, roadsides; uncommon (rare in NC and VA). April-June. NL (Newfoundland) and BC south to e. VA, w. NC, TN, MO, NE, CO, NM, and AZ. [= C, F, G; < *F. vesca* – RAB; = *F. vesca* sp. *americana* (Porter) Staudt – FNA, K, W; = *F. americana* (Porter) Britton – S; > *F. vesca* var. *americana* – W; > *F. vesca* var. alba (Ehrhart) Rydberg – F]

**Fragaria vesca** LINnaeus var. *vesca*. NL (Newfoundland), QC and MI south to PA, WV (?), KY, and IL. [= C, F, G; = *F. vesca* sp. *vesca* – FNA, K]

**Geum** LINnaeus 1753 (Avens)

A genus of 40-60 species, herbs, mainly of north temperate areas. Many researchers have advocated breaking *Geum* into varying numbers of segregate genera; even the most conservative divisions place *G. radiatum* in a genus separate from our other species (such as *Parageum*; see synonymy) and some would place *G. vernum* in *Stylitus*. Molecular studies (Smedmark 2006; Smedmark & Eriksson 2002) make a strong case for a broad circumscription of *Geum*, including *Waldsteinia*, as many of the segregates are complexly and reticulately interrelated. References: Rohrer in FNA (in press); Phipps in FNA (in press); Robertson (1974)=Z, Bolle (1933)=Y; Král (1966)=X; Smedmark (2006)=V; Weakley & Gandhi (2009)=Q; Smedmark & Eriksson (2002); Kalkman in Kubitzki (2004). [including *Parageum* and *Waldsteinia*]

<table>

---

### Notes

- *Fragaria ×ananassa*: Hybrid of *F. chiloensis* and *F. virginiana*.
- *Fragaria vesca*: Native to North America.
- *Geum*: Includes freshwater and upland species, with a wide range of leaf shapes and flower colors.

---

11 Petals (2-) 2.5-4 (-5.5) mm long; pedicels densely hirsute with spreading or slightly reflexed hairs, and also puberulent; [of wetlands] ................................................................. G. laciniatum

9 Plant in fruit.

12 Pedicel predominantly puberulent, also sometimes with scattered longer hairs; cauleine leaves mostly 3-foliolate or simple; receptacle densely hirsute with yellowish, stiff hairs (best seen by removing a several achenes to expose the receptacle surface); [widespread and common in our area, primarily occurring in moist to wet forests] ........................................... G. canadense

12 Pedicel moderately to densely hirsute with spreading to reflexed hairs 1-2.5 mm long, and also puberulent; cauleine leaves mostly pinnately compound, the leaflets mostly elongate and often also lateri-acuminate divided; receptacle glabrous or sparsely to densely hirsut; [rare in our area, occurring in the Mountains of NC and the Mountains, Piedmont, and Coastal Plain of VA, primarily in bogs and boggy meadows].

13 Hairs on the achene extending upward onto the lower portion of the style; pedicel sparsely hirsute with spreading hairs; receptacle densely hirsut .......................................................... G. aleppicum

13 Hairs on the achene absent or at least not extending upward onto the lower portion of the style; pedicel densely hirsute with spreading to reflexed hairs; receptacle glabrous to sparsely hirsut ......................................................... G. laciniatum

Geum canadense Jacquin. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): moist slope forests, bottomland forests, swamp forests; common. May-July; July-September. NS west to ND, south to c. GA and TX. Some authors have recognized a number of varietes in G. canadense (see synonymy); some (at least) of these may warrant recognition. [= RAB, C, FNA, G, GW, S, W, Z; > G. canadense var. canadense – K, F, WW, Y; > G. canadense var. brevipes Fernald – F, Y; > G. canadense var. camorum (Rydberg) Fernald & Weatherby – F, Y; > G. canadense var. grimesii Fernald & Weatherby – F, Y]

Geum fragarioides (Michaux) Smledmark, Northern Barren Strawberry. Pd (NC, VA), Mt (WV): forests, streambanks; rare. Late March-May; May-June. NB west to MN, south to NC, TN, IN, MO, and AR. [= Q = Waldsteinia fragarioides (Michaux) Trouetnick var. fragarioides – C, F; < W. fragarioides – RAB, W, WW, Y; = W. fragarioides ssp. fragarioides – K, Z; = Waldsteinia fragarioides – FNA, G, S; < Geum fragarioides (Michaux) Smledmark = V]

Geum geniculatum Michaux, Bent Avens. Mt (NC): seeps, seepy boulderfield forests, grassy balds, cliff bases, banks of cool streams up to about 5 m wide, at high to moderate elevations on Grandfather Mountain (Avery, Watauga, and Caldwell counties, NC), the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County TN), and Rich Mountain (Watauga County, NC); rare, though locally fairly common (US Species of Concern, NC Threatened). Late June-August; August-September. G. geniculatum is apparently restricted to the few highest peaks in nw. NC and ne. TN: the Roan Mountain massif (Roan High Knob, Roan High Bluff, Round Bald, Jane Bald, Grassy Ridge, Little Hump Mountain, Big Yellow Mountain, and Big Hipp Mountain), Grandfather Mountain, and Rich Mountain. It may be found on a few other peaks, such as Snake Mountain. The distribution of this species is peculiar. While limited to the several highest and coldest mountains in the Southern Appalachians, it extends downslope on Roan Mountain and Grandfather Mountain nearly to their bases, in environmental situations that are apparently duplicated on many other Southern Appalachian peaks. Perhaps G. geniculatum was more widespread in the Southern Appalachians in the cooler, moister conditions of the post-Pleistocene, but became restricted to the few coldest peaks during the warmer, drier conditions of the Hypsithermal Interval (7000-2000 B.C.). Following climactic cooling, it was able to disperse downslope from its several refugia, but has not dispersed successfully to other peaks. G. geniculatum is most closely related to the circumboreal G. rivale, with which it shares such characteristics as purplish, non-reflexed sepals, a relatively long terminal style segment, upper pedicel with long glandular hairs, and basal style segment with long glandular hairs. [= RAB, FNA, KS, S, W, Y, Z]

Geum lacinatum Murray, Rough Avens. Mt (NC, SC, VA, WV), Cp (DE, VA), Pd (DE, VA): bogs and wet meadows; uncommon (rare in NC, SC, and VA). June-July; July-August. Two varieties are sometimes recognized: var. lacinatum has glabrous achenes and is generally more northern and more restricted in distribution than var. trichocarpum, which has achenes sparsely to densely pubescent with long stiff trichomes, and ranges from NS west to s. ON, south to MD, VA, w. NC, TN, OH, IL, MO, and KS. The difference appears to be that of a single trait, uncorrelated with other traits, and with largely overlapping geographic distributions; the varieties are not recognized here. [= RAB, C, FNA, GW, W, Y; > G. lacinatum var. lacinatum – F, G, K, WW, Z; > G. lacinatum var. trichocarpum Fernald – F, G, K, Z]

Geum lobatum (Baldwin ex Elliott) Smledmark, Lobed Barren Strawberry. Mt (GA, NC, SC), Pd (GA, SC): forests, streambanks; rare. March-May; May-June. SW. NC south to nw. SC and n. and c. GA. Some populations appear to be morphologically intermediate between G. lobatum and G. donianum; further study is needed. [= Q, V; = Waldsteinia lobata (Baldwin ex Elliott) Torrey & A. Gray – FNA, KS, S, Y, Z]

Geum raditatum Michaux, Spreading Avens, Cliff Avens. Mt (NC): high elevation rocky summits, in thin soil at tops of cliffs and on ledges (where not tramplled), in pockets of soil on nearly vertical portions of cliffs, in open grassy balds, around Rhododendron catawbiense in grassy balds, or in grassy areas at bases of cliffs (where succession by shrubs is prevented by accumulation of seepage ice and by stone fall); rare. June-August; July-September. Ranging from Ashe County, NC (Phoenix Mountain) south and west to Sevier County, TN (Mount Leconte) and Transylvania County, NC (the Devil's Courthouse), restricted to "pseudo-alpine" rock outcrops and grassy meadows near the summits of the higher peaks of the Southern Blue Mountains.
Gillenia Moench 1802 (Indian-physic, Bowman's-root)

A genus of 2 species, herbs, of e. North America. The contention that Gillenia is a later homonym of Gillena and must therefore be rejected for the later name Portanthenus has been ruled against (see Robertson 1974; Brummitt 1988; Parkinson 1988). References: Nesom in FNA (in press); Robertson (1974)=Z; Kalkman in Kubitzki (2004).

1 Stipules ovate, 10-20 (125) mm long; lower leaf surface densely glandular; leaves trifoliolate, the leaflets of the lower leaves laciniate-toothed
   to divided .................................................................................................................................................................................................
   G. trifoliata

1 Stipules linear, 6-8 mm long; lower leaf surface glabrous or sparsely glandular; leaves trifoliolate, the leaflets of the lower leaves merely
toothed, like the upper leaves ...........................................................................................................................................G. stipulata

Gillenia stipulata (Muhlenberg ex Willdenow) Nuttall, Midwestern Indian-physic. Pd (GA, NC, VA), Mt (GA, WV): dry to mesic woodlands and forests, especially over circumneutral soils derived from diabase (in NC) or greenstone (in VA); uncommon (rare in GA, NC, and VA). May-June; July-October. NY to KS, south to nw. GA and TX, and disjunct east of the Blue Ridge in sc. VA, c. NC, and c. GA. [= RAB, F, FNA, G, WV; = Portanthenus stipulatus (Muhlenberg ex Willdenow) Britton – C, K, S, W, Z]

Kerria A.P. de Candolle 1818 (Kerria)

Malus P. Miller 1754 (Apple, Crabapple)

* Neillia incisa* (Thunberg) S.H. Oh, Lace Shrub. Pd (VA): suburban woodlands; rare, establishing from horticultural plantings, native of Japan and Korea. [= FNA, Z; = Stephanandra incisa (Thunberg) Zabel – K]

**Neviusia** A. Gray 1858 (Snow-wreath)

**Neviusia alabamensis** A. Gray, Alabama Snow-wreath. Mt (GA): limestone woodlands, where there is seasonal moisture; rare. Sc. TN (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), and n. AL; disjunct in AR and MO. [= K, S]

**Photinia** Lindley 1821 (Photinia, Redtip)

A genus of about 40 species, trees and shrubs, of Asia and Central America. References: Nesom in FNA (in press); Kalkman in Kubitzki (2004). [also see *Aronia* and *Pourthiaea*]

1 Leaves evergreen, coriaceous, (6-) 9-20 cm; inflorescences 4-18 cm wide; pedicels without lenticels ........................................... *P. serratifolia*

1 Leaves deciduous, herbaceous, 4-9 cm long; inflorescences 3-6 cm wide, pedicels with warty lenticels ........................................... [see *Pourthiaea*]
Physocarpus (Cassinian Gooseberry)

1 Follicles stellate-pubescent ................................................................. P. opulifolius var. intermedius
1 Follicles glabrous ................................................................................. P. opulifolius var. opulifolius

Physocarpus opulifolius (Linnaeus) Maximowicz var. intermedius (Rydberg) B.L. Robinson, Midwestern Ninebark. Cp (FL), Pd (SC, NC?): mesic hammocks, streambanks; rock outcrops; rare. W. NY west to MN and CO, south to SC, FL, AL, and AR. It is unclear whether the southern species recognized by Small (1933) are best allied with this taxon. Additional study is needed. [= C, F, G, K, Z; < P. opulifolius – RAB, W, WH; = P. intermedius (Rydberg) C.K. Schneider – FNA; > Opulaster alabamensis Rydberg – S; > Opulaster stellatus Rydberg – S; > Opulaster intermedius Rydberg]

Physocarpus opulifolius (Linnaeus) Maximowicz var. opulifolius, Eastern Ninebark. Mt (NC, SC, WV), Pd (DE, NC, SC), {GA, VA}: stream banks, riverside thickets, rock outcrops, cliffs, especially over mafic or calcareous rocks; common. May-July. QC west to WI, south to SC, TN, and n. IL. [= C, F, G, K, Z; < P. opulifolius – RAB, W, WV; = P. opulifolius – FNA; > Opulaster opulifolius (Linnaeus) Kunze – S; > Opulaster australis Rydberg – S]

Potentilla Linnaeus 1753 (Cinquefoil, Five-fingers, Potentilla)

1 Flowers in terminal cymes; leaves palmately 3-9-foliolate.
2 Leaves 3-foliolate; [section Rivasae].
3 Petals and sepals subequal; stamens (15-) 20; achenes usually ridged ................................................................. P. norvegica
3 Petals much shorter than the sepals; stamens 5-10 (-15); achenes smooth ................................................................. P. rivialis
2 Leaves 5-9-foliolate.
4 Leaves (5-) 7-9-foliolate; petals 8-15 mm long, pale (sulfur) yellow; [section Rectae] ................................................................. P. recta
4 Leaves 5 (-7)-foliolate; petals 3-7 (-8) mm long, medium yellow; [section Terminales].
5 Leaves pubescent beneath, the green surface not concealed; petals 4-5 mm long ................................................................. P. intermedia
5 Leaves densely tomentose beneath, the surface concealed; petals either 2.5-4 mm long or 5-7 (-8) mm long.
6 Pubescence of the stem and veins of the leaf undersurface tomentose only; lower leaf surface silvery-white tomentose; leaves revolute; petals 2.5-4 mm long. ................................................................. P. argentea
6 Pubescence of the stem and veins of the leaf undersurface tomentose and also with long, spreading hairs; lower leaf surface somewhat to strongly grayish-tomentose; leaves not revolute; petals 5-7 (-8) mm long. ................................................................. P. inclinata
1 Flowers solitary, on naked, axillary pedicels; leaves either palmately 3-5-foliolate or pinnately (5-) 7-21 (-31)-foliolate.
7 Leaves pinnately (5-) 7-21 (-31)-foliolate; [section Anserinae] ........................................................................................................ P. anserina
7 Leaves palmately 3-5-foliolate.
8 Leaves 3-foliolate; fruit strawberry-like, fleshy and red, consisting of an expanded fleshy receptacle bearing superficial achenes; [formerly genus Duchesnea]. ................................................................................................. P. indica
8 Leaves primarily 5-foliolate on a plant (some poorly developed leaves may be 3-4-foliolate); fruit a head of achenes, dry; [section Potentillae].
9 Plants lacking rhizomes; petals (6-) 8-12 mm long; anthers 1.3-2.0 mm long ................................................................. P. reptans
9 Plants with horizontal rhizomes; petals 4-10 mm long; anthers 0.6-1.0 mm long.
10 Terminal leaflet toothed for > ½ its length; plant flowering at 2nd node of stolon, typically with 2 leaves and 1 pedicel at each subsequent node; plants only flowering on elongating stolons ................................................................. P. simplex
10 Terminal leaflet toothed for < ½ its length; plant flowering at 1st node of stolon, typically with only 1 leaf and pedicel at each subsequent node; plants often flowering on short stolons obscured by basal leaves.
11 Middle leaflet of larger leaves 2.5-4 mm long; plants pale-pilate, the pubescence apressed or loosely ascending ................................................................. P. canadensis var. canadensis
11 Middle leaflet of larger leaves 3-6 mm long; plants long-villoso, the pubescence loosely spreading to reflexed ................................................................. P. canadensis var. villosissima

* Potentilla anserina Linnaeus, Silverweed. Lawns, disturbed areas. Circumboreal, south in North America to MA, NY, nw. PA, OH, IN, IL, IA, NE, NM, AZ, and CA; also scattered further south, apparently as an introduction, as in Sevier County, TN (Chester, Wofford, & Kral 1997), se. PA (Rhoads & Klein 1993), MD (BONAP 2010), and n. NJ (BONAP 2010). [= C, F, G; > Potentilla anserina ssp. anserina – FNA; = Argentina anserina (Linnaeus) Rydberg – K]

* Potentilla argentea Linnaeus, Silvery Five-fingers, Hoary Five-fingers. Mt (NC, VA, WV), Pd (NC, VA), Cp (NC, VA): disturbed areas; uncommon (rare in NC and VA), naturalized from Europe. May-July. [= RAB, C, F, FNA, G, W; > P. argentea var. argentea – K]

* Potentilla inclinata Villars. Cp (NC): disturbed areas; rare, naturalized from Europe. May-June. [= C, FNA, K; ? P. canescens Bess. – RAB, F, G]

* Potentilla indica (Andrews) T. Wolf, Indian-strawberry. Cp (DE, FL, GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): disturbed areas, lawns, gardens; common (uncommon in FL and WV), native of Asia. February-frost. Duchesnea is apparently not closely related to Fragaria, and is best combined with Potentilla, which does have other species with accrescent fruits (Eriksson, Donoghue, & Hibbs 1998). The strawberry-like fruit is not sweet; it can also be distinguished from Fragaria by its whitish interior flesh. The leaves are more coarsely toothed than Fragaria. [= Duchesnea indica (Andrews) Focke – RAB, C, F, G, K, S, W, WH, WV]

* Potentilla intermedia Linnaeus. Mt (NC, VA), Pd (VA), Cp (VA), {MD}: disturbed areas; rare, naturalized from Europe. May-July. [= RAB, C, F, FNA, G, K]

Potentilla norvegica Linnaeus, Strawberry-weed, Rough Cinquefoil. Mt (GA, NC, VA, WV), Cp (DE, NC, VA), Pd (DE, GA, NC, SC, VA): pastures, fields, disturbed areas, especially where moist; common (uncommon in GA, NC, SC, and VA Piedmont, uncommon in GA, NC, SC, and VA Coastal Plain). Late May-frost; June-frost. This species is apparently a complex circumboreal species complex, with both native and introduced elements now present in NC. [= RAB, C, FNA, G, W, WV; > P. norvegica var. norvegica – F; > P. norvegica ssp. monspeliensis (Linnaeus) Aschers & Grabe – K; > P. monspeliensis Linnaeus – S; > P. norvegica ssp. hisuta (Michaux) Hylander]

* Potentilla rivalis Nuttall, Brook Five-fingers. Mt (VA, WV), Pd (VA), Cp (VA): habitat not known; rare, adventive from further west. [= C, FNA, G, K; > P. millegrana Engelmann ex Lehmann – F; > P. rivalis var. millegrana (Engelmann ex Lehmann) S. Watson]

Poteridium Spach 1846 (American Burnet)

Poterium Linnaeus 1753 (Salad Burnet)

* Poterium sanguisorba Linnaeus ssp. muricatum (Spach) Rouy, Salad Burnet, Garden Burnet, Fodder Burnet. Mt (NC, VA, WV), Cp (DE, VA): cultivated as an herb and salad green, escaped to moist, disturbed areas; rare, native of Europe. June-July. [= FNA; = Sanguisorba minor Scopoli ssp. muricata (Spach) Nordborg – K, Y, Z; > Sanguisorba minor – RAB, C, F, G, WV; > Poterium sanguisorba Linnaeus – S; = Poterium polygonum Waldstein & Kitaibel]

Pourthiaea Decaisne 1874 (Photinia)

A genus of about 25 species, shrubs, of e. Asia. Guo et al. (2011) indicate that Pourthiaea should be separated from both Photinia and Aronia. References: Guo et al. (2011).

* Pourthiaea villosa (Thunberg) Decaisne, Oriental Photinia. Mt (NC), Pd (DE, NC): uncommonly cultivated, sometimes escaping to suburban woodlands; uncommon (rare in NC), native of e. Asia. [= Z; = Photinia villosa (Thunberg) A.P. de Candolle – FNA, K]
Prunus Linnaeus 1753 (Plum, Cherry, Sloe, Peach, Apricot)

1 Flowers in elongate racemes of (12-)20-many flowers.
2 Leaves evergreen, entire or serrate with few or rather many (but widely spaced) prominent teeth; petioles lacking 2 glands near junction with leaf blade; [native in maritime situations from e. NC southward, but cultivated and escaped inland]; [laurel cherries, subgenus Laurocerasus] .............................................................................................................................................. P. caroliniana
2 Leaves deciduous, regularly and rather finely toothed; petioles with 2 glands near the junction with the leaf blade; [collectively widespread, native and alien]; [black cherries, subgenus Padus] .............................................................................................................................................. Key A
1 Flowers solitary, in fascicles, in umbellate or corymbose inflorescences, or in short racemes (P. mahaleb) of 1-12 flowers.
3 Flowers and fruit pedicellate, the pedicel > 4 mm long; fruit glabrous, ovary glabrous or pubescent initially.
4 Stones globose, not 2-edged; sepals hairy or not; inflorescences subtended by leafy bracts arising from the same bud as the flowers (except P. pensylvanica, P. susquehanna, and P. pumila var. depressa); cherries .............................................................................................................................................. Key B
4 Stones somewhat to strongly flattened, 2-edged; sepals hairy on the upper surface (except P. domestica, P. insititia, and P. persica); inflorescences without leafy bracts arising from the same bud as the flower; plums .............................................................................................................................................. Key C
3 Flowers and fruit sessile or on a pedicel < 2 mm long
5 Fruit scarlet-red, 1 cm in diameter; twigs densely tomentose; fruit and ovary glabrous or somewhat pubescent (but not velvety); leaves < 5 (-7) cm long; petals white (pink in bud), < 13 mm long; [subgenus Lithocerasus, section Armeniacerasus] ..........P. tomentosa
5 Fruit yellow, peach, or orange-colored, > 2 cm in diameter; twigs glabrous; fruit and ovary velvety pubescent; leaves > 5 cm long; petals white or pink, > 11 mm long.
6 Leaves 8-15 cm long, > 4x as long as wide, falcate; fruit peach-colored, > 5 cm in diameter; [peach, subgenus Amygdalus] ......................P. persica
6 Leaves 5-10 cm long, 1-1.5x as long as wide, not falcate; fruit yellow to orange, 3-5 cm in diameter; [apricots, subgenus Prunus, section Armeniaca]
7 Twigs reddish-brown; fruits 3-5 cm in diameter, the flesh sweet when ripe ...................................................................................... P. armeniaca
7 Twigs bright green; fruits 2-3 cm in diameter, the flesh sour and/or bitter when ripe ............................................................................................. P. mume

Key A – BLACK-CHERRIES, subgenus Padus

1 Petals 6-10 mm long; hypanthium pubescent within; stone sculptured; [alien, rarely naturalizing] ......................................................... P. padus
1 Petals 4-7 mm long; hypanthium glabrous within; stone smooth; [native]
2 Leaf teeth triangular, pointing outwards; leaves dull above; sepals conspicuously glandular-eroded on the margin, not persistent on the fruit; colonial, thicket-forming shrub from rhizomes; [montane in our area] ............................................................................................................... P. virginiana var. virginiana
2 Leaf teeth curved, appressed, leaves shiny above; sepals entire or slightly glandular-eroded on the margin, persistent on the fruit; small to large tree, not clonal; [collectively widespread]
3 Leaves mostly 1.5-2x as long as wide, often blunt-tipped (except in shoot leaves); lower leaf surface rather uniformly pubescent, the midrib lacking conspicuous tufts or fringes; branchlets reddish hairy ...................................................................................... P. alabamensis
3 Leaves mostly 2.2-5x as long as wide, slightly acuminate; lower leaf surface glabrous except for tufts or fringes along the midrib; branchlets glabrous .................................................................................................................................................. P. serotina var. serotina

Key B – CHERRIES, subgenera Cerasus and Lithocerasus

1 Plants shrubs, to 1.5 (-3) m tall; [subgenus Lithocerasus; section Microcerasus]
2 Inflorescences of 1-2 flowers; [exotic, persistent from cultivation] ........................................................................................................... P. glandulosa
2 Inflorescences of 2-4 flowers; [native]
3 Youngest twigs glabrous; leaf blades (1.6-)3-4x as long as wide; plants decumbent; stones fusiform, (5.5-)7.3-9.5 (-10.2) mm long; [plants of calcareous shores and gravel bars] ............................................................................................................... P. pumila var. depressa
3 Youngest twigs minutely pubescent; leaf blades mostly 1.7-2.5x as long as wide; plants erect, stones mostly orbicular, (5.3-)5.8-7.8 (-9.2) mm long; [plants of acid sandy or rocky upland sites] ............................................................................................................... P. susquehanna
1 Plants trees, well over 3 m tall when mature; [subgenus Cerasus]
4 Leaf serrations single to double, the tips of the serrations acuminate to attenuate.
5 Leaf serrations attenuate; tree with upright form; [section Sargentella] ................................................................................................. P. serrulata
5 Leaf serrations acuminate; tree usually with weeping form; [section Microcalymma] ...................................................................................... P. subhirtella
6 Petals 4-7.5 mm long; fruit < 1 cm in diameter; [section Phyllomahaleb]
7 Inflorescence with a central axis, thus nearly or actually racemose; fruit blackish; leaves 1-1.5x as long as wide; [exotic tree] ..........P. mahaleb
7 Inflorescence umbellate to corymbose, the central axis absent or poorly developed; fruit red; leaves 2-5x as long as wide; [native tree] ......................................................................................................................... P. avium
6 Petals 9-15 mm long; fruit 1.3-2.5 cm in diameter; [section Eucerasus]
8 Leaves 7-15 cm long, persistently hairy beneath, at least along the midrib and veins; pair of petiolar glands on the petiole near the blade; fruit sweet when ripe .................................................................................................................. P. avium
8 Leaves 4-8 cm long, glabrous beneath once fully-expanded; pair of petiolar glands on the base of the leaf blade; fruit sour when ripe. ......................................................................................................................... P. cerasus
1. Flowers 1-2 (-3) per inflorescence; stone somewhat sculptured; [exotic]; [section Prunus].

2. Leaves 4-6 cm long; fruits 2-3 cm long, yellow to red when ripe; inflorescence of a solitary flower. [P. cerasifera]

3. Leaves 5-10 cm long; fruits 3-7 cm long, blue-black, yellow, or greenish when ripe; inflorescence of (1-) 2-3 flowers. [P. domestica var. domestica]

4. Fruit 5-7 cm long; single-trunked small to medium tree, usually thornless. [P. domestica var. insititia]

5. Fruit 3-4 cm long; thicklet-forming shrub to small tree, often thorny. [P. domestica var. insititia]

1. Flowers (3-) 4-5 per inflorescence; stone nearly smooth; [native]; [section Prunocerasus].

4. Leaf teeth gland-tipped (or with a scar where the gland has fallen); sepals with marginal glands (except P. angustifolia); fruit yellow to red when ripe.

5. Leaves 3-6 cm long, often folded longitudinally; sepals lacking marginal glands. [P. angustifolia]

6. Leaves < 2x as long as wide; petals 10-15 mm long; [of w. VA northward]. [P. nigra]

7. Leaves > 2x as long as wide; petals 4-7 mm long; [of nw. United States, eastward into KY, TN, MS, and present as an introduction still farther eastward in NC, SC, VA, and GA].

8. Leaf teeth triangular, ascending, the gland terminal; flowers opening with the leaves. [P. hortulana]

9. Leaf teeth depressed, the gland near the sinus; flowers opening before the leaves. [P. munsoniana]

4. Leaf teeth glabrous; sepals without marginal glands; fruit yellow, red, purple-red, purple, or black when ripe.

8. Petals 10-15 mm long; leaves 6-10 cm long, acuminate; fruit 2-2.5 cm long, red or yellow.

9. Leaves narrowly to broadly cuneate at the base; petiole usually lacking glands near its junction with the leaf blade; sepals glabrous on the lower side. [P. americana]

9. Leaves broadly rounded at the petiole; usually with glands near its junction with the leaf blade; sepals pubescent on the lower side. [P. mexicana]

10. Twigs and pedicels pubescent, often densely so; leaf apices acute to obtuse. [P. nigra]

11. Plants often suckering and forming thickets, less often single plants, shrubs or less often trees; leaf apices short acuminate (merely acute); pedicels usually < 10 mm long; [Mountains and Piedmont from nw. NC northward].

11. Plants usually not suckering, often single plants but sometimes in small colonies, generally trees; leaf apices mostly acute; pedicels usually > 10 mm long; [Coastal Plain, Piedmont, and Mountains of s. NC, SC, GA, FL, AL, MS, LA, and westward]. [P. umbellata]

Prunus alchemensis C. Mohr, Alabama Black Cherry. Cp (AL, FL, GA, SC), Pd (GA), Mt (AL, GA): sandhills, other xeric sandy or rocky forests and woodlands, often associated with Pinus palustris (even in the Piedmont and Mountains); uncommon (rare north of GA). April-May; July-August. C. SC, nw. GA, n. AL south to Panhandle FL and s. AL; the NC record is based on a misidentified specimen. [= K; = Prunus serotina Ehhrart var. alchemensis (C. Mohr) Little – RAB, WH; > Padus alchemensis (C. Mohr) Small – S; > Padus cuthbertii Small – S; > Padus australis Beadle – S; = Prunus serotina ssp. hirsuta (Elliott) McVaugh – FNA, Y, Z]

Prunus alleghaniensis Porter var. alleghaniensis, Allegheny Plum, Allegheny Sloe. Mt (NC, VA, WV), Pd (VA): dry rocky woodlands, shale barrens, primarily over calcareous or mafic rocks; rare. MA and NY south to w. VA, w. NC, and e. TN. Var. davissii (W. Wight) Sargent is endemic to MI. [= K; < Prunus alleghaniensis – C, F, G, W, WV; = Prunus umbellata Elliot var. alleghaniensis [in press] – FNA]

Prunus angustifolia Marshall, Chickasaw Plum. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, VA, WV): roadsides, fencerows, abandoned fields, especially sandy; common (uncommon in DE and FL, rare in WV). March-April; May-early July. NJ, PA, IN, IL, MO, NE, and CO, south to FL, TX, and e. NM. The original native distribution is unclear; much of its eastern distribution may be the result of early spread by native Americans. [= RAB, C, FNA, G, S, W, WH, WV, Z; > Prunus angustifolia var. angustifolia – F, K]

* Prunus armeniaca Linnaeus, Apricot. Cp (VA): persistent around old home sites; rare, native of n. China. [= C, FNA, K; = Armeniaca vulgaris Lamark]

* Prunus avium Linnaeus, Sweet Cherry, Mazzard Cherry, Bing Cherry. Pd (DE, NC, VA), Mt (VA, WV), Cp (VA), [NC, SC]: common (uncommon in DE Piedmont, rare in DE Coastal Plain), native of Eurasia. [= RAB, C, F, FNA, G, K, S, W, WV, Z; = Prunus serotina var. serotina (Elliott) McVaugh – FNA, Y, Z]

* Prunus caroliniana (P. Miller) Aiton, Carolina Laurel Cherry. Cp (FL, GA, NC, SC), Pd* (GA*), Mt* (GA*): native in maritime forests and sandy hammocks near the coast, escaped cultivation to fencerows and suburban forests and thickets in more inland areas; common (uncommon in GA, NC, SC). March-April; September-October. Se. NC south to FL, west to TX, near the coast. [= RAB, FNA, K, WH, Z; = Laurocerasus caroliniana (P. Miller) M. Roemer – S]

* Prunus cerasus Linnaeus, Sour Cherry, Pie Cherry. Mt (NC, VA, WV), Pd (DE, VA), Cp (VA), [GA]: commonly cultivated, disturbed areas; fencerows, suburban forests; rare, native of Eurasia. April-May; June. [= RAB, C, F, FNA, G, K, S, W, WV, Z; = Cerasus vulgaris P. Miller]
* Prunus domestica Linnaeus *var.* *domestica*, European Plum. Pd (VA): suburban forests; rare, native of Europe. Introduced at scattered locations; reported for Manassas National Battlefield Park (Virginia Botanical Associates 2005); also reported for MD, PA, NJ. Depypere et al. (2009) found that *P. domestica* and *P. insititia* were genetically very similar, but generally separable morphologically; they favored combining the two into a single species based on their similarity, variability and likely origin from complicated hybridization and domestication by man. [= K; = Prunus domestica ssp. domestica – C; < Prunus domestica – FNA]

* Prunus domestica Linnaeus *var.* *insititia* (Linnaeus) Fiori & Paoletti, Damson, Bullace. Cp (DE), Pd (VA): uncommonly cultivated, suburban woodlands; rare, native of Europe. [= K; = P. insititia Linnaeus – F, G, Z; = Prunus domestica ssp. insititia (Linnaeus) C.K. Schneider – C; = Prunus domestica Linnaeus *var.* *insititia* (Linnaeus) Fiori & Paoletti – K; < Prunus domestica – FNA]

* Prunus glandulosa* Thunberg, Dwarf Flowering Almond. Cp (NC), Mt (WV): persisting at abandoned homesteads; rare, native of c. and n. China and Japan. [= FNA, K; = Cerasus glandulosa (Thunberg) Sokolov]

* Prunus mahaleb* Linnaeus, Mahaleb Cherry, Perfumed Cherry, St. Lucie Cherry, Rock Cherry. Mt (NC, VA, WV), Pd (DE, NC, VA): roadsides, old homesteads; rare, native of Europe. April-May; July. [= RAB, C, F, FNA, G, K, W, WV, Z; = Cerasus mahaleb (Linnaeus) P. Miller]

**Prunus maritima** Marshall, Beach Plum. Cp (DE, MD, VA?): ocean dunes and sandy coastal soils (from c. MD northward), disturbed dune-like area on shore of Chesapeake Bay (in e. VA); uncommon (rare in MD and VA). Native from NB south to e. MD, along the coast; somewhat disjunct in e. VA in an ambiguously native occurrence. [= C, FNA; > Prunus maritima var. maritima – C; > Prunus maritima – F, G]

* Prunus mume* (Siebold) Siebold & Zuccarini, Japanese Apricot. Pd (NC): suburban forests; rare, native of s. Japan. April-March. Documented as naturalizing in Battle Park, University of North Carolina, Chapel Hill, where apparently spread from cultivation and reproducing as early as 1939. [= Armeniaca mume Siebold]

*? Prunus munsoniana* W. Wight & Hedrick, Munson Plum. Pd (GA, NC, VA), Mt (VA): roadsides; rare. OH, IL, MO, and KS, south to MS and TX; disjunct (introduced?) in GA, NC, VA, and NJ. [= C, F, G, K, S, Z]

* Prunus nigrum* Aiton, Canada Plum. Mt (VA, WV), Pd (VA): old fields, hedgerows, forest edges; uncommon. May-June. NL (Newfoundland) west to MB, south to NY, OH, IN, IL, and IA; apparently disjunct in VA and WV. [= C, F, FNA, G, K, WV]

* Prunus padus* Linnaeus, European Bird Cherry. Pd (DE): suburban woodlands; rare, native of Europe. Cultivated and rarely escaped at least as far south as se. PA (Rhoads & Klein 1993) and DE (Kartesz 1999). [= C, FNA, K]

* Prunus pennsylvanica* Linnaeus f., Fire Cherry, Pin Cherry. Mt (GA, NC, VA, WV): high elevation forests, thickets at high elevations resulting from fire or logging; common (rare in GA). April-May; August-September. NL (Newfoundland) west to BC, south to w. NC, n. GA, e. TN, n. IL, IA, SD, and CO. [= RAB, C, F, FNA, G, K, W, WV, Z; > Prunus pennsylvanica var. pennsylvanica – C; > Prunus pennsylvanica – S (an orthographic variant)]

* Prunus pumila* Linnaeus *var.* *depressa* (Pursh) Gleason, Prostrate Dwarf-cherry, Northern Sand Cherry. Mt (WV): sandy or gravelly shores and islands; rare. NL (Labrador) west to ON, south to NJ, s. PA (Rhoads & Klein 1993), c. WV, and TN. [= C, G, FNA, K, X; = Prunus depressa Pursh – F; < Prunus pumila – WV]

* Prunus serotina* Ehrhart *var.* *serotina*, Black Cherry. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): rich coves, bottomlands, northern hardwood forests, and in a wide variety of lower elevation habitats from dry to mesic, and weedy in fencerows; common. North-May; July-August. NS west to ND, south to c. peninsular FL and e. TX. Several other varieties occur in sc. and sw. America, from c. TX westwards. In the Piedmont and Coastal Plain, *P. serotina* is generally a small, scrubby tree of fencerows and an understory tree in forests and woodlands, but in the Mountains reaching large sizes and full canopy stature. [= K, WH; > Prunus serotina var. serotina – RAB; < Prunus serotina – C, F, G, W; < Padus virginiana – S, misapplied; = Prunus serotina ssp. serotina (FNA, Y, Z)

* Prunus serrulata* Lindley, Japanese Flowering Cherry. Pd (NC): suburban forests; rare, native of Japan. [= FNA, K; = Cerasus serrulata (Lindley) Loudon]

* Prunus subhirtella* Miquel, Higan Cherry, Weeping Higan Cherry, Winter-flowering Cherry. Pd (VA), Mt (NC), Cp (FL): floodplain forests in suburban areas, other disturbed areas; rare, native of e. Asia, commonly planted, rarely escaped, but locally invasive. [= FNA, K; > Prunus subhirtella var. pendula (Maximowicz) = Cerasus subhirtella (Miquel) S.Y. Sokolov]

* Prunus susquehanae* Willdenow, Appalachian Dwarf-cherry, Appalachian Sand Cherry, Susquehanna Cherry. Pd (NC, VA), Mt (NC, VA): open rocky or sandy sites; rare. Sw. ME and sw. QC west to MB, south to nc. and sw. NC, sc. TN (the Barrens region of the Eastern Highland Rim), and IL. Catling (1997) supports species status, based on the greater distinctions of this entity from the other three in the complex. [= F, X; = Prunus pumila Linnaeus var. susquehanae (Willdenow) H. Jaeger – RAB, FNA, K; = Prunus pumila var. cuneata (Rafinesque) L.H. Bailey – C, G; = Prunus cuneata Rafinesque – S; < Prunus pumila – W, Z]

* Prunus umbellata* Elliott, Hog Plum, Flatwoods Plum. Cp (FL, GA, NC, SC), Pd (GA, NC, SC): upland, usually xeric, sandy or rocky forests and woodlands; common. March-April; August-September. S. NC, TN, and AR south to c. peninsular FL and TX. Fox, Godfrey, & Blomquist (1952) report *Prunus mitis* for s. NC (Cleveland County). It is presently unclear how best to treat variation in this complex. [> Prunus umbellata Elliott var. umbellata – K; > Prunus umbellata Elliott var. injuncta (Small) Sargent – K; > Prunus umbellata – RAB, WH, Z; > Prunus umbellata – S; > Prunus mitis Beadle – S; > Prunus injuncta Small – S; = Prunus umbellata var. umbellata – FNA]
**Prunus virginiana** Linnaeus var. virginiana, Choke Cherry. Mt (GA, NC, VA, WV): forming clonal thickets in oak and northern hardwood forests; common (uncommon in WV, rare in GA). Late April-June; July-August. NL (Newfoundland) and NL (Labrador) west to MB, south to w. NC, n. GA, AR, and OK. Other varieties occur in w. North America. [= FNA, K, Z; < *Prunus virginiana* – RAB, C, F, G, W, WV; = *Padus nana* (Du Roi) Roemer – S]

* Prunus cerasifera Ehnhart, Cherry Plum, Flowering Plum, Purpleleaf Plum. Introduced at scattered locations; reported for TN, PA, NJ (Kartesz 1999). [= F, FNA, K]

* Prunus mexicana S. Watson, Big-tree Plum, Mexican Plum. {AL, KY, LA, MS}: streamsides, upland forests, fencerows; rare. IN, IL, and IA, south to AL, MS, LA, TX, and Mexico; reports from further east are apparently in error and based on pubescent material of *P. americana*. [= C, FNA, G, K, S, Z; = *Prunus americana* Marshall var. lanata – F]

* Prunus sargentii Rehder, Sargent Cherry, North Japanese Hill Cherry. Mt (WV): disturbed areas, rare, native of e. Asia. {not yet keyed}

* Prunus tomentosa Thunberg, Nanking Cherry, Korean Cherry. Disturbed areas, suburban forests and woodlands. Naturalized at least as far south as MD Piedmont and PA; native of Asia. April. [= FNA, K]

**Pyracantha** M.J. Roemer 1847 (Firethorn, Pyracantha)

1 Leaf blades ovate to lanceolate or oblanceolate, margins finely crenulate-serrulate, apices acute; young twigs grayish pubescent... *P. coccinea*

1 Leaf blades obovate, oblong-oval, or elliptic, margins remotely serrulate-crenulate or entire, apices obtuse, notched, or apiculate; young twigs brownish or rusty pubescent.

2 Pedicels and hypanthia glabrate at flowering. ................................................................. *P. fortuneana*

2 Pedicels and hypanthia pubescent.

3 Leaf apices obtuse, apiculate, or aristate. .............................................................................. *P. atlantoides*

3 Leaf apices notch ed or truncate. ............................................................................................... *P. koidzumii*

* Pyracantha atlantoides* (Hance) Stupf. {AL, GA}; rarely escaped or persistent, native of China. [= Y]

* Pyracantha fortuneana* (Maximowicz) H.L. Li, Chinese Firethorn. Cp (AL, FL), Pd (AL), Mt (SC). {GA, NC}: planted, rarely escaped or persistent, native of China. May-July; October-December. Reported for AL, SC, and TX (Nesom 2010a). [= K, WH, Y; > *P. crenatiflora* (Hance) Rehder]

**Pyrus** Linnaeus 1753 (Pear)

1 Fruit pyriform; flowers 2.5-3 cm across; leaves crenate; styles 5 .................................................. *P. communis*

1 Fruit subglobose; flowers either 2.25 cm or 3-3.5 cm across; leaves serrate; styles 2 or 5 (rarely 3 or 4).

2 Fruit ca. 1 cm in diameter; styles 2 (-3). ....................................................................................... *P. calleryana*

2 Fruit 3-10 cm in diameter; styles (4-) 5. ............................................................................................ *P. pyrifolia*

* Pyrus pyrifolia* (Burmann f.) Nakai, Oriental Pear, Japanese Pear, Chinese Pear. Cp (VA), Pd (VA), Mt (WV): planted, persistent around old houses and in orchards; uncommon, native of Asia. April; August-October. [= F, K, Z]

Rhaphiolepis Lindley 1820 (Asian-hawthorn)

A genus of about 15 species, shrubs, of e. Asia.
Rhodotypos Siebold & Zuccarini 1841 (Jetbead)

Identification notes: Distinguished by its opposite leaves and black, beadlike fruits.

* Rhodotypos scandens (Thunberg) Makino, Jetbead. Pd (DE, NC, SC, VA), Mt (WV), Cp (DE, VA): suburban woodlands, disturbed areas, road sides, old house sites, well established locally; uncommon (rare in NC, SC, VA, and WV, rare in DE Coastal Plain), native of e. Asia. Late March-May. [= C, F, G, K, WV; ? R. tetrapetalus (Siebold) Makino]

Rosa Linnaeus 1753 (Rose)

A genus of more than 100 species, shrubs or woody vines; mainly of north temperate regions. Many cultivars cannot be readily identified to species. References: Joly & Bruneau (2007)=Y; Lewis (2008); Robertson (1974)=Z; Kalkman in Kubitzki (2004). Key adapted in part from FNA and Y.

1 Stipules adnate to the petiole only basally, for < ½ their length; vigorous climbing vines, 3-5 (-10) m tall; petals white.

2 Stems brown-tomentose, stipitate-glandular; terminal leaflet petiolules 3-5 mm; pedicels tomentose, 3-6 mm; hypanthium subglobose, white tomentose; [section Bracteatae] ................................................................. **R. bracteata**

3 Styles connate into a column which protrudes from the orifice by 3-6 mm (sometimes separating in fruit); stipule margins and auricles deeply laciniate (or entire to ciliate in *R. setigera*); vines, climbing and scrambling to 4 m tall; [section Systylae].

4 Leaflets 3-5; stipule margins and auricles mostly entire or ciliate; inflorescences laxly corymbose; flowers 3-5 cm in diameter, petals single, rose-purple to pink; carpels 20-25, styles glabrous, exserted 5-6 mm beyond the orifice; [native] ................................. **R. setigera**

5 Petioles 5-12 mm, tomentose, stipitate glandular at least near the base; flowers 1.5-2.5 cm in diameter; hypanthium 2 mm × 1-1.5 mm, eglandular or stipitate-glandular; carpels 6-11, styles glabrous, exserted 3-4 mm beyond the orifice (0.5-1 mm in diameter) of conical discs (2-3 mm in diameter) ................................................................. **R. luciae**

6 Sepals either lobed or with broadened apices, or if entire then spreading, reflexed, or deciduous from fruit; flowers solitary or corymbose.

7 Fruit blackish when ripe, 8-16 mm in diameter; petals 1-2.5 mm long; pedicel lacking a clasping bract, though often with a modified 3-foliolate leaf; [section Pimpinellifoliae] ................................................................. **R. spinosissima**

8 Inflorescence of a solitary flower (rarely with a few laterals), the paired bracts on the pedicel caducous; [section Gallicae].

9 Leaves not glandular-ciliate (or only remotely so); leaves not rugose ................................................................. **R. ×damascena**

10 Inflorescence either corymbose, or of a solitary flower and its pedicel subended by persistent bracts.

11 Sepals disparate in size and shape, the outer pinnatifid with leafy segments; orifice of the hypanthium ca. 1 mm in diameter, the styles slightly exerted; [aliens]; [section Caninae].

12 Sepals 5 mm tall, prickles all similar; leaflets abaxially glabrous or rarely pubescent on midveins, eglandular; bracts 6-18 mm × 4-5 mm, glabrous; sepals abaxially eglandular ................................................................. **R. canina**

13 Stems to 5 m tall, prickles of varying sizes; leaflets abaxially pubescent or tomentose, rarely glabrous, glandular; bracts 13-15 mm × 5-7 mm, tomentose; sepals abaxially densely stipitate-glandular.

14 Sepals 6-10 mm × 2-4 mm, margins mostly stipitate-glandular; leaflet blades 10-22 mm × 8-15 mm, abaxial surfaces glabrous or pubescent; glands of the leaves apple-scented; bracts caducous, glabrous, margins stipitate-glandular; pedicels 6-9 mm long, densely stipitate- or setose-glandular; flowers 2.5-4 mm in diameter, hips red, 10-25 mm × 10-22 mm, sepals subpersistent ................................................................. **R. rubiginosa**

15 Sepals 10-16 (-20) mm × 3-4 mm, margins densely glandular-ciliate; leaflet blades 15-30 (-60) mm × 8-22 (-50) mm, abaxial surfaces tomentose; glands of the leaves resin-scented; bracts persistent, tomentose, margins ciliate-glandular; pedicels (11-) 20-35 mm long, densely stipitate-glandular; flowers 3.5-5 cm in diameter, hips dark red, 10-15 mm × 10-12 mm, sepals caducous before hips mature ................................................................. **R. tomentosa**

16 Sepals 5 or more; [native to North America (some populations may be locally introduced)].

17 Sepals (3-) 4-7 (-9); [native to North America (some populations may be locally introduced)].
14 Hypanthium glabrous.
15 Long and straight prickles present throughout the stems. .............................................. R. acicularis ssp. sayi
15 Prickles absent from the stems, or present and short or curved.
16 Infrastipular prickles stout and broad-based. ................................................................. R. carolina
16 Infrastipular prickles absent or not especially stout or broad-based.
17 Lower leaf surface with generally < 2 hairs per mm²; infrastipular prickles always absent on new stems; bristles always present on new stems; leaflets 7-9 ................................................................. R. arkansana
17 Lower leaf surface with generally > 2 hairs per mm²; infrastipular prickles present or absent on new stems; bristles generally absent on new stems; leaflets 5-7 ................................................................. R. blandia
14 Hypanthium with glands.
18 Bristles present on new branches.
19 Infrastipular prickles absent. ............................................................................................. R. arkansana
19 Infrastipular prickles present. ......................................................................................... R. carolina
20 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infrastipular prickles, lacking internodal prickles or aciculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) ........................................... R. carolina ssp. carolina
20 Fertile branches armed with straight, thin or often stout, circular or flattened infrastipular prickles, with internodal prickles of small prickle, aciculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, or upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular ................................................................. R. carolina ssp. subsperrulata
18 Bristles absent on new branches.
21 Leaflets 3.5-5× as long as wide; leaves with (5-) 7-9 (-11) leaflets; [c. MS westwads] .................. [R. foliolosa]
21 Leaflets 1-3× as long as wide; leaves with (3-) 5-7 (-9) leaflets; [collectively widespread].
22 Hypanthium typically with > 86 glands; terminal leaflet oblong, generally with 20-30 small teeth per side. ...........
22 Hypanthium typically with < 86 glands; terminal leaflet ovate, elliptic, or obovate, with 10-18 (<23) small teeth per side.
23 Bristles absent on new stems; auricles > 3.8 mm long; stipules > 1.1 mm wide; infrastipular prickles stout, broad-based, and often curved ................................................. R. virginiana
23 Bristles present or absent on new stems; auricles < 3.8 mm long; stipules < 1.1 mm wide; infrastipular prickles slender and not especially broad-based or curved.
24 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infrastipular prickles, lacking internodal prickles or aciculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) ........................................... R. carolina ssp. carolina
24 Fertile branches armed with straight, thin or often stout, circular or flattened infrastipular prickles, with internodal prickles of small prickle, aciculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular ................................................................. R. carolina ssp. subsperrulata

Rosa blanda Aiton, Smooth Rose, Meadow Rose. Mt (WV), Pd (VA): rocky forests; rare. QC west to MB, south to s. PA (Rhoads & Klein 1993), MD, VA, WV (Harmon, Ford-Wernitz, & Grafton 2006), OH, IN, IL, MO, KS, and MT. [= C, F, N, G, Y; > R. blanda var. blanda – K]

Rosa × damascena P. Miller (pro sp.) [R. gallica Linnaeus × moschata J. Herrmann], Damask Rose. Mt (NC): disturbed areas; rare, persistent after cultivation, native of Europe. May-June; September-October. [= K; = R. damascena P. Miller – RAB]

Rosa gallica Linnaeus, French Rose. Cp (DE), Mt (NC, VA), Pd (SC, VA): disturbed areas; uncommon (rare in NC, SC, and VA), native of Europe. May-June; September-October. There is a question as to whether the name R. gallica can be used; if not, it would be replaced with R. austrica. Represented by many cultivated forms, some involving complex hybridization with...
other species. *R. × damascena* P. Miller is apparently a hybrid of *R. gallica* and *R. moschata* J. Hermann. = RAB, C, F, G, K, Z; *R. austriaca* Crantz

**Rosa laevigata** Michaux, Cherokee Rose. Cp (FL, GA, NC, SC), {VA}: roadsides, moist forests; common (rare in NC, rare [if present] in VA), native of China. Late March–April; September–October. = RAB, FNA, K, S, WH, Z

**Rosa spinosissima** Linnaeus, Scotch Rose. Mt (VA): cultivated and rarely escaped; rare, native of Eurasia. = F, FNA, G, K; > *R. pimpinellifolia* Linnaeus – C

**Rosa tomentosa** J.E. Smith. {NC} = C, F, FNA, K, S

**Rosa virginiana** P. Miller, Virginia Rose. Pd (DE, VA), Cp (DE, WV), {GA, NC}: moist to dry forests and woodlands; uncommon (rare in DE, VA, and WV). May–June; August–October. NL (Newfoundland) and ON south to GA, AL, and MO. C. TN (Chester, Wofford, & Krul 1997), e. and c. KY (Clark et al. 2005). = C, F, G, K, S, W, Y; > *R. virginiana var. virginiana* – K

**Rosa chinensis** Thunberg, Chinese Rose. Cp (AL, MS), {VA}. Reported for AL, MS, and VA (BONAP 2010). = K [not yet keyed]

**Rosa × dametorum** Thuillier (pro sp.). {KY} Introduced in KY. = K [not yet keyed]

**Rosa moschata** J. Hermann, Musk Rose. Allegedly introduced in AL. = K, S [not yet keyed; investigate]

**Rosa rubifolia** Villars, Red-leaf Rose. (SC) Reported for SC (Kartesz 1999). = K

**Rosa xanthina** Lindley, Yellow Rose. Reported for SC (Kartesz 1999). = K [not yet keyed]

**Rubus** Linnaeus 1753 (Blackberry, Raspberry, Dewberry, Wineberry, Bramble)

A genus of about 250 species (if treated conservatively) or 2000-3000 microspecies, shrubs (and a few herbs), almost cosmopolitan in temperate areas. References: Robertson (1974)–Z; Alice & Campbell (1999); Widrlechner (1998); Kalkman in Kubitzki (2004).

**Identification Notes:** All of our species of *Rubus* except *R. dalibarda*, *R. odoratus*, and *R. pubescens* have biennial stems. The first year the stems remain sterile and are termed **primocanes**. The second year, these stems produce lateral branches with flowers and are termed **floricanes**. Primocane and floricanes leaves differ.

1 Leaves simple.
   2 Leaves unlobed, elliptic to ovate-oblanceolate, finely toothed, 1.5-3 cm long; plant an herb, < 1 dm tall; petals white = *R. dalibarda* – flowering raspberries
   2 Leaves palmately lobed, orbicular, coarsely toothed, 9-30 cm long; plant a shrub, 10-20 dm tall; petals deep pink; > *subgenus Anopolobatus*

1 Leaves 3-9-foliolate (reduced simple leaves may also be present in the inflorescence).
   2 Upright stems herculean, annual, not differentiated into primocanes and floricanes, unarmed or with a few weak bristles; stipules ob lanceolate; C. WV northwards; > *subgenus Cylactus – dwarf raspberries* = R. odoratus
   2 Upright stems woody, biennial, differentiated into primocanes and floricanes, these usually well-armed with bristles and/or curved prickles; stipules linear; [collectively widespread]

3 Fruit separating from the receptacle, the receptacle remaining on the pedicel; stems either strongly white-glaucous (*R. occidentalis*), or densely beset with slender-based prickles and bristles (*R. ideoeus*), or densely pubescent with 3-5 mm long glandular hairs (*R. phoenicolasius*), or if not as above then the leaves pinnately 5-9-foliolate (*R. illecebrosus*); > *subgenus Idaeobatus – raspberries*

4 Floricanes leaves pinnately 5-9-foliolate
   5 Flowering raspberries
   5 Floricanes leaves 1-3-foliolate.

5 Inflorescence panicleiform, many-flowered; berries sticky, purplish-red, lacking a glaucous bloom = R. phoenicolasius

6 Fruit black (rarely yellow); pedicels with stout curved prickles; stems (at least the primocanes) strongly white-glaucous

Rubus canadensis Linnaeus, Smooth Blackberry, Thornless Blackberry. Mt (GA, NC, SC, VA, WV): forests, woodlands, grassy balds, especially at high elevations; common. June-July; July-August. NL (Newfoundland) west to MN, south (primarily in the Appalachians) to w. NC, e. TN, and n. GA. [= RAB, C, G, K, S, W, WV]

Rubus cuneifolius Pursh, Sand Blackberry. Cp (DE, FL, GA, NC, SC), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): woodlands, forests, disturbed areas; common (rare in Mountains). Late April-early June; June-July. CT and NY (Long Island) south to s. FL and AL, MS, and sc. LA, primarily on the Coastal Plain. [= RAB, C, G, GW, S, W; > R. cuneifolius var. cuneifolius – F; > R. cuneifolius var. subellipticus Fernald – F; > R. cuneifolius – K; > R. longii Fernald – F; K; > R. probabilis L.H. Bailey – K; > R. sejunctus L.H. Bailey – F]

Rubus dalibarba Linnaeus, Dewdrop, Robin-runaway, Star-violet. Mt (NC, VA, WV): bog margins and mountain swamp forests, often along spring seeps, mostly in dense shade beneath *Rhododendron maximum*; rare. June-September. NL (Newfoundland) west to MI and MN, south to NJ and OH, and disjunct to WV, sw. VA, and w. NC. [= Dalibarda repens Linnaeus – RAB, C, G, GW, S, W, WV; > R. repens (Linnaeus) Kunze]

**ROSACEAE**

*Sanguisorba* Linnaeus 1753 (Burnet)

1 Leaflets pinnatifid (each leaflet incised nearly to the midvein).................................................................[Poterium annuum]
2 Leaflets toothed (the incisions not nearly to the midvein).
ROSACEAE

2 Leaflets 3-10 cm long; inflorescence 6-30 cm long, spike-like; stamens 4 per flower, the filaments 8-10 mm long; sepals white (sometimes fading greenish); [native] .........................................................Sanguisorba canadensis

2 Leaflets 0.8-2 cm long; inflorescence 1-2 cm long, globose; stamens 15-20 per flower, the filaments 3-4 mm long; sepals green to pinkish-purple; [cultivated, occasionally escaped] .........................................................[Poterium minor ssp. mucicata]

Sanguisorba canadensis Linnaeus, Canada Burnet, American Burnet, White Burnet. Mt (GA, NC, SC, VA, WV), Cp (DE): fens, seepage over mafic or ultramafic rocks (such as amphibolite, greenstone, serpentinite), spray zones around waterfalls, other seepage wetlands, wet meadows; rare. Late July-September. NL (Newfoundland) and NL (Labrador) west to MB, south to NJ, PA, OH, and IN; disjunct southwest in KY, nc. VA, and from sw. VA south to sw. NC, ne. TN, and ne. GA. First reported for SC by Hill & Horn (1997) and Hill (1999). [= RAB, C, F, FNA, G, GW, K, S, W, WV, Z]

Sibbaldia Linnaeus 1753 (Sibbaldia, Mountain-cinquefoil)

A genus of 5-7 species, subshrubs, circumboreal, of n. Eurasia and n. North America. Our single species, has been variously also treated in Potentilla and Sibbaldiopsis. Many recent studies (see references) have shown that it is not closely related to Potentilla, and falls into a group of genera including Sibbaldia, Comarum, Alchemilla, Aphanes, Drymocallis, Dasiphora, and Fragaria (Lundberg et al. 2009; Potter et al. 2007; Eriksson et al. 2003). I here follow Lundberg et al. (2009) and Paule & Sojak (2009), who further demonstrate that Sibbaldiopsis is embedded in Sibbaldia and is best transferred there. References: Paule & Sojak (2009)=Z; Lundberg et al. (2009); Potter et al. (2006); Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

Sibbaldia tridentata (Aiton) Paule & Sojak, Mountain-cinquefoil, Three-toothed Cinquefoil, Mountain White Potentilla, Wine-leaf Cinquefoil, White Sibbaldia. Mt (GA, NC, TN, VA, WV): grassy balds, crevices of rock outcrops at high (rarely moderate) elevations, high elevation glades; rare (though sometimes very locally abundant). June-August; July-September. Greenland and NL (Newfoundland) west to NT, south to ND, IA, WI, MI, s. ON, and NS, and in the mountains to w. VA, ne. TN, and ne. GA. (at progressively higher elevations southward). Showy in flower, and also in leaf from late summer on, when the leaves tend to turn a rich burgundy red. Though appearing herbaceous, *S. tridentata* is really an evergreen sub-shrub. [= Z; = Sibbaldiposis tridentata (Aiton) Rydberg – K, S; = Potentilla tridentata Aiton – RAB, C, F, G, W, WV]

Sorbaria (Seringe) A. Braun 1860

*Sorbaria sorbifolia* (Linnaeus) A. Braun, False Spiraea. Mt (WV): disturbed areas; rare, native of Asia. Cultivated and naturalized at least as far south as s. PA (Rhoads & Klein 1993), MD, and WV. Reports of it in VA (Massey 1961, repeated in Kartesz 1999) are apparently based only on cultivated plants. [= C, F, G, K]

Sorbus Linnaeus 1753 (Mountain-ash, Rowan)

A genus of about 250 species, trees and shrubs, of mainly temperate Northern Hemisphere. References: McAllister (2005)=Y; Jones (1939)=Z; Aldasoro et al. (2004). [also see Aronia]

1 Branches and lower leaf surfaces glabrous (or inconspicuously and sparsely pubescent); winter buds glutinous; [native tree] ......S. americana
1 Branches and lower leaf surfaces densely white-villous; winter buds white-villous; [introduced tree] .......................S. aucuparia ssp. aucuparia

Sorbus americana Marshall, Mountain-ash, American Rowan. Mt (GA, NC, VA, WV), Pd (NC): high elevation forests, balds, and high elevation rock outcrops, often with Picea, Abies, and/or Betula alleghaniensis; common (rare in NC Piedmont, rare in GA). June-July; September-October (persisting well into winter). NL (Newfoundland) west to MN, south to PA, w. NC, e. TN, ne. GA, and n. IL. This small-to-medium tree is showy in most seasons; in the summer its creamy-white corymbs are attractive, the leaves turn a bright orange-red in fall, and the red berries persist well into winter. [= RAB, C, G, K, S, W, Y, Z; = Pyrus americana (Marshall) A.P. de Candolle – F, WV]

*Sorbus aucuparia* Linnaeus ssp. aucuparia, Rowan, European Mountain-ash. Mt (WV): disturbed areas; rarely cultivated; rare, native of n. Europe. A planted tree and escape (sometimes appearing naturalized), south to s. PA (Rhoads & Klein 1993), MD, DE, WV (Kartesz 1999), and DC (Jones 1939). Also reported for SC by Kartesz (1999), supposedly based on Jones (1939), but Jones (1939) does not mention SC in his account of *S. aucuparia*. [= Y; < S. aucuparia – C, G, K, Z; < Pyrus aucuparia (Linnaeus) Gaertner – F, WV]

Spiraea Linnaeus 1753 (Spiraea, Meadowsweet, Hardhack)

A genus of about 80-120 species, shrubs, of north temperate areas (especially Asia). Many species and hybrids are cultivated, and additional taxa to those treated below may be encountered as persistent or escaped. References: Lis in FNA (in press); Robertson (1974)=Z; Rehder (1940); Uttal (1974); Kalkman in Kubitzki (2004).
ROSACEAE

1 Inflorescence a simple umbel; flowers white; [section Chamaedryon]; [alien].

2 Flowers 10-15 mm in diameter.

3 Leaves 2-7 cm long, coarsely serrate and sometimes also slightly 3-lobed; inflorescences with > 6 flowers; S. cantoniensis

4 Flowers 6-10 mm in diameter.

5 Leaf blades linear to lanceolate, 2.5-4 cm × 0.3-1 cm, < 4· as long as wide; flowers 6-8 mm in diameter; S. thunbergii

6 Leaf blades ovate to oblique, 3.5-5 cm × 2-3 cm, < 2· as long as wide; flowers 7-10 mm in diameter; S. vanhouttei

1 Inflorescence a compound corymb or panicle; flowers white, pink, or red; [native or alien].

5 Inflorescence a corymb, flat-topped or rounded, broader than long; [section Calopula]

6 Leaves rounded, obtuse, or acute at the apex; petal white (rarely pink); [native].

7 Leaves 1-4 (-5) cm long, finely serrulate, not lobed; inflorescences with 3-6 flowers; S. prunifolia

8 Leaves pubescent on the veins beneath; flowers usually pink (rarely white); shrub to 15 dm tall; S. virginiana

3 Inflorescence a panicle, longer than broad; [section Spiraea].

9 Lower leaf surface densely tomentose with white, tawny, or rustyomentum which obscures the surface.

10 Follicles glabrous; [alien, rare] S. ×bumbalda

10 Follicles pubescent; [native, common in boggy woodlands] S. ×tomentosa

11 Lower leaf surface glabrous or with a few scattered hairs that do not obscure the surface.

12 Leaves lanceolate to oblong-lanceolate, widest at or below the middle; flowers pink; [alien, rarely escaped or persisting] S. salicifolia

11 Leaves oblanceolate to oblong, widest above or at the middle; flowers white (rarely slightly pink); [native, of bogs, stream-banks, swampy areas, or moist to dry rocky areas].

13 Leaves 3-5 (-8)× as long as wide, finely and sharply toothed; inflorescence, hypanthium, and sepals pubescent; sepals usually obtuse; twigs yellow-brown to brown; S. alba

12 Leaves 2-3× as long as wide, coarsely and bluntly toothed; inflorescence, hypanthium, and sepals usually glabrous or nearly so; sepals usually acute; twigs red-brown to purple-brown; S. latifolia

Spiraea alba Du Roi, Narrowleaf Meadowweet, Pipestem. Mt (NC, VA, WV), Pd (DE, VA): bogs, boggy streambanks, seepages; uncommon (rare in DE and NC). June-September; August-October. QC west to AB, south to NC, IN, and MO. There is considerable disagreement over whether S. alba and S. latifolia represent two species with some introgression in areas of overlap, two varieties, or a variable or clinal species. [= F, FNA, G, S, W, WV, Z; = S. alba var. alba – RAB, C, GW, K]

* Spiraea ×bumbalda Burven [S. albiflora × japonica]. Pd (VA): cultivated, escaped or persisting; rare, native of cultivation, both parents from Asia. [= FNA, K]

* Spiraea cantoniensis Loureiro. Cp (AL, GA, LA, NC): roadsides; rare, native of Asia. S. cantoniensis has been collected twice on Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Soirie, pers. comm.). Also reported for other scattered states in N. America (AR, AL, LA, NY) and Kentucky (FNA 1999, FNA). [= FNA, K]

Spiraea corymbosa Rafinesque, Dwarf Spiraea, Rock Spiraea. Mt (NC, VA, WV), Pd (NC, VA), (GA?): rocky forests and woodlands, granitic domes, dry slopes of Piedmont monadnocks, rocky slopes in partial sun; common (rare in NC and WV). June-August; Southern and Central Appalachian endemic: SC PA and MD south through w. VA, e. WV, to nw. NC, and perhaps also to e. TN (?), to n. AL (?), apparently fairly common only in w. VA. The species is limited to only a few counties each of NC and WV (Franklin 2004, Straubhaug & Core 1978), and is not listed for TN in Chester, Wofford, & Kral (1997). Although Mohr (1901) listed the species for AL, it is not listed as a part of the state's woody flora by Clark (1971). S. corymbosa is related to S. lucida (Deanes ex Greene [= S. betulifolia var. lucida (Deanes ex Greene) C.L. Hitchcock] of the Rocky Mountains, S. betulifolia [= S. betulifolia var. betulifolia] of ne. Asia (Japan, e. Siberia, ne. China, Sakhalin, and the Kurile Islands, and S. aemiliana Schneider [= S. betulifolia var. aemiliana (Schneider) Koidz.]. The group is often treated as 4 varieties or subspecies of S. betulifolia, but the morphological differences and strongly disjunct distribution seem to warrant treatment as a relictual complex of related species. See Uttal (1974, Greene 1992), and others listed in Robertson (1974) for additional discussion and a range of conclusions. [= F, FNA, S, WV; < S. betulifolia – RAB; = S. betulifolia Pallas var. corymbosa (Rafinesque) Maximowicz – C, G, K, W, Z; = S. betulifolia ssp. corymbosa (Rafinesque) Taylor & MacBryde]

Spiraea latifolia (Aiton) Burkhart, Broadleaf Meadowsweet. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): bogs, seeps, and rock outcrops (glades) over amphibolite, greenstone, olivine, and granite; uncommon (rare in DE, GA, and NC, rare in Piedmont and Coastal Plain). June-September; August-October. NL (Newfoundland) west to MI, south to e. VA and w. NC. [= FNA, G, S, W, WV, Z; = S. alba var. latifolia (Aiton) Dippel – RAB, C, GW, K; = S. latifolia var. latifolia – F]

* Spiraea prunifolia Siebold & Zuccarini, Bridal-wreath Spiraea. Mt (VA, WV), Pd (DE, VA), Cp (AL, MS, LA, NC, VA): cultivated, escaped or persisting; uncommon (rare in AL, DE, LA, MS, and WV), native of China, Korea, and Taiwan. [= C, FNA, G, K]
**Spiraea salicifolia** Linnaeus, Willowleaf Spiraea. Mt (GA, NC, VA), Pd (VA), Cp (MS, VA): cultivated, escaped or persisting; rare, native of Eurasia. [= C, FNA, K]

**Spiraea thunbergii** Siebold ex Blume. Mt (GA), Cp (AL, LA, MS, NC): roadsides; rare, native of Asia. *S. thunbergii* has been collected from roadside at Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also GA, MS, and MD (FNA). [= C, FNA, K]

**Spiraea triloba** Linnaeus var. triloba, Asian Meadowsweet, Three-lobed Spiraea. Disturbed areas; native of c. Asia. Reported by Will Cook from Wake County, NC (Cook, pers. comm. 2011). [ ] (not yet keyed)

**Spiraea ×vanhouttei** (C. Briot) Carrière [S. cantoniensis × trilobata], Bridal-wreath Spiraea. Pd (NC), Mt (WV); cultivated, escaped or persisting; rare, introduced from cultivation, the two parents both from Asia. [= FNA, K, Z; = C. vanhouttei – C, G]

150. **ELAEAGNACEAE** A.L. de Jussieu 1789 (Oleaster Family) [in ROSALES]

A family of 3 genera and 30-50 species, shrubs, small trees, and lianas, of temperate Eurasia and North America, and tropical Asia and Australia. References: Bartish & Swenson in Kubitzki (2004).

_Elaeagnus_ Linnaeus 1753 (Silverberry, Oleaster, Russian-olive)

1 Flowering in the fall (October-November) and fruiting in the spring (March-April); leaves evergreen; branches usually spiny....... *E. pungens*

2 Fruit reddish-brown or pinkish, lepidote with silver and brown scales; leaves with a mixture of silver and bronze scales beneath. .......................... *E. angustifolia*

3 Fruit 10-15 mm long, bright red; fruiting pedicel 15-25 mm long; hypanthium tube about as long as the separate calyx lobes..............

3 Fruit 6-8 mm long, silvery red; fruiting pedicel 8-12 mm long; hypanthium tube about 2× as long as the separate calyx lobes..............

*Elaeagnus pungens* Thunberg, Thorny-olive, Autumn Silverberry. Forests and woodlands in suburban areas, spread by birds; native of Japan. October-November; March-April. [= RAB, K]

*Elaeagnus umbellata* Thunberg var. parvifolia (Royle) Schneider, Autumn-olive, Spring Silverberry. Forests and woodlands, spread by birds; native of Japan and China. April-May; August-September. This species has rapidly become a noxious weed shrub, still unfortunately sometimes promoted for "wildlife plantings." The rapidity of its increase may be judged by its treatment in Strausbaugh & Core (1978) as not definitely naturalized in WV; Harmon, Ford-Werntz, & Grafton (2006) map it for every county of WV. [= K; < *E. umbellata* – RAB, C, F, G, W, WV; < *E. umbellatus* – S, orthographic variant]

151. **RHAMNACEAE** A.L. de Jussieu 1789 (Buckthorn Family) [in ROSALES]

A family of about 50-52 genera and 900-925 species, mostly trees, shrubs, and lianas, cosmopolitan in distribution. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Richardson et al. (2000a, 2000b); Medan & Schirarend in Kubitzki (2004).
1 Plant a woody vine.
2 Leaf margins entire; tendrils absent; [widespread in our area]; [tribe Rhamnaceae]..............................................................................................Berchemia
2 Leaf margins serrate to crenate; tendrils present; [of ne. FL southwards]; [tribe Gouaniae].................................................................Gouania
1 Plant a shrub or small tree.
3 Leaves with 3 prominent veins from near the base.
4 Plants not spiny; fruit dry, capsular; [native]; [tribal placement uncertain]...............................................................Ceanothus
4 Plants armed with stipular spines; fruit pulpy; [alien, cultivated and escaped]; [tribe Pallireae]......................................................Ziziphus
3 Leaves with prominently pinnate venation, the lowermost lateral veins no more prominent than others.
5 Leaves opposite, 2-4 cm long; [of shell middens and shell hammocks in the outer Coastal Plain of NC and SC]; [tribe Rhamnaceae]......
.............................................................................................................................Sageretia
5 Leaves alternate (or opposite in Frangula and some Rhamnus), 3-15 cm long; [of various habitats in the Piedmont and Mountains (rarely Coastal Plain) of VA, NC, and SC]
6 Inflorescence repeatedly branched dichotomously; peduncles fleshy and reddish in fruit; nectariferous disc pubescent; [tribe Pallireae] ..............................................................Frangula
6 Inflorescence not repeatedly branched dichotomously; peduncles not fleshy; nectariferous disc glabrous; [tribe Rhamnaceae].
7 Winter buds naked, pubescent; flowers perfect, sepals, stamens, and petals 5; style undivided; leaves with 8-10 lateral veins on either side of the midvein........................................................................................................................................RHAMNUS
7 Winter buds with bad scales; flowers functionally unisexual, sepals and stamens 4 or 5 (the stamens rudimentary in the pistillate flowers), petals 9 or 4 (never 5); style divided 1/3 to 2/3 its length into 2, 4 or 5 segments; leaves with (2-) 3-9 lateral veins on either side of the midvein........................................................................................................................................RHAMNUS

Berchemia Necker 1825 (Supplejack)

Identification notes: The young stems are shining and reddish; older stems can reach 10 cm in diameter, with bark medium gray and smooth (though often marred by sap wells drilled by Yellow-bellied Sapsuckers). The smooth bark and neatly pinnately-veined leaves are distinctive.

Berchemia scandens (Hill) K. Koch, Supplejack, American Rattan. Cp (FL, GA, NC, SC, VA), Pd (GA, NC), Mt (GA): swamp forests, bottomlands, streambanks, in mesic to even xeric uplands over calcareous rock or sediment; common (rare in Piedmont). April-May; August-October. Se. VA south to s. FL, west to TX, north in the interior to nc. TN, w. TN, s. IL, and s. MO. Berchemia climbs high into the crowns of swamp trees. [= C, F, FNA, G, GW, K, RAB, S, WH, Z]

Ceanothus Linnaeus 1753 (Redroot, New Jersey Tea)

Ceanothus americanus Linnaeus var. americanus, Common New Jersey Tea. woodland borders, dry woodlands, glady openings, dry ridge forests and woodlands (pine or oak) in the Mountains. May-June; June-July. ME west to s. MB, south to FL Panhandle and TX. [= C, F, G, X, Y, Z; < C. americanus – FNA, K, RAB, W, WH; = C. americanus – S]

Ceanothus americanus Linnaeus var. intermedius (Pursh) Torrey & A. Gray, Southern New Jersey Tea. Sandhills, dry sandy woodlands and forests, rocky openings around granitic or quartzitic rocks in the Piedmont. May-June; June-July. NJ (or possibly MA) south to c. peninsular FL, west to LA, mostly on the Coastal Plain, but disjunct inland to sandy soils around outcrops of siliceous rocks. The recognition of infraspecific taxa in the variable C. americanus is uncertain; var. intermedius may either represent ecological forms, or the variation may be too clinal to make taxonomic recognition rewarding. However, material from our area (and beyond) sorts relatively easily, with some intermediates from the Piedmont; varietal status seems provisionally appropriate. [= C, F, G, X, Y, Z; < C. americanus – FNA, K, RAB, W, WH; = C. intermedius Pursh – S]

Ceanothus herbaceus Rafinesque, Prairie Redroot. Flood-scoured rocky riverbanks. April-May. Primarily midwestern: MI west to MT, south to nw. IN, AR, TX, and Mexico; disjunct eastward in QC, NH, VT, NY, DC, and n. VA (?- Arlington County). Rafinesque described C. herbaceus from "near the falls of the Potomack, between the rocks." The holotype not extant, Coile (1988) chose a neotype, collected by Sheldon in 1881 from "Arlington County, Virginia, Chain Bridge, rocky river bottoms, Potomac River." However, Bartgis, Fleming, & Wiegand (1997) indicate that C. herbaceus in the Washington, D.C.
area can only be ascribed with certainty to DC. [= FNA, K, X, Y, Z; = C. ovatus Desfontaines – F, S, misapplied; = C. pubescens (Torrey & A. Gray ex S. Watson) Rydberg ex Small – S]

*Ceanothus microphyllus* Michaux. Sandhills. E. GA south to c. peninsular FL, west to s. AL, approaching to within a few kilometers of SC (in Screven and Chatham counties, GA), and should be sought in se. SC (except that its outlandish appearance makes it difficult to overlook!). *C. ×serpyllifolius* Nuttall (pro sp.) is apparently a hybrid of *C. americanus* var. *intermedius* and *C. microphyllus* (Coile 1988); it is known from scattered sites in FL and GA. [= FNA, K, S, X, Y, Z]

Frangula P. Miller 1754 (Buckthorn)

A genus of ca. 50 species, shrubs and small trees, of the northern hemisphere. The distinctions between *Frangula* and *Rhamnus* are many and meaningful; their separation at the generic level seems warranted based on morphological and molecular analyses (Richardson et al. 2000a; Bolmgren & Oxelman 2004). References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

1 Leaves entire; leaves ca. 2× as long as wide ................................................................................................................................................... *F. alnus*
1 Leaves serrulate; leaves ca. 3× as long as wide ................................................................................................................................... *F. caroliniana*

*Frangula alnus* P. Miller, European Alder-Buckthorn, Glossy Buckthorn. Forested areas, other disturbed areas; native of Europe. This species is a seriously invasive weed in ne. United States, south to (at least) NJ, s. PA (Rhoads & Klein 1993), KY, and se. TN (Marion County) (Chester, Woford, & Kral 1997, Kral 1981), and w. NC (where recently found in a forested area along the Blue Ridge Parkway). [= FNA, K; = *Rhamnus frangula* Linnaeus – C, F, G]

*Frangula caroliniana* (Walter) A. Gray, Carolina Buckthorn. Dry to moist barrens, woodlands, and forests, Coastal Plain limestone bluffs and shell middens, especially over mafic or calcareous rocks. May-June. Sw. VA west to s. OH and s. MO, south to c. peninsular FL and TX. [= K; = *Rhamnus caroliniana* Walter – FNA, RAB, S, W, WH; > *Rhamnus caroliniana* Walter var. caroliniana – C, F, G, Z]

Gouania Jacquin 1763 (Chewstick)

A genus of ca. 50 species, shrubs, of tropical America. References: Nesom in FNA (in prep.).

Hovenia Thunberg 1781 (Raisin-tree)

Rhamnus Linnaeus 1753 (Buckthorn)

A genus of ca. 150 species, trees and shrubs, of the northern hemisphere. The recognition of *Frangula* as separate from *Rhamnus* is supported by molecular phylogeny (Bolmgren & Oxelman 2004). References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Bolmgren & Oxelman (2004); Medan & Schirarend in Kubitzki (2004). [also see *Frangula*]

1 Leaves mostly opposite or subopposite (or some alternate), mostly with (2-) 3-6 lateral veins on either side of the midrib; plant a large shrub or small tree, to 10 m tall; fruit with 4 stones; [aliens, mostly of moist (but not boggy) soils].
2 Leaves mostly 1-2× as long as wide, with (2-) 3 (-4) lateral veins on either side of the midrib; style divided ½ its length into 4 segments....
   ........................................................................................................................................................................................................... *R. cathartica*
2 Leaves mostly 2-3× as long as wide, with 4-6 lateral veins on either side of the midrib; style divided ½ its length into 2 segments ........
   ............................................................................................................................................................................................................ *R. davurica*
Rhamnaceae

1 Leaves alternate, mostly with (4-)6-9 lateral veins on either side of the midrib; plant a shrub to 2 m tall; fruit with 2-3 stones; [natives of various, calcareous habitats].

3 Sepals and stamens 5; petals 0; fruit with 3 stones; [of mafic or calcareous peaty wetlands and seeps] .......... R. alnifolia

3 Sepals and stamens 4; petals 4; fruit with 2 stones; [of dry to moist calcareous woodlands and thickets].

4 Young leaves and young branches glabrous or with scattered hairs; mature leaves glabrous below .......... R. lanceolata var. glabrata

4 Young leaves and young branches pubescent; mature leaves soft pubescent below ........................................... R. lanceolata var. lanceolata

* Rhamnus cathartica Linnaeus, Common Buckthorn. Disturbed areas; native of Eurasia. April-June. Reported for VA by Harvill et al. (1991), but the report is actually based on specimens of R. davurica (Virginia Botanical Associates 2005); now bonafide specimens have been found in Giles and Wythe counties (T.F. Wieboldt, pers. comm. 2009). [= C, F, FNA, G, K, Z]

Rhamnus cathartica

* Rhamnus davurica Pallas, Dahurian Buckthorn. Suburban woodlands, rarely naturalized; native of e. Asia. April-June. Also reported from suburban areas near Louisville, KY, and Knoxville, TN (D. Estes, pers. comm.). [> Rhamnus davurica ssp. davurica – FNA, K; = R. citrifolia (Weston) W. Hess & Steam – C]

Rhamnus davurica Pursh var. glabrata Gleason, Western Lance-leaved Buckthorn. Dry habitats over calcareous rocks. April-May. Var. glabrata Gleason ranges from OH west to SD, south to w. WA (Ludwig 1999), KY, c. TN, AR, and KS. [= C, F, G, Z; = R. lanceolata ssp. glabrata (Gleason) Kartesz & Gandhi – FNA, K; < R. lanceolata – S, W]

Sageretia Bronn 1827 (Small-flowered Buckthorn)

Identification notes: S. minutiflora can appear superficially a bit like Ilex vomitoria, with which it typically grows; it can be distinguished from Ilex vomitoria by its opposite leaves.

Sageretia minutiflora (Michaux) C. Mohr, Small-flowered Buckthorn. Shell middens and shell hammocks, dry calcareous hammocks and maritime forests. August-September; October-November. Se. NC south to s. FL, west to s. MS. S. minutiflora is apparently most closely related to S. elegans (Kunth) Bronn, which ranges from s. Mexico south to s. South America. [= FNA, K, RAB, S, WH, Y, Z]

Ziziphus P. Miller 1754 (Jujube)

A genus of 85-100 species, shrubs and trees, of tropical and warm temperate areas. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

* Ziziphus zizyphus (Linnaeus) Karsten, Chinese Jujube, Common Jujube, Chinese Date. Disturbed areas; native of Eurasia. Reported from ec. GA (Jones & Coile 1988). Cultivated at least as far north as NC. As of 2010, Z. jujuba is proposed for conservation over the nearly tautonymic Z. zizyphus. [= K, WH; = Zizyphus zizyphus (Linnaeus) Karsten – S, orthographic variant; = Z jujuba P. Miller – FNA, Z]
### 152. ULMACEAE de Mirbel 1815 (Elm Family) [in ROSALES]

As here circumscribed (excluding Celtis and relatives), a family of 6-7 genera and about 35 species, of temperate, subtropical, and boreal Northern Hemisphere, rarely extending into the Southern Hemisphere. Zavada & Kim (1996) discuss compelling reasons to recognize the Celtis from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable. References: Sherman-Broyles, Barker, & Schulz in FNA (1997); Zavada & Kim (1996); Todzia in Kubitzki, Rohwer, & Bittrich (1993). [also see CANNABACEAE]

1. Leaves strongly 3-veined from the base, the venation otherwise pinnate; fruit a drupe with thin flesh..............[Celtis – see CANNABACEAE]
2. Leaf venation pinnate throughout, the venation strictly pinnate; fruit dry, a samara (flat and winged) or nutlike (with numerous fleshy protuberances).
3. Fruit nutlike (with numerous fleshy protuberances); primary lateral veins mostly forking before reaching the margin; [small trees of swamp forests of the Coastal Plain from se. NC and SC southward]..........................Planera
4. Fruit a samara (flat and winged); primary lateral veins mostly parallel and unforked to the leaf margin; [small to large trees, widespread in our area]....................................................................................Ulmus

#### Planera J.F. Gmelin 1791 (Planer-tree, Water-elm)

**Planera aquatica** (Walter) J.F. Gmelin, Planer-tree, Water-elm. River swamps where flooded (often to depths of 1-2 m) in the winter. Se. NC (limited to the Waccamaw and Lumber rivers) south to n. FL, west to e. TX, and north in the Mississippi Embayment to w. TN, w. KY, s. IL, and se. MO. [= RAB, C, F, FNA, G, GW, K, S]

**Ulmus** Linnaeus 1753 (Elm)

A genus of about 25-30 species, trees (rarely shrubs), of temperate and boreal regions of the Northern Hemisphere (most diverse in c. and n. Asia). References: Sherman-Broyles in FNA (1997); Wiegreffe, Sylsma, & Guries (1994); Kurz & Godfrey (1962)=Z; Todzia in Kubitzki, Rohwer, & Bittrich (1993). Key adapted in part from FNA.

1. Leaves mostly < 7 cm long, the base symmetrical to somewhat oblique.
2. Samaras ciliate-margined; twigs often cork-winged; upper surfaces of leaves glabrous to scabrous; [native trees, sometimes weedy].
3. Leaf apex acute; flowers appearing in the late winter to late spring; calyx lobes 5; upper surfaces of leaves glabrous; [widespread in our area; [subgenus Oreoptelea, section Chaetoptelea].................................U. alata
4. Leaf apex obtuse; flowers appearing in the late spring to fall; calyx lobes 6-9; upper surfaces of leaves harshly scabrous; [of w. TN, w. MS westward; also disjunct in FL; [subgenus Oreoptelea, section Trichoptelea]..........................U. crassifolia
5. Samaras with glabrous margins; twigs never cork-winged; upper surfaces of leaves glabrous; [introduced trees, planted and sometimes naturalized or persistent]; [subgenus Ulmus, section Microptelea].
6. Flowers appearing in the late summer to fall; leaf base generally oblique; leaves 1.5-2.5 cm wide, 5 or more of the lateral veins forked per side..........................................................U. parvifolia
7. Flowers appearing in the late winter to late spring; leaf base generally symmetrical; leaves 2-3.5 cm wide, 3 or fewer of the lateral veins forked per side..........................................................U. pumila
8. Leaf bases strongly oblique; larger leaves 10-15 cm long; primary leaf teeth acuminate, often curved inward; [tree widespread in our area].................................................................U. rubra
9. Leaf bases moderately oblique (rarely nearly symmetrical); larger leaves 7-10 cm long; primary leaf teeth acute, not curved; [tree restricted to moist calcareous sites in the Coastal Plain of se. NC southward].................................U. americana var. americana
10. Leaf undersurfaces glabrous or slightly to moderately scabrous on stump sprouts or seedlings; leaf undersurface glabrous to tomentose, with or without tufts of hairs in the vein axes; flowers and fruits pedicellate (on pedicels 5-20 mm long), pendulous, in fascicles or racemes.
11. Leaf bases obliquely truncate; larger leaves 10-15 cm long; primary leaf teeth acuminate, often curved inward; [tree widespread in our area]..........................................................U. americana var. floridana
12. Leaf bases obliquely truncate; larger leaves 7-10 cm long; primary leaf teeth acute, not curved; [tree restricted to moist calcareous sites in the Coastal Plain of se. NC southward].................................U. americana var. americana
13. Leaf undersurfaces glabrous or slightly pubescent, lacking prominent tufts of hairs in the vein axes (differing from the general pubescence of the surface); branches often developing corky wings; inflorescence a raceme or racemose cyme; [trees of calcareous areas in the western portion of our area]; [subgenus Oreoptelea, section Trichoptelea].

---

1. Leaf blades mostly > 7 cm long, the base generally symmetrical (rarely nearly symmetrical).
2. Leaf apex obtuse; flowers appearing in the late spring to fall; calyx lobes 6-9; upper surfaces of leaves glabrous to scabrous; [widespread in our area; [subgenus Ulmus, section Microptelea].
3. Flowers appearing in the late winter to late spring; leaf base generally symmetrical; leaves 2-3.5 cm wide, 3 or fewer of the lateral veins forked per side..........................................................U. pumila
4. Flowers appearing in the late summer to fall; leaf base generally oblique; leaves 1.5-2.5 cm wide, 5 or more of the lateral veins forked per side..........................................................U. parvifolia
5. Leaf undersurface slightly to very strongly scabrous; leaf undersurface tomentose or villos, with tufts of hairs in the vein axes; flowers and fruits sessile or subsessile (on pedicels 0-2 mm long), not pendulous, in dense fascicles; [subgenus Ulmus, section Ulmus].
6. Leaves with ciliate margins; samara pubescent on the body with reddish hairs; bud scales red, the margins red-tomentose; [native tree].
7. Leaves without ciliate margins; samara glabrous except along the margin of the notched apex or on the central vein of the wing; bud scales brown, margins pale-ciliate; [introduced tree, planted and sometimes naturalized or persistent].
8. Leaf base oblique but not overlapping the petiole; branchlets not corky; samara glabrous except on the central vein of the wing.................................................................U. glabra
9. Leaf base oblique, the lower side overlapping the petiole; branchlets not corky; samara glabrous except along the margin of the notched apex..........................................................U. procera
10. Leaf undersurface glabrous (or slightly to moderately scabrous on stump sprouts or seedlings); leaf undersurface glabrous to tomentose, with or without tufts of hairs in the vein axes; flowers and fruits pedicellate (on pedicels 5-20 mm long), pendulous, in fascicles or racemes.
11. Leaf bases obliquely truncate; larger leaves 10-15 cm long; primary leaf teeth acuminate, often curved inward; [tree widespread in our area]..........................................................U. rubra
12. Leaf bases strongly oblique; larger leaves 10-15 cm long; primary leaf teeth acuminate, often curved inward; [tree widespread in our area].................................................................U. americana var. americana
13. Leaf bases moderately oblique (rarely nearly symmetrical); larger leaves 7-10 cm long; primary leaf teeth acute, not curved; [tree restricted to moist calcareous sites in the Coastal Plain of se. NC southward].................................U. americana var. floridana
14. Leaf undersurfaces glabrous or slightly pubescent, lacking prominent tufts of hairs in the vein axes (differing from the general pubescence of the surface); branches often developing corky wings; inflorescence a raceme or racemose cyme; [trees of calcareous areas in the western portion of our area]; [subgenus Oreoptelea, section Trichoptelea].
ULMACEAE

10 Leaves 7-8 (-14) cm long, lanceolate to ovate, the undersurface with yellowish-gold pubescence; buds and young twigs glabrous; calyx lobes 5-6; seeds thickened ............................................................ *U. serotina*

10 Leaves 9-11 (-16) cm long, obovate, the undersurface with whitish pubescence; buds and young twigs pubescent; calyx lobes 7-8; seeds inflated ........................................................................................................................................... *U. thomasii*

*Ulmus alata* Michaux, Winged Elm. Rock outcrops, dry and mesic forests and woodlands, bottomlands, old fields, disturbed areas. February-March; March-April. N. VA west to MO, south to c. peninsular FL and c. TX. [= RAB, C, F, FNA, G, GW, K, S, W, WH, Z]

*Ulmus americana* Linnaeus var. *americanus*, American Elm, White Elm. Swamps, bottomland forests, moist slopes, especially on relatively or strongly nutrient-rich substrates. February-March; March-April. NS, NB, and QC west to se. SK, south to n. FL and c. TX. An ascomycetous fungus, *Ceratocystis ulmi*, is the cause of the Dutch Elm disease. In our area, the effects of the disease appear to have been mild or nonexistent, especially in natural areas. [= Z; < *U. americana* – RAB, C, F, FNA, G, GW, K, W, WV; = *U. americana* – S]

*Ulmus crassifolia* Nuttall, Cedar Elm. Bottomlands, mesic forests. W. TN, s. MO, and OK south to c. TN, nw. GA, AL, and MS. [= FNA, K, S, Z]

*Ulmus parvifolia* Jacquin, Chinese Elm, Lacebark Elm. Disturbed areas; native of China and Japan. August-October; September-November. [= FNA, K]

*Ulmus procer* Salisbury, English Elm, English Cork Elm. Disturbed areas; native of Europe. [= C, FNA, K; *U. minor* P. Miller, misapplied]

*Ulmus pumila* Linnaeus, Siberian Elm, Dwarf Elm. Disturbed areas; native of Asia. [= C, F, FNA, K]

*Ulmus rubra* Muhlenberg, Slippery Elm, Red Elm. Moist to fairly dry calcareous forests, rich bottomlands, rich cove forests in the low Mountains. February-March; March-April. ME, QC, and ON west to MN and ND, south to Panhandle FL and c. TX. [= RAB, C, FNA, G, K, W, WV, Z; = *U. fulva* Michaux – S]

*Ulmus serotina* Sargent, September Elm. Mesic limestone forests. KY, s. IL, and e. OK south to c. TN, nw. GA, AL, and MS. It was collected on the French Broad River by Rugel in 1842, and has been attributed to NC by Mohr. [= C, FNA, F, G, K, S]

*Ulmus thomasii* Sargent, Cork Elm, Rock Elm. Rocky or rich slopes, especially over limestone. April. QC to MN and NE, south to NJ, MD, PA, WV, KY, TN, AR, and KS. [= C, FNA, K; = *U. thomasi* – F, G, WV, orthographic variant]

CANNABACEAE

As circumscribed to include the Celtidaceae, a family of 14 genera and about 120 species, trees, shrubs, woody vines, herbs, and herbaceous vines, of cosmopolitan distribution. Zavada & Kim (1996) discuss compelling reasons to recognize the Celtidaceae as a family distinct from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable; and Sytsma et al. (2002) conclude that Celtidaceae should be considered a part of Cannabaceae. References: Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Sherman-Broyles, Barker, & Schulz in FNA (1997); Zavada & Kim (1996); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Sytsma et al. (2002).

1 Tree or shrub; leaves simple and unlobed .......................................................................................................................................................... *Celtis*

1 Herb or vine; leaves either compound or lobed.

2 Erect herb; leaves with 3-7 leaflets .......................................................................................................................................................... *Cannabis*

2 Climbing or sprawling vine; leaves simple, with 1-9 lobes ....................................................................................................................................... *Humulus*
Cannabis Linnaeus 1753 (Hemp, Marijuana)

A genus of 1-3 species, herbs, originally native to c. Asia. *Cannabis* was formerly widely cultivated nearly worldwide for the fiber hemp; it is now better known as the source of the drug marijuana. References: Small in FNA (1997); Hillig & Mahlberg (2004); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

* *Cannabis sativa* Linnaeus, Hemp, Marijuana. Disturbed areas and clandestinely cultivated plots; native of Asia. June-October. Though perhaps not truly naturalized or persistent, *Cannabis* is treated here since clandestine cultivated plots are encountered by the field biologist, especially in fairly remote areas in the mountainous parts of our area. [= F, FNA, G, WH, WV; > *C. sativa* Linnaeus ssp. *sativa* – C, K]

**Celtis** Linnaeus 1753 (Hackberry)

1 Branches armed with short spines.......................................................................................................................................................... *C. iguanae*
1 Branches unarmed.
2 Leaves thick, very glossy above; bark remaining smoothish, lacking protuberances; [rare alien] ......................................................... *C. sinensis*
2 Leaves thin, dull or glossy above (glossy normally only in sun leaves, especially of *C. laevigata*); bark developing wartlike corky protuberances on larger individuals; [collectively common natives]
3 Leaf blades mostly > 2× as long as wide, the tip attenuate and long-acute to long-acuminate, the base cuneate to rounded; leaf margins entire or with a few teeth on each margin; [large trees, mostly of floodplains, but also in upland situations over calcareous substrates such as limestone, dolostone, and shell middens]............. *C. laevigata*
3 Leaf blades mostly < 2× as long as wide, the tip obtuse to short-acuminate, the base slightly to strongly cordate at least on one side; leaf margins entire or with a few teeth on each margin (the plant then a shrub or small tree of rocky places) or distinctly serrate with 10-35 teeth on each margin; leaves scabrous above, at least toward the tip; [shrubs to medium trees, of floodplains, moist slopes, and dry rocky woodlands, barrens, and glades].
4 Leaves 5-12 cm long, toothed well below the middle; fruit 7-14 mm long, ellipsoid or subglobose, dark orange, purple, or black, on a pedicel 7-25 mm long; [small to medium trees of dry to moist habitats] ................................................................. *C. occidentalis*
4 Leaves 2-8 cm long, toothed only near the tip if at all; fruit 5-9 mm long, subglobose or essentially spherical, orange, red, or brown, on a pedicel 3-13 mm long; [shrubs or small twisted trees of dry, rocky habitats] ......................................................... *C. tenuifolia*

**Celtis iguanae** (Jacquin) Sargent, Iguana Hackberry. Shell-middens and calcareous coastal sites. AL, sw. peninsular FL, West Indies, American tropics. [= KH; = *Momisia iguanae* (Jacquin) Rose & Standley – S]

**Celtis laevigata** Willdenow, Southern Hackberry, Sugarbark. Bottomland forests, especially on natural levees, upland calcareous forests and woodlands, shell middens. April-May; August-October. MD, WV, IN, IL, MO and KS south to s. FL and TX. [= RAB, C, FNA, G, GW, W; > *C. laevigata* var. *laevigata* – F; > *C. laevigata* var. *smallii* (Beadle) Sargent – F; = *C. laevigata* var. *laevigata* – K; > *C. mississippiensis* Rose – S; > *C. smallii* Beadle – S]

**Celtis occidentalis** Linnaeus, Northern Hackberry. Xeric to mesic glades, outcrops, barrens, woodlands, and bottomland forests, usually over calcareous substrate. April-May; August-October. NH, QC, MB, and MT south to Panhandle FL, TX, and NM. [= C, FNA, G, K, S, W, WV; > *C. occidentalis* var. *occidentalis* – RAB; > *C. occidentalis* var. *canina* (Rafinesque) Sargent – F; > *C. occidentalis* var. *occidentalis* – F; > *C. occidentalis* var. *pumila* (Pursh) A. Gray – F; < *C. occidentalis* – WH]

* *Celtis sinensis* Willdenow, Chinese Hackberry. Suburban woodlands; native of China, Korea, and Japan. Found naturalizing in Guilford County, NC (W. Cook, pers. comm., 2010). Not yet keyed

**Celtis tenuifolia** Nuttall, Dwarf Hackberry, Georgia Hackberry. Xeric to mesic glades, outcrops, barrens, woodlands, often over calcareous substrate. April-May; August-October. NJ, PA, IN, IL, and KS south to Panhandle FL and TX. [= C, FNA, G, K, W, WV; > *C. occidentalis* var. *georgiana* (Small) Ahles – RAB; > *C. tenuifolia* var. *georgiana* (Small) Fernald & Schubert – F; > *C. tenuifolia* var. *tenuifolia* – F; = *C. georgiana* Small – S; < *C. occidentalis* – WH]

Humulus Linnaeus 1753 (Hops)

A genus of 2 species, herbaceous vines, of temperate regions of the Northern Hemisphere. References: Small (1978)=Z; Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Z.
CANNABACEAE

1. Veins on lower surface of leaves armed with rigid, spinulose hairs; bracts of pistillate flowers spinulose-ciliate; most leaves 5-9 lobed .............. H. japonicus
2. Veins on lower surface of leaves more or less pubescent with lax, weak hairs, but lacking rigid, spinulose hairs; bracts of pistillate flowers smooth-margined; most leaves 1-3 lobed.

Humulus lupulus Linnaeus

- Humulus lupulus Linnaeus var. lupuloides E. Small, Northeastern Hops. Pd (VA), Mt (VA, WV), Cp (NC, VA): disturbed areas, particularly in rich, alluvial soils; uncommon (rare in NC and WV, rare in VA Coastal Plain). July-August; September-October. NS and NL (Newfoundland) south to VA and NC, west to NE, MT, and AB. It is not clear whether its occurrence in NC is native or native of further north. The 3 varieties (two native and one introduced) in our area are subtly different, the differences apparently sometimes further obscured by introgressive hybridization. [= C, FNA, K, Z; < H. lupulus – RAB, F, G, S, W, WV]

- Humulus lupulus Linnaeus var. lupulus, Brewer's Hops, European Hops. Pd (VA), Mt (WV): disturbed areas; rare, native of Europe. July-August; September-October. The European var. lupulus is (of course) one of the key ingredients of beer. [= C, FNA, K, Z; < H. lupulus – RAB, F, G, S, W, WV]

- Humulus lupulus Linnaeus var. pubescens E. Small, Midwestern Hops. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): disturbed areas, particularly in rich, alluvial soils; rare. July-August; September-October. NY and PA south to NC and ne. GA and west to MN, NE, KA, and AR. It is not clear whether the few occurrences east of the Blue Ridge (including those in NC and VA) are native or adventive from further west. [= C, FNA, K, Z; < H. lupulus – RAB, F, G, S, W]

Humulus japonicus

MORACEAE Lindley 1847 (Mulberry Family) [in ROSALES]

A family of about 38 genera and 1100 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (few) warm temperate areas. References: Wunderlin in FNA (1997); Rohwer & Berg in Kubitzki, Rohwer, & Bittrich (1993).

1. Herb, 0.3-1.0 m tall; stem without latex; [tribe Moreae]................................................................. Fatoua

Broussonetia L'Héritier ex Ventenat 1799 (Paper Mulberry)

**Cudrania** Trécul 1847 (Cudrania)

* **Cudrania tricuspidata** (Carrière) Bureau ex Lavallée, Cudrania. Pd (NC), Cp (GA): escaped and naturalized from plantings; rare, native of China and Korea, where cultivated as a food for silkworms. July. Naturalized in Orange County, NC, in McIntosh Co. GA (Jones & Coile 1988), and perhaps elsewhere in our area, where recommended as a hedge plant since at least 1940 (Rehder 1940). [= FNA, K; = *Maclura tricuspidata* Carrière]

**Fatoua** Gaudichaud-Beaupré 1830 (Crabweed)

* **Fatoua villosa** (Thunberg) Nakai, Crabweed, Mulberry-weed, Foolish-weed. Pd (GA, NC, SC, VA), Cp (GA, SC), Mt (NC): disturbed areas, vegetable and flower gardens; rare, native of Asia (apparently s. Asian islands). July–November. As reported by Massey (1975) and Vincent (2004), *Fatoua* was first reported in the United States (Louisiana) in the early 1960's. As of 2004, its distribution in North America had spread to include 28 states and the District of Columbia, including most states except the Great Plains and Rocky Mountains had spread (Vincent 2004, Sundell et al. 1999, Miller & Wood 2003. Since all early collections seem to be in and around greenhouses and nurseries, it is likely that it has been introduced in horticultural material, perhaps repeatedly (Kral 1981b). *Fatoua* appears to have become a fairly aggressive weed in eastern North America. It can be expected to continue to spread, and has the potential to become noxious. It has alternate, ovate leaves with cordate bases, borne on long petioles (about as long as the leaf blade), the inflorescences are dense cymes borne on peduncles in the axils of leaves. Pubescence of the stem and foliage is uncinulate, giving the plant a "tacky" feel. An excellent illustration appears in Correll & Correll (1982). [= FNA, K, Y, Z]

**Ficus** Linnaeus 1753 (Fig)

1 Leaves lobed, 7–30 cm long; [shrub to small tree]............................................................................................................ *F. carica*
1 Leaves unlobed, 1–5 cm long; [vine, climbing appressed to walls]....................................................................................... *F. pumila*

* **Ficus carica** Linnaeus, Edible Fig, Garden Fig. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC): grown for its fruits, persistent from plantings, persisting and naturalizing particularly on barrier islands, where it sometimes forms thickets on dunes, or otherwise in the outer Coastal Plain, where proximity to the ocean ameliorates cold winter temperatures; rare, native of w. Asia. May–August; July–October. This is the common cultivated fig, grown for its fruit in the Mid-east for millenia. [= RAB, F, FNA, K, S, WH; = *Toxylon pomiferum* Rafinesque ex Sargent – S]

* **Ficus pumila** Linnaeus, Climbing Fig. Cp (AL, FL, GA, LA, SC): walls, disturbed urban areas; rare, native of s. Asia. Locally common in Charleston, Savannah, Pensacola, Mobile, New Orleans, and other old seaports, where grown on walls as an ornamental and certainly persisting. [= FNA, K, WH]

**Maclura** Nuttall 1818 (Osage-orange)

A monotypic genus (or sometimes broadened to include *Cudrania* and other genera), a tree, of sc. North America. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

* **Maclura pomifera** (Rafinesque) C.K. Schneider, Osage-orange, Bow-wood, Bois-d'arc, Hedge-apple. Fields, hedgerows, forests; common (uncommon in DE Coastal Plain, rare in FL), naturalized from extensive planting in the eighteenth and nineteenth centuries, native of TX, OK, AR, and L.A. April–May; October. The large fruits are unmistakable: yellowish-green, grapefruit-sized, and wrinkled, reminiscent of a giant, spherical mulberry fruit. The wood is extremely heavy, fine-grained, a bright yellow-orange when fresh, but darkening with age, famous for making bows and also used in cabinetry. [= RAB, C, F, FNA, G, K, W, WH, WV; = *Toxylon pomiferum* Rafinesque ex Sargent – S]

1 Upper leaf surface glossy, glabrous or slightly scabrous; lower leaf surface glabrous, or slightly pubescent on the veins and in the vein axils only; ripe fruits black, purple, red, pink, or white............................................................................................................ M. alba

* Morus nigra Linnaeus, Black Mulberry. Reported. [add to synonymy; add to key; add to Access]

Morus rubra Linnaeus, Red Mulberry. Bottomland forests, mesic slopes, disturbed areas, suburban woodlands. April-May; May-June. MA, VT, NY, MI, WI, and se. SD south to s. FL and w. TX, and into Mexico. The fruits are very variable in quality from tree to tree. M. rubra is the only member of the Moraceae native to our area. M. murrayana D.E Saar & S.J. Galla has recently been described as distinct from M. rubra and occurring widely in eastern North America (KY, TN, MO, IL, IN, MS, LA, VA, NC, and AL) (Galla et al. 2009). It is alleged to differ from M. rubra by its leaves to 38 cm long (vs. to 15 cm long), the outer three leaves on branchlets almost always > 15 cm long (vs. < 15 cm long), leaves with caudate apex (vs. acute to acuminate apex), lateral veins curving before reaching margins, only the tiniest veins ending in a tooth (vs. lower outer three leaves on branchlets almost always > 15 cm long), leaves with caudate apex (vs. acute to acuminate apex), mature fruit to 4 cm long and 1.5 cm wide but often thinner, with much size variation on a single individual (vs. mature fruit to 3 cm long). All the alleged characters appear to be highly variable and correlated with vigor. [= RAB, C, F, G, GW, K, S, W, WV; > M. rubra var. rubra – K; > M. rubra – Z; > M. murrayana D.E. Saar & S.J. Galla – Z]

155. URTICACEAE A.L. de Jussieu 1789 (Nettle Family) [in ROSALES]

A family of about 45 genera and 1000 species, herbs, shrubs, vines, and trees, of cosmopolitan distribution in tropical, subtropical, and temperate regions. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Miller (1971a).

1 Leaves alternate.

2 Flowers in axillary spikes; woody herb to 4 m tall; [tribe Boehmerieae]............................................................................................................................................................................................................................................................................ Boehmeria nivea

Boehmeria Jacquin 1760 (False-nettle)

1 Leaves opposite; monoecious herb to 1.5 m tall; [subgenus Duretia].................................................................................................................................................................................................................................................................................................................. B. cylindrica

URTICACEAE

* **Boehmeria nivea** (Linnaeus) Gaudichaud-Beaupré, Ramie. Disturbed suburban areas, waste ground; native of Asia. This plant is cultivated for the fiber of its stems, which is extracted and used for fabric in a manner reminiscent of linen (which is made from *Linum usitatissimum*). Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). [= RAB, FNA, K; = Ramium niveum (Linnaeus) Small – S]

**Laportea** Gaudichaud-Beaupré 1830 (Wood-nettle)

**Laportea canadensis** (Linnaeus) Weddell, Wood-nettle. Moist, nutrient-rich forests, especially abundant in cove forests in the Mountains and bottomlands in the Piedmont. Late June-August; late July-October. NS and se. MB south to Panhandle FL and OK. By mid-summer, *Laportea* often becomes the aspect dominant in rich, moist cove forests of the mountains (especially those with extensive seepage), visually replacing the diverse spring flora. The stinging hairs can penetrate pants made of lightweight or loosely woven fabrics. [= RAB, C, F, FNA, G, GW, K, W, WV; ? *Urticastrum divaricatum* (Linnaeus) Kunze – S]

**Parietaria** Linnaeus 1753 (Pellitory)

1 Leaves softly pubescent; [alien weed]; [subgenus *Parietaria*]. .............................................................. *P. judaica*

1 Leaves glabrescent; [native, sometimes weedy in calcareous or coastal areas]; [subgenus *Freirea*].

2 Main lateral veins diverging from the midvein above the usually narrowly cuneate leaf base; larger leaves 2-5× as long as wide ...........

2 Main lateral veins diverging from the midvein at the usually truncate, rounded, or broadly cuneate leaf base; larger leaves 1-2× as long as wide.

3 Achene with a flanged stipe, the minute apiculate tip located symmetrically at the pole of the achene, the achene 0.8-1.0 mm long...........

3 Achene without a flanged stipe, the minute apiculate tip located asymmetrically, the achene usually 1.2 (-1.4) mm long..........

Parietaria floridana Nuttall, Florida Pellitory. Coastal shores, sometimes weedy in calcareous situations. March-frost; April-frost. DE south to FL and west to TX, on the outer Coastal Plain. This species has smaller leaves than *P. praetermissa*. [= FNA, GW, K, WH, Z; = *P. nummularia* Small – C, F, S]

* **Parietaria judaica** Linnaeus, Pellitory-of-the-wall. Disturbed urban areas; native of Europe. [= FNA, K, WH; ? *P. diffusa* Mertens & Koch]

* **Parietaria officinalis** Linnaeus, Pellitory. Reported as introduced in Mobile County, AL (Kartesz 2010). {investigate} [= K2] [not keyed; add to synonymy]

**Parietaria pensylvanica** Muhlenberg ex Willdenow, Pennsylvania Pellitory, Rock Pellitory. In circumneutral soils, such as in thin soils at the bases of calcareous or subcalcareous cliffs or on calcareous shale barrens, rich floodplain soils. April-October; May-October. ME west to BC, south to e. NC, w. NC, AL, Panhandle FL, TX, NV, and Mexico. Two varieties are sometimes delimited, var. *pensylvanica* eastern and northern and var. *obtusa* (Rydberg ex Small) Shinners southwestern. [= C, FNA, G, GW, K, K2, RAB, S, W, WH; > *P. pensylvanica* – F, WV (sensa stricto)]

**Parietaria praetermissa** Hinton, Coastal Pellitory. Shell middens, coastal hammocks. March-frost; April-frost. E. NC south to s. FL and west to w. LA. [= FNA, GW, K, WH, Z; = *P. floridana* Nuttall – RAB, C, F, S, misapplied]
Pilea Lindley 1821 (Clearweed)

1 Leaves 0.5-1.0 (-1.8) cm long ............................................................................................................................................................ P. microphylla
1 Leaves 4-10 cm long.
2 Achene 1-1.5× as long as broad, tuberculate, dark brown or black, the margins slightly paler .......................................................... P. fontana
2 Achene 1.5-2× as long as broad, smooth, green or light brown, with slightly raised dark to black lines and motlings. .......... P. pumila

Pilea fontana (Lunell) Rydberg, Blackfruit Clearweed, Lesser Clearweed. Swamp forests, freshwater marshes, calcareous wetlands. August-September; September-November. E. Canada west to MN and ND, south to FL, IN, and NE. Only reliably distinguishable from P. pumila using fruits, P. fontana is, however, somewhat less shiny and transparent-translucent. [= RAB, C, F, FNA, G, GW, K, S, WH; < Adicea pumila (Linnaeus) Rafinesque – S]

* Pilea herniarioides (Swartz) Lindley, Caribbean Clearweed. Reported for Mobile County, AL and scattered sites in the FL peninsula (Karens 2010). [= K2] (not keyed; add to synonymy)

Pilea pumila (Linnaeus) A. Gray, Greenfruit Clearweed, Coolwort, Richweed. Swamp forests, bottomlands, freshwater marshes. August-September; September-November. QC west to MN, south to FL, LA, and OK. [= RAB, C, FNA, G, GW, W, WH, WV; > P. pumila var. pumila – F, K; > P. pumila var. deamii (Lunell) Fernald – F, K; < Adicea pumila (Linnaeus) Rafinesque – S (including in concept P. fontana)]

Urtica Linnaeus 1753 (Stinging Nettle)

1 Tap-rooted annual; stipules 1-3 mm long, spreading or deflexed; inflorescences usually shorter than the subtending leaf petiole, each panicle consisting of a mixture of pistillate and staminate flowers.
2 Flower clusters subglobose; mature achenes ovate, 1-1.5 mm long, < 1 mm wide; leaf teeth generally blunt, the sides of the tooth convex ................................. U. chamaedryoides
2 Flower clusters elongate; mature achenes triangular, 1.5-2.5 mm long, 1-1.5 mm wide; leaf teeth generally sharp, the sides of the tooth straight .............................................................................................................................................. U. urens
1 Rhizomatous perennial; stipules 5-15 mm long, erect; inflorescences usually surpassing the subtending leaf petiole, each panicle of either pistillate or staminate flowers.
3 Plants dioecious (male and female flowers always on separate plants); stems usually weak, sprawling, branching; stems strongly hislipid with stinging hairs; leaf blades strongly hispid with stinging hairs on both surfaces; leaf teeth commonly 5-6 mm long .................. U. dioica
3 Plants mostly monoecious (with male and female flowers in separate inflorescences on the same plant), rarely an entire plant male or female; stems upright, erect, less branched; stems glabrous to puberulent or strigose, lacking (or nearly so) stinging hairs; leaf blades glabrous or glabrescent above (lacking stinging hairs), glabrous to puberulent below (with some stinging hairs); leaf teeth commonly 2-3.5 mm long ............................................................................................................................................................................. U. gracilis

Urtica chamaedryoides Pursh, Dwarf Stinging Nettle. Rich moist soil, usually on floodplains. November-May; May-July, WV, KY, se. MO and OK south to FL, TX, and Mexico; very rare east of the Blue Ridge. Notable locations in our area include...
URTICACEAE

Stevens Creek (McCormick County, SC), Congaree Swamp (Richland County, SC), and various sites on very rich levees of the Roanoke River (NC). Gaddy & Rayner (1980) report the common winter flowering of this species in our area. [= RAB, C, F, FNA, G, K, S, WH, Z]

* Urtica gracilis Aiton, American Stinging Nettle. Bottomland forests and edges, particularly over limestone. May-July; July-September. NL (Laborador and NS west to AK, south to sw. VA, w. NC (?), s. OH, s. IL, s. MO, n. TX, s. NM, and se. AZ. The native stinging nettle of e. and c. North America is best treated as specifically distinct from U. dioica of Europe. Woodland (1982) and Woodland, Bassett, Crompton, & Forget (1982) showed that U. gracilis differs from U. dioica in a variety of morphologic characters (see key), chromosome number (2n = 26 for U. gracilis, 2n = 52 for U. dioica), breeding system (monoeary vs. dioecious), and distribution (North American vs. Eurasian); furthermore, the two taxa could not be crossed. Woodland (1982) chose subspecific status, apparently to emphasize the close relationship of the two (and a third taxa in w. North America). The combination of morphological distinctiveness, allopatry, major differences in species biology, and incompatability seem adequate to warrant separation as species, however. Until herbaria can be checked, it is uncertain whether U. gracilis occurs in NC. F (as U. procera), G (as U. dioica var. procera and S include NC in the range; Woodland (1982), however, showed the range as extending only south to VA. [= S, WV; < U. dioica – RAB, W; = U. dioica Linnaeus var. procera (Muhlenberg ex Willdenow) Weddell – C, G; > U. gracilis Aiton – F; > U. procera Muhlenberg – F; = U. dioica Linnaeus ssp. gracilis (Aiton) Selander – FNA, K, Z]

1 Leaves elliptic to oblanceolate, mostly < 15 cm long, the apices acute to obtuse; twigs puberulent; spine-covered husk of fruit splitting into 2 sections, enclosing 1 nut; nut circular in cross-section, 7-19 mm in diameter; pistillate dichasia of 1 flower; leaves with stellate trichomes, some of them usually > 12 cm long .......................................................................................................................................................... Quercus

1 Fruits partially enclosed in a scaly cup; leaves lobed, toothed, crenate, or entire .................................................................................................................................................................................................................................................. Castanea

2 Nuts rounded or flattened on one or two sides; bur with long, straight spines; winter buds < 1 cm long; leaves elliptic or oblanceolate, some of them usually > 12 cm long .......................................................................................................................................................................................................................... Fagus

2 Undersurface of leaves densely covered with bulbous-based trichomes when young, essentially glabrous in age; leaves mostly > 15 cm long, generally long-acuminate; twigs glabrous; trees single-trunked; spines of fruit husk weak, easily bent ......................................................... C. dentata

2 Undersurface of leaves persistently and densely tomentose beneath; leaves mostly < 15 cm long, generally short-acuminate; twigs puberulent; trees multi-trunked from base; spines of fruit husk stiff; nut ................................................................. C. mollissima

1 Leaves elliptic, oblongate or lanceolate, 8-30 cm long, the apices acuminate, sometimes only shortly so; spine-covered husk of fruit splitting into 4 sections, enclosing (2-) 3 (-5) nuts; nut flattened on at least one side, 18-25 mm in diameter; pistillate dichasia of 3 flowers; leaves usually without stellate trichomes; twigs puberulent or glabrous.

2 Undersurface of leaves densely covered with bulbous-based trichomes when young, essentially glabrous in age; leaves mostly > 15 cm long, generally long-acuminate; twigs glabrous; trees single-trunked; spines of fruit husk weak, easily bent ......................................................... C. dentata

2 Undersurface of leaves persistently and densely tomentose beneath; leaves mostly < 15 cm long, generally short-acuminate; twigs puberulent; trees multi-trunked from base; spines of fruit husk stiff; nut ................................................................. C. mollissima

1 Leaves elliptic to oblongate, mostly < 15 cm long, the apices acute to obtuse; twigs puberulent; spine-covered husk of fruit splitting into 2 sections, enclosing 1 nut; nut circular in cross-section, 7-19 mm in diameter; pistillata dichasia of 1 flower; leaves with stellate trichomes, with few bulbous-based trichomes when young, puberulent, pilose, tomentulose, or tomentose in age (usually rather densely so).

3 Longest spines of the fruit husk usually > 10 mm long; young twigs glabrous; petiole 8-10 (-15) mm long; [plants of n. AL and westward]..

3 Longest spines of the fruit husk usually < 10 mm long; young twigs puberulent; petiole 3-7 (-10) mm long; [plants widespread in our area].

Castanea P. Miller 1754 (Chesnut, Chinquapin)

A genus of 8-10 species, trees and shrubs, of temperate regions of the Northern Hemisphere. References: Nixon in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Elias (1971a).

A family of about 8 genera and 620-1050 species, trees and shrubs, mostly of the Northern Hemisphere, but extending into se. Asia and Australia. References: Nixon in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Elias (1971a).

1 Fruits partially enclosed in a scaly cup; leaves lobed, toothed, crenate, or entire .................................................................................................................................................................................................................................................. Quercus

1 Fruits enclosed in a spiny or prickly bur; leaves toothed.

2 Nuts sharply triangular; bur with short, recurved prickles; winter buds 1.5-2.5 cm long; leaves ovate, 6-12 cm long .......................................................................................................................................................................................................................... Fagus

2 Nuts rounded or flattened on one or two sides; bur with long, straight spines; winter buds < 1 cm long; leaves elliptic or oblanceolate, some of them usually > 12 cm long .......................................................................................................................................................................................................................... Castanea

Castanea dentata (Marshall) Borkhausen, American Chestnut. Mesic and xeric forests. June-July; September-October. S. ME, s. ON, MI, c. IN, s. IL, south to c. NC, c. GA, Panhandle FL, and sc. MS. Formerly one of the most important, largest, and
most abundant forest trees in the Mountains of our area, *C. dentata* was severely affected by chestnut blight, *Cryphonectria parasitica* (Murrill) Barr, introduced at New York City in 1904 on nursery stock of *C. mollissima*. Blight spread steadily southward, reaching our area in the 1920's and 1930's. *C. dentata* remains rather abundant, but now occurs only as stump sprouts and small trees, usually reinfected by blight persisting on oaks and killed at about the size of first fruit production. The accidental introduction of chestnut blight and the subsequent profound alteration of the role of chestnut is one of the most tragic ecological disasters to have affected our area. *Castanea × neglecta* Dode (pro sp.) [C. dentata × *pumila*], occurs in our area; "the leaves of the hybrid resemble those of *C. dentata* in size and shape but have the vestiture and stellate trichomes of *C. pumila*" (Johnson 1988).  [= RAB, C, F, FNA, G, K, S, W, WH, Z]

\* *Castanea mollissima* Blume, Chinese Chestnut. Forests; native of China. June; September. This species is relatively resistant to chestnut blight and has been planted widely as an ornamental and nut tree; it sometimes naturalizes and appears nearly native. Reported for NC (Macon County) by Pittillo & Brown (1988).  [= C, FNA, K, WH]

*Castanea ozarkensis* W.W. Ashe, Ozark Chinquapin. Dry forests. May-July; September-October. S. MO, e. OK, and w. AR; disjunct in c. AL, where now apparently extirpated by blight. *C. ozarkensis* is related to *C. pumila*, though showing some relation as well to *C. dentata*. *C. ozarkensis* is more susceptible to blight than *C. pumila*.  [= FNA, S, = C. pumila P. Miller var. ozarkensis (W.W. Ashe) G.E. Tucker – K, Z]

\* *Castanea sativa* P. Miller, Spanish Chestnut. Reported as naturalized in KY, AL, PA, and elsewhere in e. North America (Clark et al. 2005).  [= K] {not yet keyed; synonymy incomplete}

---

**Fagus** Linnaeus 1753 (Beech)

1 Leaves denticulate; cupule prickles 1-2.5 (-4) mm long, slightly to strongly recurved; cupule valves generally ovate, the apex obtuse, reddish in color; leaves with fairly dense white acicular trichomes on the lower leaf surface at maturity; leaf base sometimes clearly cordate; [plants of the Coastal Plain, Piedmont, and low to moderate elevations (mostly below 1050 m or 3500 feet) in the Mountains]

\-----------------------------

**F. grandifolia** var. *caroliniana*

1 Leaves sharply serrate; cupule prickles (3-) 4-10 mm long, projecting forward; cupule valves generally narrowly triangular, the apex acute, grayish-yellow in color; leaves usually lacking white acicular trichomes on the lower surface at maturity, instead with yellowish glandular hairs (acicular trichomes often present on the veins); leaf base not clearly cordate; [plants of moderate to high elevations (mostly above 1050 m or 3500 feet) in the Mountains]

\-----------------------------

**F. grandifolia** var. *grandifolia*

*Fagus grandifolia* Ehrhart var. *caroliniana* (Loudon) Fernald & Rehder, White Beech, American Beech. Moist forests, from near sea level to low elevations in the Mountains, mostly below 1050 meters (3500 feet). March-May; September-October. Se. MA, OH, IN, s. IL, s. MI (?), and MO south to Panhandle FL and c. TX. Several subspecies, varieties, or phases of *Fagus grandifolia* have been described, and their taxonomic recognition is controversial. The most recent monograph, Shen (1992), recognizes three subspecies, one of which is limited to Mexico, the other two as treated here but at the subspecific level. I have here chosen to recognize 2 intergradient varieties in our area. A third variety, var. *mexicana* (Martínez) Little, of the mountains of México, is apparently most closely related to var. *grandifolia*. Cooper & Mercer (1977) studied variation in NC, concluding that two genetic races or varieties were present, the montane var. *grandifolia* and the Piedmont and Coastal Plain var. *caroliniana*, but that patterns of variation were complicated. Hardin & Johnson (1985) and Hardin (1992, 1985) note that variation is "more-or-less" clinal, variation within populations is great, and they do not favor recognition of infraspecific taxa. Depending on one's tolerance or intolerance for intergradational varieties, one may choose to recognize one or two taxa in our area.  [= C, F, G, Y; < *F. grandifolia* – RAB, FNA, K, S, W, WV, Z; < *F. grandifolia* ssp. *grandifolia* – Vj; = *F. grandifolia* ssp. *caroliniana* (Loudon) Camp ex Shen – X, nomen nudum; = *F. ferruginea* Aiton]

**Fagus grandifolia** Ehrhart var. *grandifolia*, Gray Beech, Red Beech, American Beech. Moderate to high elevation forests, especially on high elevation ridges, gaps, and open slopes, often forming clonal dwarfed thickets in the most exposed situations. April-May; September-October. NS, NB, and s. QC west to s. ON and n. MI, south to VA, w. NC, n. GA, e. TN, and n. OH.

"Red beech" is alleged to differ from "gray beech" in having the involucral segments not covering the nutlets at maturity. Hardin
Our oaks are divided into two well-marked sections; other sections occur outside our area. Red oaks (section *Lobatae*, sometimes treated as subgenus *Erythrobalanus*) are characterized by acorns maturing in two years (in one year in *Q. elliottii*), styles elongate, aborptive ovules are at the top of the seed, leaves and leaf lobes bristle-tipped, inner surface of the acorn shell velvety-pubescent, and acorns rooting in spring. White oaks (section *Quercus*, sometimes treated as subgenus *Quercus*) are characterized by acorns maturing in a single year, styles short or absent, aborptive ovules at the base of the seed, leaves and leaf lobes not bristle-tipped, inner surface of the acorn shell smooth, and acorns rooting in autumn. Twenty of our *Quercus* species are in this group: *Q. alba*, *Q. australis*, *Q. bicolor*, *Q. boytontii*, *Q. chapmani*, *Q. geminata*, *Q. lyrata*, *Q. macrocarpa*, *Q. margarettiae*, *Q. michauxii*, *Q. minima*, *Q. montana*, *Q. muehlenbergii*, *Q. oglethorpii*, *Q. prinoides*, *Q. robur*, *Q. similis*, *Q. sinuata* var. *simulata*, *Q. stellata*, and *Q. virginiana*. Hybrids within each section are frequent and diverse; hybrids do not naturally occur between the two sections. The live oaks of the southeastern Coastal Plain and Central America are subsections *Fagineae*; other white oaks are subsection *Quercus*. References: Nixon in FNA (1997) (overall treatment); Jensen in FNA (1997) (red oaks); Nixon & Muller in FNA (1997) (white oaks); Godfrey (1988); Stein, Binion, & Acciavatti (2003); Cronquist (1991); Duncan & Duncan (1988); Hunt (1990–Z; Hunt (1994); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

**Identification notes:** Many oak species are well-adapted to ecological situations in which fires frequently burn the ground layer. Fire-maintained communities of the Piedmont and Mountains typically have oaks such as *Q. stellata*, *Q. marilandica var. marilandica*, *Q. illicifolia*, and *Q. prinoides*. The two latter species are normally shrubby, and have become rarer because of fire suppression (they require fire to prevent larger trees from outcompeting them). In contrast, *Q. stellata* and *Q. marilandica var. marilandica* become larger and more frequent in fire-suppressed conditions.

Fifteen oak species in our area are typical of upland Coastal Plain communities with at least occasional fire: *Q. arkansana*, *Q. chapmani*, *Q. geminata*, *Q. hemisphaerica*, *Q. incana*, *Q. laevis*, *Q. margarettiae*, *Q. marilandica var. marilandica*, *Q. minima*, *Q. myrtifolia*, *Q. stellata*, and less typically *Q. falcata*, *Q. nigra*, *Q. velutina*, and *Q. virginiana*. Fire suppression of Coastal Plain communities, especially of sandhills, leads to an unnatural increase in the stature and abundance of oaks present. In frequent fire conditions, most oaks will persist as short, shrubby fire sprouts. Additional suggestions of how to recognize fire sprouts of these species are given below. In general, leaves of fire sprouts are larger and more deeply lobed than normal leaves. In species of the red oak group, the bristle tips are larger and more pronounced. Increased size in leaves is particularly noticeable when an area previously long fire-suppressed is burned (the large underground root system and nutritional resources of a small tree destroyed by fire being devoted to a few very vigorous sprouts). Fire sprouts are often in sunny conditions, which tend to make oak leaves more deeply lobed and more coriaceous than shaded leaves.

White oaks with lobed leaves:

**Quercus** Linnaeus 1753 (Oak)

A genus of about 350–530 species, trees and shrubs, of temperate, subtropical, and rarely tropical regions of the Northern Hemisphere. Oaks are the predominant tree of our area, with a variety of species dominating much of the landscape in nearly every ecological situation. Only in a few specialized (and usually in some sense edaphically extreme) communities are oaks generally entirely absent: deepest Coastal Plain swamps, some Coastal Plain depression ponds, wettest pine savannas, pocosins, spruce-fir forests, highest elevation northern hardwood forests, and mountain bogs.

& Johnson (1985), Hardin (1985), and Shen (1992) point out that var. *mexicana* (Martínez) Little, of the mountains of México, is more closely related to our montane variety or to the lower elevation variety or phase. [= C, F, G, Y; < *F. grandifolia* – RAB, FNA, K, S, W, WV, Z; < *F. grandifolia* ssp. *grandifolia* – V; = *F. grandifolia* ssp. *grandifolia* – X] *Fagus sylvatica* Linnaeus, European Beech, Copper Beech, of subgenus *Fagus*, section *Fagus*, is sometimes cultivated, but is not known to escape in our area. It has only 5-10 (-12) lateral veins, as opposed to (12-) 15-18 (-20) in *F. grandifolia*. [not keyed] [= V; ? *F. sylvatica* ssp. *sylvatica* – X] [not keyed]
**FAGACEAE**

*Q. elliottii* – Strongly clonal via a stoloniferous "runner", never tree-like. Leaves never lobed, even on fire sprouts, though fire sprout leaves can be larger (to 15 cm long and 5 cm wide). Very difficult to tell from fire sprouts or seedlings of *Q. incana*, best separated by leaf pubescence (white in *Q. elliottii*, gray in *Q. incana*), margin (slightly revolute in *Q. elliottii*, flat in *Q. incana*), leaf vernation (planate in *Q. incana*, rolled in *Q. elliottii*), and acorn maturation (1 year in *Q. elliottii*, with acorns often on small plants, 2 years in *Q. incana*, with small plants rarely producing acorns).  

*Q. hemisphaerica* – Not clonal. Leaves of vigorous shoots and fire sprouts often shallowly lobed, the lobing usually fairly neat and regular, triangular-ascending, and with bristle tips.

**Live oaks:**

*Q. geminata* – Sometimes clonal. Leaves, even of sprouts, not normally with lobes or teeth.

*Q. virginiana* – Sometimes clonal. Leaves of vigorous summer shoots (but apparently not spring shoots) often coarsely toothed, very similar to similar leaves of *Q. hemisphaerica*, but lacking bristle tips (instead the translucent margin with a darker, thickened callus at the tip of the tooth).

*Q. minima* – Always clonal. Leaves often with lobes or teeth.

Some oaks with ambiguous leaves are keyed in both Key A and Key D or in both Key B and Key C. The leaves of juvenile (seedling or sapling) branches, fire-sprout shoots, or other vigorous shoots (resulting from similar stimuli such as insect damage) are often much different than typical leaves and are not accounted for in these keys (see discussion at end of generic treatment). Hybrids are frequently encountered; they, too, are not keyed here, but can usually be identified (with difficulty) by their intermediate morphology and by parental context. Trichome types are useful in making and confirming identifications of oaks, since certain types are restricted to various groups of species. Hand lenses of 10× or 20× can be useful, but a dissecting scope with 20× to 40× dissecting microscope is far preferable. See Hardin (1992, 1976, 1979), and Thomson & Mohlenbrock.

1. Most of the leaves on a relatively mature tree entire and unlobed (some species frequently with some leaves on a tree, especially those on young or vigorous growth, that are toothed or shallowly lobed, the teeth or lobes generally and irregular in size or location); [primarily either "laurel oaks" of section Lobatae or "live oaks" of section Quercus].

Key A – Leaves (most of them) entire and unlobed (Laurel Oaks and Live Oaks)

2. Venation of the leaves neatly and evenly pinnate, 3-17 (or more) main lateral veins on each side distinctly parallel to each other, each ending in a tooth or shallow, crenate lobe extending <¼ of the way to the midrib; ["chestnut oaks" of sections Quercus and Cerris]..........

   Key B

3. Apices of the leaves or teeth obtuse (rarely acute), lacking bristle tips; ["white oaks" of section Quercus].

   Key C

4. Apices of the leaves or teeth acuminate (rarely acute), and with bristle tips; ["red oaks" of section Lobatae].

   Key D

1. Most of the leaves on a relatively mature tree entire and unlobed (Laurel Oaks and Live Oaks)

2. Venation of the leaves neatly and evenly pinnate, 3-17 (or more) main lateral veins on each side distinctly parallel to each other, each ending in a tooth or shallow, crenate lobe extending <¼ of the way to the midrib; ["chestnut oaks" of sections Quercus and Cerris]..........

   Key B

3. Apices of the leaves or teeth obtuse (rarely acute), lacking bristle tips; ["white oaks" of section Quercus].

   Key C

4. Apices of the leaves or teeth acuminate (rarely acute), and with bristle tips; ["red oaks" of section Lobatae].

   Key D

1. Leaves broadly obovate or spatulate, 1-2.5 (-3)× as long as wide.

2. Leaves 2-10 (-15) cm long, with rounded, subcordate, truncate, or oblique bases; lower leaf surfaces thinly to densely pubescent with tawny to orange glandlike hairs; [section Lobatae].

   Q. marilandica var. marilandica

2. Leaves 2-10 (-15) cm long, mostly with cuneate or rounded bases (in some species sometimes subcordate, truncate, or oblique); lower leaf surfaces glabrous, glabrescent, or pubescent, but the pubescence not orange and glandlike.

   Q. chapmanii

3. Twigs of the current year densely and finely hairy, obscuring the surface; [scrubby trees of sandhills from se. SC southward]; [section Quercus].

   Q. sinuata var. sinuata

3. Twigs of the year glabrous or sparsely pubescent; [shrub, shrubby small trees, or large trees of various habitats].

4. Leaves grayish beneath; [section Quercus].

   Q. inopina

4. Leaves bright green or orange-scurfy beneath; [section Lobatae].

   Q. myrsinifolia

5. Leaf blade strongly convex; lower leaf surface orange-scurfy; [of sandhills and scrub from n. FL southward]...............

6. Leaves evergreen, (including the pedicel) usually <4 cm long (sometimes to 9 cm long) and <2 cm wide (to 6 cm wide); lower leaf surface usually entirely glabrous at maturity (rarely with pubescence in the vein axes); leaf blades rarely lobed; [shrub to scrubby tree of sandhills in se. SC and southward].

   Q. arkansana

6. Leaves deciduous, (including the pedicel) usually >5.5 cm long (rarely smaller) and usually 3-5 cm wide; lower leaf surface usually with tufts of hairs in the main vein axes beneath; leaf blades often lobed.

7. Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axis; [of sw. GA westward].............

   Q. nigra

7. Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axes; [widespread in our area]..........

   Q. phellos

8. Leaves (at maturity) glabrous or at most sparsely pubescent on the surface below, though often with tufts of hairs in the main vein axes.

9. Twigs of the year densely and finely hairy, obscuring the surface; [at maturity] sparsely pubescent beneath; [scrubby trees of sandhills from se. SC southward]; [section Quercus].

   Q. chapmanii

9. Twigs of the year glabrous or sparsely pubescent; leaves (at maturity) bright green and glabrous beneath, though often with tufts of hairs in the main vein axes; [medium to large trees, more widespread, mostly of moist habitats, except Q. hemisphaerica]; [section Lobatae].

10. Leaves predominantly lanceolate, mostly 6-12 cm long and 0.7-2 cm wide, most of them 5-8× as long as wide, the apex acute; mature leaves with tufts of hairs in the vein axes below, and sometimes also some pubescence on the blade surface near the midrib; blades never with lobes or teeth; leaves deciduous in autumn; young leaves bronze red, emerging tightly rolled lengthwise and appearing linear; [trees of bottomlands and upland depression swamps, mesic uplands, and also weedy and frequent in disturbed successional habitats]..........

   Q. phellos
10 Leaves predominantly oblongate, obovate, or rhombic, mostly 2.5-10 cm long and 1.5-4 cm wide, most of them 2-5× as long as wide, the apex acute, obtuse, or rounded; mature leaves with or without tufts of hairs in the vein axils below, lacking pubescence on the blade surface; blades sometimes with 1-5 lateral lobes or teeth; leaves persisting until spring, or tardily and irregularly deciduous in winter; young leaves red, yellow, or green, not emerging tightly rolled lengthwise; [trees primarily either of swamp forests, maritime forests, or sandhills, not typically weedy].

11 Mature leaves entirely glabrous below; leaves mostly with acute apices and bristle tips (rarely a few rounded), mostly 2.5-8 cm long and 1-2 (-3) cm wide, the upper surface shiny, the vein network not readily visible when backlit; leaves evergreen (persisting until spring); petiole 0.5-2 mm long; leaves of vigorous growth often with dentate lobes; [trees of dry sandy habitats, such as sandhills and maritime forests]..........................................................................................................................Q. hemisphaerica

11 Mature leaves with tufts of stellate trichomes in the vein axils; leaves mostly with rounded apices (rarely a few acute and then bristle-tipped), mostly 5-10 cm long and (1.8-) 2-4 cm wide, the upper surface dull, the vein network readily visible when backlit; leaves tardily deciduous; petiole 2-6 mm long; leaves of vigorous growth rarely lobed, and then not dentate; [trees of most habitats, such as floodplain forests]..........................................................................................................................Q. laurifolia

8 Leaves (at maturity) persistently and densely pubescent on the surface below, the pubescence in some species so dense and tight as to be difficult to perceive without at least 10× magnification.

12 Leaves bristle-tipped (sometimes the bristle fallen or broken off, but leaving a truncate scar), deciduous in autumn; multi-armed trichomes of the rosulate or multiradiate types, many of the arms ascending or erect (never with the stellate or fused-stellate trichomes characteristic of the live oaks); acorns maturing in 2 years (immature acorns present through the winter on fruiting trees); [section Lobatae]..........................................................................................................................Q. imbricaria

13 Leaves (including petiole) mostly 10-17 cm long, 3.5-7 cm wide; lower leaf surface (at maturity) sparsely to moderately densely pubescent with soft hairs; leaves lustrous dark-green above; [trees of the Mountains, Piedmont, and rarely Coastal Plain]..........................

13 Leaves (including petiole) mostly 4-11 cm long, 0.5-3.0 cm wide; lower leaf surface densely covered with soft hairs; leaves lustrous dark-green or bluish-green above; [stoloniferous shrubs and small to medium trees of the Coastal Plain].

14 Leaves 0.5-1.5 cm wide, mostly 4-8× as long as wide, lustrous dark-green above; acorns 8-12 mm long; petioles 1-3 mm long; [plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands)] ........................................Q. elliottii

14 Leaves 1.5-3.0 cm wide, mostly 2-4× as long as wide, dull bluish-green above; acorns 10-15 mm long; petioles 4-15 mm long; [plant a small to medium tree]..........................................................................................................................Q. incana

12 Leaves not bristle-tipped, evergreen (overwintering, falling with the expansion of new leaves in the spring) or deciduous (in Q. oglethorpensis); multi-armed trichomes of the fused-stellate and stellate types, the arms parallel to the leaf surface, radiating from a well-developed disc that appears as a white eye or dot at 20-40× magnification (or rosulate or multiradiate in Q. oglethorpensis); acorns maturing in 1 year (immature acorns not present through the winter, unless aborted); [section Quercus].

15 Leaves deciduous in autumn; bark gray, resembling Q. alba; [trees of bottomlands and upland clay flats of GA and SC]..........................

15 Leaves evergreen (overwintering, falling with the expansion of new leaves in the spring); bark (on the tree species) brownish, deeply furrowed; [trees and stoloniferous shrubs of sandy habitats of the Coastal Plain of GA, NC, SC, and VA].

16 Plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands) and producing acorns at that size............Q. virginiana

16 Plant a small to large tree, not producing acorns until >2m tall.

17 Leaf blades with the margins strongly revolute, and also the sides of the blades generally rolled downward and obscuring part of the lower surface, the leaf appearing boatlike (the depth of the "boat" often approaching the width of the leaf); midvein and major lateral veins impressed on the upper surface and raised on the lower surface (the lower surface therefore appearing rugose); buds dark brown; cup scales gray-tipped; pubescence of the lower surface stellate, both appressed and erect, the individual stellae readily visible at 20× magnification (sometimes at 10× magnification); acorns (1-) 2 (-6) per stalk; [typically a small tree of dry sands] ..........................................................................................................................Q. geminata

17 Leaf blades flat, or the margins slightly to strongly revolute, the sides of the blade sometimes rolled downward, usually not obscuring part of the lower surface, the leaf not boatlike (the leaf much wider than deep); midvein and major lateral veins not impressed (or very slightly so) on the upper surface and only very slightly, if at all, raised on the lower surface (the lower surface therefore not appearing notably rugose); buds red-brown; cup scales red-tipped; stellate-appearing clusters of the lower surface stellate, all of it tightly appressed, the individual stellae readily visible only at 30× magnification (sometimes barely distinguishable at 20× magnification); acorns 1-2 per stalk; [typically a salt-pruned shrub to large tree of dunes, estuarine shorelines, and southward of upland flats and slopes]........Q. virginiana

---

Key B – Leaves with even crenations or teeth (Chestnut Oaks)
Key C – Leaves with lobes not bristle-tipped (White Oaks)

1 Lower surfaces of mature leaves glabrous.
2 Leaf lobes with acute apices; sinuses often both broad and "flat-bottomed" (with portions parallel to the midrib); acorn cup covering 2/3 to 3/4 of acorn ................................................................. Q. lyrata
3 Leaf lobes with obtuse apices; sinuses narrow (often notch-like), narrowly to broadly rounded or triangular (lacking portions parallel to the midrib); acorn cup covering 1/4 to 1/2 of acorn.
4 Leaves mostly 4-10 (-17) cm long, 2-5 (-9) cm wide, with 1-5 shallow lobes or undulations, extending 1/8 to 1/2 of the way to the midrib; acorn cup flat at the base, covering < 1/4 of the acorn .............................................. Q. sinuata var. sinuata
5 Leaves mostly 7-20 cm long, 3-10 cm wide, with 3-11 lobes, extending 1/4 to 5/6 of the way to the midrib (if the lobing < 1/5 of the way to the midrib, then the acorn cup rounded at the base and covering 1/4 to 1/2 of the acorn).
6 Leaf base deeply cordate; [native] .................................................................................. Q. alba
7 Leaf base cuneate; [alien, sometimes planted and persistent] ................................................................. Q. robur
8 Leaves mostly 7-11 lobes (the sinuses usually deep, those of the larger leaves usually about 2/3 to 5/6 of the way to the midrib), 10-20 cm long, 5-10 cm wide; terminal bud rounded or globose; basal scales of acorn cup thickened, the thickening giving the cup a knobby texture ........................................................................................................ Q. stellata
9 Leaves mostly relatively deeply lobed throughout the length of the leaf, the total number of lobes 3-13; acorns sessile or borne on peduncles up to 1 cm long; acorn cup covering 1/3 to 3/4 of acorn, the upper scales with acute, long-acuminate to, long-awned apices.
10 Upper scales of the acorn cups thin and acute; acorn cup covering 1/2 to 3/4 of the acorn; [swamps in the Coastal Plain and lower Piedmont of GA, NC, SC, and VA] ................................................................. Q. lyrata
11 Upper scales of the acorn cups long-attenuate into nearly terete awns; acorn cup covering 1/3 to 1/2 of the acorn; [Mountains of VA] .......................................................................................... Q. macrocarpa var. macrocarpa
12 Lower surfaces of mature leaves gray, green, pale green, or yellowish, glabrescent or densely pubescent, the hairs few-branched and erect; leaves mostly relatively deeply and obtusely lobed, rarely shallowly lobed (if so, the lobes 3-7), the sinuses extending 1/2 to 4/5 of the way to the midrib, the total number of lobes 3-7; acorns sessile or nearly so.
9 Leaf lobes with acute apices; acorn cup covering 2/3 to 3/4 of acorn ................................................................. Q. lyrata
10 Leaf lobes with obtuse to rounded apices; acorn cup covering 1/3 to 1/2 of acorn.
11 Woody twigs of the season glabrous or with scattered, deciduous 2-forked hairs; petioles of mature leaves 3-10 (-15) mm long; leaf blades (2.5-)4-8 (-13.5) cm long, irregularly and often rather shallowly 3-5 (-7) lobed, the overall form of the leaf only rarely cruciform; largest lateral lobes usually at the midpoint of the blade (or even below it), the lobes usually not sublobed, tapering from base to tip; [kERIC sandy sites in the Coastal Plain from sc. VA southward] ................................................................. Q. margarettae
12 Woody twigs of the season densely and persistently stellate-pubescent, especially toward the tip of the twig; petioles of mature leaves 15-20 mm long (Q. stellata) or 3-10 (-15) mm long (Q. boytonii and Q. similis); leaf blades (5-)7.5-15 (-20) cm long, usually 5-lobed, the overall form of the leaf typically cruciform (Q. stellata) or not (Q. boytonii and Q. similis); largest lateral lobes of the leaves usually above the midpoint of the blade, these lobes often sublobed or squarish in shape, usually wider near their tips than at their bases (Q. stellata) or not sublobed, tapering from base to tip (Q. boytonii and Q. similis); [collectively widespread in our area].
11 Leaves usually cruciform, the largest lateral lobes often sublobed or squarish in shape, usually wider near their tips than at their bases, and borne at right angles to the midrib; [usually of dry to dry-mesic upland situations, widespread in our area]................................. Q. stellata
12 Leaves not cruciform, the largest lateral lobes usually not sublobed, tapering from base to tip, and borne at ascending angles relative to the midrib; [of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward in our area (Q. similis) or localized on sandstone in ne. AL (Q. boytonii)].
13 Rhizomatous shrubs to small trees, generally < 2 m tall; [of sandstone outcrops in ne. AL] ................................................................. Q. boytonii
14 Single-trunked large trees, [usually of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward in our area] ................................................................. Q. similis

Key D – Leaves with lobes or teeth bristle-tipped (Red Oaks)

1 Leaves shallowly 3-lobed near the broad apex (some leaves of sprout or juvenile shoots may be more lobed).
2 Leaf blades 5-15 cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils (or pubescent across the surface in Q. arkansana).
### FAGACEAE

**Q. acutissima** Carruthers, Sawtooth Oak. Commonly cultivated as a suburban street tree and also widely planted in "wildlife food plots", rarely naturalizing; native of Japan. This species has been a popular recommendation for "wildlife plantings" in the recent past, and entire stands can be encountered in relatively remote areas, planted by federal and state land management agencies; why "wildlife" species in our area need more oak trees is somewhat mystifying! See Whittomore (2004) for additional information. Spreading from plantings in Knoxville, TN (D. Estes, pers. comm. 2007). [= K; ? Q. acutissima ssp. acutissima]

**Q. alba** Linnaeus, White Oak. Mesic to xeric forests. April; September-November (of the same year). ME west to MN, south to Panhandle FL and e. TX. Historically, one of the most valuable timber trees of eastern North America. **Q. alba** is

</table>
probably the most abundant native plant in our area, and in eastern North America, based on biomass, leaf area, and ubiquity. Hardin (1975) discusses introgression between *Q. alba* and many other species of *Quercus* subgenus *Quercus*. [= RAB, C, F, FNA, G, K, W, WH, WV; < *Q. alba* – S (also see *Q. austrina*)]

**Quercus arkansas** Sargent, Arkansas Oak. Dry bluffs. Sw. and wc. GA and Panhandle FL west in a fragmented distribution to sw. AR and e. TX. [= FNA, K, S, WH; > *Q. caput-rivuli* W.W. Ashe]

**Quercus austrina** Small, Bluff Oak. River bluffs, mesic hammocks, dry hammocks, natural levees of brownwater rivers, over mafic rocks, on shell or calcareous sediments. April; October (of the same year). Essentially a Southeastern Coastal Plain endemic, ranging from sc. NC south to n. FL and west to MS, nowhere common. [= RAB, FNA, K, WH; < *Q. alba* – S (apparently)]

**Quercus bicolor** Willdenow, Swamp White Oak. Upland depression swamp forests over mafic rocks such as gabbro or diabase, bottomland swamps with calcareous sediments. April, September (of the same year). Widespread in ne. North America, south to NC, SC (Nelson 1993), TN, n. AL, and MO. [= RAB, C, F, FNA, G, GW, K. S, W]

**Quercus boytonii** Beadle, Boynton Oak. Dry forests. Ne. AL and (possibly) TX. [= FNA, K, S; = *Q. stellata* Wangenheim var. boytonii (Beadle) Sargent]

**Quercus chapmanii** Sargent, Chapman Oak. Dry pinelands, sandhills, scrub. February-March; September-November (of the same year). A Southeastern Coastal Plain endemic: se. SC south to s. FL, west to sw. AL. [= RAB, FNA, K, S, WH]

**Quercus coccinea** Muenchhausen, Scarlet Oak. Xeric upland forests. April; September-November (of the second year). Centered in the Appalachians, from s. ME south to c. AL, but ranging west to MS, ne. AR, s. IL, and s. MI. [= RAB, C, F, FNA, G, S, W, WV; > *Q. coccinea* var. coccinea – K; > *Q. coccinea* var. tuberculata Sargent – K]

**Quercus elliotii** Wilbur, Running Oak. Pine flatwoods, especially on loamy soils in the Middle Coastal Plain. March-April; September (of the first year). A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to s. MS. Wilbur (2002b) and Wilbur & Ho (2008) discuss the reasons for rejecting the traditional use of *Q. pumila* for this species; Walter's diagnosis states that *Q. pumila* has leaves that are glabrous and glaucous below, ruling out application to this species. [= WH; = *Q. pumila* Walter – RAB, FNA, K, S, Z, apparently misapplied]

**Quercus falcata** Michaux, Spanish Oak, Southern Red Oak. Upland forests, usually xeric. April; September-November (of the second year). Widespread in se. North America, north to e. OK, s. MO, s. IL, s. IN, s. OH, WV, se. PA, NJ, and reported (apparently without specimen documentation) from Long Island, NY. "*Q. triloba* Michaux", the form with the leaves only shallowly trilobed at the apex, causes much confusion. Though even medium-sized trees sometimes have leaves only of this form (rather than the typical form, deeply 5-7-lobed, the terminal lobe long-attenuate and falcate), it has no taxonomic merit. [= C, FNA, K, W, WH, WV; = *Q. falcata* var. falcata – RAB, G, GW; > *Q. falcata* var. falcata – F; > *Q. falcata* var. triloba (Michaux) Nuttall – F; = *Q. rubra* – S, misapplied; ? *Q. digitata* Sudworth; > *Q. triloba* Michaux]

**Quercus geminata** Small, Sand Live Oak. Xeric sandhills (northwards restricted to areas very near the coast). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. NC south to s. FL, and west to s. MS. The alleged occurrence of *Q. geminata* as far north as se. VA is apparently based on ambiguous specimens that probably are only *Q. virginiana* (the so-called var. maritima). A careful study of the genetics, morphology, and ecology of *Q. geminata* and *Q. virginiana* supports their recognition as separate species (Cavender-Bares & Pahlich 2009). *Q. geminata* flowers about 2-3 weeks later than *Q. virginiana* when growing in close proximity. [= C, FNA, GW, K, S, WH; < *Q. virginiana* – RAB; ? *Q. virginiana* var. maritima (Michaux) Sargent – F, misapplied]

**Quercus georgiana** M.A. Curtis, Georgia Oak. Dry slopes and bluffs, mainly over granite. April; September-October (of the second year). W. SC south and west through GA to c. AL. [= RAB, FNA, K, S]

**Quercus hemisphaerica** Bartram ex Willdenow, Sand Laurel Oak, Darlington Oak. Sandhills and other dry, sandy soils, an abundant component of maritime forests with *Q. virginiana*, and widely planted as a street tree in most parts of our region. March-April; September-November (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to s. TX, north uncommonly in the interior to nc. AL., n. MS, and s. AR. Often confused with *Q. laurifolia* (see the key for distinctions). *Q. hemisphaerica* is the semi-evergreen laurel oak planted widely as a street tree in southern cities, often
intermixed with the strictly deciduous *Q. phellos*. [= C, F, FNA, Z; < *Q. laurifolia* – RAB, WH; = *Q. laurifolia* – S, misapplied; > *Q. hemisphaerica* var. *hemisphaerica* – K; > *Q. hemisphaerica* var. *maritima* (Michaux) Muller – K]

**Quercus ilicifolia** Wangenheim, Bear Oak, Scrub Oak. Xeric soils in ridges in the Mountains and monadnocks in the upper Piedmont, other dry sites. Late April-June; August (of the second year). Primarily Appalachian: s. ME south to w. VA, w. NC, and e. KY. In NC this scrubby oak is rare and probably declining because of fire suppression (Barden 1985), though recent ice storms have opened the tree canopy at several of its NC sites. The occurrence of *Q. ilicifolia* in KY was confirmed at the Devil's Teatable, Floyd County (Clark et al. 1997). [= RAB, C, F, FNA, G, K, S, W, WV]

**Quercus falcata** Michaux, Small) Sargent – F

**Quercus geminata**

**Quercus georgiana**

**Quercus hemisphaerica**

**Quercus ilicifolia**

**Quercus imbricaria** Michaux, Shingle Oak. Rich soils of upper floodplains of rivers and creeks, often at the base of the slope into the upland, also on upland ridges, in forests over diabase in the Piedmont of VA and n. NC. May; October (of the second year). Primarily midwestern, ranging from NJ, PA, n. OH, s. MI, n. IL, and c. IA, south to e. VA, nc. and w. NC, sc. TN, n. AL, and n. AR. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

**Quercus incana** Bartram, Bluejack Oak. Sandhills, primarily in somewhat loamier textured, submesic soils, inland from the Coastal Plain on coarse sandy alluvium or upland ridges over quartzite or other acidic rocks. April; September-November (of the second year). Primarily a species of the Southeastern Coastal Plain, but rarely extending inland into the Piedmont (especially on coarse sandy alluvium): se. VA south to c. peninsular FL and west to e. TX, sw. AR, and se. OK. This oak is recognizable even at a distance by its bluish color. [= RAB, F, FNA, K, Z; = *Q. cinerea* Michaux – C, G, S; ? *Q. humilis* Walter]

**Quercus inopina** W.W. Ashe, Florida Scrub Oak. Scrub, sandhills. FL peninsula, north to St. Johns County. [= FNA, K, WH] [add to synonymy]

**Quercus laevis** Walter, Turkey Oak. Sandhills, primarily in very xeric soils of deep sandy deposits (Carolina bay rims, old beach dunes, early Cenozoic deposits of the Sandhills Province), or inland from the Coastal Plain on dry ridges and slopes over quartzite or other acidic rock types. April; September-October (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. LA. The leaves turn an intense orange-red in the autumn (November). [= RAB, C, F, FNA, G, K, S, WH, Z; = *Q. catesbaei* Michaux]

**Quercus laurifolia** Michaux, Laurel Oak. Mesic to seasonally flooded soils of floodplains, also (rarely) mesic slopes and swamps in maritime forests. March-April; September-November (of the second year). A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX and s. AR. Sometimes confused with *Q. hemisphaerica*, but (in addition to the key characters above) *Q. laurifolia* has blunter leaf tips, flowers about 2 weeks earlier, and generally occupies much moister habitats. [= C, F, FNA, G, GW, K, Z; < *Q. laurifolia* – RAB, WH (also see *Q. hemisphaerica*); = *Q. obtusa* (Wildenow) Ashe – S]

**Quercus lyrata** Walter, Overcup Oak. Seasonally rather deeply and frequently flooded soils of floodplains of the Coastal Plain, less commonly in seasonally flooded swamps in Triassic basins in the lower Piedmont, and rarely in upland depression swamps of the Piedmont (developed over clays weathered from mafic rocks) and Coastal Plain. March-April; September-October (of the same year). Primarily a species of the Southeastern Coastal Plain: DE south to Panhandle FL, west to e. TX and se. OK, north in the inland to w. TN, s. IN, s. IL, and se. MO. Of our oaks, *Q. lyrata* tolerates the wettest habitats, both in terms of depth and duration of flooding. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Quercus macrocarpa** Michaux var. *macrocarpa*, Bur Oak, Mossycup Oak. Rich bottomland forests. NB and QC west to s. MB, south to nw. VA, KY, TN, LA, and TX. Variation in this species needs additional study; *Q. macrocarpa* in our area is the typic variety or subspecies if other taxa are recognized. [= K; < *Q. macrocarpa* – C, F, FNA, G, GW, S, WH]

**Quercus margarettae** Ashe ex Small, Sand Post Oak. Sandhills, typically in slightly loamy or clayey soils, not usual in the deepest and most xeric sands. April; September-November (of the same year). Primarily a species of the Southeastern Coastal Plain: se. VA south to FL and west to TX and se. OK. As stated by Fernald (1950), this oak was "chivalrously named [by W.W. Ashe] in 1903 for Margaret Henry Wilcox, who two years later became Mrs. Ashe." There has been controversy, however, over the spelling of the specific epithet; apparently it should be corrected to the genetive "ae" (K. Gandhi, pers. comm. 2007). [= Q. margarettae – RAB, C, FNA, G, S, WH; = *Q. margarettae* Ashe ex Small – K, orthographic variant; = *Q. stellata* var. *margarettae* (Ashe ex Small) Sargent – F]
**Quercus marilandica** Muenchhausen var. *marilandica*, Blackjack Oak. Upland forests and woodlands, usually on periodically droughty soils, as over shrink-swell clays, sandstones, deep sands, and sands with clay lenses. April; September-November (of the second year). NY (Long Island), NJ, se. PA, w. VA, s. OH, s. IN, c. IL, s. IA, and se. NE south to s. GA, Panhandle FL, and sc. TX (west to the Prairie border). There are historical accounts of the existence of prairies or barrens in the vicinity of Charlotte in the late eighteenth century, known as the "the blackjack lands." These areas were described as open and prairie-like, until the early nineteenth century, when they became dominated by dense forests of blackjack oak. The previously open condition was almost certainly maintained by fire, perhaps set by the Waxhaw Indians. Blackjack oak has long been considered an indicator of poor soil, as in Guthrie (1820), who states in his discussion of NC, "the Black Jack land is generally poor, though it has sometimes a black appearance, it is wet and loose, and is avoided by farmers, unproductive." Var. *marilandica* is the widespread taxon; var. *ashei* Sudworth [= *Q. neoashei* Bush] is worthy of recognition at the varietal level at least, and occurs from s. MO and s. KS south to c. AR, e. TX, and sc. TX, especially on the Edwards Plateau (Hunt 1990). [= FNA, K, Z; < *Q. marilandica* – RAB, C, F, G, S, W, WH, WV]

**Quercus michauxii** Nuttall, Basket Oak, Swamp Chestnut Oak. Bottomland forests, especially in fertile soils of upper terraces where flooded only infrequently and for short periods, upland depression ponds. April; September-October (of the same year). NJ south to n. peninsular FL and west to e. TX and se. OK, north in the interior to s. IL and s. IN. See discussion under *Q. montana* about the application of the name *Q. prinus* Linnaeus. [= RAB, C, F, G, GW, K, W, WH; = *Q. prinus* Linnaeus – S, name rejected (possibly misapplied, and a source of confusion)]

**Quercus minima** (Sargent) Small, Dwarf Live Oak. Pine flatwoods, coastal fringe sandhills. April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. NC (New Hanover County) south to s. FL, west to s. MS. [= FNA, K, S, WH]

**Quercus montana** Wildenow, Rock Chestnut Oak. Xeric forests of ridges, slopes. April; September-November (of the same year). Primarily Appalachian but broadly distributed in e. North America: s. ME, NY, MI, s. UN, s. IL, and se. MO (Smith & Parker 2005) south to c. GA, c. AL, ne. MS (and LA?). The proper application of the Linnaean *"Q. prinus"* is controversial and unclear, having been debated and variously applied for well over a century. The name "*Q. prinus*" has nomenclatural priority over either "*Q. montana*" or "*Q. michauxii*", but it is not clear which species was intended; Whittemore & Nixon (2005) proposed its formal rejection and the proposal was formally and unanimously accepted (Brummitt 2007). [= FNA, S, W; = *Q. prinus* Linnaeus – RAB, C, F, G, K, WV, name rejected (probably misapplied, and a source of confusion)]

**Quercus muehlenbergii** Engelmann, Yellow Oak, Chinquapin Oak. Slopes and bluffs, on soils derived from calcareous or mafic rocks. April; October-November (of the same year). S. New England and ON west to WI, se. MN, and IA, south to nw. FL, TX, and n. Mexico. The similar *Q. montana* sometimes has a few leaves with somewhat sharply lobed leaves, but these are minutely mucronate and lack the well-developed callus of *Q. muehlenbergii*. Additionally, *Q. muehlenbergii* has a flaky, light gray bark, very different from the dark gray, deeply furrowed bark of *Q. montana*. [= RAB, C, F, K, WH, WV; = *Q. muehlenbergii* – FNA, S, W, orthographic variant; = *Q. prinoides* Wildenow var. *acuminata* (Michaux) Gleason – G]

**Quercus myrtifolia** Wildenow, Myrtle Oak. Dry pinelands. February-March; September (of the second year). A Southeastern Coastal Plain endemic: sc. SC south to s. FL, west to se. MS. [= FNA, F, S, WH, Z]

**Quercus nigra** Linnaeus, Water Oak, Paddle Oak. Bottomland forests, especially on levees or second terraces where flooded infrequently and for short periods, less commonly on mesic slopes. April; September-November (of the second year). Primarily a species of the Southeastern Coastal Plain: s. NJ south to s. FL and west to e. TX and se. OK, north in the interior to se. TN, c. TN, w. and sc. KY (Clark et al. 2005), se. MO, and e. OK. Seedlings and fire sprouts of this species are highly variable; see discussion at end of generic treatment. [= RAB, C, FNA, G, GW, K, S, W, WH, Z; > *Q. nigra* var. *nigra* – F; > *Q. nigra* var. *heterophylla* (Aiton) Ashe – F; = *Q. aquatica* Walter]

**Quercus oglethorpensis** Duncan, Oglethorpe Oak. Bottomland forests, upland oak flats over clays (Iredell and Enon soils). April; September-October (of the same year). Widely scattered from w. SC, to adjacent c. GA, nw. AL (Sorrie pers. comm. 2002), MS, and LA. [= RAB, FNA, GW, K]

**Quercus pagoda** Rafinesque, Cherrybark Oak, Swamp Spanish Oak. Bottomland forests, especially on second terraces, also mesic upland sites. April; September-November (of the second year). A Southeastern Coastal Plain endemic: e. and c. VA south to nw. FL and west to se. TX and north in the interior to e. TN, s. IL, and s. IN. [= C, FNA, K, S, WH; = *Q. falcata* var. *pagodifolia* Elliott – RAB, F, G, GW]
though there has been much debate about its taxonomic status, with opinions ranging from full species to mere form \(Q. acerifolia\) is an endemic of Magazine Mountain in n. AR and scattered sites in OK; it is best treated as a distinct species, varieties should be recognized within \(Q. stellata\) \(Q. similis\) Bonpland, Common Chinquapin Oak. Rarely cultivated in our area; sometimes persisting or escaping in ne. United States, south at least to s. FL. Moist to fairly dry forests of slopes, coves, and ravines, below 1000 meters elevation. April; September-November (of the same year). MA and s. MI south to n. peninsular FL and TX. A number of varieties have been recognized in \(Q. similis\) and var. \(Q. similis\).  

**Quercus palustris** Muenchhausen, Pin Oak. Swamps and bottomlands, especially the broader swamps developed in the sedimentary rocks of Triassic basins of the lower Piedmont, isolated upland sag ponds, also widely planted as a street tree in towns and cities. March-April; October-November (of the second year). MA and NY west to se. IA and e. KS, south to e. NC, nw. GA, sc. TN, n. AR, and e. OK. \(=\) RAB, C, F, FNA, G, GW, K, S, W, WV

**Quercus phellos** Linnaeus, Willow Oak. Bottomland forests, especially on natural levees and second terraces, also in upland depression swamps developed on clay soils, weedy and successional on slopes and upland sites following disturbance, and widely planted as a street tree in towns and cities. March-April; September-November (of the second year). Primarily a species of the Southeastern Coastal plain: NY (Long Island), s. NJ, and se. PA south to s. GA and Panhandle FL, west to e. TX and se. OK, north in the interior to e. TN, s. KY, w. KY, s. IL, and se. MO, and e. OK. \(=\) RAB, C, F, FNA, G, GW, K, S, W, Z

**Quercus prinoides** Willdenow, Dwarf Chinquapin Oak. Xeric uplands, especially on clay soils derived from mafic rocks, and probably in sites which naturally burned rather frequently. April; August-September (of the same year). MA and s. MI south to NC, OK, and TX. Fire suppression in the Piedmont swamps where this rare oak occurs has nearly or entirely extinguished it from much of our area. \(=\) RAB, C, FNA, K, S, W; \(>\) Q. prinoides var. prinoides \(-\) F; \(>\) Q. prinoides var. rufescens Rehder \(-\) F; \(=\) Q. prinoides var. prinoides \(-\) G

\* **Quercus rubra** Linnaeus, English Oak. Rarely cultivated in our area; sometimes persisting or escaping in ne. United States, south at least to s. PA (Rhoads & Klein 1993; Rhoads & Block 2007). \(=\) FNA, K \[rejected; not mapped\]

**Quercus rubra** Linnaeus var. ambiguus (A. Gray) Fernald, Gray Oak. Forests on ridges, slopes, and coves, mostly at over 1000 meters elevation. May; September-October (of the second year). Fairly widespread in ne. North America south to PA, and in the Appalachians to w. NC, nw. SC, and n. GA. This and var. \(Q. rubra\) tend to intergrade and their distinction as even varieties may not be warranted. For discussion of the two varieties, see McDougal & Parks (1984) and Jensen (1977). \(=\) K; \(=\) Q. rubra var. borealis (Michaux f.) Farwell \(-\) RAB, F, FNA, WV; \(<\) Q. rubra \(-\) C, W; \(=\) Q. borealis Michaux f. var. borealis \(-\) G; \(=\) Q. borealis \(-\) S

**Quercus rubra** Linnaeus var. rubra, Red Oak. Moist to fairly dry forests of slopes, coves, and ravines, below 1000 meters elevation. April; August-September (of the second year). Widespread in e. North America, south to e. VA, GA, AL, MS, AR, and OK. \(=\) RAB, F, FNA, K, WV; \(<\) Q. rubra \(-\) C, W; \(=\) Q. borealis Michaux f. var. maxima (Marshall) Ashe \(-\) G; \(=\) Q. maxima (Marshall) Ashe \(-\) S

**Quercus shumardii** Buckley, Shumard Oak. Moist and fertile soils of bottomlands and lower slopes, also in xeric sites over calcareous rocks (such as limestone). April; September-October (of the second year). Sc. PA, OH, s. MI, IN, s. IL, MO, and e. KS south to n. peninsular FL and TX. A number of varieties have been recognized in \(Q. shumardii\), and the morphological and habitat variation needs additional study. Var. \(Q. schneckii\) (Britton) Sargent is apparently more midwestern, but should be looked for in our area, especially on dry limestone slopes, its preferred habitat. It is allegedly distinguished by the acorn cups rounded to turbinate below (vs. flattened and saucer-shaped in var. \(shumardii\)). Hess & Stoytontoff (1998) tentatively concluded that no varieties should be recognized within \(Q. shumardii\). \(Q. acerifolia\) E.J. Palmer) Stoytontoff & W.J. Hess \(Q. shumardii\) var. \(acerriforma\) Palmer is an endemic of Magazine Mountain in n. AR and scattered sites in OK, it is best treated as a distinct species, though there has been much debate about its taxonomic status, with opinions ranging from full species to mere form (Smith 1988, Stoytontoff & Hess 1990, Johnson 1992, Johnson 1994, Hess & Stoytontoff 1998). \(=\) RAB, C, S, W, WH; \(>\) Q. shumardii var. shumardii \(-\) F, FNA, G, K, WV; \(>\) Q. shumardii var. schneckii (Britton) Sargent \(-\) F, FNA, G, K, WV

**Quercus similis** Ashe, Swamp Post Oak, Delta Oak. Calcareous stream flats. SC south to GA, west to e. TX. \(Q. similis\) resembles \(Q. stellata\), differing in its less definitely cross-shaped leaves and its distinctly wetland habitat. \(=\) FNA, K; \(=\) Q. stellata Wangenheim var. paludosa Sargent; \(=\) Q. ashei Sterrett

**Quercus sinuata** Walter var. sinuata, Bastard Oak. Alluvial and slope forests. April-May; September-November (of the same year). Se. SC south to FL Panhandle, west to TX. \(=\) FNA, K; \(>\) Q. durandii Buckley \(-\) RAB, S; \(<\) Q. sinuata \(-\) WH

**Quercus stellata** Wangenheim, Post Oak. Upland forests and woodlands, especially in clay or rocky soils and in fire communities. April; September-November (of the same year). Se. MA, s. NY, s. PA, s. OH, s. IN, s. IA, and e. KS south to n. peninsular FL and TX. In KS, OK, and TX, post oak is one of the trees that forms the Prairie boundary. There is no question of the distinctness of \(Q. margarettae\) from \(Q. stellata\). See \(Q. similis\). \(=\) RAB, C, FNA, G, K, S, WH, WV; \(=\) Q. stellata var. stellata \(-\) F; \(=\) Q. villosa Walter
**FAGACEAE**

*Quercus texana* Buckley, Nuttall Oak, Texas Red Oak. Floodplain swamps and bottomlands. AL, TN, w. KY (Clark et al. 2005), west to e. TX. [= FNA, K; = *Q. nuttallii* E.J. Palmer – F, GW; = *Q. shumardii* Buckley var. texana (Buckley) W.W. Ashe] [not yet keyed]

*Quercus velutina* Lamarck, Black Oak. Upland forests and woodlands, especially in fairly xeric and sandy soils. April; September-October (of the second year). ME west to MN and NE, south to Panhandle FL and TX. [= RAB, C, F, FNA, G, K, S, W, WH, WV]

*Quercus virginiana* P. Miller, Live Oak. Locally common to abundant in maritime forests and maritime scrub on barrier islands, more rarely inland (though regularly on the mainland from s. NC south, and extending substantially inland from s. SC south), sometimes in dry, fire-maintained habitats more usually occupied by *Q. geminata*, also planted (especially in the outer Coastal Plain). April; September-November (of the same year). A Southeastern Coastal Plain endemic: s. VA south to s. FL islands, more rarely inland (though regularly on the mainland from s. NC south, and extending substantially inland from s. SC south), sometimes in dry, fire-maintained habitats, also in xeric and fire-maintained habitats on monadnocks in the upper Piedmont and in dry, sandy sites in the lower Piedmont and fall-line sandhills. April; August-September. NB, ON and MN, south to sc. and w. NC, w. SC, ne. GA, nc. TN, and IL. [= C, FNA, GW, K, S; = *Q. virginiana* var. virginiana – F; = *Q. sempervirens* Walter]

---

1 Leaves oblong or linear-lanceolate, pinnatifid, stipulate; fruit in a bristly involucre formed by 8 bractlets ..........................................

2 Fruit flattened, not waxy, partially enclosed in 2 wing-like bractlets; terminal buds lacking; aments inserted on old wood mainly below the leaves; [in our area, common and in the Coastal Plain, Mountains, and Piedmont] ..................................................

3 Fruit spherical, densely waxy, exposed (the 4-6 bractlets small and inconspicuous); terminal buds present; aments inserted on old wood mainly below the leaves; [in our area, very rare and restricted to bogs in the Mountains] ..................................................

4 Fruit in a bristly involucre formed by 8 bractlets ..........................................

5 Leaves mostly obovate or oblanceolate, entir e or toothed (especially apically), estipulate; fruit either exposed and densely waxy (*Myrica*), or partially enclosed in 2 wing-like bractlets (*Myrica*).

---

**Myrica** L'Heritier ex Aiton 1789 (Bayberry Family) [in FAGALES]

---

1 Fresh leaves odorless when crushed; staminate flowers with 6-10 stamens (or as few as 3 in distal flowers); leaves usually entire; [of s. GA south and west]; [subgenus *Cerothamnus*, series *Faya*] ..........................................................................................................................

2 Fruit flattened, not waxy, partially enclosed in 2 wing-like bractlets; terminal buds lacking; aments inserted on the summit of the branchlets of the preceding year; [in our area, very rare and restricted to bogs in the Mountains] ..................................................

3 Fruit spherical, densely waxy, exposed (the 4-6 bractlets small and inconspicuous); terminal buds present; aments inserted on old wood mainly below the leaves; [in our area, common and in the Coastal Plain, Mountains, and Piedmont] ..................................................

---

**Comptonia** L'Heritier ex Aiton 1789 (Sweet-fern)

---

*Comptonia peregrina* (Linnæus) J.M. Coulter, Sweet-fern. In the mountains on xeric ridges at low to medium elevations, usually in fire-maintained habitats, also in xeric and fire-maintained habitats on monadnocks in the upper Piedmont and in dry, sandy sites in the lower Piedmont and fall-line sandhills. April; August-September. NB, ON and MN, south to sc. and w. NC, w. SC, ne. GA, nc. TN, and IL. [= RAB, C, FNA, K, S, W, WV; > *Comptonia peregrina* var. *asplenifolia* (Linnæus) Fernald – F, Y; > *Comptonia peregrina* var. *peregrina* – F, Y; > *Myrica asplenifolia* Linnaeus var. *asplenifolia* – G; > *Myrica asplenifolia* var. *tomentosa* (Chevallier) Gleason – G]

---

**Morella** Loureiro 1790 (Bayberry, Wax-myrtle, Candleberry)

Wilbur (1994) makes a compelling case for the recognition of three genera among eastern North American Myricaceae, and for application of the name *Myrica* to *Myrica gale*. The typification of the genus *Myrica* with *Myrica gale* Linnaeus has been confirmed (Brummitt 1999); thus, the familiar southeastern species placed by many authors in *Myrica* must take another name. Wilbur (1994) prefers to treat our species as subgenus *Cerothamnus* (Tidestrom) Wilbur of genus *Morella* Loureiro; subgenus *Morella* is restricted to e. Asia, the Philippines, and Malaysia, and differs in a number of ways from subgenus *Cerothamnus*, including its fleshy and succulent, rather than waxy and hard, berries. Small maintained *Cerothamnus* at the generic level. Wilbur's inclusion of *Cerothamnus* in *Morella* may well be warranted (and is followed here), but I disagree with his provisional decision to include the taxon treated below as *Morella pumila* in *Morella cerifera*, and the taxon treated below as *Morella pensylvanica* in *Morella caroliniensis*, though their appropriate rank may be questioned. References: Bornstein in FNA (1997); Wilbur (1994)=Z; Wilbur (2002a); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

---

1 Leaves mostly obovate or oblanceolate, entir e or toothed (especially apically), estipulate; fruit either exposed and densely waxy (*Myrica*), or partially enclosed in 2 wing-like bractlets (*Myrica*).

---

**FAGACEAE**

*Quercus texana* Buckley, Nuttall Oak, Texas Red Oak. Floodplain swamps and bottomlands. AL, TN, w. KY (Clark et al. 2005), west to e. TX. [= FNA, K; = *Q. nuttallii* E.J. Palmer – F, GW; = *Q. shumardii* Buckley var. texana (Buckley) W.W. Ashe] [not yet keyed]
Morella caroliniensis (P. Miller) Small, Pocosin Bayberry, Evergreen Bayberry. Pocosins, wet savannas and pine flatwoods, sandhill seepage bogs, and wet or sandy peatlands. April; August-October. Primarily limited to the Southeastern Coastal Plain, from NJ south to FL and west to TX and AR. [= K; = Myrica heterophylla Rafinesque – RAB, FNA, W, Y; > Myrica heterophylla var. heterophylla – F; > Myrica heterophylla var. curtissii (Chevalier) Fernald – F; < Myrica pensylvanica – G; < Cerothamnus carolinensis – S (also see Morella pensylvanica); < Morella caroliniensis (P. Miller) Small – Z (also see Morella pensylvanica)]

Morella cerifera (Linnaeus) Small, Common Wax-myrtle, Southern Bayberry. Interdune swales (where often dominant), pocosins, brackish marshes, or wet to moist habitats, now also widely planted (including in the Piedmont) as an ornamental or landscaping shrub and preistent or naturalizing in suburban woodlands. April; August-October. Widespread in the Coastal Plain of Southeastern United States: NJ south to FL and west to TX. Our most common Morella, and also the largest, sometimes becoming a small tree, to at least 10 m tall and 20 cm DBH. See Morella pumila for a discussion of the controversial taxonomy of Morella cerifera and Morella pensylvanica. [= Myrica cerifera Linnaeus var. cerifera – RAB, Y; < Myrica cerifera – C, FNA, GW (also see C. pumilus); = Myrica cerifera – F, G; = Cerothamnus ceriferus (Linnaeus) Small – S; < Morella cerifera (Linnaeus) Small – K, Z (also see Morella pumila)]

Morella inodora (Bartram) Small, Odorless Bayberry. Acid wetlands, especially in wooded, acid, streamhead "bogs" and bayheads, often associated with Magnolia virginiana, Persea palustris, Cyrilla racemiflora, Cliftonia monophylla, and Woodwardia areolata. A Southeastern Coastal Plain endemic: se. GA west to s. MS. [= K, Z; = Myrica inodora Bartram – FNA, GW, Y; = Cerothamnus inodorus (Bartram) Small – S]

Morella pensylvanica (Mirbel) Kartesz, Northern Bayberry. Dunes, sometimes even on the foredune and stoloniferously colonizing the upper beach, more typically behind the foredune on secondary dunes and sandy flats, often growing intermixed with Morella cerifera, but able to occupy drier sites higher on the dunes, from VA north, also ranging inland in sandy situations. April; August-October. This species reaches its southern limit at Avon (Kinnakeet), Dare County, NC. On interdune flats, it often grows intermixed with Morella cerifera, but is readily distinguished (even at a distance) by its stoloniferous growth (appearing as dome-shaped clones 3-20 m in diameter), stouter twigs, and tardily deciduous leaves. The twigs of this species are noticeably stouter than those of Morella cerifera; measured at 10 cm from the twig tips, they are (2-) 3.5 mm in diameter, those of Morella cerifera ca. 1.5-2.5 mm. [= K; = Myrica pensylvanica Loiseleur – RAB, C, FNA, GW, Y; = Myrica pensylvanica – G (also see Morella heterophylla); < Cerothamnus carolinensis – S (also see Morella pensylvanica); < Morella caroliniensis (P. Miller) Small – Z; = Cerothamnus pensylvanicus (Mirbel) Moldenke]

Morella pumila (Michaux) Small, Dwarf Bayberry, Dwarf Wax-myrtle. Savannas, pine flatlands, relatively moist to extremely dry sites in sandhills (under Quercus laevis and Q. geminata). April; August-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to LA (or TX). Some authors dismiss the distinction between this taxon and Morella cerifera as merely environmental, others treat the two as distinct at the varietal or specific level. In our area at least, they appear to be genetically distinct. They often occur in close proximity (though their typical habitats differ, they can be seen side by side in wet spodosolic pine savannas, sometimes also intermixed with Morella caroliniensis), and maintain their distinctiveness. There are some observations that there is a phenologic difference, with Morella pumila peak flowering 3 weeks later than Morella cerifera (J. Townsend, pers. comm. 2002). Though the issue remains unresolved, the stoloniferous growth of Morella pumila is not merely a fire response; I here maintain the two as distinct, pending further research. [= Myrica cerifera Linnaeus var. pumila Michaux – RAB, Y; < Myrica cerifera – C, FNA, GW; = Myrica pumilla Rafinesque – F, G; = Cerothamnus pumilus (Michaux) Small – S; < Morella cerifera (Linnaeus) Small – K, Z]

*Myrica gale* Linnaeus, Sweet Gale. Peaty bogs. April; August-September. A circumboreal species, south in North America to NJ, PA, MI, MN, and OR, disjunct from PA and s. NJ to Henderson County, NC, where considered extirpated at one time, as a result of the destruction of the famous East Flat Rock Bog. This shrub has been relocated at a single site, where it is abundant in a small area (less than 0.25 hectare). [= C, FNA, GW, K, S, W, Y; = *Gale palustris* Chevalier – RAB; > *Myrica gale* var. *gale* – F]

159. JUGLANDACEAE A. Richard ex Kunth 1824 (Walnut Family) [in FAGALES]

A family of about 8 genera and 60 species, trees and shrubs, mostly temperate. References: Stone in FNA (1997); Manos & Stone (2001); Elias (1972); Stone in Kubitzki, Rohwer, & Bittrich (1993).

1 Nuts 6-7 mm long, with 2 wings; leaves even-pinnate, the rachis usually winged

2 Fruit with husk dehiscent into 4 valves; pith of twigs continuous; leaves with (3-) 5-17 (-19) leaflets, the largest usually the terminal or final 2 lateral; nut with shell smooth, ridged, or irregularly wrinkled (but not deeply furrowed); terminal buds with imbricate (overlapping) or valvate scales; [tribe *Juglandae*, subtribe *Caryinae*] ....................................................... *Pterocarya*

2 Nuts > 15 mm long, unwinged; leaves odd-pinnate, the rachis unwinged.

2 Fruit with husk indehiscent; pith of twigs chambered (not always developing until autumn of the first year's growth); leaves with (7-) 11-19 (-23) leaflets, the largest usually about halfway up the leaf; nut with shell deeply furrowed in a complex corrugated pattern; terminal buds with valvate; [tribe *Juglandae*, subtribe *Juglandinae*] ....................................................... *Juglans*

*Juglans* Nuttall (Hickory)
(by A.S. Weakley & R.K. Peet)

A genus of about 18 species, trees, of e. North America (south into s. Mexico), and e. Asia. *Carya* in our area is separated into two sections, section *Apocarya* (*C. aquatica*, *C. cordiformis*, *C. illinoinensis*) and section *Carya* (*C. carolinensis–septentrionalis*, *C. glabra*, *C. laciniosa*, *C. myristicifolium*, *C. ovalis*, *C. ovata*, *C. pallida*, *C. tomentosa*). The southeastern United States is the center of diversity of *Carya*. Our four-state area includes 11 of 13 North American species (including the naturalized *C. illinoinensis* and lacking only a more southern species, *C. floridana* Sargent of peninsular FL, and a south-central species, *C. texana* Buckley, of sc. United States), and 11 of 18 species worldwide. Section *Rhamphocarya* includes a single Asian species. The remaining 4 species in the genus are all in section *Apocarya*: *C. palmeri* Manning of Mexico and 3 Asian species. *C. cordiformis*, *C. aquatica*, *C. illinoinensis*, *C. myristicifolium*, *C. laciniosa*, *C. ovata*, and *C. carolinensis–septentrionalis* are diploids, with *n* = 16. *C. pallida*, *C. glabra*, *C. ovalis*, and *C. tomentosa* are tetraploids with *n* = 32 (Stone 1961). As suggested by Stone, Adrouny, & Flake (1969), it seems possible that reticulate evolution involving extant or extinct diploid species is responsible for some of the difficulties in the *C. glabra-ovalis* complex. Many hybrids have been described, but some are questionable. Additionally, Hardin & Stone (1984) state that "most of these hybrids are localized and have not led to introgressive populations, or at least none that have been recognized". Ecologically, *Carya* is one of the more diverse and ubiquitous genera of trees in our area, surpassed in number of species, abundance, and ecological amplitude only by *Quercus* and *Pinus*. This has led to a long tradition of describing large parts of our area (in particular the Piedmont) as being characterized by "oak-hickory" or "oak-pine-hickory" forests (e.g. Küchler 1964; Grelle 1988; Schaffale & Weakley 1990; Sargent & Van Lear 1993). Ware (1992) and others have recently questioned this tradition, pointing out that *Carya* only rarely dominates or codominates, primarily in specialized circumstances (such as in soils with greater cation concentrations, derived from mafic rocks). The association of many (but certainly not all) species of hickories with soils with high base status was noted in print as early as 1820 in an account of the landscape of North Carolina. "The sandy pine barrens, and all the lands on which pine is the exclusive growth, are unfriendly to agriculture; but where the pine is intermixed with oak and hickory, the soil is good. Some of our strongest lands have tall pine, mixed not only with hickory and oak, but also with walnut and cherry, and such trees that indicate the best soil. Where hickory prevails, the land is strong" (Guthrie 1820). References: Stone in FNA (1997); Hardin (1992); Hardin & Stone (1984); Elias (1972); Stone, Adrouny, & Flake (1969); Stone (1961); Mohlenbrock (1986); Sargent (1918); Manning (1950); Hardin (1952); Little (1969); Harrar & Harrar (1962); Stone in Kubitzki, Rohwer, & Bittrich (1993). Key based in part on an unpublished manuscript prepared by Stone & Hardin for the Flora of the Southeastern United States.

**Identification notes:** Surface vestiture of leaves and bud scales is useful in distinguishing species of *Carya*. Some use of these characters can be made with a 10× or 20× hand lens; better still is a dissecting microscope. It is important to understand the different trichome types mentioned in the key (terminology follows Hardin 1990 and Hardin & Stone 1984). Short acicular trichomes are simple, unicellular trichomes tapered to a pointed tip, 0.10-0.35 mm long and with rough walls. Long acicular trichomes ("solitary" of Hardin & Stone 1984) are similar to short acicular, but are much larger, 0.45-1.6 mm long, and have smooth walls. Fasciculate trichomes are multicellular and have 2-8 straight or curled rays radiating from a clustered base. Multiradiate trichomes are similar to fasciculate, but have 8-17 rays, the inner (and usually more upright) rays attached basally above the outer (and usually more spreading) rays. Capitate glandular trichomes are unicellular or multicellular, and are distinguished by their bulbous or expanded tip; they are usually 0.02-0.1 mm long. Peltate scales are flat or dome-shaped shields or disks, slightly to strongly glandular, (sometimes regularly or irregularly lobed) and can be either sessile or stalked (they are often referred to as scales,
resin dots, peltate glands, or lepidote scales). On the lower surfaces of leaflets, peltate scales are of two types: large peltate scales are 0.08-0.3 mm in diameter and are round, with smooth or slightly irregular margins, while small peltate scales are 0.025-0.12 mm in diameter and are either round, irregularly lobed or regularly 2- or 4-lobed.

1 Terminal buds elongate, flattened in cross-section, with 4-6 valvate scales; leaves with 7-13 (-19) leaflets, these symmetrical to strongly falcate; fruit sutures narrowly winged.

2 Leaves with 7-9 (-11) leaflets, these symmetrical to slightly falcate; fasciculate trichomes with 2-4 rays; terminal bud 9-19 mm long, bright orangy yellow to dull orange-tan; [common and widely distributed tree in our area, typically in floodplain and slope forests] ..............

2 Leaves with (7-) 9-19 leaflets, these slightly to strongly falcate; trichomes with 2-8 rays; terminal bud 11 mm long, brown to rusty-brown.

3 Leaves with (7-) 9-11 (-13) leaflets, the lower surfaces pubescent at least along the midrib and in the main vein axis; bark shaggy; lateral petiololes 0-2 mm long; nut flattened and angled in cross-section; kernel bitter; [native, of swamp forests, primarily in the Coastal Plain] ................................................................. C. cordiformis

3 Leaves with (7-) 11-19 leaflets, the lower surfaces nearly glabrous; bark scaly, with small exfoliating plates; lateral petiololes 0-7 mm long; nut round in cross-section; kernel sweet; [introduced, frequently cultivated, long persistent, and occasionally naturalized] ............... C. aquatica

............................................................................................................................. .......................................................

4 Bark tight (the ridges typically forming an interlocking diamond pattern), scaly, or shaggy (when shaggy, the separated segments normally much < 1 meter long); leaves with (3-) 5-9 (-11) leaflets; serrations of the leaflets densely (or only moderately) ciliate when young, most densely so just below the tooth apex, the hairs sloughing with age but leaving a subapical tuft of white trichomes on at least some teeth; fallen foliage turning black.

5 Twigs slender, hardened first-year growth 1-3 mm in diameter; terminal bud 6-15 mm long, glabrous to sparsely puberulent (except for ciliate fringe on the scales), reddish-brown (usually turning black on drying); lower surface of leaflets nearly glabrous, except for tufts of trichomes in the main vein axis, and only slightly lepidote with a few, scattered scales, the large peltate scales yellow and round, the small peltate scales brown, 2- and 4-lobed; terminal leaflet 2-5 (-6) cm wide ... C. carolinae-septentrionalis

5 Twigs stout, terminal buds 8-20 mm long; leaves with (5-) 7-9 (-11) leaflets; lower surface of leaflets moderately to densely hisurate with a mixture of acicular (single), fascicled (2-8 rays), and multiradiate (8-many rays) hairs; small peltate scales of the lower surface of leaflets all round; fruit husk 4-13 mm thick; nuts slightly to strongly 4-angled toward the apex.

6 Bark shaggy; petiole hirtellous; leaflet apex acuminate; lower surface of leaflets hisurate with acicular (single), 2-6-rayed fascicled, and occasional multiradiate hairs; fruit pubescent, lacking pubulate bumps; fruit 4-7 cm long; nut 3-6 cm long; [rare in our area] ................................................................. C. laciniosa

6 Bark tight; petiole hisulate; leaflet apex acute; lower surface of leaflets densely hisurate with acicular (single) and abundant 2-8-rayed fascicled and multiradiate hairs; fruit husk glabrous, with pubulate bumps; fruit 3.5-5 cm long; nut 2.5-3.5 cm long; [common in our area] ................................................................. C. tomentosa

6 Twigs slender; terminal buds 3-15 mm long; leaves with (3-) 5-7 (-9) leaflets; lower surface of leaflets mostly glabrous, except for along the midrib and primary veins, and sometimes hisurate on the surface with acicular (single) and infrequent fascicled (2-8 rays) hairs (lacking multiradiate trichomes); small peltate scales of the lower surface of leaflets of various types, 4-lobed and/or irregular scales often more frequent than round scales; fruit husk 2-5 mm thick; nuts not 4-angled toward the apex.

8 Terminal bud 5-15 mm long, predominantly pubescent (also sparsely lepidote); leaves with (3-) 5-7 (-9) leaflets; lower surface of small peltate scales slightly to densely lepidote with irregular and round peltate scales (4-lobed peltate scales uncommon).

9 Fruit husk indehiscent at maturity or tardily splitting to base  along 1 suture; leaves with (3-) 5 (-7) leaflets, glabrous to pubescent beneath; petiole usually green; fruits ellipsoidal, pyriform, or subglobose; bark tight; ................................................................. C. glabra

9 Fruit husk splitting to base at maturity along 2-4 sutures; leaves with (5-) 7 leaflets, pubescent beneath; petiole reddish; fruits typically ellipsoidal; bark tight or often scaly or somewhat shaggy. ................................................................. C. ovata

8 Terminal bud 4-10 mm long, predominantly lepidote (also pubescent); leaves with (5-) 7 (-9) leaflets; lower surface of spring leaflets densely lepidote with 4-lobed, irregular, and round peltate scales, giving the undersurface a reflective, silvery-tan, rusty-brown, or bronze sheen.

10 Lepidote scales initially silver, soon turning bronze, and giving the buds, young twigs, and undersurface of the leaves a metallic bronze sheen; fruit 2-3 cm long; [of calcareous swamps, bottomlands and slopes of the Coastal Plain of sc. NC southwards] ...........

............................................................................................................................. .......................................................

10 Lepidote scales silvery-tan or rusty-brown, giving the buds, young twigs, and undersurface of the leaves a dull or slightly shiny tan or rusty-brown color; fruit 3-5 cm long; [usually of upland and acidic forests and woodlands, collectively widespread in our area].

11 Undersurface of the leaflets with dense, silvery-tan large peltate scales, and fewer and less conspicuous fewer small peltate scales (thus the leaves appearing overall silvery-tan); petiole and rachis hisurate with fasciculate trichomes, and also with concentrations of hairs near the leaflet insertions; [widespread in our area, of upland and acidic forests and woodlands] ................................. C. myristicifloris

11 Undersurface of the leaflets with dense, rusty-brown small peltate scales, and fewer and less conspicuous sivery-tan large peltate scales (thus the leaves appearing overall rusty-brown); petiole and rachis with few fasciculate hairs (but densely scaly), and lacking concentrations of hairs near the leaflet insertions; [of the sc. United States, east to MS, w. KY, w. TN, and perhaps AL and GA, of upland or lowland, acidic or calcareous forests and woodlands] .............................................. C. texana
Hicoria glabra (P. Miller) Britton, Bitternut Hickory. Forests and woodlands, especially in rich, moist alluvial or slope forests. April; October. ME and s. QC west to MN and NE, south to Panhandle FL and e. TX. [= RAB, C, F, FNA, G, GW, K, W, WH; = Hicoria cordiformis (Wangenheim) Britton – S]

Carya glabra (P. Miller) Sweet, Pignut Hickory. In a wide variety of forests and woodlands. April-May; October. S. NH west to s. MI, se. IA, and se. KS, south to c. peninsular FL and e. TX. The C. glabra-C. ovalis portion of this treatment is tentative; in our area, this group has been variously treated as consisting of between 1 and 10 (or more) taxa. Here we recognize two species (C. glabra and C. ovalis) and no varieties, but further study of variation in this group is needed. Var. megacarpa in particular seems to show correlation of morphological traits and geographic distribution, with larger fruits (2.5-5 cm long vs. 1.5-3 cm long), thicker husks (ca. 3.5 mm thick vs. ca. 2 mm thick), large terminal leaflets (often to 20-25 cm long, vs. 10-17 cm long), and a primarily southern Coastal Plain distribution. glabrous. [= RAB, C, G, K, WH; > C. glabra var. glabra – F; > C. glabra var. megacarpa (Sargent) Sargent – F; > C. ovalis (Wangenheim) Sargent var. hirsuta (Ashe) Sargent – F; < C. glabra – FNA; > Hicoria glabra (P. Miller) Britton var. glabra – S; > Hicoria glabra – S; = Hicoria glabra var. glabra – W]

* Carya illinoensis (Wangenheim) K. Koch, Pecan. Bottomlands, eastwards persistent around dwellings and in pecan orchards, escaped to suburban woodlands, rural forest edges and floodplains, commonly cultivated. April-May; October. Native to the sc. United States, now more widespread in the se. United States as a result of cultivation. The spelling of the specific epithet has been a source of controversy. [= C, FNA, K, WH; = C. illinoensis – RAB, F, G, GW, orthographic variant; > Hicoria pecan (Marshall) Britton – S; > Hicoria texana LeConte – S]

Carya laciniosa (Michaux f.) Elliott, Nutmeg Hickory. Nonriverine swamps over calcareous substrates, including calcareous clays and coquina limestone ("marl"), oak flatwoods. April; October. Se. NC south to GA, and from wc. AL west to e. TX and se. OK, disjunct in Mexico (Nuevo Léon and Tamaulipas). The bronze sheen of the leaflets of this species is diagnostic. First reported for NC by Leonard (1971b). [= FNA, K; = C. myristicaefolia – RAB, GW, orthographic variant; = Hicoria myristicaefolia (Michaux f.) Sargent – S]

Carya myristicaefolia (Michaux f.) Elliott, Nutmeg Hickory. Nonriverine swamps over calcareous substrates, including calcareous clays and coquina limestone ("marl"), oak flatwoods. April; October. Se. NC south to GA, and from wc. AL west to e. TX and se. OK, disjunct in Mexico (Nuevo Léon and Tamaulipas). The bronze sheen of the leaflets of this species is diagnostic. First reported for NC by Leonard (1971b). [= FNA, K; = C. myristicaefolia – RAB, GW, orthographic variant; = Hicoria myristicaefolia (Michaux f.) Sargent – S]

Carya pecan (Marshall) Britton – S; > Hicoria texana LeConte – S]
**JUGLANDACEAE**

*Carya texana* Buckley, Black Hickory. Dry slopes and ridges, especially calcareous. April-May; October. Reported to occur as far east as KY, TN, and MS (FNA). Jones (2005) states that w. KY material of *C. pallida* is transitional to *C. texana.* [= FNA, K; > *C. texana* var. *arkansana* (Sargent) Little – C; > *C. texana* var. *texana* – F; > *C. buckleyi* Durand var. *arkansana* (Sargent) Sargent – G; = *Hicora texana* LeConte, misapplied – S]

*Carya tomentosa* (Lamarck ex Poiret) Nuttall, Mockernut Hickory, White Hickory. Forests and woodlands. April-May; October. MA west to IN and IA, south to n. peninsular FL and TX. One of the most common forest trees of much of our area. There has been confusion and controversy for several centuries over the specific epithet. The oldest basionym available is *Juglans alba* Linnaeus, which apparently included disparate elements, including this taxon and *C. ovata.* Following a more circumscribed typification by Crantz in 1766, the epithet "*alba*" should have been applied to this taxon, but continued to be applied in various ways. Rehder (1945) proposed that *C. alba* should be considered a *nomen ambiguum*, but agreed that it applied correctly to what has often been called *C. tomentosa*. He argued that the use of *C. alba* should be rejected "in order to avoid confusion and ambiguity." In 2008, Ward & Wiersema (2008) formally proposed rejection of *Juglans alba* (the basionym of *Carya alba*), and the Committee has recommended its rejection unanimously (Brummitt 2010). For further discussion see Rehder (1945), Howard & Staples (1983), Wunderlin, Hansen, & Hall (1985), and Brummitt (2010). [= C, F, FNA, G, RAB, W; = *Hicoria alba* (Linnaeus) Britton – S]

*Juglans* Linnaeus (Walnut)

A genus of about 21 species, trees and shrubs, of Mediterranean Europe to e. Asia, and North America to Andean South America. Stanford, Harden, & Parks (2000) present a molecular phylogeny and a discussion of biogeography; our two species are distantly related within the genus, with *J. nigra* most closely related to sw. North American *J. microcarpa* and *J. major,* and *J. cinerea* most closely related to several e. Asian species. References: Whittemore & Stone in FNA (1997); Stanford, Harden, & Parks (2000); Stone in Kubitzki, Rohwer, & Bittrich (1993); Stanford (1998).

1. Lower surface of the leaflets densely hirsute with 4-8-rayed fascicled hairs; fruit ellipsoid, densely pubescent with reddish-brown glandular hairs; leaf scars with a velvety ridge along the upper margin; leaves with (7-) 11-17 leaflets; pith dark brown; terminal buds 12-18 mm long; bark of mature trees pale; [section *Trachycaryon*] ................................................................. *J. cinerea*

1. Lower surface of the leaflets hirsute with single and 2-rayed fascicled hairs; fruit spherical or nearly so, lepidote with peltate scales and occasional glandular hairs; leaf scars without a velvety ridge along the upper margin; leaves with (9-) 15-19 (-23) leaflets; pith light brown; terminal buds 8-10 mm long; bark of mature trees dark; [section *Rhysocaryon*] ................................................................. *J. nigra*

*Juglans cinerea* Linnaeus, Butternut, White Walnut. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (VA): moist, nutrient-rich forests; uncommon. April-May; October. NB east to MN, south to n. GA and AR. This tree, formerly common, is afflicted with butternut canker disease, which now threatens its continued existence. [= RAB, C, F, FNA, G, K, W, WV; = *Wallia cinerea* (Linnaeus) Alefeld – S]

*Juglans nigra* Linnaeus, Black Walnut. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (VA): moist, nutrient-rich forests of floodplains and slopes, calcareous hammocks; common (uncommon in the Coastal Plain of NC and SC, rare in FL). April; October. MA west to MN, south to Panhandle FL and TX. The dark brown wood is famous for cabinetry and other uses; it is one of the most prized of North American hardwoods. The nuts, though difficult to crack, are prized for their intense flavor. The husk is used as a dye. Country people dehusk the nuts by putting them in dirt or gravel driveways where the passage of car tires removes the husk but does not crack the nut. [= RAB, C, F, FNA, G, K, W, WH, WV; = *Wallia nigra* (Linnaeus) Alefeld – S]

*Pterocarya* Kunth (Wingnut)

A genus of 6 species, trees, of e. and sw. Asia.

*Pterocarya stenoptera* C. de Candolle, Japanese Wingnut. Cp (LA): uncommonly cultivated, rarely naturalized or persistent; rare, native of e. Asia (China, Japan, and Korea). April-May; August-September. Naturalized in e. LA. [= K]
A family of 4 genera and about 100 species, trees and shrubs, of Malesia, Australia, and Melanesia. References: Johnson & Wilson in Kubitzki, Rohwer, & Bittrich (1993); Rogers (1982c).

**Casuarina** Linnaeus 1759 (Casuarina, Beefwood, She-oak)

A genus of about 17 species, trees, tropical to warm temperate in s. Asia, Australia, and Polynesia. References: Johnson & Wilson in Kubitzki, Rohwer, & Bittrich (1993); Rogers (1982c)=Z.

1. Leaves (teeth in whorls at each node) 6-8 per node; longitudinal ridges of branchlets sharply angular; plant monoecious; branchlet segments 5-8 (-13) mm long, 0.5-0.7 (-1) mm in diameter

1. Leaves 10-14 (-17) per node; longitudinal ridges of branchlets flattened or rounded; plant dioecious; branchlet segments 8-20 mm long, 0.9-1.2 mm in diameter

1. Fruit narrowly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula]*

1. Fruit broadly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula*]... *A. viridis* var. *crispa*

1. Fruit narrowly winged; winter buds stalked, covered by 2-3 equal scales.

1. Fruit broadly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula*]... *A. viridis* var. *crispa*

**162. BETULACEAE** S.F. Gray 1821 (Birch Family) [in FAGALES]

A family of 6 genera and about 150 species, primarily of arctic to cold temperate regions of the Northern Hemisphere, but extending through Central America to n. South America. The two subfamilies recognized here are sometimes elevated to family status, as by Govaerts & Frodin (1998). References: Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

1. Scales of the pistillate catkins persistent; leafy involucre absent; fruit a small winged nut; [subfamily *Betuloideae*].

2. Pistillate scales deciduous with or soon after the fruits; plant a tree, > 10 m tall at maturity...

1. Scales of the pistillate catkins caducous; leafy involucre present, conspicuous; fruit an unwinged nut; [subfamily *Coryloideae*].

3. Nut spherical, 1-1.5 cm in diameter, closely enveloped by the involucre...

3. Nut ovoid, 0.4-0.6 cm long, loosely or not at all enveloped by the involucre.

4. Infructescence bracts inflated, loosely enclosing the nut; bark brown, shaggy; trunk not fluted; buds not 4-angled...

4. Infructescence bracts flat, 1-3 lobed, not enclosing the nut; bark gray, smooth; trunk moderately to strongly fluted; buds 4-angled...

*Alnus* P. Miller 1754 (Alder)

1. Fruit broadly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula*]... *A. viridis* var. *crispa*

1. Fruit narrowly winged; winter buds stalked, covered by 2-3 equal scales.

2. Pistillate catkins mostly 1-1.5 (-2) cm long, subsessile and often clustered together closely; typical leaves with 8-14 principal veins on each side of the midrib; [subgenus *Alnus*].

3. Fruiting catkins drooping; leaves broadest at or below the middle, pale green to glaucous beneath, doubly serrate, the teeth of various sizes, usually some of them coarse; bark dark reddish-brown, shiny, with prominent light-colored lenticels...

3. Fruiting catkins erect; leaves broadest at or above the middle, green beneath, finely serrate, the teeth approximately equal in size; bark light gray or brown, with inconspicuous lenticels...

2. Pistillate catkins mostly 1.5-3 cm long, evidently pedunculate and therefore spaced; typical leaves with 5-8 principal veins on each side of the midrib.

4. Flowering spring; plant a tree; leaves broadly rounded to slightly notched at the tip; [alien, rarely planted and possibly persistent in our area]; [subgenus *Alnus*]...

*Alnobetula* Sieber ex Sprengel, Gray She-oak, Suckering Australian-pine, Scaly-bark Beefwood. Disturbed beaches and yards; native of Australia.
4 Flowering late summer or autumn; plant a shrub; leaves obtuse to short-acuminate at the tip; [native of e. MD, DE, and GA]; [subgenus Cleftropsis].
5 Strobili (14-) 14.5-19 (-24) mm long, <1.3× as long as wide; large shrub or tree 5.5-9.5 m tall, with a narrow crown; [of nw. GA]...  

* Alnus glutinosa (Linnaeus) Gaertner, Black Alder, European Alder. Disturbed areas, suburban woodlands; native of Europe. Sometimes cultivated, especially northward, and naturalized at least as far south as s. PA (Rhoads & Klein 1993); it has also been reported for Morgan County, TN (Chester, Wofford, & Kral 1997). [= FNA, C, F, G, K; = Alnus alnus (Linnaeus) Britton]

**Alnus maritima** (Marshall) Muhlenberg ex Nuttall ex Fernald spp. georgiensis Schrader & Graves, Georgia Alder. Standing water of Ridge-and-Valley spring run. Endemic to a single site in Bartow County, GA. It is one of three subspecies of A. maritima, each endemic to a small area – ssp. maritima of the Delmarva Peninsula of MD and DE, ssp. georgiensis Schrader & Graves of nw. GA, and ssp. oklahomensis Schrader & Graves of sc. OK. The closest relatives of A. maritima are in Asia. [= X; < A. maritima – FNA, K]

**Alnus viridis** (Villars) Lamarcq & De Candolle var. crispa (Aiton) House, Green Alder, Mountain Alder. Grassy balds, shrub balds, spruce-fir forests, and rock outcrops at high elevations (1600-1900m) in the Roan Mountain Massif, Mitchell and Avery counties, NC and Carter County, locally common. May-June; July. Ssp. crispa has variously been considered a variately, subspecifically, and specifically distinct from typic A. viridis. A. viridis is here treated as a circumpolar complex of 4 subspecies. Ssp. viridis occurs in montane portions of Europe. Ssp. simuta (Regel) A. Löve & D. Löve occurs in w. Canada and south in the montane west to nw. United States. Ssp. fruticosa (Ruprecht) Nyman ranges from n. CA north to coastal AK, and in ne. Asia. Ssp. crispa is generally far northern, ranging across n. Canada, south to MA and c. NY, and disjunct at a few localities in PA and at Roan Mountain on the NC-TN border, where it forms an extensive population. [= C; = A. viridis (Villars) Lamarcq & De Candolle ssp. crispa (Aiton) Turrill – FNA, K, Z; = A. crispa (Aiton) Parsh – RAB, G, W, Y; > A. crispa var. crispa – F; < A. alnobetula (Ehrhart) K. Koch – S; = Alnus michelliana M.A. Curtis ex Gray]

---

**Betula** Linnaeus 1753 (Birch)

1 Leaf blades suborbicular, the apex rounded; [section Costatae]. ................................................................................................................................. B. lenta var. uber
2 Leaf blades ovate or triangular, the apex acute to acuminate.
3 Bark yellowish-gray, yellowish, pink, reddish-brown, or dark brown; samara rounded or slightly retuse at its apex, the wings making up 1/2 or less of the width; fruiting peduncles sessile (peduncled in B. nigra); [section Costatae].
4 Inner bark of the twigs bitter, not aromatic; leaves cuneate at the base. ................................................................................................................................. B. nigra
5 Park of stems 5-30 cm in diameter (on larger trees look up for branches) yellow or yellowish-gray, exfoliating in papery shreds (bark of larger trunks becoming platey, the plates not prominently marked horizontally by old lenticels); scales of fruiting catkins 6-13 mm long, pubescent and marginally ciliate; twigs and buds slightly hairy ................................................................................................................................. B. alleghaniensis
6 Bark of stems 5-30 cm in diameter (on larger trees look up for branches) reddish-brown or dark brown, tight (bark of larger trunks becoming platey, the plates prominently marked horizontally by old lenticels); scales of fruiting catkins 5-7 mm long, glabrous; twigs and buds glabrous................................................................................................................................. B. lenta var. lenta
Betula alleghaniensis Britton, Yellow Birch. Forests at medium to high elevations, rarely at low elevations. April-May; June-August. NL (Newfoundland) west to se. MB, south to DE, PA, OH, n. IN, WI, MN, and IA, and in the mountains south to w. NC, n. GA, and e. TN. [= C, FNA, S, W, WV, Y, Z; = B. lutea Michaux f. – RAB; > B. lutea var. lutea – F, G; > B. lutea var. macrolepis Fernald – F, G; > B. alleghaniensis var. alleghaniensis – K; > B. alleghaniensis var. macrolepis (Fernald) Brayshaw – K]
Betula cordifolia Regel, Mountain Paper Birch. High elevation forests, primarily on talus of avalanche chutes, in the Black Mountains, Yancey County, NC, and on talus slopes and adjacent forests at high elevations, especially on quartzite on the western flank of the Blue Ridge, and on sandstone talus in the Ridge and Valley in VA. May-August; July-September. NL (Newfoundland) and e. QC south to the mountains of NY; disjunct in n. MN, w. VA, w. NC, and e. TN (Chester, Wofford, & Kral 1997). The question of the appropriate treatment of B. cordifolia and B. papyrifera is difficult (and still controversial). [= FNA, G, S, Y, Z; = B. papyrifera Marshall var. cordifolia (Regel) Fernald – RAB, C, F, K, W]

Betula lenta Linnaeus var. lenta, Sputt Birch, Cherry Birch, Black Birch, "Mahogany." Forests at low to high elevations; common (uncommon in Piedmont). March-April; June-July. S. ME west to OH, south to GA and n. AL. This species is generally restricted elevationally in Newfoundland to medium elevations and lower, but in VA it reaches higher elevations, where it can be as common as B. alleghaniensis. Once the primary source of methyl salicylate (wintergreen flavoring), used in medicines and confections; it is now produced synthetically. [= B. lenta – RAB, F, FNA, G, K, S, W, WV, Z; < B. lenta – C, Y (also including B. uber)]

Betula lenta Linnaeus var. uber Ashe, Virginia Roundleaf Birch. Mountain forests (endemic to Smyth County, VA). May-June; July-August. B. lenta var. uber is related very closely to B. lenta var. lenta, and is apparently endemic to Smyth County, VA. In addition to the characters in the key, it differs from B. lenta var. lenta in having the leaves 2-6 cm long (vs. 7-15 cm long), with 4-6 pairs of lateral veins (vs. 8-12 pairs). See Mazzeo (1974), Ogle & Mazzeo (1976), Hayden & Hayden (1984), and McAllister & Ashburner (2004) for additional information on this birch and its history. It does not breed "true" and should perhaps be considered a form of B. lenta. [= B. lenta Linnaeus – C, Y; = Betula uber (Ashe) Fernald – F, FNA, K, W, Z; = B. lenta ssp. uber (Ashe) E. Murray; = B. lenta forma uber (Ashe) McAllister & Ashburner]

Betula papyrifera Marshall, Paper Birch, Canoe Birch. Dry soils. NL (Newfoundland), NL (Labrador) and AK, south to NJ, WV, OH, IN, IL, IA, NE, CO, and BC; it has sometimes been attributed to the Mountains of VA, but apparently these reports are based on B. cordifolia. [= FNA, G, WV, Y, Z; = B. papyrifera var. papyrifera – C, F, K, W]

* Betula pendula Roth, European Weeping Birch, European White Birch. Persistent and escaping from plantings; native of Europe. Reported for Watagua County, NC by Poindexter (pers. comm.). [= C, F, FNA, K]

Betula populifolia Marshy, Gray Birch, White Birch. Woods, thickets, in VA native in old fields and young forests in the Big Meadows area on greesone (Madison & Page counties, VA), disturbed areas. May-June; June-July. NS to s. QC, south to s. NJ and MD, more or less disjunct in n. VA, s. ON, n. OH, and n. IN. [= RAB, C, F, FNA, G, K, W, Y, Z]

* Betula pubescens Ehrhart ssp. pubescens, European White Birch, Downy Birch. Disturbed areas; native of Europe. Also reported as an introduction in e. GA (Jones & Coile 1988) and at scattered sites throughout PA (Rhoads & Klein 1993). [= FNA, K; = B. alba Linnaeus – C, F, G, an ambiguous name]
BETULACEAE

Carpinus Linnaeus 1753 (Hornbeam, Ironwood, Muscle-tree, Water-beech, Blue-beech)

A genus of about 26 species, trees, in temperate regions of the Northern Hemisphere, extending southward to se. Asia and Central America. The smooth gray bark gives Carpinus the names “Water-beech” and “Blue-beech”, the fluted, sinewy appearance of the trunk the name “Muscle-tree”, and the very hard, heavy wood the name “Ironwood.” References: Furlow (1990)=Z; Hardin (1971)=Y; Furlow (1987a); Furlow (1987b)=X; Furlow in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves narrowly ovate to oblong-ovate, 3.8-8.5 cm long, 1.4-5 cm wide, the apex acute, secondary teeth small and blunt, the lower leaf surface lacking conspicuous dark glands; bracts of the infructescence with rounded to subacute tips and few, blunt teeth; [primarily of the Coastal Plain and lower Piedmont] .................................................................................. C. caroliniana var. caroliniana

1 Leaves ovate to elliptic, 5.8-12.5 cm long, 2.5-6.0 cm wide, usually abruptly narrowed to the tip (sometimes gradually tapered to a long, acuminate apex), the secondary teeth often almost as long as the primary teeth, sharp-tipped, the lower leaf surface with conspicuous dark-brown glands; bracts of the infructescence mostly sharp-tipped and bearing several sharp teeth; [primarily of the Mountains and Piedmont] ...

..........................................................C. caroliniana var. virginiana

Carpinus caroliniana Walter var. caroliniana, Coastal American Hornbeam. Streambanks, riverbanks, bottomland forests, lower slopes, maritime forests. March-April; September-October. S. NJ, e. MD, and e. VA south to e. peninsular FL, west to e. TX, and north in the inland to s. MO and s. IL. The validity of 2 taxa was established by Furlow (1987a, 1987b) largely through statistical methods. The two taxa have some morphologic and phytogeographic coherence, but intergradation appears to be extensive, and individual specimens (in the herbarium) or trees (in the field) may not be readily identifiable to variety. [= C, F = C. caroliniana ssp. caroliniana – FNA, K, X, Z; < C. caroliniana – RAB, G, GW, S, WH, Y]

Corylus Linnaeus 1753 (Hazelnut, Filbert)

A genus of about 15-18 species, shrubs and trees, of temperate regions of the Northern Hemisphere. Eurasian species of this genus, C. avellana Linnaeus and C. maxima P. Miller, are the sources of commercial filberts or hazelnuts. They are sometimes cultivated in North America, especially in the Pacific Northwest. Our wild species are also excellent eating, but wild animals, especially squirrels, usually harvest them before they are ripe. References: Furlow in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Whitcher & Wen (2001); Forest & Bruneau (2000); Govaerts & Frodin (1998).

1 Mature involucre 1.5-3 cm long, the lobes flattened and laciniate; young twigs and petioles stipitate-glandular; [section Corylus, subsection Corylus] .................................................................................................................................................. C. americana

1 Mature involucre 4-7 cm long, extended into a tubular beak; young twigs and petioles villous, glandless; [section Corylus, subsection Siphonochlamys] ........................................................................................................................................ C. cornuta var. cornuta

Corylus americana Walter, American Hazelnut, American Filbert. Rocky woodlands, mesic to rich forests and thickets. February-March; September-October. ME west to SK, south to GA, LA, and OK. [= RAB, C, FNA, K, S, W, Y, Z; < C. americana var. americana – F, G; > C. americana var. indesectens Palmer & Steyermark – F, G]

Corylus cornuta Marshall var. cornuta, Beaked Hazelnut. Dry rocky woodlands, thickets, high elevation forests and openings, seepage swamps. February-April; August-October. The species ranges from NL (Newfoundland) west to BC, south to NJ, n. GA, e. TN (Chester, Wofford, & Kral 1997), OH, MO, CO, and CA. Var. cornuta occupies most of that range; var. californica (A. de Candolle) Sharp [ssp. californica (A. de Candolle) E. Murray], a small tree, is far western and grades into var. cornuta. [= K, Z; < C. cornuta – RAB, C, F, G, S, W, Y; = C. cornuta ssp. cornuta – FNA]

Ostrya Scopoli 1760 (Hop-hornbeam, Ironwood)

Ostrya virginiana (P. Miller) K. Koch, American Hop-hornbeam, Ironwood. Mesic to dry forests, often rocky, especially over basic rocks, reaching high elevations. April-May; August-October. NS west to MB, south to c. peninsular FL, Panhandle FL, and TX. One of our heaviest and hardest woods. [= RAB, C, FNA, G, S, W, WV, Y, Z; > O. virginiana var. lassia Fernald – F; > O. virginiana var. virginiana – F; = O. virginiana var. virginiana – K]

167. CUCURBITACEAE Durande 1782 (Gourd Family) [in CUCURBITALES]

A family of about 97-120 genera and 800-1000 species, of tropical and subtropical areas, with a few extending to temperate areas. Schaefer & Renner in Kubitzki (2011); Nesom (2011b); Nesom in FNA (in prep.).

1. Ovaries and fruits muricate, tuberculate, or echinate; fruits 1-25 cm long at maturity.
2. Plants climbing; tendrils present; leaves with whitish-crisped margins; [section Bryoniae]................................. 2. Ecballium
3. Ovaries and fruits smooth or pubescent, but not prickly; fruits 1-70 cm long at maturity.

1. Momordica Linnaeus 1753 (Balsam-apple, Bitter Melon)

1. Bract of the male flowers toothed; bract of male flowers attached at the apex of the peduncle; fruit 2.5-4 (-7) cm long.............. M. balsamina
2. Bract of the male flowers entire; bract of male flowers attached near or below the midpoint of the peduncle; fruit 7-25 cm long.......................... M. charantia ssp. charantia

Momordica balsamina Linnaeus, Balsam-apple, Bitter Melon. Disturbed areas; native of Africa. May-September. [= FNA, K2, WH]

2. Ecballium A. Richard 1824 (Squirtin Cucumber)

3. **Luffa** P. Miller 1754 (Luffa)

1. Fruits clavate, strongly 10-angled; petals pale yellow; leaves shallowly lobed ........................................ L. acutangula var. acutangula
1. Fruits cylindric, not angled; petals deep yellow; leaves deeply lobed .......................................................... L. aegyptiaca

* **Luffa acutangula** (Linnaeus) Roxburgh var. acutangula, Angled Luffa, Ridged Gourd, Sponge Gourd. Gardens, fields, trash heaps; cultivated in home gardens, sometimes volunteering from seed the following year; native of s. Asia. Var. amara (Roxburgh) Clarke is also native of s. Asia. [= FNA; < L. acutangula – K]

* **Luffa aegyptiaca** P. Miller, Smooth Luffa, Sponge Gourd, Vegetable Sponge. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of s. Asia. [= FNA, K; ? L. cylindrica (Linnaeus) M. Roemer – S]

4. **Echinocystis** Torrey & A. Gray 1840 (Wild-cucumber)

5. **Sicyos** Linnaeus 1753 (Bur-cucumber)

A genus of about 75 species, annual or perennial vines, of Australia, Pacific Islands, tropical America. References: Nesom (2011a) = Z; Schaefer & Renner in Kubitzki (2011).

6. **Cucumis** Linnaeus 1753 (Canteloupe, Muskmelon, Cucumber)

1. Fruits with spine-bearing tubercles (aculeae); [West Indian gherkin]; [subgenus *Cucumis*; section *Aculeatosi*].
2. Aculei 1–2 mm long; leaves deeply 3–5-palmately lobed .......................................................... C. anguria var. anguria
2. Aculei 4–10 (15) mm long; leaves slightly to deeply 3–5-palmately lobed.......................................................... C. anguria var. longaculeatus
1. Fruits smooth, reticulate, or hairy, lacking aculeae; [subgenus *Cucumis*; section *Cucumis*].
3. Leaf blade lobe broadly triangular; corolla tube of female flower 3.5–6.5 mm long; corolla tube of male flower 3.4–4.9 mm long; [cucumber] .......................................................... C. sativus
3. Leaf blade central lobe elliptic, oblong or ovate; corolla tube of female 0.8–2.8 mm long; corolla tube of male flower 0.8–2.0 mm long.
4. Fused portion of hypanthium or youngest fruits with appressed hairs; stem abundantly beset with retrorse prickles; fruit diameter 2.5–5 cm .......................................................... C. melo var. texanus
4. Fused portion of hypanthium or youngest fruits with spreading hairs; stems smooth or nearly so; fruit diameter > 10 cm.
5. Fruits with smooth or wrinkled rind; ripe fruits with white or green flesh, lacking musky odor ...................................... C. melo var. inodorus
5. Fruits with netted, warty, or scaly rind; ripe fruits with orange (rarely green) flesh, with aromatic flavor and musky odor. .......................................................... C. melo var. melo
**Cucumis anguria** Linnaeus var. anguria, Bur Gherkin. Disturbed areas; native of Africa. [= FNA, K2; < *C. anguria* – S, V]

**Cucumis anguria** Linnaeus var. *longaculeatus* J.H. Kirkbride, West Indian Gherkin. Disturbed areas; native of the Africa. Reported for GA (Jones & Coile 1988), FL (Wunderlin & Hansen 2003, as *C. anguria*), and AL (Diamond & Woods 2009, as *C. anguria*). [= K, Z; < *C. anguria* – S, V, WH]

**Cucumis anguria** Linnaeus var. *longaculeatus* J.H. Kirkbride, West Indian Gherkin. Disturbed areas; native of the Africa. Reported for GA (Jones & Coile 1988), FL (Wunderlin & Hansen 2003, as *C. anguria*), and AL (Diamond & Woods 2009, as *C. anguria*). [= K, Z; < *C. anguria* – S, V, WH]

**Cucumis melo** Linnaeus var. melo, Canteloupe, Muskmelon. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of w. Africa. [= FNA, Y; < *Cucumis melo* Linnaeus – RAB, F, G, K, S, V, WV; = *C. melo* var. *canalipes* Naudin – U, X; < *C. melo* ssp. *melo* – Z]

**Cucumis melo** Linnaeus var. texanus Naudin, Gulf Coast Melon. Fields, roadsides, other disturbed areas; apparently evolved into a distinct variety in the southeastern United States from Asian stock introduced at an unknown time and by unknown means. Panhandle FL south to peninsular FL, west through s. MS, s. TX, and Mexico. Decker-Walters et al. (2002) show that var. *texanus* is morphologically and molecularly distinct from the most closely related varieties, the Asian var. *chito* (C. Morren) Naudin and var. *dudaim* (Linnaeus) Naudin; they postulate that var. *texanus* was likely introduced from Asia in pre-Columbian times. [= FNA, Y; < *Cucumis melo* Linnaeus – RAB, F, G, K, S, V; = *C. melo* ssp. agrestis (Naudin) Pangalo var. *texanus* – FNA; < *C. melo* var. *chito* – U, X; < *C. melo* ssp. agrestis (Naudin) Pangalo – Z]

**Cucumis sativus** Linnaeus, Cucumber. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of s. Asia. [= F, FNA, G, K, V, Z]

### 7. Melothria Linnaeus 1753 (Melonette)

A genus of about 12 species, vines, of the New World. References: Nesom in FNA (in prep.).

**Melothria pendula** Linnaeus, Melonette, Creeping Cucumber, Mouse Melon. Bottomland forests, moist roadsides and disturbed areas, marshes. June-November. DC, MD, and VA west to IN, south to FL and TX. [= C, F, FNA, G, GW, RAB, W; > *M. pendula* – S; > *M. pendula* var. *pendula* – K; > *M. pendula* var. *aspera* Cogniaux – K, S; > *M. pendula* var. *crassifolia* (Small) Cogniaux – K; > *M. microcarpa* Shuttleworth – S; > *M. nashii* Small – S]

### 8. Citrullus Schrader 1836 (Watermelon)

### 9. Coccinia Wight & Arnott 1834 (Ivy Gourd)

A genus of ca. 30 species, herbaceous vines, of sub-Saharan Africa. References: Nesom in FNA [in prep.]

**Coccinia grandis** (Linnaeus) Voigt, Ivy Gourd. Disturbed areas, escaped from cultivation; native of sub-Saharan Africas. May-November. [= K, WH]

### 10. Lagenaria Seringe 1825 (Bottle Gourd)

A genus of 6 species, Old World tropical, centered in Africa. References: Nesom in FNA (in prep.).

**Lagenaria siceraria** (Molina) Standley ssp. *siceraria*, Bottle Gourd, Calabash Gourd. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, rare as a volunteer from seed the following year; native of Africa. One of the oldest cultivated plants. [= FNA; < *L. siceraria* – K, WH; < *L. vulgaris* Seringe – RAB, F; < *L. leucantha* Rusby – G; < *Cucurbita lagenaria* Linnaeus – S]
11. Cayaponia Silva Manso 1836

A genus of about 45 species, of tropical, subtropical and warm-temperate America.

*Cayaponia quinqueloba* (Rafinesque) Shinners. Swamp forests, river banks. June-November. E. SC south to GA, west to e. TX, north in the interior to w. TN. [= FNA, K; = *C. boykinii* (Torrey & A. Gray) Cogniaux – RAB, S; > *C. quinqueloba* GW; > *C. grandifolia* (Torrey & A. Gray) Small – GW]

12. *Cucurbita* Linnaeus 1753 (Squash, Zucchini, Pumpkin, Gourd, Vegetable Marrow)

A genus of 14-22 annual or perennial vines, of the New World. References: Nesom in FNA (in prep.); Nesom (2011b)=Z.

1 Leaf blades distinctly longer than broad, triangular, usually unlobed; [coyote melon]..........................................................................................*C. foetidissima*

2 Leaf blades as wide or wider than long, deeply to shallowly lobed.

3 Fruiting peduncles relatively soft and cork-thickened, terete and not strongly ribbed, expanding gradually along their length ..................*C. maxima*

2 Stems and leaves variously pubescent, the hairs generally not pustulate-based.

3 Fruiting peduncles hardened and woody, 5-ribbed, abruptly and widely expanded at point of fruit attachment..........................*C. moschata*

4 Wild plants; fruit almost always bitter, solid ivory or green-and-white striped, usually not yellow or orange; rind smooth.

5 Fruit usually solid ivory, sometimes green-and-white striped; germination within 1-4 days .......................*C. melopepo* var. *ozarkana*

5 Fruit usually green-and-white striped, sometimes maturing yellow; germination within 3-7 days ......................*C. melopepo* var. *texana*

6 [scallop, pattypan, acorn, crookneck, and straightneck squashes, most ornamental gourds]...............................*C. melopepo* var. *melopepo*

6 [cucozelle, jack-o’-lantern pumpkins, vegetable marrows, zucchini, some ornamental gourds].................................................*C. pepo*

*Cucurbita maxima* Duchesne, Hubbard Squash, Pumpkin. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical America. [= F, K]

*Cucurbita melopepo* Linnaeus var. *melopepo*, Crookneck Squash, Straightneck Squash, Scallop Squash, Pattypan Squash, Acorn Squash, Ornamental Gourd. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year; native of tropical America. May-October. [= *C. melopepo* ssp. *texana* (Scheele) Nesom var. *melopepo* – Z]

*Cucurbita moschata* Duchesne, Butternut Squash. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year; native of tropical America. May-October. [= F, K, WH; = *Pepo moschata* (Duchesne) Britton – S]

*Cucurbita pepo* Linnaeus, Pumpkin, Zucchini, Ornamental Gourd, Vegetable Marrow. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical America. May-October. [= Z; < *C. pepo* – F, RAB, WV; = *C. pepo* var. *pepo* – K; < *Pepo pepo* (Linnaeus) Britton ex Small – S]
**CUCURBITACEAE**

A family of 2 genera and about 900-1500 species, herbs and shrubs, of tropical and subtropical (rarely warm temperate) regions. References: de Wilde in Kubitzki (2011).

*Begonia* Linnaeus (Begonia)

A genus of about 900-1500 (or more) species, herbs and shrubs, of tropical and subtropical (rarely warm temperate) regions. References: de Wilde in Kubitzki (2011).

* Begonia cucullata* Willdenow, Wax Begonia, Club Begonia. Disturbed places; native of South America. Escaped or persistent in e. GA (Jones and Coile 1988) and AL (Woods & Diamond 2006), south to Panhandle FL and ne. FL (Wunderlin & Hansen 2004). [= K, WH]

---

**172. PARNASSIACEAE** Gray 1821 (Grass-of-Parnassus Family) [in CELASTRALES]

A family of 2 genera and about 16 species, herbs, of largely north temperate and arctic areas. Numerous anomalous features separate *Parnassia* from the Saxifragaceae; affinities with the Droseraceae, Clusiaceae, Celastraceae, and other families have been historically suggested. It is now clear that its affinities lie with Celastraceae, but APG III’s (2009) inclusion of it in Celastraceae seems premature; it is here retained as separate. Considering the uncertainties of its relationships, *Parnassia* is best treated as a family, the Parnassiaceae, as suggested by numerous workers as early as 1821, and increasingly accepted in recent decades. The very distant relationship of *Parnassia* to the Saxifragaceae (sensu stricto) has been strongly reaffirmed by molecular analyses (Morgan & Soltis 1993, Soltis et al. 2000, Savolainen et al. 2000). References: Simmons in Kubitzki (2004). [including LEPUROPETALACEAE]

1 Plants diminutive, rosettes < 3 cm across; winter annual .................................................................................................................. Lepuropetalon
1 Plants larger, rosettes over 8 cm across; perennial from rhizomes ............................................................................................................. Parnassia

**Lepuropetalon** Elliott 1817 (Lepuropetalon)

A monotypic genus, of se. North America, Mexico, c. Chile, and Uruguay. Sometimes treated as part of a broad and polymorphic Saxifragaceae, *Lepuropetalon* has often been associated with *Parnassia* in the Parnassiaceae. Morgan & Soltis (1993) suggest a close relationship of Lepuropetalon and Parnassia, as well as the "distant relationship between both genera and the Saxifragoideae." The affinities of Lepuropetalon with Parnassia remain uncertain, however, as emphasized by Gastony & Soltis (1977) in their analysis of chromosomes and partially reiterated by Morgan & Soltis (1993). Lepuropetalon is here treated in the Parnassiaceae, as supported by molecular analyses (Soltis et al. 2000, Savolainen et al. 2000); treatment in a monotypic Lepuropetalaceae is perhaps equally warranted. References: Ward & Gholson (1987); Spongberg (1972); Gastony & Soltis (1977); Wilbur (1988b); Simmons in Kubitzki (2004).

*Lepuropetalon spathulatum* Elliott, Lepuropetalon. In moist open areas, such as seepage on granitic flatrocks, ditches, seasonally wet depressions. February-April. Se. NC and SC south to GA and FL Panhandle (Kunzer et al. 2009), west to e. TX and Mexico; also in Chile and Uruguay. As indicated by Ward & Gholson (1987), Lepuropetalon is more common than collections would indicate; the rosettes are 0.5-2 (-3) cm across, the greenish flowers are 2-3 mm across. It has been considered "the smallest terrestrial angiosperm" (Morgan & Soltis 1993). Its apparently greater abundance in the western portion of its range, where largely found by a few botanists "who have made determined efforts to establish its range" (Ward & Gholson), and in habitats such as granitic flatrocks, which have overall received close scrutiny, may be more a reflection of its diminutive size and early season of occurrence than of its real distribution and abundance. The recent increase in collections, mostly in disturbed or human-maintained habitats, also suggests a possible increase in abundance (and range?) from its original state. It should be more vigorously sought in our area. The presence of lines of red glandular dots on the leaves and sepals is a helpful diagnostic character. [= RAB, GW, K, S]

**Parnassia** Linnaeus 1753 (Grass-of-Parnassus, Parnassia)**
**PARNASSIACEAE**

A genus of 15-70 species, herbs, primarily of arctic and north temperate areas. Our species (especially *P. caroliniana*) are among the most southerly of the genus in distribution. *Parnassia* (all species) are among the most beautiful of our native plants. From a distance the white flowers are attractive but not extraordinary; when observed closely, though, the delicate tracery of the green veins on the waxy white petals is astonishing. References: Gastony & Soltis (1977); Spongberg (1972); GW; Simmons in Kubitzki (2004).

**Identification notes:** Note that the five staminodia are (in our species) deeply three-lobed to the base, thus appearing as 15.

1 Leaf blades reniform, as wide or wider than long, the base strongly cordate; staminodia shorter than the stamens [note that the stamens elongate after the staminodia; thus at a certain early stage the stamens of *P. asarifolia* may be shorter than the staminodia; check several flowers] .................................................................................................................. *P. asarifolia*

2 Staminodia longer than the stamens; [of VA, WV, MO, OK southward].......................................................................................................................... *P. glauca*

3 Main parallel veins of each petal 5-9 (counted at a point halfway between the base and the apex and ignoring short laterals), often strongly dilated toward the apex of the petal; outer- or basal-most main vein branching pseudo-dichotomously several times; rhizome horizontal, long-creeping, the leaves scattered or loosely clustered, tending to form clonal patches to several m in diameter; ovary white; [of Coastal Plain pinelands] ........................................................................................................................................... *P. caroliniana*

4 Staminodia shorter than the stamens; [of NJ, PA, and OH northward] ........................................................................................................................................ *P. glauca* or shorter than the stamens (P. glauca) ........................................................................................................................................... *P. grandifolia*

**Parnassia asarifolia** Ventenat, Kidney-leaved Grass-of-Parnassus, Appalachian Grass-of-Parnassus, Brook Parnassia. Bogs, sphagnous seeps, brookbanks, generally in more acidic habitats than *P. grandifolia*, up to elevations over 1800 m. (July-) August-October. VA, e. WV, sw. AR south to GA and e. TX, primarily in the Appalachian and Ozarkian highlands. [= RAB, C, F, G, GW, K, S, W, WV]

**Parnassia caroliniana** Michaux, Carolina Grass-of-Parnassus, Savanna Parnassia, Eyebright. Wet longleaf pine, pond pine, or pond cypress savannas (especially but not strictly where shallowly underlain by coquina limestone), sandhill seepage bogs. September-November (-December). Se. and sc. NC south through SC; disjunct in the Panhandle of FL, the distribution (at least now) fragmented and disjunctive. In NC, locally common in three small areas, centered around Maple Hill (Pender and Onslow counties), Old Dock (Columbus and Brunswick counties), and the Green Swamp (Brunswick County). Following Michaux's discovery of the species it was apparently not reported again in the Carolinas until found by H.A. Rankin near Hallsboro. His comments, quoted in Alexander (1934) are interesting. "What if our savannas are sometimes steaming, it is the condition necessary for the development for many wonderful plants which find here their most congenial surroundings. But Grass-of-Parnassus does not star the meadows during the steaming season, instead, by local tradition, the 'Eyebright,' its local name, times its first flowers to come just two weeks before frost ... As a matter of fact, I saw the first flowers this year on October 12th and our first frost came the morning of the 25th. Its chosen habitat is the wet savannas and hundreds of acres may be seen liberally dotted with its white stars, but it finds its best development in the lower places, and here it often almost covers the ground. Today, November 1st, it is in its prime and is the most conspicuous flower on many acres and in one little depression less than two feet in diameter I counted seventy-two flowers and buds." With the extensive destruction of our wet savannas (by conversion to pine tree farms, agriculture, and developed areas) and fire suppression, very few such places now remain. [= RAB, GW, K, S, WH]

**Parnassia glauca** Rafinesque, American Grass-of-Parnassus, Fen Grass-of-Parnassus. Fens. NL (Newfoundland), QC, and SK south to NJ (Ocean County), s. PA (Rhoads & Klein 1993), OH, IN, IA, and SD. [= C, F, G, K]

**Parnassia grandifolia** A.P. de Candolle, Bigleaf Grass-of-Parnassus, Limeeep Parnassia. Fens, gravelly seepages, pineland seepage bogs and ecotomes, primarily or solely over calcareous, mafic, or ultramafic rocks, in the outer Coastal Plain in seepage over marl on nearly vertical river bluffs on the Cape Fear River (NC) and in pineland seepage bogs. September-October. VA, WV, s. MO, and OK south to n. GA, Panhandle FL, s. MS (Sorrie & Leonard 1999), AR, and e. TX, primarily in the Appalachian and Ozarkian highlands. The discovery of populations of this species in Brunswick and Columbus counties, NC, was remarkable. In the Panhandle of FL and the West Gulf Coastal Plain of LA and TX it also occurs in wet savannas and pitcherplant bogs (MacRoberts, MacRoberts, & Jackson 2004), in FL sometimes in close proximity to *P. caroliniana; Parnassia* in Coastal Plain savannas should not necessarily be assumed to be *P. caroliniana.* [= RAB, C, F, G, GW, K, S, W, WH, WV]

![Image of Parnassia species](image_url)

**172b. CELASTRACEAE** R. Brown 1814 (Bittersweet Family) [in CELASTRALES]
A family of ca. 98 genera and ca. 1200 species, trees, shrubs, lianas, perennial and annual herbs, nearly cosmopolitan, especially in the tropics and subtropics. References: Brizicky (1964); Simmons in Kubitzki (2004).

1 Leaves spiny-toothed, coriaceous; [rare waif in our area]........................................................................................................................ Crossoptetalum

2 Leaves entire; twining woody vines .................................................................................................................................................. Celastrus

2 Leaves opposite; upright to trailing shrubs or climbing woody vines.

3 Leaves widely spaced, averaging < 1 pair per cm of stem; leaves 2.5-12 cm long, (0.5-) 1-6 cm wide; [shrubs to small trees, mostly > 0.4 m tall, collectively in many habitats].................................................................................................................. Euonymus

3 Leaves closely spaced, 2-4 pairs per cm of stem; leaves 1.1-2.5 cm long, 0.2-0.6 cm wide; [shrub < 0.4 m tall, native to calcareous rock outcrops, rarely naturalized elsewhere] ........................................................................................................... Paxistima

**Celastrus** Linnaeus 1753 (Bittersweet)

A genus of ca. 30 species, scandent shrubs, primarily in e. Asia, Malaysia, Oceania, Madagascar, and Central and South America. The one species native to e. North America is related to e. Asian species. The grammatical gender of the genus has been conserved as masculine (Brummitt 2005). References: Duncan (1969)=Z ; Leicht-Young et al. (2007); Simmons in Kubitzki (2004).

1 Flowers in 2-3-flowered axillary cymes; mature leaves mostly obovate, averaging 1.2-1.4 (-1.7)× as long as wide; expanding leaves folded (conduplicate); capsule yellow (contrasting with the seeds); pollen white................................................................. C. orbiculatus

1 Flowers in 6-many-flowered terminal panicles; mature leaves mostly ovate-lanceolate to elliptic, averaging (1.8-) 2.0-2.6× as long as wide; expanding leaves rolled (involute); capsule orange (similar to color to the seeds); pollen yellow ...................................................... C. scandens

* Celastrus orbiculatus *Thunberg, Oriental Bittersweet. Thickets, roadsides, forests; native of Asia. May; August-September. *C. orbiculatus*, though attractive, is becoming a noxious weed in our area. The first reports of its occurrence in our area appear to be in the 1960’s; it is now much more common than its native relative, *C. scandens*. [= RAB, C, F, W, Z; = C. orbiculata – G, K, orthographic variant]*

**Celastrus scandens** Linnaeus, American Bittersweet. Mesic forests. May-June; August-September. QC west to MB and WY, south to w. SC, n. GA, AL, LA, and TX. [= RAB, C, F, G, K, S, W, Z]

**Crossoptetalum** P. Browne 1756 (Christmas-berry)

A genus of about 26 species, trees and shrubs, of the West Indies and tropical America. References: Simmons in Kubitzki (2004).

* Crossoptetalum ilicifolium * (Poiret) Kuntze, Holly-leaf Rhacoma, Christmas-berry. Disturbed, acid, peaty soil; native of subtropical FL. Presumably introduced via cattle at an agricultural experiment station near Wenona, Washington County, NC (Hayes 1946). The species has probably not persisted in our area. [= K, WH; = Rhacoma ilicifolia (Poiret) Trelease – S]

**Euonymus** Linnaeus 1753 (Spindle-tree, Euonymus, Strawberry-bush)

A genus of ca. 129 species, of temperate and tropical areas, trees, shrubs, and lianas. The genus name was variously spelled "Euonymus" and "Eunonymus" by Linnaeus. The spelling *Euonymus* has been nomenclaturally "conserved." The genus is now considered to be grammatically masculine, and specific epithets therefore end in "-us." References: Ma & Funston (2008)= Y; Voss (1985)=Z; Simmons in Kubitzki (2004).

1 Leaf undersurface with mostly erect hairs to ca. 0.2 mm long; petioles 8-20 mm long; flowers 4-merous; [native]; [section Euonymus]................................. E. atropurpureus var. atropurpureus

1 Leaf undersurface glabrous (or with some hairs on the midrib); petioles 1-33 mm long; flowers 4- or 5-merous; [introduced or native].

2 Leaves evergreen; flowers 4-merous; [introduced species, rarely naturalized]; [section Illicifoli].

3 Leaves 2-5.5 cm long, 2-3.5 cm wide; capsule 5-6 mm in diameter............................................................................................ E. fortunei

3 Leaves (3-) 5-10 (-12) cm long, (2-) 3-5 (-5.5) cm long; capsule 6-9 (-12) mm in diameter .................................................................................. E. japonicus

2 Leaves deciduous; flowers 4- or 5-merous; [introduced or native].

4 Petioles 5-33 mm long; flowers 4-merous; [introduced, rarely naturalized]; [section Euonymus].

5 Leaf apex acute to short-acuminate; larger leaves 8-11 per cm.................................................................................. E. europeus

5 Leaf apex long-acuminate; larger leaves with teeth 6-8 per cm .................................................................................. E. maackii

4 Petioles 1-5 mm long; flowers 4- or 5-merous; [native and introduced].

6 Twigs and branches with 2-4 corky wings; flowers 4-merous; capsules smooth; [introduced, rarely naturalized]; [section Melanocarya].................................................................................................................. E. alatus

6 Twigs and small branches lacking corky wings, terete (or nearly so); flowers 5-merous; capsules muricate; [native species]; [section Echinococcus].

7 Primary stems erect, to 20 dm tall; upper leaves widest at or below the middle; petioles mostly 1-3 mm long; [widespread in our area]................................................................. E. americanus

Euonymus americana Linnaeus, Strawberry-bush, Heart's-a-bustin'- (with-love). Mesic to submesic forests. May-June; September-October. Se. NY west to s. OH and se. MO, south to n. peninsular FL and TX. A variety, var. angustifolia (Pursh) A. Wood, with narrowly lanceolate to linear leaves, has been named and occurs in our area; it is of uncertain status (Brizicky 1964). [= RAB, C, F, G, S, W, WH, WV; = Euonymus americana – K]  

Euonymus atropurpureus Jacquin var. atropurpureus, American Wahoo, Burning Bush. Bottomland forests, riverbanks, mostly on rich alluvial sediments, or on slopes over mafic or calcareous rocks. May; October. NY west to ND, south to Panhandle FL and TX. Var. cheathumii Lundell is endemic to TX. [= E. atropurpurea var. atropurpurea – K; > Euonymus atropurpureus – RAB, C, F, G, S, W, WH, WV; < Euonymus atropurpurea – Z]  

* Euonymus europaeus* Linnaeus, European Spindle-tree. Suburban woodlands, uncommonly cultivated, rarely naturalized; native of Europe. [= C, F, G; = Euonymus europaea – K, Z]  

* Euonymus japonicus* Thunberg, Japanese Spindle-tree. Disturbed areas, especially on barrier islands; native of Japan. Widely planted on barrier islands and in other maritime situations because of its resistance to salt damage (Brown 1959). [= C, Y; = E. japonica – K]  

* Euonymus maackii* Ruprecht, Winterberry. Cultivated, rarely naturalized; native of n. China. [= WH, Y; > Euonymus bungeanum Maximowicz – K; > E. hamiltonianus Wallich var. hamiltonianus – K2]  

* Euonymus obovatus* Nuttall, Running Strawberry-bush. Cove forests, northern hardwood forests, other mesic forests, especially in boulderfields, where sometimes quite abundant locally. May-June; September-October. W. NY west to s. MI, south to sw. NC, ne. GA, TN, and MO. [= RAB, C, F, G, S, W; = Euonymus obovata – K, Z]  

Paxistima Rafinesque 1838 (Mountain-lover)  

A genus of 2 species, rhizomatous shrubs, of temperate North America. The only other species in the genus is *P. myrsinites* (Pursh) Rafinesque of the Western Cordillera; its two subspecies are ssp. *myrsinites*, ranging from BC and AB south to AZ and NM, and ssp. *mexicana* Navarro & Blackwell of mountainous Mexico (Coahuila, Nuevo León, and Tamaulipas). For discussion of the long confusion and controversy over the appropriate spelling of the genus, see Navarro & Blackwell (1990) and Uttal (1986). The first validly published spelling of the name was “Paxistima,” and this spelling should be retained. References: Navarro & Blackwell (1990) in Z-Simmons in Kubitzki (2004).  

Paxistima canbyi A. Gray, Cliff-green, Canby’s Mountain-lover, Ratstripper. On calcareous bluffs and cliffs (generally near the top of the cliffs or bluffs, rarely far below the crest), mostly on limestone and dolostone, but rarely on greenstone or shale; in NC naturalized at the site of a plant nursery and possibly also native (see discussion below). April-May; September. The species is a Central Appalachian endemic: sc. PA (Bedford County) (Rhoads & Klein 1993), e. WV, w. VA, s. OH, e KY, ne. TN, and w. NC (wherequestionably native). The only collection definitely known from NC is that from an old nursery site (Hardin 1963). Navarro & Blackwell (1990) note that "the presence of *P. canbyi* in North Carolina was, however, noticed as long ago as 1883 by Chapman, and *P. canbyi* is likely native to North Carolina." Small (1933) reports it from "n. NC." Casting doubt on its native status in NC is the species' habitat: limestone ravines and bluffs, a very rare habitat in NC. [= RAB, C, K, W, Z; = Paxistima canbyi – F, WV (the name not validly published); = Pachystima canbyi – G, S (the name not validly published)]
175. OXALIDACEAE R. Brown 1818 (Wood-sorrel Family) [in OXALIDALES]

A family of 5-6 genera and 600-775 species, herbs, shrubs, vines, and small trees, nearly cosmopolitan (especially temperate). References: Cocucci in Kubitzki (2004).

Oxalis Linnaeus 1753 (Wood-sorrel, Oxalis)

2 Leaflets obdeltoid.
3 Leaflets green; plants with bulbs and bulblets .................................................................................................................. O. intermedia
4 Leaflets purple; plants with scale-clad rhizomes .................................................................................................................. O. triangularis

5 Plants arising from slender, herbaceous, stoloniform rhizomes at intervals producing white, horizontal, fusiform tubers or tuberlike thickenings; leaflets with upper shoulders flattened, margins green; flowers produced mostly within the level of the leaves; petals 12-18 mm long, throat strongly red-lined within ................................................................. O. illinoensis
6 Plants arising from slender, herbaceous, stoloniform rhizomes at intervals producing white, horizontal, fusiform tubers or tuberlike thickenings; leaflets with upper shoulders flattened, margins green; flowers produced mostly within the level of the leaves; petals 12-18 mm long, throat strongly red-lined within ................................................................. O. illinoensis

7 Stems pilose to villous to nearly glabrous, rarely strigose and then only on peduncles or pedicels.
8 Petals 10-20 mm long, red-lined in the throat.
9 Corolla throats strongly red-lined within; petals 14-20 mm long; flowers 1 or (2-3) 3-8 in umbelliform cymes above the level of the leaves; stems densely and pilose with stiffly spreading non-septate hairs; stoloniform rhizomes lignescent and numerous on an individual plant .................................................................................................................................................. O. priceae
10 Plants arising from slender, lignescent, stoloniform rhizomes without tubers; leaflets with upper shoulders usually rounded, margins often with a narrow purple margin; flowers produced above the level of the leaves; petals 10-14 mm long, throat yellow very faintly or weakly red-lined within .................................................................................................................................................. O. grandis

11 Stems erect, usually arising singly from the base, rarely decumbent, nor very rarely rooting at the nodes, from a short, thin, often herbaceous to slightly lignescent rhizome etc.; seeds all brown or with white transverse ridges; stipules absent or so reduced to be barely evident.
12 Stems 5-7 (-15) in regular (rarely irregular) cymes; capsules villous to sparsely puberulent, not villous .................................................................................................................................................. O. floribunda

* Oxalis articulata Savigny in Lamarck. Roadside, old gardens; native of South America. [= V; > O. rubra St. Hilaire – RAB, K, Q, WH; ? Ionoxalis martiana (Zuccarine) Small – S, misapplied; > O. articulata Savigny ssp. rubra (St. Hilaire) Lourteig]

* Oxalis corniculata Linnaeus. Creeping Lady’s-sorrel. Gardens, fields, disturbed areas, sometimes more natural areas including pinelands, dunes; probably native of New World tropics, but possibly including the deeper South. February–December. Now nearly worldwide in distribution, probably native of the New World tropics and subtropics. [= RAB, C, F, K, Q, WV, Y; = O.

Oxalis dillenii Jacquin. Southern Yellow Wood-sorrel. Roadsides, pastures, lawns, a wide variety of other habitats. February-May (-October). NS west to SK, south to FL, TX, NM; introduced elsewhere. [= C, K; > O. dillenii – RAB, > O. floridana var. floridana – RAB; > O. floridana Salisbury var. filipes (Small) Ahles – RAB; > O. stricta Linnaeus – G, WV, misapplied; > O. dillenii ssp. dillenii – Q, W, Y, Z; > Xanthoxalis brittoniae (Small) Small – S]

Oxalis illinoensis Schwedegmann, Illinois Wood-sorrel. Dry to dry-mesic forests and bluffs, often but not necessarily calcareous. S. IN and s. IL south through KY to c. TN. [= K]

* Oxalis intermedia A. Richard. West Indiana Wood-sorrel. Moist disturbed areas; native of West Indies. April-September. [= V; < O. latifolia Kunth – WH]

Oxalis texana (Small) Fedde. Reported for GA (GANHP, Kartesz 1999); not in GA (Ward 2004). Rejected for our area. [= O. priceae Small ssp. texana (Small) Eiten – K, Q, Y] {not keyed or mapped}

* Oxalis triangularis A. St.-Hilaire. Disturbed areas; native of Brazil and Argentina. April-May. [= V; < Oxalis triangularis A. St.-Hilaire ssp. papilionacea (Hoffmannsseg ex Zuccarini) Loureiro – WH]

181. Rhizophoraceae R. Brown 1814 (Red Mangrove Family) [in MALPIGHIACEAE]

A family of about 15 genera and 120 species, of tropical areas of the Old and New World.

Rhizophora Linnaeus (Red Mangrove)
A genus of 8-9 species, trees and shrubs, of tropical shores.

**Rhizophora mangle** Linnaeus, Red Mangrove. Cp (FL, GA, NC, SC): beaches; rare. Well-established from n. FL southwards into the West Indies and beyond in tropical America. The distinctive floating seedlings of *Rhizophora* occasionally wash up as jetsam on beaches of GA, NC, and SC, particularly following hurricanes. Photographic evidence has been supplied from Bear Island, Onslow County, NC, 11 June 1996 (Dave Owen, pers. comm. and photograph). These propagules may sprout and grow for some time, forming a young sapling with leaves, but do not survive because of frost. *Rhizophora* is not currently truly an established part of the flora north of FL,” but is repeatedly introduced naturally. [= GW, K, S, WH]

### 184. EUPHORBIACEAE A.L. de Jussieu 1789 (Spurge Family) [in MALPIGHIALES]

A family of about 313-322 genera and 8100-9000 species, trees, shrubs, vines, and herbs, nearly cosmopolitan in distribution, as defined broadly. Molecular systematics suggests that various units traditionally included in the Euphorbiaceae should be segregated (Solits et al. 2000, Chase et al. 2002). In our flora, this includes *Phyllanthus* (in Phyllanthaceae). References: Webster (1967), Webster (1994); Govaerts, Frodin, & Radcliffe-Smith (2000). [also see PHYLANTHACEAE]

1 Shrub or tree (woody).

2 Leaves entire.

3 Leaf blades 2-5× as long as wide; petioles 0.2-1.0 cm long; plant a native shrub; [subfamily *Euphorbioideae*] ................................................. *Ditrysinia*

3 Leaf blades 1-1.5× as long as wide; petioles 2-6 cm long; plant an alien tree; [subfamily *Acalyphoideae*] .......................................................... *Triotica*

2 Leaves crenate, serrate, or palmately lobed.

4 Leaves elliptic or lanceolate, with crenate or serrate margins.

5 Petiole lacking glands; [subfamily *Acalyphoideae*] ................................................................. *Sapum*

5 Petiole with 2 glands at summit; [subfamily *Euphorbioideae*] .......................................................... *Stillingia*

4 Leaves ovate or orbicular in outline, palmately lobed.

6 Inflorescence an panicle; petals absent; [subfamily *Acalyphoideae*] .......................................................... *Ricinus*

6 Inflorescence a dichasium; petals present; [subfamily *Crotonoideae*] .................................................. *Vernicia*

1 Herb.

7 Leaves palmately or ternately lobed or divided.

8 Leaves peltate; calyx green or purple; plant glabrous; stamens 100-1000; [subfamily *Acalyphoideae*] .......................................................... *Ricinus*

8 Leaves cordate at base; calyx petaloid, white; plant glabrous or ith conspicuous stinging trichomes; stamens 8-10; [subfamily *Crotonoideae*].

9 Plant with stinging trichomes; stamens connate ................................................................. *Cnidoscolus*

9 Plant lacking stinging trichomes; stamens separate ............................................................... *Manihot*

7 Leaves generally not lobed, entire or serrate (rarely pinnately lobed in *Euphorbia*).

10 Plant with copious white latex; flowers enclosed in a cyathium; [subfamily *Euphorbioideae*] .......................................................... *Euphorbia*

10 Plant without white latex (the sap clear, or slightly milky in *Stillingia*); flowers not enclosed in a cyathium.

11 Pubescence of stellate trichomes and/or scales; [subfamily *Crotonoideae*] .................................................. *Croton*

11 Pubescence of simple trichomes, or glabrous.

12 Flowers in terminal spikes; stout perennial with several to many stems arising from a subterranean crown [subfamily *Euphorbioideae*]. ................................................................. [see *Phyllanthus – PHYLLANTHACEAE*]

12 Flowers strictly axillary or both axillary and terminal, in small clusters, racemes, or spikes; finer perennial or annual, not typically with > 1 stem arising from a subterranean crown.

13 Ovules and seeds 2 per locule (the capsule thus 6-seeded); flowers in small axillary clusters of 2-4 ..........................................................

13 Ovules and seeds 1 per locule (the capsule thus 3-seeded, or fewer by abortion); flowers in axillary spikes or in racemes borne in leaf axils or opposite the leaves; [subfamily *Acalyphoideae*].

14 Pistillate flowers lacking a leafy bract; plant with stinging trichomes; styles undivided .......................................................... *Tragia*

14 Pistillate flowers subtended by a conspicuous leafy bract; plant lacking stinging trichomes; styles laciniate

15 Leaves alternate; carpels 3 (sometimes fewer by abortion) .......................................................... *Acalypha*

15 Leaves opposite; carpels 2 ...........................................................................................................

**Acalypha** Linnaeus 1753 (Copperleaf, Three-seeded Mercury)
A genus of about 430-462 species, shrubs, herbs, and trees, of primarily tropical and subtropical regions (rarely warm temperate). References: Levin in FNA (in prep.); Levin (1999b)=Z; Levin (1999a); Govaerts, Frodin, & Radcliffe-Smith (2000)=Y. Key based in part on Levin in FNA.

1 Bracts of pistillate flowers with linear tips or lobes longer than the broad basal portion; pistillate flowers all or chiefly in terminal spikes, the staminate flowers in axillary clusters (except sometimes in A. arvensis).
2 Pistillate inflorescences with the bracts densely crowded, completely hiding the inflorescence axis; bracts of pistillate flowers with lobes consisting of deltate bases bearing long linear tips, long-hirsute with non-glandular hairs to 2 mm long ......................................................A. arvensis
3 Leaves cordate at base; fruit tuberculate, but not pubescent .............................................................A. ostryifolia
4 Leaves rounded to widely cuneate at base; fruit pubescent with pubescence-based trichomes ......................................................A. setosa

Bracts of the pistillate flowers with deltate or lanceolate tips or lobes; pistillate and staminate flowers all in axillary inflorescences, the staminate flowers above and pistillate flowers below in each inflorescence.

4 Bracts subtending the pistillate flowers (5-) 7-9 (-11) lobed, usually stipitate-glandular; petiole 0.5-1.5× as long as the leaf blade; stems with only short, incurved trichomes.
5 Fruit 2-seeded; seeds 2.4-3.2 mm long ..............................................................................................................A. deamii
5 Fruit 3-seeded; seeds 1.2-2.0 mm long .............................................................................................................A. rhomboidea

4 Bracts subtending the pistillate flowers 9-15 (-16) lobed, stipitate-glandular or merely pubescent; petiole 0.2-0.5× as long as the leaf blade; stems with short incurved trichomes, with or without longer, straight, spreading trichomes as well.
6 Bracts subtending the pistillate flowers usually stipitate-glandular, the bract lobes ovate to deltoid, the longest < 2 mm long .................A. gracilens
6 Bracts subtending the pistillate flowers usually non-stipitate, pointed hairs, the bract lobes linear to oblanceolate, the longest usually > 3 mm long broadly ......................................................A. virginica

* Acalypha arvensis Poeppig & Endlicher. Disturbed ground; native of West Indies, Mexico, and Central America. [= FNA, K, WH]

Acalypha deamii (Weatherby) Ahles, Big-seeded Copperleaf, Two-seeded Copperleaf. Pd (VA), Mt (VA), Cp (VA): alluvial forests, especially on sandy beaches; un cultivated. W. PA (Rhoads & Klein 1993), s. OH, and s. IN south to w. TN (Chester, Wofford, & Kral 1997) and AR; apparently disjunct in c. VA (where now known from 23 counties, mainly in the Piedmont), but probably now overlooked elsewhere. This plant is up to a meter tall and occurs in moist bottomland forests. [= C, FNA, K, Z; = A. rhomboidea var. deamii (Weatherby) Weatherby – F; G; = A. virginica Linnaeus var. deamii Weatherby – Y]

Acalypha gracilens A. Gray, Shortstalk Copperleaf. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): woodlands, disturbed ground; common (uncommon in WV). Late June-November. ME west to WI, south to FL and TX. The related A. monococca (Engelmann ex A. Gray) Lill. W. Miller & Gandhi is of broadly Ozarkian distribution and warrants specific status (Levin 1999a, 1999b). Var. fraseri is generally more southern and is considered to differ in having more elongate staminate spikes, to 3-4 cm long (vs. 0.5-1.5 cm long). It may have merit, but was not recognized by Levin (1999a, 1999b). [= RAB, FNA, K, S, W, Z; > A. gracilens var. gracilens – C, F, G; > A. gracilens var. fraseri (Müller of Aargau) Weatherby – C, F, G; = A. virginica Linnaeus var. gracilens (A. Gray) Müller of Aargau – Y; = A. gracilens ssp. gracilens]

Acalypha ostryifolia Riddell ex J.M. Coulter, Rough-pod Copperleaf. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, SC): disturbed ground; uncommon (rare in WV). Late June-November. NJ west to IN and NE, south to FL, TX, Mexico, and the West Indies. [= FNA, K, W, Y; = A. ostryifolia – RAB, C, F, G, s, orthographic variant]

Cnidoscolus Pohl 1827 (Spurge-nettle)

**Croton Linnaeus 1753 (Croton, Doveweed, Rushfoil)**

A genus of about 1250 species, herbs, shrubs, and (rarely) trees, of nearly cosmopolitan distribution. Webster (1992, 1993) considers the 2 species traditionally treated as *Crotonopsis* to be closely related to sections within *Croton*, such as section *Gynamblosis*; his reasoning has been supported by molecular phylogenetic studies and all recent floristic treatments and is followed here. References: van Ee & Berry in FNA (in prep.); van Ee, Riina, & Berry (in press); Webster (1992)=Z; Webster (1993)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000).

---

1 Evergreen shrub, (1-)2-3 m tall; pistillate flowers with petals; [section *Alabamenses*]................. *C. alabamensis* var. *alabamensis*

1 Herbaceous or suffrutescent, 0.1-1.2 m tall; pistillate flowers lacking petals.

2 Leaves with coarsely serrate margins; 1-2 glands present near the junction of the petiole and the leaf blade; [section *Geiseleria*]..............

2 Leaves with entire margins; glands absent at the junction of the petiole and the leaf blade.

3 Leaves sessile or with short petioles (to 3.2 mm long), the petiole < 1/5 the length of the leaf blade; fruit 1-locular, indehiscent; seed 1 per fruit, 2.2-5.5 mm long; [section *Crotonopsis*].

4 Branches monopodial; stellate hairs of the upper leaf surface with arms to 0.3 mm long, not overlapping the arms of the nearby stellae...

4 Branches dichotomous and trichotomous; stellate hairs of the upper leaf surface with arms to 1.0 mm long, overlapping the arms of nearby stellae...

5 Stem leaves mostly 2× or more as long as wide; lobes of the calyx of the pistillate flowers 5-9 (-12); [section *Pilophyton*].

6 Leaves (the larger) 4-15 cm long, 1.5-6 cm wide (generally 2-3× as long as wide), lanceolate to elliptic, cordate at the base; hairs of 2 colors, the shorter gray, the longer tan; lobes of the calyx of the pistillate flowers (6-) 7-9 (-12); [alien, of disturbed habitats]..

............................................................................................................................. ................................................................

55 mm long.

6 Leaves (the larger) 2.5-6 cm long, 0.7-1.5 cm wide (generally 3-6× as long as wide), linear to linear-lanceolate, cuneate at the base; hairs of 1 color, all gray; lobes of the calyx of the pistillate flowers 5-6; [native, of Coastal Plain pondshores]............. *C. elliottii*

5 Stem leaves mostly < 2× as long as wide, 1-8 cm long, broadly cuneate to rounded at the base (a few rarely subcordate); lobes of the calyx of the pistillate flowers 5.

7 Styles 3, each 4-lobed, the style branches thus 12; capsule erect, 5-7 mm long; seeds 4.5-5.0 mm long; lower leaf surface silvery; plant an annual or perennial; [of coastal dunes]; [section *Drepanodium*]...

....................................................................................... *C. punctatus*

7 Styles 2 or 3, each 2-lobed, the style branches thus 4 or 6; capsule pendulous, 3-6 mm long; seeds 2.5-4.0 mm long; lower leaf surface white to silvery; plant an annual; [of limestone outcrops, fields, or weedy situations].

8 Fruit 2-locular; seeds 1 per fruit; styles 2, each 2-lobed; [of limestone outcrops or weedy situations]; [section *Gynamblossis*].....

....................................................................................... *C. monanthogynus*

8 Fruit 3-locular; seeds 3 per fruit; styles 3, each 2-lobed or 4-lobed; [of fields or weedy situations]; [section *Velamea*]........

....................................................................................... *C. lindeheimerianus* var. *lindeheimerianus*.

---

**Croton alabamensis** E.A. Smith ex Chapman var. *alabamensis*, Alabama Croton. Dry to mesic limestone glades, woodlands, and wooded ravines. Endemic to scattered populations in c. AL; alleged populations in sc. TN (Chester, Wofford, & Kral 1997) are apparently based on mislabeled specimens (Wurdack 2006). *C. alabamensis* var. *texensis* S. Ginzbarg is endemic to c. TX (Ginzberg 1992; Aplet et al. 1994), where it occurs in canyons in the Edwards Plateau. The species is most closely related to species of the West Indies, Central America, and South America; its distribution is obviously relictual. [= K; < *Croton alabamensis* – S]

* Croton bonplandianus Baillon. Cp (VA): chrome ore piles; rare. Reported for chrome ore piles at Newport News, VA and Canton, MD (Reed 1964). [= K] (not keyed; not mapped; rejected)

**Croton elliotii** Chapman, Pondshore Croton, Elliott's Croton. Cp (FL, GA, SC): shores and exposed drawdown zones of clay-based Carolina bays and limesink ponds (dolines); rare (GA Special Concern, SC Rare). Se. SC south to Panhandle FL, west to se. AL. [= K, S, WH]

* Croton glandulosus Linnaeus var. *septentrionalis* Müller of Aargau, Doveweed, Tooth-leaved Croton, Sand Croton. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, roadsides, disturbed areas; common (uncommon in DE and WV). May-October. *C. glandulosus* is widespread in tropical and subtropical America; var. *septentrionalis* is the northernmost variety, but its pre-Columbian range is obscure because of its weedy nature. [= RAB, C, F, G, K, S, W; < Croton glandulosus var. *glandulosus* – WH; < Croton glandulosus – WV]

---

**Croton stimulosus** (Michaux) Engelmann & A. Gray, Spurge-nettle, Tread-softly, Finger-rot, Bull-nettle. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, SC): sandhills, dry sandy woodlands, other dry sandy soils; common (rare in Piedmont and Mountains). Late March-August; May-September. Se. VA south to s. FL, west to e. LA, mostly on the Coastal Plain, but further inland southward. Beset with stinging thistles. Allied to *C. urens* of Mexico, Central America, and n. South America, and sometimes treated as a variety of it. [= RAB, C, F, G, K, W, WH, Y; = Bivonea stimulosa (Michaux) Rafinesque – S = *C. urens* (Linnaeus) Arthur var. *stimulosus* (Michaux) Govaerts – Z]
Croton lindheimerianus  Scheele var. lindheimerianus, Lindheimer's Croton. Pd (NC): fields and other disturbed soils; rare, adventive from further west. June-October. [= K;  < Croton lindheimerianus – RAB]

Croton michauxii Webster, Sand Rushfoil, Michaux's Croton. Cp (FL, GA, SC, VA?): sandhills, disturbed sandy soils; common (uncommon in GA, rare north of GA). June-October. SC south to s. FL, west to TX, north in the interior to MO, IL, and IA. Fernald (1950) alleges that this species extends as far north as VA, but the documentation is unknown to me. [= K, WH, Z; = Crotonopsis linearis Michaux – RAB, C, F, G, S]

Croton monanthogynus Michaux, Prairie-tea, One-seed Croton. Mt (GA, NC, VA, WV), Pd (GA, SC, VA*), Cp (GA, VA?): limestone outcrops, blackland prairies, disturbed dry soil; rare. June-October. Sw. VA, OH, IN, IA, NE, and CO, south to nw. GA, FL, TX, and Mexico; adventive as a weed at scattered locations east of the Blue Ridge. [= RAB, C, F, G, K, S, W, WV]

Croton punctatus Jacquin, Silverleaf Croton, Beach-tea, Gulf Croton. Cp (FL, GA, NC, SC): beach dunes, coastal grasslands, usually with Uniola paniculata and/ or Spartina patens; common. Late May-November. NC (Dare County) south to s. FL, west to TX, and south into Central and South America. [= K; = RAB, K, S, WH]

Croton argyranthemus Michaux, Silver Croton, Sandhill Croton, Healing Croton. Cp (FL, GA): sandhills; common. C. GA and s. AL south to c. peninsular FL; w. LA and sw. OK south through e. and c. TX to Nuevo León and Tamaulipas. [= K1, K2, S, WH]  {not ye t keyed}

Croton lindheimeri (Engelmann & A. Gray) Müller of Aargau – K; = Croton capitatus Michaux var. lindheimeri (Engelmann & A. Gray) Müller of Aargau – K; = C. engelmannii Ferguson – S}  {not yet keyed}

* Croton texensis (Klotzsch) Müller of Aargau var. texensis, Texas Croton. Cp (DE): disturbed areas; rare, native of c. North America. [= K]  {not yet keyed; add to synonymy

**Dirysinia** Rafinesque 1825 (Sebastian-bush)

A monotypic genus, a shrub, of the Southeastern United States Coastal Plain. Perhaps as close to Gymnanthes as to Sebastiania. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

Dirysinia fruticosa (W. Bartram) Govaerts & Frodin, Sebastian-bush. Swamp forests, other wet to moist, mostly shaded, habitats. May-June; July-October. Se. NC south to c. peninsular FL, west to e. TX. [= Z = Sebastiania fruticosa (W. Bartram) Fernald – GW, K, WH; = Sebastiania ligustrina (Michaux) Müller of Aargau – RAB; = Sebastiania ligustrina – S (orthographic error)]

* Euphorbia* Linnaeus 1753 (Spurge)

1 Leaves strictly opposite, oblique or inequilateral at base; branches often prostrate .......................................................... **Key A (subgenus Chamaesyce)**

1 Leaves alternate or opposite, not oblique or asymmetrical at base; branches usually erect.

2 Bracteal leaves lobed or toothed (rarely linear), usually marked with red or white at the base or purple-spotted; glands of the cyathia usually 1 (rarely more), bilabiate, lacking petaloid appendages ............................................................................................................ **Key B (subgenus Poinsettia)**

2 Bracteal leaves entire, not marked with red (white-margined in E. marginata); glands of the cyathia 4-5, not bilabiate, with or without petaloid appendages.

3 Glands of the cyathia 5 (or 7-10 on the central cyathium in *E. pubentissima*), with petaloid appendages 0.1-5.0 mm long (measured along a radius), these white, maroon, red, pink, or green; stipules present, glandlike, often minute ....... **Key C (subgenus Tithymalopsis)**

3 Glands of the cyathia 4 (except 5 in *E. purpurea*), oval, reniform, or crescent-shaped, lacking petaloid appendages (the glands themselves yellowish or green); stipules absent or vestigial ................................................................. **Key D (subgenus Eula)**

**Key A – subgenus Chamaesyce**

1 Young stems and leaves glabrous; leaves **either** entire or serrulate, at least at the apex (use 10× magnification).

2 Leaves serrulate, at least at the apex (use 10× magnification); seeds with 2-4 transverse ridges.

3 Seeds 1.0-1.3 mm long, with 3-4 transverse ridges ................................................................. **E. glyptosperma**

3 Seeds 0.8-1.0 mm long, with 2-3 (-4) transverse ridges ........................................................................... **E. hyssopifolia**

2 Leaves absolutely entire; seeds smooth.

4 Stipules united into a triangular scale-like structure (this often lobed or fringed), thus appearing as 2 stipules at each node ....... **E. serpens**

**Key B – subgenus Poinsettia**

1 Leaves serrulate or serrate; stamens rarely 3, often more than 8.
Key B – subgenus Poinsettia

1 Principal stem leaves opposite, dentate, neither lobed nor linear; plant pubescent .................................................. E. dentata
1 Principal stem leaves alternate, either lobed or linear; plant usually glabrous
2 Cyathial gland 2-lipped, the opening elongate; bracteal leaves red or green at base; seeds not angular ...................... E. cyathophora
2 Cyathial gland with a circular opening; bracteal leaves purple-spotted or green; seeds angular .................................. E. heterophylla

Key C – subgenus Tithymalopsis

1 Upper stem leaves and bracteal leaves with white margins, ovate, the apex acute; [alien, cultivated and rarely persisting or a waif]; [section Petaloma] .......................................................... E. marginata
1 Upper stem leaves and bracteal leaves entirely green, obovate, elliptic, narrowly elliptic, or oblanceolate, the apex rounded or obtuse; [native]; [section Tithymalopsis].
2 Petaloid appendages (0.5-) 1.0-4.4 mm long (measured along a radius), about as long as wide or longer, white; stems (1.5-) 3-9 (-11) dm tall, erect; leaves not ciliate-margined.
3 Nodes below the umbel (25-) 35-60 (-115); cyathia (5-) 6.5-8.0 (-11.0) mm wide (across the appendages); stems (1-) 3-10 from a crown, each (1.2-) 2.5-5 (-7) mm in diameter at the base; plants flowering March-July; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS, west to e. TX]. .............................................. E. corollata
3 Nodes below the inflorescence (6-) 15-26 (-41); cyathia (3.5-) 4.0-5.5 (-6.5) mm wide (across the appendages); stems usually 1-2 (-3) from a crown, each (0.8-) 1.5-2.8 (-3.5) mm in diameter at the base; plants (1.5-) 3-5 (-6.5) dm tall; leaves usually reflexed (E. pubentissima) or usually ascending (E. discoidalis), thin, petiolate or subpetiolate; plants flowering March-July; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS]. ................................................................................... E. discoidalis
4 Leaves 1.9-7.2 cm long, 0.1-0.5 cm wide, averaging >10x as long as wide; primary inflorescence rays usually 3; [e. and c. GA (or e. SC?)] south and west to Panhandle FL and e. TX] .......................................................... E. pubentissima
4 Petaloid appendages 0.05-0.6 mm long (measured along a radius), shorter than wide; green, red, white, or pink; stems (0.8-) 1.5-4.5 (-6) dm tall, erect, ascending or decumbent; leaves ciliate-margined (E. mercurialina and E. curtisii) or not.
5 Leaf margins ciliate; cyathia 3.5-5.9 mm wide (across the appendages), green; leaves not fleshy, 1.7-2.2 (-3)x as long as wide, not especially variable; [of mesic forests with rich soils]. ............................................................................................................ E. mercurialina
5 Leaf margins not ciliate (except some margin hairs in E. curtisii); cyathia 2.0-3.4 mm wide (across the appendages), green or maroon; leaves slightly to strongly fleshy, 0.7-20x as long as wide, often very variable in shape, even on the same plant; [of more or less xeric sandhill woodlands with acidic, sandy soils].
6 Stems usually 10-18 per crown, decumbent to weakly ascending; leaves opposite (scales on the lower stem sometimes alternate), fleshy, blue-green with a narrow, thickened, red-hyaline margin; branching dichotomous from the base of the plant (the branches typically equal, though sometimes unequal). .......................................................... E. ipecauanhiae
**Key D – subgenus Esula**

1. Principal stem leaves finely serrulate (especially toward the apex); [subgenus Esula, section Thymalmus]... \[E. helioscopa\]
2. Ovary and capsule smooth................................................................. \[E. obtusata\]
3. Ovary and capsule verrucose-roughened.
4. Principall stem leaves entire.
5. Stem leaves alternate (or mostly so); seeds 1-3 mm long; [subgenus Esula, section Esula]... \[E. spatulata\]
6. Stem leaves 1-3 cm long, 1-3 mm wide............................................ \[E. cyprissias\]
7. Stem leaves 3-8 cm long, 4-8 mm wide.............................................. \[E. esula\]
8. Seeds pitted only on one face, the inner face furrowed.................. \[E. peplus\]
9. Seeds pitted on both the inner and outer faces.
10. Seeds finely pitted with numerous, evenly distributed, circular pits; bracteal leaves broader than long; glands of the cyathia crescent-shaped, the horns elongate, and caudate........................ \[E. commutata\]

**Euphorbia bombensis** Jacquin, Southern Seaside Spurge, Dixie Sandmatt. Cp (FL, GA, NC, SC, VA): open sands of dunes, dune blowouts and overwashes, often growing with perennial grasses such as *Uniola paniculata*, but preferring open sands with little competition, sometimes mixed with the more common *E. polygonifolia*; common (uncommon in GA, NC, and SC, rare in VA). June-October. E. VA south to s. FL along the Atlantic, from s. FL to TX and Mexico along the Gulf of Mexico, and south into n. South America. Johnson (1992) describes the habitat of this species with that of the closely similar *E. polygonifolia*; *E. bombensis* prefers areas behind the foredune, while *E. polygonifolia* prefers the pioneer situation on the upper beach and foredune front. [=Q = Chamaesyce bombensis (Jacquin) Dugand – K, WH, Z; = Euphorbia ammannioides Kunth – RAB, C, F, G; > Chamaesyce ingaalisii Small – S]

**Euphorbia commutata** Engelmann ex A. Gray, Woodland Spurge, Tinted Spurge. Mt (GA, NC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, VA): rich forests and rock outcrops, over calcareous or mafic rocks; uncommon (rare in Coastal Plain, rare in NC). March-July. PA west to s. ON and MN, south to FL and TX. The southern var. *ectera* J.B.S. Norton may be worthy of recognition; we probably have both it and the typical var. *commutata* in our area. Var. *ectera* (ranging north to VA, KY, and MO) has all the cauleine leaves oblanceolate and with petioles 5-12 mm long; var. *commutata* has leaves varying from oblanceolate to obovate, the upper leaves usually broad and sessile. [= RAB, F, K, Q, W, WH, WV; > Eu. commutata var. *commutata* – C, G; > Eu. commutata var. *ectera* J.B.S. Norton – C, G; = Galarhoeus commutatus (Engelmann) Small – S]

**Euphorbia cordifolia** Elliott, Heartleaf Sandmat. Cp (FL, GA, NC, SC): open sands of very dry sandhills; uncommon (rare north of FL). July-October. Se. NC south to s. FL and west to s. TX. [= RAB, Q; = Chamaesyce cordifolia (Elliott) Small – K, S, WH, Z]

**Euphorbia corollata** Linnaeus, Eastern Flowering Spurge. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, VA): woodlands and forests; uncommon. June-September. NH and MA west to s. ON, MI, WI, MN, and NE, south to se.VA, c. NC, n. GA, s. AL, and e. TX. Huft (1979) considered *Eu. marilandica* a sporadic growth form of *Eu. corollata*. [= K, WV, Y, Z; = Eu. corollata var. *corollata* – RAB; > Eu. corollata var. *corollata* – C, F; > Eu. marilandica Greene – C, F, G; > Eu. corollata – G, W (also see Eu. pubentissima); = Thymalopsis corollata (Linnaeus) Klootsz – S; < Eu. corollata var. *corollata* – Q (also see Eu. discoidalis)]

Euphorbia cyathophora Murray, Unnamed Leaf, Fire-on-the-mountain. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): disturbed habitats, dunes; common (uncommon in GA, NC, SC, and VA). June-October. E. VA, KS, and CA south into the New World tropics, the original range obscure. [= C, K, Q; > Eu. heterophylla Linnaeus var. heterophylla – RAB, F, misapplied; > Eu. heterophylla var. graminifolia Engelmann – RAB, F; = Eu. heterophylla – G; > Poinsettsia cyathophora (Murray) Klotzsch & Garcke – S; > Poinsettsia heterophylla – S, misapplied]

* Euphorbia discoidalis * Chapman, Summer Spurge. Cp (FL, GA): sandhills; uncommon. E. and c. GA (or e. SC?) south and west to Panhandle FL and e. TX. [Park 1998] includes in synonymy *Eu. corollata var. angustifolia* Elliott, which has a stated type locality in e. SC. [= K, WH, Y; > Tithymalopsis discoidalis (Chapman) Small – S; < Eu. corollata var. corollata – Q]

* Euphorbia esula * Linnaeus var. esula, Wolf's-milk, Leafy Spurge Mt (WV), Pd (VA): disturbed areas; rare, native of Eurasia. May-September. [= K; < Eu. esula – C, F, G, WV; = Eu. esula ssp. esula – Q; > Tithymalus esula (Linnaeus) Scopoli]

* Euphorbia esculenta * (Small) Coker, Maroon Sandhills Spurge, Coastal Sand Spurge. Cp (FL, GA, NC, SC, VA): sandhills; uncommon. March-June. Sc. NC south to e. South Carolina and e. Panhandle FL; disjunct in se. VA (Sussex County) (Belden et al. 2004). The leaves are extremely variable in size and shape, from linear to rotund. Park (1998) recognizes *Eu. esculenta* and *Eu. gracilis* as distinct from one another, differing in the involucre (purple in *Eu. esculenta* and green in *Eu. gracilis*) and the appendages (rudimentary and purple in *Eu. esculenta* and semicircular and white in *Eu. gracilis*). [= K, Q, WH, Z; > Eu. gracilis Cronquist – RAB; > Tithymalopsis esculenta Small – S; > Tithymalus gracilis (Boissier) Small – S; > Eu. esculenta – Y; > Eu. gracilis – Y]

* Euphorbia falcata * Linnaeus. Mt (VA, WV), Pd (VA): disturbed areas; rare, native of Europe. [= C, F, G, K, QW; > Eu. falcata ssp. falcata – Q]

* Euphorbia helioscopia * Linnaeus, Wattweed. Pd (GA, NC, SC, VA), Mt (VA), Cp (DE, VA): cultivated ground; rare, native of Europe. Late March-June. [= RAB, C, F, G, K; = Galarhoeus helioscopia (Linnaeus) Haworth – S; > Eu. helioscopia sp. helioscopia – Q]

* Euphorbia heterophylla * Linnaeus, Fiddler’s Spurge, Mexican Fireplant. Cp (FL, GA): disturbed areas; uncommon. All year. [= K, Q; > Poinsettsia heterophylla (Linnaeus) Klotzsch & Garcke ex Klotzsch – S; > Poinsettsia geniculata Ortega – S; = Poinsettsia heterophylla (Linnaeus) Klotzsch & Garcke ex Klotzsch – S, WH]

* Euphorbia hirta * Linnaeus, Pillpod Sandmat. Cp (FL, GA, NC, SC), Pd (GA, SC, VA): fields, disturbed ground, waste areas, in and around greenhouses; rare, perhaps only adventive in the northern part of our area. (January-) June-October (-December). E. NC, c. SC, south to s. FL, west to TX, and south into Central and South America. Reported for Goldsboro, NC and Abbeville, Abbeville County, SC (C.N. Horn, pers.comm. 2008). [= RAB, C, G, Q; = Chamaesyce hirta (Linnaeus) Millsbaugh – K, S, WH, Z]

* Euphorbia himmistrata * Engelmann, Spreading Sandmat. Cp (FL, VA*), Mt (VA*, WV*), Pd (GA*, VA*): floodplain forests, exposed river shores, rocky riverside gravel bars, disturbed areas; uncommon (rare in FL, GA, and WV, rare in VA Mountains and Coastal Plain), some of the easternmost occurrences apparently adventive from further west. ON and MN south to Panhandle FL and TX; scattered eastwards, apparently as an adventive. [= C, F, G, Q, WV; = Chamaesyce himmistrata (Engelmann) Small – GW, K, S, WH, Z]

* Euphorbia hyssopifolia * Linnaeus, Hyssopleaf Sandmat. Cp (FL, GA, SC): disturbed ground; common. May-October. Sc. south to s. FL, west to LA; also in w. TX, s. NM, and n. Mexico, and south to s. South America. Its status in our area has been muddied by confusion with *E. mutans*. [= Q; = Chamaesyce hyssopifolia (Linnaeus) Small – GW, K, WH, Z]

* Euphorbia ipecacuanhae * Linnaeus, Carolina Ipecac. Sandhills. February-May (and later, especially in response to fire). CT (formerly), NY (Long Island), NJ, and se. PA (Roads & Klein 1993) south to ec. GA, on the Coastal Plain. The leaves are extremely variable in size and shape, from linear to rotund. Huft (1979) considered *Eu. arundelana* Bartlett (reported from MD, SC, and GA) a sporadic form of *Eu. ipecacuanhae*. Park (1998) suggested that *Eu. ipecacuanhae* is actually a member of *Chamaesyce* (treated by Park as a subgenus), rather than of *Euphorbia*. [= RAB, C, G, K, QZ; > Eu. ipecacuanhae – F; > Eu. arundelana Bartlett – F; = Tithymalus ipecacuanhae (Linnaeus) Small – S]

* Euphorbia latyris * Linnaeus, Caper Spurge, Myrtle Spurge, Mole Plant. Mt (NC, SC, VA, WV), Pd (VA), Cp (VA): roadsides, disturbed areas; uncommon (rare in NC and SC, rare in VA Piedmont, rare in VA Coastal Plain), native of Europe. June-August. [= RAB, F, K, Q, WV; = Eu. latyris – C, G, an orthographic variant; = Galarhoeus latyris – S]

* Euphorbia mercurialina * Michaux, Cumberland Spurge, Mercury Spurge. Mt (GA), Pd (GA*, NC, SC, VA*): rich moist forests over mafic or calcareous rocks; rare. May-June. S. KY south through e. TN to nw. GA and n. AL; disjunct in sc. NC, where found in 1992, and in nc. SC. Apparently introduced in VA. [= C, F, G, K, Q, W, Y, Z; > Tithymalopsis mercurialina (Michaux) Small – S]

EUPHORBIACEAE  

544
**EUPHORBIACEAE**

_Euphorbia nutans_ Lagasca y Segura, Eyebane. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, gardens, waste places, disturbed ground; common. May-October. NH west to MI and ND, south to Panhandle FL and TX; introduced in widespread places worldwide. [= C, Q, W = Chamaesyce nutans (Lagasca y Segura) Small – GW, K, WH, Z; = Euphorbia maculata Linnaeus – RAB, F, WV, misapplied; = Euphorbia preslii Guss. – G; = Chamaesyce hyssopifolia (Linnaeus) Small – S, in part, misapplied]

_Euphorbia polygonifolia_ Linnaeus, Northern Seaside Spurge, Northern Sandmat. Cp (DE, FL, GA, NC, SC, VA): open sands of dunes, upper beach, dune blowouts and overwashes, sometimes growing with perennial grasses such as Uniola paniculata, but preferring open sands with little competition. Introduction with the less common _E. bombensis_; common (rare in FL). May-October. NS to ne. FL along the Atlantic Ocean; disjunct to the Great Lakes. See _E. bombensis_ for discussion of the habitats of these related species. [= RAB, C, F, G, Q; = Chamaesyce polygonifolia (Linnaeus) Small – K, S, WH, Z]

* Euphorbia prostrata_ Aiton, Prostrate Sandmat. Pd (GA, NC, SC, VA), Cp (FL, NC, SC, VA), Mt (NC, SC, VA, WV): crevices of pavement or sidewalks, disturbed places; rare, probably native of tropical America and only naturalized in our area. January-December. [= C, Q; = Chamaesyce prostrata (Aiton) Small – K, WH; = Euphorbia chamaesyce Linnaeus – RAB, F, G, misapplied]

_Euphorbia purpurea_ (Rafinesque) Fernald, Glade Spurge, Darlington Spurge, Purple Spurge. Mt (NC, VA, WV), Pd (DE), Cp (DE): rich moist forests in bottomlands or on slopes, in rich soil around rock outcrops, in swamps or seeps, especially over calcareous rocks (such as dolomite) or mafic clays (such as amphibolite); rare. May-September. NJ, PA, and OH south to w. NC. [= RAB, C, F, G, K, K, Q, WV; = Galarhoeus darlingtonii (A. Gray) Small – S]

_Euphorbia spathulata_ Lamarck, Prairie Spurge, Warty Spurge. Mt (NC?, VA), Cp* (FL*): rocky woodslands, disturbed areas; rare. May-June. MN and WA south to w. VA, AL, LA, TX, and Mexico. [= C, W, WH; ? Eu. dictyosperma Fischer & Meyer – F, G; < Eu. spathulata – K, Q (also see Eu. obtusata?); = Galarhoeus arkansanae (Engelmann & A. Gray) Small ex Rydberg – S]

* Euphorbia davidii_ Subils, David's Spurge. Mt (NC), Pd (NC): disturbed areas; rare, native of {}. Introduced in se. TN (Chester, Wofford, & Kral 1997). [= K, Q; ? Eu. dentata var. gracillima Millspaugh] [not yet keyed]

_Euphorbia exigua_ Linnaeus, Dwarf Spurge. Mt (WV): disturbed areas; rare, native of {}. In PA and WV (Kartesz 1999). [= K, WV; ? Eu. exigua ssp. exigua – Q] [not yet keyed]

_Euphorbia glyptosperma_ Engelmann, Ridge-seed Spurge. East to se. TN (Chester, Wofford, & Kral 1997). In VA, WV, LA (Q). [= C, F, G, Q; = Chamaesyce glyptosperma (Engelmann) Small – K]

* Euphorbia graminea_ Jacquin. Landscaped areas, other disturbed areas. Native of tropical America. Naturalized in FL Panhandle, FL peninsula. [= Agaloma graminea (Jacquin) D.B. Ward] [not yet keyed; not mapped]

* Euphorbia hexagona_ Nuttall ex Sprengel, Six-angle Spurge. Pd (DE): disturbed areas; rare, native of c. North America. [= K] [not yet keyed; add to synonymy]

_Euphorbia hypericifolia_ Linnaeus, reported for SC (Kartesz 1999), FL, GA, LA (Q). [Investigate] [= Q; = Chamaesyce hypericifolia (Linnaeus) Millsap – K, S] [not yet keyed]

_Euphorbia inunudata_ Torrey ex Chapman var. inunudata, Flatwood Spurge. Wet pine flatwoods, savannas, seepage slopes. Ne. FL and se. GA (Bridges & Orzell 2002); Panhandle FL west to s. MS. Var. garrettii Bridges & Orzell is endemic to e. and s. FL peninsula. [= WH, X; < Eu. inunudata – K, Q; < Galarhoeus inunudatus (Torrey ex Chapman) Small – S] [not yet keyed]

_Euphorbia ophthalmica_ Persoon. GA and PA (Kartesz 1999), widespread in FL (WH), but not in North America (Q). [= Q; = Chamaesyce ophthalmica (Persoon) Burch – K; = Chamaesyce gemella (Lagasca y Segura) Small] [not yet keyed]

_Euphorbia serpyllifolia_ Persoon var. serpyllifolia. Cp (FL): disturbed areas; rare, native of the Great Plains. Also in GA, PA, and DE (Kartesz 1999). In NC, GA, SC (Q) [investigate] [= Q; = Chamaesyce serpyllifolia (Persoon) Small ssp. serpyllifolia – K; < Chamaesyce serpyllifolia – WH] [not yet keyed]

_Euphorbia telephioides_ Chapman. Cp (FL): pine flatwoods; rare. Endemic to FL Panhandle (Bay, Franklin, and Gulf counties). [= K, WH; = Galarhoeus telephioides (Chapman) Small – S] [not yet keyed; add to synonymy]

_Euphorbia tetrapora_ Engelmann. GA and AL west to TX. [= K, Q] [not yet keyed]
EUPHORBIAEAE

546

Manihot P. Miller 1754 (Cassava)

A genus of about 100 species, trees, shrubs, and herbs, of tropical and subtropical America. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

1 Leaf segments 5-7, with entire margins; calyx of male flowers < 10 mm long; fruit wing-angled.......................... M. esculenta
1 Leaf segments 9-13, with undulate lobes towards the tip; calyx of male flowers 12-15 mm long; fruit not winged .................... M. grahamii

* Manihot esculenta Crantz, Manioc, Tapioca. Disturbed areas; native of tropical America. Naturalized on the Gulf Coast, as in AL and s. FL. [= K, WH, Z; = Jatropha manihot Linnaeus – S]

* Manihot grahamii Hooker, Hardy Tapioca, Graham's Cassava. Suburban forests, vacant lots, other disturbed areas, uncommonly grown as an ornamental, rarely naturalizing; native of tropical America. Introduced in sw. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009), FL Panhandle, peninsular FL, west to LA. [= K, WH, Z]

Mercurialis Linnaeus 1753 (Mercury)

A genus of about 8 species, herbs, of the Old World. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

* Mercurialis annua Linnaeus, Annual Mercury, Boys-and-girls. Disturbed areas, waif on ballast; native of Mediterranean Europe. This species has been reported as a rare "ballast weed" from Charleston, SC and Mobile, AL (Wiggins 1932); some of the occurrences presumably represent non-persistent waifs. [= C, F, G, K, S, Z] [not yet keyed]

Ricinus Linnaeus 1753 (Castor-bean)

A monotypic genus, a shrub or tree, native to Africa and w. Asia, now pantropical. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

* Ricinus communis Linnaeus, Castor-bean, Castor-oil Plant, Palma Christi. Waste places, gardens; native of the tropics, probably Africa. July-October. The seeds are dangerously poisonous, formerly the source of an oil used as a purgative and machine lubricant. In FL and further south in the tropics, R. communis is a small to medium tree. [= RAB, C, F, G, K, S, WH, Z]

Sapium P. Browne (Milktree)

A genus of 21 species, trees and shrubs, of the Neotropics. The most recent monographers of Sapium and related genera (Kruijt 1996; Esser 2002) separate Triadica from Sapium sensu stricto. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Kruijt (1996)=Z; Govaerts, Frodin, & Radcliffe-Smith (2000)=Y. [also see Triadica]

Stillingia Garden ex Linnaeus 1767 (Queen's-delight)
EUPHORBIACEAE

1 Stems woody, single; leaves < 1 cm wide; [of pineland ponds and other aquatic habitats] .................................................. Stillingia aquatica
1 Stems herbaceous, several from a crown; leaves > 1 cm wide; [of dry habitats] ................................................................. Stillingia sylvatica

Stillingia aquatica Chapman, Corkwood, Water Toothleaf. Ponds in pine flatwoods. May-September. Se. SC south to s. FL, west to sw. AL. [= RAB, K, S, WH, Z]

Stillingia sylvatica Garden ex Linnaeus ssp. sylvatica. Queen's-delight. Sandhills, dryish coastal plain woodlands. May-July; June-September. Se. VA south to s. FL, west to TX and NM, north in the interior to KS. Ssp. tenuis (Small) D.J. Rogers is in s. FL. [= K, Z; < S. sylvatica – RAB, C, G, WH; > S. sylvatica var. sylvatica – F; > S. sylvatica – S; > S. pathulata (Müller of Aargau) Small – S]

Tragia Linnaeus 1753 (Noseburn)

A genus of about 100-170 species, of tropical to warm temperate regions of the Old and New Worlds. References: Miller & Webster (1967) = Z; Govaerts, Frodin, & Radcliffe-Smith (2000) = Y.

1 Plant vining and trailing; larger leaf blades on a plant > 5 cm wide and > 8 cm long, deeply cordate at the base .................................. Tragia cordata
1 Plant not vining, erect; larger leaf blades on a plant < 3.5 cm wide and < 8 cm long, cuneate, rounded, truncate, or shallowly cordate at the base.

2 Leaf base cuneate at base; leaf blade 3-20× as long as wide .................................................................................................................. Tragia urens
2 Leaf base cordate, subcordate, truncate, or broadly rounded at base; leaf blade 1-3× as long as wide.

3 Petioles 1-4 mm long; leaves rounded to acute at the tip; stamens 2 (-3) ........................................................................................ Tragia smallii
3 Petioles 3-17 mm long; leaves acute to acuminate at the tip; stamens 3 .................................................................................... Tragia urticifolia

Tragia cordata Michaux, Heartleaf Noseburn. Rocky calcareous woodlands, calcareous prairies. C. KY, s. IN to s. MO, south through c. TN, rarely to e. TN (Meigs County, in the Ridge and Valley Province) (Chester, Wofford, & Kral 1997), n. AL (Jackson Co.) (D. Spaulding pers. comm.) to sc. and sw. GA, Panhandle FL, and e. TX. [= C, K, WH, Z; = T. macrocarpa Willdenow – S]

Tragia smallii Shinners, Gulf Coast Noseburn. Sandhills. Sw. GA south to c. peninsular FL, west to e. TX. Reports of T. betonicaefolia from GA are based on misapplication of that name to material representing T. smallii. [= K, WH, Z; = T. betonicaefolia Nuttall – S, misapplied; = T. betonicaefolia Nuttall, misapplied]

Tragia urens Linnaeus, Southeastern Noseburn, Wavyleaf Noseburn. Sandhills, sandy woodlands, other woodlands. May-October. Se. VA south to s. FL and west to TX, mostly on the Coastal Plain, but ranging into the mountains southward. [= RAB, C, F, G, K, S, W, WH, Z; = T. linearifolia Elliott – S]

Tragia urticifolia Michaux, Nettleleaf Noseburn. Dry woodlands and rock outcrops, particularly over mafic or calcareous rocks. May-October. Sc. VA west to MO, KS, and CO, south to c. peninsular FL, Panhandle FL, and AZ. [= RAB, F, G, K, W, WH; = T. urticaefolia – S, orthographic variant]

Triadica Loureiro 1790 (Chinese Tallow-tree)

A genus of 1-3 species, native to tropical and subtropical Asia. The most recent monographers of Sapium and related genera (Kruijt 1996; Esser 2002) place our naturalized species in the genus Triadica, native to Asia; Sapium (excluding Triadica) is a genus of 21 species restricted to the neotropics. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Kruijt (1996) = Z; Esser (2002) = Y; Govaerts, Frodin, & Radcliffe-Smith (2000) = X.

* Triadica sebifera (Linnaeus) Small, Chinese Tallow-tree, Popcorn Tree. Marsh edges, shell deposits, disturbed areas; native of c. Asia. May-June; August-November. With Euphorbia and Cnidoscolus, one of our few Euphorbiaceous genera with milky sap. Triadica sebifera has become locally common from Colleton County, SC southward through the tidewater area of GA, and promises to become a serious weed tree (as it is in parts of LA, TX, and FL). [= K, S, X, Y, Z; = Sapium sebiferum (Linnaeus) Roxburgh – RAB, GW, WH]

Vernicia Loureiro 1790 (Tung-oil Tree)
EUPHORBIACEAE

* Vernicia fordii (Hemsley) Airy-Shaw, Tung-oil Tree, Tung Tree. Planted for the oil and for ornament, rarely naturalizing; native of central and western China. Naturalized on the Gulf Coastal Plain from former plantations; planted and showing a tendency to naturalize in the Coastal Plain of NC (Mount Olive, Wayne Co.). [= K, Z; = Aleurites fordii Hemsley – WH]

189. PHYLLANTHACEAE Martinov 1820 (Leaf-flower Family) [in MALPIGHIACEAE]

A family of about 60 genera and 1800 species, trees, shrubs, and herbs, mainly tropical. References: Webster (1994); Chase et al. (2002).

1 Woody shrub; stamens 5-6 ........................................................................................................................................................................Phyllanthopsis

1 Annual herb; stamens 3 ............................................................................................................................................................................Phyllanthus

Phyllanthopsis (Scheele) Vorontsova & Petra Hoffman 2008 (Maidenbush)

Phyllanthopsis phyllanthoides (Nuttall) Vorontsova & Petra Hoffman, Maidenbush. Barrens, including river-scour barrens, on limestone or other calcareous rock. C. MO, AR, and OK, south to c. TX; disjunct in c. AL and ec. TN. [= Leptopus phyllanthoides (Nuttall) G.L. Webster – K; = Andrachne phyllanthoides (Nuttall) Coulter – F, G]

Phyllanthus Linnaeus 1753 (Leaf-flower)

1 Plant with “normal” arrangement of branches and leaves (leaves uniformly distributed on the stem and branches, alternate and either distichous or spirally arranged, the ultimate branches not deciduous, flowers produced on ultimate and penultimate orders of branches); [subgenus Isocladus].

2 Leaves arranged distichously; stipules typically auriculate; [section Loxopodium].

3 Stems terete; filaments free; seeds 0.8-1.0 mm long; [widespread in our area]..............................P. caroliniensis ssp. caroliniensis

3 Stems flattened and winged; filaments connate; seeds 1.3-1.5 mm long; [of e. LA westward]..............................P. evanescens

4 Plant herbaceous, with a single or few stems; seeds 1.7-1.8 mm long; calyx lobes 2.8-3.5 mm long (when in fruit); [endemic to FL Gulf Coast].................................................................P. liebmannianus ssp. platylepis

4 Plant suffruticose, with many stems clustered from the plant base; seeds 1.1-1.5 mm long; calyx lobes 1.5-2.5 mm long (when in fruit); [of e. LA westward] .................................................................P. polygonoides

1 Plant with “phyllanthoid” arrangement of branches, leaves, and flowers (leaves lacking on the main stem, the penultimate order of branches with scales arranged spirally, the ultimate order of branches deciduous, bearing normal leaves alternately and distichously, flowers produced only on the ultimate, deciduous branches).

5 Stamens 5, filaments free; fruiting pedicels capillary, 3-7 mm long; seeds densely papillose; [subgenus Kiepertelia] triplete P. tenellus

5 Stamens 3, filaments connate into a column 0.1-0.15 mm long; fruiting pedicels thicker and often also shorter; seeds variously ribbed or striate; [subgenus Phyllanthus]
6 Fruit pedicels 0.5 mm long; seeds with 12-15 transverse ridges and sometimes 1-3 pits; male flowers borne towards the tip of the branchlets. Female flowers towards the base; [section *Urinaria*] ............................................................... *P. urinaria* ssp. *urinaria*

6 Fruit pedicels > 0.5 mm long; seeds longitudinally ribbed or striate; female flowers borne towards the tip of the branchlets, male flowers towards the base; [section *Phyllanthus*] ...............................................................

7 Cymules bisexual (each with 1 female and 1 male flower); calyces of male flowers 4 (-5) ....................................................... *P. abnormis* var. *abnormis*

7 Cymules unisexual; calyces lobes usually 6. .......................................................................................................................... *P. fraternus*

**Phyllanthus abnormis** Baill. var. *abnormis*, Drummond’s Leaf-flower. Cp (FL): dunes; uncommon. All year. Ne. FL south to s. peninsular FL; TX south into Mexico. Another variety occurs along the Rio Grande River in TX. [= FNA, K, X, Y; > *P. garberi* Small – S; < *P. abnormis* – WH]

* Phyllanthus amarus Schumacher, Gale-of-wind, Carry-me-seed. Reported by RAB for NC and SC; misidentified and actually represents *P. tenellus* (Webster 1970). [rejected; not keyed or mapped]

*? Phyllanthus caroliniensis* Walter ssp. *caroliniensis*, Carolina Leaf-flower. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): roadsides, moist woodlands, forests, and fields, often in seasonally wet, muddy places; common (rare in VA and WV Mountains). July-November. PA and IL south to c. peninsular FL and TX, and south to Argentina and Paraguay, the original range not clear, likely introduced in part of the area. Ssp. *saxicola* (Small) G.L. Webster (sometimes treated as a species) is restricted to s. FL, the Bahamas, and Greater Antilles. [= FNA, K, X, Y; < *P. caroliniensis* – RAB, F, G, W, WV; = *P. carolinianus* var. *carolinianus* – C; < *P. carolinianus* – GW, orthographic correction; = *P. carolinianus* – S]

**Phyllanthus evansescens** Brandegee. LA (St. Charles Parish) west to TX. March-November. [= FNA; > *Phyllanthus pudens*]

L.C. Wheeler – K, X, Y]

* Phyllanthus fraternus* G.L. Webster. Disturbed areas. S. FL, MS, LA. Introduced in SC (Kartesz 1999). [investigate] [= FNA, K, WH, X, Y]

**Phyllanthus liebmannianus** Müller of Aargau ssp. *platylepis* (Small) G.L. Webster. Cp (FL): wet hammocks; rare. Late March-late June. Endemic to the “Big Bend” area of the FL Gulf Coast (Dixie, Levy, and Taylor counties). Apparently closely related to *P. liebmannianus* ssp. *liebmannianus* of the western Gulf Coast (Tamaulipas south to Yucatan and Belize). [= FNA, K, WH, X, Y; = *Phyllanthus platylepis* Small – S]

**Phyllanthus niruri** Linnaeus. Reports of *P. niruri* Linnaeus from NC and SC (Ahles, Bell, & Radford 1958) have proved to be *P. tenellus* (Webster 1970). [rejected; not keyed or mapped]

**Phyllanthus pentaphyllus** Wright, Fivepetal Leaf-flower. Unlikely to be correctly labeled from Darlington County, SC (as also indicated by RAB), is here excluded.

**Phyllanthus polygonoides** Nuttall ex Sprengel. Grasslands, calcareous glades. April-October. E. LA west to NM, south into Mexico. [= FNA, K, X, Y]

* Phyllanthus tenellus* Roxburgh, Mascarene Island Leaf-flower. Cp (DE, FL, GA, NC, SC), Pd (GA, NC): disturbed areas, in and around greenhouses; uncommon (rare north of FL), native of the Mascarene Islands. This species appeared in FL in the 1920’s, s. GA in the 1940’s, SC in the 1950’s, NC in the 1960’s, and TN in the 1970’s (Kral 1981). Reported from a single collection from VA, as a “contaminant in a container plant” (Virginia Botanical Associates 2007). [= FNA, GW, K, WH, Y; ? *P. amarus* – RAB, misapplied (misidentified); > *P. tenellus* var. *tenellus* – X]

190. ELATINACEAE Dumortier 1829 (Waterwort Family) [in MALPIGHIACEAE]

**Elatine** Linnaeus 1753 (Waterwort)

1 Seeds mostly straight, the areoles elliptic, the rounded ends not dovetailing into adjacent rows, the longitudinal ridges thus appearing straight and distinct; seeds basal-axile, extending lengthwise through the capsule, not overlapping; leaves 1-5 mm long; flowers mostly 2-merous; ............................................................... **E. minima**

1 Seeds mostly curved, the areoles 6-sided, the angular ends dovetailing into the adjacent rows, the longitudinal ridges thus appearing broken or irregular; seeds axile, attached along an elevated placenta at different levels, therefore overlapping; leaves 1-15 mm long; flowers mostly 3-merous.

2 Leaves obovate to broadly spatulate, rounded at the tip, 3-8 mm long, the larger 1.5-5 mm wide; seeds with 20-30 pits in each row...........  ............................................................................................................................... **E. americana**

2 Leaves linear-lanceolate to narrowly spatulate, emarginate to truncate to rounded at the tip, 1-15 mm long, the larger 0.5-3 mm wide; seeds with 9-25 pits in each row.

3 Leaves 1.5-4 mm long, 0.7-1.8 mm wide; seeds with 9-15 pits per row ............................................................... **E. brachysperma**

3 Leaves 2.8-15 mm long, 0.5-3 mm wide; seeds with 16-25 pits per row ............................................................... **E. rubella**

**Elatine americana** (Pursh) Arnott, American Waterwort. Cp (DE, VA), Mt (NC, SC): tidal flats, lakes; rare. July-October. Widespread in ne. United States, s. to NC and MO. The only known site for this species in NC is an artificial lake; it is uncertain
whether it should be considered native or introduced. [= F, K, S; < E. triandra Schkuhr – RAB, W; = E. triandra var. americana (Parsh) Fassett – C, GW]

**Elatine brachysperma** A. Gray, Shortseed Waterwort. Pd (GA): {habitat not known}; rare. It has been reported for nc. GA (Jones & Coile 1988). [= F, K; = E. triandra Schkuhr var. brachysperma (A. Gray) Fassett – C, G]

**Elatine minima** (Nuttall) Fischer & C.A. Meyer, Tiny Waterwort. Cp (DE, VA), Pd (NC, SC): tidal flats, lakes, mud flats; rare. July-October. First found in NC in 1990. *E. minima* is widespread in ne. United States, south to VA, NC, and SC (Horn, pers. comm. 2004). The only known site for this species in NC is the spillway of an artificial lake (Lake Butner, Granville County); it is uncertain whether it should be considered native or exotic in NC. It may have been introduced by waterfowl or humans. [= C, F, G, K]

**Elatine rubella** Rydberg, Red Waterwort. Pd (SC): ponds; rare. This species occurs in AL (Fayette County) as well as north of our area (Haynes 1998). Hill & Horn (1997) reported *E. triandra* for SC, but the specimen is *E. rubella* Rydberg (Horn, pers. comm. 2004). [= K; = E. triandra Schkuhr – F, misapplied; = E. triandra var. triandra – C, G, misapplied]

196. **CHRYSOBALANACEAE** R. Brown 1818 (Coco-plum Family) [in MALPIGHIALES]

A family of about 18 genera and 530 species, trees, shrubs, and vines of tropical and subtropical areas, especially tropical America. References: Prance & Sothers (2003); Prance (1970).

**Licania** Aublet (Gopher-apple)

**Licania michauxii** Prance, Gopher-apple, Ground-oak. Cp (GA, SC): sandhills, dry sandy pinelands; common (uncommon in GA, rare in SC). May-June; September-October. Se. SC south to s. FL, west to LA, becoming abundant and ubiquitous in dry sandy habitats in the southern part of its range. *L. michauxii* is one of 49 species of subgenus *Moquilea*, section *Moquilea*, which is distributed from se. North America through Central America and the West Indies to South America; our species may be most closely related to *L. retifolia* Blake, a small tree of sw. Mexico and El Salvador (Prance 1970; Prance & Sothers 2003). A rare upright shrub form (to over 15 dm tall) has been found in Brevard County, FL, suggesting that *L. michauxii* evolved from a taller and more upright ancestor (Horn & Taylor 1999).

199. **PASSIFLORACEAE** A.L. de Jussieu ex Kunth 1817 (Passionflower Family) [in MALPIGHIALES]

A family of about 27 genera and 935 species, vines, shrubs, trees, and herbs, of tropical and warm temperate regions, especially America and Asia. Here circumscribed to include Turneraeae, following Angiosperm Phylogeny Group (2009). References: Feuillet & MacDougal in Kubitzki, Bayer, & Stevens (2007); Arbo in Kubitzki, Bayer, & Stevens (2007).

**Passiflora** Linnaeus 1753 (Passionflower)

**Identification notes**: *Passiflora* flowers are structurally striking. There are 5 sepals and either 0 or 5 petals; a *corona* of numerous linear structures is present, arranged in 1-several series. The ovary, 3 styles, and 5 stamens are basally adnate and elevated on an *androgynophore*. Most species have *glands* on the leaves which function as extrafloral nectaries; these can be seen as paired glands on the leaf petiole (in all our species except *P. lutea*), and some species also have *laminar glands* on the leaf blade, near the margin.

1 Sepals 25-35 mm long, green on the outer surface, white on the inner surface; petals 30-40 mm long, lavender, violet, or mauve; berry 40-70 mm long; corona in 2-3 series, the longer 15-30 mm long; [subgenus *Passiflora*; supersection *Passiflora*] .............................. *P. incarnata*

2 Petiole lacking paired glands; leaf blade lacking laminar glands; berry 7-12 mm long; [subgenus *Decaloba*; supersection *Decaloba*].

3 Calyx, petals, and stems glabrous; [WV, OH, and OK south to AL and TX] ........................................... *P. lutea* var. glabriflora

4 Sepals 5-10 mm long; petals absent; corolla in 2 series the outer 3-7 mm long; berry 6-10 (-15) mm long; [native, of ne. FL southwards]; [subgenus *Decaloba*; supersection *Sieca*] .............................. *P. pallida*
PASSIFLORACEAE

Piriqueta Aublet 1775

Piriqueta caroliniana (Walter) Urban var. caroliniana. Cp (FL, GA, SC): longleaf pine sandhills, sandy soils of roadsides, woodland edges, and disturbed areas; uncommon. May-September. SC south to s. FL; Cuba and Hispaniola; and in Central and S. America. Arbo (1990; 1995) considers P. caroliniana as a subspecies of P. cistoides, but the morphological distinctions seem strong and the two taxa have widely overlapping distributions in the Neotropics. Maskas & Cruzan (2000) discuss variation and evolutionary taxa in this complex in the southeastern United States and the Bahamas. [<P. caroliniana – RAB; <P. cistoides (Linnaeus) Grisebach var. caroliniana (Walter) M.M. Arbo = K, WH; Z; = P. caroliniana – S] * Piriqueta cistoides (Linnaeus) Grisebach. Reported for GA (Kartesz 1999), but the documentation is untraceable. [<P. cistoides ssp. cistoides – K, Z; not keyed; rejected pending better documentation]

201. SALICACEAE de Mirbel 1815 (Willow Family) [in MALPIGHIACEAE]

Populus Linnaeus 1753 (Poplar, Aspen, Cottonwood)

Winter buds not viscid; stem 5-20. 2 Stems 12-20; scales of the catkins deeply fimbriate; petals terete; [section Leucoidea] ................................................................. P. heterophylla

1 Leaf blades (2-)3-30× as long as wide; stem 5-12; scales of the catkins dentate or with only 3-7 linear-triangular lobes; petals strongly flattened laterally (90 degrees to the plane of the leaf blade), especially near the junction with the blade; [section Populus].

Petioles flatly or deeply crenate-laterally; leaves glabrous when mature (pubescent when young in P. grandidentata); [native trees].

4 Leaf margins coarsely crenate- or undulate-toothed, with fewer than 12 (-15) teeth per side, the sinuses of the larger teeth 1.5-6 mm deep; leaves puberulent beneath when young (glabrate in age); buds gray-pubescent .............................................................................. P. grandidentata

3 Petioles either or nearly so, leaves densely pubescent (P. alba) or glabrescent (P. ×canescens); [exotic trees].

Populus Linnaeus 1753 (Poplar, Aspen, Cottonwood)
5 Leaves of vigorous shoots palmately 3-5 (-7)-lobed (and also toothed); leaves densely white-tomentose beneath when young and mature .................................................. \textit{P. alba} \\
5 Leaves of vigorous shoots merely toothed; leaves glabrescent when mature ................................................................................................. \textit{P. \textit{canescens}} \\

1 Winter buds viscid (sticky and shiny as if recently varnished); stamens (15-) 20-80. \\
6 Petiole terete or dorsally flattened (in the plane of the leaf blade), and often also channeled above; leaf blades dark green above, glaucous white beneath; leaf margin not translucent, finely serrate with teeth < 1 mm deep; [section \textit{Tacamahaca}]. \\
7 Petioles 7-10 cm long; leaves ovate, broader below the midpoint; leaf base rounded to subcordate; twigs terete or slightly angled in cross-section .................................................................................. \textit{P. balsamifera} \\
7 Petioles < 2 cm long; leaves obovate, broader past the midpoint; leaf base cuneate to rounded; twigs strongly angled in cross-section ..... .......................................................................................................................... \textit{P. simonii} \\
6 Petiole laterally flattened (90 degrees to the plane of the leaf blade), especially near the junction with the blade; leaf blades light green above, often paler beneath but not distinctly whitened; leaf margin translucent, coarsely serrate with teeth > 1 mm deep. \\
8 First-year branches reddish-brown; leaves noticeably paler beneath; flattened portion of petiole < 2× as deep as wide; early leaves with > 20 teeth per side, the largest < 2.5 mm deep; [probable intersectional hybrid of section \textit{Aegeiros} and section \textit{Tacamahaca}] .................. \textit{P. \textit{jackii}} \\
8 First-year branches yellow-orange-brown; leaves nearly the same color above and below; flattened portion of petiole > 2× as deep as wide; early leaves usually with < 20 teeth per side, the largest < 2.5 mm deep; [section \textit{Aegeiros}]. \\
9 Stigmas 3-4; stamens (30-) 40-80; [native tree, common] ............................................................................................................................. \textit{P. deltoides \textit{ssp. deltoides}} \\
9 Stigmas 2-3; stamens (15-) 20-30; [alien trees, rare out of cultivation]. \\
10 Floral disk 2-4 mm wide; stigmas 2-3; ovules and seeds 6-14 (-20) per placenta ........................................................................ \textit{P. \textit{canadensis}} \\
10 Floral disk 1-2 mm wide; stigmas 2; ovules and seeds 4-8 per placenta ......................................................................................... \textit{P. nigra} \\

* \textit{Populus balsamifera} Linnaeus, Balsam Poplar, Hackmatack, Tacamahac. Cp* (DE*, VA*), Pd* (VA*), Mt* (VA*, WV): floodplains, disturbed areas; rare. NL (Labrador) and AK south to PA, WV, OH, IN, IL, IA, SD, CO, ID, and OR; scattered further south by introduction. Ranges south to s. PA (Rhoads & Klein 1993), e. and c. KY (Clark et al. 2005), and to VA (according to Kartesz 1999). Also reported for n. GA (Jones & Coile 1988) and provisionally for SC (Kartesz 1999). Many of the attributions of this species to states in our area are based on misidentifications. [= C, FNA, G, WV; = \textit{P. balsamifera \textit{ssp. balsamifera}} – K; > \textit{P. balsamifera \textit{var. subbalsamifera}} – F; > \textit{P. balsamifera \textit{var. magnifica}} Victorian – F; > \textit{P. balsamifera \textit{var. subcordata}} Hylander; > \textit{P. balsamifera \textit{var. michauxii}} (Duffey) tenry] \\
* \textit{Populus \textit{canadensis}} Moench (pro sp.) (\textit{P. \textit{deltoides} \textit{\textit{\times} nigra}}), Hybrid Black Poplar. Pd (GA, VA), Mt (VA, WV), \{NC\}: disturbed areas; rare. Reported for a county in c. GA (Jones & Coile 1988) and for NC and VA (Kartesz 1999). [= C, FNA, K] \\
* \textit{Populus \textit{\textit{\times} jackii}} Sargent [probably \textit{P. balsamifera \textit{\times deltoides}}], Balm-of-Gilead. Mt (NC, VA, WV), Pd (VA), Cp (DE): bottomlands, riverbanks, streambanks; uncommon (rare or locally abundant in DE, NC, and VA), spread from cultivation. April. This cultivar is of uncertain origin, considered by some to be a hybrid \textit{P. balsamifera \textit{\times deltoides}}, by others to be an atypical cultivar of \textit{P. deltoides} Linnaeus. The cultivar 'gileadensis' is distinguished from the typical form by the petioles densely and stiffly pubescent (vs. petioles glabrous). \textit{P. \textit{\textit{\times} jackii}} is locally abundant along the New River in Watauga, Ashe, and Alleghany counties, NC and downstream into VA. [= C, FNA, K, Y; = \textit{P. candidans} Aiton – RAB, G, S, misapplied; > \textit{P. \textit{\textit{\times} gileadensis}} Rouleau – F, W, WV] \\
* \textit{Populus nigra} Linnaeus, Black Poplar, Lombardy Poplar. Pd (GA, VA), Cp (GA, VA): disturbed suburban areas; rare, native of s. Europe. Cultivated in many forms, including the columnar "Lombardy Poplar," short-lived and only weakly spreading to disturbed areas in the vicinity of plantings. [= C, F, FNA, G, K; > \textit{P. italicus} (Du Roi) Moench – S; > \textit{P. nigra \textit{var. italicus}} Du Roi – \textit{WV}]

* \textit{Populus tremuloides} Michaux, Quaking Aspen. Mt (NC*, VA, WV), Pd (DE*, VA): heath balds, rocky woodlands, exposed rock outcrops, clearings, floodplains; uncommon (rare in DE, and NC, and VA). April-May. NL (Labrador) west to AK,
south to NJ, VA, nw. NC (where perhaps not native), WV, MO, and (in the Rockies) to TX and Mexico. [= C, FNA, G, K, S, W, WV; > P. tremuloides var. tremuloides – F]

**Populus ×smithii** Boivin [P. grandidentata × tremuloides]. Mt (WV): {habitat}; rare. South to MD and WV. [= C, FNA, K] {not yet keyed}

**Salix Linnaeus 1753 (Willow)**

A genus of about 400 species, trees, shrubs, and subshrubs, mostly north temperate and boreal. References: Argus in FNA (2010); Argus (1986)=Z; Dorn (1995)=Y; Argus (1997); Chen et al. (2010). Key adapted from Z and FNA.

1 Leaves mostly alternate, but some opposite or subopposite; [subgenus Vetrice, section Helix].......................................................................................................................... S. purpurea
2 Leaves all alternate.
3 Bud apex short-pointed; bud scale margin free and overlapping; leaf blades 2.5-16× as long as wide; [subgenus Protitea].
4 Leaf blades (4-) 7-10- (16-) times as long as wide; leaf undersurface glaucous or not; [section Longifoliae, subgenus Longifoliae].
5 Leaves lanceolate or elliptic-lanceolate, 2-6× as long as wide; leaf margin usually absent on the upper leaf surface; pistils glabrous; stamens 3, or if 2 (S. ernicephala), the staminate floral bracts dark brown, the anthers sessile with a few leafy bracts. 
6 Leaves glaucous beneath; pistils borne on stipes averaging 2 mm long (range 1-5 mm); staminate floral bracts nectariferous, to 5 mm long.
7 Leaves tomentose beneath with a mixture of white and rusty hairs; [section Griseae, subgenus Griseae].
8 Leaf margin serrulate; leaves long-acuminate; capsules 5-7 mm long.......................................................................................................................... S. lucida
9 Leaf margin minutely and uniformly serrulate; leaves long-sericeous or glabrate beneath; leaf blade 5-13× as long as wide; petioles 3-12 mm long, tomentose or sericeous.
10 Leaf margin entire or crenate (to slightly and irregularly serrate); [subgenus Vetrice, section Cinerella].
11 Leaves glabrate (sparsely pubescent when young), not revolute .......................................................................................................................... S. discolor
12 Leaves permanently pubescent, at least on the lower surface (densely villous or tomentose when young), revolute.
13 Leaves stipulate; leaf blades (5-) avg. 7 (-13) cm long, (12-) avg. 17 (-35) mm wide; staminate aments 1-2 cm long; pistillate aments 2-3.5 cm long.................. S. humilis
14 Leaves exstipulate; leaf blades (2.5-) avg. 4 (-5) cm long, (5-) avg. 7 (-10) mm wide; stamine aments 0.5-1.1 cm long; pistillate aments 1-2 cm long...................................................................................... S. occidentalis
15 Trees or tall shrubs, to 15 m tall; decorticated wood of 1-4 year old branches smooth or with a few ridges usually < 5 mm long......................................................... S. caprea
16 Shrubs to 6 m tall; leaves lacking stomates on the upper surface; [native to our area]; [subgenus Vetrice].
17 Stipules prominent, 5-15 mm long; branches flexile; mature leaves glabrous or glabrescent beneath; stamine aments borne on short, leafy branches; [section Cordatae] ................................................................. S. ericophila var. ericophila
18 Leaf margin coarsely and irregularly serrate; leaves glabrous beneath; leaf blade 4-7 (-10)× as long as wide; petioles (7-) 10-20 mm long, glabrous; [section Salix].................................................................................................................................. S. fragilis
19 Leaf margin minutely and uniformly serrulate; leaves long-sericeous or glabrate beneath; leaf blade 5-13× as long as wide; petioles 3-12 mm long, tomentose or sericeous.
20 Leaves long-sericeous beneath; branches ascending (rarely pendulous); leaves narrowly lanceolate, with length/width ratio of 5-6:5; petioles 3-6 mm long; petioles 3-6 mm long, sericeous; flowering branches 1-1.5 cm long; [section Salix].. S. alba
21 Leaves glabrate beneath; branches normally pendulous; leaves very narrowly lanceolate, with length/width ratio of 6.5:8; petioles 7-12 mm long; petioles 7-12 mm long, tomentose; flowering branches ca. 0.3 cm long; [section Subalbae].

Salix amygdaloides Andersson, Peachleaf Willow. Mt (WV): floodplains and other wet places; rare. April-May. QC west to BC, south to PA, n. WV, w. KY, MO, TX, NM, NV, AZ, and OR. [= C, F, FNA, G, K, Z]

Salix caprea Linnaeus, Goat Willow, Great Sallow. Mt (NC, VA), Pd (DE, VA): disturbed areas; uncommon (rare in NC and VA), native of Eurasia. April. [= C, F, FNA, G, K, Z]

Salix caroliniana Michaux, Carolina Willow, Coastal Plain Willow. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, WV, NY): riverbanks, sandbars, other wet sites; common (uncommon in Piedmont and Mountains). March-April. Widespread in the Southeast. S. caroliniana has a somewhat peculiar range, with three main centers of distribution, the Coastal Plain from VA south to s. FL, the Interior Low Plateau of TN, KY, and n. AL, and the Ozark-Ouachita Highlands of AR and MO. [= RAB, C, F, FNA, G, GW, WH, WV; < S. longipes Andersson – S]

Salix discolor Muhlenberg, Pussy Willow. Mt (VA, WV), Pd (DE, NC*): calcareous wetlands, disturbed areas; rare, apparently native in DE, VA, and WV, introduced only in NC. March-April. NL (Newfoundland) and AB south to DE, w. VA, WV, KY, MO, SD, and MT. [= C, FNA, K, S, Z; > S. discolor var. discolor – F, G, WV; > S. discolor var. latifolia Andersson – F, G, WV; > S. discolor var. prinosoides (Pursh) Andersson – WV]

Salix exigua Nuttall var. sericans (Nees) Nesom, Sandbar Willow. Mt (VA, WV), Pd (VA), Cp (DE, VA): sandbars, riverbanks, creekbanks; common (rare in DE and VA). March-mid May and June-August. S. exigua occurs throughout North America except most of the Southeast, south to DE, se. VA, w. VA, e. TN, MS, LA, TX, and Mexico; var. sericans is the more western variety of the complex (Nesom 2002). [= < S. exigua – W, Z; > S. exigua ssp. interior (Rowlee) Conquist var. angustissima (Andersson) Revel & Broome – C; > S. interior Rowlee var. interior – F, G; = S. interior Rowlee – FNA, GW, K, S, WV]

Salix fragilis Linnaeus, Crack Willow, Brittle Willow. Pd (DE, VA), Mt (WV), Cp (DE): low areas; uncommon (rare in VA), native to Asia Minor, introduced to Europe and thence to here. [= C, F, G, K, S, WV, Z; = S. ×fragilis Linnaeus – FNA]

Salix humilis Marshall, Upland Willow, Prairie Willow. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, FL, GA, NC, SC, VA): upland areas, often in open or semi-open sites, in barrens, fens, and grassy balds over mafic rocks (such as amphibolite) up to at least 1800m elevation, also in powerline rights-of-way, woodland borders, and other miscellaneous habitats; uncommon. March-May. NL (Newfoundland) and MB, south to FL and TX. [= C, G, S, WH; < S. humilis – RAB, GW (also see S. occidentalis); > S. humilis var. humilis – FNA, K, S, Z; > S. humilis var. humilis – F, WV; > S. humilis var. hypophylla Fernald – F, WV]

Salix lucida Muhlenberg, Shining Willow. Mt (VA*), WV), Pd (DE), Cp (DE): seepages, low areas; rare. May. Uncertainly indigenous to the one known VA population in Roanoke County. [= C, FNA, W, WV, Z; > S. lucida var. lucida – F, G; = S. lucida ssp. lucida – K]

Salix occidentalis Walter, Dwarf Upland Willow, Sage Willow. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, GA, NC, SC, VA): upland areas, often over mafic (amphibolite) or ultramafic (olivine) rocks; uncommon (rare in WV). March-May. This species is less widespread than the related S. humilis, with a distribution centered in the central Appalachians. ME to
**SALICACEAE**

ND, south to GA, LA, and OK. [= C; < S. humilis – RBW, G; = S. humilis var. microphylla (Andersson) Fernald – F; W, Z; = S. tristis Aiton – G, WB; = S. humilis var. tristis (Aiton) Griggs – FNA, K]

* Salix ×pendulina Wenderoth [S. babylonica × euxina], Weeping Willow. {DC, GA, MD, NC, VA, WV}: disturbed areas; uncommon, a hybrid introduced from Europe. March-April. [= FNA, K]

* Salix pentandra Linnaeus, Bay Willow. Mt (NC, VA), Pd (NC): disturbed areas; rare (perhaps not established), native of Eurasia. April. [= C, F, FNA, G, K, Z]

* Salix ×sepulcralis Simonkai [S. alba × babylonica], Weeping Willow. {DC, KY, LA, MD, NC, VA, WV}: disturbed areas: uncommon, a hybrid introduced from Europe. March-April. [= FNA, K]

Salix bebbiana Sargent, Long-beaked Willow, Gray Willow, is widespread and rather common in PA (Rhoods & Klein 1993) and also occurs in MD (Argus 1986). [= C, FNA, K, Z; > S. bebbiana var. bebbiana – F] [subgenus Salix, section Fulvae]

Salix cordata Michaux, south to MD, PA (Kartesz 1999). {investigate} [= C, FNA, K; > S. cordata var. cordata – F] [not yet keyed]

* Salix elaeagnos Scopoli, Hoary Willow, Rosemary Willow, Diamond Willow. Reported for SC (Kartesz 1999). [= FNA, K] [subgenus Vetrix, section Canae] [not yet keyed]

* Salix matsudana Koidzumi, Corkscrew Willow. Pd (VA): disturbed areas; rare, doubtfully naturalized, native of e. Asia. Reported for VA (Fairfax and Fauquier counties). [= K] [not keyed]

* Salix petiolaris Sm. Cp (NJ). [research]

* Salix triandra Linnaeus, Almond-leaf Willow. {DC, VA}. [= FNA] [not yet keyed]

---

**202. VIOLACEAE** Batsch 1802 (Violet Family) [in MALPIGHIACEAE]

A family of about 20 genera and 900 species, herbs, shrubs, and vines, cosmopolitan in distribution. References: McKinney & Russell (2002)=X.

1 Plants acaulescent, 3-10 dm tall, the leaves narrowly cuneate to a petiole 0-20 mm long, also long acuminate; petals green............. **Hybanthus**

1 Plants acaulescent or caulescent, 0-4 dm tall, if caulescent, the leaves not at the same time cuneate, short-petiolate, and acuminate; petals white, yellow, violet, or blue, the lowermost spurred........................................................................................................... **Viola**

**Hybanthus** Jacquin (Green-violet)

1 Leaves 9-17 cm long, entire (or with a few obscure teeth); capsule 15-20 mm long; seeds ca. 4 mm long; [native, of nutrient-rich forests].... .......................................................... **H. concolor**

1 Leaves 0.6-3 cm long, finely crenate; capsule 3-4 mm long; seeds ca. 1.5 mm long; [alien, of weedy areas].......................... **H. parviflorus**

* Hybanthus parviflorus* (Mutis ex Linnaeus f.) Baillon. Cp (GA): disturbed area; rare, native of South America. April. First collected in North America in New Jersey in the 19th century; and again in 1998 by Tom Govus at Fort Pulaski National Monument (Chatham County, GA). It is unclear whether this is a recent introduction or an old weed introduced via ship's ballast (Wofford et al. 2004). [= *Pombalia*]

**Viola** Linnaeus 1753 (Violet, Johnny-jump-up, Pansy)

(.contributed by B.A. Sorrie and A.S. Weakley)

**Identification notes:** *Viola* has presented numerous problems in taxonomy, distribution, and identification. Particularly troublesome are the so-called “acaulescent blue violets”, including *V. sororia*, *V. sagittata*, *V. palmata*, *V. septempetala*, etc. They may be difficult to identify due to morphological overlap, or trying to key plants without mature leaves; in some instances hybridization may be suspect. Leaf maturity is an
important feature to recognize–the earliest 1-2 leaves produced in most of these taxa are generally ovate-cordate in outline and may not display characteristic lobing, toothing, or pubescence until more mature leaves are produced, 1-2 weeks later. Specimens thus collected early in the flowering period can present the botanist with a perplexing series of plants that do not key cleanly. A second troublesome group contains the small white violents, including Viola tricolor, Viola incognita, and Viola macloskeyi. These taxa have been dealt with in various ways, but resist a wholly satisfactory treatment, due to apparent hybridization (Russell, 1954, Amer. J. Bot. 41: 679-85; Russell, 1955, Amer. Midl. Nat. 54: 481-94). However, recent reviews of these 3 species in the Southeast show that Viola tricolor and Viola macloskeyi are quite distinct, with Viola incognita less so (but this may be due to paucity of specimens from the area). A third difficult group contains Viola appalachiensis, Viola conspersa/labradorica, and Viola walteri. They have been treated recently by Ballard (1992, 1994) and McKinney & Russell (2002). Despite the problems present in the genus, the great majority of plants encountered in the field may be successfully keyed out, particularly by botanists working within an area of several counties. Violet species are usually quite faithful to one or a few plant community types, so once learned these habitats can be valuable indicators as to which species to expect. Botanists working in larger regions (state, floristic province), however, must be aware of increased morphological variation and potential hybridization. The works of McKinney & Russell and Ballard provide the most satisfactory understanding of taxa and are followed here, with exceptions based on field and herbarium studies throughout the Southeast US. All species possess brownish or reddish nectar guide striae in the corolla throat; these are ignored in the key. Hairs of the corolla throat and on leaf surfaces are important key characters; several plants should be inspected with a 10× lens before deciding the character state.

1 Plant acaulescent (producing aerial stems bearing leaves and flowers).

2 Corolla yellow, or white with a yellow center (sometimes drying lavender); stipules entire or erose ........................................................... Key A

2 Corolla wholly cream-colored, or cream with a yellow center, or blue-violet, or multicolored (blue or violet with orange or yellow); stipules fringed or deeply lobed ....................................................................................... Key B

1 Plant acaulescent (with leaf petioles and flower stalks arising separately from the base of the plant).

3 Plant producing stolons; corolla white (or blue in V. odorata) ....................................................................................... Key C

3 Plant not producing stolons; corolla blue-violet (or yellow in V. rotundifolia) ................................................................. Key D

Key A – Acaulescent Violets with yellow or white flowers

1 Corolla white with a yellow center (sometimes drying lavender); stipules long-triangular, attenuate.............................. V. canadensis var. canadensis

1 Corolla solid yellow; stipules ovate to narrowly ovate.

2 Leaf blades > 1.5× as long as broad.

3 Leaf blades narrowly ovate; base of leaf blade rounded to broadly cuneate................................................................. V. hastata

4 Leaf blade hastate; base of leaf strongly cordate................................................................. V. tripartita

5 Leaf blade narrowly ovate; base of leaf strongly cordate....................................................................................... V. tripartita

Key B – Acaulescent Violets with blue, cream, or multicolored flowers

1 Stipules foliaceous, deeply lobed (the lobes narrow, but not ciliate or fringed; leaves cuneate at base; plants annual, without thickish rootstock; [of weedy habitats].

2 Corolla pale blue with a cream center; petals 2× as long as the sepals.............................................................................. V. bicolor

2 Corolla either cream with a yellow center or multicolored; petals < 2× as long as the sepals.

3 Corolla cream with a yellow center; petals shorter than the sepals or longer by up to 2 mm ................................................. V. arvensis

4 Corolla multicolored (cream to orange with a yellow center, the upper petals at least partly dark blue); petals longer than the sepals by 2 mm or more ................................................................. V. tricolor

1 Stipules herbaceous, fringed or ciliate along the margin; leaves truncate or cordate at the base; plants perennial, with thickish rootstock; [mainly of natural habitats]; [section Viola]

4 Stems immediately becoming prostrate at time of flowering; stems persistent through winter, rooting at the nodes, and generating the following year's plants at their tips (plants thus mat-forming).

5 Leaf blades with scattered hairs near the margin only; petioles, peduncles and stems glabrous; stipules shallowly lacerate, with marginal processes < ½ as long as the stipule................................................................. V. walteri var. appalachiensis

5 Leaf blades moderately to densely puberulent over the entire surface; petioles, peduncles and stems moderately to densely puberulent; stipules deeply laciniate with marginal processes > ½ as long as the stipule ................................................................. V. walteri var. walteri

4 Stems ascending to erect at time of flowering and fruiting; stems deciduous at end of growing season, not rooting at nodes (plants thus solitary).

6 Corolla wholly cream-colored................................................................. V. striata

6 Corolla blue or blue-violet.

7 Spur of basal petal 4-6 mm long; lateral petals bearded within; corolla uniformly blue ................................................................. V. labradorica

7 Spur of basal petal 10-15 mm long; lateral petals beardless; corolla lavender, with a purple-black eyespot surrounding the throat........ V. rostrata

Key C – Acaulescent Violets with stolons and white (or rarely blue) flowers

1 Flowers generally blue (sometimes white or blue-and-white variegated); style terminating in a slender hook ca. 1 mm long; capsules hirtellous; [introduced, cultivated, rarely persistent or spreading] .............................................................................. V. odorata

1 Flowers white; style broad at the tip, in most species resembling a scoop; capsules glabrous; [native].

2 Leaf blades > 1.5× as long as broad.
VIOLACEAE

3 Leaf blades lance-ovate, broadly cuneate to subtruncate at the base ................................................................. V. primulifolia
3 Leaf blades linear to lanceolate, narrowly cuneate at the base.
4 Leaf blades lanceolate, < 8× as long as wide; plant glabrous ................................................................. V. lanceolata var. lanceolata
4 Leaf blades linear or narrowly lanceolate, > 10× as long as wide; plant glabrous to pubescent................. V. lanceolata var. vittata
2 Leaf blades < 1.5× as long as broad.
5 Leaf blades completely glabrous (petioles may be villous); [of wet, acidic seepage or swampy woods, often with Sphagnum]................. V. macloskeyi var. pallens
5 Leaf blades pubescent, at least on the upper surface of the basal lobes; [of wet to more mesic situations].
6 Lateral petals glabrous within; petals and peduncles usually reddish-tinted; leaf apex acute; basal lobes of the leaf often overlapping; pubescence of the upper leaf surface often restricted to the basal lobes; [of mesic, often nutrient-rich forests]......................... V. blanda
6 Lateral petals bearded within; petals and peduncles green; leaf apex obtuse to rounded; basal lobes of the leaf not overlapping; pubescence of the upper leaf surface usually widespread; [of mesic to wet situations]................................................................. V. incana

Key D – Acaulescent Violets without stolons, with blue-violet or yellow flowers

1 Corollas yellow; leaf blades rotund, lie nearly flat on ground ................................................................................................. V. rotundifolia
1 Corollas violet to bluish or purple, leaves various (flat on ground only in some V. villosa and V. hirsutula).
2 Leaf blades completely divided throughout, or lobed basally, or deeply toothed basally (beware that in V. pedata the earliest 1-2 leaves may be uncut and cordate, to shallowly lobed).
3 Bladeflower divided, lobed, or deeply toothed only on basal portion, or blades incised only in distal half.
4 Orange stamens conspicuously exsert and beak-like; blades incised only in distal half or only apically ......................... V. pedata var. 1
4 Stamens not visible, not exsert; blades divided, lobed, or deeply toothed only on basal portion.
5 Blade outline oblong-lanceolate to ovate-triangular, much longer than wide.
6 Petioles distinctly shorter than blades; blades densely pubescent, apex blunt, basal teeth undeveloped or with a few coarse teeth on mature leaves.
7 Mature leaves deeply lobed with 2-3 lanceolate lobes on each side; spurred petal bearded; [of small blackwater streamsides and floodplains]................................................................................................. V. sagittata var. avata
6 Petioles equal or longer than blades; blades glabrous or glabrate, apex acute; basal teeth well developed, very coarse to lobe-like................................................................................................................................. V. sagittata var. sagittata
5 Bladeline ovate to subrotund, about as wide as long.
7 Plant moderately to densely pubescent, at least on petioles and undersurface of leaves; mature leaves trilobed; [of mesic to dryish woods]......................................................................................................................................................... V. palmata
8 Mature leaves trilobed, with 1 (~2) remiform or obovate lobes on each side; spurred petal glabrous; [of small blackwater streamsides]................................................................................................. V. esculenta
7 Plant glabrous or glabrate (hairs on leaf margins or atop lobes).
8 Mature leaves deeply lobed with 2-3 lanceolate lobes on each side; spurred petal bearded; [of mesic to moist pine savannas and pocoino ecotones]................................................................................................................................. V. sagittata var. sagittata
6 Petioles equal or longer than blades; blades glabrous or glabrate, apex acute; basal teeth well developed, very coarse to lobe-like
3 Blades deeply divided throughout into linear or lanceolate segments (or with several narrow lateral segments and a broadly lanceolate central segment), blades about as broad as long, or broader.
9 Lateral petals glabrous within; orange stamens conspicuously exsert and beak-like............................................. V. pedata var. pedata
9 Lateral petals bearded; stamens not visible, not exsert.
10 Central lobe of leaf blade mostly 1-2.5× the width of the first lateral lobes.
11 Blades pubescent, divisions mostly 7-11; [midwestern, disjunct to shale barrens of western VA].............................. V. pedatifida
11 Blades glabrous or glabrate, divisions 5-11; [of limestone glades or of Coastal Plain woodlands].
12 Blade divisions 7-11; [of Coastal Plain, moist to mesic hardwoods along rivers or streams]................................. V. brittoniana
12 Blade divisions 5-9; [of inland regions, dry limestone glades or barrens]................................................................. [V. egglestonii]
10 Central lobe of leaf blade mostly 3-4× the width of the first lateral lobes.
13 All leaves homophyllous, the early ones not ovate, rotund, or cordate; blades pubescent; [of Piedmont and Mountains]......................... V. subsubulata
13 Leaves heterophyllous, the early ones ovate, rotund, or cordate, the mature ones divided; blades pubescent or glabrate; [of various distributions].
14 Blades and petioles moderately to densely pubescent; lowestmost lobe directed outward parallel to ground; [primarily of mesic hardwoods, widespread]............................................................................................................................ V. palmata
14 Blades glabrous or glabrate; lowestmost (outermost) lobe on each half of blade usually directed downward towards ground; [primarily of pine savannas on Coastal Plain]......................................................... V. septemloba
15 Most or all blades longer than broad, narrowly ovate to long-triangular, tapering to an acute apex.
16 Blades and petioles moderately to densely pubescent; leaves distinctly longer than wide; dry to xeric clearings and banks..................... V. sagittata var. avata
16 Blades and petioles glabrous or glabrate.
17 Lateral petals bearded with clavate hairs; spurred petal glabrous within; [of swamps, seepages, bogs, and sphagnum streamside].
18 All leaf teeth uniform; leaf bases cordate; [of mesic woods to moist seepages to streamside]........... V. sororia var. missouriensis
17 Lateral petals with hairs of essentially uniform width; spurred petal bearded within.
18 Basal teeth longer than others; leaf bases truncate to subcordate (ignore earliest 1-2 leaves).
19 Leaf outline broadly triangular, not much longer than wide; basal teeth of the leaf numerous, ± pectinate............ V. brittoniana
19 Leaf outline narrowly ovate-triangular, much longer than wide; basal teeth of the leaf few, very coarse................................. V. sagittata var. sagittata
15 Blades as wide as long or wider, ovate to suborbicular, apex obtuse (to acute).
20 Lateral petals bearded with clavate hairs; foliage glabrous or glabrate.
21 Petals light blue or light blue-violet, with a dark eye (also with dark veins); sepalis 8-12 mm long; no plants in population with lobed blades; [mostly Piedmont and Mountains, rare in Coastal Plain] ................................................................. \textit{V. cucullata}

22 Leaf blades moderately to densely pubescent on one surface or both, and on petioles.

23 Leaf blades equally pubescent on both surfaces.

24 Leaf blades large, apex acute, carold afoft on long petioles, deciduous; peduncles shorter than to equaling petioles ...........

25 Leaf blades densely pubescent above, sparsely so beneath and on petiole; apex blunt to rounded; in life dark veins prominent on pale upper surface of blade ................................................................................................. \textit{V. hirsutula}

26 Leaf blades glabrous or glabrate, or with hairs confined to just the basal lobes; petioles glabrous or glabrate.

27 At least some plants in population with trilobed leaves; [southern and mainly Coastal Plain, of small blackwater streamside and floodplains] ................................................................. \textit{V. esculenta}

28 Spurred petal densely bearded; leaf blades reniform; [northern, ranging south to PA and WV, of fens and swamps in alkaline soils] ................................................................................................. \textit{V. nephrophylla}

29 Spurred petal glabrous or glabrate; leaf blades ovate to widely triangular; [widespread, of mesic slopes to moist floodplains] ................................................................................................. \textit{V. sororia} var. \textit{sororia}

\textit{Viola blanda} Willdenow, Sweet White Violet. Mt (GA, MD, NC, SC, VA, WV), Pd (DE, MD, NC, VA): moist, rich forests; common (uncommon in Piedmont). NH and QC west to MN and ne. ND, south to DE, MD, w. NC, n. GA, e. TN, OH, IN, IL, and e. IA. [= F, G, S, WV; \textit{V. blanda} – RAB, C, W, X (also see \textit{V. cognicita}); \textit{V. blanda} var. \textit{blanda} – K, V]

\textit{Viola canadensis} Linnaeus var. \textit{canadensis}, Tall White Violet. Mt (GA, MD, NC, SC, VA, WV), Pd (NC, VA): rich cove forests, other rich mesic situations, such as floodplains; common. April-July. NL (Newfoundland) to ON, south to GA, AL, TN, and AR. Other varieties are more western. [= RAB, C, K, V; \textit{V. canadensis} var. \textit{rugulosa} (Greene) C.L. Hitchcock – RAB, C; \textit{V. rugulosa} Greene – RAB, C; misapplied to plants in our area; \textit{F. canadensis} – F, G, S; \textit{V. rugulosa} Greene – M, missapplied to our plants; \textit{V. canadensis} – W, X]

\textit{Viola hirsutula} Brindley. Mt (AL, GA, NC, SC, VA, WV), Pd (AL, DE, GA, NC, SC, VA), Cp (NC): bottomlands and moist slopes; common (rare in NC Coastal Plain). CT, NY, PA, OH, and s. IN, south to Panhandle FL, AL, and MS. [= RAB, F, G, K, S, W, V, WV, X; \textit{V. villosa} Walter – C]

\textit{Viola incognita} Brindley. Mt (NC, VA, WV): moist to wet forests; rare. April-June. NL (Labrador) to MN, south to DE, PA, and WI, and in the Appalachians south to w. NC. [= S, WV; < \textit{V. blanda} – RAB, C, X; \textit{V. incognita} var. \textit{incognita} – F, G; \textit{V. incognita} var. \textit{forbesii} Brindley – F, G; \textit{V. blanda} Willdenow var. \textit{palustriformis} A. Gray – K, V]

\textit{Viola labradorica} Schrank, American Dog-violet. Mt (GA, MD, NC, SC, VA, WV), Pd (DE, MD), Cp (FL, GA, VA): moist alluvial woodlands and forests, seepage slopes, marl ravines, hammocks; uncommon (rare in FL, GA, and WV). Late March-May. NL (Labrador) west to AK, south to e. VA, nw. SC, n. GA, c. AL, and OH; disjunct in sw. GA and Panhandle FL.
Ballard (1992) concluded that *V. conspersa* was not distinct from *V. labradorica*. [= K, V, X; > *V. conspersa* Reichenbach – RAB, C, F, G, GW, S, W, WV]

**Viola lanceolata** Linnaeus var. *lanceolata*. Lanceleaf Violet. Cp (AL, DE, FL, GA, MD, NC, SC, VA), Pd (DE, NC), Mt (VA, WV): wet habitats; common (uncommon in Piedmont and Mountains). March-May. NB west to MN, south to FL and e. TX. [= C, F, V; > *V. lanceolata* – RAB, W, X; > *V. lanceolata ssp. lanceolata* – GW, K; = *V. lanceolata* – G, S, WV]

**Viola lanceolata** Linnaeus var. *vittata* (Greene) Weatherby & Griscom, Strap-leaf Violet. Cp (GA, NC, SC, VA): wet pinemelasses, depressions ponds, other wetlands; common. February-May. Se. VA south to FL, west to e. TX. [= C, F, V; < *V. lanceolata* – RAB, W, X; > *V. lanceolata ssp. vittata* (Greene) Russell – GW, K; = *V. vittata* Greene – G, S]

**Viola macloskeyi** F. Lloyd var. *pallens* (banks ex A.P. de Candolle) C.L. Hitchcock, White Wild Violet. Mt (GA, NC, SC, WA), Pd (DE, NC, VA), Cp (FL, DE): brookbanks, seepages; uncommon (rare in DE). NL (Labrador) west to NT, south to GA, AL, MS, MO, SD, CO, UT, NV, and CA. Perhaps better recognized at the specific level, as *V. pallens*, which seems distinct from the narrowly distributed *V. macloskeyi*, of CA, OR and e. NV. Ballard et al. (2001) suggest that **Hispnomaulan dominensis** Urban is conspecific with *F. macloskeyi** sensu latu. [= RAB, C; > *V. pallens* (banks ex A.P. de Candolle) Brainerd – F, G, GW, S, WV; > *V. pallens* var. *pallens* – G; > *V. pallens* var. *subrepens* Roush – G; = *V. macloskeyi** ssp. pallens* (banks ex A.P. de Candolle) M.S. Baker – K, V, W; < *V. macloskeyi** F. Lloyd – X]

**Viola nephrophylla** Greene, Northern Bog Violet. Mt (WV): bogs; rare. May. NL (Newfoundland) and YT south to PA, WV, IN, IL, LA, TX, and CA. [= C, F, G, K, V, WV] [add to synonymy]

*Viola odorata* Linnaeus, Sweet Violet, English Violet. Pd (NC, VA), Mt (NC), Cp (LA), (GA): gardens, lawns, disturbed places, persistent or weakly spreading from horticultural use; rare, native of Europe. [= C, F, G, K, S, V, Z]

**Viola palmata** Linnaeus, Wood Violet. Mt (AL, GA, MD, NC, SC, VA, WV), Pd (AL, DE, GA, NC, SC, VA), Cp (FL, DE, GA, NC, SC, VA): moist forests; common (uncommon in DE). ME west to WI, south to FL, AL, MS, and LA. [= V, X; > *V. palmata ssp. palmata* – RAB, WV; > *V. palmata ssp. triloba* (Schweinitz) Gingsins ex A.P. de Candolle – RAB, WV; < *V. palmata ssp. palmata* – C; > *V. triloba* Schweinitz – triloba – F, G, K; > *V. stoneana* – F, G; > *V. palmata* – F, G, S, W, in the narrow sense; > *V. chalcosperma* Brainerd – F, S; < *V. palma ssp. palma* (Linnaeus) (pro sp.) – K; > *V. triloba* Schweinitz – S, W]

**Viola pedata** Linnaeus var. *pedata*. Bird’s-foot Violet. Mt (GA, NC, SC, WA, WV), Pd (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): dry rocky or sandy forests, wetlands, and roadbanks; common (uncommon in GA, NC, and SC Coastal Plain; rare in DE). March-May; May-June. NH, NY, MI, WI, MN, and ND south to s. GA, AL, MS, MO, SD, CO, UT, NV, and CA. Perhaps better recognized at the specific level, as *V. pedata* (Cp (NC, SC): sandhills; uncommon. [distribution] [= *V. pedata* var. ranunculifolia (Jussieu ex Poiret) Gings ex A.P. de Candolle – F, GW, WV; > *V. pedata var. pedata* – X; > *V. pedata var. ranunculifolia* (Jussieu ex Poiret) Gings ex A.P. de Candolle – X, probably misapplied; < *V. pedata* – RAB, K, S, V;]

**Viola pedatifida** G. Don, Crowfoot Violet. Mt (VA): shale barrens; rare. April-May. ON west to AB, south to OH, IN, AR, OK, NM, and AZ; disjunct in w. VA. [= F, G, K; = *V. palmata* Linnaeus var. *pedatifida* (G. Don) Cronquist – C; = *V. pedatifida* G. Don sp. *pedatifida* – X]

**Viola pensylvanica** Michaux, Smooth Yellow Forest Violet. Mt (AL, GA, KY, MD, NC, SC, TN, VA, WV), Pd (DE, MD, NC, SC, VA), Cp (DE, NC, SC, VA): mesic forests; common (rare in DE Coastal Plain). March-May. QC west to MB south to DE, MD, w. NC, GA, AL, AR, and OK. [= WV; = *Viola pubescens* Aiton var. *scabriuscula* Schweinitz ex Torrey – K, V, X; = *F. eriocarpon* (Nuttall) Schweinitz var. *leiocarpa* Fernald & Wiegand – RAB; < *V. pubescens* – C, GW, W; > *V. pensylvanica* Michaux var. *pensylvanica* – F; > *V. pensylvanica var. leiocarpa* (Fernald & Wiegand) Fernald – F; = *F. eriocarpon* – G, S; = *V. eriocarpon* (Nuttall) Schweinitz var. *leiocarpus* Fernald & Wiegand; > *V. pubescens* Aiton var. *leiocarpus* (Fernald & Wiegand) Seymour]

**Viola primuldilfolia** Linnaeus, Primrose-leaf Violet. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): bogs, wet savannas, poeciscus, most poeciscus oils along small streams; common. March-May. NL (Newfoundland) to ON, to SE FL, and west to TX and se. OK. [= RAB, C, GW, S, V, W, WV, X; > *V. primulifolia var. primulifolia* – F, G; > *V. primulifolia var. acuta* (Bigelow) Torrey & A. Gray – F; > *V. primulifolia var. villosa* Eaton – F, G; = *V. primulifolia* Linnaeus (pro sp.) (*lanceolata × macloskeyi*) – K]

**Viola pubescens** Aiton, Hairy Yellow Forest Violet. Mt (MD, NC, TN, VA, WV), Pd (DE, MD, NC, SC, VA), Cp (DE, NC, SC, VA), Mt (VA, WV): deciduous forests; common in WV Mountains, in DE Piedmont (rare in DE Coastal Plain). March-May. ME and s. QC west to SD, south to DE, NC, TN, MO, and NE. [= G, S, WV; > *V. pubescens* var. *pubescens* – K, V, X; = *V. eriocarpon* (Nuttall) Schweinitz var. *eriocarpon* – RAB; < *V. pubescens* – C, GW, W; > *V. pubescens* var. *pubescens* – F; > *V. pubescens* var. *peckii* House – F; = *V. eriocarpon* (Nuttall) Schweinitz var. *eriocarpon*]

**Viola rostrata** Pursh, Long-spurred Violet. Mt (GA, NC, SC, VA, WV), Pd (VA): mesic forests, often under *Tsuga*; common. April-May. NH and QC west to WI, south to GA and AL. [= RAB, F, G, K, S, V, W, WV, X, Z]

**Viola rotundifolia** Michaux, Round-leaf Yellow Violet, Early Yellow Violet. Mt (GA, NC, SC, VA, WV), Pd (DE): rich coves; common (rare in DE). March-April. ME to s. ON, south to w. NC, n. GA, and e. TN. [= RAB, C, F, G, K, S, V, W, WV, X]

**Viola sagittata** Aiton var. *avata* (Nuttall) Torrey & A. Gray. Mt (NC, WV), Pd (NC), (DE, VA): dry soils, glades, prairies; uncommon. April. SS west to MN, south to n. FL, AL, LA, and OK. [= K, V, X; = *V. biflora* L. J.E. Smith – RAB, F, G, S, W, WV, Y; < *V. sagittata* Aiton – C]

**Viola sagittata** Aiton var. *sagittata*. Arrowhead Violet. Mt (WV), Pd (DE), Cp (DE), (GA, NC, SC, VA): dry to moist forests and woodlands; common in WV, uncommon in DE. April. MA west to MN, south to GA and e. TX. [= K, V, X; = *V. sagittata* – RAB, F, S, W, WV, Y; > *V. emarginata* (Nuttall) Le Conte var. *emarginata* – RAB, F, G; > *V. emarginata var. acutiloba* Brainerd – RAB, F, G; < *V. sagittata* – C; > *V. emarginata*?; < *V. emarginata* – S]

**Viola septemloba** Le Conte. Cp (FL, GA, NC, SC): sandy pinelands; rare. Late March-early May. E. NC south to s. FL, west to LA, mainly on the Coastal Plain. [= F, G, GW, K, S, W, Y; < *V. septemloba* – RAB (also see *V. esculenta*); < *V. septemloba* var. *palmata* – C; < *V. septemloba ssp. septemloba* – X]

**Viola septentrionalis** Greene. Mt (NC, TN, WV): wet woods, moist thickets; rare. NL (Newfoundland) to BC south to PA, w. NC (P. McMillan, pers. comm.), e. TN (Chester, Wofford, & Kral 1997), MI, WI, MT, and WA. [= G, K, W, WV, Y; <
**VIOLACEAE**

V. sororia – C; V; ? V. septentrionalis var. septentrionalis – F; < V. sororia var. sororia – X; = V. sororia Willdenow var. septentrionalis (Greene) XXX [comb. nov.,]

**Viola sororia** Willdenow var. missouriensis (Greene) L.E. Mc Kinney, Thinleaf Violet, LeConte’s Violet. Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swamp forests, wet bottomlands; common. March-May. ME west to se. MN, south to Panhandle FL and e. TX. Var. sororia and var. missouriensis are not yet satisfactorily understood. The extremes of these varieties (with blades distinctly longer than wide, and glabrate; var. sororia with blades wider than long or equally wide/long, and pubescent) are readily identified. However, too many specimens still cannot be readily keyed. [= X; = V. affinis Le Conte – RAB, F, G, GW, S, V, W, WV; < V. sororia – C; > V. affinis Le Conte – K; Y; > V. missouriensis Greene – K, Y]}

**Viola subsinuata** Greene. Mt (KA, KY, MD, NC, SC, TN, VA, WV), Pd (DE, GA, MD, NC, SC, VA, WV), Ip (TN): {distribution} [= V, X; < V. palmata var. palmata – C; ? V. triloba Schweinitz var. dilatata (Elliott) Brainerd – F, G, K] *

**Viola villosa** Walter, Southern Woolly Violet. Cp (FL, GA, NC, SC, PD (GA, NC, SC), Mt (GA): pocosin ecotones, other sites with moist soils; uncommon. Late February-May. MD south to n. peninsular FL, west to TX and OK. Reported for VA by Kartesz (1999), on the basis of Massey (1961); report requiring additional documentation. [= RAB, F, G, K, S, X, Y; < V. villosa – C (also see V. hisututa)]

**Viola walteri** House var. appalachiensis (L.K. Henry) L.E. Mc Kinney, Appalachian Violet. Mt (NC, WV): serpentine barrens, rich cove forests (especially old road beds through coves); uncommon (rare in NC). April-May. PA, MD, and WV south to sw. NC. See Grund & Isaac (2007) and Ballard & Wujek (1994) for discussion of the taxonomy of this species. [= X; = V. appalachiensis L.K. Henry – K, WV, Z]

**Viola walteri** House var. walteri, Walter's Violet. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp (GA, SC): nutrient-rich woodlands and forests, especially over mafic or calcareous rocks; uncommon (rare in Coastal Plain). March-May. W. VA west to s. OH and AR, south to n. peninsular FL and e. TX. [= X; = V. walteri – RAB, F, G, K, S, W, Z]

---

A genus of about 180 species, herbs of temperate and subtropical areas. References: Robertson (1971)=Y.

**Linum** Linnaeus 1753 (Flax)

A genus of about 180 species, herbs, of temperate and subtropical areas. References: Rogers (1984)=Z; Rogers (1963)=Y.

---

1. Petals blue, red, or pink; capsule 5-10 mm long; [section Linum].
2. Petals red or pink ................................................................................................................................................................. L. grandiflorum
3. Petals blue.
4. Inner sepals with minutely ciliate margins; stigmas slender, elongate; capsule 6-10 mm long .............................................. L. usitatisimum
5. Inner sepals entire; stigmas capitulate; capsule 5-7 mm long.
6. Flowers homostylos (flowers with stigmas at about the level to slightly above the anthers) .............................................. L. lewisii var. lewissii
7. Flowers heterostylos (some flowers with stigmas below the anthers, others with stigmas well above the anthers) ............. L. perenne

1. Petals yellow; capsules 1-4 mm long; [section Linopis].
2. Inner and outer sepals all very conspicuously glandular-toothed; annual; leaves with 2 brownish glands flanking the attachment to the stem; styles united basally for (0.2-) 0.5-1.2 (-1.8) mm; [section Linopis, subsection Rigidis]
3. Sepals 2.3-3.5 mm long, acute; inflorescence consisting of 1 or more elongate and racemiform branches; dried plants dark, purple-dotted ........................................................................................................ L. harperi
4. Sepals (3.1-) 3.6-5 (-7.3) mm long, acuminate; inflorescence an open panicle; dried plants pale green ........................................ L. sulcatum
5. Outer sepals entire (very rarely sparsely glandular-toothed), inner sepals entire or sparsely to conspicuously glandular-toothed; perennial; leaves without brownish glands flanking the attachment to the stem; styles free; [section Linopis, subsection Linopis].
6. Fruit as long as broad or longer, its apex acute, apiculate, or obtuse, (2-) 2.2-3.2 (-3.3) mm long; leaves mostly 1.3-4.3 mm wide.
8 Leaves (1.2-) 2.3-4.3 (-5.6) mm wide, mostly 25-50 below the inflorescence; sepal of the fruit sparsely but conspicuously ciliate; false sepal incomplete; fruit apex acute, the exposed portions purple..................\textit{L. intercursum} \\
8 Leaves (1.0-) 1.3-2.0 (-3.2) mm wide, mostly 50-120 below the inflorescence; sepal of the fruit glabrous; false sepa virtually complete; fruit apex rounded to apiculate, the exposed portions purple or yellow. \\
9 Fruit pyriform, (2.0-) 2.3-2.8 (-3.0) mm long, 1.7-2.6 mm in diameter, the apex rounded, the exposed portions purple; seeds (1.6-) 1.7-2.0 (2.1) mm long; anthers averaging 0.8 mm long ..........................................................\textit{L. floridanum var. floridanum} \\
9 Fruit ovoid, (2.8-) 3.0-3.2 (-3.3) mm long, 2.5-3.1 mm in diameter, the apex minutely apiculate, the exposed portions yellow; seeds 2.1-2.4 mm long; anthers averaging 1.2 mm long ..........................................................\textit{L. floridanum var. chrysocarpum} \\
7 Fruit broader than long, its apex depressed, flattened, or broadly rounded, (1.3-) 1.5-2.1 (-2.3) mm long; leaves mostly 1.9-9.3 mm wide. \\
10 Margins of the inner sepal with conspicuous stalked glands; mature fruits of dried specimens usually adhering to the plant...............\textit{L. medium var. texanum} \\
10 Margins of the inner sepal glandless, or with a few inconspicuous, sessile glands; mature fruits of dried specimens usually shattering and falling freely. \\
11 Inflorescence paniculate, the lower inflorescence branches not elongate, their tips not nearly reaching the tips of the upper inflorescence branches; branchlets striate-ridged; leaves mostly opposite (usually to beyond the midpoint from the base of the plant to the first inflorescence branch)..........................................................................................................................\textit{L. striatum} \\
11 Inflorescence corymbose, at (at least) the lower branches of the inflorescence elongate, their tips nearly equaling the tips of the upper inflorescence branches; branchlets terete or nearly so; leaves mostly alternate (usually the opposite leaves of the lower stem not extending beyond the midpoint from the base of the plant to the first inflorescence branch)..........................\textit{L. virginianum} \\

\textit{Linum floridanum} (Planchon) Trelease \textit{var. chrysocarpum} Rogers, Yellow-fruited Yellow Flax. Wet savannas. June-October. Se. NC south to s. FL and west to s. MS. [= K, Y, Z; < \textit{L. virginianum\textit{ var. floridanum}} Planchon – RAB; < \textit{L. floridanum} – GW, WH; < \textit{Cathartolinum floridanum} (Planchon) Small – S] \\

\textit{Linum floridanum} (Planchon) Trelease \textit{var. floridanum}, Florida Yellow Flax. Savannas, sandhill seeps. June-October. E. NC south to s. FL and west to LA, also in the West Indies, essentially limited to the Coastal Plain. [= K, Y, Z; < \textit{L. virginianum\textit{ var. floridanum}} Planchon – RAB (also see \textit{L. floridanum\textit{ var. chrysocarpum} and \textit{L. intercursum}); < \textit{L. floridanum} – C, F, G, GW, WH; < \textit{Cathartolinum floridanum} (Planchon) Small – S; > \textit{Cathartolinum macrosepalum} Small – S] \\
* \textit{Linum grandiflorum} Desfontaines, Red Flax. Disturbed areas; native of Africa. [= F, K, WH; = Adenolinum grandiflorum (Desfontaines) W. A. Weber] \\

\textit{Linum harperti} Small, Harper's Grooved Flax. Dry pinelands. This is a rare taxon of longleaf pine woodlands or savannas in w. FL, sw. GA, and c. AL. It is probably distinct from \textit{L. sulcatum} at the species level, needing additional study. [= \textit{L. sulcatum} Riddell \textit{var. harperti} (Small) Rogers – K, Y, Z; < \textit{Cathartolinum harperti} (Small) Small – S; > \textit{L. sulcatum} – WH] \\

\textit{Linum intercursum} Bicknell, Bicknell's Yellow Flax. Dry to moist places. June-October. MA south to c. TN, nw. GA, and c. AL; from MA to MD, nearly restricted to the Coastal Plain, in VA, NC, SC, GA, AL, and se. TN, however it is primarily on the Piedmont and Mountains. It also occurs disjunctively in s. IN near the Great Lakes. [= C, F, G, K, W, Y, Z; < \textit{L. virginianum\textit{ var. floridanum}} (Planchon) – RAB; = \textit{Cathartolinum intercursum} (Bicknell) Small – S] \\

\textit{Linum lewisii} Pursh \textit{var. lewisii}, Prairie Flax. Calcareous glades and barrens. A western blue-flowered species, ranging from N. west to AK, south to MI, LA, TX, NM, AZ, and CA; disjunct at Smoke Hole Caverns, WV, and several adjacent counties. [= K; < \textit{L. perenne} – C, apparently misapplied to WV material; < \textit{L. lewisii} – F; < \textit{L. perenne} Linnaeus var. \textit{lewisii} (Pursh) Eaton & J. Wright – G; < \textit{Adenolinum lewisii} (Pursh) A. & D. Löve] \\

\textit{Linum macrocarpum} C.M. Rogers, Spring Hill Flax. Pitcher plant bogs, wet savannas. FL Panhandle west through s. AL and s. MS to se. LA. [= K, WH] [not yet keyed; add synonymy] \\

\textit{Linum medium} (Planchon) Britton \textit{var. texanum} (Planchon) Fernald, Texas Yellow Flax. Dry to moist places. Var. \textit{texanum} ranges from s. ME, MI, and n. IL south to s. FL and TX, and in the West Indies. Var. \textit{medium} is limited to area around the Great Lakes. [= C, F, GW, K, W, WH, WV, Y, Z; < \textit{L. virginianum\textit{ var. medium}} Planchon – RAB; < \textit{L. medium} – G; < \textit{Cathartolinum medium} (Planchon) Small – S; = \textit{L. medium ssp. texanum} (Planchon) A. Haines] \\
* \textit{Linum perenne} Linnaeus, Perennial Flax. Disturbed areas; native of Europe. Cultivated and "rarely naturalized along road sides" in scattered locations in PA (Rhoads & Klein 1993) and reported tentatively for VA (Kartesz 1999). [= K; < \textit{L. perenne} – C (also see \textit{L. lewisii var. lewisii})] \\

**LINACEAE**

*Linum sulcatum* Riddell, Grooved Yellow Flax. Dry calcareous places in the mountains of VA (where also somewhat weedy in adjacent disturbed areas), diabase barrens in the Piedmont of NC. May-August. Primarily a species of the Great Plains of s. MB, ND, and MN south through SD, IA, WI, NE, MO, IL, KS, and MO to OK. *L. sulcatum* occurs farther east as a rare disjunct on glades or barrens over rocks such as limestone or diabase. [= RAB, C, F, G, W, WV; = Linum sulcatum Riddell var. sulcatum – K, Y, Z; = Cathartolinum sulcatum (Riddell) Small – S; = Mesynium sulcatum (Riddell) A. & D. Löve]

*Linum usitatissimum* Linnaeus, Common Flax. Disturbed places; native of Europe. This is the flax of commerce, used both for its fiber, the source of flax, and the oil expressed from its seeds (linseed oil). [= RAB, C, F, G, K, S, WH, WV, Z]

*Linum westii* C.M. Rogers, West’s Flax. Bogs, margins of flatwoods ponds. Ne. FL; Panhandle FL. [= K, WH] [not yet keyed; add synonymy]

213. **PODOSTEMACEAE** Richard ex C. Agardh 1822 (Riverweed Family) [in MALPIGHIALES]

A family of about 47-49 genera and 280 species, aquatic herbs, of tropical, subtropical, and rarely temperate regions of the New World and Old World. References: Graham & Wood (1975); Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007).

*Podostemum* Michaux 1803 (Riverweed)

A genus of about 7-17 species, reduced aquatic herbs, of tropical to temperate America. References: Graham & Wood (1975)=Z; Philbrick & Crow (1983); Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007).

**Identification notes:** *Podostemum* is a curious plant, seeming more like an alga than a vascular plant in color, texture, mode of attachment to substrate (by a fleshy disk), and irregular thalloid branching.

*Podostemum ceratophyllum* Michaux, Threadfoot, Riverweed. Attached to rocks and dams in rapidly or slowly flowing water. May-July. NS, ME, and QC south to sw. GA, s. AL, s. MS, LA (Florida parishes), AR, and w. TN; disjunct in the Ozark-Ouachita Highlands of w. AR and se. OK; Dominican Republic; Honduras. [= RAB, C, F, G, GV, K, W, WV; = Podostemon ceratophyllum - GW, orthographic variant; > Podostemon ceratophyllum – S, orthographic variant; > Podostemon abroloanoioides Nuttall – S]

214. **HYPERICACEAE** A.L. de Jussieu 1789 (St. John's-wort Family) [in MALPIGHIALES]

A family of 7-9 genera and 480-560 species, herbs, shrubs, and trees, nearly cosmopolitan. It appears from molecular analysis that recognition of the Hypericaceae may (after all) be warranted. *Hypericum* is in a clade with *Podostemum* and *Bonnetia*, sister to a clade including Clusiaceae s.s. (Savolainen et al. 2000), and unless the morphologically very different Podostemaceae is to be included in a broad Clusiaceae, Hypericaceae and Podostemaceae must be recognized. References: Adams (1973)=Z; Godfrey (1988)=Y; Wood & Adams (1976); Stevens in Kubitzki, Bayer, & Stevens (2007).

*Hypericum* Linnaeus 1753 (St. John's-wort)

A genus of 370-420 species, trees, shrubs, and herbs, primarily temperate. *Hypericum* in our area is a large, complex, and interesting genus, with a number of unresolved questions remaining. The species treated in Key B have often been treated in the segregate genus *Ascyrum*. Evidence from a variety of disciplines now suggests that they should be included in *Hypericum* (Adams & Robson 1961; Calie, Schilling, & Webb 1983; Robson 1996). References: Adams (1973)=Z; Godfrey (1988)=Y;
Key H

1. Petals pale pink; stamens fascicled, in 3 fascicles of 3 stamens each; staminodia (hypogynous glands) present, alternating with the fascicles of stamens; perianth 5-merous; "Triadenum" ........................................................................................................... Key A1 or A2

2. Leaves with an articulation at the very base, appearing as a narrow line, groove, or abrupt change of color and texture which extends across the petiole; shrub; [section Myriandra].

3. Plant an erect shrub 0.5-4 m tall, with single main stem branched above; inflorescence elongate (3-7 nodes); flowers [section Brathys] ....... Key D

4. Leaves needle-like, 0.5-1.5 (-2) mm wide, the margins essentially parallel (except for the two marginal sutures; primary branches with two ridged or winged angles running the length of the internodes, extending from the leaf midribs (but not the margins) at the base of the paired leaves; leaf surface glossy; of alfisols and ultisols of wet pine savannas, seepage bogs] ........................................................................................................................................................................................................

5. Capsules 3 (-4) locular; stamens connate at the base into 3 or 5 fascicles; leaves with black glandular dots when backlit (except in H. perfoliatum); sepals and/or petals marked with black glandular dots or lines; perennial herbs; [section Centrosperma] ...................................................................................................................................... Key E

6. Leaves ascending or appressed, 1-nerved, < 1 mm wide; inflorescence a compound raceme; annual herbs; [section Trigynobrathys] ....... Key F

7. Capsules 1-locular; stamens separate or connate at the base, not grouped into fascicles; leaves with translucent glandular dots, without black glandular dots (when backlit); sepals and petals with translucent glandular lines or dots only, not marked with black glandular dots or lines.

8. Shrubs, decumbent shrubs, or suffruticose herbs; [section Myriandra, subsections Pseudobrathydium and Suturosperma] ....... Key G

Key A1 – shrubby St. John's-worts with needle-like leaves and flowers with 5 petals and 5 sepals [section Myriandra, subsection Centrosperma]

1. Longest leaves 5-16 mm.

2. Capsules 3-6 mm long; seeds reddish-amber or brown, the alveoli not in distinct longitudinal rows, the seed lacking longitudinal ridges except for the two marginal sutures; primary branches with two ridged or winged angles running the length of the internodes, extending from the leaf midribs (but not the margins) at the base of the paired leaves; leaf surface glossy; [of alfisols and ultisols of wet pine savannas, seepage bogs] ........................................................................................................................................................................................................

2. Capsules 6-9 mm long; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles running the length of the internodes, extending from the midribs and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry spodosol pine flatwoods] .......................................................... H. tenuifolium

1. Longest leaves 13-30 mm.

3. Plant a low shrub < 5 dm tall, more- or-less decumbent, forming dense clumps; inflorescence elongate (flowers at up to 5 nodes); flowers 10-12 mm diameter; [of dry to mesic soils of lower prairie and inner coastal plain of sc. VA-NC-SC-GA-AL; disjunct to rock outcrops of s GA] ........................................................................................................................................................................................................

4. Understory of most leaves easily seen on both sides of midrib, veins obvious on undersurface, leaves narrowly oblanceolate to oblongar, 1.5-5 (-7) mm wide; inflorescence elongate (3-7 nodes) ............................................................................................................. H. galioides

5. Plant short, < 1 m tall; stem < 1 cm wide at base; plant unbranched or few-branched, wand-like with narrow crown; [endemic to FL Panhandle] .......................................................... H. exile

5. Plant tall, normally > 0.8 m; stem 1-several cm wide at base; crown broader with many ascending to spreading branches.

6. Young branches, leaves, and sepals strongly glaucous; bark of upper stem and branches silvery gray and smooth; mature plant 2-4 m tall with ascending branches imparting tree-like or vase-like aspect; [restricted to shores of sinkhole ponds in Bay and Washington Counties, FL] ............................................................................................................. H. issipotheus

7. Inflorescence elongate (3-7 nodes); stem bark tight, thin, not exfoliating or exfoliating in narrow strips, not revealing buff or pale cinnamon color; if leaf undersurface is exposed it is distinctly paler than upper surface; [usually associated with flowing water (blackwater streams and impoundments)] ............................................................................................................. H. nitidum

7. Inflorescence short (1-3 nodes); stem bark corky-thickened to spongy, exfoliating in broad strips or sheets revealing buff or pale cinnamon color; if leaf undersurface is exposed it is about the same color as upper surface; [usually associated with static water (Carolina bays, impoundments, beaver ponds, borrow pits, flatwoods depressions, cypress-gum ponds)]

8. Mature plant 2-3 (-4) m tall; branches ascending and imparting a tree-like or vase-like aspect (younger plants may be bushy); youngest internodes terete; [of flatwoods depressions and cypress-gum ponds and stringers of FL Panhandle only] ...

... H. chapmanii

8. Mature plant 0.8-1.5 (-2) m tall; branches spreading and imparting a bushy or gumdrop aspect; youngest internodes with distinct winged ridge on either side; [of Carolina bays, impoundments, beaver ponds, borrow pits, widespread] .......................... H. fasciculatum
Key A2 – shrubby St. John’s-worts with needle-like leaves and flowers with 5 petals and 5 sepals
[section Myriandra, subsection Centrosperma]

1 Plants < 0.6 m tall, erect, decumbent, or matted and with ascending/erect branches.
   2 Longest leaves 5-13 mm; flowers 13-15 mm diameter.
   3 Capsules 3-6 mm long; seeds reddish-amber or brown, the alveoli not in distinct longitudinal rows, the seed lacking longitudinal ridges except for the two marginal sutures; primary branches with two ridged or winged angles running the length of the internodes, extending from the leaf midrib (but not the margins) at the base of the paired leaves; leaf surface glossy; [of alfisols and ultisols of wet pine savannas, seepage bogs] .................................................. H. brachyphyllum
   3 Capsules 6-9 mm long; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles running the length of the internodes, extending from the midrib and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry spodosol pine flatwoods] .................................................. H. tenuifolium

2 Longest leaves 11-25 mm; flowers 9-17 mm diameter.
   4 Plant unbranched or few-branched, wand-like with narrow crown; [restricted to FL Panhandle flatwoods] .................. H. exile
   4 Plant densely branched, bushy with broad crown; [plants of dry mesic soils of lower piedmont and inner coastal plain of se. VA-NC-SC-GA-AL, disjunct to rock outcrops of s GA] ........................................................................................................ H. lloydii

1 Plants > 0.6 m tall, plants erect.
   5 Longest leaves (12-)15-30 mm, linear and needle-like or narrowly oblanceolate to oblinear (H. galioides), permanently tightly revolute with usually only the midrib showing on underside; flowers 13-15 mm diameter; [s GA-s FL-w LA] ............................................................................................................................ H. brachyphyllum
   5 Capsules 6-9 mm long; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles running the length of the internodes, extending from the midrib and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry spodosol pine flatwoods] .................................................. H. tenuifolium

   6 Leaves narrowly oblanceolate to oblinear, 1.5-5 (-7) mm wide, margins revolute during drying but leaving considerable exposed undersurface; veins obvious on undersurface; flowers 13-15 mm diameter in elongate inflorescences of 3-7 nodes........ H. galioides
   6 Leaves linear, needle-like, 0.5-1.5 mm wide, permanently tightly revolute with usually only the midrib showing on underside, if undersurface visible there are no veins; flowers 14-26 mm diameter, inflorescences elongate or short.

   7 Plant short, < 1 m tall; stem < 1 cm wide at base; plant unbranched or few-branched, wand-like with narrow crown; [restricted to FL Panhandle].......................... H. exile
   7 Plant tall, normally > 0.8 m; stem 1-several cm wide at base; crown broader with many ascending to spreading branches; [collectively more widespread].

   8 Plant 2-4 m tall, with tree-like or vase-like aspect; [restricted to FL Panhandle].
   9 Young branches, leaves, and sepals not glaucous; bark of upper stem and branches normally not silvery gray, variously roughened; inflorescence short (1-3 nodes); [flatwoods depressions and cypress-gum ponds of FL Panhandle]..... H. chapmanii
      9 Young branches, leaves, and sepals strongly glaucous; bark of upper stem and branches silvery gray and smooth; inflorescence elongate (3-7 nodes); [restricted to shores of sinkhole ponds in Bay and Washington Counties, FL] .................. H. lissophloeus

   8 Plant to 1.5 m tall, with broad bushy or gumdrop aspect; [collectively more widespread].
   10 Inflorescence short (1-3 nodes); bark corky-thickened, exfoliating in sheets and wide strips exposing buff or pale cinnamon color; if leaf undersurface is exposed it is about the same color as upper surface; [usually in static waters of Carolina bays, impoundments, beaver ponds, borrow pits] .................................................. H. fasciculatum
      10 Inflorescence elongate (3-7 nodes); bark tight, thin (not corky thickened), not exfoliating in sheets or wide strips; if leaf undersurface is exposed it is distinctly paler than upper surface; [in moving water of blackwater streams and impoundments] .... H. nitidum

Key B – shrubby St. John’s-worts with 4 petals and 4 (rarely 2) sepals
[section Myriandra, subsection Ascyrum]

1 Styles and carpels 3 (rarely 4); leaves (5-)7-20 mm wide, rounded, subcordate, or cordate-clasping at the base; plant an erect shrub.
   2 Leaves rounded or subcordate at the base; [widely in our area] .................................................................................. H. crux-andreae
   2 Leaves cordate-clasping at the base; [of e. GA southward] .......................................................... H. tetrapetalum

1 Styles and carpels 2 (3 in H. microsepalum); leaves 1-7 mm wide, mostly cuneate (or if rounded the leaves < 8 mm long and 3 mm wide); erect or decumbent shrub.
   3 Sepals nearly equal in size; styles 3; [s. GA south to n. FL] .................................................................................. H. microsepalum
   3 Sepals markedly unequal, one opposite pair large and enclosing the capsule; styles 2; [collectively widespread].
   4 Pedicels 6-13 mm long, soon reflexed; subtending bractlets located near the last pair of leaves; decumbent shrub, to 2 dm tall ........ H. suffruticosum
   4 Pedicels 1-5 mm long, erect; subtending bractlets located midway between the base of the flower and the last pair of leaves; erect or decumbent shrub, mostly 1-15 dm tall.
   5 Erect shrub, usually with a single stem, freely branched well above ground level (or from ground level if injured, as by fire, but then the multiple branches still erect rather than decumbent), to 1 m or more tall; leaves usually variable in size and shape, widest near the middle .......................................................... H. hypericoides
   5 Decumbent, matted shrub, with several prostrate stems arising from a primary rootstock near ground level, each with numerous erect branches, rarely over 3 dm tall; leaves usually relatively uniform in size and shape, widest above the middle .......................................... H. stragulum

Key C – shrubby St. John’s-worts with broader leaves (mostly lanceolate or oblanceolate)
and flowers with 5 petals and 5 sepals

1 Leaves cordate-clasping at the base, ovate; [of s. SC southward]; [section Myriandra, subsection Brathydium] .................. H. myrtifolium
1 Leaves cuneate at the base, oblanceolate, oblong, elliptic, or narrowly elliptic; [collectively widespread]; [section Myriandra, subsection Centrosperma].
2 Leaves mostly narrowly oblanceolate, the larger 2-3 cm long, 2-5 (-7) mm wide, mostly 5-10× as long as wide; seeds 0.4-0.8 mm long, dark brown ................................................................. H. galioides
2 Leaves mostly oblong, elliptic, narrowly elliptic, or broadly oblanceolate, the larger (2-) 3-7 cm long, 5-15 mm wide, mostly 2.5-5× as long as wide; seeds 0.8-1.3 mm long, amber to medium brown.
3 Flowers solitary, terminal (or in 3-flowered terminal cymes); petals 10-20 mm long; sepals 7-15 mm long; shrubs to 1 m tall .................. H. frondosum
3 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepals 1.5-8 mm long; shrubs to 3 m tall.
4 Flowers (1-) 3-7 per inflorescence; capsules (6-) 7-14 mm long; larger leaves (4-) 7-14 mm wide ..................... H. prolificum
4 Flowers 7-many per inflorescence; capsules (3-) 4-5-6 mm long; larger leaves 1-7 (-11) mm wide.
5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [widespread].......................... H. densiflorum
5 Leaves 1.0-3.7 (-4.1) mm wide; [of the Ridge and Valley of nw. GA, c. and nw. AL, and e. TN] ......................... H. interior

**Key D** – herbaceous St. John’s-worts with leaves ascending or appressed, 1-nerved, < 1 mm wide and with a diffuse, racemose inflorescence

1 Leaves linear-subulate, (5-) 8-20 mm long; capsules 1-1.75× as long as the sepals; seeds coarsely rugose-areolate ................ H. drummondii
1 Leaves scale-like, 1-5 mm long; capsules ca. 2-3× as long as the sepals; seeds minutely and inconspicuously reticulate .......... H. gentianoides

**Key E** – herbaceous St. John’s-worts with broad leaves, 3 (-4) locular capsules, stamens connate at base into 3 or 5 fascicles, leaves with black dots as well as translucent glands (except in *H. perforatum*), and sepals and/or petals marked with black dots or lines

1 Smaller stems strongly wing-angled; seeds 1.0-1.3 mm long; leaves of the main stem (8-) 11-20 (-26) mm long, those of the lateral branches typically much smaller; leaves punctate primarily with translucent glands; [alien, usually in disturbed habitats]; [section Hypericum] ................ H. perforatum
1 Smaller stems not wing-angled; seeds 0.6-1.1 mm long; leaves of the main stem (11-) 21-48 (-64) mm long, those of the lateral branches nearly to quite as large; leaves punctate with black glands; [native, in a variety of habitats]; [section Graveolentia].
2 Petals (3.0-) 4.3-12.2 (-14.0) mm long; sepals 1.5-6 mm long, conspicuously punctate with black glands (sometimes also black-lined); capsules (2.5-) 3.0-5.4 (-6.0) mm long; [collectively widespread, occurring in the Coastal Plain, Piedmont, and Mountains of NC, SC, and VA].
3 Sepals 3-6 mm long; styles (2.5-) 5.4-7.4 (-9.0) mm long; petals (6.0-) 9.2-12.2 (-14.0) mm long; leaf apices acute ................ H. psuedomaculatum
3 Sepals 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse to slightly retuse ........ H. punctatum
2 Petals 6-18 mm long; sepals 4-10 mm long, with or without black lines (sometimes also black-punctate); capsules (3.0-) 4.0-7.7 (-10.0) mm long; [endemic to moderate to high elevations of w. NC, sw. VA, and e. TN].
4 Styles (3.0-) 5.6-10.0 (-12.0) mm long; sepals without black lines; petals (5.0-) 11.5-16.1 (-18.0) mm long, without black lines and with round black glands only along the petal margin; longest stamens (8.0-) 10.7-16.3 (-22.0) mm long; cymes relatively few-flowered, (2-) 5-14 (-22) flowers per plant ......................................................... H. gravesent
4 Styles (1.5-) 1.9-2.9 (-5.0) mm long; sepals with black lines; petals (6.0-) 7.0-9.2 (-11.0) mm long, with black lines and round black glands scattered over the surface of the petal; longest stamens (4.0-) 6.1-8.5 (-10.0) mm long; cymes relatively many-flowered, (5-) 13-61 (124) flowers per plant ................................................................. H. mitchellianum

**Key F** – shrubby and subshrubby St. John’s-worts

1 Plant a matted, decumbent shrub, 0.5-3 (rarely to 5) dm tall; leaves 1.5-2.5× as long as wide, without axillary fascicles of leaves; flowers in simple 3-flowered cymes; [mostly of the Coastal Plain and Piedmont, very rarely in the Mountains and then at low elevations]; [section Myriandra, subsection Suturosperma].
2 Larger leaves 4-10 mm wide, 3-5× as long as wide; axillary leaf fascicles present in main leaf axils; seeds pale brown, faintly reticulate, 0.4-0.5 mm long .................. H. cistifolium
2 Larger leaves 10-30 mm wide, 1.5-3× as long as wide; axillary leaf fascicles absent; seeds dark brown, strongly reticulate, 1.5-2.5 mm long.
3 Flowers in simple 3-flowered cymes or in compound cymes with up to 8 flowers; sepals 3 mm long, oblong, obtuse apically; capsules ovoid, 8-10 mm long (excluding the styles) and 5-7 mm broad; seeds 1.8-2.0 mm long, cylindric, sometimes slightly falcate, dull brown when mature ................................................. H. apocynifolium
3 Flowers usually in many-flowered cymes terminating branches; sepals 1.5-2.0 mm long, usually triangular-acute; capsules ovoid to subglobose, 4-5 mm long (excluding the styles) and 4-5 mm broad; seeds 1.5-1.8 mm long, usually falcate-cylindric, dark purplish-brown and lustrous when mature ........................................... H. nudiflorum

**Key G** – herbaceous St. John’s-worts with broad leaves, 1-locular capsules, stamens separate or connate at base, but not grouped into fascicles, leaves with translucent dots, without black dots, sepals and petals with translucent lines or dots only, not marked with black dots or lines

1 Plant an erect suffrutescent herb, 1.5-10 dm tall; leaves 1.5-5× as long as wide, with or without axillary fascicles of leaves; flowers in compound cymes; [mostly of the Coastal Plain and Piedmont, very rarely in the Mountains and then at low elevations]; [section Myriandra, subsection Suturosperma].
2 Larger leaves 4-10 mm wide, 3-5× as long as wide; axillary leaf fascicles present in main leaf axils; seeds pale brown, faintly reticulate, 0.4-0.5 mm long .................. H. cistifolium
2 Larger leaves 10-30 mm wide, 1.5-3× as long as wide; axillary leaf fascicles absent; seeds dark brown, strongly reticulate, 1.5-2.5 mm long.
3 Flowers in simple 3-flowered cymes or in compound cymes with up to 8 flowers; sepals 3 mm long, oblong, obtuse apically; capsules ovoid, 8-10 mm long (excluding the styles) and 5-7 mm broad; seeds 1.8-2.0 mm long, cylindric, sometimes slightly falcate, dull brown when mature ................................................. H. apocynifolium
3 Flowers usually in many-flowered cymes terminating branches; sepals 1.5-2.0 mm long, usually triangular-acute; capsules ovoid to subglobose, 4-5 mm long (excluding the styles) and 4-5 mm broad; seeds 1.5-1.8 mm long, usually falcate-cylindric, dark purplish-brown and lustrous when mature ........................................... H. nudiflorum
HYPERICACEAE

1 Stems and leaves pubescent; [section Trigynobrathy] .......................................................... H. setosum
2 Stems and leaves glabrous.

1 Leaves 3-6 cm long, 4-6× as long as wide; margins revolute; [plants (in our area) of low elevations in the Coastal Plain] .......................... H. adpressum
2 Leaves 1-3 (-4) cm long, 2-3× as long as wide, the margins not revolute; [plants (in our area) of high elevations in the Mountains] .......................... H. ellipticum

2 Styles 2-4 mm long; stamens 50-80.
3 Punctate glands absent on the stem (rarely very few on the internodes of the inflorescence); punctate glands of the leaves small, round, distributed on the lower leaf surface, becoming sparse toward the base of the leaf and toward the midrib; midstem leaves mostly broadest at or beyond the middle .................................................................................. H. virgatum
4 Punctate glands frequent on the stem of leaves and stems large, oval, distributed evenly and densely on the lower leaf surface, also dense on the upper leaf surface in H. denticulatum and H. harperi (absent on upper leaf surface in H. species 1); midstem leaves usually broadest at or below the middle. .................................................................................................................................. H. radfordiorum
5 Punctate glands abundant on the stem of leaves and stems large, oval, distributed evenly and densely on the lower leaf surface, also dense on the upper leaf surface in H. denticulatum and H. harperi (absent on upper leaf surface in H. species 1); midstem leaves usually broadest at or beyond the middle. .................................................................................................................................. H. radfordiorum

6 Upper surface of the leaf with no punctate glands; inflorescence branches typically with 3-12 pairs of bracteal leaves about 1/2 as large as the foliage leaves; [of shallow soil mats on granitic domes in the Piedmont of NC] .......................... H. radfordiorum
7 Upper surface of the leaf with abundant punctate glands; inflorescence branches with at most a few pairs of very small bracts; [of Coastal Plain wetlands, very rarely disjunct inland and then in wetlands].

1 Leaves 5-20 (-24) mm long, 5-15 mm wide, 1.5-3× as long as wide, ovate to obovate to narrowly elliptic, mostly appressed to the stem, mostly shorter than the internodes; sepals 4.0-8.0 mm long, 2.0-4.0 mm wide, acute; lower stem not spongy-thickened with aerenchymatous tissue; [of moist pinelands of the Coastal Plain, very rarely disjunct inland to bog habitats in the Piedmont and Mountains] .......................... H. denticulatum
2 Leaves 10-35 (-40) mm long, 3-8 (-12) cm mm wide, 3-10× as long as wide, lanceolate to linear-lanceolate, mostly ascending to spreading, often equaling the internodes; sepals 3.0-5.0 mm long, 0.8-2.5 mm wide, acute to acuminate; lanceolate to linear-lanceolate; upper portion of stem with numerous axillary branches; lower stem usually spongy-thickened with aerenchymatous tissue; [of upland depression ponds of the Coastal Plain, growing where seasonally inundated] .......................... H. harperi

4 Styles 0.5-1.5 mm long; stamina 5-22.
5 Leaves ovate to elliptic, 3-35 mm long, 2-15 mm wide, the leaf base rounded to cordate-clasping.

1 Ultimate bracts of the inflorescence linear, differing conspicuously from the leaves; leaves paler beneath; sepals acute, about equaling the capsule; capsule 3-5 mm long .......................................................... H. boreale
2 Ultimate bracts of the inflorescence linear, differing conspicuously from the leaves; leaves paler beneath; sepals acute, about equaling the capsule; capsule 2-3.5 mm long.
3 Inflorescence branches from the upper 1-6 nodes of the stem, the further branching repeatedly monochasial; stem with apical internode well developed, usually longer than the internode below; sepals broader above the middle, more- or less imbricate; [of the Coastal Plain] .......................... H. mutilum var. latipesatum
4 Inflorescence branches from the upper 2-10 nodes of the stem, the further branching mostly dichasial; stem with apical internode shorter than the the internode below or even essentially absent; sepals broader below the middle, not imbricate (rarely broader above the middle and imbricate); [widespread] .......................... H. mutilum var. mutilum
5 Inflorescence branches from the upper 6-10 nodes of the stem, the further branching mostly dichasial; stem with apical internode shorter than the the internode below or even essentially absent; sepals broader below the middle, not imbricate (rarely broader above the middle and imbricate); [widespread] .......................... H. mutilum var. mutilum

Key H – “Triadenum”

1 Leaves narrowed to the cuneate or broadly cuneate (rarely truncate) base.
2 Lower leaves sessile; sepals 5-7 mm long, acute (to obtuse); leaves lacking translucent or dark glands or punctae; styles 0.5-1.5 mm long (best seen in fruit) .......................................................... H. tubulosum
2 Lower leaves petiolate; sepals 3-5 mm long, obtuse; leaves with translucent glands and dark punctae; styles 1.5-3 mm long (best seen in fruit) .......................................................... H. walteri

1 Leaves claspving, cordate, or subcordate at the base.
2 Sepals 2.5-5 mm long at maturity, obtuse to acute; styles 0.5-1 (-1.5) mm long (best seen in fruit) .......................................................... H. fraseri
3 Sepals 5-8 mm long at maturity, acute to acuminate; styles 1.8-3 mm long (best seen in fruit) .......................................................... H. virginicum

Hypericum ascyron Linnaeus ssp. pyramidatum (Aiton) N. Robson, American Great St.-John’s-wort. [habitat]. June-August. The species is of e. North America and c. Asia; the North American ssp. pyramidatum occurs from QC west to MN, south to s. PA (Rhoads & Klein 1993), MD (Robson 2000), and WV (Harmon, Ford-Werntz, & Grafton 2006). [= X; < H. ascyron Linnaeus – K; = H. pyramidatum Aiton – C, F, G] [not yet keyed] [section Roscyna]

Hypericum boreale (Britton) Bicknell, Dwarf St.-John’s-wort, Northern St.-John’s-wort. Sinkhole ponds in the Mountains, interdune ponds in the outer Coastal Plain, boggy places. NL (Newfoundland) and QC west to w. ON, south to VA, nw. NC (?),
OH, IN, and n. IL. Hybrids with *H. canadense* have been called *H. ×dissimulatum* Bicknell (pro sp.). [= C, F, G, K, WV; = *H. mutilum* Linnaeus ssp. boreale (Britton) J.M. Gillett – X]

**Hypericum brachyphyllum** (Spach) Steudel. Ponds and wet pinelands. Se. NC south to s. FL, west to s. MS. Material from se. NC was at one point thought to perhaps represent a new taxon. [= GW, K, WH, X, Y, Z; < *H. aspalathoides* – S]

**Hypericum canadense** Linnaeus, Canada St. John's-wort. Cp (DE, FL, GA, NC, SC, VA), Mt (NC, SC, VA, WV), Pd (DE, NC, VA); bogs, pine savannas, ditches; common (rare in NC and VA Piedmont, rare in VA Mountains, rare in FL). July-September. NL (Newfoundland) and QC west to MN, south to s. GA, ne. FL, Panhandle FL, and MS; also in Holland and Ireland, where considered by some to be native. Hybrids with *H. mutilum* and/or *H. boreale* have been called *H. ×dissimulatum* Bicknell (pro sp.). [= RAB, C, G, GW, K, S, WH, WV, X, Z; > *H. canadense* var. canadense – F; > *H. canadense* var. galiiforme Fernald – F]

**Hypericum chapmanii** W.P. Adams, Apalachicola St. John's-wort, Tree St. John's-wort. Margins of pond-cypress ponds, pond-cypress stringers, often growing with *Cyrilla parviflora* and *Nyssa ursina*. Endemic to Panhandle FL (9 counties). [= GW, K, V, WH, X, Y, Z; < *H. fasciculatum* – S; = *H. arborescens* Chapman]

**Hypericum cistifolium** Lamarck. Pine savannas, wet pine flatwoods. June-August. E. NC south to s. FL, west to e. TX. [= RAB, GW, K, WH, X, Y, Z; > *H. cistifolium* – S, in a narrower sense; > *H. opacum* Torrey & A. Gray – S]

**Hypericum crux-andreae** (Linnaeus) Crantz, St. Andrew's Cross, St. Peter's-wort. Dry forests and woodlands, pine flatwoods. June-October. NY (Long Island) and NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to w. NC and n. GA, also north in the interior to c. TN, s. KY, c. AR, and se. OK. [= GW, K, W, WH, X, Y; = *H. fasciculatum* Michaux ex Willdenow – F; G; = *Ascyrum stans* – S, > *Ascyrum cuneifolium* Chapman – S]

**Hypericum densiflorum** Pursh, Mountain Bushy St. John's-wort. Bogs, streambanks, dry to moist forests, rock outcrops, moist forests, pine savannas. June-September. Sw. PA south to n. GA and c. AL in and near the Mountains; NJ south to SC in the Coastal Plain; s. GA west to TX in the Coastal Plain. The related *H. lobocarpum* Gattinger is more western, extending east to TN; the basis for attribution of *H. lobocarpum* to "Blue Ridge, N.C." by Small (1933) is unknown. [= RAB, C, G, GW, K, S, WH, WV, X, Z; > *H. densiflorum* Small – S; > *H. glomeratum* Small – S]

**Hypericum denticulatum** Walter, Coppery St.-John's-wort. Savannas, wet pine flatwoods, adjacent ditches, borrow scraps, blackwater stream shores. July-September. S. NJ south to e. GA (McIntosh County) (Sorrie 1998b) on the Coastal Plain; disjunct inland in c. and w. NC, sc. TN, and in s. AL. See discussion under *H. virgatum*. [= K, Q, S; = *H. denticulatum* var. denticulatum – RAB, C, F, G, Z; < *H. denticulatum* – GW (also see *H. virgatum*); = *H. denticulatum* var. denticulatum – X]

**Hypericum dolabriforme** Ventenat, Glade St.-John's-wort. Limestone glades and barrens. In nw. GA (Jones & Coile 1988) and e. TN (Chester, Woford, & Kral 1997); this species should be sought in sw. VA. [= C, F, G, K, S, V, X, Z; ]

**Hypericum ellipticum** Hooker, Pale St.-John's-wort. Swamp forests, wet places along streams. July-August. NL (Newfoundland) and NS south to c. TN, se. AL, and in the mountains to WV, NC (?), and ne. TN (Johnson County) (Chester, Woford, & Kral 1997), and NC (?). The documentation for C's attribution of *H. ellipticum* to NC is unknown. [= C, F, G, K, V, WV, X]
**HYPERICACEAE**

Hypericum erythreae (Spach) Steudel, Georgia St.-John's-wort, Sparse-leaved St.-John's-wort, Grit St.-John's-wort. Seepage bogs, roadside ditches. Apparently nearly endemic to the Altamaha Grit region of the GA Coastal Plain, extending to Beaufort County, SC (Allison, in press). [= Q, not yet keyed]

Hypericum fasciculatum Lamarck. Pebblek St.-John's-wort. Wet pine savannas, beaver ponds, upland depression ponds. May-September. E. NC south to s. FL, west to s. MS. [= RAB, GW, K, V, WH, X, Y, Z; < *H. fasciculatum* – S (also see *H. nitidum* and *H. chapmani*)]

Hypericum dolabriforme
Hypericum drummondii
Hypericum ellipticum
Hypericum erythreae
Hypericum exile
Hypericum fasciculatum

Hypericum fraseri Spach, Fraser's Marsh St.-John's-wort. Bogs, peaty wetlands. July-August. NL (Newfoundland) and QC west to MN, south to NY, PA, w. VA, ne. TN, w. NC, OH, n. IN, and NE. Closely related to *T. virginicum* and reduced to a variety of (or included in) that species by some authors. [= *Triadenum fraseri* (Spach) Gleason – C, G, K; = Hypericum virginicum Linnaeus var. fraseri (Spach) Fernald – F, WV; < *T. virginicum* – W, Z]

Hypericum frondosum Michaux. Rock outcrops and rocky woodland. Late May-July. This species is native and widespread as far east as e. TN (Chester, Wofford, & Kral 1997), GA, and FL. [= C, F, G, K, V, WH, Y, Z; = *H. aureum* Bartram – S; = *H. splendens* Small – S]

Hypericum graveolens Buckley, Mountain St.-John's-wort. Grassy balds, grassy openings, forests, at high elevations (1200 m or more). July-August. Nw. NC and ne. TN south to sw. NC, a Southern Appalachian endemic. This and the related *H. Mitchellianum* (another narrow endemic to the Southern Appalachians) hybridize, forming local hybrid populations with intermediate characteristics (Culwell 1970). [= RAB, GW, K, S, W, X, Z]

Hypericum gymnanthum Engelmann & A. Gray, Clasping-leaf St.-John's-wort. Pine savannas, wet pine flatwoods, sinkhole ponds (Augusta and Rockingham counties, VA), other wet to moist habitats. June-September. S. NJ south to ne. FL, Panhandle FL, west to c. TX, and scattered inland in PA, WV, sc. TN, OH, IN, IL, MO, and c. KS; also disjunct in Guatemala (introduced?). [= RAB, C, F, G, GW, K, S, WH, X, Z]

Hypericum harperi R. Keller, Harper's St.-John's-wort. Clay-based Carolina bays, other upland depression ponds, with *Taxodium ascendens*. July-September. E. and c. SC south to sw. GA and e. Panhandle FL. *H. harperi* should be sought in sc. and se. NC, where it may well occur. This species has generally been considered a part of *H. denticulatum* or *H. virgatum*, but Webb (1980) makes a convincing argument for its recognition, including the ecological differentiation and absence of intermediates or hybrids when growing in proximity to *H. denticulatum*. See *H. virgatum* for additional discussion. [= Q, WH, X; < *H. denticulatum* var. acutifolium – RAB, Z; < *H. denticulatum* – GW; < *H. harperi* – K; < *H. acutifolium* – S]

Hypericum hypericoides (Linnaeus) Crantz, St. Andrew's Cross. Dry forests and woodlands. May-August. NJ, w. VA, c. KY, se. MO, and c. OK, south to s. FL and e. TX; also in the West Indies, Mexico, and Central America. [= RAB, C, GW, V, W, WH, Y, Z; > *Ascyrum hypericoides* Linnaeus var. hypericoides – F, G; > *Ascyrum hypericoides* Linnaeus var. oblongifolium (Spach) Fernald – F, G; = *H. hypericoides* ssp. hypericoides – K, X; > *Ascyrum hypericoides* Linnaeus – S; > *Ascyrum linifolium* Spach – S]

HYPERICACEAE

Hypericum lobocarpum Gattinger. Streambanks, river bottoms, pinelands. C. TN (Chester, Wofford, & Kral 1997) and MS west to s. IL, se. OK, e. TX; credited to SC by Robson (1996), based on specimens debated and dismissed by Adams (1973). Late May-September. [= C, K, S, V, X, Z; = H. densiflorum var. lobocarpum (Gattinger) Svenson – F, G; < H. densiflorum – GW] {not yet keyed}

Hypericum mitchellianum Rydberg, Blue Ridge St.-John's-wort. Grassy balds, grassy openings, forests, seepages, at moderate to high elevations (generally at 1000-1900 m or more). July-August. W. VA, e. WV, and e. TN south to sw. NC, a Southern Appalachian endemic. Robson (2006) interprets this as a hybrid of H. graveolens and H. punctatum but offers no evidence other than its general morphological intermediacy. [= RAB, C, F, G, GW, K, S, W, WH, Z; = H. mitchellianum Rydberg, pro sp. – X]

Hypericum munitum Linnaeus var. latisepalum Fernald, Southern Dwarf St.-John's-wort. Marshes and other wet habitats. June-October. Se. SC south to peninsular FL, to TX (and, according to F, north to s. NJ). Hybrids with H. canadense have been called H. ×dissimulatum Bicknell (pro sp.). [= F; < H. munitum – RAB, G, GW, K, S, W, WH, WV, Z; = H. munitum ssp. latisepalum (Fernald) N. Robson – X]

Hypericum myrtifolium Lamarck, Myrtle-leaf St.-John's-wort. Ponds. Small (1933) reports this species from SC; this distribution is now documented by a specimen from Jasper Co., SC (P. McMillan, pers. comm.). Se. SC south to s. FL, west to se. MS, a Southeastern Coastal Plain endemic. [= GW, K, S, V, WH, X, Y, Z]

Hypericum pseudomaculatum Bush. Wet, moist, or dry forests. June-September. SC south to Panhandle FL, west to TX, north in the interior to c. TN, c. IL, s. MO, and c. OK. [records east of the Ozarks need to be studied more carefully] [= RAB, C, G, K, S, X, Z; = H. punctatum Lamarr var. pseudomaculatum (Bush) Fernald – F; < H. punctatum Lamarr – WH]

**Hypericum radfordiorum** Weakly ex J.R. Allison, Radfords' St. John's-wort, Brushy Mountain St. John's-wort. Shallow circumneutral soil mats of granitic domes in the Brushy Mountains. Apparently endemic to the Brushy Mountains of Alexander and Wilkes counties, NC. This taxon, included in *H. denticulatum* var. *acutifolium* by Webb (1980), differs from typical *H. virgatum* in being profusely branched from the medial and upper nodes (rather than being little if at all branched, and then only from the uppermost nodes), in having leaves with acuminate (rather than acute to obtuse) apices, and electrophoretically (Webb 1980). Additionally, these plants have numerous bracteal leaves along the inflorescence branches (vs. few or none), the punctate glands of the foliage are large and oval, resembling those of *H. denticulatum* (vs. small and round), and the punctate glands are distributed on the lower leaf surface and stem (vs. lower leaf surface only). It may be notable that these same outcrops are phytogeographically interesting, with other disjunct and weakly differentiated races (see *Allium cuthbertii*). [=; < *H. denticulatum* (included in concept of *H. denticulatum* (= *H. denticulatum* var. *acutifolium*, *H. denticulatum* ssp. *acutifolium*) by most earlier authors]

**Hypericum stragulum** W.P. Adams & Robson, Low St. John’s-wort, Straggling St. John’s-wort. Dry rocky or sandy woodlands. May-August. MA (Nantucket Island), NY (Long Island), west to s. PA, s. IN, s. IL, c. MO, se. KS, and c. OK, south to ne. NC, c. SC, c. GA, n. AL, n. MS, n. LA, and c. TX. [= C, V, W, Z; = *H. stragulum* – RAB, misspelling; = Ascyrum hypericoides Linnaeus var. multicaule (Michaux ex Willdenow) Fernald – F, G, WV; = *H. hypericoides* (Linnaeus) Crantz ssp. multicaele (Michaux ex Willdenow) Robson – K, X]

**Hypericum tenuifolium** Pursh, Sandhill St.-John’s-wort. Pine flatwoods, pine savannas, sandhills. June-September. Se. NC south to c. peninsular FL; Panhandle FL and se. AL. Robson (1996) indicates that the older name *H. tenuifolium* Pursh has now been adequately shown to apply to this taxon. [= X; = *H. reductum* (Svenson) W.P. Adams – RAB, GW, K, V, WH, Y, Z; < *H. aspalathoides* Willdenow – S (also including *H. brachyphyllum*)]

**Hypericum tetrapetalum** Lamarck. Wet pinelands and in depressional wetlands (open or dominated by *Taxodium ascendens*). E. GA (within a few counties of se. SC), south to s. FL, west to Panhandle FL. [= GW, K, V, WH, X, Y; = Ascyrum tetrapetalum (Lamarck) Vail – S]

**Hypericum tubulosum** Walter, Southern Marsh St.-John's-wort. Bogs, peaty wetlands, drawdown sloughs along rivers, drawdown shorelines along man-made reservoirs. August-September. Se. VA south to Panhandle FL, west to LA, and north in the interior to se. and c. TN, s. IL and s. OH. [= RAB; = Triadenum tubulosum (Walter) Gleason – C, G, GW, K, WH, Z; = Hypericum tubulosum Walter var. tubulosum – F; = *T. longifolium* Small – S]

**Hypericum virgatum** Lamarck, Strict St. John’s-wort. Woodlands, rock outcrops, woodland borders. Late June-September. MD west to s. OH, s. IN, and s. IL, south to c. NC, c. SC, sw. GA, Panhandle FL, s. MS, and se. LA. Though treated by most recent authors as a variety of *H. denticulatum*, *H. virgatum* is better considered as a distinct species. Webb (1980) recognized *H. harperi* as a separate species (it had previously been considered a part of *H. virgatum*), and continued to recognize this taxon as a variety of *H. denticulatum*. However, based on the nature of the punctate glands, size of seeds, inland distribution, etc., it appears that *H. virgatum* is more distantly related to *H. denticulatum* and *H. harperi* than they are to one another; recognition at the species level is warranted for *H. virgatum*. As pointed out by Webb, *H. denticulatum* is primarily tetraploid (n = 24), while *H. virgatum* and *H. harperi* are (as far as is known) strictly diploid. Additionally, the aberrant populations from granitic outcrops in the Brushy Mountains of Alexander and Wilkes counties, NC referred by Webb (1980) to this taxon are distinct, and more closely allied to *H. denticulatum* and *H. harperi*; see *Hypericum radfordiorum* for additional discussion. [= K, Q; < *H. denticulatum*

Hypericum virginicum Linnaeus, Common Marsh St.-John's-wort. Bogs, peaty wetlands. July-September. NS west to OH and s. ON, south to s. FL and MS, mostly on the Coastal Plain but scattered inland. [= RAB; = Triadenum virginicum (Linnaeus) Rafinesque – C, G, GW, K, S, WH; = Hypericum virginicum Linnaeus – RAB; = Hypericum virginicum var. virginicum – F, WV; < T. virginicum – W, Z (also see T. fraseri)]

Hypericum walteri J.G. Gmelin, Walter’s Marsh St.-John’s-wort. Swamp forests and marshes. August-September. MD south to n. peninsular FL, west to e. TX, and north in the interior to s. MO, s. IL, and OH. [= RAB; = Triadenum walteri (J.G. Gmelin) Gleason – C, G, GW, K, W, WH; = Hypericum tubulosum Walter var. walteri (J.G. Gmelin) Lott – F, WV; = T. petiolatum (Walter) Britton – S]

215. GERANIACEAE A.L. de Jussieu 1789 (Geranium Family) [in GERANIALES]

A family of about 5-11 genera and 700-835 species, herbs and shrubs, mostly temperate. References: Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007).

1 Leaves simple, deeply lobed but not divided............................................................................................................................................. Erodium
1 Leaves pinnately cleft or compound; fertile stamens 5, staminodia 5........................................................................................................ Erodium

Erodium L’Héritier in Aiton 1789 (Stork's-bill, Filaree)

1 Leaves simple, deeply lobed but not divided............................................................................................................................................. E. texanum
1 Leaves pinnately cleft or compound; fertile stamens 5, staminodia 5........................................................................................................ E. texanum

* Erodium texanum A. Gray, Texas Stork’s-bill. Cp (SC): waste areas near wool-combing mill; rare, perhaps merely a waif, native of sc. and sw. United States. [= K]

Geranium Linnaeus 1753 (Geranium, Crane’s-bill)

A genus of about 300-430 species, herbs, mainly temperate. House plants called ‘geranium’ are members of the genus Pelargonium. References: Aedo, Aldasoro, & Navarro (1998); Yeo (1984); Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007).

1 Petals 12-18 mm long; perennial, from a stout rhizome; anthers > 2 mm long; [subgenus Geranium, section Geranium] ........... G. maculatum
1 Petals 2-13 mm long; annual or biennial, from a taproot; anthers < 1 mm long.
2 Leaves dissected, but not compound, all segments interconnected by leaf tissue; petals 2-10 mm long; [collectively common and widespread in our area].
3 Sepals blunt or acute, or terminating in a minute callus tip; [subgenus Robertium, section Batrachioidea].
4 Mericarps glabrous, reticulately ridged; stem pubescence an admixture of long eglandular hairs (1.0-1.7 mm long) and short (< 0.5 mm long) gland-tipped and eglandular hairs; stamens (all 10) fertile (note that anthers may fall readily) ....................................................... G. molle
GERANIACEAE

4 Mericarps appressed pubescent, not ridged; stem pubescence of short (< 0.3 mm long), gland-tipped and eglandular hairs; stamens partly sterile (the inner 5 fertile, the outer 5 lacking anthers). ...................................................... G. pusillum

3 Sepals awned or subulate, the subulate awn 0.7-3 mm long.

5 Mature pedicels < 1.5× as long as the calyx.

6 Mericarps with spreading hairs about 0.5 mm long, these often gland-tipped; [subgenus Geranium, section Dissecta] .............................................................................................................. G. dissectum

6 Mericarps with long appressed hairs about 1 mm long, these not gland-tipped; [subgenus Geranium, section Geranium].

7 Inflorescence diffusely corymbiform (because of long upper internodes), mostly 4-12-flowered; pubescence of stem mostly < 0.5 mm long ........................................................................................................ G. carolinianum var. carolinianum

7 Inflorescence a compact corymb (because of notably short upper internodes), mostly 5-25-flowered; pubescence of stem mostly > 0.75 mm long ........................................................................................................ G. carolinianum var. confertiflorum

5 Mature pedicels > 2× as long as the calyx; [subgenus Geranium, section Geranium].

8 Pedicels spreading pubescent, the hairs not glandular; mature stylar beak 0.5-1.5 mm long

9 Peduncles bearing a single flower; seed reticulate .......................................................... [G. sibiricum]

9 Peduncles mostly with 2 flowers; seed nearly smooth to very finely reticulate .......................................................... G. thunbergii

8 Pedicels either retrorse-striose or glandular-villosus; mature stylar beak 3-5 mm long.

10 Pedicels glandular-villosus .............................................................................................................. G. bicknellii

10 Pedicels retrorse-striose .............................................................................................................. G. columbinum

Geranium bicknellii Britton, Northern Cranebill, Bicknell’s Crane’s-bill. Mt (WV): open woods and clearings; uncommon. July-September. NL (Newfoundland) and AK south to PA, WV, c. TN, IN, IL, MO, CO, UT, and CA. [= C, G, K, W; > G. bicknellii var. bicknellii – F]

Geranium carolinianum Linnaeus var. confertiflorum Fernald, Northern Carolina Crane’s-bill. Mt (NC, VA), Pd (VA), {DE}: fields, roadsides, lawns, gardens, disturbed areas; common. March-June (and sometimes later). ME and MN, south to DE and MO, and in the mountains to w. NC and e. TN. [= C, F, G; < G. carolinianum – RAB, S, W; < G. carolinianum var. carolinianum – K]

* Geranium robertianum Linnaeus, Herb Robert. Mt (VA, WV), Pd (DE): rocky woodlands, especially over calcareous rocks; uncommon (rare in VA and WV). June-October. Circumpolar, ranging south in North America to w. VA, nc. TN (Chester, Wofford, & Kral 1997), OH, IN, and IL. Considered by C and G to be introduced in North America, but apparently native. [= C, F, G, K, W, WV]

* Geranium ibericum Cavanilles, Iberian Crane’s-bill. Mt (NC): rare, spread from horticultural use, native of Europe. Recently found in Great Smoky Mountains National Park, in both NC and TN (K. Langdon, pers. comm.). [= K; ? G. nepalense – C] {not yet keyed}

* Geranium sanguineum Linnaeus, Blood-red Crane’s-bill. Mt (NC): roadbank, rare, probably persistent or spread from cultivation. [= C, F, G, K] {not yet keyed; add to synonymy}

* Geranium sibiricum Linnaeus, native to Asia, is naturalized south to s. PA (Rhydas & Klein 1993) and is likely to occur in at least the northern part of our area. [= C, F, K]

219. LYTHRACEAE J. St.-Hilaire 1805 (Loosestrife Family) [in MYRTALES]

A family of about 27-35 genera and about 600 species, herbs, shrubs, and trees, primarily tropical (a few warm temperate). References: Graham (1975) = Z; Graham in Kubitzki, Bayer, & Stevens (2007). Keys adapted, in large part, from Z. [including PUNICACEAE and TRAPACEAE]
**LYTHRACEAE**

1 Plant woody or suffrutescent, a shrub or a small tree 1-10 m tall; petals present, showy, 8-20 mm long.
2 Aquatic shrubs with arching suffrutescent or woody stems; leaves opposite or whorled; [native] .............................................. Decodon
3 Terrestrial shrubs or small trees with erect woody stems; leaves alternate to subopposite; [aliens cultivated and sometimes persistent].
4 Flowers in many-flowered terminal or axillary panicles; fruit a loculicidal capsule ................................................................. Lagerstroemia
5 Flowers solitary or several in terminal or axillary clusters; fruit a leathery berry (pomegranate) ................................................... [Punica]
6 Plant not woody, an herb 0.1-1.2 m tall; petals absent or present, inappositive or showy, 1-10 mm long.
7 Fruit with 2-4 prominent spines; leaves coarsely toothed ............................................................... Trapa
8 Fruit not spinose; leaves entire.
9 Stems pubescent.
10 Floral tube (hypanthium) swollen obliquely at its base; capsule dehiscing longitudinally along the upper surface .................. Cuphea
11 Floral tube (hypanthium) symmetrical; capsule dehiscing sepctically at the apex ............................................................... Lythrum
12 Floral tube cylindric to turbinate, about 2× as long as wide ............................................................... Lythrum
13 Floral tube campanulate to globose, about 1× long as wide.
14 Flowers or fruits (1-) 3-10 in the leaf axils (at least some axils with 2 or more flowers or fruits on a given plant) ........... Ammannia
15 Flowers or fruits solitary in the leaf axils (never > 1 per axil).
16 Capsule indehiscent; petals 0; sepals 4, broadly triangular, lacking intersepalary appendages; seeds spatulate or oblanceolate, about 1 mm long, minutely granular on one face and smooth on the other ............................................................... Didiplis
17 Capsule dehiscing septicidally; petals 4; sepals 4 (-6), triangular, with intersepalary appendages of size about equal to the calyx lobes; seeds hemispheric, about 0.3 mm long, the surface very finely reticulate ................................................... Rotala

**Ammannia** Linnaeus 1753 (Toothcup)

1 Style exerted (when in fruit), filiform, 1.5-3.0 mm long (equal to or longer than the ovary); calyx lobes triangular, with acute apices; petals 4 .............................................. W, WH, Y, Z
2 West to TX (mostly on the Coastal Plain), and also in the West Indies, Yucatan, Central America, and South America. All plants south to TX and Mexico. [= GW, K2, Y, Z] {not yet keyed}

2 Style included (when in fruit), thick, 0.5-1.0 mm long (much shorter than the ovary); calyx lobes obtuse, often with the apices mucronate; petals 0, 1, or 4, pale pink to white, to 1 mm long and 1 mm wide. .............................................. A. latifolia
1 Style exerted (when in fruit), filiform, 1.5-3.0 mm long (equal to or longer than the ovary); calyx lobes triangular, with acute apices; petals 4 (-5), deep rose-purple or pale lavender, ca. 2 mm long and 2 mm wide.
2 Inflorescence usually a short- or long-pedunculate cyme (sometimes reduced); flowers usually > 3 per axil; petals deep rose-purple; fruits 3.5-5 mm in diameter ............................................................... A. coccinea
3 Flowers solitary or several in terminal or axillary clusters; fruit a leathery berry (pomegranate) ...................................................[Punica]
4 Fruit not spinose; leaves entire.
5 Leaves whorled (at least in part); pedicels > 10 mm long; [flatwoods of FL Panhandle] ........................................................... C. aspera
1 Leaves opposite (none whorled); pedicels < 3 mm long; [collectively widespread].

2 Floral tube green, 4.5-6 mm long, glabrous inside; stamens much shorter than the floral tube; petioles to 8 mm long, often very short....................

........................................................................................................................................................................................................

C. carthagenensis

2 Floral tube purple-green, 6-10 mm long, villous inside; stamens equal to or exceeding the the floral tube; petioles to 20 mm long................

........................................................................................................................................................................................................

C. viscosissima

Cuphea aspera Chapman, Apalachicola Waxweed. Flatwoods. Endemic to the FL Panhandle (Franklin, Gulf, and Calhoun counties). [= K, WH, Z; = Parsonsia lythroides Small – S]

* Cuphea carthagenensis (Jacquin) J.F. Macbride, Colombian Waxweed. Marshes, ditches, floodplain forests, wet hammocks, other wet places; native of South America. June-September. [= GW, K, WH, Z; = C. carthagenensis – RAB (a misspelling); = Parsonsia balsamona (Chamisso & Schlechtendahl) Standley – S]

* Cuphea procumbens Gómez Ortega is reported for NC by Small (1933). Graham (1975) considers this Mexican species to be represented in se. United States only by "garden escapes that do not persist." [= K, Z; = Parsonsia procumbens (Gómez Ortega) Heller – S] {not keyed; not mapped}

Cuphea viscosissima Jacquin. Dry or wet places. July-October. NH west to IA and KS, south to e. GA, LA, and e. OK. [= RAB, C, GW, K, W, WV, Z; = C. petiolata (Linnaeus) Koehne – F; G; = Parsonsia petiolata (Linnaeus) Rusby – S]

Decodon J.F. Gmelin 1791 (Water-oleander, Water-willow)

Decodon verticillatus (Linnaeus) Elliott, Water-oleander, Water-willow, Swamp Loosestrife, Peatweed. Natural lakes, limesink ponds, peatlands, peaty swamps, not known in the Piedmont or Mountains of NC or SC, but scattered in the Ridge and Valley of VA. July-September. NS, ON, and MN south to e. peninsular FL and e. TX. The lower stems are spongy in texture. [= RAB, GW, K, S, WH, WV, Z; > D. verticillatus var. verticillatus – C, F, G; > D. verticillatus var. laevigatus Torrey & Gray – C, F, G]

Didiplis Rafinesque 1833 (Water-purslane)

Lagerstroemia Linnaeus 1759 (Crape-myrtle)

Lythrum Linnaeus 1753 (Loosestrife)

1 Flowers numerous in terminal spike-like thyrses; stamens usually 12; leaves opposite or whorled.................................................. L. salicaria

1 Flowers solitary or paired in axils; stamens usually (4-) 6; leaves opposite or alternate.---------------------------L. salicaria

2 Annual; flowers present in nodes more-or-less throughout the plant; flowers homostylyous, all alike, the stamens always included ..........

........................................................................................................................................................................................................... L. hyssopifolia
LYTHRACEAE

2 Perennial by basal stoloniferous outshoots; flowers present only at upper nodes; flowers heterostyloous (either with an exerted style and included stamens, or vice versa).

3 Leaves opposite throughout, mostly shorter than to as long as the internodes, 1-4 mm wide......................L. lineare

3 Leaves opposite below, alternate above, mostly longer than the internodes, 2-14 mm wide.

4 Floral tube 3-4 mm long; petals 2-3 mm long; calyx appendages about the same length as the calyx lobes; branch leaves abruptly and definitely reduced in size relative to the stem leaves, and widely spaced; [of sw. GA southward]..........................L. curtissii

4 Floral tube 5-6 mm long; petals 5-6 mm long; calyx appendages about 2× as long as the calyx lobes; branch leaves gradually reduced relative to the stem leaves, dense and overlapping; [collectively widespread in our area].

5 Leaves ovate to lanceolate, widest at a point 1/6 to 1/2 of the way from the base to the apex, the base rounded to subcordate; stems mostly slender, to 8 dm tall; bracteoles mostly at the base of the pedicel ......................................................L. alatum

5 Leaves lanceolate to linear-lanceolate, widest at a point 1/3 to 2/3 of the way from the base to the apex, the base cuneate, often narrowly so; stems stout, to 13 dm tall; bracteoles mostly on the upper pedicel, immediately below the floral tube ..............................................L. lanceolatum

Lythrum curtissii Fernald, Curtiss's Loosestrife. Calcareous swamps, seepage areas. June-early September. Sw. GA south to Panhandle FL, and disjunct in ne. FL; the report from Emanuel County, GA (Jones & Coile 1988) is in error. [= GW, K, S, WH, Z]

Lythrum hyssopifolia Linnaeus, Annual Loosestrife. Salt marshes, other wet soils; probably only adventive from Eurasia, but sometimes interpreted as native from ME to NJ. June-September. [= C, G, K]

Lythrum lanceolatum Elliott, Southern Winged Loosestrife. Moist to wet places. May-September. Se. VA, se. NC, SC, GA, AL, MS, n. AR, and OK south to s. FL, s. TX, and in the West Indies. Although Graham (1975) argues that L. lanceolatum should be reduced to a variety of L. alatum, her evidence can also be interpreted as warranting specific status. [= RAB, F, S; = L. alatum Pursh var. lanceolatum (Elliott) Torrey & A. Gray ex Rothrock – C, G, GW, K, WH, Z; = L. alatum ssp. lanceolatum (Elliott) A. Haines – Y]

Punica Linnaeus 1753 (Pomegranate)

* Punica granatum Linnaeus, Pomegranate. Suburban areas, cultivated and at least persistent; native of Mediterranean Europe. Reported as cultivated on Hatteras Island (Dare County, NC) (Brown 1959). This species has been cultivated in the Old World at least since the 3rd millennium B.C. [= K, S]

Rotala Linnaeus 1771 (Toothcup)

A genus of about 44 species, wetland herbs, of temperate to tropical areas, closely related to Didiplis. References: Graham (1975)=Z; Graham in Kubitzki, Bayer, & Stevens (2007).

1 Leaves linear to oblanceolate, > 3× as long as wide..........................................................R. ramosior

1 Leaves broadly elliptical to orbicular, < 1.5× as long as wide...........................................R. rotundifolia

Rotala ramosior (Linnaeus) Koehne, Toothcup. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): marshes, ditches, exposed drawdown muds and silts; common (uncommon in VA Mountains). June-October. VT, NY, ON, MI, WI, MN, SD, MT, and BC, south to s. FL, TX, AZ, CA, and south through Mexico to Central America and , South
LYTHRACEAE

Flowers (3-)4(-7)-merous, the petals yellow, pink, or white (or absent); fruits lacking uncinate trichomes; leaves alternate (rarely opposite). *Rotala rotundifolia* (Buchanan-Hamilton) Koehne, Dwarf Rotala, Roundleaf Toothcup. Disturbed wet areas, perhaps just a waif; native of Asia. March-August. [= K2, WH]

*Trapa* Linnaeus 1753 (European Water-chestnut)

A genus of 1 highly polymorphic or up to 45 more narrowly defined species, annual aquatic herbs, native of the Old World. Often placed in a monogenic family, Trapaceae, but *Trapa* is deeply embedded phylogenetically in Lythraceae (Graham, Diazgranados, & Barber 2011). References: Angiosperm Phylogeny Group (2003, 2009); Graham in Kubitzki, Bayer, & Stevens (2007).

220. ONAGRACEAE A.L. de Jussieu 1789 (Evening-primrose Family) [in MYRTALES]

A family of about 18 genera and 655 species, herbs, shrubs, and rarely trees, cosmopolitan (especially of temperate and subtropical America). References: Wagner, Hoch, & Raven (2007); Munz (1965)=X; Crisci et al. (1990).

1 Flowers 2-merous, the petals white; fruits with uncinate trichomes; leaves opposite, decussate, borne spreading at right angles to the stem, mostly ovate, on petioles mostly 0.5-8 cm long; [subfamily *Onagroideae*; tribe *Circeae*] .......................................................................................................................... 2. **Circeae**

   1 Flowers (3-)4 (-7)-merous, the petals yellow, pink, or white (or absent); fruits lacking uncinate trichomes; leaves alternate (rarely opposite), not decussate, usually ascending or appressed (rarely spreading at right angles to the stem), mostly lanceolate, mostly sessile or subsessile. 2 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; [subfamily *Onagroideae*; tribe *Onagreae*] ............................................................................... 5. **Oenothera**

   1 Leaves opposite; plants creeping (rooting at the nodes); [section *Dantia*] ................................................................................................................................. Key A

   1 Leaves alternate; plants erect or ascending (not rooting at the nodes), or creeping (rooting at the nodes)

   2 Stamens 8-14; sepals 4-7; petals 4-7; [of various habits, including annual and perennial herbs and shrubs, variously erect, ascending, creeping, or forming floating mats] ........................................................................ Key B

   2 Stamens 4; sepals 4; petals 0-4; [perennial herbs, with erect ascending flowering stems] ........................................................................................................... Key C

   3 Seeds not comose (gravity-dispersed); petals yellow or absent (rarely white or pink).

   4 Calyx tube not extended beyond the summit of the ovary; sepals persistent on the capsule (rarely deciduous); stamens 4, 8, or 10-14; petals yellow or absent; [primarily of wetlands]; [subfamily *Ludwigioideae*] ........................................................................................................ 1. **Ludwigia**

   5 Calyx tube extended beyond the summit of the ovary; sepals deciduous; stamens 8; petals yellow (rarely pink or white); [primarily of uplands]; [subfamily *Onagroideae*; tribe *Onagreae*] ........................................................................................................ 5. **Oenothera**

I. **Ludwigia** Linnaeus 1753 (Seedbox, Water-primrose, Water-purslane)

**Identification notes:** Many natural hybrids are known, not necessarily in our area. Hybrids are generally recognizable from their intermediate morphology and usual association with their two parents. However some hybrids resemble one parent much more than the other, and some hybrids are found in populations independent (and even disjunct) from one or both parents. Allopolyploidy may have had a major role in the evolution of this genus, especially section *Microcarpium*, which has a majority of polyploid species.

1 Leaves opposite; plants creeping (rooting at the nodes); [section *Dantia*] ................................................................................................................................. Key A

1 Leaves alternate; plants erect or ascending (not rooting at the nodes), or creeping (rooting at the nodes)

2 Stamens 8-14; sepals 4-7; petals 4-7; [of various habits, including annual and perennial herbs and shrubs, variously erect, ascending, creeping, or forming floating mats] ........................................................................ Key B

2 Stamens 4; sepals 4; petals 0-4; [perennial herbs, with erect ascending flowering stems] ........................................................................................................... Key C
Key A – Ludwigia with opposite leaves

1 Pedicels of flowers and fruits 5-35 mm long.
2 Petals 7-11 mm long; pedicels of capsules 15-35 mm long, longer than the leaves .............................................................. L. arcuata
3 Petals 4-5 mm long; pedicels of capsules 5-16 mm long, shorter than to equaling the leaves ...................................................... L. brevipes

Key B – Ludwigia with alternate leaves, 8-14 stamens, 4-7 sepals, and 4-7 petals

1 Pedicels of flowers and fruits 0-3 mm long.
2 Sepals 5 (-7); stamens 10 (-14); seeds in 1 vertical series in each locule, loosely embraced or embedded in endocarp tissue.
3 Sepals 4; stamens 8; seeds in 2-several vertical series in each locule, free of endocarp tissue.
4 Petals 0; floral tubes and capsules with 4 longitudinal dark green bands; bractlets (borne at or near base of floral tube) absent or present, if present then 0-1 mm long .............................................................. L. palustris
5 Petals 4; floral tubes and capsules lacking green banding; bractlets (borne at or near base of floral tube) present, 2-4 mm long ........ L. repens

Key C – Ludwigia with alternate leaves, 4 stamens, 4 sepals, and 0-4 petals

1 Pedicels 2-15 mm long; capsules subglobose to spheric or cubic, about as long as wide, box-like, 4-angled, dehiscence by an apical pore (later sometimes also irregularly loculicidal); petals present, 4-15 mm long, persistent or caducous; roots fascicled, fusiform, tuberous; plants lacking basal, stoloniform shoots; [section Ludwigia].
2 Leaves cuneate at base; pedicels 2-5 mm long; nectary discs at base of style flatish, inconspicuous; [widespread in our area, in a wide variety of habitats] .............................................................................................................................................. L. alternifolia
3 Leaves rounded or truncate at base; pedicels 4-15 mm long; nectary discs at base of style domed, prominent; [nearly restricted to the Coastal Plain, primarily of pinelands].
4 Styles (at least the lower portions) decumbent, creeping, or floating in mats (the flowering stems more-or-less erect in L. grandiflora and L. hexapetala); floral tube much shorter than the pedicel; seeds embedded in the woody endocarp; [section Oligoxypomum].
5 Flowering stems decumbent, floating, or creeping; stem and leaves glabrous or glabrescent; petals mostly 1-1.5 cm long; anthers 1-1.7 mm long ...................................................................................................................................................................... L. leptocarpa
6 Flowering stems more-or-less erect; stem and leaves sparsely to densely pubescent with long soft hairs; petals (1.2-) 1.6-3 cm long; anthers 2.5-3.5 mm long.
7 Sepals 5-7 mm long; lateral and marginal veins obscure on lower leaf surface; seeds reddish brown; capsules obpyramidal, tapering through most or all of their length, with a shallow longitudinal groove on each face; anthers 1.1-1.6 mm long ........ L. grandiflora ssp. grandiflora
8 Sepals 4; lateral and marginal veins parallel-sided through most of their length, not grooved; anthers 0.5-1.1 mm long .............................................................. L. macrocarpon

5 Petals 0; floral tubes and capsules with 4 longitudinal dark green bands; bractlets (borne at or near base of floral tube) absent or present, if present then 0-1 mm long .............................................................................................................................................. L. hexapetala

6 Sepals 2.3-4 mm long, acuminate, the surfaces densely and minutely papillose, the papillae 0.02-0.05 mm long and appressed; capsules 5-8.5 (-10) mm long, 2-4 (-5) mm in diameter; pedicels 0-0.4 mm long; seed surface cells elongate parallel to the seed length (as seen at 20× or more); anthers 1.1-1.6 mm long ...................................................................................................................................................... L. linearis var. linearis
Ludwigia alata

Elliott, Winged Seedbox.  Cp (GA, NC, SC, VA):  interdune ponds, freshwater to slightly brackish (oligohaline) marshes; rare.  June-September.  Se.  VA south to s.  FL, west to se.  LA; disjunct in Jamaica.  This species is a hexaploid (n = 24).  One third of the genome of L.  alata is apparently derived from L.  microcarpa or its ancestor (Peng 1988).  [= RAB, C, F, G, K, U, Z; > L.  alata – GW (also see L.  lanceolata); > L.  alata – S; > L.  simulata Small – S]

Ludwigia alternifolia

Ludwigia brevipes (B.H.  Long ex Britton, A.  Braun, & Small) Elliott, Long Beach Seedbox.  Coastal Plain Water-primrose.  Cp (GA, SC, VA):  ponds, lakes, sluggish waters of ditches or swamps; rare.  May-September.  Se.  SC south to FL, west to TX; disjunct in MO, Guatemala, and in

Ludwigia brinkworthii (Michaux) Greuter & Burdet ssp.  brinkworthii, Showy Water-primrose.  Cp (GA, SC):  ponds, lakes, sluggish waters of ditches or swamps; rare.  May-September.  Se.  SC south to FL, west to TX; disjunct in MO, Guatemala, and in

Ludwigia brachycarpa (E.J.  Palmer & Steyermark – C, F; > L.  brachycarpa Small – S]

**Ludwigia grandiflora** (Michaux) Greuter & Burdet ssp. *hexapetala* (Hooker & Arnott) Nesom & Kartesz, Common Water-primrose. Cp (NC, SC), Pd (GA, NC), Mt* (VA*, WV*): ponds, lakes, sluggish waters of ditches or streams; uncommon (but often locally abundant) (rare in VA and WV). May-September. NC south to FL, west to OK and TX; also in CA, Europe, South America, Mexico; also introduced further north in North America. This taxon is decaploid (n = 40). See Zardini, Gu, and Raven (1991) and Nesom & Kartesz (2000) for additional information. [= Q; < L. uruguayensis (Cambessedes) Harra – RAB, C, GW, K; < Jussiaea uruguayensis Cambessedes – F, G, WV; > Jussiaea michauxiana Fernald – F; = L. hexapetala (Hooker & Arnott) Zardini, Gu, & Raven – U, V]

**Ludwigia lanceolata** Elliott, Lanceleaf Seedbox. Cp (GA, NC, SC): interdune ponds, open wet areas; rare (NC Rare). August-September. Se. NC south to c. peninsular FL, west to Panhandle FL. This species is tetraploid (n = 16). [= RAB, K, S, U, Z; < L. alata – GW]

**Ludwigia leptocarpa** (Nuttall) Harra, Water-willow. Cp (DE*, GA, NC, SC, VA), Pd (GA, VA), Mt (GA, WV): riverbanks, marshes, and ditches; common (uncommon in VA, rare in DE). June-September. VA south to c. peninsular FL, west to e. TX, north in the interior along the Mississippi and Ohio rivers to se. MO, s. IL, and w. WV; and in tropical America. [= RAB, C, GW, K, U, W; = Jussiaea leptocarpa Nuttall – F, G, S, WV]

**Ludwigia linearis** var. *linearis*, Eastern Narrowleaf Seedbox. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC): savannas; common (uncommon in DE). June-September. Var. *linearis* ranges from s. NJ south to c. peninsular FL, west to se. LA, extending inland to the Cumberland Plateau of nc. AL and c. TN. Var. *linearis* is here interpreted to be equivalent to Peng's subglabulose morph. Peng (1989) declines to recognize infraspecific taxa in *L. linearis*, but his discussion makes clear that 2 distinctive entities are present, as characterized by orientation of seed surface cells and characters of leaves, bracteoles, pedicels, sepals, stigmas, and styles (see key). The orientation of seed surface cells, recognized as a distinctive character in other difficult species pairs (such as *L. alata* and *L. lanceolata*) is the most reliable character separating the 2 varieties. This species is diploid (n = 8). [= < L. linearis – RAB, C, F, G, GW, K, S, U, W, Z]

**Ludwigia linearis** var. *puberula* Engelmann & A. Gray, Western Narrowleaf Seedbox. Cp (GA, NC, SC), Pd (GA, SC): savannas, interdunal swales; uncommon. June-September. Var. *puberula* ranges primarily from c. AL west to c. AR, south to e. TX, with intergradational material extending as far north and east as n. FL and e. NC. Var. *puberula* is here interpreted to include Peng's intermediate morph, densely strigillose morph, and completely glabrous morph (Peng 1989). As pointed out by Peng (1989), the glabrous morph is exactly like the densely strigillose morph except for the absence of pubescence. They often grow together, have essentially the same distribution, and may differ only at a single allele. Peng's intermediate morph is heterogeneous; some likely being truly intermediate between (and possibly hybrid derivatives of) the 2 varieties here recognized, while others clearly belong to var. *puberula* (based on surface cell orientation and floral characteristics) and merely have an amount of pubescence intermediate between the densely strigillose and completely glabrous morphs. [= < L. linearis – RAB, C, F, G, GW, K, S, U, W, Z]

**Ludwigia linifolia** Poiret, Flaxleaf Seedbox. Cp (GA, NC, SC), Pd (NC): limesink ponds (dolines) and *Taxodium ascendens* savannas; rare (NC Rare). June-September. Nc. NC south to s. FL, west to s. MS; disjunct in Tabasco, Mexico. This species is diploid (n = 8). [= RAB, GW, K, S, U, Z]

**Ludwigia microcarpa** Michaux, Small-fruited Seedbox. Cp (GA, SC, NC), Pd (GA, NC), Mt (GA): in circumneutral or alkaline soils of moist places, over calcareous rock, mafic rock, shell hash, or brackish sands, such as in maritime wet grasslands, savannas and adjacent ditches over coquina limestone ("marl"), and wet clay flats over diabase, often in roadside ditches; uncommon. July-Oct. November. Ne. NC south to s. FL, west to se. TX (Brown & Marcus 1998); disjunct inland on calcareous or mafic rocks in nc. NC, n. GA, n. AL, c. TN, and sc. MO; also in the Bahamas, Cuba, and Jamaica. This species is diploid (n = 8). [= RAB, F, GW, K, S, U, W, Z]

**Ludwigia pilosa** Walter, Hairy Seedbox. Cp (GA, NC, SC, VA), Pd (NC): ditches, wet places; common (rare in VA). June-October. Se. VA south to n. FL, west to se. TX, restricted to the Coastal Plain except for disjunct occurrences inland in NC, VA, and n. AL. This species is tetraploid (n = 16). \[= K, U, W, Z; < L. pilosa – RAB, C, F, G, GW, S (also see L. ravenii)]

**Ludwigia polyacarpa** Short & Peter. Pd (VA), Mt* (WV*): [habit]; rare. June-September; July-October. MA, CT, and w. VT west to s. ON, MI, WI, MN, and c. NE, south to c. VA, KY, s. IL, s. MO, and e. KS. This species is tetraploid (n = 16). \[= C, F, G, GW, K, S, U, Z]

**Ludwigia repens** Peng, Raven's Seedbox. Cp (NC, SC, VA): savannas, swamps, marshes, wet open places; rare. June-October. Se. VA south to ne. FL (no known records for GA), restricted to the Coastal Plain. For further information, see Peng (1984, 1988, 1989). This species is tetraploid (n = 16). \[= K, U, Z; < L. pilosa – RAB, C, F, G, GW, S (included within concept of L. pilosa by most earlier authors)]

**Ludwigia sphaerocarpa** Elliott, Globe-fruited Seedbox. Cp (DE, GA, NC, SC, VA), Pd (GA), Mt (VA): ditches, pools, and streams; uncommon (rare in VA). June-September. Se. VA south to s. FL, west to TX and n. Mexico, north in the interior to TN, MO, and OK; also in CA, Bermuda, and the West Indies. Reveal et al. (2003) propose the name *L. repens* for nomenclatural conservation with a conserved type; if this proposal is not accepted, *L. natans* Elliott will become the name of this species. \[= RAB, GW, K, U; = Ludwigia natans* Elliott – F, G; = Isnardia repens – S]

**Ludwigia spathulata** Torrey & A. Gray, Southern Water-purslane. Cp (GA, SC), Pd (GA): sinkhole ponds, cypress-gum ponds, depression meadows, boggy shores; rare. June-October. SC south to Panhandle FL and s. AL. \[= RAB, GW, K, U; = Isnardia spathulata (Torrey & A. Gray) Small – S]

**Ludwigia suffruticosa** Walter, Shrubby Seedbox. Cp (GA, NC, SC): periodically to seasonally flooded portions of limesink ponds (dolines) and clay-based Carolina bays; rare north of SC (NC Rare). June-September. Se. NC south to s. peninsular FL, west to Panhandle FL and se. AL. This species is tetraploid (n = 16). \[= RAB, GW, S, W, WV; = Ludwigia natans* Elliott – F, G; = Isnardia spathulata* (Torrey & A. Gray) Small – S; the leaf teeth are quite different.\]

**Ludwigia peruviana** Linnaeus, Primrose-willow. In s. GA (Jones & Coile 1988). Reported for NC (Kartesz 1999). All or part of the Southeastern distribution is as an alien species. \{investigate\} \[= GW, K, U; = Jussiaea peruviana Linnaeus – S\]

2. *Circaea* Linnaeus 1753 (Enchanter's-nightshade)

Identification notes: Sometimes confused in vegetative condition with *Phryma*; the leaf teeth are quite different.

1 Flowers opening before elongation of the raceme axis, more or less loosely spaced, borne on spreading pedicels; plants (12-) 20-100 cm tall; 
\[= C. alpina – RAB, F, G, GW, S (also see C. alpina var. alpina – C)]

1 Flowers opening after elongation of the race me axis, therefore clustered and corymbiform at the apex of the raceme, borne on erect or spreading pedicels; plants (12-) 20-100 cm tall; 
\[= C. canadensis ssp. canadensis – C. sterill]

1 Flowers opening before elongation of the raceme axis, more or less loosely spaced, borne on spreading pedicels; plants (12-) 20-100 cm tall; 
\[= C. alpina – RAB, F, G, GW, S, W, WV; = C. alpina var. alpina – C]*

**Circaea alpina** Linnaeus ssp. *alpina*, Alpine Enchanter's-nightshade. Mt (GA?, KY, NC, VA, WV), Ip (KY): moist organic soil at high elevations (especially in spruce-fir and northern hardwood forests), rocky seepages, in spray behind waterfalls, at dripping cliff bases; uncommon (rare in KY Interior low Plateau). June-September. *C. alpina* is treated by Z as a circumboreal complex of six subspecies. Ssp. *alpina* is itself circumboreal, in North America ranging from NL (Newfoundland) and NL (Labrador), west to AK, south to MD, w. NC, e. TN, n. GA (?), KY, n. IL, MN, MT, and WA, disjunct in montane sites southward in the w. United States, such as the Black Hills of SD, and isolated montane sites in CO, AZ, and NM. Another subspecies occurs in w. North America, and four subspecies occur in humid and montane parts of Asia. \[= K, U, X, Z; < C. alpina – RAB, F, G, GW, S, W, WV; = C. alpina var. alpina – C]

**Circaea canadensis** (Linnaeus) Hill ssp. *canadensis*, Canada Enchanter's-nightshade. Mt (GA, KY, NC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, KY, NC, VA), Ip (KY): mesic, nutrient-rich forests; common (rare in SC). June-August. NS and NB west to se. MB and ND, south to e. NC, e. SC, s. GA, LA, OK, and NE. The systematics of this taxon is controversial, and the best treatment is still unclear. Most recently, Boufford (2005) has treated the complex as 2 species, *C. canadensis* and *C.
Quadrisculata, the former with 2 subspecies, ssp. canadensis of eastern North America and ssp. quadrisculata of Asia. Previously, Boufford (1983) treated the complex as a circumboreal complex of 3 subspecies of C. lutetiana, including the North American ssp. canadensis (Linnaeus) Ascherson & Magnus, the primarily Asian ssp. quadrisculata (Maximowicz) Ascherson & Magnus, and the European ssp. lutetiana. Other authors have preferred varietal status for the 3 entities, full species status, no formal status at all (C. lutetiana as a polymorphic complex), or associating the more similar pair (North American and Asian) as 2 subspecies separate from the European at specific rank. Boufford (1983) and Averett & Boufford (1985) show convincingly that separate taxonomic status for the three entities is warranted, and that ssp. canadensis is more closely related to ssp. quadrisculata. The question of the appropriate taxonomic level remains. Boufford (1983) states that "although subspp. canadensis and quadrisculata are placed in C. lutetiana, this might not ultimately prove to be the best treatment." Later, flavonoid data showed strong differences between the three taxa, stronger than the differences between many of the other species in the genus (Averett & Boufford 1985). Morphologic differences between the three taxa are fairly subtle but appear to be consistent. The complicated synonymy is perhaps an example of a too-zealous attempt to have nomenclature reflect subtleties of relationship and evolutionary divergence, our understanding of which is unclear and changeable. [=U, Y; = C. lutetiana Linnaeus ssp. canadensis (Linnaeus) Ascherson & Magnus – RAB, K; W, X, Z; = C. lutetiana var. canadensis Linnaeus – C; = C. quadrisculata (Maximowicz) Franchet & Savatier var. canadensis (Linnaeus) Harra – G, WV; > C. canadensis var. canadensis – F; > C. canadensis var. virginiana Fernald – F; = C. latifolia Hill – S; = C. quadrisculata ssp. canadensis (Linnaeus) Löve & Löve]

Circarea ×sterilis Boufford, Hybrid Enchanter’s-nightshade. Mt (NC, VA, WV): mesic, nutrient-rich forests; rare. June-August. C. ×sterilis is reported to occur frequently in the absence of one or both of its parents (Z, Skvortsov 1979), and is therefore treated separately and keyed here. It ranges from NL (Newfoundland) west to ON and MN, south to w. NC, OH, and WI. It appears to be rare in our area, but should be sought more carefully. Recognition of C. canadensis (Linnaeus) Hill as distinct from C. lutetiana renders the hybrid binomial name C. ×intermedia inappropriate for North American plants, since it is the hybrid of C. alpina ssp. alpina and the European C. lutetiana. [= U, Y; = C. ×intermedia Ehrhart (pro sp.) – RAB, C, K; W, X, Z (but misapplied as to our material if C. canadensis is accepted as a species); > C. canadensis var. canadensis – F; misapplied; > C. canadensis var. virginiana Fernald – F; = C. canadensis (Linnaeus) Hill – G, WV, misapplied]

3. Chamerion Rafinesque ex Holub 1972 (Fireweed)

A genus of 8 species (9 taxa), herbs, of arctic, boreal, and temperate Northern Hemisphere. There is increasingly strong evidence for the recognition of this group of plants as a genus separate from Epilobium. References: Wagner, Hoch, & Raven (2007)=U; Mosquin (1966)=Z; Holub (1972)=Y; Munz (1965)=X.

Chamerion platyphyllum (Daniels) Löve & Löve, Great Willow-herb, Fireweed. Mt (NC, VA, WV), Pd (DE), Cpt (DE): grassy balds, road sides, disturbed areas; uncommon (rare in DE and NC). July-September. Chamerion platyphyllum has a circumboreal distribution; it is a member of a circumboreal complex, consisting of several related taxa that differ in chromosome number, a variety of morphological characters, and distribution. The tetraploid C. platyphyllum is generally more southern, extending south in North America to NJ, montane w. NC and ne. TN, n. IN, MN, SD, AZ, NM, and CA; it may be more appropriately treated as a variety or subspecies of C. angustifolium. The diploid Chamerion angustifolium (Linnaeus) Holub is arctic and boreal, extending south in North America to NB, QC, ON, alpine WY, and BC. The hexaploid is Chamerion danielsii D. Löve. [< Epilobium angustifolium – RAB, G, GW, W, WV; = E. angustifolium var. canescens A. Wood – C; >> E. angustifolium var. angustifolium – F, X; = E. angustifolium var. platyphyllum (Daniels) Fernald – F; = Chamerion angustifolium (Linnaeus) Holub ssp. circumvagum (Mosquin) Kartesz – K, V; = Chamaenerion angustifolium (Linnaeus) Scopoli – S; < Chamerion angustifolium (Linnaeus) Holub – Y; = E. angustifolium Linnaeus ssp. circumvagum Mosquin – Z]

4. Epilobium Linnaeus 1753 (Willow-herb) [also see Chamerion]

A genus of ca. 165 species (ca. 185 species), herbs, distributed primarily in boreal and alpine latitudes and elevations. All five of the species in our area reach or approach their southern limits in eastern North America in our area. All members of the genus is ur area are placed in section Epilobium. References: Wagner, Hoch, & Raven (2007)=U; Munz (1965)=X.

1 Stigma capitate; petals 2-8 mm long........................................................................................................................................................................... E. hirsutum
1 Stigma 4-cleft; petals 10-15 mm long........................................................................................................................................................................... E. leptophyllum
2 Leaves lanceolate, distinctly broader below the middle, flat, the larger generally at least 10 mm wide, toothed.
3 Principal leaves 3-7 cm long, with obscure marginal teeth, the apices merely acute; internodes (below the inflorescence) glabrous, glabrescent, or with pubescence scattered over the surface; mature coma (attached to plump seeds) brown (pale when immature); plants often strict or sparingly branched; seeds striate (with well-developed papillae arranged conspicuously in lines) .................. E. ciliatum ssp. ciliatum
3 Principal leaves 5-15 cm long, with conspicuous and often irregular marginal teeth, the apices acuminate to attenuate; internodes (below the inflorescence) with lines of pubescence (some internodes on a given plant sometimes with scattered pubescence or glabrous); mature coma cinnamon (attached to plump seeds) brown (pale when immature); plants generally well-branched, with a bushy habit; seeds papillose (the papillae sometimes forming weak lines) ......................................................... E. coloratum
4 Pubescence spreading........................................................................................................................................................................... E. strictum
4 Pubescence appressed, the upper leaf surface finely and rather densely pubescent .................................................................................. E. leptophyllum
**Epilobium ciliatum** Rafinesque *ssp. ciliatum*, American Willow-herb. Mt (NC, VA), Pd (VA): bogs, seeps, disturbed wet places (such as margins of logging roads); common (uncommon in VA, rare in NC). June-September. NL (Newfoundland) and NL (Labrador) west to AK, south to VA, w. NC, ne. TN, IN, IA, CA, TX, Mexico, Central America; disjunct in Chile and Argentina. [= K, U; < E. ciliatum – RAB, W; = E. ciliatum var. ciliatum – C; > E. ciliatum – F, X, in a narrower sense; > E. glandulosum Lehmann var. adenocaulon (Hausknecht) Fernald – F, W; > E. adenocaulon Hausknecht var. adenocaulon – G, Z]

**Epilobium coloratum** Biehler, Bronze Willow-herb, Eastern Willow-herb. Mt (GA, KY, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, VA), Ip (KY): seepages, moist open places; common (uncommon in KY Interior Low Plateau, rare in NC Coastal Plain). June-September. ME west to MN, south to NC, n. GA, AL, AR, and TX. There are some difficulties in distinguishing this species and *E. ciliatum* in our area. [=RAB, C, F, G, K, U, W, WV, Z]

**Epilobium leptophyllum** Rafinesque, Narrowleaf Willow-herb, American Marsh Willow-herb. Mt (NC, VA, WV): bogs, seepages, and boggy meadows; rare. July-October. NL (Newfoundland) and NT west to BC, south to w. NC, ne. TN, KS, ne. TX (Mink, Singhurst, & Holmes 2011b), and CA. [= RAB, C, F, G, K, U, W, WV, Z]

**Epilobium strictum** Muhlenberg ex Sprague, Northeastern Willow-herb, Downy Willow-herb, Soft Willow-herb. Marshes, bogs. QC west to MN, south to n. VA (?), OH, and n. IL. Reported for Arlington County, VA; the single record is regarded as questionable. [= C, F, G, K, U, Z]

---

**5. Oenothera** Linnaeus 1753 (Evening-primrose)

A genus of about 124 species, herbs, of America (especially temperate regions). This treatment provisional, with further revision likely, especially in the *O. fruticosa-O. tetragona-O. pilosella* complex. References: Wagner, Hoch, & Raven (2007)=U; Dietrich, Wagner, & Raven (1997)=Z; Dietrich & Wagner (1988)=Y; Munz (1965)=X; Straley (1977)=V. Keys adapted in part from those references. [also see Calypohluus]

1 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; []
2 Pedicels 2-4 mm long; fruit with a stipe at maturity; clumped or matted perennials from woody rhizomes or rootstocks; [of sandy habitats of SC and GA southward].
3 Clumped perennial; petals 4-10 mm long; body of the fruit 5-10 mm long; stipe of the fruit 0.5-4.5 mm long..........................**O. filipes**
4 Mat-forming perennial; petals 7-15 mm long; body of the fruit 8-15 mm long; stipe of the fruit 2-8 mm long..........................**O. sinuosa**
2 Pedicels 0-1 mm long; fruit without a stipe; annual, winter annual, or biennial; [collectively of various habitats and more widespread in our area].
4 Sepals 2.5-3.5 mm long; petals 1.5-3 mm long..........................**O. curtiflora**
4 Sepals 2.5-12 mm long; petals 2.5-9 mm long.
5 Sepals 2.5-8 mm long; leaves 0.3-2.5 cm wide, the largest nearly always > 1 cm wide; flowers 4-merous; fruits 4-angled; [primarily of the Mountains and Piedmont of NC, SC, and VA, extending to the Coastal Plain of GA and SC]..........................**O. gaura**
1 Fruit dehiscent; seeds (10-) 50-many per capsule, 0.3-2 mm long.
6 Ovary essentially terete; fruit terete or with 4 rounded ridges; stamens equal in length (except in *O. speciosa*).
7 Flowers white or pink; flower buds nodding; [section Hartmania]..........................**O. speciosa**
7 Flowers yellow; flower buds erect; [section Oenothera]
8 Fruit linear, nearly isodiametric through its length; seeds borne ascending in the locules, rounded or fusiform, more or less regularly pitted; [section Oenothera, subsection Raimannia].
9 Petals acute to rounded at the apex.
10 Inflorescence dense, with > 2 flowers per spike opening each day; leaves gray-green..........................[O. clevelandii]
10 Inflorescence lax, 1-2 flowers per spike opening on each day; leaves green..........................**O. curtisii**
9 Petals truncate to emarginate at the apex.
11 Nonflowering portion of stems stiff, densely strigillose or sometimes also villous; leaves gray-green, densely strigillose, usually subentire to shallowly dentate (rarely lorate); [in maritime situations].
12 Sepals 2.0-3.3 cm long; petals 2.5-4.5 cm long; stigma elevated above the anthers at anthesis; capsule 2.5-5.5 cm long; rosette leaves 5-14 cm long, 1-2 cm wide ..................................................**O. drummondii** ssp. drummondii
12 Sepals 0.3-1.1 cm long; petals 0.45-1.6 cm long; stigma surrounded by the anthers at anthesis; capsule 1.5-4.5 cm long; rosette leaves 4-8 cm long, 0.7-1.0 cm wide ..................................................**O. humifusa**
11 Nonflowering portion of stem not stiff, moderately to sparsely strigillose to sometimes densely villous, and also ± glandular puberulent; leaves green, sparsely to moderately strigillose and usually villous, deeply lobed to dentate (rarely some of them subentire); [in inland disturbed situations].
13 Petals 2.5-4 cm long; style 4.7-5 cm long; stigma lobes well elevated above the anthers at anthesis .......................**O. grandis**
13 Petals 0.5-2.2 cm long; style 2-5 cm long; stigma lobes surrounded by the anthers at anthesis .......................**O. laciniata**
8 Fruit thickest near the base, tapering to the apex; seeds borne horizontally in the locules, angled-prismatic, not regularly pitted; [section Oenothera, subsection Oenothera]
14 Stigma elevated above the anthers at anthesis; petals 2.5-5.5 cm long.
15 Cauline leaves 0.4-1.0 cm wide; apex of the inflorescence curved; free sepall tips subterminal, usually spreading; capsules spreading at nearly right angles to the stem, long-attenuate toward apex, usually conspicuously arculate ..................**O. argillicola**
15 Cauline leaves 1.5-6 cm wide; apex of the inflorescence erect; free sepall tips terminal, erect; capsules erect or slightly spreading, gradually attenuate toward the apex.
ONAGRACEAE

16 Upper stem, ovary, floral tube, and sepals always conspicuously pubescent, usually with at least some red-pustulate hairs; bracts green, persistent; sepals often flushed with red, or red-striped .................................................. O. glazioviana

16 Upper stem, ovary, floral tube, and sepals often apparently glabrous without magnification; pustulate hairs absent, or if present not red (in fresh material); bracts often pale-green and deciduous; sepals yellowish green, or flushed with some red...

.......................................................... O. grandiflora

14 Stigma surrounded by or below the anthers at anthesis; petals 0.7-2.5 (-3) cm long.  
17 Plant appearing exclusively (as seen without magnification).

18 Apex of the inflorescence curved; free sepals tips subterminal in bud, erect to spreading; dry capsules usually rusty brown ....  
.......................................................... O. oakesiana

18 Apex of the inflorescence erect; free sepals tips erect in bud; dry capsules gray-green or dull green.

19 Leaves green to pale green; stems, ovary, floral tube, and sepals sparsely appressed-pubescent ................. O. biennis

19 Leaves dull green to gray-green; stems, ovary, floral tube, and sepals densely appressed-pubescent ... O. villosa ssp. villosa

17 Plant appearing either glabrous or with a mixture of long pubustulous hairs and appressed pubescence (as seen without magnification).

20 Apex of inflorescence curved; free sepals tips subterminal in bud.

21 Plant (at least the lower portions) predominantly strigillose; leaves dull green to gray-green; dry capsules rusty brown .....  
.......................................................... O. oakesiana

21 Plant predominantly erect-pubescent or appearing glabrous (as seen without magnification); leaves usually bright green; dry capsules usually dark green or black .......................................................... O. parviflora

22 Inflorescence conspicuously pubescent .......................................................... O. biennis

22 Inflorescence glabrous (or appearing so without magnification).

23 Free sepals tips terminal in bud; petals 1.4-2.5 (-3) cm long; bracts caducous, pale green; capsules dull green when dry; petals fading yellowish-white to translucent. .................................................. O. nutans

23 Free sepals tips subterminal in bud; petals 0.8-1.5 (-2) cm long; bracts persistent, green; capsules usually black or dark green when dry; petals fading pale yellow, usually opaque................................................. O. parviflora

6 Ovary 4-angled or 4-winged (at least near its tip); fruit sharply 4-angled or 4-winged; stamens of two lengths (except O. triloba and O. macrocarpa ssp. macrocarpa).

24 Leaves all basal, pinnatifid; [section Lavauxia, subsection Lavauxia] .......................................................... O. triloba

24 Leaves in part cauline, entire or toothed.

25 Petals 50-70 mm long; flowers opening in the evening; wings of the fruit 10-25 mm wide; [section Megapoterium] .......................................................... O. macrocarpa

25 Petals 3-30 mm long; flowers opening in the day; wings of the fruit <3 mm wide; [section Kneiffia] ............................ O. macrocarpa ssp. macrocarpa

26 Cauline leaves linear, < 1 mm wide; petals 1-5 (-7) mm long; floral bracts shorter than the subtended ovaries; mature fruits elliptipsoid-rhomboid, 4-6 mm long; annual; [section Kneiffia, subsection Peniophyllum] ........................................ O. linifolia

26 Cauline leaves lanceolate to ovate, > 1 mm wide; petals 5-30 mm long; floral bracts longer than the subtended ovaries; mature fruits clavate to oblong-elliptic, 8-20 mm long; perennial; [section Kneiffia, subsection Kneiffia].

27 Petals 5-10 mm long; inflorescence usually nodding .......................................................... O. perennis

27 Petals 15-30 mm long; inflorescence usually erect.

28 Plant conspicuously pilose-hirsute with hairs 1-3 mm long; free sepals tips 1-4 mm long, divergent .................. O. pilosella

28 Plant either with shorter or appressed pubescence, of glandular or nonglandular hairs; free sepals tips 0-2 (-6) mm long, divergent or not.

29 Capsules oblong, widest near the middle, usually abruptly tapered to a stipe 0.1-3 (-7) mm long; hairs of the ovary and capsule predominantly glandular (or the ovary glabrous); leaves subglabrous or sparsely pubescent, more or less dentate.

30 Petals (20-) 25-35 mm long; cauline leaves lanceolate to ovate, 2-7 cm long, 1-3 cm wide, often glaucous beneath ......  
.......................................................... O. tetragona var. fraseri

30 Petals 12-20 (-25) mm long; cauline leaves linear to lanceolate, 2-7 cm long, 0.5-1.0 (-1.5) cm wide ......................... O. tetragona var. tetratoga

29 Capsules clavate, widest above the middle, gradually tapered to a stipe 3-10 mm long; hairs of the ovary and capsule nonglandular (or with a mixture of glandular and nonglandular hairs); leaves generally pubescent, subentire.

31 Petals 15-30 mm long; stems 7-12 dm tall, freely branched, slightly pubescent; cauline leaves lanceolate, 5-12 cm long, 0.5-1.5 cm wide; [of tidal marshes, usually with spongy lower stems and adventitious roots where regularly submerged] .......................................................... O. riparia

31 Petals (8-) 15-22 mm long; stems 1-8 dm tall, less branched (unless mowed, grazed, or otherwise damaged), more pubescent; cauline leaves 2-6 (-8) cm long, 0.2-1.0 (-1.2) cm wide.

32 Capsule vestiture a mixture of glandular and nonglandular hairs.

33 Cauline leaves not velutinous, 5-10+ as long as wide................................. O. tetragona var. brevistipula

33 Cauline leaves velutinous, 2+4 as long as wide.

34 Petals 7-12 mm long; leaves lance-oblong, obtuse; [of barrens of TN, KY, and AL]................................. O. tetragona var. sharpii

34 Petals 15-20 mm long; leaves lanceolate, acute; [of the Atlantic Coastal Plain] ......................... O. tetragona var. velutina

32 Capsule vestiture strictly nonglandular.

35 Free sepals tips 1-3 mm long, cartilaginous and often arching after the sepals have reflexed; calyx strigose ............  
.......................................................... O. fruticosus var. unguaiculata

35 Free sepals tips < 1 mm long; calyx various.

36 Capsule body 6-11 mm long, the pubescence rather coarse................................. O. fruticosus var. fruticosus

36 Capsule body 3-5 mm long, the pubescence very fine.

37 Capsule body 3.5-4 mm long; strigose-pilose; [of Coastal Plain bog]................................. O. fruticosus var. microcarpa

37 Capsule body 4-5 mm long; very finely strigillose; [of Piedmont rock outcrops] ................................. O. fruticosus var. subglobosa

* Oenothera curtiflora W.L. Wagner & Hoch, Small-flowered Gaura. Cp (GA, SC, VA), Pd (GA): sandy fields, disturbed areas, and clearings; rare, native of e. and w. North America. May-July. IN and IL west to WA, south to MS, and Mexico; apparently introduced eastward to MA, TN, GA, and SC. Kartesz's (1999) adoption of *Mollis* as the name for this taxon has been rejected (Wagner & Hoch 2000, Brummitt 2001). [= U; = Gaura parviflora Dough ex Lehm – RAB, F, G, Q, S; = Gaura mollis James – K; > Gaura parviflora var. parviflora – X; > Gaura parviflora var. lachnocarpa Weatherby – X]

**Oenothera curtissii** Small. Cp (GA, SC): sandhills, sandy fields; rare. May-September. Se. SC south to n. peninsular FL, west to s. AL. Closely related to *O. rhombipetala*, which is restricted to the Great Plains, with scattered occurrences east to AR, IL, and MI. [= K, Y; < O. rhombipetala Nuttall ex Torrey & A. Gray – RAB, F, X, misapplied; = Raimannia curtissii Rose – S]

**Oenothera drummondioides** Hooker ssp. drummondioides, Drummond's Evening-primrose. Cp (NC, SC): sandy ocean beaches; rare, perhaps only introduced or adventive from the Gulf Coast. April-October. Ssp. drummondioides ranges from se. NC south to s. FL, west to s. TX, and south to Tamaulipas and Vera Cruz. Ssp. thalassiphila (Brandegee) W. Dietrich & W.L. Wagner is restricted to the southern tip of Baja California. [= Y; < O. drummondioides – RAB, K; < Raimannia drummondioides (Hooker) Rose ex Sprague & Riley – S; > O. drummondioides var. drummondioides – X]

**Oenothera filipes** (Spach) W.L. Wagner & Hoch, Threadstalk Gaura. Cp (GA, SC), Pd (GA), Mt (GA): sandy fields, disturbed areas, and clearings; common. April-July. SC west to n. TN and s. IN, south to ne. FL and e. LA. [= U; = Gaura filipes Spach RAB, C, G, K, Q, W; > Gaura filipes var. filipes – F; > Gaura filipes var. major Torrey & A. Gray – F, X; > Gaura michauxii Spach – S]

**Oenothera fruticosa** Linnaeus var. subglobosa (Small) Munz, Flatrock Sundrops. Pd (GA): granite flatrocks and domes; rare. GA to AL. [= X; < O. fruticosa – RAB, C; < O. fruticosa sp. fruticosa – H, K, V; = Kneiffia subglobosa Small – S]

**Oenothera fruticosa** Linnaeus var. unguiculata Fernald, Southern Sundrops. Cp (NC, SC, VA): sandhills, moist to wet loamy savannas; uncommon. April-August. Se. VA south to e. SC. [= F, X; < O. fruticosa – RAB, C; < O. fruticosa sp. fruticosa – H, K, V]

**Oenothera gaura** W.L. Wagner & Hoch, Biennial Gaura, Northeastern Gaura. Mt (NC, SC, VA, WV), Pd (GA, NC, VA), Cp (DE, GA, NC, SC, VA): roadsides, woodlands, streambanks, fields, disturbed areas; common (uncommon in VA Coastal Plain, rare in DE Coastal Plain). June-October. MA and NY west to WI, se. MN, and IA, south to sw. NC, c. GA (Jones & Coile 1988), sc. TN, and c. IL. [= U; = Gaura biennis Linnaeus – RAB, K, Q, S, W, WV; > Gaura biennis var. biennis – C, F, G, X]

* Oenothera glaziouvsia* Micheli in Martius, Garden Evening-primrose. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): disturbed areas; uncommon. This species apparently arose as a garden hybrid, and has been widely cultivated and naturalized nearly worldwide. [= K, Z; = O. erythrophea Borbás – X]

**Oenothera grandiflora** L'Héritier ex Aiton. Cp (GA, NC, SC), Pd (GA, NC, SC), Mt (GA, NC, SC): disturbed areas; uncommon. June-June. VT west to KY, south to c. peninsular FL and s. MS. [= F, K, X, S, Z]

* Oenothera grandis* (Britton) Smyth. Cp (NC): roadsides; rare, introduced from further west. March-July. The native range of this species is centered in KS, OK, and TX. [= K, X, Y; = O. laciniata Hill var. grandiflora (S. Watson) B.L. Robinson – RAB, F, G]

**Oenothera laciniata** Hill, Cutleaf Evening-primrose. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas; common. February-October. ME west to ND, south to s. FL and TX; also in CA. [= K, W, WV; > O. laciniata var. laciniata – RAB, C, F, G; = Raimannia laciniata (Hill) Rose – S; > O. laciniata sp. laciniata – X]

**Oenothera linifolia** Nuttall, Threadleaf Sundrops, Flaxleaf Sundrops. Pd (GA, NC, SC, VA*), Cp (GA, SC), Mt (GA): dry openings and fields; rare (SC Rare, VA Watch List). C. VA west to s. IL and se. KS, south to Panhandle FL and se. TX. Occurrences east of the Mississippi River may be mainly or entirely adventive. Belden et al. (2004) discuss the Virginia occurrence. [= RAB, C, F, G, K, W, V, X; = Peniophyllum linifolium (Nuttall) Pennell – S]

**Oenothera nutans** Atkinson & Bartlett. Mt (GA?, NC, SC?, VA, WV), Pd (GA?, NC, SC?): roadsides, openings, forest edges, pastures; common (rare in VA). July-October. ME west to MI, south to n. FL, s. AL, and s. MO. [= K, Z; < O. biennis – RAB, G, S, WV; > O. biennis Linnaeus var. austromontana (Munz) Cronquist – C; > O. biennis var. nutans (Atkinson & Bartlett) Wiegand – F; > O. austromontana (Munz) Raven, Dietrich, & Stubbe – H, W; > O. biennis spp. austromontana Munz – X]
Oenothera oakesiana (A. Gray). RS west to MB, south to e. NC, SC, VA, PA, n. IN, n. IL, and s. MN. [= G, K, Z; = O. parviflora Linnaeus var. oakesiana (A. Gray) Fernald – C, F; = O. parviflora ssp. parviflora var. oakesiana (A. Gray) Fernald – X]

Oenothera perennis Linnaeus, Little Sundrops. Mt (NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA); bogs, sphagnum seeps, moist fields; uncommon (rare in DE, NC, and SC; rare in VA Coastal Plain). May-August. NS west to MB, south to w. NC, nw. SC, KY, and MO. [= RAB, C, G, K, W, X, WV; > O. perennis var. perennis – F; = Kneiffia perennis (Linnaeus) Pennell – S]

Oenothera pilosella Rafinesque, Midwestern Evening-primrose. Mt (VA, WV), Pd (VA), Cp (VA); moist fields, disturbed areas; rare. NH west to ON, south to s. VA, KY, n. AL, c. MS, and c. LA. O. sessilis (Pennell) Munz, treated by Straley (1977) as O. pilosella ssp. sessilis (Pennell) Staley, is best recognized as a species; it is restricted to West Gulf Coastal Plain. [= F, G, WV, X; = O. pilosella ssp. pilosella – C, K, V; > Kneiffia pratensis Small – S; > O. pilosella var. pilosella – X; = O. pilosella Linnaeus var. hirsuta Nuttall ex Torrey & A. Gray]

Oenothera riparia Nuttall, Riverbank Evening-primrose. Cp (NC, SC, VA?); tidal marshes; rare (NC Rare). June-July. Se. VA (?) south to se. NC and e. SC. Distinct from O. fruticosa. Present in the freshwater tidal portions of the Waccamaw, Northeast Cape Fear, Black, Greater Pee Dee, and Cape Fear (?) rivers. [= O. fruticosa – RAB; < O. fruticosa ssp. fruticosa – K, V; = Kneiffia riparia (Nuttall) Small – S; > O. tetragona Roth ssp. glauca (Michaux) Manz var. riparia (Nuttall) Munz – X]

Oenothera simulans (Small) W.L. Wagner & Hoch, Southeastern Gaura. Cp (GA, NC, SC); open woodlands, sandy fields, roadsides, primarily in the outer Coastal Plain; common. May-September. E. NC (Dare County) south to s. FL, west to e. TX, endemic to the Coastal Plain. [= U; = Gaura angustifolia Michaux – RAB, K, Q, S; > Gaura angustifolia var. angustifolia – X]

* Oenothera sinuosa W.L. Wagner & Hoch, Texas Gaura. Cp (GA, SC), Pd (GA); sandy fields, disturbed areas, and clearings; uncommon, native of further west. April-June. AR and OK south to s. TX, introduced eastward to SC and FL. [= U; = Gaura sinuata Nuttall ex Seringe – RAB, K, Q, X]

* Oenothera speciosa Nuttall, White Evening-primrose, Pink-ladies. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); roadsides and fields, also cultivated as an ornamental; common (rare in Mountains), introduced from western US. May-August. [= RAB, C, F, K, W, X; = Hartmannia speciosa (Nuttall) Small – S]

Oenothera tetragona Roth var. brevistipata (Pennell) Munz. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (VA); dry forests and woodlands, roadsides; common. May-August. SC and KY, south to GA and MS. Should perhaps be considered more closely related to O. fruticosa (where placed in synonymy by Straley), if it is determined to be valid. [= G; > O. tetragona – RAB, C; = O. fruticosa Linnaeus ssp. fruticosa – H, K, V, W; = Kneiffia brevistipata Pennell – S; = O. tetragona ssp. tetragona var. brevistipata – X]

Oenothera tetragona Roth var. fraseri (Pursh) Munz, Appalachian Sundrops. Mt (GA, NC, SC, VA, WV), Pd (NC, SC, VA), Cp (VA); dry to moist forests and woodlands, roadsides; common. May-August. NY and PA, south to nw. SC and n. GA. This is the more montane and higher elevation variant of O. tetragona. [= F, G, X; = O. tetragona – RAB, C; > O. tetragona var. hybrida (Michaux) Fernald – F, WV; > O. tetragona var. latfolia (Rydberg) Fernald – F, WV; > O. fruticosa Linnaeus ssp. glauca (Michaux) Staley – H, K, V, W; > Kneiffia glauca (Michaux) Spach – S; > Kneiffia hybrida (Michaux) Small – S; > Kneiffia latfolia Rydberg – S; = O. tetragona ssp. glauca var. glauca – X]

Oenothera tetragona Roth var. tetragona, Northern Sundrops. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, VA); dry forests and woodlands, roadsides; common. May-August. NL (Newfoundland) west to MI, south to e. VA and MO. [= F, = O. tetragona – RAB, C; = O. tetragona var. longistipitata (Pennell) Munz – F, WV; = O. tetragona var. tetragona – G; = O. fruticosa Linnaeus ssp. glauca (Michaux) Staley – H, K, V, W; = Kneiffia tetragona (Roth) Pennell – S; = O. tetragona ssp. tetragona var. tetragona – X – X]

Oenothera tetragona Roth var. velutina (Pennell) Munz. Cp (VA); dry sandy soils. Se. NY (Long Island) south to se. VA. Should perhaps be considered more closely related to O. fruticosa (where placed in synonymy by Straley), if it is determined to be valid. [= F, G, X; > O. tetragona – RAB, C; = O. fruticosa Linnaeus ssp. fruticosa – H, K, V, W; = Kneiffia velutina Pennell – S; = O. tetragona ssp. tetragona var. velutina – X]

Oenothera triloba Nuttall, Stemless Evening-primrose. Mt (GA, VA*); limestone glades (in GA), blackbelt prairies, disturbed areas (in VA); rare, perhaps only introduced in VA, though native into eastern KY and TN (GA Watch List). [= C, F, G, H, K, X; = Lavackia triloba (Nuttall) Spach – S]

* Oenothera villosa Thunberg ssp. villosa. Mt (VA, WV), Pd (VA); disturbed areas; uncommon (rare in WV), apparently naturalized in our area from an original distribution in the Great Plains. [= K, Z; = O. strigosa (Rydberg) Mackenzie & Bush – G; = O. biennis var. canescens Torrey & A. Gray – C, F; = O. strigosa (Rydberg) Mackenzie – B; Bush & Bush ssp. canovirens (Steele) Munz – X]

Oenothera macrocarpa Nuttall ssp. macrocarpa, Wingfruit Evening-primrose, occurs as a disjunct in c. TN. [= K; = O. missouriensis Sims – F; = O. macrocarpa Nuttall – C, G; = O. missouriensis Sims ssp. missouriensis – X; = Megaperium missouriense (Sims) Spach]

Oenothera serrata Nuttall, east to w. KY. [= U; = Calylophus serrulatus (Nuttall) Raven – K] {not yet keyed, synonymy incomplete} Oenothera speciosa Roth var. sharpii Munz. Known from the Eastern Highland Rim of TN, AL, and KY. [= O. tetragona – RAB, C; = O. tetragona var. tetragona – G; = O. fruticosa Linnaeus ssp. fruticosa – H, K, V, W; = O. tetragona ssp. tetragona var. sharpii – X]

Oenothera xenogaura W.L. Wagner & Hoch. Disjunct eastward in GA (Kartesz 1999). [= U; = Gaura drummondii (Spach) Torrey & A. Gray] {not yet keyed}
222. MYRTACEAE A.L. de Jussieu 1789 (Myrtle Family) [in MYRTALES]

A family of about 100 genera and 3500 species, trees and shrubs, nearly worldwide in tropical and subtropical areas.

Melaleuca Linnaeus 1767 (Cajeput, Bottlebrush, Punktree)

A genus of ca. 300 species (if circumscribed, as here, to include Callistemon), trees and shrubs, of tropical and subtropical Australia and nearby Asia and Pacific Islands.

1 Filaments red or crimson; flowers attached to the inflorescence axis singly ................................................................. M. cirrina
1 Filaments white, greenish, or yellowish; flowers attached to the inflorescence in triads .......................................................... M. quinquenervia

223. MELASTOMATAEAE A.L. de Jussieu 1789 (Melastome Family) [in MYRTALES]

A family of about 200 genera and 4500-5000 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and warm temperate areas.

Rhexia Linnaeus 1753 (Meadow-beauty)

(by Richard J. LeBlond)

Identification notes: Measurements of the hypanthium are to the base of the calyx lobes.

1 Anthers straight, ca. 2 mm long.
2 Stem internodes with at least some hairs; leaves oblong, linear, or spatulate; petals yellow ..................................................... R. lutea
2 Stem internodes glabrous; leaves ovate, suborbicular, or widely elliptic; petals lavender-rose to pink.
3 Calyx segments acuminate-aristate; floral tube nearly glabrous except along the calyx lobes; surface of seeds pebbled ........... R. petiolata
1 Anthers curvate, 5-11 mm long.
4 Stem nodes and internodes glabrous; stem and foliage blue-green ............................................................ R. alifanus
4 Stem nodes and usually also the internodes hirsute; stem and foliage green.
5 Sepal lobes aristate, the awn-tip 0.5-1.5 mm long, and also with flaring, yellowish, stiff hairs 3-5 mm long ...................... R. aristosa
5 Sepal lobes obtuse to acuminate, not aristate, the hairs shorter and not yellowish or stiff.
7 Leaves twisted at base, borne in a vertical plane; four stem faces subequal, the angles narrowly winged; mature hypanthium neck shorter than body; calyx lobes 1.5-2 mm long; anthers 4-5 mm long ......................... R. salicifolia
7 Leaves not twisted at base, borne more or less horizontally; four stem faces markedly unequal, the angle wings inconspicuous or absent; mature hypanthium neck as long as or longer than body; calyx lobes 2-4 mm long; anthers 5-10 mm long.
8 Petals lavender-rose, (1-) 1.5-2 (2.5) cm long; mature hypanthium 10-14 mm long, with glandular hairs; marginal nerves of leaf abaxial surface either absent or obscure and discontinuous; anthers 7-10 mm long ........................................... R. cubensis
8 Petals white to pink (-rose-purple), (7-) 0.9-1.4 cm long; mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; marginal nerves of leaf abaxial surface prominent; anthers 5-8 mm long .............................................................. R. mariana var. exalbida
6 Leaves (5-) 7-20 (35) mm wide, lanceolate, elliptic, or ovate.
9 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale.
10 Mature hypanthium 6-10 (-11) mm long, glandular-setose; petals 12-15 (-18) mm long, glabrous on the lower surface; anthers 5-8 mm long ................................................................................................................. R. mariana var. mariana
10 Mature hypanthium (9-)10-15 (-20) mm long, glabrous or glabrate; petals (18-) 20-25 mm long, glandular-hairy on the lower surface (best seen in bud); anthers 8-11 mm long ......................................................................................... R. nashii
9 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
11 Roots tuberous; stem angles at mid-stem conspicuously winged; hypanthium 7-10 mm long, the neck shorter than the body...... R. virginica
11 Roots not tuberous; stem angles sharp to narrowly winged; hypanthium 10-13 mm long, the neck as long as or longer than the body.
12 Hypanthium 7-9 (-10) mm long; petals 8-12 mm long; seeds irregularly ridged, especially along the crest [west of the Appalachians]...................................................................................................................... R. interior
12 Hypanthium (9-) 10-12 mm long; petals 10-25 mm long; seeds papillate, the papillae in concentric lines [from NJ to SC east of the Appalachians] .................................................. R. ventricosa

Alternate Key based largely on vegetative characters

1 Stem internodes glabrous.
2 Stem nodes as well as internodes glabrous, leaf margins entire or remotely low-toothed apically, glabrous ........................................ R. alifanus
3 Stem nodes hirsute, leaf margins toothed, the teeth often tipped with hairs.
4 Longest leaves 1.5 (-2) cm long, ovate or suborbicular ................................................................. R. nuttallii or R. petiolata
5 Longest leaves > 2 cm long, lanceolate, elliptic, or ovate.
6 Rhizomes present, roots not tuberiferous or spongy-thickened .............................................. R. mariana var. ventricosa
7 Rhizomes absent, roots tuberiferous or spongy-thickened.
8 Stem leaves gradually reduced upward .................................................. R. virginica
9 Stem leaves gradually lengthening from the base to mid-stem .................................................. R. aristosa
10 Rhizomes absent, roots tuberiferous or spongy-thickened.
11 Mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; petals white, 1.2-1.5 cm long ........ R. mariana var. exalbida
12 Hypanthium (9-) 10-12 mm long; petals 10-25 mm long; seeds papillate, the papillae in concentric lines [from NJ to SC east of the Appalachians] .................................................. R. ventricosa

Rhexia alifanus Walter, Yellow Meadow-beauty. Pine flatwoods and savannas, pocosins borders, more able to tolerate merely moist soils than other Rhexia species. May-September. A Southeastern Coastal Plain species: e. NC south to n. peninsular FL and west to se. Texas (Singhurat, Mink, & Holmes 2010). Our tallest and showiest Rhexia: the unbranched (unless injured), wandlike stems, with strongly ascending, bluish-green, generally entire leaves make this species unmistakeable. [=GW, K, RAB, S, WH, Z]

Rhexia aristosa Britton, Awned Meadow-beauty, Bristly Meadow-beauty. Clay-based Carolina bays, depression meadows, and limesink ponds (dolines). June-September. This species has a very local and disjunct range extending (strictly on the Coastal Plain) from NJ south to AL. The long yellowish bristles at the summit of the calyx/hypanthium are diagnostic. R. aristosa × virginica is known from the Coastal Plain of NJ (Snyder 1996). [= C, F, G, GW, K, RAB, S, Z]

Rhexia cubenensis Grisebach, West Indies Meadow-beauty. Limesink ponds (dolines). June-September. Se. NC south to s. FL and west to sw. MS; also in the West Indies. [=GW, K, RAB, S, WH, Z]

Rhexia interior Pennell. Moist to wet areas, ditches, prairies. S. IN, s. IL, s. MO, and se. KS south to c. AL, c. MS, n. LA, and se. OK. [=F, G; = R. mariana Linnaeus var. interior (Pennell) Kral & Bostick – GW, K, Z; < R. interior – C]

Rhexia lutea Walter, Yellow Meadow-beauty, Golden Meadow-beauty. Wet pine flatwoods and savannas, seepage slopes, and bogs. April-July (and later in response to growing-season fire). A Southeastern Coastal Plain species: e. NC south to ne. FL and Panhandle FL, and west to se. TX. The only yellow-flowered Rhexia and also our bushiest species. [=GW, K, RAB, S, WH, Z]

Rhexia mariana Linnaeus var. exalbida Michaux, White Meadow-beauty. Wet pine flatwoods and savannas, wet meadows, ditches, and wet roadsides. June-September. NC south to FL and west to MS. Merging into R. mariana var. mariana from FL westward, var. exalbida appears quite distinct in NC. The white flowers and linear leaves are diagnostic. [=RAB; ? R. lanceolata – S; < R. mariana var. mariana – GW, K, Z; < R. mariana – WH]

Rhexia mariana Linnaeus var. mariana, Maryland Meadow-beauty, Dull Meadow-beauty, Pale Meadow-beauty. Pine flatwoods, wet woods, bog margins, ditches, wet roadsides, often weedy. May-October. E. MA south to s. FL, west to TX, and north to s. IN and IL. [=G, W, RAB; < R. mariana var. mariana – F; GW, K, Z (also see R. mariana var. exalbida); > R. mariana var. leiosperma Fernald & Griscom – F; ? R. delicatula Small – S; < R. mariana – WH, WV]
Rhexia nashii Small, Hairy Meadow-beauty, Maid Marian. Wet pine flatwoods and savannas; pondshores, bogs, marshes, ditches, wet roadsides. May-October. Primarily a Southeastern Coastal Plain species: e. VA south to s. FL and west to se. LA. [= GW, K, S, WH, Z; = R. mariana var. purpurea Michaux – F, G, RAB]

Rhexia nuttallii C.W. James, Nuttall's Meadow-beauty. Pine flatwoods, bogs. Coastal Plain of se. GA west to FL Panhandle, south to s. peninsular FL. [= GW, K, WH, Z; = R. serrulata Nuttall – S]

Rhexia parviflora Chapman, Small-flowered White Meadow-beauty, Apalachicola Meadow-beauty. Limesink pond margins. Sw. GA (Mitchell County) south into Panhandle FL. [= GW, K, S, WH, Z]

Rhexia petiolata Walter, Ciliate Meadow-beauty, Short-stemmed Meadow-beauty. Wet pine flatwoods and savannas, pocosin borders, and ditches. June-September. May-October. A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to se. TX. The flowers are sessile, the petals ascending. [= C, G, GW, K, RAB, WH, Z; = R. ciliosa Michaux – F, S]

Rhexia salicifolia Kral & Bostick, Willowleaf Meadow-beauty, Panhandle Meadow-beauty. Drawdown zones of Coastal Plain depression ponds and interdune swales. Sw. GA and FL Panhandle west to s. AL (Jensen 2007). [= GW, K, WH, Z]

Rhexia ventricosa Fernald & Griscom, Swollen Meadow-beauty. Pine flatwoods and savannas, clearings in cypress-hardwood swamps, ditches, wet roadsides. June-September. S. NJ south to e. SC. This taxon is closely related to R. interior Pennell, which is distributed west of the Appalachians. [= F, RAB; = R. mariana Linnaeus var. ventricosa (Fernald & Griscom) Kral & Bostick – GW, K, WH, Z; = R. interior Pennell – C]

230. STAPHYLEACEAE Martynov 1820 (Bladdernut Family) [in CROSSOSOMATALES]

A family of 2 genera and about 45-50 species, trees and shrubs, of mainly temperate Northern Hemisphere, especially e. Asia. References: Spongberg (1971)-Z; Simmons in Kubitzki, Bayer, & Stevens (2007).

Staphylea Linnaeus 1753 (Bladdernut)

A genus of 23 species, trees and shrubs, mainly of temperate Eurasia and e. North America, but extending into Central and South America. References: Simmons in Kubitzki, Bayer, & Stevens (2007).

Identification notes: The opposite, trifoliolate leaves with serrulate margins are diagnostic.

Staphylea trifolia Linnaeus, Bladdernut. Nutrient-rich bottomland forests, extending upslope over calcareous or mafic rocks. April, September-October. QC west to MN, south to sw. GA, Panhandle FL, n. AL, n. MS, and OK. [= RAB, C, F, G, GW, K, S, WH, WV, Z]

239. ANACARDIACEAE R. Brown 1818, nom. cons. (Cashew Family) [in SAPINDALES]

A family of about 70-81 genera and about 800-875 species, trees, shrubs, lianas, and rarely herbs, of tropical, subtropical, and temperate regions. Our representatives are all classed in subfamily Anacardioideae (Pell et al. 2011). References: Pell et al. in Kubitzki (2011); Barkley (1937).

**Cotinus** P. Miller 1754 (Smoketree)

1 Leaves elliptic, to 10 cm long; [planted tree, rarely persistent]............................................................................................................ C. coggygria
1 Leaves obovate, to 20 cm long; [native tree of calcareous habitats] ........................................................................................................... C. obovata

* **Cotinus coggygria** Scopoli, European Smoketree. Suburban areas; native of Europe and Asia. *C. coggygria* is planted as an ornamental, and is reported as naturalized in various states in ne. United States. There is little evidence of its true naturalization or persistence in our area. [= K1, K2]

* **Cotinus obovata** Rafinesque, American Smoketree. Limestone woodlands and glades. Se. TN (Cumberland Plateau) (Chester, Wofford, & Kral 1997), nw. GA, and n. AL west to OK and e. and sc. TX. A small tree of limestone woodlands and glade margins, occasionally planted as an ornamental tree. [= C. obovatus Rafinesque – K1, K2, orthographic variant; = C. americanus Nuttall – S]

**Pistacia** Linnaeus 1753 (Pistachio)

* **Pistacia chinensis** Bunge, Chinese Pistachio. Uncommonly planted, rarely persistent or naturalizing; native of China, the Philippines, and Taiwan. March-April. AL, GA. [= K1; > P. chinensis ssp. subintegerrima (Stewart) Rech. f. – K2]

**Rhus** Linnaeus 1753 (Sumac)

**Identification notes:** Two hybrids have been documented to occur naturally in our area: *Rhus ×pulvinata* Greene (glabra × typhina) and *Rhus ×ashei* (Small) Greene (glabra × michauxii). They are intermediate between their parents. For instance, *R. ×ashei* has sparsely pubescent leaves and stems, slight winging of the rachis between the terminal leaflets, potentially greater stature than *R. michauxii*, and leaflets with a length/width ratio of 2.5-3. Hardin & Phillips (1985b) discuss other natural and artificial hybrids in *Rhus*.

1 Leaves 3-foliolate; shrub to 2 m tall; inflorescence of small lateral and terminal clusters; [subgenus Lobadium]..............................................................
1 Leaves (5-) 7-31-foliolate; shrub or small tree, to 12 m tall; inflorescence of dense, terminal panicles; [subgenus Rhus].
2 Rachis of the leaf winged between each pair of adjacent leaflets; stems and petioles puberulent; leaflets entire to remotely toothed.
3 Leaflets 11-25, attenuate to base, 2-9 cm long, 1-2 cm wide, either >3× as long as wide or < 4 cm long; leaflet margins entire (rarely serrate); leaflet apex rounded, obtuse, acute, or acuminate (often at least the more basal leaflets with an obtuse tip).........................................................
3 Leaflets 5-13, rounded to base, 4-9 cm long, 1.5-5 cm wide, > 2.5× as long as wide; leaflet margins entire or serrate; leaflet apex acute or acuminate tip.................................................................
4 Leaflets densely pubescent (rarely sparsely pubescent); short shrubs to 1 m tall; stems densely long-pubescent; rachis of the leaf often winged terminally; leaflets mostly ovate, averaging about 2× as long as wide, acute.................................................................
4 Leaflets densely pubescent (rarely sparsely pubescent); short shrubs to 1 m tall; stems densely long-pubescent; rachis of the leaf often winged terminally; leaflets mostly ovate, averaging about 2× as long as wide, acute.................................................................
5 Stems essentially glabrous; pubescence of the fruit short and blunt-tipped.........................................................
5 Stems densely long-pubescent; pubescence of the fruit long and pointed.........................................................

**Rhus aromatica** Aiton var. *aromatica*. Fragrant Sumac, Squawbush. Rocky, rather dry, woodlands, usually over mafic rocks (such as gabbro or diabase) or calcareous rocks, less commonly in sandy soils. Late February-early May; late April-June. The species ranges throughout much of temperate North America; var. *aromatica* is the most eastern component of the complex, distributed from NH, ON, and MN south to Panhandle FL and TX. The foliage of *R. aromatica* bears some superficial
resemblance to *Toxicodendron pubescens*. [= C, F, G, K, WV; < *R. aromatica* – RAB, W, WH; = *Schmaltzia crenata* (P. Miller) Greene – S] *Rhus copallinum* Linnaeus var. *copallinum*, Winged Sumac, Flameleaf Sumac. Sandhills, dry woodlands, maritime thickets (especially from VA northward), old fields, roadsides. S. NY south to s. FL, mainly on the Coastal Plain and lower Piedmont. The Linnaean epithet “*Copallinum*” is grammatically a noun in apposition rather than an adjective, and therefore does not change grammatical gender. [= K; < *R. copallina* – RAB, W; < *R. copallinum* – C, G, WH; = *R. copallina* var. *copallina* – F; > *R. copallinum* – S; > *R. leucanthe* Jacquin – S; > *R. obtusifolia* (Small) Small – S] *Rhus copallinum* Linnaeus var. *latifolia* Engler, Eastern Winged Sumac. Rocky glades, dry woodlands. S. ME to n. IL, south to c. GA, AL, LA, and e. TX. [= K; < *R. copallina* – RAB, W; < *R. copallinum* – C, G, S; = *R. copallina* var. *latifolia* – F] *Rhus glabra* Linnaeus, Smooth Sumac. Disturbed areas, clearings, roadsides, woodlands. Late May-July; June-October. ME west to BC, south to Panhandle FL, TX, CA, and beyond. [= RAB, C, G, K, S, WH, WV, WV; > *R. glabra* var. *glabra* – F] *Rhus michauxii* Sargent, Michaux’s Sumac, Dwarf Sumac. In the fall line sandhills characteristically in submesic, loamy swales, usually associated with such species as *Paspalum bifidum, Helianthus divaricatus, Tridens carolinianus, Rhus copallinum, Anthaenantia villosa, Gymnopogon* sp., and *Aristida lanosa*; in the eastern Piedmont on sandy soils derived from granite; in the central Piedmont on clayey soils derived from mafic rocks such as gabbro or mafic Carolina slates, probably all of its habitats (formerly) in frequently burned situations. June; August-September. Rare and scattered (though formerly more common) from s. VA south to GA; disjunct in Alachua County, FL (just south of area). Large populations were found in sc. VA (Nottoway and Dinwiddie counties) in frequently burned military artillery “impact areas” (Fleming & Ludvig 1996). Barden & Matthews (2004) present a detailed account of its discovery by André Michaux in 1794 in what is now Union County, NC. [= RAB, K, S; = *R. pumila* Michaux] *Rhus typhina* Linnaeus, Staghorn Sumac. Roadsides, old pastures, thickets, clearings, rock outcrops, barrens. May-June; June-September. NS and NB west to MN, south to n. GA, AL, MS, and KS. The apparently older epithet “*hirta*” was rejected in 1999. The species, especially in its cut-leaved forms, forma *laciniata* (Wood) Rehder and forma *dissecta* Rehder, is very popular in Europe as a cultivated ornamental. [= RAB, C, F, G, K, W, WH, WV; = *R. hirta* (Linnaeus) Sudworth] *Schinus* Linnaeus 1753 (Brazilian-pepper) A genus of about 15 species, shrubs and trees of the tropics. References: Pell et al. in Kubitzki (2011). * Schinus terebinthifolius* Raddi, Brazilian-pepper. Disturbed areas, especially moist or wet; native of Brazil and Paraguay. A noxious invasive in the FL peninsula. [= *S. terebinthifolius* Raddi – GW, WH, orthographic variant; > *S. terebinthifolius var. raddianus* Engl. – K] *Toxicodendron* P. Miller 1754 (Poison Ivy, Poison Oak, Poison Sumac) A genus of about 10-15 species, trees and shrubs, primarily temperate, of North America, n. South America, Indonesia, and e. Asia. References: Gillis (1971)=Z; Pell et al. in Kubitzki (2011). 1 Leaflets 7-13, entire; small tree ................................................................................................................................................................... *T. vernix* 1 Leaflets 3, toothed, lobed, or entire; shrub or vine 2 Fruits pubescent or papillose; leaflets entire, coarsely toothed, undulate, or round-lobed; lower surfaces of leaflets either velvety puberulent, sometimes becoming glabrate in age (*T. pubescens*) or glabrous (glabrescent or rarely pilose beneath) but with prominent tufts of tannish hairs present in the vein axils (*T. radicans* ssp. *radicans*). 3 Leaves sparsely pubescent (rarely pilose beneath), the apex and the lobes (if present) generally acute to acuminate; drupes papillos, scabrous or puberulent; plant a high-climbing vine or stoloniferous shrub; [of mesic, swampy, or dry habitats] .................................................. ................................................................................................................................. *T. radicans* var. *radicans*
3 Leaves velvety puberulent (sometimes becoming glabrate in age), the apex and the lobes (if present) generally obtuse to broadly acute; drupes pubescent (becoming glabrate); plant a stoloniferous shrub; [of dry habitats, especially sandhills]...........................................Toxicodendron pubescens

2 Fruits glabrous (or very sparsely pubescent); leaflets coarsely toothed or notched (rarely entire); lower surfaces of leaflets glabrous to pubescent, but without tufts of tanish hairs in the vein axils.

4 Leaves densely pilose and velvety on the lower surface; leaves pubescent on the upper surface; pubescence of the leaves erect..................Toxicodendron radicans var. pubens

4 Leaves glabrous to sparingly strigose on the lower surface; leaves glabrous on the upper surface; pubescence of the leaves appressed.

5 Leaflets suborbicular or broadly ovate, nearly as wide as long; petiole glabrous (rarely glabresecnet); plant a shrub, the stems upright, entirely lacking aerial roots, not vining; fruits (3-) 4-7 mm in diameter ..............................................Toxicodendron rydbergii

5 Leaflets ovate to lanceolate; petiole puberulent to densely pubescent; plant a shrub or vine, the stems upright or twining; fruits 2.5-5.5 mm in diameter ..........................................................Toxicodendron radicans var. negundo

Toxicodendron pubescens P. Miller, Poison Oak. Dry woodlands, around dry rock outcrops in the Piedmont and Mountains, especially prevalent in sandhills. Late April-May; August-October. Primarily Southeastern: NY (Long Island) south to n. FL, west to e. TX, inland to WV, e. TN, c. TN, se. MO, and s. KS. The nomenclatural confusion may still not be resolved. [= C, K, WH; = Rhus toxicodendron – RAB, F, G; = T. toxicodendron (Linnæus) Britton – S; = T. toxicarium Gillis – W, Z; = T. quercifolium (Michaux) Greene]

Toxicodendron radicans (Linnæus) Kuntze var. negundo (Greene) Reveal, Midwestern Poison Ivy. In a wide range of habitats, including mesic forests, rock outcrops, open areas, and disturbed ground. Late April-May; August-October. NY west to MI, MN, and NE, south to sw. VA, KY, AR, and TX, almost entirely in or west of the Appalachians. In our area seemingly mostly in the New River drainage; to be expected in nw. NC. [= C = Rhus radicans var. vulgaris (Michaux) A.P. de Candolle forma negundo (Greene) Fernald – F, G; = T. radicans sp. negundo (Greene) Gillis – K, Z]

Toxicodendron radicans (Linnæus) Kuntze var. pubens (Engelmann ex S. Watson) Reveal. Xeric limestone sites. S. IL and MO south to LA and s. TX; disjunct eastward in c. KY, c. TN, and w. VA (Virginia Botanical Associates 2006). [= T. radicans – GW, W; = T. radicans sp. pubens (Engelmann ex S. Watson) Reveal. – K, Z; = Rhus radicans]

Toxicodendron radicans (Linnæus) Kuntze var. radicans, Eastern Poison Ivy. In a wide range of habitats, including mesic forests, rock outcrops, swamp forests, brackish marshes, open areas, disturbed ground, usually in more mesic to hydric sites than T. pubescens, and particularly common in areas with fertile soils, such as bottomlands or over calcareous rocks or calcareous sands (as in maritime forests). Late April-May; August-October. Var. radicans is the typical poison ivy of the Atlantic and Gulf Coastal Plains, rarely found west of the Appalachians. It ranges from NS south to s. FL (and the Bahamas), west to e. TX, inland to VT, c. PA, WV, KY, and AR. It is normally a vine, climbing by adventitious roots, and can attain diameters of 10 cm and climb to the crowns of forest trees. It can also resemble T. pubescens in habit, producing numerous meter-high upright stems from rhizomes. T. radicans is ubiquitous in our area, absent only from the high mountains of NC. [= C; = Rhus radicans Linnaeus – RAB; > Rhus radicans var. radicans – F, G, WV; > Rhus radicans vulgaris (Michaux) A.P. de Candolle forma vulgaris – F, G; < T. radicans – GW, S, W, WH; = T. radicans sp. radicans – K; > Rhus radicans vulgaris (Michaux) A.P. de Candolle – WV]

Toxicodendron rydbergii (Small ex Rydberg) Greene, Western Poison Ivy. Acid pine-oak forests and woodlands at moderate elevations. NS west to BC, south to New England, NY, n. OH, n. IL, IA, w. KS, w. TX, AZ, and OR; disjunct in the Appalachians in PA, WV, and VA. Reported for NC by Gillis (1971), but the location (Cumberland Co., in the fall-line Sandhills), does not seem plausible {investigate further with specimen}. [= C, K, Z; = Rhus radicans var. rydbergii (Small) Rehder – F, G, WV; = T. radicans (Linnæus) Kuntze var. rydbergii (Small ex Rydberg) Erskine]

Toxicodendron vernix (Linnæus) Kuntze, Poison Sumac, Thunderwood. In peaty habitats, in the Coastal Plain frequent in streamhead pocosins and sandhill seepage bogs, in the mountains in bogs. May-early June; August-September. NS west to MN, south to c. peninsular FL and TX. The leaf rachis and leaflet petiolules are usually a dark red or maroon color. The leaves turn a very attractive shade of orange-red in autumn. [= C, GW, K, S, W, WH; = Rhus vernix Linnæus – RAB, F, G, WV]

240. SAPINDACEAE A.L. de Jussieu 1789 (Soapberry Family) [in SAPINDALES]

A family of about 133 genera and 1465 species, trees, shrubs, vines, and herbs, primarily of tropical (rarely temperate) regions of the Old World and New World. APG III (2009) and others have recently included Hippocastanaceae and Aceraceae in the Sapindaceae. References: Buerki et al. (2009).
SAPINDACEAE

3 Leaves pinnately or biternately compound.
4 Vine; leaves biternately compound; [subfamily Sapindoideae] ................................................................. 3. Cardiospermum
4 Tree or shrub; leaves pinnately compound.
5 Leaflets entire; fruit drupe-like; [native, of coastal hammocks of se. SC southward]; [subfamily Sapindoideae] ....... 5. Sapindus
5 Leaflets coarsely toothed; fruit a samara or inflated "pod;" [native or alien, collectively widespread].
6 Fruit winged; [native]; [subfamily Hippocastanoideae] ..................................................................................... 1. Acer
6 Fruit inflated; [alien ornamental, rarely escaped]; [subfamily Sapindoideae] ...................................................... 4. Koelreuteria

I. Acer Linnaeus 1753 (Maple)

Section Parviflora, Series Caudata: spicatum
Section Palmata, Series Palmata: palmatum
Section Negundo, Series Negundo: negundo
Section Rubra: drumondii, rubrum, saccharinum
Section Macrantha: pensylvanicum
Section Platanoidae: platanoides, campestre
Section Acer, Series Acer: pseudoplatanus
Section Acer, Series Saccharodendron:
Section Ginnala: ginnala

1 Leaves compound, divided into 3-7 (-9) leaflets; [section Negundo].
2 Twigs glabrous .................................................................................................................................................. A. negundo var. negundo
2 Twigs puberulent ............................................................................................................................................... A. negundo var. texanum
1 Leaves simple, generally shallowly to deeply 3-5 (-7) lobes.
3 Leaves not toothed, or often with a few rounded, coarse, and irregular teeth on the principal lobes; these teeth 0-5 per principal lobe; sinuses between the principal leaf lobes generally broadly rounded, the sinus broader than deep.
4 Petioles and young twigs exuding milky sap when broken; inflorescence peduncled, the flowers on ascending, moderately stout pedicels; paired samaras held at >135° from one another; [section Platanoidae]; [alien].
5 Leaves 3-5-lobed, 4-8 (-10) cm wide .............................................................................................. A. campestre
5 Leaves 5-7-lobed, 10-18 cm wide .................................................................................................................... A. platanoides
4 Petioles and young twigs exuding clear sap when broken; inflorescence sessile, the flowers on drooping, filiform pedicels; paired samaras held at <110° from one another; [section Acer, Series Saccharodendron]; [native, also widely planted.
6 Leaves pale, grayish, silvery-gray, or strongly glaucous beneath, glabrous, pubescent on the veins, or pubescent across the surface; leaf sinuses on either side of the terminal lobe deep, the two sides of each sinus forming an angle of > 70 degrees (the terminal lobe typically with parallel margins, or even narrower toward the base than toward the tip); leaves usually planar, but sometimes with drooping lobe tips, especially in A. floridanum, and also in sun-exposed individuals of A. floridanum or A. saccharum.
7 Leaves small, (3-5-) avg. 8 (-11) cm broad; leaf undersurface usually pubescent; fruits 20-25 mm long; medium to large trees; bark gray, smooth and beech-like, becoming irregularly furrowed or plated in large individuals; [primarily of the Coastal Plain and Piedmont, extending into the Mountains in GA] A. floridanum
7 Leaves large, (8-) avg. 15 (-20) cm broad; leaf undersurface glabrous or pubescent only on the veins; fruits 25-30 mm long; large trees; bark grayish-brown, with loose-edged plates; [primarily of the Mountains and upper Piedmont] A. saccharum
6 Leaves green beneath, moderately to densely pubescent across the surface; leaf sinuses on either side of the terminal lobe shallow, the two sides of each sinus forming an angle of > 90 degrees (the terminal lobe typically broadly triangular); leaves sometimes planar, more usually with drooping lobe tips.
7 Leaves small, (3-) avg. 6 (-11) cm broad; small trees, often multi-trunked and crooked; bark whitish (in part because of dense growth of crustose lichens), becoming cracked and blackened on larger stems; [primarily of the Piedmont, extending into the lower Mountains in w. SC and n. GA] A. leucoderme
8 Leaves large, (8-) avg. 15 (-20) cm broad; large trees, single-trunked; bark dark brown or blackish, becoming furrowed in large individuals; [primarily of the Mountains and westward] A. nigrum

3 Leaves finely to coarsely toothed, the toothing often regular, the teeth 8-50 per principal lobe; sinuses between the principal leaf lobes generally sharp, forming a definite angle (or if rounded, then the sinus much deeper than broad).
9 Leaves deeply lobed, the two sinuses on either side of the central lobe deep and narrow, approaching the midrib, the terminal lobe thus narrower at its base than at its middle; flowers either with petals (A. palmatum) or without petals (A. saccharinum).
10 Leaves green beneath (or purple in many forms); main leaf lobes 5-9; these main lobes merely toothed or in some cultivars variously further divided; [small exotic tree, commonly planted and weakly naturalizing]; [section Palmata] A. palmatum
10 Leaves silvery white beneath; main leaf lobes 3-5, these main lobes with coarse teeth and smaller lateral lobes; [large native tree (also extensively planted)]; [section Rubra] A. saccharinum
9 Leaves shallowly lobed, the two sinuses on either side of the central lobe broadly wedge-shaped, not approaching the midrib, the terminal lobe thus broadest at its base and progressively (though often irregularly) narrowing toward the tip; flowers with petals.
11 Winter buds stalked, with 2-4 valvate scales; inflorescence an elongate drooping raceme or erect panicle; petals green to bright yellow, 2-10 mm long; fruits maturing in midsummer to autumn; leaves green beneath, shrub, small tree, or medium tree (to 35 cm DBH).
12 Bark with narrow white stripes on a green background (best seen on stems 3-10 cm in diameter); leaf blades 12-20 (-30) cm long and wide, finely serrate (5-10 teeth per cm), pubescent beneath with yellow to orange hairs 0.1-0.3 mm long (as seen at 10× magnification); inflorescence a drooping raceme; [section Macrantha] A. pensylvanicum
12 Bark brownish, never conspicuously striped; leaf blades 8-12 (-14) cm long and wide, coarsely serrate (2-3 teeth per cm), pubescent beneath with whitish hairs 0.3-1.0 mm long (as seen at 10× magnification); inflorescence an erect panicle; [section Parviflora] .............................................................. A. spicatum

11 Winter buds sessile, with 4-10 imbricate scales; inflorescence either a drooping panicle (A. pseudoplatanus) or a sessile or sub sessile cluster or fascicle; fruits maturing either in midsummer to autumn (A. pseudoplatanus) or in spring; leaves slightly to strongly glaucous-whitened beneath; medium to large tree (to 100 cm DBH).

13 Inflorescence a drooping panicle, flowering in May-June, fruiting August-September (and persisting overwinter); petals yellowish-green; leaf blades 8-17 cm long; [section Acer, series Acer] ......................................................... A. pseudoplatanus

13 Inflorescence a sessile or sub sessile cluster or fascicle, flowering in January-March, fruiting April-July (and dropping); petals red (rarely yellowish), 1-3 mm long; leaf blades 10 cm long; [section Rubra].

14 Mature leaves densely white tomentose (fely-pubescent) beneath; petioles usually with white tomentum; mature samaras 2.7-5 cm long ................................................................. A. saccharum

14 Mature leaves glabrous to densely pubescent (but not white-tomentose) beneath; petioles usually glabrous; mature samaras 1.5-3 cm long.

15 Leaves (3-) 5 (-9)-lobed, the central lobe 4-8 cm long, the 2 upper lateral lobes 2-5 cm long; leaf base generally cordate (rarely rounded); leaves 7-18 cm wide; [widespread, in nearly all habitats] ........................................... A. rubrum var. drummondii

15 Leaves unlobed or 3 (-5)-lobed, the central lobe 1-5 cm long, the lateral lobes (if present) 0.5-2 (-3) cm long; leaf base broadly cuneate to rounded or subcordate; leaves 2-10 cm wide; [primarily of wetlands, especially in the Coastal Plain] ....... A. rubrum var. trilobum

* Acer campestre Linnaeus, Hedge Maple. Suburban woodlands, planted and persistent and weakly spreading; native of Europe and w. Asia. Reported to be "occasionally spreading from cultivation to moist, rocky, disturbed woods" in sc. and se. PA (Rhoads & Klein 1993). Infraspecific taxa are often recognized in its native area. [= C, F, G, K, Z]

Acer floridanum (Chapman) Pax, Southern Sugar Maple, Florida Maple. Bottomland forests, mesic slopes, especially common over mafic or calcareous rocks, but not at all limited to such situations. April-May; June-October. S. VA, w. KY, se. MO, e. OK, c. OK, and n. TX, south to c. peninsular FL and e. TX. It is widely planted in southern cities and towns as a street tree. Ward (2004b) discusses the reasons for accepting *A. negundo* as the correct name for this species; the Michauxian name *A. barbatum* is associated with specimens that are demonstrably *A. saccharum*. [= A. saccharum ssp. floridanum (Chapman) Desmarais – RAB, WH, Z; = A. barbatum Michaux – C, K; > A. barbatum var. barbatum – F, G; > A. barbatum var. longii (Fernald) Fernald – F, G; = Saccharodendron floridanum (Chapman) Nieuwland – S]

* Acer ginnala Maximowicz, Amur Maple. Mt (WV), Ip (KY): disturbed areas; rare, native of e. Asia. Reported as "cultivated and escaped" in s. PA (Rhoads & Klein 1993). Infraspecific taxa are often recognized in its native area. [= F, K, Z] (not yet keyed)

Acer leucoderme Small, Chalk Maple. Rocky slopes and bluffs, particularly over mafic or calcareous rock, on the Gulf Coast in floodplains. March-April; May-September. A species of se. North America, primarily of the Piedmont from NC to AL, less commonly in the Ridge and Valley of se. TN (Chester, Wofford, & Kral 1997), low Blue Ridge of w. NC and adjacent TN and GA, Coastal Plain of Panhandle FL, GA, AL, MS, LA, and se. TX, and in sw. AR and se. OK. The leaves, at least those on lower and inner branches, tend to dry a tawny color and remain on the tree until spring, reminiscent of beech. [= K, W; = A. saccharum ssp. leucoderme (Small) Desmarais – RAB, WH, Z; = Saccharodendron leucoderme (Small) Nieuwland – S]

Acer negundo Linnaeus var. negundo. Eastern Box Elder, Ash-leaved Maple. Riverbanks, swamps, bottomlands, also upslope on calcareous substrates. March-April; May-October. The species, broadly treated, ranges nearly across North America, including well into the arid west along rivers. Var. *negundo* occurs from NB west to MB, south to c. peninsular FL and TX; also allegedly in nw. United States. *A. negundo* often grows on the banks of rivers, leaning out over the water at a 45 degree angle. The leaves can resemble poison ivy (*Toxicodendron radicans*), which has alternate leaves. The coarse toothing (approaching lobing) distinguishes it from any of our ashes (*Acer*). The leaves can also resemble the leaves of box elder. [section Rubra].

Acer negundo Linnaeus var. texanum Pax, Texas Box Elder. Riverbanks and bottomlands. April; June-October. Sw. NC, KY, MO, KS, and NM south to AL, MS, and TX. The status of this variety in our area is poorly known at present. [= C, F, G, K, Z; < A. negundo – RAB, GW, W; < Negundo negundo (Linnaeus) Karsten – S; < Negundo aceroides (Linnaeus) Moench]

* Acer palmatum Thunberg, Japanese Maple. Suburban woodlands; native of e. Asia. April; August-September. Frequently planted in its numerous cultivars. Infraspecific taxa are recognized in its native area. It is also reported as escaped in the DC area (Shetler & Orli 2000). [= K, Z]
Acer pensylvanicum Linnaeus, Striped Maple. Dry to mesic forests. May; June-September. NS west to MB, south to w. NC, nw. SC, ne. GA, e. TN, WI, and MN. The prominently striped bark of this common, mid-elevation understory tree is unmistakable. [= RAB, C, F, G, K, S, W, Z]

* Acer pictum Thunberg. Moist forests; native of Eurasia. [= A. mono Maximowicz] [not yet keyed]

* Acer pseudoplanatus Linnaeus, Sycamore Maple. Suburban woodlands; native of Europe. Planted widely in our area as a street and yard tree, especially in the mountains. It may be naturalized more extensively in our area; northward it is a noxious weed tree. [= C, G, K, Z; = Acer pseudo-platanus – F, orthographic variant]

Acer rubrum Linnaeus var. rubrum. Eastern Red Maple. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): upland deciduous forests, up to at least 1500m elevation, moist bottomlands and slopes; common. January-March; April-July. This variety is the most widespread and common in our area; indeed it is one of the most ubiquitous and common trees of e. North America. It is probably more abundant than formerly, because of its weedy abilities. Overall, it ranges throughout e. North America. Whether the varieties of A. rubrum are worthy of recognition is a matter of disagreement; I choose here to try to distinguish them. [= F, K, Z; < A. rubrum – RAB, C, GW, WH; < A. rubrum var. rubrum – G (also see var. trilobum); = Rufacer rubrum (Linnaeus) Small – S]

Acer rubrum Linnaeus var. trilobum Torrey & A. Gray ex K. Koch, Carolina Red Maple. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, VA, WV): wetlands, especially peaty, acid sites; common (rare in Piedmont and Mountains. January-March; April-June. Primarily a Southeastern Coastal Plain variety, the range of var. trilobum is unclear, possibly extending well inland and northward (see F). This variety has greatly increased in abundance in the Coastal Plain of our area because of fire suppression and mechanical disturbance of peaty wetlands. Former large pocosin tracts, such as the Dismal Swamp, are now largely dominated by this tree. [= F, K, Z; < A. rubrum – RAB, C, GW, WH; < A. rubrum var. rubrum – G; = Rufacer carolinianum (Walter) Small – S]

Acer saccharinum Linnaeus, Silver Maple, Soft Maple. Bottomlands, riverbanks, and disturbed areas. February-April; April-July. NS west to SK, south to Fanhandle FL, LA, and OK, rare and mostly introduced east of the Appalachians and south of VA. This is an abundant tree along major rivers in the Piedmont of VA. In our area (particularly from c. NC south), the species is more common as a street tree or an escape from cultivation than as a native tree. On the Coastal Plain of NC and SC, A. saccharinum is largely confined to the banks and levees of large brownwater rivers, such as the Roanoke and Congaree. The silvery undersides of the leaves are obvious in windy conditions. The hybrid Acer × freemani A.E. Murray [A. rubrum × saccharinum] has been collected at scattered locations in our area. [= RAB, C, F, G, GW, K, W, WH, Z; = Argentacer saccharinum (Linnaeus) Small – S]

Acer saccharum Marshall, Sugar Maple, Hard Maple, Sugar Tree. Cove forests, other rich forests, especially over mafic and calcareous rocks, on calcareous soils common and typical in dry-mesic forests and dry woodlands as well, less typically extending to high elevation northern hardwood forests where sometimes in acidic situations (as in Highlands County, VA), in parts of thye Piedmont perhaps more common than an introduction by ornamental planting than as a native, at least south of VA. April-June; June-July. Two varieties are sometimes recognized. Var. saccharum is distributed from NS west to ND, south to GA, LA, and OK. Var. schneckii Rehder, with petioles and lower leaf surfaces densely pubescent, is alleged to occur in s. PA (Rhoads & Klein 1993), IN, IL, and MO; it is probably only a form. A. saccharum is the primary source of maple sugar and maple syrup; formerly, commercial sugaring was done in w. NC and w. VA. Large individuals of this species are the favorite substrate of a number of lichens, including Lobaria pulmonaria. The brown, platy bark is often similar to that of Aesculus flava. For its bright orange fall color, A. saccharum is one of our most prized ornamental trees. In NC, it is most common northward and on mafic rocks, thus reaching perhaps its best development in the amphibolite peaks of Ashe, Watauga, Avery, and Mitchell counties; it is more general in VA. [= C; > A. saccharum var. saccharum – F, G, K, Z; = A. saccharum ssp. saccharum – RAB, Wh; = Saccharodendron barbatum (Michaux) Nieuwland – S]

Acer spicatum Lamarck, Mountain Maple. High elevation forests (northern hardwoods or spruce-fir), generally above 1500 m in NC, above 1000 m in VA, especially common in periglacial boulderfields. May-July; August-October. NL (Newfoundland), NL (Labrador), and SK south to PA, OH, and IA, and in the mountains to w. NC, e. TN, ne. GA, and ne. AL. The foliage is quite similar to that of A. rubrum var. rubrum, with which it can occur; in addition to the key characters, A. spicatum can be distinguished from A. rubrum by its leaves which have a strongly rugose texture, the secondary and tertiary veins
impressed on the upper surface, distinctly raised on the lower (vs. not rugose, the secondary and tertiary veins only slightly impressed on the upper surface, and slightly raised on the lower). *A. spicatum* is also sometimes confused with *A. pensylvanicum*, but these two species are readily distinguished by their leaves (see key). [= RAB, C, F, G, K, S, W, Z]

### Identification notes:

The following hybrids are known from our area: *Aesculus × neglecta* Lindley [*flava × sylvatica*] and *Aesculus × mutabilis* (Spach) Scheele [*pavia × sylvatica*]. They can be recognized by their intermediate morphology.

1. Petals usually 5, white with a reddish mark near the cordate base of the petal blade; buds glutinous (sticky); fruit spiny; leaflets 7 (-9) per leaf; [alien, uncommonly planted, rarely naturalized]; [section *Aesculus*] ................................................................................................................................. *A. hippocastanum*
2. Petals 4 (or 4-5 in *A. parviflora*), cream-colored, yellow, red, or white (and then lacking a red blaze); buds not glutinous; fruit smooth (or with some prickles in *A. glabra* var. *glabra*); leaflets 5 (-7) per leaf; [native].
2. Petals white, unmarked with red; stamens exerted, 2-4× as long as the petals; inflorescence 2-5 dm long; [section *Macrothyrsus*] .................. ................................................................. *A. parviflora*
3. Stamens about 2× as long as the petals, well-exserted beyond the corolla; petals only slightly unequal in size; fruit spiny with short prickles (rarely essentially smooth) ................................................................. *A. glabra* var. *glabra*
3. Stamens about 1× as long as the petals, included or barely exerted beyond the corolla; petals markedly unequal in size; fruit smooth.
4. Petal margins villous, not glandular; petals yellow; fruits 2-8 cm in diameter. .................................................................................................................. *A. pavia* var. *pavia*
4. Petal margins villous, not glandular; petals yellow; fruits 2-8 cm in diameter. .................................................................................................................. *A. sylvatica*
5. Calyx and pedicels stipitate-glandular; large tree; petiolules 2-3 (-4) mm long; fruits 5-8 cm in diameter .................. *A. flava*
5. Calyx and pedicels puberulent; shrub to small tree; petiolules 3-12 mm long; fruits 2-4 cm in diameter .................. *A. sylvatica*

### Aesculus flava Solander, Yellow Buckeye.

Moist forests, up to nearly 2000m, especially prominent in seepy cove forests, in the Piedmont only in "montane" habitats. Late April-mid June; August-September. A broad Southern Appalachian endemic: sw. PA, s. OH, s. IN, and s. IL south through KY, WV, sw. VA, and TN to n. AL, n. GA, nw. SC, and w. NC. *A. flava* is one of the largest, most massive, and commonest trees in Southern Appalachian coves, recognizable in winter by the bark of large plate-like slabs, thick twigs, and massive form. Meyer & Hardin (1987) discuss the nomenclatural issues relating to the names "A. flava" and "A. octandra." [= C, K, W; = A. octandra Marshall – RAB, F, G, Z; < A. octandra – S (also see *A. sylvatica*)]

### Aesculus glabra Willdenow var. *glabra*, Ohio Buckeye.

Mecis forests over limestone. April-May. Largely midwestern, but ranges east to sw. PA, e. TN, and nw. GA (Jones & Coile 1988); it is also sometimes introduced eastward of that distribution. It occurs in TN counties adjacent to both VA and NC. [= C, F, G, K, Z; < A. glabra – S, WV]

### Aesculus hippocastanum Linnaeus, Horsechestnut.

Urban and suburban areas, perhaps not definitely naturalized, but fairly often planted as a street tree and escaping as seedlings in the vicinity of plantings; native of se. Europe. [= C, F, G, K, Z]

### Aesculus parviflora Walter, Bottlebrush Buckeye.

Mecis forests on bluffs and in ravines (the SC occurrence is on Fall Line river bluffs, with shaley, subcalcareous soils). Wc. GA west to nc. AL, south to sw. GA and sw. AL; disjunct in wc. SC (Aiken County). See Wyatt (1985) for a discussion of the interesting, relicsual occurrence in SC. Occasionally planted outside its native range. [= C, S, Z]

### Aesculus pavia Linnaeus var. *pavia*, Red Buckeye.

Swamp forests, usually stagnant, usually blackwater (not receiving significant alluvium), and especially over marl (coquina limestone). April-early May; July-August. Var. *pavia* ranges from se. NC south to c. peninsular FL and west to e. TX, extending north into the Mississippi Embayment to se. MO and s. IL, and in scattered occurrences off the Coastal Plain, as in sc. TN; also it is sometimes cultivated further inland and persistent or slightly naturalizing. Var. *flavescens* (Sargent) Correll occurs in the Edwards Plateau of c. TX. Fernald reports this species from VA and WV, but there is likely taxonomic or nomenclatural confusion. [= K, Z; < A. pavia – RAB, C, G, S, W, WH; >> A. pavia – F; << A. discolor Pursh – F]

### Aesculus sylvatica Bartram, Painted Buckeye.

In the Piedmont in mesic, nutrient-rich forests, on bottomlands, lower slopes, and in ravines, in the Coastal Plain primarily on floodplains of brownwater (alluvium-carrying) rivers (most notably the Roanoke River in NC), in the Mountains only at low elevations. April-mid May; July-August. Primarily a Southeastern Piedmont endemic, occurring primarily in the Piedmont from sc. VA south through c. NC, c. SC, and nc. GA to nc. AL, with an extension north into e. TN. [= RAB, C, F, K, W, Z; = A. neglecta Lindley – G, misapplied; < A. octandra – S (also see *A. flava*); > A. georgiana Sargent]
3. Cardiospermum Linnaeus 1753 (Balloon Vine)

A genus of about 14 species, vines, of tropical regions (especially America).

4. Koelreuteria Laxmann 1772 (Golden Rain Tree)

1 Leaves pinnate (rarely bipinnate in part), the leaflets coarsely crenate to lobulate; capsule valves ovate, ca. 2 × as long as wide; capsules greenish to tawny when young, aging to dark brown............................................................K. paniculata
2 Leaves bipinnate, the leaflets entire to shallowly serrate; capsule valves orbicular, 0.9-1.4 × as long as wide; capsules rose-purple when young, aging to tawny-brown.

2 Leaflets weakly oblique, acute to short-acuminate, entire to shallowly serrate; petals 4 (-5) ............................................................K. bipinnata
2 Leaflets strongly oblique, long acuminate to caudate, entire to irregularly crenate-serrate; petals (4-) 5 ............................................................K. henryi

*Koelreuteria bipinnata* Franchet, Bougainvillea Golden Rain Tree. Disturbed areas, roadsides; native of s. China. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive. [= Z]

*Koelreuteria henryi* Dümmer, Flamegold. Disturbed areas, roadsides; native of Taiwan. This taxon appears to be distinct morphologically and geographically from *K. elegans*, and warrants recognition at the species level. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive, and established just south of our area in peninsular FL. [= Koelreuteria elegans (Seem.) A.C. Smith ssp. formosana (Hayata) F.G. Meyer – K, WH, Z]

5. Sapindus Linnaeus 1753 (Soapberry)

A genus of about 13 species, trees, of tropical and warm temperate regions of the Old and New World.

*Sapindus marginatus* Willdenow, Florida Soapberry. Coastal marsh hammocks, shell middens. May-June. Se. SC (?) and e. GA south to c. peninsular FL (Lee and Brevard counties), and on the Gulf Coast in s. MS. Small (1933) reports this species from SC, but there is doubt whether this species was actually ever documented to occur in SC; there are no recent records. Although sometimes combined (as by K) with the tropical *Sapindus saponaria*, I follow most recent Florida authors (Clewell 1985, Tomlinson 1986, Godfrey 1988, Nelson 1994, Nelson 1996) in maintaining it as distinct. *S. marginatus* is a species of n. FL, e. GA, and possibly SC and has wingless rachises, acuminate leaflets, and globose fruits; *S. saponaria* is a species of s. FL and tropical America and has winged rachises, rounded leaflet tips, and ovoid to globose fruits. [= RAB, S; < S. saponaria Linnaeus var. saponaria – K]

6. Dodonaea P. Miller 1754 (Varnishleaf, Hopbush)

A genus of about 65 species, shrubs, mainly Australian.

*Dodonaea viscosa* (Linnaeus) Jacquin, Varnishleaf, Hopbush. Widespread in the Old World and New World tropics, north in FL to St. Johns County. [= S, WH; < D. viscosa – K]
241. RUTACEAE A.L. de Jussieu 1789 (Citrus Family) [in SAPINDALES]

A family of about 156 genera and 1800 species, trees, shrubs, vines, and rarely herbs, cosmopolitan.

1 Leaves unifoliolate (appearing simple); [subfamily Aurantioideae] .............................................................................................. Citrus
2 Leaves pinnately or palmately compound.

2 Petiole not winged, and lacking an articulation at the juncture with the blade; fruit 4.5-15 cm long.................................................... C. trifoliata
2 Petiole winged, and with an articulation at the juncture with the blade; fruit 4.5-15 cm long.................................................... C. ×aurantium

* Citrus ×aurantium (Linnaeus) Burmann f., Lemon, C. ×paradisi Macfadyen in Hooker (pro sp.), Grapefruit, and C. sinensis (Linnaeus) Osbeck, Orange, have been grown on the Outer Banks of North Carolina in Buxton, Dare County, NC (Brown 1959). They are apparently not naturalized, being killed outright or severely damaged by occasional colder winters, and are not keyed or otherwise treated here.

1 Leaves trifoliolate; fruit densely pubescent, 3-6 cm long........................................................................................................ C. trifoliata
1 Leaves unifoliolate; fruit glabrous, 4.5-25 cm long.

* Phellodendron Ruprecht 1857 (Cork-tree)

A genus of about 10 species, trees, native of e. Asia.

* Phellodendron japonicum Maximowicz, Japanese Cork-tree. Pd (DE), Mt (WV): suburban woodlands; uncommon (rare in WV), native of Japan. [= C, K1; ? P. amurense Ruprecht – K2]
**RUTACEAE**

**Ptelea** Linnaeus 1753 (Hop-tree, Wafer-ash, Stinking Ash)

A genus of about 11 species, of North America (south into Mexico). References: Bailey (1962)=Z.

*Ptelea trifoliata* Linnaeus, Hop-tree. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): rocky bluffs, especially calcareous or mafic; open woodlands, calcareous Coastal Plain river bluffs, granitic domes; uncommon. April-June; June-August. NJ, w. NY, MI, s. WI, and NE south to c. peninsular FL, c. AL, c. MS, e. and s. TX. Bailey (1962) treats two varieties in our areas, doubtfully distinguishable; they need additional study. [= RAB, WH; > *P. trifoliata* var. *mollis* – F, WV; > *P. trifoliata* var. *trifoliata* – F, WV; > *P. trifoliata* ssp. *trifoliata* var. *mollis* Torrey & A. Gray – C, K, Z; > *P. trifoliata* ssp. *trifoliata* var. *trifoliata* – C, K, Z; = *P. trifoliata* var. *trifoliata* – G; > *P. trifoliata* – S; > *P. servaisi* Small – S; > *P. microcarpa* Small – S; > *P. baldwinii* Torrey & A. Gray – S]

**Ruta** Linnaeus 1753 (Rue)

A genus of about 7 species, of the Old World.

* Ruta graveolens Linnaeus, Rue. Pd (NC, VA), Mt (VA, WV): cultivated in gardens as a medicinal herb, persistent and rarely escaping, sometimes locally abundant in pastures over limestone or gravelly floodplains; rare, native of Eurasia. May-August; June-September. This plant causes dermatitis in some people, apparently by removing the skin's sun-resistance. *Ruta* has a disagreeable smell, and has toxic properties. [= RAB, C, F, G, K, S, WV]

**Zanthoxylum** Linnaeus 1753 (Prickly-ash, Toothache Tree)

A genus of about 250 species, of America, Africa, Asia, and Australia. References: Porter (1976)=Z.

1 Leaves thin in texture, pubescent; flowers in small axillary clusters ................................................................. *Z. americanum*

1 Leaves coriaceous in texture, glabrous and waxy; flowers in large terminal compound cymes .................................... *Z. clava-herculis*

**Zanthoxylum americanum** P. Miller, Prickly-ash, Toothache Tree, Northern Prickly-ash. Woodlands and forests over calcareous or mafic rocks, often forming extensive colonies near outcrops. March-April; July-August. S. QC west to e. ND, south to e. SC, c. GA, Panhandle FL, e. TN, c. TN, and OK. Sometimes planted. There is only a single known site in SC. [= RAB, C, K, W, S, WH, WV, Z; = *Xanthoxylum americanum* – F, orthographic variant]

**Zanthoxylum clava-herculis** Linnaeus, Toothache Tree, Hercules'-club, Sea-ash, Southern Prickly-ash, Pepper-bark, Tickle-tongue. Maritime forests, dunes, shell middens, shell hammocks, maritime scrub, inland (in FL and GA) in hammocks. April-May; July-September. A Southeastern Coastal Plain endemic: se. VA south to FL and west to TX, AR, and OK. The compound leaves are armed with stout prickles along the rachis. The twigs are also spiny. On the larger branches and trunks, the spines become elevated on conical, pyramidal, or cylindrical corky bases up to 5 cm long and 4 cm in diameter, giving the trunk a very peculiar appearance. Many of the common names come from the numbing effect on the mouth of chewing the leaf or twig, the flavor, smell, and effect being very similar to *Ctenium aromaticum*, Toothache Grass. In the northern part of its distribution, it is restricted to the outer Coastal Plain, nearly entirely on the barrier islands. Although normally a small tree, it can reach considerable size, up to about 60 cm DBH. In the 5 km immediately north of Buxton, Dare County, NC one can see several hundred individuals growing on open, *Uniola*-dominated dunes. Because of salt-pruning, the trees often have 5 times as wide a spread as they are tall. Some trees have a basal diameter of 30-40 cm, a short trunk less than a meter tall, a total height of 2-3 m, and a spread of 10 m. [= RAB, C, G, K, S, WH, Z; = *Zanthoxylum clava-herculis* – F, orthographic variant]

**242. SIMAROUBACEAE** A.P. de Candolle 1811 (Quassia Family) [in SAPINDALES]

A family of about 13 genera and 111 species, trees and shrubs of primarily tropical areas of the New World and Old World. The Leitneriaceae has been traditionally considered to be a monotypic family, endemic to se. North America; a variety of recent studies have suggested its inclusion in the Simaroubaceae (Angiosperm Phylogeny Group 1998, 2003, 2009; Bogle in FNA 1997). References: Angiosperm Phylogeny Group (1998, 2003). [including LEITNERIACEAE]

1 Leaves compound; [species alien, aggressively naturalizing in upland sites].................................................................................. *Ailanthus*

1 Leaves simple; [species native, in wetland sites].................................................................................................................. *Leitneria*
**Simaroubaceae**

*Ailanthus* Desfais 1788 (Tree-of-Heaven)

* Ailanthus altissima* (P. Miller) Swingle, Tree-of-Heaven, Copal Tree, Stink-tree. Roadsides, forests, disturbed areas, including cities, especially in moist, fertile soils; native of e. Asia. Late May-early June; July-October. In our area, this tree is now an aggressive and noxious weed, colonizing even undisturbed forests and outcompeting the native vegetation. As serious a weed as it is here, it is (at the time of this writing, at least), much worse to the north, now the dominant tree in fencerows, woodlots, and forests in the urbanized, suburbanized, and even rural Northeast. It can be recognized vegetatively by its large pinnately compound leaves, very stout twigs (over 1 cm thick), and the characteristic and unpleasant odor of the crushed foliage. [= RAB, C, F, G, K, S, W]

*Leitneria* Chapman 1860 (Corkwood)

*Leitneria floridana* Chapman, Corkwood. Swamps and cabbage palm / sawgrass marshes. February-March. Sw. GA and Panhandle FL west to e. TX, and north in the Mississippi Embayment to AR and MO, very scattered in occurrence. [= FNA, GW, K, S, WH]

### 243. Meliaceae

A.L. de Jussieu 1789 (Mahogany Family) [in Sapindales]

A family of about 50 genera and 565 species, trees and shrubs, of tropical and subtropical areas. The only native member of the family in e. North America is *Swietenia mahogani* (Linnaeus) Jacquin (West Indian Mahogany), a very valuable timber tree which ranges north to s. FL. References: Miller (1990)=Z in the synonymy.

*Melia* Linnaeus 1753 (Chinaberry)

A genus of 3 species, trees, of the Old World tropics.

* Melia azedarach* Linnaeus, Chinaberry, Carolina Mahogany, Umbrella-tree, Pride-of-India. Disturbed areas, abandoned rural yards and fields; native to se. Asia, commonly cultivated in our area (mainly in the Coastal Plain) and commonly escaped. April-May; September-October. [= RAB, C, F, G, K, S, WH, Z]

### 250. Malvaceae

A.L. de Jussieu 1789 (Mallow Family) [in Malvales]

Malvaceae has always been difficult to circumscribe cleanly, relative to members of such families as Sterculiaceae and Tiliaceae. Molecular evidence now adds to morphologic evidence that traditional circumscriptions of these families are highly polyphyletic. Bayer et al. (1999) present a new classification of an expanded Malvaceae, with 9 subfamilies recognized. If circumscribed broadly (as here) to include Sterculiaceae and Tiliaceae, a family of about 243 genera and 4000-4500 species, herbs, shrubs, and trees, of cosmopolitan distribution, but especially diverse in the tropics and subtropics. This family includes several economically important species, including cotton (*Gossypium* spp.), cacao or chocolate, *Theobroma cacao* Linnaeus, and cola, *Cola acuminata* R. Brown. References: Bayer et al. (1999); Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell (1988). [including Sterculiaceae and Tiliaceae]

1. Petals absent; carpels 5, whorled, each expanding into a stalked and papery structure which bears 1-4 pea-sized seeds along its margins; tree; leaves 10-40 cm wide, 3-5 lobed, the lobes acute, the margins entire; [subfamily Sterculioideae] .............................................................................. **Firmiana**

1. Petals present; carpels 1, 5, or many, united or separate, but not as above; tree, shrub, or herb; leaves< 15 cm wide, lobed or unlobed, but if lobed then also serrate.

2. Epicalyx of bracts (immediately subtending the calyx) absent.

3. Stamens 5; [subfamily Byttnerioideae].
MALVACEAE

4 Ovary with 5 carpels and 5 styles; capsule with 5-10 seeds; corolla pink, purple, or white. ............................................................. Melochia
4 Ovary with 1 carpel and 1 style; capsule with 1 seed; corolla orange to yellow .................................................................[Waltheria]
3 Stamens >10.
5 Stamens free.
6 Tree; fruit a woody drupe; [subfamily Tiliioideae] ............................................................ Tilia
6 Herb or shrub; fruit a capsule; [subfamily Grewioideae].
7 Leaves rounded or suborbate at base, acute at apex; fruit much longer than broad, unarmed ...............................Corchorus
7 Leaves cuneate at base, acuminate at apex; fruit subglobose, with hooked spines ................................................Triumphetta
5 Stamens united into a staminal column adnate to the corolla at its base; [subfamily Malvoideae; tribe Malveae].
8 Seeds 2 or more per carpel ............................................................................................................................ Abutilon
8 Seed 1 per carpel.
9 Leaves palmately and deeply cleft (> 9/10s of the way to the midrib) into linear segments ..............................Callirhoe
9 Leaves unlobed or lobed (if lobed, < 4/5’s of the way to the midrib and the lobes broad).
10 Flowers many in a terminal panicle; corolla white; style branches filiform, the stigmatic surface elongate along the inner side of the branches; leaves >10 cm wide, deeply 5-9-lobed; plants 1-2 m tall ..........................................................Napaea
10 Flowers solitary or a few in leaf axils (or many in a terminal panicle in Sida hermaphroditica); corolla blue-purple, yellow, or white; style branches truncate, the stigmatic surface terminal and capititate; leaves < 2cm wide, unlobed (or leaves >10 cm wide and deeply 3-7-lobed in Sida hermaphroditica); plants < 1 m tall (or 1-4 m tall in Sida hermaphroditica). ..............................................Anoda
11 Corolla yellow or white; lateral walls of the carpels disintegrating at maturity of the fruit ......................................................... Sida

2 Epicalyx of bracts (immediately subtending the calyx) present.
13 Fruit fleshy and berry-like; [subfamily Malvoideae; tribe Hibisceae] ................................................................. Malaviscus
13 Fruit a loculicidal capsule.
14 Calyx spathe-like, soon falling after anthesis; [subfamily Malvoideae; tribe Hibisceae] .................................Abelmoschus
14 Calyx radially symmetrical, 5-lobed.
15 Style branches short, erect, the stigmas nearly sessile; epicalyx bracts 3, large, foliaceous, and incised; seeds bearing long white fibers; [subfamily Malvoideae; tribe Gossypiae] ................................................................. Gossypium
15 Style branches elongate, spreading; epicalyx bracts 6-15, linear to lanceolate and untoothed; seeds sometimes pubescent but not withy long white fibers; [subfamily Malvoideae; tribe Hibisceae].
16 Locules of the fruit several-seeded; capsule longer than broad, the apex pointed or rounded, petals yellow, white, red, or pink (if pink, then > 4 cm long, or the plant a shrub). ................................................................. Hibiscus
16 Locules of the fruit 1-seeded; capsule depressed-globose, indented at the apex; petals pink, 2-4 cm long. ................................. Kosteletzkya
10 Fruit of radially disposed, 1- to several-seeded, dry carpels that split apart at maturity.
17 Bracts of the epicalyx 5 or more.
18 Shrubs or woody herbs, with leaves not basally disposed; flowers in axes of well-developed leaves; fruit spiny (or lacking spines in Pavonia hastata); [of SC southward]; [subfamily Malvoideae; tribe Hibisceae].
19 Bracts of the epicalyx 5-15, distinct; fruit with 0-3 spines per carpel; leaves lacking foliar nectaries ............................Pavonia
19 Bracts of epicalyx 5, fused basally; fruit covered with numerous glochidiate spines; leaves with 1-3 foliar nectaries (glands) on undersurface near base ......................................................... Urena
18 Herbs, with leaves basally disposed; flowers in terminal bracteates spikes or racemes; fruit lacking spines; [collectively widespread]; [subfamily Malvoideae; tribe Malveae].
20 Plant 1.5-3 m tall, usually unbranched; flowers 6-10 cm across ................................................................................. Alcea
20 Plant 0.5-1.2 m tall, branched; flowers 2-3 cm across ............................................................................................. Althaea
17 Bracts of the epicalyx 2-3; [subfamily Malvoideae; tribe Malveae].
21 Ovules and seeds 2 or more per carpel.
22 Herb 0.5-2.5 m tall, upright; petals 2-3 cm long, pink-purple; carpels not beaked at the tip ...................................................................... Iliamna
22 Herb to 0.5 m tall, prostrate to ascending; petals 0.3-0.5 cm long, orange-red; carpels beaked at the tip .................................................................... Mediola
21 Ovules and seeds 1 per carpel.
23 Leaf blades 1.5-8× as long as wide.
24 Style branches filiform, the stigmatic surface elongate along the inner side of the branches .............................. Callirhoe
24 Style branches truncate, the stigmatic surface terminal and capititate ............................................................. Malvastrum
23 Leaf blades orbicular, about as wide as long.
25 Leaves deeply palmately cleft ................................................................................................................................. Callirhoe
25 Leaves unlobed or shallowly lobed ................................................................................................................................. Malva

Abelmoschus Medikus 1787 (Okra, Gumbo)

* Abelmoschus esculentus (Linnaeus) Moench, Okra, Gumbo. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): frequently cultivated in gardens, rarely persistent or self-seeding the year following; common in cultivation, rare (as an escape), native of Africa. The young capsules are a famous component of southern cooking. [= FNA, K, S, WH; = Hibiscus esculentus Linnaeus – F]

Abutilon P. Miller 1754 (Indian-mallow, Indian-hemp)

Alcea Linnaeus 1753 (Hollyhock)

* Alcea rosea Linnaeus, Hollyhock. Cp (NC, VA), Pd (DE, NC, VA), Mt (NC, VA, WV) {GA}: roadsides, dumps, frequently cultivated, less commonly escaped or persistent; uncommon (rare in GA, NC, VA, and WV), native of Eurasia. Late May-August (rarely later). [= FNA, K; = Althaea rosea (Linnaeus) Cavanilles – RAB, C, F, G]

* Alcea rugosa Alefeld, Russian Hollyhock. Reported for MD. [= FNA] {not yet keyed}

Althaea Linnaeus 1753 (Marsh-mallow)

* Althaea officinalis Linnaeus, Marsh-mallow. Cp (VA): marshes; rare, native of Europe. The roots of this plant were the original source of the mucilaginous paste used to make marshmallows (which are now made with a synthetic mucilage). [= C, F, FNA, G, K]

Anoda Cavanilles 1785 (Anoda)

Callirhoe Nuttall 1821 (Poppy-mallow)

1. Calyx not subtended by an epicalyx.
2. Inflorescence racemose, corymbose, or nearly umbellate; petals white, pink, or mauve; plants ascending, 1.5-8.5 dm tall; mericarps pubescent with simple, appressed hairs................................................................. C. alcaeoides
3. Inflorescence paniculate; petals deep red, with a white basal spot; plants erect, 5-20 dm tall; mericarps glabrous................................. C. pedata

1. Calyx subtended by an epicalyx of 3 bractlets.
2. Calyx lobes distinct and divergent in bud; stems decumbent ................................................................. C. involucrata var. involucrata
3. Calyx lobes valvate in bud, forming a point; stems erect, ascending, or decumbent.
4. Bractlets of the epicalyx linear, 0.1-1.7 mm wide; peduncles 1-flowered; calyx lobes lanceolate, 7-15.4 mm long; mericarps indehiscent; leaves cordate or ovate in outline, palmately deeply divided into 5-7 lobes ................................................................. C. papaver
5. Bractlets of the epicalyx obovate, 2.5-4.6 mm wide; peduncles several-flowered; calyx lobes deltoid, 2.5 (-6.5) mm long; mericarps dehiscent; leaves triangular, not lobed or only slightly so ................................................................................................................. C. triangulata

Callirhoe alcaeoides (Michaux) A. Gray, Pale Poppy-mallow. Calcareous prairies, glades, and other open habitats. E. NE south through e. and OK to c. TX; disjunct and scattered eastwards in IA, MO, AR, nw. LA, IL, s. IN, c. KY, c. TN, and c. AL (Dorr 1990). [= C, F, G, K, Z; = Callirhoe alcaeoides – S, orthographic variant]

* Callirhoe involucrata (Torrey & A. Gray) A. Gray var. involucrata. Purple Poppy-mallow. Pd (VA): disturbed areas; rare, adventive from its native range in the midwestern United States. [= C, G, K, Z; < C. involucrata var. involucrata – F

* **Callirhoe pedata** (Nuttall ex Hooker) A. Gray, Palmleaf Poppy-mallow. Mt (GA): occasionally mowed roadside and adjacent powerline right-of-way, with other species of calcareous prairie habitats, one occurrence recorded to date; rare, plausibly native, but perhaps only adventive from a native range in prairies and glades of the sc. United States (w. AR and e. OK, south to c. TX). Previously misidentified as *C. digitata* Nuttall. [= K, Z]

**Callirhoe triangulata** (Leavenworth) A. Gray, Sand Poppy-mallow, Clustered Poppy-mallow. Sandhills, sandy scrub, and other dry, open habitats. Sc. NC south to GA and west to ec. MA (upper Coastal Plain and lower Piedmont); also sw. WI and ne. IA south to s. IN, s. IL, and se. MO. [= C, F, G, K, Z; = Callirhoë triangulata – S, orthographic variant]

**Corchorus Linnaeus 1753 (Jute)**

**Firmiana Marsili 1786 (Chinese Parasol-tree, Phoenix Tree)**

**Gossypium Linnaeus 1753 (Cotton)**

**Identification notes**: Agricultural cotton is now a complex set of cultivars, some involving cross-breeding between the two species treated below, and some plants may not be readily identifiable to species.

1 Capsule 3-6 cm long, narrowly ovoid to elongate, its surface deeply pitted with oil glands; leaves 3-7-lobed, the central lobe usually > 1.5× as long as wide; stipules 1-5 cm long; corolla deep yellow; long fibers of the seed completely separable from the seed; short fibers of the seed absent or present................................................................. **G. barbadense**

1 Capsule 2-3 cm long, ovoid to subglobose, its surface smooth; leaves 3-5-lobed, the central lobe usually 1.0-1.5× as long as wide; stipules 0.5-1.5 (-2.0) cm long; corolla pale yellow; long fibers of the seed firmly attached to the seed; short fibers of the seed present ...... **G. hirsutum**

* **Gossypium hirsutum** Linnaeus, Upland Cotton. Cp (FL, GA, NC, SC, VA): frequently cultivated crop, especially in sandy soils of the Coastal Plain, rarely adventive or a waif, common (as a crop), rare (as an adventive), native of Central America, South America, the West Indies, and s. FL. Probably first domesticated in the Yucatan Peninsula. [= C, G, WH, Z; > G. hirsutum var. hirsutum – K; = G. herbaceum Linnaeus – F, misapplied; > G. herbaceum – S; > G. hirsutum – S, misapplied]

**Hibiscus Linnaeus 1753 (Hibiscus, Rose-mallow)**

MALVACEAE

1 Woody shrub, the stems usually solitary from a creeping rhizome; [section Hibiscus].................................................................H. syriacus
2 Herb (sometimes robust and to as tall as 3.5 m), often several from ground level, from a crown or taproot.
3 Perennial from a crown, usually 0.7-3.5 m tall; calyx not inflated at maturity; capsule 1.7-3.5 cm long; petals 4-14 cm long; leaves 4-25 cm long, deeply cleft, hastate-lobed, or not at all lobed or cleft.
4 Leaves and stems harshly scabrous; calyx lobes each with an elongate purplish nectary on the back; [of pine savannas and dry sandy soils of maritime forest edges, from se. NC southward]; [section Furcaria].........................................................................................H. aculeatus
5 Leaves and stems glabrous, softly pubescent, or slightly scabrous; calyx lobes lacking nectaries; [of marshes and swamps (sometimes cultivated in drier soils), collectively widespread in our area]; [section Muenchhausia].
6 Stem glabrous; leaves glabrous; leaves either palmately 3-5-lobed, or prominently halberd-lobed at the base (uncommonly unlobed).
7 Leaves either palmately 3-5-lobed, petals bright scarlet;..............................H. coccineus
8 Leaves halberd-lobed at the base (uncommonly unlobed); petals pink or white with a purplish base;..............................H. laevis
9 Stem pubescent at least when young; leaves pubescent on at least one surface; leaves unlobed or slightly lobed toward the tip (except H. grandiflorus).
10 Staminal column 6.2-9.5 cm long, > ½ × as long as the petals; petals 8.5-14 cm long; [e. GA southwards].............................H. grandiflorus
11 Staminal column 1.2-5 cm long, < ½× as long as the petals; petals 4-12 cm long; [widespread].
12 Capsule pubescent (the dark surface largely or completely obscured); bracts of the involucel usually ciliate; upper leaf surface usually densely stellate-pubescent.................................................................H. lasiocarpus
13 Capsule glabrous and dark brown to black; bracts of involucel ciliate; upper leaf surface glabrous or nearly so .............................H. moscheutos

Hibiscus grandiflorus Michaux, Large-flowered Hibiscus. Cp (FL, GA): tidal marshes, lakeshores, wet flatwoods and savannas; rare. E. GA (Chatham Co., adjacent to the SC border) (Jones & Coile 1988) south to s. FL, west to e. LA; e. Cuba. [= FNA, GW, K, S, WH]

Iliamna Greene 1906 (Globe-mallow)

1 Leaves 5-7-lobed, the lobes narrowly triangular, the sinuses acute; flowers odorless; plant to ca. 1 m in height; [sandstone outcrops on ridgetop]..................................................................................................................I. corei
2 Leaves 5-7-lobed, the lobes broadly triangular or deltoid, the sinuses obtuse; flowers fragrant; plant to ca. 2.5 m in height; [of river shores and along railroads] ..................................................................................I. remota

Iliamna corei Sherff, Peters Mountain Mallow. Mt (VA): in shallow soil in crevices of outcroppings of Clinch sandstone, near the summit of Peters Mountain; rare (US Endangered, VA Endangered). June-August; July-October. Endemic to the
**MALVACEAE**

summit of Peters Mountain, Giles County, VA. The validity of *I. corei* as a species distinct from *I. remota* is supported by Bodo Slotta & Porter (2006). [= F, Y, Z; < *I. remota* – C, G, W; < *I. rivularis* (Douglas ex Hooker) Greene var. *rivularis* – K]

**Hliamna remota** Greene, Kankakee Globe-mallow. Mt (VA): shores and gravel bars along rivers, and along railroad embankments; rare. June-August; July-October. W. VA; nw. IN and ne. IL. Considered by some to be introduced only in our area, however, the VA populations are genetically different than those in IN and IL (Bodo Slotta & Porter 2006). [= F, Y, Z; < *I. remota* – C, G, W; < *I. rivularis* (Douglas ex Hooker) Greene var. *rivularis* – K; ? Sphaeralcea remota (Greene) Fernald]

**Kosteletzya** K. Presl 1835 (Seashore-mallow)

**Kosteletzya pentacarpos** (Linnaeus) Ledebour, Seashore-mallow, Saltmarsh-mallow, Fen-rose. Cp (FL, GA, NC, SC, VA): brackish to fresh water tidal marshes; common. July-October. NY (Long Island) south to s. FL, west to TX; West Indies. Several varieties have often been recognized on the basis of length of hairs and of parts of the flower and inflorescence (see synonymy). While geographic trends are readily apparent, the recognition of infraspecific taxa is made problematic by the non-correlation of various characters. In recent studies, neither Blanchard (2008) nor Alexander (2010) recognize varieties in our flora area. *K. smilacifolia* A. Gray, of peninsular FL, appears to warrant specific status, as treated by Small (1933). It also appears that the Eurasian *K. pentacarpos* represents an early introduction of North American *Kosteletzya* to the Old World (probably via ship’s ballast) and is conspecific; *K. pentacarpos* (based on European material) has nomenclatural priority over *K. virginica* (Blanchard 2008). [< WH, Z; < *K. pentacarpos* – FNA, orthographic variant; = *Kosteletzya virginica* – RAB, orthographic variant; > *Kosteletzya virginica* var. *aquilonia* Fernald – C, F, G; > *Kosteletzya virginica* var. *virginica* – C; > *Kosteletzya virginica* var. *virginica* – F, G; > *Kosteletzya virginica* var. *althaeifolia* Chapman – F, G; > *Kosteletzya virginica* Linnaeus) K. Presl ex A. Gray – GW, K; > *Kosteletzya althaeifolia* (Chapman) Rusby – S; > *Kosteletzya virginica* – S; = *Kosteletzya pentacarpos* var. *pentacarpos* – Y; = *Hibiscus pentacarpos* Linnaeus]

**Malva** Linnaeus 1753 (Mallow)

A genus of about 40 species, herbs, of temperate Eurasia and montane Africa. References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003). Key based in part on FNA.

1 Upper leaves 5-7-lobed, the sinuses cut over halfway to the middle; petals 20-35 mm long; erect perennial........................................... *M. moschata*

1 Upper leaves less deeply lobed, rarely to as deep as halfway to the middle; petals 5-30 (-45) mm long; prostrate to erect annual or biennial.

2 Epicalyx of 3 oblong-ovate bractlets; petals reddish purple, (12-) 16-30 (-45) mm long; biennial, erect, usually not branched at the base .......... *M. neglecta*

2 Epicalyx of 3 linear or linear to narrowly lanceolate bractlets; petals white or pink, 3-15 mm long; annual, sprawling, usually branched at the base (except *M. verticillata*).

3 Bractlets of the epicalyx linear; petals to 3-5 mm long, white to pale lilac .......................................................... *M. parviflora*

3 Bractlets of the epicalyx broadly linear to narrowly lanceolate; petals (3-) 5-10 mm long, pink or purple (rarely white).

4 Stems erect, usually < 5 dm long; leaf blades 3-8 (-17) cm long ................................................................. *M. neglecta*

4 Stems prostrate to ascending, to 5 dm long; leaf blades 1.5-5 cm long.

5 Petals 6-13 mm long, about 2× as long as the sepals; mature mericarps slightly roughened or obscurely reticulate........... *M. pusilla*

5 Petals 3-6 mm long, about 1× as long as the sepals; mature mericarps strongly rugose-reticulate.............................. *M. pusilla*

* Malva pusilla* Smith, Small Mallow, Dwarf Mallow, Cheeses. Mt (VA): pastures, roadsides, barnyards; rare, native of Europe. [= FNA; = *M. rotundifolia* Linnaeus – C, F, G, K, S, rejected because of uncertain application]

**Malvastrum** A. Gray 1849 (False-mallow)

1 Leaves glabrous or nearly so on the lower surface ........................................................................................................................

1 Leaves broadly lanceolate to broadly ovate, 1.5-2.5× as long as wide; plant (5-) 10-20 dm tall; [of near coastal habitats, mainly FL, waifs elsewhere].

2 Hairs of the stems stellate with 5-12 ascending rays; leaves often shallowly 3-lobed............................................................................

2 Hairs of the stems stellate with 2-5 appressed rays; leaves unlobed.

3 Mericarps with minute cusps, none longer than 0.1-0.4 mm long ....................................................................................

3 Mericarps with well-developed sharp cusps, the larger 1-2 mm long.................................................................

**Malvastrum angustum** A. Gray, Hairy False-mallow. Mt (VA): limestone barrens; rare (VA Rare). July-August; August-October. KY, w. VA (Lee Co.), and c. TN, west to IA, KS, and OK. Discovered in our area in 1994 by J.C. Ludwig (Fleming & Ludwig 1996). [= FNA; = Malvastrum hispidum (Pursh) Hochreutiner – C, K, epithet misapplied; = Malvastrum angustum A. Gray – G, S; ? Sphaeralcea angusta (A. Gray) Fernald – F; = Sidopsis hispidum (Pursh) Rydberg, epithet misapplied; = Sida hispida Pursh, misapplied]

**Malvastrum americanum** (Linnaeus) Torrey. Cp (FL): disturbed areas; rare. January-December. FL, TX south through Central America to South America; West Indies; also in the Old World tropics. [= FNA, K, WH]

**Malvastrum corchorifolium** (Desrousseaux) Britton ex Small. Cp (FL): coastal hammocks; rare. January-December. FL and AL south to Central America; West Indies. [= FNA, K, WH]

* * Malvastrum coromandelianum* (Linnaeus) Garcke, Cp (FL): coastal hammocks, waif on ballast; rare, native of tropical America (TX to Argentina). January-December. Northern occurrences, such as in PA (Rhoads & Klein 1993) and NJ (Kartesz 1999), represent old records of ballast waifs. [= FNA, K, WH]

**Malvaviscus** Fabricius 1759 (Wax-mallow)

1 Leaves pubescent on the lower surface.................................................................................................................................

1 Leaves glabrous or nearly so on the lower surface ...................................................................................................................

**Malvaviscus penduliflorus** DC., Turk’s-cap Mallow, Mazapan. Cp (FL): disturbed areas; rare, native of tropical America. April-November. [= K, WH; = M. arboreus Dillenius ex Cavanilles var. penduliflorus (DC.) Schery; *Hibiscus*]

**Melochia** Linnaeus 1753 (Chocolate-weed)

1 Petoles >1.5 cm long; pubescence of the stem and leaves sparse, of stellate, forked, and/or simple hairs; cymes terminal on primary and secondary branches..........................................................

1 Petoles < 1 cm long; pubescence of the stem and leaves dense (tomentose), of stellate hairs; cymes in upper leaf axils..........

**Melochia spicata** (Linnaeus) Fryxell, Bretonica-peluda. Cp (FL, GA*): disturbed areas; rare, native of tropical America, the original distribution uncertain. In GA (Kartesz 1999) and FL (Brizicky 1966). [= K, WH; = Riedlea hirsuta (Cavanilles) Alphonse de Candolle – S; = Melochia villosa (P. Miller) Fawcett & Rendle – Y]

**Modiola** Moench 1794 (Bristly-mallow)

**Modiola caroliniana** (Linnaeus) G. Don, Bristly-mallow. Cp (FL, GA, NC*, SC, VA*), Pd (GA, NC*, SC*, VA*): lawns, roadsides, disturbed areas, pondshores; uncommon (rare in DE), adventive in part of its range in our area. Late March-June...

1 Leaves ovate; calyx lobes lanceolate; carpels with 3 apical awns up to 10 mm long; [rare native] ........................................................ P. hastata
1 Leaves ovate; calyx lobes lanceolate; carpels with 3 apical awns up to 10 mm long; [rare native] ........................................................ P. spinifex

Pavonia spinifex (Linnaeus) Cavaines, Gingerbush. Cp (FL, SC): hammocks; rare. Reported for the vicinity of Charleston, SC on the basis of a specimen collected by Bachman (Chapman 1878). Small (1933) considers this species as likely native, at least in FL. [= K, S, WH]

Sida Linnaeus 1753 (Sida)

1 Leaves hastate; calyx lobes broadly ovate; carpels un-awned; [introduced species of disturbed habitats]................................................. S. hermaphrodita
1 Leaves hastate; calyx lobes broadly ovate; carpels un-awned; [introduced species of disturbed habitats]................................................. S. hermaphrodita

Sida cordifolia Linnaeus. Cp (AL, FL): disturbed sandhills, disturbed hammocks; rare, native of tropical America. [= K, S, WH, Z]

Sida elliottii Torrey & A. Gray var. elliottii, Coastal Plain Sida. Cp (GA, NC, SC, VA), Pd (NC), Mt (GA): stream banks, sandy openings, pineland pond margins, limestone glades and barrens, mesic hammocks; uncommon (GA Special Concern). July-October. Var. elliottii ranges from se. VA south to n. FL, west to LA and north in the interior to c. TN and se. MO. A second variety, var. parviflora Chapman, occurs in Peninsular FL, se. TX, and through montane e. Mexico to Guatemala. S. elliottii, of se. VA and ne. NC, is alleged to differ as follows: S. elliottii with calyx 7-10 mm long, leaves elliptic to narrowly elliptic, 4-20 mm wide, (3-) 4-10× as long as wide (vs. S. elliottii var. elliottii with calyx 5-7 mm long; leaves narrowly lanceolate to linear, 1.5-7 mm wide, 10-20× as long as wide). [= Y; < S. elliottii – RAB, C, F, G, K, S, WH, Z; > S. elliottii Femald – F, K, Z]

Sida hermaphrodita (Linnaeus) Rusby, Virginia Sida, Virginia-mallow. Mt (VA, WV), Pd (VA): sandy or rocky areas along riverbanks; rare. July-August. C. PA and MD west to s. OH, south to DC, WV, w. VA, and ne. TN; disjunct in nw. OH, ne. IN, and s. MI (where presumably native) and with additional collections from e. MA, NY (Long Island), and s. NJ (where probably adventive) (Spooner et al. 1985). Fryxell (1985) comments that this species is so different from the rest of the genus that "one might plausibly argue that it be elevated to generic rank." A molecular phylogenetic analysis suggests that its affinities
are not with Sida, but with the South American Sidasodes (Fuertes, Fryxell, & Jansen 2003). Spooner et al. (1985) provide a

* Sida rhombifolia Linnaeus var. rhombifolia, Arrowleaf Sida. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, SC):
roadsides, fields, gardens, disturbed areas; common. April-October. Verdcourt (2004) discusses variation in this taxon, and
suggests that "studies throughout the entire range of the species will necessitate recognition of more than one species." He
recognizes 6 varieties in e. Africa, aside from the Linnaean var. rhombifolia (with type in Jamaica). [= X; < S. rhombifolia – RAB,

* Sida spinosa Linnaeus, Prickly Sida, Prickly-mallow, False-mallow. Cp (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt
(GA, NC, SC, VA, WV): disturbed areas, wet fields; common, (uncommon in FL, rare in DE), native of the Tropics. June-

Tilia Linnaeus 1753 (Basswood, Whitewood, Linden, Linn)

A genus of about 25-45 species, trees, of temperate regions of North America, Europe and Asia. Hardin’s (1990) treatment of
American Tilia seems a practical and reasonable approach; it gives taxonomic status to the more distinctive (and geographically
based) elements of variation, while recognizing the intergradational nature of the variation. Further investigation of this complex
group is, however, warranted. References: Hardin (1990)=Z; Bayer & Kubitzki in Kubitzki & Bayer (2003). Key adapted from

Identification notes: While the varieties treated below are broadly distinctive and have definite geographic distributions across e. North
America, they are imperfectly distinct in geographic areas of overlap. In our area, their identification is particularly problematic in Virginia,
where individuals in many parts of the state show intergradation between the northern var. americana and the Southern and Central Appalachian
var. heterophylla.

1 Lower leaf surfaces puberulent with bulbous glands, acicular trichomes, and (rarely) sparsely scattered stellate trichomes; fruiting peduncles
and pedicels glabrous or sometimes puberulent; [generally northern, south to VA and w. NC].......................... T. americana var. americana

1 Lower leaf surfaces usually tomentose or becoming puberulent, with bulbous glands, acicular trichomes, and a predominance of stellate or
fasciculate trichomes; fruiting peduncles and pedicels stellate-tomentulose (becoming puberulent in age); [collectively widespread in our
area].

2 Lower leaf surfaces pale or whitish, densely stellate tomentose with appressed, sessile-stellate trichomes obscuring the surface (rarely
becoming puberulent with age but with some stellate trichomes persisting along major veins, the margin, and/or the apex; lateral buds 5-8
mm long; pericarp 0.8-1.0 mm thick; [widespread in our area]................................................................. T. americana var. heterophylla

2 Lower leaf surfaces grayish or brownish, loosely but densely tomentose with fasciculate and/or stipitate-stellate trichomes, either
remaining tomentose or becoming puberulent, or puberulent from emergence and green beneath; lateral buds 3-5 mm long; pericarp 0.5-
0.6 mm thick; [generally southern, Coastal Plain and Piedmont of NC, SC, GA and southward and westward]..........................

........................................................................................................................................................................

........................................................................................................................................................................

Tilia americana Linnaeus var. americana, Northern Basswood. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): rich
coves, rocky slopes, metabasalt boulderfields, rich north-facing river bluffs, calcareous Coastal Plain ravines; common (rare
in NC, rare in DE Coastal Plain). June; August-September. NB and MB south to e. VA, w. NC, and OK. In VA, var. americana
occurs throughout the northern half of the state, with scattered populations southward in the mountains. [= C, K, Z; = T. americana

Tilia americana Linnaeus var. caroliniana (P. Miller) Castiglioni, Southern Basswood, Carolina Basswood. Cp (FL, GA,
NC), Pd (GA, NC, SC): mesic forests, in the outer Coastal Plain usually associated with shell deposits, Indian shell middens, or
underlying coquina limestone ("marl"); uncommon. June-July; July-August. NC south to c. peninsular FL and west to OK and c.
S]............................ T. americana var. caroliniana

Tilia americana Linnaeus var. heterophylla (Ventenat) Loudon, Mountain Basswood, White Basswood, Linn. Mt (GA,
NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): rich coves and mesic to dry slopes (the drier sites usually
on limestone), often one of the most abundant trees in Southern Appalachian cove forests; common (rare in Coastal Plain). June;
July-August. Centered in the Southern Appalachians: sw. PA and WV south to c. NC, wc. GA, FL Panhandle, and westward as
disjunct populations to the Ozarkian Highlands of s. MO and n. AR. In VA, var. heterophylla dominates in sw. VA and along
southern Piedmont river bluffs, with disjunct populations in calcareous ravines in the upper Coastal Plain (Surry County); it also
extends less commonly into the Northern VA mountains and foothills, where var. americana is more prevalent, but seems to be
absent (or very uncommon) in the Potomac valley east of the Blue Ridge. [= C, K, WH, Z; = T. heterophylla Ventenat – RAB, F, W,
WV; > T. heterophylla – G, S; > T. monticola Sargent – G; > T. australis Small - S; > T. eburnea Ashe – S; > T. lasioclada Sargent – S; > T.
michauxii Nuttall – S; > T. venulosa Sargent]

Tilia ×europaea Linnaeus (pro sp.) [Tilia cordata × platyphyllos], European Linden. Mt (NC, WV): suburban woodlands; uncommonly
planted, rarely naturalizing, native of Europe. [= T. ×vulgaris Hill.] [not yet keyed]

Several additional European species, T. platyphyllos Scopoli and T. cordata P. Miller, are planted as street or yard trees; they differ from
the native species in having smaller leaves (usually 4-12 cm long vs. 8-25 cm long) and lacking staminodes. Planted material should be identified by
using appropriate manuals of cultivated species.
Triumfetta Linnaeus 1753

1 Capsule hispid; lower leaf surface not velutinous ................................................................. T. pentandra
1 Capsule glabrous; lower leaf surface velutinous ................................................................ T. semitriloba

* Triumfetta pentandra A. Richard. Cp (FL): disturbed areas; rare, native of tropical America. [= K, WH]
* Triumfetta semitriloba Jacquin, Mosote, Burweed. Cp (GA): disturbed areas; rare, native of tropical America. In sw. GA (Jones & Coile 1988) and s. peninsular FL. [= K, S, WH]

Urena Linnaeus 1753 (Caesarweed)

Waltheria Linnaeus 1753 (Raichie)

252. THYMELAEACEAE A.L de Jussieu 1789 (Mezereum Family) [in MALVALES]

A family of about 45-53 genera and 500-800 species, mostly trees and shrubs, of cosmopolitan distribution, but especially diverse in Africa (Van der Bank, Fay, & Chase 2002). Dirca, Edgeworthia, and Thymelaea are all in subfamily Thymelaeoideae (Van der Bank, Fay, & Chase 2002). References: Van der Bank, Fay, & Chase (2002); Herber in Kubitzki & Bayer (2003).

1 Annual herb, annual; leaf blades < 2 cm long; fruits capsular, indehiscent ................................................................................................................................. Thymelaea
1 Perennial shrub; leaf blades> 2 cm long; fruits drupaceous or berrylike.
2 Stems jointed; leaves scattered; stamens exserted ................................................................................................................................. Dirca
2 Stems not jointed; leaves clustered toward apex of stems; stamens included ........................................................................................................ Edgeworthia

Dirca Linnaeus 1753 (Leatherwood, Leatherbark)

A genus of 4 species, shrubs, of North America (including Mexico). Our species is most closely related to D. mexicana Nesom & Mayfield (of the Sierra Madre Oriental, Tamaulipas, Mexico) and D. decipiens Floden (of e. MS, mw. AR, and sw. MO); the other species is D. occidentalis A. Gray of California (Schrader & Graves 2004; Floden, Mayfield, & Ferguson 2009). References: Nevling (1962)=Z; Floden, Mayfield, & Ferguson (2009)=Y.

Dirca palustris Linnaeus, Leatherwood, Leatherbark, Wicopee, Rope-bark. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, VA, WV), Cp (FL, GA, VA); very rich forests, on slopes or bottomlands, limited to calcareous or mafic rocks such as limestone, calcareous siltstone, calcareous shale, gabbro, or amphibolite, in marl ravine bottoms in the Coastal Plain of VA, in Ashe County NC ascending to 1500 ft elevation; uncommon (rare in DE, FL, GA, NC, and SC, rare in VA Coastal Plain). March-April; June-July. Widespread in e. North America, from NS and s. QC, south to Panhandle FL, AL, and OK. The curiously flexible twigs and swollen nodes are distinctive. The common names refer to the extraordinary toughness of the tan-brown bark, which was used by native Americans for cordage. [= RAB, C, F, G, K, S, WH, WV, Y, Z]

Edgeworthia Meisner 1841 (Paperbush)
A genus of 3 species, shrubs, of e. Asia.

**Thymelaea** P. Miller 1754 (Mezereon)

References: Neving & Barringer in FNA (in prep.).

* * Thymelaea passerina (Linnaeus) Lange in Willkomm & Lange, Mezereon. Disturbed areas. AL and MS. [= K]

**255. CISTACEAE** A.L. de Jussieu 1789 (Rockrose Family) [in MALVALES]

A family of about 8 genera and 180 species, shrubs and herbs, of warm temperate and subtropical areas, centered in Mediterranean Europe. References: Arrington & Kubitzki in Kubitzki & Bayer (2003).

1 Shrub, usually much branched from the lower stem; flowers solitary, terminal on the branches; leaves 1-3 mm long and scalelike, or 3-7 mm long and aciculare; capsule cylindric, > 2× as long as wide ............................................................... *Hudsonia*

1 Succulent herb, usually little branched from the lower stem (often much branched above, and in *Lechea* with specialized short basal shoots at ground level); flowers axillary or terminal in branching inflorescences; leaves 4-50 mm long, mostly linear, lanceolate, oblanceolate, or elliptic; capsule globose, subglobose, ellipsoid, ovoid, or obovoid, < 2× as long as wide.

2 Flowers of 2 types, the chasmogamous with 5 showy yellow petals, the cleistogamous lacking petals; pubescence of the stem stellate; leaves 10-50 mm long, alternate; plants with shoots of one type only, not producing short basal shoots; capsules 1.3-12.5 mm long, the larger capsules of chasmogamous flowers at least 2.0 mm long .................................................. *Crocanthemum*

2 Flowers of 1 type, with 3 inconspicuous, dark red petals; pubescence of the stem simple; leaves 4-15 mm long (to 30 mm long in *C. pulchella* and *L. mucronata*), linear to linear-elliptic, 0.5-4 mm wide (to 13 mm wide in *L. mucronata*), alternate, opposite, or whorled; plants with shoots of two types, the short, prostrate to ascending basal shoots produced late in the season and overwintering; capsules 0.9-1.7 mm long ............................................................... *Lechea*

**Crocanthemum** Spach 1836 (Frostweed, Rockrose)

A genus of about 24 species, of eastern North America, California, Mexico, and s. South America. The eastern North American species previously attributed to *Helianthemum* are in a clade distinct from the Old World *Helianthemum*, and should be recognized as *Crocanthemum*. References: Daoud & Wilbur (1965)=Z; Wilbur & Daoud (1964)=Y; Arrington & Kubitzki in Kubitzki & Bayer (2003).

Identification notes: The identification of most of our species of *Crocanthemum* requires an understanding of the 2 types of flowers produced. Chasmogamous flowers have showy yellow petals and larger sepals, the distinct portion of the 2 linear outer sepals usually linear, (0.7-) 1.3-5.5 mm long, the distinct portion of the 3 broader inner sepals 2.5-12 (-14) mm long. Cleistogamous flowers lack petals and have smaller sepals, the distinct portion of the 2 linear outer sepals 0.2-3 mm long, the distinct portion of the 3 broader inner sepals 1.5-4.8 mm long. In some species (*C. canadense*, *C. bicknellii*, *C. propinquum*) the chasmogamous flowers open earlier (April-July) than the cleistogamous (June-September). In others (*C. ericoides*, *C. georgianum*, *C. nashii*, *C. rosmarinifolium*), the two types of flowers open at the same time (March-June) or cleistogamous flowers are nearly always absent (*C. carolinianum*). Capsules from chasmogamous flowers are larger and contain more seeds than those from cleistogamous flowers.

1 Leaves 1-4 (-7) mm wide, (5-) 7-15× as long as wide; capsules from chasmogamous flowers 2-3 mm long, with 1 (-2) seeds ............................................................... *C. rosmarinifolium*

1 Leaves 2-20 mm wide, 2-6 (-8)× as long as wide; capsules from chasmogamous flowers (2.4-) 3-9 (-10.5) mm long, with 6-92 (-135) seeds; capsules from cleistogamous flowers 1.5-4.2 mm long, with 1-20 seeds.

2 Leaves basally disposed, the largest and most prominent leaves in a basal rosette; stem leaves 2-5 below those subtending flowers or fruits; stem with spreading trichomes to 2.5 mm long; lower surface of leaves sparsely pubescent, the surface readily visible; cleistogamous flowers usually never produced; capsules 6-9 (-10.5) mm long, with 80-92 (-135) papillate seeds ............................................................... *C. carolinianum*

2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; stem glabrate to densely puberulent (the pubescence not long and spreading); lower surface of leaves densely pubescent, hiding the surface; cleistogamous flowers regularly produced, either intermixed with the chasmogamous or in separate inflorescences; capsules 1.3-7 (-8.5) mm long, with 1-46 papillate, reticulate, or smooth seeds (pebbled to somewhat papillate in *H. nashii*)

3 Ovary and capsule densely stellate pubescent

4 Inflorrence a terminal umbellate cluster; fruit 2-valved ............................................................... *C. arenicola*

4 Inflorescence a thyrse, the flowers borne in clusters the axis of leaves; fruit 3-valved ............................................................... *C. nashii*

3 Ovary and capsule glabrous.

5 Chasmogamous flowers usually solitary, terminal or subterminal, later overtopped by lateral branches; seeds papillate, 35-46 per chasmogamous capsule, 5-9 (-12) per cleistogamous capsule; chasmogamous capsules (4-) 5-7 (-8.5) mm long, cleistogamous capsules (2-) 2.3-3.0 (-3.8) mm long; upper surface of cauline leaves with some long simple trichomes mixed with the shorter stellate trichomes ............................................................... *C. canadense*
5. Chasmogamous flowers usually (1-) 2-18, rarely overtopped by lateral branches (often 1-3 in cymes in *H. georgianum*); seeds smooth or reticulate, 12-35 per chasmogamous capsule, 1-20 per cleistogamous capsule; chasmogamous capsules (2.4-) 3.5-5.7 mm long, cleistogamous capsules 1.5-4.2 mm long; upper surface of calyceal leaves with the shorter stellate trichomes only.

6. Chasmogamous and cleistogamous flowers borne together, the two types of flowers open at the same time (March–June); seeds smooth, 15-35 per chasmogamous capsule, 4-20 per cleistogamous capsule; outer sepals of the cleistogamous flowers 1.4-3.0 mm long; inner sepals of the cleistogamous flowers 2.0-4.8 mm long; [of the outer Coastal Plain (primarily barrier islands) of NC and SC].

7. Flowers borne in dense many-flowered flat-topped cymes terminating the stem and sometimes also the main branches; capsules of the cleistogamous flowers 1.6-3.8 mm long, with 4-8 (-10) seeds; pedicels and calyx with 0.5-1.5 mm long simple trichomes mixed with the shorter stellate trichomes; outer sepals of both chasmogamous and cleistogamous flowers with an expanded, obstate, spatulate tip, 0.3-1.2 mm wide……………………………………………………………………………………………………… *C. corymbosum*

8. Stems mostly 20-50 cm tall, clustered, arising from an upright caudex; distinct portion of the outer sepals of the cleistogamous flowers linear, (0.3-) 0.6-1.2 (-1.8) mm long, about 3-5× as long as wide; distinct portion of calyx of the chasmogamous flowers (2.4-) 3.5-4.5 (-8) mm long; cleistogamous capsules sharply 3-angled in cross-section; leaf with broadly cuneate base………………………………………………………………………………………………………………………………………………………………………………………. *C. bicknellii*

---

*Crocanthemum arenicola* (Chapman) Barnhart, Gulf Coast Frostweed. Cp (FL): sandhills, dunes, scrub; rare. Panhandle FL west to s. MS. [= S; = *Helianthemum arenicola* Chapman – K, WH, Y, Z]

*Crocanthemum bicknellii* (Fernald) Barnhart, Hoary Frostweed, Plains Frostweed, Plains Sunrose, Bicknell's Hoary Rockrose. Mt (GA, NC, VA, WV), Pd (DE, NC, VA): woodlands, glades, barrens, rock outcrops, and grassy balds, to at least 1500m in elevation; rare. June–July (chasm.), July–September (cleist.); August–October. ME and s. ON west to MN and s. MB, south to ne. GA, e. TN, AR, KS, and CO. [= S; = *Helianthemum bicknellii* Fernald – RAB, C, F, G, K, W, Y, Z; = *Halimium*

*Crocanthemum georgianum* (Chapman) Barnhart, Georgia Sunrose, Georgia Frostweed. Cp (FL, GA, NC, SC): openings in maritime forests, sandy disturbed areas; uncommon (rare in GA, NC, and SC). April–May; May–October. E. NC south to n. FL, west to c. TX and AR. [= S; = *Helianthemum georgianum* Chapman – RAB, K, WH, Y, Z; = *Halimium georgianum* (Chapman) Grosser]

*Crocanthemum rosmarinifolium* (Pursh) Barnhart, Rosemary Sunrose. Cp (FL, GA, NC, SC): sandy roadsides, fields; common (uncommon in FL, rare in NC). May–June; July–October. S. NC south to Panhandle FL, west to c. TX; also disjunct in the West Indies. [= S; = *Helianthemum rosmarinifolium* Pursh – RAB, K, WH, Y, Z; = *Halimium rosmarinifolium*]

---

*Hudsonia* Linnaeus 1767 (Sand-heather, Golden-heather, Beach-heather)

CISTACEAE

1 Pedicels 0-1 (-3) mm long; leaves 1-3 mm long, ovate, densely tomentose, appressed to the stem and overlapping; stamens 8-20; [of the outer Coastal Plain of VA and NC] .................................................................H. tomentosa

1 Pedicels 4-10 mm long; leaves 3-7 mm long, subulate, slightly pubescent, spreading; stamens 10-30; [collectively of the Mountains of NC and inner Coastal Plain of SC].

2 Sepals obtuse to acute, lacking long-acuminate apices; stamens 10-20; leaves 3-4.5 (-6) mm long, sparsely villous; fruits cylindric; [of the inner Coastal Plain of SC (in our area)] .........................................................................................H. ericoides

2 Sepals acuminate, with attenuate apices 1-2 mm long; stamens 20-30; leaves 5-7 mm long, glabrate to sparsely villous; fruits urceolate to campanulate; [of the Mountains of NC] ...........................................................................................................H. montana

Hudsonia ericoides Linnaeus, Northern Golden-heather. Cp (DE, SC): sandy flats in longleaf pine sandhills (SC) or Coastal Plain pitch pine barrens (DE); rare. May; August. NL (Newfoundland) south to ME, NH, MD (Sipple 2002), and DE; disjunct in NC. The disjunct occurrence in SC has every appearance of being native; it is discussed by Bozeman & Logue (1968). [= RAB, C, F, G, K, S, Z; = H. ericoides Linnaeus ssp. ericoides – Y]

Hudsonia montana Nuttall, Mountain Golden-heather. Mt (NC): shallow sandy soils on ledges of quartzite or other felsic rocks in the Blue Ridge Escarpment, at various sites along the eastern side of Linville Gorge, Burke County, NC, and disjunct further south in McDowell County, NC; rare. June-early July; mid-July-September. This species is endemic to w. NC; it is almost certainly a southern sibling of the more northern H. ericoides. As well as being a very narrowly distributed endemic, H. montana is endangered by fire suppression in its habitat. [= RAB, K, S, W, Z; = H. ericoides Linnaeus ssp. montana (Nuttall) Nickerson & J. Skog – Y]

Hudsonia tomentosa Nuttall, Woolly Beach-heather. Cp (DE, NC, VA), Mt (WV): dunes, sand flats, blowouts (in DE, NC, VA), high elevation quartzitic sandstone outcrops (in WV); common (rare in NC and WV). May-July; August-September. NL (Labrador) west to MB and NT, south to WV (Panther Knob), WI, and MN, and south along the Atlantic Coast from ME to VA and ne. NC (where it reaches its southern limit in Dare County). [= RAB, C, F, G, S, WV, Z; > H. tomentosa var. tomentosa – K; = H. ericoides Linnaeus ssp. tomentosa (Nuttall) Nickerson & J. Skog – Y]

Lechea Linnaeus 1753 (Pinweed)

( contributed by Bruce A. Sorrie)

Identification notes: Lechea is recognizable by its production of numerous basal shoots (usually prostrate) in the late summer and fall. These are evergreen and overwinter, and the fertile stems (usually erect or ascending) are produced from renewed growth of the basal shoots in the spring and summer.

1 Pubescence of the stems strongly spreading, not at all appressed; inner sepals carinate (U- or V-shaped in cross-section); plant tall, often > 5 dm tall ...............................................................L. mucronata

1 Pubescence of the stems more or less appressed, usually strongly so; inner sepals shallowly curved in cross section, not carinate; plants variable in height.

2 Outer (slender) sepals equaling or exceeding the inner (broad) sepals.

3 Base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx; pedicels averaging > 2 mm long; plant umbrella-like, with reflexed drops of water; capsules in a dense row ..............................L. racemulosa

3 Base of the fruiting calyx not conspicuously differentiated in texture and color; pedicels averaging < 1.5 (-2) mm long.

4 Capsule completely enclosed by the sepals, subglobose; leaves averaging > 10× as long as wide; plant short and usually densely bushy, < 3 dm tall .................................................................L. tenuifolia

4 Capsule exserted, usually conspicuously so, the sepals not enclosing the summit of the fruit, ellipsoid to ovate; leaves < 8× (usually < 6×) as long as wide; plant usually taller, 1-7 dm tall.

5 Outer sepals distinctly longer than the inner sepals, usually also longer than the capsule; stem leaves usually whorled, 2 mm wide; plant erect, with short, ascending branches .........................................................L. minor

5 Outer sepals shorter than to barely longer than the inner sepals, shorter than the capsule; stem leaves alternate, rarely wider than 1.5 mm wide; plant ascending (sometimes erect or spreading, branches spreading)...........................................................................L. sessiliflora

2 Outer (slender) sepals shorter than the inner (broad) sepals.

6 Capsules ellipsoid to narrowly pyriform, normally about 2× as long as wide (or even longer in L. racemulosa).

7 Stigmas not persistent; pedicels averaging about 2 mm long; base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx .................L. racemulosa

7 Stigmas persistent, reddish-brown, conspicuous on the summit of the capsule; base of the fruiting calyx not conspicuously differentiated in texture and color .............................................................L. sessiliflora

6 Capsules of a broader shape, ovoid, broadly ellipsoid, or subglobose, normally < 1.5× as long as wide.

8 Capsules obviously longer than the sepals.

9 Seeds 3 (-4), relatively narrow and 3-sided, like the sections of an orange; fruiting stems 2.5-5.5 dm tall; panicle ovoid to subcylindric, the principal branches subequal and relatively short; capsules clustered at branch tips, or in a dense row.................L. pulchella var. pulchella

9 Seeds 2 (-3), broad and compressed, or obscurely 3-sided; fruiting stems 3.5-8.5 dm tall; panicle subcylindric to subglobose, the principal branches diminishing upward, relatively long; capsules in a sparse row (rarely more dense).........................L. pulchella var. ramosissima

8 Capsules almost completely enveloped by the sepals.

10 Leaves sparsely pubescent on the midrib and margin only beneath; branches and stems sparsely subappressed-pilose; seeds 4-6....

258. TROPAEOLACEAE A.L de Jussieu ex A.P. de Candolle 1824 (Nasturtium Family) [in BRASSICALES]

_Tropaeolum_ Linnaeus 1753 (Nasturtium)

A genus of about 85-90 species, herbs, of tropical Central America and South America (s. Mexico to Peru). References: Tucker in FNA (2010); Sparre & Andersson (1991)=Z.

* _Tropaeolum majus_ Linnaeus, Nasturtium, is cultivated and rarely persistent or present around refuse areas, as in se. PA (Rhoads & Klein 1993). _T. majus_ is considered by Sparre & Andersson (1991) to be a taxon of hybrid origin, not known from wild populations. It is probably not truly established in our area. [= FNA, K, Z] [not mapped; not keyed; rejected as a component of our flora]

261. LIMNANTHACEAE R. Brown 1838 (False-mermaid Family, Meadow-foam Family) [in BRASSICALES]

_Floerkea_ Willdenow 1801 (False-mermaid)

264. BATAEAE von Martius ex Meisner 1842 (Batis Family) [in BRASSICALES]

A monogeneric family, of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. References: Thorne in FNA (2010); Rogers (1982b); Bayer & Appel in Kubitzki & Bayer (2003).

_Batis_ P. Browne 1756 (Saltwort, Beachwort, Batis)

A genus of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. The only other member of the family and genus is _B. argillicola_, of New Guinea and Australia. References: Thorne in FNA (2010); Rogers (1982b)=Z; Goldblatt (1976); Bayer & Appel in Kubitzki & Bayer (2003).

_Batis maritima_ Linnaeus, Saltwort, Beachwort, Batis, Turtleweed, Vidrillos. Brackish marshes. June-July; October. Se. SC south to s. FL, west to TX, and in Central and South America; West Indies; HI (where apparently introduced). _B. maritima_ is alleged (as by FNA and S) to occur as far north as NC, but the documentation is unknown; there is no twentieth century evidence to place _Batis_ in NC. [= RAB, FNA, GW, K, S, WH, Z]

270. RESEDACEAE A.P. de Candolle ex Gray 1821 (Mignonette Family) [in BRASSICALES]

A family of about 6 genera and 75-85 species, herbs and shrubs, of the northern hemisphere. References: Martín-Bravo, Tucker, & Daniel in FNA (2010); Kubitzki in Kubitzki & Bayer (2003).

_Reseda_ Linnaeus 1754 (Mignonette)

1 Upper and middle leaves deeply pinnately lobed.
2 Carpels 4; petals white; seeds tuberculate .................................................................................................................................................. _R. alba_
2 Carpels 3; petals yellowish; seeds smooth ............................................................................................................................................. _R. lutea_
1 Upper and middle leaves entire or finely toothed (sometimes with 1-2 lateral lobes).
RESEDACEAE

3 Sepals and petals 4; seeds smooth; fruits < 7 mm long, crowded, erect to ascending .................................................. R. luteola
3 Sepals and petals 6; seeds rugose; fruits > 7 mm long, well-spaced, pendent.
4 Capsules 7-11 mm long; sepals (in fruit) < 5 mm long ................................................................. [R. odorata]
4 Capsules (well-developed) 11-15 mm long; sepals (in fruit > 5 mm long) ................................................................. [R. phyteuma]

* Reseda luteola Linnaeus, Weld, Dyer's Rocket, Yellow-weed. Formerly cultivated as a dye plant; native of Eurasia. Reported from se. and sc. PA (Rhoads & Klein 1993) and elsewhere mainly north of our area. [= C, F, FNA, G, K]

* Reseda phyteuma Linnaeus, Corn Mignonette. Disturbed areas; native of Europe. Reported from se. PA (Rhoads & Klein 1993). [= K]

{no definite report for our area; not mapped; rejected as a component of our flora}

272. CLEOMACEAE Horaninow 1834 (Cleome Family) [in BRASSICALES]

The Cleomaceae is here circumscribed to include the members of the Capparaceae, subfamily Cleomoideae, following phylogenetic analyses which show this group to be a monophyletic clade more closely related to Brassicaceae than to the rest of Capparidaceae (Hall, Sytsma, & Iltis 2002). References: Rucker & Vanderpool in FNA (2010); Hall, Sytsma, & Iltis (2002); Judd, Sanders, & Donoghue (1994); Sanders & Judd (2000). Key based on FNA.

1 Stamens (8-) 10-27; petals notched or irregularly lacerate at the apex; gynophore (stipe of the pistil, above the calyx) 2-6 mm long; leaflets (1-) 3 ................................................................. Polanisia
1 Stamens 6 (except 14-25 in Arivela); petals obtuse or acute at the apex; gynophore (stipe of the pistil, above the calyx) 1-80 mm long; leaflets 5-7.
2 Plants with nodal spines (and sometimes with prickles on petioles and leaf veins).
3 Petals 5-10 mm long; gynophore 1-4 mm long; petioles and leaf blades unarmed ................................................................. [Hemiscola]
3 Petals 10-30 mm; gynophore 45-80 mm; petioles and sometimes leaf blades prickly ................................................................. Tarenaya
2 Plants lacking nodal spines and lacking prickles on petioles and leaf veins.
4 Filaments fused to lower half of gynophore (evident from scars near the midpoint of the gynophore of fruiting specimens) ................................................................. Gynandropsis
4 Filaments free from gynophore
5 Bracts subtending the pedicels minute ............................................................................................................ Cleoserrata
5 Bracts subtending the pedicels with expanded blades, sometimes even trifoliolate.
6 Style 0.2-0.8 mm long; gynophore 3-12 mm; stamens 6; sepals fused ¼-⅓ their length ................................................................. Cleome
6 Style 1-1.2 mm long; gynophore obsolete; stamens 14-25; sepals free ............................................................................ Arivela

Arivela Rafinesque 1838

* Arivela viscosa (Linnaeus) Rafinesque, Wild Caia, Yellow Cleome. Cp (GA, SC, VA?): disturbed areas; rare, introduced, native of Asia (now pantropical). Reported for sc. GA (Carter, Baker, & Morris 2009; Jones & Coile 1988), se. PA (Rhoads & Klein 1993), and recently from Beaufort County, SC (J. Nelson, pers.comm. 2006). Reported from chrome ore piles in Newport News (Reed 1959); presumably a waif. [= FNA; = Cleome viscosa Linnaeus – K] {synonymy incomplete}

Cleome Linnaeus 1753 (Cleome, Spiderflower)

A genus of about 20 species, annual herbs, of the Old World. References: Tucker in FNA (2010); Ilitis (1960)=Z; Kers in Kubitzki & Bayer (2003). {also see Arivela, Cleoserrata, Gynandropsis, Hemiscola, and Tarenaya}
CLEOMACEAE

1 Fruits (12-)15-25 mm long; bracts unifoliate; leaflets linear to elliptic ................................................................. [C. ornithopodioides]

1 Fruits 40-70 mm long; bracts trifoliate; leaflets oblanceolate to rhomboid-elliptic ...................................................... C. rutidosperma

* Cleome rutidosperma DC. Cp (FL, SC?): disturbed areas; rare, native of tropical Asia and Africa. Reported for SC by FNA. [= FNA, WH] {add to synonymy}

* Cleome ornithopodioides Linnaeus, Bird Spiderflower. Reported for KY, MD, PA, OH. [= FNA; > C. iberica de Candolle] {add to synonymy}

Cleoserrata H.H. Iltis 2007

1 Petals white, tinged with pink or red; bracts at most 1 mm long, subulate; gynophore 1-2 mm long................................................. C. serrata

1 Petals brilliant pink to purple, fading to pink or white (rarely initially white); bracts 3-18 mm long, ovate-cordate; gynophore 30-85 mm long ............................................................................................................................. C. speciosa

* Cleoserrata serrata (Jacquin) H.H. Iltis. {GA}; disturbed areas; rare, native of tropical America. Reported as introduced in GA (Kartesz 1999). [= FNA; = Cleome serrata Jacquin – K; = Neocleome serrata (Jacquin) Small – S] {not yet keyed; synonymy incomplete}

* Cleoserrata speciosa (Rafinesque) H.H. Iltis. Cp (FL): vacant lots, disturbed areas; rare, native of Mexico. [= FNA; = Cleome speciosa Rafinesque – K, WH]

Gynandropsis de Candolle 1824

Hemiscola Rafinesque 1838

1 Leaflets ovate to rhomboidal; sepals lanceolate; anthers 0.9-1.0 mm long; silique 20-40 (-60) mm long............................................................. [H. aculeata var. aculeata]

1 Leaflets obovate; sepals ovate; anthers 0.3-0.5 mm long; silique 15-20 mm long ............................................................................................... [H. diffusa]

* Hemiscola aculeata (Linnaeus) Rafinesque var. aculeata. Prickly Spiderflower. Cp (AL): disturbed areas; rare, native of tropical America. Reported for AL. [= FNA; < Cleome aculeata Linnaeus – K]

* Hemiscola diffusa (Banks ex de Candolle) H.H. Iltis. Cp (AL): on ballast (Mobile, AL); rare, native of South America. [= FNA; = Cleome diffusa Banks ex de Candolle – K]

Polanisia Rafinesque 1819 (Clammy-weed)

Identification notes: Polanisia has some resemblance to Warea.

1 Petals broadest toward the base, barely or not at all clawed; capsule valvate; [of xeric longleaf pine sandhills]................................. P. tenuifolia

1 Petals broadest toward the tip, narrowed to a long, distinct claw; capsule opening near the tip; [of floodplains and disturbed soils].

2 Larger petals 3.5-6.5 (-8) mm long; longest stamens 4-10 (-14) mm long ............................................................................................. P. dodecandra var. dodecandra

2 Larger petals (7-) 8-13 (-16) mm long; longest stamens (9-) 12-30 mm long ................................................................................. P. dodecandra var. trachysperma

Polanisia dodecandra (Linnaeus) A.P. de Candolle var. dodecandra. Clammy-weed, Spider-weed. Mt (VA, WV*), Pd (VA): sandy or gravelly floodplains along the James River in VA, also introduced on railroad ballast; rare. June-September. VT west to MB, south to MD, w. VA, TN, AR, and OK. Apparently both native and introduced in our area. [= C; = P. dodecandra ssp. dodecandra – FNA, K; = P. graveolens Rafinesque – F, S, WV; = P. dodecandra – G; < P. dodecandra – W; = Cleome graveolens (Rafinesque) Sch. & Sch.]

**Polanisia tenuifolia** Torrey & A. Gray, Slenderleaf Clammy-weed, Pineland Catchfly. Cp (AL, FL, GA, MS): sandhills; rare. E. GA (several counties from the SC border) (Jones & Coile 1988) south to s. FL, west to s. MS. [= FNA, K, WH; = Aldenella tenuifolia (Torrey & A. Gray) Greene – S]

**Tarenaya** Rafinesque 1838

A genus of about 33 species, annual herbs, of South America. References: Tucker & Iltis in FNA (2010). Key based on FNA.

1. Sepals, ovary, and fruit glabrous; fruit about as long as gynophore; petals deep pink or purple (infrequently white) .................... **Tarenaya hassleriana**

1. Sepals, ovary, and fruit glandular-pubescent; fruit longer than gynophore; petals white or greenish-white .......................................... **Tarenaya spinosa**

* **Tarenaya hassleriana** (Chodat) H.H. Iltis, Cleome, Spiderflower, Pinkqueen. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): gardens, disturbed areas, riverbanks, persistent and self-seeding from cultivation as an ornamental; rare, native of South America. June-November. The petals in bud are a pale pink to nearly white, they turn a deep pink upon opening late in the day; by morning the petals have once again faded to a pale pink or white. [= FNA; = Cleome hassleriana Chodat – C, K, WH; ? C. houtteana Schlechtendahl – RAB, misapplied; < C. spinosa Jacquin – F, G, misapplied; < Neocleome spinosa (Jacquin) Small – S]

* **Tarenaya spinosa** (Jacquin) Rafinesque. Cp (FL): disturbed areas; rare, native of South America. Also in AL. [= FNA; < Neocleome spinosa (Jacquin) Small – S; = Cleome spinosa Jacquin – WH]

**273. BRASSICACEAE** Burnett 1835 or CRUCIFERAE A.L. de Jussieu 1789 (Mustard Family) [in Brassicales]

Tribe a. Alyssaeae: Alyssum, Berteroa
Tribe b. Anchonieae: Matthiola
Tribe d. Arabideae: Arabis, Draba
Tribe e. Boehereae: Boeckera
Tribe f. Brassicaceae: Brassica, Cakile, Coincya, Diplotaxis, Eruca, Erucastrum, Orychophragmus, Raphanus, Rapistrum, Sinapis
Tribe g. Buniaeae: Bunias
Tribe h. Calepineae: Calepina
Tribe i. Camelineae: Arabidopsis, Camelina, Capsella, Turritis
Tribe j. Cardamineae: Armoracia, Barbarea, Cardamine, Iodanthus, Leavenworthia, Nasturtium, Planodes, Rorippa
Tribe k. Chorisopoeae: Chorisopoeae
Tribe m. Conringaeae: Conringia
Tribe n. Descruainaeae: Descruainia
Tribe o. Erysimaeae: Erysimum
Tribe p. Euclidieae: Braya
Tribe s. Hesperideae: Hesperis
Tribe t. Iberideae: Iberis, Teedsalia
Tribe v. Isatidaeae: Isatis, Myagrum
Tribe w. Lepidieae: Lepidium
Tribe x. Lunarieae: Lunaria
Tribe y. Malcolmieae: Lobularia
Tribe z. Noccaeeae: Microthlaspi
Tribe aa. Physarieae: Paysonia, Physaria
Tribe bb. Sisymbrieae: Sisymbrium
Tribe dd. Thelypodieae: Warea
Tribe ee. Thlaspiadeae: Alliaria, Thlaspi

**Alliaria** Heister ex Fabricius 1759 (Garlic Mustard)

* **Alliaria petiolata** (Bieberstein) Cavara & Grande, Garlic Mustard, Hedge Garlic. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA) (GA, SC): moist forests in bottomlands and on slopes; common (uncommon in VA Piedmont, rare in NC, rare in VA Coastal Plain), native of Europe. April-May; May-June. This species has become a noxious weed in ne. United States, invading undisturbed moist forests. Dhillion & Anderson (1999) report on physiological characteristics that make Alliaria a successful invader in shaded situations. [= RAB, C, FNA, K, W, Y, Z; = Alliaria officinalis Andrzejowski ex Bieberstein – F, G]

* Alyssum alyssoides* (Linnaeus) Linnaeus, Yellow Alyssum. Mt (VA, WV), Pd (VA), Cp (VA): roadsides, disturbed areas, especially in dry, barren soil; uncommon (rare in WV), native of Europe. June-September. [= C, F, NFA, G, K, W, Z; > A. alyssoides var. alyssoides – Y]

**Arabidopsis** Heynhold (Mouse-ear Cress)

1 Fruit strongly flattened; petals 6-10 mm long; [native perennial, of calcareous and mafic rock outcrops] ................................................. *A. lyrata ssp. lyrata* 
1 Fruit terete; petals 2-4 mm long; [alien annual, of disturbed, weedy sites] .................................................. *A. thaliana* 

* Arabidopsis thaliana* (Linnaeus) Heynhold, Mouse-ear Cress. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, fields, roadsides, lawns; common (rare in DE Piedmont), native of Eurasia. March-May. *Arabidopsis thaliana* has sometimes been referred to as the white mouse of the vascular plant world, having been very extensively used as an experimental plant; a journal, the Arabidopsis Information Service, publishes annual bibliographies of studies using this plant. [= RAB, C, F, NFA, G, K, S, W, X, Y, Z]

**Arabis** Linnaeus 1753 (Rockcress)

The circumscription of *Arabis* is in flux; there is increasing evidence that the broad circumscription traditionally employed in most North American floras includes discordant elements. Based on molecular phylogenetic studies and morphology, *Arabis* in our area should be divided into 4 genera, as follows: *Arabidopsis* (*A. lyrata*); *Arabis* sensu stricto (n=8) (*A. hirsuta var. adpressipilis, A. hirsuta var. pycnocarpa, A. georgiana); *Boechera* Löve & Löve (n=7) (*A. canadensis, A. drummondii, A. laevigata var. burkii, A. laevigata var. laevigata, A. missouriensis, A. patens, A. persiellata var. ampla, A. serotina, A. shortii); and *Turritis* (*A. glabra var. glabra*). References: Al-Shehbaz in FNA (2010); Hopkins (1937)=Z; Rollins (1993)=Y; Al-Shehbaz (1988a)=X; Al-Shehbaz (2003)>X; Al-Shehbaz (2003)=Q; Koch, Bishop, & Mitchell-Olds (1999); Koch & Al-Shehbaz (2002). [also see *Arabidopsis, Boechera, Turritis*]

1 Plants matted from a branching caudex, perennial; [cultivated and rarely persistent or escaped] .......................................................... *A. caucasica* 
1 Plants unbranched, biennial; [native to our area].

2 Petals 3-5 mm long; siliques 3-6 cm long; [collectively known from NC, TN, VA, and northward and westward from those states].
2 Petals 6-9 mm long; siliques 2-5 cm long.

3 Siliques (4.5-) 5-7 cm long; [endemic to w. GA and c. AL] ................................................................................................. *A. georgiana* 
3 Siliques 2.5-4 cm long; of se. PA, c. PA, and IN south to NC, e. TN, and AL] ............................................................................................. *A. patens* 

4 Stem pubescence primarily appressed and of 2-armed or dolabiform hairs .............................................................................. *A. pycnocarpa var. adpressipilis* 
4 Stem pubescence primarily spreading and of simple hairs .............................................................................. *A. pycnocarpa var. pycnocarpa* 

**Arabis georgiana** R.M. Harper, Georgia Rockcress. Mt (GA), Pd (GA), Cp (GA): nutrient-rich streambanks and rock outcrops; rare. April-May; May-early July. Endemic to n. and sw. GA and c. AL. It differs from our other species by the following combination of characters: fruits 5-7 cm long, borne appressed to ascending, leaves with bifurcate, trifurcate, or stellate hairs. See Patrick, Allison, & Krakow (1995). [= FNA, K, Y, Z]

**Arabis patens** Sullivant, Spreading Rockcress. Mt (GA, NC, VA, WV), Pd (VA): thin soils around calcareous or dolomitic outcrops, very rarely in nutrient-rich seepage from mafic rocks; rare. May-June; June-August. Irregularly distributed, primarily in the sedimentary rock Appalachians, from se. PA, c. PA, and IN south to NC, e. TN, and AL. In NC, this species occurs over marble at Blowing Spring, Nantahala River Gorge, Swain County, at various sites over calcareous sedimentary rocks in the Hot Springs Window, near Hot Springs, Madison County, and in nutrient-rich seepage from amphibolite at Chimney Rock, Rutherford County. [= RAB, C, F, NFA, G, K, S, W, X, Y, Z; = Boechera patens (Sullivant) Al-Shehbaz – Q]

**Arabis pycnocarpa** M. Hopkins var. *adpressipilis*. M. Hopkins, Slender Rockcress, Hairy Rockcress. Pd (NC), Mt (NC, VA): thin soils near outcrops of mafic or other rock weathering to nutrient-rich soils; rare. April-May; May-June. Var.
adpressipilis ranges from OH to IL, south to AR, c. TN, and LA; disjunct east of the mountains in NC. Related to, but specifically distinct from, A. hirsuta (Linnaeus) Scopoli of Europe and A. eschscholtziana Andrejeewski in Ledebour of w. North America. [= FNA, Z; = A. hirsuta (Linnaeus) Scopoli var. adpressipilis (M. Hopkins) Rollins – C, F, G, X, Y; < A. hirsuta var. pycnocarpa (M. Hopkins) Rollins – K; > A. ovata Michaux – S]

Arabis pycnocarpa M. Hopkins var. pycnocarpa, Slender Rockcress. Mt (WV): thin soils near outcrops of calcareous soils; rare. QC west to AK, south to e. and sw. PA (Rhoads & Klein 1993), AR, and AZ, primarily west of the Blue Ridge. Reports of this taxon from GA (Fernald 1950, Kartesz 1999, Hopkins 1937) are based on material collected by A.W. Chapman near Rome, and later described as Arabis georgiana. See discussion under A. pycnocarpa var. adpressipilis. [= FNA; = A. hirsuta (Linnaeus) Scopoli var. pycnocarpa (M. Hopkins) Rollins – C, F, G, X, Y; < A. hirsuta var. pycnocarpa – K (also see var. adpressipilis); = A. pycnocarpa M. Hopkins var. typica – Z]

Artoracia Gaertner, B. Meyer, & Scherbius 1800 (Horseradish)

A genus of 3 species, perennial herbs, of Eurasia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Y; Al-Shehbaz (1988a)=X.

1 Plant aquatic; stem submersed or prostrate; fruit unilocular .................................................................[see Rorippa aquatica]
1 Plant terrestrial; stem erect; fruit bilocular ............................................................................................A. rusticana

* Armoracia rusticana P. Gaertner, B. Meyer, & Scherbius, Horseradish. Mt (NC, VA, WV), Pd (DE), Cp (DE): persistent after cultivation, sometimes spreading (generally only very locally, but sometimes greater distances, probably by water transport of rhizomes); uncommon (rare south of DE), native of Europe. May-July. The root is grated to provide the condiment. [= RAB, C, G, K, X, Y, Z; = A. lapathifolia Giliberti – F; = A. armoracia (Linnaeus) Britton – S]

Barbara R. Brown 1812 (Winter-cress, Creasy Greens)

A genus of about 20 species, biennial and perennial herbs, semicosmopolitan. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

1 Basal leaves with 4–10 pairs of lateral lobes; siliques 4.5–7 cm long; pedicels 1.2–1.8 mm thick..................................................B. vulgaris
1 Basal leaves with 1–4 pairs of lateral lobes; siliques 1.5–3 cm long; pedicels 0.5–1.0 mm thick..................................................B. verna

* Barbarea vulgaris W. Aiton, Common Winter-cress, Yellow Rocket. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): fields, disturbed areas; common, native of Eurasia. April-June. Additional study is needed of the various infraspecific or specific taxa recognized by some authors (particularly Europeans) in what is here considered a variable species; see Stace (2010), for instance. [= RAB, C, F, G, K, W, Y, Z; = B. vulgaris var. vulgaris – F, G; > B. vulgaris var. arcuata (Opiz ex J. & K. Presl) Fries – RAB, F, G; > Campe barbarea (Linnaeus) Wight ex Piper – S; > Campe stricta (Andrzejowski) W. Wight ex Piper – S, misapplied; > B. vulgaris var. sylvestris Fries]

Berteroa A.P. de Candolle 1821 (Hoary Alyssum)

A genus of about 5 species, annual or perennial herbs, of Europe and the Middle East. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1987)=Y.

* Berteroa incana (Linnaeus) A.P. de Candolle, Hoary Alyssum. Mt (VA, WV), Pd (VA): disturbed areas; uncommon, native of Europe. [= C, F, FNA, G, K, Y, Z]

Boechera Löve & Löve 1975 (Rockcress)

1 Pedicels of flowers or fruits deflexed..............................................................................................................B. canadensis
1 Pedicels of flowers or fruits erect, ascending, or spreading.
2 Mature fruits < 3 cm long; stems branched or simple at the base.
3 Stem leaves (most of them) < 5 mm wide; stems branched at the base .................................................[see Arabidopsis lyrata ssp. lyrata]
3 Stem leaves (most of them) > 8 mm wide; stems simple at the base.
4 Lower cauleine leaves glabrous or sparsely pubescent on the upper surface; fruits erect and appressed, 3-5 mm long ..........[see Arabis]
5 Petals 6-9 mm long; fruiting pedicels 10-16 mm long; mature fruits 2.5-4 cm long; pubescence of the lower leaf surface simple; seeds winged .................................................................[see Arabis patens]
5 Petals 2-5 mm long; fruiting pedicels 2-10 (-13) mm long; mature fruits 1.5-3 cm long; pubescence of the leaf surface stellate; seeds wingless.
6 Petals 3-5 mm long, pink or purplish; fruiting pedicels 5-10 (-13) mm long; siliques 1.5-2 cm long; pubescence of the upper leaf surface stellate .................................................................[B. perstellata]
6 Petals 2-3 mm long, white to cream; fruiting pedicels 2-3.5 mm long; siliques 1.5-3 cm long; pubescence of the upper leaf surface simple .................................................................[B. shortii]

Boechera burkii (Porter) Windham & Al-Shehbaz, Burks Smooth Rockcress. Mt (NC, VA, WV): limestone barrens, shale barrens, and other dry, rocky habitats; rare. April-May. e. and c. PA south to e. WV, ne. TN, and w. NC in the sedimentary rock Appalachians. Windham & Al-Shehbaz (2007) […] RAB assigns this plant (as Arabis laevigata var. burkii) to NC based on somewhat aberrant specimens from high elevation cove forests; these are better assigned to B. laevigata var. laevigata. Hopkins (1937), however cites a specimen from Hot Springs, Madison County, NC, an area with plausible habitats (dry sedimentary rock woodlands, shale barrens). [= FNA; = Arabis laevigata (Muhlenberg ex Willdenow) Poiret var. burkii Porter – C, K, X, Y; < A. laevigata var. burkii – F, G, Z (also see A. serotina); < A. burkii (Porter) Small – S, misapplied in part; < Boechera laevigata – Q]

Boechera canadensis (Linnaeus) Al-Shehbaz, Sicklepod, Canada Rockcress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, VA): thin soils around rock outcrops, especially mafic or calcareous, and in dry to mesic, nutrient-rich, often rocky woodlands over mafic or calcareous rocks; uncommon (rare in Coastal Plain, rare in DE Piedmont). May-July; June-August. QC and ND south to Panhandle FL and TX. [= FNA, Q, WH; = Arabis canadensis Linnaeus – RAB, C, F, G, K, S, W, X, Y, Z]

Boechera laevigata (Muhlenberg ex Willdenow) Al-Shehbaz, Common Smooth Rockcress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (VA): rocky woodlands and forests, rock outcrops, especially mafic or calcareous, but also on more acidic substrates, rarely also in bottomlands; common (uncommon in VA Coastal Plain, rare in DE Piedmont). April-May; May-June. ME west to MN and SD, south to GA, AL, MS, AR, OK, and CO. Of our Boechera, B. laevigata is the most common, being the least limited to calcareous substrates. [= FNA; = Arabis laevigata (Muhlenberg ex Willdenow) Poiret var. laevigata – C, F, G, K, W, X, Y, Z; < A. laevigata var. laevigata – RAB; > A. laevigata var. burkii – RAB, misapplied; > > A. burkii (Porter) Small – S, misapplied in part; > A. laevigata – S; < Boechera laevigata – Q]

Boechera missouriensis (Greene) Al-Shehbaz, Missouri Rockcress. Pd (GA, NC, SC), Mt (NC): thin soil around outcrops of metamudstone, diabase, or granite (generally on mafic or rich granitic substrates); rare. April-May; May-June. ME to WI, south to KY, AR, and OK; disjunct eastward in NC, SC, and GA. [= FNA, Q; = Arabis missouriensis Greene – C, K, X, Y; = A. laevigata var. missouriensis – RAB; > A. missouriensis var. missouriensis – F; > A. viridís Harger var. viridís – G, Z]

Boechera serotina (Steele) Windham & Al-Shehbaz, Shale Barren Rockcress. Mt (VA, WV): shale barrens; rare. Mid-July-September. Endemic to Devonian and Ordovician shales of w. VA and e. WV. Wieboldt (1987) has clarified the taxonomy of this species and A. laevigata var. burkii. Also see Porter & Wieboldt (1991) for further discussion. [= FNA; = Arabis serotina Steele – C, K, X, Y; < A. laevigata var. burkii – F, G, Z; < Boechera laevigata – Q]

Boechera shortii (Fernald) Al-Shehbaz. Mt (WV), Pd (VA): nutrient-rich alluvial and river bluff forests (in VA, along the Potomac River); rare (VA Rare). April-May. NY west to MN, south to n. VA, nc. TN (Chester, Wofford, & Kral 1997), and AR. [= FNA, Q; = Arabis shortii (Fernald) Gleason – C, G, K, X, Y; = A. perstellata E.L. Braun var. shortii Fernald – F; = A. dentata (Torrey) Torrey & A. Gray – S, Z (name preoccupied); > A. shortii var. phalacrocarpa (M. Hopkins) Steyermark]
BRASSICACEAE

Boechera stricta (Graham) Al-Shehbaz. Pd (DE): {habitat}; rare. April-June. NL (Labrador) and AK south to NJ, DE, OH, IL, NM, AZ, and CA. [= FNA, Q; = Arabis drummondii A. Gray – C, F, G, K, Y; > A. drummondii A. Gray var. typica – Z; = Boechera drummondii (A. Gray) Löve & Löve, illegitimate name]

Boechera perstellata (E.L. Braun) Al-Shehbaz is apparently endemic to KY and c. TN (Chester, Wofford, & Kral 1997). [= FNA, Q; = Arabis perstellata – K, Y; > Arabis perstellata E.L. Braun var. perstellata – X; > Arabis perstellata E.L. Braun var. ampla Rollins – X]

Brassica Linnaeus 1753 (Mustard, Turnip, Rape, Cabbage, Collard Greens, Kale, Broccoli, Cauliflower, Kohlrabi, Rutabaga, Bok-Choy, Chinese Cabbage, Brussels Sprouts)

A genus of about 40 species, herbs, of the Old World. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z. [also see Erucastrum, Sinapis]

1 Upper cauline leaves petiolate, or sessile and cuneate.
2 Pedicels and siliques widely spreading to divaricately ascending; siliques 2-4 cm long, terete or nearly so; [section Rapa]...........................................Br. juncea
3 Petals mostly 18-25 mm long; beak of the siliqua (3-4) 11 mm long .........................................................[Br. napus]
4 Petals 6-10 (-11) mm long, deep yellow; beaks of the siliqua usually (8-) 10-15 (-22) mm long; plant usually glaucous; siliques 5-10 cm long.................................................Br. rapa var. rapa
5 Petals 10-18 mm long, pale yellow; beak of the siliqua usually (5-) 7-10 (-16) mm long; plant usually glaucous; siliques 5-10 cm long .........................................................Br. rapa

* Brassica juncea (Linnaeus) Czernajew, Leaf Mustard, Brown Mustard, Indian Mustard, Mustard Greens, Chinese Mustard, Cp (DE, GA, SC, VA), Mt (NC, SC, VA, WV), Pd (DE, SC, VA): fields, disturbed areas; common (uncommon in GA, NC, SC, VA, and WV), native of Eurasia. April-June. This species is apparently a recently derived polyploid (n=18) of B. nigra (n=8) and B. rapa (n=10). The seeds of this species are one source of table mustard; other components include B. nigra and Sinapis alba. [= RAB, C, G, K, W, Y, Z; > B. juncea – S; > B. japonica (Thunberg) Siebold ex Miquel – S]

* Brassica napus Linnaeus, Rutabaga, Rape, Canola, Colza, Swede. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA,)?, Cp (SC): fields, disturbed areas; uncommon (rare in GA, NC, SC, and VA), native of Eurasia. May-July. This species is apparently a recently derived polyploid (n=19) of B. oleracea (n=9) and B. rapa (n=10). The seeds of this species are the source of "canola" oil, the name recently coined by marketers from "Canadian" + "oil" + "low" + "acid" to avoid the negative connotation of the ancient name "rape." [= K, W, Y, Z; < B. napus – RAB (also see B. rapa)]

* Brassica nigra (Linnaeus) W.D.J. Koch, Black Mustard, Charlock. Cp (DE, VA), Pd (DE, VA), Mt (VA, WV) [NC]: fields, disturbed areas; common (uncommon of DE), native of Eurasia. May-August. The seeds of this species are one source of table mustard; other species used include B. juncea and Sinapis alba. [= C, F, G, K, S, Y, Z; = Sinapis nigra Linnaeus]

* Brassica rapa Linnaeus var. rapa, Turnip, Bird’s-rape, Field Rape, Field Mustard, Bok-choy, Chinese Cabbage. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA): fields, disturbed areas; common, native of Europe. March-June. B. rapa is cultivated in a variety of forms, B. rapa var. chinensis (Linnaeus) Kitam. (Bok-choy or Pak-choi) and B. rapa var. amplexicaulis Tanaka & Ono (Chinese Cabbage). [= K; < B. rapa – C, Y, Z; < B. napus – RAB; > B. rapa – G; > B. campestris Linnaeus – G, S]

* Brassica oleracea Linnaeus. Commonly cultivated in our area in a variety of forms, including B. oleracea var. acephala A.P. de Candolle (Collard Greens, Kale), B. oleracea var. capitata Linnaeus (Cabbage), B. oleracea var. italica Plench (Broccoli), B. oleracea var. botrytis Linnaeus (Cauliflower), B. oleracea var. gemmifera Zenk (Brussels Sprouts), and B. oleracea var. gongylodes Linnaeus (Kohlrabi). [= FNA, K]

Braya Sternberg & Hoppe 1815

A genus of about 6 species, perennial herbs, of alpine and arctic Eurasia and North America. References: Harris in FNA (2010); Rollins (1993)=Z.

Bunias Linnaeus 1753 (Warty-cabbage)

1 Plant an annual; cauline leaves < 5 cm long; siliques 10-12 mm long, more-or-less straight, 4-winged, spiny; seeds 3-4 per siliqua..............................B. erucago
BRASSICACEAE

Cakile. P. Miller 1754 (Sea Rocket)

Identification notes: The siliques of Cakile are divided near their middle by an abscission zone into two halves, each with a single seed: the upper abscises and disperses by water or wind, the lower remains attached to the parent plant. The size of the two segments and the contour of the abscised surface remaining on the lower segment are important taxonomic characters.

1 Lower siliques 5-9 mm wide, the beak somewhat flattened and typically rather blunt; [of NC northward to NL (Labrador)] ................................................................. C. maritima
2 Infructescences usually >20 cm long; [of the Gulf Coast] ........................................................................................................ C. lanceolata
3 Siliques 3-4 mm wide, the beak conical and acute at the apex; [of the Gulf Coast] ......................................................................................... C. pseudoconstricta
4 Upper fruit segment 7-15 mm long, 4-angled (to weakly 8-ribbed); articulating surface of lower fruit segment flat to concave and without teeth; [of NC southward to St. Lucie County, FL] ..................................................................................... C. harperi

Cakile edentula (Bigelow) Hooker, Northeastern Sea Rocket. Cp (DE, MD, NC, VA): beaches, at or near the wrack line; common. May-June (-October). NL (Labrador) south to NC; introduced in various other shores around the world, including w. North America and Australia. See C. harperi for discussion of the relation between these taxa. [= RAB, S; = C. edentula var. edentula – C, F, G; = C. edentula var. pseudoconstricta – GW; = C. edentula var. edentula – FNA, K, X, Y, Z]

Cakile harperi Small, Southeastern Sea Rocket. Cp (FL, GA, NC, SC): beaches, at or near the wrack line; common. May-June (-October). A Southeastern Coastal Plain endemic: e. NC south to the east coast of c. peninsular FL. Rodman (1974) and most authors since have treated C. harperi as C. edentula var. harperi (Small) Rodman. Rodman further treats the Great Lakes and ne. United States coastal populations (respectively) as C. edentula var. pseudoconstricta – Fernald and C. edentula var. edentula. Rodman points out the morphologic distinctions between the three taxa, the chemical differences between "edentula" and "harperi," and the rarity or absence of intermediates in areas of pairwise overlap between the 3 entities. The geographic / morphologic pattern is not clinal, but is rather a sharp step function, with an overlap in the distribution of (and rare hybridization between) two largely distinct taxa. The few intermediates can be interpreted as hybrids or very limited and more southern taxa. For these reasons I prefer the simplicity of treating the three taxa as binomial species. [= RAB, S; = C. edentula (Bigelow) Hooker ssp. harperi (Small) Rodman – FNA, GW, K, WH, X, Y, Z]

Cakile maritima Scopoli ssp. maritima, European Sea Rocket. Cp (NC, VA): beaches, at or near the wrack line; uncommon, native of Europe. The other subspecies are also European but are apparently not introduced in our area. The NC location was on ballast at Wilmington, and is apparently not persistent. VA locations are, however, well-established. [= FNA, X, Y; < C. maritima – C, F, G, K, Z; = C. cakile (Linnaeus) Karstens – S]

Calepina Adanson 1763

Calepina irregularis (Asso) Thellung. Mt (NC), Pd, Cp (VA): fields, disturbed areas; rare, native of Eurasia. April. [= RAB, C, FNA, K, Y, Z]
Camelina Crantz 1762 (Gold-of-pleasure, False-flax)

1 Siliques 4-7 mm long; leaves and stem rough-hairy, the stellate trichomes exceeded by simple trichomes (which are 1-2 mm long)..............

1 Siliques 7-12 mm long; leaves and stem glabrate to sparsely hairy, the stellate trichomes as long as the few simple trichomes.............. C. microcarpa

* **Camelina sativa** (Linnaeus) Crantz, Gold-of-pleasure, False-flax. Pd (DE, NC, VA), Cp (DE, SC), Mt (WV); fields, disturbed areas; rare, native of Eurasia. April-May. [= RAB, C, F, FNA, G, S, WV, Y, Z; > C. sativa ssp. sativa – K]

Capsella Medikus 1792 (Shepherd's Purse)

* **Capsella bursa-pastoris** (Linnaeus) Medikus, Common Shepherd's Purse. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA); fields, roadsides, disturbed areas; common (uncommon in DE), native of Europe. March-June. C. rubella Reuter, Pink Shepherd's Purse, is sometimes distinguished (as by F, G, Stace 2010), and occurs in our area. It is alleged to be diploid (vs. tetraploid), to have pink petals 1-2 mm long (vs. white, 2-3 mm long), and lateral margins of the fruit concave (vs. straight to convex). Al-Shehbaz (1986) considered the character correlations to be poor, not warranting taxonomic recognition. [= RAB, C, FNA, K, W, Y, Z; > C. bursa-pastoris – F, G, X; > C. rubella Reuter – F, G, X; > C. gracilis Gren. – F; = Bursa bursa-pastoris (Linnaeus) Britton – S]

Cardamine Linnaeus 1753 (Bittercress, Toothwort)

1 Leaves palmately divided (if 1-ternate, then palmately so, the terminal leaflets on a petiolule the same length as the those of the lateral leaflets); [Dentaria].

2 Plants entirely glabrous (including on the leaf margins); leaflets highly dissected with linear to filiform segments; [in our area known from Piedmont of NC and VA].................................................................................................................... C. dissecta

3 Plants with marginal leaf trichomes, and often also pubescent on the stem, inflorescence, and petioles; leaflets entire, toothed, or deeply lobed; [collectively widespread in our area].

4 Rhizome with 2-3 cm long segments, each separated by a narrow and fragile connecting portion (which typically is broken on herbarium specimens), and lacking “teeth” (prominent reduced leaves) along it; leaflets of the stem leaves (2×-) avg. 3× (-4×) as long as wide (thus proportionately similar to the leaflets of the basal leaves); central leaflet of stem leaves (2.5-) avg. 3.25 (-4) cm long × (0.5-) avg. 0.75 (-1.0) cm wide; taste of fresh plants relatively mildly mustardy...................................................... C. angustata

4 Rhizome elongate and of uniform diameter, lacking definite segments, but with periodic “teeth” (prominent reduced leaves) along it; leaflets of the stem leaves (2×-) avg. 3× (-4×) as long as wide (thus proportionately similar to the leaflets of the basal leaves); central leaflet of stem leaves (4-) avg. 6 (-8) cm long × (1.5-) avg. 2 (-2.5) cm wide; taste of fresh plant strong, like horseradish or wasabi..... ..................................................................................................................... C. diphylla

5 Trichomes of leaf margins appressed and ca. 0.1 mm long; stem leaves 2 (-3), opposite; lateral leaflets of stem leaves very rarely incised, the leaf being (and appearing merely 3-foliolate, though teeth may be prominent and lacerate); basal leaves usually present at flowering.

5 Rhizome elongate and of uniform diameter, lacking definite segments, but with periodic “teeth” (prominent reduced leaves) along it; leaflets of the stem leaves (2×-) avg. 3× (-4×) as long as wide (thus proportionately similar to the leaflets of the basal leaves); central leaflet of stem leaves (4-) avg. 6 (-8) cm long × (1.5-) avg. 2 (-2.5) cm wide; taste of fresh plant strong, like horseradish or wasabi..... ..................................................................................................................... C. diphylla

6 Cauline leaves simple, sometimes the lower to middle cauline leaves with 1-2 pairs of very small lateral lobes.

7 Plant from a tuberous or bulbous base, erect and generally unbranched, not stoloniferous or rooting down from upper nodes after flowering; petals 7-20 mm long.

</tbody>
</table>

**Cardamine angustata** O.E. Schulz, Eastern Slender Toothwort. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (NC, SC, VA): rich, mesic forests; common (rare in VA Coastal Plain, rare in DE Piedmont). March-April; April-May. NJ and IN south to n. GA, c. TN, and ne. MS; disjunct in the Ouachita Mountains of AR. Var. *ouachitana* E.B. Smith, alleged to differ from var. *angustata* in its non-ciliate leaves (vs. leaves with margins ciliate with antorse trichomes 0.1 mm long), is apparently not a valid taxon. [= *C. pratensis var. angustata* – RAB; = *Dentaria heterophylla* Nutall – F, G, S, W] |

**Cardamine bulbosa** (Schreber ex Muhlenberg) Britton, Sterns, & Poggenburg, Bulbous Bittercress. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swampy woods and bogs, primarily (but not strictly) in circumneutral soils over limestone or mafic rocks; common (uncommon in GA, NC, SC, VA, rare in DE Coastal Plain). March-May; April-May. ME west to MB, south to FL, LA, and TX. [= RAB, F, FNA, G, GW, K, S, W, Z; = *Rhamboidea* (Persoon) A.P. de Candolle – C, X] |

**Cardamine clematidis** Shuttleworth ex A. Gray, Mountain Bittercress. Mt (GA, NC, VA): shaded brookbanks, rock outcrops with seepage, at high elevations (1200m and above); rare. April-May; June-July. Endemic to the high elevation Southern Appalachians of w. NC, e. TN, sw. VA, and ne. GA (Brassstown Bald). [= *C. pratensis var. clematidis* Shuttleworth ex Gray – RAB, F, G, GW (also see *C. flagellifera*); = *Dentaria heterophylla* Nutall – F, G, S, W] |

**Cardamine debilis** D. Don. Cp (GA): disturbed areas; rare, native of Europe. This species is similar to *C. pycnantha* and *C. flexuosa* and may be overlooked (Rollins 1993, Brown & Marcus 1998). It is reported for e. GA (Jones & Coile 1988). [= K, Z; < *C. flexuosa* Withersing – FNA] |

**Cardamine dissecta** (Leavenworth) Al-Shehbaz, Dissected Toothwort. Pd (NC, VA), Mt (GA): rich, mesic forests; rare. March-April; April-May. Al-Shehbaz (1988c) describes the range as separated into four areas: c. AL (3 counties); c. NC and sc.
**Cardamine douglassii** Britton, Limestone Bittercress, Douglass's Bittercress, Purple Cress, Pink Spring-cress. Pd (NC, VA), Cp (VA), Mt (WV); nutrient-rich, mesic forests, especially alluvial bottomlands, and in nutrient-rich seepages, in NC in the drainages of the Neuse, Meherin, and (rarely) Cape Fear rivers; uncommon (rare in NC). Mid-March-early April; April-May. NY, ON, and MN south to c. NC, se. TN, AL, and MO. [= RAB, C, F, FNA, G, K, GW, X, Z]

**Cardamine flagellifera** O.E. Schulz var. *flagellifera*, Large-flowered Blue Ridge Bittercress. Mt (GA, NC, SC, VA), Pd (NC): seepages, on streambanks, and in moist and moister bottomland forests, mainly at moderate to low elevations; uncommon (rare in GA, SC, VA, and WV). March-May; June-July. *C. flagellifera* is endemic to the Southern Appalachians of w. NC, SC, e. TN, GA, VA, and WV, and is quite distinct from *C. clematis*, as pointed out by Dudley (1974). Rollins's division of this species into two varieties (following Small's recognition of two species) needs further evaluation. [= K, Z, < C. flagellifera – C, FNA, W, X; < C. clematis – RAB, GW; = C. flagellifera – S]

**Cardamine flagellifera** O.E. Schulz var. *hugeri* (Small) Rollins, Small-flowered Blue Ridge Bittercress. Mt (NC, VA?), Pd (NC): seepages, on streambanks, and in moist and moister bottomland forests, mainly at moderate to low elevations; rare. March-April; June-July. Endemic to the Southern Appalachians of NC and TN. [= K, Z; < C. flagellifera – C, FNA, W, X; < C. clematis – RAB, GW; = C. hugeri Small – S]

* *Cardamine flexuosa* Withering, Woodward Bittercress. Mt (NC, VA, WV), Cp (NC, VA), Pd (NC, VA): disturbed sites; rare, native of Eurasia. February-May. Lihová et al. (2006) show that Asiatic *C. flexuosa* is a distinct taxon from European *C. flexuosa* and will need a new name; at least some of our material is the Asiatic species, whose proper name is unclear (Lihová et al. 2006). Both the European and Asiatic taxa are allotetraploids of unclear parentage. [= RAB, F, K, X, Z; < C. flexuosa Withering – FNA]

**Cardamine longiflora** Fernald, Long's Bittercress. Cp (DE, NC, VA): tidal freshwater marshes and cypress-gum swamps; rare. June-July. Coastal in distribution, irregularly from ME south to SC (or FL). Difficult to distinguish from depauperate or submerged forms of *C. pensylvanica* with few leaflets; the short style (capsule beak) and short and thick pedicels appear to be the most reliable characteristics. [= C, F, FNA, K, X, Z]

**Cardamine micranthera** Rollins, Streambank Bittercress, Small-anthered Bittercress. Pd (NC, VA): sand and gravel bars in creeks, swampy floodplain woods, seepage over rocks; rare. April-May; May-June. A narrow endemic, known only from Stokes County, NC and Patrick County, VA; apparently extirpated from Forsyth County, NC. The description and key in RAB are partly in error, being based on the inadequate and unrepresentative material available at the time. *C. micranthera* is most closely related to *C. rotundifolia*, but also shows some affinities to *C. pensylvanica*. It can be distinguished from *C. rotundifolia* by the characters in the key; additionally, *C. micranthera* does not form proliferative branches from the upper nodes, generally branching from the base in vigorous plants, or unbranched in smaller plants. It can be distinguished from *C. pensylvanica* by its predominately simple leaves, especially those on the upper stem, the larger flowers, the petals 3-5 mm long (vs. 1.5-3 mm long), the fruiting pedicels thin, 10-20 mm long, spreading to ascending (vs. thick, 4-10 mm long, ascending). Wieboldt (1992) reasonably speculates that *C. micranthera* may be an in-breeding relative derived from *C. rotundifolia* in the Piedmont/Mountain interface. [= RAB, FNA, K, X, Z]

**Cardamine parviflora** Linnaeus var. *arenicola* (Britton) O.E. Schulz, Sand Bittercress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA): various habitats, primarily seasonally wet areas with shallow soil or sand, also on mafic outcrop glades, as on greenstone, diabase, and nutrient-rich granites; common (rare in DE and WV). March-May. The typic variety is Eurasian; our variety is widespread in e. North America, also occurring in the Pacific Northwest. Our plant may warrant specific status. [= RAB, C, F, K, X, Z; < C. parviflora – FNA, G, GW, S, W; = C. arenicola Britton – S]

**Cardamine pensylvanica** Muhlenberg ex Willdenow, Quaker Bittercress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): various wet habitats, especially swampy depressions, streambanks, small woodland seeps; common. March-May. NL (Newfoundland), NL (Labrador), NT, and AK south to FL, TX, and CA. [= RAB, C, FNA, G, GW, K, S, W, X, Z; > C. pensylvanica var. pensylvanica – F; > C. pensylvanica var. brittoniana Farwell – F]

**Cardamine pratensis** Linnaeus var. *palastris* Wimmer & Graebner, American Cuckoo-flower, Lady's-smock. Mt (VA), Cp (VA): bogs and swamps; rare. April-July. Var. *palastris* ranges from Canada south to NJ, VA, OH, IN, MN, and BC. The Eurasian var. *pratensis*, with pink (vs. white) flowers, is introduced in ne. North America and may occur in our area. These two varieties may not be distinguishable; Rollins combines var. *palastris* into var. *pratensis*. [= C, F, G, < C. pratensis – FNA; < C. pratensis var. pratensis – K, Z]

**Cardamine rotundifolia** Michaux, American Bittercress, Mountain Watercress. Mt (GA?, NC, VA, WV), Pd (DE, NC, VA): seepages, streambanks, swampy depressions; common (rare in DE, NC, and VA). April-May; June-July. Characteristically, *C. rotundifolia* branches from the upper nodes while in flower, the branches rooting down and proliferating.
A Central/Southern Appalachian endemic: n. DE, PA, and w. NY, west to OH and KY, south to w. NC and n. GA. [= RAB, C, F, G, GW, K, S, W, X, Z]

(Cardamine maxima (Nuttall) Wood, Large Toothwort. NB, ON, and MI south to NJ, PA, OH, WV (?), and KY (?). [= FNA, K, Y, Z; = C. maxima – C; = Dentaria maxima Nuttall – F, G]

Chorispora R. Brown ex A.P. de Candolle 1821 (Chorispora)

* Chorispora tenella (Pallas) A.P. de Candolle, Chorispora, Blue Mustard. Mt (WV): disturbed areas; rare, native of w. Asia. Well established in the w. United States, and occurs at scattered locations eastward, as in c. and w. TN (Chester, Wofford, & Kral 1997) and s. PA (Rhoads & Klein 1993). [= C, FNA, K, Y, Z]

Coincya Porta & Rigo ex Rouy 1891 (Wallflower-cabbage, Coincya)

Conringia Adanson 1763 (Hare's-ear Mustard)
A genus of 6 species, herbs, of Europe and the Middle East. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

Descurainia Webb & Berthelot 1836 (Tansy-mustard, Flixweed)
A genus of ca. 40 species, primarily of North and South America. References: Goodson & Al-Shehbaz in FNA (2010); Rollins (1993)=Z, Al-Shehbaz (1988b)=Y; Detting (1939)=X.

1 Silique 10-25 (-30) mm long, acute to acuminate, the seeds mostly in 1 row ................................................................. D. sophia
1 Silique 5-10 (-13) mm long, obtuse or clavate, the seeds mostly in 2 rows.
2 Leaves densely gray-canescent; angle between fruiting pedicels and rachis ca. 75 degrees; pedicels glandular-puberulent, 6-12 mm long; plants 2-5 dm tall; [primarily of the Coastal Plain]............................................................................................................................................................. D. pinnata var. pinnata
2 Leaves glabrous or glabrescent; angle between fruiting pedicels and rachis ca. 45 degrees; pedicels glabrous, 6-16 mm long; plants 3-7 dm tall; [primarily of the Mountains and Piedmont, rarely weedy in the Coastal Plain].
3 Stems moderately to densely glandular and pubescent (but not canescent); siliques 5-10 (-12) mm long; pedicels 8-16 mm long, ................................................................. D. pinnata var. brachycarpa
3 Stems sparsely pubescent to glabrous; siliques 8-12 mm long; pedicels 6-12 mm long, .............................................................................. D. pinnata var. intermedia

Descurainia pinnata (Walter) Britton var. brachycarpa (Richardson) Fernald, Northeastern Tansy-mustard. Mt (VA, WV), Pd (VA), Cp (NC)*: dry rocky openings and woodlands; rare. April-August. QC west to NT, south to VA, TN, and TX; introduced in the Coastal Plain of NC. [= C, F, G; = D. brachycarpa (Richardson) O.E. Schulz – RAB; = D. pinnata ssp. brachycarpa (Richardson) Detting – K, X, Y, Z; = Sophia millefolia Rydberg – S; < D. pinnata – W; > D. pinnata var. brachycarpa – WV; > D. pinnata var. pinnata – WV; misidentified; < D. pinnata ssp. brachycarpa – FNA]

Diplotaxis A.P. de Candolle 1821 (Wallrocket)

1 Leaves mostly basal or very low-cauline; plant annual or biennial; siliques lacking a gynophore (stipe) between the sepal scars and the base of the valves; [section Anacarpum] .......................................................... 2 D. reptans
2 Leaves mostly cauline; plant perennial, becoming somewhat woody at the base; siliques with a 0.5-2 mm gynophore (stipe) between the sepal scars and the base of the valves; [section Diplotaxis] .................................................................................. D. tenuifolia

Draba Linnaeus 1753 (Draba, Whitlow-grass)

1 Leaves mostly cauline; petals deeply bifid (about 1/2 way to base) ...................................................................................................................... D. verna
1 Leaves basal and cauline (the basal sometimes withering by fruiting); petals merely emarginate.

Draba cuneifolia Nuttall ex Torrey & A. Gray var. cuneifolia. Cp (AL, GA, *NC, *SC): open blackland prairies, preferring rocky, bare soil, also waste areas around wool-combing mills, possibly other habitats; rare, in NC and SC perhaps only native of further west. February-March; March-April. All three varieties are primarily distributed in sw. United States, but the species extends as a native at least as far east as c. GA (Houston County) (Echols 2007) and AL, where it occurs in prairies and on limestone outcrops (Diamond & Woods 2009). [= FNA, K, Z, ♂ D. cuneifolia – RAB, C, F, G, S]

Draba platycarpa Torrey & A. Gray. Cp (SC): waste areas around wool-combing mill; rare, perhaps not established, native of w. North America. [= FNA, K, Z]

Draba ramosissima Desvaux, Rocktwist, Appalachian Draba. Mt (NC, VA), Pd (VA): in crevices of rock outcrops, or in dry talus slopes, over a variety of rock types (including limestone, dolostone, schist, gneiss, shale); common (uncommon in NC and WV Mountains, rare in NC and VA Piedmont). April-May; May-July. W. MD and e. WV south through w. VA and e. KY south to w. NC and e. TN. [= RAB, FNA, K, S, W, WV, Z]
Draba reptans (Lamarck). Pd (NC), Cp (SC): dry soil; rare. February-March; March-April. MA and ON west to WA, south to NC, GA, TX and CA. The few occurrences in our area seem to make little ecological or phytochorographic sense; they may represent introductions. The first collection in our area was, however, by Walter. [= RAB, FNA, K, Z; > D. reptans var. reptans – C, F, G; > D. caroliniana Walter – S]

* Draba verna Linnaeus, Whitlow-grass Cp (DE, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, especially in dry, barren soils, including granitic flatrocks; common (uncommon in DE), native of Europe. February-April; March-May. [= RAB, C, FNA, K, S, W, WV, Z; > D. verna var. verna – F, G; > D. verna var. boerhaavii van Hall – F, G; = Erophila verna (Linnaeus) Besser]

Eruca P. Miller 1754 (Rocket-salad, Arugula)

A monotypic genus, an annual herb, native to Mediterranean Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* Eruca vesicaria (Linnaeus) Cavanilles ssp. sativa (P. Miller) Thellung. Garden Rocket, Rocket-salad, Arugula. Pd (NC), Mt (WV): cultivated as a salad green, persistent around gardens or occurring as a waif; rare, native of Mediterranean Europe. [= FNA, K, Y, Z; = E. sativa P. Miller – C, F, WV; < E. vesicaria – G; < E. eruc a (Linnaeus) Ascherson & Graebner – S]

Erucastrum K.B. Presl 1826 (Dog-mustard)

A genus of ca. 22 species, herbs, of Africa, Europe, and Arabia. References: Warwick in FNA (2010); Rollins (1993)=Z; Luken, Thieret, & Kartesz (1993); Al-Shehbaz (1985b)=Y.

Erysimum Linnaeus 1753 (Wallflower, Treacle Mustard)

A genus of ca. 150-180 species, of the Northern Hemisphere. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988d)=Y; Rollins (1993)=Z.

1 Petals 13-25 (-30) mm long, 4-11 (-13) mm wide; seeds 2-3 mm long; biennial or perennial; [native, usually in thin rocky soil].................................

.........................................................................................................................................................................................E. capitatum var. capitatum

1 Petals 3.5-10 mm long, 1.5-3 mm wide; seeds ca. 1 mm long; annual or biennial; [introduced, usually in disturbed situations]

2 Sepals 1.8-3.5 mm long; petals 3.5-5.5 mm long; fruits (1-) 1.5-2.5 (-4) cm long; pedicels slender (much narrower than the fruit), 5-13 (-16) mm long……………………………………………………………………………………………………………………………………………..E. cheiranthoides

2 Sepals 4.5-6 mm long; petals 6-9 (-11) mm long; fruits (2-) 3-8 (-10) cm long; pedicels thick (as wide as the fruit or nearly so), 2-9 (-15) mm long.

3 Biennial or perennial; fruit 3-5.8 (-7) cm long; fruiting pedicel somewhat narrower than the fruit……………………………………...[E. inconspicuum]

3 Annual; fruit (2-) 3-8 (-10) cm long; fruiting pedicel as wide as the fruit…………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………
**Hesperis** Linnaeus 1753 (Dame's Rocket)

* Hesperis matronalis Linnaeus, Dame's Rocket. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA), {GA}: bottomlands, roadsides, moist forests; common (uncommon in VA Piedmont, rare in Coastal Plain), native of Europe. April-August. The flowers are white or pink. [= RAB, C, F, FNA, G, K, S, W, WV, Y, Z]

**Iberis** Linnaeus 1753 (Candytuft)

* Iberis sempervirens Linnaeus, Evergreen Candytuft, is reported for NC and TN by Kartesz (1999), but the specimens he cites are from cultivated material. [= FNA, K] {rejected; not keyed}

**Iodanthus** Torrey & A. Gray 1840 (Purple Rocket)

Identification notes: *Iodanthus pinnatifidus* somewhat resembles *Hesperis matronalis* in overall appearance, but differs in the following ways: petals 10-13 mm long (vs. 20-25 mm long), siliques 2-4 cm long (vs. 5-10 cm long), pubescence of the lower stem of simple trichomes (vs. branched trichomes).

* Iodanthus pinnatifidus (Michaux) Steudel, Purple Rocket. Mt (WV): rich forests of bottomlands and lower slopes; rare. May-June. W. PA west to MN and IA, south through WV and e. and c. TN to AL and TX. [= C, F, FNA, G, K, S, WV, Y, Z]

**Isatis** Linnaeus 1753 (Woad)

**Leavenworthia** Torrey 1837 (Glade Cress)

1 Petals entire, white, < 7 mm long; leaf lobes deeply dentate, the terminal lobe only slightly larger than the larger lateral lobes .......... *L. uniflora*
2 Siliques conspicuously torulose (constricted between the seeds), even when young ................................................................. *L. torulosa*
3 Petals 7-10 mm long, shallowly emarginate (notched at the tip), yellow, white, or lavender, 7-15 mm long; leaf lobes entire to shallowly dentate; the terminal lobe markedly larger than the largest lateral lobes.
4 Petals yellow; [of AL and TN] ................................................................. *L. exigua var. lutea*
5 Styles 2-3 mm long; sepals green; [of KY] ................................................................. *L. exigua var. laciniata*
6 Siliques thick, fleshy; styles 2.5-5 mm long; petals yellow, white, or lavender; [of n. AL and e. TN].
7 Styles 1.5-2 (-3) mm long; mature siliques cuneate at the base and acute at the tip; [of Colbert, Franklin, and Lawrence counties, AL] ................................................................. *L. stylosa var. stylosa*
8 Siliques 12-15 mm long, 3-4 mm wide; seeds slightly elongate, cleft at one side of the long axis; [of Sumner, Smith, Wilson, Davidson, Rutherford, Bedford, and Maury counties, TN] .................................................................................................................. *L. stylosa var. brachystyla*

Leavenworthia exigua Rollins var. exigua. Limestone glades, disturbed calcareous sites nearby. Endemic to the Central Basin of c. TN (8 counties) (Chester, Wofford, & Kral 1997), western Highland Rim (Decatur and Perry counties), and the Ridge and Valley of nw. GA (Walker and Catosa counties). [= K, Y, Z; <L. exigua – FNA]

Leavenworthia exigua Rollins var. laciniata Rollins. Limestone glades, disturbed calcareous sites nearby. April. Endemic to the Western Highland Rim and w. Knobs of c. KY (Bullitt and Jefferson counties). [= C, K, Y, Z; <L. exigua – FNA]

Leavenworthia exigua Rollins var. lutea Rollins. Limestone glades, disturbed calcareous sites nearby. March-April. Endemic to the Central Basin of n. AL (Jefferson County) and c. TN (Bedford and Maury counties) (Chester, Wofford, & Kral 1997). [= K, Y, Z; <L. exigua – FNA]

Leavenworthia torulosa A. Gray. Limestone glades, disturbed calcareous sites nearby. March-April. Endemic to the Central Basin of c. TN (10 counties), the Ridge and Valley of c. TN (Bradley and Meigs counties), and the Western Highland Rim of KY (Logan, Simpson, Todd, and Warren counties). [= C, F, FNA, G, K, S, Y, Z]

Leavenworthia uniflora (Michaux) Britton. Limestone glades, disturbed calcareous sites nearby. Endemic to the Central Basin of c. TN (8 counties), the Ridge and Valley of c. TN (Hamilton, Meigs, Bledsoe, and Knox counties), nw. GA (Walker and Murray counties), and c. KY (15 counties). [= C, F, FNA, G, K, S, Y, Z]

Leavenworthia uniflora var. lutea

Leavenworthia uniflora var. stylosa

Leavenworthia uniflora var. torulosa

Leavenworthia uniflora var. uniflora

Lepidium Linnaeus 1753 (Pepperwort, Peppergrass, Pepperweed)

section Lepidium: perfoliatum, graminifolium
section Cardamon: sativum
section Lepia: campestrae
section Diligentium: austrinum, densiflorum, oblongum, virginicum ssp. virginicum
??: didymum, draba, ruderale, africanum, bonariense, lasiocarpum, schinzii, coronopus

1Upper cauline leaves perfoliate or sagittate.

* Lepidium perfoliatum Linnaeus, Perfoliate Pepperwort, Clasping Pepperweed, Shieldcress. Cp (NC), Pd (GA, NC), Mt (WV), {SC, VA}: disturbed areas; rare, native of Europe. April-May. [= RAB, C, F, FNA, G, K, Y, Z]

* Lepidium africanum (Burmann f.) A.P. de Candolle, African Pepperwort. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= K, Y, Z]

* Lepidium austrinum Small, Southern Pepperwort. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our primary area. March-June. Also reported from MS (Bryson 1991, FNA). For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= FNA, K, Y, Z]

* Lepidium bonariense Linnaeus, Argentinian Pepperwort. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= K, Y, Z]

* Lepidium coronopus (Linnaeus) Al-Shehbaz. [AL, FL, TN]; disturbed areas; rare, of native Europe. [= FNA; > Lepidium squamatum Forsskål – X; > Coronopus squamatus (Forsskål) Ascherson – C, K; > Coronopus procumbens Gilibert – F, G; = Carara coronopus (Linnaeus) Medikus – S]

* Lepidium graminifolium Linnaeus, Grassleaf Pepperwort. Introduced, especially on ballast, south to MD, PA. April-June. [= K, Y, Z]

* Lepidium lasiocarpum Nuttall ssp. lasiocarpum. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. March-June. Also reported for information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= FNA; = L. lasiocarpum var. lasiocarpum – K, Z; < L. lasiocarpum – Y]

* Lepidium oblongum Small. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= FNA, Y; > L. oblongum var. oblongum – K, Z]

* Lepidium schinzi Thellung. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986). [= Y, Z]

**Lobularia** Desvaux 1815 (Sweet Alyssum)

* Lobularia maritima (Linnaeus) Desvaux, Sweet Alyssum. Pd (VA), Cp (DE, NC, VA), Mt (WV): disturbed areas, lawns; rare, native of Europe. June-November. The NC occurrences are doubtfully established, from gardens and a "lawn." [= C, F, FNA, G, K, Y, Z]

**Lunaria** Linnaeus 1753 (Honesty)

1 Upper cauline leaves coarsely and irregularly dentate, the teeth acute to obtuse, sometimes with a mucron or short linear tip < 0.5 mm long; siliques broadly rounded at both ends (when mature – young siliques may be cuneate and acute); plant annual or biennial.................L. annua
1 Upper cauline leaves spinulose-dentate, the teeth acuminate and usually with a linear tip > 0.5 mm long; siliques cuneate at the base, acute at the tip; plant perennial.[L. rediviva]

* _Lunaria annua_ Linnaeus, Annual Honesty, Silver-dollar. Cp (DE, VA), Pd (DE, VA), Mt (NC, VA, WV) {GA}: escaped from cultivation around gardens, not usually persistent; uncommon (rare in GA, NC, VA, and WV), native of se. Europe. April-June. [= C, F, FNA, G, K, Z]

**Matthiola** W.T. Aiton 1812 (Stock)

A genus of about 50 species, herbs, mainly of Eurasia and Africa. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

**Microthlaspi** F.K. Meyer 1973 (Penny-cress)

**Myagrum** Linnaeus 1753

* _Myagrum perfoliatum_ Linnaeus. {VA}; {habitat}; rare, native of s. Europe. [= FNA]

**Nasturtium** R. Brown 1812 (Watercress)

1 Petioles of emergent leaves lacking auricles toward the base; seeds yellowish-brown, finely reticulate, with 400-500 polygonal depressions on each side ......................... _N. floridanum_ .

2 Petioles of emergent leaves auriculate toward the base; seeds reddish-brown, rather coarsely reticulate, with 25-150 (-175) polygonal depressions on each side.

   1 Mature siliques 1-1.5 mm wide, terete or subterete; seeds in 1 row in each locule of the silique; seeds with (75-) 100-150 (-175) polygonal depressions on each side ......................... _N. officinale_ .

   2 Mature siliques 1.8-2.3 mm wide, flattened; seeds in 2 rows in each locule of the silique; seeds with 25-50 (-60) polygonal depressions on each side ......................... _N. microphyllum_ .

* _Nasturtium floridanum_ (Al-Shehbaz & Rollins) Al-Shehbaz & R.A. Price, Florida Watercress. Cp (FL): spring runs, blackwater bottomlands; rare. March-May. Ne. FL and e. Panhandle FL south to s. FL; endemic to FL, but north to counties adjacent to se. GA. [= FNA, V; = Rorippa floridana Al-Shehbaz & Rollins – K, WH, Z; < Nasturtium microphyllum Boenninghausen ex Reichenbach – GW, misapplied; Nasturtium stylosum Shuttleworth ex O.E. Schulz] {syonymy incomplete}

* _Nasturtium microphyllum_ Boenninghausen ex Reichenbach, Narrow-fruited Watercress. Mt (NC, VA): streams, springs; rare, native of Europe. See Green (1962) for additional information. [= FNA, V; = Rorippa microphylla (Boenninghausen ex Reichenbach) Hylander ex Löve & Löve – C, K, Q, X, Z; < Nasturtium officinale – RAB, G, W; = Nasturtium officinale R. Brown var. microphyllum (Boenninghausen ex Reichenbach) Thellung – F]

Paysonia O’Kane & Al-Shehbaz 2002 (Bladderpod)

A genus of 8-9 species, herbs, endemic to southeastern United States. O’Kane & Al-Shehbaz (2002) clearly show that Paysonia is not a part of Lesquerella, which itself is included within Physaria. References: O’Kane in FNA (2010); Rollins (1993)=Z; Rollins & Shaw (1973)=Y; O’Kane & Al-Shehbaz (2002)=X; Al-Shehbaz (1987)=V. Key adapted from X and Z.

1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow. [see Physaria]
1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white.
2 Fruits (1-) 2-3 mm long, slightly pubescent on the exterior; petals 3.5-6.5 (-7.5) mm long, bright yellow; biennial or perennial from branched, woody caudex. [P. globosa]
2 Fruits 3-8 mm long, glabrous on the exterior; petals 5-11 mm long, either pale yellow or bright yellow to orange; annual, biennial, or short-lived perennial from a fine taproot. [P. filiformis]
3 Stems 1-7 dm long; basal leaves 1.5-5 (-8) cm long, lyrate-pinnatifid (rarely merely dentate or entire); petals bright yellow to orange. [P. gordonii]
4 Fruiting pedicels sigmoid, 5-15 (-25) mm long; gynophore 0.5-1 mm long. [Ph gracilis ssp. gracilis]

Physaria (Nuttall ex Torrey & A. Gray) A. Gray

1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white. [see Physaria]
1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow.
2 Fruits 3-8 mm long, glabrous on the exterior; petals 5-11 mm long, either pale yellow or bright yellow to orange; annual, biennial, or short-lived perennial from a fine taproot. [P. globosa]
2 Fruits 1-2.4 cm long, entire or sinuate; petals pale yellow ................................................................. [P. filiformis]
3 Stems 1-7 dm long; basal leaves 1.5-5 (-8) cm long, lyrate-pinnatifid (rarely merely dentate or entire); petals bright yellow to orange. [P. gordonii]
4 Fruiting pedicels sigmoid, 5-15 (-25) mm long; gynophore 0.5-1 mm long. [Ph gracilis ssp. gracilis]

* Physaria gordonii (A. Gray) O’Kane & Al-Shehbaz, Gordon’s Bladderpod. Mt (VA): shaly roadside; rare, native of further west. Rollins (1993) reports this species (identification unconfirmed) as a waif along the Blue Ridge Parkway, VA; it may not be
established.  [= FNA; > P. gordonii ssp. gordonii – X; > Lesquerella gordonii (A. Gray) S. Watson var. gordonii – Z; = Lesquerella gordonii – K, Y]

Physaria filiformis (Rollins) O’Kane & Al-Shehbaz, Missouri Bladderpod.  Reported for AL (FNA), apparently erroneously (Yatskievich, 2010, pers. comm.).  [= FNA, X; = Lesquerella filiformis (Desvaux) S. Watson – K, V, Y, Z]  {rejected; not keyed}

Physaria globosa (Desvaux) O’Kane & Al-Shehbaz.  Endemic to an area from Posey County, IN and allegedly also s. OH south through c. KY to c. TN.  [= X; = Lesquerella globosa (Desvaux) S. Watson – C, F, G, K, S, V, Y, Z]  {not yet keyed}

Physaria gracilis (Hooker) S. Watson ssp. gracilis.  TN, IL, MO, and OK south to AL, MS, LA, and TX.  [= X; < Lesquerella gracilis – F, G; = Lesquerella gracilis (Hooker) S. Watson ssp. gracilis – K, V, Z]  {not yet keyed}

Planodes E.L. Greene 1912 (Virginia-cress)

A monotypic genus, of North America and Mexico. References:  Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

Raphanus Linnaeus 1753 (Radish)

1 Siliques moniliform (constricted between the seeds), the silique body about the same diameter for most of its length, longitudinally grooved; petals usually yellow, fading white (rarely purple); seeds 4-12 per silique .................................................... R. raphanistrum ssp. raphanistrum

1 Siliques not moniliform, the silique body tapered from its widest point below the middle to the apex, smooth or slightly longitudinally grooved; petals usually purple (rarely white); seeds 1-3 (-5) per silique ......................................................... R. sativus

Rapistrum Crantz 1769 (Bastard-cabbage)

A genus of 2 species, herbs, of Europe. References:  Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* Rapistrum rugosum (Linnaeus) Allioni, Annual Bastard-cabbage.  Cp (SC):  waste areas around wool-combing mills; rare, native of Mediterranean Europe.  Also naturalized at scattered sites in e. TN (Chester, Wofford, & Kral 1997), PA (Rhoads & Klein 1993), and elsewhere.  [= C, F, FNA, Z; > R. rugosum var. rugosum – G; > R. rugosum ssp. rugosum – K, Y]

Rorippa Scopoli (Yellow Cress, Marshcress)

A genus of about 75 species, herbs, cosmopolitan. The separation of Nasturtium from Rorippa is warranted (Al-Shehbaz & Price 1998); Franzke et al. (1998) provide corroboration based on molecular analysis. The species treated here as R. aquatica has been placed in several genera in recent years. References:  Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=X; Rollins (1993)=Z; Stuckey (1972)=Y; Al-Shehbaz & Bates (1987)=V; Les, Anderson, & Cleland (1995)=U; Al-Shehbaz (1988a)=Q. Key modified from FNA.

1 Plant a submerged aquatic, rooting from lower nodes; leaves of two forms, the submerged pectinately divided, the emergent simple, sometimes lobed; fruit <2.5× as long as wide; petals white ...................................................... R. aquatica

1 Plant terrestrial or of wet places, not rooting from lower nodes; leaves of one form, pinnately lobed or simple; fruit >2.5× as long as wide; petals yellow or pale yellow (or absent).

2 Plant a rhizomatic, colony-forming perennial; petals (2.0-) 2.8-6.0 mm long; siliques 3-15× as long as wide.
A genus of 7 species, herbs, of s. Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z and C.

1 Beak of silique strongly compressed; silique densely covered with long, stiff trichomes, ca. 4 mm in diameter; pedicels slender, mostly at right angles to the rachis; seeds 4-8 per silique; [section Sinapis] .............................................................................................................. \textit{S. alba}

1 Beak of silique conical; silique glabrous or nearly so, ca. 2 mm in diameter; pedicels thick, erect to spreading; seeds 7-13 per silique; [section Ceratosinapis] .............................................................................................................................................. \textit{S. arvensis}

* \textit{Sinapis alba} Linnaeus, White Mustard, Yellow Mustard. Mt (NC, WV), Pd (DE, NC), Cp (DE): disturbed areas; rare, native of Mediterranean Europe. April-June. The seeds of this species are one source of table mustard; other species used include \textit{Brassica juncea} and \textit{B. nigra}. = C, K, S, Y, Z; ? Brassica hirta = RAB, F, G, WV]

**Sisymbrium** Linnaeus (Jim Hill Mustard)

1 Silique linear, 5-10 cm long; spreading from the rachis; pedicels 5-20 mm long; petals 6-8 mm long ............................... *S. altissimum*

1 Silique subulate, 0.8-1.5 cm long, appressed to the rachis; pedicels 1.3 mm long; petals 3-4 mm long ............................... *S. officinale*

* Sisymbrium irio* Linnaeus, London-rocket. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= C, F, FNA, G, K, Y, Z]

* Sisymbrium loeselii* Linnaeus. Mt (WV), Cp (SC): disturbed areas, waif around wool-combing mills; rare, native of e. Europe and w. Asia. [= C, F, FNA, G, K, Y, Z] {not yet keyed}

* Sisymbrium tereaninowii* Sonderegger, Russian Rocket. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= K, Y, Z] {not keyed}

**Teesdalia** Aiton f. 1812 (Shepherd's Cress)

**Thlaspi** Linnaeus 1753 (Penny-cress)

1 Siliques 5-8 mm long, 2-4 mm wide; seeds brown, alveolate; lower stem with scattered long hairs; fresh plant smelling of garlic when crushed; [section *Pterotropis*] ................................................................. *T. alliaceum*

1 Siliques (8-) 10-17 mm long, 7-12 mm wide; seeds brown, concentrically ridged; lower stem glabrous; fresh plant not smelling of garlic when crushed; [section *Thlaspi*] ........................................................................................................ *T. arvense*

* Thlaspi alliaceum* Linnaeus, Garlic Penny-cress. Pd (DE, NC, VA), Mt (WV), Cp (DE): fields, disturbed areas, roadsides; uncommon (rare in NC, VA, and WV, rare in DE Coastal Plain), native of Europe. March-April; April-May. [= RAB, FNA, K, Y, Z]

**Turritis** Linnaeus 1753 (Tower Mustard)

**BRASSICACEAE**

_Warea_ Nuttall 1834 (Warea, Pineland-cress)

A genus of 4 species, annual herbs, of se. North America. The genus is endemic to se. United States, consisting of our species and two others of peninsular FL. This is the only genus of tribe _Thelypodieae_ in our area. References: Al-Shebaz in FNA (2010); Rollins (1993) = Z; Al-Shehbaz (1985a) = Y; Channell & James (1964).

**Identification notes:** _Warea_ (Brassicaceae) and _Polanisia_ (Cleomaceae) are superficially similar. The genus is quite showy and conspicuous, reminiscent of a small _Cleome_ because of its white to pink, clawed petals and silique borne on a long gynophore.

1 Leaves opposite; dioecious shrubs.
2 Herb, < 2 (-3) dm tall; leaves 1-4 cm long, glabrous; inflorescence a terminal panicle of cymes; [tribe Comandraceae or family _COMANDRACEAE_]...
3 Aerial shrubs, parasitic on treetrunks and branches; leaves coriaceous, brittle when live; [tribe Viscaceae or family _VISCACEAE_]...

1 Leaves rounded or slightly auriculate at the base; petals deep purple ........................................ W. sessilifolia

---

**277. OLACACEAE** A.L. de Jussieu ex R. Brown in Tuckey 1818 (Olax Family) [in SANTALALES]

A family of about 14 genera and 100 species, trees, shrubs, and woody vines, pantropical in distribution. Sometimes further divided, as by Nickrent et al. (2010), in which case _Ximenia_ is placed in Ximeniaceae. References: Nickrent et al. (2010).

_Ximenia_ Linnaeus 1753 (Tallow-wood)

A genus of about 8 species, root-parasitic shrubs, tropical. _Ximenia_ is placed in the segregate family Ximeniaceae by Nickrent et al. (2010).

---

**279. SANTALACEAE** R. Brown 1820 (Sandalwood Family) [in SANTALALES]

A family of about 41 genera and 930 species, trees, shrubs, and herbs, primarily of tropical and warm temperate regions of the Old World and New World. All members of the family are hemiparasitic, attaching to the stems or roots of other plants. Viscaceae are closely related to and should either be included in the Santalaceae (Angiosperm Phylogeny Group 2003, 2009), as done here, or the contrasting approach should be taken, involving the segregation of smaller, monophyletic families (Nickrent et al. 2010). In our area, this would mean Santalaceae s.s. (Angiosperm Phylogeny Group 2003, 2009), as done here, or the contrasting approach should be taken, involving the segregation of smaller, monophyletic families (Nickrent et al. 2010). References: Nickrent et al. (2010); Nickrent & Malécot (2001).

1 Leaves alternate; monoecious herb or shrub.
2 Herb, < 2 (-3) dm tall; leaves 1-4 cm long, glabrous; inflorescence a terminal panicle of cymes; [tribe Comandraceae or family _COMANDRACEAE_]...
3 Shrub, > 4 dm tall; leaves 5-15 cm long, pubescent; inflorescence a terminal raceme; [tribe Pyrularaceae or family _PYRULARACEAE_]...

1 Leaves opposite; dioecious shrubs.
2 Aerial shrubs, parasitic on treetrunks and branches; leaves coriaceous, brittle when live; [tribe Viscaceae or family _VISCACEAE_]...
3 Stamineate flowers in terminal umbel-like dichasias; pistillate flowers (and fruits) solitary, terminal; clumped shrub to 4 m tall; [tribe _Thesiaeae_ or family _THESIAEAE_]...
4 Stamineate flowers in axillary umbels; pistillate flowers (and fruits) solitary, axillary; rhizomatous shrub to 1 m tall; [tribe _Santaleae_ or family _SANTALEAE_].

---

**Ximenia americana** Linnaeus, Tallow-wood, Hog-plum. Cp (FL): hammocks, pine flatwoods, scrub; uncommon. Endemic to FL peninsula, north to Duval County, FL. [= K, S, WH]

---

Buckleya Torrey (Piratebush)

A genus of 5 species, shrubs, of temperate e. North America and e. Asia; the 3 species other than our own are *B. lanceolata* of Japan, and *B. henryi*, *B. graebneriana*, and *B. angulosa* of China. *Buckleya* is placed in the segregate family Thesiaceae by Nickrent et al. (2010). References: Carvell & Eshbaugh 1982=Z; Massey et al. (1983).

*Buckleya distichophylla* (Nuttall) Torrey, Piratebush. Mt (NC, VA): dry or rocky bluffs and slopes; rare. April-May; June-October. A Southern Appalachian endemic: sw. VA south through ne. TN to sw. NC, in the western edge of the Blue Ridge and to the west in the Ridge and Valley. It is apparently parasitic on a variety of hosts – not limited to *Tsuga*, as has sometimes been reported. The branches are often mistaken for a compound leaf. [= RAB, C, F, G, K, S, W, Z]

Comandra Nuttall (Bastard-toadflax)

A genus of 2 species (the only other species European). *Comandra* is placed in the segregate family Comandraceae by Nickrent et al. (2010).

Nestronia Rafinesque (Nestronia)

**Identification notes:** In its clonal, usually knee-high growth, *Nestronia* has something of the aspect of an opposite-leaved lowbush blueberry.

Phoradendron Nuttall 1848 (Mistletoe)

*Phoradendron serotinum* (Rafinesque) M.C. Johnston ssp. *serotinum*, American Mistletoe, Christmas Mistletoe. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA, WV), Mt (GA, NC, SC, VA, WV): parasitic on various species of trees, especially abundant in swamp forests (perhaps because they are less frequently cut and have older, more mature hardwoods); common (uncommon in Piedmont and Mountains). October-November (-March); November-January (-May). Kuijt (2003) interprets this as a species with four subspecies; ssp. *serotinum* is the eastern component, ranging from NJ west to s. OH, s. IN, and s. MO, south to s. FL and s. TX; this interpretation is supported by genetic studies currently underway (Hawkins et al., in prep.). The other three subspecies are distributed in sw. United States and n. Mexico. The nomenclatural argument about which Rafinesquian epithet to adopt is arcane; the basionym *leucarpum* has nomenclatural precedence by 3 years, but the combination in *Phoradendron* can be considered a later homonym of *Phoradendron leucocarpum* Patshovsky. I here follow Kuijt (2003) in his decision to reject *leucarpum.* *Phoradendron* is, of course, the mistletoe familiar (at least traditionally) in e. United States as a Christmas decoration. Z comments that "the superficial likeness of *Phoradendron serotinum* to the European *Viscum album* has made the transfer of the latter's folklore to North America easy;" *Viscum album* was a sacred plant of Celtic and druidical pre-Christian European societies. The white berries of *P. serotinum* are extremely poisonous. Their sticky flesh promotes the dispersal of the seeds by birds from tree to tree. [= Y; = *Phoradendron leucocarpum* (Rafinesque) Reveal & M.C. Johnston – K; < *P. serotinum* (Rafinesque) M.C. Johnston – RAB, C, W, Z; < *P. flavescens* (Pursh) Nuttall – F, G, S, WV]

Pyrularia Michaux (Buffalo-nut)

A genus of 4 species, shrubs, of e. North America and e. Asia (the other 3 species are of e. Asia). *Pyrularia* is placed in the segregate family Cervantesiaceae by Nickrent et al. (2010).
VISCACEAE

Pyrularia pubera Michaux, Buffal-nut, Oak-nut. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA): moist forests; common. April-May; July-October. A Southern and Central Appalachian endemic. P. pubera ranges from sw. PA (Rhoads & Klein 1993), e. WV, and w. VA south and west to e. KY, w. NC, e. TN, and n. and wc. GA. The oil in the fruits is very poisonous. [= RAB, C, F, G, K, S, W, WV]

284. TAMARICACEAE Link 1821 (Tamarisk Family) [in CARYOPHYLLALES]

A family of about 4 genera and 78 species, shrubs and trees, of Eurasia and Africa (especially from the Mediterranean to c. Asia). References: Crins (1989b); Gaskin in Kubitzki & Bayer (2003); Gaskin et al. (2004).

Tamarix Linnaeus 1753 (Tamarisk, Salt-cedar)

A genus of about 54 species, trees and shrubs, native of Eurasia and Africa. References: Baum (1978)=Z; Crins (1989b)=Y.

Identification notes: An important character is the staminal disk; three terms are used. In holophytic disks, the lobe between each stamen is obvious and separate from the stamens on either side, and each is usually 2-lobed. In paralophic disks, each lobe is deeply binate and, each half-lobe is fused to the base of the adjacent stamen, but is still somewhat distinct from it. In synlophic disks, the lobes are also deeply binate, but each half-lobe is fused confluent with the stamen base, giving the appearance that the filament has swollen base.

1 Flowers 4-merous; [section Oligadenia].
2Petals 1.5-2.5 mm long; bracts subtending the pedicels diaphanous; young growth completely glabrous; [section Oligadenia; series Arbusculae] ....................................................................................................................................................... T. parviflora
3Petals 3.5-5 mm long; bracts subtending the pedicels herbaceous; young growth (especially the bracts and the raceme axis) papillose; [section Oligadenia; series Anisandrae] ....................................................................................................................................................... T. tetragyna
1 Flowers 5-merous.
3 Racemes 5-10 mm wide; [section Oligadenia].
4Bracts of the raceme linear to linear-oblong, about equaling the pedicel; disk holophytic; young growth glabrous; [section Oligadenia; series Lexae] ....................................................................................................................................................... T. chinensis
4Bracts of the raceme lanceolate to ovate, exceeding the pedicel; disk synlophic, paralophic, or holophytic; young growth glabrous or papillose; [section Oligadenia; series Anisandrae].
5Young growth glabrous (except sometimes papillose on the raceme axis); disk synlophic; flowers with 5 antepetalous stamens and 0 antepetalous stamens ................................................................. T. africana
5Young growth papillose; disk holophytic to paralophic; flowers with 4-5 antepetalous stamens and 0-4 antepetalous stamens ................................................................. T. tetragyna
3 Racemes 3-5 mm wide; [section Tamarix].
6Young growth papillose; disk synlophic; [section Tamarix; series Canariensis] ....................................................................................................................................................... T. canariensis
7Petals caducous; disk synlophic ....................................................................................................................................................... T. gallica
7Petals persistent; disk holophytic ....................................................................................................................................................... T. ramosissima

* Tamarix aralensis Bunge, Russian Tamarisk. Reported for NC (Kartesz 1999), but the specimen on which the report is based is of a plant in cultivation as an ornamental. Not keyed. [= K, Y, Z]
* Tamarix chinensis Loureiro, Chinese Tamarisk. Cp (NC): coastal sands; rare, native of China, Korea, and Japan. [= C, K, Y, Z; = T. chinensis Linnaeus – G, an illegitimate name]
* Tamarix gallica Linnaeus, French Tamarisk. Cp (GA, NC, VA?): brackish marshes; rare, native of the w. Mediterranean region of Europe. April-July. Most reports of this taxon from the Southeast represent misidentifications or a very broad interpretation of the species. [= F, G, K, Y, Z; = T. gallica – RAB, S]

285. PLUMBAGINACEAE A.L. de Jussieu 1789 (Leadwort Family) [in CARYOPHYLLALES]
A family of about 24-27 genera and 650-775 species, shrubs, vines, and herbs, of cosmopolitan distribution. Lledó et al. (1998) and other authors suggest that the portion of the Plumbaginaceae often recognized as tribe Staticeae or subfamily Stacteae (which includes Limonium) would be better treated as a distinct family. References: Morin in FNA (2005); Lledó et al. (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

Limonium P. Miller 1754 (Sea-lavender)

Limonium carolinianum (Walter) Britton, Carolina Sea-lavender. Cp (DE, FL, GA, NC, SC, VA): tidal marshes, especially in hypersaline flats; common. August-October. Along the coast from NL (Labrador) south to s. FL, west to TX and ne. Mexico. Various treatments recognize from 1 to 4 taxa in our area. The most recent monographer, Luteyn (1976), recognizes only a polymorphic L. carolinianum – a treatment followed by most flora authors since. Godfrey & Wooten (1981) follow Luteyn's treatment, but state "we are not at all confident that Luteyn's treatment is a reasonable one." [= C, FNA, GW, K, WH, Z; Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).]

PLUMBAGINACEAE

A family of about 43-48 genera and 1100-1200 species, trees, shrubs, vines, and herbs, cosmopolitan, but especially north temperate. Recent changes in the circumscription of various genera (including Polygonum, Persicaria, Fallopia, etc.) have received strong support from molecular phylogenetic studies (Kim & Donoghue 2008; Lamb Frye & Kron 2003). References: Freeman & Reveal in FNA (2005); Horton (1972)=Z; Mitchell & Dean (1978)=Y; Ronse Decraene & Akeroyd (1988); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Lamb Frye & Kron (2003); Kim & Donoghue 2008).

1 Woody vine, climbing by tendrils; [subfamily Polygonoideae, tribe Coccolobeae].
2 Leaf base deeply cordate.................................................................Antigonon
2 Leaf base truncate to broadly cuneate...............................................Brunnichia

3 Herb (sometimes very robust and rather woody), herbaceous vine, or (Fallopia baldschuaniaca) a somewhat woody vine lacking tendrils.

4 Stem leaves in our species) whorled; flowers in involucrate heads; ocreae absent; stamens 9; leaves densely white-tomentose on the lower surface; [of xeric situations of shale barrens and sandhills]; [subfamily Eriogonoideae, tribe Eriogoneae] ........................................Eriogonum
3 Stem leaves alternate; flowers in various inflorescences (not involucrate); ocreae present; stamens (3-) 5-8 (-9); leaves glabrous or variously pubescent, but not densely white-tomentose; [of various habitats, including xeric ones]; [subfamily Polygonoideae].
4 Tepals 6, in 2 series of 3 each, plants with leaves basally disposed, the largest basal (these withering in some species later in the season); [tribe Rumiceae].
5 Tepals (the outer series) spinose ..................................................................................Emex
5 Tepals foliaceous.
6 Fruit 3-winged; basal leaves very large, 20-40 cm wide; inner and outer tepals similar; [plant cultivated, rarely persistent or escaped] ..........................................................................................................................Rheum
6 Fruit 3-angled; basal leaves small to medium in size, 0.5-15 cm wide; inner tepals wider than the outer tepals; [plants common, mostly weedy] ..........................................................................................................................Rumex
4 Tepals mostly 5 in a single whorl; plants with leaves along the stem, lacking well-developed basal leaves.
7 Flowers in small clusters or very reduced racemes of 1-5 flowers, borne in the axils of normally sized or reduced leaves; plants erect or sprawling herbs with stems < 1 m long, from taproots; leaves jointed at base; [tribe Polygonaceae] ........................................Polygonum
7 Flowers in diffuse axillary panicles, or in terminal or long-peduncled axillary racemes, corymb, or heads; plants various, either erect or sprawling herbs, or erect, robust, and suffrutescent herbs, or climbing herbaceous or suffrutescent vines, or suffrutescent bushy herbs; leaves not jointed at base (except Polygonella).
8 Leaves cuneate at the base, either linear, spatulate, or oblanceolate, mostly < 4 cm long and < 5 mm wide; leaves jointed at the base; pedicels jointed at the base; [tribe Polygonaceae] .................................................................Poligonella
8 Leaves subulate, cordate, or hastate at the base, either lanceolate or ovate, mostly > 5 cm long and > 8 mm wide; leaves not jointed at the base; pedicels not jointed at the base.
9 Inflorescence corymbose, terminal; achenes strongly exerted at maturity; tepals almost free, horizontally spreading, white, 3-4 mm long; [erect annual, uncommonly cultivated and rarely persistent or escaped]; [tribe Persicarioideae] ..............Fagopyrum
9 Inflorescence paniculate, racemiform, or headlike, terminal and axillary; achenes enclosed in the perianth at maturity; tepals fused for much of their length, ascending, pink, green, or white.
10 Outer tepals mostly keeled or winged at maturity; inflorescence of spikelike racemes, heads, or sparse, interrupted racemes; [tribe Persicarioideae] .................................................................Persicaria
10 Outer tepals keeled or winged at maturity; inflorescence a compound panicle of racemes; [tribe Polygonaceae].
11 Plants climbing or sprawling, herbaceous to somewhat woody, the stems slender; perianth usually not enlarging in fruit; stigma capitate or peltate ..........................................................................................................................Fallopia
11 Plants erect, robust (1-4 m tall), woody, the stems generally over 1 cm in diameter, hollow; perianth enlarging in fruit; stigma fimbriate ..........................................................................................................................Reynoutria
**Antigonon** Endlicher 1837 (Love-chain, Coralvine, Corallita)

*Antigonon leptopus* Hooker & Arnott, Love-chain, Queen's-jewels, Confederate-vine, Corallita. Cultivated and persisting; commonly cultivated, rarely persisting or escaping, native of tropical America. [= FNA, K, WH; = *Corculum leptopus* (Hooker & Arnott) Stuntz]

**Brunnichia** Banks ex Gaertner 1788 (Buckwheat-vine)

*Brunnichia ovata* (Walter) Shinners, Buckwheat-vine, Eardrop-vine, Ladies'-eardrops, Redvine. Floodplain forests, swamp forests. June-July; August-September. Ne. SC south to n. FL, west to e. TX, and north in the interior to w. TN, w. KY, s. IL, and se. MO. Introduced in sc. VA. [= FNA, GW, K, WH; = *B. cirrhosa* Gaertner – RAB, C, F, G, S]

**Emex** Campderá (Emex, Devil’s-thorn, Cape Spinach)

A genus of 2 species, herbs, of Mediterranean Europe and s. Africa.

*Emex spinosa* (Linnaeus) Campderá. Disturbed areas; not recently collected and perhaps only a waif, native of Mediterranean Europe. [= K, S, WH]

**Eriogonum** Michaux 1803 (Wild-buckwheat)

1 Basal leaves absent; cauline leaves alternate; [of limestone glades and barrens of KY, TN, and n. AL]; [subgenus *Eriogonum*]..... [E. harperi]
1 Basal leaves well-developed; cauline leaves whorled; [of other habitats and areas (see below)].
2 Tepals bright yellow; plants 3-5 dm tall; achenes pilose at the beak; [of shale barrens of VA and WV]; [subgenus *Oligogonum*].....E. allenii
2 Tepals white to pink; plants 4-12 dm tall; achenes glabrous; [of sandhills of s. NC (at least formerly), SC, and southward]; [subgenus *Eriogonum*]...................................................................................................................................................................................

*Eriogonum tomentosum* Michaux, Sandhill Wild-buckwheat, Southern Wild-buckwheat, Dog-tongue. Sandhills, usually in white sand, primarily in the fall-line Sandhills and on riverine dunes in the middle and upper Coastal Plain. Late July-September; September-November. S. NC (at least formerly) south to c. peninsular FL, west to s. AL. There seems no reason to doubt the label data of an 1890's Biltmore Herbarium collection from Bladen County, NC (Pittillo, Horton, & Herman 1972), as *E. tomentosum* is fairly common not far away in SC; the species has apparently not been seen in NC since. [= RAB, FNA, K, S, WH, Y, Z]

**Fagopyrum** P. Miller 1754 (Buckwheat)
A genus of about 8-16 species, perennial and annual herbs, of e. Asia and Africa. The Latin and common name refer to the similarity of the seeds to beechnuts. References: Hinds & Freeman in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993).

1 Flowers greenish; achene rough and dull .............................................................................................................................................. *Fagopyrum esculentum*

1 Flowers greenish; achene rough and dull ................................................................. *F. tataricum*

_Fallopia_ Adanson 1763 (Climbing Buckwheat)

A genus of about 9-10 species, woody and herbaceous vines, of temperate regions of the Northern Hemisphere. If accepted (as here) as a genus distinct from Polygonum, this group takes the name *Fallopia_ Adanson (1763), which has priority over *Tiniaria* (1832) and *Bilderdykia* (1827). *Reynoutria* is sometimes included. References: Ronse Decraene & Akeroyd (1988)=X; Brandbyge in Kubitzki, Rohwer, & Bittrich (1993). [also see *Reynoutria*

1 Plant herbaceous; inflorescences less-branch ed, usually a reduced panicle with only a few racemose branches; [collectively common and in various natural and disturbed habitats].

2 Ocreae reflexed bristly at the base; perianth white; achene glossy black; [of high elevation openings and woodlands]........... *F. baldschuanica*

2 Ocreae smooth; perianth greenish to yellowish; achene glossy or dull black; [mostly of lower elevations].

3 Achene dull black; outer sepals keeled, not expanding into obvious wings in fruit, the fruit therefore 3.5-4.5 mm long (measured from the pedicel joint to the tip); [weedy annual]................................................................. *F. convolvulus var. convolvulus*

3 Achene glossy black; outer sepals expanding into obvious wings in fruit, the fruit therefore 7-15 mm long (measured from the pedicel joint to the tip); [native perennial or weedy annual].

4 Fruiting perianth wings usually truncate to attenuate-decurrent on stipelike base, flat, or (less often) undulate or crinkled, margins entire (rarely undulate-crenate) ................................................................................................................................. *F. dumetorum*

4 Fruiting perianth wings decurrent on stipelike base, undulate or crinkled, rarely flat, margins wavy-crenulate to incised or lacerate (rarely entire).

5 Perianth 7-10 mm long at maturity (measured from the pedicel joint to the tip); achenes 2-3.5 mm long.......................... *F. cristata*

5 Perianth 10-15 mm long at maturity (measured from the pedicel joint to the tip); achenes 3.5-6 mm long...................... *F. scandens*

* Fallopia baldschuanica* (Regel) Holub, Silver-lace-vine, China Fence-vine. Disturbed areas, roadsides; rare, native of Asia. [= FNA; > *Fallopia aubertii* (Henry) Holub – X; > *Polygonum aubertii* Henry – C, F, K]

_Fallopia dumetorum* (Linnaeus) Holub. Mt (WV), Pd (DE, Cp (DE): disturbed areas, thickets; uncommon (rare in DE). Introduced at least as far south as scattered locations in e. and se. PA (Rhoads & Klein 1993), WV, KY, TN, and AL. NS and MI south to FL and TX (FNA). [= FNA; < *Polygonum scandens* Linnaeus var. *cristatum* (Engelmann & A. Gray) Gleason – RAB; = *Polygonum*
scandens Linnaeus var. dumetorum (Linnaeus) Gleason – C, G, K; < Polygonum scandens – F, W, WV; = Bylerderbya dumetorum (Linnaeus) Dumortier – S {add to synonymy}

Fallopia scandens (Linnaeus) Holub, Common Climbing Buckwheat. Mt (NC, SC, VA, WV), Pd (NC, SC, VA), Cp (FL, NC, SC, VA), {DE?, GA}: moist to wet open habitats; uncommon. July–October. NS, ON and MB, south to Panhandle FL and TX. = Polygonum scandens Linnaeus var. scandens – RAB, C, GW, K, WH, Y; < Polygonum scandens – F, W, WV; = Bilderdykia scandens (Linnaeus) Greene – S; < Fallopia scandens – X; < Polygonum scandens – Z; = Tiniaria scandens (Linnaeus) Small]

Persicaria P. Miller 1754 (Smartweed, Tearthumb, Jumpseed)

1 Stem, petioles, and lower surface of major leaf veins with abundant recurved prickles; [section Echinocaulon].
2 Ocreae foliaceous, green, orbicular, perfoliate; tepals becoming fleshy and blue in fruit ............................................................ P. perfoliata
3 Ocreae scarious, not as above; tepals not becoming fleshy or blue in fruit.
4 Leaf blades triangular in outline, the larger 6-11 cm wide; perianth 4-parted ............................................................ P. arifolia
5 Leaf blades lanceolate to narrowly elliptic, the larger 0.8-3 cm wide; perianth 5-parted.
6 Inflorescences glandular-pubescent; stamens 5, in 1 whorl; leaves sessile (rarely shortly petiolate), usually cuneate or rounded at the base (rarely slightly cordate) P. meissneriana var. beyrichiana
7 Inflorescences glabrous; stamens 8, an outer whorl of 5 and an inner whorl of 3; leaves petiolate, sagitate at the base ......... P. sagittata
8 Ocreae with a green, herbaceeous flange; leaves 3-17 cm wide ............................................................ P. orientalis
9 Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide.
10 Plants annual, lacking rhizomes or stolons; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in P. minor). P. glabra
11 Plants perennial, with rhizomes or stolons; leaves lacking a triangular reddish blotch in the middle of the upper surface ............................................................ P. hirsuta
12 Peduncles glabrous; leaves often with a triangular reddish blotch in the middle of the upper surface P. glabra
13 Outer tepals with 3 strong veins, each forked in an anchor shape; tepals 4 (1-5); inflorescences usually arching-drooping P. lapathifolia
14 Outer tepals with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect P. pensylvanica
15 Achenes minutely textured, dull; axillary inflorescences sometimes included within ocrea P. hydropiperoides
16 Achenes smooth, shiny; axillary inflorescences never included within ocrea. P. hydropiperoides
17 Peduncles stipitate-glandular; leaves 2-4.5 cm wide .................................................................................................................. P. robustior
18 Plants annual, lacking rhizomes or stolons P. careyi
19 Peduncles not stipitate-glandular. P. hydropiperoides
20 Bristles of ocrea (0.5-)1-4 (-6) mm long; leaves lacking a triangular reddish blotch in the middle of the upper surface; achenes biconvex in ×-section; styles 3 ............................................................ P. longiseta
21 Bristles of ocrea 0.2-1.3 (-2) mm long; leaves often with a triangular reddish blotch in the middle of the upper surface; achenes biconvex or oval in ×-section; styles 2-3 ........................................................................ P. maculosa
22 Ocreae glabrous, or strigose towards the base (the hairs stiff and appressed) .......................................................... P. hydropiperoides
23 Ocreae strigose and hirsute, at least some of the hairs loosely ascending to spreading. P. hirsuta
24 Leaf blades rounded to cordate at the base; stem internodes pubescent (the hairs stiff and appressed) P. tuberosa
25 Leaf blades cuneate to truncate at the base; stem internodes glabrous or loosely spreading-hirsute near the nodes only .................................................................................. P. setacea
**Persicaria amphibia** (Linnaeus) S.F. Gray, Water Smartweed. Mt (NC, SC, VA, WV), Pd (NC, SC, VA), Cp (DE), {GA}: marshes, wet disturbed areas; common (uncommon in SC, VA, and WV, rare in GA and NC). June-August. Widespread in the Northern Hemisphere, in North America from NL (Newfoundland), NU, and AK south to SC, TN, TX, and CA, and southwards into the New World tropics. [= FNA; > Polygonum coccineum Muhlenberg ex Willdenow – RAB, G, Z; > Polygonum amphibium Linnaeus var. emersum Michaux – C, GW, K, W, Y; > Polygonum amphitheatrum Linnaeus – W; > Polygonum coccineum var. coccineum – F; > Polygonum natans (Michaux) Eaton – G; > Persicaria muhlenbergii (S. Watson) Small – S; > Persicaria amphibia (Linnaeus) S.F. Gray var. emersa (Michaux) Hickman; > Persicaria amphibia (Linnaeus) S.F. Gray var. stipulacea (Coleman) Hara; > Polygonum amphibium Linnaeus var. stipulacea Coleman – C, F, K, Y]

**Persicaria arifolia** (Linnaeus) Haraldson, Halberd-leaf Tearthumb. Cp (DE, GA, NC, SC, VA), Pd (DE, NC, VA), Mt (VA, WV): marshes, wet thickets; common (uncommon in WV, rare in GA). July-November; August-December. NS west to MN, south to se. GA w. NC, and w. TN. [= FNA; = Polygonum coccineum Linnaeus – RAB, C, GW, K, W, WV, X, Y, Z; > Polygonum arifolium var. arifolium – F, G; > Polygonum arifolium var. pubescens (R. Keller) Fernald – F, G; = Tracaulon arifolium (Linnaeus) Rafinesque – S; = Tracaulon arifolium (Linnaeus) Sojak]

**Persicaria careyi** (Olney) Greene. Cp (DE, FL*), Mt (WV), {VA}: moist soils, disturbed areas; rare. NB west to ON and MN, south to VA, KY, IL, seemingly widely scattered. Reported for sc. PA (Rhoads & Klein 1993), DE, NJ, and MD (Kartesz 1999). [= FNA; = Polygonum careyi Olney – C, F, G, WH] {synonymy incomplete}

* **Persicaria chinensis** (Linnaeus) H. Gross, Chinese Knotweed. Disturbed areas; native of Asia. Introduced in MD and NJ. [= FNA; = Polygonum chinense Linnaeus – K]

**Persicaria extremorientalis** (Voroshchilov) Tzvelev, East Asian Smartweed. Disturbed areas; roadsides, roadsides; native of Japan, China, Korea, and Sakhalin. August-November. See Atha, Nee, & Naczi (2010) for additional information. [] {not yet keyed!}

**Persicaria hydropiperoides** (Michaux) Small, Waterpepper. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, VA, WV): swamp forests, streams, ditches; common (uncommon in VA and WV Mountains). May-November. NS, ON, and AK, south to FL, TX, and CA, and into the New World tropics. [= FNA; > Polygonum hydropiperoides Michaux – GW, WH, Y; > Polygonum hydropiperoides – RAB, C, F; > Polygonum hydropiperoides Michaux – GW, WH, Y; > Polygonum hydropiperoides – K, W, WV, Z; > Polygonum hydropiperoides var. brevicallum Fernald – F; > Polygonum hydropiperoides var. euromortorum Fernald – F; > Persicaria hydropiperoides (Michaux) Small – S; > Persicaria hydropiperoides (Michaux) Small var. opolousana (Riddell ex Small) J.S. Wilson; > Polygonum hydropiperoides var. opolousana (Riddell ex Small) Riddell ex W. Stone – RAB, C; > Polygonum opolousanum Riddell – GW, Y; > Polygonum opolousanum Riddell var. opolousanum (Riddell ex Small) Riddell – GW, Y; > Polygonum opolousana Riddell – F; > Persicaria opolousana (Riddell ex Small) M. Gómez]

**Persicaria longiseta** (de Brujin) Kitagawa, Longbristle Smartweed, Bristly Lady’s-thumb. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, ditches; common (uncommon in NC and SC
Mountains, rare in FL, native of Asia. May-October. [= FNA; = Polygonum cespitosum Blume var. longisetum (de Bruijn) A.N. Steward – RAB, C, F, G, GW, K, W, WV, Y, Z; = Polygonum caespitosum Blume var. longisetum (de Bruijn) A.N. Steward – WH; = Polygonum longisetum de Bruijn]

* Persicaria meinsieri (Chamisso & Schlechtendahl) M. Gómez var. beyrichiana (Chamisso & Schlechtendahl) C.C. Freeman, Mexican Tearthumb. Cp (FL, GA, SC): wet savannas, blackwater river floodplains, ditches; rare (GA Special Concern), sometimes considered only introduced in southeastern North America, but probably native. E. SC south to FL, west to LA; Mexico and Central America south to n. South America; Brazil; se. Africa. See Mitchell (1970) and Freeman (2004). [= FNA; = Polygonium meixnerianum Chamisso & Schlechtendahl var. beyrichianum (Chamisso & Schlechtendahl) Meinsner – GW, K, WH; < Polygonum meioserianum – Z; < Truellum meioserianum (Chamisso & Schlechtendahl) Sojak]

* Persicaria minor (Hudson) Opiz, Small Water-pepper. {VA}: disturbed moist areas; rare, native of Europe. [= FNA; = Polygonum minus Hudson]

* Persicaria punctata (Elliott) Small, Dotted Smartweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swamp forests, bottomlands, marshes; common. July-November. NS, ON, and BC south to FL, TX, and CA, south into the New World tropics. [= FNA; = Persicaria punctata (Elliott) Small var. punctata – S; = Polygonum punctatum – RAB, GW, W, WH, WV; > Polygonum punctatum Elliott var. punctatum – C, F, G, K, Y; > Persicaria punctata (Elliott) Small var. leptostachya (Meisner) Small – S; > Polygonum punctatum Elliott var. leptostachya (Meisner) Small – F; > Polygonum punctatum parvum Marie-Victorin & Rousseau – F; > Polygonum punctatum Elliott var. confertiflorum (Meissner) Fassett – C, G, K, Y; < Polygonum punctatum – Z (also see Persicaria robustior)]

* Persicaria robustior (Small) E.P. Bicknell, Water Smartweed. {VA}: peaty shores or semi-aquatic in water; rare? NS, QC, MI, MO, south irregularly to FL s. and TX, and south into tropical America. Probably under-represented as to states of occurrence because of frequent synonymization. [= FNA; = Polygonum robustius (Small) Fernald – C, F, G, K, Y; < Polygonum punctatum – Z]

* Persicaria virginiana (Linnaeus) Gaertner, Jumpseed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): floodplains, moist forests; common (uncommon in DE Coastal Plain). NH, QC, MN, and NE, south to FL and TX; disjunct in c. Mexico. Section Tovara consists of 3-5 species of e. North America and e. Asia (Mun & Park 1995); if the section is recognized as a genus (as it often has been), the correct name for this species is Antenoron virginianum. Variation in North America, previously sometimes recognized as varieties, as by F and G, is under study by M. Pyne. [= FNA; = Tovara virginiana (Linnaeus) Rafinesque – RAB, S, WV; > Tovara virginiana var. glaberrima Fernald – F; > Tovara virginiana var. virginiana – F; = Polygonum virginianum Linnaeus – C, GW, K, W, Y; > Polygonum virginianum var. virginianum – G; > Polygonum virginianum var. glaberrimum (Fernald) Steyermark – G; = Antenoron virginianum (Linnaeus) Roberty & Vau-tier – Z]

* Persicaria wallichii Greuter & Burdet var. wallichii, Himalayan Knotweed, Kashmir Plume. Mt (NC): persistent and spreading from plantings; rare, native of Himalayan Asia. [= FNA; = Polygonum wallichii Wallach ex Meisner – C, F, G (a later homonym); = Aconogonon polystachyum (Wallich ex Meissner) M.Král; = Rubrivena polystachya (Wallich ex Meissner) M.Král; = Reynoutria polystachya (Wallich ex Meissner) Moldenke]
**Polygonella** Michaux 1803 (Jointweed)

A genus of about 9 species, annual, perennial, and suffrutescose herbs, of warm temperate e. North America. Ronse De Craene, Hong, & Smets (2004) suggest that *Polygonella* should be merged into *PolYGONUM*, as section *Duravia*, subsection *Polygonella*.

1 Ocreae ciliate; inner perianth segments fimbriate; [subgenus *Thysanella*].

2 Leaves not hyaline-bordered; stem (below the inflorescence) minutely but densely scabrous; [of e. GA south to Panhandle FL]

3 Leaves (3-) 9-30 mm wide; [of sand pine scrub and coastal dunes in Panhandle FL and s. AL] ........................................... 

4 Style and stigma 0-0.1 (-0.2) mm long at anthesis; inner sepals (0.6-) 0.7-1.8 (-2.3) mm long in flower, (1.6-) 1.7-2.8 (-3.6) mm in fruit; annual or perennial; leaves (2.5-) 4.4-39.0 (-65.0) mm long, (0.3-) 0.6-5.0 (-8.0) mm wide, wider than thick.

5 Annual, simple to much-branched from near the distinctly woody base; leaves with hyaline margins toward the tip, persistent through fruiting; ocreae obtuse; achenes 1.0-1.4 mm wide.

6 Leaves (0.8-) 1.0-5.0 (-8.0) mm wide; flowers barely exserted from the ocreolae on pedicels ca. 0.1 mm long at anthesis; [of the outer Coastal Plain of ne. NC and ne. VA northward] ......................................................... P. articulata

7 Vernal leaves (larger leaves towards the base of the plant) 4-13 mm long, 0.5-1.2 (-2.1) mm wide, linear to linear-spatulate; leaf ocrea tips 1-1.5 mm long, acuminate to attenuate; floral ocreolae orange-reddish to orange-brownish throughout or pale distally, the pale portion no more than 1/5 the length of the ocreola; longitudinal grooves evident in ocreola. . . . . . . . . . . . . P. polygama var. croomii

Vernal leaves 7-30 mm long, 1.0-6 mm wide (flowers remaining at flowering often only 1-2 mm wide), spatulate to linear-spatulate; leaf ocrea tips 0.3-0.7 mm long, acute to long-acute; floral ocreolae olivaceous proximally, pale orange to beige distally, the pale portion 1/3-1/2 the length of the ocreola; longitudinal grooves absent or faint in ocreolae. ............................................. P. polygama var. polygama

---

**Polygonella americana** (Fischer & Meyer) Small, Southern Jointweed. Sandhills, other dry habitats. June-September, August-November. Sc. NC south to s. GA west to TX and NM, north in the interior to ec. TN (Chester, Wofford, & Kral 1997), se. MO, and AR, perhaps adventive toward the northern part of the range. [= RAB, F, FNA, G, K, S, X; Polygonum]

**Polygonella articulata** (Linnaeus) Meisner, Northern Wireweed. Sandhills, dunes, and other dry, sandy habitats. September-October, October-November. ME and s. QC west to MN, south on the Coastal Plain to VA and ne. NC, otherwise south to se. PA, NY, s. ON, MI, n. IN, n. IL, and e. IA. *P. articulata* is the only northern member of an otherwise southern and predominantly Coastal Plain genus. The record cited for GA in Jones & Coile (1988) is a mis-identification. [= RAB, C, F, FNA, G, K; X; = Delopyrum articulatum (Linnaeus) Small – S; = Polygonum articulatum Linnaeus]

**Polygonella fimbriata** (Elliott) Horton, Sandhill Jointweed. Sandhills. E. GA (not far from SC) and se. AL south to Panhandle FL. It differs from all our other species in having the inner sepals fimbriate. [= FNA, K, Q, WH; = Thysanella fimbriata (Elliott) A. Gray – S; = Polygonella fimbriata var. fimbriata – X; = Delopyrum fimbriatum Elliott]

**Polygonella gracilis** Meisner, Wireweed. Sandhills. Late August-October, October-November. Sc. NC south to s. FL, west to s. MS, perhaps adventive toward the northern part of the range. [= RAB, FNA, K, WH, X; = Delopyrum gracile (Meisner) Small – S; = Polygonum gracile Nuttall]

**Polygonella macrophylla** Small, Largeleaf Wireweed. Sand pine scrub, coastal dunes. S. AL and Panhandle FL. [= FNA, K, S, WH, X; Polygonum]

**Polygonella polygama** (Ventenat) Engelmann & A. Gray var. croomii (Chapman) Fernald, Carolina October-flower. Sandhills, primarily in the fall-line Sandhills and middle Coastal Plain. August-October, October-November. [croomii] ranges from se. and sc. NC south to SC and GA. [croomii] occurs mainly in the fall-line Sandhills, scattered as well in the middle Coastal Plain (Robeson and Bladen counties, NC, Dillon, Darlington, and Lee counties, SC) and rarely the outer Coastal Plain (New Hanover County, NC). In addition to our 2 varieties, var. brachystachya (Meisner) Wunderlin is endemic to c. and s.
Polygonum Linnaeus 1753 (Knotweed)

A genus of about 20 species, herbs, of temperate regions of the Northern Hemisphere. References: Costea, Tardif, & Hinds in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Costea & Tardif (2003a)=X. [also see Fallopia, Persicaria, Reynoutria] Key adapted from FNA and other sources.

1 Stems with 8-16 distinct ribs; leaf venation pinnate, the secondary veins apparent; anthers whitish yellow; [section Polygonella] ............................................ ............................... 6

2 Stems with 4 obscure ribs, or lacking apparent ribs; leaf venation parallel, with inconspicuous secondary veins; anthers pink-purple; [section Duravia].

3 Perianth bottle-shaped, constricted above the achene.

4 Fruiting perianth divided about ⅓ of its length; stem leaves (1-) avg. 1.8 (-3)× as long as branch leaves ............................................ ............................... 7

5 Inflorescences spikelike, the cymules borne in the axis of bracts shorter than the cymules ............................................ ............................... 8

6 Ocreae not pruinose; mature tepals yellow-green, white, pink, or reddish, appressed to the achene; achenes smooth, glossy; [of maritime situations] ................. ...............................P. glaucum

6 Ocreae not pruinose; mature tepals yellow-green, white, or reddish, appressed to the achene; achenes either smooth and glossy or textured and dull; [mainly of inland and disturbed situations]; [P. aviculare complex].

7 Outer 3 tepals flat, equaling or shorter than the inner 2 sepals. 10

8 Plants prostrate; leaves 2.5-5.6 (-10)× as long as wide ............................................ ............................... P. buxiforme

9 Plants bluish green when fresh, turning dark brown to black when dried; leaves rounded or obtuse at the apex; pedicels 1-2 mm long; stem leaves 1-2.5 (-3.5)× as long as the branch leaves ............................................ P. prolificum

10 Plants yellowish green when fresh, not darkening when dried; leaves acute to acuminate at the apex; pedicels 2.5-6 mm long; stem leaves 2.1-3.5 (-4.2)× as long as the branch leaves ............................................ P. ramosissimum

11 Tepals green, margins pink or red (rarely white), with branched veins; plants prostrate to ascending, with 3-15 stems; leaf blades 2.8-5.7 (-6.5)× as long as wide ............................................ ............................... P. aviculare complex

12 Leaf blades 2.4-5.5× as long as wide; perianth (2.3-) 2.8-4.7 (-5) mm long; achenes (of the early season) (2.1-) 2.7-3.7 mm long ................................................................. P. aviculare complex

13 Leaf blades (3.4-) 4.2-9.2× as long as wide; perianth 1.9-3.4 mm long; achenes (of the early season) 1.2-1.8 mm long ................................................................. P. aviculare complex

POLYGONACEAE

* Polygonum aviculare Linnaeus ssp. depressum (Meisner) Arcangeli, Dooryard Knotweed. Mt (WV), {DE, FL?, GA, NC, SC, VA}. [= FNA, X: = Polygonum arenastrum Boreau – C, K; < Polygonum aviculare – G]

* Polygonum aviculare Linnaeus ssp. neglectum (Besser) Arcangeli, Needle-leaf Knotweed. Cp (VA): fields, disturbed areas; rare, introduced. Also documented from scattered locations in s. PA (Rhoads & Klein 1993); DE, NJ, and MD (Kartesz 1999); and WV (as Polygonum ssp. rurivagum) (Costea & Tardif 2003). [= FNA: ? P. bellardii Allioni – K; < Polygonum aviculare var. aviculare – F; < Polygonum aviculare – G; Polygonum aviculare Linnaeus var. rurivagum (Jord. ex Boreau) Berther; Polygonum aviculare Linnaeus var. angustissimum Meisner]

Polygonum buxiforme Small, Small's Knotweed. Mt (WV), {NC, SC, VA}: disturbed areas, marsh edges; rare in WV {uncommon?}. NL (Newfoundland), NL (Labrador), NU, and NT, south to SC, AI, MS, LA, TX, and CA. [= C, K, S, Y: = Polygonum aviculare Linnaeus ssp. buxiforme (Small) Costea & Tardif – FNA, X; = Polygonum aviculare Linnaeus var. littorale (Link) Mertens – F; < Polygonum aviculare – G; Polygonum littorale Link]

Polygonum erectum Linnaeus, Erect Knotweed. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (VA), {GA}: disturbed areas, open places; common (rare in GA, NC, SC, and VA). June-October; July-October. ME, ON, and AB south to GA, LA, and NM. [= RAB, C, F, FNA, K, S, W, WV, Y, Z]

Polygonum ramosissimum Michaux. {GA, NC, SC, VA}: disturbed areas; brackish marshes and shores; {uncommon?}. NS west to NU and BC, south to GA, LA, TX, CA. Reported for SC (Kartesz 1999); [investigate distribution] [= C, F, G: = Polygonum ramosissimum Michaux var. ramosissimum – K, Y; = Polygonum ramosissimum Michaux ssp. ramosissimum – FNA, X; = Polygonum ramosissimum – C, F, G] [synonymy incomplete]

Polygonum rurivagum Michaux. Glade Knotweed, Slender Knotweed. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, VA, WV), Cp (DE, VA): glades, barrens, and thin, rocky soils, over various rock types (including granite, diabase, amphibolite, greenstone, metagabbro, and shale); uncommon (rare in DE and NC). July-September; August-October. ME, ON, MN, SD, WV, south to GA, AL, MS, LA, TX. [= RAB, C, F, FNA, S, W, WV, Y, Z; > Polygonum rurivagum Michaux var. proliforum Fernald – F, K; > Polygonum rurivagum Michaux var. tenue – F, K]

Polygonum achoreum Blake. Mt (WV): disturbed areas; rare. NS and NT south to CT, WV, MO, KS, CO, UT, NV, OR. [= C, F, FNA, G, K]

* Polygonum douglasii Greene. Mt (WV), {VA}: [habitat not known]; rare, native of western North America. Reported for VA in FNA. [= C, F, FNA; ? P. douglasii ssp. douglasii – K]

Reynoutria Houttuyn 1777

A genus of about 15 species, perennial herbs, of temperate e. Asia. Ronse Decraene & Akeroyd (1988) and most other recent workers in Polygonaceae treat this group as Fallopia section Reynoutria (Houttuyn) Ronse Decraene. This treatment may prove to be better than the recognition of Reynoutria as a genus; either course is compatible with molecular phylogenetic analyses completed to date (Lamb Frye & Kron 2003). References: Freeman & Hinds in FNA (2005); Ronse Decraene & Akeroyd (1988); X; Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Zika & Jacobson (2003). Key based on Zika & Jacobson (2003).

1 Veins of leaf underside with multiseriaceous hairs (as seen at 20× magnification); mid-stem leaves with deeply cordate bases; inflorescence much shorter than the subtending mid-branch leaf..............................................................................................................R. sachalinensis

1 Veins of leaf underside with simple hairs, or merely minutely bumpy-scabrous; mid-stem leaves with truncate to slightly cordate or very broadly V-shaped bases; inflorescence shorter or longer than the subtending mid-leaf. 2

2 Veins of leaf underside with scattered simple, stout-based hairs; mid-branch leaf bases usually slightly cordate; well-developed stem leaves usually > 20 cm long.........................................................................................................................R. bohemica

2 Veins of leaf underside minutely scabrous with scattered bumps; mid-branch leaves truncate (to very broadly V-shaped); well-developed stem leaves < 18 cm long.........................................................................................................................R. japonica

A genus of about 30-60 species, perennial herbs, of temperate and subtropical Asia and Europe. References: Freeman in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993).

*Rheum rhabarbarum* Linnaeus, Rubarb, Pie-plant. Mt (NC, VA, WV): uncommonly cultivated (primarily in gardens in the cooler portions of our area), rarely persistent or escaped; rare, native of Europe (though originally native of Asia). July-September. [= K.; = *R. rhabarbaricum* – C., misspelled; = *R. rhaponticum* – G, misapplied]

*POLYGONACEAE* 648

A genus of about 200 species, perennial and annual herbs (and a few shrubs), of cosmopolitan distribution. References: Mosyakin in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993). Key based on FNA and other sources.

1 Leaf blades hastate or sagittate on at least well-developed leaves; plants dioecious (rarely polygamo-monoecious), the flowers mostly unisexual; fresh foliage pleasant acid to taste.

2 Inner tepals (at fruiting) about as wide as the achene, with a minute or absent free wing; pedicel jointed just below the tepals; [subgenus *Acetosella*] ................................................................. *R. acetosella*

3 Inner tepals (at fruiting) enlarged, longer and wider than the achene; pedicel jointed near its middle or base, well below the tepals; [subgenus *Acetosa*] ................................................................. *R. patientia*

4 Leaves sagittate, the lobes pointing downwards towards the petiole; [subgenus *Acetosa*; section *Acetosella*] ................................................................. [subgenus *Acetosa*; section *Americanae*] ................................................................. *R. hastatus*

5 Leaf blades 2.5-5× as long as the inner tepals; pedicel joint between the midpoint of the pedicel and the inner tepals.

6 Leaf blades ca. 2× as long as wide; lateral veins of leaves forming angle of ca. 80° to midvein ................................................................. *R. fasciculatus*

7 Leaf blades 3-7 (-10)× as long as wide; lateral veins of leaves forming angle of 40-60° to midvein.

8 Leaf blades widest near the middle; inner sepals (2-) 2.5-4.5 (-5) mm long, (2-) 2.5-4 (-4.5) mm wide.

9 Inflorescence lax, distinctly interrupted; leaf blades thick and coriaceous, deep green, with veins prominent on the lower surface; leaf apex nearly obtuse; inner sepals 3.5-4.5 (-5) mm long, 3-4 (-4.5) mm wide ................................................................. *R. chrysocarpus*

10 Inflorescence dense, interrupted only towards its base; leaf blades light or yellowish green, the veins on the lower surface not noticeably prominent; leaf apex acute; inner sepals (2-) 2.5-3.5 (-3.8) mm long, (2-) 2.5-3 (-3.5) mm wide ................................................................. *R. triangularis*

11 Inner tepal margins entire, indistinctly erose, or (rarely) minutely denticulate (the teeth then < 0.2 mm long).

12 Inner tepals ca. 2× as long as wide, margins entire, largest tubercle almost as wide as the inner tepal.

13 Tubercles 3, equal or nearly so in size; inflorescence leafy through at least 2/3 of its length; pedicels 1.4 (-5) mm long......................... [R. conglomeratus]

14 Inner tepals ca. 1-1.5× as long as wide, margins entire or denticulate, largest tubercle much narrower than the inner tepal.

15 Leaf blade 15-30 (-35) cm long, 2-6 cm wide, the margins strongly undulate; inner tepals 3.5-6 mm long; tubercles normally 3 or 4, rarely 1-2.............................. [R. crispus ssp. crispus]

16 Leaf blade 30-45 (-50) cm long, 10-15 cm wide; the margins plane or weakly undulate; inner tepals (5-) 5.5-8 (-10) mm long; tubercles normally 1 (rarely 2-3).............................. [R. stenophyllus]

11 Inner tepal margins prominently dentate, at least some of the teeth > 0.3 mm long.

16 Inner tepals (not including the teeth) orbiculate-ovate to deltate, as wide as long ................................................................. *R. stenophyllus*

17 Inner tepals with 3-5 strongly hooked teeth on each side.............................. [R. brownii]

17 Inner tepals with straight teeth.
* Rumex acetosella * Linnaeus, Red Dock, Sheep Sorrel, Sourgrass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA), pastures, fields, roadsides, rock outcrops, grassy balds, gardens; common (rare in FL), native of Eurasia. March-June (sometimes later); May-July (sometimes later). Variation in *R. acetosella* has been studied in considerable detail in Eurasia, and a number of infrataxons have been named; the application of these to North American material is unclear at this time. [= RAB, C, FNA, G, GW, S, W, WV; > *R. acetosella* ssp. pyrenanensis (Pourret ex Lapeyrouse) Akerman, a hexaploid subspecies from western Europe, is apparently the predominant naturalized subspecies in North America. See Mosyakin in FNA (2005) and the references cited therein for further information.]

**Rumex brownii** Campderá, Brown's Dock. Cp (SC), Pd (NC): disturbed areas, floodplains, wool-combing waif; rare, native of Australia. [= FNA; = *R. brownii* – K, orthographic variant]

**Rumex chrysocarpus** Moris, Amamastla Dock. Cp (FL*, LA): swamps, disturbed wet areas; rare. Se. LA west to TX and Tamaulipas. [= FNA, WH]

**Rumex cuneifolius** Campderá. Cp (FL): disturbed areas; rare, not recently collected and perhaps only a waif, native of South America. A rare introduction from South America in AL, FL. [= FNA, S; = *R. frutescens* Thouars – K, misapplied]

**Rumex fascicularis** Small. Cp (FL, NC?): swamps and marshes; rare (if present). Peninsular FL, and perhaps north to se. NC. [= FNA, S; = *R. verticillatus* Linnaeus – F, G, WH; = *R. verticillatus* ssp. *fascicularis* (Small) Á. Löve]

**Rumex hastatulus** Baldwin, Wild Dock, Heartwing Dock. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, SC): fields (especially sandy fields in the Coastal Plain), roadsides, disturbed areas; common (rare in VA). March-May; April-June. NY, IN, IL, MO, and KS, south to c. peninsular FL, TX, and NM. [= RAB, C, F, FNA, G, GW, K, S, W; = *Acetosa hastatula* (Baldwin) Á. Löve]

**Rumex obvatus** Danser, Tropical Dock. Cp (FL, LA): maritime shores, riverbanks, pond margins; rare, native of South America. [= FNA, K]

**Rumex patientia** Linnaeus, Patience Dock, Monk’s-rhubarb. Mt (NC, WV), Pd (DE, NC), Cp (VA): disturbed areas; rare, native of Mediterranean Europe. April-May; May-June. [= RAB, C, F, FNA, G, K]

**Rumex stenophyllus** Ledebour, Narrowleaf Dock. Cp (SC), native of Eurasia. [= FNA, K]

**POLYGONACEAE**

* Rumex acetosa* Linnaeus, Green Sorrel. Introduced and naturalized as a weed at least far south as se. PA (Rhoads & Klein 1993). [= C, F, FNA, G; = R. acetosa ssp. acetosa – K; = Acetosa pratensis Miller]

*Rumex britannica* Linnaeus, Great Water Dock. Native species south to PA, NJ, KY (FNA). The specimen reported for VA as R. orbiculatus Gray (R. britannica of FNA) in Castanea 42:261 (1977) has subsequently been annotated to R. obtusifolius. No valid collections of R. britannica are known for VA. [= FNA; > R. orbiculatus A. Gray – C, F, G, W; > R. orbiculatus var. orbiculatus – K]

* Rumex sanguineus* Linnaeus, Bloody Dock, Red-veined Dock. Introduced at least as far south as se. PA (Rhoads & Klein 1993), MD, NJ, and AL (Kartesz 1999), perhaps only as a waif. Reported for AL, MS, LA, and VA by Small (1933). [= C, FNA, G, K, S]

### 287. DROSERACEAE

Salisbury 1808 (Sundew Family) [in Caryophyllales]

A family of 3 genera (*Drosera, Dionaea, Aldrovanda*) and about 100 species, nearly cosmopolitan. References: Schnell (2002b); Kubitzki in Kubitzki & Bayer (2003). [including DIONEAECAEAE]

1 Leaves catching insects via "snap-trap" leaves, with stiff marginal hairs; stamens 10-20; inflorescence cymose; [endemic to the Coastal Plain of se. NC and ne. SC] ...............................................................................................................................................................................................................

1 Leaves catching insects via "flypaper" leaves, with gland-tipped hairs; stamens 5; inflorescence racemose; [collectively widespread in our area] ...............................................................................................................................................................................................................

**Dionaea** Ellis 1768 (Venus Flytrap, Meadow Clam)

This monotypic genus is endemic to the Coastal Plain of NC and SC; it has been introduced in various places, including Panhandle FL, Yancey County in the mountains of NC, and s. NJ, where it persists and spreads to varying degrees (Evert 1957). References: Roberts & Oosting (1958); Wood (1960); Schnell (2002b)=Z.

**Dionaea muscipula** Ellis, Venus Flytrap, Meadow Clam, Tippitiwitchet. Cp (FL*; NC, SC): wet savannas, sandhill seepages; rare. The shiny black seeds are exposed at the maturity and dehiscence of the capsule. Perhaps the most remarkable species in our flora, *Dionaea* has become increasingly rare and now receives some protection as a NC Special Concern species and a Convention on International Trade in Endangered Species "Appendix 2" species. Although collection and trade as a novelty item have contributed to the decline of *Dionaea*, its more fundamental problem is that faced by the great majority of Coastal Plain species in our area – destruction of habitat and fire suppression. In the fall-line Sandhills, *Dionaea* is now restricted to a very few sites on Fort Bragg; in the central Coastal Plain, it is also nearly extirpated. Substantial populations remain only in the Outer Coastal Plain, primarily in Brunswick, Pender, and Onslow counties. Ellis's Latin phrase describing the plant to Linnaeus (quoted in Croom 1837) is worth repeating for its succinctness: "Miraculum naturae! – folia biloba, radicalia, ciliata, sensibilis, conduplicantia, insecta incarcerantia." The colonial governor of North Carolina, Arthur Dobbs, wrote in 1759, "we have a kind of Catch Fly Sensitive which closes upon anything that touches it." Gibson (1991) shows that trap size and prey size are correlated; trap leaves of *Dionaea* primarily capture insects about 5 mm smaller than the length of the trap. Deliberately introduced and at least somewhat naturalized at other places in the Coastal Plain, notably Apalachicola National Forest, FL. [= RAB, GW, K, S, WH, Z]

**Drosera** Linnaeus 1753 (Sundew)

1 Leaves filiform, the expanded leaf bases forming a corn-like base.
2 Petals 7-10 (12) mm long; leaves 8-25 (-30) cm long, < 1 mm wide; glandular hairs on the leaves red to purple, drying dark brown; scape 6-26 cm long ...............................................................................................................................................................................................................

2 Petals 12-17 (-20) mm long; leaves 30-50 cm long, > 1 mm wide; glandular hairs on the leaves pale green, drying pale greenish brown; scape 25-60 cm long ...............................................................................................................................................................................................................

1 Leaves spatulate or suborbicular, the leaf bases not expanded.
3 Inflorescence stipitate-glandular; basal rosettes 0.8-3.5 cm in diameter; stipules absent or obsolete (consisting of a few hair-like segments); seeds black, crateriform ...............................................................................................................................................................................................................

3 Inflorescence glabrous; basal rosettes (2-) 3-12 cm in diameter; stipules present, fimbriate; seeds light brown and longitudinally striate, or reddish brown to black and densely papillose, or brown and coarsely corrugated into 14-16 longitudinal ridges.
4 Leaf blades wider than long, suborbicular or reniform; seeds about 6× as long as wide; [primarily of the Mountains, rarely disjunct eastward] ...............................................................................................................................................................................................................

4 Leaf blades about as wide as long, spatulate to obovate; seeds 1-2× as long as broad; [primarily of the Coastal Plain, rarely disjunct westward].

**Drosera sanguinea** L., Bloody Dock, Red-veined Dock. Introduced at least as far south as se. PA (Rhoads & Klein 1993), MD, NJ, and AL (Kartesz 1999), perhaps only as a waif. Reported for AL, MS, LA, and VA by Small (1933). [= C, FNA, G, K, S]
**DROSERACEAE**

651

5 Petioles with few to many long trichomes; petals pink (sometimes fading to white); plants scapose; inflorescence straight at base; seeds coarsely corrugated into 14-16 longitudinal ridges .................................................. *D. capillaris*

5 Petioles glabrous; petals white; plants usually with a leafy stem 1-10 cm long; inflorescence arching at base; seeds reddish brown to black and densely papillose .......................................................... *D. intermedia*

*Drosera brevifolia* Pursh, Dwarf Sundew. Cp (FL, GA, NC, SC, VA), Pd (GA, NC), Mt (GA, SC): pine savannas, other wet sandy sites, rarely in seepage over rock outcrops; common (rare in lower Piedmont only and Mountains, rare in VA). April-May. The species ranges from se. VA south to s. FL and west to AR, OK, and TX; disjunct in sc. TN. *D. leucantha* may be the correct name for this taxon; see Shinners (1962) and Wood (1966) for a contentious discussion of nomenclatural issues. [= C, F, GW, G, K, Q, S, WH, X, Z; = *D. leucantha* Shinners – RAB, Y]  

*Drosera capillaris* Poiret, Pink Sundew. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC, VA): pine savannas, other wet sandy or peaty sites; common (rare in Piedmont, rare in DE and VA). May-August. Se. VA south to s. FL and west to TX, rarely inland, as in TN; also extending into tropical America, in the West Indies, Mexico, and n. South America. [= RAB, C, F, G, GW, K, Q, S, W, WH, X, Y, Z]  

*Drosera filiformis* Rafinesque, Threadleaf Sundew. Cp (DE, FL, NC): margins of natural pools in pinelands, especially clay-based Carolina bays; rare. June; August. E. MA south to se. NC; disjunct in the FL Panhandle (Bay and Washington counties) and in sw. NS (Sorrie 1998a). Sorrie (1998a) has clarified the taxonomy and phytogeography of *D. filiformis* and *D. tracyi*. See comments about *D. tracyi* below. Reported as adventive in a single county in WV (Harmon, Ford-Werntz, & Grafton 2006). [= GW, K, WH, Y; < *D. filiformis* – RAB, C, G (also see *D. tracyi*); = *D. filiformis* var. *filiformis* – F, Q, X, Z; < *D. tracyi* Macfarlane in L.H. Bailey – S (also see *D. filiformis*)]  

*Drosera tracyi* MacFarlane in L.H. Bailey, Tracy's Sundew. Cp (FL, GA): savannas; common (rare in GA). Sc. GA and Panhandle FL, west to e. LA; it has been reported for SC by various authors, including Wynne (1944), but the basis for these reports is unknown. The notion that this species is not distinguishable from *D. filiformis* (or is only varietally distinct) is erroneous (Sorrie 1998a); see Schnell (1995) for a contrary view. [= GW, K, WH, Y; = *D. filiformis* Rafinesque var. *tracyi* (MacFarlane in L.H. Bailey) Diels – Q]

296. CARYOPHYLLALES A.L. de Jussieu 1789 (Pink Family) [in CARYOPHYLLALES]

1 Stipules present and readily apparent, scarios or hyaline.  
2 Fruit a utricle; seed 1 per fruit; petals absent; [subfamily *Paronychoideae*] ........................................................................................................... Key A  
2 Fruit a capsule; seeds 3-many per fruit; petals present; [subfamily *Polycarpoideae*] ........................................................................................................... Key B  
1 Stipules absent.  
3 Sepals fused into a toothed or lobed tube; [subfamily *Caryophylloideae*] ........................................................................................................... Key C  
3 Sepals distinct, or slightly fused at their bases; [subfamily *Alsinoideae*] ........................................................................................................... Key D

**Key A – Paronychioideae**

1 Leaves alternate; staminodes petaloid, ovate to oblong .......................................................... [Corrigiola]  
1 Leaves opposite (or the uppermost alternate in *Herniaria*); staminodes not petaloid, subulate.  
2 Stipules inconspicuous; sepals green-margined, obtuse, lacking awns ............................................... [Herniaria]  
2 Stipules usually conspicuous; sepals white-scarios-margined, hooded or awned ........................................ [Paronychia]

**Key B – Polycarpoideae**

1 Stem leaves subulate, 1-2 mm long, pectinate-fringed at the base; basal rosette leaves spatulate (usually withering quickly after overwintering; stems wiry, stiff, subdichotomously branched; [of xeric sands on the Coastal Plain from se. VA southward] ............... *Sipulpilda*  
1 Stem leaves larger, mostly both longer and broader, not pectinate-fringed at the base; basal rosette present or absent; stems either thicker, more flexuous, or not subdichotomously branched; [collectively more widespread].  
2 Leaves appearing verrucellate, 10-16 per node; filiform to linear .................................................. *Spergula*  
2 Leaves opposite or in whorls of 4, linear to ovate or spatulate.
---

**CARYOPHYLLACEAE**

---

1 **Calyx immediately subtended by 1-3 pairs of bracts.**
2 **Calyx 20-40-nerved.** .............................................................. *Dianthus*
3 **Calyx lacking subtending bracts.**
4 **Sepals 25-62 mm long; calyx lobes longer than the calyx tube, the lobes as long as or longer than the corolla lobes.** ........*Agrostemma*
5 **Sepals (1-)10-28 (-40) mm long; calyx lobes shorter than the calyx tube, the lobes much shorter than the corolla lobes (except *Gypsophila*).**
6 **Styles 3-5 (or 0 in staminate plants); fruit valves 3, 4, 5, 6, 8, or 10; petals generally appendaged.** .............................................. *Silene*
7 **Styles 2; fruit valves 4; petals appended or not.**
8 **Sepals 1-5 mm long, the commissures between the sepals scarious.** ........................................................................................... *Gypsophila*
9 **Sepals 7-25 mm long, lacking commissures.**
10 **Calyx tubular, 20-nerved; petals appended; perennial.** .............................................................. *Saponaria*
11 **Calyx ovoid, 5-nerved; petals not appended; annual.** ................................................................................................. *Vaccaria*

---

**Key C – Caryophylloideae**

---

1 **Leaves mostly in whorls of 4, obovate-spatulate, 2-8 mm long.** .......................................................... *Polycarpon*
2 **Leaves opposite, linear or orbicular, 5-40 mm long.**
3 **Leaves orbicular-ovate; styles partly united.** .............................................................. *Drymaria*
4 **Leaves linear; styles separate.** ........................................................................................................... *Spergularia*

---

**Key D – Alsinioideae**

---

1 **Petals absent; fruit a 1-seeded, indehiscent utricle; styles 2.** ............................................................... *Scleranthus*
2 **Petals present (rarely obsolete or essentially absent); fruit a few-many seeded capsule; styles 3-5.**
3 **Leaves fleshy; seeds > 3 mm long; [of seabeaches and dunes].** ................................................................. *Honckenya*
4 **Leaves membranaceous or stiff; seeds < 2 mm long; [of various habitats].**
5 **Styles 4-5.**
6 **Valves or teeth of the capsule twice as many as the styles.** ............................................................................ *Moenchia*
7 **Valves or teeth of the capsule as many as the styles.** ................................................................................. *Sagina*
8 **Leaves ovate, obovate, > 4 mm wide; styles 5.**
9 **Capsule cylindric, dehiscent by 10 apical teeth.** ......................................................................................... *Cerastium*
10 **Capsule ovoid, dehiscent by 5 valves, each apically 2-cleft.** ............................................................................. *Myosoton*
11 **Styles 3.**
12 **Capsule cylindrical, and often somewhat curved; petals entire or barely emarginated.** .................................................. *Arenaria*

---

**Agrostemma Linnaeus 1753 (Corncockle)**

---

**Arenaria Linnaeus 1753 (Sandwort)**

A genus of about 150-210 species, herbs, of temperate and subarctic regions of the Northern Hemisphere, extending southward to the montane tropics of South America and Africa. References: Hartman, Rabeler, & Utech in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993). [also see *Minuartia*]
CARYOPHYLLACEAE

* Arenaria leptoclados (Reichenbach) Gussone, Small Thyme-leaved Sandwort, slender Sandwort. Cp (FL), [GA, NC, SC, VA, WV]; rare in FL, native of Eurasia. The relative ranges, habitats, and abundance of the A. leptoclados and A. serpyllifolia are poorly known [additional herbarium work]. March-June. [= S; A. serpyllifolia – RAB, K, W; = A. serpyllifolia Linnaeus var. leptoclados (Reichenbach) Nyman – WH]

* Arenaria serpyllifolia (Michaux) Rohrbach var. serpyllifolia, Large Thyme-leaved Sandwort. Cp (DE, FL), [GA, NC, SC, VA, WV]; uncommon in DE and FL. The relative ranges, habitats, and abundance of this and A. leptoclados are poorly known. March-June. [= S; A. serpyllifolia – RAB, K, W; = A. serpyllifolia Linnaeus var. serpyllifolia – WH]

Cerasium Linnaeus 1753 (Mouse-ear Chickweed, Mouse-ear)

A genus of about 100 species, herbs, especially north temperate but nearly cosmopolitan. References: Morton in FNA (2005); Bittrich in Kubitzki, Rohrer, & Bittrich (1993); Rabeler & Thieret (1988); Scheen et al. (2004). Key based in part on FNA.

1 Petals 10-18 mm long, 2-3× as long as the sepals; leaves 2-7 cm long; plants perennial, typically with some shoots not flowering.
2 Leaf blades narrowly to broadly linear, acute or short-acuminate at tip, tapered to base; stems erect nearly whole length
3 Plants strongly rhizomatous with long-creeping shoots, lacking taproot; flowering stems usually 25-30 cm long; stem pubescence eglandular (glandular hairs present in the inflorescence only); sepals 5-7 mm long; anthers 1.0-1.1 mm long; petals often turning brown when dry; [alien] .................................................................C. arvense ssp. arvense
4 Plants clumped, with taproots or short rhizomatous; flowering stems usually 5-20 cm long; stem pubescence glandular; sepals 3.5-6 (-7) mm long; anthers 0.8-0.9 mm long; petals usually remaining white when dried; [native] .................................................................C. arvense ssp. strictum

5 Annual, taprooted.
6 Sepals with long, appressed, eglandular hairs extending beyond the tip of the sepal.
7 Inflorescence an open cyme, most of the pedicels longer than the sepals .........................................................C. brachypetalum
8 Inflorescence a compact, cymose cluster, most of the pedicels shorter than the sepals ............................................C. glomeratum

9 Styles, sepals, and petals 3-4(-5); capsule teeth 6-8 (-10).
10 Capsules 8-10 mm long; capsules ca. 1.5 × as long as the sepals; cauleine leaves 2.3 × as long as wide .................................................................C. diffusum
11 Styles, sepals, and petals 3 (-4); capsule teeth 6 (-8); capsules 2 × as long as the sepals; cauleine leaves 8-10 × as long as wide ...

12 Styles, sepals, and petals 5; capsule teeth 10.
13 Bracts of the inflorescence with distinctly scarious margins; leaves mostly 0.5-1.0 (-1.5) cm long.
14 Petals equaling or surpassing the sepals; cleft in petal apex 0.2-0.5 (-0.9) mm deep .........................................................C. pumilum
15 Petals shorter than the sepals; cleft in petal apex 0.8-1.5 mm deep .................................................................C. semidecandrum
16 Bracts of the inflorescence with green margins; leaves mostly (1.0-)1.5-8 cm long.
17 Pedicels 3-10 (-15) mm long; leaves to 3.5 cm long .................................................................C. brachypodium
18 Pedicels (10-)15-40 (-55) mm long; leaves to 8 cm long .................................................................C. nutans

Cerasium arvense Linnaeus ssp. strictum (Linnaeus) Ugborough. Mt (WV): sandy and gravelly areas; rare. [overall distribution]. Reported for GA, TN, KY, WV, MD, DE, and NJ, among other states (Kartesz 1999), the GA record not validated in FNA. [= FNA, K; < C. arvense – C, G; < C. arvense var. arvense – F]

* Cerasium brachypetalum Desportes, Gray Mouse-ear. Mt (NC, SC, WV), Pd (NC, SC, VA), Cp (NC, VA): roadsides, disturbed areas; common (rare in SC and WV), native of Europe. April-June. The reports of C. tetrandrum for e. VA in F and G are actually this species. [= RAB, C, F, FNA, G, W; > C. brachypetalum ssp. brachypetalum – K; >= C. tetrandrum W. Curtis – F, G, misidentified]

Cerasium brachypodium (Engelmann ex A. Gray) B.L. Robinson. Mt (NC, VA), Pd (SC, VA), Cp (VA): disturbed areas, roadsides; rare. April-May. IL west to AB and OR, south to NC, ne. GA (Jones & Coile 1988), and AZ. This taxon is perhaps...
only introduced in our area from further west. [= F, FNA, K, S; = C. nutans Rafinesque var. brachypodium Engelmann ex A. Gray – RAB, G, W; < C. nutans – C]

*Cerasium nutans* Rafinesque. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, VA): alluvial forests, bottomlands, moist forests; common (uncommon in NC, rare in DE). April-May. NS west to NT, south to SC, GA, AZ, Mexico, and OR. [= F; = C. nutans var. nutans – RAB, G, K, W; < C. nutans – C; > C. nutans var. nutans – FNA; > C. longipedunculatum Willdenow ex Britton – S]

*Cerasium pumilum* W. Curtis, Dwarf Mouse-ear. Cp (NC, VA), Pd (NC, SC, VA), Mt (NC, WV): disturbed areas; rare, native of Europe. April-May. See Rabeler & Thieret (1988) for discussions and reports. [= C, F, FNA, G, K; > C. glatino-sus Fries]

*Cerasium velutinum* Rafinesque var. *velutinum*, Field Mouse-ear, Starry Grasswort. Pd (DE, VA), Mt (VA): rocky riverscour areas, other open situations; rare. April-August. [= FNA; < C. arvense – C, G, S; < C. arvense Linnaeus var. velutinum (Muhlenberg ex Darlington) Hollick & Britton – F; > C. arvense Linnaeus ssp. velutinum (Rafinesque) Ugborogho var. velutinum (Rafinesque) Britton – K; > Cerasium arvense Linnaeus var. velutinum (Rafinesque) Britton]

*Corrigiola* Linnaeus (Strapwort)

*Dianthus* Linnaeus 1753 (Pink, Carnation)

A genus of about 300-320 species, herbs, of Eurasia and Africa. Species other than those treated here are grown in gardens and may escape or perish. References: Rabeler & Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

1 Flowers clustered in crowded cymes, short-pedicelled; [subgenus *Carthusianastrum*].
2 Leaves 2-5(-8) mm wide; annual or biennial; inflorescence pubescent .................................................. *D. armeria*
3 Leaves mostly (8-)10-20 mm wide; perennial; inflorescence glabrous .................................................. *D. barbatus*
1 Flowers solitary, or few, long-pedicelled; [subgenus *Dianthus*].
3 Petal blade 5-9(-10) mm long, toothed ................................................................................................... *D. deltoides*
3 Petal blade 8(-10) 12-18 mm long, fringed .............................................................................................. *D. plumarius*

*Dianthus barbatus* Linnaeus ssp. *barbatus*, Sweet William. Pd (DE, NC, SC), Mt (VA, WV), Cp (DE), (GA); cultivated as an ornamental, rarely escaped to disturbed areas; rare, native of Europe. June-August. [= FNA; < D. barbatus – RAB, C, F, G, K, WV]
**Dianthus deltoides** Linnaeus, Maiden Pink, Meadow Pink. Pd (NC, VA), Mt (NC, WV): cultivated as an ornamental, rarely escaped to adjacent areas; rare, native of Europe. May. See Rabeler & Thieret (1988) for additional information. [= FNA; < *D. deltoides* – C, F, G, K]

**Dianthus plumarius** Linnaeus ssp. plumarius, Garden Pink, Grass Pink. Cp (NC), Pd (NC, SC), Mt (VA): cultivated as an ornamental, rarely escaped to disturbed areas; rare, native of e. Europe. June-August. [= FNA; < *D. plumarius* – RAB, C, F, G, K]

**Drymaria** Willdenow ex J.A. Schultes 1819 (Drymary)

**Drymaria cordata** (Linnaeus) Willdenow ex Schultes var. cordata, Drymary, West Indian Chickweed. Cp (FL, GA): moist hammocks, moist disturbed areas; uncommon (rare in GA). Sc. GA south to s. FL south into the New World tropics; also old World tropics. Var. *diandra* Blume is restricted to the Old World. [= FNA; = *D. cordata* ssp. cordata – K, Z; < *D. cordata* – S, WH]

**Gypsophila** Linnaeus 1754 (Baby’s-breath)

G. muralis

1 Leaves 0.2-2 (-3) mm wide; stems diffusely and repeatedly branched near the base and upward..........................................................G. muralis
1 Leaves (1-) 3-16 mm wide; stems simple, few-branched toward the top, or much-branched
2 Annual; plants strict or few branched upwards; petals 6-15 mm long..........................................................G. elegans
2 Perennial; plants much-branched 1-4 (-8) mm long................................................................................................................G. paniculata

**Gypsophila elegans** Bieberstein, Annual Baby’s-breath. Cp (NC), Pd (NC), Mt (WV): disturbed areas, persistent from cultivation, doubtfully established; rare, native of Eurasia. See Rabeler & Thieret (1988) for additional information. [= C, FNA, K]

**Gypsophila paniculata** Linnaeus, Tall Baby’s-breath. Cp (FL): disturbed areas; rare, native of Eurasia. [= FNA, K, WH] {add to synonymy}

**Herniaria** Linnaeus (Rupture-wort)

**Holosteum** Linnaeus 1753 (Jagged Chickweed)

**Honckenya** Ehrhart 1788 (Seabeach-chickweed, Sea-sandwort)

**Honckenya peploides** (Linnaeus) Ehrhart ssp. *robusta* (Fernald) Hultén, Southern Seabeach-chickweed, Southern Sea-sandwort. Cp (DE, VA): seabeaches and dunes; rare. June-July. The species is circumboreal, in North America ranging south to e. VA. Ssp. *robusta* ranges from NL (Newfoundland) south to e. VA; 3 other subspecies do not occur south of NL.
CARYOPHYLLACEAE

Minuartia Linnaeus 1753 (Sandwort)

A genus of about 120-175 species, herbs, of the northern hemisphere (and rarely South America). References: Rabeler, Hartman, & Utech in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

1 Sepals acute, with prominent nerves; [of calcareous or mafic barrens of VA, and westward or northward].
2 Primary leaves with axillary fascicles of secondary leaves ................................................................. M. michauxii var. michauxii
3 Sepals 3-nerved; seeds 0.7-0.9 mm long .................................................. [M. muscorum]
4 Lower stem leaves not imbricate; [of xeric sands of the Coastal Plain] .............................................. M. caroliniana
5 Stems erect, leafy near the base, the stem leaves few in number and reduced in size upward; pedicels and sepals glabrous; [of rock outcrops of the Piedmont and Mountains].
6 Larger stem leaves 2.5-7 mm long; petals 1-7 mm long .................................................. M. uniflora
7 Leaves distinctly oblanceolate, very thin in texture, prominently veined; flowers 1-3 per stem ............. M. cumberlandensis
8 Plants 5-10 cm tall, annual, not mat-forming; cymes 9-15-flowered; sepals 3-4 mm long; petals 4-6 (-8) mm long; [of Piedmont and low mountain granitic flatrocks and other outcrops] ........................................... M. glabra
9 Plants 1.5-3 cm tall, perennial, mat-forming; cymes 3-7-flowered; sepals 3.5-5.5 mm long; petals 6-10 mm long; [of mountain peaks and Piedmont monadnocks] .................................................. M. greggii

Minuartia cumberlandensis (B.E. Wofford & Kral) Meinck, Cumberland Sandwort. Vertical sandstone outcrops in the Cumberland Plateau of NE TN; it might be expected in extreme SW VA. [= FNA, K; = Arenaria cumberlandensis B.E. Wofford & Kral – C]

Minuartia glabra (Michaux) A. Mattfeld, Appalachian Sandwort. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): granitic flatrocks, other outcrops of granite, granitic gneiss, or other felsic gneisses and schists, in the mountains restricted to low or medium elevations; uncommon. April-May. ME and NH south to w. GA (Jones & Coile 1988) and AL, primarily on the Piedmont and also in the Cumberlands (Chester, Wofford, & Kral 1997). [= FNA, K; = Arenaria groenlandica (Retzius) Sprengel var. glabra (Michaux) Fernald – RAB, C, F, G; = A. glabra Michaux – GW, W; = Sabulina glabra (Michaux) Small – S; = Porsildia groenlandica (Retzius) Á. Löve & D. Löve spp. glabra (Michaux) Á. Löve & D. Löve]

Minuartia godfreyi (Shinners) McNeill, Godfrey's Sandwort. Cp (FL, NC, SC), [GA]: tidal freshwater marshes, other wetlands; rare. April-June. Peculiarly and irregularly distributed, with isolated and scattered locations in the Coastal Plain and Mountains: w. VA, ne. TN, c. NC, ne. SC, e. Panhandle FL, n. peninsula FL, w. FL, and se. AR. [= FNA, K, WH; = Arenaria godfreyi Shinners – RAB, GW, W; = Sabulina uniflora – S, misapplied; = Stellaria paludicola Fernald & Schubert]

Minuartia groenlandica (Retzius) Ostenfeld, Mountain Sandwort, Greenland Sandwort. Mt (NC, VA, WV), Pd (NC): low elevation rock outcrops (such as sandstone pavements in the VA Ridge and Valley) to high elevation rock outcrops in the Mountains (ascending to nearly 2000m on Roan Mountain), also disjunct on the summits of quartzite monadnocks in the upper Piedmont (such as Pilot Mountain, Surry County, NC and Hanging Rock, Stokes County, NC); rare. May-October. Greenland, NS, and QC south to the higher mountains of New England and NY; disjunct in the Southern Appalachians of VA, w. NC, and c. TN. [= FNA, K; = Arenaria groenlandica (Retzius) Sprengel var. groenlandica – RAB, C, F, G; = Sabulina groenlandica (Retzius) Small – S; = A. groenlandica (Retzius) Sprengel – W; = Porsildia groenlandica (Retzius) Á. Löve & D. Löve spp. groenlandica]

Minuartia michauxii (Fenzl) Farwell var. michauxii, Rock Sandwort. Mt (VA, WV), Pd (DE): limestone, dolostone, calcareous sandstone, and calcareous shale outcrops and barrens; uncommon (rare in DE and WV). June-July. Var. michauxii ranges from NY west to MN, south to sw. VA and AR. Var. texana (B.L. Robinson) Mattfeld occurs from MO and NE south to TX. [= K; = Arenaria stricta Michaux var. stricta – C, F; < M. michauxii – FNA; = A. stricta Michaux spp. stricta – G; < Sabulina stricta (Michaux) Small – S; < A. stricta Michaux – W, WV]

Minuartia patula (Michaux) Mattfeld, Lime-barren Sandwort. Mt (GA, VA), Pd (VA), Cp (GA): rocky barrens of calcareous or mafic rocks, locally common in Lee County, VA; rare (VA Watch List). April-June. Ec. PA and w. VA west to IN and MN, south to AL and TX. [= FNA, K; = Arenaria patula Michaux var. patula – C, G; < A. patula Michaux – F; < Sabulina patula (Michaux) Small – S]

Minuartia uniflora (Walter) Mattfeld. Pd (GA, NC, SC), Cp (GA): granitic flatrocks, outcrops of Altamaha grit; uncommon (rare in NC and SC). April-May. SC south to c. GA, west to ec. AL, on the Piedmont and extending into the Coastal Plain of Georgia on Altamaha grit. M. alabamenensis, named on the basis of its tiny flowers, has been shown to be a self-
pollinating form of *M. uniflora* which has arisen repeatedly and independently at various sites in the range of *M. uniflora.* [ = FNA, K; = *Arenaria uniflora* (Walter) Muhlenberg – RAB; > *A. uniflora* (Walter) Muhlenberg – GW, W; > *A. alabamensis* McCormick, Bozeman, & Spongberg – GW, W; = *Sabulina brevifolia* (Nuttall ex Torrey & A. Gray) Small – S; > *M. alabamensis* (McCormick, Bozeman, & Spongberg) Wyatt]

*Minuartia muscorum* (Fassett) Rabeler. KY and TN west to MO. [ = FNA, K; = *Arenaria patula* Michaux var. *robusta* (Steyermark) Maguire – C, G; < *A. patula* – F; < *Sabulina patula* (Michaux) Small – S; = *M. patula* (Michaux) Mattfeld var. *robusta* (Steyermark) McNeill]

**Moehringia** Linnaeus 1753 (Grove-sandwort)

**Moehringia lateriflora** (Linnaeus) Fenzl, Grove-sandwort, Blunt-leaved Sandwort. Pd (VA), Mt (WV): rocky, disturbed areas (powerline) over mafic rocks (diabase); rare. May-July. Circumboreal, ranging south in North America to n. VA (Fairfax County), n. WV (Morton et al. 2004), MO, and CA. [ = FNA, K; = *Arenaria lateriflora* Linnaeus – C, F, G]

**Moenchia** Ehrhart 1788

* Moenchia erecta* (Linnaeus) P.G. Gaertner, B. Meyer, & Scherbius *ssp. erecta*, Upright Chickweed. Cp (SC): disturbed areas; rare, introduced. This species was collected as a "wool alien" in Berkeley County, SC in 1958 (Rabeler 1991). [ = FNA, < *M. erecta* – K; = *Sagina erecta* Linnaeus]

**Myosoton** Moench 1794 (Water-chickweed)

**Paronychia** P. Miller 1754 (Whitlow-wort, Nailwort)

A genus of about 110 species, herbs and shrubs, nearly cosmopolitan in distribution. This genus consists mostly of plants of dry rocky or sandy habitats. References: Hartman, Thieret, & Rabeler in FNA (2005); Chaudhri (1968)=Z, Ward (1977a, 1977b)=Y; Shinners (1962h)=X; Bittrich in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Y and Z.

Identification notes: Magnification of at least 10× is necessary for the identification of many of the taxa.

1 Leaf surfaces with silky, appressed pubescence (usually densely so, but sometimes sparse), giving the plant a silvery appearance; flowers 3.5-6 mm long, largely concealed by scarious bracts; [subgenus *Paronychia*].......................................................................................................................... ..........................P. argyrocoma

1 Leaf surfaces glabrous or with very short pubescence (neither appressed nor silky), the plant green; flowers 1-4 mm long, not concealed by scarious bracts.

2 Sepals petaloid, the tip, margins, or entire sepal whitish; perigynous zone very well developed (mostly equaling or somewhat longer than the sepals); [of the Coastal Plain, from SC southward and westward]; [subgenus *Siphonychia*].

3 Sepals glabrous to the base; plant a cespitose perennial with ascending annual stems.

4 Stems minutely gray-puberulent............................................................P. erecta *var. corymbosa*

4 Stems glabrous and often also glaucous............................................................P. erecta *var. erecta*

5 Pubescent portion of the sepal nearly ½ its length; sepal broadly rounded and hooded; stem glabrous or one side with curly hairs.....

6 Stem spreading or ascending, the branching unevenly dichotomously, the flowers therefore in diffuse cymes; glabrous portion of the sepal 0.8 mm long ............................................................P. rugelii

6 Pubescent portion of the sepal <1/3 its length; sepals narrowed toward the apex, with a short tooth or awn; stem uniformly pubescent with retrorse hairs.

6 Stem erect, the branching symmetrical and dichotomous, the flowers therefore in weirdly geometric, tight square cymes; glabrous portion of the sepal > 1.1 mm long.............................................................................................................................................P. americana
2 Sepals not petaloid, green, sometimes scarious-margined; perigynous zone somewhat shorter than the sepal; [of various provinces, collectively widespread in our area]; [subgenus Paronychia].

7 Sepals tipped with a distinct awn, 0.35-0.75 mm long; flowers 2-4 mm long.

8 Serrate or serrulate leaf margins; flowers 15-25 (-30) mm long, 0.5-1 mm wide, acute; [of Mountain and Piedmont rocky areas] = Paronychia americana var. virginica

8 Prostrate annual; leaves oblanceolate or spatulate, 3-12 (-16) mm long, 1.5-3.5 (-5) mm wide, obtuse; [of Coastal Plain sands from sc. NC southward] .......................................................... P. virginiaca var. virginica

7 Sepals tipped with a short cusp or mucro; flowers 1-1.6 mm long.

9 Leaves with a distinctly ciliate margin; plants prostrate, the branching below the inflorescence not pseudo-dichotomous.

10 Plant an annual (biennial); stems 1-4 dm long, uniformly and minutely recurved-puberulent; flowers 1.25-1.4 mm long, shortly ciliate to nearly glabrous; sepal ca. 1 mm long, oval-oblong, the margin ciliate; style 0.4-0.5 mm long, bifid; fruit rounded at the top .......................................................... P. baldwinii ssp. baldwinii

10 Plant a perennial; stems 2-12 dm long, glabrous or minutely puberulent in longitudinal bands; flowers 1.45-1.55 mm long, more or less glabrous; sepals 1.1-2 mm long, oblong, with a brownish margin; style 0.35-0.4 mm long, the 2 lobes divergent-recurved at maturity; fruit narrowed to the top .......................................................... P. baldwinii ssp. riparia

9 Leaves entirely glabrous or with a slightly ciliate-serrulate margin; plants erect, suberect, or somewhat prostrate, pseudo-dichotomously branched.

11 Style elongate, 0.6-0.75 mm long; anthers 0.25-0.3 mm in diameter; stipular bracts subtending the flowers narrowly lanceolate, ca. 0.5× as long as the flowers ............................................................................................................................................................................. P. montana

11 Style short, 0.3-0.35 mm long; anthers ca. 0.15 mm in diameter; stipular bracts subtending the flowers lanceolate, from much shorter to exceeding the flowers.

12 Stems glabrous; leaves oblanceolate, 5-25 mm long, 2-8 (-10) mm wide, obtuse (rarely sub-oblanceolate or acute), very thin in texture, deep-green; calyx 0.9-1.3 mm long; sepal 0.5-1 mm long, herbaceous .................................................................................................................. P. canadensis

12 Stems retrorsely puberulent (sometimes sparsely so); leaves oblanceolate, 3-15 mm long, 2.5-5 mm wide, acute (rarely sub-obtuse to obtuse), firm in texture, dull brownish-green; calyx 1.1-1.6 mm long; sepal 1.1-2 mm long, leathery.

13 Stipular bracts subtending the flowers exceeding the flowers (calyx) ................................................................................................................................................................................. P. fastigiata var. paleacea

13 Stipular bracts subtending the flowers so much shorter than the flowers (calyx).

14 Sepals with a minute cusp or mucro. ............................................................................................................................................................................................. P. fastigiata var. fastigiata

14 Sepals with a distinct white awn to 0.2 mm long ............................................................................................................................................................................................. P. fastigiata var. nuttallii

Paronychia americana (Nuttall) Fenzl ex Walpers, American Whitlow-wort. Cp (FL, GA, SC): sandhills; rare. June-September. S. SC south to GA and s. FL. Two taxa have been unquestionably distinguished. Ssp. americana, with the cymes many-flowered and forming spheroidal glomerules, has the range of the species; ssp. pauciflora (Small) Chaudhri, differing in its laxer, more open cymes, is restricted to s. GA and n. FL. [= FNA, WH, X, Y; > Paronychia americana (Nuttall) Fenzl ex Walpers ssp. americana – K, Z; > Paronychia americana (Nuttall) Fenzl ex Walpers ssp. pauciflora (Small) Chaudhri – K, Z; > P. americana – RAB; > Siphonophyllum americana (Nuttall) Torrey & Gray – S; > Siphonophyllum pauciflora Small – S]

Paronychia baldwinii (Torrey & A. Gray) Fenzl ex Walpers ssp. baldwinii, Annual Dune Whitlow-wort. Cp (FL, GA, NC, SC): dry sandy sites, woodlands or dunes; uncommon. June-October. E. NC south to c. peninsular FL and west to AL (and LA?), on the Coastal Plain. [= K, Y, Z; < P. baldwinii – FNA, WH; < P. riparia – RAB; = Anychiastrum baldwinii (Torrey & Gray) Small – S]

Paronychia baldwinii (Torrey & A. Gray) Fenzl ex Walpers ssp. riparia (Chapman) Chaudhri, Perennial Dune Whitlow-wort. Cp (FL, GA, NC, SC, VA): dry sandy sites, woodlands or dunes; uncommon (VA Watch List). June-October. Se. VA south to n. FL (and AL?), on the Coastal Plain. Though Chaudhri (1968) and Ward (1977a and 1977b) independently reached the conclusion to reduce P. riparia to a subspecies of P. baldwinii, neither stated any reasons for their choice of subspecific status. I here follow the independent conclusions of Chaudhri and Ward, but the appropriate taxonomic rank remains unclear. [= K, Y, Z; < P. riparia – RAB, F; < P. baldwinii – FNA, WH; = P. riparia Chapman – C, F; = Anychiastrum riparium (Chapman) Small – S; > P. baldwinii ssp. riparia var. riparia – Z; > P. baldwinii ssp. riparia var. ciliata Chaudhri – Z]

Paronychia canadensis (Linnaeus) Wood, Canada Whitlow-wort, Forked Chickweed. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA): dry rocky woods, shale barrens; uncommon (common in WV, rare in the NC, SC, and VA Coastal Plain). June-October. NH and s. ON west to MN, south to n. GA (Jones & Coile 1988), AL, MO, and KS. This species is somewhat taller on average than P. fastigiata or P. montana. [= RAB, C, F, FNA, G, K, W, WV, Z; = Anychiastrum canadensis (Linnaeus) Britton, Sterns, & Poggenburg – S]

Paronychia fastigiata (Rafinesque) Fernald var. fastigiata, Common Forked Whitlow-wort. Mt (NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, SC, VA): dry, usually rocky, woodlands, often on thin soil around outcrop edges; uncommon (rare in DE). June-October. MA west to MN south to FL and TX. The three varieties of P. fastigiata (though accepted by Chaudhri
and many recent floras) need additional investigation to confirm their taxonomic status, habitats, and geographic ranges. [= C, F, G, K, WV, Z; < *P. fastigiata* – RAB, W; < *P. fastigiata* var. *fastigiata* – FNA; < *Anychia polygonoides* Rafinesque – S]

**Paronychia fastigiata** (Rafinesque) Fernald var. **paleacea** Fernald, Green Forked Whitlow-wort. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (NC, VA): dry, mostly rocky woodlands; uncommon (rare in WV). June-October. NJ, DE, and PA west to IL, south to VA, NC, KY, TN, MO, and TX. [= C, F, G, K, WV, Z; < *P. fastigiata* – RAB, W; < *P. fastigiata* var. *fastigiata* – FNA; < *Anychia polygonoides* Rafinesque – S]

**Paronychia hermarioides** (Michaux) Nuttall, Michaux's Whitlow-wort. Cp (FL, GA, NC, SC): sandhills; rare. April-July. Sc. NC south to c. peninsular FL and e. Panhandle FL. The NC distribution ascribed by Small, Chaudhri, and FNA is based on the type specimen of André Michaux ("in arenosis aridis Carolinae septentrionalis"); the species has been relocated in NC (Scotland County) by Harry E. LeGrand, Jr, over two centuries later. [= RAB, FNA, K, WH, Y, Z; =*Gastronchya hermarioides* (Michaux) Small – S]

**Paronychia montana** (Small) Pax & K. Hoffmann, Shale-barrow Whitlow-wort. Mt (NC, VA): dry rock outcrops and talus bars, especially on shale barrens; uncommon. June-October. C. PA (and OH?) south through w. VA and e. WV to a few localities in NC, TN, GA, and AL. [= K, Z; < *P. fastigiata* – RAB, W; < *P. fastigiata* var. *pumila* (A. Wood) Fernald – C, F, FNA, G; = *Anchyiastrum montanum* Small – S]

**Paronychia patula** Shiners, Pineland Nailwort. Cp (FL, GA): sandhills; uncommon (rare in GA). July-September. Sw. GA west to s. AL, south to c. peninsular FL. [= FNA, K, WH, X, Y, Z; = *Siphonochrya diffusa* Chapman – S]

**Paronychia virginica** Sprengel var. **virginica**, Virginia Whitlow-wort. Mt (VA, WV), Pd (GA, VA): shale barrens, rocky riversides, calcareous rock outcrops and talus, serpentine outcrops; rare. June-August. The ranges of the two varieties are variously stated; the distinguishing characteristics and distributions are not clear. Var. **virginica** occurs in w. MD, w. VA, WV, GA, and AL (or allegedly also in NC, AR, OK, and TX). Var. **parksii** (Cory) Chaudhri occurs in TX (or also in OK). [= C, Z; < *P. virginica* – F, FNA, K, W, WV; = *P. virginica* ssp. *virginica* – S; = *P. dichotoma* (Linnaeus) Nuttall – S]

**Paronychia chartacea** Fernald var. **minima** (L.C. Anderson) R.L. Hartman, Paper Nailwort. Cp (FL): scrub; rare. (May-) July-October. Endemic to Panhandle FL. [= FNA; < *P. chartacea* – WH; < *Nyachia pulvinata* Small = *P. chartacea* Fernald ssp. *minima* L.C. Anderson – K] {add to synonymy; add to key}*

**Petrohragia** (Seringe) Link 1831 (Pink)

1 Flowers in capitate inflorescences (solitary in impoverished or very young plants); bracts subtending the calyx broad and long, usually completely enclosing the calyx; [section *Koltruschia*].................................................................................................................... *P. prolifera*

1 Flowers solitary (or in fascicles of 2-3); bracts subtending the calyx narrow and short, enclosing about ½ of the calyx; [section *Petrohragia*]...

* Petrohragia saxifraga* (Linnaeus) Link var. *saxifraga*, Saxifrage Pink, is "cultivated and occasionally escaped" south to se. PA (Rhoads & Klein 1993), s. NJ, and MD (Rabeler 1985). Rabeler (1985) reports a location from Page Co. VA, but it appears that this is persistent from cultivation. [= FNA; < *P. saxifraga* – C, K, Z; < *Tunica saxifraga* (Linnaeus) Scopoli]

**Polycarpon** Linnaeus 1759 (Allseed)

A genus of about 18 species, herbs, primarily of Europe, with several species in South America, and 1 cosmopolitan. References: Thieret & Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

**Sagina** Linnaeus 1753 (Pearlwort)

1 Leaf blades fleshy; seeds reniform or nearly spherical, lacking a groove on one side; flowers 5-merous. ................................................................................. **S. japonica**
1 Leaf blades thin; seeds obliquely triangular, with a groove on one side; flowers 4-merous or 5-merous.

2 Annual, usually without a persistent rosette of leaves; flowers (4-)5-merous; seeds 0.3–1.4 mm long; sepalss erect-appressed in fruit. ................................................................................. **S. decumbens**
2 Perennial, usually with a persistent rosette; flowers 4 (-5)-merous; seeds (0.3-) 0.4 (0.5) mm long; sepals spreading in fruit. ................................................................................. **S. procumbens**

**Sagina decumbens** (Elliott) Torrey & A. Gray, Eastern Pearlwort. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed ground, fields, cracks in pavement or sidewalks; common (uncommon in Mountains of GA, NC, SC, and VA, rare in Mountains of WV). March–June. NB west to IL and MO, south to c. peninsular FL and TX, with adventive occurrences further west. Crow (1978) and Crow in FNA (2005) treat *S. decumbens* and *S. occidentalis*. Watson of the Pacific Coast of North America as subspecies. They differ primarily in seed architecture. Though clearly closely related, they seem equally well (and more simply) regarded as sibling species. A report of *S. subulata* (Swartz) K. Presl for Bedford County, VA, is apparently actually *S. decumbens*.

*Sagina procumbens* Linnaeus, Northern Pearlwort, Bird’s-eye. Cp (DE), Pd (DE), Mt (NC, WV): disturbed soils; uncommon (rare in NC), native of Eurasia (or, at least, ne. North America). May–September. Crow (1978) questions whether *S. procumbens* is native in all of the Western Hemisphere. In North America, it is concentrated in 2 main regions, from NS and QC south to MD, and from sw. BC south to e. CA, with scattered occurrences elsewhere, such as around the Great Lakes, CO, AR, s. OH, and w. NC. Whether or not the species is native in the New World, the occurrence in NC (in a gravel parking lot on top of Roan Mountain) is almost certainly adventive.

*S. procumbens* var. *procumbens* – F; > *S. procumbens* var. *procumbens* ssp. *decumbens* – F

**Saponaria** Linnaeus 1753 (Soapwort)

A genus of about 40 species, herbs, of temperate regions of Eurasia. References: Thieret & Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993). [also see *Vaccaria*]

[* Saponaria subulata* (Swartz) K. Presl for Bedford County, VA, is apparently actually *S. officinalis*. [= C, FNA, G, K, WV, Z; > S. procumbens var. procumbens – F; > S. procumbens var. compacta Lange – F]

**Silene** Linnaeus 1753 (Catchfly, Campion, Fire-pink, Wild-pink)

1 Styles mostly 5; capsule with 5 or 10 teeth; calyx tubular at anthesis, becoming strongly inflated later in *S. dioica* and *S. latifolia*.
2 Petal limbs deeply divided into 4 linear segments ................................................................................. **S. flos-cuculi**
2 Petal limbs unlobed, emarginate, or shallowly 2-lobed.

3 Leaf blades with dense silky white hairiness; flowers bisexual. ................................................................................. **S. coronaria**
3 Leaf blades variously pubescent, but not with silky-appressed pubescence.

4 Petals pink; capsule teeth revolute .................................................................................................................. [S. dioica]
4 Petals white; capsule teeth spreading to slightly reflexed ............................................................................... **S. latifolia**

1 Styles mostly 3; capsule with 3 or 6 teeth; calyx tubular or campanulate at anthesis, not greatly inflated (except in *S. vulgaris*).

**S. latifolia** Linnaeus 1753 (Catchfly, Campion, Fire-pink, Wild-pink)

1 Styles mostly 5; capsule with 5 or 10 teeth; calyx tubular at anthesis, becoming strongly inflated later in *S. dioica* and *S. latifolia*.
2 Petal limbs deeply divided into 4 linear segments ................................................................................. **S. flos-cuculi**
2 Petal limbs unlobed, emarginate, or shallowly 2-lobed.

3 Leaf blades with dense silky white hairiness; flowers bisexual. ................................................................................. **S. coronaria**
3 Leaf blades variously pubescent, but not with silky-appressed pubescence.

4 Petals pink; capsule teeth revolute .................................................................................................................. [S. dioica]
4 Petals white; capsule teeth spreading to slightly reflexed ............................................................................... **S. latifolia**

1 Styles mostly 3; capsule with 3 or 6 teeth; calyx tubular or campanulate at anthesis, not greatly inflated (except in *S. vulgaris*).

Silene caroliniana Walter var. caroliniana, South Carolina Wild-pink, Rock Catchfly. Pd (FL, GA, NC, SC), Cp (GA, NC, SC): in acidic, sandy, open woodlands, especially woodlands around granitic flatrocks and sandy Coastal Plain woodlands; uncommon (rare in GA and NC). April-July. Sc. NC south through the e. three-quarters of SC just into e. GA; disjunct in Panhandle FL. See Wilbur (1970b) and Clausen (1939) for additional discussion of these infraspecific taxa in *S. caroliniana.* (= S. virginiaca – RAB, S, WH; = S. caroliniana ssp. caroliniana – FNA, G, K, Z, = S. caroliniana ssp. caroliniana var. caroliniana – Y)

Silene caroliniana Walter var. wherryi (Small) Fernald. Mt (VA?, WV): dry, rocky places; rare. April-July. OH and WV (and VA according to FNA) south and west to AL, KY, MO, and KS. [= F; > S. caroliniana var. pensylvanica – C; = S. caroliniana ssp. wherryi (Small) Clausen – FNA, G, K, Y, Z; = S. wherryi Small]

* Silene cseresi Baumgarten, Balkan Bladder-campion. Mt (NC, WV): habitat not known; rare, native of Europe. Documented for w. NC (J.K. Morton, pers.comm.). Also reported in se. PA (Rhoads & Klein 1993) and e. WV. [= FNA; K; = S. cseresi – C, F, G, orthographic variant]

* Silene dichotoma Ehrhart ssp. dichotoma, Forked Catchfly. Mt (NC, VA, WV), Pd (VA), {GA}: fields, disturbed areas; common (uncommon in WV), native of Europe. May-August. [= FNA; < S. dichotoma – RAB, C, F, G, K, S, W, WV]

* Silene flos-cuculi (Linnaeus) Clairville ssp. flos-cuculi, Ragged Robin. Mt (NC): rare; native of Europe. Introduced and established in Allegheny County, NC (Poindexter 2008) and elsewhere in ne. North America, as in MD and PA. [= FNA; < Lychnis flos-cuculi Linnaeus – C, F, G, K]

* Silene nivea (Nuttall) Muhlenberg ex Othl, Snowy Campion. Mt (GA, VA, WV), Pd (VA): rocky or sandy flood-scoured riversides or creek-sides; rare (VA Rare). June-July. NJ west to ND, south to n. VA, w. VA, WV, nw. GA (Jones & Coile 1988), TN, and MO. [= C, F, FNA, G, K, W, WV; = Silene alba Muhlenberg – S, misapplied]

* Silene ovata Pursh, Mountain Catchfly. Mt (GA, NC, SC, VA), Cp (GA): circumneutral soils of woodlands and forests, especially over mafic or calcareous rocks, mostly at medium elevations in the mountains; rare. August-September. Sw. VA and KY west to AR, south to nw. GA, n. AL, and AR; disjunct in sc. and sw. GA. [= RAB, C, F, FNA, G, K, S, W]

* Silene regina Sims, Royal Catchfly. Cp (FL, GA): prairies and calcareous woodlands and forests; rare (GA Rare). OH and e. MO south to e. TN (Chester, Wofford, & Kral 1997), nw. and sw. GA (Jones & Coile 1988), FL Panhandle (Jackson County), and AL. [= C, F, FNA, G, K, S, WH]

* Silene rotundifolia Nuttall, Roundleaf Fire-pink, Sandstone Fire-pink. Mt (GA, VA, WV): sandstones cliffs, ledges, and talus, and at bases of sandstone cliffs; rare. S. OH and WV south to nw. GA (Jones & Coile 1988) and n. AL, nearly restricted to the Cumberland Plateau. [= FNA, G, K, S, W, WV]

* Silene virginica Linnaeus, Fire-pink. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): woodlands, rock outcrops, crevices in cliffs, roadbanks; common (rare in Coastal Plain, rare in DE Piedmont). April-July. NJ and NY west to s. ON and SE. MI, south to Panhandle FL (Bay County), GA and OK. Var. robusta Strausbaugh & Core, named from locations in e. WV, extends as well to se. KY and e. TN. It differs in its greater size and numerous pairs of cauleine leaves, the leaves larger (7-15 cm long, 2-4 cm wide, vs. 7.5-10 cm long, 0.5-2 cm wide) and smaller calyx (1.5-2 cm long, vs. ca. 2.2 cm long) (Strausbaugh & Core 1952, 1978); additional study is needed. [= RAB, C, F, FNA, G, S, W, WH; > S. virginica var. virginica – K, WV; > S. virginica var. robusta Strausbaugh & Core – K, WV]

*Spergula* Linnaeus 1753 (Spurrey)

1 Wing of the seed narrower than the body of the fruit; leaf blades terete or nearly so, 1.5-3 (-5) cm long. .................................................. Sp. arvensis
1 Wing of the seed as wide as or wider than the body of the seed; leaf blades usually flat, 0.3-1.5 (-2.0) cm long.
2 Seed wings light brown or darker, 0.2-0.3 mm wide; stamens usually 10 ................................................................. [Sp. morisonii]
2 Seed wings white to tan, 0.4-0.6 mm wide; stamens usually 5 ................................................................. Sp. pentandra

* Spargula arvensis Linnaeus, Corn Spurrey. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (VA, WV): fields, roadsides, disturbed areas; uncommon (rare in FL and WV), native of Europe. April-June. Two varieties are sometimes recognized; var. arvensis, with seeds ornamented with white, clavate papillae, the plants sparsely glandular, and var. sativa, with seeds reticulate and lacking papillae, the plants sparsely to densely glandular. Additional information is needed on the distinctiveness, range in our area, etc. of the two putative varieties. [= RAB, C, F, K, S, WH, WV; > S. arvensis Linnaeus var. arvensis – F, G; > S. arvensis Linnaeus var. sativa (Boenninghausen) Mertens & W.D.J. Koch – F, G]

* Spargula morisonii Boreau, Morion’s Spurrey. Fallow fields, disturbed areas. Native of Europe, known from MD (Prince Georges County) (Steuery 2004a), MA, and NJ (FNA). [= C, FNA]

Spargularia (Persoon) J. & K. Presl 1819 (Sand-spurrey)

1 Stamens 6-10; seeds either 0.4-0.6 or 0.8-1.1 mm long; axillary leaf clusters of 2-4 leaves (or sometimes absent in Sp. media). [Sp. media var. media]
2 Seeds 0.8-1.1 mm long, smooth, without sculpturing except for wings; leaf blades fleshy ................................................................. Sp. echinosperma
2 Seeds 0.4-0.6 mm long, sculptured with wavy lines, not winged but with peglike papillae; leaf blades scarcely fleshy .......... Sp. rubra
1 Stamens 1-5; seeds 0.5-0.7 (-0.8) mm long; axillary leaf clusters usually absent.
3 Seeds shiny and silvery; stipules wider than long; styles 0.3-0.4 mm long ................................................................. Sp. echinosperma
3 Seeds dull, not silvery; stipules longer than wide; styles 0.4-0.7 mm long ................................................................. Sp. salina

* Spargularia media (Linnaeus) K. Presl var. media. Mt (WV): disturbed areas; rare, native of {}. Known from salted highways in NY, OH, MI, and IL and salt or brackish marsh habitats in coastal NY. [= FNA; < S. media – C, F, G; ? Spargularia maritima (Linnaeus) Chiovenda – K] {synonymy incomplete}

Stellaria Linnaeus 1753 (Chickweed, Stitchwort, Starwort)

1 Leaves narrow, usually linear, lanceolate, oblanceolate, or narrowly elliptic, the blade 3-10× as long as wide, 0.8-10 mm wide; stems prominently 4-angled.
2 Sepals 2.0-3.5 mm long; petals 0-3.0 mm long, shorter than the sepals or absent; seeds 0.3-0.9 mm long.
3 Inflorescence a leafy terminal cyme of 1-5 flowers; seeds 0.7-0.9 mm long, smooth or slightly rugose .......... S. borealis var. borealis
3 Inflorescences axillary, solitaire or in small cymes of 2-5 flowers; seeds 0.3-0.8 mm long, distinctly papillose.
4 Flowers in axillary inflorescences of 1-5 flowers; sepals 5; petals 5; seeds 0.3-0.4 mm long, with small, rounded tubercles; [widespread]................................................................. S. alsine
4 Flowers solitary in leaf axils; sepals 4 (-5); petals absent; seeds 0.6-0.8 mm long, with stalked, knoblike tubercles; [of c. KY and TN] ................................................................. [S. fontinalis]
1 Sepals 3.5-9 mm long; petals 3.5-13 mm long, equaling or longer than the sepals; seeds 0.7-2.5 mm long.
5 Seeds 2.2-5.5 mm long; bracts of the inflorescence herbaceous; petals notched < halfway to the base .................................................. S. holostea
5 Seeds 0.7-1.2 mm long; bracts of the inflorescence scarious; petals notched > halfway to the base.
6 Sepals 4.5-5.5 mm long, strongly 3-nerved; seeds 0.8-1.2 mm long, coarsely tuberculate; inflorescence diffuse, many-flowered........... S. graminea
6 Sepals 3.5-4.5 mm long, weakly 3-nerved; seeds 0.7-1.0 mm long, obscurely sculptured and appearing almost smooth; inflorescence more compact, fewer-flowered. ............................... S. longifolia

1 Leaves broad, usually ovate, obovate, or broadly elliptic, the blade 1-2.5× (or to 4×) as long as wide, 4-30 mm wide (if > 2.5× as long as wide, then definitely > 10 mm wide); stems terete or 4-angled.
2 Leaves long-petiolate, the petiole about as long as the blade, the blades cordate to truncate at the base; sepalas 2.5-3.5 mm long, obtuse to broadly acute; seeds 0.6-0.8 mm long; stem glabrous or glandular-puberulent (the pubescence not in lines). ............................... S. prostrata
3 Leaves sessile, short-petiolate, to long-petiolate (if long petiolate, the blades cuneate), the blades rounded to cuneate at the base; sepalas 3.0-6.5 mm long; stem pubescent always in vertical lines; annual, the stems weak and in part prostrate, the tips or vigorous growth ascending; [alien].
4 Leaves 0.5-4.0 cm long; seeds 0.6-1.7 mm long; sepalas 3.0-6.5 mm long; stem pubescence always in vertical lines; annual, the stems weak and in part prostrate, the tips or vigorous growth ascending; [alien].
5 Leaves 0.5-6.5 mm long; stamens 8-10; seeds 1.1-1.7 mm long........................................ S. neglecta
6 Leaves 3.0-5.2 (-6.0) mm long; stamens 1-5 (-8); seeds 0.4-1.3 mm long.
7 Leaves 0.5-4.0 cm long; (with strong dimorphism between sterile and fertile shoots, the leaves of sterile shoots much larger); seeds 1.7-2 mm long; sepalas 4-11 mm long; stem pubescence in vertical lines or uniformly distributed; perennial, the stems strong and ascending to erect; [native].
8 Sepals 7-11 (-12) mm long, acuminate, ciliate, but more-or-less glabrous on the back; [of the mountains]................................. S. corei
9 Sepals 3.5-7 mm long, acute, ciliolate and more-or-less pubescent on the back; [widespread in our area]................................. S. pubera
10 Leaves 0.5-4.0 cm long; seeds 0.6-1.7 mm long; sepalas 3.0-6.5 mm long; stem pubescence always in vertical lines; annual, the stems weak and in part prostrate, the tips or vigorous growth ascending; [alien].
11 Stamens 3-5 (-8); seeds 4.5-5.2 (-6.0) mm long; seeds 0.9-1.4 mm long; petals usually present ........................................ S. media
12 Stamens 0-3 (-5); sepalas 3.0-4.0 mm long; petals usually absent........................................ S. pallida

Stellaria borealis Bigelow var. borealis, Northern Chickweed. Mt (WV): cold swamps; rare. May-September. Greenland and NL (Labrador) west to AK, south to MD, n. WV (Canaan Valley, Tucker Co.), sc. PA, MI, WI, MN, CO, NV, and OR. Var. stichana (Steudel) Fernald is restricted to nw. North America. [= C; = S. borealis ssp. borealis – FNA, K; > S. calycantha (Ledebour) Bongard var. florigonda Fernald – F, G; > S. calycantha var. isophylla Fernald – F, G, WV, misapplied]

Stellaria corei Shinners, Tennessee Starwort. Mt (NC, VA, WV), Pd* (DE*): cove forests and seepages at moderate to high elevations, rarely escaped from cultivation; rare. April-June. W. VA, WV, and sw. PA west to OH and IN, south to w. NC, e. and c. TN, and n. AL. Cronquist (1991) reports that S. corei has a chromosome number of 2n = 60, as opposed to 2n = 30 for S. pubera. In mountain coves, S. corei and S. pubera sometimes grow intermixed; they are best regarded as species. Both species have an interesting seasonal growth form, producing short and relatively small-leaved flowering shoots in the spring (which wither following fruiting), followed by taller, more vigorous growth shoots with larger and tougher leaves and lacking flowers, which persist until autumn. Some of the description in various manuals of differences in petiole length and leaf size and shape between the two species is obscured or complicated by these seasonal differences; more careful observation is needed. [= RAB, FNA, K, W, WV; > S. pubera Michaux var. silvatica (Béguinot) Weatherby – C, F; > S. silvatica (Béguinot) Maguire – G, preoccupied; = Alsin tennesseensis (C. Mohr) Small – S, misapplied]

* Stellaria holostea Linnaeus, Easter-bell, Greater Stitchwort. Cp? (NC): escaped or persistent from cultivation; rare, native of Europe. [= C, F, FNA, G, K]

* Stellaria neglecta Weihe. Mt (NC): disturbed areas; rare, native of Europe. Similar to S. media and S. pallida. It has been found at scattered localities in e. North America and will presumably eventually be found elsewhere in our area. [= FNA, G; < S. media (Linnaeus) Villars – RAB, C, W; < S. media var. media – F; = S. media ssp. neglecta (Weihe) Murbeck – K; = Alsin neglecta (Weihe) A. & D. Love]

Stellaria prostrata Baldwin. Cp (FL, GA, SC): moist soil along streams; rare. March-April. Apparently ranging from SC south to c. peninsular FL, west to c. TX. This species has been reported repeatedly for SC and sometimes for VA as well; the VA reports are referable to S. pallida. More information is needed about its occurrence in our area. [= K, WH; = S. cuspidata Willdenow ex Schlechtendahl ssp. prostrata (Baldwin) J.K. Morton – FNA; = Alsin baldwinii Small – S]

Stellaria pubera Michaux, Star Chickweed, Common Starwort, Giant Chickweed, Great Chickweed. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, NC, SC, VA): bottomland forests, moist slopes, coves, hammocks; common (uncommon

Stellaria fontinalis (Short & Peter) B.L. Robinson is a native species of c. TN (Chester, Wofford, & Kral 1997) and c. KY, occurring in seepages and wet cliffs. Its generic placement has been controversial and uncertain (see synonymy). [= F, FNA, G, K; = Sagina fontinalis Short & Peter – C; = Alside fontinalis (Short & Peter) Britton – S; = Arenaria fontinalis (Short & Peter) Shinners; = Spergula fontinalis (Short & Peter) Dietrich]

Stipulicida Michaux 1803 (Wire-plant)

Identification notes: Stipulicida is immediately recognizable by its very wiry, dichotomously branched stems, the stem leaves reduced to subulate scales 0.5-2 mm long. Often overlooked are the basal rosette of spatulate leaves, to 15 mm long and 4 mm wide.

1 Sepal margin entire or nearly so; outer sepal tips acute to obtuse; [of se. VA south to s. FL, west to LA]............................

Stipulicida setacea Michaux var. lacerata C.W. James. Cp (FL): xeric sands of sandhills, dry pine flatwoods, maritime forests; rare. May-August. Ne. FL south to s. FL; Cuba. [= FNA, K, WH, X, Y, Z; < S. setacea – S]

Stipulicida setacea Michaux var. segetalis. Wire-plant. Cp (FL, GA, NC, SC, VA): xeric sands of sandhills, dry pine flatwoods, maritime forests; common, rare in VA. May-August. Se. VA south to s. FL, west to e. LA (Florida parishes). A third variety, var. filiformis (Nash) D.B. Ward, endemic to c. Peninsular FL, is often considered a mere form of var. setacea (see synonymy and references). [= Y; < S. setacea var. setacea – FNA, K, WH, X, Z (including var. filiformis, but not var. lacerata); < S. setacea – RAB, C, S; < S. setacea – S (including var. lacerata but not var. filiformis)]

Vaccaria von Wolf 1781 (Cow-cockle, Cow-herb)

298. AMARANTHACEAE A.L. de Jussieu 1789 (Amaranth Family) [in CARYOPHYLLALES]

A family of about 175 genera and 2250 species, mostly herbs, but including shrubs and trees, nearly cosmopolitan, but most diverse in subtropical and temperate regions (Judd & Ferguson 1999). References: Robertson & Clements in FNA (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993); Welsh, Crompton, & Clements in FNA (2003b); Judd & Ferguson (1999)=Z; Kühn in Kubitzki, Rohwer, & Bittrich (1993). [including CHENOPODIACEAE]

{Note: several of the genera below have been treated in very different ways by various authors. Complicating the situation is the pantemperate or pantropical distribution of some species, questions of application of names having priority, and the use of technical characters not readily observed on herbarium specimens. The treatments below of Salicornia, Sarcocornia, Atriplex, and Suaeda may require considerable change prior to publication}

Subfamily Amaranthoideae

Tribe Celosiae: Celosia.

Tribe Amarantheae, subtribe Amaranthinae: Amaranthus.

Tribe Amarantheae, subtribe Aervinae: Achyranthes.

Subfamily Gomphrenoideae

Tribe Gomphrenae, subtribe Froelichiniae: Alternanthera, Froelichia, Guellimenea.

Tribe Gomphrenae, subtribe Gomphreninae: Gomphrena, Irisine.

Former Chenopodiaceae

1 Leaves opposite, reduced to scales a few mm long, clasping and appressed against the succulent stem; flowers in groups of 3, sunken into the stem; [subfamily Salicornioideae, tribe Salicorniae].

2 Annual from a taproot; central flower (of each group of 3) above the 2 lateral flowers............................... Salicornia

2 Perennial from a horizontal rhizome; central flower (of each group of 3) inserted at the same level as the 2 lateral flowers......... Sarcocornia
1 Leaves mostly or entirely alternate (the lower sometimes opposite), not reduced to appressed scales; flowers not usually grouped into groups of 3, not sunken into the stem.

3 Fruit enclosed and concealed by paired accrescent bracteoles (these usually deltoid, diamond-shaped, or ovoid).

4 Leaves pale green to silvery green; stigmas 2; plants without basal leaves, the stems freely and rather divergently branched; [native or introduced, primarily in saline situations]; [subfamily Chenopodioidae, tribe Atripliceae] — Atriplex

4 Leaves bright to dark green; stigmas 4-5; plants with basal leaves, the flowering stems erect, strict or with ascending branches in the inflorescence; [introduced, frequently cultivated as a garden vegetable, rarely escaped]; [subfamily Chenopodioidae, tribe Atripliceae] — Spinacia

3 Fruit enclosed by the persistent calyx.

5 Leaves sessile, linear, entire, succulent or not.

8 Leaves spine-tipped; [subfamily Salsoioideae; tribe Salsoleae] — Salsola

8 Leaves not spine-tipped.

9 Leaves pubescent to villous; [subfamily Chenopodioidae, tribe Camphorosmeae] — Bassia

9 Leaves glabrous; [subfamily Salsoioideae, tribe Suaedae] — Suaeda

1 Inflorescences borne on peduncles 1-7 cm long, these from the leaf axis or terminal

2 Bracts keeled; tepals pilose; leaves not succulent, acute to acuminate at the tip. — A. flavescens

2 Bracts not keeled; tepals glabrous; leaves somewhat succulent, obtuse to rounded at the tip. — A. philoxeroides

1 Inflorescences sessile, in the leaf axil.

3 Tepals dimorphic; tepal hairs barbed.

4 Leaf blades longer than broad; tepals 3-5 mm long, densely villous — A. caracasana

4 Leaf blades as broad as long; tepals 5-7 mm long, sparsely villous — A. pungens

3 Tepals monomorphic; tepal hairs not barbed.

5 Mature fruit exerted between the tepals; spikes globular; stems sericeous. — A. paronychioides

5 Mature fruit included within the tepals; spikes globular; stems glabrous or pubescent in lines (the nodes also pubescent) — A. sessilis

* Alternanthera caracasana Kunth. Cp (FL, GA, NC, SC): disturbed areas; rare, native of South America. Reported for Coastal Plain of SC, and in s. Coastal Plain of GA (Jones & Coile 1988) and for NC (FNA, K) and MD (K). [= A. flavescens repens Linnaeus – S, misapplied]

* Alternanthera flavescens Kunth, Yellow Joyweed. Cp (FL): hammocks, sandbars; rare. Widespread in the FL peninsula, north to ne. FL (Clay County) (Wunderlin & Hansen 2004). [= K; > A. flavescens repens Linnaeus – S; > Alternanthera floridana (Chapman) Small] [add synonymy]
A genus of about 60 species, all annual herbs, of tropical and temperate regions. References: Mosyakin & Robertson in FNA (2003b); Costea & Tardif (2003b) = Y; Henrickson (1999) = Z; Sauer (1955) = X; Costea, Sanders & Waines (2001a, 2001b); in the Southeast from SC, FL, AL, MS, LA, TX (Brown & Marcus 1998) and GA (Jones & Coile 1988). = FNA, GW, K

Amaranthus Linnaeus 1753 (Amaranth, Pigweed)

1 Plants dioecious; [subgenus Acnida].........................Key B
2 Plants monoecious (the pistillate and staminate flowers intermingled, or in separate inflorescences on the same plant); [subgenera Albersia and Amaranthus] .................................................................Key B

Key A – Amaranthus, subgenus Acnida

1 Plants pistillate.
2 Tepals present and well-developed (usually 5 present, at least the outer tepals >2 mm long and with a visible midvein).
3 Tepals 1 or 2, lanceolate to linear; [subgenus Acnida, section Acnida] ...............................................................A. tuberculatus
4 Tepals 5, at least the inner spatulate; [subgenus Acnida, section Sauerauthus].
5 Outermost tepal obtuse or notched (similar to the others), the midvein excurrent slightly or not at all .........................A. arenicola
6 Outermost tepal acute or acuminate (dissimilar to the inner obtuse tepals), the midvein excurrent into a rigid point ..........A. palmeri

2 Tepals lacking, or rudimentary (only often 1-2 present, these <1 (2) mm long and lacking a visible midvein); subgenus Acnida, section Acnida
5 Seeds 2-3 mm long; utricle 2.5-4 mm long .........................A. cannabinus
6 Seeds 0.7-1.2 mm long; utricle 1-2.5 mm long.
7 Utricle with conspicuous and regular longitudinal ridges; bract > 1.5 mm long, with a stout midrib not far excurrent beyond the bract blade ...............................................................A. australis
8 Utricle smooth or irregularly tuberculate; bract < 1.5 mm long, with a slender excurrent midrib
9 Leaf blades narrow, all or nearly all < 1 cm wide .........A. floridanus
10 Leaf blades broader, well-developed leaves 1-3 cm wide ........A. tuberculatus
11 Plants stamine (some identifications following this lead may not be reliable).
8 Outer tepals with prominent midrib, usually longer than the inner tepals; bracts >2 mm long (or 1-2 mm long in A. tuberculatus), mostly with prominent midribs.
9 Outer tepals with apex acute or obtuse; dark midribs not excurrent .................................................................A. arenicola
10 Outer tepals with apex acuminate; midribs excurrent as rigid spines.
11 Bracts ca. 4 mm long, equaling or exceeding the outer tepals .................................................................A. palmeri
12 Leaf blades narrow, all or nearly all < 1 cm wide ........A. floridanus
13 Leaf blades broader, well-developed leaves 1-3 cm wide
14 Outer tepals without prominent midribs, not appreciably longer than the inner tepals; bracts <2 mm long, the midribs usually not prominent (except sometimes in A. australis).
11 Bracts < 1 mm long; midribs scarcely excurrent .................................................................A. cannabinus
12 Bracts > 1 mm long; midribs often conspicuously excurrent.
14 Leaf blades narrow, all or nearly all < 1 cm wide ........A. floridanus
15 Leaf blades broader, well-developed leaves 1-3 cm wide
16 Outer tepals excurrent .................................................................A. tuberculatus
14 Bracts with slender midribs; midribs of outer sepals not excurrent .................................................................A. tuberculatus

Key B – Amaranthus, subgenera Albersia and Amaranthus

1 Inflorescences axillary clusters of glomerules (sometimes leafy terminal spikes also present); [subgenus Albersia].
2 Pistillate flowers usually with 3 tepals; utricles usually regularly dehiscent (indiscent in A. blitum).
3 Utricles indehiscent; leaf blades usually deeply notched at the tip .................................................................A. blitum
4 Utricles dehiscent; leaf blades obtuse, acuminate, or very shallowly notched at the tip.

* Alternanthera philoxeroides* (Martius) Grisebach, Alligator-weed. Cp (FL, GA, NC, SC, VA): floating in mats on the surface of the waters of blackwater rivers, sloughs, ditches, ponds, and in very moist soil of ditches and shores; common, native of tropical America. April-October. This plant is a serious weed of natural areas. [= RAB, C, FNA, K; = *Achyranthes philoxeroides* (Martius) Standley – S]

* A. australis (A. Gray) J.D. Sauer, Southern Water-hemp, Careless. Cp (FL, GA, NC), Mt* (VA*): tidal marshes, ditches, disturbed areas; uncommon. E. NC, TN, AR, and TX south into West Indies, Mexico, and n. South America; perhaps adventive in most of our range, from an original distribution on the Gulf Coast, in FL, and southward into the New World tropics. *This annual is alleged to get as large as 9 m tall and 30 cm diameter at the base of the stem!* [= FNA, GW, K, WH, X; = Acnida cuspidata Bertero ex Sprengel – S; = Acnida alabamensis Standley – S]

**Amaranthus cannabinus** (Linnaeus) J.D. Sauer, Salt-marsh Water-hemp. Cp (DE, FL, GA, NC, SC, VA): salt, brackish, and freshwater tidal marshes, also along the banks of tidal guts; common (rare in FL). July-December. ME south to ne. FL; AL? Extremely variable in size, flowering and fruiting at heights ranging from 3 dm to 4 m tall. The stem can reach 10 cm in diameter at the base. [= RAB, C, FNA, GW, K, WH, X; = A. cannabinus Linnaeus – F, G, S]

**Amaranthus caudatus** Linnaeus, Love-lies-bleeding. Cp (DE), Pd (DE): disturbed areas; rare, native of India. Cultivated and rarely escaped or persistent, as in TN (Chester, Wofford, & Kral 1997), and scattered in PA (Rhoads & Klein 1993). [= FNA, C, F, G, K, Y]

**Amaranthus crispus** (Lespinasse & Thévenau) A. Braun, Crisp-leaved Amaranth. Cp (NC): disturbed areas, especially around seaports; rare, native of South America. Reported for VA by Massey (1961), but no documentation is known. [= FNA, C, F, G, K, S]

**Amaranthus cruentus** Linnaeus, Red Amaranth, Blood Amaranth, Purple Amaranth. Mt (VA, WV), [NC, SC]: disturbed areas, old gardens; rare, native of Central America. [= RAB, C, F, FNA, K; S, WV, Y]

**Amaranthus hypochondriacus** Linnaeus, Prince's-feather. (VA): Type locality is "Virginia". Possibly of hybrid origin, from *A. cruentus × powelli*. [= FNA, C, K, S]

**Amaranthus powelli** S. Watson, Green Amaranth, Powell's Amaranth. Mt (VA, WV), [GA, NC, SC, VA]: disturbed areas; rare. Widespread and common in PA (Rhoads & Klein 1993). Many earlier reports of *A. retroflexus* may actually pertain to this species. [= FNA, C, F, G, K; =* A. retroflexus* Linnaeus var. powelli (S. Watson) Boivin; =* A. powelli ssp. powelli* – Y]

**Amaranthus pumilus** Rafinesque, Seabeach Amaranth, Dwarf Amaranth. Cp (DE, NC, SC, VA): sea beaches, fore-dunes, island end flats, rarely on sound-side beaches; rare. Se. MA south to c. SC; presently known to be extant only from NC, n. SC, e. MD, DE (McAvoy 2002), se. NY (Long Island), VA, and NJ. Seeds of this plant require cold stratification, high temperatures, and light to germinate (Baskin & Baskin 1998); this is apparently responsible for the late seasonality of the species (germination in late spring and early summer) and its seed-banking. See Hancock & Hosier (2003) for discussion of the ecology of this interesting species. [= RAB, C, F, FNA, G, K, WH, X]

**Amaranthus viridis** Linnaeus, Slender Amaranth, Tropical Green Amaranth. Cp (FL, VA), Mt (VA), [GA, NC, SC]; disturbed areas; rare, native of South America. [= RAB, C, F, FNA, G, K, WH, Y; =* Amaranthus gracilis* Desfontaines – S]

**Amaranthus thunbergii** Moquin-Tandon, Thunberg's Amaranth. Native of Africa. Collected from near wool-combing mills in SC; probably not naturalized. [= FNA, K]

**Atriplex Linnaeus 1753 (Orach)**

Identification notes: There are a number of idiosyncratic characters that are used for the identification of the species of *Atriplex*. Many important characters are associated with the mature fruits. The fruit is closely invested by 2 arenariae, which are variously shaped and ornamented. Mature seeds are dimorphic in most of our species, with large, brown seeds and small, black seeds. The radicle of the seeds is variously apical, lateral, or basal (which can be seen by observing the seed through the clarified bracteoles or with strong transmitted light).

1 Leaves white to gray, densely and finely scurfy, especially adaxially.
2 Seeds dimorphic, black and brown; branches not angled; [introduced, of disturbed situations]; [subgenus *Atriplex*, section *Semibaccata*]...
3 Seeds monomorphic, brown; branches obtusely angled; [native, of coastal saline situations]; [subgenus *Obione*, section *Obione*, subsection *Arenariae*].
3 Fruit bracteoles (3.5-) 4.5-7 mm long, 3.5-5.6 mm wide, longer than broad; faces with or without appendages.............. *A. muconata*
3 Fruit bracteoles 2.5-4.5 mm long, 2.6-5 mm wide, as wide as or wider than long; faces with appendages ..................... *A. pentandra*

1 Leaves usually green on both surfaces, glabrous or only sparingly powdery or scurfy; [subgenus *Atriplex*, section *Teutiolpis*].
Atriplex dioica Rafinesque. Cp (NC, VA?), Mt (VA): brackish flats; rare? July-frost. NL (Newfoundland) west to AK, south to NC and CA. [= FNA; Atriplex subspicata (Nuttall) Rydberg – K, Y; < A. littoralis Linnaeus – C, misapplied; < A. patula Linnaeus var. littoralis (Linnaeus) A. Gray – F, misapplied]

Atriplex mucronata Rafinesque, Seabeach Orach. Cp (DE, FL, NC, VA): ocean beaches, island-end flats; uncommon. July-frost. NH south to FL west to TX. This species and A. pentandra are closely related, and have been variously treated as species, subspecies, varieties, and forms. [= FNA; < A. arenaria Nuttall – RAB, C, G, GW, S, Y (also see A. patula); < A. cristata Humboldt and Bonpland ex Willenow – K (also see A. patula); < A. pentandra ssp. arenaria H.M. Hall & Clements] * Atriplex patula Linnaeus, Spear Orach. Pd (VA), Mt (VA, WV): disturbed areas, inland saline areas; rare, native of Eurasia. July-frost. [* = C, FNA, K, S, Y; < A. patula Linnaeus – RAB, W (also see A. prostrata); = A. patula var. patula – F, G] * Atriplex pentandra (Jacquim) Standley in N.L. Britton et al., Seabeach Orach. Cp (FL, GA, NC, SC): ocean beaches, island-end flats; uncommon. July-frost. NC to FL, west to TX; West Indies; South America. This species and A. mucronata are closely related, and have been variously treated as species, subspecies, varieties, and forms. [= FNA; < A. arenaria Nuttall – RAB, C, G, GW, S, Y (also see A. mucronata); < A. cristata Humboldt and Bonpland ex Willenow – K (also see A. mucronata); = A. pentandra ssp. pentandra] * Atriplex prostrata Bouche ex A.P. de Candolle, Thinleaf Orach, Fat-hen. Cp (DE, NC, SC, VA), Mt (VA?, WV): marsh edges, brackish flats; uncommon (rare in WV). July-frost. Widespread in e. North America, also in w. North America and Eurasia, usually considered to be native of Eurasia. [Is Saltville VA occurrence of Atriplex this taxon?] [* = FNA, K, Y; < A. hastata Linnaeus – C, S, misapplied; < A. patula Linnaeus – RAB, W, in part; < A. patula var. hastata (Linnaeus) A. Gray – F, G, GW]

Atriplex acadiensis . Saltville VA.

Bassia Allioni 1766 (Bassia)

1 Calyx segments (1 lower and 2 upper) bearing stout knobs ............................................................................................................... B. hirsuta
1 Calyx segments (all 5) bearing a horizontal wing ........................................................................................................................................ B. scoparia

Beta Linnaeus 1753 (Beet)

1 Seeds arranged vertically or both horizontally and vertically in the fruit; leaf blades glabrous or occasionally sparsely farinose; [subgenus Blitum].
2 Perianth segments 5; plants perennial; [subgenus Blitum, section Agathophyllum].............................................................. [C. bonus-henricus]
2 Perianth segments 3; plants annual.
3 Leaves lanceolate or oblanceolate, glaucous on the lower surface ...............................................................[C. glaucum]
3 Leaves triangular or rhombic, green on the lower surface.
4 Leaves farinose on the lower surface; [subgenus Blitum, section Degenia].................................................................[C. macrosporum]
4 Leaves glabrous on the lower surface.
5 Glomerules 3-10 mm in diameter, borne sessile on unbranched terminal and occasionally axillary spikes; perianth segments fleshy and red at maturity; [subgenus Blitum, section Blitum].................................................................[C. capitatum var. capitatum]
5 Glomerules 2-5 mm in diameter, borne sessile on lateral branched spikes; perianth segments membranaceous, green at maturity; [subgenus Blitum, section Pseudoblitum].................................................................[C. rubrum]

Chenopodium Linnaeus 1753 (Goosefoot, Lamb's-quarters, Pigweed)

1 Seeds arranged horizontally in the fruit; leaf blades usually farinose; [subgenus Chenopodium].
6 Flowers individually dispersed in panicles; leaf blades glabrous; [subgenus Chenopodium, section Grossefaveata]..........................[C. simplex]
6 Flowers in loose or dense glomerules; leaf blades usually farinose; [subgenus Chenopodium, section Chenopodium].
7 Primary leaves linear, linear-lanceolate, at least 2-3× as long as wide, usually untoothed and unlobed (but often with 2 basal lobes in C. foggii); [subsection Leptophylla].
8 Leaves 2-3× as long as wide...............................................................[C. atrovirens]
8 Leaves > 3× as long as wide.
9 Perianth spreading from fruit at maturity; plants strictly erect...............................................................[C. pratericola]
9 Perianth enclosing the fruit at maturity; plants erect to spreading.
10 Plants usually spreading; perianth segments obtuse; leaf blades usually unlobed ...............................................................[C. desiccatum]
10 Plants erect; perianth segments acute; leaf blades often with basal lobes ...............................................................[C. foggii]
7 Primary leaves ovate, rhombic, triangular, or lanceolate, usually with basal lobes and often also with additional teeth on the margins.
11 Seeds honeycomb-pitted; [subsection Favosa].
12 Seeds 1.2-2.0 mm in diameter.
13 Style bases with yellow area; seeds 1.2-1.5 mm in diameter ...............................................................[C. berlandieri var. zschackei]
13 Style bases without yellow area; seeds 1.3-2.0 mm in diameter.
14 Inflorescences large and drooping; seeds 1.7-2.0 mm in diameter ...............................................................[C. berlandieri var. bushianum]
14 Inflorescences small and erect; seeds 1.3-1.9 mm in diameter ...............................................................[C. berlandieri var. macrocalyx]
12 Seeds 1.0-1.3 mm in diameter.
15 Leaves rhombic-triangular, usually without basal lobes; inflorescences becoming bractless ........[C. berlandieri var. boscianum]
15 Leaves 3-lobed; inflorescences with or without bracts.
16 Inflorescences bracteolate .................................................................................................................................[C. berlandieri var. berlandieri]
16 Inflorescences with leafy bracts .................................................................................................................................[C. berlandieri var. zschackei]
11 Seeds smooth or areolate.
17 Leaves triangular.
Chenopodium album
Linnaeus, Lamb's-quarters, Pigweed. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed soils, gardens; common. June-October. As broadly interpreted, this species includes both native and alien races and is now distributed nearly worldwide. [= FNA, W; < C. album – RAB, in part (also including C. berlandieri and all vars); > C. album Linnaeus var. album – K; > C. album Linnaeus var. missouriense (Aellen) I.J. Bassett & C.W. Crompton – K; > C. album – C; < C. album – G; > C. missouriense Aellen – C, Y; > C. paganum – F, S, misapplied; < C. album – FNA, G; > C. album var. album – Y; > C. album var. lanceolatum (Muhlenberg ex Wildened) Goss. & Germ. – Y; > C. giganteum Don – Y; > C. lanceolatum Muhlenberg ex Wildened] * C. album

Chenopodium berlandieri
Moquin-Tandon var. boscianum (Moquin-Tandon) H.A. Wahl. Cp (GA, NC, SC, VA): beaches, marshes; uncommon. August-September. FL west to e. TX; with scattered occurrences further north (these of unknown nativity). [= FNA, K, Y; < C. album – RAB]

Chenopodium berlandieri
Moquin-Tandon var. bushianum (Aellen) Cronquist, Soybean Goosefoot. Cp (NC, SC, VA), Mt (WV): disturbed areas, alluvial forests; rare. June-November. ME west to ND, south to VA, TN, LA, and KS. [= C, FNA, K; < C. album – RAB, G; < C. berlandieri – S; = C. bushianum Aellen – Y]

Chenopodium berlandieri

Chenopodium berlandieri

Chenopodium foggii
H.A. Wahl. Mt (NC, VA): rocky, mountain slopes; rare. July. ME and ON south to w. VA and w. NC. [= FNA, K, Y; < C. pratericola Rydberg – C]

Chenopodium fremontii
S. Watson. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, native of w. North America. [= FNA; < C. fremontii var. fremontii – K, Y] [not yet keyed]

Chenopodium glaucum
Linnaeus, Okkleaf Goosefoot. Pd (DE, VA), Mt (WV), SC: disturbed areas; rare, native of ne. North America and Europe. [= FNA, K; < C. glaucum – C, F, G, WV; = C. glaucum var. glaucum – Y]

Chenopodium incanum
(S. Watson) Heller var. incanum. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, native of w. North America. [= FNA, K; < C. incanum – Y] [not yet keyed]

Chenopodium macroperpus

Chenopodium mirale

Chenopodium opulifolium

Chenopodium pratericola
Rydberg, Narrowleaf Goosefoot. Cp (GA, NC, SC, VA), Mt (WV): sandy soils, roadsides, disturbed areas; uncommon. May-November. Maine and ON west to YT, south to FL, TX, and CA. [= FNA, K; = C. desiccatum A. Nelson var. leptophylloides (J. Murray) H.A. Wahl – RAB, W, misapplied; < C. pratericola – C (also see C. foggii); ? C. leptophyllum – F, G, misapplied; = C. pratericola var. pratericola – Y]

Chenopodium simplex
(Torrey) Rafinesque, Mapleleaf Goosefoot. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE): in shaded situations, generally at cliff bases; common (uncommon in WV, rare in NC and VA). July-October. NS west to AK, south to nw. NC, LA, TX, and UT. [= FNA, K; = C. giganteospermum Aellen – C, W, Y; = C. hybridus Linnaeus var. giganteospermum (Aellen) Aellen] [not yet keyed]

Chenopodium standleyanum
Aellen, Woodland Goosefoot. Mt (VA, WV), Pd (VA), Cp (VA), [GA, NC, SC]: rock outcrops, steep slopes, shaded disturbed soils; uncommon (rare in WV). QC west to ND, south to FL and e. TX. [= RAB, C, FNA, G, K, W; < C. boscianum – F, S, misapplied]

Chenopodium urbicum
Linnaeus, City Goosefoot. Mt (WV), Pd (DE): disturbed areas; rare, native of Eurasia. Introduction in waste ground south to MD, s. PA (Rhoads & Klein 1993), WV, KY, and TN (Kartesz 1999, FNA 2003b). [= C, FNA, K, Y]

AMARANTHACEAE

18 Seeds 1.0-1.5 mm in diameter, the seed margin sharp; leaf blades without basal lobes; [subsection Undata] .............. C. murale
18 Seeds 0.8-1.2 mm in diameter, the seed margin rounded; leaf blades often with basal lobes; [subsection Urbica] ...... C. urbicum
17 Leaves ovate to broadly ovate, rhombic, or lanceolate, variously lobed or toothed.
19 Leaf blades without teeth, except for the often present basal lobes or teeth.
20 Leaves not aromatic; flowers in each glomerule in markedly different stages of development; [subsection Standleyanum] .............. C. standleyanum
20 Leaves strongly malodorous; flowers in each glomerule in similar stages of development; [subsection Chenopodium] .............. C. vulvaria
19 Leaf blades with lateral teeth and often basal lobes; [subsection Chenopodium].
21 Leaves widely ovate, 1× as long as wide; lateral leaf lobes as large as the terminal lobe................................. C. opulifolium
21 Leaves ovate, rhombic, or lanceolate, > 1× as long as wide; lateral leaf lobes smaller than the terminal lobe (or absent).
22 Leaf margins tapering to an acute apex; leaves ovate, rhombic, or lanceolate; inflorescence branched (spicate or cymose).
22 Leaf margins more or less parallel below the obtuse apex; leaves lanceolate or narrowly elliptic; inflorescence generally moniliform, not profusely branched .......................................................... C. strictum
**Chenopodium vulvaria** Linnaeus, Stinking Goosefoot. Pd (DE); disturbed areas; rare, native of Eurasia. Introduced at scattered locations in eastern North America, as in MD, PA, DE, FL (FNA 2003b). [= C, FNA, K, Y]

*Chenopodium bonus-henricus* Linnaeus, Good King Henry, is cultivated and is known from as far south as MD and PA. [= FNA, C, K, Y]

*Chenopodium capitatum* (Linnaeus) Ascherson var. capitatum, Indian-paint, Strawberry-blithe, a native, occurs south to scattered locations in PA (Rhoads & Klein 1993). [= FNA; Y; < C. capitatum – C; = C. capitatum – K, in a narrow sense; *Blitum capitatum* Linnaeus]

*Chenopodium desciscatum* A. Nelson. (SC?, VA?). (VA Watch List). [Resolve against *C. pratericola*]. [= FNA; = *C. pratericola* var. oblongifolium (S. Watson) H.A. Wahl – Y]

*Chenopodium rubrum* Linnaeus, Red Goosefoot, alien, reported as far south as MD and in other widely scattered sites (such as AL) (Kartesz 1999) and PA (FNA). [= C, K; > C. rubrum var. rubrum – FNA, Y]

*Chenopodium strictum* Roth. Scattered locations south to se. PA. Reported for SC (Kartesz 1999). [= FNA; = *Chenopodium album* Linnaeus var. strictum (Kraanal) comb. nov. ined. – K; > *Chenopodium strictum* ssp. glaucophyllum (Aellen) Aellen & Just.; > *Chenopodium strictum* Roth var. glaucophyllum (Aellen) H.A. Wahl – Y]

**Cycloloma** Moquin 1840 (Winged-pigweed)

**Dysphania** R. Brown 1810

A genus of about 32 species, annual and perennial herbs, nearly cosmopolitan, mostly in the tropics, subtropics, and warm temperate areas. References: Clemants & Mosyakin in FNA (2003b); Wahl (1954)=Y.

1 Leaves deeply pinnately lobed, the lobes linear; plant perennial; mature calyx shallowly toothed, obovoid-urceolate, reticulate-veiny; [section *Adenois*] ............................. *D. multifida*

2 Leaves serrate to sinuate-pinnatifid, the lobes broad-based and triangular-tapered; plant annual; mature calyx deeply lobed, neither reticulate nor prominently veined.

2 Flowers in a slender thyrsoid inflorescence of lateral cymes; [section *Botryoides*].......................................................... *D. botrys*

3 Flowers in dense glomerules arranged in spikes and panicles.

3 Leaf blades 0.5-2.7 cm long; seeds horizontal; stems 3-15 dm tall; [section *Adenois*].

4 Inflorescences flosiform throughout ................................................................................................................................. *D. ambrosioides*

5 Perianth segments keeled and crested ........................................................................................................................................

5 Perianth segments rounded ..........................................................................................................................................................

5 Perianth segments rounded ..........................................................................................................................................................

673

**Dysphania ambrosioides** (Linnaeus) Mosyakin & Clemants, Mexican-tea, Epazote. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed habitats; common, probably native southward. Widespread in North America to South America, the original range unclear. [= FNA; < *Chenopodium ambrosioides* – RAB, C, G, W, Y (also see *Dysphania anthelmintica*); = *C. ambrosioides* var. ambrosioides – F; < *C. ambrosioides* var. ambrosioides – K (also see *Dysphania anthelmintica*); < *Ambrina ambrosioides* (Linnaeus) Spach – S (also see *D. anthelmintica*); < *Teloxys ambrosioides* (Linnaeus) W.A. Weber] **Dysphania anthelmintica** (Linnaeus) Mosyakin & Clemants, Wormseed, Epazote. Cp (GA, NC, SC, VA): dunes; common. NY south to FL, west to TX; Mexico, West Indies, Bermuda, Central America; scattered inland in North America probably as an introduction. [= FNA; < *C. ambrosioides* – RAB, C, G, W, Y; = *C. ambrosioides* var. anthelminticum (Linnaeus) A. Gray – F; < *C. ambrosioides* var. ambrosioides – K; < *Ambrina ambrosioides* (Linnaeus) Spach – S].

**Froelichia** Moench 1794 (Cottonweed, Snake-cotton)
AMARANTHACEAE

1 Calyx conical in fruit, ca. 3-4 mm long; plant 2-7 dm tall, branching from the base ......................................................... F. gracilis
2 Calyx flask-shaped in fruit, ca. 5 mm long; plant 3-20 dm tall, not branching from the base
2 Hairs of the peduncles mostly 1-2 mm long; plants typically 10-20 dm tall; [of the Southeastern Coastal Plain] .......... F. floridana

Froelichia floridana (Nuttall) Moquin-Tandon, Florida Cottonseed, Common Cottonweed. Cp (DE*, FL, GA, NC, SC): sandhills, sandy fields, sandy roadsides; common (rare in NC, uncommon in DE). June-October. S. NC south to FL, and west to LA, north in the interior to w. TN; disjunct (probably introduced) in DE and e. MD. F. campestris Small is more midwestern, ranging from OH, IN, WI, and SD south to KY, AR, and TX; it is sometimes treated as a variety of F. floridana, but seems amply distinct in morphology, and with an allopatric distribution. [= RAB, S; = F. floridana var. floridana – C, F, G, K, Z; < F. floridana – FNA, WH]

Gomphrena Linnaeus 1753 (Globe-amaranth)

1 Heads 20-28 mm in diameter; stems erect .............................................................. G. globosa
1 Heads 8-16 mm in diameter; stems prostrate or decumbent ......................................... G. serrata

* Gomphrena globosa Linnaeus, Globe-amaranth. Cp (SC) {VA?): disturbed areas; rare, native of s. Asia. Introduced and known from scattered locations in s. PA (Rhoads & Klein 1993). Also reported for VA (Kartesz 1999) and MD (Reed1961b). [= FNA, C, F, G, K]

Guilleminea Kunth 1823

Iresine P. Browne 1856 (Bloodleaf)

1 Plant an annual to weak perennial, 4-30 dm tall, with fibrous roots; tepals 0.6-0.8 mm long, the tips obtuse to rounded .......... I. diffusa
1 Plant a perennial, 3-10 dm tall, with stolons; tepals 1.0-1.3 mm long, the tips acute to acuminate ............................................. I. rhizomatosa

* Iresine diffusa Humboldt & Bonpland ex Willdenow, Judas-bush. Cp (FL): hammocks, disturbed areas; rare. Reported for NC by Small (1933), so far as is known in error. Ne. FL, Panhandle FL, south to s. FL. [= FNA, K, WH; < Iresine celosia Linnaeus – S]

* Iresine rhizomatosa Standley. Cp (FL, GA, NC, SC, VA), Pd (VA): moist interdune thickets, hammocks, edges of maritime forests, moist thickets inland, floodplain forests, bluff forests of the Coastal Plain; rare. August-October. MD south to FL, west to se. TX; also inland from KY and TN west and south to KS and n. TX. [= RAB, C, F, FNA, G, K, S, WH]

Salicornia Linnaeus 1753 (Glasswort)

A genus of about 10-20 species, succulent herbs, of cosmopolitan distribution. References: Judd & Ferguson (1999)=Z; Ball in FNA (2003b); Kadereit et al. (2007); Kühn in Kubitzki, Rohwer, & Bittrich (1993). [also see Sarcocornia]
AMARANTHACEAE

Salicornia bigelovii Torrey, Dwarf Glasswort, Dwarf Saltwort. Cp (DE, GA, NC, SC, VA): salt pannes in coastal marshes; common (rare in DE). July-October. ME (NS?) south to FL; west to TX; also West Indies; also CA. [= RAB, C, F, FNA, G, GW, K, S, Z]

Salicornia virginica Linnaeus, Samphire. Cp (DE, GA, NC, SC, VA), Mt (VA): salt pannes in coastal marshes; common. July-October. NS and QC south to FL. It is unclear whether our eastern North American plants are distinct from European plants of the S. europaea complex. Recent European workers recognize multiple species in the S. europaea complex. S. europaea (in the narrow sense) is a diploid species; our plants are apparently all tetraploid and may or may not be conspecific with one of the European tetraploid entities in this complex. Until further studies are completed, it seems best to recognize our plants as distinct. The oldest name available for the American plants is Salicornia virginica Linnaeus, which has unfortunately been generally misapplied to the perennial glasswort, Sarcocornia perennis. [= K; = Salicornia depressa Standley in N.L. Britton et al. – FNA; < Salicornia europaea Linnaus – RAB, C, G, GW, S, W, Z, misapplied; >: Sarcocornia europaea var. europaea – F]

Salicornia maritima Wolff & Jefferies, Sea Saltwort, supposedly occurs south to MD (Kartesz (1999); FNA (2003b) does not map it south of the Canadian Maritimes. [= FNA, K] (not keyed; synonymy incomplete)

Salsola Linnaeus 1753 (Saltwort, Russian-thistle)

1 Leaf blades not fleshy in fresh material, narrowly linear to filiform, < 1 mm wide in herbarium material; leaves with a weak apical spine .............................................................. S. bigelovii

1 Leaf blades fleshy in fresh material, linear, 1-2 mm wide in dried specimens; leaves with a strong apical spine.

2 Perianth segments with a weak non-spiny apex and obscure midvein; bracteoles connate at base, swollen ............................................. S. perennis

2 Perianth segments with a subspineose apex and prominent midvein; bracteoles distinct, not swollen ..................................................... S. kali

Sarcocornia A.J. Scott 1978 (Woody Glasswort)

Spinacia Linnaeus 1753 (Spinach)

AMARANTHACEAE

Suaeda Forsskål ex Scopoli 1777 (Sea-blite)

1 Calyx segments keeled on the back; flowers in 1-3-flowered glomerules, these aggregated in a dense panicule; seeds dimorphic, black seeds shiny, 1-1.8 mm in diameter, brown seeds dull, 1.5-2.6 mm in diameter.............................................................. S. linearis
1 Calyx segments rounded or obscurely keeled on the back; flowers in axillary glomerules of 1-3 (-4) flowers; seeds monomorphic, reddish brown or black, 1-2.2 mm in diameter..............................................................S. maritima

Suaeda linearis (Elliott) Moquin, Southern Sea-blite. Cp (DE, FL, GA, NC, SC, VA), Mt* (WV*): island-end flats, marsh edges, brackish flats, rarely adventive in inland disturbed areas; uncommon (rare in WV). August-frost. ME south to FL, west to TX; West Indies. [= C, F, FNA, G, GW, K, WH, Y, Z; = Dondia linearis (Elliott) Heller – S]

*? Suaeda maritima (Linnaeus) Dumortier, White Sea-blite. Cp (DE, VA): salt marsh edges and disturbed saline habitats; common (uncommon in DE), possibly native, introduced, or a combination. Usually considered (as by C, GW, S) to be naturalized from Eurasia, but Ferren & Schenk (2003b) consider S. maritima in North America to include native and naturalized components. [= C, F, FNA, G, GW, K, WH, Y, Z; > S. maritima ssp. maritima – K; = Dondia maritima (Linnaeus) Druce – S]

304. AIZOACEAE Rudolph 1830 (Fig-marigold Family) [in CARYOPHYLLALES]

A family of about 128 genera and about 1850-2500 species, mostly succulent herbs and subshrubs, of tropical and subtropical regions, especially in s. Africa and Australia. References: Boetsch (2002); Vivrette, Bleck, & Ferren in FNA (2003b); Hartmann in Kubitzki, Rohwer, & Bittrich (1993). [also see MOLLUGINACEAE]

1 Leaves opposite, connate-perfoliate around the stem, triangular in cross-section; fruit a fleshy, indehiscent berry; [subfamily Ruschioideae] ...
1 Leaves opposite or alternate, sessile or short-petiolate, flattened in cross-section (though often succulent-thickened); fruit either a dry, indehiscent nut or a capsule.

2 Leaves linear, lanceolate, or oblanceolate, the blade > 3× as long as wide; [subfamily Sesuvioideae]................................................................. Sesuvium
2 Leaves orbicular, obovate, or triangular-ovate, the blade < 2.5× as long as wide.
3 Leaves opposite to subopposite; fruit a circumcissile capsule; [subfamily Sesuvioideae]................................................................. Trianthema
3 Leaves alternate; fruit either a loculicidal capsule or an indehiscent nut.

4 Fruit a loculicidal capsule; ovary superior; stems densely covered with white scales; [subfamily Aizioideae]................................. Galenia
4 Fruit an indehiscent nut; ovary inferior; stems green; [subfamily Tetragonioidae]................................................................. Tetragonia

Carpobrotus N.E. Brown 1925 (Fig-marigold)

* Carpobrotus edulis (Linnaeus) N.E. Brown, Hottentot-fig. Cp (FL): dunes, disturbed sandy sites; rare, native of s. Africa. [= FNA, WH]

Galenia Linnaeus 1753

* Galenia secunda (Linnaeus f.) Sonder. Cp (FL): disturbed areas; rare, native of s. Africa. [= FNA, S, WH]

Sesuvium Linnaeus 1759 (Sea-purslane)

1 Flowers and fruits on pedicels (3-) 5-20 mm long................................................................. S. portulacastrum
1 Flowers and fruits sessile (or on pedicels to 1 mm long).
2 Stamens numerous, in fascicles; leaves 3-6 cm long, 10-20× as long as wide; [rare waif]................................................................. S. crithmoides
2 Stamens 5, distinct; leaves 1-3.5 cm long, 3-10× as long as wide; [native]................................................................. S. maritimum

*Sesuvium portulacastrum* (Linnaeus) Linnaeus, Large Sea-purslane, Shoreline Sea-purslane. Cp (FL, GA, NC, SC): island end flats and sea beaches; uncommon (rare in NC). May-December. A pantropical coastal species, in North America from e. NC south to s. FL, west to e. TX; also in the West Indies and south into the tropics (introduced on ballast in se. PA). [= RAB, FNA, GW, K, S, WH, Z]

**Tetragonia** Linnaeus 1753 (New Zealand Spinach)

**Trianthema** Linnaeus 1753 (Horse-purslane)

**305a. PHYTOLACCACEAE** R. Brown 1818 (Pokeweed Family) [in CARYOPHYLLALES]

A family of about 18 genera and 70 species, herbs, shrubs, vines, and trees, of tropical and warm temperate regions, especially America. References: Nienaber & Thieret in FNA (2003b); Rohwer in Kubitzki, Rohwer, & Bittrich (1993). [also see PETIVERIACEAE]

**Phytolacca** Linnaeus 1753 (Pokeweed)

1 Fruiting pedicels (6-) 7-12 (-15) mm long; raceme (not including the peduncle) 10-20 (-25) cm long, divergent or drooping in flower and fruit (or erect in flower); [widespread in our area] ...................................................................................................................................... *P. americana*

1 Fruiting pedicels (2-) 4-6 (-7) mm long; raceme (not including the peduncle) (3-) 6-9 (-13) cm long, erect (rarely divergent) in flower and fruit; [restricted in our area to maritime habitats] .................................................................................................................. *P. rigida*

**Phytolacca americana** Linnaeus, Common Pokeweed. In a wide variety of natural and disturbed habitats, usually associated with exposed mineral soil. May-frost. An abundant "native weed" occurring throughout e. North America, *P. americana* is widely dispersed by birds and quickly colonizes exposed mineral soil even in undisturbed forests, such as on tree-fall tip-up mounds or flood scars. It is most abundant, as a weed of urban, suburban, and agricultural disturbances. The berries and mature stems are poisonous; the young stems have been used as a potherb and the purple berries as a source of ink. [= C, F, G, S, W, WV, X, Y; < *P. americana* – RAB, GW, WH (also see *P. rigida*); = *P. americana* var. americana – FNA, K, Z]

**Phytolacca rigida** Small, Maritime Pokeweed. Dune slacks, dune slopes, edges of tidal marshes, disturbed areas on barrier islands, xeric sandhills near the coast. May-frost. DE (reportedly), se. VA south to FL and west to TX in the Southeastern Coastal Plain. In the northern parts of our area, in NC and VA, *P. rigida* is rather rare, limited to the vicinity of the coast, and less weedy than *P. americana*. Caulkins and Wyatt (1990) reduce *P. rigida* to a variety of *P. americana*, but it seems distinct at the species level. [= S, X, Y; < *P. americana* – RAB, GW, WH; = *P. americana* var. rigida (Small) Caulkins & Wyatt – FNA, K, Z]

**305b. PETIVERIACEAE** C. Agardh 1824 (Petiveria Family) [in CARYOPHYLLALES]

A family of about 9 genera and 13 species, herbs, vines, and trees, of tropical areas. Sometimes included in the Phytolaccaceae.
**PETIVERIACEAE**

_**Rivina** Linnaeus 1753 (Rouge-plant)_

A monotypic genus, an herb, of the American tropics.

---

**307. NYCTAGINACEAE** A.L. de Jussieu 1789 (Four-o'clock Family) [in CARYOPHYLLALES]

A family of about 31 genera and 400 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (less commonly) warm temperate regions, especially diverse in the New World. Both our genera are in tribe Nyctagineae (Douglas & Spellenberg 2010). References: Bogle (1974)=Z; Spellenberg in FNA (2003b); Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993).

1 Flowers < 3 mm long, lacking involucral bracts subtending the petaloid calyx ................................................................. _Boerhavia_

1 Flowers > 10 mm long, with involucral bracts (simulating a calyx) subtending the petaloid calyx ........................................... _Mirabilis_

---

**Boerhavia** Linnaeus 1753 (Spiderling)

A genus of about 20-40 species, annual and perennial herbs, of tropical, subtropical, and warm temperate regions of the Old and New World. References: Spellenberg in FNA (2003b); Bogle (1974)=Z; Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993). Key based on Spellenberg in FNA.

1 Fruit truncate at the apex, glabrous, with longitudinal ribs acute and winglike; annual................................................................. _B. erecta_

1 Fruit rounded at apex, stipitate-glandular, with longitudinal ribs rounded; perennial.

2 Leaves well-distributed throughout the plant; inflorescences axillary and terminal; branches spreading-villous or hispid to minutely and finely pubescent ...................................................................................................................................................................... _B. coccinea_

2 Leaves mostly concentrated in the basal ½ of the plant; inflorescences mostly terminal; branches glabrate or glabrous ............... _B. diffusa_

* _Boerhavia coccinea_ P. Miller, Wineflower. Disturbed areas, adventive on ballast; native of tropical America. June-September. Contrary to the statement in RAB that this species is "apparently not established," it is well established on the Wilmington (New Hanover County, NC) waterfront. [= RAB, FNA, K; = Boerhaavia coccinea – S, orthographic variant]

_B. diffusa_ Linnaeus, Red Spiderling, Spreading Hogweed. Vacant lots, road shoulders, other disturbed areas. Pantropical and subtropical. [= FNA, K, Z]

_B. erecta_ Linnaeus, Erect Spiderling. Sandy fields, roadsides, disturbed areas, railroad yards. May-October. NC south to FL, west to TX and AZ, perhaps only introduced in our area, at least in the Carolinas. [= RAB, FNA, K, Z; = Boerhaavia erecta – G, S, orthographic variant]

---

**Mirabilis** Linnaeus 1753 (Umbrella-wort, Four-o'clock)

1 Petaloid calyx with a narrow tube 3-4 cm long, the spreading portion to 5 cm in diameter; involucre with 1 flower, not expanding in fruit; [section Mirabilis] .............................................................................................................................................................................. _M. jalapa_

1 Petaloid calyx with a broad tube < 0.5 cm long, the spreading portion < 1.5 cm in diameter; involucre with 3-5 flowers, expanding in fruit; [section Oxybaphus].

2 Leaves linear to narrowly lanceolate, 0.1-1 cm wide, 7-15× as long as wide ........................................................................ _M. linearis var. linearis_

2 Leaves lanceolate to ovate, 1-8 cm wide, 1-6× as long as wide.

3 Leaves cordate at the base, 1-2× as long as wide; [introduced, of disturbed habitats] ........................................................................ _M. nyctaginea_

3 Leaves cuneate at the base, 2.5-6× as long as wide; [native, of dry sandy habitats in s. SC southward] ............................................ _M. albida_

* Mirabilis jalapa Linnaeus, Garden Four-o’clock, Marvel-of-Peru. Disturbed areas, or persistent at former garden sites; native of tropical America. June-November. [= RAB, C, F, G, K, S, Z]

* Mirabilis linearis (Pursh) Heimerl var. linearis. Disturbed areas; native of c. North America, scattered further east as a rare introduction. [= FNA; < M. linearis – C, F, K; < Oxybaphus linearis (Pursh) B.L. Robinson – G]

308. MOLLUGINACEAE Hutchinson 1926 (Carpetweed Family) [in CARYOPHYLLALES]

Mollugo Linnaeus 1753 (Carpetweed)

A genus of about 35 species, annual herbs, of tropical and subtropical regions of both hemispheres, introduced in temperate regions. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

309. MONTIACEAE Rafinesque 1820 (Montia Family) [in CARYOPHYLLALES]

A family of about 14 genera and 250 species, annual and perennial herbs and subshrubs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Packer in FNA (2003b); Nyffeler & Eggli (2010); Carolin in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves terete, alternate; subshrubs with woody bases................................................................................................................Phermeranthus

1 Leaves flat, opposite or alternate; herbs.

2 Stems with 2 opposite cauline leaves; petals 6-14 mm long...........................................................................................................Claytonia

2 Stems with > 2 leaves, opposite or alternate; petals 1-6 mm long..............................................................................................Montia

Claytonia Linnaeus 1753 (Spring-beauty)

1 Cauline leaves either fused together, perfoliate, the pair together nearly round, or not fused but each broadly ovate; annual, from fibrous roots with minute tubers; [cultivated, rarely naturalizing].

2 Basal rosette leaves erect or ascending, the blade 1-7 cm long......................................................................................................C. perfoliata ssp. perfoliata

2 Basal rosette leaves flattened against the ground, the blade 0.5-1.5 cm long........................................................................C. rubra ssp. rubra

1 Cauline leaves not fused, each linear, lanceolate, or ovate; perennial, from tubers 1-2 cm in diameter; [native, of moist forests].

3 Cauline leaves 3-6 (-11) cm long (including the evident petiole), the blade narrowly diamond-shaped, 2.5-6 (-8)× as long as wide; leaves 10-15 (-30) mm wide ..............................................................................................................C. caroliniana

3 Cauline leaves (5-) 7-20 cm long (including the poorly differentiated petiole), the blade > 8× as long as wide; leaves 1-10 (-20) cm wide.

4 Broadest leaves on a plant 1-2 (-4) mm wide .........................................................................................................................C. virginica var. acutiflora

4 Broadest leaves on a plant 5-10 (-20) mm wide .........................................................................................................................C. virginica var. virginica

Claytonia caroliniana Michaux, Carolina Spring-beauty. Moist forests, especially northern hardwood forests and cove forests at moderate to high elevations. March-May. NS west to MN, south to w. NC, e. TN, and n. GA; disjunct in AR. [= RAB, C, F, FNA, G, S, W, Y, Z; > C. caroliniana var. caroliniana – K; > C. caroliniana Michaux var. lewisi McNeill – K]

* Claytonia perfoliata Donn ex Wildenow ssp. perfoliata. Miners'-lettuce. Disturbed areas, lawns, gardens; native of w. North America. [= FNA, K]

Claytonia virginica Linnaeus var. acutiflora A.P. de Candolle, Southern Spring-beauty. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA): moist forests; common. (January-)February-April. VA west to IL, south to sw. GA and TX. This variety has chromosome numbers of n=6, n=7, and polyploid and polyploid/aneuploid derivatives of those numbers. [= C, Ki; < C. virginica – RAB, F, FNA, G, W, Y; = C. virginica – S; = C. virginica var. simplicifolia (Sweet) R.J. Davis – Z; = C. simplicifolia Sweet]

Montia Linnaeus 1753 (Blinks, Montia)

1 Leaves opposite .................................................................................................................................................................M. fontana
2 Leaves alternate ...........................................................................................................................................................................M. linearis

Phemeranthus Rafinesque 1814 (Rock-pink, Fameflower)

A genus of about 20 species, herbs and dwarf shrubs, of America. Our North American "Talinums" are not closely related to the broad-leaved type of *Talinum* and are transferred to *Phemeranthus* (Kiger 2001). Adaptation of our native species of *Phemeranthus* to different rock substrates is discussed by Ware & Pinion (1990). References: Kiger in FNA (2003b); Wilson (1932)=X; Ware (1967)=Y; Kiger (2001)=Z; Murdy & Carter (2001)=Q; Carter & Murdy (1985); Rose & Standley (1911); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Hershkovitz & Zimmer (2000).

1 Stamens 4-8; flowers open in late afternoon.................................................................[P. parviflorus]
2 Stamens 12-80; flowers variously open from early or late afternoon.
   1 Style 2-3.5 mm long, shorter than or about the same length as the stamens; stamens 12-30; flowers open from (3-) 3:30 to 7 p.m. E.D.S.T. .................................................................P. teretifolius
   2 Style 3.8-7 mm long; stamens 25-80 (-90); flowers open from about 1 to 7 p.m. E.D.S.T. ............................P. mengesi
      3 Stamens 40-50; mature seeds covered with a dull gray coating; [of mafic and ultramafic rocks, known from noncalcareous rocks].
      4 Stamens 25-42; mature seeds covered with a dull gray coating; [of mafic and ultramafic rocks, known from noncalcareous rocks].

Phemeranthus calcaricus (S. Ware) Kiger, Cedar-glade Rock-pink. Calcareous glades. C. TN south to n. AL. A tetraploid species, probably derived from *P. calycinus* Engelmann. [= FNA, Z; = Talinum calcaricum S. Ware – K, Q, Y]

Phemeranthus mengesi (W. Wolf) Kiger, Large-flowered Rock-pink. Pd (GA, SC), Cp (GA): in shallow soil over felsic rocks (granite) or sandstone (in GA and AL), or Altamaha Grit (GA), where periodically wet by seepage; rare (locally common in GA). June-September. C. SC south to c. GA (where it extends into the Coastal Plain on outcrops of Altamaha Grit), west to n. AL and sc. TN. *P. mengesi* and *P. parviflorus* Nutall of the midwestern United States (and disjunct as far east as AL) are apparently the parents of the allotetraploid *P. teretifolius*. Diploid and tetraploid populations are known of this taxon; further investigation is needed to determine if the tetraploids are allotetraploids or autotetraploids. [= Phemeranthus mengesi – FNA, Z (also see *P. species 1*); = Talinum mengesi W. Wolf – Q, S, X; = Talinum mengesi – K (also see *P. species 1*)]

**Phemeranthus species 1.** Pd (NC, VA): in periodic seepage on mafic or ultramafic rocks; rare. (June?) July-September. This taxon was discovered at a diabase glade in Granville County, NC and ultramafic barrens in Franklin County, VA, floristically rich in other species of disjunct and relict distribution. [< *Talinum mengesi* – K; < *Phemeranthus mengesi* – FNA, Z]

**Phemeranthus teretifolius** (Pursh) Rafinesque, Appalachian Rock-pink. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (GA): in shallow soil over felsic or mafic rocks (granite, gneiss, schist, granite, diabase, greenstone, metabasalt, sandstone, Altamaha grit), especially where periodically wet by seepage (often in mats of the moss *Grimmia*); common (rare in WV). June-September. DE (at least formerly), se. PA, and WV, south to se. TN, GA (where it extends into the Coastal Plain on outcrops of Altamaha Grit), and AL, in the Appalachians and adjacent provinces. *P. teretifolius* is an allotetraploid, probably derived from hybridization followed by polyploidization of the diploids *P. mengesi* and *P. parviflorus*. [= FNA, Z; = *Talinum teretifolium* Pursh – RAB, C, F, G, K, Q, S, W, WV, X, Y]

---

**311. BASELLACEAE** Moquin-Tandon 1840 (Madeira-vine Family) [in CARYOPHYLLALES]

A family of 4 genera and about 20 species, fleshy perennial vines and herbs, of the tropics and subtropics. References: Vincent in FNA (2003b); Sperling & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010).

1 Filaments free nearly to base, adnate for < ¼ of their length to the petals. .................................................. **Anredera**

1 Filaments adnate for > ½ of their length to the petals .......................................................................................... **Basella**

**Anredera** Jussieu (Madeira-vine)

* **Anredera cordifolia** (Tenore) Steenis, Madeira-vine. Cp (FL): disturbed areas; rare, native of South America. In Panhandle FL (Leon County) and n. peninsular FL (Alachua County) (Wunderlin & Hansen 2004). [=FNA, K1, K2, WH; < *Boussingaultia leptostachya* Moquin – S]

**Basella** Linnaeus 1753

A genus of 5 species, perennial vines, of the tropics and subtropics. References: Sperling & Bittrich in Kubitzki, Rohwer, & Bittrich (1993). *(also see *Phemeranthus*)

**Basella alba** Linnaeus. Disturbed areas, grown as a vegetable, and rarely found as a waif; native of s. Asia. Reported for Calhoun County, AL (AL Atlas in prep.; Kartesz 2010). [= K2]

---

**313. TALINACEAE** Doweld 2001 (Fameflower Family) [in CARYOPHYLLALES]

A family of about 2 genera and 35 species, herbs and shrubs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Packer in FNA (2003b); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010).

1 Leaves linear, terete, 1-2 mm wide; plants to 5 dm tall; [native] ...................................................................................... [**Phemeranthus** in MONTIACEAE]

1 Leaves obovate or elliptic, 20 mm or more wide; plants to 8 dm tall; [alien, persistent or escaped] ................................................................ **Talinum**

**Talinum** Adanson 1763 (Jewels-of-Opar)

A genus of about 15 species, herbs, and dwarf shrubs, mainly of Africa but with 2 species of the New World tropics. References: Kiger in FNA (2003b); Wilson (1932) = X; Carolin in Kubitzki, Rohwer, & Bittrich (1993). *(also see *Phemeranthus*)

* **Talinum paniculatum** (Jacquin) Gaertner, Jewels-of-Opar. Fairly commonly cultivated, locally escaped to disturbed areas and garden edges; native of the West Indies. June-September. [= FNA, S, X; † *T. paniculatum var. paniculatum* – K]
**TALINACEAE**

### 314. PORTULACACEAE A.L. de Jussieu 1789 (Purslane Family) [in CARYOPHYLLALES]

A family of 1 genus and 40-100 species, annual and perennial herbs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Packer in FNA (2003b); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010).

1. Flowers sessile or subsessile; capsule circumscissile. .................................................. *Portulaca*
2. Flowers pedicelled; capsule opening longitudinally.
   1. Flowers borne on a scape, with cymose branching. .................................................. [see TALINACEAE]
   2. Flowers solitary or in racemes. .................................................................................. [see MONTIACEAE]

*Portulaca* Linnaeus 1753 (Purslane, *Portulaca*)

A genus of about 40-100 species, annual and perennial herbs, nearly cosmopolitan, but especially in tropical, subtropical, and warm temperate regions. *Portulaca* flowers open only for a few hours each on sunny days (Matthews & Levins 1985).

1. Plants in flower.
   2. Petals yellow, orange, copper, bronze, or white.
      3. Flowers > 25 mm across (single petals > 15 mm long).
         4. Leaves terete; capsule not encircled by an expanded, membranaceous wing. ........................................... *P. grandiflora*
         5. Flowers < 20 mm across (single petals < 12 mm long).
         6. Leaf blades flattened in cross-section, linear, usually < 2 mm wide; [rare waif]. ........................................... *P. halimoides*
         7. Leaf blades flat in cross-section, obovate or spatulate, > 2.5 mm wide; [collectively common].
      8. Leaves terete to hemispherical in cross-section, usually < 2 mm wide, linear to lanceolate.
      9. Petals deeply bilobed; stamens > 40; [of sandstone (Altamaha Grit) outcrops in s. GA] ..................................... *P. biloba*
      10. Petals not bilobed; stamens usually < 30; [collectively widespread and of various habitats].
      11. Petals dark pink to purple; seeds < 0.6 mm wide, round. .................................................. *P. pilosa*
      12. Petals medium to pale pink; seeds > 0.6 mm wide, elongate. .................................................... *P. smallii*

1. Plants in fruit.
   13. Capsule not encircled by an expanded membranaceous wing.
      14. Leaves flattened in cross-section, > 2.5 mm wide, obovate to spatulate.
      15. Nodes and inflorescences with inconspicuous trichomes. ........................................... *P. pilosa*
      16. Capsule encircled by an expanded membranaceous wing.
         17. Trichomes at nodes conspicuous; seeds round, < 0.6 mm wide. ............................................... *P. umbratica*
         18. Trichomes at nodes inconspicuous; seeds elongate, > 0.6 mm long. ......................................... *P. oleracea*
      19. Leaves terete to hemispherical in cross-section, usually < 2 mm wide, linear to lanceolate.
      20. Capsules 1.5-5 mm in diameter; seeds (0.4-) 0.5-0.6 mm in diameter ........................................... *P. biloba*
      21. Longest leaves mostly < 20 mm long; capsules mostly < 3.5 mm in diameter; [native, on granitic or diabase flatrocks] ........................................... *P. smallii*
      22. Longest leaves mostly > 20 mm long; capsules mostly > 3.5 mm in diameter; [introduced, usually in obviously disturbed sites] ............................ *P. grandiflora*
      23. Leaves > 0.65 mm wide.

* *Portulaca amilis* Spegazzini, Broadleaf Pink Purslane. Sandy fields, lawns, and other dry, sandy, disturbed habitats; native of South America. May-September. Matthews & Levins (1985) describe the spread of this alien species in North America, apparently from an introduction in North Carolina (the earliest North American collection in 1932 in Robeson County, NC). Reported for Lowndes County, MS (Whitson 2010). [= FNA, K, WH, Z]

*Portulaca biloba* Urban, Grit Purslane. Outcrops of the Altamaha Grit. This species has been collected repeatedly on outcrops of the Altamaha Grit in s. GA (Matthews, Faircloth, & Allison 1991); it also occurs in Cuba. Matthews, Faircloth, & Allison (1991) hypothesize introduction to the United States by hurricane. [= FNA, K; < *Portulaca teretifolia* ssp. cubensis (Urban) Ortega]

Portulaca grandiflora  Hooker, Rose-moss. In sandy soil or around granitic flatrocks; native of Argentina. [= RAB, C, FNA, G, K, S, Z]

Portulaca halimoides  Linnaeus. Waste area along railroad; probably only a waif, native of sw. North America. Reported by Reed (1964). [= FNA, K; > P. parvula A. Gray]

Portulaca oleracea  Linnaeus, Common Purslane, Garden Purslane, Pussley. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): gardens, disturbed areas, cracks in sidewalks; common (uncommon in DE and FL), originally native (apparently) of Asia, probably introduced to North America from Europe. May-October. The various subspecies recognized may or may not be taxonomically significant; a decision awaits an analysis of variation worldwide, or, at least, in the native range of the species. In North America, P. oleracea is a widespread, sometimes noxious weed, probably representing numerous introductions of various genotypes, treated as multiple subspecies by some authors. In North America, these genotypes appear to have intermixed; in our area (at least), the recognition of infraspecific taxa has been considered unwarranted, difficult, and unmeaningful (see Matthews, Ketron, & Zane 1993); see Danin & Anderson (1986) for a contrasting opinion. During the Great Depression, P. oleracea was eaten extensively in the Valley of Virginia as a potherb. [= RAB, C, F, FNA, G, K, S, W, WH, WV, Z]

Portulaca pilosa  Linnaeus, Kiss-me-quick. Disturbed sandy soils. June-October. NC south to s. FL, west to NM, north in the interior to c. TN, AR, and OK, and in Central America; the native range perhaps obscure. See Matthews, Ketron, & Zane (1992a) for a further discussion of this species. [= RAB, FNA, K, S, WH, Z]

Portulaca smallii  P. Wilson, Small's Portulaca. In thin soils on granitic and diabase flatrocks, sometimes locally spreading to adjacent fields, mowed areas, or other disturbed areas. June-October. Sc. VA south to c. GA. Generally considered an endemic limited to granitic flatrocks, P. smallii also occurs on a diabase flatrock, growing with an interesting mixture of granite flatrock and limestone cedar glade species (LeGrand 1987, Schafale & Weakley 1990). [= RAB, FNA, K, S, Z]

Portulaca umbraticola  Kunth. Disturbed areas, spreading weakly or persistent following cultivation; native of South America and the West Indies. See P. coronata for further discussion. [< P. umbraticola Kunth – Z; = P. umbraticola Kunth ssp. umbraticola – K]

Opuntia  P. Miller 1754 (Prickly-pear Cactus)

**Identification notes:** New joints sometimes bear reduced leaves and have not yet developed spines; look for spines 1 or 2 joints back from the growing tip.

1 Spines absent.
2 Joints narrowly obovate, narrowly elliptic, or oblong, mostly 12-25 (-35) cm long, 7.5-10 (-20) cm broad; [of the Coastal Plain] .................. **C. stricta var. stricta**

2 Joints orbiculate to obovate, 5-7.5 (12.5) cm long, 4-6 (-7.5) cm broad; [widespread in our area].
3 Joints mostly 7.5-10 (-15) cm long, 5-9 (-12.5) cm broad; hypanthium with 7 or more areoles; style diameter < 3.5 mm; petals > 3 cm long; [of the Coastal Plain] ................................................................. **C. humifusa var. australis**
4 Joints mostly 5-7.5 (-12.5) cm long, 4-6.2 (-7.5) cm broad; hypanthium with 6 or fewer areoles; style diameter > 3.5 mm; petals < 3 cm long; [widespread in our area] ................................................................. **C. humifusa var. humifusa**

1 Spines present.
2 Spines strongly and retrorsely barbed; joints slender, (2-) 3-6 (-13) cm long, 2-5 (-7) cm broad, easily detached from the plant; spines to 3.7 cm long, 0-2 per areole (usually some areoles on a plant with 2 well-developed spines); [of coastal dunes] .................. **C. pusilla**
3 Spines not strongly and retrorsely barbed; joints broad, 10-30 cm long, 7.5-12.5 cm broad, not easily detached from the plant; spines to 7.5 cm long, 0-2 (-12) per areole; [of various habitats, including coastal dunes].
4 Spines (at least the larger) flattened throughout or basally, narrowly elliptic in cross-section, 0-11 per areole.
5 Spines white, tan or pale-brown at maturity; pads 22.5-30-60 cm long, 20-40 cm broad; [rare introduction] ........... **C. ficus-indica**
6 Spines yellow at maturity; pads 10-30 cm long, 5-15 (-25) cm broad; [common native in the southern part of our area].
7 Spines 1-11 per areole, 1.2-4 (-6) cm long; pads 20-30 cm long, 5-12 cm broad. ................................................................. **C. stricta var. dillenii**
8 Spines 0 (-1 per areole only in marginal areoles), usually < 2 cm long; pads 10-30 cm long, 7-15 (-25) cm broad ................................................................. **C. stricta var. stricta**

5 Spines needle-like, not flattened, elliptic to circular in cross-section, 1-6 (-12) per areole.
6 Plants not mat-forming or prostrate, rising the height of several joints, commonly 3-20 dm tall; largest joints (7.5-) 10-30 cm long, (5-) 7.5-12.5 cm broad; spines gray, reddish-brown, or yellowish-brown; fruit 5-7.5 cm long, 4-5 cm in diameter; [introduced, rarely spread or persistent from cultivation] .................. **C. monacantha**
7 Plants low and mat-forming, usually prostrate and < 3 dm tall, the joints usually in series of 3-5; largest joints 3.8-10 cm long, 4-6 cm broad; spines white, gray, brown or brown; fruit 2.5-4 cm long, 2-3 cm in diameter; [native].
8 Joints mostly 7.5-10 (-15) cm long, 5-9 (-12.5) cm broad; spines to 8 cm long; hypanthium with 7 or more areoles; style diameter < 3.5 mm; petals > 3 cm long; [of the Coastal Plain] ................................................................. **C. humifusa var. australis**
9 Joints mostly 5-7.5 (-12.5) cm long, 4-6.2 (-7.5) cm broad; spines to 3 cm long; hypanthium with 6 or fewer areoles; style diameter > 3.5 mm; petals < 3 cm long; [widespread in our area] ................................................................. **C. humifusa var. humifusa**

**? Opuntia cantabrigiensis** Lynch. Small (1933) also reports *O. cantabrigiensis* Lynch from dunes near Beaufort, NC, based on a fragmentary 1930 collection accompanied by a photograph. Similar plants were apparently seen near Beaufort by Engelmann, prior to 1856. Benson (1982) refers the collection tentatively to *O. lindheimeri* Engelmann var. *cuija* (Griffiths & Hare) L. Benson, treated in K as *O. engelmannii* Salm-Dyck var. *cuija* Griffiths & Hare, a native of Mexico. Benson (1982) also states, however, that it could also be var. *lindheimeri* (primarily of TX and Mexico), or, indeed, *O. tuna* (Linnaeus) P. Miller (native to the West Indies). Benson (1982) failed to relocate the plant in the field in 1956, but stated there was “insufficient time for a thorough search.” Unless relocated (and hope is fading for that, with the extensive destruction of maritime vegetation in the vicinity of Beaufort by construction), the identity of the plant will probably remain a mystery, as well as whether it represents a native species, an established population from aboriginal use, or a more recent introduction or adventive. [= S] [excluded; not keyed]

**Opuntia humifusa** (Rafinesque) Rafinesque var. *austrina* (Small) Dress, Southern Prickly-pear. Cp (FL, GA, SC): dunes, shell middens, and other dry sandy soils, mostly but not entirely on barrier islands; rare. Var. *austrina* (Small) Linnaeus Benson occurs throughout FL, and at scattered locations north to se. SC and west to se. TX; Ward (2009e) considers this (as *O. australis*) to be endemic to FL. A third variety, var. *ammophila* (Small) L. Benson, is apparently endemic to FL, occurring in most of the state; it might occur in the southern portion of our area. It has more elongate joints than the other two varieties, the joints with a length-to-width ratio of 2-4 (vs. 1-2) and is a more erect plant, often 3-4 joints high. [K, Y, Z; < O. humifusa var. humifusa – FNA; > O. australis – S; > O. cumulicola Small – S; = O. australis Small – X; = O. compressa (Salisbury) J.F. Macbride var. *austrina* (Small) L. Benson]

**Opuntia humifusa** (Rafinesque) Rafinesque var. *humifusa*, Eastern Prickly-pear. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry open places, such as in thin soil around rock outcrops, sandhill forests and woodlands, dry barrens and woodlands, barrier island dunes, dry pastures; common (uncommon in Piedmont and Mountains). May-June; August-October. The only cactus widespread in e. North America, var. *humifusa* ranges from MA, MI, and e. IA, south to s. FL and e. TX, with some outlying stations farther west. Various authors, including Small (1933) and Ward (2009e), separate the Coastal Plain *O. pollardii* from the inland *O. humifusa* (s.s.); this may have merit. Ward (2009e) separates *O. pollardii* as always having spines, these 2-3 cm long, leaves prior to shedding 6-8 mm long, fruits 2.2-5 cm long (vs. often lacking spines, when present these fewer and < 1 cm long, leaves 2-3 mm long, fruits 1-1.5 cm long in *O. humifusa*). Where growing in proximity to *O. pusilla*, the two species hybridize rather freely, sometimes producing hybrid swarms. See Doyle (1990) for discussion of the correct nomenclature for this taxon (*O. compressa* vs. *O. humifusa*). [K, Y, Z; < O. humifusa var. *humifusa* – FNA; > O. compressa (Salisbury) J.F. Macbride var. *compressa* – G; < O. compressa – RAB; < O. humifusa (Rafinesque)]

Opuntia pusilla (Haworth) Nuttall, Dune Prickly-pear, Sand-bur Prickly-pear, Little Prickly-pear, Creeping Cactus. Cp (FL, GA, NC, SC): dunes on barrier islands; uncommon. May-June; August-October. A Southeastern Coastal Plain endemic: NC (Dare County) south to c. peninsular FL and west to se. TX, nearly always within a few hundred meters of the sea. As mentioned by Small (1933) and RAB, this little coastal cactus is inconspicuous and often becomes attached by its retrorsely barbed-spines to the pants or shoes of people walking through the dunes. It can inflict painful wounds, the spines not easily removed from flesh or clothing because of the retrorse barbs. O. pusilla sometimes forms hybrid swarms with O. humifusa on coastal dunes (see Y for additional discussion). [= FNA, K, WH, X, Z; = O. drummondii Graham – RAB, S]

Opuntia stricta (Haworth) Haworth var. dillenii (Ker-Gawler) L. Benson. Cp (FL, GA, NC?, SC): dunes on barrier islands; rare. Se. SC south to s. peninsular FL. This taxon was reported from NC by Small (1933), as (1982) and Doyle (1990) do not verify this distribution, showing var. stricta reaching its northern limit along the coast in se. SC. [= K, X, Y, Z; < O. stricta – FNA, WH; > O. tunicata Gibbs – S]

Opuntia stricta (Haworth) Haworth var. stricta. Cp (FL, GA, NC, SC, VA?): dunes, shell middens, sandhills, dry woodlands; rare. Sc. NC (Robeson County) and c. SC south to s. peninsular FL, with a single collection from Isle of Wight County, VA (Benson 1982), mostly near the coast. Small (1933) describes the habitat of O. stricta as "shell mounds, kitchenmiddens, and aboriginal village sites" and identifies it as the "the prickly-pears the early Spanish records tell us the aborigines feasted on for three months of each year and also cured, like figs, for food when out of season." [= K, X, Y, Z; < O. stricta – FNA, WH; > O. stricta – S]

320a. CORNACEAE (Berchtold & J. Presl) Dumortier 1829 (Dogwood Family) [in CORNALES]

A family of 2 genera and about 85 species, trees, shrubs, lianas, and subshrubs, semicosmopolitan (mainly northern hemisphere). The Cornaceae is best circumscribed to exclude Nyssa (Xiang et al. 2002). References: Xiang et al. (2002); Kubitzki in Kubitzki (2004).

Cornus Linnaeus 1753 (Dogwood, Cornel)

(contrasted by Z.E. Murrell & A.S. Weakley)

A genus of about 65 species, trees, shrubs, and subshrubs, mainly north temperate. The generic limits are controversial. Phylogenetic analyses show that Cornus is monophyletic, but various clades within it are also monophyletic and have levels of genetic and morphologic divergence often regarded as warranting generic distinction. Zhang et al. (2008) estimate the time of divergences of the various subgenera as having been from the Paleocene to the Oligocene. At very least, the subgenera are well-marked. References: Godfrey (1988)=Z; Wilson (1965); Murrell (1993); Zhang et al. (2008); Xiang et al. (2006); Fan & Xiang (2001); Eyde (1987); Xiang, Solis, & Soltis (1998); Ferguson (1966c, 1966d)=Y; Kubitzki in Kubitzki (2004).

1 Leaves alternate (the internodes typically short and therefore the leaves looking nearly whorled); [subgenus Mesomora]..............C. alternifolia
2 Leaves opposite.
3 Herb or dwarf shrub from a woody rhizome, to 2 dm tall; leaves in 2-4 pairs below the inflorescence; [of NJ and montane VA and WV northward]; [subgenus Arctocrania]..................................................................C. canadensis
4 Shrub or tree, much taller than 2 dm when mature; leaves many; [collectively widespread].
5 Inflorescence subtended by 4 showy (white, creamy, or pink) bracts.
6 Showy bracts subtending the inflorescence rounded and notched; fruits separate in a compact cluster; [common native small tree]; [subgenus Cynoxylon]..................................................................C. floridana
7 Showy bracts subtending the inflorescence acute; fruits fused together; [exotic uncommonly planted, rarely escaped or persistent]; [subgenus Syncaerpe]........................................................................................................[C. kousa]
8 Inflorescence lacking bracts; [subgenus Kraniopsis].
9 Veins usually 5 or more per leaf side.
10 Bark of older branches and stems splitting longitudinally, appearing braided; leaves without tufts of trichomes in axils of secondary veins on abaxial surface. 7 Abaxial leaf surface not coronulate, trichomes appressed and rigid, and erect and curling, on the same leaf, leaf base usually rounded or truncate .................................................................C. ammonum
11 Abaxial leaf surface coronulate, trichomes appressed and rigid, leaf base usually cuneate .........................................................C. obliqua
12 Bark of older branches and stems smooth, with scattered protruding lenticels; leaves with tufts of trichomes in axils of secondary veins on the abaxial surface. 8 Area surrounding lenticels suffused with purple; leaves suborbicular or broadly ovate; 7-9 veins per leaf side; tertiary veins usually prominent. ........................................................................................................C. rugosa
13 Area surrounding lenticels not differentiated; leaves lanceolate, elliptic, or ovate; 5-7 veins per leaf side; tertiary veins not prominent.................................................................C. stolonifera
**CORNACEAE**

10 Petioles 8-25 mm long; leaf veins emanate from the basal half of the leaf .................................................. *C. drummondii*

9 Trichomes appressed or slightly raised on abaxial leaf surface.

11 Rhizomatous, forming large colonies; lenticels protrude slightly, older stems appear verrucose; fruit white ............... *C. racemosa*

11 Multiple stems from a single rootstock (occasionally appearing rhizomatous from decumbent stems); lenticels not protruding, bark swelling between lenticels; fruit blue .................................................. *C. stricta*

*Cornus alternifolia* Linnaeus f., Alternate-leaf Dogwood, Pagoda Cornel, Pagoda Dogwood. Moist forests. May-June; August-September. NL (Newfoundland) west to MN, south to Panhandle FL, AL, s. MS, and AR. [= RAB, C, F, G, K, W, WH, WV, Y, Z; = *Swida alternifolia* – S; = *Cornus alternifolia* (Linnaeus f.) Small]

*Cornus amomum* P. Miller, Silky Dogwood. Shores, streams, bottomlands. May-July; August-September. NV and MA west to IN, south to GA, Panhandle FL, and MS. [= RAB, F, G, K, W, WV; = Cornus amomum var. amomum – C; = *Cornus amomum* P. Miller ssp. amomum – GW, Y, Z; = *Swida amomum* – S; = *Swida amomum* (P. Miller) Small]

*Cornus asperifolia* Michaux, Eastern Roughleaf Dogwood. Mesic calcareous forests and thickets, shell middens, calcareous hammocks. May-June; August-September. Se. NC south to n. peninsular FL, west to s. AL. Nash (1896) collected *C. asperifolia* Michaux at River Junction, Florida; based upon conflicting reports of fruit colors given by Chapman (1860) and Coulter and Evans (1890) for the two rough-leaved dogwoods (*C. asperifolia* and *C. drummondii*), Nash decided to name the rough-leaved dogwood with blue fruit as *C. microcarpa*. However, Michaux's (1803) description, even without reference to fruit color, is clearly attributable to this species, since its locality was given as "Carolinae inferiores." The populations of this rough-leaved dogwood in NC and SC have morphology intermediate between *C. stricta* and *C. asperifolia* and these should possibly be attributed to a hybrid origin. More analysis needs to done on this complex. [= RAB, K, Y, Z; = *Cornus foemina* P. Miller ssp. microcarpa (Nash) J.S. Wilson – GW; = *Swida asperifolia* (Michaux) Small]

*Cornus canadensis* Linnaeus, Bunchberry, Dwarf Cornel, Dwarf Dogwood. High elevation forests, in humus or on talus, under Betula cordifolia, Picea rubens, or Pinus rigida. Greenland west to AK, south to NJ, VA, WV, and CA. [= C, F, G, K, W, WV, Y; = *Chaemapericlymenum canadense* (Linnaeus) Ascherson & Graebner]

*Cornus drummondii* C.A. Meyer, Midwestern Roughleaf Dogwood. Open woodlands and glades over calcareous rocks (limestone, calcareous shale). NY, ON, and SD south to e. TN, nw. GA, LA, and TX. [= C, G, GW, K, Y; = *Cornus drummondii* – F; > *Cornus priceae* Small – F; > *Swida priceae* Small – S; > *Swida asperifolia* – S, misapplied; = *Swida drummondii* (C.A. Meyer) Sojak]

*Cornus florida* Linnaeus, Flowering Dogwood. May-June; August-September. Me to MI, south to c. peninsular FL; disjunct in montane ne. Mexico (Veracruz and Nuevo Léon). The Mexican plants may warrant recognition as *C. urbaniana*. *C. florida* has been impacted since the 1980s by widespread infection by the dogwood anthracnose fungus (*Discula destructiva*). [= RAB, C, F, G, K, W, WH, WV, Y, Z; = *Cynoxylon floridum* (Linnaeus) Rafinesque ex B.D. Jackson – S, Benthamidia florida (Linnaeus) Spach]

*Cornus kousa* Hance, Kousa Dogwood. Suburban areas, sometimes planted as an ornamental and may persist or seed down in the immediate vicinity of the parent tree. [= K; Benthamidia japonica (Siebold & Zuccarini) Hara; = *Cynoxylon kousa* (Hance) Nakai] [not mapped; rejected as a component of our flora]

*Cornus obliqua* Rafinesque, Silky Dogwood. Swamps, moist thickets, (in VA) rocky rivershores where periodically scoured. May-July. ME and QC west to MN, south to VA, KY, c. TN, AR, and OK. Some material intermediate between *C. amomum* and *C. obliqua* has been found in the Mountains of nw. NC and w. VA. These plants are recognizable by leaves intermediate between the putative parents, ovate with an attenuate base, abaxial surface papillose; abaxial and adaxial surfaces with mostly appressed ornamented trichomes, but with scattered unornamented trichomes with erect arms on both blade surfaces and midvein and secondary veins. [= F, K, WV; = *Cornus amomum* P. Miller var. schuetzeana (C.A. Meyer) Rickett – C; = *Cornus purpurii* Koehne – G; = *Cornus amomum* P. Miller ssp. obliqua (Rafinesque) J.S. Wilson – GW, Y; = *Swida amomum* var. schuetzeana (C.A. Meyer) A. Haines; = *Swida obliqua* (Rafinesque) Moldenke]

*Cornus racemosa* Lamark, Northern Swamp Dogwood. Wet to moist forests and thickets. May-July; August-September. ME and s. QC west to s. MB, south to VA, nc. NC, s. IL, and MO. [= RAB, C, F, G, K, WV; = *Swida feminina* (P. Miller) Small – S, misapplied; = *Cornus foemina* P. Miller ssp. racemosa (Lamark) J.S. Wilson – W, Y; = *Swida racemosa* (Lamark) Moldenke]

*Cornus rugosa* Lamark, Roundleaf Dogwood. At high elevations, usually on talus (greenstone, quartzite, sandstone). QC to MB, south to NJ, PA, w. VA, OH, IN, and IL. [= C, F, G, K, W, WV; = *Swida rugosa* (Lamark) Rydberg]

*Cornus stolonifera* Michaux, Red Osier Dogwood. Shrub swamps, bottomlands, suburban areas. At least some of the occurrences in VA represent horticultural introductions. NL (Labrador) and AK south to VA, WV, KY (Clark et al. 2005), IL, NM, AZ, and CA. Attempts to link the name *C. sericea* Linnaeus to the red-osier dogwood have focused on the Linnaean description of "foliis subtus sericeis" and "ramis rubicundis." The reference to the red branches has been emphasized to rule out any other species, yet *C. amomum* and *C. obliqua* also have reddish-maroon branches. The description of "fructo nigro-caeruleo" cannot be dismissed as a reference to individuals of the red-osier dogwood which have pale blue fruit, often considered to be due to hybridization with *C. amomum* or *C. obliqua*. It seems clear that the description fits *C. obliqua* better than it does the red-osier dogwood. Although there is a specimen in the Linnaean herbarium which has been identified as the red-osier dogwood, it is

---

* = *Cornus kousa* Hance, Kousa Dogwood. Suburban areas, sometimes planted as an ornamental and may persist or seed down in the immediate vicinity of the parent tree. [= K; Benthamidia japonica (Siebold & Zuccarini) Hara; = *Cynoxylon kousa* (Hance) Nakai] [not mapped; rejected as a component of our flora]
neither dated nor is the label of *C. sericea* in Linnaeus' hand. Also, considering the similarity of the red-osier dogwood and *C. alba* Linnaeus, it is doubtful *Nyssa* would have described the red-osier dogwood without reference to *C. alba*. Therefore, we agree with Ricket's description of *C. sericea* as a *nomen dubium*. This species is also sometimes considered to be indistinguishable from the Eurasian *C. alba*. [= G, W, WV; = *C. sericea* Linnaeus – C, nomen dubium; = *Cornus stolonifera* Michaux – G, W; > *Cornus stolonifera* var. stolonifera – F; > *Cornus stolonifera* var. baileyi (Coulter & Evans) Drescher – F; > *C. sericea* ssp. sericea – K, nomen dubium; = *Swida sericea* (Linnaeus) Holub, nomen dubium; = *Swida stolonifera* (Michaux) Rydberg; < *C. alba* Linnaeus]

*Cornus stricta* Lamarck, Southern Swamp Dogwood. Swamps, streambanks, marshes, alluvial forests. April-May; July-August. DE south to s. FL, west to TX, and north in the interior to TN, s. IN, s. IL, AR, and se. OK. Although the name *C. foemina* P. Miller predates *C. stricta* Lamarck, it is very unclear what plant was intended by that name (the description is very obscure and no type is available), so *C. foemina* is best rejected as a *nomen dubium*. [= RAB, C, G; = *Cornus foemina* P. Miller – F, K, WH, Z; = *Cornus stricta* Lamarck – RAB, C, G; = *Swida stricta* (Lamarck) Small – S; = *Cornus foemina* P. Miller ssp. foemina – GW, W, Y; = *Swida foemina* (P. Miller) Rydberg; = *Swida stricta* (Lamarck) Small]

320b. NYSSACEAE A.L. de Jussieu ex Dumortier 1829 (Tupelo Family) [in CORNALES]

A family of 5 genera and 22 species, trees and shrubs, of e. Asia, se. Asia, e. North America, and Central America. The circumscription and recognition of this family has been controversial; Nyssaceae has sometimes been included in a broadly circumscribed Cornaceae, but this appears to be phylogenetically incorrect (Xiang et al. 2002). References: Xiang et al. (2002).

*Nyssa* Linnaeus 1753 (Tupelo, Sour Gum, Black Gum)

Identification notes: *Nyssa sylvatica* is often mistaken (especially as seedlings, saplings, or fire-sprouts) for *Diospyros virginiana*, because of their similar, alternate, glossy-green, acuminate leaves. *Nyssa* can be distinguished by its three vascular bundle scars per leaf scar (vs. one *Diospyros*), leaves often with a few irregular teeth (vs. never toothed), leaves pale to medium green beneath (vs whitish-green beneath), leaves lacking dark glands on the midrib above and the outer petiole (vs. present), and leaves glabrous or nearly so below (vs. glabrate to tomentose with curly hairs) (McKenney 1967).

1 Petioles of mature leaves 3-6 cm long; leaves to 30 cm long and 15 cm wide, at least the larger on a tree normally > 8 cm wide, often with a few irregular teeth, these typically located near the widest part of the blade.................................................................*N. aquatica*

2 Petioles of mature leaves 0.5-2.0 (-2.5) cm long; leaves to 18 cm long and 10 cm wide, the largest leaves on a tree rarely > 7 cm wide, generally entire, rarely with a few irregular teeth, these typically located toward the leaf apex.

2 Fruits 20-40 mm long, yellow, orange, or red when mature, the stone winged; pistillate flowers and fruits 1 per peduncle; trees often multiple-trunked, the trunks crooked; mature leaves densely pubescent beneath .........................................................*N. ogeche*

3 Fruits 6-15 mm long, blue-black when mature, the stone slightly ridged to nearly smooth; pistillate flowers (1-) 2-5 per peduncle; trees typically single-trunked, the trunk fairly straight; mature leaves glabrous to pubescent beneath.

3 Pistillate flowers and fruits (2-) 3-5 (-8) per peduncle; leaves with thick texture, pliable, typically widest near the middle, the apex typically acuminate, the margins often with a few irregular teeth near the apex (though sometimes an entire tree with no toothed leaves); trunk not swollen or buttressed at base (even when growing in moist or wet habitats); bark of large trees rough, divided by deep vertical and horizontal furrows into a pattern of squarish checks; [trees of dry to mesic upland forests, less commonly in bottomlands or other wetlands, where flooding occurs at most occasionally and is of short duration; throughout our area].................................................*N. sylvatica*

4 Petioles of mature leaves 0.5-2.0 (-2.5) cm long; leaves to 18 cm long and 10 cm wide, the largest leaves on a tree rarely > 7 cm wide, generally entire, rarely with a few irregular teeth, these typically located toward the leaf apex.

4 Fruits 6-15 mm long, blue-black when mature, the stone slightly ridged to nearly smooth; pistillate flowers (1-) 2-5 per peduncle; trees typically single-trunked, the trunk fairly straight; mature leaves glabrous to pubescent beneath.

3 Pistillate flowers and fruits (2-) 3-5 (-8) per peduncle; leaves with thick texture, pliable, typically widest near the middle, the apex typically acuminate, the margins often with a few irregular teeth near the apex (though sometimes an entire tree with no toothed leaves); trunk not swollen or buttressed at base (even when growing in moist or wet habitats); bark of large trees rough, a vertical ridge-furrow pattern most prominent; [trees of swamps with periodic or seasonal flooding; mostly on the Coastal Plain].

5 Tree; leaves 5-14 cm long, 1.5-4 cm wide; fruit ovoid, 7-14 mm long; [widespread in our area].................................................*N. biflora*

4 Shrub or small tree, 1-3 (-5) m tall; leaves 3-6 cm long, 1-2 cm wide; fruit globose, 6-11 mm long; [restricted to c. FL Panhandle (Apalachicola lowlands region, Bay, Calhoun, Franklin, Gulf, Liberty, and Wakulla counties)].................................................*N. ursina*

*Nyssa aquatica* Linnaeus, WaterTupelo, Tupelo Gum, Cotton Gum. River swamps, where inundated for substantial periods of time. April-May; September-October. Se. VA south to Panhandle FL, west to se. TX, north in the Mississippi Embayment to se. MO, s. IL, and e. KY, primarily on the Coastal Plain, but with scattered locations in other physiographic provinces, such as in se. TN. [= RAB, C, F, GW, K, S, V, WH, X, Y, Z; = *N. uniflora* Wangenheim – G]
**Nyssa biflora** Walter, Swamp Tupelo, Water Gum, Swamp Black Gum. Blackwater river swamps, depressions in pine lands, pocosins, either where inundated for substantial periods of time or in more-or-less permanently saturated organic peaty soils. April-June; August-October. NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to c. NC, w. SC, c. TN, w. KY (Clark et al. 2005), se. MO, and c. AR. [= G, K, S, Z; = *N. sylvatica* Marshall var. biflora (Walter) Sargent – RAB, C, F, X, Y; < *N. sylvatica* Marshall var. biflora (Walter) Sargent – GW, WH; = *N. biflora* var. biflora – V]

**Nyssa ogeche** Bartram ex Marshall, Ogeechee Lime, Ogeechee Tupelo, Ogeechee Plum. River swamps and wet forests with peaty soils, also in upland depression ponds. April; August-October. A Southeastern Coastal Plain endemic: se. SC south to c. peninsular FL, west to s. AL. [= RAB, GW, K, V, WH, X, Y, Z; > *N. acuminate* Small – S; > *N. ogeche* – S]

**Nyssa sylvatica** Marshall, Sour Gum, Black Gum, Pepperidge. Dry or mesic upland forests, less commonly in bottomlands, pine savannas, or upland depressions, where occasionally inundated briefly. April-June; August-October. S. ME west to MI and se. WI, south to c. peninsular FL, west to e. TX and e. OK. *N. sylvatica* is quite variable in morphology and ecology, at least some of the morphologic variation correlated with geography and ecology. The status of varieties recognized by previous authors (such as Fernald 1950) needs reassessment. In the Mountains of our area *N. sylvatica* is typically found in dry woodlands, such as pine-oak/heath, with xerophytic species such as *Pinus virginiana* and *Quercus montana*. In the outer Coastal Plain of the Carolinas, *N. sylvatica* often occurs in wet savannas with *Pinus serotina*, where often mistaken (because of the wetland habitat) for *N. biflora*. The leaves turn a brilliant orange-red in fall (often a few on any tree turning prematurely in July or August). [= G, K, S, V, VW, Z; = *N. sylvatica* var. sylvatica – RAB, C, GW, WH, X, Y; > *N. sylvatica* var. sylvatica – F; > *N. sylvatica* var. dilatata Fernald – F; > *N. sylvatica* var. caroliniana (Poiret) Fernald – F]

**Nyssa ursina** Small, Bear Tupelo, Apalachicola Tupelo. Stringers, flatwoods depressions. Endemic to Panhandle FL (Apalachicola lowlands region; Bay, Calhoun, Franklin, Gulf, Liberty, and Wakulla counties). A 2-5 m tall shrub or small tree, intricately branched, related to *N. biflora*. Because of the co-occurrence of this and *N. biflora* in the FL Panhandle, it seems best to recognize this taxon at the species level. [= K, S, Z; < *N. sylvatica* Marshall var. biflora (Walter) Sargent – GW, WH, X; = *N. biflora* Walter var. ursina (Small) D.B. Ward – V; > *N. sylvatica* Marshall var. ursina (Small) Wen & Stuessy – Y]

### 321. HYDRANGEACEAE

Dumortier 1829 (Hydrangea Family) [in CORNALES]

A family of about 17 genera and 190-220 species, trees, shrubs, vines, and herbs, primarily north temperate. As here interpreted, the family Hydrangeaceae includes two well-marked groups, the Hydrangeae (including *Decumaria* and *Hydrangea*) and the Philadelpheae (including *Deutzia* and *Philadelphus*). This group has been shown by molecular research to be unrelated to the Saxifragaceae, and to have its closest affinities to the Loasaceae, Cornaceae, and Nyssaceae (Xiang et al. 2002; Soltis, Xiang, & Hufford 1995; Morgan & Soltis 1993). References: Spongberg (1972); Soltis, Xiang, & Hufford (1995); Morgan & Soltis (1994); Xiang et al. (2002); Hufford in Kubitzki (2004).

1 Woody vine, climbing by aerial rootlets; petals 7-10; [tribe Hydrangeae].......................................................................................................................... *Decumaria*
1 Shrub; petals 5 (rarely 10 in the cultivars of the alien *Deutzia*).
2 Pubescence of leaves and twigs stellate; stamens 10; [a cultivated alien, rarely escaped]; [tribe Philadelphaceae]........................................................................... *Deutzia*
2 Pubescence of leaves and twigs simple; stamens 8-10 (Hydrangea) or 25-90 (Philadelphus); [natives and aliens].
3 Leaf blades 10-30 cm long; inflorescences of 25-many flowers; stamens 8-10; [tribe Hydrangeae].......................................................................................................................... *Hydrangea*
3 Leaf blades 3-8 cm long; inflorescences of 1-7 flowers; stamens 25-90; [tribe Philadelphaceae].......................................................................................................................... *Philadelphus*

**Decumaria** Linnaeus (Climbing Hydrangea, Woodvamp)

**Identification notes:** *Decumaria* is readily distinguished from the other opposite-leaved, woody vines in our flora (*Gelsemium*, *Trachelospermum*, *Lonicera*, *Bignonia*, *Campsis*, and *Clematis*) by its leaves (simple, ovate, and usually serrate) and climbing structures (adventitious roots).

**Decumaria barbara** Linnaeus, Climbing Hydrangea, Woodvamp. Swamp forests and bottomlands, moist forests in the mountains. May-June; July-October. Se. VA south to FL and west to LA and e. TX (Singhurst, Keith, & Holmes 2005), inland to nw. SC, se. TN, and w. TN. This handsome vine climbs to the tops of trees via adventitious roots. The opposite leaves are somewhat fleshy in texture. [= RAB, C, F, G, GW, K, S, W]

**Deutzia** Thunberg (Deutzia)
**HYDRANGEACEAE**

*Deutzia scabra* Thunberg, Deutzia, Pride-of-Rochester. Fairly commonly cultivated, persistent around old homesites and escaping to adjacent woodlands; native of Japan and China. First reported for NC (Jackson Co., NC) by Pittillo & Brown (1988); now known from scattered sites. *D. crenata* Siebold & Zuccarini, Chinese Deutzia, is reported as introduced in GA by Kartesz (1999); this may not be taxonomically distinct from *D. scabra*. [= K, F; > *D. scabra* – K; > *D. crenata* Siebold & Zuccarini – K; > *D. scabra* var. *candisissima* (Froebel) Rehder]

**Hydrangea** Linnaeus (Hydrangea, Sevenbark)

**Hydrangea arborescens** Linnaeus, Smooth Hydrangea. Forests, especially around rock outcrops and along streambanks. May–July. NJ, s. NY, OH, IN, IL, and se. KS south to e. NC, c. SC, c. GA, Panhandle FL, s. AL, LA, and OK. [= K, S, W, WH, Z; = *H. arborescens* ssp. *arborescens* – RAB, Y; = *H. arborescens* var. *arborescens* – C, G, WV; > *H. arborescens* var. *arborescens* – F; > *H. arborescens* var. oblonga Torrey & A. Gray – F]

**Hydrangea paniculata** Siebold, Panicle Hydrangea. Persistent after cultivation at old home-sites, sometimes appearing naturalized; native of e. Asia. July–August. [= C, F, G, K]

**Hydrangea quercifolia** Bartram, Oakleaf Hydrangea. Native in hammocks, moist forests, also in disturbed areas, thickets, or forests adjacent to urban or suburban areas. May–July. C and sw. TN, south through w. GA, AL, and MS to Panhandle FL and e. LA; scattered elsewhere as a remnant or escape from cultivation. Boufford & Wood (1977) describe a purportedly native occurrence in nw. SC, but it seems more likely to be n escape from cultivation (R. Clark, pers. comm.). This southeastern native is a spectacular garden plant, frequently planted, rarely escaping or persisting. [= C, F, G, K, S, WH]

**Hydrangea radiata** Walter, Snowy Hydrangea, Silverleaf. Mt (GA, NC, SC), Pd (NC, SC): rocky forests and rock outcrops, often common and conspicuous on roadbanks; common. May–July. A Southern Appalachian endemic: sw. NC (in the valley of the French Broad River and to its southwest), nw. SC, ne. GA, and se. TN, with outliers (perhaps escaped from cultivation?) in Stokes County, NC and Calhoun County, SC. This attractive species is especially typical of the escarpment gorge region near the tricorner of NC, SC, and GA, in the vicinity of the towns of Highlands, Cashiers, and Rosman, NC, where it is conspicuous along roadbanks. [= K, S, W, Z; = *H. arborescens* ssp. *radiata* (Walter) McClintock – RAB, Y]
Philadelphus Linnaeus (Mock-orange)

A genus of 65 (or fewer) species, shrubs, of north temperate areas. The most recent monographer of the genus, Hu (1954-1955) recognizes many species and varieties on the basis of minor differences in pubescence. Many of the recognized taxa are based only on cultivated material. The native distributions of the varieties have little phytochoristic coherence, and several varieties are often reported from the same site, suggesting that they reflect merely variation within a population (if genetically based at all). For instance, Hu recognizes three varieties in *P. hirsutus* and five in *P. inodorus*, but these seem to be no more than forms. As Hu writes, "the formerly recognized species, *P. grandiflorus* Willd., and *P. laxus* Schrad., are merely different forms of a species with heterogeneous leaf shape, size, and margins. Fostered by growers, propagated and distributed through cuttings, these forms have maintained their distinction in gardens since their discoveries. But when they are projected on the spectrum of variations exhibited by a large number of specimens collected from the homeland of *P. inodorus* Linn. they appear to be nothing but a few transitional forms. In this paper, these forms are treated as varieties." Hu's "varieties" should be treated as forms or cultivars, if recognized at all. I have taken a conservative approach, though variation in several of our native species could use additional study. References: Weakley & Henrickson in FNA (in press); Hu (1954-1956)=Z; A.E. Weakley (2002); Hufford in Kubitzki (2004).

1. Axillary buds exposed above the petiole base (best observed in mature long-shoot leaves, not always visible in axils of young leaves or on short-shoot leaves); twigs of the current year villous-hirsute; seeds not caudate; [subgenus Deutzioideae, section Deutzioideae]........... *P. hirsutus*

1. Axillary buds contained within a distinct pouch directly below the petiole (best observed in mature, long-shoot leaves); twigs of the current year glabrous; seeds with caudate tails about as long as the embryo; [subgenus Philadelphus].

2. Flowers 1-3 (-9) in a cyme or cyme-like cluster; stamens 60-90; [subgenus Philadelphus, section Paeoniflorus]............................. *P. inodorus*

2. Flowers 5-9 in a determinate raceme; stamens 20-50; [subgenus Philadelphus, section Philadelphus].

3. Bark of the current year brown, exfoliating in its second year; flowers fragrant................................................................. *P. coronarius*

3. Bark of the current year gray, not exfoliating later; flowers not fragrant or only slightly so.......................................................... *P. pubescens*

*Philadelphus coronarius* Linnaeus, European Mock-orange. Cultivated (though more so in the past than now), and sometimes escaped or persisting around old homesites; native of Europe. May-July. *P. coronarius* is the most commonly cultivated *Philadelphus* in our area, though it is currently considered rather old-fashioned. [= C, FNA]

*Philadelphus hirsutus* Nuttall, Hairy Mock-orange, Cumberland Mock-orange. Bluffs, rock outcrops, rocky woodlands, often with seepage, over mafic or calcareous rocks. April-May; June-August. A Southern Appalachian species: sw. VA and KY south and west to w. NC, TN, n. GA, and n. AL. *P. sharpianus* Hu, known from e. TN and nc. AR, is similar to *P. hirsutus*, allegedly differing in the hypanthium glabrous (vs. more or less pubescent), the leaves strigose-pilose above, glabrous or sparsely strigose or with the nerves only villous beneath (vs. scabrous-hirsute above, uniformly villous beneath); it is probably best considered only a form of *P. hirsutus*. *P. hirsutus* is cultivated and it may escape outside of the range stated. [= RAB, C, F, FNA, G, S, W; > P. hirsutus var. strigosus Hu – K, Z; > P. hirsutus var. intermedium Hu – Z; > P. hirsutus var. nanus Hu – Z; > P. sharpianus Hu var. parviflorus Hu – Z]

*Philadelphus inodorus* Linnaeus, Appalachal Mock-orange. Rich forests and woodlands, rocky bluffs over mafic or calcareous rocks, and also cultivated and persistent. April-May; June-August. VA and TN south to Panhandle FL (Gadsden, Liberty, and Jackson counties), GA, and s. AL (and according to C, also in e. PA). *P. floridus* Beadle, known from nw. GA, is similar to *P. inodorus*, allegedly differing in the pedicels and hypanthium pubescent (vs. glabrous); it is probably only a form of *P. inodorus*. [= RAB, C, FNA, G, W, WH; > P. inodorus var. inodorus – F, S, Z; > P. inodorus var. carolinus Hu – Z; > P. inodorus var. grandiflorus (Wildenow) A. Gray – F, Z; > P. inodorus var. laxus (Schrader) Hu – Z; > P. inodorus var. strigosus Beadle – S, Z; > P. grandiflorus Wildenow – S; > P. gloriosus Beadle – S; > P. inodorus var. intermedium Hu – Z; > P. floridus Beadle – K, S, Z]

*Philadelphus pubescens* Loiseleur, Ozark Mock-orange, Hairy Mock-orange. Limestone bluffs. E. TN, KY, nw. GA (Jones & Coile 1988), AL, MO, OK, and AR, west of the Blue Ridge. It has been documented from TN counties adjacent to both VA and NC, and is likely to be found in VA, at least. [= FNA; > P. inodorus Beadle – S; > P. lattifolius Schrader ex A.P. de Candolle – S; > P. intercus var. intercus – Z; > P. intercus var. pubigerus Hu – Z; > P. pubescens var. verrucosus (Schrader) Hu – Z; > P. pubescens var. pubescens – K, Z; > P. pubescens var. intercus (Beadle) A.H. Moore – K]

322. LOASACEAE A.L. de Jussieu 1804 (Loasa Family) [in CORNALES]

*Mentzelia* Linnaeus (Blazingstar)

*Mentzelia floridana* Nuttall ex Torrey & A. Gray, Stickleaf. Hammocks, shell middens, dunes, other dry sands. Ne. FL (Duval County) south to s. FL. [= K, S, WH]

### 323. BALSAMINACEAE

A Richard 1822 (Touch-me-not Family) [in ERICALES]

**Impatiens** Linnaeus (Jewelweed, Touch-me-not, Snapweed, Balsam)

1. Corolla purple, pink, or white; plants 3-6 (-8) dm tall; stems puberulent or glabrous; [cultivated alien, rarely escaped].
2. Sepal spur strongly recurved; stems puberulent. .......................................................... *I. balsamina*
3. Sepal spur slightly curved; stems glabrous or with widely scattered hairs. .......................................................... *I. walleriana*

*Impatiens capensis* Meerburgh, Orange Jewelweed, Orange Touch-me-not, Spotted Touch-me-not. Moist forests, bottomlands, cove forests, streambanks, bogs. May-November. NL (Newfoundland) west to SK, NT, and BC, south to SC, Panhandle FL, AL, TX, CO, ID, and OR. Within the portion of our area where *I. capensis* and *I. pallida* overlap, the two species often occur in mixed populations. *I. capensis* tends to have the leaf apices and crenulations more rounded than *I. pallida*, but the character is overlapping and variable. [= RAB, C, F, GW, K, W, WV; = *I. biflora* Walter – G, S]

*Impatiens pallida* Nuttall, Yellow Jewelweed, Yellow Touch-me-not, Pale Touch-me-not. Cove forests, streambanks, seepages, moist forests, bogs, roadsides. July-September. NS and QC west to SK, south to e. VA, we. NC, TN, WV, MO, and OK. [= RAB, C, F, GW, K, S, W, WV]

*Impatiens walleriana* Hooker f., Garden Impatiens. Suburban woodlands, weakly spreading from horticultural plantings; native of Africa. [= K, WH]

### 327. POLEMONIACEAE

A.L. de Jussieu 1789 (Jacob’s-ladder Family) [in ERICALES]

A family of 18 genera and 350-380 species, herbs, vines, and shrubs (rarely trees), mainly of temperate North America, but extending into tropical America and also in Eurasia. References: Wilson (1960a); Grant (1997); Grant (1998); Prather, Ferguson, & Jansen (2000); Wilken in Kubitzki (2004).

1. Leaves simple; [tribe Polemoniae] .......................................................................................... 5. *Phlox*
2. Leaves compound.
3. Leaf segments ovate or elliptic, 5-16 mm wide; corolla blue; [tribe Polemoniae] .......................................................................................... 4. *Polemonium*
4. Leaf segments linear, ca. 1 mm wide; corolla red, yellow, or blue; [tribe Gilieae] .......................................................................................... 3. *Ipomopsis*
5. Inflorescences elongate; flowers red or yellow .................................................................................. 2. *Gilia*
6. Inflorescences spherical; flowers blue or white
7. Inflorescence bracts not spinose; inflorescence on a long peduncle; flowers blue; plant 1-9 dm tall .................................................................. 1. *Gilia*
8. Inflorescence bracts spine-tipped; inflorescence not long-pedunculate, subtended by bracts; flowers white; plant < 1 dm tall ...............

*Gilia* Ruiz & Pavón 1794 (*Gilia*)
A genus of about 40 species, herbs, of w. North America.

2. **Navarretia** Ruiz & Pavón 1794 (Navarretia)

3. **Ipomopsis** Michaux 1803 (Standing-cypress)

**Ipomopsis rubra** (Linnaeus) Wherry, Standing-cypress. Sandhills, sand rims of Carolina bays, dunes, roadbanks, disturbed areas. June-August; August-September. Sc. NC south to e. peninsular FL, west to TX and OK, spread from cultivation in other areas to the north (including sites in the Piedmont and Mountains of GA and NC). [= RAB, K, WH, Z; = *Gilia rubra* (Linnaeus) A.A. Heller – C, F, G, S]

4. **Polemonium** Linnaeus 1753 (Jacob's-ladder)

1 Stamens exserted 5-7 mm from the corolla; flowers in a compact panicle, the pedicels usually shorter than the calyx; flowering in July .............. *P. vanbruntiae*
1 Stamens included in the corolla; flowers in a diffuse, corymbiform panicle, the pedicels usually longer than the calyx; flowering in April-May.
2 Inflorescence minutely puberulent; corolla 12-16 mm long .......................................................... P. reptans var. reptans
2 Inflorescence densely glandular-villous; corolla 8-12 (-13) mm long, ........................................ P. reptans var. villosum

**Polemonium reptans** Linnaeus *var. reptans*, Spreading Jacob's-ladder. Moist, nutrient-rich forests, such as bottomlands and rich slopes. April-May; June. NY west to MN, south to VA, nc. NC, nw. GA, AL, and e. OK. [= C, K; < P. reptans – RAB, F, G, S, W, WV]

**Polemonium reptans** Linnaeus *var. villosum* E.L. Braun. Moist forests. Appalachian Plateau and vicinity, in s. OH and e. KY. [= C, K; < P. reptans – F, G]

**Polemonium vanbruntiae** Britton. Calcareous fens, swamps, and streambanks. May-July. ME, VT, and n. NY south to se. PA, sw. PA, and e. WV. [= K; = *P. van-bruntiae* – C, F, G, WV, orthographic variant]

5. **Phlox** Linnaeus 1753 (Phlox)

A genus of about 70 species, herbs (to subshrubs), of temperate North America (with 1 species in ne. Asia). References: Wherry (1955)=Z; Ferguson, Krämer, & Jansen (1999); Wilken in Kubitzki (2004). Key based on C and Z.

1 Stems woody or suffrutescent, trailing or decumbent; leaves to 25 mm long (-60 mm long in *P. bifida*), to 3 (-5) mm wide, generally with short-shoots or fascicles of leaves in the axils of leaves of the sterile shoots.
2 United portion of the style 5-12 mm long, the cleft portion ca. 1 mm long.
3 Larger leaves > 3 cm long; nodes 4-5, spaced; petals deeply notched, the notch 1.5-5 mm deep .................................................... *P. bifida*
3 Larger leaves < 2.5 cm long; nodes >6, crowded; petals shallowly notched, the notch 0.5-3 mm deep................................................. *P. subulata*
2 United portion of the style 1.5-4 mm long, the cleft portion 0.5-2 mm long.
POLEMONIACEAE

1 Stems herbaceous, erect or decumbent; leaves (at least the larger) > 25 mm long and/or > 5 mm wide, generally lacking axillary fascicles of leaves.

5 Style short, 1-4 mm long, the united portion 1-1.5 × as long as the cleft portion; stamens shorter than the corolla tube (thus included).

6 Upper leaves alternate; annual; corolla red, white, or variegated; [alien, mostly naturalized in dry sandy soils of roadsides, fields, and disturbed areas]................................................................................................................. P. drummondi

11 Plants forming colonies by rhizomes, stolons, and/or prostrate sterile shoots with evergreen to semi-evergreen leaves; flowering shoots 1-4 (-5) dm tall.

12 Plants with rhizomes and stolons tipped with clustered, evergreen, linear to lanceolate leaves 3-12 cm long, 5-10 (-12) mm wide.............................................. P. buckleyi

13 Leaf margin ciliate-serrulate; lateral veins of the leaves readily apparent, these joining to form a connecting vein parallel to the leaf margin.

14 Bracts of the inflorescence pubescent with non-glandular hairs; corolla tube pubescent (rarely glabrous); leaves subopposite (at least near the inflorescence); nodes usually 15-40; leaves usually 3-4 × as long as wide.............................................. P. paniculata

18 Nodes 16-35, crowded; upper leaves lanceolate to ovate-oblong; flowering late summer............. P. thalii

19 Calyx subcampanulate, the sepals narrow with a well-developed midrib, the junction-membranes thin, narrow, becoming markedly plicate-keeled (to slightly plicate-keeled)......................................................................................... P. glabrerrima

Phlox amoena
Sims, hairy Phlox, Chalice Phlox. Dry woodlands and forests, roadbanks, sandhills. April-June, June-July.
W. NC west to s. KY, south to n. FL and MS. (= C, F, G, S, W; = P. amoena ssp. amoena – K, Z; < P. amoena – RAB, WH (also see P. lighthei))

Phlox amplifolia
Britton, Broadleaf Phlox. Moist forests, particularly over mafic rocks. July-August. W. VA west to s. IN and se. MO, south to w. NC, AL, and n. AR. (= RAB, C, F, G, K, S, W, WV, Z)

Phlox bifida

Phlox buckleyi

Phlox carolina
Linnaeus, Carolina Phlox, Thick-leaf Phlox, Giant Phlox. Forests, woodlands, woodland borders, barrens. May-July. VA, WV, IL and MO south to s. GA, s. AL, s. MS, se. LA and e. TX. (= RAB, G, S, W; < P. glabrerrima – C; > P. carolina
POLEMONIACEAE

**Phlox drummondii** Hooker, Annual Phlox, Drummond Phlox. Dry sandy soils of road sides, fields, disturbed areas; native of TX. April-July. Wherry recognized 3 subspecies in *P. drummondii*, all endemic to TX; it does not seem meaningful to try to distinguish infraspecific taxa in our area, since our plants are the progeny of various cultivars derived from hybrids and selections of the wild taxa. [= RAB, F, G, S, WH; > P. drummondii ssp. drummondii – K, Z]

**Phlox drummondii** Hooker, Annual Phlox, Drummond Phlox. Dry sandy soils of road sides, fields, disturbed areas; native of TX. April-July. Wherry recognized 3 subspecies in *P. drummondii*, all endemic to TX; it does not seem meaningful to try to distinguish infraspecific taxa in our area, since our plants are the progeny of various cultivars derived from hybrids and selections of the wild taxa. [= RAB, F, G, S, WH; > P. drummondii ssp. drummondii – K, Z]

**Phlox floridana** Bentham. Sandhills. SW GA and SE AL south to FL Panhandle and nw. peninsular FL. [= K, S, WH, Z]

**Phlox lighthipei** Small, Lighthipe’s Phlox. Dry to moist sandy soils. April-May; June-July. S. SC south to n. FL. [= S; = P. amoena ssp. lighthipei (Small) Wherry – K, Z; < P. amoena – RAB, WH]

**Phlox maculata** Linnaeus var. maculata, Northern Meadow Phlox. Moist forests and openings. June-July. S. QC west to MN, south to c. NC, KY, and IA. [= F, G, WV; = P. maculata ssp. maculata – K, Z; < P. maculata – C, S]

Phlox pulchra Wherry, Alabama Phlox. [habitat] Endemic to c. AL. [= K] {add to synonymy}

Phlox stolonifera Sims, Creeping Phlox. Moist forests. April-May; May-June. PA and s. OH south to w. NC, n. GA, and e. TN, essentially a Southern and Central Appalachian endemic. This species is sometimes locally abundant, as in parts of Great Smoky Mountains National Park. [= RAB, C, F, G, K, S, W, WV, Z]

Phlox subulata Linnaeus, Moss Phlox, Mountain-pink. Dry and exposed rock outcrops, rocky flood-scoured riversides, dry woodlands over a wide variety of rocks, shale barrens. April-May. NY and OH south to w. NC and TN; escaped or naturalized more widely from horticultural use. Infraspecific taxa that are sometimes recognized seem poorly correlated with morphology and geography. [= RAB, S, W; > P. subulata var. australis – G; > P. subulata var. setacea (Linnaeus) Brand – C; > P. subulata var. brittonii – F, WV; > P. subulata var. setacea (Wherry) Wherry – K, Z; > P. subulata ssp. brittonii (Small) Wherry – K, Z; > P. brittonii Small – S; > P. subulata var. subulata – C, F, WV; < P. subulata var. subulata – C (also see var. brittonii); > P. subulata var. ciliata Wherry – G; > P. subulata ssp. subulata – K, Z]

330. PENTAPHYLACACEAE Engler 1897 (Pentaphylax or Sakaki Family) [in ERICALES]

A family of 12 genera and ca. 340 species, of the tropics and subtropics (a few of warm temperate areas), mainly of Asia and America. There is nomenclatural dispute over whether to use the name Pentaphylacaceae (which is conserved) or the older Ternstroemiaceae. References: Weitzman, Dressler, & Stevens in Kubitzki (2004).

Cleyera Thunberg 1783 (Sakaki)

A genus of about 8 species, of e. Asia, se. Asia, and tropical America.

* Cleyera japonica Thunberg, Sakaki. Moist forests and bluffs; native of e. Asia (Japan, China, Nepal, n. India, Myanmar). Locally and aggressively naturalizing at Kalmia Gardens, Coker College, Hartsville, Darlington County, SC, where perhaps planted as long ago as the 1930s. [= K1; = Ternstroemia japonica (Thunberg) Thunberg]

331. SAPOTACEAE A.L. de Jussieu 1789 (Sapodilla Family) [in ERICALES]

A family of about 53-54 genera and 1100-1250 species, trees and shrubs, primarily tropical (rarely temperate), of Old World and New World. References: Elisens, Whetstone, & Wunderlin in FNA 2009); Pennington in Kubitzki (2004); Govaerts, Frodin, & Pennington (2001).

Sideroxylon Linnaeus 1754 (Bumelia, Buckthorn, Bully)

As defined broadly by Pennington (1991), Sideroxylon includes about 75 species, widely distributed in the New World and Old World Tropics (our species are the northern tip of a "tropical iceberg"). Pennington found that no consistent set of characters could be used to separate Bumelia from other New World genera (such as Mastichodendron and Dipholis), and that the New World segregate genera were also not separable from several Old World genera. The Linnaean Sideroxylon has nomenclatural priority. References: Elisens & Jones in FNA (2009); Clark (1945)=V; Cronquist (1945)=Q; Pennington (1991)=Z; Godfrey (1988)=Y; Govaerts, Frodin & Pennington (2001)=X; Allison (2006)=U. Key adapted from Y.

1 First-year twigs persistently pubescent; leaves pubescent beneath with appressed to tomentose hairs, ranging in color (depending partly on age) from silvery through coppery to dark brown.

2 Mature leaves densely pubescent beneath, the hairs sericeous, matted and shiny; leaves 2-5 (-7) cm long, 0.5-2 (-3) cm wide .......... S. tenax
1 First-year twigs pubescent when young, soon becoming glabrous or nearly so; leaves glabrous, glabrate, or sparsely pubescent beneath with pubescent hairs on upper leaf surface, deciduous. Leaf blade oblong or obovate, more or less asymmetrical, 1-4 (-5.2) cm long; 

2 Mature leaves pubescent beneath, the hair s woolly-tomentose, neither matted nor shiny; leaves 1-10 cm long, 0.5-4 cm wide. 

3 Low shrub, 0.1-0.5 (-1) m tall, clonal from subterranean stems; leaves 1-4 (-5.2) cm long; [endemic to xeric sands in GA] ...........................

4 Leaf pubescence slightly tawny when leaves are first emerging, later becoming gray or white ..........S. lanuginosum

5 Shrub or small tree, to 20 m tall, sometimes multi-stemmed but not extensively clonal; leaves 1-12 (-15) cm long; [collectively widespread].

6 Lower leaf surface glabrous or glabrescent, green; {stems…}. 

7 Leaf blade not conspicuously reticulate ...............................................................................................................................S. alachuense

8 Upper surfaces of the mature leaf blades faintly and coarsely reticulate-veined (at 20× or greater magnification), the veins of the reticulum not at all raised, usually somewhat impressed, and, although pale, not bony-cartilaginous ..........S. thornei

9 Larger leaf blades 8-12 (-15) cm long; large shrub or small tree, the stem usually solitary; berries 10-15 mm long, 10-12 mm in diameter; [of NC, SC, and VA and southward] ..............................................................S. lycioides

10 Larger leaf blades 2-5 (-7) cm long; small to large shrub, usually multi-stemmed; berries 5-8 mm long, ca. 5 mm in diameter; [of NC and SC and southward]..............................................S. reclinatum ssp. reclinatum

---

Sideroxylon alachuense L.C. Anderson, Alachuah Bella, Silver Buckthorn. Sandy hammocks, shell middens. S. GA south to c. peninsular FL. [= FNA, K; = Bumelia anomala (Sargent) R.B. Clark – V, Y; = S. alachense – K, misspelled: = B. lanuginosa (Michaux) Persoon var. anomala Sargent]

Sideroxylon celastroides (Kunth) T.D. Pennington, Saffron-plum. Sandy hammocks. Peninsular FL (immediately south of our area), s. AL, s. TX, south through Mexico and Central America to n. South America; West Indies. [= FNA, K2, WH; X; = Bumelia celastroides Kunth]

Sideroxylon lanuginosum Michaux ssp. lanuginosum, Eastern Gum Bumelia, Eastern Gum Bull. Mesic to floodplain forests. E. GA south to nc. FL, west to LA. Other subspecies are more western. Reported for SC by Kartesz (1999) {investigate}. [= FNA, X; > S. lanuginosum ssp. lanuginosum – K; > S. lanuginosum ssp. albicans (Sargent) Kartesz & Gandhi – K; = Bumelia lanuginosa ssp. typica Q; < B. lanuginosa (Michaux) Persoon – S; > B. lanuginosa var. lanuginosa – V; > B. rufa Rafinesque – Y; = B. lanuginosa ssp. lanuginosum – Y; < S. lanuginosum – Z]

Sideroxylon lycioides Linnaeus, Buckthorn Bumelia, Buckthorn Bull. Maritime forests, maritime scrub, river bluffs, swamp margins, usually in circunnatural soil (over shell hash, coquina limestone, marl, or limestone), in the Piedmont and Mountains in rich, mesic forests over mafic or calcareous rocks. June-July; September-October. Se. VA south to Panhandle FL, west to se. TX, north in the interior to s. IN, s. IL, and se. MO, mostly on the Coastal Plain, but extending (in our area in NC and SC) to the upper Piedmont and north in the interior (primarily on limestone) to KY and TN. This species is extremely variable in leaf shape; though described in most works as 10-12 cm long and up to 4 cm wide, the leaves can be 15 cm long and 8 cm wide. The leaf apex can be acuminate, acute, rounded, or notched. [= FNA, K, X, Z; = Bumelia lycioides (Linnaeus) Persson var. RAB, C, G, GW, S, Y; > B. lycioides var. lycioides – F, V; > B. lycioides var. virginiana Fernald – F, V; > B. lycioides var. ellipsoidalis R.B. Clark – V; > B. smallii R.B. Clark – F]

Sapotaceae

Sideroxylon rufohirtum Herring & Judd, Red-haired Bully. Endemic to FL: ne. FL south to c. peninsular FL. (= FNA; = S. reclinatum Michaux ssp. rufotomentosum (Small) Kartesz & Gandhi – K; = Bumelia rufotomentosa Small – V, S, Y; = B. reclinata (Michaux) Ventenat var. rufotomentosa (Small) Cronquist – Q)

Sideroxylon tenax Linnaeus, Tough Buckthorn, Tough Bumelia, Tough Bully. Maritime scrub, maritime forests, also inland in hammocks. May-June; September-October. Se. NC south to s. peninsular FL. (= FNA, K, X, Z; = Bumelia tenax (Linnaeus) Willdenow – RAB, Q, V, Y; > B. tenax – S; > B. lacuum Small – S)

Sideroxylon thornei (Cronquist) Pennington, Thorne’s Bumelia, Swamp Bumelia. Bottomlands and limesink depressions, particularly over calcareous substrates. May-June; August-early October. Ne. GA south to Panhandle FL, and west to AL. The validity of this species has been supported by Anderson (1996). (= FNA, K, X, Z; = Bumelia thornei Cronquist – Y)

332. Ebenaceae Gürke 1891 (Ebony Family) [in ERICALES]

A family of 2-6 genera and 500-600 species, trees and shrubs, distributed in tropical and subtropical (rarely warm temperate) regions. References: Eckenwalder in FNA (2009); Wallnöfer in Kubitzki (2004).

Diospyros Linnaeus 1753 (Persimmon)

A genus of 500-600 species, trees and shrubs, of tropical and subtropical regions (with very few exceptions). The genus includes a variety of tropical trees called ebony in the wood trade. References: Eckenwalder in FNA (2009); Spongberg (1977)=Z; Wallnöfer in Kubitzki (2004).

Identification notes: Seedlings and fire sprouts are superficially very similar to Nyssa sylvatica, but can be separated in the following ways: bundle scar 1 per bud scar, narrowly crescent-shaped (vs. Nyssa with 3 distinct, circular, bundle scars arranged in a broad V pattern), leaves never with teeth (vs. Nyssa leaves sometimes with a few irregular teeth), leaves glabrate to tomentose with curly hairs (vs. glabrous or with a few straight, forward-pointing hairs), leaves with sessile to short-stipitate glands on upper surface of midrib and outer petiole, later becoming necrotic spots (vs. leaves without glands).

1 Twigs stout, reddish-pubescent; fruits to 10 cm in diameter; [cultivated alien] .................................................................................................................. [D. kaki]
1 Twigs slender, glabrous or with gray pubescence; fruits to 4 cm in diameter; [native] .................................................................................. D. virginiana

* Diospyros kaki Linnaeus f., Kaki, Kaki-plum, Japanese Persimmon. Rarely grown in our area for its fruits, which are much larger than D. virginiana (to 9 cm in diameter). (= FNA, Z) {not mapped; rejected as a component of our flora}

Diospyros virginiana Linnaeus, American Persimmon, Possumwood. Dry woods, sandhills, disturbed places, floodplain and mesic forests, fencerows. May-June; September-December (and persisting). CT, PA, OH, IN, IL, MO, and e. KS south to s. FL and TX. East of the Mississippi River, D. virginiana var. virginiana has leaves cuneate to rounded at the base, and glabrous or glabrescent; mostly west of the Mississippi River and perhaps eastward along the Coastal Plain, D. virginiana var. pubescens (Pursh) Dippel has leaves subcordate, and persistently pubescent. Though these differences seem relatively trivial, they are consistent, geographically correlated, and may be worthy of varietal recognition. Persimmons are famous for their sweet and edible fruits, and infamous for the bitter-astringency of the not fully ripe fruit. The species is dioecious, the male trees appear to reach a greater size than the females. The wood is one of the heaviest and hardest in e. North America. (= RAB, FNA, GW, K, W, WH, WV; > D. virginiana var. virginiana – C, F, G, Z; > D. virginiana var. pubescens (Pursh) Dippel; > D. virginiana – S; > D. mosieri Small – S]

333. Primulaceae Ventenat 1799 (Primrose Family) [in ERICALES]

As broadly circumscribed to include Myrsinaceae and Samolaceae, cosmopolitan in distribution. Following the discovery that various herbaceous and more largely temperate genera (Lysimachia, Trientalis, Anagallis, Samolus, etc.) traditionally placed in Primulaceae actually were more closely related to the largely tropical and woody Myrsinaceae, various authors, including Källersjö, Bergqvist, & Anderberg (2000) and Martins, Oberprieler, & Hellwig (2003) proposed the transfer of Lysimachia, Anagallis, and Trientalis to Myrsinaceae and of Samolus to Theophrastaceae. APG III (2009) alternatively merges Samolaceae and Myrsinaceae into Primulaceae, and recognizes variation at the subfamilial and tribal ranks; this approach is followed here. References: Cholewa in FNA (2009); Cholewa & Kelso in FNA (2009); Cholewa, Pipoly, and Rickston in FNA (2009); Channell & Wood (1959); APG III (2009); Källersjö, Bergqvist, & Anderberg (2000); Martins, Oberprieler & Hellwig (2003);

1 Pedicels ebracteate; corolla 3-7.5 mm long, the flowers 5-7 mm across; leaves all below the inflorescence; calyx lobes equaling or longer than tube; staminodes absent .................................................. Samolus ebracteatus
1 Pedicels with a minute bract near the middle; corolla 1.2-3 mm long, the flowers 2-3 mm across; leaves extending into the inflorescence; calyx lobes equaling or shorter than tube; staminodes present ............................................................................................... Samolus parviflorus

Samolus ebracteatus Humboldt, Bonpland, & Kunth, Limewater Brookweed. Cp (FL): brackish marshes, swamps over calcareous substrate; rare. Peninsular FL, coastal Panhandle FL, sw. LA, and TX, south into Mexico; West Indies. [=FNA, GW, WH; > S. ebracteatus ssp. ebracteatus – K; > S. ebracteatus ssp. alyssoides – K]

Samolus parviflorus Rafinesque, Water-pimpernel, Brookweed. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, VA, WV): stream banks, brackish marshes, pools in floodplains, interdune ponds; common (uncommon in WV). April-October. NB west to BC, south to Central America; also in c. and s. South America. Sometimes treated as a subspecies of the European S. valerandi; the American plant is sufficiently distinct to warrant specific status. S. parviflorus has priority over S. floribundus by a month. [=RAB, F, FNA, GW, W, WV; = Samolus floribundus Kunth – C, G, S; = S. valerandi Linnaeus ssp. parviflorus (Rafinesque) Hultén – K, WH]

2. Hottonia Linnaeus 1753 (Water-violet)

Hottonia inflata Elliott, Featherfoil, Water-violet. Cp (DE, NC, SC, VA), Pd (GA, NC), Mt (WV): slow-moving or stagnant waters of swamps, millponds, beaverponds, sag ponds, oxbows, rivers, probably dispersed by waterfowl, primarily in the Coastal Plain, very rarely in the Piedmont and Mountains; rare. April-July; May-August. ME south to GA, west to TX, inland up the Mississippi Embayment to IL, and at other scattered locations inland (as w. WV, and especially around the Great Lakes). The species shows large population fluctuations, and may be essentially ephemeral at many locations. Townsend (1995) documents its first SC record. [=RAB, C, F, FNA, G, GW, K, S, WV]

3. Primula Linnaeus 1753 (Shooting star)

A genus of about 450 species, primarily of the temperate Northern Hemisphere. Mast et al. (2004) show that Dodecatheon is nested within Primula, and is closely related to (and derived from) Primula subgenus Auriculastrum, apparently via a relatively

1 Leaves cordate, subcordate, or abruptly narrowed to the petiole .............................................................. *P. frenchnii *
1 Leaves long-cuneate at the base, gradually narrowed to the petiole .............................................................. *P. meadia*

**Primula frenchnii** (Vasey) A.R. Mast & Reveal, French's Shooting-star. Ledges, cliffs. April-May. IN, IL, and MO south through KY to AL and AR. [= Y; = Dodecatheon mediana Linnaeus var. frenchnii Vasey – C, F, G, Z; = D. frenchnii (Vasey) Rydberg – FNA, K]

**Primula meadia** (Linnaeus) A. R. Mast & Reveal, Eastern Shooting Star. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, SC): rich forests, woodlands, and rock outcrops (primarily calcareous or mafic), especially with nutrient-rich seepage; uncommon (rare in NC). Late March–early June; late May–June. MD and PA west to s. WI, se. MN, IA, and OK, south to sc. SC, n. GA, n. FL (Gadsden County), AL, and TX. [= Y; = Dodecatheon mediana – RAB, FNA, W, WH, WV; > D. meadia Linnaeus var. mediana – C, F, G, Z; > Dodecatheon mediana Linnaeus var. brachycarpum (Small) Fassett – C, F, G, Z; > D. meadia ssp. mediana – K; > D. meadia ssp. brachycarpum (Small) R. Knuth – K; > D. brachycarpus Small – S; > D. meadia – S; > D. hugeri Small – S; > D. meadia var. genuinum – Z; > D. meadia var. obesum Fassett – Z]

4. **Ardisia** Swartz 1788 (Marlberry)

5. **Myrsine** Linnaeus 1753 (Cocicwood)

A genus of about 300 species (if circumscribed to include *Rapanea*), shrubs and trees, pantropical. References: Pipoly & Ricketson in FNA (2009); Ståhl & Anderberg in Kubitzki (2004).

* *Myrsine cubana* A. de Candolle, Myrsine, Colicwood. Cp (FL): hammocks; rare. Dixie, Levy, and Volusia Counties FL, south to s. FL; West Indies and Central America. [= FNA; = M. guayanensis (Aublet) Kuntze – GW, misapplied; > M. floridana A. de Candolle – K (superfluous name); > M. guayanensis – S, misapplied, orthographic variant; > Rapanea punctata (Lamarck) Lundell – WH]

6. **Anagallis** Linnaeus 1753 (Pimpernel)

1 Leaves alternate; flowers subsessile, on thick pedicels 0.3-1.0 mm long; leaf blades 3-10 mm long ................................................................. *A. minima*
1 Leaves opposite (occasionally in whorls of 3); flowers pedicellate, on slender pedicels 10-25 mm long; leaf blades 5-30 mm long.
2 Petals blue, ca. 2× as long as the sepals .............................................................................................................................................. *A. monelli*
2 Petals red or white (rarely blue), ca. 1× as long as the sepals.
3 Flowers red (rarely white); pedicels usually longer than the leaves ............................................................................................ *A. arvensis* ssp. arvensis
3 Flowers blue; pedicels usually shorter than the leaves ................................................................................................. *A. arvensis* ssp. foemina

* *Anagallis arvensis* Linnaeus ssp. foemina (P. Miller) Schinz & Thellung, Blue Pimpernel. Cp (DE), Pd (DE): disturbed areas; rare, native of Europe. Also reported as introduced in PA, KY, OH, and other scattered states north and west of our area (Kartesz 1999). [= K; = Anagallis arvensis Linnaeus var. caerulea (Schreber) Grenier & Godron – C, G; < A. arvensis – RAB, F, FNA, GW, W; = A. arvensis ssp. coerulea Hartman – S]

* *Anagallis monelli* Linnaeus, Blue Pimpernel. Cp (VA): along intermittent stream in suburban woodlands; rare, probably only a waif, native of sw. Europe. Reported for Fairfax County, VA by Harvill et al. (1992) and Shetler & Orli (2000). [= FNA, K]

**PRIMULACEAE**
7. Trientalis Linnaeus 1753 (Starflower)

Identification notes: Trientalis can be recognized by its terminal whorl of leaves (4-10 cm long), the one to several white flowers borne on terminal, slender pedicels, each flower typically with 7 petals (inconspicuously united at the bases), each petal acuminate. The plant is reminiscent of a white-flowered Lysimachia with only one whorl of leaves.

Trientalis borealis Rafinesque, Northern Starflower, Maystar. M1 (GA, NC, VA, WV), C1 (DE): northern hardwood forests, rich slope forests, often in second-growth areas; uncommon (rare in DE, GA, and NC). May-June. This northern species, widespread in the mountains of VA, and known from a few locations in n. GA and ne. TN (Chester, Wofford, & Kral 1997), was first located in NC only in 1988 (Dellinger 1989). "The attractive white corollas, usually with 7 petals united only at the very base, are open in the late spring and they drop intact – like fallen stars" (Voss 1996). [= FNA; = Trientalis borealis Rafinesque ssp. borealis – K; < T. borealis – C, F, G, W, WV]

8. Lysimachia Linnaeus 1753 (Loosestrife)

A genus of about 150 species, herbs (rarely shrubs), cosmopolitan. Hao et al. (2004) showed that the traditional subgeneric classification of Lysimachia is highly artificial, and that Glauca is embedded within Lysimachia. References: Cholewa in FNA (2009); Coffey & Jones (1980)=Z; Hao et al. (2004); Ståhl & Anderberg in Kubitzki (2004). Key partly adapted from Z.

1 Petals present. .............................................................................................................................................................................................. L. maritima

5 Flowers 5-7 mm across; sepals about 1× as long as the petals ........................................................................................................ L. virginica

5 Flowers 16-24 mm across; sepals about ½× as long as the petals ......................................................................................... L. ×producta

6 Flowers in a terminal raceme or panicle, subtended by bracts much smaller than the stem leaves. ..................................................... L. ×producta

6 Flowers in a terminal raceme or panicle, subtended by bracts much smaller than the stem leaves. ..................................................... L. ×producta

7 Inflorescence a terminal panicle. .................................................................................................................................................. L. fraseri

7 Inflorescence a terminal raceme. .................................................................................................................................................. L. fraseri

8 Leaves linear to lanceolate, broadest near the base, with 3 prominent veins........................................................................... L. ×producta

8 Leaves linear to lanceolate, broadest near the middle, with 1 prominent vein. .................................................................................. L. ×producta

9 Leaves linear to narrowly lanceolate, (1-)-2-4-8 mm wide; sepals stipitate-glandular ........................................................................ L. ×producta

9 Leaves lanceolate to elliptic, 7-20 mm wide; sepals glabrous. ........................................................................................................ L. ×producta

10 Flowers in part (the lower) in the axils of well-developed leaves .............................................................................................. L. ×producta

10 Flowers in the axils of much reduced linear bracts ..................................................................................................................... L. ×producta

11 Flowers in peduncled axillary racemes in the axils of midstem leaves; petals linear to lanceolate, ca. 5 mm long and ca. 1 mm wide, much surpassed by the stamens; [Naumbergia]................................................................................................................ L. thyrsiflora

11 Flowers solitary, or most of them subtended by leaves similar in shape to (though often somewhat smaller than) stem leaves not subtending flowers (or with flowers in axillary, peduncled, densely-flowered racemes in L. thyrsiflora).

12 Petals yellow, marked with black lines; sepals 2.5-4.5 mm (L. vulgaris) or 5.5-9 mm long (L. punctata); stem hairy; [alien]. ................................................................. L. punctata

12 Petals yellow, marked with black lines; sepals 2.5-4.5 mm (L. vulgaris) or 5.5-9 mm long (L. punctata); stem hairy; [alien]. ................................................................. L. punctata

13 Petals plain yellow, not marked with black lines; sepals 2.5-4.5 mm (L. vulgaris) or 5.5-9 mm long (L. punctata); stem hairy; [alien]. ................................................................. L. punctata

13 Petals plain yellow, not marked with black lines; sepals 2.5-4.5 mm (L. vulgaris) or 5.5-9 mm long (L. punctata); stem hairy; [alien]. ................................................................. L. punctata

14 Calyx lobes 3-5 mm long, with red margins; corolla lobes 8-12 mm long, entire ................................................................. L. ×producta

14 Calyx lobes 3-5 mm long, with red margins; corolla lobes 8-12 mm long, entire ................................................................. L. ×producta

15 Mid-cauline leaves with petioles ciliate their entire length. ........................................................................................................... L. punctata

15 Mid-cauline leaves with petioles ciliate their entire length. ........................................................................................................... L. punctata

16 Mid-cauline leaves 1-2 mm wide; flowers 7-14 mm across; [of ne. AL]......................................................................................... L. punctata

16 Mid-cauline leaves 1-2 mm wide; flowers 7-14 mm across; [of ne. AL]......................................................................................... L. punctata

17 Mid-cauline leaves ovate to lanceolate, 17-60 mm wide; sepals with 3 (or 6) usually reddish-brown veins .... L. ciliata

17 Mid-cauline leaves lanceolate to linear, 4-23 mm wide; sepals without reddish-brown veins.

18 Cilia of the petiole not extending onto the leaf blade; leaf blade lanceolate to ovate, typically 2-4× as long as wide, rounded to cuneate at the base; sepal venation conspicuous; capsules 4-6.5 mm in diameter ............................. L. ×producta

18 Cilia of the petiole not extending onto the leaf blade; leaf blade lanceolate to ovate, typically 2-4× as long as wide, rounded to cuneate at the base; sepal venation conspicuous; capsules 4-6.5 mm in diameter ............................. L. ×producta

19 Rhizomes absent, new shoots arising from crown of rootstock ................................................................................................. L. ×producta

19 Rhizomes present, new shoots arising from the rhizome.
Lysimachia asperulifolia

Poiret, Pocsin Loosestrife, "Roughleaf Loosestrife". Cp (NC, SC): low pocosins, high pocosins, streamhead pocosins, savanna-pocosin ecotones, sandhill-pocosin ecotones; rare. May-June; August-October. Endemic to the Coastal Plain of NC and SC. L. asperulifolia is a very distinctive species, easily recognized vegetatively by its whorls of sessile, rounded-based, acuminate, bluish-green (to yellowish-green when shaded or otherwise stressed) leaves. The leaves of L. asperulifolia are not rough; the common name "roughleaf loosestrife" is a misnomer, based on a mistranslation of the specific epithet, the translator assuming that "asperulifolia" meant "rough-leaved." The epithet actually refers to the perceived similarity of the leaves to those of the European Asperula odorata (treated in this work as Galium odoratum), Sweet Woodruff, a plant with which Poiret would have been very familiar. The leaves of G. odoratum are similar to those of L. asperulifolia in their whorled disposition. Franklin (2001) studied the biology of this rare species. [= FNA; K; = L. asperulaefolia – RAB, GW, S (orthographic variant)]

* Lysimachia barystachys

Bunge, Manchurian Loosestrife. Pd (GA): disturbed areas; rare, native of Manchuria. Reported from a single county in nc. GA (Jones & Colle 1988) [further investigate]. [= FNA, K]

* Lysimachia ciliata

* Lysimachia clethroides

Duby, Gooseneck Loosestrife. Mt (NC, WV): roadsides (cultivated and rarely persistent or escaped); rare, native of Japan. July-August. Collected in the Mountains of NC (Macon County), escaped from cultivation; it is also reported as naturalized in Grundy County, TN (Chester, Wofford, & Kral 1997, Kral 1981). It and L. barystachys differ from our other species in their white flowers in a dense terminal spike (with secund tip) and alternate leaves. [= C, FNA, G, K]

* Lysimachia fraseri

Duby, Fraser's Loosestrife. Mt (GA, NC, SC): hardwood forests, forest edges and roadbanks, thin soils around rock outcrops, usually flowering only when exposed to extra sunlight by a tree-fall light gap or other canopy opening; rare. June-August; September-October. W. NC and e. TN south to n. SC, n. GA, and AL; disjunct in s. IL and nw. TN (Stewart County) (Chester, Wofford, & Kral 1997). This rare species is limited in NC to the mountains south of the Asheville Basin, especially in the escarpment gorges of Macon and Jackson counties. Potentially the largest and coarsest of our Lysimachia (up to 2 meters tall), L. fraseri usually occurs as much smaller seedlings and non-flowering individuals. When a tree-fall light gap occurs, individuals flower and fruit. Even seedlings can be separated from the more common and widespread L. quadrifolia by the following characteristics (all best observed at 10×): leaves with a narrow, translucent red border, upper internodes of the stem glandular-puberulent, and backlit leaf without sinus, translucent lineations (L. quadrifolia: leaves without red border, upper internodes sparsely pubescent with longer, nonglandular hairs, or rarely a few of the hairs with slightly bulbous tips, and backlit leaf with numerous sinusuous, translucent lineations). [= RAB, FNA, GW, K, S, W]

* Lysimachia hybrida

Michaux, Lowland Loosestrife. Cp (DE, FL, NC, SC, VA), Mt (NC, VA, WV), Pd (NC, VA): mesic hardwood forests, wet areas; rare. June-August; September-October. ME and s. QC west to AB and WA, south irregularly to ne. FL, Panhandle FL, AR, NE, and AZ. [= C, F, FNA, K, W, WV, Z; = L. lanceolata var. hybrida (Michaux) A. Gray – RAB, GW, WH; = Steironema hybridum (Michaux) Rafinesque ex B.D. Jackson – G, S]

* Lysimachia japonica

* Lysimachia lanceolata

* Lysimachia loomisi

Torrey, Carolina Loosestrife. Cp (GA, NC, SC): moist to wet savannas, pocosin ecotones; uncommon (rare in GA). May-June; August-October. Endemic to the outer and middle Coastal Plain of NC, SC, and e. GA. L. × radfordii = hybrid of L. loomisi × quadrifolia, is intermediate between its parents. [= RAB, FNA, GW, K, S]

* Lysimachia maritima

(Linnaeus) Galasso, Banfi, & Soldano, Sea-milkwort. Cp (MD, NJ, VA?): saline coastal habitats; rare. June-July. The species is interruptedly circumboreal, in North America from QC south to VA on the east coast, and from BC south to OR on the west coast, also inland in w. North America, from SK south to NM. G suggests that L. maritima is introduced near its southern limit in the east. [= FNA; = Glaux maritima Linnaeus – C; K; > G. maritima var. maritima – F, G]

* Lysimachia nummularia

Linnaeus, Creeping Charlie, Creeping Jenny, Moneywort. Pd (DE, GA, NC, SC, VA), Mt (NC, SC, VA, WV), Cp (DE, NC, SC, VA): lawns, pastures, seepages, other moist, disturbed places; common (uncommon in GA, NC, SC), native of Europe. May-July; August-September. The leaves have many minute, maroon dots. [= RAB, C, F, FNA, G, GW, K, S, W]
**PRIMULACEAE**

**Lysimachia × producta** (A. Gray) Fernald (pro sp.). Mt (NC, VA), Pd (VA), Cps (NC): moist areas; rare. May-July; August-October. This is a fertile hybrid of *L. quadrifolia* and *L. terrestris*, sometimes occurring in the apparent absence of one or both parents. [= RAB, C, FNA, K; *L. producta* (A. Gray) Fernald – G, S]  

* Lysimachia quadriflora *Sims, Smooth Loosestrife, Four-flowered Loosestrife. Mt (GA, VA, WV): wet meadows and calcareous fens, stream banks; rare. July-September. MA, s. ON, MI, and ND south to w. VA, WV, nw. GA, AL, and AR; mainly north and west of the Ohio River, very rare and scattered in or east of the Appalachians. Reported for c. NC by Coffey & Jones (1980), the record seems very unlikely and is rejected unless documentation is found. [= F, FNA, K, W, WV, Z; = Steironema quadriflora (Sims) Hitchcock – G]  

* Lysimachia quadrifolia *Linnaeus, Whorled Loosestrife. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cps (DE, NC, SC, VA): a wide variety of forests and openings, including pine savannas of the outer Coastal Plain, ranging from moist to very dry; common (uncommon in Coastal Plain south of VA). May-August; August-October. ME west to WI and MN, south to SC, c. GA, AL, and TN. Although the species normally has whorled leaves, immature and small plants often have opposite leaves only. See *L. fraseri* for discussion of vegetative features useful in distinguishing the two species. *L. × radfordii* Ahles, a hybrid of *L. loomisii × quadriflora*, is intermediate between its parents. [= RAB, C, F, FNA, G, GW, K, S, W, WV]  

* Lysimachia radicans *Hooker, Trailing Loosestrife. Mt (VA), Cps (VA): moist forests, swamps; rare. June-August. The main distribution of this species is in the Mississippi Embayment, from MO and w. TN south to s. AL, MS, AR, LA, and e. TX; disjunct occurrences in VA and (allegedly) e. NC are curious. The report for NC is from a species list for Nags Head Woods, Dare County; it is unpublished, apparently not documented by an herbarium specimen, and rejected unless documentation is found. [= C, F, FNA, K, W, Z; = Steironema radicans (Hooker) A. Gray – G, S]  

* Lysimachia thyrsiflora *Linnaeus, Tufted Loosestrife. Mt (WV): bogs, swamps, marshes; rare. May-July. Circumboreal, south in North America to NJ, PA, OH, and MO (Kartesz 1999), WV (FNA), and MD (from Big Marsh, Kent County) (Steury, Tyndall, & Cooley (1996), NE, CO, UT, and CA. [= C, F, K; = Naumburgia thyrsiflora (Linnaeus) Duby – G]  

* Lysimachia tonsa *(Wood) ex Pax & R. Knuth, Southern Loosestrife, Appalachian Loosestrife. Pd (GA, NC, SC, VA), Mt (GA, VA, WV): upland forests, especially over calcareous or mafic rocks; rare. May-July; August-October. Sc. VA, sw. VA, and KY south to SC, wca. GA, and e. TN. The range is centered on the Southern Appalachians, but the species is essentially absent from the higher mountains – a "doughnut range." [= RAB, C, F, FNA, K, W, WV, Z; = Steironema intermedium (Kearney – G) Ahles, a hybrid of *L. loomisii × quadriflora*, is intermediate between its parents. [= RAB, C, F, FNA, G, GW, K, S, W, WV, Z; = Steironema radicans (Hooker) A. Gray – G, S]  

* Lysimachia vulgaris *Linnaeus, Garden Loosestrife. Mt (WV): disturbed bottomlands, marshes, disturbed areas; rare, native of Europe. Introduced and naturalized south at least to se. and sc. PA (Rhoads & Klein 1993), WV, KY, MD, and NJ (Kartesz 1999) and now reported for all of WV (Steury, Fleming, & Strong 2008). [= C, F, FNA, G, K]  

* Lysimachia graminea *(Greene) Handel-Mazzetti, Grassleaf Yellow-loosestrife. Endemic to ne. AL (Little River Canyon area). [= FNA, K, Z; = Steironema gramineum Greene – S]  

**334. THEACEAE** D. Don 1825 (Tea Family) [in ERICALES]  

With a more circumscribed definition (excluding Pentaphylacaceae), a family of about 9 genera and 450 species, trees and shrubs, of primarily tropical and subtropical regions of the Old and New Worlds. References: Prince in FNA (2009); Prince & Parks (2001); Stevens, Dressler, & Weitzman in Kubitzki (2004).  

1 Leaves deciduous, medium green above, herbaceous in texture.  
2 Leaves broader toward the tip, 2-2.5× as long as wide; [tribe Gordonieae] ................................................................. Frankinia  
2 Leaves broadest near or below the middle, 1-1.8× as long as wide; [tribe Stewartieae] ................................................................. Stewartia  
1 Leaves evergreen, dark green above, coriaceous in texture.  
3 Leaves ovate to elliptic (broadest at or below the middle), 1-3× as long as wide, slightly to strongly acuminate, 5-10 (<15) cm long; [introduced shrub, planted in upland soils]; [tribe Theaceae] ................................................................. Camellia  
3 Leaves oblanceolate to narrowly elliptic (broadest at or above the middle), 2.5-4× as long as wide, acute to obtuse (rarely slightly acuminate), 8-30 cm long; [small to large tree, native in acidic Coastal Plain wetlands]; [tribe Gordonieae] ................................................................. Gordonia  

**Camellia** Linnaeus 1753 (Camellia, Tea)  

1 Sepals deciduous; flowers sessile; leaves mostly ovate, acuminate, > 4 cm wide ................................................................. C. japonica  
1 Sepals persistent; flowers on pedicels; leaves mostly elliptic, only slightly acuminate, < 4 cm wide ................................................................. C. sinensis
Camellia japonica Linnaeus, Camellia. Frequently cultivated, sometimes persistent around old home sites; native of China and Japan. [= K]

Camellia sasanqua Thunberg, Sasanqua Camellia, is reported as introduced in NC, SC, GA, and FL (Kartesz 1999). [= K] [not yet keyed]

Camellia sinensis (Linnaeus) Kuntze, Tea. Cultivated in plantations and as a horticultural novelty, rarely escaped; native to China. [= K; = Thea sinensis Linnaeus]

Franklinia Bartram ex Marshall 1785 (Franklinia)

A monotypic genus, apparently endemic to e. GA (now presumably extinct in the wild). Franklinia is actually most closely related to the Asian genus Schima (Prince & Parks 2001); its closest relative in North America is Gordonia, from which it differs in its deciduous leaves (vs. evergreen) and globose fruits (vs. pointed). References: Prince in FNA (2009); Bozeman & Rogers (1986); Stevens, Dressler, & Weitzman in Kubitzki (2004).

Franklinia alatamaha Bartram ex Marshall, Franklinia. Habitat speculative, probably dry sandy ridges, near the mouth of the Altamaha River; believed to be extinct in the wild. It was native to the Coastal Plain of GA, where it was found by William Bartram near the mouth of the Altamaha River. It has not been seen in the wild since 1803 and is now considered to be extinct in the wild. It is sometimes cultivated in our area. Bozeman & Rogers (1986) discuss the history of this tree. [= FNA, K, S; = Gordonia alatamaha (Bartram ex Marshall) Sargent]

Gordonia Ellis 1771 (Loblolly Bay, Gordonia)

As recircumscribed, a genus of 2 species, trees, of se. North America and Central America (Gordonia brandegeei H. Keng). The other 20-70 species, trees and shrubs, of se. Asia, previously assigned to Gordonia are actually in a different tribe and should be reassigned to Polyspora (Yang et al. 2004). References: Prince in FNA (2009); Yang et al. (2004); Stevens, Dressler, & Weitzman in Kubitzki (2004).

Identification notes: Gordonia is one of the "bay trees" so typical of acid Coastal Plain wetlands of our area – the other two being Sweet Bay (Magnolia virginiana of the Magnoliaceae) and Swamp Red Bay (Persea palustris of the Lauraceae). Gordonia can be distinguished from the other two species by its smooth leaves, serrate toward the tip, odorless when crushed (vs. pubescent leaves, entire-margined, aromatic when crushed). Gordonia is also distinctive in its narrow, conical crown, resembling Liriodendron or Chamaecyparis, and its medium-gray, deeply furrowed bark. Most individuals of Gordonia have at least a few orange-red leaves visible, at any season.

Gordonia lasianthus (Linnaeus) Ellis, Loblolly Bay, Gordonia. Pocosins, bayheads, acidic, organic-rich swamp forests, wet pine savannas, bay forests. July-September; September-October. Ne. NC south to s. peninsular FL, west to s. MS (Sorrie & Leonard 1999), a Southeastern Coastal Plain endemic. Peat-filled Carolina bays and large peat dome pocosins typically have Gordonia as an important tree, surpassed in abundance and importance only by Pinus serotina. On deep peats, Gordonia individuals are stunted and rarely reach sizes larger than pocosin shrubs. [= RAB, FNA, GW, K, S, WH]

Stewartia Linnaeus 1753 (Stewartia, Wild Camellia)

A genus of about 20 species, trees and shrubs, of temperate e. Asia and e. North America. Both our species of Stewartia are very attractive shrubs. The other species of the genus are Asian. Li et al. (2002) demonstrate that our 2 species form a clade together, separate from and basal to the Asian species; Prince (2002) shows a different tree topology. References: Prince in FNA (2009); Spongberg (1974)=Z; Li et al. (2002); Prince (2002); Stevens, Dressler, & Weitzman in Kubitzki (2004).

Identification notes: The leaves are borne in horizontal planes, reminiscent of Cornus florida and Cornus alternifolia. The leaves of both species are obsequiously serrate or crenate, and also conspicuously and copiously ciliate-margined.

1 Style 1, with a 5-lobed stigma; seeds 5-7 mm long, shiny, plump, angled; fruit lobes rounded; leaves mostly 4-10 cm long, with 7-8 pairs of lateral veins; petioles narrowly winged (0.1-1 mm wide), not enclosing and concealing the terminal and lateral buds; calyx subtended by 2 persistent bracts, each 2-4 mm long; seeds shiny.................................................................S. malacodendron

1 Styles 5, separate; seeds 8-10 mm long, dull, flat, thin (to slightly winged); fruit lobes angled; leaves mostly 7-15 cm long, with 5-7 pairs of lateral veins; petioles widely winged (1-2 mm wide), enclosing and concealing the terminal and lateral buds; calyx subtended by 1 persistent bract, 11-14 mm long; seeds dull...........................................................................................................................................S. ovata
Stewartia malacodendron Linnaeus, Silky Camellia, Virginia Stewartia. Mesic forests, especially on beech-dominated bluffs or "islands" in Coastal Plain swamps. May-June; September-October. Primarily Coastal Plain, se. VA south to FL, west to se. TX, but extending inland to the Piedmont of GA, NC, and SC and the Mountains of NC. [= RAB, FNA, K, W, WH, Z; = Stewartia malacodendron – C, F, G (orthographic variant); = Stauria malachodendron – S (orthographic variant)]

Stewartia ovata (Cavanilles) Weatherby, Mountain Camellia, Mountain Stewartia. Mesic forests, especially acidic bluffs, often in openings in rhododendron thickets ("hells"), in the Coastal Plain of VA restricted to ravines. Late June-July; August-September. Primarily Appalachian: e. KY, sc. VA, e. VA south to c. NC, w. SC, e. and c. TN to n. GA and n. AL, avoiding, however, the higher mountains, and extending into the Coastal Plain in e. VA. The species is most abundant in the Cumberland Plateau of KY and TN. [= RAB, C, F, FNA, G, K, W, Z; = Malachodendron pentagynum (L'Héritier) Small – S]

335. SYMPLOCACEAE Desfontaines 1820 (Sweetleaf Family) [in ERICALES]

A family of 1 genus and about 250-300 species, trees and shrubs, of tropical and warm temperate America and Asia. References: Nooteboom in Kubitzki (2004).

Symplocos Jacquin 1760 (Sweetleaf)

A genus of about 300 species, trees and shrubs, of tropical and warm temperate America and Asia. Wang et al. (2004) found that the affinities of S. tinctoria are with South American species of subgenus Epigenia, rather than with east Asian species of subgenus Hopea, section Palaeosymplocos. References: Wang et al. (2004); Nooteboom in Kubitzki (2004).

Identification notes: The foliage of S. tinctoria has a sweet taste, and an odor and taste similar to green apples. Sometimes the leaves are glossy and appear subcoriaceous, somewhat resembling Kalmia latifolia.

1 Leaf margins sharply and finely glandular-dentate; inflorescence a terminal panicle; drupes blue (white); [alien, rarely cultivated and escaped]; [subgenus Palauros].........................................................................................................................S. paniculata

1 Leaf margins entire to coarsely serrate-crenate; inflorescence an axillary fascicle; drupes green; [native, common in parts of our area]; [subgenus Symplocos; section Barberina].......................................................................................................................................S. tinctoria

* Symplocos paniculata (Thunberg) Miq., Sapphire-berry, Asiatic Sweetleaf. Suburban woodlands; native of e. Asia. Spreading from plantings at scattered locations in the ne. United States, such as DE and District of Columbia (Whittemore 2003).

Symplocos tinctoria (Linnaeus) L'Heritier, Sweetleaf, Horsesugar. Moist bottomland forests, pocosin edges, mesic forests, ridgeline forests. March-May; August-September. DE south to n. FL and west to e. TX and se. OK. The range in our area is discontinuous and interesting, the species rather abundant in the Coastal Plain throughout our area, and in the Mountains of NC and SC (absent from the VA mountains!), but present in the Piedmont only near its borders with the other provinces and in scattered sites in the central Piedmont. The leaves have a subcoriaceous and rather evergreen appearance, but are (in our area) only semi-evergreen. As the name implies, the leaves are somewhat sweet, but the sweetness seems variable from plant to plant, season to season, and taster to taster. Whether sweet or not, the taste is distinctive and is helpful (once learned) in distinguishing this rather nondescript shrub or small tree. Where protected from fire, S. tinctoria can reach considerable size, up to 20 cm in diameter and 10 m tall, with longitudinally striped bark. [= RAB, C, GW, K, S, W, WH; > S. tinctoria var. tinctoria – F, G; > S. tinctoria var. pygmaea Fernald – F, G (probably based on fire sprouts); > S. tinctoria var. ashei Harbison]

336. DIAPENSIACEAE (Link) Lindley 1836 (Diapensia Family) [in ERICALES]

1 Leaves cauline, generally < 10 mm long and < 3 mm wide; [of Coastal Plain pinelands]................................................................. Puxidanthanthera

1 Leaves basal (or on a short caudex), generally > 50 mm long and > 30 mm wide; [throughout our area, more common in the Piedmont and Mountains].

2 Leaves orbicular, rounded or with a slight point at the apex, finely serrate (4-8 teeth per cm), the teeth not prominently mucronate; flowers in racemes; [widespread]............................................................................................................................................... Galax
2 Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1–4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere].................................................................................................................................Shortia

**Galax** Sims 1804 (Galax)

**Galax urceolata** (Poiret) Brummitt, Galax. Mountain forests, rock outcrops, nearly ubiquitous in the Mountains, more restricted in habitat elsewhere, moist to dry slopes in the Piedmont and Coastal Plain, often associated with *Kalmia latifolia* or *Rhododendron maximum*. May–July; August–October. The genus consists of this single species, with a range centered in the Southern Appalachians, occurring in NC, SC, GA, AL, e. TN, KY, VA, WV, and MD. Diploid and tetraploid races exist, and both are present in our area (Nesom 1983). In NC, diploids are the predominant race in the Mountains, the s. Piedmont, and the s. and c. Coastal Plain; tetraploids predominate along the Blue Ridge Escarpment, the n. Piedmont, and the n. Coastal Plain. In SC, diploids occur in the Coastal Plain and Piedmont, tetraploids in the mountains and escarpment. In GA, the pattern is similar, with diploids extending further into the Piedmont and tetraploids restricted to the Mountains and upper Piedmont. In AL, only diploids are known. In VA, however, tetraploids occupy the Coastal Plain and e. Piedmont, diploids in the upper Piedmont and Mountains. A study of the flavonoids supported the idea that the tetraploid is an autopolyploid derivative of the diploid. Because of the close morphologic similarity, substantially sympatric distributions, and apparent general absence of demonstrable ecologic differentiation between the two races, it seems best not to attempt to taxonomically distinguish them (Nesom 1983; Soltis, Bohm, & Nesom 1983). "Galax-pulling" (the gathering of the often bronze-colored evergreen leaves for the florist trade) is an important folk industry in the mountains. [= FNA, K, W, X; = *G. aphylla* Linnaeus – RAB, C, F, G, S, WV, misapplied]

*Pyxidanthera* Michaux 1803 (Pyxie-moss, Pyxie)

1 Leaves (3.3) 4–10 mm long; leaves lanceolate, averaging > 1.0 mm wide (oblanceolate and up to 2.5 mm wide if etiolated under leaf litter); leaves (in fresh material) herbaceous in texture, < 0.1 mm thick; leaves of sterile shoots ciliate along the margins at the base, usually also pubescent on the upper surface near the base, but the pubescence rarely extending > 1/3 of the way from the base to the tip; internodes usually > 1 mm long; [of moist sites in the outer and inner Coastal Plain, including the Sandhills]............................................................. *P. barbulata*

1 Leaves 1–5 mm long (to 7 mm long if etiolated under leaf litter); leaves ovate, averaging < 1.2 mm wide (lanceolate and up to 1.5 mm wide if etiolated under leaf litter); leaves (in fresh material) succulent in texture, up to 0.5 mm thick; leaves of sterile shoots ciliate along the margins; internodes usually < 1 mm long; [in extremely xeric sites over coarse deep sand or clay in the Sandhills region or se. NC and se. SC] ......................................................................................... *P. brevifolia*

*Pyxidanthera barbulata* Michaux, Common Pyxie-moss, Big Pyxie. Pine savannas, pine flatwoods, pocosin margins, edges of sandhill seepage bogs, primarily in mesic to hydric sites, in wet sands and peaty sands, occasionally extending to submesic sands, but generally with a permanently or seasonally high water table, often with *Sphagnum*. March–April; May–June. NY (Long Island) south to NJ, and from se. VA south to n. SC. In the Sandhills, where its range overlaps *P. brevifolia*, *P. barbulata* is limited to seepage areas or pocosin ecotones, while *P. brevifolia* occurs in xeric situations far upslope. [= F, FNA, G, GW, K, S; = *P. barbulata* var. barbulata – RAB, < *P. barbulata* – X, Z]

*Pyxidanthera brevifolia* B.W. Wells, Sandhills Pyxie-moss, Wells’s Pyxie-moss, Little Pyxie. On xeric sandhills, generally over deep sand or sand-clay mixtures near the summits or on the upper slopes of sandhills, restricted to the Sandhills region. December–March; February–May. This species is endemic to a six-county area of the Sandhills of NC and SC. In NC, it is nearly limited to Fort Bragg, and is puzzlingly absent from seemingly suitable habitat on the Sandhills Game Land to the west. The taxonomic status of this entity has been controversial, with different authors considering it a species, a variety, or an ecotype not worthy of taxonomic status. A combination of morphologic, embryologic, phytogeographic, ecological, and phenologic evidence favors the recognition of two taxa in *Pyxidanthera*. Recent surveys of *Pyxidanthera* in the Sandhills of NC have shown that it is ecologically distributed in a strongly bimodal manner. While ecologically intermediate situations predominate in the Sandhills, this habitat is rarely occupied by *Pyxidanthera*. Instead, *Pyxidanthera* is usually found either in very dry (hill-top) or moist (pocosin ecotones) situations. A few morphologically intermediate populations are occasionally found, in ecologically intermediate situations, but the vast majority of populations are readily assigned to one taxon or the other. Godt & Hamrick (1995) showed low levels of allozyme differentiation between the two taxa and supported varietal status. [= FNA, K, S; = *P. barbulata* var. brevifolia (B.W. Wells) Ahles – RAB, < *P. barbulata* – X, Z]

*Shortia* Torrey & Gray 1842 (Shortia, Ocone Bells)
A genus of 5-6 species, perennial herbs, of e. Asia and the Southern Appalachians. The Asian species are: *S. uniflora* (Maximowicz) Maximowicz of montane Japan (with 3 varieties), *S. rotundifolia* (Maximowicz) Makino of Japan, *S. exappendiculata* Hayata, of montane Taiwan, *S. soldanelloides* (Siebold & Zuccarini) Makino, of montane Japan (with as many as 5 varieties recognized), and *S. sinensis* Hemsley of montane Yunnan Province, China. References: Nesom in FNA (2009); Davies (1952)=Z; Hatley (1977)=Y; Barnes (1990); Scott in Kubitzki (2004).

1 Style 6-10 (-12) mm long; filaments generally 5-7 mm long; corolla lobes 14-17 mm long; [native of McDowell County, NC] ..................................................

1 Style (10-) 12-18 mm long; filaments generally 6-9 mm long; corolla lobes 16-25 mm long; [native to Transylvania and Jackson counties, NC, Oconee and Pickens counties, SC, and Rabun County, GA; introduced elsewhere] ...........................................

*Shortia galacifolia* Torrey & A. Gray var. *brevistyla* Davies, Northern Shortia. On moist slopes, creekbanks, and rock outcrops in humid escarpment gorges with high rainfall, generally in deep shade under *Rhododendron maximum*, at elevations of 350-550m. March–April; July–August. This variety is known only from McDowell County, NC, where it occurs on several tributaries of the Catawba River and North Fork Catawba River. It has also been reported from the gorge of the Linville River, Burke County, but this locality is questionable and has not been relocated. This area is disjunct about 100 kilometers to the northeast along the Blue Ridge Escarpment from the range of the typic variety. In addition to the characters used in the key, var. *brevistyla* differs in a variety of characters of the flowers and leaves, as discussed in Davies (1952) and Hatley (1977). Whether the recognition of infraspecific taxa is warranted is not clear; Davies argued for and Hatley against. Though the morphological characters are relatively minor and partially overlapping, their correlation with disjunct ranges and their likely influence on pollination and reproduction influence me to provisionally accept varietal status, pending further research. [= FNA, K, Z; < *Sherwoodia galacifolia* (Torrey & A. Gray) House – S]

*Shortia galacifolia* var. *galacifolia*, Southern Shortia, Oconee Bells. On moist slopes, creekbanks, and rock outcrops in humid escarpment gorges with high rainfall, generally in deep shade under *Rhododendron maximum and R. minus*, at elevations (in NC) of 350-650m. March–April; July–August. This variety occurs in Transylvania and Jackson counties, NC, Oconee and Pickens counties, SC, and Rabun County, GA, where it occurs in the remarkable escarpment gorges region, at elevations from 200-650m (formerly at lower elevations, now submerged under Lake Jocassee). Most of the population of this species, including the type locality, was destroyed in the early 1960’s by the construction of Lake Jocassee (Zahner & Jones 1983). In the gorge tributaries of the Eastatoe, Toxaway, Horsepasture, and Thompson rivers, *Shortia* can sometimes form a dense groundcover covering acres. Various outlying locations, such as in NC (Swain and Macon counties), VA (Amherst County), and TN (Blount, Monroe, and McMinn counties) are not considered native, and are adventive or the result of persistence after cultivation. The species is prized by gardeners, and survives well outside its natural range. [= FNA, K, Z; < *Sherwoodia galacifolia* – RAB, C, G, W, X, Y; < Sherwoodia galacifolia (Torrey & A. Gray) House – S]

337. STYRACACEAE Dumortier 1829 (Storax Family) [in ERICALES]

1 Corolla lobes 4; fruit elongate, winged, 2.5-5 cm long; petioles 15-25 mm long.......................................................... *Halesia*

1 Corolla lobes 5; fruit globose, not winged, 0.5-0.9 cm in diameter; petioles 2-10 mm long.......................................................... *Styrax*

1 Petals united only basally, the lobes longer than the tube; fruits broadly 2-winged; leaves broadly obovate to suborbicular, 1-2× as long as wide.

2 Corolla 10-15 mm long.................................................................................................................................................. *H. diptera var. diptera*

2 Corolla 20-30 mm long.................................................................................................................................................. *H. diptera var. magniflora*

*Halesia* J. Ellis ex Linnaeus 1759 (Silverbell, Snowdrop Tree)

A genus of about 4 species, trees and shrubs, of e. North America and e. Asia. The genus was named to honor Stephen Hales; it therefore seems more appropriate to pronounce the genus with three syllables (the accent on the first) than the commonly heard four, which thoroughly distorts the honoree’s name. The number of taxa in our area and their appropriate taxonomic level are in dispute; recent analyses vary from 2-5, with specific or varietal status. References: Fritsch in FNA (2009); Fritsch & Lucas (2000)=X; Reveil & Seldin (1976)=Y; Sargent (1921); Godfrey (1988)=Z.

1 Petals united only basally, the lobes longer than the tube; fruits broadly 2-winged; leaves broadly obovate to suborbicular, 1-2× as long as wide.

2 Corolla 10-15 mm long.................................................................................................................................................. *H. diptera var. magniflora*

2 Corolla 20-30 mm long.................................................................................................................................................. *H. diptera var. diptera*
STYRACACEAE

1 Petals united for most of their length, the tube longer than the lobes; fruits narrowly or broadly 4-winged; leaves elliptic-oblong, ca. 2× as long as wide.

2 Leaves generally broadly obovate, sometimes broadly ovate, 5-14 cm long, 4-10 cm wide, the apices acute to short-acuminate, densely and finely pubescent beneath, giving the underside of the leaf a pale color; inflorescence usually of 5-20 flowers .............................................. S. japonicus

3 Leaves narrowly elliptic to ovate or obovate, usually 2-8 cm long, 1-4 cm wide, the apices short- to long-acuminate, glabrous or sparsely pubescent beneath (to densely pubescent and then giving the underside of the leaf a rusty color in var. pulverulentus); inflorescence usually of 1-7 flowers.

4 Leaves oblong-elliptic, glabrous or sparsely pubescent on the undersurfaces and petioles, the margins usually distantly toothed toward the apices; pedicels 10-14 mm long; calyces essentially glabrous; new growth glabrous to sparsely pubescent ................................................................. S. americanus var. americanus

5 Leaves elliptic to ovate or oblanceolate or obovate, sparsely to densely scurfy-hairy on the undersurfaces and petioles, margins entire to serrate; pedicels 4-6 mm long; calyces and pedicels densely scurfy-hairy; new growth densely matted pubescent .............................................. S. americanus var. pulverulentus

Styrax Linnaeus 1753 (Snowbell, Storax)

A genus of about 120-130 species, trees and shrubs, of s. Europe, Malesia, se. Asia, se. North America, and tropical America. References: Gonsoulin (1974)=Z. Nicolson & Steyskal (1976) discuss at length the grammatical gender of the genus, and conclude that it should be treated as masculine.

1 Pedicels 15-50 mm long ................................................................................................................................................ S. japonicus

2 Pedicels 4-10 (-14) mm long

3 Leaves oblong-elliptic, glabrous or sparsely pubescent on the undersurfaces and petioles, the margins usually distantly toothed toward the apices; pedicels 10-14 mm long; calyces essentially glabrous; new growth glabrous to sparsely pubescent ................................................................. S. americanus var. americanus

4 Leaves elliptic to ovate or oblanceolate or obovate, sparsely to densely scurfy-hairy on the undersurfaces and petioles, margins entire to serrate; pedicels 4-6 mm long; calyces and pedicels densely scurfy-hairy; new growth densely matted pubescent .............................................. S. americanus var. pulverulentus

Styrax americanus Lamarck var. americanus, American Snowbell, American Storax. Swamp forests, pocosin edges, other moist to wet habitats. April-June; July-September. Var. americanus ranges from ne. WV, OH, s. IN, s. IL, s. MO, south to s. FL and e. TX. See discussion below on var. pulverulentus and the presence in our area of transitional plants. [= C; < S. americana – RAB, G, GW, W; < S. americana var. americana – F; Z; = S. americana – Y]

Styrax grandifolius Aiton, Bigleaf Snowbell, Bigleaf Storax. Upland forests, bluffs. April-May; August-September. Se. VA south to ne. FL and Panhandle FL, west to e. TX, north to se. MO. [= C, FNA, K, WH; = S. grandifolia – RAB, F, G, S, W, Z]

Styrax japonicus Siebold & Zuccarini, Japanese Snowbell. Suburban woodlands; native of e. Asia. [= FNA, K]
A family of 3 genera and about 22 species, perennial insectivorous herbs, of e. North America (Sarracenia), w. North America (Darlingtonia), and ne. South America (Heliamphora). References: Mellichamp in FNA (2009); Neyland & Merchant (2006); Kubitzki in Kubitzki (2004).

**Sarracenia** Linnaeus 1753 (Pitcherplant)

**Identification notes:** Hybrids between the various species of pitcher-plants are relatively frequent; see Bell (1952), Bell & Case (1956), Mellichamp (2008), and Mellichamp in FNA (2009) for further discussion. They are usually rather easy to determine, since they show intermediacy in characters, and usually are found in close proximity to both parents.

1. Pitchers mostly decumbent; lateral wing of the pitcher very prominent; petals maroon to pink; **[section Erectae]**

2. Pitchers prominently marked with white on the hood; hood of the pitcher globose; orifice formed by the fusion of the hood margins ...

3. Petals pale pink; lip of pitcher 2.6-7.5 mm thick at thickest point; scape 16.3-35.1 cm high; style arm 2.6-4.1 cm long; [of the Gulf Coastal Plain, from sw. GA westward] ........................................................................................................... S. purpurea var. purpurea

4. Pitchers > 3× as long as broad; pitchers glabrous on the outer surface; petals dark maroon (occasionally red); rhizomes generally vertical, and with relatively many pitchers per crown (often 6-10); [of Ya. VA northward] ........................................... S. purpurea var. purpurea

5. Hood lobes closely incurved, touching each other or nearly so, obscuring the hood opening; hairs lining the hood averaging 0.8-1.0 mm long; [of the Mountains of sw. NC, nw. SC, and ne. GA] ................................................................. S. purpurea var. montana

6. Areas of white tissue all around the summit of the pitcher and throughout the hood, the areas of bright white tissue surrounded by a conspicuous network of reddish venation; hood erect or ascending; petals maroon .............................................. S. leucophylla

7. Areas of white tissue all around the summit of the pitcher and throughout the hood, the areas of bright white tissue surrounded by a conspicuous network of reddish venation; hood arching horizontally over the orifice; petals pale lemon yellow

8. Pitchers with white (or whitish and translucent) patches toward the summit and behind the orifice and/or on the hood.

9. Petals yellow; pitcher hood 4-10 (-14) cm wide.

10. Phyllodia (nonpitcher leaves) many per plant and forming a rosette, 5-18 cm long, strongly curved, usually curving 45-90 degrees; scapes taller than the pitchers; [inland, from sw. NC and e. TN south and west to n. and wc. GA and e. AL] ................................................. S. oreophila

Phyllodia (nonpitcher leaves) rare, only a few per plant (if present at all), 12-30 cm long, straight to slightly curved; scapes shorter than the pitchers; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to e. TX].

11. Narrowed base of the hood not purple-spotted, its sides revolute but not rolled backwards and nearly touching; blade of the hood ovate, slightly cordate basally; [of the Coastal Plain, from s. AL west to e. TX] .................................................................................. S. alata

12. Narrowed base of the hood usually purple-spotted, its sides strongly rolled backwards (away from the orifice) such that they nearly touch; blade of the hood broadly reniform to orbicular-reniform, broadly cordate basally; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to se. MS] ........................................................................... S. flavus

**STYRACACEAE** Dumortier 1829 (Pitcherplant Family) [in ERICALES]

A family of 3 genera and about 22 species, perennial insectivorous herbs, of e. North America (Sarracenia), w. North America (Darlingtonia), and ne. South America (Heliamphora). References: Mellichamp in FNA (2009); Neyland & Merchant (2006); Kubitzki in Kubitzki (2004).
SARRACENIACEAE

9 Petals maroon; pitcher hood < 4 cm wide (except S. alabamensis ssp. alabamensis, which can be up to 8.8 cm wide).

12 Orifice wing loosely rolled, with a pronounced “spout” over the wing; summer pitchers ca. 10× as long as the width of the pitcher mouth; orifice yellow-green; [of the Coastal Plain of c. and s. AL and s. MS]

13 Pitcher background color yellow, the upper pitcher weakly or not veined on the outer surface; [of c. AL (Autauga, Chilton, and Elmore counties)] S. alabamensis ssp. alabamensis

13 Pitchers background color tan, the upper pitcher strongly reticulately veined on the outer surface; [of s. AL, s. MS, and w. FL]......

12 Orifice rim tightly rolled, with a very slight “spout” over the wing; summer pitchers narrow and elongate, ca. 20× as long as the width of the pitcher mouth; [of the Coastal Plain of NC, SC, GA, and Panhandle FL, and the Mountains of sw. NC and nw. SC].

14 Pitchers (25-) avg. 40-50 (-75) cm tall; scapes about the same height as the pitchers; hood ascending, leaving the orifice exposed, 1.5-6.5 cm long, 2.0-5.4 cm wide; orifice 2.8-4.2 cm wide; [of the Mountains of NC and SC]...

14 Pitchers (7-) avg. 15-60 cm tall (-35) cm tall; scapes 1.5-2× the height of the leaves (pitchers); hood horizontal, held closely over the orifice, 0.7-4.5 cm long, 0.7-3.9 cm wide; orifice 1.5-3.5 cm wide; [of the Coastal Plain of NC, SC, and GA].

15 Pitchers (7-) 15-43 cm tall; orifice 1.5-2.3 cm wide; [se. and sc. NC south through SC to sc. GA]...

15 Pitchers 47-61 cm tall; orifice 2.4-3.5 cm wide; [sw. GA west to FL Panhandle]...

Sarracenia flava Linnaeus, Yellow Pitcherplant, Trumpetsavannas, seepage bogs, pocosins. March-April; May-June. Se. VA south to n. FL and west to s. AL and se. MS. In the centers of peat domes and large peat-filled Carolina bays, S. flava is sometimes very abundant, occasionally the dominant plant over areas exceeding several square kilometers. [= RAB, C, F, FNA, G, GW, K, Q, U, W, Z; < S. flava – S (also see S. oreophila); > S. flava var. flava – X; > S. flava var. atropurpurea (Bull) C.R. Bell – X; > S. flava var. maximula Bull ex Masters – X; > S. flava var. ornata Bull ex Masters – X; > S. flava var. cuprea Schnell – X; > S. flava var. rugelii (Shuttleworth ex de Candolle) Masters – X; > S. flava var. rubricorpora Schnell – X]

Sarracenia jonesii Wherry, Mountain Sweet Pitcherplant. Bogs, cataract seeps. May; July. Endemic to a small area in sw. NC and nw. SC. There has been a great deal of disagreement over the taxonomic treatment of this taxon, a montane sibling of S. rubra. See Wherry (1929), Bell (1949), McDaniel (1971), Wherry (1972), Case and Case (1976), Schnell (1977), Massey et al. (1983), and McDaniel (1986) for further discussion. [= FNA, V, W; < S. rubra – RAB, GW, Q, U, Z; = S. rubra ssp. jonesii (Wherry) Wherry – K, X]

Sarracenia leucophylla Rafinesque, Whitetop Pitcherplant, Crimson Pitcherplant. Wet pine savannas. Sw. GA, w. FL, s. AL, and se. MS, a Gulf Coastal Plain endemic; introduced in eastern NC. The NC population (on Croatan National Forest, Carteret Co.) was apparently introduced in the 1980s; it is not known whether this species will spread in NC, but it is persisting and has been independently “discovered” several times. [= FNA, GW, K, U, X, Z; = S. drummondii Croom – Q, S]

Sarracenia minor Walter var. okefenokeensis Schnell, Okeefenokee Hooded Pitcherplant. On floating vegetation mats, ditches, and other very wet sites. Endemic to Okeefenokee Swamp, se. GA. See Schnell (2002a) for additional information. < S. minor – FNA, GW, K, Q, S, U, X, Z]

Sarracenia psittacina Michaux, Parrot Pitcherplant. Savannas. This distinctive species is distributed primarily in the East Gulf Coastal Plain, but ranges east to the Atlantic Coastal Plain of e. GA (Bullock County), in close proximity to the SC border. [= FNA, GW, K, Q, S, U, X, Z]
**SARRACENIACEAE**

*Sarracenia purpurea* Linnaeus var. *purpurea*, Northern Purple Pitcherplant. Bogs. April–May; June–July. The species as a whole is widespread in e. North America, the only *Sarracenia* to extend north of se. VA. Var. *purpurea* ranges from NL (Labrador) to NT and BC, south to NJ, DE, e. MD, w. MD (where not native), ne. VA, e. WV (where not native), OH, IN, IL, MN, and WA. A nomenclatural battle about the application of the typic variety has been resolved, with *purpurea* applying to the northern variety (Reveal 1993, Cheek 1994, Kartesz & Gandhi 1995, Cheek 2001). [= C, F, G, Z; < *S. purpurea* – RAB, GW, Q, S, U, W, WV; = *S. purpurea* ssp. *gibbosa* (Rafinesque) Wherry – K; = *S. purpurea* var. *terrae-novae* de la Pylaie – Reveal (1993); < *S. purpurea* ssp. *purpurea* – FNA; = *S. purpurea* ssp. *purpurea* – X]

*Sarracenia purpurea* Linnaeus var. *venosa* (Rafinesque) Fernald, Southern Purple Pitcherplant. Wet savannas, sandhill seepage bogs, hillside seepage bogs. April–May; June–July. Var. *venosa* is restricted to the Atlantic Coastal Plain of the southeastern United States, ranging from se. VA south to se. SC and e. GA; perhaps disjunct in e. LA. See MacRoberts & MacRoberts (2004) for a detailed discussion about old LA collections of *S. purpurea* or *S. rosea*. For those tolerant of quadrinomial taxonomy, plants in our area may be considered *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *venosa*. It is notable, though, that the findings of Godt & Hamrick (1999) and Ellison et al. (2004) do not support the greater relationship of the southern taxa to one another and their divergence from the northern taxon, and thus do not support the quadrinomial taxonomy. [= C, F, G, Z; < *S. purpurea* – RAB, GW, Q, S, U, W; = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald – FNA; = *S. purpurea* Linnaeus var. *purpurea* var. *purpurea* – K; = *S. purpurea* var. *purpurea* – Reveal (1993); = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *venosa* – X, Y]

*Sarracenia rosea* Naczi, F.W. Case, & R.B. Case, Rose Pitcherplant. Wet pine savannas and seepage bogs. Sw. GA and Panhandle FL west to s. MS and (?) e. LA. Schnell (1993) distinguished the distinctive East Gulf Coastal Plain population (with short peduncles, white stigmas, and pale pink petals) as *S. purpurea* ssp. *burkii* Schnell; Naczi et al. (1999) elevated this to species rank, as *S. rosea*. See Naczi et al. (1999) and Schnell (1993) for more detailed information and color photographs. Naczi et al.’s (1999) treatment of this taxon at specific rank is supported by the greater genetic distance found by Godt and Hamrick (1999) and morphologic and genetic analyses (Ellison et al. 2004). See MacRoberts & MacRoberts (2004) for a detailed discussion about old LA collections of *S. purpurea* or *S. rosea*. [= FNA, WH; < *S. purpurea* – GW, Q, S, U, Z; = *S. purpurea* Linnaeus var. *purpurea* var. *burkii* Schnell – K; < *S. purpurea* var. *purpurea* – Reveal (1993); = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *burkii* Schnell – X, Y]

*Sarracenia rubra* Walter ssp. *gulfinensis* Schnell, Gulf Pitcherplant. Seepage bogs and savannas. April–May. Sw. GA to Panhandle FL. Schnell (2002b) considers the populations of the "*rubra complex" in Taylor County, GA (the western Coastal Plain of GA, near the AL line) to be best assigned to "*gulfinensis*." [= FNA, K, WH, X; < *S. rubra* – GW, S, U, V, Z]

*Sarracenia rubra* Walter ssp. *rubra*, Sweet Pitcherplant, Redflower Pitcherplant. Sandhill seepage bogs, pocosins, wet savannas. April–May; June–July. Se. and sc. NC south to sc. GA. The *S. rubra* complex consists of five geographically isolated entities, variously treated as species, subspecies, or geographic races (see *S. jonesii* for some of the pertinent references). [= FNA, K, X; < *S. rubra* – RAB, GW, Q, S, U, V, Z]

---

340. **ACTINIDIACEAE** Hutchinson 1926 (Kiwi-fruit Family) [in ERICALES]
ACTINIDIACEAE

Actinidia Lindley (Kiwi-fruit)

A genus of 40-60 species, lianas, of e. and se. Asia. In addition to *A. chinensis*, various other species in the genus *Actinidia* are in limited or novelty cultivation in our area; some show potential to escape and naturalize. References: Dressler & Bayer in Kubitzki (2004).

* Actinidia chinensis Planchon, Kiwi-fruit, Chinese Gooseberry. Pd (NC, VA), Mt (VA): suburban woodlands; rare, native of e. Asia. Also naturalized in nc. TN.

341. CLETHRACEAE Klotzsch 1851 (Clethra Family) [in ERICALES]

A monogeneric family of 65-95 species, shrubs and trees, primarily of tropical America and Asia. Sometimes combined into the Cyrillaceae. References: Tucker & Jones in FNA (2009); Sleumer (1967b); Anderberg & Zhang (2002); Schneider & Bayer in Kubitzki (2004).

Clethra Linnaeus (Sweet Pepperbush, White-alder, Clethra)

A genus of 65-95 species, shrubs and trees, primarily of tropical America and Asia. References: Tucker & Jones in FNA (2009); Sleumer (1967b)=Z ; Schneider & Bayer in Kubitzki (2004). Key based on FNA.

1 Leaves oblong or elliptic, averaging 11-13 cm long and 5-7 cm wide; distance up leaf margin from the leaf base to the first tooth avg. 2.4 cm; leaf margins leaf apex acuminate; inflorescence bracts exceeding the flowers; [of the Mountains]...............................

Clethra acuminata

1 Leaves obovate or oblong, averaging 5-9 cm long and 2-4 cm wide cm wide; distance up leaf margin from the leaf base to the first tooth avg. 3.4 cm; leaf apex obtuse to acute; inflorescence bracts shorter than the flowers; [of the Coastal Plain and rarely lower Piedmont].

2 Lower leaf surface sparsely hairy; petioles 2.5-3.5 (-6) cm long; styles 6-7 mm long, hairy at the base with straight hairs; filaments 0.2-0.3 (-0.4) mm in diameter........................................................................................................................................................................

C. alnifolia

2 Lower leaf surface wooly-tomentose; petioles 0.5-1 (-1.5) cm long; styles 3.5-5 mm long, downy throughout; filaments 0.4-0.5 (-0.7) mm in diameter........................................................................................................................................................................................

C. tomentosa

342. CYRILLACEAE Endlicher 1841 (Ti-ti Family) [in ERICALES]

A family of 2 genera and 3 or more species, ranging from se. North America to the West Indies and n. South America (following the removal of *Purdiaea* to the Clethraceae (Anderberg & Zhang 2002). References: Lemke in FNA (2009); Godfrey (1988); Anderberg & Zhang (2002); Thomas (1960)=Y; Kubitzki in Kubitzki (2004). Key adapted from Godfrey (1988).

1 Lateral veins of the leaf blades scarcely or not at all apparent on either surface; flowers in terminal and axillary racemes, the racemes solitary or several at a node, not markedly radiating; fruit 5-7 mm long, 2-5 winged................................................................. Cliftonia

1 Lateral veins of the leaf blades readily apparent on both surfaces, the main laterals neatly pinnate, the smaller veins forming a fine reticulum; flowers in lateral racemes, the racemes clustered together at the summit of the previous year's growth and radiating outward or reflected; fruit 2-2.5 mm long, not winged........................................................................................................................................................................... Cyrilla

Cliftonia Banks ex C.F. Gaertner 1807 (Black Ti-ti, Buckwheat-tree)

**Cliftonia monophylla** (Lamarck) Britton ex Sargent, Black Ti-ti, Buckwheat-tree. Acid bogs, bayheads, swamps, and streambanks. Se. SC south to n. FL, west to se. LA. [= FNA, GW, K, S, WH, Y]

**Cyrilla** Garden ex Linnaeus 1767 (Ti-ti)

1 Leaves mostly 1-4 cm long, mostly 0.5-1 cm wide; inflorescences mostly 4-9 cm long; petals < 3 mm long; [mostly of flatwoods ponds, in s. GA southward] ...................................................... C. parvifolia

1 Leaves mostly 5-10 cm long, mostly 1-2 cm wide; inflorescences mostly 10-18 cm long; petals > 3 mm long; [of various wetland habitats, throughout our area and widely distributed beyond] ...................................................... C. racemiflora

**Cyrilla parvifolia** Rafinesque, Littleleaf Ti-ti. Flatwood pond margins and along drains through savannas. S. GA south into Panhandle FL. Its taxonomy is problematic; while very distinctive in some places (such as Apalachicola National Forest, FL), apparent intermediates are seen elsewhere. [= K, S, Z; < C. racemiflora – FNA, GW, Y]

**Cyrilla racemiflora** Linnaeus, Ti-ti. Pocosins, swamps, lake and flatwood pond margins, streambanks, pine flatwoods. May-July; September-October. E. VA (Accomack County) south to FL, west to TX, and south into the West Indies, Belize, Mexico, and n. South America (Thomas 1960). The leaves are quite variable in shape and size; the venation and glossy smoothness, however, are distinctive once learned. Under various ecological conditions, titi can be anything from a small shrub to a medium tree (or large tree in the West Indies). [= RAB, C, G, K, S, Z; < C. racemiflora – FNA, GW, Y; > C. racemiflora var. racemiflora – F; > C. racemiflora var. subglobosa Fernald – F]

### 344. ERICACEAE

A.L. de Jussieu 1789 (Heath Family) [in ERICALES]

A family of about 107-124 genera and 3400-4100 species, primarily shrubs, small trees, and subshrubs, nearly cosmopolitan. The Ericaceae is very important in our area, with a great diversity of genera and species, many of them rather narrowly endemic. Our area is one of the north temperate centers of diversity for the Ericaceae. Along with *Quercus* and *Pinus*, various members of this family are dominant in much of our landscape. References: Tucker in FNA (2009); Gillespie & Kron (2010); Kron et al. (2002); Wood (1961); Judd & Kron (1993); Kron & Chase (1993); Luteyn et al. (1996)=L; Dorr & Barrie (1993); Cullings & Hileman (1997); Stevens et al. in Kubitzki (2004).

Main Key, for use with flowering or fruiting material

1 Plant an herb, subshrub, or sprawling shrub, not clonal by underground rhizomes (except *Gaultheria procumbens* and *Epigaea repens*), rarely > 3 dm tall; plants mycotrophic or hemi-mycotrophic (except *Epigaea, Gaultheria,* and *Arctostaphylos*).

2 Plants without chlorophyll (fully mycotrophic); stems fleshy; leaves represented by bract-like scales, white or variously colored, but not green; pollen grains single; [subfamily *Monotropoideae*; tribe Monotropeae].

3 Petals united; fruit nodding, a berry; flower and fruit several per stem ............................................................. 6. Monotropis

3 Petals separate; fruit erect, a capsule; flower and fruit 1-several per stem.

4 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown ................................................................................................................................. 5. Hypopitys

4 Flowers solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black ................................................. 4. Monotropa
Plants with chlorophyll (hemi-mycotropic or autotrophic); stems woody; leaves present and well-developed, green; pollen grains in tetrads (single in Orthilia).

Herb with a rosette of ascending basal leaves; flowers scapose; [subfamily Monotropoideae; tribe Pyroloideae].

Style and filaments straight; filaments straight, the anthers closely surrounding the style; inflorescence distinctly secund (1-sided) ...

Style and filaments strongly declined; filaments curved, the anthers not closely surrounding the style; inflorescence slightly or not at all secund (1-sided) .......................................................... 3. Orthilia

Subshrub or sprawling shrub with cauline leaves; flowers axillary (except scapose in Chimaphila).

Plant erect, the leaves clustered near the apex of the single stem.

Leaves lanceolate or oblanceolate, normally 2-4× as long as wide (sometimes proportionately less narrow in stunted individuals; fruit a capsule, borne 1-several on an erect scape above the leaves [subfamily Monotropoideae; tribe Pyroloideae] .... 2. Chimaphila

Leaves obovate, 1-2× as long as wide; fruit a red berry, borne on nodding axillary pedicels beneath the leaves; [subfamily Vaccinioideae; tribe Gaultherieae] .............................................................. 27. Gaultheria

Plant creeping or sprawling, leaves scattered along the stems.

Leaves solitary and axillary; fruit a white berry; [subfamily Vaccinioideae; tribe Gaultherieae] ........................................... 27. Gaultheria

Leaves in axillary or terminal spikes or racemes; fruit a fleshy loculicidal capsule or red drupe.

Leaves glabrous, 1-3 cm long, tapered to the base; corolla urceolate; calyx not subtended by large bracts; [subfamily Arbutioideae] ........................................................................................................ 7. Arctostaphylos

Leaves pilose (glabrate in age), 2-10 cm long, rounded or subcordate at the base; corolla salverform, the lobes spreading; calyx subtended by 2 large bracts; [subfamily Ericoideae; tribe Phyllodoceae] ................................................ 12. Epigaea

Plant a shrub, > 3 dm tall, or 1-3 dm tall and definitely and obviously clonal by underground rhizomes; plants not mycotrophic or hemi-mycotropic.

Leaves ca. 1 mm wide, 3-12 mm long, appearing opposite, alternate, or whorled (the internodes very short, thus the leaves generally appearing whorled); petals absent; fruit a subglobe, 2-stoned drupe, 1-3 mm in diameter; branches often appearing in whorls of 3-7; [subfamily Ericoideae; tribe Empetreae]

Leaves 5-15 mm long; shrubs 2-25 dm tall; drupes red, 1.5-3 mm in diameter; [of SC southwards] ........................................ 15. Ceratola

Leaves 3-6 mm long; shrubs 1.5-6 dm tall; drupes gray, 1-1.5 mm in diameter; [of NJ northwards] ........................................ 14. Corema

Leaves either > 2 mm wide or < 5 mm long, mostly alternate or whorled; petals present; fruit not as above, mostly either a capsule or 10- or many-seeded berry; branches appearing alternate or whorled; [subfamily Vaccinioideae; tribe Vaccinieae] ........................................... 12. Epigaea

Ovary inferior; fruit indehiscent, a fleshy berry.

Ovary 10 locular; seeds 10; leaves glandular-punctate, at least on the lower surface (except G. brachycera) ................. 29. Gaylussacia

Ovary 4-5 locular; seeds numerous; leaves not glandular-punctate .......................................................... 28. Vaccinium

Ovary inferior; fruit dehiscence, a dry capsule.

Petals separate; fruit 2-7-locular; either a shrub to 1 m tall with ovate to oblong, evergreen leaves, 0.6-1.2 cm long, or a shrub to small tree 2-6 (-9) m tall with elliptic, deciduous leaves, 4-12 cm long, or a shrub 1-2.5 m tall, with elliptic to ovate, evergreen leaves 2-4 cm long; [subfamily Ericoideae; tribe Phyllodoceae].

Fruit 2-3 (5)-locular; shrub to 1 m tall; leaves, 0.4-1.2 cm long; petals 2-4 mm long ........................................ 13. Kalmia buxifolia

Fruit 4-7-locular; shrub to small tree 1-6 (-9) m tall; leaves 2-12 cm long; petals 12-30 mm long.

Fruit 7-locular; leaves evergreen 2-4 cm long; petals 20-30 mm long; shrub 1-2.5 m tall ........................................... 8. Bejaria

Fruit 4-5-locular; leaves deciduous, 4-12 cm long; petals 12-14 mm long; shrub to small tree 2-6 (-9) m tall ............. 11. Elliotia

Petals fused for part or all their lengths; fruit 4-5-locular; shrub or tree with leaves of various shape, evergreen or deciduous, these either < 6 mm long, linear and whorled, or > 12 mm long.

Leaves whorled, < 5 mm long, linear; [subfamily Ericoideae, tribe Ericeae].

Leaves opposite, sessile, clasping at the base .......................................................... 16. Calluna

Leaves whorled (in 4s), petiolate ................................................................................................. 17. Erica

Leaves alternate or whorled, > 20 mm long.

Flowers 4-merous; fruits 4-locular; leaves with a series of fascicles of trichomes on the midrib below; [subfamily Ericoideae, tribe Rhodoreae] ................................................ 9. Menziesia

Flowers 5-merous; fruits 5-locular; leaves not as above.

Leaves coriaceous, evergreen, shiny and dark green above.

Leaves sharply and distinctly serrate.

Petioles slender, 7-10 mm long; filaments strongly curved just below the anthers; pith transversely diaphragmed; [subfamily Vaccinioideae; tribe Lyoneae] ......................................................... 20. Agarista

Petioles stout, 2-6 mm long; filaments straight; pith solid; [subfamily Vaccinioideae; tribe Gaultherieae] .......................... 25. Leucothoe

Leaves entire, or obscurely and finely crenulate-serrulate.

Capsules elongate, > 2× as long as broad, 8-18 mm long; [subfamily Ericoideae; tribe Rhodoreae] .......................................... 10. Rhododendron

Capsules ovoid to globose or subglobose, about as long as broad, 5-8 mm long.

Leaves with a prominent vein running parallel to (and about 1 mm in from) the margin; [subfamily Vaccinioideae; tribe Lyoneae] .......................................................... 21. Lyonia

Leaves without a prominent marginal vein.

Corolla saucer-shaped, 10-30 mm across; leaves entire; [subfamily Ericoideae; tribe Phyllodoceae] .... 13. Kalmia

Corolla narrowly urceolate, 4-6 mm across; leaves finely crenulate-serrulate; [subfamily Vaccinioideae; tribe Lyoneae] .......................................................... 19. Pieris

Leaves membranaceous or subcoriaceous, deciduous or evergreen, if subcoriaceous and evergreen, then not shiny and dark green above.

Capsules elongate, > 2× as long as broad, 7-23 mm long; [subfamily Ericoideae; tribe Rhodoreae] .... 10. Rhododendron

Capsules ovoid to globose or subglobose, about as long as broad, or broader than long, 2-7 mm long.

Leaves (at least the larger) > 2.5 cm wide.

Pedicels with 2 bracteoles.
Alternate Key to Ericaceae (including some relatives), emphasizing vegetative characters
[This key includes some related shrubs, of the Diapensiaceae, Clethraceae, and Cyrillaceae]

Key A – Achlorophylllose plants

1 Leaves and stems lacking chlorophyll (either white or variously tinted with colors such as pink, tan, red, or violet).

   a. Leaves and stems white or pink when fresh, aging or drying black ................................. Monotropa uniflora
   b. Leaves membranaceous or subcoriaceous, deciduous or tardily deciduous, usually not particularly glossy (except in new foliage of some species) ................................................................. Monotropa uniflora

   2 Leaves coriaceous, more or less stiff, evergreen, usually glossy and often dark green.

   3 Subshrub or sprawling shrub, 0-1 (-2) dm tall, not clonal by underground rhizomes (except Gaultheria procumbens), though often clonal by creeping stems, or sprawling and patch-forming (many of these species are only ambiguously shrublike and are considered herbs by the casual observer) ......................................................................................................... Key C

   4 Shrub, > 3 dm tall, or 1-3 dm tall and definitely and obviously clonal by underground rhizomes .................................................................................................................. Key D

Key B – Deciduous ericaceous shrubs and trees

Gaylussacia spp., Vaccinium spp., Elliottia racemosa, Menziesia pilosa, Rhododendron spp., Kalmia cuneata, Chamaedaphne calyculata, Lyonia mariana, Lyonia ligustrina var. ligustrina, Lyonia ligustrina var. foliosaflora, Eubotrys racemosa, Eubotrys recurva, Oxydendrum arboreum, Zenobia pulverulenta, Clethra acuminata, Clethra alnifolia, Cyrilla racemiflora

Key C – Evergreen subshrubs and sprawling shrubs

1 Plant erect, the leaves few (< 10), clustered near the apex of the single stem.

2 Leaves obovate, 1-2× as long as wide; fruit a red berry, borne on nodding axillary pedicels beneath the leaves........ Gaultheria procumbens

3 Leaves lanceolate or oblong lanceolate, normally 2-4× as long as wide (sometimes proportionately less narrow in stunted individuals; fruit a capsule, borne I-several on an erect scape above the leaves.

   a. Leaves lanceolate (broadest below the middle), base rounded, striped with white or paler green along the major veins........ Gaultheria procumbens

   b. Leaves oblong lanceolate (broadest above the middle), base cuneate, solid dark green throughout ................................................................. Chimaphila umbellata ssp. cisatlantica

   c. Leaves obovate, 1-2× as long as wide; fruit a red berry, borne on nodding axillary pedicels beneath the leaves........ Gaultheria procumbens

4 Leaves 2-15 cm wide; leaves (2-) 3.5-15 cm long, rounded or suborbate at the base.

5 Leaves dull green, with a pebbled texture, pilose (glabrate in age) .................................................................................................................. Epigaea repens

6 Leaves bright shiny green (or pruple), with a smooth texture, glabrous.

   a. Leaves orbicular, rounded or with a slight point at the apex, finely serrate (4-8 teeth per cm), the teeth not prominently mucronate; flowers in racemes; [widespread in distribution] .................................................................................................................. Galax urceolata [DIAPENSIACEAE]
Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1–4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere].

Leaves linear, needle-like, 

**ERICACEAE**

Leaves 0.1–1.5 cm wide; leaves 0.5–3 cm long, cuneate at the base (at least widely so), glabrous (or bristly beneath in

Leaves opposite, sessile and clasping; [exotic, rarely naturalized] ...........................................................................................

Leaves whorled (at least in part), petiolate; [.................................................................]

5 Leaves (at least the larger) > 3 cm long.

5 Leaves (all of them) < 2 cm long.

7 Leaves broader, > 2 mm wide.

9 Leaves serrate or serrulate (sometimes inconspicuously so); [of pinelands of the Coastal Plain and (very rarely) lower Piedmont of se. VA southward].

10 Leaves 2.5–15 mm long, generally elliptic (less commonly ovate or obovate); angle of leaf base typically > 90 degrees; margins finely glandular mucronulate-crenulate, the teeth tightly appressed and therefore often obscure, the margin superficially entire; stems mostly prostrate (ascending in areas that have been long fire-suppressed); [widespread in NC and SC, rare in se. VA and e. GA] .............................................................................................

10 Leaves (4-) 7-35 (-63) mm long, elliptic to obovate (less commonly elliptic-ovate); angle of leaf base typically < 90 degrees; margins glandular mucronulate-serrulate to serrulate-crenulate, the teeth apparent, especially toward the apex; stems often ascending to upright; [of Lexington County, SC] ........................................................................................................

9 Leaves entire; [of the Mountains of VA northward, except Vaccinium macrocarpon of bogs, as far south as se. se. and sw. NC].

11 Leaves 10-30 mm long; leaves obovulate to obovate, the widest point past the middle; primary stems 1-3 mm in diameter; [of relatively dry, rocky habitats].

11 Leaves (3-) 5-10 (-18) mm long; leaves ovate or elliptic, the widest point below or at the middle; primary stems delicate; [of moist to distinctly boggy habitats].

12 Leaf undersurface green, sparsely bristly; [of moist habitats] ..................................................................................

12 Leaf undersurface whitened, glabrous; [of saturated wetlands].

13 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-involute; pedicels with 2 green, leaf-like bracts 1-2 mm wide; berry 8-15 mm in diameter ...............[Vaccinium macrocarpon]

13 Leaves ovate, broadest toward base, (3-) 5-6 (-9) mm long, (1-) 2-3 (-5) mm wide; leaves involute at least along the margins, thus making the leaf tip acute; pedicels with (0-) 2 (-5) reddish, scale-like bracts < 1 mm wide; berry 6-12 mm in diameter ...

[Arctostaphylos uva-ursi]

13 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-

13 Inflorescence a 3-9 flowered raceme, borne in the axils of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens] .................................................................

13 Inflorescence a 3-9 flowered raceme, borne in the axis of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens] .................................................................

Key D – Evergreen ericaceous shrubs (either tall or obviously clonal) and trees

1 Leaves linear, needle-like, either appearing whorled (at least in part, sometimes also with nodes appearing opposite or alternate) or opposite (Calluna).

2 Leaves opposite, sessile and clasping; [exotic, rarely naturalized] .................................................................

2 Leaves whorled (at least in part), petiolate; [either native or exotic and rarely naturalized]

3 Leaves densely puberulent and ciliate with gland-tipped hairs; leaves 1.5-5 mm long; [exotic, rarely naturalized] ...............[Erica vulgaris]

4 Leaves glabrous; leaves 3-15 mm long; [native].

4 Leaves 5-15 mm long; shrubs 5-25 dm tall; drupes red, 1.5-2 mm in diameter; [of SC southwards] ...............[Ceratiola ericoides]

4 Leaves 3-6 mm long; shrubs 1.5-6 dm tall; drupes gray, 1-1.5 mm in diameter; [of NJ northwards] ..........[Corema conradi]

5 Leaves (all of them) < 2 cm long.

6 [Either of the Mountains, the Piedmont, or the Coastal Plain of ne. SC and se. NC].

7 Leaves alternate, glabrous, finely serrulate ..........[Gaylussacia brachyptera]

7 Leaves alternate or opposite, stipitate-glandular or glabrous, entire, or with a few obscure teeth ..........[Kalmia buxifolia]

6 [Of the Coastal Plain, from se. SC southward].

8 Twigs densely hispid; leaves hispid on both surfaces ..........[Kalmia hirsuta]

8 Twigs glabrous to puberulent; leaves glabrous or with scattered inconspicuous hairs.

9 Plant glaucous and bluish-green throughout; leaf undersurface lacking scattered glandular hairs; [of s. GA south to s. peninsular FL, west to e. TX] .................................................................

9 Plant glaucous and bluish-green throughout; leaf undersurface lacking scattered glandular hairs; [of s. GA south to s. peninsular FL, west to e. TX] .................................................................

9 Plant dark green throughout, generally exceeding 20 mm in length; leaf undersurface with scattered glandular hairs, these sometimes very few yet late in the season (best seen in the field by folding a leaf, holding the fold up to the light, and using a 10× lens); [of se. SC southward to n. FL, west to s. AL] .................................................................

9 Plant dark green throughout, generally exceeding 20 mm in length; leaf undersurface with scattered glandular hairs, these sometimes very few yet late in the season (best seen in the field by folding a leaf, holding the fold up to the light, and using a 10× lens); [of se. SC southward to n. FL, west to s. AL] .................................................................

[Vaccinium myrsinoides]

5 Leaves (at least the larger) > 3 cm long.

10 Leaves toothed, at least toward the tip of the leaf (note that fine serrations or crenations can be obscured by revolute margins).

11 Leaves elliptic to obovate, widest near or above the middle, obtuse, acute, or short-acuminate, 1.5-7 cm long, 0.5-2.5 cm wide; leaf serrations fine and obscure; leaf surfaces with small stipitate glands (Piers) or lepidote with scales (Chamaedaphne).

11 Leaves lepidote with scales; leaves obovulate, widest above the middle

12 Leaves with small stipitate glands, otherwise appearing glabrous; leaves elliptic, widest near the middle.

13 Inflorescence a many-flowered panicle of racemes, borne terminally; seeds 2.5-3.3 mm long; [of slopes and ridges of the Mountains and upper Piedmont] .................................................................

13 Inflorescence a 3-9 flowered raceme, borne in the axis of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens] .................................................................

13 Inflorescence a 3-9 flowered raceme, borne in the axis of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens] .................................................................
11 Leaves lanceolate or ovate, widest below the middle, short-acuminate to acuminate, 4-15 cm long, 1-5 cm wide; leaf serrations generally obvious (at least toward the acuminate leaf tip); leaf surfaces glabrous, or with non-stipitate hairs on the lower surface.

14 Pith transversely diaphragmed; [pedicels slender, 7-10 mm long]; [filaments strongly curved just below the anthers] ..........................Agarista populifolia

15 Leaves with an acute or short-acuminate apex; racemes 2-4 (5) cm long; sepals ovate, with an obtuse or rounded apex; longest petioles 3-8 mm long .................................................................Leucothoe axillaris

15 Leaves with a long-acuminate apex; racemes 4-10 cm long; sepals lanceolate-ovate, with an acute (or subacute) apex; longest petioles 8-15 mm long .................................................................................................................Leucothoe fontanesiana

10 Leaves entire.

16 Leaves whitened beneath by a dense mat of white hairs; leaves linear and strongly revolute ............................................................Andromeda

16 Leaves green or brown beneath, glabrous, glabrescent, or lepidote with scales.

17 Leaves densely lepidote on the under surface with brown scales.

18 Leaves planar, not revolute; petioles 7-20 mm long; twigs more-or-less terete in cross-section; [of the Mountains, Piedmont, and upper Coastal Plain].

19 Corolla mostly 15-20 mm long, the corolla tube (9-13 mm long) shorter than to as long as the corolla lobes (12-18 mm long); plant flowering early relative to R. minus, despite occurring at higher elevations and more northern latitudes; seeds ovoid, < 1.0 mm long, < 2.5× as long as wide (reminiscent of tiny watermelon seeds), coarsely textured, unornamented at the ends; calyx lobes deltoid; [of mountain ridges, heath balds, and rocky summits, mostly either away from the Blue Ridge Escarpment or north of the Asheville Basin] ...............................................................Rhododendron carolinianum

19 Corolla mostly 25-37 mm long, the corolla tube (13-22 mm long) longer than the corolla lobes (8-12 mm long); plant flowering late relative to R. carolinianum; seeds usually > 1.0 mm long, usually > 3× as long as wide, ornamented at one or both ends; calyx lobes ovate; [of the Coastal Plain, Piedmont, and Mountains, in the Mountains mostly of the Blue Ridge Escarpment of sw. NC and nw. SC, ranging in elevation up to the higher granitic domes in Macon and Jackson counties, NC].

20 Leaf apices mostly obtuse to rounded; petioles 2-6 (-7) mm long; branches erect and rigid; seeds moderately to elaborately ornamented with flared protrusions at both ends; [of n. FL] .................................................................Rhododendron chapmanii

20 Leaf apices mostly acute to acuminate; petioles (5-) 6-20 mm long; branches spreading, not notably erect and rigid; seeds somewhat ornamented at one end; [of c. GA northward] .........................................................................................Rhododendron minus

18 Leaves slightly to strongly revolute (or nearly planar in Lyonia fruticosa); petioles 1-7 mm long; twigs angled in cross-section; [of the lower Coastal Plain, from se. SC southward].

21 Ultimate branches not rigidly ascending, flowers nearly always restricted to branches of the previous year, the leaves not conspicuously reduced toward the branch tips; leaves with distal margin usually revolute, sometimes strongly so; major veins usually depressed; lower leaf surface with some scales often large and with irregular margins, others smaller and more nearly entire, at least the smaller scales more-or-less persistent; [shrub or small tree to 6 (-10) m tall] Lyonia ferruginea

21 Ultimate branches rigidly ascending, flowers frequent on branches of the current year (though also on older growth), the leaves conspicuously reduced toward the branch tips; leaves with distal margin at most slightly revolute; major veins not depressed; lower leaf surface with scales usually all large and with irregular margins, the scales often deciduous; [shrub to 1.5 (-3) m tall] .................................................................Lyonia fruticosa

17 Leaves not lepidote beneath (Lyonia lucida with scattered minute scales on young leaves).

22 Leaves whorled or rarely opposite.

23 Calyx lobes glandular-canescence and with marginal stipitate glands; leaves glabrous beneath; bracts and bracteoles densely glandular; stomates 18 μ long and 13 μ wide, 15-24 per 0.2 square millimeter; shrub to 1 (-1.2) m tall; [of ne. NC northward] .................................................Kalma angustifolia

23 Calyx lobes canescent but lacking glands; leaves short puberulent beneath; bracts and bracteoles nearly glandless; stomates 13 μ long and 9 μ wide, 35-51 per 0.2 square millimeter; shrub to 2 m tall (though often much shorter); [of se. and sw. VA southward] ........................................................ Kalma carolina

22 Leaves alternate.

24 Leaf blades (8-) 10-30 cm long, 3-9 cm wide, rounded to obtuse at the tip.

25 Leaves rounded at base (rarely broadly cuneate or slightly cordate), obtuse at apex; leaf generally 1.5-2.5× as long as wide; [corolla usually deep pink to purple]; [sepals 0.5-1 mm long] .................................................................Rhododendron catawbiense

25 Leaves cuneate at base, acute at apex; leaf generally 3-5× as long as wide; [corolla usually white to pale pink]; [sepals 4-6 mm long] .............................................................................................Rhododendron maximum

24 Leaf blades 2-10 (-12) cm long, 1-5 cm wide, acute, short-acuminate (or obtuse or rounded in Cyrilla) at the tip.

26 Leaf with a prominent vein running the length of the margin, about 1 mm in; [shrub to 4 m tall] .........................................................................................................................Lyonia lucida

26 Leaf venation not as above; [shrub to small tree] ..........................................................................................................................Kalma latifolia, Cyrilla racemiflora, Cliftonia racemosa, Bejaria racemosa

I. Pyrola Linnaeus 1753 (Shinleaf, Pyrola)

A genus of 30-35 species, subshrubs, circumboreal and also in Sumatra and Guatemala. The inclusion of this group of species in the Ericaceae or its recognition as a separate family has been controversial. Recent studies (Judd & Kron 1993, Kron & Chase 1993) suggest that it is best resubmerged in the Ericaceae. References: Freeman in FNA (2009); Liu et al. (2010); Stevens et al. in Kubitzki (2004).

1 Calyx lobes distinctly longer than broad, 3-4 mm long; leaves coriaceous, more or less glossy; [section Pyrola; series Pyrola] .................................................................P. americana

1 Calyx lobes about as broad as long, 1.5-2 mm long; leaves not coriaceous, dull.
2. Pyrola Pursh 1814 (Shinleaf, Pipsissewa)

A genus of 4-5 species, subshrubs, of temperate and tropical America, and Eurasia. References: Freeman in FNA (2009); Stevens et al. in Kubitzki (2004).

1 Leaves lanceolate (broadest below the middle), base rounded, striped with white or paler green along the major veins ..............C. maculata
1 Leaves oblanceolate (broadest above the middle), base cuneate, solid dark green throughout .................................C. umbellata ssp. cisatlantica

Chimaphila maculata (Linnaeus) Pursh, Pipsissewa, Striped Wintergreen. Forests and woodlands, mostly rather xeric and acid. May-June; July-October. ME west to MI, south to GA, FL Panhandle, and AL; disjunct in mountains of AZ, Mexico, and Central America south to Panama. [= RAB, C, F, G, K, L, S, WH]

3. Orthilia Rafinesque 1840 (Sidebells, One-sided Shinleaf, One-sided Wintergreen)

A monotypic genus, a subshrub, circumboreal in distribution. The recognition of Orthilia as separate from Pyrola is supported by molecular data (Freudenstein 1999a). References: Freeman in FNA (2009); Stevens et al. in Kubitzki (2004).

Orthilia secunda (Linnaeus) House, Sidebells, One-sided Shinleaf, One-sided Pyrola. Forests under Pinus virginiana, other forests? June-July; July-September. Circumboreal, in North America south to VA, IN, IA, NE, NM, AZ, and CA; disjunct in Mexico and Guatemala. [= FNA, K, L; = Pyrola secunda Linnaeus – C, G, W; > P. secunda var. secunda – F]

4. Monotropa Linnaeus 1753 (Indian Pipes, Pinesap)

A monotypic genus, an herb, of North America, Central America, South America, and e. Asia. The segregation of Monotropa, Hypopitys, and Monotropsis into the Monotropaceae or their inclusion in the Ericaceae has been controversial. Recent studies suggest that their inclusion in the Ericaceae is warranted (Kron & Chase 1993, Judd & Kron 1993). References: Wallace in FNA (2009); Wallace (1975)=Z; Stevens et al. in Kubitzki (2004). [also see Hypopitys]

1 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown .................................................................[Hypopitys monotropa]
1 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black .................................Monotropa uniflora

Monotropa uniflora Linnaeus, Indian Pipes. In a wide variety of forests. June-October; August-November. NL (Labrador) and AK south to s. FL, TX, CA; disjunct in s. Mexico, Central America, South America (Colombia), and e. Asia. A preliminary
molecular study suggests that splitting of worldwide *Monotropa uniflora* into several geographic species or varieties may be warranted (Neyland & Hennigan 2004). [= RAB, C, F, FNA, G, K, L, W, WH, WV, Z; > *M. uniflora* – S; > *M. brittonii* Small – S]

5. *Hypopitys* Crantz 1766 (Pinesap)

A genus of 1–several species, herbs, of circumboreal distribution. Recent molecular evidence supports its separation as a genus distinct from *Monotropa* (as has often been done in the past) (Neyland & Hennigan 2004). References: Wallace in FNA (2009); Wallace (1975)=Z; Stevens et al. in Kubitzki (2004).

**Hypopitys monotropa** Crantz, Pinesap. Forests. May-October; July-November. Circumboreal, south nearly throughout North America, to c. peninsular and Panhandle FL, TX, NM, AZ, CA, and Mexico; disjunct in Guatemala; Europe; c. and e. Asia. Recent studies suggest that several cryptic to semi-cryptic species or infraspecific taxa should be recognized (M. Klooster, pers. comm., 2009). [= *Monotropa hypopithys* Linnaeus – RAB, C, F, G, K, L, W, WH, WV, Z; > *Hypopitys americana* (A.P. de Candolle) Small – S; > *Hypopitys lanuginosa* (Michaux) Nuttall – S; > *H. insignata* Bicknell; > *Monotropa lanuginosa* Michaux]

A genus of probably 2 species, mycotrophic herbs, of se. North America. Often treated as monotypic, but there appears to be more to at least of the “lumped” taxa than has usually been credited; the genus warrants additional study. *Monotropis* is mycotrophic, receiving its nutrition by association with a mycorrhizal fungus, the intertwined root mass and fungal mantle about 1–2 cm in diameter. References: Wallace in FNA (2009); Wallace (1975)=Z; Chafin (2000)=Y; Wolf (1922); Stevens et al. in Kubitzki (2004).

1 Sepals about 0.75–1.25× as long as the corolla, ovate; corolla pink, lavender, purple, or purplish-red, the corolla lobes in the plane of the corolla tube or curved inwards from that plane; either flowering prematurely in September-November and the flowers not fragrant, or flowering February-April and the flowers strongly and spicily fragrant; [of AL and GA northwards] .................................................. *M. odorata*  
1 Sepals about 0.5× as long as the corolla, lanceolate; corolla white or pale lavender, the corolla lobes spreading or reflexed; flowering January-February, the flowers slightly fragrant; [of FL] .................................................. *M. reynoldsiae*

**Monotropis odorata** Schweinitz ex Elliott, Spring Pigmy Pipes. Dry to mesic upland woods under oaks and/or pines (*Pinus virginiana* or *P. echinata*), especially slopes or bluffs with abundant heaths, often including *Kalmia latifolia* and/or *Rhododendron maximum*. February-April (and sometimes September-November); May-June (and sometimes October-November). Centered in the Appalachians: DE, MD, and WV south to GA and AL. The flowers are very fragrant, the odor variously compared to cloves, nutmeg, cinnamon, and violets. Since the diminutive plants (3–10 cm tall) are often covered by leaf litter, fragrance is often the key to finding this species. The fall flowering form, entity “lehnmaniae” (see synonymy), appears to represent the early development of *M. odorata* which will typically then overwinter in “suspended animation” and flower in the early spring. [< *M. odorata* – C, F, FNA, G, K, L, W, WV, Z; > *M. odorata var. odorata* – RAB; > *M. odorata var. lehmaniae* (Burnham) Ahles – RAB; > *M. odorata* – S; > *M. lehmaniae* Burnham – S]

**Monotropis reynoldsiae** (A. Gray) A. Heller, Florida Pigmy Pipes. Upland mixed hardwood forests, mesic hammocks, xeric hammocks, scrub. January-February. Endemic to nc. peninsular FL, in St. Johns, Marion, Citrus, Hernando, Pasco, and Volusia counties. See Chafin (2000) for additional information; there seems little question that this is specifically distinct from *M. odorata*. [= S, Y; < *M. odorata* – FNA, K, L, W, WH, Z]

7. *Arctostaphylos* Adanson 1760 (Bearberry)

A genus of 60–70 species, shrubs, woody vines, or small trees, mostly in w. North America, but with 2 circumboreal species. References: Parker, Vasey, & Keeley in FNA (2009); Rosatti (1987b)=Z; Stevens et al. in Kubitzki (2004).

**Arctostaphylos uva-ursi** (Linnaeus) Sprengel, Bearberry, Kinnikinick. High elevation granitic outcrop (VA); Coastal Plain pitch pine woodlands (DE). May-June. Circumboreal, ranging in North America from NL (Labrador) west to AK, south to DE, n. VA, n. IN, IL, IA, SD, NM, AZ, and CA; disjunct in Guatemala. Following Rosatti (1987), *A. uva-ursi* is here treated inclusively, as a complex species not readily divisible into infraspecific taxa. [= C, FNA, K, L, W, Z; > *A. uva-ursi* var. coaetilis Fernald & J.F. Macbride – F, G; > *A. uva-ursi* ssp. coaetilis (Fernald & J.F. Macbride) A. & D. Löve & Kapoor]

8. *Bejaria* Mutis in Linnaeus 1771 (Tarflower)

A genus of 15 species, shrubs and trees, of se. United States to Cuba, and from Mexico south into Bolivia. The spelling of the generic name has been controversial; it was originally published as ‘Bejaria,’ because of Linnaeus's misreading of Mutis's handwriting, but was intended to commemorate José Béjar. The spelling has now been conserved as ‘Bejaria’ (Greuter et al. 2000). References: Clemants in FNA (2009); Stevens et al. in Kubitzki (2004).
**ERICACEAE**

**Befaria racemosa** Ventenat, Tarflower, Flycatcher. Pine flatwoods. E. GA (adjacent to se. SC) south to s. peninsular FL, west to AL. [= FNA, L, WH; = Befaria racemosa – GW, K, S, orthographic variant]

1 Leaves evergreen, coriaceous, entire; stamens 10; [subgenus *Hymenanthes*, section *Ponticum*, subsection *Pontica*].
2 Leaves rounded at base (rarely broadly cuneate or slightly cordate), obtuse at apex; leaf generally 1.5-2.5× as long as wide; corolla usually deep pink to purple; sepals 0.5-1 mm long ........................................................................................................
3 Leaves cuneate at base, acute at apex; leaf generally 3-5× as long as wide; corolla white or pale pink; sepals 4-6 mm long ........................................................................................................

2 Lower surface of leaves not punctate with brown scales; larger leaves 10-30 cm long; [subgenus *Hymenanthes*, section *Ponticum*, subsection *Pontica*].
6 Corolla tube 2-5 mm long, much shorter than the corolla lobes; leaves generally oblanceolate to narrowly elliptic, generally < 3 cm wide, acute to obtuse, mucronate; capsule cylindrical-ellipsoid, 10-25 mm long; [subgenus *Hymenanthes*, section *Pontica*].
7 Corolla yellow, orange, or red.
8 Flowers appearing after the leaves have expanded.

9. *Menziesia* J.E. Smith 1791 (Minniebush)

A genus of about 7-10 species, shrubs, of e. Asia (mostly), w. North America (1 species), and se. North America (1 species). *M. ferruginea* J.E. Smith of w. North America is closely related to *M. pilosa*; the e. Asian species of the genus are more distantly related. Molecular evidence suggests that *Menziesia* should be included in *Rhododendron*, and is actually closely related within *Rhododendron* to *R. vaseyi* (Goetsch, Eckert, & Hall 2005; Kurashige et al. 2001). References: Fabian in FNA (2009); Stevens et al. in Kubitzki (2004).

*Menziesia pilosa* (Michaux ex Lamarck) Antoine Laurent de Jussieu ex Persoon, Minniebush. Heath balds, bogs, rocky summits, and rocky woodlands, mostly at high elevations. May-July; August-October. A Southern and Central Appalachian endemic: sc. PA, sw. PA, e. WV, w. VA, e. TN, w. NC, and ne. GA. The very prominent macro on the leaves and the series of fascicles of trichomes along the leaf midrib below readily distinguish the species in sterile condition from similar deciduous *Rhododendron*. [= RAB, C, F, FNA, G, K, L, S, W, WV; = *Rhododendron species 1*]

10. *Rhododendron* Linnaeus 1753 (Rhododendron, Azalea)

1 Leaves deciduous, membranaceous, ciliate or serrulate; stamens 5-7; [subgenus *Azaleastrum*, section *Sciadorhodion*].
2 Lower surface of leaves punctate with brown scales; larger leaves 6-12 cm long; [subgenus *Rhododendron*, section *Rhododendron*, subsection *Caroliniana*].
4 Corolla mostly 15-20 mm long, the corolla tube (9-13 mm long) longer than as long as the corolla lobes (12-18 mm long); plant flowering early relative to *R. minus*, despite occurring at higher elevations and more northern latitudes; seeds ovoid, < 1.0 mm long, < 2.5× as long as wide (reminiscent of tiny watermelon seeds), coarsely textured, unornamented at the ends; calyx lobes deltoid; [of mountain ridges, heath balds, and rocky summits, mostly either away from the Blue Ridge Escarpment or north of the Asheville Basin].
5 Leaf apices mostly acute to acuminate; petioles (5-) 6-20 mm long; branches erect and rigid; seeds moderately to elaborately ornamented with flared protrusions at both ends; [of n. FL] .................................................................................................................................
6 Corolla mostly 25-37 mm long, the corolla tube (13-22 mm long) longer than the corolla lobes (8-12 mm long); plant flowering later relative to *R. carolinianum*; seeds usually > 1.0 mm long, usually > 3× as long as wide, ornamented at one or both ends; calyx lobes ovate; [of the Coastal Plain, Piedmont, and Mountains, in the Mountains mostly of the Blue Ridge Escarpment of sw. NC and nw. SC, ranging up to the higher granitic domes in Macon and Jackson counties, NC].
7 Leaf apices mostly acute to acuminate; petioles (5-) 6-20 mm long; branches spreading, not notably erect and rigid; seeds somewhat ornamented at one end; [of e. GA northward] .....................................................................................................................
8 Flowers appearing after the leaves have expanded.
Alternate Key to Azaleas

Identification notes: this key makes as much use as possible of vegetative characters, geography, and capsule characters; capsules are generally available for longer during the year than flowers, and even when plants are in flower, last year's capsules can often be found.

1 Corolla tube 2-5 mm long, much shorter than the corolla lobes; pedicels strigose to puberulent, not stipitate-glandular; flowers appearing before or with the leaves. ..................... R. viscosum var. serrulatum
1 Corolla tube 13-25 mm long, equal to or longer than the corolla lobes; stamens 5; leaves generally oblanceolate to narrowly elliptic, generally available for longer during the year than flowers, and even when plants are in flower, last year's capsules can often be found. .................................................... R. austrinum
11 Floral bud-scales with glandular margins, the outer surface glabrous; corolla tube glandular-pubescent on its outer surface; sepal 2.0-3.0 mm long. ........................................ R. calendulaceum
11 Floral bud-scales with ciliate margins, the outer surface glabrous; corolla tube pubescent (not glandular or rarely very weakly so) on the outer surface; sepal 0.5-3.0 mm long. ........................................ R. flammeum
7 Corolla white or pink (white marked with yellow in R. eastmani and R. abalamanse).
12 Sepals 1.5-5 mm long. 
13 Young stems glabrous (rarely very sparsely pubescent); nonclonal shrub or small tree, to 7 m tall. ..................... R. arborescens
13 Young stems densely pubescent, generally with a mixture of glandular and nonglandular hairs; clonal shrub, the upright stems up to 1.5 m tall. ................................................................. R. atlanticum
720
Rhododendron abalamanse

Rehder, Alabama Azalea. Moist slopes, bluffs, streambanks. March-April. W. GA and Panhandle FL west through AL to e. MS. R. abalamanse is reported for Calhoun County, SC (RAB), but this record actually represents the more recently described R. eastmani. (= FNA, K, L, WH, Z; = Azalea abalamanensis (Rehder) Small – S)

Rhododendron arborescens

(Pursh) Torrey, Sweet Azalea, Smooth Azalea. Rocky riversides, wooded stream banks, swamps, high elevation forests, shrub balds. Late May-July; July-October. Primarily Appalachian: ne. PA and se. KY south to se. NC, w. SC, c. GA, and c. AL. (= RAB, C, F, FNA, G, K, L, W, WV, Z; = Azalea arborescens Pursh – S)

Rhododendron atlanticum

(Ashe) Rehder, Dwarf Azalea. Pocosins, savannas, pine flatwoods, sandhill-pocosin ecotones. April-May (sporadically later, particularly in response to fire); August-October. An Atlantic Coastal Plain endemic: s. NJ and se. PA south to sc. GA. (= RAB, C, F, FNA, G, GW, K, L, Z; = Azalea atlantica Ashe – S)

Rhododendron austrinum

(Small) Rehder, Florida Flame Azalea. Hammocks, bluffs, floodplain forests. Sc. GA and ne. FL west to s. AL and se. MS (Kron 1993); also reported for e. GA (Jones & Coile 1988). (= FNA, K, L, WH, Z; = Azalea austrina Small – S)

Rhododendron calendulaceum

(Michaux) Torrey, Flame Azalea. Deciduous forests, particularly on mountain slopes, grassy balds. May-June; June-September. Largely Appalachian: s. PA and s. OH to e. GA and e. TN. This is a tetraploid species; various theories have been advanced about the origin of this polyploid chromosome complement. Kron (1993) argues that the evidence best fits an allopolyploid derivation of R. calendulaceum, involving hybridization between ancestors of R. cumberlandense and R. prinophyllum. (= RAB, C, F, FNA, G, K, L, W, WV, Z; = Azalea calendulacea Michaux – S)

Rhododendron canescens

(Michaux) Sweet, Piedmont Azalea, Southern Pinxterbloom Azalea, Wild Azalea. Swamps, pocosins, and savannas. March-early May; September-October. Se. and sc. NC, n. TN, se. KY, s. IL, and e. OK, south to n. peninsular FL and se. TX. (= RAB, C, F, FNA, G, GW, L, W, WH, Z; = R. canescens var. canescens – K; = R. canescens var. candidum (Small) Rehder – K; = R. canescens var. subglabrum Rehder – K; = Azalea candida Small – S; = Azalea canescens Michaux – S)

Rhododendron carolinianum

Rehder, Carolina Rhododendron, Punctatum. Rocky summits, heath balds, high elevation forests, moist slopes. Late April-May; September-October. A Southern Appalachian endemic: w. NC, e. TN, ne. GA, and nw. SC, from the Linville Gorge area south and west to the Great Smoky Mountains; its precise southern limit uncertain. R. carolinianum is phenologically separated from R. minus, flowering earlier than R. minus, despite its occurrence at higher elevations and with a more northerly distribution. Morphological distinctions between the two taxa are subtle and inconsistent, as discussed by Duncan & Pullen (1962). From a horticultural perspective, Davidian (1982) supports recognition of R. carolinianum and R. minus as distinct. Gensel (1988, and pers.comm.) did detailed studies of the complex and supported the recognition of 3 taxa (R. carolinianum, R. minus, and R. chapmanii). (= D, K, S; < R. minus – RAB, W; < R. minus var. minus – FNA, L, Q, V)

Rhododendron catawbiense

Michaux, Pink Laurel, Catawba Rhododendron, Mountain Rosebay. Rocky summits, shrub balds, acid ridges and slopes (mostly at high elevations), north-facing bluffs in the Piedmont. April (in the Piedmont and Coastal Plain)-June; July-October. A Southern Appalachian endemic: VA and KY south to GA and AL, with scattered disjunct populations in the Piedmont and extreme upper Coastal Plain. The disjunct populations in central NC are discussed by Coker (1919), who named them forma insularis on the basis of "the larger and broader leaves and ... the longer flowers." R. catawbiense is apparently most closely related to R. macrophyllum D. Don ex G. Don of nw. North America (Milne 2004). (= RAB, C, F, FNA, G, K, L, S, W, WV, X)

Rhododendron chapmanii

Rhododendron colemanii

**Rhododendron eastmani** Kron & Creel, May White Azalea, Eastman's Azalea. Rich slopes. Early-mid May. This species is endemic to the Piedmont of South Carolina. It is locally fairly common, in the Broad River drainage (C. Horn, pers. comm. 2000). It should be sought in NC and GA, approaching with 4 miles of the NC border in Cherokee County, SC (M. Creel, pers. comm., 2007). Previous reports of *R. alabamense* in SC (RAB) are based on this species. [= FNA; < *Rhododendron alabamense* Rehder – RAB, misapplied]

**Rhododendron flammeum** (Michaux) Sargent, Oconee Azalea. Sandhills, upland forests on slopes, ridges, stream bluffs. April. W. SC west to w. GA. [= FNA, K, L, Z; = *Azalea speciosa* Wildenow – S; = *Rhododendron speciosum* (Wildenow) Sweet]

**Rhododendron minus** Michaux, Gorge Rhododendron, Punctatum. Rocky slopes, escarpment gorges, rocky areas in the Piedmont, sandhill bluffs in the Coastal Plain. Late April (in the Piedmont and Coastal Plain)-June (at the higher elevations along the Blue Ridge escarpment); September-October. GA and AL north to the Blue Ridge escarpment of n. GA, nw. SC, and sw. NC, and the Piedmont and inner Coastal Plain (fall-line sandhills) of sc. NC. This species ranges up to granite domes along the Blue Ridge Escarpment (such as Whiteside Mountain, Macon and Jackson counties, NC). [= D, K, S; < *R. minus* – RAB, W (also see *R. carolinianum*); < *R. minus var. minus* – FNA, L, Q, V]

**Rhododendron periclymenoides** (Michaux) Shinners, Wild Azalea, Pinxterflower, Pinxterbloom Azalea, Election Pink. Moist to dry slopes and streambanks. Late March-May; September-October. Fairly widespread in e. United States, ranging from MA, NY, and s. OH, south to GA and AL. See Shinners (1962) for explanation of the change from the name *R. nudiflorum*. [= C, FNA, K, L, W, Z; = *Azalea nudiflora* Linnaeus – S]

**Rhododendron prinophyllum** (Small) Millais, Election Pink, Early Azalea, Roseshell Azalea. Upland forests (especially under *Quercus montana* and *Quercus rubra*), xeric pine and oak woodlands. May-June; August-October. NH, NY, and ne. OH, south to w. NC, nc. KY, and s. OH; disjunct in ne. AL and c. TN; also disjunct from s. IL and s. MO south to AR and e. OK. The only known location in NC is on Bluff Mountain, Ashe County (on a rocky plateau over amphibolite at about 1300m elevation); Kron (1993) also cites a collection from Transylvania County. See Shinners (1962) for explanation of the change from the name *R. roseum*. [= C, FNA, K, L, W, Z; = *R. roseum* (Loiseleur) Rehder – RAB, F, G, GW, WV; = *Azalea prinophylla* Linnaeus – S]

**Rhododendron prunifolium** (Small) Millais, Plumleaf Azalea. Mesic ravine forests and streambanks. Endemic to a small area along the AL-GA border, in se. AL (Kron 1993) and sw. and wc. GA (Jones & Coile 1988). [= FNA, K, L, Z; = *Azalea prunifolia* Small – S]

**Rhododendron vaseyi** A. Gray, Pinkshell Azalea. Moist slopes, bogs, high elevation rocky summits, cliffs, high elevation heath balds. May-June; August-October. Endemic to the mountains of NC, though approaching very close to SC and GA in the vicinity of Cashiers and Highlands, NC and reported for Rabun Bald (Rabun Co. GA) without definite documentation; *R. vaseyi* occurs primarily southwest of the Asheville Basin, but is found at scattered locations farther north and is locally abundant on Grandfather Mountain (at the junction of Avery, Watauga, and Caldwell counties, NC), its northernmost outpost. Judd & Kron (1995) treat *R. vaseyi* and *R. canadense* (Linnaeus) Torrey (of ne. North America) as the only two members of section *Rhodora*. When not in flower, *R. vaseyi* is readily distinguished from our other azaleas by its distinctive foliage (see key). [= RAB, F, FNA, K, L, W, Y; = *Biltia vaseyi* (A. Gray) Small – S]
**ERICACEAE**

11. _Elliottia_ Muhlenberg ex Elliott 1817 (Elliottia, Southern-plume)

A genus of 4 species (as here circumscribed), shrubs to small trees, of se. North America, nw. North America, and Japan. As discussed by Wood (1961), the generic limits of _Elliottia_ have been controversial. The closest relatives of _E. racemosa_ are _E. paniculata_ (Siebold & Zuccarini) Bentham & Hooker and _E. bracteata_ (Maximowicz) Bentham & Hooker, both of Japan, and _E. pyroliflorus_ (Bong.) S.W. Brim & P.F. Stevens [= _Cladothamnus pyroliflorus_ Bong.], of AK, British Colombia, WA, and OR; these have sometimes been placed in other genera. References: Tucker in FNA (2009); Stevens et al. in Kubitzki (2004).

_**Elliottia racemosa**_ Muhlenberg ex Elliott, Elliottia, Southern-plume, Georgia-plume. Xeric sandy ridges, sandhills, river bluffs; serpentine woodlands. June-August. Endemic to e. GA and s. SC (Aiken County, where considered to have been extirpated). _Elliottia_ extends barely into the Piedmont in Georgia, occurring on Burks Mountain on serpentine in a _Pinus palustris_ woodland. [= FNA, K, L, S]

12. _Epigaea_ Linnaeus 1753 (Trailing Arbutus)

A genus of 3 species, subshrubs, in e. North America and Eurasia; the other 2 species of the genus occur in the Caucasus and Asia Minor, and in Japan. References: Judd & Kron in FNA (2009); Stevens et al. in Kubitzki (2004).

_**Epigaea repens**_ Linnaeus, Traileing Arbutus, Mayflower, Ground Laurel. In a wide variety of acidic forests, xeric to mesic, sandy, rocky, and loamy. Late February-early May; April-June. NL (Newfoundland) and QC west to MB, south to FL Panhandle, MS, and IA. At maturity, the fruits split along the sutures, exposing tiny brown seeds embedded in "sticky, white, placental tissue" which is "distinctly sweet to the taste;" ants are strongly attracted to the placental tissue, and in carrying it away disperse the seeds (Clay 1983). [= RAB, C, FNA, G, K, L, S, WH, WV; > _E. repens_ var. _glabrifolia_ Fernald – F; > _E. repens_ var. _repens_ – F]

13. _Kalmia_ Linnaeus 1753 (Wicky, Sheepkill, Mountain Laurel, Ivy, Sand-myrtle)

A genus of 9-11 species, shrubs, of North America and Cuba, except the circumboreal _K. procumbens_ (formerly _Loiseleuria_). _Leiophyllum_, traditionally treated as a monotypic or small genus of se. United States, is better treated as a part of _Kalmia_ along with the northern _Loiseleuria_, based on molecular and morphological studies (Kron & King 1996, Kron et al. 2002). While this idea may initially seem outlandish (particularly to those whose concept of _Kalmia_ is based only on _Kalmia latifolia_), the morphological and habitat similarities of _Leiophyllum to Kalmia_ are striking. The foliage and wood of all species (and the smoke from burning them) are poisonous. References: Liu, Denford, Ebinger, Packer, & Tucker in FNA (2009); Southall & Hardin (1974)=Z; Ebinger (1974)=Y; Strand & Wyatt (1991)=Q; Wilbur & Racine (1971)=R; Camp (1938)=P; Kron & King (1996); Kron et al. (2002)=V; Haines (2010)=U; Stevens et al. in Kubitzki (2004).

1. Petals separate; fruit 2-3 (-7)-locular .................................................................................................................................................... _K. buxifolia_
2. Petals fused; fruit 5-locular.
3. Leaves whorled or opposite; inflorescence either an axillary raceme or a terminal corymbiform raceme.
4. Calyx lobes glandular-canescent and with marginal stipitate glands; leaves glabrous beneath; bracts and bracteoles densely glandular; stomates 18 μ long and 13 μ wide, 15-24 per 0.2 square millimeter; shrub to 1 (-1.2) m tall; [of ne. NC northward]..... _K. angustifolia_
**Kalmia angustifolia** Linnaeus, Northern Sheepkill. Sandy, xeric to mesic hillsides and moist areas, rocky areas. April-May; September-October. NL (Labrador) west to MN, south to se. VA and extreme ne. NC, WV, s. ON, and MI, reaching its southern limit in the Coastal Plain of extreme ne. NC (Sorrie & LeBlond 2008). See *Kalmia carolina* for discussion of the taxonomy of these two taxa. [= K, S, Z; = *K. angustifolia* var. *angustifolia* – C, F, FNA, G, L, Y; = *K. angustifolia* ssp. *angustifolia* – U]

**Kalmia buxifolia** (P.J. Bergius) Gift, Kron, & Stevens, Sand-myrtle. Locally abundant but very restricted in wet (spodosol) pinelands of the outer Coastal Plain (in Brunswick and Carteret counties, NC), locally common in relatively dry sandhills in a few locations in the Sandhills, disjunct in the Piedmont on a few quartzite monadnocks, fairly common in the mountains on rock outcrops at high to moderate elevations (on a wide variety of rock types). Late March-June (sporadically to October); September-October. The species is curiously distributed, both in its overall range and within NC. *Kalmia buxifolia* is found in the Pine Barrens of NJ, the outer Coastal Plain of se. NC, the inner Coastal Plain (fall-line sandhills) of sc. NC and ne. SC, monadnocks of the upper Piedmont of NC, mountain peaks of NC and immediately adjacent nw. SC, ne. GA, and e. TN, and isolated in extreme e. PA (Monroe County) and in se. KY (on sandstone in Whitley County, in the Cumberland Plateau). Populations in the high mountains consist of very old, prostrate krummholz, the stems to 6 cm in diameter at the base, the branches spreading to cover at least a square meter. The disjunct distribution, various habitats, and subtle morphological variation between populations has led to periodic attempts to divide the species into two or more varieties or species, but the variability apparently cannot be successfully described taxonomically; it is here treated as a single species. See X, Y, and Q for detailed discussion of the various taxa recognized by various authors (within the genus *Leiothyrium*). Strand & Wyatt (1991) found a population from Hanging Rock, Stokes County, NC to be the most distinctive, but did not choose to give it formal taxonomic status. [= FNA, V; = *Leiothyrium buxifolium* (P.J. Bergius) Elliott – C, K, L, Q, R, W; > *Leiothyrium buxifolium* var. *buxifolium* – RAB; > *Leiothyrium buxifolium* var. *prostratum* (Loudon) Gray – RAB; > *Leiothyrium buxifolium* var. *hugeri* (Small) Schneider – F, G, P; > *Leiothyrium lyoni* Sweet – S, P; > *Leiothyrium hugeri* (Small) K. Schumann – S; = *Dendrium buxifolium* (Bergius) Desvauex]

**Kalmia carolina** Small, Southern Sheepkill, Carolina Wicky, Carolina Bog Myrtle. Moist to wet pinelands of the Coastal Plain, pocosin margins (or seemingly in pocosins or swamps because of fire suppression), mountain bogs and fens (and less commonly in rocky areas at high elevations) in the Mountains. April-May (sporadically to September, especially in response to fire); September-October. This species, a close relative of the more widespread and northern *K. angustifolia*, occurs in two disjunct areas: the Coastal Plain, from se. VA south through NC to wc. GA (Taylor County), and the Southern Appalachians from sw. VA south through w. NC and ne. TN to ne. GA. Southall & Hardin (1974) favored species status for *K. carolina* because of its essentially allopatric distribution relative to *K. angustifolia* (the 2 meet in Southampton County, VA), the near absence of intermediates or hybrids in this range, and because "significant morphological and anatomical differences have developed and remain constant between these two species when grown together." [= GW, K, S, W, Z; = *K. angustifolia* Linnaeus var. *caroliniana* (Small) Fernald – RAB (an orthographic error); = *K. angustifolia* var. *carolina* (Small) Fernald – C, F, FNA, G, L, Y; = *K. angustifolia* ssp. *carolina* (Small) A. Haines – U]

**Kalmia cuneata** Michaux, White Wicky. Pocosins and pocosin-savanna or pocosin-sandhill ecotones. Late May-June; September-October. This species is a narrow endemic of the Coastal Plain of se. NC and e. SC. It is not closely related to other species in the genus. It is most easily distinguished from other pocosin shrubs by the combination of the following characters: leaves deciduous, dull, and subcordate, 1.5-3 cm wide; inflorescence a fascicle of 1-3 flowers, axillary to leaf scars near the tips of the previous year's growth; petiole 1-4 mm long; [of the Coastal Plain of NC and SC] ......................................................

**Kalmia latifolia** Linnaeus, Mountain Laurel, Ivy, Calico-bush. Acidic forests, bluffs, bogs, along sandhill steams, and in a wide range of other habitats, nearly ubiquitous in the mountains, up to at least 1600m, more restricted in habitat in the lower

---

**ERICACEAE**

4 Calyx lobes canescent but lacking glands; leaves short puberulent beneath; bracts and bracteoles nearly glandless; stamens 13 μ long and 9 μ wide, 35-51 per 0.2 square millimeter; shrub to 2 m tall (though often much shorter when growing in burned situations); [of se. and sw. VA southward].................................................................

2 Leaves alternate; inflorescence an axillary fascicle or a terminal panicle.

5 Leaves 0.5-1.5 cm long, 2-8 mm wide; twigs densely persistently hispid; [of the Coastal Plain of s. SC southward] ...............

6 Leaves deciduous, dull, and subcordate, 1.5-3 cm wide; inflorescence a fascicle of 1-3 flowers, axillary to leaf scars near the tips of the previous year's growth; petiole 1-4 mm long; [of the Coastal Plain of NC and SC] ......................................................

6 Leaves evergreen, glossy, and coriaceous, (1) 3-5 cm wide; inflorescence a terminal panicle; petiole 7-45 mm long; [widespread].....

---

Piedmont and Coastal Plain.  April-July; September-October.  ME, OH, and IN south to Panhandle FL and extreme e. LA.  Unlike our other species, which are strictly shrubs, K. latifolia reaches the stature and diameter of a small tree.  [= RAB, C, FNA, K, L, S, W, WH, WV, Y, Z; > K. latifolia var. laevipes Fernald – F, G; > K. latifolia var. latifolia – F, G]

14. Corema D. Don 1826

A genus of 2 species, shrubs, one of ne. North America and one of Spain and the Azores.  References:  Elisens in FNA (2009); Stevens et al. in Kubitzki (2004).

15. Ceratiola Michaux 1803 (Florida Rosemary)

A monotypic genus, a shrub, of se. North America.  Ceratiola has been traditionally placed in the Empetraceae.  Many workers have expressed doubt about the naturalness of the Empetraceae and its distinction from the Ericaceae.  Molecular data have corroborated that concern, and shown Ceratiola and the rest of the Empetraceae to be better included in a broader Ericaceae (Kron & Chase 1993); the affinities of Ceratiola may actually be with other southeastern United States genera, Kalmia, Elliottia, and Bejaria (Kron & Chase 1993).  References:  Kron & Chase (1993); Judd & Kron (1993); Johnson (1982); Stevens et al. in Kubitzki (2004).

Ceratiola ericoides Michaux, Rosemary, Florida Rosemary, Sandhill Rosemary, Sand Heath.  Xeric sandhills, usually in white "sugar sand."  October-November.  Ne. SC south to s. FL and west to s. MS.  Its content of aromatic compounds makes it very flammable.  [= RAB, K, L, S, WH]

16. Calluna R.A. Salisbury 1802 (Heather)

17. Erica Linnaeus 1753 (Heath)

18. Oxydendrum A.P. de Candolle 1839 (Sourwood)

A monotypic genus, a tree, of se. North America.  The genus Oxydendrum is "isolated ... among the Ericaceae, apparently with no close relatives" (Wood 1961):  the only member of tribe Oxydendreae (Judd in FNA, in press).  References:  Judd in FNA (2009); Stevens et al. in Kubitzki (2004).

Oxydendrum arboreum (Linnaeus) A.P. de Candolle, Sourwood, Sorrel-tree.  Mesic to xeric deciduous forests, especially dry-mesic to xeric oak-hickory and oak-pine forests, also in the fall line sandhills in sandhill/pocosin ecotones.  Se. and sw. PA
west to IL, south to n. FL and se. and c. LA. It is an especially characteristic understory tree of upland forests of the Piedmont and lower Mountains. The bark is dark grayish-brown and fairly deeply furrowed; the tree nearly always has a characteristic lean (toward a former canopy light-gap). The finely serrate, elliptic leaves are distinctive, with the sour taste of garden sorrel (*Rumex acetosa*), sheep sorrel (*Rumex acetosella*), or wood sorrel (*Oxalis*). [= RAB, C, F, FNA, G, K, L, S, W, WH, WV]

19. *Pieris* D. Don 1834 (Evergreen Fetterbush)

1 Inflorescence a many-flowered panicule of racemes, borne terminally; seeds 2.5-3 mm long; [of slopes and ridges of the Mountains and upper Piedmont]; [subgenus *Pieris*, section *Pieris*].............................................................................................................. *P. floribunda*

1 Inflorescence a 3-9 flowered raceme, borne in the axils of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with *Taxodium ascendens*]; [subgenus *Pieris*, section *Phillyreoides*].............................................................................................................. *P. phillyreoides*

**Pieris floribunda** (Pursh) Bentham & Hooker f., Mountain Andromeda, Evergreen Mountain Fetterbush. Acid wooded slopes, heath balds at high elevations, summits of Piedmont monadnocks, sometimes escaped from cultivation. May-June; August-October. A Southern Appalachian endemic: e. WV, w. VA, w. NC, e. TN, and n. GA. The type locality is supposedly in n. GA. The range in NC is peculiar, the species occurring at high elevations southwest of Asheville, absent from apparently suitable habitats to the northeast (such as the Craggies, Blacks, Roan Mountain, and Grandfather Mountain), yet reappearing in a few disjunct populations at low elevations in the upper Piedmont. In w. VA (and adjacent e. WV), *P. floribunda* occurs on rather dry sandstone ridges and upper slopes, often under an oak canopy, especially in the front ranges of the Cumberland Mountains. *P. floribunda* is placed in subgenus *Pieris*, section *Pieris*, along with *P. japonica* (see below) and another Asian species. [= RAB, C, F, FNA, G, K, L, S, W, WV, Z]

*Pieris japonica* (Thunberg) D. Don ex G. Don, Japanese Andromeda or Lily-of-the-valley Bush, rather closely related to our *P. floribunda*, is frequently grown as an ornamental. [= FNA, Z] [not keyed]

**Pieris phillyreoides** (Hooker) A.P. de Candolle, Vine-wicky, Climbing Fetterbush. Swamp forests. E. SC south to c. peninsular FL west to s. AL. This southeastern species has the remarkable habit of often growing as a creeping vine under the bark of *Taxodium ascendens*, the branches exserted through the cypress bark, sometimes ascending into the upper canopy with the main stem never visible except at the very base of the tree; it also sometimes grows as a low shrub. Godfrey (1969) documents the occurrence of this species in our area. See GW and Godfrey (1989) for excellent descriptions and illustrations of this curious "shrub-vine." It is apparently most closely related to the other two members of subgenus *Pieris*, section *Phillyreoides*, *P. cubensis* (Grisebach) Small, endemic to w. Cuba, and *P. swinhoei* Hemsley, of se. China, neither of which shares its unusual habit. [= FNA, GW, K, L, WH, Z; = Ampelothamnus phillyreoides (Hooker) Small – S]

20. *Agarista* D. Don ex G. Don 1834 (Agarista)

**Agarista populifolia** (Lamarck) Judd, Agarista, Pipe-plant. Blackwater swamps, hydric hammocks, marly spring runs. April-May; September-October. E. SC (or se. NC?) south to ne. and c. peninsular FL. Reported for several locations in s. AL, likely escaped (Diamond & Woods 2009). A specimen at the University of North Carolina at Chapel Hill is labeled as coming from a nursery, originally taken from plants in a swamp in Columbus County, NC. The record is plausible and would add the species to the state's flora. [= FNA, K, L, WH, Z; = Leucothoe populifolia (Lamarck) Dippel – RAB, GW; = Leucothoe acuminata (Aiton) G. Don – S; = Andromeda populifolia Lamarck]

21. *Lyonia* Nuttall 1818 (Staggerbush, Maleberry, Fetterbush)

1 Lower leaf surfaces stipitate-peltate with rusty scales; [of s. SC southward].
2 Ultimate branches not rigidly ascending, flowers nearly always restricted to branches of the previous year, the leaves not conspicuously reduced toward the branch tips; leaves with distal margin usually revolute, sometimes strongly so; major veins usually depressed; lower leaf surface with some scales often large and with irregular margins, others smaller and more nearly entire, at least the smaller scales more-or-less persistent; [shrub to 6 (-12) m tall] .................................................. L. ferruginea

2 Ultimate branches rigidly ascending, flowers frequent on branches of the current year (though also on older growth), the leaves conspicuously reduced toward the branch tips; leaves with distal margin at most slightly revolute; major veins not depressed; lower leaf surface with scales usually all large and with irregular margins, the scales often deciduous; [shrub to 1.5 (-3) m tall] .............. L. fruticosa

1 Lower leaf surfaces glabrous or pubescent; [collectively widespread].
2 Leaves evergreen (some leaves present on wood of the previous year), coriaceous, and shining .................................................. L. lucida
3 Leaves deciduous (no leaves present on wood of the previous year), subcoriaceous, and dull. .............................................................. L. mariana
4 Young twigs terete; leaf margin minutely serrulate; corolla 3-5 mm long; inflorescence a terminal panicle; capsule 2.5-3 mm long; leaf surfaces with appressed, strigillose hairs, pale with a red base.
5 Inflorescences (at least the lower) with conspicuous bracts; [of the Coastal Plain and lower Piedmont] ...L. ligustrina var. foliosiflora

Lyonia ferruginea (Walter) Nuttall, Crookedwood, Dragonwood, Staggerbush. Dry oak and pine woodlands, scrub, rarely pocosins, spodosotic flatwoods. February-May; April-October. Se. SC south to se. peninsular FL, west to Panhandle FL. See discussion under L. fruticosa. [= FNA, GW, K, L, WH, Z; < Lyonia ferruginea – RAB (also see L. fruticosa); = Xolisma ferruginea (Walter) Heller – S]

Lyonia fruticosa (Michaux) G.S. Torrey, Staggerbush, Poor-grub. Pocosins. March-July; May-October. Se. SC (at least formerly) south to s. peninsular FL, west to e. Panhandle FL. Though not included in RAB for our area, Judd (1981) cites several old specimens from SC. The species is definitely known from immediately adjacent GA, and there seems no reason to doubt its (at least historical) occurrence in SC. This species is difficult to distinguish from L. ferruginea, with which it often co-occurs. [= FNA, GW, K, L, WH, Z; < L. ferruginea – RAB; = Xolisma fruticosa (Michaux) Nash – S]

Lyonia ligustrina (Linnaeus) A.P. de Candolle var. foliosiflora (Michaux) Fernald, Southern Maleberry, He-huckleberry. Pocosins, seepage bogs, and other wet habitats. Late April-June; September-October. Se. VA south to s. FL, west to e. TX and e. OK, and (west of the mountains) north to TN and AR. Rather nondescript when sterile, the gray-green hue of the leaves is a useful character. Var. foliosiflora is the usual variety on the Coastal Plain (including the fall-line sandhills). [= FNA, GW, K, L, W, Z; < L. ligustrina – RAB, C, G; > L. ligustrina var. capreaefolia (Watson) A.P. de Candolle – F; > L. ligustrina var. foliosiflora – F; > L. ligustrina var. salicifolia (Watson) A.P. de Candolle – F; = Arsenococcus frondosus (Pursh) Small – S; = Xolisma foliosiflora (Michaux) Small]

Lyonia ligustrina (Linnaeus) A.P. de Candolle var. ligustrina, Northern Maleberry, He-huckleberry. Mountain bogs, shrub balds, bottomlands, other moist to wet habitats, "dry" ridges at high elevations. May-July; September-October. S. ME, s. NH, s. VT, s. and e. NY, s. OH, WV, and KY south to w. and e. SC, n. GA, and ne. AL, primarily in the mountains and adjacent provinces. Var. ligustrina is the usual variety in the Mountains and Piedmont, but extends as well into the Coastal Plain in NC and SC. This variety is very variable in leaf shape and size, some populations having leaves about 3 cm long and 1.3 cm wide, others with leaves as long as 8 cm long and 5 cm wide. The plants with smaller leaves occur in bogs and other distinctly wet habitats, while plants with large leaves occur in thin soils in high elevation heath balds and thin soils around rock outcrops (as, for instance, on Grandfather Mountain, NC). [= F, FNA, GW, K, L, W, Z; < L. ligustrina – RAB, C, G, WV; = Arsenococcus ligustrinus (Linnaeus) Small – S; = Xolisma ligustrina (Linnaeus) Britton]

Lyonia lucida (Lamarck) K. Koch, Shining Fetterbush. Pocosins, wet woodlands, blackwater swamp forests, other acidic habitats especially if peaty. April-early June; September-October. Se. VA south to s. FL and west to e. and c. LA; also in w. Cuba. Readily distinguished by the glossy, coriaceous leaves with a prominent vein running along the margins. When in flower in large numbers, the odor is cloyingly sweet. [= RAB, C, F, FNA, G, GW, K, L, WH, Z; = Desmothenus lucidus (Lamarck) Small – S; = Neopieris nitida (Bartram ex Marshall) Britton]

Lyonia mariana (Linnaeus) D. Don, Staggerbush. Pine flatwoods, savannas, pocosin-sandhill ecotones, dry rocky woodlands in the lower Piedmont (especially with chestnut oak). April-May; September-October. RI (formerly) and NY (Long Island) south to e. peninsular and e. Panhandle FL; disjunct west of the Mississippi River in sc. MO, c. AR, nw. LA, se. OK, and e. TX. Readily distinguished by the broadly elliptic leaves borne at an ascending 45 degree angle, with bright pink axillary buds. [= RAB, C, F, FNA, G, GW, K, L, WH, Z; = Neopieris mariana (Linnaeus) Britton – S]

**Andromeda polifolia** Linnaeus var. *latifolia* Aiton, Bog-rosemary. Bogs. May-July; June-September. Circumboreal, in North America from NL (Newfoundland) and NL (Labrador) west to SK, south to NJ, ne. PA (Rhoads & Klein 1993), e. WV (at Cranberry Glades, Pocahontas County), IN, IL, and MN. Var. *polifolia* is also circumboreal, overall more northern. [= FNA; = *A. glaucophylla* Link – C, F, G, L; = *A. polifolia* var. *glaucophylla* (Link) A.P. de Candolle – K; = *A. polifolia* ssp. *glaucophylla* (Link) Hultén]

23. **Zenobia** D. Don 1834 (Zenobia, Honey-cups)

**Zenobia pulverulenta** (Bartram ex Willdenow) Pollard, Zenobia, Honey-cups. Pocosins, margins of pineland ponds. April-June; September-October. This monotypic genus is a narrow endemic of the Coastal Plain of se. VA, NC, SC, and e. GA (Bryan Co.). It was considered by Wood (1961) to have "no close relatives," but molecular phylogeny suggests that it is sister to *Andromeda*. The crenate leaves help distinguish *Zenobia* from other pocosin shrubs. The flowers are extremely fragrant. The species is remarkably variable in leaf glaucescence. Many plants in the fall-line sandhills and upper Coastal Plain have the lower leaf surface, pedicels, and capsules covered in wax to the point that they are bright white; outer Coastal Plain plants generally lack any glaucescence. The division into two species listed below in synonymy was based largely on this character; further study appears warranted. In the centers of major peat domes in the Outer Coastal Plain and in large Carolina bays in the Bladen Lakes region, where peat depths reach 3-5 meters, occur areas of up to 25 square kilometers dominated by *Zenobia* (sometimes codominant with *Chamaedaphne* or *Sarracenia flava*). This community has been referred to as "deciduous low pocosin," to distinguish it from the dominance of evergreen shrubs found in most pocosins. [= RAB, C, F, FNA, G, GW, K, L; > *Z. pulverulenta* – S; > *Z. cassinefolia* (Ventenat) Pollard – S]

24. **Chamaedaphne** Moench 1794 (Leatherleaf, Cassandra)

**Chamaedaphne calyculata** (Linnaeus) Moench, Leatherleaf, Cassandra. Pocosins in the Coastal Plain, bogs in the Mountains, *Chamaecyparis* bogs. March-April; June-October. Circumboreal; in North America from NL (Newfoundland) to AB, south to WV (Tucker County) (T.F. Wieboldt, pers.comm., 2007), MD, OH, n. IL, WI, n. IA, AB, and BC; disjunct to the mountains of NC (where now nearly extirpated, known only from a single bog of less than 1 hectare) and to the Coastal Plain of NC and ne. SC. The Coastal Plain occurrences in our area are mainly in the centers of large peat dome or Carolina Bay pocosins, the insufficiently famous southern blanket bogs or "southern muskeg." In these areas, *Chamaedaphne* is sometimes dominant (or codominant with *Zenobia pulverulenta* or *Sarracenia flava*) over expanses of 25 square kilometers. The southern occurrences of *Chamaedaphne* are certainly the result of Pleistocene distributions. A number of varieties have been named: (the Eurasion var. *calyculata*, var. *latifolia* in Maritime Canada, south to n. New England, and var. *angustifolia*, to which our material would presumably be referred). The validity of the varieties is doubtful. [= C, FNA, G, K, L, S, W; = *Cassine* calyculata (Linnaeus) D. Don – RAB, GW; > *Chamaedaphne* calyculata var. *angustifolia* (Aiton) Rehder – F]

25. **Leucothoe** D. Don 1834 (Fetterbush, Leucothoe)

A genus of 5-6 species, shrubs, of Japan, Himalayan Asia, and e. North America. References: Tucker in FNA (2009); Stevens et al. in Kubitzki (2004). [also see *Agarista* and *Eubotrys*]

1 Leaves deciduous, dull, membranaceous [. . .]. [see *Eubotrys*]

2 Leaves evergreen, glossy, coriaceous. [. . .]

2 Leaves with an acute or short-acuminate apex; racemes 2-4 (5) cm long; sepals ovate, with an obtuse or rounded apex; longest petioles 3-8 mm long. [. . .] = *L. axillaris* [. . .]

2 Leaves with a long-acuminate apex; racemes 4-10 cm long; sepals lanceolate-ovate, with an acute (or subacute) apex; longest petioles 8-15 mm long. [. . .] = *L. fontanesiana*

**Leucothoe axillaris** (Lamarck) D. Don, Coastal Doghobble. Pocosins, blackwater swamp forests, and moist and acid slopes. Late March-May; September-October. A Southeastern Coastal Plain endemic: sw. VA south to FL and west to extreme e. LA. [= C, FNA, G, GW, K, L, S, WH; = *L. axillaris* var. *axillaris* – RAB; > *L. axillaris* var. *axillaris* – F; > *L. axillaris* var. *ambigens* Fernald – F]

**Leucothoe fontanesiana** (Steudel) Sleumer, Mountain Doghobble, Switch-ivy. Moist slopes, streambanks, ravines, often associated with *Rhododendron maximum* thickets. April-May; September-October. A Southern Appalachian endemic: sw. VA
A genus of 2 species, shrubs to small trees, of e. North America. Recent molecular evidence supports the recognition of *Eubotrys* as a genus separate from *Leucothoe*, and more closely related to *Chamaedaphne*, supporting the views, based on morphological grounds, of many earlier authors (Kron et al. 2002). References: Tucker in FNA (2009); Kron et al. (2002); Stevens et al. in Kubitzki (2004).

1 Anthers with 4 awns; capsule rounded on the sutures; sepals broadly lanceolate; racemes 3-5 cm long; seeds not winged, shaped like a section of an orange ................................................. *E. racemosa*

1 Anthers with 2 awns; capsule angled on the sutures; sepals ovate; racemes 5-12 cm long; seeds winged, oblanceolate, flat ............... *E. recurva*

**Eubotrys racemosa** (Linnaeus) Nuttall, Coastal Fetterbush. Swamps, pocosins, streambanks, and other wet places. Late March-early June; September-October. E. MA south to c. peninsular FL and west to LA, primarily on the Coastal Plain; disjunct inland, as in e. TN (Chester, Wofford, & Kral 1997). [= C, FNA, G; L. racemosa var. projecta Fernald – F; > L. racemosa var. racemosa – F; > Eubotrys racemosa – S; > Eubotrys elongata Small – S]

**Eubotrys recurva** (Buckley) Britton, Mountain Fetterbush. Heath balds, high elevation ridges and granitic domes, bogs. April-early June (rarely sporadically in the fall); August-October. A Southern Appalachian endemic: sw. VA, s. WV, and se. KY south through w. NC and ne. TN to ne. GA (Rabun County) and nw. SC. [= C, FNA, G, S; > Leucothoe recurva (Buckley) A. Gray – RAB, F, K, L, W, WV]

**27. Gaultheria** Kalm ex Linnaeus 1754 (Wintergreen, Teaberry)

A genus of 115-135 species, shrubs and subshrubs, of Asia, Australia and New Zealand, South America, West Indies, Central America, and North America (primarily Asian). References: Trock in FNA (2009); Stevens et al. in Kubitzki (2004).

1 Stems creeping, the leaves 3-10 mm long, well-distributed along the stem; berries white; flowers 4-merous............................... *G. hispidula*

1 Stems erect, the leaves 15-50 mm long, clustered at the tip of the stem; berries red; flowers 5-merous............................... *G. procumbens*

**Gaultheria hispidula** (Linnaeus) Muhlenberg ex Bigelow, Creeping Snowberry, Moxie. Spruce-fir forests, northern hardwoods forests, bogs at high elevations. May. NL (Newfoundlnd) and NL (Labrador) west to BC, south to NJ, MD, WV, OH, MN, ID, and WA; there is no known documentation for the attribution (by C, F, G, and S) of this species as occurring in NC. [= C, F, FNA, G, K, WV; > Chiogenes hispidula (Linnaeus) Torrey & A. Gray – S]

**Gaultheria procumbens** Linnaeus, Wintergreen, Teaberry, Checkerberry. Heath balds, woodlands, and openings, usually acidic and xeric. June-August; September-November. NL (Newfoundlnd) west to MB, south to e. NC, ne. GA, AL, c. TN, KY, n. IN, and MN. [= RAB, C, F, FNA, G, K, L, S, WV]

**28. Vaccinium** Linnaeus 1753 (Blueberry)

A genus of 140 species, shrubs, lianes, and small trees, semicosmopolitan. *Vaccinium* in our area is divided into 6 strongly differentiated sections, sometimes, as by Small, treated as separate genera. The taxonomy of *Vaccinium* remains unclear – past divergence of opinion is obvious in the synonymy. For instance, Small (1933) recognizes 6 genera and 25 species for our area, Ahles in RAB (1968) recognizes 1 genus and 14 species (one with 2 varieties) (not including VA), and Vander Kloet (1988) recognizes 1 genus and 9 species. The highbush blueberries of section Cyanococcus are particularly difficult. Vander Kloet's extremely broad concept of the highbush blueberries as consisting of a single species, *V. corymbosum*, including *V. fuscatum* (*V. atroococcum* – RAB), *V. simulatum* ("V. constablaei" – RAB), *V. virgatum* (*V. amoenum* – RAB, *V. elliottii*, *V. formosum* (*V. australae), and *V. caesariense* (and many other named taxa not recognized here) has been adopted by some recent authors, at least partly for its ease of application. I agree with Godfrey (1988), though, that *V. elliottii* has "such distinctiveness as to be recognizable in the field at a glance."

The other taxa are less easily recognizable, but seem to have substantial morphological and phytogeographic integrity. The fairly frequent presence of hybrid individuals and populations can make identification frustrating, but I agree with Ward (1974) that "the genus *Vaccinium* ... is difficult but not in any way an irresolvable tangle of intergrading
populations. The vast bulk of individuals encountered in the field may be assigned, as with any non-apomictic genus, to a relatively few, discrete, and wholly recognizable species". Many of the taxa included in *V. corymbosum* by Vander Kloet (1988) and Luteyn et al. (1996) occur together in combinations of two to four, are immediately recognizable in the field, bloom at different times, and have different flower, fruit, and leaf morphology. Failure to recognize multiple entities within the highbush blueberries results in the taxonomic homogenization of the diversity of the group and obscures important phytogeographic patterns. Our area, with 20 species (24 taxa) in 6 sections, has a greater diversity of *Vaccinium* than any other comparably sized area in North America. References: Vander Kloet (1988)=Z; Uttal (1987)=Y; Camp (1945)=X; Ashe (1931)=V; Ward (1974)=Q; Luteyn et al. (1996)=L; Vander Kloet in FNA (2009); Vander Kloet & Hall (1981); Vander Kloet (1977, 1978a, 1978b, 1980, 1982, 1983a, 1983b); Uttal (1986a, 1986b); Stevens et al. in Kubitzki (2004). Key based in part on Uttal (1987).

1 Trailing vines, erect shoots (if present) borne on horizontal stems; leaves evergreen, glossy and dark green above, rarely exceeding 20 mm in length.

2 Leaves narrowly elliptic, glabrous above, glaucous-white below; leaf margin entire and eglandular; berry red when ripe, 8-15 mm long; [cranberries, section Oxycoccus]........................... Key A

3 Twigs of the season not verrucose.

4 Corolla lobes 4, strongly recurved, 7-10 mm long; calyx lobes 4 (also visible on the berry); leaves lanceolate to ovate, the apex acuminate, the margin regularly and finely serrate with glandular teeth; [of high elevations in the Mountains]; [mountain cranberry, section Oxycoccusoides].................................................................................................................................................. Key D

5 Mature leaves green (or glaucous), glandular beneath, mostly elliptic to round, generally 1.5-4.5 cm long; corolla broad-urceolate to narrow-campanulate, the stamens included; berry black, lustrous, 5-9 mm long; [farkeberry, section Batodendron].......................... Key E

6 Mature leaves pale and glaucous, eglandular beneath, mostly elliptic, 3-10 cm long; corolla campanulate, the stamens long-exserted; berry green, yellow, pink, or purple, usually glaucous, 7-18 mm long; [deerberries, section Polycodium].......................... Key F

**Key A – cranberries, section Oxycoccus**

1 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-involute; pedicels with 2 green, leaf-like bracts 1-2 mm wide; berry 8-15 mm in diameter.............................................................................. V. macrocarpon

1 Leaves ovate, broadest toward base, (3-) 5-6 (-9) mm long, (1-) 2-3 (-5) mm wide; leaves involute at least along the margins, thus making the leaf tip acute; pedicels with (0-) 2 (-5) reddish, scale-like bracts < 1 mm wide; berry 6-12 mm in diameter................................. V. oxycoccus

**Key B – creeping blueberries, section Herpothamnus**

1 Leaves (2-) 3-18 (-25) mm long, generally elliptic (less commonly ovate or obovate); angle of leaf base typically >90 degrees; margins finely glandular mucronulate-crenulate, the teeth tightly appressed and therefore often obscure, the margin superficially entire; stems mostly prostrate (ascending in areas that have been long fire-suppressed); [widespread in NC and SC, rare in se. VA and e. GA]....... V. crustisfolium

1 Leaves (4-) 7-35 (-63) mm long, elliptic to obovate (less commonly elliptic-ovate); angle of leaf base typically <90 degrees; margins glandular mucronulate-serrulate to serrulate-crenulate, the teeth apparent, especially toward the apex; [of Lexington County, SC]................................................................................................................................. V. sempervirens

**Key C – blueberries, section Cyanococcus**

Note: Hybrids and apparent local races in this section are frequent, and will key poorly. Hybrids are particularly frequent among the taxa of the highbush blueberries, somewhat less so among lowbush blueberries and between lowbush and highbush. In the Coastal Plain, *V. marianum* (*formosum* × *fasciculatum*) is the most common, and will be responsible for most difficulties encountered in the key from lead 10 on. Uttal (1987) presents a complicated key with *V. marianum* (but not other hybrids) included.

1 Shrubs rhizomatous, forming clonal colonies, the upright stems < 1 m tall (and often < 0.5 m tall); ["lowbush blueberries"].

2 Leaves evergreen, 5-15 mm long (rarely to 30 mm long on fire sprouts), subcoriaceous, glossy dark-green or dull blue-green; [restricted in our area to the Coastal Plain of se. SC southward].

3 Plant glaucous and bluish-green throughout; leaf undersurface lacking scattered glandular hairs; [of s. GA south to s. peninsular FL, west to e. TX].................................................................................................................................................. V. darrowii

3 Plant dark green throughout; leaf undersurface with scattered glandular hairs, these sometimes very few by late in the season (best seen in the field by folding a leaf, holding the fold up to the light, and using a 10× lens); [of se. SC southward to n. FL, west to s. AL]......... V. myrsinites

2 Leaves deciduous to semi-evergreen, herbaceous, generally > 20 mm in length, dull to somewhat glossy and medium green; [collectively widespread in our area].
3 Lower surfaces of the leaves with red stipitate glands (sometimes pubescent as well when young), berry usually black and lustrous; [of the Coastal Plain and lower Piedmont] ........................................................... V. tenellum

3 Lower surfaces of the leaves eglantriform, pubescent or glabrous; berry either blue and glaucous, or black and glandular-hirsute; [collectively widespread in our area].

4 Leaves entire or obscurely serrulate (if obscurely serrulate then 30-50 mm long and 13-25 mm wide), either glaucous and glabrous (or nearly so) beneath, or green and densely pubescent beneath.

5 Leaves pale and glaucous, glabrous on both sides or pubescent on the underside only; berry blue and glaucous; [plants collectively widespread].

6 Plants mostly 0.5-1.0 (-1.4) m tall, stems brown for much of their length; leaves entire; fruit 7-12 mm in diameter; [of moderate to high elevations of the Mountains] ........................................................... V. aldomontanum

6 Plants mostly 0.2-0.6 (-1.0) m tall, stems green to the base (or brown at the very base); leaves serrulate (rarely entire); fruit 4-7 (-8) mm in diameter; [widespread, at low to moderate elevations] ........................................................... V. pallidum

5 Leaves green, pilose on both sides; berry either blue and glaucous, or black and glandular-hirsute; [of the Mountains].

7 Berry black and glandular-hirsute; calyx and corolla hirsute and stipitate-glandular; leaves mostly > 3 cm long; [of the mountains of sw. NC and adjacent TN and GA] ........................................................... V. formosum

7 Berry blue and glaucous; calyx and corolla glabrous; leaves mostly < 3.5 cm long; [of the mountains of n. NC and north] ..........

----------------------------------------

Key D – mountain cranberry, section Oxycoccoides

One species in our area ........................................................... V. erythrocarpum

Key E – farkleberry, section Batodendron

One species in our area ........................................................... V. arboreum

Key F – deerberries, section Polycopodium

[This key and treatment provisional]

1 Leaves strongly white-glaucous beneath; stamens 4-6 mm long.

2 Bracts of the inflorescence nearly as large as normal foliage leaves; [of the Coastal Plain from se. NC southward] ...........................................................
**Ericaceae**

---

Vaccinium alnorum W.W. Ashe, Blue Ridge Blueberry. Mt (GA, NC, SC, VA): grassy balds, heath balds, high elevation forests and woodlands; uncommon. May-June; July-September. The tetraploid *V. alnorum* occurs primarily in the Mountains at moderate to high elevations (the type collection is from the Fodderstacks, Macon County, NC); it differs from the diploid *V. pallidum* in forming tighter (often circular) clones, with taller plants (to 1 m tall), the leaves thick in texture, often revolute, strictly glaucous and glabrous, and with excellent berries. [v. *corymbosum* – RAB; = *V. alto-montanum* – G, X, orthographic variant; < *V. pallidum* – FNA, K; > Cyanococcus subcordatus Small – S; > Cyanococcus liparis Small – S, as to type]

Vaccinium angustifolium Aiton, Northern Lowbush Blueberry, Sugarberry, Low Sweet Blueberry. Mt (NC, VA, WV), Pd (DE): acidic forests and woodlands, cliffs and talus (especially sandstone and quartzite), usually at high elevations; common (uncommon in WV, rare in DE and NC). NL (Labrador) and NL (Newfoundland) west to MB, south to NJ, PA, sw. VA, IL, and MN. Recently reported for the Great Smoky Mountains National Park (J. Rock, pers. comm. 2009) and from Cheoah Bald, Graham County (E. Schwartzman, pers. comm. 2010 and NCU specimen). [= C, FNA, K, W, Y, Z; > *V. angustifolium* var. angustifolium – F, WV; > *V. angustifolium* var. laevifolium House – F, WV; > *V. angustifolium* var. hypolasium Fernald – F; > *V. angustifolium* var. nigrum (Wood) Dole – F, WV; > *V. angustifolium* – G, X; > *V. latissimum* Camp – G, X; > *V. brittonii* Porter ex Bicknell – X]

Vaccinium darrowii Marshall, Dark Blueberry. Savannas, pine flatwoods, pocosin-sandhill ecotones, upland sandhills over clay pans. April-May; June-July. This species is nearly endemic to the Carolinas, barely extending into immediately adjacent VA and GA. See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for discussion of the systematics and ecology of this species and the closely related *V. sempervirens*. [= RAB, C, F, G, GW, Y; > *V. darrowii* ssp. crassifolium (Andrews) Small – S; < *V. crassifolium* – FNA, L, Z]

Vaccinium formosum L., Blueberry. Coastal Plain pinelands, coastal plain swamps, coastal dunes. [= *Cyanococcus formosus* – S]

Vaccinium corymbosum var. caesium (Hooker) Fernald – F, orthographic variant; = *Cyanococcus myrsinites* (Lamarck) Small var. glaucum A. Gray – S

---

1 Leaves green beneath (often slightly paler but not at all glaucous); stamens 5-8 mm long.
2 Bracts of the inflorescence much smaller than normal foliage leaves; plants short, 0.2-0.5 (-1.0) m tall, distinctly clonal; [primarily of Coastal Plain pinelands].
3 Bracts of the inflorescence nearly as large as normal foliage leaves; plants short, 0.2-0.5 (-1.0) m tall, distinctly clonal; [primarily of Coastal Plain pinelands].
4 Hypanthium and fruit glabrous
5 Hypanthium and fruit pubescent

Vaccinium crassifolium

**Vaccinium erythrocarpum** Michaux, Bearberry, Highbush Cranberry, Mountain Cranberry. Rocky ridges, shrub or grassy balds, bogs, spruce-fir forests, usually at high elevations. Late May-July; August-September. A Southern and Central Appalachian endemic, *V. erythrocarpum* ranges from WV through VA to w. NC, e. TN, and ne. GA. The only other member of Section Oxycoccoides is *V. japonicum* Miguel of montane Japan, so similar as to be sometimes regarded as only a subspecies or variety of our species. [= RAB, C, F, K, L, W, WH, Y, Z; = *V. corymbosum* – FNA; = Hugeria erythrocarpa (Michaux) Small – S]

**Vaccinium formosum** H.C. Andrews, Southern Highbush Blueberry, Swamp Highbush Blueberry. Bogs, swamps (especially blackwater, or at least where away from strong alluvial influence), seepages, depression ponds (dolines), other moist ground. Late February-May; June-August. Apparently ranging from NJ south to n. FL and s. AL, primarily on the Coastal Plain. This species is the primary source of the cultivated highbush blueberries. It has the largest and arguably the highest quality fruit of the native highbush blueberries. [= K, Y; < *V. corymbosum* – RAB, C, FNA, L, WH, Z; = *V. australis* Small – G, GW, X; = Cyanococcus virgatus (Aiton) Small – S, misapplied]

**Vaccinium hirsutum** Buckley, Woollyberry, Hairy Blueberry. Mountain slopes and ridges, primarily in pine-oak and oak forests. April-May; June-July. *V. hirsutum* is a narrow Southern Appalachian endemic, occurring only in a few counties of sw. NC, se. TN, and n. GA. It is the only species in our area with pubescent fruit. [= RAB, FNA, K, L, W, X, Z; = *Cyanococcus hirsutus* (Buckley) Small – S]

**Vaccinium macrocarpon** Aiton, Cranberry, Large Cranberry. Mountain bogs, low pocosins with deep peat, interdunal swales. May-July; August-November. Unlike the circumboreal *V. oxycoccus* Linnaeus, *V. macrocarpon* is limited to North America. This is the familiar edible cranberry, raised commercially in artificial bogs, primarily in MA, WI, and NJ. It ranges as a native plant from NL (Newfoundland) west to s. ON, MN, ne. IL, n. IN, n. and c. OH, PA, and NJ, extending south along the Appalachians as a disjunct rarity through WV, w. VA, and ne. and se. TN to w. NC, and south along the outer Coastal Plain as a disjunct rarity in e. MD, se. VA, and ne. and se. NC. The occurrence in the inner Coastal Plain (fall-line sandhills) along the Little River in Cumberland County, NC is questionably native. [= RAB, FNA, G, K, L, W, WH, Y, Z; = *Oxycoccus macrocarpus* (Aiton) Persoon – S]

**Vaccinium myrsinites** Lamarck, Southern Evergreen Blueberry. Pine flatwoods. March-April; May-June. Se. SC south to s. peninsular FL, west to s. AL. *V. myrsinites* is readily distinguished from all our species by the following combination of characteristics: clonal shrub with upright stems usually < 50 cm tall, the young twigs verrucose, leaves evergreen, mostly 5-15 mm long and 2-10 mm wide, lower surface of young leaves with stout glandular hairs. Further south, it can be difficult to distinguish from the closely related *V. darrowii* Camp (see key), with which it often co-occurs in their area of overlap. [= RAB, FNA, GW, K, L, WH, X, Z; = *Cyanococcus myrsinites* (Lamarck) Small var. myrsinites – S]

**Vaccinium myrtilloides** Michaux, Velvetleaf Blueberry, Sourtop, Canada Blueberry. Acidic, high elevation slopes and cliffs. May-July. NL (Labrador) west to BC, south to PA, VA, w. NC, WV, IN, and MN. Reported for the NC side of Great Smoky Mountains National Park (Haywood County) (K. Langdon, pers. comm. 2009). The possible occurrence of this species on Grandfather Mountain is based on somewhat ambiguous specimens and needs additional confirmation. See Vander Kloet & Hall (1981) for a summary of information on this diploid species. [= C, F, FNA, G, K, W, WV, X, Y, Z]

**Vaccinium oxyccoccus** Linnaeus, Small Cranberry. Bogs. Circumboreal, south in North America to NJ, PA, WV (Grant, Mineral, Pendleton, Pocahontas, Preston, Randolph, and Tucker counties), IN, and MN. This species has been reported for NC,
by Fernald (1950) as *V. oxyccocos var. ovalifolium* Michaux, by Scoggan (1979) as *Oxycoccus ovalifolius* (Michaux) Persold, and by Kartesz (1999). Most likely, ambiguous collections of *V. macrocarpon* are the basis for these reports.  [= C, FNA, G, K; > *V. oxyccocos* Linneaus var. *ovalifolium* – F; > *Oxycoccus palustris* Persoon; > *Oxycoccus palustris* Persoon var. *ovalifolius* (Michaux) Seymour; > *Oxycoccus ovalifolius* (Michaux) Persold]

### Vaccinium pallidium

### Vaccinium semprevirens

Rayner & Henderson, Rayner's Blueberry.  Seeepage bogs in the fall-line Sandhills, longleaf pine woodlands over sandstone and gravel outcrops.  Endemic to Lexington County, SC, known from only a few sites.  This species is clearly closely allied to *V. crassifolium*.  Kirkman & Ballington (1990) reduce it to a subspecies.  Because it is allopatric and relatively discrete morphologically, despite occurring in similar habitats, I prefer to retain it as a species.  See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for further discussion of the systematics and ecology of this species and *V. crassifolium*.  [= *V. crassifolium* Andrews ssp. *sempervirens* (Rayner & Henderson) Kirkman & Ballington – K; < *V. crassifolium* – FNA, L, Z]

### Vaccinium simulatum

Small, Mountain Highbush Blueberry.  Forested slopes (northern hardwoods, spruce-fir forests), ridges, and shrub balds, at moderate and high elevations.  Late April-early June; July-August.  A Southern and Central Appalachian endemic, *V. simulatum* ranges from e. KY and sw. VA south through w. NC and e. TN to n. GA and n. AL.  The name *V. constablaei* has been misapplied to this species, as by RAB; see *V. corymbosum* for a discussion of the correct application of *V. constablaei*.  [= G, K, X, Y; = *V. constablaei* Gray – RAB, G, misapplied; < *V. corymbosum* – C, FNA, L, W, Z; = *Cyanococcus simulatus* (Small) Small – S]

### Vaccinium stamineum

Linnaeus var. *I*, Dwarf Deerberry.  Pinelands.  April-June; August-October.  This dwarf taxon is characteristic of Coastal Plain pinelands; its stature is not the result of fire; it never achieves greater height, even following decades of fire suppression.  Se. NC south to GA.  < *V. stamineum* var. *stamineum* – RAB; < *Vaccinium stamineum* – C, FNA, K, L, W, Y, Z; = *Polycodium arenicola* (W.W. Ashe) V; > *Polycodium floridanum* var. *caesium* (Greene) D.B. Ward – V]

### Vaccinium vaccillans

Linneaus var. *2*, Appalachian Deerberry.  Xeric to submesic woodlands and forests, including pine-oak/heath and shrub balds.  April-June; August-October.  PA south to GA, in the Appalachians and adjacent provinces.  [= *V. stamineum* var. *stamineum* – RAB, F, WV; < *V. stamineum* – C, FNA, K, L, W, Y, Z; = *Polycodium candicans* Small – S, V; = *V. corymbosum* – C, FNA, L, W, Z; = *Cyanococcus simulatus* (Small) Small – S]

### Vaccinium vacillans

Linneaus var. *interius*, Southern Deerberry.  Xeric woodlands.  April-June; August-October.  This dwarf taxon is clearly closely allied to *V. crassifolium*.  Kirkman & Ballington (1990) reduce it to a subspecies.  Because it is allopatric and relatively discrete morphologically, despite occurring in similar habitats, I prefer to retain it as a species.  See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for further discussion of the systematics and ecology of this species and *V. crassifolium*.  [= *V. crassifolium* Andrews ssp. *sempervirens* (Rayner & Henderson) Kirkman & Ballington – K; < *V. crassifolium* – FNA, L, Z]

### Vaccinium vaccillans

Linneaus var. *interius*, Southern Deerberry.  Xeric woodlands.  April-June; August-October.  This dwarf taxon is clearly closely allied to *V. crassifolium*.  Kirkman & Ballington (1990) reduce it to a subspecies.  Because it is allopatric and relatively discrete morphologically, despite occurring in similar habitats, I prefer to retain it as a species.  See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for further discussion of the systematics and ecology of this species and *V. crassifolium*.  [= *V. crassifolium* Andrews ssp. *sempervirens* (Rayner & Henderson) Kirkman & Ballington – K; < *V. crassifolium* – FNA, L, Z]

### Vaccinium vaccillans

Linneaus var. *interius*, Southern Deerberry.  Xeric woodlands.  April-June; August-October.  This dwarf taxon is clearly closely allied to *V. crassifolium*.  Kirkman & Ballington (1990) reduce it to a subspecies.  Because it is allopatric and relatively discrete morphologically, despite occurring in similar habitats, I prefer to retain it as a species.  See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for further discussion of the systematics and ecology of this species and *V. crassifolium*. [= *V. crassifolium* Andrews ssp. *sempervirens* (Rayner & Henderson) Kirkman & Ballington – K; < *V. crassifolium* – FNA, L, Z]
**Vaccinium tenellum** Aiton, Southern Blueberry, Small Cluster Blueberry. Sandhills, pine flatwoods, other xeric woodlands. Late March-early May; June-July. Though abundant in the Carolinas, *V. tenellum* is rather restricted, occurring as a common species from se. VA to c. GA, with a range extension (where it is scattered and rare) south and west to n. FL, s. AL, and se. MS. [= RAB, C, F, FNA, G, K, L, X, Y, Z; = *Cyanococcus tenellus* (Aiton) Small – S]

**Vaccinium virgatum** Aiton, Swamp Blueberry, Rabbiteye Blueberry. Pocosins and *Chamaecyparis* swamps, also in various drier habitats, including turkey oak sandhills. March-April; May-June. A Southeastern Coastal Plain species, *V. virgatum* occurs from se. NC south to FL and west to e. TX. [= GW, K; = *V. amoenum* Aiton – RAB; = *Cyanococcus amoenus* (Aiton) Small – S; < *V. corymbosum* – L, WH, Z; > *V. virgatum* – X; > *V. amoenum* – X; > *F. ashei* Reade – X]

29. **Gaylussacia** Kunth 1819 (Huckleberry)

A genus of ca. 50 species, shrubs, of North and South America (centered in South America). The sections and subsections follow Sleumer (1967a). A study of the phylogeny of the genus *Gaylussacia* provided some evidence for the treatment of *Gaylussacia brachytera* as a monotypic genus or within *Vaccinium*; additional study is needed. References: Sorrie, Weakley, & Tucker in FNA (2009); Sleumer (1967a) = Z; Camp (1935) = Y; Godfrey (1988) = X; Duncan & Brittain (1966) = V; Sorrie & Weakley (2007a) = U; Gajdeczka et al. (2010) = Q; Pernald (1911); Stevens et al. in Kubitzki (2004).

1 Leaves 0.7-2.2 cm long, serrulate, leathery, evergreen, lacking punctate glands; [section *Vitis-idaea*] .............................................. **G. brachytera**

1 Leaves 1.5-10 cm long, entire (or minutely glandular-crenate), membranaceous to subcoriaceous, deciduous, with punctate glands.

2 Leaves subcoriaceous, upper surface shining, dark green, 1.5-4 cm long; bracts of the inflorescence equal to or longer than the pedicels (5-12 mm long), persistent; sepals, pedicels, bracts, and leaves stipitate-glandular and pubescent; [section *Gaylussacia*].

3 Plant < 3 dm high.

4 Corollas averaging 1.0 mm long; anthers averaging 0.8 mm long; glandular hairs on hypanthium dense, < 0.5 mm long; plants of open bogs, sedge and sedge-glandular swamps; [northeastern, south to DE, NC, SC, and WV] ................................................................. **G. dumerosa**

3 Plant 4-10 (-15 dm) tall.

5 Sessile glands on upper leaf surface absent; glandular hairs on hypanthium 0.3-1.5 mm long; [East Gulf Coastal Plain endemic, sw. GA, n. FL, s. AL, s. MS, and se. LA] ............................................................ **G. mosieri**

5 Sessile glands on upper leaf surface numerous; glandular hairs on hypanthium 0.3-0.5 mm long; ranging from SC northward.

6 Corollas averaging 7.0 mm long; anthers averaging 3.7 mm long; plants of peat bogs, raised bogs, peat-based pocosins, and Atlantic white cedar-red maple swamps; [from NL (Newfoundland) to DE, and as a rare disjunct in the Coastal Plain of NC and SC] ................................................................. **G. biligeviana**

6 Corollas averaging 6.0 mm long; anthers averaging 2.9 mm long; plants of montane bogs, seepage over rock, and possibly drier forests; [rare endemic of southern Appalachian swamps of w. NC] ................................................................. **G. orocola**

2 Leaves membranaceous to subcoriaceous, upper surface dull, yellow-green to medium-green, 10-15 cm long; bracts of the inflorescence shorter than the pedicels, early deciduous; sepals, pedicels, bracts, and leaves with sessile glands, pubescent or not pubescent; [section *Decamerium*].

7 Leaves glandular on both surfaces; racemes 0.5-1.5 cm long; [section *Decamerium, subsection Baccatae*] ............................................. **G. baccata**

7 Leaves glandular on the lower surface only; racemes 1-5 cm long.

8 Leaves membranaceous, medium-green, with acuminate apices; [section *Decamerium, subsection Ursinae*] .................................. **G. urseta**

8 Leaves subcoriaceous, yellow-green to glaucous, with obtuse to emarginate apices; [section *Decamerium, subsection Frondosae*].

9 Young twigs glabrous; leaves glabrous or pubescent beneath, often glaucous; shrub to 20 dm tall; [widespread in our area] ................................................................. **G. frondosa**

9 Young twigs densely pubescent with short, curled hairs; leaves sparsely to densely pubescent beneath, glaucous or not; shrub to 10 dm tall; [of se. NC and southward in the Coastal Plain].

10 Larger leaves mostly 2-4 cm long and 1-2 cm wide; lower leaf surface usually strongly glaucous, sparsely pubescent, with the longest nonglandular hairs < 0.27 mm long; floral tube and calyx glaucous; shrub 2-6 (-10) dm tall ............................................. **G. nana**

10 Larger leaves mostly 3-6 cm long and 2-3.5 cm wide; lower leaf surface not glaucous, sparsely to densely pubescent, with the longest nonglandular hairs 0.46-0.64 mm long; floral tube and calyx not glaucous; shrub to 10 dm tall ............................................. **G. tomentosa**

**Gaylussacia baccata** (Wangenheim) K. Koch, Black Huckleberry, Cracklberry. Xeric, acidic forests and woodlands, rock outcrops, to 1600m elevation. April-June; July-August. NL (Newfoundland) and QC west to ON and MB, south to ne. NC, nw. SC, n. GA, AL, and MO; in GA, NC, and SC it is primarily montane in distribution, but in VA it occurs throughout the state. [= C, F, FNA, G, K, L, Q, RAB, V, W, WV, Y, Z; = Decachaena baccata (Wangenheim) Small – S]
Gaylussacia bigeloviana (Fernald) Sorrie & Weakley, Northern Dwarf Huckleberry. Peat dome pocosins (in NC and VA), sandhill seepage bogs (SC), Chamaecyparis bogs (DE), generally growing in peat, forms transitional to var. dumosa in wet pinelands and disturbed pocosins. April-June; June-October. Var. bigeloviana ranges from NL (Newfoundland) south to NJ, with forms transitional to var. dumosa as far south as VA, and disjunct in Carteret, Dare, and Pender counties, NC (in low pocosins of large peat domes with Chamaedaphne and Zenobia), in a Sandhill seepage bog in Lexington County, SC. [= FNA, Q, U; = G. dumosa (Andrews) Torrey var. bigeloviana Fernald – C, F, G, Y; < G. dumosa – GW, K, L, RAB, V, W, X, Z]

Gaylussacia brachycera (Michaux) A. Gray, Box Huckleberry. Dry, acidic ridgetops and upper slopes, locally forming large clones. May-June. Sc. PA and DE south to e. KY and ec. TN, primarily on the Cumberland and Alleghany Plateaus; also disjunct on a steep, xeric, west-facing bluff in Durham Co. NC, where evidently native. Treatment of this species in a monotypic genus may be warranted, but the genus name Buxella (as used by Small) is unavailable, as it had already been used prior to Small in a different application (Wilbur & Bloodworth 2004). [= C, F, FNA, G, K, L, Q, W, WV, Y, Z; = Buxella brachycera (Michaux) Small – S (but Buxella is preoccupied); = Vaccinium brachycera Michaux; note that the report in RAB is based on a misidentification]

Gaylussacia dumosa (Andrews) Torrey & A. Gray, Southern Dwarf Huckleberry. Xeric to mesic, acidic forests and woodlands. March-June; June-September. Se. SC (spodosolic flatwoods in Beaufort County) south to c. peninsular FL, west to s. GA (n=12) (Luteyn et al. 1996). [= FNA, K, L, Q, V, Y; narrow Southern Appalachian endemic: sw. NC, nw. SC, ne. GA, and se. TN; disjunct at Cumberland Gap National Historic Park, Bell County, KY. On mountain slopes and summits in that area it is often the dominant shrub, forming large clonal patches. [= FNA, K, L, Q, RAB, V, W, Y, Z; = Decachaena nana (A. Gray) Small – S]

Gaylussacia frondosa (Linnaeus) Torrey & A. Gray ex Torrey, Dangleberry. Mesic, acidic woodlands, especially in sandhill-pocosin and savanna-pocosin ecotones, also in xeric chestnut oak forests in the lower Piedmont. Late March-May; June-August. Primarily a Southeastern Coastal Plain species: s. NH south to s. SC, less commonly inland to w. NY, c. and w. PA, w. VA, and w. SC. [= C, F, FNA, G, K, L, Q, W, V; = G. frondosa var. frondosa – GW, RAB, X, Y, Z; = Decachaena frondosa (Linnaeus) Torrey & Gray – S]

Gaylussacia mosieri Small, Mosier's Huckleberry, Hirsute Huckleberry. Savannas and seepages. S. GA and Panhandle FL and west to e. LA. Material from Lexington County, SC originally identified as this taxon has been reassigned to G. bigeloviana. [= FNA, GW, K, L, Q, U, V, X, Y, Z; = Lasiococcus mosieri (Small) Small – S]

Gaylussacia nana (A. Gray) Small, Dwarf Dangleberry. Xeric sandhills. Se. SC (Beaufort County) south to n. and c. FL peninsula, FL Panhandle, and west to e. LA (Florida prishes); disjunct in se. NC (New Hanover County) (Sorrie & LeBlond 2008). This species is disjunct at several sites in xeric sandhills of se. NC (on the Carolina Beach peninsula and the 421 Sandhills nw. of Wilmington). G. nana has a diploid chromosome complement (n=12), compared to tetraploid for G. tomentosa (n=12) (Luteyn et al. 1996). [= FNA, K, L, Q, V, Y; = G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. nana A. Gray – GW, X, Y; = Decachaena nana (A. Gray) Small – S; < G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. tomentosa A. Gray – WH]

Gaylussacia orocola (Small) Camp, Blue Ridge Bog Huckleberry. Bogs, seepages over granite. Endemic to the sw. NC mountains. The montane plants named Lasiococcus orocola by Small are probably most closely allied to northern G bigeloviana, and occur with other notable northern disjuncts, such as Myrica gale and Chamaedaphne calyculata (often associated with var. G. bigeloviana in northern peat bogs); they differ in several respects, however, and are here given taxonomic standing (Sorrie & Weakley 2007a). [= FNA, Q, U, Y, Z; < G. dumosa – RAB, GW, K, L, W, X; = Lasiococcus orocola (Small) Small – S]

Gaylussacia tomentosa (A. Gray) Pursh ex Small, Hairy Dangleberry. Pine flatwoods, sandhills, xeric coastal fringe sandhills. March-May; June-August. Se. SC (spodosolic flatwoods in Beaufort County) south to e. peninsular FL, west to s. GA and sw. AL. As discussed by Godfrey (1988) and Duncan & Brittain (1966), probably better treated as a species than as a variety of G. frondosa. G. tomentosa has a tetraploid chromosome complement (n=24), compared to diploid for G. nana and G. frondosa (n=12) (Luteyn et al. 1996). [= FNA, K, L, Q, V, Y; = G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. tomentosa A. Gray – GW, RAB, X, Z; = Decachaena tomentosa (Pursh ex Small) Small – S; < G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. tomentosa A. Gray – WH]

Gaylussacia ursina (M.A. Curtis) Torrey & A. Gray ex A. Gray, Bear Huckleberry, Mountain Huckleberry. Mesic to xeric forests, frequently dominant, but limited to areas southwest of the Asheville Basin; common. May-June; July-September. A narrow Southern Appalachian endemic: sw. NC, nw. SC, ne. GA, and se. TN; disjunct at Cumberland Gap National Historic Park, Bell County, KY. On mountain slopes and summits in that area it is often the dominant shrub, forming large clonal patches. [= FNA, K, L, Q, RAB, V, W, Y, Z; = Decachaena ursina (M.A. Curtis) Small – S]
**349. GARRYACEAE** Lindley 1834 (Garrya Family) [in GARRYALES]

Garryaceae is here circumscribed to include *Aucuba* (Bremer et al. 2002). References: Bremer et al. (2002)

* **Aucuba** Thunberg (Aucuba, Japanese-laurel)

* **Aucuba japonica** Thunberg, Aucuba, Japanese-laurel, Spotted-laurel. Pd (NC): commonly planted throughout our area, rarely escaping and naturalizing in suburban woodlands; rare, native of Japan and se. Asia. The most frequently planted cultivars have the dark green leaves prominently speckled with yellow. [= K]

**350. RUBIACEAE** A.L. de Jussieu 1789 (Madder Family) [in GENTIANALES]

A family of about 630-650 genera and 10,200-13,000 species, trees, shrubs, vines, and rarely herbs, cosmopolitan, but especially diverse in tropical and subtropical areas. References: Rogers (1987, 2005).

1 Trees, shrubs, or woody vines.
2 Woody vine; corolla lilac; [alien]; [subfamily *Rubioideae*; tribe *Paederiaceae*]........................................................................................................... *Paederia*
2 Shrub or tree; corolla white, green, or maroon; [native].
3 Inflorescence spherical; [widespread in our area]; [subfamily *Cinchonoideae*; tribe *Naucleaceae*] .............................................. *Cephalanthus*
3 Inflorescence cymose or thyrsoid; [in the Coastal Plain, from s. SC southward].
4 Inflorescence cymose; some calyx lobes expanded into pink or reddish “flags”; leaves deciduous; domatia not present; [of s. SC southward]................................................................. *Pinckneya*
4 Inflorescences thyrsoid; calyx lobes inconspicuous; leaves evergreen; domatia present in secondary vein axils; [of ne. FL southward]
5 Lateral veins 3-6 on either side of the midvein; fruit red; flowers white, <5 mm long; [subfamily *Cinchonoideae*; tribe *Chiococca*] ................................................................................................. *Chiococca*
5 Lateral veins 8-14 on either side of the midvein; fruit red; flowers white; >6 mm long; [subfamily *Rubioideae*; tribe *Psychotria*] ........................................................................................................... *Psychotria*

1 Herbs (or creeping subshrubs in *Mitchella*).
6 Leaves opposite
6 Leaves whorled; [subfamily *Rubioideae*; tribe *Rubiaceae*]........................................................................................................... *Galium*
10 Flowers single or in inflorescences with multiple flowers, the fruits either dry or fleshy and yellowish or black; leaves various; [subfamily *Rubioideae*; tribe *Spermacoceae*].
10 Carpels with few to many seeds.
12 Corolla 5-lobed................................................................................................................................. *Pentodon*
12 Corolla 4-lobed.
13 Capsule longer than the calyx tube; flowers blue, pink, or white.......................................................................................... *Houstonia*
13 Capsule not longer than the calyx tube; flowers white .............................................................................. *Oldenlandia*
11 Carpels 1-seeded.
14 Flowers in dense, terminal, involucre heads; flowers 4- or 6-lobed; styles 3................................................................. *Richardia*
14 Flowers in axillary or terminal clusters, or in single, not involucrate; flowers 4-lobed; styles 2.
15 Flowers usually solitary in leaf axils; fruit separating into 2 parts ........................................................................ *Diodia*
15 Flowers in terminal and axillary clusters; fruits not separating into 2 parts.
16 Carpels opening transversely .............................................................................................................. *Mitracarpus*
16 Carpels opening longitudinally ........................................................................................................... *Spermacarpus*

**Cephalanthus** Linnaeus (Buttonbush)

**Cephalanthus occidentalis** Linnaeus, Buttonbush. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): streambanks, riverbanks, depressional wetlands, lakes, often in standing water; common. June-July. Widespread
in North America, and south into Mexico, Guatemala, and Honduras. \(= \text{RAB, K, W, S, Y, Z; } > \text{C. occidentalis var. occidentalis – C, F, G; } > \text{C. occidentalis var. pubescens – C, F, G; } = \text{C. occidentalis var. occidentalis – GW (including var. pubescens)}\)

**Chiococca** P. Browne 1759

A genus of about 30 species, of FL and the West Indies south to s. South America. References: Rogers (2005).

**Chiococca alba** (Linnaeus) A.S. Hitchcock, Snowberry, Milkberry. Cp (FL): coastal hammocks, shell middens; rare. N. FL (St. Johns and Dixie counties) south to s. FL. \(= \text{K, S, WH}\)

**Diodia** Linnaeus

1 Sepals 4 and similar in size; style entire; \([\text{of dry habitats}]\) ................................................................. *D. teres*

1 Sepals 2 (or 4, and then markedly dimorphic); style cleft; \([\text{of moist to wet habitats}]\) ........................................................................

**Diodia teres** Walter, Poorjoe. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dunes, sandy road-sides, glades, other dry habitats; common. June-December. MA, NY and WI, south to FL, TX, and CA, south through Mexico and Central America. \(= \text{RAB, C, GW, W, WV; } > \text{Diodia teres var. hirsutior Fernald & Griscom – F, K; } > \text{Diodia teres var. hystricina Fernald & Griscom – F, G, K; } > \text{Diodia teres var. oblongifolia Fernald – F, K; } > \text{Diodia teres var. teres – F, G, K; } = \text{Diodella teres (Walter) Small – Z}\)

**Diodia virginiana** Linnaeus. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): pondshores, ditches, other moist to wet habitats; common. June-December. CT, PA, IL, and KS south to FL and TX. \(= \text{RAB, C, G, GW, W, WV; } > \text{D. virginiana var. attenuata Fernald – F, K; } > \text{D. virginiana var. latifolia Torrey & A. Gray – K; } > \text{D. virginiana var. virginiana – F, K; } > \text{D. harperi Walter – S; } > \text{D. hirsuta Pursh – S; } > \text{D. harperi Small – S}\)

**Galium** Linnaeus 1753 (Bedstraws, Cleavers, Woodruff)

A genus of ca. 500 species, herbs, cosmopolitan. Here circumscribed to include *Asperula*, *Cruciata*, and *Sherardia*, following an analysis by Soza & Olmstead (2010) that shows the genera *Galium*, *Cruciata*, and *Sherardia* each to be paraphyletic relative to one another, if circumscribed as traditionally. Other solutions are possible, including the dispersal of *Galium* into two or more genera. Interestingly, the number of leaves per whorl appears to be a more fundamental character than those (such as tubular corollas) used to separate genera in the past. References: Soza & Olmstead (2010); Puff (1976, 1977)=Z; Lipscomb & Nesom (2007)=Y; Rogers (2005); Dempster (1978, 1981).

1 Leaves mostly in whorls of 4 (rarely a few in whorls of 5-6) at the primary nodes ................................................................. **Key A**
1 Leaves mostly in whorls of 5-8 or more at the primary nodes.

2 Leaves mostly 6 per node (ranging from 5-8) at the primary nodes .................................................................................. **Key B**
2 Leaves mostly 8 or more per node at the primary nodes ........................................................................................................**Key C**

**Key A** – Bedstraws with leaves mostly in whorls of 4 (rarely a few in whorls of 5-6)

1 Flowers yellow; plant an annual, 0.5-3 dm tall .......................................................................................................................... *G. pedemontanum*
1 Flowers white, creamy, greenish-purple, maroon, or purple; plant a perennial, 1-8 dm tall.

2 Flowers solitary, sessile or subsessile in the leaf axils; leaves 4-10 mm long ........................................................................... *G. virgatum*
2 Flowers on pedicels, usually in complex inflorescences; leaves >10 mm long.

3 Larger leaves 6-25 mm wide, mostly 1.5-4× as long as wide; fruits uncinate-hispid (except smooth in *G. latifolium*); flowers greenish or purplish.
4 Larger leaves 4-8 cm long, 1-2 cm wide, widest below the middle, tapering to a long-acuminate apex, averaging about 3-4× as long as wide.
5 Fruits uncinate-hispid; flowers yellowish, turning maroon ......................................................................................... *G. lanceolatum*
5 Fruits smooth; flowers purple ........................................................................................................................................... *G. latifolium*
4 Larger leaves 1.5-5 cm long, 0.6-2.5 cm wide, widest at about the middle, tapering to an obtuse (or broadly acute) apex, averaging about 2× as long as wide.
6 Flowers (some of them) sessile or subsessile along the inflorescence branches; leaves 1.5-5 cm long, the larger usually > 2.5 cm long, not punctate.
7 Lower leaf surface glabrous or sparsely short-hispid on the veins; larger leaves 1.5-2.5 (-4.0) cm long and 0.7-1.4 (-1.8) cm wide; [more southern] ......................................................................................... *G. circæanz var. circæanzs*
7 Lower leaf surface appressed-pilose, long-hisrate on the veins; larger leaves 2-5 cm long, 1-2.5 cm wide; [more northern] .......................... *G. circæanz var. hypomalacum
6 Flowers all distinctly pedicelled; leaves 1-2.5 cm long, glandular-punctate beneath.
8 Stem glabrous .......................................................... G. orizabense ssp. laeuricaule
8 Stem pubescent.
9 Stem and leaves pubescent with spreading, straight hairs; [more northern] ................. G. pilosum var. pilosum
3 Larger leaves 1-6 mm wide, mostly 4-20× as long as wide; fruits smooth or pubescent (if pubescent, the hairs not hooked at the end, though they may curve through their length), either fleshy or dry; flowers white or creamy.
10 Fruits fleshy, blue-black; leaves firm, more-or-less evergreen, glandular-punctate beneath.
11 Leaves elliptic, 7-18 mm long, 3-6 mm wide; 2.3-3.5× as long as wide ................................................. G. hispidulum
11 Leaves linear, 15-25 mm long, 2-4 mm wide; 5-10× as long as wide ....................................................... G. uniflorum
10 Fruits dry, black; leaves herbaceous, deciduous, not glandular-punctate beneath.
12 Stems erect or nearly so; leaves 15-45 mm long, 2-6 mm wide. ................................................................. G. boreale
12 Stems sprawling, matted; leaves 6-30 mm long, 0.5-5 (-6) mm wide.
13 Corollas 4-lobed, the lobes longer than wide.
14 Leaves (8-) 10-20 (-25) mm long, (0.5-) 0.8-2 mm wide, margin usually smooth, with strongly down-rolled margins; corolla (1.8-) 2-2.5 (-3) mm across; pedicels filiform; stems 15-50 (-60) cm long, delicate....................... G. obtusum var. filifolium
14 Leaves (10-) 15-25 (-30) mm long, (2-) 3-5 (-6) mm wide, margin scabrous, not down-rolled; corolla (2-) 2.5-3.5 (-4) mm across; pedicels thicker; stems (15-) 25-60 (-80) cm long, firm .................. G. obtusum var. obtusum
15 Corollas 3(-4)-lobed, the lobes about as wide as long, or wider than long.
15 Flowers and fruits borne on axillary pedicels, (5-) 7-15 (-20) mm long and densely retrorsely scabrous, .................. [G. triflorum var. triflorum]
15 Flowers and fruits borne on straightforward pedicels, these (2-) 2.5-8 (-12) mm long and smooth.
16 Fruiting pedicels (4-) 5-8 (-12) mm long; pairs of fruits (3-) 3.5-5 mm across at maturity; leaves 2-3 (-4) mm wide........ 
.......................................................................................................... G. uniflorum var. floridanum
16 Fruiting pedicels (2-) 2.5-5 (-6) mm long; pairs of fruits 2-3 mm across at maturity; leaves (1.5-) 2-2.5 (-2.8) mm wide......
.......................................................................................................... G. uniflorum var. boreale

Key B – Bedstraws with leaves mostly 6 per node (ranging from 4-8)

1 Flowers in terminal heads, subtended by an involucre of leaves fused at the base; stem rough-hairy, but not retrorsely-scabrid; [clade IV] ..........
2 Largest leaves < 10 mm long; fruits 0.7-1 mm across; annual; [alien]; [clade III].
3 Inflorescence relatively diffuse, branches divaricate; ultimate fruits (2-) 3-6 (-7) nodes beyond primary stem axis (with largest leaves); first inflorescence internode (beyond primary stem axis) 15-50 mm long; fruit surface glabrous (without hairs).............. G. divaricatum
3 Inflorescence relatively strict, branches ascending; ultimate fruits 2-3 (-4) nodes beyond primary stem axis (with largest leaves); first inflorescence internode (beyond primary stem axis) 3-12 (-20) mm long; fruit surface glabrous or bristly-hispid.
4 Fruit surface without hairs, smooth to shallowly papillate ................................................................. G. anglicum
4 Fruit surface bristly-hispid with uncinate-tipped hairs, distinctly papillate ........................................ G. parisienne
2 Largest leaves > 10 mm long; fruits 1-2.5 mm across; perennial; [native].
5 Fruits and ovaries uncinate-hispid; leaves 15-50 mm long, 7-10 mm wide; [clade III] .............................................. G. triflorum
5 Fruits and ovaries glabrous or papillose; leaves 5-25 mm long, 1-6 mm wide.
6 Corolla 1.5-2.5 mm across, 3-lobed; [collectively widespread in our area]; [clade V].
7 Fruiting pedicels (4-) 5-8 (-12) mm long; pairs of fruits (3-) 3.5-5 mm across at maturity; leaves 2-3 (-4) mm wide........ 
.......................................................................................................... G. unpiorium var. floridanum
7 Fruiting pedicels (2-) 2.5-5 (-6) mm long; pairs of fruits (2-) 2.5-3 mm across at maturity; leaves (1.5-) 2-2.5 (-2.8) mm wide ......
.......................................................................................................... G. triflorum var. triflorum
6 Corolla 2.5-4.5 mm across, 4-lobed; [mostly of the Mountains in our area, extending into the Piedmont or even Coastal Plain in n. VA and northward].
8 Leaf margins retrorsely ciliate-scabrid; leaves 3-5× as long as wide; [plants of bogs and moist thickets]. G. asprellum
8 Leaf margins antrorsely ciliate-scabrid; leaves 4-8× as long as wide; [plants of dry forests and woodlands].
9 Leaves sharply acute or cuspidate; corolla 2.5-3 mm across.......................... G. concinnum
9 Leaves rounded, obtuse, or barely acute; corolla ca. 4 mm across.......................... G. palustre

Key C – Bedstraws with leaves mostly 8 or more per node (ranging from 5-12)

1 Leaves 8-12 per whorl (many whorls with > 8 leaves); flowers bright yellow, in a large showy terminal compound inflorescence; fruits glabrous; perennial.
2 Stems golden-yellow, fragrant; inflorescence dense, usually not interrupted .................................................. G. verum
3 Flowers lemon-yellow, odorless; inflorescence interrupted .......................................................... G. wirtgenii

1 Leaves (5-) 8 (-10) per whorl (few if any whorls with > 8 leaves); flowers white or greenish, in a terminal compound inflorescence or in small axillary inflorescences; fruits glabrous, papillose, or uncinate-hispid; annual or perennial.
3 Stems glabrous; annual.
4 Fruits and ovaries uncinate-hispid; flowers and fruits mainly in clusters of 2-5 ............................................. G. aparine
4 Fruits and ovaries sharply papillose; flowers and fruits mainly in clusters of 3 ............................................. G. tri tradingatum
3 Stems glabrous or pubescent, but not scabrous; perennial.
5 Fruits and ovaries uncinate-hispid; nodes bearded, the stem otherwise glabrous........................................ G. odoratum
5 Fruits and ovaries glabrous; nodes not bearded, the stem either glabrous or pubescent toward the base of the plant.
6 Corolla 3-5 mm across, the pedicels usually shorter than the width of the corolla; inflorescence branches ascending, mostly at < 45 degrees ............................................................... \textit{G. mollugo} \textit{var. erectum}

6 Corolla 2-3 mm across, the pedicels usually longer than the width of the corolla; inflorescence branches spreading, mostly at > 45 degrees ............................................................... \textit{G. mollugo} \textit{var. mollugo}

\textit{Galium aparine} Linnaeus, Cleavers. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): meadows, thickets, disturbed areas, forests; common. April-June. Nearly cosmopolitan, from n. North America south through Central and South America. Apparently represented in North America (including our area) by both native and introduced genotypes. [= RAB, F, G, GK, SW, WV; > \textit{G. aparine} \textit{var. aparine} – C; > \textit{G. aparine} \textit{var. echinospermum} (Wallroth) Farwell – C]

\textit{Galium asprellum} Michaux, Rough Bedstraw. Mt (NC, VA, WV), Pd (DE, VA), Cp (VA): bogs, streambanks, wet meadows; uncommon (rare in DE). June-September. NL (Newfoundland) west to MN, south to n. VA, w. NC, ne. TN (Chester, Wofford, & Kral 1997), and MO. The report for sc. TN is an error (D. Estes, pers. comm. 2005). [= RAB, C, F, G, GK, SW, WV]

\textit{Galium circaezans} Michaux \textit{var. hypomalacum} Fernald, Northern Forest Bedstraw. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE), {GA?, SC?): moist forests; common. April-July. QC west to MN and NE, south to VA, w. NC, KY, MO, and TX (?). The varieties need additional study. [= C, F, G, GK, SW; < \textit{G. circaezans} – RAB, S, W]

* \textit{Galium divaricatum} Pourret ex Lamarck. Disturbed areas; native of s. Europe. June-July. [= Y; < \textit{G. parisiense} \textit{var. leiocarpum} Tausch – C; < \textit{G. parisiense} Linnaeus – F, G, S; < \textit{G. divaricatum} – K; = \textit{G. parisiense} \textit{var. divaricatum} (Pourret ex Lamarck) Koch; = \textit{G. anglicum} \textit{var. divaricatum} (Pourret ex Lamarck) Reichenbach; = \textit{G. parisiense} \textit{ssp. divaricatum} (Pourret ex Lamarck) Rouy] [add to synonymy]

\textit{Galium hispidulum} Michaux. Cp (DE, GA, NC, SC, VA), Mt (NC): maritime forests, sandhills, dry sandy forests; common (rare in Mountains, rare in DE and VA). June-August; August-September. S. NJ south to FL, west to LA, primarily on the Coastal Plain. [= RAB, C, F, G, GK, SW; = \textit{G. bermudense} Linnaeus – S, misapplied]

\textit{Galium lanceolatum} Torrey, Wild-licorice. Mt (NC, SC, VA, WV), Pd (DE, VA), Cp (VA): moist hardwood forests; uncommon (rare in VA Coastal Plain, rare in Piedmont). June-July. QC west to MN and NE, south to VA, w. NC, KY, MO, and TX (?). [= RAB, C, F, G, GK, SW, WV]

\textit{Galium latifolium} Michaux, Wideleaf Bedstraw. Mt (GA, NC, SC, VA, WV), Pd (NC, VA): moist hardwood forests; common (uncommon in Piedmont). May-August. C. PA and KY south to n. GA and n. AL, a Southern and Central Appalachian endemic. The closely related \textit{G. arkansanum} A. Gray is the Ozarkian sibling of the Appalachian \textit{G. latifolium}. Var. \textit{hispidulum}, named from VA, needs additional study. [= RAB, C, GK, SW; > \textit{G. latifolium} \textit{var. latifolium} – F, G; > \textit{G. latifolium} \textit{var. hispidulum} Small – F, G]

Galium odoratum (Scopoli) Sweet Woodruff, Waldmeister. Mt (NC, VA), Pd (DE, NC, VA): commonly cultivated, rarely escaped or persistent, native of Europe. May. Used fresh as a flavoring for May-wine. [= C, K; = Asperula odorata Linnaeus – F, G]

Galium palustre Linnaeus. Marsh Bedstraw, Ditch Bedstraw. Mt (WV): marshes, wet soil; rare. June-August. NL (Labrador) and ON south to MD, s. PA (Rhoads & Klein 1993), MD, WV, OH, IN, and IL; also in Europe and nw. North America. [= C, F, G, K]

Galium parisiense Linnaeus. Disturbed areas; native of s., w., and c. Europe. June-July. [= K, Y; = G. parisiense ssp. parisiense] [add to synonymy]

Galium parisiense

Europe

Galium pilosum Aiton var. pilosum. Mt (NC, SC?, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, NC, SC, VA), {GA}: forests, woodland borders, clearings; common. May–August. S. NH west to MI, south to NC, TN, MO, and TX. The varieties need additional study. [= C, F, G, K; < G. pilosum – RAB, S, W, WV]

Galium tinctorium (Linnaeus) Scopoli var. floridanum Wiegand, Florida Three-lobed Bedstraw. Cp (GA, NC, SC, VA), Mt (NC, SC, VA), Pd (NC, SC): swamps, marshes, and ditches; common (VA Watch List). April–June. MA south to FL, west to e. TX, mostly on the Coastal Plain, but extending inland to w. VA, w. NC, se. KY, s. IL, and se. MO. See Puff (1976) for additional information. [= F, < G. tinctorium – RAB, C, K, W; = G. obtusum var. floridanum (Wiegand) Fernald – G; < G. claytonii Michaux – S; = G. tinctorium ssp. floridanum (Wiegand) Puff – Z]

Galium tricornutum Dandy, Small Bedstraw. Pd (GA, SC): disturbed areas; rare, introduced. This species has been reported from Cherokee and Greenwood counties, near GA, and se. PA (Rhoads & Klein 1993). [= K; < G. tricorne Stokes – F]

* Galium verum Linnaeus, Yellow Bedstraw, Our Lady’s Bedstraw. Mt (NC, VA, WV), Pd (DE, VA): meadows, pastures, roadsides; uncommon (rare in DE and NC), native of Europe. May-September. [= C, F, G, K1; = G. verum var. verum – K2; < G. verum – RAB, W, WH (also see G. wirtgenii)]

**Galium virgatum** Nuttall, Ozark Bedstraw. Cp (GA, SC*): (in GA) open blackland prairies, (in SC) waif around wool-combing mill; rare. Native from TN, e. GA (Houston County), and AL west to KS, OK, and TX. [= C, F, G, K; > G. virgatum var. leioarpum Terrey & A. Gray – S; > G. virgatum var. virginatum – S]

* Galium arvense (Linnaeus) F. Hermann, Blue Woodruff. Pd (DE), Mt (WV): disturbed areas, rare, native of Europe. Naturalized south to WV, MD, DE (USDA NRCS 2007), and se. PA (Rhoads & Klein 1993). [= Asperula arvensis Linnaeus C, G, K, WV] [not yet keyed]

**Galium trifidum** Linnaeus var. trifidum, Northern Three-lobed Bedstraw. Mois places, bogs, and swamps. Circumboreal, south in North America to MD, DE, PA, and NJ. [= C, F, G; = G. trifidum ssp. trifidum – K, Z]

* Galium wirtgenii F.W. Schultz, Yellow Bedstraw. Not definitely known from our area, but likely to be present. [= C, F, G, K1; = G. verum var. wirtgenii (F.W. Schultz) Oborny – K2; < G. verum – W]

### Houstonia Linnaeus 1753 (Bluet)

#### Identification notes:
In the key below, all leaf measurements and length/width ratios are based on median cauline leaves.

1 Flowers solitary on terminal (rarely axillary) pedicels (2-) 6-50 (-70) mm long; corolla salverform; leaves 2-15 mm long; [subgenus *Houstonia*].

2 Stems prostrate and creeping.

3 Corolla white (rarely pale lavender); capsule (2.3-) 3.0-6.3 mm across; leaves 2-13 mm wide; pedicels usually single, 2-25 mm long; flowers chasmogamous and cleistogamous (the cleistogamous borne underground); [of the outer Coastal Plain]; [section Mullera] .................. ............................................................................

4 Corolla blue (rarely white); capsule 2.5-5.0 mm across; leaves 0.5-7 mm wide; pedicels single or paired, to 60 mm long; flowers all chasmogamous and aerial; [of the Mountains]; [section Houstonia] ............................................................... H. serpyllifolia

5 Plants erect or spreading.

4 Stems 1-4 (-7) cm tall; leaves mostly oblanceolate, 0.3-3.0 mm wide; corolla 5-12 mm long, white to pale pink; seeds with a hilar ridge in an elliptical depression; [section Mullera] ......................................................................... H. rosea

6 Stems 1-26 cm tall; leaves elliptic, ovate or spatulate, 0.3-9.0 mm wide (at least some on a plant generally > 3 mm wide); corolla 2-21 mm long, purple, pale blue, pink, or white; seeds subglobe with a ventral cavity; [section Houstonia].

5 Plants perennial, with a well-developed, persistent basal rosette; corolla 5.8-16 (-21) mm long, the tube (2-) 4-11 (-12) mm long; ............................................................................ H. serpyllifolia

6 Plants annual, with at most a few short-lived basal leaves; corolla 2-10 (-12) mm long, the tube 0.8-5.5 mm long.

6 Calyx lobes slightly shorter than to slightly longer than the corolla tube; corollas white, 2.0-5.5 mm long, the tube 0.8-2.5 mm long .......................................................... H. procumbens

7 Calyx lobes 1/5 as long as to slightly longer than the corolla tube; corollas purple or violet (rarely white), 3.5-10 (-12.5) mm long, the tube 2.0-4.5 mm long ................................................................................................. H. pusilla

8 Plants with a well-developed, persistent basal rosette; corolla 5.8-16 (-21) mm long, the tube (2-) 4-11 (-12) mm long; ............................................................................ H. caerulea

8 Stems erect or spreading.

9 Flowers several to many, in terminal cymes; corolla funnelliform; leaves (8-) 10-60 mm long; [subgenus Chamisme, section Amphiothis].

7 Capsule obovoid-cylindric, longer than wide, the free calyx lobes distinctly shorter than the capsule; stipules of mid-cauline leaves ciliate or fringed, and also often bristle-tipped; leaves 1-3 mm wide; [of calcareous glades and barrens] ................. H. nigricans var. nigricans

7 Capsule as long as wide or wider, depressed globose, the free calyx lobes about as long as the capsule; stipules of mid-cauline leaves not ciliate, fringed, or bristle-tipped; leaves 0.5-34 mm wide; [of various habitats, including calcareous glades and barrens]

8 Basal leaves absent at the onset of flowering; leaves smooth-margined or ciliate.

9 Leaves ovate or lanceolate, 1-6× as long as wide, 4-34 mm wide, widest toward the base or at the middle; calyx lobes 1-7 mm long.

10 Calyx lobes 4-7 mm long; leaves mostly lanceolate (varying from narrowly lanceolate to broadly ovate), 17-33 mm long, 4-10 mm wide, 3.3-6× as long as wide ................................................................. H. purpurea var. calycosa

10 Calyx lobes 1-4 mm long; leaves mostly ovate (varying from broadly ovate to ovate-lanceolate), 8-63 mm long, 6-34 mm wide, 1-3.2× as long as wide.

11 Corollas light purple to white, (4-) 5-8 (-10) mm long; leaves (10-) 25-50 (-60) mm long, (6-) 12-30 (-34) mm wide; stems sparsely to densely pubescent; median internodes 2-9 cm long; leaves with pubescence ciliate on the leaf margin, on the midrib, and scattered on the surface; [of various habitats, widely distributed] ......................................................... H. purpurea var. purpurea

11 Corollas deep purple, 8-12 mm long; leaves 8-20 (-30) mm long, 3-8 (-13) mm wide; stems glabrous (or slightly short-pubescent on the lower nodes only); median internodes 0.5-4.5 cm long; leaves entirely glabrous or with pubescence ciliate on the leaf margin, on the midrib, but lacking from the leaf surface; [of high elevation rocky summits and adjacent grassy balds in w. NC and e. TN] ........................................................................................................................................ H. montana

9 Leaves linear to narrowly elliptic, 4-20× as long as wide, 0.5-6 mm wide, widest at the middle or near the apex or nearly equally wide for most of their lengths; calyx lobes 0.5-3 mm long.
12 Leaves 1.3-4.7 cm long, 0.5-4.0 mm wide (mostly < 2.5 mm wide), 7-20× as long as wide; inflorescence very diffuse and open, to 20 cm long, the branches ascending, spreading, or deflexed, slender and often ultimately filiform, with 1-4 remote nodes bearing reduced leaves, the pedicels to 14 mm long; internodes mostly 4-9; mature capsules mostly 1.5-2.5 mm long and wide; stem densely cirenoso-puberulent, especially at the nodes. 

12 Leaves 1.6-4.0 cm long, > 2.5 mm wide, 4-11× as long as wide; inflorescence rather open to rather compact, < 12 cm long, the branches ascending or spreading, slender, pedicels to 8 mm long; internodes mostly 7-11; mature capsules mostly 1.8-3.0 mm long and wide; stem densely cirenoso-puberulent, glabrate, or glabrous.

13 Stems glabrate or glabrous (sometimes puberulent on the nodes only); internodes 7-10, the median internodes (1.1-) 2.0-4.5 (-6.0) cm long; [of seasonally wet soil mats on moderate to high elevation granitic domes in sw. NC, nw. SC, and ne. GA]. 

13 Stems densely cirenoso-puberulent; internodes (6-) 7-11 (-13), the median internodes (1.0-) 1.5-3.5 (-4.4) cm long; [of dry sandy, shaley, gravelly, or rocky soil, widely distributed]. 

12 Houstonia caerulea Linnaeus, Quaker Ladies, Innocence, Common Bluet. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): forests, woodlands, openings, lawns, a wide variety of disturbed sites; common. April-July. This species is widespread in e. North America. The flowers of this species and H. serpyllifolia are very similar; H. caerulea is a somewhat duller blue. [= RAB, G, K, S, W, WV, X, Y; = Houstonia caerulea var. caerulea – F; = Hedyotis caerulea (Linnaeus) Hooker – C, GW; < Hedyotis caerulea – Q]

12 Houstonia canadensis Willdenow ex Roemer & J.A. Schultes, Canada Bluet. Mt (GA, VA, WV): dry limestone barrens, locally abundant in shallow soils on limestone; rare (VA Rare). April-August. ME and s. ON west to MN, south to sw. VA, se. and c. TN, nw. GA, and AR. Terrell (1959) determined that Houstonia setiscapha (allegedly a narrow endemic of sw. VA) fell within the range of variation of southern populations of H. canadensis. Further study is perhaps warranted. [= G, K, W, WV, X, Y, Z; = Hedyotis canadensis (Willdenow ex Roemer & J.A. Schultes) Fosberg – C, Q; > Houstonia longifolia var. longifolia – Y; > Houstonia canadensis var. setiscapha (L.G. Carr) C.F. Reed]

12 Houstonia longifolia Gaertner var. compacta Terrell, Eastern Longleaf Bluet. Mt (GA, NC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): dry rock outcrops and adjacent open woodlands, dry sandy woodlands, dry roadbanks, glades and barrens; uncommon. Early June-August; September-October. Var. compacta is centered in the central Appalachians of VA, WV, e. KY, and se. OH, with extensions north to VT, west into n. IL, and south in the Piedmont and adjacent Coastal Plain to SC, GA, and Panhandle FL. The typical variety is more northern, apparently reaching its southern limit in IN, not reaching our area. [= WV, Z; < Houstonia longifolia – RAB, C, F, G, S, W; < Houstonia setiscaphia (allegedly a narrow endemic of sw. VA)]

12 Houstonia longifolia Gaertner var. glabra Terrell, Granite Dome Bluet. Mt (GA, NC, VA, WV): seasonally and periodically wet soils of shallow soil mats and crevices of granitic domes; rare. June-August; September-October. Var. glabra is endemic to the granitic dome district centered around Highlands, NC, occurring in sw. NC, nw. SC, and ne. GA. Terrell (1959) says "the lower internodes [are often] so smooth they appear to have been polished," and gives an altitudinal range of 850-1750 m. Although the morphological differences between var. glabra and var. compacta are not great, the combination of distinctive morphology correlated with a disjunct habitat and a disjunct range seem to warrant recognition at the varietal level. [= Z; < Houstonia longifolia – RAB, S, W; < Houstonia longifolia (Gaertner) Hooker – C, Q, WH; > Houstonia longifolia var. longifolia – Y; > Houstonia longifolia var. setiscapha (L.G. Carr) C.F. Reed]

12 Houstonia micrantha (Shinners) Terrell. Cp (FL, GA, CA): dunes, sandy soils, granitic flatrocks; uncommon (rare in FL and GA). February-April. E. and c. GA west to sw. TN, nw. AR, south to w. FL Panhandle, s. MS, s. LA, and e. TX. [= K, X; = Hedyotis australis W.H. Lewis & D.M. Moore – Q; = Houstonia pusilla – S, misapplied]

12 Houstonia montana Small, Roan Mountain Bluet. Mt (NC): in crevices of rock outcrops at the summits of high elevation peaks of the Southern Blue Ridge, also in thin, frost-heaved, gravelly soils of grassy balds near summit outcrops, from 1250-1950 m in elevation; rare. June-July; July-August. This species is endemic to the high Blue Ridge of nw. NC and ne. TN, most notably occurring on Roan Mountain, Grandfather Mountain, Bluff Mountain, and Three Top Mountain. It was first noted by Asa Gray in 1841, who described it as "a remarkable dwarfy form." There has been debate over whether it is not indeed merely a weather-induced form, but recent studies show that it is distinct. In addition to the characters given above in the key, H. montana also differs from H. purpurea in having larger calyx lobes, corolla, capsules, and seeds. See Terrell (1959), Yelton (1974), and Terrell (1978) for further discussion. [= S, W; < Houstonia purpurea – RAB; = Houstonia purpurea Linnaeus var. montana (Small) Terrell – K, X, Y, Z; < Houstonia setiscaphia – Q; = Hedyotis purpurea (Linnaeus) Torrey & A. Gray var. montana (Small) Fosberg]

12 Houstonia nigricans (Lamarck) Fernald var. nigricans, Diamond-flower. Mt (VA), Cp (GA): limestone barrens dominated by Andropogon gerardii, blackland prairies; rare. Sw. VA (Ludwig 1999), s. MI, IA, NE, and e. CO, south to s. FL, TX, e. NM, and along the Sierra Madre Oriental to Hidalgo, Mexico. This species has been variously placed in Houstonia, Hedyotis, and Stenaria. Based primarily on seed characters and chromosome numbers, Terrell (2001) has concluded that this taxon is not congeneric with the Sri Lankan type of the genus Hedyotis, and is also not a Houstonia, so has published the new genus Stenaria for Houstonia nigricans and its close relatives. Church (2003) considers Stenaria congenic with Houstonia, based on molecular phylogeny. The resolution of generic limits in this group is still unresolved. As interpreted by Terrell (1991, and Turner (1995b), Houstonia nigricans is a polymorphic species, with Houstonia nigricans var. nigricans as a widespread "matrix variety," and other, much more local varieties warranting recognition. Turner (1995b) reports Houstonia nigricans var. nigricans (as Hedyotis nigricans var. nigricans) from Pickens County, SC; the documentation is not known to me, and suitable habitats there are unlikely. [= Hedyotis nigricans (Lamarck) Fosberg var. nigricans – K, U, Y; = Stenaria nigricans (Lamarck) Terrell var. nigricans – M; < Houstonia nigricans – C, Q; < Houstonia nigricans (Lamarck) Fernald – F, G; > Houstonia angustifolia Michaux – S; > Houstonia filifolia (Chapman) Small – S; < Stenaria nigricans (Lamarck) Terrell var. nigricans – WH]

12 Houstonia procumbens (Walter ex J.F. Gmelin) Standley, Creeping Bluet, Fairy-footprints, Roundleaf Bluet. Cp (FL, GA, SC): beach dunes, moist to wet sandy pinelands; common. October-April. Se. SC south to s. FL, west to se. L.A. Gaddy &
Rayner (1980) note that this plant is fairly common on SC barrier islands, but flowers in the winter and is easily overlooked in other seasons (when botanists are more likely to be afield). See Wilbur (1968) and Ward (2004c) for differing opinions about the merits of the taxonomic recognition of the glabrous and pubescent plants. [= RAB, K, S, WH, X, Y; = Hedyotis procumbens (Walter ex J.F. Gmelin) Fosberg – Q; = Houtonia rotundifolia Michaux; > Houtonia procumbens var. procumbens – V; > Houtonia procumbens var. hirsuta (W.H. Lewis) D. B. Ward – V]

Houtonia purpurea Linnaeus var. calycosa Shuttleworth ex A. Gray, Midwestern Summer Bluet. Mt (GA, NC, WV): dry woodlands, banks, rock outcrops, shallow soils around mafic and calcareous rock outcrops; rare. May-July; July-August. The distribution and ecology of var. calycosa in our area are poorly known; it apparently occupies drier and typically more circumneutral sites than var. purpurea. Var. calycosa ranges from s. ME and w. NY west to s. OH, and sw. MO, south to w. NC, n. GA, AL, MS, AR, and e. OK. [= G, K, WV, X, Y, Z; = Houtonia purpurea – RAB, W; = Houtonia purpurea (Linnaeus) Torrey & A. Gray – C, Q; = Houtonia lanceolata (Poir.) Britton – F, S; = Houtonia purpurea (Linnaeus) Torrey & A. Gray var. calycosa (Shuttleworth ex A. Gray) Fosberg]

Houtonia purpurea Linnaeus var. purpurea, Summer Bluet. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): moist and dry woodlands and forests, roadbanks, thinner soils around rock outcrops, a variety of disturbed sites; common (rare in Coastal Plain, rare in DE Piedmont). May-July; July-August. Var. purpurea ranges from DE, MD, and s. PA west to s. OH, s. IL, and sw. MO south to SC, sw. GA, Panhandle FL, MS, s. LA, e. TX, and e. OK. Plants growing in high elevation and exposed sites are sometimes dwarfed, and in that respect only, superficially resemble H. montana. [= G, K, WV, X, Y, Z; = Houtonia purpurea – RAB, W, WH; = Houtonia purpurea – F, S; = Houtonia purpurea (Linnaeus) Torrey & A. Gray – C, Q; = Houtonia purpurea (Linnaeus) Torrey & A. Gray var. purpurea]

Oldenlandia serpyllifolia Michaux, Appalachian Bluet, Thyme-leaf Bluet. Mt (GA, NC, SC, VA, WV): streambanks, grassy balds, moist forests, seepy rock outcrops, spray cliffs, and moist disturbed areas; common (uncommon in GA, VA, and WV). (March-) May-June. A Southern and Central Appalachian endemic: PA south to nw. SC and ne. GA. The flowers are very similar to, but usually a brighter blue than, the more widespread H. caerulea. [= RAB, F, G, K, S, W, WV, X, Y; = Houtotis michauxii Fosberg – C, GW, Q]

Oldenlandia tenuifolia Nuttall, Diffuse-branched Bluet. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (NC, SC, VA): usually in dry woodlands, often rocky (especially mafic rocks) or sandy; uncommon (rare in Coastal Plain). May-July; July-October. This species is centered in the Southern Appalachians and the Ozarks, extending into provinces adjacent to both areas of concentration, ranging overall from PA west to MO and OK, south to SC, GA, and TX. [= RAB, F, G, S, W, WV, X, Y; = Houtotis nuttalliana Fosberg – C; = Houtotis longifolia (Gaertner) Hooker – Q; = Houtonia longifolia var. tenuifolia (Nuttall) Wood; = Houtotis longifolia, "Tenuifolia Group" – X; = Houtonia longifolia – K]

Mitchella Linnaeus (Partridge-berry)

A genus of 2 species, perennials, ours and 1 in e. Asia. References: Rogers (2005)=Z.

Mitchella repens Linnaeus, Partridge-berry. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): deciduous and coniferous forests, stream-banks, heath balds, maritime forests, on rotten logs; common. May-June; June-July. NS west to MN, south to c. peninsular FL and TX; disjunct in Guatemala. Plants in maritime forests are more robust than others and often have an ascending habit, the stems sometimes 20-30 cm tall. [= RAB, C, F, G, GW, K, S, W, WH, ZWV, ]

Mitracarpus Zuccarini (Girdle-pod)

Oldenlandia Linnaeus (Oldenlandia)

Paederia Linnaeus (Skunk-vine)

Pentodon Hochstetter in Krauss 1844

Pinckneya Michaux (Pinckneya, Fever-tree)

Identification notes: Pinckneya is showy when in flower because of the development of 1 of the 5 calyx lobes of some of the flowers of the inflorescence into a large (to 7 cm by 5 cm), petaloid (pink or cream) appendage.

Psychotria Linnaeus 1759 (Wild Coffee)

* Psychotria nervosa* Swartz, Wild Coffee. Cp (FL): hammocks; rare. Ne. FL (Duval County) south to s. FL, West Indies, Central America, and South America. [= K, S, WH, Z]

Richardia Linnaeus (Richardia)

1 Mericarps smooth; corolla 4-lobed; [section Asterophyton]................................................................. R. humistrata
2 Mericarps either conspicuously and densely hispidulous to strigose or papillose to tuberculate; corolla 6-lobed; [section Richardia].

* Richardia humistrata* (Chamisso & Schlechtendahl) J.A. & J.H. Schultes. Cp (FL) {AL, MS}: disturbed areas, savannas, pine flatwoods; rare, native of South America. Also collected in 1886 as a ballast waif in Camden County, NJ; first noted on the Gulf Coast only in 1941, but perhaps early introduced there on ballast as well, such as at Pensacola. [=K, WH, Z]

* Richardia scabra* Linnaeus. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): roadsides, fields, vacant lots, urban areas, disturbed areas; common, native of South America. June-December. Lewis & Oliver (1974) consider this species to be native from our area south through Central America into northern South America, based on the semi-contiguous distribution, but occurrences in our region seem to be in altered habitats. [= RAB, C, F, G, K, S, WH, Z]

Richardia grandiflora (Chamisso & Schlechtendahl) J.A. & J.H. Schultes, Largeflower Richardia. Cp (FL): disturbed areas; rare, native of South America (mainly Brazil). Reported for Alachua County, immediately south of our area (Kunzer et al. 2009), and “rapidly spreading.” [= K, WH, Z]

*Spermacoce* Linnaeus (Buttonweed)

A genus of about 50 species, herbs, of tropical and warm-temperate Old and New World. References: Rogers (2005).

1 Calyx with 2 long lobes, the other 2 absent or vestigial............................................................... S. densiflora
2 Calyx with 4 lobes of nearly equal length.
3 Calyx lobes with a conspicuous white margin ................................................................................. S. prostrata
4 Calyx lobes green throughout.
5 Fruit pubescent ................................................................................................................................ S. assurgens
6 Fruit glabrous .................................................................................................................................. S. glabra

* Spermacoce densiflora* (deCandolle) Alain. Cp (FL): disturbed areas; rare, native of the Neotropics. [= K, WH; = *Borreria densiflora* deCandolle] [add to synonymy]

*Spermacoce glabra* Michaux, Smooth Buttonweed. Mt (VA, WV), Cp (FL, GA, SC*, VA*): rocky riversides in the mountains, disturbed areas in the Coastal Plain; rare (GA Rare). Perhaps only introduced in at least some parts of our area; see Wieboldt et al. (1998) for discussion. [=RAB, C, F, G, GW, K, S, WH]

*Spermacoce prostrata* Aublet. Cp (FL): wet pine flatwoods, floodplain forests; uncommon. FL, AL, MS, south through the New World tropics. July-September. [= K, WH; = *Borreria ocimoides* (Burnmann) e de Candolle – S, misapplied] [add to synonymy]

*Spermacoce tenuior* Linnaeus, reported from sw. GA (Kartesz 1999). [ID needs checking] [= K; S. riparia* Chamisso & Schlechtendahl] [not yet keyed; add to synonymy]

351. GENTIANACEAE A.L. de Jussieu 1789 (Gentian Family) [in GENTIANALES]

A family of about 87 genera and over 1600 species, herbs, shrubs, and trees, cosmopolitan (Struwe & Albert 2002). References: Wood & Weaver (1982), Struwe & Albert (2002). [also see MENTHACEAE]

1 Leaves all scale-like, 1-3 (-5) mm long, appressed to the stem; [tribe Gentianeae, subtribe Swertiniae]............................................ Bartonia
2 Leaves larger, spreading or ascending.
3 Stem leaves whorled; plants robust, 1-3 m tall; [tribe Gentianeae, subtribe Swertiniae]..................................................................... Frasera
GENTIANACEAE

Centaurium Hill (Centaury)

A genus of about 20 species, herbs, mainly north temperate.

1 Flowers pedicellate, the pedicels 3-5 mm long. .......................................................... C. pulchellum
1 Flowers sessile or nearly so (sometimes appearing stalked but with bracteal leaves immediately below the calyx).
2 Inflorescence a corymbiform cyme (about as broad as long, the central axis poorly developed). .......................................................... C. erythraea
2 Inflorescence a spike-like cyme (distinctly elongate, the central axis straight). .......................................................... C. spicatum

* Centaurium pulchellum (Swartz) Druce, Lesser Centaury, Branching Centaury. Disturbed areas; native of Europe. June-September. [= C. F, G, K, S]
* Centaurium spicatum (Linnaeus) Fritsch, Spiked Centaury. Disturbed areas; native of s. Europe. July-August. [= C, F, G, K]

Bartonia Muhlenberg ex Willdenow (Bartonia)

A genus of 3 species, herbs, of e. North America. The genus has coralloid mycorrhizae and lacks root hairs, and is thus presumably partially mycotrophic. References: Mathews et al. (2009)=Y; Gillett (1959)=Z.

1 Corolla lobes white, 4-9 mm long, spreading, spatulate to obovate, rounded at the apex; flowering in early spring (rarely to early summer) ....... B. virginica
1 Corolla lobes green to creamy white, 2-3 (-5.2) mm long, ascending or erect, oblong to ovate or lance-ovate, acuminate or rounded-mucronate at the apex; flowering in summer or fall (July-October).
2 Mid-cauline scale leaves alternate; corolla lobes acuminate at the apex, their margins entire; anthers 0.3-0.5 mm long .......................................................... B. paniculata ssp. paniculata
2 Mid-cauline scale leaves opposite; corolla lobes rounded at the apex, abruptly narrowed to a mucro, their margins erose (uncommonly entire); anthers 0.5-1.1 mm long.......................................................... B. virginica

Bartonia paniculata (Michaux) Muhlenberg ssp. paniculata, Screwstem Bartonia. Swamps, bogs, pocosins, pocosin ectones, sphagnum seepages, sinkhole ponds. August-October; September-October. Ssp. paniculata ranges from MA south to c. peninsular FL and west to e. TX, chiefly on the Coastal Plain, but with scattered occurrences inland (to c. VA, w. NC, KY, and AR). Ssp. iodandra (B.L. Robinson) J. Gillett is more northern, ranging from NL (Newfoundland) south to MA. Ssp. texana (Corell) K. Mathews, Dunne, E. York, & Struwe is endemic to the West Gulf Coastal Plain of w. LA and e. TX, where it is more-or-less sympatric with ssp. paniculata (Mathews et al. 2009). [= K, Y, Z; < B. paniculata – RAB, GW, WH; = B. paniculata – G; = B. paniculata var. paniculata – C, F; = B. lanceolata Small – S]

Bartonia verna (Michaux) Rafinesque ex Barton, Spring Bartonia, White Bartonia. Wet pine savannas, shores of Coastal Plain depression ponds, other moist sands. (November-)February-April (-June); April-June. VA (one site known from City of Virginia Beach) (Belden et al. 2004) and se. NC (Carteret County) south to s. FL, west to se. TX. Wood & Weaver’s (1982) speculation that B. verna is an outlier relative to the other species appears not to be true, with the true division being between B. verna/virginica on one hand and B. paniculata and its infrataxa on the other (Mathews et al. 2009). [= RAB, GW, K, S, WH, Y, Z]

Eustoma Salisbury ex G. Don (Prairie-gentian)

Eustoma exaltatum (Linnaeus) Salisbury ex G. Don, Prairie-gentian. Cp (FL): alkaline prairies, saline coastal areas; rare. AL and peninsular FL west to TX, south to Mexico and Belize; West Indies. June-November. [= GW, S, WH, Y, Z; = Eu. exaltatum ssp. exaltatum – K] (not yet keyed in generic key)

Frasera Walter (Columbo)

Frasera caroliniensis Walter, American Columbo. Mt (GA, NC), Pd (GA, SC): rich forests over mafic rocks, upper slopes of cove forests, floodplain forests; rare. Late May-June; September-October. W. NY, nw. PA, and s. ON west to IL, MI, MO, and e. OK, south to w. SC, n. GA, and LA, primarily west of the Blue Ridge. Horn (1997) studied the ecology of this species in the Piedmont of SC. [= C, K, S, W, Z; = Svertia caroliniensis (Walter) Kunze – RAB, F, G]

Gentiana Linnaeus 1753 (Gentian)

A genus of about 350-400 species, herbs, primarily temperate and arctic. Even following the removal of Gentianopsis and Gentianella, Gentiana is a large and apparently heterogeneous group, perhaps not monophyletic. No satisfactory comprehensive treatment is available, however. All of the species treated here as Gentiana are in the distinctive group often treated as section, subgenus, or genus Pneumonanthe. References: Pringle (1967)=Z; Halda (1996)=Y; Ho & Liu (2001)=X; Pringle & Weakley (2009)=Q; Ho & Liu (1990); Yuan, Küpfer, & Doyle (1996); Pringle (1977). Key adapted from Z.

Identification Notes: In some species it may be somewhat difficult to interpret the corolla lobes and the corolla appendages. The filaments are alternate to the corolla lobes, and are therefore attached to the lower portion of the corolla appendages.

1 Flower solitary (rarely 2 or 3); corolla spotted within; leaves twisted, oblanceolate to oblinear; [subgenus Pneumonanthe, series Angustifoliae].
2 Calyx lobes widest at base, the sides then parallel upwards for a distance; corolla exterior intensely indigo blue; [of s. NJ and adjacent DE, and from se. VA south through e. NC to ne. SC].**********************************G. autumnalis
3 Calyx lobes widest above the base, narrowing upwards and downwards from that point; corolla exterior dull purplish-green; [of FL Panhandle].-----------------------------------------------G. pennelliana
4 Corolla blue, purplish, pale blue, or nearly white; seed winged; lower leaves linear, lanceolate, acuminate..........................................................G. puberulenta
5 Margins of leaves and calyx lobes conspicuously ciliate (as seen at 10×); corolla appendages with 2 teeth, as long as broad or longer (sometimes with a deflexed segment)..................................................G. linearis
6 Anthers separate at anthesis; outer surfaces of petals suffused with green; calyx lobes linear-subulate, about as long as the tube; corolla lobes 6-14 mm long, about 2× as long as the the free portions of the corolla appendages ..................................................G. decora
7 Calyx lobes lanceolate, oblanceolate, ovate, or orbicular, 1-5× as long as broad, longer or shorter than the glabrous or puberulent calyx tube; stems glabrous or puberulent; corolla appendages subequally bifid, both segments erect.

Gentianopsis

is a large and apparently heterogeneous group, perhaps not monophyletic. No satisfactory comprehensive treatment is available, however. All of the species treated here as Gentiana are in the distinctive group often treated as section, subgenus, or genus Pneumonanthe. References: Pringle (1967)=Z; Halda (1996)=Y; Ho & Liu (2001)=X; Pringle & Weakley (2009)=Q; Ho & Liu (1990); Yuan, Küpfer, & Doyle (1996); Pringle (1977). Key adapted from Z.
GENTIANACEAE

749

Gentiana alba Muhlenberg ex Nuttall, Pale Gentian. Moist meadows. August-October. MI west to MN, south to n. AR; with scattered disjunctions eastward to PA, OH, WV, KY, and w. NC. G. alba has nomenclatural over G. flavida as the older name; there is controversy, however, over whether it was validly published and applies clearly to the species at hand (see Wilbur 1988c for discussion). [= RAB, K, W, WV, X, Y, Z; = Pneumonanthe flavida (A. Gray) Britton – S; = Pneumonanthe alba (A. Gray) Greene]

Gentiana andrewsii Grisebach var. andrewsii. Prairie Closed Gentian. Meadows, seeps, forest edges. NH, s. QC, MN, and s. MB, south to s. MD, WV, MO and WV; earlier reports of it as far south as GA or NC (as by F and G) are apparently based on misidentifications. An additional variety, var. dakotica A. Nelson, occurs from MB and SK south in the Great Plains to MO and IL. [= C, K, X, Y, Z; < G. andrewsii – F, G, WV; < Dasystephana andrewsii (Grisebach) Small – S; = Pneumonanthe andrewsii (Grisebach) W.A. Weber var. andrewsii]

Gentiana austromontana J.S. Pringle & Sharp, Blue Ridge Gentian. Mountain forests and grassy balds, especially at medium to high elevations, but descending to ca. 600 m (2200 feet). August-October. A Southern Appalachian endemic: s. WV and sw. VA south to w. NC and ne. TN. The flowers of G. austromontana are usually a deeper and more intense blue-violet than the similar G. clausa and G. decorata. See Pringle & Sharp (1964) for additional discussion. [= C, K, Q, W, WV, X, Y, Z; < G. clausa Rafinesque – RAB, F, G, GW; < Dasystephana decorata (Pollard) Small – S]

Gentiana autumnalis Linnaeus, Pinebarren Gentian. Savannas, pine flatwoods, sandhills, in a variety of sites varying from moist to very xeric, nearly always associated with Pinus palustris and/or Aristida stricta (in se. VA, NC, and SC). Late September-mid January (rarely at other times of the year, such as spring, in response to fire). This species is a "bimodal endemic," occurring in s. NJ and adjacent DE (at least formerly), and from se. VA south through e. NC to sc. This is endemic to the FL Panhandle; other siblings, G. bicuspidata (G. Don) Briq., G. hooperi Pringle, and G. longicollis Nesom, occur in Mexico. G. autumnalis is often overlooked, since it is very inconspicuous except when in flower, it usually flowers at a season when few botanists are about, and sterile plants greatly outnumber fertile ones. Vegetatively it is extremely distinctive once learned; the leaves are glossy, dark-green, opposite, oblong and twisted and curved in a manner reminiscent of an airplane propellor. [= RAB, C, F, GW, K, X, Z; < Gentiana porphyrio (F.J. Gmelin – G; = Dasystephana porphyrio (J.F. Gmelin) Small – S; = Gentiana autumnalis ssp. autumnalis – Y; = Pneumonanthe porphyrio (Linnaeus) Greene]

Gentiana clausa Rafinesque Closed Gentian, Meadow Bottle Gentian. Forests. September-October. Mostly Appalachian: ME south to w. NC and ne. TN, extending east and west to adjacent physiographic provinces. [= C, Q, WV; < G. clausa – C, K, W, X, Y, Z (also see G. latidens); < G. clausa – RAB, F, G, GW (also see G. austromontana and G. latidens); < Dasystephana decorata (Pollard) Small – S; < Pneumonanthe clausa (Rafinesque) Greene]

Gentiana latidens (House) J.S. Pringle & Weakley, Balsam Mountain Gentian. Moist, often seeping, more or less open sites on rocky slopes. September-October. Restricted to the higher mountains sof NC south of Asheville, NC (Haywood,
1 Calyx 4-5 mm long; calyx tube 1.5-2.0 mm long; calyx lobes 2.0-2.5 mm long, narrowly triangular with hyaline margins and very prominent occidentalis west to n. KY and w. TN, south to Panhandle FL and e. LA. [= RAB, C, F, G, K, W, WV, X, Y, Z, Fernald – F, G; = Pneumonanthe linearis (Linnaeus) Small – S, misapplied; = Dasystephana puberula (Michaux) Small – S, misapplied]

**Gentiana lineari** Frölich, Narrowleaf Gentian. Openings in spruce-fir forests, bogs, at high elevations. September-October. Mainly occurring in ne. United States and e. Canada, west to Lake Superior, and south (scattered) in the Appalachians to sw. VA (in openings in spruce-fir forest near summit of Whittetop Mountain) and e. TN (Chester, Wofford, & Kral 1997). On Mount LeConte (Sevier County, TN), G. lineari occurs in thin soils around high elevation outcrops of Anakeesta Slate. See Pringle (1977) for extensive discussion of actual and putative southern occurrences of this species. [= C, F, G, K, W, WV, X, Y, Z, = Gentiana lineari (Frölich) Greene]

**Gentiana pennellina** Fernald, Wiregrass Gentian. Pine flatwoods. December-March. Endemic to Panhandle FL. [= GW, WH; = Dasystephana tenuefolia (Linnaeus) Pennell – S] [add to synonymy X, Y, Z]

**Gentiana puberulenta** J.S. Pringle, Prairie Gentian. [habitats]. W. NY west to ND, south to KY, sc. TN (Coffee County) (Chester, Wofford, & Kral 1997), LA, n. AR, and KS. Reports for WV are unconfirmed (Harmon, Ford-Werntz, & Grafton 2006). [= C, K, X, Y, Z; = G. puberula – F, G, misapplied; = Dasystephana puberula (Michaux) Small – S, misapplied]

**Gentiana saponaria** Linnaeus, Soapwort Gentian. Bogs, marshes, wet hardwood forests, other moist to wet habitats. Late September-November. NY west to n. IL, south to Panhandle FL and e. TX. A peculiar form with very narrow leaves has been found at several localities in Ashe and Watauga counties, NC, and in the South Mountains, NC; it may warrant taxonomic recognition after further study. [= RAB, C, GW, K, W, WH, X, Y, Z; > G. saponaria – F, G, WV; > G. cherokeensis (W.P. Lemmon) Fernald – F, G; = G. saponaria var. saponaria – K; = Dasystephana saponaria (Linnaeus) Small – S; = Pneumonanthe saponaria (Linnaeus) F.W. Schmidt]

**Gentiana villosa** Linnaeus, Striped Gentian. Upland forests, sandhill/pocosin ecotones. Late August-November. Se. PA west to n. KY and w. TN, south to Panhandle FL and e. LA. [= RAB, C, F, G, K, W, WH, X, Y, Z; = Dasystephana villosa (Linnaeus) Small – S; = Pneumonanthe villosa (Linnaeus) F.W. Schmidt]

**Gentianella Moench (Agueweed)**

A genus of about 125-250 species, herbs, temperate. The separation of Gentianella from Gentiana appears to be well warranted; some characters suggest that Gentianella is more closely allied to Swertia, Halemia, and Lomatogonium than to Gentiana (Wood & Weaver 1982). A molecular analysis has confirmed this (Yuan & Küpfer 1995). References: Gillett (1957)=Z. Key based on Gillett (1957).

1 Calyx 8-10 mm long; calyx tube 3.0-3.5 mm long; calyx lobes 5-6 mm long, elliptic-lanceolate to oblanceolate with thickened margins, and with broadly flattened, frequently nerve-like keels; corolla ca. 20 mm long .......................................................... G. quinquefolia var. occidentalis

2 Calyx 4-5 mm long; calyx tube 1.5-2.0 mm long; calyx lobes 2.0-2.5 mm long, narrowly triangular with hyaline margins and very prominent keels; corolla 16-18 mm long ............................................................................................................................ G. quinquefolia var. quinquefolia

**Gentianella quinquefolia** (Linnaeus) Small var. occidentalis A. Gray, Western Agueweed. Calcareous barrens, dry and dry-mesic limestone woodlands. Late August-October. Var. occidentalis A. Gray is more widespread, from OH and s. ON west to MN, east and south to w. VA, sc. KY, AR, and se. KS. [= C, G; < Gentiana quinquefolia Linnaeus – RAB, GW, W; = Gentiana quinquefolia var. occidentalis (A. Gray) Hitchcock – F; = Gentianella quinquefolia ssp. occidentalis (A. Gray) J. Gillett – K, Z; = Gentianella occidentalis (A. Gray) Small – S]

**Gentianella quinquefolia** (Linnaeus) Small var. quinquefolia, Eastern Agueweed. Forests, grassy balds. Late August-October. Var. quinquefolia is primarily Appalachian, from ME west to w. NY and s. ON, south to n. GA and sc. TN. [= C, G; < Gentiana quinquefolia Linnaeus – RAB, GW, W, WV; = Gentianella quinquefolia var. quinquefolia – F; = Gentianella quinquefolia ssp. quinquefolia – K, Z; = Gentianella quinquefolia – S]

**Gentianopsis Ma 1951 (Fringed-gentian)**

A genus of about 20 species, herbs, of north temperate Asia and North America. The reasons for the recognition of Gentianopsis are enumerated by Ma (1951), Ilitis (1965), and Wood & Weaver (1982). References: Gillett (1957)=Z; Ilitis (1965); Ma (1951).
Anthopogon crinitum (Frölich) Rafinesque – S;
1. Flowers with 5-6 (-7) corolla lobes. Inconspicuous, often nearly hidden under fallen leaves. To OH, s. IN, and s. IL, south to Panhandle FL and se. LA (reported from TX). The small purplish-green plants are a monotypic genus, herb, of e. North America. References: Wilbur (1955) = Z.

Obolaria Linnaeus (Pennywort)

Obolaria virginica Linnaeus, Pennywort. Nutrient-rich, moist forests, mesic hammocks. March-May; May-June. NJ west to OH, s. IN, and s. IL, south to Panhandle FL and se. LA (reported from TX). The small purplish-green plants are inconspicuous, often nearly hidden under fallen leaves. Obolaria has well-developed mycorrhizae and may be substantially mycotrophic. [= RAB, C, F, G, K, S, W, WH, WV, Z]

Sabatia Adanson 1763 (Sabatia, Rose-gentian, Rose-pink, Marsh-pink, Sea-pink)

(Contributed by B.A. Sorrie and A.S. Weakley)

A genus of about 20 species, of North America and the West Indies. References: Wilbur (1955) = Z.

1. Flowers with (7-) 8-12 (-14) corolla lobes.
2. Pedicels > 10 mm long; calyx subtended by long bracts; terminal flower single.
3. Upper branches of main stem opposite.
4. Upper stem leaves about as wide as the diameter of the stem, or narrower; calyx lobes terete or semi-terete; stems 6-12 dm tall; [of Taxodium ascendens-Nyssa biflora depressions and wet pine flatwoods in se. SC] ...................................................... S. bartramii
5. Upper stem leaves much wider than the diameter of the stem; calyx lobes flat, linear to narrowly oblanceolate; stems 3-12 dm tall; [of various habitats, primarily along the shores of blackwater rivers or ponds, or in tidal marshes].
6. Primary branches opposite; terminal flower short-stalked (much shorter than the first internode of the adjacent branch); stems 5-12 dm tall; [of Taxodium ascendens-Nyssa biflora depressions and wet pine flatwoods in se. SC] ...................................................... S. bartramii
7. Primary branches usually alternate; terminal flower long-stalked (usually longer than the first internode of the adjacent branch); stems 3-7 dm tall; [of brackish marshes or openings along blackwater streams].
8. Surficial stolons usually present and well-developed, elongate; internodes shorter than to equaling the leaves; [of openings of blackwater streams] ...................................................... S. dodecandra
9. Surficial stolons usually absent or poorly developed; internodes commonly much longer than leaves; [of tidal brackish or freshwater marshes] ...................................................... S. dodecandra
10. Calyx lobes foliaceous, 5-8 mm wide, oblong to oblanceolate, mostly exceeding the corolla lobes ........................................... S. calycina
11. Calyx lobes linear-setaceous, 0.5-2 mm wide, if equalling the corolla lobes then very narrow and not foliaceous. 
12. Plants perennial, often with several stems from a caudex; calyx lobes > 3/4× as long as the corolla lobes, and sometimes exceeding them; [of saturated soils from Coastal Plain savannas to Mountain bogs] ...................................................... S. campanulata
13. Plants annual, solitary; calyx lobes up to 3/4× as long as the corolla lobes 
14. Corolla lobes pink (rarely white in individual plants). 
15. Lower half of stem winged; leaves ovate, clasping, < 2× as long as wide; [widely distributed in our area] ...................................................... S. angularis
15 Lower half of stem not winged; leaves elliptic to lanceolate, more or less tapered to the base, mostly > 3× as long as wide; [of the Coastal Plain or very rarely Piedmont] ...........................................................S. brachiata
14 Corolla lobes white or creamy white; pedicels (above the uppermost bracts or branches) ca. 1-2 (-5) mm long.
16 Lower portion of stem quadrangular, narrowly winged, plants annual or biennial, with 1 (-several) stems arising from a taproot...........
16 Lower portion of stem terete, not winged (though the upper stem is quadrangular or angled in S. difformis); plants perennial, with several stems arising from a short rhizome; [section Eusabatia, subsection Difformes].
17 Leaves and upper stem not glaucous; stem terete below, becoming quadrangular or quadrangular-angled above; corolla lobes (5-)
7-15 (-21) mm long; [widespread in our area]............................................................S. difformis
17 Leaves and upper stem glaucous; stem terete throughout; corolla lobes (4-) 5-7 (-8) mm long; [of GA southward and westward].
18 Calyx-lobes erect, (0.1-) 0.2-1.5 (-2.0) mm long, as long as or shorter than the calyx-tube; [of e. and sc. GA south to ne. FL]..............
18 Calyx lobes strongly recurved, (1.0-) 1.5-3 mm long, longer than the calyx-tube; [of e. and sc. GA south to ne. FL] ..............

Sabatia angularis (Linnaeus) Pursh, Bitter-bloom, Common Marsh-pink. Forests, woodlands, marshes, fields, calcareous hammocks (in FL). July-August; September-October. NY west to s. MI, IL, and e. KS, south to Panhandle FL and e. TX. [= RAB, C, F, GW, K, WH, WV, Z; = Sabatia angularis – S]

Sabatia arenicola Greenman, Sand Rose-gentian. Interdune depressions, wet savannas, saline flats. April-July. Se. LA west through TX to ne. MX. [= GW, K, Z]

Sabatia brachiata Elliott, Narrowleaf Rose-pink. Mesic pinelands, sandhills, pine savannas, pine flatwoods. Late May-July; August-September. Se. VA south to s. GA, west to LA, north in the interior to c. TN and se. MO. [= RAB, C, F, GW, K, W, Z; = Sabatia brachiata – S]

Sabatia brevifolia Rafinesque. Pine savannas. September-October; October-November. E. SC south to peninsular FL, west to s. AL. [= RAB, GW, K, WH, Z; = Sabatia elliotii Steudel – S]

Sabatia calycina (Lamarck) Heller, Coastal Rose-pink. Swamp forests, river banks. June-October; July-October. Se. VA south to s. FL, west to se. TX; e. Cuba and Hispaniola. [= RAB, C, F, GW, K, WH, Z; = Sabatia calycina – S]

Sabatia campanulata (Linnaeus) Torrey, Slender Marsh-pink. Pine savannas, bogs. June-August; September-October. MA south to ne. FL, oanhandle FL, west to LA and AR; scattered inland as in w. VA, w. NC, c. TN, and KY. [= RAB, C, GW, K, W, WH, Z; > S. campanulata var. campanulata – F; > S. campanulata var. gracilis (Michaux) Fernald – F; < Sabatia campanulata – S]

* Sabatia campestris Nuttall, Western Marsh-pink, Prairie Rose-gentian, Prairie Sabatia. Roadsides and woodland edges; native of c. United States. July-August; September-October. [= RAB, C, F, GW, K, Z]

Sabatia capitata (Rafinesque) Blake, Cumberland Rose-gentian. Sloping woodlands and meadows, over sandstone or shale. July-August; September-October. Sw. NC and se. TN south to nw. GA and e. AL. Apparently present in NC, at least formerly, based on a specimen collected "from Cherokee", probably Cherokee County, NC, a remarkably poorly botanized area. [= K, Z; = Lapithea capitata (Rafinesque) Small – S]

Sabatia dodecandra (Linnaeus) Britton, Sterns, & Poggenburg, Perennial Sea-pink, Large Marsh Rose-pink. Tidal brackish and freshwater marshes. June-August; August-October. CT south to e. SC and e. GA (Sorrie 1998b). [= F; < S. dodecandra var. dodecandra – RAB (also see S. foliosa); = S. dodecandra var. dodecandra – C, GW, K, Z; = Sabatia dodecandra – S]
**GENTIANACEAE**

*Sabatia foliosa* Fernald. Openings along blackwater rivers, cypress ponds. June-August; August-October. E. SC south to ne. FL and Panhandle FL, west to se. TX. [<*S. dodecandra* var. *dodecandra* – RAB; = *S. dodecandra* (Linnaeus) Britton, Stems, & Poggenburg var. *foliosa* (Fernald) Wilbur – GW, K, Z; > *Sabatia foliosa* – S; > *Sabattia harperi* Small – S; = *S. dodecandra* – WH]

*Sabatia gentianoides* Elliott. Pine savannas, bogs. July-August; September-October. NC south to ne. FL and Panhandle FL, west to se. TX. [= RAB, GW, K, WH, Z; = *Lapithea gentianoides* (Elliott) Grisebach – S]

*Sabatia grandiflora* (Gray) Small. Largeflower Rose-gentian. Cp (FL): wet flatwoods, marshes, cypress-gum depressions, limesink ponds, borrow pits; common. Ne. FL, Panhandle FL, s. AL, south to s. FL. [= RAB, GW, K, WH, Z; = *Lapithea grandiflora* (Elliott) Grisebach – S]

*Sabatia kennedyana* Fernald, Plymouth Gentian. Seasonally exposed drawdown banks of the Waccamaw River, in adjacent ditches and disturbed flats (in se. NC and ne. SC), and very rarely on shores of beaver ponds (in e. VA, by introduction). June-August; August-October. This species has a strange, disjunct range, likely related to Pleistocene refugia on the (now) Continental shelf, present in s. NS, e. MA and RI; se. NC and ne. SC. The record of the species in e. VA (Caroline County) reported by Fleming & Ludwig (1996) has now been determined to be a deliberate introduction. Studies underway suggest that the Carolina plants may differ varietally from those in New England (Sorrie, pers. comm.). [= C, F, GW, K, Z; = *S. dodecandra* var. *kennedyana* (Fernald) Ahles – RAB]

*Sabatia macrophylla* Hooker var. *macrophylla*, Large-leaf Rose-gentian. Wet savannas. Sw. GA west to e. LA. [= K, Z; < *S. macrophylla* – GW, WH; = *Sabbatia macrophylla* Hooker – S]

*Sabatia macrophylla* Hooker var. *recurvans* (Small) Wilbur, Small’s Rose-gentian. Wet savannas. E. and c. GA south to ne. FL; it may occur in se. SC. [= K, Z; < *S. macrophylla* – GW, WH; = *Sabbatia recurvans* Small – S]

*Sabatia quadrangularis* Wilbur, Four-angle Sabatia. Sandhills, moist forests, pocosin ecotones. June-September; August-November. E. VA south to n. peninsular FL, west to s. AL. [= RAB, C, GW, K, WH, Z; = *S. paniculata* Michaux – F, misapplied; = *Sabatia paniculata* – S]

*Sabatia stellaris* Pursh, Annual Sea-pink. Brackish marshes. July-October; August-November. S. MA south to s. FL, west to LA; Bahama Islands, Cuba, c. Mexico. [= RAB, C, F, GW, K, WH, Z; = *S. campanulata* var. *paniculata* – S]

**LOGANIACEAE** R. Brown ex Martius 1827 (Logania Family) [in GENTIANALES]

As here rather narrowly interpreted, Loganiaceae consists of 12 genera and about 420 species, herbs and subshrubs, of tropical, subtropical, and warm temperate areas of the Old and New Worlds. Other genera in our area which have traditionally been considered components of the Loganiaceae now are clearly better placed in the small families Tetrachondraceae (*Polypremum*), Gelsemiaceae (*Gelsemium*), and Scrophulariaceae (*Buddleja*), more closely related to other families (such as Rubiaceae) than to Loganiaceae sensu stricto (Struwe, Albert, & Bremer 1994). The affinities of *Spigelia* appear to be with a small group of tropical and subtropical genera, the largest of which is *Strychnos*. Struwe, Albert, & Bremer (1994) treated this group as the family Strychnaceae, based on a cladistic analysis of data. A later, more thorough analysis suggested that Strychnaceae is best recombined with Loganiaceae (Backlund, Oxelman, & Bremer 2000). References: Rogers (1986). [also see GELSEMIACEAE, SCROPHULARIACEAE, and TETRACHONDRACEAE]

1 Woody vine ......................................................................................................................................................*Gelsemium* [see GELSEMIACEAE]
1 Herb.
2 Corolla funnelform, 0.1-0.2 cm long, white ......................................................................................................................*Mitreola*
2 Corolla tubular, 3-6 cm long, red and yellow...............................................................................................................*Spigelia*

**Mitreola** Linnaeus 1758 (Miterwort)

**LOGANIACEAE**

1 Leaves 2-8 cm long petiolate or sessile and tapering to a cuneate base .................................................. *M. petiolata*

1 Leaves 1-4 cm long, sessile, the base rounded.

2 Mature seed reticulate; mature capsule smooth to slightly and finely tuberculate; larger leaves ca. 4× as long as wide.............. *M. angustifolia*

2 Mature seed smooth; mature capsule markedly papillose-warty; larger leaves 1.5-2× as long as wide................................. *M. sessilifolia*

*Mitreola petiolata* (J.F. Gmelin) Torrey & A. Gray, Caribbean Miterwort. Swamps, marshes, ditches, other wet habitats. July-September; September-November. Se. VA south to FL and west to AR and c. TX, north in the interior to nw. GA and c. and se. TN; Mexico, the West Indies, and n. South America. [= GW, K, WH, Y; = *Cynoctonum mitreola* (Linnaeus) Britton – RAB, C, F, G, S]

*Mitreola sessilifolia* (J.F. Gmelin) G. Don, Small-leaved Miterwort. Wet savannas, pocosins, ditches, margins of limesink depressions (dolines). Late June-August; September-October. Se. VA south to FL, west to e. TX, and in the Bahama Islands. [= GW, WH, Y; = *Cynoctonum sessilifolium* J.F. Gmelin – RAB, C, F, G, S; < *M. sessilifolia* – K, Z (also see *M. angustifolia*)]

**Spigelia** Linnaeus 1753 (Pinkroot)

1 Corolla scarlet on the outer surface, yellow on the inner surface.......................................................................................... *S. marilandica*

1 Corolla light pink to white on the outer and inner surfaces.

2 Corolla 36-50 mm long; pistil 24-27 mm long; sepals 8-11 mm long; inflorescence with 2-4 flowers; [of dolomitic glades in Bibb Co. AL] ..........................................................................................................................................................................

2 Corolla 25-30 mm long; pistil 17-19 mm long; sepals 4-6 mm long; inflorescence with 3-8 flowers; [of pine savannas of Panhandle FL].............................................................................................................................................................................................................

*S. gentianoides* var. *gentianoides*

*S. marilandica* (Linnaeus) Linnaeus, Pinkroot, Wormgrass. Woodlands and forests, usually on circumneutral soils. May-June; late June-July. SC, sw. NC (Cherokee Co. and Macon Co.), and TN west to s. IN and OK, south to Panhandle FL and TX; some floras allege its occurrence north to VA, MD, NJ, and PA. *S. marilandica* will likely be found in sw. VA. [= RAB, C, F, G, K, S, W, WH]

**353. GELSEMIACEAE** (G. Don) Struwe & V. Albert 1995 (Jessamine Family) [in GENTIANALES]

A family of 2 genera and about 10 species, shrubs and vines, of tropical and warm temperate America, Africa, and Asia. There is persuasive evidence that *Gelsemium* and *Mostuea* Didr., traditionally treated as part of a heterogeneous Loganiaceae, should be accorded family status as Gelsemiaceae (Backlund, Oxelman, & Bremer 2000; Struwe, Albert, & Bremer 1994; Sennblad & Bremer 1996). The Gelsemiaceae form a clade most closely related to the Apocynaceae (Backlund, Oxelman, & Bremer 2000).

**Gelsemium** Antoine Laurent de Jussieu (Yellow Jessamine)

A genus of 3 species, vines, our 2 species in se. North America (and also Central America) and 1 species in e. Asia. References: Wyatt et al. (1993); Duncan & Dejong (1964); Godfrey (1988); Rogers (1986)=Z; GW.

1 Sepals acuminate apically, persistent on the fruit; capsule elliptical, 1.0-1.6 cm long, 6-8 mm broad, the tapering tip bearing a definite beak about 3 mm long; seeds wingless; flowers odorless (rarely fragrant), usually golden-yellow .......................................................... *G. rankinii*
1. Sepals obtuse to broadly acute, not persistent on the fruit; capsule oblong, 1.5-2.5 cm long, 8-12 mm broad, very abruptly narrowed to a beak 1.5-2 mm long; seeds with a prominent membranous wing sharply differentiated from the body of the seed; flowers fragrant, usually lemon-yellow ................................................................. G. sempervirens

**Gelsemium rankinii** Small, Swamp Jessamine. Swamps of blackwater rivers, restricted in NC to the se. corner of the state, most notably the swamps of the Waccamaw and Black rivers. March-April; September-October. Se. NC south through SC and trees, also commonly planted as an ornamental. March–early May; September–November. VA, se. TN, and AR south to e. peninsular FL and e. TX; disjunct in Guatemala and Mexico (Chiapas, Oaxaca, Puebla, and Veracruz). Jessamine climbs to the tops of trees. (= RAB, F, GW, K, S, W, WH, Z)

**Gelsemium sempervirens** (Linnaeus) St. Hilaire, Carolina Jessamine. In a wide range of habitats, from swamp forests to dry uplands and thickets, also commonly planted as an ornamental. March–early May; September–November. VA, se. TN, and AR south to e. peninsular FL and e. TX; disjunct in Guatemala and Mexico (Chiapas, Oaxaca, Puebla, and Veracruz). Jessamine climbs to the tops of trees. (= RAB, F, GW, K, S, W, WH, Z)

### 354. **APOCYNACEAE** A.L. de Jussieu 1789 (Dogbane Family) [in GENTIANALES]

As here circumscribed including the Asclepiadaceae, a family of about 480 genera and about 4800 species, lianas, shrubs, herbs, and trees, widespread in tropical and temperate areas. There appears to be overwhelming evidence favoring the combination of the Asclepiadaceae into the Apocynaceae; see, for instance, Rosatti (1989), Sennblad & Bremer (1996), and many others.

References: Rosatti (1989); Lieder (1997a).

1. Plant a twining herbaceous or woody vine.

2. Leaves ovate, cordate at the base, < 2.5× as long as wide.

3. Plants in flower.

4. Petals white; gynostegial corona nearly as long to longer than the corolla lobes ................................................................. **Cynanchum laeve**

5. Petals brown, yellow, yellow-green, cream, or maroon (white in **Matelea baldwyniana**); gynostegial corona < half the length of the corolla lobes.

6. Corolla lobes glabrous on the outer surface, very stiff in texture; dorsal anther appendages laminar; carpels smooth and angled ...... ................................................................. **Gonolobus**

7. Corolla lobes glandular-puberulent on the outer surface, herbaceous in texture; dorsal anther appendages absent; carpels muricate. ................................................................. **Gelsemium**

3. Plants in fruit.

6. Follicles muricate ........................................................................................................................................................................**Matelea**

7. Follicles smooth and angled. .................................................................................................................................................. **Cynanchum laeve**

7. Leaves cordate, broadly rounded to an acuminate apex .............................................................................................................. **Gonolobus**

2. Leaves ovate, lanceolate, or linear, not cordate at the base, > 1.5× as long as wide

8. Leaves linear, the margins parallel

9. Leaves petiolate; calyx lobes deltoid, obtuse, ca. 1 mm long; leaves petiolate, not reflexed, often caducous; follicle 1-3 mm in diameter; [of se. SC and south] ................................................................. **Cynanchum scoparium**

10. Leaves sessile; calyx lobes lanceolate, acute, (1.3-) 1.5-2.5 mm long; leaves sessile, reflexed, persistent; follicle 6-7 mm in diameter; [of ne. NC and south] ................................................................. **Seutera angustifolia**

8. Leaves ovate to lanceolate.

10. Flowers brownish-purple, with a corona of narrow segments; fruit 10-15 cm long, > 5 mm in diameter; leaves obtuse to acute at the tip (rarely slightly acuminate) ........................................................................... **Periplocoa**

11. Flowers white to creamy yellow, lacking a corona; fruit 10-25 cm long, 1-2 mm in diameter; leaves acuminate at the tip ................. ................................................................................................................................. **Trachelospermum**

1. Plant an erect or trailing herb or shrub.

11. Plant a woody shrub.

12. Plant rhizomatous, suffrutescent, < 4 dm tall; leaves narrowly to broadly ovate; flowers blue, lavender, or white ............................................ **Vinca**

12. Plant erect, > 4 dm tall; leaves either lanceolate or elliptic; flowers yellow, white, pink, or red.

13. Flowers yellow; shrub 4-12 dm tall, with only a few wand-like branches; [very rare waif in our area] ...................................................... **Angadenia**

14. Flowers white, pink, or red; shrub 10-40 dm tall, much branched from the base; [commonly cultivated in our area (and sometimes persistent), particularly near the coast] .......................................................................... **Nerium**

11. Plant an herb.

14. Flowers with conspicuous corona; follicles not paired; seeds with coma present ............................................................................. **Asclepias**

15. Leaves alternate (rarely a few on a plant subopposite) ................................................................................................................. **Amsonia**

15. Leaves opposite.

16. Flower < 8 mm across; paired follicles pendent, 10-22 cm long; seeds with coma; mature plants normally > 7 dm tall ... **Apocynum**

16. Flower > 20 mm across; paired follicles erect, 1.5-2.5 cm long; seeds lacking coma; mature plants 2-6 dm tall ........ **Catharanthus**

**Amsonia** Walter 1788 (Blue-stars)

A genus of about 20 species, herbs, of temperate North America and Japan. References: Woodson (1928)=Z.
A genus of 2 species, of Florida and the West Indies.

*Angadenia berteroi* (Alphonse de Candolle) Miers, Pineland Golden-trumpet, Pineland Allamanda. Lice-root. Cp (NC): disturbed, acid, peaty soil; rare, native of s. FL, the Bahamas, Cuba, and Hispaniola. The only record in our area is from an agricultural experiment station near Wenona, Washington County, NC (Hayes 1946), where presumably introduced via cattle; the species has probably not persisted in our area. [= K; > Rhadadenia coralliflora Small – S]

**Apocynum** Linnaeus 1753 (Dogbane, Indian-hemp)

A genus of about 12 species, herbs, of temperate e. and c. Asia and North America. References: Woodson (1930)=Z.

1 Corolla 5-10 mm long, pink or white with pink veins, the lobes spreading or recurved.

2 Leaves drooping; corolla ca. 3× as long as the calyx lobes. .................................................................A. androsaemifolium
**APOCYNACEAE**

1. Leaves spreading; corolla ca. 2× as long as the calyx lobes..........................Key A
2. Sap clear; leaves alternate; corolla orange to yellow.............................. **Key B**
3. Leaves lanceolate, ovate, or elliptic, < 1-5 (-10)× as long as wide.
4. Plants in flower ..................................................................................... **Key C**
5. Plants in fruit (or sterile) ......................................................................... **Key D**
6. Plants in flower ..................................................................................... **Key E**

**Key A** – milkweeds with clear sap and alternate leaves

1. Leaves cuneate at the base; leaves usually obovate to oblanceolate (widest beyond the middle); [s. NH west to OH, south to Panhandle FL and e. TX widespread eastward] ........................................................................................................................................... **A. tuberosa var. tuberosa**
2. Leaf margins flat; leaves widest towards the base; [PA, WV, KY, TN, MS westward] ................................................................. **A. tuberosa var. interior**
3. Leaf margins usually crisped; leaves widest near the middle; [of se. Coastal Plain, se. VA south to s. FL, west to s. MS] .......................................................................................................................... **A. tuberosa var. rolfsii**

**Key B** – milkweeds with milky sap, with linear leaves opposite, subopposite, or whorled

1. Leaves either mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves), or subopposite (the leaves more-or-less paired but separated by 0.5-3 mm); corolla whitish or greenish, usually suffused with rose-purple (especially at the tips of the corolla lobes).
2. Leaves mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves); leaves 1.5-7 cm long, 1-2 mm wide; seeds ca. 5 mm long, the coma ca. 2.5 cm long; milky sap often difficult to show .......................................................................................................................... **A. verticillata**
3. Leaves subopposite (the leaves more-or-less paired but separated by 0.5-3 mm); leaves (3-) 5-18 cm long, (1-) 2-10 mm wide; seeds ca. 7-11 mm long, the coma 3-5 cm long; milky sap obvious and profuse.

**A. ×floribundum** Greene (pro sp.) [A. androsaemifolium × cannabinum]. Forests, woodlands, roadsides, pastures. June-July; September-October. Sometimes occurring in populations seemingly lacking one or both parents. [= C, K; = A. medium Greene – RAB, F, S, W; > A. medium var. medium – Z]

**A. sibiricum** Jacquin. Forests, woodlands, riverside scour areas, roadsides, pastures. July-September; September-October. NL (Newfoundland and BC south to e. VA, w. VA, WV, and MO. A. sibiricum var. cordigerum has been found in Kent County, MD (Steyr, Tyndall, & Cooley 1996). [= C, W; > A. sibiricum var. sibiricum – F, G; > A. sibiricum var. cordigerum (Greene) Fernald – F, G; < A. cannabinum var. interior] (Greene) Baptista & Belosersky – Z; < A. cannabinum – K]

**Asclepias** Linnaeus 1753 (Milkweed)

3 Umbels 1-4, terminal and from upper nodes; corona 2-3 mm in diameter; horns absent; hoods ca. 2 mm long, surpassed by the anther heads; [either wet pinelands of the Coastal Plain or dry glades or woodlands] .......................................................... A. michauxii

4 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [dry glades or woodlands, known from the Mountains of nw. GA, e. TN, w. WV westward] .................................................................................................. A. hirtella

5 Leaves 2.5-4.5 cm long, puberulent beneath, sessile; corolla lobes erect, creamy yellow to dull or greenish white, 7-10 mm long; plant 1-4 dm tall; [dry pinelands of the Coastal Plain] .................................................................................................. A. pedicellata

5 Umbels 5-20 cm long, glabrous or glabrate beneath (rarely puberulent), sessile to petiolate; corolla lobes reflexed, either orange-red or usually with at least some purple (rarely merely whitish or greenish), 3-7 mm long (except 8-11 mm long in the orange-red A. lanceolata); plant 1-15 dm tall; [collectively of various habitats].

5 Leaves with pedioles 0-1 mm long; leaves 1-7 mm wide; plants 1-7 dm tall.

6 Leaves 1-2 mm wide; each hood with 2 erect, acuminate, marginal teeth on the inner side (adjoining the anther heads) ........ A. cinerea

6 Umbel 1, terminal; corona 5-7 mm in diameter; hoods present, about as long as the hood; hoods ca. 2-4 mm long, surpassing the anther heads; [dry pinelands] .......................................................... A. michauxii

9 Umbels 1-4, terminal and from upper nodes; corona 2-3 mm in diameter; horns absent; hoods ca. 2 mm long, surpassed by the anther heads; [either of wet pinelands of the Coastal Plain or dry glades or woodlands] .......................................................... A. incarnata var. incarnata

9 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [dry glades or woodlands, east to nw. GA, TN, and WV] ...................................................................................... A. hirtella

9 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [wet pinelands of the Coastal Plain] .................................................................................................. A. pedicellata

Key C – milkweeds with milky sap, with sessile, nonlinear leaves

1 Leaves 2-5 cm long, 0.3-1.0 cm wide; corolla lobes erect, creamy yellow to greenish white, 7-10 mm long; plant 1-4 dm tall; [of dry pinelands of the Coastal Plain of NC and SC] .................................................................................................. A. pedicellata

1 Leaves 3-30 cm long, 0.5-11 cm wide (not simultaneously < 5 cm long and < 1 cm wide); corolla lobes reflexed, either orange-red, purple, pink, or green, 5-15 mm long; plant 2-10 dm tall; [collectively of various habitats, including dryish pinelands of the Coastal Plain].

2 Leaves cordate-clasping at base, 3-10 cm wide, 1-2× as long as wide; stem and leaves glabrous and usually also glaucous.

3 Plant erect, the stems 4-10 dm long, the leaves perpendicular to the stem thus in a plane parallel to the ground; corolla lobes 7-11 mm long; inflorescence solitary, terminal (rarely a second from an upper node); corona 5-8 mm across; [widespread].............. A. amplexicaulis

3 Plant prostrate or decumbent, the stems 2-7 dm long, the leaves perpendicular to the stem and thus perpendicular to the ground as well; corolla lobes 5-6.5 mm long; inflorescences 2-6 from upper nodes; corona 3-5 mm across; [of dry pinelands of the Coastal Plain].............. A. hirtella

4 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [wet pinelands of the Coastal Plain] .................................................................................................. A. pedicellata

Key D – milkweeds with milky sap, with petiolate, nonlinear leaves, in flower

1 Corolla greenish, either pale green or yellowish green.

2 Leaves subopposite; corolla lobes 13-15 mm long. .......................................................... A. viridis

3 Leaves opposite; corolla lobes 6-10 mm long.

3 Corona 2-3 mm across; corolla lobes pale green, 6-7 mm long; [of various provinces, primarily of the Piedmont] .............. A. viridis

3 Corona 5-9 mm across; corolla lobes yellowish green, 9-10 mm long; [strictly of the Coastal Plain, of NC and SC, and southward].

4 Hoods ca. 6 mm long, about 2× as long as the anther heads; stem and leaves densely tomentulose ...................... A. obovata

4 Hoods ca. 4 mm long, scarcely exceeding the anther heads; stem and leaves softly puberulent ...................... A. tomentosa

1 Corolla pink, purple, or white.

5 Hoods about as long as the anther heads; hoods 1.5-2× as long as the hood, exerted well beyond the hood.

6 Hood opening truncate, the hood therefore beaker-shaped; corolla lobes 8-12 mm long; [primarily of mesic forests of the Mountains] .... A. exaltata

6 Hood opening very oblique, the hood therefore scoop-shaped; corolla lobes 2.5-6 mm long; [primarily of wetlands of various provinces].

7 Plants 3-5 dm tall; corolla lobes usually white (rarely slightly pink); leaves glabrous beneath; [of the Coastal Plain of SC] .............. A. perennis

7 Plants 5-15 dm tall; corolla lobes rose to purple (rarely white); leaves pubescent to glabrate beneath; [collectively widespread].
Oxypteryx curtissii (A. Gray) Small – S [not yet keyed]

- Slightly persistent. Kartesz (1999) reports it for TN. [= K, WH, Z] [not yet keyed]

- And s. ON west to MN and IA, south to n. GA, n. AL (Schotz 2009). e. and c. TN (Chester, Wofford, & Kral 1997), KY, and IL.

Asclepias curtissii

**Asclepias feayi** Chapman ex A. Gray, Feay’s Milkweed. Sandhills, scrubby pine flatwoods. Endemic to FL, from Clay County south to s. peninsular FL. [= K, WH, Z; = Asclepiodella feayi (Chapman ex A. Gray) Small – S] {not yet keyed}

**Asclepias hirtella** (Pennell) Woodson, Barrens Milkweed. Limestone glades, prairies. MI, WI, and MN south to w. WV (Mason County), KY, e. TN (Bradley County) (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), AR, w. LA, and e. TX. This species of midwestern prairies and barrens that closely resembles *A. longifolia*. The two taxa have sometimes been treated as distinct only at the rank of subspecies (see synonymy) or as “very distinct varieties” (Turner 2009). [= C, F, K, Z; = Acerates hirtella Pennell – S; = Asclepias longifolia Michaux ssp. hirtella (Pennell) J. Farmer & C.R. Bell – X; = Asclepias longifolia var. hirtella (Pennell) B.L. Turner – Y]

**Asclepias humistrata** Walter, Fleshy Milkweed. Sandhills. May-June; June-July. E. NC south to s. FL, west to e. LA. [= RAB, K, S, WH, Z]

**Asclepias incarnata** Linnaeus var. incarnata, Western Swamp Milkweed. Swamps, marshes, especially over limestone or calcareous shale. July-September; August-October. ME and s. QC west to MB, south to VA, s. TN (Chester, Wofford, & Kral 1997), AR, TX, and CO; disjunct from n. FL south to s. FL; disjunct in TX, NM, and UT. The distribution is peculiar. [= C, F, G, GW; = Asclepias incarnata ssp. incarnata – RAB, K, W, Z; = Asclepias incarnata – S; < Asclepias incarnata – WH]

**Asclepias lanceolata** Walter, Few-flower Milkweed. Swamps, fresh to slightly brackish marshes, wet pine savannas. June-August; August-September. NJ south to s. FL, west to e. TX. [= RAB, C, GW, K, S, WH, Z; > Asclepias lanceolata var. lanceolata – F, G; > Asclepias lanceolata var. paupercula (Michaux) Fernald – F, G]

**Asclepias longifolia** Michaux, Longleaf Milkweed, Savanna Milkweed. Wet pine savannas. May-June; June-July. DE (formerly) south to s. FL, west to e. TX. *A. longifolia* and *A. hirtella* are closely related; the two taxa have sometimes been treated as distinct only at the rank of subspecies (see synonymy) or as “very distinct varieties” (Turner 2009). [= RAB, C, F, GW, K, WH, Z; = Acerates longifolia (Michaux) Elliott – G; ? Acerates floridana (Lamarck) A.S. Hitchcock – S; = Asclepias longifolia var. longifolia – Y; = Asclepias longifolia ssp. longifolia – X]

**Asclepias michauxii** Decaisne, Michaux's Milkweed. Pine savannas. May. S. SC south to peninsular FL, west to e. LA. [= RAB, K, S, WH, Z]

**Asclepias obovata** Elliott, Pineland Milkweed. Sandhills. June-September. Se. SC south to Panhandle FL, west to AR and TX. [= RAB, K, S, WH, Z]

**Asclepias pedicellata** Walter, Stalked Milkweed, Savanna Milkweed. Dry pine savannas. July-August. Se. NC south to s. FL and Panhandle FL. This species generally occurs in small populations of widely scattered individuals; populations of more than 50 individuals are rare. [= RAB, GW, K, WH, Z; = Podostigma pedicellata (Walter) Vail – S]

**Asclepias perennis** Walter, Smoothseed Milkweed, Swampforest Milkweed. Swamp forests. June-August; August-September. E. SC south to c. peninsular FL, west to e. TX, north in the interior to s. IN and s. IL. [= RAB, C, F, GW, K, S, WH, Z] [Asclepias perennis (Michaux) Elliott – G; ? Acerates floridana (Lamarck) A.S. Hitchcock – S; = Asclepias longifolia var. longifolia – Y; = Asclepias longifolia ssp. longifolia – X]

**Asclepias rubra** Linnaeus, Purple Milkweed. Openings in moist bottomlands and swamp forests, perhaps mostly on soils derived from mafic or calcareous rocks. June. NH and s. ON west to WI, IA, and KS, south to NC, nw. TN (Chester, Wofford, & Kral 1997), KY, AR, and OK. [= RAB, C, F, G, K, S, WH, Z]

**Asclepias quadrijolia** Jacquin, Fourleaf Milkweed. Moist to dryish forests and forest margins, most common on mafic and calcareous substrates; common (rare in DE). May-June; August-September. NH and NY west to IN, south to NC, n. GA, n. AL, and e. TN; also from w. IL west to MO, south to AR and OK. [= RAB, C, F, G, K, S, WH, Z]

**Asclepias rubra** Linnaeus, Purple Savanna Milkweed, “Red Milkweed.” Pocosin ecotones, wet pine savannas, sandhill seeps, seepage swamps. June-July; September. Se. NY (Long Island), se. PA, and NJ south to wc. GA and w. Panhandle FL, west to e. TX. *A. laurifolia* is alleged to differ in sessile, cordate-clasping leaf bases (vs. petioled and rounded), and other
Asclepias syriaca Linnaeus, Common Milkweed. Pastures, roadsidess, disturbed areas. June-August; July-September. NB and ME west to s. MB and ND, south to SC, GA, c. TN (Chester, Wofford, & Kral 1997), AR, OK, and KS. This species is apparently expanding its range southward; see Wyatt et al. (1993) and Wyatt (1996) for discussion. [= RAB, C, K, S, W, Z; > Asclepias syriaca var. syriaca – F, G]

Asclepias viridis Walter, Green Antelope-horn. Prairies, dry woodlands, calcareous hammocks. S. SC south to s. FL, west to TX; and from OH, w. WV, and KY west to NE, south to se. TN, c. TN (Chester, Wofford, & Kral 1997), nw. GA, c. AL, c. MS, AR, TX, and OK. [= K, WH, Z; = Asclepiadorea viridis (Walter) A. Gray – S]

Catharanthus G. Don 1836 (Rosy-periwinkle)

A genus of about 8 species, herbs, 7 endemic to Madagascar and 1 endemic to India. References: van Bergen (1996)=Z; Snoeijer (1996). *

* Catharanthus roseus (Linnaeus) G. Don, Rosy-periwinkle, Madagascar Periwinkle, Cayenne Jasmine. Disturbed areas, persistent after cultivation or as a waif or "throwout" after cultivation; native of Madagascar, now a pantropical weed. May-October. C. roseus is the source of a powerful anti-leukemia drug. [= K, S, WH, Z; = Vinca rosea Linnaeus – RAB]
**Cynanchum** Linnaeus 1753 (Swallow-wort)

A genus of about 400 species, vines and lianas, primarily of tropical and warm temperate portions of the New World and Old World. *Ampelamus* was retained as a genus by Liede (1997a), but later results suggest that it is not distinct from some other portions of *Cynanchum* (Liede & Tauber 2002). However, *Cynanchum* itself is strongly polyphyletic and will be broken up; further taxonomic and nomenclatural changes are likely. *C. laeve* will probably remain in *Cynanchum* s.s. (which is primarily Old World in distribution), while *C. scoparium* will likely shift to *Orthosia*. References: Liede (1997b); Liede & Meve (1997); Liede (1997a); Krings (2001)=Z; Liede & Tauber (2002).

1. Leaves oblong or ovate.
2. Leaves broadly cordate, deeply cordate at base; corona of 5 erect, petaloid segments, each divided into 2 slender lobes...............*C. laeve*
3. Leaves oblong or obovate, rounded or subcordate at base; corona a fleshy, lobed cup ..................*C. louiseae*

1. Leaves linear.
2. Calyx lobes lanceolate, acute, (1.3-) 1.5-2.5 mm long; leaves sessile, reflexed, persistent; follicle 6-7 mm in diameter; [of se. NC and south]..........................[see *Seutera angustifolia]*
3. Calyx lobes deltoid, obtuse, ca. 1 mm long; leaves petiolate, not reflexed, often caducous; follicle 1-3 mm in diameter; [of se. SC and south]..........................*C. scoparium*

* Cynanchum louiseae Teijsm. & Binn. Black Swallow-wort. Disturbed areas; native of Mediterranean Europe. Reported for many states in ne. United States, south to MD, KY, TN. [= K; = *Vincetoxicum nigrum* (Linnaeus) Moench – C; = *Cynanchum nigrum* (Linnaeus) Persoon – F, G]

**Cynanchum scoparium** Nuttall, Leafless Swallow-wort. Coastal hammocks. Se. SC south to s. FL, west to s. MS. Liede (1997b) indicates that this species will likely be transferred to *Orthosia* DeCandolle in de Candolle, a large group primarily of the Caribbean, Central America and n. South America, but she refrain from the new combination pending further studies. [= RAB, K, WH; = *Amphistelma scoparia* (Nuttall) Small – S; *Orthosia sp.*]

**Gonolobus** Michaux 1803 (Anglepod)

1. Upper surface of corolla lobes uniformly colored, olive green on anthesis, glabrous; laminar dorsal anther appendage yellow, apex rounded or truncate; [of c. KY, e. TN, nw. AL westward] ..........................................................*[G. suberosus var. granulatus]*
2. Upper surface of corolla lobes multi-colored, generally dark maroon to brownish near the base and green to yellowish near the tips on anthesis (or uniformly yellowish-green to neon green in rare mutants), pubescent or glabrous; laminar dorsal anther appendage darkly purplish or maroonish tinted, apex bilobed to emarginate; [of se. VA south to c. peninsular FL, west to s. MS and inland to nw. GA] ...............

**Gonolobus suberosus** (Linnaeus) R. Brown var. *suberosus*, Eastern Anglepod. Mesic to wet forests and thickets. June-August; September-November. Se. VA south to s. peninsular FL, west to s. MS, inland to nw. GA and c. KY. Rosatti (1989) and Drapalik (1969) have expressed considerable doubt about whether two species should be recognized; their view, supporting the recognition of a single species in our area, is followed here for now. However, studies by Krings & Xiang (2004, 2005) suggest that 2 entities should be circumscribed at the varietal level. Drapalik (1969) considered the basionym "suberosa" as not applicable to *Matelea* of North America; Reveal & Barrie (1992) lectotypified the name, resulting in it applying to our material. It has priority over "gonocarpus." [= U, V; > *Matelea gonocarpa* (Walter) Shinners – RAB, C, W; > *Matelea suberosa* (Linnaeus) Shinners – RAB, C, W; > *Gonolobus gonocarpus* (Walter) Perry – F, G; > *Gonolobus suberosus* (Linnaeus) R. Brown – F, Y; < *Matelea gonocarpos* (Walter) Shinners – K, WH; < *Vincetoxicum gonocarpos* Walter – S; > *Vincetoxicum suberosum* (Linnaeus) Britton – S; = *Matelea gonocarpa* – X; = *Gonolobus gonocarpus* – Z]

**Ampelamus** – S; > *Vincetoxicum suberosum* (Linnaeus) Britton – S; = *Matelea gonocarpa* – X; = *Gonolobus gonocarpus* – Z]
Matelea Aublet 1775 (Spinypod)

A genus of about 180 species, vines, primarily tropical and restricted to the New World. References: Drapalik (1969)=Z.

1 Plant a prostrate herb, usually not twining, with stems 0.2-0.6 (-1.1) m long at maturity; leaf blades 2-4 (-6) cm long; cymes sessile; flowers (2-) 3-4 (-5) per inflorescence; upper (inner) surface of the petals pubescent; [of xeric sandhills, from e. GA southward] .................. M. pubiflora

2 Inflorescence with 1-12 flowers, averaging 4-5; corolla light green, reticulated with darker green; corona disc-shaped, lacking 5 pairs of appendages; [of mesic slopes of s. GA southward and westward] .................................................................................. M. alabamensis

3 [collectively widespread].

4 Corolla lobes in a horizontal plane or slightly reflexed; flower buds ovoid, < 1.5× as long as wide; corolla lobes 1.5-2.6× as long as wide.

5 Corolla dark maroon (rarely maroon-yellow or yellow), not reticulated with darker veins; paired corona appendages always higher than the alternating corona lobes .................................................. M. carolinensis

6 Corolla green, green-yellow, or yellow (rarely rosy or olive-maroon), reticulated with darker green veins; paired corona appendages about as high as the alternating corona lobes .................................................................................. M. floridana

7 Corolla lobes 2.4-3.6 (-4.0)× as long as wide, the widest part above the sinus; corolla dark maroon.......................... M. decipiens

8 Corolla lobes (3.2-) 4.0-6.2× as long as wide, the widest part at the sinus; corolla rose to light maroon (rarely dark maroon, green, or cream) ................................................................................................................. M. obliqua

Matelea baldwyniana (Sweet) Woodson, White Spinypod. Dry to mesic bluffs over calcareous rocks. Panhandle FL and sw. GA west to MO, AR, and OK. Drapalik (1969) discusses the probability that the name M. baldwyniana is based on material of M. floridana. [= K, WH, Z; = Odontostephana baldwyniana (Sweet) Alexander – S]

Matelea carolinensis (Jacquin) Woodson, Carolina Spinypod. Moist to dry, nutrient-rich forests. April-June; July-October. DE, MD, KY, and s. MO south to GA and MS. [= RAB, C, K, W; = Gonolobus carolinensis (Jacquin) R. Brown ex J.A. Schultes – F, G; = Odontostephana carolinensis (Jacquin) Alexander – S]

Matelea decipiens (Alexander) Woodson, Deceptive Spinypod. Woodlands and thickets, generally over mafic (in the Piedmont) or calcareous rocks (in the Coastal Plain). April-June; August-October. VA south to nc. GA, AL, and e. TX, north in the interior to s. IL and MO. [= RAB, C, K; = Gonolobus decipiens (Alexander) Perry – F, G; = Odontostephana decipiens Alexander – S]

Matelea flavidula (Chapman) Woodson, Yellow Spinypod. Moist, nutrient-rich forests. May-June; August-October. E. NC (?) and e. SC south to Panhandle FL, apparently rare throughout its range. [= RAB, K, WH, Z; = Odontostephana flavidula (Chapman) Alexander – S]

Matelea obliqua (Jacquin) Woodson, Northern Spinypod, Limeroak Milkvine. In forests, woodlands, or thickets over calcareous rocks. June-July; August-November. PA west to OH, IN, and MO, south to w. NC, nw. GA (Jones & Coile 1988), and TN. [= RAB, C, K, W; = Gonolobus obliquus (Jacquin) R. Brown ex J.A. Schultes – G; > G. obliquus – F; > G. shortii A. Gray – F; > Odontostephana obliqua (Jacquin) Alexander – S; > O. shortii (A. Gray) Alexander – S; = Matelea carolinensis – WV, misapplied]

Nerium Linnaeus 1753 (Oleander)
A monotypic genus, a shrub, of Mediterranean Europe.

* **Nerium oleander** Linnaeus, Oleander. Frequently cultivated, especially on barrier islands (because of its salt resistance), sometimes persistent; native of Mediterranean Europe. [= K, S, WH]

**Periploca** Linnaeus 1753 (Silkvine)

* **Periploca graeca** Linnaeus, Silkvine. Disturbed areas; native of Mediterranean Europe. July-August. Sometimes cultivated and escaped or persistent; it is reported for various states in e. North America, as in Knox County, TN (Chester, Wofford, & Kral 1997). [= RAB, C, K]

**Seutera** Reichenbach 1828 (Swallow-wort)

* **Seutera angustifolia** (Persoon) Fishbein & W.D. Stevens, Swallow-wort. Coastal hammocks, edges of marshes, generally or always on barrier islands. June-July; July-October. E. NC (Dare County) south to s. FL, west to TX; Bahamas and West Indies. See Krings (2005) for a discussion of typification. [= Y; = Cynanchum angustifolium Persoon – GW, K, WH; = C. palustre (Pursh) Heller – RAB; = Lyonia palustris (Pursh) Small – S; = Funastrum angustifolium (Persoon) Liede & Meve – Z]

**Trachelospermum** Lemaire 1851 (Climbing Dogbane)

A genus of about 20 species, vines, of se. Asia (India to Japan), except the single species of se. United States.

**Identification notes:** Trachelospermum difforme is sometimes mistaken at a glance for Gelsemium (both woody vines with opposite lanceolate leaves), but in the field the milky sap of Trachelospermum provides an immediate identifying characteristic.

1 Corolla lobes 3-4 mm long, acute, reflexed, pale yellow; leaves subcoriaceous; [native, common] .................................................... T. difforme
1 Corolla lobes 8-12 mm long, rounded, spreading, white; leaves coriaceous; [alien, commonly planted, rarely persistent or spreading] ............ T. jasminoides

**Trachelospermum difforme** (Walter) A. Gray, Climbing Dogbane. Bottomlands, swamp forests, marshes. May-July; July-September. DE south to n. peninsular FL, west to e. TX, north in the interior to MO and IN. See Krings (2003) for a discussion of nomenclature. [= RAB, C, F, G, GW, K, S, WH]

* **Trachelospermum jasminoides** (Lindley) Lemaire, Confederate Jasmine, Star Jasmine. Disturbed areas; native of se. Asia. April-May. Cultivated and sometimes persistent or spreading. Also reported for e. LA and to be expected along the Gulf coast in AL and MS. [= K, WH]

**Vinca** Linnaeus 1753 (Vinca, Periwinkle)

1 Leaves ovate, broadest near the base, cordate or subcordate-rounded at the base, 2-4 cm wide, thin in texture and deciduous to semi-evergreen; leaf margins ciliate; flowers 3-5 cm across.............................................................. V. major
1 Leaves lanceolate or elliptic, broadest near the middle, rounded to cuneate at the base, 1-1.5 cm wide, thick in texture and evergreen; leaf margins not ciliate; flowers 2-3 cm across.............................................................. V. minor

* **Vinca major** Linnaeus, Greater Periwinkle. Disturbed areas, suburban woodlands, around old house sites, persistent and spreading from cultivation; native of Europe. Late February-May; June-July. [= RAB, C, F, G, K, S, W]
APOCYNACEAE

* Vinca minor * Linnaeus, Common Periwinkle, Myrtle. Disturbed areas, around old house sites and especially old cemeteries, persistent and spreading from cultivation; native of Europe. April-May; June-July. [= RAB, C, F, G, K, S, W, WH, WV]

356. BORAGINACEAE A.L. de Jussieu 1789 (Borage Family) [order assignment uncertain]

A family of about 155 genera and ca. 3200 species, herbs, shrubs, and trees, nearly cosmopolitan (Al-Shehbaz 1991).

1 Leaves dissected, lobed, or toothed (sometimes the basalmost leaves simple); style fused for a portion of its length, 2-cleft toward the tip; ovary with 1 locule; [subfamily Hydrophilioideae].
2 Flowers solitary opposite the leaves on the upper portion of the stem (sometimes also terminal in a lax, (1-) 2-6-flowered cyme).
3 Flowers opposite below, alternate above; petals 5-8 mm long; leaves elliptical in outline, pinnatifid into 7-13 lanceolate segments; calyx lobes to 10 mm long in fruit; capsule 4-seeded ............................................................................................ 16. Ellisia
4 Flowers all terminal in 3-many-flowered cymes.
5 Styles absent (the stigma sessile and terminal), single, or with 2 branches.
6 Flowers in axillary cymes; capsule subglobose; leaves 2-12 cm long ................................................... 17. Nemophila
7 Ovary deeply 4-parted; style gynobasic; [subfamily Boragineae]
8 Ovary slightly 2-4-lobed, or not at all lobed; style terminal or reduced to a sessile terminal stigma; [subfamily Heliotropioideae]......
9 Mericarps spreading or divergent, attached to the gynobase on the upper third of the mericarp; [tribe Cynoglossae]..................
10 Fruiting pedicels deflexed; plant perennial or biennial .................................................................................. 2. Hackelia
11 Corolla pink to blue (rarely white), 18-25 mm long; leaves elliptic or ovate; [plant a native, of moist, nutrient-rich habitats, and sometimes grown as an ornamental] ............................................................................................ 6. Borago
12 Corolla lobes distinctly unequal, pink to blue.
13 Stamens unequal in length, the longer conspicuously exserted ........................................................................... 8. Echium
14 Plant a scrambling climber with retrorsely prickly-hispid stems ........................................................................ 20. Asperugo
15 Corolla yellow, the tube 4-5 mm long; corolla throat lacking appendages............................................................. 4. Amsinckia
16 Corolla white (with a yellow eye), or pink to blue, the tube 6-20 mm long; corolla throat with appendages.
17 Corolla pink to blue (rarely white), 18-25 mm long; leaves elliptic or ovate; [plant a native, of moist, nutrient-rich habitats, and sometimes grown as an ornamental] ........................................................................... 10. Mertensia
18 Corolla white with a yellow eye; leaves linear; [plant a rare alien, of disturbed habitats] .................. 13. Plagiobothrys
19 Mericarps smooth, rugose, or pitted, lacking glocidiate prickles.
20 Mericarps attached laterally to a flat or broadly convex gynobase.
21 Mericarps compressed laterally, with an evident raised margin .............................................................. 11. Myosotis
22 Mericarps neither laterally compressed nor with an evident thickened margin.
23 Mericarps with a prominent, toothed, basal rim ................................................................. 14. Symphytum
24 Mericarps lacking a prominent, toothed, basal rim.
25 Corolla lobes erect or slightly spreading, acute to acuminate; style exerted.......................... 12. Onosmodium
26 Corolla lobes spreading, rounded; style included.
BORAGINACEAE

21 Corolla whitish or bluish white; plant annual from a slender taproot; leaves without evident lateral veins; 
mericarps brown, dull, wrinkled and pitted; [plant a weedy alien] ................................. 7. Buglossoides
21 Corolla bright yellow-orange, or greenish-white; plant perennial from a thickened, woody rhizome; 
mericarps white, shining, smooth or pitted; [plant a native] .............................................. 9. Lithospermum

1. Cynoglossum Linnaeus (Comfrey)

1 Flowering stem with leaves above the first inflorescence branch; corolla reddish-purple; [plant a biennial alien, weedy] .......... C. officinale
1 Flowering stem leafless above the first branch; corolla blue or white; [plant a perennial native, not weedy] 
2 Nutlets 3.5-5 mm; calyx at anthesis 2-2.5 mm long; corolla 6-8 mm wide, the lobes oblong and not overlapping ........................ [C. virginianum var. boreale]
2 Nutlets 5.5-9 mm; calyx at anthesis (3.0-) 3.5-4.5 mm long; corolla (8-) 10-12 mm wide, the lobes broadly rounded and more or less 

* Cynoglossum officinale Linnaeus, Garden Comfrey, Hound's-tongue. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE): disturbed areas, roadsides, pastures, calcareous shale barrens; common (uncommon in DE and WV, rare in NC), native of 

Cynoglossum virginianum Linnaeus var. boreale (Fernald) Cooperrider, Northern Hound's-tongue, ranges from NB west to BC, south to 
CT, NY, c. PA, n. OH, MI, and MN. Cooperrider (1995) prefers varietal status for this taxon, stating that in OH there are numerous 
intermediates, while Voss (1996) and Rhoads & Klein (1993) maintain C. boreale at the species level. [= C, K; = C. boreale – F, G, Z; = C. virginianum ssp. boreale (Fernald) A. Haines – Y]

2. Hackelia Opiz (Stickseed)

3. Lappula Moench (Sheepbur)

1 Nutlets with 1 row of marginal prickles...................................................................... L. occidentalis var. occidentalis
1 Nutlets with 2-3 rows of marginal prickles....................................................... L. squarrosa

* Lappula occidentalis (S. Watson) Greene var. occidentalis. Cp (SC): waste areas near wool-combing mill; rare, perhaps 
only a waif, native of w. North America. April-June. [= K; = L. redowskii var. redowskii – C, Z; = L. redowskii (Hornemann) Greene var. 
occidentalis (S. Watson) Rydberg – F, G] 
* Lappula squarrosa (Retzius) Dumortier. Mt (WV): disturbed areas; rare, native of Europe. May-September. Introduced 
south to MD, WV, KY, and TN. [= C, Z; = L. echinata Gilibert – F, G, WV; = L. lappula (Linnaeus) Karst. – S]

4. Amsinckia Lehmann (Fiddleneck)

* Amsinckia menziesii (Lehmann) A. Nelson & Macbride. Pd (NC), Cp (SC): disturbed areas, waste areas near wool-
combing mill; rare, native of w. United States. May-September. [= Z; <$> A. hispida (Ruiz & Pavón) I.M. Johnston – RAB, 
misidentification; <$> A. menziesii var. menziesii – K; <$> A. parviflora Heller – S, misidentification; <$> Amsinckia lycopsoides Lehmann, 
misidentification]

5. Anchusa Linnaeus (Bugloss, Alkanet)
**BORAGINACEAE**

* Anchusa arvensis (Linnaeus) M. Bieberstein, Small Bugloss, Alkanet. Pd (NC, VA), Mt (WV): disturbed areas, rare, native of Europe. [= C, K; = Lycoptis arvensis Linnaeus – F, G, S]

6. *Borago* Linnaeus (Borage)

* Borago officinalis Linnaeus, Borage. Pd (VA), Mt (WV): disturbed areas; rare, native of s. Europe. [= C, F, G, K, Z]

7. *Buglossoides* Moench (Corn-gromwell)

A genus of about 7 species, herbs or shrubs, of temperate Eurasia. References: Al-Shehbaz (1991) = Z.

8. *Echium* Linnaeus (Viper's-bugloss, Blueweed)

A genus of about 60 species, herbs, widespread in the Old World. The common name is pronounced "bew-gloss," not "bug-loss," as it refers to an ox's tongue rather than to the departure of insects. References: Al-Shehbaz (1991) = Z.

1 Hairs of the stem pstural-based ........................................................................................................................................................ [E. pustulatum]
1 Hairs of the stem not pstural-based ............................................................................................................................................. E. vulgare

* Echium pustulatum* Sibthorp & Smith, Blue-devil, is reported by F for "N.J. to W.Va.," and by G and K as south to VA. It differs in having pustular-based hairs on the foliage. [= K; = E. vulgare var. pustulatum (Sibthorp & Smith) Coincy – F, G, < E. vulgare – Z]

9. *Lithospermum* Linnaeus (Gromwell, Puccoon, Stoneseed)

1 Corolla white or yellowish-white, the tube 4-8 mm long.
2 Plant with basal rosette; lower cauline leaves about equal in size to the upper cauline leaves; leaves acute to obtuse ................. *L. tuberosum*
2 Plant lacking basal rosette; lower cauline leaves smaller than the upper cauline leaves; leaves acuminate or acute.
3 Upper stem internodes mostly 1-2 cm long; leaves mostly <2 cm wide, acute ........................................................................... [L. officinale]
3 Upper stem internodes mostly 3-6 cm long; leaves mostly >2 cm wide, acuminate ................................................................. [L. incisum]
1 Corolla tube 7-30 mm long; [mostly of rocky or clayey circumneutral soils of the Piedmont and Mountains] ......................... [L. canescens]
6 Pubescence with slender bases; mature lobes flat; plants with 15-25 well-developed leaves below the inflorescence; [of sandy Coastal Plain habitats from se. VA southward] .............................................................. *L. carolinense*
6 Pubescence with pustular bases; mature lobes strongly keeled; plants with (30-) 35-45 well-developed leaves below the inflorescence; [inland, known from west and north of our area] ................................................................. [L. crocium]

*Lithospermum canescens* (Michaux) Lehmann, Hoary Puccoon, Indian-paint. Pd (NC, SC, VA), Mt (GA, VA, WV), Cp? (VA): dry woodlands and glades over calcareous rocks (such as limestone, dolostone), mafic rocks (such as diabase); uncommon (rare in NC). April-May. ON west to SK, south to c. NC, nw. GA, AL, and TX. [= RAB, C, F, G, K, W, WV, Y, Z; = Batschia canescens Michaux – S]

*Lithospermum carolinense* (Walter ex J.F. Gmelin) MacMillan, Coastal Plain Puccoon. Cp (FL, GA, SC, VA): sandhills, dry sandy soils; common (rare north of s. SC). April-June. A Southeastern Coastal Plain endemic: se. SC south to Panhandle FL, and west to TX. The disjunction from SC to se. VA, skipping over large amounts of apparently suitable sandhill habitat in
BORAGINACEAE

NC, is surprising. The sibling taxa *L. caroliniense* and *L. croceum* have been variously treated as distinct species, subspecies, or varieties, or as mere forms (see synonymy). They appear to be as clearly separable as *L. caroliniense* is from *L. canescens*; I regard them as allopatic species. [= F; < *L. caroliniense* – RAB, G, WH, Z; = *L. caroliniense var. caroliniense* – C, K; = *Batschia caroliniensis* Walter ex J.F. Gmelin – S; = *L. caroliniense ssp. caroliniense* – Y]

**Lithospermum incisum** Lehmann, Narrowleaf Gromwell. Cp (FL): disturbed areas; rare. April-July. S. ON west to BC, south to IN, LA, TX, and CA; disjunct from FL Panhandle south to c. peninsular FL. [= F, C, G, K, WH; = *Batschia linearifolia* (Goldie) Small – S]

**Lithospermum croceum** Fernald. ON west to MT, south to w. PA, n. OH, AR, OK, and CO. Reports by Kartesz (1999) for WV, KY, and TN have not been verified. [= F; = *L. caroliniense* (Walter ex J.F. Gmelin) MacMillan var. croceum (Fernald) Cronquist – C, K; < *L. caroliniense* – G, Z; = *L. caroliniense ssp. croceum* A.W. Cusick – Y]

10. Mertensia Roth (Bluebell)

11. *Myosotis* Linnaeus (Forget-me-not, Scorpion-grass)

A genus of about 100 species, temperate and montane tropical. References: Al-Shehbaz (1991)=Z. Key based closely on RAB and C.

1 Calyx strigose, the hairs neither spreading nor uncinate; [mostly of moist to wet habitats].
2 Corolla limb 2-5 mm wide; mericarps distinctly surpassing the style................................................................. *M. laxa* ssp. laxa
2 Corolla limb 5-10 mm wide; mericarps not surpassing the style................................................................................................................. *M. scorpionoides*
1 Calyx with some loose or spreading, uncinate hairs; [of various habitats, mostly dry].
3 Corolla limb 5-8 mm wide; perennial................................................................. *M. sylvatica*
3 Corolla limb 1-4 mm wide; annual or biennial.
4 Calyx lobes unequal, 3 lobes shorter than the other 2; corolla white; [native, of dry or moist habitats].
5 Fruiting pedicels divergent; fruiting calyx deciduous, 3-10 mm long; inflorescence internodes usually longer than 10 mm; mericarps 1.4-2.2 mm long .................................................................................................................................................................................. *M. macrocarpa*
5 Fruiting pedicels more-or-less erect; fruiting calyx persistent, 3-5.5 mm long; inflorescence internodes usually shorter than 10 mm; mericarps 1.2-1.5 mm long .................................................................................................................................................................................. *M. verna*
4 Calyx lobes equal, all 5 the same size; corolla blue (occasionally yellow or white); [alien, mostly of dry disturbed habitats].
6 Fruiting pedicels equalizing or generally longer than the calyx .......................................................................................................................................................... *M. arvensis*
6 Fruiting pedicels distinctly shorter than the calyx.
7 Plants floriferous from about the middle upward; style surpassing the mericarps ................................................................................................................. *M. discolor*
7 Plants floriferous nearly to the base; style shorter than the mericarps ................................................................................................................. *M. stricta*

**Myosotis macrocarpa** Engelmann, Bigseed Forget-me-not. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), [DE]: bottomland forests and alluvial fields, probably associated with nutrient-rich soils; uncommon. April-May. MD west to MO, south to FL and TX. [= RAB, C, F, G, GW, K, S, W, WV, Z]
12. *Onosmodium* Linnaeus (Marbleseed, False-gromwell)

A genus of about 7 species (or fewer species and the same number of taxa in some interpretations), perennial herbs, of North America. Recent studies strongly suggest that *Onosmodium* is better included in a broadened *Lithospermum* (Cohen & Davis 2009; Weigend et al. 2009). References: Cohen & Davis (2009); Cochrane (1976)=X; Turner (1995a)=Y; Al-Shehbaz (1991)=Z. Key based in part on X and Y.

1. Corolla lobes yellow to orange; nutlet 2.0-2.8 mm long; corolla lobes either 2.5-4× as long as wide and acuminate (*O. virginianum*) or 1.5-2× as long as wide, acute (*O. decipiens*).
   - Stems hairs 2.5-5.0 mm long; corolla lobes 1.5-2× as long as wide, acute; tips of the anthers reaching the base of the corolla sinuses; endemic to Ketona dolomite glades, Bibb County, c. AL.
   - Stems persistently and obviously pubescent below the inflorescence branches.
   - Upper leaf surface with hairs of similar length, these appressed to ascending; corolla 11-20 mm long; nutlets tapered to the base, longest stem hairs near midstem > 2.3 mm long.
   - Leaf vestiture at least in part of spreading or ascending hairs.

2. Upper leaf surface with hairs of two lengths, these spreading; corolla 6-10 mm long; nutlets flared at the base, forming a collar; longest stem hairs near midstem > 2.3 mm long.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).  
   - Stems mostly glabrous below the inflorescence branches.
   - Leaf at least in part of spreading or ascending hairs.

3. Leaf at least in part of spreading or ascending hairs.
   - Neutral soils derived from mafic rocks (Piedmont).
   - Stems lacking a collar; longest stem hairs near midstem < 2.2 mm long.
   - Stems persistently and obviously pubescent below the inflorescence branches.

4. Corolla lobes dull greenish-white; nutlet 2.5-3.0 mm long; corolla lobes 1.5-2× as long as wide, acute.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).
   - Corolla 11-20 mm long; nutlets tapered to the base, longest stem hairs near midstem < 2.2 mm long.

5. Corolla lobes 1.5-2× as long as wide, acute.
   - Leaf at least in part of spreading or ascending hairs.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

6. Corolla lobes 1.5-2× as long as wide, acute.
   - Leaf at least in part of spreading or ascending hairs.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

7. Corolla lobes 1.5-2× as long as wide, acute.
   - Leaf at least in part of spreading or ascending hairs.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

8. Corolla lobes 1.5-2× as long as wide, acute.
   - Leaf at least in part of spreading or ascending hairs.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

9. Corolla lobes 1.5-2× as long as wide, acute.
   - Leaf at least in part of spreading or ascending hairs.
   - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

10. Corolla lobes 1.5-2× as long as wide, acute.
    - Leaf at least in part of spreading or ascending hairs.
    - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

11. Corolla lobes 1.5-2× as long as wide, acute.
    - Leaf at least in part of spreading or ascending hairs.
    - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

12. Corolla lobes 1.5-2× as long as wide, acute.
    - Leaf at least in part of spreading or ascending hairs.
    - Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).

---

13. **Plagiobothrys** Fischer & C.A. Meyer (Popcorn-flower)

14. **Symphytum** Linnaeus (Comfrey)

1 Upper leaves not decurrent, or decurrent < 1 cm below the leaf attachment; pubescence of stem in part of strong, recurved prickles (resembling miniature rose thorns) .................................................................[S. asperum]

1 Upper leaves decurrent on the stem; pubescence of the stem not of prickles .................................................................S. officinale

*Symphytum officinale* Linnaeus, Common Comfrey. Mt (GA, VA, WV), Pd (DE, VA), Cp (DE): disturbed areas; uncommon, native of Europe. *Symphytum* is a traditional "medicinal herb," but recent evidence suggests that it can cause dangerous (even fatal) liver damage. [= C, F, G, K, S, WV, Z]

*Symphytum asperum* Lepechin, Prickly Comfrey, another Eurasian species, is reported by F as occurring south to MD. It may occur in our area. [= C, F, G, K, Z]

15. **Nama** Linnaeus 1753 (Fiddleleaf)

A genus of about 45 species, herbs, of sw. North America, tropical America, and Hawaii. [also see *Hydrolea* in HYDROLEACEAE]

*Nama jamaicense* Linnaeus, Jamaica Weed. Cp (FL, SC): lawns; rare, native of tropical America (including s. FL and TX). May. [= K; = N. jamaicensis – RAB, WH, orthographic variant; = Marilaunidium jamaicense (Linnaeus) Kuntze – S]

16. **Ellisia** Linnaeus 1763 (Waterpod)

*Ellisia* is considered to be a monotypic genus, an herb of c. and e. North America, but generic limits in the Hydrophyllaceae are badly in need of critical reassessment. References: Constance (1940)=Z.

**Ellisia nyctelea** (Linnaeus) Linnaeus, Waterpod, Aunt Lucy. Pd (VA), Mt (VA, WV): moist shaded forests, especially bottomlands; uncommon (rare in WV). April-July. IN and MI west to AR, south to AR and OK; disjunct in e. North America from s. NY and NJ south to sc. VA. Likely to occur in nc. NC. [= C, F, G, KW, K, W, WV, Z; = Nyctelea nyctelea (Linnaeus) Britton – S]

17. **Nemophila** Nuttall 1822 (Baby Blue-eyes)

**Identification notes**: *Nemophila* is superficially similar to *Phacelia covillei* and *P. ranunculacea*, with which it often co-occurs. They can be distinguished with the following key.

1 Flowers solitary, on pedicels opposite the leaves, the pedicels mostly > 12 mm long; corolla white (sometimes aging to pale lavender), 2.5-3.5 mm long; fruits ovoid, longer than thick, turning purple at maturity, exceeding the 2-4 mm long calyx lobes .............. *Nemophila aphylla*

1 Flowers borne in 2-6-flowered terminal cymes, the pedicels mostly < 12 mm long; corolla pale blue or lavender, 4-5 mm long; fruits depressed globose and weakly 4-lobed, the apex depressed, remaining green at maturity, shorter than the calyx, the lobes of which expand to 5-8 mm long.

2 Pubescence of the middle stem (from 2nd to 5th node from the base) consisting of appressed to ascending, stiff, pointed hairs, sometimes also with a few gland-tipped hairs < 2 mm long; terminal leaflet of leaves directly subtending an inflorescence with acute to cuneate bases; [of rivers in the Atlantic drainage, very rarely disjunct west of the Appalachians] .......................................................... *Phacelia covillei*

2 Pubescence of the middle stem spreading or even retrorse, most of the hairs weak and twisted, and many of them glandular-tipped and > 2 mm long; terminal leaflet of leaves directly subtending an inflorescence with obtuse to rounded or truncate bases; [of rivers in the Mississippi drainage] .............................................................................................................. *Phacelia ranunculacea*

*Nemophila aphylla* (Linnaeus) Brummitt. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): moist, nutrient-rich floodplain forests; uncommon, though often locally abundant (rare in FL). March-April. MD south to Panhandle FL and west to
BORAGINACEAE

TX, north in the interior to e. TN, w. KY, and se. MO. [= GW, K; = N. microcalyx (Nuttall) Fischer & Meyer – RAB, F, G, S; = N. triloba (Rafinesque) Thieret – C]

18. Hydrophyllum Linnaeus 1753 (Waterleaf)

A genus of 8 species, herbs, of e. and w. North America. References: Constance (1942)=Z; Beckmann (1979)=Y; Alexander (1941)=X.

1 Principal cauline leaves palmately lobed, maple-like, differing from the pinnately divided basal leaves.
2 Sepals with small reflexed appendages exerted at each sinus of the calyx; plant biennial from a taproot; stamens exerted 1-3 mm beyond the corolla; leaf lobing relatively shallow and irregular .......................................................... H. appendiculatum
3 Sepals with appendages absent or rudimentary; plant perennial from fibrous roots; stamens exerted 3-6 mm beyond the corolla; leaf lobing relatively deep and regular .......................................................... H. canadense
4 Corolla deep purple to maroon; lower stem glabrous to slightly (rarely moderately) pubescent with retrorse hairs; [of low to high elevations in the Mountains] .................................................................................................................................................. H. virginianum var. atranthum
5 Corolla white to lavender or pale purple; lower stem slightly to densely pubescent with retrorse to spreading hairs; [of low elevations of the Piedmont, Mountains, and Coastal Plain] ........................................................................................................................................ H. virginianum var. virginianum

Hydrophyllum appendiculatum Michaux, Biennial Waterleaf. Mt (WV): rich forests; rare. May-June. S. ON and MN, south to sw. PA, a. and sc. WV, e. TN, n. AL (Jackson Co.), MO, and e. KS. It was attributed to NC by Small (1933) on unknown grounds. [= C, F, G, K, WV, Y, Z; = Decemium appendiculatum (Michaux) Small – S]

Hydrophyllum canadense Linnaeus, Mapleleaf Waterleaf, Canada Waterleaf, Broadleaf Waterleaf. Mt (GA, NC, SC, VA, WV), Pd (NC, VA), Cp (VA): cove forests, rocky streambanks, other moist and nutrient-rich forests; common (rare in VA Coastal Plain, rare in NC Piedmont, rare in sc. NC Mountains). May-August; August-September. VT and s. ON west to MI and WI, south to n. GA, AL, AR, and MO. [= RAB, C, F, G, K, S, W, WV, Y, Z]

Hydrophyllum virginianum Linnaeus var. atranthum (E.J. Alexander) Constance, Appalachian Waterleaf. Mt (NC, VA): cove forests and other moist rocky forests; common (uncommon in WV). May-June; July-August. N. WV south through w. and sw. VA and e. KY to w. NC and e. TN. Since its naming as a species (Alexander 1941) and subsequent reduction to a variety (Constance 1942) there has been little consensus about this taxon, some regarding it as merely a color form. Alexander lists numerous characters additional to that of flower color; they need further investigation. "H. atranthum differs from H. virginianum in the dark-violet flowers, the brown hairs on the appendages, brown filaments, corolla-lobes longer than the tube, stamens shorter [11.5 mm] and more slender, and the more numerous leaf-lobes. H. virginianum has flowers white to pale lavender or pinkish, white hairs on the appendages, white filaments, corolla-lobes and tube equal in length, filaments longer (13.5 mm) and stouter, and 5-7 leaf-segments." Beckmann (1979) did not accept the variety, stating that "this pigment combination appears sporadically in other sectors of the species range." Based on herbarium material, I have seen darker than usual flowers that are found outside of the Southern Appalachians; they do not, however, approach in darkness the flowers of Southern Appalachians; they incline me to accept it provisionally as a variety. It is not, however, limited to high elevations, as stated or implied by some authors. The two varieties provisionally accepted here need more careful study, including either statistical studies of morphology, or electrophoretic or molecular studies. [= C, F, G, WV, Z; < H. virginianum – RAB, K, W, Y; < H. virginicum – S, orthographic error; = H. atranthum E.J. Alexander – X]

Hydrophyllum virginianum Linnaeus var. virginianum, Eastern Waterleaf, Virginia Waterleaf. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): cove forests, moist rocky forests, alluvial forests; common (rare in DE Coastal Plain). April-June; July-August. NH and QC west to ND, south to e. VA, c. NC, KY, s. IN, s. IL, nc. AR, and ne. OK. As discussed by Beckmann (1979) and Constance (1941), H. virginianum is a closely related vicariant of H. tenutipes Heller of BC south to CA. See Phacelia bipinnatifida for additional suggestions on distinguishing it from this species. [= C, F, G, WV, Z; < H. virginianum – RAB, K, W, Y; < H. virginicum – S, orthographic error; = H. virginianum – X]

19. Phacelia A.L. de Jussieu 1789 (Phacelia)

Identification notes: 1. Phacelia bipinnatifida and Hydrophyllum virginianum are sometimes confused. P. bipinnatifida has the larger and more basal leaves distinctly bipinnatifid, the lower pinnae often stalked (vs. pinnatifid, the basal or terminal pinnae sometimes 2-lobed, all the pinnae more or less sessile), pubescence of the upper stem and inflorescence in part glandular (pubescence nonglandular), and seeds 4 per capsule, black (vs. 2 per capsule, light brown). 2. Phacelia covillei and P. ranunculacea are superficially similar to and sometimes confused with Nemophila aphylla, which see for discussion.

1 Corolla lobes fimbriate; seeds 4 per capsule.
2 Corolla white (rarely slightly lavender); pubescence of the stem spreading; lobes of cauline leaves mostly obtuse; seeds 3.0-3.5 mm long.................P. fimbriata
3 Corolla lobes entire; seeds 4-15 per capsule.
4 Pubescence of the middle stem (from 2nd to 5th node from the base) consisting of appressed to ascending, stiff, pointed hairs, sometimes also with a few gland-tipped hairs < 2 mm long; terminal leaflet of leaves directly subtending an inflorescence with acute to cuneate bases; [of rivers in the Atlantic drainage, very rarely disjunct west of the Appalachians] ..................................................P. covillei
5 Pubescence of the middle stem spreading or even retrorse, most of the hairs weak and twisted, and many of them glandular-tipped and > 2 mm long; terminal leaflet of leaves directly subtending an inflorescence with obtuse to rounded or truncate bases; [of rivers in the Mississippi drainage] ........................................................................................................................................P. ranunculacea

Phacelia bipinnatifida Michaux, Fernleaf Phacelia, Forest Phacelia. Mt (GA, NC, SC, VA, WV): cove forests, especially where rocky; common (uncommon in VA and WV, rare in SC). April-May; June. WV. WA west to s. OH, n. IN, n. IL, and c. MO, south to w. NC, nw. SC, n. GA, c. AL, and n. AR. P. bipinnatifida var. plummeri (= P. brevistyla) is "based on a variation with sparser pubescence, larger and less divided leaf segments, smaller flowers, and sub-included stamens and style. These variations are not concomitant, and the distribution of forms showing a complete or partial combination of them is sporadic" (Constance 1949). The matter deserves additional study. [= RAB, C, G, X; S. Watson ex A. Gray, Eastern Buttercup Phacelia. Pd (NC, VA), Mt? (WV?): rich soils of floodplains, and contiguous terraces and slopes; rare. April; May. Ranging in three disjunct areas – c. NC and sc. VA (in the drainages of the Cape Fear, Tar, and Roanoke rivers), DC, n. VA, and sc. MD (in the drainage of the Potomac River), and disjunct in Texas County, MO. Most recent authors have included this taxon within the closely similar P. ranunculacea; as thus broadly defined, P. ranunculacea was considered to occur in three peculiarly disjunct areas; one centered around St. Louis, MO (w. KY, w. TN, e. MO, ne. AR, se. MO, s. IL, and s. IN), one near Washington, DC (DC, n. VA, and sc. MD), and a third in c. NC and sc. VA. Sewell & Vincent (2006) have clarified the status of P. covillei and P. ranunculacea. Chuang & Constance (1977) felt that P. covillei and P. ranunculacea (sensu stricto) have numerous characteristics that rendered their inclusion in Phacelia uncomfortable (also see discussion in Constance 1949 and Gillett 1968), but Sewell & Vincent (2006) countered this idea. See Nemophila aphylla for suggestions on distinguishing these two superficially similar species. [= K, X, < P. ranunculacea (Nuttall) Constance – RAB, C, F, G, Z] Phacelia dubia (Linnaeus) Trelease var. dubia. Appalachian Phacelia. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), C (DE, NC, SC, VA): floodplain forests, rocky forests, fields, roadsides, granitic flatrocks; common (rare in DE). April-May; June. var. dubia ranges from NY and PA west to WV, south to nc. SC, sw. NC, and se. TN. The Phacelia dubia complex has been under detailed biosystematic study by Foster Levy and associates (Levy 1991a, 199b, 1997; Levy et al. 1996; Levy & Malone 2001; Levy & Neal 2001; Taylor & Levy 2002; del Castillo 1994, 1998). Male sterile cytotypic variants are common in some populations but formal taxonomic recognition ius not warranted (Levy 1991a, 1991b; del Castillo 1994, 1998). Additionally, an incipient variety, informally termed "imitator", occurs in s. SC (Levy 1991a; Levy & Malone 2001). These populations are morphologically variable, some more similar to var. georgiana, others more similar to var. dubia; see Levy (1991a) for further discussion. They may warrant taxonomic recognition, as they are allopatric from each of the 3 named varieties, and show degrees of sterility when bred with each of the three, but morphologic differences have not evolved (Levy & Malone 2001). [= K, Y, < P. dubia – RAB, C, F, S, W, WV; > P. dubia var. dubia – G; > P. dubia var. fallax (Fernald) Gleason – G; > P. dubia var. dubia – Z (also including var. interior)] Phacelia dubia (Linnaeus) Trelease var. georgiana McVaugh, Georgia Phacelia. Pd (GA): granitic flatrocks; rare. April-May; June. var. georgiana ranges from GA west to ec. AL, in the Piedmont. It has sometimes been attributed to SC, and Levy
found plants in SC which morphologically resemble var. *georgiana*, but he concluded that this "imitator" genotype was largely sterile when bred with var. *georgiana*. See var. *dubia* for additional discussion. [= K, Y, Z; < *P. dubia* – RAB, C, F, S, W; ? *P. dubia* var. *dubia* – G]

**Phacelia purshii** Buckley, Miami-mist. Mt (GA, NC, SC, VA, WV), Pd (VA): moist forests on floodplains and slopes; uncommon (rare in NC, GA, SC, and VA). May-June. S. PA west to s. ON, OH and MO, south to mw. SC, nw. GA, and e. AL. Plants "with smaller flowers, shorter pedicels, and smaller capsules and seeds" are the basis of *P. boykinii* and *P. bicknellii* (Constance 1949). A study of the matter was initiated and specimens annotated as "*P. purshii* ssp. *boykinii*," but the research was not completed and the name was never published; further study is warranted. [= RAB, C, F, G, K, W, WV, Z; > *P. purshii* – S; > *P. boykinii* (A. Gray) Small – S; > *P. bicknellii* Small – S]

**Phacelia dubia** (Linnaeus) Trelease var. *interior* Fernald, endemic in c. TN. [= K; < *P. dubia* – C, F, G, S; < *P. dubia* var. *dubia* – Z] (not yet keyed)

**Phacelia ranunculacea** (Nuttall) Constance, Western Buttercup Phacelia. In the Mississippi and Ohio river drainages, centered around St. Louis, MO (w. KY, w. TN, e. MO, ne. AR, sc. MO, s. IL, and s. IN). See Sewell & Vincent (2006). [= K, X; < *P. ranunculacea* – RAB, C, F, G, Z; see also]

**Phacelia strictiflora** (Engelmann & Gray) Gray var. *robbinsi* Constance. East to AL. [= K, Z] (not yet keyed)

20. **Asperugo Linnaeus** (Madwort, Catchweed)

A monotypic genus, an annual scrambling herb, of Eurasia.

* **Asperugo procumbens** Linnaeus, Madwort, Catchweed. Cp (DE), Pd (DE): disturbed areas; rare, native of Eurasia. [= C, F, G, K] [not yet keyed]

21. **Heliotropium** Linnaeus (Heliotrope, Turnsole)

A genus of ca. 250 species, widespread in tropical and temperate regions. Either treated as part of a broadly defined Boraginaceae, or else better placed in the family Heliotropiaceae, as it is apparently more closely related to Hydrangeaceae than to Boraginaceae. Currently under study and additional taxonomic changes may be forthcoming (Hilger & Diane 2003).

1 Flowers solitary at the ends of short branches; [of limestone habitats from nw. GA westward]; [section Orthostachys, subsection Bracteata]............................ *H. tenellum*

2 Leaves glabrous, succulent, < 7 mm wide; [of saline coastal situations]; [section Halymyrhina]............................ *H. curassavicam var. curassavicam*

2 Leaves pubescent, not succulent, > 10 mm wide; [of a variety of mostly disturbed, inland situations].

3 Mericarps separating at maturity; fruit 4-lobed prior to maturation; leaves petiolate, ca. 2× as long as wide; [section Heliotropium]...........

3 Mericarps cohering in pairs at maturity; fruit 2-lobed prior to maturation; leaves petiolate or sessile to subsessile, ca. 2-5× as long as wide.

4 Fruit tuberculate, 4-seeded; leaves sessile to subsessile, ca. 4-5× as long as wide; corolla throat and tube densely villous within; [section Tiaridiurn]................................................................. *H. amplexicaule*

4 Fruit longitudinally ribbed, 2-seeded; leaves petiolate, ca. 2× as long as wide; corolla throat and tube glabrous within; [section Tiaridiurn]................................................................. *H. indicum*

**Heliotropium curassavicam** Linnaeus var. *curassavicam*, Seaside Heliotrope. Cp (DE, FL, GA, NC, SC, VA): edges of brackish and salt marshes, estuarine shores; rare. June-September. Var. *curassavicam* ranges from DE (and farther north as an introduction) south to the New World tropics. Considered by some authors to be introduced and naturalized in our area. Other varieties occur inland in the mw. and w. United States. [= C, K, Z; < *H. curassavicam* – RAB, GW; = *H. curassavicam* – F, G; = Heliotropium curassavicam ssp. curassavicam] *

**Heliotropium tenellum** (Nuttall) Torrey, Delicate Heliotrope. Mt (GA, WV): limestone glades and barrens; rare. WV, KY, IN, IL, IA, and KS south to mw. GA, AL, MS, LA, and TX. [= C, F, G, K, Z; = *Lithococcum tenella* (Nuttall) Small – S]
**Heliotropium polyphyllum** Lehmann, Pinel. Heliotrope. Cp (FL): pine flatwoods, pond margins; common. FL. [= K] {add synonym; not yet keyed}

357. **CONVOLVULACEAE** A.L. de Jussieu 1789 (Morning Glory Family) [in SOLANALES]

A family of about 56 genera and 1600 species, nearly cosmopolitan, especially in tropical and subtropical areas. Tribes follow the classification of Stefanović, Austin, & Olmstead (2003). References: Wilson (1960b); Austin (1979), Stefanović, Krueger, & Olmstead (2002); Stefanović, Austin, & Olmstead (2003). [including CUSCUTACEAE]

| 1 Plant parasitic; stems orange; [tribe Cuscuteae] | Cuscuta |
| 1 Plant photosynthetic; stems green. |
| 2 Corolla 0.1-0.2 cm long; capsule deeply 2-lobed; leaves orbicular-reniform, 1-3 cm long and wide, not fleshy; [tribe Dichondraceae] |
| 2 Corolla 1-10 cm long; capsule entire; leaves various, but not as above (most similar vegetatively are *Calystegia soldanella*, *Ipomoea pes-caprae* var. *emarginata*, and *I. imperati*; all beach plants with fleshy, emarginate, and usually larger leaves). |
| 3 Styles 2, free nearly to the ovary or fused most of their length (at least the terminal 1-2 mm free); corolla 1-2.5 cm long; leaves cuneate or rounded at the base, and narrowly ovate, lanceolate, or linear; [tribe Cresseae]. |
| 3 Styles free, each 2-cleft, the stigmas therefore 4, linear-filiform. |
| 4 Styles free or fused at the base, the stigmas 2, globose-peltate. |
| 4 Styles free or fused at the base, the stigmas 2, globose-peltate (garden escape occasionally naturalised) (Garden escape occasionally naturalised) ......... Evolus |
| 5 Flowers not double, corolla entire; leaves orbicular-reniform, 1-3 cm long and wide, not fleshy; [tribe Dichondraceae]. |
| 5 Flowers not double, corolla entire; leaves orbicular-reniform, 1-3 cm long and wide, not fleshy; [tribe Convolvulaceae]. |
| 6 Calyx concealed by 2 large bracts; [tribe Convolvulaceae]. |
| 6 Calyx not concealed by bracts. |
| 7 Stigma 1, capitate (sometimes lobed); leaves 3-5 cm long, mostly strongly hasteate or cordate at base; corolla white, pink, lavender, blue, orange, or red. |
| 7 Stigma 1, capitate (sometimes lobed); leaves 3-5 cm long, mostly strongly hasteate or cordate at base; corolla white, pink, lavender, blue, orange, or red. |
| 8 Anthers straight after dehiscence; fruits valvate-dehiscent; [tribe Ipomoeae]. |
| 8 Anthers twisted after dehiscence; fruits longitudinally or irregularly dehiscent; [tribe Merremiae]. |

**Calystegia** R. Brown 1810 (Bindweed)

A genus of about 25 species, vines, cosmopolitan. Stefanović, Krueger, & Olmstead (2002) conclude (based on molecular phylogeny) that *Calystegia* should be combined with *Convolvulus*. References: Wilson (1960b); Lewis & Oliver (1965); Brummitt (1965, 1980); Austin, Diggs, & Lipscomb (1997)=Y.

| 1 Leaves about as wide as long, rounded at the tip. | C. soldanella |
| 1 Leaves longer than wide, abutse, acute, or acuminate at the tip. |
| 2 Flowers double, the corolla deeply divided into many parts (garden escape occasionally naturalised) | C. pubescens |
| 2 Flowers double, the corolla deeply divided into many parts (garden escape occasionally naturalised) | C. pubescens |
| 3 Stems mostly less than 1.5 m, erect at least in the lower part, but sometimes twining towards the apex, flowers mostly borne in lower leaf axils. |
| 3 Stems mostly less than 1.5 m, erect at least in the lower part, but sometimes twining towards the apex, flowers mostly borne in lower leaf axils. |
| 4 Stems not twining, up to 0.6 m high; leaves overtopping the stem apex 1.5-6 cm long. |
| 4 Stems not twining, up to 0.6 m high; leaves overtopping the stem apex 1.5-6 cm long. |
| 5 Stems twining in the upper part; mostly 0.8-1.4 m high; leaves overtopping stem apex less than 1 cm long. |
| 5 Stems twining in the upper part; mostly 0.8-1.4 m high; leaves overtopping stem apex less than 1 cm long. |
| 6 Stem and leaves glabrous to pubescent; leaves more or less flat at maturity, with basal lobes 0-5 mm long. |
| 6 Stem and leaves glabrous to pubescent; leaves more or less flat at maturity, with basal lobes 0-5 mm long. |
| 7 Corolla pink. |
| 7 Corolla pink. |
| 8 Bracteoles forming a continuous spiral series with sepals, the flower appearing to have 3 bracteoles when seen from side; leaves with almost closed sinus, the lobes posteriorly truncate. |
| 8 Bracteoles forming a continuous spiral series with sepals, the flower appearing to have 3 bracteoles when seen from side; leaves with almost closed sinus, the lobes posteriorly truncate. |
| 9 Leaves with basal lobes rounded or with a single angle, or if with 2 angles then not spreading; plant glabrous or commonly pubescent to tomentose onstem and. |
| 9 Leaves with basal lobes rounded or with a single angle, or if with 2 angles then not spreading; plant glabrous or commonly pubescent to tomentose onstem and. |
| 10 Bracteoles saccate at base, obtuse to truncate at apex, strongly overlapping each other; leaf sinus with more or less parallel sides; often with 2 peduncles in the same leaf axil. |
| 10 Bracteoles flat to weakly saccate at base, more or less acute, not or scarcely overlapping each other; leaf sinus not parallel sided; peduncles solitary in leaf axils. |
Calystegia catesbaiana Pursh, Catesby’s Bindweed. Mt (WV), Cp (VA), {GA, NC, SC}: longleaf pine savannas, marsh edges, openings in dry to dry-mesic montane forests; {abundance} (rare in GA, VA, and WV). [= K; < Calystegia spithamea – C; < Convolvulus spithamaeus Linnaeus var. pubescens (Gray) Fernald – F; = Calystegia sericata (House) Bell – RAB, W; = Convolvulus sericus House – S, Z]

* Calystegia pubescens Lindley. Mt (WV), {NC, VA}; rare in WV, native of e. Asia. [? Calystegia pellita (Ledebour) G. Don – K; < Convolvulus pellitus Ledebour – F, Z; < Convolvulus japonicus Thunberg – G; < Calystegia hederacea Wallroth – C]

Calystegia sepium (Linnaeus) R. Brown sp. american (Sims) Brummitt. Mt (WV), {GA, NC, VA}; uncommon in WV. [= K; < Calystegia sepium – RAB, C, GW, W; < Convolvulus sepium Linnaeus var. repens (Linnaeus) A. Gray – F, WV, Z; > Convolvulus sepium Linnaeus var. repens (Linnaeus) A. Gray – G; > Convolvulus sepium var. americanus Sims – G; > Convolvulus americanus (Sims) Greene – S; > Convolvulus repens Linnaeus – S]

Calystegia sepium (Linnaeus) R. Brown spx. angulata (Sims) Brummitt. Mt (WV), {GA, NC, SC, VA}; {habitats}; (uncommon in WV). NB to BC, south to SC, TX, NM, and OR. [= K, Y; < Calystegia sepium – RAB, C, GW, W; < Convolvulus sepium Linnaeus var. sepium – F, G, Z]

Calystegia sepium (Linnaeus) R. Brown sp. appalachiana Brummitt. Mt (WV), {NC, VA}; {habitats}; common in WV. [= K; < Calystegia sepium – RAB, C, GW, W; < Convolvulus sepium Linnaeus var. sepium – F, G, Z; = Convolvulus linnophila Greene]

Calystegia sepium (Linnaeus) R. Brown sp. britannica. Mt (WV), {DE, GA, NC, SC, VA}; {habitats}; common in WV. [= K; < Calystegia sepium – RAB, C, GW, W; < Convolvulus sepium Linnaeus var. sepium – F, W, Z; > Convolvulus sepium var. britannicus R. Tryon – G; < Convolvulus sepium – S]

Calystegia silvatica Grisebach spx. fraterniflora (Mackenzie & Bush) Brummitt. Mt (VA, WV), Pd (VA), Cp (VA), {GA, NC, SC}; {habitats}; uncommon in VA, rare in WV. Ssp. silvatica and ssp. disjuncta are European. [= K, Y; < Calystegia sepium – C; > Convolvulus sepium Linnaeus var. fraterniflorus Mackenzie & Bush – F, G, WV, Z; = Calystegia sepium (Linnaeus) R. Brown var. fraterniflora (Mackenzie & Bush) Shimer]

* Calystegia soldanella (Linnaeus) R. Brown ex Roemer & J.A. Schultes. Cp (NC, VA): beaches, dunes; rare, native of {}. [= RAB, K; = Convolvulus soldanella Linnaeus]

Calystegia spithamea (Linnaeus) Pursh spx. spithamea, Low Bindweed. Pd (DE, VA), Mt (VA, WV): dry limestone areas; uncommon in VA and WV. [= K; < Calystegia spithamea – RAB, C, W; = Calystegia spithamea var. spithamea; = Convolvulus spithameus var. spithamea – F; > Convolvulus spithameus Linnaeus – G, S; < Convolvulus spithameus – Z]

Calystegia spithamea (Linnaeus) Pursh spx. stans (Michaux) Brummitt, Shale Bindweed. Mt (GA, NC, SC, WA, VA): shale barrens and woodlands, less typically on limestone; uncommon. [Calystegia spithamea (Linnaeus) Pursh spx. purshiana (Wherry) Brummitt – K; = Calystegia spithamea spx. stans (Michaux) Brummitt – K; < Calystegia spithamea – RAB, C, W; > Calystegia spithamea var. pubescens; > Convolvulus spithameus Linnaeus var. pubescens (A. Gray) Fernald – F; > Convolvulus purshianus Wherry – G; > Convolvulus spithameus – G; < Convolvulus spithameus – Z]

Calystegia macounii (Greene) Brummitt. Reported for NC and VA; Brummitt says this species does not occur east of the Mississippi River. Rejected pending convincing documentation. [= K, Y; = Convolvulus macounii Greene] {not keyed}

Convolvulus Linnaeus 1753 (Field-bindweed)

A genus of about 100 species, vines, cosmopolitan, especially in temperate areas. [also see Calystegia]

Cuscuta Linnaeus 1753 (Dodder)

Identification notes: corolla measurements are from the base to the sinuses of the corolla. The infrastamininal scales are transparent structures at the base of the stamens.

1 Styles more-or-less united; capsule circumscissile; [subgenus Monogynella]
CONVOLVULACEAE

Cuscuta harperi Small, Harper's Dodder. Cp (GA), Pd (GA): outcrops of granite ( Piedmont) and Altamaha grit (Coastal Plain), typically on plants such as Liatris microcephala, Bigelowia nutallii, Hypericum gentianoides, and Croton willdenowii; rare. September-November. C. and we. GA west to nw. AL. [= K, S, V, Z]
**CONVOLVULACEAE**

* **Cuscuta japonica** Choisy, Japanese Dodder. Mt (SC), Cp (FL): disturbed area; rare, native of e. Asia. Apparently eradicated in Pickens County, SC. [= K, WH, Z]

**Cuscuta obtusiflora** Kunth var. *glandulosa* Engelmann, Glandular Dodder. Cp (FL, GA): on herbs in calcareous glades and other habitats; rare. GA and OK south to FL, TX, Mexico; West Indies. See Anderson (2007) for FL Panhandle record. [= G, GW, K, V, WH, X; = *C. glandulosa Small* – S]

**Cuscuta polygonorum** Engelmann, Smartweed Dodder. Cp (DE), Pd (DE, VA), Mt (VA, WV): on *Polygonum* and other hosts; rare. NY and ON west to ND, south to FL and TX. [= C, F, G, K, S, W, V, X, Y, Z]

**Cuscuta cuspidata** Engelmann. IN, ND, and UT south to KY, MS, TX, and NM. [= C, F, K, X, Z]

**Cuscuta glomerata** Choisy. OH, MI, MN, and ND south to KY, TN, MS, and TX. [= C, F, G, GW, K, S, X, Z]

* **Cuscuta suaveolens** Seringe, Fringed Dodder. Scattered sites in eastern North America, including AL, MD, and OH. [= C, G, K, Z]

**Dichondra** J.R. Forster & G. Forster 1775 (Ponyfoot, Dichondra)

A genus of about 8 species, of tropical and warm temperate areas. References: Tharp & Johnston (1961)–Z.

1 Calyx lobes > 2× as long as wide, exceeding the fruit; pedicels straight or nearly so....................................................... *D. carolinensis*  
1 Calyx lobes < 2× as long as wide, shorter than the fruit; pedicel strongly recurved just below the calyx ........................................ *D. micrantha*

**Dichondra carolinensis** Michaux, Carolina Ponyfoot. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt*, (VA*, WV*): lawns, roadsides, moist pinelands; common (uncommon in VA, rare in Mountains of VA and WV). March-May. Se. VA south to s. FL, west to AR and TX; also in Bermuda and reported for the Bahamas; sometimes adventive beyond that range. This plant is rarely seen in a "natural" habitat, but is often seen in lawns and other mowed grassy areas. [= RAB, C, GW, K, S, WH, Z; = *D. repens* J.R. Forster var. *carolinensis* (Michaux) Choisy – F, G]

**Evolvulus** Linnaeus 1762 (Dwarf Morning-glory)

A genus of about 90-100 species, almost all of tropical, subtropical, and warm temperate America. References: Ward (1968); Wilson (1960b)–Z.

1 Leaves densely pilose on both surfaces with spreading to loosely appressed hairs; internodes short, generally < 1 cm long; [calcareous glades and barrens of c. TN].......................................................................................................................... *E. pilosus*  
1 Leaves densely pilose with appressed (sericous) hairs below, the upper surface glabrous or loosely pubescent; internodes long, many over 1.5 cm long; [wet flatwoods, seepages, bogs, Altamaha Grit outcrops in the the Coastal Plain].................................................................................. *E. sericus*

**Evolvulus sericus** Swartz var. *sericus*, Silky Dwarf Morning-glory. Cp (FL, GA): wet flatwoods, seepages, bogs, Altamaha Grit outcrops; uncommon (rare in GA). Coastal Plain of ec. GA (Appling, J eff Davis, and Coffee counties) (Bridges & Orzell 1989; Patrick, Allison, & Krakow 1995) south to s. FL; AR and LA west to AZ, south into Mexico; West Indies. [= K; < *E. sericus* – S, WH, Z]

* **Evolvulus nuttallianus** J.A. Schultz, Shaggy Dwarf Morning-glory, in c. TN (Chester, Wofford, & Kral 1997), disjunct from the Great Plains. [= F, K, Z; = *E. nuttallianus* – C, orthographic variant; = *E. pilosus* Nuttall – G]

**Ipomoea** Linnaeus 1753 (Morning-glory)

**Ipomoea alba** Linnaeus, Moonflowers, Tropical Morning-glory. Cp (FL): hammocks, marsh edges; rare. Ne. FL south to s. FL. [= WH; *Calonyction aculeatum* (Linnaeus) House]  
* Ipomoea batatas* (Linnaeus) Lamark, Sweet Potato. Cp (FL, GA?, NC, SC, VA?): persistent in fields after cultivation, disturbed areas; rare, apparently native of tropical America. [= RAB, K, S, Y, Z]  
Ipomoea hederacea

* Ipomoea hederifolia
Linnaeus, Scarlet Creeper. Cp (FL, GA, SC): disturbed areas; uncommon. {Distribution in our area uncertain, native of tropical America – Kartesz (1999) says GA only} [= GW, K, WH, Y, Z; = I. coccinea Linnaeus var. hederifolia (Linnaeus) A. Gray]

Ipomoea imperati
(Vahl) Grisebach, Beach Morning-glory. Cp (FL, GA, NC, SC): beaches, dune blowouts, fore-dunes; common (rare in NC and SC). August-October. Se. NC south to s. FL, west to TX, and extensively distributed in the tropics. [= K, WH, Y; = I. stolonifera (Cirillo) J.F. Gmelin – RAB, GW, S, Z]

Ipomoea indica
(Burmann) Merr. var. acuminata (Vahl) Fosberg. Cp (FL): hammocks, coastal areas, disturbed areas; uncommon. Also AL, MS, LA. [= K, WH; ? Pharbitis cathartica (Poiret) Choisy – S] {add to synonymy}

Ipomoea lacunosa

Ipomoea macrorhiza
Michaux, Indian-midden Morning-glory, Manroot. Cp (FL, GA, NC, SC): hammocks, shell middens, dry sands, disturbed maritime areas; uncommon (rare north of FL). June-July. Se. NC south to s. FL, west to s. AL. [= RAB, K, S, WH, Y, Z]

* Ipomoea muricata

Ipomoea pandurata

Ipomoea pes-caprae
(Linnaeus) R. Brown var. emarginata Hallier f., Railroad Vine, Goat's-foot, Bay Hops, Bay Winders. Cp (FL, GA, NC, SC): ocean beaches; uncommon (rare north of FL). E. NC (Carteret County), SC (Beaufort, Horry, Charleston, Colleton, and Georgetown counties), south to FL, west to TX, and widespread on tropical shores of the the New World and Old World. The records in the Carolinas may reflect the periodic arrival of sea-borne seeds. [= I. pes-caprae – GW, S, Z; = I. pes-caprae ssp. brasiliensis (Linnaeus) van Ooststroom – K, WH, Y]

* Ipomoea purpurea

* Ipomoea quamoclit

Ipomoea sagittata
Poiret. Cp (FL, GA, NC, SC): edges of brackish marshes, moist thickets on barrier islands, hammocks; common. July-September. E. NC south to s. FL, west to TX; also in the West Indies. [= RAB, GW, K, S, WH, Y, Z]

* Ipomoea triloba
Linnaeus, Little-bell. Cp (FL): hammocks, sand dunes; uncommon. N. FL south to s. FL; West Indies; New World and Old World tropics. [= S, WH] {add to synonymy}

* Ipomoea tricolor
Cavanilles is reported for several locations in se. PA (Rhoads & Klein 1993). [= K] {not yet keyed; synonymy incomplete}

Merremia
dennstedt ex Endlicher 1838

A genus of about 90 species, tropical, subtropical, and warm temperate areas, especially America. References: Wilson (1960b)=Z.
* Merremia dissecta (Jacquin) Hallier f., Noyau Vine. Cp (FL, GA): disturbed areas; common (rare in GA), native of South America. Ranges as far north as e. and sw. GA. [= K, WH, Z; =? Ipomoea sinuata Ortega; = Operculina dissecta (Jacquin) House]

Stylisma Rafinesque 1825 (Dawnflower)

A genus of about 6 species (and about 8 taxa), vining to trailing herbs, endemic to se. North America. References: Myint (1966) = Z; Shinners (1962) = Y; Wilson (1960b) = X.

1 Corolla < 2× as long as the calyx; leaves < 2 cm long; [of FL] ............................................................................................................................... *S. abdita*

2 Corolla pink or purple; filaments glabrous, or nearly so; leaves densely and conspicuously silvery-sericeous; [of seasonally wet habitats] ...

3 Larger leaves (7-) 12-30 mm wide; peduncles with (1-) 3-7 (-12) flowers; stems with a tendency to twine, at least near growing tip.

4 Septal glabrous; [widespread in the Coastal Plain and Piedmont of our area] ................................................................. *S. humistrata*

5 Bracteoles 1-3 (-5) mm long;stylar branches usually fused more than 5/6 of the total length (occasionally fused less than 1/6 of length), the free portion of the stylar branches usually less than 3 mm long; sepal villous, 4-6 (-7) mm long, ovate-elliptic with obtuse to acute apices; leaves 1-3 mm wide.

6 Stylar branches 1-1.5 mm long, usually unequal in length, the longer nearly 2× as long as the shorter; sepal mostly acute; [of MS westward] ................................................................................................. *S. pickeringii var. pattersonii*

7 Larger leaves 2-10 mm wide; peduncles with 1 (-5) flowers; stems without a tendency to twine.

Bracteoles (2-) 10-20 mm long; stylar branches usually fused more than 5/6 of the total length (occasionally fused less than 1/6 of length), the free portion of the stylar branches usually less than 3 mm long; sepal villous, 4-6 (-7) mm long, ovate-elliptic with obtuse to acute apices; leaves 1-3 mm wide.

Stylisma abdita Myint. Cp (FL): scrub; rare. Ne. FL (Clay County) south to s. FL. [= K, WH, Z; = Bonamia abdita (Myint) R.W. Long]

Stylisma humistrata (Walter) Rafinesque, Water Dawnflower. Cp (AL, FL, GA, LA, MS, NC, SC): clay-based Carolina bays and wet savannas; uncommon (rare in NC and SC). June-July. Se. NC south to c. and w. FL Panhandle, west to se. AR and e. TX. *S. aquatica*, as the epithet implies, occurs in wetter habitats than our other species. [= GW, K, WH, Z; = Bonamia humistrata (Walter) A. Gray = RAB, Y; = Breveria michauxii Fernald & Schubert = F; = Bonamia michauxii (Fernald & Schubert) K.A. Wilson = X]

Stylisma humistrata (Walter) Chapman, Southern Dawnflower. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): sandhills and other dry woodlands, especially on dryish stream terraces; common (uncommon in FL and rare in VA). June-August. Se. VA south to Panhandle FL, west to AR and e. TX, north in the interior to n. AL and w. TN. [= C, K, WH, Z; = Bonamia humistrata (Walter) A. Gray = RAB, X, Y; = Breveria humistrata (Walter) A. Gray = F, G]

Stylisma patens (Desrousseaux) Myint var. patens, Common Dawnflower. Cp (GA, NC, SC): sandhills and other relatively dry sandy areas; common. June-August. Overall, the most common and widespread taxon of the genus in our area, regularly encountered in its habitat. E. NC south to n. FL, and west to s. MS. [= Stylisma patens (Desrousseaux) Myint var. patens = K, Z; = Bonamia patens (Desrousseaux) Shinners var. patens = RAB, Y; = S. trichosanthes (Michaux) House = S, misapplied; = S. patens = WH; = Bonamia aquatic (Walter) A. Gray = X, misapplied]

Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. pickeringii, Pickering's Dawnflower. Cp (AL, GA, MS, NC, NJ, SC): sandhills, usually in the driest, most barren, deep-sand areas, occasionally colonizing dry, disturbed areas in sandhills, such as sandy roadbanks, known from the Fall-line Sandhills, aeolian rims of Carolina bays, and sandhills on relic tidal riverine dunes along Coastal Plain rivers; rare. June-August (-September); July-September. Var. pickeringii ranges from s. NC south through SC, GA, AL, and e. MS, with a disjunct area in the Pine Barrens of s. NJ, sometimes treated as a separate variety “caesariensis” (see synonymy). This rare species is easily recognizable by its growth form, with numerous stems arching from a central point, then trailing radially away, forming a mound 1-2 meters in diameter. The narrowly linear leaves are borne vertically. Fernald & Schubert (1949) named four varieties in this widely but disjunctly distributed species; Myint (1966) reduced this to two varieties, one eastern and one western. [= C, K, Z; = Bonamia pickeringii (Torrey ex M.A. Curtis) A. Gray = RAB, X, Y; = Breveria pickeringii (Torrey ex M.A. Curtis) A. Gray var. pickeringii = F; = Breveria pickeringii var. caesariensis Fernald & Schubert = F; = Breveria pickeringii – G; = Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray = S]

Stylisma villosa (Nash) House, Hairy Dawnflower. Cp (FL, GA): sandhills, scrub; uncommon (rare in GA). Late April-July. S. GA south to s. FL, west to e. TX. [= K, WH, Z; = Bonamia villosa (Nash) K.A. Wilson = X, Y; = Breveria villosa Nash]
Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. pattersonii (Fernald & Schubert) Myint. Cp (MS): sandhills; rare. IL and IA south through KS and OK to w. LA and e. TX; disjunct east of the Mississippi River in w. MS (the material somewhat ambiguous as to varietal affinity). [= K, Z; < Bonamia pickeringii (Torrey ex M.A. Curtis) A. Gray – X, Y; < Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray – S]

358. SOLANACEAE A.L. Jussieu 1789 (Nightshade Family) [in SOLANALES]

Subfamily Browalliioideae: Cestrum
Subfamily Nicotaniioideae: Calibrachoa, Nicotiana, Nierembergia, Petunia
Subfamily Solanioideae, tribe Solaneae: Alkekengi, Capsicum, Physalis, Salpichroa, Solanum
Subfamily Solanioideae, tribe Datureae: Datura
Subfamily Solanioideae, tribe Lycieae: Lycium
Subfamily Solanioideae, tribe Nicandreae: Nicandra
Subfamily Solanioideae, tribe Hyoscyameae: Hyoscyamus

2 Fruiting calyx bright red (fresh or dry); corolla white; [cultivated and weakly naturalized near gardens]......................... Alkekengi

2 Fruiting calyx green, yellow, or orange, drying brown or tan; corolla yellow, often marked with 5 large spots in the throat; [collectively widespread].............................................................................................................................................................................................. Physalis

Alkekengi P. Miller 1754 (Chinese-lantern Plant)
A monotypic genus, a perennial herb, native of e. Asia. I here separate Alkekengi from Physalis as generically distinct, on the presumption that the re-typification of Physalis proposed by Whitson (2011) will be accepted. References: Mione et al. (1994); Whitson & Manos (2005); Whitson (2011).

* Alkekengi officinarum Moench, Chinese-lantern Plant. Pd (DE), Mt (WV), {VA?}: disturbed suburban areas; uncommon (rare in VA), native of Japan, Korea, and n. China. Commonly cultivated as an ornamental and occasionally naturalized in e. North America, as at scattered locations in TN (Chester, Wofford, & Kral 1997). It is perennial, readily recognized by its mature calyces red-orange and up to 5 cm long. [= Physalis alkekengi Linnaeus – C, F, G, K, WV, Z]

Bouchetia Augustin de Candolle ex Dunal 1852 (Bouchetia)
A genus of about 3-4 species, tropical American.

Bouchetia erecta A.P. de Candolle. {MS}. Reported for MS and TX. [= K; = Salpiglossis erecta (A.P. de Candolle) D’Arcy] {synonymy incomplete}

Calibrachoa Cervantes 1825 (Seaside Petunia)
References: Hunziker (2001)=Z.

Capsicum Linnaeus 1753 (Red Pepper, Chile)

1 Flowers usually only one per node after the first flowering node (rarely more); corolla bright to milky white (rarely bluish or violet) ...................

1 Flowers 2-5 per node above the first flowering node; corolla greenish-white

2 Pedicel of mature fruit with constriction (waist) at junction with calyx; pedicels declining or erect at anthesis; corolla lobes planar;
[habanero, scotch bonnet]................................................................................................................................................................ [C. chinense]

2 Pedicel of mature fruit broadening evenly into the calyx, without constriction; pedicels erect at anthesis, the flower itself nodding; corolla lobes usually slightly revolute; [tabasco]................................................................................................................................................................ C. frutescens
* **Capsicum annuum** Linnaeus, Bell Pepper, Chile, Pimiento, Paprika, Chile Piquín, Ancho, Cayenne, Pepperoncini, Jalapeño, Serrano, Chiltepin, and others. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA): naturalized or persistent from gardens; commonly cultivated, rare as a naturalized species, native of Mexico (but early spread through Central America by native Americans, and since nearly worldwide in distribution at least in cultivation). June-frost. A very influential food crop introduced from the New World to the Old World, now important in various (especially tropical or subtropical) cuisines, including Hunan, Szechuan, Indian, Thai, various African, Mexican, and others. The great majority of our cultivated forms are of this species. The wild form, *var. glabriusculum*, was certainly present at one time in the Southeast and may still be represented in our area as reverted forms; it probably cannot be reliably distinguished from cultivars of *C. annuum*, and the two are not here distinguished taxonomically. [= RAB, S, > C. annuum var. annuum – K, V, X, Y, Z; > Capsicum annuum Linnaeus var. glabriusculum (Dunal) Heiser & Pickersgill – K, V, X, > C. annuum var. aviculare (Dierbach) D’Arcy & Eshbaugh – Y, Z]

* **Capsicum chinense** Jacquin, Habanero, Scotch Bonnet. Rarely cultivated, not (yet) reported as persistent or escaped. Native of Andean South America. [= V, X, Y, Z]

**Cestrum** Linnaeus 1753 (Night-flowering Jessamine)

A genus of 150-200 shrubs (rarely trees or vines), of Tropical America. References: Hunziker (2001)=Z.

**Datura** Linnaeus 1753 (Jimsonweed)

A genus of about 10 species, of s. North America (probably originally native to sw. United States and Mexico). Several species of *Datura* are known to have been in our area at the time of first settlement by Europeans. They may have been weeds in Indian fields, or grown for their hallucinogenic properties. The common name "Jimsonweed" is a corruption of "Jamestown Weed." References: Avery, Satina, & Rietsema (1959)=Z. {needs thorough rework, based on herbarium material and clarification of nomenclature}

1. Calyx 3-5 cm long, the tube strongly angled, the angles even narrowly winged; corolla 7-10 cm long; capsule erect, dehiscent by 4 valves; [section *Datura*] .............................................................................................................................................. *D. stramonium*
1. Calyx 5-15 cm long, the tube terete or slightly angled; corolla 12-25 cm long; capsule inclined or nodding, irregularly dehiscent; [section *Datura*],
2. Corolla with 10 teeth, lavender; spines of capsule few, very stout-based .................................................................................................................................................. *D. metel*
3. Corolla with 5 or 10 teeth, white or pale lavender; spines of capsule many, hispid (the base only slightly thickened).
3. Corolla with 10 teeth; leaves soft-pubescent .................................................................................................................................................... *D. inoxia*
3. Corolla with 5 teeth; leaves glaucescet. ............................................................................................................................................................ *D. wrightii*

* **Datura inoxia** J.S. Miller, Indian-apple. Cp (NC, SC), Pd (NC, SC), Mt (WV), {VA?}: disturbed areas; rare, native of Mexico. September-October. This species may not be distinct from *D. wrightii*. {It is currently not known with confidence which records in our area apply to which taxon,} [= K, Z; = D. inoxia – F, S, WV, orthographic variant; ? D. meteloides – G, misapplied]

* **Datura metel** Linnaeus (NC): location and habitat in our area not known; rare, presumably introduced, allegedly native of tropical Africa and Asia. July-August. [= RAB, C, K, S, Z]

* **Datura stramonium** Linnaeus, Jimsonweed. Cp (AL, DE, FL, GA, LA, MS, NC, SC, VA), Pd (AL, DE, GA, NC, SC, VA), Mt (AL, GA, NC, SC, VA, WV): fields, pastures, disturbed areas, especially common in severely over-grazed pastures; common, presumably introduced from further south and west (Mexico or Central America). July-September; August-October. The plant is dangerously poisonous. [= RAB, C, K, S, W, WV, Z; > D. stramonium var. stramonium – F; > D. stramonium var. tatula (Linnaeus) Torrey – F; > D. tatula Linnaeus]

* **Datura quercifolia** Kunth is reported for sw. GA by Jones & Coile (1988). [= K] {not yet keyed}

**Hyoscyamus** Linnaeus 1753 (Henbane)

A genus of about 23 species, herbs, of Eurasia and n. Africa.

SOLANACEAE

* Lycium Linnaeus 1753 (Matrimony-vine, Wolfberry, Goji Berry)

A genus of about 100 species, shrubs, of warm temperate and tropical areas of the Old World and New World (especially America).

1 Leaves succulent, oblanceolate, 1-5 mm wide; [native, in maritime situations]......................................................... *L. carolinianum*

1 Leaves herbaceous, elliptic, ovate, or broadly oblanceolate, 8-30 mm wide; [introduced, persistent or naturalized, usually around old home sites].

2 Corolla lobes shorter than the corolla tube; leaves gray-green, 2-5 cm long............................................................. *L. barbarum*

2 Corolla lobes longer than the corolla tube; leaves bright green, 3-8 cm long............................................................. *L. chinense*

* Lycium barbarum Linnaeus, Common Matrimony-vine, Wolfberry, Goji Berry. Cp (NC, SC, VA), Pd (DE, GA, NC, VA), Mt (GA, NC, VA, WV): old home sites, disturbed areas, along railroad tracks; rare, native of s. Europe. May-November; August-December. [= K; ? L. halimifolium P. Miller – RAB, F, G, S, W, WV; < L. barbarum – C (also see L. chinense)]

Lycium carolinianum Walter, Christmas-berry, Carolina Matrimony-vine. Cp (FL, GA, SC): shell middens, shell mounds, shelly sand dunes, brackish marshes, maritime sand spits; uncommon (rare in GA and SC). September-October. Se. SC and e. GA south to FL, west to e. TX; also in the West Indies. Apparently not recently seen in SC; its occurrence in that state is based on Walter's flora. [= RAB, GW, S, WH; > L. carolinianum var. carolinianum – K]

* Lycium chinense P. Miller, Chinese Matrimony-vine, Wolfberry, Goji Berry. Mt (NC, VA), Cp (VA): old home sites; rare, native of China. May-November; August-December. [= RAB, F, G, K; < L. barbarum – C]

Nicandra Adanson 1763 (Apple-of-Peru)

A monotypic genus, an annual herb native of Peru.

* Nicandra physalodes (Linnaeus) Gaertner, Apple-of-Peru. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (DE, NC, SC, VA): disturbed places, such as cultivated fields; uncommon, native of Peru. July-September; August-October. [= RAB, C, F, G, K, W, WV; > Physalodes physalodes (Linnaeus) Britton – S]

Nicotiana Linnaeus 1753 (Tobacco)

1 Plant a shrub or small tree, 3-10 m tall; stems glabrous and glaucous; [section Paniculatae] ......................................................... *N. glauca*

1 Plant an herb, 0.5-3 m tall; stems densely viscid-puberulent (or sparsely so to merely tuberculate in *N. longiflora*).

2 Corolla tube 1.2-1.7 cm long, greenish yellow, with limb 3-6 mm wide; leaves distinctly petiolate; [section Rusticae] ......................... *N. rustica*

2 Corolla tube 3.0-12.0 cm long, cream, white, yellow, or pink, with limb 10-25 mm wide; leaves auriculate clasping.

3 Larger leaves on a plant 3.5-8 dm long; corolla tube 3.0-5.5 cm long, 4-7× as long as the average diameter, the limb 10-15 mm wide, pink or reddish (rarely white); [section Nicotiana] .............................................................. *N. tabacum*

3 Larger leaves on a plant 1-3 dm long; corolla tube 4.0-12.0 cm long, 10-20× as long as the average diameter, the limb 15-25 mm wide, white or lavender; [section Alatae].

4 Rosette of a few leaves, not persisting; cauline leaves clasping and decurrent on the stem .................................................... *N. alata*

4 Rosette persisting; cauline leaves clasping but not decurrent on the stem ................................................................. *N. longiflora*

* Nicotiana longiflora Cavanilles, Long-flower Tobacco. Pd (DE): disturbed areas, rare, native of South America. Cultivated and may be found as a waif or persistent. [= K, S, Z]

* Nicotiana rustica Linnaeus, Indian Tobacco, Wild Tobacco. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): formerly commonly cultivated by native Americans in all parts of our area, persistent following cultivation, now apparently extinct in our area; rare, originally native of Peru. This was the tobacco cultivated by American Indians at the time of contact by Europeans, and was the first tobacco taken to Europe and cultivated there. [= RAB, C, F, K, S; > *N. rustica* var. rustica – Z]

* Nicotiana tabacum Linnaeus, Cultivated Tobacco. Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA): persistent after cultivation; commonly cultivated, rarely naturalized, native of tropical America. June-frost; September-October. This is the tobacco currently cultivated in our area for the manufacture of cigarettes, cigars, and other smoking and chewing tobacco products. Two different strains are cultivated. Burley tobacco, with acute to acuminate leaves, grown mostly in the
Mountains and upper Piedmont, is air-cured in open barns, and used mostly for cigar and pipe tobacco. Flue-cured tobacco, with obtuse or broadly acute leaves, is grown mostly in the Coastal Plain and lower Piedmont, cured in closed, cubical barns with forced heat, and used mostly for cigarettes. [= RAB, C, F, K, S]

Nierembergia Ruiz & Pavón 1794 (Cupflower)

A genus of about 23 species, of Mexico, Central America, and South America.

* Nierembergia frutescens Durieu, Tall Cupflower, is reported from sw. GA (Jones & Coile 1988). [= K]

Petunia Antoine Laurent de Jussieu 1803 (Petunia)

[also see Calibrachoa]

* Petunia ×hybrida Vilmorin [P. axillaris × integrifolia], Petunia. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (WV): disturbed areas, garden edges, common in cultivation; rare, native of Argentina. May-November. Individual plants may closely resemble either parent, but this taxon in our area is best considered as a variable hybrid taxon. [= WH; = P. ×atkinsiana D. Don ex Loudon – RAB; > P. axillaris (Lamarck) Britton, Sterns, & Poggenburg – C, F, G, K, S; > P. violacea Antoine Laurent de Jussieu – F, S, misapplied; > P. integrifolia (Hooker) Schinz. & Thellung – C, G, K; > P. ×atkinsiana D. Don ex Loudon – K]

Physalis Linnaeus 1753 (Ground-cherry)

(contributed by Milo Pyne)

A genus of about 80 species, nearly cosmopolitan, but especially diverse in America. Many of the species of Physalis in our area occur primarily in disturbed habitats; their pre-Columbian ranges are unclear and they may have been introduced to e. North America by native Americans. Of the species treated here, only a few are definitely introduced. References: Sullivan (2004) = Z; Waterfall = Y (1958, 1967); Sullivan (1985) = X; Ward (2008a) = V; Mione et al. (1994); Whitson & Manos (2005); Whitson (2011). Key based in part on Sullivan (2004).

1 Flowers 2 or more per leaf axil; berries with spherical seed-like bodies intermixed with the flattened, reniform seeds; [of the Gulf Coastal Plain]...................................................................................................................................................................................................... P. carpenteri

2 Berry 20-40 mm in diameter, green or yellow-green when ripe (tomatillo); anthers strongly coiled after dehiscence, blue; corolla throat with bluish tinge; [cultivated and weakly naturalized near gardens]........................................................................................................ P. philadelphica

2 Berry to 20 mm in diameter, orange, yellow, or green when ripe; anthers not coiled after dehiscence, yellow, blue, or purple; corolla throat purple, brown, green, or ochre; [collectively widespread].

3 Plants pubescent with stellate hairs, these in some taxa abundantly covering the leaves, or if leaves glabrous, the stellate hairs visible on the tips and margins of the sepals; plants perennial, from deeply buried rhizomes.

4 Leaves linear, 10-20× as long as wide, glabrous; plants erect; [of FL Panhandle westwards]......................................................... P. angustifolia

4 Leaves ovate, elliptic, obovate or spatulate, 2-10× as long as wide, stellate pubescent, especially on the young growth, flowering calyces, and pedicels (or glabrous south of our area); [of FL Panhandle, peninsula, and Atlantic coast from VA southwards]............... .................................................. P. walteri

3 Plants glabrous, or pubescent with simple hairs; plants annual or perennial.

5 Leaves glabrous or essentially so.

6 Perennials from rhizomes, frequently with remnant of last year's stem attached to crown; corolla with 5 dark maculations in the throat.

7 Hairs on the pedicels and young stems retrorse or retrorse-spreading; flowering calyx 5-angled, indented at base ......................... P. virginiana var. virginiana

7 Hairs on the pedicels and young stems antrorse; flowering calyx subterete, with 10 ribs, not indented at base ................................ P. longifolia var. subglabrata

6 Annuals from taproots; corolla with or without 5 dark maculations in the throat.

8 Upper part of the stem glabrous or glabrate (when young, sometimes with minute, deflexed hairs in lines); corolla with or without 5 dark maculations in the throat.

9 Corolla 7-15 mm long, yellow and with 5 dark maculations in the throat; anthers 2.5-4 mm long; berry to 40 mm in diameter ................................................................. P. philadelphica

9 Corolla 4-10 mm long entirely yellow, without 5 dark maculations in the throat; anthers 1-2.3 mm long; berry 8-11 mm in diameter.

10 Principal cauleine leaf blades generally < 2.5× as long as wide; flowering and fruiting pedicels 0.5-1.0 cm long; pedicels and calyx essentially glabrous at anthesis except for hairs on the margins of the calyx lobes .... P. angulata var. angulata

10 Principal cauleine leaf blades generally > 2.75× as long as wide; flowering pedicels 1.5-2.5 cm long, elongating to 3.0-4.0 cm long in fruit; pedicels and calyx covered at anthesis with fine, even, antrorse hairs, especially at the base of the calyx. ........................................................................................................[P. angulata var. pendula]

8 Upper part of the stem with long, spreading hairs; corolla with 5 dark maculations in the throat.
Physalis angulata Linnaeus var. angulata, Smooth Ground-cherry. Cp (DE*, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA): disturbed areas, open woodlands, agricultural fields; common (uncommon in VA, rare in DE). August-October. Var. angulata is widely distributed in tropical America, north to se. VA and MO, and scattered as an adventive further north.

Physalis lanceolata Michaux, Sandhills Ground-cherry. Cp (GA, NC, SC): sandhills; rare. June-July; July-September. Endemic to sandhill habitats of (primarily) sc. and (rarely) se. NC (northern limit in Lee, Wayne, and New Hanover counties), south through SC to just over the Savannah River in Richmond County, GA. Many earlier florals included midwestern material in the concept of this species; it is, however, limited to the Carolinas and Georgia. See Hinton (1970) for discussion of its taxonomic status. [= RAB, Z; < P. virginiana – F, G, S (also see P. hispida (Waterfall) Cronquist)]

Physalis longifolia Nuttall var. subglabrata (Mackenzie & Bush) Cronquist, Longleaf Ground-cherry. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, FL), {GA, SC}: open woodlands, gardens and disturbed areas; common (uncommon in GA, NC, SC, VA). June-August; August-October. The species is widespread in e. and c. United States; var. subglabrata is more eastern, south to Panhandle FL, var. longifolia more western. [= C, G, K, W, Z; = P. virginiana Miller var. subglabrata (Mackenzie & Bush) Waterfall – RAB; = P. subglabrata Mackenzie & Bush – F, S, WV; < P. longifolia – WH] * Physalis philadelphica Lamarck, Tomatillo. Cp (DE), Pd (DE, NC), Mt (VA, WV): naturalized after cultivation; uncommon (rare in NC and VA), native of Mexico and Central America. June-August; July-October. See Kartesz & Gandhi (1994) for a discussion of this group. It is the large-flowered plant (and therefore P. philadelphica in the narrow sense) that is weakly naturalized after cultivation in our area. [= C, Z; < P. ixocarpa Brotero ex Hornemann – F, G, misapplied; > P. philadelphica var. immaculata Waterfall – K]

Physalis pubescens Linnaeus var. pubescens, Thickleaf Downy Ground-cherry. Mt (WV), {VA}: disturbed areas; rare in WV. The distribution, abundance, and habitats of the two varieties are poorly known. July-September; August-October. Widespread in the American tropics, north to VA. [= C, K; < P. pubescens var. pubescens – RAB; > P. barbadensis Jacquin var. barbadensis – F; > P. barbadensis Jacquin – G, S; > P. pubescens – S; > P. barbadensis Jacquin – S; < P. pubescens – WH, Z] * Physalis virginiana P. Miller var. virginiana, Virginia Ground-cherry. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA), Candiland and disturbed areas; common (rare in FL and WV). April-May; June-July. This complex species is widespread in e. and c. North America. Var. virginiana is the most eastern of a number of varieties, some of the others being var. campaniforma Waterfall, var. polypylla (Greene) Waterfall, and var. texana (Rydb) Waterfall. The validity and true affinities of some of these varieties is, at present, uncertain; var. texana may be actually affiliated with P. longifolia. [= RAB, K; < P. virginiana – C, F, G, V, W, Z; > P. virginiana – S; > P. intermedia Rydb – S; > P. monticola C. Mohr – S]

Physalis walteri Nuttall, Dune Ground-cherry. Cp (FL, GA, NC, SC, VA): dunes of sea-beaches, openings in maritime forests, sandhills (southwards), and rarely inland as a waif in disturbed areas; common (uncommon in GA, NC, SC, rare in VA). May-September. This species ranges from se. VA south to s. FL and west to s. MS. See Sullivan (1985) for further information on this species and its relatives. It is largely replaced on the Gulf Coast by the related P. angustifolia, with which it locally intergrades in peninsular FL. P. viscosa Linnaeus is South American. [= C, K, WH, Z; < P. viscosa Linnaeus spp. maritima (M.A. Curtis) Waterfall – RAB; < P. maritima M.A. Curtis – F; < P. viscosa – G, S; > P. walteri var. walteri – V; > P. walteri var. glabra (Waterfall) D.B. Ward – V]

* Physalis acutifolia (Miers emend Sandwith) Sandwith, native to AZ and vicinity, was collected once in NC (in 1936), from a nursery in Mecklenburg County, NC, and is now in MS (Sullivan 2004). It may not be established. It is most similar to P. angulata, but differs in its white to cream-colored corollas, with yellow basal spots, and the presence of hairy petals, alternating with the stamens near the base of the corolla limb. [= K, Z]

* Physalis cinerascens (Dunal) A.S. Hitchcock var. cinerascens, native to OK, TX, and Mexico, occurs locally in the Southeastern United States in weedy situations; it has been found once in our area, in a disturbed habitat in SC. It is probably not established. It resembles P. walteri in having stellate pubescence, but differs in having leaves ovate to suborbicular, with margins sinuate, dentate, or entire (vs. leaves obovate, with margins entire), anthers at least 1.5× as long as the filaments (vs. anthers equal to or shorter than the filaments), and fruiting pedicels mostly at least 1.5× as long as the calyces (vs. fruiting pedicels equal to or shorter than the fruiting calyces). [= K, Z] (not yet keyed; full treatment)

Physalis longifolia Nuttall var. longifolia. East to PA, WV, KY, TN, and GA (Kartesz 1999). [= K, Z]

* Physalis peruviana Linnaeus, Cape Gooseberry or Po'ha, is also cultivated. Native to South America, it is now cultivated for its edible fruit in various tropical and temperate areas, and is known to rarely persist in e. North America. [= K]

* Physalis viscosa Linnaeus. Reports in the Southeast are based on a broad interpretation of P. viscosa to include southeastern taxa P. angustifolia and P. walteri. Rejected.

Salpichroa Miers 1845

A genus of about 17 species, herbs and shrubs, native of South America. References: Hunziker (2001)=Z.
**Solanum** Linnaeus 1753 (Nightshade, Tomato, Potato, Horse-nettle)  
*(contributed by Milo Pyne and Alan S. Weakley)*

*S. capsicoides*
**Solanum americanum** P. Miller. Cp (FL, GA), [GA]: hammocks, disturbed areas; common. North to e. GA (SC). South to s. FL. [= K, WH; < S. americanum – RAB; F; < S. nigrum – C, G, S]

**Solanum capiscoides** Allioni, Soda Apple. Cp (FL, SC), Pd* (NC*): disturbed areas; uncommon (rare in NC and SC). [= K, WH; = S. aculeatissimum – RAB; S, misapplied]

* Solanum dulcamara Linnaeus, Bittersweet, Nightshade. Mt (NC, WA, WV), Pd (DE, VA), Cp (FL, VA), [GA]: disturbed areas; common (rare in FL, GA, NC, and VA), native of Europe. [= RAB, C, W, WH, WV; > S. dulcamara var. dulcamara – F, K]

* Solanum lycopersicum Linnaeus, Tomato. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): persistent and weakly naturalized around gardens, especially where compost or sewage sludge is spread; commonly cultivated, rare as a naturalized species. June-frost. The species is native to the Andes Mountains of nw. South America. *S. lycopersicum* is one of the most important and influential of edible species native of the New World introduced to the Old World, along with two other Solanaceae, the potato (*Solanum tuberosum*) and the chili (*Capsicum annuum*). There appears to be little reason to separate *Lycopersicon* from *Solanum*. [= Lycopersicon esculentum – RAB, C, F, G; > Solanum lycopersicum Linnaeus var. cerasiforme (Dunal) Spooner, J. An derson, & R.K. Jansen – K; > Solanum lycopersicum var. lycopersicum – k; = Lycopersicon lycopersicum (Linnaeus) Karsten – S; > Lycopersicon esculentum var. cerasiforme (Dunal) Alefani]

* Solanum pseudocapsicum Linnaeus, Jerusalem-cherry. Cp, Mt (GA), Pd (NC), [SC]: rarely cultivated, perhaps not established, native of Mediterranean Europe. [= K; = S. pseudo-capsicum – F, orthographic variant]

* Solanum pumilum Dunal. [GA]: Known from dolomitic Ketona glades in Bibb County, c. AL (Allison & Stevens 2001) and historically in GA (GAHP). [= Solanum carolinense Linnaeus var. hissutum (Nuttall) A. Gray – K]

* Solanum sarrachoides Sendtner, Hairy Nightshade. Cp (NC, VA), Pd (DE, NC, VA): disturbed areas; uncommon, native of South America. Works by Edmonds and associates have established that *S. sarrachoides* and *S. physalifolium* Rusby are two distinct species, but both are presently known from North America. Mistranslations of Cronquist's 1991 treatment of *Solanum* (e.g. by Kartesz 1999) have given rise to the incorrect belief that only *S. physalifolium* is found in North America. True *S. physalifolium* is present in the western United States, *S. sarrachoides* in the Southeast. [= RAB, C, Z; < S. physalifolium Rusby – K; = S. sarrachoides – F, orthographic error]

* Solanum viarum Dunal, Tropical Soda Apple. Cp (GA, NC, SC): pastures; rare, native of South America (s. Brazil, Paraguay, and n. Argentina). This species has only recently appeared in our area, but has been publicized as a severe, extremely aggressive and, rapidly spreading weed further south (Wunderlin et al. 1993, Mullaley et al. 1993, Mullaley 1996). [= K]
**360. SPHENOCLEACEAE** von Martius ex A.P. de Candolle 1839 (Chickenspike Family) [in SOLANALES]

A family of one genus and 2 species, annual herbs, of tropical regions, native of the Old World. References: Rosatti (1986)=Z.

*Sphenoclea* Gaertn. (Chickenspike)

A genus of 2 species, annual herbs, native of the Old World.

* Sphenoclea zeylanica* Gaertn., Chickenspike. Cp (FL, SC), Pd (GA, NC): rice plantations, reservoirs, other disturbed wetlands; rare, native of Old World tropics. August-October. [= K, S, WH, Z; = S. zeylandica – RAB, GW, orthographic error (presumably from a mistaken notion that the epithet refers to New Zealand rather than Ceylon)]

**361. HYDROLEACEAE** Berchtold & J. Presl 1820 (Hydrolea Family) [in SOLANALES]

A family of one genus and about 12 species, herbs and shrubs of water bodies and wetlands, primarily tropical. The Hydroleaceae is not closely related to Hydrophyllaceae; recent molecular data confirm the view prevailing through most of the 19th century that *Hydrolea* should be placed in its own family. References: Ferguson (1998); Hilger & Diane (2003); Angiosperm Phylogeny Group (1998, 2003, 2009).

*Hydrolea* Linnaeus 1762

A genus of about 11 species, aquatic and wetland herbs, of tropical and subtropical regions.

1. Flowers in axillary cymes; leaves 3-14 cm long, 1.5-4 cm wide; axillary spines present in the axils of some leaves; corolla 7-8 mm long.
2. Calyx and stem glabrous, or minutely puberulent or with sessile glands...............................................................................................................................................................................H. quadrivalvis
3. Calyx and stem sparsely pubescent with spreading hairs 2-3 mm long.............................................................................H. uniflora

1. Flowers in terminal cymes or corymb; leaves 2-6 cm long, 0.6-2.5 cm wide; axillary spines present or absent; corolla 10-15 mm long.
3. Leaves ovate to ovate-lanceolate, 3-6 cm long, 1.5-2.5 cm wide; axillary spines preset, well-developed, to 1.5 cm long.............H. ovata

*Hydrolea corymbosa* J. Macbride ex Elliott, Skyflower. Cp (FL, GA, SC): pond cypress savannas, depression meadows; uncommon (rare north of FL). Ne. SC south to sw. GA and s. FL. See Nelson (1993). The author is sometimes stated as J.F. Macbride, but this is an error. [= RAB, GW, K, WH; = *Nama corybosum* (Macbride ex Elliott) Kuntze – S]

*Hydrolea uniflora* Rafinesque. Swamp forests, sloughs, marshes. June-September. Mainly in the Mississippi River Alluvial Plain, west to e. TX and east to AL, TN, and KY. [= C, F, G, GW, K; = *Nama affine* (A. Gray) Kuntze – S; = *Hydrolea affinis* A. Gray]

**364. OLEACEAE** Hoffmannsegg & Link 1813 (Olive Family) [in LAMIALES]

1. Leaves compound.
2. Leaves pinnately compound with > 5 leaflets; petals absent; fruit a samara; small to large tree; [tribe Oleaeae, subtribe Fraxininae]..........
3. Flowers white, lilac, or purplish; fruit a drupe or 4-seeded capsule.
4. Leaves cordate or truncate at the base; fruit a 4-seeded capsule; corolla lobes shorter than the tube; flowers lilac or white, in terminal panicles; [tribe Oleaeae, subtribe Ligustrinae].................................................................Syringa
5. Corolla absent; calyx minute or lacking; flowers in axillary fascicles; [tribe Oleaeae, subtribe Oleinae]..................................Forestiera

*Oleaceae* Linnaeus 1753

A family of one genus and 2 species, trees and shrubs, nearly cosmopolitan, but centered in Asia.

1. Flowers in axillary cymes; leaves 3-14 cm long, 1.5-4 cm wide; axillary spines present in the axils of some leaves; corolla 7-8 mm long.
2. Calyx and stem glabrous, or minutely puberulent or with sessile glands...............................................................................................................................................................................H. quadrivalvis
3. Calyx and stem sparsely pubescent with spreading hairs 2-3 mm long.............................................................................H. uniflora

1. Flowers in terminal cymes or corymb; leaves 2-6 cm long, 0.6-2.5 cm wide; axillary spines present or absent; corolla 10-15 mm long.
3. Leaves ovate to ovate-lanceolate, 3-6 cm long, 1.5-2.5 cm wide; axillary spines preset, well-developed, to 1.5 cm long.............H. ovata

*Hydrolea corymbosa* J. Macbride ex Elliott, Skyflower. Cp (FL, GA, SC): pond cypress savannas, depression meadows; uncommon (rare north of FL). Ne. SC south to sw. GA and s. FL. See Nelson (1993). The author is sometimes stated as J.F. Macbride, but this is an error. [= RAB, GW, K, WH; = *Nama corybosum* (Macbride ex Elliott) Kuntze – S]

*Hydrolea uniflora* Rafinesque. Swamp forests, sloughs, marshes. June-September. Mainly in the Mississippi River Alluvial Plain, west to e. TX and east to AL, TN, and KY. [= C, F, G, GW, K; = *Nama affine* (A. Gray) Kuntze – S; = *Hydrolea affinis* A. Gray]
Chionanthus Linnaeus 1753 (Fringe-tree, Old Man's Beard)

A genus of controversial circumscription, either of only 3 species, limited to se. North America and e. Asia, or (if including Linociera) of about 60, primarily tropical. *C. pygmaeus* Small is endemic to scrub in peninsular FL. References: Hardin (1974)=Z.

*Chionanthus virginicus* L. (Fringe-tree, Old Man's Beard. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA, VA), April-May; July-September. NJ, s. PA, s. OH, and MO south to c. peninsular FL and e. TX. *C. virginicus* in our area shows a diversity of morphology and correlated habitat that suggests the possible presence of two taxa. Swamp- and pocosin-inhabiting populations in the outer Coastal Plain have leaves 4-8× as long as wide and seem very different than Piedmont dry woodland populations with leaves 1-2× as long as wide; further and more careful study is needed. *C. virginicus* is a traditional southern yard plant, often used as a "specimen plant," very showy in spring, particularly when grown to its full size. [= RAB, C, F, G, GW, K, S, W, WH, Z]

Forestiera Poiret 1812 (Forestiera)

1 Leaves (6-) 7-8 (-9) cm long, long-acuminate or acuminate (rarely acute) at the apex, the tip sharply pointed; [of swamp forests, sloughs, and ponds] ......................................................................................................................................................F. acuminata
   1 Leaves 1.5-7 (-8) cm long, obtuse at the apex, or if short-acuminate the ultimate tip blunt; [of shell middens and calcareous bluffs].
   2 Leaves deciduous, at least sparsely pubescent on the midrib above, pubescent and non-punctate below.  First-year twigs pubescent, the pubescence evenly distributed (not in 2 lines); petioles moderately pubescent; flowering in early spring from buds on twigs of the previous season; leaves 5-7 (-8) cm long .................................................................F. godfreyi
   2 Leaves evergreen, glabrous above, glabrous and punctate below; leaf margins entire ............................................F. segregata
   3 First-year twigs pubescent, the pubescence in 2 lines on either side of the twig; petioles glabrous (or with a very few hairs); flowering in mid-late summer, the flowers in leaf axils; leaves mostly 2-5 cm long .............................................................................................................................................F. ligustrina

*Forestiera acuminata* (Michaux) Poiret, Swamp-privet. Cp (FL, GA, SC): swamp forests, especially over calcareous substrates; uncommon. March; May-June. SC south to n. FL, west to TX, north in the interior to KY, e. and c. TN, IN, IL, MO, and KS. [= RAB, C, F, G, GW, K, S, Q, WH, X, Y, Z]

*Forestiera godfreyi* L.C. Anderson, Godfrey's Forestiera. Cp (FL, GA, SC): shell middens, maritime forests over shell substrate; rare. Mid January-February; April-May. Se. SC (Beaufort and Charleston counties) to e. GA and n. peninsular and e. Panhandle FL. [= K, WH, X, Y; < F. pubescens Nuttall – S, in part (apparently)]

*Forestiera ligustrina* (Michaux) Poiret, Southern-privet. Cp (FL, GA, SC), Pd (GA, SC): upland forests and slopes along streams, mostly on shell middens or calcareous rocks; uncommon (rare in SC). E. SC south to n. peninsular FL, west to se. TX, north in the interior to c. TN and KY. [= K, S, Q, X, Z]

*Forestiera segregata* (Jacquin) Krug & Urban var. segregata, Florida-privet. Cp (FL, GA, SC): calcareous scrub, shell middens, maritime forests and thickets; rare. Se. SC south to s. FL, and in the West Indies. Var. pinetorum (Small) M.C. Johnston is restricted to s. FL. [= K, Q, Z; > F. porulosa (Michaux) Poiret – S; > F. globularis Small – S; < F. segregata – WH, X]

Forsythia Vahl 1804 (Forsythia, Golden-bells)

1 Mature branches hollow or irregularly pith-filled between the nodes; leaves oblong-ovate, toothed or 3-parted; branches arching when well-developed .................................................................................................................F. suspensa
   1 Mature branches cross-septate (chambered) between the nodes; leaves oblong-lanceolate, toothed; branches upright ................................F. viridisssima

1 Young twigs 4-angled or narrowly 4-winged; [trees of calcareous woodlands west of ne. WV, sw. VA, e. TN, nw. GA, and c. AL]; [section Dipetalae] ............................................................................................................................. ......................................................................................

1 Young twigs terete (rounded in cross-section); [trees of various habitats, collectively widespread in our area].

2 Lateral leaflets sessile; calyx absent; seed cavity of samara flattened in cross-section; [of VA and KY northwards]; [section Fraxinus] ..........

2 Petiole bases and leaf scars oblong-obovate to widely obovate with a nearly truncate apex; samaras (32-) 33-54 mm long, samara wings (19-) 25-32 (-38) mm long, 1.5-2.5 mm wide; twigs, petioles, petiolules, and rachises glabrous

3 Leaves minutely honeycomb-reticulate beneath (best seen at magnification of 40× or more), and sometimes pubescent, more-or-less strongly whitened; wing of the samara decurrent only onto the upper 1/3 (or less) of the samara body ............................... F. americana

3 Leaves glabrous to pubescent beneath (and sometimes with papillae and small scales visible at 40×, but never minutely honeycomb-reticulate), green; wing of the samara decurrent onto 1/2 (or more) of the samara body.

4 Petiolules of the lowermost leaves 1-9 mm long, all but 1-2 mm narrowly winged; samara mostly < 7 mm wide; calyx 0.5-1.5 mm long ................................................................. F. pennsylvanica

4 Petiolules of the lowermost leaves 3-20 mm long, not winged (except F. caroliniana); samara mostly > 7 mm wide; calyx 1-6 mm long.

5 Body of samara flattened, winged the full length of the samara body; calyx 1 mm long; leaf scars slightly notched; small tree, often multi-trunked ......................................................................................................................... F. caroliniana

5 Body of samara terete or subterete, winged about 1/2 the length of the samara body; calyx 2.5-6 mm long; leaf scars deeply notched; medium to large tree, typically single-trunked ............................................................................................................................. F. profunda

New provisional key

1 Leaves minutely honeycomb-reticulate beneath (best seen at magnification of 40× or more), more-or-less strongly whitened (and otherwise variously glabrous or pubescent).

2 Petiole bases and leaf scars V- to U- or crescent-shaped with a deeply concave or notched apex; samaras (19-) 25-32 (-38) mm long, samara wings 3-5 (-6) mm wide, samara bodies (5-) 6-11 mm long, 1.5-2.5 mm wide; twigs, petioles, petiolules, and rachises glabrous

3 Twigs, petioles, petiolules, and rachises densely hirtellous to hirtellous-puberulent to tomentulose; samaras 33-54 mm long, samara wings 6-8 mm wide, samara bodies (7-) 11-15 mm long, 2-4 mm wide ......................................................................................................................... F. biltmoreana

3 Twigs, petioles, petiolules, and rachises glabrous; samaras (32-) 36-44 mm long, samara bodies (4.5-) 5-7 mm wide, samara bodies (9-) 10-13 mm long, 2.5-3.5 mm wide ............................................................................................................................. F. smallii

4 Youngest twigs 4-angled to narrowly 4-winged; petiole bases raised on a distinct pedestal; lateral leaflets sessile to subsessile.

5 Samara bodies flattened but clearly distinct from wings, wings 5-10 mm wide; buds gray to reddish brown; leaf scars crescent-shaped, apex concave; flowers bisexual ......................................................................................................................... F. quadrangulata

5 Samara bodies strongly flattened and often nearly indistinct from wings, wings 5-8 mm wide; buds black to blackish brown; leaf scars shallowly hemispheric, apex truncate; flowers bisexual and unisexual ......................................................................................................................... [F. excelsior]

4 Youngest twigs terete; petiole bases flush with stem; lateral leaflets sessile to subsessile or petiolulate.

6 Multi-trunked shrubs or small trees; samara wings 2-3, arising from the base or proximal ⅛ of body, (8-) 10-20 mm wide ...................... F. caroliniana

6 Trees; samara wings 2, arising from near the base to near apex of body, (5.5-) 6-10 (-12) mm or 4-7 mm wide.

7 Lateral leaflets sessile; samara bodies strongly flattened and often nearly indistinct from wings; buds black to blackish brown, corky-ridged ............................................................................................................................. F. profunda

7 Lateral leaflets petiolulate; samara bodies distinct from wings; buds brownish, not corky-ridged

8 Leaflets mostly (6-) 7.5-11 (-12) cm × 2.5-5(-6) cm, bases obtuse to acute or abruptly attenuate; samaras 20-45 (-60) mm, wings arising abruptly from distal ⅔/1-5/ (⅗) of body, 4-7 mm wide ................................. F. pennsylvanica

8 Leaflets (7-) 9-15 (-25) cm × (2.5-) 3.5-7 (-11) cm, bases often rounded, less commonly obtuse to acute or acuminate; samaras (35-) 40-70 (-75) mm, wings gradually expanded from near the base of the body to proximal ⅓, (5.5-) 6-10 (-12) mm wide ..........

Fraxinus Linnaeus, White Ash, American Ash. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): mesic slopes, rich cove forests, dryish calcareous or mafic glades and woodlands (with Juniperus

OLEACEAE

1 Leaves trifoliolate; flowers white ................................................................................................................................. [J. multiflorum

2 Leaflets 1-3 cm long; flowers 2.5-7 cm across .............................................................................................................. J. mesnyi

2 Leaflets 2.5-7 cm long; flowers 3.5-5 cm across ............................................................................................................ [J. nudiflorum

* Jasminum nudiflorum Lindley, Winter Jasmine, native of China, is commonly planted and often persists. It has green stems and yellow flowers. Reported for GA (K). [= K]

Ligustrum Linnaeus 1753 (Privet)

[contributed by Guy L. Nesom and Alan S. Weakley]

1. Leaves (3-) 4-13 (-15) cm long.
2. Leaves mostly (3-) 4-8 (-9) cm long, primary lateral veins 3-5 pairs, apex acute to abruptly acuminate, abaxial midvein covered by epidermis; flowers short-pedicellate on pedicels 0.5-2 mm; corolla tube hardly exserted from calyx, ca. equal lobe length .................. L japonicum
3. Leaves 4.5-6 x 13 (-15) cm, primary lateral veins (5-) 6-8 pairs, apex usually long-acuminate, abaxial midvein not covered by epidermis; flowers subsessile on pedicels 0-0.5 mm; corolla tube distinctly exserted from calyx, ca. 2 x longer than lobes ...................... L lucidum

1. Leaves 1.5-6 (-6.5) cm long.
2. Branchlets glabrous and usually glossy ................................................................. L ovalifolium
3. Branchlets minutely hirsutellous, hirsute-hirtellous, or hirsutulous, dull.
4. Leaf blades hirsutulous abaxially, rarely only along the nerves, sparsely hirsute-striose adaxially, sometimes mostly near the margins, primary lateral veins (5-) 6-8 pairs, apices sharply acute (to slightly acuminate, or rarely obtuse) ......................... [L tschonoskii]
5. Leaf blades glabrous on both surfaces or sometimes sparsely hairy along the abaxial midvein, primary lateral veins (2-) 3-6 pairs, apices obtuse to acute (in L vulgar) or obtuse to rounded.
6. Leaf blades narrowly oblanceolate to oblanceolate-elliptic, oblanceolate or narrowly obovate, usually broadest slightly above the middle; inflorescence usually narrowly cylindric, flowers sessile to subsessile in verticil-like clusters ......................... L quihoui
7. Leaf blades variously shaped; inflorescence broadly cylindric to pyramidal, flowers sessile to pedicellate in broadly cylindric to pyramidal panicles of cymes.
8. Corolla tube < 1.2 x as long as the lobes.
9. Leaf blades oval-elliptic to oblong-ovate, elliptic-lanceolate, or suborbicular, primary lateral veins (3-) 4-5 pairs, apex obtuse to rounded or retuse, abaxial midvein usually sparsely hirsutulous to puberulent; inflorescence diffuse and open panicles terminal and on essentially leafless, lateral branches interspersed with leafy ones; branchlets hirtellous to loosely substipitate with straight hairs of uneven length; corolla tube slightly shorter than lobes, often barely exserted from the calyx tube; pedicels glabrous ......................................................... L sinense
10. Leaf blades narrowly oblong-elliptic to oblanceolate-elliptic, oblanceolate or narrowly obovate, usually broadest slightly above the middle; inflorescence usually narrowly cylindric, flowers sessile to subsessile in verticil-like clusters ......................... L vulgar
11. Corolla tube 1.5-3 x longer than the lobes.
12. Leaf blades usually sparsely villous abaxially; calyx and pedicels sparsely to densely hirtellous (rarely nearly glabrous); corolla tube 2-3 x as long as the lobes .......................... L obtusifolium var. obtusifolium
13. Leaf blades usually glabrous abaxially; calyx and pedicels glabrous to very sparsely hirtellous; corolla tube 1.5-2 x as long as the lobes ............................................. L obtusifolium var. suave

* Ligustrum lucidum* Aiton f., Glossy Privet, Broadleaf Privet. Pd (NC), Cp (FL, NC): disturbed places; rare, native of China, Japan, and Korea. This species is superficially similar to *L japonicum*; the lateral leaf veins are translucent in this species. [= K, WH, Y, Z]
* Ligustrum obtusifolium* Siebold & Zuccarini var. obtusifolium. Cp (NC, VA), Pd (NC, VA), Mt (VA, WV), {SC}: disturbed places; uncommon (rare in WV), native of Japan. [= Y; = L obtusifolium – C, F, G, K, Z]
* Ligustrum obtusifolium* Siebold & Zuccarini var. suave (Kitagawa) H. Harms, Privet. Cp, Pd (NC, VA), Mt (VA), {SC}: disturbed places; uncommon, native of Japan. [= Y; = L amurense Carrière – RAB, C, F, G, K, Z; = Ligustrum obtusifolium Siebold & Zuccarini var. amurense (Carrière) Mansfeld]
* Ligustrum sinense* Loureiro, Chinese Privet. Cp (FL, GC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): moist forests, especially alluvial bottomlands; common, native of China. This species is one of the most noxious of our weeds, choking out native vegetation in hundreds of square kilometers of land in our area. The rapidity with which it has engulfed southern wetlands is hinted at by Small's (1933) mention of it only as "an escape in southern Louisiana." [= RAB, C, G, GW, K, S, W, WH, Y, Z]

Ligustrum tschonoskii Decaisne. Pd (DC): suburban forests; rare, native of Japan. Known in the flora area "only from the woods along the bank of Rock Creek in Rock Creek Park" (Nesom 2009a; Shetler and Orli 2000). Two varieties within *L tschonoskii* were recognized by Noshiro (1985), distinguished by slight and overlapping size differences. Var. *tschonoskii* is restricted in native range to Japan; var. *kiyozumianum* (Nakai) Ohwi occurs in Japan and Korea. [= Y]

Osmanthus Loureiro 1790 (Wild Olive, Devilwood)

OLEACEAE

1 Leaf margins entire; leaves usually >7 cm long; [native tree of Coastal Plain forests] ................................................................. **O. americanus**

1 Leaf margins spiny-toothed; leaves < 10 cm long; [horticulturally planted, rarely naturalizing] .............................................................. **O. ×fortunei**

**Osmanthus americanus** (Linnaeus) Bentham & Hooker f. ex A. Gray, Wild Olive, Devilwood. Cp (FL, GA, NC, SC, VA): maritime forests and (in FL, GA, SC, and extreme s. NC) dry, sandy forests well inland, and reported for wet habitats as well further south; uncommon (rare in VA). April-May; August-October. Se. VA south to c. peninsular FL, west to LA; also in Mexico. **O. megacarpus** Small, sometimes treated as a variety, **O. americanus** var. **megacarpus** (Small) P.S. Greene, is endemic to pine scrub in peninsular FL and differs primarily in having a larger fruit. The very hard, tough, and “unsplittable” wood is the inspiration for the common name “Devilwood.” **O. americanus** is a conspicuous element of maritime forests in most of our area, readily recognizable by the flattened twigs characteristic of the family, and the opposite (or typically, actually subopposite), glossy, oblanceolate to obovate, evergreen leaves. [= RAB, F, G, GW, WH; = **O. americanus** var. **americanus** – C, K, Z; = **Amarolea americana** (Linnaeus) Small] *

**Osmanthus ×fortunei** Carrière [= **O. fragrans** × **heterophyllus**], Fortune’s Sweet Olive. Pd (NC): suburban woodlands, escaped from horticultural plantings; rare, hybrid originating in Japan of two species native to Japan.

**Syringa** Linnaeus 1753 (Lilac)

* **Syringa vulgaris** Linnaeus, Lilac. Mt (NC, VA, WV): commonly planted, persistent and naturalizing around old farms; rare, native of se. Europe. [= C, F, G, K, Z]

365. **TETRACHONDRACEAE** Wettstein 1924 (Tetrachondra Family) [in LAMIALES]

A family of 2 genera, **Polypremum** and **Tetrachondra** (Oxelman et al. 1999), and 3 species, perennial herbs, of s. North America south to South America, and New Zealand. The assignment of **Polypremum** to family has been controversial, with placement formerly in Loganiaceae or Buddleiacae. A recent molecular analysis strongly suggests that its closest relationship is with **Tetrachondra** (Oxelman et al. 1999), and the treatment followed here reflects the current general consensus. References: Oxelman et al. (1999); Wagstaff in Kadereit (2004).

**Polypremum** Linnaeus 1753 (Polypremum)

The genus is monotypic, an herb, or warm temperate, subtropical and tropical America. References: Rogers (1986)=Z; Wagstaff in Kadereit (2004).

**Polypremum procumbens** Linnaeus, Polypremum, Rustweed, Juniperleaf. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): fields, disturbed areas; common, rare in Mountains. Late May-September; August-October. Se. NY, NJ, and MO south to FL and TX, and south into Central America, South America West Indies. [= RAB, C, F, G, GW, K, S, W, Z]

368. **PLANTAGINACEAE** A.L. de Jussieu 1789 (Plantain Family) [in LAMIALES]

As newly and radically recircumscribed, a family of about 120 genera and 1800 species. References: Albach, Meudt, & Oxelman (2005); Olmstead et al. (2001); Schwarzbach in Kadereit (2004); Fischer in Kadereit (2004).

1 Leaves alternate, at least those on the upper stem; calyx 5-merous; stamens 4.

2 Corolla lacking a spur or pouch at the base.

3 Stem erect; flowers > 10 mm long; [tribe **Digitaleae**] ................................................................................................................................. **Digitalis**

3 Stems prostrate; flowers < 5 mm long; [tribe **Limoselleae**] .................................................................................................................. **Limosella**

2 Corolla with a distinct spur or broad pouch protruding between the 2 lower calyx lobes; [tribe **Antirrhineae**].

4 Corolla with a broad pouch at the base.
5 Corolla with a slender spur at the base.
6 Flowers in terminal racemes.
7 Corolla yellow; capsule 9-12 mm long.................................................................Linaria
8 Stems erect; leaves linear ......................................................................................Chaenorrhinum
9 Calyx lobes distinctly unequal, all longer than the corolla tube; corolla 25-40 mm long; leaves to 15 mm wide. ………Antirrhinum
5 Calyx lobes about equal, all shorter than the corolla tube; corolla 25-40 mm long; leaves to 15 mm wide. ………Antirrhinum
4 Corolla with a slender spur at the base.
6 Flowers solitary in leaf axils.
7 Corolla blue; capsule 2-3 mm long........................................................................Nuttallanium
8 Stems prostrate; leaves orbicular, ovate, or triangular.
9 Leaves orbicular in outline, palmately lobed and veined; stems rooting at nodes .................................................Cymbalaria
10 Leaves strongly basally disposed, usually all the leaves basal; petals 4, scarious and translucent in texture; inflorescence a spike; [tribe Plantagineae] ..................................................................................................................Antirrhinum
10 Leaves caulescent, either opposite or whorled; petal 0, or 4, or 5; inflorescence various.
11 Leaves opposite.
12 Aquatic; leaves 5-30 mm long, lanceolate, toothed to deeply dissected into linear segments; [tribe Gratioleae] ..................Limnophila
13 Calyx and corolla 4-merous.
14 Calyx and corolla 5-merous.
16 Plants erect, moderately robust, usually > 4 dm tall, larger leaves > 5 cm long; inflorescences terminal (the bracts subending flowers strongly reduced in size in comparison to main leaves of the stem); [tribe Cheloneae] .........................................................Chelone
17 Inflorescence compact, the inflorescence axis generally hidden by the closely packed and overlapping flowers; each flower subended by large overlapping bracts. .........................................................................................Chelone
18 Stamens 2; [section Gratioleae].
19 Capsule flattened, wider than long, notched; leaves dimorphic, with narrow submersed leaves on the lower stems, and broad floating leaves just subending the aerial inflorescences; [of vernal pools on granite outcrops in Piedmont SC, GA, and AL]. .................................................................................................................Gratiola amphibantha
20 Flowers and fruits on definite pedicels; annual or perennial; leaves not papillose .........................................................Gratiola
21 Sepals evidently connate into a tube about as long as the lobes; [section Cheloneae] .........................................................Collinsia
22 Leaves deeply pinnatifid; [tribe Stemoniaceae] ..........................................................Leucospora
23 Corolla nearly radially symmetrical; corolla lobes about as long as the corolla tube; leaves palmately veined, with parallel veins diverging from the base, margins entire to crenulate; of aquatic to moist habitats, often somewhat succulent ..........................................................................................................................Bacopa
24 Flowers and fruits sessile or subsessile, the pedicels < 1 mm long; perennial; leaves papillose on the surfaces and margins ..............................................................................................................................Sophronanthus
25 Stamens 4.
26 Plants creeping, decumbent or erect, small, usually < 4 dm tall (except Mecardonia, to 5 dm tall), larger leaves < 5 cm long; inflorescences axillary (all or most of the flowers axillary to more-or-less normally sized leaves).
27 Flowers and fruits on definite pedicels; annual or perennial; leaves not papillose .........................................................Mecardonia
28 Stamens 2; [section Gratioleae].
29 Capsule turgid, longer than wide; leaves monomorphic; [collectively of many habitats and widespread].
30 Flowers and fruits sessile or subsessile, the pedicels < 1 mm long; perennial; leaves papillose on the surfaces and margins ..............................................................................................................................Sophronanthus
31 Stamens 4.
32 Plants erect, moderately robust, usually > 4 dm tall, larger leaves > 5 cm long; inflorescences terminal (the bracts subending flowers strongly reduced in size in comparison to main leaves of the stem); [tribe Cheloneae] .........................................................Chelone
33 Inflorescence more diffuse, the inflorescence axis readily visible between the flowers; flowers lacking extra subending bracts .........................................................................................................................Chelone
34 Leaves entire or toothed; [tribe Cheloneae].
35 Corolla distinctly bilabiate; corolla lobes shorter than the corolla lobe; leaves pinnately veined, with a single main-vein and lateral veins diverging along it, margins serrate; of moist habitats, not succulent .................................................Mecardonia

Antirrhinum Linnaeus 1753 (Snapdragon)
A genus of about 20 species, herbs, of Mediterranean Europe. References: Sutton (1988)=Z; Pennell (1935)=P. [also see Misopates]

* Antirrhinum majus Linnaeus, Common Snapdragon. Mt (VA, WV), Pd (VA): cultivated, rarely persistent or naturalized; rare, native of Mediterranean Europe. July. [= C, G, K, P, WV, Z]

Bacopa Aublet 1775 (Water-hyssop)
A genus of about 50 species, herbs (mostly aquatic or at least wetland), of tropical, subtropical, and warm temperate regions of the Old and New Worlds. References: Schuyler (1989)=Z; Fernulal (1942); Pennell (1935)=P.

1 Leaves ovate to oblanceolate, cuneate at the base, 1-veined (or with 1-2 additional obscure veins), 3-8 mm wide; stems glabrous; fresh plants not aromatic ..............................................................................................................................B. monnieri
1 Flowers and young fruits lacking bracts at their base; leaves monomorphic, obovate-spatulate, rounded at the tip. Schuyler (1989) concluded that GW, K, Z; F, G, GW, K, W, WH; Bacopa rotundifolia where apparently native (though C considers introduced). Known in NC only from Lake Mattamuskeet, Hyde County, where not muddy shores, streams and pools; common (uncommon in GA, NC, SC, and VA). E. VA south to s. FL, west to c. TX; disjunct in KY. The strongly fragrant stems and leaves are unique. [= RAB, C, F, G, GW, K, W, WH; = Hydrotridica rotundifolia (Walter) Small – P, S]

2 Fresh plants not aromatic when bruised; corolla pale to bright blue, 9-13 mm long; calyx subtended by 2 subulate bractlets; stamens 4-10 mm long; calyx not subtended by bractlets; stamens 2 or 4.
3 Flower margin either not winged or with a wing < 0.05 mm wide, narrowing towards the base of the fruit before ending above the base; fruit ellipsoidal, obovoid, or nearly heart-shaped.
4 Leaves strongly clasping, mostly ovate; stamens 2 (or very rarely 4); [native] Bacopa repens

Bacopa inominata (Gómez Maza) Alain, Tropical Water-hyssop. Cp (FL, GA, NC, SC, VA): freshwater tidal mudds, marshes, shallow water; uncommon (rare in GA, NC, SC, and VA). June-September. MD south to s. FL, and in the West Indies and Central America. B. stragula Fernald has been considered a rare endemic of tidal areas in VA and MD, differing from B. inominata in its glabrous stems (vs. pubescent), smaller flowers (the corolla < 3 mm long vs. > 3 mm long), and shorter, glabrous pedicels 3-6 mm long (vs. pubescent and to 8 mm long). Schuyler (1989) concluded that B. stragula is an intertidal form of B. inominata, the morphologic differences induced by the flooding regime. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. [= C, GW, K, WH, Z; B. cyclophyila Fernald – RAB; B. stragula Fernald – F, G; ? Herpestis rotundifolia Gaertner – P, S; ? Macuillamia obovata Rafinesque – P]

Bacopa rotundifolia (Michaux) Wettstein, Midwestern Water-hyssop. Cp (NC, VA): tidal mudds, shallow water of large natural lake; rare. June-September. IN and IA west to ND and MT, south to AL and AZ, disjunct in e. MD, e. VA, and ne. NC, where apparently native (though C considers introduced). Known in NC only from Lake Mattamuskeet, Hyde County, where not seen since 1929. B. simulans Fernald has been considered a rare endemic of tidal areas in VA and MD. It is alleged to differ from B. rotundifolia in its glabrous to glabrescent stems (vs. pubescent), more succulent condition, smaller leaves (the larger 1-2 cm long and 0.6-1.5 cm wide vs. 2-3.5 cm long and 1.5-2.7 cm wide), smaller flowers (corolla 3-4 mm long vs. 6-10 mm long). Schuyler (1989) concluded that B. simulans is an intertidal form of B. rotundifolia, the morphologic differences result the the differences of inundation. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. [= C, GW, K, Z; B. rotundifolia – F, G; B. simulans Fernald – F, G; = Macuillamia rotundifolia (Michaux) Rafinesque – P, S]

Callitrichie Linnaeus 1753 (Water-starwort)

A genus of 20-50 species, annual and perennial herbs of aquatic, wetland, and upland habitats, notably cosmopolitan. This genus should be included in a greatly expanded Plantaginaceae. References: Angiosperm Phylogeny Group (2003, 2009); Crow & Hellquist (2000)–Z; Fassett (1951)–Y; Erbar & Leins in Kaderéeit (2004). Key based on Z.

1 Flowers and young fruits with 2 inflated bracteoles at the base; leaves dimorphic (with floating rosettes of spatulate leaves and submerged linear leaves) or monomorphic.
2 Fruit margin distinctly winged, the wing nearly 0.1 mm wide, extending the entire distance from the summit to the base of the fruit; fruit globose
3 Flower margin either not winged or with a wing < 0.05 mm wide, narrowing towards the base of the fruit before ending above the base; fruit ellipsoidal, obovoid, or nearly heart-shaped.
4 Flowers and young fruits lacking bracts at their base; leaves monomorphic, obovate-spatulate, rounded at the tip.
5 Mericarps bent at an angle and thickened on one side at the base; [of SC southward] Mericarps not bent at an angle nor thickened at the base; [collectively widespread].
6 Fruit on pedicels 0.5-7 mm long; margin of fruit curled over on itself, appearing thickened; fruit developing underground 
7 Fruit on pedicels 0.1-0.6 mm long; margin of fruit narrow, thin; fruit developing aboveground

Callitrichie heterophylla Pursh var. heterophylla, Common Water-starwort. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV): pools, slow-moving streams, ditches; common (uncommon in GA, NC, SC, and VA Piedmont, uncommon in Mountains). March-October. Greenland west to AK, south to c. peninsular FL, TX, CA, and Mexico. The other variety, var. bolanderi (Hégelmann) Fassett, with larger fruits, co-occurs with var. heterophylla in nw. North America
and is of uncertain taxonomic status, having been treated as species, subspecies, variety, and lumped. [<\textit{C. heterophylla} – RAB, C, G, GW, S, WH, Z; > \textit{C. heterophylla} – F; > \textit{C. aniceps} Fernald – F, Y; = \textit{C. heterophylla} ssp. \textit{heterophylla} – K; > \textit{C. heterophylla} var. \textit{heterophylla} – Y]

\textbf{Callitriche palustris} Linnaeus, Swamp Water-starwort. Cp (DE, VA), Pd (DE, VA), Mt (VA, WV): ponds, lakes, stagnant streams, wet soil; rare. Circumboreal, in North America south to VA, WV, IL, TX, and CA; South America. The nomenclatural debate between \textit{C. palustris} and \textit{C. verns} is difficult to resolve. = C, F, K, S = \textit{C. verns} Linnaeus – G, W, Y, Z

\textbf{Callitriche pedunculosa} Nuttall. Cp (FL, GA, NC), Pd (NC): low fields, pond shores; rare. NC, c. TN, and OK south to c. peninsular FL, AL, and TX. = [K, WH; = \textit{C. nutallii} Torrey – GW, Y, Z]

\textbf{Callitriche peplodes} Nuttall. Cp (FL, GA, SC): low fields, ditches; rare. April-June. SC south to s. FL, west to TX; disjunct inland in TN, AR; e. Mexico south to Costa Rica. = RAB, GW, K, S, W; = \textit{C. peplodes} var. \textit{peplodes} – Y)

* \textbf{Callitriche stagnalis} Scopoli. Pd (DE, VA), Mt (VA), Cp (VA): ponds, stagnant water, wet soil; rare, native of Europe, or possibly also native in some areas. See Philbrick, Aakjaer, & Stucky (1998) for additional discussion of the spread of this species in North America. = C, F, K, Y, Z

\textbf{Chaenorrhinum} (A.P. de Candolle ex Duby) Reichenbach 1828

\textit{Dwarf Snapdragon, Lesser Toadflax)}

\textbf{Chelone} Linnaeus 1753 (Turtlehead)

\textbf{Identification notes:} The four fertile stamens are inserted on either side of the corolla near its base and are flattened and conspicuously pilose. The single staminodium (the color of which is used in the key) is much shorter (often only a few mm long), and is inserted uppermost on the corolla near its base.

1 Leaves sessile; flowers distinctly 4-ranked; staminodium purple; corolla purple ................................................................. \textit{C. cuthbertii}

1 Leaves with petioles 0.5-1.5 cm long (or subsessile in \textit{C. glabra}); flowers less distinctly 4-ranked; staminodium white or green; corolla purple or white.

2 Petioles 1.5-4 cm long; leaf blade rounded at the base; leaf blades averaging 2× as long as wide, 4-8 cm wide; staminodium white; corolla purple ......................................................................................................................................................... \textit{C. elongata}

2 Petioles 0.1-1.5 cm long; leaf blade cuneate at the base; staminodium white or green; leaf blades averaging 3× (or more) as long as wide, 1-6 cm wide; corolla purple or white.

3 Corolla white (or tinged with purple near the summit); staminodium green ..................................................................................... \textit{C. glabra}

3 Corolla purple throughout; staminodium white .............................................................................................................................. \textit{C. obliqua}

**Collinsia** Nuttall 1817 (Blue-eyed Mary)

**Cymbalaria** Hill 1756 (Kenilworth-ivy)

* Cymbalaria muralis P.G. Gaertner, B. Meyer, & Scherbias ssp. muralis, Kenilworth-ivy. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): naturalized on walls and rock crops near plantings, roadsides, disturbed areas; uncommon (rare in NC and VA), native of Eurasia. May-August. The other two subspecies, both villous throughout (vs. glabrous or with a few scattered hairs in ssp. muralis) are Mediterranean and are not known to be naturalized in North America. Reported for NC (Henderson County) by Pittillo & Brown (1988) as "derived from potted plants that have become established beneath the overhang of a porch for over a decade," and reported again more recently as spreading from plantings in Alleghany County, NC (Poindexter 2006) and Buncombe County, NC (C.A. McCormick, pers.comm. 2009). Reported by Pennell (1935) as being "in herbaria" from DC, KY, MD, SC, TN, WV, and other states beyond our area. [= Z; < C. muralis – C, F, G, K, P, WV; = C. cymbalaria (Linnaeus) Wettstein; = Linaria cymbalaria (Linnaeus) P. Miller]

**Digitalis** Linnaeus 1753 (Foxglove)

A genus of about 19 species, herbs, of Europe west to central Asia. Famous as the source of the drug digitalis, a cardiac glycoside. References: Pennell (1935)=P.

1 Corolla 1.3-1.8 cm long, pale yellow to white; plant nearly glabrous .................................................................[D. lutea]
2 Corolla 2-5.5 cm long, white, yellow, or purple; plant conspicuously pubescent on the stem and/or leaves.

* Digitalis purpurea Linnaeus, Digitalis, Common Foxglove, Purple Foxglove, Lady’s-glove. Mt (NC, WV), Cp (VA): disturbed areas, bog margins; uncommon (rare in NC and VA), native of Europe. June-August. Introduced and established at scattered locations in ne. North America, as far south as PA (Rhoads & Klein 1993). [= C, P, WV; > D. purpurea var. purpurea – K; > D. purpurea var. alba – K]

* Digitalis lutea Linnaeus, Straw Foxglove. Naturalized south to MD, PA, and OH. [= C, G, K]

**Gratiola** Linnaeus 1753 (Hedge-hyssop)

**Identification notes:** Gratiola amphiantha somewhat resembles Callitriche, but has floating leaves in single pairs rather than in a whorl.

1 Capsule flattened, wider than long, notched; leaves dimorphic, with narrow submersed leaves on the lower stems, and broad floating leaves just subtending the aerial inflorescences; [of vernal pools on granite outcrops in Piedmont SC, GA, and AL]...............................G. amphiantha
2 Capsule turgid, longer than wide; leaves monomorphic; [collectively of many habitats and widespread].
3 Flowers and fruits sessile or sub sessile, the pedicels < 1 mm long; perennial.
4 Leaves linear-subulate; corolla 2-3× as long as the calyx .................................................................[see Sophronanthe hispida]
5 Leaves ovate; corolla 1-1.5 × as long as the calyx .................................................................[see Sophronanthe pilosa]
6 Flowers and fruits on definite pedicels; annual or perennial.
7 Calyx subtended by 0 (-1) bractlet; corolla lobes white; corolla tube greenish yellow, conspicuously veined.........................G. ramosa
8 Calyx subtended by 2 bractlets; corolla lobes white or yellow-orange; corolla tube greenish yellow and conspicuously veined, or orange and not conspicuously veined.
9 Corolla lobes and tube yellow-orange (very rarely white), not conspicuously veined; sepals and flower stalks sparsely or not at all glandular-puberulent.................................................................G. aurea
10 Corolla lobes white to lavender, corolla tube greenish yellow, usually conspicuously veined; sepals and flower stalks densely glandular-puberulent.

Gratiola aurea Pursh, Yellow Hedge-hyssop, Golden-pert. Cp (DE, FL, GA, NC, SC): blackwater river banks, pondcypress savannas in Carolina bays, other acidic wetlands; uncommon (rare in FL). May-September. NL (Newfoundland) and QC south in the Coastal Plain to Panhandle FL; disjunct around the Great Lakes and inland in NY, ON, IL, and ND. [= RAB, C, F, G, GW, K, S, WH; > G. lutea Rafinesque var. typica – P; > G. lutea var. obscura (Pennell) Pennell – P]

Gratiola parviflora D. Estes, Limestone Hedge-hyssop, Quarterman’s Hedge-hyssop. Ip (TN): limestone glades; rare. April-early June. C. TN south to n. AL; c. TX (Edwards Plateau); s. ON; ne. IL. [= Z; < G. neglecta – C, GW, K, P, S, W; < G. neglecta var. neglecta – F]

Gratiola ramosa Walter. Cp (FL, GA, NC, SC, VA): wet pine savannas, marshes, pond margins; ditches; common (rare in VA). May-June. Se. NC south to s. FL, west to sw. LA; disjunct in se. VA (Greenville County) and (at least historically) in c. MD. [= RAB, C, F, G, GW, K, P, S, WH]

Gratiola virginiana Linnaeus, Virginia Hedge-hyssop. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, WV): sluggish streams, bogs, wet areas; common (uncommon in WV). March-May. NJ west to OH and IA and KS, south to c. peninsular FL, c. TX. Var. aestuariorum Pennell, of s. NJ south to e. VA, is alleged to differ in being shorter, with more rounded leaves, short pedicels (< 2 mm long), a shorter calyx and corolla, and a smaller capsule; it is likely merely a stunted form, but needs additional study (see F and P for additional details). [= RAB, C, G, GW, S, W, WH, WV; > G. virginiana var. virginiana – F, K, P; > G. virginiana var. aestuariorum Pennell – F, K, P]

Kickxia Dumortier 1827 (Fluellen, Cancerwort)

1 Leaves round-ovate, rounded to cordate at the base; pedicels villous throughout their length; [ballast wair] ..........................................

K. spuria

1 Leaves triangular-ovate or hastate, truncate at the base; pedicels glabrous through much of their length or villous; [more widespread alien].
2 Stems densely villous; stems robust (usually 1.5-3.5 mm thick), often much-branched; pedicels 5-12 (-20) mm long, 0.25-0.35 mm in diameter, often villous their entire lengths..............................................................K. elatine ssp. crinita
2 Stems sparsely villous; stems slender (to 1.5 mm thick), sparingly (if at all) branched, pedicels mostly (8-) 15-25 (-30) mm long, 0.1-0.2 mm in diameter, glabrous except for immediately below the calyx ..............................................................................K. elatine ssp. elatine

**Leucospora** Nuttall 1834 (Leucospora)

A genus of 2 species, herbs, of e. North America and Coahuila, Mexico. *Leucospora* may not be distinct from *Stemodia.* References: Pennell (1935)=P.

*Leucospora multifida* (Michaux) Nuttall, Leucospora, Narrowleaf Paleseed. Cp* (FL*, NC*), Pd (VA*), Mt (GA, WV): moist to wet, sandy margins of artificial ponds, drawdown areas on riverbanks, drawdown depressional wetlands, other seasonally ponded disturbed areas; rare, probably introduced in most of our area from c. United States. S. ON west to IA and KS, south to nw. GA, AL, LA, and e. TX; scattered occurrences further east (as in e. NC, FL, KY, TN, VA, and se. PA) may be recent introductions. [= C, G, GW, K, P, S, = Conoeba multifida (Michaux) Bentham – F, WH; = Stemodia multifida (Michaux) Sprengel]

**Limnophila** R. Brown 1810 (Marshweed)

A genus of about 37 species, of tropical regions of the Old World.

**Limosella** Linnaeus 1753 (Mudwort, Awl-leaf)

A genus of about 11 species, aquatic herbs, of cosmopolitan distribution. References: Pennell (1935)=P.

*Limosella australis* R. Brown, Mudwort, Awl-leaf. Cp (DE, NC, VA): fresh or slightly brackish tidal flats; rare. June. NL (Newfoundland) and QC south along the Atlantic Coast to se. VA and extreme ne. NC. This plant is very inconspicuous, though locally abundant. [= K; ? L. subulata Ives – RAB, C, F, G, GW, P]

**Linaria** P. Miller 1754 (Yellow-toadflax)

A genus of about 150 species, of temperate regions of Eurasia. References: Sutton (1988)=Z; Pennell (1935)=P. [also see Nuttallanthus]

*Linaria maroccana* Hooker f., Moroccan Toadflax. Mt (WV), Pd (VA): disturbed areas; rare, native of n. Africa. Introduced in VA (perhaps just a waif) and WV. [= K] {investigate; not yet keyed; synonymy incomplete}

**Mecardonia** Ruiz & Pavón 1794 (Mecardonia, Axil-flower)

A genus of about 10 species, of tropical, subtropical, and warm temperate regions of America. References: Pennell (1935)=P.

1 Corolla yellow; outer sepals broadly lanceolate to ovate, overlapping the shorter, much narrower inner sepals.................................................M. procumbens
1 Corolla white, with purple veins; sepals lanceolate nearly equal in length.
2 Peduncles > 10 mm long; sepals < 2 mm wide ...............................................................................................................................M. acuminata var. acuminata
2 Peduncles < 10 mm long; sepals > 2 mm wide ...............................................................................................................................[M. acuminata var. microphylla]

*Misopates* Rafinesque 1840 (Weasel's-snout)

* *Misopates orontium* (Linnaeus) Rafinesque, Weasel's-snout, Lesser Snapdragon. Pd (VA), Cp (FL): disturbed sites; rare, cultivated, persistent or possibly naturalized, native of Eurasia. Introduced at least far south as se. PA (Rhoads & Klein 1993), KY (Pennell 1935), and FL Panhandle (Hansen & Wunderlin 2008). [= K, WH; = *Antirrhinum orontium* Linnaeus – C, G, P, Z]

*Nuttallanthus* D.A. Sutton 1988 (American-toadflax)

A genus of 4 species, herbs, of North and South America. Sutton (1988) separates these three species, along with *N. subandinus* (Diels) D.A. Sutton, of Bolivia, Chile, Ecuador, Peru, and Uruguay, from *Linaria* on the basis of "the corolla with the abaxial lip greatly exceeding the adaxial lip; the palate weakly developed and scarcely occluding the tube; the spur very slender or absent and the prismatic seeds with 4-7 longitudinal ridges." *Nuttallanthus* is American; *Linaria* is Eurasian. References: Sutton (1988)=Z; Pennell (1935)=P. Key based on Z.

1 Infructescence axis zigzag; fruiting pedicels densely glandular pubescent, 5-13 mm long, 2× or more as long as the calyx............ *N. floridanus*
1 Infructescence axis straight or nearly so; fruiting pedicels glabrous or with a few scattered glandular hairs, 2-6 (-9) mm long, < 1× as long as the calyx.

2 Corolla 8-11 (-13) mm long (measured from the tip of the spur to the apex of the adaxial lip), the abaxial lip 2-6 mm long; seeds longitudinally ridged, the intervening faces smooth or with sparse low tubercles......................................................... *N. canadensis*  
2 Corolla 14-22 mm long (measured from the tip of the spur to the apex of the adaxial lip), the abaxial lip 6-11 mm long; seeds densely tuberculate, not longitudinally ridged............................................................ *N. texanus*

**Nuttallanthus canadensis** (Linnaeus) D.A. Sutton, Common Toadflax. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV): in a wide variety of natural and disturbed habitats, especially common and weedy in disturbed sites such as roadsides and fields, also common and apparently native in thin soil of rock outcrops; common (rare in WV, rare in Mountains of VA). March-May. NS west to ND, south to s. FL and TX; also adventive on the west coast, from WA to CA. Sutton (1988) comments that there is substantial variation in this species not taxonomically explained. [= K, Z; < *Linaria canadensis* (Linnaeus) Dumortier – RAB, W (also see *N. texanus*); = *Linaria canadensis var. canadensis* – C, F, G, S; = *Linaria canadensis* (Linnaeus) Dumortier – P, WH, WV]

**Nuttallanthus floridanus** (Chapman) D.A. Sutton, Florida Toadflax. Cp (FL, GA): sandhills, scrub, dunes, other dry, sandy places; uncommon. E. GA south to s. FL and west to s. MS. [= K, Z; = *Linaria floridana* Chapman – P, S, WH]

**Nuttallanthus texanus** (Scheele) D.A. Sutton, Texas Toadflax. Cp (FL, GA, NC*?, SC*, VA*?), Pd (NC*, SC): granite flatrocks, dry sandy soils, tidiest soils of roadsides and fields; uncommon, native of sc. United States, not clear how far east the original range extended. March-May. Ranging as a native species in sc. and sw. North America and in temperate South America; introduced elsewhere (as in most of our area, the exact limits unclear). [= K, Z; < *Linaria canadensis* (Linnaeus) Dumortier – RAB, W; = *Linaria canadensis var. texana* (Scheele) Pennell – C, F, G, S; = *Linaria texana* Scheele – P, WH]

**Penstemon** Mitchell 1769 (Beard-tongue, Penstemon)

1 Cauline leaves bipinnatifid; basal leaves sessile; [ endemic to GA]; [ section *Dissecti*].............................................................................................................. *P. dissectus*  
1 Cauline leaves entire or toothed; basal leaves petiolated; [collectively widespread].

2 Infructescence with many nodes; anther cells dehiscing by short proximal slits; [ s. GA south to s. FL]; [ section *Multiflori*]...... *P. multiflorus*  
2 Infructescence with <10 nodes; anther cells dehiscing their entire length; [collectively widespread].

3 Corolla glandular-pubescent within; [ section *Tubiflori*]........................................................................................................... *P. tubiflorus*  
3 Corolla pubescent with non-glandular hairs within; [section *Gracilis*].
PLANTAGINACEAE

802

4 Lower lobes of the corolla essentially equaling the upper lobes; corolla throat with little ridging on its floor; sterile filament slightly to moderately bearded.
5 Anthers with short, stiff hairs; corolla white, lined with purple.
6 Stems pubescent; inflorescence glabrous or slightly glandular-pubescent; corolla 16-23 mm long ..................[P. alluviorum]
5 Anthers glabrous; corolla purple to violet.
7 Sepals long-attenuate, to 12 mm long; leaves finely serrate; corolla 20-35 mm long ..................[P. calycosus]
7 Sepals < 8 mm long; leaves obscurely serrate; corolla leaves boldly deflexed; corolla 15-22 mm long ..................[P. laevigatus]
4 Lower lobes of the corolla projecting beyond the upper lobes; corolla throat strongly ridged on its floor; sterile filament densely bearded (only moderately bearded in P. pallidus).
8 Throat of corolla more-or-less closed by a palate formed by the upward arch of the corolla lip (opened only by the weight of the landing pollinator).
9 Buds yellow-purple; corolla violet-purple with white lobes (fading white when dried); leaves essentially glabrous..................[P. hirsutus]
9 Buds yellow; corolla creamy white; leaves pubescent ..........................................................[P. tenuiflorus]
8 Throat of corolla open.
10 Peduncles strongly ascending, the inflorescence therefore narrow; corolla reddish-purple ....................[P. australis]
10 Peduncles spreading, the inflorescence therefore relatively broad; corolla white to violet or purple.
11 Leaves pubescent, but not velvety; corolla violet or purple.
11 Leaves velvety pubescent; corolla white with fine purple lines ..................................................[P. pallidus]
12 Basal leaves truncate or cordate at base; lower bracts of inflorescence foliose, slightly smaller than the cauleine leaves..........................[P. smallii]
12 Basal leaves cuneate at base; lower bracts of inflorescence reduced, much smaller than the cauleine leaves.
13 Cauline leaf blades wide, ovate-lanceolate to ovate ..........................................................[P. canescens]
13 Cauline leaf blades narrow, acute to acuminate ..........................................................[P. laxiflorus]

?? Penstemon digitalis Nuttall ex Sims, Tall White Beardtongue. Mt (NC, SC, VA, WV), Pd (DE, VA), Cp (DE, VA): alluvial forests, moist fields, disturbed areas; common (rare in Coastal Plain of VA). May-June; July-August. NS and ME west to MN and SD, south to e. VA, w. SC, AL, and TX. [= RAB, C, F, G, GW, K, P, S, W, WV, Z]

Penstemon disectus Elliott, Georgia Beardtongue, Grit Beardtongue. Cp (GA): Altamaha Grit outcrops, sandhills; rare. Endemic to Altamaha Grit outcrops and other sandy areas from e. GA south and west to sw. GA. This species is unmistakable because of its bipinnatifid leaves. [= K, P, S, Z]

Penstemon laxiflorus Pennell. Cp (FL, GA): dry sandy areas; rare. C. GA, FL Panhandle, and n. AL west to c. OK and c. TX. [= K, P, S, Z; < P. australis – WH; = P. laxiflorus Small sp. laxiflorus (Pennell) Bennett]

Penstemon species 1. Of e. AL, with very small corollas and sharply dentate teeth. Under study by Dwayne Estes.

Penstemon tenuiflorus Pennell, Plateau Beardtongue, Limestone Beardtongue, Kentucky Beardtongue. Endemic to the Interior Low Plateau of wc. KY, c. TN, n. AL, extending slightly into the Coastal Plain to the west, and disjunct in the Black Belt of AL and MS. [= C, F, G, K, P, S, Z]

Penstemon tubiflorus Nuttall, Tube Beardtongue. A more western species, reaching its eastern limit in w. TN (Chester, Woffor, & Kral 1997). It is also known from adventive sites further east, as in e. PA (Rhoads & Klein 1993). [= S; = P. tubaeﬂorus – C, G, P, Z, orthographic

1 Leaves cauline, opposite; spikes on peduncles from the leaf axils; [section Psyllium] ..............................................................................................................P. psyllium

2 Leaves ovate to broadly lanceolate or broadly oblongate, distinctly broadened upward from a petiolar base, the leaves > 1 cm wide (some species keyed both ways).

3 Leaf venation pinnate, some major veins departing from the midvein well above the leaf base; perennial from thick, fleshy rootstock, typically 3-8 cm wide near its summit, with a cavity below (like an inverted bowl), and with 3-10 fleshy roots 3-15 mm thick descending or spreading from the bowl rim; capsule 2-4-seeded; scapes hollow and terete; [aquatic or semi-aquatic]; [section Palaeopsyllium] ..............................................................................................................P. cordata

4 Leaves broadly ovate-elliptic, the blades 1-3× as long as wide, distinctly petiolate; scapes solid and terete; [section Plantago].

5 Fruit 2.5-4 mm long, dehiscent near the middle, the terminal portion about as long as the basal; sepals broadly ovate, ca. 1.5× as long as wide, mostly obtuse; petals usually green and pubescent at the base........................................................................P. major

6 Bracts and calyx glabrous; perennial, flowering April-November.

7 Mature seeds 2.5-3 mm long, reddish, nearly flat on both sides; sepals with an excurrent midrib; leaves typically toothed; [rare

8 Spikes very densely flowered, the rachis hidden; capsule 2-30-seeded; scapes either solid and terete, solid and angled, or hollow and terete; [terrestrial].

9 Summer and winter leaves not dimorphic, all leaves lanceolate or linear, plant either perennial from thin, fibrous roots, or annual from a small taproot; [terrestrial].

10 Leaves mostly broadly oblongate, broadly lanceolate, or spatulate, (3-) 4-10× as long as wide, attenuate to the only somewhat petiolar base; scapes solid and 5-angled, or hollow (tu solid) and terete.

11 Bracts of the lower flowers in the spikes not conspicuously exserted, < 2× as long as the subtended flower.

12 Leaves ovate; [section Virginica] ..............................................................................................................P. virginica

13 Bracts of the lower flowers in the spikes conspicuously exserted, at least 2× as long as the subtended flower.

14 Leaves glabrous or puberulent above; longer bracts 8-30 mm long; seeds 2.2-3.0 mm long .................................................P. aristata

15 Bracts 1-2× as long as the calyx; seeds 1.3-1.9 mm long .................................................................P. patagonica

16 Annual; flowers with 2 stamens; capsule 4-25-seeded; leaves linear, 0.5-5 mm wide; [section Micropsyllium].

17 Capsule mostly 10-25-seeded; seeds 0.5-0.8 mm long .................................................................P. heterophylla

18 Spikes loosely flowered, the rachis visible its entire length; scape terete; [rare native of Coastal Plain pinelands and adjacent fire-plow lines, ditches, and mowed roadsides]; [section Palaeopsyllium] ..............................................................................................................P. sparsiflora

* Plantago aristata Michaux, Buckhorn Plantain. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, especially dry, barren, exposed soil, such as clay soils denuded by bull-dozing; common (uncommon
in DE), introduced from farther west (though the original distribution is unclear, and the species is sometimes considered native in at least portions of our area). Late April-July. [= RAB, C, F, G, K, S, W, WH, WV, Z]

**Plantago cordata** Lamarck, King-root, Heartleaf Plantain. Pd (NC), Mt (GA, VA), Cp (VA): aquatic or semi-aquatic in streambeds with outcrops of slate, aquatic in tidal estuaries; rare. March-April; May-June. NY and s. ON west to WI, south to w. VA, c. NC, nw. GA, AL, sc. TN, and MO, very scattered and rare in every state in which it occurs, except MO. Characteristically, *P. cordata* is a very robust plant, the inflorescences often 1 meter in height, and the glabrous leaves with ovate blades to 30 cm long and 20 cm wide, on ascending petioles up to 40 cm long and 2 cm wide; Winter leaves are 3-10 cm long, ca. 1 cm wide, and remotely toothed. Slighting show a gradual transition from the winter form to the summer form. *P. cordata* is not known to be extant in VA, where it formerly occurred in the estuary of the Potomac River and in Smyth County in sw. VA. In NC, *P. cordata* is apparently limited to 2 slate-bottomed streams in s. Davidson County, where it is locally abundant. A recent study of morphological and genetic variability in the species found the 2 NC populations to "represent sites of primary [conservation] concern with unique genetic composition" (Myrnes & Les 1993). [= RAB, C, F, G, K, S, W, X, Z]

**Plantago major** Linnaeus, Common Plantain, Whiteman's-foot. Cp (DE, FL*, GA, NC, SC, VA), Pd (DE, GA, NC, VA), Mt (GA, NC, SC, VA, WV): lawns, roadsides, disturbed areas; common (uncommon in FL, GA, NC, SC, VA, and WV), native of Europe, possibly also native in ne. North America, possibly as far south as the northern part of our area. June-November. Very variable, and possibly worthy of some of the infraspecific subdivisions suggested by various authors. The Coastal Plain populations associated with the Chesapeake Bay in VA may represent a native, estuarine genotype. [= RAB, C, GW, K, S, WH, WV, Z, > P. major var. major – F; > P. major var. scopolum Fries & Broberg – F; > P. major ssp. pleiosperma Pilger var. paludosa Béguinot – G; > P. major ssp. pleiosperma Pilger var. scopolum Fries & Broberg – G; > P. major var. intermedia (A.P. de Candolle) Pilger]

**Plantago maritima** Linnaeus var. juncoides (Lamarck) A. Gray, Seaside Plantain. Cp (VA): salt marshes; rare. Var. *juncoides* apparently ranges from Greenland and ne. Canada south to e. VA. Other varieties occur in nw. North America and n. Eurasia, the species as a whole is an intermediately circumboreal plant of ocean shores, also disjunct inland in saline areas. [= K; = P. maritima ssp. juncoides (Lamarck) Hultén – C; > P. juncoides Lamarck var. decipiens (Barneoud) Fernald – F; < P. maritima – G]

* **Plantago rhodopensis** Decaisne, Redseed Plantain, reported as ranging east to KY, TN, and GA (Kartesz 1999), probably as adventive from further west. The reports for GA and TN require confirmation. [= C, F, G, K]

* **Plantago sparsiflora** Michaux, Pineland Plantain. Cp (FL, GA, NC, SC, VA): wet savannas over calcareous substrates (coquina limestone), now usually found in moister human-created microhabitats adjacent to these sites, such as fire-plow lines, shallow ditches along roadsides, or mowed powerline rights-of-way; rare. April-October. Se. NC south to ne. FL, restricted to the Coastal Plain. Harper (1944), with his usual keen understanding of the ecology of southeastern plants, has provided the most succinct and accurate description of the habitat of this plant: "flatish pine-barrens where there is evidently some calcareous material not far from the surface." Reports of this species for VA are in error. [= RAB, GW, K, S, WH, X, Z]

* **Plantago wrightiana** Decaisne, Wright's Plantain. Cp (FL, GA, NC, SC), Pd (GA, NC, SC, VA): roadsides, lawns, disturbed areas; common (uncommon in NC). Late April-July. VA, NC, OK, and AZ south to c. peninsular FL, MS, TX, and Mexico, the original distribution unclear. [= K, WH, Z; = P. hookeriana Fischer & C.A. Meyer var. nuda (A. Gray) Poe – RAB, W]

* **Plantago floccosa** Decaisne. Cp (FL): disturbed areas; rare, native of {}. Panhandle FL. [= WH] {not yet keyed; add to synonymy}

**Scoparia** Linnaeus 1753 (Goat-weed, Sweet-broom)
| 1 | Corolla white; sepals 4, ovate; stem 3-8 dm tall; annual ................................................................. | \( S. \) dulcis |
| 1 | Corolla yellow; sepals 5, lanceolate; stem 1-1.5 d tall; perennial .................................................. | \( S. \) montevidensis var. glandulifera |

*Scoparia montevidensis* (Sprengel) R.E. Fries var. glandulifera (Fritsch) R.E. Fries. Cp (FL, NC): on ballast, other disturbed areas; rare, native of South America. [= K, P, WH]

**Sophronanthe Bentham 1836**

A genus of 2 species, herbs, of southeastern North America. The two taxa included here are not part of *Gratiola*. References: Pennell (1935) = P.

| 1 | Leaves linear-subulate; corolla 2-3× as long as the calyx .......................................................... | \( S. \) hispida |
| 1 | Leaves ovate; corolla 1-1.5 × as long as the calyx ................................................................. | \( S. \) pilosa |

**Veronica Linnaeus 1753 (Speedwell)**

A genus of about 180 species, herbs, nearly cosmopolitan (at least now), most diverse in Europe. The genus appears to be paraphyletic as currently circumscribed (Albach & Chase 2001). References: Walters & Webb (1972)=Z; Crow & Hellquist (2000)=Y; Pennell (1935)=P. Key partly based on C.

| 1 | Flowers in axillary racemes; upper bracteal leaves opposite throughout. | .......... |
| 2 | Leaves and stems pubescent; [plants of mesic to dry habitats]; [section Veronica]. | .......... |
| 3 | Leaves cuneate at the base; leaves widest at the middle or beyond; pedicels equaling or longer than the subtending bracts. | .......... |
| 4 | Stem pubescence generally distributed; calyx shorter than the capsule; style 6-8 mm long; stems erect .... | \( V. \) austriaca ssp. teucrium |
| 5 | Stems pubescence restricted to 2 lines; calyx longer than the capsule; style 3-5 mm long; stems creeping or ascending. | .......... | \( V. \) chamaedrys |

| 1 | Leaves broadest towards the base, acute at the tip; style 2.5-3.5 mm long .................................................. | \( V. \) americana |
| 1 | Leaves broadest near or above the middle, rounded at the tip; style 1.8-2.2 mm long ......................................... | \( V. \) beccabunga |

| 1 | Leaves (at least the middle and upper) sessile. | .......... | \( V. \) scutellata |
| 2 | Capsule flattened, conspicuously notched at the style and therefore appearing 2-lobed, wider than long; seeds 1.2-1.8 mm long; leaves (3-)4-20+ as long as wide; < 1 cm wide, tapering to the base and not clapping; [section Veronica]. | .......... | \( V. \) austriaca ssp. teucrium |
| 3 | Capsule turgid, slightly or not notched at the style, about as long as wide; seeds <0.5 mm long; leaves 1.5-5 (8-) as long as wide, mostly > 1 cm wide, clapping at the base; [section Beccabunga]. | .......... | \( V. \) austriaca ssp. teucrium |
| 4 | Racemes 20-65-flowered; pedicels 4-8 mm long; capsule ovoid to globose, not notched or barely so ............... | \( V. \) anagallis-aquatica |
| 5 | Racemes 5-25 (-35)-flowered; pedicels 3-6 mm long; capsule broadly obcordate, distinctly though slightly notched at the style..... | .......... | \( V. \) catenata |

| 1 | Flowers in terminal racemes or solitary and axillary, subtended by normally-sized leaves; upper bracteal leaves often alternate. | .......... | \( V. \) serpyllifolia var. peregrina |
| 9 | Bracts abruptly smaller than the foliage leaves, the flowers thus in well-developed terminal racemes or spikes; perennials from rhizomes. | .......... | \( V. \) serpyllifolia var. peregrina |
| 10 | Stems 3-10 dm tall; flowers in a crowded terminal spike; larger leaves > 4 cm long, sharply serrate; [section Pseudolysimachium] .......... | .......... | \( V. \) longifolia |
| 11 | Flowers bright blue; pedicels with some longer gland-tipped hairs; flowers usually < 12 per raceme .... | \( V. \) serpyllifolia var. humifusa |
| 12 | Flowers pale blue with darker blue lines; pedicels puberulent; flowers usually > 12 per raceme ............... | \( V. \) serpyllifolia var. serpyllifolia |
| 13 | Bracts gradually reduced in size upwards, all of the flowers or at least those lower on the stem axillary in the axes of well-developed foliage leaves; annuals (except \( V. \) filiformis); [section Pocilla]. | .......... | \( V. \) serpyllifolia var. peregrina |
| 14 | Pedicels 0-2 mm long; flowers in the axils of bracts, all or at least the upper of which are very different than foliage leaves. | .......... | \( V. \) serpyllifolia var. xalapensis |
| 15 | Leaves 3-10× as long as wide, toothed or entire; flowers white or very pale, ca. 2 mm across; stems usually glabrous (except \( V. \) serpyllifolia var. xalapensis) | .......... | \( V. \) serpyllifolia var. peregrina |
| 16 | Stem glabrous; sepals and fruit glabrous .................................................................................................. | \( V. \) serpyllifolia var. peregrina |
| 17 | Stem pubescent with short, gland-tipped hairs; sepals and fruit glabrous or pubescent with short, gland-tipped hairs ............................................................................................................. | \( V. \) serpyllifolia var. xalapensis |
13 Leaves 1-2× as long as wide, palmately lobed or toothed; flowers blue, 2-4 mm across; stems pubescent.
15 Upper leaves and lower bracts trilobed, the lobes cut > ½ way to base. \(\text{V. triphylllos}\)
15 Leaves unlobed (though crenate-serrate). \(\text{V. arvensis}\)
16 Style 0.4-1.0 mm long. \(\text{V. dillenii}\)
16 Style ca. 1.5 mm long. \(\text{V. serpyllifolia}\)
12 Pedicels 5-40 mm long; flowers in the axils of leaves similar in shape and size to foliage leaves (though the upper are sometimes somewhat smaller).
17 Perennial, the stems rooting at the nodes the length of the stem; pedicels > 2× as long as the the leaves. \(\text{V. filiformis}\)
17 Annual, the stems not rooting at the base (or at most only at the base of the plant); pedicels < 2× as long as the the leaves.
18 Calyx lobes cordate at the base; leaves with 3-7 teeth or shallow lobes. \(\text{V. hederifolia}\)
18 Calyx lobes cuneate to rounded at the base; leaves with usually > 7 small teeth or crenations.
19 Lobes of the capsule with apices diverging at ca. 90 degrees; corolla > 8 mm wide. \(\text{V. persica}\)
19 Lobes of the capsule with apices parallel or diverging at an acute angle; corolla < 8 mm wide.
20 Capsule with all hairs straight and gland-tipped; corolla white to pale blue or violet. \(\text{V. agrestis}\)
20 Capsule with a mixture of short, arching, non-glandular hairs and longer, straight, gland-tipped hairs; corolla bright blue. \(\text{V. polia}\)

* Veronica agrestis* Linnaeus, Field Speedwell. Pd (DE, GA, NC), Cp (DE, FL), Mt (GA), {VA, WV}: lawns and disturbed areas; common (rare in FL, GA, NC, and VA), native of Eurasia. [= C, F, G, K, P, WH, Z; < *V. agrestis* – RAB, G; < *V. polia* – WV]

* Veronica americana* Schweinitz ex Bentham, American Speedwell, Brooklime. Mt (NC, VA, WV), Pd (DE, VA), {SC}: bogs, marshes, streamside; uncommon (rare in DE, NC, and SC). May-June; July. NL (Newfoundland) west to AK, south to NC, TN, TX, and CA; ne. Asia. [= RAB, C, F, G, K, P, S, W, WV, Y]

* Veronica anagallis-aquatica* Linnaeus, Water Speedwell. Mt (NC, VA, WV), Cp (DE, NC, VA), Pd (DE, VA): bogs, marshes, streamside, ditches; uncommon (rare in NC). May-June; July. Circumboreal, south in North America to c. peninsular FL, TX, and CA; some occurrences probably represent introductions of European material. Some authors interpret *V. anagallis-aquatica* as being non-native in North America. [= C, F, G, P, WH, WV, Y; < *V. anagallis-aquatica* – RAB, C, K, W, Z]

* Veronica dillenii* Crantz, Dillenius’s Speedwell. Mt (VA): disturbed areas; rare, native of Europe. [= C, G, K, P, Z; < *V. verna* Linnaeus – F]

?? * Veronica officinalis* Linnaeus, Common Speedwell, Gypsyweed, Heath Speedwell. Mt (GA, NC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, SC, VA): fields and forests; common, often interpreted as being of mixed native and alien background. May-August. [= RAB, C, G, P, S, W, WV, Z; > *V. officinalis var. officinalis* – F, K; > *V. officinalis var. tournefortii* (Vill.) Reichenbach – F, K]

* Veronica peregrina* Linnaeus var. persica, Common Purslane Speedwell. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): fields, roadsides, disturbed areas; common. April-May. NS and ND south to FL and TX; AK south to OR (perhaps only as an introduction?); South America. [= C, F, G, S, WV; = *V. peregrina* ssp. persica – K; < *V. peregrina* – RAB, W, Z; = *V. peregrina* var. typica – P; ? *V. peregrina* – WH]

* Veronica peregrina* Linnaeus var. xalapensis (Kunth) Pennell, Western Purslane Speedwell. Cp (GA), {NC?, SC?): fields, lawns, disturbed places; rare, probably introduced in our area on ballast. April-May. QC and AK south to MA, KY, TX, and south to Guatemala. [= C, F, G, P, S, WH, Z; < *V. peregrina* – RAB, G; ? *V. didyma* Tenore – P, misapplied; < *V. polia* – WV]

* Veronicastrum catenata* Pennell. Streams and wetlands. Circumboreal, the southern limits obscure because of taxonomic confusion, misidentifications, and misattributions. [= C, G; misapplied

---

**369. SCROPHULARIACEAE** A.L. de Jussieu 1789 (Snapdragon Family) [in LAMIALES]

There is increasing evidence that the Scrophulariaceae as traditionally constituted includes two main and quite distinct groups (Olmstead & Reeves 1995; Young, Steiner, & dePamphilis 1999; Albach, Meudt, & Oxelman 2005). Based on molecular analysis, Young, Steiner, & dePamphilis (1999) suggest that Scrophulariaceae, Antirrhinanthaceae, and Orobanchaceae be restructured to include the current members of Orobanchaceae, Scrophulariaceae, and Callitrichaceae. Beardsley & Olmstead (2002) suggest that *Mimulus* and *Mazus* be included with *Phryma* in a redefined Phrymaceae. Additional changes have been suggested, as summarized blow. References: Pennell (1935)=P; Olmstead & Reeves (1995); Young, Steiner, & dePamphilis (1999); Olmstead et al. (2001); Beardsley & Olmstead (2002). [also see OROBANCHACEAE, PAULOWNIACEAE, PHRYMACEAE, and PLANTAGINACEAE]

Disposition of the traditional Scrophulariaceae (including Antirrhinanthaceae), Orobanchaceae, Plantaginaceae, Buddlejaceae, Phrymaceae: Lindeniaceae: *Lindernia, Heisteria, Microphantherum, Torenia*

Orobanchaceae: *Agalinis, Aureolaria, Buchnera, Castilleja, Conopholis, Dasistoma, Epifagus, Macranthera, Melamphyrum, Orobanche, Pedicularis, Schwalbea, Seymeria, Sriga.*

Phrymaceae: *Glossostigma, Mazus, Mimulus, Phryma.*

Scrophulariaceae s.s.: *Buddleja, Scrophularia, Verbascum.*

---

**Buddleja** Linnaeus 1753 (Butterfly-bush)

A genus of about 90 species, trees and shrubs, of subtropical and tropical America, Asia, and Africa. The two species listed (and others) are grown for ornament and for their attractiveness as nectar-feeding sites for butterflies. References: Rogers (1986)=Z; Oxelman, Kornhall, & Norman in Kadereit (2004).

1 Leaves serrate or crenate; corolla, calyx, pedicels, and inflorescence rachis pubescent (not granular-farinose)…………………………………………………………………………………………………………………………………...*B. davidii*

1 Leaves entire or remotely dentate; corolla, calyx, pedicels, and inflorescence rachis granular-farinose……………………………………………………………………………………*B. lindleyana*

---

* Buddleja alternifolia* Maximowicz. Reported as introduced in NC by Kartesz (1999), but the alleged documentation is not present. *B. officinalis* Maximowicz is reported as introduced in GA by Kartesz (1999), but the alleged documentation is not available. [not keyed; not mapped; rejected as a component of our flora]

* Buddleja davidii* Franchet, Summer-lilac, Orange-eye Butterfly-bush. Mt (GA, NC, VA, WV), Pd (DE, SC): planted, rarely escaped to disturbed places, such as thickets or streambanks (Wise Co., VA); rare, native of China. June-October. [= RAB, C, F, G, K, Z]

* Buddleja lindleyana* Fortune ex Lindley. Pd (GA, NC, SC), Mt, Cp (NC, SC): rarely escaped to disturbed areas; rare, native of China. June-October. [= RAB, K, Z; = Adenoplea lindleyana (Fortune ex Lindley) Small – S]
SCROPHULARIACEAE

Scrophularia Linnaeus 1753 (Figwort)

A genus of about 200 species, of temperate and tropical regions of the Old and New Worlds. Though our 2 species are only subtly distinct morphologically, they are clearly distinct. References: Pennell (1935)=P; Fischer in Kadereit (2004).

1 Sterile filament (hidden under the upper corolla lip) yellowish-green, often wider than long; leaf serrations coarse, often > 3 mm long; flowering May-early July; capsule 4-7 mm long. ............................................................................................................................................................................ S. lanceolata

Verbascum Linnaeus 1753 (Mullein)

1 Leaves green and glabrous on both sides, or sparingly pubescent with glandular hairs; hairs of the calyx and upper stem simple and glandular.

2 Flowers < 2 mm long. ............................................................................................................................................................................ V. thapsus

3 Inflorescence generally simple (sometimes with 1-several small branches), dense and spike-like (at least initially); leaves moderately to densely tomentose above; upper 3 filaments bearing white hairs.

4 Leaves sessile, decurrent down the stem to the next leaf; stigma capitate; corolla yellow ............................................................ V. thapsus

5 Basal leaves lobed; inflorescence lacking glandular hairs; filaments bearing white hairs .................................................................. V. lycnitis

6 Basal leaves lobed; inflorescence with glandular hairs; filaments bearing violet hairs .................................................................. V. virgatum

* Verbascum sinuatum Linnaeus, Wavyleaf Mullein, is introduced at scattered locations in MD, PA, NJ, and NY, on ballast and in disturbed areas. July-August. [= G, K]

371. LINDERNIACEAE Borsch, K. Müller, & Eb. Fischer 2005 (False-pimpernel Family) [in LAMIALES]

1 Calyx conspicuously 5-winged .......................................................................................................................................................... Torenia

2 Flowers > 4 mm long. ........................................................................................................................................................................ Lindernia

3 Leaves elliptic, cuneate at the base; calyx lobes even, all of the sinuses reaching nearly to the base of the calyx. .................................. Hemianthus
LINDERNIACEAE

Hemianthus Nuttall 1817

1 Calyx lobes acute, ⅓ to ⅔ as long as the calyx tube; flowers opening, chasmogamous.................................H. glomeratus
1 Calyx lobes obtuse, < ⅓ as long as the calyx tube; flowers not opening, cleistogamous...............................H. micranthemoides

Hemianthus glomeratus (Chapman) Pennell. Lake margins, ponds. January-December. Panhandle FL (Gadsden County) south to s. FL. [= P; = Micranthemum glomeratum (Chapman) Shimmers WH]

Hemianthus micranthemoides Nuttall, Nuttall's Micranthemum. Muddy, freshwater intertidal shores, possibly extinct. NY (Hudson River) south to VA (Chesapeake Bay, Potomac River, James River). [= C, G, P; = Micranthemum micranthemoides (Nuttall) Wettstein F, K]

Lindernia Allioni 1755 (False-pimpernel)

1 Fertile stamens 4; calyx lobes connate at anthesis for > ⅔ their length, later separating; [section Torenioides].................................L. crustacea
1 Fertile stamens 2 (with 2 staminodia without anthers, or with rudimentary anthers); calyx lobes separate, or connate at base for < ⅓ the length of the calyx.

2 Capsule lanceoloid, > 8× as long as its diameter; calyx lobes connate at base < ⅓ the length of the calyx; [section Bonnaea].........L. antipoda
2 Capsule ovoid to ellipsoid, < 5× as long as its diameter; calyx lobes distinct to the base at anthesis and after; [section Brachycarpae].

3 Pedicels shorter than or about as long as the subtending leaves ..........................................................L. dubia var. dubia
3 Pedicels longer than the subtending leaves (or bracteal leaves in some species).
4 Leaves nearly orbicular; stems creeping .................................................................................................L. grandiflora
4 Leaves distinctly longer than wide; stems erect (sometimes decumbent at the base and rooting if knocked down by water).
5 Leaves not glandular punctate; seeds 2-3× as long as wide.................................................................L. dubia var. anagalidea
5 Leaves glandular punctate; seeds ca. 1× as long as wide.
6 Leaves primarily in a basal rosette, leaves of the stem strongly reduced upward to bracts; capsule (1.8-) 3.4-7 mm long; [primarily of seepage of flatrocks].............................................L. monticola ("monticola" form)
6 Leaves primarily on the stem, not conspicuously reduced upward; capsule 1.4-3.4 mm long; [of stream or river banks]..........L. monticola ("saxicola" form)

* Lindernia antipoda (Linnaeus) Alston. Disturbed areas; native of se. Asia, Polynesia, and n. Australia. [= K, Y]
* Lindernia crustacea (Linnaeus) F. Mueller. Lawns; native of Malaysia. September. [= RAB, GW, K, P, WH, X, Y]
* Lindernia diffusa (Linnaeus) Wettstein. Reported for SC by Kartesz (1999) on the basis of specimens at NCU, but the specimens so labelled are actually L. dubia. [rejected; not keyed or mapped]

Lindernia monticola Muhlenberg ex Nuttall, Flatrock Pimpernel, Riverbank Pimpernel. In seasonal seepage on granitic flatrocks, and on river-scoured siliceous rocks. April-June (-September). Nc. and sw. NC south to ne. FL and ec. AL. L. saxicola appears to be merely a form of L. monticola, the leafy stems the result of the basal leaves being covered by silt deposited by floodwaters (Qualls 1984; Lewis 2000); this needs additional study. [= K, WH, X; > L. monticola – RAB, GW, P, W, Y; > L.
LINDERNIACEAE

* Lindernia procumbens (Krock.) Borb. One record as a waif in Arlington County, VA. {rejected; not keyed or mapped}

Micranthemum Michaux 1803

Micranthemum umbrosum (J.F. Gmelin) Blake, Shade Mudflower. Shallow pools, stagnant streams, wet depressions in swamp forests. May-October. Se. VA south to FL, west to TX, and south into tropical America (Mexico, Central America, West Indies, e. South America). [= RAB, C, F, G, GW, K, P, WH; = Globifera umbrosa J.F. Gmelin – S]

Torenia Linnaeus 1753 (Blue-wings)

* Torenia fournieri Linden ex E. Fournier, Bluewings, Wishbone-flower. Disturbed areas, flowerbeds; native of China. Also reported for Mountains of NC (Pitillo & Brown 1988), but it appears that it was a short-lived waif there. Likely to be found sporadically, especially southwards. [= K, WH]

372. PEDALIACEAE R. Brown 1810 (Sesame Family) [in LAMIALES]

A family of about 13 genera and 70 species, herbs, shrubs, and trees, of the Old World tropics.

Sesamum Linnaeus 1753 (Sesame)

A genus of about 19 species, of the old World tropics.

* Sesamum orientale Linnaeus, Sesame. Disturbed areas; native of the East Indies. January-December. Also reported for AL. [= K, WH; = S. indicum Linnaeus – S]

373. LAMIACEAE Lindley 1836 or LABIATAE A.L. de Jussieu 1789 (Mint Family) [in LAMIALES]

A family of about 230-250 genera and 6700-7170 species, herbs, shrubs, vines, and trees, cosmopolitan. The placement in the Lamiaceae of several genera traditionally placed in Verbenaceae (e.g. Clerodendrum) is strongly supported by several lines of evidence. References: Harley et al. in Kadereit (2004).

incertae sedis: Callicarpa.
subfamily Viticoidae: Vitis.
subfamily Ajugoideae: Ajuga, Clerodendrum, Teucrium, Trichostema.
subfamily Scutellarioideae: Scutellaria.
subfamily Lamioideae:
tribe Synandreae: Synandra, Macbridea, Physostegia
tribe Stachydeae: Galeopsis, Stachys, Sideritis
tribe Leonurideae: Leonurus
tribe Marrubieae: Marrubium
tribe Lamieae: Lamium
subfamily Nepetoideae:
tribe Elsholtzieae: Collinsonia, Elsholtzia, Mosla, Perilla.
tribe Mentheae:
subtribe Salviinae: Rosmarinus, Salvia.
LAMIACEAE

subtribe Nepetinae: Agastache, Dracocephalum, Glechoma, Mechania, Nepeta.

incertae sedis: Melissa.

tribe Ocimeae:

subtribe Hypytidinae: Hypytis.

subtribe Ociminae: Ocimum.

I. Callicarpa Linnaeus 1753 (Beautyberry)

1 Leaves 7-23 cm long, stellate-scurfy beneath; peduncles 1-5 mm long.................................................................C. americana
1 Leaves 2-6.5 (-7) cm long, glabrous or nearly so beneath (except on the midrib); peduncles 10-20 mm long.
2 Inflorescence supra-axillary, diverging from the twig 1-4 mm above the leaf axil ..........................................................C. dichotoma
2 Inflorescence axillary, borne directly in the axil of the leaf..........................................................................................C. japonica

* Callicarpa americana Linnaeus, Beautyberry, American Beautyberry, French-mulberry. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): hammocks, other forests (especially with sandy or rocky soils), maritime forests (the main habitat northwards), disturbed areas; common (rare in Mountains). June-July; August-October (persisting into the winter). MD and AR south to s. FL, TX, Mexico, West Indies. [= RAB, C, F, G, K, S, W, WH]
* Callicarpa dichotoma (Loureiro) K. Koch, Chinese Beautyberry. Pd (NC, VA), Cp (DE, NC, VA), Mt (NC), {SC}: roadsidess, powerline rights-of-way, woodland edges, suburban woodlands, bogs; uncommon (rare in DE and VA), native of Asia. September-November. This species is beginning to spread more rapidly in the Southeast. [= RAB, C, K]

2 Vitex Linnaeus 1753 (Chaste Tree)

1 Leaves palmately 5-7-foliolate; leaflets lanceolate; plant an upright small tree.................................................................V. agnus-castus
1 Leaves unifoliolate (or palmately 3-foliolate); leaflets orbicular or obovate; plant a sprawling and spreading shrub/vine ............V. rotundifolia

* Vitex negundo Linnaeus, Chinese Chaste-tree. Reported for FL, MS, LA, KY. June-July; August-November. [= WH; > V. negundo var. intermedia (S.J. Pei) Moldenke – K; > V. negundo var. negundo – K, Z; > V. negundo var. heterophylla (Franchet) Rehder – K, Z; > V. negundo var. cannabifolia (Siebold & Zuccarini) Handel-Mazzetti – Z] (not keyed; rejected as not definitively naturalized in Flora area)
* Vitex rotundifolia Linnaeus f., Beach Vitex, Roundleaf Chaste-tree. Coastal dunes, planted for ornament and stabilization and now spreading aggressively as an invasive species; native of e. Asia, se. Asia, and nearby islands. See Cousins et al. (2010) and Roecker & Socha (2004) for additional information. The runners are reported to reach 10 m in length. [= K, Z; < V. trifolia Linnaeus ssp. littoralis Steenis]

3. Ajuga Linnaeus 1753 (Bugle, Bugleweed)

1 Leaves deeply cleft into narrow segments; corolla yellow; annual......................................................................................A. chamaepitys
1 Leaves entire to shallowly lobed; corolla blue (to white or pink); perennial.
2 Plants not stoloniferous; stems hairy all around................................................................................................................A. genevensis
2 Plants stoloniferous; stems hairy in lines .........................................................................................................................A. reptans
* Ajuga chamaepitys* (Linnaeus) Schreber, Yellow Bugle, Ground-pine Bugle. Cp (VA): disturbed areas; rare, native of Europe. May-September. [= C, F, G, K]

* Ajuga genevensis* Linnaeus, Standing Bugle. Mt (WV): disturbed areas; rare, native of Europe. Cultivated and rarely escaped in ne. North America, reported as naturalized as far south as PA (Rhoads & Klein 1993), MD (Kartesz 1999), and WV (Harmon, Ford-Werntz, & Grafton 2006), where considered “not confirmed as naturalized.” [= C, F, G, K, WV]

4. *Teucrium* Linnaeus 1753 (Germander)

* Teucrium botrys* Linnaeus, Cutleaf Germander. Mt (WV): disturbed areas; rare, native of Europe. July-September. [= C, K] {add to synonymy}

Teucrium canadense Linnaeus var. canadense. Mt (WV), Cp (DE), {GA, NC, SC, VA}: rich bottomlands; common. Mainly coastal, NS south to FL, west to TX and OK. [= C, F, G, K; < T. canadense – RAB, GW, W; = T. littorale Bicknell – S]

Teucrium canadense Linnaeus var. hypoleucum Grisebach. {GA, NC, SC}. E. NC south to FL, west to TX. [= K; < T. canadense – RAB, GW, W; = T. nashi Kamey – S]

Teucrium canadense Linnaeus var. occidentale (A. Gray) McClintock & Epling. Mt (VA, WV*). Reported for VA (Kartesz 1999). {investigate} Occurs at least as far south and east as PA (Rhoads & Klein 1993) and ne. WV. [= C, G, K; > T. occidentale A. Gray var. occidentale – F; > T. occidentale A. Gray var. boreale (Bicknell) Fernald – F, WV]

Teucrium canadense Linnaeus var. virginicum (Linnaeus) Eaton. Pd (DE), {AL, GA, MS, NC, SC, VA}: {habitat}; common. NY, QC, and MN south to GA, AL, MS, and TX. [= C, F, G, K; < T. canadense – RAB, GW, W; = T. canadense – S]

Teucrium cubense Jacquin var. cubense. AL. [= K] {synonymy incomplete}

5. *Clerodendrum* Linnaeus 1753 (Glory-bower)

A genus of about 400-500 species, trees and shrubs, mostly tropical and warm temperate, African and Asian (after removal of the “Pantropical Coastal” clade into Volkmemia (Yuan et al. 2010). References: Yuan et al. (2010); Steane et al. (1999); Hsiao & Lin (1995); Steane, de Kok, & Olmstead (2004); Harley et al. in Kadereit (2004).

| 1 Corolla tube > 8 cm long. | .......................................................... C. indicum |
| Corolla tube < 3 cm long. | .......................................................... C. chinense |
| 2 Calyx 5-8 mm long | .......................................................... C. bungei |
| 2 Calyx > 10 mm long. | .......................................................... C. chinense |
| 3 Corolla double | .......................................................... C. chindense |
| 3 Corolla single | .......................................................... C. trichotomum var. ferrugineum |

* Clerodendrum bungei* Steudel, Rose Glory-bower. Cp (FL, GA), Pd (GA, SC): roadsides and suburban woodlands; rare, native of e. Asia. August-September. First reported from South Carolina by Hill & Horn (1997); also reported for our area by W. Duncan (pers. comm.). [= K, WH]

* Clerodendrum japonicum* (Thunberg) Sweet. Also cultivated and is reported to be naturalized in MD (Staff of the Bailey Hortorium 1976). [= K] {not yet keyed}

* Clerodendrum trichotomum* Thunberg var. ferrugineum Nakai, Harlequin Glory-bower. Pd (NC), Mt (NC), Cp (FL), {GA}: roadsides, streambanks; rare, cultivated and strongly naturalized, native of e. Asia. [= K; < Clerodendron trichotomum – WH]

6. *Trichostema* Linnaeus 1753 (Blue Curls)

A genus of about 18 species, shrubs, annual and perennial herbs, of temperate North America (especially diverse in w. North America). Morphology, pollen, and phytogeography suggest the plausible recognition of *Trichostema* section *Orthopodium* (which includes this species and several from w. North America) as *Isanthus*, a genus distinct from section *Trichostema* (which includes all other eastern North American species). References: Weakley (in prep.)=Z; Lewis (1945)=Y; Harley et al. in Kadereit (2004).
1 Calyx lobes essentially equal; stamens straight, < 10 mm long; leaves acute to slightly acuminate, the two main lateral veins reascending to the midvein; [section Orthopodium] .......................................................... T. brachiatum
1 Calyx strongly bilobate; stamens strongly arched, 12-20 mm long; leaves obtuse, the two main lateral veins not reascending to the midvein; [section Trichostema]
2 Plants annual; larger leaves 3-7 cm long (excluding the petiole); plants with long internodes near the base, near-basal branches absent, the best-developed branches from the mid or upper stem; hairs on the upper stem long (0.5-2.0 mm long) or short (0.1-0.4 mm long); [collectively widespread, in a wide variety of habitats, primarily inland, though occasionally occurring as a weed in coastal areas].
3 Leaves 2.5-4× as long as wide; longer hairs of the upper stem (0.3-0.5-2.0 mm long).................................................. T. dichotomum
3 Leaves 5-15× as wide; longer hairs of the upper stem 0.1-0.3-0.4 mm long.......................................................... T. setaceum
2 Plants perennial; larger leaves 1-4 cm long (including the petiole); plants with short internodes near the base, near-basal branches well-developed, these often branching again; hairs on the upper stem short (0.1-0.4 mm long); [of the Coastal Plain]
4 Corolla deep blue (almost black in bud); flowers stems typically virgate, not branched above the base; hairs of the stem not longer at each node; [of peninsular FL, inland as well as on sand ridges near the coasts] ........................................................................................................ T. suffrutescens
4 Corolla pastel blue or pink; stems typically rebranching above the base, the plant more-or-less bushy; hairs of the stem longer at the node (in a line between the 2 petals); [of NC south to s. FL and west to s. MS; restricted to barrier islands, coastal peninsulas, and other maritime situations within 10 km of the ocean]
5 Anthers lemon yellow; leaves ovate-rombic, 1-1.5× as long as wide; corolla lavender (definitely with a pinkish tint); bark on older stems dark, tight; plants 1-4 dm tall, forming a tight, compact, hemispheric bush; [of maritime dunes, grasslands, and forest openings from 10 km north of Cape Hatteras (Dare County, NC) south to near Cape Romain (Georgetown County, SC) .................. T. species 1
5 Anthers blue; leaves spatulate, the petiole relatively well-developed, 1.5-3× as long as wide; corolla bluish (lacking a well-developed pinkish tint); bark on older stems yellow to tan, somewhat papery; plants 3-7 dm tall, often gangly and irregularly shaped; [of maritime dunes, grasslands, and coastal scrub from e. GA around the FL peninsula west to s. MS]................................. T. species 2

Trichostema brachiatum Linnaeus, Glade Blue Curls, False Pennyroyal. Mt (GA, NC, VA, WV), Pd (NC, SC, VA): shale barrens, outcrops of calcareous or mafic rock, diabase barrens, calcareous dry prairies, disturbed rocky areas; uncommon (rare in NC). August-September. VT and s. ON west to MN and NE, south to c. NC, nw. GA, AL, TX, and AZ. [= W, Y; = Isanthus brachiatus (Linnaeus) Britton, Sterns, & Poggenburg – C, F, K, S, WV; > Isanthus brachiatus var. brachiatus – G]

Trichostema species 1. Dune Blue Curls, Carolina Blue Curls. Cp (NC, SC): dunes on barrier islands, vegetated with perennial grasses (especially Uniola paniculata), openings in maritime scrub; rare. August-November. Endemic to barrier islands from slightly north of Cape Hatteras, Dare County, NC south to North Island, Georgetown County, SC, north of Cape Romain. When growing together, the flowering period of T. species 1 is about 2-3 weeks later than that of T. dichotomum. Despite a considerable overlap of blooming period, only one hybrid has been seen, and that in common-garden cultivation in the Piedmont. [= Z]

Trichostema species 2. Florida Blue Curls. Cp (AL, FL, GA, MS): maritime dunes, grasslands, and coastal scrub; uncommon. August-November. E. GA around the FL peninsula west to s. MS; Bahamas. [= Z; > T. dichotomum var. puberulum Fernald & Griscom – F; > T. dichotomum – WH; < T. dichotomum – Y; < T. suffrutescens – Y]

Trichostema suffrutescens Kearney, Scrub Blue Curls. Cp (FL): scrub, sandhills; rare. August-November. Ne. FL (Clay County) south to s. peninsular FL. [= Z; < T. dichotomum – WH; < T. suffrutescens – Y]

7. Scutellaria Linnaeus 1753 (Skullcap)

Identification notes: Recognizable by the "tractor seat"-shaped protuberance on the upper calyx. *Note: in key break 22b, corollas of S. alabamensis may reach 22 mm long; its calyces are both stipitate glandular and punctate glandular, thus differing from S. arenicola and S. mellichampii. In key break 22a, corollas of S. mellichampii may be as short as 21 mm; its calyces are punctate glandular only, unlike S. incana var. australis which has both punctate glands and stipitate glands on calyces.

1 Flowers axillary, bracts resembling stem leaves; stem leaves sessile or petioles < 4 mm.
2 Corollas 12-32 mm long .................................................. Sc. galericulata
2 Corollas 5-10 mm long.
3 Lower leaves hastate; plants glabrous.................................................. Sc. racemosa
3 Lower leaves ovate or deltoid-ovate; plants puberulent or pubescent.
4 Stems glabrate, the pubescence ascending, curled or appressed, eglandular.
5 Median leaves 10-15 mm long; corolla 6.5-9 mm long.................................................. Sc. leonardii
5 Median leaves 20-40 mm long; corolla 8-10 mm long.................................................. Sc. nervosa
4 Stems obviously hairy, pubescence spreading, glandular or not (or both).
LAMIACEAE

814

6 Lower leaf surface with glandular hairs only; leaf veins tending to anastomose along leaf margins ...................................................... Sc. australis
6 Lower leaf surface with glandular hairs or eglandular; leaf veins usually unbranched along margins .................................................. Sc. parvula
1 Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
7 Corolla tube glabrous within or sparsely hairy, lacking a sharply defined ring of hairs at bend of tube (non-anunnulate).
8 Racemes second.
9 Corollas ca. 6 mm long; racemes terminal and axillary. ................................................................................................................. Sc. lateriflora
9 Corollas ca. 10 mm long; racemes terminal or terminating axillary branches .................................................................................. Sc. saxatilis
8 Racemes not second, flowers on more than one side of axis.
10 Stems and petioles with ascending hairs; at least some racemes from axillary branches; mid to upper leaves truncate basally ..............
................................................................................................. Sc. saxatilis
10 Stems and petioles with spreading or retrorse hairs; racemes terminal or in panicles; mid to upper leaves strongly cordate.
11 Margins of lower lip cleft and erose; lower lip with large lateral auricles (flabelliform)......................................................................... Sc. ovata ssp. bracteata
11 Margins of lip entire; lip undulate or weakly auriculate.
12 Lower lip entirely white with a few blue spots; leaf surface smooth with sparse glandular hairs .................................................... Sc. ovata ssp. ovata
12 Lower lip blue with two longitudinal white stripes; leaf surface rugose, usually densely glandular hairy (but may be eglandular).
13 [Ridge and Valley (especially shale barrens) of VA, WV, MD] ............................................................................................... Sc. ovata ssp. rugosa var. rugosa
13 [Blue Ridge (moist talus slopes) of NC, TN] ............................................................................................................................... Sc. ovata ssp. rugosa var. 1

7 Corolla tube with sharply defined ring of hairs (annulous) at bend of tube.
14 At least some upper leaves entire.
15 Leaves without stipitate glands. .................................................................................................................................................. Sc. multiglandulosa
15 Leaves with stipitate glands.
16 Corolla glabrous, lower lip with immaculate white central band; leaf bases long-attenuate ................................................................ Sc. glabriuscula
16 Corolla short pilose, lower lip with blue spots or lines on white central band; leaf bases cuneate to deltoid.
17 Lowest pedicels of main axis of inflorescence >4 mm, or if less, then subtending bracts < 13 mm ...................................................... Sc. arenicola
17 Lowest pedicels < 4 mm, or if more, then bracts >13 mm ................................................................................................................ Sc. integriglora
14 All leaves serrate or crenate.
18 Second internode below base of inflorescence stipitate glandular.
19 Corollas 24-33 mm long and upper surfaces of leaves punctate glandular ................................................................. Sc. pseudoserrata
19 Corollas 14-23 mm, or if longer, then upper surfaces of leaves eglandular.
20 Corollas 25-36 mm long; bracts elliptic to oblanceolate, apices acute ........................................................................................ Sc. montana
20 Corollas 14-23 mm; bracts obovate to broadly oblanceolate, apices obtuse.
21 Bases of upper leaves cuneate to rounded; corollas 14-18 (-21) mm ...................................................................................... Sc. elliptica var. hirsuta
21 Bases of upper leaves cordate to rounded; corollas 18-23 mm ......................................................................................... Sc. ocmulgee
18 Second internode below base of inflorescence eglandular.
22 Corollas > 21 mm long*.
23 Calyces densely to sparsely canescent, eglandular or with punctate glands (stipitate glands may also be present).
23 Calyces densely to sparsely canescent, eglandular or with punctate glands (stipitate glands may also be present).
24 Leaves softly villous beneath; calyces and bracts eglandular ................................................................................................. Sc. incana var. incana
24 Leaves glabrate, with appressed hairs on veins.
25 Stems canescent; calyces and bracts densely punctate glandular .......................................................................................... Sc. incana var. 1
25 Stems glabrous; calyces and bracts eglandular ...................................................................................................................... Sc. incana var. punctata
23 Calyces pilose with spreading stipitate glandular hairs.
26 Bracts with stipitate glands; leaves eglandular ................................................................................................................... Sc. elliptica var. elliptica
26 Bracts without stipitate glands; leaves densely punctate glandular.
27 Corollas 19-22 mm long; [Mountains of AL] .............................................................................................................................. Sc. alabamensis
27 Corollas 11-16 mm long; [Coastal Plain of SC and GA] ............................................................................................................... Sc. altamaha

Scutellaria altamaha Small, Altamaha Skullcap. Cp (GA, SC), Pd (GA, SC): sandy or rocky, dry forests; rare (GA Special Concern). Ne. SC to ec. GA and se. GA. [= K, S, Y; < S. mellichampii Small – RAB]
Scutellaria arenicola Small, Sandhill Skullcap. Cp (FL, GA): sandy scrub; rare. GA and ne. FL south to s. FL. [= K, S, WH, Y]
Scutellaria australis (Fassett) Epling, Southern Skullcap. Pd (GA, NC, SC, VA), Mt (WV), Cp (FL, GA): bottomland forests; rare. VA, s. WV, KY, IN, IL, MO, and KS, south to Panhandle FL, LA, and e. TX. [= G, WV, X; < S. parvula – RAB, S, WH; = S. parvula Michaux var. australis Fassett – F, K]
Scutellaria elliptica Muhlenberg ex Sprengel var. hirsuta (Short & Peter) Fernand. Mt (GA, NC, VA, WV), Pd (VA): mesic to dry forests; uncommon. Late May-June; June-July. PA and MI south to w. VA, w. NC, nw. GA, s. AL, and e. TX. [= C, F, G, K, W, WV, Y; < S. elliptica – RAB; < S. ovatifolia – S; = S. ovatifolia ssp. hirsuta (Short & Peter) Epling – X]
LAMIACEAE

Scutellaria glabrisscula Fernald, Georgia Skullcap. Cp (AL, FL, GA, MS): sandhills; rare. Sw. GA and w. FL Panhandle west through s. AL to s. MS. [= K, S, WH, Y]

Scutellaria incana var. 1. Cp (FL, GA, NC): dry sandy open woods or woodland margins; rare. July-August. Gulf Coastal Plain of sw. GA, nw. FL, s. AL, and c. MS; disjunct to Brunswick County, NC. [= S. altamaha Small ssp. australis Epling; < S. incana – WH; = S. incana var. australis (Epling) Collins comb. nov. ined.]

Scutellaria incana Biehler var. incana. Pd (NC, VA), Cp (NC, VA), Mt (WV): dry to mesic forests and woodlands; uncommon. NY, OH, IN, and IL, south to e. VA, c. NC, KY, w. TN, MS, and AR. [= C, F, G, K, WV, Y; < S. incana – RAB, S; = S. incana – X]

Scutellaria mellichampi Small, Mellichamp's Skullcap. Cp (GA, SC): sandy deciduous forests on river bluffs; rare (GA Special Concern). June; July. Se. SC south to e. GA; seemingly disjunct in c. AL. [= S, X, Y; < S. mellichampii – RAB; = S. incana Biehler var. australis (Epling) Collins comb. nov. – K, misapplied]

Scutellaria montana Chapman, Large-flowered Skullcap. Mt (GA): mesic hardwood (or hardwood-shortleaf pine) forests; rare. Se. TN south to nw. GA. [= K, S, Y; = S. serrata Andrzejedowski var. montana (Chapman) Penland – F]

Scutellaria nervosa Pursh, Bottomland Skullcap, Veined Skullcap. Pd (DE, NC, SC, VA), Cp (NC, VA), Mt (VA, WV), {GA}: alluvial forests, mesic forests; common (uncommon in VA Mountains and Piedmont, rare in DE, GA, NC, and SC, rare in VA Coastal Plain). May-June; June-July. NY, MI, and IA, south to GA, AL, and LA. [= RAB, K, S, W, WV; > S. nervosa var. nervosa – C, F, G; > S. nervosa var. calvifolia Fernald – C, F, G}

Scutellaria ocmulgee Small, Ocmulgee Skullcap. Cp (GA): bluff forests and other mesic hardwood forests; rare (GA Threatened). Endemic to e. GA. [= K, S, Y]

Scutellaria ovata Hill ssp. bracteata (Bentham) Epling. Mt (GA), Cp (FL): dry forests and woodlands, hammocks; rare. MO south through AR and OK to c. TX; disjunct eastward in s. MS, c. and n. AL, w. Panhandle FL, and nw. GA. [= K, W, WH, X; < S. ovata var. ovata – C, F, G; = S. ovata var. bracteata Bentham; > Scutellaria ovata Hill ssp. cuthbertii (Alexander) Epling – K, X; > S. cuthbertii Alexander – S; = S. ovata var. bracteata (Bentham) Epling var. bracteata – Z] [synonymy incomplete]

Scutellaria pseudoserrata Epling. Mt (GA), Pd (GA), {NC?, SC}: rich, rocky forests; rare. Also in e. TN (Chester, Wofford, & Kral 1997), nc. and e. GA (Jones & Coile 1988). Cultivated in Highlands, Macon Co., NC. [= K, W, X, Y]

**Scutellaria alabamensis** Alexander. AL (Epling 1942, Kartesz 1999). [= K, S, X, Y]

**Scutellaria drummondii** Bentham var. *drummondii*. Drummond's Skullcap. Cp (FL*, GA): blackland prairies, dry disturbed areas; rare. GA west to LA, south into Mexico. First reported for GA by Lee Echols in 2005 (pers. comm.). [= K; < S. *drummondii* = WH] [not yet keyed]

**Scutellaria floridana** Chapman, Florida Skullcap. Cp (FL): pine flatwoods; rare. Endemic to FL Panhandle. [= K, S, WH] [not yet keyed]

8. **Synandra** Nuttall 1818 (Synandra)

**Synandra hispidula** (Michaux) Baillon, Synandra, Gyandotte Beauty. Mt (NC, VA, WV): moist, rich forests; rare. Late April-May; May-June. A broad Appalachian endemic: s. OH west to s. IL, south to sw. VA, w. NC, and n. AL. [= RAB, C, F, G, K, S, W, WV]

9. **Macbridea** Elliott in Nuttall 1818 (Birds-in-a-nest, Macbridea)

1  Corolla white (faintly marked with purple in the throat); leaf tips obtuse to rounded; [FL Panhandle] .................................................... *M. alba*

1  Corolla lavender or pink; leaf tips acute; [se. NC south to s. GA] .......................................................... *M. caroliniana*

**Macbridea caroliniana** (Walter) Blake, Carolina Birds-in-a-nest, Carolina Macbridea. Cp (GA, NC, SC): swamp forests, especially in sphagnous seepage areas away from direct flooding, savanna edges, ditches; rare). July-November. Se. NC to s. GA; reported but undocumented from n. FL, AL, and MS. Apparently rare throughout its range. [= RAB, GW, K; = *M. pulchra* Elliott – S]

10. **Physostegia** Bentham 1829 (Obedient-plant)

10 Calyx and rachis lacking stalked glands; nutlets 2.0-3.6 mm long, smooth.

11 Uppermost pair of leaves below the terminal raceme often no larger than the floral bracts, the next pair of leaves down the stem 0.4-3.2 cm long, generally 0.1-0.3× as long as the internode above……………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………
A genus of about 300 species, herbs and shrubs, mainly temperate, nearly cosmopolitan (except Australia and New Zealand). References: Nelson (1981) – Z; Nelson & Fairey (1979); Mulligan & Munro (1989); Pringle (2002); Harley et al. in Kader (2004). Key adapted from various manuscript keys of the contributors.

1. Herbage variously pubescent or glabrous; [rare escapes from cultivation].
2. Biennial; leaf blades silky-pillose or tomentose, rounded to ciliate at the base, obviously dentate; calyx lobes projecting beyond the pubescence.................................................. S. germanica
3. Perennials from rhizomes, not branching in the lower portion (unless damaged); leaf blades often > 5 cm long, with acute apices; [natives, except S. floridana and S. palustris].

6. Petioles poorly developed, less than one-fifth as long as the blade or absent.
7. Calyx strongly glandular with atrophic glands or gland-tipped hairs, or both.
8. Calyx lobes narrowly lanceolate, about as long as the calyx tube; leaf blades lance-ovate to lanceolate, < 3 cm wide; stem angles glabrate to short retrorse pubescent; roots with moniliform tubers; [adventive weed of the Coastal Plain].......................... S. floridana
9. Calyx lobes deltoid; leaves broadly rounded to crenulate at the base and crenulate margins.................................................. S. cordata
10. Leaves ovate to elliptic with long acuminate apex and truncate base, margins strongly dentate.............................. S. lingnanii
11. Leaves ovate to broadly ovate, deeply ciliate at base.......................................................... S. subcordata
12. Calyx hispidulus to strong hispid with long, stiff, deflexed hairs; stems moderately to densely pubescent on the sides and angles; leaves usually pubescent above (some forms glabrate); petioles rarely 1-2 cm long............................ S. hispida
13. Leaf blades wider, ovate-oblong to elliptic; calyx lobes deltoid-acminate to an apiculate tip, ½ to 2/3 as long as the calyx tube; bracts of the inflorescence usually conspicuous and only gradually reduced upward; plants generally more pubescent

22. Leaf margins serrulate or serrate; stem nodes not bearded (sometimes obscure fine-hairy); stem angles with scattered, pustulate, short deflexed hairs; [high-elevation montane habitats] ........................................... S. latifolius

24. Leaves ovate-oblong to elliptic, usually widest near the middle, (1.6)-2.0-5.0(-6.0) cm wide; leaf margins crenate to sharply serrate.
25. Stem (including the sides) and usually the leaves with minute but copious atrophic glands............................. S. ephlei
26. Leaves and stem glandular or with a few scattered glands.
27. Mature calyx lobes triangular deltoid and abruptly apiculate, less than half as long as the calyx tube.
28. Leaf margins serrulate or serrate; stem nodes not bearded (sometimes obscure fine-hairy); stem angles with scattered, pustulate, short deflexed hairs; [high-elevation montane habitats] ........................................... S. latifolius
29. Leaf margins crenulate or crenate; stem nodes bearded; lower stem angles copiously pubescent with 3-celled spreading hairs; [low-elevation Piedmont and Coastal Plain habitats] .......................................................... S. species 1

Stachys agraria Chamisson & Schlechtendahl, Mouse’s-ear, Shade Betony. Cp (FL, SC): calcareous hammocks; rare. SC south to s. FL, west to TX. [= Stachys crenata Rafinesque – K, WH] (add synonymy)

Stachys arenicola Britton, Woundwort. Mt (VA, WV), Pd (VA), Cp (SC): marl fens, roadsides, banks of waterfowl impoundments; rare, possibly adventive in part from further west, but at least some populations native. NS and QC west to AK, south to VA, KY, AR, OK, NM, AZ, and CA. [= s. palustris Linnaeus var. pilosa (Nuttall) Fernald – C, F, G; < s. palastris Linnaeus ssp. pilosa (Nuttall) Epling; = s. pilosa var. arenicola (Britton) Mulligan & Monroe – K; < s. palastris – WV]

Stachys clingmannii Small, Clingman’s Hedge-nettle. Mt (NC), Cp (VA?), {SC?}: cove forests, especially periglacial boulderfields, mostly at high elevations (and see comments below); rare. June-September; September-October. A narrow Southern Appalachian endemic, known only from sw. NC and se. TN. Some plants similar to and perhaps referable to this species occur in Surry County VA (calcareous bushy thickets and ravines) and in IN. [= C, G, K, S, W, Z; < S. clingmannii – RAB]

Stachys cordata Riddell, Heart-leaved Hedge-nettle. Mt (GA, NC, VA), Pd (NC, VA): moist forests, especially alluvial bottomlands or over calcareous rocks; uncommon (rare in GA). June-August; September-October. NY west to IL, south to SC, GA, AL, and AR. Primarily montane, but extending east to Stokes County, NC, and Campbell County, VA. See Pringle (2002) for a discussion of nomenclature. [= S; < S. nuttallii Shuttleworth ex Bentham – K, W, Z; > S. cordata – C; = S. riddellii House – F, G; > S. salvioides Small – S]

Stachys eplingii J. Nelson, Epling’s Hedge-nettle. Mt (GA, NC, SC, VA, WV), Pd (VA): mesic forests, bogs, wet meadows over calcareous or mafic substrates; rare. June-August; August-September. W. VA and WV south to e. TN, w. NC, and w. SC. This species has a scattered and sporadic range in the southern and central Appalachians; material in the Interior Highlands previously included in S. eplingii has been separated as S. itisii J. Nelson (Nelson 2008). See Nelson & Fairney (1979) for a discussion of the nomenclural change. [= C, GW, K, W, Z; < S. nuttallii – RAB, F, G, S, WV, misapplied]

Stachys hispida Pursh, Hissy Hedge-nettle. Mt (NC, VA), Pd (DE, VA), Cp (DE, VA), ?? (GA): wet meadows and mesic forests; common (uncommon in NC and VA, rare in GA). {distribution} A highly variable taxon. [= C, G; = S. tenella Wildenow var. hispida (Pursh) Fernald – F; < S. tenella var. tenufolia – K, Z]

16. Lamium Linnaeus 1753 (Dead-nettle, Henbit)

1 Corolla yellow; anthers glabrous; bracts present, reflexed ...................................................... L. galeobdolon
1 Corolla blue or white; anthers with tufts of hairs; bracts absent or present (if present not reflexed).
2 Perennial, with rhizomes or stolons; corolla 18-35 mm long, the tube curved; leaves all petioled; [section Lamiotypus].
3 Corolla white; leaves not blotched with white; lower corolla lip with 2-3 teeth on each side; pollen light yellow ...... L. album ssp. album
3 Corolla pinkish-purple (rarely white); leaves usually marked with white; lower corolla lip with 1 tooth on each side; pollen orange........... L. maculatum

2 Annual, lacking rhizomes or stolons; corolla 10-18 (-20) mm long, the tube straight; leaves all petiolate or upper leaves sessile and clasping:

4 Leaves subtending flower clusters sessile; [section Amplexicaule] ........................................ L. amplexicaule var. amplexicaule

4 Leaves all petiolate; [section Lamium],

5 Leaves subtending whors deeply serrate, with many teeth > 2 mm long; nutlets (2.5-) 2.7-3.0 (-3.3) mm long............. L. dissectum

5 Leaves subtending whors crenate-serrate, with teeth < 2 mm long; nutlets (2.0-) 2.2-2.5 (-2.8) mm long............. L. purpureum

* Lamium dissectum Withering, Cutleaf Dead-nettle. Lawns, fields, roadsides, disturbed areas; native of Eurasia. April-May. This taxon is apparently an allopolyploid derivative (2n=36), resulting from hybridization of L. purpureum and another species, perhaps L. amplexicaule. Because of its allopolyploid status, this taxon should not be treated as a variety of L. purpureum. It is, however, possible that some individuals identified here may be sterile hybrids (2n=18). [= L. hybridum Villars – RAB, C, F, G, misapplied; = L. purpureum Linnaeus var. incisum (Willdenow) Persoon – K, Z]

* Lamium galeobdolon (Linnaeus) Linnaeus, Yellow Archangel. Disturbed areas; native of Europe and e. Asia. Several subspecies are recognized in Europe. [= Lamiumstrum galeobdolon (Linnaeus) Ehrendorfer & Polatschek – FNA, K; = Lamium galeobdolon (Linnaeus) Linnaeus – Z; = Galeobdolon luteum Hudson]

17. Collinsonia Linnaeus 1753 (Horsebalm, Richweed, Stoneroot)

1 Inflorescence an unbranched thyrse, the lower nodes with (3-) 6 flowers per node; floral bracts absent; pedicels flattened at base; leaves (2-) 4 (-6), the 4 upper (or only) leaves subverticillate; flowers light pink to lavender; flowering April-June; [subgenus Micheliella] ...... C. verticillata

1 Inflorescence a panicle (rarely unbranched), the flowers 2 per node; floral bracts present, minute to large; pedicels not enlarged basally; leaves 6 or more, opposite; flowers cream to yellow; flowering July-September; [subgenus Collinsonia].

2 Fertile stamens 4; fresh plants with anise scent; [GA southward and westward] ................................................................. C. anisata

2 Fertile stamens 2; fresh plants with lemon scent; [collectively widespread in our area].

3 Blades of the larger stem leaves 8.0-10.5 cm long, with 5-15 teeth on each margin, glabrous or hispidulous on the main veins beneath; plant from a small, rounded tuber-like crown, to 6 cm long and 5 cm in diameter. ................. C. tuberosa

3 Blades of the larger stem leaves 8-25 cm long, with 11-42 teeth on each margin, glabrous or variously pubescent beneath; plant from an elongate, woody, rhizome-like crown, to 15 cm long.

4 Calyx 2-5 mm long; calyx teeth lance-subulate to narrowly lanceolate; flowers 8-13 mm long........................................ C. canadensis

4 Calyx 4.5-7 mm long; calyx teeth broadly lanceolate; flowers 12-17 mm long ................................................................. C. punctata

Collinsonia anisata Sims, Southern Horsebalm, Anise Horsebalm. Pd (GA), Cp (FL, GA): rich foods; uncommon. Late July-September; September-October. C. GA south and west to Panhandle FL and west to s. MS, on the Piedmont and Coastal Plain. This species is apparently distinct, but Shinners’ concept of it included hybrids with C. canadensis and aberrant C. canadensis (Peirson, Cantino, & Ballard 2006). [= Y; < Collinsonia serotina Walter – K, W, WH, Z; < C. canadensis var. punctata (Elliott) A. Gray – F, misapplied; < C. punctata Elliot – S; ? Micheliella anisata (Sims) Briquet – S]

Collinsonia canadensis Linnaeus, Richweed, Northern Horsebalm. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): cove forests, rich forests, especially over calcareous or mafic substrates; common (rare in VA Coastal Plain). Late July-September; September-October. QC, MI, and WI, south to Panhandle FL and LA. [= RAB, C, F, G, K, S, W, WV, Z; < C. canadensis – Y (also see C. tuberosa)]

Collinsonia punctata Elliott, Florida Horsebalm. Cp (FL, GA, SC): rich woods; rare. Late August-mid October; September-October. S. SC (Barnwell County) to e. LA, on the Coastal Plain. [= Y; < Collinsonia serotina – K, WH, Z]
Collinsonia species 1. Pd (GA). Under study by Steve Bowling. (not yet keyed)

**Collinsonia tuberosa** Michaux, Stoneroot. Pd (GA, NC, SC), Mt (GA): rich forests, over calcareous or mafic substrates; rare (NC Watch List). Late July-September; September-October. C. NC west to c. TN, south to n. GA and MS (or LA?). Peirson, Cantino, & Ballard (2006) conclude that *C. tuberosa* should be merged into *C. canadensis*, a conclusion not followed here. [= RAB, K, S, W, Z; < C. canadensis – Y; = C. canadensis Linnaeus var. tuberosa (Michaux) A. Wood]

**Collinsonia verticillata** Baldwin, Whorled Horsebalm. Pd (GA, NC, SC, VA), Mt (GA): rich forests, ranging from moist (cove) forests to rather dry oak forests over mafic or calcareous rocks; rare. Late April-early June; June-July. Sc. VA west to e. TN, south to w. NC, nw. SC, c. GA, and MS; disjunct in s. OH. The range is strangely scattered and fragmented. [= RAB, C, G, K, W, Y; = Michelia verticillata (Baldwin) Briquet – F, S]

18. Elsholtzia Willdenow 1790

19. Mosla (Bentham) Buchanan-Hamilton ex Maximowicz 1875 (Mosla)

* Mosla dianthera (Buchanan-Hamilton ex Roxburgh) Maximowicz, Mosla. Mt (GA, NC), Pd (VA): disturbed areas; rare, native of e. Asia. August-September. This species is becoming a noxious weed west of our area (in KY and TN); it should be expected to become more widespread in our area. [= RAB, F, G, K; = Orthodon dianthera (Buchanan-Hamilton) Handel-Mazzetti – C]

20. Perilla Linnaeus 1764 (Perilla, Beefsteak-plant)

* Perilla frutescens (Linnaeus) Britton, Perilla, Beefsteak-plant. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA): moist disturbed areas; common (uncommon in DE Coastal Plain, rare in FL), native of India. August-October; October-December. Two varieties are sometimes recognized. Var. *crispa* (Bentham) Deane (leaves purple above and below; leaf margins laciniate-dentate and also crisped) and var. *frutescens* (leaves purple below; leaf margins dentate, not crisped). These probably represent cultivars more than taxonomically distinct entities. [= RAB, C, G, S, W, WH; > P. frutescens var. frutescens – F, K, WV; > P. frutescens (Linnaeus) Britton var. crispa (Bentham) Deane – F, K, WV]

Agastache Clayton ex Gronovius 1762 (Giant-hyssop)

A genus of about 22 species, herbs, of c. and e. Asia, and North America to Mexico. References: Vogelmann (1985); Lint & Epling (1945); Harley et al. in Kadereit (2004).

1 Leaves densely white tomentose below; corolla blue; [cultivated as an ornamental and rarely naturalized] ......................... A. foeniculum

1 Leaves glabrous to villous beneath, appearing green; corolla yellow, greenish-yellow, or pinkish; [native].

2 Corolla yellow or greenish-yellow; calyx lobes obtuse or sub acute, 1-1.5 mm long at anthesis; calyx lobes and bracts green; midstem internodes glabrous or minutely pubescent; lower surface of the leaf pubescent on the veins and surface................................. A. nepetoides

2 Corolla pinkish; calyx lobes acute or acuminate, 2-2.5 mm long at anthesis; calyx lobes and bracts with white or pink margins; midstem internodes at least sparsely long-pubescent; lower surface of the leaf pubescent mainly on the veins ........................................ A. scrophulariifolia

* Agastache foeniculum (Pursh) Kuntze, Lavender Giant-hyssop. Pd (DE, NC): disturbed areas, spread from cultivation; rare, native of w. North America. Cultivated as an ornamental and naturalized in scattered locations in PA (Rhoads & Klein 1993), KY (Kartesz 1999), and elsewhere. [= C, F, G, K]

* Agastache nepetoides (Linnaeus) Kuntze, Yellow Giant-hyssop. Pd (DE, NC, SC, VA), C (DE, NC, VA), Mt (GA, NC, VA, WV): woodlands and forests, generally over calcareous or mafic rocks; uncommon (rare in DE, rare in Coastal Plain of NC and VA). July-September; September-October. VT west to MN, south to nw. GA and OK. In our area, this species occurs mostly in the Piedmont. [= RAB, C, F, G, K, S, W]

Blephilia Rafinesque 1819 (Woodmint, Pagoda-plant)

1 Stem glabrate below the middle; leaf lower surface glabrous or with a few unicellular hairs on the midvein; [of sandy or rocky habitats of the Coastal Plain and Piedmont, from s. NC southward].

2 Plant a shrubby perennial, not flowering the first year; [of sandy or rocky habitats of the Coastal Plain and Piedmont, from s. NC southward].

3 Corolla light lavender or pink with darker spots, 10-20 mm long; calyx 5.0-7.5 mm long.

4 Leaves ovate or elliptic, sharply serrate, not revolute; leaves distinctly petioled; leaf surfaces glabrous.

5 Stem pubescent; leaves of flowering stems elliptic to ovate; [alien or native, generally of disturbed or weedy situations].

6 Plant stoloniferous, bearing leafy stolons with ovate leaves; leaves of the flowering stems 1-2 cm long, 1-5 mm wide, entire.

7 Axillary flower clusters in peduncled, contracted cymes.

8 Calyx 6.0-10.2 mm long, the hairs inside the throat barely or not exerted; blades of larger stem leaves 2-5 cm long.

9 Corolla 4-5 mm long; calyx 2.5-3.5 mm long.

10 Whorls with 8 or fewer flowers; calyx 2-3 mm long; corolla 12-12.5 mm long.

823
Clinopodium arkanasum (Nuttall) House, Arkansas Calamint. Mt (VA): dry limestone glades; rare (VA Rare). On west to MN, south to w. NY, nw. PA, w. VA, WV, IL, c. TN, and s. WI; also in MO, OK, AR, and TX. There appears to be confusion about the identities and distributions of this taxon and Clinopodium glabellum. [= K; Y; = Satureja glabella (Michaux) Briquet var. angustifolia (Torrey) Svenson – C, G; = Satureja arkanasum (Nuttall) Briquet – F; < Calamintha arkanasum (Nuttall) Shinners – GW (also see Clinopodium glabellum); = Calamintha arkanasum (Nuttall) Shinners – Z; < Clinopodium glabellum (Michaux) kuntze – S]

* Clinopodium ascendens (Jordan) Sampayo, Common Calamint. Cp (VA): rich calcareous slope; rare, native of Europe. August. [= Calamintha sylvatica Bromfield ssp. ascendens (Jordan) P.W. Ball – K, < Calamintha officinalis – Z]

Clinopodium ashei (Weatherby) Small, Ashe's Calamint, Ashe's Savory, Ohoopee Dunes Wild Basil. Cp (GA): xeric sandhills; rare. Peninsular FL (south of our area); disjunct in e. GA (Candler and Tatnall counties). [= K, S, Y; = Calamintha ashei (Weatherby) Shinners – WH, Z; = Satureja ashei Weatherby]

* Clinopodium calamintha (Linnaeus) Stace, Lesser Calamint, Basil-thyme. Mt (NC, VA), Pd (NC, VA), Ip (KV), Cp (NC, VA), {GA}: disturbed areas; common (uncommon in Europe). July-October. [= Satureja calamintha (Linnaeus) Scheele var. nepeta (Linnaeus) Briquet – RAB, F, G, W; = Satureja calamintha (Linnaeus) Scheele – C; > Satureja calamintha var. calamintha – F; > Satureja calamintha var. nepetoides (Jordan) Briquet – F, G; > Satureja calamintha var. glandulosa (Riquien) Briquet – F; > Calamintha nepeta (Linnaeus) Savissp. nepeta – K; > Calamintha nepeta ssp. glandulosa (Riquien) P.W. Ball – K; = Clinopodium nepeta (Linnaeus) kuntze – S; > Calamintha officinalis Moench – Z; > Calamintha nepeta (Linnaeus) Savi – Z]

Clinopodium glabellum (Michaux) kuntze. Ip (KY): dry-mesic to mesic shaley forests, limestone barrens; uncommon. Nc. KY, c. TN, south to c. AL; MO and AR. Reports of this for VA (Kartesz 1999) are apparently based on confusion with Clinopodium arkanasum. [= Y; = Satureja glabellum (Michaux) Briquet var. glabella – C; > Clinopodium glabellum (Michaux) kuntze – K; < Calamintha arkanasum (Nuttall) Shinners – GW; < Clinopodium glabellum (Michaux) kuntze – S; = Calamintha glabella (Michaux) Bentham]

* Clinopodium gracile (Bentham) kuntze, Slender Wild Basil. Cp (AL, FL, LA, MS): disturbed areas, bottomland forests; rare, native of Asia. June-August; August-October. Introduced in s. AL, FL, LA (Kartesz 1999; Woods, Diamond, & Searcy 2003) and MS (S.W. Leonard, pers. comm. 2005). [= K, WH] [add to synonymy]

Clinopodium vulgare Linnaeus, Wild Basil. Mt (KY, NC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, VA), Ip (KY): pastures, roadsides, forests, thin soils around rock outcrops; common (uncommon in DE Piedmont; rare in DE Coastal Plain). July-September. Nl (Newfoundland) to MB, south to NC, sc. TN, and KS, scattered in the west, widespread in Europe. Plants in our area may reflect both native and introduced genotypes. [= K, S, Y, Z; = Satureja vulgaris (Linnaeus) Fritsch – RAB, C, F, G, W; > Satureja vulgaris var. vulgaris – F; > Satureja vulgaris var. diminuta (Simon) Fernald & Wiegand – F; > Satureja vulgaris var. neogaea Fernald – F; > Clinopodium vulgare var. neogaea (Fernald) C.F. Reed]

Clinopodium dentatum (Chapman) kuntze, Florida Calamint, Toothed Savory. Cp (FL, GA): sandhills and xeric steepheads; rare. Endemic to sw. GA and Panhandle FL. [= K, S; = Satureja dentata (Chapman) Briquet; = Calamintha dentata Chapman – WH] [not yet keyed; add to synonymy]

Clinopodium species 1, Indian Grave Mountain Wild Basil. It occurs in montane longleaf pine/chestnut oak/Gorgia oak woodlands on Hollis quartzite along the main Pine Mountain ridge. Under study by Jim Allison. [not yet keyed]

* Condradina A. Gray 1870 (Condradina, Rosemary)

1 Leaves ob lanceolate, slightly revolute, the leaf undersurface mostly visible and showing 1-4 raised lateral veins; [Putnam County, FL, adjacent to the coverage area].
2 Calyx 8.5-11 mm long, the upper lobe 3.6-4.4 mm long; cyme 1.5-flowered; unicellular hairs of the lower leaf surface thin-walled, collapsing and flattened in drying; [ec. Putnam County, FL] ........................................................................................................... C. cymniflora
2 Calyx 7-8.5 mm long, the upper lobe 1.8-3.5 mm long; cyme 3-7-flowered; unicellular hairs of the lower leaf surface thick-walled, terete to conical, unchanged in drying; [w. Putnam County, FL] ................................................................................................. C. etonia
1 Leaves either linear and strongly revolute such that essentially only the mid vein is visible on the undersurface (C. canescens) or linear to narrowly ob lanceolate, slightly to strongly revolute, some leaf surface sometimes showing on the leaf undersurface, but lacking raised lateral veins (C. glabra and C. verticillata); [collectively more widespread].
3 Leaves densely gray-pubescent above and below; midrib on lower leaf surface densely gray-pubescent to gray-pilo se. ............ C. canescens
3 Leaves sparsely or glabrous or inconspicuously short-pubescent; midrib on lower leaf surface glabrous or glabrate, contrasting with the more densely pubescent lower leaf surface.
4 Plants upright to 8 dm tall; calyx tube glabrous or minutely and inconspicuously puberulent; [Coastal Plain of Panhandle FL and s. AL] ................................................................................................................... C. glabra
4 Plants decumbent, rooting at the nodes; calyx tube densely short-pubescent and also pilose with longer glandular hairs; [Cumberland Plateau of KY and TN].................................................................................................................................................C. verticillata

Conradina verticillata Jennison, Cumberland Rosemary. Mt (KY, TN): flood-scoured cobbble bars of large rivers; rare. Endemic to the Cumberland Plateau area of ne. TN and se. KY. It has an odor similar to rosemary, and showy purplish flowers. [= K, Y, Z; = C. montana Small – S]

Cunila D. Royen ex Linnaeus 1759 (Stone-mint, American-dittany, Wild-oregano)

Dicerandra Bentham 1830 (Dicerandra)

1 Corolla tubular, straight or slightly curved; superior lobe cucullate (hoodlike); stamens and style arching under the hooded upper lobe of the corolla, included or slightly exerted beyond its apex; filaments inserted at 2 levels within the corolla; odor of fresh plant cinnamon-like, spicy; [section Lecontea].

2 Corolla tube ca. 18 mm long, the orifice ca. 2 mm wide; leaves (15-) avg. 25 (-45) mm long, linear, the margins entire; [s. SC south through much of the Coastal Plain of GA].........................................................................................................................D. odoratissima

3 Corolla funnel-shaped, the tube geniculate; superior corolla lobe a lobed, flaring standard; stamens and style exserted, the stamens either widely flaring to the sides or declined along the lower lobe of the corolla; filaments inserted at the same level within the corolla; odor of fresh plant minty; [section Dicerandra].

4 Leaves narrowly rhombic; cymes 5-7-flowered; corolla purplish red to vivid purple; anthers strongly reddish brown; [extreme s. GA south into e. Panhandle FL and ne. FL]. [..........................D. linearifolia var. robustior]

Dicerandra densiflora Bentham, Florida Balm. Cp (FL): longleaf pine sandhills; rare. October-early November. Reported for GA by Small (1933), but this report is apparently in error; Huck (1987) regards it as endemic to n. peninsular FL. This taxon is tetraploid. [= K, S, WH, X, Y, Z]

Dicerandra linearifolia (Elliott) Bentham var. linearifolia. Cp (AL, FL, GA): sandhills and flatwoods; uncommon. Mid September-late November. W. and ec. Coastal Plain of GA south to ne. FL and s. AL. This taxon is hexaploid. [= K, WH, X, Y, Z; < D. linearifolia – S]

Dicerandra linearifolia (Elliott) Bentham var. robustior R.B. Huck. Cp (FL, GA): sandhills and flatwoods; uncommon. Late September-late November. Sc. Coastal Plain of GA (Brooks, Echols, Lowndes counties) (Huck 1987) south to e. Panhandle FL and ne. FL. This taxon is tetraploid. [= K, WH, X, Y, Z; < D. linearifolia – S]

Dicerandra odoratissima R.M. Harper. Cp (GA, SC): sandhills; uncommon (SC Rare). Late August-early October. S. SC south to se. GA. This taxon is tetraploid. [= RAB, K, S, Y, Z]

Dicerandra radfordiana R.B. Huck, Radford's Dicerandra. Cp (GA): dry flatwoods and sandhills; rare (GA Special Concern). September-October. Endemic to e. GA (McIntosh County). This species was postulated to be a polyploid derivative of D. odoratissima by Huck (1984, 1987); later study has shown that this is not the case (Huck & Chambers 1997). Both taxa are tetraploid. [= K, Y, Z]

Dracocephalum Linnaeus 1753 (Dragon's-head)
A genus of about 45-70 species, herbs, of Eurasia and North America. References: Harley et al. in Kadereit (2004). [also see Physostegia]

* Dracocephalum parviflorum Nuttall, Dragon's-head. Pd (DE, NC), WV (Mt): cultivated ground; rare, native west of the Appalachians. May-July; July-September. [= C, F, G, K, WV; = Moldavica parviflora (Nuttall) Britton – RAB]

** Glechoma Linnaeus 1753 (Gill-over-the-ground)**

A genus of about 4-10 species, herbs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).

**Hedeoma** Persoon 1807 (American Pennyroyal)

1 Leaves elliptic, 4-11 mm wide, slightly to strongly crenate; nutlets subspHERiCAL, 0.7-1.0 mm long, 0.6-0.9 mm wide, the surface smooth, mottled, not glaucous; [subgenus Hedeoma] ................................................................................................................................. H. pulegioides
2 Leaves linear to narrowly elliptic, 1-4 mm wide, entire; nutlets narrowly ovoid, 1.0-1.3 mm long, 0.4-0.6 mm wide, the surface areolate and strongly glaucous; [subgenus Saturejoidei].

1 Calyx teeth converging, closing the orifice at maturity; bracteoles subtending the individual flower pedicels 1-2 mm long, about ½ as long as the pedicel; leaves (5.0-) avg. 7.7 (-11.0) mm long, (1.2-) avg. 2.2 (-4.0) mm wide, 1-5× as long as wide .......... [H. drummondii]
2 Calyx teeth spreading (the upper) to slightly convergent (th lower), not closing the orifice at maturity; bracteoles subtending the individual flower pedicels (1.5-) 2.5-6 mm long, generally as long as or longer than the pedicel; leaves (11.0-) avg. 16.4 (-21.0) mm long, (1.0-) avg. 2.2 (-3.0) mm wide, > 5× as long as wide .......................................................................................................................... H. hispida

*? Hedeoma hispida* Pursh, Rough Pennyroyal. Pd (GA, SC, VA), Mt (GA, WV*), Cpt (FL, GA): disturbed areas, pastures, granitic flatrocks; rare, apparently adventive from further south and west. Irving (1980) shows H. hispida east to e. Panhandle FL, c. AL, nc. TN, and s. OH; it may be recently arrived further east or previously overlooked. First reported for SC by Hill & Horn (1997). [= C, F, G, K, WV, Z; = H. hispida – WH (orthographic variant)]

**Hedeoma pulegioides** (Linnaeus) Persoon, American Pennyroyal. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cpt (DE, NC, SC, VA): dry soils of woodlands, roadbanks, woods-roads, especially common in shaly parts of the VA and WV mountains; common (uncommon in NC and SC). Late July-October. NS, s. QC, s. ON, MI, WI, and IA south to c. SC, c. GA, and AR. The fragrant oil is apparently very similar to that of the European Pennyroyal, *Mentha pulegium* Linnaeus. The oil is a powerful insect repellent and insecticide, often used on pets to repel fleas. It is also poisonous to humans, however, at least in substantial quantities. It is sometimes used as a tea; native Americans are reputed to have used it as an abortion inducer. This plant should be used with great caution, if at all. [= RAB, C, F, G, K, S, W, WV, Z]

Hedeoma drummondii Bentham. Cpt (AL, MS): black belt prairies; rare. MN and MT south to TX and CA; disjunct eastwards to AR, MS, and AL, where it occurs in black belt prairies. [= K, Z]

**Hypis** Jacquin 1786 (Cluster Bushmint)

1 Flowers borne in large, globose heads, 1.5-2.5 cm across, on peduncles 2-6 cm long; leaves lancolate, narrowed to a narrowly cuneate, subpetiolar base ............................................................................................... H. alata
2 Flowers borne in irregular verticillate spikes, sessile to pedunculate on peduncles 1-2 mm long; leaves either ovate to deltate, narrowed to a broadly cuneate to truncate base and well-developed petiole (4-6 cm long on larger leaves), or lancolate and narrowed to a cuneate, subpetiolar base.

1 Stem scabrous on the angles; corolla blue-purple; leaves ovate to deltate .......................................................................................................................... H. mutabilis
2 Stem glabrous or pubescent; corolla white; leaves lancolate .............................................................................................................................. H. verticillata

**Hypis alata** (Rafinesque) Shinners, Musky Mint, Cluster Bushmint. Cpt (FL, GA, NC, SC): wet pine savannas, margins of swamp forests, wet powerline rights-of-way, ditches; common. Late June-September. Ne. NC south to s. FL, west to se. TX; West Indies. [= RAB, GW, K, WH; = H. radiata Willdenow – S]

* Hypis mutabilis* (A. Richard) Briquet, Tropical Bushmint. Cpt (FL, GA, SC, VA); moist disturbed areas; common (uncommon in GA, rare in SC and VA), native of South America. [= GW, K, S, WH]
**LAMIACEAE**

827

Hyssopus Linnaeus 1753 (Hyssop)

* Hyssopus officinalis* Linnaeus, Hyssop. {NC} Reported for NC (see G and S); documentation not known. Native of Eurasia. July-October. [= RAB, C, F, G, K, S]

Leonotis (Persoon) R. Brown 1810 (Lion's-ears)

A genus of about 9 species, herbs, shrubs, and small trees, of sub-Saharan Africa. References: Iwarsson & Harvey (2003)=Z.

Lycopus Linnaeus 1753 (Bugleweed, Water-horehound)

1. Calyx lobes acute at the apex, shorter than or equaling the nutlets.
   2. Plant usually with tubers; leaf base tapered to a long, winged petiole; corolla lobes 4, erect; leaf teeth (6-) avg. 8.6 (-11) per side;... *L. viriginicus*
   3. Calyx lobes 4, one erect and three spreading; nutlet tubercles well-developed, deeply toothed; leaf teeth (2-) avg. 4.5 (-6) per side;... *L. cokeri*
   4. Nutlet tubercles well developed.
   5. Leaves evidently petiolate, the petioles narrowly winged; stems and branches sparsely pubescent with hairs 0.5-1.6 mm long; leaf teeth blunt to acute... *L. europaeus*
   6. Leaves sessile or subsessile.
   7. Leaves ovate to lanceolate, usually rounded at the base, scarcely reduced upward on the stem... *L. angustifolius*

* Lycopus europaeus* Linnaeus, Gypsywort, European Bugleweed. Cp (DE, NC, VA), Pd (DE), Mt (WV): marshes, ditches; common (uncommon in NC and VA, rare in WV), native of Europe. June-November. In the Great Lakes and St. Lawrence River regions, hybrid swarms involving *L. americanus* and *L. europaeus* are numerous (Webber & Ball 1980). However, to date there is no evidence that these species have hybridized within the Flora region. [= RAB, C, G, K, S, Z; > L. europaeus var. europaeus – F; > L. europaeus var. mollis (Kern.) Brijt. – F]
LAMIA CEE

Lycopus rubellus Moench, Stalked Bugleweed. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC, VA), Mt (GA, VA, WV*): marshes, swamp forests, bottomlands; common (rare in WV, rare in VA Mountains). June-November. ME west to MI, south to FL and TX. [= C, S, Z; = L. rubellus var. rubellus – RAB, GW; < L. rubellus – G, K, W, WH (also see L. angustifolius); > L. rubellus – S; > L. velutinus Rydberg – S]

Lycopus uniflorus Michaux, Northern Bugleweed. Mt (NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE): bogs, seeps, wet forests; common. July-October. NL (Newfoundland) west to AK, south to w. NC, AR, and CA. [= RAB, C, F, G, S, W, WV; Z; < L. uniflorus – GW (also see L. cokeri); > L. uniflorus var. uniflorus – K]

Meehania Britton 1894 (Meehania)

Melissa Linnaeus 1753 (Balm)

Mentha Linnaeus 1753 (Mint)

Identification notes: The distribution, habitats, phenology, and abundance of all Mentha species need substantial additional herbarium investigation.

1 Flowers in axillary verticils subtended by ordinary foliage leaves, and separated by internodes of ordinary length.

2 Calyx glabrous throughout, or pubescent toward the tips only; calyx 2-3.5 mm long; plants usually sterile; fresh plant usually with spearmint odor or flavor ..............................................................................................................................................................................M. × gracilis

2 Calyx pubescent throughout its length; calyx 1.5-2.5 mm long; plants usually fertile; fresh plant usually with a rather unpleasant odor of flavor.

3 Leaves subtending the inflorescence mostly broadly rounded at the base; leaves of the inflorescence relatively narrow; [alien] ......................... ..................................................................................................................................................................................M. × arvensis ssp. arvensis

3 Leaves subtending the inflorescence mostly cuneate at the base; leaves of the inflorescence relatively broad; [native, though often in weedy situations] ............................................................................................................................................................................................................................................M. canadensis

1 Flowers in terminal spikes or heads, the subtending leaves absent or distinctly smaller than the foliage leaves.

4 Inflorescence a terminal glbose to ovoid head of 1-3 verticils.

5 Pedicels, calyx, and leaves pubescent; plants usually fertile. ...........M. aquatica var. aquatica

5 Pedicels and calyx glabrous, leaves glabrous or nearly so; plants usually sterile ..................................................................................M. aquatica var. citrata

4 Inflorescence a spike of several to many verticils.

6 Bracteal leaves much longer than the flowers, resembling the foliage leaves, but smaller or narrower .................................................M. × gracilis

6 Bracteal leaves linear to lanceolate, little surpassing the flowers.

7 Calyx tube glabrous; leaves glabrous, or with scattered hairs on the lower surface.

8 Petioles of the main leaves 4-15 mm long; spikes stout; plants sterile; fresh plant with peppermint odor or flavor ................................ ..................................................................................................................................................................................................................................................................................M. × gracilis var. piperita

8 Petioles of the main leaves 0-3 mm long; spikes slender; plants fertile; fresh plant with spearmint odor or flavor ................................ ..................................................................................................................................................................................................................................................................................M. spicata var. spicata

7 Calyx tube pubescent; leaves moderately to densely hairy on the lower surface.

9 Leaves lanceolate to oblong-lanceolate, > 3x as long as wide.

10 Hairs of the leaf undersurface unbranched; leaves widest near the middle, slightly rugose; fertile anthers 0.28-0.38 mm long; fresh plant with musty flavor or odor ..................................................................................................................M. longifolia ssp. longifolia

10 Hairs of the leaf undersurface denticulate; leaves oblong lanceolate, widest towards the base, conspicuously rugose; fertile anthers 0.38-0.52 mm long; fresh plant with spearmint odor or flavor ..................................................M. spicata var. spicata

9 Leaves oblance to ovate, 1-3x as long as wide.
11 Leaves generally 1-2× as long as wide, ovate- orbicular, broadly rounded to subcordate at the base, obtuse at the apex; leaf serrations rounded and often turned downward (thus appearing crenate); leaf surface strongly rugose, with scattered denticulate hairs below; fresh plant with sickly or sweet flavor or odor. ................................................................. M. suaveolens

11 Leaves generally 1-3× as long as wide, ovate to oblong, broadly cuneate to rounded at the base, acute at the apex; leaf serrations sharp; leaf surface moderately rugose; fresh plant with spearmint odor.

12 Leaves generally oblong, with nearly parallel sides and a broadly rounded base; flowers consistently with 4 fertile anthers ......... M. ×rotundifolia

12 Leaves generally ovate, infrequently oblong; flowers typically with all or mostly sterile anthers ......................... M. ×villosa

* Mentha aquatica Linnaeus var. aquatica, Water Mint, Lemon Mint. Cp (DE), Mt (WV), {NC, VA}: disturbed areas; uncommon, native of Europe. [= Y; = M. aquatica – C, F, G, S, Z; < M. aquatica – K (also see Mentha aquatica var. citrata)]

* Mentha aquatica Linnaeus var. citrata (Ehrhart) Fresen., Lemon Mint, Orange Mint, Bergamot Mint. {VA} native of Europe. [= Y; = M. ×piperita Linnaeus (pro sp.) var. citrata (Ehrhart) Briquet (pro sp.) – Z; = M. ×citrata Ehrhart – C; = M. citrata – F, G, S; < M. aquatica – K]

* Mentha arvensis Linnaeus ssp. arvensis, Field Mint. Pd (DE), Mt (VA, WV): marshes, disturbed areas; uncommon (rare in VA and WV), native of Europe. [= Y; = M. arvensis var. arvensis – C, F, G; = M. arvensis Linnaeus – S, Z; = M. arvensis ssp. arvensis – Y; < M. arvensis – K]

Mentha canadensis Linnaeus, Canada Mint. Mt (VA, WV), Cp (DE, VA), Pd (DE, VA), {NC}: moist soils; common.

{distribution} [= S, Y; = M. arvensis Linnaeus var. canadensis (Linnaeus) Kuntze – C; ? M. arvensis – RAB, misapplied; ? M. gentilis Linnaeus – RAB; = M. arvensis var. villosa (Bentham) S.R. Stewart – F, WV; > M. arvensis var. glabrata (Bentham) Fernald – G; > M. arvensis var. lanata Piper – G; = M. arvensis Linnaeus ssp. canadensis (Linnaeus) H. Harr; < M. arvensis – K]

* Mentha longifolia (Linnaeus) Linnaeus ssp. longifolia, Horse Mint. {VA} Native of Europe. [= Y; < M. longifolia – RAB, C, G, WV; > M. longifolia (Linnaeus) Hudson var. longifolia – F; > M. longifolia (Linnaeus) var. undulata (Wildenow) Fiori & Paolotti – F]

* Mentha ×piperita Linnaeus (pro sp.) var. piperita [Mentha aquatica × spicata], Peppermint. Cp (DE, FL, VA), Pd (DE, VA), Mt (VA), {GA, NC, SC}: disturbed areas; uncommon, native of Europe. [= C, K, Y, Z; = M. piperita – RAB, G, S, WV; > M. piperita – F; > M. crispa Linnaeus – F; < M. piperita – WH]

* Mentha ×rotundifolia (Hudson) (pro sp.) [Mentha longifolia × suaveolens]. Mt (NC, VA), Pd (VA), Cp (VA), {GA, SC}: rare, native of Europe. [= C, K, Y; = M. rotundifolia – G, S, WV]

* Mentha spicata Linnaeus var. spicata, Spearmint. Mt (VA), Pd (DE, VA), Cp (FL, VA), {GA, NC, SC}: disturbed areas; uncommon (rare in FL and VA Coastal Plain), native of Europe. [= Y; < M. spicata – RAB, C, F, G, K, S, WH, WV, Z]

* Mentha suaveolens Ehrhart sp. suaveolens, Apple Mint, Pineapple Mint, Round-leaved Mint. Cp (DE, FL, NC), Mt (NC), Pd (DE, NC?), {SC, VA}?: disturbed areas; rare, native of Europe. See Denslow & Poindexter (2009) for helpful information on distinguishing M. suaveolens from M. ×rotundifolia. [= Y; < M. suaveolens – C, K, WH, Z]

* Mentha ×villosa Hudson (pro sp.) [Mentha spicata × suaveolens]. Introduced south to PA and KY. [= C, K, Z; > M. alopecuroides Hull – F; > M. ×villosa var. villosa – Y; > M. ×villosa var. alopecuroides (Hull) Briquet – Y] {not yet keyed}

* Mentha ×veteciliana Linnaeus (pro sp.) [Mentha arvensis × aquatica]. Mt (WV): most soils; rare, native of Europe. [= C, K, WV, Z] {add synonymy; not yet keyed}

Monarda Linnaeus 1753 (Bergamot)

A genus of about 12-20 species, herbs, of North America. Many of our species are cultivated, especially M. didyma in various selected forms. Additional studies are needed on a number of taxonomic problems in Monarda. Most of the varieties recognized above have been considered valid by a succession of workers; they do seem to describe morphologically distinguishable (if not entirely discrete) entities which make phytogeographic sense. References: McClintock & Epling (1942)=Z; Scora (1967)=Y; Fosberg & Artz (1953)=X; Gill (1977); Prather & Keith (2003); Harley et al. in Kader et al. (2004).

1 Flowers in 2-6 glomerules, terminal and at 2-5 successive nodes down the stem; stamens included; leaves lanceolate to narrowly elliptic, usually broadest near the middle and tapered to a cuneate base, (2.5-) 3-8× as long as wide.

2 Calyx lobes attenuated into a spinose awn 2-7 mm long; corolla white to pink; inner bracts subending the flowers 4-9 mm wide, abruptly acuminate into a spinose bristle ................................................................. M. citriodora var. citriodora

2 Calyx lobes narrowly to broadly triangular, acute or long-acuminate but not awned; corolla yellow, spotted with purple; inner bracts 8-14 mm wide, acuminate.

3 Lower leaf surface moderately to densely silvery-tomentose; stem densely villous with spreading or downwardly-curved coarse hairs, lacking coarse, horizontal bristles and short downwardly-curved hairs. ................................................................. M. punctata var. villosa

3 Lower leaf surface pubescent mainly on the midvein and other main veins, appearing green; stem pubescent with short downwardly-curved hairs, also with coarse, horizontal bristles and/or upwardly-curved hairs.

4 Stem with many coarse horizontal bristles, also pubescent with short, downwardly-curved hairs; leaves (40-) 50-70 (-95) mm long, 10-28 mm wide (at least some over 15 mm wide), averaging ca. 3× as long as wide ................. M. punctata var. arkansana

4 Stem with few or no coarse horizontal bristles, also pubescent with a mixture of upwardly-curved and downwardly-curved hairs; leaves (25-) 35-55 (80) mm long, 5-17 mm wide (the widest very rarely over 15 mm wide), averaging ca. 4× as long as wide ................. M. punctata var. punctata
LAMIAEAE

1 Flowers in 1-2) glomerule, terminal (rarely also 1 at the next node down the stem); stamens exerted; leaves ovate to ovate-lanceolate, broadest near the rounded, truncate, or suborbate base, 1.5-3 (-4) x as long as wide.

5 Corolla 30-45 mm long, scarlet-red, (3-) 4-8 mm broad at the expanded portion of the throat; [primarily of mountain seepages, streambanks, and boggy places]...

**M. didyma**

5 Corolla 14-33 (-36) mm long, white, lavender, or purple, 1-3 (-4) mm broad at the expanded portion of the throat; [of various habitats, usually dryish to mesic].

6 Leaves deltoid-ovate to ovate, 2-6 cm wide, usually ca. 2 x as long as wide; orifice of the calyx glabrous to slightly hirsute with a few long hairs; upper lip of the corolla 5-8 mm long and not bearded (M. clinopodia) or 13-16 mm long and slightly bearded (M. media) near its apex; outer surface of the corolla glabrous to evenly pubescent with short curled hairs.

7 Corolla white, greenish, or pale pink, the lower lip spot-pilose; outer bracts subtending the inflorescence green or pale (rarely with a purplish midvein); upper lip of the corolla 5-8 mm long, not bearded...

**M. clinopodia**

7 Corolla deep purple, the lower lip usually not spotted; outer bracts subtending the infloresence purple to red; upper lip of the corolla 13-16 mm long and slightly bearded near its apex;...

**M. media**

6 Leaves narrowly-deltoid, ovate-lanceolate to lanceolate, 1-4 cm wide, usually ca. 3 x as long as wide; orifice of the calyx densely hirsute with numerous erect, stiff, white hairs; upper lip of the corolla prominently bearded near its apex; outer surface of the corolla evenly pubescent with short curled hairs.

8 Corolla deep purple; middle lobe of the lower corolla lip 4-6 mm long; outer bracts subtending the inflorescence reddish...

**M. fistulosa** var. *rubra*

**M. clinopodia** Linnaeus, Basil Bergamot. Mt (NC, SC, VA), Pd (DE, NC, SC, VA): mesic, forested slopes; common (uncommon in VA Piedmont, rare in DE). Late May-September; July-October. NJ, w. NY, and IL, south to n. GA, and c. AL (some of the range perhaps accountable to cultivation). There appear to be a number of chemical races in *M. clinopodia* which may warrant taxonomic status. [= RAB, C, F, G, K, S, W, Y, Z; = *M. fistulosa* Linnaeus var. *clinopodia* (Linnaeus) Cooperrider]

**M. didyma** Linnaeus, Bee-balm, Oswego Tea. Mt (NC, SC, VA, WV), Pd (DE*, NC, VA), Cp* (NC*): seepage slopes, periglacial boulderfields with abundant seepage, streambanks, boggy places, usually in strong to moderately filtered sunlight; common (rare in Piedmont, rare in Coastal Plain, rare in SC). July-September; September-October. ME west to MI, south to PA and OH, and in the Appalachians south to sw. NC, se. TN, and ne. GA (part of the northern range is likely only by introduction). McClintock & Epling (1942) describe 2 forms of *M. didyma*: the "broad-leaved form," with leaves averaging 9.2 cm long and 5.2 cm wide and corollas averaging 35 mm long, ranging south to se. PA and ne. WV, and the "narrow-leaved form," with leaves averaging 11.8 cm long and 4.4 cm wide and corollas averaging 39 mm long, occurring throughout the range of the species. Further study seems warranted. [= C, F, G, K, S, W, Y, Z; = *M. didyma* – RAB (also see *M. medio*)]

**M. fistulosa** Linnaeus var. *brevis* Fosberg & Artz, Smoke Hole Bergamot, Cedar Glade Bergamot. Mt (VA, WV): limestone outcrops, cliffs, barrens, and glades, and on limestone talus; rare. June-August; July-October. Apparently endemic to w. VA (Giles County) and e. WV. This variety is seemingly very distinct (Kimball et al. 2002). It had been collected only a very few times prior to the work of Bargtis (1993), who found it to be a characteristic plant of limestone barrens and woodlands in localized areas in the Ridge and Valley Province of WV. It flowers about a month earlier than *M. fistulosa* in the vicinity (Bargtis, pers. comm.). [= WV, X, Y; = *M. fistulosa* ssp. *brevis* (Fosberg & Artz) Scora, comb. nov. ined. – K; < *M. fistulosa* – W]

**M. fistulosa** Linnaeus var. *fistulosa*, Appalachian Bergamot. Mt (NC, VA, WV), Pd (DE, NC, VA): moist wooded slopes; roadsides, woodland edges, old fields; common (rare in DE). June-September; August-October. CT south to sw. NC, nearly or entirely limited to the Appalachians. I have interpreted var. *fistulosa* and var. *mollis* somewhat differently than some previous workers. A more coherent geographic pattern is achieved by limiting var. *fistulosa* to plants with spreading hairs only. [= F, WV, X, Y; < *M. fistulosa* – RAB, W; = *M. fistulosa* ssp. *fistulosa* var. *fistulosa* – K; < *M. fistulosa* var. *fistulosa* – C, G, Z (also see var. *mollis*); = *M. fistulosa* – S]

**M. fistulosa** Linnaeus var. *rubra* A. Gray, Purple Bergamot. Mt (NC, VA), {GA}: moist slope forests; rare (NC Watch List). ME to NJ, and from nw. NC to n. GA, in the Appalachians. Perhaps native only in the Southern Appalachians. A problematic taxon; see *M. media* for comments. [= X, Y, Z; < *M. fistulosa* – RAB, W; = *M. fistulosa* ssp. *fistulosa* var. *rubra* A. Gray – K; < *M. media* – C, F, S]

**M. media** Willdenow, Purple Bee-balm. Mt (GA, NC, VA, WV): grassy balds, moist slopes, mostly at high elevations; rare. July-September; September-October. VT west to IN, south to w. MD; disjunct in w. NC and sw. TN, part of the range perhaps the result of cultivation. *M. media* is a problematic taxon, especially in combination with *M. fistulosa* var. *rubra*.
Many have suggested that *M. media* is the result of hybridization or introgression of *M. didyma* with either *M. fistulosa* or *M. clinopodia*, or both (see Scora 1967). Scora (1967) implies that *M. media* consists of hybrids, backcrosses, and "introgressive elements" involving all three pairwise combinations, but that *M. fistulosa* var. *rubra* is not of hybrid origin. Needed are studies of *M. media*, *M. fistulosa* var. *rubra*, and their possible parents which go beyond the herbarium and determine the genetics, origin, and population structure of these taxa. It seems best for the moment to recognize (or to attempt to!) *M. media* and *M. fistulosa* var. *rubra* in order to foster additional observation and study, hopefully leading to a more definite understanding of their taxonomic status(es).

---

**Monarda punctata** Linnaeus var. *arkansana* (McClintock & Epling) Shiners, Arkansas Horse-mint. Mt (NC), Pd (GA): dryish forests over mafic rock; rare. McClintock & Epling (1942) map and discuss this taxon as endemic to AR and immediately adjacent TX, but mention that "a specimen collected near Columbus, Polk County, North Carolina (Townsend, 1897) is scarcely different from subsp. *arkansana*." Scora (1967) treats var. *arkansana* as similarly endemic, though he cites (but does not map) a specimen from Cherokee County, GA and annotated (following the publication of his paper) a later collection from Polk County, NC as var. *arkansana*. The Polk County, NC material is manifestly var. *arkansana* and might be considered merely aberrant or a chance introduction, were it not for its repeated collection and the phytogeographic interest of the Blue Ridge Escarpment of Polk County, which harbors numerous Ozarkian and other Midwestern disjuncts, such as *Veratrsum woodii*.  

---

**Nepeta** Linnaeus 1753 (Catnip, Catmint)  

---

**Ocimum** Linnaeus 1753 (Basil)  

A genus of about 65 species, herbs and shrubs, of warm temperate and tropical areas. References: Harley et al. in Kadereit (2004).

---

**Origanum** Linnaeus 1753 (Oregano, Marjoram)  

---

**Piloblephis** Rafinesque 1838 (Florida Pennyroyal)  

**Piloblephis rigida** (Bartram ex Bentham) Rafinesque, Florida Pennyroyal. Cp (GA): xeric oak scrub, with *Quercus myrtifolia*; rare. S. GA; c. to s. peninsular FL. [= K, WH; = Pycnothymus rigidus (Bartram ex Bentham) Small – S; = Satureja rigida II. Bartram ex Bentham]

**Prunella Linnaeus 1753 (Self-heal, Heal-all)**

A genus of about 4-7 species, herbs, of n. temperate areas. References: Harley et al. in Kadereit (2004).

1 Upper leaves pinnatifid; flowers creamy yellow or white (rarely pale blue) .................................................................................................................................................. *P. lacinia*

1 Upper leaves entire to obscurely toothed; flowers blue-violet (rarely pink or whitish).

2 Principal or median cauline leaves lanceolate to oblanceolate, (2-) avg. 3 (-5)× as long as wide; leaf cuneate at the base .................................................. *P. vulgaris var. lanceolata*

2 Principal or median cauline leaves ovate to ovate-oblong, (1.5-) avg. 2 (-2.5)× as long as wide; leaf broadly rounded at the base .......... *P. vulgaris var. vulgaris*

* *Prunella lacinia* (Linnaeus) Linnaeus, Cutleaf Self-heal. Mt (NC!, VA), {GA}: disturbed areas; rare, native of Eurasia. [= RAB, C, G, K, S]

**Prunella vulgaris** Linnaeus var. lanceolata (W. Barton) Fernald, American Self-heal. Pd (DE), Cp (DE), {Mt, Pd, Cp (FL, GA, NC, SC, VA, WV)}: disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands; common. April-December. Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties. NL (Newfoundland) west to AK, south to NC, SC?, TN, MO, KS, NM, AZ, and CA. [= C, F, G; < *P. vulgaris* – RAB, S, W; = *P. vulgaris* ssp. lanceolata (W. Barton) Hultén – K]

* *Prunella vulgaris* Linnaeus var. vulgaris, Eurasian Self-heal. Pd (DE), {Mt, Pd, Cp (FL, GA, NC, SC, VA, WV)}: disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands; uncommon in DE, native of Eurasia. April-December. Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties, var. vulgaris and var. lanceolata. The possible additional recognition of var. hispida also needs assessment. Var. hispida Bentham, considered to have been originally e. Asian, is alleged to be widespread in se. United States. It differs from *P. vulgaris* var. vulgaris in having the "stems, petioles, and often the lower surfaces of leaves densely villous-hispid" (vs. "only sparingly and not conspicuously pilose" – F). [< *P. vulgaris* – RAB, S, W, WH; > *P. vulgaris* var. vulgaris – C, F, G; > *P. vulgaris* var. hispida Bentham – C, F, G; = *P. vulgaris* ssp. vulgaris – K]

**Pycnanthemum** Michaux 1803 (Mountain-mint, Wild-basil)

1 Leaves 1-15 mm wide (to 30 mm wide in *P. setosum*), mostly > 3× as long as wide (except in *P. nudum*); calyx lobes not tipped with a tuft of long, jointed bristles (except *P. clinopodioides*).

2 Longer calyx lobes 1.5-5 mm long, attenuate-aristate, stiff, whitened; [Coastal Plain pinelands, rarely in Mountain bogs with Coastal Plain affinities].

3 Principal stem leaves 5-15 mm wide .......................................................................................................................... *P. flexuosum*

3 Principal stem leaves 10-30 mm wide ......................................................................................................................... *P. setosum*

2 Longer calyx lobes 0.5-1.6 mm long, deltoid to narrowly triangular, not notably stiff (except in *P. tenuifolium*) or whitened; [widespread in our area, but mainly of the Piedmont and Mountains].

4 Leaves 10-15 mm wide (or more often even wider, to 25 mm wide, in *P. clinopodioides*); longer calyx lobes 0.7-1.6 mm long, tipped with a few long (1-3 mm) jointed bristles (*P. clinopodioides*) or not tipped (P. nudum).

5 Leaves 3-5× as long as wide, herbaceous; stems and leaves pubescent; [NC northward] ........................................................................................................ *P. clinopodioides*

5 Leaves 1.2-2.5× as long as wide, coriaceous; stems and leaves glabrous; [se. SC southward] ........................................................................................................ *P. nudum*

4 Leaves 1-12 (-15) mm wide; longer calyx lobes 0.5-1.5 mm long, variously pubescent but not tipped with a tuft of long jointed bristles.

6 Leaves glabrous on the lower and upper surface, with 2-3 pairs of lateral veins; stems glabrous on the faces and angles (rarely with a few small upwardly-curled hairs on the angles).

7 Leaves 5-15 mm wide, 1-2.5× as long as wide; calyx lobes and inner bracts of the inflorescence herbaceous .................. *P. nudum*

7 Leaves 1-4 (-5.5) mm wide, 8-15× as long as wide; calyx lobes and inner bracts of the inflorescence semi-spinose, their tips subulate, thickened, and stiff .......................................................... *P. tenuifolium*

6 Leaves pubescent at least on the lower surface along the midrib and main veins; leaves with 4-5 pairs of lateral veins; stems glabrous or pubescent on the faces, pubescent on the angles.

8 Stems pubescent on the angles only (or distinctly less pubescent on the faces); leaves 3-10 mm wide .................. *P. virginianum*

8 Stems pubescent on the faces and angles, the hairs distributed more-or-less evenly; leaves 8-12 (-15) mm wide.

9 Longer calyx teeth 1.0-1.5 mm long, lanceolate and attenuate; bracts of the inflorescence and leaves glabrous or very sparsely pubescent on the upper surface .......................................................... *P. toreyi*

9 Longer calyx teeth 0.5-1.0 mm long, narrowly deltoid; bracts of the inflorescence (and usually also the leaves) canescent on the upper surface .................................................................................. *P. verticillatum var. verticillatum*

1 Leaves broad, 15-40 mm wide, mostly 1.5-3× as long as wide; calyx lobes mostly tipped with a tuft of long, jointed bristles (except *P. curvipes, P. muticum, P. setosum*).
species (n = 19).  

**Pycnanthemum monorchidum** Fernald.  Cp (VA): sandy woodlands; rare.  Allegedly endemic to se. VA.  Perhaps only a hybrid or else likely more widespread and overlooked.  (= F, G, K)

**Pycnanthemum muticum** (Michaux) Persoon.  Mt (GA, NC, SC, VA, WV), Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), (GA): bogs, wet meadows, moist to wet forests; common (uncommon in Piedmont, uncommon in DE Coastal Plain, rare in WV).  June-August; September-October.  MA west to MI and MO, south to FL and LA.  A diploid, tetraploid, and hexaploid (?) species (n = 20, 40, ca. 54).  (= RAB, C, F, G, GW, K, Y; = Koellia mutica (Michaux) Kunze – S)

**Pycnanthemum nudum** Nuttall, Smooth Mountain-mint.  Cp (FL, GA, SC): wet pine flatwoods; uncommon (rare in GA and SC).  Se. SC south to n. peninsular FL, Panhandle FL, and se. AL.  Small (1933) attributes this species to NC; the documentation is unknown (and doubtful).  This is a diploid species (n = 20).  (= GW, K, WH, Z; = Koellia nuda (Nuttall) Kunze – S)

**Pycnanthemum pycnanthemoideae** (Leavenworth) Fernald var. **pycnanthemoideae**.  Mt (GA, NC, SC, VA), Pd (NC, SC, VA): forests and woodland borders; common.  July-August.  VA and IL south to w. SC and n. GA.  A tetraploid species (n = 36).  (= K, WH, Z; < P. incamun – RAB; < P. pycnanthemoideae – C, Y; < P. pycnanthemoideae – G (also see P. loomisii); < Koellia pycnanthemoideae (Leavenworth) Kunze – S; > P. tullia Bentham – Z)

**Pycnanthemum torreyi** Bentham, Torrey’s Mountain-mint.  Mt (NC, SC?, VA), Pd (DE, VA), Cp (DE, VA).  (GA?): dry rocky woodlands, over mafic, ultramafic, or calcareous rocks, dry powerline rights-of-way; rare.  NH west to IL, south to NC (and SC?).  A tetraploid and hexaploid species (n = 40 and ca. 60).  The epithet spelling ‘torrei’ is a correctable error under the Vienna code.  (= C, G, Y, Z; < P. verticillatum – RAB; = P. torrei – K, orthographic variant; > P. torrei var. torrei – F; > P. torrei var. leptodon (Gray) Boomhour – F; = Koellia leptodon (Gray) Small – S)

**Pycnanthemum verticillatum** (Michaux) Persoon var. **verticillatum**.  Mt (NC, SC, VA), Pd (DE, NC, VA), Cp (DE, VA): upland rocky woodlands; common (uncommon in DE).  July-September.  Var. **verticillatum** ranges from VT west to MI, south to NC and KY.  A tetraploid species (n = 38-39).  (= C, K; < P. verticillatum – RAB (also see P. clinopodioides, P. torrei); > P. verticillatum – F, G, Y, Z; > Koellia verticillata (Michaux) Kunze – S; > Koellia leptodon (A. Gray) Small – S; > P. verticillatum – W)

**Pycnanthemum floridanum** E. Grant & Epling.  Cp (FL, GA): sandhills; rare.  Se. GA south to n. peninsular FL and e. Panhandle FL.  (= K, WH; not yet keyed; synonymy incomplete)

**Pycnanthemum verticillatum** (Michaux) Persoon var. **pilosum** (Nuttall) Cooperrieder.  Mt (WV): (GA).  Var. **pilosum** (Nuttall) Cooperrieder ranges from s. ON west to MI and IA, south to TN, AR, and OK.  It differs in having the stems thickly (vs. thinly pubescent), the lower surface of the leaves evenly pubescent (vs. pubescence chiefly restricted to the midrib).  In c. TN, and reported from a single county in e. TN (Chester, Wofford, & Kral 1997), in se. PA (Rhoads & Klein 1993), and WV (Kartesz 1999).  (= C, K; = P. pilosum Nuttall – F, G; = Koellia pilosa (Nuttall) Britton – S; not yet keyed; synonymy incomplete)

**Rosmarinus** Linnaeus 1753 (Rosemary)

A genus of 2-3 species, herb/shrubs, of Mediterranean Europe.  Closely related to *Salvia* (Walker et al. 2004), and probably to be combined there.  References: Harley et al. in Kadereit (2004).
LAMIACEAE

* Rosmarinus officinalis* Linnaeus, Rosemary. Cp (NC, SC), Pd (NC, SC): gardens; commonly cultivated, rarely persistent or established, native of Mediterranean Europe. October-April. [= K]

Salvia Linnaeus 1753 (Sage, Clary)

A genus of about 900 species, shrubs and herbs, almost cosmopolitan. Walker et al. (2004) have determined that *Salvia* as traditionally circumscribed is polyphyletic. References: Epling (1938)—Z; Walker et al. (2004).

1 Leaves predominantly basal.
2 Veins of the 3 upper calyx lobes parallel, the lobes themselves minute and widely-spaced (> 1 mm between the 2 lateral teeth), separated by flattish sinuses; basal leaves lobed; [native, though weedy, common throughout our area]............................ *S. lyrata*
3 Veins of the 3 upper calyx lobes converging, the lobes themselves minute and spaced within a distance of 1 mm; basal leaves lobed or toothed; cauline leaves toothed (rarely lobed); [alien weeds, rarely naturalized in our area].
4 Upper corolla-lip strongly arched; leaves serrate .................................................................................................................. *S. pratensis*
5 Upper corolla-lip straight; leaves lobed. ............................................................................................................................. *S. verbenacea*

1 Leaves predominantly cauline, not lobed.
4 Leaves rhombic-ovate, the base cordate, subcordate, truncate, or broadly cuneate.
5 Petiole not clearly differentiated from the leaf blade (leaf tissue decurrent on the petiole for most or all its length); corolla blue.................. ............................................................................................................................. *S. urticifolia*
6 Petiole clearly differentiated from the leaf blade; corolla blue, white, or scarlet.
7 Corolla scarlet; larger leaves 3-6.5 cm long ................................................................. *S. coccinea*
8 Corolla blue or whitish; leaves 5-20 cm long ............................................................... *S. officinalis*
9 Corolla blue or whitish; leaves 5-10 flowers per node; corolla > 13 mm long
10 Upper calyx lip > ½× as long as the calyx tube; flowers 4-12 per node; leaves (8-) 12-20 cm long ................................................................. *S. sclarea*
11 Upper calyx lip < 1/3× as long as the calyx tube; flowers 12-30 per node; leaves 5-10 cm long ................................................................. *S. verticillata*

6 Corolla blue or whitish; leaves 5-20 cm long

7 Upper calyx lip > ½× as long as the calyx tube; flowers 4-12 per node; leaves (8-) 12-20 cm long ................................................................. *S. sclarea*

8 Leaves canescent, gray; [introduced, rarely persistent from cultivation in gardens]............................ *S. officinalis*
9 Leaves puberulent, green; [native, of dry woodlands from SC NC southwest and westward].
10 Flowers 2-4 (per) node; corolla 81-12 mm long.......................................................................................................................... *S. reflexa*
11 Flowers 6-10 flowers per node; corolla > 15 mm long

Salvia azurea* Michaux ex Lamarcq var. azurea* Azure Sage. Cp (FL, GA, NC, SC), Pd (GA, NC, SC), Mt (GA): sandhills, hammocks, other sandy or rocky woodlands; common (rare in NC). Late August-October; October-November. S. NC south to Panhandle FL, west to TX. [= K; < S. azurea – RAB, S, WH]

Salvia azurea* Michaux ex Lamarcq var. grandiflora* Bentham. Mt (GA): prairies, woodlands over calcareous or mafic rocks; rare. August-October; October-November. IL, IA, NE, and eastern CO south to nw. AL, ne. MS, LA, se. TX, and c. TX. [= F, K; = S. pitcheri Torrey ex Bentham – C, G; < S. azurea – S; = S. azurea ssp. pitcheri (Torrey ex Bentham) Epling]

Salvia coccinea* P.J. Buc’hoz ex Etlinger, Scarlet Sage, Blood Sage. Cp (FL, GA, SC**?), Pd (GA**?): hammocks, disturbed areas; uncommon (rare in GA and SC), in the more northern part of its distribution (such as SC) perhaps only introduced from farther south and west. May-November. [= RAB, C, F, G, K, S, W, WH, WV]

* Salvia officinalis* Linnaeus, Garden Sage. Cp (VA, WV), Pd (VA): cultivated as a garden herb, rarely persistent; rare, native of Europe. [= C, F, G, K, WV]

* Salvia pratensis* Linnaeus, Meadow Sage, Meadow Clary. Cp (VA): fields and disturbed areas; rare, native of Europe. [= C, F, G, K]

* Salvia reflexa* Hornemann, Lanceleaf Sage, Mintweed. Mt (WV): dry sandy soil, disturbed areas; rare, native of c. North America. In c. TN (Chester, Wofford, & Krall 1997). The apparent ascription by C of *S. reflexa* Hornemann to "N.C." is a typographic error for "N.D." This species is, however, sometimes adventive as far east as WV. [= C, F, G, K, Z] [not yet keyed]

* Salvia sclarea* Linnaeus, Clary. Mt (NC?); cultivated as a garden herb, rarely persistent; rare, native of Europe. [= C, G, K, S]

Salvia chapmanii A. Gray. AL and FL. Uncertain taxonomic status, often included in S. urticifolia. [= K, S] (not yet keyed; synonymy incomplete)

Satureja Linnaeus 1753 (Savory)

A genus of ca. 38 species, herbs, of Mediterranean Europe west to c. Asia.

* Satureja hortensis Linnaeus, Summer Savory. Pd (DE), Mt (WV): disturbed areas; uncommon, native of Mediterranean Europe and sw. Asia. July-September. [= C, K]

Stachydeoma Small 1903

Thymus Linnaeus (Thyme)

* Thymus pulegioides Linnaeus, Lemon Thyme. Pd (VA), Cp (VA): disturbed areas; rare, native of Eurasia. [= K]

374. PHRYMACEAE Schauer 1847 (Lopseed Family) [in LAMIALES]

As radically circumscribed, a family of about 20 genera and 240 species, herbs, cosmopolitan. See Tank et al. (2006). References: Lee et al. (1996)=Z; Tank, Beardsley, Kelchner, & Olmstead (2006); Thieret (1972); Wagstaff & Olmstead (1997); Fischer in Kadereit (2004); Cantino in Kadereit (2004).

1 Plant a rhizomatous aquatic; leaves spatulate, entire, 10-20 mm long and 0.3-2 mm wide (reminiscent of Limosella or Lilaeopsis)..........................Glossostigma

1 Plant terrestrial (though sometimes in wetlands) with an aerial; leaves ovate, elliptic, or obovate, > 20 mm long and > 2 mm wide.

2 Inflorescence of a solitary, terminal flower; bracteal leaves alternate..............................................................Mazus

2 Inflorescence either of axillary flowers or of terminal and axillary spikes; bracteal leaves or bracts opposite.

3 Inflorescence of axillary flowers; flowers 17-30 mm long ............................................................................Mimulus

3 Inflorescence of terminal and axillary spikes; flowers 6-8 mm long .................................................................Phryma

Glossostigma Wight & Arnott 1836

Mazus Loureiro 1790

A genus of 10-15 species, herbs, of Asia to Australia. References: Pennell (1935)=P.

1 Plant stoloniferous, perennial; corolla ca. 15 mm long ..................................................................................M. miquelii

1 Plant not stoloniferous, annual; corolla 7-10 mm long ....................................................................................M. pumilus

* Mazus miquelii Makino. Pd (NC, VA), Mt (WV): lawns; rare, native of e. Asia. April-June. [= C, K; = M. miquelii – RAB, misspelling; ? M. reptans N.E. Brown]

Mimulus Linnaeus 1753 (Monkey-flower)
A genus of about 150 species, herbs and shrubs, of w. North America, s. Africa, Asia, and e. North America. References: Grant (1924)=Y; Pennell (1935)=P.

1 Corolla yellow; stem viscid glandular-pubescent; plant usually 2-4 dm tall ..............................M. moschatus

1 Corolla blue; stem glabrous; plant usually 3-15 dm tall; [section Mimulus].

2 Leaves petiolate (the upper sessile or nearly so); pedicels 2-15 mm long; stem with 4 winged angles .....................M. alatus

2 Leaves sessile; pedicels 20-45 mm long; stem with 4 rounded angles ...........................................M. ringens var. ringens

Mimulus moschatus Douglas ex Lindley, Muskflower, Musky Monkey-flower. Mt (NC, VA, WV): streambanks, brookbanks, saturated soil of cold springs; rare. July; August. NL (Newfoundland) and QC west to MI, south to w. VA, WV, NC, and MI, and in w. North America. The native/naturalized status of M. moschatus in e. North America is controversial. Some at least of our populations appear to be native, not occurring in situations where likely to have been introduced. [= RAB, C, F, G, P, W, WV; > M. moschatus var. moschatus – K]

Phryma Linnaeus 1753 (Lopseed)

A genus of 1-2 species, herbs, of e. North America and Asia. The disjunct populations have been variously treated as species, varieties, or races. References: Lee et al. (1996)=Z; Thieret (1972); Wagstaff & Olmstead (1997); Cantino in Kadereit (2004).

Phryma leptostachya Linnaeus var. leptostachya, American Lopseed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): bottomland forests, nutrient-rich slopes, mesic hammocks, in the Coastal Plain primarily in places underlain by coquina limestone ("marl") and essentially absent from the more acidic portions of the Coastal Plain; common (uncommon in Coastal Plain). June-August; August-October. The species is interpreted as occurring disjunctly in e. North America and e. Asia. Var. leptostachya ranges from QC west to MB, south to ne. FL, Panhandle FL, and TX; var. asiatica Hara occurs in e. Asia. The fruits "lopped down" against the stem are unmistakable. [= Z; < P. leptostachya – RAB, C, G, K, S, W, WH, WV; > P. leptostachya var. leptostachya – F; > P. leptostachya var. confertifolia Fernald – F]

375. PAULOWNIACEAE Nakai 1949 (Paulownia Family) [in LAMIALES]

A monogeneric family, trees, of e. Asia. There has been disagreement over whether Paulownia is best placed in Scrophulariaceae, Bignoniaceae, or its own family, Paulowniaceae; superficially it closely resembles Catalpa of the Bignoniaceae. Armstrong (1985) concluded that Paulownia's affinities lie with the Scrophulariaceae, based on floral anatomy, embryo morphology, and seed morphology. A molecular study by Spangler & Olmstead (1999) conclude that Paulownia is best retained in its own family. Manning (2000) concurs with its removal from Bignoniaceae. Molecular evidence supports that it is sister to the reconstituted Orobancheaceae. References: Spangler & Olmstead (1999); Manning (2000).

Paulownia Siebold & Zuccarini 1835 (Princess-tree)

* Paulownia tomentosa (Thunberg) Siebold & Zuccarini ex Steudel, Princess Tree, Empress Tree, Paulownia. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): roadsides, disturbed areas, roadcuts, forests; common (uncommon in DE Coastal Plain, rare in FL), native of China. April-June; September-October. Paulownia is becoming a nuisance, showing an ability to invade pristine woodlands. The very soft wood is highly prized in Asia. The leaves of stump sprouts can reach very large sizes (at least to 80 cm long and wide). The woody capsules are persistent, and the densely tomentose, tan flower buds are conspicuous through the winter. [= RAB, C, F, G, K, S, W, WH, WV]

376. OROBANCHACEAE Ventenat 1799 (Broomrape Family) [in LAMIALES]

A family of about 96 genera and 2060 species, root-parasitic herbs lacking chlorophyll (Orobanchaceae sensu stricto) and chlorophylllose hemi-parasites (formerly placed in the Scrophulariaceae), of temperate and subtropical regions of the Northern Hemisphere (Manen et al. 2004). References: Thieret (1971); Olmstead et al. (2001); Fischer in Kadereit (2004).

1 Plants lacking chlorophyll (parasitic), variously pink, purple, brown, tan, orange, or white.
2 Stem panically branched; flowers dimorphic, those low in the inflorescences small, pistillate, and fertile, those high in the inflorescence larger, apparently perfect but functionally stamine; [tribe Orobancheae] .............................................................................................................................. 6. Epifagus

2 Stem simple (rarely few-branched); flowers all alike.

3 Calyx deeply cleft on the lower side; stamens exerted; [tribe Rhinantheo] ............................................................................................................................. 14. Conopholis

3 Calyx either nearly regular, or deeply cleft above and below into 2 lateral halves; stamens included; [tribe Orobancheae] ............................................................................................................................. 7. Orobanche

1 Plants with chlorophyll (hemiparasitic), with foliage and stems normally green.

4 Stem leaves alternate.

5 Leaves pinnately lobed; [tribe Rhinantheae] .............................................................................................................................. 12. Pedicularis

5 Leaves entire or 3-5-lobed at the tip.

6 Bract subtending flowers orange, red, or yellow; calyx 4-lobed; capsule loculicidal; pedicel lacking bracteoles; seeds broad, wingless; [tribe Castillejoae] ................................................................................................................................................................................................... 11. Castilleja

6 Bracts subtending flowers green; calyx 5-lobed; capsule septicipetalic and tardily also loculicidal; pedicel with 2 bracteoles; seeds narrow, winged; [tribe Cymbarieae] ................................................................................................................................................................................................... 10. Schwatbea

4 Stem leaves (at the lowest) the opposite.

7 Corolla salverform; [tribe Buchnerae].

8 Plant strict, unbranched unless damaged; flowers in a terminal spike; corolla purple; [native, sometimes weedy] .................. 8. Buchnera

8 Plant strongly branched; flowers solitary and axillary; corolla red or orange; [alien, in agricultural fields] ................. 9. Striga

7 Corolla various, but not salverform.

9 Calyx 4-lobed or essentially unlobed; corolla strongly bilabiuate, the upper lip consisting of 2 petals almost wholly connate and strongly cucullate (hooded); corolla white or yellow; [tribe Rhinantheae].

10 Lower lip of corolla with raised yellow, densely pubescent palate; stem leaves entire (bracteal leaves in and near the inflorescence sometimes pectinately fringed; annual, 1-4 dm tall) ........................................................................................................................................................................... 13. Melampyrum

10 Lower lip of corolla without palate; stem leaves pinnately lobed, the lobes themselves crenate; perennial, 3-8 dm tall ........ 12. Pedicularis

9 Calyx 5-lobed; corolla 5-lobed, the lobes relatively similar in size and shape, spreading; corolla yellow, orange, red, or pink; [tribe Geraniaceae].

11 Corolla pink; leaves linear and thread-like (except lanceolate in A. auriculata) ................................................................. 1. Agalinis

11 Corolla yellow or orange; leaves either lanceolate or broader, at least the basal pinnately or bipinnately lobed or toothed, or pinnately or bipinnately divided into linear segments.

12 Leaves pinnately or bipinnately divided into linear segments up to 2 mm wide; corolla rotate, the tube shorter than the lobes .

12 Leaves not lobed or divided, or the segments broader; corolla tubular, campanulate, or funnelform, the tube much longer than the lobes.

13 Corolla orange, tubular, the tube narrow and straight, > 5× as long as the diameter ....................................................... 3. Macranthera

13 Corolla yellow, campanulate or funnelform, the tube conical, < 4× as long as the diameter.

14 Anthers pubescent; lower leaves ≤ 12 cm long ................................................................................................................. 4. Aureolaria

14 Anthers glabrous; lower leaves 20-40 cm long ..................................................................................................................... 5. Dasistoma

I. Agalinis Rafinesque 1836 (Agalinis, Purple-foxtglove)

A genus of about 40 species, hemiparasitic herbs, of tropical and warm temperate regions of America. References: Canne (1979); Hays (1998b); Pennell (1935) = P.

1 Perennial, from horizontal rootstalk bearing slender, scaly rhizomes; corollas 3-4 cm long; [of Carolina bays, cypress savannas, limesink ponds] .................................................................................................................... A linifolia

1 Annual, with 1-several fibrous roots from the stem base; corollas < 3 cm long (except sometimes A. fasciculata and A. purpurea).

2 Stem retrorse-hispid; leaves lanceolate to ovate, usually lobed at the base; [of mafic glades and woodlands] .......................... 8. Buchnera

2 Stem leaves opposite.

3 Leaves reduced to scales < 2.5 mm long; plant thus appearing leafless ................................................................................. 3. Macranthera

3 Leaves not scale-like, > 8 mm long.

4 Pedicels less than 1.5× as long as the calyx, mostly 1-5 mm long at anthesis, mostly < 8 mm long in fruit.

5 Plants fleshy; [of saline or brackish marshes and salt flats].

6 Pedicels usually longer than or equaling the leaflike bracts; corollas 15-20 mm long; anther cells 1.8-2.3 mm long, usually long-lanose; [of Princess Anne County, VA, southward] ................................................................................................. A. maritima var. grandiflora

6 Pedicels usually less than or equaling the leaflike bracts; corollas 12-17 mm long; anther cells 1.3-1.8 mm long, glabrous or somewhat pubescent; [of the Delmarva Peninsula northward] ..................................................................................... A. maritima var. maritima

5 Plants not fleshy; [not inhabiting saline habitats, though some species may be found in freshwater interdune swales].

7 Stems appearing copiously leafy because of the well-developed fascicles of axillary leaves; [inhabiting dry to moist, often ruderal, habitats] ................................................................. A. aphylla

7 Stems not copiously leafy, the axillary fascicles absent or poorly developed; [inhabiting moist to wet natural habitats].

8 Corolla (10-)15-20 mm long; calyx lobes from 0.4-1.9× as long as the calyx tube; pollen sacs 1.4-2.0 mm long .................. A. paupercula var. paupercula

8 Corolla 18-38 mm long; calyx lobes 0.2-0.5× as long as the calyx tube; pollen sacs 2.5-3.5 mm long.

9 Branches spreading or ascending; stems more-or-less scabridulous; corollas 18-38 mm long ......................... A. purpurea

9 Branches virgate; stems glabrous; corollas 20-25 mm long .................................................................................. A. virgata

4 Pedicels > 2.5× as long as the calyx, mostly 5-20 mm long at anthesis, mostly > 10 mm long in fruit.

10 Living plants dull green, usually suffused with much purplish pigment; leaves < 20 mm long; dried plants dark, sometimes blackish; dried calyx deep purple, the veins obscure (difficult to see even at 10×).
11 Upper lip of the corolla arched forward over the stamens, greatly reducing the opening of the throat; corolla throat glabrous or glabrate within; [of the Piedmont and Mountains] .................................................

_**A. tenuifolia**_

11 Upper lip of the corolla erect or reflexed, the throat open; corolla throat densely hairless within; [of the Coastal Plain].

12 Branches widely spreading or laxly ascending; pedicels > 4× as long as the leaflike bracts; anterior filaments 5-5.5 mm long; [of Berkeley and Beaufort counties, SC, southward] .................

_**A. laxa**_

12 Branches ascending to somewhat spreading; pedicels < 3× as long as the leaflike bracts; anterior filaments 7-9 mm long; [widespread] .................................................................

_**A. setacea**_

10 Living plants light green or glaucous, usually with no purple pigment; leaves < 15 (-20) mm (except _A. decemloba_, with leaves 15-25 mm long); dried plants not dark, but turning pale yellowish green; dried calyx pale yellowish green, the veins distinct and obvious without magnification.

13 Corolla throat within lacking 2 yellow lines; leaves widen distally to obtuse tips; stem and branches distinctly rough-scalbridulous to the touch.................................................................

_**A. obtusifolia**_

13 Corolla throat with 2 prominent yellow lines; leaves taper to acute or acuminate tips; stem and branches not (or very slightly) scalbridulous.

14 Corolla 10-15 mm long, its lobes emarginate or reulate; [of the Piedmont and Mountains, and rarely the upper Coastal Plain].

14 Corolla 15-20 mm long, its lobes entire to slightly emarginate; [of the Coastal Plain, from c. NC southward] ..............

_**A. tenella**_

_Agalinis auriculata_ (Michaux) S.F. Blake, Earleaf Foxglove. _Pd_ (SC, VA), _Cp_ (AL), _PD_ (WV): glands, barrens, blackbelt prairies, and disturbed clearings on mafic rocks (such as diabase and gabbro) or calcareous rocks; rare. August-October; September-November. KY and OH west to MN, south to n. AL, wc. AL (Schotz 2009), AR, and TX; also rarely disjunct east of the Blue Ridge, in NJ, n. VA, and nc. SC. In Lewis County, KY (D. White, pers. comm.). Sometimes treated in the genus _Tomanthera_.

_Agalinis decemloba_ (Greene) Pennell. _Pd_ (NC, SC, VA), _Mt_ (GA, NC): dry clayey or sandy woodlands; rare. [= RAB, S, W; < _A. obtusifolia_ – C, K; = _Gerardia decemloba_ Greene – _F, G, P_]

_Agalinis maritima_ (Rafinesque) Rafinesque var. _maritima._ _Cp_ (DE, NC, VA): tidal marshes; uncommon (rare in DE).

July; August. NS and s. ME south to se. VA and e. NC. [= K; < _A. maritima_ – RAB, C, GW; = _Gerardia maritima_ Rafinesque var. _maritima_ – _F_; = _Gerardia maritima_ – _G_; = _Gerardia maritima_ ssp. _typica_ – _P_]

_Agalinis paupercula_ (A. Gray) Britton var. _paupercula._ _Mt_ (VA): calcareous fens; rare. NS west to MB, south to NJ, PA, OH, IN, IL, and IA; disjunct in sw. VA (Washington County). [= K; < _A. purpurea_ (Linnaeus) Pennell var. _parviflora_ (Bentham) B. Boivin – _C_; = _Gerardia paupercula_ (A. Gray) Britton var. _paupercula_ – _F_; = _Gerardia purpurea_ Linnaeus var. _parviflora_ Bentham – _G_; = _Gerardia paupercula_ var. _typica_ – _P_] (not yet keyed)

_Agalinis plukenetii_ (Elliott) Rafinesque. _Cp_ (FL, GA), _Pd_ (GA), _Mt_ (SC): sandhills, other dry forests; uncommon. SC south to c. peninsular FL, west to wc. LA, and northward in the interior to extreme se. TN (Polk County) (Chester, Wofford, & Kral 1997). Scattered in GA (e.g., Baldwin and Laurens counties). [= K, S; = _Gerardia plukenetii_ Elliott – _P_]

839

Agalinis acuta Pennell, Sandplain Agalinis. Cp (MD): coastal sand plains; rare. MA south to Baltimore County, MD. [= C, K; = Gerardia acuta Pennell – F, G, P] [not yet keyed]

Agalinis divaricata (Chapman) Pennell, Pineland Agalinis. Cp (FL, GA): sandhills; common (rare in GA). GA (Decatur County) south to c. peninsular FL, west to MS (Sorrie & LeBlond 2008). [= K, S, WH; = Gerardia divaricata (Chapman) Pennell – P] [not yet keyed]

Agalinis filicaulis Bentham Pennell, Spindly Agalinis. Cp (FL, GA): wet pine savannas, prairies; rare. GA (Tattnall County) south to c. peninsular FL and Panhandle FL, west to w. LA. [= K, S, WH; = Gerardia filicaulis (Bentham) Chapman – P] [not yet keyed]

Agalinis filifolia (Nuttall) Rafinesque, Seminole Agalinis. Cp (FL, GA): dry longleaf pine savannas, scrub; uncommon (rare in GA). S. GA (east to Liberty County) south to s. FL, west to sw. AL (Baldwin County) (Sorrie & LeBlond 2008). [= K, S, WH; = Gerardia filifolia Nuttall – P] [not yet keyed]

Agalinis flexicaulis Hayns. Cp (FL): wet pinelands; rare. Endemic to ne. FL. (Bradford County, to be expected in adjacent counties). See Hays (2010) for detailed information. [not yet keyed]

Agalinis gattengeri (Small) ex Britton. Barrens, glades, outcrops, woodlands. ON, MN, and NE south to AL, MS, LA, and TX. In c. TN, east to e. TN (Rhea and Scott counties) (Chester, Wofford, & Kral 1997). Reported for NC (Kartesz 1999). [investigate] [= K, S; = Gerardia gattengeri Small – G, P]

Agalinis harperi Pennell in Small. Cp (FL, GA, SC?): wet pine savannas, interdune swales; uncommon (rare in GA). GA south to s. FL, west to w. LA. Glynn County, GA and east to McIntosh County, GA as A. pinetorum. See Hays (1998a) who has established the nomenclatural priority of A. harperi. Reported for SC (Kartesz 1999); [investigate]. [= S, WH; > A. harperi Pennell in Small – S; > A. pinetorum – S; = A. pinetorum Pennell – K; > A. delicatula Pennell; = Gerardia harperi (Pennell in Small) Pennell – P] [not yet keyed]

Agalinis heterophylla (Nuttall) Small ex Britton. GA west to s. MO, AR, e. OK, and e. TX. [= G, K]

Agalinis oligophylla Pennell. Sc. TN (Coffee and Warren counties) (as A. pseudophylla) (Chester, Wofford, & Kral 1997), c. and s. AL, west through s. MS to w. LA. [= K, S; > Gerardia pseudophylla (Pennell) Pennell – P; > A. pseudophylla (Pennell) Shinners; > A. pseudophylla (Pennell) Shinners, an orthographic variant

Agalinis pulchella Pennell. Cp (FL, GA): pine savannas and sandhills; rare. Reported for Coffee and Ware counties, GA. [Nomenclatural and typification problems] [= K, S, WH; = Gerardia pulchella Pennell – P] [not yet keyed; synonymy incomplete]

Agalinis skinneriana (A. Wood) Britton. Coffee County, TN (Chester, Wofford, & Kral 1997). [= K; = Gerardia skinneriana A. Wood – G, P] [not yet keyed; synonymy incomplete]

Agalinis tenuifolia var. leucantha (Rafinesque) Pennell. Cp (FL, GA): savannas; rare (GA Special Concern). [= K, S; < A. tenuifolia – WH] [not yet keyed; synonymy incomplete]

Agalinis tenuifolia (Vahl) Rafinesque var. macropylla (Bentham) Blake. [= K, S; = Gerardia tenuifolia Vahl ssp. macropylla (Bentham) Blake – P] [not yet keyed; synonymy incomplete]

Agalinis tenuifolia (Vahl) Rafinesque var. polyphylla (Small) Pennell. Pd (GA): granitic flatrocks; uncommon? Endemic to granite flatrocks in GA. [= K, S; = Gerardia tenuifolia Vahl ssp. polyphylla (Small) Pennell – P; = Gerardia polyphylla (Small) Pennell – P] [not yet keyed; synonymy incomplete]

2. Seymeria Pursh 1814 (Seymeria)

A genus of about 25 species, herbs, of s. North America (including Mexico). References: Pennell (1935)=P.

1 Corolla pubescent on its outer surface; leaf segments linear, < 0.5 mm wide; stem glabrous or puberulent; seeds wingless (though with ridges).

Seymeria pectinata Pursh sps. pectinata, Comb Seymeria. Dry pinelands, sandhills. July-October. Sps. pectinata ranges from se. NC south to c. peninsular FL, west to s. MS, a Southeastern Coastal Plain endemic. Sps. penuinarius (Pennell) Pennell ranges from n. peninsular FL south to s. FL. [= K; < S. pectinata – RAB, WH; = S. pectinata ssp. typica – P; = Afzelia pectinata (Pursh) Kuntze ssp. pectinata – S]

3. Macranthera Nuttall ex Bentham 1836 (Flameflower)

Macranthera flammnea (Bartram) Pennell, Flameflower, Hummingbird-flower. Pitcherplant bogs, bayheads. July-September. Nearly restricted to the East Gulf Coastal Plain (e. GA and FL Panhandle west to se. LA), but ranging east to the Atlantic Coastal Plain of e. GA (Bullock County), within a county of the SC border. [= GW, K, P, S, WH]

4. Aureolaria Rafinesque 1836 (Oak-leach, False-foxglove)

A genus of about 10 species, hemiparasitic herbs, of e. North America and Mexico. References: Pennell (1935)=P.

1 Plant pubescent (especially on the calyx, corolla, capsule, and lower stem) with glandular hairs; annual; seeds 0.8-1.0 mm long, not winged.
2 Calyx tube hemispherical, glandular-hirsute to glandular-lanate on the outer surface; capsule ovoid; trichomes of the leaves usually glandular, at least in part; leaf lobes usually acute.................................................................A. pectinata
2 Calyx tube turbinate, glandular-puberulent on the outer surface; capsule ellipsoid; trichomes of the leaves usually non glandular, leaf lobes usually obtuse ................................................................................................................A. pedicularia

1 Plant glabrous or pubescent with nonglandular hairs; perennial; seeds 1.3-2.7 mm long, winged.
3 Capsule pubescent; inflorescence, pedicels, and/or calyx pubescent with nonglandular hairs; pedicels 1-3 mm at anthesis; flowering May-July .................................................................A. flava
3 Capsule glabrous; inflorescence, pedicels, and calyx glabrous (or pubescent with nonglandular hairs in Au. patula); pedicels 1-25 mm long at anthesis; flowering August-September.

4 Inflorescence, pedicels, and calyx pubescent (at least sparsely so); pedicels slender, ca. 0.5 mm in diameter .........................A. patula
4 Inflorescence, pedicels and calyx glabrous; pedicels stout, ca. 1 mm in diameter.
5 Lower leaves entire to serrate (or with only a few shallow lobes at the base of the leaf); pedicels 1-8 mm long at anthesis, straight; corolla 3.0-4.0 cm long; capsule 10-15 mm long; stem not glaucous .................................................................A. laevigata
5 Lower leaves pinnately lobed, the lobes themselves usually serrate, the sinuses extending over half of the distance to the midrib; pedicels 4-25 mm long at anthesis, upwardly curved; corolla 3.5-6 cm long; capsule 12-20 mm long; stem slightly to strongly glaucous .............................................................................A. flava

Aureolaria flava (Linnaeus) Farwell, Smooth Oak-leach. Oak forests and woodlands. August-September; September-October. ME west to MN, south to GA. c. peninsular FL, AL, and e. LA. The various named varieties or subspecies need additional study; the variation seems to be too clinal to be practically recognized taxonomically. [= RAB, W, WH; > A. flava var. flava – C, G, K; > Gerardia flava Linnaeus var. flava – F; > Gerardia flava var. reticulata (Rafinesque) Cory – F; > A. flava ssp. typica – P; > A. flava ssp. flavicarpa – S; > A. flava ssp. reticulata (Rafinesque) Pennell – P; S; > A. flava (Linnaeus) Farwell var. macrantha Pennell – F; > A. flava ssp. macrantha Pennell – P; > A. flava ssp. flavicarpa – S; > A. flava ssp. flavicarpa var. pedicellaris (Pennell) Pennell – P]

Aureolaria laevigata (Rafinesque) Fernald, Appalachian Oak-leach. Oak forests and woodlands. August-September; September-October. PA west to s. OH, south to SC and GA, primarily a Central and Southern Appalachian endemic, but extending into adjacent provinces, and, rarely, even the Coastal Plain. [= RAB, C, G, K, P, S, W; = Gerardia laevigata Rafinesque – F]

Aureolaria pectinata (Nuttall) Pennell, Southern Oak-leach. Turkey oak sandhills, other dry oak forests and woodlands. May-September, September-October. NC south to s. FL, west to LA, inland north to AR and MO. Related to A. pedicularia, but much more southerly in distribution. [= RAB, K; = A. pectinata (Linnaeus) Rafinesque var. pectinata (Nuttall) Gleason – C, G, WH; = Gerardia pectinata (Linnaeus) (Nuttall) Bentham – F; > A. pectinata ssp. eurycarpa (Pennell) Pennell – P; S; > A. pectinata ssp. transcedens (Pennell) Pennell – P; S; > A. pectinata ssp. typica – P; > A. pectinata ssp. pectinata – S; < A. pedicularia – W]

Aureolaria pedicularia (Linnaeus) Rafinesque, Annual Oak-leach. Oak forests and woodlands. September-October; November. ME west to NY and e. MN, south to nw. SC, ne. GA, e. TN, and n. IL. The various named varieties or subspecies need additional study; the variation seems to be too clinal to be practically recognized taxonomically. [= RAB, W; > A. pedicularia var. pedicularia – C, G, K; = Gerardia pedicularia Linnaeus var. pedicularia – F; > A. pedicularia ssp. caesariensis Pennell – S; > A. pedicularia ssp. carolinensis Pennell – P; S; > A. pedicularia (Linnaeus) Rafinesque var. austromontana Pennell – C, G, K; > Gerardia pedicularia Linnaeus var. austromontana (Pennell) Fernald – F; > A. pedicularia ssp. austromontana (Pennell) Pennell – P, S; > A. pedicularia (Linnaeus) Rafinesque var. intercedens – Pennell – C, G; K; > Gerardia pedicularia Linnaeus var. intercedens (Pennell) Fernald – F; > A. pedicularia ssp. intercedens (Pennell) Pennell – P]

5. Dasistoma Rafinesque 1819 (Mullein Foxglove)
A monotypic genus, a hemiparasitic herb, endemic to se. North America. The genus is sometimes spelled 'Dasystoma.'

References: Pennell (1935)=P.

Dasistoma macrophyllum (Nuttall) Rafinesque, Mullein Foxglove. Xeric to dry-mesic woodlands and bluffs, riverbanks, over limestone or diabase. July-September. WV, OH, s. WI, IA, and NE, south to sw. VA (Lee County), nc. SC, nw. GA, c. AL, MS, LA, and nc. TX. First reported for VA by Wieboldt et al. (1998). [= Dasistoma macrophylla – RAB, C, G, K, P, S, orthographic variant; = Seymeria macrophylla Nuttall – F, GW, WV; = Dasystoma macrophylla, orthographic variant]

6. Epifagus Nuttall 1818 (Beechdrops)

7. Orobanche Linnaeus 1753 (Cancer-root, Broomrape)

Orobanche ludoviciana Nuttall, Prairie Broomrape. Pastures, upland areas, and glades, parasitic on perennial composites such as Grindelia, Artemisia, and Heterotheca. April-August. SK and BC south to MO, w. TX, AZ, and n. Mexico. [= X; < O. ludoviciana – F, G, Z; < O. ludoviciana var. ludoviciana – C; < O. ludoviciana ssp. ludoviciana – K] {excluded; not keyed or mapped}

* Orobanche ramosa Linnaeus, Branching Broomrape. Disturbed areas; native of Asia. As discussed by Musselman (1984), the identity of the sole NC record (collected in 1884) is somewhat presumptive, and the precise location uncertain. An infestation of this serious weed was discovered in 2007 at a car wash in urban Norfolk, VA (Musselman & Bolin 2008). [= C, F, G, K]

Orobanche riparia L.T. Collins, Riparian Broomrape. Bottomlands, parasitic on annual composites such as Ambrosia trifida, Xanthium strumarium, and Ambrosia artemisiifolia. August-October. VA, s. WV, and DC (James, Potomac, Shenandoah, and New rivers); OH, IN, IL, MO, TN (Mississippi and Ohio rivers and their tributaries); NE and CO south to w. TX and NM. See Collins, Colwell, & Yatskievych (2009) for detailed discussion. [= X; < O. ludoviciana var. ludoviciana – C; < O. ludoviciana – F, G, W, Z; < O. ludoviciana ssp. ludoviciana – K]

OROBOCHACEAE

A genus of about 100 species, hemiparasitic herbs, of tropical and warm temperate regions of the Old and New Worlds. The taxonomy of this genus is poorly understood. The plants are root hemi-parasites, apparently not particular about the host species. References: Sorrie & Weakley (in prep.)=Z; Pennell (1935)=P.

Identification notes: Lower leaves are broadest, mid and upper leaves narrowest, often markedly so; the key refers to lower leaves. Leaf teeth are usually few in number and vary in development, from crenate to 2-3 mm long and sharply pointed. The former condition is normal for *B. floridana*, the latter for *B. americana*. Calyx length is ca. 0.5 mm longer in fruit than in flower. The foliage turns black on drying.

1 Leaves lanceolate to narrowly ovate, tapering to a point; veins of lower stem leaves consisting of 3 major and 2 minor ones (narrow leaves may only have 3 total veins); leaf teeth usually well developed, rarely absent, usually 2-3 mm long; calyx (6.0-) 6.5-8.0 mm long; corolla lobes 5.0-7.0 mm long; [primarily of moderate to high pH soils in southern Great Plains, ranging to southern margin of the Great Lakes and eastward to the mid Atlantic seaboard, especially in mafic or calcareous glades and prairies, sometimes in more acid sites]........... *B. americana*

1 Leaves narrowly oblanceolate to lanceolate, rounded at tip; veins of lower stem leaves consisting of 1 major and 2 minor ones (narrow leaves may only have 1 vein); leaf teeth usually crenate but may be absent, < 2 mm long; calyx (4.0-) 4.5-5.5 mm long; corolla lobes 4.0-5.0 mm long; [primarily of low pH soils on the southern Atlantic and Gulf Coastal Plain, sometimes in calcareous sites (especially outside of our area)].......................................................................................................................................................................................................

*Buchnera americana* Linnaeus, Prairie Bluehearts, American Bluehearts, Plains Bluehearts. Dry (seasonally moist) rocky, gravelly, or clayey soil of limestone glades, glades over mafic rock (such as diabase, gabbro, etc.), wet meadows, sandy roadsides. July-September; August-October. NY and s. ON west to MI, IL, MO, and s. KS, south to c. NC, GA, Panhandle FL, and TX. In addition to the key characters given, *B. americana* is overall a larger and more robust plant than *B. floridana*, though both are quite variable in size, depending on the conditions in which they grow. *B. americana* has apparently declined very greatly in our area, probably owing to fire suppression in its habitats. [= K; = S. lutea Loureiro – RAB]

*Buchnera floridana* Gandoger, Savanna Bluehearts, Florida Bluehearts. Pine savannas, flatwoods, seepage bogs, sandy roadsides. April-October; May-September. se. NC south to s. FL, west to TX, and in the West Indies. Previous attributions of *B. longifolia* Kunth (including *B. elongata* Small) to southeastern states (notably FL, AL, GA, and MS) are based on misidentifications of material which is actually *B. floridana*. [= RAB, GW, S; >* B. americana – K, WH; > B. americana var. australis (Pennell) Reveal & C.R. Broome]

9. *Striga* Loureiro 1790 (Witchweed)

A genus of about 40 species, hemiparasitic herbs, of tropical to temperate regions of the Old World.

* Striga asiatica* (Linnaeus) Kuntze, Witchweed. Cultivated fields, parasitic on the roots of corn and other grasses; native of the Old World. A serious weed, *Striga* has been the subject of eradication efforts and quarantine policies since its appearance in our area. [= = K; = S. lutea Loureiro – RAB]

10. *Schwalbea* Linnaeus 1753 (Chaffseed)

The genus is monotypic, a hemiparasitic herb, of se. North America. References: Pennell (1935)=P.

*Schwalbea americana* Linnaeus, Chaffseed. Savannas, sandhill-pocosin ecotones (in the uphill portions), mesic loamy-soil slopes or swales in sandhill longleaf pine woodlands, fire-maintained interior woodlands and barrens. May-June; August. Formerly rather widespread in e. North America, primarily in the Coastal Plain, from e. MA, south to c. peninsular FL and west to TX, and disjunct in the Cumberland Mountains of KY and TN. The species is now limited to a few scattered sites in NJ, NC, SC, GA, FL, AL, and LA. It appears to require high fire frequency, especially during the growing season, perhaps related to its establishment ecology. The tiny seeds are hyaline-winged. [= = RAB, C, F, G, GW, K, WH; >* S. americana – P, S; > S. americana var. australis (Pennell) Reveal & C.R. Broome]

11. *Castilleja* Mutis ex Linnaeus f. 1782 (Indian Paintbrush)

A genus of about 200 species, hemiparasitic herbs, primarily of w. North America, with a few species also in e. North America, Eurasia, Central America, and Andean South America. References: Pennell (1935)=P.
**12. Pedicularis** Linnaeus 1753 (Wood-betony, Lousewort)

1 Inflorescence 1-4 dm tall; stem leaves alternate; stem pubescent, at least near the inflorescence; flowering April-May ............... *P. canadensis*

1 Inflorescence 4-10 dm tall; stem leaves opposite; stem glabrous; flowering August-October ............................................. *P. lanceolata*

**Pedicularis canadensis** Linnaeus, Eastern Lousewort, Wood-betony. Moist to dry forests and woodlands, streambanks. April-May; May-July. ME, QC, and MB south to ne. FL, FL Panhandle, TX, and n. Mexico. Var. *dobbsii* Fernald, alleged to differ in having nearly solitary flowering stems and stoloniform basal offsets, needs additional study. [= RAB, C, G, GW, P, S, W, WH, WV; > *P. canadensis var. canadensis* – F; > *P. canadensis var. dobbsii* Fernald – F; > *P. canadensis* ssp. *canadensis* – K]

**Pedicularis lanceolata** Michaux, Swamp Lousewort. Springheads and swampy areas, over calcareous, mafic, or ultramafic rocks. August-October; September-October. MA and NY west to MN and ND, south to e. VA, w. NC, e. TN, ne. GA, w. TN, n. AR, and NE. [= RAB, C, F, G, GW, K, P, S, W, WV]

**13. Melampyrum** Linnaeus 1753 (Cow-wheat)

A genus of about 35 species, hemiparasitic herbs, of temperate regions of North America and Eurasia. References: Pennell (1935)=P.

1 Lowermost bracteal leaves generally with a few prominent sharp teeth or segments; leaves 2-10 mm wide; plants usually with numerous branches (often 10 or more); internodes of the midstem usually 1-3 cm long. ................................................................. *M. lineare var. latifolium*

1 Lowest bracteal leaves entirely or nearly so, or the uppermost with a few short basal teeth; leaves (2-) 10-30 mm wide, the widest leaves on a plant usually over 10 mm wide; plants usually simple or with 4 (rarely more) branches; internodes of the midstem usually 4-6 cm long. ...

................................................................. *M. lineare var. latifolium*

1 Teeth of the middle and upper bracts shorter than the width of the undivided portion of the bracts; leaves lanceolate, (2-) 5-10 mm wide; [widespread in our area] ........................................................................................................... *M. lineare var. americanum*

1 Teeth of the middle and upper bracts commonly as long as the width of the undivided portion of the bracts; leaves linear to lanceolate, 2-6 (-8) mm wide; [of the Coastal Plain] .............................................................................................. *M. lineare var. pectinatum*

**Melampyrum lineare** Desrousseaux var. *americanum* (Michaux) Beauverd, Common Cow-wheat. Dry soils. May-July; August-September. QC west to MN, south to VA, NC, and TN. Our three varieties are quite distinctive in morphology and have distinctive geographic ranges, they seem worthy of distinction from one another at the varietal level, at least. The fourth variety, var. *lineare*, is more northern, ranging from NL (Labrador) west to BC, south to New England, n. MI, and n. MN. It is similar to var. *latifolium* in its entire bracteal leaves, but overall is more like var. *americanum*, differing in the bracteal teeth and in its linear leaves, rarely over 5 mm wide. The distinction between var. *americanum* and var. *lineare* may not be worth making; if combined (as by K), the correct name is var. *lineare*. [= C, F, G; < *M. lineare* – RAB, W; < *M. lineare* var. *lineare* – K, WV; < *M. lineare* var. *typicum* – P; < *M. lineare* – S]
Melampyrum lineare Desrousseaux var. latifolium Barton, Appalachian Cow-wheat. Dry soils in ridgetop woodlands, in thin soils around rock outcrops. Late April-July; August-September. MA and NY south to n. GA, mostly in the Appalachians. [= C, F, G, K, P, WV; < M. lineare – RAB, W; = M. latifolium (Barton) Muhlenberg ex Britton - S]

Melampyrum lineare Desrousseaux var. pectinatum (Pennell) Fernald, Pine-barren Cow-wheat. Dry sandy areas. May-July; August-September. E. MA to se. VA, on the Coastal Plain. [= C, F, G, K, P; < M. lineare – RAB, W]

1. Conopholis Wallroth 1825 (Squawroot, Bearcorn)

Conopholis americana (Linnaeus) Wallroth, Squawroot, Bearcorn. Rich, moist forests, under Quercus species. March-June. NS west to WI and south to c. peninsular FL, AL, and TN; disjunct in e. Mexico (Chiapas, Oaxaca, and Puebla). Haynes (1971) discusses the nature of the parasitism. Conopholis apparently germinates near an oak root, forms a parasitic connection to the root, resulting in the formation of a gall consisting of both Quercus and Conopholis tissue. The gall can be up to 25 cm in diameter, and lasts for many years, repeatedly sending up flowering shoots. It is believed that the gall exists underground for some years prior to first flowering. [= RAB, C, F, G, K, P, S, WH, WV, X, Y, Z]

377. LENTIBULARIACEAE Richard 1808 (Bladderwort Family) [in LAMIALES]

1 Leaves or leaf segments linear, borne along a subterranean or submersed stem; carnivory via specialized bladder-like traps; flowers in (1-) many-flowered racemes, each flower pedicel subtended by a bract ................................................................. Utricularia

2 Leaves ovate or elliptic, in a basal rosette; carnivory via the viscid-slimy upper leave surfaces; flowers solitary on bractless peduncles .......... Pinguicula

2 Leaves of the lower portion of the scape elongated, pointed, multicellular, nonglandular, transitioning upward to 1-celled glandular hairs; expanded portion of corolla markedly "veiny" (darker along the veins); [of se. NC southward to s. peninsular FL and e. Panhandle FL]. ................................................................. P. caerulea

3 Hairs throughout scape glandular; expanded portion of corolla not "veiny," [collectively of sw. GA and FL Panhandle westward to s. MS].

4 Fresh leaves dull red or reddish green; corolla lobes ca. 2× as long than broad, the lobes notched almost ½ their length. ... P. planifolia

5 Corolla tube violet, with darker violet veins; hairs of the inner corolla tube white ................................................................. P. ionantha

6 Corolla tube yellow, with reddish-brown veins; hairs of the inner corolla tube yellow ................................................................. P. primuliflora

Pinguicula caerulea Walter, Blue Butterwort. Pine savannas and wet pine flatwoods, mostly in the outer Coastal Plain, rarely extending inland to seepages and sandhill-pocosin ecotones in the fall-line Sandhills of NC and SC. April-May. Se. NC
Utricularia, as monographed by Taylor (1989), consists of 214 species in 35 sections, with a nearly cosmopolitan distribution. In our area, 14 or 15 species in 5 sections are known to occur. References: Taylor (1989)=Z; Schnell (2002b)=Y; Müller & Borsch (2005); Fischer et al. in Kadereit (2004). Key based in part on Z and GW.

1 Flowers white or cream-white, 1-3 mm long; inflorescence peduncles very reduced, the pedicels appearing to arise directly from the stolons; tracts 0.3-0.8 mm long; plants floating unattached in water (sometimes deposited land by dropping water, but then the principal branch systems stranded on the soil surface); capsules ca. 1 mm long, fusiform, indiscernent, with 1 seed; seeds essentially smooth, unornamented; leaves absent; [section Utricularia] [section Setiscapella] [very rare in our area]; [section Lecticula] .................................................................U. resupinata

2 Plants attached (with principal branch systems within the soil); leaves absent or simple, linear, grass-like aerial leaves; bladders 0.2-1.1 mm long, most or all on a plant usually < 1.0 mm long; seeds reticulate-alveolate (also angled in U. resupinata), 0.20-0.25 mm long. [section Stomoisia].

3 Flowers pink; inflorescence 1 (-2)-flowered; bract at base of the pedicel tubular, flattened; [section Vesiculina] .................................................................U. cornuta

4 Bracts subtending the pedicels peltate (attached near their middles), unattached at either end; pair of bracteoles absent; spur of the corolla oriented forward, more-or-less appressed to the lower lip; aerial leaves (when present) with subacute to obtuse apex; [section Vesiculina] .................................................................U. juncea

5 Corolla 1.5-2.0 cm long; spur 8-12 mm long; raceme usually short, the (1-) 2-6 flowers crowded together, all of them chasmogamous ......................................................................................................................U. cornuta

5 Corolla 0.25-1.5 cm long; spur 5-7 (-9) mm long; raceme usually elongate, the (1-) 2-15 flowers well-spaced, often the lower (sometimes all) cleistogamous and much smaller than the chasmogamous flowers ......................................................................................................................U. inflata

2 Plants floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); leaves present and dissected into linear segments; bladders 0.7-5.0 mm long, most or all on a plant > 1.0 mm long; seeds papillose, reticulate, ridged, angled, or winged, 0.5-2.0 mm long.

6 Flowers purple; leaves divided into verticillate segments with terminal traps; [section Vesiculina] .................................................................U. purpurea

6 Flowers yellow; leaves divided into alternate segments with lateral traps; [section Utricularia].

7 Peduncle with whorl of inflated leaf-like organs (floats).

8 Floats 4-7, not fused basally to one another, fusiform, tapering gradually to base and apex from a widest point near the middle; leaves with the 2 primary divisions unequal; bracts of the scape longer than broad, entire; flowers (6-) 9-14 (-17) per scape; apex of corolla spur bifid .................................................................U. inflata

8 Floats (5-) 6-8 (-10), fused basally to one another, cylindrical, more-or-less parallel-sided through most of their length, tapering abruptly to base and apex; leaves with the 2 primary divisions equal; bracts of the scape broader than long, the apex slightly to strongly 3-lobed; flowers (1-) 3-4 (-7) per scape; apex of corolla spur usually entire (rarely bifid) .................. U. radiata

7 Peduncle without whorl of inflated leaf-like organs (floats).

9 Main axes distinctly flattened in cross-section, up to 10 mm wide ............................................................................................................U. foliosa
9 Main axes round in cross-section.
10 Lower lip of corolla 3-lobed; seeds disk-shaped, not angular or winged; inflorescences of 2 types, the chasmogamous on erect peduncles 2.5-25 cm long bearing 2-8 flowers, the cleistogamous without a peduncle, the solitary pedicels borne directly on the stolons, 0.5-2 cm long, deflexed..........................\textit{U. geminiscapa}
10 Lower lip of corolla entire or slightly irregular, not 3-lobed; seeds angular or winged; inflorescences of 1 type (erect, chasmogamous).

Upper corolla lip smaller than the lower, entire; capsule circumsissely dehiscent; seeds 0.7-1.0 mm long, 4-6-angled; corolla without stipitate glands on its external surface.

Leaves of one kind only, divided into numerous capillary segments bearing lateral traps; bracts scarcely auriculate; plant distinctly aquatic, floating in water and only rarely stranded; [of the Coastal Plain] ........................................\textit{U. macrorhiza}

Leaves of 2 or 3 kinds, some divided into capillary or narrowly linear segments and bearing few or no traps, others divided into fewer capillary segments and bearing more-or-less numerous traps; bracts distinctly auriculate; plants typically in boggy situations, in shallow water or frequently stranded; [either of the Mountains at high elevations or of various physiographic provinces northward].

Brodest leaf segments with 9-20 lateral setae (use 10× magnification); spur of corolla cylindrical, distinctly longer than wide, the apex distinctly curved forward............................................\textit{U. intermedia}

Brodest leaf segments lacking lateral seta; spur of corolla shortly saccate to broadly conical, wider than long, the apex not curved forward...........................................................................................................\textit{U. minor}

Upper corolla lip larger than the lower, obscurely 3-lobed; capsule laterally 2-valved or indehiscent; seeds 0.8-2.5 mm long, lenticular, with an irregular, lobed, or continuous wing; corolla (or at least the spur) with a few to many short stipitate glands (sometimes patchily distributed).

Vegetative shoots uniform, all bearing rather sparsely divided leaf segments bearing traps, seeds 0.8-1.1 mm long, with a continuous, circumferential wing, slightly to irregularly lobed.

Lower corolla lip 8-10 mm long, about equaling or slightly shorter than the conical, 5-9 mm long spur; leaves usually forked twice.........................................................................................\textit{U. biflora}

Lower corolla lip 5-6 mm long, exceeding the blunt, 3.5-4.5 mm long spur; leaves usually forked once ..........\textit{U. gibba}

Vegetative shoots of 2 kinds, some bearing leafy segments and few or no traps, others bearing reduced segments and more-or-less numerous traps; seeds 1.0-2.5 mm long, with an irregularly deeply lobed or partial wing.

Plant anchored in mud up to 100 cm below water surface; green leafy shoots up to 40 cm long and 5 cm wide; peduncle flexuous, to 100 cm long, only the uppermost ca. 10 cm emergent ..............................................\textit{U. floridana}

Plant in shallow water or stranded; green leafy shoots usually not >10 cm long and 2 cm wide; peduncle erect, straight, to 30 cm long, the uppermost 10-25 cm emergent .........................................................\textit{U. striata}

\textit{Utricularia biflora} Lamarrck, Longspur Creeping Bladderwort. Ponds, lakes, and ditches. June-October. This species may not be distinct from \textit{U. gibba} (which see for discussion). E. MA south to FL, west to TX and OK, primarily on the Coastal Plain; also apparently widespread in the New World and Old World tropics. [= RAB, C, F, G, GW, W; = \textit{U. pumilu} Walter – S, apparently misapplied; < \textit{U. gibba} – K, WH, Y, Z]

\textit{Utricularia cornuta} Michaux, Horned Bladderwort. Shores of limesink ponds (dolines), bogs, mountain bogs. May-September. NL (Newfoundland) and QC west to n. ON, AB, and MN, south to s. FL and e. TX; also in the Bahamas and Cuba. Taylor (1989) states that where sympatric with \textit{U. juncea}, \textit{U. cornuta} flowers much earlier. [= RAB, C, F, G, KW, W, WH, WV, Y, Z; = \textit{Stomoisca cornuta} (Michaux) Rafinesque – S]

\textit{Utricularia floridana} Nash, Florida Bladderwort. In deep water of natural Carolina bay lakes, other natural lakes, and limesink ponds (dolines). July-August. Se. NC south to c. peninsular FL, west to Panhandle FL and sw. GA. [= GW, K, S, WH, Y, Z]

\textit{Utricularia foliosa} Linnaeus, Flatstem Bladderwort. In deep water of natural lakes and ponds. Se. NC south to s. FL, west to TX (Brown & Marcus 1998); West Indies, South America, Africa. This species is reported for NC by Taylor (1989). See GW for a detailed description of this species. [= GW, K, S, WH, Y, Z]

\textit{Utricularia geminiscapa} Benjamin, Two-flowered Bladderwort, Hidden-fruitied Bladderwort. Beaver ponds, mucky seepages. NL (Newfoundland) and QC west to n. MI and n. WI, south to PA and sc. NC. [= C, F, G, KW, W, WH, WY, Y, Z]

\textit{Utricularia gibba} Linnaeus, Shortspp Creeping Bladderwort. Ponds, lakes, and ditches. May-September. QC west to WI, south to FL and LA; also apparently widespread in the West Indies and Central America and apparently the Old World tropics. Taylor (1989) includes \textit{U. biflora} in \textit{U. gibba}. Other authors have expressed doubts about the distinction, including RAB ("doubtfully distinct"). Taylor suggests that "further research is clearly indicated, but to be at all meaningful, it must be conducted on a worldwide basis." I have here, for the moment, retained the 2 traditionally recognized species, though intermediates will be encountered. [= RAB, C, F, G, S, W, WY; < \textit{U. gibba} – K, Y, Z (also see \textit{U. biflora})]

\textit{Utricularia inflata} Walter, Swollen Bladderwort, Inflated Bladderwort. Ponds, lakes, ditches. May-November. NJ south to s. FL, west to e. TX; disjunct in WA (probably introduced). Also disjunct in an artificial pond in Henderson County, NC (Carl Sandburg Home National Historic Site). [= C, G, KW, K, S, WH, Y, Z; = \textit{U. inflata var. inflata} – RAB, F]
**Utricularia intermedia** Hayne, Northern Bladderwort. {habitats} South to se. PA (Rhoads & Klein 1993), DE (?), and MD (Kartesz 1999). The report from sc. GA (Jones & Coile 1988) is in error. [= C, F, G, K, Y, Z]

**Utricularia juncea** M. Vahl, Southern Bladderwort. Shores of limesink ponds (dolines), borrow pits, wet sands. July-September. NY (Long Island) and NJ south to s. FL, west to e. TX and se. AR; also in the West Indies, Central America and South America. [= RAB, C, F, G, GW, K, WH, Y, Z; > Stomoisia juncea (M. Vahl) Barnhart – S; > Stomoisia virgatula Barnhart – S]

**Utricularia macrorhiza** Le Conte, Greater Bladderwort. Pools and ponds. May-September. NL (Newfoundland) west to AK, south to NC, SC, TX, CA, and Mexico; also in e. Asia. See Taylor (1989) for a discussion of the differences between this species and *U. vulgaris* of Europe and w. Asia, with which it has often been combined or associated as a variety. [= K, Y, Z; < U. vulgaris Linnaeus – RAB, C, F, G, WV, misapplied to American plants]

**Utricularia minor** Linnaeus, Lesser Bladderwort, Small Bladderwort. Fens and bogs, in the Southern Blue Ridge at about 1400 meters elevation. Circumboreal, south in North America to NJ, DE, PA, IN, IL, IA, NE, CO, UT, NV, and CA; disjunct in w. NC. [= C, F, G, K, Y, Z]

**Utricularia olivacea** Wright ex Grisebach, Dwarf Bladderwort, Minute Bladderwort. In floating mats (often algal) in water of limesink ponds (dolines), artificial lakes or beaver ponds. September-October. NJ south to FL, west to s. AL and s. MS (Sorrie & Leonard 1999), in the Coastal Plain; also in the West Indies (Cuba), Central America, and South America. [= RAB, GW, K, WH, Y, Z; = Biovularia olivacea (Wright ex Grisebach) Kam. – S]

**Utricularia purpurea** Walter, Purple Bladderwort. In water of ponds, ditches, other slow-moving water. May-September. NS and QC west to MN, south to NY, n. IN, s. MI, and WI, and on the Coastal Plain south to s. FL, west to se. TX; also in Mexico, the West Indies, and Central America. [= RAB, C, F, G, GW, K, WH, Y, Z; = Vesiculina purpurea (Walter) Rafinesque – S]

**Utricularia radiata** Small, Floating Bladderwort, Small Swollen Bladderwort. Ponds, depression ponds, lakes, and ditches. May-November. NS south to s. FL, west to TX; disjunct in w. VA, w. TN, nw. IN; reports of this species in Cuba and South America are apparently in error. [= C, G, K, S, W, WH, Y, Z; = U. inflata var. minor Chapman – RAB, F]

**Utricularia resupinata** B.D. Greene ex Bigelow, Northeastern Bladderwort, Resupinate Bladderwort. Wet pine flatwoods, pond margins, shores of natural lakes. NS west to nw. WI, south (irregular and scattered in part) to FL and sw. GA; also in the Bahamas (Sorrie & LeBlond 1997). Although "the curious gap in the North American range" [NC, SC, and VA] (Taylor 1989) is no longer strictly a gap, *U. resupinata* does appear to have a strangely bimodal range, with a center of distribution in ne. United States and se. Canada and a second extending from se. United States south into the West Indies and Central America. [= C, F, G, GW, K, WH, Y, Z; = Lecticula resupinata (B.D. Greene) Barnhart – S]

**Utricularia striata** Le Conte ex Torrey, Fibrous Bladderwort. Ponds, lakes, and ditches. May-November. Se. MA south to n. FL, west to e. TX and e. OK. [= K, WH, Y, Z; = U. fibrosa Walter – RAB, C, F, GW, S, of uncertain application and likely misapplied]

**Utricularia subulata** Linnaeus, Slender Bladderwort, Zigzag Bladderwort. Moist sands or peats of various kinds of acidic wetlands, including wet pine savannas and flatwoods, shores of limesink ponds (dolines), borrow pits, ditches. March-July (later). In North America primarily in the Coastal Plain, from NS and e. MA south to s. FL, west to TX, north in the interior to TN and AR; also in the West Indies, Central America, South America, Africa, and Asia. Taylor (1989) terms this "the most widespread of *Utricularia* species." [= RAB, C, F, G, GW, K, WH, Y, Z; > Setiscapella subulata (Linnaeus) Barnhart – S; > Setiscapella cleistogama (A. Gray) Barnhart – S]

**378. ACANTHACEAE** Durande 1762 (Acanthus Family) [in LAMIALES]

1 Plant a tree, with opposite leathery leaves; [of FL, s. MS, s. LA southward]........................................................................................................... *Avicennia*

1 Plant an herb, with various leaf arrangements.

2 Leaves in a basal rosette (sometimes with smaller leaves on a scape).
ACANTHACEAE

849

3 Leaves glabrate, to 22 cm long and 8 cm wide; corolla 0.8-1.3 cm long; capsule 8-10 mm long; stamens 2; [of moist to wet swamps] ............................................................ Elytraria

3 Leaves pubescent, to 10 cm long and 3 cm wide; corolla 1.8-4 cm long; capsule 9-18 mm long; stamens 4; [of dry upland pinelands].

4 Leaves 2-10 cm long, 1-3 cm wide; corolla 3-4 cm long; calyx lobes 15-30 mm long; capsule 12-18 mm long. ................. Ruellia ciliosa

4 Leaves 1.5-2.5 cm long, 0.7-0.8 cm wide; corolla ca. 2 cm long; calyx lobes 6-9 mm long; capsule ca. 10 mm long. ................. Stenandrium

2 Leaves cauline.

5 Fertile stamens 4; corolla not distinctly 2-lipped, the corolla lobes of nearly equal size (except distinctly 2-lipped in Hygrophila).

6 Corolla distinctly 2-lipped ......................................................... Hygrophila

6 Corolla not distinctly 2-lipped, the corolla lobes of nearly equal size.

7 Plant an herbaceous vine; leaves cordate-hastate at the base; flowers yellow to orange, usually with a dark purple “eye” .................

7 Plant an herb; leaves cuneate to rounded at the base; flowers white to various shades of blue or pink.

8 Calyx lobes linear-aristate; anther sacs awned or pointed at the base. ....................................................................................... Thanbergia

8 Calyx lobes lanceolate or linear; anther sacs blunt .......................................................... Dyschoriste

5 Fertile stamens 2; corolla distinctly 2-lipped (except salverform in Pseuderanthemum and with 4 nearly equal lobes in Yeatsea).

9 Corolla salverform, 5-lobed ........................................................................................................ Pseuderanthemum

9 Corolla distinctly 2-lipped or 4-lobed.

10 Bracts and bractlets inconspicuous, 2-5 mm long, linear or triangular; stem subterete or obscurely 4-angled ......... Justicia

10 Bracts and/or bractlets subtending the flowers conspicuous, 5-15 mm long, obovate; stem terete or 6-angled.

11 Stem six-angled in cross-section; corolla conspicuously 2-lipped ........................................................................... Yeatsea

11 Stem terete in cross-section; corolla 4-lobed, the lobes nearly equal .............................................................................. Yeatsea

Andrographis Wallich (False Water-willow)

A genus of about 20 species of tropical Asia.

* Andrographis echioides (Linnaeus) Nees, native of India, is reported for chrome ore piles near Newport News, VA, by Reed (1961); it is likely not established in our area. [= K] {not keyed; not mapped; rejected as a component of our flora}

Avicennia Linnaeus (Black Mangrove)

1 Corolla tan to purplish-pink, 15-20 mm long, the tube straight or nearly so ........................................................................ D. brachiata

1 Corolla scarlet red, 20-25 mm long, the tube curved ........................................................................................................ B. sexangularis

Dicliptera Antoine Laurent de Jussieu (Dicliptera, Foldwing)

A genus of 4-7 species, tropical. Of variable family placement, having been variously placed in the Acanthaceae, Verbenaceae, or Acanthaceae.

Avicennia germinans (Linnaeus) Linnaeus, Black Mangrove. Brackish and salt marshes and swamps. Scattered on the Gulf Coast in FL peninsula (Dixie county southward on the west coast, St. Johns County southwards on the east coast), Panhandle FL (Franklin and Taylor counties), s. MS, s. LA, and se. TX, southwards into the West Indies and Tropical America. [= RAB, C, F, GW, K, WH, Y; = K, WH, Y; = GW, K, WH; = K, WH, Y] ...........................

Dyschoriste Nees (Twinflower, Snakeherb, Dyschoriste)

1 Corolla 25-27 mm long (including the 5-10 mm lobes); capsule 10-14 mm long; [of pinelands] ........................................ D. oblongifolia

1 Corolla 10-15 mm long (including the 3.5 mm lobes); capsule 7-10 mm long

2 Leaves linear to linear-elliptic; [of moist pinelands] ........................................................................ D. angusta

2 Leaves elliptic to elliptic-ovate; [of floodplain forests] ........................................................................ D. humistrata

Dyschoriste angusta (A. Gray) Small, Pineland Twinflower. Moist pinelands. N. FL south to s. peninsular FL. Reported for FL Panhandle ( Wakulla County) by Kunzer et al. (2009). [= K, S, WH] {add GW, Y, Z to synonymy; improve key}

849
**ACANTHACEAE**

_Dyschoriste humistrata_ (Michaux) Kuntze, Swamp Twinflower, Swamp Dyschoriste. Bottomland forests, especially on soils over limestone. April-May. SC to c. peninsular FL, west to e. Panhandle FL. [= RAB, GW, K, S, WH, Y, Z]

_Dyschoriste oblongifolia_ (Michaux) Kuntze, Blue Twinflower, Pineland Dyschoriste. Pine savannas, flatwoods, and sandhills. April-May. SC to s. FL, west to se. AL and e. Panhandle FL. The basis of Small's (1933) attribution of this species to VA is unknown. [= RAB, K, S, WH, Y; > Dyschoriste oblongifolia var. oblongifolia – Z]

**Elytraria** Michaux (Elytraria)

_Hygrophila_ R. Brown

1 Leaf blades 5-12 cm long; calyx segments ca. 5 mm long, glabrous; flowers borne in axillary clusters .................................................. _H. lacustris_
1 Leaf blades 1-3.5 cm long; calyx segments ca. 2 mm long, pubescent; flowers borne in terminal and axillary spikes .......................... _H. polysperma_

_Hygrophila lacustris_ (Schlectendahl & Chamisso) Nees, Gulf Swampweed. Shallow water of swamps and shores. Sw. GA south to c. FL Peninsula, west to e. TX; West Indies. [= GW, K, S, Y, Z; = Hygrophila costata Nees et al. – WH; = Ruellia lacustris Schlectendahl & Chamisso]  

_Justicia_ Linnaeus (Water-willow)

1 Bracts of the inflorescence foliaceous and overlapping .................................................................................................................. _J. brandegeana_
1 Bracts of the inflorescence small, neither foliaceous nor overlapping.
2 Spike densely flowered; seeds verrucose; primary leaves averaging 6-8× as long as wide; [of the Piedmont, Mountains, and Coastal Plain]. .................................................................................................................................................. _J. americana_
2 Spike loosely flowered; seeds smooth or minutely muricate (with very fine, sharp projections); primary leaves either ca. 2-6× as long as wide .......................... _J. ovata_ var. _lanceolata_
3 Corolla purple, 18-30 mm long; leaves averaging > 8× as long as wide; cystoliths parallel to the midvein of the leaf; [of s. GA south into FL].
4 Upper leaf blades 4-7 cm long, not channeled, tough but not fleshy; calyx segments 5-7 mm long, < 1 mm wide ................. _J. angusta_
4 Upper leaf blades 8-13.5 cm long, channeled, fleshy; calyx segments 11-15 mm long, ca. 1 mm wide .................. _J. crassifolia_
3 Corolla pale lavender to white, 8-13 mm long; leaves averaging 2-6× as long as wide; cystoliths parallel to the secondary veins of the leaf; [of the Coastal Plain throughout our area].
5 Spikes lax, the flowers usually borne singly, secund; seeds smooth; leaves averaging ca. 5× as long as wide ............................. _J. ovata_ var. _ovata_

**Justicia brandegeana** Wasshausen, Shrimp-plant. Disturbed areas; native of Mexico. January-December. [= K2, WH]

**Justicia ovata** (Walter) Lindau var. lanceolata (Chapman) R.W. Long. Swamps, marshes. May. Se. GA west to TX, north in the Mississippi Embayment to s. IL, s. IN, w. KY. Needs additional study; may warrant specific status. [= K, WH, Y, Z; < J. ovata – GW; = J. lanceolata (Chapman) Small – S]

**Pseuderanthemum** Radlk.

A genus of about 60 species, mostly shrubs, of tropical regions.

* **Pseuderanthemum variabile** (R. Brown) Radlkofner, Night-and-Afternoon. Disturbed areas, also in potted plants and greenhouses; native of the Old World. Reported as a greenhouse weed from SC (Nelson & Kelly 1997), but not included as a regular member of the flora of SC because "it is unlikely that it could persist anywhere in South Carolina outside a greenhouse environment" (Nelson & Kelly 1997). [= K, Y; ? Ps. fasciculatum (Oerst.) Leonard – WH]

**Ruellia** Linnaeus (Wild-petunia)

1 Principal leaves linear-lanceolate, > 10× as long as wide (8-27 cm long, 0.7-2 cm wide); [alien, cultivated and naturalized] ..........**R. simplex**

1 Principal leaves elliptic, ovate or broadly lanceolate, 2-5× as long as wide (2-16 cm long, 0.5-7 cm broad); [native].

2 Calyx lobes narrowly linear-lanceolate, flattened to the tip, 1-4 mm wide ..............................................................................................................**R. strepens**

2 Calyx lobes linear, filiform or setaceous at least apically, < 1.2 mm wide at their widest point (usually the base), hairlike at the tip.

3 Corolla 6-10 cm long, opening at night and withering by mid-morning, white to pale lavender; calyx lobes 2.5-4.5 cm long; [of Coastal Plain seepage bogs and wet pine flatwoods][...............................**R. noctiflora**]

3 Corolla 3-7 cm long, opening during the day, lavender to lavender-blue (rarely white in *R. humilis*); calyx lobes 1-3 cm long; [of various habitats].

4 Flowers borne on peduncles 0.2-7 cm long, from the axils of lower and median nodes, not from the terminal node or terminal cluster.

5 Stem divergently branched (rarely simple); calyx glabrous or glabrate, with many partially imbedded cysoliths; calyx lobes 0.5-1 mm wide; tapering from the base to a very slender tip; [of dry to wet pine woodlands of the Coastal Plain][..................**R. pinetorum**]

5 Stem simple (rarely with a few ascending branches); calyx subulate, without cysoliths; calyx lobes 0.67-1.2 mm wide, widest near the middle and tapering to the apex; [of dry woodlands, forests, and glades of the Piedmont and Mountains] .........**R. purshiana**

4 Flowers sessile or sub sessile, in the axils of median and upper nodes, and usually also from the terminal node or cluster.

6 Leaves sessile or sub sessile; flower-bearing nodes usually 4-8; stem typically branched at base; stigma lobe 1 .................**R. humilis**

6 Leaves petiolate; flower-bearing nodes usually 1-3; stem typically simple below (unless damaged), sometimes branched upward; stigma lobes (1-) 2.

7 Plant with all leaves caulescent; leaves ovate, lanceolate, elliptic, or oblong; [widespread in our area] ..........**R. carolinensis**

7 Plant with a rosette of purplish basal leaves, flat on the ground; leaves spatulate to obovate; [restricted to dry pine woods in the Coastal Plain] ..............................................................................................................**R. ciliosa var. ciliosa**

**Ruellia carolinensis** (J.F. Gmelin) Steudel, Carolina Wild-petunia, Common Wild-petunia. Dry to moist forests and woodlands. (May-) June-September. NJ, s. OH, s. IN, s. IL, and OK, south to s. FL and e. TX. [= RAB, C, G, WH, X; > R.
* **Ruellia ciliata** Hooker, Hairyflower Wild-petunia. Disturbed areas; native of South America. [= K2, WH] [not yet keyed; add to synonymy]

**Ruellia noctiflora** (Nees) A. Gray, Night-flowering Wild-petunia. Wet pinelands and savannas. (May-) June-July (-August). E. GA (in counties immediately adjacent to SC) south to ne. FL; Panhandle FL west to se. LA. [= GW, K, S, WH, X, Y, Z]

**Ruellia pedunculata** Torrey ex A. Gray, Stalked Wild-petunia. Dry woodlands and forests. IL and MO south to w. LA and e. TX, apparently not in our area. [= F; < *R. pedunculata* – C, G; = *R. pedunculata* ssp. *pedunculata* – K, Y, Z] [not yet keyed]

**Ruellia pinetorum** Fernald, Pineland Wild-petunia. Dry to wet pinelands. May-September. SC south to Panhandle FL, west to e. TX. Although treated as only subspecifically distinct from *R. pedunculata* by many recent authors, there seem ample differences in morphology, distribution, and habitat to warrant specific distinction. First reported for GA by Sorrie (1998b). [= RAB, F, X; = *R. pedunculata* Torrey ex A. Gray ssp. *pinetorum* (Fernald) R.W. Long – K, WH, Y, Z]

**Ruellia purshiana** Fernald, Pursh’s Wild-petunia. Dry woodlands and forests, especially over mafic or calcareous rocks. May-(-June). MD south to c. GA and c. AL, in and adjacent to the Appalachians. [= RAB, F, K, W, WV, Y, Z; < *R. pedunculata* Torrey ex A. Gray – C, G]

**Stenandrium Nees**

**Stenandrium dulce** (Cavanilles) Nees var. *dulce*. Sweet Shaggytuft. Pine savannas. GA to FL. Var. *dulce* ranges from GA south to FL; var. *floridanum* A. Gray is restricted to s. peninsular FL. [= K, Y; < Gerardia *floridanum* (A. Gray) Small – S; < *S. dulce* var. *floridanum* A. Gray – Z]

**Thunbergia** Retzius (Clock-vine)
**ACANTHACEAE**

ACANTHACEAE

853

* Thunbergia alata Bojer ex Sims, Black-eyed-Susan Vine. Disturbed areas; native of Africa. [= K, S, WH, Y, Z]

**Yeatesia** Small (Bractspike)

---

**BIGNONIACEAE** A.L. de Jussieu 1789 (Bignonia Family) [in LAMIALES]

A family of about 110 genera and 800 species, trees, shrubs, and lianas, mainly tropical and especially of South America. The monophyly of the Bignoniaceae (excluding Paulownia) was confirmed by Spangler & Olmstead (1999). References: Manning (2000)=Z; Spangler & Olmstead (1999); Fischer, Theisen, & Lohmann in Kubitzki (2004).

1 Leaves simple, cordate; plant a tree; corolla white (marked internally with other colors); [tribe Tecomeae]...........................1. Catalpa

1 Leaves pinnately compound; plant a vine; corolla reddish or yellowish.

2 Leaves 7-15-foliolate, with a leaflet in the terminal position; [tribe Tecomeae].........................................................2. Campsis

2 Leaves 2-foliolate, with a 3-branched tendril in the terminal position; [tribe Bignonieae].

3 Tendrils not hooked, claw-like.......................................................................................................................................................

3 Tendrils hooked, claw-like ........................................................................................................................................................

4. Macfadyena

---

1. Catalpa Scopoli 1777 (Catalpa)

A genus of about 10 species, trees, of e. North America (2 species), e. Asia (4 species), and the West Indies (4 species). References: Manning (2000)=Z; Paclt (1952)=Y; Li (2008); Fischer, Theisen, & Lohmann in Kubitzki (2004).

1 Flowers creamy yellow, striped inside with deeper yellow and spotted with dark violet; leaves usually lobed; seeds elliptical, 2.5-3 mm long, 8-10 mm wide............................................................................................................................................................C. ovata

1 Flowers white or pale rose, striped inside with yellow and spotted with purple; leaves rarely lobed; seeds elongate, 4-10 mm long, 20-35 mm wide.

2 Corolla 2-4 cm wide, the lower corolla lobe densely spotted with purple, entire; pod 6-10 mm thick, each valve 9-15 mm wide when flattened; seeds with 2 elongated wings, each wing narrowing to an acutish end, the hairs at the end appressed to one another in 2 planes, thus forming a pointed tail; fresh foliage with a fetid odor.................................................................C. bignonioides

2 Corolla 4-6 cm wide, the lower corolla lobe sparsely spotted with purple, notched; pod 10-15 mm thick, each valve 13-18 mm wide when flattened; seeds with 2 elongated wings, each wing narrowing only slightly to a rounded or oblique end, the hairs at the end appressed to one another only in one plane, thus forming a flattish fringe; fresh foliage essentially odorless ......................................................C. speciosa

---

Catalpa bignonioides Walter, Southern Catalpa. Bottomlands and streambanks (as a native), escaped or persistent after cultivation. June; October. S. GA, ne. FL, n. peninsular FL, and Panhandle FL west to s. MS (or LA?), on the Coastal Plain, early naturalized in a more widespread area, and now extending north to CT and MI. [= RAB, C, F, G, GW, K, W, WH, Z; = C. catalpa (Linnaeus) Karsten – S]

* Catalpa ovata G. Don, Chinese Catalpa. Suburban woodlands; native of China. Introduced in WV, MD, DC, PA, and other northeastern states (Manning 2000; Kartesz 1999), and beginning to be considered invasive. [= C, F, G, K, Z; > C. ovata var. ovata – Y; > C. ovata var. flavescens Bean – Y]

Catalpa speciosa (Warder) Warder ex Engelmann, Northern Catalpa. Bottomlands and river banks (as a native), also escaped or persistent after cultivation, and sometimes thoroughly naturalized. May-June; July-August. Native in the upper Mississippi River Embayment of s. IN and s. IL, south to w. TN and e. AR; early naturalized in a more widespread area. [= RAB, C, F, G, K, S, W, Z]

2. Campsis Loureiro 1790 (Trumpet-creeper)

*Campsist radicans* (Linnaeus) Seemann ex Bureau, Trumpet-creeper.  Bottomland forests, swamp forests, fencerows, old fields, forests, thickets, disturbed areas.  June-July; September-October.  NJ west to IA, south to s. FL and c. TX.  In the pre-Columbian landscape this plant was primarily limited to swamps and bottomlands; it has done well as a weedy colonizer of abandoned farmland, fencerows, and thickets (where particularly conspicuous on fenceposts and old tobacco barns).  In swamps of the Coastal Plain it is a common liana, often with its foliage in the canopy 30-40 m above the ground, and with stems to 15 cm in diameter.  Even when the foliage cannot be seen, *Campsis* is immediately recognizable by its shreddy tan or yellow bark (unlike any of our other high-climbing vines).  [= RAB, C, F, G, GW, K, W, WH, Z; *Bignonia radicans* Linnaeus – S]

3. *Bignonia* Linnaeus 1753 (Cross-vine)  

*Bignonia capreolata* Linnaeus, Cross-vine.  Swamp forests, bottomlands, forests, woodlands.  April-May; July-August.  MD west to s. OH and s. MO, south to c. peninsular FL and e. TX.  This species is absent from most of the Mountains in our area (also scarce in the Piedmont of Virginia and upper Piedmont of NC), reappearing at lower elevations on the west side of the Blue Ridge.  Though primarily a species of swamp and bottomland forests, *Bignonia* often occurs as well in mesic or even dry forests, where it generally remains stunted (most individuals with only a few leaves) and does not flower or fruit.  [= C, F, GW, K, W, WH, Z; *Anisostichus capreolata* (Linnaeus) Bureau – RAB; G; *Anisostichus crucigera* (Linnaeus) Bureau – S]

4. *Macfadyena* Alphonse de Candolle 1845 (Claw-vine)  

*Macfadyena unguis-cati* (Linnaeus) A.H. Gentry, Claw-vine, Cat’s-claw-vine.  Cultivated and naturalized; native of tropical America.  This vine is introduced and naturalized in s. and e. GA (Jones & Coile 1988) and is locally commonly naturalized in Charleston.  [= K, WH, Z; *Bignonia unguis-cati* Linnaeus]

382. VERBENACEAE J. St.-Hilaire 1805 (Verbena Family) [in LAMIALES]

As recently reworked, a family of about 34-41 genera and 950-1200 species, trees, shrubs, vines, and herbs, widespread in tropical, subtropical, and warm temperate regions of the Old World and New World.  References:  Atkins in Kadereit (2004).  [also see LAMIACEAE and PHRYMACEAE]

1 Shrubs; fruits fleshy; [tribe Lantaneae] ...................................................................................................................................................... *Lantana*  
1 Herbs; fruits dry.  
2 Mericarps 2; corolla 4-lobed, evidently zygomorphic (bilabiate); [tribe Lantaneae] ...................................................................................................................................... *Phyla*  
2 Mericarps 4; corolla 5-lobed, actinomorphic or only weakly irregular; [tribe Verbeneae].  
3 Mericarps not separating at maturity; [sandy woodlands of the Coastal Plain] .............................................................................................. *Stylodon*  
3 Mericarps separating at maturity; [collectively widespread].  
4 Styles > 6 mm long; calyx 8-10 mm long, longer than the fruit; corolla salverform ................................................................................. *Glandularia*  
4 Styles < 3 mm long; calyx 2-4 mm long, often shorter than the fruit; corolla funnelliform ........................................................................... *Verbena*

*Aloysia* Palau 1784 (Bee-brush)  
VERBENACEAE

1 Leaves finely dissected, the divisions 1 mm or less wide, the margins strongly revolute.
   2 Bracts as long as or longer than the calyx; leaf segments 1-4 mm wide ...................................................... G. bipinnatifida var. bipinnatifida
   1 Leaves coarsely dissected or lobed, the divisions > 1 mm wide, the margins slightly or not at all revolute.
   3 Calyx lobes > 3 mm long ........................................................................................................................................... G. canadensis
   3 Calyx lobes < 3 mm long ........................................................................................................................................... G. ×hybrida

Glandularia bipinnatifida (Nuttall) Nuttall var. bipinnatifida, Dakota Vervain. Cp (GA, Mt (GA)): dry prairies on clay soils; rare. KY, MO, SD, and CO south to e. GA, AL, AZ and s. Mexico; elsewhere in n. America as waifs. [= K; = Verbena bipinnatifida Nuttall – C] [synonymy incomplete]

Glandularia canadensis (Linnaeus) Nuttall, Rose Vervain, Rose Verbena, Creeping Vervain. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt* (WV*): roadsides, sandhills, other dry (especially sandy) soils; uncommon. March-May. PA, IL, and CO, south to FL and TX, and introduced elsewhere. [= K, S, Z; = Verbena canadensis Linnaeus – RAB, C, F, G]

* Glandularia ×hybrida (Grönland & Rümpler) Nesom & Pruski, Garden Vervain. Cp (SC): cultivated in gardens; uncommonly cultivated, rarely escaped or persistent. March-July. Nesom & Pruski (1992) have provided the transfer to Glandularia of this common garden plant. [= Verbena ×hybrida Grönland & Rümpler – RAB, G, K; = Verbena hybrida – C]

Lantana Linnaeus 1753 (Lantana)

1 Heads with an involucre; flowers pink or purple........................................................................................................... L. montevidensis
   2 Heads with bracts, but not an involucre; flowers orange, yellow, or multicolored.
   3 Calyx lobes acute, as long as or longer than the calyx tube ...................................................................................... L. camara
   3 Calyx lobes obtuse, shorter than the calyx tube ........................................................................................................... L. urticoides

* Lantana camara Linnaeus, Common Lantana, Hedgeflower. Cp (FL, GA, NC, SC): disturbed areas, especially near the coast; rare, native of the West Indies. [= RAB, K, S, Z]

Lantana depressa Small var. floridana (Moldenke) R. Sanders, Florida Lantana. Cp (FL, SC*?): edges of brackish marshes, dunes; rare, the SC occurrence apparently introduced from FL. Native from ne. FL south to se. FL. [= K, Z; = L. ovatifolia Britton – RAB, S, misapplied; = L. depressa Small – S]

* Lantana urticoides Hayek, West Indian Lantana. Cp (NC, SC): disturbed and brackish areas; rare, native of West Indies. May-December. [= K; = L. hordida Kunth – RAB, misapplied]

Phyla Loureiro 1790 (Frogfruit)

1 Leaves 2-6 cm long, lanceolate, widest at or below the middle, acute at the tip; leaf teeth (5-) 7-11 per leaf side ................. P. lanceolata
   1 Leaves 1-4 cm long, obovate, widest above the middle, obtuse to rounded at the tip; leaf teeth (3-) 5 (-7) per leaf side .................. P. nodiflora

Phyla lanceolata (Michaux) Greene, Marsh Frogfruit, Northern Frogfruit. Cp (DE, FL, GA, NC, SC, VA), Pd (VA), Mt (VA, WV): brackish marshes, other marshes, ditches; common (rare in DE, FL, GA, and WV). June-November. On west to SD, south to Panhandle FL, AL, MS, LA, CA, and n. Mexico; primarily in the outer Coastal Plain in the Carolinas, but extending inland in VA. [= C, G, GW, K, S, W, WH; = Lippia lanceolata Michaux – RAB, WV; > L. lanceolata var. lanceolata – F; > Lippia lanceolata var. recognita Fernald & Griscom – F]
Phyla nodiflora (Linnaeus) Greene, Creeping Frogfruit, Capeweed, Turkey-tangle, Matgrass. Cp (FL, GA, NC, SC, VA): sandy soils of roadsides, lawns, ditches, disturbed areas; common (rare in VA). May-November. Pantropical, in North America from se. VA south to s. FL and west to CA, north in the interior to AR, se. MO, and southward into the tropics. This species is very weedy, and is a familiar component of road margins and lawns in the southeastern Coastal Plain. [= C, G, GW, K, S, WH; = Glandularia nodiflora (Linnaeus) Michaux – RAB, F]

Verbena Linnaeus 1753 (Verbena, Vervain)

1 Spikes short and stout, the flowers or fruits overlapping and completely obscuring all of the rachis (except in V. montevidensis, the fruits spaced towards the base of the spike).

2 Plant procumbent or decumbent; leaves pinnately lobed or dissected; [section Verbena, series Bracteatae]................................. V. bracteata

3 Plant erect; leaves coarsely serrate.

4 Central spikes sessile to subsessile, spikes compact, 3-5 mm wide, fruits remaining densely overlapping at maturity; [section Verbena, series Bracteatae]................................................................. V. brasiliensis

5 Central spikes pedunculate, spikes loose, 2-3 mm wide, with fruits becoming remote at least in the proximal portion at maturity’ [section Verbena, series Bracteatae]................................. [V. montevidensis]

6 Leaves not lobed or dissected, or some of the leaves lower on the stem 3-lobed.

7 Leaves mostly lobed or dissected.

8 Plants much branched at base, stems decumbent to ascending; leaves 1-5 cm long; [section Verbena, series Tricesimae] .............................. [V. canescens]

9 Plants little branched, stems erect; leaves 3-12 cm long.

10 Basal and lower cauline leaves persistent, relatively thick, large and spatulate, margins revolute, cauline leaves quickly reduced in size distally and becoming linear-entire; rachis and calyces eglandular; [section Verbena, series Haleae]................................. V. halei

\[V. urticifolia\]

11 Stem leaves with well-developed petioles.

12 Leaves linear to narrowly oblanceolate, < 1.5 cm wide, > 6× as long as wide; [section Verbena, series Simplices] ............... V. simplex

13 Mericarps tightly adhering in fruit, appearing as one; calyx lobes curved inward in fruit; corolla pink to pinkish lavender; [section Verbena, series Candelabrae]................................. V. carnea

\[V. bonariensis\]

14 Leaves ovalate, 2-4 cm wide, < 4× as long as wide

15 Upper leaf surfaces densely scabrous or hirsute to hirsudulous; calyx lobes triangular, connivent; corollas mostly pinkish to bluish, lavender, or purple; nutlet outer surfaces deeply ridged and grooved, often with prominent cross-ridges, commissural faces consistently densely white minutely papillate-bullate; fibrous-rooted................................. V. scabra

\[V. xutha\]

16 Lower leaf surfaces scabrous to hirsute; calyx lobes deltate-subulate, not connivent or subconnivent; corollas white, rarely pinkish; nutlet outer surfaces smooth to longitudinally ridged, sometimes with cross-ridges distally, commissural faces smooth or rarely with slight development of minutely bullate ornamentation; taprooted................................. V. urticifolia

* Verbena bonariensis Linnaeus. Cp (GA, NC, SC): roadsides, disturbed areas, old fields; common, native of South America. May-October. [= V, X; = V. bonariensis – RAB, C, G, GW, S, WH (also see V. incompta); = V. bonariensis var. conglomerata Briquet – K]

**VERBENACEAE**

* Verbena halei* Small, Texas Vervain. Cp (FL, GA, NC*, SC*): dry hammocks, roadsides, pastures; common (rare in NC and SC, where presumably introduced). April-June. C. GA south to c. peninsular FL, TX, AZ, and Mexico; scattered as an introduction further north, as in NC and SC. [= RAB, K, S, X; = *V. officinalis* ssp. *halei* (Small) S.C. Barber – WH, Z]

* Verbena hastata* Linnaeus, Common Vervain, Blue Vervain, Simpler's-joy. Cp (DE, NC, VA), Pd (DE, NC, VA), Mt (NC, VA, WV): marshes, bogs, low fields; common (rare in NC). June-October. NS west to BC, south to NC, n. AL, AR, OK, n. TX, NM, AZ, CA; scattered occurrences further south appear to be introductions. The hybrid with *V. urticifolia*, *Verbena ×engelmannii* Moldenke, is known from our area. [= RAB, C, F, G, GW, S, W, WV, X, Z; > *V. hastata* var. *hastata* – K; > *V. hastata* var. *scabra* Moldenke – K]

* Verbena rigida* Sprengel. Cp (FL, GA, NC, SC, VA), Pd (GA): roadsides, disturbed areas; common (uncommon in NC, rare in VA), native of South America. Late March-July. [= K, S, WH, X, Y]

* Verbena scabra* Vahl, Rough Vervain, Harsh Vervain. Cp (FL, GA, NC, SC, VA), Pd (GA, VA), Mt (VA, WV?): brackish marshes, shell deposits, other wet habitats; common (uncommon in NC, rare in VA and WV). May-October. VA and WV south to s. FL, west to TX and CA, south into tropical America; mainly coastal in our area but with scattered inland records (probably adventive). [= RAB, C, F, G, GW, K, S, U, WH, WV, X]

* Verbena simplex* Lehmann, Narrowleaf Vervain. Pd (DE, GA, NC, SC, VA), Mt (GA, VA, WV), Cp (DE, FL, VA): glades, woodlands, forests, and roadsides, over mafic or calcareous rocks; common (uncommon in WV). May-September. NH west to MN and NE, south to Panhandle FL (Jackson County) and TX. [= RAB, C, F, G, K, WH, WH, X, Z; > *V. angustifolia* Michaux – S]

* Verbena urticifolia* Linnaeus, White Vervain, Velvetleaf Vervain. Cp (NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC, VA, WV): [habitats]; common. May-November. NB west to SK, south to Panhandle FL and TX. Two varieties have been distinguished by many authors (see synonymy), but the characters used are poorly correlated and the distributional ranges largely overlapping. The hybrid with *V. hastata*, *Verbena ×engelmannii* Moldenke, is known from our area. [= RAB, GW, W, U, X, Z; > *V. urticifolia* var. *leioarpa* Perry & Femald – C, F, G, K, WV; > *V. urticifolia* var. *urticifolia* – C, F, G, K, WV; = *V. urticaefolia* – S, orthographic variant]

* Verbena canescens* Kunth, Gray Vervain. Cp (AL): disturbed areas; rare, native of TX. Reported for s. AL. [= K, X]

* Verbena suhba Lehmann, Gulf Vervain. Cp (AL, LA, MS): [habitat]; rare. AL west to TX. [= K, S, X]

384. MARTYNIACEAE  Stapf 1895 (Martynia Family) [in LAMIALES]

**Probsocidea** Schmidel 1763 (Unicorn-plant)

* Probsocidea louisiana* (Miller) Thellung, Unicorn-plant, Devil's-claw, Cow Catcher. Disturbed areas; native of the Great Plains. The curious fruits are unmistakable. [= RAB, F, GW, WV, Y; = *P. louisiana* – C, G, orthographic variant; = *Martynia louisiana* Miller – S; > *P. louisiana* ssp. *louisiana* – K, Z]

389. AQUIFOLIALES Bartling 1830 (Holly Family) [in AQUIFOLIALES]
**AQIFOLIACEAE**

A monogenic family of about 500 species, nearly cosmopolitan.

*Ilex* Linnaeus 1753 (Holly, Winterberry, Gallberry)

**Identification notes:** Some of our species can be superficially similar to various shrubs and trees of the Rosaceae, in their alternate toothed leaves borne on spur shoots.

1 Leaves coriaceous, evergreen.

2 Leaves with a well-developed apical spine (and usually also marginal spines) 2-6 mm long.

3 Flowers in 1-few-flowered axillary cymes, on growth of the same year; [native trees of a wide variety of habitats]

4 Leaves dark green above, 1.5-5.0 cm long, 1.0-2.5 cm wide; [of FL]..........................*I. opaca* var. *arenicola*

5 Leaves deciduous, 3-12 cm long, 2.0-5.5 cm wide; [widespread in our area]..........................*I. opaca* var. *opaca*

6 Flowers in axillary clusters, on branches of the previous year; [alien shrub, rarely naturalized, especially in suburban areas] .......

7 Leaves toothed; [collectively of various habitats, widespread in our area] ..............................................................................

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spinose prickles (or commonly entire), generally about 2-3 cm wide ..........................................................*I. coriacea*

9 Leaves 3-4× as long as wide, crenate in the apical 1/2 to 1/3 (or rarely entire), generally about 1 cm wide (almost never > 2 cm wide) ..........................................................*I. glabra*

10 Leaves lanceolate to narrowly oblong, 2-4 cm long, 3-8 mm wide, 3-7× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch ..............

11 Pedicels of fruits and pistillate flowers (5.5-) 10-30 mm long; pedicels of staminate flowers (10-) 15-25 mm long; leaves rarely revolute; pubescence of the lower leaf surface stellate, distributed on the surface; leaf margins often ciliate.

12 Pedicels of fruits and pistillate flowers (5.5-) 10-30 mm long; pedicels of staminate flowers (10-) 15-25 mm long; leaves rarely revolute; pubescence of the lower leaf surface stellate, distributed on the surface; leaf margins often ciliate.

13 Leaves 4.5-8.5 (-10) cm long, 1.5-3 cm wide; fruits (4-) 5-8 (-9) mm in diameter; sepals not ciliate; [plant widespread in our area, in the Coastal Plain, Piedmont, and rarely Mountains of our area] ..................................................................

14 Upper leaf surface glabrous, or with trichomes confined to the veins or their vicinity; sepals ciliate; leaf blades crenate to distinctly serrate ..........................................................*I. cassinoides*

15 Upper leaf surface glabrous, or with trichomes confined to the veins or their vicinity; sepals ciliate; leaf blades crenate to distinctly serrate ..........................................................*I. longipes*

16 Sepals glabrous (in flower or fruit), acute; leaves lighter green, slightly if at all rugose ..................................................*I. laevigata*

17 Sepals ciliate (in flower or fruit), obtuse; leaves darker green, often moderately rugose ..................................................*I. verticillata*
AQUIFOLIACEAE

859

Ilex verticillata  
Fruits duller red, longer than broad, 5-7 mm in diameter, borne on stalks 1-6 mm long, primarily in the axils of leaves on normal shoots with ground pedicels will separate fruiting plants readily. [K, WV; = K, WV, C, F, G, GW, K, S, Y; ]

Ilex montana  
Fruits bright cherry-red, broader than long, (7-) 8-12 mm in diameter, borne on stalks 9-20 mm long, primarily in the axis of leaves on spur shoots; bark of 2-3 year old twigs usually light tan; calyx (persistent on fruit) 4-6 lobed; nutlets 4-6 per fruit, with bony white longitudinal striations on the back, the furrows between the striations very shallow if developed at all; petiole with a deeply U- to V-shaped channel on its upper surface (made by the decurrent leaf edges), with dark ascending trichomes in the channel; leaves variable, but mostly 3-6 cm wide and about 1.5× as long as wide, usually abruptly short-acuminate; [plant of bogs, seepages, streambanks, and (rarely) moist forests, mostly at high elevations]...........................................................................................................................................................................I. collina

Ilex ambigua (Michaux) Torrey, Carolina Holly. Sandy upland forests, dry slope forests, rarely in pocosin ecoregions in the fall-line sandhills region. April-June; April-September. Ne. NC, se. TN, n. AR, and se. OK south to c. peninsular FL, s. MS, and se. TX; disjunct in the Sierra Madre Oriental and Chiapas, Mexico. The various taxa that have been distinguished in this complex may have some merit, though a detailed study by Krakow (1989) did not show a clear basis for their recognition. I. buswellii Small, strictly of xeric habitats of the Coastal Plain from se. NC southward, has the larger leaves 2.3-5 (-4) cm long and 0.7-1.7 (-2.5) cm wide. I. ambigua (sensu stricto) is distributed in the Coastal Plain, Piedmont and Low Mountains, and has leaves 3.9-10.5 cm long and 1.7-6 cm wide. I. beadlei of the Low Mountains and Piedmont has leaves 7.9 (-10.5) cm long and 2.6 cm wide. [= K, Z; = I. ambigua var. ambigua – RAB, W, Y; > I. montana var. mollis (A. Gray) Britton – C, F; > I. montana var. beadlei (W.W. Ashe) Fernald – G; > I. ambigua – S; > I. beadlei W.W. Ashe – S; > I. buswellii Small – S; > I. ambigua (Michaux) Torrey var. monticola (A. Gray) Wunderlin & Poppleton – Y, misapplied; > I. beadlei var. laevis W.W. Ashe; > I. caroliniana Trelease ex Small; > I. mollis A. Gray]

Ilex amelanchier M.A. Curtis ex Chapman, Sarvis Holly. Banks of blackwater creeks and rivers, clay-based Carolina bays. April-May; October-November. A Southeastern Coastal Plain endemic: se. NC south to the FL Panhandle and west to se. LA (reports from se. VA appear to be based on confusion of material). The fruits are sometimes persistent until the following spring; the species is perhaps most conspicuous in the winter, when the dull red fruits can be easily seen. [= RAB, C, F, G, GW, K, S, Y; ]

Ilex cassine Limnaeus, Dahoon, Cassena. Blackwater stream swamps, pocosins, nearly always in very acid peaty or sandy sites. May-June; October-November. Primarily a Southeastern Coastal Plain endemic: se. NC south to se. FL and west to se. TX; also in Cuba and Mexico. I. cassine is variable in leaf shape, sometimes approaching I. myrtifolia. Some populations in our area show intergradation with or poor differentiation from I. myrtifolia, lending some credibility to their treatment as varieties. [= GW, S, Y; > I. cassine var. cassine – RAB; > I. cassine var. cassine – K]

Ilex collina Alexander, Long-stalked Holly, Cherry Holly. In peats of bogs and seepages, on banks of cold, high elevation streams (less common on moist, rocky slopes in northern hardwood forests or mixed spruce-hardwood forests) at moderate to high elevations (1100-1800m). May-June; (August-) September-October. A Southern Appalachian endemic: e. and c. WV, sw. VA, w. NC, and e. TN (Sevier County) (Boetsch & Nielsen 2003). The affinities of this species are with Ilex montana and I. verticillata, not with Ilex (Nemopanthus) microcarpon (Baas 1984). See Clark (1974) and Boetsch & Nielsen (2003) for additional information about this species. I. collina often occurs with or in close proximity to the similar I. montana and I. verticillata; the long fruiting pedicels will separate fruiting plants readily. [= K, W, V; = Nemopanthus collinus (Alexander) R.C. Clark – C, W; < I. longipes – F, G]

Ilex coriacea (Pursh) Chapman, Big Gallberry, Sweet Gallberry. Pocosins, more restricted to wet, peaty sites than I. glabra. April-May; September-October. A Southeastern Coastal Plain endemic: se. VA south to c. peninsular FL and west to e. TX. [= RAB, C, F, G, GW, K, S, Y; ]

* Ilex crenata * Thunberg, Japanese Holly. Planted as a landscaping shrub, escaped into forests in suburban areas; native of Japan. First reported for NC by Pittillo & Brown (1988). [= K]

Ilex cuthbertii Small, Cuthbert Holly. Upland circumneutral woodlands and forestse. Endemic to an area along the Fall Line in SC and adjacent GA (Krakow 1989). Perhaps best treated as a variety of * I. longipes *, but the combination has not yet been made. [= K; <= I. cuthbertii – S (as to type, not as to range); = I. longipes var. cuthbertii (Small) G.A. Krakow, in prep. – Z]

Ilex decidua Walter var. curtissii Fernald, Suwanee Possum-haw, Curtiss’s Holly. Floodplains and moist forests in the Suwanee River drainage. Mid-March-mid-April; September-October. Apparently endemic to the Suwannee River drainage of s. GA and n. FL. [= Z; < I. decidua – GW, K, Y; = I. curtissii (Fernald) Small – S]

Ilex decidua Walter var. decidua, Possum-haw. Floodplain forests, less commonly on mesic (or even dry), upland slopes. March-May; September-October. MD south to Panhandle FL, west to TX on the Coastal Plain, extending also to adjacent provinces (the Piedmont and rarely Mountains in our area), and extending north in the interior to c. TN, w. KY, s. IL, c. MO, se. KS, and e. OK; also disjunct (as a variety) in the Sierra Madre Oriental of e. Mexico. The Mexican material was recognized by Krakow (1989) at the varietal level, but has not been formally named; it is known from a single collection from Nuevo León, Mexico. [= Z; < I. decidua var. decidua – RAB; < I. decidua – C, F, G, GW, K, > I. decidua var. decidua – Y (also including I. cuthbertii)]

Ilex glabra (Linnaeus) A. Gray, Little Gallberry, Inkberry. Savannas, pine flatwoods, pocosin margins, swamps, primarily in wetlands, but extending upslope even into sandhills. May-June; September-November. NS and ME south to FL, west to TX. [= RAB, C, F, G, GW, K, S, Y]

Ilex laevigata (Pursh) A. Gray, Smooth Winterberry. Pocosins, other wet, acidic sites, such as in small blackwater stream swamps. April-May; September-October. ME and NY south to SC, mostly near the coast. [= RAB, C, F, G, GW, K, S]

Ilex longipes Chapman ex Trelease, Georgia Holly, Chapman's Holly. Upland forests. April-May; September-October. Sc. NC, sc. TN (Chester, Wofford, & Kral 1997), and wc. AR south to Panhandle FL, s. MS, and sc. TX. [= GW, K, S; = I. decidua var. longipes (Chapman ex Trelease) Ahles – RAB, Y; <= I. decidua – F, G (apparently also including I. collina); = I. longipes var. longipes – Z]

Ilex montana Torrey & A. Gray ex A. Gray, Mountain Holly. Mesic forests, rarely bogs or bog edges. April-June; August-September. W. MA and w. NY south to n. GA and n. AL, essentially an Appalachian endemic. The range of this species is sometimes stated or shown as broader, extending into the Coastal Plain in our area, and as far south as n. FL, LA, and e. TX, but these reports are based on misidentifications, primarily of the "beadlei" component of * I. ambiguus *. [= K, WV, Z; = I. ambiguus var. montana (Torrey & A. Gray ex A. Gray) Ahles – RAB; = I. montana var. montana – C, F, G; = I. monticola A. Gray – S; = I. ambiguus var. monticola (A. Gray) Wunderlin & Poppleton – W]

Ilex mucronata (Linnaeus) M. Powell, V. Savolainen, & S. Andrews, Nemopanthus. Bogs and moist, high-elevation forests. NL (Newfoundland) west to ON and MN, south to MD, WV, OH, IN, and IL (and allegedly in VA, according to Fernald 1950). It can be separated vegetatively from other hollies in the mountain regions of w. VA (I. montana, I. collina, I. opaca, and I. verticillata) by its smaller, narrower, entire (or nearly so) leaves, 2-5 (-6) cm long, 1-2.5 cm wide. Debate about the distinctiveness of * Nemopanthus * from * Ilex * have now been unequivocally answered, with * Nemopanthus * to be included in * Ilex * (Powell et al. 2000; Manen, Boulter, & Naciri-Graven 2002). [= X; = Nemopanthus mucronatus (Linnaeus) Trelease – C, F, G, K, WV]

Ilex myrtifolia Walter, Myrtle Holly. Limesink (doline) ponds, wet savannas. May-June; October-November. A Southeastern Coastal Plain endemic: se. NC south to n. peninsular FL and west to e. LA. See * I. cassine * for comments about these two taxa. [= GW, K, S, Y; = I. cassine var. myrtifolia (Walter) Sargent – RAB]
**Ilex opaca** Aiton var. *arenicola* (Ashe) Ashe, Scrub Holly. Xeric sands of sand pine scrub. Baker and Clay counties (ne. FL) south to c. peninsular FL. [= K; = I. *cumulicola* Small – S; = I. *arenicola* Ashe]

**Ilex opaca** Aiton var. *opaca*, American Holly, Christmas Holly. In a wide variety of forests, ranging from xeric to wetland. April-June; September-October. MA (?) NS and ME; IL, MO, and OK south to s. peninsular FL and TX. This is our only species of *Ilex* that becomes a medium to large tree. [= GW, K, Y; < I. *opaca* – RAB, C, F, G, WV; = I. *opaca* – S]

**Ilex vomitoria** Aiton, Yaupon. Maritime forests, other dry sandy forests. March-May; October-November. Widespread in the Southeastern United States, primarily on the Coastal Plain, from e. VA (from Northampton County south) south to c. peninsular FL and west to se. TX. *I. vomitoria* from the Deep South often has much smaller leaves than plants in our area. In NC and VA, yaupon is nearly restricted to maritime habitats, on the barrier islands and in a narrow band on the mainland, in forests with substantial maritime influence. *I. vomitoria* is increasingly popular as an ornamental shrub, and is persistent or establishing in suburban woodlands. [= RAB, C, F, G, GW, K, S, Y]

---

391. **CAMPANULACEAE** A.L. de Jussieu 1789 (Bellflower Family) [in ASTERALES]

A family of about 80-82 genera and 2000-2400 species, mostly herbs, cosmopolitan. There is controversy about the circumscription of the family, specifically whether subfamily Lobelioideae should be recognized at the family level. References: Rosatti (1986)=Z; Eddie et al. (2003); Shulkina, Gaskin, & Eddie (2003); Lammers in Kadereit & Jeffrey (2007). [also see SPHENOCLEACEAE]

1 Corollas bilaterally symmetrical (zygomorphic); carpels 2; [subfamily Lobelioideae] ................................................................. 1. *Lobelia*

2 Capsule dehiscent laterally (the pores nearly apical in some *Campanula*); flowers in spikes, racemes, or panicles; [mostly native species of various habitats (some of them weedy)].

3 Inflorescence spicate, the flowers sessile, mostly in the axils of well-developed leaves; corollas rotate and style straight .......... 5. *Triodanis*

4 Flowers and fruits borne in an involucrate umbel (Jasione); [aliens, generally in weedy or disturbed situations].

5 Flowers large, 1 to few, solitary or nearly so; leaves large, ovate to elliptic; [Platycodonoid clade] ........................................... 2. *Platycodon*

6 Flowers small, several to many, borne in a diffuse inflorescence; leaves small, linear to narrowly elliptic; [Wahlenbergioideae clade] .... 3. *Wahlenbergia*

---

1. **Lobelia** Linnaeus 1753 (Lobelia)

(contrIBUTED by A.S. Weakley and B.A. Sorrie)

**Identification notes:** Vegetative *Lobelia* can be recognized by their milky sap, and the alternate leaves with obscure, whitish, callus-tipped, and often irregular or divergent teeth.

1 Corolla bright red (faded in dried specimens) or very rarely white, 30-45 mm long; filament-tube 19-33 mm long ............... *L. cardinalis*
Corolla blue, purple, or white, 10-33 mm long; filament-tube 2-15 mm long.

Larger leaves in a basal rosette, either linear to linear-oblong lanceolate or orbicular, with a well-developed petiole; [plants generally of wetlands, often growing in shallow water, more rarely in dry or seasonally dry habitats].

Rosette leaf blades orbicular, broadly rounded at the base and the apex; stems trailing, rooting at nodes, mat-forming; [of FL].

Rosette leaf blades linear to linear-oblong lanceolate; stems erect.

Calyx segments with small auricles at the base; pedicels with very small bracteoles at the base; filament-tube 6-7.9 (-11) mm long; corolla tube not fenestrate (lacking lateral slits); larger leaves 10-30 cm long; plants (5-) 8-10 (-15) dm tall ................. \textit{L. floridana}

Calyx segments not auriculate; pedicels lacking bracteoles; filament tube 3-4.5 mm long; corolla tube fenestrate (with lateral slits); larger leaves 5-12 cm long; plants (4-) 5-6 (-13) dm tall ........................................ \textit{L. paludosa}

Larger leaves cauline; [collectively of a range of habitats].

Flowers relatively large, the corolla (including the hypanthium) 18-33 mm long, fenestrate (with a slit or window on each side of the tube near the base).

Calyx with prominent leafy auricles; pedicels with bracteoles near the middle.

Calyx not auriculate; pedicels with bracteoles near the base (or sometimes near the middle in \textit{L. puberula}).

Flowers relatively large, the corolla (including the hypanthium) 18-33 mm long, fenestrate (with a slit or window on each side of the tube near the base).

Calyx not auriculate; pedicels with bracteoles near the middle.

Calyx segments with small auricles at the base; pedicels with very small bracteoles at the base; filament-tube 6-7.9 (-11) mm long; corolla tube not fenestrate (lacking lateral slits); larger leaves 10-30 cm long; plants (5-) 8-10 (-15) dm tall ................. \textit{L. floridana}

Calyx segments not auriculate; pedicels lacking bracteoles; filament tube 3-4.5 mm long; corolla tube fenestrate (with lateral slits); larger leaves 5-12 cm long; plants (4-) 5-6 (-13) dm tall ........................................ \textit{L. paludosa}

Flowers relatively large, the corolla (including the hypanthium) 18-33 mm long, fenestrate (with a slit or window on each side of the tube near the base).

Calyx with prominent leafy auricles; pedicels with bracteoles near the middle.

Calyx not auriculate; pedicels with bracteoles near the middle.

Calyx not auriculate; pedicels with bracteoles near the middle.

Calyx segments with small auricles at the base; pedicels with very small bracteoles at the base; filament-tube 6-7.9 (-11) mm long; corolla tube not fenestrate (lacking lateral slits); larger leaves 10-30 cm long; plants (5-) 8-10 (-15) dm tall ................. \textit{L. floridana}

Calyx segments not auriculate; pedicels lacking bracteoles; filament tube 3-4.5 mm long; corolla tube fenestrate (with lateral slits); larger leaves 5-12 cm long; plants (4-) 5-6 (-13) dm tall ........................................ \textit{L. paludosa}

Flowers relatively large, the corolla (including the hypanthium) 18-33 mm long, fenestrate (with a slit or window on each side of the tube near the base).

Calyx with prominent leafy auricles; pedicels with bracteoles near the middle.

Calyx not auriculate; pedicels with bracteoles near the middle.

Calyx segments with small auricles at the base; pedicels with very small bracteoles at the base; filament-tube 6-7.9 (-11) mm long; corolla tube not fenestrate (lacking lateral slits); larger leaves 10-30 cm long; plants (5-) 8-10 (-15) dm tall ................. \textit{L. floridana}

Calyx segments not auriculate; pedicels lacking bracteoles; filament tube 3-4.5 mm long; corolla tube fenestrate (with lateral slits); larger leaves 5-12 cm long; plants (4-) 5-6 (-13) dm tall ........................................ \textit{L. paludosa}

Flowers relatively large, the corolla (including the hypanthium) 18-33 mm long, fenestrate (with a slit or window on each side of the tube near the base).

Calyx with prominent leafy auricles; pedicels with bracteoles near the middle.

Calyx not auriculate; pedicels with bracteoles near the middle.
23 Stems lacking hirsute hairs, either densely puberulent (at least below) or glabrous to glabrescent (with a few chaffy hairs on the lower stem); plant unbranched or with a few upright branches; hypanthium obconic, shorter than the corolla; hypanthium slightly inflated in fruit.

24 Stem glabrous to glabrescent (with a few chaffy hairs on the lower stem); leaf bases (all) clasping to rounded; flowers 10-15 mm long.

25 Calyx segments prominently ciliate-margined; basal auricles of the calyx segments prominent and declined, obscuring the corolla tube; plants to 9 dm tall.................................................................L. appendiculata

26 Calyx segments glabrous (rarely minutely ciliate); basal auricles of the calyx segments small, not declined and obscuring the corolla tube; plants to 5.5 dm tall.........................................................................................L. gattingeri

24 Stem densely puberulent, at least at the base; leaf bases petiolate to sessile (and then decrepentes); flowers 7-12 mm long.

26 Leaves chiefly basal, the stem leaves < 5 and much smaller than the basal; [of s. PA south to SC, west to LA, especially on the Piedmont]...............................................................................................L. spicata var. scaposa

27 Calyx lobes with long, slender auricles, these often as long as the hypanthium; [of WV south]...........................

28 Flowers 7-9 mm long, deep purplish-blue; anthers white; [south to NJ, DE, MD, WV, s. IN, and IL]..............

Lobelia amoena Michaux, Southern Lobelia. Marshes, streambanks, seeps, floodplain forests. Late July-October. W. NC and e. TN south through w. SC to c. GA and ec. AL; disjunct in FL Panhandle and Coastal Plain of GA and SC. Reported for VA by Kartesz (1999), supposedly on the basis of McVaugh (1936), but McVaugh does not record *L. amoena* for VA and no specimens have been seen from there. [= RAB, C, GW, S, Y; = L. amoena var. amoena – K, WH; < L. amoena – W]

*Lobelia appendiculata* Alphonse de Candolle. Pinelands, prairies, roadsides, usually in mesic or dry soils. AR and se. KS south to LA and TX; disjunct east of the Mississippi in c. AL, MS, and e. LA. [= GW, S, Y; = *Lobelia appendiculata* Alphonse de Candolle var. appendiculata – K]

*Lobelia brevifolia* Nuttall ex Alphonse de Candolle, Shortleaf Lobelia. Savannas, flatwoods, and bogs. July-November. Endemic to the East Gulf Coastal Plain of c. and w. Panhandle FL, west through s. AL and s. MS to e. LA (Florida Parishes). [= GW, K, WH, Y]

*Lobelia canbyi* A. Gray, Canby’s Lobelia. Depression ponds, Carolina bays, pine savannas. July-November. NJ to GA in the Coastal Plain; disjunct in Coffee County (and three other counties), TN, and in Bartow County, GA, with other Coastal Plain plants. [= RAB, C, F, G, KW, S, WH, Y]

*Lobelia cardinalis* Linnaeus, Cardinal Flower. Streambanks, riverbanks, marshes, swamp forests. July-October. NB, QC, ON, MN, CO, UT, and s. CA south to c. peninsular FL, TX, and south through Mexico and Central America to Colombia. See Thompson & Lammers (1997). [= RAB, F, G, K, S, WH, Y; > *L. cardinalis* var. cardinalis – C; > *L. cardinalis* ssp. cardinalis – GW; > *L. cardinalis* ssp. cardinalis var. cardinalis – K]

Lobelia amoena

Lobelia appendiculata

Lobelia boykinii

Lobelia brevifolia

Lobelia canbyi

Lobelia cardinalis

*Lobelia elongata* Small. River and stream margins, floodplain forests, marshes, bogs, pine savannas. August-October. Primarily a Southeastern Coastal Plain endemic from DE to se. GA, rarely inland onto the lower Piedmont of NC and SC. [= C, F, G, KW, S, WH; < *L. elongata* – RAB]

*Lobelia eyanyna* A. Gray, Bay Lobelia, Fey’s Lobelia. Open, moist areas. Ne. FL (Duval County) and e. Panhandle FL (Madison and Taylor counties) south to s. FL. [= GW, K, S, WH, Y]

*Lobelia flaccidifolia* Small. Depression ponds, swampy woods along rivers and streams. June-September. E. GA south into Panhandle FL, west to sw. AL (and presumably s. MS); disjunct in sw. LA and e. TX. [= GW, K, S, WH; > *L. halei* Small – Y]

*Lobelia floridana* Chapman, Florida Lobelia. Wet pine savannas and flatwoods, depression ponds. S. GA (Jones & Coile 1988) and Panhandle FL west to LA; disjunct in se. NC? McVaugh (1936) reports this species for Wilmington, New Hanover County, NC, based on a collection by MacFarlane in 1909 (PENN). This record seems unlikely and needs confirmation; mislabeling is a possibility. [= GW, K, S, WH, Y]

*Lobelia gattingeri* A. Gray, Gattinger’s Lobelia. Calcareous glades. Endemic to sc. KY south through c. TN to n. AL. [= GW, S, Y; = *Lobelia appendiculata* Alphonse de Candolle var. gattingeri (A. Gray) McVaugh – K]
Lobelia georgiana McVaugh. Swamps, floodplain forests, wet places. August-October. E. VA to Panhandle FL, inland to w. NC and e. TN. Very close to L. elongata and inhabiting apparently the same habitats; additional taxonomic work is desirable. See McVaugh (1940) for an explanation of the need to replace the name L. glandulifera with L. georgiana. [= C, F, G, GW; < L. elongata – RAB; = L. amoena Michaux var. glandulifera A. Gray – K, WH; = L. glandulifera (A. Gray) Small – S, Y; < L. amoena – W]

Lobelia glandulosa Walter. Seepage slopes, pitcher-plant bogs, streamhead margins, pine savannas, flatwoods, margins of beaver ponds. September-October. E. NC (or se. VA) to s. FL, west to s. AL. Prior reports from the Piedmont are erroneous, most referring to L. elongata and L. georgiana. [= RAB, C, F, G, GW, K, S, W, WH, Y]

Lobelia homophylla E. Wimmer. Just south of our area in FL (St Johns County) (Wunderlin & Hansen 2003). [= GW, K, S, WH, Y]

(neither keyed nor mapped)

Lobelia kalmii Linnaeus, Kalm’s Lobelia. Calcareaous swamps. July-September. NL (Newfoundland) and BC, south to PA, e. WV, OH, IL, and MN. [= C, F, G, K, Y]

Lobelia nuttallii J.A. Schultes, Nuttall’s Lobelia. Flatwoods, bogs, savannas. May-November. NY (Long Island) south to FL Panhandle on the Coastal Plain; less commonly disjunct inland to w. NC, w. SC, KY, and TN. [= RAB, C, F, G, GW, K, S, W, WH, Y]

Lobelia paludosa Nuttall, White Lobelia. Flatwoods, savannas, ditches, dune swales. March-May. Se. GA (Jones & Coile 1988) and FL Panhandle south to s. FL. [= F, GW, K, S, WH, Y]

Lobelia puberula Michaux var. mineolana F. Wimmer, Western Downy Lobelia. Forests, openings. W. KY, s. MO, and e. OK, south to s. AL, MS, LA, and e. TX. [= K; < L. puberula – C, G, GW, S; = L. puberula “form d” – Y]

Lobelia puberula Michaux var. simulans Fernald, Appalachian Downy Lobelia. Mt (GA, NC, SC, VA, WV), Pd (GA), Cp (GA): [habitats]; [abundance], common in WV. Late July-October. Sw. VA, s. WV, and IL south to n. FL, AL, MS, and LA. [= F, K; < L. puberula – RAB, C, G, GW, S, W; = L. puberula “form a” – Y]

Lobelia siphilitica Linnaeus var. ludoviciana A. DC., Western Great Blue Lobelia. Bottomlands, moist forests, ditches, wet meadows, streambanks. Late July-October. WI, MB, ND, and WY, south to MS, LA, and TX. [= C, F, G, GW, K, Y; < L. siphilitica – RAB, S]

Lobelia siphilitica Linnaeus var. siphilitica, Eastern Great Blue Lobelia. Bottomlands, moist forests, ditches, wet meadows, streambanks. Late July-October. ME, ON, and MN, south to GA, AL, MS, AR. [= C, F, G, GW, K, Y; < L. siphilitica – RAB, S, W]

Lobelia species 1, Batson’s Lobelia. Wet streamheads and seepage slopes. Endemic to the Sandhills Region of NC and SC. Under study by A. Bert Pittman. [= “L. batsonii” in prep.]

Lobelia spicata Lamarck var. campanulata McVaugh. [habitats]. S. ME west to MN, south to NJ, DE, MD, WV, s. IN, and IL. [= F, G, K, WV, Y; < L. spicata var. spicata – C; < L. spicata – W]

Lobelia spicata Lamarck var. scaposa McVaugh. Meadows, woodlands, disturbed areas. Late May-August. S. PA south to SC, west to LA. [= C, F, G, K, WV, Y; < L. spicata – RAB, GW, S, W]

Lobelia spicata Lamarck var. spicata. Meadows, woodlands, disturbed areas. Late May-August. ME and NB west to ND, south to PA and AR, and in the mountains to n. GA. [= F, G, K, WV; < L. spicata var. spicata – C; < L. spicata – RAB, GW, W; > L. spicata – S; > L. bracteata Small – S; = L. spicata var. originalis – Y]

2. Platycodon Alphonse de Candolle 1830 (Japanese Bellflower, Balloonflower)

* Platycodon grandiflorum (Jacquin) Alphonse de Candolle, Japanese Bellflower, Balloonflower. Ditches, disturbed areas, spread from horticultural cultivation; native of e. Asia. [= RAB, K, Z]

3. Wahlenbergia Schrader ex Roth 1821 (Wahlenbergia)

* Wahlenbergia linarioides (Lamarck) Alphonse de Candolle. Disturbed areas; native of s. South America. [= K] {add Z synonymy}

* Wahlenbergia marginata (Thunberg) Alphonse de Candolle. Sandy soils along roadsides and in fields; native of e. Asia and Oceania. February-December. Apparently only recently introduced in se. United States, the earliest recorded date 1937 in Alachua County, FL (Rosatti 1986), but now quite common on sandy roadsides. [= RAB, K, Z]

4. Jasione Linnaeus 1753 (Sheep's-bit)

5. Triodanis Rafinesque 1838 (Venus's Looking-glass)

A genus of 6-8 species, annual herbs, of America. References: McVaugh (1945) = Z; McVaugh (1948); Lammers in Kadereit & Jeffrey (2007). Key based on Z.

1 Openings of the capsule linear, 0.2-0.4 mm wide; seeds minutely tuberculate in longitudinal lines; [sw. TN westward] .................. T. holzingeri

1 Openings of the capsule broadly elliptic, oval, or rounded, 0.5-1.5 mm wide; seeds either muriculate over the entire surface or nearly to quite smooth; [collectively more widespread].

2 Pores at or very near the apex of the capsule; seeds smooth and highly polished; open (chasmogamous) corolla usually 1 (the terminal), the others usually closed (cleistogamous) .......................................................... T. biflora

2 Pores well below the apex of the capsule (usually 1-1.5 mm below), usually about midway between apex and base; seeds muriculate or smooth and lustrous; open (chasmogamous) corollas usually several .......................................................... T. perfoliata
**Triodanis biflora** (Ruiz & Pavón) Greene. Roadsides, gardens, glades, disturbed areas. April-June. E. VA, KY, KS, AZ, and OR, south c. peninsular FL and Mexico; South America. [= C, K, WH, Z; = Specularia biflora (Ruiz & Pavón) Fischer & C.A. Meyer – RAB, F, G; = T. perfoliata var. biflora (Ruiz & Pavón) Bradley – W]

**Triodanis holzingeri** McVaugh. {habitats} MO west to CO, south to sw. TN, AR, TX, and NM. [= K, Z; = Specularia holzingeri (McVaugh) Fernald – F]

**Triodanis perfoliata** (Linnaeus) Nieuwland. Roadsides, gardens, glades, dry forests, disturbed areas. April-June. ME and BC south to c. peninsular FL and Mexico; West Indies; Ecuador. [= C, K, Z, WH, = Specularia perfoliata (Linnaeus) Alphonse de Candolle – RAB, F, G, W; = T. perfoliata var. perfoliata – W]

### 6. Campanula Linnaeus 1753 (Bellflower)

A genus of about 300-425 species, herbs (rarely shrubby), north temperate, most diverse in s. Europe. The appropriate circumscription remains uncertain and controversial, and related genera are sometimes combined into a broadly circumscribed *Campanula*, or alternately, several segregates recognized (*Campanula, Rapunculus, Campanulastrum*, etc.). A broad circumscription is adopted here, based on considerations discussed in Roquet et al. (2008). Park et al. (2006) propose splitting *Campanula* into a number of segregates, a suggestion which also has some merits; if followed, most or all of our species would likely be placed in the genus *Rapunculus*. References: Roquet et al. (2008); Park et al. (2006); Rosatti (1986)=Z; Shetler & Morin (1986); Shetler (1982)=Y; Shulkina, Gaskin, & Eddie (2003); Lammers in Kadereit & Jeffrey (2007).

1. Corolla rotate
2. Stem erect; leaf obviously serrate or crenate; [of FL and northward, of uplands] .............................................................. *C. americana*
3. Stems weak and slender, reclining, 3-angled.
4. Corolla 4-10 mm long; pedicels divergent, the bractless portion 0.4-4 cm long; corolla white to very pale blue.............................. *C. aparinoïdes var. aparinoïdes*
5. Stems more robust, erect, terete or nearly so.
6. Corolla 6-8 mm long; leaves lanceolate, averaging about 1 cm wide, generally with prominent, often somewhat divergent teeth......... .............................................................. *C. divaricata*
7. Flowers on long pedicels (the upper < 5 mm long), the inflorescence a diffuse panicle; [native species of rock outcrops or rocky woodlands].
8. Capsules with pores in the apical half ............................................................................................................................................. *C. persicifolia*
9. Capsules with pores at or near the base ................................................................................................................................. *C. rotundifolia*

**Campanula americana** Linnaeus, Tall Bellflower. Moist to fairly dry forests, especially over mafic or calcareous rocks. Late June-September; August-October. NY, ON, MN, and SD, south to Panhandle FL, LA, and OK. Shetler & Morin (1986) stated that "Small's view [segregating *Campanula americana* into the monotypic genus *Campanulastrum*] appears to have increasing justification from palynological, cytological, and now seed evidence." Also recently supported as a genus by Shulkina, Gaskin, & Eddie (2003), but combined into *Campanula* by Lammers in Kadereit & Jeffrey (2007) and Roquet et al. (2008). [= RAB, C, F, G, W, WH, Z; = Campanulastrum americanum (Linnaeus) Small – K, S; = Rapunculus]

**Campanula aparinoides** Pursh var. *aparinoides*, Marsh Bellflower. Bogs, marshes, wet meadows, seepage slopes over mafic or calcareous rocks. Late June-August; August-September. Widespread in ne. North America, south to nc. GA (Jones & Coile 1988), KY, MO, and NE. [= C, G; < C. aparinoides – RAB, K, W, Z; = C. aparinoides – F, S]

**Campanula aparinoides** var. *grandiflora* Holzinger ranges south to PA. It should be sought in our area. It has been variously treated as a species, variety, geographic phase, or form; its taxonomic status is uncertain. [= C, G; < C. aparinoides – K; = C. uliginosa Rydberg – F] {not mapped}
**Campanula divaricata** Michaux, Southern Harebell, Appalachian Bellflower. Rock outcrops, cliffs, rocky summits, talus, up to at least 1850m. July-October; September-December. A broad endemic of the Southern and Central Appalachians: MD and KY south to AL and GA. [= RAB, C, F, G, K, W, Z; = C. flexuosa Michaux – S; Rapunculus]

**Campanula floridana** S. Watson ex A. Gray, Florida Bellflower. Cypress ponds, depressions marshes, wet prairies. March-May. Ne. FL and Panhandle FL south to s. peninsular FL. [= GW, K, WH; = Rotantha floridana (S. Watson ex A. Gray) Small – S]

*Campanula persicifolia* Linnaeus, Peachleaf Bellflower. Naturalized from gardens; native of Eurasia. This species was reported by Small (1933) as "escaping from gardens" in w. NC; no specimens have been seen to document this occurrence. Additional documentation is needed to confirm this record. [= RAB, K, S; = Rapunculus persicifolius (Linnaeus) Fournier; = Neocodon persicifolius (Linnaeus) A. A. Kolakovskii & L. B. Serdyukova]

**Campanula rotundifolia** Linnaeus, Bluebell, Harebell, Bluebell-of-Scotland. Limestone outcrops, high elevation rocky summits (in thin soil over amphibolite). July-August; August-September. A circumboreal species, widespread and common in n. North America and n. Eurasia, south to nw. NC, TN, MO, TX, NM, AZ, and CA. In our area rare, and generally limited to limestone in its occurrences in the Central Appalachians of WV and VA and to mafic rocks in nw. NC. It was added to the flora of NC in 1991 (Three Top Mountain, Ashe County). See Shetler (1982) for a detailed study of the species. [= C, F, G, K, Y, Z; Rapunculus]

**397. MENYANTHACEAE** Dumortier 1829 (Buckbean Family) [in ASTERALES]

A family of about 5 genera and 40 species, wetland herbs, of cosmopolitan distribution. References: Wood (1983a)=Z.

1 Leaves trifoliolate; inflorescence a raceme.............................................................................................................................................Menyanthes
1 Leaves simple; inflorescence an umbel...............................................................................................................................................Nymphoides

**Menyanthes** Linnaeus 1753 (Buckbean, Bogbean)

The genus is monotypic, an herb, circumboreal. References: Wood (1983a)=Z

**Menyanthes trifoliata** Linnaeus, Buckbean, Bogbean. Mucky soils of mountain bogs at high elevations over amphibolite (in the Blue Ridge), boggy marshes over calcareous rocks (in the Ridge and Valley), seepage swamps (in the Coastal Plain). May-June. This circumboreal species is widespread in n. North America and n. Eurasia, ranging south in North America to NJ, DE, w. VA, IN, MO, and CA, and disjunct to Long Hope Valley, Watauga County, NC. The NC populations are disjunct about 400 km from the next nearest populations in VA and WV. McDowell (1984) reported the first documentation of the species for NC. [= C, G, K, W, WV, Z; > M. trifoliata var. minor Rafinesque – F]
Nymphoides Séquier 1754 (Floating Heart)

**Identification notes:** As the scientific name indicates, the leaves of *Nymphoides* bear a superficial resemblance to those of *Nymphaea*. The leaves of *Nymphoides* are more cordate, the two basal lobes more rounded, rather than having a rather sharp corner or angle. *Nymphoides cordata* has much smaller leaves than *Nymphaea*, while the thickly pebbled texturing of *Nymphoides aquatica* is very unlike the glossy smoothness of *Nymphaea*.

1. Flowers yellow; floating stems usually with multiple leaves; capsules 12-25 mm long ................................................................. *N. peltata*
2. Flowers white; floating stems with single leaves; capsules 3-14 mm long. ....................................................................................... *N. cristata*
3. Adaxial petal surface bearing a ruffled crest down its length in the middle ................................................................................. *N. aquatica*
4. Leaves 3-7 cm wide, smooth below, thin in texture; stems 0.6-0.9 mm in diameter a few cm below the inflorescence, rarely spotted with red; tuberous roots of floating clusters slender, with pointed tips; seeds smooth (rarely papillate); capsule 4-5 mm long...........*N. cordata*

*Nymphoides aquatica* (Walter ex J.F. Gmelin) Kuntze, Big Floating Heart, Banana Floating Heart. Limesink ponds (dolines), other acidic and nutrient-poor water-filled depressions, sluggish streams, beaverponds, primarily in the Outer and Middle Coastal Plain. Late April-September. A Southeastern Coastal Plain endemic: NJ south to FL and west to TX. [= RAB, C, F, GW, K, S, Z; = *N. aquaticum* – G, orthographic variant]

*Nymphoides cordata* (Elliott) Fernald, Little Floating Heart. Upland depression ponds, sluggish streams, beaverponds, primarily in the fall-line Sandhills. NL (Newfoundland) and ON south MD; disjunct in the Coastal Plain of NC and SC; disjunct from sw. GA and Panhandle FL west to e. LA. [= RAB, C, F, GW, K, Z; = *N. cordatum* – G, orthographic variant; ? *N. lacunosa* (Ventenat) Kuntze – S, misapplied]

* Nymphoides cristata* (Roxburgh) Kuntze, Crested Floating Heart, Water Snowflakes. Ponds and lakes; native of China and India. Apparently first naturalizing in North America in FL in 2000; introduced for water gardens and aquariums, and considered a noxious aquatic weed in our area.

* Nymphoides peltata* (S.G. Gmelin) Kuntze, Yellow Floating Heart. Ponds; native of Europe. This European native is sparingly naturalized in e. North America; it is sold for cultivation in water gardens, and will likely become more widely naturalized. [= C, F, K; = *N. peltatum* – G, orthographic variant]

398. GOODENIACEAE R. Brown 1810 (Goodenia Family) [in ASTERALES]

*Scaevola* Linnaeus 1771 (Fanflower, Half-flower, Scaevola)

*Scaevola plumieri* (Linnaeus) Vahl, Beachberry, Inkberry, Gull-feed. Coastal dunes, marsh edges. January-December. N. peninsular FL south to s. FL; s. LA; s. TX south through Mexico into Central and South America; West Indies. [= K, S, WH]

399. CALYCERACEAE R. Brown ex Richard 1820 (Calycera Family) [in ASTERALES]

A family of 4 genera and ca. 60 species, perennial and annual herbs, endemic to s. South America. References: Hellwig in Kadereit & Jeffrey (2007).

*Acicarpa* Antoine Laurent de Jussieu

* Acicarpha tribuloides* Antoine Laurent de Jussieu, Madam Gorgon. On ship’s ballast near old port-cities; probably no longer present, native of South America (Brazil, Uruguay, Paraguay, and Argentina). The NC and SC records were both collected by Gerald McCarthy in 1888; though the localities are not specified, the likely sites (based on his itinerary and what is known of the species) are Wilmington (New Hanover County, NC) and Charleston (Charleston County, SC). DeVore (1991) discusses ballast plants and the apparent failure of *Acicarpha* to naturalize in North America. This species has not been collected in our area (or North America) since 1888; it is here treated for historical interest and to increase the likelihood that it will be relocated, if it is, indeed, actually naturalized. [*K, S, WH, Z*]

**Key A – shrubby composites**

1 Leaves strictly alternate; [tribe *Asteraceae*].
2 Heads discoid; shrubs to 5 m tall; [widespread in our area] .......................................................................................... Baccharis
3 Heads radiate.
   4 Rays yellow, orange, or red (sometimes with some brown, maroon, or purple coloration as well) ........ Key C [under construction]
4 Rays white, cream-colored, or pale pink or lavender ................................................................. Key D [under construction]
2 Leaves either alternate (not opposite even at lower nodes of the stem) or basal only (the heads on scapiform stems).
6 Heads liguliflorous (composed of ligulate florets); sap usually milky................................................................................ Key E
7 Heads discoid, disciform, radiant, or radiate; sap usually clear.
   8 Heads discoid or disciform ............................................................................................................... Key F [under construction]
7 Heads radiate or radiant ................................................................................................................ Key F [under construction]

**Key B – herbaceous composites with opposite or whorled leaves and discoid or disciform heads (lacking ray florets)**

1 Plant a shrub or woody vine, definitely with woody growth well above ground level................................................................. Key A
1 Plant an annual, biennial, or perennial, lacking woody growth above ground level.
2 Leaves opposite or whorled, at least on the lower stem nodes (the leaves higher on the stem sometimes alternate).
3 Heads discoid or disciform .................................................................................................................. Key B [under construction]
3 Heads radiate.
4 Rays yellow, orange, or red (sometimes with some brown, maroon, or purple coloration as well) ........ Key C [under construction]
4 Rays white, cream-colored, or pale pink or lavender ................................................................................ Key D [under construction]
2 Leaves either alternate (not opposite even at lower nodes of the stem) or basal only (the heads on scapiform stems).
6 Heads liguliflorous (composed of ligulate florets); sap usually milky................................................................................ Key E
7 Heads discoid, disciform, radiant, or radiate; sap usually clear.
   8 Heads discoid or disciform ............................................................................................................... Key F [under construction]
7 Heads radiate or radiant ................................................................................................................ Key F [under construction]

**Key C – herbaceous composites with opposite or whorled leaves and discoid or disciform heads (lacking ray florets)**

1 Plant a shrub or woody vine, definitely with woody growth well above ground level................................................................. Key A
1 Plant an annual, biennial, or perennial, lacking woody growth above ground level.
2 Leaves opposite or whorled, at least on the lower stem nodes (the leaves higher on the stem sometimes alternate).
3 Heads discoid or disciform................................................................................................................ Key B [under construction]
3 Heads radiate.
4 Rays yellow, orange, or red (sometimes with some brown, maroon, or purple coloration as well) ........ Key C [under construction]
4 Rays white, cream-colored, or pale pink or lavender ................................................................................ Key D [under construction]
2 Leaves either alternate (not opposite even at lower nodes of the stem) or basal only (the heads on scapiform stems).
6 Heads liguliflorous (composed of ligulate florets); sap usually milky................................................................................ Key E
7 Heads discoid, disciform, radiant, or radiate; sap usually clear.
   8 Heads discoid or disciform ............................................................................................................... Key F [under construction]
7 Heads radiate or radiant ................................................................................................................ Key F [under construction]

**Key D – herbaceous composites with opposite or whorled leaves and discoid or disciform heads (lacking ray florets)**

1 Plant a shrub or woody vine, definitely with woody growth well above ground level................................................................. Key A
1 Plant an annual, biennial, or perennial, lacking woody growth above ground level.
2 Leaves opposite or whorled, at least on the lower stem nodes (the leaves higher on the stem sometimes alternate).
3 Heads discoid or disciform................................................................................................................ Key B [under construction]
3 Heads radiate.
4 Rays yellow, orange, or red (sometimes with some brown, maroon, or purple coloration as well) ........ Key C [under construction]
4 Rays white, cream-colored, or pale pink or lavender ................................................................................ Key D [under construction]
2 Leaves either alternate (not opposite even at lower nodes of the stem) or basal only (the heads on scapiform stems).
6 Heads liguliflorous (composed of ligulate florets); sap usually milky................................................................................ Key E

7 Heads radiate or radiant ................................................................................................................ Key F [under construction]
ASTERACEAE

1 Disc florets yellow.
2
2 Acmella
Flaveria
Pulicaria
Dittrichia
Inula

1 Disc florets white, pink, purplish.
6
6 Ambrosia
Xanthium
Iva
Cyclachaena
Melanthera
Lagasca
Palafaxia
Eupatorium
Euthrochium
Conoclinium
Ageratum
Brickellia
Hartwrightia
Fleischmannia
Chromolaena
Mikania
Chevreulia
Sclerolepis

Key C – herbaceous composites with opposite leaves and radiate heads,
the rays predominantly yellow, orange, or red

Key D – herbaceous composites with opposite leaves and radiate heads,
the rays predominantly white, cream or pale lavender or pink

Key E – herbaceous composites with leaves alternate or basal,
liguliflorous heads (composed of ligulate florets), and sap usually milky

1 Cypselas (at least of the inner florets of the head) beaked.
2 Heads solitary and terminal at the end of a stem unbranched to its base.
3 Leaves basal and cauline, grasslike (untoothed and unlobed); stem leafy .............................................................. Tragopogon
4 Pappus of bristles .................................................................................................................. Taraxacum

4 Pappus either of outer scales and inner bristles or entirely of aristate scales.
5 Pappus of outer scales and inner plumose bristles; leaves oblanceolate to oblong; plants annual or perennial .......... Leontodon
5 Pappus of aristate scales; leaves linear to narrowly lanceolate; plants annual ......................................................... Uropappus

2 Heads several per stem, in various corymbiform, umbrelliform, spiciform, or paniculiform arrays (rarely solitary and terminal in the
smallest and most depauperate individuals in a population.
6 Achenes distinctly flattened.................................................................................................................. Lactuca
6 Achenes terete or prismatic.
7 Pappus of plumose bristles, at least the inner series; plant an annual or biennial.
8 Receptacles lacking paleae .............................................................................................................. Helminthotheca
8 Receptacles with paleae .............................................................................................................. Hypochaeris
7 Pappus of simple capillary bristles; plant an annual, biennial, or perennial.
9 Beak of the cypsela with a ring of soft white reflexed hairs at the summit (just below the pappus) ....................... Pyrrophappus
9 Beak of the cypsela lacking a ring of hairs as described.
10 Pappus of 80-150 barbellulate bristles; plant an annual or biennial ......................................................... Crepis
10 Pappus either of 40-50 (or more) smooth bristles or of 20-30 barbellulate bristles; plant a perennial
11 Pappus of 40-50 (or more) smooth bristles ....................................................................................... Chondrilla
11 Pappus of 20-30 barbellulate bristles ............................................................................................... Ixeris
1 Cypselas beakless.
12 Leaves basally disposed (stem leaves few or none generally smaller in size than the basal leaves, which are persistent into flowering and
fruiting); corollas yellow, orange, or red.
13 Pappus absent or of both scales and barbellulate bristles ........................................................................ Krigia
13 Pappus of bristles only (these barbellulate or plumose).
14 Pappus of plumose bristles (these somewhat flattened at their bases) ................................................................ Oporinia
ASTERACEAE

14 Pappus of barbellate bristles.
15 Leaves with entire margins; plants perennials, either from long to short rhizomes or from a short caudex with fibrous roots.

| 15 Leaves coarsely toothed or pinnately lobed; plants annuals, from a taproot. |
| 16 Involucre 5-12 mm high; achenes usually > 2.5 mm long; pappus bristles distinct, 3-7 mm long. |
| 16 Involucre 3-5 mm high; achenes 1.5-2.5 mm long; pappus bristles basally connate, 2.5-3.5 mm long. |

12 Leaves basal and cauline (plant often beginning with a basal rosette, but by flowering bearing well-developed stem leaves about as large as the basal leaves, the basal rosette often withering prior to flowering and fruiting); corollas yellow, orange, red, blue, pink, white, or lavender.

17 Pappus absent or of scales.
18 Corollas pale blue (rarely pink or white).
19 Stem winged and spiny; leaves spiny-margined; receptacle with paleae.

| 19 Stem not winged or spiny; leaves not spiny-margined; receptacle lacking paleae. |
| 20 Cypselas 1.2-2.8 mm long; heads borne single at the ends of scapiform stems that are unbranched (rarely few-branched near the base); plants to 7 dm tall. |
| 20 Cypselas 3-5 mm long; heads borne in corymbiform or thyrsiform arrays; plants to 15 dm tall. |

17 Pappus of numerous smooth or barbellate bristles.

Acanthospermum Schrank 1820 (Paraguay Bur)

A genus of about 6 species, herbs, of tropical America. References: Strother in FNA (2006c); Cronquist (1980)=SE.

1 Stems erect and rooting at the nodes; bur 7-9 mm long, slightly compressed, strongly 5-7-ribbed. A. australis
1 Stems erect; bur 2-6 mm long, obviously compressed, obscurely ribbed or 3-ribbed. A. humile

2 Leaves 1-3 (-4.5) cm long, petiolate, the petiole 4-18 mm long; bur unarmed or nearly so on the side faces, the prickles along the ribs and around the tip. A. hispidum
2 Leaves (2-) 4-12 (-15) cm long, sessile or subsessile; bur with prickles on all surface. A. humile

Achillea Linnaeus 1753 (Yarrow, Milfoil, Thousand-leaf)

1 Leaves pinnately dissected into linear segments; [section Achillea].
1 Leaves serrate to almost entire; [section Patrma].

Achillea millefolium Linnaeus, Yarrow, Thousandleaf. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): grassy balds, roadsides, disturbed areas; common (rare in FL). April-November. Circumboreal (as here broadly treated). A taxonomically very complex entity, with races of different ploidies, and apparently both introduced and native genotypes in e. North America. It would be desirable to treat the variation, but a workable treatment has not yet been produced. Ramsey, Robertson & Husband (2008) have recommended treating native North American races as A. borealis, but it is not clear what (if any) eastern North American races are native. [= RAB, FNA, SE; > A. millefolium ssp. millefolium – C, G; > A.

\* Achillea filipendulina Lamarck, Fern-leaf Yarrow. Cp (DE): [habitat]; uncommon. [= FNA, K] [not yet keyed; add to synonymy]

Acmella L.C. Richard ex C.H. Persoon 1807 (Spotflower)

A genus of about 30 species, herbs, primarily of tropical distribution. References: Jansen (1985)=Z; Strother in FNA (2006c); Cronquist (1980)=SE.

1 Leaves linear to lanceolate; petioles 2-4.5 mm long; outer series of phyllaries narrowly to broadly ovate, the apex acute; heads radiate or discoid.......................................................... A. pusilla

1 Leaves narrowly to broadly ovate; petioles (3-) 5-43 mm long; outer series of phyllaries lanceolate, the apex acuminate; heads radiate or discoid.......................................................... A. repens

\* Acmella pusilla (Hooker & Arnott) R.K. Jansen, Argentine Spotflower. Cp (FL, GA, NC, SC): lawns, disturbed areas (especially around old seaports); rare, native of South America. May-September. Known from scattered locations in the se. United States (NC, SC, GA, FL), associated with old seaports, such as Wilmington, NC, Savannah, GA, Pensacola and Apalachicola, FL, and perhaps not well-established at some of the reported locations. Reported as naturalized and “locally common” at a site in Chatham County, GA (Carter, Baker, & Morris 2009). [= FNA, K, WH, Z]

Acmella repens (Walter) L.C. Richard in Persoon, Creeping Spotflower. Cp (FL, GA, NC, SC), Pd (NC, SC): floating vegetation mats, roadsides, streambanks, other moist, open, habitats; common (uncommon in GA, rare in NC, SC). July-December. Se. NC south to s. FL, west to e. TX, north in the Mississippi Embayment to w. TN and s. MO. Jansen (1985) treats this as var. repens of A. oppositifolia, the typic var. oppositifolia widely distributed from c. Mexico south through Central America into n. South America, stating that var. repens "can be easily separated from var. oppositifolia by its lanceolate, acuminate phyllaries and short double hairs on the achene margins." Jansen also states that "four factors have caused extreme difficulties in delimiting taxa at the specific and infraspecific level within this group: very close morphological similarity; polyploidy; hybridization, especially between different ploidy levels; and asexual reproduction." In his more statistical taxonomic analyses, his var. repens (tetraploid, and the only taxon out of 39 native to North America) separates rather well from A. oppositifolia (diploid, tetraploid, and hexaploid). Given the morphological distinctiveness and substantial allopatry of the two taxa, I prefer not to associate this taxon as a variety of the complex A. oppositifolia. [= FNA; = Spilanthes americana (Mutis ex Linnaeus f.) Hieronymus var. repens (Walter) A.H. Moore – RAB, F; < Spilanthes americana – C, G, GW, S, SE; = Acmella oppositifolia (Lamarck) R.K. Jansen var. repens (Walter) R.K. Jansen – K, WH, Z]

Acroptilon Cassini 1827 (Russian Knapweed)

\* Acroptilon repens (Linnaeus) de Candolle, Russian Knapweed. Reported for VA (FNA), but there is apparently no documentation for its occurrence there; this serious invasive weed is widespread in western North America, east to OH, KY, and AR. [= FNA, K; = Centaurea repens Linnaeus – C, F, G; = Rhaponticum repens (Linnaeus) Hidalgo – Z]

Ageratina Spach 1847 (Milk-poison, White Snakeroot)

A genus of about 250-290 species, American. The separation of Ageratina from Eupatorium is clearly warranted, on morphological, karyological, and molecular grounds. References: Nesom in FNA (2006c); Clewell & Wooten (1971)=Z; Cronquist (1980)=SE. Key based in part on Z and SE.

1 Leaves subcoriaceous in texture; leaves crenate or crenate-serrate; leaf blades 3-7 (-10) cm long, 2-5 cm wide; [primarily of xeric or submesic sites].

2 Larger leaf blades >5× as long as the petiole; leaf margins crenate; corolla lobes densely long-pubescent; achene glabrous; [widespread in our area] .................................................. A. aromatica

2 Larger leaf blades (1-) 2-4× as long as the petiole; leaf margins crenate, dentate, or incised; corolla lobes glabrous or sparsely short-pubescent; achenes usually short-pubescent, at least near the apex; [of e. GA southward] ................................................. A. jucunda

1 Leaves membranaceous in texture; leaves serrate or coarsely dentate; leaf blades 6-18 cm long, 3-12 cm wide (at least the larger on a given plant usually more 8 cm long); [primarily of mesic sites].

3 Leaves delicately membranaceous, coarsely dentate; larger leaf blades 1.0-1.4× as long as the petiole; [of seepage and waterfall splash zones associated with sandstone rockhouses and cliff bases] ................................................. A. luciae-brauniae

3 Leaves membranaceous, of a "typical" herbaceous character, coarsely serrate; larger leaf blades 1.4-5× as long as the petiole; [of a wide variety of mesic habitats, especially moist forests and forest openings].
**Eupatorium urticifolium** possibly ne. AL. [= FNA, K, Z; Appalachian Milk-poison. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): moist forests, such as cove forests; common (uncommon in Coastal Plain south of DE). Late July-October. Var. urticifolium ranges from QC west to se. ND, south to Panhandle FL and e. TX. Var. angustata (A. Gray) Clewell & Wooten ranges from IL and e. KS south to LA and e. TX. This species has been shown to be the cause of the "milk sickness" of pioneer days; the plants contain a poison which is transmissible to humans through cow milk. [= FNA, K; < Eupatorium rugosum Houttuyn – RAB, G, W; = E. rugosum Houttuyn var. rugosum – C, SE; > E. rugosum var. rugosum – F; > E. rugosum var. chlorolepis Fernald – F; > E. rugosum var. tomentellum (B.L. Robinson) Blake – F; = Eupatorium urticifolium Reichard – S; < A. altissima var. altissima (also see A. luciae-brauniae) – WH, Z]

**Ageratina altissima** King & H.E. Robinson var. roanensis (Small) Clewell & Wooten, Appalachian White Snakeroot, Appalachian Milk-poison. Mt (GA, NC, SC, VA): moist forests, often abundant at high elevations; common. August-October. Endemic to moderate to high elevations of the Southern Appalachians, from nw. VA south to s. SC, e. GA, c. W.V. and possibly ne. AL. [= FNA, K, Z; < Eupatorium rugosum Houttuyn – RAB, G, W; = Eupatorium rugosum var. roanensis (Small) Fernald – C, F, SE; = Eupatorium roanensis Small – S]

**Ageratina aromatica** (Linnaeus) Spach, Small-leaved White Snakeroot, Wild-hoarhound. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV), Mt (GA, NC, SC, VA, WV): woodlands and forests, usually xeric, and often fire-maintained, also woodland edges; common (uncommon in Piedmont and Mountains, rare in DE and WV). Late August-October. MA, NY, and OH, south to ne. FL, Panhandle FL, and e. LA (Florida parishes). Two varieties have been delineated, both of them occurring in our area. Var. incisa (A. Gray) C.F. Reed is described as differing from var. aromatica in having the leaves cuneate (vs. truncate to rounded), acuminate (vs. acute), sharply toothed (vs. bluntly toothed, thin in texture (vs. thick), and the petioles slender and 0.5-2 cm long (vs. less slender and 0.1-1.5 cm). It is supposed to be Southeastern in range, from se. VA south to FL, on the Coastal Plain. The validity of this variety needs further assessment. [= FNA, WH, Z; = Eupatorium aromatica Linnaeus – RAB, C, G, SE; W; > Eupatorium aromatica var. aromatica – F; > Eupatorium aromatica var. incisum A. Gray – F; > A. aromatica var. aromatica – K; > A. aromatica var. incisa (Gray) C.F. Reed – K; > Eupatorium latidens Small – S; > Eupatorium aromatica Linnaeus – S]

**Ageratina jucunda** (Greene) Clewell & Wooten, Hammock Snakeroot. Cp (FL, GA): sandhills, dry pinelands, and subxeric hardwood hammocks; common (uncommon in GA). Se. GA south to s. FL, west to e. Panhandle FL. [= FNA, K, WH, Z; = Eupatorium jucundum Greene – S, SE]

**Amblyolepis** Small – S; **Ambrosia** Linnaeus 1753 (Ragweed)

**Amblyolepis** A.P. de Candolle 1836 (Huisache-daisy)

**Ambrosia** Linnaeus 1753 (Ragweed)

1 Leaves either undivided, with 2 lateral teeth, or palmately 3-5-lobed.
2 Leaves sessile to clasp ing, 2.5-7 cm long, undivided, with 2 teeth near the base .......................................................... A. bidentata
2 Leaves petiolate, 7-30 cm long, (1-) 3 (-5) lobed .................................................................................................. A. trifida var. trifida
1 Leaves 1- to 2-pinnatifid.
3 Annual, with fibrous roots; fruiting involucre with short, sharp spines .............................................................. A. artemisiifolia
3 Perennial, with deep-seated, creeping roots; fruiting involucre with bumps ......................................................... A. psilostachya

**Ambrosia bidentata** Michaux. Pd (VA), Mt (GA, NC, WV); [SC]: mafic woodlands; uncommon (rare in WV). August-November. CT, NY, and MN south to Panhandle FL and TX. Widely scattered throughout TN, east to e. TN (Chester, Wofford, & Kral 1997) and in nw. GA (Jones & Coile 1988). [= RAB, C, FNA, G, K, S, SE]  

**Ambrosia psilostachya** A.P. de Candolle, Perennial Ragweed. Cp (FL, GA, NC, SC), Pd (VA): loamy sandy soil of flats and slight depressions in periodically burned longleaf pine uplands, also in disturbed areas; uncommon. September-November. MI west to MT, south to LA and NM; also scattered along eastern seaboard states (ME, NH, NY, NC, SC, GA, FL), where perhaps some of the distribution is adventive. Apparently first collected in VA in 2000. [= C, FNA, G, K, SE, WH; > A. psilostachya – RAB; > A. rugelii Rydberg – RAB, S; > A. psilostachya var. coronopifolia (Torrey & Gray) Farwell – F]

**Amphelaster** Nesom 1995 (Climbing-aster)  

**Amphichyris** (A.P. de Candolle) Nuttall 1840 (Broomweed)  

* **Amphichyris dracunculoides** (A.P. de Candolle) Nuttall, Prairie Broomweed, Broom Snakeroot. Mt (VA), Cp (SC): disturbed areas over calcareous rocks, wool-combing mill waif (Nesom 2004d); rare, presumably adventive from further west. August-September. This species is common and weedy in disturbed cedar glade habitats in the Nashville Basin of c. TN, where apparently native (Chester, Wofford, & Kral 1997). [= FNA, K, S; = Gutierrezia dracunculoides (A.P. de Candolle) Blake – F, G, SE; = Xanthocephalum dracunculoides (A.P. de Candolle) Shinners]

**Anaphalis** A.P. de Candolle 1838 (Pearly-everlasting)
A genus of about 35 to 110 species, herbs, of tropical and temperate areas, with a center of diversity in Asia. References: Nesom in FNA (2006a); Arriagada (1998)=Z; Cronquist (1980)=SE.

**Anaphalis margaritacea** (Linnaeus) Bentham & Hooker f., Pearly-everlasting. Mt (NC*, VA, WV), Pd (DE, VA): dry open places, probably persistent from cultivation in NC, seemingly native in DE and VA; uncommon (rare in DE, NC, and VA). July-September. Interruptedly circumboreal, in North America from NL (Labrador) and NL (Newfoundland) west to AK, south to NC, TN, OK, TX, NM, CA, and Baja California. Very abundant and weedy in large parts of n. and w. North America, sometimes grown for ornament (especially dried arrangements) in our area. [= C, FNA, G, K, S, SE, W, Z; > A. margaritacea var. angustior (Miqueil) Nakai – F; > A. margaritacea var. intercedens Hara – F]

**Antennaria** Gaertner 1791 (Pussytoes)
A genus of about 70 species, herbs, of temperate and subtropical areas. Of our species, *A. neglecta*, *A. solitaria*, *A. virginica*, and *A. plantaginifolia* are sexual diploids. *A. parlinii* is of multiple hybrid origin, includes sexual and asexual populations, and is derived from *A. plantaginifolia*, *A. racemosa*, *A. virginica*, and *A. neglecta* (Bayer 1985). For reasons discussed in Bayer & Stebbins (1982) and parallel to those applied in this work to allopolyploid taxa in *Eupatorium*, the treatment of Bayer (1985) and Bayer & Stebbins (1993, 1982) is preferable to Cronquist's treatments, used in most of the floras covering or approaching our area. Much remains to be learned about the relative habitats and distributions of the various taxa in our area. References: Bayer in FNA (2006a); Bayer & Stebbins (1993)=Z; Bayer & Stebbins (1982)=Y; Arriaga (1998)=X; Cronquist (1980)=SE; Bayer (1985); Bayer & Stebbins (1987); Bayer (1984). Key closely adapted from Z, Y.

1. Flowering stalks with 1 head
2. Flowering stalks with 2 or more heads
3. Pistillate involucres 5-7 mm high; pistillate corollas 3-4 mm high; staminate corollas 2-3.5 mm high; basal leaves tomentose on the upper surface; young stolons mostly ascending; staminate and pistillate plants equally common
4. Pistillate involucres 7-10 mm high; pistillate corollas 4-7 mm high; staminate corollas 3.5-5 mm high; basal leaves tomentose or glabrous on the upper surface; young stolons mostly decumbent; sexual and apomictic populations present.
5. Basal leaves prominently 3-5-nerved, mostly > 1.5 cm wide.
6. Largest basal leaves > 6.0 mm wide and > 20 mm long; pistillate involucres 4.5-7 mm high; species sexual, populations consisting of both pistillate and staminate plants;
7. Middle and upper cauline leaves tipped with flags; mature basal leaves glabrous, young basal leaves pubescent; species apomictic or sexual.
8. Basal leaves spathulate, with a distinct petiolo; stolons mostly 5-8 cm long, with leaves along the stolon almost equal in size to those of the terminal rosette.
Anthemis Linnaeus 1753 (Chamomille)

A genus of about 175-210 species, herbs, mainly Eurasian. References: Watson in FNA (2006a); Cronquist (1980)=SE; Arriagada & Miller (1997)=Z. Key adapted from C. [also see Chamaemelum, Cota]

1 Rays yellow .......................................................................................................................... [see Cota tinctoria]
1 Rays white.
2 Rays sterile and usually neutral; receptacle chaffy only toward the middle..............................................................A. cotula
2 Rays pistillate and fertile; receptacle chaffy throughout.
3 Achenes not tuberculate; leaves not glandular-punctate beneath .............................................................................A. arvensis
3 Achenes tuberculate; leaves glandular-punctate beneath ..........................................................[A. secundiramea]

* Anthemis secundiramea Bivona-Bernardi. Cp (VA): railroad embankment; rare, native of Mediterranean Europe, probably merely a waif and not established. [= C, F, FNA, K, SE]

Aphanostephus A.P. de Candolle 1836 (Doze-daisy)

Aphanostephus skirrobasis (Alphonse deCandolle) Trelease var. thallasius Shinners, Dune Doze-daisy. Cp (FL): dunes, disturbed coastal sands; rare. S. LA west to coastal TX and Tamaulipas; scattered in n. FL, both Panhandle FL (Bay and Escambia counties) and ne. FL (St. Johns County) (Wunderlin & Hansen 2004). [= FNA, K, SE, WH; = A. skirrobasis – S, orthographic variant]

Arctium Linnaeus 1753 (Burdock)

1 Inner phyllaries constricted above the middle, widened toward the truncate (or rarely acuminate) apex..........................[A. tomentosum]
1 Inner phyllaries never constricted above the middle, gradually narrowing toward the acute to acuminate apex.
2 Petiole of the basal leaves solid; heads in the upper part of the inflorescence on peduncles > 2.5 cm long; heads corymbose arranged on the main branches ..............................................................................................................A. lappa
2 Petiole of the basal leaves hollow (at least toward its base); heads in the upper part of the inflorescence on peduncles < 2 cm long; heads racemose arranged on the main branches.
3 Heads 1.1-2.4 cm in diameter; heads on terminal branches sessile or pedunculate; middle phyllaries < 1.8 mm wide; corolla with glandular hairs .........................................................................................................................A. minus
3 Heads 1.9-2.9 cm in diameter; heads on terminal branches sessile; middle phyllaries (1.6-) 1.7-2.5 mm wide; corolla glabrous .............[A. nemorosum]

**Arctotis** Linnaeus 1753 (African-daisy, Arctotis)

A genus of about 60 species, annual and perennial herbs, native of South Africa. References: Norlindh (1965)=Z; Mahoney in FNA (2006a); McKenzie et al. (2006).

**Arnica** Linnaeus 1753 (Arnica)

**Arnoglossum** Rafinesque 1817 (Indian-plantain)

1 Larger leaves palmately veined, cordate at the base, either strongly toothed or lobed.
2 Leaves glaucous beneath; stem glaucous and conspicuously grooved .......................................................... *A. atriplicifolium*
3 Leaves green beneath; stem green and conspicuously grooved ................................................................. *A. reniforme*
4 Basal and lower cauline leaves linear to lanceolate, green to slightly glaucous below; plants 0.5-2.5 m tall; [usually of pine savannas, se. NC south to s. FL, west to e. TX] .............................................................. *A. ovatum* var. lanceolatum
5 Basal and lower cauline leaves ovate to ovate-lanceolate, glaucous beneath; plants 1.5-2.5 m tall; [usually of shaded, moist to bottomland habitats, e. GA west to e. LA] .......................................................... *A. ovatum* var. ovatum
6 Phyllaries not wing-keeled; stem terete.
7 Basal and low-cauline leaves truncate or subcordate at the base; larger leaves irregularly angulate-lobed or toothed, often somewhat hastate at the base; corolla usually pale lavender .............................................................................................................. *A. diversifolium*
8 Basal and low-cauline leaves cuneate at the base; larger leaves entire, crenate, sinuate, but not lobed or hastate; corolla creamy yellow (or greenish or tinged with pink).
9 Phyllary wings highest towards the base; phyllary wings chalky white, erose; leaves with main lateral veins running with the midrib for 2-4 cm into the blade before diverging; [of FL Panhandle] .................................................................................................................. *A. album*
10 Phyllary wings uniform or highest towards the tip; phyllary wings pale green, entire; leaves with main lateral veins diverging from the midrib at or very near the base of the blade, not concurrent; [collectively more widespread].
11 Involucres 12-15 mm high; corollas (9-)11-12 mm long .................................................................................. *A. floridanum*
12 Involucres 8-14 mm high; corollas 7-11.5 mm long.
13 Involucres (9.5-)10-12 (-13) mm high; corollas 5-8 (-9) mm long; leaves usually with 3-5 main parallel veins; mid-stem leaves petiolate, with rounded bases) .................................................................................. [A. plantagineum] / *A. sulcatum*
14 Involucres (9.5-)10-12 (-13) mm high; corollas 6-8 (-9.5) mm long; leaves usually with 3-5 main parallel veins; mid-stem leaves sessile, with broadly cuneate bases .................................................................................................

Arnoglossum floridanum (A. Gray) H.E. Robinson. Cp (FL): sandhills; uncommon. Ne. FL and e. FL Panhandle south to c. peninsular FL. [= FNA, K, WH, Z; = Cacalia floridana (A. Gray) SE, U; = Mesadenia floridana (A. Gray) Greene – S]

Arnoglossum ovatum (Walter) H.E. Robinson var. lanceolatum (Nuttall) D.B. Ward, Savanna Indian-plantain. Cp (FL, GA, NC, SC): wet savannas, especially over coquina limestone ("marl"); rare. Late July-October. SE. NC to s. FL, west to e. TX. [= Q; = Arnoglossum ovatum – FNA, GW, K, WH, Y, Z; = Cacalia lanceolata Nuttall – RAB; = Cacalia ovata Walter – SE, U; = Mesadenia lanceolata (Nuttall) Rafinesque – S; = Mesadenia lanceolata var. lanceolata – V; = Mesadenia lanceolata var. virens (Harper – V; = Cacalia lanceolata var. lanceolata – X)

Arnoglossum ovatum (Walter) H.E. Robinson var. ovatum, Broadleaf Indian-plantain. Cp (FL, GA), Pd (GA): bottomlands, bay forests, moist or wet forests; uncommon. Late July-October. E. GA west to e. LA. The division of A. ovatum into two taxa (species or, as done here, varieties) needs additional study. [= Q; < Arnoglossum ovatum – FNA, GW, K, WH, Y, Z; = Cacalia ovata Walter – SE, U; = Mesadenia ovata R.M. Harper – S; = Mesadenia maxima R.M. Harper – S; = Cacalia lanceolata var. elliptii (Shinners) Kral & Godfrey – X]

Arnoglossum reniforme (Hooker) H.E. Robinson, Great Indian-plantain. Mt (GA, NC, VA, WV): cove forests, other mesic forests; common (uncommon in WV, rare in VA). June-October. The very large, reniform leaves (sometimes up to 80 cm across) are conspicuous in rich cove forests. PA and MN, south to GA, MS, and OK. [= FNA, Y, Z; = Arnoglossum muehlenbergii (Schultz 'Bipontinus') H.E. Robinson – K; = Cacalia muehlenbergii (Schultz 'Bipontinus') Fernald – RAB; = Cacalia reniformis (Hooker) Rafinesque – S]

Arnoglossum plantagineum Rafinesque. Reported for sc. SC, in the unpublished flora of the Savannah River Site by Batson, Angerman, and Jones. It is known definitely from the Nashville Basin of c. TN (Chester, Wofford, & Kral 1997), AL, MS, LA, and KY. [= FNA, K, Y, Z; = Cacalia tuberosa Nuttall – G; = Mesadenia tuberosa (Nuttall) Britton – S; = Cacalia plantaginea (Rafinesque) Shinners – SE, U]

Artemisia Linnaeus 1753 (Wormwood, Mugwort, Sage)

If defined (as here) to include the segregate genus Seriphidium, a genus of about 500 species, shrubs and herbs, north temperate, boreal, and arctic. References: Shulz in FNA (2006a); Ling Yeou-Ruenn (1995)=Z; Cronquist (1980)=SE; Arriaga & Miller (1997)=Y. Key based primarily on C.

1 Disk flowers fertile, with abortive ovaries; plant not aromatic when fresh; [subgenus Dracunculus] ............................................................... A. caudata
2 Disk flowers fertile, with normal ovaries; plant variously aromatic or not when fresh.
3 Leaves tomentose on the lower surface, densel y so in many species; perennials from a branched rhizome or woody caudex; plants lacking nonflowering shoots.
4 Inflorescence obviously paniculate, the branches evident, the heads on slender peduncles; involucres 1-2 mm high and 1-2 mm wide; fresh plants not aromatic. ............................................................... A. annua
5 Principal leaves entire to 2-pinnatifid, the terminal segments > 2 mm wide; plant an herb (sometimes somewhat woody at the base).
6 Leaves 2-pinnatifid; leaves with 1-2 stipule-like lobes at the base ............................................................... A. ludoviciana
7 Leaves 2-pinnatifid; leaves with 1-2 stipule-like lobes at the base ............................................................... A. vulgaris

* Artemisia annua Linnaeus, Sweet Annie, Sweet Wormwood, Annual Mugwort. Cp (DE, SC, VA), Pd (DE, VA), Mt (VA, WV), {NC?}; road sides, disturbed areas, waste areas around wool-combing mills (Nesom 2004d); common (uncommon in NC, SC, VA, and WV), native of Asia and e. Europe. August-November. [= C, F, FNA, G, K, S, SE, Y, Z]
* Artemisia biennis* Willdenow var. *biennis*, Biennial Wormwood. Cp (DE, SC), Pd (DE), Mt (WV): disturbed areas, waste area around wool-combing mills; rare, native of the w. United States. Reported for SC by Nesom (2004d); also reported to be naturalized as far east as TN and WV (Hardy County). [= C, K; < *A. biennis* – F, FNA] [synonymy incomplete]

* Artemisia ludoviciana* Nuttall, White Sage, Prairie Sage. Pd (DE, NC, SC, VA), Cp (DE, FL, NC, VA), Mt (VA), {GA}: roadsides, disturbed areas; common (rare in FL), native of western North America. Late August-November. [= WH; > *A. ludoviciana* – RAB, Z; = *A. ludoviciana* var. *ludoviciana* – C, G, SE; > *A. ludovicana* Nuttall var. *gnaphalodes* (Nuttall) Torrey & A. Gray – F; > *A. ludoviciana* var. *ludoviciana* – F; = *A. ludoviciana* ssp. *ludoviciana* – FNA, K]

* Artemisia pontica* Linnaeus, Roman Wormwood, Green-ginger. Cp (DE), Pd (DE), Mt (WV): disturbed areas, old fields, woodland edges, roadsides, ditches; rare, native of Europe. Naturalized at least as far south as DE, se. PA (Rhoads & Klein 1993), and KY. [= C, F, FNA, G, K]

* Artemisia stelleriana* Besser, Beach Wormwood, Dusty Miller, Hoary Mugwort. Cp (DE, NC, VA), Pd (DE), Mt (WV): sandy roadsides, dunes, other disturbed areas; uncommon (rare in NC and VA), native of Japan and ne. Asia. May-September. This plant is reported (with documenting photograph) as naturalized and spreading in Nags Head (Dare County, NC) (Graetz 1973). [= C, F, FNA, G, K, SE, WH, Z; = *A. stelleriana* – Y, orthographic variant]

*Aster* Linnaeus 1753 (Aster)

It is now abundantly clear that the traditional, broad circumscription of *Aster*, as a genus of some 250 species of North America and Eurasia, is untenable. All of our native asters have affinities elsewhere than with Old World Aster; most are now placed in Symphyotrichum and Eurybia, with fewer species in Ampelaster, Doellingeria, Ionactis, Ocleomena, and Seriocarpus. These changes will undoubtedly cause uproar. It may be worth noting for those that consider the dissolution of *Aster* as radical, that most of the segregate genera were recognized in the 19th century, and many have been widely recognized for much of the time since. For instance, Seriocarpus and Doellingeria were both segregated from *Aster* in the early 1830's, and were frequently recognized as distinct, including by Small (1903, 1913, 1933); Seriocarpus was in fact usually regarded as a good genus until sunk by Cronquist. References: Brouillet in FNA (2006b); Semple & Brouillet (1980a, 1980b); Jones (1980a, 1980b); Brouillet & Semple (1981); Reveal & Keener (1981); Jones & Young (1983); Jones (1984); Semple, Chmielewski, & Lane (1989); Nesom (1997); Xiang & Semple (1996). [also see Ampelaster, Doellingeria, Eurybia, Ionactis, Ocleomena, Seriocarpus, Symphyotrichum]

*Astranthium* Nuttall 1840 (Western-daisy)

*Astranthium integrifolium* (Michaux) Nuttall. Mt (GA, WV): limestone glades; rare. Nc. KY south through c. TN to nw. GA and ne. AL (primarily in the Interior Low Plateau); disjunct in c. MS and also disjunct in nc. WV, where perhaps introduced. The related *A. ciliatum* (Rafinesque) Nesom of the Ozarkian region and Texas is sometimes treated as a variety, subspecies, or unnamed component of *A. integrifolium*, but see Nesom (2005a) for rationale for recognition at the specific rank. The report for NC by Kartesz (1999) is erroneous; the cited documentation does not mention NC. [= FNA, Z; = *A. integrifolium* var. *integrifolium* – C; = *A. integrifolium* ssp. *integrifolium* – K, Y; < *A. integrifolium* – F, G, SE, W]

*Baccharis* Linnaeus 1753 (Silverling, High-tide Bush, Mullet Bush, Groundsel Tree)

A genus of about 350-450 species, shrubs, perennial herbs, and trees, of tropical, subtropical, and warm temperate America. References: Sundberg & Bogler in FNA (2006b); Nesom (2000b); Cronquist (1980)=SE. Key based in part on SE.

1 Leaves linear, 1-3 mm wide, entire.................................................................................................................. *B. angustifolia*

1 Leaves obovate, oblongellate, or elliptic, the larger > 7 mm wide and generally coarsely toothed toward the tip.

2 Leaves entire, spatulate-obovate, 1.5-3 (-3.5) cm long (including the petiole)............................................. *B. dioica*
**ASTERACEAE**

2 Leaves (at least the larger) with coarse teeth and > 3.5 cm long (including the petiole).
3 Most of the heads sessile (a few pedunculate), the glomerules scattered along leafy branches in the axils of well-developed leaves; [strictly of the outer Coastal Plain, not spread inland as a weed] .................................................. Baccharis angustifolia
3 Most of the heads pedunculate (a few sessile), the glomerules grouped into terminal paniculiform inflorescences; [of the outer Coastal Plain and also spread extensively inland as a weed] .................................................. Baccharis halimifolia

**Baccharis angustifolia** Michaux, False-willow. Cp (FL, GA, NC, SC): interdune swales, wet hammocks, marsh edges; uncommon (rare in GA, NC, SC). September-October. Ne. NC (Dare County) south to s. FL, west to LA; Bahamas. [= RAB, FNA, GW, K, S, SE, WH]

**Baccharis glomeruliflora** Persoon. Cp (FL, GA, NC, SC): wet hammocks, marsh edges, interdune swales; common (rare in GA, NC, SC). October-November. Se. NC (Brunswick County) south to s. FL, west to MS; West Indies. [= RAB, FNA, GW, K, S, SE, WH]

**Baccharis halimifolia** Linnaeus, Silverling, High-tide Bush, Mullet Bush, Groundsel Tree. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC): fresh and brackish marshes, marsh borders, hammocks, moist abused land, roadsides, ditches, old fields, and a wide variety of disturbed areas; common (rare in Mountains and VA Piedmont). September-October. Se. MA south to s. FL, west to TX, AR, and OK; West Indies. *B. halimifolia* is becoming increasingly common inland, and can be an aggressive invader in sunny sites after silvicultural disturbance. [= RAB, C, F, FNA, G, K, S, SE, WH]

_Baccharis dioica_ Vahl, Broombush False-willow. Dunes and shores. S. AL; s. FL; West Indies. [= FNA, K, S, SE, WH]

**Balduina** Nuttall 1818 (Honeycomb-head, Balduina)

**Identification notes:** The common name alludes to the honeycomb-like texture of the receptacle, made up of connected receptacular bractlets which surround the achenes. This condition is diagnostic of the genus, and can be seen even when the plant is in flower by stripping the flowers from the receptacle. Superficially, the perennial species resemble some *Helenium* (particularly *H. pinnatifidum* and *H. vernale*), but these bloom months earlier. The punctate leaves are very distinctive.

1 Plant an annual or biennial; cauline leaves numerous, linear, 0.5-1.9 mm wide; outer involucral bracts 0.6-1.7 mm wide, lanceolate, acuminate; disk 0.6-1.5 mm wide; pappus scales obovate-oblong, 0.2-0.6 mm long .................................................. Baccharis angustifolia
1 Plant a perennial; cauline leaves few, linear-spatulate, 2-7 mm wide; outer involucral bracts 1.7-3.1 mm wide, ovate, acute; disk (10-) 15-25 mm wide; pappus scales lanceolate, 1.1-2.1 mm long .................................................. Baccharis halimifolia
2 Disk corollas purple; basal leaves linear-spatulate, (7-) avg. 14 (-32) cm long, about 20× as long as wide; cauline leaves 3.8-6.2 cm long; outer phyllaries 2.9-5.4 mm long; inner phyllaries 4.5-7.6 mm long; ray flower ligules 2.3-4.7 mm wide at apex .......... *B. atropurpurea*
2 Disk corollas yellow to reddish-orange; basal leaves spatulate, (5-) avg. 7.5 (-10.5) cm long; about 8× as long as wide; cauline leaves 2.7-4.3 cm long; outer phyllaries 4.7-7.2 mm long; inner phyllaries 5.1-11 mm long; ray flower ligules 3.2-8.6 mm wide at apex ...... *B. uniflora*

**Balduina angustifolia** (Pursh) B.L. Robinson. Cp (FL, GA): sandhills and other dry, sandy soils; common. GA south to s. FL, west to s. MS; it should be sought in s. SC. [= FNA, K, SE, WH; Z = Actinospermum angustifolium (Pursh) Torrey & A. Gray – S]

**Balduina atropurpurea** R.M. Harper, Bog Honeycomb-head, Purple Honeycomb-head, Purple Balduina. Cp (FL, GA, NC, SC): peaty seepage bogs and wet pine savannas; rare. Late August-early November; October-December. A southeastern Coastal Plain endemic, very rare and disjunct in se. NC and nc. SC (where not recently seen), primarily in ne. to sc. GA and ne. FL. [= RAB, FNA, GW, K, SE, Z = Endorima atropurpurea (R.M. Harper) Small – S]

**Balduina uniflora** Nuttall, Savanna Honeycomb-head, Yellow Balduina. Cp (FL, GA, NC, SC): wet pine savannas and flatwoods; common (uncommon in GA and NC, rare in SC). Late July-September. A southeastern Coastal Plain endemic: se. NC and immediately adjacent ne. SC (apparently absent from much of SC), and from extreme sc. SC south to ne. FL, FL Panhandle, and west to e. LA. [= RAB, FNA, GW, K, SE, Z = Endorima uniflora (Nuttall) Rafinesque – S]

**Bellis** Linnaeus 1753 (English Daisy)

A genus of about 8 species, herbs, of Europe. References: Nesom (2000b); Brouillet in FNA (2006b); Cronquist (1980)=SE.

**Berlandiera** A.P. de Candolle 1836 (Green-eyes)

1 Leaves mainly cauline; leaves unlobed; disk flowers red to maroon; [of ne. SC south to n. FL, west to TX] ................. *B. pumila var. pumila*
### ASTERACEAE

**Bidens Linnaeus 1753** (Beggar-ticks, Bur-marigold)

A genus of about 240 species, herbs, cosmopolitan. Recent molecular studies suggest that the relationship between *Bidens* and *Coreopsis* is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford & Mort 2005). References: Strother & Weedon in FNA (2006c); Cronquist (1980)=SE; Sherff & Alexander (1955)=Z; Ballard (1986)=Y. Key based on FNA.

**Identification notes:** The involucre of phyllaries is subtended by an additional series of bracteal structures, the *calyculus*.

NJ south to FL, west to TX, primarily Coastal Plain, rare and scattered inland. [= RAB, C, F, FNA, G, GW, K, S, SE, W, WH, Z; > B. mitis var. lephtyphalla (Nuttall) Small – S; < B. mitis var. mitis – S]

* Bidens pilosa Linnaeus. Cp (FL, GA?, NC, SC?): waste areas near wool-combing mill, ballast, other disturbed areas; rare, native of tropical America. Reported for NC (Kartesz 1999), perhaps based on confusion with *B. alba*; known from ballast in se. PA (Rhoads & Klein 1993). [= K, WH; > B. pilosa – FNA; > B. pilosa var. pilosa – Z; > B. pilosa Linnaeus var. bimucronata (Turczaninov) Schultz “Bipontinus” – Z]

**Bidens beckii** Torrey ex Sprengel, Water-marigold, Water Beggar-ticks. South to e. PA and NJ. July-October. This species is sometimes treated in the monotypic genus *Megalodon*; this is contradicted by molecular evidence, which shows *B. beckii* as a component of *Bidens* (Ganders 2000). [= C, FNA, G; > Megalodon beckii (Torrey ex Sprengel) Greene – F, K; > Megalodon beckii var. beckii – Z]

* Bidens tripartita Linnaeus. Eurasian; not known to be in our area. [= combined distribution of *biconus*, *connuata*, and *triptaria*: Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): marshes, swamps] [= B. tripartita – F, G, W, Z; < B. conosoma (A. Gray) Wiegand – C, F, G, S; < B. tripartita – FNA, K; < B. tripartita – RAB, GW (also see B. conosoma and B. conosoma)] [not keyed]

**Bigelowia** A.P. de Candolle 1836 (Rayless-goldenrod)

1 Basal leaves many, 1-2 mm wide; plants strongly rhizomatous and colonial; [of dry clayey or rocky places] .......................... *B. nutfallii* .......................... *B. nutfallii*

2 Basal leaves few, 2-14 mm wide; plants cespitose, or weakly rhizomatous; [of wet to mesic pine savannas and flatwoods] .......................... *B. nudata var. australis* .......................... *B. nudata var. australis*
**Boltonia L'Heritier 1789** (Doll's-daisy)

*(contributed by John F. Townsend and Alan S. Weakley)*

1 Achenes with pappus reduced to a short ring of bristles or to 0.15 mm long or with occasional slender awns to 0.6 mm; achene wings lacking or up to 0.1 mm wide; faces of achenes glabrous.

2 Phyllaries 0.2-0.5 mm wide, whitened throughout or with greenish tip, midrib relatively prominent (25-35% phyllary width); heads 4.3-6.1 mm wide, peduncles 0.25-0.5 mm in diameter; ray corollas white fading to pinkish in age; bracteal leaves narrowly oblong-cuneate to linear; [of Coastal Plain and Piedmont of VA southwards] = *B. asteroides* var. *latisquama*.

3 Phyllaries linear-subulate to lanceolate; inflorescence various.

4 Phyllaries spathulate, oblong-cuneate, or linear-oblong-cuneate, apices cuspidate, pappus awns 2/3 or more as long as the achenes; inflorescence diffusely branched, with numerous heads.

5 Inflorescence more or less leafy-bracteate.

6 Phyllaries linear-filiform; peduncles 0.2-0.5 mm wide; faces of achenes glabrous.

7 Inflorescence diffusely branched, heads relatively numerous, phyllaries (0.2-) 0.3-0.4 (-0.5) mm wide, (1.3-) 1.4-1.8 (-2.1) mm long, pappus awns 0.3-0.8 mm long; [of Coastal Plain and Piedmont of VA southwards] = *B. asteroides* var. *latisquama*.

8 Plants reproducing vegetatively by basal offsets, culms ascending, leaves elliptic to obovate with rounded or blunt apices, held at various angles from culm and inflorescence branches, plants with weak apical dominance; [of the Susquehanna River of MD and PA] = *B. asteroides* var. *recoginta*.

9 Plants reproducing vegetatively by elongate stolons, culms more strictly erect, leaves lanceolate with acute apices, the leaves oriented at an acute angle to the culm and inflorescence branches, plants with relatively strong apical dominance; [more widespread in our area] = *B. asteroides* var. *glastifolia*.

**Boltonia apalachicolensis** L.C. Anderson, Apalachicola Doll’s-daisy. Cps (FL): floodplain forests; rare. August-October. Panhandle FL, s. MS, west to LA. = [F; K, WH; < Boltonia sp. – GW]

**Boltonia asteroides** (Linnaeus) L’Heritier var. asteroides, Susquehanna Doll’s-daisy. Riverbanks. Along the Susquehanna River, MD and PA. = [Y; < *B. asteroides* var. *asteroides* – C, FNA, G, K, SE, X; Z; = *B. asteroides* var. *asteroides* – F]

**Boltonia asteroides** (Linnaeus) L’Heritier var. glastifolia (Hill) Fernald, Eastern Doll’s-daisy. Cps (DE, FL, NC, SC, VA), Mt (NC), {GA}: marshes, ditches; common (rare in Mountains, rare in FL and VA). August-October. NJ south to Panhandle FL, west to LA, mostly on the Coastal Plain, but with a few disjunct occurrences inland, such as Henderson County, NC. = [F; < *B. asteroides* – RAB, W, WH; Y; < *B. asteroides* var. *asteroides* – C, FNA, G, K, SE, X; Z; = Boltonia sp. – GW]

**Boltonia asteroides** (Linnaeus) L’Heritier var. recognita (Fernald & Griscom) Cronquist. MI, OH, KY, TN west to SK and OK. = [C, FNA, G, K; = Boltonia recognita (Fernald & Griscom) G.N. Jones] [synonym incomplete]

* Boltonia asteroides* (Linnaeus) L’Heritier var. *latisquama* (A. Gray) Cronquist, Midwestern Doll’s-daisy. Cps (NC, VA); ditches; rare, native of mw. United States. August-October. WI west to ND, south to MS and OK; disjunct (presumably introduced) in NC and se. VA. = [C, FNA, G, K, SE, X; > *B. latisquama* var. *latisquama* – F; > *B. latisquama* var. *recognita* Fernald & Griscom – F; < Boltonia sp. – GW]

**Boltonia caroliniana** (Walter) Fernald, Carolina Doll’s-daisy. Cps, Pd (NC, SC, VA), {GA}: bottomlands, ditches, roadsides, prairies; common (rare in GA and VA). August-October. Se. VA south to s. SC (and GA according to Kartesz 1999),
primarily on the Coastal Plain and Piedmont. [= C, FNA, G, K, SE, X, Y; < B. caroliniana – RAB (also see B. diffusa var. diffusa); > B. caroliniana – F; > B. ravenelii Fernald & Griscom; F; < Boltonia sp. – GW; = B. diffusa var. caroliniana – Z]

**Boltonia diffusa** Elliott var. diffusa, Southern Doll's-daisy. Cp (FL, GA, SC), Pd* (NC*, VA*): clay-based Carolina bays, road sides, powerline rights-of-way, and other artificially open areas; uncommon (rare in NC, SC, VA). August-October. Se. SC south to s. FL, west to e. TX, inland in the interior to c. TN, s. IL, s. MO, AR, and se. OK; disjunct in the Bahamas (Mangrove Cay of Andros Island). See Sorrie & LeBlond (2008) for comments on distribution and nativity. [= FNA, K, Z; < B. caroliniana – RAB; < B. diffusa – C; < Boltonia sp. – GW]

**Boltonia diffusa** Elliott var. interior Fernald & Griscom. KY and TN west to IL, OK, and LA. [= FNA, K; < B. diffusa – C; < Boltonia sp. – GW] [synonymy incomplete]

**Borrichia** Adanson 1763 (Seaside Oxeye)

A genus of 2 species, shrubs, of se. United States and West Indies. References: Semple in FNA (2006c); Cronquist (1980)=SE.

**Borrichia frutescens** (Linnaeus) A.P. de Candolle, Seaside Oxeye. Cp (FL, GA, NC, SC, VA): salt and brackish marshes; common. May-September. DC and e. VA south to s. FL, west to TX and Mexico; also in Bermuda. This species often forms nearly pure stands of many hectares, conspicuous from the fleshy, gray leaves. [= RAB, C, F, FNA, G, K, SE, WH]

**Brickellia** Elliott 1823 (False-boneset)

1 Leaves cuneate at base; upper stem leaves (at least) linea r-lanceolate; pappus whitish, of 20-25 bristles; [widespread in our area] .......................... **B. cordifolia**

1 Leaves cuneate at base; upper stem leaves (at least) linear-lanceolate; pappus whitish, of 20-25 bristles; [widespread in our area] .......................... **B. eupatorioides** var. eupatorioides

**Brickellia cordifolia** Elliott, Flyr's False-boneset. Cp (FL, GA): mesic pine-hardwood or oak-hickory woods of upland hammocks; rare. Late August-late October. Sw. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009) and AL south to Panhandle FL and n. peninsular FL. [= FNA, K, SE, WH; = Coleosanthes cordifolius (Elliott) Kuntze – S]

*Brickellia eupatorioides* (Linnaeus) Shinners var. *corymbulosa* (Torrey & Gray) Shinners, Midwestern False-boneset. Var. *corymbulosa* (Torrey & Gray) Shinners ranges as far east as IN, IL, MO, and AR (and allegedly to KY) and has larger heads than var. *eupatorioides* (9-15 mm high, with mostly 15-35 florets, vs. 7-11 mm high, with mostly 6-15 florets). [ ] {investigate; add synonymy; add to key}

*Brickellia eupatorioides* (Linnaeus) Shinners var. *eupatorioides*, Eastern False-boneset. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, SC, VA): dry slopes, shale barrens, dry woodlands, thickets; common (uncommon in Mountains, uncommon in VA Piedmont, rare in VA Coastal Plain). June-October. NJ west to IN, south to c. peninsular FL and se. TX. In addition to var. *eupatorioides*, *B. eupatorioides* includes several other varieties, of more southern or western distribution. Var. *floridana* (R.W. Long) B.L. Turner [= B. mossieri Small] has all leaves linear and is apparently restricted to s. FL; previous references to its occurrence further north (as by SE) are now interpreted as being based on narrow-leaved forms of *B. eupatorioides* var. *eupatorioides*. Var. *texana* (Shinners) Shinners [= var. ozarkana (Shinners) Shinners] has the outer phyllaries prolonged into setae, nearly or fully as long as the inner phyllaries, and should be considered a possibility for our area, in dry open habitats with prairie or midwestern affinities; it is known from as far eastward as AR and MO. [= FNA, K, X, Z; < Kuhnia eupatorioides Linnaeus – RAB, S, W; = Kuhnia eupatorioides var. eupatorioides – C, F, G, SE; < Brickellia eupatorioides – WH; = Kuhnia eupatorioides var. pyramidalis Rafinesque – Y]

**Brintonia** Greene 1895 (Brintonia)

**Brintonia discoidea** (Elliott) Greene, Brintonia, Rayless Mock-goldenrod. Cp (FL, GA): rich bluff forests; rare. August-October. A Southeastern Coastal Plain endemic: sw. GA and Panhandle FL west to LA. [= FNA, S, SE, WH; = Solidago discoidea Elliott – K]

**Calotis** R. Browne 1820

**Calypocarpus** Lessing 1832 (Straggler-daisy, Lawnflower)

**Carduus** Linnaeus 1753 (Plumeless Thistle)

A genus of about 90 species, herbs, of temperate Old World. References: Keil in FNA (2006a); Cronquist (1980)=SE. [also see Cirsium]

1 Phyllaries 2-8 mm wide; heads mostly noding (declined at least slightly from the vertical) ................................................................. C. nutans
1 Phyllaries 1-2 mm wide; heads erect.
2 Involucres cylindrical or narrowly ellipsoid................................................. C. pycnocephalus ssp. pycnocephalus
2 Involucres spherical or hemispherical.
3 Involucre 14-20 mm high, 25-35 mm across (excluding the flowers); leaves glabrate to glabrous beneath; plants very spiny; stem tough. ................................................................. C. acanthoides ssp. acanthoides
3 Involucre 12-17 mm high, 15-20 (-25) mm across (excluding the flowers); leaves cottony-tomentose beneath, at least when young, plants not very spiny; stem brittle ................................................................. C. crispus

* Carduus nutans* Linnaeus, Musk Thistle, Nodding Thistle. Mt (VA, WV), Pd (GA, NC, VA), Cp (DE, SC, VA): fields, roadsides, disturbed areas; uncommon (rare in DE, NC, and SC), native of Eurasia. Late May- November. C. nutans in its native range consists of a complex of taxa variously treated at specific, subspecific, and varietal rank; the application of these taxa to North American material is problematic and unresolved (see FNA for discussion). [= RAB, C, F, FNA, G, SE, W; > Carduus nutans Linnaeus ssp. macrolepis (Petermann) Kazmi – K]

* Carduus tenatifolius* W. Curtis. Known from ballast collections from se. PA from 1877-1879 (Rhoads & Klein 1993) and from NJ (Kartesz 1999). [= FNA, K] [not keyed]

**Carphephorus** Cassini 1816

A genus of 4 species, herbs, endemic to the Southeastern Coastal Plain of North America. The merger of Trilisa and Litrisa into Carphephorus has been questioned (Schmidt & Schilling 2000) and Schilling (2011) provides evidence that both Trilisa and Litrisa should be maintained as separate genera. The only species of this complex not occurring in our area is Cardiaca pycnocephalus Small (of c. peninsular FL). References: Nesom in FNA (2006c); Schilling (2011)=V; Correa & Wilbur (1969)=Z; DeLaney, Bissett, & Weidenhamer (1999)=Y; Orzell & Bridges (2002)=X; Cronquist (1980)=SE.

**Identification notes:** Trilisa can be distinguished from Carphephorus by its smaller heads (involucres 3.5-6 mm high vs. 6-15 mm high) and fewer phyllaries (6-12 vs. 15-40). When vegetative, Trilisa lacks shining resin dots on the leaves, while Carphephorus has numerous resin dots.

1 Stem glabrous or nearly so, the pubescence (if present) short and appressed; surfaces of the basal leaves glabrous; inflorescence corymiform.
2 Stem glabrous; heads mostly noding (declined at least slightly from the vertical) ................................................................. C. nutans
2 Stem leaves few, most of the stem exposed; basal leaves 4-20 cm long, 0.5-2.5 cm wide, dull, minutely punctate-pitted, fairly thick in texture, but not succulent; stems 1-5 dm tall, (1-) 2-5 per plant; [se. VA south to e. GA] ................................................................. C. bellidifolius
2 Stem leaves numerous, densely clothing the stem at least below; basal leaves 9-50 cm long, 2-10 cm wide, shiny, succulent, not glandular-punctate; stems 6-20 dm tall, 1 per plant; [se. NC south to FL, west to e. LA] ................................................................. [Trilisa odoratissima]
3 Leaves linear, the widest 1-3 mm wide; [sw. GA west through the East Gulf Coastal Plain] ................................................................. C. pseudoliatris
3 Leaves oblancolate, the widest 7-40 mm wide; [collectively widespread in the Coastal Plain of our area].
4 Inflorescence thyrsoid-paniculate; florets 4-10 per head; basal leaves glabrous, minutely and inconspicuously punctate, lacking resin droplets; phyllaries in 1-2 (-3) series, scarcely overlapping

4 Inflorescence corymbiform; florets 15-30 per head; leaves generally conspicuously pubescent (sometimes glabrate or with a few long hairs on the upper surface), not punctate, copiously beset with resin droplets; phyllaries in 3-6 series, closely imbricate.

5 Phyllaries glabrate on the back; phyllaries subacute to rounded, entire to erose; phyllaries mostly 15-20

5 Phyllaries viscid-pubescent on the back; phyllaries acute to subacute, entire and often callus-tipped; phyllaries 20-40

.......................................................... C. tomentosus

Carphophorus bellidiformis (Michaux) Torrey & A. Gray, Sandhill Chaffhead. Cp (GA, NC, SC, VA): xeric sandy forests and woodlands, primarily in sandhills; common (rare in GA and VA). August-October. Se. VA to extreme e. GA. The leaf apices are generally blunt, giving the leaves a nearly spatulate shape. Although often occurring with other species of Carphophorus, C. bellidiformis ranges into drier habitats than its congeners. [= RAB, C, F, FNA, G, K, S, SE, V, Z]

Carphophorus corymbosus (Nuttall) Torrey & A. Gray. Cp (FL, GA, SC): wet flatwoods; common (rare in GA and SC). August-October. Se. SC south to s. FL. This species was reported as far north as NC by Small (1933); Correa & Wilbur (1969) considered the northern limit of the species to be e. GA, but it is now known from Jasper County, SC. [= RAB, FNA, K, S, SE, V, WH, Y, Z]

Carphophorus tomentosus (Michaux) Torrey & A. Gray. Cp (NC, SC, VA): savannas, flatwoods, and sandhills; common (rare in VA). August-October. Se. VA south to s. GA. The specific epithet is somewhat misleading; C. tomentosus is highly variable in its pubescence, ranging from glabrate to densely hirsute. [= RAB, C, FNA, G, GW, K, S, SE, V, Z; > C. tomentosus var. tomentosus – F; > C. tomentosus var. walteri (Elliott) Fernald – F]

Carthamus Linnaeus 1753 (Distaff-thistle)

A genus of 14 species, annual and perennial herbs, of the Mediterranean region. Closely related to Centaurea, and perhaps to be included there. References: Keil in FNA (2006a).

Centaurea Linnaeus 1753 (Star-thistle, Knapweed)

A genus of about 500 species, herbs, native of Eurasia and n. Africa. References: Keil & Ochssmann in FNA (2006a); Cronquist (1980)=SE. Key adapted from C, SE, and FNA. [also see Acroptilon, Carthamus, and Plectocephalus]

1 Phyllaries evidently spine-tipped.

2 Leaf bases not decurrent on the stem, the stem merely angled; pappus absent; corollas purple

3 Central spines of the principal phyllaries 10-25 mm long................................. C. calcitrapa

3 Central spines of the principal phyllaries 1-3 mm long...................................... [C. diffusa]

2 Leaf bases decurrent on the stem as wings (only shortly so in C. benedicta); pappus present in at least the central flowers in the head; corollas yellow.

4 Heads sessile, closely subtended and partially concealed by large foliar bracts................................................. C. benedicta

4 Heads obviously pedunculate, lacking large foliar bracts subtending the head.

5 Larger spines of the middle and outer phyllaries 5-9 mm long; marginal and central flowers of the head with pappus .......... C. melitensis

5 Larger spines of the middle and outer phyllaries 11-22 mm long; marginal flowers of the head lacking pappus .............. C. solstitialis

1 Phyllaries not spine-tipped.

6 Plant an annual; flowers pale to medium blue, flowering April-June ................................................................. C. cyanus

6 Plant a perennial; flowers pink to purple, flowering June-October.

7 Phyllary appendages tapering to long, often recurved, pectinately dissected, filiform tips........................................ C. phrygia

7 Phyllary appendages obuse to acute, erect or ascending.

8 Involucres 10-13 mm high................................................................. C. stoebes ssp. micranthos

8 Involucres 15-25 mm high.

9 Phyllary appendages evidently uncurled along phyllary margins ........................................................................ C. scabiosa

9 Phyllary appendages not or only slightly uncurled along phyllary margins.

10 Phyllary appendages roundish (seldom triangular), scarious, light to dark brown, undivided to irregularly lacerate ........ C. jacea

10 Phyllary appendages more-or-less triangular, brown to black, more-or-less wholly pectinate-margined.

11 Heads discoid (the peripheral florets not expanded and showy); pappus blackish, < 1 mm long; green parts of phyllaries nearly or completely covered by black appendages, the involucres thus appearing totally black................................. C. nigra

11 Heads radiate (the peripheral florets expanded and showy); pappus absent or rudimentary (when present usually not black); green part of phyllaries sometimes evident, or the appendages light to dark brown.

12 Heads relatively broad, the pressed involucres usually as wide as or wider than long; green parts of phyllaries usually covered by brown, variously pectinate fimbriate appendages, the involucres thus light to dark brown .......... C. ×moncktonii
12 Heads relatively narrow, the pressed involucres usually longer then wide; green parts of phyllaries not fully covered by black appendages, the involucres black and green. ................................. C. nigrescens

* Centaurea × moncktonii C.E. Britton, Meadow Knapweed.  Mt (VA), Pd (VA): roadsides, disturbed areas; rare, native of Europe.  July-October.  [= FNA; = C. pratensis Thuiiller – C; ? C. nigra var. radiata A.P. de Candolle – F; ? C. debeauxii Godron & Grenier ssp. thuilliieri Dostal]

* Centaurea nigra Linnaeus, Black Knapweed, Spanish-buttons.  Mt (WV), Pd (DE, VA), Cp (DE): roadsides, disturbed areas; uncommon (rare in VA), native of Europe.  July-October.  [= C, F, G, K, S, SE]

* Centaurea nigrescens Willdenow, Tyrol Knapweed, Short-fringed Knapweed.  Mt (VA, WV), Pd (DE, VA): roadsides, disturbed areas; uncommon (rare in DE and VA), native of Europe.  July-October.  This species is increasing rapidly in the n. VA Piedmont.  C. transalpina Schleicher ex de Candolle was also reported for VA by Kartesz (1999).  [= FNA; = C. dubia Suter – C, SE, W (not a valid name); > C. vochinensis Bernhardi ex Reichenbach – F; > C. dubia ssp. vochinensis (Berhardi ex Reichenbach) Hayek – G; > C. nigrescens – K; > C. transalpina Schleicher ex de Candolle – F, K]

* Centaurea phylgia Linnaeus, Wig Knapweed.  [VA].  Reported for VA in FNA.  [= FNA, K; > Centaurea austriaca Willdenow]

* Centaurea stoebbe Linnaeus ssp. micranthos (S.G. Gmelin ex Gugler) Hayek, Spotted Knapweed, Bushy Knapweed.  Mt (NC, SC, VA, WV), Pd (NC, SC, VA), Cp (DE, FL, VA): roadsides, disturbed areas; common (rare in FL and SC), native of Europe.  Late June-December.  [= FNA, WH; = Centaurea biebersteinii A.P. de Candolle – K; = C. maculosa Lamarck – RAB, C, F, G, SE, W, misapplied]

* Centaurea diffusa Lamarck, Tumble Knapweed.  Naturalized in Davidson County, TN (Chester, Wofford, & Kral 1997); also in KY (FNA).  [= C, F, G, K; = Acosta diffusa (Lamarck) Sojak]

* Centaurea scabiosa Linnaeus, Greater Knapweed, Hardheads.  Naturalized in KY, PA, NJ (FNA), MD (Kartesz 1999), and other states in e. North America.  [= FNA, C, F, G, K]

Chaetopappa A.P. de Candolle 1836 (Least-daisy)

Chamaemelum P. Miller 1754 (Chamomile)

A genus of 2 species, herbs, of the Mediterranean region.  References:  Cronquist (1980)=SE.  [also see Cladanthus]

1 Rays white with a yellow base; plant an annual ........................................................................................................................................ [see Cladanthus mixtus]

1 Rays white; plant a perennial ................................................................................................................................................. C. nobile

* Chamaemelum nobile (Linnaeus) Allioni, Garden Chamomile.  Pd (NC): persistent from cultivation in gardens; rare, native of Europe.  [= FNA, K; = Anthemis nobilis Linnaeus – C, F, G, S, SE]

Chaptalia Ventenat 1802 (Sunbonnets)
A genus of about 60 species, herbs, of warm temperate, subtropical, and tropical America. The remainder of the genus is distributed in the West Indies, Central America, and South America. References: Nesom in FNA (2006a); Vuilleumier (1969)=Z; Nesom (1995a)=Y; Cronquist (1980)=SE.

Identification notes: The basal leaves are distinctive, the underside permanently and tightly white floccose, the upper surface floccose when young but glabrate in age, and the margins with obscure dentations.

**Chaptalia tomentosa** Ventenat, Sunbonnets, Pineland Daisy, Night-nodding Bog-dandelion, Woolly Sunbonnets. Cp (FL, GA, NC, SC): savannas, sandhill seeps, pine flatwoods; common. February-May. A Southeastern Coastal Plain endemic: e. NC south s. FL and west to e. TX. [= RAB, FNA, GW, K, S, SE, WH, Y, Z]

*Chevreulia Cassini 1817*

**Chondrilla Linnaeus 1753 (Skeleton-weed)**

**Chromolaena A.P. de Candolle 1836**

**Chrysanthemum Linnaeus 1753 (Chrysanthemum)**

* Chrysanthemum indicum Linnaeus, Garden Chrysanthemum, is persistent or perhaps naturalized as far south as se. PA (Rhoads & Klein 1993). [= Dendranthema ×grandiflorum Kitam. – K; ? Dendranthema morifolium (Ramat.) Tzvelev; ? Chrysanthemum morifolium Ramat.; Dendranthema indicum × japonicum]

**Chrysogonum Linnaeus 1753 (Green-and-gold)**

1 Plants occurring individually, not producing stolons; earliest flowering stems leafless, later flowering stems leafy; leafy flowering stems mostly 15-35 (-50) cm high; [of e. VA, sc. PA, and se. OH south to se. NC, ne. SC, nw. NC, and sw. VA].................................................................

1 Plants colonial, forming mats by stolons; flowering stems leafless or leafy; leafy flowering stems (if present) 15-25 cm high; [of ne. SC, se. NC, nw. NC, ne. TN. and se. KY southward].

2 Earliest flowering stems leafless, mostly 2-10 cm high; later flowering stems leafy, 15-25 cm high; longest stolon internodes 2-6 cm long; [of ne. SC, sc. NC, nw. NC, sw. VA, ne. TN. and se. KY south to e. GA, c. GA, and ec. AL]...................................................C. virginianum var. virginianum

2 Earliest flowering stems leafless, 2-10 cm high; later flowering stems leafless as well, 2-10 cm high; longest stolon internodes 12-60 cm long; [of sc. and sw. GA west to e. LA]..................................................................C. virginianum var. brevistolon

and sw. GA west to e. LA.  [= FNA, WH, Z; < C. virginianum var. australae – RAB, K, SE, W (also see var. brevistolon); < C. australae Alexander ex Small – S (also see var. brevistolon)]

**Chrysogonum virginianum** Linnaeus var. virginianum, Northern Green-and-gold, Virginia Green-and-gold.  Cp (NC, SC, VA), Pd (NC, VA), Mt (VA, WV): moist to fairly dry woodlands and forests; common (uncommon in WV).  Late March-early June.  E. VA, sc. PA, and se. OH south to se. NC, nc. SC, nw. NC, and sw. VA.  [= RAB, C, FNA, K, SE, W, Z; = C. virginianum – S]

---

**Chrysoma** Nuttall 1834 (Woody Goldenrod)

**Chrysoma pauciflosculosa** (Michaux) Greene, Woody Goldenrod.  Cp (FL, GA, NC, SC): xeric sands of very barren, open, white-sand sandhills, in our area primarily on fluvial dunes, and less commonly in the fall-line Sandhills; uncommon (rare north of FL).  Late July-October.  S. NC south to n. FL and west to s. MS.  **Chrysoma** has a growth habit unlike any other shrub in our flora.  From a trunk-like base, numerous branches ascend, forming a flat-topped shrub 3-5 dm tall.  Each branch has a cluster of evergreen leaves restricted to its terminal few cm, the internodes very short (a few mm at most).  In summer, some of the woody branches produce terminal, deciduous, flowering branches, which elongate rapidly, the leaves widely spaced, reaching a height of a meter or more.  Following flowering and fruiting, the deciduous branches die back to the summit of the woody branches.  The leaves are gray-green, rather thick-textured, and finely reticulate, the reticulations giving an appearance rather like anole skin.  The midrib is prominent below, almost invisible on the upper surface.  Godfrey (1988) has an excellent drawing and description of this distinctive shrub.  [= FNA, K, S, SE, WH; = Solidago pauciflosculosa Michaux – RAB; = Chrysoma solidaginoides Nuttall]

**Chrysopsis** (Nuttall) Elliott 1823 (Golden-aster)

A genus of about 10 species, herbs, of se. North America, Mexico, and the Bahamas.  This remains a difficult and rather poorly understood group.  The appropriate taxonomic status of many of the entities remains unclear; for the moment, I am recognizing a number of entities at the specific level that should perhaps be recognized at lower taxonomic levels; in some cases, the appropriate nomenclatural combinations are not already available.  References:  Semple in FNA (2006b); Semple (1981)=Z; Harms (1974)=Y; Semple (1996)=X; Cronquist (1980)=SE; Nesom (2000b); DeLaney, Wunderlin, & Semple (2003).  Key adapted from Semple (1981).  [also see Heterotheca and Pityopsis]

1 Stem, leaves, and phyllaries sparsely to densely pubescent with spreading non-glandular hairs as well as having minutely glandular pubescence; annuals with taproots; [section Broduria].................................................................................................................................C. pilosa

1 Stems, leaves, and phyllaries various but lacking spreading non-glandular hairs; biennials or perennials, either fibrous-rooted or with a mostly short and quickly disintegrating taproot; [section Chrysopsis].

2 Peduncles and phyllaries glabrous or the outer phyllaries basally with a few stipitate glands; achenes usually with raised yellow-red translucent ribs.

3 Stems erect; leaf margins serrate-ciliate, the surfaces sparsely pubescent to glabrous; all phyllaries glabrous.......................C. hyssopifolia

3 Stems decumbent to ascending; leaf margins entire, either eciliate and glabrous, or sometimes ciliate with glabrate to sparsely woolly surfaces; phyllaries either glabrous and glandular punctate or the outer basally stipitate-glandular.

4 Stem leaves glabrous and eciliate (but rosette leaves densely woolly), lower stem leaves absent at flowering; outer phyllaries with a few stipitate glands basally, the involucre otherwise glabrous.................................................................C. cruiseana

4 Stem leaves eciliate or ciliate, the surfaces glabrous or sparingly pubescent, the hairs often only or mostly near the margin, lower stem leaves usually present at flowering; phyllaries glabrous, glandular-punctate..................................................................................C. trichophylla

{Add linearifolia under 2a}

2 Peduncles and phyllaries evidently stipitate-glandular or woolly-hairy, or both; achenes with or without raised yellow-red translucent ribs.

5 Upper stem leaves woolly-hairy; not stipitate-glandular; peduncles and involucres sparsely pubescent to woolly, sometimes stipitate-glandular as well.

6 Stems decumbent; inflorescence loosely corymbose-cymose, buds not nodding; peduncles stipitate-glandular or not, ligules 7-12 mm long; achenes sparsely to moderately striate, usually with raised yellow-red translucent ribs; [of se. VA to FL].........................C. gossypina

6 Stems decumbent to ascending; inflorescence corymbose, buds nodding; peduncles densely stipitate-glandular, ligules 10-15 mm long; achenes densely striate, lacking raised yellow-red translucent ribs; [of barrier islands of w. FL Panhandle]...............C. godfreyi

5 Upper stem leaves arachnoid to glabrate or densely stipitate-glandular; peduncles and involucres stipitate-glandular but otherwise glabrous.

7 Upper stem leaves lacking stipitate glands, either arachnoid to glabrate, or woolly..............................................................C. marniana

7 Upper stem leaves densely stipitate-glandular, not woolly.

8 Stems decumbent to ascending; leaves lanceolate; inflorescence compactly corymbose; involucres 9-12 mm long; phyllaries acute to attenuate; ligules 10-15 mm long.................................................................C. godfreyi

8 Stems erect; leaves linear-elliptic; inflorescence open flat-topped corymbose; involucres 6-9 mm long; phyllaries obtuse; ligules 6-8 mm long ..................................................................................................................C. scabrella

{Add lanuginosa & latisquamea under 2b}
**Chrysopsis cruiseana** Dress. Cp (AL, FL): coastal sand dunes. October-December. FL Panhandle and s. AL. [= Chrysopsis gossypina (Michaux) Elliott ssp. cruiseana (Dress) Semple – FNA, K, WH, Z] [add synonymy]

**Chrysopsis godfreyi** Semple. Cp (AL, FL): coastal sand dunes. November-December. FL Panhandle and s. AL. Plants with densely stipitate-glandular, non-woolly upper stem leaves have been treated as forma viridis (Semple 1981). [= FNA, K, WH, Z] [add synonymy]

**Chrysopsis hyssopifolia** Nuttall. Cp (FL): dry sands; uncommon. October-December. N. FL peninsula west to FL Panhandle, s. AL, s. MS, and se. LA. [= SE = Chrysopsis gossypina (Michaux) Elliott ssp. hyssopifolia (Nuttall) Semple – FNA, K, WH, Z; > Chrysopsis gigantea Small – S; > Heterotheca hyssopifolia (Nuttall) Harms – Y]

**Chrysopsis mariana** (Linnaeus) Elliott. Mt (GA, NC, SC, VA): dry forests and woodlands, roadsides, other dry habitats; common. Late June-October. Se. NY west to se. OH, e. KY, w. TN, south to c. peninsular FL and se. TX. [= C, FNA, G, K, S, SE, W, WH, Z; = Heterotheca mariana (Linnaeus) Shinners – RAB; Y; > Chrysopsis mariana var. mariana – F; > C. mariana var. macradenia Fernald – F]

**Chrysopsis trichophylla** (Nuttall) Elliott. Cp (GA?, NC, SC): sandhills, sandy roadsides, coastal dunes; rare (NC Watch List). The taxon treated by many authors as C. trichophylla was reduced to a form by Semple (1981), as C. gossypina ssp. gossypina f. trichophylla (Nuttall) Semple. He suggests, though, that varietal status may be warranted. Plants in SC previously identified as C. cruiseana are referable to C. trichophylla. [= SE = Heterotheca trichophylla (Nuttall) Shinners – RAB; < Chrysopsis gossypina ssp. gossypina – FNA, K, Z; < C. gossypina – C, G; > C. trichophylla – S; < C. arenicola Alexander – S; < C. pilosa – S, misapplied; < Heterotheca gossypina (Michaux) Shinners – Y]

**Chrysopsis lanuginosa** Small, Lynn Haven Goldenaster. Cp (FL): dry pinelands; rare. Endemic to FL Panhandle. [= FNA, K, WH, Z; < Chrysopsis scabrella Torrey & A. Gray – SE; not yet keyed; synonymy incomplete]

**Chrysopsis latisquamea** Pollard. Cp (FL): sandhills; uncommon. Ne. FL south to c. peninsular FL. [= FNA, K, SE, WH; = Heterotheca latisquamea (Pollard) V.L. Harms] [not yet keyed; synonymy incomplete]

**Chrysopsis linearifolia** Semple. Cp (FL): scrub, sandhills; uncommon. Endemic to FL Panhandle. [= Chrysopsis linearifolia ssp. linearifolia – FNA, K, WH, Z] [not yet keyed; synonymy incomplete]

**Chichorium Linnaeus 1753** (Chicory)

**Cirsium P. Miller 1754** (Thistle)

A genus of about 250 species, herbs, north temperate. References: Keil in FNA (2006a); Cronquist (1980)=SE. Key adapted in part from SE.

1 Plant colonial from creeping rhizomes; heads 13-20 (-25) mm high; phyllaries all lacking spine tips, or the outermost tipped with spines < 1 mm long; plant perennial; [alien weeds, generally in disturbed habitats] .............................................................. C. arvense

1 Plant not colonial; heads 25-50 mm high (as small as 15-25 mm in C. carolinianum, C. mutillii, C. muticum, and C. virginianum); phyllaries mostly spine-tipped, with at least some of the spines > 1 mm long (except sometimes mostly or entirely spine free in C. muticum); plant biennial (to weakly perennial); [native (except C. vulgare), in natural or some species also in disturbed habitats]

2 Leaves decurrent onto the stem below, the decency extending as a wing at least several cm down the stem, and often to the leaf below; leaves scabrous-hispid above; phyllaries lacking a glutinous dorsal ridge; [alien weed] .............................................................. C. vulgare

2 Leaves not decurrent as a conspicuous wing, or the decency extending < 1 cm (sometimes more decurrent in C. lecontei); leaves not scabrous-hispid above; [native, sometimes in disturbed habitats]

3 Phyllaries lacking spine tips (the outermost sometimes with a weak spine-tip to 0.5 mm long); leaves deeply lobed, to 55 cm long and 20 cm wide .............................................................. C. muticum

3 Phyllaries (at least the outer and middle) with well-developed spine-tips > 1 mm long; leaves lobed or merely toothed, generally < 30 cm long and < 10 cm wide (except in C. altissimus).
4 Heads immediately subtended by several spiny-toothed leaves (appearing as a leafy involucre); flowers yellow, white, or purple.
5 Involucres more-or-less densely tomentose; stems densely tomentose; [of the Coastal Plain and Piedmont].............................................. ................. ................................................................................................................................. C. horridulum var. horridulum
6 Involucres glabrous; stems glabrous or sparsely tomentose; [of the Coastal Plain].............................................................. C. horridulum var. megacanthum
7 Leaves spinescent to deeply pinnatifid; main spines mostly 5-10 mm long; [widespread in the Coastal Plain] .............. C. horridulum var. vittatum
8 Heads pendunculate (rarely with 1 or 2 reduced leaves below); flowers pink, purple, lavender, or white.
9 Lower surface of the leaves densely white-tomentose beneath; persistent and entirely obscuring the green surface.
10 Heads 15-25 mm high; plants 4-15 dm tall; larger leaves < 5 cm wide.
11 Cauline leaves mostly 10-30; plants flowering April-June; [of dry soils of the Piedmont] ................................................. C. carolinianum
12 Cauline leaves mostly 10-30; plants flowering August-October; [of moist to dry soils of the Coastal Plain (and rarely the lower Piedmont in association with other Coastal Plain species, such as Pinus palustris)] ................. C. virginianum
13 Plants generally with well-developed, persistent basal leaves; cauline leaves with internodes usually > 2 cm; [of various habitats, mostly inland from the Coastal Plain].[.......................... C. pumilum
14 Plants lacking well-developed basal leaves; cauline leaves with internodes mostly 0.5-2 cm long; [of dry pinelands of the Coastal Plain].[.......................... C. repandum

Cirsium altissimum (Linnaeus) Hill, Tall Thistle. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, GA): pastures, woodlands, thickets; uncommon (rare in DE, FL, and VA). September-November. MA west to ND, south to Panhandle FL (Jackson County) and TX. [= C, F, FNA, G, K, S, SE, W, WH; = Carduus altissimus Linnaeus – RAB]
* Cirsium arvense (Linnaeus) Scopoli, Canada Thistle, Field Thistle. Mt (NC, VA, WV), Pd (DE, Cp (DE): pastures, disturbed areas; common (uncommon in NC and VA), native of Europe. July-November. Two varieties are often recognized: var. arvense, with leaves shallowly undulate-lobe and with only a few fine marginal prickles, and var. horridum, with leaves strongly simulate-pinnatifid and with numerous well-developed marginal prickles. [= FNA, K, S, W; = Carduus arvensis (Linnaeus) Robson – RAB; > C. arvense var. arvense – C, G, SE; > Cirsium arvense var. horridum Wimmer & Gräbner – C, G, SE; > Cirsium arvense var. mite Wimmer & Gräbner – F; > Cirsium arvense var. arvense – F, misapplied; = Breea arvense (Linnaeus) Lessing]
Cirsium carolinianum (Walter) Fernald & Schubert, Carolina Thistle, Spring Thistle. Pd (GA, NC, SC, VA), Mt (GA): prairies, open woodlands over mafic, ultramafic, or calcareous rocks; rare. April-June (-July). N. VA west to S. OH and MO, south to w. SC, n. GA, AL, and TX. In our area, C. carolinianum seems to be restricted to prairies and woodlands (or maintained powerline or road rights-of-way) over circumneutral rocks and soils, in situations which were oak savannas or even prairies prior to fire suppression. [= C, F, FNA, G, K, S, SE, W; = Carduus carolinianus Walter – RAB; > Cirsium flavicium Small – S; > Cirsium virginianum – S, misapplied]
Cirsium discolor (Muhlenberg ex Willdenow) Sprengel, Field Thistle. Mt (NC, SC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, VA): pastures, woodlands, thickets; common. August-November. QC west to MB, south to NC, MS, LA, and KS. [= C, F, FNA, G, K, S, SE, W; = Carduus discolor (Muhlenberg ex Willdenow) Nutall – RAB]
Cirsium horridulum Michaux var. horridulum, Common Yellow Thistle. Cp (DE, FL?, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, woodlands, pine savannas; common (rare in DE and VA Piedmont, rare in Mountain). Late south to FL, west to TX, mostly on the Coastal Plain and adjacent provinces; also in Mexico. [= C, K, SE; = Carduus spinosissimus Walter – RAB; < Cirsium horridulum – F, G, WH; < Cirsium horridulum complex – GW; = Carduus horridulum – S]
Cirsium horridulum Michaux var. megacanthum (Nutall) D.J. Keil, Bigspine Thistle. Cp (AL, FL): moist ground; uncommon. AL and Panhandle FL west to TX and OK. [= FNA; < Cirsium horridulum complex – GW; > Cirsium horridulum var. vittatum – K, SE; > Cirsium vittatum – S; < Cirsium horridulum complex – WH]
Cirsium horridulum Michaux var. vittatum (Small) R.W. Long, Southern Yellow Thistle. Cp (FL, GA?, NC, SC): wet pine savannas; uncommon. May-July. Se. NC south to s. peninsular FL and Panhandle FL. [= Carduus smallii (Britton) Ashles – RAB; < Cirsium horridulum complex – GW; > Cirsium horridulum var. vittatum – K, SE; > Cirsium smallii Britton – S; > Cirsium vittatum Small – S; < Cirsium horridulum – WH]
Cirsium muticum Michaux, Swamp Thistle. Cp (DE, FL, NC, SC, VA), Mt (GA, NC, VA, WV), Pd (DE, NC, VA): swamps, wet thickets, woodlands, seepage slopes, wet prairies, meadows; uncommon (rare in DE, FL, and GA, VA Piedmont and Coastal Plain). August-November. NL (Newfoundland) west to SK, south to DE, NC, TN, and MO, and less commonly south to FL, AL (Diamond & Woods 2009), and TX. [= C, FNA, G, GW, K, S, SE, W, WH; = Carduus muticus (Michaux) Persoon – RAB; > Cirsium muticum var. muticum – F]
**ASTERACEAE**

*Cirsium pumilum* (Nuttall) Sprengel, Pasture Thistle. Pd (DE, NC, VA), Cp (DE, VA), Mt (VA, WV): pastures, thickets, and woodlands, perhaps especially over mafic rocks; uncommon (rare in Coastal Plain south of DE). Late May-July. S. ME west to w. NY, south to DE, and w. NC. [= C, F, G, K, SE; = Carduus pumilus Nuttall – RAB; = Cirsium pumilum var. pumilum – FNA; = Carduus odoratum (Muhlenberg ex W. Bart.) Petrak – S]

*Cirsium repandum* Michaux, Sandhill Thistle. Cp (GA, NC, SC, VA): sandhills, other dry sandy habitats; common (rare in VA). May-July. Se. VA south to e. GA, nearly endemic to the Carolinas. Similar in distribution to *Vaccinium crassifolium*, *Carpephorus bellidifolius*, and *Baptisia cinerea*, which are all locally abundant endemic indicators of Carolina pinelands. [= C, FNA, G, K, S, SE; = Carduus repandum (Michaux) Persoon – RAB]

*Cladanthus Cassini 1816*

*Conoclinium* A.P. de Candolle 1836 (Mistflower)

*Conoclinium coelestinum* (Linnaeus) A.P. de Candolle, Mistflower, Ageratum. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA, WV): moist to wet disturbed areas, especially ditches; common (uncommon in DE Piedmont, native in Europe. Late July-October. NJ west to IL, c. MO, se. KS, and OK, south to s. FL and c. TX; also in Cuba, and scattered further north (as in NY, n. OH, and n. IN) probably as escapes from cultivation. See Wooten & Clewell (1971) for further discussion of this species. [= FNA, K, WH; = Eupatorium coelestinum Linnaeus – RAB, C, F, G, SE, W, WV]

*Conyza* Lessing 1832 (Horseweed)

A genus of about 60 species, herbs, shrubs, and trees, of temperate, subtropical, and tropical regions. Recent molecular studies have indicated the likely polyphyly of *Conyza* and its close relationship with *Erigeron*; the ultimate circumscription of these genera is in doubt (Nesom 2000b, Noyes 2000). References: Strother in FNA (2006b); Cronquist (1980)=SE; Nesom (2000b). Key based in part on SE.

1 Plants diffusely branched from the base and throughout; plants 1-2.5 (-3) dm tall .......................... *C. ramosissima*

2 Plants with a well-developed central axis, sparingly branched (unless mowed or otherwise injured); plants 1-15 dm tall.

3 Involucre 4-6 mm high, densely pubescent; pistillate flowers (50-) 70-200 or more per head .................... *C. bonariensis*

4 Involucre 3-4 mm high, glabrous or very sparingly pubescent; pistillate flowers mostly 25-45 per head.

5 Stem coarsely spreading-hirsute; leaves ciliate, the larger generally with a few to many coarse teeth; phyllaries green-tipped ................................................................. *C. canadensis var. canadensis*

6 Stem glabrous or with widely scattered, appressed hairs; leaves with a few cilia toward the base, generally entire; phyllaries purple-tipped .................................................................................................................................................................................. *C. canadensis var. pusilla*

* Conyza floribunda* Kunth. Reported as introduced in GA, AL, and MS by Kartesz (1999), probably on the basis of confusion with *C. bonariensis*. [= FNA, K] [rejected; not keyed]

**Conyza ramosissima** Cronquist. Weedy situations. Oh west to MN, south to KY, ec. TN (Chester, Wofford, & Kral 1997), ne. AL, LA, and TX. [= C, FNA, G, K, SE; = *Erigeron divaricatus* Michaux – F; = *Leptilon divaricatum* (Michaux) Rafinesque – S]

**Coreopsis** Linnaeus 1753 (Coreopsis, Tickseed)

[contributed by Alan S. Weakley and Bruce A. Sorrie]

A genus of about 50 species, herbs, of America. Recent molecular studies suggest that the relationship between *Bidens* and *Coreopsis* (as traditionally circumscribed) is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford & Mort 2005). References: Strother in FNA (2006c); Smith (1976)=Z; Sherff & Alexander (1955)=Y; Cronquist (1980)=SE. Key adapted from Y and Z.

1 Disk flowers with 4 corolla lobes and 4 anthers; ray flowers usually apically 3-lobed.
2 Leaves pinnately or bipinnately lobed into linear segments or narrowly lanceolate segments; [section *Calliopsis*] .......................................................... ..........................................................
3 All of the major cauline leaves opposite (except in *C. linifolius* the lowermost few leaves may be alternate).
4 Ray flowers pink (white); plant rhizomatous .......................................................................................................................... *C. rosea*
5 Ray flowers yellow; plant fibrous-rooted.
6 Ray flowers yellow; leaves with an expanded blade.
7 Outer phyllaries deltoid and very short, less than 0.3× as long as the inner phyllaries; flowering late September-January; [endemic to FL] .......................................................................................................................... *C. floridana*
8 Basal/lower leaves present at anthesis; leaves rapidly reduced upwards such that mid-cauline leaves are narrow or slender; achene awns various; [wet savannas, seepage slopes, pitcher-plant bogs, streamhead ecotones, pocosin ecotones, collectively widespread].
10 Leaves without auricles; achene wing narrow, < ½ the width of the achene body; achene awns averaging 1.5 mm long; leaf texture thick and leathery; flowering mid August-early November; [se. NC south to c. FL and west to s. MS; also rarely inland in GA, NC, SC, off the Coastal Plain] ............................................................................. *C. gladiata*
11 All of the leaves simple or the plant with a mixture of simple leaves and leaves with 1-2 (-4) basal auricles or leaflets, these distinctly smaller than the terminal lobe or leaflet.
12 Leaves all simple, 4-12 cm wide, the margins coarsely serrate (some of the lower leaves sometimes pinnately lacerate basally); [section *Silphidium*] .......................................................... ..........................................................
13 Stems with 1-5 (-8) nodes between the first node > 1 cm above the basal leaves and the first head.
14 Plants spreading by elongate stolons; leaf blades (or terminal leaflets) 1-2.2× as long as wide .................. *C. auriculata*
15 Leaf blades (or terminal leaflets) more or less broadly elliptical, ca. 1.5-4 cm wide, acute; stem (and often also the leaves) rather densely hairy (to glabrate). .................................. *C. pubescens* var. *pubescens*
16 Leaf blades (or terminal leaflets) narrowly elliptical to oblanceolate, ca. 0.6-2 cm wide, acuminate; stem and leaves glabrous ....... *C. pubescens* var. *robusa*

**Coreopsis** Linnaeus 1753 (Coreopsis, Tickseed)

[contributed by Alan S. Weakley and Bruce A. Sorrie]

A genus of about 50 species, herbs, of America. Recent molecular studies suggest that the relationship between *Bidens* and *Coreopsis* (as traditionally circumscribed) is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford & Mort 2005). **Coreopsis** Linnaeus 1753 (Coreopsis, Tickseed)

[contributed by Alan S. Weakley and Bruce A. Sorrie]

A genus of about 50 species, herbs, of America. Recent molecular studies suggest that the relationship between *Bidens* and *Coreopsis* (as traditionally circumscribed) is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford & Mort 2005). References: Strother in FNA (2006c); Smith (1976)=Z; Sherff & Alexander (1955)=Y; Cronquist (1980)=SE. Key adapted from Y and Z.

1 Disk flowers with 4 corolla lobes and 4 anthers; ray flowers usually apically 3-lobed.
2 Leaves pinnately or bipinnately lobed into linear segments or narrowly lanceolate segments; [section *Calliopsis*] .......................................................... ..........................................................
3 All of the major cauline leaves opposite (except in *C. linifolius* the lowermost few leaves may be alternate).
4 Ray flowers pink (white); plant rhizomatous .......................................................................................................................... *C. rosea*
5 Ray flowers yellow; plant fibrous-rooted.
6 Ray flowers yellow; leaves with an expanded blade.
7 Outer phyllaries deltoid and very short, less than 0.3× as long as the inner phyllaries; flowering late September-January; [endemic to FL] .......................................................................................................................... *C. floridana*
8 Basal/lower leaves present at anthesis; leaves rapidly reduced upwards such that mid-cauline leaves are narrow or slender; achene awns various; [wet savannas, seepage slopes, pitcher-plant bogs, streamhead ecotones, pocosin ecotones, collectively widespread].
10 Leaves without auricles; achene wing narrow, < ½ the width of the achene body; achene awns averaging 1.5 mm long; leaf texture thick and leathery; flowering mid August-early November; [se. NC south to c. FL and west to s. MS; also rarely inland in GA, NC, SC, off the Coastal Plain] ............................................................................. *C. gladiata*
11 All of the leaves simple or the plant with a mixture of simple leaves and leaves with 1-2 (-4) basal auricles or leaflets, these distinctly smaller than the terminal lobe or leaflet.
12 Leaves all simple, 4-12 cm wide, the margins coarsely serrate (some of the lower leaves sometimes pinnately lacerate basally); [section *Silphidium*] .......................................................... ..........................................................
13 Stems with 1-5 (-8) nodes between the first node > 1 cm above the basal leaves and the first head.
14 Plants spreading by elongate stolons; leaf blades (or terminal leaflets) 1-2.2× as long as wide .................. *C. auriculata*
15 Leaf blades (or terminal leaflets) more or less broadly elliptical, ca. 1.5-4 cm wide, acute; stem (and often also the leaves) rather densely hairy (to glabrate). .................................. *C. pubescens* var. *pubescens*
16 Leaf blades (or terminal leaflets) narrowly elliptical to oblanceolate, ca. 0.6-2 cm wide, acuminate; stem and leaves glabrous ....... *C. pubescens* var. *robusa*
11 Most or all of the leaves deeply lobed or dissected into distinct leaflets or divisions, the leaflets or divisions 3-20 or more, if only 3, then the lateral leaflets nearly or fully as large and well-developed as the terminal.

16 Leaves sessile or with a short subpetiolar base < 2 mm long, the initial division of the leaves palmate into 3 leaflets (these sometimes further divided), giving the 2 opposite leaves the superficial appearance of a whorl of 6 leaves; [section Gyrophyllum].

17 Leaves palmately compound, the leaflets simple to lobed or pinnatifid, the total number of leaflets or divisions 3-5,2-5.5, the middle leaflet of median leaves 0.5-7 mm wide.

19 Leaflets usually lobed (rarely simple), the total number of leaflets or divisions 3-5,11 (-15) per leaf, the segments of median leaves 1.5-7 (-9) mm wide .......................................................... C. delphinifolia

19 Leaflets pinnatifid, the total number of leaflets or divisions 11-25 or more per leaf, the segments of median leaves 0.2-1.2 mm wide .......................................................... C. verticillata

16 Leaves, at least the lower, distinctly petioled on petioles 5-50 mm or more long.

20 Ray flowers not toothed terminally (or rarely with a few with inconspicuous and irregular teeth); mid-cauline leaves palmately 3-foliolate, the terminal leaflet sometimes again 3-5-foliolate (sometimes giving an appearance of a pinnately 5-7-foliolate leaf), the leaflets 6-35 mm wide, 3-15× as long as wide; [section Gyrophyllum] ................................................. C. tridentis

20 Ray flowers apically with 2-4 5-10 teeth; mid-cauline leaves pinnately 5-11-foliolate, the leaflets either 3-15 mm wide and about 1-3× as long as wide, or 0.5-2 mm wide and > 20× as long as wide; [section Coreopsis].

21 Disk flowers reddish; ray flowers usually with a basal red mark; leaflets of mid-cauline leaves 3-15 mm wide and about 1-3× as long as wide .......................................................... C. baicalis

21 Disk flowers yellow; ray flowers yellow; leaflets of mid-cauline leaves 0.5-6 (-10) mm wide and > 10× as long as wide.

22 Achenes wings fimbriate; [of granitic outcrops of the Piedmont of GA and AL] ................................................. C. grandiflora var. saxicola

22 Achenes wings entire; [collectively more widespread].

23 Divisions of the midstem and upper cauleine leaves with 1-3 divisions; plants reclining; flowering late June-July; [of dolomite glades in c. AL] .......................................................... [C. grandi flora var. inclinata

23 Divisions of the midstem and upper cauleine leaves with > 5 divisions; plants erect; flowering May-late June; [of granite outcrops and disturbed areas].

24 Larger divisions of midstem and upper leaves 2-6 (-10) mm wide .......................................................... C. grandiflora var. grandiflora

24 Larger divisions of midstem and upper leaves 0.5-1.5 mm wide .......................................................... C. grandiflora var. harveyana

* Coreopsis baicalis (A. Dietrich) Blake, Texas Coreopsis. Cp (FL, GA, NC, SC), Pd (GA): sandy roadsides and fields; common (uncommon in FL), native of farther west. May-July. Probably native only to e. TX, now distributed across the Coastal Plain from TX east to FL and north to NC. [= RAB, C, F, FNA, G, K, S, SE, WH, Z; > C. baicalis var. baicalis – Y]

Coreopsis delphinifolia Lamarc, Larkspruce Coreopsis. Cp (GA, SC, VA), Pd (GA, NC, SC), Mt (GA): dry woodlands; uncommon (rare north of GA). May-July. The species ranges from e. VA and s. NC south to c. GA, and se. TN (Polk County) (Chester, Wofford, & Kral 1997), and reputedly AL. Smith (1976) indicates that the species is an allopolyploid derivative (at 4x, 6x, and 8x) of < C. major, C. triperis, and C. verticillata. Its range extends south well beyond the range of C. verticillata. [= FNA, K; < C. major var. stellata – RAB; = C. delphinifolia – F, G, S, SE (an orthographically variant); > C. delphinifolia var. delphinifolia – Y; > C. delphinifolia var. chloioea Sheff – Y; > C. major Walter var. linearis Small – Y; = C. <delphinifolia – Z>

Coreopsis falcata Boynton, Pool Coreopsis. Cp (GA, NC, SC, VA), Mt (SC): peat bogs, very wet savannas, ditches and borrow pits in savannas; common (rare in VA). Early-May-late July (rarely later, perhaps in response to growing season fire). The species is endemic to the Coastal Plain of se. VA (City of Chesapeake), e. NC, e. SC, and e. GA; disjunct in Oconee County, SC. First reported for VA by Wieboldt et al. (1998). C. falcata should not be included (as in Cronquist in C and SE) in C. gladiata; the two species are distinctive in ecological preferences, morphology, phenology, and distribution. [= RAB, GW, K, S, Y, Z; < C. gladiata var. gladiata – C, SE; < C. gladiata – FNA, WH]

Coreopsis gladiata Walter, Swamp Coreopsis. Cp (FL, GA, NC, SC), Mt (GA, NC, SC): swamp forests; rare (SC Rare). Mid-August-early November. Sc. NC south to c. FL and west to s. MS; scattered inland as a disjunct in montane NC, SC, and GA. See C. helianthoides and C. linifolia for further discussion of the taxonomy of this group of species. [= RAB, S, Z; < C. gladiata var. gladiata – C, G, SE (also see C. falcata); < C. gladiata – FNA, GW, K, WH (also see C. helianthoides); > C. gladiata – Y; > C. longifolia var. gladiata – Y; > C. longifolia Small var. longifolia – Y; > C. longifolia Small var. godfreyi Sheff – Y]

Coreopsis grandiflora Hogg ex Sweet var. grandiflora, Large-flowered Coreopsis. Pd (GA, SC): in thin soils of rock outcrops, especially granitic flatrocks; rare. Late May-late June. Var. grandiflora ranges from c. GA and w. SC west to e. TX and e. OK, very scattered in distribution; it differs from var. harveyana in having the leaf divisions 2-6 mm wide (vs. 0.5-2 mm wide). [= F, K, Z; < C. grandiflora – RAB, FNA, G, S, W; < C. grandiflora var. grandiflora – C, SE (also see var. harveyana); > C. grandiflora var. grandiflora – Y; > C. grandiflora var. pilosa Sheff – Y]

* Coreopsis grandiflora Hogg ex Sweet var. harveyana (A. Gray) Sherff, Large-flowered Coreopsis. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC, VA, WV): disturbed areas; rare, native of farther west. Late May-late June. As treated by Smith (1976), the species consists of 4 varieties. Var. harveyana is the most abundant variety, probably originally endemic to AR, n.
the tetraploid could be an allotetraploid (though likely an autotetraploid), and the allopatric ranges of the two races, specific
the existence of morphologic characters, the failure of Smith's attempted hybridizations of the two "races," his speculation that
nomenclatural recognition." Fernald, however, named
\[ \texttt{C. linifolia} \texttt{recognition is plausible. Further study is needed. Cronquist (in C, G, SE) does not recognize} \]
this taxon and its relatives remains unclear. Smith (1976) interpreted
the leaf), with small dark dots when backlit, and very thick (ca. 1 mm) and stiff in texture. The proper taxonomic treatment of

LA, ne. TX, OK, e. KS, and s. and c. MO, but now scattered eastward to IN, NC, and SC. Var. \texttt{longipes} (Hooker) Torrey & Gray
is endemic to e. TX. See Crawford & Smith (1984) for additional discussion of the varieties. [= F, K, Y, Z; \(< \texttt{C. grandiflora} = \texttt{RAB, \texttt{FNA, G, S, W, WH}; \lt \texttt{C. grandiflora var. grandiflora} = \texttt{C, SE,}} \]
Coreopsis grandiflora Hogg ex Sweet var. \texttt{saxicola (Alexander) E.B. Smith, Stone Mountain Coreopsis. Pd (GA): granitic
outcrops; uncommon. As interpreted by Smith (1976) and Cronquist (1980), this variety is endemic to granite outcrops in c. GA
and ec. AL and to sandstone outcrops in nc. AR; the AR plants, differing in morphology, phenology, karyotype, and distribution,
may well warrant separate status. [= K, SE, Z; \(< \texttt{C. grandiflora} = \texttt{Hogg ex Sweet – FNA}; \lt \texttt{C. saxicola Alexander = S}; \gt \texttt{C. saxicola var. saxicola – Y}; \gt \texttt{C. saxicola var. duncanii Sherff – Y} \]
Coreopsis helianoides Beadle, Beadle's Coreopsis. Cp (GA, NC, SC), Mt (NC), Pd (GA): swamp forests, swamp edges, and
bogs; rare. September-October. Se. NC south to c. and w. FL and west to s. MS, with a disjunct occurrence in sw. NC. The
validity of this taxon is controversial. Smith (1976) includes it in \texttt{C. gladiata}, considering it merely a pubescent form. Cronquist
(in SE) regards it as distinct at the species level, despite his serious over-lumping of all its close relatives into a single species
with two varieties: \texttt{C. gladiata var. gladiata} (including \texttt{C. falcata} and \texttt{C. gladiata}), and \texttt{var. linifolia} (including \texttt{C. oniscicarpa}
and \texttt{C. linifolia}), \([= \texttt{RAB, S, SE, Y, Z}; \lt \texttt{H. gladiata} = \texttt{FNA}; \lt \texttt{C. gladiata = Aiton – S} \]
Coreopsis integrifolia Poirét, Chipola Dye-flower. Cp (GA, SC): banks and floodplains of small blackwater streams
(especially over limestone), edges of swamp forests bordering longleaf pinelands or bordering brackish marshes; rare (GA
Special Concern). Mid August-early November. Se. SC south to FL Panhandle, apparently uncommon throughout its range. It
is related to \texttt{C. helianoides} and \texttt{C. linifolia}; the leaves are cauline and opposite, the petioles are ciliate. [= \texttt{FNA, GW, K, S, SE, WH, Y, Z} \]
Coreopsis lanceolata Linnaeus, Longstalk Coreopsis. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC,
SC, VA, WV): disturbed areas; common (uncommon in DE, rare in Mountains). April-June. S. MA, MI and WI south to c.
peninsular FL, e. TX, and NM. Often spread from cultivation, its original range obscure. [= \texttt{RAB, C, FNA, K, SE, W, WH, WV, Z}; \gt \texttt{C. lanceolata var. lanceolata – Y}; \gt \texttt{C. lanceolata var. villosa} Michaux – F, G, Y; \gt \texttt{C. heterogyna Fernald – F}; \gt \texttt{C. lanceolata – S}; \gt \texttt{C. crassifolia Aiton – S} \]
Coreopsis latifolia Michaux, Broadleaf Coreopsis. Mt (GA, NC, SC): in rich, moist, cove forests and slopes at medium
elevations, primarily from 500 m in the Blue Ridge Escarpment to nearly 1500 m; rare (though often locally abundant). (July-)
August-September. A Southern Appalachian endemic: sw. NC and se. TN (Polk County) (Chester, Wofford, & Kral 1997) south
into nw. SC and ne. GA. This species is treated by Smith (1976) in a monotypic section (section Silphidium) of \texttt{Coreopsis}, and,
indeed, it does not closely resemble our other species. Smith (1976) considered it a primitive species, with its closest relatives in
Mexico, and all of his attempts to hybridize it with other southeastern \texttt{Coreopsis} failed. Flowering appears to be triggered by
canopy tree-fall light gaps. It often occurs with \texttt{Helianthus glaucophyllus}. [= \texttt{RAB, FNA, K, S, SE, W, Y, Z}; \lt \texttt{Leiodon latifolius}
(Michaux) Shuttleworth] \]
Coreopsis linifolia Nuttall, Savanna Coreopsis. Cp (FL, GA, NC, SC, VA): savannas, sandhill seeps, sandhill-pocosin
ecotones; common (rare in VA). Early July-late October. Se. VA south to ne. and Panhandle FL, west to e. TX. Basal rosettes of
this species are abundant in wet savannas and can be distinguished readily by the distinctive leaves: very long-petiolate, about
1 cm across, the pinnate venation very neat (the main lateral veins straight and parallel to the other laterals on the same side of
the leaf), with small dark dots when backlit, and very thick (ca. 1 mm) and stiff in texture. The proper taxonomic treatment of
this taxon and its relatives remains unclear. Smith (1976) interpreted \texttt{C. linifolia} to range from se. VA south and west along the
Coastal Plain to e. TX (with a few inland disjunctions) and to consist of two chromosome races, a diploid Gulf Coast race (w. FL
to se. TX) and a tetraploid Atlantic Coast race (s. GA to se. VA), "not differing sufficiently morphologically to justify
nomenclatural recognition." Fernald, however, named \texttt{C. oniscicarpa} (the tetraploid) based on morphologic characters. Given
the existence of morphologic characters, the failure of Smith's attempted hybridizations of the two "races," his speculation that
the tetraploid could be an allotetraploid (though likely an autotetraploid), and the allotropic ranges of the two races, specific
recognition is plausible. Further study is needed. Cronquist (in C, G, SE) does not recognize \texttt{C. oniscicarpa} as distinct from \texttt{C. linifolia}, and reduces \texttt{C. linifolia (sensu lato)} to a variety of \texttt{C. gladiata}, also including \texttt{C. falcata} in the typic variety of \texttt{C. gladiata}. The abundant morphologic, phenologic, and ecologic differences between \texttt{C. gladiata}, \texttt{C. linifolia}, and \texttt{C. falcata} render such an approach undesirable. [= \texttt{GW, K, W, Y, Z}; \lt \texttt{C. angustifolia Aiton = RAB, possibly misapplied}; \lt \texttt{C. gladiata var. linifolia (Nuttall) Cronquist – C, G, SE}; \lt \texttt{C. oniscicarpa Fernald var. oniscicarpa – F}; \lt \texttt{C. oniscicarpa var. simulans Fernald – F}; \lt \texttt{C. gladiata – FNA}] \]
Coreopsis major Walter var. major, Woodland Coreopsis. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV):
woodlands; common (rare in GA, NC, SC, VA). May-July. W. VA, s. OH, and KY south to SC, GA, w. FL, s. AL, and s. MS. How to treat the "\texttt{Coreopsis major complex}" (here including \texttt{C. major var. major}, \texttt{C. major var. rigida}, \texttt{C. delphinitifolia}, and \texttt{C. verticillata}) is not clear. The group apparently includes diploids and a variety of allopolyploids and autoployploids (at various
ploidy) variously derived from \texttt{C. major var. major} and \texttt{C. verticillata}. [= \texttt{RAB, C, F, G, SE, W, Y}; \lt \texttt{C. major – FNA, K, S, WH, Z} \]
Coreopsis major Walter var. rigidia (Nuttall) F.E.Boynton, Stirrleaf Coreopsis. Mt (GA, NC, SC, WV), Pd (GA, NC, SC),
Cp (GA, NC, SC), \[\texttt{YA}; \] dry woodlands and forests; common (rare in WV). June-August. VA, WV, and KY south to w. FL, s.
AL, s. MS, and se. LA. The recognition of varieties is problematic and controversial. [= \texttt{C, SE, Y}; \lt \texttt{C. major var. stellata (Nuttall)
B.L. Robinson – RAB, WV}; \lt \texttt{C. major var. stellata – F, G, Y}; \lt \texttt{C. major var. rigidia – F, Y}; \lt \texttt{C. major – FNA, K, S, WH, Z} \]
Coreopsis nudata Nuttall. Cp (FL, GA): seasonally flooded pineland depressions, either herbaceous-dominated or under a
canopy of \texttt{Taxodium ascendens}; uncommon. E. GA (in close proximity to SC) south to ne. FL and Panhandle FL, west to e. LA.
[= \texttt{FNA, GW, K, S, SE, WH, Y, Z} \]
Coreopsis pubescens Elliott var. pubescens, Common Hairy Coreopsis. Mt (NC, VA, WV), Pd (GA, NC), Cp (NC):
forests, woodlands, and rock outcrops; common, rare in Piedmont and Coastal Plain (rare in VA and WV). July-September.
The species as a whole is largely centered in the Southern Appalachians and Ozarks-Ouachitas, with scattered outlying occurrences;

ASTERACEAE
895
var. *pubescens* has essentially the range of the species, from s. VA, s. KY, s. IL, and s. MO south to nw. FL, MS, and LA. Var. *robusta*, of the Southern Appalachians, is discussed below. [= F, GW, K, Y, Z, < *C. pubescens* – RAB, C, FNA, G, S, SE, W, WH, WV]  

**Coreopsis rosea** Nuttall. Cp (DE, GA, SC): upland depression ponds in the Inner Coastal Plain, drawdown zones on banks of blackwater rivers in the Outer Coastal Plain; rare. July-September. Coastal Plain of s. NS, MA, RI, NY (Long Island), NJ, DE, MD, e. SC, and e. GA, where it occurs on shores with fluctuating water levels, primarily on Coastal Plain pond shores, but also on river banks. It occurs in Horry County, SC, in the drawdown zone on the banks of the Waccamaw River; it should be sought in NC. It is immediately distinguishable from all our species by its pink to white ray flowers; another pink-rayed species, *C. nudata* Nuttall, ranges in the Coastal Plain from GA west to e. LA and has linear, terete, "juncoid" leaves. [= FNA, GW, K, S, SE, Y, Z]  

**Coreopsis species 1.** Cp (NC): calcareously influenced acid savannas; rare. September-October. Known from a single site on the Onslow-Pender county line, where growing with *Thalictrum cooleyi*, *Allium species 1*, and *Scleria species 1*.  

**Coreopsis tripteris** Linnaeus, Tall Coreopsis. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, VA): rich, moist woodlands and woodland borders, primarily over calcareous or mafic rocks or on nutrient-rich alluvium; common (uncommon in FL, GA, NC, SC, and VA). July-early September. MA, s. ON, and WI south to Panhandle FL and TX. [= RAB, C, FNA, G, KW, K, S, SE, W, WH, WV, Z; > *C. tripteris var. deumii* Standley – F; > *C. tripteris var. smithii* Sherff – F, Y; > *C. tripteris var. tripteris* – F, Y]  

**Coreopsis verticillata** Linnaeus, Threadleaf Coreopsis. Pd (NC, SC, VA), Cp (NC, SC, VA), Mt (NC, SC, VA, WV): dry sandy, rocky, or clacey woodlands and woodland borders; common (uncommon in Coastal Plain and Mountains, rare in WV Mountains). May-July. Smith (1976) indicates that the species consists of two chromosome races, a diploid, ranging in the Piedmont and Mountains from e. SC and NC north to ne. WV, and s. MD, and an allotetraploid, limited to the Coastal Plain of ne. NC and se. VA. The finely-divided leaves are attractive and the plant is cultivated horticulturally; scattered occurrences outside the ranges indicated above are escapes from cultivation. [= RAB, C, F, FNA, G, K, S, SE, W, WV, Y, Z]  

**Coreopsis grandiflora** Hogg ex Sweet var. *inclinata* J. Allison, Ketona Tickseed, Ketona Coreopsis, is endemic to dolomitic Ketona glades of c. AL (Allison & Stevens 2001). [<C. grandiflora – FNA]  

**Coreopsis leavenworthii** Torrey & Gray. AL and FL. (= FNA, K; > *C. leavenworthii* var. – Y) [not yet keyed; synonymy incomplete]  

**Coreopsis pubescens** Elliott var. *debilis* (Sherff) E.B. Smith. Cp (FL): {habitat}; rare. C. TN south through AL and ne. MS to w. FL, s. AL, s. MS, and se. LA; it has very narrow leaf blades or terminal leaflets. [= GW, K, Z; < *C. pubescens* – FNA, S, SE; > *C. cornissularis* Sherff – Y; > C. *debilis* Sherff – Y] [not yet keyed]  

**Coreopsis pulchra** F.E. Boynton, Lookout Mountain Coreopsis. Nw. GA and ne. AL. [= FNA, K, S, SE, Y, Z] [not yet keyed]  

**Coreopsis atkinsoniana** Douglas ex Lindley. Mt (GA): roadsides; rare, apparently introduced eastward in nw. GA from a distribution in the w. North America. [= K; < *C. tinctoria* – FNA, SE; > C. *atkinsoniana* Douglas ex Lindley – Y] [not yet keyed; synonymy incomplete]  

**Cosmos** Cavanilles 1791 (Cosmos)  

1 Rays pink or white; ultimate leaf segments mostly ca. 1 mm wide or less ............................................................................ *C. bipinnatus*  
1 Rays orange, yellow, or red; ultimate leaf segments mostly > 2 mm wide ............................................................................ *C. sulphureus*  

* *Cosmos bipinnatus* Cavanilles, Common Cosmos. Cp (DE, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (NC, WV): garden edges, roadsides, disturbed areas, commonly cultivated, sometimes escaped; uncommon (rare in NC, SC, VA, and WV), native of Mexico. August-October. [= RAB, C, F, FNA, G, K, S, SE, WV; > *C. bipinnatus var. bipinnatus* – Z]  

* *Cosmos sulphureus* Cavanilles, Orange Cosmos. Cp (GA, NC, SC, VA), Mt (WV): garden edges, roadsides, disturbed areas; commonly cultivated, rarely escaped, native of tropical America. August-November. [= C, F, FNA, G, K, S, SE; > *C. sulphureus var. sulphureus* – Z]  

**Cota J. Gay ex Gussone 1845 (Golden Marguerite)**  

Cypselas narrowed toward the summit, but not distinctly beaked. To C. peninsular FL and west to C. TX, inland to SE OK and S AR. [= FNA, K; NC, SC, VA]: Sandy soils of fields, roadsides, and sandhill woodlands; common (rare in VA). August-November. SE VA south to N GA (Nesom 2004d). [= FNA, K].

1 Stems hairy; leaf blades 2-3 × pinnately lobed; annual .......................................................... C. australis
1 Stems glabrous; leaf blades entire or with a few teeth or lobes; perennial .......................................................... C. coronopifolia

Cotula Linnaeus 1753 (Brassbuttons)

A genus of about 200 species, herbs, of the Northern Hemisphere, South America, and southern Africa. References: Bogler in FNA (2006a); Cronquist (1980)=SE. Key adapted from C and SE. [also see Youngia]

1 Cypselas (at least the inner in the head) with a distinct narrow beak
2 Cypselas dimorphic, the inner beaked .................................................................................. C. foetida
2 Cypselas monomorphic, all beaked.
3 Stems coarsely setose, the setae yellowish; bracts subtending the phyllaries 10-14, not reflexed. [C. setosa]
4 Stems variously pubescent, not with viscid with stipitate glands; phyllaries glabrous on both the inner and outer surfaces; cypselas 1.5-7 mm long. [.C. pulchra]
5 Inner surface of the inner phyllaries pubescent; outer surface stipitate-glandular and with 2 rows of black setae; cypselas 1.5-2.5 mm long .[C. capillaris]
6 Cypselas 4-7 mm long, yellowish- or reddish-brown, with 13-20 ribs; pappus 5-7 mm long; biennial .......... C. biennis
6 Cypselas 3-4 mm long, reddish- or purplish-brown, with 10 ribs; pappus 4-5 mm long; annual ............... C. tectorum

* Crepis tectorum Linnaeus. Mt (NC), Cp (VA): disturbed areas; rare, perhaps not established, native of Europe. June-July. [= C, F, FNA, G, K, S]

* Crepis vecaria Linnaeus ssp. taraxacifolia (Thuillier) Thellung. Mt (NC): lawns; rare, native of Mediterranean and w. Europe. Late May-July. [= RAB, C, FNA, K, SE; ? Crepis vecaria Linnaeus ssp. haensis (Boiss. ex A.P. de Candolle) P.D. Sell]

* Crepis foetida Linnaeus, Stinking Hawksbeard. [NC] native of Eurasia. April-September. [= FNA, K]

* Crepis setosa Haller f., Bristly Hawksbeard. Reported for Polk County, TN by Chester, Wofford, & Kral (1997) and from s. PA by Rhoads & Klein (1993). [= C, FNA, K] [not yet keyed]

Croptilon Rafinesque 1837 (Scratch-daisy)

**Cyclachaena Frensenius 1838**

**Diaperia Nuttall 1840 (Dwarf Cudweed)**

1 Heads ellipsoid to cylindrical, 3.5-4.5 mm high, 2-3× as high as wide; capitular leaves visible between and surpassing the heads; cypselas 0.7-0.9 mm long.

1 Heads campanulate to spherical, 2-3.3 mm high, about 1× as high as wide; capitular leaves more-or-less hidden between and surpassed by the heads; cypselas 0.9-1.2 mm long.

2 Pistillate paleas individually visible through thin, silky pubescence; heads spherical, the largest 2.5-3.3 mm high

.............................................................................................................................

[D. verna var. drummondii] 

* Diaperia verna (Rafinesque) Morefield var. verna, Cotton-rose, Bighead Pygmy-cudweed. Cp (*SC): disturbed areas, waste areas around wool-combing mill; mild, introduced from farther south and west (Nesom 2004d). May-June. MO west to MT, south to LA and TX; disjunct eastwards in the Black Belt prairies of AL and MS. [= FNA; = Filago prolifera (Nuttall ex de Candolle) Britton – Y, Z; = Evax verna Nuttall ex A.P. de Candolle – K, SE] 

**Ditrichia W. Greuter 1973**

* Ditrichia graveolens (Linnaeus) W. Greuter. Cp (SC): waste area around wool-combing mill; rare, native of Mediterranean Europe, but quite possibly introduced into SC by wool from Australia (Nesom 2004d). [= FNA, K] [add to synonymy]

* Ditrichia viscosa (Linnaeus) Greuter. Cp (FL): disturbed areas, on ballast; rare, native of Mediterranean Europe. Collected as a ballast weed in Pensacola, Escambia County, FL, and elsewhere in eastern North America, in the late 1800s; it does not appear to be naturalized. [= FNA, WH; = Cupularia viscosa (Linnaeus) Godron & Grenier – S; = Inula viscosa (Linnaeus) Ation – SE] [not keyed]

**Doellingeria Nees 1832 (Flat-topped Aster)**

A genus of about 7 species, herbs, of e. North America and e. Asia. This group of species has long been recognized as distinctive, sometimes given status as the genus Doellingeria (first by Nees in 1832), or as subgenus Doellingeria of Aster. Nesom (1993d) argues that Doellingeria should be separated from Aster, as its affinities seem to be at least as strongly to Solidago and its relatives, an assertion supported by molecular evidence (Noyes & Rieseberg 1999). References: Semple & Chmielewski in FNA (2006b); Nesom (1993d)=Z; Cronquist (1980)=SE; Nesom (2000b).

1 Disk flowers 4-14 per head; ray flowers 2-7 per head; leaves mostly 1.5-4× as long as wide; [of sandhill ecotones and streamhead pocosins of the Coastal Plain (primarily fall-line sandhills) from sc. NC southward]........................................................................................................... D. sericocarpoides

1 Disk flowers 16-40 per head; ray flowers 5-14 per head; leaves 2-6× as long as wide; [collectively widespread in our area].

2 Plants with stems solitary or several from a crown, to 11 dm tall; leaves mostly 2-4 (-5)× as long as wide............................ D. infirma

2 Plants with stems scattered from creeping rhizomes (forming clonal patches), to 20 dm tall; leaves mostly 4-6× as long as wide...................

............................................................................................................................. D. umbellata
**Doellingeria infirma** (Michaux) E. Greene, Appalachian Flat-topped White Aster. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), C (DE, FL, NC, VA): woodland borders, dry or dry-mesic woodlands, glades; common (rare in DE and FL). Late June-September. MA west to KY, south to SC, GA, Panhandle FL (Gadsden County), AL, and W. TN. [= FNA, K, WH, Z; = Aster infirma Michaux – RAB, C, G, SE, W, WH; > Doellingeria humilis – S, in part]

**Doellingeria sericocarpoides** Small, Pocosin Flat-topped Aster. C (FL, GA, NC, SC): sandhill ecotones and streamhead pocosins; uncommon. Sc. NC south to ne. FL and Panhandle FL, west to AL; also in AR, OK, and TX. [= FNA, K, S, WH, Z; = Aster sericocarpoides (Small) K. Schumann – SE; = A. umbellatus var. laevisula; A. Gray – GW; < Doellingeria humilis (Wildenow) Britton – S, in part, misapplied]

**Dracopis** Cassini 1825 (Coneflower)

**Dracopis amplexicaulis** (Vahl) Cassini. C (FL, SC*), Pd* (GA*): prairies, calcareous bottomlands, dry open areas, disturbed areas, waste areas near wool-combing mill; rare, introduced at least in part in our area. Native to prairie-like areas and calcareous bottomlands from GA (?) and AL west to KS and TX; reported for ne. GA (Jones & Coile 1988) and introduced in SC (Nesom 2004d). [= FNA, K, SE, WH; = Rudbeckia amplexicaulis Vahl – F, FNA]

**Dyssodia** Cavanilles 1802

**Echinacea** Moench 1794 (Purple Coneflower)

A genus of 4-9 species, herbs, endemic to e. and c. North America. There has been considerable medicinal use of extracts from many of the species, and collection of plants from the wild to meet the demand of the herbal trade has extirpated many populations, particularly in c. United States. Foster (1991) presents a lengthy and detailed discussion of medicinal uses of *Echinacea*, along with considerable information on the biology, conservation needs, taxonomy, and nomenclatural history of the genus. Binns, Baum, & Arnason (2002) provide no rationale for their approach of recognizing the same number of taxa as McGregor, but treating them as 4 species and 10 varieties; the entities seem to be distinct at the specific level. References: Urbatsch, Neubig, and Cox in FNA (2006c); Baskin, Snyder, & Baskin (1993)=Z; Foster (1991)=Y; Cronquist (1980)=SE; Binns, Baum, and Arnason (2002)=X; McKeown (1999); Gaddy (1991); McGregor (1968).

1 Leaves lanceolate to ovate, the larger > 5 cm wide, the stem leaves well-developed, though smaller than the basal.
2 Leaves glabrous on both sides, or scabrous above; chaffy bracts (pales) ca. 9 mm long, the awns about a fourth as long as the body of the pales and with incurved tips; rays 3.5-8 cm long, strongly drooping. ......................................................... E. laeavigata
3 Leaves pubescent or scabrous on both sides; chaffy bracts (pales) 10-13 mm long, the awns about half as long as the body of the pales and with straight tips; rays 2.5-5.5 cm long, horizontal to slightly drooping. ............................................ E. purpurea
1 Leaves lanceolate to linear, the larger < 5 cm wide, stem leaves few and poorly developed, the basal leaves predominant.
3 Rays curved upward, medium pink, 2.5-3.2 cm long; [endemic to calcareous glades in c. TN].............................. [E. tennesseensis]
4 Fresh pollen white ......................................................................................................................................................... E. pallida
4 Fresh pollen pale to bright yellow ................................................................................................................................. E. simillata

**Echinacea laeavigata** (C.L. Boynton & Beadle) S.F. Blake, Smooth Purple Coneflower. Pd (NC, VA), M (GA, SC, VA), C (SC): open woodlands and glades over mafic or calcareous rocks, such as diabase, limestone, and dolostone, rarely in oak-pine savannas of the upper Coastal Plain over circumneutral clay sediments; rare. Late May-July. The species is an eastern sibling of *E. purpurea*. In NC, this attractive, medicinal plant is now limited to a few populations in Durham, Granville, and Rockingham counties. Extensive populations occur over Elbrook Dolomite in Montgomery, VA. Populations of this species in sandy soils of the Coastal Plain of SC have been variously interpreted as native or introduced (Nelson & Kelly 1997). [= RAB, C, F, FNA, K, S, SE, W, X, Y; = E. purpurea var. laeavigata (C.L. Boynton & Beadle) Cronquist – G]
**Echinacea pallida** (Nuttall) Nuttall, Pale Purple Coneflower. Pd (GA, NC?, VA), Mt (VA), Cp (GA): roadsides; rare, perhaps introduced in part from c. US (GA Special Concern, NC Watch List). June-July. ON west to MI, WI, and NE, south to IN, LA, and TX; disjunct eastwards in TN, AL, GA, SC, NC, and VA, where probably but uncertainly native. Some at least of the eastern populations considered to be *E. pallida* are actually the closely related *E. simulata*; additional work is needed to disentangle the relative distributions of these two species in our area. [= RAB, FNA, K, Y, Z; < *E. pallida var. pallida* – C, SE; < *E. pallida* – F, G, W; = *E. pallida var. pallida* – X]

**Echinacea purpurea** (Linnaeus) Moench, Eastern Purple Coneflower. Mt (NC, VA*, WV*), Pd (NC, VA*), Cp (FL): open woodlands, roadsides, some of the occurrences persistent or spread from cultivation; rare. OH, WI, and IA south to FL and TX; introduced more broadly as in ne. United States and ON, the exact limits of the native distribution unclear. [= RAB, C, F, FNA, K, SE, W, WH, X, Y; = *E. purpurea var. purpurea* – G]

**Echinacea simulata** R.L. McGregor, Prairie Purple Coneflower. Mt (GA!, VA*?), Pd (NC!, VA*?), Cp (NC!): prairies, roadsides; rare. June-July. IN, IL, and MO south to KY and TN; some of the more eastern disjunct populations previously considered to be *E. pallida* are actually *E. simulata*; additional work is needed to disentangle the relative distributions of these two species in our area. GA native populations (Floyd Co.) are *E. simulata*. [= FNA, K, Y, Z; < *E. pallida var. pallida* – C, SE; < *E. pallida* – F, G, W; = *E. pallida* (Nuttall) Pallid var. simulata (McGregor) Binns, B.R. Baum, & Arnason – X]

**Echinops Linnaeus (Globe-thistle)**

A genus of about 120 species, herbs, of temperate and subtropical Europe, Asia, and Africa. References: Keil in FNA (2006a).

**Eclipta Linnaeus 1753**

A genus of 4 species, herbs, of temperate, subtropical, and tropical regions. References: Strother in FNA (2006c); Cronquist (1980)–SE.

**Eclipta prostrata** (Linnaeus) Linnaeus, Yerba-de-tajo. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): moist or wet disturbed areas, ditches, shores, disturbed bottomlands; common (uncommon in Mountains). June-November. MA west to WI, south to s. FL and TX, and southward into the tropics. [= C, FNA, K, WH; = *E. alba* (Linnaeus) Hasskarl – RAB, F, G, GW, SE, W, WV; = Verbesina alba Linnaeus – S]

**Elephantopus Linnaeus 1753** (Elephant's-foot)

A genus of about 12-30 species, of tropical, subtropical, and warm temperate regions. References: Strother in FNA (2006a); Jones (1982)–Z; Cronquist (1980)–SE.

**Identification notes**: The acaulescent species are easily and often confused with *Vernonia acaulis*, especially when sterile. *Vernonia* has leaves scabrous above and sparsely pilose to glabrate beneath; *Elephantopus* has leaves sparsely pilose above, densely pilose or tomentose below. *Vernonia* leaves tend to have a more acute apex, and the veins above are more strikingly differentiated in their color (white or pink) from the adjacent leaf tissue. When in flower, the presence of subtending foliaceous bracts below the compound glomerule of heads in *Elephantopus* (versus the absence of foliaceous bracts below the simple head in *Vernonia*) is diagnostic.

1 Leaves cauline, the stem with well-developed leaves over 10 cm long................................. *E. carolinianus*
2 Leaves basal, the stem scapose or with a few leaves much smaller than the basal, usually < 8 cm long.
3 Longest phyllaries 10-13 mm long; pappus 6-8 mm long; basal leaves 5.5-10.5 cm wide, usually at least some on a plant > 7 cm wide; leaves pubescent on the midrib below with spreading or reflexed hairs; [of the Coastal Plain, Piedmont, and rarely the Mountains].......................... *E. elatus*
4 Longest phyllaries 6-9 mm long; pappus 3-4.5 mm long; basal leaves 1.5-7.5 cm wide, rarely any on a plant > 7 cm wide; leaves pubescent on the midrib below with appressed or spreading hairs; [of the Coastal Plain, and rarely the lower Piedmont].
5 Phyllaries densely villous with white hairs (0.3-) 0.5-1.0 mm long, the punctate glands obscured; cypselas 3-3.5 mm long; [of e. SC southward]................................................................. *E. nudatus*
6 Phyllaries punctate-glandular, also sparsely pubescent with hairs 0.05-0.3 (-0.5) mm long; cypselas 2.5-3.0 mm long; [widespread in our area].................................................................................. *E. obtusifolius*
**ASTERACEAE**

_Elephantopus elatus_ Bertolini, Southern Elephant's-foot. Cp (FL, GA, SC): pine barrens; common (rare in GA and SC). Late August-September. E. SC south to s. FL, west to se. LA, on the Coastal Plain. [= RAB, FNA, K, S, SE, WH, Z]

_Elephantopus nudatus_ A. Gray, Coastal Plain Elephant's-foot. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC, VA): woodlands and woodland borders, usually fairly dry; common (rare in Piedmont, rare in DE). Late July-September. DE south to n. peninsular FL, west to e. TX and AR, primarily on the Coastal Plain; south into n. South America. [= RAB, C, F, FNA, G, GW, K, S, SE, WH, Z]

_Elephantopus tomentosus_ Linnaeus, Common Elephant's-foot. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): woodlands and woodland borders, usually fairly dry; common (rare in Mountains). August-November. MD south to Panhandle FL, west to e. TX, north in the interior to w. NC, KY, and south to Chiapas, Mexico. [= RAB, C, F, FNA, G, K, S, SE, WH, Z]

**Emilia** Cassini 1817 (Tasselflower)

A genus of 50-100 species, of the Old World. References: Barkley in FNA (2006b); Cronquist (1980)=SE.

1 Leaves well-distributed along the stem, with at most few and shallow lobes; corollas salmon or red-orange; involucre 1-2 (-3)× as high as wide..............................................................................................................................................................................................................E. fosbergii

1 Leaves mostly on the lower portion of the stem, the larger lyrate-pinnatifid; corollas lilac; involucre 3-4× as high as wide.................................E. sonchifolia var. sonchifolia

* _Emilia sonchifolia_ (Linnaeus) A.P. de Candolle var. sonchifolia, Lilac Tasselflower. Cp (FL, SC), Pd (GA): disturbed areas, native of the Old World tropics. The occurrence of this species in SC was first reported by Nelson & Kelly (1997); it is unclear how well established _Emilia_ is in the northern part of our area. See Anderson (2007) for FL Panhandle record. [= FNA, K; < _E. sonchifolia_ – S, SE, WH]

**Erechtites** Rafinesque 1817 (Fireweed)

A genus of about 12-15 species, American and Australian. Barkley in FNA (2006a) points out that the genus should be treated as masculine gender. References: Barkley in FNA (2006b); Cronquist (1980)=SE. Key based in part on C and FNA.

1 Denuded receptacle 5-8 mm in diameter; achenes 2-3 mm long, with 10-12 ribs............................................................................................E. hieraciifolius

1 Denuded receptacle 9-12 mm long; achenes 4-5 mm long, with 16-20 ribs............................................................................................_E. megalocarpus_

_Erechtites hieraciifolius_ (Linnaeus) Rafinesque ex de Candolle, Fireweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): in disturbed soil in nearly all habitats except the extremely xeric, present in most parts of the modern (beat-up) landscape at least as seedlings, liable to turn up at the smallest disturbance (such as small tree-fall tip-up mounds or campfires, even in large natural areas), most abundant in areas extensively disturbed or scarified by timber-harvest, bulldozing, or severe fire; common. Late July-November. NL (Newfoundland) west to SK, south to s. FL and e. TX; West Indies; tropical America. Ecologically filling something of the same role in the south as the other (unrelated) "fireweed" in the north, _Epilobium angustifolium_. The only other species in our area as adept at appearing (seemingly from nowhere) at small soil disturbances in forests are _Phytolacca americana_ and the moss _Atrichum angustatum_ (Brid.) BSG. [= _E. hieraciifolius_ var. _hieraciifolius_ – C, G, K, SE; < _E. hieraciifolius_ – RAB, GW, S, W, WV; > _E. hieraciifolius_ var. _hieraciifolius_ – F; > _E. hieraciifolius_ var. _intermedia_ Fernald – F; > _E. hieraciifolius_ var. _praedulta_ (Rafinesque) Fernald – F; = _E. hieraciifolius_ var. _hieraciifolius_ – FNA; < _E. hieraciifolius_ – WH]

_Erechtites megalocarpus_ (Fernald) Cronquist. Coastal marshes (brackish or salty) from MA to NJ and should be sought in our area, especially in VA. As the differences between this and _E. hieraciifolius_ consist of multiple, non-overlapping morphological characters, the presumption should be to treat the two as specifically distinct. [= _E. hieraciifolius_ var. _megalocarpa_ – C, G, K; = _E. megalocarpus_ Fernald – F, orthographic variant; = _E. hieraciifolius_ var. _megalocarpus_ – FNA]

**Erigeron** Linnaeus 1753 (Daisy Fleabane)

A genus of about 150 species, nearly cosmopolitan. References: Nesom in FNA (2006b); Cronquist (1980)=SE; Allison & Stevens (2001)=Z. Key adapted from those references. [also see _Conyza_]
**ASTERACEAE**

1. Stem leaves sessile; pappus of the pistillate (ray) flowers consisting of a few short, slender scales, < 1 mm long (visible at 20× magnification); annual or perennial (rarely biennial).

2. Stem leaves many, mostly toothed, the larger > 1 cm wide; pubescence of the mid-stem long and spreading………………………………………. **E. annuus**

3. Phyllary hairs flattened, 0.5-1.2 mm long; stem hairs appressed to spreading, 0.5-1.0 mm long………………… **E. strigosus** var. **septentrionalis**

4. Plants annual (rarely biennial), lacking rhizomes; [of various, often weedy, habitats]………………… **E. strigosus** var. **strigosus**

5. Plants perennial, rhizomatous; [of plants of shallow soil over calcareous rock].

6. Basal leaves obovate to narrowly obovate or spatulate, (3.2-) 3.8-15 (-21) mm wide; cauline leaves glabrous, except along the midvein and the ciliate margins; [of limestone glades and barrens of c. TN, nw. GA, and n. AL]………………… **E. strigosus** var. **calcicola**

7. Basal leaves linear-obovate, f-3.5 (-6) mm wide; cauline leaves sparsely to moderately stipitate; [of dolomite glades of c. AL (Bibb Co.)]…………………………………………………………………………………..**E. strigosus** var. **dolomitica**

1. Stem leaves relatively large and clasping, or small and sessile (in **E. vernus**); pappus of the pistillate (ray) flowers of elongate capillary bristles (sometimes also with scales); plants biennial or perennial.

6. Plants trailing or ascending, rooting at the nodes, and with stolons ………………………………………………………………..**E. procumbens**

7. Stem leaves not clasping; basal leaves fleshy; rays 25-40, white, 0.5-1.3 mm wide; [of moist to wet habitats of the Coastal Plain]………...

8. Plants erect (sometimes the shoots curved at the base but ultimately vertical).

9. Stem leaves relatively large and clasping, or small and sessile (in **E. vernus**); pappus of the pistillate (ray) flowers of elongate capillary bristles (sometimes also with scales); plants biennial or perennial.

Stem leaves clapping; basal leaves herbaceous; rays 50-400, pink, blue, purplish, or white, either 0.3-0.5 mm wide (in **E. philadelphicus** var. **philadelphicus**, **E. quercifolius**, and **E. tenuis**) or 0.8-1.2 mm wide (in **E. pulchellus** var. **pulchellus**); [of more general distribution and habitat].

8. Disk corollas 4-6 mm long; rays 50-100, 0.8-1.2 mm wide.

9. Stems and leaves glabrous ……………………………………………………………………………………………………………………………………………………………………………………..**E. pulchellus** var. **brauniae**

10. Involute 4-6 mm high; rays 150-400, white to deep pink, 5-10 mm long……………………………………… **E. philadelphicus** var. **philadelphicus**

10. Involute 2.5-4 mm high; rays 60-250, blue-lavender (rarely white to pink), 2.5-5 (-6) mm long.

11. Pappus simple; stem spreading pubeatent in the upper third only; rays 100-250………………… **E. quercifolius**

11. Pappus double, with short outer setae in addition to the long slender bristles; stem appressed pubeatent in at least the upper half; rays 60-120………………… **E. tenuis**

**Erigeron philadelphicus** Linnaeus var. **philadelphicus**, Philadelphia-daisy. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): roadides, meadows, disturbed areas; common (uncommon in FL, NC, SC, and VA Coastal Plain). April-August. NL (Newfoundland) west to BC, south to FL and TX. Var. **scutariola** Fernald, of bluffs along the James River in VA, seems to be merely an extreme form. Other varieties [var. glaber Henry and var. provancheri (Victonir & Rouss.) Boivin] may have more merit. [= FNA, K; < E. philadelphicus – Rab, C, G, GW, S, SE, W, WH, WH; > E. philadelphicus var. **philadelphicus** – F; > E. philadelphicus var. **scutariola** Fernald – F]

**Erigeron pulchellus** Michaux var. **brauniae** Fernald. Mt (WV): sandy woodlands and forests, riverbanks; uncommon. April-June. MD, WV, and s. OH south to KY. [= C, F, FNA, G, K, WV]

**Erigeron pulchellus** Michaux var. **pulchellus**, Robin's-plantain. Mt (DE, GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): moist slopes, coves, limestone bluffs, trail margins, roadbanks; common (uncommon in Coastal Plain, rare in FL). April-early June. ME west to MN, south to Panhandle FL (Jackson County), GA, and TX. In addition to the widespread var. **pulchellus**, and the Alleghenian var. **brauniae**. **E. pulchellus** has an additional local variety, var. tolsteadii Cronquist, of se. MN. [= C, FNA, G, K, SE, WV; < E. pulchellus – Rab, GW, S, WH, WH]

**Erigeron quercifolius** Lamarck, Oak-leaved Fleabane. Cp (FL, GA, NC, SC, VA): sandy roadsides, disturbed areas; common, rare in VA. April-June. Se. VA south to s. FL, west to TX, north in the interior to TN; Bahamas. [= Rab, C, F, FNA, G, K, SE, WH]

**Erigeron strigosus** Michaux ex Willdenow var. **calcicola** J. Allison, Cedar Glade Daisy Fleabane. Mt (GA): limestone glades; rare. (April-) May-October. Central basin of TN (Allison & Stevens 2001), nw. GA (GANHP) and n. AL. [= FNA, Z]

**Erigeron tenius** Torrey & A. Gray, Midwestern Fleabane. Cp (FL): disturbed areas; rare. FL Panhandle (Okaloosa County) and AL west to KS, OK, and TX. Reported for w. NC (Nesom 1980); but later discounted (Nesom in FNA 2006b). Mid March-May (sporadically later). [= FNA, K, SE, WH]

**Erigeron procumbens** (Houstoun ex Miller) Nesom, Corpus Christi Fleabane. Moist to dry coastal areas, including marsh edges. S. MS (?), LA, TX, Tamaulipas, Veracruz. [= FNA, K; < E. myriacanthus Small – S, SE]

---

**Erigeron strigosus** var. **septentrionalis** Boivin may have more merit. [FNA, K; = FNA, K; < FNA, K; < E. myriacanthus Small – S, SE]
**Eupatorion Linnaeus 1753** (Eupatorium, Thoroughwort, Dog-fennel)

A genus of about 40 species, herbs, of e. North America and Eurasia (after the exclusion of Ageratina, Chromolaena, Conoclinium, Eutrochium, Fleischmannia, and other genera). I have differed considerably from Cronquist's treatments, as for example in SE, regarding the rank at which to recognize taxonomic entities in *Eupatorium*. In the Southeastern United States, *Eupatorium is* a reticulately evolved complex, including diploids, triploids, and tetraploids; derivatives of hybridization produce sterile pollen but in some cases reproduce vigorously via agamospermous production of seeds. In some cases, these entities form separate populations from their presumed parental species, with distinctive ranges and habitats and more-or-less distinctive morphology. Cronquist treats morphologically highly distinctive entities, such as *E. pinnatifidum*, as full species, while stating that they are "not long-persistent." He treats morphologically more subtle entities as varieties of one of the two presumed parental species, such as *E. album* var. *vaseyi* ("very probably derived by hybridization of *E. album* var. *album* and *E. sessilifolium*"). Other entities, difficult to distinguish morphologically from another species, he does not recognize, as for example *E. saltuense*, included as a synonym under *E. altissimum* ("*E. saltuense* may reflect hybridization between *E. altissimum* and some other species such as *E. album*, or possibly between *E. hyssopifolium* and *E. album*").

A species concept that stresses ecological, biological, and distributional independence seems preferable. When plants of a putative hybrid occur in substantial populations, reproducing independently of one or both alleged parents, and in geographically and/or ecologically distinctive situations they should be treated as a separate species. Only field observations and studies can provide the necessary information. I have seen no evidence that *E. pinnatifidum* (though morphologically strikingly distinctive) occurs independent of its parents; thus I treat it as a hybrid (see below). *E. vaseyi* regularly occurs without one or both of its presumed parents, forms fertile achenes, occurs in large populations, and (in NC) is distributionally more limited than its presumed parents (Sullivan 1978). Biologically, it is best treated as an allopolyploid species; its treatment as a variety leads to conceptual and nomenclatural problems (reflected in the synonymy above): of which species should it be a variety? Sullivan (1978) considered that *E. saltuense* was derived from hybridization of *E. album* and *E. lecheifolium* (= *hyssopifolium*), but found it to be a triploid, growing in association with triploid (and pollen-sterile) *Conoclinium, Eutrochium, Fleischmannia* (and other genera).  I have differed considerably from Cronquist's treatments, as for example in SE, regarding the rank at which to recognize taxonomic entities in *Eupatorium*. In the Southeastern United States, *Eupatorium is* a reticulately evolved complex, including diploids, triploids, and tetraploids; derivatives of hybridization produce sterile pollen but in some cases reproduce vigorously via agamospermous production of seeds. In some cases, these entities form separate populations from their presumed parental species, with distinctive ranges and habitats and more-or-less distinctive morphology. Cronquist treats morphologically highly distinctive entities, such as *E. pinnatifidum*, as full species, while stating that they are "not long-persistent." He treats morphologically more subtle entities as varieties of one of the two presumed parental species, such as *E. album* var. *vaseyi* ("very probably derived by hybridization of *E. album* var. *album* and *E. sessilifolium*"). Other entities, difficult to distinguish morphologically from another species, he does not recognize, as for example *E. saltuense*, included as a synonym under *E. altissimum* ("*E. saltuense* may reflect hybridization between *E. altissimum* and some other species such as *E. album*, or possibly between *E. hyssopifolium* and *E. album*").

### Key A – leaves pinnatifid or pinnate into linear or capillary segments (Dog-fennel)

| 1 | Leaves generally in whorls of 3-7 (very rarely all of them opposite), most of them > 2 cm wide; involucre 6.5-9 mm high, the flowers pale pink to purple.................................................................[see Eutrochium] |
| 2 | Leaves pinnate or pinnatifid, divided into linear or capillary segments, 0-5 mm wide.................................................................Key A |
| 3 | Leaves simple. |
| 4 | Leaves long-petiolate, the petioles of larger leaves > 10 mm long. |
| 5 | Leaf blades deltate or rhombic, held vertically; [of FL]....................................................................................................................E. mikanoides |
| 5 | Leaf blades lanceolate, held horizontally; [widespread]....................................................................................................................E. serotinum |
| 4 | Leaves sessile or short-petiolate, the petioles < 9 mm long. |
| 6 | Florets (3-)5 (-7) per head.........................................................................................................................................................E. perfoliatum |
| 7 | Leaf bases fused.............................................................................................................................................................................Key B |
| 7 | Leaf bases tapering to a cuneate base............................................................................................................................................E. resinosum |

### Key B

| 1 | Stem glabrous throughout, or short-pubescent in the lower portion only; inflorescence paniculate, the panicle branches recurved, the heads secondarily arranged....................................................................................................................................................E. leptophyllum |
| 2 | Leaves bright green, glabrous, sparsely glandular-punctate, segments of the basal leaves 1-1.5 mm wide, segments of the upper leaves 0.2-0.5 mm wide ....................................................................................................................................................E. capitellifolium |
| 2 | Leaves grayish-green, pubescent, densely glandular-punctate, segments of the basal leaves 2-5 mm wide, segments of the upper leaves 1-2.5 mm wide........................................................................................................................................E. compositifolium |
1 Phyllaries acuminate to attenuate.

2 Larger leaves 0.2-1.3 cm wide; stems puberulent; involucre 3.5-7 mm high.

3 Rhizome absent to < 2 cm long; leaves usually reflexed-spreading to spreading-ascending, the larger (5-) 6-13 mm wide; leaf margins and surfaces moderately to densely strigose; involucre 5-8 mm long; pappus (3.3-) 3.9-5.0 mm long; corolla:pappus length ratio 0.63-0.89; mature achene 2.2-3.5 mm long. ......................................................... 

4 Leaves with few or no resin-glands; phyllaries glabrous, lacking resin-glands; [of the Coastal Plain of GA, Panhandle FL, AL, and MS] .......................................................... E. petalotium

5 Leaves 3-nerved from the base; leaves 4-7 cm long, 10-20 mm wide; [of DC, DE, NJ, and NY] ........................ E. album var. subvenosum

6 Leaves pubescent, the pubescence short to long; phyllaries generally attenuate (rarely acuminate); leaves (2.5-) 3-6× as long as wide; leaf apices obtuse; teeth obtuse or rounded ......................................................... E. album var. album

7 Leaf bases broadly cuneate, truncate, or subcordate, the leaves generally distinctly convex-curved near the base.

8 Leaves (2.5-) 3-6 (-7)× as long as wide; plants glabrous below the inflorescence.

9 Leaves subopposite, the larger ones 8-18 cm long, 3-6 cm wide, averaging about 3× as long as wide. ................................................................................................................. E. sessilifolium var. brittonianum

10 Leaves pinnately veined .......................................................................................................................... E. godfreyanum

11 Leaves averaging (1.5) 2-2.5× as long as wide, usually with a purple border; upper leaves and main inflorescence branches usually alternate ............................................................................................................. E. pilosum

12 Leaf base broadly rounded, cordate-clasping; leaves very densely pubescent, the pubescence often harsh; larger leaves usually 4-10 cm long; principal pair of lateral veins diverging from the midrib 2-10 mm above the base of the leaf; tooting of leaf often irregular and coarse ............................................................................................................. E. cordigerum

13 Leaves mostly 1-1.5 (-1.7)× as long as wide, tending to be obtuse (the apex usually 90º or more), the teeth generally rounded (the 2 sides of each tooth usually distinctly convex-curved, the end of the tooth therefore rounded), the principal pair of lateral veins diverging directly from the base of the midrib ......................................................... E. rotundifolium

14 Leaves broadly cuneate to broadly rounded, thin in texture, the pubescence rather soft and long (and also often sparse), the leaf blade not twisted at base, not borne in a vertical plane, up to 10 cm long and 6.5 cm wide ......... E. pubescens

15 Plants from conspicuously tuberous-thickened (ca. 1 cm in diameter) horizontal rhizomes; leaves deflexed, spreading, or ascending.

16 Leaves 15-30 mm wide, spreading or ascending. ............................................................................................................. E. anomalum

17 Leaves 2-12 mm wide, deflexed to erect-ascending.

18 Stems 3-6 (-7) dm tall, often erectly branching from near the base; involucres 3-4 mm high, the bracts with rounded apices ................................................................. E. recurvans

19 Leaves distinctly cuneate, firm in texture, the pubescence rather harsh and short, the leaf blade twisted at the base, thus borne in a vertical plane, up to 5.5 cm long and 3 cm wide ............................................................... E. scabridum

20 Plants generally simple below the middle, the axillary shoots of the lower nodes not elongating (except in response to injury of the main stem); leaves 3-12 cm long, lanceolate or linear.

21 Leaves mostly 6-40× as long as wide, the larger ones usually < 10 mm wide, ranging from 1-12 mm wide, whorled or opposite (rarely alternate above).
22 Leaves linear to narrowly lanceolate, the principal leaves 2-7 cm long, 1-5 mm wide, 10-40× as long as wide, entire. 
23 Involucre 2.5-4 mm high; leaves obtuse to acute, elliptic to elliptic-oblanceolate, the 2 main lateral veins separating from the midrib about 1 cm above the base; leaves commonly 3 per node ............... E. semiseratrum
24 Leaves 3-5 cm long, 5-13 mm wide; leaf surfaces generally glabrous; [of AL westward] .........................[E. lancifolium]
25 Leaves 5-12 cm long, 5-20 mm wide; leaf surfaces short or long puberulent; [widespread] .......................
26 Leaf surfaces glandular-punctate, densely puberulent on the surfaces and veins, the hairs fairly long and curling or twisted (as seen with at least 10× magnification); stem densely puberulent; leaves entire to serrate, the teeth varying from obscure to sharp, generally about 1 mm long (measured on the side toward the leaf apex), rarely to 3 mm long, generally forward-pointing; leaves acuminate to acute, the terminal portion not strongly attenuated, and about as likely to have teeth as the rest of the margin .......................................................... E. altissimum
27 Leaf surfaces densely glandular-punctate, sparsely puberulent (mainly on the veins), the hairs short; stem sparsely puberulent; leaves serrate to pinnatifid, the teeth often 1-5 mm long (measured on the side toward the leaf apex), often salient or divergent; leaves attenuate-acuminate, the terminal 1/3 extended and generally entire ......................E. saltuense

Eupatorium album Linnaeus var. album. White-bracted Thoroughwort. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry woodlands; common (rare in Mountains, uncommon in Piedmont). Late June-September. CT, NY, OH, and TN, south to FL and LA. Var. glandulosum is alleged to differ from var. album in having the involucres with copious dark glands (vs. glandless or nearly so). The distinction is dubious; variation seems essentially continuous in our area, with frequent intermediates, and there seems to be little correlation between morphology and habitat/range. [= FNA; < E. album – RAB, S, WH; < E. album var. album – C, K, SE, W (also see E. petaloideum); > E. album var. album – F, G, WV; > E. album var. glandulosum (Michaux) A.P. de Candolle – F, G, WV]

Eupatorium altissimum Linnaeus, Tall Thoroughwort. Pd (GA, NC, VA), Mt (GA, VA, WV), Cp (FL): woodlands, old fields, woodland borders, and openings over mafic rocks (such as diabase) or calcareous rocks (such as limestone and calcareous sandstone); common (uncommon in WV, rare south of VA, rare in Coastal Plain). Late August-October. CT, NY, QC, MN, and NE, south to Panhandle FL and TX, primarily in the midwest, especially on limestone substrates, and uncommon east of the mountains. [= RAB, F, G, S, W, WV; < E. altissimum – C, FNA, K, SE, WH (also see E. saltuense)]

Eupatorium anomalous Nash, Anomalous Eupatorium. Cp (FL, GA, NC, VA): moist savannas, moist interdune swales; rare. August-October. E. anomalous is believed to be a triploid and tetraploid, apomictic derivative of the hybrid E. mohrii × serotinum. Se. VA south to c. peninsular FL and west to s. AL. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [= FNA, GW, K, SE; < E. recurvans – RAB; < E. anomalous – S (also see E. mohrii); = E. * anomalous – WH]

* Eupatorium cannabinum Linnaeus, Hemp-agrimony. Cp, Pd (VA): disturbed areas; rare, perhaps merely a waif or garden remnant, native of Europe. July-September. The documentation for VA is an 1899 specimen from Fairfax County and a record from Westmoreland County. [= FNA, K]

Eupatorium compositifolium Walter, Coastal Dog-fennel, Yankeweeds. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): sandy disturbed areas; common. September-December. S. VA, KY, and OK south to s. FL and TX. This species, like E. capillifolium, is an excellent indicator of soil disturbance. At its northern limit, in se. VA, this species occurs on riverbanks, in the seasonally exposed drawdown zone (Fleming & Ludwig 1996). [= RAB, FNA, GW, K, S, SE, W]
Eupatorium leptophyllum A.P. de Candolle, Limesink Dog-fennel. Cp (FL, GA, NC, SC): limesink depression ponds (dolines) in the outer Coastal Plain and clay-based Carolina bays in the inner Coastal Plain; common (rare in GA, NC, SC). September-November. A Southeastern Coastal Plain endemic, ranging from SE NC south to FL and west to s. GA and s. AL; also in the Bahamas and Cuba. [= E. capillifolium var. leptophyllum (A.P. de Candolle) Ahles – RAB]

Eupatorium leucoploes (A.P. de Candolle) Torrey & Gray, Savanna Eupatorium. Cp (DE, FL, GA, NC, SC, VA), Pd (VA), Mt (VA, WV): savannas, seepage bogs, depression ponds; common; uncommon in DE and VA, rare in Piedmont and Mountains. August-October. Primarily of the Southeastern Coastal Plain, ranging from NY south to n. peninsular FL, Panhandle FL, and west to LA; disjunct in Coffee County, TN (Chester, Wofford, & Kral 1997). This species is often confused with members of the E. recurvans-mohrii-anomalum complex. The following differences are useful: E. leucoploes has phyllaries acuminate to attenuate (vs. acute to obtuse), leaves of the uppermost 2-15 nodes below the inflorescence alternate, and leaves generally longitudinally folded (vs. generally planar). The plants formerly called E. leucoploes var. novae-angliae Fernald and endemic to freshwater ponds in MA and RI apparently represent a distinct allopolyploid species, E. novae-angliae (Fernald) V.I. Sullivan ex A. Haines & Sorrie, and should not be treated as a variety of E. leucoploes. [= W; = E. leucoploes var. leucoploes – C, F, G; < E. leucoploes – RAB, GW, S, SE, WH; < E. leucoploes var. leucoploes – FNA, K]

Eupatorium linearifolium Walter, Narrowleaf Bushy Eupatorium. Cp (FL, GA, NC, SC, VA): sandhills; uncommon. Late July-October. Se. VA south to FL and west to LA. The appropriate treatment of this taxon is unclear; it may be a derivative of the hybrid E. cuneifolium × hyssopifolium; it is more widespread than E. recurvans sensu stricto. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [= GW; < E. recurvans – RAB, F, G (also see E. anomalum and E. recurvans); < E. mohrii – C, F, G, S, SE, WH (also see E. recurvans); < E. leucoploes; < E. leucoploes – FNA, K]

Eupatorium mikanioides Chapman, Semaphore Thoroughwort. Cp (FL): saline and brackish flats, seasonally ponded freshwater wetlands, wet flatwoods; rare. Endemic to FL, primarily in the peninsula, but also along the coast of the eastern Panhandle (Bay, Franklin, Gulf, Taylor, and Wakulla counties). July-September. [= FNA, GW, K, S, SE, WH]

Eupatorium mohrii Greene, Mohr's Eupatorium. Cp (FL, GA, NC, SC, VA): moist savannas, other wet habitats; common (uncommon in VA). August-October. Se. VA south to s. FL and west to TX. This is by far the most abundant of the E. recurvans-anomalum-mohrii complex in our area. Like E. anomalum, E. mohrii is believed to be a triploid and tetraploid, apomictic derivative of the hybrid E. recurvans × rotundifolium; it is more widespread than E. recurvans sensu stricto. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [= GW; < E. recurvans – RAB, F, G (also see E. anomalum and E. recurvans); < E. mohrii – C, F, G, S, SE, WH (also see E. recurvans); < E. leucoploes; < E. leucoploes – FNA, K]

Eupatorium perfoliatum Linnaeus, Boneset. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA); marshes, swamps, bogs, wet pastures, and other wet habitats; common (uncommon in FL). August-October. NS west to MB, south to n. peninsular FL and TX. [= RAB, FNA, GW, G, WH, WV; = E. perfoliatum var. perfoliatum – C, F, G, K, S, SE; ? E. cuneatum Engelm. – S (actually a hybrid)]

Eupatorium pilosum Walter, Ragged Eupatorium. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): savannas, bogs, other moist areas; common (uncommon in Piedmont, rare in Mountains). August-October. MA south to c. peninsular FL, west to KY, c. TN, and MS. This species is clearly distinct; it should not be treated as a variety of E. rotundifolium. [= RAB, C, F, FNA, GW, K, WH, WV; = E. verbenaefolium Reichard – S; = E. rotundifolium var. saundersii (T.C. Porter) Cronquist – G, SE, W]

Eupatorium pubescens Muhlenberg ex Willdenow, Inland Roundleaf Eupatorium. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): forests and woodlands, woodland edges, roadbanks; common (uncommon in Mountains, uncommon in Coastal Plain south of DE). July-September. The distribution, abundance, and phenology of E. pubescens in our area need additional study. Where growing together, E. pubescens apparently flowers about a month earlier than E. rotundifolium. Primarily in the Appalachians and adjacent provinces, ranging from ME south to n. GA and n. AL. This taxon appears to be a stabilized polyploid complex originating from hybridization of E. rotundifolium and (perhaps) E. sessilifolium; in that it now functions as a more-or-less independent evolutionary lineage, with distinctive morphology, habitat, and distribution, it is here treated as a species. [= F, WV; < E. rotundifolium var. ovatum (Bigelow) Torrey – RAB (also see E. corderi); = E. rotundifolium var. ovatum var. Bigelowii Torrey – C, FNA, G, K, S, W; < E. rotundifolium var. Bigelowii – GW; < E. pubescens – S (also see E. corderi); = E. rotundifolium Linnaeus sp. ovatum (Bigelow) Montgomery & Fairbrothers]

Eupatorium recurvans Small, Recurved Eupatorium. Cp (FL, GA, NC, SC): moist savannas; rare (NC Watch List). August-October. Se. NC south to GA and s. FL. The diploid sexual E. recurvans (sensu stricto) is rare in our area; GW gives its range as se. and sc. GA and FL. E. mohrii is believed to be a triploid and tetraploid, apomictic derivative of the hybrid E. recurvans × rotundifolium; it is more widespread. [= GW, S; < E. recurvans – RAB, WH (also see E. anomalum and E. mohrii); < E. mohrii – C, FNA, K, SE]

Eupatorium resinosum Torrey ex A.P. de Candolle, Resinous Boneset, Pinebarren Eupatorium. Cp (DE, NC, SC): seepage bogs, beaver ponds, frequently burned streamhead pocosins, in the Sandhills and inner Coastal Plain of sc. NC; rare. August-
October. A "bimodal endemic," known from the NJ, DE (formerly), and (formerly) NY, thence disjunct to the Sandhills and upper Coastal Plain of NC and SC. [= RAB, C, FNA, G, GW, K, SE; > E. resinosum var. resinosum – F]

**Eupatorium scabridum** Elliott, Roughleaf Eupatorium. Cp (FL, GA, SC): savannas, wet pinelands; uncommon. Late July-October. SC south to n. FL, west to AR, LA, and OK. This plant is believed to be an allopolyploid derivative of the hybrid *E. rotundifolium × semiserratum*. In some areas it apparently consists only of short-lived diploids, but in others (according to GW especially in SC, AR and LA) to occur as populations of polyploid amopics. It resembles *E. rotundifolium*, but has cuneate leaves with a less prominent pair of lateral veins, narrower leaves, and is more likely to have 3-whorled leaves (as *E. semiserratum* often does). [= GW, S; = E. rotundifolium var. scabridum (Elliott) A. Gray – FNA, K, SE; < E. rotundifolium – WH]

**Eupatorium semiserratum** A.P. de Candolle. Cp (FL, GA, NC, SC, VA): swamp forests, seepage bogs, savannas, clay-based Carolina bays, other wetlands; uncommon. Late July-October. Se. VA south to ne. FL, Panhandle FL, west to TX and AR; disjunct in sc. TN. This species often has 3 leaves per node; most similar species rarely or never have whorled leaves. [= RAB, C, FNA, G, GW, K, S, SE, WH; = E. cuneifolium var. semiserratum (A.P. de Candolle) Fernald & Griscom – F]

**Eupatorium serotinum** Michaux, Late Eupatorium. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): interdune swales, fields, open forests, powerline rights-of-way, tidal marshes, disturbed areas; common (uncommon in DE). Late August-October. MA, NY, MI, WI, MN, and NE south to s. FL, LA, and TX. This species was apparently largely or strictly coastal in our area, but has spread inland similarly to *Baccharis halimifolia*. [= RAB, C, F, FNA, G, GW, K, S, SE, WH, WH, WV]

**Eupatorium sessilifolium** Linnaeus var. brittonianum Porter, Britton's Eupatorium. Mt (NC, WV): circumboreal soils of woodlands at moderate elevations; rare. August; September. NH and MN, south to NJ, PA, MD, w. NC, KY, and MO. The only collection from NC known to me is from Cedar Cliff, Buncombe County, in 1897. I disagree with Cronquist's equation of this taxon with *E. godfreyanum*. [= F, K, WV; < E. sessilifolium var. sessilifolium – RAB; < E. sessilifolium – C, FNA, G, S, SE, W]

**Eupatorium sessile** Linnaeus var. sessile Eupatorium. Pd (DE, GA, NC, VA), Mt (GA, NC, VA, WV), Cp (DE, VA): open upland woodlands and woodland borders, especially calcareous or mafic; common (uncommon in VA Piedmont, rare in VA Coastal Plain, rare in DE). July-October. S. NH west to se. MN, south to n. GA, n. AL, n. MS, n. AR, and e. KS. Grubbs, Small, & Schilling (2009) discuss the genetics of *E. sessilifolium*; most of the species' distribution consists of agamospermous triploids, with sexual diploids only known from two disjunct areas of the southern Appalachians (w. VA, and W.NC-e. TN). There may be merit to the taxonomic recognition of the diploids and the triploids. [= F, K, WV; < E. sessilifolium var. sessilifolium – RAB (also see var. brittonianum); < E. sessilifolium – C, FNA, G, S, SE, W]

**Eupatorium vaseyi** T.C. Porter, Vasey's Eupatorium. Mt (GA, NC, VA, WV), Pd (NC, VA), Cp (DE): moist to dry woodlands and openings; uncommon (rare in upper Piedmont). July-October. MD, DE, and VA south to se. TN (Chester, Wofford, & Kral 1997), n. GA, and n. AL. This species is apparently a tetraploid derivative of *E. album × sessilifolium*. It is sometimes treated as a variety of *E. album*, but seems better regarded as a species of hybrid origin. [= E. album var. vaseyi – RAB, W (also see E. godfreyanum); = E. album var. vaseyi (T.C. Porter) Cronquist – C, FNA, SE; = E. album var. monardifolium (Fernald) – F; < E. vaseyi – G; = E. sessilifolium var. vaseyi (Porter) Fernald & Griscomb – K, WV, ? E. fernaldii Godfrey]

**Eupatorium album** Linnaeus var. subvenosum A. Gray. Cp (DE): pine barrens, open woodlands; rare. DC, DE, NJ, NY. July-September. [= C, F, FNA, K, SE; [add to synonymy]]

**Eupatorium lancefolium** (Torrey & A. Gray) Small. Prairies, open woodlands. AL west to s. AR and TX. [= FNA, GW, K, S, SE; = E. semisserratum A.P. de Candolle var. lancefolium (Torrey & A. Gray)

**Eupatorium × pinnatifidum** Elliott. E. VA south to Panhandle FL. It is variously considered a species (as by S), a species of hybrid origin (as by SE), or a hybrid (as by GW and K). The parents are variously listed as *E. capillifolium × pinnatifidum* (as by K) or *E. capillifolium × compositifolium × pinnatifidum* (as by GW and SE). I have seen the plant in Pender County, NC, where it appears to be a first-generation hybrid, growing with *E. capillifolium* and *E. pinnatifidum*. Until and unless additional evidence appears that it reproduces itself and exists in independent populations I am inclined to treat it as a hybrid rather than a species of hybrid origin. It is recognizable by its pinnatifid or bipinnatifid leaves (the segments broader than in the dog-fennel) and its corymbose-paniculate inflorescence. [= FNA, K, WH; = E. pinnatifidum Elliott – GW, S, SE]

**Eurybia** (Cassini) Cassini 1820 (Wood-aster)

1 Basal and lower cauline leaves both distinctly petiolate and with a cordate or subcordate blade; [subgenus Eurybia, section Eurybia].

2 Outer phyllaries squarrose-reflexed; rhizomes short or absent, the plants not forming extensive clonal colonies; [of rich slopes an

3 Involucre 10-11 (-13) mm tall; phyllaries 36-50, ovate, elliptic, or lanceolate, acute to acuminate at the apex, squarrose in life, often

4 Ray flowers white; branches of the inflorescence glandular-pubescent, often remaining so in dried specimens, the reflexed portion herbaceous with a narrow hyaline margin or none at all; ray florets (7-)

5 Plants with basal leaves on well-developed shoots separate from the flowering shoots; larger leaves with 15-30 teeth per side ............

6 Longest peduncle in inflorescence > 1.5 cm long; involucre 6.5-9 (-10) mm tall; ray florets (8-) 12-16 (-20), the ray portion (10-)

7 Leaves linear, up to about 10 mm wide; leaves strongly basally disposed.

8 Involucre flat-topped (corymbiform); [subgenus Heleastrum, section Heleastrum].

9 Pappus fine, the bristles not thickened above; ray florets 8-15 (-25); [of the Piedmont and low Mountains of GA, SC, and possibly sw.

10 Stem spreading-hairy throughout; ray florets 25-60, white or pinkish; disc florets; [ endemic of FL Panhandle and adjacent sw. GA];

11 Upper stem glabrous, upper stem variously hairy; ray florets 8-30, deep lavender or purple; [collectively widespread]

12 Leaves obviously veined beneath, usually toothed, hairy on the undersurface; [subgenus Eurybia, section Radulini].

13 Larger leaves > 4.0 cm wide; rays white to pale purple; [of the Cumberland Plateau of KY and n. TN] .......... E. saxicastelli

14 Ray florets 9-14; rays 5-15 mm long. .................................................................................................................. E. radula

15 Phyllaries glandular-pubescent on the back and also glandular-ciliate; involucre 8-16 mm high ......................... E. spectabilis

16 Involucre (10-) 11-13 mm tall; phyllaries 36-50, ovate, elliptic, or lanceolate, acute to acuminate at the apex, squarrose in life, often

17 Leaves broader, the largest on a plant over 15 m wide; leaves somewhat basally disposed, the lowermost sometimes withering before

18 Involucre (10-) 11-13 mm tall; phyllaries 36-50, ovate, elliptic, or lanceolate, acute to acuminate at the apex, squarrose in life, often

19 Plants without basal leaves on well-developed shoots separate from the flowering shoots; larger leaves with 5-20 teeth per side.

20 Longest peduncle in inflorescence < 1.5 cm long; involucre (3.5-) 4.2-6 (-7.5) mm tall; ray florets 5-10 (-12), the ray portion (5-)

21 Basal and lower cauline leaves not as above.

24 A diploid species (2n=18).  [= FNA, K, X; Eurybia chlorolepis (E.S. Burgess) Nesom, Blue Ridge White Heart-leaved Aster. Mt (GA, NC, SC, VA, WV?): northern hardwood forests, spruce-fir forests; common (rare in VA). August-October. A Southern Appalachian endemic: sw. VA south through w. NC and e. TN to nw. SC and n. GA (Lamboy 1992); also reported for scattered locations in WV (Harmon, Ford-Wernitz, & Graffon 2006). Lamboy (1992) has shown that Eurybia chlorolepis is a species distinct from Eurybia divaricata. E. chlorolepis is tetraploid (2n=36) and hexaploid (2n=54); E. divaricatus is diploid (2n=18). = FNA, K, X; = Aster chlorolepis E.S. Burgess – G, S, Y; = A. divaricatus Linnaeus var. chlorolepis (E.S. Burgess) Ahles – RAB, C, SE, W; < A. divaricatus – F, WV]

25 A diploid species (2n=18).  [= FNA, K, X; Eurybia divaricata (Linnaeus) Nesom, Common White Heart-leaved Aster. Mt (GA, NC, SC, VA, WV); Pd (DE, GA, NC, SC, VA), Cq (DE, NC, VA): moist to fairly dry forests and woodlands; common (uncommon in VA Coastal Plain, rare in DE Coastal Plain). August-October. N. NH west to s. ON, sw. QC, and n. OH, south to e. SC, n. GA, and c. AL. The many species described by Burgess and here treated as synonyms may deserve further assessment; see S for details. A diploid species (2n=18). = FNA, K, X; = Aster gracilis Nuttall – RAB, C, F, G, S, SE]

26 A diploid species (2n=18).  [= FNA, K, X; Eurybia surculosa (Linnaeus) Nesom, Blue Ridge White Heart-leaved Aster. Mt (GA, NC, SC, VA, WV): northern hardwood forests, spruce-fir forests; common (rare in VA). August-October. A Southern Appalachian endemic: sw. VA south through w. NC and e. TN to nw. SC and n. GA (Lamboy 1992); also reported for scattered locations in WV (Harmon, Ford-Wernitz, & Graffon 2006). Lamboy (1992) has shown that Eurybia chlorolepis is a species distinct from Eurybia divaricata. E. chlorolepis is tetraploid (2n=36) and hexaploid (2n=54); E. divaricatus is diploid (2n=18). = FNA, K, X; = Aster chlorolepis E.S. Burgess – G, S, Y; = A. divaricatus Linnaeus var. chlorolepis (E.S. Burgess) Ahles – RAB, C, SE, W; < A. divaricatus – F, WV]

27 A diploid species (2n=18).  [= FNA, K, X; = Aster avitus Alexander – SE, W]

ASTERACEAE

909

Eurybia macrophylla (Linnaeus) Cassini, Big-leaved Aster. Mt (GA, NC, SC, VA, WV), Pd (VA): moist to dry forests, in NC mostly at moderate to high elevations, particularly in red oak forests on ridgetops; common (uncommon in Piedmont). Late July-September. NB and QC west to MN, south to PA, MD, VA, NC, ne. GA, e. TN, and IN. Aster macrophyllus var. ianthinus [= Aster multiformis] is sometimes recognized. It is alleged to differ in having the stipitate glands of the pedicels with minute heads (vs. broadly capitate), the leaves thin in texture and only slightly sebaceous (vs. thick in texture and strongly sebaceous). Many other varieties have been recognized by Fernald (1950); see F for a key. E. macrophylla is octoploid (2n=72). [= FNA, K, X; = Aster macrophylla Linnaeus – RAB, C, G, SE, W, Y; > Aster macrophylla var. macrophylla – F, WV; > A. macrophyllus var. ianthinus (E.S. Burgess) Fernald – F, WV; > A. macrophyllus var. pinquifolius E.S. Burgess – F; > A. macrophyllus var. pinquifolius E.S. Burgess – WV, missspelling; > A. macrophyllus var. excelsior E.S. Burgess – F, WV; > A. macrophyllus var. velutinus E.S. Burgess – F, WV; > A. macrophyllus var. sejunctus E.S. Burgess – F; > A. macrophyllus var. apriecensis Fernald – F; > A. macrophyllus – S; > A. multiflorus E.S. Burgess – S; > A. viciniatus E.S. Burgess – S]

Eurybia schreberi (Nees) Nees, Schreber's Aster. Mt (VA, WV), Pd (DE, VA): mesic forests and seepage slopes; uncommon (rare in DE). Late June-October. NH west to WI, south to DE, MD, sc. and w. VA, ne. TN (Chester, Wofford, & Kral 1997), AL, and KY. E. schreberi is hexaploid (2n=54). [= FNA, K, X; = Aster schreberi Nees – C, G, SE, W, Y; > A. schreberi – F; > A. glomeratus (Bernhart ex Nees) E.S. Burgess – F]

Euthania (Nutall) Cassini 1825 (Flat-topped Goldenrod)

1 Leaves with numerous slightly raised, pale, translucent, blister-like pustules; leaves transmit light when held up; plant glabrous

2 Major veins on leaf underside 3-5 (if 3 then all 3 veins bold), leaves 5-12 mm wide; heads with 20-50 flowers.

3 Leaves 3-6 (8) mm wide, pectae on leaf upper side bold, flower heads 10-20 flowered

4 Leaf undersides, upper stems, and branches glabrate, often with villous hairs or midrib of leaf underside

5 E. graminifolia var. graminifolia
*Euthamia caroliniana* (Linnaeus) Greene ex Porter & Britton. Cp (DE, FL, GA, NC, SC, VA), Pd (VA), Mt (VA): pine savannas, moist forests, ditches, pastures, disturbed areas; common. September-December. S. ME south to FL and west to se. LA, mainly on the Coastal Plain, extending somewhat into the Piedmont in places (reports from further north or further west are mased on misidentifications or on broader circumscriptions of the taxon). [= FNA, K, WH, V, X; > *Solidago microcephala* (Nuttall) Bush – RAB, F, G; > *Solidago tenuifolia* Pursh – RAB; > *E. tenuifolia* var. *tenuifolia* – C; > *Solidago tenuifolia var. tenuifolia* – F; > *Solidago tenuifolia var. tenuifolia* – G; < *E. tenuifolia* – GW (also see *E. hirtipes*); > *E. minor* (Michaux) Greene - GW, SE; = E. minor – S; > *E. tenuifolia* (Pursh) Nuttall – SE; = E. tenuifolia – W, Z]  

*Euthamia graminifolia* (Linnaeus) Nuttall var. *graminifolia*. Mt (VA, WV), Pd (DE, VA), Cp (DE, SC*, VA): moist to dry weedy situations, riverbanks, bottomlands, bog margins; common (rare in SC). August-September. NL (Newfoundland) and ND south to MD, c. VA, WV, n. KY, TN, and e. IA; a SC Coastal Plain report (Hill & Horn 1997) is probably an introduction. Also introduced on the Gulf Coast (LA and MS?). [= C, V, X, Y, Z; < *E. graminifolia* – S, SE; W; < *Solidago graminifolia* (Linnaeus) Salisbury – RAB; < *Euthamia graminifolia* – FNA; > *Solidago graminifolia* var. *polypephala* Fernald – F; > *S. graminifolia* var. *graminifolia* – F, G; < *E. graminifolia* var. *graminifolia* – K]  

*Euthamia graminifolia* (Linnaeus) Nuttall var. *nuttallii* (Greene) W. Stone. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, SC*, VA): moist to dry weedy situations, riverbanks, bottomlands, bog margins; common (rare in NC and SC). August-September. NL (Newfoundland) south to se. VA, w.NC, KY, nw. TN and MO. Also introduced on the Gulf Coast (LA and MS?). [= C, V, X, Y, Z; < *E. graminifolia* – S, SE; W; < *Solidago graminifolia* (Linnaeus) Salisbury – RAB; < *Euthamia graminifolia* – FNA; = *S. graminifolia* var. *nuttallii* (Greene) Fernald – F, G; < *E. graminifolia* var. *graminifolia* – K]  

*Euthamia hirtipes* (Fernald) Sieren, Marsh Flat-topped Goldenrod. Cp (DE, FL, GA, NC, SC, VA): brackish marshes, salt marshes, marsh edges, wet hammocks; uncommon (rare in VA). September-December. S. NJ and DE south to c. peninsular FL, west to c. AL. *E. hirtipes* has been variously treated: considered by Fernald to be a hybrid of "*minor*" and "*graminifolia var. nuttallii*" by Sieren to be a species endemic to NC, SC, and VA, by Taylor and Taylor (1983) to be a variety of *E. graminifolia* ranging from se. VA south to FL and west to se. LA, mainly on the Coastal Plain, extending somewhat into the Piedmont in places (reports from further north or further west are mased on misidentifications or on broader circumscriptions of the taxon). [= FNA, K, WH, V, X; > *Solidago microcephala* (Nuttall) Bush – RAB, F, G; > *Solidago tenuifolia* Pursh – RAB; > *E. tenuifolia* var. *microcephala* Nuttall – C; > *E. tenuifolia* var. *tenuifolia* – C; > *Solidago tenuifolia var. tenuifolia* – F; > *Solidago tenuifolia var. tenuifolia* – G; < *E. tenuifolia* – GW (also see *E. hirtipes*); > *E. minor* (Michaux) Greene - GW, SE; = E. minor – S; > *E. tenuifolia* (Pursh) Nuttall – SE; = E. tenuifolia – W, Z]  

*Euthamia graminifolia* var. *minor* (Greene) C. & J. Taylor – K, WH, X, Y]  

*Euthamia leptochephalia* (Torrey & A. Gray) Greene. Mt (GA), Pd (GA): fields, pastures, roadsides, prairies, savannas; uncommon. KY, IL, MO, and OK south to nw. GA (Floyd and Heard counties), AL, and TX. [= C, FNA, GW, K, S, SE, V, Z; = *Solidago leptochephalia* Torrey & A. Gray – F, G]  

*Euthamia gymnosperrmoides* Greene, Texas Goldentop. Prairies, roadsides, and light woodlands. MI, nw. MN, and e. ND south to c. IN, sw. KY (Graves Co), w. TN (Hardeman, Lawrence counties), ec. and c. AR, ne. TX, w. OK, and e. CO.; disjunct in Coffee Co. TN. [= FNA, K, SE, V, Z; < *Solidago gymnosperrmoides* (Greene) Fernald – F, G]  

*Eutrochium* Rafinesque 1838 (Joe-pye-weed)  

1 Florets (4-) 6-9 (12) per head; leaves more or less 3-nerved from the base, rather abruptly contracted to the short petiole, thick in texture, 5-12 (15) cm long, strongly resin-dotted beneath; leaves in whorls of (2-) avg. 3-4 (5); stem generally purple-speckled (sometimes uniformly purple); [primarily of the Coastal Plain]………………………………………………………………………………………………………………………………………..*E. dubbium*  

2 Florets either (8-) 9-22 or 4-7 per head; leaves generally pinnately veined (rarely with a tendency to be 3-nerved), usually cuneate and less abruptly contracted to the petiole, thick or thin in texture, 6-35 cm long, weakly or not at all resin-dotted beneath (except often strongly resin-dotted in *E. maculatum*); leaves in whorls of (2-) 3-7; stem purple-speckled, purple at the nodes, purple throughout, or green; [collectively widespread in our area]  

2 Florets (8-) 9-22 per head; leaves mostly in whorls of (3-) avg. 4-5 (6), 6-20 cm long; inflorescence more or less flat-topped; stem usually speckled with purple (rarely evenly purplish) ………………………………………………………………………………….*E. maculatum* var. *maculatum*  

2 Florets 4-7 per head; leaves in whorls of (2-) 3-7, 8-35 cm long; inflorescence rounded; stem usually purple throughout, purple at the nodes, or lacking purplish pigment.  

3 Stem hollow (with a large central cavity), purple throughout, strongly glaucous when fresh; flowers bright pink-purple; leaves in whorls of (3-) avg. 5 (7); leaves mostly 3.5-5.5× as long as broad………………………………………………………………………………………………………………………………………..*E. fistulosum*  

3 Stem solid (rarely with a slender central cavity), dark purple at the nodes or greenish purple throughout, not glaucous or only slightly so when fresh; flowers pale pink-purple; leaves in whorls of (2-) avg. 3-4 (5); leaves mostly 2.4× as long as broad.  

4 Stem persistently glandular-pubescent throughout; lower surface of leaves glandular-pubescent; leaves mostly 2.2-2.5× as long as wide; stem greenish-purple (or even purple); [of the Mountains] ……………………………………………………………………………………………………………………………………………………..*E. stelei*

Eutrochium purpureum (Linnaeus) E.E. Lamont var. purpureum, Purple-node Joe-pye-weed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, DE, GA, NC, SC, VA): upland, usually mesic forests; common (rare in Coastal Plain, uncommon in DE Piedmont). July-October. NH west to s. ME, MA, and e. NE, south to SC, GA, Panhandle FL, n. LA, and e. OK; var. holzingeri (Rydberg) E.E. Lamont, differing in having the lower leaf surface densely and persistently pubescent (vs. glabrous or nearly so) is found in the Midwest (Lamont 1990). Eupatorium purpureum var. amoenum is smaller, more slender, with narrower leaves which are nearly glabrous below; it is probably only a form. [<< Eutrochium purpureum var. purpureum – FNA, X; < Eupatorium purpureum Linnaeus var. purpureum – K, Z; < E. purpureum – RAB, C, F, SE, W, WH; < Eupatorium purpureum var. purpureum – G, WV; < Eupatorium trifoliatum Linnaeus – S]  

Eutrochium steelei (E.E. Lamont) E.E. Lamont, Appalachian Joe-pye-weed, Steele's Joe-pye-weed. Mt (NC, VA): cove hardwood and northern hardwood forests, up to at least 1600 m; uncommon. July-October. A Southern Appalachian endemic: c. KY and w. VA south w. NC and e. TN. [= FNA, X; = Eupatoriadelphus steelei (E. Lamont) G.J. Schmidt & Schilling – Y; = Eupatorium steelei E.E. Lamont – Z]  

Facelis Cassini 1819  

Filago Linnaeus 1753 (Cotton-rose, Herba Impia, Rabbit-tobacco)  

1 Inner flowers of the head with a well-developed capillary pappus; heads woolly, but not so densely and completely as to hide the phyllaries...  

1 All flowers of the head lacking a pappus of capillary bristles; heads completely surrounded by wool, the phyllaries hidden......[see Diaperia]  

Flaveria de Jussieu 1789
A genus of about 21 species, herbs and subshrubs, subcosmopolitan in tropical and subtropical areas. References: Yarborough & Powell in FNA (2006c); Cronquist (1980)=SE.

1 Heads borne in axillary glomerules; disc florets 0-1 (-2) .................................................................F. trinervia
1 Heads borne in terminal arrays; disc florets (2-) 3-8.
2 Lower leaves petiolate, 10-25 (-70) mm wide; annual; cypselas 2.0-2.5+ mm long ...........................................F. bidentis
2 Lower leaves sessile, 1-4 (-15) mm wide; perennial; cypselas 1.2-1.8 mm long ................................................F. linearis

* Flavia bidentis (Linnaeus) Kuntze. Cp (FL, GA): disturbed areas; rare, native of tropical America. FL Panhandle, s. FL, AL, GA. [= FNA, K, S, SE, WH]

* Flavia trinervia (Sprengel) C. Mohr, Clustered Yellowtops. Cp (SC, VA): waste areas around wool-combing mill, ore piles, seaport ballast; rare, probably only a waif, introduced from sw. United States (Nesom 2004d). March-December. Also known from ballast at Mobile, AL (Cronquist 1980). [= FNA, K, S, SE, WH]

Fleischmannia Schultz ‘Bipontinus’ 1850

Fleischmannia incarnata (Walter) King & H.E. Robinson, Pink Thoroughwort, Pink Eupatorium. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, SC, VA): nutrient-rich, moist to dry, forests and woodlands over diabase, limestone, coquina limestone, or other basic rocks, or on rich alluvium; rare. Late August-October. Se. VA west to WV, s. OH, s. IN, s. IL, s. MO, and e. OK, south to w. peninsular FL, Panhandle FL, s. TX, and e. Mexico, the distribution fragmented. See Wooten & Clewell (1971) for further information about this species. [= FNA, KH, Z; = Eupatorium incarnatum Walter – RAB, C, F, G, S, SE, W, WV]

Gaillardia Fougeroux 1786 (Blanket-flower, Gaillardia, Fire-wheels)

1 Receptacle naked, lacking well-developed setae (if setae present, < 1 mm long) ...........................................G. aestivalis var. aestivalis
1 Receptacle with well-developed setae 2-3 mm long.
2 Leaves fleshy; perennial or annual, strongly branching, the secondary branches spreading and therefore forming compact, rounded “bushes” .................................................................G. pulchella var. drummondii
2 Leaves herbaceous; annual, with secondary branches ascending .................................................................G. pulchella var. pulchella

Galinsoga Ruiz & Pavón 1794 (Peruvian-daisy, Quickweed)

A genus of about 13 species, herbs, of temperate and subtropical Central America and South America. References: Canne-Hilliker in FNA (2006c); Cronquist (1980)=SE.

1 Rays 0-1.5 (-2) mm long, lacking pappus scales (or with vestigial scales); outer phyllaries 2-4, with scarious margins; inner paleae deeply 3-lobed; pappus scales of the disc florets not awn-tipped; stem usually glabrous or sparsely pubescent with appressed (rarely spreading) hairs; gland-tipped hairs of the peduncles < 0.5 mm long; teeth of leaf margins usually well developed, acute .........................................................G. parviflora var. parviflora
1 Rays 2-3 mm long, with pappus scales about as long as the corolla tube; outer phyllaries 1-2, with green herbaceous margins; inner paleae usually entire; pappus scales of the disc florets awn-tipped; stem usually moderately pubescent with long, spreading hairs; gland-tipped hairs of the peduncles > 0.5 mm long; teeth of leaf margins usually well developed, acute ...........................................................................G. quadriradiata

**Gamochaeta** Weddell 1856 (Cudweed, Everlasting)

1 Leaves concolored or weakly bicolored (abaxial and adaxial faces more or less equally greenish to gray-greenish, indument usually loosely tomentose or arachnose, sometimes subpamnose).

2 Blades of basal and lower cauline leaves 4-16 mm wide; bracts among the inflorescence heads spatulate to oblanceolate, the lowermost (at least) surpassing the heads...............................................................................................................................................................

3 Involucres 2.5-3 mm high, seated in tomentum; capitulescence initially cylindric and uninterrupted, at least distally, the main axis obscured by clustered heads; phyllaries in 3-4 (-5) series, the outer and middle ovate-lanceolate with narrowly to broadly acute apices, the outer 1/3-½ as long as the inner, none with purplish color; flowering May-July .............................................................

4 Basal and proximal cauline leaves present or not at anthesis; stems erect or ascending; plants (30-) 50-85 cm; apices of inner phyllaries acute-acuminate; flowering mostly July-August ....... *G. simplicicaulis* 

5 Upper leaf surfaces glabrous or glabrate; involucres 2.5-3.0 mm high, more-or-less purplish, the bases glabrous; outer phyllaries elliptic-obovate to broadly ovate-elliptic, apices rounded to obtuse; bisexual florets 2-3 ...............................................................................................................................

6 Stems not pinnate (indument whitish, like closely appressed, polished cloth, hairs not individually evident); involucres 3.0-3.5(-4.0) mm high; apices of inner phyllaries acute to acute-acuminate; bisexual florets 2-4; cypselae purple ........................................ *G. chionothes* 

7 Blades of cauline leaves oblongate to oblong-oblong or oblongate-obovate; involucres 3.0-3.5 mm high; laminae of inner phyllaries elliptic-oblong to oblong, apices truncate-rounded or obtuse and apiculate; bisexual florets (3-) 4-6; plants usually fibrous-rooted, rarely taprooted ........................................................................................................... *G. argyrinea* 

8 Blades of cauline leaves oblongate to spatulate (basal cells of hairs on adaxial faces persistent, expanded, glassy); involucres 4.0-4.5 mm high; laminae of inner phyllaries triangular, apices acute (not apiculate); bisexual florets 3-4; plants fibrous-rooted or taprooted ........................................................................................................... *G. purpurea*
Zealand (introduced). [= FNA, X; < Gamochaeta falcatula (Lamarck) Cabrera – K, Z; < Gnaphalium purpureum Linnaeus var. falcatum (Lamarck) Torrey & A. Gray – RAB, C, G, SE; < Gnaphalium calviceps Fernald – F; < Gnaphalium falcatum Lamarck – S; < Gnaphalium purpureum Linnaeus – W]  
* Gamochaeta pensylvanica * (Willdenow) Cabrera, Pennsylvania Everlasting. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA?, NC): fields, roadsides, pastures, disturbed areas; common, probably native of South America. March-July. PA south to s. FL, west to TX, mostly on the Coastal Plain, and widespread in South America and elsewhere. [= FNA, K, WH, X, Z; > < Gnaphalium purpureum Linnaeus var. spathulatum (Lamarck) Baker – RAB; < Gnaphalium purpureum Linnaeus var. purpureum – C, G, SE; > < Gnaphalium peregrinum Fernald – F; > < Gnaphalium spathulatum Lamarck – S; > < Gnaphalium purpureum Linnaeus – W]  
* Gamochaeta purpurea * (Linnaeus) Cabrera, Spoonleaf Purple Everlasting. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV): fields, roadsides, pastures, disturbed areas; common. Late March-September. ME west to MI, south to s. FL and e. TX; apparently disjunct in CA and OR, adventive in w. US, Mexico, South America, and elsewhere. [= FNA, WH, X; < Gamochaeta purpurea (Linnaeus) Cabrera – K, Y, Z; < Gnaphalium purpureum Linnaeus var. purpureum – RAB, C, G, SE; < Gnaphalium purpureum Linnaeus – F, S, W, WV]  

*Garberia* A. Gray 1879 *(Garberia)*  

A monotypic genus, a shrub, of peninsular FL. References: Lamont in FNA (2006c).  

*Glebionis* Cassini 1826 *(Chrysanthemum)*  

1 Leaf blades 2-3-pinnate; rays pale yellow, 15-25 mm long ................................................................................................................. <G. coronaria>  
1 Leaf blades not lobed or coarsely 1-pinnate; rays golden yellow, 8-20 mm long................................................................. <G. segetum>  

*Glebionis coronaria* *(Linnaeus) Cassini ex Spach, Garland Chrysanthemum, Crown-daisy. Cp (FL), {NC, SC}: disturbed areas; rare, native of Eurasia, cultivated and escapes and occurs as waifs in our area. [= FNA, WH; = Chrysanthemum coronarium Linnaeus – K, Z]  
*Glebionis segetum* *(Linnaeus) Fourreau, Corn Marigold, Corn Chrysanthemum. Pd (NC): disturbed areas, trash heaps, field edges; commonly cultivated, rarely escaped, persistent, or as a waif, native of Eurasia. April-May. [= FNA; = Chrysanthemum segetum Linnaeus – RAB, C; F, G, K, S, SE]  

*Gnaphalium* Linnaeus 1753 *(Cudweed, Rabbit Tobacco)*  

A genus of about 40 species (as recircumscribed more narrowly), distributed on most continents. References: Nesom in FNA (2006a); Anderberg (1991)=Z. [also see Gamochaeta and Pseudognaphalium]  

1 Involucre 2-3 mm high; plants to 2.5 dm tall; inflorescence of many, small, axillary and terminal clusters overtopped by subtending leaves.....  
1 Involucre 4-7 mm high; plants generally well over 2.5 dm tall; inflorescence terminal, usually elongate ................. <see Pseudognaphalium>  

*Gnaphalium uliginosum* Linnaeus, Low Cudweed. Mt (VA, WV), Cp* (DE*), Pd* (DE*): high elevation openings, especially in ruts or mud-puddles, rocky places; rare, possibly introduced in North America. July-October. NL (Newfoundland) west to BC, south to VA, WV, OH, IN, MN, CO, UT, and OR. [= C, F, FNA, G, K, S, SE, WV, Z]  

*Grindelia* Willdenow 1807 *(Gum-plant, Tarweed, Rosinweed, Gumweed)*
A genus of about 55 species, herbs and shrubs, of w. North America and South America. References: Strother & Wetter in FNA (2006b); Cronquist (1980)=SE.

1 Phyllaries loose (but not squarrose), only slightly imbricate ............................................. \textit{G. lanceolata} var. \textit{lanceolata}
1 Phyllaries squarrose-reflexed, strongly imbricate................................................................. \textit{G. squarrosa} var. \textit{squarrosa}

\textbf{Grindelia} Cassini in Cuvier 1829 (Niger-seed)

A genus of 6 species, herbs, of Africa. References: Strother in FNA (2006c); Sherff & Alexander (1955)=Z.

\textbf{Gutierrezia} Lagasca y Segura 1816

1 Subshrub; stems minutely hispidulous; ray florets 2-8; disc florets 2-9 ........................................ \textit{G. sarothrae}
1 Annual; stems glabrous; ray florets 5-23; disc florets 7-13 ....................................................... \textit{G. texana} var. \textit{texana}

\textbf{Hartwrightia} A. Gray ex S. Watson 1888 (Hartwrightia)

\textbf{Helenium} Linnaeus 1753 (Sneezeweed, Bitterweed)

A genus of about 32-40 species, herbs, of America. References: Bierner (1989)=Y; Bierner (1972)=Z; Rock (1957); Knox (1987); Rydberg (1915); Cronquist (1980)=SE.

1 Stem leaves very numerous, 0.5-2 (-4) mm wide, not decurrent on the stem or branches; plant a taprooted annual; [section \textit{Amarum}].
2 Disc corollas yellow, the lobes yellow or yellow-brown; lower and basal leaves usually withered at anthesis; lower leaves usually entire (rarely toothed); basal leaves entire to toothed (rarely pinnatifid)........................................ \textit{H. amarum} var. \textit{amarum}
2 Disc corollas yellow, the lobes (and sometimes also the upper portion of the corolla tube) purple; lower and basal leaves often persistent; lower leaves linear to ovate, entire, toothed, lobed or pinnatifid; basal leaves pinnatifid............................................. \textit{H. amarum} var. \textit{badium}
1 Stem leaves few to numerous, at least the larger > 4 mm wide, decurrent on the stems and branches; plant a fibrous-rooted perennial or a taprooted annual.
3 Ray flowers lacking a pistil and style, sterile; [section \textit{Leptopoda}].
4 Disc flowers with lobes brown, red, or purple. 5 Disc flowers 5-lobed and with 5 stamens ................................ \textit{H. brevifolium}
5 Disc flowers predominately 4-lobed and with 4 stamens ...................................................... \textit{H. flexuosum}
4 Disc flowers with lobes yellow.
6 Midstem leaves barely decurrent on the stem, the decurrency < 0.5 cm; basal leaves often pinnatifid (less commonly merely dentate, repand, or entire), the lower portion of the leaf not contracted so as to be petiolate in form; achene pubescent on the ribs; peduncle pubescent; basal leaves (3.0-) 4.5-8.0 (-19.0) cm long, 0.3-1.1 cm wide, averaging ca. 7-10× as long as wide ………………… H. pinnatifidum

6 Midstem leaves decurrent on the stem, the decurrency > 2 cm, and usually extending to the next leaf down; basal leaves usually repand or entire (rarely somewhat lobed or pinnatifid), the lower portion narrowed into a petiolate form which enlarges at its base to more-or-less clasping the stem; achene glabrous, or pubescent on the ribs; peduncle pubescent or glabrous; basal leaves averaging narrower or broader in shape (see below).

7 Peduncle pubeuse to tomentose or lanose between the uppermost leaf and the head; achene pubescent on the ribs; heads 1-4 per plant; basal leaves (2.5-) 4.0-10.5 (-18.0) cm long, (0.8-) 1.2-2.0 (-2.5) cm wide, averaging ca. 4-6× as long as wide ………………… H. brevisilfolium

7 Peduncle glabrous or glabrate between the uppermost leaf and the head; achene glabrous; heads 1 per plant; basal leaves (3.0-) 4.5-17.0 (-25.0) cm long, (0.4-) 0.6-1.0 (-1.5) cm wide, averaging ca. 10-15× as long as wide …………………………… H. vernale

8 Plant a fibrous-rooted perennial; [native species, collectively widespread and common]; [section Helenium].

9 Leaves not basally disposed, the basal leaves usually absent at flowering (if present, mostly < 2 cm long), the stem leaves not progressively reduced upward; pappus scales brownish, 0.3-1.2 mm long (usually < 1 mm long); upper cauline leaves serrate (rarely entire), most often oblanceolate, usually broadest near the midpoint or beyond it, with conspicuous lateral veins apparent on the lower surface: …………………………………………… H. autumnale

9 Leaves basally disposed, the basal rosette usually present at flowering, the basal leaves > 4 cm long, larger than the progressively smaller stem leaves; pappus scales white-biwhiny, 0.9-1.9 mm long (usually < 1 mm long); upper cauline leaves entire, lanceolate, usually broadest at or near the base and rather evenly tapered to the apex, lacking conspicuous lateral veins……………… H. virginicum

Plant a tap-rooted annual or biennial; [alien species, rare waifs of wool-combing mills]; [section Tetrodus].

10 Disc corollas 4-lobed; heads 7-11 (-14) mm high, 6-11 wide (excluding the ray flowers)…………………………………… H. quadridentatum

10 Disc corollas 5-lobed; heads 4-8 mm high, 4-8 mm wide (excluding the ray flowers).

11 Upper leaves entire………………. H. elegans var. elegans………………… H. microcephalum var. microcephalum

* Helenium amarum (Rafinesque) H. Rock var. amarum, Bitterweed. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): roadsides, overgrown pastures, urban areas; common (rare in Mountains), apparently introduced from further west. May–December. Now widespread in e. North America. Biemer (1989) discusses the taxonomy of section Helenium, consisting only of the 2 varieties of H. amarum. Var. amarum is widespread; var. badius (A. Gray ex S. Watson) Waterfall, distinguished in part by its purple disk flowers, occurs in OK, TX, and Mexico. The plant has a very bitter taste and is generally avoided by grazing animals, a point noted by Rafinesque in his original description (in 1817): "the whole plant is odorous and intensely bitter, it gives an abominable taste to the milk of the cows that feed on it in summer." Overgrown areas come to be dominated by H. amarum. In areas where it is frequently mowed, H. amarum appears to evolve a genotype capable of flowering and fruiting when only a few cm tall. [= F, N, K, Z; > H. tenifolium Nuttall – F, S; = H. amarum – RAB, G, W, Z; < H. amarum – SE, WH]

Helenium parviflorum (Nuttall) A. Wood. Cp (GA, NC, VA), Mt (NC, VA), Pd (GA, NC, VA): seepage bogs; rare. May–June. H. parviflorum has a peculiar distribution, reaching its greatest abundance on the Gulf Coastal Plain from Panhandle FL west to e. LA, and occurring at widely scattered disjunct sites in c. and n. AL, wv. GA, c. and w. NC, ec. TN (Chester, Wofford, & Kral 1997), and sw. and se. VA. [= RAB, C, FNA, G, GW, K, SE, W, WH, Z; > H. brevisilfolium – F, S; > H. autumnale – RAB, G, W, Z; < H. autumnale – SE, WH]

Helenium pinnatifidum (Nuttall) Rydberg. Cp (FL, GA, NC, SC): wet savannas and adjacent ditches; rare (NC Rare, SC Rare). April–May. A Southeastern Coastal Plain endemic: se. NC south to s. FL, west to Panhandle FL, sw. GA, and at s. AL. [= RAB, FNA, GW, K, SE, WH, Z; > H. vernale – S, misapplied]

Helenium quadridentatum Labill. (SC): location and habitat unknown; presumably introduced from sc. United States. Reported for SC by Rydberg (1915), Small (1933), and Kartesz (1999); also east to AL (SE). [= F, K, S, SE, Z]

Helenium virginicum S.F. Blake, Virginia Sneezeweed. Mt (VA): seasonal sinkhole ponds and clearings where such ponds once occurred; rare. July–September. H. virginicum is bimodally endemic in VA (Augusta and Rockingham counties, VA, where a series of sinkhole ponds (dolines) on acid colluvium support numerous Coastal Plain disjuncts) and MO (Ozarkian...
2 Stems pubescent; leaf margins often revolute.
3 Plants short, < 1.5 m tall; leaves < 1 cm wide; rhizomes lacking or poorly developed..........................H. angustifolius
3 Plants robust, > 1.5 m tall; leaves > 1 cm wide; rhizomes well developed.................................H. simulans
1 Leaf blades shorter and broader, lanceolate, lance-ovate, deltoid, deltoid-ovate and usually < 5× as long as wide.
4 Phyllaries 1.5-3 mm broad, lanceolate ..........................................................H. floridanus
4 Phyllaries 3-5 mm broad, oblong, ovate, or obovate.
5 Abaxial surfaces of leaves and ligules lacking subsessile glandular trichomes; leaves usually broadly ovate to orbicular and with a petiole > 1 cm long..........................................................H. silphioides
5 Abaxial surfaces of leaves and ligules with subsessile glandular trichomes; leaves usually lanceolate to lance-ovate or rhombic-ovate and with a petiole usually < 1 cm long.
6 Phyllaries oblong-lanceolate, apex acuminate, abaxially usually pubescent........................................H. laetiflorus
6 Phyllaries elliptical to oblong-ovate, apex acute, abaxially glabrate ................................................H. pauciflorus ssp. pauciflorus

Key D – perennial sunflowers with leafy stems and yellow disk flowers
1 Stems below the capitulescence glabrous or nearly so, sometimes glaucous.
2 Leaves whorled at principal nodes, either alternate or opposite at other nodes ..................................H. verticillatus
2 Leaves either alternate or opposite (or both).
3 Leaves grayish-green or bluish green in color, sessile, and abaxially glabrous and glaucous.
4 Rays 10-14; leaves strumose adaxially, rough to the touch; phyllaries 2.5-4.5 mm wide..........................H. eggertii
4 Rays 5-10; leaves glabrous or glabrate adaxially, smooth or only slightly rough to the touch; phyllaries 2.5-3 mm wide ...H. laevigatus
3 Leaves light to dark green, sometimes whitish abaxially, but not grayish or bluish green in color; leaves sessile or petiolate, glabrous or pubescent.
5 Leaves linear-lanceolate, with only a single main vein ..........................................................H. smithii
5 Leaves linear-lanceolate to lanceolate, lance-ovate, or ovate, triplinerved at base.
6 Rays few, usually 5 or 8; heads small, the involucres usually 9 mm broad or less.
7 Leaves abaxially whitish in color and glabrous and glaucous, lacking subsessile glandular trichomes (“resin dots”) ..................H. glaucophyllus
7 Leaves abaxially greenish in color, usually tomentulose (sometimes glabrate), with abundant subsessile glandular trichomes ..................H. microcephalus
6 Rays usually 10 or more in larger heads; heads larger, the involucres usually > 9 mm broad.
8 Leaves sessile, rounded to cordate at base, and trinerved, with the 2 lateral veins diverging from the midrib at the very base of the leaf..........................................................H. divaricatus
8 Leaves sessile to petiolate, but narrowing gradually to base and triplinerved, the 2 lateral veins diverging from the midrib above the base of the blade.
9 Anther appendages yellow.
10 Leave blade lanceolate to lance-ovate, sessile to petiolate but the petiole usually < ½ as long as the blade; phyllaries not conspicuously graduated and imbricate, usually loose and spreading..............................H. grosseserratus
10 Leaf blade ovate to elliptic, with a distinct petiole usually > 2 cm long and ½ as long as blade or longer; phyllaries conspicuously graduated and imbricate, usually appressed, not exceeding disk ............H. occidentalis ssp. occidentalis
9 Antther appendages dark or reddish-brown.
11 Plants producing abundant tubers; leaves sessile, the petioles < 1 cm long; [endemic to the Piedmont of NC and SC]..................H. schweinitzii
11 Plants rizomatosus, but not producing tubers; leaves petiolate, the petioles 1-5 cm long; [collectively widespread in our area].
12 Phyllaries equal to or slightly exceeding disk, apex acute; leaves moderately serrate to entire, with a petiole 1-3 cm long, and abaxially with usually abundant subsessile glandular trichomes (“resin dots”) ..................H. stramosus
12 Longer phyllaries usually exceeding disk by ⅓ their length or more, apex acuminate; larger leaves moderately to conspicuously serrate, with a petiole 2-5 cm long, and abaxially with usually relatively few subsessile glandular trichomes ........H. decapetalus

13 Leaves sessile and cordate, mostly or all opposite ..........................................................H. mullis
13 Leaves petiolate or sessile, but not cordate, and alternate or opposite.
14 Phyllaries attenuate, conspicuously exceeding the disk in length and reflexed, apically with numerous subsessile glandular trichomes (“resin dots”); leaf bases often conical, the basically ovate or lance-ovate blade joined to a broadly winged and gradually narrowed petiole ..........................................................H. resinosus
14 Phyllaries acute to attenuate, but not reflexed, subsessile glandular trichomes present or absent; leaf bases usually attenuate to truncate or rounded, the blade lance-linear or lanceolate, or if ovate or lance-ovate either sessile or with a petiole that is at most narrowly winged.
15 Leaves conduplicate and entire, usually with only a single prominent main vein; inflorescence when well developed spiciform or racemose ..........................................................H. maximilianii
15 Leaves not conduplicate, entire or serrate, triplinerved (with a prominent lateral pair of veins near the base); inflorescence not spiciform or racemose.
16 Phyllaries conspicuously graduated and imbricate, usually appressed.
17 Leaf blades lanceolate to ovate, petiole 1-5 cm long and usually < ⅓ as long as blade; anther appendages with dark pigment; cypselas 4-5 mm, usually sterile ..........................................................H. lactiflorus
17 Leaf blades ovate to elliptic, petiole distinct, > 2 cm and usually > ⅓ as long as the blade; anther appendages yellow;
cypselas 3-4 mm long, fertile ..........................................................................................H. occidentalis ssp. occidentalis
16 Phyllaries not conspicuously graduated and imbricate, usually loose or spreading.

Helianthus angustifolius Linnaeus, Narrowleaf Sunflower. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV*), Pd (GA, SC, VA): savannas, ditches, marshes, other wet habitats; common (uncommon in Piedmont of GA, NC, and SC, uncommon in DE Coastal Plain, rare in VA Piedmont, rare in Mountains). (July-) September-October (-frost). Primarily Coastal Plain, from Long Island, NY south to c. peninsular FL west to TX, irregularly inland to OH, IN, and MO. This plant is very showy when in flower on roadsides, especially in October. [= RAB, C, FNA, GW, K, S, SE, WH, WV; > H. angustifolius var. angustifolius – F; > H. angustifolius var. planifolius Fernald – F]

* Helianthus argophyllus Torrey & A. Gray, Silverleaf Sunflower. Cp (FL, NC): dunes and disturbed sandy soil on a barrier island; rare, native of TX. July-October. Native to s. TX. Heiser et al. (1969) noted a collection from NC, but stated their uncertainty as to its establishment. H. argophyllus is well-established near Captain Charlie's on Bald Head Island, Brunswick County, where it has apparently persisted and spread over the last 30 years (at least). [= F, FNA, K, S, SE, WH]

Helianthus atrorubens Linnaeus, Appalachian Sunflower. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (FL, NC, SC, VA): dry soils of rocky, sandy, or clayey woodlands and roadbanks; common (uncommon in VA Mountains, rare in FL). Late July-October. N. VA west to w. TN, and south to c. GA, Panhandle FL, AL, and sc. LA. Related to the Ozarkian H. silphioides Nuttall. [= RAB, C, FNA, G, K, SE, W; > H. atrorubens var. alidades Fernald – F; > H. atrorubens var. atrorubens – F; < H. atrorubens – S (also see H. silphioides Nuttall)]

Helianthus debilis Nuttall spp. tardiflorus (Heiser) Cronquist – SE; < H. debilis spp. cucumerifolius – WH]

Helianthus glaucophyllus D.M. Smith, Whiteleaf Sunflower. Mt (NC, SC), Pd (SC): moist forests, woodlands, and woodland edges, at medium elevations, mostly from 1000-1500 m (but sometimes lower), generally flowering only when in a canopy gap (as caused by a tree-fall) or along banks of narrow roads; rare. July-September. A narrow Southern Appalachian
ASTERACEAE

920

* Helianthus grosseserratus Martens, Sawtooth Sunflower. Pd (DE, GA, NC, VA), Mt (VA, WV), Cp (DE, VA): disturbed areas; uncommon (rare in GA, NC, and VA Coastal Plain, rare in VA Mountains, rare in DE Piedmont), introduced from farther west. The original range of this species was apparently centered in OH, IN, IL, IA, and MO, but its exact extent is obscured by its subsequent spread. Reported for NC by Matthews & Mellichamp (1989). [= C, F, FNA, G, K, W, WV; = H. grosse-serratus – S, SE, orthographic variant]

* Helianthus laetiflorus Persoon. Cp (NC, SC, VA), Pd (NC, SC, VA), Mt (VA, WV): disturbed areas; uncommon, introduced from farther west. Late July-September. Widely scattered in e. and c. North America, believed to be a derivative of the hybrid of H. pauciflorus Nuttall spp. subhomboides (Rydbeger) O. Spring & E. Schilling and H. tuberosus. [= RAB, G, S, SE, WV; = H. laetiflorus Persoon (pro sp.) – C, FNA, K; = H. laetiflorus var. laetiflorus – F]

* Helianthus laevigatus Torrey & A. Gray, Shale-barren Sunflower, Smooth Sunflower. Mt (NC, VA, WV), Pd (NC, SC, VA): on dry, rocky or shaly soils, on roadbanks, powerline rights-of-way, open woodlands, in the Carolinas nearly limited to the Carolina Slate Belt; common in VA, uncommon in WV, rare in NC and SC). August-October. The primary range of H. laevigatus is in the mountains of c. and w. VA and e. WV, from whence it is disjunct to a few places in the Piedmont of NC and SC, most notably the Carolina Slate Belt in Montgomery and Stanly counties, NC. [= RAB, C, F, FNA, G, K, SE, W, WV; = H. laevigatus – S; = H. reindutus (Steele) E.E. Watson – S]

* Helianthus longifolius Pursh, Longleaf Sunflower. Mt (GA, NC*), Pd (GA, CA, VA): sandstone and granite glades and woodlands, loamy to xeric longleaf pine sandhills; rare. August-October. This species is apparently rare, occurring in ne. AL, n. GA (introduced in sw. NC). [= RAB, FNA, K, S, SE]

* Helianthus maximilianiii Schröder, Maximilian Sunflower. Pd (NC, SC, VA), Mt (NC, SC, VA, WV), Cp (NC, VA): moist roadsides and disturbed areas; uncommon, introduced from farther west. September-October. MI and MB west to BC and south to TX; introduced in the East. [= C, SE, W; = H. maximiliani – RAB, F, FNA, G, K, S, orthographic variant]

* Helianthus occidentalis Riddell ssp. occidentalis, Naked-stem Sunflower. Mt (GA, NC, VA, WV), Pd (VA), Cp (FL): rocky or sandy flood-scoured riverbeds, dry hammocks (in FL); rare. July-October. MD and DC west to MN, and south to w. NC, n. GA, Panhandle FL, and TX. Ssp. occidentalis occupies most of the range of the species. Ssp. plantagineus (Torrey & Gray) Shimmers occurs in sw. LA, se. TX, and AR. Var. dawellianum Torrey & Gray, of uncertain status (if valid, then usually treated as a variety under ssp. occidentalis), occurs in the Appalachian portion of the range. The species has been collected only twice in NC, the type collection of H. dawellianus M.A. Curtis, from "near Franklin, Macon Co.,” and in 1897, near Asheville, Buncombe County ("sandy bottoms along the French Broad River near Biltmore"). GAHP reports H. occidentalis as a rare species in the state, from "limestone glades and barrens, rocky or cherty soils" (GAHP 2003); it is uncertain what variety is represented. [= FNA, K; = H. occidentalis Riddell var. dawellianus (M.A. Curtis) Torrey & A. Gray – C, F, SE; = H. occidentalis – RAB, G, S, W, WH, WV; = H. occidentalis – RAB, M.A. Curtis – WV]

* Helianthus pauciflorus Nuttall ssp. pauciflorus, Stiff Sunflower. Mt (GA), Pd (GA*, VA*), Cp (VA*): disturbed areas; rare, native in the more western portion of our area, introduced eastwards. July-September. Reported for VA by Fernald (1950) under the name H. laetiflorus var. rigida; and for nc. GA by Jones & Coile (1988) under the name H. rigida (Cassini) Desf. [= FNA, K; = H. pauciflorus var. pauciflorus (Cassini) Desf. – C; = H. laetiflorus var. rigida (Cassini) Fernald – F; = H. rigida (Cassini) Desfontaines – S; = H. rigida var. rigida – SE]

* Helianthus porteri (A. Gray) Pruski, Confederate Daisy. Pd (GA, NC*, SC): in shallow soils over granite on low-elevation granite domes or flatsrocks; uncommon, native in GA and SC, introduced and vigorously established in NC (SC Rare). August-September. A Piedmont endemic: nw. SC south to GA and ec. AL. The species has often been treated in Viguiera; see Pruski (1998) and Schilling et al. (1998) for discussion of the reasons for treating this species in Helianthus. It is well-established at two sites in NC, on Rocky Face Mountain (Alexander County, NC) and Mitchell Mill Flatrock (Wake County, NC), where it was introduced with soil blocks of Diamorpha smallii as part of a ecological experiment (Mellinger 1972; McCormick & Platt 1964). [= FNA, K; = Viguiera porteri (A. Gray) Blake – SE]

* Helianthus radula (Pursh) Torrey & A. Gray, Roundleaf Sunflower, Rayless Sunflower. Cp (FL, GA, SC): sandhills, dryish savannas, and dry pine flatwoods; common (rare in FL). Late August-October. S. SC south to s. peninsular FL and west
to se. LA. It is readily distinguishable from all other species by its rosette of orbicular to nearly round leaves, borne flat against the ground. [= RAB, FNA, GW, K, S, SE, WH]

**Helianthus schweinitzii** Torrey & A. Gray, Schweinitz's Sunflower. Pd (NC, SC): clayey soils of woodlands and roadides, in areas formerly with post oak-blackjack oak savannas, xeric oak-pine woodlands, or "Piedmont prairies," now primarily on mowed road or powerline rights-of-way; rare. Late August-October. Piedmont of nw. NC and ne. SC, primarily within 100 km of Charlotte, NC. Some earlier reports (as in Heiser et al. 1969) of occurrences in se. NC, e. SC, and c. SC are based on misidentifications. See Matthews, Barden, & Matthews (1997) for an informative discussion about this species. [= RAB, FNA, GW, K, S, SE]

**Helianthus simulans** E. Watson. Cp (FL, GA, NC*, SC), Pd* (GA*, SC*): wet soils, ditches, roadides; uncommon (rare in GA and SC). October-November. Native from SC south to c. peninsular FL, FL Panhandle, and west to LA; now spread more widely by horticultural use. [= FNA, GW, K, S, VE, WH]

**Helianthus smithii** Heiser, Smith's Sunflower. Mt (GA): dry forests and woodlands; rare. August-September. Known from n. GA, e. AL, and se. TN. It has small heads (like *H. microcephalus*, *H. laevigatus*, *H. schweinitzii*), the leaves narrowly lanceolate and subsessile (like *H. schweinitzii* or *H. laevigatus*), the leaves resin-dotted below (like *H. microcephalus*), but nearly glabrous. It may be a hybrid derivative of *H. microcephalus* and *H. strumosus*. [= FNA, K; < *H. microcephalus* – C, SE]

**Helianthus verticillatus** Small, Whorled Sunflower. Mt (GA): seasonally wet to moist calcareous prairies; rare. August-October. Nw. GA, ne. AL, and sc. TN. This taxon is a species, not a hybrid; its morphological characteristics alone (with its unique whorled leaves) make hybrid status implausible. See Matthews et al. (2002) for additional information. [= FNA, S; = *H. ×verticillatus* E.E. Watson (pro sp.) – K; = "a hybrid of *H. angustifolius* with either *H. eggertii* or *H. grosse serratus*" – C, SE]

**Helianthus carnosus** Small, Flatwoods Sunflower. Cp (FL): wet flatwoods, wet prairies; rare. September-November. Endemic to ne. FL (including Clay County in our area). [= FNA, K, S, SE, WH] [not yet keyed]

**Helianthus silphioides** Nuttall. East to se. TN (Chester, Wofford, & Kral 1997) and e. AL. [= C, F, FNA, K, SE; = *H. atrorubens* Linnaeus var. pubescens Kuntze] [synonymy incomplete]

**Heliomeris** Nuttall 1848 (Golden-eye)

* Heliomeris multiflora* (Nuttall) Blake var. multiflora. Golden-eye. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a wafi, native of western United States and Mexico. May. [= FNA, K; = *Viguiera multiflora* (Nuttall) Blake]

**Heliopsis** Persoon 1807 (Sunflower-everlasting, Oxeye)

A genus of about 18 species, herbs, of America. References: Smith in FNA (2006c); Fisher (1957)=Z; Cronquist (1980)=SE. Key adapted in part from Z.

1 Plants 3-8 dm tall; larger leaves on a plant generally 3-8 cm long; heads 1 (-3) per plant; rays 6-10 (-13) per head; rays 1-2 (-2.4) cm long; [of the Coastal Plain] [....][.....][.....][.....] **Helianthoides var. gracilis**

1 Plants (4-) 8-15 dm tall; larger leaves on a plant generally 7-15 cm long; heads (1-) 3-8 per plant; rays (8-) 10-16 per head; rays (1.5-) 2-4 cm long; [widespread in our area, rare in the Coastal Plain].

2 Leaves smooth on both sides (or sometimes sparsely pubescent below and slightly scabrous above); leaves (4.0-) 4.5-6.0 (-12) cm wide; stem glabrous and glaucous below, slightly pubescent above, the hairs generally all slender and ascending. [..............................] .............................. **H. helianthoides var. helianthoides**

2 Leaves moderately to densely scabrous on both sides; leaves 2.0-3.5 (-5.0) cm wide; stem also scabrous with short, broad-based hairs .... [..............................] .............................. **H. helianthoides var. scabra**

**Heliopsis helianthoides** (Linnaeus) Sweet var. gracilis (Nuttall) Gandhi & Thomas, Smooth Oxeye, Pineywoods Oxeye, Coastal Plain Sunflower-everlasting, Coastal Plain Oxeye. Cp (FL, GA, SC): moist calcareous forests; rare. April-July; May-July. A Southeastern Coastal Plain endemic: se. SC (Berkeley, Dorchester, and Charleston counties) south to GA (Jones & Coile
ASTERCACEAE

922

Heliopsis helianthoides (Linnaeus) Sweet var. scabra (Dunal) Fernald, Western Sunflower-everlasting, Rough Oxeye, Western Oxeye. Mt (WV), Pd (VA): dry, open forests and woodlands, woodland borders; uncommon (rare in VA). May-October. NL (Newfoundland) and SK south to VA, WV, KY, GA, LA, TX, and NM. FNA mentions frequent intergradation, and some plants in our area best considered var. scabra do not seem to be “pure.” [= C, F, G, K, SE; = H. scabra Dunal – S, WV; = H. helianthoides ssp. scabra (Dunal) Fisher – Z]

Helminthotheca Zinn 1757 (Oxtongue)

* Helminthotheca (Linnaeus) Holub, Bristly Oxtongue. Cp (VA?): disturbed areas; rare, native of Europe. July-September. Reported from DC and VA; uncertain whether documented from our area. [= FNA; = Picris echioides Linnaeus – C, F, G, K, SE]

Heterotheca Cassini 1817 (Camphorweed, Golden-aster)

1 Ray flowers with pappus; perennial, from creeping rhizomes; upper and lower leaves cuneate to a sessile base...............................................................H. camporum var. glandulissimum

1 Ray flowers without pappus; annual or biennial, taprooted; upper leaves rounded to clasping at the sessile base, lower leaves (deciduous by late in the season) petiolate.

2 Plants erect or decumbent, 0.3-1 m tall; leaves scabrous on both sides or only beneath; phyllaries densely hirsute and glandular on the back; [of coastal dunes] .........................................................................................................................................................................................H. latifolia var. latifolia

2 Plants erect or decumbent, 0.3-1 m tall; leaves scabrous on both sides or only beneath; phyllaries densely hirsute and glandular on the back; [of a variety of weedy habitats, mainly inland]............................................................................................................................H. minor

Heterotheca subaxillaris (Lamarck) Britton & Rusby, Dune Camphorweed. Cp (DE, FL, GA, NC, SC, VA), Pd (GA): coastal dunes and sand-flats; common. July-October (-December). NJ south to FL, west to TX and Mexico, along the coast. This taxon is apparently native in our area, and is a conspicuous component of the flora of ocean dunes. [= Y; = H. subaxillaris (Lamarck) Britton & Rusby var. subaxillaris – X; < H. subaxillaris – RAB, C, F, G, K, S, SE, WH (also see H. latifolia); = H. subaxillaris ssp. subaxillaris – FNA, Q]

Hieracium Linnaeus 1753 (Hawkweed, King-devil)

A genus of 250-1000 species, herbs, primarily temperate. Hieracium is a complicated genus, with many apomictic races sometimes recognized as taxa. Sometimes separated into Hieracium and Pilosella. References: Strother in FNA (2006a); Cronquist (1980)=SE. Key adapted from C.

1 Leaves primarily cauline, the largest leaves definitely on the stem, basal leaves usually absent; [Hieracium s.s.]

2 Florets 8-20 (-30) per head; leaves nearly glabrous, or with a few long hairs on the lower surface; upper stem glabrous......H. paniculatum

2 Florets 30-110 per head; leaves setose, with long hairs on the upper and lower surfaces; upper stem stipitate-glandular, stellate-pubescent, or glabrous.

3 Leaves with entire margins, rounded to obtuse at the tip; [widespread in our area].................................................................H. scabrum

3 Leaves with toothed to laciniate margins, acute to obtuse at the tip; [disjunct at high elevations in WV].........................H. umbellatum

1 Leaves primarily basal, the largest leaves basal, leaves in some species extending onto the lower portion of the stem.
Plants stoloniferous; [aliens of weedy habitats, especially pastures, roadsides, and lawns]; [Pilosella].

4 Plants not stoloniferous; [primarily natives (except \(H. \text{aurantiacum}\) and \(H. \text{piloselloides}\)), of various (mostly dry) habitats].

9 Cypselas 1.5-2 mm long, truncate at the tip; basal leaves mostly 5-12× as long as wide (the petiole included); well-developed basal leaves rarely over 3 cm wide; [-]; [Pilosella].

10 Leaves and stem glaucous; leaves sparsely hairy to nearly glabrous on the upper surface. .......................................................... \(H. \text{piloselloides}\)

11 Leaves not purple-veined.

9 Cypselas 2-4 mm long, usually distinctly narrowed to the tip (except \(H. \text{scabrum}\)); basal leaves mostly 1.5-5× as long as wide (the petiole included); well-developed basal leaves often over 3 cm wide; [native]; [Hieracium s.s.].

13 Inflorescence corymbiform.

14 Cypselas 2-3 mm long, truncate, broadest at the tip; flowers 40-100 per head. ................................................................................. \(H. \text{scabrum}\)

16 Cypselas 2.2-5 mm long, at least the longer achenes narrowed to the tip; flowers 15-40 per head.

17 Stem with several well-developed leaves slightly smaller than the basal leaves; inflorescence corymbiform or tending toward paniculate.

5 Heads (1-) 2-many per plant. .......................................................................................................................... \(H. \text{pilosella}\)

6 Heads (1-) 2-6 per plant, leaves nearly glabrous on the upper surface. ................................................................................. \(H. \text{flagellare}\)

7 Flowers deep orange. .......................................................................................................................... \(H. \text{aurantiacum}\)

8 Flowers yellow.

* \(H. \text{caespitosum}\) Dumortier, Yellow King-devil, Yellow Fox-and-cubs. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): pastures, fields, roadsides, grassy balds; common (uncommon in DE, rare in VA Coastal Plain), native of Europe. May-July. [= C, FNA, K, SE, W; \(= \text{Pilosella caespitosa}\) (Linnaeus) F. Schultz & Schultz ‘Pilosella flagellaris’]

* \(H. \text{flagellare}\) Willdenow, Whiplash Hawkweed. Mt? (VA), Pd (DE): roadsides; rare, native of Europe. Considered to derive from hybridization between \(H. \text{caespitosum}\) Dumortier and \(H. \text{piloselloides}\) Linnaeus. [= C, F, FNA, SE; \(= H. \times\text{flagellare}\) Willdenow (pro sp.) var. flagellare – K; \(= \text{Pilosella flagellaris}\) (Willdenow) Sell & C. West]

* \(H. \text{floribundum\text{Wimmer \& Grabowski, Glaucous Hawkweed. Mt (VA), Pd (VA): roadsides, pastures; rare, native of Europe. Considered to derive from hybridization between \(H. \text{caespitosum}\) Dumortier and \(H. \text{lactuella}\) Wallroth. [= C, F, G; \(= H. \times\text{floribundum}\) Wimmer & Grabowski (pro sp.) – K; \(= \text{Pilosella floribunda}\) (Wimmer & Grabowski) Arvet-Touvet]

* \(H. \text{marianum}\) Willdenow, Maryland Hawkweed. Cp (NC, SC), Pd (NC, SC), Mt (NC, SC, WV) {GA}: dry forests, woodland margins, roadsides; common (uncommon in WV). May-November. NH west to OH, south to FL and MS. Considered to derive from hybridization between \(H. \text{gronovii}\) Linnaeus and \(H. \text{venosum}\) Linnaeus. There is apparently no definite report from VA. [= F, K, S, WV; \(= H. \times\text{marianum}\) Willdenow (pro sp.) \(\rightarrow RAB, C, SE\]

* \(H. \text{piloselloides}\) Linnaeus, Leafy Hawkweed. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA): dry to mesic forests, especially along dirt roads; common. July-October. NS and QC west to MN, south to w. NC, n. GA, and OH. The leafy stem and lack of basal leaves of \(H. \text{piloselloides}\) readily distinguish it from our other species of \(H. \text{aurantiacum}\). In fact, it often puzzles the inexpertified botanist, who may overlook the possibility that this plant is a \(H. \text{aurantiacum}\)!* The milky sap and obscure teeth on the leaves are good corroborative characters. [= RAB, C, F, FNA, G, K, SE, W, WV]

**Hieracium trilinarii** Greene, Shale-barren Hawkweed. Mt (VA, WV), Pd (VA): shale barrens and dry shaley woodlands, other xeric woodlands; uncommon. May-June. Sc. PA south to w. VA and e. WV. [= C, F, FNA, G, SE, W; = H. greenii Porter & Britton – K, S, WV, a preoccupied name]

**Hieracium umbellatum** Linnaeus, Northern Hawkweed. Mt (WV): rocky areas; rare. Circumboreal, south in North America to PA, WV (Spruce Knob), IN, MO, CO, and OR. [= C, FNA, K; > H. canadense Michaux var. fasciculatum (Pursh) Fernald – F, G; > H. canadense var. hirtirameum Fernald – F, G]

* Hieracium lachenalii* K.C. Gmelin, European Hawkweed. Pd (DE), Mt (WV): disturbed areas; uncommon, native of Europe. [= C, K; ? H. vulgatum Fr. – FNA, F, G] [not yet keyed]

Hieracium longilobum Torrey, ON, OH, KY, and TN west to MN, NE, KS, OK, and TX. [= C, F, FNA, G, K, SE]

* Hieracium sabaudum* Linnaeus. Naturalized south to NJ and PA; native of Europe. August-October. May be found in our area. [= C, F, FNA, G, K] [not yet keyed]

Many of our species hybridize, and some of the species listed above are apparently hybrid derivatives. I prefer to treat taxa such as *H. marianum* as species (even if hybridization-derived) because they occur independently of the parental taxa (see above). Other hybrids of native species known in our area include: *H. gronovii × H. paniculatum* (Torrey & A. Gray) B.L. Turner is distributed in the s. Great Plains and adjacent areas, from NE south to TX and Coahuila. [*H. ×scribneri* Small (pro sp.), *H. scribneri* Small (pro sp.)]*

**Hymenopappus** L’Héritier 1788 (Woolly-white)

**Hymenopappus scabiosaeflorus** L’Héritier var. scabiosaeflorus. Cp (FL, GA, SC): turkey oak sandhills and adjacent sandy fields; common (rare in GA and SC). Sc. SC south to n. peninsular FL, west to AR, MO, and OK, and north in the interior to IN, c. and s. IL, and se. MO. Var. corymbosus (Torrey & A. Gray) B.L. Turner is distributed in the s. Great Plains and adjacent areas, from NE south to TX and Coahuila. [= C, FNA, K, SE; < H. scabiosaeflorus – RAB, F, G, S, WH]

**Hymenoxys** Cassini 1825

A genus of about 25 species, herbs, of w. North America, south through Central America to South America. References: Bierner in FNA (2006a); Cronquist (1980)=SE.

**Hypocharis** Linnaeus 1753 (Cat’s-ear)

A genus of about 60 species, herbs, of South America, Europe, Asia, and n. Africa. The controversial spelling of the genus name is now resolved in favor of *Hypocharis*. References: Bogler in FNA (2006a); Cronquist (1980)=SE.

1 Stem with at least a few well-developed leaves, clasping and similar to the basal; pappus of one length, all long and plumose.
2 Flowers yellow; middle and outer phyllaries hispid; heads usually 5-8 mm across at anthesis, the involucre campanulate........... *H. chillensis*
3 Flowers white; middle and outer phyllaries glabrous or puberulent; heads usually 2-4 mm wide at anthesis, the involucre cylindric.......... 

* H. microcephala var. albiflora

1 Stem naked, or only with few and very small bracts; pappus of two lengths, the outer short and barbellate, the inner long and plumose.
2 Plants glabrous or apparently so; plants mostly annual ................................................................. *H. glabra*
3 Plants conspicuously pubescent, as on the hispid leaves; plants mostly perennial ................................................................. *H. radicata*

* Hypochoeris glabra* Linnaeus, Smooth Cat’s-ear. Cp (FL, GA, NC, SC), Pd (NC, SC), Mt (NV): roadsides, fields, disturbed areas; common (rare in NC and WV, uncommon in FL), native of Europe. Early March-July. [= FNA, K, S, WH; = *Hypochoeris glabra* – RAB, C, SE, WV, orthographic variant] 

* Hypochoeris microcephala* (Schultz ‘*Bipontinus*’) Cabrera var. *albiflora* (Kuntze) Cabrera, White-flowered Cat’s-ear. Cp (GA): disturbed areas; rare, native of South America. This species has been found as a naturalized introduction at Fort Pulaski (Chatham County, GA) (T. Govus, pers. comm. 2006) and in Camden County, GA (Carter, Baker, & Morris 2009). [= FNA, K, SE]

**Inula** Linnaeus 1753 (Elecampane)

**Ionactis** Greene 1897 (Stiff-leaved Aster)

A genus of 5 species, herbs, of North America. *Ionactis* has usually been included in *Aster*, but differs in many characters and is more closely related to *Heterotheca* (Nesom & Leary 1992). References: Nesom in FNA (2006b); Nesom & Leary (1992)=Z; Cronquist (1980)=SE.

* Ionactis linariifolia* (Linnaeus) Greene, Stiff-leaved Aster. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry savannas, sandhills, pine flatwoods, prairie-like openings, glades, and barrens, high elevation rock outcrops and glades, to at least 1450 m, dry roadbanks, woodland edges, rocky woodlands; common (uncommon in WV, rare in DE). August-November. ME and QC west to WI, south to NE FL, Panhandle FL, and TX. There appears to be substantial variation in *I. linariifolia*, with montane (and northern) populations having considerably longer and broader leaves than Coastal Plain (and southern) populations; additional study is needed. [= FNA, WH, Z; = *I. linariifolia* – K, S, orthographic variant; = *Aster linariifolius* Linnaeus – RAB, C, G, SE, W, WV]

**Iva** Linnaeus 1753 (Marsh-elder)

A genus of about 9 species, shrubs and herbs, of North America and the West Indies, as circumscribed more narrowly by recent authors. References: Turner (2009a)=Z; Cronquist (1980)=SE; Jackson (1960)=Y; Strother in FNA (2006c).

1 Plants annual (perennial in *I. asperifolia*), not fleshy, more-or-less pubescent (at least in the inflorescence); [of mainly inland wetlands or disturbed areas].

2 Outer phyllaries united; [rare waif of disturbed areas and beaches]

3 Leaves 1.5-4.5 (-6.0) cm long, 0.4-1.0 (-1.5) cm wide, 1-3 mm thick when fresh, mostly untoothed; involucres 4-7 mm high; leaves alternate from midstem upward; [mostly of dunes and the upper beach]

4 Larger leaves 6-10 cm long, 2.0-4.0 cm wide, 1.5-4× as long as wide, usually with 8-17 teeth on each side; [of NJ southward]...

5 Involucres 1.5-2 mm high; outer phyllaries distinct, glandular-punctate; leaves 0.5-3 mm wide; pistillate flowers 3 per head

6 Involucres 2.5-3 mm high; outer phyllaries conuate, not glandular-punctate; leaves 1-8 mm wide; pistillate flowers 1 (-2) per head

7 Plants annual, erect, 5-12 dm tall; staminate flowers 1-5 per head
**Iva asperifolia** Lessing, Narrowleaf Marsh-elder. Cp (FL): wet disturbed areas; rare, native of sw. United States and Mexico. August-September. Perhaps *I. asperifolia* and *I. angustifolia* are best treated as only varietally distinct, as done by Turner (2009). [= S, Y; < *I. angustifolia* Nuttall ex Candolle – FNA, K, SE, WH; = *I. asperifolia* var. *asperifolia* – Z]

**Iva annua** Linnaeus, Sumpweed, Rough Marsh-elder. Cp (FL, GA**, SC**, VA*): fields, disturbed places; rare, in the eastern and inland part of area probably introduced by (native Americans) known from further west. September-November. PA, ND, and CO south to FL, NM, and Mexico (the original distribution uncertain). This species was apparently an important crop of native Americans. The so-called var. *macrocarpa* (Blake) R.C. Jackson, known from archeological remains and presumed extinct, is almost certainly a cultivated form, selected for its large seeds. [= RAB, C, FNA, GW, SE, WH, = *I. ciliata* Willdenow – F; = *I. ciliata* Willdenow var. *ciliata* – G; > *I. ciliata* var. *macrocarpa* Blake – G; > *I. annua* var. *annua* – K, Y; > *I. annua* var. *caudata* (Small) R.C. Jackson – K, Y; > *I. annua* var. *macrocarpa* (Blake) R.C. Jackson – K, Y; > *I. ciliata* – S; > *I. caudata* Small – S]

**Iva frutescens** Linnaeus var. *oraria* (Bartlett) Fernald & Griscom, Northern Maritime Marsh-elder. Cp (DE, MD, NC, VA): brackish marshes and marsh edges, normally on the back side of barrier islands; common (uncommon south of MD). Late August-November. NS south to Dare County, NC. The two varieties are morphologically distinct, except in the zone of overlap (NJ south to Dare County, NC), where intermediates will be encountered. Even in the zone of overlap, though, most plants are readily identified to variety. There might be some merit in considering these taxa species, with limited hybridization in a small portion of their total distributions. [= C, F, G, SE; = *I. frutescens* ssp. *oraria* (Bartlett) R.C. Jackson – K, Y; < *I. frutescens* – RAB, FNA, S; = *I. oraria* Bartlett]

**Iva imbricata** Walter, Dune Marsh-elder. Cp (FL, GA, NC, SC, VA): dunes, upper beach, island-end flats; common (rare in VA). Late August-November. SE. VA south to s. FL, west to LA; Bahamas and Cuba. This plant is often the most oceanward perennial plant, often the first perennial to colonize the upper beach or incipient dunes on island-end flats, where it occurs with such upper beach annuals as *Euphorbia polygonifolia*, *Euphorbia bombensis*, *Cakile edentula*, and *Amaranthus pumilus*. [= RAB, C, F, FNA, G, K, S, SE, WH, Y]

**Iva microcephala** Nuttall, Small-headed Marsh-elder. Cp (FL, GA, NC, SC, VA): wet pine flatwoods, flatwood ponds, clay-based Carolina bays; common (rare north of FL). September-October. C. NC south to s. FL, west to se. AL. A seed-banking annual, locally abundant some years and absent others depending on the variable hydrologic conditions of Carolina bays and other seasonally flooded wetlands. [= RAB, FNA, GW, K, S, SE, WH, Y]

**Ixeris** (Cassini) Cassini 1822

* *Ixeris stolonifera* A. Gray, Creeping Lettuce. Established as a weed in lawns, gardens, and plant nurseries in se. PA (Rhoads & Klein 1993) NY (Long Island), and DE (Cronquist 1980). Native of Japan. June-August. [= C, FNA, K, SE; = *Lactuca stolonifera* (A. Gray) Bentham ex Maximowicz – F]

**Jamesianthus** Blake & Sherriff 1940 (Warbonnet)

A monotypic genus, a perennial herb, endemic to c. AL and wc. GA. References: Strother in FNA (2006c).

**Jamesianthus alabamensis** Blake & Sherriff, Alabama Warbonnet. Mt (GA): streambanks over limestone or other calcareous rocks; rare (GA Special Concern). Endemic to stream banks in c. AL and wc. GA. The opposite leaves are squared off at the base in a distinctive manner. [= FNA, K, SE]

**Krigia** Schreber 1791 (Cynthia, Dwarf-dandelion)

ASTERACEAE

Krigia biflora (Walter) S.F. Blake var. biflora, Orange Dwarf-dandelion. Mt (GA, NC, VA), Pd (GA, NC, SC, VA); [add to synonymy] Krigia wrightii (A. Gray) K.L. Chambers ex K.J. Kim, Wright’s Dwarf-dandelion. AR and OK south to LA and TX. [= FNA, K]

Krigia dandelion (Linnaeus) Nuttall, Colonial Dwarf-dandelion. Pd (GA, NC, SC, VA); rocky woodlands, roadsides, disturbed areas; common (uncommon in VA Coastal Plain, rare in GA, NC, SC Coastal Plain). April-May. NJ, IL, and KA, south to Panhandle FL and ne. TX. = RAB, C, F, FNA, G, GW, K, SE, W, WH, Z; = Cynthia dandelion (Linnaeus) A.P. de Candolle – S]

Identification notes: Most species are highly variable in leaf lobing.

Lactuca Linnaeus 1753 (Lettuce)
Lactuca biennis (Moench) Fernald, Tall Blue Lettuce. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE): pastures, roadsides, forest edges, thickets; common (uncommon south of DE). August-November. NY, MB and MN south to s. FL and TX. [RAB, F, G, K; SE, WH; W, WV; > Mulgedium spicatum (Lamarck) Small var. spicatum – S; > Mulgedium latifolia (Raven) Small – S]

Lactuca hirsuta Muhlenberg ex Nuttall, Downy Lettuce. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC, VA, WV): forests and forest edges; uncommon (rare in Piedmont and Mountains, rare in GA Coastal Plain). Late May-November. NS and ON south to n. FL and TX. [RAB, C, F, G, K; SE, WH; WV; > L. hirsuta var. hirsuta – F, G, K; > L. hirsuta var. sanguinea (Bigelow) Fernald – F, G, K]

Lactuca ludoviciana (Nuttall) Riddell, Louisiana Lettuce. MB and BC, south to IN, KY, MS, LA, TX, and CA. [C, F, G, K, S, SE]

Lactuca virosa Linnaeus, Bitter Lettuce. Reported for DC and AL (Kartesz 1999; FNA); no specimens have been seen that document this distribution. [FNA, K] {not keyed}

Lagosceae Cavanilles 1803

A genus of 8 species, herbs and shrubs, of sw. United States, Mexico, and Central America, not pantropical by introduction. References: Harris in FNA (2006c); Stuessy (1978)=Z.

Lapsesa mollis Cavanilles, Silkleaf. Cp (FL): disturbed areas (on ballast); rare (not recently collected), native of Mexico (but now pantropical). Collected at Apalachicola, Franklin County, FL by A.W. Chapman and previously in FL by Rugel. [FNA, WH, Z] {not keyed}

Lapsana Linnaeus 1753 (Nipplewort)

A monotypic genus (after the removal of most members to Lapsanastrum), an annual herb, of temperate Eurasia. References: Bogler in FNA (2006a); Cronquist (1980)=SE.
A genus of about 30 species, herbs, primarily of temperate Eurasia. Samuel et al. (2006) show that *Leontodon* subgenus *Oporinia* should be recognized as a separate genus from *Leontodon* sensu stricto. References: Samuel et al. (2006); Bogler in FNA (2006a); Cronquist (1980) = SE. [also see *Oporinia*]

*Liatis* Schreber 1791 (Blazing-star, Gayfeather)

| 1 | Pappus plumose, the barbels mostly 0.5-1.0 mm long. | 2 Inner phyllaries with apices prolonged, loosely spreading, slightly dilated, and petaloid (white to yellow, pink, or purplish); heads 3-5 mm in diameter, with 4-6 flowers per head; corolla lobes glabrous within; [of the Coastal Plain from SC southward]. |
| 2 | Heads sessile; petaloid phyllary apices lavender, pink, or magenta, recurved, the petaloid portion short relative to the green phyllary bases | 3 Heads pedunculate on short peduncles; petaloid phyllary apices light yellow or cream (rarely pale lavender), divergent with tips ascending, the petaloid portion elongate relative to the green phyllary bases |
| 3 | *Leucanthemum elegans* var. *elegans* | *Leucanthemum elegans* var. *kralii* |
| 4 | 2 Inner phyllaries not prominently petaloid; heads 10-20 mm in diameter, with 10-60 flowers per head; corolla lobes coarsely hairy within; [collectively widespread]. | 4 Outer phyllaries as long as or (more usually longer than) the inner phyllaries, spreading or reflexed, the spreading portion typically > 2 mm long. |
| 5 | Outer phyllaries shorter than the inner phyllaries, erect-appressed to spreading or reflexed, the spreading portion 0-2 mm long. | 5 Stems and leaves usually glabrous; inner phyllaries apically rounded to truncate, apiculate, all essentially erect and appressed, usually with a narrow hyaline border, [L. simplicifolium] |
| 6 | 5 Stems and leaves hirsute to hirsute-pilosae; inner phyllaries apically acute-acuminate, all usually spreading to reflexed on the distal 1/3 (outer) to 1/5 (inner), usually without a hyaline border | 6 Pappus barbellate, the barbels 0.1-0.3 (-0.4) mm long. |
| 7 | Heads mostly 1-7 (-10) in a subcorymbiform arrangement; [of Bibb Co., AL] | Heads usually > 10 in a spiciform or racemiform arrangement; [collectively widespread]. |
ASTERACEAE

7 Leaves 3-5-veined.

8 Basal and lower cauline leaves (2-) 4-8 mm wide, cauline usually abruptly reduced in size at ca. midstem, continuing distally as linear, bract-like leaves; heads in a densely (-to-loosely) spiciform arrangement; involucres 7-9 mm, purplish to greenish; florets 5-6 (-8) per head; [mainly of the Coastal Plain] .........................................................L. spicata var. resinosa

8 Basal and lower cauline leaves 4-10 (-20) mm wide, cauline usually gradually reduced in size distally; heads in a densely to loosely spiciform arrangement; involucres (7-) 8-11 mm, usually greenish; florets (4-) 6-8 (-12) per head; [of the Mountains and Piedmont] .........................................................L. spicata var. spicata

7 Leaves 1-veined.

9 Mid and inner phyllaries either acutely or rounded-acute and minutely involute-cuspidate to apiculate.

10 Stems hirtellous with spreading to slightly deflexed hairs or variously puberulent to hirsute.

11 Stems hirsute to puberulent to strigose-puberulent .................................................................................................................L. gracilis

11 Stems hirtellous with spreading to slightly deflexed hairs.

12 Heads sessile, relatively crowded in a cylinder arrangement, rigidly ascending, appressed to the rachis and to each other, densely overlapping; [e. NC south to Panhandle FL and AL] .................................................................L. chapmanii

12 Heads sessile to short-pedicunculate, in a relatively loose, spiciform, racemoid, or paniculate, commonly second arrangement; [e. GA south through ne. FL to c. peninsular FL] .................................................................L. pauciflora

10 Stems glabrous.

13 Phyllaries acutely entirely hairs, minutely involute-cuspidate to apiculate; corolla tubes glabrous within.

14 Stems and basal leaves glabrous; basal leaves mostly coming from congested nodes at very base of plant, (1-) 2-6 (-9) mm wide, abruptly reduced in size distally, surfaces minutely white-dotted by stomates, not glandular-punctate ........L. laevigata

14 Stems and basal leaves glabrous to very sparsely pilose, leaves usually with a few, spreading cilia near insertion; basal and lower cauline leaves arising from numerous, separated nodes on proximal part of stem, 1-2 (-5.5) mm wide and relatively even-sized, surfaces glandular-punctate .................................................................L. tenuifolia

13 Phyllaries acutely entire; corolla tubes pilose within.

15 Heads in a second arrangement or not; involucres 6-15 mm; phyllaries ovate-triangular to generally oblanceolate; florets 4-10 (-12).

16 Heads densely arranged, on internodes 1-2 (-5) mm long, often secund; phyllary apex sharply acuminate-acute, distinctly involute, lamina relatively thin, glands consistently present and superficial at least on proximal portion; florets 4-7 (-9); basal and lower cauline leaves 2-5 mm wide, gradually reduced in length distally; .........................L. cokeri

16 Heads loosely arranged, on internodes 6-15 (-20) mm long, not secund; phyllary apex acutely sharp to obtuse-angled with a thickened apiculum, not markedly involute, lamina relatively thick, usually with evidently sunken punctate glands, without superficial glands; florets 7-10 (-12); basal and lower cauline leaves 4-9 (-12) mm wide, quickly reduced in width and length distally .................................................................L. virgata

17 Heads densely arranged, on internodes 2-5 (-10) mm; peduncles 0-2 (-7) mm; involucres 6-8 mm; phyllaries in 3-4 (-5) series ......................................................................................L. elegans

17 Heads loosely arranged, on internodes 2-5 (-10) mm; peduncles 0-2 (-7) mm; involucres 6-8 mm; phyllaries in 3-4 (-5) series ......................................................................................L. elegans

18 Stems glabrous (rarely sparsely hirtellous); leaves and phyllaries distinctly punctate-glandular to weakly punctate; pappus bristles as long as the corolla tubes .................................................................................................................L. microcephala

19 Involucres 6-10 mm; florets (6-) 7-13 (-17); corolla tubes internally pilose; pappus bristles as long as the corolla tubes (shorter in some populations of L. helleri).

20 Stems 15-55 cm; leaves and phyllaries weakly or not at all punctate; pappus bristles 1/3-2/3 to equal the corolla tube length; montane .................................................................................................................L. helleri

20 Stems 40-120 cm; leaves and phyllaries distinctly punctate-glandular to weakly punctate; pappus bristles equal the corolla tube length; coastal plain and piedmont. .........................L. pauciflora

21 Stems glabrous; heads loosely arranged, on internodes 2-5 (-10) mm; peduncules 0-2 (-7) mm; involucres 6-8 mm; phyllaries in 3-4 (-5) series ......................................................................................L. elegans

21 Stems glabrous to sparsely or moderately pilose; heads densely arranged, on internodes 1-2 (-5) mm; peduncules 0-10 (-17, -80 in proximal part of capitulescence) mm; involucres (7-) 8-10 mm, phyllaries in (3-) 4-5 (-6) series ..............L. pilosa

18 Stems puberulent to strigose.

22 Involucres 2.5-7 mm wide; florets 3-12.

23 Stems and peduncles puberulent to pilose-puberulent or strigose-puberulent; heads usually on ascending peduncles 2-10 (-12) mm; involucres 2.5-4 (-5) mm wide; phyllaries acutely rounded or obtuse to acute or acuminate; florets 3-6 (-9) ...L. gracilis

23 Stems and peduncles stiffly short-strigose with closely ascending hairs; heads on divergent, arcuate-ascending peduncles 10-25 (-30) mm; involucres 5-7 mm wide; phyllaries acutely rounded to nearly flat; florets 7-12 .........................................................L. patens

24 Heads usually on peduncles usually 8-50 mm (rarely subsessile); phyllaries erect, not reflexing; florets ca. 30-80 (19-33 in L. scariosa); corolla tubes glabrous or pilose within.

25 Leaves or leafy bracts 20-85 below the heads, cauline usually abruptly reduced above the basal; florets 19-33; [plants of the Central and Southern Appalachian] .................................................................L. scariosa var. scariosa

25 Leaves or leafy bracts 20-85 below the heads, usually continuing relatively even-sized upward above the basal; florets ca. 30-80; [plants of WV and PA northward] .................................................................L. scariosa var. newfoundlandii

26 Heads usually less strongly subsessile on peduncles 1-8 mm (rarely more); at least outer phyllaries usually reflexing; florets 11-26 (-30); corolla tubes pilose within.

26 Phyllaries glabrous, bullate, with broad, conspicuous, often erose to lacerate or irregular, hyaline border ........................................L. aspera

26 Phyllaries glabrous to puberulent or puberulent-hirtellous, essentially flat (not bullate), without hyaline border or border narrow and inconspicuous ..................................................................................................L. squarrulosa

Liatris chapmanii Torrey & A. Gray, Chapman's Blazing-star. Xeric sands of scrub. August-October. Sw. GA, s. AL, south to s. FL. [= FNA, K, SE, WH; > Lacinaria chapmanii (Torrey & A. Gray) Kuntze – S] {synonymy incomplete}

Liatris cokeri Pyne & Stucky, Sandhills Blazing-star. Sandhills. (August-) September-October. Sc. and se. NC south to ne. SC. [= FNA; > Liatris regimontis (Small) K. Schumann – RAB, SE, W, Y, misapplied; > Liatris cokeri – K; > Liatris regimontis – K]

Liatris cylindracea Michaux, Barreled Blazing-star. Limestone glades, prairies, rarely escaped from cultivation eastwards. July-September. NY, ON, and MN south to se. TN (Ridge and Valley) (Chester, Wofford, & Kral 1997), nw. GA, and c. AL (Bibb County), and OK. [= C, F, FNA, G, K, SE] {synonymy incomplete}

Liatris elegantula (Greene) K. Schumann. Cp (FL, GA): sandhills; uncommon. August-October (-November). GA south to n. peninsular FL, west to MS. [= FNA, WH; > Liatris graminifolia Willdenow var. elegantula (Greene) Gaiser – Z; > Lacinaria elegantula (Greene) Gaiser – Z; > Lacinaria elegantula (Greene) Kuntze – S; > Liatris graminifolia – SE] {synonymy incomplete}

Liatris gholsonii L.C. Anderson, Gholson’s Gayfeather. Mesic sandy sites. (July-) August-October (-November). Endemic to Liberty and Leon counties, FL. [= FNA, WH] {not yet keyed; add to synonymy}

Liatris gracilis Pursh, Slender Blazing-star. Sandhills, dry pine flatwoods. (July-) August-October (-November). SC south to s. FL, west to MS. [= RAB, FNA, K, SE, WH; > Lacinaria laxa Small – S; > Lacinaria gracilis (Pursh) Kuntze – S]

Liatris hirsuta Rydberg. Glades, and prairies. IA and NE south to MS, LA, and TX; disjunct eastward in nw. GA. [= FNA; > Lacinaria squarrosa (Linnaeus) Hill – S; > Lacinaria squarrosa (Linnaeus) Michaux var. hirsuta (Rydberg) Gaiser – C, F, G, K, SE, Y, Z; > Liatris squarrosa – W] {add to synonymy}

Liatris patens Nesom & Kral, Georgia Blazing-star. Longleaf pine sandhills and dry flatwoods. Late August-early November. SC south to e. Panhandle FL. See Kral & Nesom (2003) for detailed information. [= FNA, WH]

Liatris pauciflora Pursh, Few-flower Blazing-star. Xeric sands of scrub. August-October. GA (Tatnall Co.) south to c. peninsular FL; alleged by Small (1933) to extend to SC. [= Liatris pauciflora – K, SE (also see L. secunda); > Lacinaria pauciflora (Pursh) Kuntze – S; > Liatris pauciflora var. pauciflora – FNA, WH]

**Liatris provincialis** R.K. Godfrey. Sandhills, scrub, dunes. (August–) September-October. Endemic to FL Panhandle (Franklin and Wakulla counties). [= FNA, WH] {not yet keyed; add to synonymy}

**Liatris pycnostachya** Michaux var. *lasiophylla* Shinners. [= FNA; < *Lacinaria pycnostachya* (Michaux) Kuntze – S; < *Liatris pycnostachya* – C, F, G, SE] {not yet keyed; add to synonymy}

**Liatris pycnostachya** Michaux var. *provincialis*. [= FNA; < *Lacinaria pycnostachya* (Michaux) Kuntze – S; < *Liatris pycnostachya* – C, F, G, SE] {not yet keyed}

**Liatris squarrosula** Michaux. Diabase barrens, other glades and barrens, prairies, open woodlands. August-October (-November). S. WV, KY, IL, and MO south to GA, Panhandle FL, AL, and TX. Highly variable and needing additional study to determine if multiple taxa should be recognized. [= C, FNA, K, SE, W, WH; > *Liatris earlei* (Greene) Schumann – F, RAB, Y, Z; > *Liatris squarrosula* – G; > *Liatris squarrosula* (Greene) K. Schumann – F, G; > *Lacinaria ruthii* Alexander – S; > *Lacinaria shortii* Alexander – S; = *Liatris scariosa* var. *squarrosula* – Y, Z]

**Liatris tenuifolia** Nuttall. Longleaf pine sandhills. August-November. SC south to s. FL, west to AL. [= FNA, RAB; = *Liatris tenuifolia* Nuttall var. *tenuiifolia* – K, SE, WH; < *Lacinaria tenuifolia* (Nuttall) Kuntze – S] {also see *Liatris laevigata*}

**Asteraceae**

Ligularia Cassini 1816 (Ligularia)

A genus of 125 species (or more), perennial herbs, natives of temperate Eurasia. References: Barkley in FNA (2006b).

* Ligularia dentata (A. Gray) H. Hara. Commonly cultivated horticulturally in ne. North America, locally established or persistent, as in MD; native of China and Japan. [= FNA, K; = Senecio elivorum (Maximowicz) Maximowicz – C, SE]

Lygodesmia D. Don 1829 (Rush Pink, Skeletonplant)

Lygodesmia aphylla (Nuttall) Torrey & A. Gray, Flowering Straws, Rose-rush. Xeric sandhills. C. GA south to s. FL and west to c. Panhandle FL. [= FNA, K, S, SE, WH, Z]

**Madia** Molina 1782 (Tarweed)

A genus of about 10 species, of w. North America and Chile. References: Baldwin & Strother in FNA (2006c); Cronquist (1980)=SE.

* Madia sativa Molina, Tarweed. Disturbed areas, scattered occurrences (perhaps only waifs) in eastern North America, including GA, NC, PA; variously considered native of Chile or w. North America (see FNA). [= K; M. capitata Nuttall; > M. sativa var. sativa – SE; > M. sativa var. congesta Torrey & A. Gray – SE]

**Marshallia** Schreber 1791 (Barbara's-buttons)

A genus of about 11 species, perennial herbs, of the se. United States. Marshallia ranges from sc. VA, sw. PA, WV, s. KY, s. MO, and c. OK, south to c. peninsular FL, and sw. TX. References: Channell (1957)=Z; Watson in FNA (2006c); Watson & Estes (1990)=Y; Cronquist (1980)=SE; Watson, Elisen, & Estes (1991); Watson, Jansen, & Estes (1991); Beadle & Boynton (1901)=X.

**Ligularia** Cassini 1816 (Ligularia)

A genus of 125 species (or more), perennial herbs, natives of temperate Eurasia. References: Barkley in FNA (2006b).

* Ligularia dentata (A. Gray) H. Hara. Commonly cultivated horticulturally in ne. North America, locally established or persistent, as in MD; native of China and Japan. [= FNA, K; = Senecio clivorum (Maximowicz) Maximowicz – C, SE]
to oblanceolate, the apex obtuse to rounded (often emarginate); outer well-developed phyllaries with obtuse to rounded apex; corollas white to very pale pink; plants flowering late April-May (~early June).

7 Plant with 3-10 leaves on the lower stem, extending (5-) 8-20 (~30) cm up the stem; pappus scales (0.5-) 1.0-1.5 mm long; plant (2-) 3-5 (~7) dm tall; [of the Piedmont from sc. VA southward] .................................................. M. obovata var. obovata

7 Plant scapose (all of the leaves basal) or nearly scapose, with 1-5 leaves extending 1-5 (~10) cm up the stem; pappus scales (1.0-) 1.5-2.5 (~3.0) mm long; plant (0.5-) 1.5-3.5 (~5.0) dm tall; [of the Coastal Plain from NC southward] ........................................ M. obovata var. scaposa

6 Leafy portion of the stem 23-50 cm long, the naked peduncle 0.4-1.2× as long as the leafy portion of the stem; stem leaves reduced upward, the uppermost < 1/3 as long and wide as the largest leaves on the plant; basal leaves obovate to oblanceolate, the apex obtuse to acute or acuminate; outer well-developed phyllaries with acute to obtuse apex; corollas medium pink; plants flowering late June-July.

8 Basal and lower cauline leaves (2-) 3-13 (~20) cm long (including the petiole), (5-) 10-20 (~30) mm wide, averaging about 6× as long (including the petiole), the apex obtuse to rounded; pappus scales ca. 2 mm long; plants (2-) 3-5 (~8.5) dm tall; achenes without resin-dots between the ridges; [of the Mountains] .................................................. M. grandiflora

8 Basal and lower cauline leaves (8-) 15-25 (~32) cm long (including the petiole), (3-) 7-12 (~15) mm wide, averaging about 10× as long as wide (including the petiole), the apex acute to acuminate; pappus scales ca. 1.2 mm long; plants (4-) 6-9 (~10) dm tall; achenes with copious resin-dots between the ridges; [of the Piedmont] .................................................. M. species 1

**Marshallia graminifolia** (Walter) Small, Grassleaf Barbara's-buttons. Pine savannas. Late July-mid October. Ne. NC south to se. SC, and rarely to e. GA (Emanuel County) (Sorrie 1998b). Closely related to *M. tenuifolia* Rafinesque, which differs in having a well-developed horizontal rosette of thin-textured spatulate leaves, which do not leave fibrous remains (vs. with firm, ascending, linear-lanceolate basal leaves, which leave fibrous remains). [= GW, RAB, SE, Z; < *M. graminifolia* – FNA, = *M. graminifolia* var. *graminifolia* – K; > *M. graminifolia* var. *graminifolia* – X]

**Marshallia grandiflora** Beadle & F.E. Boynton, Appalachian Barbara's-buttons, Large-flowered Barbara's-buttons. Sandy or rocky riverbanks, bog margins, dry slopes over mafic rocks. June-August. Sw. PA south to sw. NC, e. TN (Cumberland Plateau) (Chester, Wofford, & Kral 1997), and se. KY. [= C, F, FNA, G, K, S, SE, W, WV, X, Y, Z; < *M. grandiflora* – RAB (also see *M. species 1*)]

**Marshallia mohrii** Beadle & F.E. Boynton, Coosa Barbara's-buttons. Sandstone, limestone, and dolostone glades, calcareous prairies. Nw. GA and n. and c. AL. It somewhat resembles *M. grandiflora*, but typically has 2-10 heads per plant (or solitary in depauperate individuals). [= FNA, K, S, SE, X, Y, Z]

**Marshallia obovata** (Walter) Beadle & F.W. Boynton var. scaposa Channell. Pine savannas. Late April-May. E. NC south to se. AL, in the Coastal Plain. [= K, RAB, SE, Y, Z; = *M. obovata* var. obovata – F, X, misapplied; < *M. obovata* – FNA, S]

**Marshallia ramosa** Beadle & F.E. Boynton, Pineland Barbara's-buttons, Southern Barbara's-buttons. Pinelands, Altamaha Grit outcrops, woodlands over ultramafic rocks. Coastal Plain from e. GA south to ne. FL and Panhandle FL. It somewhat resembles *M. graminifolia* in its linear leaves, but differs in the phyllaries acute (vs. subulate-acuminate), and flowering period (late May-June vs. July-mid-October). [= FNA, K, S, SE, WH, X, Y, Z]

**Marshallia species I** Oak Barrens Barbara's-buttons. Diabase barrens and fire-maintained woodlands over greenstone. Late June-July; August-September. This species is known from three extant and one extirpated population, in Granville County, NC and Halifax Co. VA, where associated with numerous rare and disjunct taxa of prairie or barren affinities: *Solidago phlomoides*, *Solidago rigidoides* var. glabrata, *Symphyotrichum depauperatum*, *Echinacea laevigata*, *Silphium terebinthinaceum*, *Baptisia australis* var. aberrans, *Linum sulphatum* var. sulphatum, *Carex meadii*, *Eryngium yuccifolium* var. *yuccifolium*, *Scutellaria leonardii*, *Lithospermum canescens*, and others. [= *M. graminifolia* – RAB]

**MATRICARIA** Linnaeus 1740 (Mayweed)

1 Heads with evident white rays (very rarely lacking rays); plant chamomile-scented; disc flowers 5-lobed................................. *M. chamomilla*
1 Heads discoid (lacking rays); plant pineapple-scented; disc flowers 4-lobed................................................................. *M. discoidea*

* Matricaria chamomilla* Linnaeus, German Chamomile, False Chamomile, Scented Mayweed. Roadsides; native of Europe. July-September. [= F, FNA, G, SE; = Matricaria recutita Linnaeus – C, K, Z; = Chamomilla recutita (Linnaeus) Rauschert]

**MELAMPODIUM** Linnaeus 1753

* Melampodium divaricatum* (Richard) DC. Disturbed areas; native of tropical America. [= FNA, K, WH]

**MELANTHERA** Rohr 1792

**Melanthera nivea** (Linnaeus) Small. Calcareous outcrops, sandy woodlands. June-October. E. SC south to s. FL, west to LA; also widespread in the West Indies, Mexico, Central America, and northern South America (Colombia, Ecuador, Peru, and Venezuela). [= FNA, K, SE, WH, Z; > M. hastata Michaux – RAB, S]

**MIKANIA** Willdenow 1803 (Climbing Hempweed)

A genus of about 430-450 species, vines, perennial herbs, and shrubs, primarily pantropical in distribution, but with extensions into temperate areas (Holmes 1995). References: Holmes in FNA (2006c); Cronquist (1980)=SE.

1 Involucre 6.5-8 mm; achenes 3.5-4.5 mm long; pubescence of the stems, leaves, and involucres spreading; [of se. SC southward] .......................................................... *M. cordifolia*
1 Involucre 4.5-5.5 (-6) mm high; achenes 1.5-2.5 (-2.7) mm long; pubescence of the stems, leaves, and involucres puberulent or nearly smooth; [widespread in our area] ........................................................................................................ *M. scandens*

**Mikania cordifolia** (Linnaeus f.) Willdenow, Heartleaf Climbing Hempweed. Bottomland hardwood forests, mesic hammocks near the coast, margins of tidal marshes. Se. SC (Beaufort and Colleton counties) (P. McMillan, pers. comm. 2005), e. GA (Bryan & Camden counties) (Carter, Baker, & Morris 2009), south to s. FL, west to s. LA. [= K, S, SE, WH]

**Mikania scandens** (Linnaeus) Willdenow, Climbing Hempweed. Marshes, swamp forests, wet thickets, seepages. July-October. ME to s. ON, south to s. FL and e. TX, south into the tropics. [=C, G, GW, K, RAB, S, SE, W, WH; > M. scandens var. pubescens (Nuttall) Torrey & A. Gray – F; > M. scandens var. scandens – F]
Oclemena E.L. Greene 1903 (Aster, Nodding-aster)

A genus of 3 species, perennial herbs, of e. North America. There now appears to be strong evidence (morphologic and molecular) and something approaching a consensus for the recognition of Oclemena as distinct from Aster. It appears that Oclemena is most closely related to Ionactis, and that these two genera are more closely related to Solidago and Heterotheca than to Aster (in a narrower sense). References: Brouillet in FNA (2006b); Nesom (1994)=Z; Semple, Heard, & Xiang (1996)=Y; Cronquist (1980)=SE; Nesom (1997).

1 Leaves 30-100 or more per plant, 1-8 mm wide ...................................................................................................................................
   Oclemena nemoralis

1 Leaves 11-30 per plant, 10-50 mm wide.

2 Leaves obovate, acuminate at the tip, thin in texture; [of the Mountains] ......................................................................................
   Oclemena acuminata

2 Leaves narrowly elliptic, acute to obtuse at the tip, coriaceous in texture; [of the Coastal Plain, from se. SC southward] ...........
   Oclemena reticulata

Oclemena nemoralis (Aiton) Greene, Leafy Bog Aster, Bog Nodding-aster. Peaty bogs. NL (Labrador) and ON south to nc. PA, MD, DE (formerly), and NJ. [= FNA, K, Z; = Aster nemoralis Aiton – C, F, G]

Oclemena reticulata (Pursh) Nesom, Pinet-barren Aster. Wet pine flatwoods. Late April-early June. Se. SC south through e. GA to c. peninsular FL. [= FNA, K, WH, Z; = Aster reticulatus Pursh – GW, RAB, SE; = Doellingeria reticulata (Pursh) Greene – S]

Onopordum Linnaeus 1753 (Scotch Thistle, Cotton-thistle)

A genus of about 60 species, herbs, of the Mediterranean region and w. Asia. References: Keil in FNA (2006a); Cronquist (1980)=SE.

Oporinia D. Don 1829 (Fall-dandelion)

A genus of about 20 species, herbs, primarily of temperate Eurasia. Samuel et al. (2006) show that Leontodon subgenus Oporinia (including L. autumnalis among the species treated below) should be recognized as a separate genus from Leontodon sensu stricto. References: Samuel et al. (2006), Bogler in FNA (2006a); Cronquist (1980)=SE.

* Oporinia autumnalis (Linnaeus) D. Don, Fall-dandelion. Roadsides, fields; native of Europe. June-October. [= Leontodon autumnalis Linnaeus – FNA, SE, WV; > Leontodon autumnalis Linnaeus var. autumnalis – C, F, G; > L. autumnalis ssp. autumnalis – K]

Packera Á. & D. Löve 1976 (Ragwort)

A genus of about 64 species, annual and perennial herbs, of subtropical, temperate, and arctic North American, with a few species in Siberia. These species have usually been considered part of Senecio, and have often been given informal status as "the Aureoid group". According to recent interpretations, this group warrants generic status, asPackera (Bremer 1994). References:
1 Plant an annual (rarely a biennial); leaf with lateral lobes broadly rounded, resembling the terminal lobe; [of wet soil of swamps and wet fields] ................................................................. P. glabella

1 Plant a perennial (rarely a biennial); leaf with lateral lobes absent, or distinctly narrower than the terminal lobe; [of dry to mesic soils, but not generally as above].

2 Principal leaves (especially the basal) 2-3-pinnatifid, the segments mostly 1-3 mm wide ................................................. P. millefolium

2 Principal leaves entire, toothed, or irregularly and raggedly 1-pinnatifid.

3 Plants densely tomentose or floccose when young, remaining visibly tomentose throughout the growing season on the leaves (these appearing grayish because of the persistent tomentum); basal leaves entire, obscurely crenate, or serrate (rarely lobed).

4 Basal leaves (including petioles) mostly 10-25 cm long, held in a vertical posture; [Coastal Plain and Piedmont of NC, SC, and VA, and Mountains of SC] .............................................................................. P. tomentosa

4 Basal leaves (including petioles) mostly 3-10 cm long, arching or prostrate; [Mountains].

5 Tomentum of leaf blades very fine and tight; [shale barrens and woodlands, w. VA and WV north to w. MD and we. PA] .............. P. antennariifolia

5 Tomentum of leaf blades coarser, looser; [calcareous, mafic, or ultramafic cliffs, barrens, and woodlands, w. VA and e. VA southward to w. NC and e. TN] ................................................................. P. paupercula var. appalachiana

3 Plants glabrate to sparsely floccose when young, becoming glabrous to glabrate later in the growing season, though some species with some persistent floccose tomentum near the base or in the leaf axils (the leaves appearing green); basal leaves serrate or lobed.

6 Basal leaves ovate, orbicular, or reniform, the blade 0.8-2× as long as wide; leaf blades cordate, truncate, or abruptly narrowed at the base.

7 Basal leaves reniform, strongly cordate at the base. ........................................................................................................ P. aurea

7 Basal leaves obovate to orbicular, truncate or abruptly narrowed at the base ................................................................. P. obovata

6 Basal leaves oblanceolate, narrowly elliptic, the blade 2-8× as long as wide; leaf blades cuneate at the base (truncate to cordate in P. Schweinitziana); plants usually not forming clonal patches by stolons or widely creeping rhizomes.

8 Basal leaves with truncate to cordate bases (and typically oblique); [high elevation grassy balds] ........................................... P. schweinitziana

8 Basal leaves cuneate at the base; [collectively widespread and of various habitats].

9 Heads many, generally 20-100; basal leaves (including petioles) up to 30 cm long and 3.5 cm wide ........................................ P. anemona

9 Heads few, generally 5-20; basal leaves (including petioles) up to 12 cm long and 2 cm wide ........................................ P. paupercula var. paupercula and P. crawfordii

Packera aurea (Linnaeus) Á. & D. Löve, Golden Ragwort, Heartleaf Ragwort. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, FL, VA): moist forests, bottomland forests, bogs, stream banks; common (rare in FL). Late March-June. NL (Labrador) west to MN, south to NC, ne. SC, n. GA, n. AL, and c. AR; disjunct in Panhandle FL. This species is variable, and some of the more striking variants have been named; some may well warrant formal taxonomic recognition, but additional study is needed. [= FNA, K, WH, Y; = Senecio aureus Linnaeus – C, G, GW, RAB, SE, WV, X; > Senecio aureus var. aureus – F; > Senecio aureus var. intercursa Fernald – F; > Senecio aureus var. gracilis (Pursh) Hooker – F; > Senecio aureus – S; > Senecio gracilis Pursh – S]

Packera crawfordii (Britton) A.M. Mahoney & R.R. Koval ined. Mt, Cp (NC): bogs and fens; rare. NJ, PA, and s. IN south to e. NC, w. NC, and TN. [= Senecio paupercula Michaux – RAB, C, G, GW, S, SE, X; = Senecio crawfordii (Britton) G.W. & G.R. Douglas – F; < Packera paupercula (Michaux) Á. & D. Löve – FNA]

Packera millefolium (Torrey & A. Gray) W.A. Weber & Á. Löve, Blue Ridge Ragwort, Yarrowleaf Ragwort. Mt (GA, NC, SC, VA): granitic domes, cliffs, and rocky woodlands, over granite, gneiss, schist, and amphibolite, and in calcareous glades (in sw. VA); rare. Late April-early June. Endemic to sw. NC, nw. SC, and ne. GA; disjunct in sw. VA (Lee Co.). The hybrid with Packera anonymous (= Senecio × memmingeri Britton [pro sp.]) occurs with the parents. The epithet in Packera is often spelled “millefolia,” ignoring that this epithet is a noun in apposition based on the pre-Linnaean genus name Millefolium (for Achillea)...

[= Senecio millefolium Torrey & A. Gray – C, F, S, RAB, SE, X; = Packera millefolia – FNA, K, Y; orthographic variant]
Packera obovata (Muhlenberg ex Willdenow) W.A. Weber & Á. Löve, Roundleaf Ragwort, Running Ragwort. Nutrient rich forests and woodlands (dry or moist), usually over calcareous or mafic rocks. April-June. VT west to KS, south to Panhandle FL and TX. [=FNA, KH, Y; = Senecio obovatus Muhlenberg ex Willdenow – C, RAB, S, SE, X; > Senecio obovatus var. obovatus – F, G, GV; > Senecio obovatus var. elliotii (Torrey & A. Gray) Fernald – F, G, GV; > Senecio obovatus var. rotundus Britton – F; > Senecio obovatus var. – S; > Senecio rotundus (Britton) Small – S]

Packera pauperculá (Michaux) Á. & D. Löve var. pauperculá, Balsam Ragwort, Northern Meadow Groundsel. Thickets, meadows, glades, generally over circumneutral soils derived from calcareous or mafic rocks. April-May. NL (Labrador) west to AK, south to GA, Panhandle FL (Bay County), AL, and OR. [< Packera pauperculá (Michaux) Á. & D. Löve – FNA, KH, X; < Senecio pauperculá Michaux – C, G, GW, RAB, SE, S; > Senecio pauperculá var. pauperculá – F; > Senecio pauperculá var. balsamae (Muhlenberg ex Willdenow) Fernald – F; > Senecio pauperculá var. praelongus (Greenman) House – F]

Packera pauperculá (Michaux) Á. & D. Löve var. pseudotomentosa (Mackenzie & Bush) R.R. Kowal. [habitats]; rare. [ ] [not yet keyed; add to synonymy]

Packera schweinitziana (Nuttall) W.A. Weber & Á. Löve, New England Ragwort. Grassy balds (in deep soil), at high elevations, in our area generally over metagabbro or amphibolite. May-July. NS and QC south to n. NY; disjunct to a few locations in w. NC and e. TN, notably on grassy balds on Roan Mountain, Snake Mountain, Rich Mountain, and Big Bald. [= FNA, KH; = Senecio schweinitzianus Nuttall – C, SE, X; = Senecio rotundus Oakes ex Rusby – F, G, RAB, S; = Packera schweinitzianus – Y, orthographic variant]

Packera tampicana (de Candolle) C. Jeffery, Great Plains Ragwort. AR and KS south and east to e. LA (Florida parishes) or s. MS (SE), and south to TX and Mexico. [= FNA; = Senecio imparipinnatus Klatt – SE] [not yet keyed]

Packera tomentosa (Michaux) C. Jeffrey, Woolly Ragwort. Sandy roadsides, sandy woodlands and forests, granitic flatrocks, granite domes. April-early June. S. NJ south to GA, west to TX, primarily on the Coastal Plain, but extending inland in the Piedmont and Mountains in thin sandy soils around rock outcrops, and as a roadside weed. [= FNA, KH, Y; = Senecio tomentosus Michaux – C, F, G, GW, RAB, SE, X; > Senecio tomentosus – S; > Senecio alabamensis Britton – S]

Palafoxia Lagasca y Segura 1816 (Palafoxia)

1 Perennial suffrutescence herb or shrub, 3-15 dm tall; phyllaries unequal, the longer inner phyllaries 8-11 mm long; pappus scales of the inner cypselas 4-7 mm long; [longleaf pine sands and sandy scrub, of sc. GA and FL] ................................................................. P. integrifolia

1 Annual herb, 2-8 dm tall; phyllaries equal, 3-10 mm long; pappus scales of the inner cypselas either 0.3-1 or 2-6 mm long.

2 Phyllaries 3-5 mm long; corollas 5-6 mm long; leaves 1-4 mm wide; pappus scales of the inner cypselas 0.3-1 mm long; [of calcareous prairies and glades, of MS westward] ................................................................. P. callosa

2 Phyllaries 5-8 mm long; corollas 7-10 mm long; leaves 5-20 mm wide; pappus scales of the inner cypselas 2-6 mm long; [in alien in our area, of disturbed sites] ................................................................. P. texana var. ambigua

Palafoxia callosa (Nuttall) Torrey & A. Gray, Small Palafoxia. Blackland prairies. MO, AR, and OK south to c. TX and Coahuila; disjunct in c. MS. [= FNA, KH, Z]

Panphalea Lagasca y Segura 1811

ASTERACEAE

* * Parthenium heterophyllum* Lessing. Waste areas around wool-combing mill; perhaps merely a waif, native of South America. April. See Pruski (2004) and Nesom (2004d).

Parthenium Linnaeus 1753 (Wild Quinine)

A genus of about 16 species, herbs and shrubs, of North America and the West Indies. Mears (1975) does not seem to me to be a fully satisfactory explanation of the variation within the genus. Morphologically and ecologically, *P. auriculatum* seems worthy of specific status, and I have not followed Mears's reduction of it to varietal status. *P. integrifolium* var. *mabryanum*, and var. *integrifolium* serve to describe real patterns of variation, but are disturbingly confluent morphologically, ecologically, and geographically. References: Mears (1975)=Z; Cronquist (1980)=SE; Strother in FNA (2006c).

1 Leaves pinnatifid to bipinnatifid, the primary sinuses extending 9/10 or more of the way to the midrib; leaves thin in texture; pappus of 2 petaloid scales; [alien annual] ................................................................. *P. hysterophorus*

**Parthenium auriculatum** Britton, Glade Wild Quinine. In shallow, xeric, circumneutral soil of glades, barrens, and woodlands, over calcareous rocks (such as dolostone) or mafic rocks (such as diabase). Mid May-August. Ne. WV south to c. NC and n. AL, west to c. TN. As indicated by the confusion over its taxonomy, the relationships and appropriate taxonomic treatment of this taxon are unclear. It is clearly a close relative of the Ozarkian *P. radfordii*, and perhaps not readily distinguished from it; some, at least, of our material has creeping rhizomes and heads over 7 mm in diameter, supposed to be serving to describe real patterns of variation, but are disturbingly confluent morphologically, ecologically, and geographically.

2 Stems glabrous or with short, appressed pubescence <1 mm long; cauline leaves only rarely auriculate-clasping, the upper cauline leaves sessile or petiolate, the lower cauline leaves petiolate, the petioles winged or not; blades of basal leaves (4-) 6-21 (-27) cm long, (1.4-) 2-12 (-13.5) cm wide.
3 Blades of basal leaves ovate-lanceolate, (4-) 6-12 (-20) cm long, (3-) 4-8 (-9.5) cm wide, never undulately lobed; heads (18-) 90-180 (-400) per inflorescence ................................................................. *P. integrifolium* var. *integrifolium*
3 Blades of basal leaves linear-lanceolate to ovate-lanceolate, (6-) 7-12 (-13.5) cm long, (1.4-) 2-4 (-4.5) cm wide, sometimes undulately lobed throughout their length; heads (30) 40-75 (-85) per inflorescence ................................................................. *P. integrifolium* var. *mabryanum*

**Parthenium integrifolium** Linnaeus, Santa Maria, Feverfew. Disturbed areas; native of tropical America, including the West Indies. July-November. [= C, FNA, G, K, S, SE, WH]

**Parthenium integrifolium** Linnaeus var. *mabryanum* Mears, Mabry's Wild Quinine. Sandhills and other dry soils, in forest openings or woodlands. Late May-November (blooming strongly in response to fire). Ne. SC, e. NC, and se. VA, barely extending into the e. Piedmont of NC in dry sandy soils around granitic flatrocks or in (formerly) fire-maintained communities. Var. *mabryanum* is the characteristic variety of *P. integrifolium* in the Sandhills of NC. Mears named a new species, *P. radfordii* Mears, to accommodate sinuate-lobed *Parthenium* from the fall-line sandhills of NC and SC, which he also believed to be later-blooming (August-November) than other *Parthenium*. Extensive observations in the Sandhills of NC show that "*P. radfordii*" consistently co-occurs in mixed populations with *P. integrifolium* var. *mabryanum*, and that flowering is triggered by fire. These sinuate-lobed plants are best considered a form of var. *mabryanum*. [= K; < *P. integrifolium* var. *integrifolium* – RAB; < *P. integrifolium* – C, F, FNA, G, S, SE, W; > *P. integrifolium* var. *mabryanum* – Z; > *P. radfordii* Mears – Z]

*Pascalea* Ortega 1797

* *Pascalea glauca* Ortega, Beach Creeping Oxeye. Coastal dunes, disturbed areas; native of South America, perhaps only a waif. Reported for FL, GA, and AL. [= FNA, K, S, WH; = Wedelia glauca (Ortega) O. Hoffmann – SE]
**Pectis** Linnaeus 1759

* **Pectis prostrata** Cavanilles. Roadsides, mowed areas, other dry disturbed areas; native of tropical America (probably including s. FL). July-November. Reported for NC (Basinger, pers. comm. 2006) and GA (Carter, Baker, & Morris 2009); likely to be in AL and SC. Spreading northward along roadsides. [= FNA, WH]

---

**Peripleura** (N.T. Burbidge) Nesom 1994

* **Peripleura arida** (N.T. Burbidge) Nesom. Waste areas around wool-combing mill; perhaps only a waif, native of Australia. See Nesom (2004d). [= **Vittadinia arida** N.T. Burbidge]

---

**Petasites** P. Miller 1754 (Butterbur)

* **Petasites hybridus** (Linnaeus) P.G. Gaertner, B. Meyer, & Scherbius, Butterbur, Butterfly-dock. Disturbed areas, frequently cultivated, rarely naturalized or persisting, native of Europe. Introduced and naturalizing south to DE, WV, and se. PA. [= C, F, FNA, G, K, SE]

---

**Phoebanthus** S.F. Blake 1916

1 Leaves 3-5 mm wide; phyllaries appressed; [of ne. FL south to s. peninsular FL] ................................................................. **P. grandiflorus**
1 Leaves 1.2 mm wide; phyllaries spreading; [of Panhandle FL and s. AL] ........................................................................... **P. tenuifolius**

**Phoebanthus grandiflorus** (Torrey & A. Gray) S.F. Blake. Sandhills. March-November. Ne. FL (Clay County) south to c. peninsular FL. [= FNA, K, SE, WH; = *P. grandiflora* – S, orthographic variant]

**Phoebanthus tenuifolius** (Torrey & A. Gray) S.F. Blake. Sandhills and flatwoods. May-September. Endemic to s. AL and Panhandle FL. [= FNA, K, SE, WH; = *P. tenuifolia* – S, orthographic variant]

---

**Picris** Linnaeus 1753 (Bitterweed, Oxtongue)

A genus of about 40 species, of the Old World, particularly the Mediterranean region. References: Strother in FNA (2006a); Cronquist (1980)=SE. [also see **Helminthotheca**]

1 Phyllaries in 2 series; phyllaries 3.5-8 mm wide; inner phyllaries 12-20 mm long; plant annual or biennial .... [see **Helminthotheca echioides**]
1 Phyllaries imbricate; phyllaries <3 mm wide; inner phyllaries 11-13 mm long; plant biennial to perennial................................. **P. hieracioides**

* **Picris hieracioides** Linnaeus, Hawkweed Oxtongue, Cat's-ear. Disturbed areas; native of Europe. May-October. [= RAB, C, F, FNA, G, SE, W; > **Picris hieracioides** Linnaeus ssp. hieracioides – K]
A genus of about 8 species (and numerous infraspecific taxa), herbs, of se. North America south to Central America. *Pityopsis* is taxonomically and nomenclaturally a difficult genus. The problems include nomenclatural issues involving typification and application (and frequently misapplication) of a plethora of names at specific and varietal level, disagreement over whether to include *Pityopsis* within an inclusive *Chrysopsis*, whether then to include *Chrysopsis* within an even more inclusive *Heterotheca*, and differences in species concepts in a morphologically and cytologically diverse group. References: Semple in FNA (2006b); Semple & Bowers (1985)=Z; Ward (2004c)=Y; Cronquist (1980)=SE.

1 Basal leaves shorter than the stem leaves; middle and upper stem leaves similar in size to one another.
2 Leaves and stems silky pubescent; disc 2-7 mm wide; [of se. TN, or of s. NJ northward, or of FL Panhandle].
3 Peduncles and phyllaries moderately to densely stipitate-glandular; [plants of the Mountains of TN]...............................[P. ruthii]
4 Stems straight; involucres 5-8 mm high; [plants of sandy places, from s. NJ northward]....................................................P. falcata
5 Peduncles flexuous; involucres (7-11 mm high, equaling the pappus; [plants of Panhandle FL] ..............................P. flexuosa
1 Basal leaves much longer than the stem leaves; stem leaves strongly reduced upward, the upper stem leaves much smaller than middle stem leaves.
5 Heads < 10; cauline leaves few, generally 2-7; [of sw. GA westward and southward]. ..................................................P. oligantha
5 Heads > 10; cauline leaves many; [collectively widespread in our area].
6 Peduncles and upper stem densely glandular-hairy (stipitate-glandular); phyllaries densely glandular-hairy; involucres 4.5-8 mm high; lower leaves < 10 mm wide.
7 Stems straight; involucres 5-8 mm high; middle and upper stem leaves similar in size to one another.
8 Involucres 14-18 mm high; disc florets 25-30; phyllaries densely glandular, involucres 12-14 mm high; lower leaves up to 20 mm wide.
9 Peduncles and phyllaries not stipitate-glandular (or only sparsely and minutely so); [plants of the Coastal Plain].
10 Inner phyllaries densely stipitate-glandular; at least distally; involucres 5-14 mm high; lower leaves up to 20 mm wide.
9 Involucres 8-14 mm high; disc florets > 30
10 Involucres 8-12 mm high; ray florets 10-16; disc corolla throats and lobes glabrous to short pilose (never long pilose); [widespread].........................................................P. graminifolia var. latifolia
9 Involucres 12-14 mm high; ray florets 13-25; disc corolla throats and lobes sometimes long-pilose; [of FL Panhandle].................P. graminifolia var. tracyi
8 Involucres 5-8 mm high; disc florets 15-29
10 Inner phyllaries densely stipitate-glandular, at least distally..................................................P. graminifolia var. tenuifolia
10 Inner phyllaries eglandular to sparsely glandular.........................................................................................P. graminifolia var. tenuifolia

**Pityopsis aspera** (Shuttleworth ex Small) Small var. *adenolepis* (Fernald) Semple & Bowers. Dry woodlands, forests, and disturbed places, apparently in the NC Mountains only in the Escarpment. Late June-October. E. and c. VA south to n. FL and west to s. MS. *P. adenolepis* includes 2 chromosome numbers (2n = 18 and 36), which "account, in part, for the range of variation in involucre, floret, and fruit size" (Semple & Bowers 1985). [= FNA, K, Z; < *Heterotheca adenolepis* (Fernald) Ahles – RAB; < *Heterotheca graminifolia* (Michaux) Shinners – RAB, misapplied; < *Chrysopsis graminifolia* (Michaux) Elliott var. *aspera* (Shuttleworth ex Small) A. Gray – C, G, SE, W; = *Chrysopsis graminifolia* (Michaux) Elliott – F, misapplied; = *P. adenolepis* (Fernald) Semple; < *Pityopsis aspera* – S, WH; < *Heterotheca aspera* (Shuttleworth ex Small) Shinners]

**Pityopsis aspera** var. *adenolepis* (Small) var. *adenolepis* (Fernald) Semple & Bowers. Dry woodlands, forests, and disturbed places, apparently in the NC Mountains only in the Escarpment. Late June-October. E. and c. VA south to n. FL and west to s. MS. *P. adenolepis* includes 2 chromosome numbers (2n = 18 and 36), which "account, in part, for the range of variation in involucre, floret, and fruit size" (Semple & Bowers 1985). [= FNA, K, Z; < *Heterotheca adenolepis* (Fernald) Ahles – RAB; < *Heterotheca graminifolia* (Michaux) Shinners – RAB, misapplied; < *Chrysopsis graminifolia* (Michaux) Elliott var. *aspera* (Shuttleworth ex Small) A. Gray – C, G, SE, W; = *Chrysopsis graminifolia* (Michaux) Elliott – F, misapplied; = *P. adenolepis* (Fernald) Semple; < *Pityopsis aspera* – S, WH; < *Heterotheca aspera* (Shuttleworth ex Small) Shinners]

**Pityopsis graminifolia** (Michaux) Nuttall. Stable dunes (NJ), further north in sandplain grasslands, coastal heathlands, pitch pine-scrub oak barrens. Sc. MA south through RI, CT, and NY (Long Island) to s. NJ; found once as a rare introduction in w. Pennsylvania (Pinellas County – Wunderlin & Hansen 2003). [= FNA, K, Z; = *Chrysopsis falcata* (Pursh) Elliott – C, F, G]

**Pityopsis graminifolia** var. *microcephala* (Michaux) Nuttall var. *graminifolia*. Sandhills. July-October. As interpreted here, *P. graminifolia* includes 5 varieties "that intergrade and hybridize, when the ploidy level is the same" (Semple & Bowers 1985). Var. *graminifolia* ranges from se. NC south to c. pensular FL, and west to e. LA; in our area it is known only from the outer Coastal Plain. Two of the varieties do not reach our area, being restricted to Pensacola FL: var. *aequilifolia* Bowers & Semple and the hexaploid (2n = 54) var. *tracyi* (Small) Semple. [= FNA, K, Z; < *Heterotheca nervosa* (Willdenow) Shinners var. microcephala (Small) Shinners ex Ahles – RAB; < *Chrysopsis graminifolia* (Michaux) Elliott var. *graminifolia* – C; < *Pityopsis microcephala* (Small) Small – S; < *Chrysopsis graminifolia* (Michaux) Elliott var. *microcephala* (Small) Cronquist – SE; < *Pityopsis graminifolia* – WH]
**Pityopsis graminifolia** (Michaux) Nuttall var. *latifolia* Fernald. Sandhills, dry woodlands and forests (such as ridgetop pine/heath communities in the Mountains), roadbanks. June-October. *Var. latifolia* is the most widely distributed variety of *P. graminifolia*, ranging from DE (formerly), s. OH, and c. AR south to s. FL and e. TX; Bahamas; and in Mexico (Tamaulipas, Vera Cruz, Oaxaca, Chiapas) and Central America (Belize, Guatemala, Honduras). [= FNA, K, Z; > *Heterotheca nervosa* (Wildenow) Shinners var. nervosa – RAB; > *Heterotheca correllii* (Fernald) Ahles = RAB = *Chrysopsis graminifolia* (Michaux) Elliott var. *latifolia* Fernald – C, W; > *Chrysopsis nervosa* (Wildenow) Fernald var. *nervosa* – *F*; < = *Chrysopsis graminifolia* (Michaux) Elliott var. *graminifolia* – SE, misapplied; = *Chrysopsis graminifolia* (Michaux) Elliott var. *graminifolia* – WH.

**Pityopsis graminifolia** (Michaux) Nuttall var. *tenuifolia* (Torrey) Semple & Bowers. Sandhills, sandy woodlands, savannas, pine flatwoods. July-October. *Var. tenuifolia* ranges from se. NC south to s. FL and west to e. TX (north inland to c. AR and e. OK); apparently disjunct in se. VA. [= FNA, K, Z; < *Heterotheca nervosa* (Wildenow) Shinners var. *microcephala* (Small) Shinners ex Ahles – RAB (also see *P. graminifolia* var. *graminifolia*); < *Pityopsis microcephala* (Small) Small – S (also see *P. graminifolia* var. *graminifolia*); < *Chrysopsis graminifolia* (Michaux) Elliott var. *microcephala* (Small) Cronquist – SE (also see *P. graminifolia* var. *graminifolia*); < *Pityopsis graminifolia* – WH; ? *Pityopsis nervosa* var. *nervosa* – Y).

**Pitopyis graminifolia** (Michaux) Nuttall var. *tracyi* (Small) Semple. Sandhills. October-December. Endemic to Panhandle FL; reports of it in n. AL are probably based on aberrant individuals of *P. graminifolia*. [= FNA, K, Z; = *P. tracyi* Small – S; < *Chrysopsis graminifolia* – SE; < *Pityopsis graminifolia* – WH; = *Pityopsis nervosa* (Willdenow) Dress var. *tracyi* (Small) D.B. Ward]

**Pityopsis oligantha** (Chapman ex Torrey & A. Gray) Small, Narrow-leaved Goldenaster. Wet flatwoods and pitcherplant bogs. Sw. GA and Panhandle FL west to s. AL (alleged reports from further west seem to be in error). [= FNA, K, S, WH, Z; = *Chrysopsis oligantha* Chapman ex Torrey & A. Gray = *Heterotheca oligantha* (Chapman ex Torrey & A. Gray) Harms]

**Pityopsis pinifolia** (Elliott) Nuttall, Sandhill Goldenaster. Sandhills, sandy roadsides. August-October. This species is locally abundant (and often weedy) but very local in distribution, limited to (apparently) scattered counties in the Sandhills (rarely middle Coastal Plain) of s. NC, SC, GA, and c. AL. [= FNA, K, S, Z; = *Heterotheca pinifolia* (Elliott) Ahles – RAB; = *Chrysopsis pinifolia* Elliott – SE]

**Pityopsis ruthii** (Small) Small. Flood-scoured rocks along rivers. Restricted to rocks within the flood zone of the Hiwassee and Ocoee rivers, Polk County, TN; it should be sought in adjacent sw. NC. [= FNA, K, S, Z; = *Chrysopsis ruthii* Small – SE; = *Heterotheca ruthii* (Small) V.L. Harms]

---

**Plectocephalus** D. Don in R. Sweet 1830 (Basketflower)

---

**Pluchea** Cassini 1817 (Marsh-fleabane)

1 Stems winged by decurrent leaf bases .................................................................................................................................................... *P. sagittalis*
1 Stems not winged by decurrent leaf bases.
2 Leaves petiolate or narrowly cuneate at the base; [section *Pluchea*].

---

A list of sources for the references is provided in the document. Further details about the distribution and identification of each species are included in the text.
3 Phyllaries glandular on the outer surface (the outer bracts also somewhat pubescent); inflorescence paniculiform, the lateral branches not reaching or exceeding the central branches; plants to 20 dm tall; [in freshwater habitats, widespread in the Coastal Plain and Piedmont] ............................................................ P. camphorata

3 Phyllaries short-pubescent with several-celled glandular-tipped hairs; inflorescence more-or-less cymiform and flat-topped, some of the lower lateral branches elongate and reaching or exceeding the central branches; plants to 10 (-15) dm tall; [mainly in salty or brackish habitats, restricted to the outer Coastal Plain] .............................................................. P. odorata

2 Leaves sessile, and either rounded, truncate, or clasping at the base; [section Amplexifolium].

4 Leaves mostly 8-20 cm long and 3-7 cm wide; involucre 9-12 mm high; middle phyllaries 2.5-3 mm wide ......................... P. longifolia

4 Leaves mostly 3-10 cm long and 1-3 cm wide; involucre 5-10 mm high; middle phyllaries 1-1.5 mm wide.

5 Stems and leaves glandular, otherwise nearly glabrous; involucre 4-5 mm wide ......................................................... P. yucatanensis

5 Stems and leaves puberulent or arachnose as well as glabular; involucr 5-12 mm wide.

6 Corollas pink or purple; heads 4-6 mm high, 5-9 mm wide; phyllaries usually arachnoid and commonly also with dense, thick, viscid hairs; outer phyllaries acuminate; nutlets black, 0.5-1 mm long, densely pubescent; [flowering June-July] .............. P. baccharis

6 Corollas creamy white; heads 6-10 mm high, 6-12 mm wide; phyllaries thinly arachnoid, with sessile glands; outer phyllaries obtuse or obtuse-apiculate; nutlets pinkish, ca. 1 mm long, pubescent on the angles; [flowering late July-October].

7 Plants 3-11 dm tall; inner phyllaries 4-6 mm long; [widespread in our area] ................................................................. P. foetida var. foetida

7 Plants 9-25 dm tall; inner phyllaries 6-7 mm long; [in the Coastal Plain of SC southward] ............................................. P. foetida var. imbricata

Pluchea camphorata (Linnaeus) A.P. de Candolle, Camphorweed, Camphor Pluchea. Bottomland sloughs, clay flatwoods, other freshwater wetlands. August-October. DE (formerly) and MD south to n. peninsula FL, west to TX and OK, north in the interior to s. OH and e. KS. [= RAB, C, F, FNA, G, GW, K, SE, WH, X, Y; = P. petiolata Cassini – S]

Pluchea foetida (Linnaeus) A.P. de Candolle var. foetida, Stinking Fleabane. Seasonally wet areas, ditches, various other freshwater wetlands. Late July-October. S. NJ south to s. FL, west to e. TX; West Indies (?). [= K; < P. foetida – RAB, C, F, FNA, G, GW, SE, WH, X, Y; > P. foetida – S; > P. tenutifolia Small – S]

Pluchea foetida (Linnaeus) A.P. de Candolle var. imbricata Kearney. Freshwater wetlands. Late July-October. SC south to FL Panhandle. The validity and distribution of this taxon need additional study. [= K; < P. foetida – RAB, C, FNA, GW, SE, WH, X, Y; = P. imbricata (Kearney) Nash – S]

Pluchea longifolia Nash. Brackish and fresh marshes and swamps, ditches, canals. Ne. FL and eastern FL Panhandle (Wakulla and Taylor counties) south to c. peninsular FL (Wunderlin & Hansen 2008). [= FNA, SW, S, WH]

Pluchea odorata (Linnaeus) Cassini, Saltmarsh Fleabane. Salt and brackish marshes. August-October. MA and MI south to s. FL and TX (mostly on the Coastal Plain), also in w. United States, Central America, and South America. Two varieties are sometimes recognized, the widespread and more robust, but small headed var. odorata (involucre 4-6 (-7) mm across the disk, with 6-13 (19) functionally staminate flowers; plants 2-8 (-20) dm tall; of VA southward), and the northeastern North American and less robust but large-headed var. succulenta (involucre 7-8 (-10) mm across the disk, with (14-) 21-34 functionally staminate flowers; plants 2-6 dm tall, of NC northward). Additional study is needed to warrant recognition of the varieties. [= GW, WH, X, Y; = P. purpurascens (Swartz) A.P. de Candolle – RAB; > P. odorata var. odorata – C, FNA, K, SE; > P. odorata (Linnaeus) Cassini var. succulenta (Fernald) Cronquist – C, FNA, K, SE; > P. purpurascens (Swartz) A.P. de Candolle var. purpurascens – F, G; > P. purpurascens (Swartz) A.P. de Candolle var. succulenta Fernald – F, G; > P. camphorata – S, misapplied]

* Pluchea sagittalis (Lamarck) Cabrera, Wing-stem Camphorweed. Disturbed areas, probably only a waif, known from older collections (1891-1901) from Pensacola, FL, and Mobile, AL; native of South America. July-August. [= FNA, WH; = P. quitoc de Candolle – S; = P. suaveolens (Vell.) Kuntze – SE] [synonymy incomplete]

* Pluchea yucatanensis Nesom, Yucatan Camphorweed. Brackish marshes; native of Mexico and Belize. Introduced in s. AL and s. MS. [= FNA]

Polyommia Linnaeus 1753

**Prenanthes** Linnaeus 1753 (Rattlesnake-root)

**Identification notes**: The species cannot be reliably identified in sterile condition. "Principal phyllaries" are the inner, well-developed, excluding the few smaller and poorly-developed outer phyllaries.

1 Principal phyllaries 12–15; florets 15–38 per head; [entering our area in WV from the north and west].
   1 Principal phyllaries 4–10; flowers mostly 4–19 per head; [collectively widespread in our area].
   2 Phyllaries evidently (though sometimes sparsely) pubescent with long coarse hairs (1.5–3 mm long).
   3 Inflorescence corymbiform to paniculiform, many of the branches well-developed.
   4 Phyllaries densely setose; principal leaves usually evidently lobed.
   5 Heads ascending or nearly erect; principal phyllaries (6–)8 (–10); flowers (8–)11–14 (–19) per head; [WV, KY, TN, nw. AL, MS and westwards].
   6 Principal phyllaries (4–)5 (–6); flowers 4–6 per head.
   7 Inflorescences narrow and elongate (virete); flowers pink to purple.
   8 Pappus cinnamon-brown; corolla whitish to pinkish.
   9 Pappus straw-colored to light brown; corolla pale yellow.

**Prenanthes alba** Linnaeus, Northern Rattlesnake-root. Forests. August-November. ME west to MB, south to NC, w. NC, WV, and MO. Reported for GA (GANHP). Reports of *P. alba* from the Coastal Plain of NC and perhaps VA are based on *P. alba* ssp. *pallida*, which is invalidly published; additionally, specimens attributed to this taxon appear to be better attributed to *P. trifoliolata*. [= C, F, FNA, G, K, SE, W, Z; = *P. alba* ssp. *alba* – RAB; = *Nabalus albus* (Linnaeus) Hooker – S]

**Prenanthes aspera** Michaux, Rough Rattlesnake-root. Prairies, glades, and barrens. August-September. PA, OH, WI, MN, and SD south to c. TN, MS, LA, and OK. [= C, F, G, K, SE; = *Nabalus asper* (Michaux) Torrey & A. Gray – S; = *Nabalus asperus*, orthographic variant]

**Prenanthes autumnalis** Walter, Slender Rattlesnake-root. Pocosins, pine savannas, forest edges. September-November. NJ south to ne. FL, a Southeastern Coastal Plain endemic. [= C, F, FNA, G, K, RAB, SE, WH, Z; = *Nabalus virgatus* (Michaux) A.P. de Candolle – S; = *Nabalus species 1*]

**Prenanthes barbata** (Torrey & A. Gray) Milstead, Barbed Rattlesnake-root, Flatwoods Rattlesnake-root. Limestone glades and barrens. C. TN (Western Highland Rim) (Chester, Wofford, & Kral 1997), nw. GA, and n. AL. west to se. AR, e. TX and w. LA. [= FNA, K, SE; < *Nabalus integriformis* Cassini – S, misapplied; = *P. serpentina* Pursh var. *barbata* Torrey & A. Gray; = *Nabalus barbatus* (Torrey & A. Gray) A. Heller]

**Prenanthes roanensis** (Chickering) Chickering, Roan Rattlesnake-root, Appalachian Rattlesnake-root. Mountain forests, grassy balds, at high elevations. August-October. Sw. VA south to w. NC and e. TN. Fusiak & Schilling (1984) studied *P. roanensis* and related species. Additional characters (other than those explicitly used in the key above) useful in separating *P. roanensis* from *P. altissima* are: phyllary tips usually black (vs. usually green), flowers 5-8 per head (vs. 4-6), and inflorescence usually narrow and thyrsoid (vs. usually conspicuously branched). = C, FNA, K, RAB, SE, W, Y, Z; > *P. cylindrica* (Small) Braun – G; > *Nabalus roanensis* Chickering – S; > *Nabalus cylindricus* Small – S

---

**Pseudognaphalium** Kirpicznikov 1950 (Rabbit-tobacco)

1 Involucre 3-7 mm high; plants 15-100 cm tall; inflorescence terminal, elongate, clustered, or corymbose. ................................................................................................................................................................................................. [see *Gnaphalium uliginosum*]

1 Leaves distinctly (but shortly) decurrent 1-10 mm and adnate-aunculicate on the stem.

2 Upper surface of the leaves coarsely glandular-hairy; heads in corymbose arrays................................................................. *Ps. macounii*

2 Upper surface of the leaves loosely tomentose, not glandular; heads in terminal glomerules

3 Involucres 3-4 mm high; bisexual florets 5-10 (corollas evenly yellowish, not red-tipped); cypselae with papilliform hairs ................................................................. *Ps. lutealbum*

3 Involucres 4-6 mm high; bisexual florets mostly 18-28 (corollas evenly yellowish, not red-tipped); cypselae glabrous................................................................. *Ps. stramineum*

4 Leaves sessile, not decurrent or adnate-aunculate.

5 Stem white-woolly or arachnoid with matted white hairs, the stem surface generally obscured (sometimes glandular-pubescent at the base of the stem only). ................................................................................................. *Ps. obtusifolium*

5 Stem glandular-pubescent or glandular-puberulent, the hairs at right angles to the stem, the stem surface plainly visible.

6 Stems glandular-villos, the stipitate glands (0.1-) 0.3-1.0 mm high, prominently visible in height on any portion of the stem, with a stalk broadened toward the base and about equal the gland width; pistillate florets 83–107, bisexual florets 9–15; leaves mostly oblong-lanceolate, 2.5–7 cm long, 4–20 mm wide, 4–8 times longer than wide; plant 4-10 dm tall ......................... *Ps. helleri*

6 Stems glandular-puberulent, the stipitate glands 0.1-0.2 mm high, relatively even in height on any portion of the stem, with a filiform stalk of even width and narrower than the gland width; pistillate florets 47–78; bisexual florets (7–) 11–20; leaves linear to linear-lanceolate or linear-oblanceolate, 1.5–5.5 cm long, 1.5–10 mm wide, 6–10 times longer than wide; plant 3-7 dm tall.............. *Ps. micradenium*

---

**Pseudognaphalium helleri** (Britton) A. Anderberg, Heller's Rabbit Tobacco. Dry woodlands and openings (especially over mafic rocks), sandhills. September-October. Sc. VA south to Panhandle FL, s. AL, west to AR, LA, and ne. TX. = FNA, X; = *Gnaphalium helleri* Britton var. *helleri* – Z; < *Gnaphalium helleri* – C, G, RAB, SE, W (also see *Ps. micradenium*); = *Gnaphalium obtusifolium* var. *helleri* (Britton) Blake – F, Y; = *Pseudognaphalium helleri* (Britton) A. Anderberg ssp. *helleri* – K; < *Pseudognaphalium helleri* – WH

---

**Nabalus roanensis** Chickering – S; > *Nabalus cylindricus* Small – S

**Nabalus crepidineus** (Michaux) A.P. de Candolle – S

**Nabalus serpentarius** (Pursh) Hooker – S

**Nabalus trifoliatus** Cassini – S
Pseudognaphalium luteoalbum (Linnaeus) Hilliard & B.L. Burtt, Red-tipped Rabbit Tobacco. Mowed rights-of-way; native of Eurasia. April-June. [= FNA, K] [add synonymy]

Pseudognaphalium macounii (Greene) Kartesz, Clammy Cudweed, Winged Cudweed, Clammy Everlasting. Dry fields, pastures, and woodland edges at high elevations. July-September. QC west to BC, south to w. VA, WV, TN, and Mexico. [= FNA, K; = Gnaphalium macounii Greene – C, F, S, WV; < Gnaphalium viscosum – SE, Y, misapplied; < Pseudognaphalium viscosum (Kunth) W.A. Weber, misapplied]

Pseudognaphalium micradenium (Weatherby) Nesom, Small Rabbit Tobacco. Dry woodlands and openings. September-October. Se. ME west to WI, south to e. SC, c. GA, se. TN, and s. MO. Nesom (2001a) discusses the distinctiveness of this taxon and its treatment as a species, rather than variety. [= FNA, X; = Gnaphalium helleri Britton var. micradenium (Weatherby) Mahler – Z; > Gnaphalium helleri – C, G, RAB, S, SE, W; = Gnaphalium obtusifolium var. micradenium Weatherby – F, Y; = Pseudognaphalium helleri (Britton) A. Anderberg ssp. micradenium (Weatherby) Kartesz – K]

Pseudognaphalium obtusifolium (Linnaeus) Hilliard & Burtt, Fragrant Rabbit Tobacco. Openings, woodlands, coastal dunes, sandy pinelands, disturbed areas. August-October. NL (Newfoundland) west to ON, south to s. FL and TX. [= FNA, WH, X; = Gnaphalium obtusifolium Linnaeus – RAB, S, SE, W, WV; > G. obtusifolium var. obtusifolium – F; > Gnaphalium obtusifolium Linnaea var. praecox Fernald – F; = Gnaphalium obtusifolium var. obtusifolium – C, G, Y; > Pseudognaphalium obtusifolium ssp. obtusifolium – K; > Pseudognaphalium obtusifolium ssp. praecox (Fernald) Kartesz – K; ? Gnaphalium polycephalum Michaux]

Pseudognaphalium stramineum (Kunth) A. Anderberg. Sandy fields, roadsides, disturbed places; native of TX south through Mexico and into South America. Late May-August. [= FNA, K; = Gnaphalium stramineum Kunth – C; ? G. chilense Sprengel – RAB, SE, Y]

Pterocaulon Elliott 1823 (Blackroot)

Identification notes: Pterocaulon is an unmistakable plant, the stems and leaf undersurfaces creamy-white floccose-tomentose, the leaf bases deciduous down the stem, the heads in oblong, terminal spikes, the tip nodding before anthesis.

Pterocaulon pycnostachyum (Michaux) Elliott, Blackroot, Wingstem. Sandhills, dry pinelands, pine flatwoods. May-June. Se. NC south to s. FL and west to s. AL. [= RAB, FNA, GW, K, SE, WH, Z; = P. undulatum (Walter) C. Mohr – S]

Pulicaria Gaertner 1791 (False-fleabane)

A genus of 100 or more species, herbs (rarely shrubs), of Europe, Asia, and Africa. References: Preston in FNA (2006a).

* Pulicaria arabica (Linnaeus) Cassini. Disturbed areas (on ballast); perhaps just a waif (not recently collected), native of Africa. [= FNA, SE, WH; = Vicoa auriculata Cassine – S (misapplied)] [not keyed]

Pyrrhopappus A.P. de Candolle 1838 (False-dandelion)

1 Outer phyllaries mainly 1/3-2/3 as long as the inner phyllaries; lower and middle stem usually glabrous; leaf margins usually glabrous; upper cauline leaves usually pinnately (3-) 5-7 (-9)-lobed.................................................................................................................................P. carolinianus

1 Outer phyllaries mainly < 1/3 as long as the inner phyllaries; lower and middle stem usually sparsely to densely pilose; leaf margins usually ciliate; upper cauline leaves usually unlobed or pinnately 1-5-lobed.................................................................................................................................P. pauciflorus

Pyrrhopappus carolinianus (Walter) A.P. de Candolle, False-dandelion. Dry and moist forests, roadsides, meadows, fields. March-June (and sometimes later). DE, se. PA, and MD south to c. peninsular FL, west to IL, MO, and TX; he pre-Columbian range is uncertain. [= C, F, FNA, G, K, WH, WV, > P. carolinianus var. carolinianus – RAB, SE; > P. carolinianus var. georgianus (Shinners) Ahles – RAB, SE; = Sittilias multicaulis (A.P. de Candolle) Greene – S; = P. multicaulis A.P. de Candolle – SE]
ASTERACEAE

A genus of about 7 species, herbs, of North America. References: Urbatsch & Cox in FNA (2006c); Richards (1968)=Z; Cronquist (1980)=SE. Key adapted from SE.

1 Disks columnar, 2-4.5× as long as thick; plant a tap-rooted perennial; rays < 2 (-2.5) cm long; achenes ciliate and winged, crowned by a pappus consisting of 1 or more awn-teeth ................................................................. R. columnifera
1 Disks ellipsoid-globular, 1-1.6× as long as thick; plant a fibrous-rooted perennial from a woody rhizome or caudex; rays 2.5-3.5 (-4.5) cm long; achenes smooth, lacking a pappus ................................................................................................................. R. pinnata

* Ratibida columnifera (Nuttall) Wooton & Standley, Columnar Prairie Coneflower. Dry disturbed areas, established around nurseries or plantings, waste areas near wool-combing mills; introduced from further west. May-August. ON west to AB, south to TX, Mexico, and AZ; introduced at scattered sites eastward, including e. NC, e. SC, and c. TN (Chester, Wofford, & Kral 1997). [= C, F, FNA, G, K, SE, WH, WV, Z; = R. columnaris (Sims) D. Don – S]

Ratibida pinnata (Ventenat) Barnhart, Globular Prairie Coneflower, Grey-headed Coneflower. Prairie-like glades and oak savannas over gabbro (usually in Iredell soils) or calcareous rocks, cedar glades, calcareous (black belt or chalk) prairies, disturbed areas (naturalized from cultivation). June-August. S. ON west to MN and SD, south to w. PA, e. TN, nw. GA, Panhandle FL, MS, OK, and ne. TX (Singhurst, Mink, & Holmes 2010); disjunct in nc. SC. A characteristic plant of midwestern prairies and limestone glades, remarkably disjunct to "Piedmont prairie" remnants in SC (Nelson 1993). [= C, F, FNA, G, K, S, SE, W, WH, WV, Z]

Rudbeckia Linnaeus 1753 (Yellow Coneflower, Black-eyed Susan)

Identification notes: This treatment needs considerable additional work in the herbarium, and will likely be substantially modified.

1 Leaves grasslike, linear-lanceolate, > 10× as long as wide, the basal with blade 10-20 cm long and < 1 cm wide; [of Coastal Plain, of s. GA southward and westward].
2 Plant with 1 head; rays red, orange, or maroon, 1.0-1.5 cm long; plant pubescent ........................................................................ R. graminifolia
2 Plant with several heads; rays yellow, 1.5-3.5 cm long; plant glabrous ................................................................................ R. mohrii
1 Leaves broader, lanceolate, ovate, or pinnately-cleft, < 10× as long as wide; [collectively widespread].
3 Leaves (at least some of the largest and generally more basal) 3-lobed or more divided.
  4 Disc flowers yellow or yellowish-green; achenes 3.5-6.0 mm long.
   5 Basal and lower stem leaves 1-5-pinnatifid; plants 0.5-2 m tall.
      6 Heads small, the disc mostly 1.0-1.5 cm wide; rays usually 5 or 8; [of the Coastal Plain and Piedmont, VA south to FL, west to LA] ................................................................. R. laciniata var. digitata
      6 Heads larger, the disc mostly 1.5-2.0 cm wide; rays usually 8 or 13; [of high elevations of the Appalachians, VA and KY south to NC and TN] ................................................................. R. laciniata var. humills
  5 Basal and lower stem leaves 1-5-pinnatifid, with 5-many lobes; plants 1-3 m tall.
   7 Achenes 3.5-4.0 mm long; pappus > 0.7 mm long; [of DE, MD, and PA northward] ................................................................. R. laciniata var. bipinnata
   7 Achenes 4.2-6.0 mm long; pappus < 0.7 mm long; [widespread in our area] ................................................................. R. luciniata var. laciniata
  4 Disc flowers purple-brown; achenes 1.9-3.5 mm long.
   8 Pales acute, hairy near the tip; rays 20-40 mm long ........................................................................................................ R. subtomentosa
   8 Pales cuspidate, with awn-like tips ca. 1.5 mm long, glabrous; rays 8-30 mm long.
9 Cauline leaves 1-3-lobed (at least some on a plant 3-lobed).
10 Ray blades 8-17 mm long; discs 10-15 mm across; [widespread in our area]...\textit{R. triloba} var. triloba
10 Ray blades 18-30 mm long; discs 15-20 mm across; [at moderate to high elevations in the Appalachians]...\textit{R. triloba} var. rupesiris
9 Cauline leaves 1-7-lobed (at least some on a plant 5-7-lobed).
11 Phyllaries > 9 mm long; [of the Mountains of NC, VA, and TN]...\textit{R. triloba} var. bealdei
11 Phyllaries < 7 mm long; [of the Coastal Plain of s. AL and Panhandle FL]...\textit{R. triloba} var. pinnatifolia

3 Leaves simple, unlobed, toothed (or not).
12 Pales (bracts of the receptacle) glabrous or nearly so (except sometimes for a minutely ciliate margin).
13 Pales obverse to acute.
14 Larger leaves < 2 cm wide...\textit{[R. missouriensis]}
14 Larger leaves > 2 cm wide.
15 Plants 2-3 m tall; stem leaves strongly auriculate-clasping...\textit{R. auriculata}
15 Plants 0.5-1.3 m tall; stem leaves petiolate or sessile, but not auriculate-clasping.
16 Basal leaves with bases cuneate to broadly cuneate.
17 Basal leaves with blades 2.5-3.5× as long as wide; plants villous-hirsute...\textit{R. fulgida} var. fulgida
17 Basal leaves with blades < 2× as long as wide; plants glabrous to sparsely hairy.
18 Basal leaves attenuate-cuneate at the base; rays 15-25 mm long; upper stem leaves notably reduced in size from the lower stem leaves...\textit{R. fulgida} var. spathulata
18 Basal leaves broadly cuneate at the base; rays 20-40 mm long; upper stem leaves not typically reduced in size from the lower stem leaves...\textit{R. fulgida} var. speciosa
16 Basal leaves with bases rounded to cordate.
19 Upper stem leaves not typically reduced in size from the lower stem leaves...\textit{R. fulgida} var. sullivantii
19 Upper stem leaves notably reduced in size from the lower stem leaves.
20 Basal leaves with bases rounded; rays 20-40 mm long...\textit{R. fulgida} var. speciosa
20 Basal leaves with bases broadly rounded to cordate; rays 10-30 mm long...\textit{R. fulgida} var. umbrosa

12 Pales densely pubescent near the tip.
21 Plants glabrous or with scattered inconspicuous hairs.
22 Stem very sparsely spreading-villous (to more conspicuously hairy, and then keyable under 21b); disc to 15 mm high...\textit{R. heliopsidis}
22 Stem glabrous; disc elongating in fruit, ultimately 12-60 mm high.
23 Leaves strongly blue-green and glaucous; flowering plants 1-2.5 m tall; largest leaves 7-16 cm wide; [cultivated in our area and rarely persisting or spreading]...\textit{R. maxima}
23 Leaves green; flowering plants 0.5-1.3 m tall; largest leaves < 6.5 cm wide; [native of pitcher-plant bogs and wet flatwoods of e. GA and ne. FL west to s. AL]...\textit{R. nitida}
21 Plants conspicuously hirsute or pilose.
24 Plants perennials from a woody rhizome; pappus a low crown; style appendages short, blunt.
25 Disc 10-15 mm across; rays 6-12, mostly spreading, 15-25 mm long; leaves not folded longitudinally...\textit{R. heliopsidis}
25 Disc 15-25 mm across; rays 12-25, mostly reflexed, 15-25 mm long; leaves folded longitudinally.
26 Stem hairy only on the upper stem, the hairs ascending and < 0.5 mm long...\textit{[R. grandiflora var. alismaefolia]}
26 Stem hairy throughout, the hairs spreading on the lower stem, ascending on the upper stem and ca. 1.0 mm long...\textit{[R. grandiflora var. grandiflora]}
24 Plants annuals, biennials, or perennials from fibrous roots; pappus lacking or a low crown to 0.1 mm high; style appendages elongate, subulate (\textit{R. hirta}) or short, acute to obtuse (\textit{R. mollis}).
27 Stems and leaves softly pilose to woolly; style branches short, acute to obtuse; [plants of dry sands of the Coastal Plain of SC southward]...\textit{[R. mollis]}
27 Stems and leaves leafy mainly towards the base, branched mainly near the middle; peduncles usually ½ the height of the plants; [of the Coastal Plain]...\textit{R. hirta} var. angustifolia
28 Stems leafy mainly towards the base, branched mainly near the middle; peduncles usually ½ the height of the plants; [collectively widespread].
29 Basal leaves broadly elliptic to ovate, 2.5-7 cm wide, mostly ca. 2× as long as wide, with coarsely serrate margins; [primarily Appalachian and westward, mostly of undisturbed habitats]...\textit{R. hirta} var. hirta
29 Basal leaves lanceolate to oblanceolate 1-2.5 (-5) cm wide, mostly 3-5× as long as wide, with entire to serrate margins; [widespread and weedy]...\textit{R. hirta} var. pulcherrima

\textbf{Rudbeckia auriculata} (Perdue) Kral, Swamp Black-eyed Susan. Cp (FL, GA); pitcherplant bogs, wet roadssides and powerline rights-of-way, seepages; rare (GA Special Concern). Sw. GA and Panhandle FL (Walton County) west to c. and s. AL. See Diamond & Boyd (2004) for detailed information. [= FNA, Sw. KE, SE, WH; = \textit{R. fulgida} \textit{Aiton} var. auriculata Perdue]

\textbf{Rudbeckia fulgida} \textit{Aiton} var. \textit{spathulata} (Michaux) Perdue. Cp (VA), [FL, GA, NC, SC, VA]; bottomlands, bogs; uncommon? August-October. VA, WV, and TN south to FL and AL. [= FNA; < \textit{R. fulgida} – RAB, WH; = \textit{R. spathulata} Michaux – F, S; < \textit{R. fulgida} var. fulgida – K].

\textbf{Rudbeckia hirta} \textit{Aiton} var. \textit{speciosa} (Wendroth) Perdue. Mt (WV), Cp* (DE*) [GA, VA]; moist forests and woodlands; uncommon (rare in GA and WV). August-October. QC and WI south to GA, AL, and AR. [= C, FNA, K, Z; < \textit{R. fulgida} – RAB, GW, W; = \textit{R. speciosa} Wendroth \textit{var. speciosa} – F; > \textit{R. speciosa} Wendroth – WV]}

**Rudbeckia grandiflora** (Sweet) A.P. de Candolle var. *grandiflora*, Largeflower Coneflower. Mt (GA): limestone glades and barrens; rare. MO and KS south to LA and TX; disjunct in nw. GA. [=F, K, SE, Z; = R. *grandiflora* – S]

* Rudbeckia maxima* Nuttall, Giant Coneflower. Cp (SC): disturbed ground; rare, cultivated and rarely persistent, native of se. United States (AR and OK south to LA and TX). [=F, FNA, K, S, SE]

**Rudbeckia mollis** Elliott, Woolly Coneflower. Cp (FL, GA, SC): longleaf pine / turkey oak sandhills; uncommon (rare in SC). Late August-October. SC south to n. peninsular FL, FL Panhandle, west to s. AL. [=RAB, FNA, K, SE, WH, Z]

**Rudbeckia octopus** Elliott, Woolly Coneflower. Cp (FL, GA, SC): longleaf pine / turkey oak sandhills; uncommon (rare in SC). Late August-October. SC south to n. peninsular FL, FL Panhandle, west to s. AL. [=RAB, FNA, K, SE, WH, Z]

**Rudbeckia triloba** Linnaeus var. *beadlei* (Small) Fernald, Chauncey's Coneflower. Mt (NC, VA): seepy mafic or limestone cliffs; rare. July-October. A Southern Appalachian endemic: sw. VA and KY south to w. NC and TN. It is not at all clear that this taxon is distinct. [< R. *triloba* var. *beadlei* – F; < R. *triloba* var. *pinnatloba* Torrey & A. Gray – C, FNA, G, K, SE, Z (defined broadly to include "R. *beadlei*"; < R. *triloba* – RAB, W; < R. *triloba* – RAB, W; > R. *triloba* – WH] synonymy incomplete, etc.]

**ASTERACEAE**

**Rugelia** Shuttleworth ex Chapman 1860 (Rugelia, Rugel's Ragwort)

A monotypic genus, an herb, endemic to the Great Smoky Mountains of w. North Carolina and e. Tennessee. Treated variously as *Senecio* or *Cacalia* in most recent North American floras (see synonymy), this species is anomalous in both and is best treated as a monotypic genus (Bremer 1994). References: Barkley in FNA (2006b); Bremer (1994)=Z; Barkley (1999)=Y; Pippen (1978)=X; Cronquist (1980)=SE.

**Rugelia nudicaulis** Shuttleworth ex Chapman, Rugelia, Rugel's Ragwort, Winter-well. High elevation forests and openings, primarily in spruce-fir forests, but extending in places downslope into northern hardwood forests. June-August. The genus and species is endemic to the Great Smoky Mountains of w. NC and e. TN, all known populations within Great Smoky Mountains National Park. Where it occurs, it is usually locally abundant, often even the dominant herb. The basal rosettes are evergreen, and are conspicuous in all seasons.  [= FNA, K, Y, Z; *Senecio rugelia* Gray – RAB, S; *Cacalia rugelia* (Gray) Barkley & Cronquist – SE, W, X]

**Santolina** Linnaeus 1753

* Santolina chamaecyparissus* Linnaeus, Holy-flax, Lavender-cotton, Cypress Lavender-cotton. Disturbed areas; native of Mediterranean Europe. March-October. This species is introduced in e. and w. NC (Fox, Godfrey, & Blomquist 1952). Graetz (1973) recommended it for planting in barrier island areas of the Carolinas.  [= C, K]

**Sclerolepis** Cassini 1816 (Sclerolepis)

**Sclerolepis uniflora** (Walter) Britton, Sterns, & Poggenburg, Sclerolepis. In shallow water (later sometimes stranded on shore by dropping water levels) of clay-based Carolina bays, natural lake shores, blackwater stream shores and swamps, in seepage wetlands including sea-level fens. May-August; July-October. NH south to c. peninsular FL, west to sw. AL (very rare north of NC); slightly disjunct in s. MS and se. LA (Sorrie & LeBlond 2008).  [= RAB, C, F, FNA, G, GW, K, SE, WH]

**Scolymus** Linnaeus 1753 (Golden Thistle)

1 Stem wings and leaf blades with margins little or not whitened and thickened; pappus of several scales; plant a biennial or perennial..............
   ..............................................................................................................................................................................................................
   ..............................................................................................................................................................................................................
   ..............................................................................................................................................................................................................
1 Stem wings and leaf blades with margins white and thickened; pappus absent; plant an annual.........................................................
   ..............................................................................................................................................................................................................
   ..............................................................................................................................................................................................................

1 S. hispanicus

**Scolymus hispanicus** Linnaeus, Golden Thistle, Spanish Salsify. On ballast at seaports (at least formerly); native of Europe. AL.  [= FNA, K]

**Scolymus maculatus** Linnaeus, Golden Thistle. On ballast at seaports (formerly); native of Europe. Small (1933) states that *Scolymus* "has been found on ballast on the seacoast of N.C.", the site was likely the port of Wilmington.  [= FNA, K, S]

**Senecio** Linnaeus 1753 (Ragwort, Groundsel)

A genus of very uncertain circumscription, if treated broadly with as many as 1500-2000 species, trees, shrubs, herbs, and vines. The trend is to divide *Senecio* into smaller, more natural genera. Most species traditionally treated as "Senecio" in our flora are
not even part of a broadly defined core group, and have been transferred to Packera and Rugelia. Hasteola (Synosma) has been treated as a small genus of perennial herbs (consisting of Hasteola suaveolens and the FL peninsular endemic, H. robertiorum L.C. Anderson), but Pelser et al. (2007) demonstrate that Hasteola is deeply embedded in Senecio and closely related to a group of New World Senecio; it is so included here. References: Barkley in FNA (2006b); Pelser et al. (2007); Bremer (1994); Cronquist (1980)=SE; Barkley (1999)=Z; Barkley (1978)=Y; Anderson (1994)=X; Pippen (1978)=V. [also see Ligularia, Packera, Rugelia]

1 Leaves ovate, hastate at the base, merely toothed, 10-30 (-40) cm long, 4-20 cm wide......................................................S. suaveolens
1 Leaves ovate to oblanceolate, tapered at the base, pinnatifid (or at least strongly toothed), 2-10 cm long, 0.5-2 (-4) cm wide ..........S. vulgaris

*S. brasiliensis* (Sprengel) Lessing var. *triparitus* (A.P. de Candolle) Baker, Hempleaf Ragwort. Disturbed areas (on ballast); rare (not collected since 1894, Pensacola, Escambia County, FL), native of South America. [= FNA, WH; = S. cannabinifolius Hooker & Arnott] [not keyed]

*S. suaveolens* (Linnaeus) Elliott, Sweet Indian-plantain. Sandy bottomlands and riverbanks. MA, NY, n. OH, n. IN, c. WI and se. MN, south to n. VA, sw. VA, sw. NC, wc. TN (Chester, Wofford, & Kral 1997), and se. MO; apparently rare through much of its range. This species has not been seen in NC in recent years. [= Hasteola suaveolens (Linnaeus) Pojarkova – FNA, K, X; = Caacilia suaveolens Linnaeus – RAB, C, F, G, GW, SE, V, W, WV, Y; = Synosma suaveolens (Linnaeus) Rafinesque ex Britton – S]

**Sericocarpus** Nees 1832 (White-topped Aster)

A genus of 5 species, herbs, of North America. This group of species, traditionally treated as *Sericocarpus*, was transferred to *Aster* by Cronquist, a treatment followed by most (but not all) recent floristic works. It now appears, based on morphological and molecular studies, that the traditional treatment as a separate genus is far superior. Nesom (1993a) argues that a variety of characters indicate that *Sericocarpus* is more closely allied to *Solidago, Euthamia, Bigelowia, Chrysoysia*, and *Gutierrezia* than it is to *Aster*. Noyes & Rieseberg (1999) provide strong support for this contention, based on molecular evidence. See Nesom (1993a), Jones (1980), Semple & Brouillet (1980), and Noyes & Rieseberg (1999) for further discussion about the affinities of this group. References: Semple & Leonard in FNA (2006b); Leonard, Cook, & Semple (2005)=Y; Nesom (1993a)=Z; Cronquist (1980)=SE.

1 Leaves basally disposed, leaves of the basal rosette much larger than the cauline leaves; leaves (at least the basal) toothed ............S. asteroides
1 Leaves cauline, basal rosette lacking, the mid-cauline leaves the largest; leaves entire (or with 1-2 teeth in *S. tortifolius*).

2 Leaves (2-)4-8 cm long, 0.2-1.2 cm wide, linear to oblanceolate, 6-12× as long as wide, not twisted at the base (the leaf blade in a more-or-less horizontal plane); leaves glabrous (but with a ciliate margin), glandular-punctate; involucres glabrous..................................................S. linifolius
2 Leaves 1.5-4 cm long, 0.6-1.5 (-2.0) cm wide, obovate, 1.5-4× as long as wide, twisted at the base (bringing the leaf blade into a more-or-less vertical plane); leaves puberulent, glandular-punctate, and with prominent resin globules (at 10× magnification); involucres puberulent ..............................................................S. tortifolius

**Sericocarpus asteroides** (Linnaeus) Britton, Sterns, & Poggenburg, Toothed White-topped Aster. Dry woodlands, thin soils around rock outcrops, sandhills, dry pinelands. June-July. S. ME and s. VT west to c. OH, south to e. SC, c. GA, w. Panhandle FL, s. AL, and s. MS. Coastal Plain populations are rhizomatous, while inland populations are not; some taxonomic distinction may be warranted (Nesom, pers. comm.). [= F, FNA, K, S, WH, WV, Y, Z; = Aster paternus Cronquist – RAB, C, G, SE, W]

**Sericocarpus linifolius** (Linnaeus) Britton, Sterns, & Poggenburg, Narrow-leaf White-topped Aster. Dry woodlands, sandhills. June-July. MA west to s. OH and s. IN, south to se. SC, c. GA, s. AL, s. MS, and e. LA (Florida parishes). [= F, FNA, K, S, WV, Y, Z; = Aster solidagineus Michaux – RAB, C, G, SE, W]

**Sericocarpus tortifolius** (Michaux) Nees, Twisted-leaf White-topped Aster. Dry to mesic sandhills. August-October. E. NC south to s. FL, west to e. LA (Florida parishes), more or less restricted to the Coastal Plain, but inland onto hard-rock provinces in nc. GA and nc. AL. [= FNA, K, WH, Y, Z; = Aster tortifolius Michaux – RAB, SE, W; = Sericocarpus bifolius (Walter) Porter – S]

**Silphium** Linnaeus 1753 (Rosinweed)

Identification notes: The number of ray flowers per head is a useful taxonomic character in Silphium; since only ray flowers are fertile, the number of ray flowers can also be determined by the number of achenes in freshly fruiting material. The key and taxonomic treatment is provisional.

1 Leaves basally disposed, the basal leaves large and persistent, the stem with very few to many leaves, but these definitely reduced upward in size; leaves entire to toothed, to deeply cut; plants with definite taproots (except S. brachiatum, S. mohrii, and S. wasiotense).

2 Stem relatively leafy, with 4-5 nodes or more, the stem leaves smaller than the basal, but not merely bracteal.

3 Leaves deeply pinnatifid to bipinnatifid ......................................................... S. laciniatum

3 Leaves merely nearly entire to coarsely toothed (but not pinnatifid).

4 Leaves cuneate to rounded at the base; rays pale (sulfur) yellow; phyllaries acuminate, hispid ........................................ S. mohrii

4 Leaves subcordate, cordate, to truncate-sagittate at the base; phyllaries glabrous, obtuse to acute.

5 Stem glabrous; pedicel glabrous; phyllaries acute; leaves truncate-sagittate at the base .................................................... S. brachiatum

5 Stem hispid; pedicel hispidulous with hairs ca. 1 mm long; phyllaries obtuse; leaves cordate to subcordate at the base .................. S. wasiotense

2 Stem nearly naked, bearing only one or a few bracteal (very reduced) leaves.

6 Heads relatively large (involucre 13-25 mm high, disk 15-25 mm wide), with 14-40 ray flowers; [of calcareous or mafic glades or woodlands].

7 Principal leaves deeply pinnatifid (or, if entire, definitely lanceolate and with the base tapering to the petiole) .............. S. pinnatifidum

7 Principal leaves toothed (or subentire), cordate or truncate at the base (rarely abruptly narrowed) .......................................... S. terebinthinaceum

6 Heads relatively small (involucre 6-11 mm high, disk 8-15 mm wide), with 6-12 ray flowers; [of a wide range of mostly dry, often acidic habitats].

8 Blades of basal leaves unlobed (or with a single obscure basal lobe on each side), reniform, usually wider than long, often > 25 cm wide; leaves usually puberulent beneath; achene shorter than the phyllaries at maturity; [of the upper Piedmont and Mountains] ...... S. reniforme

8 Blades of basal leaves divided or shallowly to deeply lobed, with several lobes on each side, about as wide as long, or longer than wide; < 25 cm wide; leaves usually glabrous (or sparingly scabrous) beneath; achenes longer than (or as long as) the phyllaries at maturity; [collectively widespread].

9 Involucre mostly 1.0-1.5 cm wide; achenes 6-9 mm long at maturity; achene wings < 1 mm wide, the wing tips long acute to acuminate, the sinus between the wing tips V-shaped; [of the Coastal Plain and lower Piedmont from SC south to extreme e.

10 Achene wing tip obtuse, the sinus between the wing tips narrowly U-shaped; leaf blade usually longer than wide; petiole short, as long as or shorter than the leaf blade (midrib); [of se. SC south to e. peninsular FL and FL Panhandle] ...... S. compositum var. ovatifolium

10 Achene wing tip acute to acuminate, the sinus between the wing tips V-shaped; leaf blade usually as long as wide; petiole long, as long as or longer than the leaf blade (midrib); [of se. NC south to se. GA and FL Panhandle] ...... S. compositum var. venosum

1 Leaves primarily on the stem, basal leaves usually absent or soon withering, the stem with many leaves, these similar in size; leaves entire or toothed; plants fibrous-rooted from a crown, rhizome, or caudex.

11 Stem terete; leaves not connate.

12 Pales eglandular, scabrous to puberulent (in addition to the eglandular pubescence).

13 Basal and lower cauline leaf blades cordate, sagittate, or truncate at the base, and on well-developed petioles ............... S. brachiatum

13 Basal and lower cauline leaf blades either rounded or cuneate at the base, or sessile.

14 Plants mostly 8-15 dm tall, with usually 6 or 7 nodes below the inflorescence; glandular hairs of the stems and leaves longer than the eglandular hairs; rays (8-) 12-14 (-16) per head; [of dolomite or limestone in Bibb County, e. AL] ................. S. glutinosum

14 Plants mostly 15-20 dm tall, with usually 9-12 nodes below the inflorescence; stems and leaves; glandular hairs of the stems and leaves about as long as the eglandular hairs; rays (17-) 19-23 (-33) per head; [of chalk in e. AL] ................. S. perplexum

15 Plants mostly 8-15 dm tall, with usually 6 or 7 nodes below the inflorescence; glandular hairs of the stems and leaves longer than the eglandular hairs; rays (8-) 12-14 (-16) per head; [of dolomite or limestone in Bibb County, e. AL] ................. S. glutinosum

15 Plants mostly 15-20 dm tall, with usually 9-12 nodes below the inflorescence; stems and leaves; glandular hairs of the stems and leaves about as long as the eglandular hairs; rays (17-) 19-23 (-33) per head; [of chalk in e. AL] ................. S. perplexum

16 Leaves both strictly opposite throughout and clasping the stem.

17 Ray flowers 12-22 per head; phyllary surfaces scabrous, hisrate, or hispid ................................................................. S. integrifolium

17 Ray flowers 20-36 (or more) per head; phyllary surfaces glabrous ................................................................. S. speciosum

16 Leaves alternate, opposite, whorled, or combinations of those states (if strictly opposite then not clasping the stem).

18 Ray flowers 20-30 per head (or more) .......................................................................................................................... S. radula

18 Ray flowers 12-20 per head.

19 Leaf surfaces glabrous.

20 Cauline leaves predominately in whorls of 3 ......................................................... S. asteriscus var. trifoliatum

20 Cauline leaves opposite ................................................................................................................................. S. asteriscus var. lantifolium

19 Leaf surfaces scabrous to hispid.

21 Basal leaves persistent at flowering ................................................................................................. S. asteriscus var. simpsonii

21 Basal leaves caducous at flowering.

22 Pales stipitate-glandular ................................................................................................................................. S. asteriscus var. dentatum

22 Pales eglandular, scabrous to puberulent ................................................................................................. S. asteriscus var. asteriscus

Silphium asteriscus Linnaeus var. asteriscus. Cp (FL), {Mt, Pd, Cpa (GA, NC, SC, VA)} VA, KY, and MO south to FL
and TX. [= C, FNA, K1, K2; > S. asteriscus – RAB; > S. dentatum var. gatesii (Mohr) Ahles – RAB; = S. asteriscus – F, G, W; > S. asteriscus

*Silphium compositum* Michaux var. *compositum*. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC): sandhills, other xeric forests; common. May-September. VA south to GA. Perhaps worth dividing further into two taxa: *S. compositum* sensu stricto, restricted to the Coastal Plain and extreme lower Piedmont, and distributed from SE VA through the Carolina Coastal Plain to extreme e. GA, a distribution very similar to those of *Carphophorus bellidifolius*, *Cirsium repandum*, and *Vaccinium crassifolium*; and *S. collim* Greene, with less deeply lobed leaves, and distributed from se. and sc. VA, NC, sw. NC and ne. AL south to sc. SC, c. GA, and ec. AL. [= K1, Y; = C. compositum – F; < S. compositum var. compositum – RAB; > C. compositum – S; > S. orae Small – S; < S. compositum – C, FNA, G, K2, SE, W; = S. compositum ssp. compositum – Z; > S. collin* Greene]

*S. integrifolium* Michaux, Prairie Rosinweed. Prairies, calcareous glades and barrens. July-September. MI, WI, and se. SD south to c. TN, se. AL, s. MS, s. LA, and OK. [= S. integrifolium Michaux var. integrifolium – C, FNA, G, K2, SE; > S. integrifolium var. integrifolium – F, K1, Y; > S. integrifolium var. deamii L.M. Perry – F, K1; > S. integrifolium var. gattingeri L.M. Perry – K1, Y]

*S. lacinatum* Linnaeus, Compass-plant. Prairies, limestone barrens, calcareous glades, also sometimes cultivated (including outside of its native distribution). July-September. S. ON, MI, WI, s. MN, and e. SD south to se. TN, s. AL, c. MS, s. LA, c. TX, and n. NM. [= C, FNA, G, K2, SE; > S. lacinatum var. robinsonii L.M. Perry – F, K1, Y]

*S. mohrii* Small, Shaggy Rosinweed. Mt (GA): prairies; rare. Endemic to c., sc., and se. TN (Chester, Wofford, & Kral 1997) south to nw. GA (Jones & Cole 1988) and nc. AL. [= C, FNA, K1, K2, SE, Y]

*S. pinnatifidum* Elliott. Mt (GA): limestone glades and woodlands; rare. C. and se. TN south to nw. GA and AL. [= K1, S, SE, = S. terebinthinaceum Jacquin var. pinnatifidum (Elliott) A. Gray – F, FNA, K2, Y; < S. terebinthinaceum – G; > S. chickawawenee Canby]

*S. reniforme* Rafinesque ex Nuttall. Mt (NC, SC, VA, WV), Pd (NC, SC, VA): dry forests; uncommon. Sc. VA, c. WV, and e. TN, south to c. sc. GA, and e. AL. Plants with shallowly lobed leaves, with nearly the same distribution as typical *S. reniforme*, have been variously interpreted. [= S; = S. compositum Michaux var. reniforme (Rafinesque ex Nuttall) Torrey & A. Gray – RAB, F, K1, Y; < S. compositum – C, FNA, G, SE, W; < S. compositum – K2; > S. compositum ssp. reniforme (Rafinesque ex Nuttall) Sweeney & Fisher – W, Z]

*S. speciosum* Nuttall. Prairies, calcareous glades and barrens. July-September. MO west to NE, south to OK; disjunct in c. TN. [= F, Y; = S. integrifolium Michaux var. laeve Torrey & A. Gray – C, FNA, G, K1, K2, SE]

*S. terebinthinaceum* Jacquin, Prairie-dock. Mt (GA, VA), Pd (NC, SC): mafic glades, barrens, woodlands, and roadsides (NC, SC), calcareous glades, barrens, and woodlands (GA); rare. July–September. NY, ON, WI, and NE south to nw. GA, MS, and AR; disjunct eastwards in Piedmont of NC and n. SC. *S. ramicifolium* Small refers to plants of limestone in the Ridge and Valley province of e. TN and extreme sw. VA, alleged to differ from *S. terebinthinaceum* in the leaf bases cuneate at the base (vs. cordate or truncate), smaller leaf blades (only to 15 cm long), smaller plants (to 8 dm tall vs. to 30 dm tall), and
ASTERACEAE

954

outer phyllaries broader than long (vs. longer than broad). The distinction of var. luciae-brauniae Steyermark, with leaf blades glabrous above vs. scabrous, is dubious and needs additional study. [= RAB, SE; = S. terebinthinaceum var. terebinthinaceum – F, FNA, K2; < S. terebinthinaceum – G; > S. terebinthinaceum var. terebinthinaceum – K1, Y; > S. terebinthinaceum var. luciae-brauniae Steyermark – K1; > S. terebinthinaceum – S; > S. rumicifolium Small – S, Y]

Silphium brachiatum Gattinger, Cumberland Rosinweed. Endemic to sc. and se. TN (Chester, Wofford, & Kral 1997) and n. AL. And GA? [= F, FNA, G, K1, S, SE, Y]

Silphium radula Nuttall. Mt (GA): rocky hardwood forests; rare (GA Rare). East to nw. GA (Jones & Coile 1988). Not given credence as in our area in FNA and other sources. [= K1, SE; ? S. aspererrimum Hooker – Y, misapplied; ? S. gatesii Mohr – Y?]

Silybum Adanson 1763 (Milk-thistle)

A genus of 2 species, herbs, of the Mediterranean region. References: Keil in FNA (2006a); Cronquist (1980)=SE.

Smallanthus Mackenzie ex Small 1933 (Bearsfoot)

Smallanthus uvedalii (Linnaeus) Mackenzie ex Small, Bearsfoot, Leafcup. Moist forests, bottomland forests, and disturbed places. July-October. NY and IL south to c. peninsular FL and TX; possibly extending through e. Mexico and Central America to Panama, depending on circumscription. [= FNA, K, S, WH, Z; = Polymnia uvedalii Linnaeus – RAB, C, SE, W, WV; > Polymnia uvedalii var. uvedalii – F, G, Y; > Polymnia uvedalii var. densipilis Blake – F, G, Y; > Polymnia uvedalii var. floridana Blake – F, Y]

Solidago Linnaeus 1753 (Goldenrod)

A genus of 90-110 species, herbs, primarily North American, but with a few species in South America, Macaronesia, and Eurasia. The placement of the flat-topped goldenrods has been controversial; they are here included in Solidago rather than being treated as the separate genus Oligoneuron. References: Semple & Cook in FNA (2006b); Nesom (1990); Cronquist (1980)=SE; Morton (1973, 1974); Zhang (1996); Cook & Semple (2004); Nesom (1993b)=Z; Heard & Semple (1988)=Y; Brouillet & Semple (1981)=X; Cronquist (1980)=SE; Braun (1942). Portions of the key adapted (in part) from various sources, especially FNA and SE. [also see Brintonia, Chrysoma, and Euthamia]

Identification notes: Several related genera readily mistaken for (and/or sometimes included in) Solidago are included here as keying “failsafes.”

1 Inflorescence corymbiform, flat-topped or broadly rounded and about as broad as long, or broader; [section Ptarmicoideae, and section Solidago, subsection Multiradiatae]................................................................. Key A

1 Inflorescence a panicle, raceme, thyrse, or in axillary clusters, usually longer than broad, or with either the central branch well-developed and elongate, or with numerous branches elongate and more-or-less secund heads; [section Solidago].

2 Leaves basally disposed, the basal and lower cauline leaves larger, petiolate, and usually persistent, the middle and upper cauline leaves smaller and less petiolate.

3 Inflorescence cylindrical, of axillary clusters subtended by well-developed stem leaves, or a terminal thryse or raceme, the branches not secund (unless the stem is arching and the heads become oriented to the side of the axis); [subsections Glomeruliflorae, Humiles, Maritimae, Squarrosoae].......................................................................................................................... Key B

3 Inflorescence paniculiform, the major branches (at least) recurved with the heads borne secundly; [subsections Argutae, Junceae, Maritimae, Nemorales].......................................................................................................................... Key C
Leaves chiefly cauline, the basal and lower cauline leaves (when not early withering) the same size as or smaller than the middle and upper cauline leaves.

Inflorescence predominantly axillary, with well-developed leaves in at least the lower part of the inflorescence; [ subsections Argutae, Glomeruliflorae, Squarrosose, Thysiflorae ] .................................................................................................................... Key E

Inflorescence a well-developed panicle; [ subsections Triplinervae, Venosae ] .................................................................................................................... Key E

Key A – goldenrods with corymbiform inflorescences

( section Parnicoideae, and section Solidago, subsection Multiradiatae )

1 Plant a woody shrub; leaves with a markedly pebbled surface ........................................................................................................... [ see Chrysoma ]

1 Plant an herb; leaves variously smooth or rugose, but not pebbled.

2 Heads very large, involucre 8-13 mm high; fresh leaves noticeably thick and rubbery in texture; [ subsections Humiles, Solidago, subsection Multiradiatae ] .................................................................................................................... S. siphonacea

2 Heads smaller, involucre < 8 mm high; fresh leaves not thick or rubbery in texture; [ plants collectively widespread ]

3 Rays white; leaves linear-lanceolate to linear-oblancoate, the longer (10-) 15-20× as long as wide; pappus bristles slightly to strongly clavellate-thickened; [ section Parnicoideae ] .................................................................................................................... S. pinnicollis

3 Rays yellow; leaves oblong, elliptic, obovate, or spatulate, 2-8× as long as wide; pappus bristles not clavellate thickened.

4 Larger leaves obovate, 5-10 cm long, 1.5-4 cm wide, with prominent teeth; plants small, 0.5-4 dm tall; [ of high elevation rock outcrops on Grandfather Mountain, Roan Mountain, and Hanging Rock Mountain (Avery, Watauga, and Mitchell counties), NC ] ; [ section Solidago, subsection Multiradiatae ] .................................................................................................................... S. rigid var. glabrata

4 Involucres 7-12 mm high; basal leaves 15-40 mm wide; [ of n. AL, e. TN, and e. KY ] .................................................................................................................... S. rigid var. rigid

4 Larger leaves 0.4-1.6 cm wide, ca. 12.5× as long as wide, acuminate to acute, or serrate with a few salient teeth on either side, with 3+ parallel veins.

5 Achenes pubescent (even when mature); flowering plants 1.5-6 (-8.5) dm tall; inflorescence narrowly cylindrical, averaging 2-4 cm in diameter.

5 Larger leaves 3-6 cm wide, ca. 2-8× as long as wide, acute to obtuse, or serrate to crenate with numerous teeth (sometimes the teeth very obscure), with many pinnate-netted veins; leaves, stems, and peduncles moderately to densely pubescent.

6 Outer series of phyllaries glabrous on the back (glabrous to short-ciliate on the margin); leaf undersurface glabrous to somewhat hispid (0-20 hairs per mm²) (the margins and midrib often more densely pubescent); stems glabrous to somewhat hispid (0-25 hairs per mm²) ............................................................................................................................................... S. rigid var. rigid

6 Outer series of phyllaries pubescent on the back (short-ciliate on the margin); leaf undersurface hispid (7-50 hairs per mm²); stems slightly to strongly hispid (10-70 hairs per mm²) ........................................................................................................................................... S. nitida

5 Larger leaves 0.4-1.6 cm wide, ca. 12.5× as long as wide, acuminate to acute, or serrate with a few salient teeth on either side, with 3+ parallel veins.

7 Rays 1-4 per head; cypselas 2-3 mm long; leaves acute to obtuse, rarely folded along the midvein; [ of prairies and longleaf pine savannas from MS westward on the Coastal Plain ] .................................................................................................................... S. nitida

7 Rays 7-9 per head; cypselas 1.5-2.2 mm long; leaves acuminate, often folded along the midvein; [ of wet prairies and fens of interior physiographic provinces ] .................................................................................................................... S. riddellii

Key B – goldenrods with basally disposed leaves and elongate, non-seed inflorescences

( section Solidago, subsections Glomeruliflorae, Humiles, Maritimae, Squarrosoae )

1 Heads very large, involucre 8-13 mm high; fresh leaves noticeably thick and rubbery in texture; [ subsection Glomeruliflorae ]; [ plants of high elevations of NC and TN ] .................................................................................................................... S. glomerata

1 Heads smaller, involucre < 8 mm high; fresh leaves not thick or rubbery in texture; [ plants collectively widespread ].

2 Phyllaries and phyllarys copiously glandular; [ plants of Coastal Plain sandhills ] .................................................................................................................... S. kralii

2 Phyllaries and phyllarys slightly glandular; [ plants of rocky glades, cliffs, barrens, and river-scoured outcrops, primarily on mafic or calcareous rocks ]

3 Involucres 7-12 mm high; basal leaves 15-40 mm wide; [ of n. AL, e. TN, and e. KY ] .................................................................................................................... S. arenicola

3 Involucres 3-7 mm high; basal leaves (2-) 3-22 (-31) mm wide; [ of sc. NC, w. VA, and n. VA northward ] .................................................................................................................... S. plumosa

4 Achenes glabrous (even when young); flowering plants (3-) 4-10 (-13) dm tall; inflorescence broadly cylindrical, averaging 5-6 cm in diameter; [ of rocky, flood-scoured riversides, known only from the Yadkin River in sc. NC ] .................................................................................................................... S. racemosa

4 Involucres 7-12 mm high; basal leaves 3-8× as long as wide, (4.2-) 6-11.3 (-15.9) cm long, (5-) 10-22 (-31) mm wide, generally sharply toothed; [ of cliffs and barrens, primarily over mafic rocks, from w. VA northward ] .................................................................................................................... S. randii

5 Basal leaves 0.7-2.5 (-5) cm wide; [ south to PA and WV ] .................................................................................................................... S. uliginosa var. uliginosa

5 Basal leaves 0.7-8 cm wide; plants short, 4-10 (-15) dm tall, typically fairly stout; [ of the Mountains and northward ]

9 [ of seepage over sloping rock on granitic domes, of sw. NC, tw. SC, and ne. GA] .................................................................................................................... S. uliginosa var. linoideae

10 Basal leaves 0.7-2.5 cm wide; [ south to PA and WV ] .................................................................................................................... S. uliginosa var. uliginosa

8 Basal leaves 0.7-2.5 (-5) cm wide; plants short to tall, 3-20 dm tall, typically very slender; [ of the Coastal Plain and lower Piedmont and southward ]

11 Leaf margins smooth, entire; ray flowers 8-13 per head; disk flowers 14-25 per head; pappus (2.5-) 3.0-3.5 mm long ...... S. pulchra

11 Leaf margins (of the basal leaves at least) scabrous-margined, also often toothed; ray flowers 2-7 per head; disk flowers 6-16 per head; pappus (3-) 3.5-4.5 (-5.0) mm long.
12 Leaf margins scabrous (or at least tubercululate) throughout; panicle branches often spreading-erect with recurved-second tips; pappus 2.2-4.0 mm long .................................................... S. gracillima

12 Leaf margins tending to become smooth on the upper stem; panicle branches usually stiffly erect; pappus 4.0-4.5 (-5.0) mm long. ................................................................. S. stricta

7 Phyllaries of lower stem leaves not sheathing the stems; [of mesic or drier habitats]; [subsection Squarrosae]. ................................................................. S. squarrosa

8 Plants with slender, stoloniferous rhizomes (in addition to the main, more deeply-seated rhizomes) .............................................................. S. arguta var. boottii

9 Plants lacking slender, stoloniferous rhizomes. ................................................................. S. auriculata

10 Basal and lower cauline leaves with cuneate leaf blades and petioles not cordate-clasping (though leaves may have petioles which sheath the petiole)

11 Achenes strigillose, at least towards the apex. ................................................................. S. speciosa var. speciosa

11 Achenes glabrous. ........................................................................................................... ...............................

12 Blades of lower leaves ovate to lanceolate, acute to obtuse or rounded. ... ................................. S. hispida

13 Petioles of lower stem leaves not sheathing the stems; [of mesic or drier habitats]; [subsection Squarrosae]. ................................................................. S. squarrosa

14 Phyllaries appressed. ........................................................................................................ ...............................

15 Phyllaries linear-lanceolate, attenuate, tapering to pointed or rounded tip. ... ................................. S. roaneensis

16 Proximal to mid stem glabrous; rays mostly 6-9; inner phyllaries usually striate with 2 prominent secondary veins .............. S. hispida

17 Leaves 20-50 (-60) cm long; midstem leaves usually 4-5 cm long; phyllaries attenuate; [of the Mountains and Piedmont (rarely Coastal Plain), of GA northward] ......................................................... S. puberula var. puberula

17 Leaves (20-) 50-120 cm per stem; midstem leaves usually 1-4 cm long; phyllaries acute to acuminate; [of the Coastal Plain from se. VA southward] ......................................................... S. puberula var. pulverulenta

18 Rays white ...................................................................................................................... S. bicolor

19 Leaves and stems sparsely to densely hairy with spreading to appressed hairs ................................................................. S. speciosa var. rigidisscula

20 Inflorescence usually denser, broader, and crowded, sometimes more open in robust plants, or narrow in plants outside range of S. erecta; mid cauline leaves often > 20 mm wide; [of MA to GA, west to SD and scattered south in CO to ne. NM] ................................................................. S. speciosa

21 Mid-stem leaves 0.4-1.5 (-2.0) cm wide; basal leaves 0.8-2.0 cm wide, entire or slightly serrate, present or absent at flowering ................................................................................................. S. speciosa var. squarrosa

21 Mid-stem leaves usually > 2 cm wide; basal leaves (2.0-) 3.0-5.5 cm wide, coarsely serrate, present at flowering ...... S. speciosa var. speciosa
ASTERACEAE

15. Rhizomes thin, elongated, creeping; stem leaves usually 3-nerved; [disjunct from west to glades and barrens].

16. Rays 7-13; disc florets 8-12.................................................................S. missouriensis var. fasciculata

17. Upper stem leaves ascending to appressed, usually lacking axillary fascicles; [west of the Blue Ridge] ....S. gattingeri

18. Leaves somewhat fleshy, the stem leaves reduced but not very markedly so; inflorescence almost always with lower branches strongly recurved with second heads; [of coastal or otherwise saline habitats].

19. Involucres 3-4 mm high; rays 7-11; disc flowers ca. 10-16; [of MA south to FL, west to TX and beyond] ...............................................................S. sempervirens var. mexicana

20. Basal leaves 0.7-2.5 (-5) cm wide; plants short to tall, 3-20 dm tall, typically very slender; [of the Coastal Plain and lower Piedmont and southward].

21. Leaf margins smooth, entire; ray flowers 8-13 per head; disk flowers 14-25 per head; pappus (2.5-) 3.0-3.5 mm long; plants to 1 m tall .................................................................S. pulchra

22. Leaf margins scabrous (or at least tuberculate) throughout; panicule branches often spreading-erect with recurved-second tips; pappus 2.2-4.0 mm long.................................S. graciliflora

23. Basal leaves 0.7-8 cm wide; plants short, 4-10 (-15) dm tall, typically fairly stout; [of the Mountains, e. VA, and northward].

24. Basal leaves 3-8 cm wide; [south to NC and TN] .................................................................S. uliginosa var. uliginosa

Key D – goldenrods with cauleine leaves and axillary inflorescences (section Solidago, subsections Argutae, Glomeruliflorae, Squarrosae, Thyrsiflorae)

1. Leaves entire or obscurely few-toothed; achenes glabrous at maturity; outer phyllaries with squarrose tips (tips appressed in S. speciosa var. rigidiuscula).

2. Outer phyllaries appressed; [subsection Squarrosae] .............................................................S. speciosa var. rigidiuscula

3. Leaves oblong-ovate, often short acuminate at the apex; mid-cauline leaves 6-10 cm long, 8-20 mm wide, margins sharply serrate on at least the upper 2/3; [subsection Argutae] .................................................................[S. buckleyi]

4. Stem terete, glaucous.

5. Lower midstem leaves narrowly lanceolate, 5-15 cm long, 0.8-3 cm wide, 5-6x as long as wide; stems strongly arching; [plants widespread in our area] .................................................................S. caesia var. caesia

6. Larger leaf blades on a plant 2-6 cm long; stems with spreading white hairs; [endemic to sandstone rockhuses in the Red River Gorge in Menifee, Powell, and Wolfe counties, KY] .................................................................S. alhophilosa

7. Leaves 1-3 (-5.5)x as long as wide.

8. Leaves (2.2-) 2.5-3 (-3.5)x as long as wide, cuneate to a sessile base; teeth of the leaf margins not notably elongate and narrow, mostly 1-2 (-3) mm long (as measured on the upper side of the teeth) .................................................................S. flavidifolia

9. Leaves 1-2.2 (-2.5)x as long as wide, abruptly contracted to a winged petiole; teeth of the leaf margins elongate and narrow, acuminate, mostly (2-) 3-8 mm long (as measured on the upper side of the teeth) .................................................................S. flexicaulis

10. Leaves 3-10x as long as wide.

11. Involucres (2.5-) 3-5 (-6) mm high; phyllaries 0.7-1 mm wide, 1-nerved; stems 4-9 (-10) dm tall; ray flowers 2-4 (-6); [broadly Appalachian] .................................................................S. curtisii

12. Involucres 4.5-7 mm high; phyllaries 1-1.5 mm wide, 3-10-nerved; stems 6-16 dm tall; ray flowers 5-8; [apparently restricted to high elevations in the Blue Ridge of NC and TN] .................................................................S. lancifolia

Key E – goldenrods with cauleine leaves and well-developed paniculate inflorescences (section Solidago, subsections Nemorales, Triplinervae and Venosae)
### Solidago albopilosa

### Solidago altissima

Linnaeus var. altissima, Tall Goldenrod. Fields, roadsides, disturbed areas. August-October. NS, QC, and SK south to c. peninsular FL, TX, and Mexico; introduced in w. North America. Var. gigavocanescens (Rydberg) Semple, with heads smaller (mainly 2-3 mm high vs. 3-4 mm high) is mainly distributed in the Great Plains. [= FNA; = S. altissima – F, K, W]; = S. canadensis Linnaeus var. scabra Torrey & Gray – C, G, SE, WH; < S. altissima Linnaeus – RAB, GW (including S. canadensis vars. and S. rugosa); – S. hirsutissima P. Miller – S; < S. canadensis – W; = S. gigavocanescens – FNA]

### Solidago arenicola

B.R. Keener & Kral, Black Warrior Goldenrod. Riverside scour areas. September-October. Known from Blount County, AL (Black Warrior River) and on rivers in the Cumberland Plateau of TN and KY (notably Big South Fork of the Cumberland River). See Keener & Kral (2003) for additional information. [= FNA]

### Solidago arguta

Aiton var. arguta, Forest Goldenrod. Woodlands, woodland borders, road margins. August-October. ME and s. ON west to MO, south to NC and TN. [= S. arguta ssp. arguta – C, SE, W; < S. arguta – RAB (also see S. tarda and S. vasyi)]; = S. arguta – F, G, S; = S. arguta ssp. arguta – FNA; < S. arguta var. arguta – K]

### Solidago celtidifolia

1 Mid-stem leaves 3-nerved (obscurely so in S. tortifolia); leaves elliptic, lanceolate, oblanceolate, or linear.
2 Rays 2-6; larger leaves linear to lance-linear, 2-7 (-10) mm wide, twisted at base; plants (3-) 7-13 dm tall; [subsection Triplinervae]..........
3 Rays 4-10 (-11); plants 3-15 dm tall
4 Rays 4-7; plants 3-9 dm tall; stems scabrous to loosely puberulent below; cauline leaves oblong-lanceolate, 7-20 (-30) mm wide, faces slightly to strongly scabrous; involucres 3-5 mm long; ray floret laminae 2-3.5 × 0.2-0.7 mm; disc floret corolla lobes 1 mm long; pappus 3 mm long [of Piedmont and Mountains of KY, NC, SC, GA, and AL, and from IL and KS south to LA and TX]; [subsection Nemorales].................................................................S. tortifolia
5 Stems glabrous and usually also glaucous ..........................................................S. gigantea
6 Stems pubescent (at least the upper portion).
7 Leaves glabrous above and below, or pubescent only on the main veins beneath; midstem leaves serrulate, with 1-10 teeth per side, the largest < 0.5 mm long; [of the Coastal Plain, from NC south to FL and AL]..............................S. leavenworthii
8 Leaves moderately to densely pubescent across the lower surface, and scabrous to puberulent above; midstem leaves entire, serrulate, or serrate; [collectively widespread].
9 Mid-stem leaves entire to serrulate; involucres (2.5-) 3-4.5 mm high...............................S. altissima var. altissima
10 Mid-stem leaves serrate, the teeth 3-10 per side, the largest > 1.5 mm long; involucres 1.7-2.5 (-3.0) mm high.
11 Main leaves ovate to lanceolate, 2-5 (-6) × as long as wide; stem pubescence general and circumferential; [of FL] ..........S. champanii
12 Main leaves lanceolate to linear, (4-) 5-15 (-23) × as long as wide; stem pubescence in lines decurrent down the stem from the margins of the leaf bases; [widespread]..................................................S. odora
13 Mid-stem leaves sessile, somewhat clasping; leaf margins nearly entire to obscurely serrulate; leaves planar............................S. fistulosa
14 Involucres 4-6 mm high; broader phyllaries 0.7-1.2 mm wide; stems glabrous below the inflorescence; mid-stem leaves elliptic (widest near the middle) .................S. latissimifolia
15 Involucres (2-) 2.5-3.5 (4.5) mm high; phyllaries mostly < 0.5 mm wide; stems hairy or glabrous below the inflorescence; mid-stem leaves lanceolate to ovate (widest below the middle).
16 Leaves relatively thin, not very rugose, usually sharply serrate, the apices acuminate, glabrous or soft-hairy on the surfaces.
17 Leaves relatively thick and firm, strongly rugose, usually subentire to bluntly serrate, the apices often only acute, scabrous or stiffly-hairy on the surfaces.
18 Inflorescences narrow, the lower lateral branches only slightly exceeding the subtending leaves; leaves sparsely pubescent; [of the Southern Appalachians]..............................................................S. rugosa var. cronoquistanua
19 Inflorescences broad, the lower lateral branches generally much longer than the subtending leaves; leaves moderately to densely pubescent; [collectively widespread].
20 Upper cauline leaves lanceolate, elliptic, not much reduced relative to leaves lower on the stem.............S. rugosa var. aspera
21 Upper cauline leaves ovate, much reduced relative to leaves lower on the stem..............................S. rugosa var. celtidifolia
Solidago arguta Aiton var. boottii (Hooker) Palmer & Steyermark, Boott's Goldenrod. Dry open woodlands, dry slopes, often in sandy or rocky soils. September-October. C. SC south to s. AL, west to LA, AR, and s. MO, most common in the Ozarks. Reported for n. WV by Harmon, Ford-Werntz, & Grafton (2006), but it seems likely that this is based on different interpretations of the taxa. [= K, SE, W; < S. arguta – RAB (also see S. tarda and S. vaseyi); > S. boottii – F, S, WV; > S. strigosa – F, G, S; = S. arguta ssp. caroliniana (A. Gray) G.H. Morton var. boottii (Hooker) Palmer & Steyermark – FNA; > S. boottii var. boottii – G; = S. arguta Aiton spp. boottii (Hooker) G.H. Morton]

Solidago brachyphylla Chapman, Dixie Goldenrod. Open woodlands, bluff forests. September-November. SC (NC?) south to ne. FL and Panhandle FL, west to s. AL (s. MS?). [= FNA, K, S, SE, WH]

Solidago buckleyi Torrey & A. Gray, Buckley's Goldenrod. Forests, open ridgetop and bluff woodlands. September-October. W. KY, s. IN, s. IL, s. MO; perhaps eastwards in GA and AL (these occurrences controversial as to identification). [= F, FNA, G, K, S, SE; < S. petiolaris – RAB]

Solidago caesia Linnaeus var. zeidia R.E. Cook & Semple, Gulf Coast Axillary Goldenrod. Moist forests. September-October. GA and Panhandle FL west to LA and AR. [= FNA; < S. caesia – K, SE, WH]

Solidago curtissii Torrey & A. Gray, Curtis's Goldenrod. Moist forested slopes, and rarely in mafic woodlands in the Piedmont of VA. September-October. A Central and Southern Appalachian endemic: PA, WV, and MD south to n. GA and n. AL. Var. curtissii, with stem glabrous or slightly puberulent in the inflorescence, and var. pubens (M.A. Curtis) A. Gray, with stem densely puberulent, are sometimes distinguished. They do not appear to be worthy of taxonomic recognition. [= C, SE, W, WV; < S. curtissii var. curtissii – RAB (also see S. lancifolia); > S. curtissii var. curtissii – F, G; > S. curtissii var. pubens (M.A. Curtis) A. Gray – RAB, F, G; = S. curtissii var. curtissii – FNA; < S. curtissii – K (also see S. lancifolia); = S. caesia Linnaeus var. curtissii (Torrey & A. Gray) Wood; > S. curtissii – S; > S. pubens M.A. Curtis – S]
**Solidago delicatula** Small. Possibly east to AL, FL. August-October. [= FNA, SE; = *S. ulmifolia* Muhlenberg ex Willdenow var. microphylla A. Gray – K; < *S. ulmifolia* – S] {not keyed; not mapped}

**Solidago erecta** Pursh. Woodlands, old fields, woodland borders, grassy balds. August-October. NY and CT south to GA, AL, and MS. [= RAB, C, F, FNA, G, K, S, SE, W, WV; < *S. caesia* – RAB, F; = *S. latissimifolia* – S, misapplied; = *S. curtisii* Torrey & A. Gray var. flavicifolia (Small) R.E. Cook & Semple – FNA; = *S. caesia* Linnaeus var. paniculata A. Gray]

**Solidago microphylla** A. Gray – K; [ < *S. ulmifolia* – S] {not keyed; not mapped}

**Solidago erecta** Nuttall var. erecta (Pursh) MacMillan

**Solidago faucibus** Wieboldt, Gorge Goldenrod. Moist forests. Late August-October. S. WV south to sw. VA, and se. KY; disjunct in nw. SC. See Wieboldt & Semple (2003) for additional information. [= FNA]

**Solidago flexicaulis** Linnaeus, Zigzag Goldenrod. Moist wooded slopes, especially over calcareous or mafic rocks. August-October. NS, ON and ND south to GA, AL, MS, and KS. [= RAB, C, F, FNA, G, K, S, SE, W, WV]

**Solidago gigantea** Aiton, Smooth Goldenrod. Old fields, roadsides, streamside meadows, bottomlands. August-September (-October). NS west to SK and MT, south to Panhandle FL (Liberty County), TX, and CO. [= RAB, C, GW, K, W, WH; < *S. gigantea* var. gigantea – F, G, SE, WV; > *S. gigantea* var. serotina (Kuntze) Cronquist – G, SE; > *S. gigantea* var. leiophylla Fernald – F, WV; = *S. serotina* – S]

**Solidago glomerata** Michaux, Skunk Goldenrod. High elevation situations, including grassy balds, rock outcrops, heath balds, northern hardwood forests, and spruce-fir forests. Mid August-October. A narrow Southern Appalachian endemic, restricted to w. NC and e. TN (perhaps reaching its northern limit on Elk Knob, Watauga County, NC). The basal rosettes are evergreen, and are a conspicuous component of the winter flora at high elevations. The plants have a distinctive skunky odor, easily smelled without touching or bruising the plant. [= RAB, FNA, K, S, SE, W]

**Solidago gracillima** Torrey & A. Gray, Southern Bog Goldenrod, Graceful Goldenrod. Wet pine savannas, seepage bogs. August-October. E. VA south to c. Panhandle FL, west to s. AL. Several distinct entities appear to have been referred to this taxon; the number of entities, and the appropriate names to apply to them, are presently obscure. The names *S. perlonga* Fernald, *S. austrina* Small, and *S. simulans* Fernald have been synonymized under *S. gracillima* (as by Cronquist 1980). Cronquist (1980) refers material from WV and high elevation granitic domes of sw. NC (*S. simulans*) to *S. gracillima*, a treatment which is not phytogeographically credible. The distinction between *S. gracillima* s.s and *S. austrina* may prove warranted. They are alleged to differ as follows: *S. austrina*: pappus 2.2-2.8 mm long, ray flowers 2-4, disc flowers 6-8; of the inner Coastal Plain and lower Piedmont; *S. gracillima*: pappus (3.0-) 3.5-4.0 mm long; ray flowers 3-7; disk flowers 9-13; of the Coastal Plain. [= RAB, K, W, WH; < *S. gracillima* – C, SE (also see *S. simulans*); > *S. austrina* Small – F, G, S; > *S. longicaulis* Fernald – F; = *S. stricta* Aiton ssp. gracillima (Torrey & A. Gray) Semple – FNA; > *S. gracillima* – S]

**Solidago harrisii** Steele, Shale-barren Goldenrod. Limestone, dolostone, greenstone, shale, and calcareous siltstone woodlands, barrens, and cliffs. August-September. A Central Appalachian endemic: w. MD south to e. WV and w. VA. [= F, S, W, WV; = *S. arguta* Aiton var. harrisii (Steele) Cronquist – C, K, SE; = *S. arguta* ssp. arguta var. harrisii – FNA; < *S. boottii* var. boottii – G]

**Solidago hispida** Muhlenberg ex Willdenow, Hairy Goldenrod. Dry rocky forests and woodland edges. August-October. NL (Labrador) west to SK, south to nw. GA, AL, AR, IA, and SD. Widespread in e. and c. TN (Chester, Wofford, & Kral 1997) and in nw. GA (Jones & Coile 1988). Also reported for NC and SC by Kartesz (1999). [= C, FNA, S, SE, W, WV; > *S. hispida* var. hispida – F, G, K]

Solidago lancefolia  (Torrey & A. Gray) Chapman, Lanceleaf Goldenrod. Mountain slopes, mostly at high elevations. Late August-September. W. VA and e. WV south to w. NC and e. TN. [= C, FNA, S, SE, W; < S. curtisi var. curtisi – RAB; < S. curtisi – K]

Solidago latissimifolia  P. Miller, Coastal Swamp Goldenrod. Pocosins, swamp forests, sandhill seepages, sandhill-pocosin ecotones. August-October. NS south c. peninsular FL, west to s. AL. [= FNA, WH; > S. elliottii var. ascendens Fernald – F; > S. elliottii var. pedicellata Fernald – F]

Solidago leavenworthii  Torrey & A. Gray, Leavenworth’s Goldenrod. Wet pine savannas, wet pine flatwoods, pond margins, marshes. August-November. Se. NC south to s. FL, west to s. AL. [= RAB, FNA, GW, K, S, SE, WH]

Solidago nitida  Torrey & A. Gray, Shiny Goldenrod. Pine savannas, prairies. (July-) August-October. MS west to s. AR, se. OK, and TX. [= FNA, SE; = Oligoneuron nitidum (Torrey & A. Gray) Small – K, S, Z; = Solidago nitida Torrey & A. Gray – FNA, SE]

Solidago odora  Aiton, Licorice Goldenrod. Meadows, pastures, roadbanks, woodland borders, such as glades, barrens, and ridgetop pine-oak woodlands. July-October. NH, VT, NY, OH, and MO south to FL and TX. [= RAB, F, G, S, W, WV; = S. odora var. odora – C, K, SE, WH; = S. odora ssp. odora – FNA]

Solidago patula  Muhlenberg ex Willdenow var. patula, Northern Roughleaf Goldenrod. Bogs, seepages over mafic rocks, grassy balds (as Whitetop Mountain). August-September (-October). NH and VT west to WI, WI, MI, and IA, south to GA, AL, MS, and MO. Some or all of the coastal records may actually represent ambiguous specimens of S. patula var. strictula. [= RAB, C, F, G, K, SE; = S. patula ssp. patula – FNA; < S. patula – GW, W, WV; = S. rigida – S, misapplied]

Solidago petiolaris  Aiton var. petiolaris. Upland forests and woodlands. Late August-November. The distribution of S. petiolaris (in the broad sense) is peculiar, with an eastern component (NC south to ne. FL and Panhandle FL, west to AL) and a western component (IL, MO, AR, and LA west to NE, CO, and NM). The eastern component is sometimes treated as S. petiolaris (sensu stricto) and the western as S. angusta Torrey & A. Gray. Alternatively these are recognized as the varietal rank (as here), or combined entirely. Var. angusta (Torrey & A. Gray) A. Gray and var. wardii (Britton) Fernald are Ozarkian and more western (Nesom 2008). [= C, F, K, SE; < S. petiolaris – RAB, W, WH (and also see S. buckleyi); = S. petiolaris var. petiolaris – C, F, K, SE; = S. petiolaris – G; > S. milleriana Mackenzie – S; > S. harperi Mackenzie in Small – S]

Solidago plumosa Small, Yadkin River Goldenrod. In crevices of outcrops in rocky, flood-scoured riverbanks. September. Known only from the type locality, the gorge of the Yadkin River in c. NC. Most of the population was lost by construction of two hydropower dams, one at each of the two ends of the gorge, and the flooding of the intervening area. This species is related to the more northern S. racemosa and the newly described and more western S. arenicola. [= FNA, K, S, SE]

Solidago porteri Small, Porter's Goldenrod. Upland forests. So far as known, this species is endemic to the Piedmont of GA; its taxonomic status is very uncertain. [= K, S, SE; < S. erecta – FNA] [not yet keyed]

Solidago ptarmicaoides (Nees) Boivin, White Prairie-goldenrod, Upland White Aster. Prairie-like barrens over mafic, ultramafic, or calcareous rock, serpentine woodlands, prairies. August-October. VT and NY west to SK, south to e. TN (Rhea and Roane counties in the Ridge and Valley) (Chester, Wofford, & Kral 1997), nw. GA (Floyd County), AR, and CO; disjunct in nc. NC (Granville County, and historically in Rowan County) and nc. SC (York County). [= C, FNA, SE, W, X; = Oligoneuron album (Nuttall) Nesom – K, Z; = Aster ptarmicaoides (Nees) Torrey & A. Gray – F, G, S; = Unanima alba (Nuttall) Rydberg; > Aster ptarmicaoides var. georgianus A. Gray (referring to plants of se. US); = Solidago asteroides Semple, superfluous name]

Solidago puberula Nuttall var. puberula. Bogs, wet meadows, and wet pastures, in dry acid soils in VA and WV. August-October. NS west to ON, south to GA and TN. [= RAB, C, F, G, K, SE; = S. puberula ssp. puberula – FNA; = S. puberula – S; < S. puberula – W, WV]

Solidago pulchra Small, Beautiful Goldenrod, Carolina Goldenrod. Wet pine savannas, seepage bogs. July-September. Endemic to a small part of the Coastal Plain of se. NC, where locally common in the few wet savannas remaining. Notable sites include Green Swamp (Brunswick County), Holly Shelter Game Land (Pender County), Camp Lejeune Marine Corps Base (Onslow County), and Croatan National Forest (Carteret County). There is no question of the distinctness of this species from S. stricta and S. gracillima. Once learned, the basal leaves are recognizable at a glance, the petiole very long (often twice as long as the leaf blade), the venation finely netted, the margins smooth and entire, the tip usually acute and prominently mucronate. Even following fire, sterile rosettes typically outnumber flowering plants 100 to 1. [= FNA, K, S, SE; < S. stricta – RAB, GW]

Solidago racemosa Greene, Sticky Goldenrod. Rocky, flood-scoured riversides. ME and QC south to n. VA and WV; plants in the Cumberland Plateau of KY and ne. TN (Churchill & Schell 1992; Chester, Wofford, & Kral 1997) placed here are problematic and may represent another taxon or taxa. This complex remains poorly understood. [= WV; = S. simplex Kunth ssp. randii (Porter) Ringius var. racemosa (Greene) Ringius – C, FNA, K; = S. racemosa Greene var. racemosa – F; = S. spathulata A.P. de Candolle ssp. randii (Porter) Cronquist var. racemosa (Greene) Cronquist – G, SE]

Solidago radula Nuttall, Rough Goldenrod. Dry woodlands over mafic rocks. August-October. IL west to KS, south to LA and TX; disjunct eastward in KY, NC, SC, GA, and AL. [= RAB, C, FNA, G, S, SE, W; > S. radula var. radula – K]

Solidago randii (Porter) Britton, Rand's Goldenrod. Cliffs and barrens, primarily over mafic (such as greenstone and hornblende) or calcareous rocks. NS west to ON and MI, south to w. VA and WV. [= WV; < S. simplex ssp. randii (Porter) Ringius var. monticola (Porter) Ringius – C, FNA; > S. randii – F; > S. maxonii Pollard – F; = S. spathulata A.P. de Candolle ssp. randii (Porter) Cronquist var. randii – G; = S. simplex Kunth ssp. randii (Porter) Ringius var. randii – K]

Solidago riddelli Frank ex Riddell, Riddell's Goldenrod. Wet, calcareous prairies; rare. ON and MB south to OH, IN, IL, AR, and KS; disjunct in w. VA and nw. GA. The specimen from Fort Monroe ("Fortress Monroe, Va." – Fernald 1950) is accurately identified but may be mislabeled. [= C, F, FNA, G; = Oligoneuron riddelli (Frank ex Riddell) Rydberg – K, Z]
**Solidago rigida** Linnaeus var. *glabra* - E.L. Braun, Southeastern Bold Goldenrod. Glades, barrens, and prairie-like areas, over mafic (such as diabase) or calcareous (such as calcareous shale) rocks, and in adjacent disturbed areas, such as roadbanks and powerline rights-of-way. Late August-October. Sc. VA, se. TN, c. OH, and e. MO south to c. SC, sw. GA, and e. TX. This taxon (variously treated as a species, subspecies, or variety) is rare and scattered throughout its range, restricted to prairie-like situations. Var. *glabra* is apparently strictly diploid. [= C, G, SE; = *Oligoneuron rigidum* (Linnaeus) Small var. *glabra* - E.L. Braun] Nesom – K, Z; < *Solidago rigida* Linnaeus – RAB, W; = *Solidago jacksonii* (Kuntze) Fernald – F; = *Solidago rigida* ssp. *glabra* (E.L. Braun) Heard & Semple – FNA, Y; = *Oligoneuron jacksonii* (Kuntze) Small – S]

**Solidago rigidoides** Linnaeus var. *rigida* - Midwestern Bold Goldenrod. Glades, barrens, and prairie-like areas, over mafic or calcareous rocks. August-October. Ri and MA west to NY, s. ON, MI, WI, s. MN and c. NE, south to c. VA. Sc. NC, w. NC, SE, GN, and c. AR, and se. TX. Var. *rigida* is generally rare and restricted to relictual prairie-like situations east of MI, IN, IL, MO, and OK. Var. *rigida* is tetraploid through most of its range, including (apparently) all of our area. A third variety, var. *hamilis* (T.C. Porter) Nesom, is more northern and western, ranging from ON west to AB, south to MI, IN, IL, MO, OK, n. TX, and NM. [= C, G, SE; = *Oligoneuron rigidum* (Linnaeus) Small var. *rigida* – K, Z; < *Solidago rigidoides* Linnaeus – RAB, W; = *Solidago rigidoides* – F; = *Solidago rigidoides* sp. *rigida* – FNA, Y; = *Oligoneuron rigidum* (Rafinesque) Small – S]

**Solidago rugosa** P. Miller var. *spaghaphilosa* Grav. - Peat-loving Goldenrod. Cpe (DE, NC, SC, VA): boggy habitats; common. August-October. NS and ME south to SC. [= < *S. rugosa* var. *rugosa* – RAB; = *S. rugosa* ssp. *spaghaphilosa* Grav. – C, FNA, G, K; < *S. rugosa* – GW; < *S. rugosa* ssp. *rugosa* – W; = *S. aestivalis* E. Bicknell]

**Solidago rugosiflora** Rauli, Riverbank Goldenrod. Rock Goldenrod. Pd (VA), Mt (VA); crevices in rocky, flood-scorched riversides; rare. July-September. PA, OH, and IL south to n. VA and TN. [= C, F, FNA, K, SE; < *S. altissima* – RAB; = *S. canadensis* var. *rugosiflora* (Raufesque) Porter – G; < *S. canadensis* – S]

**Solidago sempervirens** Linnaeus var. *melanica* (Linnaeus) Fernald, Southern Seaside Goldenrod. Cpe (DE?, FL, GA, NC, SC, VA): coastal dunes, dune slacks, maritime wet grasslands, tidal marshes; common (rare in VA). Late August-December (and sporadically until at least January in mild winters). DE (or allegedly MA) south to s. FL, west and south to TX and Mexico; west Indies. [= C, F, G, KW, K, SE; < *S. sempervirens* – RAB, WH; = *S. mexicana* Linnaeus – S; = *S. sempervirens* ssp. *mexicana* (Linnaeus) Semple – FNA]

**Solidago sempervirens** Linnaeus var. *semperflorens*, Northern Seaside Goldenrod. Cpe (DE, VA): coastal dunes, dune slacks, maritime wet grasslands, tidal marshes; common. Late August-November. NL (Newfoundland) south to se. VA along
the coast (and introduced inland in saline situations such as along salted roadways). [= C, F, G, K, SE; = S. sempervirens Linnaeus – S; = S. sempervirens ssp. sempervirens – FNA]

**Solidago shortii** Torrey & A. Gray. Endemic to nc. KY (Fleming, Jefferson, Nicholas, Robertson counties) and s. IN. August-October. See Smith et al. (2004) and Homoya & Abrell (2005) for additional, detailed information. [= C, F, FNA, G, K, SE] [not yet keyed]

**Solidago simulans** Fernald, Granite Dome Goldenrod, Cliffside Goldenrod. Mt (GA, NC, SC): in thin soil mats wetted by periodic seepage on granitic domes and lower elevation montane cedar hardwood woodlands; rare. August-September. Endemic to sw. NC, nw. SC, and ne. GA. [= K, < S. uliginosa – RAB, FNA; = S. gracillima – SE]

**Solidago speciosa** Nuttall var. rigidulicarpa Torrey & A. Gray. Mt (GA): limestone barrens; rare. (August-)September-October. On west to ND and WV, south to TN, LA, and TX; disjunct eastward in glade habitats to nw. GA (GANHP), TN (Chester, Wofford, & Kral 1997), and KY. [= C, G, K, SE; = S. speciosa var. angustata Torrey & A. Gray – F, misapplied; = S. speciosa ssp. speciosa var. rigidulicarpa – FNA; = S. rigidulicarpa (Torrey & A. Gray) Porter – S1 {synonym incomplete}

**Solidago spathulata** Raffinesque, Stout Goldenrod, False Goldenrod Mt (GA, NC, SC, VA, WV), Pd (NC, VA): rock outcrops and dry woods, usually on calcareous or mafic rocks; uncommon. (July-)August-September (-October). C. VA, s. WV, OH, IN, and IL south to GA, AL, and MS. [= RAB, C, F, G, K, SE, W, WV; = Brachychaeta spathulata (Raffinesque) Britton – S]

**Solidago stricta** Aiton, Wand Goldenrod. Cp (DE, FL, GA, NC, SC, VA?): pine savannas, Coastal Plain bogs, pocosins; common (rare in DE). Late August-October. NJ and DE (formerly) south to s. FL, west to TX; West Indies and s. Mexico. [= C, F, G, K, SE, WH; < S. stricta – RAB, GW (also see S. pulchra); = S. petiolata P. Miller – S, misapplied; = S. stricta Aiton ssp. stricta – FNA]

**Solidago tarda** Mackenzie. Cp (DE, FL, GA, VA), Pd (GA, VA): sandhills, other dry pinelands, xeric fluvial sand ridges, Piedmont barrens; rare. September-October. NJ and e. PA south to e. VA, c. and s. GA, AL, and Panhandle FL, in our area primarily in the Coastal Plain; disjunct in Marion County, TN (Chester, Wofford, & Kral 1997). [= C, FNA, S, SE; < S. arguta – RAB; < S. ludoviciana – F, misapplied as to our area; < S. arguta var. arguta – K; < S. arguta var. caroliniana – WH]

**Solidago uliginosa** Nuttall var. linoides (Torrey & A. Gray) Fernald. Mt (WV): bogs; rare. NS and NL (Labrador) west to MB, south to s. PA, e. WV, OH, IN, and IL. [= K; < S. uliginosa – C, FNA; > S. uliginosa var. linoides – F; > S. purshii Porter – F, WV; > S. uliginosa var. percarnea (Fernald) Friesner – G]

**Solidago uliginosa** Nuttall, Northern Bog Goldenrod. Mt (GA?, NC, SC, VA, WV), Cp (DE, VA): bogs, wet meadows, mafic fens, acidic seepage swamps; rare. NL (Labrador) west to Keewatin, south to e. VA, w. NC, ne. TN, IL, and IA (reports from further south need additional evaluation; some material formerly identified as S. uliginosa is actually S. simulans or S. gracillima). [= F, G, K, WV; < S. uliginosa – RAB, C, FNA, SE, W; < S. wilguida (A.P. de Candolle) Porter – S]

**Solidago ulmifolia** Muhlenberg ex Willdenow var. palmeri Cronquist. East to MS and AL?. [= FNA, G, K, SE; < S. ulmifolia – S]

**Solidago ulmifolia** Muhlenberg ex Willdenow var. ulmifolia, Elmleaf Goldenrod. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, FL, VA): rocky forests and woodlands, especially on mafic and calcareous substrates, moist hammocks (in FL); common (rare in DE, FL, GA, NC, SC, rare in VA Coastal Plain, where usually confined to coquina limestone). August-October. NS, ME, ON, and MN, south to FL and TX. [= C, FNA, G, K, SE; < S. ulmifolia – RAB, F, S, WH, WV]

**Solidago verna** M.A. Curtis, Spring-flowering Goldenrod. Cp (NC, SC): moist pine savannas, lower slopes of sandhills, pineland roadbanks; rare. May-June. Sc. NC south to e. SC. [= RAB, FNA, K, S, SE]

**Solidago villosissima** LeBlond, Carolina Maritime Goldenrod. Cp (NC): dry-mesic and mesic hardwood forests (and related disturbed areas), in the outer Coastal Plain; rare. September. Endemic to se. NC (Onslow, Pender, Brunswick, and Craven counties). See LeBlond (2000) for additional information. [= FNA]

---

**Solina** Ruiz & Pavón 1794 (Burweed)

A genus of about 8 species, herbs, of South America. References: Watson in FNA (2006a); Cronquist (1980)=R; Arriagada & Miller (1997)=Z. [also see Gymnostyles]
**ASTERACEAE**

965

1 Achenes (1.5-) 2.5-3.0 mm long, usually winged, the wings not transversely ribbed ............................................................................ *S. sessilis*

1 Achenes 1.5-2.2 mm long, winged, transversely ribbed.

2 Leaves mostly basal; leaf blades 3-8 (-15) cm long, 2-3× pinnatifid .................................................................................... *S. arvensis* var. *arvensis*

2 Leaves cauline and basal; leaf blades 1-2 (-3) cm long, 1-2× pinnatifid .................................................................................... *S. tenuifolia*

**Sonchus** Linnaeus 1753 (Sow-thistle, Milk-thistle)

A genus of about 50-60 species, herbs and shrubs, of the Old World. References: Hyatt in FNA (2006a); Cronquist (1980)=SE.

1 Heads 30-50 mm across in flower, the involucre (10-) 15-20 mm high; perennials from creeping rhizomes.

2 Phyllaries and peduncles densely pubescent with glandular hairs; longer phyllaries 14-17 mm long ............... *S. arvensis* var. *arvensis*

2 Phyllaries and peduncles glabrous (but with sessile glands); longer phyllaries 10-15 mm long ..................... *S. arvensis* var. *glabrescens*

1 Heads 15-25 mm across in flower, the involucre 9-13 mm high; annuals.

2 Leaves cauline and basal; leaf blades 1-2 (-3) cm long, 1-2× pinnatifid .......................................................... *S. asper*

2 Leaves base auricles rounded; mature achenes not transversely rugose ............................................................... *S. oleraceus*

2 Leaves base auricles sagittate, the two lobes on either side of the stem coming to a point; mature achenes transversely rugose ...... *S. uliginosus*

**Sonchus arvensis** Linnaeus var. *glabrescens* (Günther) Grabowski & Wimmer, Perennial Sow-thistle. Mt (NC, VA, WV), Pd (VA): disturbed areas; uncommon (rare in NC), native of Europe. June-November. [= C, SE, WV; < *S. arvensis* – RAB, W; = *Sonchus arvensis* ssp. *uliginosus* (Bieberstein) Nyman – FNA, K; > *S. arvensis* var. *glabrescens* – F; > *S. uliginosus* Bieberstein – F; = *S. uliginosus* – G]

*Sphagenticola* O. Hoffmann 1900

**Stokesia** L’Héritier 1789 (Stokesia, Stokes Aster)

**Stokesia laevis** (Hill) Greene, Stokesia, Stokes Aster, Blue Stokesia. Cp (FL, GA, SC), Pd* (NC*): native in pitcherplant bogs and moist pinelands of FL, GA, and SC, rather frequently grown as a garden plant and naturalized from cultivation at least in NC; rare. Late June-August. Native from e. SC south ne. FL, FL Panhandle, west to LA. There seems no reason to question the validity and native status of the early record from SC. A unique tetraploid population found by the Atlanta Botanical Garden in Omega, GA (near Tifton) in the 1990s was distinguished by having distinct upright and long scapes, up to 1 meter in length; the original population has been destroyed, but a selection derived from it was named 'Omega Skyrocket' and introduced into the commercial trade (D. Werner, pers. comm. 2006). [= RAB, FNA, K, S, SE, WH, Z]
A genus of 2 species, endemic to Australia.

**Symphyotrichum** Nees 1833 (American Aster)

1 Basal and lower stem leaves both petiolate and with cordate blades; [subgenus *Symphyotrichum*, section *Heterophylli*]..........................Key A

1 Basal and lower stem leaves not both petiolate and cordate-bladed.

   2 Perennials, from a taproot; [of moist, usually maritime, and usually saline habitats]; [subgenus *Astropolium*].................................Key B

   2 Annuals, from a taproot; [of moist, usually maritime, and usually saline habitats]; [subgenus *Symphyotrichum*]..........................Key C

3 Leaves not fleshy, usually toothed, stems usually variously pubescent.

   4 Leaves either very numerous on the main stem, the internodes < 1 cm long (in some species the leaves of the lower and middle main stem withered or deciduous by flowering season, the internode length then reckonable by leaf scars), the leaves clasping or sessile, or leaves rather numerous on main stem, the internodes > 3.5 cm long, the leaves of the main stem strongly auriculate clasping (*S. georgianum*, *S. phlogifolium*); stem leaves entire, (often scabrous-margined); rays purple, lavender, rose, or blue (or characteristically white in *S. ericoides* and very rarely also in other species); [subgenus *Virgula*]........................................Key D

   4 Leaves less numerous on the main stem, the internodes averaging > 3.5 cm long, the leaves clasping, subclasping, or not clasping; stem leaves toothed (or rarely entire); rays blue, purple, lavender, pink, or white.

   5 Stem leaves clasping to sheathing; rays blue, purple, lavender, pink, or white..........................................................Key E

   5 Stem leaves not clasping; rays blue, purple, lavender, rose, or white..........................................................Key F

**Key A Symphyotrichum** with petiolute, cordate-bladed lower leaves
[of subgenus *Symphyotrichum*, section *Heterophylli*]

1 Disc florets 35-50 (or more); ray florets (13-) 20-30; involucre 3.8-7 mm high; phyllary tips spreading to squarrose ..........*S. retroflexum*

1 Disc florets 8-10-25 (-30); ray florets 8-20 (-25); involucre 3.8-7 mm high (or to 8 mm high in *S. oolentangiense*); phyllary tips appressed (or the outer phyllaries spreading).

2 Cauline leaf blades sessile and cordate-clasping, or petiolute, the petiole strongly dilated to a cordate-clasping base, or both..........................Key B

2 Cauline leaves not cordate clasping; [collectively widespread].

3 Lower stems glabrous; upper stems sparsely hirtellous or pilose.

4 Basal leaves deeply cordate; phyllaries with lanceolate diamond shaped blaze (2-3× as long as wide), purple to greenish purple..........

   5 Phyllaries with short diamond-shaped green blaze (1-1.5× as long as wide)..........................................................*S. lowrieanum*

   5 Phyllaries with linear-lanceolate-shaped green blaze (> 4× as long as wide)..........................................................*S. urophyllum*

3 Lower stems glabrous to sparsely hirsute; upper stems densely hirtellous to hirsute; [mainly west of the Appalachians].

6 Phyllaries with short diamond-shaped green blaze (1-1.5× as long as wide); basal and lower stem leaves mostly crenate to entire; upper stem leaves entire.

7 Plants with only the basal and lower stem leaves cordate or subcordate; phyllary faces glabrous; lower disc florets (15-) 20-25 (-30)..........................*S. oolentangiense var. oolentangiense*

7 Plants with nearly all basal and stem leaves cordate or subcordate; phyllary faces short-pubescent; disc florets 16-23......*S. shortii*

6 Phyllaries with elongate green blaze (> 2× as long as wide); basal and lower stem leaves serrate or crenate; upper stem leaves serrate or crenate (to entire).

8 Plants 4-12 dm tall; cypselae glabrous..........................................................*S. drummondii var. drummondii=S. drummondii texanum=S. texanum*

8 Plants 3-8 dm tall; cypselae strigillose..............................................................................................................................*S. subulatum*

**Key B – annual salt-marsh asters**
[of subgenus *Astropolium*]

1 Heads usually dense in an elongate, pyramidal-paniculate arrangement; inner phyllaries 6-7 mm long, phyllary apices linear-acuminate, distal margins often inrolled/involute, green zone of phyllaries narrowly lanceolate, usually extending the entire length of the phyllary, chartaceous bases short or absent; pappus acrescent, 4-5.5 mm long at maturity and usually longer than coiled ray corollas; [habitats wet, saline]..............*S. subulatum*
1 Heads corymbiform to thyrsiform, diffusely paniculate, or secund to subsecund and paniculiform arrangements or at the tips of long, bracteate branches; inner phyllaries 4-6.5 mm long, phyllary apices acute to acuminate, distal margins inrolled/involute or not, green zone of phyllaries lanceolate to elliptic, chartaceous bases usually conspicuous; pappus not accrescent, 3.5-4 (-5) mm long at maturity, longer or shorter than ray corollas; [habitats moist to wet, rarely saline].

2 Phyllary tips appressed, acute, flat, inner phyllaries with broadly lanceolate, distinctly demarcated, apical green zone, proximal ½ -1/3 white-chartaceous; ray floret laminae erect, often involute along the edges (curling inwardly), rarely coiling back distally (if so, then only ca. 1/2 coil), usually shorter than mature pappus; disc florets (3-) 7-14 ................................................................. \textit{S. squamatum}

2 Phyllary tips loose, linear-acuminate, distal margins often inrolled/involute, inner phyllaries with narrowly lanceolate, often weakly demarcated apical green zone, white-chartaceous bases short, ca. 1/3–1/2 the length of the phyllaries; ray floret laminae not involute along edges, usually coiling back distally in 1–4 or more coils, usually as long or longer than mature pappus; disc florets either (6-) 8-15 or 11-23 or (20-) 33-45 (-50).

3 Heads usually corymbiform to thyrsiform in arrangement (borne primarily on distal branches, distally clustered); inner phyllaries 4-5.5 (–6) mm long; phyllary apices acute to abruptly short-acuminate or long-acuminate, the distal margins inrolled/involute or not; ray florets in 1 (-2) series, corollas 2-3 mm long, the laminae 0.1-0.3 mm wide (dried), white to light pinkish or slightly blue, coiling back in 1-2 coils or less commonly remaining straight; disc florets (6-) 8-15; [of FL westward across the Gulf Coast] ........................................... \textit{S. expansum}

3 Heads diffusely paniculiform to pyramidal-paniculiform to corymbiform or second to subsecund and paniculiform; inner phyllaries 5-6.5 mm long; phyllary apices long-acuminate, the distal margins usually inrolled/involute; ray florets in 1-3 series, corollas 2-7 mm long, the laminae 0.2-0.8 mm wide (dried), white to blue or purple, coiling back in 2-5 coils; disc florets either 11-23 or (20-) 33-45 (-50).

4 Heads at first at ends of long, bracteate branches, then produced and maturing as axillary and nearly sessile or on very short lateral branches, commonly on one side of the main stem and appearing second to subsecund, in paniculiform arrangements; ray florets in 2-3 series, corollas mostly 2-3.5 (-4) mm long, laminae 0.2-0.4 mm wide (dry), blue to purple, coiling back in 2-3 (-4) coils; disc florets 11-23; [e. GA southwards].......................................................... \textit{S. bahamense}

4 Heads often at ends of long, bracteate branches, axillary heads usually maturing on elongate lateral branches, the whole arrangement often diffusely paniculiform to pyramidal-paniculiform, or heads more distally disposed and the arrangement corymbiform to thyrsiform; ray florets in 1 series, corollas mostly 4-7 mm long, laminae 0.4-0.8 mm wide (dry), blue to white, coiling back in 3-5 coils; disc florets (20-) 33-45 (-50); [sc. United States east to AL and scattered eastward as an introduction] ................. \textit{S. divaricatum}

**Key C – perennial asters with linear, fleshy leaves**

**[of Symphyotrichum subgenera Astrophilum and Chapmanianii]**

1 Leaves basally disposed; disc florets 47-57; ray floret laminae (10-) 14-15 (-20) mm long; [of FL]; [subgenus \textit{Chapmanianii}] .......... \textit{S. chapmanii}

1 Leaves mainly cauline, the basal and lower stem leaves typically withered by flowering season; disc florets (10-) 13-45 (-54); ray floret laminae (4-) 5-8.5 (-9.5) mm long; [collectively widespread]; [subgenus \textit{Astrophilum}]

2 Midstem leaves (1.0-) 1.5-2.7 mm wide; involucres 4.1-5.3 mm high; ray florets 10-16; disc florets (10-) 13-23; achenes 1.5-2.0 (-2.5) mm long; pappus 3.0-4.4 mm long; [collectively widespread]

3 Midstem leaves > 2 cm long, spreading; rays > 9 mm long (to as short as 7 mm in \textit{S. fontinale} of Panhandle FL); [collectively widespread]

4 Mid-stem leaves < 1.5 cm long, \textit{either} ascending-appressed, \textit{or} spreading, and then the apical portion abruptly deflexed; rays 5-9 (-11) mm long; [of the Coastal Plain from e. NC southward].................. \textit{S. patens}

5 Mid-stem leaves > 2 cm long, spreading; rays > 9 mm long (to as short as 7 mm in \textit{S. fontinale} of Panhandle FL); [collectively widespread]

6 Mid-stem leaves cuneate, rounded, or subclasping; [section \textit{Grandiflori}].

**Key D – perennial asters**

**[of Symphyotrichum subgenus Virgulus]**

1 Mid and upper stem leaves > 8 x as long as wide; phyllaries tipped with a small, white spine; rays white (to pale pink); involucre 2.5-4.5 (-5) mm high; disc florets 6-12 (-20) per head; [section \textit{Ericoidi}].......................... \textit{S. ericoides} var. \textit{ericoides}

1 Mid and upper stem leaves 2-7 x as long as wide; phyllaries not spine-tipped; rays purple, lavender, rose, blue (rarely nearly white); involucre > 5 mm high (except sometimes as short as 4 mm high in \textit{S. adnatum} of s. GA and FL west to LA); disc florets (6-) 11-110 per head.

2 Disc florets yellow, cream, or white (with purplish corolla lobes), fading purple or brown; mid and upper stem leaves with bases rounded to cuneate (or slightly clasping in \textit{S. plumosum} of FL Panhandle); phyllaries not stipitate-glandular; [section \textit{Floridus}]

3 Rays 13-15 (-36); cypsela glabrous............................ \textit{S. fontinale} var. \textit{fontinale}

3 Rays 7-12; cypsela densely strigose.

4 Phyllaries long-acuminate, spreading to recurved; phyllaries with woolly, tangled hairs; involure 7-9 mm tall; [of Franklin County, FL Panhandle].......................... \textit{S. ericoides} var. \textit{ericoides}

4 Phyllaries acute, appressed; phyllaries \textit{either} with appressed, straight hairs (moderately to densely sericeous) \textit{or} glabrous to sparsely pilose; involure 5-7 mm high; [collectively widespread]

5 Phyllaries and upper stem leaves moderately to densely sericeous (silky-pubescent); [widespread]........... \textit{S. concolor} var. \textit{concolor}

5 Phyllaries and upper stem leaves glabrous or sparsely pilose; [of the Gulf Coastal Plain]................. \textit{S. concolor} var. \textit{devestimum}

2 Disc florets pink, fading purple; mid and upper stem leaves with bases clasping or auriculate clasping (except cuneate, rounded, or slightly clasping in \textit{S. grandiflorum}, \textit{S. oblongifolium}, and \textit{S. fontinale}); phyllaries stipitate glandular (or sometimes or always lacking stipitate glands in \textit{S. fontinale} and \textit{S. walteri} (of the Coastal Plain from e. NC southward), and \textit{S. patens} var. \textit{patentissimum} (of KY and MS westward).

6 Mid-stem leaves < 1.5 cm long, \textit{either} ascending-appressed, \textit{or} spreading, and then the apical portion abruptly deflexed; rays 5-9 (-11) mm long; [of the Coastal Plain]; [section \textit{Patentes}].

7 Blades of mid-stem leaves ascending-appressed, basally decurrent; [of s. GA south to s. FL, west to s. LA]............. \textit{S. adnatum}

7 Blades of mid-stem leaves spreading, the apical portion then abruptly deflexed, basally clasping; [of e. NC to c. peninsular FL] ........... \textit{S. bahamense}

6 Mid-stem leaves > 1.5 cm long, \textit{either} ascending-appressed, \textit{or} spreading, and then the apical portion abruptly deflexed; rays 5-9 (-11) mm long; [of the Coastal Plain]; [section \textit{Patentes}].
Key E

1. Phyllaries appressed (or in some species the outer slightly spreading); rays usually < 20 [(10-) 12-23 (-34)]; [mainly of sunny, moist to wet pinelands and marshes of c. Panhandle FL south to s. FL] [section Grandiflorum] ........................................... S. fontinalis

2. Middle stem leaves strongly clasping; involucre 3.8-5.5 mm high; disc corollas 15-22 (-23); phyllaries acute, acuminate, to attenuate; green blaze on phyllary lanceolate to elongate diamond-shaped ................................................................. S. andatum

3. Leaf faces glabrous. .......................................................... S. oolentangiense var. oolentangiense

4. Leaves basally disposed, the largest basal and persistent; largest leaves linear, to 20 cm × 2.5 cm, avg. 10× as long as wide; leaf margins often strongly scabrous; [mainly of the Coastal Plain, of SC and GA west to AR and TX] ................................................................. S. laeve var. purpuratum=S. attenuatum

5. Larger leaves > 5× as long as wide, rarely > 2.5 cm wide, the bases slightly clasping; [N]Y and KY south to GA, Panhandle FL (Jackson County), and MS] ................................................................. S. laeve var. concinnum=S. concinnum

5a. S. laeve var. laeve=S. laeve s.s.

5b. S. oolentangiense var. oolentangiense

5c. S. laeve var. laeve=S. laeve s.s.

1. Phyllaries spreading to squarrose; rays usually > 20 [15-50 (-60)].

6. S. novi-belgii var. elodes [Symp-Sym-Pun]

60d. S. novi-belgii var. elodes [Symp-Sym-Pun]
60c. [S. novi-belgii var. novi-belgii] [Symp-Symp-Symp]
[from Warners & Laughlin (1999)]

1 Stems glabrous, occasionally hispidulous in lines; stem leaves with glabrous midvein on the lower surface; rays white to pale lavender; inflorescence dense, leafy; shoots arising singly from elongate rhizome; stems 3-5 mm thick (at 20 cm above soil surface) .............. S. firmum
1 Stems densely pubescent, usually purplish; stem leaves with pubescent midvein on the lower surface; rays lavender to purple; inflorescence widely spreading; shoots often in clumps of 2-6 stems from a persistent stout caudex; stems 5-9 mm thick (at 20 cm above soil surface) .............

Symphyotrichum bahamense (Britton) Nesom, Bahama Salt-marsh Aster. Cp (FL, GA): salt, brackish, and fresh marshes, ditches, wet areas; uncommon. October-November. E. GA and e. FL Panhandle south to s. FL; the Bahamas. [= K, V = S. subulatum (Michaux) Nesom var. elongatum (Bossard) S.D. Sundberg – FNA, Q; < Aster subulatus – GW; < A. subulatus Michaux var. cubensis – SE; = A. subulatus Michaux var. elongatus Bossard]

Symphyotrichum boreale (Torrey & A. Gray) Löve & Löve, Rushlike Aster, Northern Bog Aster. Mt (WV): calcareous wetlands; rare. August-October. E. FL (Newfoundland) west to AK, south to n. NJ, ne PA, nw. PA, WV, OH, IN, IL, IA, NE, CO, ID, and WA. Reported for WV (Barbour, Fayette, Nicholas, and Randolph counties), PA, and NJ. [= FNA, K, X = Aster borealis (Torrey & A. Gray) Provancher – C; ? Aster junciformis Rydberg – F, G]

Symphyotrichum chapmanii (Torrey & Gray) Sempie & Brouillet, Chapman’s Aster. Cp (FL): flatwoods and seepage bogs; rare. Endemic to Panhandle FL and AL, with a few widely scattered records in the FL peninsula. [= FNA, WH = Eurybia chapmanii (Torrey & Gray) Nesom – K, X = Aster chapmanii Torrey & Gray – S, SE]

Symphyotrichum concolor (Linnaeus) Nesom var. concolor, Eastern Silvery Aster. Cp (DE, FL, GA, NC, SC, VA), Pa (GA, NC, SC, VA), Mt (GA, NC, SC, VA); sandhills, Piedmont woodlands, forest edges, roadbanks; common (rare in DE, rare in Mountains). September-October. MA and NY south to s. FL, west to LA, inland less commonly to TN and KY. [= FNA; < S. concolor (Linnaeus) Nesom – K, WH, X = Aster concolor Linnaeus – RAB, C, F, G, S, SE, W; < Virgulus concolor (Linnaeus) Reveal & Keener; = Symphyotrichum concolor sp. concolor – Haines (2010)]

**Symphyotrichum depauperatum** (Fernald) Nesom, Serpine Aster. Pd (NC), Mt (WV): glades and barrens over mafic rocks (diabase) [or calcareous rocks in WV?]; rare. Early September-October. MD and se. PA; disjunct southward in nc. NC. Reported for Hardy County, WV (Harmon, Ford-Werntz, & Grafton 2006, Strausbaugh & Core 1978). [= FNA, K, X; = Aster depauperatus Fernald – C, F, G, SE]

**Symphyotrichum dumosum** (Linnaeus) Nesom var. *pergracile* (Wiegand) Nesom. {NC, SC}. Late August-October. Endemic to NC and SC. [= K; < Aster *dumosus* – RAB, GW, SE; < S. dumosum – FNA; = Aster *dumosus* Linnaeus var. *pergracile* Wiegand]

**Symphyotrichum dumosum** (Linnaeus) Nesom var. *strictior* (Torrey & A. Gray) Nesom. Mt (VA), {NC}: woodlands and glades over mafie rock; rare. Late August-October. NH, ON, and WI south to NC and MO. [= K, X; < Aster *dumosus* – RAB, C, G, GW, SE, W; = Aster *dumosus* Linnaeus var. *strictior* Torrey & A. Gray – F; < S. dumosum – FNA]

**Symphyotrichum ericoides** (Linnaeus) Nesom var. *ericoides*, Heath Aster, Square-rose White Aster. Mt (GA, VA): limestone glades; rare. ME, NL (Labrador), ON, ND, CO, AZ, south to VA, MS, TX, Nuevo Léon, and Coahuila. [= FNA; > Symphyotrichum ericoides (Linnaeus) Nesom var. *ericoides* – K, X; = Symphyotrichum ericoides (Linnaeus) Nesom var. *prostratum* (Kuntze) Nesom – K, X; > Aster ericoides Linnaeus var. *ericoides* – G; > Aster *ericoides* Linnaeus var. *prostratum* (Kuntze) Blake – G; = Aster *ericoides* – C, F; = S. ericoides var. *ericoides* – FNA; = Virgulus ericoides (Linnaeus) Reveall & Keener]

**Symphyotrichum expansum** (Poepigg ex Sprengel) Nesom. Cp (FL): pond margins, disturbed wet areas; rare. July-November (-January). FL. Panhandle and peninsula, AL, OK, UT, NV, and CA south through Mexico and Central America to n. South America; West Indies. [= K, V, X; = Aster *sululatum* (Michaux) Nesom var. *parviflorum* (Nees) S.D. Sundberg – FNA, Q; [add synonymy – S]

**Symphyotrichum georgianum** (Alexander) Nesom, Georgia Aster. Pd (GA, NC, SC), Cp (FL, GA): dry, rocky woodlands, woodland borders, roadbanks, powerline rights-of-way, primarily in places that formerly would have burned and likely been post oak or blackjack oak woodlands or savannas, also in thin soils around granitic flatrocks; rare. Early October-mid November; November-December. SC. NC south to c. GA and west to c. AL; apparently disjunct on the Coastal Plain of sw. GA and e. Panhandle FL (Leon County). [= FNA, K, WH, X; = Aster *georgianum* Alexander – S, Z; < Aster *patens* – RAB; = Aster *patens* Aiton var.
**ASTERACEAE**

**Symphyotrichum grandiflorum** (Linnaeus) Nesom, Big-headed Aster. Cp, Pd (NC, SC, VA): dry woodlands, forest edges; roadbanks and powerline rights-of-way; common. Late September-November. E. and c. VA south through e. and c. NC to nc. SC. [= FNA, K, X; = *Aster grandiflorus* Linnaeus – RAB, C, F, G, S, SE, W; = *Vigilus grandiflorus* (Linnaeus) Reveal & Keener]

**Symphyotrichum laeve** (Linnaeus) Löve & Löve var. *concinnum* (Willdenow) Nesom, Narrow-leaved Smooth Aster. Pd (DE, NC, SC, VA), Mt (VA, WV), Cp (FL). {GA}: dry woodlands over mafic or calcareous rocks; rare. September-October. NY and KY south to GA, Panhandle FL (Jackson County), and MS. [= FNA, K, WH, X; = *Aster concinnus* Willdenow – C, G, S, SE; < *A. laevis* – F, WV; = *A. laevis* Linnaeus var. *concinnum* (Willdenow) House – RAB, W; = *laeve* ssp. *concinnum* (Willdenow) Semple & Brouillet]

**Symphyotrichum laeve** (Linnaeus) Löve & Löve var. *laeve*, Smooth Blue Aster. Pd (DE, NC, SC, VA), Mt (NC, VA, WV), Cp (DE, VA). {GA}: mesic hardwood forests; rare. September-October. NS west to MB, south to GA, LA, and OK. [= FNA, K, X; = *Aster attenuatus* Lindley ex Hooker – G, S; > *Aster purpureus* Nees – S; = *Aster laevis* Linnaeus var. *purpureus* (Nees) A. G. Jones; = *Symphyotrichum attenuatum* (Lindley) Semple]

**Symphyotrichum lanceolatum** (Willdenow) Nesom var. *lanceolatum*. Cp (DE), Pd (DE, MT; NC, WV), {VA}: moist soils; rare. July-October. NL (Newfoundland) west to SK, south to PA (Rhoads & Klein 1993), VA (reported in FNA), NC, SC (?) TN, MS, LA, and TX. Reported for Ashe County, NC (Poidexter & Murrell 2008). [= FNA, X; < *Aster simplex* Willdenow – RAB, GW, WV; = *Aster lanceolatus* Willdenow var. *lanceolatus* – C; = *A. simplex* var. *ramosissimus* (Torrey & A. Gray) Cronquist – F, G; < *A. simplex* var. *simplex* – SE; < *A. lanceolatus* – W; = *A. lanceolatus* ssp. *lanceolatum*; = *A. lanceolatus* ssp. *lanceolatum*]

**Symphyotrichum lateriflorum** (Linnaeus) Löve & Löve var. *horizontale* (Desfontaines) Nesom, Goblet Aster. {DE?, GA, NC, VA}: September-October. ME and MN south to FL and AR. [= K, X; < *S. lateriflorum* – FNA; = *Aster lateriflorus* – C, G, GW, SE, W; = *A. lateriflorus* var. *pendulus* (Aitons) E. S. Burgess – F; = *Aster lateriflorus* (Linnaeus) Britton var. *horizontalis* (Desfontaines) Farwell]

**Symphyotrichum lateriflorum** (Linnaeus) Löve & Löve var. *lateriflorum*, Starved Aster. Mt (WV), {DE?, GA, NC, SC, VA}: dry to moist areas; common in WV. September-November. NS, QC, and MB south to FL and TX. [= K; = *Aster lateriflorus* – RAB (also see *A. ontariensis*); < *A. lateriflorus* – C, G, GW, SE, W; = *A. lateriflorus* Britton var. *lateriflorus* – F; < *S. lateriflorum* – FNA; > *S. lateriflorum* var. *lateriflorum* – X; > *S. lateriflorum* var. *hiruticaule* (Lindley ex A.P. de Candolle) Nesom – X; > *A. lateriflorus* var. *hiruticaule* (Lindley ex A.P. de Candolle) Porter]

**Symphyotrichum novae-angliae** (Linnaeus) Nesom, New England Aster, Michaelmas-daisy. Mt (GA, NC, VA, WV), Pd (DE, VA), Cp (DE, VA*): wet meadows, bogs, prairies; common (rare in GA and NC). September-October. NS west to MT, south to GA, w. AL, c. MS, s. AR, OK, and NM. [= FNA, K, Z; = *Aster novae-angliae* Linnaeus – RAB, C, F, GW, S, SE, W, WV; = *Virgulus novae-angliae* (Linnaeus) Reveal & Keener]

**Symphyotrichum oblongifolium** (Nuttall) Nesom, Eastern Aromatic Aster, Shale-barren Aster. Mt (NC, VA, WV), Pd (VA): rock outcrops and dry woodlands over limestone, calcareous shale; common (uncommon in WV, rare in NC). Late September-October. NY, WI, MN, and MT, south to sc. VA, w. NC, nc. AL, n. MS, TX, and NM. [= FNA, K, X; = *Aster oblongifolius* Nuttall var. *augustatus* Shinners – G, SE; > *A. oblongifolius* var. *orientis* Shinners – WV; > *A. oblongifolius* – RAB, C, F, S, W; = *Virgulus oblongifolius* (Nuttall) Reveal & Keener]

**Symphyotrichum ontariensis** (Wiegand) Nesom var. *ontariensis*, Bottomland Aster. Mt (WV), {GA}: bottomlands, samps, bogs; rare. August-October. QC, ON, MN, and SD, south to WV, GA, AL, MS, LA, and TX. See Nesom (1997) and Brouillet
**Symphyotrichum oolentangiense** (Riddell) Nesom var. oolentangiensi. Cp (FL), {GA}: {habitat}; rare. NY, ON, MN, and SD, south to Panhandle FL and TX. Reported for GA (Kartesz 1999) on the basis of Fernald (1950), and also reported for GA in FNA.

**Symphyotrichum praecatum** (Poiret) Nesom var. angustior (Wiegand) Nesom, Willow Aster, Veiny Lined Aster. Mt (VA, {NC}?): fen-like calcareous wetlands; rare (VA Rare). ME south to NC and TN. Abrams Creek, Frederick County, VA. Also reported for GA (Kartesz 1999). [= FNA, K, X; = Aster praecatum – RAB; = Symphyotrichum praecatum var. angustior – C, F, G, SE; = Symphyotrichum pilosum var. angustior – WH]

**Symphyotrichum pratense** (Linnaeus) G.L. Nesom var. pratense. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA, WV), Cp (DE, NC, SC, VA): dry woodlands, roadsides, woodland edges, clearings, roadbanks; common (rare in FL). Late August-early November, October-November. Var. pratense ranges from VT and NY west to PA, s. OH, s. IN, s. MO, and se. KS, south to e. GA, ne. FL, Panhandle FL, s. AL, s. MS, s. LA, and sc. TX. [= FNA, K, X; = Aster pratense var. pratense – C, F, G, SE, WV; = A. pratense var. gracilis Hooker – C, F, G, SE, misapplied as to our area (now more narrowly defined and occurring only west of our area); = A. pratense – S; = A. pratense var. pratense – Z; = Virgulopsis pratense (Aiton) Reveal & Keener var. pratense]

**Symphyotrichum phlogifolius** (Muhlenberg ex Willdenow) Nesom, Appalachian Clasping Aster. Mt (GA, NC, SC, VA, WV), Pd (NC, SC, VA): mesic, nutrient-rich mixed hardwood forests; uncommon (rare in GA). Late August-mid October. NJ and Long Island, NY west to PA, n. OH, and e. IN south to c. VA, c. NC, w. SC, n. GA, and ne. AL, primarily in the Appalachian Mountains and adjacent provinces. [= FNA, K, X; = Aster phlogifolius var. phlogifolius – RAB, C, F, G, SE, W; = Symphyotrichum phlogifolius (Willdenburg ex Willdenow) Reveel & Keener var. phlogifolius (Muhlenberg ex Willdenow) Reveel & Keener]

**Symphyotrichum pilosum** (Willdenow) Nesom var. pringlei (A. Gray) Nesom. Cp (DE, NC), Pd (DE, NC, VA), Mt (WV), {GA, SC}: {habitat}; common (uncommon in NC and VA, rare in WV). September-November. NS west to MN, south to GA and TN. [= FNA, K, X; = Aster pilosus Willdenow var. demotus Blake – RAB, SE; = Aster pilosus var. pringlei A. Gray – C; = A. pilosus Willdenow var. demotus Blake – F, G, WV; = A. pilosus var. pringlei – F, G, WV]

**Symphyotrichum praealtum** (A.P. de Candolle) Nesom. Mt (GA, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): old fields, disturbed areas, woodland borders; common. September-November. NB west to MN, south to Panhandle FL and TX. Reported for Giles County, VA. [= FNA, K, X; = Aster praecatum – RAB; = Symphyotrichum praealtum – C, F, G, SE, WV; = Symphyotrichum praealtum var. praecatum – WH]

**Symphyotrichum racemosum** (Willdenow) Nesom var. racemosum. Mt (GA, NC, SC, VA, WV), {in e. WV and apparently through our area judging from F)} [= FNA, K, X; = Aster racemosum Elliott – C; = A. racemosum Elliott var. racemosum – F; = A. racemosum – S; = A. racemosum var. racemosum – WH; = A. racemosum var. subdulvatus (Wiegand) A.G. Jones, misapplied]

**Symphyotrichum retroflexum** (A.P. de Candolle) Nesom. Mt (GA, NC, SC, VA): forests; common. Late August-October. W. NC and e. TN south to nw. SC and n. GA. [= FNA, K, X; = Aster curtissii Torrey & A. Gray – RAB, S, SE, W; = A. retroflexum Lindley ex A.P. de Candolle – C]
**Symphyotrichum rhiannon** Weakley & Govus, Buck Creek Aster, Rhionn's Aster. Mt (NC): ultramafic outcrop barren; rare. October. Endemic (as far as is known) to the Buck Creek Serpentine Barren, Clay County, NC. Showing some similarities to *S. puniceum* and *S. prenanthoides*, but unique in many characters and not seemingly intermediate. See Kauffman et al. (2004) for additional information. [= FNA]

**Symphyotrichum ×schistosum** (Steele) Nesom [*S. cordifolium × laeve var. laeve*], Millboro Aster. Mt (VA): rare. [= K, X; = *Aster ×schistosus* Steele (pro sp.); = *A. schistosus* Steele]

**Symphyotrichum shortii** (Lindley) Nesom, Midwestern Blue Heart-leaved Aster, Short's Aster. Pd (GA, VA), Mt (GA, NC, WV), Cp (FL): dry, rocky slopes, calcareous hammocks (in FL); uncommon (rare in FL, GA, NC, and VA). Pa, s. ON, and MN, south to w. NC, c. GA, Panhandle FL (Gadsden and Jackson counties), MS, and AR. The lower stem leaves are indeed reminiscent of the leaves of *Asplenum rhizophyllum* (formerly known as *Camptosorus*), explaining one of Small's names for this species. [= FNA, K, X; = *Aster shortii* Lindley – C, F, G, SE, WV; > *A. shortii* – S; > *A. cordifolium* Small – S]

**Symphyotrichum simmondsii** (Small) Nesom. Cp (FL, GA, NC, SC), Pd (SC): ditches, other wet places, uncommon? Se. NC south to s. FL. [= K, X; < S. simmondsii – FNA, WA (also see *S. krakii*); = *Simmondsia* Small; < *A. pinifolius* Small]

> **Symphyotrichum squamatum** (Sprengel) Nesom, South American Salt-marsh Aster. Cp (FL): disturbed areas (on ballast), escaped to coastal marshes and dunes; rare, native of South America. AL (Mobile County), FL (Escambia County), LA, TX. [= K, V, WH, X; = *S. subulatum* (Linnaeus) Nesom var. *squamatum* (Sprengel) S.D. Sundberg – FNA, Q; < *Aster subulatus* Michaux var. *cubensis* – SE; ? *Aster subulatus* Michaux var. *australis* (A. Gray) Shinners]

**Symphyotrichum undulatum** (Linnaeus) Nesom. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): dry forests, woodlands, roadbanks; common. August-November. NS west to s. ON, south to c. peninsular FL and LA. [= FNA, K, WH, X; = *Aster undulatus* Linnaeus – RAB, C, G, SE, W; > *A. undulatus* var. *undulatus* – F, WV; > *A. undulatus* var. *loriformis* E.S. **Syndredrella** Gaertner 1791 (Nodeweed)

**ASTERACEAE**

* Synedrella nodiflora* (Linnaeus) Gaertner, Nodeweed. Cp (FL): moist to wet disturbed areas (on ballast); rare (not collected since the late 1800s), native of tropical America. January-December. [= FNA, S, SE, WH]

---

**Tagetes** Linnaeus 1753 (Marigold)

A genus of about 40-50 species, of tropical and warm temperate America. References: Strother in FNA (2006c); Cronquist (1980)=SE.

1 Rays inconspicuous, ca. 1-2 mm long; [plant a well-established weed, primarily in the Coastal Plain].................................................. *T. minuta*

2 Rays showy, mostly > 10 mm long; [plant cultivated, rarely occurring as a waif].

2 Peduncles conspicuously swollen and hollow below the flower; involucr 15-20 mm high; achenes 7-10 mm long ..................... *T. erecta*

2 Peduncles not conspicuously swollen and hollow below the flower; involucre 10-15 mm high; achenes 4-7 mm long ..................... *T. patula*

---

**Tanacetum** Linnaeus 1753 (Tansy)

1 Leaves simple, crenate (sometimes with a few basal lobes).................................................................................................................. *T. balsamita*

1 Leaves 1-3-pinnatifid.

2 Rays present, white; leaf blades 4-10 cm long, 1-2-pinnate (with 3-5 pairs of primary lobes) ................................................... *T. parthenium*

2 Rays absent; leaf blades 8-20 cm long, 2-3-pinnate (with 4-20+ pairs of primary lobes)............................................................... *T. vulgare*

* Tanacetum balsamita* Linnaeus, Costmary. Cp (DE): disturbed areas, rare, native of Mediterranean Europe. Introduced south to PA (Rhoads & Klein 1993), MD (Kartesz 1999), and DE (Kartesz 1999). August-September. [= FNA; = Chrysanthemum balsamita (Linnaeus) Baillon – C; = Balsamita major Desfontaines – K]

---

**Taraxacum** G.H. Weber ex Wiggers 1780 (Dandelion)

A genus of about 60 species (or as many as 2000 if apomictic microspecies are recognized), herbs, of boreal and temperate regions. There seems little utility in trying to reconcile the numerous European microspecies against our introduced material. References: Brouillet in FNA (2006a); Cronquist (1980)=SE.

1 Cypselas reddish or purplish at maturity; leaves usually deeply cut throughout their length, the lobes narrow...................... *T. erythrospermum*

1 Cypselas brown or tan at maturity; leaves less deeply cut, particularly toward the base ................................................................. *T. officinale*

---

**Tetragonothea** Linnaeus 1753 (Squarehead)

*Tetraneuris* E.L. Greene 1898 (Bitterweed)

Thelesperma Lessing 1831

A genus of 10 or more species, of c. and w. North America, Mexico, and South America. References: Strother in FNA (2006c).

* Thelesperma filifolium* (Hooker) A. Gray. MS. Prairies, glades, and roadsides over calcareous substrates. MO, SD, and WY south LA, TX, Nuevo Léon, and NM; disjunct eastward in the Black Belt of MS and on a chalk bluff in Sumter County, wc. AL (Keener (2009). [= FNA; > Th. filifolium var. filifolium – SE]

Thymophylla Lagasca y Segura 1816

Tithonia Desfontaines ex Jussieu 1789 (Sunflowerweed)

* Tithonia rotundifolia* (Miller) S.F. Blake, Clavel de Muerto. Cp (FL): disturbed areas; rare, native of Mexico. November-January. Also reported for Orleans Parish, LA. [= FNA, K, WH]

Tragopogon Linnaeus 1753 (Goat’s-beard)

A genus of about 110 species, herbs, of temperate Eurasia and the Mediterranean region. References: P. Soltis in FNA (2006a); Voss (1996); Cronquist (1980)=SE.

1 Flowers purple; pappus brownish .......................................................................................................................................................... *T. porrifolius*
1 Flowers yellow; pappus dingy white.
2 Peduncle obviously swollen below the flower and fruit; margins of the phyllaries green (or pale); leaf tips straight; rays pale yellow, obviously shorter than the longest phyllaries .................................................................................................................................................. *T. dubius*
2 Peduncle only slightly swollen below the flower and fruit; margins of the phyllaries reddish purple (rarely green); leaf tips more or less curled or curved; rays bright yellow, as long as or longer than the phyllaries .................................................................................................................................................. *T. pratensis*

ASTERACEAE

Tridax Linnaeus 1753

A genus of about 26 species, herbs, mainly of the New World tropics. References: Strother in FNA (2006c); Powell (1965)=Z.

Trilisa Cassis 1820 (Trilisa)

Identification notes: Trilisa can be distinguished from Carphephorus by its smaller heads (involucres 3.5-6 mm high vs. 6-15 mm high) and fewer phyllaries (6-12 vs. 15-40). When vegetative, Trilisa lacks shining resin dots on the leaves, while Carphephorus has numerous resin dots.

1 Stem glabrous; capitulescence corymbose, the lateral branches equally or overtopping the central ones; leaves 1-6 (-11) cm wide.........................T. odoratissima
1 Stem densely spreading-pubescent; capitulescence a cylindrical panicle; leaves (0.5-) 1-3 (-4) cm wide.........................T. paniculata

Trilisa odoratissima, Deer-tongue, Vanilla-leaf. Cp (FL, GA, NC, SC): moist to mesic savannas and flatwoods; uncommon. Late July-October; September-November. Se. NC south to c. peninsular FL and west to e. L.A. T. odoratissima has the largest leaves of our species of Carphephorus and Trilisa; its leaves are normally wider than 3 cm, and have a very wide and prominent midrib, usually purple toward the base of the leaf and white toward the tip. This species contains coumarin and gives off a pleasant vanilla odor when drying; it is gathered from the wild and used as a supplementary flavoring in cigarettes. See DeLaney, Bissett, & Weidenhamer (1999), Ward (2001), and Orzell & Bridges (2002) for discussion of a southern Florida taxon related to T. odoratissima, named (in Carphephorus) as a species, Carphephorus subtropiccanus DeLaney, N. Bissett, & Weidenhamer, and later reduced in rank to a variety, C. odoratissimus var. subtropiccanus (DeLaney, N. Bissett, & Weidenhamer) Wunderlin & B.F. Hansen. It is probably best treated at the varietal level, but the combination is not yet available in Trilisa. [= Carphephorus odoratissimus (J.F. Gmelin) Herbert var. odoratissimus – FNA, WH, X; < Carphephorus odoratissimus – GW, K, SE, Z = Carphephorus odoratissimus – Y; < Trilisa odoratissima (J.F. Gmelin) Cassini – RAB, S; = Trilisa odoratissima var. odoratissima – V]

Trilisa paniculata (J.F. Gmelin) Cassini. Cp (FL, GA, NC, SC): savannas and flatwoods; common. August-October; September-November. Se. NC south to s. FL, and west to the FL Panhandle and s. AL. The leaves of this species are reminiscent of C. odoratissimus, but are narrower, (0.5-) 1-3 (-4) cm wide, vs. 1-6 (-11) cm wide in C. odoratissimus. Sterile C. paniculata can be mistaken for glabrate C. tomentosus, which has shorter and broader leaves. [= RAB, S, V; = Carphephorus paniculatus (J.F. Gmelin) Herbert – FNA, GW, K, SE, WH, Y, Z]

Tripleurospermum Schultz ‘Bipontinus’ 1844 (Mayweed)

A genus of about 40 species, herbs, of the northern hemisphere. References: Brouillet in FNA (2006a); Arriagada & Miller (1997)=Z.

1 Stem ascending or erect; achenes with resin glands > 2× as long as wide; annual............................[T. inodorum]
1 Stem procumbent (rarely ascending); achenes with resin glands 1.0-1.5× as long as wide; perennial or biennial...............................[T. maritimum ssp. maritimum]

* Tripleurospermum inodorum (Linnaeus) Schultz ‘Bipontinus’, Scentless Chamomille. Introduced at scattered locations in North America, such as AL, FL, KY, MD, and PA. [= FNA; = T. perforata (Mérat) M. Lainz – K, Z; = Matricaria maritima Linnaeus var. agrestis (Krafft) Wilmott – F; = Matricaria perforata Mérat]
* Tripleurospermum maritimum (Linnaeus) W.D.J. Koch ssp. maritimum, Scentless Chamomille. Introduced at scattered locations in eastern North America, such as AL, PA, NJ. [= FNA; = Matricaria maritima Linnaeus var. maritima – F; = T. maritima ssp. maritima – K, orthographic variant; ? Chamomilla maritima (Linnaeus) Rydberg – S]

Tussilago Linnaeus 1753 (Coltsfoot)

A monotypic genus, an herb, of Eurasia and n. Africa. References: Barkley in FNA (2006b); Cronquist (1980)=SE.
**Tussilago farfara** Linnaeus, Coltsfoot. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (VA): roadsides, especially gravelly or shaly roadbanks or ditches, streamside gravel bars, disturbed ground; common (uncommon in VA Piedmont and Coastal Plain, rare in DE, rare in NC Piedmont), native of Eurasia. This species has spread rapidly southward from the Northeast, where it was introduced in North America. Fernal (1950) considered its southern limit to be "New Jersey, Pennsylvania, and Ohio". Gleason (1952) extended it to WV. Strausbaugh and Core (1978) reported that the first collection in WV was actually in 1933, "migrating southward year by year, now abundant and often conspicuous along highways, on strip-mined areas and other denuded areas, in every county of the state." First reported in NC in 1971, it is now rather common in most of the mountain counties, and is beginning to appear at scattered sites in the Piedmont. Though preferring a cool and moist climate, *Tussilago* seems likely to continue to increase in abundance and to spread into the Piedmont. [= C, F, FNA, G, K, SE, W, WV]

*Uropappus* Nuttall 1841 (Silver-puffs)

**Verbesina** Linnaeus 1753 (Crownbeard, Wingstem, Frostweed)

1 Stem and lower leaf-surfaces grey strigose-canescent; alien annuals, 2-10 dm tall, with taproots; [section *Ximenesia*]..............
   1 Stem and lower leaf-surfaces glabrous or pubescent, but not grey strigose-canescent; native perennials, 5-40 dm tall, with fibrous or fleshy-fibrous roots.

2 Leaves primarily opposite (the uppermost sometimes alternate).
   3 Internodes winged; [collectively widespread]...
   4 Plants 4-5 (-10) dm tall, perennating from short horizontal rhizomes; ray florets (5-) 8; disc florets 20-60+; [endemic to ne. FL and se. GA]; [section *Pterophyton*]..........................................................V. heterophylla
   5 Plants 10-30 dm tall, perennating from a crown with fleshy roots; ray florets (0-) 1-3 (-5); disc florets 8-15+; [widespread]; [section *Phaethusa*] ..............................................V. occidentalis

3 Internodes not winged; [collectively of sw. GA, s. AL, and FL Panhandle]; [section *Pterophyton*].
   5 Ray florets (5-) 11-13, yellow; heads 3-20.................................................................V. aristata
   6 Heads, 1-15 (-20), in a compact inflorescence; disc 7-16 mm wide at anthesis; ray florets (5-) 7-15, yellow; plants 5-12 dm tall; [section *Pterophyton*].................................................................V. helianthoides

4 Plants 10-30 dm tall, perennating from a crown with fleshy roots; ray florets (0-) 1-3 (-5); disc florets 8-15+; [widespread]; [section *Pterophyton*] .................................................................V. occidentalis

5 Ray florets 0; heads 1 (-3).................................................................................................V. chapmanii

6 Heads, numerous, 10-200 or more, in a dense to open inflorescence; disc 3-15 mm wide at anthesis; ray florets either absent, or 1-5 and white, or 2-10 and yellow; plants 10-40 dm tall.

7 Ray florets 1-5, white; [section *Ochtractinia*].
   8 Lower and middle leaves pinnately lobed or dissected; achenes of ray florets glabrous; [of the outer Coastal Plain from SC southward]...............................................................V. virginica var. laciniata
   9 Lower and middle leaves entire, serrate, or slightly undulate; achenes of ray florets papillose or short-pubescent; [more widespread in our area]..........................................................V. virginica var. virginica

   7 Ray florets present, 2-10, yellow; [section *Actinomeris*].
   8 Ray florets absent; or 2-10 and yellow; [section *Actinomeris*].
   9 Ray florets absent; disc florets yellow .................................................................V. alternifolia

**Verbesina alternifolia** (Linnaeus) Britton ex Kearney, Common Wingstem. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, NC, VA): alluvial forests, marshes, floodplain pastures; common (uncommon in VA Coastal Plain, rare in DE and FL). August-September. NY and s. ON west to IA, south to Panhandle FL and LA. [= RAB, C, FNA, G, K, SE, WH, WV; *Ridana alternifolia* (Linnaeus) Britton – S]

**Verbesina arista** (Elliott) Heller, Coastal Plain Crownbeard. Cp (FL, GA): longleaf pine sandhills, swamp margins, dry woodlands; rare. SW. GA and ne. FL west to FL Panhandle and s. AL. June-August. [= FNA, K, SE, WH; *Pterophyton aristatum* (Elliott) Alexander – S]

ASTERACEAE

**Verbesina helianthoides** Michaux, Ozark Crownbeard. Mt (NC), Cp (GA?): dry woodlands over mafic rocks; rare. May-October. OH west to IA and KS, south to c. TN, nw. GA, n. AL, and nc. TX; disjunct in w. NC and e. GA. [= C, F, FNA, G, K, SE; = Pterophyton helianthoides (Michaux) Alexander – S]

**Verbesina heterophylla** (Chapman) A. Gray. Cp (FL, GA): pine flatwoods; rare. (April-) June. Ne. FL (8 counties) and se. GA (Charlton County). [= FNA, GW, K, SE, WH; = Pterophyton heterophyllum (Chapman) Alexander – S]

**Verbesina occidentalis** (Linnaeus) Walter, Southern Crownbeard. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): forests, woodlands, pastures, and roadsides, especially abundant in alluvial areas or upland over mafic or calcareous rocks; common (uncommon in FL). MD west to OH and MO, south to Panhandle FL and MS. [= RAB, C, F, FNA, G, GW, K, SE, WH, WV; = Phaethusa occidentalis (Linnaeus) Britton – S]

**Verbesina virginica** Linnaeus var. laciniata (Poiret) A. Gray, Southern Frostweed. Cp (FL, GA, NC, SC): moist forests and thickets; rare. September-October. E. SC (or e. NC?) south to s. FL. Olsen (1979) maps this variety as occurring in e. NC; I know of no documentation. The two varieties need additional study; specific status may be warranted. [= RAB, GW, K, SE, Z, WH; < V. virginica – FNA; = Phaethusa laciniata (Poiret) Small – S; = V. laciniata (Poiret) Nuttall]

**Verbesina virginica** Linnaeus var. virginica. Common Frostweed. Mt (CA, NC, SC, VA), Pd (GA, NC, SC), Cp (FL, GA, SC, VA): moist to dryish forests, especially over mafic or calcareous rocks, in Coastal Plain ravines in VA over coquina limestone; uncommon (rare in VA). July-October. Sc. NC (e. VA?) west to e. KS, south to s. FL and c. TX. Populations of V. virginica from e. VA appear to be substantially disjunct from other populations of either variety. [= RAB, C, F, GW, K, SE, Z; < V. virginica – F, FNA, G, WH; = Phaethusa virginica (Linnaeus) Britton – S]

**Verbesina waltoni** Shinners, Walter’s Wingstem. Cp (GA, SC), Pd (NC): floodplains, low moist forests; rare (NC Watch List). Late August-September. Coastal Plain of SC south to GA, west to LA; disjunct in Piedmont of NC and Ouachita Mountains of AR. [= RAB, FNA, GW, K, SE; = Ridan paniculata (Walter) Small – S]

**Vernonia** Schreber 1791 (Ironweed)

A genus of about 20 species, perennial herbs, of e. and c. North America and n. Mexico; a few species in South America. Traditionally very broadly circumscribed to include about 500 species, trees, shrubs, and herbs, of tropical, subtropical, and warm temperate regions, especially America and Africa; this broader circumscription appears increasingly indefensible.

References: Strother in FNA (2006a); Jones (1982)=Z; Urbatsch (1972)=Y; Jones in Cronquist (1980)=SE. Key based on FNA and SE.

**Identification notes:** Hybrids are frequent between co-occurring species. Only V. ×georgiana is keyed separately below (because of its distinctive appearance). Others may be recognized by intermediate morphology and ecological/geographic context.

1 Basal rosette present, its leaves larger than those of the stem; [of xeric habitats of the Coastal Plain and (in NC southward) xeric rocky habitats of the Piedmont].

2 Phyllary tips acute to rounded (sometimes minutely apiculate), the narrowest short acuminate; [from s. MS westward] ...............[V. texana]

3 Phyllary tips subulate to filiform, the broadest long-acuminate; [from s. MS westward] ...............V. acaulis

1 Basal rosette absent; [collectively of a wide variety of habitats].

4 Phyllary tips subulate to filiform, the broadest long-acuminate.

5 Involucres 11-15 mm in diameter; phyllaries (50-) 60-70+; florets 50-100+ ...............................................................V. arkansana

6 Middle cauleine leaves 1.2-7.5 cm wide; plants 4-35 dm tall; [of various habitats, but not typically in Coastal Plain pineyards].

7 Pappus whitish to yellowish, 30 outer bristles intergrading with 30+ inner bristles; leaf blades 2.5-3.5 (-4)× as long as wide ............V. glauca

7 Pappus brown to purple, 20 outer scales contrasting with 30-40+ inner bristles; leaf blades (3.3-) 4-6× as long as wide.................................V. noveboracensis

6 Middle cauleine leaves 0.1-1.8 cm wide; plants 3-11 dm tall; [of Coastal Plain pineyards].

8 Leaves 3-7 cm long, (5-) 10-20+ mm wide, 2.5-6× as long as wide, somewhat auriculate at the base ......................V. pulchella

8 Leaves 5-12 cm long, 2-4 (-8+) mm wide, (8-) 12-50+ as long as wide, attenuate at the base.

9 Tips of the inner phyllaries long-acuminate, 1.4-4.8 mm long ..........................................................V. angustifolia var. scabrima

9 Tips of the inner phyllaries acuminate, 0.1-1.0 mm long ..........................................................V. angustifolia var. angustifolia

4 Phyllary tips acute to rounded (sometimes minutely apiculate), the narrowest short acuminate.

10 Leaves 2-4 (-8+) mm wide, (8-) 12-50+ as long as wide.

11 Heads 16-19-flowered; phyllary tips acuminate ...............................................................V. angustifolia var. angustifolia

11 Heads 8-15-flowered; phyllary tips acute ...............................................................V. angustifolia var. mohrii

10 Leaves 5-70 mm wide, 2-9 (-17+)× as long as wide.

12 Undersurface of leaf glabrous or nearly so, with pits (best seen at >10× magnification) containing awl-shaped hairs or glands.............

........................[V. fasiculata var. fasiculata]

12 Undersurface of leaf scabrously scabrous or pubescent, lacking pits.

13 Stems glabrous ...............................................................V. flaccidifolia

13 Stems hairy.

14 Leaf undersurfaces scabrous with appressed awl-shaped hairs, with few or no resin glands.

15 Heads with 13-30 flowers; leaf blades linear-lanceolate, 10-30 cm long, 1.2-7.5 cm wide, 4-10× as long as wide .................

........................[V. gigantea

15 Heads with 9-20 flowers; leaf blades elliptic to oblanceolate, 6-20 cm long, 1.2-5 cm wide, 3-5× as long as wide...
**ASTERACEAE**

979

14 Leaf undersurfaces with curled, erect hairs, and with conspicuous resin glands.

16 Heads with (15-) 20-25 (-35) florets; involucres 4-6.7 mm high, 4-7 mm across ................. [V. baldwinii var. baldwinii]

16 Heads with 30-55 florets; involucres (6-) 7-10 mm high, 5-9 mm across ......................... [V. missurica]

**Vernonia acculus** (Walter) Gleason. Cp, Pd (GA, NC, SC): sandhills, dry rocky woodlands, bluffs, and barrens; common. Late June-August; August-October. Coastal Plain and lower Piedmont of ne. and nc. NC south to sc. GA. [= RAB, FNA, K, S, SE]

**Vernonia angustifolia** Michaux var. angustifolia. Cp (GA, NC, SC), Mt? (NC): sandhills; common. Late June-early September; September-October. Se. NC south to GA. [= RAB; < V. angustifolia – FNA, S; = V. angustifolia ssp. angustifolia – K, SE]

**Vernonia ×georgiana** Bartlett (pro sp.). Cp (GA, NC, SC): sandhills; uncommon. Late June-early August; August-October. [= RAB, K, SE; = V. georgiana – S]

**Vernonia gigantea** (Walter) Trelease. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (GA, NC): pastures, bottomlands, streamside; common. Late August-October; August-November. W. NY, s. MI and ne. NC south to SC, FL, and TX. [= W; = V. gigantea (Walter) Trelease ssp. gigantea – K, SE, Y; = V. altissima Nuttall – RAB, G, WV; = V. gigantea var. gigantea – C; > V. altissima var. altissima – F; < V. gigantea – FNA, WH; > V. altissima var. tenniotricha Blake – F; < V. altissima – S; > V. gigantea – S]

**Vernonia missurica** Rafinesque, Missouri Ironweed. Cp (FL), [GA]: wet hammocks, prairies, glades; rare. IN, CN, TN (Chester, Wofford, & Kral 1997), GA (FNA), and Panhandle FL, west to IA, KS, OK, and TX. [= C, K, S, SE, WH]

**Vernonia pulchella** Small. Cp (GA, SC): sandhills; uncommon. Se. SC (Beaufort and Jasper counties) south to se. GA. [= FNA, K, S, SE]

Xanthium Linnaeus 1753 (Cocklebur)

A genus of about 3 species, herbs, cosmopolitan (of somewhat uncertain original distribution). References: Strother in FNA (2006c); Cronquist (1980)=SE.

1 Leaves lanceolate, 2-5× as long as wide, cuneate at the base; leaf axil with a 1-3 cm long yellow 3-forked spine ................. [X. spinosum]

1 Leaves ovate or orbicular, 0.8-1.5× as long as wide, cordate at the base; leaf axil lacking spines ........................................ [X. strumarium]

* **Xanthium spinosum** Linnaeus, Spiny Cocklebur. Mt (VA, WV), Pd (DE, NC, SC), Pd (DE, GA, VA): fields, disturbed ground; uncommon (rare in GA, NC, SC, VA, and WV), introduced, but the native distribution unknown. July-November. [= RAB, C, FNA, K, SE, WV; > X. spinosum var. spinosum – F; > X. spinosum var. inermis Bel – F; > X. ambrosioides Hooker & Arnott – F; = Acanthoxanthium spinosum (Linnaeus) Fourrée – S]

Vittadinia A. Richard 1832

**Xanthium strumarium** Linnaeus, Cockslebur. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed ground, roadsides, pastures, barnyards, beaches; common. July-November. Nearly cosmopolitan, its original distribution unclear, but probably native to the New World. Various taxa have been recognized (see synonymy); it is unclear that any are usefuly distinguished. The most commonly followed recent treatment is that by Cronquist, recognizing two varieties in eastern North America: var. *canadense*, with burs 2-3.5 cm long, the prickles of the bur with spreading hairs and stipitate glands toward the prickles, and var. *glabratum* (A.P. de Candolle) Cronquist, with burs 1.5-2 cm long, the prickles of the bur nearly glabrous or with short glandular or nonglandular puberulence toward the prickles. [= FNA, GW; > *X. strumarium* var. *glabratum* (A.P. de Candolle) Cronquist – RAB, C, G, K, SE, WH; > *X. strumarium* var. *strumarium* – RAB, misapplied; > *X. strumarium* var. *canadense* (P. Miller) Torrey & A. Gray – C, G, K, SE, WH; > *X. chinense* P. Miller – F; > *X. echinatum* Murray – F; > *X. italicum* Morett – F; > *X. oviforme* Wallroth – F; > *X. pensylvanicum* Wallroth – F; WV; > *X. strumarium* – F, WV]

*Youngia* Cassini 1831 (Youngia)

A genus of about 30-40 species, herbs, of Asia. References: Spurr in FNA (2006a); Cronquist (1980)=SE.

* *Youngia japonica* (Linnaeus) A.P. de Candolle, Asiatic Hawk's-beard, Youngia. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC): roadsides, disturbed areas, trail edges; uncommon, native of se. Asia. Spreading rapidly in our area, and now moving into minimally-disturbed natural areas. [= C, FNA, K, SE, WH; = *Crepis japonica* (Linnaeus) Bentham – RAB, F, G, S; > *Y. japonica* ssp. japonica]

**Zinnia** Linnaeus 1759 (Zinnia)

1 Achenes wingless; receptacular bracts (chaff) toothed or erose on the lip ..........................................................Z. peruviana
2 Achenes winged; receptacular bracts (chaff) with a differentiated fimbriate lip ........................................Z. violacea

* *Zinnia violacea* Cassini, Garden Zinnia, Elegant Zinnia. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC): roadsides, disturbed areas; rare (commonly cultivated), native of the New World tropics. May-November. [= FNA, K, SE, WH; = *Z. elegans* Jacquin – S, SE]

405. **ADOXACEAE** Trautvetter 1853 (Moschatel Family) [in DIPSACALES]

A family of about 4 genera and about 165-200 species, shrubs, small trees, and herbs (here interpreted as including *Sambucus* and *Viburnum*). There now appears to be little doubt that *Sambucus* and *Viburnum* are more naturally placed in the Adoxaceae, in contrast to their traditional placement in the Caprifoliaceae (Zhang et al. 2003, Eriksson & Donoghue 1997). References: Ferguson (1966a).

1 Leaves pinnately compound; fruit 3-5-seeded.................................................................................................. *Sambucus*
1 Leaves simple; fruit 1-seeded.................................................................................................................. *Viburnum*

**Sambucus** Linnaeus 1753 (Elderberry)

A genus of about 9 species of shrubs and small trees, north temperate and subtropical. References: Bolli (1994)=Z; Ferguson (1966a)=Y.

1 Inflorescence racemose, normally longer than broad; fruits red when ripe; pith of stems and second-year branches brown; leaves with 5-7 leaflets, these never further divided; foliage and young twigs puberulent; [primarily of the Mountains, extending into the Piedmont in VA]...........
2 Inflorescence cymose, normally broader than long; fruits black or deep purple when ripe; pith of stems and second-year branches white; leaves with 5-11 leaflets, the lower leaflets sometimes further divided; foliage and young twigs glabrous or with trichomes mostly limited to the veins of the leaves; [collectively widespread].

* *Sambucus canadensis* Linnaeus, Common Elderberry. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): streambanks, thickets, moist forests, disturbed areas; common. Late April-July; July-August. NS west to MB, south to s. FL, TX, Mexico; West Indies. The leaflets, particularly of young shoots or stunted sprouts, are often variegated. This is one of the first woody plants to leaf out in the spring. Bolli (1994) treats this taxon as a subspecies of a
broadly defined *S. nigra*. He recognizes 6 subspecies: ssp. *nigra* in Europe, ssp. *palmensis* (Link) R. Bolli in the Canary Islands, ssp. *maderensis* (Lowe) R. Bolli in Madeira Island, ssp. *canadensis* in eastern North America, Mexico, Central America, and the West Indies, ssp. *cerifera* (Rafinesque) R. Bolli of western North America, and ssp. *peruviana* (Humboldt, Bonpland, and Kunth) R. Bolli of South America. I prefer to retain these taxa at the species level, particularly as Bolli states "the geographical races, in the following defined as subspecies, turned out to be the biological units in *Sambucus*." Bolli further discusses 3 races within what is here called *S. canadensis* (his *S. nigra ssp. canadensis*), one from eastern North America, another from montane Mexico and Central America, and a third from subtropical se. North America and the West Indies; he considers these geographic races to represent "morphological and perhaps genetic" differences, and that "at present, all races are probably interconnected." This variation may be worthy of taxonomic recognition at the varietal level, and these "races" have formerly been considered to be species or varieties. Plants of most of our area represent *S. canadensis* var. *canadensis*, while evergreen (or tardily deciduous), bipinnate plants of FL, s. GA, s. AL, s. MS, s. LA, se. TX, and the West Indies represent *S. canadensis* var. *laciniiata* A. Gray. [= RAB, C, GW, W, WV, Y; > *S. canadensis* var. *canadensis* – F; G; > *S. canadensis* var. *submollis* Rehder – F; G; = *S. nigra* Linnaeus ssp. *canadensis* (Linnaeus) R. Bolli – K, WH, Z; > *S. canadensis* – S; > *S. simpsonii* Rehder ex Sargent – S; > *Sambucus canadensis* Linnaeus var. *laciniiata* A. Gray]

*Sambucus racemosa* Linnaeus var. *pubens* (Michaux) Koehne, Red Elderberry. Mt (GA, NC, VA, WV), Pd (VA): spruce-fir and northern hardwood forests, especially typical on boulderfield, talus, and other rocky situations, primarily at high elevations in the Mountains, though sometimes descending in our area (mainly in VA) to low elevations (as low as 75 m); uncommon (rare in VA Piedmont). Late April-early June; late June-August. As interpreted here, *S. racemosa* is an intermediately circumboreal species, represented in ne. North America by var. *pubens*, in n. Europe by var. *racemosa*, and in ne. Asia and nw. North America by several additional varietal taxa. *Sambucus racemosa* var. *pubens* ranges from NL (Newfoundland) west to BC (?), south to PA, IN, IL, and in the mountains to w. NC, e. TN, and ne. GA (Jones & Coile 1988). [= *S. pubens* – RAB, F, G, S, W, WV; = *S. racemosa* ssp. *pubens* (Michaux) House var. *pubens* – C; < *S. pubens* ssp. *pubens* – Y; < *S. racemosa* var. *racemosa* – K, Z]

**Viburnum** Linnaeus 1753 (Viburnum)

(contrived by B.A. Sorrie & A.S. Weakley)

A genus of about 150 species of shrubs and small trees, largely temperate, and primarily in Asia and North America. There remain a number of taxonomic problems, particularly in the *Viburnum dentatum* complex; the treatment and key for that group is highly provisional. Dirr (2007) discusses the genus in detail from a horticultural perspective. References: McAtee (1956)=Z; Ferguson (1966a)=Y; Weckman et al. (2002); Winkworth & Donoghue (2005).

**Identification notes:** Leaves vary in shape in some taxa more than in others; we have allowed for some of this variation in the key, but readers should expect that some specimens will not key cleanly, especially vegetative shoots. Petiole length of leaves varies considerably, even with those possessing "short" petioles. However, by measuring only the petioles of the first leaves below an inflorescence one reduces the chances of misidentifications greatly. Warning: even in some of the "long" petioled taxa, one may occasionally encounter unusually short petioles; therefore it is wise to examine several twigs. Density of pubescence and glandularity of leaves, petioles, and inflorescences varies more in some taxa than in others; we have allowed for some of this variation in the key, but readers should expect that some specimens will not key cleanly, especially vegetative shoots. Stipitate glands are usually very short, especially those on leaf veins; a 10× lens may not be adequate to see them clearly. It is highly provisional. Dirr (2007) discusses the genus in detail from a horticultural perspective. References: McAtee (1956)=Z; Ferguson (1966a)=Y; Weckman et al. (2002); Winkworth & Donoghue (2005).

1 Leaves (at least the larger and better developed) palmately lobed and veined.
2 Petioles lacking glands near its junction with the leaf blade; flowers all alike and fertile; twigs pubescent; fruit blue-black; [section *Lobata*] .......................................................... \*V. acerifolium*
3 Petioles with several glands near its junction with the leaf blade; marginal flowers of the inflorescence stem much larger and the fertile central flowers (or in cultivated forms all the flowers sterile and enlarged); twigs glabrous; fruit red; [section *Opulus*]
4 Petiolars glands mostly taller than wide, stalked, rounded on the top; [native, of n. WV, PA, and NJ northward] .......................................................... \*V. opulus var. *americanum*
5 Petiolars glands mostly wider than tall, sessile, concave on the top; [alien, sometimes planted and escaped] ............ \*V. opulus var. *opulus*
6 Leaves unlobed and pinnately veined.
7 Lateral veins curving and branching repeatedly through most of their length, not noticeably parallel, the lateral veins becoming obscure in the general pattern of anastomasing veins and not obviously leading to marginal teeth; [section *Lentago*]
8 Leaves entire or with a crenate margin, the teeth < 5 cm of margin.
9 Leaves 2-5 cm long, obovate or spatulate, widest towards the tip; [of e. SC southward in then Coastal Plain] ............... \*V. obovatum*
10 Leaves 5-12 cm long, generally elliptic or ovate, widest at or below the middle; [collectively widespread and of various habitats].
11 Leaves dull to slightly shiny above; peduncle (5-) avg. 13 (-25) mm long; leaves undulate-crenulate (or rarely entire); [of Mountains and upper Piedmont] .......................................................... \*V. cassinoides*
12 Leaves shiny above (as if varnished); peduncle (20-) avg. 35 (-50) mm long; leaves entire (rarely somewhat undulate-crenate); [of Coastal Plain, Piedmont, and low elevation boggy sites in the Mountains] ................................................ \*V. nudum*
13 Leaves serrulate, the teeth > 5 cm of margin.
14 Leaves mostly strongly acuminate at the tip; [of w. VA northward] .......................................................... \*V. lentago*
15 Leaves acute, obtuse, or rounded (rarely somewhat acuminate) at the tip; [collectively widespread in our area].
16 Leaves herbaceous in texture, dull above; petioles and veins (lower surface) glabrous or slightly brown-scurfy; [widespread in our area, usually in bottomland or other mesic forests] ................................................ \*V. prunifolium*
9 Leaves somewhat coriaceous in texture, glossy above (as if lacquered); petioles and veins (lower surface) red-scurfy; [of c. VA southward, usually in dry to dry-mesic woodlands and forests] ......................................................... V. rufidulum
4 Lateral veins of the leaves nearly straight and prominently parallel for most of their length, many of themforking near the margin, the ultimate veins leading to a tooth.
10 Winter buds consisting of tightly folded leaves uncovered by bud scales; plants strongly and noticeably stellate pubescent, especially on young parts and on the lower leaf surface; fruits red then turning black.
11 Leaves lanceolate, 3-5× as long as wide, entire; leaf base truncate to rounded; leaf surface strongly rugose; [section Viburnum] ................. V. rhytidophyllum

10 Winter buds covered by bud scales; plants noticeably stellate-pubescent or not; fruits orange, red, or blue-black.
14 Leaves oblong-obovate, wider towards the tip; inflorescence panicle, with an elongate central axis, the lowest branches opposite and with other branches above; fresh leaves malodorous; [section Saccodontotinus] ........................................................................... V. sieboldii
13 Marginal flowers of the inflorescence sterile and much larger than the fertile central flowers (or all the flowers sterile and enlarged) ........................................................................................................... [V. macrocephalum]

16 Fruit blue-black; [native].
18 Petioles short, those immediately below a cyme ≤ 8mm long.
19 Cymes and petioles stipitate-glandular; leaf shape ovate, occasionally rotund; [endemic to two small areas: Ozark and Ouachita Mountains of s. MO, AR, and e. OK] ................................................................. V. bracteatum
15 Leaves with 8-12 lateral veins on each side; marginal flowers of the inflorescence sterile and much larger than the fertile central flowers; winter buds with 2 scales; [section Tomentosa] ............................................................................. V. plicatum
17 Leaves broadly ovate, acute, pubescent on both surfaces .............................................................................. V. dilatatum
16 Fruit orange or red; [aliens, planted and escaping]; [section Vaccinopsis] .............................................................. V. setigerum
18 Petioles longer, those immediately below a cyme ≥ 11mm long.
19 Cymes stipitate-glandular (occasionally glabrous in V. dentatum var. deamii and V. dentatum var. indianense).
20 Leaf bases strongly cuneate; plants usually restricted to limestone substrates.
21 Petioles eglandular; leaf veins eglandular; leaves glabrate beneath or with simple hairs in axils; bark not exfoliating; [endemic to two small areas: n. AL, sc. TN, and nw. GA, and Ozark and Ouachita Mountains of s. MO, AR, and e. OK] ................................................................................................................ V. bracteatum
17 Leaves ovate or ovate-lanceolate, acuminate, glabrous except for long, somewhat appressed hairs along the veins beneath,........... V. dilatatum
22 Stipitate glands present on petioles and leaf veins; stipular leaf bracts often present.
23 Petioles with stellate hairs all over; leaves beneath moderately to densely stellate pubescent .................................................. V. dentatum var. deamii
22 Stipitate glands absent on petioles and leaf veins; stipular leaf bracts absent; [of sandstone substrates in Lookout Mountain region of ne. AL] ........................................................................................................ V. specie 1
23 Petioles with stellate hairs confined to groove; leaves beneath glabrate .................. [V. dentatum var. indianense]
19 Cymes eglandular (occasionally glandular in V. dentatum var. dentatum and V. scabrellum)
24 Petioles glabrous or glabrate; stellate hairs absent on leaves and petioles; hairs on leaf undersides confined to axils and a few veins; leaf shape usually ovate.................................................. V. dentatum var. lucidum
25 Petioles sparsely to densely stellate pubescent; stellate hairs present on leaf underside and petiole, dense and soft to touch (V. carolinianum, V. scabrellum, most V. venosum) or sparse to moderate (V. dentatum var. dentatum, some V. venosum); leaf shape various.
26 Leaf shape ovate to broadly ovate; leaf teeth 5-12 per side; upper leaf surface scabridulous with abundant simple hairs; [of southern Atlantic and Gulf Coastal Plain] ................................................. V. scabrellum
27 Leaf underside densely pubescent and soft to touch (felt-like); stipular leaf bracts often present; fruits pubescent; leaf teeth 13-18 per side; [of southern Appalachian mountains of w. NC, n. GA, and se. TN] ........... V. carolinianum
27 Leaf underside moderately to densely pubescent and somewhat soft to touch (but not felt-like); stipular leaf bracts absent; fruits glabrous; leaf teeth 10-15 per side; [of northern Appalachian Coastal Plain of se. MA, s. RI, and Long Island, NY] ........................................ V. venosum

**Viburnum bracteatum** Rehder, Linnomon Arrowwood. Mt (GA): calcareous forests and woodlands. Late April–early May. Se. TN south to nw. GA and ne. AL; disjunct westwards in the Ozark region of s. MO, nw. AR, and e. OK. [= *V. bracteatum* Rehder – K, S, Y, Z; > *V. ozarkense* W.W. Ashe – K, S, Y, Z]

**Viburnum cassinoides** Ashe, Carolina Arrowwood. Mt (GA, NC, SC?, VA?). Pd (NC): moist to dry forests, rock outcrops, streambanks; uncommon. April; September. Sw. NC and adjacent GA and TN: remainder of distribution unclear at this time. [=? *V. dentatum* Linnaeus var. *decom* (Rehder) Fernand – C, F, G; < *V. dentatum* var. *dentatum* – RAB, K; < *V. dentatum* – GW; < *V. semitomentosum* (Michaux) Rehder – S; > *V. carolinianum* Ashe var. *cismontanum* McAtee – Z; > *V. carolinianum* Ashe var. *carolinianum* – Z]

**Viburnum cassinoides** Linnaeus, Northern Wild Raisin, Withe-rod, Shonny Haw. Mt (GA, NC, SC, VA, WV), Pd (NC, SC), Cps (DE): bogs, moist forests, high elevation forests and outcrops; common (rare in DE). Late May–June; August–October. NL (Newfoundland), ON, and WI south to n. GA and AL. [= RAB, F, G, S, WV, Y; = *V. nudum* Linnaeus var. *cassinoides* (Linnaeus) Torrey & A. Gray – C, K; < *V. nudum* – GW; > *V. cassinoides* var. *cassinoides* – Z; > *V. cassinoides* var. *nitidum* Aiton – Z; > *V. cassinoides* var. *harbisonii* McAtee – Z]

**Viburnum dentatum** Linnaeus var. *dentatum*, Arrowwood. Cps (DE, FL?, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (NC, SC, VA, WV): marshes, streambanks, other moist places; common (rare in WV). Late March–April; July–September. East of the Appalachians, from Se. PA and sw. NJ south to s. SC and ne. GA, with scattered records westward to sw. NC, nw. TN, sw. VA, n. WV, and w. MD. [= C, F, G, K; < *V. dentatum* var. *dentatum* – RAB (also see *V. carolinianum*); < *V. dentatum* – GW, W, WH, WV, Y; < *V. semitomentosum* (Michaux) Rehder – S; > *V. dentatum* – Z]

**Viburnum dentatum** Linnaeus var. *lucidum* Aiton. Mt (GA, NC, SC, VA, WV): marshes, moist forests, streambanks; common. Late March–May; July–September. ME, NY, and OH south to s. SC, c. GA, and ne. AL. [= RAB, C, G; = *V. recognitum* Fernand – F, K, WV; < *V. dentatum* – GW, W; > *V. dentatum* – S, misapplied; > *V. recognitum* var. *lucidum* Aiton – Z; > *V. recognitum* var. *alabamense* McAtee – Z]

**Viburnum dilatatum** Thunberg, Linden Viburnum. Pd (DE, VA), Cps (VA): suburban woodlands; uncommon (rare in VA), native of e. Asia. [= C, K]

**Viburnum lantanoides** Linnaeus, Wayfaring Tree. Mt (WV): widely planted, sometimes escaped or persistent; rare, native of Eurasia. Reported as naturalized as far south as MD (Kartesz 1999) and KY (Weckman et al. 2002). May; September. [= C, F, G, K, Z]

**Viburnum lenta* Linnaeus, Nannyberry, Sheepberry. Mt (VA, WV), Pd (DE): shrubby stream-bottoms, other wetlands and woodland margins; rare. NB and SK south to w. VA, MO, and CO. Reported in the past for NC (see Radford, Ahles, & Bell 1968), from GA (Kartesz 1999), and from AL; these reports all appear to be based on misidentifications. [= RAB, C, F, G, K, S, W, WV, Y, Z]

**Viburnum nudum** Linnaeus, Southern Wild Raisin, Possumhaw. Cps (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): bogs, blackwater floodplains, seepages; common (rare in Mountains). April–May; August–October. RI, CT, and NY south to e. peninsular FL, west to TX, inland to w. NC, TN, w. KY, and AR. [= RAB, G, S, W, WH, Y, Z; = *V. nudum* var. *nudum* – C, K; > *V. nudum* var. *angustifolium* Torrey & A. Gray – F; < *V. nudum* – GW]

**Viburnum obtusifolium** Walter, Small Leaf Viburnum. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA): marshes, streams, streambanks; common. Late March–May; July–September. ME, NY, and OH south to e. SC, c. GA, and ne. AL. [= RAB, C, G; = *V. recognitum* Fernand – F, K, WV; < *V. dentatum* – GW, W; > *V. dentatum* – S, misapplied; > *V. recognitum* var. *lucidum* Aiton – Z; > *V. recognitum* var. *alabamense* McAtee – Z]

**Viburnum opulus** Linnaeus. Aiton. Mt (VA, WV), Pd (DE, GA, NC, SC, VA, WV), Cps (DE, FL, GA, NC, SC, VA): alluvial forests, other mesic forests; common. March–April; September–October. E. SC south to s. FL, west to s. AL. [= RAB, GW, K, Y, Z; > *V. opulus* var. *opulus* – S; > *V. opulus* var. *roseum* Linnaeus – F, WV, Y; > *V. opulus* var. *glabrescens* Chapman – F, WV]

**Viburnum plicatum** Thunberg, Japanese Snowball, Doublefile Viburnum. Pd (DE, NC), Mt (WV): suburban woodlands; uncommon (rare in NC), native of e. Asia. Also reported as naturalized in various more northern states, including se. and sw. PA (Rhoads & Klein 1993), OH (Cooperrider 1995), MI (Voss 1996), and others. [= C, G, K, Z]

**Viburnum rafinesquianum** J.A. Schulz, Downy Arrow-wood. Mt (GA, NC, SC, VA), Pd (VA, WV): dry-mesic to dry woodlands and forests, especially over mafic rocks (but not at all restricted to such sites); common (uncommon in WV, rare in DE and GA). Mid April–May; June–July. NH, QC and MB south to n. GA, AL, AR, and OK; apparently not yet recorded for SC. [= *V. rafinesquianum* – RAB, K, S, W, WV (orthographic variant); > *V. rafinesquianum* var. *rafinesquianum* – C, F, G, Y; =? *V. affine* Bush ex Schneider var. *hypomalacum* Blake – Z]
Viburnum scabrellum (Torrey & A. Gray) Chapman. Cp (FL, GA, SC): streambanks, marshes, other moist sites; common. A Coastal Plain endemic, ranging from se. GA south to c. peninsular FL, west to e. TX; with scattered collections north to ec. GA (Richmond County), ne. AL (Cherokee County), nw. AL (Lamar County), c. MS, and n. LA. Expected in s AR, but no specimens seen. Specimens of V. dentatum from s. SC show signs of hybridization. Mohr (1901) and some other 19th century authors misapplied the name V. molle to it. <| V. dentatum var. dentatum – RAB; <| V. dentatum var. venosum (Britton) Gleason – G, K; <| V. dentatum – GW, W, WH, Y; <| F. semitomentosum (Michaux) Rehder – S, misapplied; > V. scabrellum (Torrey & Gray) Chapman var. scabrellum – Z; > V. scabrellum var. ashei Bush – Z; = Viburnum dentatum Linnaeus var. scabrellum Torrey & A. Gray]

Viburnum setigerum Hance, Tea Viburnum. Pd (DE, NC): suburban forests, commonly planted horticulturally; uncommon (rare in NC), native of China. Naturalizing at Guilford Courthouse National Military Park (Greensboro, Guilford County, NC) and in Battle Park (Chapel Hill, Orange County, NC), and elsewhere in our area. Also naturalizing in KY (Weckman et al. 2002). [= K]

Viburnum macrocephalum Fortune, Chinese Snowball. Mt (NC): suburban areas near plantings; rare, native of China. Reported as naturalized in the mountains of NC (Pitillo 2003. pers. comm.). [investigate]

Viburnum molle Michaux. Limestone areas. Scattered, discontinuous range (but locally may occur in several contiguous counties) from sw. OH, nc. IN, wc. IL, and sc. IA south to sc. TN, nw. AR; disjunct in sw. IA. [= C, F, G, K, Y, Z]

406a. DIERVILLACEAE (Rafinesque) Pyck 1998 (Bush-honeysuckle Family) [in DIPSACALES]

Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of Sambucus and Viburnum to the Adoxaceae, placement of Diervilia and Weigela in the Diervillaceae (Backlund & Pyck 1998), placement of Abelia and Linnaea in the Linnaeaceae (Backlund & Pyck 1998, Pyck et al. 2002), and retention of Lonicera, Symphoricarpos, and Triosteum in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsaceae and Valerianaceae, as a broadly circumscribed Caprifoliaceae. References: Backlund & Pyck (1998); Pyck et al. (2002); Ferguson (1966a).

**Diervilla P. Miller (Bush-honeysuckle)**

1 Petioles 5-8 mm long; leaves ciliate on the margins; twig terete in cross-section; [of the Mountains of VA and n. NC, south to Buncombe and McDowell counties, NC].................................................................................................................................D. lonicera

2 Petioles 0.5 mm long; leaves not ciliate; twig more-or-less square in cross-section; [of the Mountains of SC and s. NC, north to Mitchell and Yancey cos., NC].

2 Branchlets, leaves, pedicels, and calyx densely pubescent; sepal lobes < 2 mm long ............................................................................................................................D. rivularis

2 Branchlets, leaves, pedicels, and calyx glabrous, except for hairs on the twig angles; sepal lobes 2-3 mm long .......................D. sessilifolia

Diervilla lonicera P. Miller, Northern Bush-honeysuckle. Mt (GA?, NC, VA, WV), Pd (DE), {DC, MD, NJ?, TN, WV}: rock outcrops and ridges at high elevations; uncommon (rare in DE). June-July; August-October. NL (Newfoundland) west to SK, south to w. NC, e. TN, IN, and IA. Reported for GA (GANHP). [= RAB, C, G, K, S, W, WV, Y, Z; > D. lonicera var. lonicera – F; > D. lonicera var. hypomaicala Fernald – F]

Diervilla rivularis Gattinger, Hairy Southern Bush-honeysuckle. Mt (GA, NC), {AL, TN}: rock outcrops, ridges, and streambanks at moderate to high elevations; rare (NC Rare). June-August; August-October. W. NC (Yancey County) and e. TN south to nw. GA (Jones & Coile 1988) and ne. AL. [= K, S, Y, Z; = D. sessilifolia Buckley var. rivularis (Gattinger) Atkes – RAB, W]

Diervilla sessilifolia Buckley, Smooth Southern Bush-honeysuckle. Mt (GA, NC, SC), {AL, TN}: rock outcrops, ridges, landslide scars, trail margins, other rocky open places, streambanks, at moderate to high elevations; uncommon. June-August; August-October. Sw. NC and e. TN south to nw. SC, ne. GA, and ne. AL. [= F, K, S, Y, Z; = D. sessilifolia Buckley var. sessilifolia – RAB, W]
406b. CAPRIFOLIACEAE A.L. de Jussieu 1789 (Honeysuckle Family) [in DIPSAECES]

As here circumscribed, a family of about 5 genera and 220 species, shrubs, trees, and less typically herbs and vines, mainly north temperate and boreal. Circumscription of the family is controversial. Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of *Sambucus* and *Viburnum* to the Adoxaceae, placement of *Dierverilla* and *Weigela* in the Dierverillaceae (Backlund & Pyck 1998), placement of *Abelia* and *Linnaea* in the Linnaeaceae (Backlund & Pyck 1998), and retention of *Lonicera*, *Symphoricarpus*, and *Triosteum* in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsacaceae and Valerianaceae, as a very broadly circumscribed Caprifoliaceae (APG III 2009). References: Backlund & Pyck (1998); Ferguson (1966a). [also see ADOXACEAE, DIERVILLACEAE, AND LINNAEACEAE]

1 Erect herb. .................................................. Triosteum
1 Shrubs or woody lianas.

2 Corolla usually > 10 mm long, bilaterally symmetrical; ovary 2-3-locular. .......................................................... Lonicera
2 Corolla 3-8 mm long, radially symmetrical or nearly so; ovary 4-locular .......................................................... Symphoricarpus

A genus of about 180 species, shrubs and vines, mainly north temperate. References: Ferguson (1966a)=Z; Rehder (1903)=Y; Green (1966).

1 Flowers in opposite 3-flowered cymules, borne in terminal clusters subtended by connate leaves; corolla red and yellow (or yellowish-orange only); twining vine or shrub with vining tendencies (in *L. flava* the "vininess' sometimes not apparent).
2 Corolla tube (20-) 30-50 mm long; corolla lobes 4-8 mm long, more or less radially symmetrical; [of a wide variety of habitats, primarily in the Piedmont and Coastal Plain].......................................................... L. sempervirens
2 Corolla tube 10-35 mm long; corolla lobes 8-15 mm long, unequally divided into 2 lips (4 lobes on the upper side and one lobe on the lower side); [of ridgetops, rocky slopes, granite domes, and bogs of the Mountains, or of areas to the north or west of the primary area].
3 Leaves pubescent on the upper surface; [of moist forests, south to PA] .......................................................... L. hirsuta
3 Leaves glabrous on the upper surface.

4 Fused leaves immediately below the inflorescence glaucous on the upper surface, rounded or emarginate; [of c. TN and other areas west and north of our primary area] .......................................................... L. reticulata
4 Fused leaves immediately below the inflorescence green on the upper surface, pointed to mucronate.
5 Corolla tube 30-35 mm long; leaves gray beneath; [of soil mats on dome outcrops of s. NC, SC, and GA and westward].... L. flava
5 Corolla tube 15-25 mm long; leaves strongly white-glaucous beneath; [of rocky forests, ridgetops, and bogs of n. NC, VA, and northward] .......................................................... L. dioica

1 Flowers in peduncled pairs in the axils of leaves, not subtended by connate leaves; corolla white to pastel pink or yellow; plant an erect shrub or (*L. japonica*) a trailing or climbing vine.
6 Trailing or climbing vine; corolla 30-50 mm long; fruit black at maturity; leaves of vigorous shoots often pinnately lobed........ L. japonica
6 Upright shrub; corolla 7-25 mm long; fruit red or yellow at maturity; leaves unlobed.

8 Corolla lobes 5, nearly equal; ovaries separate, divergent; [native species of cool moist forests and bogs] ............... L. canadensis
8 Corolla lobes fused into a 4-lobed lip and a 1-lobed lip; ovaries fused; [exotic species].
9 Branches glabrous; corolla glabrous on the exterior .......................................................... L. fragrantissima
9 Branches retrorsely hispid with reddish-brown hairs; corolla pilose on the exterior............................................. L. standishii

7 Branches hollow between the nodes, with tannish pith; [exotic species, many of them seriously invasive and likely to be encountered in natural areas].
10 Peduncles shorter than or equal to the subtending petiole; leaves ovate (broadest near the base) and distinctly long-acuminate.............. L. maackii
10 Peduncles longer than the subtending petiole; leaves elongate (broadest near the middle) and obtuse to acute (rarely short-acuminate).

11 Leaves glabrous; peduncles 15-25 mm long. .......................................................... L. tatarica
11 Leaves pubescent, at least on the lower surface; peduncles 5-15 mm long.

12 Corolla pink (aging to yellow), nearly glabrous on the exterior, barely bulging on one side at the base; leaves thinly pubescent beneath .......................................................... L. ×bella
12 Corolla white (aging to yellow), pubescent on the exterior, distinctly bulging on one side at the base; leaves rather densely grayish-pubescent beneath.
13 Bracts and sepals ciliate, not glandular; ovary lacking glands; leaf blades broadest at or below the middle ........ L. morrowii
13 Bracts and sepals glandular; ovary glandular; leaf blades broadest beyond the middle............................................ L. xylostereum

**Lonicera dioica** Linnaeus. Seeages, bogs, rocky woods, shrubby mountain bogs at high elevations, rocky ridgetop thickets over amphibolite. June-August; August-September. MA and QC west to WI, south to NJ, NC, and IN. Varieties or species have sometimes been maintained based on minor variation of pubescence; it is unlikely that these are taxonomically meaningful. Var. orientalis has the lower leaf surfaces, hypanthium, and style hairy (vs. glabrous or nearly so in var. dioica). [= RAB, K, W, WV; > L. dioica var. dioica – C, F, G, Z; > L. dioica Linnaeus var. orientalis Gleason – C, G; > L. dioica var. glaucescens (Rydberg) Butters – F, Z; > L. dioica – S, Y; > L. glaucescens (Rydberg) Rydberg – S, Y]

**Lonicera fragrantissima** Lindley & Paxton, Sweet-breath-of-spring. Forests, woodlands, old house sites; native of China. February-early April; April-May. [= RAB, K, Y, Z; = Xylosteon fragrantissimum (Lindley & Paxton) Small – S]

**Lonicera hirsuta** Eaton, Hairy Honeysuckle. QC west to MB, south to c. PA (Rhoads & Klein 1993) and MN. [= F, K, Y; > L. hirsuta var. interior Gleason – C] {rejected; keyed; not mapped}

**Lonicera maackii** (Ruprecht) Maximowicz, Amur Honeysuckle. Suburban woodlands, moist forests, fencerows; native of e. Asia (Korea, China, Japan). May-June. This is one of worst “shrub-weeds”, aggressively invasive in various parts of eastern North America, as in the vicinity of DC and in calcareous substrate parts of the interior South. [= C, K, Y, Z]

**Lonicera ×minutiflora** Zabel [of complex hybrid origin, apparently involving *L. morrowii*, *L. tatarica*, and *L. xylosteum*]. Suburban areas, disturbed areas. Known from KY and other states in e. North America (Clark et al. 2005). [= K] {not yet keyed}

**Lonicera reticulata** Rafinesque. {habitats}. NY west to WI, south to TN and AR. In nc. TN (Davidson County) (Chester, Wofford, & Kral 1997; Wofford & Chester 2002). [= K; > L. prolifera (G. Kirchner) Booth ex Rehder var. prolifera – C, G; = L. sullivantii A. Gray – Y; = L. prolifera – F, Z]

**Lonicera sempervirens** Linnaeus, Coral Honeysuckle. Dry forests and woodlands, maritime forests. March-July (and sporadically to November); July-September. CT to OK, south to c. peninsular FL and TX; and more widely distributed as an escape from cultivation. Var. hirsutula has sometimes been maintained, differing from var. *sempervirens* in its ciliate leaf margins, pubescent upper leaf surfaces, sometimes glandular hypanthium and stems (vs. glabrous; it is doubtful that these distinctions are taxonomically meaningful. [= RAB, GW, W, WH, WV, Z; > L. sempervirens Linnaeus var. sempervirens – C, G, K, Y; > L. sempervirens Linnaeus var. hirsutula Rehder – F, C, F, G, K, Y; > L. sempervirens var. sempervirens – F; > L. sempervirens var. minor Aiton – F; = Phanenanthus sempervirens (Linnaeus) Rafinesque – S]

**Lonicera standishii** Jacques, Standish's Honeysuckle. Forests, woodlands, old home sites; native of China. Locally abundant and invasive in c. NC (Uwharrie National Forest, Montgomery County, NC). Also reported from KY (Jones 2005), se. PA (Rhoads & Klein 1993), and MD (Kartesz 1999). [= F, K, Y]

**Lonicera tatarica** Linnaeus, Tartarian Honeysuckle. Disturbed forests; native of Central Asia. [= C, F, G, K, WV; > L. tatarica var. tatarica – Y]
CAPRIFOLIACEAE

* Lonicera xylosteum * Linnaeus, European Fly-honeysuckle. Suburban forests, disturbed forests; native of Europe and Asia. Establishing mainly in ne. United States, south to VA, MD (Kartesz 1999), and KY (Clark et al. 2005). [= C, F, G, K; > L. xylosteum var. xylosteum – Y]

Symphoricarpos Duhamel 1755 (Snowberry, Coralberry)

A genus of about 17 species, shrubs, of North America and e. Asia. References: Jones (1940); Ferguson (1966a)=Z.

Corolla 2-4 mm long; fruits pink to purple .......................................................... S. orbiculatus
Corolla 5-9 mm long; fruits white.

Fruit 6-10 (-12) mm in diameter; young twigs puberulent; leaves usually pubescent beneath; shrub usually < 1 m tall; [native] ..........

Fruit 12-20 mm in diameter; young twigs glabrous; leaves usually glabrous beneath; shrub usually 1-2 m tall; [introduced] ..........

Symphoricarpos albus (Linnaeus) Blake var. albus, Common Snowberry. Limestone woodlands. QC west to s. AK, south to w. VA, WV, MI, MN, and CA; the original native distribution somewhat uncertain due to cultivation and escapes. Var. albus is the more eastern variety. [= C, F, G, K, Z; < S. albus – RAB, S, W, WV]

Symphoricarpos occidentalis Hooker, Western Snowberry, Wolfberry. In PA, MD, KY. {investigate} [= F, K] {not yet keyed}

Symphoricarpos orbiculatus Moench, Coralberry. Moist to dry forests, woodlands, thickets, pastures, and old fields, especially over mafic or calcareous rocks. Late July–September; September–November (and often persisting well into winter). CT west to IN, MN, and CO, south to Panhandle FL, TX, and Mexico; the original native distribution somewhat uncertain due to cultivation and escapes. Seemingly increasing in VA and behaving aggressively in dry woodlands and barrens over greenstone and diabase. [= RAB, C, F, G, K, W, WH, WV, Z; = S. symphoricarpos (Linnaeus) MacM. – S]

Triosteum Linnaeus 1753 (Horse-gentian, Feverwort)

A genus of 6 species, rather woody herbs, of e. Asia (3 species) and e. North America (3 species); the 3 North American species form one clade, the 3 Asian species another (Gould & Donoghue 2000). References: Gould & Donoghue (2000); Ferguson (1966a)=Z.

Longer (nonglandular) hairs of the stem 1.5-3 mm long; corolla greenish-yellow; leaves 1.5-6 cm wide.

Lower leaf surface glabrous or pubescent only along the main veins; leaves averaging 4× as long as wide .................................................. T. angustifolium var. angustifolium

Lower leaf surface densely puberulent; leaves averaging 2× as long as wide .................................................. T. angustifolium var. eamesii

Longer (nonglandular) hairs of the stem 0-1.5 mm long (or with a very few longer hairs); leaves 4-15 cm wide; corolla greenish-yellow to purple.

Most the stem hairs 1-2 mm long, mostly not gland-tipped; leaves predominantly not connate (or if 1-3 pairs connate, then only 1-2 cm wide at the joined base); style equaling or slightly shorter than the corolla (rarely exserted) ...................... T. aurantiacum var. aurantiacum

Most the stem hairs 0-0.5 mm long (sometimes with a few scattered longer hairs), gland-tipped; leaves predominantly connate-perfoliate, the joined base 3-9 cm wide; style exserted beyond the corolla.......................................................... T. perfoliatum

Triosteum angustifolium Linnaeus var. angustifolium, Smooth Lesser Horse-gentian. Cp (DE, Pd (DE), Mt (WV), {Pd (NC, VA)}, Mt (GA, VA), Cp (VA)); distributional and habitat information needed for two varieties} (GA Rare). April-May; July-August. CT west to ON and MO, south to NC, nw. GA (Jones & Coile 1988), AL, and LA. [= C, F, G; < T. angustifolium – RAB, K, S, W, WV, Z]

Triosteum angustifolium Linnaeus var. eamesii Wiegand, Hairy Lesser Horse-gentian. {Pd (NC, VA), Mt (VA), WV?}; distributional and habitat information needed for two varieties. April-May; July-August. CT and NJ south to NC. [= C, F, G; < T. angustifolium – RAB, K, S, W, Z]

Triosteum aurantiacum Bicknell var. aurantiacum. Mt (GA?, NC, SC, CA, WV), Pd (DE, NC, VA); woodlands and forests in circumneutral soils, particularly those over mafic or calcareous rocks; uncommon (rare in DE, GA, and NC). Late May–early June; August–October. QC west to MN, south to GA, KY, and OK; other varieties are more restricted and midwestern or northern in distribution. [= C, F, K; < T. aurantiacum – RAB, S, W, WV, Z; < T. perfoliatum Linnaeus var. aurantiacum (Bicknell) Wiegand – G]
**Triosteum perfoliatum** Linnaeus, Perfoliate Horse-gentian. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, VA): woodlands and forests in circumneutral soils, particularly those over mafic or calcareous rocks; uncommon (rare in DE). Late May-early June; August-October. MA west to MN, south to SC, GA (Jones & Coile 1988), and OK. [= RAB, C, F, K, S, W, WV, Z; = T. perfoliatum var. perfoliatum – G]

406c. **LINNAEACEAE** (Rafinesque) A. Backlund 1998 (Twinflower Family) [in DIPSACALES]

A family of 5 genera and about 35 species, shrubs and suffrutescent herbs. Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of *Sambucus* and *Viburnum* to the Adoxaceae, placement of *Diervilla* and *Weigela* in the Diervillaceae (Backlund & Pyck 1998), placement of *Abelia*, *Linnaea*, and *Kolkwitzia* in the Linnaeaceae (Backlund & Pyck 1998), and retention of *Lonicera*, *Symphoricarpos*, and *Triosteum* in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with *Dipsacaceae* and *Valerianaceae*, as a very broadly circumscribed Caprifoliaceae. References: Backlund & Pyck (1998).

1 Trailing shrubby herb; [native] .................................................................................................................................................................... Linnaea

1 Upright shrub; [planted and persistent or weakly naturalizing].

2 Sepals oblanceolate, the larger > 1 mm wide; fruit and ovaries free, not hirsute ................................................................. Abelia

2 Sepals lanceolate to linear, < 1 mm wide; fruit and ovaries fused in pairs, densely hirsute ......................................................... Kolkwitzia

**Abelia** R. Brown, Abelia

A genus of about 30 species, shrubs, primarily of s. and e. Asia.

* Abelia ×grandiflora (André) Rehder [chinensis × uniflora], Abelia. Cp (AL, FL, NC): suburban thickets; commonly planted in our area; sometimes persistent or rarely weakly naturalizing, the parent species native of China. Reported for AL (Diamond & Woods 2009). [= K, WH]

**Kolkwitzia** Graebner (Beautybush)

A monotypic genus, a shrub, of c. China.

* Kolkwitzia amabilis. Beautybush. Mt (NC) {KY}: disturbed areas; planted as an ornamental shrub, rarely naturalized from plantings, native of c. China. [= K]

**Linnaea** Linnaeus (Twinflower)

A monotypic genus, a trailing weak shrub, circumboreal.

* Linnaea borealis Linnaeus ssp. americana (Forbes) Hultén ex Clausen, American Twinflower. Mt (MD, TN, WV): northern hardwoods; rare. Greenland, NL (Labrador), and AK south to WV, IN, IL, IA, NM, AZ, and CA; disjunct in e. TN. *L. borealis* is documented by an early specimen (1892) from Sevier County, TN, presumably from the Great Smoky Mountains; the TN population (not seen since) is disjunct from e. WV and w. MD. [= K; = L. borealis var. longiflora Torrey – C, G; = L. borealis var. americana (Forbes) Rehder – F; < L. borealis – W; = L. americana Forbes; = L. borealis ssp. longiflora (Torrey) Hultén]

406d. **DIPSACACEAE** A.L. de Jussieu 1789 (Teasel Family) [in DIPSACALES]

A family of about 11 genera and 300 species, herbs and shrubs, of Eurasia and Africa.

1 Stem prickly .................................................................................................................................................................................. Dipsacus

1 Stem not prickly ................................................................................................................................................................................. Knautia

**Dipsacus** Linnaeus (Teasel)
DIPSACACEAE

A genus of about 15 species, herbs, of Eurasia. *Dipsacus* begins flowering about halfway up the head, the flowers then opening sequentially toward both the base and the tip of the inflorescence. References: Ferguson (1965)=Z; Ferguson & Brizicky (1965); Stace (2010).

1. Principal cauline leaves laciniate-pinnatifid, cut at least halfway to the midrib; stems to 3 (-4) m tall ......................... *D. laciniatus*
2. Bracts on the receptacle with straight apical spines, these stiff but flexible; bracts of the involucre curved upward ............ *D. fullonum*
3. Bracts on the receptacle with recurved apical spines, these rigid; bracts of the involucre spreading more or less horizontally....... *D. sativus*

* Dipsacus fullonum *Linnaeus, Wild Teasel, Common Teasel. Mt (GA, NC, VA, WV), Pd (VA), Cp (DE, VA): roadsides, pastures, disturbed areas; common (rare in DE and NC, rare in VA Coastal Plain), native of Europe. July-September; September-October. Recently discovered for GA in Floyd County (T. Govus, pers. comm. 2009). The inflorescences are frequently collected for crafts and dried arrangements. [= K, W, Z; = D. sylvestris (Hudson) Clapham]

* Dipsacus laciniatus *Linnaeus, Cutleaf Teasel. Mt (VA, WV), Pd (VA): disturbed areas; uncommon, native of Europe. July-September; September-October. [= C, F, G, K, WV, Z]

* Dipsacus sativus *Linnaeus, Fuller's Teasel. Mt (VA): disturbed areas; rare, native of Europe. July-September; September-October; September-October. I am here following Ferguson (1965), Ferguson & Brizicky (1965), and Stace (2010) in their determination that *D. sativus* is the correct name to apply to this plant. The occurrence of this species in our area is implied in various sources; I have not seen specimens. The dried inflorescences were used in the past for fulling cloth (raising the nap). [= K, Z; = D. fullonum – C, F, G, misapplied]

**Knautia** *Linnaeus*

A genus of about 60 species, herbs, of Europe, w. Asia, and n. Africa.

* Knautia arvensis *Linnaeus* Coulter, Blue Buttons. Mt (WV): dry areas, pastures, other disturbed areas; rare, native of Europe. June-September. Naturalized south at least to s. PA (Rhoads & Klein 1993), MD (Kartesz 1999), and WV (Harmon, Ford-Werntz, & Grafton 2006). [= C, F, G, K; = Scabiosa arvensis *Linnaeus]*

406e. VALERIANACEAE Batsch 1802 (Valerian Family) [in DIPSACALES]

A family of about 10 genera and 300-350 species, herbs (rarely shrubs), nearly cosmopolitan in distribution. References: Bell (2004); Ferguson (1965).

1. Stem leaves divided into 3-21 segments .................................................................................................................................................... *Valeriana*
2. Stem leaves simple .................................................................................................................................................................................. *Valerianella*

* Valeriana* *Linnaeus 1753* (Valerian)

A genus of about 200 species, herbs and shrubs, of temperate North America and Eurasia, s. Africa, and Andean South America.

1. Corolla tube 12-16 mm long; stem leaves pinnately divided into 3-7 segments; [native, of VA and TN northward]......................... *V. pauciflora*
2. Corolla tube 1.5-4 mm long; stem leaves divided either into 3 segments or into 11-21 segments.
3. Upright perennial herb; stem leaves divided into 11-21 segments; corolla tube 3-4 mm long; [alien, grown as an ornamental and casually escaped]................................................................. *V. officinalis*
4. Scandent vine; stem leaves divided into 3 segments; corolla tube 1.5-2 mm long; [native, of FL]................................................................. *V. scandens*

* Valeriana officinalis *Linnaeus, Garden-heliotrope. Mt (WV): cultivated and rarely escaped; rare, native of Europe. Sometimes cultivated in our area; it may escape or persist. May-August. [= C, F, G, K]

* Valeriana pauciflora *Michaux, Pink Valerian, Long-tube Valerian. Pd (VA, WV): very nutrient-rich alluvium in floodplain forests; uncommon (rare in VA). May; June. MD, se. PA, and sw. PA, west to s. IL, south to n. VA, sc. TN, KY, and MO. [= C, F, G, K, W, WV]

* Valerianella* *P. Miller 1754* (Corn-salad)

A genus of about 50 species, herbs, of temperate North America, Eurasia, and n. Africa. References: Ware (1983)=Z.

Identification notes: *Valerianella* species exhibit an interesting set of fruit polymorphisms; the fruit forms in a single species are often strikingly different, and these forms were traditionally regarded as separate taxa. Ware (1983) demonstrated that they were under simple genetic control,
and that different fruit forms were found in the same population. Thus, some taxa previously considered distinct are best considered mere fruit types. The fruit consists of three locules, one of which is fertile and dorsal to or more-or-less flanked by the two sterile locules. The sterile locules may be elongate, forming (between them) a groove, or they may be expanded laterally well beyond the width of the fertile locule into flattened or bulbous wings. In *V. locusta*, there is additionally a corky mass on the side of the fertile locule opposite the two sterile locules.

1 Fruit greatly thickened by a corky mass on the back of the fertile locule; corolla pale blue (or white) ......................................................... *V. locusta*

1 Fruit lacking a corky mass on the back of the fertile locule; corolla white.

2 Fertile locule much wider than the combined width of the 2 sterile locules; fruit sharply triangular in ×-section .................. *V. chenopodiifolia*

2 Fertile locule slightly wider or narrower than the combined width of the 2 sterile locules; fruit not sharply triangular in ×-section.

3 Corolla 1.5-2 mm long, the corolla lobes 0.4-0.8 mm long.............................................. *V. radiata*

3 Corolla 3-5 mm long, the corolla lobes 1-2 mm long.................................................. *V. umbilicata*

**Valerianella chenopodiifolia** (Pursh) A.P. de Candolle. Mt (VA, WV): moist forests, bottomlands; common (rare in VA). S, ON west to WI, south to MD, PA, WV, sw. VA, IN, and IL. [= K; = *V. chenopodiifolia* – C, F, G, WV, orthographic variant]

* Valerianella umbilicata* (Suffivant) Wood. Pd (NC, VA), Mt (NC, VA, WV), Cp (VA), {SC?}; moist forests, bottomlands, disturbed areas; rare. S, NY west to IL, south to NC and sc. TN (Chester, Wofford, & Kral 1997). Ware (1983) raises the question of whether *V. woodsiiana* is a distinct taxon; further study is needed. [= Z; < *V. umbilicata* – RAB, C, WV; > *V. umbilicata* – F, G; > *V. patelaria* (Suffivant ex A. Gray) Wood – F, S; > *V. intermedia* Dyal – F; > *V. radiata* var. *intermedia* (Dyal) Gleason – G]

* Valerianella dentata* (Linnaeus) Pollich. Reported as naturalized in central TN by Kral (1981) and Chester et al. (1997), in nc. GA (Jones & Coe 1988), and in AL (Kartesz 1999). [= K] {not yet keyed; synonymy incomplete}

* Valerianella woodsiiana* (Torrey & A. Gray) Walpers. Cp (NC, SC, VA), Pd (SC): bottomlands; rare. {distribution} [= K, S, Z] {not yet keyed; add to synonymy}

**410. PITOSPORACEAE** R. Brown 1814 (Pittosporum Family) [in APIALES]

**Pittosporum** Banks ex Solander (Pittosporum)

A genus of about 100-150 species, trees and shrubs, of tropical and warm temperate Old World. References: Judd (1996)=Z.

* Pittosporum tobiira* (Thunberg) Aiton f., Japanese Pittosporum, Australian Laurel. Cp (FL, GA?, NC, SC?): frequently planted on barrier islands, at least persisting and apparently naturalizing; rare, native of Japan and China. Various cultivars are seen, including ones with variegated leaves. This species is one of the more common landscaping plants used on developed barrier islands. The revolute, obovate leaves are characteristic. [= K, WH, Z]

**411. ARALIACEAE** A.L. de Jussieu 1789 (Ginseng Family) [in APIALES]

A family of about 47 genera and 1325 species, trees, shrubs, vines, and rarely herbs, mainly tropical in distribution. *Hydrocotyle* is more closely related to Araliaceae than to Apiaceae, and is transferred here (Chandler & Plunkett 2003). References: Frodin & Govaerts (2003); Graham (1966); Smith (1944).
Aralia Linnaeus 1753 (Aralia)

A genus of about 30-70 species, herbs, shrubs, vines, and trees, primarily of e. North America, e. Asia, and se. Asia. Wen (1998) has suggested that *A. nudicaulis* may need to be removed from the genus *Aralia* in order to maintain both *Aralia* and *Panax* as monophyletic genera. References: Smith (1982)=Z; Moore, Glenn, & Ma (2009)=V; Wen et al. (1998); Wen (1993); Wen (1998); Smith (1944)=Y; Frodin & Govaerts (2003)=X.

1 Plant a shrub, with prickles; fruit black ................................................................. [Eleutherococcus]
1 Plant an herb, lacking prickles; fruit red or yellow ................................................... *Panax*

6 Plant a shrub, with prickles; fruit black ................................................................. [Eleutherococcus]
6 Plant an herb, lacking prickles; fruit red or yellow ................................................... *Panax*

---

*Aralia elata* (Miquel) Seemann, Japanese Angelica-tree. Pd (DE): suburban woodlands; uncommon. Naturalizing in ne. North America at least as far south as NJ, DE, se. PA, and DC (likely to be present in MD). See Moore, Glenn, & Ma (2009) for detailed information on this alien species and its naturalization in the northeastern United States. [= K, V]

*Aralia hispida* Ventenat, Bristly Sarsaparilla. Mt (NC?, VA, WV, ): rocky woodlands, cliffs, and clearings, primarily over acidic rocks (such as quartzite, granite, and sandstone); rare. June-August. NL (Labrador) and NL (Newfoundland) west to MB, south to w. VA, w. NC (?), WV, OH, IN, IL, and MN. This species appears to be strongly dependent on disturbance, such as fire, appearing in great numbers following fire where previously rare or apparently absent. F and Y credit this species to w. NC; the documentation is not known to me, and the species was not treated by RAB. Doug Rayner (pers. com. 2002) reports a site record of it in Polk County, NC. [= C, F, G, K, S, W, X, Y, Z]

*Aralia nudicaulis* Linnaeus, Wild Sarsaparilla. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): upland forests and woodlands, rocky places, most typically in rather dry places, such as ridgetop forests; common (uncommon in Piedmont south of DE, rare in Coastal Plain south of DE, rare in GA). May-July. NL (Labrador) and NL (Newfoundland) west to BC, south to e. VA, e. NC, ne. GA, w. TN, IL, MO, NE, CO, and ID. [= RAB, C, F, G, K, S, W, X, Y, Z]

*Aralia racemosa* Linnaeus, Spikenard, Hungry-root. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): rich woodlands, trail margins and roadsides; uncommon (rare in Coastal Plain, locally common in Mountains of far sw. VA). June-August. NB and QC west to MN and SD, south to NC, n. GA, AL, MS, MO, and e. KS. The related *A. bicornata* Woolton & Standley (sometimes treated as a subspecies of *A. racemosa*) occurs in AZ, NM, TX, and n. Mexico. [= RAB, C, F, G, S, W, X, Y, Z; *A. racemosa* ssp. racemosa – K]

**Eleutherococcus** Maximowicz 1859 (Fiveleaf Aralia)

* *Eleutherococcus sieboldianus* (Makino) Koidz., Fiveleaf Aralia. Mt (WV): disturbed areas; rare, native to e. Asia. Reported as introduced and apparently naturalized in Randolph County, WV, scattered locations in PA (Rhoads & Klein 1993), OH, and n. KY (Clark et al. 2005). [= Z; *Eleutherococcus pentaphyllus* (Siebold & Zuccarini) Nakai – K, misapplied; = Acanthopanax sieboldianus Makino]

**Hedera** Linnaeus 1753 (Ivy)

**Identification notes:** The leaves of *Hedera* are dimorphic, sometimes confusing observers; ”juvenile” leaves (those of the sterile branches) are about as wide as long and (in *H. helix*) palmately 3-5-lobed, those of the fertile branches (less commonly seen) are obovate or elliptic.

---

**ARALIACEAE**

991
1 Trichomes scale-like, 0.1-0.4 mm, those on the leaves, petioles, and young stems with rays fused basally for 1/4 to 1/2 their length; juvenile leaves orbicular, little or not at all lobed, the larger 15-25 cm wide. ........................................................................................................ H. colchica

1 Trichomes stellate, 0.5-1.0 mm, those on the leaves, petioles, and young stems with rays fused basally for < 1/8 their length; juvenile leaves slightly to deeply lobed, the larger 5-15 cm wide.

2 Hairs of young stems, leaves, and petioles whitish, the rays erect (at a right angle to the leaf surface); juvenile leaves usually < 8 cm wide, usually dark green and often also marbled with white, often lobed > 1/2 the way to the base; [often strongly climbing] .... H. helix var. helix

2 Hairs of young stems, leaves, and petioles yellowish-brown to rusty-brown, the rays not erect (parallel to the leaf surface); juvenile leaves often > 8 cm wide, usually medium green (rarely also marbled with white), usually lobed < 1/2 the way to the base; [usually not climbing] .... H. hibernica

Hydrocotyle Linnaeus 1753 (Water-pennywort)

A genus of about 130 species, herbs, cosmopolitan (especially Australia). Molecular analyses have clarified that the affinities of Hydrocotyle lie with the Araliaceae rather than the Apiaceae (Downie et al. 1998; Chandler & Plunkett 2004). References: Mathius & Constance (1945)=MC;

1 Leaves petate, lacking a sinus extending to the attachment of the petiole.

2 Inflorescence umbellate; leaves 1-4 (~7) cm wide. ........................................................................................................ H. umbellata

2 Inflorescence verticillate or umbellate-verticillate (when first developing sometimes appearing merely umbellate); leaves 1-15 cm wide.

3 Inflorescence compound, the main inflorescence axis with nodes which produce verticels or umbels of pedicellate flowers, the inflorescence nodes also producing branches which themselves produce verticels or umbels of flowers; leaves (1-) 4-15 cm wide .......... H. bonariensis

3 Inflorescence verticillate, all the flowers borne sessile or on pedicels on the unbranched inflorescence axis; leaves 1-6 cm wide.

4 Flowers and fruits pedicellate, the pedicels 1-10 mm long. ...................................................................................................... H. prolifera

4 Flowers and fruits sessile or subsessile .................................................................................................................................... H. verticillata

1 Leaves not petate, a sinus extending to the attachment of the petiole.

5 Central leaf lobe notably more distinct than the other lobes (the sinuses on either side extending 1/3 to 3/4 of the way to the petiolar attachment); stems and petioles fleshy. ................................................................. H. ranunculoides

5 Central leaf lobe not more distinct than the other lobes (the sinuses on either side extending 1/10 to 1/4 the way to the petiolar attachment); stems and petioles filiform.

6 Fruiting umbels on peduncles 1-3 mm long; leaves 10-50 mm wide; [native of bogs, spray cliffs, and other wetlands] ...... H. americana

6 Fruiting umbels on peduncles 9-24 mm long; leaves 5-30 mm wide; [alien of lawns and other disturbed habitats].

7 Leaves 5-lobed, 15-30 mm wide ................................................................. H. bowlsiooides

7 Leaves 7-lobed, 5-13 mm wide .................................................................................................................. H. sibthorpioides

* Hydrocotyle bonariensis Lamarck, Dune Water-pennywort. Cp (FL, GA, NC, SC, VA): beaches, dunes, and moist sandy areas; uncommon (rare in VA). April-September. Widespread in South and Central America, north in North America to the Southeastern Coastal Plain, se. VA to s. FL and TX. [= RAB, GW, K, MC, S, WH]

**Kalopanax** Miquel 1863 (Castor Aralia)

**Panax** Linnaeus 1753 (Ginseng)

1 Leaflets (3-) 5, petiolulate, the petiolules (0.7-) 1-2.5 cm long; larger leaflets 6-15 cm long, 3.5-7 cm wide, mostly about 2× as long as wide, the apex acuminate; fruit bright red when ripe ........................................................................................................................................................................P. quinquefolius
2 Leaflets 3 (-5), sessile or subsessile; larger leaflets 4-8 cm long, 0.5-2.5 cm wide, mostly about 3× as long as wide, the apex obtuse to acute; fruit yellow-green when ripe ........................................................................................................................................................................P. trifolius

**Panax quinquefolius** Linnaeus, Ginseng, Sang, American Ginseng. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, VA): cove forests, mesic hardwood forests, generally in nutrient-rich forests though tending to avoid the richest coves; uncommon (rare in DE). May-June; August-October. QC west to MN and SD, south to e. VA, e. NC, nc. SC, GA, c. AL, LA, and OK. *P. quinquefolius* is gathered in quantity throughout its range for the herbal trade; most of the North American harvest is shipped to China, where it is prized for medicinal uses. Dried roots command prices in excess of $1000 per kilogram; in our area, "sang" is a multimillion dollar industry. Formerly abundant and occurring in large populations, *P. quinquefolius* has been reduced in most of its range to small populations of scattered individuals, a classic example of a "predator-prey" relationship. Collection and trade in ginseng is monitored and regulated in most states. In NC, it is illegal for ginseng dealers to buy ginseng from collectors before September; this allows the plants to mature fruits prior to collection. Schlessman (1985) discusses the floral biology of *P. quinquefolius*. [= F, K, W, WV, Y, Z; = P. quinquefolium – RAB, C, G, S, orthographic variant]

**Panax trifolius** Linnaeus, Dwarf Ginseng. Mt (GA, NC, VA), Pd (DE, NC, VA), Cp (DE, VA): cove forests, bottomland forests, other nutrient-rich forests; uncommon (rare south of VA). April-June; August-October. NS and QC west to MN, south to PA, e. VA, c. NC, nc. GA, ec. TN, IN, and IA. [= F, K, W, WV, Y, Z; = P. trifolium – RAB, C, G, S, orthographic variant]

**Tetrapanax** (K. Koch) K. Koch 1859 (Ricepaper-plant)

A monotypic genus, a robust herb or shrub, of China.

**UMBELLIFERAE** A.L. de Jussieu 1789 (Carrot Family) [in APIALES]

A family of about 445 genera and about 3540 species of herbs (rarely shrubs or trees), cosmopolitan, but especially north temperate. *Hydrocotyle* is more closely related to Araliaceae, and has been transferred there (Chandler & Plunkett 2004). References: Mathias & Constance (1945) = MC. [also see ARALIACEAE]

[only a small fragment of the key to genera complete at this time]

1 Fruits (partly to fully mature) with thin-edged wings; flowers yellow, maroon, or white; central flower of each umbellet stamine and pedicelled; fruits all pedicelled in all umbellets............................................................................................................................................................................... *Thaspium*
APIACEAE

Aegopodium Linnaeus 1753 (Goutweed)

A genus of 5-7 species, perennial herbs, of temperate Eurasia. References: Mathias & Constance (1945)=MC.

*Aegopodium podagraria* Linnaeus, Goutweed. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, SC, VA): disturbed areas; rare, native of Europe. The cultivated forms encountered in our area are usually those with white-margined or variegated leaves. [= C, F, K, MC; > *A. podagraria* var. podagraria – RAB, G; > *A. podagraria* var. variegatum L.H. Bailey – RAB, G]

Aethusa Linnaeus 1753

*Aethusa cynapium* Linnaeus, Fool's-parsley. Cp (DE), Pd (DE), Mt (WV): disturbed areas; uncommon, native of Eurasia. Introduced and naturalized in ne. United States, at least as far south as se. PA (Rhoads & Klein 1993), DE, and Pocahontas County, WV. In Europe, several subspecies are often recognized; it is not known how these entities relate to material naturalized in North America and for now we treat the species broadly. [= C, F, G, K, MC, WV; > *A. cynapium* ssp. agrestis (Wallr.) Dostál – Z; > *A. cynapium* ssp. cynapium – Z; > *A. cynapium* ssp. gigantea (Lejeune) P.D. Sell; > *A. cynapium* ssp. cynapioides (M. Bieb.) Arcangeli – Z]

Ammi Linnaeus 1753 (Bishop's-weed)

A genus of about 4-10 species, annual or biennial herbs, distributed in Mediterranean Europe. References: Mathias & Constance (1945)=MC.

1 Lower leaves with elliptic to narrowly elliptic segments; fruits 1.5-2 mm long; rays 15-60, not rigid and thickened at maturity; bracts not strongly reflexed in fruit ..............................................................................................................................................................

A. majus

1 Lower leaves with filiform segments; fruits 2-2.8 mm long; rays up to 150, rigid and thickened at maturity; bracts strongly reflexed in fruit...

A. visnaga

* Aegopodium podagraria * Linnaeus, Goutweed. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, SC, VA): disturbed areas; rare, native of Europe. The cultivated forms encountered in our area are usually those with white-margined or variegated leaves. [= C, F, K, MC; > *A. podagraria* var. podagraria – RAB, G; > *A. podagraria* var. variegatum L.H. Bailey – RAB, G]

*Ammoselinum* Torrey & A. Gray 1855 (Sand-parsley)

A genus of 3 species, herbs, of sc. and sw. North America and temperate s. South America. References: Mathias & Constance (1945)=MC.

1 Umbels sessile; fruit glabrous (or slightly roughened) ..............................................................................................................................................................................

A. butleri

1 Umbels pedunculate; fruit roughened with well-developed teeth ..............................................................................................................................................................................

A. popei

*Ami* Linnaeus 1753 (Angelica)

1 Fruits ribbed (with rounded, cordlike ribs), lacking thin-edged wings; flowers yellow; central flower of each umbellet either staminate and pedicelled, or pistillate and sessile; fruits all pedicelled in some umbellets (those with a staminate central flower), or the central fruit sessile in some umbellets (those with a pistillate central flower) ..............................................................................................................................................................................

Zizia

*Ammoselinum popei* Torrey & A. Gray, Pope’s Sand-parsley. Ip (TN): limestone barrens; rare. KS, OK, TX, and NM south to ne. Mexico (Nuevo Léon); disjunct and apparently native in the Nashville Basin of c. TN. [= K, MC]

Anethum Linnaeus 1753 (Dill)

A monotypic genus, an annual herb, apparently native to sw. Asia. References: Mathias & Constance (1945)=MC.

A genus of about 60-110 species, perennial herbs of the northern hemisphere. References: Mathias & Constance (1945)=MC.

1 Larger leaflets 3-6 cm long, 1-2.5 cm wide, obtuse at the apex; umbels either densely pubescent or glabrous; ovary and fruit either pubescent or glabrous; [collectively widespread in our area, in dry to mesic habitats].
2 Umbels pubescent; ovary and fruit hispid; leaf segments coarsely toothed. ................................................................. A. dentata

A genus of about 20 species, herbs, of temperate and subtropical regions, mainly Southern Hemisphere. References: Ronse et al. 1996=Z; Mathias & Constance (1945)=MC.

1 Involucel present; fresh plant not smelling of celery; stem hollow ............................................................................
2 Involucel absent; fresh plant smelling of celery; stem solid ............................................................................................

1 Larger leaflets 8-15 cm long, 4-8 cm wide, acute at the apex; umbels glabrous or sparsely pubescent; ovary and fruit glabrous or sparsely pubescent; [restricted to the Mountains in our area, in mesic habitats]
3 Leaflets acute, the margin hyaline and mostly glabrous; umbels with 20-45 umbellets ...................................................... A. atropurpurea

3 Leaflets acuminate, the margin ciliate; umbels with 13-25 umbellets ............................................................................. A. triquinata

Angelica atropurpurea Linnaeus, Purple Angelica. Pd (DE), Mt (NC*?, WV): riverbanks, streambanks, moist roadsides; rare. May-June; July-August. S. NL (Labrador) west to WI and MN, south to NL (Newfoundland), NS, DE, MD, WV, OH, IN, IL, and ne. IA (and in the mountains to ne. TN and w. NC – the NC occurrences have sometimes been speculated to be naturalized). [= RAB, C, G, K, MC, W; > A. atropurpurea var. atropurpurea – F]

Angelica lucida Linnaeus. Native to n. North America. Reported by Harvill et al. (1992) for Warren County, VA; more information is needed to substantiate this surprising record, presumably from cultivation. [= C, G, K, MC; = Coelopleurum lucidum (Linnaeus) Fernald – F]

Angelica triquinata Michaux, Mountain Angelica, Filmy Angelica. Mt (GA, NC, VA, WV): mesic forests at moderate to high elevations, grassy balds, brookbanks; common (uncommon in WV). August-September; September-October. PA south to sw. NC, se. TN, and n. GA, a Southern and Central Appalachian endemic. The nectar is very attractive, but apparently strongly intoxicating, to yellow jackets and hornets; on the grassy balds of Roan Mountain one can see thousands of umbels of Angelica densely coated by lethargic bees. [= RAB, C, F, G, K, MC, W; ? A. curtisii Backley – S]

Angelica venenosa (Greenway) Fernald, Hairy Angelica. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): dry forests and woodlands, woodland borders, longleaf pine sandhills, hammocks; common (rare in DE and FL). June-August; July-September. MA west to MN, south to Panhandle FL, MS, and AR. Populations of this species in dry sandhill communities in the Fall Line Sandhills have a number of peculiar features: basal leaves often borne appressed against the ground, small leaflets, course and more equilateral toothing of the leaflets. These populations may be worthy of taxonomic recognition; they need further study. [= RAB, C, F, G, K, MC, W; ? A. villosa (Walter) Britton, Sterns, & Poggenburg – S]

Anthriscus Persoon 1814 (Chervil)

1 Fruit ovoid, 2.9-3.2 mm long, hispid with hooked hairs; [section Anthriscus].................................................................. A. caucalis
2 Fruit lanceolate or linear, 6-10 mm long, glabrous.
3 Beak of fruit (1-) 2-4 mm long, well-differentiated from the body; plant an annual; umbel rays pubescent; [section Anthriscus]................
2 Beak of fruit ca. 1 mm long, scarcely differentiated from the body; plant a perennial; umbel rays glabrous (or nearly so); [section Cacosciadium] ............................................................... A. sylvestris

* Anthriscus sylvestris (Linnaeus) Hoffmann ssp. sylvestris, Wild Chervil, Cow-parsley. Mt (NC, TN, VA), Pd (DE): moist disturbed areas; rare, native of Eurasia. May-July. This species has also been reported from the NC-TN state line, on Roan Mountain (Mellichamp, Matthews, & Smithka 1987, 1988); the population is actually entirely in TN. Reported for Watauga, Ashe, and Alleghany counties, NC (Poinexter, pers. comm. 2009). [= Z, < A. sylvestris – C, F, G, K, MC]

Apium Linnaeus 1753 (Celery)

A genus of about 20 species, herbs, of temperate and subtropical regions, mainly Southern Hemisphere. References: Ronse et al. (2010)=Z; Mathias & Constance (1945)=MC.

1 Involucel absent; fresh plant smelling of celery; stem solid............................................................................................. A. graveolens var. dulce
1 Involucel present; fresh plant not smelling of celery; stem hollow.................................................................................... A. graveolens var. dulce

...

**Bifora** Hoffmann 1816 (Bishop)

A genus of 4-6 species, annual herbs, of Mediterranean Europe, w. Asia (Caucasus), and w. North America.

* **Bifora americana** Bentham, Prairie Bishop. Disturbed areas; native of sc. North America. April-June. [= K] [perhaps not naturalized; not keyed or mapped]

* **Bifora radians** Bieberstein. [= K] [probably not naturalized; not keyed or mapped]

* **Bifora testiculata** (Linnaeus) Sprengel. [= K] [probably not naturalized; not keyed or mapped]

**Bowlesia** Ruiz & Pavón 1794 (Bowlesia)

A genus of ca. 15 species, herbs, of South America. References: Mathias & Constance (1945)=MC.

* **Bowlesia incana** Ruiz & Pavón. Cp (FL): open wet hammocks and bottomlands; rare, native of South America. [= GW, K, MC, WH; = *Bowlesia septentrionalis* Coulter & Rose – S]

**Bupleurum** Linnaeus 1753 (Hare’s-ear, Thoroughwax)

A genus of about 190 species, herbs and shrubs, primarily Eurasian. References: Snogerup & Snogerup (2001)=Z; Mathias & Constance (1945)=MC.

1 Upper leaves linear, sessile; [section *Aristata*] ........................................................................................................................................ B. *gerardii*
1 Upper leaves ovate, perfoliate; [section *Bupleurum*] .................................................................................................................... B. *rotundifolium*

* **Bupleurum lancifolium** Hornemann. Reported as a waif for MD by Shetler & Orli (2000) and Reed (1964). [= K] [not keyed; not mapped]

**Carum** Linnaeus 1753 (Caraway)

A genus of about 30 species, temperate. References: Mathias & Constance (1945)=MC.

**Centella** Linnaeus 1764 (Centella, Coinleaf)

A genus of about 40 species, of warm temperate and tropical regions, centered in s. Africa. References: Mathias & Constance (1945)=MC.

**Centella erecta** (Linnaeus f.) Fernald, Centella, Coinleaf. Cp (DE, GA, NC, SC, VA): savannas, pondshores, ditches, and a wide variety of other moist to wet habitats; common (rare in DE). June-August; July-September. S. NJ and DE south to s. FL; west to s. TX; West Indies, Mexico, Central America. *C. erecta* has sometimes been included in the pantropical *C. asiatica*, but the two taxa differ in morphology and chromosome number (*C. erecta* has n = 27, *C. asiatica* has n = 9). [= C, F, G, K, MC; < *C. asiatica* (Linnaeus) Urban – RAB, GW, misapplied; ? *C. repanda* (Persoon) Small – S]

**Chaerophyllum** Linnaeus 1753 (Chervil)

A genus of about 35 species, herbs, of north temperate areas. References: Mathias & Constance (1945)=MC.
A genus of 8 species, herbs, north temperate in distribution. References: Mulligan (1980)=Z; Mathias & Constance (1945)=MC.

1 Flowers usually aborting (if present, the fruits 1.5-2 mm long); axils of upper leaves not bearing bulbils; leaflets with narrowly linear segments, usually <5 mm wide .................................................. C. bulbifera
2 Flowers usually forming mature fruits 2-4 mm long; axils of leaves not bearing bulbils; leaflets lanceolate, usually >6 mm wide.
   1 Dorsal and lateral corky ribs of the fruit much narrower than the oil tubes; fruit abruptly and unevenly constricted at the commissure..........
   2 Dorsal and lateral corky ribs of the fruit equaling to slightly exceeding the width of the oil tubes; fruit restricted or not at the commissure, but not as above.
      3 Leaflets ovate, up to 3.5-5 cm wide .................................................. C. maculata var. maculata
      2 Leaflets lanceolate, 0.6-3 cm wide .................................................. C. maculata var. acuta

Cicuta tainturieri Hooker, Southern Chervil. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA, WV), Mt (GA, NC, SC, VA, WV); roadsides, disturbed areas, fields; common (rare in DE and WV). March-April; April-May. MD west to NE, south to c. peninsular FL, TX, and AZ. Var. tainturieri (with fruits glabrous) and var. dasycarpum (with fruits pubescent) are sometimes distinguished (see synonymy). They have largely overlapping distributions, and seem unlikely to warrant taxonomic status, but need additional study. C. texanum Coulter & Rose is reported as a native in the Nashville Basin of TN (Chester, Wofford, & Kral 1997); it is usually now included in C. tainturieri (var. tainturieri). [= RAB, C, GW, W, WH; > C. tainturieri var. tainturieri – K; > C. texanum var. texanum – C, F, G; > C. tainturieri var. floridanum Coulter & Rose – F; C. texanum Coulter & Rose – F, G, MC; > C. teinturieri – S, orthographic variant; > C. floridana (Coulter & Rose) Bush – S; > C. tainturieri var. dasycarpum Hooker ex S. Watson – K, MC; > C. dasycarpum (Hooker ex S. Watson) Nuttall ex Small – S]

* Chaerophyllum bulbosum Linnaeus, Parsnip Chervil. Waif in DC; native of Europe. [= C, G, K, MC] [not keyed; not mapped]

A genus of about 10 species, herbs, north temperate in distribution. References: Mathias & Constance (1945)=MC.

Cicuta Linnaeus 1753 (Water-hemlock)

Cicuta bolanderi S. Watson. Marshes, bogs, seepages, ditches, swamp forests. Scattered in distribution, from NJ, WI, and MN south to GA, TX, Mexico, and AZ. Further study is needed of the distinctiveness, distribution, and ecology of this species. [=K, MC; < C. maculata var. maculata – C, F, G; = C. maculata Linnaeus var. bolanderi (S. Watson) Mulligan – Z]

Cicuta bulbifera Linnaeus, Bulb-bearing Water-hemlock. Marshes and swamps. July-September. NL (Newfoundland) west to AK, south to MD, n. VA (?), OH, KY, IN, IL, IA, NE, MT, ID, and OR; disjunct (perhaps introduced only) in NC and FL. [= C, F, G, K, MC, Z]

Cicuta maculata Linnaeus var. maculata. Water-hemlock. Marshes, bogs, seepages, ditches, swamp forests. May-August; July-September. NS west to AK, south to FL, CA, and Mexico. Two other varieties are more northerly or western: var. victorinii (Fernald) Boivin of QC and var. angustifolia Hooker of western North America. All parts of the plant, especially the tubers, are dangerously poisonous. [= C. maculata – RAB, GW, MC, S, W; < C. maculata var. maculata – C, F, G (also see var. bolanderi); < C. maculata var. maculata – K, Z (also see C. mexicana); < C. maculata – WH]

Cicuta mexicana Coulter & Rose, Southern Water-hemlock. Marshes, bogs, seepages, ditches, swamp forests, floating vegetation mats. May-August; July-September. Se. VA (GW), south to FL, and west to TX, south into Mexico (more inland records in our area and westward are of uncertain disposition). Though not recognized by Mulligan (1980), this taxon appears to warrant taxonomic recognition. It is a generally coarser plant than C. maculata. [= RAB, GW, MC; = C. maculata var. curtissii (Coulter & Rose) Fernald – F, G; < C. maculata var. maculata – K, Z; = C. curtissii Coulter & Rose – S; < C. maculata – WH]

Conioselinum Hoffmann 1819 (Hemlock-parsley)

A genus of about 10 species, herbs, north temperate in distribution. References: Mathias & Constance (1945)=MC.

Conioselinum chinense (Linnaeus) Britton, Sterns, & Poggenburg, Hemlock-parsley. Nutrient-rich seepage over cliffs and through boulderfields, at high elevations, known from seepage over cliffs and through boulderfields at about 1500 m on the north
slop of Grandfather Mountain (Avery County, NC), and from a north-facing greenstone cliff-top seep at 1150 m on Stony Man, Page County (VA). July-September. The specific epithet is a misnomer; the species is native to n. North America (the specific epithet a misnomer): south to PA, IN, IA, and NB, and disjunct in VA and NC) and ne. Asia (e. Siberia), but not found in China (the epithet a mistake based on confusion between "Genesee," New York, and "Chinensem"). The single NC population was first discovered in 1842 by Asa Gray and John Carey, and not seen again until 1989. The VA population was first reported by Fleming & Ludwig (1996). The report of the species from Roan Mountain was found to be in error; see Anthriscus (Melchamp, Matthews, & Smithka 1987, 1988). [= RAB, C, F, G, K, MC, S, W]

**Conium** Linnaeus 1753 (Poison-hemlock)

* **Conium maculatum** Linnaeus, Poison-hemlock. Ditches, roadsides, streambanks, disturbed areas; native of Eurasia. May-June; June-July. All parts of the plant are highly toxic if ingested, causing respiratory failure in humans and other mammals. [= RAB, C, F, GW, K, MC, S, W, WV]

**Coriandrum** Linnaeus 1753 (Coriander, Cilantro)

**Cryptotaenia** A.P. de Candolle 1829 (Honewort)

A genus of 6 species, herbs, in north temperate areas (and montane Africa). References: Mathias & Constance=MC.

* **Cryptotaenia canadensis** (Linnaeus) A.P. de Candolle, Honewort. Moist and nutrient-rich forests (alluvial, bottomland, slope, and cove forests). May-June; June-August. NB and QC to MB, south to e. GA, sw. GA, Panhandle FL, AL, and TX; also in Japan. [= RAB, C, F, GW, K, MC, WH, WV; = Deringa canadensis (Linnaeus) Kuntze – S]

**Cyclospermum** Lagasca y Segura 1821 (Marsh-parsley)

A genus of 3 species, herbs, of tropical and warm temperate America. Only distantly related to *Apium* and warranting generic sttus (Ronse et al. 2010). References: Ronse et al. (2010)=Z; Mathias & Constance (1945)=MC.

**Cynosciadium** A.P. de Candolle 1829

* **Cynosciadium digitatum** A.P. de Candolle. Wet places, ditches, blackland prairies. IL, sw. TN (Shelby County), and AL west to OK and TX. [= C, F, G, GW, K, MC, S]

**Daucus** Linnaeus 1753 (Wild Carrot, Queen-Anne's-lace)

A genus of about 22 species, herbs, of temperate and tropical areas, primarily Old World. References: Mathias & Constance (1945)=MC.
Daucus carota Linnaeus, Queen-Anne's-Lace, Carrot, Wild Carrot. Pastures, fields, roadsides, waste places; native of Europe. May-September. The cultivated carrot is a form with a fleshy taproot rich in carotene; the familiar field weed has a "carrot" flavor, but the root is woody and tan in color. [= RAB, C, F, G, K, MC, S, W, WH, WV]

Daucus pusillus Michaux, American Queen-Anne's-lace. Pastures, fields, roadsides, waste places. April-May; May-June. This native relative of *D. carota* is smaller and less branched. Widespread in Southeastern United States, north to NC and MO. It should be expected in the lower Piedmont of NC and in the Coastal Plain of se. VA, which it closely approaches. Robert Wright has collected this species as a waif in Henrico County, VA (R. Wright, 2002, pers. comm.). [= RAB, C, F, G, K, MC, S, W, WH]

Erigenia Nuttall 1818 (Harbinger-of-spring, Pepper-and-salt)

Erigenia bulbosa (Michaux) Nuttall, Harbinger-of-spring, Pepper-and-salt, Erigenia. Mesic, nutrient-rich forests, either over calcareous substrate or on very rich alluvial deposits (such as riverbanks). February-May. S. PA, w. NY, s. ON, c. MI, and se. WI south to MD, DC, c. VA, w. VA, nc. NC, w. NC, e. TN, nw. GA, c. AL, n. MS, sw. AR, and se. KS (almost entirely west of the Blue Ridge). Rodgers (1950) states "reported in mtns. of N.C. by Kephart and Hyams;" now documented from both the nc. Piedmont and the w.MD, DC, Mountains. See Buddell & Thieret (1985) for a very interesting and entertaining account of this plant. [= RAB (excluded), C, F, G, K, MC, S, W, WV, Z]

Eryngium Linnaeus 1753 (Eryngo)

1 Leaves thickly coriaceous, palmately lobed, the lobes and teeth tipped with stout spines; [subgenus *Eryngium*] ................................................................. *E. martinum*
1 Leaves thin, fleshy, or subcoriaceous, entire, toothed, palmately lobed, or pinnately incised, the teeth or lobes (if present) unarmed or with weak spines.
2 Inflorescence unbranched, the heads solitary on peduncles from the leaf axils of the prostrate to erect stem; [subgenus *Monocotyloidea*].
3 Leaves pinnately lobed or dissected. ................................................................................................................................. *E. divaricatum*
3 Leaves entire, irregularly toothed (rarely with some irregular lobing).
4 Heads subglobose or hemispherical when fully developed, about as wide as long; bracts subtending the head barely extending beyond the base of the head; main stems leaves linear, narrowly elliptic, narrowly oblanceolate, sometime tricuspid apically                  ................................................................................................................................. *E. baldwinii*
4 Heads cylindrical, longer than wide; bracts subtending the head longer than the radius of the head, thus extending conspicuously beyond the base of the head; main stem leaves elliptic, broader than above .................................................................................................................... *E. prostratum*
2 Inflorescence branched, the heads in a cyme borne terminally on the erect stem.
5 Basal and cauline leaves (all, or at least many of the cauline) definitely deeply lobed into 3 or more divisions, < 10 cm long.
6 Heads blue; basal leaves serrate but not divided; [subgenus *Monocotyloidea*] .......................................................... *E. hookeri*
6 Heads greenish; basal leaves pinnately or pinnately-ternately divided.
7 Plants slender, not fleshy, green; basal and cauline leaves 2-6 cm long, 3-5 (-7) pinnately parted; heads 5-8 mm in diameter; [native species of dry pinelands of the Coastal Plain of e. GA, s. AL, and FL]; [subgenus *Monocotyloidea*] ........................................... *E. aromaticum*
7 Plants stout, fleshy, usually glaucous; basal leaves 10-25 cm long and wide, pinnately or pinnate-ternately divided into > 7 segments, the cauline leaves similar but reduced in size and number of divisions; heads 10-15 mm in diameter; [rare ballast waif of disturbed ground]; [subgenus *Eryngium*] ........................................................................................................................................... *E. campestre*
5 Basal and cauline leaves unlobed (except sometimes the uppermost; note that bracts in the inflorescence are often lobed), 3-100 cm long; [subgenus *Monocotyloidea*]
8 Blades of basal and lower cauline leaves 3-7 (-10) cm long, acute to obtuse apically, cordate to truncate basally, with a length/width ratio of 1.5-3 (-6) ...................................................................................................................................................... *E. integrifolium*
**APIACEAE**

Blades of basal and lower cauline leaves 10-100 cm long, acuminate to acute apically, clasping basally, with a length/width ratio of 5-50.

10 Larger leaves > 1.5 cm wide; marginal bristles of leaves solitary........................................E. yuccifolium var. yuccifolium

10 Larger leaves < 1.5 cm wide; marginal bristles in fascicles of 1-3 (<4), those on the lower portion of the leaf usually in fascicles of 2-3.................................................................E. yuccifolium var. synchaetum

9 Leaves with primary veins pinnate-reticulate, with or without marginal bristles; flowers blue.

11 Styles 3.0-3.5 mm long at maturity, scarcely exceeding the bractlets (which subtend each flower); heads subglobose to hemispherical, 6-12 mm in diameter; middle cusp of the bractlets elongate, distinctly longer than the lateral cusps..............................E. aquaticum var. aquaticum

11 Styles 4.0-6.0 mm long at maturity, exceeding the bractlets; heads globose, 9-15 mm in diameter; middle cusp of the bractlets about equal in length to the lateral cusps .................................................................E. aquaticum var. ravenelli

---

**Eryngium aquaticum** Linnaeus var. aquaticum, Marsh Eryngo. Cp (DE, FL, GA, NC, SC, VA): tidal freshwater to brackish marshes; uncommon (rare in DE). July-September. NJ to ne. FL along the Atlantic coast, mostly in brackish marshes. [= RAB, K, MC, Z; < *E. aquaticum* – C, F, G, GW, WH; = *E. virginianum* Lamark – S]

**Eryngium aromaticum** Baldwin, Fragrant Eryngo. Cp (FL, GA): dry pinelands; common (uncommon in GA). E. GA west to s. AL, south to s. FL. [= K, MC, S, WH, Z]

**Eryngium baldwini** Sprengel. Cp (FL, GA): pinelands, temporary pools, ditches, other moist to wet sites; common (uncommon in GA). Se. GA and sw. GA south to s. FL. [= GW, K, S, WH, Z; = E. baldwini – MC, orthographic variant]

* Eryngium divaricatum* Hooker & Arnott. Cp (FL, NC): disturbed areas, introduced on ballast at old port towns (Wilmington, NC; Pensacola, FL); rare, native of South America. July-October. Not seen in recent years and probably not persistent. [= RAB, K, MC, S, WH, Z]

* Eryngium foetidum Linnaeus, Spiritweed. Listed by Kartesz (1999) as introduced in GA and FL, but the only reports are very early and anecdotal, and the species was excluded from the North American flora by Coulter & Rose (1900), with no subsequent documentation that would change that conclusion. Native of Mexico, Central America, South America, and West Indies. [= K, MC] {not keyed}

**Eryngium hookeri** Walpers. Ditches, other wet areas. MS and AR west to OK and TX, perhaps recently adventive in the eastward portions of that distribution, not credited as occurring east of TX in Matthias & Constance (1945). [= K, MC]

**Eryngium integrifolium** Walter, Savanna Eryngo. Cp (FL, GA, NC, SC), Mt (GA, NC, SC), Pd (GA, NC, SC, VA): savannas, pine flatwoods, seepages, other moist, nutrient-poor places; common (rare in Piedmont and Mountains). August-October. Se. VA (Greensville County) (Belden et al. 2004) and e. NC south to ne. FL and Panhandle FL, west to OK and TX, inland in c. TN. [= RAB, K, MC, W, WH, Z; = E. integrifolium – S; > *E. ludovicianum* Morong – S]

---

**Eryngium prostratum** Nuttall ex A.P. de Candolle, Spreading Eryngo. Cp (DE*, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC): floodplain forests, bogs, pond margins, moist ditches and lawns, other moist, open habitats; uncommon, definitely native southwards, perhaps only rather recently spread to the northern parts of our area. May-October. Se. VA south to FL, west to OK and TX. [= RAB, C, GW, K, MC, S, W, WH, Z; > *E. prostratum* var. prostratum – F, G; > *E. prostratum* var. disjunctum Fernald – F, G]

**Eryngium yuccifolium** Michaux var. synchaetum A. Gray ex Coulter & Rose, Southern Rattlesnake-master. Cp (FL, GA, NC, SC): wet savannas, especially those over calcareous clay soils; rare (NC Watch List). June-August. A Southeastern Coastal Plain endemic: se. NC to s. FL and west across the Gulf Coastal Plain, the exact range limits obscure. The distinction between the two varieties, seemingly clear in NC and elsewhere in states bordering the Atlantic, seems to become less straightforward further west, as in LA and AR. In NC it has been seen in Pender, Brunswick, Columbus, Bladen, and Robeson counties. [= RAB, K, MC, Z; < *E. yuccifolium* – GW, WH; = *E. synchaetum* (Gray ex Coulter & Rose) Coulter & Rose – S]

**Eryngium yuccifolium** Michaux var. yuccifolium, Northern Rattlesnake-master. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA), Cp (FL2, GA, NC, SC, VA): diabase barrens and glades, olivine barrens, pine savannas, pine flatwoods over loamy or clay soils, other open sites with at least periodic moisture, generally in sites showing some prairie affinities; uncommon (rare in VA). June-August. Widespread in southeastern and midwestern North America, the exact range limits of the typic variety and var. synchaetum somewhat obscure. [= RAB, K, MC, Z; < *E. yuccifolium* – C, F, G, W, WH; < *E. yuccifolium* – GW (also see *E. yuccifolium* var. synchaetum); > *E. aquaticum* – S, misapplied]
**Falcaria** Fabricius 1827 (Sickleweed)

A monotypic genus, an herb, of Eurasia. References: Mathias & Constance (1945)=MC.

**Foeniculum** P. Miller 1763 (Fennel)

A genus of 4-5 species, herbs, of Asia and Mediterranean Europe. References: Mathias & Constance (1945)=MC.

* Foeniculum vulgare P. Miller, Fennel. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA): fields, dredge spoil, old gardens, waste places, vacant lots, roadsides; uncommon (sometimes locally common, rare in DE and WV), native of Mediterranean Europe. June-August, August-September. This is the common garden fennel, cultivated for its seeds, leaves, "bulbs" (finocchio), and ornamental appearance (especially bronze forms), widely used in Mediterranean cuisines. [= RAB, C, F, G, K, MC, W, WH, WV; = Foeniculum foeniculum (Linnaeus) Karsten – S]

**Harperella** Rose 1906 (Harperella)

A genus of 3 species, herbs, temperate, of e. North America. Based on work of Feist & Downie (2008), Harperella should be (re)-separated from Ptilimnium. Some authors, such as C, K, and Kral (1981a) prefer to include H. fluviatilis and H. vivipara in H. nodosa, but recent electrophoretic and morphologic data suggest the existence of three taxa: H. vivipara of w. MD, e. WV, VA, and e. NC, P. fluviatile of n. AL and AR, and P. nodosa of SC and GA. See Maddox & Bartgis (1990) and Kress, Maddox, & Roesel (1994) for additional information. Further electrophoretic and morphologic studies are underway. References: Feist & Downie (2008); Easterly (1957)=Z; Kral (1981a)=Y; Rose (1911)=X; Mathias & Constance (1945)=MC; Kress, Maddox, & Roesel (1994).

1 Leaves 8-30 cm long; plants 4-10.5 dm tall, not proliferating from the nodes (strictly annual); rays 10-25 mm long, 6-15 per inflorescence; pedicels 3.0-6.0 mm long; [of still water of Coastal Plain ponds] ........................................................................................................... H. nodosa
2 Leaves 4-12 (-15) cm long; plants 1-5 (-8 ) dm tall, proliferating from the nodes (thus adventitiously perennial); rays 1-9 mm long, 2-5 (-9) per inflorescence; pedicels 0.5-2.0 (-2.5) mm long; [of shoals, outcrops, and banks of rocky streams or rivers]

**Harperella nodosa** Rose, Pond Harperella. Upland depression ponds, seepage on granite outcrops. June. Known only from a few sites in SC and c. GA. [= S, X; = Ptilimnium nodosum (Rose) Mathias – RAB, GW, MC, Z; < P. nodosum (Rose) Mathias – C, K, Y (also see P. fluviatile)]

**Helosciadium** W.D.J. Koch 1824

A genus of 5 species, herbs, of Eurasia. References: Ronse et al. (2010)=Z; Mathias & Constance (1945)=MC.

* Helosciadium nodiflorum (Linnaeus) W.D.J. Koch, Fool's Watercress. Cp (SC): disturbed areas near old seaports; rare, native of Eurasia. [= Z; = Apium nodiflorum (Linnaeus) Lagasca y Segura – RAB, K, MC; = Ciclospermum nodiflorum (Linnaeus) W.D.J. Koch – S]
Heracleum Linnaeus 1753 (Cow-parsnip, Hogweed)

A genus of about 65 species, herbs, north temperate (and tropical mountains). References: Mathias & Constance (1945)=MC.

* Heracleum mantegazzianum Sommier & Lever. Native to the Caucasus Mountains, has been introduced in ne. North America and is becoming established; it may eventually spread to our area. It is considerably larger and coarser even than *H. maximum* (not a paltry herb itself), reaching 5.5 m in height, the hollow stems to 15 cm in diameter, the lower leaves to 2.5 m long, and the umbels to 5 dm across. More modestly-sized individuals may be distinguished from *H. maximum* by wider oil tubes on the fruit [(0.6-) 0.8-1.0 mm wide vs. 0.3-0.5 (-0.8). [= K] {not keyed}

Heracleum maximum W. Bartram, Masterwort, Cow-parsnip, American Hogweed. Mt (GA, NC, VA, WV), Pd (DE): forests, roadbanks, meadows, forest openings; uncommon (rare in GA). May-July; July-August. NL (Labrador) west to AK, south to DE, PA, OH, IN, IL, MO, KS, NM, AZ, CA, and in the Appalachians south to w. NC, e. TN, and n. GA; also in e. Siberia. The synonymy reflects two questions, one nomenclatural, the other taxonomic. North American plants are very similar to European ones, leading some workers to treat our plants as a subspecies or variety of the European. If recognized as specifically distinct from European *H. sphondylium*, the nomenclatural question is whether to accept Bartram’s (older) name as validly published. [= F, GW, K, WV; = *H. lanatum* Michaux – RAB, C, G, MC, W; = *H. sphondylium* Linnaeus var. *lanatum* (Michaux) Dorn; ? *H. sphondylium* Linnaeus ssp. *montanum* (Schleicher ex Gaudin) Briquet]

Imperatoria Linnaeus 1753 (Masterwort)

A genus of 3 species, of Eurasia. References: Ball in FNA (in prep.); Mathias & Constance (1945)=MC.

* Imperatoria ostruthium* Linnaeus, Masterwort. Mt (TN, WV): disturbed areas; rare, native of Europe. May-July. Naturalized in ne. United States from Europe. Reported from Carter County, TN (Chester, Wofford, & Kral 1997), and also is reported for scattered localities in PA (Rhoads & Klein 1993). [= FNA, MC, WV; = *Peucedanum ostruthium* (Linnaeus) W.D.J. Koch – C, K]

Ligusticum Linnaeus 1753 (Lovage)

A genus of 40-50 species, herbs, circumboreal and north temperate. References: Mathias & Constance (1945)=MC.

Lilaeopsis Greene 1891 (Lilaeopsis)

1 Leaves 7-30 (or more) cm long, often spatulate, up to 11 mm wide toward the apex, with (7-) 10-20 transverse septae; peduncles much shorter than the leaves; pedicels 5-10 mm long ..................................................................................................................................

1 Leaves 1-5 cm long, linear (rarely spatulate), 1-2 (-5) mm wide, with 4-8 (-10) transverse septae; peduncles about as long as or longer than the leaves; pedicels 3-4 mm long ...................................................................................................................................

Lilaeopsis carolinensis Coulter & Rose, Carolina Lilaeopsis. Cp (FL, GA, NC, SC, VA): freshwater marshes and pondshores, ditches, interdune ponds, shores of brackish to freshwater estuarine sounds and rivers; uncommon (rare in GA, NC, SC, and VA). May-June. Se. VA south to FL and west to e. TX (Hatch & Slack 2008); it is also found in South America (Argentina, Brazil, and Paraguay). [= RAB, F, GW, K, S, WH, Z; = *L. attenuata* (Hooker & Arnott) Fernald – C, G, MC]

Lilaeopsis chinensis (Linnaeus) Kuntze, Marsh Lilaeopsis. Cp (DE, FL, GA, NC, SC, VA): brackish and freshwater tidal marshes, especially in mud-flats in the intertidal zone; common. May-June. NS south to FL and west to TX (Brown & Marcus 1998). The epithet "chinensis" is a misnomer; the species is native to e. North America and has nothing to do with China. [= RAB, F, G, GW, K, MC, WH, Z; = *L. lineata* (Michaux) Greene – S]

Oenanthe Linnaeus 1753 (Water-dropwort)

A genus of ca. 40 species, herbs, of north temperate areas.

* Oenanthe javanica* A.P. de Candolle, Water Celery, Water Parsley, Java Dropwort, Seri. Pd (VA), Mt (GA): edge of swamp forests, ditches; rare (but seemingly with the ability to spread rapidly), native of Asia. July-August. [] {add to synonymy}
**Osmorhiza** Rafinesque 1819 (Sweet Cicely, Wild Chervil)

A genus of about 10 species, herbs, of temperate North America, temperate South America, montane tropical Central and South America, and Asia (Wen et al. 2002). References: Lowry & Jones (1979)=Z; Mathias & Constance (1945)=MC; Wen et al. (2002).

1 Styles plus stylopodium 0.5-1.5 mm long; flowers 4-7 (-10) per umbellet (including withering staminate flowers); flowers 3-4 mm across; umbellets 3-5 (-6) per umbel, on rays 2-8 (-10) cm long, the umbel therefore relatively uncrowded; roots (and foliage) not strongly anise-scented ......................................................... **O. claytonii**

1 Styles plus stylopodium 2.0-3.5 mm long; flowers (6-) 9-18 per umbellet (including withering staminate flowers); flowers 5-6 mm across; umbellets 4-6 (-8) per umbel, on rays 1.5-5.0 (-7.5) cm long, the umbel therefore rather crowded; roots (and foliage) strongly anise-scented ....................................................... **O. longistylis**

**Oxypropis** Rafinesque 1825 (Dropwort, Hog-fennel, Cowbane)

A genus of about 7 species, herbs, of temperate North America. Based on work of Feist & Downie (2008), *Oxypropis* is likely to be split into two genera. References: Feist & Downie (2008); Mathias & Constance (1945)=MC; Kral (1981); Tucker et al. (1983).

1 Leaves with 1-13 leaflets, the leaflets flat; [*Oxypropis s.s.*].

2 Leaflets (5-) 7-11 (-13), pinnately disposed, usually toothed (rarely entire), net-veined......................................................... **O. rigidior**

3 Mature fruits with peripheral ribs progressively thinning away from the seed cavity, the fruit with a fusiform cross-section, distinctly thinner toward the ends of the ribs than at the center, 0.2 mm thick at the edge; plants with stout rhizomes or a caudex, not long stoloniferous; lower nodes generally retaining their leaves until flowering; umbellets/umbel 10-20................................................................. **O. canbyi**

4 Flowers white; segments of phyllodia cylindrical ................................................................. **O. filiformis**

5 Flowers maroon; segments of phyllodia distinctly bulging .................................................. **O. greenmanii**

**Oxypropis canbyi** (Coulter & Rose) Fernald, Canby's Cowbane. Cp (DE, GA, NC, SC): clay-based Carolina bays and other depressional wetlands; rare. July-August; August-September. Sw. GA through SC to se. NC (mostly in the middle and inner Coastal Plain); and from e. MD to (formerly) DE. See Tucker et al. (1983) for detailed information on this rare species and a comparison of it to the more widespread *O. filiformis*. [= C, F, G, K, MC; **Tiedemannia**]

**Oxypropis filiformis** (Walter) Britton, Water Dropwort. Cp (FL, GA, NC, SC): wet savannas, sandhill seepages; common (uncommon north of FL). July-August; August-September. Se. NC south to s. FL, west to s. TX; West Indies. [= RAB, GW, K, MC, S; = O. filiformis ssp. filiformis – WH; **Tiedemannia**]

**Oxypropis ternata** (Nuttall) A. Heller, Savanna Cowbane. Cp (FL, GA, NC, SC, VA): wet pine savannas, sandhill seepages; rare. September-October; October-November. Scattered from se. VA south to Panhandle FL; alleged occurrences in e. TX are based on misidentifications of narrow-leafleted forms of *O. rigidior* (Sorrie et al. 2003). Edmondson’s (2005) change of the name to *O. denticulata* is incorrect; the type of *O. denticulata* is unquestionably *O. rigidior* (Feist 2009). [= O. ternata (Nuttall) A. Heller – RAB, C, F, G, GW, K, MC, S, WH; = O. denticulata (Baldwin) J.R. Edmondson, missapplied]
**Pastinaca** Linnaeus 1753 (Parsnip)

A genus of about 14 species, herbs, of temperate Eurasia. References: Mathias & Constance (1945)=MC.

**Perideridia** Reichenbach 1837

**Petroselinum** J. Hill 1756 (Parsley)

A genus of about 2 species, herbs, of Mediterranean Europe. References: Mathias & Constance (1945)=MC.

**Pimpinella** Linnaeus 1753

A genus of about 150 species, herbs, of Europe and Africa. References: Mathias & Constance (1945)=MC.

* *Pimpinella saxifraga* Linnaeus *ssp. saxifraga*, Burnet-saxifrage. Cp (DE), Pd (DE), Mt (VA, WV): fields and roadsides, disturbed areas; common (rare in VA), native of Eurasia. [= K, MC; < *P. saxifraga* – C, F, G]

**Polytaenia** A.P. de Candolle 1830

A genus of 2 species, herbs, of North America. References: Mathias & Constance (1945)=MC.

* *Polytaenia nuttallii* A.P. de Candolle, Prairie-parsley. Prairies, glades. MI west to NE, south to TX and NM, occurring as a disjunct eastward in prairie-like or glade situations in MS and c. TN (Chester, Wofford, & Kral 1998). [= C, F, G, K, MC; = *Pleiotena nuttallii* (A.P. de Candolle) Coulter & Rose – S]

**Pseudotaenidia** Mackenzie 1903 (Mountain Pimpernel)

A monotypic genus, an herb, endemic to the central Appalachians. Although this species has been traditionally separated into a monotypic genus, *Pseudotaenidia*; Cronquist (1982) has suggested that *Pseudotaenidia* be submerged in *Taenidia*. Cronquist's argument that the two monotypes are most closely related to one another is very possibly correct and has been generally followed since, but awaits further assessment with molecular methods. References: Cronquist (1982)=Z; Mathias & Constance (1945)=MC; Weakley & Nesom (2004)=Q; Kress, Maddox, & Roesel (1994).

**Ptilimnium** Rafinesque 1819 (Bishopweed, Harperella)

1 Leaves reduced to hollow, linear, nodose-septate quills, consisting of the petiole and leaflet-less rachis, undivided................. [see Harperella]
1 Leaves dissected into filiform or linear segments.
**Sanicula Linnaeus 1753** (Sanicle, Snakeroot)

A genus of about 40 species, herbs, nearly cosmopolitan. References: Pryer & Phillippe (1989)=Z; Mathias & Constance (1945)=MC. Key based in part on Z.

**Identification note:** *Sanicula* species cannot be reliably determined from sterile plants. Fruits or flowers are required for identification of *Sanicula* species. An important character is the length of the styles in relation to the calyx and/or to the bristles on the fruit. In the longer-styled species, the styles are slender and curved outward, sometimes enmeshed in the bristles, but distinctively longer than them or than the calyx. In the shorter-styled species, the styles are straight to slightly curved, shorter than or about as long as the bristles, and more or less included in the calyx. In most species the calyx is inconspicuous, but consists of 5 deltoid to narrowly triangular (or even subulate) calyx lobes, 0.4-2.0 mm long, at the summit of the schizocarp (the fruit).

1 Styles 1.5× or more as long as the calyx; umbels dimorphic – some contain perfect and staminate flowers, while others contain stamineate flowers only (except sometimes *S. canadensis* var. *grandis*, which may have polygamous umbels only).

2 Styles about 1.5× as long as the calyx; conspicuously exerted from between the calyx lobes and recurved; umbellets usually polygamous; some polygamous and others stamineate only; polygamous umbels with 12-120 flowers (3-4 perfect and the remainder staminate); fruits sessile to subsessile; bracteoles of umbellets broad, white; bases of fruit bristles prominently bulbous, with a minutely warty-reticulate surface pattern ........................................... *S. marilandica*

3 Styles 0.7-2.0 mm long, narrowly triangular to subulate, rigid in texture, the apices acute-acuminate; petals white or greenish-white, equal to or slightly longer than the calyx.

4 Calyx lobes 0.4-0.7 mm long, deltoid, flexible or weak in texture, the apices acute to obtuse; petals yellowish green, much longer than the calyx ............................................................... *S. odorata*

5 Styles 0.3-0.5 mm long; umbellets usually 3-5 per umbel; flowers usually 3-5 per umbellet; umbelles dimorphic, one polygamous and others stamineate only; polygamous umbels with 12-120 flowers (3-4 perfect and the remainder staminate); fruits sessile to subsessile; bracteoles of umbellets broad, white; bases of fruit bristles prominently bulbous, with a minutely warty-reticulate surface pattern ........................................... *S. trifoliata*

6 Styles 0.1-0.2 mm long; umbellets usually 1-3 per umbellet; flowers usually 1-3 per umbellet; umbelles dimorphic, one polygamous and others stamineate only; polygamous umbels with 1-120 flowers (3-4 perfect and the remainder staminate); fruits sessile to subsessile; bracteoles of umbellets broad, white; bases of fruit bristles prominently bulbous, with a minutely warty-reticulate surface pattern ........................................... *S. trifoliata*

7 Styles shorter than or (rarely as long as) the calyx; umbels usually monomonoecious (all containing both perfect and staminate flowers), with staminate flowers 1-7 per umbellet.

8 Sepals on mature fruit connivent, forming a beak-like structure equaling or usually exceeding the adjacent fruit bristles, the tips of the sepals subulate and incurved; pedicels of stamineate flowers 3-8 mm long; [collectively widespread in our area.]

9 Sepals on mature fruit spreading, loose, inconspicuous and immersed in the adjacent fruit bristles, the tips of the sepals acute or narrowly acute, straight; pedicels of stamineate flowers 1-2 (-3) mm long; ........................................... *S. trifoliata*

10 Larger leaves mostly 8-15 cm across; leaf teeth weak, hylane; [collectively widespread in our area.

**Sanicula Linnaeus 1753** (Sanicle, Snakeroot)
**Sanicula canadensis** Linnaeus var. canadensis, Canada Sanicle, Black Snakeroot. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): dry-mesic to mesic forests; common. April-May; June-July. VT and s. ON west to MN and SD, south to Panhandle FL and e. TX. [= F, G, Z; < S. canadensis – RAB, C, MC, W, WH, WV; < S. canadensis var. canadensis – K; = S. canadensis – S]

**Sanicula canadensis** Linnaeus var. floridana (Bicknell) H. Wolff, Florida Sanicle, Florida Snakeroot. Cp (FL, GA, NC, SC, VA): dry-mesic to mesic, sandy forests, often associated with *Fagus grandifolia* (and southward *Magnolia grandiflora*); common (uncommon north of GA). April-May; June-July. Se. VA south to c. peninsular FL, west to s. MS, in the Coastal Plain. Additional differences between var. *floridana* and var. *canadensis* should be investigated. They may not be worthy of taxonomic differentiation. [= F, G; < S. canadensis – RAB, C, MC, WH, WV; < S. canadensis var. canadensis – K; = S. floridana Bicknell – S]

**Sanicula canadensis** Linnaeus var. grandis Fernald, Large Sanicle. Mt (NC?, VA?, WV): {herbarium work, and information on habitats, rarity, phenology}. VT and n. NY west to s. ON, WI, se. MN, and n. IA, south to PA, n. WV, n. KY, c. IL, and allegedly south in the Mountains to VA and/or NC. [= F, K, Z; < S. canadensis – RAB, C, MC, W, WV]

**Sanicula marilandica** Linnaeus, Maryland Sanicle. Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, SC, VA), Pd (DE, NC, SC, VA): mesic to dry-mesic nutrient-rich forests; common (uncommon in Coastal Plain, uncommon in WV, rare in DE). May-June; July-August. QC and NL (Newfoundland) west to BC, south to Panhandle FL, se. LA, NM, and WA. The Coastal Plain populations (designated as var. *petiolulata* by Fernald) are disjunct from the main range of distribution, occur in rather different (more acidic) habitats, and warrant additional study. The primary morphological difference indicated by F is that var. *petiolulata* has "the leaflets of 1 or 2 lower cauline leaves on petiolules 1.5-5 cm long" (vs. sessile or short-petiolulate). [= RAB, C, K, MC, W, WH, WV, Z; > S. marilandica var. marilandica – F, G; > S. marilandica var. petiolulata Fernald – F, G; = S. marylandica – S, orthographic variant]

**Sanicula trifoliata** Bicknell, Beaked Sanicle, Large-fruited Sanicle. Mt (GA, NC, SC, VA, WV), Pd (DE, VA): cove forests, other mesic, nutrient-rich forests; common (rare in Piedmont, rare in GA). May; June-July. QC and VT west to s. WI and se. MN, south to n. VA, w. NC, n. GA, c. TN, c. IL, and ne. IA. [= RAB, C, F, G, K, MC, S, W, WV, Z]

**Scandix Linnaeus 1753 (Venus'-comb)**

A genus of about 15-20 species, herbs, temperate, of Eurasia. References: Mathias & Constance (1945)=MC.

**Sium Linnaeus 1753 (Water-parsnip)**

A genus of about 14 species, herbs, of the northern hemisphere. References: Mathias & Constance (1945)=MC.

* **Sium suave** Walter, Water-parsnip. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (NC, SC, VA, WV): freshwater marshes, brackish marshes, swamp forests; uncommon (rare in Piedmont south of DE, rare in Mountains). June-August; August-October. NL (Newfoundland) west to AK and Siberia, south to Panhandle FL, n. peninsular FL, and CA. The plant can be very coarse, up to 3 m in height and the stem to 5 cm in diameter. The taxonomic status of *Sium floridana* Small, known from se. VA south to GA, needs additional investigation; it is probably just a depauperate shade form. [= RAB, C, K, W, WH, WV; > S. suave – F, G, GW, MC; > S. floridana Small – F, G, GW, MC, S; > S. cicutaefolium Schrank – S]

**Smyrnium Linnaeus 1753**

A genus of 7 species, herbs, of Europe.

* **Smyrnium perfoliatum** Linnaeus. Mt (AL): moist forests; rare, introduced. Found in a mesic forest in Cherokee County, AL, apparently introduced via seed in nursery material (Keener 2007).

**Spermolepis Rafinesque 1825 (Spermolepis)**

A genus of 5 species, herbs, of North America, Argentina, and Hawaii. References: Mathias & Constance (1945)=MC.
## APIACEAE

1. Ovary and fruit with hooked bristles. .......................................................... *S. echinata*
2. Ovary and fruit smooth or tubercled. .......................................................... *S. divaricata*

### Spermolepis divaricata (Walter) Rafinesque ex Seringe, Southern Spermolepis, Roughfruit Spermolepis. Cp (FL, GA, NC, SC, VA), Pd (GA, SC): sandy roadsides, disturbed areas; common. April-May; May-June. VA south to s. FL, west to TX, and north in the interior to KS and MO. Apparently native in our area, though weedy in behavior, and perhaps introduced only in VA. [= RAB, C, G, GW, K, MC, S, WH]

### Spermolepis inermis (Nuttall ex A.P. de Candolle) Mathias & Constance, Western Spermolepis. Mt (GA), Cp (NC*): calcareous prairies in the Mountains (GA), disturbed areas in the Coastal Plain (NC); rare (GA Rare), northeastward in our area native of sc. United States. April; May. [= RAB, C, F, G, K, MC, S, WH]

#### Taenidia (Torrey & A. Gray) Drude 1898 (Yellow Pimpernel)

A monotypic genus (unless *Pseudotaenidia* is included), an herb, temperate, of e. North America. References: Mathias & Constance (1945) = MC. [also see *Pseudotaenidia*]

#### Taenidia integrerrima (Linnaeus) Drude, Yellow Pimpernel. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (VA): in rocky, dry to dry-mesic forests and woodlands over mafic or calcareous rock, such as diabase, amphibolite, calcareous siltstone, calcareous shale, or limestone; common (uncommon in NC and SC, rare in DE). April-May; May-June. QC, ON, MN, and SD south to c. GA, AL, MS, LA, and TX. [= RAB, C, F, G, K, MC, S, WH]

#### Thaspium Nuttall 1818 (Meadow-parsnip)

A genus of 3-4 species, herbs, temperate, of e. North America. References: Mathias & Constance (1945) = MC; Cooperrider (1985) = Z; Coulter & Rose (1900) = Y.

**Identification notes:** Because *Thaspium* and *Zizia* are often confused when not in fruit, a combined key emphasizing vegetative characters has been provided; it may also be helpful to use the key to genera, and if a clear answer is obtained, then use the *Thaspium-Zizia* combined key, skipping taxa of the "wrong" genus

1. Leaves 3-4-ternate, the very numerous ultimate segments 1-3 mm wide; petals white (fading to yellowish tan in older herbarium material)....

### Thaspium trifoliatum

2. Basal leaves 2-ternate or more divided.

3. Leaflets finely to coarsely serrate or incised, many of the teeth at least 2 mm long as measured on the shorter side; umbel rays 8-10, < 3.5 cm long even in petal; petals pale to creamy yellow. .......................... *Thaspium barbinode*

4. Teeth of the leaflets fine, averaging (4-) 5-10 per cm of margin, acuminate (the 2 sides making an angle of about 45 degrees); umbel rays (6-) 10-18, in fruit 2-5 (-4) cm long; basal leaves many-foliolate, the leaflets mostly acuminate; fruit ca. 2× as long as wide. ...

5. Teeth of the leaflets coarse, averaging (1-) 2-3 (-4) per cm of margin, acute to obtuse (the 2 sides making an angle of about 90 degrees); umbel rays 4-10 (-12), the longest to 11 cm long in fruit (some on a plant at least 5 cm long); basal leaves 3-5 (-7)-foliolate, the leaflets mostly rounded to obtuse at the apex; fruit 1-1.5× as long as wide. .......................... *Zizia aurea*

6. Basal leaves simple or 3-foliolate.

7. Teeth of the leaflets coarse, averaging 2-3 (-4) per cm of margin, the long side of most of the teeth 2-10 mm long; basal leaves mostly 3-foliolate (or more divided); middle and upper stem leaves equally or more divided than the basal leaves (the most divided leaves usually those of the mid-stem) ....... *Zizia trifoliata*

8. Teeth relatively acute, without a well-developed callous tip and a thickened, transluscent border (use 10×); lower portion of stem puberulent, the upper nodes also usually puberulent (use 10×); leaf margins often ciliate; umbel rays 7-15; flowers golden yellow...

9. Teeth relatively obtuse, with a well-developed callous tip and a thickened, transluscent border (use 10×); lower portion of stem glabrous, the upper nodes sometimes minutely roughened; leaf margins glabrous and hyaline; umbel rays 4-10 (-11); flowers maroon or golden yellow. .......................... *Zizia trifoliata var. aureum*

10. Flowers golden yellow. .................................................................................. *Thaspium trifoliatum var. aureum*

11. Flowers dark maroon.................................................................................. *Thaspium trifoliatum var. trifoliatum*
**Thaspium barbinode** (Michaux) Nuttall. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (GA, NC, SC, VA): moist forests; common (rare in DE). April-May; July-August. NY and ON west to IA, south to c. GA, c. AL, and ne. MO. The hispid, purple-tinged leaf sheath is a good additional character for this species. [= RAB, S, W; = Th. barbinode var. barbinode – F, Y; < Th. barbinode – C, G, K, MC, WV, Z (also see Th. chapmanii)]

**Thaspium pinnatifidum** (Buckley) A. Gray. Mt (GA, NC): forests and woodlands over calcareous rock, such as limestone, dolostone, or calcareous siltstone); rare. May-June; June-July. KY south to w. NC, e. TN (Chester, Wofford, & Kral 1997), and n. AL. The report from VA is of unknown documentation. The distribution and rarity of this plant is complicated because of dolostone, or calcareous siltstone); rare. May-June; June-July. KY south to w. NC, e. TN (Chester, Wofford, & Kral 1997), and n. AL. The report from VA is of unknown documentation. The distribution and rarity of this plant is complicated because of confusion with Th. chapmanii. [= RAB, C, F, G, K, MC, S, W, Y, Z]

**Thaspium trifoliatum** (Linnaeus) A. Gray var. aureum (Linnaeus) Britton. Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (NC, SC, VA); [GA]: moist forests; uncommon (rare in Coastal Plain). April-May; July-August. NY west to MN, south to SC, AL, AR, and se. KS. Various workers have differed on the characters used to separate two varieties in T. trifoliatum. RAB and C separate the two strictly on petal color; F, however, allows var. aureum to sometimes have purple petals, seeming to regard the critical differences to be var. aureum's generally more robust size and larger fruits (4.5 mm long vs. 3-4 mm long). It is presently not clear how two varieties should be separated, or, indeed, if varieties are warranted. Though the ranges overlap, var. aureum is generally more northern and western, var. trifoliatum more southern and eastern. [= K, S, Y; = T. trifoliatum var. flavum Blake – RAB, C, F, MC, W, WV, Z; < T. trifoliatum – G]

**Thaspium trifoliatum** (Linnaeus) A. Gray var. trifoliatum. Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (FL, NC, SC, VA), {GA}: moist forests; common (rare in Coastal Plain). April-May; July-August. NJ, PA, and MO, south to Panhandle FL and LA. [= RAB, C, F, K, MC, S, W, WV, Y, Z; < T. trifoliatum – G]

**Thaspium chapmanii** (Coulter & Rose) Small. Mt (GA, WV), Pd (GA), Cp (FL, GA): calcareous bluffs; rare. Sw. PA, s. ON, s. MI, sw. WI, and s. MN south to Panhandle FL and e. TX. [= T. barbinode var. angustifolium Coulter & Rose – F; < Th. barbinode (Michaux) Nuttall – C, G, K, MC, WV, WH, WV, Z; > Th. barbinode var. angustifolium – Y; > Th. barbinode var. chapmanii Coulter & Rose – Y] {not yet keyed}

**Torilis Adanson 1763** (Hedge-parsley, Bur-parsley)

A genus of about 15 species, herbs, temperate, of the Old World. References: Mathias & Constance (1945)=MC.

1 Rays reduced or absent, < 5 mm long, the inflorescence therefore compact, appearing like a head; inflorescences opposite the leaves, on peduncles 0-1 (-2) cm long; mericarps dimorphic, one with spines, the other tuberculate .................................................................................................................. T. arvensis
1 Rays and pedicels well-developed, > 5 mm long, the inflorescence therefore open, distinctly and obviously an umbel; inflorescences opposite the leaves and terminal, on peduncles (1-) 3-16 cm long; mericarps monomorphic, both with spines.

2 Involutal bracts >2, generally 1 per ray; fruits 2-2.5 mm long (not including the spines); spines curved, not hooked at the tip ............................................................................................................................ T. arvensis
2 Involucral bracts >2, generally 1 per ray; fruits 2-2.5 mm long (not including the spines); spines straight or nearly so, with a minute hook at the tip ............................................................................................................................ T. aureum

* **Torilis japonica** (Houttuyn) A.P. de Candolle. Mt (VA, WV), Pd (VA), Cp (VA): disturbed areas; uncommon (rare in VA), native of Eurasia, naturalized south to se. PA and VA. [= C, F, G, K, MC, WV; = T. anthriscus (Linnaeus) Gmelin]

**Trepocarpus Nuttall ex A.P. de Candolle 1829**

A monotypic genus, an herb, temperate, of se. United States. References: Mathias & Constance (1945)=MC.

**Trepocarpus aethusae** Nuttall ex A.P. de Candolle. Cp (FL), Pd (SC), ?? (GA): rich moist forests, sometimes weedy in disturbed soils; rare. May-June. C. SC south to Panhandle FL and AL, west to e. TX, north in the interior to w. TN, w. KY, AR, and se. OK. Nelson (1993) states that despite "something of a reputation as a rarity," Trepocarpus is "a reasonably successful weed." [= RAB, C, GW, K, MC, WH]

**Zizia** W.D.J. Koch 1825 (Golden-Alexanders)

A genus of about 4 species, herbs, temperate, of North America. References: Mathias & Constance (1945)=MC; Cooperrider (1985)=Z.

[see combined key to Thaspium and Zizia under Thaspium]

**Zizia aptera** (A. Gray) Fernald, Heartleaf Golden-Alexanders. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): moist forests, openings, and woodland edges; common (rare in Coastal Plain, rare in DE). April-May;

### AUXILIARY KEYS

**Key to Maianthemum (RUSCACEAE), Polygonatum (RUSCACEAE), Prosartes (LILIACEAE), Streptopus (LILIACEAE), and Uvularia (COLCHICACEAE), emphasizing vegetative features**

1 Leaves perfoliate.
2 Leaves puberulent beneath (or rarely glabrate); leaves below the fork (0-1 (-2); tepals glabrous within; ............... _Uvularia grandiflora_
2 Leaves glabrous and often glaucous beneath; leaves below the fork 2-4; tepals conspicuously granular-papillose within.........................

1 Leaves sessile (though sometimes slightly to strongly clasping).
3 Stem simple.
4 Stem brown, wiry, puberulent; distalmost 2 leaves on each branch approximate to one another (sometimes subopposite) and with noticeably oblique bases; flowers and fruits terminal on the branches.
5 Leaf glabrous on the surface above (except for sparsely pubescent on the midrib and main veins), densely pubescent on the midrib below, sparsely pubescent on the surface below; leaf pubescence weak, often twisted or curled apically (as seen at 10-20× magnification), the leaf therefore very soft to the touch; fruit glabrous, ellipsoid, weakly triangular in cross-section, the surface smooth and shiny, red when ripe; tepals greenish, unspotted; leaves relatively small and many............................................. _Prosartes lanuginosa_
5 Leaf sparsely pubescent on the surface above and below; leaf pubescence stiff, generally straight and perpendicular to the surface (as seen at 10-20× magnification), the leaf therefore slightly rough to the touch; fruit pubescent, strongly 3-lobed (or 1- or 2-lobed by abortion), the surface textured and dull, whitish-tan when ripe; tepals whitish, spotted with purple; leaves relatively few and large............................................................. _Prosartes maculata_
4 Stem green, not wiry, glabrous; distalmost 2 leaves on each branch no closer together than other leaves, with symmetrical bases; flowers (and fruits) either terminal on the branches or solitary and axillary to most leaves.
6 _Streptopus_
7 Leaf margins and nodes not coarsely ciliate; leaves strongly cordate-clasping; fruit ellipsoid.........................................................
7 Leaf margins and nodes coarsely ciliate; leaves sessile to somewhat cordate-clasping (especially the lower leaves of robust individuals); fruit globose ....................................................... _Streptopus lanceolatus var. lanceolatus_

6 _Uvularia_
3 Stem simple.
Maianthemum
*Polygonatum*
_Uvularia_

1 Leaves pubescent on the veins beneath; flowers 7-13 mm long ........................................... _Polygonatum pubescens_
1 Leaves glabrous; flowers 12-21 mm long.
2 Stem slender, 1.5-5 mm in diameter; plants to 9 dm tall; lower axillary peduncles terete or nearly so, with (1-) 2-3 (-5) flowers; lowest peduncle in the axil of the (3rd-) 4th-5th (-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300° ....

2 Stem robust, 5-13 mm thick below the leaves; plants to 20 dm tall; lower axillary peduncles strongly flattened, with (2-) 3-6 (-15) flowers; lowest peduncle in the axil of the (3rd-4th, 5th-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300° ........

1 Leaves sessile, the margins scarious and minutely papillose-denticulate; [section Oakesiella].
3 Undivided portion of the style 0.5-1× as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; rhizome very short, with clustered, thickened roots.
4 Leaves cuneate at base, thin in texture, faintly reticulate on the undersurface, glabrous (rarely puberulent becoming glabrate); stems usually glabrous; [of the Coastal Plain and Piedmont]......................................................... _U. puberula var. nitida_
4 Leaves broadly rounded to somewhat clasping at base, firm in texture, obviously reticulate on the undersurface, puberulent (sometimes becoming glabrate); stems usually minutely puberulent in lines; [of the Mountains and Piedmont].............. _Uvularia puberula var. puberula_
3 Undivided portion of the style 3-5× as long as the style branches; upper stem and lower leaf surfaces glabrous, usually also glaucous; rhizome elongate, with scattered, fibrous roots.
5 Pedicel bearing a sessile, leaf-like bract 5-17 mm below the flower; capsule sessile at base, conspicuously beaked at apex

5 Pedicel bractless; capsule on a stalk 2-4 (-6) mm long, not beaked........................................... _Uvularia sessilifolia_

**APIACEAE**

1 Leaves sessile (though sometimes slightly to strongly clasping).
3 Stem simple.
2 Stem robust, 5-13 mm thick below the leaves; plants to 20 dm tall; lower axillary peduncles strongly flattened, with (2-) 3-6 (-15) flowers; lowest peduncle in the axil of the (3rd-) 4th-5th (-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300° ........

2 Stem slender, 1.5-5 mm in diameter; plants to 9 dm tall; lower axillary peduncles terete or nearly so, with (1-) 2-3 (-5) flowers; lowest peduncle in the axil of the (3rd-) 4th-5th (-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300° ....

1 Leaves pubescent on the veins beneath; flowers 7-13 mm long ........................................... _Polygonatum pubescens_
1 Leaves glabrous; flowers 12-21 mm long.
2 Stem slender, 1.5-5 mm in diameter; plants to 9 dm tall; lower axillary peduncles terete or nearly so, with (1-) 2-3 (-5) flowers; lowest peduncle in the axil of the (1st-) 3rd-5th (-9th) axil; larger leaves 5-15 cm long, 1.2-6 cm wide; lower leaves clasping to 90° (-180°) ................................................................. _Polygonatum biflorum var. biflorum_
2 Stem robust, 5-13 mm thick below the leaves; plants to 20 dm tall; lower axillary peduncles strongly flattened, with (2-) 3-6 (-15) flowers; lowest peduncle in the axil of the (3rd-4th, 5th-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300° ........

1 Leaves sessile, the margins scarious and minutely papillose-denticulate; [section Oakesiella].
3 Undivided portion of the style 0.5-1× as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; rhizome very short, with clustered, thickened roots.
4 Leaves cuneate at base, thin in texture, faintly reticulate on the undersurface, glabrous (rarely puberulent becoming glabrate); stems usually glabrous; [of the Coastal Plain and Piedmont]......................................................... _U. puberula var. nitida_
4 Leaves broadly rounded to somewhat clasping at base, firm in texture, obviously reticulate on the undersurface, puberulent (sometimes becoming glabrate); stems usually minutely puberulent in lines; [of the Mountains and Piedmont].............. _Uvularia puberula var. puberula_
3 Undivided portion of the style 3-5× as long as the style branches; upper stem and lower leaf surfaces glabrous, usually also glaucous; rhizome elongate, with scattered, fibrous roots.
5 Pedicel bearing a sessile, leaf-like bract 5-17 mm below the flower; capsule sessile at base, conspicuously beaked at apex

5 Pedicel bractless; capsule on a stalk 2-4 (-6) mm long, not beaked........................................... _Uvularia sessilifolia_
APIACEAE

1 Flowers in a terminal panicle ........................................................................................................... Maianthemum racemosum ssp. racemosum
1 Flowers in a simple raceme.
2 Perianth segments 4 (flowers 2-merous); leaves 1(-) 2 (-3) .......................................................... Maianthemum canadense
2 Perianth segments 6 (flowers 3-merous); leaves 6 or more .......................................................... Maianthemum stellatum
