53d. MELANTHIACEAE Batsh 1802 (Bunchflower Family) [in LILIALES] ................................................................. 115
55. ALSTROEMERIACEAE Dumortier 1829 (Peruvian-lily Family) [in LILIALES] ............................................ 118
56. COLCHICACEAE A.P.de Candolle 1805 (Meadow Saffron Family) [in LILIALES] .............................. 118
59. SMILACACEAE Ventenat 1799 (Greenbrier Family) [in LILIALES] ......................................................... 119
60. VINCAEAE L. de Jussieu 1789 (Lily Family) [in LILIALES] ................................................................. 120
62. ORCHIDACEAE A.L.de Jussieu 1789 (Orchid Family) [in ASPARAGALES] ........................................... 127
67. HYPOXIDACEAE R. Brown 1814 (Stargrass Family) [in ASPARAGALES] ............................................ 143
71. IRIDACEAE A.L.de Jussieu 1789 (Iris Family) [in ASPARAGALES] ......................................................... 144
73. XANTHORRHoeACEAE R. Brown 1810 (Day-lily Family) [in ASPARAGALES] ............................... 151
74. AMARYLLIDaceae J. St. Hilaire 1805 (Amaryllis Family) [in ASPARAGALES] ........................................ 151
75a. ASPARAGACEAE A.L.de Jussieu 1789 (Asparagus Family) [in ASPARAGALES] ............................. 150
75b. RUSCACEAE M. Roemer 1840 (Ruscus Family) [in ASPARAGALES] ................................................... 150
75c. AGAVACEAE Endlicher 1841 (Agave Family) [in ASPARAGALES] ....................................................... 163
75d. HOSTACEAE B. Mathew 1898 (Hosta Family) [in ASPARAGALES] ...................................................... 165
75e. THEMIDACEAE Salisbury 1866 (Brodiaea Family) [in ASPARAGALES] .............................................. 165
75f. HYACINTHACEAE Batsch 1786 (Hyacinth Family) [in ASPARAGALES] .......................................... 165
76. ARECACEAE Schult 1832 or PALMAE de Jussieu 1789 (Palm Family) [in ARECALES] .................. 167
78. COMMELINACEAE R. Brown 1810 (Spiderwort Family) [in COMMELINALES] ............................ 169
81. HAEMODORACEAE R. Brown 1810 (Bloodroot Family) [in COMMELINALES] ............................ 175
86. CANNACEAE A.L.de Jussieu 1789 (Canna Family) [in ZINGIBERALES] ............................................. 175
87. MARANTACEAE Petersen in Engler & Prantl 1888 (Arrowroot Family) [in ZINGIBERALES] ............. 176
89. ZINGIBERACEAE Martyn 1820 (Ginger Family) [in ZINGIBERALES] ................................................. 176
91. TYPHACEAE A.L.de Jussieu 1789 (Cattail Family) [in POALES] ............................................................ 176
92. BROMELIACEAE A.L.de Jussieu 1789 (Bromeliad or Pineapple Family) [in POALES] ..................... 176
93. LILIACEAE C. Agardh 1823 (Yellow-eyed Grass Family) [in POALES] ............................................... 179
95. ERIOCAULACEAE Pallas de Beauvis 1828 (Pipe-wort Family) [in POALES] .............................. 183
96. MAYACACEAE Kunth 1840 (Bogmoss Family) [in POALES] ............................................................... 185
98. JUNCACEAE A.L.de Jussieu 1789 (Rush Family) [in POALES] ............................................................ 185
99. CYPERACEAE A.L.de Jussieu 1789 (Sedge Family) [in POALES] ................................................... 192
106. POACEAE (R. Brown) Barnhart 1895 or GRAMINEAE A.L.de Jussieu 1789 (Grass Family) [in POALES] 267
SECTION 6: EUDICOTYLEDONAE (EUDICOTS)
109a. FUMARIACEAE A.L.de Jussieu 1789 (Palm Family) [in ARECALES] ................................................ 167
112. LARDIZABALACEAE Decaisne 1839 (Lardizabala Family) [in RANUNCULALES] ............................. 367
114a. HYDRASTIDACEAE Martyn 1826 (Golden-seal Family) [in RANUNCULALES] ............................. 370
114b. RANUNCULACEAE A.L.de Jussieu 1789 (Buttercup Family) [in RANUNCULALES] ..................... 371
117. PLATANACEAE Dumortier 1829 (Plane-tree Family) [in PROTEALES] ........................................... 389
121. BUXACEAE Dumortier 1822 (Boxwood Family) [in BUXALES] ......................................................... 390
127. ALTINGIACEAE Lindley 1846 (Sweet-gum Family) [in SAXIFRAGALES] ............................................ 390
128. HAMAMELIACEAE R. Brown 1818 (Witch Hazel Family) [in SAXIFRAGALES] ............................. 391
131. ITEACEAE J. Agardh 1858 (Sweetspire Family) [in SAXIFRAGALES] .................................................. 392
132. GROSSULARIACEAE A.P.de Candolle 1805 (Currant Family) [in SAXIFRAGALES] ...................... 392
134. RUSCACEAE A.L.de Jussieu 1789 (Saxifrage Family) [in SAXIFRAGALES] ....................................... 400
135. ERICACEAE A.P.de Candolle 1825 (Stonecrop Family) [in SAXIFRAGALES] ................................. 400
137. PENTHRORACEAE Rydberg ex Britton 1901 (Ditch-stonecrop Family) [in SAXIFRAGALES] .......... 404
138. HALORAGACEAE R. Brown 1814 (Water-milfoil Family) [in SAXIFRAGALES] ......................... 404
140. VITACEAE A.L.de Jussieu 1789 (Grape Family) [in VITALES] ........................................................ 406
141. KRAMERIACEAE Dumortier 1829 (Kramera Family) [in ZYGOPHYLLALES] ............................... 410
142. ZYGOPHYLLACEAE R. Brown 1814 (Cressate-bush Family) [in ZYGOPHYLLALES] ................. 410
144. EARBACEAE Lindley 1836 or LEGUMINOSAE A.L.de Jussieu 1789 (Legume Family) [in FABALES] 411
146. POLYGALACEAE R. Brown 1814 (Milkwort Family) [in FABALES] ................................................ 461
147. ROSACEAE A.L.de Jussieu 1789 (Rose Family) [in ROSALES] ............................................................ 464
150. ELAEAGNACEAE A.L.de Jussieu 1789 (Oleaster Family) [in ROSALES] ............................................ 495
151. RHAMNACEAE A.L.de Jussieu 1789 (Buckthorn Family) [in ROSALES] ............................................ 495
152. ULMACEAE de Mire 1815 (Elm Family) [in ROSALES] ............................................................. 499
153. CANNABACEAE Endlicher 1827 (Hops Family) [in ROSALES] .......................................................... 500
154. MORACEAE Lindley 1847 (Mulberry Family) [in ROSALES] ............................................................. 502
155. URTICACEAE A.L.de Jussieu 1789 (Nettle Family) [in ROSALES] .................................................... 504
157. FAGACEAE Dumortier 1829 (Beech Family) [in FAGALES] ............................................................. 507
158. MYRICACEAE Blume 1829 (Birch Family) [in FAGALES] ................................................................. 518
159. JUGLANDACEAE A. Richard ex Kunth 1824 (Walnut Family) [in FAGALES] ................................. 520
160. CASUARINACEAE R. Brown 1814 (Casuarina Family) [in FAGALES] ............................................. 523
162. BETULACEAE S.F.Gray 1821 (Birch Family) [in FAGALES] ............................................................... 524
163. EUPHORBIACEAE Darrah 1872 (Gnaw Family) [in EUPHORBIALES] ................................................ 528
170. BEGONIACEAE C.Agardh 1824 (Begonia Family) [in CUCURBITALES] ......................................... 532
172a. PARNASSIACEAE Gray 1821 (Grass-of-Parnassus Family) [in CYTISALES] ................................. 532
172b. CELASTRACEAE R. Brown 1814 (Bittersweet Family) [in CYTISALES] ......................................... 533
175. OXALIDACEAE R. Brown 1818 (Wood-sorrel Family) [in OXALIDALES] ....................................... 536
181. RHIZOPHORACEAE R. Brown 1814 (Red Mangrove Family) [in MALPIGHIALES] ...................... 537

INTRODUCTION

The Flora

Floras serve as the basic reference of the plant biota of an area; they are critical tools that serve botanists, conservationists, ecologists, foresters, gardeners, agronomists, researchers, and the general public. In the nineteenth and early twentieth centuries, the botanical exploration of an area and writing a flora to summarize that information was seen as a basic societal need leading to the discovery of economically valuable information. Financial support for the research and writing of floras has waned in recent decades, though, as they have been increasingly regarded as “old science” and resources have shifted to areas of plant science seen as more “cutting edge.” Even in taxonomic research, the advent of molecular techniques has largely supplanted detailed taxonomic research (at generic levels and below) and the writing of floras, and the great majority of papers in plant systematics now address phylogenetic relationships within a particular group of plants, and mostly at higher taxonomic levels. Traditional monographic taxonomy, with descriptions of taxa, keys to facilitate their identification, distribution maps, and assessments of habitat and relative abundance or rarity, has become increasingly rare.

Yet, paradoxically, the societal uses and needs for the translation of taxonomic information to a useable form, such as floras, have never been greater. Globalization of human societies and economies has meant that plants are regularly introduced far away from their regions of nativity, and many become established and can be either benign or cause economic and conservation damages. Increasing human utilization of land resources has fueled a biodiversity crisis, with many species now considered imperiled. In the United States and elsewhere, this has resulted in considerable government and nongovernmental activity focused on biodiversity inventory and conservation, “recovery” of endangered and threatened species, ecological studies and ecological restoration, and assessment and suppression of invasive exotics. All these activities require an accurate and sophisticated understanding of the flora of an area. These activities also generate new information about the taxonomy, distribution, and conservation status of components of a region’s flora which then needs to be incorporated into new iterations

In the southeastern United States, the publication thirty-seven years ago of the Manual of the Vascular Flora of the Carolinas, by A.E. Radford, H.E. Ahles, and C.R. Bell (Radford, Ahles, & Bell 1968), was a landmark. In the decades since its publication, it has served as the primary reference for the identification of plants in the Carolinas, and throughout the southeastern United States (since most other states were not covered by comparable, recent references. The effort to research and write the Manual of the Vascular Flora of the Carolinas took about 11 years, and resulted in a series of publications, the Guide to Vascular Flora of the Carolinas (Radford, Ahles, & Bell 1964), the Atlas of the Vascular Flora of the Carolinas (Radford, Ahles, & Bell 1965), and finally the Manual itself (1968). Once published, the existence of “the Manual” helped generate an interest in and further studies of the flora of the region; since then, many additional species have been documented as part of the region's flora, additional alien species have become naturalized, new species have been described, monographs have given new taxonomic insights into groups, nomenclature accepted in 1968 has been found to be invalid, new and more reliable keys have been developed, and systematic treatments have changed and advanced. Increasingly, identification of the flora of our area (and other states of the Southeast and Mid-Atlantic) by academic researchers, agency personnel, and the interested public is hampered by the lack of an up-to-date flora. Without such a flora, identification must involve reference to herbaria and thousands of monographs, papers, and other floras – resources not readily available to many people who need them. The absence in the region of a single-source modern standard for the systematic treatment, nomenclature, and identification of the flora compromises scientific studies, ecological research, and agency inventory, management, and monitoring of ecosystem and species biodiversity.

Chapter 1 consists of a new treatment of the flora of the Carolinas, Virginia, and Georgia, to fill the need for a new standard reference to aid in the consistent identification of the flora of the region. While building on the tradition of the Manual, the Flora is not a revision or second edition; it takes some different approaches, has features the Manual lacks, lacks features the Manual has, and has an expanded geographic scope. At the present time, the Flora includes treatment of all species in the flora area of Delaware, Virginia, West Virginia, North Carolina, South Carolina, Georgia, northern Florida (the Panhandle and northeastern Florida, south to and including Dixie, Gilchrist, Columbia, Union, Bradford, Clay, and Duval counties), Alabama, Mississippi, Tennessee, Kentucky, the District of Columbia, and Maryland, and portions of the additional states of New Jersey (southern New Jersey, south of and including Monmouth and Burlington counties), and Louisiana (the Florida Parishes, east of and including West Feliciana, East Baton Rouge, Ascension, St. James, St. John the Baptist, St. Charles, Jefferson, and Plaquemines parishes) (see Figure 1.A.). Approximately 6800 taxa are keyed and treated, making the Flora a comprehensive resource for understanding the flora of all of the Southeastern United States east of the Mississippi River and south of the Ohio River and Mason-Dixon Line, excluding peninsular Florida.

Sources of information.
This new flora is based on all resources available: herbarium specimens, published literature, grey literature, Natural Heritage databases and rare species lists, and personal communication with a regional network of botanists and taxonomic experts. Herbarium specimens have been consulted at major institutions in the region.
INTRODUCTION

Criteria for inclusion of taxa.

One of the first challenges that the author of a flora encounters is to decide the criteria for the inclusion of taxa. The general rule in most floras can be simply summarized as “all native taxa and naturalized alien taxa,” but within this simplistic phrase hide many complicated issues, and floras often differ widely in the actual criteria and judgments that they apply (Pyšek et al. 2004; Palmer, Wade, & Neal 1995). In particular, coverage of alien species is very uneven in floras, and the frequent exclusion of many alien species from floras hampers ecological studies, conservation efforts, and efforts to minimize the ecological and economic impacts of invasive aliens.

The following categories of taxa are included and treated fully as “primary” species:

1. Native taxa documented from the Flora (Georgia, South Carolina, North Carolina, Virginia, West Virginia, Delaware, and northern Florida, Alabama, Mississippi, Tennessee, Kentucky, Maryland, District of Columbia, Maryland, eastern Louisiana, and southern New Jersey), whether extant or presumed extinct. Some authors, such as Isely (1990), have “excluded” taxa from a flora if they believed them to be extinct or extirpated. This philosophy seems poorly considered: these taxa may prove not to be extinct or extirpated and their inclusion in the Flora will facilitate possible rediscovery, even if never found again specimens of them in the herbarium need to be identified or confirmed, and their former existence in the region should be documented.

2. Alien taxa introduced by whatever means and demonstrably established and reproducing (sexually or vegetatively) as a component of the flora. Parallel to #1 above, established alien taxa which have been presumably eradicated (such as Striga asiatica in the Carolinas) are included, as their eradication may not have been effective, they may be reintroduced, specimens need to be identifiable using the Flora, and their former existence should be documented.

3. Alien taxa substantially cultivated in the Flora area as crops, such as Triticum aestivale, Zea mays, Vitis vinifera, and Pinus clausa. Such species are variably represented in herbaria, and are often included in floras only if one or more herbarium specimens indicate that the species is persisting, or has been collected around a dump or in the edge of a field “out of cultivation.”

Additional categories of taxa are included and treated as “secondary” species:

1. Native taxa with uncertain documentation, this varying from literature reports not definitely verifiable with specimens (some of these old and some new), to sight reports regarded as probably correct. Taxa in this category are included as secondarily-treated taxa, and their imperfect documentation is described.

Species which have been reported from the Flora area but which are excluded for one reason or another are also listed and the reason for their exclusion mentioned or discussed.

Taxonomic philosophy. Taxonomic treatments generally follow recent monographic and revisionary work, but an effort has been made to provide a certain rough consistency of “splitting” vs. “lumping” across different taxonomic groups. As is generally true in recent treatments, generic and family concepts are often narrower than those used in the Radford, Ahles, and Bell (1968) Manual, based on new evidence, including (but not limited to) cladistic methods applied to morphologic and molecular data. Ironically, these results have often resulted in a validation of earlier, narrower generic (and familial) concepts espoused by J.K. Small, P.A. Rydberg, and others (see Weakley 2005 for extensive discussion). Varieties are less frequently recognized than by
INTRODUCTION

Fernald (1950), though a considerable number of species and infraspecific taxa “lumped” by Radford, Ahles, and Bell (1968) are recognized (generally following more recent monographic or revisionary work). Some taxa not formally recognized are discussed and characters for their recognition provided in the text, to draw attention to putative taxa that may warrant recognition after further evaluation.

Format and features.

Detailed keys. Keys have been subjected to rigorous testing in the field and herbarium by hundreds of users. To the degree feasible, keys are structured to emphasize characters that are readily observable and available for long parts of the year, such as vegetative characters; this is not feasible for all groups, of course. Multiple characters are provided. Terminology strives to avoid abstruse technical terms which do not significantly add meaning (for some genera, an introduction to morphological characters and terms used is provided as “Identification notes” preceding the key). Geographic distributions and habitats are sometimes included in the keys as pragmatic, useful, secondary “characters,” but are placed in brackets to indicate that they are not “true” characters. The keys include all species from the primary and secondary flora areas (North Carolina, South Carolina, Virginia, Georgia, Alabama, Mississippi, Tennessee, Kentucky, West Virginia, Maryland, Delaware, the District of Columbia, and parts of Florida, Louisiana, and New Jersey). In some cases, several alternate keys are provided. The primary emphasis of the keys is pragmatism – effective and efficient identification. For this reason, a key to a genus sometimes includes closely similar taxa not in the genus that may be mistaken for it. Another example is that the “family key” to ferns and fern allies is actually a key to genera, allowing an emphasis in the key on readily observable characteristics, rather than the technical characters often needed to distinguish fern families. Keys are based on herbarium specimens, though reference is made when characters based on live or fresh plants may differ from those of pressed and dried specimens. Some keys have been adapted from literature cited; where the adaptation is particularly close, credit is given to the source by specific citation.

Habitat. Information is provided about the habitat of the taxon. This information is largely from the field experience of the author, supplemented by information from other botanists, from herbarium labels, and from the literature. For species with wide ecological amplitudes, the habitat may be described simply and broadly (“a wide variety of upland forests”), while the habitat of more localized, specialized, or rare taxa may be described in considerable detail (“moist outcrops of calcareous to semi-calcareous metamorphic rocks, such as mylonite or marble, near waterfalls in humid escarpment gorges with high rainfall, at low elevations”).

Native status. The native or alien status is stated. Also, an asterisk prior to the species’ name indicates that it is considered alien throughout the primary flora area. Some past floras, including Radford, Ahles, and Bell (1968), were haphazard in their inclusion of this information, which is a very important attribute of each recognized taxon. If there is a question, it is mentioned or discussed. For aliens, an opinion is given as to whether the taxon is naturalized, persistent, waif, etc. in the primary flora area.

Flowering/fruiting dates. Flowering and fruiting dates are provided for the primary flora area. These are derived from herbarium specimens viewed by the author (collected from within the Flora area), from field observations by the author (within the Flora area), and from literature cited.

Distribution of species. A statement of the rangewide distribution of each taxon treated is provided. This is based on published distribution maps and distribution statements in other floras, amended and improved by additional herbarium specimens and published records (such as the “Noteworthy Collections” section in the journal Castanea). The distribution within the primary area is provided by state and physiographic province.

Distributional information. The distribution statements are being replaced by a map. The map shows distribution within the Flora area symbolically, with each state × physiographic province area, except that on the maps, the very small areas of the DC Piedmont, the DC Coastal Plain, and the DE Piedmont are not shown separately from the MD Piedmont, the MD Coastal Plain, and the MD Piedmont, respectively. The native/alien status of the taxon is shown by squares for native occurrence and triangles for alien occurrence. Note that some species have distributions including both alien and native distributions, so Dionaea muscipula for instance is native in the Coastal Plain of NC and SC, but alien in the Coastal Plain of FL. The abundance in that state × physiographic province area is shown by the symbol, an open symbol is rare, a symbol with a dot is uncommon, and a filled symbol is common.

In the lower right corner is a space designated for distributional information. If the species is endemic to the Flora Area, you will see "EN." If the species is alien, you will see the region of the world to which it is native. If the species is native but not endemic, you will see a compass rose. Eight arrows depict the native distribution of the taxon outside of the Flora area. Arrows can be long (common at least somewhere in that region), or short (only uncommon or rare in that region).

The regions to which the eight arrows point are:
N arrow -- ne. North America (PA and n. NJ north to the Canadian maritime provinces, west through QC to se. ON and e. and s. OH);
NW arrow -- nw. North America (w. OH, MI, w. ON, and NU west to AK, BC, and OR, north of and including n. MO, NE, WY, ID, and OR);
W arrow -- w. United States (the western “Southeast” of trans-Mississippi LA, AR, s. MO, OK, and e. TX), west to sw. United States;
SW arrow -- Mexico, Central America, and South America;
S arrow -- peninsular FL;  
SE arrow (dashed to indicate oversea) -- West Indies (including Bahamas) and Bermuda;  
E arrow (dashed to indicate oversea) -- Asia and/or Africa;  
NE arrow (dashed to indicate oversea) -- Europe.

Figure 1.B: Sample distribution maps and distribution map key

### Literature
Nearly all genera have citations to recent, pertinent systematic literature, as well as more limited citations to literature on ecology and population biology. The intent is to provide the user with access into more detailed literature, and to document the literature basis of the treatment followed in the Flora. About 2100 references have been consulted and are cited.

### Synonymy

I ask the forgiveness of anyone omitted inadvertently.
KEYS TO FAMILIES AND GENERA

ARTIFICIAL KEY TO THE GENERA AND FAMILIES OF LYPHOPTES AND PTERIDOPTES

1 Plant a free-living gametophyte, consisting of filaments or thalli, generally a single cell thick, usually with abundant single-celled gemmae. ............................... Key A

2 Plant a sporophyte, consisting of a stem, rhizome, corn, or crown producing well-developed leaves, > 1 cell thick (except in Didymoglossum, Crepidomanes, Vandenboschia, and Hymenophyllum), generally reproducing by spores.

2 Plant aquatic, either floating and unattached, or rooting and largely submerged ................................................................. Key B

2 Plant of various habitats, including wetlands, where sometimes growing in soils saturated or intermittently flooded, but not aquatic. .................................................. Key C

2 Leaves "fern-like," variously lobed or divided, ranging from pinnatifid to 4-pinnate. ................................................................. Key C

3 Leaves not "fern-like," unlobed, variously awl-shaped, scale-like, or terete ................................................................. Key C

4 Leaves blades (not including the petiole) small, < 30 cm long or wide (some species will key either here or in the next lead).

5 Epipetric or epiphytic, growing on rock, tree bark, walls, or over rock in thin soil mats or in small soil pockets ........................................ Key D

5 Terrestrial, growing in soil, not associated with rock outcrops ................................................................. Key E

6 Leaves medium to large, > 30 cm long or wide. .......................................................................................................................... Key E

6 Epipetric or epiphytic, growing on rock, walls, over rock in thin soil mats or in small soil pockets, or on tree trunks .......... Key F

6 Terrestrial, growing in soil, not associated with rock outcrops ................................................................. Key G

Key A – Pteridoptes reduced to thalloid or filamentous, free-living gametophytes

1 Gametophytes filamentous .......................................................................................................................... Crepidomanes (HYMENOPHYLLACEAE)

1 Gametophytes thalloid, ribbon-like and branched. ........................................................................................................... Hymenophyllum (HYMENOPHYLLACEAE)

2 Gemmae absent or spatulate (> 1 cell wide) ................................................................................................. Vittaria (PTERIDACEAE)

2 Gemmae uniseriate (1 cell wide) .......................................................................................................................... Schizaea

Key B – Pteridoptes and lycophytes growing as floating or rooted aquatics

1 Plant with at least some leaves palmately or pinnately lobed or 1-4 x pinnately divided ("fern-like") and > 2 cm long .............................................................. Ceratopteris (PTERIDACEAE)

1 Plant either a floating aquatic with leaves <5 cm long, or with clover-like or linear leaves.

2 Plant a floating aquatic. .......................................................................................................................... Azolla (SALVINIAEAE)

3 Leaves 5-50 mm long, bright green, with obvious hairs on the upper surface.............................................................. Salvinia (SALVINIAEAE)

2 Plant a rooted aquatic. .......................................................................................................................... Marsilea (MARSILEACEAE)

3 Leaves linear. ............................................................................................................................................... Pilularia

4 Leaves large. ............................................................................................................................................... Gioenia

5 Plants cormose or with short rhizomes; leaves numerous, undivided leaves ...................................................... Isoetes (ISOETACEAE)

5 Plants with creeping rhizomes; leaves few, reduced to a winged petiole ...................................................... Pilularia (PTERIDACEAE)

5 Terrestrial, growing in soil, not associated with rock outcrops ................................................................. Key C

Key C – Lycophytes and pteridoptes with leaves not "fern-like"

(unknown, various awl-shaped, scale-like, or terete)

1 Stem obviously jointed; leaves scale-like, borne in a whorl at each of the distant joints; spores borne in a terminal strobilus with peltate scales ............................... Equisetum (EQUISETACEAE)

2 Stem not jointed; leaves scale-like or larger, but if scale-like not borne in whorls at distant joints; spores borne variously, but if in a terminal strobilus the scales not peltate.

2 Leaves linear, grass-like, 1-50 cm long, 20x or more as long as wide.

3 Leaves solitary (though often the internodes very short from a thin, creeping rhizome); sporangia borne in a spherical (ca. 3 mm in diameter) sporocarp on a separate branch from the rhizome......................................................... Pilularia (MARSILEACEAE)

3 Leaves numerous from a corn or short rhizome; sporangia either borne in the expanded leaf bases (Isoetes) or in 2 rows at the tip of the linear fertile leaves (Schizaea).

4 Leaves straight, arching, or flaccid, from a 2-3-lobed corn; sporangia borne in the expanded, hyaline leaf bases

.................. .......................................................................................................................... Isoetes (ISOETACEAE)

4 Leaves notably spiral-curly, from a short rhizome; sporangia borne in 2 rows at the tip of the linear fertile leaves ........................................................................................................... Schizaea (SCHIZAEEAE)

5 Leaves inconspicuous, reduced to a few nerveless scales (< 1.5 mm long), the internodes much longer than the leaves; sporangia yellowish, 3-locular, 1-2 mm in diameter; stems upright, repeatedly branched dichotomously ...................................................... Pilota (PSILOTACEAE)

5 Leaves either larger or, if scale-like, with nerves and longer than the internodes (the leaves thus overlapping); sporangia yellowish to brownish, 1-locular, < 1 mm in diameter; stems either subterranean or surficial rhizomes or erect or ascending (and sometimes dichotomously branched in whole or in part in Huperzia, Diphasiastrum, and Dendrolycopodium).

6 Leaves either larger or, if scale-like, with nerves and longer than the internodes (the leaves thus overlapping); sporangia yellowish to brownish, 1-locular, < 1 mm in diameter; stems either subterranean or surficial rhizomes or erect or ascending (and sometimes dichotomously branched in whole or in part in Huperzia, Diphasiastrum, and Dendrolycopodium).

6 Leaves either larger or, if scale-like, with nerves and longer than the internodes (the leaves thus overlapping); sporangia yellowish to brownish, 1-locular, < 1 mm in diameter; stems either subterranean or surficial rhizomes or erect or ascending (and sometimes dichotomously branched in whole or in part in Huperzia, Diphasiastrum, and Dendrolycopodium).

6 Leaves either larger or, if scale-like, with nerves and longer than the internodes (the leaves thus overlapping); sporangia yellowish to brownish, 1-locular, < 1 mm in diameter; stems either subterranean or surficial rhizomes or erect or ascending (and sometimes dichotomously branched in whole or in part in Huperzia, Diphasiastrum, and Dendrolycopodium).
7 Sporangia borne in flattened or quadrangular strobili sessile at the tips of leafy branches; spores and sporangia of two sizes, the megasporangia larger and borne basally in the strobili ................................................................. *Selaginella* (SELAGINELLACEAE)
7 Sporangia borne either in the axis of normal foliage leaves, or in strobili sessile at the tips of leafy branches or stalked on specialized branches with fewer and smaller leaves; spores and sporangia of one size.
8 Leafy stems erect, simple or dichotomously branched, the ultimate branches vertically oriented; sporophylls like the sterile leaves or only slightly reduced, in annual bands along the stem; vegetative reproduction by leafy gemmae near stem apex........... *Huperzia* (LYCOPODIACEAE)
8 Leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae.
9 Leaves herbaceous, pale or yellow-green, dull, deciduous; leafy stems creeping; rhizome dying back annually to an underground vegetative tuber at apex; [of wetlands, mostly on moist or wet sands or peats].
10 Leaves of the prostrate stems 0.5-1.2 mm wide, ciliate-toothed or not toothed; leaves of the erect stem many, overlapping, spirally arranged; leaves of the strobilus resembling leaves of the prostrate and upright stems in size and shape; upright stems 1.5-15 mm in diameter (including the leaves) ................................................................. *Lycopodiella* (LYCOPODIACEAE)
10 Leaves of the prostrate stems 1.3-2.1 mm wide, not toothed; leaves of the erect stem few, not overlapping, whorled; leaves of the strobilus much reduced relative to the prostrate and upright stems; upright stems 1.5-3 mm in diameter (including the leaves) ................................................................. *Pseudolycopodiella* (LYCOPODIACEAE)
9 Leaves rigid, bright to dark green, shiny, evergreen; leafy stems mainly erect, treelike, fanlike, or creeping (if creeping, then the leaves with elongate, hyaline hair-tips); rhizome perennial, elongate, surficial or subterranean; [of uplands, mostly in moist to dry soils].
11 Branches 1-5 mm wide (including the leaves), compressed to quadrangular, with 4 ranks of leaves; branching of strobilus stalks dichotomous ................................................................. *Diphasiastrum* (LYCOPODIACEAE)
11 Branches 4-12 mm wide, terete (to somewhat compressed in *Dendrolycopodium obscurum*), with 6 or more ranks of leaves; branching of strobilus stalks (when present), pseudomonomidal (falsely appearing to have a main axis from which branches arise).
12 Strobili borne on elongate, sparsely leafy peduncles borne at the tips of leafy, ascending branches; leaves with attenuate, hyaline hair-tips ................................................................. *Lycopodium* (LYCOPODIACEAE)
12 Strobili sessile, borne directly above densely leafy portions of upright branches; leaves acuminate to acute.
13 Erect leafy stems 3-8 mm in diameter (including the leaves), treelike or fanlike, with a definite main axis; leaves acute at the apex; horizontal shoots subterranean, without winter bud constrictions .......... *Dendrolycopodium* (LYCOPODIACEAE)
13 Erect leafy stems 10 mm or more in diameter (including the leaves), branched 1-4 times sub-dichotomously; leaves with a 0.4-1.0 mm long stiff spinule; horizontal shoots at or near the ground surface, with winter bud constrictions ............ *Spinulum* (LYCOPODIACEAE)
6 Plant with leaves not as above (see below).
14 Plant with 1 (-several) leaves, the sterile leaf blade 0.3-24 cm long, ovate to lanceolate, entire-margined, obtuse, the longer fertile portion with 2 rows of sporangia somewhat imbedded in it........................................... *Ophioglossum* (OPHIOGLOSSACEAE)
14 Plant with many leaves, generally 5 or more, not divided into separate sterile and fertile segments, the leaves either (a) small, 0.3-1.6 cm long, obovate, scattered along a very thin creeping rhizome, or (b) larger, (2-) 8-30 cm long, corolate at base, the tip long-attenuate (often proliferous, bearing a plantlet at the tip).
15 Leaf blades (2-) 8-30 cm long, cordate at the base, the tip long-attenuate, often proliferous (bearing a plantlet at the tip); sporangia in indusiate sori on the undersurface; leaf texture moderately thick; rhizome erect or ascending, 1.0-1.5 mm in diameter, the leaves clustered from its tip ................................................................. *Asplenium rhizophyllum* (ASPLENIACEAE)
15 Leaf blades 0.3-1.6 cm long, cuneate at the base, rounded to obtuse at the tip, not proliferous; sporangia solitary in a marginal pocket on the leaf; leaf texture very thin; rhizome creeping on the surface of rock or bark, 0.1-0.3 mm in diameter, the leaves scattered along it ................................................................. *Didymoglossum petersonii* (HYMENOPHYLLACEAE)

**Key D – Small pteridophytes, epipetric or epiphytic, growing on rock, tree bark, walls, or over rock in thin soil mats or in small soil pockets**

1 Leaves pinnatifid or bipinnatifid, most of the pinnae not fully divided from one another (the rachis winged by leaf tissue most or all of its length).
2 Leaves bipinnatifid, at least the lowermost pinnae deeply lobed.
3 Leaves of a very delicate texture, 1 cell thick; sori borne in cups on the leaf margins; [of rock outcrops with high air humidity].
4 Rhizomes filiform, <0.5 mm in diameter, glabrous or with sparse light-colored hairs; indusium (“involucre”) tubular or bivalvate (deeply divided with 2 rows of sporangia somewhat imbedded in it) ................................................................. *Hymenophyllum* (HYMENOPHYLLACEAE)
4 Rhizomes moderately stout, 0.8-1.5 mm in diameter, densely clad with dark-colored hairs; indusium (“involucre”) tubular or funnelform, sometimes slightly 2-lobed; receptacle long and whiplike, exserted from the mouth of the tubular (slightly bilobed) indusium ................................................................. *Vandenboschia* (HYMENOPHYLLACEAE)
3 Leaves of an herbaceous, subcoriaceous, or coriaceous texture, > 1 cell thick; sori otherwise; [of various habitats, not strictly of moist sites].
5 Lowermost (and other) pinnae with numerous, rather even lobes .................................................. *Phegopteris* (THELYPTERIDACEAE)
5 Lowermost pinnae with a few, irregular lobes (the upper pinnules unlobed) ....................... *Pteris multifida* (PTERIDACEAE)
2 Leaves pinnatifid, the pinnate not lobed.
6 Leaf blades with a long-attenuate apex, blade unlobed for 1/3 its length; sori elongate ................................................................. *Asplenium* (ASPLENIACEAE)
6 Leaves without a long-attenuate apex, blade lobed for most of its length; sori round.
7 Plants dwarf, the leaf blades < 5 cm long; [occurring only in permanently moist habitats, as in grottoes behind waterfalls] ................................................................. *Microlypodium* (POLYPODIACEAE)
7 Plants larger, the leaf blades 7-30 cm long; [occurring on moist to dry habitats].
8 Leaf blade densely scaly on the lower surface; leaf segment margins entire; rhizome 1-2 mm in diameter ................................................................. *Pleopeltis* (POLYPODIACEAE)
1 Leaves pinnate, pinnate-pinnatifid, 2-pinnate, or even more divided (the rachis naked for most of its length, often winged in the apical portion).  
2 Leaves pinnate or pinnate-pinnatifid.  
10 Leaves of a very delicate texture, 1 cell thick; sori borne in cups on the leaf margins; [of rock outcrops with high air humidity].  
11 Rhizomes filiform, <0.5 mm in diameter, glabrous or with sparse light-colored hairs; indusium ("involute") bivalve (deeply divided into 2 flaps); receptacle not exserted from between the deeply bilobed indusium, ................................. 
Hymenophyllum (HYMENOPHYLLACEAE)  
11 Rhizomes moderately stout, 0.8-1.5 mm in diameter, densely clad with dark-colored hairs; indusium ("involute") tubular or funnelform, sometimes slightly 2-lobed; receptacle long and whiplike, exserted from the mouth of the tubular (slightly bilobed) indusium, ................................................................., Vandenboschia (HYMENOPHYLLACEAE)  
10 Leaves of an herbaceous, subcoriaceous, or coriaceous texture, > 1 cell thick, sori otherwise; [of various habitats, not strictly of moist sites].  
12 Pinnae > 1 cm wide; leaves subcoriaceous to coriaceous; veins anastomosing, rejoining to form a netlike pattern, ................................................................. 
Cycatonia (DROUGHTPERIDACEAE)  
12 Pinnae < 1 cm wide; leaves herbaceous to subcoriaceous; veins free, not rejoining.  
13 Sori on the undersurface of the leaf, away from the margins,................................................................. Asplenium (ASPLENIACEAE)  
13 Sori on the undersurface of the leaf, marginal and more-or-less hidden beneath either the unmodified revolute leaf margin or under a modified, reflexed false indusium.  
14 Leaf undersurface densely covered with stellate and ciliate scales .................................. Astrolepis sinuata ssp. sinuata (PTERIDACEAE)  
14 Leaf undersurface glabrous or on non-stellate scales.  
15 Rachis dark-brown or purple; leaf margin unmodified, though often revolute ..........................................., Pelligea (PTERIDACEAE)  
15 Rachis green or tan; leaf margin modified into a false indusium, reflexed to cover the sori .... Pteris viitata (PTERIDACEAE)  
9 Leaves bipinnate or more divided.  
16 Leaf blade pentagonal or broadly triangular in outline, ca. 1/3 as long as wide.  
17 Leaf blade pentagonal in outline, the terminal pinna by far the largest; rhizome 5-8 mm in diameter; indusium present, thick, persistent, and reniform; [introduced species, naturalized in moist ravines in SC] ............................................., Arachniodes (DROUGHTPERIDACEAE)  
17 Leaf blade broadly triangular in outline, the basal pinnae by far the largest; rhizome ca. 1 mm in diameter; indusia absent; [native species of mountain peaks of n. NC and VA] ....................................................... Gymnocarpium (CYSTOPTERIDACEAE)  
16 Leaf blade elongate, mostly lanceolate, generally > 4× as long as wide (except in Adiantum capillus-veneris, with leaf blade often only 1.5-3× as long as wide, but not notably triangular or pentagonal in outline).  
18 Sori not marginal, either naked, or slightly to strongly hidden by indusia.  
19 Leaf blades 3-12 cm long; sori elongate, covered by a flag-like, entire indusium ....................................... Asplenium (ASPLENIACEAE)  
19 Leaf blades 4-30 (-50) cm long; sori globular, surrounded or covered by an entire, ciliate, or divided indusium.  
20 Veins reaching the margin; indusium attached under one side of the sorus, hoodlike or pocketlike, arching over the sorus; petioles glabrous or sparsely beset with scales, the petiole bases not persistent ............... Cystopteris (CYSTOPTERIDACEAE)  
20 Veins ending short of the margin; indusium attached under the sorus, cuplike (divided into 3-6 lanceolate to ovate lobes which surround the sorus from below) or of minute numerous septate hairs, which extend out from under the sorus on all sides; petioles often densely beset with scales, the petiole bases persistent. .................................. Woodsia (WOODSPIACEAE)  
18 Sori marginal, usually more-or-less hidden under the revolute margin of the pinnae.  
21 Sori round or oblong, distinct and separate along the pinnule margins; leaves bright-green, glabrous, herbaceous, delicate, and flexible ................................................................. Adiantum (PTERIDACEAE)  
21 Sori continuous along the pinnule margins; leaves mostly dark-green or glaucous, often pubescent, coriaceous, tough, and stiff.  
22 Leaves strongly dimorphic, the fertile leaves obviously longer than the sterile and with narrow elongate ultimate segments .... 
Crypsogramma (PTERIDACEAE)  
22 Leaves essentially monomorphic.  
23 Lower leaf surfaces covered with whitish powder, otherwise glabrous or sparsely pubescent ............................................. Argyrochosma (PTERIDACEAE)  
23 Lower leaf surfaces pubescent (or glabrous in Cheilanthes alabamensis), never with conspicuous whitish powder ............ Cheilanthes (PTERIDACEAE)  

Key E – Small pteridophytes, terrestrial, growing in soil, not associated with rock outcrops

1 Petiole branched dichotomously, each branch bearing 3-7 pinnae in one direction only, the outline of the blade fan-shaped, often broader than long. ................................................................. Adiantum pedatum (PTERIDACEAE)  
2 Petiole not branched dichotomously, the blade either longer than broad or triangular and about as wide as long.  
3 Sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome). ................................................................. Botrychium (OPHIOGLOSSACEAE)  
3 Sporangia either borne on normal leaf blades or on specialized (fertile) leaves separate from the rhizome.  
4 Leaves monomorphic, the sori borne on normal leaf blades ............................................. Phegopteris (THELYPERIDACEAE)  
4 Leaves dimorphic, the sori borne on leaves significantly different than normal leaves.  
5 Fertile leaf wooly, with bead-like segments; pinnae margins entire, often wavy or the lowermost even somewhat lobed; pinnae mostly with obtuse apices, tending to be borne opposite. ....................................................... Onoclea (ONOCLEACEAE)  
5 Fertile leaf stiff but herbaceous, the pinnae linear, not at all bead-like; pinnae margins finite or serrulate, otherwise slightly wavy or straight; pinnae mostly with acute apices, tending to be borne alternate. ................................................................. Woodwardia areolata (BLECHNACEAE)  
2 Leaves pinnate, pinnate-pinnatifid, 2-pinnate, or even more divided (the rachis naked for most of its length, often winged in the apical portion).  
6 Leaves broadly triangular in outline, about as broad as long; sporangia borne on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome) ............... Sceptriump (OPHIOGLOSSACEAE)
KEYS TO FAMILIES AND GENERA

6 Leaves lanceolate in outline, much longer than broad; sporangia either borne on normal leaf blades, on slightly dimorphic blades, or on an erect stalk that arises at or above ground level from the petiole of the sterile leaf blade (joining the petiole of the sterile leaf above the rhizome). Botrychium (OPHIOGLOSSACEAE)

7 Leaf blades 1-8 cm long; sporangia borne on erect stalks from the petiole of the sterile leaf blade; joining the petiole of the sterile leaf above the rhizome. Botrychium (OPHIOGLOSSACEAE)

7 Leaf blades 10-30 (-100) cm long; sporangia either borne on normal leaf blades or on slightly dimorphic blades.

8 Leaves green, subcoriaceous, evergreen

9 Leaves 2 pinnate, the pinnules toothed ......................................................... Rumohra (DRYOPTERIDACEAE)

9 Leaves 1-pinnate, the pinnacles toothed ......................................................... Polystichum (DRYOPTERIDACEAE)

8 Leaves light to medium green, herbaceous, deciduous to semi-evergreen.

10 Sori continuous along the midrib of the pinna .............................................. Asplenium platynemum (ASPLENIAEAE)

11 Sori distinct.

11 Sori elongate; leaf blades somewhat dimorphic, the fertile larger and erect, the sterile smaller and prostrate, the larger leaf blades 2-4 (-6.5) cm wide ................................................................. Thelypteris (THELYPTERIDACEAE)

11 Sori round; leaf blades monomorphic; the larger leaf blades 5-15 cm wide. Thelypteris (THELYPTERIDACEAE)

Key F – Medium to large pteridophytes, epipetric, growing on rock, walls, over rock in thin soil mats or in small soil pockets, or on tree trunks

1 Leaves vine-like, 0.3-10 m long, the branching dichotomous, 1 branch of each dichotomy terminating in a pair of pinnae, the pinnae often widely spaced (> 10 cm apart) ............................................................. Lygodium (LYGODIACEAE)

1 Leaves not vine-like, 0.3-3 m long, the branching not as described above, the pinnae regularly and more-or-less closely spaced (mostly < 10 cm apart).

2 Leaves 1-pinnate-pinnatifid or less divided, the pinnae entire, toothed, lobed or pinnatifid.

3 Sori marginal, continuous, covered by a reflected false indusium along the leaf margin; pinnae usually opposite, linear, not toothed or lobed. Pecluma (POLYPODIACEAE)

3 Sori neither marginal nor continuous, slightly to entirely covered by an elongate or roundish indusium (sometimes ciliate, toothed, or divided into narrow segments); pinnae usually at least in part alternate, mostly lanceolate, toothed, lobed, or pinnatifid.

4 Sori elongate, the indusium flap-like, attached along the side; leaf blades (if >30 cm long) < 7 cm wide ......................................................... Asplenium platynemum (ASPLENIAEAE)

4 Sori circular or globular, the indusium peltate, reniform, or cuplike; leaf blades (if >30 cm long) > 5 cm wide.

5 Leaves pinnatifid.

6 Larger leaves with >25 pairs of segments, each 1.5-5 (-8) mm wide; [of ne. FL southward] Pecluma (POLYPODIACEAE)

6 Larger leaves with < 25 pairs of segments, (3-) 5-40 mm wide; [collectively widespread in our area.

7 Veneration highly reticulate, with 3-4 rows of areoles between the midvein and the margin; rhizome 8-15 (-30) mm in diameter; leaf blade 10-50 cm wide ................................................................. Phlebodium (POLYPODIACEAE)

7 Veneration free or with a row of areoles between the midvein and the margin; rhizome 3-6 mm in diameter; leaf blade <9 cm wide ................................................................. Polypodium (POLYPODIACEAE)

5 Leaves 1-pinnate or more divided.

8 Leaves 1-pinnate, the pinnule toothed and each with a slight to prominent lobe near the base on the side toward the leaf tip; indusia peltate (Cystopteris and Polystichum) or reniform or crescent-shaped (Nephrolepis).

9 Leaves pale green, thin in texture; pinnae articulate to rachis, deciduous with age; thin, rhizome bearing elongate, thin, wiry stolons ......................................................... Nephrolepis (NEPHROLEPIDACEAE)

9 Leaves dark-green, subcoriaceous to coriaceous; pinnae not articulate and deciduous with age; rhizome not producing stolons.

10 Veins anastomosing, rejoining to form a netlike pattern; pinnae 4-25 pairs per leaf; [non-native, rarely naturalized]................................................. Cystopteris (DRYOPTERIDACEAE)

10 Veins branching dichotomously, free, not rejoining to form a netlike pattern; pinnae 25-50 pairs on larger leaves; [native, common] ......................................................... Polypodium (POLYPODIACEAE)

8 Leaves 1-pinnate-pinnatifid, the pinnate pinnatifid, generally lacking a prominent basal lobe; indusia either reniform or cuplike.

11 Vascular bundles in the petiole 3-7 ................................................................. Dryopteris (DRYOPTERIDACEAE)

11 Vascular bundles in the petiole 2, uniting above.

12 Indusia reniform, arching over the sorus ......................................................... Thelypteris (THELYPTERIDACEAE)

12 Indusia cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments ................................................................. Woodsia obtusa (WOODSIACEAE)

2 Leaves 2-pinnate or more divided, the pinnae divided to their midribs.

13 Sori marginal and borne on the underside of the false indusium; pinnules and rachis shiny black or reddish-black, glabrous except at the very base of the petiole; pinnules fan-shaped or obliquely elongate ................................................. Adiantum (PTERIDACEAE)

13 Sori not marginal, borne on the undersurface of the leaf blade (if marginal, as in Pteridium and Dennstaedtia, borne on the underside of the leaf); pinnules darkened only basally (if at all), rachis green, tan, or reddish; pinnules not notably fan-shaped or obliquely elongate.

14 Leaf blades pentagonal or broadly triangular in outline, ca. 1 x as long as wide.

15 Leaf blade pentagonal in outline, the terminal pinna the largest; sori submarginal, roundish, the indusium reniform; [alien, rarely naturalized] ................................................................. Arachniodes (DRYOPTERIDACEAE)

15 Leaf blade broadly triangular in outline, the basal pinnae the largest; sori marginal, linear, indusium absent, protected by the revolute leaf margin and a minute false indusium; [native, common] ................................................................. Pteridium (DENNSTAEDTIACEAE)

14 Leaf blades elongate, mostly lanceolate, generally 4 x or more as long as wide.

16 Outline of leaf blade narrowed to base, the widest point > 7 pinna pairs above the base, the lowermost pinnae < 1/4 as long as the longest pinnae; rhizomes long-creeping, the leaves scattered, forming clonal patches ................................................................................................................................. Thelypteris noveboracensis (THELYPTERIDACEAE)

16 Outline of the leaf blade slightly if at all narrowed to the base, the widest point < 5 pinna pairs from the base, the lowermost pinnae > 1/2 as long as the longest pinnae; rhizomes short-creeping, the leaves clustered, not forming clonal patches (or with rhizomes long-creeping, leaves scattered, forming clonal patches in Dennstaedtia).
Rhizomes long-creeping, leaves scattered, forming clonal patches; vascular bundles in the petiole 1, U-shaped (even in the lower petiole); sori very small, marginal in sinuses, the indusium cuplike, 2-parted, the outer part a modified tooth of the leaf blade; leaf blades conspicuously puberulent with sepalike hairs.................................................Dennstaedtia (DENNSTAEDTIACEAE)

Rhizomes short-creeping, the leaves clustered, not forming clonal patches; vascular bundles in the petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike in Woodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes.

Vascular bundles (3-5) 5 (-7) in the petiole..............................................................Dryopteris (DRYOPTERIDACEAE)

Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).  

Leaves 25-65 cm wide, with whitish, straight, acicular hairs; [species adventive and weedy] ..............................................................Macrobotrygium (THELYPTERIDACEAE)

Leaves 5-25 (-30) cm wide, with scales and minute glands (sometimes also with sepalike hairs); [native species].

Leaves 1-pinnate-pinnatifid; indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments ..................................................Woodsia obtusa (WOODSIACEAE)

Leaves 2-pinnate-pinnatifid; indusium flap-like or pocketlike, attached at one side of the sorus and arching over it.

Leaves 10-30 cm wide, the tip acute to acuminate; indusium flaplike...........................................Athyrium (ATHYRIACEAE)

Leaves 4-9 cm wide, the tip long-attenuate; indusium pocketlike or hoodlike.................................................Cystopteris bulbifera (CYSTOPTERIDACEAE)

Key G – Medium to large pteridophytes, terrestrial, growing in soil, not associated with rock outcrops

1. Leaves vine-like, 0.3-10 m long, the branching dichotomous, 1 branch of each dichotomy terminating in a pair of pinnae, the pinnae often widely spaced (> 10 cm apart)

2. Vine-like leaves scrambling or trailing; sporangia borne 6-12 per sorus ..............................Dicranopteris (GLEICHENIACEAE)

2. Vine-like leaves twining; sporangia borne singly, each subtended by an indusium-like flap..............................Lygodium (LYGODIACEAE)

1. Leaves not vine-like, 0.3-3 m long, the branching not as described above, the pinnae regularly and more-or-less closely spaced (mostly < 10 cm apart).

3. Leaf blades broadly (about equilaterally) triangular, pentagonal, or flabellate in outline, 0.7-1.3× as long as wide.

4. Leaf blades flabellate or fan-shaped in outline, the petiole branched once dichotomously, each branch bearing 3-7 pinnae in one direction only..............................................................Adiantum pedatum (PTERIDACEAE)

4. Leaf blades pentagonal or broadly triangular in outline, the petiole not branched dichotomously.

5. Leaf blade pentagonal in outline, the terminal pinna the largest; sori submarginal, roundish, the indusium reniform; [alien, rarely naturalized] .................................................................Acrinos (DRYOPTERIDACEAE)

5. Leaf blade broadly triangular in outline, the basal pinnae the largest; sori marginal, linear, indusium absent, protected by the revolute leaf margin and a minute false indusium (Pteridium), or sporangia borne in a stalked, specialized, fertile portion of the blade (Botrychium); [native, collectively common].

6. Sporangia borne in a stalked, specialized, fertile portion of the blade; texture of mature leaves somewhat fleshy; plants solitary from a short underground rhizome with thick, mycorrhizal roots; [primarily of moist forests].[Botrypus (OPHIOGLOSSACEAE)

6. Sporangia borne in marginal, linear sorus, indusium absent, protected by the revolute leaf margin and a minute false indusium; texture of mature leaf blades hard and stiff; plants colonial from deep-seated rhizomes; [primarily of moist to dry woodlands and savannas] ..............................................................Pieris (DENNSTAEDTIACEAE)

7. Leaves elongate in outline, mostly ovate, lanceolate, oblanceolate, or narrowly triangular, 1.5-10× or more as long as wide.

7. Leaves 2-pinnate or more divided, the pinnae divided to their midrib.

8. Leaf blade divided into sterile and fertile portions, the fertile pinnae basal, the sterile pinnales 30-70 mm long and 8-23 mm wide, serrulate, rounded basally, rounded to somewhat acute apically, the fertile pinnae terminal and greatly reduced in size, the fertile pinnales 7-11 mm long and 2-3 mm wide.................................Osmunda regalis var. spectabilis (OSMUNDACEAE)

8. Leaf blade not divided into sterile and fertile portions (though often not all pinnales on a leaf bearing sporangia), the pinnales bearing sporangia only slightly if at all reduced in size, both fertile and sterile pinnales usually 6-10 mm long and 2-4 mm wide.

9. Rhizomes long-creeping, leaves scattered, forming clonal patches; vascular bundles in the petiole either 1, U-shaped (even in the lower petiole) or > 3; sori very small, marginal in sinuses, the indusium cuplike, 2-parted, the outer part a modified tooth of the leaf blade; leaf blades conspicuously puberulent with sepalike hairs (Dennstaedtia) or glabrous to puberulent with glandular trichomes (Hypolepis).  

10. Leaves 3-4-pinnate-pinnatifid; indusium flap-like; leaves generally > 1 m long; petiole and rachis with prickles; [of n. FL southward] .................................................................Hypolepis (DENNSTAEDTIACEAE)

9. Rhizomes short-creeping, the leaves clustered, not forming clonal patches; vascular bundles in the lower petiole 2-7 (sometimes uniting to 1 in the upper petiole); sori mostly larger, mostly not marginal, the indusium not as above (though cuplike in Woodsia obtusa); leaf blades either glabrous, glabrescent, with flattened scales, or puberulent with glandular trichomes.

11. Vascular bundles (3-5) 5 (-7) in the petiole.

12. Indusia reniform; leaf blade (at least of larger leaves on mature plants) usually > 40 cm long..............................................................................................................................Dryopteris (DRYOPTERIDACEAE)

12. Indusia peltate; leaf blade < 40 cm long......................................................................................... Runohra (DRYOPTERIDACEAE)

13. Vascular bundles 2 in the petiole (or uniting near the leaf blade into 1).

13. Leaves 25-65 cm wide, with whitish, straight, acicular hairs; [species adventive and weedy] ..............................................................Macrobotrygium (THELYPTERIDACEAE)

13. Leaves 5-25 (-50) cm wide, with scales and minute glands (sometimes also with sepalike hairs); [native species, widespread].

14. Leaves 1-pinnate-pinnatifid; indusium cuplike, attached beneath the sorus and consisting of 3-6 lanceolate to ovate segments .................................................................Woodsia obtusa (WOODSIACEAE)

14. Leaves 2-pinnate-pinnatifid; indusium flap-like or pocketlike, attached at one side of the sorus and arching over it.

15. Leaves 4-9 cm wide, the tip long-attenuate; indusium pocketlike or hoodlike.................................................Cystopteris bulbifera (CYSTOPTERIDACEAE)

15. Leaves 10-30 cm wide, the tip acute to acuminate; indusium flaplike

16. Veins free, simple or forked..............................................................................................Athyrium (ATHYRIACEAE)
16 Veins anastomosing. .................................................................................................................. \textit{Diplazium} (ATHYRIACEAE)

17 Leaves 1-pinnate-pinnatifid or less divided, the pinnae entire, toothed, lobed or pinnatifid.

18 Fertile leaf woody, with head-like segments; pinnae margins entire, often wavy or the lowermost even somewhat lobed; pinnae mostly with obscure apices, tending to be borne opposite. ...................................................... \textit{Onoclea} (ONOCLEACEAE)

18 Fertile leaf stiff but herbaceous, the pinnae linear, not at all beak-like; pinnae margins finely serrulate, otherwise slightly wavy or straight; pinnae mostly with acute apices, tending to be borne alternate. ........................................ \textit{Woodwardia areolata} (BLECHNACEAE)

17 Leaves 1-pinnate or 1-pinnate-pinnatifid, the pinnae fully divided from one another (the rachis naked for most of its length, often winged in the terminal portion); leaves dimorphic or not.

19 Rhizomes long-creeping, leaves scattered, forming clonal patches.

20 Sori elongate, borne end to end along either side of the main veins; pinna lobes of sterile leaves with reticulate, chain-like venation along the central vein. ................................................... \textit{Woodwardia virginica} (BLECHNACEAE)

20 Sori roundish, borne away from the main veins; pinna lobes of sterile leaves with the lateral veins free and pinnately arranged (the lowermost lateral vein sometimes joining that of the adjacent pinna lobe just below the sinus, but the remainder of the lateral veins all free).......................................................................................... \textit{Thelypteris} (THELYPTERIDACEAE)

21 Plants moderately to very robust, the leaves typically 6-50 dm tall; leaves either strongly dimorphic, the fertile le-aves very unlike the sterile, brown at maturity, borne as an interruption in the blade, with normal green pinnae above and below (\textit{Osmunda clavatiana}), or the fertile pinnae very unlike the sterile, brown at maturity, borne as an interruption in the blade, with normal green pinnae above and below (\textit{Osmunda cinnamomea}), or the fertile pinnae towards the tip of the leaf and with sporangia entirely covering the lower surface (\textit{Acrostichum}); rhizomes scaleless, petioles scaleless (except at the base in \textit{Matteuccia}).

22 Leaves 1.5–5 m long; fertile pinnae with sporangia covering the lower surface; [of n. FL southward]............................................................... \textit{Acrostichum} (PITERIDACEAE)

22 Leaves 0.6–2.5 m long; fertile portions otherwise.

23 Leaves strongly tapering to the base from the broadest point (well beyond the midpoint of the blade), the basalmost pinnae much < ½ as long as the largest pinnae. ......................................................... \textit{Matteuccia} (ONOCLEACEAE)

23 Leaves slightly if at all tapering to the base, about equally broad through much of their length, the basalmost pinnae much > ½ as long as the largest pinnae.

24 Leaves hemidimorphic (juvenile leaves with only sterile pinnae, leaves bearing sporangia with sterile and fertile pinnae, the fertile pinnae borne medially); photosynthetic pinnae lacking tufts of hairs. \textit{Osmunda} (OSMUNDACEAE)

24 Leaves dimorphic (each leaf normally either completely photosynthetic or completely fertile); photosynthetic pinnae with tufts of reddish hairs near the junction with the rachis. \textit{Osmunda} (OSMUNDACEAE)

21 Plants mostly less robust, the leaves 3–10 dm tall (except \textit{Dryopteris ludoviciana}, \textit{D. celsa}, \textit{D. goldiana}, and \textit{Nephrolepis exaltata} to 15 dm); leaves not at all or only slightly dimorphic, the fertile differing in various ways, such as having narrower pinnae (as in \textit{Dryopteris ludoviciana}, \textit{Polystichum acrostichoides}, \textit{Diplazium}, and \textit{Thelypteris palustris}) or the fertile leaves taller and more deciduous (as in \textit{Asplenium platyneuron} and \textit{Dryopteris cristata}), but not as described in the first lead; rhizomes and petioles variously scaly or scaleless, but at least the petiole and often also the rachis scaly if the plants over 1 m tall.

25 Sori elongate, the indusium elongate, attached along one side as a flap.

26 Petiole and rachis lustrous brownish-black; fertile leaves 2–8 (-12) cm wide. \textit{Asplenium platyneuron} (ASPLENACEAE)

26 Petiole and rachis green; fertile leaves 10–20 (-30) cm wide.

27 Leaves 1-pinnate-pinnatifid (the pinnae pinnatifid). ......................................................... \textit{Deparia} (ATHYRIACEAE)

27 Leaves 1-pinnate (the pinnae entire). ................................................................. \textit{Homalosorus} (DIPLOZIOPSISIDACEAE)

25 Sori roundish, the indusium kidney-shaped or rounded, attached by a central stalk.

28 Leaves 1-pinnate, the pinnae toothed and each with a slight to prominent lobe near the base on the side toward the leaf tip (except \textit{Nephrolepis exaltata}); indusia peltate (\textit{Polystichum}) or reniform or crescent-shaped (\textit{Nephrolepis}).

29 Leaves pale green, thin in texture; pinnae articulate to rachis, deciduous with age and with tufts of reddish hairs near the junction with the rachis. \textit{Nephrolepis} (NEPHROLEPIDACEAE)

29 Leaves dark-green, subcoriaceous to coriaceous; pinnae not articulate and deciduous with age; rhizome not producing stolons; [native, common]. ....................................................... \textit{Polystichum} (DRYOPTERIDACEAE)

28 Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid, generally lacking a prominent basal lobe; indusia reniform.

30 Vascular bundles in the petiole 4-7. .............................................................................. \textit{Dryptopteris} (DRYOPTERIDACEAE)

30 Vascular bundles in the petiole 2, uniting above. ....................................................... \textit{Thelypteris} (THELYPTERIDACEAE)

\section*{KEY TO THE GENERA AND FAMILIES OF GYMNOSPERMS}

The gymnosperms are a likely artificial grouping of about 16 families, about 86 genera, and about 850 species. References: Kramer & Green (1990).

\textbf{Standard Key to Families}

1 Leaves pinnately compound. ........................................................................................................ \textit{ZAMIACEAE}

1 Leaves simple.

2 Leaves fan-shaped, dichotomously-veined, deciduous. ........................................................ \textit{GINKGOACEAE}

2 Leaves needle-like or scale-like, not dichotomously veined, evergreen (rarely deciduous).

3 Seeds 2-many, borne in a woody or fleshy cone (sometimes resembling a rather hard berry).

4 Foliage leaves needle-like or scale-like, alternate, opposite, or whorled; cone scales valvate or imbricate (if imbricate, the leaves scale-like and opposite). ....................................................... \textit{CUPRESSACEAE}

4 Foliage leaves needle-like, alternate or fascicled; cone scales imbricate. ........................................ \textit{PINACEAE}

3 Seeds borne singly in a soft fleshy to leathery aril

5 Leaves opposite. ......................................................................................................................... \textit{CEPHALOTAXACEAE}

THE FLORA

SECTION 1: LYCOPODIOPHYTA (CLUBMOSES)

I. Lycopodiaceae

A family of 10-15 genera and about 400 species. Lycopodiaceae, along with Selaginellaceae and Isoetaceae, have now been shown to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). The division of North American Lycopodium into three or more genera has been strongly advocated by Wagner & Beitel (1992), Wagner & Beitel in FNA (1993), Haines (2003a), and nearly all other recent authors. The traditionally broad Lycopodium appears to include a number of natural groups which are strikingly different from one another and have constituted separate lineages for tens to hundreds of millions of years. These natural groups are separable by numerous morphological, developmental, and anatomical characters, karyotype, and inability to hybridize. Wagner & Beitel (1992) divide Lycopodium (sensu latissimo) of our area into six genera in three subfamilies, as follows: Huperzia in Subfamily Huperzioideae, Lycopodium and Diphasiastrum in Subfamily Lycopodielloideae, and Lycopodiella, Palhinhaea, and Pseudolycopodiella in Subfamily Lycopodielloideae. Haines (2003a) further divides Lycopodium (sensu lato) into three genera: Dendrolycopodium, Spinulum, and Lycopodium (sensu stricto). The reasoning behind this division is very strong, and it is here followed. Profound differences in anatomy, morphology, reproduction, gametophyte morphology, and karyotype support this separation. The chromosome numbers of our genera: Dendrolycopodium (x=34), Diphasiastrum (x=23), Huperzia (x=67, 68), Lycopodiella (x=78), Lycopodium (x=34), Palhinhaea (x=55), Pseudolycopodiella (x=35), and Spinulum (x=34). Òllgaard in Kramer & Green (1990) and Wikstròm & Kenrick (2000) follow a somewhat broader course, recognizing three genera for our species (corresponding to the subfamilies of Wagner & Beitel 1992), and recognizing as sections the genera of Wagner & Beitel (1992). Òllgaard states that the "genera are very distinct, and also the sections within Lycopodiella and Lycopodium seem to represent ancient, independent evolutionary lines." Wikstròm & Kenrick (2000, 2001) suggest that the phylogenetic separation of Lycopodium (including Diphasiastrum) and Lycopodiella (including Pseudolycopodiella and Palhinhaea) occurred at least as long ago as the early Jurassic (208 million years before present), and the divergence of Huperzia from Lycopodium and Lycopodiella still longer ago. Based on this deep division between Huperzia and the other genera, some authors additionally advocate the recognition of Huperzia in a separate family, Huperziaceae, a suggestion which is by no means outlandish (though not followed here). References: Lellinger (1985); Michell (1979); Wagner and Beitel (1992); Beitel (1979); Snyder & Bruce (1986); Wagner & Beitel in FNA (1993b); Òllgaard in Kramer & Green (1990); Wikstròm & Kenrick (2000, 2001); Òllgaard (1987); Haines (2003a). Key based in part on Haines (2003a).

1. Leafy stems erect, simple or dichotomously branched, the ultimate branches vertically oriented; sporophylls like the sterile leaves or only slightly reduced, in annual bands along the stem; vegetative reproduction by leafy gemmae near the stem apex; [subfamily Huperzioideae]...

...the leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae. 1. Huperzia

1. Leafy stems prostrate or erect, if erect then generally branched, the ultimate branches spreading (horizontal) or ascending; sporophylls differing from sterile leaves, either broader and shorter, or more spreading, aggregated into terminal cones; lacking vegetative reproduction by gemmae.

1. Huperzia Bernhardii (Firmoss, Clubmoss)
A genus of about 10-15 species, north temperate and arctic (and tropical mountains of Asia). Within the Lycopodiaceae, *Huperzia* has "an isolated position", basal to the remainder of the family, and is sometimes separated in a separate family, the Huperziaceae (Haines 2003a). References: Wagner & Beitel in FNA (1993b); Haines (2003a)=Z; Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000).

**Identification notes:** Several hybrids are known from our area; they usually occur in intermediate habitats (such as in thin soil at the base of cliffs) and generally are found in proximity to both parents, but sometimes occur in the absence of one or both parents. Hybrids can be recognized by their intermediate morphology. In addition, *Huperzia selago* (Linnaeus) Bernhardi ex Martius & Schrank, Northern Firmoss, is circumboreal, ranging south in North America to NY, New England, and the Great Lakes region, and disjunct to OH. It could easily occur as a disjunct in our area, and should be sought in the high mountains.

Huperzia appressa (Desvaux) A. Löve & D. Löve, Appalachian Firmoss. Rock outcrops at high elevations (very rarely at middle elevations), rarely also in seepage or along banks of small streams at high elevations, and in fens (on hummocks). June-August. N. QC and NL (Newfoundland) west to ON, MI, and MN and south along the Appalachians to w. NC, e. TN, and ne. GA. This species was named in 1992 as *H. appalachiana* (Beitel & Mickel 1992), but *H. appressa* (Desvaux) A. Löve & D. Löve is an older combination that applies to the same species (Haines 2003a). Though morphologically only subtly differentiated from the circumboreal *H. selago* (for distinctions see Beitel & Mickel 1992; Brunton, Wagner, & Beitel 1992; Haines 2003a), the case for the distinctness of *H. appressa* is confirmed by the production of sterile (abortive-spored) hybrids where it co-occurs with *H. selago*. [= Z = *H. appalachiana* Beitel & Mickel – FNA, K; < Lycopodium selago Linnaeus – RAB, S, W; < Lycopodium selago Linnaeus var. appressum (Desvaux) Petrovic – C, F; > < Lycopodium selago var. selago – C, G]

Huperzia × bartleyi (Cusick) Kartesz & Gandhi [H. lucidula × porophila]. Rock outcrops. Reported for NC by Waterway (1986). This hybrid can be told from its parents by the presence of stomates on both surfaces of the leaf (unlike *H. lucidula*), but their marked lower density on the upper surface (unlike *H. porophila*). [= K, Z]

Huperzia × protoporophila A. Haines [H. appressa × lucidula]. Rock outcrops and cliff bases. Known from Chimney Rock Park, Rutherford County, NC (the lowest elevation occurrence of *H. appressa* in NC) and from Roan Mountain, Mitchell County, NC, and Grandfather Mountain, Avery County, NC. Expected at other cliff bases where the two parents are in proximity. This hybrid can be told from its parents by the presence of stomates on both surfaces of the leaf (unlike *H. lucidula*), but their marked lower density on the upper surface (unlike *H. appressa*). An additional useful character is the distribution of gemma-bearing branches: those of *Huperzia appressa* are abundantly distributed throughout the apical portion of mature plants, while those of the hybrid are confined to 1 or 2 pseudowhorls at the apex of annual growth (i.e., there are large gaps between the pseudowhorls of gemma-bearing branches). [= Z]

2. Lycopodiella Holub 1964 (Bog Clubmoss)
may be found in the Southeastern Coastal Plain. This group is variously treated as genus *Lycopodiella*, or as *Lycopodiella* section *Lycopodiella* (Øllgaard in Kramer & Green 1990, Wikström & Kenrick 2000). References: Wagner & Beitel in FNA (1993b); Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000); Haines (2002a, 2003a, 2003b)=Z.  [also see *Pseudolycopodiella*]

**Identification notes:** Species of this genus are difficult to identify. They often grow together; it is not uncommon to find two or more species at a single site in the Coastal Plain. Hybrids occur. Juvenile plants, resprouting in spring or after fire, are especially difficult to identify. In contrast to the other species, *Pseudolycopodiella caroliniana* and, to a lesser degree, *L. prostrata*, are dorsiventrally flattened (or apparently distichous), but it seems that juvenile sprouts of all species are somewhat flattened.

1 Leaves of the horizontal shoots entire (rarely those toward the shoot apex with a few teeth); horizontal shoots, excluding the leaves, 0.5-0.9 (-1.0) mm in diameter; each horizontal shoot segment commonly producing a single upright shoot; [in our area, a plant of the Mountains].............

2 Fertile leaves (sporophylls) 2.9-5.0 (-5.2) mm long, appressed at maturity, entire or with short teeth < 0.3 mm long; strobili 3-6 mm in diameter at maturity.........................................................L. inundata

3 Prostrate stems arching, not in contact with the ground (and rooting) all along their length, 8-11 mm wide (including leaves), the stem (stripped of leaves) 2-4 mm in diameter; leaves of the prostrate stem of one size and shape, spreading to ascending, 5-7 mm long, 0.5-0.7 mm wide; erect stems many, equally spaced along the prostrate stems, progressively shorter and sterile toward the apex of the prostrate stems.................................L. alopecuroides

4 Prostrate stems creeping, in contact with the ground (and rooting) all along their length, 12-19 mm wide (including leaves), the stem (stripped of leaves) 1-2.2 mm in diameter; leaves of the prostrate stems dimorphic, spreading to reflexed, the upper leaves smaller (4-5 mm long, 0.4-0.6 mm wide) than the lateral leaves (7-8 mm long, 0.7-1.8 mm wide); erect stems few, clustered well behind the apex of the prostrate stems, mostly fertile and subequal in length...............................................................L. prostrata

**Lycopodiella alopecuroides** (Linnaeus) Cranfill, Foxtail Clubmoss. Savannas, seepages, and other wet, sandy sites. July-September. Primarily Southeastern Coastal Plain: se. MA south to FL and west to e. TX, and disjunct in the Cumberland Plateau of KY, TN, and VA, the Allegheny Mountains of WV (Morton et al. 2004), the e. Highland Rim of TN, and in ME (Haines 2001); s. Mexico south through Central America to n. South America; Cuba. [= FNA, K, Z; *Lycopodium alopecuroides* Linnaeus – RAB; = Lycopodium alopecuroides Linnaeus – C, F, G, Md, S, W]

**Lycopodiella inundata** (Linnaeus) Holub, Northern Bog Clubmoss. Gravelly or sandy seepage areas, bogs. July-September. A circumboreal species, ranging south in the Appalachians to NC, where it was first found in 1986 (Weakley, *in prep.*). [= FNA, K, Z; *Lycopodium inundatum* Linnaeus – C, Md, W, WV; = Lycopodium inundatum var. inundatum – F, G]

**Lycopodiella prostrata** (Harper) Cranfill, Featherstem Clubmoss, Prostrate Bog Clubmoss. Savannas, seepages. July-September. A Southeastern Coastal Plain endemic: se. NC south to FL and west to TX, with scattered occurrences disjunct inland (as in n. GA and n. AL). [= FNA, K; < *Lycopodium alopecuroides* – RAB; = Lycopodium prostratum Harper – C, S]

All pairwise combinations of sympatric species form fertile hybrids (only *L. inundata* and *L. prostrata* are entirely allopatric and not known to hybridize). The following hybrids would be expected where the parents grow together.

**Lycopodiella alopecuroides × appressa.** [= *Lycopodiella×copelandii* (Eiger) Cranfill – K, Z; *Lycopodium×copelandii* Eiger]

**Lycopodiella alopecuroides × prostrata.** [= *Lycopodiella×brucei* Cranfill – K; = *Lycopodium×brucei* (Cranfill) Lellinger]

**Lycopodiella appressa × inundata.** [b *Lycopodiella×gilmani* A. Haines – Z]. Earlier tentative reports of *Lycopodiella margueritae* J.G. Bruce, W.H. Wagner, & Beitel for the Mountains of Virginia are apparently based on this hybrid. See Haines (2003a, 2003b) for additional information. [= *Lycopodiella margueritae* J.G. Bruce, W.H. Wagner, & Beitel – K, misapplied; = *Lycopodiella×gilmani* A. Haines – Z]

**Lycopodiella appressa × prostrata.**

A genus of about 12 species, sub-cosmopolitan. This group has often been treated as section of Lycopodium (or of Lycopodiella); it appears to warrant status as a genus separate from Lycopodiella. In addition to the morphologic distinctions, this species has considerable anatomical differences, a different base chromosome number than the four species of Lycopodiella (x = 35 vs. x = 78), and does not hybridize with Lycopodiella (Wagner & Beitel 1992). Øllgaard in Kramer & Green (1990) and Wikström & Kenrick (2000) retain it as Lycopodiella section Caroliniana. References: Wagner & Beitel in FNA (1993b); Haines (2003a)–Z; Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000).

Pseudolycopodiella caroliniana (Linnaeus) Holub, Carolina Bog Clubmoss, Slender Clubmoss. Savannas, seepages. July-September. This species occurs in se. North America, the West Indies, and is widespread in the Southern Hemisphere; in North America, it ranges from MA south to s. FL and west to e. TX. [= FNA; Z = Lycopodium carolinianum Linnaeus – C, F, G, Md, RAB, S; > Lycopodiella caroliniana (Linnaeus) Pichi Sermolli var. caroliniana – K]

4. Palhinhaea Vasconcellos & Franco 1967 (Nodding Clubmoss)
A genus of 10-15 species, tropical and subtropical. This group is variously treated as the genus Palhinhaea or as Lycopodiella section Campylostachys (Øllgaard in Kramer & Green 1990, Wikström & Kenrick (2000). References: Wagner & Beitel in FNA (1993b); Øllgaard in Kramer & Green (1990); Wikström & Kenrick (2000).

Palhinhaea cernua (Linnaeus) Vasconcellos & Franco, Nodding Clubmoss, Staghorn Clubmoss. Wet savannas, ditches and other disturbed moist areas. This species is pantropical, occurring in both the Neotropics and the Paleotropics. Some of its occurrences in our area may be adventive. [= FNA; =? Lycopodiella cernua (Linnaeus) Pichi Sermolli var. cernua – K = Lycopodium cernuum Linnaeus – S]

5. Dendrolycopodium A. Haines 2003 (Tree-clubmoss)
A genus of 4 species, temperate and subarctic. Haines (2003a) makes the case for this genus as distinct from Lycopodium s.s. and other relatives. References: Wagner & Beitel in FNA (1993b); Wagner, Beitel, & Moran (1989); Hickey (1977); Øllgaard in Kramer & Green (1990); Haines (2003a)–Z.

1 Leaves of the main vertical axis spreading (30-90° angle to stem) in the vicinity of the lower lateral branches, prickly to the touch; branchlets round in cross-section, the 6 ranks of leaves (2 lateral ranks, 2 adaxial ranks, and 2 abaxial ranks) equal in length and spreading to ascending.

1 Leaves of the main vertical axis appressed (15-30° angle to stem) in the vicinity of the lower lateral branches, soft to the touch; branchlets slightly to strongly dorsiventrally flattened in cross-section, the 6 ranks of leaves (4 lateral ranks, 1 adaxial rank, 1 abaxial rank) round or slightly to very unequal, the abaxial leaves more appressed and mostly shorter than (to equal to) the spreading lateral leaves.

2 Abaxial leaves of the horizontal branchlets about the same length as the lateral leaves; leaves of all the ranks spreading at a (21°-) ca. 27° (-36°) angle from the branchlet, thus the branchlet and leaves together ca. 6-9 mm wide = D. obscurum

Dendrolycopodium dendroideum (Michaux) A. Haines, Tree Ground-pine, Round-branch Clubmoss, Prickly Tree-clubmoss. Openings, grassy balds, high elevation spruce-fir and northern hardwood forests. July-September. The northernmost of the L. obscurum complex, ranging from n. QC and NL (Newfoundland) west to AK, south to s. NJ, w. NC, MO, MN, SD, CO, MT, ID, and WA; also in Asia. [= Z; < Lycopodium obscurum var. dendroideum (Michaux) D.C. Eaton – RAB, F, G, Md, WV; = Lycopodium dendroideum Michaux – FNA, K, W; < L. obscurum – C]

Dendrolycopodium obscurum (Linnaeus) A. Haines, Common Ground-pine, Flat-branched Tree-clubmoss. Acidic forests; July-September. NS and NB west to MI and WI, south to n. GA, ne. AL, s. IN, n. IL, and c. MN. [= Z; = Lycopodium obscurum Linnaeus – FNA, K; = Lycopodium obscurum var. obscurum – F, G, Md, RAB, W, WV; < L. obscurum – C, S]

6. Diphasiastrum Holub 1975 (Flat-branched Clubmoss, Running Cedar)

1 Foliage dark green, not glaucous; horizontal branchlets 2-4 mm wide (including the leaves); branchlets without conspicuous annual constrictions; rhizomes 0-1 cm deep (which can be determined by pulling up a single upright shoot – the depth to rhizome is approximately the length of the white portion of the vertical stem); abaxial rank of leaves shorter than lateral ranks (thus the branchlets flat in cross-section).

**Diphasiastrum digitatum** (Dillenius ex A. Braun) Holub, Common Running-cedar, Fan Ground-pine. Dry to mesic, usually acid forests and openings, especially common in disturbed sites, such as successional pine forests. July-September. NL (Newfoundland) west to MN, south to SC, GA, AL, MS, and AR. Hickey & Beitel (1979) and Holub (1979a & 1975b) explain the nomenclatural decision to accept the epithet 'digitatum' over the more familiar 'flabelliforme.' [= FNA, Z; = *Lycopodium flabelliforme* (Fernald) Blanch – Md, RAB, S, WV; = *Lycopodium digitatum* Dillenius ex A. Braun – C, K, W; = *Lycopodium complanatum* Linnaeus var. *flabelliforme* Fernald – F, G]

*Diphasiastrum ×habereri* (House) Holub [D. *digitatum* × *tristachyum*]. Mt (KY, NC, VA, WV), Pd (VA): dry forests; rare. Known from widely scattered localities in our area; not always in close proximity to its parents. [= FNA, Z; = *Lycopodium × habereri* House – K; = L. ×*habereri* – WV, orthographic error] [not keyed; not mapped]

**Diphasiastrum tristachyum** (Pursh) Holub, Blue Running-cedar, Ground-cedar. Dry forests, glades, balds, barrens, forest openings. July-September. NL (Labrador) west to AB, south to nw. SC, ne. GA, ne. AL, MO, MN, and e. ND. [= FNA, Z; = *Lycopodium tristachyum* Pursh – C, F, G, K, Md, RAB, S, WV, WV]

7. *Spinulum* A. Haines (Bristly Clubmoss)

A genus of 3 species, north temperate and subarctic. References: Wagner & Beitel in FNA (1993b); Wagner, Beitel, & Moran (1989); Hickey (1977); Öllgaard in Kramer & Green (1990); Haines (2003a)=Z.

**Spinulum annotinum** (Linnaeus) A. Haines, Stiff Clubmoss, Bristly Clubmoss. High elevation hardwood or coniferous forests. August-October. A circumboreal species, south in North America to n. NJ, MN, SD, NM, AZ, and OR, and in the Appalachians to WV, sw. VA, and e. TN (Blount County). Two varieties have been considered to reach our area in VA: var. *acrifolium* Fernald and var. *annotinum*. They are doubtfully distinct but need further study. This species was reported for NC by Lellinger (1985) and FNA, and is apparently indicated as occurring in NC on the range map in Mickel (1979); there is apparently no documentation for these reports, though the species occurs in Grayson County, VA, a county adjacent to NC. [= Z; = *Lycopodium annotinum* Linnaeus – C, FNA, K, W; > *L. annotinum* var. *acrifolium* Fernald – F, G, WV; > *L. annotinum* var. *annotinum* – F, G, Md, WV; > *L. annotinum* var. *pungens* (La Pylaie) Desvaux – WV]

8. *Lycopodium* Linnaeus 1753 (Running Clubmoss)

A genus of 5-10 species, mainly temperate and subarctic. The fractionation of *Lycopodium* has resulted in the creation of more natural genera, more comparable to those in other groups of plants. References: Wagner & Beitel in FNA (1993b); Wagner, Beitel, & Moran (1989); Hickey (1977); Öllgaard in Kramer & Green (1990); Haines (2002b, 2003a)=Z. [also see *Dendrolycopodium*, *Huperzia*, *Lycopodiella*, *Palhinhaea*, *Pseudolycopodiella*, and *Spinulum*]

1 Strobili (1-) 2-5, borne on alternate "pedicels" branching from the central "peduncle"; leaves 4-6 mm, spreading to loosely ascending; upright shoots each usually bearing 3-6 branches ................................................................. *L. clavatum*

1 Strobili 1 rarely 2, if then, the 2 strobili not on separate "pedicels," but sessile and paired at the top of the "peduncle"; leaves 3-5 mm long, ascending to appressed; upright shoots each usually bearing 2-3 branches ................................................................. *L. lagopus*

**Lycopodium clavatum** Linnaeus, Running Clubmoss. Openings, balds, roadbanks, open forests. July-September. Circumboreal, south in e. North America along the Appalachians to NC and n. GA; also c. Mexico south through Central America to n. South America; West Indies. [= RAB, FNA, K, Md, W, Z; < *L. clavatum* – C, WV]; = *L. clavatum* var. *clavatum* – F, G, S]

L1. LYCOPODIACEAE

L2. ISOETACEAE Reichenbach 1828 (Quillwort Family, Merlin’s-grass Family) [in ISOETALES]

A family of a single genus and about 300 species. Isoetaceae, along with Selaginellaceae and Lycopodiaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). References: Jermy in Kramer & Green (1990).

**Isoetes** Linnaeus 1753 (Quillwort, Merlin’s-grass)

Identification notes: Hybrids are possible between many combinations of species.

Key fragment to eastern granite outcrop species by Heafner et al (in prep.)

1 Megaspores black or gray, leaves usually no more than 5.0 cm long.
2 Corms transversely oblong to oblong, roots dichotomously branched, phyllotaxy spiraled .......................................................
   I. melanospora
3 Corms horizontally elongate, roots fibrous and not dichotomously branched, phyllotaxy distichous ...............................................
   I. tegetiformans
1 Megaspores white, leaves to 18.7 cm long or longer.
3 Plants diploid (2n = 22); [widespread from VA to AL in the Piedmont] ....................................................................................
   I. piedmontana
3 Plants tetraploid (2n = 44); [narrow endemics (as far as is known) to a few counties in the Piedmont of AL and NC].
4 Velum covering 0-10% of the sporangium; leaves (7.9-) avg. 11.5 (-14.9) cm long; [endemic to Franklin County, NC] .................
   I. species 5 “analogous”
   I. species 6 “alabamensis”
4 Velum covering approximately 10-20% of the sporangium; [endemic to Randolph County, AL, or Wake County, NC].
5 Leaves (5.9-) avg. 11.9 (-18.9) cm long; [endemic to Randolph County, AL] ...............................................
   I. species 5 “analogous”
5 Leaves (4.2-) avg. 9.3 (-14.2) cm long; [endemic to Wake County, NC] ..................................
   I. species 4 “carolinae-septentrionalis”

**Isoetes acadiensis** L. Kott, Acadian Quillwort. Freshwater tidal marshes. A tetraploid species (2n=44). [= FNA, K; < I. tuckermanii A. Braun – C, F, G]

**Isoetes boomii** N. Luebke, Boom’s Quillwort. Shallow water of slow-moving streams. Known from Laurens County, GA, AL, and FL. A hexaploid species (2n=66). [= FNA, K; < I. boomii – Z (also see I. georgiana)]

**Isoetes butleri** Engelmann, Butler’s Quillwort. See page areas on calcareous glades. Occurs in calcareous areas of the Midwest, extending east to c. TN, nw. GA (Jones & Coile 1988), and n. AL. A diploid species (2n=22), genotype=BB. [= C, F, FNA, G, K, S, Z]

**Isoetes engelmannii** A. Braun. Usually in permanent water bodies with active current. A diploid species (2n=22). Apparently there are 2 cryptic taxa currently comined under the name I. engelmannii (Hoot, Napier, & Taylor 2004), genotype NN and genotype SS. [= K, Z; < I. engelmannii – RAB, C, G, FNA, W, WV (also see I. appalachiana, I. hyemalis, and I. valida); < I. engelmannii var. engelmannii – F, S]

**Isoetes flaccida** A. Braun var. alata Pfeiffer, Winged Florida Quillwort. Springs, stream bottoms, river bottoms, ditches. S. GA south to s. FL. A diploid species (2n=22). [= K, S; < I. flaccida FNA, Z]

**Isoetes flaccida** A. Braun var. chapmanii Engelmann, Chapman’s Florida Quillwort. Springs, stream bottoms, river bottoms, ditches. FL Panhandle. A diploid species (2n=22). [= K, S; < I. flaccida FNA, Z]
**L3. ISOETACEAE**

*Isoetes hyemalis* D.F. Brunton, Wintergreen Quillwort. Blackwater streams and sandy streambanks. Sc. VA south through e. and c. NC to GA, AL, and FL Panhandle (Nelson 2000), in the Coastal Plain and lower Piedmont. A tetraploid species (2n=44), apparently derived from 2 unknown or extinct species, X and Y (Hoot, Napier, & Taylor 2004). See Brunton, Britton, & Taylor (1994) and Brunton & Britton (1996a) for additional information on this species. [= K, Z; <I. engelmannii var. engelmannii – F, S]

*Isoetes louisianensis* Thieret, Louisiana Quillwort. Small streams. S. AL, MS, and LA. [= FNA, K] {add to synonymy}

**L3. ISOETACEAE**

*Isoetes species 4* “carolinae-septentrionalis”. Granite flatrocks

*Isoetes species 5* “analogous”. Granite flatrocks.

*Isoetes species 6* “alabamensis”. Granite flatrocks.

*Isoetes species 8* “tegetiformans” Rury, Merlin’s-grass. In shallow pools on granite flatrocks. Endemic to a few granite flatrocks in ec. GA (notably Heggies Rock), near the SC line. A diploid species (2n=22), genotype=TT. [= FNA, K, Z]

*Isoetes tenella* Léman, Spiny-spore Quillwort. In acid lakes, ponds, and rivers (submerged to emersed), tidal mud flats. Circumboreal, in North America from Greenland, NL (Labrador), and AK south to DE, n. OH, MI, WI, CO, and CA. South to PA and NJ (Kartesz 1999). [= K; = I. echinospora Durieu – FNA; > I. echinospora var. echinospora – F, G; > I. echinospora var. muricata (Durieu) Engelmann – C, F, G; > I. echinospora var. braunii (Durieu) Engelmann – G; > I. muricata Durieu] [synonymy incomplete]

*Isoetes tuckermanii* A. Braun, Tuckerman’s Quillwort. South to MD (Kartesz 1999). A tetraploid species (2n=44), apparently derived from hybridization of a northern *I. engelmannii* entity and an unknown or extinct species, Z (Hoot, Napier, & Taylor 2004), genotype=NNZZ. [= FNA, K; < I. tuckermanii – C, F, G]

**L3. SELAGINELLACEAE** Willkomm 1854 (Spikemoss Family) [in SELAGINELLALES]

A family of a single genus (as currently broadly conceived) and about 700-750 species. References: Valdéspin in FNA (1993b); Tryon (1955); Lellinger (1985); Buck (1977); Somers & Buck (1975); Jermy in Kramer & Green (1990). Key adapted in part from Valdéspin in FNA (1993b).

**Selaginella** Palisot de Beauvois 1804 (Spikemoss)

As currently conceived broadly, a genus of about 700-750 species, cosmopolitan, but mostly tropical. It appears likely that *Selaginella* will be subdivided, based on morphology and molecular phylogenetic analyses (Soják 1992; Škoda 1997; Korall, Kenrick, & Therrien 1999). Selaginellaceae, along with Lycopodiaceae and Isoetaceae, now appear to be only distantly related to other extant pteridophytes and seed plants (Pryer et al. 2001). References: Valdéspin in FNA (1993b); Tryon (1955); Lellinger (1985); Buck (1977); Somers & Buck (1975); Jermy in Kramer & Green (1990). Key adapted in part from Valdéspin in FNA (1993b).

---

1 Sterile leaves dimorphic, in 4 ranks, the ventral pair spreading laterally, the dorsal pair ascending; leaves acute, mucronate, lacking a white or translucent apical hair-tip; fertile branch tips strongly differentiated (into strobili) from the sterile portions of the stem; [subgenus *Stachygynandrum* or genus *Lycopodioides*]

2 Main stems erect, the plants to 5 dm tall

3 Lateral leaves of the main stems 2.5-4 mm long, elliptic; lateral stems ascending or erect, 2-6 cm long; rhizophores (modified, leafless, root-producing shoots) borne on the upper side of the stem
L2. SELAGINELLACEAE

Sterile leaves monomorphic, spirally arranged around the stems; leaves acuminate and with a white or translucent apical hair-tip (the hair-tip rarely lost); fertile branch tip only slightly differentiated from the sterile portions of the stems; [subgenus Tetragonostachys or genus Bryodesma].

Apical hair-tip of the leaves twisted-contorted, 1.2-1.7 mm long (sometimes deciduous); strobili 3-6 mm long, 1.5-2 mm wide; leaves 0.15-0.3 mm wide, the marginal cilia absent, too brittle, or as much as 1/6 as wide as the leaf blade; budlike “arrested” branches present...

Apical hair-tip of the leaves straight, 0.3-1.4 mm long (sometimes deciduous); strobili (5-) 10-35 mm long, 1-1.5 mm wide; leaves 0.2-0.45 mm wide, the marginal cilia 1/4-1/3 as wide as the leaf blade; budlike “arrested” branches present or absent.

Stems mostly creeping or turned up at the apex, forming mats 1.5-4 cm high; rhizome or rhizomatous stem absent; aerial roots present all along the stems; budlike “arrested” branches absent..............................S. rupestris

Stems mostly erect or ascending, forming compact clumps usually > 4 cm high; rhizome or rhizomatous stem present; aerial roots present only at or near the base of the erect stems; budlike “arrested” branches present.

LEAVES OF THE UNDERGROUND (RHIZOMATOUS) STEMS NOT SCALEDLIKE; RHIZOPHORES MOSTLY AERIAL; SPOРОPHYLL BASE PUBESCENT; LEAF AND SPOРОPHYLL APICES OFTEN PUBESCENT..............................S. acanthonota

LEAVES OF THE UNDERGROUND (RHIZOMATOUS) STEMS SCALELIKE; RHIZOPHORES MOSTLY SUBTERRANEAN; SPOРОPHYLL BASE GLABROUS; LEAF AND SPOРОPHYLL APICES GLABROUS.

LEAVES MOSTLY TIGHTLY APPRESSED; BASE CONVIXY PUBESCENT; STROBILI DISTINCTLY LARGER IN DIAMETER THAN THE SUBTENDING STEM; SPOРОPHYL AXEP OFTEN RECURRED.............................S. arenicola

LEAVES MOSTLY LOOSELY APPRESSED; BASE USUALLY GLABROUS; STROBILI NOT DISTINCTLY LARGER IN DIAMETER THAN THE SUBTENDING STEM; SPOРОPHYL AXEP USUALLY STRAIGHT.............................S. corallina

Selaginella acanthonota Underwood, Spiny Spikemoss, Sand Spikemoss. Sandhills, Altamaha Grit glades. June-August. S. acanthonota ranges from se. NC south to s. FL, west to w. Panhandle FL. The complex comprising S. acanthonota, S. arenicola, and S. riddellii has been controversial. The complex ranges from se. NC south to s. FL and west to c. TX; see Tryon (1955) and Valdespino in FNA (1993b) for additional information on the complex. [= FNA, K; < S. arenicola – RAB; = S. arenicola Underwood ssp. acanthonota (Underwood) R. Tryon; = Bryodesma acanthonota (Underwood) Škoda]

Selaginella apoda (Linnaeus) Spring, Meadow Spikemoss. Seepages, bogs, spray cliffs, stream margins, wet meadows, marsh edges, wet spots in lawns, other moist habitats. June-October. S. ME, NY, OH, s. IN, AR, and e. OK south to FL, GA, AL, MS, LA, and e. TX; c. Mexico south to Guatemala. Often overlooked by vascular plant botanists as a moss or liverwort. S. ludoviciana of the Gulf Coast east to GA, and S. elegans, more northern, are superficially very similar. [= C, F, FNA, G, K, Md, RAB, W, WV; = Diplostachyon apodum (Linnaeus) Beauvois – S; = Lycopodioidea apodum (Linnaeus) Kunze]

* Selaginella braunii Baker. Treelet Spikemoss, Braun’s Spikemoss. Naturalized around graveyards or gardens; rare, introduced, native of China. [= FNA, K; = Lycopodioidea species 1]

Selaginella corallina (Riddell) Wilbur & Whitson. Riddell’s Spikemoss. Dry sands, granite outcrops, sandstone outcrops. E. and c. GA west to c. TX and s. OK. See Wilbur & Whitson (2005) for an explanation of the nomenclatural change. [= S. arenicola Underwood ssp. riddellii (Van Eseltine) R.M. Tryon – FNA, K; = Bryodesma arenicola (Underwood) Sojak ssp. riddellii (Van Eseltine) Škoda]

* Selaginella kraussiana (Kunze) A. Braun, Krauss’s Spikemoss, Mat Spikemoss. Naturalized around gardens or lawns; native of s. Africa. [= FNA, K; Lycopodioidea species 2]

Selaginella ludoviciana (A. Braun) A. Braun, Gulf Spikemoss, Louisiana Spikemoss. Swamp margins, wet meadows. Gulf Coastal Plain from ne. FL and sw. GA west to e. L.A. [= FNA, K; = Diplostachyon ludovicianum (A. Braun) Small – S; = Lycopodioidea ludovicianum (A. Braun) Kunze]

Selaginella rupestris (Linnaeus) Spring, Rock Spikemoss. Granite flatrocks, other, mostly acidic, rock outcrops, occasionally on greenstone or calcareous shales. June-September. S. Greenland and NS west to BC, south to GA, AL, AR, OK, and WV. Valdespino in FNA (1993b) suggests that two or more cryptic or semicryptic species are present within what is currently called S. rupestris; additional study is needed. [= C, F, FNA, G, K, Md, RAB, S, W, WV; = Bryodesma rupestris (Linnaeus) J. Sojak]

Selaginella tortipila A. Braun, Twisted-hair Spikemoss. Rock outcrops, mostly at high elevations. July-September. Endemic to the Southern Appalachians (rarely into the Piedmont) of NC, SC, and GA. Occurring close to TN and VA; it should be sought there. [= RAB, FNA, K, S, W; = Bryodesma tortipila (A. Braun) J. Sojak]
* Selaginella uncinata (Desvaux ex Poiret) Baker, Blue Spikemoss. Moist forests; native of China. Introduced in sw. GA and other places in the Southeastern United States. [= FNA, K, Lycopodioides species 3]
**SECTION 2: MONILOPHYTA (FERNS)**

Family circumscriptions and sequence follow Christenhusz, Zhang, & Schneider (2011), with relatively minor modifications from Smith et al. (2006). References: Smith et al. (2006); Christenhusz, Zhang, & Schneider (2011).

**F4. EQUISETACEAE** Michaux ex de Candolle 1804 (Horsetail Family) [in EQUISETALES]

A family with a single genus and about 15 species. References: Hauke in FNA (1993b); Lellinger (1985); Mickel (1979); Hauke in Kramer & Green (1990); Des Marais et al. (2003).

_Equisetum_ Linnaeus 1753 (Horsetail, Scouring Rush)

A genus of about 15 species, nearly cosmopolitan in distribution. References: Hauke in FNA (1993b); Lellinger (1985); Mickel (1979); Hauke in Kramer & Green (1990); Des Marais et al. (2003).

1 Stems perennial, evergreen, stiff; sterile and fertile stems monomorphic and either unbranched or with 2-3 short and unequal branches per node; [subgenus **Hippochaete**].
2 Main erect stems unbranched (rarely branched as a result of injury); stems 3-18 mm in diameter; stomatal lines 1 on each slope of the stem ridges. .................................................. **E. hyemale** ssp. **affine**
3 Main erect stems usually with 2-3 branches at the nodes; stems 1.5-7 mm in diameter; stomatal lines 1-2 on each slope of the stem ridges. .......................................................................................................................... **E. ramosissimum** ssp. **ramosissimum**

**Equisetum ×ferrissii** Clute (pro sp.) [= _E. hyemale × laevigatum_]. Riverbanks, wet forests. There are old reports, repeated in RAB, S, and FNA, of the occurrence of _E. ×ferrissii_ in NC and SC; documentation of these reports is not known; it is reported for Prince George's County, MD (Shetler & Orli 2000) and for KY (Campbell & Medley 2007). _E. ×ferrissii_ may be distinguished from _E. hyemale_ var. _affine_ (to which it will key above) by the failure of its cones to produce spores at all or the production of aborted spores (vs. production of normal spores) and most stem sheaths lacking a blackish band well below the teeth (vs. most stem sheaths with a narrow to broad blackish band well below the teeth). [= C, F, K; = _ferrissii Clute – G; = Hippochaete ×ferrissii (Clute) Škoda & Holub] [not yet keyed]

**Equisetum laevigatum** A. Braun. [habitats]. QC and BC south to NY, w. PA, s. OH, s. IN, s. IL, AR, r. TX, NM, AZ, CA, and n. Mexico. There are old reports, repeated in RAB, and S, of this species further south; documentation of these reports is not known. It will key to _E. hyemale_ ssp. _affine_ in the above key, but has the strobilus apex rounded (vs. pointed), and aerial stems annual (vs. perennial). [= C, FNA, G, K; > _E. hyemale_ Linnaeus var. _intermedium_ A.A. Eaton – F; > _E. kansanum_ Schaffner – F; = Hippochaete _laevigata_ (A. Braun) Farwell] [not yet keyed]

**Equisetum ×litorale** Kühlwein ex Ruprecht (pro sp.) [× _E. fluviatile_] is reported by FNA for VA. It can be distinguished from _E. arvense_ by its white, misshapen spores. [= C, F, FNA, K; = _E. litorale_ Kühlwein ex Ruprecht – G] [not yet keyed]

* **Equisetum ramosissimum** Desfontaines ssp. _ramosissimum_, Branched Scouring Rush. Disturbed areas; native of the Old World, where it is widespread in Europe, Asia, and Africa. This species was apparently introduced long ago on ship's ballast to various old ports, such as Wilmington (New Hanover County, NC), Pensacola (Escambia County, FL) and New Orleans, LA. It is naturalized on the Wilmington waterfront, persisting in disturbed areas, such as in gravel along railroad tracks. Hauke (1979, 1984, 1992) discusses the occurrence of this species in North America. Ssp. _dehile_ (Roxburgh) Hauke occurs in se. Asia and southern Pacific Islands; it is not known to be naturalized in North America. [= FNA; = _E. ramosissimum_ – K; = Hippochaete _ramosissima_ (Desfontaines) Farwell ssp. _ramosissima_;
**Equisetaceae** (F4)

**F5. Ophioglossaceae** (R. Brown) Agardh 1822 (Adder's-tongue Family) [in OPHIOGLOSSALES]

A family of 7-8 genera and about 75-115 species. The Ophioglossaceae is only distantly related to the leptosporangiate ferns; Kuo et al. (2011) and Pryer et al. (2004) indicate that it is most closely related to Psilotaceae. References: Wagner & Wagner in FNA (1993b); Wagner in Kramer & Green (1990).

1 Sterile portion of the leaf simple, unlobed; fertile stalks unbranched, the sporangium embedded in a linear spike............... 1. *Ophioglossum*
1 Sterile portion of the leaf blade pinnate, pinnatifid, or more divided; fertile stalks branched, the sporangium sessile or stalked.
2 Fertile stalk joined to stalk of sterile leaf blade near the rhizome, far below the base of the leaf blade, and usually at or below the surface of the ground; leaves evergreen ................................................................. 3. *Sceptridium*
2 Fertile stalk joined to stalk of sterile leaf blade near the base of the leaf blade, far above the rhizome, and usually well above the surface of the ground; leaves deciduous.
3 Sterile portion of the leaf blade 1-2-pinnate; plants usually < 20 cm tall; sterile blade fleshy in texture, 1-8 cm long............ 1. *Botrychium*
3 Sterile portion of the leaf blade 3-pinnate or even more finely divided; plants (9-) 30-50 cm tall; sterile blade herbaceous in texture, 10-40 cm long ......................................................... 2. *Botrypus*

1. *Ophioglossum* Linnaeus 1753 (Adder's-tongue)

1 Underground stem globose, nearly spherical, 3-11 mm in diameter; fertile spikes commonly with a conspicuous, acute or truncate sterile portion (apiculum) at its apex; sterile blade 1-4 cm long, 0.5-2.5 cm wide, borne horizontally near the ground............. *O. crotalophoroides*
1 Underground stem narrowly cylindrical or irregularly elongate, 2-4 mm in diameter; fertile spikes without a sterile portion at the apex or the sterile portion inconspicuous; sterile blade 0.5-10 cm long, 0.2-5.5 cm wide, borne horizontally, ascending, or vertically.
2 Sterile blade 0.1-1 cm wide, the polygonal venation areoles usually lacking both smaller areoles and free included veinlets..... *O. rudicaule*
2 Sterile blade (0.5-) 1.2-5 cm wide, the polygonal venation areoles either with smaller areoles or with free included veinlets....
3 Large areoles of the of the sterile blade subdivided into smaller areoles, further subdivided into smaller areoles and free veinlets; sterile blade apiculate ................................................................. *O. engelmannii*
3 Large areoles of the sterile blade subdivided into smaller areoles, which lack free veinlets; sterile blade obtuse or acute.
4 Sterile blade ovate-lanceolate, the base obtuse to nearly truncate, broadest < ¼ of the way from the base to the apex; primary areoles mostly > 2 mm wide, without included veinlets ................................................................. *O. petiolatum*
4 Sterile blade ovate to elliptic, the base cuneate to obtuse, broadest between one quarter and one half of the way from the base to the tip; primary areoles mostly < 2 mm wide, with included veinlets.
5 Sterile blade elliptic, broadest near the middle, acute to attenuate at the base, pale green, dull, herbaceous in texture; basal frond sheath membranaceous and ephemeral; spores 50-60 μ in diameter................................................................. *O. pusillum*
5 Sterile blade ovate, broadest below the middle, obtuse at the base, dark green, shiny, firm in texture; basal frond sheath leathery and tending to persist; spores 35-45 μ in diameter ................................................................. *O. pycnostichum*

*Ophioglossum crotalophoroides* Walter, Bulbous Adder's-tongue. Moist ditch banks and grassy roadside flats. March-September. E. NC (Dare County) south to FL and west to TX; also in Mexico, the West Indies, Central America, and South America. [= RAB, FNA, S, WH; > *O. crotalophoroides var. crotalophoroides* – K; > *O. crotalophoroides var. nanum* Osten ex de Lichtenstein – K]  

*Ophioglossum rudicaule* Linnaeus f., Slender Adder's-tongue. Lawns and other moist, grassy areas. E. NC south to s. FL, west to TX; also in Mexico, the West Indies, Central and South America, Asia, and Africa. First reported from NC by Thomas & Marx (1979). [= RAB, FNA, K, WH; > *O. rudicaule* E.P. St. John – S; > *O. mononerve* E.P. St. John – S; > *O. tenerum Mettenius – S]  

*Ophioglossum petiolatum* Hooker, Long-stem Adder's-tongue. Maritime wet grasslands, moist ditch banks, and grassy roadside flats. March-November. Se. VA south to FL and west to TX and OK; also in the West Indies, Mexico, n. South America, and Asia. First reported for NC by Thomas & Marx (1979). Wagner & Wagner in FNA (1993b) suggest that this species is likely introduced in North America. [= RAB, FNA, K, WH; > *O. floridanum* E. St. John – S]
**Ophioglossum pusillum** Rafinesque, Northern Adder's-tongue. Wet meadows, swamp edges. March-July. NS west to ND and BC, south to w. VA, n. IN, n. IL, and w. NE, w. WY, w. MT, and CA. [= FNA, K = O. vulgatum Linnaeus var. pseudopodium (Blake) Farwell – C, F, WV; < O. vulgatum – G]

**Ophioglossum pycnostichum** (Fernald) A. & D. Löve, Southern Adder's-tongue. Bottomland forests, moist loamy soils of successional forests and old fields. March-July. S. NJ, IN, IL, and s. MI south to GA, MS, and e. TX; s. Mexico. O. vulgatum (defined narrowly) is Eurasian. The best treatment of this complex remains uncertain. [= W; = O. vulgatum Linnaeus var. pycnostichum Fernald – RAB, C, F, WV; < O. vulgatum Linnaeus – FNA, G, K, S]

2. **Botrypus** Richard 1801 (Rattlesnake Fern)

**Botrypus virginianus** (Linnaeus) Holub, Rattlesnake Fern, Sang-find. In a wide range of fairly dry, mesic, and wet forests, cove forests, especially in nutrient-rich, moist bottomlands and slopes. April-June. NL (Newfoundland) and BC south to n. peninsular FL and CA, and Mexico south through Central America and n. South America; West Indies; Asia; Australia; scattered in Europe. [= Botrychium virginianum (Linnaeus) Swartz – RAB, C, FNA, G, K, W, WH, WV; = B. virginianum var. virginianum – F; = Osmundopteris virginiana (Linnaeus) Small – S]

3. **Sceptridium** Lyon 1905 (Grape Fern)

1. Sterile leaf 4-pinnate-pinnatifid, finely divided, the ultimate segments lacerate and linear, < 3 mm wide ........................................... S. dissectum
2. Sterile leaf 2-pinnate to 4-pinnate, not finely divided, the ultimate segments ovate or oblong, > 8 mm wide.
3. Sterile pinna and pinnule apices obtuse to acute (rarely round); ultimate segments mostly rounded at the base, not fan-shaped, ovate or oblong; ultimate segments often crowded and overlapping ................................................................. S. multifidum
4. Sterile pinna and pinnule apices round to obtuse; ultimate segments cuneate, rounded, or truncate at the base; ultimate segments remote or overlapping.
5. Stalk of the basal sterile pinnae 15-70 mm long; roots irregularly ribbed, blackish; ultimate leaf segments fan-shaped, obovate, longer than wider, pinnately veined, the midrib weakly developed; sporulating August-October ...................................................... S. jennianii
6. Stalk of the basal sterile pinnae 4-15 mm long; roots smooth, yellowish; ultimate leaf segments about as long as wide, subflabellately veined, lacking a midrib; sporulating January-April ............................................................... S. lunarioides
2. Sterile pinnae (or their terminal portion) elongate (the sides often nearly parallel), entire to shallowly lobed, not divided into pinnules; lateral pinnules with a conspicuous and well-developed central vein; plant producing 1 leaf per season.
5. Sterile pinna and pinnule apices obtuse to rounded (to somewhat acute); ultimate segments mostly ovate, narrowly ovate, or oblong, mostly about 2× as long as broad or less; overwintering leaves green, not bronze .............................................. S. oneidense
6. Sterile pinna and pinnule apices obtuse to rounded (to somewhat acute); ultimate segments mostly oblong or lanceolate-oblong, often > 2× as long as broad; overwintering leaves bronze (or green if covered by leaves).
5. Sterile blade mostly 3-pinnate, the segments sharply serrulate or crenulate, .................. S. biternatum
2. Sterile blade mostly 2-pinnate, the segments sharply serrulate or crenulate, .................. S. dissectum

**Sceptridium biternatum** (Savigny) Lyon, Southern Grapefern. Moist forests, clearings, old fields. August-October. MD, PA, s. IN, s. IL, and c. OK south to s. FL and e. TX. [= Botrychium biternatum (Savigny) Underwood – RAB, C, FNA, K, S, W; = B. dissectum var. tenuifolium (Underwood) Farwell – F; G; < B. dissectum (Sprengel) Lyon – WH]

**Sceptridium dissectum** (Sprengel) Lyon, Cut-leaf Grape Fern, Dissected Grapefern. Moist forests, clearings, old fields. August-October. NS and QC west to ON and MI, south to Panhandle FL and e. TX; also in the West Indies. The two forms have caused much confusion. In our area, forma obliquum is much more common and widely distributed, often confused with B. biternatum. Forma dissectum is fairly common in our area only in VA (rare in GA, NC, and SC), occurring primarily in the Mountains. The different distributions of the 2 forms suggest that further research is needed. [= Botrychium dissectum Sprengel – RAB, C, FNA, K, W, WV; < B. dissectum var. dissectum – F (also see S. oneidense); > B. dissectum var. obliquum (Muhlenberg ex Wildenow) Clute – G; > B. dissectum var. dissectum – G; > B. dissectum – S; > B. obliquum Muhlenberg ex Wildenow – S; < B. dissectum (Sprengel) Lyon – WH]

**Sceptridium jennianii** (Underwood) Lyon, Alabama Grapefern. Moist to dryish forests and disturbed areas. August-October. C. and sw. VA and w. KY south to Panhandle FL, s. AL, and e. LA; also in the West Indies. This species probably
arose as a hybrid between *B. biternatum* and *B. lunarioides* (Michaux) Swartz, followed by polyploidization, resulting in a fertile taxon functioning as a species. [= *Botrychium jennani* Underwood – C, FNA, K, W, WH; = *B. alabamense* Maxon – RAB, S]

*Sceptridium* *lunarioides* (Michaux) Holub, Winter Grapefern. Old fields, pastures, young forests, granitic flatrocks, juniper-oak-blue ash woodlands over limestone. January-April. W. NC, e. TN, and s. SC south to n. FL, and west to e. TX and se. OK. Wagner (1992) proposes that *B. lunarioides* be treated in a new monotypic section, *Hiemobotrychium*, of *Botrychium*, subgenus *Sceptridium*. The species is hard to spot, and all the more difficult to find because of its phenology; the leaves appear in late fall and die by early spring. [= *Botrychium lunarioides* (Michaux) Swartz – FNA, K, WH; = *Holubiella lunarioides* (Michaux) Škoda; = *Botrypus lunarioides* Michaux]

*Sceptridium* *multidum* (S.G. Gmelin) M. Mishida, Leather Grapefern. Grassy balds and high elevation meadows; moist forests. August-September. NL (Labrador) and AK south NJ, PA, OH (and in the mountains to VA and NC), IN, IL, IA, NE, CO, NM, and CA. [= *Botrychium multidum* (S.G. Gmelin) Treviranus – C, FNA, K, W; > *B. multifidum* var. *multidum* – F, G; > *B. multifidum* var. *intermedium* (D.C. Eaton) Farwell – F, G]  

*Sceptridium* *oneidense* (Gilbert) Holub, Bluntlobe Grapefern. Moist or boggy forests, foodplain forests, bogs. July-October. Local in occurrence from NB, QC, and ON south to NC, TN, KY, IN, and WI. Recent studies by Warren Hauk suggest that *B. oneidense* may not be distinct from *B. dissectum*. [= *Botrychium oneidense* (Gilbert) House – RAB, C, FNA, K, W, WV; < *B. dissectum* var. *dissectum* – F ("forma oneidense" (Gilbert) Clute – embarrassingly transitional")); = *B. multifidum* var. *oneidense* (Gilbert) Farwell – G]

4. *Botrychium* Swartz 1801 (Moonwort)

A genus of 25-30 species, nearly cosmopolitan, but primarily temperate and concentrated in North America and e. Asia. *Botrychium* as traditionally circumscribed to include *Botrypus* and *Sceptridium* is very heterogeneous (Hauk, Parks, & Chase 2003); I have here accepted the arguments of Hauk (1996), Hauk, Parks, & Chase (2003), and others recommending recognition of the adventageantly divergent and molecularly and morphologically distinctive segregates as genera. References: Wagner in Kramer (2003); I have here accepted the arguments of Hauk (1996), Hauk, Parks, & Chase (2003), and others recommending recognition of the adventageantly divergent and molecularly and morphologically distinctive segregates as genera. References: Wagner in Kramer & Green (1990); Hauk, Parks, & Chase (2003). [also see *Botrypus* and *Sceptridium*]

1 Sterile pinnae contracted at the base, thus cuneate or wedge-shaped; leaf blades pinnate to nearly simple, 1-6 cm long, 0.3-2 cm wide; pinna margins entire, the apices round; [section *Simplex*] .......................................................... .......................................................... .......................................................... *B. simplex* var. *simplex*  

1 Sterile pinnae (or pinnules of 2-pinnate blades) not contracted at the base, thus oblong or elongate; leaf blades pinnate, pinnate-pinnatifid, or 2-pinnate, 1-8 cm long, 0.8-6 cm wide; pinna or pinnule margins entire, lobed, or incised, the pinna apices round, obtuse, or acute; [section *Lanceolatum*].  

2 Sterile pinnae apices obtuse to round at the apex, their segments (and undivided pinnae) about as long as wide, round, obtuse, or truncate at the apex; leaf blade mostly short-petioled (rarely sessile), the petiole (0-) 1-3 cm long; leaf blade pinnate to pinnate-pinnatifid...........................  

.......................................................... .......................................................... .......................................................... *B. maticartifolium*  

2 Sterile pinnae acute at the apex, their segments (and undivided pinnae) at least twice as long as wide, mostly lanceolate, acute at the apex; leaf blade sessile, leaf blade pinnate-pinnatifid to 2-pinnate .......................................................... .......................................................... .......................................................... *B. lanceolatum* var. *angustisegmentum*  

*Botrychium* *matricariifolium* (A. Braun ex Duwell) A. Braun ex W.D.J. Koch, Daisyleaf Moonwort. Dry to moist forests (often successional), old fields, grassy balds, northern hardwood forests. June-August. NL (Newfoundland) and AB south to w. NC, TN, KY, WV, OH, IL, WI, MN, and ND. [= FNA, K, W; = *B. matricariaefolium* – F, G, WV (orthographic variant); > *B. matricariaefolium* var. *matricariaefolium* – C]  

*Botrychium* *simplex* E. Hitchcock var. *simplex*. Least Moonwort. Disturbed gravelly areas in spruce-fir forests, northern hardwoods forests, grassy balds. May-June. NL (Newfoundland) and BC south to NJ, VA, NC, MI, IN, WI, IA, SD, WV, CO, NM, UT, NV, and CA. Wagner & Wagner in FNA (1993b) discuss variation within *B. simplex*. Farrar & Wendel (1996) indicate that 3 varieties of *B. simplex* have strong genetic divergence, comparable to that usually distinguishing species. [= C, F, G; < *B. simplex* – FNA, K, W, WV]
**F6. PSILOTACEAE** Kanitz 1887 (Whiskfern Family) [in PSILOTALES]

A family of 2 genera and 4-12 species, pantropical and warm temperate. References: Lellinger (1985); Thieret in FNA (1993b); Kramer in Kramer & Green (1990)

**Psilotum** Swartz 1800 (Whiskfern)

A genus of 2-3 species, tropical and warm temperate. *Psilotum* lacks roots and true leaves. Other than the Australasian genus *Tmesipteris*, *Psilotum* has no close living relatives, and the 2 genera are usually considered to comprise a distinct class (Wagner 1977). The stem is chlorophyllose. Fungal cells interspersed in the outer layers of the rhizome aid in the absorption of nutrients. References: Lellinger (1985); Thieret in FNA (1993b); Kramer in Kramer & Green (1990).

**Identification notes:** The stiff, dichotomously-branched habit of *Psilotum* is unmistakable.

*Psilotum nudum* (Linnaeus) Palisot de Beauvois, Whiskfern. In moist bottomland forests, on soil, stumps, and tree bases, along building foundations (where introduced). April-September. S. SC south to s. FL, west to e. TX, disjunct (and apparently native) in ne. NC (Perry & Musselman 1994), rarely naturalized around buildings in c. NC; also in sw. United States and in the tropics of Central and South America, Africa, and Asia. [= RAB, FNA, K, S]

**F8. OSMUNDACEAE** Martinov 1820 (Royal Fern Family) [in OSMUNDALES]

1 Leaves hemidimorphic (juvenile leaves with only sterile pinnae, leaves bearing sporangia with sterile and fertile pinnae, the fertile pinnae either borne medially or terminally); photosynthetic (sterile) pinnae lacking tufts of hairs........................................................................2. Osmunda

2 Leaves diphomorphic (each leaf normally either completely photosynthetic or completely fertile); photosynthetic (sterile) pinnae with tufts of reddish hairs near the junction with the rachis........................................................................1. Osmundastrum

**1. Osmundastrum** C. Presl (Cinnamon Fern)

A monotypic genus, of the Americas and e. Asia. “When the rbcL trees, the fossil and morphological evidences are all taken into account, it can be concluded that the extant *Osmunda cinnamomea* has no closely related living species in Osmundaceae, and it has evolutionarily very static morphology with no significant modification for more than 200 million years. Thus we can call extant *Osmunda cinnamomea* a ‘living fossil’” (Yatabe, Kishima, & Murakami 1999); Metzgar et al. (2008) confirmed the opinion that cinnamon fern is an outlier and warrants generic status. References: Metzgar et al. (2008)=Z; Lellinger (1985); Whetstone & Atkinson in FNA (1993b); Kramer in Kramer & Green (1990); Yatabe, Nishida, & Murakami (1999).

**Identification notes:** Sterile plants of *Osmundastrum cinnamomeum* are sometimes confused with *Woodwardia virginica*, which also has rather coarse, pinnate-pinnatifid leaves and grows in similar wet, acid places. *Osmundastrum* is coarser (to 2 m tall, vs. to 1 m tall), has cinnamon tufts of tomentum present in the axils of the pinnae (vs. absent), has the rachis greenish and rather fleshy in texture (vs. brown and wiry), and bears fronds clumped or tufted from a massive, woody, ascending rhizome covered with old petiole bases (vs. fronds borne scattered along a thick, horizontal, creeping rhizome).

*Osmundastrum cinnamomeum* (Linnaeus) C. Presl, Cinnamon Fern. Bogs, peatlands, pocosins, wet savannas, floodplains, blackwater stream swamps, and other wetlands. March-May. NL (Labrador) west to MN, south to s. FL, c. TX; Mexico south through Central America to n. South America; West Indies; e. Asia. The species also occurs in e. Asia, where sometimes treated as a separate variety (but the combination is not available in *Osmundastrum*). The taxonomic significance of the densely glandular pubescent *Osmunda cinnamomea var. glandulosa* needs additional evaluation; it is reported from scattered locations in e. North America, including SC and VA. Because of its geographic incoherence it is here regarded as a form. [= Z; = *Osmunda cinnamomea* Linnaeus – RAB, FNA, G, S, W, WV; > *Osmunda cinnamomea var. cinnamomea* – C, F, K; > *Osmunda cinnamomea* Linnaeus var. glandulosa Waters – F, K]

**2. Osmunda** Linnaeus (Royal Fern, Cinnamon Fern, Interrupted Fern)
Farrar, & Sheffield (1991); Iwatsuki in Kramer & Green (1990); Morton (1968).

OSMUNDACEAE (F8)

1 Leaves pinnate-pinnatifid, each pinna pinnatifid but not divided into distinct pinnules; spores borne on modified pinnae in the middle of the leaf blade; veins mostly 1-forked; [subgenus Clavatosoma] ................................................................. O. claytoniana var. claytoniana
1 Leaves bipinnate, each pinna fully divided into distinct pinnules, the larger pinnules 3-7 cm long, and 0.7-2.0 cm wide; spores borne on modified pinnae in the terminal portion of the leaf blade; veins mostly 2-forked; [subgenus Osmunda] ................................................................. O. spectabilis

Osmunda claytoniana Linnaeus var. claytoniana, Interrupted Fern. Upland forests, woodlands, and balds, moist to rather dry. March-June. NL (Newfoundland) west to MN, south to n. GA, TN, and AR; another variety occurs in e. and sc. Asia. A fossil from the Triassic is seemingly indistinguishable from this species and suggests “that O. claytoniana has perhaps been in morphological stasis for at least 200 million years and also that the genus Osmunda is at least this old” (Metzgar et al. 2008). [= C, F; < O. claytoniana – RAB, FNA, G, K, S, W, WV; = Osmundastrum claytoniana (Linnaeus) Tagawa]

Osmunda spectabilis Willdenow, American Royal Fern. Bogs, marshes (including tidal), moist forests, floodplains, swamp forests, and other wetlands. March-June. NL (Newfoundland) west to MB, south to s. FL, e. TX; Mexico south through Central America south to n. South America; West Indies. The taxonomy of O. regalis and relatives needs additional reassessment (Metzgar et al. 2008); preliminary results suggest that e. North American O. spectabilis is more closely related to Asian O. japonica (=O. regalis var. japonica) and O. lancea than to European, African, and sw. Asian (typic) O. regalis. [= O. regalis Linnaeus var. spectabilis (Willdenow) A. Gray – RAB, C, F, FNA, G, K, W, WV; < O. regalis – S]

F9. HYMENOPHYLLACEAE Link 1833 (Filmy Fern Family) [in HYMENOPHYLLALES]

A family of 6-10 (or many more) genera and about 600 species. This treatment follows the generic interpretation of Ebihara et al. (2006), which splits Trichomanes (as both polyphyletic and morphologically diverse) and retains a broad and monophyletic Hymenophyllum. See Moran (1998) for an interesting discussion and overview of independent fern gametophytes in e. North America. References: Farrar in FNA (1993b); Ebihara et al. (2006, 2007); Iwatsuki in Kramer & Green (1990); Morton (1968).

1 Gametophytes only present, not in association with or in close proximity to filly-fern sporophytes.
2 Gametophytes filamentous, no portion flattened and planar, forming felt-like mats ................................................................. 4. Crepidomanes
2 Gametophytes thalloid, flattened ......................................................................................................................... 1. Hymenophyllum

1 Sporophytes present.
3 Leaves simple to slightly lobed, <2 cm long; rhizomes filiform, <0.5 mm in diameter. Hymenophyllum tunbrigense
4 Leaves glabrous or with simple hairs; rhizomes densely covered with dark-colored hairs ................................................................................................. 2. Didymoglossum
4 Leaves stellate pubescent; rhizomes glabrous or with sparse light-colored hairs ................................................................. 1. Hymenophyllum
5 Rhizomes filiform, >5 cm long; rhizomes filiform or moderately stout. Hymenophyllum tunbrigense
6 Rhizomes filiform, <0.5 mm in diameter, glabrous or with sparse light-colored hairs; indusium (“involucre”) bivalvate (deeply divided into 2 flaps); receptacle not exserted from between the deeply bilobed indusium ......................................................... 1. Hymenophyllum
5 Rhizomes moderately stout, 0.8-1.5 mm in diameter, densely clad with dark-colored hairs; indusium (“involucre”) tubular or funneliform, sometimes slightly 2-lobed; receptacle long and whiplike, exserted from the mouth of the tubular (slightly bilobed) indusium ................................................................. 3. Vandenboschia

1. Hymenophyllum J.E. Smith 1793 (Filmy Fern)

As here broadly circumscribed, a genus of about 250-330 species, almost strictly tropical in distribution, but very rarely expending into humid north temperate regions. Sphaeroctionium C. Presl and other segregates are often recognized; these segregates may well be warranted. Iwatsuki in Kramer & Green (1990) takes a broad view of the genus, recognizing only Sphaeroctionium among the potential segregates. If this distinction is recognized, H. tunbrigense is in Hymenophyllum and H. tayloriae in Sphaeroctionium (the combination has not been made). References: Ebihara et al. (2006)=Z; Davison (1997); Raine, Farrar, & Sheffield (1991); Iwatsuki in Kramer & Green (1990); Morton (1968).

1 Sporophytes present.
2 Leaf blade with stellate hairs; [subgenus Sphaeroctionium] ......................................................................................... H. tayloriae
2 Leaf blade glabrous; [subgenus Hymenophyllum] ................................................................................................. H. tunbrigense

1 Gametophytes only present.
3 Gemmae present; margin crenate, composed predominantly of cells with concave outer walls; archegonia and antheridia rare; plant forming spreading, ribbon-like forms; branches filamentous to broad; proliferations abundant, arising marginally and centrally; [subgenus Sphaeroctionium] ......................................................................................... H. tayloriae
3 Gemmae absent; margin entire, composed predominantly of straight-sided cells; archegonia and antheridia common, often present on the same gametophyte; plant typically forming rosettes; branches always broad; proliferations few, always marginal; [subgenus Hymenophyllum] ................................................................................................. H. tunbrigense

Hymenophyllum tayloriae Farrar & Raine, Gorge Filmy Fern. Spray cliffs near waterfalls, permanently moist ceilings of grottoes in escarpment gorges with high rainfall. This species is endemic to the southern end of the Southern Appalachians (Transylvania, Jackson, and Macon counties, NC, Pickens and Oconee counties, SC, Rabun County, GA, Fentress, Scott, and Sevier counties, TN, and Lawrence, Franklin, and Lamar counties, AL). It was recently named (in honor of the first collector), following the demonstration that it represented a gametophyte distinct from the gametophytes of any (sporophytically) known species (Raine, Farrar, & Sheffield 1991), including H. tunbrigense, present in the close vicinity. Raine, Farrar, & Sheffield
HYMENOPHYLLACEAE (F9) 33

(1991) point out that "H. tayloriae is distinguished from the independent gametophytes of Vittaria appalachiana Farrar & Mickel by its 2-dimensional spatulate gemmae (those of V. appalachiana are uniseriate), rhizoid attachment only to marginal cells, yellow-green color, and glossy texture. Thalloid liverworts of similar size are generally more than one cell thick or have a distinct midrib, have notched apical meristems, and do not produce spatulate gemmae." An immature sporophyte, collected by Taylor in 1936, has stalked stellate hairs on the margins and midrib of the leaf and was the only sporophytic collection of the species until the recent discovery of additional juvenile sporophytes in AL (FNA 1993b). [= FNA, K, Z; = "a branching ribbon-like gametophyte with marginal rhizoids and small, ovate, plate-like gemmae several cells wide, of the genus Hymenophyllum" – RAB; = Sphaerocionium species 1]

Hymenophyllum tunbrigense (Linnaeus) J.E. Smith, Tunbridge Filmy Fern. Moist rock faces in an escarpment gorge with high rainfall. June-September. N. Mexico south through Central America to n. South America; SC; West Indies (Jamaica and Hispaniola); w. Europe; Africa; Australia and New Zealand. The occurrence of this filmy fern in the escarpment gorge of Eastatoe Creek and its tributaries (Pickens County, SC) is remarkable. Overall, H. tunbrigense is a "Gulf Stream plant," found in highly humid, climates in the West Indies, and the maritime west coast of the British Isles. H. tunbrigense somewhat resembles Trichomanes boschianum. This species may yet be found in NC in similarly rugged and humid escarpment gorges. It differs from T. boschianum in having the sporangia not extending beyond the deeply 2-lobed involucre (as opposed to having the sporangia exerted beyond the slightly bilobed, funnelform involucre). [= RAB, FNA, K, W, Z]

2. Didymoglossum Desvaux 1827

Didymoglossum petersii (A. Gray) Copeland, Dwarf Filmy Fern. On vertical faces of acidic rock outcrops in humid gorges, primarily of the Savannah River drainage, in the context of the very humid escarpment gorges on relatively dry rocks, not on rocks receiving substantial seepage or spray from waterfalls, also on outcrops of Altamaha Grit in the Coastal Plain, and on tree bark in swamps (in LA and MS). June-August. W. NC, nw. SC, sw and sc. TN, south to n. peninsular FL, c. AL, s. MS, and e. LA; disjunct in the Ozarks and Ouachitas of AR; Mexico (Chiapas, Veracruz, and Puebla) and Guatemala. This diminutive species is often overlooked, except by bryologists and hepaticologists; superficially, it does resemble a moss or liverwort more than a fern. It occurs on tree bark in some parts of its range. [= Z; = Trichomanes petersii A. Gray – RAB, FNA, K, S, W]

3. Vandenboschia Copeland 1938

A genus of 15-20 species, of the tropics and extending to north temperate areas of high humidity. References: Ebihara, Farrar, & Ito (2008)=Y; Ebihara et al. (2006)=Z; Ebihara et al. (2007); Iwatsuki in Kramer & Green (1990); Morton (1968); Dubuisson et al. (2003).

Vandenboschia boschiana (Sturm) Ebihara & K. Iwatsuki, Appalachian Filmy Fern. On rock outcrops, usually vertical or overhanging, usually in deeply shaded grottoes receiving seepage or spray from waterfalls. June-September. W. VA, s. OH, s. IN, s. IL south to w. NC and nw. SC, n. GA, n. AL, and ne. MS (Menapace, Davison, & Webb 1998); disjunct in the Ozarks of nw. AR; disjunct in Chihuahua, Mexico. See Belden et al. (2004) for more details on the first documented Virginia occurrence. [= Z; = Trichomanes boschianum Sturm – RAB, C, F, FNA, G, K, S, W, WV]

4. Crepidomanes C. Presl 1851

A genus of 30-40 species, tropical and extending to north temperate areas of high humidity; strictly Old World, except for our species. References: Ebihara, Farrar, & Ito (2008)=Y; Ebihara et al. (2006)=Z; Ebihara et al. (2007); Iwatsuki in Kramer & Green (1990); Morton (1968); Dubuisson et al. (2003).

Crepidomanes species 1, Grotto-felt, Appalachian Trichomanes, Weft Fern. On ceilings or back walls of grottoes, especially in humid gorges or near or behind waterfalls. Rather widespread in e. North America, from NH, VT, w. NY, OH, IN, and IL south to NC, nw. SC, n. GA, and n. AL. Crepidomanes species 1 cannot be morphologically distinguished from gametophytes of Vandenboschia boschiana or Didymoglossum petersii; the electrophoretic and phytogeographic evidence of Farrar (1992) leave little question, however, that it should be considered a distinct species. Although Farrar (1992) found that 30 of 30 populations of Trichomanes (s.l.) gametophytes "east of the Mississippi River that were not within or adjacent to sporophyte populations of T. boschianum or T. petersii" were "T. intricatum," the absence of sporophytes should be considered to
provide only a presumptive or likely identification of gametophytes. Farrar (1992) also showed that independent gametophytes in AR were those of *Vandenboschia boschiana* and *Didymoglossum petersii*. Farrar (1992) points out the "intriguing possibility that somewhere in the Appalachian Mountains sporophytes of this species may yet exist." Probably the most likely area in which to search for the sporophyte generation of *Crepidomanes species 1* is the escarpment gorge region of NC, SC, and GA near Highlands, NC, where topography, waterfalls, and the highest rainfall east of the Cascade Mountains combine to create microclimatic conditions that have favored the relict survival of numerous species of mosses, liverworts, and ferns. Any filmy-furn sporophyte which differs from known eastern North America species of Hymenophyllaceae should be investigated carefully. *Vittaria appalachiana* and *Hymenophyllum tayloriae* gametophytes differ from *Trichomanes intricatum* in being thallose rather than filamentous. Ebihara, Farrar, & Ito (2008) have recently reported that *Crepidomanes species 1* shares its chloroplast genome with the Asian triploid *Crepidomanes schmidtianum* var. *schmidtianum*; further studies are underway to determine the relationship of the two. [= *Trichomanes intricatum* Farrar – FNA, K; = "a filamentous gametophyte, with spindle-shaped gemmae one cell wide but with the cells decreasing in size toward the apices, of the genus *Trichomanes*" – RAB; = *Vandenboschia species 1* – Z; ≈ *Crepidomanes schmidtianum* (Zenker ex Tasch.) K. Iwatsuki var. *schmidtianum* – Y]

**F10. GLEICHENIACEAE** C. Presl 1825 (Forking-fern Family) [in GLEICHENIALES]

*Dicranopteris* Bernhardi 1805 (Forking-fern)

* Dicranopteris flexuosa* (Schrader) Underwood, Forked-fern. Wet pine flatwoods, moist disturbed areas; native in New World tropics. FL Panhandle (Bay and Franklin counties) and FL peninsula, s. AL (Mon Louis Island, Mobile County); West Indies; Mexico, Central America, and South America. [= FNA, K, S]

**F13. LYGODIAEAE** M. Roemer 1840 (Climbing Fern Family) [in SCHIZAEALES]

A family with a single genus and about 40 species, of tropical and temperate regions, particularly equatorial and south temperate. Sometimes included in the Schizaeaceae, but the relationship is remote and unclear. References: Nauman in FNA (1993b).

*Lygodium* Swartz 1800 (Climbing Fern)

A genus of about 40 species, mostly tropical, with a few temperate species.

1 Sterile pinnae pinnately divided into numerous serrate pinnules ................................................................. *L. japonicum*

1 Sterile pinnae palmately lobed in to 4-8 smooth to undulate lobes.......................................................... *L. palmatum*

* Lygodium japonicum* (Thunberg) Swartz, Japanese Climbing Fern. Disturbed areas; native of Asia. June-September. The leaves (up to 30 m in length!) climbing into the canopy of trees in swamp forests and other wet habitats. [= RAB, FNA, K, S]

Lygodium palmatum (Bernhardi) Swartz, American Climbing Fern, Hartford Fern. Bogs, moist thickets, swamp forests, sandstone outcrops, roadside ditches and roadbanks, in strongly acid soils. July-September. NH, VT, NY and MI south to SC, n. GA, and n. AL, widely scattered except in the Cumberland Plateau of KY, TN, and AL, where it is most common. Garrison (1992) discusses two forms of the species, "one with long appressed hairs scattered over the lower (abaxial) side of the sterile leaflets and the other relatively hair-free." The two forms appear to be geographically differentiated, the pubescent form predominating south and west of Maryland, the glabrous form occurring primarily in the Northeast. Both forms are present in our area. Further research is needed to determine the taxonomic significance of this variation in pubescence. [= RAB, C, F, FNA, G, K, S, W, WV]

**F14. SCHIZAEACEAE** Kaulfuss 1827 (Curly-grass Family) [in SCHIZAEALES]

A family of 3-4 genera and about 30 species (depending on circumscription). The Lygodiaceae is often combined with the Schizaeaceae. References: Wagner in FNA (1993b); Kramer in Kramer & Green (1990).
**Schizaea** J.E. Smith 1793 (Curly-grass Fern)

*Schizaea pusilla* Pursh, Curly-grass Fern. Moist, peaty oil in Coastal Plain bogs, often associated with *Pseudolycopodiella caroliniana*, *Drosera filiformis*, and *Chamaecyparis thyoides* (though not in dense *Chamaecyparis* stands). May-July. In acid, boggy sites in DE, NJ, NY, NL (Newfoundland), NS, and NB; a similar or possibly identical plant is known from Peru. The leaves are filiform, 1-12 cm long. Spores of *Schizaea* have been identified in Pleistocene organic sediment from Singletary Lake (Bladen County, NC) and Rockyhock Bay (Chowan County, NC) (Whitehead 1963). Its native occurrence in our area as an extant species is plausible. See LeBlond & Weakley (2002) for further information on this species' occurrence in North Carolina. [= C, F, FNA, G, K]

---

**F16. MARSILEACEAE** Mirbel 1802 (Water-clover Family) [in SALVINIALES]

Identification notes: The *raphe* is the portion of the peduncle adnate to the sporocarp. The peduncle ends in a blunt tooth, the *proximal tooth.* Further up on the sporocarp is a second tooth, the *distal tooth.*

1 Leaves clover-like, the 4 cuneate, obovate or wedge-shaped leaflets borne at the summit of the petiole; sporocarps ovoid ........................ *Marsilea*
2 Leaves grass-like, linear, the leaf blade absent, the petiole narrowly winged; sporocarps spherical ........................................................... *Pilularia*

**Marsilea** Linnaeus 1753 (Water-clover)

Identification notes: The *raphe* is the portion of the peduncle adnate to the sporocarp. The peduncle ends in a blunt tooth, the *proximal tooth.* Further up on the sporocarp is a second tooth, the *distal tooth.*

1 Leaves strongly bicolored (pale green towards the base of each of the 4 leaflets, darker green towards the tip); aquatic forms with a swollen air bladder just below the leaf........................................................... *M. mutica*
2 Leaves unicolored.
3 Roots present only at the nodes
   3 Distal tooth 0.3-0.8 mm long; sporocarps 3.5-5.0 mm long............................................................... *M. minuta*
   4 Distal tooth absent or < 0.2 mm long; sporocarps 4.5-6.0 mm long ....................................................... *M. quadrifolia*
4 Roots present (1-3) between the nodes
   4 Distal tooth absent or a very low bump ................................................................................................. *M. macropoda*
6 Distal tooth 0.4-1.2 mm long, sharply acute to pointed, often hooked ............................................................................. *M. vestita*

* Marsilea macropoda* Engelmann ex A. Braun, Bigfooted Water-clover. {habitat}; native of s. TX and Mexico. Reported as introduced eastward in AL and c. and s. peninsular FL. [= FNA, K, Z]

* Marsilea minuta* Linnaeus, Small Water-clover. Lakes and streams; native of the Old World. Known in North America from AL, FL, GA, and TN. [= FNA, Z; *M. crenulata* Desv.; *M. crenata* Presl]

* Marsilea mutica* Mettenius, Nardoo, Australian Water-clover. Ditches, ponds; native of Australasia. Apparently spreading rapidly in VA. [= Z]

* Marsilea quadrifolia* Linnaeus, European Water-clover. Shallow water of artificial impoundment; native of Europe. Not seen fertile in NC. Sold in garden stores as an aquatic to be grown in water gardens, and likely to be encountered more widely in the future. [= C, F, FNA, G, K]

---

**Pilularia** Linnaeus 1753 (Pillwort)

Identification notes: *Pilularia* lacks a leaf-blade, the 1-8 cm long petiole is narrowly winged, and looks a bit like an *Isoetes* or *Juncus* leaf. In vegetative condition, it may be recognized as a "fern" by the typical coiled ("fiddlehead") development of young leaves. The primary rhizome produces individual "fronds" at nodes, a short rhizome branch at each node also produces "fronds."

*Pilularia americana* A. Braun, American Pillwort. Vernal pools and seepage areas on granitic flatrocks, other ponds. This peculiar plant has a puzzling distribution, being known from several disjunct regions: WA to s. CA; NE and MO south to c. TX; SC, GA, TN, AL, and Mexico (Durango and Baja California Norte); similar plants, perhaps conspecific, occur in South America and Africa. The fragmented distribution may be at least partly explainable by the inconspicuous nature of the plant. First reported for SC in 1993 (J. Allison, pers. comm.). [= FNA, K, S]
**MARSILEACEAE** (F16)

A family of 2 genera and about 16 species, all floating aquatics. *Azolla* is sometimes separated as a separate family, Azollaceae. References: Nagalingum, Nowak, & Pryer (2008); Nauman in FNA (1993b); Lumpkin in FNA (1993b); Schneller in Kramer & Green (1990).

1. Leaves < 1 mm long, reddish or green, without hairs on the upper surface.................................................................................................... *Azolla*
2. Leaves 5-50 mm long, bright green, with obvious hairs on the upper surface ............................................................................................ *Salvinia*

**Azolla** Lamarck 1783 (Mosquito Fern)

A small genus of about 6 species, floating aquatics, in tropical and warm temperate regions. Very un-fernlike, this floating aquatic looks superficially more like an aquatic liverwort. In some years and some places it occurs in great abundance, covering the surface of the water with a green or red mass of vegetation. *Azolla* has a symbiotic, nitrogen-fixing cyanobacterium, *Anabaena azollae* Strasburger. The nitrogen-fixing capabilities of *Azolla* have resulted in its use as a fertilizer, green manure, and livestock feed, much promoted in recent years, but used historically in Asian rice paddies for centuries (Lumpkin in FNA 1993b). References: Evrard & Van Hove (2004)=Z; Lumpkin in FNA (1993b).

1. Largest hairs on upper leaf lobe with 2 or more cells; megaspores densely covered with tangled filaments ................................................. *A. caroliniana*
2. Largest hairs on upper leaf lobe with 1 cell; megaspores with raised angular bumps, visible through a sparse layer of filaments .................. *A. filiculoides*

1. Leaves 5-15 mm long; multicellular hairs of the upper leaf surface with 4 free, spreading branches (use 10× magnification)................. *S. minima*
2. Leaves to 50 mm long; multicellular hairs of the upper leaf surface with 4 branches joined at their tips, forming a cage-like structure (use 10× magnification)................................................................. *S. molesta*

**Salvinia** Séguier 1754 (Water Spangles)

1. Leaves 5-15 mm long; multicellular hairs of the upper leaf surface with 4 free, spreading branches (use 10× magnification)................. *Salvinia minima*
2. Leaves to 50 mm long; multicellular hairs of the upper leaf surface with 4 branches joined at their tips, forming a cage-like structure (use 10× magnification)................................................................. *Salvinia molesta*

**Salvinia minima** Baker, Water Spangles. Quiet waters; probably introduced in our area from further south. [= FNA, K, Z; *S. auriculata* – S, misapplied]

**Salvinia molesta** D.S. Mitchell. Still waters of farm ponds, calcareous seepage ponds, and other situations; native of Brazil. *S. molesta* has been found at scattered sites in GA (Gwinnett and Lamar counties) (Carter, Baker, & Morris 2009), NC (Brunswick, Carteret, Craven, Duplin, Durham, Johnston, Jones, Lenoir, Mecklenburg, New Hanover, Onslow, Orange, Person, Pitt, Sampson, and Wake counties), SC (Colleton County), and VA (Shenandoah County), where it has been subjected to extermination efforts; it will likely be reintroduced (Anonymous 1999, D. Patterson, pers. comm.). This species is considered a noxious aquatic weed and has been reported from other southeastern states, such as TX and LA (Jacono 1999). Moran & Smith (1999) support the continued use of the name *S. molesta* for this species, as opposed to the ambiguous name *S. adnata* Desvaux. [= FNA, K, WH, Z; ? *S. adnata* Desvaux]

**F30. DENNSTAEDTIACEAE** Lotsy 1909 (Bracken Family) [in POLYPODIALES]

A family of about 16 genera and 370 species, of cosmopolitan distribution; the circumscription is very uncertain and controversial, however. References: Lellinger (1985); Cranfill in FNA (1993b); Kramer in Kramer & Green (1990).

1. Leaf blades broadly triangular in outline, about as broad as long, subcoriaceous; sori linear, confluent ................................................. *Pteridium*
**Dennstaedtia** Bernhardi 1801 (Cuplet Fern)

A genus of about 45 species, of tropical to temperate distribution; *Dennstaedtia* is poorly known and of uncertain circumscription. Only *D. punctilobula* is temperate in distribution; anatomical evidence suggests that it is not closely related to tropical *Dennstaedtia*, and its separation from that genus may be warranted. References: Nauman & Evans in FNA (1993b); Kramer in Kramer & Green (1990).

Identification notes: *Dennstaedtia punctilobula* can be distinguished from other woodland ferns with deciduous fronds of similar size and shape (such as *Athyrium, Dryopteris*, and *Thelypteris*) by the following characteristics: leaves yellow-green or pale-green in color, with whitish-gray glandular trichomes, petioles silvery-pilose, leaves borne scattered (as clonal patches), sori tiny (< 0.5 mm in diameter).

* Dennstaedtia cicutaria (Sw.) T. Moore. Reported for AL by Kartesz (1999) on the basis of Dean’s (1969) mention of an individual plant of *D. rubiginosa* having been planted in Mobile. This report is rejected, as there is no evidence of naturalization. The species is native of tropical America. [= K; ? *D. rubiginosa* (Kauffuss) T. Moore] [rejected; not keyed]

**Hypolepis** Bernhardi 1806 (Bramble Fern)

1. Stipe and rachis bearing numerous small prickles; [native, restricted to FL] ............................................................... *H. repens*
1. Stipe and rachis smooth, lacking prickles; [alien] ........................................................................................................... *H. tenuifolia*

**Hypolepis repens** (Linnaeus) C. Presl, Creeping Bramble Fern. Swamps, wet hammocks. N. FL (Clay County) south to C. FL; West Indies; Mexico, Central America, South America. [= FNA, K, S, WH]

**Pteridium** Gleditsch ex Scopoli 1760 (Bracken)

A genus of 2-11 species, cosmopolitan in distribution. Bracken taxonomy remains provisional; the molecular work of Der et al. (2009) outlines a probable taxonomic structure for the genus. *Pteridium* is a notorious and nearly worldwide weed (though less consequential in our area than in many parts of the world), nearly impossible to eradicate because of its deeply subterranean rhizomes. Bracken fiddleheads are sometimes eaten, but they are poisonous and highly carcinogenic. Bracken is not favored by grazing animals, and increases its abundance under grazing pressure. In overgrazed pastures, however, cattle will graze on bracken, the carcinogenic compound (shikimic acid) then transmittable to humans through milk. References: Thomson, Mickel, & Mehltreter (2008)=Z; Der et al. (2009); Jacobs & Peck in FNA (1993b); Tryon (1941).

1. Leaf segment margins slightly to moderately pubescent; terminal (caudate) tip of the basalmost pinnule of the basal pinna (3-) avg. 12 (-28)% as long as the entire pinna; lower surface of rachis and costae shaggy pubescent; terminal segments of well-developed pinnules generally 2-4× as long as broad, about 8-30 mm wide ................................................................. *P. aquilinum* ssp. *latiusculum*
1. Leaf segment margins glabrous or sparsely pilose; terminal (caudate) tip of the basalmost pinnule of the basal pinna (16-) avg. 25 (-45)% as long as the entire pinna; lower surface of rachis and costae glabrous or sparsely pilose; terminal segments of well-developed pinnules generally 6-15× as long as broad, about 2-5 mm wide ................................................................. *P. aquilinum* ssp. *pseudocaudatum*
DENNSTAEDTIACEAE (F30)

_Pteridium aquilinum_ (Linnaeus) Kuhn = _P. pseudocaudatum_ (Clute) Hultén, Tailed Bracken, Southern Bracken. Mainly in dry sandy woodlands, often locally abundant in sandhills and flatwoods. July-September. _Ssp. pseudocaudatum_ is primarily distributed in the Southeastern Coastal Plain (where it is ubiquitous and abundant), but is reported north to MA, OH, IN, s. MI, and MO. [= Z; = _Pteridium aquilinum_ (Linnaeus) Kuhn var. _pseudocaudatum_ (Clute) Heller – RAB, C, F, FNA, G, K, W, WV; = _P. lattisculum_ (Desvaux) Hieronymus var. _pseudocaudatum_ (Clute) Mason – S]

_F31. PTERIDACEAE_ E.D.M. Kirchner 1831 (Maidenhair Fern Family) [in POLYPODIALES]

A family of about 40 genera and about 1000 species. This family may be further subdivided, into families Adiantaceae (_Adiantum, Vittaria_), Sinopteridaceae (_Chelana, Notholaena, Astrolepis, Pellae_), Cryptogrammaceae (_Cryptogramma_), Pteridaceae (_Pteris_), and Parkeriaceae (_Acrostichum, Ceratopteris_). Here circumscribed to include Vittariaceae (see Smith et al. 2006). References: Lellinger (1985); Windham in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Kramer in Kramer & Green (1990); Crane (1997).

1. Gametophytes only present; [subfamily _Vittarioideae_]. ................................................................. 10. _Vittaria_
1. Sporophytes present.
2. Leaves linear, 10-60 cm long and 1-3 mm wide; [subfamily _Vittarioideae_]. .................................................. 10. _Vittaria_
2. Leaves dissected, not linear, > 20 mm wide.
3. Sori round or oblong, distinct and separate along the pinnule margins; leaves bright-green, glabrous, herbaceous, delicate, and flexible; [subfamily _Vittarioideae_]. ........................................................................................................................................................................ 9. _Adiantum_
4. _Plant_ aquatic or semi-aquatic, pale green, delicate. .................................................................................. 3. _Ceratopteris_
4. _Plant_ terrestrial (except _Acrostichum_), usually dark green and coriaceous.
5. Fertile pinnae with entire lower surface covered by sporangia; leaves 1.5-5 m long; [of wetlands, n. FL southward]; [subfamily _Ceratopteridioidea_]. ........................................................................................................................................................................ 2. _Acrostichum_
5. Fertile pinnae with sori marginal; leaves < 0.5 m long; [of rocky sites, collectively widespread].
6. Leaves strongly dimorphic, the fertile leaves obviously longer than the sterile and with narrow elongate ultimate segments; [subfamily _Cryptogrammoidea_]. ........................................................................................................................................................................ 1. _Cryptogramma_
7. Leaves 2-5-pinnate, the ultimate leaf-segments 1-4 (-8) mm long, more-or-less densely hairy (glabrous in _Chelana alabamensis_) or covered on the undersurface with a whitish powder; [subfamily _Chelanaioideae_]. ................................................................. 5. _Argyrochosma_
8. Lower leaf surfaces pubescent (or glabrous in _Chelana alabamensis_), never with conspicuous whitish powder..............
7. Leaves 1-2-pinnate, the ultimate leaf-segments 8-100 mm long, glabrous or sparsely and inconspicuously hairy.
9. Leaf undersurface densely covered with stellate and ciliate scales; [subfamily _Chelanaioideae_]. ...................... 7. _Astrolepis_
9. Leaf undersurface glabrous or with non-stellate scales.
10. Rachis dark-brown or purple; [subfamily _Chelanaioideae_]. .................................................................................. 8. _Pellae_
10. Rachis green or tan; [subfamily _Pteridoideae_]. ......................................................................................... 4. _Pteris_

1. _Cryptogramma_ R. Brown 1823 (Parsley Fern)

_Cryptogramma stelleri_ (S.G. Gmelin) Prantl in Engler, Slender Rock-brake. Limestone cliffs. NL (Newfoundland) and AK, south to c. PA, WV (Pendleton and Randolph counties), IL, IA, CO, UT, NV, and OR. [= FNA, C, F, G, K, WV]

2. _Acrostichum_ Linnaeus 1753 (Leather Fern)

_Acrostichum danaeifolium_ Langsdorff & Fischer, Giant Leather Fern. Freshwater and brackish swamps and marshes. N. peninsular FL (Dixie County) south to s. FL; West Indies; Mexico, Central America and South America. [= FNA, K; = _A. danaeifolium_ – S, orthographic variant]
3. Ceratopteris Brongniart 1821 (Antler fern)

A genus of 3 species, widespread in tropical, subtropical, and warm temperate areas. References: Lloyd in FNA (1993b). Key based on FNA.

1 Sterile leaves simple, or palmately to pinnately lobed, or 1-4-pinnately divided, the pinnae (or veins) towards the base of the leaf opposite; petioles often inflated; sporangia with or without an annulus, the annulus with 0-10 (-40) indurated cells ......................... C. pteridoides
   2 Sterile leaves (1-) 2-3-pinnately divided, the pinnae towards the base of the leaf alternate; petioles usually not inflated; sporangia with an annulus, the annulus with 13-71 indurated cells.
   
   ? Ceratopteris pteridoides (Hooker) Hieronymus. Ponds and lakes (natural and artificial). S. GA, FL, LA (including Florida parishes); West Indies; Central and South America; se. Asia. [= FNA, K, S, WH]

   ? Ceratopteris richardii Brongniart. Lakes and ponds. Probably only introduced in the southeastern United States. West Indies; Central and South America; Africa. [= FNA, K]

   ? Ceratopteris thalictroides (Linnaeus) Brongniart. Canals, swamps, ditches. Widespread in tropical and subtropical areas of America and Asia. Regarded by some authors as introduced in the se. United States. [= FNA, K; = C. deltoidea Benedict –S]

4. Pteris Linnaeus 1753 (Brake)

A genus of about 250-300 species, warm temperate and tropical. References: Nauman in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990).

1 Pinnae strictly simple, without lobes or pinnules; outline of leaf blade lanceolate, typically > 3× as long as wide ......................... P. vittata
   2 Pinnae (at least the basal ones) with 1-severeral lobes or pinnules; outline of leaf blade ovate to orbicular, typically nearly as wide as long
   
   ? Pteris cretica Linnaeus, Common Cretan Brake. Limey rocks and soils. Pantropical, the original range unclear. Var. albolineata Hooker is sometimes recognized, seemingly differing only in the broad white central stripe on the pinnae (as opposed to solid green pinnae in var. cretica). [= Pycnodoria cretica – S; > Pteris cretica Linnaeus var. cretica – FNA, K; <]

   ? Pteris multifida Poiret, Spider Brake. Old walls with lime mortar; native of the Tropics. [= RAB, FNA, K; = Pycnodoria multifida (Poiret) Small – S]

   ? Pteris vittata Linnaeus, Ladder Brake. Old walls with lime mortar; native of e. Asia. [= RAB, FNA, K; = Pycnodoria vittata (Linnaeus) Small – S]

5. Argyrochosma (J. Smith) Windham 1987 (Powdery Cloak Fern)

A genus of about 20 species, of s. North America, Central America, South America, and the West Indies. Traditionally treated as a component of Notholaena (or sometimes Pellaea) (Tryon, Tryon, & Kramer in Kramer & Green 1990), but best recognized as a separate genus (Windham in FNA 1993b, Windham 1987, Gastony & Rollo 1998). Molecular studies show that this group is more closely related to Pellaea and Astroplepis than to Notholaena. References: Windham in FNA (1993b); Windham (1987); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998).

Argyrochosma dealbata (Pursh) Windham, Powdery Cloak Fern. Limestone cliffs. IL, MO, and KS south to AR and TX; disjunct in sc. KY. [= FNA, K; = Notholaena dealbata (Pursh) Kunze – C, F, G; = Cheilanthes dealbata Pursh; = Pellaea dealbata (Pursh) Prantl]

6. Cheilanthes Swartz 1806 (Lipfern)

A genus of about 150 species, primarily in the Western Hemisphere. References: Lellinger (1985)=Z; Windham & Rabe in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998). [also see Argyrochosma and Astroplepis]

1 Leaf surfaces glabrescent; ["Cheilanthes alabamensis group"].
   2 Rhizomes short-creeping, usually 4-7 mm in diameter; pinnule midveins green on the upper surface for most of their length; spores 32 per sporangium .......................................................... C. alabamensis
Cheilanthes alabamensis (Buckley) Kunze, Alabama Lipfern. Dry outcrops of limestone. June-September. VA, w. NC, s. MO, and OK south and west to n. GA, AL, TX, NM, se. AZ, and Mexico (south to Oaxaca). Considering morphology and chromosome number (sharing x = 29 with Pellaea, in contrast to x = 30 in the rest of Cheilanthes), it has been suggested that C. alabamensis and close relatives could be placed equally well in Pellaea, as P. alabamensis (Buckley) Baker ex Hooker, as done by Cranfill (1980). Windham & Rabe in FNA (1993b) suggest that C. alabamensis is uncomfortably placed in either Cheilanthes and Pellaea and that "it may constitute a natural group worthy of consideration as a distinct genus." A molecular analysis suggests that C. alabamensis and close relatives form a monophyletic group sister to the rest of Cheilanthes; this could be the basis for status as a separate genus or for inclusion in Cheilanthes (but not for inclusion in Pellaea) (Gastony & Rollo 1998). Our plants are apparently apogamous triploids. [= RAB, C, F, FNA, G, K, S, W, Z; = Myriopteris sp.]

Cheilanthes castanea (Michaux) D.C. Eaton, Hairy Lipfern. Dry outcrops of felsic or intermediate metamorphic and igneous rocks. June-September. WI, MN SD, MT, AB, and BC south to AR, TX, NM, AZ, s. CA, and n. Mexico (Chihuahua and Coahuila); disjunct eastward in KY and w. VA. The only known site in our area is on a dolostone cliff in Pulaski County, VA, where disjunct about 450 km east of a population in Bullitt County, KY, and an additional 200 km from other populations in IL (Wieboldt & Bentley 1982, Porter & Wieboldt 1991). The species is an apogamous triploid of unknown parentage. [= C. alabamensis, as done]

Cheilanthes lanosa (Michaux) D.C. Eaton, Hairy Lipfern. Dry outcrops of felsic or intermediate metamorphic and igneous rocks. June-September. CT, NY, PA, s. IL, MO, and KS south to FL, AL, MS, LA, and e. TX, and disjunct in WI and MN. Much of the commonest lip-fern in our area, a sexual diploid, and the most "eastern" of a predominantly western genus. [= RAB, C, FNA, G, K, S, W, Z; = Myriopteris sp.]

Cheilanthes microphylla (Swartz) Swartz, Southern Lipfern. Shell hammocks, limestone outcrops. Ne. FL south through FL; West Indies; Mexico through Central America to n. South America; West Indies. [= FNA, K, S, Z; = Myriopteris sp.]

Cheilanthes tomentosa Link, Woolly Lipfern. Dry outcrops of intermediate or calcareous metamorphic, igneous, or sedimentary rocks (including sandstone outcrops in the Coastal Plain of GA and SC). June-September. Primarily Appalachian, from PA south to KY, GA, and AL, also at scattered localities from AR, OK, and KS south and west to NM, AZ, and Mexico (south to Veracruz). The species is an apogamous triploid. [= RAB, C, FNA, G, K, W, S, Z; = C. lanosa – F, misapplied; = Myriopteris sp.]

7. Astrolepis D.M. Benham & Windham 1992 (Star-scaled Cloak Fern)
to *Argyrochosma, Pellaea*, and *Cheilanthes* than to *Notholaena* (Gastony & Rollo 1998) References: Benham & Windham in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998).

1 Scales of the upper leaf surface dense and usually persistent; largest pinnae asymmetrically lobed or entire; [rare eastern disjunct known from AL]..................................................................................................................................................*A. integerrima*

1 Scales of the upper leaf surface sparse and usually deciduous; largest pinnae usually symmetrically lobed; [rare eastern disjunct known from GA]..................................................................................................................................................*A. sinuata ssp. sinuata*

**Astrolepis integrerima** (Hooker) D.M. Benham & Windham. Outcrops of Ketona dolostone. OK, NM, AZ, and NV south into Mexico; disjunct to c. AL (Bibb County); also disjunct in Hispaniola. This taxon is apparently an apogamous triploid derived from *Astrolepis coxisensis* (Gooding) D.M. Benham & Windham and an unknown taxon. [= FNA; = Astrolepis ×integrerima – K; = Cheilanthes integrerimna (Hooker) Mickel; = Notholaena integrerima (Hooker) Hevly; = Pellaea sp.]

**Astrolepis sinuata** (Lagasca ex Swartz) D.M. Benham & Windham ssp. sinuata, Wavy Cloak-fern. Granitic outcrops and boulders. OK, TX, NM, and AZ, south into Central and South America; West Indies; disjunct in GA. Its leaves are pinnate-pinnatifid, with 30-60 pairs of pinnae. [= FNA, K; < Cheilanthes sinuata (Lagasca ex Swartz) Domin; < Notholaena sinuata (Lagasca ex Swartz) Kaulfuss; = Pellaea sp.]

8. **Pellaea** Link 1841 (Cliff-brake)

A genus of about 40 species, mostly in the Western Hemisphere. References: Gastony (1988); Gastony, Yatskievych, & Dixon (1992); Windham in FNA (1993b); Tryon, Tryon, & Kramer in Kramer & Green (1990); Gastony & Rollo (1998); Heafner (2001). Key based in part on Heafner (2001). [also see *Argyrochosma, Astrolepis, Cheilanthes*]

1 Petioles terete, glabrous or pubescent; rhizome scales uniformly orangish-brown, entire.
2 Petioles and rachises sparsely to densely pubescent, dull; pinnae long-stalked, those toward the base of the leaf on stalks 5-15 mm long; [of a variety of substrates, including non-calcareous]..................................................................................................................................................*P. atropurpurea*
3 Petioles and rachises glabrous to very sparsely pubescent, shiny; pinnae sessile or short-stalked, those toward the base of the leaf on stalks 0-4 (-6) mm long; [strictly of calcareous substrates]..................................................................................................................................................*P. glabella ssp. glabella*
1 Petioles slightly grooved or flattened, glabrous; rhizome scales with a blackish median stripe and pale brown margins, obscurely toothed.
3 Ultimate segments thin in texture, not strongly rolled, acute to acuminate at the apex, but lacking a mucro or cusp ....................... *P. viridis*
3 Ultimate segments leathery, strongly rolled, mucronate at the apex.
4 Leaves oblong to elliptic in outline; pinnae either ternate toward the base and simple toward the tip of the leaf, or all simple; [known from outcrops in the upper Piedmont of SC]...............................................................................................*P. ternifolia ssp. arizonica*
4 Leaves usually narrowly triangular in outline; pinnae usually pinnate toward the base, becoming ternate to simple toward the tip; [known from outcrops in Piedmont of NC]...............................................................................................*P. wrightiana*

**Pellaea atropurpurea** (Linnaeus) Link, Purple Cliff-brake. Outcrops of limestone and other rocks (usually calcareous or mafic), rarely on masonry walls (Wieboldt 1995). May-September. This species is an apogamously-reproducing triploid, either an allopolyploid derived from the hybridization of a sexually-reproducing diploid species and sexually-reproducing tetraploid, or an autopolyploid of an undiscovered or extinct species. Gastony, Yatskievych, & Dixon (1992) provide convincing evidence that modern *P. glabella* is not one of the parental taxa, as indicated by Lellinger (1985). *P. atropurpurea* is widespread in e. North America, from VT, NY, MN, SD, SK, and AB south to FL, AL, TN, AR, OK, NM, AZ, Mexico, and Guatemala. [= RAB, C, F, FNA, K, S, W, WV; = P. atropurpurea var. atropurpurea – G; = P. ×atropurpurea]

**Pellaea glabella** Mettenius ex Kuhn ssp. glabella. Smooth Cliff-brake. Dry, exposed outcrops of calcareous rocks (limestone, dolostone), rarely on masonry walls (Wieboldt 1995). May-September. The diploid, sexually-reproducing *P. glabella ssp. missouriensis* (Gastony) Windham is (so far as is known) restricted to MO; the apogamously-reproducing autotetraploid derivative, ssp. *glabella*, is more widespread, ranging from VT, ONT, and MN, south to VA, TN, KY, AR, OK, and n. TX. Two additional taxa (both western) have been variously treated as additional subspecies of *P. glabella* or as two subspecies of *P. occidentalis* (E.E. Nelson) Rydberg. [= FNA, K; = P. glabella var. glabella – C; = P. atropurpurea var. bushii Mackenzie – G; = P. glabella – F, S, W, WV]

**Pellaea ternifolia** (Cavaniîles) Link ssp. arizonica Windham, Arizona Cliff-brake. On granitic outcrops. A remarkable disjunct from sw. United States and Mexico (south to Oaxaca) to w. SC; see Heafner (2001) for additional information. When discovered, it was believed that this was a SC record for *P. wrightiana* (Platt & Townsend 1996), but Heafner (2001) has demonstrated that this actually represents *P. ternifolia ssp. arizonica*. [= FNA, K]

* **Pellaea viridis** (Forsskål) Prantl, Green Cliff-Brake. Outcrop of Altamaha Grit; native of Africa. This species is naturalized on an Altamaha Grit outcrop in Coffee County, GA (J. Allison, pers. comm.). Various infraspecific taxa have been recognized in the native range. [= K; = Cheilanthes viridis (Forsskål) Swartz]
**Pteridaceae** (F31)

Adiantum Linnaeus 1753 (Maidenhair Fern)

1. Petiole and rachises glabrous; *rare introduction* .................................................. *A. hispidulum*

1. Petiole and rachises glabrous; *collectively common natives*.

2. Leaves longer than broad, pinnately divided, with a main central axis, not fanlike; ultimate segments rhombic, about as long as broad to slightly longer than broad ............................................................................................................ *A. capillus-veneris*

2. Leaves broader than long, dichotomously divided at the summit of the petiole, the two main branches pedately branched, fanlike; ultimate segments oblong, > 2× as long as broad.

3. Ultimate segments at middle of penultimate divisions usually > 3.2× as long as broad, the apices with sharply denticulate, angular lobes, these lobes separated by deep sinuses 0.6-4 mm deep; segment stalks 0.2-0.9 (-1.3) mm long; [disjunct in n. MD and se. PA on serpentine, from a generally more northern and western distribution] .................................................. *A. aleuticum*

3. Ultimate segments at middle of penultimate divisions usually < 3× as long as broad, the apices with rounded, crenulate, or crenate-denticulate lobes, these lobes separated by shallow sinuses 0.1-2.0 (-3.7) mm deep; segment stalks 0.5-1.5 (-1.7) mm long ... *A. pedatum*

Adiantum aleuticum (Ruprecht) Paris, Aleutian Maidenhair. Serpentine barrens. NL and QC south at scattered sites to se. PA and MD (Paris in FNA 1993b); also in scattered locations in w. North America, from s. AK south to s. CA, AZ, and Mexico (Chihuahua). [= FNA, K; = *A. pedatum* Linnaeus ssp. *calderi* (Cody – C; = *A. pedatum* Linnaeus var. aleuticum Ruprecht – F]

Adiantum capillus-veneris Linnaeus, Venus’-hair Fern, Southern Maidenhair. Moist calcareous substrates, in the Coastal Plain on "marl" (coquina limestone) (NC and SC), on calcareous clay bluffs (GA), and adventive on lime mortar of old buildings and walls (as in Wilmington and Fayetteville, NC); in the Mountains and Interior Low Plateau on limestone or other calcareous sedimentary rocks. June-July. Widespread in e. North America largely southern in distribution, from e. NC, w. VA, MO, CO, UT, and CO south; also disjunct in SD and BC, and in Mexico, the West Indies, tropical and warm temperate portions of Central and South America, Eurasia, and Africa. There is some question whether North American plants are conspecific with those in the Old World (Paris in FNA 1993b). [= RAB, C, F, FNA, G, K, S, W]

Adiantum pedatum Linnaeus, Northern Maidenhair. Moist forests and cliffs, especially over calcareous or mafic rocks, sometimes in seasonal seepage. June-August. NS and NB west to ON and MN, south to GA, AL, MS, LA, and OK. [= RAB, FNA, G, K, S, W, WV; = *A. pedatum* ssp. *pedatum* – C; = *A. pedatum* var. *pedatum* – F]

Vittaria J.E. Smith 1793 (Shoestring Fern)

A genus of about 50 species, tropics and subtropics. References: Farrar in FNA (1993b); Farrar & Mickel (1991); Kramer in Kramer & Green (1990). Key adapted from Farrar in FNA.

1. Sporophytes present, the leaves linear, 10-60 cm long and 1-3 mm wide ................................................................................................. *V. lineata*

1. Gametophytes only present.

2. Gemmae with 2-12 body cells (with at least some present with 2-3 body cells); end cells of gemmae often swollen and larger than the medial cells; rhizoid primordia often absent on 1 or both end cells, seldom present on medial cells; sporophytes apparently not produced... ................................................................. *V. appalachiana*

2. Gemmae with 4-16 body cells; end cells of gemmae equal or smaller than the medial cells; rhizoid primordia regularly present on the end cells, as well as on some medial cells; sporophytes frequently produced (and small sporophytes often present in largely gametophytic colonies) ......................................................................................... *V. lineata*

Vittaria appalachiana Farrar & Mickel, Appalacian Shoestring Fern, "Appalachian Gametophyte." Shaded grotoes, undersides of overhanging rock outcrops, especially in moist gorges or on spray cliffs in the vicinity of waterfalls, usually on felsic metamorphic rocks, such as mica schist, mica gneiss, granite gneiss, or metaquartzite, or on sandstone. This reduced species consists of "a branched, ribbon-like thallus one cell in thickness, usually differentiated into basal and upright branches; basal branches attached to the substrate by numerous short, brown rhizoids emanating from marginal and interior cells; upright branches terminating in the production of gemmae" (Farrar & Mickel 1991). The species is often overlooked or mistaken for a
liverwort; it is most often collected by bryologists and hepaticologists, and was first noted in 1824 by von Schweinitz, who considered it a *Jungermannia*. Southern and Central Appalachians, south of the glacial boundary, from se. PA, sw. NY, and ne. OH south through c. TN and c. KY to n. GA, n. AL, and n. MS (Menapace, Davison, & Webb 1998). Although this species has been known for some time (often referred to as the "Appalachian Gametophyte"), it was only recently named formally (Farrar & Mickel 1991). A range of evidence (morphologic, electrophoretic, and developmental) indicates that it is not the gametophyte of any known *Vittaria* sporophyte; instead, it is a distinct taxon, reproducing vegetatively by gemmae, having lost the capability of producing sporophytes. For additional information, see Farrar (1974), Farrar (1978), Gastony (1977), Farrar, Parks, & McAlpin (1983), and Pittillo et al. (1975). [= FNA; = "a branching, ribbon-like gametophyte, with diffuse rhizoids and linear-shaped gemmae only one cell wide, of the genus *Vittaria*" – C; < *V. lineata* (Linnaeus) Smith – WV)

*Vittaria lineata* (Linnaeus) Smith, Shoestring Fern. Epiphyte on the bark of *Sabal palmetto*, but the northernmost native site (in Lincoln County, GA) was on rock. Se. GA and formerly ec. GA south to s. FL; c. Mexiso south through Central America to n. South America; West Indies; introduced in e. SC (Beaufort and Jasper counties) on landscaping plants. Sporophytic plants have pendant linear leaves, 1-3 mm wide and up to 60 cm long, hence the common name. [= FNA, K, S]

---

F32. CYSTOPTERIDACEAE Schmakov 2001 (Brittle Fern Family) [in POLYPODIALES]

*Cystopteris* Bernhardi 1806 (Bladder Fern, Brittle Fern)

A genus of about 20 species, sub-cosmopolitan in distribution, primarily of temperate regions but also in montane to alpine settings in tropical regions. References: Hauffer, Moran, & Windham in FNA (1993b); Hauffer, Windham, & Ranker (1990); Kramer et al. in Kramer & Green (1990).

**Identification notes:** See *Wood sia* for suggestions on distinguishing between *Cystopteris* and *Wood sia*, similar ferns often confused. Hybrids frequently occur where two or more species of *Cystopteris* grow in proximity. The following hybrids may be anticipated in our area: *Cystopteris bulbifera × tennesseensis*, *Cystopteris bulbifera × tenuis* [= C. ×*illinoensis* R.C. Moran], *Cystopteris fragilis × tenuis*, *Cystopteris protrusa × tennesseensis*, *Cystopteris protrusa × tenuis* [= C. ×*wagneri* R.C. Moran].

1 Lowest pair of pinnae the longest, thus the leaf widest at the base; bulblets often present on the rachis; indusia, rachises, and veins with stalked glands (these sometimes sparse in *C. tennesseensis*).

2 Leaf blade 10-55 cm long, usually 2-3× as long as the reddish to tan petiole; bulblets usually present, smooth, green, 2-3 mm in diameter, usually on the rachis and the midrib; spores 20-27 μm long.................................................................*C. bulbifera*

2 Leaf blade 6-25 cm long, usually about 1× as long as the dark brown petiole; bulblets present or absent, deformed and scaly, dark, < 1.5 mm in diameter, on the rachis only; spores 25-35 μm long.................................................................*C. tennesseensis*

1 Lowest pair of pinnae shorter than the second or third pair, thus the leaf widest above the base; bulblets never present; indusia, rachises, and veins eglandular.

3 Leaf blade (2.5-) 3-4× as long as wide; pinnae usually perpendicular to the rachis (or even reflexed); margins of pinnae serrulate, the teeth sharp; basal pinnules sessile, truncate to rounded at the base; indusium up to 1 mm long, lanceolate; pinnae usually perpendicular to rachis; [on rock outcrops] .................................................................*C. fragilis*

3 Leaf blade (2.5-) 3-4× as long as wide; pinnae usually at an acute angle to the rachis, curving toward the blade apex; margins of pinnae crenulate, the teeth sharp; basal pinnules short-stalked or sessile, rounded to cuneate at the base; indusium about 0.5 mm long, ovate to round; pinnae usually at an acute angle to the rachis; [on rock outcrops or forest floor].

4 Rhizome long-creeping, the apex extending 10-60 mm beyond the last of the widely-spaced petioles (especially as seen from late spring to summer); rhizome covered with scales and tan to golden hairs; spores 20-32 μm long; leaves membranaceous in texture; basal pinnules conspicuously stalked; petiole green to tan, darkened at base; lowestmost pinnules of each pinna deeply cut; [typically on forest floor, less commonly on rocks] ....................................................................................*C. protrusa*

4 Rhizome short-creeping, the apex extending only 1-5 mm beyond the last of the closely-spaced petioles; rhizome covered with scales, lacking hairs; spores 32-42 μm long; leaves thicker in texture; basal pinnules slightly stalked or merely cuneate to the base; petiole dark brown; lowestmost pinnules of each pinna slightly lobed; [often on rocks, less commonly on forest floor]..............................*C. tenuis*

*Cystopteris bulbifera* (Linnaeus) Bernhardi, Bulblet Fern, Bulblet Bladder Fern. Moist outcrops and talus of calcareous rocks, rarely up to 1500 m elevation. May-August. NL (Newfoundland) west to MN, south to NC, nw. SC (Oconee County), nw. GA, AL, and AR; also disjunct in UT, AZ, NM, and TX. This species is a diploid involved in the reticulate evolution of *Cystopteris* in e. North America. It is one parent of *C. tennesseensis*. Its genome can be symbolized BB. [= RAB, C, F, FNA, G, K, S, W, WV]
Cystopteris fragilis (Linnaeus) Bernhardi, Fragile Fern, Brittle Fern. Cliffs, ascending in our area to 1650 m. June-September. Circumboreal, in North America ranging from NL (Newfoundland) west to AK, south to MA, CT, NJ, montane NC, VA, KY, MO, OK, TX, NM, and AZ. This species is a fertile allotetraploid, presumed to be derived from hybridization between C. reevesiana Lellinger and an extinct or currently undiscovered second parent (C. "hemifragilis"); its genome can be symbolized HHRR (Paler & Barrington 1995). C. fragilis appears to be a complex needing further study; additional entities may be found to warrant taxonomic recognition (see FNA for discussion). [= FNA, K, W; = C. fragilis var. fragilis – C, F, G, S, < C. fragilis (also see C. tennesseensis – WV)]

Cystopteris tennesseensis Shaver, Tennessee Bladder Fern. Moist to dry outcrops of calcareous rocks, including coquina limestone ("marl") in the outer Coastal Plain. April–June. PA, KY, IL, WI, and IA south to NC, nw. GA, n. AL, AR, and OK. This species is a fertile allotetraploid derived from hybridization between C. bulbifera and C. prostrusa. Its genome can be symbolized BBPP. Haufler, Windham, & Ranker (1990) consider this a "successfully fledged and vigorous young species," adapted to a hybrid niche not successfully utilized by either parent. [= RAB, C, FNA, K, W; = C. tennesseensis – WV]

Cystopteris tenuis (Michaux) Desvaux, Mackay's Bladder Fern. Moist outcrops and cliffs of metamorphic and sedimentary rocks, occasionally in moist soils near rock outcrops or moist soil banks. May–August. NL (Newfoundland) west to MN and NE, south to VA, IL, and MO, and in the mountains to NC, TN, and n. GA. This species is a fertile allotetraploid derived from hybridization between C. prostrusa and an extinct or currently undiscovered second parent (C. "hemifragilis"); its genome can be symbolized HHPP (Paler & Barrington 1995). [= FNA, K, W; = C. fragilis var. mackayi Lawson – C, F, G, < C. fragilis – WV]

Gymnocarpium Newman 1851 (Oak Fern)

A genus of about 8 species, north temperate in distribution. References: Pryer in FNA (1993b); Pryer & Haufler (1993)=Z; Pryer (1992); Kramer et al. in Kramer & Green (1990). Key based on FNA.

1 Sessile basal basiscopic pinnule of the proximal pinnae with basal basiscopic pinnulet shorter than the adjacent pinnule; pinnae of second pair sessile, with basal pinnules shorter than the adjacent pinnule (or second basal pinnae rarely stalked); spores 27-31 µm in diameter.................................................................G. dryopteris

1 Sessile basal basiscopic pinnule of the proximal pinnae with basal basiscopic pinnulet more or less equal in length to the adjacent pinnule; pinnae of second pair usually sessile, with basal pinnules more or less equal in length to the adjacent pinnule; spores 34-39 µm in diameter.................................................................C. bulbifera

Gymnocarpium appalachianum Pryer & Haufler, Appalachian Oak Fern. Moist, rocky forests, at medium to high elevations. June–September. Endemic to the c. and s. Appalachians (known from ne. WV, nw. VA, sc. PA, and disjunct in nw. NC and OH). Electrophoretic and morphologic analyses show that it is one of the diploid parents of the widespread allotetraploid G. dryopteris. In NC, it is limited to a single site, below the north-facing summit cliffs on Bluff Mountain, Ashe County, where seepage results in extensive ice formations which frequently persist until June. Karyotype = AA. [= FNA, K, Z; < G. dryopteris (Linnaeus) Newman – C, G, W, WV; = Dryopteris disjuncta (Ledebour) C.V. Morton – F]

Triploids are known from the mountains of VA. Their identity is uncertain; based on geography they are presumably G. appalachianum × dryopteris (AAJ), but could be G. brittonii (Sarvela) Pryer & Haufler [= G. disjunctum × dryopteris = AJJ]. Triploids can be distinguished by the presence of malformed spores, irregular in shape and size, often intermixed with large round spores (vs. all spores reniform and relatively uniform in size and shape). [G. ×brittonii (Sarvela) Pryer & Haufler – K]
A family of 2 genera and more than 720 species, of nearly cosmopolitan distribution. Murakami et al. (1999) conducted a molecular phylogenetic analysis of the Aspleniaceae, which confirmed that Camptosorus should be included in Asplenium, but suggested that Phyllitis is better separated from Asplenium. A later and more comprehensive study shows Phyllitis and Camptosorus to be deeply embedded in Asplenium (Schneider et al. 2004), a conclusion followed here. References: Kramer & Viane in Kramer & Green (1990); Schneider et al. (2004).

Asplenium Linnaeus 1753 (Spleenwort)

Asplenium is a large, nearly cosmopolitan genus of more than 720 species, with centers of diversity in the Appalachians, Central America mountains, Andes, and Himalayas. References: Wagner, Moran, & Werth in FNA (1993b); Moran (1982); Taylor, Mohlenbrock, & Burton (1976); Murakami et al. (1999); Kramer & Viane in Kramer & Green (1990).

Identification notes: Several of the more frequently encountered sterile hybrids are included in the key and treated fully below. Others may be recognized by intermediate morphology and usual co-occurrence with both parents.

1 Leaves simple, unlobed (or sometimes with a few, irregular forking); veins free or anastomosing-areolate.
2 Leaf blades 0-3 mm wide, linear, forking or with a few toothlike projections .............................................. \( A. \) septentrionale
2 Leaf blades 10-40 mm wide, lanceolate, lance-attenuate, or oblong.
3 Leaf apex long-attenuate and characteristically producing plantlets at the tip; veins anastomosing .................. \( A. \) rhizophyllum
3 Leaf apex acute or obtuse, not attenuate, not producing plantlets at the tip; veins free.
4 Longer indusia of each frond avg. 1.2 cm long; leaves (1-) avg. 2.3 (-3.4) dm long; [native in TN, AL, and elsewhere, in natural limestone sinkholes] ............................................. \( A. \) scolopendrium var. americanum
4 Longer indusia of each frond avg. 1.7 cm long; leaves (1-) avg. 3 (-6) dm long; [rarely introduced in North America, typically in artificial settings, such as wells].
1 Leaves pinnatifid (at least in the lower half of the leaf), pinnate, pinnate-pinnatifid, bipinnate, or tripinnate, the apex obtuse, acute, acuminate, or attenuate; veins free.
5 Rachis dull green throughout its length, or at least toward the tip; leaves pinnatifid to tripinnate, the outline of the leaf blade narrowly to broadly triangular, widest at the base (or slightly above the base in \( A. \) abscissum).
6 Petiole partially or entirely green (darkened or not at its base).
7 Leaves bipinnate at the base, pinnate-pinnatifid above; spores normal .............................................................. \( A. \) bradleyi
7 Leaves pinnate at the base, pinnatifid above; spores abortive (or normal from Hale County, AL).
8 Spores abortive ...................................................................................................................................................... \( A. \) xebenoides
8 Spores normal; [endemic as far as known to Hale County, AL] .............................................................................. \( A. \) tutwilerae
6 Petiole entirely green; pinnules toothed; leaves bipinnate, the leaf blades ovate-triangular; ultimate leaf segments mostly stalked; [of calcareous rocks] \( A. \) rhizophyllum var. cryptolepis
5 Rachis shiny black or dark brown throughout its length; leaves pinnate, the outline of the leaf blade linear, lanceolate, or oblongate, with more-or-less parallel sides for much of its length.
13 Pinnae orbicular to obovate-oblong, 1-2× as long as wide, the base more-or-less symmetrical (if auriculate, only slightly so and on the side of the pinna toward the base of the leaf); old leaf rachises often with persistent projections left from the disarticulation of the pinnae.
14 Main pinnae deeply lobed into 3-many segments (the leaves therefore pinnate-pinnatifid); [of FL] ................................ \( A. \) verecundum
14 Main pinnae merely toothed (the leaves therefore pinnate); [widespread in our area]
15 Sori 4-6 (-9) per pinna, up to 2 mm long; rhizome scales up to 3 mm long; petiole relatively thin, shiny, coppery or bronze; pinnae mostly alternate, suborbicular, spaced more distantly, thinner in texture, set at a fairly oblique angle to the rachis, often slightly auriculate on the side of the pinna toward the leaf base; spores mostly 29-36 μm long; stoma guard cells mostly 38-43 μm long; [mostly of noncalcareous rocks] \( A. \) trichomanes ssp. trichomanes
15 Sori 4-9 (-12) per pinna, up to 3 mm long; rhizome scales up to 5 mm long; petiole relatively thicker, blackish-brown; pinnae mostly opposite, oblong, spaced more closely, thicker in texture, set at a nearly right angle to the rachis, rarely at all auriculate; spores mostly 34-43 μm long; stoma guard cells mostly 41-49 μm long; [of calcareous rocks].
### ASPLENIACEAE (F33)

13. Pinnae oblong-rectangular, 2× or more as long as wide, the base asymmetrical or auricled (more prominently auricled on the side of the pinna toward the tip of the leaf); old leaf rachises lacking persistent projections left from the disarticulation of the pinnae.

16. Leaves slightly dimorphic, the fertile upright and larger, the sterile spreading and smaller; pinna auricles prominent, often overlapping the rachis; [terrestrial, often not associated with rock outcrops] ....... \[ A. \text{ platyneuron} \]

16. Leaves not dimorphic; pinna auricles less prominent, usually not overlapping the rachis; [epipetric, always growing in crevices of rock outcrops or in thin soil immediately adjacent to exposed rock].

17. Main vein of the pinna running along the basal edge; sori 1 (-3) per pinna, 1.5-3 mm long, borne along the basal edge, the indusium translucent, whitish, opening toward the leaf tip ....... \[ A. \text{ monanthes} \]

17. Main vein of the pinna running more-or-less medially; sori 4-10 per pinna (on well-developed pinnae), 1.0-1.5 mm long, borne on both sides of the main vein, the indusium opaque, greenish, opening toward the pinna tip.

18. Pinnate margins subentire; pinnae blue-green, coriaceous, borne at right angles to the rachis or slightly reflexed, usually strictly opposite throughout the entire length of the leaf blade ................. \[ A. \text{ resiliens} \]

18. Pinnate margins shallowly crenate or crenate-serrate; pinnae bright-green, subcoriaceous, borne at right angles to the rachis or ascending, opposite below but usually becoming alternate in the apical 1/3-1/2 of the leaf blade.

19. Pinnae margins crenate to serrate; pinna base lacking an auricle, or the auricle rudimentary; veins evident; spores 64 per sporangium ................................................................. \[ A. \text{ heterochroum} \]

19. Pinnae margins shallowly crenate; pinna base with auricle; veins obscure; spores 32 per sporangium ........................................ \[ A. \text{ hetroresiliens} \]

---

**Asplenium abscessum** Wildenow, Cutleaf Spleenwort. Limestone sinkhole. Mexico, Central America, and n. South America; West Indies; nc. and e. FL peninsula; s. FL; n. AL. This species is a diploid, with chromosome complement AA. Found in Jackson County, AL in 2009 (Barger, pers. comm. 2009). [= FNA, K, WH] [add synonymy: S]

**Asplenium bradleyi** D.C. Eaton, Bradley’s Spleenwort. Dry outcrops of felsic sedimentary or metasedimentary rocks, such as sandstone, quartzite, or metarquatize, at low to moderate elevations. April-October. VT, NJ, c. PA, OH, s. IL, and MO south to c. NC, e. GA, AL, TN, and AR, reaching its greatest abundance in the Ozarkian highlands. This species is a fertile allotetraploid derived from hybridization between *A. montanum* and *A. platyneuron*. Its chromosome complement can be symbolized MMPP. The sterile hybrid has also been found in NC; its chromosome complement is MP. [= RAB, C, F, FNA, G, K, S, W, WV; = A. \text{ × bradleyi}]

**Asplenium \text{ × ebenoides}** R.R. Scott (pro species) [\(A. \text{ platyneuron} \times \text{ rhizophyllum}\)], Scott’s Spleenwort. Moist outcrops of calcareous sedimentary rocks, such as limestone, dolostone, and on coquina limestone (shell marl), at low elevations. May-October. VT, NJ, c. PA, OH, s. IL, and MO south to e. VA, w. NC, nw. GA, c. AL, TN, and AR. A. \text{ × ebenoides} is a sterile hybrid (chromosome complement symbolized PR). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP). In AL, however, one population in Hale County has undergone chromosome doubling and is a fertile allotetraploid (PPRR), now treated as hybrid (chromosome complement symbolized PP).

**Asplenium \text{ × heterochroum}** Kunze, Bicolor Spleenwort. Fairly moist outcrops of calcareous sedimentary rocks, such as coquina limestone ("marl"). Se. and se. GA (Jones & Cole 1988) south to n. FL; West Indies; s. Mexico (Chiapas, Veracruz), Belize. Its chromosome complement can be symbolized HHHH. [= FNA, K, WH; < A. \text{ hetroresiliens} – K; < Asplenium \text{ ebenoides} (R.R. Scott) Wherry – G; < Asplenium \text{ × ebenoides} – K; < Asplenium \text{ ebenoides} R.R. Scott – FNA, S]

**Asplenium \text{ × heteroresiliens}** W.H. Wagner, Marl Spleenwort, Carolina Spleenwort, Wagner’s Spleenwort, Morzenti's Spleenwort. Fairly moist outcrops of calcareous sedimentary rocks, such as coquina limestone ("marl"), along small blackwater streams or larger rivers, at low elevations, and rarely also on old ruins made of tabby (a cement made from lime, sand, and oyster shells). April-October. Rare and scattered from se. NC to se. GA, sw. GA, and n. FL, on the Coastal Plain. This species is an apogamous (producing viable spores asexually) allotetraploid derived from hybridization of the sexual tetraploid *H. heterochroum* Kunze (of Florida and the West Indies) and the apogamous triploid *A. resiliens*. Its chromosome complement can be symbolized EEEHH. [= RAB; = A. \text{ × heteroresiliens} – FNA, K, WH; < A. \text{ heterochroum} Kunze – S]

**Asplenium monanthes** Linnaeus, Single-sorus Spleenwort. Moist calcareous situations, in the mountains in moist grottoes of calcareous to semi-calcareous metamorphic rocks (such as mylonite or marble) near waterfalls in humid escarpment gorges with high rainfall, on limestone talus in collapsed sinkhole mouth, or on moist Coastal Plain limestone outcrops. April-October. Scattered in highly humid (montane or maritime) parts of the tropics, subtropics, and warm temperate areas, known from se. and sw. North America, the West Indies (Hispaniola and Jamaica), n. South America, Central America, Mexico, South Africa, Hawaii, and the Azores, Madeira Islands, Madagascar, and the Philippines. In the continental United States, it is known from widely scattered sites with humid and calcareous microhabitats: humid escarpment gorges in Transylvania County, NC and Oconee County, SC; moist limestone outcrops in n. peninsular and Panhandle FL (Nelson 2000); limestone talus in the collapsed mouth of a sinkhole in Jackson County, AL; and the Huachuca Mountains, Cochise County, AZ. Given the variability of *A. monanthes* throughout is widely and scattered distribution, and its complex of related and closely similar species, our material deserves additional study to verify its true identity. [= RAB, FNA, K, W, WH]

---

**Asplenium montanum** Wildenow, Mountain Spleenwort. Moist to dry outcrops of metamorphic, sedimentary, or igneous rocks, such as gneiss, schist, amphibolite, quartzite, rhyolite, sandstone, mostly at moderate to high elevations (up to over 2000
Aspleniaceae (F33) 47

m), but in the Piedmont to as low as 150 m. May-October. Primarily Appalachian: s. VT, MA, NY, OH, and KY south to c. NC, n. GA and AL; absent from the Ozarkian highlands. *A. montanum* is one of the diploid progenitors of the reticulately evolved Appalachian *Asplenium* complex; its chromosome complement is symbolized MM. It is one parent of *A. bradleyi*, *A. pinnatifidum*, and *A. ×trudellii* (and of other sterile hybrids). [= RAB, C, F, FNA, G, K, S, W, WV]

*Asplenium pinnatifidum* Nutall, Lobed Spleenwort. Fairly moist to very dry outcrops of felsic sedimentary or (mostly low-grade) metamorphic rocks, such as sandstone, phyllite, and schist, at low to moderate elevations. May-October. NJ, se. PA, wc. PA, s. OH, IN, IL, and MO south to w. NC, c. GA (Jones & Coile 1988), AL, n. MS, AR, and e. OK. This species is a fertile allotetraploid derived from hybridization of *A. montanum* and *A. rhizophyllum*; its chromosome complement is symbolized MMRR. [= RAB, C, F, FNA, S, W, WV; = *A. pinnatifidum* var. *pinnatifidum* – G; = *A. ×trudellii* – K]

*Asplenium platyneuron* (Linnaeus) Britton, Sterns, & Poggenburg, Ebony Spleenwort. Moist to dry soils of forests, woodlands, old fields; also on outcrops, especially of calcareous rocks and in masonry crevices, at low to moderate elevations; common. April-October. QC, ON, se. MN, IA, and se. CO south to FL, TX, NM, and AZ (and varieties or relatives reported from Central and South America). This species is one of the diploid progenitors involved in the reticulately evolved Appalachian *Asplenium* complex. It is one parent of *A. bradleyi* and *A. ×ebenoides* (as well as other sterile hybrids). *A. platyneuron* in general, and var. *platyneuron* specifically, is by far the most common of our *Asplenium* species, and the only one found characteristically away from rock. *A. platyneuron* var. *incisum* does not seem to warrant taxonomic recognition. Strikingly large plants of the outer Atlantic Coastal Plain and Gulf Coastal Plain have been named var. *bacculum-rubrum* (Featherman) Fernald; they are probably not worthy of taxonomic recognition. They can be distinguished as follows: var. *bacculum-rubrum* has the longest pinnae > 3.5-6 cm long, the pinnae often coarsely serrate-incised to pinnatifid and the larger leaves to (30-) 40-70 (~100) cm tall, with 45-70 pairs of pinnae (vs. longest pinnae < 3.5 cm long, pinnae subentire to pinnatifid, larger leaves to 20-45 (~50) cm tall, with 25-50 pairs of pinnae). [= RAB, C, FNA, S, W, WH, WV; > *A. platyneuron* var. *platyneuron* – F; > *A. platyneuron* var. *bacculum-rubrum* (Featherman) Fernald – F, G, K; > *A. platyneuron* var. *incisum* (Howe ex Peck) B.L. Robinson – F]

*Asplenium resiliens* Kunze, Blackstem Spleenwort. Moist to dry outcrops of calcareous sedimentary or metamorphic rocks, such as limestone, dolostone, coquina, or marble, sometimes on calcareous outcrops of calcareous materials in otherwise acidic rocks, rarely on mortar or concrete, mostly at low to moderate elevations, but remarkably on Grandfather Mountain at over 1800 m. April-October. SC, PA, KY, s. IL, MO, se. KS, OK, TX, CO, and s. NV south to FL, TX, AZ, and Mexico; West Indies; Central America and South America. This species is a triploid (EEE), unable to produce viable spores by sexual means, but producing spores apogamously. It is a parent species of the rare *A. heteroresiliens*. [= RAB, C, F, FNA, K, S, W, WH, WV]

*Asplenium rhizophyllum* Linnaeus, Walking Fern. Moist outcrops of calcareous sedimentary, calcareous metamorphic, or mafic metamorphic rocks, such as limestone, dolostone, calcareous siltstone, amphibolite, mostly at low to moderate elevations, rarely to 1500 m or higher. May-October. S. QC, ON and se. MN south to c. GA, AL, MS, AR, OK, and IA. This species, sometimes placed in the genus *Camptosorus* because of its strikingly different morphology from (most) other *Asplenium*, is one of the diploid progenitors of the reticulately evolved Appalachian *Asplenium* complex. It is a parent of *A. pinnatifidum* and *A. ×ebenoides* (as well as other sterile hybrids), both of which have inherited a limited ability to produce plantlets at the attenuate leaf-tip. It is closely related to *Asplenium sibiricum* of e. Asia. [= RAB, C, FNA, K, W; = *Camptosorus rhizophyllum* (Linnaeus) Link – F, G, S, WV]

*Asplenium ruta-muraria* Linnaeus var. *cryptolepis* (Fernald) Wherry, American Wall-rue. Moist to dry outcrops of calcareous sedimentary or metamorphic rocks, such as limestone, dolostone, or marble, at low to moderate elevations. May-October. *A. ruta-muraria* is a circumboreal species of Europe, Asia, and North America; in North America it ranges as var. *cryptolepis* from VT, s. ON and n. MI south to n. NJ, w. NC, nw. GA (Jones & Coile 1988), n. AL, TN, and AR. Var. *ohionis* is very likely only a form. The relationship of North American *A. ruta-muraria* (here distinguished as var. *cryptolepis*), a tetraploid, to the diploid and tetraploid subspecies of *A. ruta-muraria* present in Europe and e. Asia is uncertain. Given the prevalence of allopolyploidy in *Asplenium* and slight morphologic differences between American and European material, I prefer not to assume its identity to the European plants. In Europe *A. ruta-muraria* is an abundant plant of masonry, such as the defensive walls of towns and cities; it is very rarely seen on walls in North America, presumably because they are not old enough. [= WV; < *A. ruta-muraria* – RAB, C, FNA, W; > *A. cryptolepis* Fernald var. *cryptolepis* – F, S; > *A. cryptolepis* Fernald var. *ohionis* Fernald – F, S; > *A. ruta-muraria* var. *ohionis* (Fernald) Wherry – G; > *A. ruta-muraria* var. *cryptolepis* – G, K; > *A. ruta-muraria* var. *lanceolatum* Christ – K]

*Asplenium scolopendrium* Linnaeus var. *americanum* (Fernald) Kartesz & Gandhi, American Hart's-tongue Fern. Humid sinkholes. E. TN and n. AL, and in other habitats farther north in c. NY, n. MI, and ON; also in the West Indies (Haiti) and s. Mexico (Chiapas, Nuevo León, Oaxaca). It is also reported as naturalized in MD by Reed (1953). [= FNA, K; = *Phyllitis scolopendrium* (Linnaeus) Newman var. *americana* Fernald – C, F, G; < *Phyllitis scolopendrium* – S]

Asplenium septentrionale (Linnaeus) Hoffmann, Forked Spleenwort. Acidic rocks. Western North America south into nw. Mexico (Baja California), Asia, Europe; disjunct in WV (Hardy and Monroe counties). This very inconspicuous species is likely to be found at additional locations. Its chromosome formula is SSSS. [= C, FNA, K]

Asplenium trichomanes Linnaeus ssp. quadrivalens D.E. Meyer emend. Lovis, Maidenhair Spleenwort. Moist outcrops of calcareous sedimentary rocks, such as limestone or dolostone. May-October. Ssp. quadrivalens is known from North America and Europe (at least); in North America it is substantially rarer than ssp. trichomanes and more limited in range, occurring from New England and s. ON south to w. VA, OH, and s. IL, and in BC, WA, and OR. Ssp. quadrivalens is a tetraploid of uncertain origin, presumably autotetraploid, but perhaps the result of the hybridization of two ecologically differentiated diploid races of A. trichomanes. [= FNA, K, W; < A. trichomanes C, F, G, S]

Asplenium trichomanes Linnaeus ssp. trichomanes, Maidenhair Spleenwort. Moist outcrops of slightly to strongly calcareous sedimentary or metamorphic rocks and moderately to strongly mafic metamorphic and igneous rocks, such as limestone, dolostone, mafic and intermediate gneisses and schists, amphibolite, most typically in strong shade, as under overhangs. May-October. A. trichomanes as a whole is a complex species, with diploid, tetraploid, and hexaploid elements, occurring in North America, Europe, Australia, New Zealand, and Asia. Ssp. trichomanes is known to occur in Europe and North America (at least); in North America, it ranges from NL (Newfoundland) to AK, south to NC, e. GA (Jones & Coile 1988), c. AL, AR, OK, w. TX, Chihuahua, se. AZ, and w. OR. Ssp. trichomanes is a diploid, probably involved in the origin of ssp. quadrivalens. [= FNA, K, W; < A. trichomanes – RAB, C, F, G, S, WH, WV]

Asplenium ×trudellii Wherry (pro species) [montanum × pinnatifidum], Trudell’s Spleenwort. Moist outcrops of felsic sedimentary or metamorphic rocks, such as sandstone, phyllite, schist, at low elevations. May-October. This taxon is a sterile triploid hybrid (MMR) of A. montanum and A. pinnatifidum. It is considerably more common than most other sterile Asplenium hybrids, sometimes occurring without one or either parents. There are some reports that it can sometimes produce fertile spores. [= F, FNA, K, WV; = Asplenium pinnatifidum Nuttall var. trudellii (Wherry) Chute – G; = Asplenium trudellii Wherry – S; = ×Asplenosorus trudellii (Wherry) Mickel]

F34. DIPLAZIOPSISIDACEAE X.C. Zhang & Christenhusz 2011 (Glade Fern Family) [in POLYPODIALES]

A family of 3 genera. References:

Homalosorus Small ex Pichi-Sermolli 1977 (Glade Fern)

Homalosorus pycnocarpus (Sprengel) Pichi-Sermolli, Glade Fern. Very nutrient-rich, loamy or seepy forests, over calcareous sedimentary (such as limestone or dolostone) or mafic metamorphic or igneous rocks (such as greenstone or amphibolite). July-September. QC, ON, and MN south to GA and LA (much more common in sedimentary rock areas of the Appalachians than in the primarily acid-soil Blue Ridge and Piedmont). [= S, W, Z; = Diplazopsis pycnocarpa (Sprengel) M. Broun – FNA, K; = Athyrium pycnocarpum Sprengel – RAB, C, F, G, WV; = Diplazopsis pycnocarpa (Sprengel) M.G. Price]

F35. THELYPTERIDACEAE Pichi Sermolli 1970 (Marsh Fern Family) [in POLYPODIALES]

A family of 6-30 genera (generic circumscription especially controversial and problematic) and about 900 species. References: Smith in FNA (1993b); Smith & Cranfill (2002); Lellinger (1985); Mickel (1979); Smith in Kramer & Green (1990).

1 Leaf blades 7-25 (-30) cm long, triangular, < 2× as long as wide; rachis with adnate wings between the pinnae; sori without indusia; midribs of pinnae lacking an adaxial groove................................................................................................................................. Phegopteris
1 Leaf blades (15-) 20-100 cm long, lanceolate, oblance-lanceolate, or triangular, > 2× as long as wide; rachis without adnate wings between the pinnae; sori with reniform indusia; midribs of pinnae with an adaxial groove (adaxial groove lacking in Macrothelypteris).
2 Midribs of the pinnae lacking an adaxial groove; leaf bipinnate to tripinnate .................................................. Macrothelypteris
2 Midribs of the pinnae with an adaxial groove; leaf pinnate-pinnatifid ............................................................. Thelypteris

Macrothelypteris (H. Itô) Ching 1963 (Maiden Fern)

* Macrothelypteris torresiana (Gaudichaud-Beaupré) Ching, Mariana Maiden Fern. Disturbed areas, and increasingly invasive in natural habitats (especially in the southern parts of our area); native of the Asian and African tropics. Leonard (1972) discusses the history of this species in the southeastern United States. [= FNA, K, WH; = Dryopteris setigera Blume – S, misapplied; = Thelypteris torresiana (Gaudichaud-Beaupré) Alston]

Phegopteris (C. Presl) Fée 1852 (Beech Fern)
1 Rachis wings absent between the two basal pinna pairs; rachis bearing on its lower surface numerous tan to brown, lanceolate scales (these mostly 6-12 cells wide at the base) and acicular hairs 0.3-1.0 mm long. ................................................................. P. connectilis
1 Rachis wings present between the two basal pinna pairs; rachis bearing on its lower surface relatively few, white to pale tan, narrowly lanceolate scales (these mostly 3-5 cells wide at the base) and hairs 0.1-0.25 mm long ................................................................. P. hexagonoptera

Phegopteris connectilis (Michaux) Watt, Northern Beech Fern. Moist cliffs where wet by spray from waterfalls (at medium elevations), also on high elevation cliffs wet by seepage and in spruce-fir forests, northwards in cool ravines and on swamp borders. April-August. A circumboreal species, at its southern limit in North America in MD, WY, OH, IL, IA, MT, and OR; disjunct southwards in W, NC, and E, TN, and in CO. Most of the occurrences in NC are at waterfalls in the escarpment gorges of Transylvania, Macon, and Jackson counties, near Highlands. The species is a triploid, reproducing apogamously. [= FNA, K, WV; = Thelypteris phegopteris (Linnaeus) Slosson – RAB, C, G, W; = Dryopteris phegopteris (Linnaeus) C. Christensen – F; = Phegopteris phegopteris (Linnaeus) Keyserling – S]

Phegopteris hexagonoptera (Michaux) Fée, Broad Beech Fern. Mesic to submesic forests. April-August. Widespread in eastern North America, from QC west to ON, W1, and MN, south to Panhandle FL and e. TX. [= FNA, K, S, WH, WV; = Thelypteris hexagonoptera (Michaux) Weatherby – RAB, C, G, W; = Dryopteris hexagonoptera (Michaux) C. Christensen – F]

Asplenium vercardum
Diplazium pyrnocarpum
Macrothelypteris
torresiana
Phegopteris
connectilis
Phegopteris
hexagonoptera

Thelypteris Schmidel 1763 (Maiden Fern, Shield Fern, Marsh Fern)
A genus of about 875 species, cosmopolitan, perhaps warranting separation into various segregates. Thelypteris is a large and rather heterogeneous group, even with the removal of Phegopteris and Macrothelypteris. Our species fall into several subgenera, sometimes treated as genera: subgenus or genus Thelypteris (Th. palmius var. pubescens), subgenus or genus Paratheypteris (Th. noveboracensis; Th. simula), subgenus Cyclosorus or genus Christella (Th. denticula, Th. hispidula var. versicolor, Th. interrupta, Th. kunthii, Th. ovata var. ovata), and subgenus or genus Stegnogramma (Th. burksiorum). The appropriate names, should the additional segregate genera be adopted, are listed in synonymy. References: Smith (1981); Smith in Kramer & Green (1990). [also see Macrothelypteris and Phegopteris]

1 Sori elongate; sporangia with hairs 0.1-0.2 mm long; [endemic to NC, AL]; [subgenus or genus Stegnogramma] .................................................. T. burksiorum
1 Sori round or slightly longer than wide; sporangia glabrous; [collectively widespread]
2 Leaves 5-15 (-20) cm wide; rhizome scales 1-4 mm long, lanceolate to ovate, glabrous, pale brown to golden brown, flexible and very thin.
3 Leaf blade broadest near the middle, gradually reduced to the base, the petiole < 1/3 the length of the blade; [of upland and wetland habitats]; [subgenus or genus Paratheypteris] ........................................................................................................ T. noveboracensis
3 Leaf blade broadest near the base, the pinnae stopping abruptly, the petiole 2/3 to fully as long as the blade; [of wetland habitats].
4 Undersurface of blades without glands; lateral veins of sterile lobes forked once between the pinnule midvein and the margin; lower surface of costae with tan, ovate scales; lobes of fertile leaves revolute; indusia ciliate (rarely glabrous); [subgenus or genus Thelypteris] ........................................................................................................ T. palmius var. pubescens
4 Undersurface of blades with minute, sessile, globose, golden to reddish glands; lateral veins of sterile lobes simple, not forked between the pinnule midvein and the margin; lower surface of costae lacking scales; lobes of fertile leaves plane to slightly revolute; indusia with minute glands along the margins; [subgenus or genus Paratheypteris] ........................................................................................................ T. simula
d
2 Leaves (6-) 10-35 cm wide; rhizome scales 2-6 mm long, linear-lanceolate, usually minutely pilose, yellowish-brown to brown, stiff and rather thick; [subgenus Cyclosorus or genus Christella].
5 Basal veins from adjacent lobes of the pinna uniting below the sinus (between the sinus and the costa), with a united vein continuing to the sinus.
6 Lower surface of costae with tan scales; upper surface of costae glabrous or sparsely pubescent with hairs < 0.2 mm long; rhizomes long-creeping. .................................................. T. interrupta

Lower surface of costae lacking scales; upper surface of costae moderately to densely hairy with hairs > 0.3 mm long; rhizomes short-creeping.

7 Rachises and pinnules usually purplish; costae densely short-hairy on the lower surface, the hairs 0.01 - 0.2 mm long (about half as long as the costa width); widest point of the leaf usually 3-5 pairs of pinnae up from the base. .................................................. T. dentata

Rachises and pinnules usually tan; costae sparsely hairy on the lower surface, the hairs variable in length, most of them > 0.3 mm long and at least some > 0.5 mm long (the longer as long as or longer than the costa width); widest point of the leaf usually 1-3 pairs of pinnae up from the base ........................................................................................................ T. hispidula var. versicolor

5 Basal veins from adjacent lobes of the pinna not meeting at all, or reaching the sinus at the same point, thus without a united vein to the sinus.

8 Upper surface of the costae and costules glabrous above (rarely minutely hairy, the hairs never > 0.2 mm long), eglundular..........

50

Upper surface of the costae and costules with at least a few stout hairs > 0.3 mm long; upper leaf surface pubescent to nearly glabrous, also glandular with stipitate glands.

9 Lowermost 1-2 pairs of pinnae distinctly shorter than the pair above (ca. ¼ as long); basal veins from adjacent lobes of the pinna always meeting ................................................................................................................ T. hispidula var. versicolor

Lowermost pair of pinnae equal to or very slightly shorter than the next pair above; basal veins from adjacent lobes of the pinna not meeting at all, or reaching the sinus at the same point ........................................................................................................ T. kunthii

**Thelypteris burkii** J.E. Watkins & D.R. Farrar. Moist sandstone grottoes. A narrow endemic of nc. AL. Watkins & Farrar (2002, 2005) present evidence for its recognition as a species distinct from Thelypteris pilosa and discuss its likely evolution as an ancient relictual taxon. The appropriate combination for its recognition at the species level in Stegnogramma has not been made. [= Thelypteris pilosa (M. Martens & Galeotti) Crawford var. alabamensis Crawford – FNA, K; = Stegnogramma pilosa (M. Martens & Galeotti) K. Iwatsuki var. alabamensis (Crawford) K. Iwatsuki; = Stegnogramma species 1]

* Thelypteris dentata (Forskål) E. P. St. John, Downy Maiden Fern, Soft Fern. Disturbed areas; native of tropical and subtropical Asia and Africa. [= FNA, K, S, WH; = Christella dentata (Forskål) Brownsey & Jermy]

**Thelypteris hispida** (Decaisne) C.F. Reed var. versicolor (R. St. John) Lellinger, Hairy Maiden Fern. Moist forests, limesinks, and on soil in disturbed areas. E. SC south to s. FL < west to e. TX. Other varieties occur in the West Indies, in tropical New and Old World. [= FNA, K, WH; = T. versicolor R. St. John – S; < Christella hispida (Decaisne) Holttum; = T. quadrangularis (Fee) Schelpe var. versicolor (R. St. John) A.R. Smith]

**Thelypteris interrupta** (Willdenow) K. Iwatsuki, Hottentot Fern. Marshes, swamps, ditches. Pantropical. [= FNA, K, WH; ? T. gongolodes (Schkuhr) Small – S; > T. tota (Thunberg) Schelpe; = Cyclosorus interruptus (Willdenow) H. Ito; = Christella]

**Thelypteris kunthii** (Desvaux) C.V. Morton, Kunth's Maiden Fern, Southern Shield Fern. Coquina limestone ("marl") outcrops, calcareous bluffs and sinkhole slopes, also adventive on and around coquina limestone (marl) riprap around small bridges and ditches and in suburban forests. May-August. SE. NC south to s. FL and west to c. TX; Mexico south through Central America into n. South America; West Indies. [= RAB, FNA, K, WH; < T. normalis (C. Christensen) Moxley – S; < Christella normalis (C. Christensen) Holttum]

**Thelypteris noveboracensis** (Linnaeus) Nieuwland, New York Fern. Mesic forests, bottomland forests, bogs, submesic forests. May-August. NL (Newfoundland) and WI south to GA, AL, and AR. Distinctive in the leaves tapering about equally to both tip and base. [= RAB, C, FNA, G, K, S, W, WV; = Dryopteris noveboracensis (Linnaeus) A. Gray – F; = Parathelypteris noveboracensis (Linnaeus) Ching]

---

**Thelypteris ovata** R. P. St. John var. ovata, Oxate Maiden Fern. On coquina limestone ("marl") or in disturbed, calcareous areas. S. SC south to s. FL, west to s. AL; and in the Bahamas. Var. lindheimeri (C. Christensen) A.R. Smith occurs in TX, Mexico, Belize, Guatemala, and Jamaica. [= FNA, K; > T. ovata var. ovata – S, in a narrower sense; > T. ovata var. harperi (C. Christensen) R. P. St. John – S; < T. ovata – WH; = Christella ovata (R.P. St. John) Löve & Löve]

**Thelypteris palustris** Schott var. pubescens (Lawson) Fernald, Marsh Fern. Bogs, marshes (including freshwater tidal marshes), and bottomland forests. June-September. The species is circumboreal, occurring in n. Europe, n. Asia, and n. North America. Var. pubescens is the American variety, ranging from NL (Newfoundland) and MB south to s. FL and c. TX, c. Mexico (Michoacán, Distrito Federal); Bermuda, Cuba. [= C, FNA, G, K, S, WH, WV; < T. palustris – RAB; = Dryopteris thelypteris (Linnaeus) Swartz var. pubescens (Lawson) A.R. Prince ex Weatherby – F; < T. thelypteris (Linnaeus) Nieuwland – S]

**Thelypteris simulata** (Davenport) Nieuwland, Bog Fern, Massachusetts Fern. In NC and WV in acid peat bogs at about 1000 meters in elevation, in DE, NJ, and VA in acid seepage swamps in the Coastal Plain. July-September. Northeastern, ranging from NS south to ne. VA (Accomack, New Kent, Northampton and Westmoreland counties) and n. WV (Tucker and Preston counties), and disjunct in NC (Alleghany and Avery counties) and WI. Discovered in NC in the 1980's. Presently known in NC only from two sites. [= C, FNA, G, S, W, WV; = Dryopteris simulata Davenport – F; = Parathelypteris simulata (Davenport) Holttum]
L1. Lycopodiaceae

F36. Woodsiaceae Herter 1949 (Woodsia Family) [in Poly podiales]

A family of about 15 genera and 700 species, cosmopolitan in distribution, but concentrated in temperate and montane areas. References: Smith in FNA (1993b); Smith et al. (2006); Lellinger (1985); Kramer et al. in Kramer & Green (1990).

1. Sori elongate, indusia present and flampleke, attached along a long side.
2. Leaves 2-piniate to 3-piniate (the pinnae at least 1-piniate); sori elongate, 2-3× as long as wide, the larger sori generally curved and extending across the veins (except Diplazium esculetum).
3. Veins free, simple or forked
4. Leaf blades broadly triangular in outline, ca. 1× as long as wide; rhizome ca. 1 mm in diameter; indusia absent; [native species of mountain peaks of n. NC and VA].
5. Indusium attached under one side of the sorus, hoodlike or pocketlike, arching over the sorus; petioles glabrous or sparsely beset with scales, the petiole bases not persistent. [see Gymnocarpium in Cystopteridaceae]
6. Leaf blades lanceolate, oblanceolate, or ovate in outline, 2× or more as long as wide; rhizome more than 2 mm in diameter.
7. Indusium attached under the sorus, cuplike (divided into 3-6 lanceolate to ovate lobes which surround the sorus from below) or of minute numerous septate hairs, which extend out from under the sorus on all sides; petioles often densely beset with scales, the petiole bases persistent. [see Cystopteris in Cystopteridaceae]

Woodsia R. Brown 1810 (Woodsia, Cliff Fern)

A genus of about 30 species, of temperate and cool-temperate regions, widespread in the Northern Hemisphere, in montane tropical South America, and south temperate in Africa and South America. References: Windham in FNA (1993b); Kramer et al. in Kramer & Green (1990).

Identification notes: Woodsia species and Cystopteris species are all small ferns with thin-textured leaves, occurring primarily on or near rock outcrops; they frequently occur together or in proximity to one another and are often confused. Woodsia has the indusium divided into a series of scale-like or hair-like structures, attached below the sorus; Cystopteris has an undivided indusium, pocket-like or hood-like, attached around one side of the sorus. Woodsia has persistent dark petiole bases; in Cystopteris the petiole bases are deciduous. Woodsia has the final veinlets not reaching the margin; Cystopteris veins do reach the margin.

1. Petioles with a distinct joint about 1-3 cm above the base, the petiole bases of former leaves forming a fairly even stubble; leaf blade lacking glands (though bearing both long septate hairs and pale linear scales); indusium of numerous filamentous segments. W. ilvensis
2. Petioles lacking a joint, the petiole bases of former leaves disintegrating irregularly and forming an uneven stubble; leaf blade with stalked glands, at least below on the costae, costules, and veins (and also bearing non-glandular hairs and/or linear scales); indusium of 3-6 lanceolate segments.
3. Rachis with flattened, septate, white hairs and elongate stipitate glands; leaf blade with flattened, septate, white hairs and elongate stipitate glands. W. appalachiana
4. Rachis with scattered scales; leaf blade with sparse to dense stipitate glands. W. obtusa ssp. obtusa

Woodsia appalachiana T.M.C. Taylor, Appalachian Woodsia, Appalachian Cliff Fern, Mountain Woodsia. On cliffs of sandstone, shale, granite, granitic gneiss, and hornblende gneiss. June-September. Endemic to the Southern and Central Appalachians of VA, WV, NC, nw. GA, TN, and the Ozarks of AR. This species is similar to W. scopulina of the western mountains of AK south to CO and CA. The eastern plants have been variously treated as a full species, a subspecies or variety of W. scopulina, or as indistinguishable from W. scopulina (see synonymy). It now appears that W. appalachiana may be a rather cryptic but distinct element of a reticulate complex also involving W. scopulina ssp. scopulina (of the Rocky Mountains) and W. scopulina ssp. laurentiana Windham (primarily of the Rocky Mountains but also disjunct eastward in ON and QC). Windham in FNA (1993b) treats these three entities as subspecies, and suggests that ssp. laurentiana is the allotetraploid derivative of hybridization of the eastern and western diploids. If this is indeed so, each of the 3 entities should be recognized at the species level. [= F, K, < W. scopulina D.C. Eaton – RAB, C, S, W, WV; = W. scopulina ssp. appalachiana (T.M.C. Taylor) Windham – FNA; = W. scopulina var. appalachiana (T.M.C. Taylor) Morton – G]

WOODSIACEAE (F29)

52

F38. ONOCLEACEAE Pichi Sermolli 1970 (Sensitive Fern Family) [in POLYPODIALES]

A family of 4 genera and 5 species, of north temperate regions. The family as here circumscribed is monophyletic and sister to Blechnaceae (Smith et al. 2006). Christenhusz, Zhang, & Schneider (2011) prefer to combine the 5 species in the family into a single genus (*Onoclea*). References: Christenhusz, Zhang, & Schneider (2011); Smith et al. (2006)

1 Sterile leaves pinnate-pinnatifid, 6-25 dm tall, broadest toward the tip; fertile leaves 1-pinnate; veins free; rhizomes of 2 types, the slender, creeping rhizomes leafless, giving rise at intervals to extremely stout, vertical rhizomes which bear a cluster of many leaves .......... *Matteuccia*

1 Sterile leaves pinnatifid, 2-10 dm tall, broadest near the base; fertile leaves 2-pinnate; veins netted; rhizomes all slender and creeping, the leaves borne scattered along the rhizome ................................................................. *Onoclea*

Matteuccia Todaro 1866 (Ostrich Fern)

A monotypic genus, north temperate in distribution. Two other species formerly included in *Matteuccia* (or sometimes in *Onoclea*) are either better treated in the genus *Pentarhizidium* Hayata (Gastony & Ungerer 1997), or else the genera *Pentarhizidium, Matteuccia,* and *Onocleopsis* should be united into *Onoclea* (Christenhusz, Zhang, & Schneider 2011).

References: Johnson in FNA (1993b); Kramer et al. in Kramer & Green (1990).

*Matteuccia struthiopteris* (Linnaeus) Todaro var. *pensylvanica* (Willdenow) C.V. Morton, Ostrich Fern. Alluvial forests and calcareous wetlands. The species is circumboreal; the North American var. *pensylvanica* ranges from NL (Newfoundland) west to AK, south to VA (Smyth and Craig cos.), MO, SD, and BC. The North American var. *pensylvanica* is separated from the Eurasian var. *struthiopteris* on the basis of its concolorous rhizome scales (vs. bicolorous scales) and less truncate pinna lobes. *Matteuccia* stores starch in its persistent petiole bases. [= FNA, G; < *M. struthiopteris* – C, K; = *Pteretis pensylvanica* (Willdenow) Fernald – F; = *M. pensylvanica* (Willdenow) Raymond – WV; = *Onoclea struthiopteris* (Linnaeus) Roth var. persylvanica (Willdenow) B. Boivin]

Onoclea Linnaeus 1753 (Sensitive Fern)

*Onoclea sensibilis* Linnaeus var. *sensibilis*, Sensitive Fern, Bead Fern. Marshes, swamps, wet disturbed places. May-June. The species ranges from NL (Newfoundland) west to MN and CO, south to FL, TX, and CO; also in e. Asia. Var. *sensibilis* is North American; var. *interrupta* is Asian. The recognition of two varieties is supported by molecular evidence. Alternatively, species status is sometimes given (Gastony & Ungerer 1997). The specific epithet and common name refer to the fact that the fronds wither at the first touch of frost, not that they respond to touch. The peculiar fertile leaves (with their brown, beadlike, fertile pinnules) are collected for use in dried arrangements. The expanded, persistent petiole bases store starch. [<= *O. sensibilis* – RAB, C, F, FNA, G, K, S, W, WV; = *O. sensibilis* – Z]

F39. BLECHNACEAE (C. Presl) Copeland 1947 (Deer Fern Family) [in POLYPODIALES]

A family of about 9 genera and 250 species, cosmopolitan in distribution. References: Lellinger (1985); Cranfill in FNA (1993b); Kramer, Chambers, & Hemmipman in Kramer & Green (1990).

1 Veins of sterile leaves free; sori continuous .................................................................................................................................................. *Blechnum*

1 Veins of sterile leaves anastomosing; sori distinct from one another, in rows .................................................................................................................. *Woodwardia*

Blechnum Linnaeus 1753 (Deer Fern)

1 Leaf blades usually < 5 dm long; leaves pinnate-pinnatifid in all or part; margins entire (to sparingly and irregularly serrulate) .......................................................... *B. appendiculatum*

1 Leaf blades usually > 5 dm long; leaves pinnate throughout; margins serrulate ............................................................................................................................... *B. serrulatum*
BLECHNACEAE (F30)

*Blechnum appendiculatum* Willdenow, Hammock Fern. Moist forests. S. GA south to s. FL; West Indies; Central America, South America. Collected once in LA, on the west bank of the Mississippi River in bottomland hardwoods in Iberville Parish, LA. [= Z; = *B. occidentale* Linnaeus var. *minor* Hooker – FNA; < *B. occidentale* – K1, K2, S]

*Blechnum serrulatum* L.C. Richard, Swamp Fern, Marsh Fern. Vacant lots, bottomlands. Ne. FL south to FL peninsula; Mexico, Central America, South America; West Indies; Malesia and Australia. Introduced and established in e. SC (Beaufort and Jasper counties) via landscaping plants brought in from FL (P. McMillan, pers. comm. 2005). [= FNA, K1, K2, S, Z]

*Woodwardia* J.E. Smith 1793 (Chain Fern)

**Identification notes:** In sterile leaf, *Woodwardia areolata* is sometimes confused with *Onoclea*, but *W. areolata* has the pinnae generally alternate (vs. tending to be opposite), the pinnae generally acute or acuminate (vs. obtuse), and the pinna margin finely serrulate (vs. entire).

1. Sterile leaves pinnatifid, the pinnae 7-10 pairs per leaf, basally not distinct from one another, the rachis therefore winged by leaf tissue throughout its length, the pinnae merely finely serrulate ........................................................................................................... *W. areolata*

1. Sterile leaves pinnate-pinnatifid, the pinnae 15-20 pairs per leaf, fully distinct, the rachis therefore not winged by leaf tissue, the pinnae themselves pinnatifid ................................................................................................................................. *W. virginica*

*Woodwardia areolata* (Linnaeus) T. Moore, Netted Chain Fern. Moist to wet, acid, organic soils, such as bogs, blackwater bottomlands, pocosins. May-September. NS west to MI and MO, south to s. FL and e. TX, primarily on the Coastal Plain. See Cranfill (1983) for a discussion of the geography and ecology of *W. areolata*. [= RAB, C, F, FNA, G, K, W, WH; = *Lorinseria areolata* (Linnaeus) K. Presl – S, WV]

*Woodwardia virginica* (Linnaeus) J.E. Smith, Virginia Chain Fern. Moist to wet, acid, organic soils, such as bogs, blackwater bottomlands, pocosins, sometimes in standing water, as in periodically flooded coastal plain depression ponds. June-September. NS west to MI and IL, south to s. FL and TX, and in Bermuda, primarily on the Coastal Plain. Sometimes confused when sterile with *Osmandastrum cinnamomeum* (which see for discussion). [= RAB, C, F, FNA, G, K, W, WH; = *Anchistea virginica* (Linnaeus) K. Presl – S]

F40. ATHYRIACEAE Alston 1956 (Lady Fern Family) [in POLYPODIALES]

References: Christenhusz, Zhang, & Schneider (2011).

1. Leaves 2-pinnate to 3-pinnate (the pinnae at least 1-pinnate); sori elongate, 2-3× as long as wide, the larger sori generally curved and extending across the veins (except *Diplazium esculentum*).

2. Veins free, simple or forked .................................................................................................................................................................. *Athyrium*

2. Veins anastomosing ............................................................................................................................................................................. *Diplazium*

1. Leaves 1-pinnate to 1-pinnate-pinnatifid (the pinnae entire or pinnatifid); sori elongate, 2.5-6× as long as wide, even the larger sori generally straight and not extending across the veins.

3. Leaves 1-pinnate-pinnatifid, the pinnae pinnatifid ............................................................................................................................... *Deparia*

3. Leaves 1-pinnate, the pinnae entire .................................................................................................................................................. [see *Homalosorus* in DIPLAZIOPSIDACEAE]

*Athyrium* Roth 1799 (Lady Fern)

A genus of about 180 species, cosmopolitan in distribution, but concentrated in e. and se. Asia. Kellogg et al. (2002) and Kellogg & Werth (1998) support recognition of two taxa at either specific or infraspecific levels, based on morphology, allozymes, and spores. References: Kato in FNA (1993b); Kramer et al. in Kramer & Green (1990); Kellogg et al. (2002). [also see *Deparia* and *Homalosorus*]

**Identification notes:** *Athyrium* and *Deparia* superficially resemble *Dryopteris*, and they often grow together. *Athyrium* and *Deparia* have linear, flap-like sori (vs. rounded, reniform sori). Sterile individuals can be distinguished by the number of vascular bundles in the petiole (easily determined by breaking off a leaf and counting the vascular bundles, which will appear as thread-like, but flattened, strands); *Athyrium* and *Deparia* have 2, *Dryopteris* has 4-7.

1. Leaves variegated, silvery gray and gray-green; [alien] .................................................................................................................. *A. niponicum*

1. Leaves not variegated, bright green; [native, sometimes cultivated]
ATHYRIACEAE (F40) 54

1 Leaf blade widest near middle (the fourth or fifth pair of pinnacles from the base the largest); margins of indusium toothed or ciliate (not glandular); rachis glandular; spores yellow or brown, finely papillose; petiole scales persistent, up to 1 cm long and 1.5 mm wide. .......................... A. angustum

1 Leaf blade widest near base (the second or third pair of pinnacles from the base the largest); margins of indusium ciliate and glandular-ciliate; rachis eglandular; spores brown or dark brown, reticulate-wrinkled; petiole scales early deciduous, up to 5 mm long and 1 mm wide. .......................... A. asplenioides

Athyrium angustum (Willdenow) K. Presl, Northern Lady Fern. Moist forests, rock outcrops on grassy balds at high elevations. June-September. The occurrence of this northern species is not fully documented in NC or VA; it was found in the 1980's by Murray Evans on Hump Mountain, on or near the TN-NC border. NL (Newfoundland) and n. QC west to SK, south to w. NC, e. TN, OH, MO, and NE. Reported for VA by Kartesz (1999). [= S, WV; = A. filix-femina (Linnaeus) Roth ex Mertens var. michauxii (Sprengel) Farwell – C, F, G; = A. filix-femina var. angustum (Willdenow) G. Lawson – FNA; = A. filix-femina ssp. angustum (Willdenow) Clausen – K, W]

* Athyrium niponicum (Mettenius) Hance, Japanese Painted Fern. Suburban woodlands, lawns; commonly planted as an ornamental, rarely naturalizing, native of Japan. This common suburban ornamental (forma picta) spreads locally from plantings; it seems only a matter of time before it begins to naturalize more widely

Deparia Hooker & Greville 1829

A genus of about 40-50 species, primarily in tropical to warm temperate Asia and Africa. References: Kato in FNA (1993b); Kramer et al. in Kramer & Green (1990).

Identification notes: Unlike Athyrium, Deparia has the costal groove not continuous with the rachis groove. In addition, Deparia has multicellular hairs on the leaf blades.

1 Leaf blade narrowed to base; petiole bases swollen, with 2 rows of teeth; [plant a common native species of moist forests]; [section Lunathyrium] .............................................................. .............................................................. D. acrostichoides

1 Leaf blade widest at the base; petiole bases not markedly swollen, lacking teeth; [plant an exotic species, rarely introduced and naturalized]; [section Athyriopsis] .............................................................. .............................................................. D. petersenii

Deparia acrostichoides (Swartz) M. Kato, Silvery Spleenwort. Moist forests, cove forests. June-September. NS west to MN, south to NC, SC, n. GA, n. AL, and AR. D. acrostichoides is the only species native to the New World; it has several very closely related species in e. Asia (in section Lunathyrium). It stores starch in the swollen, persistent petiole bases. [= FNA, K; = Athyrium thelypteroides (Michaux) Desvaux – RAB, S, F, G, WV; = Diplazium acrostichoides (Swartz) Butters – S]

* Deparia petersenii (Kunze) M. Kato. Swamp forests, disturbed areas; native to se. Asia. Introduced and naturalized in the Southeast, including in c. and s. GA, AL, s. MS, and FL. [= FNA; = Deparia petersenii – K, orthographic variant; = Deparia japonica (Thunberg) M. Kato, misapplied; = Diplazium japonicum (Thunberg) Beddome, misapplied]

Diplazium Swartz 1800 (Twin-sorus Fern)

A genus of about 400 species, primarily in tropical and north temperate in distribution. References: Kato in FNA (1993b); Kramer et al. in Kramer & Green (1990).

1 Leaves 2-pinnate; veins anastomosing .............................................................. D. esculentum

1 Leaves 1-pinnate; veins free ........................................................................... [see Homalosorus pycnocarpos in DIPLAZIOPSIDACEAE]

* Diplazium esculentum (Retzius) Swartz, Vegetable Fern. Moist disturbed areas; native of the Old World tropics. [= FNA, K]

F42. DRYOPTERIDACEAE Ching 1965 (Wood-fern Family) [in POLYPODIALES]

A family of about 40-45 genera and 1700 species, cosmopolitan in distribution, but concentrated in temperate and montane areas. Here circumscribed (following Smith et al. 2006) to exclude Onocleaceae and Woodsiaceae. References: Smith in FNA (1993b); Smith et al. (2006); Lellinger (1985); Kramer et al. in Kramer & Green (1990).
A genus of about 50-60 species, of tropical and warm temperate regions, and especially of Asia and America. References: Smith in FNA (1993b); Kramer et al. in Kramer & Green (1990).

* Arachniodes simplicior (Makino) Ohwi, Simpler East Indian Holly Fern. Moist banks in forested creek ravine; native of Japan and China. Gordon (1981) discusses this interesting introduced population, apparently established for several decades at the time of its discovery, and likely originating from spores. [= FNA, K]

Cyrtomium K. Presl 1836 (Net-veined Holly Fern)

A genus of about 15 species, of temperate regions of Africa, Asia, and the Pacific Islands. Perhaps better treated as a portion of Polystichum; at the least, Cyrtomium is closely related to Polystichum. Both species in our area are apogamous triploids.

Identification notes: Dryopteris and Athyrium are often confused when not fertile; they can be easily distinguished by breaking off a leaf and counting vascular bundles (which will appear as thread-like strands). Dryopteris has 5 and Athyrium has 2. Many Dryopteris species will hybridize with one another to form sterile hybrids. Whenever two or more Dryopteris species are found growing together, there is a good chance that hybrids are present. Hybrids generally show intermediacy between the two parents, and have abortive sporangia or spores.
Fertile pinnae nearly in plane of the blade (like a closed Venetian blind); fertile leaves 12-20 cm wide ............... *D. clintoniana*

Fertile pinnae usually twisted out of the plane of the leaf axes, often nearly to 90° (like an open Venetian blind); fertile leaves 8-12 cm wide ......................................................... *D. cristata*

Leaves not dimorphic, or only slightly so, deciduous (*D. goldiana*), evergreen (*D. ludoviciana*), or else with usually deciduous fertile and semi-evergreen sterile fronds (*D. celsa*); fertile leaves lanceolate to ovate in outline; generally 1.5-5× as long as wide; pinnae mostly 3-5× as long as wide; scales at base of petiole dark brown with tan margins.

Leaves evergreen, fertile only toward the tip, the fertile pinnae and segments narrower than the sterile and more widely spaced; scales at the petiole base light brown, not shiny .......................... *D. ludoviciana*

Leaves deciduous or semi-evergreen, fertile throughout or nearly so, the fertile pinnae and segments not differentiated from sterile ones; scales at petiole base medium to dark brown, shiny or not.

Costa with bullate (blistered-appearing) scales abundant, usually dark; [rarely naturalized alien] ......................... *D. erythrosora*

Costa lacking bullate scales; [native, sometimes also cultivated].

Sterile leaves semi-evergreen; fertile leaves deciduous with sori submedial, not touching the costule at maturity; leaf blade lanceolate, usually 2-4× as long as wide, gradually tapering at the apex; scales at the petiole base medium to dark brown, with a narrow black central band................................. *D. celsa*

Leaves deciduous with sori semi-evergreen, touching the costule at maturity; leaf blade ovate to narrowly ovate, usually 1.5-3× as long as wide; abruptly tapering at the apex; scales at the petiole base dark brown, nearly black, with a narrow pale margin................................. *D. goldiana*

---

**Dryopteris campyloptera** Clarkson, Mountain Wood-fern. Spruce-fir forests, northern hardwood forests. July-September. NL (Newfoundland) and n. QC to extreme s. PA, and from extreme s. PA south through e. WV and w. VA to e. TN and w. NC. This species is a fertile allotetraploid derived from hybridization of *D. intermedia* and the northern and western *D. expansa* (K. Presl) Fraser-Jenkins & Jermy, which does not (now) reach our area. The chromosome complement is symbolized EEII. [= RAB, C, K, S, W, WV; = *D. spinulosa* (O.F. Mueller) Watt var. americana (Fischer ex Kunze) Fernald – F; = *D. austriaca* (Jacquin) Woynar ex Schinz & Thellung var. austriaca – G]

**Dryopteris carthusiana** (Villars) H.P. Fuchs, Spinulose Wood-fern, Toothed Wood-fern. Acidic, organic-rich bogs, swamps, less frequently in moist rocky ravines, rich forests, and sloping rock outcrops. June-September. Irregularly circumpolar, in North America ranging from n. QC west to YT, south to NC, SC, ne. GA, TN, AR, NE, w. MT, and WA. This species is a fertile allotetraploid derived from hybridization of *D. intermedia* and "*D. semicristata*"; a hypothetical species which may now be extinct. Its chromosome complement is symbolized IISS. [= C, F, K, W; = *D. spinulosa* (O.F. Mueller) Watt – RAB, S, WV; = *D. spinulosa* var. spinulosa – F; = *D. austriaca* (Jacquin) Woynar ex Schinz & Thellung var. spinulosa (O.F. Mueller) Fiori – G]

---

**Dryopteris celsa** (W. Palmer) Knowlton, W. Palmer, & Pollard ex Small, Log Fern. Swamps, seepage bogs, and calcareous floodplains, typically associated with calcareous substrates. June-September. Ne. NJ and ne. NY west to s. IL, e. MO, and AR, south to SC, GA, n. AL, TN, e. and n. LA, and e. TX (Mink, Singhurst, & Holmes 2011a); disjunct in w. NY and w. MI; overall very scattered in its distribution. This species is a fertile allotetraploid derived from hybridization of *D. goldiana* and *D. ludoviciana*; its chromosome complement is symbolized GGLL (Werth 1991). [= RAB, C, F, FNA, K, S, W, WV; = *D. goldiana* (Hooker ex Goldia) sp. celsa W. Palmer – G]

**Dryopteris clintoniana** (D.C. Eaton) Dowell, Clinton's Wood-fern, Broad Swamp Fern. Acid seepages, swampy forests, red maple swamps. NB, QC, and ON, south to DE, DC, MD (Somerset Co.), n. VA (Arlington and Fairfax counties), PA, OH, IN, and IL. This species is a fertile allotetraploid derived from hybridization of *D. cristata* and *D. goldiana*; its chromosome complement is symbolized GGGLSS. [= FNA, C, G, K; = *D. cristata* (Linnaeus) A. Gray var. clintoniana (D.C. Eaton) Underwood – F]

**Dryopteris cristata** (Linnaeus) A. Gray, Crested Wood-fern. Bogs, swamp forests. July-September. Circumboreal, in North America from NL (Newfoundland) to s. SK and se. BC, south to NC, TN, OH, IN, n. IL, IA, NE, and ID; disjunct in c. GA, AL, and LA. This species is a fertile allotetraploid derived from hybridization of *D. ludoviciana* and "*D. semicristata*"; a hypothetical species which may now be extinct. Its chromosome complement is symbolized LLSS. It has also served as a "parent species" of *D. clintoniana*, a fertile alloploid derived from hybridization of *D. cristata* × *goldiana*. Thus, its genome constitutes two thirds of the genome of *D. clintoniana*. [= RAB, C, F, G, K, S, W, WV; = *D. cristata* var. cristata – F]

**Dryopteris goldiana** (Hooker ex Goldia) A. Gray, Goldie's Wood-fern. Boulderfield forests, rich cove forests, seepage swamps, especially over calcareous mafic or igneous rocks. June-September. NB west to s. ON and MN, south to nw. SC, n. GA, n. AL, TN, KY, IL, and IA. This species is one of the diploid "parent species" of the e. North American reticulately-evolved *Dryopteris* complex. Its genome (symbolized GG) forms half of the genome of the tetraploid *D. celsa*, and one third of the hexaploid *D. clintoniana*, which does not occur as far south as our area. [= RAB, C, F, FNA, K, S, W, WV; = *D. goldiana* ssp. goldiana – G]

**Dryopteris intermedia** (Muhlenberg ex Willdenow) A. Gray, Fancy Fern, Evergreen Wood-fern. Cove forests, other moist, rocky forests, over a variety of substrates. June-September. NL (Newfoundland) west to MN, south to n. GA and AR. This species is one of the diploid "parent species" of the e. North American reticulately-evolved *Dryopteris* complex. Its genome (symbolized II) forms half of the genome of the tetraploids *D. campyloptera* and *D. carthusiana*. [= RAB, C, FNA, K, S, W, WV; =
**Dryopteris ludoviciana** (Kunze) Small, Southern Wood-fern. Blackwater swamp forests. June-September. A Southeastern Coastal Plain species: e. NC south to s. FL, west to s. AL, s. MS (Sorrie & Leonard 1999), and e. LA; disjunct in the West Gulf Coastal Plain of LA and AR, and possibly disjunct in sc. KY, the report old and somewhat uncertain. This species is one of the diploid "parent species" of the e. North American reticulately-evolved *Dryopteris* complex. Its genome (symbolized LL) forms half of the genome of the tetraploids *D. cristata* and *D. celsa*, as well as contributing one third of the genome of *D. clintoniana* indirectly (via its daughter species *D. cristata*). [= RAB, FNA, K, S]

**Dryopteris marginalis** (Linnaeus) A. Gray, Marginal Wood-fern. Rock outcrops, boulderfield forests, other rocky forests. June-September. NL (Newfoundland) west to s. ON and MI, south to SC, c. GA, AL, TN, AR, and e. OK. *D. marginalis* has not participated in the reticulate evolution of *Dryopteris* in e. North America; it does, however, form sterile hybrids with some other species. [= RAB, C, F, FNA, G, K, S, W, WV]

**Polystichum** Roth 1799 (Holly Fern)

1 Leaves 1-pinnate; [common, native] ........................................................................................................................................... *P. acrostichoides*
1 Leaves 2-pinnate; [rare, alien] .................................................................................................................................................... *P. polyblepharum*

**Polystichum acrostichoides** (Michaux) Schott, Christmas Fern. Moist to dry forests and woodlands, especially slopes, ravines, and small stream bottomlands. June-September. NS west to MN, south to s. FL and e. TX; also in ne. Mexico (Nuevo León and Tamaulipas). One of the most familiar ferns in e. North America. Var. *lonchitoides* Brooks, allegedly endemic to WV, is of dubious taxonomic value. [= RAB, C, F, FNA, G, S, W, WV; > *P. acrostichoides* var. *acrostichoides* – K; > *P. acrostichoides* var. *lonchitoides* Brook – K]

* Polystichum polyblepharum (Roemer ex Kunze) K. Presl, Japanese Tassel-fern. Moist ravines; native of e. Asia. Reported for AL as *P. braunii* (Spenner) Fée. {not yet keyed}

**Rumohra** Raddi 1819 (Leatherleaf Fern)

A genus of about 7 species, perennials, mainly tropical and Southern Hemisphere. References: Kramer et al. in Kramer & Green (1990).

**F44. Nephrolepidaceae** Pichi Sermolli 1975 (Sword Fern Family) [in POLYPODIALES]

**Nephrolepis** Schott 1834 (Sword Fern)

A genus of about 15-30 species, widespread in tropical and subtropical areas.
LYCOPODIACEAE

1. Plants dwarf, the leave blades <5 cm long; [occurring only in habitats where the air is constantly humid and the substrate saturated, as in grottoes behind waterfalls] .................................................................................................................................................. Microglossum

1. Plants larger, the leave blades 7-90 cm long; [occuring only in habitats where the air is constantly humid and the substrate saturated, as in grottoes behind waterfalls] .................................................................................................................................................. Lycopodium

2. Leaf blade densely scaly on the lower surface; rhizome 1-2 mm in diameter; leaf segment margins entire .......................................................... Pleopeltis

2. Leaf blade scaleless on the lower surface; rhizome 3-15 (-30) mm in diameter; leaf segment margins denticate (Polypodium) or entire (Phlebodium, Pecluma).

3. Leaves pinnatifid, even the larger with < 25 pairs of segments, (3-) 5-40 mm wide; [collectively widespread in our area.]

3. Leaves pectinate, at least the larger with >25 pairs of segments, each 1.5-5 (-8) mm wide; [of ne. FL southward] .......................................................... Pecluma

F48. POLYPODIACEAE Berchtold & J.C. Presl 1820 (Polypody Family) [in POLYPODIALES]

A family of about 35-40 genera and 500-700 species, cosmopolitan, especially tropical. Here circumscribed to include Grammitidaceae (including Microglossum). References: Smith in FNA (1993b); Smith et al. (2006); Hennipman, Veldhoen, & Kramer in Kramer & Green (1990); Parris in Kramer & Green (1990).

1. Plants dwarf, the leave blades <5 cm long; [occurring only in habitats where the air is constantly humid and the substrate saturated, as in grottoes behind waterfalls] .................................................................................................................................................. Microglossum

Micropolypodium Hayata (Dwarf Polypody)

A genus of about 30 species, mainly of tropical America and e. and se. Asia. *Micropolypodium* has traditionally been considered a part of a broadly circumscribed *Grammitis*, but has been re-circumscribed at the generic level by Smith (1992). Smith in FNA (1993b) states that our species “probably warrants generic status under the ame *Micropolypodium* Hayata, a primarily neotropical genus with representatives in eastern Asia (Malaysia, China, Sikkim, Taiwan, and Japan).” References: Smith in FNA (1993b); Massey et al. (1983); Smith (1992) = Z.

* Micropolypodium nimbatum* (Jenman) A.R. Smith, Dwarf Polypody. On ceiling of grotto in spray cliff of waterfall in humid gorge. Sporophytes (juvenile only) have been found at only a single site in North America, in Macon County, NC. Gametophytes (and/or sporophytes) may be present at other spray cliffs in the escarpment gorges of sw. NC or adjacent SC and GA. Other than this disjunct temperate-zone occurrence, the species is known from Cuba, Jamaica, and Hispaniola. See Moran (1998) for an interesting discussion and overview of independent fern gametophytes in e. North America. [= Z = *Grammitis nimbata* (Jenman) Proctor – RAB, FNA, K]

Pecluma M.G. Price (Rockcap Fern)

1. Veins 1-forked; segments at base of blade abruptly reduced in size; [usually epiphytic] ............................................................................................... *P. plumula*

1. Veins 2-4 forked; segments at base of blade gradually reduced to auricles; [usually terrestrial] ........................................................................ *P. pilodon var. caespitosa*

* Pecluma plumula* (Humboldt & Bonpland ex Willdenow) M.G. Price. Epiphytic on tree branches, less commonly on limestone, in hammocks and swamps. Ne. FL (Duval County) south to s. FL; West Indies, Mexico, Central America, and n. South America. [= FNA, K, Z; = *Polypodium plumula* Humboldt & Bonpland ex Willdenow – S]

* Pecluma pilodon* (Kunze) M.G. Price var. bourgeanae (F. Eournier) A.R. Smith. Terrestrial or on logs or tree bases in hammocks and swamps. Ne. FL (Duval County) south to s. FL; West Indies; Mexico and Central America. [= Z; = *Pecluma pilodon* (Kunze) M.G. Price var. caespitosa (Jenman) Lellinger – FNA; = *Pecluma piloton* (Kunze) M.G. Price ssp. caespitosa (Jenman) Windham – K; = *Polypodium pectinatum* Linnaeus – S]
Phlebodium (R. Brown) J. Smith 1841 (Golden Polypody)

A genus of 2-4 species, of tropical and subtropical regions of the Western Hemisphere. References: Nauman in FNA (1993b); Hennipman, Veldhoen, & Kramer in Kramer & Green (1990).

Phlebodium aureum (Linnaeus) J. Smith, Goldfoot Fern, Golden Polypody. Epiphytic on the old leaf bases of Sabal palmetto and in crotches and crevices of other trees, particularly Quercus virginiana, and rarely terrestrial on calcareous soils or masonry. E. SC (Beaufort, Jasper, and Charleston counties), e. GA (Camden, Chatham, and Glynn counties), south to s. FL, west to Panhandle FL (Wakulla County) (Kunzer et al. 2009). Found in Cape Romain National Wildlife Refuge (Charleston County, SC) in the late 1970s by Steve Bowling, where apparently native (S. Bowling, pers. comm. 2007); also introduced and apparently established in SC (Beaufort, Jasper, Charleston counties) via planting of palmettos from further south (P. McMillan, pers. comm. 2005). [= FNA, K, S; = Polypodium aureum Linnaeus]

Pleopeltis Humboldt & Bonpland ex Willdenow 1810 (Shielded-Sorus Polypody)

Pleopeltis polyiodioideis (Linnaeus) E.G. Andrews & Windham ssp. michauxiana (Weatherby) E.G. Andrews & Windham, Resurrection Fern, Scaly Polypody. On tree limbs and trunks (especially when leaning) and on rocks. June-October. Ssp. michauxiana ranges from se. MD, IL, MO, and se. KS, south to s. FL and TX; also in Mexico and Guatemala; recent studies suggest that it warrants specific status. Ssp. polyiodioideis ranges in the West Indies, Central America and South America. Four additional subspecies are tropical in Central America, South America, and Africa. [= FNA, K; < Polypodium polyiodioideis (Linnaeus) Watt – RAB; = Polypodium polyiodioideis (Linnaeus) Watt var. michauxiana Weatherby – C, F, G, W, WV; < Marginaria polyiodioideis (Linnaeus) Tidestrom – S]

Polypodium Linnaeus 1753 (Polypody)

A genus of about 100 species, cosmopolitan. References: Haufler et al. in FNA (1993b); Haufler, Windham, & Rabe (1995)="Z; Haufler & Windham (1991); Bryan & Soltis (1987); Kott & Britton (1982); Hennipman, Veldhoen, & Kramer in Kramer & Green (1990); Cusick (2002). [also see Pecluma, Phlebodium and Pleopeltis]

Identification notes: The two species are somewhat cryptic, and the relatively frequent triploid backcross makes field identification still more problematic. Individuals not identified to species may be referred to as "Polypodium virginianum complex."

[Note: three leads]
1 Leaf blade averaging 5.8 cm wide (range of 3.2-8.2 cm), widest at the base, thus the blade elongate-deltoid in outline; rhizome scales averaging 1.1 mm wide, mostly golden brown throughout; paraphyses (sporangiasters) usually > 40 per sorus (range of 25-120); leaves mostly lobed to apex, without an attenuate, unlobed tip ............................................................................................................. P. appalachianum
1 Leaf blade averaging 4.5 cm wide (range of 3.0-5.8 cm); blade widest near the middle, thus the blade oblong to narrowly lanceolate in outline; rhizome scales averaging 1.5 mm wide, mostly brown, with a dark central stripe; paraphyses (sporangiasters) usually < 40 per sorus (range of 7-69); leaves mostly with an attenuate, unlobed tip ............................................................................................................. P. virginianum
1 Characters intermediate; spores abortive ............................................................................................................. P. ×incognitum

Polypodium appalachianum Haufler & Windham [P. virginianum complex], Appalachian Rockcap Fern. Moist rocks at low to high elevations, especially in ravines, on north-facing outcrops, and in other moist sites. June-October. NL (Newfoundland) west to e. ON, south to n. GA and n. AL; nearly restricted to the Appalachian Mountains. Its chromosome complement can be symbolized as AA. It is one parent of P. virginianum. [= FNA, K, Z; < P. virginianum – RAB, C, F, S, W, WV; < P. vulgare Linnaeus var. virginianum (Linnaeus) Eaton – G]

Polypodium ×incognitum Cusick is the triploid hybrid [P. appalachianum × virginianum]. It is rather frequent; there is some evidence that it may reproduce successfully via apogamous spores. It is best recognized by the spores, which are irregular in size and shape. Morphologically, it tends to intermediacy between the two parents, but can closely resemble either. Its chromosome complement can be symbolized AAS. (not mapped)

Polypodium virginianum Linnaeus [P. virginianum complex], Common Rockcap Fern. Moist rocks. June-October. Haufler and Windham (1991) indicate that the tetraploid cytotype (P. virginianum) of the P. virginianum complex is an allotetraploid derivative of the sterile hybrid of the diploid occurring in our area (P. appalachianum) and another diploid with a
boreal distribution (P. sibiricum Siplivinsky). Electrophoretic evidence supports this finding (Bryan & Soltis 1987, Haufler, Windham, & Rabe 1995). Thus, Polypodium in our area is another classic example of the reticulate evolution of pteridophytes, and the cytotypes must be treated as species and given names. Unfortunately, the two species are somewhat cryptic, and the relatively frequent triploid backcross makes field identification still more problematic. Individuals not identified to species may be referred to as “Polypodium virginianum complex.” The chromosome complement of P. virginianum can be symbolized as AASS. [= FNA, K, Z; < P. virginianum – RAB, C, F, S, W, WV (also see P. appalachianum); < P. vulgare Linnaeus var. virginianum (Linnaeus) Eaton – G (also see P. appalachianum)
GYMNOSPERMS

SECTION 3: ACROGYMNOSPERMAE (EXTANT GYMNOSPERMS)

The gymnosperms are a possibly artificial grouping of about 16 families, about 86 genera, and about 850 species. References: Kramer & Green (1990). The folk taxonomy of conifers in our area is an interesting, tangled story. The town of Spruce Pine, NC is apparently named for *Tsuga canadensis*. Spruce Pinnacle in Buncombe County, NC and Tamarack Ridge in Highland County, VA are named for the abundance of *Picea rubens*. The generally used common name for *Juniperus* is "cedar," and *Chamaecyparis* is called "juniper."

G2. ZAMIACEAE Reichenbach 1837 (Sago-palm Family) [in CYCADALES]

A family of about 9-11 genera and 100-185 species, of tropical and warm temperate North America, Central America, South America, Africa, and Australia. References: Landry in FNA (1993b); Johnson & Wilson in Kramer & Green (1990); Jones (1993).

*Zamia* Linnaeus

*Zamia floridana* Alphonse de Candolle var. *umbrosa* (Small) D.B. Ward, Coontie. Maritime forests, pinelands. Se. GA (Camden and Glynn counties) south to FL. *Zamia floridana* var. *floridana* is more widespread in the FL Peninsula. Ward (2001), Landry in FNA (1993b), and Stevenson (1991) conclude that North American *Zamia* belongs to one of several *Zamia* species in the West Indies. Ward (2001, 2009) concludes that *Z. floridana* is the correct name for this taxon, and that varietal status is warranted for the "*umbrosa*" entity. [= Y; < *Zamia integrifolia* Linnaeus f. in Aiton – FNA, Z; < *Z. pumila* Linnaeus – K, misapplied; = *Z. umbrosa* Small – S; < *Z. floridana* Alphonse de Candolle]

G3. GINKGOACEAE Engler in Engler & Prantl 1897 (Ginkgo Family) [in GINKGOALES]

*Ginkgo* Linnaeus 1771 (Ginkgo, Maidenhair Tree)

A monotypic genus, a tree, native of China. *Ginkgo* is famous as a "living fossil," known from fossils nearly 200 million years old which are nearly identical to modern plants; it may be extinct as a native plant. References: Whetstone in FNA (1993b); Page in Kramer & Green (1990).

*Ginkgo biloba* Linnaeus, Ginkgo, Maidenhair Tree. Frequently planted, rarely escaped to suburban woodlands and yards; native to se. China. As pointed out by Whetstone in FNA (1993b), *Ginkgo* is only weakly naturalized. [= C, FNA, K]

G7. PINACEAE Sprengel ex F. Rudolphi 1830 (Pine Family) [in PINALES]

1 Leaves borne in fascicles of 2-5 (basally bound by a scariosh sheath) or on short shoots in clusters of many leaves in apparent whorls.  
2 Leaves borne in fascicles of 2-5 (basally bound by a scariosh sheath) ; [subfamily *Pinioideae*].................................................................*Pinus*  
3 Leaves evergreen; cones 6-12 cm long.................................................................................................................................*Cedrus*  
4 Leaves deciduous; cones 1-2 cm long.................................................................................................................................*Larix*  
5 Leaves attached directly to twig; cones 4-15 cm long, erect.................................................................................................*Abies*  
6 Leaves jointed, on short, persistent base; cones 1-3.8 cm long, pendant ...................................................................................*Tsuga*

*Abies* P. Miller 1754 (Fir)  
(by Alan S. Weakley and Derick B. Poindexter)

A genus of about 40-50 species, trees, of temperate regions of the Northern Hemisphere, south to Central America. Our 2 native species and other non-natives are grown as ornamentals, especially in the mountains. References: Hunt in FNA (1993b); Liu (1971)=Y; Page in Kramer & Green (1990).
1 Cones 3.5-8 cm long; [native, also planted]; [section Balsameae].

2 Bracts of the mature cones shorter than the scales or slightly exerted beyond the scales; stomatal rows (4-) 7 (-8) on each side of the midvein on the lower leaf surface (visible at 10× magnification); [plant of the Central Appalachians and north, native from Page and Madison counties, VA, northward] ................................................................. Abies balsamea

2 Bracts of the mature cones longer than the scales and reflexed; stomatal rows (8-) 10 (-12) on each side of the midvein on the lower leaf surface (visible at 10× magnification); [plant of the Southern Appalachians, native from Grayson and Smyth counties, VA, southward] ......

-------------------------------------------------------------------------------------------------------- Abies fraseri

1 Cones 10-15 cm long; [alien, persistent from horticultural use and sparingly naturalized].

1 Juvenile-form leaves of young plants with rounded-retuse apices; leaf resin canals 2, marginal; cone bracts exerted and reflexed with elongate apical cusps; [section Abies] .................................................................................................................. Abies alba

1 Juvenile-form leaves of young plants with spinose-bifid apices; leaf resin canals 2, median (and usually with up to 2 additional marginal canals); cone bracts exerted and erect with abrupt, short apical cusps; [section Moni] .................................................................................................... Abies firma

* Abies alba P. Miller, European Fir, Silver Fir. Naturalized in Highlands, NC (Macon Co.), from plantings made by Thomas G. Harbison in the late 1800's (J.D. Pittillo, pers. comm.). May; October. [= Y]

Abies balsamea (Linnaeus) P. Miller, Balsam Fir, Northern Balsam. High elevation forests and cliffs. April-May. NL (Newfoundland) and NL (Labrador) west to n. AB, south to NY, PA, MI, WI, and IA, and (disjunct) in the mountains to n. VA (known in our area as a native only from Page and Madison counties, VA). There has been considerable debate over the taxonomic status of some, especially southern, populations of Abies balsamea, which show some transition in characters toward Abies fraseri, and have been variously treated as Abies intermedia Fulling, Abies balsamea var. phanerolepis Fernald, or Abies ×phanerolepis (Fernald) Liu. Variation in n. American Abies is somewhat clinal, with the greatest geographical and morphological discontinuity between n. VA and s. VA. It seems best, therefore, to recognize Abies fraseri as a species and Abies balsamea as a species (which includes the clinal var. phanerolepis). The balsam woolly adelgid, an alien pest, is afflicting this species in Shenandoah National Park. [= C, FNA, K, W, Y, Z; > A. balsamea var. balsamea – F, G; > A. balsamea var. phanerolepis Fernald – F, G, WV; > A. ×phanerolepis (Fernald) Liu – Y; > A. intermedia Fulling]

* Abies firma Siebold & Zuccarini, Moni Fir. Naturalized from horticultural plantings near homesites. See Poindexter (2010b) for detailed information on the naturalization of this fir in our area and its recognition. Abies fraseri (Pursh) Poir, Fraser Fir, She Balsam, Southern Balsam. High elevation forests, from about 1500-2037 m. May-June; September-November. Southern Appalachian endemic, from Grayson and Smyth counties, VA (notably, Mount Rogers) south to e. TN and sw. NC; naturalizing on Brasstown Bald in GA, where planted. This species is threatened as a native species by a virulent alien pest, the balsam woolly adelgid, and environmental damage caused by pollution. Populations on Mt. Rogers and, to a lesser extent, Roan and Grandfather mountains, appear to be relatively healthy. Abies fraseri is closely related to the northern Balsam Fir, Abies balsamea, and may be a relatively recent derivative of it. During the 1970’s and 1980’s, the cultivation of Fraser Fir Christmas trees became an important part of the economy of the North Carolina mountains (especially Allegany, Ashe, Avery, Mitchell, and Watauga counties). Most Christmas tree plantations are at 1000-1500 m in elevation; below 1000 m, Fraser Fir is very susceptible to a fungal root rot (Phytophthora), above 1500 m it grows too slowly to be profitable and is often "flagged" by winds, ruining its shape for commercial purposes. [= RAB, C, F, FNA, G, K, S, W, WV, Y, Z]

E. Asia
Europe
E. Asia

Cedrus Trew 1757 (Cedar)

* Cedrus deodara (Roxburgh ex D. Don) G. Don, Deodar Cedar. Frequently planted, rarely escaped to suburban woodlands. [= K]

Larix P. Miller 1754 (Larch)

A genus of about 10 species, trees, of cold temperate and boreal regions of the Northern Hemisphere. References: Parker in FNA (1993b); Page in Kramer & Green (1990).

1 Leaves 2.5-3 cm long; cones 2.3-5 cm long, with > 30 pubescent scales; twigs pubescent; [alien species rarely planted] ............... Larix decidua

1 Leaves 1-2.5 cm long; cones 1.2-2 cm long, with 10-20 glabrous scales; twigs glabrous; [native species rarely south to MD and WV], .............. ................................................................. Larix laricina

* Larix decidua P. Miller, European Larch. Forests; native of Europe. Planted as an ornamental and experimentally as a forest tree, persisting and sometimes escaping in the high mountains of NC. [= F, K]
**PINACEAE (G7)**

**Larix laricina** (Du Roi) K. Koch, Eastern Larch, Eastern Tamarack. Bogs and swamps. NL (Newfoundland), NL (Labrador), Keewatin, and AK, south to MD (Garrett County, WV (Preston County and Randolph counties), OH, IN, IL, MN, and Britsh Columbia. [= FNA, C, F, G, K, WV]

**Picea A. Dietrich 1824 (Spruce)**

1 Cones 10-16 cm long; upper branches spreading to ascending, the lower drooping; outer bud scales without hairlike projections; [plant an alien, but widely planted as an ornamental and sometimes as an experimental timber plantation tree] ................................................... **P. abies**

1 Cones 2.5-4.5 cm long; upper branches ascending, the lower spreading; outer bud scales prolonged into minute hairlike projections; [plant native] ................................................................................................................................. **P. rubens**

* **Picea abies** (L. H. Karsten, Norway Spruce. Persisting and escaping from forestry plantations at moderate or high elevations, notably in e. WV, Great Smoky Mountains National Park (Kephart Prong), Mount Mitchell State Park, and the Biltmore Estate; native of n. Europe. [= FNA, K, WV]

**Picea rubens** Sargent, Red Spruce, He Balsam. Common to dominant in spruce and spruce-fir forests at high elevations, scattered in northern hardwood forests, heath balds, boulderfield forests, ridges, and rarely coves, also in bogs or swampy forests at lower elevations (down to about 1000 m), ranging in moisture tolerance from dry ridges (though these are often fog-bathed) to saturated peats, and sometimes planted and naturalized. May-June; October. NS and NB south (interruptedly) to w. NC and e. TN. **Picea mariana** (P. Miller) Britton, Sterns, & Poggenburg, Black Spruce, ranges south to s. PA and n. NJ, and has also been reported from bogs in our area: for NC (Small 1933) and for VA (Fernald 1950). He suggests that "this may be ecotypic, but one wonders whether the short leaves and bog habitat might reflect a few Black Spruce genes that have persisted since the Pleistocene." Further study with modern electrophoretic and molecular techniques is warranted. [= RAB, C, F, FNA, G, K, W, WV, Z; > P. rubens – S; > P. australis Small – S]

**Pinus** Linnaeus 1753 (Pine)

A genus of about 110 species, trees, of the Northern Hemisphere, south to Central America. The State Tree of North Carolina is the "Pine," the species left artfully and politically ambiguous. References: Kral in FNA (1993b); Duncan & Duncan (1988); Gernandt et al. (2005); Price, Liston, & Strauss (1998); Richardson (1998); Page in Kramer & Green (1990).

**Identification notes:** Young saplings generally have shorter needles than larger saplings and mature trees; measurements in the key are those of mature trees. Seedlings have needles single, rather than fascicated.

1 Needles 5 in each bundle; each needle with 1 vascular bundle; [subgenus Strobus, section Strobus] ................................................................................................................................. **P. strobus**

1 Needles 2-3 (-4) in each bundle; each needle with 2 vascular bundles; [subgenus Pinus].................................................................................................................................................................................................................

2 Bracts and bud scales fimbriate; sheath > 1.3 cm long; needles 20-50 cm long, in bundles of 3 (-4); twigs about 1 cm in diameter; [subgenus Pinus, section Trifoliae, subsection Australes] .............................................................................................................................................................................................................. **P. palustris**

2 Bracts and bud scales entire or edged with hairs, but not fimbriate; sheath < 1.5 cm long; needles (2-) 3-30 cm long, in bundles of 2-4; twigs < 1 cm in diameter.

3 Needles in bundles of 3, or 2 and 3, or 3 and 4 (predominantly or at least substantially in 3’s); [subgenus Pinus, section Trifoliae, subsection Australes].

4 Needles in bundles of 2 and 3.

5 Needles 3-7 cm long; prickles on cones 3-8 mm long, stout (> 1 mm wide at base of prickle) .............................................................................................................................................................................................................. **P. pungens**

5 Needles 5-30 cm long; prickles on cones 1-3 mm long, slender (< 1 mm wide at base of prickle).

6 Needles 17-30 cm long; cones (6) 12-15 cm long. ................................................................................................................................. **P. elliottii var. elliottii**

6 Needles 5-12 cm long; cones 4-7 cm long. ................................................................................................................................. **P. echinata**

4 Needles in bundles of 3 (rarely with a few 2’s), or 3 and 4.

7 Cones distinctly longer than broad when open or closed, 5-13 cm long; needles mostly (10-) 12-23 (-28) cm long, 0.7-1.5 mm wide; buds not resinous (or only slightly so); trunks not producing adventitious sprouts (epicormic sprouting). ................................................... **P. taeda**

7 Cones about as broad as long, 3-6 cm long; cones (4-) 7-16 (-20) cm long, 1.5-2.0 mm wide; buds resinous; trunks commonly producing adventitious sprouts (epicormic sprouting), especially in response to fire.

8 Needles (10-) 16-20 (-21) cm long, persisting 3-4 years; cones serotinous; [trees of pocosins, savannas, and other wetlands of the Coastal Plain] ................................................................................................................................. **P. serotina**

8 Needles (4-) 7-10 (-15) cm long, persisting only 2 years; cones opening at maturity, not serotinous; [trees of ridges, slopes, bottomlands, and bogs of the Mountains and Piedmont] ................................................................................................................................. **P. rigida**

3 Needles in bundles of 2 only.

9 Needles slender to somewhat stout, 0.5-1.2 mm wide.

10 Needles 10-17 cm long; branches brittle; spring shoots with a single node, with 1 whorl of branches; [subgenus Pinus, section Pinus, subsection Pinus] .............................................................................................................................................................................................................. **P. resinosa**

10 Needles 2-13 cm long; branches flexible; spring shoots usually with several nodes (several whorls of branches).

11 Needles 2-8 cm long, generally twisted; cones either opening at maturity, not serotinous, the scales bearing prominent, slender prickles 2-5 mm long, or serotinous and unarmed; [subgenus Pinus, section Trifoliae, subsection Contorta].

12 Needles 2-3.5 cm long, not twisted, curved; cones serotinous, unarmed; leaf sheaths < 2.5 mm long. ................. **P. banksiana**
12 Needles 2-8 cm long, generally twisted, straight; cones opening at maturity, not serotinous, the scales bearing prominent, slender prickles 2-5 mm long; leaf sheaths > 2.5 mm long......................................................... P. virginiana

11 Needles 5-13 cm long, twisted or not; cones opening at maturity or serotinous, the scales bearing prominent, short, stout prickles or minute, deciduous prickles, and also with a faint to conspicuous horizontal ridge.

13 Anthers yellow; bark sticky, closely ridged, not sloughing off, reminiscent of a hardwood; [native trees of mesic to fairly wet, fertile soils]; [subgenus Pinus, section Trifoliae, subsection Australes]................................................................. P. glabra

9 Needles stout, 1.3-2.5 mm wide.

14 Needles 15-25 cm long; cones 8-22 cm long; [trees naturalized on barrier islands]; [subgenus Pinus, section Pinaster] .................................................................................................................................................. P. p能够在

15 Needles 3-16 cm long; cones 3-9 cm long; needles 1.3-2 mm wide; [collectively widespread.

16 Buds light brown, resinous; [introduced tree, often planted inland]................................................................................................................................. P. nigra

17 Cones 6-9 cm long with each scale bearing a stout, woody spine, or 3-6 cm long and unarmed; [native tree of the Ganges Valley of NE India]; [subgenus Pinus, section Pinaster].................................................................................................................................................. P. tricholepis

18 Needles 2-3.5 cm long, with each scale bearing a stout, woody spine; leaf sheaths > 2.5 mm long; [trees naturalized on barrier islands].................................................................................................................................................. P. banksiana

19 Needles 7-13 cm long, twisted or not; cones opening at maturity, not serotinous, the scales bearing prominent, < 1.0 mm wide; barke plates > 4 cm wide, with crater-like blisters ca. 1 mm in diameter; winter buds not very resinous; 3-4 year-old twigs smooth to rough, but not flaking........................................... P. echinata

20 Needles 2-8 cm long, typically twisted, in bundles of 2, rather stout, 0.1-0.2 mm wide; bark plates mostly about 2 cm wide, without crater-like blisters; winter buds very resinous; 3-4 year-old twigs smooth to rough, but not flaking........................................... P. virginiana

Pinus echinata P. Miller, Shortleaf Pine, Rosemary Pine, Yellow Pine. Dry rocky ridges and slopes, sandhills, old fields, forests, generally in rather xeric sites, but also occurring in mesic to even wet sites. March-April; September-October. Widespread in se. North America, north to s. NY, NJ, s. PA, s. OH, s. IL, s. MO, and e. OK, perhaps reaching its greatest importance in dry, sandstone landscapes, such as the Cumberland Plateau of WV, KY, TN, and AL, and the Ozarks and Ouachitas of AR, MO, and OK. [= RAB, C, F, FNA, G, K, S, WH, WV, WH, Z]

Pinus elliottii Engelmann var. elliottii. Slash Pine. Native in wet pine flatwoods and maritime forests in GA and SC, extensively planted in GA, SC, and NC in silvicultural plantations on a wide variety of soils, many of them unsuitable for its successful growth. January-February; October-November. P. elliottii var. elliottii ranges from e. SC south to c. peninsular FL, west to 2. LA; var. densa Little & Dorman is restricted to c. and s. peninsular FL. P. elliottii var. densa is perhaps better treated as a full species, Pinus densa (Little & Dorman) de Laubenfels & Silba. P. elliottii var. elliottii has been extensively planted throughout the Coastal Plain of Ga, NC, and SC, where it now occupies tens of thousands of hectares. Superficially, P. elliottii resembles both P. palustris and P. taeda, with cone size and needle length intermediate. P. elliottii var. elliottii is sometimes difficult to tell from P. taeda; additional helpful characteristics are the seed cones on 1.5-3 cm long stalks (vs. essentially sessile), seed cones reddish-brown and glossy, appearing varnished (vs. brown and dull), needles thicker and a dark glossy green (vs. thinner and a yellowish green); bark prominently flaking off and revealing reddish patches (vs. not notably flaking off and not

**Pinus glabra** Walter, Spruce Pine, Walter’s Pine. Bottomland forests, rich, moist soils. March-April; September-October. SC south to n. FL and west to se. LA. This pine is unusual in growing in moist (even infrequently flooded), fertile habitats, usually mixed with bottomland hardwoods, and apparently rather shade tolerant, sometimes growing as an understory tree. [= RAB, FNA, K, S, WH, Z]

**Pinus nigra** Arnold, Austrian Pine. Disturbed areas; native of Europe. [= C, F, FNA, G, K]

**Pinus palustris** P. Miller, Longleaf Pine, Southern Pine. Formerly throughout the Coastal Plain, Sandhills, and lower Piedmont, on a wide variety of soils (sandy, loamy, clayey, or peaty), from very dry to very wet conditions, in savannas, woodlands, and forests affected by relatively frequent natural (lightning caused) fires (likely augmented by native Americans), now reduced to less than a tenth of its former abundance by a variety of forces, including turpentining, timbering, free-range hogs, fire suppression, and "site conversion" by foresters to other trees, now extremely rare in VA and north of the Neuse River in NC, still occurring in some abundance in the outer Coastal Plain from Carteret County, NC south into GA, in the Bladen Lakes area of Bladen and Cumberland counties, and in the Sandhills of Harnett, Hoke, Scotland, Richmond, Moore, Anson, and Montgomery counties, NC and south into GA. March-April; September-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to se. TX; it extends slightly into the Piedmont in most states where it occurs, and further into the Piedmont and low mountains in GA and AL. "The species has been heavily exploited for timber and turpentine production, and it has been estimated that by 1930 only ten percent of its original volume of timber remained" (Price 1989); certainly much less now remains. Longleaf Pine is featured in the official NC State Toast ("Here’s to the land of the longleaf Pine…") and the highest honor that the Governor of North Carolina can bestow on an individual for service to the state is to appoint him or her to the honorary Order of the Longleaf Pine. A hybrid with *P. taeda*, *P. × sondereggeri* H.H. Chapman, occurs. [= RAB, C, FNA, K, WH; = P. australis Michaux f. – F, G, S]

* Pinus pinaster Aiton, Maritime Pine, Cluster Pine. Planted and naturalized on barrier islands; native of Mediterranean Europe. *P. pinaster* is reported by Brown (1959) to be "introduced from Mediterranean region and planted on sand-flats in vicinity of Corolla, Currituck Banks, Bodie and Hatteras Island 1936-1940.... Now producing seeds and becoming naturalized near Cape Hatteras Lighthouse. More resistant to salt spray than native pines" (Brown 1959). Graetz (1973) discusses its use on the Outer Banks and concludes that it is "not as well adapted to inclement beach conditions as Japanese black pine." *P. pinaster* is conspicuous just south of Nags Head on NC Highway 12 (Dare County, NC), further south at Bodie Island Lighthouse (Dare County, NC), on Ocracoke Island (Hyde County, NC), and elsewhere. [= K]

**Pinus pungens** Lamb, Table Mountain Pine, Burr Pine, Hickory Pine. Dry ridges, cliffs, shale barrens, usually requiring fire for its reproduction, occurring at least up to 1550 m. May; September-October. A Central and Southern Appalachian endemic: n. NJ, through se. PA, w. MD, WV, w. VA, w. NC, and c. TN to nw. SC and ne. GA. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

**Pinus resinosa** Aiton, Red Pine. High elevation forests, in pine plantations, and persisting after silvicultural planting. This species is native as far south as WV (Pendleton and Hardy counties) and PA (Luzerne, Wyoming, Tioga, and Centre counties). In WV, it is much more common as a plantation tree than as a native. [= C, F, FNA, G, K, WV]

**Pinus rigida** P. Miller, Pitch Pine. Primarily on dry ridges, more or less requiring fire for its reproduction, less commonly in peat soils of mountain bogs (and then often at elevations of 800-1000 m) and also scattered through a variety of forest types. May; September-October. S. Canada and s. ME south to n. GA. It is abundant near sea level in the Pine Barrens of NJ, but in NC is limited to the mountains and upper Piedmont; it replaced in Coastal Plain fire-maintained wetland communities by the related *Pinus serotina*. [= RAB, C, F, FNA, G, K, S, W, WV, Z; = P. rigida ssp. rigida]

**Pinus serotina** Michaux, Pocosin Pine, Pond Pine, Marsh Pine. Peaty soils of pocosins, swamps of small blackwater streams. April; August (or at any time of year in response to fire). A Southeastern Coastal Plain endemic: s. NJ south to FL and se. AL, restricted to the Coastal Plain. A remarkable tree, well-adapted to fire by its serotinous cones and its ability to resprout needles from the branches, trunk ("epicormic sprouting"), or roots following fire. Extensive areas of peatland in the outer Coastal Plain are dominated by *P. serotina*, sometimes codominant with *Gordonia lasianthus*. Following fires which destroy all branches but do not kill the trees, epicormic sprouting results in entire forests of odd-looking cylindrical pines, the trunk thickly beset with needles, the outline of the tree a narrow cylinder 10-20 meters tall and less than 1 meter in diameter from base to summit. *P. serotina* is clearly a southern relative of *P. rigida*. It normally occurs in fire-maintained wetlands associated with ("downhill" from) *P. palustris*. On deep peats, *P. serotina* is stunted and of very irregular form; on mineral or shallower organic soils it can reach large size. Even when well-developed, the trunk is typically twisted and gnarled, helping to distinguish it from *P. taeda*. [= RAB, C, F, FNA, G, K, S, WH, Z; = P. rigida P. Miller ssp. serotina (Michaux) Clausen]

**Pinus strobus** Linnaeus, Eastern White Pine. Moist to dry forests, bottomlands, dry, rocky ridges in humid gorges. April; August-September. Widespread in ne. North America, south to VA, w. and (rarely) c. NC, nw. SC, n. GA, e. TN, KY, IN, n. IL, e. IA, and MN. *P. strobus* was probably the tallest tree in e. North America, reaching heights of 60-70 meters. It was a very important timber tree historically. In NC a notable relict and disjunct stand of *P. strobus* occurs on bluffs of the Deep River in...
the eastern Piedmont of Chatham County; in VA *P. strobus* is widely but irregularly distributed in the lower Piedmont. [= RAB, C, F, FNA, G, K, W, WV, Z; *Strobus strobus* (Linnaeus) Small – S]

* Pinus sylvestris *Linnaeus var. sylvestris*, Scots Pine. Cultivated and sometimes escaped; native of Europe. Introduced and at least weakly naturalized south to MD (Kartesz 1999) and e. WV (Morton et al. 2004). [= FNA; < *P. sylvestris* – C, F, G, K]

* Pinus taeda *Linnaeus, Loblolly Pine, Old Field Pine. Forests, fields, pine plantations, much more abundant and widespread than formerly, occurring further west than as a native. March-April; October-November. Native from s. NJ, DE, and e. MD south to n. peninsular FL, west to e. TX and se. OK, primarily on the Coastal Plain, but inland to s. TN; this distribution now expanded by forestry plantation. Northward. See *P. elliottii* for additional characters to distinguish these two species. [= RAB, C, F, FNA, G, K, S, W, WH, Z]

* Pinus thunbergiana *Franco, Japanese Black Pine. Planted and persisting, sometimes appearing native, on barrier islands, native of Japan. Growing in maritime situations in its native land, this tree's strong resistance to salt spray is the reason for its no other plants; when present, definitely non-native. March-May; September-November. Widespread in ne. North America, but the two sometimes growing in close proximity or even intermixed in humid gorges; very limited in the western Piedmont of NC to nw. SC, n. GA, n. AL, and ne. MS. A small, scrubby pine, occurring in very dense, monospecific stands in the upper Piedmont as a result of secondary succession of old fields. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

Tsuga Carrière 1847 (Hemlock)

1 Most of the leaves 8-13 mm long, those originating from the sides and lower surface of the twig spreading more or less distichously in a horizontal plane, normally sized, those borne on the upper surface of the twig more or less appressed, dwarf, mostly 1/6 to 1/2 as long as the adjacent lateral leaves, 1-3 (-6) mm long, the whitened undersurface (consisting of rows of stomata) exposed upward; leaf margins minutely serrulate; leaf apices obtuse to rounded; seed cones 12-25 mm long, the ovuliferous scales ascending, even at maturity .............. *T. canadensis*

1 Most of the leaves 10-18 mm long, those originating from the sides and lower surface of the twig spreading more or less distichously in a horizontal plane, normally sized, those borne on the upper surface of the twig not appressed, spreading at a 60-90 degree angle from the twig, mostly 3/4 to fully as long as the adjacent lateral leaves, 8-15 mm long, the whitened undersurface (consisting of rows of stomata) not exposed upward; leaf margins entire; leaf apices minutely retuse (notched), truncate, or rounded; seed cones 20-38 mm long, the ovuliferous scales spreading at a right angle to the axis at maturity .................. *T. caroliniana* (Linnaeus) Carrière, Eastern Hemlock, Canada Hemlock. In a wide variety of habitats in the mountains, most typically and abundantly in moist sites in ravines or coves along streams, but likely to be found in all but the driest habitats between 300 and 1500 m (even occurring in peaty bogs, where it has a sickly yellow color and short life expectancy); in the western Piedmont of NC limited to progressively rarer microhabitats (primarily north-facing river bluffs), reaching its eastward limit in NC at a disjunct stand at Hemlock Bluff State Natural Area, Wake County (but uncommon in the Piedmont of VA and even present, though rare, in the Coastal Plain of VA). March-April; September-November. Widespread in ne. North America, south to w. and e. VA, w. and (rarely) c. NC, nw. SC, n. GA, n. AL, TN, KY, IN, WI, and MN. One of the largest trees commonly encountered nowadays in our area, but probably not naturally larger than many other trees – because of its low timber value, it was often left by loggers. The hemlock woolly adelgid is severely affecting this species. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

* Tsuga caroliniana *Engelmann, Carolina Hemlock. Primarily in open forests on ridge tops, rocky bluffs, or gorge walls, generally in drier and rockier sites than *T. canadensis*, but the two sometimes growing in close proximity or even intermixed in humid gorges; very limited in the western Piedmont, apparently reaching its eastern limit in NC at Hanging Rock State Park, Stokes County, and ranging east to Halifax County in the Piedmont of VA. March-April; August-September. *T. caroliniana* is a rather narrow Southern Appalachian endemic, occurring only in w. NC, e. TN, sw. and sc. VA, nw. SC, and ne. GA. Carolina Hemlock has achieved a substantial reputation in NC as a Christmas tree, and is finally coming into favor as an ornamental; Coker and Totten (1945) wrote “the Carolina Hemlock is a very beautiful tree in cultivation, perhaps the handsomest of any eastern American conifer, combining in a remarkable way delicacy, symmetry, and strength.” The hemlock woolly adelgid threatens this species. [= RAB, C, F, FNA, G, K, S, W, Z]
A family of about 29 genera and about 130 species. Recent studies indicate that the separation of the Taxodiaceae from the Cupressaceae is not warranted, and they are here combined (Gadek et al. 2000; Brunsfeld et al. 1994). The subfamilial classification used here follows Gadek et al. (2000). References: Farjon (2005); Hart & Price (1990); Hardin (1971b); Watson & Eckenwalder in FNA (1993b); Page in Kramer & Green (1990).

1 Leaves alternate.
2 Leaves deciduous, flexible, < 2 cm long, parallel-sided, the apex short-acuminate; [subfamily Cunninghamioideae] ........................................ 1. Cunninghamia
3 Branchlets not disposed in one plane, thus bushy and not fan-like; plants dioecious, male and female cones on separate plants; mature female cones fleshy and berry-like, with smooth surfaces, indescent; leaves opposite (decussate) or in whorls of 3 .................. 5. Juniperus
4 Leaves acute; female cones globose and woody, the hard scales peltate, not imbricate; ultimate branchlets (including the scale leaves) about 1 mm broad ................................................................. 4. Chamaecyparis
5 Branchlets flattened in vertical planes; seeds winged; [native tree, but also sometimes planted] ............................................ 6. Platycladus

1. Cunninghamia R. Brown 1826 (China-fir)

* Cunninghamia lanceolata (Lambert) Hooker, China-fir. Suburban woodlands; commonly planted horticulturally, rarely naturalizing, native of China. A variety of forms are seen, some with dark-green, others with glaucous-blue foliage. [= K, Z; C. sinensis R. Brown]

2. Taxodium L.C. Richard 1810 (Bald-cypress)

A genus of 3 species, trees, of e. North America and Mexico. There has been much debate over whether the two taxa of Taxodium in our area should be treated as species or varieties, and if as varieties, the proper nomenclature. I agree with Godfrey (1988), in his preference "to recognize two species ... because it is my perception that the vast majority of trees (populations) are thus distinguishable." True intermediates appear to be non-existent, though the "mimicry" of the two species creates "pseudo-intermediates" that can cause difficulties in identification. Occasionally, the two species can be seen growing together, in "hybrid habitats," as at the junction of Lake Waccamaw and the Waccamaw River (Columbus County, NC); a few recognizable intermediates can be seen. See Lickey & Walker (2002) for a contrary argument supporting varietal status. Neufeld (1986) discusses the different architecture and ecophysiology of the two species. The only other species in the genus is T. mucronatum Tenore, ranging from s. TX south to Mexico and Guatemala. West of the Mississippi River, the architecture of T. distichum comes to resemble that of T. mucronatum, suggesting the possibility of introgression. For this and other reasons, Watson in FNA (1993b) and other authors prefer to treat T. mucronatum as a third variety of T. distichum, T. distichum var. mexicanum Gordon. Taxodium is most closely related to Glyptostrobus and Cryptomeris. References: Godfrey (1988)=Z; Duncan and Duncan (1988); Lickey & Walker (2002)=Y; Watson in FNA (1993b); Page in Kramer & Green (1990); Tsumura et al. (1999). Key adapted from Z.

1 Larger knees short, rarely > 4 dm tall, usually columnar or broad and mound-like, with thick, compact bark on top; leafy branchlets ascending from the twigs, secondly erect, the apical portion of the branchlet borne in a vertical plane, except on juvenile trees (which mimic T. distichum); leaves subulate, spirally arranged, not spreading laterally and feather-like (except on juvenile trees), ascending or appressed; leaves mostly 3-10 mm long (to 15 mm long on juvenile trees); bark thick (1-2.5 cm thick), furrowed, dark-brown, not exfoliating; [trees of isolated depressions (clay-based Carolina bays, depression ponds), wet savannas, pocosins and other wet peaty habitats, and, less commonly, blackwater swamps and natural lakes] ............................................................. 3. T. mucronatum
2 Larger knees often tall, often > 4 dm tall, usually narrowly conical, with thin, shreddy bark on top; leafy branchlets spreading laterally from the twigs, except in the crowns of mature trees (which sometimes mimic T. ascendens); leaves linear, flat, spirally arranged but by twisting of their basal portions spreading laterally and featherlike (pseudo-distichous), appressed only on drooping branches of the crown, if at all; leaves
mostly 8-20 mm long (sometimes less on crown branches); bark thin (< 1 cm thick), exfoliating in reddish, orange-brown strips; [trees of brownwater swamp forests, blackwater swamp forests, natural lakes, and millponds]............................................ T. distichum

**Taxodium ascendens** Brongniart, Pond-cypress. Limesink ponds (dolines), clay-based Carolina bays, wet savannas, pocosins and other wet, peaty habitats, shores of natural blackwater lakes, swamps of blackwater streams. March-April; October. SE. VA (recently confirmed, J. Townsend, pers. comm. 2009) south to s. FL, west to e. LA; it is surely one of the most scenic trees of eastern North America. [= RAB, G, K, S, WH, Z; < T. distichum – F; = T. distichum var. imbricarium (Nuttall) Croom – FNA, Y; = T. distichum var. nutans (Aiton) Sweet]

**Taxodium distichum** (Linnaeus) L.C. Richard, Bald-cypress. Brownwater and blackwater swamps, usually in riverine situations. March-April; October. DE and e. MD south to s. FL and west to e. TX and se. OK, north along the Mississippi River and its tributaries to s. IN and s. IL. This species is sometimes planted as an ornamental in upland sites. [= RAB, G, K, S, WH, WV, Z; = T. distichum var. distichum – C, FNA, Y; < T. distichum – F (also see T. ascendens)]

3. **Thuja** Linnaeus 1753 (Arborvitae)

**Thuja occidentalis** Linnaeus, American Arborvitae, Northern White Cedar, Flat Cedar. Dry limestone, dolostone, and calcareous sandstone cliffs, talus, and boulderfields, rarely in our area in calcareous swamps, also planted and persisting around old homesteads and cemeteries (mainly in the Mountains). March-April. NS, Hudson Bay, and MB south to PA (where considered strictly introduced by Rhoads & Klein 1993), OH, n. IN, n. IL, and in the mountains to WV, w. VA, and e. TN. This species is alleged by various authors to have occurred as a native species in nw. NC on limestone bluffs in Alleghany, Ashe, and/or Burke counties, but it has not been relocated in this century, and little apparently suitable habitat occurs in NC. [= RAB, C, F, FNA, G, K, S, W, WV]

4. **Chamaecyparis** Spach 1841 (White Cedar)

**Chamaecyparis thyoides** (Linnaeus) Britton, Sterns, & Poggenburg, Atlantic White Cedar, Juniper. Peat dome and streamhead pocosins, blackwater stream swamps, hillside seepages, in highly acidic, peaty or sandy soils. March-April; October-November. S. ME south to n. FL and west to s. MS. From NJ south it is strictly a tree of the Coastal Plain; northward it is often found in kettle-hole bog bogs. In SC and GA, *C. thyoides* is absent in the outer Coastal Plain, occurring primarily in the fall-line Sandhills. A prized timber tree, now much reduced in abundance, formerly used for cabinetry, boat-building, shingles, and other uses. The wood is valuable enough (and resistant enough to rot) to have been mined from bogs in NJ. NC has some of the largest remaining stands of Atlantic White Cedar, in areas of very difficult access, such as the interiors of major peat-domes and large peat-filled Carolina bays. The species is generally known as "juniper" in our area. [= RAB, C, F, FNA, G, K, S; > C. thyoides var. henryae (H.L. Li) Little – Y, Z; > C. thyoides var. thyoides – Y, Z; = Cupressus thyoides Linnaeus]

5. **Juniperus** Linnaeus 1753 (Red Cedar, Juniper, Savin)

A genus of about 60 species, trees and shrubs, of temperate, boreal, and subtropical regions of the Northern Hemisphere. Various species of *Juniperus*, especially creeping species, are frequently used in landscaping. Molecular studies suggest that section *Juniperus* (*J. communis* var. *depressa* in our area) and section *Sabina* (*J. virginiana* in our area) are quite divergent (Adams & Demeke 1993). Small's (1933) recognition of the genus *Sabina* may prove to be warranted; some modern authors accept it (especially Europeans) and recent molecular evidence provides some support. References: Adams (2008b, 2008c)=Z; Adams in FNA (1993b); Adams (1986); Adams & Demeke (1993); Adams (1995, 2008a); Page in Kramer & Green (1990).

1 Leaves flat-acicular, 5-20 mm long, never scale-like, with a white line on the upper surface; leaves borne in whorls of 3, spreading at 45-90 degrees from the twig; female cone ("berry") axillary, maturing in 2-3 years; [section *Juniperus*] ............................................ *J. communis* var. *depressa*

1 Leaves primarily scale-like, ca. 1-2 mm long, though acicular and 2-10 mm long on young trees and some lower branches of larger trees, without a white line on the upper surface (though generally somewhat glaucous); leaves of mature twigs borne in opposite pairs of 2, decussate (thus 4-ranked), appressed to the twig (leaves of immature twigs sometimes in whorls of 3, spreading at 10-45 degrees from the twig); female cones ("berries") terminal on short branches, maturing the first year; [section *Sabina*].
2 Female cones ("berries") 3-4 mm long; terminal twigs 0.75-0.90 mm wide (including the scale-like leaves); scale leaves 1.20-1.45 mm long, obtuse to acute; trees generally with rounded or flattened crowns, the lower branches often drooping...........\textit{J. virginiana} var. \textit{silicicola}

2 Female cones ("berries") 4-7 mm long; terminal twigs 0.85-1.00 mm wide (including the scale-like leaves); scale leaves 1.40-1.65 mm long, acute; trees generally with sharply tapered crowns, the lower branches generally ascending..................\textit{J. virginiana} var. \textit{virginiana}

\textit{Juniperus communis} Linnaeus var. \textit{depressa} Pursh, Ground Juniper, Mountain Juniper, Common Juniper. In thin soil around rock outcrops on mountain summits and Piedmont monadnocks and rocky bluffs (in GA and NC), high elevation old fields (in VA), xeric Coastal Plain sandhills (in SC and VA). March-April; fleshy cone maturing in second or third year. This species is circumpolar, widespread in n. North America, n. Europe, and n. Asia. Adams (2008a, 2008b, 2008c) recognizes 5 varieties in North America, all eastern North American plants belonging to var. \textit{depressa}. In North America \textit{J. communis} is primarily northern and montane, occurring nearly throughout Canada and AK, south in the Appalachians to n. GA, south in the Rocky Mountains to NM, AZ, and CA. Its berry is the juniper berry used as a spice, as well as the main flavoring of gin. It is sometimes planted as a landscaping plant. In e. North America, it is rare and scattered south of PA, MI, and WI, ranging south to a few disjunct sites in VA, NC, SC, GA, and s. IN, in our area notably from Mount Satulah (Macon County, SC), King's Pinnacle (Gaston County, NC), and in sandy soils at Hitchcock Woods (Aiken County, SC). Definitely in our area is var. \textit{depressa}, a decumbent shrub, up to about 1 meter high, forming large clonal patches. Harvill et al. (1992) report scattered sites for var. \textit{communis} in montane VA; these are based on columnar trees. Adams in FNA (1993b) considers var. \textit{depressa} to be the only variety occurring in e. United States, and states that var. \textit{depressa} sometimes forms columnar trees to 10 m tall; such individuals may be the basis of reports of var. \textit{communis} from our area. Additional problems about the status of \textit{Juniperus communis} in our area remain unresolved; variation in growth form, morphologic characters, and habitat suggest the possibility of the presence of several native taxa. See Coker & Totten (1945) for additional discussion. [= RAB, C, F, FNA, G, K, W, Z, <\textit{J. sibirica} Burzdorf – S, <\textit{J. communis} – WV]

\textit{Juniperus virginiana} Linnaeus var. \textit{silicicola} (Small) E. Murray, Southern Red Cedar, Coastal Red Cedar. Maritime forests and scrub, hammocks, coastal shell middens and natural shell deposits, brackish marshes, and other sandy or peaty, circumneutral situations. January-February; October-November. Se. VA south to c. peninsular FL, west to e. LA (Florida Parishes). Many recent authors have treated this taxon as a species, but Adams (1986) and Adams in FNA (1993b) consider varietal status more appropriate; Adams (1995) suggests that the two may have diverged as recently as the Pleistocene. The two varieties are said to intergrade in GA, and in other areas the characters used to separate them seem variable or imperfectly correlated. Large individuals can be as much as a meter in diameter. [= FNA, K, Z; = \textit{J. silicicola} (Small) L.H. Bailey – RAB; = \textit{Sabina silicicola} Small – S; = \textit{J. virginiana} ssp. \textit{silicicola} (Small) J. Silba; <\textit{J. virginiana} – WH]

\textit{Juniperus virginiana} Linnaeus var. \textit{virginiana}, Eastern Red Cedar. In a wide variety of forests, pastures, old fields, roadsides, and fencerows, primarily upland, occurring most abundantly on circumneutral soils (including shrink-swell clays), derived from mafic or calcareous rocks. January-March; October-November. Var. \textit{virginiana} ranges throughout e. United States. The wood is much used for fence posts and the traditional southern cedar chest (which takes advantage of the aromatic and moth-deterrent properties of cedar wood). [= C, F, FNA, G, K, Z; = \textit{J. virginiana} – RAB, W, WV; = \textit{Sabina virginiana} (Linnaeus) Antoine – S; <\textit{J. virginiana} – WH; = \textit{J. virginiana} ssp. \textit{virginiana}]

6. \textit{Platycladus} Spach 1842 (Chinese Arborvitae)

* \textit{Platycladus orientalis} (Linnaeus) Franco, Oriental Arborvitae, Tree-of-life. Commonly planted, especially in graveyards, and rarely persisting and spreading to pastures, fields, and roadsides; native of Asia. [= FNA, K; = \textit{Biota orientalis} (Linnaeus) Endlicher – S; = \textit{Thuja orientalis} Linnaeus]

\textit{G12a. CEPHALOTAXACEAE} Neger 1907 (Plum-yew Family) [in CUPRESSALES]

\textit{Cephalotaxus} Siebold and Zuccarini ex Endlicher 1842 (Plum-yew)

* \textit{Cephalotaxus harringtonia} (Knight ex J. Forbes) K. Koch, Plum-yew. Suburban woodlands; uncommonly grown horticulturally, rarely naturalizing in the vicinity of plantings (as in Chapel Hill, Orange County, NC, and Grottoes, Augusta County, VA), native of Asia. [= Z]
G12b. TAXACEAE S.F. Gray 1822 (Yew Family) [in CUPRESSALES]

A family of about 4 genera and ca. 16-20 species, shrubs and trees, of isolated regions of the Northern Hemisphere and New Caledonia. References: Hils in FNA (1993b); Price (1990); Page in Kramer & Green (1990).

1 Leaves flexible, the tips pointed but not piercing to the touch; fleshy "cone" ca. 5 mm long, ca. 5 mm in diameter, red when ripe, the seed exposed at the top by a gap in the aril.......................................................... Taxus

1 Leaves stiff, the tips piercing to the touch; fleshy "cone" 2.5-3 cm long, ca. 2 cm in diameter, dark green to purple when ripe, seed entirely surrounded by fleshy tissue.......................................................... Torreya

**Taxus** Linnaeus 1753 (Yew)

The genus consists of about 8 (or more) very closely related species, trees and shrubs, of temperate regions of the Northern Hemisphere. The species have been termed "discouragingly similar" by Hils in FNA (1993b). In e. North America, *T. canadensis* occurs in ne. North America, and *T. floridana* Chapman is endemic to Panhandle FL. *T. brevifolia* Nuttall, Pacific Yew, of BC and AB south to MT, ID, OR, and CA, has recently been widely publicized as the source of an anti-cancer drug, present in all species of the genus. *T. baccata* Linnaeus is native to Europe, and 3-4 additional species occur in Japan and e. mainland Asia (Price 1990). References: Hils in FNA (1993b); Spjut (2007a, 2007b)=Y; Farjon (1998)=Z; Page in Kramer & Green (1990).

1 Bud scales blunt, only slightly keeled.................................................................................................................. *T. baccata*

1 Bud scales often acute, keeled.

2 Leaf undersurfaces with cuticular papillae along the stomatal bands; shrubs or small trees to 10 m tall; [of Panhandle FL]........... *T. floridana*

2 Leaf undersurfaces usually lacking cuticular papillae along the stomatal bands; shrubs to 2 m tall (or trees in *T. cuspidata*); [of w. NC and VA northward, or naturalized from plantings].

3 Stomata in (4-) 5-9 (-11) rows on each side of midvein; [native of ne. N. America, south to w. NC and VA]................... *T. canadensis*

* Taxus baccata* Linnaeus, English Yew. Suburban woodlands, planted as hedges and ornamentals, escaping locally, as in Rock Creek Park, Washington, DC (Shetler & Orli 2000); native of Europe. [= C, G, K, Z; = *T. baccata ssp. baccata*]

**Taxus canadensis** Marshall, Canada Yew, American Yew. Cliffs, bluffs, and rocky slopes over calcareous or mafic rocks, red spruce and hemlock swamps and bogs. April-May. NL (Newfoundland), NL (Labrador), MN, and s. MB south to nw. NC, ne. TN, KY, and IA. *Taxus* was first found in NC in 1968 (McDowell 1969). In our area, *Taxus* occurs primarily on limestone and mafic bluffs, but at its southernmost site in the hanging valley of Long Hope Creek (Ashe and Watauga counties, NC), *Taxus* is found in red spruce swamps and bog edges, where it is locally common. Deer have a devastating effect on populations of this species in our area. [= C, F, FNA, G, K, W, WV, Z; > *T. canadensis var. canadensis* – Y; > *T. canadensis var. minor* (Michaux) Spjut – Y; > *T. canadensis var. adpressa* (Hort. ex Carrière) Spjut – Y; = *T. baccata Linnaeus ssp. canadensis* (Marshall) Pilger]

* Taxus cuspidata* Siebold & Zuccarini, Japanese Yew. Suburban woodlands, planted as hedges and ornamentals, escaping locally (Shetler & Orli 2000); native of Japan. [= C, G, K, Y; > *T. cuspidata var. cuspidata* – Z; = *T. baccata Linnaeus ssp. cuspidata* (Siebold & Zuccarini) Pilger]

**Torreya** Arnott 1838 (Torreya, Stinking Cedar)

**Torreya taxifolia** Arnott, Florida Torreya. Moist ravines and bluffs, and also rarely established near plantings. An endangered endemic of ravines along the Apalachicola River in Panhandle FL and sw. GA. Pittillo and Brown (1988) report that "young saplings [are] established downslope and beneath transplanted trees south of Highlands [Macon County, NC].” Godfrey (1988) reports that the national champion Florida Torreya is in Warren County, NC, with "a near-basal circumference of 9 feet, a spread of 52 feet, and a height of 60 feet. It is estimated that it may have been planted there about 1830." [= FNA, K, WH; = *Tomlin taxifolia* (Arnott) Greene – S]
ANGIOSPERMS

SECTION 4: MAGNOLIIDS AND PRIMITIVE ANGIOSPERMS

3. CABOMBACEAE A. Richard 1828 (Water-shield Family) [in NYPHAEALES]

A family of 2 genera and about 6 species, aquatic herbs, nearly cosmopolitan. This family is closely related to the Nymphaeaceae and may be best combined with it (Angiosperm Phylogeny Group 2003). References: Wiesema in FNA (1997); Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993); Les et al. (1999).

1 Plants with all leaves floating and peltate; plants coated with a layer of transparent, mucilaginous jelly; floating peltate leaves 3.5-11 cm long, 2-6.5 cm wide; [subfamily Hydroptiloeideae] ................................................................. Brasenia

Brasenia Schreber 1789 (Water-shield)

A monotypic genus, an aquatic herb, widely distributed in tropical and temperate regions of the Old and New World. References: Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: The elliptic, peltate, floating leaves and mucilaginous petioles make Brasenia unmistakable.

Brasenia schreberi J.F. Gmelin, Water-shield, Purple Wen-dock. Lakes, ponds, sluggish streams, floodplain oxbow ponds. June-October. NS west to MN, south to s. FL and TX; also from BC south to CA; also in tropical America and the Old World. [= RAB, C, F, FNA, G, GW, K, S, W]

Cabomba Aublet 1775 (Fanwort)

A genus of about 5 species, aquatic herbs, tropical and temperate regions of America. References: Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: Cabomba is sometimes mistaken for other, superficially somewhat similar aquatics, such as Ceratophyllum (Ceratophyllaceae), Utricularia (Lentibulariaceae), and Myriophyllum (Haloragaceae). Cabomba has the leaves opposite (rather than whorled), dichotomotously divided (like Ceratophyllum), but the divisions lacking the marginal denticles of Ceratophyllum, and on a 1-3 cm long petiole (vs. sessile or on a petiole 0-2 mm long). Utricularia has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. Myriophyllum has the leaves pectinately rather than dichotomously divided.

Cabomba caroliniana A. Gray, Fanwort. Millponds, lakes, slow-moving streams. May-September. NJ west to OH, s. MI, and MO, south to FL and TX; sporadically introduced elsewhere from aquarium "throw-outs." C. caroliniana var. pulcherrima R.M. Harper, with purplish flowers and vegetative parts, occurs in the southeastern Coastal Plain; it needs further evaluation. GW imply that the purple pigmentation may be merely an environmental response to warm waters, and is not correlated with morphologic characters. [= RAB, C, F, FNA, G, GW, S; > C. caroliniana var. caroliniana – K; > C. caroliniana var. pulcherrima R.M. Harper – K; > C. pulcherrima (R.M. Harper) Fassett]

4. NYPHAEALES R.A. Salisbury 1805 (Water-lily Family) [in NYPHAEALES]

A family of 6 genera and about 75 species, aquatic herbs, cosmopolitan. References: Wiesema & Hellquist in FNA (1997); Schneider & Williamson in Kubitzki, Rohwer, & Bittrich (1993); Les et al. (1999).

1 Flowers nearly spherical, 2-5 cm in diameter; sepals 6 (in our species), petaloid, green to yellow, incurved; petals many, inconspicuous, scalelike or staminodial; leaves often of 2 types, the submersed leaves (when present) thinner in texture than the floating or emersed leaves; floating or emersed leaves having 60-90% of their surface area with vasculature derived from the midrib; rhizome with triangular or winged leaf scars; [subfamily Nymphoideae] ........................................................................................................... Nuphar

Nuphar J.E. Smith 1809 (Spatterdock, Yellow Pondlily)

A genus of about 16 species, aquatic herbs, of north temperate areas. Beal (1956) recognized 8 taxa of Nuphar in North America, which he treated as subspecies of the European N. lutea. Voss’s (1985) statement (about the genus in Michigan) "our plants are quite easily distinguished ... and they are treated here as closely related species" applies equally (or better!) in our area. Recent treatments (see references) recognize multiple species. References: Beal (1956) = Z; Wiesema & Hellquist in FNA (1997); Padgett (1999) = Y; Padgett (2007) = X; Schneider & Williamson in Kubitzki, Rohwer, & Bittrich (1993). Key based in large part on FNA.
Nymphaeaceae

1. Sepals 5 (or 5-6 in N. rubrodiscus); stigmatic disc red; fruit deeply constricted below the stigmatic disc; leaf blades 3.5-25 cm long; [section Nuphar].
2. Anthers 1-3 mm long; stigmatic disc with 6-10 deep crenations; stigmatic rays terminating 0-0.2 mm from the margin of the disc; constriction below disc 1.5-5 mm in diameter; leaf sinus 2/3 or more the length of the midrib; leaf blades 3.5-10 (-13) cm long. [N. microphylla]
3. Anthers (2)-3-6 mm long; stigmatic disc with 8-15 shallow crenations; stigmatic rays terminating 0-1.6 mm from the margin of the disc; constriction below disc 5-10 mm in diameter; leaf sinus ca. 1/2 the length of the midrib; leaf blades 5-25 cm long. [N. rubrodiscus]
4. Anthers 5-9 (-12); stigmatic disc yellow, green, or sometimes reddish; fruit slightly or not at all constricted below the stigmatic disc; leaf blades 7-50 cm long; [section Astylus].

Floating leaf blades 2-6× as long as wide, the sinus < 1/4 as long as the midrib; thin-textured submersed leaves often more abundant than the floating leaves; [of blackwater or tidal streams, rivers, and lakes of the Coastal Plain, se. VA, e. NC, e. SC, Panhandle FL, s. AL].
4. Floating leaf blades 2-3× as long as wide; stigmatic rays linear, mostly terminating 1-2 mm from the edge of the disk; [of blackwater or tidal streams, rivers, and lakes of the Coastal Plain of se. VA to e. SC]. [N. sagittifolia]
5. Floating leaf blades 3-6× as long as wide; stigmatic rays elliptic, terminating < 1 mm from the edge of the disk; [of blackwater or tidal streams, rivers, and lakes of the Coastal Plain]. [N. ulvacea]
6. Floating leaf blades 2-6× as long as wide; the sinus < 1/4 as long as the midrib; thin-textured submersed leaves absent or at least fewer than floating or emersed leaves; [collectively of various habitats and distributions, but not as above].

Leaf petiole flattened on the upper (adaxial) surface and winged along the margins; fruit usually purplish; sepal red or maroon at the base adaxially. [N. variegata]
5. Leaf petiole terete or slightly flattened, not winged; fruit usually greenish or yellowish; sepal yellow or red at the base adaxially. [N. ulvacea]

Leaf surface glabrous to sparsely pubescent; leaves 7-30 cm wide, (1-) 1.5 (-2)× as long as wide, the lobes acute to broadly rounded; leaves mostly emersed; [widely in our area]. [N. advena]
6. Leaf surface densely silvery-pubescent; leaves 20-45 cm wide, ca. 1× as long as wide the lobes, broadly rounded; leaves mostly floating; [of AL, FL, and GA Coastal Plain]. [N. orbiculata]

Nuphar orbiculata (Small) Standley. Quiet waters in blackwater swamps. May-October. A Southeastern Coastal Plain endemic: e. GA south to Panhandle FL and s. AL. [FNA; = Nuphar luteum ssp. orbiculata (Small) E.O. Beal – K; > Nymphaea orbiculata Small – S; > Nymphaeas lutea ssp. orbiculata Miller & Standley – S; = Nuphar advena (Aiton) Aiton f. ssp. orbiculata (Small) D. Padgett – X, Y; = Nuphar luteum ssp. orbiculatum (Small) E.O. Beal – Z].

Nuphar sagittifolia (Walter) Pursh, Narrowleaf Pondlily, Bonnets. Blackwater streams, rivers, and lakes, in swift, sluggish, or stagnant water, extending downriver into freshwater tidal areas. April-October. Endemic to our area: e. VA south to ne. SC, very conspicuous and locally abundant on shallow bars along rivers such as the Northeast Cape Fear, Black, and Waccamaw, and forming dense colonies in Lake Waccamaw. Apparent hybrids with N. advena have been named Nuphar × interfluitans Fernald. The submersed leaves have somewhat the texture and appearance of a thin leaf lettuce or the marine alga Ulva. This species appears to be closely related to N. ulvacea (Miller & Standley) Standley of blackwater rivers of Panhandle FL, another phytogeographic connection between se. NC and Panhandle FL. DePoe & Beal (1969) and Beal & Southall (1977) argue that this taxon and N. advena intergrade clinally, with N. advena inland and N. sagittifolia in the outer Coastal Plain, and that the two taxa are maintained by water temperatures. This ignores the fact that the two taxa often occur in close proximity to one another in both the inner and outer Coastal Plain. The frequency of so-called intermediates has also been exaggerated; few populations will present any difficulties in identification. I prefer to treat these taxa as species, with rare hybridization or introgression.

Molecular data suggest that N. sagittifolia is more closely related to the boreal N. variegata than to N. advena (Padgett 2007). [C, FNA, X; = Nuphar × interfluitans Fernald].

Nuphar variegata Durand in G.W. Clinton. Lakes and ponds. Widespread in ne. North America, south to DE, NJ, PA, OH, IN, IL, IA, and NE. May-September. [= C, FNA, X; = Nuphar variegatum – F, G; = Nuphar lutea ssp. variegata (Durand) E.O. Beal – K; = Nuphar luteum ssp. variegatum (Durand) E.O. Beal – Z]

Nymphaea Linnaeus 1753 (Waterlily)

1 Leaf margins sinuate-dentate ................................................................. N. capensis var. zanzibariensis
1 Leaf margins entire.
2 Petals blue ............................................................................................................. N. elegans
2 Petals yellow or white (to pink).
3 Petals yellow; plants producing stolons ...................................................... N. mexicana
4 Petiole solid-colored; leaf length/width ratio (length measured from petiole attachment to tip of leaf, along midvein) (0.44-) avg. 0.56 (-0.71); two leaf lobes with rounded lobe tips; lower leaf surface reddish-purple .............................................................. N. odorata ssp. odorata
4 Petiole striped; leaf length/width ratio (0.44-) avg. 0.63 (-0.73); leaf lobes with pointed tips; lower leaf surface green ...................................................

* Nymphaea capensis Thunberg var. zanzibariensis (Caspy) Conard, Cape Blue Waterlily. Ponds and canals; native of Africa. April-August. [= K, WH]

Nymphaea elegans Hooker, Tropical Blue Waterlily. Ponds, ditches, cypress swamps. April-August. FL west to TX, south into Mexico; Bahamas. [= K, WH]

Nymphaea mexicana Zuccarini, Banana Waterlily, Yellow Waterlily. Sluggish or stagnant waters; scattered in occurrence and possibly introduced from further south, but the introduction agents may well be wild ducks, such as canvasbacks. June-September. Ne. NC south to s. FL, west to TX, also in sw. United States and Mexico. [= RAB, FNA, K, Z; = Castalia flava (Leitner) Greene – S]

Nymphaea odorata W.T. Aiton ssp. odorata, White Waterlily. Ponds, sluggish waters. June-September. NL (Newfoundland) west to MB, south to FL and TX; also scattered in the w. United States. N. odorata is polymorphic, leading to the naming of numerous species, subspecies, and varieties (see synonymy for a few of the named entities). Wiersema in FNA (1997) recognize ssp. odorata (all of our plants) and ssp. tuberosa (Paine) Wiersema & Hellquist, more western and northern, but approaching our area (see below). Other named entities warrant further evaluation. N. odorata var. gigantea [= Castalia lekophylla Small] occurs on the Coastal Plain, and is considered to differ from var. odorata in its larger leaves (1.5-6 dm in diameter vs. 0.5-2.5 dm), larger flowers (mostly > 15 cm wide vs. mostly < 10 cm), and leaves upturned at the margins (vs. flat). N. odorata var. minor [= Castalia minor (Sims) Nyar] is considered to differ from var. odorata in its generally smaller size, leaves 5-11 cm in diameter, flowers mostly < 8 cm wide (vs. mostly > 9 cm wide); it may be a merely a dwarf form of extremely nutrient-limited waters of the Coastal Plain. [= FNA, K, Z; < N. odorata – RAB, WV; > < N. odorata var. odorata – C; > N. odorata var. odorata – F, G; > N. odorata var. gigantea Tricker – C, F, G; > N. odorata Schivar. stenopetal Fernald – F; > Castalia odorata (W.T. Aiton) Wood – S; > Castalia minor (Sims) Nyar – S; > Castalia lekophylla Small – S]

7a. ILLICIACEAE A.C. Smith 1947 (Star-anise Family) [in AUSTRABAILEYALES]

Ilicium Linnaeus 1759 (Star-anise)

A genus of about 42 species, shrubs and trees, of temperate and subtropical se. Asia and se. North America (se. United States, Cuba, Haiti, and e. Mexico). References: Morris et al. (2007) studied the evolution of the genus and revised its sectional taxonomy; New World and Old World taxa form separate clades, treated as separate sections, our species being in section Cymbostemon. Vincent in FNA (1997); Morris et al. (2007); Keng in Kubitzki, Rohwer, & Bittrich (1993); Stone & Freeman (1968).
ILliciaceae

1 Flowers 2-5-5 cm across; tepals 21-33, red-maroon (rarely white or pinkish); leaf tips acute to acuminate .................................................. *Illicium floridanum*

1 Flowers 0.8-1.2 cm across; tepals 11-16, yellowish green; leaf tips obtuse or rounded .................................................. *Illicium parviflorum*

Illicium floridanum Ellis, Florida Star-anise. Acid ravines and small stream swamps. Sw. GA west to e. LA. Sparingly naturalized north of its native range from plantings, as along Black Creek, at Kalmia Gardens, Hartsville, Darlington County, SC (D. Hope, pers.comm. 2008). [= FNA, GW, K, S, WH]

* Illicium parviflorum *Michaux ex Ventenat, Swamp Star-anise, Yellow Anise-tree, Ocala Anise-tree. Cultivated and persistent; native of central peninsular FL. April-June. This species occurs in swampy forests, evergreen hammocks, and bayheads and is endemic to scattered localities in central FL; it is in the horticultural trade and has been introduced in various places, including sw. and se. GA and sc. SC (Aiken County) (H. Shealy and R. McCartney, pers.comm. 2008). [= FNA, K, S, WH]

7b. Schisandraceae Blume 1830 (Star-vine Family) [in AUSTROBAILEYALES]

A family of 2 genera and about 40-60 species, woody vines, of e. Asia and e. North America (only our single species). The family is most closely related to the Illiciaceae, Austrobaileyaceae, and Trimeniaceae. In APG III (2009), Schisandraceae is included in Illiciaceae, but the differences seem sufficient to keep them separate. References: Saunders (2001); Keng in Kubitzi, Rohwer, & Bittrich (1993).

Schisandra *Michaux 1803 (Star-vine)*

Schisandra glabra (Brickell) Rehder, Star-vine, Climbing-magnolia, Magnolia-vine. Rich slopes adjacent to bottomland forests, mesic "islands" surrounded by bottomlands, moist hammocks. May-June; July-August. Ne. NC (Martin County), sc. NC (Gaston County), n. GA, w. TN, e. and se. KY, and e. AR south to the FL Panhandle and LA; Mexico (Sierra Madre Oriental, Hidalgo). [= RAB, K, WH, Y, Z; = *Schizandra coccinea* Michaux – S, orthographic variant; = S. coccinea Michaux – W]

11. Saururaceae E. Meyer 1827 (Lizard's-tail Family) [in PIPERALES]

Houttuynia Thunberg

{genus info}

* Houttuynia cordata Thunberg. Disturbed areas; moist suburban forests; native of e. Asia.

Saururus Linnaeus 1753 (Lizard's-tail, Water-dragon)

Saururus cernuus Linnaeus, Lizard's-tail, Water-dragon. Swamps, overwash pools in stream floodplains, ditches, usually where water ponds seasonally or periodically. May-July; August-September. CT, s. QC, s. ON, and MI south to s. FL and e. TX. In swamps of the Coastal Plain, *Saururus* often is dominant in large patches. The elongate inflorescence, drooping at the tip, is distinctive, attractive, and the fanciful inspiration for the genus name, the specific epithet, and the common names. Thien et al. (1994) studied the reproductive biology of *Saururus cernuus*, and found that pollination was both by wind and by insects. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV]
ANGIOSPERMS

12. PIPERACEAE C.A. Agardh 1824 (Pepper Family) [in PIPERALES]

A family of about 5-8 genera and 3000 species, shrubs, herbs, trees, and vines, of tropical and subtropical areas. References: Tebbs in Kubitzki, Rohwer, & Bittrich (1993).

**Peperomia** Ruiz & Pavón 1794 (Peperomia)

1 Leaves opposite or whorled; stems pubescent ................................................................. P. humilis
1 Leaves alternate; stems glabrous ........................................................................................ P. pellucida

* Peperomia pellucida (Linnaeus) Kunth, Pepper-elder, Man-to-man. Disturbed areas; introduced. P. pellucida has been collected escaped from cultivation in FL, LA, and GA (in the vicinity of Savannah). Boufford (1982) describes the species as showing "weedy tendencies" in the southeastern United States, where "first collected in 1957," and states that "it will be interesting to see if this plant will continue to expand its range." [= FNA, K, Z]

15. ARISTOLOCHIACEAE A. L. de Jussieu 1789 (Birthwort Family) [in PIPERALES]

A family of about 6-12 genera and 600 species, vines, shrubs, and herbs, of tropical, subtropical, and warm temperate regions. References: Barringer & Whittemore in FNA (1997); Ohi-Toma et al. (2006); Neinhuis et al. (2005); Huber in Kubitzki, Rohwer, & Bittrich (1993).

1 Acaulescent herb; calyx tube straight, radially symmetrical; stamens 12; [subfamily Asaroideae].
2 Leaves deciduous, pubescent, paired .................................................................................. Asarum
2 Leaves evergreen, glabrous, not paired ............................................................................. Hexastylis
1 Twining vine or acaulescent herb; calyx tube bent, bilaterally symmetrical; stamens 6; [subfamily Aristolochioideae, tribe Aristolochieae].
3 Woody, twining vine; leaves 8-35 cm wide; [subtribe Isotrematinae] ................................ Isotrema
3 Low, erect or ascending herb; leaves 0.7-6.5 cm wide.

4 Leaf blade as wide as long, or wider than long; leaf venation palmate; [subtribe Aristolochniaceae]................................. Aristolochia
4 Leaf blade narrower than long; leaf venation pinnate; [subtribe Isotrematinae]............................. Endodeca

**Aristolochia** Linnaeus 1753 (Birthwort)

A genus of about 300 species, herbs and vines, once Endodeca, Isotrema, and Pararistolochia are excluded (Huber in Kubitzki 1993). Recent work has clarified that Aristolochia s.l. comprises 4 main clades, each of which is distinctive molecularly, morphologically, and in karyotype. These can be (as here) recognized as genera, or alternatively as four subgenera, grouped into two genera (Aristolochia including Pararistolochia, and Isotrema including Endodeca), as suggested by Ohi-Toma et al. (2006). References: Barringer in FNA (1997); Ohi-Toma et al. (2006); Kelly & González (2003); Huber in Kubitzki, Rohwer, & Bittrich (1993). [also see Endodeca and Isotrema]

1 Plant an herb; flowers yellowish, < 2 cm across.............................................................. A. clematitis
1 Plant a woody vine; flowers brownish-purple and white, ca. 10 cm across .................... A. elegans

* Aristolochia clematitis* Linnaeus, Birthwort. Disturbed areas; native of Europe. Naturalized in se. PA (Rhoads & Klein 1993) and MD (Barringer in FNA 1997). [= C, FNA, K]
* Aristolochia elegans* Mast., Elegant Dutchman’s-pipe, Calico Flower. Disturbed areas; native of Brazil. [? A. littoralis Parodi – WH]

1 Plant an herb; flowers yellowish, < 2 cm across.............................................................. A. clematitis
1 Plant a woody vine; flowers brownish-purple and white, ca. 10 cm across .................... A. elegans

**Asarum** Linnaeus 1753 (Wild Ginger)

1  Calyx lobes 5-10 (-12) mm long, strongly reflexed, often more-or-less appressed back against the calyx tube, acute or acuminate, the tubular tips 0-4 mm long.  ................................................................. A. reflexum
2  Calyx lobes 10-35 mm long, spreading to ascending from the base, acuminate to caudate, the tubular tips 4-20 mm long.  ................................................................. A. acuminatum
3  Calyx tube 10-20 mm long; calyx lobes long-caudate, 15-35 mm long, erect ................................................................. A. acuminatum
4  Calyx tube 4-10 mm long; calyx lobes acuminate to short-caudate, 10-25 mm long, spreading ................................................................. A. canadense

Asarum acuminatum (Ashe) Bicknell. Mt (NC, VA): rich deciduous forests; rare. Mainly west of the Blue Ridge; distribution unclear at this time. [< A. canadense var. canadense – C; < A. canadense – RAB, FNA, K, W; = A. canadense Linnaeus var. acuminatum Ashe – F; > A. acuminatum (Ashe) Bicknell – S; > A. rubrincinctum Peattie – S] [not yet mapped]

Asarum canadense Linnaeus, Common Wild Ginger. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA, WV): rich deciduous forests in circumneutral soils; common (uncommon in Piedmont of NC and SC, uncommon in VA Coastal Plain, rare in Coastal Plain in DE, NC, and SC). April-May. NB and QC west to MN, south to NC, AL, and n. LA. Taxa recognized at varietal or specific level in the past have recently often been ignored, but have some merit; they deserve further attention. [= S; < A. canadense var. canadense – C, G; < A. canadense – RAB, FNA, K, W; > A. canadense var. ambiguum (Bicknell) Farwell – F; > A. canadense var. canadense – F] [not yet mapped]

Asarum reflexum Bicknell. Mt (NC, VA?, WV?): rich deciduous forests in circumneutral soils; rare? April-May. CT west to s. MB, south to w. NC, KY, and MO. [= S = A. reflexum Linnaeus var. reflexum (Bicknell) B.L. Robinson – C, F, G; < A. canadense – RAB, FNA, K, W; = A. reflexum Bicknell – S] [not yet mapped]

Endodeca Rafinesque 1828 (Turbentine-root)
A genus of 2 (or more?) species, of eastern and sc. North America. This genus is morphologically distinctive within Aristolochia (in the broad sense), and forms a clade with Isotrema distinctive from Aristolochia s.s. (Ohi-Toma et al. 2006). References: Barringer in FNA (1997); Ohi-Toma et al. (2006); Kelly & González (2003); Neinhuis et al. (2005); Huber in Kubitzki, Rohwer, & Bittrich (1993).

Endodeca serpentaria (Linnaeus) Rafinesque, Turbentine-root, Virginia Snakeroot. Dry to mesic forests, perhaps more restricted to mesic situations over acidic substrate, ranging into drier situations over calcareous or mafic substrates. May–June; June–July. CT and NY west to IL, MI, and MO, south to c. peninsular FL and TX. The tremendous variation in this species needs further study. Plants with sparingly pubescent, thin-textured, linear to lanceolate leaves have been called Aristolochia hastata. Plants with broadly ovate, densely pubescent leaves have been called Aristolochia convolvulacea. These may represent merely morphologic extremes of a polymorphic complex; alternatively, some taxonomic recognition of such plants as distinct from A. serpentaria may be warranted. [= Aristolochia serpentaria Linnaeus – RAB, C, FNA, G, K, W, WH; > A. serpentaria var. hastata (Nuttall) Duchartre – F; > A. serpentaria var. serpentaria – F; > A. hastata Nuttall – S; > A. convolvulacea Small – S; > A. serpentaria – S]

Hexastylis Rafinesque 1825 (Heartleaf)
A genus of 10 species, herbs, of se. North America, very possibly best expanded to include Asian taxa treated in Heterotropa and Asiasarum. Barringer (1993) and Kelly (1997, 1998) have recently employed a broad definition of Asarum, including Hexastylis. Over the last half-century various students of the group (emphasizing a range of fields of evidence) have arrayed themselves for and against the recognition of Hexastylis as a genus distinct from Asarum. A cladistic analysis (Kelly 1997, 1998) showed distinctive clades which could be interpreted as evidence for the recognition of Hexastylis (including the Asian Heterotropa), though the author preferred to recognize 2 subgenera. I choose here to follow the more traditional (at least in our area) separation of Hexastylis from Asarum, until and unless stronger evidence is presented for their combination. Electrophoretic and morphologic studies currently in progress validate the species / varietal level taxonomy presented, insofar as results are available (R. Wyatt, pers. comm.). A difficult genus, Hexastylis is made more frustrating by the fact that nearly all diagnostic features relate to the shape and size of the fleshy and brittle calyx – characters which are difficult to describe and are largely lost when specimens are pressed. The difficulty of identifying herbarium specimens has sometimes been (apparently) used as a justification for reducing (often drastically, as in C) the number of taxa recognized. To those familiar with this genus in the field, however, the taxa here recognized form geographically distinctive populations. Size and (to a lesser degree) shape of individual flowers and (to a lesser degree) shape of individual flowers can be altered by environmental factors; individual flowers or plants can be difficult to identify if taken out of context. Populations, however, are usually readily identifiable. References: Whitemore & Gaddy in FNA (1997); Gaddy (1987a)=Z; Blomquist (1957)=Y; Barringer (1993)=X; Gaddy (1987b); Gaddy (1986); Gaddy in Wofford (1989); Sugawara (1987); Huber in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from FNA, Gaddy in Wofford (1989), and Gaddy (1987a).

Identification notes: The photograph (Figure 1) in Gaddy (1987a) of the flowers of all species other than H. arifolia and H. speciosa is highly recommended as an aid to identification. The calyx tube orifice is measured on the inside – the diameter of the opening. The width of calyx lobes is measured from sinus tip to sinus tip.
1  Style extension bifid to stigma; leaves triangular to ovate-sagittate or subabsurate, portions of the sides of nearly all leaves straight or concave; leaves mottled, the paler areas between the veins.
2  Calyx abruptly contracted near the middle, the lower portion narrowly cuplike, abruptly expanded into a much broader upper half; calyx tube with internal raised reticulations; calyx lobes spreading; [endemic near Montgomery, AL]......................................................... H. speciosa
3  Calyx gradually contracted to a smooth waist just below the calyx lobes; calyx tube smooth internally; calyx lobes spreading or erect; [collectively widespread in our area].
4  Calyx lobes erect, 2-4 mm long, 2-4 mm wide at base; [of the Mountains westward]......................................................... H. arifolia var. rathii
ARYSTOLOCHIACEAE

3 Calyx lobes spreading, 2.5-8 mm long, 3-9 mm wide at base; [of the Coastal Plain, Piedmont, and eastern Mountains].
4 Calyx tube 13-18 mm long, 6-10 mm wide; [of the Coastal Plain, Piedmont, and Mountains of s. VA, NC, SC, GA, and westward through AL and MS to se. LA].
4 Calyx tube 20-25 mm long, 10-12 mm wide; [of the lower Gulf Coastal Plain, of sw. GA, FL Panhandle, s. AL, s. MS, and se. LA].

1 Style extension notched or divided at the apex, not bifid to the stigma; leaves rounded, with cordate base, all portions of the sides of the leaves convex; leaves mottled or unnotched, if mottled, the paler areas along the veins.

5 Inner surface of calyx lobes pilose with whitish hairs; plant rhizomatous, the rhizomes long-creeping.................................H. lewisii
5 Inner surface of calyx lobes puberulent; plant clumped or short-creeping.

6 Calyx tube broadly urceolate-canpanulate or rhombic-ovate (broadest near the middle).
7 Calyx tube urceolate-canpanulate; calyx lobes 10-22 mm wide at base.
8 Leaves scattered along the length of the rhizome; [of Coastal Plain and lower Piedmont of GA and AL].
8 Leaves clustered at the tip of the rhizome; [of the Mountains and upper Piedmont of NC, SC, and GA].

7 Calyx tube rhombic-ovate (broadest near the middle); calyx lobes 3-8 mm wide at base.
9 Internal ridged reticulation an open network raised < 1 mm or absent ..................H. contracta
9 Internal ridged reticulation a close network raised 1.5-2 mm ....................H. rhombiformis

6 Calyx tube cylindrical to narrowly cylindro-urceolate; calyx lobes 2-4 mm long, erect to slightly spreading .................H. virginica
10 Calyx tube cylindrical, calyx lobes 4-15 mm long, moderately spreading to reflexed.
12 Calyx tube longer than wide.
13 Calyx tube orifice 8-12 mm wide, > ½ the length of the calyx lobes; calyx lobes 6-17 mm wide; ovary superior; leaves usually solid green (sometimes variegated) ..............................................................H. heterophylla
13 Calyx tube orifice 4-8 mm wide, < ½ the length of the calyx lobes; calyx lobes 4-7 mm wide; ovary half-interior; leaves usually variegated ..................................................................................................................H. naniflora
12 Calyx tube about as wide as long (at widest point) or wider than long, flared.
14 Calyx tube about as wide as long; calyx tube orifice width < the length of the calyx lobes. ............................................H. heterophylla
14 Calyx tube wider at flared end; calyx tube orifice width > the length of the calyx lobes.
15 Calyx tube 12-25 mm long; leaves always strongly variegated; [widespread in dry to moist upland forests of the Piedmont (and rarely Coastal Plain and low Mountains) of VA, NC, and SC] .................................................................H. minor
15 Calyx tube 8-18 mm long; leaves solid green or faintly variegated; [of pocosins and pocosin ecotones in the NC and SC sandhills, usually growing in or near Sphagnum] .........................................................H. species 1

Hexastylis arifolia (Michaux) Small var. califolia (Small) Blomquist. Mesic forests. March-May. Sw. GA and Panhandle FL (?) west to se. LA, in the lower East Gulf Coastal Plain. [= FNA, K, Y, Z; = H. califolia (Small) Small – S; = Asarum califolium Small; < Asarum arifolium Michaux – WH; = Asarum arifolium Michaux var. califolium (Small) Barringer – X]

Hexastylis arifolia (Michaux) Small var. ruthii (Ashe) Blomquist, Appalachian Little Brown Jug. Upland forests, ultramafic outcrop barrens, calcareous forests. March-June. A Southern Appalachian endemic: sw. VA, se. KY, w. NC, e. TN, n. AL, and n. GA. Perhaps warranting species status. At the Buck Creek olivine barren (Clay County, NC) this species carpets several hundred hectares, in association with Packera paupercula var. appalachiana, Thalictrum macrostylum, and Sporobolus heterolepis; various morphological differences, especially the rhizomatous habit, suggest that it may represent an undescribed taxon. [= C, FNA, K, W, Z; < H. arifolia – RAB; = Asarum ruthii Ashe – F; = H. ruthii (Ashe) Small – G, S; = Asarum arifolium Michaux var. ruthii (Ashe) Barringer – X]

Hexastylis contracta Blomquist, Mountain Heartleaf. On acidic soils in deciduous forests with Kalmia latifolia and Rhododendron maximum. May-June. Endemic to the Cumberland Plateau of TN (Chester, Wofford, & Kral 1997) and KY, with a few disjunct populations in the Blue Ridge of NC and in the Ridge and Valley of sw. VA (Washington County) (J. Townsend, pers.comm. 2006). [= RAB, FNA, K, W, Y, Z; < H. virginica – C; < Asarum contractum (Blomquist) Barringer – X (also see H. rhombiformis); = Asarum contractum (Blomquist) Barringer]

Hexastylis lewisii (Fernald) Blomquist & Oosting, Lewis’s Heartleaf. Upland forests (pine or oak), pocosin ecotones. April-May. Endemic to the Piedmont of VA and the Piedmont and Coastal Plain of NC. [= RAB, FNA, K, Y, Z; < H. shuttleworthii – C; = Asarum lewisii Fernald – F]
**Hexastylis minor** (Ashe) Blomquist, Little Heartleaf. Upland or moist forests. February-May. Endemic to the Piedmont and adjacent Coastal Plain and Mountains of nc. VA, NC, and ne. SC. [= RAB, FNA, K, W, Z; < Asarum virginicum Linnaeus – F; < H. virginica – C, G, S; = Asarum minus Ashe; = Hexastylis minus – Y, a grammatical error]

**Hexastylis naniiflora** Blomquist, Dwarf-flower Heartleaf. Acidic, sandy loam on bluffs and ravines in deciduous forests, frequently associated with *Kalmia latifolia*. March-June. Endemic to the upper Piedmont of s. NC and n. SC. [= RAB, FNA, K, W, Y, Z; < H. virginica – S; = Asarum species 2]

**Hexastylis rhombiflora** Gaddy, French Broad Heartleaf. In deciduous forests on sandy river bluffs or in ravines with *Kalmia latifolia* and *Rhododendron maximum*. Late March-June. Endemic to the southern Blue Ridge of NC and SC, known only from Henderson, Polk, Buncombe, and Transylvania counties. Following Gaddy's (1986) naming of this species, Barringer (1993) considered the species merely a form of *Asarum contractum*, but electrophoretic and morphologic studies indicate that it is distinct from *H. contracta*, and more closely related to *H. virginica* (Murrell et al. 1998; R. Wyatt, pers. comm.). [= FNA, K, W, Z; < Asarum contractum (Blomquist) Barringer – X; = Asarum species 3]

**Hexastylis shuttleworthii** (Britten & Baker f.) Small var. harperi Gaddy, Harper's Heartleaf. Bogs, acid hammocks. C. GA, c. AL, and ne. MS, south and west of (and allopatric from) var. shuttleworthii (Gaddy 1987b); it approaches SC and should be sought there. [= FNA, K, Z; < H. shuttleworthii – S; = Asarum shuttleworthii Britten & Baker f. var. harperi (Gaddy) Barringer – X]

**Hexastylis species 1** Hill, Sandhill Heartleaf. Seepage bogs, pocosins. Endemic to Sandhills region of NC and SC. For additiounal information, see Gaddy [in prep.]. [= Asarum virginicum Linnaeus var. I] [not yet keyed]

**Hexastylis virginica** (Linnaeus) Small, Virginia Heartleaf. Upland forests. April-June. A relatively widespread species, occurring throughout NC and VA, extending west into WV, e. KY, and ne. TN (Chester, Wofford, & Kral 1997). *H. memmingeri*, a doubtful taxon close to *H. virginica*, with the calyx very small (< 1.5 cm long), narrowly cylindro-urceolate, and the calyx lobes very short (ca. 2 mm long) will key here. Gaddy does not recognize it, considering it a small form of *H. virginica*, but it may warrant varietal rank. It is known from NC, VA, and WV, in the Piedmont and Mountains. [= RAB, FNA, K, W, Y, Z; < H. virginica – C (also see *H. contracta*, *H. heterophylla*, *H. minor*, and *H. naniflora*); > < Asarum virginicum Linnaeus – F (also see *H. heterophylla* and *H. minor*); > Asarum virginicum – WV; > Asarum memmingeri Ashe – F, WV; < H. virginica – G; > H. virginica – S; > H. memmingeri (Ashe) Small – S; = Asarum virginicum Linnaeus var. virginicum]

**Isotrema** Rafinesque 1819 (Dutchman’s-pipe)

A genus of about 50 species, of temperate and tropical Asia, se. North America, and Central America. References: Barringer in FNA (1997); Oh-i-Toma et al. (2006); Kelly & González (2003); Huber in Kubitzki, Rohwer, & Bittrich (1993).

1 Plant nearly glabrous; leaves abruptly pointed; calyx purple or brown; [of the Mountains]................................. *I. macrophyllum*

1 Plant soft pubescent; leaves blunt; calyx yellow, with a purple mouth; [largely of west or south of the Appalachians, also locally spread from cultivation].............................. *I. tomentosum*

**ARISTOLOCHIACEAE**

*Isotrema tomentosum* (Sims) H. Huber, Woolly Dutchman's-pipe, Pipevine. Floodplain forests, disturbed areas. S. IN, s. MO, and se. OK, south to sw. GA, Panhandle FL, and TX. FNA also reports that it is escaped in VA. [= Aristolochia tomentosa

17. MAGNOLIACEAE A.L. de Jussieu 1789 (Magnolia Family) [in MAGNOLIALES]

A family of about 7 genera and 223 species, trees and shrubs, tropical and warm temperate, of e. and se. Asia, and from e. North America south through West Indies and Central America to Brazil. References: Hardin (1972); Hardin & Jones (1989)=Z; Meyer in FNA (1997); Figlar & Nooteboom (2004); Frodin & Govaerts (1996); Nooteboom in Kubitzki, Rohwer, & Bittrich (1993); Kim et al. (2001).

1 Leaves cuneate to rounded (subcordate) at base; [subgenus Auriculata]

1 Leaves longer than broad, not lobed (in some species the leaves auriculate-cordate basally); fruit a cone-like aggregate, each follicle dehiscing to reveal the scarlet seed, at first connected to the follicle by a thread-like strand; [subfamily Magnolioideae] ..................... Magnolia

**Liriodendron** Linnaeus (Tulip-tree)

1 Leaves large, 4-8-lobed, the terminal lobes acute; [of the Mountains, Piedmont, and Coastal Plain (especially brownwater rivers and mesic bluffs and slopes)] .................................................. L. tulipifera var. tulipifera

1 Leaves small, 0-4-lobed, the terminal lobes obtuse to broadly rounded; [of the Coastal Plain, especially fire-maintained, acidic, and peaty sites] .................................................................................................................. L. tulipifera var. 1

**Liriodendron tulipifera** Linnaeus var. tulipifera, Tulip-tree, Yellow Poplar, Whitewood. Mesic forests, cove forests in the Mountains to at least 1500m in elevation, bottomland forests and swamps. April-June; September-October. Widespread in e. North America, south to Panhandle FL. An important timber tree in the Southern Appalachians. [= Z; L. tulipifera – RAB, C, F, FNA, G, GW, K, S, W, WH, WV, Z]

**Liriodendron tulipifera** Linnaeus var. 1, Coastal Plain Tulip-tree, Southern Yellow Poplar. Blackwater swamps, streamhead poxosins in the fall-line sandhills. April-June; September-October. Its occurrence in fire-maintained, acid soil habitats in the Coastal Plain is surprising to people used to *Liriodendron* as a tree of mesic, rich soil forests. It is, however, a typical species of streamhead poxosins in the fall-line sandhills, growing with *Pinus serotina, Nyssa biflora,* and *Acer rubrum,* and often with scorch marks twenty feet up the trunk. [= Z; L. tulipifera – RAB, C, F, FNA, G, GW, K, S, W, WH, Z]

**Magnolia** Linnaeus 1753 (Magnolia, Cucumber-tree)

A genus of about 130 species, trees and shrubs, of e. Asia (Himalayas and Sri Lanka to Japan and w. Malaysia) and America (e. North America to West Indies, Central America, and South America). Molecular phylogenetics show *Magnolia virginiana* and *M. grandiflora* as closely related in a New World primarily subtropical clade, *M. macrophylla* in a clade with its close relatives, *M. fraseri* and *M. pyramidata* together, *M. acuminata* as basal in a clade that is otherwise Asian (equivalent to subgenus *Yulania,* and *M. tripetala* grouped in another clade that is otherwise Asian (Azuma et al. 2001). The sections used follow Figlar & Nooteboom (2004). References: Tobe (1998)=Y; Spongberg (1998)=X; Frodin & Govaerts (1996)=V; Palmarola-Bejerano, Yulania

1 Leaves cordate-auriculate at base; [subgenus Magnolia].

2 Leaves glaucous and finely appressed-pubescent beneath; buds and twigs pubescent; [subgenus Magnolia, section Macrophylla].

3 Conelike aggregate fruit (follicetum) 2.5-6.5 cm long, 1.5-4 cm in diameter; leaf blade 15-56 cm long; stamens 170-350; pistils 20-50; small tree (to 12 m tall); [of Panhandle FL] ............................................................................................................................ M. ashei

3 Conelike aggregate fruit (follicetum) 5-8 cm long, 5-7 cm in diameter; leaf blade 50-110 cm long; stamens 300-350-580; pistils 50-80; medium to large tree (to 32 m tall); [widespread, but not of Panhandle FL] .................................................................................................................. M. macrophylla

2 Leaves green and glabrous beneath; buds and twigs glabrous; [subgenus Magnolia, section Auriculata].

4 Stamens 8-15 mm long; leaves (most of them) over 25 cm long; conelike aggregate fruit (follicetum) 6.5-11 (-14) cm long; of the Mountains and Piedmont] ........................................................................................................... M. fraseri

4 Stamens 4-8 (-10.5) mm long; leaves (most of them) < 25 cm long; conelike aggregate fruit (follicetum) 3.5-5.5 (-6) cm long; of the Coastal Plain] .................................................................................................................. M. pyramidata

1 Leaves cuspate to rounded (subcordate) at base.
Magnolia acuminata (Linnaeus) Linnaeus var. acuminata, Cucumber-tree, Cucumber Magnolia. Mesic to subxeric forests, especially (but by no means strictly) over mafic or calcareous rocks, up to at least 1550m (where growing with Betula alleghaniensis, Abies fraseri, Picea rubens, and Sorbus americana), ultramafic outcrop barrens (where codominant with Pinus rigida and Quercus alba). April-June; July-August. S. ME, M, NY, N, S, MO, and E. OK, south to C. GA, Panhandle FL, S. AL, S. MS, and W. LA. The recognition of two varieties is uncertain (see discussion below). [= C, F, G, V, W, X, Y; < M. acuminata – RAB, FNA, K, W, Z; = Tulipastrum acuminatum (Linnaeus) Small – S; < Tulipastrum acuminatum (Linnaeus) D.L. Fu var. I] 

Magnolia kobus DC., Kobus Magnolia, Kobushi Magnolia. Suburban woodlands; native of Japan. [add to synonymy]

Magnolia macrophylla Michaux, Bigleaf Magnolia. Mesic forests, primarily over limestone, other calcareous sedimentary rocks (calcareous shales, sandstones, etc.), or mafic rocks (east of the Blue Ridge), mesic hammocks in the Coastal Plain. May-June; July-August. The range of this species is often stated in such a way as to imply that it is a tree of the southern mountains. Actually, it avoids the Southern Blue Ridge, reaching its greatest abundances in the sedimentary rock Appalachians west of the Blue Ridge, particularly the Cumberland Plateau, and occurs east of the Blue Ridge only as a rare disjunct. M. macrophylla ranges from S. OH and SW. VA south through E. TN to W. GA, west to AL, MS, N. LA, and SE. AR (Sundell et al. 1999); disjunct on Crowleys Ridge in NE. AR (population now extirpated), C. and NE. SC, and E. SC (where probably not native). The leaves are up to 1.1 meter long and 3.5 dm wide. See Williams (1999) for additional information about the discovery and nomenclature of this species. The Gulf Coast endemic Magnolia ashei Weatherby is related and is sometimes treated as a variety or subspecies of M. macrophylla. [= RAB, C, F, G, K, S, W, Z; = Tulipastrum ssp. macrophylla – V, Y, X]
**Magnolia pyramidata** Bartram, Pyramid Magnolia. Mesic hammocks, mesic forests, especially of bluffs and ravines. April-May; August. A Southeastern Coastal Plain endemic: c. SC south to Panhandle FL, west to e. TX. Sometimes treated as a variety or subspecies of *M. fraseri*, to which it is clearly closely related, but the distributional and morphological differences are discrete and specific status seems warranted. [= RAB, FNA, K, S, WH, Z; = *M. fraseri* Walter var. *pyramidata* (Bartram) Pampinini – V, X; = *M. fraseri* Walter ssp. *pyramidata* (Bartram) Murray – Y]

**Magnolia tripetala** (Linnaeus) Linnaeus, Umbrella Magnolia, Umbrella-tree. Mesic forests, ravines. April-May; July-October. Centered in the Southern Appalachians, but avoiding higher elevations, and therefore occurring primarily "around" the Blue Ridge; ranging from sc. and sw. PA, s. OH, s. IN south to SC, GA, Panhandle FL (Tobe 2007), AL, and MS; also disjunct in the Ouachita Mountains of c. AR and e. OK. [= RAB, C, F, FNA, G, K, S, V, W, WH, WV, X, Y, Z; Houppoa sp. 1]

**Magnolia virginiana** Linnaeus var. *australis* Sargent, Southern Sweet Bay. Pocosins, bay forests, and swamps in the Coastal Plain, streamhead pocosins, swamps, and sandhill seeps in the Sandhills, bogs and peaty swamps in the Piedmont and Mountains. April-July; July-October. S. SC (se. NC?) south to s. FL, and west to e. TX, rarely extending into adjacent, more interior provinces; disjunct in nw. Cuba. *Magnolia virginiana* was recently discovered in Cuba, the single population named as *ssp. oviedoae* A. Palmarola, M.S. Romanov, & A.V. Bobrov (Palmarola-Bejerano, Romanov, & Bobrov 2008), but based on molecular results of Azuma et al. (2011), it seems better to consider this population as part of *M. virginiana* var. *australis*. Morphological, molecular, and chemical studies have shown strong variation in *M. virginiana* in North America, but the patterns are not clear based on the limited current studies (Azuma, Thien, & Kawano 1999). Based on the studies of Azuma et al. (2011), Azuma, Thien, & Kawano (1999), Tobe (1998), and McDaniel (1966), the recognition of two varieties seems clearly warranted, with a strong genetic break occurring in SC (a secondary and less strong genetic break separates West Gulf Coastal Plain populations from more eastern populations) (Azuma et al. 2011). Additional study is needed to understand the exact distributions of the two taxas in the area of contact (SC and adjacent GA and NC), whether species status is warranted, as suggested by Azuma et al. (2011), and the correlation between morphological traits and genetic variation. [= F, Y; < *M. virginiana* – RAB, C, FNA, G, GW, K, S, V, W, WH, X, Z; = *M. virginiana* ssp. *australis* (Sargent) A.E. Murray – U]

21. **ANNONACEAE** A.L. de Jussieu 1789 (Custard-apple Family) [in MAGNOLIALES]

**Asimina** Adanson 1763 (Pawpaw)

**Identification notes:** Hybrids are known between some of the pineland species, notably *A. angustifolia × incana* [= *A. ×nasii* Kral], and should be expected where two species are present.

1 Leaves herbaceous in texture, obovate, >6 cm wide, acut-acute-acuminate at the apex; peduncules with bracts; flowers reddish-maroon; [shrubs and trees]; [collectively widespread in our area].
2 Flowering peduncles 3-8 mm long, the hairs tan to rusty; leaves 6-15 (-20) cm long; sepals 4-7 mm long; outer petals 10-13 mm long; fruit 1-3 (-6) cm long; plant a shrub to 2 m (rarely to 5 m) tall; [primarily of the Coastal Plain in our area, extending into the Piedmont in NC and SC, and into the Mountains in SC] .................................................................*A. parviflora*
2 Flowering peduncles (10-) 15-20 (-25) mm long, the hairs dark reddish-brown; leaves 15-35 cm long; sepals 8-12 mm long; outer petals 15-25 mm long; fruit (3-) 7-15 cm long; plant a tree to 15 m tall; [widespread in our area] ..........................................................*A. triloba*
1 Leaves coriaceous in texture, linear to oval, blunt at the tip (or acut-acute-acuminate); peduncles lacking bracts; flowers maroon, pale pink, yellow, cream, or white; [shrubs to 1.75 m tall]; [of e. GA, very rarely e. SC, and southward].
3 Flowers borne on growth of the previous year, appearing before or with leaf expansion; leaves 1.5-4× as long as broad, 4-10 cm long, 1-6 cm long; flowers with a sweet odor.
4 Newly emergent leaf blades densely tomentose on both surfaces with pale blonde or tan pubescence; outer petals white to yellowish, inner petals yellowish with a deep yellow corrugated zone; [of dry pinelands] ..................................................................................*A. incana*
4 Newly emergent leaf blades densely tomentose on the lower surface with the hairs near the midrib reddish, the upper surface sparsely pubescent; outer petals white, inner petals white, yellowish, or pink, with a maroon or purple corrugated zone; [of wet pinelands] .............. ..................................................................................*A. reticulata*
3 Flowers borne on growth of the current year, appearing after leaf expansion; leaves 3-15× as long as wide, 4-20 cm long, 0.5-4 cm wide; flowers with a sweet or fetid odor.  

5 Flowers terminal; pubescence of new growth, petiole, lower leaf surface and peduncle dense, tomentose, and bright red.  

5 Flowers axillary; pubescence sparser and/or tan to rusty red.  

6 Outer petals maroon or red, 1.5-3 cm long; leaves erect and secund, 4-11 cm long, 1-4 cm wide, averaging 3-5× as long as wide; leaf tips obtuse, rounded, or rounded-endmargined (rarely somewhat acute); shrubs to 3 (-5) dm tall.  

6 Outer petals yellowish white or pale pink, 3-10 cm long; leaves erect and secund, or not, 5-15 (-20) cm long, 0.5-3 cm wide, averaging 6-15× as long as wide; leaf tips acute or obtuse; shrubs 10-15.7 dm tall.  

7 Leaves widest at or shortly above the middle, mostly 10-15× as long as wide; leaf margins revolute; outer petals white; new growth pubescent, becoming glabrous with age.  

7 Leaves widest near the tip, mostly 6-12× as long as wide; leaf margins slightly revolute; outer petals white or pink; new growth glabrous or very sparsely pubescent, becoming glabrous with age.  

**Asimina angustifolia** Rafinesque, Slimeleaf Pawpaw. Dry pinelands. Se. GA south to c. peninsular FL, west to about the Suwannee River in the e. Panhandle of FL.  

**Asimina obovata** (Willdenow) Nash. Scrub, sandhills, open dry hammocks. FL peninsula, north to Clay County.  

**Asimina pygmaea** (W. Bartram) Dunal, Dwarf Pawpaw. Pine flatwoods, wet savannas. Se. GA south to c. peninsular FL. It is a dwarf shrub 2-3 dm tall of pine flatwoods, occupying wetter sites than the other "pineland pawpaws."  

**Asimina spatulata** (Kral) D.B. Ward, Slimleaf Pawpaw. Dry pinelands, dry maritime forests. S. SC south to n. FL, west to Panhandle FL and s. AL; disjunct in Charleston County, SC (Gramling 2010, as *A. angustifolia*; P. McMillan, pers.comm. 2004).  

**Asimina triloba** (Linnaeus) Dunal, Common Pawpaw, Indian-banana. Alluvial forests, other moist, nutrient-rich forests. March-May; August-October. NJ, w. NY, and s. ON west to s. MI and e. NE, south to Panhandle FL, s. LA, and ne. TX.  

**Calycanthus** Linnaeus 1759 (Sweet-shrub)

A genus of 2-4 species, 1 (or 2) of e. North America, 1 of w. North America, and 1 of China (the latter sometimes segregated as a separate genus, *Sinocalycanthus*). References: Johnson in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Nicely (1965) (= Z; Ferry & Ferry (1987) = Y).  

1 Tepals pale yellowish-green; seeds ca. 6 mm in diameter, with short, curved hairs.  

1 Tepals reddish brown; seeds ca. 10 mm in diameter, with long, straighter hairs.  

**Calycanthus brockianus** Ferry & Ferry, Brock’s Sweet-shrub. Moist slopes. Endemic to mesic hardwood forests in GA. Its taxonomic validity is uncertain and controversial. (= *C. brokiana* – K, Y, orthographic variant; < *C. floridus* Linnaeus var. *floridus* – FNA)  

**Calycanthus floridus** Linnaeus, Sweet-shrub, Strawberry-shrub, Carolina Allspice, Sweet Bubby-bush. Forested slopes and streambanks. April-May; August-September. PA, WV, and KY, south to GA, nw. FL, AL, and s. MS. Two varieties have
A family of about 50 genera and 2500-3500 species, trees and shrubs, of tropical and temperate regions. *Laurus nobilis* Linnaeus, Laurel, Bay, native to the Mediterranean region of Europe and the bay leaf of commerce; planted as an ornamental and spice, especially in warmer parts of our area, but is not known to escape in our area. References: van der Werff in FNA (1997); van der Werff & Richter (1996); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

---

*Cinnamomum* Schaff 1760 (Cinnamon)

A genus of about 350 species, trees and shrubs, of e. and se. Asia, Oceania, and tropical America. References: Rohwer in Kubitzki, Rohwer, & Bittrich (1993); van der Werff in FNA (1997).

* Cinnamomum camphora* (Linnaeus) J. Presl, Camphortree. Disturbed areas, suburban woodlands, increasingly in natural forests; native of e. Asia. April-May. A serious invasive, especially southward. Reported as escaped and apparently naturalized in South Carolina by Hill & Horn (1997). In NC, reported for Moore County. [= FNA, K, WH; = Camphora camphora (Linnaeus) Karsten – S]

*Lindera* Thunberg 1783 (Spicebush, Benzoin)

1 Leaves typically with a thick, subcoriaceous texture (though sometimes thinner in texture if growing in shade), 4-8 cm long, 2-3.5 cm wide, narrowly obovate to oblanceolate, pubescent and strongly whitened below; leaves and bark aromatic, the odor lemony ...............*L. subcoriacea*
2 Leaves with a thin, membranous texture, 6-16 cm long, 2-6 cm wide, obovate, elliptic, or ovate, glabrous to pubescent below, but not strongly whitened; leaves and bark strongly aromatic, the odor spicy or like sassafras.
   2 Leaf base cuneate; leaves widely obovate, plane (not rugose), with a short-acuminate apex, glabrous above, borne horizontally, spicy-fragrant when crushed; shrubs not colonial, often multi-stemmed from base, short to tall (to 5 m tall) ..............................................................*L. benzoin*
   2 Leaf base widely cuneate to rounded; leaves narrowly obovate, reticulate-rugose, with an acute apex, pubescent above, drooping, fragrant when crushed with an odor like sassafras; shrubs colonial, short (to 2 m tall) .........................................................................................*L. melissifolia*

*Lindera benzoin* (Linnaeus) Blume, Northern Spicebush. Rich alluvial forests, mesic forests on slopes with circumneutral soils, bottomlands, swamps. March-April; August-September. ME, s. ON, and MI, south to Panhandle FL and e. TX; disjunct in Edwards Plateau of c. TX. Where occurring on upland slopes, *L. benzoin* is an excellent indicator of base-rich soils, generally derived from calcareous sedimentary rocks or mafic metamorphic or igneous rocks. Some floristic treatments recognize two varieties based on whether the leaves and young twigs are pubescent (var. *pubescens*) or not (var. *benzoin*) but the varieties so recognized overlap broadly in distribution; it seems best to regard this as mere variation within the species. [= FNA, GW, RAB, W,
Lauraceae

84

Litsea Lamark 1792 (Pondspice)

A genus of about 400 species, trees and shrubs, of warm temperate and tropical areas, especially se. Asia and Australia. The genus is very heterogeneous and probably needs division into more natural groups. References: van der Werff in FNA (1997); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

Litsea aestivalis (Linnaeus) Fernald, Pondspice. Margins of limesink ponds and Carolina bays, less commonly in wet depressions and wet stringers dominated by shrubs. March-April; May-June. A Southeastern Coastal Plain endemic: e. MD (Wicomico County) and se. VA (York and Isle of Wight counties) south to n. FL (and allegedly also in LA, based on an old and poorly labeled specimen). The fine, zigzag twigs are distinctive. It grows to 6 m tall, characteristically forming a rounded bush. [= FNA, K, Z; < L. melissaefolia – WH]

Lindera melissaefolia (Walter) Blume, Southern Spicebush, Pondberry. Wet flats and depressions, generally with pocosin shrubs. March-April; August-September. This species is southern in range, with a very scattered distribution in se. and c. NC, c. SC, e. & sw. GA, nw. FL, sw. AL (?); nw. MS, se. MO-AR, and se. AR-LA (recent collections unknown from FL and LA). It is nearly extirpated in NC, currently known only from three populations, in Sampson, Bladen, and Cumberland counties. A historic record from Orange County, NC (in the lower Piedmont), collected by Elisha Mitchell in 1820 and 1822, appears to be bonafide (McVaugh, McVaugh, & Ayers 1996). [= FNA, K, WH, Z; = L. melissaefolia – RAB, F, GW, orthographic variant; = Benzoin melissaefolium (Walter) Nees – S]

Lindera subcoriacea B.E. Wofford, Bog Spicebush. Peaty seepage bogs in headwaters of blackwater streams, in the sandhills and immediately adjacent Piedmont, with other pocosin shrubs. March-April; July-August. The overall range of this newly described species is still poorly known; it appears to be a Southeastern Coastal Plain endemic, ranging from se. VA (perhaps s. NJ) south to FL and west to LA. Occurring in our area primarily in a scattering of small populations in the fall line Sandhills of NC and SC, with an outlier or two in "Piedmont pocosins" just west of the Sandhills. Distinctive characteristics of sun-grown plants include the rounded apex of the leaf, the leaf strongly whitened beneath and borne in an ascending to even appressed position in relation to the twigs, and a typically fastigiate or virgate branching pattern, with multiple stems or branches ascending vertically and nearly parallel to one another. Shade plants have a different form. [= FNA, K, Z; < L. benzoin – WH]

Persea Pal. Miller 1754 (Bay)

A genus of about 150-200 species, trees and shrubs, of Asia and America. The avocado is a member of this genus, Persea americana P. Miller. References: Wofford in FNA (1997); Godfrey (1988); Clewell (1985); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

1 Twigs glabrous or glabrate; lower surfaces of leaves with minute, silvery to shining-golden hairs (the color depending on age), appressed to the surface; peduncles 1-3 cm long; leaves tending to be smaller and blunter ................................................................. P. borbonia

1 Twigs densely rusty-pubescent; lower surfaces of leaves with longer, rusty, often crooked hairs, not appressed, especially evident along the midrib and principal veins; peduncles 4-7 cm long; leaves tending to be larger and more acute ........................................................................... P. palustris

Persea borbonia (Linnaeus) Sprengel, Red Bay. Dunes, maritime forests, in dry sandy soils on barrier islands, known only north to Carteret County, NC. May-June; September-October. E. NC (Carteret County) south to FL and west to se. TX; reports of the species north of NC are based on the inclusion of P. palustris in a broadly defined P. borbonia, or are simply in error, based on less hairy plants of P. palustris. This species is rare north of Florida and becoming rarer with the destruction of most maritime and near coastal upland forests for the construction of vacation homes and tourist accommodations. [= FNA, G, GW, K, WH; < P. borbonia – RAB, F (also see P. palustris); = Tamala borbonia (Linnaeus) Rafinesque – S; = P. borbonia var. borbonia]

Persea palustris (Rafinesque) Sargent, Swamp Bay. Swamps, pocosins, bay forests, maritime forests, generally in wet peaty soils, but also in fairly dry, sandy soils in maritime forests. May-June; September-October. A Southeastern Coastal Plain endemic: DE, e. MD, and se. VA south to FL and west to se. TX; also in the Bahamas. Though variable in amount of hairs on the leaves, the hairs of P. palustris are always of a distinctly different character than those of P. borbonia. [= C, FNA, G, GW, K, WH; < P. borbonia – RAB, F; = Tamala pubescens (Pursh) Small – S; = P. borbonia var. pubescens (Pursh) Little]

Sassafras Presl 1825 (Sassafras)

A genus of 3 species, trees, of temperate e. Asia (2 species) and e. North America (1 species). References: van der Werff in FNA (1997); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).
**Sassafras albidum** (Nuttall) Nees, Sassafras. A wide variety of forests, old fields, disturbed areas, fencerows. March-April; June-July. S. ME, s. ON, MI, and s. WI, south to c. peninsular FL, s. AL, s. MS, and se. TX. The original source of "root beer." [= RAB, C, FNA, G, K, W, WH; > *S. albidum* var. molle (Rafinesque) Fernald – F, WV; > *S. albidum* var. *albidum* – F, WV]
SECTION 5: MONOCOTYLEDONAE (MONOCOTS)

29. ACORACEAE Martinov 1820 (Calamus Family) [in ACORALES]

The family consists only of Acorus. Although traditionally treated as part of the Araceae, a wide variety of morphological, anatomical, and embryological evidence supports the segregation of the Acoraceae (Grayum 1987), a segregation additionally supported by molecular studies (Duvall et al. 1993, Chase et al. 1993). The spathe in Acorus is not morphologically equivalent to the spathe of the Araceae. References: Thompson in FNA (2000); Bogner & Mayo in Kubitzki (1998b).

*Acorus Linnaeus 1753 (Calamus, Sweetflag)*

1 Midvein of the leaves not well-developed, about equally as prominent as 1-5 well-developed lateral veins; mature fruits produced; vegetative leaves (0.3-) avg. 0.8 (-1.3) cm wide .................................................. *A. americanus*

1 Midvein of the leaves well-developed, distinctly more prominent than the lateral veins (though there are better-developed lateral veins, they are distinctly less prominent than the midvein); mature fruits not produced; vegetative leaves (0.5-) avg. 1.2 (-2.0) cm wide .......... *A. calamus*

*Acorus americanus* (Rafinesque) Rafinesque, American Calamus, Sweetflag. Marshes, wet meadows, other wet areas, limey seeps. May-June. Widespread in ne. North America. This species is apparently a fertile diploid. Because this species has not generally been recognized in floras, its distribution is poorly known; additional distributional records should be expected and sought. [= FNA, K; < *A. calamus* Linnaeus – RAB, C, F, G, GW; < *A. americanus* – W]

*Acorus calamus* Linnaeus, European Calamus, Sweetflag. Marshes, wet meadows, other wet areas; native of Eurasia, now widespread in e. North America. May-June. The aromatic rhizome and leaves have been used medicinally and candied as a confection. Populations of *A. calamus* in our area are apparently sterile triploids introduced from Europe, though diploid and tetraploid populations of *A. calamus* are known from Asia. [= FNA, K; < *A. calamus* Linnaeus – RAB, C, F, G, GW (also see *A. americanus*); < *A. americanus* – W]

30. ARACEAE A.L de Jussieu 1789 (Arum Family) [in ALISMATALES]

A family of about 100-110 genera and about 3000-4000 species, herbs and reduced aquatic herbs, cosmopolitan, but mostly tropical and subtropical. The Lemnaceae is phylogenetically embedded in the Araceae, and is here included in it as subfamily Lemnoidae (Angiosperm Phylogeny Group 1998, 2003; Keating 2004). References: Thompson in FNA (2000); Cusimano et al. (2011); Mayo, Bogner, & Boyce in Kubitzki (1998b); Keating (2004); Serviss, McDaniel, & Bryson (2000); Landolt in FNA (2000); Landolt (1980); Landolt (1986); Landolt in Kubitzki (1998b); Les & Crawford (1999); Bown (2000).

1 Plant a floating aquatic (or stranded), the individual leaves <2 cm long; [subfamily Lemnoidae].

  2 Fronds rootless; fronds with 1 or more nerves; reproductive pouches 2, lateral. ................................................................. 5. Landoltia

2 Fronds with roots; fronds with 1 or more nerves; reproductive pouches 2, lateral.

  3 Fronds thick, globose, < 2 mm long ................................................................................................................................................ 3. Spirodela

  3 Fronds flat, elongate and curved, 4-14 mm long .......................................................................................................................... 7. Wolffskiella

  4 Roots (1-) 2-7 (-12) per frond; fronds with (3-) 5-7 nerves; fronds 1.5-3× as long as wide; all of the roots perforating the scalelike leaflet. ................................................................................................................................. 5. Landoltia

  5 Roots 7-21 per frond; fronds with 7-16 (-21) nerves; fronds 1-1.5× as long as wide; only some of the roots perforating the scalelike leaflet (borne on the underside) ...................................................................................................................... 3. Spirodela

1 Plant terrestrial, rooted in wetlands, or a floating aquatic (if a floating aquatic – *Pistia* – the individual leaves > 2 cm long).

6 Plant a floating aquatic, with gray-green, velvety, cabbage-like leaves; [subfamily Aroideae, tribe Pistieae]................................. 11. Pistia

6 Plant rootless (even when growing in water), the leaves various, but not as above.

7 Leaves compound; [subfamily Aroideae, tribe Asarumae] ......................

8 Bulblets lacking on the petiole; spathe free from the spathe; [native, common in our area] ............................................................ 13. Arisaema

9 Leaves not peltate, either cuneate, rounded, cordate, or hastate. ............................................................... 14. Pinellia

9 Leaves peltate and cordate-hastate; [subfamily Aroideae, tribe Colocasiae]................................................................. 12. Colocasia

10 Spathe absent or obscure; leaf blade 2.5-4× as long as wide, cuneate at the base, lanceolate or narrowly elliptic; leaf venation parallel; [subfamily Orontioideae, tribe Orontieae] .................................................................................. 1. Orontium

10 Spathe present, surrounding the spadix, at least at its base; leaf blade 1-2.5× as long as wide, either hastate at the base (Arum, Peistantrea, and Xanthosoma), or rounded (Symlocarpus), or cordate (*Calla*), broadly ovate in outline.

11 Spathe white; leaves cordate; plants from elongate rhizomes; [MD northward]; [subfamily Caloideae]........................................... 8. Calla

11 Spathe green or white; leaves hastate or rounded at base; plants from fibrous roots, a short thick rhizome, tuber, or a corm; [collectively widespread].

12 Leaves ovate, rounded or subcordate at the base; spathe purple, or purple flecked with white; [subfamily Orontioideae, tribe Symlocarpae] ........................................................................................................................................ 2. Symlocarpus

12 Leaves hastate at the base (somewhat arrowhead-shaped); spathe green or white; [subfamily Aroideae].

**Orontium aquaticum** Linnaeus, Golden Club, Bog Torches, Never-wet. Generally in peaty and stagnant water, such as beaver ponds, blackwater streams, swamps, pools in low pocosins, streambeds in the Piedmont, bogs and swamps in the mountains. March-April. MA and c. NY south to s. FL and west to LA, north in the inland to w. NC, KY, and WV, primarily but by no means strictly Coastal Plain. Fresh leaves are unwettable, silvery-glistening when forced under water. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV]

**Spirodela polyrrhiza** Schleiden 1839

**4. Lemna** Linnaeus 1753 (Duckweed)

1 Margin of fronds denticulate in the distal portion; fronds narrowed basally to an elongated, persistent, green stalk, the fronds therefore cohering in long, often branched chains of 3-50 fronds; fronds submerged (except when flowering or fruiting); [section *Hydrophylla*].

  L. trisulca

2 Fronds with (0-) 1 nerve; anthocyanin absent in fronds (fronds green); [section *Uninerves*].

3 Fronds 1-2× as long as wide; nerve indistinct to fairly prominent, reaching at most 2/3 of the distance from node to apex (nerve about as long as or shorter than the aerenchymatous portion of the frond); fruit 0.6-1.0 mm long. L. minutula

5 Seeds with 8-26 prominent ribs, brownish, falling from the fruit when ripe; fronds with only 1 papilla above the node, which is smaller than the papule at the apex; wing of the root sheath 1-2.5× as long as wide. L. aequinoctialis

3 Fronds 1.3-3× as long as wide; nerve mostly prominent, reaching at least 3/4 of the distance from node to apex (nerve longer than the aerenchymatous portion of the frond); fruit 1.0-1.35 mm long. L. valdiviana

4 Root sheath winged at the base; root tip sharply pointed; roots not longer than 3 cm long; anthocyanin absent in fronds; [section *Alatae*].

5 Seeds with 35-70 obscure ribs, whitish, remaining in the fruit when ripe; fronds very often with 2-3 papilla above the node, which are larger than the papule at the apex; wing of the root sheath 2-3× as long as wide. L. perpusilla
4. Root sheath not winged at the base; root tip mostly rounded; roots often longer than 3 cm long; anthocyanin present or absent in fronds; [section Lemna].
6. Plants forming small, olive-brown rootless turions, 0.8-1.6 mm in diameter, which sink to the bottom ......................... L. turionifera
7. Plants without distinct turions.
7. Fronds not reddish on the lower surface (or if so only slightly so and much less so than on the upper surface); greatest spacing of veins near the middle of the frond or towards its base ....................... L. minor
7. Fronds reddish on the lower surface (and more intensely so than on the upper surface); greatest spacing between the veins near the middle of the frond or its tip.
8. Fronds gibbous; fronds with very distinct papilae above the node and near the apex on the upper surface, but not between the node and the apex; seeds with 10-16 distinct ribs .................................................... L. obscura
8. Fronds flat; fronds with mostly distinct papilae on the midline on the upper surface; seeds with 3-60 indistinct ribs ............. ................................................. L. turionifera

**Lemma minor** Linnaeus, Common Duckweed. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps. Widespread in the Northern Hemisphere; scattered in the Southern Hemisphere, where perhaps in part introduced. [= FNA, K, WH, Y, Z; < L. minor – RAB, C, F, G, W, WV (also see L. obscura)]

**Lemma minuta** Kunth, Least Duckweed. Quiet waters, seepages. Widespread in North America, Central America, and South America; more local in Europe and Japan. [= C, FNA, K, WH; = L. valdiviana Philippi var. abbreviata Hegelmann – F; = L. minuscula Herter – Y, Z]

**Lemma obscura** (Austin) Daubs, Little Duckweed. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps. NY west to MN and NE, south to s. FL, TX, Mexico, and the Bahamas. [= FNA, K, WH, Y, Z; < L. minor – RAB, C, F]

**Lemma perpusilla** Torrey, Tiny Duckweed. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps. QC west to MN, south to NC, TN, and TX. [= RAB, C, F, FNA, G, K, W, Y, Z]

5. **Landoltia** D.H. Les & D.J. Crawford (Duckmeat)

6. **Wolffia** Horkel ex Schleiden 1844 (Watermeal, Mud-mary, Rootless-duckweed)

1. Fronds globose to ovoid, 1.1-1.5× as deep as wide; thallus not brownish punctate above
2. Fronds 1.0-1.3× as long as wide, 0.4-1.2 mm wide ................................................................. W. columbiana
2. Fronds 1.3-2.0× as long as wide, 0.3-0.5 mm wide ................................................................. W. globoa
1. Fronds nutshell-like, 0.5-1.0× as deep as wide; thallus punctate above with brownish pigment cells (most visible on dead fronds).
3. Frond 1.3-2.0× as long as wide, the upper side slightly convex, with an upward point apically ................................................. W. borealis
3. Frond 1.0-1.5× as long as wide, the upper side with a prominent papilla centrally ................................................. W. brasiliensis

* Wolffia globosa (Roxburgh) den Hartog & Plas, Asian Watermeal. Still to slowly moving waters of ponds, lakes, beaver ponds, and swamps; native of Asia. [= FNA]

7. Wolffiella Hegelmann 1895

1 Fronds (4-) 6-15 (-20)× as long as wide; angle of pouch 25-50° ........................................................................................................... W. gladiata
1 Fronds 1.5-8× as long as wide; angle of pouch 45-90° .......................................................................................................................... W. oblonga

Wolffiella gladiata (Hegelmaier) Hegelmaier, Mud-midgets. Ponds, ditches, beaver-ponds millponds. April-June. MA and n. IL (s. WI?) south to s. FL and TX; Mexico. [= FNA, K, WH, Y, Z; > Wolffiella floridana (Donnell-Smith) C. Thompson – RAB, C, F, G, GW, S; > W. gladiata – GW]

Wolffiella oblonga (Philippi) Hegelmaier. Quiet waters. N. peninsular FL, MS (?), LA, TX, south to Mexico, Central America, South America; West Indies. [= FNA, GW, K, WH]

8. Calla Linnaeus 1753 (Calla)

Calla palustris Linnaeus, Wild Calla, Water-arum. Swamps. A circumpolar species of seepage swamps, ranging south in North America to sw. PA, w. MD, n. IL, c. MN, and BC. [= C, F, FNA, G, K]

9. Xanthosoma Schott 1832

A genus of about 60 species, herbs, of tropical Central and South America. References: Mayo, Bogner, & Boyce in Kubitzki (1998b); Serviss, McDaniel, & Bryson (2000)=Z.

* Xanthosoma sagittifolium (Linnaeus) Schott, Elephant-ear. Ditches; native of tropical America. It can be seen in ditches adjacent to ornamental plantings; it is uncertain whether it can be considered naturalized in the more northern parts of our area. It is superficially similar to Colocasia, differing in its non-peltate leaves. [= K, WH, Z; = Xanthosoma sagittifolium – GW, orthographic error]

10. Peltandra Rafinesque 1819 (Arrow-arum)

Identification notes: *Peltandra* is often confused in vegetative condition with *Pontederia* and *Sagittaria*, superficially similar emergent aquatics with hastate or sagittate leaves. *Peltandra* leaves have pinnate venation, a prominent midvein, a prominent vein running parallel to the leaf margin, and the hastate lobes with rounded to acute apices. *Pontederia* leaves have parallel venation, lack a prominent midvein and a prominent vein parallel to the leaf margin, and have hastate lobes with broadly rounded apices. The leaves of sagittate species of *Sagittaria* have parallel venation, a prominent midrib, a vein at 90 degrees to the midrib at the junction of the main blade and each of the hastate lobes that forks, with at least one fork directed apically and at least one fork directed into the basal lobe, lack a prominent vein parallel to the margin, and have hastate-sagittate lobes with acuminate apices.

1 Spathe green at base, bright white above (the white portion not merely a margin), flared open and therefore only loosely surrounding the spadix, succulent below, the white portion thin and herbaceous, the margins generally nearly entire and plane; fruits red; distal portion of leaf blade lacking broad, coarse veins similar to the midvein (all the veins alike and fine) ................................................................. *P. sagittifolia*

1 Spathe green (rarely with a narrow cream-colored or whitish margin up to 1.7 cm wide), tightly surrounding the spadix, thick and succulent throughout, the margins crisped; fruits green to dark purplish-green; distal portion of leaf blade often with several broad, coarse veins similar to the midvein, the remainder of the veins fine (sometimes the distal portion of the leaf with fine veins only) .................................................. *P. virginica* (Linnaeus) Schott, Green Arrow-atum, Tuckahoe. Marshes, bogs, beaver ponds, pocosins, other stagnant, aquatic situations. May-June. ME, s. QC, and n. MI south to s. FL and e. TX. [= RAB, C, FNA, GW, K, S, WH; > P. virginica – F; > P. luteospadix Fernald – F; > P. virginica ssp. virginica – Z]

11. *Pistia* Linnaeus 1753 (Water Lettuce)

*Pistia stratiotes* Linnaeus, Water Lettuce. Stagnant or slow-moving waters of rivers, sometimes cultivated in ponds, where it persists for a while (presumably eventually eliminated by cold winters). This floating aquatic, pantropical in distribution, appeared in the Waccamaw River of SC (downstream from NC) in 1990 and 1991, apparently successfully overwintering (Nelson 1993). Further south it is variously and paradoxically considered as native and a noxious water-weed. Its occurrence as a naturalized component of GA’s flora is undocumented; it is at least present as a cultivated plant in water gardens and presumably escapes. The original distribution is unclear. [= FNA, GW, K, S, WH]

12. *Colocasia* Schott 1832 (Elephant's-ear, Taro, Dasheen)

*Colocasia esculenta* (Linnaeus) Schott, Elephant’s-ear, Taro, Dasheen. Ditches, shores, bottomland hardwood forests; native of the Tropics. Frequently planted for its “tropical” appearance, becoming naturalized, for instance at Lake Waccamaw, Columbus County, NC, where it grows scattered along much of the shoreline, spread by fragments of rhizome. In our area, it is generally infertile. In the Tropics, *Colocasia* is a food crop cultivated for its rhizomes and shoots. The rhizomes are the source of “poi,” a starchy staple of the Hawaiian Islands. See Serviss, McDaniel, & Bryson (2000) for a discussion of various varieties cultivated in the southeastern United States, their identification, and their weediness. [= FNA, GW, K, WH; > C. antiquorum Schott – S; > C. esculenta var. antiquorum (Schott) Hubb. & Rehder – Z; > C. esculenta var. esculenta – Z]

13. *Arisaema* Martius 1831 (Jack-in-the-pulpit, Indian-turnip)

A genus of about 150-170 species, of Asia, e. North America, e. Africa, and Arabia. Some of the taxa here recognized as subspecies of *A. triphyllum* might better be considered as species with relatively subtle morphological distinctions. They are broadly sympatric, and sometimes occur together in mixed populations with little sign of introgression or hybridization. Ssp. *triphyllum* is tetraploid and does not produce fertile seed when crossed with the other (diploid) subspecies (Treiber 1980). References: Thompson in FNA (2000); Huttleston (1981) – Z; Treiber (1980) – Y; Huttleston (1949) – X; Gusman & Gusman (2002) – Q; Renner, Zhang, & Murata (2004); Mayo, Bogner, & Boyce in Kubitzki (1998b). Key based on the references.

1 Leaf with (5-) 7-15 leaflets, arranged pedately on a semicircular axis; spadix 9-20 cm long, attenuate, long-exserted from the spathe; [section *Tortosa*] ................................................................. *A. draconium*

2 Leaves glaucous beneath at maturity; spathe flange 2-9 mm broad; spathe hood green, or green with purple stripes; sterile spadix (appendix) clavate or cylindrical.
3 Lateral leaflets (of primary leaf if more than one) 2-parted or 2-lobed (rarely unlobed); sterile spadix 1-3 mm in diameter, cylindrical, curved outward; spathe hood green .........................................................A. triphyllum ssp. quinatum
3 Lateral leaflets (of primary leaf if more than one) undivided (rarely lobed); sterile spadix 4-10 mm in diameter, clavate, straight; spathe hood green, or green striped with purple .................................................................A. triphyllum ssp. triphyllum
2 Leaves green beneath at maturity (very rarely glaucous); spathe flange 1-3 mm broad; spathe hood green with white stripes, green with purple stripes, solid green, or solid purple; sterile spadix (appendix) cylindrical.
4 Spathe tube not fluted (rarely weakly fluted); spathe hood solid green or solid purple ........................................A. triphyllum ssp. pusillum
4 Spathe tube strongly fluted; spathe hood green with white or purple stripes ..................................................A. triphyllum ssp. stewardsonii

Arisaema triphyllum (Linnaeus) Schott ssp. quinatum (Nuttall) Huttleston, Southern Jack-in-the-pulpit, Preacher John. Mesic forests. March-April. Sc. NC, sw. NC, se. TN south to Panhandle FL and e. TX. This taxon is of uncertain validity; Treiber lumps it with ssp. pusillum, while Huttleston recognizes it as a full species (Huttleston 1949) or as a subspecies (Huttleston 1981). This taxon is diploid (2n=28). [= K, Z; < A. triphyllum – RAB, FNA, W; = A. quinatum (Nuttall) Schott – GW, S, WH, X; < A. triphyllum ssp. pusillum – Q, Y; ? A. polymorphum Buckley]

Arisaema triphyllum (Linnaeus) Schott ssp. stewardsonii (Britton) Huttleston, Bog Jack-in-the-pulpit. Bogs and peaty swamps. April-May. NS west to MN, south to w. NC, e. TN, and n. IN (Treiber 1980). This subspecies is the most northern, and also has the most distinctive habitat, being restricted to distinctly wet, peaty sites. This taxon is diploid (2n=28). [= K, Q, X, Y, Z; < A. triphyllum – RAB, FNA, GW, W; = A. triphyllum var. stewardsonii (Britton) G.T. Stevens – C, G; = A. stewardsonii Britton – F]

14. Pinellia Tenore 1839 (Pinellia)

* Pinellia ternata (Thunberg) Makino ex Breitenbach, Pinellia. Suburban woodlands; native of Japan. Introduced from Japan and rarely naturalized, at least in the northern portion of our area, as in DC, se. PA, NJ, and s. NY. [= C, F, FNA, G, K]

15. Arum Linnaeus 1753 (Arum)

* Arum italicum Linnaeus ssp. italicum, Arum. Suburban woodlands; native of Europe and n. Africa, weakly naturalizing from horticultural use. It has a large (> 10 cm long) white spathe. Reported for Fairfax County, VA (Steury 2010). [= Z; < A. italicum – FNA]
Tofieldiaceae

A family of 5 genera and about 30 species, of disjunct distribution in north temperate and subarctic areas, and in the Guayana Shield and northern Andes areas of n. South America. Reveal & Zomlefer (1998) place the Tofieldiaceae in the monotypic order Tofieldiales, only distantly related to the Liliaceae. Tamura in Kubitzki (1998a) treats this group as subfamily Tofieldioideae of the Nartheciaceae. References: Zomlefer (1997c, 1999); Tamura in Kubitzki (1998a).

1 Inflorescence 1-flowered; tepals yellow; seeds yellowish; [endemic to Panhandle FL] ............................................................ Harpocallis

2 Bracts of the inflorescence large, spathe-like, acuminate-aristate at the tip; tepals 9-17 mm long; stamens (6-) 9 (-12)...................... Pleea

3 Inflorescence a raceme (the flower pedicels attached to the scape singly); scape smooth; flowering (late August-) late September-October ............................................................ Tofieldia

Identification notes: In sterile condition, Tofieldia glabra can be distinguished from Iris verna by its minutely upwardly-scabrous margins (Iris has smooth margins).

Harpocallis McDaniel 1968 (Harper's Beauty)

Pleea Michaux 1803 (Rush-featherling)

Pleea tenuifolia Michaux, Rush-featherling. Locally abundant in wet savannas, pocosin margins, usually in peaty soil, locally abundant in a few counties in se. NC, rare inland (very rarely as far as Cumberland County, NC). September-October; October-November. A Southeastern Coastal Plain endemic: se. NC and ne. SC south to sw. GA, n. FL and s. AL, but apparently absent from s. SC and ne. GA. When in flower in wet savannas and powerline rights-of-way in Brunswick County, Pleea visually dominates areas up to hundreds of hectares. In sterile condition, it is recognizable by its leathery equitant leaves, bright red at their bases. [= RAB, FNA, GW, K, S, WH; = Tofieldia tenuifolia (Michaux) Utech – Z]

Tofieldia Hudson 1778 (Bog Asphodel)

A genus of about 7-8 species, of temperate to subarctic North America and Eurasia. There is controversy about the circumscription of Tofieldia, relative to the related genera Pleea and Triantha (here recognized, but sometimes subsumed into Tofieldia). Some believe that Tofieldia, Triantha, and Pleea should be treated together in a broadly circumscribed Tofieldia (Utech 1978, Zomlefer 1997c); others that all three should be treated separately (Ambrose 1980; Packer 1993; Cruden 1991). Packer in FNA (2002a) has recently recognized Triantha, Pleea, and Tofieldia as separate genera, a conclusion followed here in part because of the ancient, relictual nature of these units. References: Zomlefer (1997c)=Z; Packer (1993); Ambrose (1980); Utech (1978); Hitchcock (1944)=Y; Tamura in Kubitzki (1998a); Packer in FNA (2002a); Cruden (1991).

Identification notes: In sterile condition, Tofieldia glabra can be distinguished from Iris verna by its minutely upwardly-scabrous margins (Iris has smooth margins).

Tofieldia glabra Nuttall, Carolina Bog Asphodel, White Asphodel. Savanna-pocosin ecotones, wet savannas, seepage bogs. (Late August-) late September-October; October-November. Endemic to the Coastal Plain (including Sandhills) of NC and northern SC; reports from GA are dubious. [= RAB, FNA, GW, K, S, Z]

Triantha (Nuttall) Baker (Bog Asphodel)

1 Perianth equal to or longer than the capsule; seeds with tails 1/2 or less as long as the body ..................................................... Tr. racemosa

2 Perianth shorter than the capsule; seeds with at least 1 tail equal to or longer than the body ..................................................... Tr. glutinosa

Trientha glutinosa (Michaux) Baker, Northern Bog Asphodel, Sticky Bog Asphodel. Bogs and seeps, especially over mafic or calcareous rocks. July-August; September-October. NL (Newfoundland) west to BC, south to w. NC, ne. GA (Jones & Coile 1988), WV, OH, n. IN, WI, MT, and OR. [= FNA, K, S, = Tofieldia racemosa var. glutinosa (Michaux) Ahles – RAB; = Tofieldia glutinosa (Michaux) Persoon – F, G, GW, W, WV; = Tofieldia glutinosa ssp. glutinosa – Y, Z; = Tofieldia glutinosa var. glutinosa – C]

Triantha racemosa (Walter) Small, Southern Bog Asphodel, Coastal Plain Bog Asphodel. Savannas, savanna-pocosin ecotones, seepage bogs, sinkhole ponds (dolines) in the mountains of VA. June-early August; late September-October. NJ south
Plantago aquatica

FL, sw. GA, and TX. [= FNA, K, WH; 1 Leaf blades 1.3-2.5 (2.7)× as long as wide, rounded to subcordate at the base; petals white, misapplied; ?

1 Leaf blades 2.7-5× as long as wide (or even narrower on submerged leaves), tapering at the base; petals pink, 2.3-3.7 mm long; achene with a single dorsal groove. Alisma Linnaeus 1753 (Water-plantain)

1 Pistils in a single whorl, borne on a flat receptacle; stamens 6; inflorescence compound, many of the primary nodes bearing whorled branches which in turn bear whorled branches or whorled flowers ................................................................. Alisma
dorsal ridge flanked by two dorsal grooves ................................................................. A. gramineum

1 Leaf blades 1.3-2.5 (2.7)× as long as wide, rounded to subcordate at the base; petals white, either 1.8-2.5 mm or 3.8-4.5 mm long; achene with a single dorsal groove.

2 Petals 1.8-2.5 mm long, 1.4-2.0 mm wide ........................................................................................................................................... A. subcordatum

2 Petals 3.8-4.5 mm long, 3.0-3.9 mm wide ....................................................................................................................................... A. triviale

Alisma gramineum Lejeune, Grassleaf Water-plantain. In seasonally flooded areas in impoundments. June-August. This species is circumboreal, ranging in North America south to e. VA, NY, WI, MO, NM, and CA. The occurrence of this species in our area may be the result of dispersal by waterfowl; first reported for our area by Wieboldt et al. (1998). [= C, F, FNA, K, < A. plantago-aquatica Linnaeus var. americanum J.A. Schultes – G]

Alisma triviale Pursh, Northern Water-plantain. Marshes and swamps. NL (Newfoundland) west to AK, south to s. NJ, s. PA, OH, IN, AR, OK, NM, AZ, CA, and n. Mexico (and according to Fernald to MD and WV). [= C, F, FNA, K, WV; < A. plantago-aquatica Linnaeus var. americanum J.A. Schultes – G]

Echinodorus L.C. Richard ex Engelmann 1848 (Burhead)

Echinodorus cordifolius (Linnaeus) Grisebach ssp. cordifolius, Creeping Burhead. Swamps, ditches, wet thickets, especially on base-rich substrates, such as over calcareous or mafic rocks. June-November. MD south to c. peninsular FL, west
to TX, south into tropical America, and north in the interior (primarily in the Mississippi Embayment) to s. IL. [= FNA; < E. cordifolius – RAB, F, G, GW, K, WH; = E. cordifolius var. cordifolius – C; = E. radicans (Nuttall) Engelmann – S]

**Echinodorus floridanus** R.R. Haynes & J.R. Burkharter, Florida Burhead. Swamps. A recently named endemic, known only from Escambia County, FL. [= FNA, K, WH]

**Identification notes**: Portions of this key (and treatment) are provisional. The taxonomy and best characters to use in the linear-leaved species is particularly problematic.

1 Leaf blades sagittate or cordate (at least some of the leaves on a plant with sagittate or cordate basal lobes; some species are keyed both here and below).
2 Leaf blades pubescent; [subgenus Sagittaria] ........................................................................................................... **S. latifolia** var. pubescens
2 Leaf blades glabrous.
3 Sepals appressed in fruit; lower flowers perfect, the stamens either functional or not; stamen filaments roughened with minute scales (except glabrous in S. spatulata); [subgenus Lophotocarpus].
4 Leaves primarily phyllodial, lanceolate or spatulate (sagittate leaves rare in the population and few on a given plant); flowers in 1-2 (-3) whorls; stamen filaments glabrous (use 10×); [native, of tidal marshes] .......................................................... **S. spatulata**
4 Leaves primarily sagittate (phyllodial leaves rare in the population and few on a given plant); flowers in 3-12 whorls; stamen filaments roughened with minute scales (use 10×); [either introduced aliens, sometimes in tidal marshes, or native, found in inland alkaline sites].
5 Petals white, immaculate; stamens of pistillate flowers functional; [of inland sites, native or introduced at a given locality] .......................... **S. calycina**
5 Petals white, with a purple spot at the base; stamens of pistillate flowers generally nonfunctional; [exotic, introduced around coastal ports] ........................................................................................................... **S. monteviensis**
3 Sepals reflexed or at least widely spreading in fruit; lower flowers pistillate; stamens glabrous (except roughened with minute scales in S. rigida); [subgenus Sagittaria].
6 Leaves cordate basally, floating; stalks of the pistillate flowers stout, reflexed in fruit; stamens mostly shorter than 15 ...... **S. filiformis**
6 Leaves sagittate basally, emersed; stalks of the pistillate not notably stout, ascending in fruit; stamens 15 or more.
7 Beak of the achene lateral (at a right angle of the achene); bracts of the inflorescence 2-14 mm long, boat-shaped, obtuse or broadly acute.
8 Lowermost (pistillate) flowers on long pedicels (at least 20 mm), the pedicels of the lowermost flowers longer than those in whors above; inflorescence normally not bent; stamen filaments glabrous ........................................... **S. latifolia** var. latifolia
8 Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long), the pedicels of the lowermost flowers notably shorter than those in whors above; inflorescence normally bent at the lowest whorl of flowers; stamen filaments minutely roughened with minute scales .......................................................... **S. rigida**
7 Beak of the achene terminal (extending along the long axis of the achene); bracts of the inflorescence 5-40 mm long, either blunt or acuminate, not boat-shaped.
9 Bracts of the inflorescence thick and herbaceous, 5-25 mm long, rounded at the tip; flowers in 2-4 whorls; achenes with facial resin-ducts; [of acidic, blackwater habitats of the Coastal Plain] .......................................................... **S. engelmanniana**
9 Bracts of the inflorescence papery and tan, 7-40 mm long, acuminate at the tip; flowers in 5-12 whorls; achenes without resin-ducts; [primarily of other habitats, commenctively widespread].
10 Petiole sharply 5-wing-angled in cross-section; inflorescence unbranched; fruiting heads 1.0-1.5 cm in diameter, globose...... **S. australis**
10 Petiole corrugated but not wing-angled in cross-section; inflorescence often branched at the base; fruiting heads (1.2-) 1.7-2.2 cm in diameter, often globular-depressed .......................................................... **S. brevirostra**
1 Leaf blades linear or lanceolate, or modified as linear, bladeless phyllodia, these often of spongy texture.
11 Stalks of the pistillate flowers reflexed in fruit, often stout; stamens filaments glabrous (except roughened with minute scales in S. platyphylla and S. calycina).
12 Sepals appressed in fruit; lower flowers perfect, the stamens either functional or not; [subgenus Lophotocarpus].
13 Leaves generally primarily sagittate (phyllodial leaves generally rare in the population); flowers in 3-12 whorls; stamen filaments roughened with minute scales (use 10× magnification); [of inland alkaline sites] .......................... **S. calycina**
13 Leaves primarily phyllodial, lanceolate or spatulate (sagitate leaves rare in the population and few on a given plant); flowers in 1-2 (-3) whorls; stamen filaments glabrous (use 10× magnification); [of tidal marshes] .................................................. S. spatulata

14 Plant generally with erect, emersed leaves with well-developed blades with firm texture, the blades lanceolate, elliptic, or ovate, 2-8 cm wide; stamen filaments roughened with minute scales ..........................................................................................................................S. platyphylla

14 Plant with all leaves phyllodial, if expanded at the summit, the expanded blade of weak texture, floating.

15 Leaves 2-10 (-30) cm long, 3-8 mm wide (sometimes with dilated tip to 20 mm wide); [of tidal, fresh to brackish waters] ............................................................ S. subalata

15 Leaves 30-300 (or more) cm long, either 1-3 or 7-14 mm wide; [of nontidal waters].

16 Leaves very variable from population to population, in swiftly flowing black water typically about 100 cm long and 1-3 mm wide, in more stagnant water (or when emersed by dropping water levels, typically with lax petioles and floating blades, the blades lanceolate, or elliptic, the base cuneate, rounded, or cordate; [of blackwater streams and ponds, MA south to FL, went to s. AL] and at least tapers acuminately, the free tips narrowly triangular, 6-15 mm long) .......................................................... S. filiformis

17 Leaves 100-300 (or more) cm long, 7-14 mm wide; [of springs and spring-runs, endemic to FL] ............................................................... S. kurziana

17 Stamen filaments either distinctly dilated toward the base (often broadly conic) or thickened throughout, the filament (at least basally) as thick or thicker than the anther.

17 Lowermost (pistillate) flowers sessile or on short pedicels (to 5 mm or rarely 10 mm long); inflorescence normally at the lowest whorl of flowers ................................................................. S. rigida

17 Lowermost (pistillate) flowers on longer pedicels; inflorescence normally not bent.

20 Leaves with blades and petioles, or if all phyllodia, the phyllodia flattened on upper surface or triangular in cross-section; [collectively widespread].

23 Phyllodia of emersed flowering plants elongate (1/2-1× as long as scape), slender, emersed or laxly ascending and submersed in water; phyllodia of stranded flowering plants elongate (1-3× as long as scape, but may be shorter), relatively stiff; [of s. AL] and at least tapers acuminately, the free tips narrowly triangular, 6-15 mm long) .......................................................... S. macrocarpa

24 Plants with coarse rhizomes, lacking corms and stolons.

27 Abaxial wing of fruit entire; [plants collectively widespread].

28 Larger phyllodes 0.8-2.5 cm wide, the apices blunt (rarely acute); longer pistillate pedicels 2-5 (-6.5) cm long; median resin duct of mature achene linear, about as wide as the posterior duct (or ducts absent) .............................................. S. weatherbiana

29 Inflorescence branched at the base (in at least some plants of a population); bracts of the inflorescence only slightly connate, the free tips narrowly triangular, 6-15 mm long ............................................................. S. champani

29 Inflorescence unbranched at the base; bracts of the inflorescence slightly to almost fully connate .......... S. gracilis

Therefore, it seems best to treat these three taxa at equal rank and at the species level. [= S; = S. graminea Michaux var. chapmannii (J.G. Smith) R.R. Haynes & C.B. Helligquist – FNA; = S. graminea Michaux var. chapmannii J.G. Smith – GW, K, WH, Y; = S. graminea Michaux var. chapmannii J.G. Smith – Z, orthographic variant]

**Sagittaria engelmanniana** J.G. Smith. Blackwater streambanks, sphagnum bogs, pocosins, beaver ponds. June-October. MA and NY south to n. FL and s. MS, primarily on the Coastal Plain. [= RAB, C, F, FNA, K, W, X; = S. engelmanniana ssp. engelmanniana – G, GW, Z]

**Sagittaria fasciculata** E.O. Beal, Bunched Arrowhead. Bogs, ditches adjacent to drained bogs, wooded seepage areas. May-August. Endemic to a several-county area in sw. NC and nw. SC, where most of its former habitat has been drained. [= RAB, FNA, GW, K, W, Y; = S. macrocarpa J.G. Smith – S, misapplied; < S. graminea Michaux var. macrocarpa (J.G. Smith) Bogin – Z, mostly misapplied]

**Sagittaria filiformis** J.G. Smith. Swiftly flowing water of blackwater rivers and streams, blackwater lake shores. May-September. As conceived here, probably ranging from MA south to FL and s. AL. The forms growing in swiftly flowing black water are remarkable and unlikely to be recognized as a Sagittaria unless in flower, with linear leaves over 100 cm long and only 1-3 mm wide, with 5-7 parallel ribbed veins, resembling *S. kurziana*. The proper taxonomic treatment and associated nomenclature to apply to these plants remains unclear (see synonymy). [= FNA, K; = S. subulata (Linnaeus) Buchenau var. gracillima (S. Watson) J.G. Smith – RAB, F, G, Z; = S. stagnorum Small – GW; < S. subulata – C, in part; > S. filiformis – S; > S. lorida (Chapman) Small – S; > S. stagnorum – S]

**Sagittaria graminea** Michaux. Marshes, ponds, tidal areas. May-November. NL (Newfoundland) and NL (Labrador) west to MN and SD, south to s. FL and c. TX; West Indies. [= S. graminea Michaux var. graminea – RAB, C, G, GW, K, WH, Y; > S. graminea – F; > S. eatoni J.G. Smith – F; = S. graminea ssp. graminea – FNA; > S. graminea – S; > S. cycloptera (J.G. Smith) C. Mohr – S; < S. graminea – W; < S. graminea var. graminea – Z (also see S. isoetiformis) = S. graminea – WV]

**Sagittaria isoetiformis** J.G. Smith. Pineland ponds, clay-based Carolina bays, other seasonally flooded depressions. June-September. Se. NC south to s. peninsular FL, west to s. MS (Sorrie & Leonard 1999). See Godfrey & Adams (1964) for additional discussion of this species. [= FNA, GW, K, S, Y; > S. teres – RAB, S, misapplied; < S. graminea Michaux var. graminea – Z]

**Sagittaria kurziana** Glück, Spring-tape. Spring-runs. Panhandle and n. peninsular FL. [= GW, K, S, WH; = S. subulata (Linnaeus) Buchenau var. kurziana (Glück) Bogin – Z]

**Sagittaria lancifolia** Linnaeus var. lancifolia. Marshes, swamps. May-June. E. SC south to s. FL, west to FL Panhandle; West Indies; n. South America. [= C; = S. lancifolia – RAB; = S. lancifolia ssp. lancifolia – FNA, GW, K, WH, Z; > S. angustifolia Lindley – S; > S. lancifolia – S, in a narrow sense]

**Sagittaria lancifolia** Linnaeus var. media Micheli. Freshwater to brackish tidal marshes, ditches. June-October. S. DE south to ne. FL, FL Panhandle, west to TX; scattered in Central America. If recognized as a species, this taxon is *S. falcata*. [= C; = S. falcata Pursh – RAB, F, G, S; = S. lancifolia ssp. media (Micheli) Bogin – FNA, GW, K, WH, Z]

**Sagittaria latifolia** Willdenow var. latifolia. July-October. Marshes, swamps, farm ponds, ditches, bogs. June-September, NS west to BC, south to tropical America (rare in the Appalachian region). In addition to the pubescence difference, var. latifolia and var. pubescens can be separated by the presence (var. latifolia) or absence (var. pubescens) of resin-ducks on the achene-faces. [= C, G, GW, W, Z; > S. latifolia var. latifolia – RAB, F; > S. latifolia var. obtusa (Engelmann) Wieand – RAB, F; > S. planipes Fernald – F; < S. latifolia – FNA, K, WH; > S. latifolia – S; < S. ornithorhyncha Small – S; > S. viscosa C. Mohr – S; = S. latifolia – WV]

**Sagittaria macrocarpa** J.G. Smith. Beaverponds, old millponds. Apparently endemic to the Coastal Plain of the Carolinas; potentially to be expected in e. GA. See Sorrie, Keeener, & Edwards (2007) for detailed discussion. [< S. graminea Michaux var. macrocarpa (J.G. Smith) Bogin – Z, misapplied]

* **Sagittaria montevidensis** Chamisso & Schlechtendahl. Disturbed areas, marshes; native of South America. July. Most of the collections from the southeastern United States are old collections around major seaports, suggesting that this plant was introduced on the ballast of sailing ships. [= RAB, K, S, WH; = S. montevidensis ssp. montevidensis – FNA, GW, Z]
**Sagittaria subulata** Buchenau. Nipple-bract Arrowhead. Bogs, swamps, ditches, depressions. C. AR and se. OK south to s. LA and c. TX; rarely disjunct east of the Mississippi in se. LA and s. MS. [= FNA, GW, K] [add synonymy]

**Sagittaria platyphylla** (Engelm.) J.G. Smith. Marshes, ditches, farm ponds. June. The distribution of this species is primarily in the Mississippi drainage; occurrences east of the Appalachians may be introduced, either by humans or by waterfowl. First reported for VA by Wieboldt et al. (1998). Known from numerous counties in sc. GA (Jones & Coile 1988). [= F, FNA, K, WH, Y; = S. graminea Michaux var. platyphylla Engelmann – RAB, G, Z; > S. platyphylla – S; > S. mohrii J.G. Smith – S]

**Sagittaria spatulata** (J.G. Smith) Buchenau. Tidal marshes. May-September. NB south to e. NC along the coast. [= C, G; > Lophotocarpus spongiosus (Engelm.) J.G. Smith – F; > S. calycina var. spongiosa Engelmann – K; WH; > S. montevensis Chamiso & Schlechtendahl ssp. spongiosa (Engelm.) Bogin – FNA, Z]

**Sagittaria subulata** (Limaeus) Buchenau. Tidal marshes and mud flats. May-September. MA and NY south to n. peninsular FL and AL. [= FNA, GW, K, S, WH; < S. subulata var. subulata – RAB, G, Z; < S. subulata – C (also see S. stagnorum); > S. subulata var. subulata – F; > S. subulata var. natans (Michaux) J.G. Smith – F]

**Sagittaria teres** S. Watson. Ponds. MA south to s. NJ. [= C, F, FNA, G, K; = S. graminea Michaux var. teres (S. Watson) Bogin – Z]

**Sagittaria weatherbiana** Fernald. Fresh to brackish marshes, streambanks, pineland pools. April-June. Se. VA south to Panhandle FL. Isozyme studies by Hauber & Legé (1999) provide evidence that this taxon should be given species status; its genetic identity with var. graminea is low, and comparable to the difference between S. graminea (in the narrow sense) and S. platyphylla. [= F; = S. graminea Michaux var. weatherbiana (Fernald) Bogin – RAB, C, G, GW, K, WH, Y, Z; = S. graminea Michaux ssp. weatherbiana (Fernald) R.R. Haynes & C.B. Hellquist – FNA]

### 34. HYDROCHARITACEAE A.L. de Jussieu 1789 (Frog's-bit Family) [in ALISMATALES]

1. Leaves basal, either elongate with parallel sides, or petiolate with a leaf blade.
2. Leaves differentiated into petiole and blade, the blade ovate to orbicular ................................................................. **Limnobium**
3. Leaves straplike, elongate, linear, the sides parallel and not differentiated into petiole and blade.
4. Leaves to 35 cm long; [saltwater]...................................................................................................................... **Halophila**
5. Leaves usually > 40 cm long; [freshwater]........................................................................................................... **Vallisneria**
6. Leaves broadened and sheathing at base, narrowing upwards via “shoulders”; perianth absent........................................... **Najas**
7. Leaves mostly 2-3 cm long, finely toothed with slender, weak teeth on the margins and rarely also the midrib beneath; fresh leaves not noticeably rough to the touch; leaf whorls generally crowded on all stems; petals white, 9-11 mm long ................................. **Egeria**
8. Leaves mostly 1-2 cm long, toothed with stout, sharp teeth on the margins and also on conical bases along the midrib beneath; fresh leaves noticeably rough to the touch; leaf whorls crowded on terminal portions of stems, remote on older stems; petals translucent, 2-5 mm long ........................................................................................................................................... **Hydrilla**

---

**ALISMATACEAE** A.L. de Jussieu 1789 (Frog's-bit Family) [in ALISMATALES]
Hydrocharitaceae

Egeria Planchon 1849 (South American Waterweed)

* Egeria densa Planchon, Brazilian Waterweed, "Elodea," "Anacharis." Ponds and stagnant water of streams or rivers; native of South America. May-November. This is the "Elodea" or "Anacharis" of the aquarium trade. [= RAB, FNA, GW, K, W, WH; = Elodea densa (Planchon) Caspary – F; = Anacharis densa (Planchon) Victorin – G; = Philotria densa (Planchon) Small & St. John – S]

Elodea Michaux 1803 (Waterweed)

1 Well-developed leaves (1-) avg. 2 (-5) mm wide, mostly 2-5× as long as wide; staminate spathe 4-8 (-15) mm long, the flower at anthesis on an elongated, very slender, flexuous stalk; sepals of pistillate flowers 2-4.5 mm long.................................E. canadensis

1 Well-developed leaves (0.3-) avg. 1.3 (-2) mm wide, mostly 5-10× as long as wide; staminate spathe 2-3 mm long, the flower at anthesis separating from the spathe (and plant) at maturity; sepals of pistillate flowers 1-1.5 mm long....................................................E. nuttallii

Elodea canadensis Michaux, Common Waterweed. Rivers, lakes, ponds, stagnant waters of streams. July-September. QC west to SK, south to NC, Panhandle FL, OK, NM, and CA. [= RAB, C, F, FNA, GW, K, W, WH; = Anacharis canadensis (Michaux) Planchon – G; < Philotria canadensis (Michaux) Britton – S (also see E. nuttallii)]

Halophila Thouars 1806 (Seagrass)

A genus of about 10 species, seagrasses, of tropical and warm temperate waters of the Caribbean Sea and the Indian/Pacific oceans.

Halophila engelmannii Ascherson ex Neumayer, Engelmann’s Seagrass. Estuarine waters. S. FL, west along Gulf Coast (MS, LA) to TX; Bahamas; West Indies. [= K, WH]

Hydrilla L.C. Richard 1814 (Hydrilla)

Limnobium L.C. Richard 1814 (Frog's-bit)

Limnobium spongia (Bosc) L.C. Richard ex Steudel, American Frog's-bit, Spongeplant. Swamps, marshes, ponds, pools. June-September. DE and MD south to s. FL, west to e. TX, north in the interior in the Mississippi Embayment to s. MO and s. IL; disjunct around the Great Lakes (as in n. IN and w. NY); also in tropical America. Often free-floating, the leaves with prominently large cells below. [= RAB, C, F, FNA, G, GW, K, S, WH]

Najas Linnaeus 1753 (Naiad, Bushy-pondweed, Water-nymph)

Identification notes: Counts of leaf-teeth do not include the broadened, sheathing base of the leaf. Seeds are necessary for the identification of most species.

1 Plants dioecious; lower side of the midvein of the leaves prickly; [subgenus Najas] .......................................................... N. marina
2 Plants monocious; lower side of the midvein of the leaves smooth; [subgenus Caulinia].
3 Leaf-teeth multicellular, evident at 10× magnification, 7-15 per side; leaves becoming recurved late in the season; seed-coat pitted, the areoles distinctly wider than long, in ca. 12-18 ladder-like rows ......................................................... N. minor
4 Leaf-teeth unincellular, not evident at 10× magnification, > 20 per side (except 13-17 per side in N. gracillima); leaves spreading to ascending; seed-coat smooth or pitted, if present the areoles longer than wide or about as long as wide.
5 Seeds smooth, glossy, obovate, broadest above the middle; anthers 1-locular. ................................................................. N. flexilis
6 Seeds pitted, dull, cylindrical, fusiform, or elliptic, broadest at the middle; anthers 1- or 4-locular.
7 Style offset from the apex of the seed; anthers unilocular ................................................................. N. gracillima
8 Style at the apex of the seed; anthers 4-locular ................................................................. N. guadalupensis var. guadalupensis

Najas flexilis (Willdenow) Rostkovius & Schmidt, Northern Naiad. Lakes and rivers. July-August. NL (Newfoundland) west to ON, south to VA, MD, MO, and NE; also in the west from AB and SK south to OR and UT. [= C, F, FNA, G, K, S, W, WV, Z; = Naias flexilis – S, orthographic variant]

Najas gracillima (A. Braun ex Engelmann, Slender Naiad, Bushy Naiad. Ponds and lakes. July-October. NS west to MN, south to NC, AL, and MO; disjunct in CA (where likely alien). Haynes (1979) reports that this species cannot tolerate pollution and is apparently declining in abundance. [= RAB, C, F, FNA, G, K, W, WV, Z]

Thalassia Banks & Solander ex Koenig (Turtlegrass)

A genus of 2 species, seagrasses, of tropical and warm temperate waters of the Caribbean Sea and the Indian/Pacific oceans.

Thalassia testudinum Banks & Solander ex Koenig, Turtlegrass. Seagrass beds in estuarine waters. January-December. E. coast of c. peninsular FL to s. FL, north along the west coast of FL to the Panhandle, and in MS, LA, and TX. [= K, WH]

Vallisneria Linnaeus 1753 (Water-celery, Eelgrass)

1 Sepals 2-3 mm long; leaves 5-6 (-10) mm wide; leaves lacking red-purple longitudinal stripes ......................................................... V. americana
2 Sepals 4-5.5 mm long; leaves 15-20 mm wide; leaves with red or purple longitudinal stripes ......................................................... V. neotropicalis

Vallisneria americana Michaux, Vallisneria, Water-celery, Tapegrass, Eelgrass. Lakes, rivers, estuaries, sounds. July-October. NS and QC west to ND, south to FL, TX, NM, AZ; south into tropical America {or is this all or partly V.
Vallisneria neotropicalis Marie-Victorin, Large Water-celery, Large Eelgrass. Spring runs; other aquatic habitats. FL Panhandle, s. FL; Cuba. The distinctiveness of this taxon has been defended by Les et al (2008) on morphological and molecular grounds. [= Y, Z; < V. americana – FNA, GW, K, WH; ? V. americana – F, G, W, WV; ? V. americana var. americana – C; > V. americana – S; > V. spiralis Linnaeus – S]

35. SCHEUCHZERIACEAE F. Rudolphi 1830 (Scheuchzeria Family) [in ALISMATALES]

Scheuchzeria Linnaeus (Scheuchzeria, Pod-grass)

Scheuchzeria palustris Linnaeus var. americana Fernald, Pod-grass. Sphagnum bogs. NL (Labrador) and AK south to s. NJ, e. WV (Cranberry Glades, Pocahontas County), sc. PA (Rhoads & Klein 1993), IN, IL, IA, WY, and CA. [= F; < S. palustris – C, FNA, G, WV; = S. palustris ssp. americana (Fernald) Hultén – K; = S. americana (Fernald) G.N. Jones]

37. JUNCAGINACEAE L.C. Richard 1808 (Arrowgrass Family) [in ALISMATALES]

Triglochin Linnaeus 1753 (Arrowgrass)

1 Pistils 6, all fertile; fruits 2-4.5 mm long; central axis between the carpels not winged; [of NJ northward] .................................. T. maritima
1 Pistils 6, 3 fertile and 3 sterile; fruits 1-2 mm long; central axis between the carpels broadly winged; [of DE and MD southward] ......... T. striata

Triglochin striata Ruiz & Pavón, Southern Arrowgrass. Brackish to nearly freshwater marshes. May-October. The species has an extensive range, occurring in tropical Central and South America, Africa, and Australia; in North America, it ranges from MD and DE south to s. FL and west to LA, and also on the west coast in CA and OR. [= F, FNA, G, K, WH; = T. striatum – RAB, C, GW, S, Z, orthographic variant]

Triglochin maritima Linnaeus. Brackish coastal habitats and inland bogs. Circumboreal, south in North America to MD, DE, OH, NE, NM, Mexico; also Patagonia. [= F, FNA, G, K; = T. maritimum – C, Z, orthographic variant]

38. ZOSTERACEAE Dumortier 1829 (Eelgrass Family) [in ALISMATALES]

Zostera Linnaeus 1753 (Eelgrass)

Zostera marina Linnaeus var. stenophylla Ascherson & Graebner, Eelgrass. Estuarine waters. February-March. The species occurs in Eurasia and North America. Var. stenophylla is North American, and ranges south along the Atlantic coast to NC and allegedly to FL (though reports from that state are apparently not substantiated and may be based on misidentification of other aquatics). [= F, G, Y; < Z. marina – RAB, C, FNA, K, S, Z]
ZOSTERACEAE

A family of 6-7 genera and about 100 species (if circumscribed, as here, to include Zannichelliaceae), aquatic herbs, nearly cosmopolitan. Here circumscribed following recent molecular studies to include Zannichellia (Lindqvist et al. 2006; Angiosperm Phylogeny Group 2003, 2009). References: Haynes & Hellquist in FNA (2000); Haynes (1978); Les & Haynes (1996); Haynes, Les, & Holm-Nielsen in Kubitzki (1998b); Wiegleb & Kaplan (1998)=Z; Lindqvist et al. (2006). [including ZANNICHELLIACEAE]

1 Leaves opposite lobes. ................................................................................................................................................................. Zannichella
1 Leaves alternate.
2 Stipules not adnate, or adnate to the blade < 1/2 the length of the stipule; peduncle stiff, the flowering spike elevated above the water's surface; submersed leaves translucent, flat, flexible; floating leaves present or absent ................................................................. Potamogeton
2 Stipules adnate to the blade for at least 2/3 the length of the stipule; peduncle flexible, the flowering spike submersed; submersed leaves opaque, channeled, stiff; floating leaves absent ................................................................................................................. Stuckenia

Potamogeton Linnaeus 1753 (Pondweed)

1 Stipular sheaths of submersed leaves adnate with leaf blade base, the tip usually projecting as a ligule ................................................. Key A
1 Stipular sheaths of submersed leaves free from the leaf blade base, or with only a few adnate, the ligule not obvious.
2 Submersed leaves broadly linear-oblong to lanceolate or nearly orbicular, 10-58 mm wide (occasional stranded forms lack submersed leaves) ..................................................................................................................... Key B
2 Submersed leaves linear, thread-like or ribbon-like, 0.1-10 mm wide .............................................................................................................. Key C

Key A
1 Leaves lax, not conspicuously 2-ranked; lacking basal lobes, with fewer than 20 veins.
1 Leaves stiffish, conspicuously 2-ranked, auriculate-lobed to rounded at the junction with the stipule, with 20-60 fine veins .......... P. richardsonii
2 Tips of submersed leaves obtuse to acute; floating leaves rounded at apex.
3 Tips of submersed leaves acute; fruit 1-2 mm wide, the lateral keel with acute tips, beak minute ......................................................... P. diversifolius
3 Tips of submersed leaves obtuse; fruit 1.3-2.4 mm wide, the lateral keel with blunt tips, beak lacking ......................................................... P. spirillus
2 Tips of submersed leaves acute to long-tapering; floating leaves acute at apex.
4 Submersed leaves 0.1-0.6 mm wide, without obvious lacunae; floating leaves 3-7 veined ................................................. P. bicupulatus
4 Submersed leaves 0.2-1 (-2) mm wide, with abundant lacunae; floating leaves 9-23 veined ................................................................. P. tennessensis

Key B
1 Leaf margins conspicuously serrate; stem flattened; fruit beak 2-3 mm long; turions commonly formed, hard ........................................ P. crispus
1 Leaf margins entire; stem terete; fruit beak < 1 mm long; turions rarely formed.
2 Submersed leaves claspers the stem; floating leaves absent.
3 Leaves orbicular to ovate, often lanceolate in soft water, 1-6 cm long, with 3-25 delicate veins; stipules deteriorating and deciduous, absent on lower portions of stem ................................................................................................................................................................. P. perfoliatus
3 Leaves ovate-lanceolate to narrowly lanceolate, 1.6-13 cm long, with 3-35 coarse veins; stipules disintegrating to persistent fibers, even on lower portions of stem ................................................................................................................. P. richardsonii
2 Submersed leaves petioled or sessile, not clasping the stem; floating leaves absent or present.
4 Submersed leaves 19-49 veined, distinctly arcuate ................................................................................................................. P. amplifolius
4 Submersed leaves with fewer than 29 veins, not arcuate.
5 Stems inconspicuously spotted or lacking spots; submersed leaves flat along the margin; floating leaves 7-29 veined.
6 Submersed leaves with petioles 1-13 cm long.
7 Larger submersed leaves acute at the apex with a sharp awl-like tip; fruit gray-green to olive-green, with well-developed lateral ridges ..................................................................................................................................................................... P. illinoensis
7 Larger submersed leaves acute at the apex but lacking a sharp awl-like tip; fruit red to reddish-brown, with maricate lateral ridges ......................................................................................................................................................... P. nodosus
6 Submersed leaves sessile.
8 Fruit reddish-brown, with obsolete or rounded keel; submersed leaves with (3-) 5-9 veins ......................................................... P. gramineus
8 Fruit gray-green or olive-green, with well-developed keel; submersed leaves with 7-19 veins ........................................ P. illinoensis

Key C

1 Fruit with a prominent keel 0.2-1.2 mm broad; floating leaves absent or present; lacunae present in some species, but generally not prominent.

2 Submersed leaves 3-13 veined; stipules of submersed leaves not adnate to the leaf base; floating leaves rounded at apex................. P. epihydrus

3 Floating leaves present, at least in some plants of the population.

4 Petiole junction with leaf distinctly pale in color; floating leaves ovate, oblong-ovate, cordate at base, rarely tapering................. P. natans

5 Floating leaves 7-12 mm wide, tapering at both ends; fruit apparently not produced ......................................................... P. floridanus

6 Floating leaves 10-20 (-30) mm wide, obtuse, round or tapering at the base; fruit often produced ........................................... P. oakesianus

7 Floating leaves absent from all plants in the population.

8 Floating leaves present, at least in some plants of the population.

9 Leaves acute, 3 (-5) veined, 0.3-1.5 (-2.3) mm wide; fruits 1-keeled, 1.4-2.3 (-2.7) mm long ......................... P. foliosus var. foliosus

10 Leaves 15-35 veined, > 2 mm wide; stem conspicuously flattened; peduncles terminal, usually straight ....................... P. zostericoides

11 Leaf apex bristle-tipped (rarely apiculate); peduncles recurved, axillary or terminal, 0.5-6.6 cm long .......... P. hillii

12 Mature fruit mostly widest at middle, or ovate, sides rounded, beak mostly central; peduncle filiform to cylindrical, usually 3 per plant; inflorescence continuous; leaves with 1-5 rows of lacunae along midrib, apex acute to obtuse; stipules mostly convolute ................................................................. P. pusillus var. teniusissimus

Potamogeton bicuspidatus Fernald. Quiet waters. July-September. ME west to WI, south to VA (Augusta County) and se. TN. [= FNA, F, K, Z; = P. diversifolius Rafinesque var. trichophyllus Morong – C, GW]

Potamogeton confervoides Reichenbach, Alga Pondweed, Conferva Pondweed, Tuckerman's Pondweed. Acidic blackwater pools and streams. April-September. NL (Newfoundland) west to ON, south to NJ and PA; disjunct in sc. NC and ne. SC (fall-line sandhills). [= RAB, C, F, FNA, G, K, Z]

Potamogeton floridanus Small, Florida Pondweed. Blackwater rivers. Apparently endemic to blackwater rivers of the Panhandle of FL. Considering the under-collection of Potamogeton, it should be sought elsewhere. [= FNA, S, WH; < P. natans – Z]

Potamogeton foliosus Rafinesque var. foliosus, Leafy Pondweed. Shallow ponds and streams. May-October. NL (Newfoundland) west to AK, south to SC, Panhandle FL, TX, and Mexico. [= C; < P. foliosus – RAB, G, GW, S, W, WH, Z; > P. foliosus var. foliosus – F, WV; > P. foliosus var. macellus Fernald – F, WV; = P. foliosus ssp. foliosus – FNA, K; > P. curtissii Morong – S; > P. foliosus – S]
Potamogeton gramineus Linnaeus, Variable Pondweed. Estuarine waters. Greenland and AK, south to sc. PA (Rhoads & Klein 1993), NJ, WV (Kartesz 1999), n. VA, MI, WI, CO, UT, and CA. Reported for VA (Fairfax County); specimen identification needing confirmation. [= C, FNA, G, K, WV, Z; > P. gramineus var. maximus Morong – F]

Potamogeton hillii Morong, Hill's Pondweed. Spring-fed oxbow pond. VT, MA, ON, and WI south to PA, VA, and OH. [= C, FNA, G, K, Z; > P. hillii – F; > P. porteri Fernald – F]

Potamogeton natans Linnaeus, Floating Pondweed. Lakes and slow streams. June-September. NL (Newfoundland) west to AK, south to e. WV, w. NC, KS, NM, AZ, and CA. [= RAB, C, F, FNA, G, K, S, W; < P. natans – Z (also see P. floridanus)]

Potamogeton nodosus Poiret, Longleaf Pondweed, American Pondweed. Ponds, streams. May-September. ME and QC west to BC, south to Panhandle FL, TX, Mexico, and CA. [= RAB, C, F, FNA, G, KW, K, W, WV, Z; > P. fluitans Roth – S; > P. oblongifolium Forster, proposed for nomenclatural rejection (Reveal et al. 2003)]

Potamogeton oakesianus J.W. Robbins, Oakes Pondweed Lakes and streams. NL (Newfoundland) west to WI, south to n. peninsular FL and e. TX. [= C, FNA, G, KW, K, S, WH, WV, Z; = P. rotundifolium Forster, proposed for nomenclatural rejection (Reveal et al. 2003)]

Potamogeton perfoliatus Linnaeus, Perfoliate Pondweed, Redhead Grass. Ponds. June-October. NL (Newfoundland), NL (Labrador) west to MI, south to ne. NC, and n. OH; apparently disjunct in w. FL, c. peninsular FL, s. AL, and se. LA, and in SD. [= FNA, G, K, S, Z; > P. perfoliatus var. bupleuroides (Fernald) Farwell – F; > P. perfoliatus var. bupleuroides Fernald – F, GW, WH; > P. bupleuroides Fernald]

Potamogeton pusillus Linnaeus var. pusillus. Acid and alkaline waters. May-September. NS west to AK, south to FL and Mexico. [= P. berchtoldii Fieber – RAB; > P. pusillus var. pusillus – F; > P. pusillus var. minor (Bivona-Bernardi) Fernald & Schubert – F; = P. pusillus ssp. pusillus – FNA, K; < P. pusillus var. pusillus – C; < P. pusillus – G, GW, S, WH, Z; = P. pusillus – WV]

Potamogeton richardsonii (Bennett) Rydberg, Richardson Pondweed. Slow-moving, calcareous waters. NL (Labrador) west to AK, south to DE, MD, PA, n. OH, n. IN, n. IL, IA, NE, NM, AZ, and CA. [= C, F, FNA, G, K, Z]

Potamogeton strictifolius A. Bennett, Straightleaf Pondweed. Calcareous waters. July-September. NL (Newfoundland) west to YT, south to w. VA, n. IL, WY, and n. UT. [= C, FNA, G, KW, W, WV, Z; > P. strictifolius var. strictifolius – F; > P. strictifolius var. rutiloides Fernald – F; > P. longiligulatus Fernald – F]
Potamogeton tennesseensis Fernald, Tennessee Pondweed. Quiet or flowing water. Late May-September. PA and OH south to w. VA, and se. TN. [= F, FNA, K, W, WV; < P. epihydrus – Z]

Stuckenia C. Börner 1912 (Sago-pondweed)

Zannichellia Linnaeus 1753 (Horned Pondweed)

Identification notes: Zannichellia is sometimes confused with other aquatics, such as Ruppia and narrow-leaved Potamogeton. Potamogeton has at least some leaves alternate; Zannichellia and Ruppia are opposite-leaved. Zannichellia lacks the abruptly broadened sheath of Najas. Also, the seeds are flattened in Zannichellia, and toothed down one side; Najas has a cylindric or elliptic fruit. Zannichellia has longer leaves (3-10 cm long) than Najas (< 4 cm long).

41. RUPPIACEAE Horaninow ex Hutchinson 1934 (Wigeon-grass Family) [in ALISMATALES]

Ruppia Linnaeus (Wigeon-grass)

Identification notes: Separable from superficially similar species of Potamogeton by the stipules adnate their entire length (vs. separate at least at the tip in Potamogeton).

42. CYMODOCEACEAE N. Taylor 1909 (Manatee-grass Family) [in ALISMATALES]

A family of about 5 genera and 16 species, estuarine aquatics, of tropical and subtropical (rarely temperate) waters. References: Kuo & McComb in Kubitzki (1998b); Haynes in FNA (2000); Green & Short (2003).

1 Leaves flat above the sheath; leaf tips 3-toothed; female plants with flowers with 1 pistil..............................................................Halodule
1 Leaves terete or subterete above the sheath; leaf tips acicular; female plants with flowers with 1-2 pistils.................................Syringodium

Halodule Endlicher 1841 (Shoal-grass)
A genus of about 6 species, of tropical and subtropical regions of both hemispheres. References: Haynes in FNA (2000); McRoy & Helliferich (1977); Kuo & McComb in Kubitzki (1998b); Green & Short (2003)=Z.

*Halodule wrightii* Ascherson, Shoal-grass. Submerged in estuarine waters up to about 2 m deep, especially in Core and Pamlico sounds (North Carolina). E. NC (reported with unknown documentation from SC, not known from GA); FL west to TX, and south along shores of the Gulf of Mexico and Caribbean; also on the Pacific coast of Panama and Nicaragua. Haynes in FNA (2000) concludes that *H. beaudettei* is not taxonomically distinct from *H. wrightii* (the older name). Seagrasses (an informal group including species such as *Halodule wrightii*, *Zostera marina*, and *Ruppia maritima* in our area) are very important components of estuarine ecosystems, providing a large proportion of the primary productivity in such systems and providing shelter and nursery grounds for fish, shrimp, and other invertebrates. An estimated 80,000 hectares of seagrass beds are found in Pamlico and Core sounds, NC, most of that area having *Halodule* as the co-dominant or dominant species (Ferguson, Rivera, & Wood 1989). There is concern about the destruction of seagrass beds by pollution, dredging of waterways, and mechanical disturbance by fishing boats (Koch & Orth 2003; Green & Short 2003). [= FNA, S, WH, Z; > *H. beaudettei* (den Hartog) den Hartog – RAB, GW, K]

*Syringodium* F.T. Kützing in R.F. Hohenacker 1860 (Manatee-grass)

*Syringodium filiforme* F.T. Kützing in R.F. Hohenacker, Manatee-grass. Estuarine waters. Panhandle FL, peninsular FL, westward along the Gulf Coast, and in the West Indies. *Syringodium* is occasionally cast ashore in Georgia and the Carolinas following hurricanes, but there is no evidence that it grows in our area. [= FNA, WH, Z; = *Cymodocea filiformis* (F.T. Kützing in R.F. Hohenacker) Correll – GW, K; = *Cymodocea manatorum* Ascherson – S]

44. *Nartheciaceae* E.M. Fries 1846 (Bog-ashphodel Family) [in DIOECOREALES]

*Alletris* Linnaeus 1753 (Colic-root, Stargrass)

1 Perianth white to creamy-white (rarely pinkish).
2 Perianth 6-10 mm long, cylindric at anthesis, 2-3× as long as broad, the perianth lobes narrowly deltoid (longer than broad); fruiting perianth markedly constricted above the middle. *A. farinosa*
3 Perianth 4-6 mm long, campanulate at anthesis, ca. 1× as long as broad, the perianth lobes broadly deltoid (about as long as broad); fruiting perianth somewhat narrowed above the base. *A. obovata*
1 Perianth short-cylindric or campanulate at anthesis, 1-2× as long as broad, the perianth lobes not spreading; [flowering May-July].
3 Perianth long-cylindric at anthesis, 2.5-4× as long as broad, the perianth lobes spreading somewhat; [flowering March-May]. *A. lutea*

*Alletris aurea* Walter, Golden Colic-root. Pine savannas, seepage bogs, pine flatwoods. Mid May-July; August. S. MD south to ne. FL, Panhandle FL, west to e. TX and se. OK. Flowering several weeks later than *A. farinosa* when growing together. [= RAB, C, F, FNA, G, GW, K, S, WH, X, Y, Z]

*Alletris farinosa* Linnaeus, Northern White Colic-root, Mealy Colic-root, Stargrass. Pine savannas, pine flatwoods, seepage bogs, upland woodlands, roadbanks. Late April-early June; July-August. S. ME, s. ON, and se. MN south to s. GA, FL (Wunderlin 1998), LA, and TX, the only species of the genus not restricted (or nearly so) to the Coastal Plain. [= RAB, C, F, FNA, G, GW, K, S, WH, X, Z]

*Alletris lutea* Small, Yellow Colic-root. Pine savannas. E. GA (in immediate proximity to the SC border) south to s. FL, and west to e. LA (Weigt 2002); disjunct in w. LA (Sorrie & LeBlond 2008). The report by F of *A. lutea* Small as far north as se. VA is in error. A specimen collected in se. NC has recently been annotated as *A. lutea*, but it appears to be *A. farinosa*. [= FNA, GW, K, S, WH, X, Y, Z]

*Alletris obovata* Nash ex Small, Southern White Colic-root. Pine savannas. May-early June; August. Se. SC south to c. peninsular FL, west to e. Panhandle FL. Reported for MS (Kartesz 1999), but the report rejected (likely based on a misidentified specimen). [= RAB, FNA, GW, K, S, WH, X, Y, Z]

*Lophiola aurea* Ker-Gawler, Golden Crest. Wet savannas, bogs, marshes, ditches adjacent to these natural habitats. Late May-June; August-September. FL Panhandle and sw. GA west to e. LA; se. NC; n. DE (at least formerly) and s. NJ; disjunct in NS. Only a few populations remain in NC. [= C, FNA, K, S, Z; > *L. americana* (Pursh) Wood – RAB, F (the NJ-DE material), G, GW; > *L. septentrionalis* Fernald – F (the Nova Scotian material)]

*Narthecium* Hudson 1762 (Asphodel)

A genus of about 8 species, many narrow disjuncts, collectively with a very fragmented distribution in the temperate Northern Hemisphere. References: Small (1924)=Z; Zomlefer (1997b)=Y; Utech in FNA (2002a); Tamura in Kubitzki (1998a); Schumacher (1947)=X; Sorrie & Weakley (in prep.)=Q.

1 Tepals 4-6 mm long; capsule 10-14 mm long; pedicels stout, about as long as the subtending bracts; [Coastal Plain seeps and savannas]..........

.............................................................................................................................

1 Tepals 6-9 mm long; capsule 8-10 mm long; pedicels slender, distinctly longer than the subtending bracts; [Mountain bogs].............

\[Coastal Plain seeps and savannas\]..........

\[Mountain bogs\].............

\[Coastal Plain seeps and savannas\]..........

\[Mountain bogs\].............

45. **Burmanniaceae** Blume 1827 (Burmannia Family) [in DIOSCOREALES]

1 Floral tube terete; ovary 1-locular..................................................................................................................................................................................\[\]

1 Floral tube 3-angled or 3-winged; ovary 3-locular..............................................................................................................................................

*Apteria* Nuttall (Nodding Nixie)

*Apteria aphylla* (Nuttall) Barnhart ex Small, Nodding Nixie. Wet hammocks, bay swamps, other acid swamps, mesic forests. E. GA west to e. TX, south to c. South America, and in the West Indies. [= FNA, GW, K, S, WH]
A genus of about 63 species, autotrophic or mycotrophic herbs, pantropical (to warm temperate). References: Lewis in FNA (2002a); Maas-van de Kamer in Kubitzki (1998a).

**Identification notes:** Both species of Burmannia are very small and easy to overlook; they occasionally occur together.

1. **Floral tube 3-winged, violet; flowers in a spicate cyme (solitary in depauperate individuals).** ......................................................... *B. biflora*
2. **Floral tube obtusely 3-angled, greenish to creamy white; flowers in a capitulate cluster (solitary in depauperate individuals).** ............... *B. capitata*

**Burmannia biflora** Linnaeus, Violet Burmannia. Savannas, bogs, shores of Coastal Plain depression ponds. August-November. Se. VA south to FL, west to e. TX. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Burmannia capitata** (J.F. Gmelin) von Martius, White Burmannia. Savannas, bogs, shores of Coastal Plain depression ponds. July-November. E. NC south to s. FL, west to e. TX and se. OK; West Indies, Central America, and South America. [= RAB, FNA, GW, K, S, WH]

---

**46. DIOSCOREACEAE** R. Brown 1810 (Yam Family) [in DIOSCOREALES]

A family of about 3-20 genera and 600-880 species, of tropical and warm temperate regions. References: Raz in FNA (2002a); Huber in Kubitzki (1998a).

**Dioscorea** Linnaeus 1753 (Yam)

A genus of about 575-850 species, vines, of tropical and warm temperate regions of the Old World and New World. Huber in Kubitzki (1998a) advocates the division of the large and unwieldy Dioscorea into separate genera. Dioscorea (broadly defined) has a wide variety of economic uses, especially in the tropics, where it is most diverse. Various species are cultivated for their edible tubers (yams, not to be mistaken for sweet potatoes, *Ipomoea batatas*, often referred to colloquially as "yams" in the southern United States), especially in Africa. Oral contraceptives were developed from extracts of Dioscorea. Many other uses are described in Al-Shehbaz & Schubert (1989). References: Raz in FNA (2002a); Al-Shehbaz & Schubert (1989)=Y; Ward (1977c)=Z; Huber in Kubitzki (1998a).

1. **Leaves cordate-ovate, the sides of the leaves continuously convex; aerial tubers never present; perennial from rhizomes < 1.5 cm in diameter; [native species, usually of forests and woodlands]; [section Macropoda].**
2. **Staminate inflorescences usually of 1 large and 1-2 smaller secondary panicles in each axil (of upper stem leaves); filaments inwardly curved, ca. 0.4 mm long; anther lobes connate; tepals oblong; [of SC south]............................................................................................................. *D. floridana*
3. **Staminate inflorescence a single panicle in each axil (of median or upper leaves); filaments straight, ca. 0.2 mm long; anther lobes separate; tepals ovate; [widespread in our area].................................................................................................................. *D. villosa*
4. **Leaves halfberd-shaped or sagittate, the concave portion (of *D. polystachya*) or continuously convex (of *D. alata, D. bulbifera*); aerial tubers often present in the leaf axils; perennial from large, vertically-oriented tubers; [non-native species, usually in disturbed areas, especially in bottomlands]; [section Enantiophyllum].**
5. **Stems with 2-4 wings or angles.................................................................................................................................................................................. *D. alata**
6. **Stems terete.**
7. **Leaf margins sagittate, the sides continuously convex.......................................................................................................................................................................................................................... *D. bulbifera**
8. **Leaf margins halfberd-shaped, the sides with a concave portion .................................................................................................................................................................................................................................. *D. polystachya**

**Dioscorea floridana** Bartlett, Florida Wild Yam. Mesic to dry forests, swampy forests. June-July; August-November. SC south to n. FL, on the Coastal Plain. *D. floridana* is "the most distinctive of North American species" (Al-Shehbaz & Schubert 1989). [= FNA, K, S, WH, Y, Z; = D. villosa Linnaeus var. floridana (Bartlett) Ahles – RAB; = Merione sp. 1]

**Dioscorea villosa** Linnaeus, Wild Yam. Most forests and woodlands. April-June; September-November. NI, NY, s. ON, WI, MN, and IA south to n. FL and LA. Various specific and infraspecific taxa are here combined. Ward (1977c) states that "a recent study at Duke University by Shu-fan Au, unfinished due to the death of its author, tentatively recognized D. hirticaulis and *D. floridana* but combined all other entities without distinction under *D. villosa*." Further study is needed. Al-Shehbaz & Schubert (1989) indicate that the lectotype of *D. villosa* has pubescent stems; nomenclatural changes are apparently needed, if varietal status of the 2 varieties of *D. villosa* proves warranted. [= FNA, K, WH; > D. var. villosa – RAB, C; > Dioscorea villosa
49. STEMONACEAE Engler 1887 (Stemona Family) [in PANDANALES]

Croomia Torrey 1840 (Croomia)

Croomia pauciflora (Nuttall) Torrey, Croomia. Moist bluff forests, often with beech and basswood. April-May. Wc. GA and n. AL south to Panhandle FL (Gadsden & Liberty counties; Wunderlin & Hansen 2008), and allegedly se. GA (Whetstone in FNA 2002, Jones & Coile 1988) and s. LA. [= FNA, K, S, WH, Z]

53a. TRILLIACEAE Lindley 1846 (Trillium Family) [in LILIALES]

Trillium Linnaeus 1753 (Trillium, Toadshade, Wake-robin)

A genus of about 50 species, of e. North America, w. North America, and e. Asia (especially se. North America). The genus Trillium in our area is difficult and complex. Trillium is now usually separated from the Liliaceae (along with Eurasian genera such as Paris) into the Trilliaceae (Zomlefer 1996, Kato et al. 1995, Kawano & Kato 1995, and others) or less drastically as part of the Melanthiaceae (Chase et al. 2000; Tamura et al. 2004). The traditional division of the genus into two well-marked subgenera, subgenus Trillium, the pedicellate trilliums, and subgenus Phyllantherum, the sessile-flowered trilliums, has been partly supported by molecular and morphological phylogenetic studies (Kawano & Kato 1995, Kato et al. 1995). These studies support the monophyly of subgenus Phyllantherum, but suggest that subgenus Trillium consists of several groups which are only rather distantly related (Kawano & Kato 1995, Kazempour Osaloo et al. 1999; Farmer & Schilling 2002). Most species are slow-growing perennials; seedlings, juveniles, and depauperate or "tired" plants are one-leaved ("monilliums"), recognizable by the similar color, texture and venation of the single leaf to the three leaves of mature plants. In some species, such as T. pusillum, individual plants remain in the single-leaf stage for long periods of time, and populations may consist largely of juvenile plants. References: Patrick (1986)=Z; Patrick (2007)=V; Freeman (1975)=Y; Case & Case 1997=X; Patrick in Wofford (1989); Case in FNA (2002a); Mitchell (1990); Kato et al. (1995); Kawano & Kato (1995); Tamura in Kubitzki (1998a); Zomlefer (1996); Farmer & Schilling (2002). Key adapted from Patrick (1986, 2007), unpublished keys of J.D. Freeman and S. Farmer, and other sources.

Identification notes: Teratological forms are frequent in some species, as, for instance, leaves, sepals, and stamens in 2’s or 4’s, petals sepaloid, or sepals petaloid, and so forth. What are called “leaves” in Trillium are actually interpreted as bracts by some.

Key A – trilliums with sessile flowers and mottled leaves (subgenus Phyllantherum)

1 Scape more-or-less decumbent in a gentle S-shape, the leaves lying on the ground, or nearly so; flower fragrance putrid; [T. sessile group].
Key B – trilliums with unmottled leaves and pedicellate flowers, of the Erectum Group

1 Flowers held below the leaves (the pedicel declined below a horizontal plane).

2 Stamens far exceeding the pistil, filaments as long as the ovary or longer, at least partly maroon, the anther sacs yellow to maroon; ovary small, globose, 3-12 mm long, dark purplish black; flower fragrance pungent, rose-like; pedicel long, 3-13 cm long; petals strongly overlapping, usually maroon (rarely white or whish); ................................................................. T. vaseyi

3 Pedicels short, 1.5-3 cm long.

4 Anthers 7.5 mm long or less, about as long as the filaments or shorter; petals narrowly elliptic to obovate, often scarcely larger than the sepals, delicate, occasionally margined in pink or green; [of damp forests of n. VA and northwards] ................................................................. T. erectum

4 Anthers 7.0 mm long or more, longer than the filaments; petals ovate to elliptic, much broader than the sepals; [of moist forests of n. NC southwards] ........................................................................................................... T. rugelii

3 Pedicels long, 4-12 cm long.
5 Stamens about as long as the ovary or slightly longer; filaments short, ca. 1/3 the length of the anthers or shorter; filaments ½ as long as the ovary or shorter; pollen creamy to pale yellow; filaments and anthers white, the anthers at least in part somewhat appressed against the ovary. .................................................................................................................................  T. flexipes

5 Stamens far exceeding ovary height; filaments ca. ½ the length of the anthers; pollen creamy, yellow, or pale grayish purple; anthers and filaments also variable in color, mostly white, occasionally purplish; anthers mostly longer than the ovary and not appressed against it. .................................................................................................................................  T. species 2

1 Flowers held at or above the level of the leaves (the pedicel nearly horizontal, inclined above the horizontal, or erect).

6 Ovary flask-shaped, broadest near the base, usually white to pinkish (sometimes darker); petals usually white to creamy white (maroon forma occasional)

7 Stamens about as long as the ovary or slightly longer; filaments short, ca. 1/3 the length of the anthers or shorter; filaments ½ as long as the ovary or shorter; pollen creamy to pale yellow; filaments and anthers white, the anthers at least in part somewhat appressed against the ovary. .................................................................................................................................  T. flexipes

7 Stamens far exceeding ovary height; filaments ca. ½ the length of the anthers; pollen creamy, yellow, or pale grayish purple; anthers and filaments also variable in color, mostly white, occasionally purplish; anthers mostly longer than the ovary and not appressed against it. .................................................................................................................................  T. species 2

6 Ovary globose, widest near the middle, black to purplish black; petals white, maroon, yellowish, or otherwise.

8 Petals lanceolate to narrowly ovate or elliptic, spreading from base in the same plane as the sepals, rarely > 2× as broad as the sepals; sepals 0.5-0.8× as long as the pedicel. weakly sulcate-tipped (keeled and upturned near apex); flower fragrance unpleasant, musty...........

8 Petals ovate, overlapping in some instances and forming a cup-shaped base, variably recurved apically, > 2× as broad as the sepals; sepals < 0.5 as long as the pedicel, sulcate-tipped; fragrance pleasant, sweet to fungal.

9 Sepals 0.4-0.7× as long as the pedicel; leaves broadly elliptic; stamens 1.2-1.8× pistil height; flowers generally large, petals much longer than the sepals; sepals green; petals usually white (rarely maroon); flower fragrance sweet, like green apples; [of sw. NC and nw. SC in our area] .................................  T. simile

9 Sepals 0.2-0.4× as long as the pedicel; leaves broadly obovate; stamens 0.9-1.6× pistil height; flowers relatively small, petals only slightly longer than the sepals; sepals suffused with purple; petals usually maroon (rarely white); flower fragrance fungal, like fresh mushrooms; [of sw. VA and nw. NC in our area] .................................  T. sulcatum

Key C – trilliums with unnotched leaves and pedicellate flowers, of various origins

1 Petals white with triangular red blaze (rarely entirely white or pinkish); anther sacs lavender to white, dehiscence extrorse; pollen light yellow.

2 Pedicel inclined below the leaves (rarely erect); sepals arcuate-recurved; anthers irregularly twisted outward; pollen egg-yolk yellow........ .................................  T. catesbaei

2 Pedicel inclined above leaves to strictly erect; sepals not arcuate-recurred; anthers erect, regular; pollen light yellow.

3 Sepals narrower than the petals, acute; anthers white to greenish-white between the anther sacs; leaves oblong, acute, or acuminate; pedicel somewhat angled from the vertical.

4 Ovary sharply 6-angled (-winged); leaves < 5 cm long, blue-green, obtuse ..................................................  T. niveale

4 Ovary sharply 6-angled (-winged); leaves > 5 cm long, green, acute to acuminate.

5 Petals obovate, tightly rolled at base, abruptly flared near the apex; leaves broadly elliptic, acuminate; style minute, < 1.0 mm long 

.................................  T. grandflorum

5 petals elliptic, loose, gradually separating; leaves ovate, acute; style conspicuous, > 1.5 mm long .................................  T. persistens

6 Leaves with stomates on the upper surface, appearing farinose; [of n. GA] .................................  T. pusillum var. 2 “germanium”

7 Leaves without stomates on the upper surface, appearing glabrous.

7 Pedicels < 10 (-12) mm long.

8 Pedicels (0-) 0.5-1 mm long; leaves (1.5-) 2.0-2.4 (-2.9) × as long as broad; leaves (14-) 15-20 (-22.5) mm wide; filaments (4.5-) 6-5.8 (-8) mm long; [of upland woods of Mountains of w. VA and e. WV] .................................  T. pusillum var. monticulum

8 Pedicels (0.5-) 1-6.5 (-11) mm long; leaves (2-) 2.5-3.8 (-6) × as long as broad; leaves (6-) 10-17 (-25) mm wide; filaments (2.5-) 3-5.6 (-11) mm long; [of wetland woods].

9 Anthers (3.2-) 4.5-6 (-7) mm long; stamens (5.7-) 8.4-10.9 (-12.5) mm long; stigmas (1-) 2.1-3 (-5) mm long; leaves elliptic; [of the outer Coastal Plain of e. MD, e. VA, and ne. NC] .................................  T. pusillum var. 5 “palustris”

9 Anthers (2.5-) 2.7-4.8 (-6.8) mm long; stamens (5.7-) 6.9-12.2 (-13.2) mm long; stigmas (1-) 1.2-2.5 (-4.7) mm long; leaves ovate; [of the upper Coastal Plain and Piedmont of ne. NC, se. VA, and Mountains of sw. VA].

10 Pedicels (0.5-) 1-2.1 (-7) mm long; stamens (6-) 7.5-9.2 (-11) mm long; stigmas (1-) 2.5-4.7 (-7) mm long; leaves ovate; [of upper Coastal Plain of e. VA] .................................  T. pusillum var. virginianum

10 Pedicels (1.2-) 1.8-6.6 (-11) mm long; stamens (5.7-) 6.7-13.6 (-13.2) mm long; stigmas (1-) 1.2-2.5 (-2.5) mm long; [of Piedmont to edge of upper Coastal Plain of ne. NC] .................................  T. pusillum var. 4 “carolinanum”

7 Pedicels 10-56 mm long.

11 Leaves ascending; sepals ca. 1.4× as long as the petals; [of sphenagom bogs in the s. SC sandhills] .................................  T. pusillum var. 3 “telmacola”

11 Leaves horizontal to declining; sepals 0.9-1.1× as long as the petals.

12 Leaves narrower, (1.9-) 3.4-4.1 (-5.6) × as long as wide; pedicels (23-) 25-33 (-56) mm long; [of calcareous savannas and swamps] .................................  T. pusillum var. pusillum

12 Leaves broader, (2-) 2.7-3.4 (-5.5) × as long as wide; pedicels (7-) 13-30 (-45) mm long.

13 Leaves ovate, acute; [of sw. VA and nw. NC in our area] .................................  T. pusillum var. ozarkanum
**TRILLIACEAE**

13 Leaves elliptic, rounded; sepal (13-) 18-25 (-30) long, (4-) 6-8 (-12) mm wide, (1.8-) 2.7-3.1 (-4)× as long as wide; [generally of swamps and floodplains] ...............................................................................

**Trillium catesbaei** Elliott, Catesby’s Trillium, Bashful Trillium, Rosy Wake-robin. Bottomland forests, mesic slopes, cove forests. Late March-early June; July-August. Nc. NC south to sw. GA and se. AL, north in the interior to n. AL and se. TN, centered in the Piedmont from NC to GA, but extending into the Mountains and Coastal Plain. This species is morphologically and genetically complex and may include several semi-cryptic taxa. Petals white to pink. [= RAB, FNA, K, S, V, W, X, Z]

**Trillium cernuum** Linnaeus, Northern Nodding Trillium. Moist rich woods, seepage edges, damp forests with Fraxinus nigra and Ulmus americana. Late April-May. NL (Newfoundland), Hudson Bay area, and se. SK south to n. VA, nc. WV, n. IN, n. IL, n. IA, and SD. Petals white, pink, maroon, or green. [= FNA, K, W, WV, X, Z; < T. cernuum var. rugelii; > T. cernuum var. cernuum – C, G; > T. cernuum var. macranthum A.J. Eames & Wiegang – C, G]

**Trillium cuneatum** Rafinesque, Sweet Betsy, Purple Toadshade, Large Toadshade, Wedge-petal Trillium, Bloody Butcher. In rich soils of cove forests, moist slopes, and bottomlands, usually over mafic or calcareous rocks, locally abundant. Mid March-April; late May-June. Centered in the Southern Appalachians (but is more abundant in adjacent physiographic provinces), extending north to the Highland Rim of KY, west to the Interior Low Plateau of TN, south to the Coastal Plain of MS and AL, and east to the Piedmont of GA, SC, and NC. Petals maroon, yellow, green, or various intermediate shades. [= C, FNA, K, V, W, X, Y, Z; < T. cuneatum var. cuneatum – RAB; > T. cuneatum – F; > T. viride – F, misapplied with respect to NC material; < T. viride var. luteum (Muhlenberg) Gleason – G, misapplied (also see T. luteum); > T. hugeri Small – S; < T. underwoodii – S, misapplied]

**Trillium decipiens** J.D. Freeman, Chattahoochee Trillium, Deceptive Trillium. Moist forests. Late January-early April. FL Panhandle (Jackson and Walton counties) and sc. AL east to ec. GA, and in Abbeville Co. SC (L.L. Gaddy, pers. comm. 2009). It is similar to T. underwoodii. [= FNA, K, S, V, WH, X, Y, Z]

**Trillium decumbens** Harbison, Decumbent Trillium. Moist forests. Mid-March-April. Sc. TN (Chester et al. 1993) south and west to nw. GA and nc. AL, and disjunct in Houston County, in central GA Coastal Plain; it should be sought in extreme sw. NC, an extremely “under-botanized” area. [= FNA, K, S, X, Y, Z]

**Trillium discolor** Wray ex Hooker, Pale Yellow Trillium, Pale Trillium, Small Yellow Toadshade. Rich cove and bluff forests, restricted to the Savannah River drainage; rare. Late March-early May; June-July. Endemic to the Savannah River drainage of nw. SC, ne. GA, and sw. NC, occurring in the Blue Ridge and Piedmont. In NC it is restricted to a few sites along the Whitewater and Thompson Rivers. Petals pale yellow, with maroon or greenish claws. [= RAB, FNA, K, S, V, W, X, Y, Z]

**Trillium erectum** Linnaeus, Red Trillium, Purple Trillium, Stinking Willie, Stinking Benjamin, Wake-robin. Wooded slopes, usually at middle to high elevations. April-early June; July-August. NB, QC, and MI south to w. NC, nw. SC, n. GA, e. TN, IN, and se. WI. Petals maroon, white, yellow, green, or various intermediate shades. [= C, K, V, W, X, Z; < T. erectum var. erectum – RAB, WV (also see T. sulcatum); < T. erectum – F, G, S (also see T. sulcatum); > T. erectum var. erectum – FNA; > T. erectum var. album (Michaux) Pursh – FNA]

**Trillium flexipes** Rafinesque, Bent White Trillium. Moist coves over mafic or calcareous rocks. April. E. PA, s. ON and s. MN south to w. NC, nw. GA, n. AL, n. MS, mostly west of the Blue Ridge, but scattered in the Blue Ridge of NC, and disjunct east of the Blue Ridge in DE, PA, and MD. Petals white or maroon. [= C, F, FNA, K, V, W, X, Z; < T. erectum var. vaseyi – RAB; = T. glutoniom Fernald – G; = T. declinatum (A. Gray) Gleason – S, misapplied; = T. erectum var. declinatum – WV]

**Trillium foetidissimum** J.D. Freeman, Stinking Wake-robin. Bluffs, ravines, bottomlands. Late February-early April. MS west to LA. [= FNA, K, X, Y, Z; < T. ludovicianum Harbison – S]

**Trillium grandiflorum** (Michaux) Salisbury, Large-flowered Trillium, White Trillium, Great White Trillium. Rich coves and mesic slopes, also less typically on ridges over "rich" rock types. April-May; July-August. S. QC, s. ON, MI, and MN, south to NJ, c. NC, nw. SC, n. GA, n. AL, s. IL, and IA. Petals white to pink. [= RAB, C, F, FNA, K, G, S, V, W, WV, X, Z]

**Trillium lancifolium** Rafinesque, Lanceleaf Trillium, Narrowleaf Trillium. Rich forests over marble, limestone, and other calcareous substrates, floodplain forests. Late March-April. Se. TN south through w. GA and AL to Panhandle FL and se. AL. Petals purple, green, or greenish-purple. Material previously referred to this species from Kershaw County, SC represents the newly described T. oostingii. [= FNA, K, V, WH, Y, X, Z; < T. lancifolium (S. Watson) Boykin ex Small – RAB, S]

**Trillium ludovicianum** Harbison, Louisiana Wake-robin. Floodplains, streambanks, ravine forests. Early March-April. MS west to LA. Reports of this species for AL are based on specimens of Trillium species 3. [= FNA, K, X, Y, Z; < T. ludovicianum – S]
**Trillium luteum** (Muhlenberg) Harbison, Yellow Trillium, Yellow Toadshade, Wax Trillium, Lemon-scented Trillium. Moist coves over mafic or calcareous rocks, locally abundant in the vicinity of the Great Smokies. Mid March-April; late May-June. Nearly endemic to the Southern Appalachians: w. NC, e. TN, nw. GA, and s. KY, allegedly disjunct in c. AL (planted and naturalized in Frederick County, VA). Petals yellow. [= C, F, FNA, K, V, W, X, Y, Z; = T. cuneatum var. luteum (Muhlenberg) Ahles – RAB; < T. viride Beck var. luteum (Muhlenberg) Gleason – G (also see T. cuneatum); < T. sessile – S, misapplied]

**Trillium maculatum** Rafinesque, Mottled Trillium, Spotted Trillium. Rich forests and floodplains, over calcareous materials such as coquina limestone (“marl”) or on shell middens. Early February-mid April. S. SC south to n. FL, west to sc. AL. Petals maroon or yellow. [= FNA, K, V, WH, X, Y, Z; < T. viride – RAB, misapplied; < T. sessile – S, misapplied]

**Trillium nivale** Riddell, Snow Trillium, Dwarf White Trillium. Rocky, calcareous forests. Early March-early April. MA, sw. PA, MI, WI, s. MN, and e. SD south to n. VA, KY, s. IN, s. IL, s. MO, and se. NE. Petals white to pink. [= C, F, FNA, G, K, WV, X, Z]

**Trillium oostingii** Gaddy, Wateree River Trillium. Rich bottomland forests. Somewhat similar to T. lancifolium and T. recurvatum. So far as is known, endemic to Kershaw and Richland counties, SC, along the Wateree River. With clawed, bicolored petals (the claw maroon and the blade green) and green sepals reflexed somewhat (in the same plane as the drooping leaves). See Gaddy (2008) for additional information. [previously misidentified as T. lancifolium]

**Trillium persistens** Duncan, Persistent Trillium. Acidic forests with hemlocks and heaths. April. Endemic to a short stretch of the Tallulah-Tugaloo river system in nw. SC and ne. GA. Petals white to pink. [= FNA, K, V, W, X, Z]

**Trillium pusillum** Michaux var. monticulum Bodkin & Reveall. Dry to dry-mesic forests and woodlands, moist forests along small mountain streams. Endemic to nw. VA, e. WV, and w. MD. NC. Var. monticulum Bodkin & Reveall has been controversial; see Cabe (1995) and Cabe & Werth (1995) for additional discussion of variation within T. pusillum in Virginia and elsewhere. Petals white to pink. [< T. pusillum – Z; < T. pusillum var. virginianum – C, K; < T. pusillum var. pusillum – FNA; = T. pusillum var. monticola Bodkin & Reveall – X, orthographic error; = T. monticola in prep.]

**Trillium pusillum** Michaux var. ozarkanum (Palmer & Steyermark) Steyermark. Dry to dry-mesic slopes, in NC under Quercus coccinea and Kalmia latifolia. Centered in the Ozarks of sw. MO, nw. AR, and e. OK; disjunct eastward at scattered localities in sc. KY, nc. TN, sw. NC, and s. MS. Petals white to pink. [= K, X; < T. pusillum – RAB, G, S, Z; < T. pusillum var. pusillum – FNA; = T. ozarkanum Palmer & Steyermark]

**Trillium pusillum** Michaux var. pusillum, Carolina Least Trillium, Carolina Dwarf Trillium. Ecotones of calcareous savannas and swamp forests in the lower Coastal Plain. Late March-May; June-July. Endemic to the outer Coastal Plain of e. NC and e. SC. T. pusillum is somewhat reminiscent of a tiny T. grandiflorum. The T. pusillum complex has a wide but very fragmented range, involving most of the Southeastern states. In addition to the taxa treated here, the complex includes T. texanum Buckley (of e. TX). The Trillium pusillum complex is currently undergoing study by Susan Farmer (Univ. of Tennessee); preliminary analysis shows that the published varieties are "good" and that the recognition of additional taxa is warranted. Petals white to pink. [= X; < T. pusillum var. pusillum – C, F, FNA, K; < T. pusillum – RAB, G, S, Z; = T. pusillum (sensu stricto)]

**Trillium pusillum** Michaux var. virginianum Fernald, Virginia Least Trillium, Virginia Dwarf Trillium. Bottomland forests along small streams in the upper Coastal Plain, swamps and bottomland forests, also mesic beech islands in swamp forests. Late March-May; June-July. Var. virginianum occurs in the Coastal Plain of se. VA. Petals white to pink. [= F, FNA, X; < T. pusillum – RAB, G, S, Z; < T. pusillum var. virginianum – C, K (also see var. monticulum); = T. virginianum (Fernald) C.F. Reed]
**TRILLIACEAE**

**Trillium pusillum** Michaux var. 1, Alabama Least Trillium. Swamps and floodplains. C. TN south to n. AL. Petals white to pink. Under study by Susan Farmer. \(< T. pusillum var. pusillum – C, F, FNA, K; < T. pusillum – G, S, Z; = T. pusillum var. alabamicum – X (nomen nudum); = T. alabamicum in prep.\)

**Trillium pusillum** Michaux var. 2, Georgia Least Trillium. Hardwood flatwoods. Endemic to n. GA. Apparently most closely related to **Trillium texanum**. Petals white to pink. Under study by Susan Farmer. \(< T. pusillum – V; = T. georgianum in prep.\)

**Trillium pusillum** Michaux var. 3, Aiken Least Trillium. Seeage bogs. Endemic to se. SC. Petals white to pink. Under study by Susan Farmer. \(< T. pusillum; = T. telemacolua in prep.\)

**Trillium pusillum** Michaux var. 4, Carolina Least Trillium. Swampy forests, bottomland forests along small streams in the upper Coastal Plain. E. NC (upper Coastal Plain and adjacent Piedmont), moist mafic areas in Grayson Co. VA. The Grayson County site is within a kilometer of the Alleghany County, NC border, and the plant may be found to also occur in nw. NC. Petals white to pink. Under study by Susan Farmer. \(< T. pusillum; = T. carolinianum in prep.\)

**Trillium pusillum** Michaux var. 5, Dismal Swamp Least Trillium. Swampy forests. E. MD south to ne. NC. Petals white to pink. Under study by Susan Farmer. \(< T. pusillum; = T. palustris in prep.\)

**Trillium recurvatum** Beck, Prairie Trillium, Prairie Wake-robin. Rich soils of cove over calcareous rock. W. OH west to s. MI, s. WI, and e. IA, south to c. TN, c. AL, c. MS, n. LA, and e. TX; disjunct in the Cumberland Plateau of e. TN, e. KY, and the Blue Ridge and w. Piedmont of NC. The two known NC occurrences (Catawba and Madison counties) appear to be native. Petals maroon or yellow. \(= C, F, FNA, G, K, S, X, Y, Z\)

**Trillium reliquum** J.D. Freeman, Relict Trillium. Rich forests on bluffs and ravine slopes. Mid March-late April. Known from two disjunct areas, along the Savannah River in the vicinity of Augusta, on the border of SC (Aiken County) and GA (Richmond counties), and along the Chattahoochee River in sw. GA (Clay and Early counties). \(= FNA, K, V, X, Y, Z\)

**Trillium rugelii** Rendle, Southern Nodding Trillium. Rich woodlands and forests over mafic or calcareous rocks. April-early May. W. NC and e. TN south to c. GA, and c. AL. Petals white or maroon. \(= FNA, K, V, W, X, Z; < T. cernuum – RAB, F, S; < T. cernuum var. macranthum A.J. Eames & Wiegand – C, G\)

**Trillium sessile** Linnaeus, Sessile Trillium, Sessile Toadshade, Toad Trillium. Rich forests, in NC limited to very rich soils of natural levees and lower slopes along the Roanoke River. March-April. Primarily a species of the northern Midwest, **Trillium sessile** ranges from MD, w. PA, w. NY, s. MI, n. IL and n. MO, south to e. VA, ne. NC, c. TN, n. AL, and n. AR. The easternmost occurrences are disjunct populations east of the Blue Ridge, in MD, VA, and along the Roanoke River in ne. NC. Petals maroon or green. \(= C, F, FNA, G, K, W, WV, X, Y, Z\)

**Trillium simile** Gleason, Sweet White Trillium. Very rich soils of slopes and coves over mafic or calcareous rocks, often also in or near seepage. Late March-early May; June-July. A Southern Appalachian endemic: Blue Ridge of w. NC, nw. SC, e. TN, and n. GA. Petals white or very rarely maroon. \(= FNA, K, S, V, W, X, Z; < T. eurcetum var. vaseyi – RAB\)

**Trillium species 2**, Amicalola Trillium. Rich forests. Under study by Tom Patrick and Susan Farmer. Also recently found in SC. \(= T. amicalola Trillium – V\)

**Trillium stamineum** Harbison, Twisted Trillium. Floodplains, slopes, especially over limestone. Late March-mid May. C. TN (Chester et al. 1993) south to c. AL and e. MS. \(= FNA, K, S, X, Y, Z\)

**Trillium sulcatum** T. Patrick, Southern Red Trillium, Barksdale’s Trillium. Coves and moist slopes. April-May. Primarily a species of the sedimentary rock Appalachians, **Trillium sulcatum** ranges from s. WV, sw. VA, and e. KY south to nw. NC (where it enters the Blue Ridge), w. TN, nw. GA, and ne. AL. This species seems quite distinctive for its small, generally maroon flowers (with strongly sulcate sepal purplish as well), borne on very long pedicels. Petals maroon or white. \(= C, F, FNA, K, V, W, X, Z; < T. eurcetum var. eurcetum – RAB, WV; < T. eurcetum – F, G, S\)

**Trillium underwoodii** Small, Underwood’s Trillium. Moist forests. Late February-mid April. N. FL north to wc. GA and c. and s. AL. The only erect trillium with the stems typically < 2× as long as the leaves (though sometimes elongating later in the season). \(= FNA, K, S, V, WH, X, Y, Z\)
**TRILLIACEAE**

*Trillium undulatum* Willdenow, Painted Trillium, Striped Wake-robin. Acidic soils of ridges, slopes, and bog margins, mostly at high elevations and often associated with *Rhododendron, Tsuga, Pinus, or Picea*. Late April-May; late July-August. NB, e. QC, s. ON, and MI, south to w. NC, nw. SC, n. GA, e. TN, and ne. OH. Of all our species, this is the species best adapted to acidic soils. Petals white with a red blaze. [= RAB, C, F, FNA, G, K, S, V, W, WV, X, Z]

*Trillium vaseyi* Harbison, Sweet Trillium, Vasey’s Trillium, Sweet Beth. Cove forests, other rich forests. Late April-early June. This species is a Southern Appalachian endemic: w. NC and e. TN south to nw. SC, n. GA, and ne. AL. Perhaps the largest trillium species, with the stems to 7 dm tall. Petals maroon or white. [= FNA, K, S, V, W, X; < *T. erectum* var. *vaseyi* (Harbison) Ahles – RAB (also see *T. simile* and *T. flexipes*)]

---

### 53b. XEROPHYLLACEAE

Takhtajan 1994 (Beargrass Family) [in LILIALES]

*Xerophyllum* Michaux 1803 (Turkeybeard, Beargrass)

*Xerophyllum asphodeloides* (Linnaeus) Nuttall, Turkeybeard, Beargrass, Mountain-asphodel. Dry ridges and slopes in the mountains, primarily in dry, strongly acidic sites which burn periodically, such as pine/heath woodlands and forests, heath balds, and xeric oak forests, most of the populations in the Blue Ridge Escarpment, often associated with *Pinus rigida* or *P. pungens*, disjunct to similar sites on quartzite monadnocks of the upper Piedmont, in the Coastal Plain in acidic pinelands. May-June; July-August. In two disjunct areas; the Coastal Plain of s. NJ and DE, and the Southern Appalachians from w. VA and e. WV south to e. TN, w. NC, nw. SC, and ne. GA. Sterile plants resemble tussocks of a bunchgrass, but the leaf bases are white and flattened and are obviously not those of a grass. The leaves remain green throughout the winter. [= RAB, C, F, FNA, G, K, W, WV, Z]

---

### 53c. HELONIADACEAE

J. Agardh 1858 (Swamp-pink Family) [in LILIALES]

1 Flowers white to cream; plants dioecious (individual flowers either male or female) .............................................................. *Chamaelirium*

1 Flowers pink; plants hermaphroditic (individual flowers perfect) ........................................................................................ *Helonias*

*Chamaelirium* Willdenow 1808 (Devil's-bit)

*Chamaelirium luteum* (Linnaeus) A. Gray, Devil's-bit. Moist slopes, bottomlands, wet savannas. March-May; September-November. MA west to ON, OH, s. IN, and AR, south to FL and LA. The ecological amplitude and morphologic variability of this species is surprising; it needs additional, more careful, study. *C. obovale* Small (or other previously unnamed entities) may warrant recognition at some level. [= RAB, C, F, FNA, G, GW, K, W, WH, Z; > *C. luteum* – S; > *C. obovale* Small – S]

*Helonias* Linnaeus 1753 (Swamp Pink)

A monotypic genus, an herb of temperate e. North America. Although *Helonias* has traditionally been considered a monotypic genus, Takahashi & Kawano (1989) have suggested that the closely related *Heloniopsis* and *Ypsilandra* (both of e. Asia) may be congeneric. Perhaps better to be placed in the segregate family Heloniadaceae. References: Zomlefer (1997a)=Z; Utech in FNA (2002a); Tamura in Kubitzki (1998a).
HELONIADACEAE

Helonias bullata Linnaeus, Swamp Pink. Bogs, usually under dense shrubs in peaty soils, in the VA Coastal Plain in acidic sandy seepage swamps. April-May; June-July. S. NY and NJ to e. VA on the Coastal Plain, and from w. VA through w. NC to nw. SC and ne. GA (Jones & Coile 1988) in the Blue Ridge Mountains. The flowering scape elongates markedly in fruit, reaching 1 m in height. [= RAB, C, F, FNA, GW, G, K, S, W, Z]

53d. MELANTHIACEAE Batsch 1802 (Bunchflower Family) [in LILIALES]

A family of about 8 genera and 80 species, mostly temperate and northern hemisphere, but extending into South America (Peru). References: Dahlgren, Clifford, & Yeo (1985); Zomlefer (1997a)=Z; Zomlefer (1996, 2003); Tamura in Kubitzki (1998a); Tamura et al. (2004); Zomlefer et al. (2001).

Amianthium A. Gray 1837 (Fly-poison)

Anticlea Kunth 1843 (Death-camas)

Anticlea glauca Kunth, White Death-camas. Limestone and dolostone woodlands, glades, cliffs, and outcrops. July-August; September-October. A. glauca is the more eastern component of a complex variously treated as two species or a single variable species, with or without recognized varieties or subspecies. A. elegans (in the broadest sense) ranges from QC and NY west to AK, south to n. OH, n. IN, n. IL, MO, IA, NM, AZ, and n. Mexico; disjunct in the mountains of w. VA, e. WV, and w. NC. Two taxa have often been recognized, at the specific, subspecific, or varietal level. The more eastern taxon (epithet "glauca" – see synonymy below) ranges from NB west to ND, south to w. NC, TN, and MO, and is distinguished by glaucous foliage, paniculate inflorescence, and tepals often purplish or brownish basally. The more western taxon (epithet "elegans"), occurring east to the MN and MO, has the foliage greener, the inflorescence often only racemose, and the tepals yellow. [= Anticlea elegans (Pursh) Rydberg – Y; = Zigadenus elegans Pursh ssp. glauca (Nuttall) Hultén – K; = Zigadenus glaucus Nuttall – RAB, F, FNA, G, K, S, W, Z; = Zigadenus elegans var. glauca (Nuttall) Preece – C; = Zigadenus elegans – FNA; = Zigadenus glaucus – G; < Anticlea chlorantha (Richardson) Rydberg – S, misapplied; = A. elegans ssp. glauca (Nuttall) A. Haines; = A. elegans var. glauca (Nuttall) Zomlefer & Judd]
Schoenocaulon A. Gray 1837 (Feathershank)

*Schoenocaulon dubium* (Michaux) Small, Florida Feathershank. Dry pine savannas, sandhills, scrub. S. GA and n. peninsular FL south to s. peninsular FL. [= FNA, K, S, WH, Z]

Stenanthium (A. Gray) Kunth 1843 (Featherbells, Featherfleece)

1 Tepals obovate, the tip rounded-obtuse.

2 Inflorescence a raceme; flowers all bisexual; plants 3-10 dm tall; flowering April-early June; [of the Coastal Plain (in our area)]

3 Inflorescence branched but not diffuse, typically up to 1.5 dm wide, the terminal racemose portion present and up to 3 dm long; flowers on mid-portion of lateral branches with pedicels 0.3-1.1 mm long, generally spaced 3-7 mm apart; uppermost non-bracteal stem leaf 22-66 mm above ground level; flowering May-late August; [of sandstone rockhouses of the Cumberland Plateau] ...

4 Larger leaves to 15 mm wide, firm to coriaceous, strongly ribbed; panicle diffuse, the branches ascending, spreading, or drooping, the flowers scattered; perianth 3-8 (-10) mm long, whitish; capsules ovoid to urceolate, 6-9 mm long, deflexed; seeds 5-5.5 mm long; leaves mainly near the base, rapidly reduced upwards; plant to 1.9 m tall and the stem to 2 cm in diameter near its base; [of dry to moist upland forests].
5 Perianth 5-10 mm long; plant to 1.9 m tall, the stem 4-10 mm in diameter near the base .......................

4 Larger leaves to 30 mm wide, thin and membranous-translucent, not strongly ribbed; panicle dense, the branches stiffly ascending, the flowers crowded; perianth 5-10 mm long, greenish; capsules oblong or subcylindric, 9-10 mm long, erect; seeds 5-8 mm long; leaves distributed all along the stem, nearly as dense just below the panicle as at the base; plant to 2.2 m tall and the stem to 2 cm in diameter near its base; [of bogs and wet meadows] ...

5 Perianth 3-4.5 (-5.0) mm  long; plant to 1.0 m tall, the stem 1.5-5 mm in diameter near the base ..........
6 Inflorescence a panicle of racemes; lower flowers of the inflorescence branches bisexual and fertile, the upper staminate or superficially perfect but the pistils nonfunctional (not producing fruits); plants 4-20 dm tall; flowering July-August; [of the Mountains of NC and VA and Coastal Plain of GA westward to LA] ...

5 Perianth 5-10 mm long; plant to 1.9 m tall, the stem 4-10 mm in diameter near the base ...S. gramineum var. gramineum
6 Inflorescence a raceme; flowers all bisexual; plants 3-10 dm tall; flowering April-early June; [of the Coastal Plain (in our area)] ...

5 Perianth 3-4.5 (-5.0) mm long; plant to 1.0 m tall, the stem 1.5-5 mm in diameter near the base ...S. gramineum var. micranthum

Stenanthium densum (Desrousseaux) Zomlefer & Judd, Crow-poison. Pine savannas, pine flatwoods. April-early June; late May-July. Se. VA south to c. peninsular FL and west to se. TX, on the Coastal Plain. See *Z. leimanthoides* for discussion of the taxonomy of the 2 species. *Z. densum* is superficially very similar to *Amanthium muscitoxicum*; *Z. densum* has a conical capsule, 2-5 or more as long as broad (vs. about 1× as long as broad), a bladeless purple sheath, 3-8 cm long, enclosing the leaves at the base (vs. sheath absent, all leaves with blades), and basal leaves usually 1-3 in number, 3-6 (-10) mm wide (vs. mostly 4 or more in number, mostly 7-10 mm wide). [= Y; = *Zigadenus densus* (Desrousseaux) Fernald – RAB, C, GW, K, Z; < *Zigadenus densus* (Desrousseaux) Fernald – FNA, WH (also including *S. leimanthoides*); = *Zigadenus densus* – G (an orthographic variant); = *Tracyanthus angustifolius* (Michaux) Small – S]

Stenanthium gramineum (Ker-Gawler) Morong var. gramineum, Common Featherbells. Moist forests, grassy balds, to 1700m in elevation. July-early September; August-October. PA west to IL and MO, south to ne. NC, Panhandle FL, and TX. [= F, K; < *S. gramineum* – RAB, C, FNA, G, S, W, WH, Z; < *S. gramineum var. gramineum* – WV]
**Veratrum Linnaeus 1753 (White-hellebore)**

A genus of about 30-55 species, herbs of temperate Northern Hemisphere. *Veratrum* is here interpreted broadly, including *Melanthium*, following the molecular phylogeny work of Zomlefer et al. (2003). A proposal to conserve the name *Veratrum* against *Melanthium* has been made but not yet ruled on (Zomlefer, Judd, & Gandhi 2010). References: Zomlefer (1997) = Z; McNeal & Shaw in FNA (2002a); Bodkin & Utech in FNA (2002a); Tamura in Kubitzki (1998a); Zomlefer et al. (2003).

1 Leaves all linear, 1-2 (-3) cm wide; tepals greenish white to creamy white (sometimes fading brownish); **[section Fuscoveratrum]** .......................................................... **V. virginicum**

1 Leaves (at least the basal) oblong-lanceolate to obovate or elliptic, 3-15 cm wide (the upper leaves sometimes linear); tepals yellowish green, green, or maroon.

2 Leaves strongly plicate, 6-15 cm wide; tepals pubescent, 8-13 mm long, 3-5 mm wide, with a conspicuous pair of glands near the base of the tepal blade (these sometimes more or less fused); filament free from the tepals; **[section Veratrum]** .......................................................... **V. viride**

2 Leaves not at all to slightly plicate, 3-14 cm wide; tepals glabrous, 4-9 mm long, 1-3 mm wide (3-5 mm wide in *V. latifolium*), with either conspicuous (of *V. latifolium* or diffuse (of *V. parviflorum* and *V. woodii*) glands; filament fused to the basal claw of the tepal; **[section Fuscoveratrum]**.

3 Tepals 3-5 mm wide, the blade of the tepal abruptly narrowed to a claw, the blade nearly as wide as long, with undulate margins, and 2 conspicuous succulent glands; leaves 1-7 cm wide .......................................................... **V. species 1**

3 Tepals 1-3 mm wide, the blade gradually narrowed to the base, the blade much longer than wide, with entire margins, and with diffuse glandular areas; leaves 3-12.5 cm wide.

4 Tepals pale to olive green, 4-7 mm long; ovaries glabrous; leaves 4.5-14 cm wide; [common, of the Mountains in our area] ............. **[V. parviflorum]**

4 Tepals dark maroon, 6-9 mm long; ovaries densely pubescent; leaves 3-10 cm wide; [rare disjunct in our area] ............. **V. woodii**

**Veratrum species 1**, Crisped Bunchflower. Moist to dry forests. July-August; September-October. An Appalachian endemic: CT south to NC, SC, and n. GA. The basionym with priority is apparently *Melanthium hybridum*; the combination in *Veratrum* has not yet been made (Ward 2010; Weakley, in prep.). = *Veratrum latifolium* (Desrousseaux) Zomlefer – Z; *Melanthium hybridum* Walter – RAB, C, F, G, W, WV; = *Melanthium latifolium* Desrousseaux – FNA, K, S

**Veratrum virginicum** (Linnaeus) Aiton, Bog Bunchflower, Virginia Bunchflower. Savannas, bogs, seepage bogs, wet forests. June-August; August-October. S. NY, PA, OH, IN, IL, and IA south to c. peninsular FL and e. TX. This species is superficially quite similar to *Zigadenus glabrerrimum*, which, in addition to characters given in the family key, has the stem glabrous (vs. pubescent in *M. virginicum*). = WH, Z; = *Melanthium virginicum* Linnaeus – RAB, C, F, FNA, G, GW, K, W, WV; = *Melanthium dispersum* Small – S; = *Melanthium virginicum* – S

**Veratrum viride** Aiton, White-hellebore, Indian Poke, Green Hellebore, Cornhusk Lily. Seeps, streambanks, wet boulderfields. June-August; July-September. QC and ON south in the mountains to NC, TN, and ne. GA. The closely related *V. eschscholtzii* A. Gray, sometimes treated as *V. viridessp. eschscholtzii* (A. Gray) A. & D. Löve or *V. viride var. eschscholtzii* (A. Gray) Breitung, is western, ranging from AK to OR. This plant is strongly poisonous; an insecticide was formerly manufactured from the roots. = RAB, C, F, G, W, S, WV, Z; = *V. viride* – K; = *V. viride var. viride* – FNA; = *V. viridessp. viride*

**Veratrum woodii** J.W. Robbins ex Wood, Ozark Bunchflower, Wood’s False-hellebore. Circumneutral soil of woodlands over mafic rocks (such as amphibolite) or other calcareous substrates, hammocks. July; September. Primarily Ozarkian, but
extending in scattered populations eastwards as far as FL Panhandle (Gadsden and Liberty counties), sw. GA, nw. GA, sc. TN, nw. SC (Pickens County), and sw. NC (Polk County). [= C, F, G, Z; = Melanthium woodii (J.W. Robbins ex Wood) Bodkin – FNA, K; > V. intermedium Chapman – S]

Zigadenus Michaux 1803 (Death-camass)

As redefined, a monotypic genus of se. North America. A molecular systematics study by Zomlefer et al. (2001) gives strong support to a treatment recognizing Zigadenus as monotypic (Zigadenus glaberrimus), Anticlea (including for our area the former Zigadenus elegans ssp. glaucus), Stenanthium (including for our area Stenanthium spp. and the former Zigadenus densus and Z. leimanthoides). Zigadenus (as redefined) has a tentatively reported chromosome number of 2n=52 (Zomlefer & Smith 2002). References: Zomlefer (1997)=Z; Tamura in Kubitzki (1998a); Zomlefer et al. (2001); Schwartz in FNA (2002a). [also see Anticlea, Stenanthium]

Zigadenus glaberrimus Michaux, Large Death-camass, Snakeroot. Sandhill seepage bogs, pine savannas, pocosin edges. Late June-early September; August-November. Se. VA south to Panhandle FL, west to se. TX, on the Coastal Plain. [= RAB, C, F, FNA, GW, K, WH, Z; = Zygadenus glaberrimus – G, S (orthographic variant)]

55. ALSTROEMERIAE Dumortier 1829 (Peruvian-lily Family) [in LILIALES]

A family of 5 genera and about 170 species, perennial herbs, of Central and South America. References: Holmes in FNA (2002a).

Alstroemeria (Peruvian-lily, Alstroemeria)

A genus of about 60 species, perennials, of South America. References: Holmes in FNA (2002a).

* Alstroemeria pulchella Linnaeus f., Peruvian-lily. Disturbed areas, roadsides near plantings; native of Brazil. Naturalized in GA, FL, AL, MS, LA, and TX (Holmes in FNA 2002; Singhurst, Keith, & Holmes 2005). [= FNA, WH]

56. COLCHICACEAE A.P. de Candolle 1805 (Meadow Saffron Family) [in LILIALES]

As here circumscribed, a family of about 15 genera and about 250 species, nearly cosmopolitan. References: Vinnersten & Manning (2007); Dahlgren, Clifford, & Yeo (1985); Nordenstam in Kubitzki (1998a).

1 Plant acaulescent, from a tunicated bulb; [tribe Colchiceae] ........................................................................................................ Colchicum

1 Plant with leafy stem, from a rhizome or tuber.

2 Tepals red or orange, reflexed; leaves attenuate into a tendril-like tip; [alien]; [tribe Colchiceae] ........................................................................ Gloriosa

2 Tepals yellow, not reflexed; leaves acute to obtuse; [native]; [tribe Uvularieae] ......................................................................................... Uvularia

Colchicum Linnaeus 1753 (Meadow Saffron)

* Colchicum autumnale Linnaeus, Meadow Saffron, Autumn-crocus. Planted as an ornamental, at least long-persistent; native of s. Europe. September-October. [= C, F, G, K]

Gloriosa Linnaeus 1753 (Flamellily)

A genus of about 5 species, perennials, native of Africa and Asia.

* Gloriosa superba Linnaeus, Flamellily, Glory-lily. Disturbed areas; native of tropical Africa. [= FNA, K, WH]
COLCHICACEAE

Uvularia Linnaeus 1753 (Bellwort, Merrybells)

1 Leaves perfoliate, the margins scarious but smooth; upper stems terete in cross-section, hollow; [section Uvularia].
2 Tepals glabrous within; leaves puberulent beneath (or rarely glabrate); leaves below the fork (0-) 1 (-2) .................................................. U. grandiflora
3 Undivided portion of the style 0.5-1× as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; rhizome very short, with clustered, thickened roots. ......................................................................................................................... U. perfoliata
4 Pedicel bearing a sessile, leaf-like bract 5-17 mm below the flower; capsule sessile at base, conspicuously beaked at apex .................................................. U. floridana
5 Pedicel bractless; capsule on a stalk 2-4 (-6) mm long, not beaked. .................................................................................................................... U. sessilifolia

Uvularia perfoliata Linnaeus, Perfoliate Bellwort. Moist to fairly dry hardwood forests. April-early May; June-August. S. NH, s. ON, and c. OH, south to Panhandle FL and LA. [= RAB, C, F, FNA, G, K, S, WH, WV, Z]

Uvularia puberula Michaux, Carolina Bellwort, Appalachiian Bellwort, Coastal Bellwort. Dry to moist upland, acidic forests, up to at least 1500m. Early April-Early May; August-October. Sometimes interpreted as having two varieties, the montane and Piedmont plants as var. puberula (leaves broader, rounded to slightly clasping at the base, firm in texture, obviously reticulate on the lower surface, the stem puberulent in lines on the ridges) and var. nitida (Britton) Fernald (leaves narrower, more cuneate, thin in texture, the reticulation of cross veins less evident, the stems glabrous); see Wilbur (1963b) and Uttal (1991). S. PA to GA in the Mountains and (more rarely) Piedmont, and from Long Island NY south to GA in the Coastal Plain and Sandhills. While Wilbur (1963b) chose not to recognize varieties, Uttal (1991) supports varietal recognition. The differences seem minor and variable, and poorly correlated with geography. [= FNA, K, W, Z; > Uvularia puberula Michaux var. puberula – C, Y; > Uvularia puberula Michaux var. nitida (Britton) Fernald – C, Y; = U. pudica (Walter) Fernald – RAB, WH, WV, nomen dubium; > U. pudica var. pudica – F, G; > U. pudica var. nitida (Britton) Fernald – F, G; = Oakesiella puberula (Michaux) Small – S; = Uvularia caroliniana (J.F. Gmelin) Wilbur]

Uvularia sessilifolia Linnaeus, Straw-lily, Wild-oats. Moist hardwood forests, on slopes and mainly in bottomlands. Late March-early May; August-October. NS west to ND, south to Panhandle FL and n. LA. [= RAB, C, F, FNA, K, W, WH, WV, Z; = Oakesiella sessilifolia (Linnaeus) S. Watson – S]

59. SMILACACEAE Ventenat 1799 (Greenbrier Family) [in LILIALES]

A family of 3-12 genera and about 375 species, widespread in tropical, subtropical, and temperate regions. References: Holmes in FNA (2002a); Judd (1998); Conran in Kubitzki (1998a).

Smilax Linnaeus 1753 (Greenbrier, Carrionflower, Smilax)

A genus of about 300 species, woody vines and herbs, subcosmopolitan in temperate and tropical regions. Our deciduous species are a monophyletic group within *Smilax*, with a classic eastern North American - east Asian disjunction, and are treated as section Nemexia or subgenus Luiste (Wilbur 2004, Fu et al. 2005). *Smilax* berries and shoots provide important food sources for many

1. Stem herbaceous, lacking prickles; ovules 2 per carpel; peduncles usually > 4 cm long; [section Nemexia].

2. Plants erect, 0.2-1.0 m tall, even when well-developed with < 20 leaves [note that immature or depauperate individuals (nonflowering) of *S. pseudochina*, *S. herbacea*, *S. lasioneura*, and *S. pulverulenta* often have this aspect]; tendrils absent or rudimentary; peduncles usually few (usually 1-4), the lowest often from bract axils.

3. Leaves glabrous and glaucous beneath, thick in texture, base cordate, tip acute or acuminate; lowest peduncle from a leaf axil (very rarely from bract axil), upper peduncles from leaf axils; leaves 5-7, clustered together near the summit of the stem ..........*S. biltmoreana*.

4. Leaves pubescent and green (or glaucous) beneath, usually thin in texture, base cordate, truncate, or rounded, tip acuminate, acute, or obtuse; lowest peduncles from axils of bracts below the lowest leaves, upper peduncles also often from bracts (the uppermost often from leaf axils); leaves either clustered together near the summit of the stem or well distributed.

5. Leaves relatively many, (7-) 10-13 (-20), often well distributed in the upper half of the stem, notably reduced in size from lower to upper, mostly with the base cordate and the tip acuminate; berry 3-5 seeded ..........*S. eicirrata*.

6. Leaves few, usually 4-8, usually clustered together near the summit of the stem (rarely well distributed), about the same size, mostly with the base ovate (to suborbicular), the tip acute to obtuse; berry 2-3 seeded ..................................................*S. hugeri*.

7. Plants vine-like, climbing or sprawling, to 3 m tall, when well-developed with > 30 leaves; tendrils present and numerous; peduncles usually many, from leaf axils.

8. Leaf bases hastate, the leaf margins straight or concave in outline; longest fruiting pedicels < 2× as long as the fruit; anthers equaling or longer than the filaments; perianth 1.5-2.5 mm long; leaves glabrous and glaucous beneath ............................................................*S. hispida*.

9. Leaf bases cordate, the leaf margins convex in outline; longest fruiting pedicels 2× or more as long as the fruit; anthers shorter than the filaments; perianth 3.5-6 mm long; leaves either puberulent beneath (at least along the veins), or glabrous and glaucous beneath. .........*S. pentandra*.

10. Leaves glabrous and glaucous on the lower surface; fruit dark blue and glaucous; peduncles 5-8× as long as the subtending petioles ...............*S. herbacea*.

11. Leaves puberulent on the lower surface, at least on the veins; fruit dark blue and glaucous or black and not glaucous; peduncles 1-10× as long as the subtending petioles.

12. Leaves bright green and shiny beneath; fruit black, not glaucous; peduncles 1-2 (-3)× as long as the subtending petioles .............................................*S. pulverulenta*.

13. Leaves pale green and dull below; fruit dark blue, glaucous; peduncles (3-) 5-10× as long as the subtending petioles .............................................*S. lasioneura*.

14. Plants vine-like, climbing or sprawling, to 3 m tall, when well-developed with > 30 leaves; tendrils present and numerous; peduncles usually many, from leaf axils.

15. Stem woody, usually with prickles; ovules 1 per carpel; peduncles usually < 3 cm long; [section China].

8. Stems and petioles tomentose, lacking prickles; leaves densely tomentose beneath; berries red; plant trailing or ascending, rarely > 0.5 m tall (with determinate growth) ........................................................................*S. herbacea*.

9. Stems and petioles stellate-scurfy or glabrous, generally with prickles; leaves glabrous or papillate beneath; berries red, black, or dark blue; plant trailing, ascending, or trailing, mature plants generally well over 0.5 m tall (with indeterminate growth). ..........................................................*S. herbacea*.

10. Prickles of the stem abundant, thin and needle-like, shiny brown or black ......................................................................................*S. hugeri*.

11. Prickles of the stem fewer, broad-based and awl-like or catclaw-like, green, brown, or black. .................................................................*S. hispida*.

1. Midvein (as seen on the lower surface) much more pronounced than the principal lateral veins, which are scarcely raised; leaves evergreen, thick, coriaceous. ..............................................................*S. lasioneura*.

2. Midvein (as seen on the lower surface) little if any more pronounced than the principal lateral veins; leaves evergreen or deciduous, thin, subcoriaceous.

3. Leaves mostly lanceolate, the base cuneate, the tip acute to acuminate; berries dull red ....................................................*S. smallii*.

4. Leaves mostly ovate, oblong, pandurate, or hastate, the base cordate, truncate, rounded, or cuneate, the tip rounded to acute; berries various in color.

5. Margin of the leaf blade prominently thickened with a marginal vein (this appearing as a thickening, a visible vein, or an apparent revolute margin); berries with 1-3 seeds. ..............................................................*S. hispida*.

6. Inflorescence peduncle (stalk of the umbel) as long or shorter than the subtending leaf petiole; stems and prickles glabrous; leaves evergreen; berries usually with 2-3 seeds; [generally of xeric or less commonly mesic sands] .............................................................*S. acuminata*.

7. Inflorescence peduncle (stalk of the umbel) > 1.5× as long as the subtending leaf petiole; stems (especially the lower) and prickles brownish stellate-scurfy; leaves semi-evergreen to evergreen; berries usually with 1 seed; [of a wide variety of habitats] ..............................................................*S. bonanox*.

8. Margin of the leaf blade thin, sometimes revolute; berries with (1-) 2-4 seeds. .............................................................*S. acuminata*.

9. Berries blue-black; perianth green; leaves semi-evergreen to evergreen, margins of mature leaves generally not revolute, the margins of the leaves and the petioles often with minute, flattish, tooth-like projections; berries with (1-3) 2-3 seeds; [a wide variety of upland and wetland habitats] .............................................................*S. rotundifolia*.

10. Berries bright red; perianth brownish-yellow; leaves deciduous, margins of mature leaves usually revolute, the margins of the leaves and the petioles lacking minute, flattish, toothlike projections; berries with 2-4 seeds; [swamp forests, bogs, often where submersed at least for part of the year] .............................................................*S. waltonii*.

---

**Smilax auriculata** Walter, Dune Greenbrier. Dunes on barrier islands, dry sandy openings in maritime forests or sandhills (northwards, as in the Carolinas, limited to sites near the near the coast). May-July; October-November (and persisting). E. NC (Dare County) south to s. FL and west to LA; Bahama Islands. [= RAB, FNA, GW, K, S, WH, Y].

**Smilax biltmoreana** (Small) J.B.S. Norton ex Pennell, Biltmore Carriionflower. Dry forests (such as dry pine ridges and chestnut oak forests) and moist forests. April-May; August-October. The species is apparently limited to to NC, SC, and GA, primarily in the Blue Ridge Escarpment region, with disjunct occurrences in Panhandle FL, s. AL, and se. KY. [= FNA, K, W, Y, Z; = *Smilax eicirrata* (Engelmann ex Kunth) S. Watson var. *biltmoreana* (Small) Ahles – RAB; < *S. eicirrata* – G, WH; = *Nemexia biltmoreana* Small – S].
**SMILACACEAE**

*Smilax bona-nox* Linnaeus, Catbrier, Tramp's-trouble. In a wide variety of upland and wetland habitats. Late April–May; September–November. MD and MO south to s. FL and TX, and also in Mexico. [= RAB, C, FNA, GW, K, S, W, WH, Y; > S. bona-nox var. hastata (Wildenow) Alphonse de Candolle – F; > S. bona-nox var. exauriculata Fernald – F; > S. bona-nox var. hederifolia (Beyrich) Fernald – F; > S. bona-nox var. bona-nox – F]

*Smilax glauca* Walter, Whitleaf Greenbrier, Wild Sarsaparilla. In a wide variety of upland and wetland habitats. Late April–June; September–November (and persisting). NJ, e. PA, OH, IN, MO, and KA, south to c. peninsular FL and TX, and also in Mexico. [= RAB, C, FNA, GW, S, W, Y; > S. glauca var. glauca – F, G, K, WV; > S. glauca var. leurophylla Blake – F, G, K, WV]

*Smilax herbacea* Linnaeus, Common Carrionflower. Moist deciduous forests. May–June; August–October. Centered in the Appalachian Mountains, from QC and ME west to OH, south to AL, GA, and TN. Young, non-flowering plants closely resemble *S. biltmoreana*. [= F, FNA, K, W, WV, Y; = Nemexia herbacea (Linnaeus) Small – S]

*Smilax hispida* Rafinesque, Bristly Greenbrier, Hellfetter. Moist to wet forests. CT, NY, MN, and NE south to s. FL and TX. Wilbur (2003) discusses the complicated nomenclatural problems involving this plant and concludes that *S. hispida* Raf. is the correct name. [= RAB, C, G, S, WV; = S. tannoides Linnaeus – FNA, GW, K, W, WH, Y, misapplied; > S. tannoides var. hispida (Muhlenberg) Fernald – F; > S. tannoides var. tannoides – F; > S. hispida var. australis Small – S; > S. hispida var. hispida – S]

*Smilax lasioneura* Hooker, Midwestern Carrionflower. Moist deciduous forests, hammocks, bluff forests, pine-oak hickory submesic forests, perhaps only or primarily over mafic rocks. April–May; August–September. ON and MT south to w. VA (?), w. NC, Panhandle FL, OK, and CO. Material from VA is ambiguous. [= F, FNA, K; > S. herbacea var. lasioneura (Hooker) Alphonse de Candolle – C, G; = Nemexia lasioneura (Hooker) Rydberg – S; > S. lasioneurn – WH, Y, orthographic variant]

*Smilax laurifolia* Linnaeus, Blaspheme-vine, Bamboo-vine. Pocosins, swamp forests, mountain bogs in sw. NC. July–August, September–October of the second year (and persisting). Primarily a Southeastern Coastal Plain species: NJ south to s. FL, west to w. TN, AR, and e. TX, and also in the Bahama Islands and Cuba. [= RAB, C, F, FNA, GW, K, W, WH, Y]

*Smilax leptanthera* Pennell. Moist forests. See Pennell (1916) for additional information. Treated as valid and rare by GAHP. [= Nemexia leptanthera (Pennell) Small – S; < S. pseudochina] [investigate]

*Smilax pulverulenta* Michaux. Moist deciduous forests. May–June; August–October. Se. NY, se. and sc. PA, IN, MO, and e. KS south to NC, TN, and AR. [= F, FNA, K, W, WV, Y; > S. herbacea var. pulverulenta (Michaux) A. Gray – RB, C, G; = Nemexia pulverulenta (Michaux) Small – S]

*Smilax pumila* Walter, Sarsaparilla-vine, Dwarf Smilax. Mesic to dryish hammocks and bluffs, northward primarily in maritime-influenced mainland forest, with *Magnolia grandiflora* and *Tilia americana* var. caroliniana. October–November; January–April (and persisting). Ne. SC (within a few hundred meters of Brunswick County, NC) to c. peninsular FL and west to TX. It occurs on Collins Neck, along the NC-SC border, in maritime-influenced forests with southern affinities, now largely destroyed by golf-course development. This unusual *Smilax* is sometimes cultivated as an ornamental ground-cover. [= RAB, FNA, K, W, WH, Y]

*Smilax rotundifolia* Linnaeus, Common Greenbrier, Bullbrier, Horsebrier. In a wide variety of upland and wetland habitats. April–May; September–November (and persisting). NS and s. ON south to n. FL and e. TX. [= RAB, C, F, FNA, GW, K, S, W, WH, WV, Y; > S. rotundifolia var. quadrangularis (Muhlenberg ex Wildenow) Wood]

*Smilax smallii* Morong, Jackson-brier. Bottomland forests. June–July; April–June of the next year. Ne. NC (se. VA?) to c. peninsular FL, west to s. AR and e. TX, primarily on the Coastal Plain. Unless the name *S. smallii* is conserved, it must be replaced by the older *S. maritima* Alph. Wood. [= RAB, FNA, GW, K, W, WH, Y; > S. lanceolata Linnaeus – S, misapplied; = S. maritima Alph. Wood]
**SMILACACEAE**

**Smilax walteri** Pursh, Coral Greenbrier, Red-berried Swamp Smilax. Swamp forests, bogs, often where submersed for at least part of the year. Late April-May; September-November (and persisting). NJ south to c. peninsular FL and west to TN, AR, and TX. In its relatively narrow leaves, *S. walteri* can resemble *S. smallii*. *S. walteri* has a thicker-textured leaf, and is almost always rounded at the base rather than cuneate. [= RAB, C, F, FNA, G, GW, K, S, W, WH, Y]

---

**61. LILIACEAE** A.L. de Jussieu 1789 (Lily Family) [in LILIALES]

As here interpreted narrowly, the Liliaceae constitutes about 11 genera and 550 species, of the Northern Hemisphere. There has been much recent investigation and re-interpretation of evidence regarding the upper-level taxonomy of the Liliales, with strong suggestions that the broad Liliaceae recognized by Cronquist (1981) is artificial and polyphylectic. Cronquist (1993) himself concurs, at least to a degree: "we still await a comprehensive reorganization of the lilies into several families more comparable to other recognized families of angiosperms." Dahlgren & Clifford (1982) and Dahlgren, Clifford, & Yeo (1985) synthesized an early phase in the modern revolution of monocot taxonomy. Since then, additional research, especially molecular (Duvall et al. 1993, Chase et al. 1993, Bogler & Simpson 1995, and many others), has strongly validated the general lines (and many details) of Dahlgren's arrangement. The most recent synthesis (Kubitzki 1998a) is followed as the basis for familial and generic taxonomy of the lilies and their relatives (see summary below). References: Angiosperm Phylogeny Group (1998, 2003, 2009); Tamura in Kubitzki (1998a). [also see AGAVACEAE, ALLIACEAE, ALSTROEMERIACEAE, AMARYLLIDACEAE, ASPARAGACEAE, COLCHICACEAE, HEMEROCALLIDACEAE, HOSTACEAE, HYACINTHACEAE, HYPOXIDACEAE, MELANTHIACEAE, NATHECIACEAE, RUSCACEAE, SMILACACEAE, THEMIDACEAE, TOFIELDIACEAE, TRILLIACEAE]

Our "liliaceous" genera (members of orders placed in the Lilianae) are therefore divided as shown below, largely following Kubitzki (1998a) and some more recent molecular analyses.

**ALISMATALES**

TOFIELDIACEAE: Harperocallis, Pleea, Tofieldia, Triantha.

**LILIACEAE**

ALSTROEMERIACEAE: Alstroemeria.  
COLCHICACEAE: Colchicum, Uvularia.  
HELONIADACEAE: Chamaelirium, Helonias. (or to be included in MELANTHIACEAE)  
LILIACEAE: Clintonia, Erythronium, Lilium, Medeola, Prosartes, Streptopus, Tulipa.  
MELANTHIACEAE: Amianthium, Anticlea, Schoenocaulon, Stenanthium, Veratrum, Toxocordyceps, Zigadenus.  
SMILACACEAE: Smilax.  
TRILLIACEAE: Trillium. (or to be included in MELANTHIACEAE)  
XEROPHYLLACEAE: Xerophyllum. (or to be included in MELANTHIACEAE)

**ASPARAGALES**

AGAVACEAE: Camassia, Manfreda, Schoenolirion, Yucca. (or to be included in ASPARAGACEAE)  
AMARYLLIDACEAE: Allium, Crinum, Galanthus, Habranthus, Hymenocallis, Leucojum, Lycoris, Narcissus, Nothoscordum, Sternbergia, Tristigma, Zephyranthes. [including ALLIACEAE]  
ASPARAGACEAE: Asparagus.  
HOSTACEAE: Hosta. (or to be included in ASPARAGACEAE)  
HYACINTHACEAE: Hyacinthoides, Hyacinthus, Muscari, Ornithogalum. (or to be included in ASPARAGACEAE)  
HYPOXIDACEAE: Hypoxis.  
IRIDACEAE: Alophia, Calydorea, Crocus, Crocosmia, Gladiolus, Herbertia, Iris, Nemastylis, Sisyrinchium.  
RUSCACEAE: Convallaria, Liriope, Maianthemum, Nolina, Polygonatum. (or to be included in ASPARAGACEAE)  
XANTHORRHEOIDACEAE: Hemerocallis. (or to be split, and then in HEMEROCALLIDACEAE)

**DIOCSCOREALES**

BURMANNIACEAE: Apteris, Burmannia.  
DIOCONACEAE: Dioscorea.  
NARTHETIACEAE: Aetom, Lophiola, Narthecium.

**PANDANALES**

STEMONACEAE: Croomia.

---

1. Leaves basal; flowers on a leafless scape; tepals yellow or white.  
2. Flowers in an umbel at the summit of a leafless scape; fruit a berry; [subfamily Medeoloideae]  
3. Flowers solitary and scapose; tepals yellow or white; fruit a capsule; [subfamily Lilioideae]  
   Clintonia  
   Erythronium  
1. Leaves on a stem; flowers not scapose; tepals orange, red, rose, yellow, or white.  
3. Leaves whorled at 1 node or more.
**LILIACEAE**

4 Leaves occurring at several nodes, these variously whorled and/or alternate; flowers orange, red, or yellow; [subfamily *Lilioideae*] ..........................................................................................................................................

4 Leaves occurring in a single whorl, with fertile plants with a second whorl of leaflike bracts subtending the flowers; flowers yellow; [subfamily *Medeoloideae*] ..........................................................................................................................................

3 Leaves alternate at all nodes.

5 Leafy stem branched; fruit a berry; [subfamily *Streptopoideae*].

6 Stems brownish, wiry; inflorescence terminal ..........................................................................................................................................

6 Stems green, rather succulent; inflorescence axillary ..........................................................................................................................................

5 Leafy stem unbranched; fruit a capsule; [subfamily *Lilioideae*].

7 Leaves at 7 or more nodes; flowers with tepals recurved; flowers orange, red, or yellow (rarely white) ..........................................................................................................................................

7 Leaves at 1-6 nodes; flowers cup-shaped, the tepals incurved-erect; flowers of various colors.........................................................................................................................................

---

**Clintonia Rafinesque 1819**

1 Flowers yellow; berry blue (rarely to whitish-blue); leaf margins glabrous or slightly ciliate; [mostly of high elevations] .................. *C. borealis*

1 Flowers white (often marked with purple); berry black; leaf margins copiously retrorsely ciliate, the cilia 2-4 mm long; [plants of middle elevations] .........................................................................................................................................

**Clintonia borealis** (Aiton) Rafinesque, Bluebead-lily. Spruce-fir forests, northern hardwood forests, less commonly in red oak forests. Late May-June; July-September. NL (Labrador) west to MB, south to NJ, PA, and n. IN, and in the mountains to w. NC, e. TN, and n. GA (Jones & Coile 1988). [= RAB, C, F, FNA, G, K, S, W]

**Clintonia umbellulata** (Michaux) Morong, Speckled Wood-lily. Red oak and other oak forests, mesic to dry ridges and slopes, less commonly in northern hardwood forests, generally at lower elevations than *C. borealis*, though the two species can co-occur. Mid May-June; August-October. An Appalachian endemic: e. NY west to s. OH, south to n. GA (Jones & Coile 1988). *Clintonia alleghaniensis* Harned, differing from *C. umbellulata* in its ultramarine blue berry (vs. black) is known from a number of sites in VA, MD, and WV. It has been variously interpreted as a species, a hybrid of *C. borealis* and *C. umbellulata*, or merely an odd form of *C. umbellulata*; it needs further study. [= RAB, C, F, FNA, G, K, W; = *Xeniatrum umbellulatum* (Michaux) Small – S; > *C. alleghaniensis* Harned]

**Erythronium** Linnaeus 1753 (Trout Lily)

**Identification notes:** Stolons are white shoots produced from the bulb. Most run horizontally, either underground or along the ground surface but beneath leaf litter. Flowering individuals often produce no stolons. The stolon characters in the key below are those of non-flowering individuals and refer to horizontal stolons only.

1 Perianth white (sometimes pinkish or bluish) .........................................................................................................................................

1 Perianth yellow.

2 Petals lacking auricles at base; capsule and ovary distinctly indented (umbilicate) at apex (or rarely truncate in *E. umbilicatum* ssp. *monostolum*, or the ovary when young not yet displaying the apical indentation); mature capsules usually reclining on ground, with the apex downward; stolons 0-1 per bulb; anthers usually lavender, brown, cinnamon, or purple (sometimes yellow).

2 Horizontal stolons 0 per bulb; flecking on perianth segments slight to strong; perianth margins slightly irregular (though not auricled); stigma lobes long; pale spot on adaxial side of perianth segments always present, small to large, usually pale yellow; [at high elevations in the Southern Appalachians] .........................................................................................................................................

3 Horizontal stolons 1 per bulb; flecking on perianth segments absent to slight; perianth margins entire, smooth; stigma lobes short; pale spot on adaxial side of perianth segments usually present, small to medium, usually white; [of lower to mid elevations, widespread in our area]. .........................................................................................................................................

3 Horizontal stolons 0 per bulb; flecking on perianth segments absent to slight; perianth margins entire, smooth; stigma lobes short; pale spot on adaxial side of perianth segments usually present, small to medium, usually white; [of lower to mid elevations, widespread in our area] .........................................................................................................................................

4 Capsule distinctly beaked at the apex; petals with well-developed auricles at the base, these encircling a filament .................

4 Capsule truncate, rounded, or apiculate at the apex; petals with small auricles at the base, which do not encircle a filament.

5 Capsule apiculus absent or poorly developed .........................................................................................................................................

5 Capsule apiculus well developed .........................................................................................................................................

**Erythronium americanum** Ker-Gawler *ssp. americanum*, American Trout Lily. Moist bottomland or slope forests, especially over mafic rocks. February-April; April-May. NB west to ON and MN, south to sc. NC, c. TN, AR, and OK. It is much rarer than *E. umbilicatum* in NC. *E. americanum* is a tetraploid (2n = 48); Parks & Hardin suggest the possibility that it is an allotetraploid involving *E. rostratum* and *E. umbilicatum* as parents. *E. americanum* is larger-flowered, more graceful, and later-blooming (by 1-2 weeks) than *E. umbilicatum* ssp. *umbilicatum*, where they co-occur. [= FNA, GW, K, Y, Z; < *E. americanum* – RAB, F, G, S (also see *E. umbilicatum*); < *E. americanum* – C, W, WV]

Erythronium rostratum W. Wolf, Beaked Trout Lily. Moist bottomland or slope forests. C. TN, MO, and se. KS, south to c. AL, wc. LA, and se. OK. [= FNA, GW, K, Y, Z; < E. americanum — V]

Erythronium umbilicatum Parks & Hardin ssp. monostolum Parks & Hardin, Southern Appalachian Trout Lily. High elevation coves, slopes, and grassy balds, moist forests. March-May; April-June. Ssp. monostolum is endemic to the high mountains of NC and TN. It approaches the VA border and should be sought, especially in the Grayson Highlands area. E. umbilicatum ssp. monostolum is a diploid (2n = 24). [= FNA, GW, K, Y, Z; < E. americanum – RAB, F, G, S; < E. umbilicatum – C, W]

Erythronium umbilicatum Parks & Hardin ssp. umbilicatum, Dimpled Trout Lily. Moist bottomland or slope forests, or in rather dry upland habitats. February-April (May?); April-June. VA and e. WV south through NC, SC, and e. TN to c. GA, e. AL, and Panhandle FL. E. umbilicatum ssp. umbilicatum is a diploid (2n = 24). Mathew (1992) suggests the possibility that an earlier name, E. nuttallianum Roemer & Schultes, may apply to this taxon; the two locations mentioned on the type, Pennsylvania and Albany, NY, are outside the known range of the species, however. [= FNA, GW, K, Y, Z; < E. americanum – RAB, F, G, S; < E. umbilicatum – C, W, WH, WV]

Lilium Linnaeus 1753 (Lily)

1. Dark bulblets produced in many leaf axils; [exotic].................................................................................. L. lancifolium

2. Flowers white; leaves narrowly linear or lanceolate; [exotic].

3. Leaves lanceolate; plants < 1 m tall; perianth parts 13-18 cm long, glabrous at the base (internally)............................................ L. longiflorum

4. Flowers orange or yellow; leaves lanceolate, oblanceolate, or obovate; [native].

5. Leaves alternate; [of the Coastal Plain].............................................................................................................. L. catesbaei

6. Leaves all alternate; [of the Mountains] ............................................................................................................... L. philadelphicum var. philadelphicum

7. Flowers nodding or declined, facing downwards or to the side; tepals narrowed to the base, but not clawed.

8. Flowers 3-4 cm in diameter; pistil 3-4 cm long; tepals 3-5.5 cm long, deep red, macronate by extension of the midrib, reflexed < 45 degrees from the flower axis, the terminal third of the tepals generally gently incurved; anthers 4-6 mm long, completely included within the perianth when viewed from the side; [high elevations in the Blue Ridge of w. NC, ne. TN, and sw. VA]................................. L. grayi

9. Perianth yellow (rarely orange to red); mid-stem leaves 5-10x as long as wide ....................... L. canadense var. canadense

10. Style reddish, more-or-less the same color as the tepals; [west of the Blue Ridge] ................................. L. michiganense

11. Style pale green, strongly contrasting with tepals; [Blue Ridge and eastward and southward].

12. Perianth orange to red; mid-stem leaves 2-5x as long as wide ...................................... L. canadense var. editorum

13. Tepals at maturity recurved fully to form a circular shape; flowers pendant to nodding; style and stamens long-exserted.

14. Tepals at maturity recurved only slightly; flowers pendulous; style and stamens barely exserted.

15. Style reddish, more-or-less the same color as the tepals; [east of the Blue Ridge] ................................. L. michiganense

16. Style pale green, strongly contrasting with tepals; [Blue Ridge and eastward and southward].

17. Leaves 7-26 cm long, oriented horizontally, with the tips downwing-arching; leaf whorls 6-24; plants 1.2-2.8 m tall; inflorescences (1-) 5-22 flowered, tepals orange to reddish; [Mountains, Piedmont, and Coastal Plain]............................................ L. superbum

18. Flowers 4.5-9 cm in diameter; pistil 4-6 cm long; tepals 6-8 cm long, yellow, orange to brick-red, acuminate, reflexed 60-120 degrees from the flower axis; anthers 5-10 mm long, exserted to fully included within the perianth when viewed from the side; [low to moderate elevations, more widespread].

19. Flowers 3-4 cm in diameter; pistil 3-4 cm long; tepals 3-5.5 cm long, deep red, macronate by extension of the midrib, reflexed < 45 degrees from the flower axis, the terminal third of the tepals generally gently incurved; anthers 4-6 mm long, completely included within the perianth when viewed from the side; [high elevations in the Blue Ridge of w. NC, ne. TN, and sw. VA]................................. L. grayi

20. Perianth yellow (rarely orange to red); mid-stem leaves 5-10x as long as wide ....................... L. canadense var. canadense

21. Perianth orange to red; mid-stem leaves 2-5x as long as wide ...................................... L. canadense var. editorum

Lilium canadense Linnaeus var. canadense, Yellow Canada Lily. Wet meadows. June-July; late July-September. Apparently ranging from NB to NC, mostly east of or in the Appalachians; the range is obscured by different interpretations of var. canadense and var. editorum, by spread from cultivation, and by collections of cultivated plants not clearly so indicated.
Some of our plants are definitely var. canadense. [= F, WV; < L. canadense – RAB, C, FNA, G, GW, S; = L. canadense ssp. canadense – K, W, Z; = L. canadense ssp. typicum – Y]

**Lilium canadense** Linnaeus var. *editorum* Fernald, Red Canada Lily. Wet meadows, forest openings. June-July; late July-September. According to Adams & Dress (1982), who emphasize tepal color in distinguishing the infraspecific taxa, ranging from NB west to s. ON, south (mostly in and west of the Appalachians) to n. GA and n. AL. Wherry (1946) and Fernald (1950) emphasize leaf shape, and secondarily flower color, restricting var. *editorum* to a range from PA west to s. IN, south to AL. There has been considerable confusion between *L. canadense* var. *editorum* and *L. grayi*, and populations in sw. VA appear to show some intergradation between the two. [= F, WV; < L. canadense – RAB, C, FNA, G, GW, S; = L. canadense ssp. *editorum* (Fernald) Wherry – K, W, Y, Z]

**Lilium grayi** S. Watson, Gray's Lily, Roan Lily. Bogs, seepages, grassy balds, moist forests, and wet meadows, at medium to high elevations. June-July; August-September. A Southern Appalachian endemic: sw. VA, nw. NC, and ne. TN. Clearly related to *L. canadense* (especially through the somewhat intermediate *L. canadense* var. *editorum*). *L. grayi* appears to be adapted for pollination by Ruby-throated Hummingbirds (Adams & Dress 1982). See *L. canadense* var. *editorum* for additional comments. The two most important strongholds for this rare lily (each with thousands of individuals) are the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County, TN), where it was first found, and Long Hope Valley (Watauga and Ashe counties, NC). Otherwise, it tends to occur in very small, isolated populations in bogs, wet pastures, and seeps. In addition to the characters in the key, *L. grayi* can be distinguished in sterile condition from the 2 more common species of the Mountains by leaves, which are widest near the midpoint, typically 4-6× as long as wide (vs. distinctly wider towards the apex in *L. michauxii*, and widest near the midpoint but typically 10× or more as long as wide in *L. superbum*). Certainly one of our most beautiful wild plants! [= RAB, C, F, G, K, S, W, Y, Z]

**Lilium iridollae** M.G. Henry, Panhandle Lily, Pot-o’-gold Lily. Bogs. Panhandle FL west to s. AL. [= FNA, GW, WH; < *L. iridollae* – K (also see *L. pyrophilum*)]

* **Lilium longiflorum** Thunberg, Easter Lily. Disturbed areas, persistent from cultivation. [= FNA, K]

**Lilium michauxii** Poiret, Carolina Lily. Dry upland forests, ridges, slopes, and ridges. July-August; September-October. S. VA, e. TN, n. AL, c. MS, and e. LA south to s. SC, Panhandle FL, s. AL, s. MS, and s. LA. [= C, F, FNA, G, GW, K, W, WH, WV, X, Y, Z; > L. michauxii – RAB; > L. michauxii – F (also see *L. pyrophilum*); = L. carolinianum Michaux – S]

**Lilium michiganense** Farwell, Michigan Lily. Wet prairies and calcareous hardwood flatwoods. ON and MN south to e. TN, KY, nw. GA, AL, AR, and e. OK. [= C, F, FNA, K; < *L. superbum* – G; = L. canadense Linnaeus ssp. *michiganense* (Farwell) Boivin & Cody]

**Lilium philadelphicum** Linnaeus var. *philadelphicum* Wood Lily. Grassy balds, moist to wet meadows (especially in thin soils over rock), open woodlands. June-July; August-October. The species ranges from ME west to BC, south to NC, nw. GA (Jones & Coile 1988), KY, Ill, IA, NE, and NM. Var. *philadelphicum*, distinguished by the leaves whorled at 3-6 nodes, 10-15 (-25) mm wide, the capsule 2.5-3.5 (-5) cm long, is eastern and mainly Appalachian, ranging from ME and s. ON south to NC, GA, and KY. Var. *andinum* (Nuttall) Ker-Gawler, distinguished by the leaves whorled at 1-2 nodes, 3-10 mm wide, the capsule 4-8 cm long, is western, ranging from OH, MN, and BC south to NM. [= C, F, G, K; < *L. philadelphicum* – RAB, FNA, S, W, WV; = L. philadelphicum ssp. *philadelphicum* – Y]

* **Lilium philippinense** Baker, Philippine Lily. Escaped from cultivation; native of the Philippines. July-August. This species is introduced at various locations in the Southeast, including FL and LA (Kartesz 1999), and has been documented from Richmond Co. NC (B.A. Sorrie, pers. comm.). In North America there has been confusion between this species and *L. formosanum* A. Wallace. [= FNA, K, WH]

**Lilium pyrophilum** M.W. Skinner & Sorrie, Sandhills Bog Lily. Peaty seepage bogs in the Sandhills and peaty swamp margins in the upper Coastal Plain. Late July-mid August. See Skinner & Sorrie (2002) for detailed information on this species.
Superficially, this plant is somewhat similar to *L. michauxii*, in its one to several, nodding flowers with recurved tepals, relatively few whorls of leaves, and relatively few leaves per whorl. In addition to the character used in the key, this plant differs from *L. michauxii* in the following ways: flowers not fragrant or only slightly so (vs. flowers strongly fragrant), leaves generally widest near the middle (vs. widest towards the tip), leaves only slightly paler below and lacking a pronounced waxy sheen (vs. leaves strongly bicolorod, the lower surface much paler and with a waxy sheen), and habitat in sphagnous, peaty bogs (vs. in xeric to mesic, sandy to loamy soils). [= FNA, X; *< L. michauxii* – RAB (misapplied to these plants); *< L. iridollae* M.G. Henry – K, misapplied]

**Lilium superbum** Linnaeus, Turk’s-cap Lily, Lilly-royal. Cove forests and moist forests, moist ravines, blackwater stream swamps, Coastal plain bogs. July-August; September-October. MA and s. NY south to ne. NC, Panhandle FL, and c. MS, southwards primarily in the Appalachians, but extending across the Piedmont to the Coastal Plain of VA and ne. NC, and with a similarly odd extension south of the southern terminus of the Appalachians into the Coastal Plain of GA, w. FL, AL, and MS. The plants of blackwater swamps of se. VA and ne. NC are very narrow-leaved and yellow-tepaled; this form, atypical in habitat, is a distinct taxon (species, or variety of *L. superbum*) or only a form. [= C, F, FNA, GW, K, RAB, S, WH, WV, Y, Z; *< L. superbum* – G (also see *L. michiganense*)]

**Medeola** Linnaeus 1753 (Indian Cucumber-root)

**Identification notes:** *Medeola* is sometimes mistaken (when sterile) for *Isotria*; *Medeola* has a wiry stem, floccose-pubescent, *Isotria* a fleshy, glabrous stem.

**Medeola virginiana** Linnaeus, Indian Cucumber-root. Moist forests, usually with acidic soils. Mid April-mid June; September-October. QC and ON west to MN, south to GA, Panhandle FL and LA. The tuber is white, crisp, tasting cucumber-like, usually about 5 cm long and 5 mm in diameter. Bell (1974) describes patterns of vegetative growth. Flowering plants have a second, smaller whorl of leaves; the flowers are borne on recurved pedicels beneath the top whorl of leaves. In fruit, however, the pedicels are ascending or erect, bringing the fruits above the top whorl. When the berries are ripe, the leaves of the upper whorl become scarlet at the base, presumably acting as an attractant to animals. [= C, F, FNA, GW, K, RAB, S, WH, WV]

**Prosartes** D. Don 1839 (Fairybells, Mandarin)

A genus of 6 species, of temperate e. North America, w. North America, and e. Asia. Dahlgren, Clifford, & Yeo (1985) suggest that American species of *Disporum* are generically distinct from Asiatic species and should be segregated in the genus *Prosartes*, a distinction made as long ago as 1839. Asian *Disporum* species lack the distinctly reticulate venation of our plants, have strictly glabrous foliage (vs. pubescent), have spurred tepals (vs. unspurred), blue or black berries (vs. red or straw-colored), tripartite stigma (vs. not), and other differences (Jones 1951). Further study of generic limits by Shinwari et al. (1994) shows that the separation into *Prosartes* of the American species often assigned to *Disporum* is clearly warranted, based on morphological and karyological grounds. *Prosartes* is much more closely related to *Streptopus* than to (Asian) *Disporum*; (Asian) *Disporum* is more closely related to *Uvularia*. References: Johnson (1968)=Z; Shinwari et al. (1994)=Y; Jones (1951); Tamura, Utech, & Kawano (1992); Utech in FNA (2002a); Tamura in Kubitzki (1998a).

1. Fruit glabrous, ellipsoid, weakly triangular in cross-section, the surface smooth and shiny, red when ripe; tepals greenish, unspotted; leaves relatively few and large; leaf pubescent on the surface and veins above and below; leaf pubescence stiff, generally straight and perpendicular to the surface (as seen at 10-20× magnification), the leaf therefore slightly rough to the touch..............

**Prosartes lanuginosa** (Michaux) D. Don, Yellow Mandarin, Yellow Fairybells. Deciduous forests, especially coves. April-May; August-September. Primarily an Appalachian species: NY and s. ON south to n. GA (Jones & Coile 1988) and AL. [= FNA, K, Y; *Disporum lanuginosum* (Michaux) Nicholson – RAB, C, F, G, S, WH, WV, Z]

**Prosartes maculatus** (Buckley) A. Gray, Spotted Mandarin, Nodding Mandarin. Nutrient-rich deciduous forests, especially cove forests. April-May; July-August. AL, n. GA, KY, MI, w. NC, OH, TN, w. VA, and s. WV; its distribution is rather fragmented, and the species is considered rare or uncommon in every state in its range. The fruits are more reminiscent of *Uvularia* than of *Prosartes lanuginosa*. [= FNA, K, Y; *Disporum maculatum* (Buckley) Britton – RAB, C, F, G, S, WH, WV, Z]
LILIACEAE

Streptopus Michaux 1803 (Twisted-stalk)

1 Leaf margins and nodes not coarsely ciliate; leaves strongly cordate-clasping; fruit ellipsoid ......................
  S. amplexifolius

1 Leaf margins and nodes coarsely ciliate; leaves sessile to somewhat cordate-clasping (especially the lower leaves of robust individuals); fruit globose ....................................................................................................................................................................
  S. lanceolatus

Streptopus amplexifolius (Linnaeus) A.P. de Candolle var. amplexifolius, White Mandarin, Pagoda-bells. Moist forests and seepages at high elevations. Late April-early June; late July-September. Fassett recognized seven varieties, the plants in our area being var. americanus. The species ranges from Greenland and NL (Labrador) to MN, south (in the mountains and disjunctly) to NC, and in the west from AK (and Kamchatka) south to NM and AZ, in Japan, and in the Alps in Europe. [= K; < S. amplexifolius – RAB, FNA, W; > S. amplexifolius var. americanus J.A. & J.H. Schultes – C, F, G, Z; < Tortipes amplexifolius (Linnaeus) Small – S]

Streptopus lanceolatus (Aiton) Reveal var. lanceolatus, Eastern Rose Mandarin, Eastern Twisted-stalk. Moist forests at high elevations. Late April-early June; late July-September. Fassett (1935) recognized four varieties in S. roseus. Reveal (1993c) determined that the correct name for the species widely known as S. roseus is S. lanceolatus (Aiton) Reveal, and he transferred Fassett's varieties. Fassett (and Reveal) considered S. lanceolatus var. lanceolatus [S. roseus var. perspectus Fassett] to range from s. NL (Labrador) west to MI, south to NJ and PA, and in the mountains to w. NC, e. TN, and ne. GA (Jones & Coile 1988). S. lanceolatus var. longipes (Fernald) Reveal [S. roseus var. longipes (Fernald) Fassett] is midwestern, from s. ON and nw. PA west to MI, WI, MN, and s. MB. Var. curvipes (Vail) Fassett is western, ranging from AK to se. BC and nw. OR. Var. roseus was considered to be a Southern Appalachian endemic, differing from var. perspectus only in having the pedicel-peduncles entirely glabrous (vs. ciliate with few to many multicellular hairs). The number of hairs on the peduncles varies constantly, and recognition of two varieties in e. North America does not appear warranted; all of our material is then S. lanceolatus var. lanceolatus [S. roseus var. roseus (in a broader sense)], which does differ significantly from the more western varieties. [< S. roseus – RAB, S, W, WV; S. roseus var. roseus – C, F, G, Z; S. roseus var. perspectus Fassett – C, F, G, Z; < S. lanceolatus – FNA; > S. lanceolatus var. lanceolatus – K; > S. lanceolatus var. roseus (Michaux) Reveal – K]

Tulipa Linnaeus 1753 (Tulip)

Tulipa sylvestris Linnaeus, Tulip, Dutch-lily. Very commonly cultivated; native of w. Asia. "Occasionally naturalized in moist meadows, fields and roadsides" in se. PA (Rhoads & Klein 1993) and MD (Kartesz 1999). [= FNA, K]

62. ORCHIDACEAE A.L. de Jussieu 1789 (Orchid Family) [in ASPARAGALES]

A family of about 800 genera and 19,000 species, perennial (rarely annual), mycotrophic herbs and vines. Only a small minority of orchid species worldwide are terrestrial rather than epiphytic; only Epidendrum magnoliae in our flora shows the common epiphytic habit. References: Luer (1972) and Luer (1975) = L; Correll (1950) = X; Romero-González, Fernández-Concha, Dressler, Magrath, & Argus in FNA (Williams & Williams (1983); Brown (2003); Homoya (1993); Correll (1937); Pridgeon et al. (1999a, 1999b, 1999c).

Identification notes: Flowering plants are necessary for use of the key to genera.
1 Plant epiphytic, growing on the branches or trunks of trees in swamps .......................................................... Epidendrum
1 Plant terrestrial, growing on soil.

2 Leaves absent at flowering, or with a solitary leaf with a purplish undersurface withering at about the time of flowering.
3 Flowers without a spur. .......................................................... Tipularia
3 Flowers with a spur. .......................................................... Cleistesiopsis

4 Flowers white, the lip, sepals, and petals all predominantly white .......................................................... Spiranes
4 Flowers pink, greenish, yellowish, or purplish, the lip sometimes white or marked with white, the sepals and petals colored.

5 Flower solitary; lip strongly bearded .......................................................... Arethusa
5 Flowers in spikes or racemes; lip not bearded.

6 Lip with 2 fleshy ridges near the base; pollinia 4; plants mycorrhizal and never with leaves .................................. Corallorhiza
6 Lip with 3-7 ridges near the base or extending most of the length of the lip; pollinia 4 or 8; plants either mycorrhizal and never with leaves, or with a plicate winter leaf withering shortly before flowering.

7 Plants with a plicate winter leaf withering shortly before flowering (the withered remnant usually detectable); pollinia 4; veins of the petals and sepals not strikingly different in color than the intervein areas; lip with 3-7 ridges .................................. Aplectrum
7 Plants never with leaves and saprophytic; pollinia 8; veins of the petals and sepals strikingly different in color than the intervein areas; lip with 5-7 ridges .................................. Hexalectris

2 Leaves present at flowering (Cleistesiopsis with a foliaceous bract at the summit of the stem).

8 Leaf solitary.
9 Leaf basal.
10 Flower with a spur .......................................................... Platanthera
10 Flower without a spur.
11 Flower solitary; leaf plicate .......................................................... Calopogon
11 Flowers in a raceme or spike.
12 Flowers relatively large, purple, pink, to rarely white, the lip oriented upwards .................................. Calopogon
12 Flowers relatively small, whitish, the lip oriented downwards .................................. Spiranes

9 Leaf caulescent.

13 Flower solitary (4), pink (rarely nearly white); [subfamily Vanillioideae; tribe Pogonieae].
14 Sepals brown to purple, linear or narrowly oblanceolate, 3-6.5 cm long, about 5 mm wide; leaf coriaceous .............. Cleistesiopsis
14 Sepals pink (rarely white), elliptic or oblanceolate, 1.3-2.7 cm long, 3-11 mm wide; leaf herbaceous .................. Pogonia

15 Flowers in spikes or racemes, 5-many, reddish, yellowish, or greenish.
16 Flower without a spur; petals, sepals, and lip 1-3 mm long .......................................................... Malaxis
17 Flower with a spur; petals, sepals, and lip 3-25 mm long .......................................................... Platanthera

8 Leaves 2-many.
16 Lip inflated, pouch-like or slipper-like, 2-6 cm long .......................................................... Cypripedium
16 Lip not inflated, or if so, then 0.3-1.1 cm long.

17 Leaves basal (sometimes with bladeless sheaths upwards on the stem).
18 Leaves plicate.
19 Lip oriented upwards; flowers pink to white .......................................................... Calopogon
19 Lip oriented downwards; flowers greenish, purplish-brown, or yellowish.
20 Leaves ovate to elliptic, 2-5× as long as wide; plant 1-3 dm tall .......................................................... Liparis
20 Leaves linear-lanceolate, > 10× as long as wide; plant 3-14 dm tall .......................................................... Pteroglossaspis

18 Leaves smooth, often creased at the midrib, but not plicate.
21 Lip with a spur.
22 Flowers bicolored, the lip white, the sepals and petals pink; leaves 2 .......................................................... Galearis
22 Flowers not bicolored, the lip, petals, and sepals similarly colored; leaves 2-5.
23 Lip deeply divided into 3 linear segments; leaves 3-5 .......................................................... Habenaria
23 Lip entire; leaves 2 .......................................................... Platanthera

21 Lip without a spur.
24 Leaf blades ascending.
25 Leaf blades more-or-less horizontally oriented, flat against the ground or 1-2 cm above it.
25 Lip oriented upwards .......................................................... Ponthieva
25 Lip oriented downwards.
26 Leaves variegated with white; lip saccate .......................................................... Goodyera
26 Leaves green, not variegated; lip not saccate .......................................................... Spiranes

24 Leaf blades ascending.
27 Leaves linear to lanceolate, 2-4 .......................................................... Spiranes
27 Leaves elliptic to ovate, 2.
28 Lip broadest near its apex .......................................................... Liparis
28 Lip broadest near its base, tapering to the apex .......................................................... Malaxis

17 Leaves caulescent.
29 Leaves plicate; lip saccate .......................................................... Epipactis
29 Leaves smooth, often creased at the midrib, but not plicate; lip not saccate.
30 Leaves whorled, terminating the stem .......................................................... Isotria
30 Leaves alternate or opposite, not terminating the stem .......................................................... Listera

17 Leaves caulescent.
31 Leaves 2, opposite, near the middle of the stem .......................................................... Listera
31 Leaves (2-) 3-many, alternate, variously distributed on the stem.
32 Lip without a spur; leaves 0.8-8.0 cm long .......................................................... Triphora
33 Leaves ovate, 0.8-2.0 cm long .......................................................... Zeuxine
33 Leaves linear or narrowly lanceolate, 1-8 cm long.......................................................... Zeuxine
32 Lip with a spur; leaves linear, lanceolate, or narrowly elliptic, 40 cm long (at least the larger > 5 cm long, except in Platythelys, with lanceolate to ovate leaves 1.5-6.5 cm long).
34 Leaves 1.5-6.5 cm long, with inflated tubular sheaths; plants from creeping rhizomes .......................... Platythelys
34 Leaves 5-40 cm long, sessile; plants from fleshy or fusiform roots.
35 Lip divided into 3 linear divisions, the divisions not further divided, fringed, or eroded .................................. Habenaria
**Aplectrum** Torrey 1818 (Puttyroot, Adam-and-Eve)

**Identification notes:** Like *Tipularia*, *Aplectrum* has a single, overwintering leaf, purplish on the underside, and withering prior to the appearance of the flowering stalk; they are readily separable by leaf shape, texture, and veining (see *Tipularia*).

**Arethusa** Linnaeus 1753 (Dragon’s-mouth, Bog-rose, Arethusa)

A genus of 3 species, endemic to e. North America. References: Sheviak & Catling in FNA (2002a); Correll (1950)=X.

**Identification notes:** The combination of the following characters serves to separate *Arethusa* from other, vaguely similar genera: flowers magenta, solitary and scapose, the lip descending, the other 2 petals and 3 sepals erect or ascending. *Calopogon* has a leafy stem, the inflorescence a raceme, the lip crested but oriented upwards. *Pogonia* has solitary, pale pink flowers, with a descending, bearded lip, but the stem has a well-developed, flat leaf, 1-2.5 cm wide, the flower is subtended by a well-developed, leaf-like bract, and the 2 lower sepals are spreading-descending. *Cleistesiopsis* has 3 brown to purplish brown sepals.

*Arethusa bulbosa* Linnaeus, Dragon’s-mouth, Bog-rose, Arethusa. Bogs. May-June. NL (Newfoundland) and NL (Labrador) west to SK, south to NJ, DE, IN, and MN, and to NC and SC in the mountains, rare south of ME, MI, and MN. The lanceolate, plicate leaf (15-30 cm long, 2-4 mm wide) develops after flowering, the flowering plant thus consisting (aboveground) of the solitary scape only. The lip is crested with fimbriate ridges, marked with yellow and purple. [= RAB, C, F, FNA, G, GW, K, L, S, W, X]

**Bletilla** Reichenbach f.

A genus of 9 species, of temperate e. Asia. References: Correll (1950)=X.

*B. straita* (Thunberg) Reichenbach f., Urn Orchid. Lawns, roadsides; native of China. Known only from Escambia County, FL. [= FNA, K, WH] {add to genus key; add X to synonymy}

**Calopogon** R. Brown 1813 (Grass-pink)

**Identification notes:** The lip is oriented upwards.

1 Pets wider towards the tip than towards the base; lip usually as wide or wider than long; flowers strongly fragrant .......... *C. multiflorus*
2 Leaf pressed against the inflorescence during flowering; flowers < 1 cm apart; flowers not fragrant; flowers on same plant opening simultaneously ................................................................. *C. barbatus*
3 Lateral sepals 10-15 mm long, falcate, widely spreading ................................................................. *C. pallidus*
3 Lateral sepals 15-28 mm long, weakly falcate to straight.
4 Flowers of each plant opening nearly simultaneously; dilated distal portion of middle lip lobe usually much narrower than long, triangular to broadly rounded; stigma typically flat against column surface; corms elongate, forked .......................... *C. oklahomensis*
4 Flowers of each plant opening sequentially; dilated distal portion of middle lip lobe usually much wider than long, typically anvil-shaped; stigma at angle to column surface; corms globose to elongate, not forked ......................... *C. tuberosus* var. *tuberosus*

Calopogon oklahomensis D.H. Goldman, Oklahoma Grass-pink. Pine savannas, prairies. E. SC south to s. GA, west to e. TX, north in the eastern Great Plains to MN. [= FNA, Y, Z]

Calopogon tuberosus (Linnaeus) Britton, Sterns, & Poggenburg var. tuberosus, Common Grass-pink. Savannas, sandhill seeps, floating peat mats, in the Piedmont and Mountains in bogs. April-July. Var. tuberosus occurs from NL west to MT, south to s. FL and e. TX, also in Cuba and the West Indies. Var. simpsonii (Chapman) Magrath occurs in peninsular FL, Cuba, and the West Indies. [= FNA, K, L, WH, Y, Z; = C. pulchellus R. Brown – F, G, RAB, X; < C. tuberosus – C, GW, W; = Limodorum tuberosum Linnaeus – S]

Cleistesiopsis Pansarin & F. Barros 2008 (Spreading Pogonia, Rosebud Orchid)

A genus of 3 species, endemic to e. North America. As traditionally circumscribed, Cleistes was a genus of about 55 species, primarily of tropical America. The circumscription of this genus has been uncertain (Cameron & Chase 1999; Cameron et al. 1999; Pridgeon et al. 1999c). North American "Cleistes" is not closely related to South American Cleistes (which includes the type of the genus), and two alternative treatments are possible: the North American species can be housed in a separate genus, or alternatively, Pogonia, Isotria, and N. American "Cleistes" could be combined into Pogonia (a generic disposition popular many decades ago). Pansarin & de Barros (2008) favor the former idea, and have named the new genus Cleistesiopsis. References: Pansarin & de Barros (2008)=Y; Catling & Gregg (1992)=Z; Brown & Pansarin (2009)=V; Gregg & Catling in FNA (2002a); Gregg (1991); Correll (1950)=X.

1 Column 21-29 mm long; lip (26-) 34-56 mm long, the basal 3/4 of the central keel of the lip with 1-3 parallel, continuous low ridges; sepals (31-) 40-56 (-65) mm long; petals 27-53 mm long; distance between median leaf and floral bract 9-20 cm; fresh flower with daffodil-like odor................................................................. C. divaricata

1 Column 13-19 mm long; lip 21-33 (-38.5) mm long, the basal 3/4 of the central keel of the lip with 5-7 discontinuous and irregular ridges; sepals (24-) 30-40 (-55) mm long; petals 21-36 mm long; distance between median leaf and floral bract 3-16 cm; fresh flowers with strong vanilla scent (in C. oricamporum, of the Coastal Plain) or odorless (in C. bifaria, of the Mountain and upper Piedmont).

2 Fresh flowers odorless; [of the Mountains and Piedmont] ................................................................. C. bifaria

2 Fresh flowers with strong vanilla scent; [of the Coastal Plain] ................................................................. C. oricamporum

Cleistesiopsis bifaria (Fernald) Pansarin & F. Barros, Appalachian Small Spreading Pogonia. Moist to fairly dry meadows, dry ridgetops under pines (where seasonally moist). May-July. WV south through w. VA, e. KY, w. NC, and e. TN to w. SC, n. GA and n. AL. Catling & Gregg (1992) make a convincing case for the recognition of Cleistesiopsis bifaria and C. divaricata as specifically distinct (as Cleistes), based on differences in morphology, range, phylogenetics (in the sympatric portions of their ranges), and floral fragrance. [= V; < Cleistesiopsis bifaria – Y; < Cleistes bifaria (Fernald) Catling & Gregg – FNA, K, Z; < Cleistes divaricata – RAB, C, G, GW, L, S, W, X; < Cleistes divaricata var. bifaria Fernald – F; < Cleistes divaricata var. bifaria – WV, misspelling; < Pogonia bifaria (Fernald) P.M. Brown & Wunderlin – WH].

Cleistesiopsis divaricata (Linnaeus) Pansarin & F. Barros, Large Spreading Pogonia. Pine savannas. May-mid June. S. NJ to sw. GA and ne. FL, in the Coastal Plain; reports from more inland (non Coastal Plain) areas are based on a taxonomic concept of C. divaricata including C. bifaria, and reports from the East Gulf Coastal Plain (west of ne. FL) are based on C. oricamporum. [= V; Y; = Cleistes divaricata (Linnaeus) Ames – FNA, K, Z; < Cleistes divaricata – RAB, C, G, GW, K, L, S, W, X (also see Cleistes bifaria); = Cleistes divaricata var. divaricata – F; = Pogonia divaricata (Linnaeus) R. Brown – WH].

Cleistesiopsis oricamporum P.M. Brown, Small Coastal Plain Spreading Pogonia. Savannas, sandhill seeps. May-July. Se. NC to e. peninsular FL and west to e. L.A. Catling & Gregg (1992) make a convincing case for the recognition of Cleistesiopsis bifaria (including C. oricamporum) and C. divaricata as specifically distinct (as Cleistes), based on differences in morphology, range, phylogenetics (in the sympatric portions of their ranges), and floral fragrance. The co-occurrence of C. divaricata and C. oricamporum at such sites as the Green Swamp, Brunswick County, NC, where phenologically separated, supports their taxonomic status. Where co-occurring, C. oricamporum flowers on average about 10 days before C. divaricata. Recent studies (Smith et al. 2004) suggest the probability that montane and Coastal Plain populations of "C. bifaria" represent 2 different species, a suggestion formalized by Brown & Pansarin (2009). [= V; < Cleistesiopsis bifaria – Y; < Cleistes bifaria (Fernald) Catling & Gregg – FNA, K, Z; < Cleistes divaricata – RAB, C, G, GW, L, S, W, X; < Cleistes divaricata var. bifaria Fernald – F, WV; < Pogonia bifaria (Fernald) P.M. Brown & Wunderlin – WH].

Coeloglossum Hartman 1820 (Frog Orchid, Long-bracted Orchid)
Usually regarded as a monotypic genus, of north temperate regions of the Old and New World. However, *Coeloglossum* is probably not distinct from *Dactylorhiza* Necker ex Nevski; *Coeloglossum* is the older name, but *Dactylorhiza* has been accepted for nomenclatural conservation. The taxonomic and nomenclatural outcome is uncertain. References: Sheviak & Catling in FNA (2002a); Bateman, Pridgeon, & Chase (1997)=Z; Pridgeon et al. (1997, 1999b); Correll (1950)=X.

**Corallorhiza** Gagnebin 1755 (Coralroot)

A genus of about 15 species, distributed in north temperate regions of the Old and New World. The closest relative of *Corallorhiza* in our flora is *Aplectrum* (Freudenstein 1992). The mycotrophic nature of *Corallorhiza* is well established, but the exact means of the transfer of nutrients from the fungal hyphae to the orchid is not yet understood. References: Freudenstein (1992, 1997, 1999)=Z; Magrath & Freudenstein in FNA (2002a); Correll (1950)=X.

1 Lip with two lateral teeth or lobes; lateral sepals spreading to down-curved.
2 Sepals 1-veined.................................................................*C. trifida*
2 Sepals 3-veined.
3 Middle lobe of lip expanded slightly or not at all distally, the ratio of the width of the dilated part to the base of the mid-lobe < 1.5; floral bracts averaging 0.5-1.0 mm long.......................................................... *C. maculata* var. *maculata*
4 Floral bracts averaging 1.0-2.8 (-4.5) mm long.......................................................... *C. maculata* var. *occidentalis*
3 Middle lobe of the lip distinctly expanded, the ratio of the width of the dilated part to the base of the midlobe greater than 1.5; floral bracts averaging 0.5-1.0 mm long.......................................................... *C. maculata* var. *maculata*

1 Lip without lateral teeth or lobes (though sometimes erose or minutely toothed near its apex); lateral sepals arching, upcurved, or forward-directed.
4 Sepals and petals 5-7.5 mm long; dorsal sepal > 4.5 mm long, 3-nerved; flowering April-July.
3 Middle lobe of lip expanded slightly or not at all distally, the ratio of the width of the dilated part to the base of the mid-lobe < 1.5; floral bracts averaging 0.5-1.0 mm long.......................................................... *C. maculata* var. *maculata*
4 Floral bracts averaging 1.0-2.8 (-4.5) mm long.......................................................... *C. maculata* var. *occidentalis*

4 Sepals and petals 3-4.5 mm long; dorsal sepal < 4.5 mm long, 1-nerved; flowering August-October.
5 Lip with prominent, thickened, involute margins; flowering mid to late July.......................................................... *C. bentleyi*
6 Lip planar; flowering April-May .......................................................... *C. westeriiana*
5 Perianth open (chasmogamous); lip 1.7-2.2 mm wide, bent downwards at a nearly right angle, column lacking or with only poorly developed basal ventral auricles; stigma 0.2-0.5 mm wide.......................................................... *C. ontosorhiza* [chasmogamous form]
6 Perianth closed or nearly so (cleistogamous); lip 2.1-3.7 mm wide, bent downwards at a nearly right angle, column with 2 prominent auricles at the base on the ventral surface; stigma 0.7-1.0 mm wide.......................................................... *C. ontosorhiza* [chasmogamous form]

**Corallorhiza bentleyi** Freudenstein. Dry-mesic to mesic forests, especially near roadsides. The species was recently named and was known (at the time of publication) from only a single population (Freudenstein 1999). This species is now known from about 15 populations in e. WV (Monroe and Pocahontas counties) and w. VA (Giles, Alleghany, and Bath counties). It is most closely related to *C. involuta* Greenman of Mexico, a component of the *C. striata* Lindley complex of w. and n. North America. [= FNA, Z]

**Corallorhiza maculata** (Rafinesque) Rafinesque var. *maculata*, Eastern Spotted Coralroot. Moist forests, northern hardwood forests. July-August. Var. *maculata* is irregularly distributed in much of North America, primarily northern, from NL (Newfoundland) QC, and MN south to PA, OH, and IN, and south in the Appalachians to ne. GA, in the west from BC south to s. CA, s. AZ, and s. NM. Var. *mexicana* (Lindley) Freudenstein *in ed.* is restricted to Mexico. [= FNA, Z; < *C. maculata* – RAB, C, F, G, K, L, W, WV, X; < Corallorhiza maculata – S, orthographic variant]

**Corallorhiza maculata** (Rafinesque) Rafinesque var. *occidentalis* (Lindley) Ames, Western Spotted Coralroot. Forests. May-July. Var. *occidentalis* (Lindley) Ames has a distribution similar to var. *maculata*, except that in the east it ranges south only to PA, s. ON, and WI, with disjunct populations in e. WV (Pocahontas County; Morton et al. 2004) and VA. [= FNA, Z; < *C. maculata* – RAB, C, F, G, K, L, W, WV, X; < Corallorhiza maculata – S, orthographic variant]

**Corallorhiza odontorhiza** (Willdenow) Poiré, Autumn Coralroot. Forests. August-October. The cleistogamous form is the more common, and is widespread in e. North America, from ME, NY, s. ON, MI, and MN south to SC, c. GA, ne. FL, c. AL, n. MS, c. AR, and e. OK. The chasmogamous form is less common, and is scattered in ne. United States and adjacent Canada, in ON, CT, PA, MI, IA, IN, DC, NC, and TN, and in Mexico (Chiapas, Distrito Federal, Guerrero, Hidalgo, Jalisco, México, Michoacán, Morelos, Oaxaca, Puebla, Sonora), Guatemala, and Nicaragua. It may be recognized as a variety; see synonymy. [= RAB, C, F, G, L, W, WH, WV, X; > *C. odontorhiza* var. *pringlei* (Greenman) Freudenstein – FNA, K, Z; > *C. odontorhiza* var. *odontorhiza* – FNA, K, Z; = *Corallorhiza odontorhiza* – S, orthographic variant; > *C. pringlei* Greenman]
**Corallorrhiza trifida** Châtelain, Early Coralroot, Pale Coralroot. Boreal forests, bogs, peaty swamps. May-July. NL (Labrador) to Alaska, south to DC [specimen at NCU], MD, WV, PA, NJ (Magrath & Freundstein in FNA 2002, Kartesz 1999), allegedly GA (Small 1933), OH, IN, IL, SD, NM, CA. [= FNA, G, K, L, WV, Z; > *C. trifida* var. *verna* (Nuttall) Fernald – C, F; = *Corallorrhiza corallorrhiza* – S]

**Corallorrhiza wisteriana** Conrad, Spring Coralroot. Moist forests. April-May. Widespread in e. North America, from NJ, PA, OH, IN, IL, MO, and OK south to FL, and TX, and also in the Rockies from MT and w. SD south to s. Mexico. [= RAB, C, F, FNA, G, K, L, W, WH, WV, X; = *Corallorrhiza wisteriana* – S, orthographic variant]

**Cypripedium** Linnaeus 1753 (Lady's-slipper)

1 Plant scapose, with 2 basal leaves; pouch-like lip of flower with a longitudinal fissure, pink (rarely nearly white); [section *Acuina*]......................................................C. aculea

1 Plant caulescent, with (2) 3-7 leaves alternate on the stem; pouch-like lip of flower with a rounded orifice, yellow or pink (rarely white).

2 Pouch-like lip of flower pink and white (rarely all white); lateral petals and dorsal sepal white, not twisted, obtuse to acute; [section *Obstipetala*] ...............................................................C. candida

2 Pouch-like lip of flower yellow or white; lateral petals and dorsal sepal brown, purplish brown, or yellow, slightly to strongly twisted, acuminate-attenuate; [section *Cypripedium*].................................................................C. candidum

3 Pouch-like lip of flower bright yellow, pale yellow, or rarely white, (2.0-) 2.2-6.3 cm long (if pale yellow or white, then > 4 cm long); orifice margin rounded-ovate on the apical margin; [of various habitats].

4 Dorsal sepal 1.5-2.9 cm wide; pouch orifice 0.5-1.3 cm long; pouch-like lip 4.5-6.3 cm long, pale yellow or creamy white; plants robust, typically 5-8 dm tall.....................................................C. kentuckiense

4 Dorsal sepal 3.5-5.0 cm wide; pouch orifice 2.7-4.5 cm long; pouch-like lip 4.5-6.3 cm long, pale yellow or creamy white; plants not as robust, typically 2-5 (-6) dm tall.

5 Pouch-like lip 2.2-3.4 cm long; orifice margin acute on the apical margin; [of calcareous barrens] ..............C. pubescens

5 Pouch-like lip (2.0-) 3.0-5.8 cm long; orifice margin rounded-ovate on the apical margin; [of various habitats].

**Cypripedium aculea** Aiton, Pink Lady's-slipper, Moccasin-flower. Dry to mesic, acid forests and woodlands, often under pine or other conifers. April-July. NL (Newfoundland) west to n. AB, south to NC, SC, GA, TN, n. IN, and MN. [= RAB, C, F, FNA, G, K, L, W, WV, X; = *Fissipes aculeis* (Aiton) Small – S]

**Cypripedium candidum** Muhlenberg ex Willdenow, White Lady's-slipper. Calcareous barrens and bluffs. NY and NJ west to ND, south to w. VA, nw. and se. AL, and MO. [= C, F, FNA, G, K, L, X]

**Cypripedium kentuckiense** C.F. Reed, Kentucky Yellow Lady's-slipper. Sandy ravine bottoms and springhead seeps along small streams. First reported for our area by Welden et al. (1996). *C. kentuckiense* C.F. Reed is similar to *C. parviflorum* var. *pubescens* and, in addition to the site discovered in e. VA, reaches AL, e. TN (Franklin and Scott counties, Cumberland Plateau) and e. KY. Case et al. (1998) studied isozymes of *C. kentuckiense* and related *Cypripedium spp.*; the recognition of *C. kentuckiense* as a species was supported. [= C, FNA, K, Y, Z; often included in a broad concept of *C. calceolus*, *C. pubescens*, or *C. calceolus var. pubescens* by most earlier authors]

**Cypripedium parviflorum** Salisbury var. *parviflorum*, Small Yellow Lady's-slipper. Mesic forests, seepy forests over amphibolite, other habitats. April-June. VT, NY, OH, IN, IL, MO and KS, south to NC, GA, AL, AR, and OK. The exact range, abundance, and habitats of this species in our area are obscure, because of confusion with the more northern var.* makasin* (Farwell) Sheviak and small-flowered forms of var. *pubescens*. See Sheviak (1994) for a discussion of why North American plants of yellow lady's-slippers are recognized as a species distinct from the European *C. calceolus* Linnaeus. [= FNA, Y, Z; < *C. calceolus var. pubescens* – RAB, G, X; = *C. parviflorum* – K, S, WV; = *C. calceolus var. parviflorum* (Salisbury) Fernald – C, F, L, W]

**Cypripedium parviflorum** Salisbury var. *pubescens* (Willdenow) Knight, Large Yellow Lady's-slipper, Whippoorwill Shoes. Rich mesic forests. April-June. NL (Labrador) and AK south to GA, AL, MS, NM, and AZ. [= FNA, Y, Z; < *C. calceolus Linnaeus var. pubescens* (Willdenow) Correll – RAB, G, X (also see *C. parviflorum var. parviflorum*); = *C. pubescens* Willdenow – K, S, WV; = *C. calceolus var. pubescens* (Willdenow) Correll – C, F, L, W]

**Cypripedium reginae** Walter, Showy Lady's-slipper, Queen Lady's-slipper. Over circumneutral to basic rocks, or (allegedly) in mossy wet forests under <Rhododendron*. May-June. NL (Newfoundland), ON and SK south to NC (?), GA, TN, AR, and ND. The native occurrence of this species in NC is questionable; the only definite specimen from the state is from an implausible habitat for the species (highly acid humus under rhododendron). [= RAB, C, F, FNA, G, K, L, S, W, WV, X]
**Epidendrum** Linnaeus 1759 (Green-fly Orchid)

A genus of about 1000 species, of tropical (and rarely subtropical) America. References: Hágsater in FNA (2002a); Pridgeon et al. (2005); Correll (1950)=X.

**Epidendrum magnoliae** Muhlenberg, Green-fly Orchid. Epiphytic on limbs of trees, especially *Magnolia grandiflora*, *Quercus virginiana*, and *Taxodium spp.*, in blackwater river swamps and mesic hardwood hammocks, usually on relatively horizontal limbs mixed with *Pleopeltis polypodioides*, also rarely in crevices of Altamaha Grit outcrops. July-October. The northernmost epiphytic orchid: se. NC south to c. peninsular FL, west to LA; also in ne. Mexico. It is locally rather common, but rarely seen as it occurs primarily in blackwater swamps, on upper limbs of *Taxodium*, *Nyssa*, and other trees, typically mixed with *Pleopeltis*. See Correll (1936) for additional discussion of this species at its northern limit. Hágsater (2000) indicates that *E. magnoliae* Muhlenberg has nomenclatural priority over *E. conopseum* R. Brown. [= FNA; = *E. conopseum* Aiton f. – RAB, L, WH, X; > *E. conopseum* var. *conopseum* – K; = *Amphiglottis conopsea* (Aiton f.) Small – S]

**Epipactis** Zinn 1757 (Helleborine)

* Epipactis helleborine* (Linnaeus) Crantz, Broad-leaved Helleborine. Forests; native of Europe. June-September. This species has been collected a handful of times in various parts of the mountains, some of the colonies dating back to the early 1960's; it has become common in ne. United States and se. Canada. [= C, F, N, K, L, WV, X; = *E. latifolia* (Linnaeus) Allioni – G]

**Eulophia** R. Brown ex Lindley 1823

A genus of about 215 species, pantropical (Romero-González in FNA 2002). References: Romero-González in FNA (2002a); Pridgeon et al. (1999b); Correll (1950)=X. [also see *Pteroglossaspis*]

**Eulophia alta** (Linnaeus) Fawcett & Rendle, Wild Coco. Flatwoods, swamps. S. GA south through the FL peninsula into the West Indies, Mexico, Central America, and South America. [= FNA, GW, K; = *Platypus altus* (Linnaeus) Small – S] [add X to synonymy]

**Galearis** Rafinesque 1833 (Showy Orchis)

A genus of 3-6 species, of e. North America and e. Asia. References: Sheviak & Catling in FNA (2002a); Pridgeon et al. (1999b); Correll (1950)=X.

**Goodyera** R. Brown 1813 (Rattlesnake Orchid)

A genus of about 55-100 species, widespread in distribution but primarily Northern Hemisphere. References: Kallunki in FNA (2002a); Pridgeon et al. (1999c); Correll (1950)=X.

1 Leaves blue-green, the upper surface variegated with white, the midrib broadly whitened (1-3 mm wide), the remainder of the network of white variegations narrow (< 0.5 mm wide), generally lacking any internal variation in color, the outlines of the variegations smooth; inflorescence cylindric, not secund or one-sided.................................................................**G. pubescens**

1 Leaves dark green, the upper surface variegated with pale green, the midrib only irregularly and narrowly pale green, most of the network of pale green variegations broad (0.5-1 mm wide), with a dark green center line (thus the variegations appearing double), the outlines of the variegations finely and irregularly toothed; inflorescence secund, primarily one-sided, or loosely spiraled.

2 Lip narrowly saccate (th pouch much longer than deep), with an elongate recurved apex.................................................................**G. repens**
**Goodyera pubescens** (Willdenow) R. Brown, Downy Rattlesnake-orchid. Dry to moist forests and woodlands. June-August. NB west to ON and MN, south to Panhandle FL, MS, and AR. One of the commonest of orchids in much of its range. [= RAB, C, F, FNA, G, K, L, W, WV, X; = *Periamium pubescens* (Willdenow) MacMillan – S]

**Goodyera tesselata** Loddiges, Checkered Rattlesnake-plantain. Mixed deciduous and pine woods. NL (Newfoundland) and MB south to NJ, MD, PA, n. OH, MI, WI, and MN. Probably an allopolyploid, derived from *G. oblongifolia × repens*. [= FNA, C, F, G, K, L, X]

**Habenaria Willdenow 1805 (Longspur Orchid, Habenaria)**

A genus of about 600 species, tropical and subtropical in the Old World and New World. References: Sheviak in FNA (2002a); Pridgeon et al. (1999b); Correll (1950) – X. [also see *Coeloglossum*, *Platanthera*]

1 Lip and lateral petals toothed .................................................................................................................................................. **H. floribunda**
2 Lip or lateral petals divided into linear segments. ...................................................................................................................... **H. quinqueseta**
1 Spur 4-10 cm long; [terrestrial, though in moist habitats] ........................................................................................................... **H. repens**
2 Spur 0.4-1.4 cm long; [aquatic or semi-aquatic in marshes and swamps] .......................................................................................... **H. repens**

**Habenaria floribunda** Lindley, Mignonette Orchid. Rich, moist hardwood hammocks. Ne. FL south to s. FL; West Indies, Mexico, Central America, South America. [= WH; = *H. odontopetala* Reichenbach f. – FNA, K; = *Habenella odontopetala* (Reichenbach f.) Small; = *Habenella floribunda* (Lindley) Szlachetko & Kras-Lapinska] [add X to synonymy]

**Habenaria quinqueseta** (Michaux) A. Eaton, Long-horned Habenaria, Michaux’s Orchid. Wet pine flatwoods, moist hardwood hammocks, Altamaha Grit outcrops, ditches. August-October. SC south to s. FL, west to se. TX. [= FNA, K, WH; = *H. quinqueseta* var. quinqueseta – L; < *H. quinqueseta* – RAB, GW, S, X]

**Habenaria repens** Nuttall, Water-spider Orchid, Floating Orchid. Blackwater swamps, pools, banks of creeks and rivers. April-November. NC south to FL and west to TX; West Indies, Mexico, Central America, and n. South America. Reported from se. VA. [= RAB, FNA, GW, K, L, S, WH, X]

**Hexalectris** Rafinesque 1825 (Crested Coralroot)

**Hexalectris spicata** (Walter) Barnhart, Crested Coralroot, Brunetta. Dry forests and woodlands, especially over mafic or calcareous rocks, such as diabase, gabbro, calcareous siltstone, and dolomite (though sometimes in distinctly acid situations), shell middens. April-August. MD, OH, and MO south to s. FL and w. and s. TX. The yellow and purple flowers borne on a brown stem present a very peculiar color combination. [= V; = *H. spicata* var. spicata – FNA, Y, Z; < *H. spicata* – RAB, C, F, G, K, L, S, W, WH, WV, X]

**Isotria** Rafinesque 1808 (Whorled Pogonia, Five-leaves, Fiveleaf Orchid)
A genus of 2 species, of e. North America. Cameron & Chase (1999) indicate that Isotria should perhaps be included in a more broadly circumscribed Pogonia (as was often done prior to 1922). References: Mehrhoff & Homoya in FNA (2002a); Correll (1950)=X.

Identification notes: Sterile Isotria is sometimes confused with Medeola. Medeola has a wiry-textured stem, with floccose hairiness, at least towards the base. Isotria has a flesher stem, lacking hairs.

1 Sepals 12-30 mm long, greenish-brown; lip 10-15 mm long; pedicel of fruit (6-) 5-10 (15) mm long; plant glaucous, the stem whitish-green. .................................................................I. medeoloides

1 Sepals 35-60 mm long, purple-brown; lip 20-25 mm long; pedicel of fruit (12-) 20-55 mm long; plant scarcely glaucous (if at all), the stem generally purplish. .......................................................I. verticillata

Isotria medeoloides (Pursh) Rafinesque, Small Whorled Pogonia, Little Five-leaves. Moist forests, in the mountains and upper Piedmont usually with Pinus strobus. May-June. Widespread (but very local) in ne. North America, from s. ME and MI south to c. and e. WV, w. VA, w. NC, e. TN, and n. GA. The reproductive biology of this species was studied by Vitt & Campbell (1997). Van Alstine et al. (1996) discuss the habitats of known occurrences in Virginia. [= RAB, C, F, FNA, G, K, L, W, X; = I. affinis (C.F. Austin) Rydberg – S; = Pogonia affinis C.F. Austin]

Liparis L.C. Richard 1817 (Wide-lip Orchid, Twayblade)

A genus of about 250-350 species, cosmopolitan. References: Magrath in FNA (2002a); Correll (1950)=X.

1 Lip (8-) 10-12 mm long, pale purple; pedicels 11-18 mm long, equal to or longer than the capsule......................................................L. lilifolia

1 Lip 4-5.5 mm long, yellowish-green; pedicels 3-7 mm long, shorter than the capsule .................................................................L. loeselii

Liparis loeselii (Linnæus) L.C. Richard, Fen Orchid, Loesel's Twayblade, Bog Twayblade, Yellow Wide-lip Orchid. Seepages at moderate to high elevations in the mountains, mucky bay swamps (dominated by Persea palustris and Magnolia virginiana) at about sea level on the Outer Banks, and other moist, seepy habitats, especially over mafic or calcareous rocks. May-July. NS and QC west to NT and BC, south to ne. NC (Dare County), sw. NC, AL, AR, KS, NE, and WA. [= RAB, C, F, FNA, G, GW, K, L, S, W, WV, X]

Listera R. Brown 1813 (Twayblade)

A genus of about 25 species, boreal, north temperate, and south temperate (Magrath & Coleman in FNA 2002). Recent studies suggest that Listera may be best included in Neottia Guettard. References: Magrath & Coleman in FNA (2002a); Correll (1950)=X.

1 Lip usually cleft about one-third its length, the two lobes oblong, with rounded apices.................................................................L. smallii

1 Lip usually cleft about two-thirds its length, the two lobes linear, with acute apices.

2 Lip 6-10 mm long, lacking prominent teeth near the base (but with 2 vertically-oriented lobes); pedicels and raceme axis glandular-puberulent; sepals and petals 1-2 mm long .................................................................L. australis

2 Lip 3-5 mm long, with 2 prominent teeth near the base, these diverging horizontally; pedicels and raceme axis glabrous; sepals and petals 1-5-3 mm long.................................................................L. cordata var. cordata

Listera australis Lindley, Southern Twayblade. Swamps, second terraces in floodplain forests, wet woods under Rhododendron maximum. February-July. Mainly a Southeastern Coastal Plain species, from NJ south to wc. peninsular FL (Kunzer et al. 2009) and west to e. TX, but also scattered inland of the Coastal Plain and north into VT and s. Canada. [= RAB, C, F, FNA, G, GW, K, L, W, WH, X; = Ophrys australis (Lindley) House – S; = Neottia bifolia (Rafinesque) Baumbach]

Listera convallariaoides (Swartz) Nuttall. Attributed to NC by Correll (1950); this record of this far-northern species is almost certainly an error. [= Neottia convallariaoides (Swartz) Richard] (rejected; not keyed)

Malaxis  Solander ex Swartz 1788 (Adder’s-mouth)

1 Leaves 2-5; lip oriented upwards, erect, entire, obtuse to acuminate …………………………………………………………………………...  M. spicata
2 Leaf solitary; lip oriented downwards , deflexed, 3-lobed (the central lobe smaller than the 2 lateral lobes).
   1 Pedicels 3-5 (-5.8) mm long (even in plants with inflorescences over 80 mm long); basal lobes of the lip prominent, 0.75-1.1 mm long, usually 1.5-2 (-2.5)< as long as the apical lateral lobes and > 0.6< as long as the length from the base to the tip of the mid-lobe; inflorescences loosely flowered above, the lower flowers withering slowly …………………………………………………………………… M. bayardii
   2 Pedicels 4-10 (-13) mm long (and > 5 mm long in plants with inflorescences > 45 mm long); basal lobes of the lip not prominent, 0.4-1.1 mm long, mostly < 1.5< as long as the apical lateral lobes and < 0.6< as long as the length from the base to the tip of the mid-lobe; inflorescences densely flowered above, the lower flowers soon withering …………………………………………………………………… M. unifolia

Malaxis unifolia  Michaux, Green Adder's-mouth.  Bogs, moist forested slopes, in the Sandhills in longleaf-oak-hickory forests.  June-August.  NL (Newfoundland) and FL west to MN, IA, MO, e. OK, and e. TX; also in Mexico, Cuba, the West Indies, and Central America.  [= F, FNA, K, Z; < M. unifolia – RAB, C, G, GW, L, S, W, WH, WV, X (also see M. bayardii)]

Mesadenus  Schlechter 1920

A genus of 7 species, of tropical and subtropical s. North America, West Indies, Central America, and South America. References:  Ackerman in FNA (2002a); Correll (1950)=X.

Mesadenus lucayanus  (Britton) Schlechter, Gray Ladies’-tresses.  Shell middens, dry calcareous hammocks.  Late December-March.  Ne. FL (Duval County) south to s. FL; West Indies; e. Mexico and n. Central America.  [= FNA, S; < Spiranthes polyantha Reichenbach f. – L, WH; {add to genus key; add X to synonymy}]

Platanthera  L.C. Richard 1817 (Fringed Orchid, Fringeless Orchid)

A genus of about 200 species, largely of the temperate northern hemisphere, extending south into tropical Central America and tropical se. Asia.  The recognition of *Gymnadeniopsis* as separate from *Platanthera* is uncertain at this time; originally named by Rydberg, its recognition was acknowledged as possibly warranted by Sheviak in FNA (2002a) and embraced by Brown (2006a).
Three of our species would belong to Gymnadeniopsis: *P. clavellata*, *P. integra*, and *P. nivea*. References: Sheviak in FNA (2002a); Correll (1950)=X; Reddoo & Reddoo (1993); Prideoone et al. (1999b).

**Identification Notes:** Hybrids are frequent and are not keyed; they are generally intermediate in characters and are generally found in mixed populations of the two parents.

1. Lip entire, finely toothed, or eroded (neither fringed nor deeply divided into 3 lobes).
2. Leaves basal, 1 or 2, orbicular, (5-)8-25 cm wide, prostrate on the ground, the stem naked or with a few bladeless bracts.---*P. orbiculata*
3. Leaves caulescent, 1-10 or more, mostly lanceolate, 1-5 cm wide, ascending, the stem with at least 1 (usually several) bladeless leaves.
4. Lip 11-15 mm long; spur mostly 40-50 mm long.---*P. integriabla*
5. Lip 2-8 mm long; spur 4-23 mm long.

4. Flowers golden-yellow or bright-white.
5. Flowers golden-yellow; spur 4-8 mm long; lip minutely crenulate, directed downward.---*P. integriabla*
6. Flowers bright-white; spur 11-23 mm long; lip entire, directed upward.---*P. nivea*
7. Flowers green, greenish-white, yellowish-green, yellowish-white, or dull-white.
8. Lip deeply divided into 3 lobes, the lobes deeply fringed, shallowly fringed, eroded, or entire; flowers purple or greenish-white or yellowish-white.
9. Lip either fringed, deeply divided into 3 lobes, or both.
10. Lip not deeply divided into 3 lobes, deeply fringed; flowers white, yellow, orange.
11. Spur 15-26 mm long, ca. 1× as long as the ovary; lip descending and thence curved back towards the stem, narrowed at its base to a very short isthmus (the section between the base and the fringed portion); lip fringing short and relatively coarse; [of NL (Newfoundland) west to MI and IL, south to GA].---*P. blephariglottis*
12. Spur 30-50 mm long, ca. 2× as long as the ovary; lip projected forward; lip narrowed to an extended isthmus; lip fringing elongate and delicate; [of e. NC south to c. peninsular FL, west to e. TX].---*P. conspicua*
13. Flowers yellow to orange; spur 5-33 mm long.
14. Spur 20-33 mm long, exceeding the 12-27 mm long ovary; undivided portion of lip 8-12 mm long.---*P. ciliaris*
15. Spur 4-17 mm long, equal to or shorter than the ovary; undivided portion of lip 4-6 mm long.---*P. chlorantha*
16. Spur 8-17 mm long, about as long as the 10-19 mm long ovary; spur orifice circular.---*P. chapmanii*
17. Spur 4-10 mm long, shorter than the 7-13 mm long ovary; spur orifice keyhole-shaped or triangular.---*P. cristata*
18. Lip deeply divided into 3 lobes, the lobes deeply fringed, shallowly fringed, eroded, or entire; flowers purple or greenish-white or yellowish-white.
19. Flowers greenish-white or yellowish-white; lateral lobes of lip deeply fringed (nearly or entirely to the point of junction with the central lobe of the lip).
20. Perianth greenish-white; lateral petals linear-spatulate, < 2 mm wide, blunt, entire to inconspicuously crenulate; lateral sepals deflexed.---*P. lacera*
21. Flowers purple (or rarely white in albino forms); lateral lobes of lip entire, eroded, shallowly fringed, or deeply fringed.
22. Lobes of lip eroded or entire, few (if any) of the segments > 1 mm long.---*P. fissa*
23. Lobes of lip shallowly or deeply divided, most or all of the segments > 1 mm long.
24. Lobes of the lip fringed < 1/3 of the way to the base of the lobes; opening to nectary dumbbell-shaped (the pollen sacs close together); spur 12-20 mm long.---*P. psycheus*
25. Lobes of lip fringed from 1/3 to nearly all the way to the base of the lobes; opening to nectary widely rounded (the pollen sacs spread widely apart); spur 20-35 mm long.
26. Lip segments moderately to deeply fringed; isthmus of the lip stout, about 2× as long as wide; spur 20-26 mm long, ca. 1.25× as long as the lip; orifice round; flowering mid June-early July.---*P. grandiflora*
27. Lip segments deeply and compoundly lacerate; isthmus of the lip slender, about 4× as long as wide; spur 21-35 mm long, 2-2.5× as long as the lip; orifice angled at top; flowering mid July-early August.---*P. shriveri*

*Platanthera blephariglottis* (Willdenow) Lindley, Small White Fringed Orchid. See pages, sandhill-pocosin echteones. July-September. NL (Newfoundland) west to MI and IL, south to GA. Following Brown (2006b), it seems best to recognize the two white-fringed orchids as separate species; they are morphologically distinct, and where they co-occur their blooming time is offset. [= Platanthera blephariglottis (Willdenow) Lindley var. blephariglottis = FNA, K, L; < Habenaria blephariglottis (Willdenow) Hooker var. blephariglottis = RAB, X; < Habenaria blephariglottis var. blephariglottis = F (possibly misapplied); < Habenaria blephariglottis = GW; = Blephariglottis blephariglottis (Willdenow) Rydberg = S (possibly misapplied); < Platanthera blephariglottis (Willdenow) Lindley = W; = Blephariglottis albiflora Rf.]

*Platanthera chapmanii* (Small) Luer, Chapman's Orange-fringed Orchid. Pine savannas. S. GA and n. FL; e. TX. Previously generally confused with the hybrid between *P. ciliaris × cristata* (P. ×chapmani); see Folsom (1984) and Brown (2004) for details. [= FNA, K, WH; = Blephariglottis chapmanii Small – S] [synonymy incomplete]

*Platanthera ciliaris* (Linnaeus) Lindley, Yellow Fringed Orchid. Savannas, moist roadbanks, meadows, pastures, bogs. July-September. NH, MI, MO, and OK south to the peninsular FL and TX. *P. ciliaris* is probably our most common and least habitat-specific *Platanthera*. [= FNA, K, L, WH; = Habenaria ciliaris (Linnaeus) R. Brown = RAB, C, F, G, GW, WV, X; = Blephariglottis ciliaris (Linnaeus) Rydberg = S]

*Platanthera clavellata* (Michaux) Luer, Small Green Wood Orchid. See pages, bogs, swamps, other wet places. June-September. NL (Newfoundland) and ND south to Panhandle FL and TX. [= FNA, K, L, WH; = Habenaria clavellata (Michaux)
Platanthera conspicua (Nash) P.M. Brown, Large White Fringed Orchid. Savannas, seepages, sandhill-pocosin ecotones. July-September. NC south to c. peninsular FL, west to TX. Brown (2006b) and Sheviak in FNA (2002a) clarify the taxonomy of this complex; previous studies (such as Hardin 1961) used different characters, and interpreted the white-fringed orchid taxa differently. [= Platanthera blephariglottis (Wildenow) Lindley var. conspicua (Nash) Luer – FNA, K, L, WH; < Habenaria blephariglottis (Wildenow) Hooker var. blephariglottis – RAB, X; = Habenaria blephariglottis var. conspicua (Nash) Ames – C; F; < Habenaria blephariglottis – GW; = Blephariglottis conspicua (Nash) Small – S]

Platanthera cristata (Michaux) Lindley, Crested Fringed Orchid, Golden Fringed Orchid. Savannas, bogs, moist roadsides. June-September. P. cristata is more limited to the Coastal Plain than the related P. ciliaris, ranging from s. MA south to FL and west to TX, and also inland in KY, TN, AR, SC, and NC. [= FNA, K, L, W, WH; RAB, C, F, G, GW, X; = Blephariglottis cristata (Michaux) Rafinesque – S]

Platanthera flava (Linnaeus) Lindley var. flava, Southern Rein Orchid, Southern Gypsy-spike. Shaded wet places, such as swampy forests. March-September. VA, IN, IL, MO, and OK, south to c. peninsular FL and TX; remarkably disjunct in s. NS, where it occurs associated with other disjuncts from the Southeastern Coastal Plain. See Homoya (1993) for additional discussion of the two varieties of P. flava. [= FNA, K, L; = Habenaria flava (Linnaeus) R. Brown var. flava – RAB, C, F, G, X; < Habenaria flava – GW; > Perularia scutellata (Nuttall) Small – S; > Perularia bidentata (Elliot) Small – S]

Platanthera grandiflora (Bigelow) Lindley, Large Purple Fringed Orchid, Plume-royal. Bogs, seepages, moist places at high elevations. June-early July. NL (Newfoundland) and ON south to NJ, OH, and MI, and south in the mountains to w. NC and ne. GA. Blooming 3-4 weeks earlier than either P. psycodes and P. shriveri when they grow in proximity. If Orchis fimbriata Aiton is conspecific, the correct name is P. fimbriata (Aiton) Lindley. [< FNA, K, L, W; = Habenaria psycodes (Linnaeus) Sprengel var. grandiflora (Bigelow) A. Gray – RAB, C, G, X; < Habenaria fimbriata (Aiton) R. Brown – F, WV; < Blephariglottis grandiflora (Bigelow) Rydberg – S; = Platanthera fimbriata (Aiton) Lindley]

Platanthera integrilabia (Nuttall) A. Gray ex Beck, Golden Fringeless Orchid, Yellow Fringeless Orchid. Savannas in the Coastal Plain, bogs in the Mountains and Piedmont. July-September. Essentially endemic to the Southeastern Coastal Plain, ranging from s. NJ south to FL and west to se. TX, with disjunct occurrences in TN (Eastern Highland Rim) and in bogs at low elevations of the Blue Ridge of NC. It is apparently now extirpated in the Mountains and Piedmont of NC. [= FNA, K, L, WH; = Habenaria integrilabia (Nuttall) Sprengel – RAB, C, F, G, GW, X; = Gymnadeniopsis integrilabia (Nuttall) Rydberg – S]

Platanthera integra (Nuttall) A. Gray ex Beck, Golden Fringeless Orchid, Yellow Fringeless Orchid. Savannas in the Coastal Plain, bogs in the Mountains and Piedmont. July-September. Essentially endemic to the Southeastern Coastal Plain, ranging from s. NJ south to FL and west to se. TX, with disjunct occurrences in TN (Eastern Highland Rim) and in bogs at low elevations of the Blue Ridge of NC. It is apparently now extirpated in the Mountains and Piedmont of NC. [= FNA, K, L, WH; = Habenaria integra (Nuttall) Sprengel – RAB, C, F, G, GW, X; = Gymnadeniopsis integra (Nuttall) Rydberg – S]

**Platanthera leucophaea** (Nuttall) Lindley, Prairie Fringed Orchid. Damp calcareous meadows. May-July. ME west to NE, south to w. VA, nw. PA, c. OH, c. IN, IL, MO, and OK. [= FNA, K, W; = Habenaria leucophaea (Nuttall) A. Gray var. leucophaea – C; = Habenaria leucophaea (Nuttall) A. Gray – G, X; = Blephariglottis leucophaea (Nuttall) Farwell]

**Platanthera nivea** (Nuttall) Luer, Snowy Orchid, Bog-spike. Wet savannas. May-September. Essentially a Southeastern Coastal Plain endemic, *P. nivea* ranges from s. NJ and DE (at least formerly) south to FL and west to TX, disjunct in Coffee County, TN (Eastern Highland Rim). This species is even more irregular than most *Platanthera* in its flowering, whole populations sometimes not flowering for a number of years. The flowers are so white as to seem illuminated from within. This species was once locally abundant in the outer Coastal Plain of the Carolinas and further south; Correll (1950) describes "large colonies of this species which form a blanket of white over the landscape." Also see the picture in B.W. Wells' Natural Gardens of North Carolina. [= FNA, K, L; = Habenaria nivea (Nuttall) Sprengel – RAB, C, F, G, GW, WH, X; = Gymnadeniopsis nivea (Nuttall) Rydberg – S]

**Platanthera orbiculata** (Pursh) Lindley, Large Round-leaved Orchid, Dinner-plate Orchid. Moist hardwood forests, especially over amphibolite. June-September. NL (Newfoundland) and NL (Labrador) west to AK, south to PA (and in the mountains to NC and TN), OH, IN, MN, SD, and OR. Reddoch & Reddoch (1993) have shown that *P. orbiculata* differs from *P. macrophylla* at the species level. Pollination is by night-flying moths, likely noctuids. [= FNA; = Habenaria orbiculata (Pursh) Lindley – RAB, WV; = Habenaria orbiculata var. orbiculata – C, F; < Habenaria orbiculata – G, W, X (also see P. macrophylla); = Platanthera orbiculata var. orbiculata – K, L; = Lysias orbiculata (Pursh) Rydberg – S]

**Platanthera shriveri** P.M. Brown, Shriver’s Purple Fringed Orchid, Shriver’s Frilly Orchid. Seepages, northern hardwoods forests, roadbanks. Mid July-August. SW. PA south through e WV and w. VA to nw. NC. See Brown, Smith, & Shriver (2008) for additional information. [= FNA, K, L, W; < Habenaria psycodes (Linnaeus) Sprengel var. grandiflora (Bigelow) A. Gray – RAB, C, G, X; < Habenaria fimbriata (Aiton) R. Brown – F; < Blephariglottis grandiflora (Bigelow) Rydberg – S; = Blephariglottis shriveri (P.M. Brown) Baumback & Löckel]

Platystelis Garay (Jug Orchid)

A genus of about 9 species, of the New World tropics and subtropics. References: Ackerman in FNA (2002a); Correll (1950)=X.

**Platystelis querceticola** (Lindley) Garay, Jug Orchid. Wet hammocks and swamps. Late July-September. N. FL south to s. FL, west to AL(?), MS, and LA; Mexico; West Indies; Central America; South America. [= FNA, K; = Erythrodes querceticola (Lindley) Ames – L, X; = Physurus querceticola Lindley – S; ? P. latifolia (Linnaeus) Garay & Ormerod – WH] {add to genus key}

**Pogonia** Antoine Laurent de Jussieu 1789 (Rose Pogonia, Pogonia)

A genus of 3 species, of temperate e. North America and e. Asia. Cameron & Chase (1999) indicate that molecular analyses indicate that there may be merit in the traditional broad circumscription of *Pogonia* to include *Isotria* and N. American taxa of *Cleistes*; alternatively, North American "*Cleistes*" can be segregated as *Cleistesiopsis*, as done here. References: Catling & Sheviak in FNA (2002a); Correll (1950)=X.

**Pogonia ophioglossoides** (Linnaeus) Ker-Gawler, Rose Pogonia, Snakemouth, Beardflower, Ettercap, Addermouth. Savannas, bogs, especially in open peaty or gravelly situations. March-June. NL (Newfoundland) and MB south to s. FL and TX. [= RAB, C, FNA, G, GW, K, L, S, W, WH, WV, X; > P. ophioglossoides var. ophioglossoides – F]

**Ponthieva** R. Brown 1813 (Shadow Witch)

A genus of about 30-53 species, of tropical and warm temperate America. References: Ackerman in FNA (2002a); Pridgeon et al. (1999b); Correll (1950)=X.

**Ponthieva racemosa** (Walter) C. Mohr, Shadow Witch. Bottomlands, floodplains, moist ravines, nearly always over calcareous rock ("marl" or coquina limestone). September-October. Se. VA south to s. FL and west to se. TX; disjunct in the Eastern Highland Rim, TN, and south into Central and South America. The basal rosette of leaves, white (sulphured with green) flowers in fall, and habitat are distinctive. [= RAB, C, F, FNA, G, GW, K, S, WH, X; = P. racemosa var. racemosa – L]
Pteroglossaspis Reichenbach filius 1878 (Wild Coco)

A genus of 7-10 species, of s. North America, Cuba, Colombia, and tropical Africa (Romero-González in FNA 2002).

References: Romero-González in FNA (2002a); Correll (1950)=X.

Identification notes: The long (to 7 dm), plicate leaves are distinctive among our orchids. Small individuals can be mistaken for Calopogon when not in bloom. Pteroglossaspis differs, however, in having the stem covered from node to node by a succession of sheaths (vs. the sheaths much shorter) and in having the leaves 2-3 on a separate shoot emerging from the corm before the bloom-stalk (vs. leaf 1, on the bloom-stalk).

Pteroglossaspis ecrista (Fernald) Rolfe, Spiked Medusa, Smooth-lipped Eulophia. Mesic pinelands with blackjack oak, other sandhills and dry-mesic to mesic longleaf pinelands. June-September; July-November. Se. NC south to FL, west to LA; West Indies (Cuba). One of the rarest orchids in our region. [= FNA, K, WH; = Eulophia ecrista (Fernald) Ames – RAB, L, X; = Triorchos ecrista (Fernald) Small – S]

Sacoila Rafinesque 1838

A genus of ca. 10 species, of the tropics and subtropics. References: Brown & Catling in FNA (2002); Correll (1950)=X.

Sacoila lanceolata (Aublet) Garay var. lanceolata. Pine flatwoods, road shoulders. April-June. Ne. and Panhandle FL south to s. FL; West Indies, Mexico, Central America, South America. [= FNA, WH; = Stenorrhynchos lanceolata (Aublet) L.C. Richard var. lanceolata – K; = Spiranthes lanceolata (Aublet) Léon var. lanceolata – L; < Stenorrhynchos orchioides (Swartz) L.C. Richard – S] {add to genus key; add X to synonymy}

Spiranthes L.C. Richard 1817 (Ladies'-tresses, Pearl-twist, Spiral Orchid)

A genus of about 30-40 species, mainly north temperate, but with species scattered in other areas. The Spiranthes flora of our region is still rather poorly understood, and the treatment here will undoubtedly change further. References: Sheviak & Brown in FNA (2002a); Luer (1975); Sheviak (1991); Pridgeon et al. (1999c). Key adapted largely from Sheviak & Brown in FNA (2002a); Correll (1950)=X. [also see Sacoila]

Identification notes: Flowering plants are necessary for identification of the species.

1 Rachis of inflorescence with all hairs not glandular, tapering to a pointed tip; [flowering March-September] ................................................................. S. vernalis

2 Rachis of inflorescence either glabrous or with some or all hairs gland-tipped, capitate or clavate.  

2 Lip bright yellow or orange-yellow, with greenish veins; sepals and petals pure white; [flowering May-July] ................................................................. S. lucida

2 Lip either white, or lip yellowish and lacking greenish veins; sepals and petals creamy, ivory, yellow, or greenish; [collectively flowering February-December].

3 Lip with conspicuous, terminally widened, greenish (rarely yellowish) diverging veins extending nearly to the tip; [flowering March-July].

4 Flowers white, with green veins; sepals appressed; flowers 6-9 mm long ................................................................. S. praecox

4 Flowers creamy green, with darker green veins; flowers 10-17 mm long ........................................................................ S. sylvatica

3 Lip lacking conspicuous, terminally widened, greenish diverging veins (veins not terminally widened); [collectively flowering February-December].

5 Rachis glabrous; flowers gaping from near middle, the tubular portion < 3 mm long; lip pure white; [flowering June-September] ...... ................................................................. S. tuberosa

5 Rachis pubescent or glabrous; flowers gaping only from beyond the middle, the tubular portion > 3 mm long; lip white, creamy, yellow, or centrally green; [collectively flowering February-December].

6 Inflorescence with 5 or more flowers per cycle of spiral, the spiral usually open and obvious; [collectively flowering February-December] ........................................................................ Key A

6 Inflorescence with 3 or 4 flowers per cycle of spiral, the spiral usually tight and obscure, but then with 3 or 4 secondary ranks of flowers evident; [collectively flowering August-December] ........................................................................ Key B

Key A

1 Petals ca. 6 mm long; lower portion of stem with recurved-spreading leaves

2 Rostellum and viscidium absent; sepals 3.5-5 mm long ........................................................................ S. ovalis var. erostellata
**Key B**

1.  Leaflets 7.5 mm long or longer; leaves wholly basal, or lower portion of stem with recurved-spreading blades, or leaves absent at flowering.

2.  Lip only slightly or not at all differentiated from the petals; buds often failing to open (but setting seed through agamospermy); column normal, or abnormal or aborted; leaves usually absent at flowering. (Ibidium floridanum)

3.  Lip clearly differentiated from petals; buds opening into normal flowers; column normal; leaves present or absent at flowering. (S. cernua)

4.  Basal callus of the lip relatively short and concave, wide as high, and usually < 1 mm long; lateral sepals free and spreading, often over the top of the flower; leaves absent at flowering; [of calcareous barrens of the Ridge and Valley and westward, in the Ridge and Valley of sw. VA and nw. GA, and westward] (S. magnicamporum)

5.  Upper margin of the lateral sepals obviously separated from the adjacent margin of the dorsal sepal, the separation abrupt at the base (commonly by about 1 mm); lip strongly curving from the claw (resulting angle 20-60 degrees), cuneate at the base; perianth creamy, yellowish, or greenish white; [of upland, dry to mesic sites] (S. ochroleuca)

6.  Plants to over 100 cm tall, forming clonal colonies via stolons; leaves broad, stiffly aerenchymatous-thickened, the petioles of basal leaves 7 mm or more wide; leaves up the stem, with spreading recurved blades on the lower cauline sheaths, frequently also on the upper, with leaves extending to the inflorescence; perianth 10-15 mm long (sometimes smaller in depauperate plants); lip fleshy, usually over 7 mm long; [of the Coastal Plain] (S. odorata)

### Spiranthes brevilabris

Lindley, Short-lipped Ladies'-tresses. Pine savannas. Late February-April. Se. SC south to s. FL, west to se. TX. [= FNA, K, WH; = S. gracilis (Bigelow) Beck var. brevilabris (Lindley) Correll – GW; = S. brevilabris Lindley var. brevilabris – L]

### Spiranthes cernua

### Spiranthes eatonii

### Spiranthes floridana

(Wherry) Cory, Florida Ladies'-tresses. Wet savannas, other moist sites. April-May. A Southeastern Coastal Plain endemic: se. NC south to c. peninsular FL and west to TX, A Southeastern Coastal Plain endemic. [= FNA, K, WH; = S. brevilabris Lindley var. floridana (Wherry) Luer – L; = S. gracilis (Bigelow) Beck var. floridana (Wherry) Correll – RAB, GW, X; = Ibidium floridanum Wherry – S]

### Spiranthes lacera

(Rafinesque) Rafinesque var. gracilis (Bigelow) Luer, Southern Slender Ladies'-tresses. Fields, meadows, pastures, woodlands. August-September. NS, MI, WI, and KS south to GA and TX. [= C, FNA, K, L, W; = S. gracilis

**Spiranthes longilabris** Lindley, Giant Spiral Orchid. Wet pine savannas. Late October-December. A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to e. TX. [= RAB, FNA, GW, K, L, WH, X; = Ibidium longilabre (Lindley) House – S]

**S spirantes ochroleuca** (Rafinesque) Rydberg, Yellow Nodding Ladies'-tresses. Meadows and pastures at moderate to high elevations, up to at least 1500m in elevation. September-October. Largely northeastern, extending south in the mountains to NC. See Sheviak & Catling (1980) and Catling (1983a) for further information on this species. [= FNA, K, L, WH; = S. ochroleuca (Rydberg) Ames – C, F, X; = Ibidium ochroleum (Rydberg) House – S]

**Spiranthes odorata** (Walter) House – S

**Spiranthes ovalis** Lindley var. erostellata Catling, Oval Ladies'-tresses. Swamp forests, bottomland forests, hammocks, ravine forests. August-November. Var. erostellata is fairly widespread in se. North America, ranging from se. PA, MI, and IL south to Panhandle FL, s. MS, and s. LA. Var. ovalis is limited to AR, LA, and TX, differing in having a viscidium and rostellum. See Catling (1983b) for further information about this variety and its biology. [= C, FNA, K, WH; = S. ovalis – RAB, F, G, GW, L, WH, X; = Ibidium ovale (Lindley) House – S; = S. montana Rafinesque]

**Spiranthes ovalis** Lindley var. ovalis. Oval Ladies'-tresses. Swamp forests, mesic ravines. October-November. GA, TN, AR, and TX, south to n. peninsular FL and LA. [= FNA, K, WH; = S. ovalis – GW, L, X; = Ibidium ovale (Lindley) House – S]

**Spiranthes praecox** (Walter) S. Ames, Grass-leaved Ladies'-tresses, Giant Ladies'-tresses. Savannas, swamps, bogs. March-July. A Southeastern Coastal Plain endemic: NJ south to s. FL and west to TX. [= WH; = S. praecox – RAB, C, F, FNA, G, GW, K, L, WH, X (also see S. sylvatica); = Ibidium praecox (Walter) House – S (also see S. sylvatica)]

**Spiranthes sylvatica** P.M. Brown, Woodland Ladies'-tresses, Pale Green Ladies'-tresses. Live oak hammocks, other woodlands. Late March-early May. VA south to c. peninsular FL, west to e. TX. [= WH; = S. praecox – RAB, C, F, FNA, G, GW, K, L, WH, X; = Ibidium praecox (Walter) House – S]

**Spiranthes tuberosa** Rafinesque, Little Ladies'-tresses, Little Pearl-twist. In a wide variety of habitats, especially relatively well-drained woodlands and fields, sandhills, dry hammocks, dry pine flatwoods. June-September. MA, OH, and MO south to c. peninsular FL and TX. [= C, FNA, G, K, L, WH, X; = S. tuberosa var. grayii Ames – RAB, L, X; = Ibidium beckii (Lindley) House – S, misapplied]

**Spiranthes vernalis** Engelmann & A. Gray, Spring Ladies'-tresses. Savannas, bogs, marshes, fairly dry fields. March-July (early September in the mountains). MA to s. FL and west to TX and SD, also in Mexico and Central America. [= RAB, C, F, FNA, G, GW, L, WH, X; = Ibidium vernalis (Engelmann & A. Gray) House – S]
**Orchidaceae**

**Tipularia** Nuttall 1818 (Cranefly Orchid)

A genus of 3 species; the other species of the genus are e. Asian (1 in Japan and 1 in the Himalayas) (Catling & Sheviak in FNA 2002). References: Catling & Sheviak in FNA (2002a); Correll (1950)=X.

**Identification notes:** The leaves are present during the winter, withering before the flowering stalk appears, the plant thus occasionally mistaken for one of the saprophytic orchids. The leaves are usually purple underneath, a characteristic shared with *Aplectrum*, but *Tipularia* leaves are ovate, < 10 cm long, and are not notably plicate along the veins (vs. *Aplectrum*, with leaves narrowly elliptic, 10-20 cm long, and notably plicate along the very prominent, white, cartilaginous veins).

*Tipularia discolor* (Pursh) Nuttall, Cranefly Orchid. In a wide variety of mesic to rather dry forests. July-September. Se. MA, s. NY, OH, IN, and s. MI south to n. peninsular FL and TX. Along with *Goodyera pubescens*, *Tipularia* is one of the commonest orchids in e. North America. [= RAB, C, F, FNA, G, K, L, W, WH, WV, X; = *T. unifolia* (Muhlenberg) Britton, Stems, & Poggenburg – S]

**Triphora** Nuttall 1818 (Three Birds Orchid)

A genus of about 25 species, of e. North America, the West Indies, and Central and South America (Medley in FNA 2002). References: Medley in FNA (2002a); Brown & Pike (2006)=Z; Correll (1950)=X.

1 Flowers yellow, erect, not opening fully, the lip uppermost ................................................................. *T. rickettii*

1 Flowers pink to white, nodding, opening fully, the lip lowermost ............................................................ *T. trianthophoros* var. *trianthophoros*

*Triphora rickettii* Luer. Upland hardwood hammocks. Late July-August. Ne. FL (Columbia County) south into wc. Peninsular FL. Sometimes treated as a disjunct component of the Mexican *T. yucatanensis*. [= L, WH, X; < *Triphora yucatanensis* Ames – FNA, K]

*Triphora trianthophoros* (Swartz) Rydberg var. *trianthophoros*, Three Birds Orchid, Nodding Pogonia, Nodding Ettercap. Humid forests and swamps, rhododendron thickets, especially on rotten logs or on humus. July-September. The species is widespread (but scattered) in e. North America, and south into Central America. Var. *trianthophoros* occurs from ME and ON west to WI, south to e. peninsular FL and e. TX; disjunct in nc. Mexico; var. *mexicana* (S. Watson) P.M. Brown occurs from Mexico south to Central America. The recently named var. *texensis* P.M. Brown & R.B. Pike needs additional evaluation. The flowers are extremely ephemeral, making the species very difficult to locate. The correct spelling of the epithet is “*trianthophoros,*” [= *Triphora trianthophora* (Swartz) Rydberg var. *trianthophora* – Z, orthographic variant; = *T. trianthophora* ssp. *trianthophora* – FNA, orthographic variant; < *T. trianthophora* – RAB, C, F, G, GW, K, L, S, W, WV, X; < *T. trianthophoros* – WH]

**Zeuxine** Lindley 1826 (Soldier Orchid)

A genus of about 26 species, of tropical and subtropical Old World (introduced elsewhere). References: Ackerman in FNA (2002a); Correll (1950)=X.

* Zeuxine strateumatica* (Linnaeus) Schlechter, Lawn Orchid, Soldier Orchid. Lawns; native of Asia. [= FNA, GW, K, L, WH]

67. *Hypoxidaceae* R. Brown 1814 (Stargrass Family) [in ASPARAGALES]
HYPOXIDACEAE

A family of about 7–9 genera and 100–220 species, herbs, subcosmopolitan (though not well distributed in the northern hemisphere of the Old World, and especially diverse in South Africa). The recognition of Hypoxidaceae at the family level is supported by a variety of authors, on morphologic and molecular grounds (see Judd 2000 for summary). References: Nordal in Kubitzki (1998a); Herndon in FNA (2002a); Judd (2000).

Hypoxis Linnaeus 1759 (Stargrass)

1 Leaves glabrous, or with a few trichomes near the base; seeds black.
2 Leaves filiform, 0.3-1.2 mm wide, stiff; seeds pebbled (the exposed portion of each cell rounded); floral bracts 1-7 (-12) mm, > 2× as long as the pedicels; ovaries densely pubescent; [of Coastal Plain pinelands] ............................................................. H. juncea
3 Leaves over 2 mm wide, soft and flexible; seeds coarsely muricate (the exposed portion of each cell pointed-conical); floral bracts 1-(-2) 20-80 mm; ovaries sparsely to densely pubescent; [collectively widespread].
4 Ovaries longer than broad, cylindric, with scattered trichomes; floral bracts 3-5 20-80 mm long; pedicels usually shorter than the floral bracts; tepals equaling or shorter than ovaries; [of Coastal Plain bottomlands] ..................................................... H. curtissii
5 Ovaries as broad as long or nearly so, deluate, densely pubescent; floral bracts 1-2 10-17 mm long; pedicels usually >2× as long as the floral bracts; tepals much longer than ovaries; [widespread] .................................................. H. hirsuta
6 Pedicels usually >2× as long as the bracts; seeds black or brown; [collectively widespread].
7 Leaves evenly pubescent, at least near the base; seeds black or brown.
8 Pedicels usually >2× as long as the bracts; seeds black; [collectively widespread].
9 Pedicels usually < 2× as long as subtending bracts; seeds black or brown; [of Coastal Plain pinelands].
10 Anthers > 2 mm long; tepals longer than the pedicels; floral bracts longer than the pedicels; seeds black, pebbled with round pebbling (the exposed portion of each cell rounded).
11 Anthers < 2 mm long; tepals shorter than to longer than the pedicels; floral bracts shorter to than longer than the pedicels; seeds brown, with detached, wrinkled cuticle.
12 Tepals 1.5-2× as long as ovaries; seed coats iridescent .................................................................................. H. sessilis
13 Tepals ca. 1 (-1.5)× the length of the ovaries; seed coats not iridescent ......................................................... H. wrightii

14 Hypoxis curtissii Rose in Small, Swamp Stargrass. Swamp forests, alluvial forests, water courses, wet hammocks. March-June; May-July. E. NC south to e. peninsular FL, west to e. TX. [= FNA, K, WH, Z; = H. hirsuta (Linnaeus) Coville var. leptocarpa (Engelmann & A. Gray) Fernald = RAB; < H. hirsuta – C, G; = H. leptocarpa (Engelmann & A. Gray) Small – GW, S]
15 Hypoxis hirsuta (Linnaeus) Coville, Common Stargrass. In a wide variety of dry to moist forests. March-June; May-July. S. ME west to SK and ND, south to GA and e. TX. [= FNA, GW, S, WV, Z; = H. hirsuta var. hirsuta – RAB; < H. hirsuta – C, G, K]
16 Hypoxis juncea Sm., Fringed Stargrass. Wet pine savannas. April-May (-later, especially in response to fire); May-June. (-later, especially in response to fire). Se. NC south to s. FL, west to s. AL. [= RAB, FNA, GW, K, WH, S, Z]
17 Hypoxis rigidula Chapman, Savanna Stargrass. Wet pine savannas. April (-later, especially in response to fire); May. (-later, especially in response to fire). Se. NC south to Panhandle FL, west to e. TX. [= RAB, FNA, GW, S, WH, Z; < H. hirsuta – K]
18 Hypoxis sessilis Linnaeus, Glossy-seed Stargrass. Wet pine savannas. April (-later, especially in response to fire); May (-later, especially in response to fire). NC south to s. FL, west to e. TX, s. AR, and se. OK. [= RAB, FNA, GW, K, S, WH, Z; > H. longi Fernald – C, F, G; > H. sessilis – C, F, G]
19 Hypoxis wrightii (Baker) Brackett, Bristleseed Stargrass. Wet pine savannas. March-April (-later, especially in response to fire); April-May (-later, especially in response to fire). Se. VA south to s. FL, west to TX; disjunct in the West Indies (Cuba, Bahamas, Jamaica, Hispaniola, Puerto Rico). [= FNA, K, Z; = H. micrantha Pollard = RAB, C, F, G, GW, S, misapplied]

71. IRIDACEAE A.L. de Jussieu 1789 (Iris Family) [in ASPARAGALES]

1 Inflorescence a spike or panicle of spikes; plants from corms; flowers slightly zygomorphic.
2 Stem usually branched, the inflorescence appearing panicle; tepals orange to red .................................................. Crocosmia
3 Stem unbranched, the inflorescence a spike; tepals any of a wide range of colors (including orange and red)
4 Inflorescence bent at its base, the inflorescence axis more-or-less horizontal, the flowers facing upwards .................................. Freesia
5 Inflorescence erect, the flowers facing outwards ................................................................. Gladiolus
IRIDACEAE

1 Inflorescence an umbellate 1-sided cyme; plants from rhizomes or bulbs; flowers actinomorphic.

4 Leaves planar; plants from rhizomes (or indistinct) or a bulb (in Iris xiphium).

5 Style branches broad, petaloid, terminating in paired crests ...................................................................... Iris

145

5 Style branches not broad or petaloid.

6 Tepals 6-15 mm long, blue, purple, lavender, pink, magenta, white, or yellowish-white; seeds 0.6-1.3 mm in diameter ...................................................................................................................... Sisyrinchium

4 Leaves plicate; plants from bulbs.

7 Tepals unequal, the inner whorl < ½ as long as the outer whorl ...................................................................................................... Herbertia

7 Tepals nearly equal in length.

8 Style recurved, with 3 flat branches that are < 2 mm long ......................................................................................... Calydorea

8 Style straight, each of the 3 branches further divided into slender lobes

9 Style branches divided for ca. ½ their length; style arms arching over or between the anthers; tepals dark purple ........... Alophia

9 Style branches divided nearly to base; style arms extending horizontally between the anthers; tepals blue, white in the center ........ Nemastylis

Alophia Herbert (Propellor-flower)

Alophia drummondii (Graham) R.C. Foster, Propellor-flower. E. LA (and MS?) west to TX and OK; Mexico; Guyana. [= FNA, K; = Herbertia drummondii (Graham) Small]

Calydorea Herbert 1843 (Ixia)

A genus of about 8 species, of warm temperate and tropical America. The circumscription relative to Nemastylis is uncertain. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

Calydorea coelestina (Bartram) Goldblatt & Henrich, Bartram’s Ixia. Pine flatwoods. Endemic to ne. FL (Chafin 2000); the single GA record is by P.O. Schallert, notoriously sloppy with his location data, and is therefore best discounted unless additional information comes to light. [= FNA, K; = Salpingostylis coelestina (Bartram) Small – S; = C. coelestina – WH, orthographic variant; = Nemastylis coelestina (Bartram) Nuttall; = Sphenostigma coelestina (Bartram) R.C. Foster; = Ixia coelestina Bartram]

Crocosmia Planchon 1851 (Montbretia)

A genus of 8-9 species, herbs, native of sub-Saharan Africa. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Dunlop (2004); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

* Crocosmia ×crocosmiiflora (V. Lemoine) N.E. Brown [C. aurea × pottsii], Montbretia. Disturbed areas, ditches, especially in moist to wet sites, including salt marshes; the parents of the hybrid both native to sub-Saharan Africa. Late June-July. Reported for Lowndes and Thomas counties, GA (Carter, Baker, & Morris 2009). [= FNA, K, WH; = C. ×crocosmiiflora – RAB, orthographic variant]

Crocus Linnaeus 1753 (Crocus)

* Crocus tomasinianus Herbert, Woodland Crocus. Disturbed areas, long-persistent after cultivation around house-sites. Reported as rarely naturalizing in DE (McAvoy & Bennett 2001). {not yet keyed}

Crocus vernus (Linnaeus) Hill, Dutch Crocus. Disturbed areas, long-persistent after cultivation around house-sites. [= K]

{not yet keyed]

Freesia Eklon ex Klatt 1865 (Freesia)

**Gladiolus** Linnaeus 1754 (Gladiolus)

A genus of about 255 species, largely of Africa. References: Goldblatt in FNA (2002a); Goldblatt, Manning, & Rudall in Kubitzki (1998a). Key based on FNA.

1 Inner tepals 60-70 mm long .......................................................... **G. ×gandavensis**
1 Inner tepals < 60 mm long.

2 Tepals white, cream, orange, or red; perianth tube plus dorsal sepal 60-95 mm long .................................................. **G. dalenii** ssp. *dalenii*
2 Tepals pink, reddish, or light purple, with white markings on the outer 3 tepals.

3 Anthers 10-13 mm long; capsules oblong, 18-24 mm long; seeds winged .......................................................... **G. communis**
3 Anthers ca. 15 mm long; capsules globose, 10-12 mm long; seeds not winged .......................................................... **G. italicus**

*Gladiolus communis* Linnaeus, False Corn-flag. Commonly cultivated as ornamentals, rarely persisting or weakly spreading; native of Mediterranean Europe and n. Africa. [= FNA; > *G. papilio* Hooker – RAB, K, misapplied; > *Gladiolus communis* Linnaeus ssp. *byzantinus* (P. Miller) A. Hamilton – K; > *G. byzantinus* P. Miller]

*Gladiolus dalenii* Van Geel ssp. *dalenii*. Sometimes cultivated, rarely persisting or spreading; native of s. Africa. Introduced in AL and LA. [= FNA]

*Gladiolus ×gandavensis* Van Houtte [*G. dalenii × oppositiflorus*]. Commonly cultivated as ornamentals, rarely persisting or weakly spreading, native of s. Africa. Goldblatt suggests that as many as 5 species are involved in the origin of the large-flowered garden gladiolus. [= RAB, FNA, K, WH; > *G. hortulanus* L.H. Bailey – S; > *G. dalenii* Van Geel]

*Gladiolus italicus* P. Miller. Sometimes cultivated, rarely persisting or spreading; native of Eurasia. Introduced in TN. [= FNA, K; > *G. segetum* Ker-Gawler – S]

**Herbertia** Sweet 1827 (Pleat-leaf Iris)

**Herbertia lahue** (Molina) Goldblatt, Prairie-nymph. Prairies and marshes. AL and FL west to TX; central South America. [= FNA, WH; > *H. lahue* ssp. *caerulea* (Herbert) Goldblatt – K; > *H. caerulea* Herbert – S]

**Iris** Linnaeus 1753 (Iris, Flag, Blackberry-lily)

**Identification notes:** the petals are usually erect, smaller than the petaloid sepals (which are brightly colored, generally reflexed, and marked with a “signal”). The styles are also petaloid, arched over the sepals, and 2-cleft at the tip (except in *I. domestica*).

1 Plant from an ovoid bulb; [subgenus *Xiphium*] ........................................................................................................... **I. xiphium**
1 Plant from short to elongate rhizomes.

2 Style branches not broad, petaloid, or crested; seeds black, shiny, in a blackberry-like cluster (the seeds exposed at maturity by dehiscence of the papery to chartaceous capsule walls) ............................................................................................. **I. domestica**
2 Style branches broad, petaloid, terminating in paired crests; seeds tan to brown, in a capsule.

3 Sepal "signal" (see above) of multicellular hairs (the “beard”), along the midrib of the petal and the base of the blade; [subgenus *Iris*].
4 Spathes green (or purplish) and herbaceous, with scarious margins ........................................................................... **I. germanica**
4 Spathes scarious, silvery-white......................................................................................................................................... **I. pallida**
3. Sepal "signal" consisting of contrasting color, ridges, small unicellular hairs, and/or a cockscomb-like crest; [subgenus *Limniris*].

5. Rhizome branches cord-like, with scale-like leaves, enlarging at the apex to produce vegetative leaves, additional branches, and flowering stems.

6. Stems 30-80 cm tall; leaves 30-60 cm long, 0.2-0.7 cm wide; cordlike portions of rhizomes to 4 dm long; [of wetlands]; [section *Limniris*, series *Prismaticae*].

6. Stems 2-15 cm tall; leaves 10-45 cm long, 0.3-2.5 cm wide; cordlike portions of rhizomes to 2 dm long; [of dry to mesic uplands].

7. Sepals crested with a 3-ridged, toothed crest; leaves 10-25 mm wide, green, falcate; flowers not or only slightly fragrant; rhizomes surficial (one can "pull" them off the ground by gently tugging on the leaves); [generally of mesic and fertile soils]; [section *Lophiris*].

7. Sepals not crested; leaves 3-13 mm wide, blue-green, straight or nearly so; flowers strongly fragrant; rhizomes deeply buried (not easily "pulled"); [generally of dry and acidic soils]; [section *Limniris*, series *Versa*].

8. Leaves 5-13 mm wide; rhizomes 1-3 cm between offshoots, thus forming clumps; capsules 1.7-3.2 cm long; [primarily of the Mountains, and upper Piedmont, extending into the Coastal Plain in sw. GA and Panhandle FL].

8. Leaves 3-8 mm wide; rhizomes 15-15 cm between offshoots, thus hardly clump-forming; capsules 1.2-1.8 cm long; [of the Coastal Plain and lower Piedmont, from e. GA northward].

5. Rhizome branches like the primary rhizome, not as above.

9. Petals 1-2 cm long; [section *Limniris*; series *Tripetalae*].

9. Petals 2-9.5 cm long.

10. Stems hollow; [section *Limniris*; series *Sibirica*].

11. Spathes hercaceous at flowering time; capsule 3.5-5.5 cm long; [section *Limniris*].

11. Spathes scarious at flowering time; capsule 2-3.5 cm long; [section *Limniris*].

10. Stems solid.

12. Capsules 3-angled or nearly round in cross-section; [section *Limniris*; series *Laevigatae*].

13. Perianth yellow. ................................................................................................................................. *I. pseudacorus*

13. Perianth blue-violet (rarely white).

14. Flowers 8-15 cm in diameter; leaves 0.5-1.5 cm wide; [alien, cultivated, rarely escaped] ................. *I. ensata*.

14. Flowers 6-8 cm in diameter; leaves 1-4 cm wide; [native].

15. "Signal" a greenish-yellow, papillate patch, surrounded by an area of heavily veined purple-on-white; [of VA northward] ................................................................. *I. versicolor*.

15. "Signal" a bright yellow, pubescent patch.

16. Plants to 10 dm tall, usually with 2 well-developed branches; capsule 7-11 cm long ....... *I. virginica* var. *shrevei*.

16. Plants to 6 dm tall, little or not at all branched; capsule 4-7 cm long ............................................. *I. virginica* var. *virginica*.

12. Capsules 6-angled or ridged in cross-section; [section *Limniris*; series *Hexagonae*].

17. Perianth dull copper or orange-brown (or dark yellow) (fading in nature or drying in the herbarium to a bluish or purplish color); petals spreading or declining. ......... *I. fulva*.

17. Perianth blue-violet (rarely white); petals erect to spreading.

18. Stems declining or semi-erect, sharply zigzag ................................................................. *I. brevicaulis*.

18. Stems erect, slightly if at all zigzag.

19. Capsules 2.5-3.5 cm long, hexagonal in cross-section, 3 sides flat, the alternating sides with 2 rounded ridges ................................................................................................................................. *I. hexagona*.

19. Capsules 6-10 cm long, slightly to strongly hexagonal in cross-section.

20. Capsules with 6 broad rounded lobes, indehiscent ............................................... *I. giganticaerulea*.

20. Capsules with 6 sharp, winglike ridges, dehiscent ......................................................... *I. savannarum*.

*Iris cristata* Aiton, Dwarf Crested Iris. Moist forests, rich woods, roadbanks. April-May; June-July. MD west to IN and MO, south to NC, AL, MS, AR, and e. OK. [= RAB, C, F, FNA, G, K, W, WV; = *Neubekia cristata* (Aiton) Afanali – S]

*Iris ensata* Thunberg, Japanese Iris. Roadsides; cultivated and rarely escaped, native of Japan, n. China, and Sakhalin. Also reported from se. PA (Rhodes & Klein 1993). [= K; I. kaempferi Siebold ex Lamarche]

*Iris germanica* Linnaeus, German Iris, Fleur-de-Lys. Roadsides, old homesites, ditches; cultivated and rarely persistent or escaped, native of Europe. April-May. [= RAB, C, F, FNA, G; > *I. flavescens* Delile – K; > *I. ×germanica* – K]

*Iris giganticaerulea* Small, Giant Blue Iris. Marshes and swamps. MS west to e. TX. [= FNA, K; > *I. giganticaerulea* Small – S; > *I. alticristata* Small – S; > *I. aurilinea* Alexander – S; > *I. citricristata* Small – S; > *I. elephantina* Small – S; > *I. fluviatilis* Small – S; > *I. mirabilosa* Small – S; > *I. paludicola* Amexander – S; > *I. parvicaerulea* Alexander – S; > *I. rivularis* Small – S; > *I. venulosa* Alexander – S; > *I. wherryana* Small – S]
IRIDACEAE

Iris hexagona Walter, Anglepod Blue Flag. Swamps. May-June. SC south to s. FL. [= RAB, FNA, GW, S, WH; = I. hexagona var. hexagona – K; > I. hexagona – S]

* Iris pallida Lamarck in J. Lamarck et al., Sweet Iris. Cultivated and persistent around buildings in GA and elsewhere (FNA). [= F, FNA, K]

Iris prismatica Pursh ex Ker-Gawler, Slender Blue Iris, Slender Blue Flag. Bogs and marshes. May-June; June-July. NS south to GA, disjunct in w. NC (Henderson County) and sc. TN (Coffee County). [= RAB, C, FNA, G, GW, K, S, W; > I. prismatica var. prismatica – F; > I. prismatica var. austrina Fernald – F]

* Iris pseudacorus Linnaeus, Water Flag, Yellow Flag. Swamps, marshes, streams, ponds, cultivated as a water plant; native of Eurasia and Africa. May-July; August-October. [= RAB, C, F, FNA, G, GW, K, S, WH, WV]

* Iris sanguinea Hornemann ex Donn, Japanese Iris. Roadsides, cultivated and rarely escaped; native of Japan, n. China, Korea, Japan, and w. Russia. [= K]

Iris savannarum Small. {habitat}. GA and AL south to s. FL. [= FNA, S; = I. hexagona Walter var. savannarum (Small) R.C. Foster – K; > I. kimballiae Small – S; > I. alabamensis Small – S]

* Iris sibirica Linnaeus, Siberian Iris. Cultivated and escaping or persisting near plantings; native of Eurasia (c. and e. Europe west to Lake Baikal). [= FNA, K]

Iris tridentata Pursh. Wet savannas, pine flatwoods, margins of pineland pools. Late May-June; August-October. Se. NC south to ne. FL and Panhandle FL. [= RAB, FNA, GW, K, WH; ? I. tripetala – S, misapplied]

Iris virginica Linnaeus var. virginica. Southern Blue Flag. Marshes, swamps, streams. April-May; July-September. Se. VA south to c. peninsular FL, west to e. TX, north in the interior to w. TN; disjunct in sc. TN. [= C, F, K; < I. virginica – RAB, FNA, W; = I. virginica – G, S]

* Iris xiphium Linnaeus, Spanish Iris. Disturbed areas; native of Spain and Portugal. [= K]

Nemastylis Nuttall 1835 (Celestial-lily)

Nemastylis geminiflora Nuttall, Prairie Celestial, Prairie Pleatleaf. Prairies. MO and e. KS south to w. LA and TX; disjunct eastward in AL and MS. [= FNA, K; Ixia acuta Bartram; Nemastylis acuta Herbert]
A genus of about 80 species, herbs, of the Americas. *Sisyrinchium* is a very difficult genus, with a number of taxonomic questions remaining in our area. References: Cholewa & Henderson in FNA (2002a); Hornberger (1991) = Y; Bicknell (1896, 1899a, 1899b); Goldblatt, Manning, & Rudall in Kubitzki (1998a).

**Identification notes:** For fully successful identification, it is necessary to collect underground parts; fibrous remains of leaves, and rhizomes (if any), are critical characters.

1. Perianth with tepals campanulate basally, flaring distally; annual; plants usually <2 dm tall; tepals lavender, pink, white, magenta, or yellow, and rhizomes (if any), are critical characters.

2. Stems with 3-6 nodes; tepals yellow basally; mature capsules broadly fusiform or elliptical, uniformly light brown; [of MS to TX]...

3. Inflorescences paired (each inflorescence composed of 1-5 flowers, their pedicels emanating from within 2 chartaceous scales; thus, there are 5 pairs of scales within each 2 outer, leaflike, green spathe bracts; outer spathe bract connate 0-1 mm)

4. Stems 1.3-3.4 mm wide, obviously winged; base of plant without fibrous remains of leaves; [of the Piedmont and Mountains]...

5. Stems simple, unbranched (rarely branched).

6. Spathe bracts connate 0-1 mm; [coastal sw LA-s TX] ..............................

7. Base of plant with fibrous remains of leaves; [southern Appalachians and northward] ............................

8. Spathe bracts equal or subequal, outer bract up to 4.2 mm longer than inner; [northern, extending south to nw. GA and c. AL] ........................................................

9. Stems 1.5-2.1 mm wide, scabrous; plants drying dark brown or blackish; spathe bracts 15-20(-25) mm long; [southern, extending south to c. AL] ...........................

10. Main stems usually >2 mm wide.

11. Plant bases with fibrous remains of leaves (usually abundant).

12. Main stems 0.5-2.1 mm wide (usually <2 mm wide).

13. Stems mostly 1.5-2.1 mm wide, scabrous; plants drying dark brown or blackish; spathe bracts 15-20(-25) mm long; [southern, extending south to c. AL] ...........................

14. Stems and leaves shiny, especially in life; stems mostly 3-6 mm wide; mature capsules mostly 5.5-8 mm long; [of FL and sw. GA] ........................................................

15. Stems and branches smooth on margins; stems mostly 2.3-4.5 mm wide; plants dried dull green or brownish green; [widespread] ..............................................................

16. Stems mostly 2.0-3.0(-3.5) mm wide; mature capsules 4-6 mm long; [of se. MD northward to sw. Nova Scotia] .............................

17. Main stems usually >2 mm wide.

18. Spathe bracts connate 2.5-4 mm; spathe bracts and stems with abundant white spicules or papillae, sometimes these +/- flattened like lenticels; stems 1-2.8 mm wide; leaf blades scabrous...........................................................
Sisyrinchium albidum Rafinesque. Woodlands, savannas?, mesic sandhills, open limestone barrens. March-May; May-June. S. NY west to s. WI, south to Panhandle FL and e. TX. [= C, F, FNA, G, K, Y; < S. albidum – RAB, W, WH (also see S. capillare); > S. albidum – S; > S. scabrellum E.P. Bicknell – S]  
Sisyrinchium arenicola E.P. Bicknell, Sandyland Blue-eyed-grass. Sandy habitats. A Coastal Plain endemic: MA to e. MD (Caroline Co.). [= F; < S. fuscatum – FNA]  
Sisyrinchium campesr E.P. Bicknell, Prairie Blue-eyed-grass. Prairies. MI and SD south to MS and NM. [= FNA, K]  
{add to synonymy}  
Sisyrinchium corymbosum E.P. Bicknell, Pinelands. Se. GA and ne. FL west to s. AL. See Ward (2005a) for its resurrection. [= S. atlanticum Bicknell – FNA, K; < S. angustifolium – WH]  
Sisyrinchium dichotomum E.P. Bicknell, White Irisette, Isothermal Irisette. Dry to mesic woodlands and forests, usually over mafic rocks (such as amphibolite), at low to moderate elevations (400-1000 m) in the Blue Ridge escarpment. May-June; June-August. Endemic to Henderson, Polk, and Rutherford counties, NC, and Greenville County, SC. [= FNA, K, W]  
Sisyrinchium fuscatum E.P. Bicknell. Xeric to dry soils of pine barrens, Carolina bay rims, sandhills, fluvial sand ridges. Late April-June; June-October. E. VA south to n. FL, west to LA. [= RAB, F, G, GW; < S. fuscatum – C, FNA, K; > S. fuscatum – S; > S. incrustatum E.P. Bicknell – S; < S. nashii – WH]  
Sisyrinchium langloisii Greene. {habitats}. AR and OK south to w. LA and s. TX; disjunct eastwards in AL, GA, MS, TN, and nw. GA. [= FNA; < S. langloisii – K (also see S. pruinosum)]  
Sisyrinchium miamiense E.P. Bicknell. {habitats}. Ne FL and s. GA south to s. FL and west to s. MS. [= FNA, K; < S. angustifolium – WH]  
{add S to synonymy}  
Sisyrinchium minus Engelmann & A. Gray. {habitats}. E. LA west to c. TX. Reported for NC (Sida 1962) and MS {check}. [= K]  
{add to synonymy}  
Sisyrinchium montanum Greene var. crebrum Fernald. {habitat in our area not known}. May-July. NL (Newfoundland) and ON south to NY. The status of this taxon in our area is not clear. S. montanum var. crebrum is reported for VA by F, and S.
**IRIDACEAE**

*Sisyrinchium montanum* Greene var. *montanum*. Reported for n. WV (Harmon, Ford-Wernzt, & Grafton 2006). [rejected; not keyed; not mapped] [= C, F, FNA, K; < *S. montanum* – G]

*Sisyrinchium angustifolium* E.P. Bicknell. [habitats]. AR south to w. LA and AR, disjunct at scattered localities eastwards in e. LA, MS, AL, and so. TN. [= FNA, < *S. langloisii* – K] [add to synonymy]

*Sisyrinchium rosulatum* E.P. Bicknell. Lawn Blue-eyed-grass, Fairy-stars. Lawns, roadsides. April-May; May-June. Se. VA south to FL, west to e. TX. [= RAB, FNA, GW, K, S, WH, Y; > *S. exile* E.P. Bicknell]

*Sisyrinchium rufipes* E.P. Bicknell. Xeric-dry longleaf pine sandhills, fluvial sand ridges. Se. NC to n. FL, west to s. AL. [= S; < *S. fuscatum* – FNA, K; < *S. nashii* – WH]

*Sisyrinchium sagittiferum* E.P. Bicknell. Ranges east to AL (FNA). [= FNA, K] [add to synonymy]

*Sisyrinchium xerophyllum* Greene, Florida Blue-eyed-grass. Xeric sands. S. GA south to s. peninsular FL; also alleged to occur in NC (FNA) but this report does not seem plausible. [= FNA, K, S, WH]

---

**73. XANTHORRHOEACEAE** R. Brown 1810 (Day-lily Family) [in ASPARAGALES]

**Hemerocallis** Linnaeus 1753 (Day-lily)

1 Flowers tawny-orange (or many variants thereof), not fragrant; inner tepal margins wavy..........................................................*H. fulva*

1 Flowers lemon-yellow, fragrant; inner tepal margins planar..........................................................*H. lilioasphodelus*

---

**74. AMARYLLIDACEAE** J. St. Hilaire 1805 (Amaryllis Family) [in ASPARAGALES]

A family of about 59 genera and 850 species, nearly cosmopolitan (especially diverse in the tropics). Here circumscribed to include the Alliaceae following the recommendation of APG III (2009). References: Dahlgren, Clifford, & Yeo (1985); Müller-Doblies & Müller-Doblies (1996); Meerow & Snijman in Kubitzki (1998a); Fay & Chase (1996); Rahn in Kubitzki (1998a). [also see AGAVACEAE and HYPOXIDACEAE]

1. Allium Linnaeus 1753 (Onion, Garlic, Leek, Ramps, Chives)
A. microscordination A. canadense (also see some level; additional study is needed. [= K, S; atroviolaceum

leaves rounded to moderately keeled in cross section (if keeled, the angle between the two lower flat faces generally 120-165 degrees), 2-8 mm wide; [of the Piedmont and Mountains].

16 Pedicels relatively stout, 1.6-3 cm long; tepals pink or pale pink (sometimes nearly white); plants flowering June to early August; [widespread in our area, on moderately to strongly calcareous substrates] A. cernuum

16 Pedicels relatively slender, 2-4 cm long; tepals greenish white to white; plants flowering August; [of barrens developed over strong acid shales in e. WV] A. oxypilum

Allium allegheniense Small, Allegheny Onion. In thin soils around outcrops, generally of mafic rocks (such as amphibolite or hornblende gneiss) or calcareous rocks, primarily at moderate to fairly high elevations (1000-1600m). July-August; September-October. Known from w. NC, w. VA, and e. WV, possibly more widespread. Although not recognized by most recent authors, A. allegheniense seems distinctive enough in morphology, ecology, and distribution to warrant taxonomic recognition at some level; additional study is needed. [= K, S; A. cernuum – RAB, C, FNA, G, W]

* Allium ampeloprasum Linnaeus, Wild Leek, Yorktown Onion. Roadsides and other disturbed areas; native of Eurasia. Late May-early July; July-August. [= RAB, C, F, FNA, G, W; A. ampeloprasum var. ampeloprasum – K; A. ampeloprasum var. atroviolaceum (Boiss.) Regel – K]

Allium burdickii (Hanes) A.G. Jones, Narrow-leaf Ramps, White Ramps. Northern hardwood forests, primarily at higher elevations than A. cernuum, perhaps also in cove forests and rich mountain slopes. June; August. Only recently determined to be a separate taxon, A. burdickii is apparently rare in our area. It blooms about a month earlier than A. tricoccum. See Jones (1979) for more details and discussion. Largely sympatric with A. tricoccum, it is somewhat more northern and midwestern, ranging from ME west to ND and south to NJ, and in the Mountains to (?) w. VA. All material ascribed to A. burdickii in w. NC and e. TN appears to be A. tricoccum. [= K, W; A. tricoccum var. burdickii Hanes – C, FNA; A. tricoccum – F, G]

Allium canadense Linnaeus var. canadense, Wild Onion. Bottomland forests, pastures, roadsides. Mid April-May; late May-June. NB west to ND, south to c. peninsular FL and TX. Though native, often appearing weedy. [= RAB, C, FNA, K, WH; A. canadense – F, G, S, W]

Allium canadense Linnaeus var. mobilense (Regel) Ownbey. Dry woodlands. Mid April-May; Late May-June. S. SC south to ne. FL and Panhandle FL, west to TX. This taxon is perhaps better treated as a distinct species. [= RAB, FNA, K, WH; A. microscordination Small – S; A. mutabile Michaux – F; A. arenicola Small – S; A. canadense ssp. mobilense (Regel) Traub & Ownbey]

* Allium cepa Linnaeus, Garden Onion. Persisting from gardens, or appearing around compost or trash piles; native to c. Asia. May-June; July. [= RAB, C, FNA, G; A. cepa var. cepa – K]

Allium cernuum Roth, Nodding Onion. Generally in open woodlands or around outcrops of shale, mafic, ultramafic, or calcareous rocks, in the mountains at low elevations. June-early August; August-October. NY, MI, MN, and BC, south to GA and AZ; the distribution is oddly fragmented into largely Rocky Mountain, Ozarkian, and Appalachian segments, and it is quite possible that cryptic taxa are involved. See discussion of A. oxypilum at end of genus. [= S; A. cernuum – RAB, C, F, FNA, G, W (also see A. allegheniense and/or A. oxypilum); A. cernuum var. ceranum – K]

Allium cuthbertii Small, Cuthbert's Onion. Sandhills, granite domes and flatrocks, in NC in thin soils around rock outcrops, receiving nutrient-rich seepage and occurring with many strict calciphiles. May-June; June-July. The bright emerald green ovary of the fresh flowers is striking and distinctive. Two morphological forms occur in our area, probably warranting taxonomic recognition. Typical A. cuthbertii occurs on xeric Coastal Plain sands from c. SC south through GA and AL to ne. FL; the perianth is white and the plants 1.5-3.5 dm tall. In NC, a peculiar form of A. cuthbertii is apparently limited to a series of unusual granitic domes in the Brushy Mountains of Alexander and Wilkes counties; these plants are more robust (4-8 dm tall), and the perianth is always pink. [= RAB, FNA, K, S, W, WH]

Allium oxypilum Wherry. Shale barrens. Endemic to WV (Greenbrier, Mercer, Monroe, and Summers counties). Although there has been much discussion of its taxonomic status, it is apparently distinct from A. cernuum. It should be expected
in VA, although the outcrops of suitable shales are quite limited (Bartgis, pers. comm.; Wieboldt, pers. comm.). [= K; < A. cernuum – C, F, FNA, G, W]

* **Allium sativum** Linnaeus, Garlic. Gardens, trash heaps, fields; commonly cultivated, rarely occurring as a waif or persistent in gardens, native of Eurasia. [= C, F, FNA, G, K, Z]

**Allium species 1**, Savanna Onion. Wet savannas over coquina limestone (marl). Late August-early October; late September-November. This remarkable Coastal Plain relative of *A. cernuum* was first discovered in 1981 by Steve Leonard in Pender County; it has since been found in similar sites in Onslow and Brunswick counties, always associated with other endemic species of primarily montane genera, such as *Thalictrum cooleyi* and *Parnassia caroliniana*. It appears to warrant taxonomic status.

**Allium speculae** Ownbey & Aase, Flatrock Onion. Seepy edges of vegetation mats on Lithonia granitic gneiss and on sandstone in ne. AL. May-June; mid June-mid July. Endemic to wc. GA and ne. AL. See Patrick, Allison & Krakow (1995) for additional information. [= FNA, K]

**Allium stellatum** Nuttall ex Ker-Gawler, Glade Onion, Prairie Onion. Limestone glades. July-September. ON and SK south to n. AR and e. TX; disjunct east of the Mississippi in c. TN. [= RAB, K, W; < A. tricoccum – F, G (also see *A. burdickii*); = Allium tricocum var. tricoccum – C, FNA; = Validallium tricoccum (Aiton) Small – S]

* **Allium vineale** Linnaeus, Field Garlic. Lawns, pastures, other disturbed places; native of Eurasia. Late May-June; June-August. This is the common weed, often known as "onion grass". [= RAB, C, F, FNA, G, S, W; > A. vineale ssp. vineale – K; > A. vineale var. vineale – Z; > A. vineale var. capsuliferum Koch – Z; > A. vineale var. compactum (Thuill.) Coss. – Z]

2. **Nothoscordum** Kunth 1843 (Grace Garlic, False Garlic)

1 Leaves 1-4 (-5) mm wide; tepals distinct or only slightly connate at the base; flowers 3-6 (-10) per umbel; flowers not fragrant ........ N. bivalve

1 Leaves 4-12 mm wide; tepals connate up to 1/3 of their length; flowers 10-20 per umbel; flowers fragrant (similar to cocoa) ........... N. gracile

**Nothoscordum bivalve** (Linnaeus) Britton, Grace Garlic, False Garlic. Around granite flatrocks, in glades and barrens of various kinds, in open woodlands, and also weedy in fields and along roadides. Mid March-mid May, and again in September-October; May-June, and again in October-November. VA west to s. OH and KS, south to c. peninsular FL, TX, and South America. An onion-like plant, but generally lacking the odor of onion. [= K; = Allium bivalve (Linnaeus) Kuntze – RAB]

3. **Tristagma** Poeppig (Star-of-Bethlehem)

4. **Crinum** Linnaeus 1753 (Swamp Lily, String Lily)

**Identification notes:** *Crinum* can be distinguished vegetatively from *Hymenocallis* by its spiral (vs. distichous) leaf arrangement and leaf margins finely toothed (vs. entire).

1 Leaves 7.5-12 cm wide; umbels 20-100-flowered.........................................................................................................................**C. asiaticum**

1 Leaves 1-5 (-7) cm wide; umbels 2-13-flowered.

2 Umbels 2-5-flowered; perianth white; [native]......................................................................................................................**C. americanum** var. **americanum**

2 Umbels 8-13-flowered; perianth usually at least in part reddish; [exotic].

3 Flowers pedicellate; bulb 6-8 cm in diameter..............................................................................................................................**C. bulbispermum**

3 Flowers sessile; bulb 12-15 cm in diameter..............................................................................................................................**C. zeylanicum**

**Crinum americanum** Linnaeus var. **americanum**, Swamp-lily, String-lily. Swamp forests. June-October. Se. NC south to s. FL and west to TX. Var. **traubii** (Moldenke) R.S. Hannibal is endemic in se. TX. [= FNA; < *C. americanum* – GW, K, S, WH]

* **Crinum asiaticum** Linnaeus, Poison-bulb. Disturbed areas, native of Asia. Reported for e. LA (East Baton Rouge Parish) and s. FL. [= FNA, K, WH]

* **Crinum zeylanicum** (Linnaeus) Linnaeus, Milk-and-wine Lily. Disturbed areas, escaped or persistent from cultivation; native of Sri Lanka and w. India. [= FNA, K, WH]

5. **Lycoris** Herbert 1819 (Magic Lily)

* **Lycoris radiata** (L'Héritier) Herbert, Magic Lily, Surprise Lily, Hurricane Lily. Frequently cultivated, sometimes persistent for long periods of time, especially in lawns around older homes; native of e. Asia. September-October. Leaves and flowers are not present at the same time. Reported as “established as waifs over past decade in lawn” in Jackson County, NC by Pittillo & Brown (1988). [= RAB, K, WH]

6. **Galanthus** Linnaeus 1753 (Snowdrop)

* **Galanthus nivalis** Linnaeus, Snowdrop. Persistent after cultivation; native of s. and c. Europe. February-March. [= F, FNA, K, Z]

7. **Leucojum** Linnaeus 1753 (Snowflake)

1 Seeds black; flowers (1-) 2-5 (-7) per stem, flowering March-April; tepals 10-22 mm long...............................................................L. aestivum
1 Seeds pale; flowers 1 (-2) per stem, flowering January-March; tepals 15-25 mm long .................................................................L. vernum

8. *Narcissus* Linnaeus 1753 (Daffodil, Jonquil, Narcissus, Buttercup)

**Identification notes:** The familiar flower consists of 6 tepals spreading in more or less a plane, and a fused, tubular, corona. The hypanthial tube is below the perianth lobes. Other taxa are under cultivation and may be expected as persistent or escaped in our area. Manuals of cultivated plants and the extensive horticultural literature on *Narcissus* (such as the references listed above) should be consulted by those interested in more information on members of this genus.

1 Perianth lobes 10-15 mm long; corona 3-5 mm long; leaves and stems cylindrical, hollow; umbel (or spathe, or stem) with 3-10 flowers ...........
..............................................................N. jonquilla
1 Perianth lobes 20-50 mm long; corona 5-50 mm long; leaves and stems flattened, solid; umbel (or spathe, or stem) with 1-4 flowers.

2 Hypanthial tube (below the tepals) parallel-sided (though sometimes suddenly expanded at its apex); corona < 10 mm long, usually wider than high; corona < 0.5x as long as the perianth lobes; corona rarely undulate; umbel (or spathe, or stem) with 1-10 flowers; stamens of 2 distinct lengths.
3 Corona of a single color, all white or yellow; umbel (or spathe, or stem) with 1 flower.............................................................N. poeticus
4 Umb (or spathe, or stem) with (1-) 2-8 (-20) flowers.  
4 Umb (or spathe, or stem) with (2-) 3-8 (-20) flowers; pollen sterile..............................................................N. ×medioluteus
5 Corona white; umbel (or spathe, or stem) with <20 flowers ..............................................................N. pseudonarcissus
5 Corona yellow; umbel (or spathe, or stem) with (2-) 3-8 (-15) flowers...

2 Hypanthial tube (below the tepals) distinctly widening toward its apex; corona usually > 10 mm long, usually as long as wide or longer than wide; corona > 0.5x as long as the perianth lobes; corona margin undulate; umbel (or spathe, or stem) with 1 flower; stamens of the same length or nearly so.
6 Tepals linear to lanceolate, < 5 mm wide ..............................................................N. bulbocodium
6 Tepals ovate, triangular-ovate, or suborbicular, > 10 mm wide.
7 Corona 30-50 mm long, about as long as the perianth lobes .........................................................N. pseudoindicus
7 Corona 10-25 mm long, distinctly shorter than the perianth lobes
8 Umb (or spathe, or stem) with 1 flower; corona usually conspicuously darker in color than the tepals; leaves somewhat glaucous, > 8 mm wide; stem distinctly2-edged ..............................................................N. ×incomparabilis
8 Umb (or spathe, or stem) with (1-) 2-4 flowers; corona and tepals the same color; leaves green, < 8 mm wide; stem nearly terete ..............................................................N. ×odorus

* Narcissus bulbocodium* Linnaeus, Hoop-petticoat Daffodil. Grassy roadsides, established; native of Eurasia. March. [= Y, Z]

* Narcissus ×incomparabilis* P. Miller (pro sp.) [poeticus × pseudonarcissus], None such Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadside, woodland borders, and disturbed areas; native of Europe. March-April. [= C, FNA, K, Z; = N. incomparabilis – RAB, F, G]

* Narcissus ×medioluteus* P. Miller (pro sp.) [poeticus × tazetta], Primrose-peerless. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; native of Europe. March-May. [= FNA, K, Z; = N. tazetta × poeticus – RAB]

* Narcissus ×odorus* Linnaeus (pro sp.) [jonquilla × pseudonarcissus], Campernelle Jonquil, Sweet-scented Jonquil. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, and disturbed areas; native of Europe. [= FNA, K, Z]

* Narcissus papyraceus* Ker Gawler, Paper-white Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, and disturbed areas; native of Mediterranean Europe. [= FNA, K, Z]

*Narcissus tazetta* Linnaeus, Bunch-flowered Daffodil. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, and disturbed areas; native of Mediterranean Europe. [= FNA, K, Z]

**9. Sternbergia** Waldst. & Kit. 1805 (Winter Daffodil)

* Sternbergia lutea* (Linnaeus) Ker-Gawler ex Sprengel, Winter Daffodil, Lily-of-the-field. Cultivated as an ornamental, persistent and naturalized in lawns, roadsides, woodland borders, and disturbed areas; native of Europe. This species has yellow, *Crocus*-like flowers, in the autumn. [= K]

10. *Habranthus* Herbert (Copper-lily)

A genus ca. 30 species, perennial bulbous herbs, of s. North America and South America.

* Habranthus tubispathus* (L'Héritier) Traub, Rio Grande Copperlily. Road shoulders, lawns, disturbed areas; native of s. Brazil. Reported for Coastal Plain of AL (Woods & Diamond 2006), GA (Carter, Baker, & Morris 2009), and FL. [= FNA, K]

**11. Zephyranthes** Herbert 1821 (Atamasco-lily, Zephyr-lily, Rain-lily)

A genus of about 70 species, from s. North America and the West Indies south to s. South America. References: Flagg, Smith, & Flory in FNA (2002a); Meerow & Snijman in Kubitzki (1998a). Key adapted in part from FNA.

1 Stigma 1, capitate; perianth either 3-5 cm long or (7.3-) 9-14 (-16) cm long; stamen filaments either 1-2 cm long or 0.2-0.5 cm long; leaves up to 5 mm wide.

2 Perianth yellow. ...................................................................................................................................................................................... Z. citrina

2 Perianth white (to pinkish).

3 Perianth 3-4.5 cm long; perianth tube shorter than the spathe; perianth tube shorter than the filaments .................................................. Z. candida

3 Perianth (7.3-) 9-14 (-16) cm long; perianth tube longer than the spathe; perianth tube longer than the filaments .................................. Z. chlorosolen

4 Stigmata 3 (trifid); perianth (4-) 4.3-9.5 (-11) cm long; stamen filaments (1.5-) 1.6-4.4 (-4.7) cm long; leaves up to 8 mm wide.

4 Stamen filaments 0.1-0.2 mm long; perianth tube 3-4 (-4.7) cm in length, the stigmas included .................................................. Z. drummondii

5 Stamen filaments (1.5-) 1.6-4.4 (-4.7) cm long; perianth tube (0.8-) 1.3-3 (-4) cm in length, the stigmas exerted.

5 Anthers 13-22 mm long.............................................................................................................................................................. Z. grandiflora

5 Anthers 3-6 (-8) mm long.

6 Style and stigma as long as or shorter than the anthers; perianth segments erect-ascending at full anthesis, (4-) 4.3-8.5 (-10) cm long. .......................................................... Z. simpsonii

6 Style and stigmas extending beyond the anthers; perianth segments spreading at full anthesis, (5.5-) 6.6-9.5 (-11) cm long.

7 Mature leaves concave, 3-8 mm wide; perianth tube (0.8-) 1-2 (-2.1) cm long; filaments > 1.5× as long as the perianth tube.................................................. Z. atamasca

7 Mature leaves grooved, 1-4 mm wide; perianth tube usually (1.7-) 2-3 (-3.1) cm long; filaments < 1.5× as long as the perianth tube.................................................. Z. treatiae

**Zephyranthes atamasca** (Linnaeus) Herbert, Common Atamasco-lily. Bottomland forests and adjacent road shoulders, wet meadows. Late March-April; May-June. Se. and sc. VA south to n. FL, west to s. MS. [= FNA; = Z. atamasca – RAB, C, F, G, GW, orthographic variant; = Zephyranthes atamasca var. atamasca – K; WH; = Atamosco atamasca (Linnaeus) Greene – S, orthographic variant]

* Zephyranthes candida* (Lindley) Herbert. Cultivated, persistent or spreading from cultivation; native of South America. Late September-October. [= RAB, FNA, K, WH; = Atamosco candida (Lindley) Small – S]

*Zephyranthes chlorosolen* (Herbert) D. Dietrich. Prairies and other moist to dry habitats. May-October. [= FNA; = Cooperia drummondii Herbert – GW, S; = Cooperia chlorosolen Herbert – K]
*Zephyranthes citrina* Baker, Yellow Zephyr-lily, Citron Rain-lily. Disturbed areas; native of South America. [= FNA, K, WH]

*Zephyranthes drummondi* (Herbert) D. Don, Ceborletta. Disturbed areas; native of TX and Mexico. [= FNA, WH; = Cooperia pedunculata Herbert – K]

**AMARYLLIDACEAE**

12. *Hymenocallis* Salisbury 1812 (Spider-lily)

**Identification notes:** *Hymenocallis* can be distinguished vegetatively from *Crinum* by its distichous (vs. spiral) leaf arrangement and leaf margins entire (vs. finely toothed).

1 Ovules 1-3 (-4) per locule; ovary 7-15 mm long, 5-10 mm wide; [collectively more widespread].

6 Staminial cup >4.5 cm long; [rocky river shoals of the Piedmont of SC, GA, and AL] ..........................................................H. coronaria

7 Leaves ob lanceolate, slightly to distinctly wider toward the tip.

8 Leaves not coriaceous, distinctly glaucous; scape bracts 4-7 cm long, the tip long-acuminate; bulbs non-rhizomatous; [of moist but not mucky habitats]..........................................................................................................................H. occidentalis var. occidentalis

9 Leaves coriaceous, not glaucous; scape bracts 3-4 (-6) cm long, the tip acute; bulbs rhizomatous; [of wet habitats].

10 Scape bracts 3-4 (-6) cm long, the tip acute; leaves distinctly wider towards the tip; bulb 3-6 cm long, 1.5-5 cm wide..............

11 Scape bracts 4-5 cm long, the tip acuminate; leaves slightly wider towards the tip; bulb 4.5-7.5 cm long, 2.5-5.5 cm wide........

12 Leaves liguliform, not wider toward the tip, the margins parallel throughout.

13 Flowers (3-) 5-12 per inflorescence .................................................................................................................................H. liliosme

14 Flowers 1-3 (rarely more) per inflorescence.

15 Staminial cups rotate at full anthesis; leaves chiefly arching low, often appearing prostrate; [of s. GA south into FL] ...............

16 Staminial cups funneliform at full anthesis but gradually spreading in time; leaves suberect to erect; [of s. NE south to FL].

17 Perianth segments 5.0-6.5 cm long; leaves 1.5-4 dm long .................................................................H. pygmaea

18 Perianth segments (6-) 7-11.5 cm long; leaves 3-7 dm long

19 Scape bracts narrowly lanceolate, 2.5-5 cm long, 7-12 mm wide; [NC south to ne. FL] ...................................................H. crassifolia

20 Scape bracts lanceolate, 3.4-5.5 cm long, 10-15 mm wide; [lower Ochlockonee River, Panhandle FL] ........................H. franklinensis

---

*Hymenocallis choctawensis* Traub, Florida Panhandle Spider-lily, Choctaw Spider-lily. Floodplains. GA (floodplain of the Ochlockonee River) and Panhandle FL west to LA. [= FNA, K, WH, Z; = *Hymenocallis sp. ?* – GW]

Hymenocallis franklinensis G. Lom. Smith, L.C. Anderson, & Flory, Cow Creek Spiderlily. Slightly brackish river margins. Endemic to the Ochlockonee River (Franklin and Wakulla counties) in the FL Panhandle. [= FNA, WH, Z; < Hymenocallis sp. ? – GW] [synonymy incomplete]

Hymenocallis godfreyi G. Lom. Smith & Darst, Godfrey’s Spiderlily, St. Marks Marsh Spiderlily. Brackish marshes. Endemic to Wakulla County in the FL Panhandle. [= FNA, K, WH, Z; < Hymenocallis sp.? – GW] [synonymy incomplete]

Hymenocallis henryae Traub var. henryae, Henry’s Spiderlily, Green Spiderlily. Cypress depressions and wet pine flatwoods. Endemic to Bay, Gulf, and Walton counties in the Panhandle of FL. [= FNA, WH, Z; < Hymenocallis sp.? – GW; < H. henryae – K] [synonymy incomplete]

Hymenocallis liriosme (Rafinesque) Shinners, Western Marsh Spiderlily; Louisiana Marsh Spiderlily. Swamps, bottomlands, ditches. March-May. AR and OK south to s. AL and TX. [= FNA, Z; < Hymenocallis sp.? – GW; > H. liriosme – K]

Hymenocallis occidentalis (LeConte) Kunth var. occidentalis, Hammock Spiderlily, Woodland Spiderlily. Mesic soils of slopes and floodplain forests, gabbro glades and other calcareous upland flats. NC west to AR and LA. Var. eulae (Shinners) G. Lom. Smith & Flory is endemic in the West Gulf Coastal Plain. [= FNA, Z; < Hymenocallis sp.? – GW; > H. occidentalis – S, WH; > H. caroliniana (Linnaeus) Herbert – K, misapplied]

Hymenocallis palmeri S. Watson, Alligator-lily. Cypress swamps; wet pine flatwoods, disturbed wet areas. From ne. FL (Bradford and Duval counties) south to s. peninsular FL. [= FNA, WH, Z; < Hymenocallis sp.? – GW; > H. palmeri S. Watson – K] [synonymy incomplete]

Hymenocallis pygmaea Traub, Pygmy Spiderlily, Waccamaw Spiderlily. Banks of blackwater rivers. May-June; June-July. Se. NC south to ne. SC; perhaps endemic to the Waccamaw River drainage. Needing further study, but strikingly different in appearance from H. crassifolia. [= FNA, Z; < Hymenocallis sp.? – GW; > H. palmeri S. Watson – K]

Hymenocallis rotata (Ker Gawler) Herbert, Spring-run Spiderlily. Spring-runs. Endemic to FL, in the Panhandle (Wakulla County) and n. peninsular FL (Alachua, Columbia, and Duval counties southward to c. peninsular FL). [= FNA, K, WH, Z; < Hymenocallis sp.? – GW] [synonymy incomplete]
A family of a single genus and 170-300 species, widespread in Europe, Africa, Asia, and Australia (introduced elsewhere). References: Dahlgren, Clifford, & Yeo (1985); Kubitzki & Rudall in Kubitzki (1998a).

**Asparagus** Linnaeus (Asparagus)

1. Cladophylls flattened, ca. 2 mm wide. ......................................................... A. aethiopicus
2. Flowers in 1-3-flowered axillary racemes; berries 6-10 mm long, red; erect herb (sometimes arching in age). .......................................................... A. officinalis
3. Flowers in 1-4-flowered terminal umbels; berries 4-5 mm long, purplish-black; scrambling vine ................................................................. A. setaceus

---

**75b. RUSCAEAE** M. Roemer 1840 (Ruscus Family) [in ASPARAGALES]

As here circumscribed, a family of about 28 genera and 500 species, of North America, Central America, Europe, and Asia. The Convallariaceae has been supported by molecular studies (Judd 2003, Bogler & Simpson 1995). Molecular studies show that Nolina is much more closely related to Convallaria, Polygonatum, etc. than to the Agavaceae (Yucca and Manfreda in our flora), with which it has often been associated. References: Bogler & Simpson (1995); Bogler in Kubitzki (1998a); Judd in Kubitzki (1998a); Conran & Tamura in Kubitzki (1998a); Yamashita & Tamura (2000).

1. Plant with an upright stem with alternate leaves.
2. Shrub; “leaves” (actually phylloclades) coriaceous, evergreen, glossy; [exotic, rarely naturalized]; [tribe Rusceae] .................. Danae
3. Inflorescence terminal, a raceme or panicle; tepals separate .............................................. Maianthemum
4. Inflorescence of 1-several axillary flowers; tepals fused ................................................. Polygonatum

---

**Convallaria** Linnaeus 1753 (Lily-of-the-Valley)

1. Leaf blades averaging 15-35 cm long, 5-13 cm wide; rhizomes absent or long-creeping; the individual plants spaced widely (usually at least 15 cm apart); flowering scape < ½ as long as the leaves; longer bracts of the inflorescence 8-20 mm long; [native, of forests of the Mountains and upper Piedmont] ................................................................. C. majuscula

*Convallaria majalis* Linnaeus, European Lily-of-the-Valley. Persistent after cultivation; native of Eurasia. April-May; July-August. [= F, K, W, WV; = C. majalis var. majalis = RAB, FNA; < C. majalis = C, G, S, Z (also see C. majuscula)]

**Convallaria majuscula** Greene, American Lily-of-the-Valley. Mountain forests, particularly in rocky woodlands or forests on or near ridgetops under northern red oak at about 1000 to 1500 m elevation, sometimes at lower elevations (down to at least 700 m) and under Quercus montana. April-June; August. Endemic to the Southern Appalachians: WV and VA through NC and TN to ne. GA (Jones & Coile 1988) and nw. SC. Cronquist's (1991) statement that Southern Appalachian plants "may reflect an early escape of a different phase of the species from cultivation" can be discounted; there is no doubt that C. majuscula is both native and taxonomically distinct, at a varietal level at least. Utech in FNA (2002a) states that our plants are more closely related to the Asian taxon, variously treated as C. keiskei Miquel or C. majalis var. keiskei (Miquel) Makino, than to the European C. majalis s.s. As best as can be determined, Raffinesque's name Convallaria montana does not apply to this species. [= K; = C.
**RUSCACEAE**

---

**Danae** Medikus (Alexandrian Laurel, Danaë)

A monotypic genus, a shrub, of sw. Asia.

* Danae racemosa* (Linnaeus) Moench, Alexandrian Laurel. Suburban forests; rare, uncommon in cultivation, rarely escaping to suburban forests; native of sw. Asia. The "leaves" are actually odd structures called phylloclades, and represent modified stems.

---

**Liriope** Loureiro 1790 (Liriope, Lilyturf)

A genus of 8 species, herbs, of e. and se. Asia. References: Nesom (in prep.)=Y; Conran & Tamura in Kubitzki (1998a); Judd (2003)=Z. Key based on Y.

1 Flowers in a simple raceme.......................................................................................................................................................... *L. muscari*
1 Flowers in a terminal panicle .................................................................................................................................................. *L. spicata*

* Liriope muscari* (Decaisne) L.H. Bailey, Liriope, Big Blue Lilyturf. Commonly planted, rarely persistent and escaping, but locally abundant; native of China, Japan, and Taiwan. [= K, Y, Z]

* Liriope spicata* Loureiro, Creeping Lilyturf. Commonly planted, rarely persistent and escaping; native of {}. [= Y, Z; = *L. spicatum* – K, orthographic variant]

---

**Maianthemum** G.H. Weber ex Wiggers 1780 (Mayflower, Solomon's-plume)

A genus of about 28 species, herbs, of n. Europe, e. Asia, North America, and Central America. The inclusion of the traditional *Smilacina* in *Maianthemum* will cause considerable consternation; LaFrankie's (1986) reasoning, however, seems very strong, and has been additionally supported by more recent evidence (Conran & Tamura in Kubitzki 1998a). The only consistent difference between the two previously accepted genera is whether the flowers are dimerous (*Maianthemum*) or trimerous (*Smilacina*). LaFrankie cites research that shows that the dimerous flowers of *Maianthemum* (sensu stricto) are the result of reduction from trimerous flowers, as indicated by vestigial vascular traces. Consideration of the many close similarities, particularly as compared to similar genera such as *Proserartes, Polygonatum, Streptopus, and Clintonia*, may convince the skeptical (see LaFrankie 1986 and Therman 1956). As an example, the fruits of *M. canadense* and *M. racemosum* are closely similar in form, coloration, and size; much more similar than the fruits of our 2 species of *Proserartes*. References: LaFrankie (1986)=Z; Judd (2003)=Y; LaFrankie in FNA (2002a); Conran & Tamura in Kubitzki (1998a).

1 Flowers in a terminal panicle .................................................................................................................................................. *M. racemosum* ssp. *racemosum*
1 Flowers in a simple raceme.
2 Perianth segments 4 (flowers 2-merous); leaves (1-) 2 (-3) ........................................................................................................ *M. canadense*
2 Perianth segments 6 (flowers 3-merous); leaves 6 or more ................................................................................................. *M. stellatum*

---

**Maianthemum canadense** Desfontaines, Canada Mayflower, False Lily-of-the-valley. Moist forests, especially at high elevations. Mid May-early July; August-September. NL (Labrador) and NL (Newfoundland) west to NT, south to MD, NC, n. GA (Jones & Coile 1988), KY and SD. Two varieties have been described, but their recognition is not strongly supported. Var. *canadense*, with leaves glabrous beneath, the margins entire or minutely crenulate, cross-veins of the leaf well-developed, is widespread in the distribution of the species. Var. *interius* Fernald has the leaves pubescent beneath, the leaf margins distinctly ciliate, and cross-veins obscure; it is not known from our area, but extends east and south as far as MA, NY, and OH. Further study of these varieties is needed. Weller (1970) reports equivocal results on the recognition of varieties, based on a study in n. MI. [= RAB, FNA, K, W, WV, Y, Z; > *Maianthemum canadense* Desfontaines var. canadense – C, F, G; = *Unifolium canadense* (Desfontaines) Greene – S]

**Maianthemum racemosum** (Linnaeus) Link ssp. *racemosum*, Eastern Solomon's-plume, False Solomon's-seal. Forests. Mid April-June; August-October. The species ranges from NS west to BC, south to GA, FL Panhandle, and AZ. A variety of chromosome races are known (2n = 36, 72, 144). The eastern ssp. *racemosum* is tetraploid; ssp. *amplexicaule* (Nuttall) LaFrankie is diploid and more western; these are perhaps more appropriately treated as species. Under the generic name *Smilacina*, two varieties had been described for our area, *Smilacina racemosa* var. *racemosa* and S. *racemosa* var. *cylindrata* Fernald, the former larger in nearly all respects and more northern than the latter, smaller, and more southern form (see F for
details). If these varieties are determined to have merit (further research is needed), the appropriate transfer to *Maianthemum* will need to be made. [= FNA, K, Y, Z; *Smilacina racemosa* (Linnaeus) Desfontaines – RAB, C, G, W; *S. racemosa* var. *cylindrica* Fernald – F, WV; *Vagniera racemosa* (Linnaeus) Morong – S; *Vagniera australis* Rydberg – S; < *M. racemosum* – WH]

*Maianthemum stellatum* (Linnaeus) Link, Starry Solomon’s-plume. Alluvial forests. April-June; August-October. NL (Newfoundland) west to BC, south to NJ, w. VA, e. TN, IN, MO, and CA. [= FNA, K, Y, Z; *Smilacina stellata* (Linnaeus) Desfontaines – C, F, G, W, WV]

**Nolina** Michaux 1803 (Beargrass)

1 Leaves 3-4 (<5) mm wide; fruit 4.4-4.5 mm long, strongly asymmetrical; [of moist flatwoods of the FL Coastal Plain]..........*N. atroparia*
2 Leaves 4-10 mm wide, glaucous; fruit 6.5-8 mm long, symmetrical; [of dry to dry-mesic sandhills of the GA and SC Coastal Plain] .................................................................*N. georgiana*

---

**Nolina atroparia** Bartlett, Florida Beargrass. Pine flatwoods and savannas. Endemic to Panhandle FL (Liberty and Franklin counties) and e. peninsular FL (St. Johns and Brevard counties). [= FNA, K, S, WH, Z]

---

**Ophiopogon** Ker-Gawler (Mondo Grass)

* *Ophiopogon japonicus* (Thunberg) Ker-Gawler, Mondo Grass, Black Mondo. Suburban forests; native of China, Taiwan, Japan, and Korea. [= K, Y]

---

**Polygonatum** P. Miller 1754 (Solomon’s-seal)

A genus of about 57 species, of temperate Eurasia and North America (most diverse in e. Asia). The *P. biflorum* complex is in need of further study. References: Ownbey (1944)=Z; Judd (2003)=Y; Utech in FNA (2002a); Eigsti (1942); Therman (1950, 1953); Kawano & Iltis (1963); Conran & Tamura in Kubitzki (1998a).

1 Leaves pubescent on the veins beneath; flowers 7-13 mm long. .................................................................*P. pubescens*
2 Leaves glabrous; flowers 12-21 mm long.
   2 Stem slender, 1.5-5 mm in diameter; plants to 9 dm tall; lower axillary peduncles terete or nearly so, with (1-) 2-3 (-5) flowers; lowest peduncle in the axil of the (3rd-) 4th-5th (-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300°. .................................................................*P. biflorum* var. *commutatum*
   3 Corolla (11-) 13-15 (-19) mm long; larger leaves 5.5-15 cm long, 1.2-6 cm wide; lower leaves clasping to 90 (-180)°. .................................................................*P. biflorum* var. *biflorum*
3 Corolla 20-23 mm long; larger leaves 6.5-13 cm long, 0.8-2 cm wide, 5-9x as long as broad; [endemic to Panhandle FL].................................................................*P. biflorum* var. *hebeifolium*

**Polygonatum biflorum** (Walter) Elliott var. *biflorum*, Small Solomon’s-seal. Moist to dry forests. April-June; August-October. CT, NY, and s. ON west to MI, NE, and IN, south to n. FL and s. AL. In addition to the varieties recognized for our area, *P. biflorum* includes two additional varieties: var. *melleum* (Farwell) R. Ownbey of MI and ON, and var. *neocopinum* R. Ownbey from the Black Hills of SD. The complex needs additional study. See var. *commutatum* for discussion of its distinction from var. *biflorum*. [= Z; < *P. biflorum* – RAB, C, FNA, W, WH, Y; = *P. biflorum* – F, G, WV; < *P. biflorum* var. *commutatum* (J.A. & J.H. Schultes) Morong – K; < *P. commutatum* (J.A. & J.H. Schultes) A. Dietrich – S]

There has been a wide divergence of opinion regarding the merits (and practicality) of distinguishing this taxon from typical *P. biflorum*, and the characters considered most reliable; the two taxa may differ in chromosome number and geographical distribution; they are not, however, always readily distinguished morphologically. I prefer to recognize this taxon as a variety. See references for additional discussion. [< *P. biflorum* – RAB, C, FNA, W, Y; = *P. canaliculatum* (Muhlenberg ex Willdenow) Pursh – F, G, WV, misapplied; < *P. biflorum* var. *commutatum* (J.A. & J.H. Schultes) Morong – K; < *P. commutatum* (J.A. & J.H. Schultes) A. Dietrich – S; = *P. commutatum* – Z]

75c. AGAVACEAE Endlicher 1841 (Agave Family) [in ASPARAGALES]

A family of about 25 genera and 640 species, herbs and rosette shrubs, of temperate and tropical America. The placement of *Camassia*, *Schoenolirion*, and *Hastingsia*, sometimes grouped as Hyacinthaceae subfamily Chlorogaloideae, is uncertain; they are probably better placed in the Agavaceae, a position supported by molecular, serological, and biogeographic evidence. References: Verhoek & Hess in FNA (2002a); Bogler & Simpson (1995, 1996); Verhoek in Kubitzki (1998a).

1 Plants with erect woody stems; leaves cauline ..............................................................................................................................................................*Yucca*
2 Plants acaulescent; leaves in basal rosettes.
3 Margins of leaves fraying into coarse, whitish, curly fibers; tepals about 4 cm long; leaves stiff and > 15 mm wide ............................................................*Yucca*
4 Margins of leaves entire, not fraying; tepals < 2 cm long; leaves stiff and wiry (and < 5 mm wide), herbaceous, or fleshy.
5 Leaves oblong-acute, 2-9 cm wide, 2-10× as long as wide, fleshy .......................................................................................................................*Manfreda*
6 Leaves narrowly linear, 3-5 mm wide, wiry and grasslike; inflorescence a diffuse panicle; perianth segments 2-4 mm long, white........... ........................................................................................................[*Nolina* – see RUSCACEAE]
7 Leaves linear, 2-18 mm wide, herbaceous; inflorescence a raceme; perianth segments 13-18 mm long, blue or nearly white. .................................*Camassia*
8 Perianth segments 5-7 mm long, white, cream, or yellow .............................................................................................................................*Schoenolirion*

*Camassia* Lindley 1832 (Wild Hyacinth, Quamash Lily, Camas Lily)

A genus of 6 species, of North America. The family placement of *Camassia* is uncertain; there is increasing evidence that the affinities of *Camassia* are with the Agavaceae, rather than the Hyacinthaceae (Fay & Chase 1996, Bogler & Simpson 1996, Speta in Kubitzki 1998a). References: Ranker & Hogan in FNA (2002a); Speta in Kubitzki (1998a).

*Camassia scilloides* (Rafinesque) Cory, Wild Hyacinth, Quamash Lily, Eastern Camas Lily. Moist forests, over circumneutral soils, in GA, VA, and WV on limestone, in NC on slopes and natural levees along the Roanoke River, in SC over gabbro. April-May. W. PA and s. ON west to s. WI and e. KS, south to nw. GA (Jones & Coile 1988) and TX, nearly entirely west of the Blue Ridge, with only a few disjunct occurrences in the Piedmont and Coastal Plain. [= RAB, C, F, FNA, G, K, W; = Quamasia hyacintha (Rafinesque) Britton – S]

*Manfreda* Salisbury 1866 (False-aloce)

*Manfreda virginica* (Linnaeus) Salisbury ex Rose, Rattlesnake-master, Eastern False-aloce. Granite flatrocks, diabase glades, xeric woodlands over mafic or calcareous rocks, sandhill woodlands. Late May-August; August-October. E. SC, c. NC, sw. VA, w. WV, s. OH, s. IN, s. IL, and MO south to c. peninsular FL and TX. [= FNA, K, W; = Agave virginica Linnaeus – RAB, C, F, WV; > *M. tigrina* (Engelmann) Small – S; > *M. virginica* – S; = Polianthes virginica (Linnaeus) Shinners]

*Schoenolirion* Torrey ex Durand (Sunnybell)

1 Inflorescence with 1-6 branches; leaves without fleshy bases, withering to a persistent fibrous crown.........................*S. albiflorum*
1 Inflorescence rarely branched; leaves with fleshy bases, not fibrous.
2 Perianth golden-yellow .............................................................................................................................................*S. croceum*
2 Perianth white .........................................................................................................................................................*S. wrightii*

**Schoenolirion albiflorum** (Rafinesque) R.R. Gates, White Sunnybell. Wet pinelands, cypress depressions, Hypericum depressions, wet hammocks. E. GA south to s. FL and west to AL. [= FNA, K, WH; *S. elliottii* Feay ex A. Gray – GW; *Oxytria albiflora* (Rafinesque) Pollard – S]

**Schoenolirion croceum** (Michaux) Wood, Yellow Sunnybell. Wet pine savannas, bogs, seepage slopes, seepages on granite flatrocks. April-May; May-June. SC (and allegedly NC) south to ne. FL, west to se. TX; and in c. TN on limestone glades (Chester et al. 1993). The occurrence in NC in "wet pinelands" in Richmond County referred to in RAB has not been relocated or further documented. [= RAB, FNA, GW, K, WH; *Oxytria crocea* (Michaux) Rafinesque – S]

**Schoenolirion wrightii** Sherman, Texas Sunnybell. Seepage over sandstone. April-early May. N. AL; w. LA and e. TX. [= FNA, K; *Oxytria texana* (Scheele) Pollard – S]

**Yucca** Linnaeus 1753 (*Yucca*, Adam's-needle)

1 Leaf margins fraying into filamentous threads or fibrils; plant acaulescent (or essentially so); fruit erect.
2 Inflorescence branches scurfy-pubescent; tepals 3-5 cm long; leaves 1.5-4 cm wide, pliable, the apex attenuate-acuminate, not notably concave at the apex, the marginal fibrils usually short (to 4 cm long). ..............................................................................................................*Y. flaccida*
2 Inflorescence branches glabrous; tepals 5-7 cm long; leaves 2-6 cm wide, stiff, the apex acute-acuminate to obtuse, often concave upward, the marginal fibrils usually elongate (to 20 cm long). ..............................................................................................................*Y. recurvifolia*
3 Leaves 1-3 cm wide, sparingly filiferous-margined; [mainly west of the Mississippi River, rarely in the Florida parishes of e. LA] ..........................................................*Y. louisianensis*
3 Leaves 1.5-4 cm wide, abundantly filiferous-margined; [widespread] ..........................................................*Y. aloifolia*
4 Leaf blades rigid, straight; fruits pendent, 5.5-8 cm long; [of NC south to FL] ..........................................................*Y. gloriosa*
4 Leaf blades recurved, flexible; fruits generally erect, 2.5-4.5 cm long; [of GA westward] ..........................................................*Y. recurvifolia*

**Yucca aloifolia** Linnaeus, Spanish Dagger. Dunes. June-early July; October-December. Se. VA south to s. FL and west to LA. [= RAB, FNA, K, S, WH]

**Yucca flaccida** Linnaeus, Curlyleaf Yucca, Spoonleaf Yucca. Woodlands, forests, dunes, roadsides, disturbed areas. Late April-early June; September-October. S. NJ south to GA, west to MS; escaped from cultivation over a broader area of e. United States. [= FNA, F, S, W, WV, Z; *Y. filamentosus* var. *filamentosus* – RAB; *Y. filamentosus* – C, G, K (also see *Y. flaccida*); *Y. filamentosus* – S; *Y. recurvifolia* – S]

**Yucca gloriosa** Linnaeus, Mound-lily Yucca, Spanish Bayonet. Dunes, shell middens, also regularly cultivated and often persistent or weakly escaped around old homesites inland. (April-) October; November-December. E. NC (Dare County) south to ne. FL and w. peninsular FL (Sorrie & LeBlond 2008). [= RAB, K, S; *Y. gloriosa* var. *gloriosa* – FNA; *Y. gloriosa* – WH]

**Yucca recurvifolia** Salisbury, Curve-leaf Yucca. Dunes, dry sandy soils. GA west to w. LA. [= S; *Y. gloriosa* Linnaeus var. *recurvifolia* (Salisbury) Engelmann – FNA; *Y. gloriosa* – WH]
75d. HOSTACEAE  B. Mathew 1988 (Hosta Family) [in ASPARAGALES]

A family of a single genus, of about 25 species, of temperate e. Asia. This family is closely related to the Agavaceae, and its inclusion there may prove warranted. References: Kubitzki in Kubitzki (1998a).

*Hosta* Trattinck 1812 (Hosta, Plantain-lily)

A genus of about 25-40 herbs, of temperate Asia, widely cultivated (since at least the 8th century), and with numerous cultivars. References: Kubitzki in Kubitzki (1998a); Utech in FNA (2002a). Key based on Utech in FNA (2002a).

1 Flowers long-tubular, to 13 cm long, white, fragrant ............................................................ H. plantaginea
1 Flowers campanulate to urceolate, 4-5.5 cm long, blue or purplish, not fragrant.

2 Leaves lanceolate to oblong, 10-17 cm long, 5-7.5 cm wide, with 5-6 lateral veins on each side of the midvein; flowers purplish violet; anthers purple ........................................................................................................................................................ H. lancifolia
2 Leaves ovate to cordate, the blade 20-30 cm long, 15-20 cm wide, with 7-9 lateral veins on each side of the midvein; flowers bluish purple; anthers spotted purple........................................................................................................................................................ H. ventricosa

* Hosta lancifolia* Engler, Narrowleaf Plantain-lily. Widely planted as a shade ornamental, rarely persistent; "native" of Japan (probably only of garden origin). [= FNA, K]

* Hosta plantaginea* (Lamarck) Ascherson, Fragrant Plantain-lily. Widely planted as a shade ornamental, rarely persistent; rare, native of China. [= FNA, K]

* Hosta ventricosa* (Salisbury) Stearn, Blue Plantain-lily. Widely planted as a shade ornamental; rare, native of China. [= FNA, K]

75e. THEMIDACEAE Salisbury 1866 (Brodiea Family) [in ASPARAGALES]

*Dichelostemma* Kunth 1843

* Dichelostemma congestum* (Smith) Kunth. Disturbed areas; native of Pacific northwestern North America, cultivated and apparently escaped in the Piedmont of nc. GA (Jones & Coile 1988). {further investigate} [= FNA, K; = Brodiaea congesta Smith]

75f. HYACINTHACEAE Batsch 1786 (Hyacinth Family) [in ASPARAGALES]

A family of about 67 genera and 900 species, herbs, nearly cosmopolitan. References: Speta in Kubitzki (1998a); Pfosser et al. (2003). [also see AGAVACEAE]

1 Tepals united into a perianth tube longer than the free portion; [subfamily Hyacinthoideae, tribe Hyacintheae].
2 Perianth tube < 2 × as long as the lobes; corolla spreading and open at the mouth ................................................................. *Hyacinthus*
2 Perianth tube ≥ 2 × as long as the lobes; corolla contracted at the mouth ........................................................................ *Muscari*
1 Tepals separate or fused only at the extreme base.
3 Tepals white, with a greenish stripe on the outer surface, separate; bracts 0-1 per flower; [subfamily Ornithogaloideae] ........................................................................................................................................... *Ornithogalum*
3 Tepals blue (less commonly white or pink), separate or fused at the extreme base; bracts either 0-1 or 2 per flower; [subfamily Hyacinthoideae, tribe Hyacintheae].
4 Bracts 2 subtending each flower ................................................................................................................................. *Hyacinthoides*
4 Bracts 0-1 subtending each flower
5 Tepals connate basally for more than 1/10 of their length .......................................................................................... *Chionodoxa*
5 Tepals separate ................................................................................................................................. *Scilla*
Chionodoxa Boissier 1844 (Glory-of-the-snow)

* Chionodoxa luciliae Boissier, Glory-of-the-snow. Lawns, disturbed areas; native of w. Turkey. April-May. [= FNA, K]

Hyacinthoides Heister ex Fabricius 1759 (Bluebell)

1 Racemes erect; perianth campanulate; anthers blue ............................................................................................................................ H. hispanica
1 Racemes pendant at apex; perianth tubular; anthers cream ................................................................................................................ H. nonscripta

* Hyacinthoides hispanica (P. Miller) Rothmaler, Spanish Bluebell. Persistent after cultivation; native of Europe. [= FNA, K, Y, Z; = Endymion hispanicus (P. Miller) Chouard]

* Hyacinthoides nonscripta (Linnaeus) Chouard ex Rothmaler, English Bluebell. Persistent after cultivation; native of Europe. [= K, Z; = Scilla non-scripta (Linnaeus) Hoffmannsegg & Link – C, G; = Scilla nonscripta (Linnaeus) Hoffmannsegg & Link – F; = Hyacinthoides non-scripta – FNA, Y, orthographic variant; = Endymion nonscripta (Linnaeus) Garcke]

Hyacinthus Linnaeus 1753 (Hyacinth)

* Hyacinthus orientalis Linnaeus, Hyacinth. Persistent after cultivation; native of w. Asia. [= K, Z]

Muscari P. Miller 1754 (Grape-hyacinth)

1 Raceme 10-20 cm long; pedicels of the terminal flowers > 5 mm long; flowers brown (the lower and fertile) and blue (the upper and sterile); leaves flat, mostly 8-20 mm wide ................................................................. M. comosum
1 Raceme 1-5 cm long in flower (somewhat longer in fruit); pedicels < 5 mm long; flowers all blue to blue-black; leaves flat, channeled, or terete, mostly 1-8 mm wide.
2 Leaves flat or channeled, 3-8 mm wide; corolla nearly spherical, the lobes strongly recurved ....................................................... M. botryoides
2 Leaves nearly terete, 1-3 mm wide; corolla ellipsoid-ovoid, distinctly longer than wide, the lobes erect.
3 Perianth of lower (fertile) flowers bright blue ........................................................................................................................ M. armeniacum
3 Perianth of lower (fertile) flowers deep blackish-blue or -purple .................................................................................. M. neglectum

* Muscari armeniacum Leichtlin ex Baker, Garden Grape-hyacinth, Armenian Grape-hyacinth. Cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; native of Mediterranean e. Europe and w. Asia. March-April; May-June. [= FNA, K, Z]

* Muscari comosum (Linnaeus) P. Miller, Tassel Grape-hyacinth. Cultivated as an ornamental, persistent and naturalized in lawns, old fields, suburban woodlands, and disturbed areas; native of Europe. March-April; May-June. [= C, F, FNA, G, K, Z]
HYACINTHACEAE

Ornithogalum Linnaeus 1753 (Star-of-Bethlehem)

1 Lower pedicels < 1 cm long, about as long as the upper pedicels (and shorter than the perianth segments); leaves mostly 8-15 mm wide; scape 2-5 dm tall ...................................................................................................................................................................................................
   O. nutans
1 Lowest pedicels 2-6 cm long, longer than the upper pedicels (and longer than the perianth segments); leaves mostly 2-5 mm wide; scape 1-3 dm tall ................................................................................................................................................................................................
   O. umbellatum

Scilla Linnaeus 1753 (Squill)

* Scilla siberica* Haworth, Siberian Squill. Suburban woodlands; native of Russia. [= FNA, K, Z]

76. ARECACEAE Schultz 1832 or PALMAE de Jussieu 1789 (Palm Family) [in ARECALES]

A family of about 190 genera and 2000 species, trees and shrubs, of tropical and subtropical regions of both hemispheres. Cold-hardy palms in other genera are sometimes planted in thje southern parts of our area, particularly near the coast. References: Zona in FNA (2000); Dransfield & Uhl in Kubitzki (1998b).

1 Leaves pinnate (with a well-developed central axis, the leaf blade much longer than wide); [introduced species]; [subfamily Arecoideae, tribe Cocoeae].
   2 Petiole with spines; leaflets 44-80 per leaf side, glaucous; fruit 1.8-3.5 cm long .........................................................................................................................Butia
   2 Petiole unarmed; leaflets 75-100 per leaf side, green; fruit 20-30 cm long .........................................................................................................Cocos
1 Leaves palmate or costapalmate (lacking a central axis or with a short central axis, the leaf blade about as long as wide; [native species]; [subfamily Coryphoideae, tribe Corypheae].
   3 Petioles armed with sharp recurved teeth; [subtribe Livistoninae]
   4 Petiolar spines > 2 mm long; tree (trunk erect) ................................................................................................................................. Livistona
   4 Petiolar spines 0.5-2 mm long; shrub (trunk prostrate or leaning) ..................................................................................................... Serenoa
   5 Petioles smooth, unarmed (leaf sheaths with long needle-like spines in Rhipidophyllum).
   5 Petioles and lower leaf surfaces more or less silvery pubescent; leaf sheaths bearing long (10-50 cm) needle-like spines; [subtribe Thrinacinae] ............................................................................................................................... Rhipidophyllum
5 Petioles and lower leaf surfaces green and glabrous; leaf sheaths without spines; [subtribe Sabalinae] .................................................................................................Sabal

Butia (Beccari) Beccari 1916 (Butia)

* **Butia capitata** (Martius) Beccari, Brazilian Butia, South American Jelly Palm, Pindo Palm. Widely planted in the outer Coastal Plain of se. NC, e. SC, e. GA, and FL; native of s. Brazil and Uruguay. It persists and can appear naturalized in apparently semi-natural situations.

**Cocos** Linnaeus 1753 (Coconut Palm)

A monotypic genus, the single species now pantropical. References: Zona in FNA (2000).

* **Cocos nucifera** Linnaeus, Coconut Palm. Coconut palm rarely reaches our shores as propagules (coconuts, which may germinate and live briefly), but it is not established; native region unknown, but probably tropical islands of the western Pacific (now pantropical). Photographic evidence has been supplied from as far north as Bear Island, Onslow County, NC, 11 June 1996 (Dave Owen, pers. comm. and photograph). [= FNA, K, S, WH]

**Livistona** R. Brown 1810 (Fan Palm)

**Rhapidophyllum** H. Wendl. & Drude ex Drude 1876 (Needle Palm)

* **Rhapidophyllum hystrix** (Pursh) H. Wendl. & Drude ex Drude, Needle Palm. Moist to wet soils of small blackwater stream swamps, especially where underlain with coquina limestone ("marl"), hydric hammocks and rich, wetland-upland transitions. Se. SC (Beaufort and Jasper counties) south to c. peninsular FL, and west to s. MS. Becoming somewhat popular as a hardy palm that can be grown in the Southeast, well north of its natural range. [= FNA, GW, K, S, WH, Z]

**Sabal** Adanson 1763 (Palmetto)

**Identification notes:** The hastula is the midrib of the leaf, as seen on the upper (adaxial) surface.

1. Tree, with erect trunk (though young plants appear as trunkless shrubs, similar in habit to *S. minor*); leaves 15-30 per plant; hastula 5.3-18 cm long, acute to acuminate; margins of leaf segments with filamentose fibrils; leaf segment apices 2-cleft ........................................... *S. palmetto*
2. Shrub, with subterranean, rhizomatous "trunk" (very rarely emerging as much as 1 meter from the ground); leaves 4-10 per plant; hastula 0.8-4.7 cm long, obtuse to acute; margins of leaf segments with or without filamentose fibrils; leaf segment apices 2-cleft (S. etonia) or entire (S. minor).
3. Margins of leaf segments with filamentose fibrils; hastula acute; fruits 9.0-15.4 mm in diameter; segment apices 2-cleft; [of dry sandy habitats] .................................................................................................................................................................................................... *S. etonia*
4. Margins of leaf segments without filamentose fibrils; hastula obtuse; fruits 6.4-9.7 mm in diameter; segment apices generally entire; [of moist to wet habitats] .................................................................................................................................................................................................... *S. minor*

**Sabal etonia** Swingle ex Nash, Scrub Palmetto. Florida scrub. Late May-July. Endemic to FL (Clay County, FL south to Miami-Dade County, FL, primarily on the Lake Wales Ridge but also on coastal and intermediate ridges). See Zona & Judd (1986) for extensive information about the ecology and distribution of this species. [= FNA, K, S, WH, Y, Z]

**Sabal minor** (Jacquin) Persoon, Dwarf Palmetto. Swamps, maritime forests, low moist woods, especially in calcareous soils developed from shell limestone (marl). May-July; September-November. Ne. NC (Currituck County) south to e. peninsular FL, west to e. TX, c. TX, se. OK, and s. AR; disjunct in Nuevo León (Goldman 1999). This palm reaches its northern limit at Monkey Island, Currituck County, NC (L. Musselman, J. Boggan, pers. comm., 2006). No other New World palm has a native range extending so far north. [= RAB, FNA, GW, K, WH, Z; > S. minor – S; > S. deeringiana Small – S]
Sabal palmetto (Walter) Loddiges ex J.A. & J.H. Schultes, Cabbage Palmetto. Maritime forests, marsh edges, and other near-coastal communities. July; October-November. Native from se. NC south to s. FL, west to w. Panhandle FL, and in the West Indies in Cuba and the Bahamas; planted beyond that range, especially on the Gulf Coast. This palm is the state tree of South Carolina and is common and conspicuous (both as a native tree and in plantings) along the South Carolina coast; it currently reaches its northern limit as a native species in Brunswick County, NC, where it is a conspicuous part of the forest on Smith Island complex (Bald Head Island, Middle Island, Bluff Island). It is planted elsewhere (and further north) on the coast. Periodic disturbance by hurricanes helps maintain populations of Sabal palmetto, which survives winds and flooding that topple or kill Quercus virginiana. Curtis (1883) reports that "Cape Hatteras is, or was, the northern limit of this Palm... It is to be deeply regretted, however, that a reckless indifference to the future, which has been charged as a characteristic of Americans, is likely to efface, at no very distant time, every vestige of this interesting ornament of our coast. The inner portion of the young plant is very tender and palatable, somewhat resembling the Artichoke and Cabbage in taste (hence its name of Cabbage Tree), and is often taken for pickling, and the stock is ruined by the process. Thus for a pound or two of pickles, no better either than many other kinds, the growth of half a century is destroyed in a moment, and posterity left to the wretched inheritance of vain mourning for the loss of the greatest beauty of our maritime forest." [= RAB, FNA, GW, K, S, WH, Z]

Serenoa Hooker f. 1828 (Saw Palmetto)

Serenoa repens (Bartram) Small, Saw Palmetto. Pine flatwoods and maritime forests. May-July; October-November. Se. SC (in maritime forests in Charleston and Colleton counties, and in spodosolic flatwoods in Beaufort and Jasper counties) south to s. FL and west to e. LA. Serenoa forms extensive clonal patches, connected by underground rhizomes, and is a dominant plant in many parts of FL, in pine flatwoods or scrub. [= RAB, FNA, GW, K, S, WH]

78. COMMELINACEAE R. Brown 1810 (Spiderwort Family) [in COMMELINANALES]

A family of about 41 genera and 650 species, herbs, of tropical and warm temperate regions of both hemispheres. References: Faden in FNA (2000); Faden in Kubitzki (1998b); Tucker (1989).

1 Spathes present, single or pair ed; inflorescence open and repeatedly branched; [tribe Tradescantieae] .......................................................... Gibasis

2 Spathes single (or paired in Callisia), either terminal or axillary, differing from the foliage leaves (in Commelina folded, heart-shaped when spread, and usually pale-green, in Cuthbertia and Murrannia scale-like, scarious, and inconspicuous, sometimes hidden by foliage leaves in Murrannia).

3 Spath folded, heart-shaped when unfolded, usually pale-green, closely subtending and surrounding the flower pedicels; petals unequal, the 2 upper petals larger and usually more deeply colored than the lower petal (which is sometimes absent); [tribe Commelinae] ..............

4 Spath scale-like, scarious, and inconspicuous, not closely subtending and surrounding the flower pedicels; petals equal, in both size and coloration.

5 Fertile stamens 3, alternating with 3 staminodia; petals pink to purplish or bluish; [tribe Commelinae] ................. Murrannia

Fertile stamens 0-6, all fertile; petals white; [tribe Tradescantieae] ................................................................. Callisia

Callisia Loefling

1 Leaves 15-30 cm long, 2.5-5 cm wide; stems ascending .......................................................... C. fragrans

2 Inflorescences sessile; flowers sessile or nearly so; capsule with 2 locules ......................................................... C. repens
**Callisia cordifolia** (Swartz) E.S. Anderson & Woodson. Disturbed areas; native from n. peninsular FL to s. FL; Mexico, the West Indies, and n. South America. Reported for nw. GA (Faden in FNA 2000). [= FNA, K; *Tradescantia cordifolia* (S. Watson) Small – S; = *Tradescantia cordifolia* Swartz]

* Callisia fragrans (Lindley) Woodson, Basketflower. Disturbed areas; native of Mexico. February. [= FNA, K]

* Callisia repens (Jacquin) Linnaeus. Disturbed areas; native of tropical America. [= FNA, K, WH]

---

**Commelina** Linnaeus 1753 (Dayflower)

1 Spaths with margins free to the base; [introduced species, usually in weedy habitats].
2 Spaths generally whitish or pale green toward the peduncle, with contrasting dark green veins; middle petal white or paler than the others; capsules with 2 locules (the third aborting); seeds rugose foveate-reticulate.......................... *C. communis*
3 Spaths not at all to slightly falcate (the lower margin straight or very nearly so); upper cyme usually vestigial (rarely well-developed and 1-flowered); seeds smooth to faintly alveolate; peduncles of the spathes with hairs to 0.5 mm long.......................... *C. caroliniana*
4 Flowers peach-colored........................................................................................................................................................................ *C. benghalensis*
5 Leaf sheaths ciliate with white hairs, the sheath prolonged upward into auricles; middle petal blue, lilac, or lavender; [mostly of moist soils].
6 Annual from fibrous roots, the stem decumbent; leaf blades broadly elliptic-ovate, 2-9 cm long; leaf margin and upper surface pubescent; [alien, weedy] ......................................................................................................................... *C. erecta* var. *angustifolia*
7 Larger leaves 4-10 (-13) cm long, 0.4-1.4 cm wide; spathes 1-2 (-2.5) cm long; [primarily of the Coastal Plain, especially on sandhills and dunes]. .......................................................................................................................... *C. erecta* var. *erecta*
8 Smaller leaves; spathes 1-2 cm long; [primarily of sandhills and dunes].

---

* Commelina benghalensis* Linnaeus, Tropical Spiderwort, Bengal Dayflower. Fields; native of tropical Asia and becoming a serious weed. This annual, pantropical weed is well established in FL and s. GA (Faden 1993). Spot infestations have been reported in NC (Wayne County), SC (Edgefield County), and MS as well. "**This annual species can be recognized by: its funnelform spathes that are often clustered; relatively broad leaves that frequently have red hairs at the summit of the sheath; and castigomatos flowers that are borne at the base of the plant and are usually subterranean (in addition to normal, aerial, chasmogamous flowers)"*(Faden 1993). [= FNA, K, Y]

* Commelina caroliniana* Walter, Indian Dayflower. Moist disturbed areas; native of India and Bangladesh. June-October. Faden (1989, 1993) discusses in detail the taxonomy and history of this species. It was apparently introduced to our area early, probably as a weed in rice. [= RAB, C, FNA, G, K, S, Y; < *C. diffusa* – GW, X, Z; > *C. hasskarlii* C. B. Clarke (the earliest name applied to the species in India)]

*Commelina erecta* Linnaeus var. *angustifolia* (Michaux) Fernald, Sand Dayflower. Dunes and dry sand flats on barrier islands, sandhills, other dry sandy sites, shale barrens, other dry rocky sites. June-October. E. NC south to s. FL, west to TX, and north and west in the interior to IA, nw. NE, CO, and NM. Contrary to the specific epithet, *C. erecta* var. *angustifolia* is a
trailing plant, the stems sometimes as long as 1.3 m. The taxonomy and distribution of the two varieties here recognized need further study. [= F, FNA, G, K, WV, X; < C. erecta – RAB, W, Y, Z; > C. angustifolia Michaux – S; > C. crispa Wooton – S]

Commelina erecta Linnaeus var. erecta, Erect Dayflower. Dry openings and woodlands, especially in thin soil around rock outcrops, streambanks, riverbanks, mesic forests. June-October. PA west to MO and e. KS, south to FL and TX. [= C, F, FNA, G, K, X; < C. erecta – RAB, W, Y, Z; = C. erecta – S]

* Commelina gambiae C.B. Clarke. Disturbed areas. A West African species first collected in North America in 1976 (Manatee County, FL), is immediately distinguishable from our species by its peach-colored flowers and fused spathes. Faden (1993) reports that it “appears to be spreading rapidly,” but whether it can spread significantly northward from peninsular FL is questionable. [= FNA; = Commelina nigritana Bentham var. gambiae (C.B. Clarke) Brenan – K, Y]

Cuthbertia Small 1903 (Roseling)

A genus of 3 species, herbs, of se. North America. There seems ample reason for recognizing Cuthbertia as distinct from Tradescantia, based on the single spathes (vs. paired), glabrous filaments (vs. hairy), differently shaped anther connectives, etc. Hunt (1983, 1986) has treated Cuthbertia as a section of Callisia Loefling, a decision followed with little additional comment or discussion by Tucker (1989). While this course may be warranted, the authors advocating it have presented little evidence to support it. Hunt (1986), in discussing a number of small tropical genera which he also reduces to sections of Callisia, states “this leaves two alternatives: to recognize numerous (perhaps 10) genera of 1-2 species, or to experiment with an amplification and sectionalization of Callisia, which I find the lesser of the two evils.” He mentions that “the succulent habit ... is a principal unifying feature of the enlarged genus as a whole, reflecting the concentration of its species in tropical seasonal habitats, often on rocks.” Cuthbertia is endemic to se. North America (a separate and more northerly distribution than the remainder of a broad Callisia), is only slightly succulent, occurs primarily in sandy habitats, and has a different base chromosome number (x=6) than some components of a broad Callisia. Until and unless a more compelling case is presented for the inclusion of Cuthbertia in Callisia, I prefer a more conservative and traditional maintenance of Cuthbertia, which is also more in line with the philosophy on the circumscription of genera. References: Faden in FNA (2000); Tucker (1989)=Z; Giles (1942); Giles (1943); Lakela (1972); Faden in Kubitzki (1998b).

1 Leaves loosely spreading, the leaf blades 4-15 mm wide (as wide as or wider than the opened, flattened sheaths)...........................C. rosea
2 Leaves erect or ascending, the blade 1-5 mm wide (narrower than the opened, flattened sheaths)

1 Plants cespitose; roots glabrous to sparingly puberulent; inflorescence bracts scarious and small or to 14 mm long and green; petals 8-10 mm long; [of se. VA south to c. FL peninsula]..........................................................C. graminea
2 Plants not cespitose; roots persistently densely woolly; inflorescence bracts 1-3 (-5) mm long, scarious; petals 9-13 mm long; [of the FL peninsula, disjunct in Gulf County in the FL Panhandle]..........................................................C. ornata

Cuthbertia graminea Small, Grassleaf Roseling. Sandhills. May-July. Cuthbertia graminea includes 3 morphologically distinguishable cytological races, occupying different (but partially overlapping) ranges (Giles 1942, Giles 1943, Tucker 1989). The predominant race is tetraploid, occupying the outer Coastal Plain of VA, NC, and SC, middle Coastal Plain of NC and SC, fall-line sandhills of SC, and south into FL. The diploid race is endemic to the fall-line sandhills of NC and SC, a distribution similar to those of Pyxidanthera brevifolia, Liatris cokeri, and Lycopus cokeri. Rare hexaploids have been found at scattered sites in SC and FL. The tetraploid race averages about 25% larger than the diploid in most vegetative and floral characters, and is reported to exhibit a greater ecological amplitude (Giles 1942, 1943). [= S; = Tradescantia rosea Ventenat var. graminea (Small) E.S. Anderson & Woodson – RAB, C, F, G; = Callisia graminea (Small) G. Tucker – FNA, K, WH, Z]

Cuthbertia ornata Small, Florida Roseling. Sandhills, scrub, dunes. FL peninsula; disjunct in Gulf County in the FL Panhandle. [= S; = Callisia ornata (Small) G. Tucker – FNA, K, WH, Z; = Tradescantia rosea Ventenat var. ornata (Small) E.S. Anderson & Woodson]

Cuthbertia rosea (Ventenat) Small, Common Roseling. Sandhills, other dry woodlands. May-July. MD south to peninsular FL, west to s. AL. [= S; = Tradescantia rosea Ventenat var. rosea – RAB; = Callisia rosea (Ventenat) D.R. Hunt – FNA, K, WH, Z]

Gibasis Rafinesque 1837 (Bridal-veil)

**Gibasis pellucida** (M. Martens & Galetti) D.R. Hunt, Tahitian Bridal-veil. Disturbed areas; native of Mexico. April-October. [= FNA, WH; = G. schiedeana (Kunth) D.R. Hunt]

![Image of plants](image)

*Murdannia* Royle 1839 (*Murdannia*)

1 Flowers solitary or in 2-4-flowered racemes borne in the upper leaf axils; capsules 8-10 mm long; seeds ca. 3 mm long; pedicels much longer than the capsule. .......................................................

1 Flowers in stalked cymose racemes borne terminally or the uppermost leaf axil; capsules 4-5 mm long; seeds 1.0-1.5 mm long; pedicels about as long as the capsule. .......................................................

**Murdannia nudiflora** (Linnaeus) Brenan. Moist sands, ditches, wet disturbed places; native of Asia, now widespread in the tropics and subtropics of both hemispheres. May-October. This species apparently arrived in the se. United States earlier than *M. keisak* (S, for instance, treats this species and not *M. keisak*), but is distinctly less common. [= FNA, GW, K, Z; = Anelilema nudiflorum (Linnaeus) Sweet – RAB, S]

*Tradescantia* Linnaeus 1753 (*Spiderwort*)

1 Leaves purple; flowers nearly sessile; petals clawed, the claws fused basally; stamens epipetalous. .......................................................

1 Leaves green; flowers distinctly pedicelled; petals neither clawed nor connate; stamens not adnate to the petals. .......................................................

2 Plant erect or ascending, not rooting at the nodes; leaves > 4 cm long, > 5× as long as wide; [native]. .......................................................

2 Plant sprawling, rooting at the nodes; leaves 2.5-5 cm long, < 4× as long as wide; [exotic] .......................................................

3 Leaf blades of the upper stem not constricted to a subpetiolar sheath, the opened sheath about as wide or wider than the leaf blade; leaf blades 11-45 cm long, 0.4-2.0 (-4.5) cm wide, mostly > 10× as long as wide; stomates slightly more abundant on the lower leaf surface than on the upper, or about equally distributed on the two surfaces, the lower surface slightly to not at all paler than the upper.

3 Leaf blades of the upper stem constricte d at their bases to a narrower subpetiolar sheath, the opened sheath narrower than the leaf blade; leaf blades 6-27 cm long, 1.0-5.0 cm wide, mostly < 10× as long as wide; stomates much more abundant on the lower leaf surface than on the upper, giving the lower surface a much paler color.

4 Pedicels 2.0-3.2 cm long; sepals 9-16 mm long. .......................................................

4 Pedicels 1.0-1.7 cm long; sepals 4-10 mm long. .......................................................

5 Sepals, pedicels, and ovary pubescent with glandular hairs or a mixture of glandular and eglandular hairs; leaves slightly to densely puberulent or pubescent.

6 Leaves dull green, densely pilose (rarely glabrate); sepals, pedicels, and ovary pubescent with a mixture of glandular and eglandular hairs; pedicels 2.0-3.5 cm long. .......................................................

6 Leaves glaucous to subglaucous, puberulent; sepals, pedicels, and ovary puberulent with glandular hairs only; pedicels 1.2-2.5 cm long. .......................................................

5 Sepals, pedicels, and ovary pubescent with glandular hairs or a mixture of glandular and eglandular hairs; leaves slightly to densely puberulent or pubescent.

7 Pedicels pubescent; sepals eglandular-villosus; leaves green; sepals green, inflated-turgid (*T. virginiana*) or not (*T. hirsuticaulis*).

7 Pedicels glabrous; sepals glabrous or the tip with a tuft of eglandular hairs; leaves glaucous or green; sepals glaucous (or rarely also suffused with purple), not inflated-turgid.

8 Stems usually hirsute or pilose throughout; roots 1.0-1.5 (-2.0) mm thick; sepals not inflated-turgid. .......................................................

8 Stems glabrous, or sparsely puberulent on the upper stem only; roots (1.5-) 2.0-4.0 mm thick; sepals usually inflated-turgid. .......................................................

9 Plants distinctly glaucous; leaves 5-45 cm long, arcing, at an acute angle to the stem. .......................................................

9 Plants green or slightly glaucous; leaves 4-11 cm long, straight, at nearly right angles to the stem. .......................................................

**Commelinaeae**

*Tradescantia fluminensis* da Conceição Vellozo, Wandering Jew. Disturbed areas, lawns, vacant lots, moist suburban woods, along streams; native of tropical America. Reported for Beaufort Co. SC (Daniel C. Payne 2009, pers. comm.). [= FNA, K, WH, Z]

*Tradescantia hirsuticaulis* Small, Hairy Spiderwort. Dry rocky woodlands, and rock outcrops (especially granitic flatrocks and domes). April-June. W. NC and wc. TN south to sc. SC, s. GA, s. AL, and sc. MS; disjunct in AR, e. OK, and nw. LA. There is some question about the validity of this species. [= RAB, FNA, K, W, Y, Z]

*Tradescantia ohiensis* Rafinesque, Smooth Spiderwort. Woodlands and forests, alluvial bottoms, disturbed areas. April-July. MA west to MN, south to c. peninsular FL and TX, some of that range the result of naturalization from cultivation. [= RAB, C, F, FNA, G, K, W, WH, WV, Z; > T. reflexa Rafinesque – S; > T. canaliculata Rafinesque – Y]

*Tradescantia pallida* (Rose) D.R. Hunt, Purplequeen, Purpleheart, Wandering Jew. Disturbed areas; native of Mexico. [= FNA, K, WH]

*Tradescantia paludosa* E.S. Anderson & Woodson. Swamps and bottomlands. March-May. Coastal Plain of AL and FL (?) west to TX and AR. [= FNA, K, Y, Z; > T. ohiensis Rafinesque var. paludosa (E.S. Anderson & Woodson) D.T. MacRoberts]

*Tradescantia roseolens* Small, Sandhill Spiderwort. Dry sandy woodlands. May-June. SC south through GA to c. peninsular FL, west to AL. [= RAB, FNA, K, WH, Y, Z; > T. longifolia Small – S]

*Tradescantia subaspera* Ker-Gawler, Wide-leaved Spiderwort. Dry to mesic woodlands and forests, hammocks. June-July. Nc. NC, w. VA, WV, OH, IN, IL, and MO, south to NC, SC, sw. GA, Panhandle FL, and AL. Two questionable varieties are sometimes recognized. Var. subaspera may be distinguished by the stem conspicuously zigzag above, except on depauperate or juvenile plants (vs. the stems straight or only slightly zigzag), uppermost lateral cymes sessile or short-pedunculate (vs. pedunculate throughout), uppermost internodes very reduced, crowding the upper leaves (vs. internodes less reduced), leaves much broader than the sheath (vs. only slightly broader), and its generally greater size than var. montana. *T. subaspera* var. *montana* ranges from sw. VA and c. WV south to nw. SC, n. GA, and se. TN, with disjunct occurrences in c. AL and Panhandle FL. Vari. subaspera ranges from WV west to n. IL, south to se. TN, ne. AR, and s. MO, with disjunct occurrences in NC. [= RAB, FNA, W; > T. subaspera Ker-Gawler var. *montana* (Shuttleworth ex Britton) E.S. Anderson & Woodson – C, F, G, K, WV, Y, Z; > T. subaspera var. subaspera – C, F, G, K, WV, Y, Z; < T. pilosa J.G.C. Lemaire – S]

---

**Pondederciaceae** Kunth 1816 (Pickerelweed Family) [in Commelinales]

A family of about 9 genera and 33 species, primarily of the tropics, but with some temperate representatives. References: Rosatti (1987a); Cook in Kubitzki (1998b); Horn in FNA (2002a).

1 Inflorescence with >50 flowers; fruit 1-seeded, indehiscent; leaves lanceolate to ovate, 1.5-10× as long as wide, the base cordate, truncate, or cuneate. .......................................................... Eichhornia

2 Inflorescence with <30 flowers; fruit 10-200-seeded, capsular; leaves either reniform, 0.5-1.5× as long as wide, the base cordate or rounded, or narrowly linear, 20-50× as long as wide, the base attenuate. .......................................................... Heteranthera

---

Eichhornia Kunth 1842 (Water Hyacinth)

A genus of 7-8 species, native of tropical America and Africa, but now introduced widely in warm regions. References: Cook in Kubitzki (1998b); Horn in FNA (2002a).
1 Plants rooted; stems elongate, with leaves spaced and alternate; petioles not inflated.......................................................... E. azurea
1 Plants floating (or stranded by dropping water levels); stems short, with leaves in a rosette with very short internodes; petioles inflated..............

* Eichhornia azurea (Schwartz) Kunth, Rooted Water-hyacinth. Ditches, rivers; native of tropical America. June-October. [= FNA, K, WH]

* Eichhornia crassipes (Martius) Solms-Laub, Water Hyacinth. Ponds, ditches, sluggish water, native of tropical America. June-September. E. crassipes is "generally considered the world's most serious aquatic weed" (Rosatti 1987). Originally native to tropical South America, E. crassipes is now a widespread naturalized weed throughout the tropics and subtropics. In the northern part of our area, water hyacinth is rare, probably not long persisting. Further south, it can be an aggressive aquatic weed. [= RAB, C, F, FNA, G, GW, K; = Piaropus crassipes (Martius) Rafinesque – S]

### Heteranthera Ruiz & Pavón 1794 (Mud-plantain)

1 Leaves narrowly linear, 20-50× as long as wide, the base attenuate; flowers solitary, the corolla yellow; stamens and anthers all alike

1 Floral tube persistently pubescent with short glandular hairs; leaves lanceolate, 0.4-8.3 cm wide, the base generally cuneate to truncate ..................H. dubia

2 Spathe with 2-several flowers; perianth tube 3-12 mm long.

2 Spathe with solitary flower; perianth tube 11-45 mm long.

3 Anthers and filaments with dark purple hairs; internode below the spathe < 1 cm long; spike with (3-) 7-16 flowers, typically elongating well out of the spathe .......................................................... H. multiflora

3 Anthers and filaments with white hairs; internode below the spathe > 1 cm long; spike with 2-8 flowers, typically mostly included within the spathe .......................................................... H. reniformis

2 Vegetative stems commonly elongating; blades of petiolate leaves round to oblong, the base truncate to cuneate; perianth tube 15-45 mm long.......................................................... H. limosa

4 Vegetative stems elongating only in water deeper than 5 cm; blades of petiolate leaves oblong to ovate, the base truncate to cuneate; perianth tube 11-29 mm long.......................................................... H. rotundifolia

### Heteranthera dubia (Jacquin) MacMillan, Water Stargrass. Streams, rivers. Late July-October. QC west to WA, south to Cuba and Central America, but rare or absent in much of the se. United States. The attribution of this species to SC is in error (as by Kartesz 1999), based on a misidentified specimen (C. Horn, pers. comm.). [= RAB, F, FNA, GW, K, W, WV; = Zosterella dubia (Jacquin) Small – C, G, S]

### Heteranthera limosa (Swartz) Willdenow. Wet ditches, other wet areas. KY, MN, SD, and CO, south to AL, MS, LA, TX, and AZ; Mexico, Central and South America, West Indies. East to TN, KY, AL (Diamond & Woods 2009), and FL (Kartesz 1999); it is attributed to VA in Small (1933), but the documentation is not known. [= FNA, C, F, G, K, S, Z]

### Heteranthera multiflora (Grisebach) Horn. In shallow, stagnant water in floodplains, or emersed on mud. June-October. IL west to NE, south to MS; also on the Atlantic Coastal Plain from NJ south through PA to ne. NC; also in South America (Brazil, Paraguay, Argentina, and Venezuela). [= C, FNA, GW, K, W, WV, Z]

### Heteranthera rotundifolia (Kunth) Grisebach. Ponds. Midwestern, as a rare disjunct east to c. KY (Larue County) (Medley 1993); Central and South America, West Indies. [= FNA, C, K, Z]

### Pontederia Linnaeus 1753 (Pickerelweed)

1 Floral tube villous when young, essentially glabrous to sparsely glandular in maturity; leaves primarily ovate to triangular-lanceolate, 2.2-21 cm wide, the base generally cordate or truncate (rarely cuneate).......................... P. cordata var. cordata

1 Floral tube persistently pubescent with short glandular hairs; leaves lanceolate, 0.4-8.3 cm wide, the base generally cuneate to truncate.............. P. cordata var. lancifolia
**Pontederiaceae**

*Pontederia cordata* Linnaeus, Heartleaf Pickerelweed. Marshes, pond-shores, lake-shores. May-October. NS west to MN, south to FL and TX; Belize; s. Brazil, Argentina, Paraguay, and Uruguay. The recognition of infraspecific taxa in *Pontederia cordata* is controversial and requires additional study. *P. cordata* exhibits tristyly, an interesting breeding system. Each plant has one of 3 types of flowers: (a) a short style, 3 medium and 3 long stamens, (b) a medium style, 3 short and 3 long stamens, or (c) a long style, 3 short and 3 medium stamens. [= GW, Z; < *P. cordata* – RAB, C, FNA, K, W; = *P. cordata* – F, G, S, WV]

*Pontederia cordata* Linnaeus var. *lancifolia* (Muhlenberg ex Elliott) Torrey, Lanceleaf Pickerelweed. Marshes, pond-shores, lake-shores. May-October. S. MA (alleged to occur as far north as ME, but these reports may be entirely based on misidentifications of var. *cordata*) to s. FL, west to e. TX, mostly on the Coastal Plain, with a few records around the Great Lakes; Cuba; s. Brazil, Argentina, Paraguay, and Uruguay. A third variety of *P. cordata*, var. *ovalis* (Martens in Roemer & Schultes) Solms in A.P. de Candolle, is restricted to South America. [= GW, Z; < *P. cordata* – RAB, C, FNA, K, W; = *P. lanceolata* Nuttall – F, G, S]

### 81. Haemodoraceae

R. Brown 1810 (Bloodwort Family) [in COMMELINALES]

A family of about 14 genera and 100 species, herbs, of semicosmopolitan distribution, but centered in Australia. The Haemodoraceae is primarily a family of the Southern Hemisphere; *Lachnanthes* is the only member native to e. North America. *Lophiola* has often been treated in the Haemodoraceae; recent evidence, however, indicate that it is better placed in the Nartheciaceae (or Liliaceae *sensu lato*); see *Lophiola* (Nartheciaceae) for additional details. References: Robertson (1976)=Z; Simpson in Kubitzki (1998b); Robertson in FNA (2002a). [also see **Melanthiaceae**]

*Lachnanthes* Elliott 1816 (Redroot)

**Identification notes:** A very distinctive plant when in flower, with its densely woolly inflorescence and flowers. When not in flower, recognizable by its equitant (iris-like) base and bright red roots.

*Lachnanthes caroliniana* (Lamarck) Dandy, Redroot. Wet savannas, pocosin edges, shores of Coastal Plain depression ponds (and similar ponds in the mountains of Virginia), ditches, wet disturbed ground. June-early September; September-November. The range is almost strictly on the Coastal Plain, and rather disjunct: s. NS, from MA to DE, from se. VA south to s. FL and west to LA, with inland disjunctions in w. VA and sc. TN (Coffee County); Cuba. The correct spelling of the specific epithet has been disputed; the original spelling was "*caroliana*," but Gandhi (1999) argues convincingly that this is a correctable typographic error. [= RAB, C, FNA, GW, W, Y; = *Lachnanthes caroliana* – K, WH, Z, orthographic variant (correctable typographic error); = *L. tinctoria* (J.F. Gmelin) Elliott – F, G; = *Gyrotheca tinctoria* (J.F. Gmelin) Salisbury – S]

### 86. Cannaceae

A.L. de Jussieu 1789 (Canna Family) [in ZINGIBERALES]

*Canna* Linnaeus 1753 (Canna)

**Identification notes:** The petals are generally sepaloid (sometimes brightly colored); the showy, colored portions of the flower are the staminodes.

1 Flowers not tubular at the base (or with a short tube to 2 cm long); petals erect; [alien, cultivated and persistent].......................... *C. ×generalis*

2 Flowers tubular at the base; petals reflexed; [native or cultivated];

1 Flowers yellow; capsule 5-6 cm long, ellipsoid (longer than broad); leaves glaucous; [native]......................................................... *C. flaccida*

2 Flowers red, orange, or mixed red-and-yellow; capsule 1.5-3 cm long, globose or subglobose (about as long as broad); leaves green; [alien, cultivated and persistent] .................................................. *C. indica*
**BURMANNIACEAE**

*Canna flaccida* Salisbury, Golden Canna, Yellow Canna. Wet pine savannas, marshes, ditches. May-early July; July-August. E. SC south to FL, west to TX, and south into Central America. [= RAB, FNA, K, S]

* Canna ×generalis L.H. Bailey (pro sp.) [= *C. glauca × indica*], Common Garden Canna. Cultivated and persisting; native of tropical America. June-September; August-October. [= RAB, FNA, K]

*Canna indica* Linnaeus, Indian-shot, Platanillo. Cultivated and persisting; native of tropical America. June-September; August-October. [= FNA, GW, K, S]

---

**87. MARANTACEAE** Petersen in Engler & Prantl 1888 (Arrowroot Family) [in ZINGIBERALES]

A family of about 31 genera and 550 species, herbs and vines, nearly pantropical (absent from Australia), and rarely extending into subtropical and warm temperate regions. References: Kennedy in FNA (2000); Andersson in Kubitzki (1998b).

*Thalia* Linnaeus 1753 (Thalia)

1 Flowers crowded on the rachis, the zigzag internodes 2-3 mm long; leaves pilose at the base on the upper surface; bracts of the inflorescence white-pruinose ..............................................................................................................................................................................

T. dealbata

1 Flowers separated on the rachis, the zigzag internodes 5-10 mm long; leaves glabrous at the base on the upper surface; bracts of the inflorescence green or purple, not pruinose .............................................................................................................................................

T. geniculata

---

*Thalia dealbata* Fraser ex Roscoe, Powdery Thalia, Powdery Alligator-flag. Swamp forests, wet ditches, brackish marshes. May-September; June-October. Ne. SC south to GA, west to TX and OK, north in the Mississippi Embayment to w. KY, s. IL, and se. MO. [= RAB, FNA, GW, K, S]

*Thalia geniculata* Linnaeus, Lilies, Bent Thalia, Bent Alligator-flag. Ponds, sloughs, marshes. AL, FL, LA, south through Central and South America; West Indies; w. Africa. [= FNA, GW, K, S, WH]

---

**89. ZINGIBERACEAE** Martynov 1820 (Ginger Family) [in ZINGIBERALES]

A family of about 50 genera and 1200 species, herbs, of tropical and subtropical areas, especially se. Asia.

1 Inflorescence terminal on short stems with scale leaves, distinct from the main leafy stems ..........................................................................................................................................................................................

Curcuma

1 Inflorescence terminal on long stems with normal, well-developed leaves ..........................................................................................................................................................................................

Hedychium

---

*Curcuma* Linnaeus 1753 (Hidden Lily)

A genus of about 80 species, rhizomatous herbs, native of the Old World tropics.

* Curcuma zedoaria* (Bergius) Roscoe, Zedoary, White Turmeric. Disturbed areas; native of se. Asia. [= K, WH]

*Hedychium* J. König 1783 (Ginger-lily)

A genus of about 40 species, rhizomatous herbs, native of the Old World tropics.

Hedychium coronarium J. König, White Ginger-lily. Disturbed areas, commonly cultivated, rarely persisting and spreading; native of India. [= K, WH]

---

**91. TYPHACEAE** A.L. de Jussieu 1789 (Cattail Family) [in POALES]

1 Inflorescences headlike, globular ..........................................................................................................................

1 Inflorescences spike like, cylindrical .......................................................................................................................

Sparganium Linnaeus 1753 (Bur-reed)

A genus of about 14 species, wetland and aquatic herbs, primarily circumboreal in arctic and temperate regions, but also in the tropics of Asia, and temperate Australia. References: Kaul in FNA (2000); Thieret (1982)=Z; Beal (1960)=Y; Crow & Hellquist (2000b)=X; Kubitzki in Kubitzki (1998b).

1 Stigmas 2; fruits truncate at apex, obpyramidal, very abruptly beaked, 4-8 mm broad .......................................................... S. eurycarpum

1 Stigmas 1; fruits rounded or acuminate to a beak at the apex, elliptic, fusiform, or obovate, 1-3 (-4) mm broad.

2 Pistillate bracteoles present (but generally evident only at 20-30× after removal from spike, resembling perigonial hairs, with brown, persistent on mature spikes; pistillate spikes green in flower when fresh, in fruit mostly 19-36 mm thick; carpodia concealed among pistil hairs; compound pedicels on denuded axis 0.6-3.5 mm; staminate scales colorless to brown.

2 Pistillate bracteoles absent, or if present then narrower than stigmas and generally not evident at spike surface; stigmas ovate to lanceolate, persistent on mature spikes; pistillate spikes green in flower when fresh, in fruit mostly 19-36 mm thick; carpodia concealed among pistil hairs; compound pedicels on denuded axis 0.6-3.5 mm; staminate scales colorless to brown.

3 Mature fruits dull, finely pitted, the body 3-5 mm long; fruiting heads 1.5-2.5 cm in diameter; branches of the inflorescence with 0-3 pistillate heads (in addition to staminate heads); stigmas 0.8-1.9 (-2.8 in the Coastal Plain) mm long ................................................................. S. emersum

3 Mature fruits shiny, smooth, the body 5.5-7 mm long; fruiting heads 2.5-3.5 cm in diameter; branches of the inflorescence with 0 (-1) pistillate heads (in addition to staminate heads); stigma 1.5-3 mm long ................................................................. S. androcladum

Sparganium americanum Nuttall, American Bur-reed. Streams, marshes, ponds, pools, often submerged. May-September.

NL (Newfoundland) west to MN, south to c. peninsular FL and c. TX. Beal (1960) discusses the interesting variation in S. americanum, perhaps worthy of taxonomic recognition. The "Appalachian Race" has stigmas 0.6-0.9 mm long, inflorescence branches 0-3, and relatively narrow leaves; in our area it is montane in distribution, and in general is Appalachian, Ozarkian, and northern. The "Coastal Race" has stigmas 1.5-2.8 mm long, 2-5 inflorescence branches, and relatively wide leaves; in our area it is primarily of the Coastal Plain, disjunct to the mountains of NC and SC south of the Asheville Basin (like many Coastal Plain taxa), and in general is nearly limited to the Coastal Plain, ranging from MA south to FL, west to e. TX, and north in the interior to sc. TN, s. IN, and s. MO. The "Ubiquitous Race" is intermediate, with stigmas 1.0-1.4 m long; it occurs throughout the range of the species. The pattern is suggestive of imperfect evolutionary separation of two taxa. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV, X, Y, Z]

Sparganium androcladum (Engelmann) Morong. Marshes, shores. May-September. ME and QC west to MN, south to se. VA, s. WV, e. TN, s. MO, and ne. OK. [= C, F, FNA, G, K, W, WV, X, Y, Z]

Sparganium emersum Rehmann, Greenfruit Bur-reed. Bogs, stream margins. May-September. NL (Newfoundland) and c. QC west to s. AB and WA, south to w. NC, IN, IA, CO, and CA; Eurasia. [= FNA, X; > S. chlorocarpum Rydberg – RAB, C, F, G, W, WV, Y, Z; > S. chlorocarpum var. acaule (Beeby) Fernald – F; ? S. angustifolium Michaux – K, misapplied; > S. acaule (Beeby) Rydberg; > S. emersum var. acaule (Beeby) A. Haines]

Sparganium eurycarpum Engelmann ex A. Gray, Giant Bur-reed. Marshes, shores. NS west to BC, south to w. VA, n. WV, IN, OK, CA and Baja California; e. Asia. Its attribution to more southern localities in some older sources (such as FL according to Small) is believed to be in error. [= C, F, FNA, G, K, S, W, WV, X; = S. erectum Linnaeus ssp. stoloniferum (Graebner) C.D.K. Cook & M.S. Nicholls]

Typha Linnaeus 1753 (Cattail)

A genus of 8-13 species, wetland herbs, cosmopolitan. References: Ward (2007a)=Z; Smith in FNA (2000); Kubitzki in Kubitzki (1998b). Key adapted from FNA.

1 Pistillate bracteoles absent, or if present then narrower than stigmas and generally not evident at spike surface; stigmas ovate to lanceolate, persistent on mature spikes; pistillate spikes green in flower when fresh, in fruit mostly 19-36 mm thick; carpodia concealed among pistil hairs; compound pedicels on denuded axis 0.6-3.5 mm; staminate scales colorless to brown.

2 Pistillate bracteoles present (but generally evident only at 20-30× after removal from spike, resembling perigonial hairs, with brown, enlarged tips narrower than stigmas); stigmas lanceolate, brown when dry; pistillate spikes usually separated from staminate spikes by gap,
3. *Typha domingensis* Godron – RAB, F; LA, and TX (?); Eurasia. Stuckey & Salamon (1987) consider inland in non-tidal wetlands (where probably only introduced). May-July; June-November. NL (Newfoundland) west to AK, south to FL, TX, CA, and Mexico; Central America; rivers. May-July; June-November. Both C and K apply this name to two different hybrids: *T. angustifolia × domingensis* × *latifolia*.

Typha angustifolia Linnaeus, Narrowleaf Cattail. Brackish to fresh waters of marshes and swamps, usually tidal, and also inland in non-tidal wetlands (where probably only introduced). May-July; June-November. NS west to ND, south to SC, FL (?), LA, and TX (?); Eurasia. Stuckey & Salamon (1987) consider *T. angustifolia* an invasive alien in North America, but later studies suggest that it was native at least in coastal areas of NE and Mid-Atlantic North America, and has expanded its range westwards in recent decades (Shih & Finkelstein 2008). [= C, F, FNA, G, GW, K, RAB, W, WH, WV, Z; = *T. angustifolia* – S (also see *T. domingensis*)]

Typha domingensis Persoon, Southern Cattail. Brackish to nearly fresh waters of marshes and swamps, usually tidal. June-July; July-November. DE south to S. FL, west to TX; north inland to NE and UT; and south into tropical America; Eurasia; Africa; Oceania. [= C, F, FNA, G, GW, K, RAB, Z; = *T. angustifolia* – S]

Typha ×glauca Godron (pro sp.) [*angustifolia × latifolia*], Hybrid Cattail. Fresh to brackish waters of lakes, ponds, and rivers. May-July; June-November. Both C and K apply this name to two different hybrids: *T. angustifolia × latifolia* and *T. domingensis × latifolia*. The name properly applies to *T. angustifolia × latifolia* (Smith in FNA 2000). [= GW, Z; = *T. glauca* Godron – RAB, F; = *T. ×glauca* – C, K]

Typha latifolia Linnaeus, Common Cattail. Fresh waters of ponds, lakes, ditches, marshes, including in tidal freshwater marshes. May-July; June-November. NL (Newfoundland) west to AK, south to FL, TX, CA, and Mexico; Central America; South America; Eurasia. [= C, F, FNA, G, GW, K, RAB, S, W, WH, WV, Z]

92. BROMELIACEAE A.L. de Jussieu 1789 (Bromeliad or Pineapple Family) [in POALES]

A family of about 56 genera and 2600 species, herbs, shrubs, and trees, of the New World tropics and subtropics (very rarely warm temperate). References: Luther & Brown in FNA (2000); Smith & Till in Kubitzki (1998b).

Tillandsia Linnaeus 1753 (Spanish-moss)

A genus of about 540 species, herbs, of s. North America south to s. South America. References: Luther & Brown in FNA (2000); Smith & Till in Kubitzki (1998b). Key based in part on FNA.

1. Leaves distichous; inflorescence 1-2 (-3) flowered.
   2. Plants in dense, more or less spherical clusters; inflorescence seapose, exserted from the cluster; corolla violet ........................................... *T. recurvata*
   3. Plants in elongate, pendulous festoons; inflorescence sessile; corolla yellowish green .......................................................... *T. usneoides*

1. Leaves spiral in a rosette; inflorescence > 3-flowered.
   4. Leaves finely lepidote, appearing green or reddish; floral bracts green or reddish; corolla lavender .................................................. *T. bartramii*
   4. Leaves densely and coarsely lepidote, appearing gray; floral bracts rose; corolla violet .............................................................. *T. setacea*
Diaphoranthema recurvata

Lachnanthes caroliniana

1 Keel of the lateral sepals shortly ciliate-scabrid (or sometimes entire in Kubitzki (1998b). Key adapted from X, GW, and Z.

References: Kral in FNA (2000); Ward (2007b)=V; Bridges & Orzell (2003)=X; Kral (1966a)=Z; Kral (1983b, 1999); Kral in America). This "technical" genus is known well by only a few botanists, and additional undescribed taxa are possible.

A genus of about 300 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). References: Kral in FNA (2000); Kral in Kubitzki (1998b).

Tillandsia bartramii Elliott, Bartram's Air-plant. On tree branches in bayswamps, tidal swamp forests, and mesic hardwood bluffs. E. GA south through FL; disjunct in Tamaulipas. In five counties in e. GA, as far north as Liberty County (Jones & Coile 1988), and reported for SC as extirpated (Kartesz 1999). [= FNA, K, WH; T. myriophylla Small – S]

Tillandsia fasciculata Swartz var. densispica Mez, Quill-leaf Airplant. Branches of trees, especially evergreen oaks. Se. GA south through FL, and in the West Indies, Mexico, and Central America. [= FNA, K, WH; < T. fasciculata – S]

Tillandsia recurvata (Linnaeus) Linnaeus, Ball-moss, Bunch-moss. On tree branches in maritime forests. Se. GA (Duncan 1985) south to s. FL; LA to AZ and south through Mexico, Central America, and South America; West Indies. Introduced in e. SC (Beaufort, Jasper, Charleston, Georgetown counties) via landscaping plants (Gramling 2010; P. McMillan, pers. comm. 2005). Outside of our area, this species also occurs on rock cliffs and is frequent on powerlines. [= FNA, K, WH; Diaphoranthema recurvata (Linnaeus) Beer – S]

Tillandsia setacea Swartz, Wild-pine, Pine-needle Airplant. In tree branches, especially on hardwoods, in mesic bluff forests. Se. GA south to s. FL; West Indies and Central America. [= FNA, K; = T. tenulifolia Linnaeus – S, misapplied]

Tillandsia usneoides (Linnaeus) Linnaeus, Spanish-moss. Branches of trees, especially in swamps, but elsewhere where air humidity is high enough, often even in dry forests (near Wilmington, NC Tillandsia is abundant on Quercus laevis in an extensive dry sandhill area which receives frequent fog from the Cape Fear, Brunswick, and Northeast Cape Fear rivers). April-June. S. MD (historically), se. VA south to s. FL, west to TX and Mexico; Central and South America, West Indies. T. usneoides is the only member of a very large genus to occur north of s. GA. The epithet 'usneoides' refers to its resemblance to the common lichen Usnea. [= RAB, C, F, FNA, G, K, WH; = Dendropogon usneoides (Linnaeus) Rafinesque – S]

94. XYRIDACEAE C. Agardh 1823 (Yellow-eyed Grass Family) [in POALES]

A family of 5 genera and about 325-350 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). References: Krul in FNA (2000); Krul in Kubitzki (1999b).

Xyris Linnaeus 1753 (Yellow-eyed Grass)

A genus of about 300 species, nearly cosmopolitan (most diverse in tropical and subtropical regions, and especially South America). This "technical" genus is known well by only a few botanists, and additional undescribed taxa are possible. References: Krul in FNA (2000); Ward (2007b)=V; Bridges & Orzell (2003)=X; Krul (1966a)=Z; Krul (1983b, 1999); Krul in Kubitzki (1999b). Key adapted from X, GW, and Z.

Identification notes: In vegetative condition, Xyris is often confused with other monocots with equitant leaves, such as Iris spp. (Iridaceae), Lachnanthes caroliniana (Haemodoraceae), and Tofieldia spp. (Tofieldiaceae).

1 Keel of the lateral sepals shortly ciliate-scabrid (or sometimes entire in X. brevifolia, and then the bract tips purplish-tinged).
2 Plants small, usually < 30 cm tall; principal leaves usually < 10 cm long; mature spikes < 1 cm long when mature.
3 Leaves filiform, with expanded brownish lustrous bases, usually exceeding the sheath of the scape; [plants of s. AL and the FL bicolored, the distal portions maroon or purplish and often with erose margins .................................................. X. isoetifolia
4 Keel of the lateral sepals straight to slightly curved, remotely ciliate or entire; spikes broadly ovoid to subglobose, the bracts loose, bicolored, the distal portions maroon or purplish and often with erose margins .................................................. X. brevifolia
5 Keel of the lateral sepals strongly curved, densely ciliate; spikes lance-ovoid to ovoid, the bracts entire, not purple-tinged, and lacking erose borders. [Plants perennials, and X. lanceolata arranged, spreading to recurved against the substrate, usually maroon; fruiting spikes often elongated and acute, not 2-edged ..................................................................................................................................
6 Plants annual; leaves flagellate arranged, spreading to recurved against the substrate, usually maroon; fruiting spikes often elongated and acute, not 2-edged .................................................................................................................................. X. flabelliformis
2 Plants large, usually > 30 cm tall; principal leaves > 10 cm long; mature spikes > 1 cm long when mature.
XYRIDACEAE

6 Leaves ascending, twisted, strongly grooved; spikes ovoid, the bracts and lateral sepals with a small tuft of short, reddish-brown hairs; bases of leaves abruptly expanded, pinkish or purplish (dark brown in age), the outermost leaves often scale-like, the plant base therefore appearing bulbous; of [the Mountains, Piedmont, and Coastal Plain] ........................................... X. torta

6 Leaves spreading, not twisted or only slightly so; spikes narrowly ovoid, ellipsoid, or oblong; bracts and sepals without a small apical tuft of hairs; bases of leaves whitish, tan, pink, purplish, maroon, or dark brown, the outermost leaves not scale-like, the plant base not appearing bulbous; [typically of the Coastal Plain, rarely disjunct inland].

7 Seeds lustrous, translucent, broadly ovoid; spike pale brown or tan, the scales loosely imbricate; plant bases pinkish, purplish, or tan, with dark longitudinal striations on the inner leaf bases; leaves 3-20 mm wide; petal blades obovate, 6-7 mm long, opening in early morning, usually closing by mid-day ................................................................. X. ambigua

7 Seeds farinose, dark brown (X. stricta) or pale (X. louisianica) at maturity, narrowly ellipsoid to ovoid; spike dark brown, the scales tightly imbricate; plant bases maroon, purplish, dark-brown, or reddish-brown; leaves 2-5 mm wide; petal blades triangular-cuneate, 8-10 mm long, opening at mid-day.

8 Seeds pale when mature; plant bases maroon to maroon-brown, solitary or in small clumps; upper end of scape somewhat flattened, but not nearly as broad as the spike; spike narrowly ovoid to ellipsoid, slightly pointed ........................................... X. louisianica

9 Leaves closely linear to filiform, 0.5-2.0 (-2.5) mm wide, not twisted (or scarcely so); leaf bases expanded, lustrous, hard, tan to brown, neither bulbous nor deeply set in the substrate; spikes ovoid or ellipsoid, 4-15 mm long.

10 Leaves filiform, terete or elliptic in cross-section, 0.5-1.0 mm wide, without a paler, hardened margin; scape as broad as or broader than the leaf blades; scales smooth-edged to denticate, not curled away from the head, the head thus appearing smooth; staminodia beardless ........................................................................................................ X. baldwiniana

10 Leaves linear, flattened in cross-section, 1-2 (-2.5) mm wide, with a pale, hardened margin; scape usually narrower than the leaf blades; scales ragged-lacerate, the tips curling away from the head, giving it a ragged appearance; staminodia bearded ........................................................................ X. elliottii

11 Keel of the lateral sepals irregularly lacerate or fimbriate, or if entire then the the bract tips not purplish.

9 Leaves not twisted linear to filiform, 0.5-2.0 (-2.5) mm wide, not twisted (or scarcely so); leaf bases expanded, lustrous, hard, tan to brown, neither bulbous nor deeply set in the substrate; spikes ovoid or ellipsoid, 4-15 mm long.

10 Leaves filiform, terete or elliptic in cross-section, 0.5-1.0 mm wide, without a paler, hardened margin; scape as broad as or broader than the leaf blades; scales smooth-edged to denticate, not curled away from the head, the head thus appearing smooth; staminodia beardless ........................................................................................................ X. baldwiniana

10 Leaves linear, flattened in cross-section, 1-2 (-2.5) mm wide, with a pale, hardened margin; scape usually narrower than the leaf blades; scales ragged-lacerate, the tips curling away from the head, giving it a ragged appearance; staminodia bearded ........................................................................ X. elliottii

11 Keel of the lateral sepals long-fimbriate toward its apex, the fimbriate tip conspicuously exserted from the subtending bract (sometimes eroded and less conspicuous on older spikes).

12 Leaves strongly twisted, 2-5 mm wide; leaf bases hardened, swollen, bulbous, dark lustrous brown; scape ridges smooth; petal blades white or yellow; of moist to dry pinelands ............................................................ X. caroliniana

12 Leaves not twisted or slightly twisted, 3-25 mm wide; leaf bases either soft, not swollen, not bulbous, and pale green (X. fimbriata) or somewhat hardened and bulbous, deep red (X. panacea); scape ridges strongly scabrous or smooth; petal blades yellow; of aquatic to very wet peaty, mucky, or sandy ponds, marshes, or other wetlands.

13 Leaves 5-25 mm wide; scape ridges well-developed, strongly scabrous; flowers open 1:00-3:00 p.m. EDT; [widespread] ........................................................................................................ X. fimbriata

13 Leaves 3-5 (-8) mm wide; scape ridges poorly-developed, smooth; flowers open 11:30-4:00 p.m. EDT; [ endemic to Wakulla County, FL] .................................................................................................. X. panacea

11 Keel of the lateral sepals lacerate or fimbriate, or if very shortly fimbriate, then not conspicuously exserted from the subtending bract.

14 Lateral sepals longer than and exserted from the subtending bracts; spikes 5-15 dm tall.

14 Lateral sepals shorter than the subtending bracts, and therefore hidden (except when the spikes open to shed seeds); spikes 1.5-12 dm tall.

15 Leaf blades 1-2 (-3) mm wide, 6-30 cm long; spikes 10-16 mm long; seeds 0.4-0.6 mm long; [ endemic to Panhandle FL and s. AL] ........................................................................................................ X. longispépala

15 Leaf blades 5-15 mm wide; (20-) 30-50 (-60) cm long; spikes 10-20 (-25) mm long; seeds (0.6-) 0.7 (-0.8) mm long; [ more widespread in our area] ........................................................................................................ X. smalliana

14 Lateral sepals shorter than the subtending bracts, and therefore hidden (except when the spikes open to shed seeds); spikes 1.5-12 dm tall.

16 Scapes flexuous, usually spirally twisted; upper portion of leaf blades conspicuously twisted; plant bases pinkish, purplish, or dark brown, bulbous or deeply set in the substrate.

17 Plant forming a rather dense tuft; scape usually < 50 cm long; spike diverging at a 10-20° angle; seed surface farinose; of ne. FL southward) ................................................................................................................ X. calcicola

17 Plant solitary or in small tufts; scape usually > 50 cm long; spike vertical; seed surface not farinose; [collectively widespread].

18 Base of plant deeply set in the substrate, without distinct outer scale leaves; leaf bases not noticeably expanded, the plant base therefore not bulbous; leaves smooth, 2-4 mm wide; petal blades ca. 3 mm long. .................................. X. chapmanii

18 Base of plant shallowly set on the substrate, often with short, black outer scale leaves; leaf bases noticeably expanded, the plant base therefore appearing bulbous; leaves either smooth and 5-10 mm wide, or scabrous and 2-10 mm wide; petal blades ca. 5 mm long.

19 Leaf and scape surfaces prominently papillose or tuberculate-scarbid; petal blades suborbicular, yellow; seeds narrowly ovoid or narrowly ellipsoidal, ca. 1.0 mm long. ............................................................ X. scabrijóla

19 Leaf and scape surfaces smooth (or scabrous only along margins and ridges); petal blades obovate, white or yellow; seeds ovoid or ellipsoid, 0.5-0.6 mm long.

20 Seeds translucent; leaf margins smooth; [plants of acidic sites of the Coastal Plain] ........................................ X. platýlepis

20 Seeds opaque; leaf margins slightly scabrous; [plants of calcareous seeps and fens of the Ridge and Valley] ............................................................ X. tennessénsis

16 Scapes usually not flexuous, usually not spirally twisted; upper portion of leaf blades not conspicuously twisted; plant bases variously colored, flabellate or equitant and set at ground level.

21 Summit of the spike distinctly flattened and broad relative to the spike; scape ridges 2-3, the most prominent comprising the flattened edge of the scape.

22 The 2 principal scape ridges noticeably and abruptly flattened and winglike below the spike, their combined width (on fresh material) broader than the scape proper; fruiting spikes mostly 8-15 cm long; seeds 0.4-0.6 mm long, translucent (material) about 1.5× as long as wide, with lines of very fine papilae, not farinose, 0.5-0.6 mm long, dark when ripe, fusiform to narrowly elliptic, 2-3× as long as wide, with lines of very fine papilae, these however obscured by a farinose covering .............................................................................................. X. difformis

22 The 2 principal scape ridges not abruptly flattened and winglike below the spike, their combined width < the scape proper, which is itself flattened (narrowly elliptic in cross-section); fruiting spikes mostly (10-) 20-25 mm long; seeds 0.8-1.0 mm long, dark when ripe, fusiform to narrowly elliptic, 2-3× as long as wide, with lines of very fine papilae, these however obscured by a farinose covering .............................................................................................. X. iridífolia
21 Summit of the scape nearly terete or somewhat flattened, much narrower than the spike; scape ridges several (usually > 3), at least on the mid to lower portion of the scape.

23 Seeds farinose, very dark; surfaces of leaves tuberculate-scarbid, the leaves strongly ascending, linear, generally > 10 cm long; leaves generally dull-colored.

24 Mature spikes ovoid, sharply acute; plants solitary or in small clumps; leaves 10-30 (-50) cm long, 1.5-6.0 mm wide, dark maroon or purplish at the base ................................................................. X. floridana

24 Mature spikes ovoid to ellipsoid, acute to obtuse; plants typically in large dense tufts; leaves 20-50 cm long, 3-12 mm wide, the older ones with dark-brown to gray bases, the younger with tan bases................................................................. X. serotina

23 Seeds translucent, not farinose; surfaces of leaves smooth (or sparsely tuberculate-scarbid in X. curtissii, which also has leaves linear-curve and generally < 10 cm long); leaves generally a bright yellowish-green above the base.

25 Leaves ascending to erect, 5-60 cm long, 2-5 (-15) mm wide; scapes (0.5-) 1.0-1.5 (-2.0) mm wide; mature spikes 7-15 (-25) mm long; fertile bracts 5-7 mm long; leaf bases tan to brown (very rarely pinkish); old flowers often persisting on spikes, drying blackish ................................................................. X. jupicai

25 Leaves spreading-recurved to erect, 3-10 (-13) cm long, 1-4.5 mm wide; scapes 0.4-0.6 (-0.7) mm wide; mature spikes 3-7 (-12) mm long; fertile bracts 3-5 mm long; leaf bases various; old flowers fugacious, not persisting on spikes.

26 Leaves spreading-recurred to ascending, 2-4.5 mm wide; leaf bases pinkish or purplish; spikes 3-5 (-7) mm long, often abruptly acute; seeds 0.4-0.5 mm long, yellowish-amber................................................................. X. curtissii

26 Leaves ascending to erect, 1-2 mm wide; leaf bases tan to brown; spikes 3-7 (-12) mm long, blunter; seeds 0.3-0.4 mm long, reddish-brown to brown................................................................. X. species 1

Xyris ambigua Beyrich ex Kunth. Wet savannas and flatwoods, pinelands, edges of depression ponds. June-August. Se. VA south to s. FL, west to AL and ec. TX, primarily on the Coastal Plain; also West Indies (Cuba), and Mexico south into Central America. [= RAB, C, F, FNA, G, K, W, WH, X; < X. ambigua – GW, S, Z (also see X. louisianica)]

Xyris baldwiniana J.A. Schultes. Grassleaf Yellow-eyed Grass. Wet savannas, seepage bogs, sandhill seeps, wet savanna ecotones. June-July. Se. NC south to n. peninsular FL, west to s. AR and ec. TX, primarily on the Coastal Plain; also s. Mexico and Central America. [= RAB, FNA, GW, K, S, WH, X, Z]

Xyris brevifolia Michaux. Shortleaf Yellow-eyed Grass. Wet sands of pinelands, especially seasonally wet, open, white sands of spodosol longleaf pine flatwoods (Leon series soils), margins of Carolina bay sandridms. June-August. Se. NC south to s. FL, west to s. AL and w. FL; West Indies and South America. [= RAB, FNA, GW, K, WH, X, Z]

Xyris calcicola E.L. Bridges & Orzell. Limestone Yellow-eyed Grass. Wet calcareous savannas and flatwoods. August-November. C. and s. peninsular FL; disjunct in ne. FL (Baker County; Wunderlin & Hansen 2008). See Bridges & Orzell (2003) for detailed information. [= WH, X]

Xyris caroliniana Walter. Pineland Yellow-eyed Grass. Dry to moist pine flatwoods, moist savannas, scrub oak sandhills. June-July. Se. VA south to s. FL, west to se. TX, disjunct northward in s. NJ and in the West Indies (Cuba). White-petaled populations of X. caroliniana occurring in the East Gulf Coastal Plain need additional study. [= RAB, C, FNA, GW, K, WH, X, Z; > X. flexuosa Muhlenberg ex Elliott – F; > X. pallescens (C. Mohr) Small – S]

Xyris chapmanii E.L. Bridges & Orzell. Chapman's Yellow-eyed Grass. Sandhill seepage bogs in areas of copious lateral seepage in deep muck soils. Sc. NC south to Panhandle FL, west to e. TX. This taxon is abundantly distinct from X. scabridifolia. [= WH, X; < X. scabridifolia – FNA, K, Z]

Xyris drummondii Malme. Drummond's Yellow-eyed Grass. Wet pine flatwoods, ditches. Se. GA south to ne. FL, west to Panhandle FL and s. MS. [= FNA, GW, K, WH, X, Z]

Xyris elliotii Chapman. Elliot's Yellow-eyed Grass. Margins of drawdown zones of clay-based Carolina bays, limesinks and flatwoods swales, wet savannas. May-June. E. SC south to s. FL, west to s. AL; West Indies; South America. [= RAB, FNA, GW, K, S, WH, X, Z; > X. elliotii var. elliotii; > X. elliotii var. stenotera Malme]

Xyris fimbriata Elliott. Giant Yellow-eyed Grass. In mucky or sandy soils of upland depression ponds, also along sandhill streams, impoundments and in other dry muck of sandhills seepage slopes often just below the zone occupied by Xyris chapmanii. September-October. Se. VA south to c. peninsular FL, west (interruptedly) to se. TX; disjunct in s. NJ, DE, and c. TN. [= RAB, C, F, FNA, GW, K, S, WH, X, Z]

Xyris flabelliformis Chapman, Savanna Yellow-eyed Grass. Wet sands of pinelands, especially seasonally wet, open, white sands of spodosol longleaf pine flatwoods (Leon series soils), margins of Carolina bay sandridms. May-June. Se. NC south to s. FL, west to se. LA, on the Coastal Plain. [= RAB, FNA, GW, K, S, V, WH, X, Z]
Xyris floridana (Kral) E.L. Bridges & Orzell, Florida Yellow-eyed Grass. Savannas, wet pine flatwoods, ditches. August. Se. NC south to s. FL, west to se. LA; Central America. [= WH, X; Xyris diffinmis Chapman var. floridana Kral – FNA, GW, K, Z]

Xyris iridifolia Chapman, Irisleaf Yellow-eyed Grass. Marshes, upland pond margins, blackwater river channels, floodplain pools, other wet habitats. July-September. Se. VA south to ne. FL and FL Panhandle, west to e. TX; disjunct in c. TN and Mexico. [= RAB, C, GW, S, Z; = X. laxifolia Mart. var. iridifolia (Chapman) Kral – FNA, GW, K, WH, X]

Xyris isoetifolia Kral. Bogs, savannas, and depression pond margins. Endemic to FL Panhandle and s. AL. [= FNA, GW, K, WH, X, Z]

Xyris jupicai L.C. Richard. Ditches, various wet habitats. July-September. NJ south to s. FL, west to TN, AR, se. OK (Singhurst, Bridges, & Holmes 2007), and TX; Mexico, Central America, South America, West Indies. Sometimes weedy and considered by some to be adventive from further south. At least some populations in our area are native and may additionally be worthy of taxonomic recognition as distinct from "true" X. jupicai (P. McMillan, pers. comm., 2003). [= RAB, C, FNA, GW, K, W, WH, X, Z; = X. caroliniana – F, misapplied; > X. communis Kunth – S; > X. caroliniana – G, S, misapplied]

Xyris longisepala Kral. Depression pond margins. Endemic to FL Panhandle and s. AL. [= FNA, GW, K, WH, X, Z]

Xyris louisianica E.L. Bridges & Orzell. Pine savannas, bogs, ditches and disturbed areas. FL Panhandle and GA west to se. TX. [= K, WH, X; = X. stricta Chapman var. obscura Kral – FNA; < X. ambigua – GW, S, Z]

Xyris panacea L.C. Anderson & Kral, St. Marks Yellow-eyed Grass. Mucky depression ponds. Late June-early October. Endemic to FL Panhandle (Wakulla County). See Anderson & Kral (2008) for additional details.

Xyris scabrafolia R.M. Harper, Roughleaf Yellow-eyed Grass. Sandhill seepage bogs and wet pine savannas. Sc. and se. NC south to Panhandle FL, west to s. AL and s. MS; disjunct in sw. LA-se. TX. X. chapmanii is a taxon distinct from X. scabrafolia. [= GW, S, WH, X; < X. scabrafolia – FNA, K, Z (also see X. chapmanii)]

Xyris serotina Chapman. Depression meadows, ultisol savannas (Lynchburg/Rains complex or Eulonia/Okeetee), ditches. September. Se. NC south to c. peninsular FL, west to s. MS, in the Coastal Plain. [= RAB, FNA, GW, K, S, WH, X, Z]

Xyris smalliana Nash, Small's Yellow-eyed Grass. Pond margins, ditches. July-August. S. ME south to s. FL, west to s. MS; disjunct to se. TX; s. Mexico south into Central America; West Indies (Cuba). [= RAB, C, FNA, GW, K, S, W, WH, X, Z; > X. congdonii Small – F; > X. smalliana – F; > X. smalliana var. smalliana – G; > X. smalliana var. olneyi (Wood) Gleason – G]

Xyris spathifolia Kral & Moffett, Ketona Yellow-eyed Grass. Seeps over dolomite. See Kral & Moffett (2009) for additional information. {not yet keyed}

Xyris species 1. Wet savannas and pond margins. July-September. Currently known only from Sandhills Region and inner Coastal Plain of NC and SC, and outer Coastal Plain of NC.

Xyris stricta Chapman. Depression ponds, depression meadows, borrow pits, ultisol savannas and ditches. July-September. SC south to ne. FL and Panhandle FL, west to s. MS and se. LA. Reported for our area by Kral (1966b). P. McMillan (pers. comm.) reports this species from a number of locations in the outer Coastal Plain of NC and SC. [= GW, K, S, WH, X, Z; = X. stricta var. stricta – FNA]

**XYRIDACEAE**

**Xyris torta** J.M. Smith, Mountain Yellow-eyed Grass. Mountain bogs, marshes, ditches. June-August. NH west to WI, south to e. VA, e. NC, w. SC, c. GA, LA, OK, and TX. This is our only species of *Xyris* not strongly associated with the Coastal Plain. [= RAB, C, FNA, GW, K, S, W, WV, Z; > *X. torta* var. *macropoda* Fernald – F, G; > *X. torta* var. *torta* – F, G]

---

**95. ERIOCULAUCEAE** Palisot de Beauvois 1828 (Pipewort Family) [in POALES]

A family of about 10 genera and 1100 species, of tropical and warm temperate regions (few in cold temperate regions), especially America, and most diverse in n. South America. References: Kral in FNA (2000); Kral (1966c) = Z; Stützel in Kubitzki (1998b).

---

1 Scape pubescent, 10-110 cm tall at maturity; roots thickened, sepalate (not requiring magnification), unbranched; leaves with obvious air spaces; petals 2, fused below; stamens (3-) usually 4 (-6), the anthers black at maturity. ................................................................. *Eriocaulon*

2 Scape pubescent (in our species, or very rarely nearly glabrous), 6-40 cm tall at maturity; leaves lacking obvious air spaces; roots fibrous or spongy, not sepalate; petals 3 or absent; stamens 2-3, the anthers yellow at maturity.

---

1 Receptacle and/or base of flowers copiously hairy; some or most of perianth parts with chalk white hairs; heads overall appearing white, 5-20 mm in diameter when in full flower or fruit.

2 Heads hard (little compressed by a plant press and feeling hard and knotty when squeezed between finger and thumb); leaves green, the tip acute to obtuse; scape sheaths shorter than most leaves; involucral bracts straw-colored, the apex acute; receptacular bracteoles pale, the apex narrowly acuminate; pistillate flower petals adaxially glabrescent; terminal cells of club-shaped hairs of the perianth whitened, the basal cells often uncongested and transparent.

3 Leaves to 1 cm wide, with acute to rounded tip; heads 13-20 mm in diameter; [widespread in our area] .......................................................... *E. decangulare var. decangulare*

4 Heads soft (much flattened by a plant press, and easily compressed when fresh between finger and thumb); leaves pale green, the tip attenuate-subbate; scape sheaths longer than most leaves; involucral bracts gray or dark, the apex rounded or obtuse; receptacular bracteoles gray to dark gray, the apex acute; pistillate flower petals adaxially villous; all cells of club-shaped hairs on perianth whitened. 

5 Stamens 6; pistil 3-carpellate. .................................................................................................................. *E. cinereum*

6 Stamens 4; pistil 2-carpellate. .................................................................................................................. *E. decangulare var. latifolium*

---

2 Scape pubescent with glandular hairs (or a mixture of glandular and eglandular hairs); roots spongy, unbranched, pale; heads yellowish-tan or gray; leaves bluish green, narrowly linear to the abruptly flared base, stiff in texture ......................................................... *Lachnocaulon*

3 Scape pubescent with eglandular hairs; roots fibrous, branched, dark; heads white, gray, or brown; leaves bright green, tapering gradually through most of their lengths, herbaceous in texture ................................................................. *Syngonanthus*

---

*Eriocaulon* Linnaeus 1753 (Pipewort)

A genus of about 400 species, of tropical and warm temperate regions (few in cold temperate areas). References: Kral in FNA (2000); Kral (1966c) = Z; Gomes de Andrade et al. (2010); Stützel in Kubitzki (1998b). Key based on Kral in FNA (2000).

1 Receptacle and/or base of flowers copiously hairy; some or most of perianth parts with chalk white hairs; heads overall appearing white, 5-20 mm in diameter when in full flower or fruit.

2 Heads hard (little compressed by a plant press and feeling hard and knotty when squeezed between finger and thumb); leaves green, the tip acute to obtuse; scape sheaths shorter than most leaves; involucral bracts straw-colored, the apex acute; receptacular bracteoles pale, the apex narrowly acuminate; pistillate flower petals adaxially glabrescent; terminal cells of club-shaped hairs of the perianth whitened, the basal cells often uncongested and transparent.

3 Leaves to 1 cm wide, with acute to rounded tip; heads 13-20 mm in diameter; [widespread in our area] .......................................................... *E. decangulare var. decangulare*

4 Heads soft (much flattened by a plant press, and easily compressed when fresh between finger and thumb); leaves green, the tip attenuate-subbate; scape sheaths longer than most leaves; involucral bracts gray or dark, the apex rounded or obtuse; receptacular bracteoles gray to dark gray, the apex acute; pistillate flower petals adaxially villous; all cells of club-shaped hairs on perianth whitened.

5 Stamens 6; pistil 3-carpellate. .................................................................................................................. *E. cinereum*

6 Stamens 4; pistil 2-carpellate. .................................................................................................................. *E. decangulare var. latifolium*

---

2 Heads soft (much flattened by a plant press, and easily compressed when fresh between finger and thumb); leaves green, the tip attenuate-subbate; scape sheaths longer than most leaves; involucral bracts gray or dark, the apex rounded or obtuse; receptacular bracteoles gray to dark gray, the apex acute; pistillate flower petals adaxially villous; all cells of club-shaped hairs on perianth whitened.

4 Mature heads 10-20 mm in diameter; leaves 5-30 cm long; petals of staminate flowers conspicuously unequal; [plants primarily of seasonally flooded ponds] .......................................................... *E. compressum*

5 Stamens 6; pistil 3-carpellate. .................................................................................................................. *E. cinereum*

6 Stamens 4; pistil 2-carpellate. .................................................................................................................. *E. decangulare var. latifolium*

---

4 Mature heads 5-10 mm in diameter; leaves (1-) 2-5 (-7) cm long; petals of staminate flower nearly equal. ............................................................................ *E. texense*

1 Receptacle and/or base of flowers glabrous or sparingly hairy; receptacular bracteoles and/or perianth parts glabrous or hairy, the hairs club-shaped, clear or white; heads dark gray or white, 3-4 mm (*E. koernickianum, E. parkeri, and E. ravenelli*), or 4-10 mm (*E. aquaticum* and *E. lineare*) in diameter when in full flower or fruit.

5 Stamens 6; pistil 3-carpellate. .................................................................................................................. *E. cinereum*

6 Stamens 4; pistil 2-carpellate. .................................................................................................................. *E. decangulare var. latifolium*

---

4 Heads 3-4 mm in diameter when in full flower or fruit; outer involucral bracts neither reflexed nor obscured by bracteoles and flowers.

5 Bracts straw-colored, greenish, or light gray to gray, dull, the margins often erose or lacerate, the apex blunt to obtuse; [of tidal waters and large natural lakes of the outer Coastal Plain] .......................................................... *E. parkeri*

6 Bracts dark, gray to blackish, very shiny, the margins all nearly entire, the apex acute; [of moist acidic sites].

7 Bracts orbicular or broadly oblong, the apex rounded or apiculate; bract margins and apex hairy; perianth hairy; seed not pale-recticate .................................................................................................................. *E. koernickianum*

8 Bracts narrowly ovate to oblong or spatulate, the apex acute; bracts and perianth parts (except sometimes the petals) glabrous; seed conspicuously pale-recticate. ......................................................................................... *E. ravenelli*
**ERIOCAULACEAE**

**Eriocaulon aquaticum** (Hill) Druce, Seven-angled Pipewort. Ponds, lakes. July-October. NB and NL (Newfoundland) west to ON and MN, south to e. NC, VA, AL, and IN; also Great Britain and Ireland. The name *E. septangulare* is invalid. *E. aquaticum* is the correct name if the species is interpreted to include both northern European and northeastern North American plants. If North American plants are distinct from European, the correct name is *E. pellucidum*. [= C, FNA, K; > *E. pellucidum* Michaux – RAB; = *E. septangulare* Withering – F, G, GW, W, Z, invalid name]

* Eriocaulon compressum Lamarck. Ponds, lakes, other depressions, wetter places in pine flatwoods and pine savannas. April-October. NJ south to s. FL, west to e. TX. [= RAB, C, F, FNA, G, GW, K, S, WH, Z]

* Eriocaulon decangulare Linnaeus var. decangulare, Common Ten-angled Pipewort. Wet savannas and pine flatwoods, bogs, seasonally flooded ponds. June-October. NJ south to s. FL, west to sw. AR and e. TX; Mexico, Central America. [= FNA, K; < *E. decangulare* – RAB, C, F, G, GW, S, W, WH, Z]

* Eriocaulon decangulare Linnaeus var. latifolium Chapman ex Moldenke, Panhandle Pipewort. Seepage bogs. Restricted to Panhandle FL, s. AL, and s. MS. It appears to warrant taxonomic status, but needs additional study. [= FNA, K; < *E. decangulare* – GW, S, WH, Z]

* Eriocaulon koernickianum van Heurck & Müller of Aargau, Dwarf Pipewort. Seepage areas on granite flatrocks. W. AR and e. OK south to e. TX; disjunct in e. GA. See Watson et al. (2002) for information on variation within the species. [= FNA, K; = *E. kornickianum* – GW, orthographic variant]

* Eriocaulon lineare Small. Seepage bogs. Sw. GA south to c. peninsular FL, west to s. AL. It has been reported for NC (Kral in FNA 2000), but this is apparently in error. Kral & Sorrie (1998) proposed the conservation of the name *E. lineare* with a conserved type, as the designated type actually represents *E. texense*; this course was accepted by Brummitt (2005). [= FNA, GW, K, S, WH]

* Eriocaulon nigrobracteatum E.L. Bridges & Orzell, Dark-headed Hatpins. Seepage bogs. Endemic to the FL Panhandle (Bay, Calhoun, and Gulf counties). [= FNA, K, WH] [not yet keyed]

* Lachnocaulon Kunth 1841 (Bogbuttons)

A genus of 7 species, herbs, of se. North America and Cuba. Based on work of Gomes de Andrade et al. (2010), *Lachnocaulon* is likely to be included in the large and primarily neotropical genus *Paepalanthus* Martius. References: Kral in FNA (2000); Kral (1966c)=Z; Gomes de Andrade et al. (2010); Stützel in Kubitzki (1998b).

1 Trichomes at the tips of the receptacular bracts milky white, opaque, the head therefore appearing gray to white, obscuring the brown color of the bractlets.

2 Mature heads 4-7 mm across; seeds obviously longitudinally striate (as seen at 10× magnification)................................. *L. anceps*

2 Mature heads 3.5-4.0 mm across; seeds not obviously longitudinally striate, the striations obscure and very fine (not visible at 10× magnification)................................................................. *L. beyrichianum*

1 Trichomes at the tips of the receptacular bracts translucent, the head therefore showing the brown color of the bractlets.

3 Scape with ascending hairs........................................................................................................................................... *L. minus*

3 Scape glabrous.

4 Leaves 0.5-1 (-2) cm long; head light brown, usually globose; carpels 2........................................................................... *L. digynum*

4 Leaves 2-3 cm long; head reddish- or dark brown, usually elongate-cylindric; carpels 3....................................................... *L. engleri*
**Lachnocaulon anceps** (Walter) Morong, Common Bogbuttons. Moist to dry sands, moist peats, in pinelands, sometimes locally abundant in open disturbed areas where competition has been removed. May-October. S. NJ south to s. FL, west to se. TX; disjunct in ec. TN; West Indies (Cuba). [= RAB, C, F, FNA, G, GW, K, WH, Z; > L. anceps – S; > L. floridanum – S; > L. glabrum Körnick – S]

**Lachnocaulon beyrichianum** Sporleder ex Körnick, Southern Bogbutton. Upper margins of Coastal Plain doline ponds (sometimes under scrub oaks), flatwoods. May-September. Se. NC south to Panhandle FL and s. peninsular FL. [= RAB, FNA, GW, K, S, WH, Z]

**Lachnocaulon digynum** Körnick, Pineland Bogbutton. Pine savannas, bogs. Panhandle FL and s. AL west to TX. [= FNA, GW, K, S, WH, Z]

**Lachnocaulon engleri** Ruhland, Engler’s Bogbutton. Pondshores, pine savannas. N. FL peninsula south to s. FL; Panhandle FL and s. AL. [= FNA, GW, K, S, WH, Z]

**Lachnocaulon minus** (Chapman) Small, Brown Bogbutton. Upper margins of Coastal Plain doline ponds, other pineland situations. May-October. E. NC south to s. peninsular FL, west to Panhandle FL and se. AL. [= RAB, FNA, GW, K, WH, Z; > L. minus – S; > L. eciliatum Small – S]

**Syngonanthus** Ruhland 1900 (Yellow Hatpins)

A genus of about 200 species, primarily of tropical America, but some in Africa and Madagascar; ours is the only temperate species. References: Kral in FNA (2000); Kral (1966c)=Z; Gomes de Andrade et al. (2010); Stützel in Kubitzki (1998b).

**Syngonanthus flavidulus** (Michaux) Ruhland, Yellow Hatpins, Bantam-buttons. Pine savannas, pine flatwoods, borders of pineland ponds, and adjacent ditches. May-October. Se. NC south to s. FL, west to s. MS. [= RAB, FNA, GW, K, S, WH, Z]

**Mayaca** Aublet 1775 (Bogmoss)

**Mayaca fluviatilis** Aublet, Bogmoss. Cp (FL, GA, NC, SC): marshes, streams, swamp forests, shores of natural lakes, seepage areas, in saturated soil or variously submersed; common. May-July. Se. NC south to c. peninsular FL, west to se. TX; West Indies; Central America to South America. The two species previously recognized appear to be only different growth forms, induced by different hydrologic conditions. [= FNA, GW, K, WH, Z; > M. aubletii Michaux – RAB, S; > M. fluviatilis – RAB, S]

**96. MAYACACEAE** Kunth 1840 (Bogmoss Family) [in POALES]

A family of a single genus and 4-10 species, of tropical to warm temperate America and Africa. References: Faden in FNA (2000); Thieret (1975); Stevenson in Kubitzki (1998b).

**98. JUNCACEAE** A.L. de Jussieu 1789 (Rush Family) [in POALES]

A family of about 8 genera and 350-440 species, herbs (and a few shrubs), largely of temperate regions of the Old and New World. References: Brooks & Clemants in FNA (2000); Balslev in Kubitzki (1998b); Drábková et al. (2003).

1 Leaves terete or flat, glabrous (or scabrous); capsule with > 3 seeds; [often in wetlands].................................................Juncus
1 Leaves flat, pubescent; capsule with 3 seeds; [rarely in wetlands].................................................................Luzula

**Juncus** Linnaeus 1753 (Rush)
(by B.A. Sorrie and W.M. Knapp)

A genus of about 250-300 species, herbs, of cosmopolitan distribution. Drábková et al. (2003) indicate that *Juncus trifidus* may not be part of *Juncus*, and may be as closely related to *Luzula*. References: Brooks & Clemants in FNA (2000); Kirschner et al. (2002b, 2002c)=Y; Bridges & Orzell (2008); Clemants (1990); Balslev in Kubitzki (1998b); Zika (2003)=Z, Drábková et al. (2003); F; GW; RAB. The key based, in part, on those references.
subgenus Juncus, section Juncus: acutus ssp. leopoldii, roemerianus

subgenus Juncus, section Graminifolia: filipendulus, marginitus, biflorus, longi, repens

subgenus Juncus, section Irisridifolia: polycyphalus

subgenus Juncus, section Ozyphyllum: acuminatus, brachycarpus, brevicaudatus, caesarianus, caudenis, megacephalus, militaris, nodosus, paludosus, pelocarpus, subcaudatus, torreyi, trigonocarpus, validus var. validus

subgenus Agathryon, section Tenagea: bufonius var. bufonius

subgenus Agathryon, section Steirochloa: gerardii, coriaceus, [brachyphyllos], germanianus, secundus, dichotomus, tenuis, angustilatius, interior, dudleyi

subgenus Agathryon, section Juncotypus: gymnocarpus, [filiformis], inflexus, effusus var. solutus, pylaei, balticus

UNCERTAIN placement (perhaps not even a Juncus): tridens

Identification Notes: For identification of most rushes, it is important to collect plants with mature capsules and seeds. Stamen number is often a diagnostic character and can be determined after anthesis by counting the number of persistent filaments located behind the tepals. Care must be taken to collect specimens with uninjured heads, especially for the group of rushes in Key D; the long beaks of the capsules are often fragile and easily broken off.

1 Flowers borne singly on branches of inflorescence; leaves not spine-tipped; each flower subtended by two bracteoles in addition to bracteole A

1 Inflorescence appearing lateral; inflorescence bract erect, appearing to be a continuation of the culm. B

1 Leaf blades septate (sometimes obscure in dried specimens; if so, rest leaf on hard surface and run fingernail over it lengthwise). C

2 Mature seeds distinctly tailed with elongate appendages at each end (may be obscure in J. subcaudatus), seeds 0.7-2.5 mm long; [subgenus Juncus, section Ozyphyllum] D

2 Mature seeds without appendages, < 0.7 mm long. E

3 Flowers solitary (rarely up to 3) along branches of inflorescence; flowers often aborted; inflorescence diffuse, with slender flexuous branches; [subgenus Juncus, section Ozyphyllum] F

3 Flowers in heads (glomerules) of 3 or more; flowers seldom aborted; inflorescence various. G

KEY A

1 Flowers borne in heads (glomerules) of 2-6 flowers per head; leaves spine-tipped; single bracteole subtending glomerule present at base of pedicle; [plants of brackish habitats]; [subgenus Juncus, section Juncus] H

2 Capsule 3.5-5.5 mm long, obviously longer than the tepals; [subgenus Juncus, section Juncus] I

2 Capsule < 3.5 mm long, shorter than or nearly equaling the tepals; [subgenus Juncus, section Juncus] J

1 Flowers borne singly on branches of inflorescence; leaves not spine-tipped; each flower subtended by two bracteoles in addition to bracteole at base of pedicle; [plants of various habitats]. K

2 At least a few sheaths at base of plant with well developed blades; inflorescence bract channeled on one side; [subgenus Agathryon, section Steirochloa] L

2 Sheaths at base of plant bladeless; bract not channeled; [subgenus Agathryon, section Juncotypus] M

3 Culms well spaced along creeping rhizomes. N

4 Anthers shorter than filaments. O

5 Rhizomes 1.5-2 mm diameter; culms 1 mm diameter; inflorescence 3-12 flowered; [boreal, south to ne. WV] [J. filiformis] P

5 Rhizomes 2-4 mm diameter; culms 1.5-2.5 mm diameter; inflorescence 8-30+ flowered; [rare montane plant in NC and SC] Q

3 Culms coarsely grooved, with 10-20 ridges just below inflorescence, firm; perianth 2.7-3.6 mm long, sepals slightly exceeding petals and capsule. R

6 Perianth < 3/4 length of capsule; stamens 6 or 3. S

6 Perianth much shorter than capsule (about 1/3 as long); stamens 6; [rare montane plant in NC and SC] T

7 Capsules 3-4 mm long; stamens 6; [rare alien in piedmont and mountains of VA] U

7 Capsules 1.5-3.2 mm long; stamens 3; [widespread native]. V

8 Stems finely grooved, with 25-30 striations just below inflorescence, soft, easily compressed; perianth 1.9-2.8 mm long, sepals equaling petals. W

8 Stems finely grooved, with 25-30 striations just below inflorescence, soft, easily compressed; perianth 1.9-2.8 mm long, sepals equaling petals. X

KEY B

1 Flowers borne in heads (glomerules) of 2 or more, individual flowers not subtended by two bracteoles (in addition to the bracteole at the base of the pedicel); [subgenus Juncus, section Graminifolia]. Y

2 Perianth 6-10 mm long; plant aquatic, submerged and sterile or emersed/stranded and fertile; stems weak, creeping, mat-forming; [subgenus Juncus, section Juncus] Z

2 Perianth < 6 mm long; plant of uplands or wetland margins, never submerged; stems erect, never creeping or mat-forming. [subgenus Juncus, section Juncus] AA

3 Heads 1-5 (-10) per culm; [calcareae glades inland, east to GA and TN] [J. filipendulus] AB

3 Heads >9 per culm; [collectively widespread]. AC

4 Inflorescence usually congested, (1.8-) 2.4-4.7 (-6.4) cm long; greatest distance between adjacent rhizome cataphylls (5.3-) 6-10.5 (-13.0) mm; rhizome width (measured between adjacent cataphylls) (0.8-) 1.0-1.4 (-) mm. AD

4 Inflorescence usually loose, (1.4-) 17.9-103.9 (-145) cm long; greatest distance between adjacent rhizome cataphylls (0.1-) 0.4-3.0 (-4.6) mm; rhizome width (measured between adjacent cataphylls) (0.4-) 1.0-3.5 (-4.5) mm. AE

5 Widest leaf blade (2.6-) 3.1-4.5 (-5.4) mm wide; leaf of lowest leaf (3.2-) 4.3-7.8 (-9.7) cm long; tallest culm (27.2-) 50.8-81.2 (-100.7) cm; anthers (0.5-) 0.6-1.0 (-1.3) mm long, exserted; stem base (3.4-) 5.8-9.6 (-12.0) mm wide; [J. biflorus] AF

5 Widest leaf blade (2.6-) 3.1-4.5 (-5.4) mm wide; leaf of lowest leaf (3.2-) 4.3-7.8 (-9.7) cm long; tallest culm (27.2-) 50.8-81.2 (-100.7) cm; anthers (0.5-) 0.6-1.0 (-1.3) mm long, exserted; stem base (3.4-) 5.8-9.6 (-12.0) mm wide; [J. biflorus] AG

186
1 Mature capsules 2 mm or more longer than perianth, 4.0-5.2 mm long .............................................. J. marginatus

6 Plants annual, without coarse roots or persistent leaf bases; [subgenus Agathryon, section Tenageia] .................................................. J. bufonius

7 Leaves finely serrulate or scabrid; auricles deeply lacerate; [rare and local in high elevation "alpine" situations] ....................... J. trifidus

8 Auricles 3-6 mm long at summit of leaf sheath.
9 Capsules < 3/4 length of perianth, borne widely spaced along the usually diffuse branches of the inflorescence .............. J. anthelatus
10 Capsules > 3/4 length of perianth, borne congested on branches with internodes about as long as perianth ................. J. tenius

11 Leaf blades terete or channeled ......................................................................................................................... J. gerardii

12 Perianth obtuse apically; capsule chestnut brown or darker; [alien, ranging south to MD] ......................................... J. dichotomus

13 Inflorescence bract shorter than inflorescence; capsules 3-locular.
14 Perianth usually 2.5-3.5 mm long; flowers secund; capsules globose to ellipsoid ......................................................... J. secundus
15 Perianth acuminate, with narrow scarious margins .................................................................................................................. J. georgianus

16 Mature capsules pale brown or darker; [of the Coastal Plain] .................................................................................. J. dichotomus
17 Mature capsules pale tan or darker; [of prairies and plains, east to KY, se TN] .................................................. J. interior

KEY C

1 Culms and leaves scabrid, gray-green or blue-green; seeds 2.0-2.5 mm long ................................................................. J. caesariensis

2 Seeds 1.2-2.2 mm long, seed body ½ length of seed.
3 Mature capsules 3.0-4.0 mm long, < 1.5 mm longer than perianth, light reddish brown to light brown; heads 5-50 flowered .................................................. J. canadensis

4 Mature capsules 4.0-5.0 mm long, 2 mm longer than perianth, dark reddish purple; heads 3-7 flowered ...................... J. trigonocarpus

5 Inflorescence open, the branches widely spreading; mature capsules dark straw colored; heads 5-20 flowered ................. J. subcaudatus

KEY D

1 Leaves flattened, narrowly elliptic in cross-section.
2 Leaves with incomplete septae; heads about 10 mm diameter; tips of dehisced capsules united; [subgenus Juncus, section Iridifolii] ............................................................. J. polycephalus

3 Leaves with complete septae; heads about 12 mm diameter; tips of dehisced capsules split; [subgenus Juncus, section Ozophyllum] ............................................. J. validus var. validus

1 Leaves terete, not at all flattened; [subgenus Juncus, section Ozophyllum].
3 Plants with at least some short, hard, knotty rhizomes; tepals lanceolate-subulate.
4 Capsules shorter than the tepals, clearly included within the tepals at maturity.
5 Capsules equaling or exceeding the tepals, exserted from or only barely included within the tepals at maturity.
6 Capsule valves separating at the apex at maturity; stamens 6. 
7 Heads 6-20 flowered, 6-9 mm diameter; auricles cartilaginous, 0.5-1.0 mm long ......................................................... J. nodosus

8 Heads 25-100 flowered, 10-14 mm diameter; auricles membranous, 2.5-4.0 mm long ..................................................... J. torreyi

9 Capsule valves remaining united at the apex after dehiscence; stamens 3. 
10 Culms 4-6 mm in diameter near the base, usually > 80 cm tall; inflorescences usually > 15 cm tall, with > 25 heads; largest leaf blades > 25 cm long and > 3 mm in diameter ............................................. J. paludosus
11 Culms 1-3 mm in diameter near the base, usually < 80 cm tall, with < 25 heads; largest leaf blades < 25 cm long and 1-2 mm in diameter 
12 Uppermost cauline leaf blade non-septate, much shorter than its sheath; outer tepals significantly longer than the inner tepals .... J. brachycarpus

9 Heads lobulate; mature capsule 2.0-3.0 mm long ................................................................. J. scirpoides var. compositus
9 Heads spherical, not lobulate; mature capsule 3.0-4.5 mm long .............................................. J. scirpoides var. scirpoides

KEY E

1 Mature capsules 2 mm or more longer than perianth, 4.0-5.2 mm long ................................................................. J. diffusissimus
**Juncus acuminatus** Michaux. In damp soils. May-August. ME and NS to ON and MN, south to n. peninsular FL, TX, and n. Mexico; Honduras; BC to CA. [= RAB, C, F, FNA, G, GW, K, S, W, WH, WV, Y]

* Juncus articulatus* Linnaeus. Jointleaf Rush. Marshes, calcareous seepage wetlands, wet open ground. July-September. Nearly cosmopolitan; in North America from NL (Newfoundland) to AK, south to e. NC (Cape Hatteras, Dare County) (Sorrie & LeBlond 2008), s. WV, sw. VA, and CA. [= RAB, C, FNA, G, K, WV; > J. articulatus var. articulatus – F; > J. articulatus var. obtusatus Engelmann – F; = J. articulatus ssp. articulatus – Y]

* Juncus biflorus* Elliott. Pine savannas, pine flatwoods, mesic areas in sandhill-pocosin ecotones, roadsides, low fields in the Piedmont, wet meadows. June-October. MA to MO, west to FL, TX, Mexico and Central America, and disjunct in South America. See Knapp & Naczi (2008) for clarification of the *Juncus marginatus* complex. [= RAB, F, K, W, WV; < J. biflorus – C, G (also see J. longii); < J. marginatus – FNA, GW, WH, Y (also see J. biflorus and J. longii); = J. aristulatus Michaux var. *biflorus* (Elliott) Small – S]

* Juncus brachypyllus* Wiegand. Wet sandy areas. MO and KS, south to TX; MT, ID, and WA south to CA; disjunct in the Coastal Plain of w. TN. [= FNA, K, C, Y]  {not yet keyed}

* Juncus bufonius* Linnaeus, Toad Rush. Wet, open ground, roadsides, dried pools, drawdown shores. June-November. Cosmopolitan, and polymorphic; a number of varieties have sometimes been recognized, but need additional study. [= RAB, FNA, GW, S, W, WH, WV, Y; > J. bufonius var. *bufonius* – C, F, G, K]
**Juncus caesariensis** Coville, New Jersey Rush. Sphagnous seepages in the Coastal Plain of VA, seeps and bogs at low to moderate elevations in the Mountains of NC. July-October. Found in 1992 from a seepage bog in Clay County, NC, and in 1993 from a bog in Henderson County, NC, where associated with northern disjuncts. Rare throughout its range, it is known only from several sites in NJ, MD, VA, NC, and NS (Newell & Newell 1994). The scabrid leaf blades and large seeds quickly separate this species from the other long-tailed rushes. It should be looked for along seepage slopes and bogs in the alluvial sandhills and the outer Coastal Plain. [= C, F, FNA, G, K, Y]

**Juncus canadensis** J. Gay ex Laharpe, Canadian Rush. Lake, pond and stream margins, swamps, bogs, seepage slopes, wet meadows, ditches. July-October. NL (Newfoundland) to MN, south to c. peninsular FL, TN, and LA. *J. canadensis* is here treated as a single, polymorphic species. Fernald and others have described up to 5 forms and varieties of *J. canadensis*, based on variation in flower and capsule size (from 2.5 mm to nearly 4.0 mm), shape of the glomerules (densely flowered and subglobose to few-flowered and turbinate), and structure and size of the inflorescence (congested to open). Further study is necessary to determine whether any of these taxa should be recognized. [= RAB, C, FNA, G, GW, K, S, W, WH, WV, Y; > J. canadensis var. canadensis – F; > J. canadensis var. euroauster Fernald – F] * = Juncus capitatus Weigel. Reported for n. AL (Kartesz 1999); rejected by Kral et al. (2010). [= K] [rejected: not keybed]

**Juncus compressus** Jacquin. Disturbed ground, ditches, in saline or alkaline soils; native of Europe. NS to ON, south to MD, PA, w. NY, MI, WS, and sporadically distributed westward in high elevations. [= FNA, C, F, FNA, G, K, Y]

**Juncus debilis** A. Gray, Weak Rush. Marshy shores, stream and pond margins, along puddles in wet, disturbed clearings, ditches. May-August. RI to MO, south to n. FL and e. TX; Honduras. [= RAB, C, F, FNA, G, GW, K, S, W, WH, Y]

**Juncus dichotomus** Elliott. Often in disturbed, open, wet areas, ditches, wet meadows. June-October. MA to c. peninsular FL, west to OK and TX; Central America. The character used to separate *J. platyphyllus* (Wiegand) Fernald from *J. dichotomus* (flat leaf blade vs. terete leaf blade) does not appear to be reliable; leaf blades from culms in the same clump may vary from flat to slightly involute to completely terete. [= FNA, GW, W, WV, Y; > J. dichotomus – RAB, F; > J. platyphyllus (Wiegand) Fernald – RAB, F; = J. tenuis var. dichotomus (Elliott) A. Wood – C; > J. dichotomus var. dichotomus – G, K, S; > J. dichotomus var. platyphyllus Wiegand – G, K, S]

**Juncus diffusissimus** Buckley, Diffuse Rush, Slim-pod Rush. Low, wet open areas, ditches, margins of ponds and streams. May-September. Mostly Coastal Plain from se. VA to c. peninsular FL, west to e. and nc. TX; also s. IN to MO, KA, OK, TN, and KY. [= RAB, C, F, FNA, G, GW, K, W, WH, WV, Y]

**Juncus effusus** Linnaeus ssp. solutus (Fernald & Wiegand) Hämert-Ahti, Common Rush, Soft Rush. Moist soil, marshes, margin of streams, ponds, lakes and swamps, low meadows. June-September. NL (Newfoundland) to MN, south to s. FL and Mexico. Ssp. *effusus* is European, and also occurs (allegedly introduced) in the ne. United States. [= WH, Y; Z; < J. effusus – RAB, FNA, GW, S, W; = J. effusus Linnaeus var. solutus Fernald & Wiegand – C; > J. effusus Linnaeus var. solutus Fernald & Wiegand – F, K; > J. griscemii Fernald – F; G; > J. effusus Linnaeus var. solutus Fernald & Wiegand – G (also see J. pylaee); > J. effusus var. compactus – G, misapplied; > Juncus effusus Linnaeus var. conglomeratus (Linnaeus) Engelmann – K]

**Juncus eliotii** Chapman, Elliott's Rush. Margins of ponds and lakes, depressions in savannas and flatwoods, wet, disturbed clearings, roadside ditches. May-September. Coastal Plain, DE to c. peninsular FL, west to se. TX. Capsules of *J. eliotii* are similar in shape to *J. acuminatus*, but the presence of tubiferous roots, shorter perianth (2.0–2.5 mm long vs. 2.5–3.5 mm) and fewer-flowered glomerules (3–8 flowered vs. 5-many flowered) clearly distinguishes *J. eliotii* from *J. acuminatus*. [= RAB, C, F, FNA, G, GW, S, WH, Y; > J. eliotii var. eliotii – K; > J. eliotii var. polyanthemus C. Mohr – K]

**Juncus filiformis** Linnaeus, Thread Rush. Bogs, wet acid areas. June-August. Circumboreal, south in North America to e. PA, w. PA, ne. WV, n. MI, and n. MN. [= C, F, FNA, G, K]
Juncus filipendulus – Buckley, Texas Plains Rush. Prairies, limestone barrens. KY, TN, and AL west to OK and TX. [= FNA, GW, K, S, Y]

Juncus gymnocarpus – Coville, Seep Rush. Bogs, seeps, streambanks. July-September. Local, mountains of e. PA, w. NC, e. TN, nw. SC and ne. GA, Coastal Plain of se. AL, s. MS (Sorrie & Leonard 1999), and w. Panhandle FL. In the Appalachians, J. gymnocarpus is scattered in mountain bogs and seeps throughout the mountain region; it reaches its most general occurrence in the escarpment gorge region of Transylvania, Macon, and Jackson counties, NC, where it also occurs along streambanks, especially in the vicinity of waterfalls. [= RAB, C, F, FNA, G, GW, K, S, W, WH, Y]

Juncus interior – Wiegang. Prairies, disturbed sites. OH west to SK, south to e. TN, AL (Sorrie & LeBlond 2008), MS (Sorrie & LeBlond 2008), LA, TX, and NM. Also reported for VA and NC (Kartesz 1999); the NC report is based on a misidentified specimen. {further investigate} [= FNA, G, S, W, Y; > J. interior var. interior – K; < J. tenuis Willdenow var. tenuis – C; < J. tenuis – GW]

Juncus longii – Fernald. Usually in very wet, often inundated sites, bogs, ditches, rooting in clay or peat. June-August. MD south through VA, NC, SC to s. MS, mainly in the Coastal Plain; disjunct inland in boggy sites, as in w. NC, nc. GA, TN, and n. AL (Knapp & Naczi 2008, 2008; see Knapp & Naczi 2008 for clarification of the Juncus marginatus complex. [= RAB, F, K; < J. biflorus – C; G; < J. marginatus – FNA, GW, Y (also see J. biflorus and J. longii); = J. aristulatus Michaux var. aristulatus – S]

Juncus nodatus – Coville. Shallow water, marshes, sloughs, savannas, bogs. KY west to KS, south to TN, AL, w. Panhandle FL, MS (Sorrie & LeBlond 2008), LA, and TX. [= FNA, C, G, GW, K, Y; ? J. robustus, preoccupied] {synonymy incomplete}

Juncus nodosus – Linnaeus. Swamps, streamside. July-August. NL (Newfoundland) to BC, south to DE, w. VA, WV, IN, MO, TX, and CA. [= C, F, FNA, G, GW, Y; > J. nodosus var. nodosus – K]

Juncus paludosus – E.L. Bridges & Orzell. Hardwood swamps, cypress swamps and stringers with seasonally flowing water, adjacent ditches. April-May; May-July. Ne. FL and e. FL Panhandle south to s. FL. See Bridges & Orzell (2008) for more detailed information.

Juncus pelocarpus – E. Meyer. Ditches, along pond and stream margins, seepage slopes, disturbed open areas, sea-level fens, interdunal swales, Atlantic white-cedar swamps. July-October. NL (Labrador) west to MN, south to DE, e. VA, n. IN; se. VA to SC; FL Panhandle and s. AL. The seepage along the narrow leaf blades of J. pelocarpus are often difficult to detect. More southern populations (from VA southwards) are more robust and have sometimes been separated as J. abortivus, but variation appears to be clinal. [= FNA, WH, Y; > J. pelocarpus – K; > J. pelocarpus var. pelocarpus – C, F, G; > J. abortivus Chapman – RAB, F, GW, K, S; > J. pelocarpus E. Meyer var. crassicaudex Engelmann – C, F, G]

Juncus interior – Wiegang. Prairies, disturbed sites. OH west to SK, south to e. TN, AL (Sorrie & LeBlond 2008), MS (Sorrie & LeBlond 2008), LA, TX, and NM. Also reported for VA and NC (Kartesz 1999); the NC report is based on a misidentified specimen. {further investigate} [= FNA, G, S, W, Y; > J. interior var. interior – K; < J. tenuis Willdenow var. tenuis – C; < J. tenuis – GW]

Juncus longii – Fernald. Usually in very wet, often inundated sites, bogs, ditches, rooting in clay or peat. June-August. MD south through VA, NC, SC to s. MS, mainly in the Coastal Plain; disjunct inland in boggy sites, as in w. NC, nc. GA, TN, and n. AL (Knapp & Naczi 2008, 2008; see Knapp & Naczi 2008 for clarification of the Juncus marginatus complex. [= RAB, F, K; < J. biflorus – C; G; < J. marginatus – FNA, GW, Y (also see J. biflorus and J. longii); = J. aristulatus Michaux var. aristulatus – S]

Juncus nodatus – Coville. Shallow water, marshes, sloughs, savannas, bogs. KY west to KS, south to TN, AL, w. Panhandle FL, MS (Sorrie & LeBlond 2008), LA, and TX. [= FNA, C, G, GW, K, Y; ? J. robustus, preoccupied] {synonymy incomplete}

Juncus nodosus – Linnaeus. Swamps, streamside. July-August. NL (Newfoundland) to BC, south to DE, w. VA, WV, IN, MO, TX, and CA. [= C, F, FNA, G, GW, Y; > J. nodosus var. nodosus – K]

Juncus paludosus – E.L. Bridges & Orzell. Hardwood swamps, cypress swamps and stringers with seasonally flowing water, adjacent ditches. April-May; May-July. Ne. FL and e. FL Panhandle south to s. FL. See Bridges & Orzell (2008) for more detailed information.

Juncus pelocarpus – E. Meyer. Ditches, along pond and stream margins, seepage slopes, disturbed open areas, sea-level fens, interdunal swales, Atlantic white-cedar swamps. July-October. NL (Labrador) west to MN, south to DE, e. VA, n. IN; se. VA to SC; FL Panhandle and s. AL. The seepage along the narrow leaf blades of J. pelocarpus are often difficult to detect. More southern populations (from VA southwards) are more robust and have sometimes been separated as J. abortivus, but variation appears to be clinal. [= FNA, WH, Y; > J. pelocarpus – K; > J. pelocarpus var. pelocarpus – C, F, G; > J. abortivus Chapman – RAB, F, GW, K, S; > J. pelocarpus E. Meyer var. crassicaudex Engelmann – C, F, G]
**Juncus polycephalus** Michaux, Many-headed Rush. Sandy pond margins, ditches, savannas. July-September. Coastal Plain, NC to s. FL, west to e. TX. [= WH = *Juncus polycephalus* – RAB, F, FNA, GW, K, S, Y; orthographic variant]

**Juncus pylaei** Laharpe, Common Rush. Moist soil, marshes, margin of streams, ponds, lakes and swamps, low meadows (overlooked and probably more widespread and common than shown). June-September. Throughout eastern North America, south to NC and SC. [= C, K, Y, Z; < *J. effusus* – RAB, FNA, GW, S, W; > *J. effusus* var. *costatus* St. John – F; > *J. effusus* Linnaeus var. *pylaei* (Laharpe) Fernald & Wiegand – F; < *J. effusus* Linnaeus var. *solutus* Fernald & Wiegand – G]

**Juncus repens** Michaux, Creeping Rush. Streams, ponds, lakes, ditches, wet depressions in flatwoods, cypress savannas. June-October. DE to s. FL, west to TX, north into OK and TN; Mexico (Tabasco); Cuba. This species commonly forms dense mats – a useful field character. [= RAB, C, F, FNA, G, GW, K, S, WH, Y]

**Juncus roemerianus** Scheele, Black Needle Rush. Coastal tidal marshes, forming dense stands at and above mean high tide, above the *Spartina alterniflora* zone. January-June; May-October. MD to s. FL, west to se. TX. See Eleuterius (1977) for additional information on this species. [= RAB, C, F, FNA, G, GW, K, S, WH, Y]

**Juncus scirpoides** Lamarck var. *scirpoides*. Wet, open, disturbed areas, ditches, sandhill pocosin ecotones and seepage bogs, savannas and wet pine flatwoods, wet meadows. June-October. S. NY to s. FL, mostly Coastal Plain and Piedmont; west to TX; IN to MI, MO, OK. [= F, S; < *J. scirpoides* – RAB, C, FNA, G, GW, K, WH, WV, Y]

**Juncus secundus** Beauvois ex Poiret. Dry fields, rock outcrops. June-October. ME to IN, south to e. OK, n. AL, and n. GA. [= RAB, C, F, FNA, G, K, S, Y, WV, Y]

**Juncus subcaudatus** (Engelmann) Coville & Blake, Somewhat-tailed Rush. Bogs, mossy woods and other wet places. July-October. NS to NY, southwest to MO and southeast to GA. *J. subcaudatus* is one of the more difficult rushes to identify. Although it is grouped with *J. canadensis*, *J. brevicaudatus*, and the other long-tailed rushes, its seeds lack distinct, long appendages. In general appearance it matches *J. acuminatus* quite well; mature seed size and mature capsule size (*J. subcaudatus* capsules are generally well exserted above the perianth, while *J. acuminatus* capsules are equal to only slightly exserted above the capsule) need to be examined in order not to confuse the two taxa. [= RAB, C, FNA, G, W, WV, Y; > *J. subcaudatus* var. *subcaudatus* – F, K]

**Juncus tenuis** Willdenow, Path Rush. Dry or moist soil along roadsides and paths, fields. June-September. NL (Labrador) west to AK, south to FL, TX, CA, and n. Mexico; Central and South America; introduced widely around the world. *J. tenuis* as it is here treated includes *J. tenuis* var. williamsi Fernald, which has a more congested inflorescence with arched to recurved inflorescence branches. [= FNA, Y; < *J. tenuis* – RAB, G, GW, K, S, W, WH; < *J. tenuis* var. *tenuis* – C; > *J. tenuis* var. *tenuis* – F, WV; > *J. tenuis* var. *williamsi* Fernald – F]

**Juncus trifidus** Linnaeus, Highland Rush. Rock crevices at high elevations, on greenstone, mica schist, amphibolite, hornblende gneiss, and quartzitic sandstone. June-September. The species is circumboreal, occurring in arctic-alpine situations in n. Europe and n. North America where it ranges from NL (Newfoundland) to QC, south to s. New England and NY; disjunct in VA (Stony Man, Page County) and NC (Craggy Pinnacle, Craggy Dome, and Craggy Gardens, Buncombe County; Eagle Cliff, Mitchell County; Three Top Mountain, Ashe County), and WV (North Fork Mountain, Pendleton County). As with many circumboreal species of polymorphic nature, there is disagreement over the recognition of infraspecific taxa. Var. *monanthos* (Jaqcumin) Bluff & Fingerhuth or ssp. *monanthos* (Jaqcumin) Aeschorn & Graebner has often been applied to e. North America *J. trifidus*, but should apply (if considered valid at all) only to *J. trifidus* of limestone areas of Europe. Although Hämet-Ahti (1980) correctly showed that Appalachian *J. trifidus* (from acidic and mafic gneisses and schists) does not belong to *J. monanthos* (*J. trifidus* ssp. *monanthos*, *J. trifidus* var. *monanthos*), her treatment of Appalachian plants as ssp. *carolinianus* Hämet-Ahti has been controversial. This treatment follows Clements (1990), who concludes that the primarily vegetative characters used to separate Appalachian plants from the European (blade lengths and relative positions) are too variable to warrant recognition of subspecies or varieties in the taxon. Further study is warranted. [= Y; < *J. trifidus* – FNA, S; > *J. trifidus* var. *monanthos* (Jaqcumin) Bluff & Fingerhuth – RAB, F, G, W, misapplied; > *J. trifidus* ssp. *carolinianus* Hämet-Ahti – C, K]
**Juncus trigonocarpus** Steudel. Seepage slopes, bogs, along stream margins, ditches. July-October. Coastal Plain, NC to FL Panhandle, west to e. TX. Young *J. trigonocarpus* and *J. canadensis* are often confused; once mature, however, the two can usually be separated by capsule color alone. Although *J. canadensis* capsules redden, they never approach the dark reddish-purple tone of *J. trigonocarpus*. Seed and capsule size are also distinct for the two taxa. [= RAB, FNA, GW, K, S, WH, Y]

**Juncus validus** Coville var. validus. Vigorous Rush. Stream and pond margins, roadside ditches, wet, open, often disturbed ground. July-September. NC to n. FL, west to TX, OK and MO. Var. *fascinatus* M.C. Johnston is endemic to TX. [= FNA, K, Y; < *J. validus* – RAB, C, F, G, GW, S, W, WH]

1 Flowers borne singly; inflorescences branched or unbranched; [subgenus *Pterodes*].
2 Inflorescences simple, with an occasional pedicel branching from the base of a flower; apical appendages of seeds 0.6-1.5 (-2.1) mm long; seed/appendage length ratio 0.8-1.7 ................................................................. *L. acuminata* var. *acuminata*
3 Inflorescences usually branching, the pedicels commonly paired; apical appendages of seeds 0.4-1.1 mm long; seed/appendage length ratio 1.0-2.8 ................................................................. *L. multiflora* var. *carolinae*

1 Flowers borne in dense glomerate clusters (glomerules); inflorescences spikelike or umbellate; [subgenus *Luzula*, section *Luzula*].
3 Inflorescence branches divergent, at least some widely spreading; glomerules often cylindric (less commonly merely capitate).
4 Seeds 0.9-1.3 mm long; caruncle 0.5-0.7 mm long; plants producing several basal bulblets (white swollen leaf bases) ........ *L. bulbosa*

Luzula A.P. de Candolle 1805 (Wood-rush)

1 Flowers borne singly; inflorescences branched or unbranched; [subgenus *Pterodes*].
2 Inflorescences simple, with an occasional pedicel branching from the base of a flower; apical appendages of seeds 0.6-1.5 (-2.1) mm long; seed/appendage length ratio 0.8-1.7 ................................................................. *L. acuminata* var. *acuminata*
3 Inflorescences usually branching, the pedicels commonly paired; apical appendages of seeds 0.4-1.1 mm long; seed/appendage length ratio 1.0-2.8 ................................................................. *L. multiflora* var. *carolinae*

1 Flowers borne in dense glomerate clusters (glomerules); inflorescences spikelike or umbellate; [subgenus *Luzula*, section *Luzula*].
3 Inflorescence branches divergent, at least some widely spreading; glomerules often cylindric (less commonly merely capitate).
4 Seeds 0.9-1.3 mm long; caruncle 0.5-0.7 mm long; plants producing several basal bulblets (white swollen leaf bases) ........ *L. bulbosa*

99. **CYPERACEAE** A.L. de Jussieu 1789 (Sedge Family) [in POALES]

A family of about 100 genera and 5000 species, mostly herbs, cosmopolitan. References: Ball, Reznicek, & Murray in FNA (2002b); Tucker (1987); Goetzhebeur in Kubitzki (1998b).

1 Achene enclosed in a perigynium (a sac-like structure); [subfamily *Caricoideae*, tribe *Cariceae*] ......................................................... *Carex*
1 Achene not enclosed in a perigynium.
### Cyperaceae

1 Ventral summit of leaf sheaths truncate or concave, the nerves destined for the leaf margins diverging gradually .......................................................... Ventral summit of leaf sheaths convex, the nerves destined for the leaf margins diverging abruptly, making a nearly right-angle bend.

2 Bristles mostly equaling to surpassing the distinctly trigonous achene ................................................................................................................. B. flavidus

3 Inflorescence terminal, more-or-less scapose (though immediately subtended by leafy bracts); leaves predominantly basal, not 3-ranked; perianth absent (Cyperus and Kyllinga) or present (Schoenus); [tribe Cyperoideae] ............................................................................................................. Schoenus

4 Perianth bristles present ......................................................................................................................................................................................... Kyllinga

5 Inflorescences branched; spikelets 1-many-flowered; rachilla elongate; scales broadly rounded ........................................................................... Cyperus

6 Inflorescences unbranched (the spikelets sessile); spikelets 1-2-flowered; rachilla not or only slightly elongate; scales conspicuously keeled ................................................................................................................................................. Eleocharis

7 Style base persistent as a differentiated tubercle (this small and inconspicuous in Bulbostylis and some spp. of Rhynchospora). 

8 Leaves consisting of bladeless sheaths; spikelet 1 per stem, (very rarely proliferating and with > 1 spikelet); [tribe Eleocharideae] ......................................................................................................................................................... Eleocharis

9 Perianth bristles absent; spikelets several-many-flowered; leaves capillary; [tribe Abildgaardiae] ................................................................. Bulbostylis

10 Achene (when ripe) bony and white; style base persistent on the summit of the achene, forming a differently-textured or differently-colored tubercle; spikelets all imperfect, the pistillate ones 1-flowered, the staminate ones several-flowered; [tribal Scleroideae, tribe Schoeneae] .............................................................................................................................. Schoenus

11 Involucral bracts 1-3, the lowest erect, appearing like a continuation of the culm, the inflorescence therefore appearing lateral. 

12 Achenes 0.5-0.7 mm long, 1.8-3× as long as wide, minutely papillose in longitudinal lines; [tribe Cyperoideae] .......... Lipocarpha

13 Achenes transversely rugose; [tribe Fuirenae] ......................................................................................................................................................... Schoenoplectus erectus

14 Spikelets in a loose cluster (not spherical) ......................................................................................................................................................... Isolepis

15 Plants moderate to very robust, 7-30 dm tall; leaves 30-150 cm long, 1.5-15 mm wide; [tribe Schoeneae] .......................................................... Cladium

16 Flowers several-many per spikelet. 

17 Style fimbriate; leaves 0.5-5 mm wide; [tribe Abildgaardiae] ............................................................................................................................ Fimbristylis

18 Achene not subtended by a modified perianth of bristles or scales (in addition to the scales of the spikelets).

19 Involucral bracts 1-3, the lowest erect, appearing like a continuation of the culm, the inflorescence therefore appearing lateral. 

20 Bristles 10-many, > 5× as long as the achene, white to tawny, straight; [tribe Scirpeae] ................................................................................................. Eriophorum

21 Involucral bracts lacking, or consisting only of the slightly modified basal scales of the solitary and terminal spikelet; [of hillsides, upland forests, or cliffs; never (in our area) in marshes, bogs, or streambeds]; [tribe Scirpeae] .......... Trichophorum

22 Main involucral bract 1 (rarely 2), erect, appearing as a continuation of the culm (the inflorescence thus appearing lateral), though in some species the longer inflorescence branches may overtop the bract; [tribe Fuirenae] ................................................................................................................................. Schoenoplectus

23 Spikelets 2.5-19 mm long, 2-4 mm in diameter, usually > 50 per culm; [tribe Scirpeae] ...................................................................................... Bolboschoenus

24 Spikelets 10-40 mm long, 6-12 mm in diameter, 3-50 per culm; [tribe Scirpeae] ................................................................................................. Cyperus

### Bolboschoenus Palla 1905 (Bulrush)

A genus of about 10-16 species, herbs, cosmopolitan. The distinction of this genus from Schoenoplectus is uncertain and controversial; it is generally accepted in the Old World, and generally not in the New World. References: Smith in FNA (2002b), Strong (1994)–Z, Goetghbeur in Kubitzki (1998b).

1 Ventral summit of leaf sheaths truncate or concave, the nerves destined for the leaf margins diverging gradually .......................................................... B. martimimus ssp. paludosus

2 Bristles shorter than to equaling the lenticular or plano-convex achene.
Bolboschoenus maritimus (Torrey) Sojak, River Bulrush. Tidal and river marshes. June-early July; July-August. NB west to SK, BC (Vancouver Island) and WA, south to VA, KY, TN, s. AL, OH, IN, KS, AZ, and CA; Asia; Australia and New Zealand. [= FNA; = Scirpus maritimus (Torrey) A. Gray – C, F, G; = Schoenoplectus maritimus (Linnaeus) Lyne – K, Z]

Bolboschoenus robustus (Pursh) Sojak, Salt-marsh Bulrush. Brackish marshes. Late May-June (-September); late June-September. Along the coasts, from NS to s. FL, west to TX, and into tropical America; also in CA. [= FNA; = Scirpus robustus Pursh – RAB, C, F, GW, S, W, WH; = Scirpus robustus var. robustus – G; = Schoenoplectus robustus (Pursh) M.T. Strong – K, Z]

Bulbostylis Kunth (Hairsedge)

A genus of about 100 species, herbs, of tropical and warm temperate areas, concentrated especially in tropical Africa and tropical South America. References: Kral (1971)–Z; Kral in FNA (2002b); Goethgeber in Kubitzki (1998b).

1 Spikelets sessile, the inflorescence therefore a capitate cluster (sometimes a few spikelets pedicellate, but the pedicels not generally longer than the spikelets, the inflorescence still appearing glomerate).

2 Inflorescence bracts widened abruptly at its base, the widened portion prominently fimbriate-pectinate; perennial, culms 5-35 cm tall; achene 0.5-0.6 mm long, finely reticulate; spikelet scales usually reddish-brown, lustrous, smooth or nearly so ........................................ B. capillaris

3 Inflorescence bracts numerous and conspicuous, several much exceeding the cluster of spikelets; achenes 0.8-1.2 mm long, transversely rugose; spikelet scales usually greenish or pale brown, dull, puberulent........................................ B. isopoda

5 Annual, to 1-2 (-3) dm tall; inflorescence a simple (rarely compound) umbel of few (3-9) lance-ovoid spikelets; longest involucral bract seldom exceeding the inflorescence; leaf margins usually hispidulous ................................................................. B. ciliatifolia

5 Perennial, to 1.5-4 dm tall; inflorescence a compound (rarely simple) umbel of many (8-30) oblong or lance-linear spikelets; longest involucral bract commonly exceeding the inflorescence; leaf margins usually distinctly tuberculate-scabrid................................. B. coarctata

Bulbostylis capillaris (Linnaeus) Kunth ex C.B. Clarke, Common Hairsedge. Thin soils on rock outcrops, especially granite domes and granite flat tops (but also on mafic rocks, such as diabase), sandy soils, fields, bogs (in FL). July-October. ME to MN, south to Panhandle FL and TX, and west to AZ and CA, also in Mexico, Central America, the West Indies, and s. Asia. This species frequently has a mixture of long and very short culms, the short culms only a few cm long and thus nearly hidden amongst the leaves. [= RAB, C, FNA, G, GW, W, WH, Z; = B. capillaris var. capillaris – F; = B. capillaris var. crebra Fernald – F; = B. capillaris var. isopoda Fernald – F; = B. capillaris sp. capillaris – K; = Stenophyllus capillaris (Linnaeus) Britton – S]

Bulbostylis ciliatifolia (Elliott) Fernald, Savanna Hairsedge. Moist to wet sands of savannas, roadsides, disturbed areas. July-October. Se. VA south to s. FL and west to s. AL. Kral (1971) describes this plant as occurring in generally wetter habitats and being much weedier than B. coarctata. The sympathy of this taxon and B. coarctata suggests that they are best recognized as species. [= F, G = Bulbostylis ciliatifolia (Elliott) Fernald var. ciliatifolia – C, FNA, GW, K, Z; = B. ciliatifolia – RAB, WH (also see B. coarctata); = Stenophyllus ciliatifolius (Elliott) C. Mohr – S]

Bulbostylis coarctata (Elliott) Fernald, Elliott's Hairsedge. Sandhills, usually associated with longleaf pine and wiregrass. July-October. Se. VA south to s. FL and west to e. TX, north in the interior to sw. TN; Cuba. [= F, G = Bulbostylis ciliatifolia
A genus of about 2000 (or more) species, herbs, cosmopolitan, especially temperate and boreal. References: Mackenzie (1931-1935)=M; Ball & Reznicek in FNA (2002b); Goetghebeur in Kubitzki (1998b); Frye & Lea (2001). Key to sections adapted closely from FNA.

Key to the keys to the sections of Carex

1 Spike 1 per culm, all flowers attached to the main stem in a terminal spike ................................................................. Key A
1 Spikes 2 or more per culm (some flowers in lateral spikes)
   2 All flowers staminate...................................................................................................................................................... Key B
   2 At least some flowers pistillate.
      3 Stigmas 2; achenes flat or biconvex in cross-section (lenticular) ................................................................................... Key C
      3 Stigmas (2-) 3 (-4); achenes trigonous or terete in cross-section.
         4 Body of perigynium pubescent, scabrous, hispid, or papillose (if papillose, the papillae longer than wide).................. Key D
         4 Body of perigynium glabrous or papillose (if papillose the papillae shorter than wide).
            5 Bracts sheathless or with sheath < 4 mm long (rarely longer, and then the sheath shorter than the diameter of the stem)...... Key E
            5 Bracts (at least the lower) with sheath > 4 mm long (and longer than the diameter of the stem) ...... Key F [not complete at this time]

Key A

1 Leaf blades 20-60 mm wide, without a midrib (with 40-100 parallel nerves all of equal prominence), leathery, the apex obtuse; leaf margin scarious, minutely crisp-tubed (feeling scaberulous to the touch) ................................................................. C. fraseriana
1 Leaf blades 0.5-25 (-52) mm wide, with a midrib, herbaceous, the apex acute; leaf margin various (smooth or scabrous, but not as described below).
   2 Spike entirely staminate
      3 Culms distinctly red or purple at the base .................................................................................................................... C. picta in Section 41: Pictae
      3 Culms yellow to brown or black, without red or purple coloration.
         4 Culms shorter than the leaves; widest leaf blades > 2 mm wide .................................................................................. Section 44: Phyllostachyae
         4 Culms longer than the leaves; widest leaf blades < 2 mm wide ........................................................................ Section 41: Stellulatae
   2 Spike pistillate or with both pistillate and staminate flowers.
      5 Stigmas 2; achenes lenticular ......................................................................................................................................... C. exilis in Section 11: Stellulatae
      5 Stigmas 3; achenes trigonous.
         6 Perigynia pubescent near the tip ....................................................................................................................... C. picta in Section 41: Pictae
         6 Perigynia glabrous.
            7 Spikes gynoecandrous; beck of perigynium with apical teeth > 0.3 mm long .................................................. C. squarrosa in Section 34: Squarrosae
            7 Spikes androgyneous or entirely pistillate; beck of perigynium with apex entire, emarginate, or with teeth < 0.2 mm long.
               8 Lower pistillate scales > 10 mm long ..................................................................................................................... Section 44: Phyllostachyae
               8 Lower pistillate scales < 10 mm long.
                  9 Perigynium beak > 2 mm long, as long as or longer than the perigynium body ................................................ Section 44: Phyllostachyae
                  9 Perigynium beak < 2 mm long, or if more, thentapering to the perigynium body shorter than the body.
                     10 Perigynia > 4× as long as wide ...................................................................................................................... C. pauciflora of Section 38: Leucochlochin
                     10 Perigynia < 4× as long as wide .................................................................................................................. Section 46: Leptocephalae

Key B

1 Widest leaves 4-8 mm wide; inflorescences more-or-less capitate (occasionally with the lowermost 1 or 2 spikes separated) .......... C. kobomugi in Section 8: Macrocephalae
1 Widest leaves 1-4 mm wide; inflorescences ovoid to cylindric .......................................................................................... Section 10: Divisae
Key C

1 Perigynia pubescent, not papillose ................................................................. Section 39: Acrocystis
1 Perigynia glabrous, papillose or not.
2 Lateral spikes usually pedunculate; lowest inflorescence bracts sometimes with sheath; peduncles with prophyll at base.
3 Pistillate scales (at least the lower) long-awned ........................................ Section 13: Phacoctis
3 Pistillate scales obtuse to acuminate or cuspidate.
4 Perigynia smooth; style persistent on the achene ........................................... Section 30: Vesicariae
4 Perigynia often papillose over most of the surface; style deciduous ............... Section 13: Phacoctis
2 Lateral spikes sessile; bracts sheathless; peduncles without (or rarely with) a prophyll
5 Perigynia papillose (visible at 20x magnification).
6 Terminal spike staminate, androgynous, or gynecandrous (if gynecandrous, the staminate flowers more numerous than the pistillate); lateral spikes at least 2x as long as wide .......................................................... Section 13: Phacoctis
6 Terminal spike staminate or gynecandrous (if gynecandrous, the pistillate flowers more numerous than the pistillate); lateral spikes not much longer than wide .......................................................... Section 9: Glareosae

Key D

1 Pistillate spikes all from the base of the plant ............................................ Section 39: Acrocystis
1 Pistillate spikes all or in part borne on the elongate, aboveground stem.
2 Bracts of the lowermost non-basal spike with well-developed sheath > 4 mm long.
3 Beak of perigynium with distinct teeth > 0.6 mm long ................................. Section 29: Carex
3 Beak of perigynium entire, notched, or with indistinct teeth < 0.6 mm long.
4 Bracts of the lowermost non-basal spike bladeless, or with a blade < 2 mm long.

**Key 1a**

1 Leaf sheath fronts yellow, thickened, and not fragile at the top; leaf blades papillose adaxially (at 25× magnification) .................. *C. laeviusculata*

2 Leaf sheath fronts smooth.

3 Larger perigynia 6-8 mm long; leaves to 12 mm wide .................................................. *C. crus-corvi*

3 Larger perigynia 3.5-5 mm long; leaves to 7 mm wide.

4 Perigynia smoothly rounded at base, not distended; perigynium veins 3-5 abaxially, 0 adaxially .................. *C. alopecoidea* [C. alopecoidea]

4 Perigynia cordate at base, distended; perigynium veins 10-12 abaxially, 7 adaxially .................. *C. oklahomensis Pictae*

2 Leaf sheath fronts rugose.

5 Perigynia broadly rounded at base, not distended; perigynium veins 3-5 abaxially, 0 adaxially .................. *C. conjuncta*

5 Perigynia cordate or truncate at base, distended; perigynium veins 15 abaxially, 7 adaxially.

6 Perigynia (5-)avg. 5.4 (6-) mm long, the beak > 3 mm long; larger leaves mostly 8-17 mm wide; perigynium scales cuspidate to short-awned; [mostly of the Coastal Plain and lower Piedmont] .................................................................................. *C. stipata var. maxima*

---

[C. richardsonii in Section 40: Clandestiniae]

[C. caryophyllea in Section 42: Mirutae]

[C. baltzellii in Section 41: Pictae]

[C. oklahomensis in Section 42: Clandestiniae]
Cyperaceae

6 Perigynia (4-) avg. 4.7 (-5) mm long, the beak < 2.5 mm long; larger leaves mostly 4-10 mm wide; perigynium scales acuminate to cuspidate; [widespread in our area] ........................................... C. stipata var. stipata

Key 1b

1 Beak of the perigynium shorter than the body.
2 Perigynia somewhat abruptly contracted into a beak ca. 0.5 × as long as the perigynium body; ventral surface of the perigynium with several incomplete veins basally; culms sharply triangular and narrowly winged, somewhat spongy and easily crushed; dorsal leaf sheaths green; ventral leaf sheaths with scattered red dots, and transversely rugose; [normally of shaded locations] ............................. C. conjuncta
3 Perigynia tapering into a beak, much shorter than the perigynium body; ventral surface of the perigynium with several inconspicuous complete veins; culms inconspicuously triangular to roundish, not winged, neither spongy nor easily crushed; dorsal leaf sheaths dark blue-green with conspicuous white dots; ventral leaf sheaths without scattered red dots, not transversely rugose; [normally of sunny locations] ............................................................. C. oklahomensis

1 Beak of the perigynium as long as, or longer than, the body.
3 Ventral leaf sheath margins with orange-red dots; achene ovate-lanceolate; perigynium wall adhering to achene ............... C. crus-cori
2 Ventral leaf sheath margins without orange-red dots; achene broadly ovate to ovate-oralicular; perigynium wall not adhering to the achene (or only slightly so).
4 Ventral leaf sheaths not transversely rugose, more or less concave at the apex and not prolonged upward past the base of the blade, thickened, not friable. .............................................................. C. laevivaginata
2 Ventral leaf sheaths transversely rugose, more or less convex at the apex and prolonged upward past the base of the blade, friable.
5 Perigynia (5-) avg. 5.4 (-6) mm long, the beak > 3 mm long; larger leaves mostly 8-17 mm wide; perigynium scales cupulidate to short-awned; [mostly of the Coastal Plain and lower Piedmont] .............................................................. C. stipata var. maxima
4 Perigynia (4-) avg. 4.7 (-5) mm long, the beak < 2.5 mm long; larger leaves mostly 4-10 mm wide; perigynium scales acuminate to cuspidate; [widespread in our area] ........................................... C. stipata var. stipata

[26b] Section 2: Heleoglochin (Paniculatae)

1 Inflorescence 7-15 cm long, the basal 3-9 branches well-separated from one another; perigynia broadly obovoid, 1.3-1.5× as long as wide; sheaths concave at the mouth; leaves 3-8 mm wide; [of swamps of the Coastal Plain and lower Piedmont] ........................................... C. decomposita
2 Inflorescence 2-8 cm long, the basal 1-5 branches indistinct to slightly separated; perigynia ovoid to lance-ovoid, ca. 2× as long as wide; sheaths prolonged beyond the blade; leaves 1-3 mm wide; [of Mountain wetlands in VA (and TN?) and northward].
2 Inner band of leaf sheath whitish (and red-dotted); basal branches of inflorescence overlapping; perigynium not concealed by the scales ......... C. diandra
3 Inner band of leaf sheath strongly copper-colored (and also red-dotted); basal branches of inflorescence often weakly separated; perigynium nearly or completely concealed by the scales ............................................ C. praere

[26c] Section 3 – section Multiplores

A section of 7 species, of North America (including Mexico). References: Standley in FNA (2002b). Key based on FNA.

1 Perigynia red-dotted .............................................................................................................................................................. C. triangularis
1 Perigynia not red-dotted.
2 Perigynia golden yellow or yellowish-brown at maturity .................................................................................................. C. annectens
2 Perigynia dull yellow-green or pale brown at maturity.
3 Leaves longer than the flowering stem; perigynia 2.0-3.2 mm long, 1.3-1.8 mm wide, the beak 1/3-1/2 the length of the body........ C. vulgaris
3 Leaves shorter than the flowering stem; perigynia 3.2-4.0 mm long, 2.0-2.6 mm wide, the beak ca. 1/3 as long as the body.
4 Awn of pistillate scales 1-3 mm long; adaxial surface of perigynia with 3-5 nerves; [native, of wet pine savannas of se. SC, GA southward] .............................................................. C. fissa var. aristata
4 Awn of pistillate scales 0.5-1.5 mm long; adaxial surface of perigynia lacking nerves; [introduced in our area from sc. United States, of disturbed sites] .............................................................. C. fissa var. fissa

[26d] Section 4 – section Phaestoglochin (Bracteosae)

1 Sheaths loose, membranaceous, and fragile on the ventral side, sepatate-nodulose and usually mottled or striped with green and white on the dorsal side.
2 Bodies of pistillate scales 1.5-2.5 mm long, 1.1-1.8 mm wide, mostly < ½ as long as the perigynia, apex obtuse to acuminate to shortly awned.
3 Basal internodes of the inflorescence usually < 1 cm long, and usually < 2× as long as the spikes; bodies of perigynia with wing < 0.1 mm wide .............................................................. C. cephaloides
3 Basal internodes of the inflorescence usually ≥ 2 cm long, at least 2× as long as the spikes; bodies of perigynia with wing 0.1-0.2 mm wide .............................................................. C. sparganioides
2 Bodies of pistillate scales 2.2-4.4 mm long, 1.2-2.4 mm wide, mostly > ½ as long as the perigynia, apex acuminate to awned.
4 Fronts of leaf sheaths yellow or brownish, thick, firm, the back often white-spotted ............................................. C. aggregata
4 Fronts of leaf sheaths white, hyaline, fragile, the backs not white-spotted.
5 Perigynia 4-5 mm long, 2× as long as wide; perigynia nerveless or very obscurely nerved on the dorsal face... C. gravida var. gravida
5 Perigynia 3-4.5 mm long, 1.3-1.5× as long as wide; perigynia strongly few-nerved on the dorsal face... C. gravida var. lunelliana

1 Sheaths tight on the ventral side, neither septate-nodulose nor mottled with green and white on the dorsal side.
6 Perigynia corky-thickened in the lower 1/3 to 1/2 (and not > 4.0 mm long); perigynia spreading or reflexed at maturity; perigynia (2-3)-12 (-20) per spike; leaves 0.5-3 mm wide.

7 Beak of perigynium smooth; pistillate scales acuminate, early deciduous.
8 Average perigynium width ≥ 1.3 mm; average spongy portion of the perigynium ≥ 1.1 mm long; perigynium base distinctly nerved, bulging on the ventral surface, making the perigynium biconvex in cross-section; perigynium 2-2.5× as long as wide; perigynium gradually narrowed to a short beak; leaves 1-3 mm wide................................................................. C. retroflexa
8 Average perigynium width < 1.3 mm; average spongy portion of the perigynium < 1.1 mm long; perigynium base nerveless, flattened on the ventral surface, making the perigynium planoconvex in cross-section; perigynium ca. 3× as long as wide; perigynium narrowed to a conspicuous beak; leaves 0.75-1.5 mm wide ................................................................. C. texensis

7 Beak of perigynium serrulate; pistillate scales obtuse, persistent.
9 Plants with creeping rhizomes, the culms arising scattered along the rhizome; perigynia 4-5× as long as wide............... C. socialis
9 Plants densely cespitose, the culms arising from the center of clump; perigynia 2-3× as long as wide.

10 Widest leaves 0.9-1.7 mm wide; base of fertile culm 0.7-1.4 mm wide.
11 Base of perigynium cuneate to rounded; distance from base of perigynium to base of achene 0.1-0.5 mm; [primarily of the Mountains in our area].................................................. C. appalachica
11 Base of perigynium rounded to truncate; distance from base of perigynium to base of achene 0.5-0.9 mm; [widespread in our area].................................................. C. radiata

12 Stigmas 0.03-0.06 mm thick, straight to slightly twisted; widest leaves < 2.0 mm wide; perigynia 3-7 (-8) per spike... C. radiata
12 Stigmas 0.07-0.10 mm thick, mostly coiled; widest leaves > 1.7 mm wide; perigynia (6-) 7-14 (-20) per spike............. C. rosea

6 Perigynia not conspicuously corky-thickened at base (except corky-thickened in the rare alien, C. spicata, which has perigynia 4-0.5 mm long); perigynia ascending to spreading at maturity; perigynia (3-) 8-40 per spike; leaves 1-5 mm wide.

13 Inflorescence ovoid in outline, the spikes densely aggregated, nearly indistinguishable except by the projecting setaceous bracts which surround each spike.
14 Perigynia 1.3-1.7× as long as wide, widest near the broadly rounded, truncate, or even subcordate base................. C. leavenworthii
14 Perigynia 1.6-2.5× as long as wide, widest just below the middle, the base broadly cuneate to rounded.
15 Pistillate scales (excluding the awns) shorter than the perigynium body; culms not greatly exceeding the leaves... C. cephalophora
15 Pistillate scales (excluding the awns) as long as or exceeding the perigynium body; culms much exceeding the leaves................. C. mesochora

16 Inflorescence spicate-racemose, the individual spikes readily distinguishable (often separated by an exposed internode of the axis).
16 Pistillate scales brown or reddish-purple; [alien, sparsely naturalized in our area].
17 Roots and basal sheaths brown to black; perigynia not corky-thickened at base; ligule blunt, wider than long........ C. divulsa
17 Roots and basal sheaths purplish-tinted; perigynia corky-thickened at base; ligule acute, longer than wide............ C. spicata
17 Pistillate scales green, hyaline, or pale tan; [native in our area (except C. austrina and C. muricata ssp. lamprocarpa), common and widespread in our area].
18 Spikes with 5-10 perigynia; pistillate scales brown with green-veined center ......................... C. muricata ssp. lamprocarpa
18 Spikes with 8-20 perigynia; pistillate scales scarious-white (rarely brown) with green-veined center.
19 Perigynia ascending, nerveless on the ventral surface; scales awned, the awns 1.5-4 mm long; lowest inflorescence bract elongate, the free portion 1-5 cm long .................................................. C. austrina
19 Perigynia spreading, either nerved or nerveless on the upper (ventral) surface; scales acuminate or with an awn to 1.5 (-2.0) mm long; lowest inflorescence bract short, delicate, the free portion 0.5-2 cm long.
20 Perigynia 3.0-3.5 mm long, nerveless on the upper (ventral) face.............................................. C. muehlenbergii var. enervis
20 Perigynia 3.5-4.0 mm long, nerved on both faces.................................................. C. muehlenbergii var. muehlenbergii

[26h] Section 5 – section Holaraena (Imperataeinae)
One species......................................................................................................................................................... C. sartwellii

[26i] Section 6 – section Divisae
1 Beak of the perigynium 1/5 to 1/3 as long as the body; spikes 2-7; [alien, naturalized primarily in brackish to salty coastal habitats]... C. divisa
1 Beak of the perigynium 1/3 to 1/2 as long as the body; spikes 5-15; [alien, naturalized primarily inland along highways treated with salt]........... .................................................. C. praegracilis

[26j] Section 7 – section Ammoglachin (Arenariae)
A section of 14 species, of temperate Northern Hemisphere. References: Reznicek in FNA (2002b). Key based closely on FNA
1 Perigynia thin-margined and prominently winged at base of beak; pistillate scales usually longer than perigynia; terminal spike usually stamine; [alien in maritime situations].................................................................................................................. C. arenaria
1 Perigynia thin-margined, lacking a prominent, expanded wing; pistillate scales shorter than to nearly equaling the perigynia; terminal spike usually pistillate or androgynous; native, inland........................................................................... C. siccata
[26k] Section 8 – section Macrocephalae

One species..............................................................................................................................................................................................................................................C. kobomugi

[26m] Section 9 – section Glareosae (Heleonastes)

A section of 20-25 species, circumboreal, but extending in montane areas to South America, New Zealand, and Australia. References: Toivonen in FNA (2002b).

1 Spikes (1-) 2-3; perigynia 1.5-5 per spike, 2.5-4 mm long.
   2 Leaves 0.3-0.8 mm wide, filiform-involute; ligules 0.3-0.8 (-1.2) mm long; inflorescences 14-32 mm long; spikes 2-3 per inflorescence; terminal spike with 1-3 perigynia per spike; [south to PA and s. NJ] ..............................................................................................................C. billingsii
   2 Leaves 0.8-1.9 mm wide, flat or thinly M-shaped; ligules 0.5-1.9 mm long; inflorescences (14-) 23-55 mm long; spikes (2-) 3-4 per inflorescence; terminal spike with (1-) 2-6 perigynia per spike; [south to w. NC] .................................................................C. trisperma

1 Spikes 4-9; perigynia 5-30 per spike, 1.7-2.5 mm long.
   3 Perigynia without ventral nerves (or the nerves very obscure); spike at maturity somewhat bristly appearing in silhouette because of the perigynium beaks ..............................................................................................................................................C. brunnescens var. sphaerostachya
   3 Perigynia 5-10 (-15) per spike; perigynium ventrally nerveíd; spike at maturity nearly smooth in silhouette (the perigynium beaks strongly appressed).
   4 Culms 15-60 cm tall; inflorescence 3-5 (-7) cm long, all but the lowest spikes approximate, the lowest spikes 0.5-2.5 cm apart.........................
      .................................................................................................................................................................................................C. canescens var. canescens
   4 Culms 30-90 cm tall; inflorescence 6-12 (-15) cm long, the lower and middle spikes well-spaced, the lowest spikes 2-5 cm apart.............
      .................................................................................................................................................................................................C. canescens var. disjuncta

[26n] Section 10 – section Deweyanae

A section of 8 species, of North America and e. Asia. References: Naczi (1990); Naczi in FNA (2002b).

1 Widest leaf (1.3-) 1.5-2.9 (-3.1) mm wide; culms (0.5-) 0.6-1.0 (-1.1) mm thick at mid-height; plants densely to loosely cespitose, the rhizome internodes 0.2-20 mm long; [of swamp forests and other wetlands, widespread in our area] ..............................................................................................................................................C. bromoides ssp. bromoides

1 Widest leaf 2.8-4.4 mm wide; culms 1.0-1.6 mm thick at mid-height; plants densely cespitose, the rhizome internodes 0.2-1.0 (-8.5) mm long; [of seeps and bogs in the Blue Ridge and Blue Ridge Escarpment region] ..............................................................................................................................................C. bromoides ssp. montana

[26o] Section 11 – section Stellulatae

A section of ca. 15 species, semicosmopolitan (except Africa). References: Reznicek & Ball (1980); Reznicek in FNA (2002b). Key based on Reznicek & Ball (1980).

1 Spikes usually solitary; leaves involute; anthers 2.0-3.6 mm long; [rare disjuncts in Coastal Plain bogs] .................................................................C. exilis
   1 Spikes 2-8; leaves flat or folded; anthers 0.6-2.2 (-2.4) mm long.
      2 Perigynium beak smooth-margined (use at least 10× magnification) .................................................................................................C. seorsa
      2 Perigynium beak serrulate on margin (use at least 10× magnification).
      3 Widest leaves 2.8-5.0 mm wide.
         4 Lower perigynia of spikes mostly 1.1-1.6× as long as wide; perigynia mostly 2.1-3.0 mm wide.................................................................C. atlantica
         4 Lower perigynia of spikes (1.5-) 1.7-3× as long as wide; perigynia mostly 1.2-2.0 mm wide.................................................................C. ruthii
      3 Widest leaves 0.8-2.7 mm wide.
      5 Terminal spikes entirely staminate; anthers (1.0-) 1.2-2.2 (-2.4) mm long...........................................................................................................C. sterilis
      5 Terminal spikes partly or entirely pistillate; anthers 0.6-2.2 (-2.4) m long.
         6 Terminal spikes without a distinct narrowed base of staminate scales, the staminate portion < 1 mm long .................................C. sterilis
         6 Terminal spikes with a distinct narrowed base of staminate scales 1.0-16.5 mm long.
            7 Lower perigynia 2.0-3.0 mm wide ...............................................................................................................................................C. atlantica
            7 Lower perigynia 0.9-2.0 mm wide.
               8 Lower perigynia mostly 2.8-4.8 mm long; lower perigynia (1.7-) 1.8-3.6× as long as wide; perigynia beaks 0.95-2.0 mm long, mostly 0.45-0.85× as long as the perigynium body .................................................................C. echinata ssp. echinata
               8 Lower perigynia mostly 1.9-3.0 mm long; lower perigynia 1.0-2.0 (-2.2)× as long as wide; perigynia beaks 0.4-0.95 mm long, mostly 0.2-0.5× as long as the perigynium body.
                  9 Perigynia mostly 1.0-nerved over the achene on the adaxial surface; beak of perigynia conspicuously setulose-serrulate; perigynia often more-or-less convexly tapered from widest point to the beak, thus forming a weak shoulder; [of calcareous sites, in our area restricted to the Mountains of VA] ..............................................................................................................................................C. interior
                  9 Perigynia mostly 1.10-nerved over the achene on the adaxial surface; beak of perigynia more sparsely serrulate, with definite spaces between the often single teeth; perigynia more-or-less cuneate or concavely tapered from widest point to the beak, not forming a shoulder; [of a variety of situations, not generally calcareous].
               10 Widest leaves 1.6-2.7 mm wide; infructescence mostly 18-45 mm long; [widespread in our area] ..............................................C. atlantica
               10 Widest leaves 0.6-1.6 mm wide; infructescence mostly 8-20 mm long; [primarily of the Coastal Plain in our area, widely scattered elsewhere] ..............................................................................................................................................C. howei
1 Pistillate scales uniformly as long as or longer than the mature perigynia, usually concealing the beaks (though not necessarily the bodies), apex obtuse to acuminate, not awned.

2 Perigynium beak cylindrical, unwinged, lacking serrations for ca. 0.4 mm below the apex .......................................................... C. ovalis

3 Perigynium beak flattened, ciliate-serrulate all the way to the apex.

4 Principal leaves pliable, green, almost always without auricles, the summit of the sheaths U-shaped, only slightly prolonged beyond the collar; flat margins of perigynia 0.2-0.6 mm wide; achenes 1.0-1.7 mm wide; [of inland, non-maritime habitats].

5 Pistillate scales (excluding the awns, if present) shorter than the perigynia at least in the middle portions of the spikes, the apical portion of the pistillate scales narrower than the perigynia, beaks not covering the perigynia completely, the apex awned in some species.

6 Perigynia 2.6-4.0 × as long as wide, the bodies lanceolate, 1.2-2.0 mm wide.......................................................... C. scoparia var. scoparia

7 Perigynium body obovate, often with conspicuous “shoulders”; leaves 2.5-6 mm at widest.......................................................... C. alata

8 Perigynium body elliptic, suborbiculate, or weakly obovate; leaves 1.3 (-4.2) mm wide at widest.

9 Perigynium body cuneately tapered to the base, the body of the perigynium more-or-less diamond-shaped; inflorescences dense, stiffly erect, with 3-5 spikes .......................................................... C. suberecta

10 Beaks ascending, < ½ the length of the lance-ovate to weakly obovate perigynium body; lateral spikes with acute staminate bases mostly < 2 mm long; [of tidal marshes] ........................................................................................................ C. normalis

11 Beaks spreading, > ½ the length of the suborbicular perigynium body; lateral spikes with tapered staminate bases 2-6 mm long; [of freshwater wetlands] ................................................................................................................................ C. triloboides

12 Pistillate scales in middle or lower portions of spikes with apex acuminate with subulate or awned tip.

13 Lower perigynia of each spike spreading or recurved (at an angle of > 80 degrees); spikes globose; pistillate scales hidden, 1.6-2.3 mm long; [of tidal marshes] ........................................................................................................ C. cristatella

14 Lower perigynia of each spike appressed-ascending to somewhat spreading (at a 30-75 degree angle); spikes subglobose to ovate-oblong; pistillate scales evident, 2.0-3.0 mm long.

15 Perigynia 3.0-4.0 mm long, 2.2-2.8 (-3) × as long as wide; [of freshwater wetlands] ........................................................................................................ C. festucacea

16 Inflorescences usually flexible, nodding at the tip, the lower spikes usually separated; perigynia usually 15-40, spreading at a 40-75 degree angle to the spike axis; leaf sheaths firm or friable at the summit .......................................................... C. projecta

17 Inflorescences straight and stiff, the lower spikes overlapping; perigynia usually > 40, appressed-ascending at a 30-40 degree angle to the spike axis; leaf sheaths firm at the summit.

18 Perigynia 3.3-3.6-5.4 mm long, 3.5 × as long as wide ........................................................................................................ C. tribuloides var. sangoamonensis

19 Perigynia (3.3-) 3.6-5.4 mm long, 3.5 × as long as wide ........................................................................................................ C. tribuloides var. tribuloides

20 Beaks spreading, > ½ the length of the suborbicular perigynium body; lateral spikes with tapered staminate bases 2-6 mm long; [of freshwater wetlands] ................................................................................................................................ C. straminea

21 Perigynia < 2 mm wide.

12 Perigynia thin, often not winged to the base; leaf sheaths somewhat expanded towards the apex, bearing narrow wings continuous with the midvein and the edges of the leaf blade; leaves 3-7.5 mm wide; vegetative shoots tall, conspicuous, with numerous leaves spaced along the upper half of the culm.

13 Lower perigynia of each spike spreading or recurved (at an angle of > 80 degrees); spikes globose; pistillate scales hidden, 1.6-2.3 mm long; [of tidal marshes] ........................................................................................................ C. cristatella

14 Inflorescences usually flexible, nodding at the tip, the lower spikes usually separated; perigynia usually 15-40, spreading at a 40-75 degree angle to the spike axis; leaf sheaths firm or friable at the summit .......................................................... C. projecta

15 Inflorescences straight and stiff, the lower spikes overlapping; perigynia usually > 40, appressed-ascending at a 30-40 degree angle to the spike axis; leaf sheaths firm at the summit.

16 Perigynia 3.0-4.0 mm long, 2.2-2.8 (-3) × as long as wide; [of freshwater wetlands] ........................................................................................................ C. festucacea

17 Perigynium body obovate, widest toward the tip (excluding the beak).

18 Perigynium body obovate, widest toward the tip (excluding the beak).

19 Perigynia body ovate, elliptic, or orbiculate, widest towards the base or near the middle (excluding the beak).

20 Achenes 0.6-0.9 mm wide; pistillate veilless or 1-3 veined on the inner face, these faint or basal only; inflorescences < 3.0 cm long .......................................................... C. bebbii

21 Achenes 0.9-1.3 mm wide; pistillate often 3-veined on the inner face; inflorescences 12-60 mm long.

22 Perigynia broadly elliptic or nearly orbiculate, the wing margin 0.4-0.8 mm wide, 0-6 veined on the inner face.............. C. molestae

23 Perigynia ovate to broadly ovate, the wing margin 0.25-0.45 mm wide, 4-7 veined on the inner face.............. C. normalis

24 Inflorescences on tallest culms compact, 1.5-3 × as long as wide, erect, the spikes overlapping, the lowest internode of the inflorescence 1-6 (-7.5) mm, ½ to 1½ (-¼) the length of the inflorescence

25 Achenes 0.6-0.9 mm wide; pistillate veinless or 1-3 veined on the inner face, these faint or basal only; inflorescences < 3.0 cm long .......................................................... C. bebbii

26 Achenes 0.9-1.3 mm wide; pistillate often 3-veined on the inner face; inflorescences 12-60 mm long.

27 Perigynia narrowly to broadly ovate, widest below mid-body.

22 Perigynia ovate to broadly ovate, the wing margin 0.25-0.45 mm wide, 4-7 veined on the inner face.............. C. normalis

23 Inflorescences on tallest culms elongate, more-or-less open towards the base, (2.5-) 3.0-5.1 × as long as wide, often arching or nodding at the tip; spikes more-or-less separate; lowest internode (5-) 7-19 mm long, mostly 1½-½ (-¼) the length of the inflorescence.

24 Perigynia ovate to broadly ovate, the wing margin 0.25-0.45 mm wide, 4-7 veined on the inner face.............. C. normalis

25 Inflorescences on tallest culms compact, 1.5-3 × as long as wide, erect, the spikes overlapping, the lowest internode of the inflorescence 1-6 (-7.5) mm, ½ to 1½ (-¼) the length of the inflorescence

26 Achenes 0.6-0.9 mm wide; pistillate veinless or 1-3 veined on the inner face, these faint or basal only; inflorescences < 3.0 cm long .......................................................... C. bebbii

27 Achenes 0.9-1.3 mm wide; pistillate often 3-veined on the inner face; inflorescences 12-60 mm long.

28 Perigynia narrowly to broadly ovate, widest below mid-body.
23 Sheaths, at least some, papillose near the collar (at magnification of 30 x), not prominently whitish-mottled; perigynium beak appressed or ascending in spikes, exceeding the pistillate scales by 0.0-0.8 mm; beak and shoulders of perigynia straw-colored to reddish-brown at maturity ................................................................. C. tenera var. tenera

11 Perigynia > 2 mm wide:

24 Spikes 12-28 mm long, with tapered base and acute tip; perigynium body lanceolate, 6-9 mm long; vegetative culms conspicuous ...

24 Spikes either shorter than 12 mm or longer and with either rounded bases or tips or both; perigynium body ovate, elliptic, orbicular, or obovate, or lanceolate (if lanceolate, then shorter than 6 mm long); vegetative culms conspicuous or not.

25 Perigynium bodies obovate, widest towards the tip; leaf sheaths green-veined adaxially nearly to the summit, or with a narrow Y-shaped hyaline area.

26 Achenes 1.3-1.8 mm wide .......................................................................................................................... C. opaca

26 Achenes 0.75-1.2 (-1.3) mm wide.

27 Inflorescences erect, 1.4-5 cm long; spikes slightly separated to congested ................................................. C. alboluteasens

27 Inflorescences arching or nodding, 2.3-8.4 cm long; spikes widely separated .............................................. C. silacea

25 Perigynium bodies lanceolate, ovate, elliptic, orbicular, or reniform, widest at the middle or towards the base; leaf sheaths various, some with prominent hyaline band near the apex adaxially.

28 Plants colonial, from creeping rhizomes; vegetative culms numerous, conspicuous, strongly 3-ranked, with 15-35 leaves when fully-developed; achenes 1.6-2 x as long as wide; larger spikes with 5-25 (-30) perigynia .................................................. [C. hyalina]

28 Plants clumping; vegetative culms few, inconspicuous, usually with fewer than 15 leaves, not strikingly 3-ranked; achenes 1-1.6 (-1.7) x as long as wide; larger spikes with 15-80 perigynia.

29 Perigynia finely granular-papillose (as seen with 30 x magnification), the body reniform to orbiculate, 0.6-0.9 x as long as wide, 3.5-4.5 (-4.9) mm wide; lowermost pistillate scale obtuse-rounded ................................................................. C. reniformis

29 Perigynia smooth, the body broadly ovate, elliptic, orbicular, or slightly obovate, (0.7-) 0.9-1.7 x as long as wide, 1.5-6.1 mm wide; lowermost pistillate scales obtuse to acuminate-awned.

30 Leaf sheaths green-veined adaxially neral to the summit; inflorescences dense to somewhat open, erect, the lowermost internodes usually < 8 (-12) mm long

31 Perigynia with acute bases, 2.0-2.8 mm wide; beak appressed, > 2/5 x the length of the body; broadest leaves 1.5-2.5 mm wide; [of sw. VA northward] .......................................................... C. suberecta

31 Perigynia with rounded bases, 3.0-4.4 mm wide; beak spreading, ca. 1/3 x the length of the body; broadest leaves 2-5 mm wide; [of FL] ................................................................................................................................. C. vaxans

30 Leaf sheaths with white-hyaline area adaxially; inflorescences open or dense.

32 Perigynium body narrowly to broadly ovate, greenish; pistillate scales with green midstripe, hyaline or pale margins (rarely brown tinged); leaves 2.5-6.5 mm wide, the sheaths green mottled, with mouth truncate, and prolonged to 2 mm along the internode base of the leaf blades...

32 Perigynium body broadly ovate, broadly elliptic, or orbiculate, yellowish to tan brown; pistillate scales greenish or brown; leaves 1.5-4 (-5) mm wide, the sheaths usually evenly colored, with mouth concave.

33 Leaf sheaths finely papillose (at magnification of 30-40 x), especially near the base.

34 Perigynia strongly and evenly 4-8-veined over the achene adaxially, (4.5-) 5.1-5.5 mm long; pistillate scales usually (1.0-) 1.4-2.3 mm shorter than the perigynia; anthers (2.4-) 2.8-4.2 mm long .............................................. C. bicknellii

34 Perigynia veinless or faintly and irregularly 0-4-6-veined over the achene adaxially, 2.5-4.2 mm long; pistillate scales 0.2-1.3 mm shorter than the perigynia; anthers 1.0-2.1 mm long .......................................................... C. festucacea

33 Leaf sheaths smooth.

35 Spikes on larger culms (3-) 5-7 (-11), tapered at the base, the terminal spike with a conspicuous staminate base; inflorescences typically open, 2.5-4.5 (-6.5) cm long, the lowermost internode (3-) 4-13 (-23) mm long; perigynium body (0.7-) 0.9-1.3 x as long as wide.

36 Achenes 1.2-1.8 mm long, 1.0-1.3 mm wide; perigynia 2.5-4.2 mm long, 1.5-2.3 (-2.5) mm wide, mostly 2-4 (-6)-veined adaxially ................................................................. C. festucacea

36 Achenes (1.6-) 1.7-2.2 mm long, (1.2-) 1.4-1.8 mm wide; perigynia 3.2-5.5 mm long, 2.5-3.6 mm wide, veinless or faintly 1-5 (-7)-veined adaxially.

37 Perigynia 3.2-4.8 (-5.2) mm long; beak 0.8-1.5 mm long; pistillate scales 3.3-4.0 (-4.3) mm long, acute; achenes 1.0-1.3 (1.4) x as long as wide................................................................. C. brevior

37 Perigynia (5.6-) 6.0-7.1 mm long; beak (1.2-) 1.5-2.1 (-2.3) mm long; pistillate scales (3.6-) 3.9-5.0 mm long, obtuse to acute ................................................................................................................ C. opaca

35 Spikes on larger culms 2-4 (-5), rounded at the base, the terminal spike usually lacking a conspicuous staminate base; inflorescences compact, 1.2-3.0 (-3.6) cm long, the lowermost internode (1.5-) 7-13 (-13) mm long; perigynium body (0.7-) 0.9-1.6 x as long as wide.

38 Achenes of larger perigynium ellipsoid to narrowly oblong, 0.9-1.3 mm wide, 1.3-1.6 x as long as wide; perigynia (25-) 30-80 per spike, squarrose-spreadig at maturity, 1.8-3.0 mm wide ............................................. C. molesta

38 Achenes of larger perigynium broadly oval to oblong near its apex, 1.35-1.8 mm wide, 1.1-3 x as long as wide; perigynia (10-) 15-40 (-45) per spike, appressed-ascending at maturity, (2.1-) 2.5-3.4 (-3.5) mm wide.

39 Perigynia veinless or faintly and irregularly 1-5-veined over the achene adaxially, more-or-less orbicular, the bodies (2.0-) 2.3-3.2 mm long, (0.7-) 0.9-1.1 (-1.3) x as long as wide; pistillate scales mostly acute, about as long as to 0.7 (-0.9) mm shorter than the subtended perigynium (flattened and measured separately) ....... C. brevior

39 Perigynia strongly 4-6-veined over the achene adaxially, broadly ovate to broadly elliptic, (or rarely nearly orbicular), the bodies (2.7-) 3.4 mm long, (0.9-) 1.0-1.6 x as long as wide; pistillate scales mostly obtuse, 0.7-1.7 mm shorter than the subtended perigynium (flattened and measured separately) ...... C. molestitformis

{add C. cumalata, C. hyalina}

[26r] Section 13 – section Phacocystis (Cryptocarpaceae and Acutea)

A section of 70-90 species, cosmopolitan. References: Standley, Cayouette, & Bruederle in FNA (2002b); Standley (1983); Bruederle & Fairbrothers (1986); Bruederle, Fairbrothers, & Hanks (1989). Key based in part on C.
1 Lowest spike erect or ascending.
2 Lower sheaths scabrous, reddish-brown, the sheath fronts (ventral faces) with prominent veins forming a persistent network; lower sheaths usually bladeless .............................................................................................................. C. stricta
2 Lower sheaths glabrous, the sheath fronts (ventral faces) not forming a persistent network; lower sheaths usually with leaf blades.
3 Perigynia evidently nerv ed on both faces .............................................................................................................. C. emoryi
3 Perigynia not nerv ed, or very faintly nerv ed.
4 Longest bracts overtopping the spikes; perigynium flattened, elliptic to obovate; pistillate scales acute to obtuse, generally shorter than the perigynia .............................................................................................................. C. australis
4 Longest bracts shorter than the spikes; perigynium inflated, obovate; pistillate scales acuminate, longer than the perigynia .............................................................................................................. C. haydenii
1 Lowest spike pendent.
5 Pistillate scales awnless, the sides black or deep purple-brown .............................................................................................................. C. torta
5 Pistillate scales awned, the sides medium brown.
6 Sheath backs glabrous [prickles 0-1 (-5) per mm² of sheath surface 5 cm from base]; perigynia somewhat inflated, obovoid, rounded above to an abrupt beak; lowest bract of the infructescence 1.7-6.2 dm long.
7 Perigynia strongly obvoid, 3-4.5 mm long, 2-3 mm wide; achene symmetrical .............................................. C. crinita var. brevicerinis
7 Perigynia ellipsoid to slightly obvoid, 2-3 (-3.5) mm long, 1-2 mm wide; achene usually shortened on one side, therefore asymmetrical .............................................................................................................. C. crinita var. crinita
6 Sheath backs scabrous [prickles 1-1.5-54 per mm² of sheath surface 5 cm from base]; perigynia flattened, elliptic to ovoid, tapering from near or below the middle to a minute beak; lowest bract of the infructescence 0.7-3.5 dm long.
8 Perigynia smooth to slightly papillate toward the apex, the papillae mostly < 10 μm long; lower pistillate scales usually acute or acuminate, tapering into the awn; sheaths strongly scabrous; [mainly distributed in our area in the Mountains] .............................................. C. gynandra
8 Perigynia densely granular-papillate throughout, the papillae mostly > 13 μm long; lower pistillate scales usually truncate or reute, abruptly awned; sheaths finely scabrous; [mainly distributed in our area in the Coastal Plain and Piedmont] .............................................. C. mitchelliana

[26s] Section 14 – section Racemosae (Atratae)
A section of ca. 60 species, of North America and Eurasia. References: Murray in FNA (2002b).
One species .............................................................................................................................................................................. C. buxbaumii

[26u] Section 15 – section Limosae (including Scitae)
A section of 6 species, in cool temperate parts of North America, Eurasia, and s. South America. References: Ball in FNA (2002b).
1 Pistillate scales 1.2-2.0 mm wide, narrower than the perigynia .............................................................................................................. C. barrattii
1 Pistillate scales 2.0-3.8 mm wide, wider than the perigynia .............................................................................................................. C. limosa

[26w] Section 16 – section Rhynchocystis
A section of 5 species, of Europe, w. Asia, and Europe. References: Reznicek in FNA (2002b).
One species .............................................................................................................................................................................. C. pendula

[26x] Section 17 – section Glaucenses (Pendulinae)
1 Awn of the pistillate scale tapering gradually into the scale; perigynium 2-ribbed, and also distinctly and evenly nerv ed between the ribs; [of swamps and marshes] .............................................. C. joorii
1 Awn of the pistillate scale emerging from a retuse notch in the apex of the scale; perigynium 2-ribbed, obscurely nerv ed between the ribs; [generally of acid seepages, pocosins, and blackwater situations, often associated with Pinus serotina].
2 Lowest pistillate spike drooping, on a peduncle 1-4 cm long; perigynia reddish-glau cous, lacking nerves; achene s slightly longer than wide .............................................................................................................. C. glaucescens
2 Lowest pistillate spike erect, sessile or with a peduncle up to 1 cm long; perigynia white-glau cous, rather distinctly 6-8 nerv ed; achenes as wide as long .............................................................................................................. C. verrucosa

[26aa] Section 18 – section Paniceae
A section of 14 species, of temperate parts of North America and Eurasia, and montane Central America and South America. References: Rothrock & Reznicek in FNA (2002b).
1 Perigynia with a distinct beak, 1.0-2.2 mm long.
2 Basal leaves with well-developed blades; basal sheaths brown; perigynia glabrous; [of moist, usually calcareous habitats of the Coastal Plain] .............................................................................................................. C. chapmanii
2 Basal leaves reduced to bladeless sheaths; basal sheaths strongly purple; [of dry, acidic habitats of the Mountains] .............................................. C. polymorpha
1 Perigynia beakless, or with an indistinct beak < 0.5 mm long.
3 Basal sheaths with well-developed blades; basal sheaths brown to strongly purple.
4 Pistillate spike 5-7 mm in diameter, with ca. 6 vertical rows of perigynia; perigynia 3.3-4.2 mm long, 2.0-2.5 mm wide; leaves 3-7 mm wide, blue green ................................................................. C. meadii

4 Pistillate spike 3-4 mm in diameter, with ca. 2-3 vertical rows of perigynia; perigynia 2.5-3.5 mm long, 1.5-2.0 mm wide; leaves 2-4.5 mm wide, pale green ..................................................................................... C. tetanica

5 Culms to 10 dm tall, 1-3.5 mm in diameter near base; larger leaves ca. 5 mm wide; plants forming large clumps; [plants of shallow soils on sloping rock outcrops] ................................................................. C. hiltmoreana

5 Culms to 5 dm tall, ca. 1-2 mm in diameter near the base; larger leaves ca. 2-4 mm wide; plants forming small, spaced clumps, interconnected by long-creeping rhizomes; [plants of mountain slopes in more-or-less deep soils] ......................................................... C. wooldii

{add C. livida to key}

[26bb] Section 19 – section Laxiflorae

1 Perigynium with 8-18 veins, 2-3 conspicuous, narrowly cuneate basally; perigynium beak short and usually abruptly bent; foliage dark green; bracts surpassing the staminate spike ................................................................. C. leptopetron

1 Perigynium with (22-) 25-32 veins, all of which are conspicuous (the central one slightly more distinct); perigynium beak various; foliage various; bracts various.

2 Perigynium with a short, bent beak, usually abruptly bent to one side.

3 Spikes loosely flowered, most perigynia not overlapping.

4 Baets very broad, 8-20 mm wide; basal leaves very wide, up to 40 mm wide; plant glaucescent; basal sheaths purple or brown ............

4 Baets narrow, 2.5-6 mm wide; basal leaves narrow, 3-8 mm wide; plant green; basal sheaths purple, often weathering to brown ............

5 Basal sheaths purple when fresh, weathering to brown; uppermost bract rarely overtopping the staminate spike; staminate spike usually long-stalked ................................................................. C. graciliscens

5 Basal sheaths brown; uppermost bract overtopping the staminate spike; staminate spike sessile or short-stalked

6 Widest bract of the uppermost lateral spike 0.5-3.4 mm wide .................................................................................................. C. blanda

6 Widest bract of the uppermost lateral spike (2.5-) 3.2-8.3 mm wide ......................................................................................... C. kraliana

2 Perigynium tapering to a straight or slightly curved beak (or a long, curved beak in C. radfordii) (note: some beaks may curve in pressing)

7 Perigynium beaks long (to 1.5 mm long) and excurved; basal sheaths green, white, and brownish striped; [endemic to the escarpment gorge area near the SC-NC-GA tricorner] .............................................. C. radfordii

7 Perigynium beaks straight or slightly curved; basal sheaths either purple, wine-red, or brownish, not prominently green-and-white striped; [collectively widespread in our area]

8 Basal sheaths purple or wine-red (may weather to brown in C. graciliscens).

9 Spikes densely flowered, the perigynia overlapping ........................................................................................................ C. graciliscens

10 Mature leaf blades of sterile shoots 4.5-6 (-6) mm wide, green; culms glaucous; bright red at base (best seen in fresh material)

10 Mature leaf blades of sterile shoots 6-7-10 mm wide, glaucous; culms glaucous, bright red at base (best seen in fresh material); pistillate spikes (4-) 7-11 (-15) flowered; staminate spike on a peduncle 2.3-6 cm long ......................... C. purpurifera

8 Basal sheaths brown, not purple or wine-red.

11 Mature perigynia obovoid.

12 Spikes overlapping, densely flowered; staminate spike more-or-less obscured; plant green ......................................................... C. crebriflora

12 Spikes scattered, loosely flowered; staminate spike prominently exserted; plant usually glaucescent ........................................................................................................ C. laxiflora

11 Mature perigynia fusiform.

13 Spikes overlapping, the staminate more-or-less obscured and overtopped by the uppermost bract ............................................... C. crebriflora

13 Spikes scattered, the staminate prominent and exceeding the uppermost bract.

14 Spikes densely flowered; perigynium beaks curved; lowest spike exserted on a long, arching, peduncle ......................... C. styloflexa

14 Spikes loosely flowered; perigynium beaks straight; lowest spike on a short, erect or ascending, peduncle ......................... C. striatula

[26cc] Section 20 – section Granulares

A section of ca. 6 species, of temperate North America south through Mexico to Central America. References: Cochrane & Naczi in FNA (2002b). Key based on FNA.

1 Plants with long-creeping rhizomes, the culms therefore mostly solitary; terminal spike and uppermost lateral spike usually separated.

2 Staminate scales with apex rounded to obtuse; widest leaves 1.8-3.0 (-4.4) mm wide; perigynium beak 0.1-0.3 mm long; [widespread] ......

2 Staminate scales with apex acute to awned; widest leaves 2.8-8.3 mm wide; perigynium beak 0.3-0.9 mm long; [of Panhandle FL and AL westward] ................................................................. C. microdonta

1 Plants with short rhizomes, the culms therefore clumped; terminal and uppermost lateral spike usually overlapping.

3 Leaves green; longest bract blade of uppermost lateral spike 1.6-4.6 (-7.1) cm long; perigynia (1.6-) 1.9-3 x as long as thick; [of the Coastal Plain] ............................................................................................................. C. gholsonii

3 Leaves glaucous (rarely green); longest bract blade of uppermost lateral spike 4.1-15.8 cm long; perigynia 1.4-2.2 (-2.4) x as long as thick; [widespread] .............................................................................................................................................. C. granularis

[26dd] Section 21 – section Caryanae

1 Basal sheaths purplish, sometimes mixed with brown.

2 Widest leaf blade 2-3 mm wide; peduncles of lateral spikes usually drooping..........................C. austrocaroliniana

2 Widest leaf blade 10-25 mm wide; peduncles of lateral spikes usually erect or spreading.

3 Bracts of middle and basal portions of culms with blades 2.1-9.2 cm long; perigynia 5.0-6.6 mm long; longest (per plant) lateral spike with 4-9 perigynia ..........................................................C. careyanana

3 Bracts of middle and basal portions of culms bladeless, or with blades 0.1-1.9 cm long; perigynia 3.7-4.9 mm long; longest (per plant) lateral spike with 9-13 perigynia.......................................................C. plantaginea

1 Basal sheaths brownish, lacking any purple coloration.

4 Widest leaf blade 11-25 mm wide; leaf blades of vegetative shoots 3.8-9.0 × as wide as bract leaves; bract blades from middle and basal portions of the culms 2.0-6.2 cm long; foliage glaucous ..................C. platypylla

4 Widest leaf blade 2-14 mm wide; leaf blades of vegetative shoots 1.0-3.5 × as wide as bract leaves; bract blades from middle and basal portions of the culms 4.5-24 cm long; foliage green or glaucous.

5 Basalmost scale of each lateral spike sterile (lacking a perigynium) or subtending a staminate flower.

6 Foliage usually bright green; longest (per plant) terminal spike 0.6-2.0 (-2.3) cm long; widest leaf blade 5.3-8.3 mm wide..........

6 Foliage usually glaucous; longest (per plant) terminal spike (1.0-) 1.2-2.5 cm long; widest leaf blade 6.4-11.8 mm wide..........

5 Basalmost scale of each lateral spike subtending a perigynium.

7 Terminal spikes (1.0-) 1.2-2.7 mm wide; staminate scales acute, those from the middle region of the staminate spike 3.6-5.5 mm long; vegetative shoots shorter than or slightly taller than the culms, the tallest vegetative shoot 0.5-1.3 (-1.8) × as tall as the tallest culm.

8 Terminal spike usually surpassing the bract blade of the distalmost lateral spike; longest (per plant) peduncle of terminal spike (6.3-) 8.1-15.9 cm long; widest leaf blade 2.0-2.9 (-3.5) mm wide; each perigynium face 7-10-nerved, C. digitalis var. macropoda

8 Terminal spike usually surpassed by the bract blade of the distalmost lateral spike; longest (per plant) peduncle of terminal spike 0.9-7.2 (-11.4) cm long; widest leaf blade 2.7-4.5 (-5.3) mm wide; each perigynium face (8-) 11-15-nerved.

9 Perigynia 2.5-3.3 mm long, the apex barely excurred..........................................................C. digitalis var. digitalis

9 Perigynia 3.2-4.2 mm long, the apex noticeably excurred........................................................C. digitalis var. floridana

7 Terminal spikes 0.6-1.4 (-1.6) mm wide; staminate scales obtuse, those from the middle region of the staminate spike 2.6-3.6 (-3.8) mm long; vegetative shoots much taller than the culms, the tallest vegetative shoot (1.4-) 1.7-3.7 (-4.9) × as tall as the tallest culm.

10 Perigynia 3.9-4.5 mm long; leaves strongly glaucous.........................................................................C. magnifolia

10 Perigynia 2.9-3.8 mm long; leaves green.

11 Perigynia spirally imbricate; longer lateral spikes with (6-) 8-13 perigynia; peduncles of proximal spikes usually erect, the longest (per plant) peduncle (7.0-) 15-42 (-49) mm long; bract blade of distalmost lateral spike 5.6-17 (-26) × as long as wide; loosely or densely cespitose; [primarily of the Coastal Plain in our area, though extending rarely into the Piedmont and Mountains]..........................................................................................................................C. abscondita

11 Perigynia distichously imbricate; longer lateral spikes with 4-8 (-9) perigynia; peduncles of proximal spikes usually drooping or nodding, the longest (per plant) peduncle (28-) 44-84 (-91) mm long; bract blade of distalmost lateral spike (12-) 17-51 × as long as wide; densely cespitose; [primarily of the Mountains and Piedmont].................................C. cumberlandensis

[26ec] Section 22 – section Griseae (Oligocarpaceae)

1 Culm bases brown.
   C. hitchcockiana
   C. brysonii
   C. flaccosperma
   C. glaucodea
   C. pigra
   C. conoidea
   C. impressinervia
   C. grisea
   C. amphibola

1 Culm bases purple-red.
   C. ouachitana
   C. godfreyi
   C. grisea
   C. amphibola
   C. corrugate
   C. bulbostylis
   C. paeninsulae
   C. oligocarpa
   C. calciguens
   C. edwardsiana
   C. planispicata
   C. thornei
   C. paeninsulae
Perigynia tapering toward the base, obtusely trigonous in cross-section, usually pubescent proximally, the apex constricted to a distinct beak (nearly beakless in C. planispicata); the perigynia closely enveloping the achene at maturity.

2. Leaf-sheaths glabrous; perigynia broadest near the middle; basal sheaths purple, greenish-white, or light tan.

3. Leaves glaucous, usually papillate abaxially; pillistate scale margins entire; perigynia 3.7-5.1 mm long, 1.5-1.8 mm wide; [of the Cumberland Plateau of n. AL] ................................................................. C. brysonii

4. Basal sheaths greenish-white or light tan; old leaf bases persistent as brownish fibrils; perigynium beaks obscure, essentially absent; ................................................................. C. impressinervia

5. Perigynia (4.0-) 4.2-5.5 (-6.0) mm long, (2.0-) 2.1-2.7 x as long as wide; widest leaf 1.8-4.0 mm wide; achene beak 0.05-0.3 (=0.5) mm long; longest pistillate spikes with 4-8 (=10) perigynia ................................................................. C. oligocarpa

6. Widest leaf 2.0-6.8 (-9.1) mm wide; foliage green; pillistate scales awnless or short-awned, the awns 0.9-4.9 (-1.9) mm long.

7. Perigynia (3.2-) 3.4-4.5 (-4.7) mm long, 1.6-2.0 x as long as the achene bodies, usually ascending; achene stipes (0.2-) 0.3-0.5 (-0.6) mm long; pillistate spikes (3.3-) 4.2-6.1 (-7.3) mm wide; perigynia beaks slightly bent to recurred, usually bent 30°-90° from the vertical ................................................................. C. flaccosperma

8. Perigynia (3.2-) 3.4-4.0 (-4.1) mm long, (1.5-) 1.8-2.3 (=2.5) x as long as wide; longest pistillate spike with (14-) 19-45 (-65) flowers, densely flowered, with the ratio [mm of spike length/number of flowers] = (0.56-) 0.67-1.1 (1.3); longest peduncle of staminate spike 0.5-15 (-31) mm long; ................................................................. C. glaucoea

9. Axis of inflorescence and pistillate spike peduncles smooth; perigynia 3.7-5.5 mm long, 1.5-1.8 mm wide; [of the Cumberland Plateau of n. AL] ................................................................. C. riga

10. Plants densely to loosely cespitose; culm purple-red coloration extending (3.5-) 4.0-9.6 cm up from base; widest leaves 2.4-6.5 mm wide; perigynia either distichous or spirally imbricate; achene stipe either 0.2-0.4 or 0.6-0.8 (-0.9) mm long.

11. Purple-red coloration extending (3.4-) 4.0-7.3 cm from base; widest leaves 2.4-4.0 (-5.3) mm wide; perigynia spirally imbricate; achene stipe 0.6-0.8 (-0.9) mm long ................................................................. C. godfreyi

12. Perigynia (3.2-) 3.4-5.5 (-6.0) mm long, (1.8-) 2.1-2.6 (-2.8) x as long as wide; longest pistillate spike with 11-25 (-28) flowers, rather loosely flowered, with the ratio [mm of spike length/number of flowers] = (0.97-) 1.0-1.3 (1.6); longest peduncle of staminate spike (1.5-) 7.5-37 (-62) mm long; ................................................................. C. planispicata

13. Widest leaves (3.3-) 4.2-5.5 (-6.0) mm wide, 1.8-2.4 (-2.6) x as long as wide; longest peduncle of staminate spike (0.2-) 0.6-1.2 mm long; ................................................................. C. planispicata

14. Perigynia (3.2-) 3.4-4.5 (-4.7) mm long, (1.8-) 2.1-2.6 (-2.8) x as long as wide; longest peduncle of staminate spike (0.2-) 0.6-1.2 mm long; ................................................................. C. planispicata

15. Plants densely cespitose; culm purple-red coloration extending 0.3-6 (-3.9) cm up from base; widest leaves 3.3-6.8 (-9.1) mm wide; perigynia spirally imbricate; achene stipe (0.2-) 0.3-0.6 mm mm long; ................................................................. C. planispicata

16. Perigynia (1.5-) 1.9-2.2 mm wide, (2.2-) 2.5-3.1 x as long as wide ................................................................. C. amphibola

17. Perigynia (1.7-) 1.8-2.6 mm wide, 1.8-2.4 (-2.6) x as long as wide. ................................................................. C. corrugata

18. Widest leaves 3.3-5.6 (-8.0) mm wide; achene stipe (0.3-) 0.4-0.6 mm long ................................................................. C. grisea

[add C. acidicola, C. thornei]
5 Perigynia 3.0-4.6 mm long, 1.4-2.0 mm wide; perigynium beaks very short to short, the orifice bidentate; leaf blades 2-6 mm wide.
6 Perigynia 3.0-4.0 mm long, 1.5-1.75 mm wide; leaves 2-4 mm wide .......................................................... *C. aestivaliformis*
7 Perigynia 3.5-6 mm long, 1.75-2.0 mm wide; leaves 3-8 mm wide.
7 Upper pistillate scales awned; perigynia 4.5-6 mm long; leaves 4-8 mm wide ................................................. *C. davisi*
8 Perigynia beakless, when mature more-or-less triangular in ×-section (or hemispheric) and with no faces flattish; blades glabrous or glabrate............................................................... *C. caroliniana*
9 Perigynia with a short but distinct beak, when mature more-or-less rounded in ×-section and with no faces flattish; blades glabrous or glabrate; pistillate spikes 4-7 mm wide.
10 Perigynia papillose, or with few scattered hairs; larger lateral spikes (3.5-) 4-8 mm wide; ligules as wide as long. 
11 Perigynia 3.0-4.0 mm long, 1.5-1.75 mm wide; leaves 2-4 mm wide .......................................................... *C. bushii*

**[26ff] Section 23c – section Hymenochlaenae (the "Sylvaticae" group)**

1 Achene sessile in the base of the perigynium; perigynia 3.2-6 mm long; sterile shoots with leaves 5-10 mm wide; [either alien and rarely naturalized in our area, or native in our area].
2 Perigynia 3.2-4.8 mm long, abruptly narrowed to a short stipe; [native, of northern hardwoods forests in the Mountains of NC and VA].................................................. *C. arctica*
3 Perigynia 5-6 mm long, sessile; [alien, rarely naturalized in our area] ................................................................. *C. sylvatica*
4 Perigynia puberulent, (5-) avg. 7 (-9) mm long; pistillate scales usually with the midrib excurrent as a short awn ........ *C. deblis*
5 Perigynia papillose, (5-) avg. 6.2 (-7.7) mm long; pistillate scales about equal to perigynia ....................................... *C. caroliniana*
6 Perigynia 7.0 (-10) mm long, broadest below the middle, tapering with straight or slightly convex sides to a conspicuous beak with a hyaline tip; [of swamps, bogs, and other moist to wet habitats, nearly throughout our area] ................................................................. *C. complanata*

**[26ii] Section 24 – section Porocystis (Virencses)**

A section of 10 species, of temperate North America, Central America, and South America. References: Ball in FNA (2002b).

1 Terminal spike staminate (rarely gynecandrous, with fewer than 25% of the flowers pistillate).............................. *C. pallescens*
2 Perigynia densely pubescent; larger lateral spikes 2-4 mm wide; ligules longer than wide.
3 Terminal spikes 5-15 (-20) mm long; anthers 0.7-1.3 (-1.6) mm long ................................................................. *C. swanii*
4 Terminal spikes (18-) 20-35 mm long; anthers (1.0-) 1.6-2.0 (-2.8) mm long .......................................................... *C. virens*
5 Perigynia glabrous, or minutely papillose, or with few scattered hairs; larger lateral spikes (3.5-) 4-8 mm wide; ligules as wide as long.
6 Perigynia puberulent, (5-) 6.4 (-avg. 7.2 (-8.1) mm long; pistillate scales usually much shorter than perigynia; pistillate spikes 6-10 mm wide.

**[26kk] Section 25 – section Anomalae**

One species ................................................................................................................................................................................. *C. scabrata*

**[26li] Section 26 – section Hallerianae**

1 Perigynia densely white-villous apically, glabrous basally; achene body 2.0-2.7 mm long, long-stipitate .......................................................... *C. dasycarpa*
2 Perigynia puberulent throughout; achene body 3.0-3.3 mm long, sessile ................................................................. *C. tenax*

**[26nn] Section 27 – section Hirtifoliae**

One species ................................................................................................................................................................................. *C. hirtifolia*
A section of about 35 species, mostly of temperate Asia and North America. References: Reznicek & Catling in FNA (2002b); Reznicek (1993).

**Identification notes:** All species of this section in our area form large clonal colonies by rhizomes.

1. Perigynia body pubescent.
2. Culms central, with the withered remains of the previous year’s leaves at the base; basal sheaths of fertile culms at most narrowly entire; [of the Coastal Plain] ................................................................. *C. striata* var. *striata*
3. Culms lateral, with bladeless sheaths at the base; basal sheaths strongly redden; [collectively widespread in our area].
4. Beak of the perigynium soft, translucent, the teeth obscure; peduncle of staminate spike 0.2-2 mm long; [of the Piedmont and Coastal Plain in our area] ......................................................................................................................... *C. vestita*
5. Beak of the perigynium stiff, opaque, the teeth well-developed; peduncle of staminate spike (0.8-) 2-9 cm long; [of the Mountains in our area].
6. Leaves folded along the midrib, appearing 0.7-2.0 (-2.2) mm wide; culms obtusely trigonous, usually smooth; base of pistillate bracts often auriculate, forming a V-shaped mouth; middle staminate scales narrowly acute …………………… *C. lasiocarpa* var. *americana*
7. Leaves more-or-less flat or M-shaped, (1.8-) 2.2-4.5 (-6) mm wide; culms acutely trigonous, often scabrous on the angles; base of pistillate bract with a short, truncate process at mouth; middle staminate scales obtuse and short-awned, or acute ……………… *C. pellita*

**[26oo] Section 28 – section Paludosae**

1. Perigynia pubescent; leaf blades glabrous or pubescent abaxially, but not papillose; vegetative culms hard.
2. Culms densely to loosely cespitose, the rhizomes connecting individual culms in a clump < 10 cm long; staminate scales (at least some of them) with a distinct, scabrous awn; perigynia 6-25-nerved.
3. Perigynia 6-12-nerved, the nerves separate nearly to the beak apex; perigynium bodies broadly ellipsoid to more or less globose, (1.8-) 2.0-4.2 mm wide; achenes round-papillate.
4. Spikes 9-14 (-15) mm thick; widest leaves 2.4-4.0 (-5) mm wide; spikes usually 2.5-3.5× as long as wide; perigynia 4.8-6.6 (-7.6) mm long, the beaks usually 0.7-1.3× as long as the body .............................................................................................................. *C. baileyi*
5. Spikes (12-) 15-22 mm thick; widest leaves (4-) 4.5-13 mm wide; spikes usually < 2.5× as long as wide if < 15 mm thick; perigynia (6-) 6.5 (-10.8) mm long, the beaks 0.6-0.9× as long as the body ......................................................................................... *C. lurida*
6. Perigynia 12-25-nerved, the nerves (except for 2 prominent laterals) confluent at or below the middle of the beak; perigynium bodies ellipsoid to lance-ovoid, 1.1-2.2 mm wide; achenes smooth.
7. Mature perigynium spreading or ascending when mature; perigynia round in cross-section; teeth of the perigynium beak 0.3-0.9 mm long, straight …................................................................. *C. hystericina*
8. Mature perigynium reflexed when mature; perigynium oblong-trigoneous to subglobose, 0.3-1.2 mm thick; [of the Mountains in our area] ......................................................................................... *C. comosa*
9. Pistillate scales smooth, oblong-trigoneous, awnless (rarely the lowermost scales awned in *C. strictula*).
10. Leaves filiform-involute, wiry, (0.5-) 1-3 (-3.2) mm wide; stems round or obtusely trigonous in cross-section, smooth; [rare, in high elevation bogs in the Mountains] ................................................................. *C. oligosperma*
11. Leaves flat, U-, V-, or W-shaped in cross-section, the widest 1.5-12 (-15) mm wide; stems round to trigonous, often scabrous-angled; [collectively widespread].

**[26pp] Section 29 – section Carex**

1. Perigynia glabrous; leaf blades finely papillose on the lower surface (and also usually long-pubescent); vegetative culms hollow, spongy (flattened when pressed) .......................................................................................................................................................... *C. hirta*
2. Leaf blades pubescent; [rare introduction] .................................................................................................................................................................................................. *C. trichocarpa*
1. Sheath of uppermost leaf absent or <1.5 cm long; beak of perigynium 1.5-4.2 mm long; achenes with elliptic or obovate sides.

2. Perigynia 6.4-10.7 mm long, 2.6-3.9× as long as wide .......................................................................................

3. Pistillate spikes globose or short ovoid, ca. 3-20-flowered; [plants of the Coastal Plain from e. NC southward]...............C. elliottii

4. Pistillate spikes cylindric, ca. 20-150-flowered; [plants collectively of the Mountains, from nw. NC northward].

5. Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) (2.5-) 3-9× as long as the inflorescence; staminate spike often 1, slightly (if at all) elevated above the summit of the crowded pistillate spikes; perigynium reflexed ................................................................. C. retorsa

6. Perigynia 1-4.5 mm long; widest leaves 1.5-15 mm wide.

7. Pistillate spikes globose or short ovoid, ca. 3-20-flowered; [plants of the Coastal Plain from e. NC southward]...............C. elliottii

8. Pistillate spikes cylindric, ca. 20-150-flowered; [plants collectively of the Mountains, from nw. NC northward].

9. Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) (2.5-) 3-9× as long as the inflorescence; staminate spikes 2-4 (-5), well elevated above the summit of the crowded pistillate spikes; perigynia spreading or ascending.

10. Perigynia lanceoloid to ovoid, convex to the base, 1-12 (-20) per spike, ascending to spreading (the lowest sometimes slightly reflexed) and therefore forming an ovoid to obovate spike.

11. Widest leaf blades (3.5-) 5-18 mm wide; bract sheaths truncate to convex at the apex; [collectively widespread in our area].

12. Widest leaf blades 1.6-3.5 (-4.2) mm wide; bract sheaths concave at the apex; [of MD northward] ........................................C. michauxiana

13. Pistillate scales smooth, 1.5-4.2 mm long; beaks 1-4.2 (-4.8) mm long, scabrous or smooth.

14. Perigynia beaks finely scabrous (at least near the tip and on the teeth), 2.4-4.2 (-4.8) mm long; widest leaves 1.8-4.3 (-5) mm wide.

15. Perigynia beaks smooth, 1.4-5 mm long; widest leaves 1.5-15 mm wide.

16. Pistillate spikes globose or short ovoid, ca. 3-20-flowered; [plants of the Coastal Plain from e. NC southward]...............C. elliottii

17. Pistillate spikes cylindric, ca. 20-150-flowered; [plants collectively of the Mountains, from nw. NC northward].

18. Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) (2.5-) 3-9× as long as the inflorescence; staminate spikes 2-4 (-5), well elevated above the summit of the crowded pistillate spikes; perigynia spreading or ascending.

19. Perigynia lanceoloid to ovoid, convex to the base, 1-12 (-20) per spike, ascending to spreading (the lowest sometimes slightly reflexed) and therefore forming an ovoid to obovate spike.

20. Widest leaf blades (3.5-) 5-18 mm wide; bract sheaths truncate to convex at the apex; [collectively widespread in our area].

21. Pistillate scales usually awned (rarely merely cuspidate); pistillate scales (including the awn, if present) 0.5-1.2× as long as the inflorescence; staminate spikes 2-4 (-5), well elevated above the summit of the crowded pistillate spikes; perigynia spreading or ascending.

22. Perigynia 5-8 mm wide at the widest point; achenes broadest at the middle, smoothly rounded to the tip; style of mature achene straight and nearly equaling or surpassing the perigynium; larger leaves mostly 4-12 mm wide; pistillate spikes normally not stamineate at apex; [primarily of the Coastal Plain] .......................

23. Pistillate scales usually awned (rarely merely cuspidate); pistillate scales (including the awn, if present) 0.3-0.6× as long as the perigynia; larger leaves mostly 4-12 mm wide; pistillate spikes normally not stamineate at apex; [primarily of the Coastal Plain] .......................

24. Pistillate scales smooth, 1-4.5 mm long; widest leaves 1.5-15 mm wide.

25. Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) (2.5-) 3-9× as long as the inflorescence; staminate spike often 1, slightly (if at all) elevated above the summit of the crowded pistillate spikes; perigynium reflexed ................................................................. C. retorsa

26. Perigynia 1-4.5 mm long; widest leaves 1.5-15 mm wide.

27. Pistillate spikes globose or short ovoid, ca. 3-20-flowered; [plants of the Coastal Plain from e. NC southward]...............C. elliottii

28. Pistillate spikes cylindric, ca. 20-150-flowered; [plants collectively of the Mountains, from nw. NC northward].

29. Bract of lowest pistillate spike (excepting isolated spikes from long-sheathing bracts on the lower part of the stem) (2.5-) 3-9× as long as the inflorescence; staminate spikes 2-4 (-5), well elevated above the summit of the crowded pistillate spikes; perigynia spreading or ascending.

30. Perigynia lanceoloid to ovoid, convex to the base, 1-12 (-20) per spike, ascending to spreading (the lowest sometimes slightly reflexed) and therefore forming an ovoid to obovate spike.

31. Widest leaf blades (3.5-) 5-18 mm wide; bract sheaths truncate to convex at the apex; [collectively widespread in our area].

32. Pistillate scales usually awned (rarely merely cuspidate); pistillate scales (including the awn, if present) 0.5-1.2× as long as the inflorescence; staminate spikes 2-4 (-5), well elevated above the summit of the crowded pistillate spikes; perigynia spreading or ascending.

33. Pistillate scales smooth, 1-4.5 mm long; widest leaves 1.5-15 mm wide.
210

Cyperaceae

2 Pistillate scales 0.4-0.9 (-1.1) mm wide, the body wide and translucent; staminate scales 0.9-1.6 mm wide, tightly imbricate in the spike; plants colonial, long-rhizomatous......................................................... C. aureolens
2 Pistillate scales 0.1-0.4 mm wide, the body narrow and indistinct; staminate scales 0.3-0.8 mm wide, irregularly imbricate with spreading tips; plant cespitose, short-rhizomatous......................................................... C. distans
1 Terminal spike gynoecandrous, mainly pistillate; pistillate scales awnless, or with a short awn not surpassing the perigynium; achenes 2.0-3.0 mm long.
3 Achene 1.9-2.5× as long as wide; style persistent, strongly kinked at the base; spikes 1-2 (-3) per stem........................................... C. squarrosa
3 Achene 1.2-1.9× as long as wide; style deciduous, straight or slightly curved; spikes (1-) 2-4 (-6) per stem........................................... C. typhina

[26v] Section 35 – section Shortianae

One species...................................................................................................................................................................... C. shortiana

[26w] Section 36 – section Spirostachyae (Extensae)

1 Leaves of flowering stems flat, the widest 3.3-5.0 mm wide................................................................. C. distans
1 Leaves of flowering stems channeled or involute, the widest 1.0-3.5 (-4.3) mm wide ..................................................... C. extensa

[26x] Section 37 – section Ceratocystis

1 Pistillate scales coppery brown; terminal (staminate) spike 6-24 mm long; pistillate spikes 2-5 per culm; culms 1-8 dm tall; [of calcareous seepages in the Mountains of VA and northward] ................................................................. C. flava
1 Pistillate scales yellowish green; terminal (staminate) spike 12-39 mm long; pistillate spikes 1-5 per culm; culms 1-12.5 dm tall; [either of calcareous savannas of the Coastal Plain of NC, or of acid situations in NJ and northward]
2 Pistillate scales yellowish-green; terminal (staminate) spike 12-21 mm long; pistillate spikes (1-) 2-5 per culm; culms 1-5 dm tall; [of acid situations in NJ and northward] ................................................................. C. cryptolepis
2 Pistillate scales yellowish green; terminal (staminate) spike (9-) 17-39 mm long; pistillate spikes 1-2 (-3) per culm; culms 5-12.5 dm tall; [of calcareous savannas of the Coastal Plain of NC] ................................................................. C. lutea

[26aaa] Section 38 – section Leucoglochin (Orthocerates)

One species...................................................................................................................................................................... C. pauciflora

[26bbb] Section 39 – section Acrocystis (Montanae)

[by D.B. Poindexter & A.S. Weakley]

A section of ca. 35 species, subcosmopolitan in temperate and boreal regions. References: Crins & Rettig in FNA (2002b); Rettig (1988); Cusick (1992); Rettig & Crins (1996); Werier (2006); Sorrie et al. (in prep.); Poindexter et al. (in prep.). Key based in part on Rettig (1988), Werier (2006), C, and M.

1 Spikes borne above the middle of the primary culm, but also with pistillate spikes borne on short or elongate peduncles from the sheathed base of the culm (referred to as subradical or basal spikes).
2 Culms usually delicate and flexuous; subradical pistillate spikes born on slender elongate peduncles, not densely aggregated at the base of the plant; terminal staminate spikes almost always with at least one approximate pistillate spike.
3 Perigynia (2.2-) 2.6-3.1 (-3.2) mm long, subglobose to obovoid, occasionally papillate (view at 45x); pistillate scales often shorter than the body of mature perigynia; staminate spike 3.5-5.9 (-6.7) mm long: lowest proximal pistillate bract “flag-like”, usually exceeding the staminate spike; leaves generally broader, 0.9-2.6 (-3.2) mm wide [north temperate, arctic-boreal] ................. C. deflexa var. deflexa
3 Perigynia (2.0-) 2.3-2.6 (-3.0) mm long, ovoid-ellipsoid to narrowly obovate (occasionally subglobose), distinctly papillate; pistillate scales often subequal to longer than the body of mature perigynia; lowest proximal pistillate bract shorter or longer than the staminate spike but very thin, not “flag-like”; staminate spike 3-11 (-16) mm long; leaves thin, delicate 0.4-2.0 (-2.4) mm wide.
4 Terminal staminate spike 3-9 mm, always closely aggregated with (1-) 2 (-3) sessile pistillate spikes; perigynia elliptic or narrowly obovate; perigynium body glabrate, with large conspicuous papillae and rarely small trichomes conflined to the beak and distal end; lowest proximal pistillate bract often exceeding the staminate spike; leaves greatly exceeding the culms; [of the se. Coastal Plain] ...

................................................................................................................................................................................................. Carex species 1
4 Terminal staminate spike 6-11 (-16) mm, some culms with staminate spikes elevated above 1 (-2) sessile to sub sessile pistillate spikes; perigynia ovoid-ellipsoid to subglobose; perigynium body pubescent with short trichomes and minute papillae; lowest proximal pistillate bract shorter than the staminate spike; leaves shorter than to exceeding the culms; [of the Southern Appalachian Mountains and ne. US] ................................................................. Carex species 2
2 Culms thick and erect; subradical pistillate spikes born on rigid, often short peduncles and densely aggregated at the base of the plant; terminal staminate spikes often alone or associated with a pistillate spike.
5 Perigynia (2.2-) 2.3-3.2 (-3.3) mm long, beaks (0.4-) 0.5-0.9 mm long; young leaves long, thin and flexuous................. C. umbellata
Spikes all borne close together above the middle of the primary culm (i.e., lacking additional basal spikes originating from the same sheaths); some taxa may exhibit naturally short individual culms (e.g., \( C. \) emmonsii, \( C. \) nigromarginata, \( C. \) reznicekii).

Body of the perigynia (excluding the beak and the contracted base) ellipsoid, distinctly longer than wide or thick, often also wider than thick, and slightly trigonous.

Plants with conspicuously long rhizomes, forming clonal patches; perigynia typically papillate [collectively of the Coastal Plain and, less commonly, Piedmont].

Achene body (1.4-) 1.5-1.7 (-2.0) mm long, biconvex, trigonous, or both; fertile culms 7-17 cm tall, usually much shorter than the leaves; basal sheaths usually not fibroillose; perigynia (2.7-) 3.0-3.7 (-4.2) mm long ......................................................................................................................... \( C. \) floridana

Achene body (1.1-) 1.2-1.3 (-1.4) mm long, trigonous; fertile culms 20-43 cm tall, equalling or exceeding the leaves; basal sheaths usually not fibroillose; perigynia (2.3-) 2.6-3.0 (-3.4) mm long ......................................................................................................................... \( C. \) physorhyncha

Plants cespitose (sometimes only loosely so from slender rhizomes in \( C. \) novae-angliae); perigynia papillate not evident to rather conspicuous [collectively widespread in our area].

Pistillate scales usually shorter than the body of the mature perigynia they subtend, perigynia without easily discernable papillae, lowest 2 pistillate spikes remote, several separated by > 7 mm, staminate spike often elevated above pistillate spikes; leaves thin, delicate 0.7-1.5 mm wide......................................................................................................................... \( C. \) novae-angliae

Pistillate scales mostly longer than the body of the mature perigynia they subtend, perigynia with discernable papillae, lowermost 2 pistillate spikes overlapping, usually separated by < 7 mm, staminate spike often closely associated with pistillate spikes; leaves various.

Achene body (1.3-) 1.4-1.6 (-1.7) mm long; fertile culms mostly 2-20 cm tall.

Culms usually variable in length, (4.5-) 6.6-38 (-51) cm tall; widest leaf (1-) 2.3-4.5 mm wide; at least some pistillate scales often with reddish to purplish/black color below the distal tip extending laterally from near the margin to the green or brown longitudinal mid-stripe on either side of midvein ......................................................................................................................... \( C. \) nigromarginata

Culms subequal in length, height 1.9-9.9 (-13.7) cm tall, widest leaf 1.2-2.2 (-2.5) mm wide; any reddish color on pistillate scales below the distal tip not extending laterally from near the margin to the green or brown longitudinal mid-stripe on either side of midvein ......................................................................................................................... \( C. \) reznicekii

Achene body (0.9-) 1.2-1.3 (-1.5) mm long; fertile culms mostly 17-35 cm tall; pistillate scales (2.0-) 2.5-3.1 (-3.2) mm long.  

Scales of the median portion of the staminate spike with a weak to moderately prominent midrib usually not extending to the tip, and minute teeth rarely present on the midrib (visible at 15× or greater); perigynium teeth mostly 0.2-0.3 mm long; staminate spike 8.4-11.1 mm long; culms erect to ascending, equalling or exceeding the leaves, the inflorescence typically conspicuous; pistillate scales with green midrib, hyaline margins, and usually reddish-tinted; mostly of loamy or clayey soils of the Piedmont and Mountains] ......................................................................................................................... \( C. \) albicans

Scales of the median portion of the staminate spike either with a strong, prominent midrib extending to the tip (or even aristate), and with minute teeth usually present on the midrib (visible at 15× or greater); perigynium teeth mostly 0.15-0.25 mm long; staminate spike 5.0-8.5 mm long; culms lax or weakly ascending, often shorter than, curving under, and more-or-less hidden by the leaves; pistillate scales with green midrib, hyaline margins, and only rarely reddish-tinted; mostly of acid, sandy soils of the Coastal Plain] ......................................................................................................................... \( C. \) emmonsii

\[26cc\] Section 40 – Clandestineae (Digitateae)

Pistillate scales short-awned......................................................................................................................... \( C. \) pedunculata

Pistillate scales acute......................................................................................................................... \( C. \) richardsonii

\[26ddd\] Section 41 – section Pictae

A monotypic section, of North America and the West Indies. References: Cochrane in FNA (2002b).

1 Plants monoecious, with 3-8 spikes per stem; leaf blades 4-8 mm wide, glaucous on the upper surface; [of the East Gulf Coastal Plain, east to sw. GA and Panhandle FL].................................................. C. baltzellii

1 Plants dioecious, with a single unisexual spike per stem; leaf blades 2-4.5 mm wide, green on the upper surface; [of areas west of area, east to c. TN and nc. GA].......................................................... C. picta

[26ff] Section 42 – section Mitrateae (Praecoces)

A section of ca. 20 species, of Europe, e. Asia, and Australia. References: Standley in FNA (2002b).

1 Plant cespitose; lowest inflorescence bract longer than the inflorescence .................................................. C. breviculmis

1 Plant from creeping rhizomes; lowest inflorescence bract much shorter than the inflorescence .................. C. caryophyllea

[26ggg] Section 43 – section Albae

A section of 4 species, north temperate. References: Ball in FNA (2002b).

One species........................................................................................................................................................................ C. eburnea

[26kkk] Section 44 – section Phyllostachyae

1 Achenes subglobose, 1-1.5× as long as wide; staminate scales more or less truncate.

2 Tallest culm 3.2-9.1 cm high, 15-32% of plant height; terminal spike with 4-8 perigynia; wider leaves with hyaline margins 0.05-0.2 mm wide; hyaline margins of distal pistillate scales 0.05-0.3 mm wide; perigynium beak 30-38% (-43%) of perigynium length; [of calcareous glades in w. VA and north and west of our area]............................................................. C. juniperorum

2 Tallest culm 9.0-41 cm high, 39-86% of plant height; terminal spike with 1-9 perigynia; wider leaves with green margins; hyaline margins of distal pistillate scales 0.3-0.7 mm wide; perigynium beak 34-53% of perigynium length; [of rich forests or rocky calcareous glades and woodlands].

3 Longest (per plant) staminate portion of terminal spike (4.9-) 5.8-13.5 mm long; proximalmost staminate scale in terminal spike 1.1-1.8 (-2.1) mm long, 13-26 (-35%) of length of staminate portion of terminal spike; perigynium beaks (1.9-) 2.3-3.9 mm long, 39-53% of perigynium length; shoot bases lacking red-purple; [of rich mesic forests widespread in our area, especially VA]......................... C. jamesii

3 Longest (per plant) staminate portion of terminal spike 3.4-5.6 (-6.2) mm long; proximalmost staminate scale in terminal spike (1.9-) 2.1-3.3 mm long, (35-) 44-77% of length of staminate portion of terminal spike; perigynium beaks 1.4-2.3 (-2.5) mm long, 34-44% of perigynium length; shoot bases tinged with reddish-purple; [of c. TN and c. KY and westward].......................................................... C. timida

1 Achenes ellipsoid, 1.5-2.0× as long as wide; staminate scales more or less truncate.

4 Tallest culm 0.18-0.38× as tall as plant; perigynia (7.0-) 7.5-10.8 mm long; perigynium beaks (3.6-) 4.1-6.4 mm long; culms erect; peduncles usually erect to spreading .............................................. C. superata

4 Tallest culm 0.41-0.87× as tall as plant; perigynia 4.5-8.0 mm long; perigynium beaks 1.7-4.3 mm long; culms erect to spreading; peduncles usually widely spreading to nodding.

5 Longest staminate portion of terminal spikes 12.7-25.6 mm long; perigynia 5.8-8.0 mm long; perigynium beaks 2.5-4.3 mm long; achenes (2.4-) 2.6-3.4 mm long ........................................ C. basiantha

5 Longest staminate portion of terminal spikes 4.9-5.7 (-6.5) mm long; perigynia 4.5-5.7 (-6.5) mm long; perigynium beaks 1.7-2.6 (-2.8) mm long; achenes 1.8-2.6 mm long........................................ C. willdenowii

[26mmmm] Section 46 – section Leptocephalae (Polytrichoidae)

A monotypic section, of North America and the West Indies. References: Cochrane in FNA (2002b).

1 Perigynia 3.4-4.9 (-5.4) mm long; pistillate scales whitish .................................................. C. leptalea var. harperi

1 Perigynia 2.5-3.5 mm long; pistillate scales pale brown, with green midrib ........................................ C. leptalea var. leptalea

Section 47 – “Cymophyllus”

One species........................................................................................................................................................................ C. fraseriana

C. abscondita Mackenzie. Rich bottomlands and other forests. April-June. MA south to Panhandle FL, west to TX and OK, and scattered inland. See C. magnifolia for discussion of the two taxa. Naczi (1999b) reports a chromosome number of n = 24. [< C. abscondita – RAB, K (also see C. cumberlandensis and C. magnifolia); < C. abscondita – C, G, M, S, W (also see C. cumberlandensis); < C. abscondita – F; > C. abscondita var. abscondita – F; > C. abscondita var. rostellata Fernald – F]

C. acidicola Naczi (section Griseae). Mesic forests. NC. GA and c. AL south to sw. GA (Naczi, Bryson, & Cochrane 2002). [= FNA] [not yet keyed; Griseae]

C. artitecta – F, FNA, K

C. aestivaliformis Mackenzie. Wet meadows (VA), upland submesic forests (GA). Considered by some to be a hybrid, but with little known documentation or evidence for or against its alleged hybrid status; further study is needed. [= C, G, M; = C. aestivaliformis – F, FNA, K]

C. aestivalis M.A. Curtis ex A. Gray, Summer Sedge. Dry mesic to mesic forests, moist rock outcrops at medium to high elevations. May-June. VT south to GA and AL, in or near the Appalachians. [= RAB, C, F, FNA, G, K, M, S, W]

C. aggregata Mackenzie. Rich forests and woodlands. May-June. NY, ON, MN, and SD, south to nc. NC, n. AL, s. MS, and OK. Other useful characters include: culms relatively smooth; pistillate scales sharp-pointed, the tip reaching to about the base of the perynium; and perigynia nerveless. [= F, FNA, K, M; = C. sparganioides Muhlenberg ex Willdenow var. aggregata (Mackenzie) Gleason – C, G]

C. alba

C. alata Torrey. Bottomland forests, marshes. May-June. NH, MI, and MO south to c. peninsular FL and TX. [= RAB, C, F, FNA, G, GW, K, W, WH; < C. alata – S (also see C. vexans)]

C. alboptertoides Schweinitz. Low fields, bottomlands. May-June. MA, NY, WI, and MO, south to Panhandle FL and TX. [= C, F, FNA, K, WH; < C. alboptertoides – RAB, G, GW, W (also see C. longii); C. straminea misapplied]

C. albosaccus Torrey. Bottomland forests, marshes. May-June. NH, MI, and MO south to c. peninsular FL and TX. [= RAB, C, F, FNA, G, GW, K, W, WH; < C. alata – S (also see C. vexans)]

C. albuscens Schweinitz. May-June. MA, s. ON, MI, IL, MO, and OK, south to GA, AL, MS, LA, and TX. [= RAB, C, F, FNA, G, M, S; = C. amphibola var. amphibola – F, K; < C. amphibola – GW]

C. alopecoidea Tuckerman. Seasonally saturated situations, typically over calcareous substrates. NS west to SK, south to DC, MD, WV, KY, TN, and IA (Standley in FNA 2002b). [= FNA, K] [synonymy incomplete; not yet keyed; Vulpinae]

C. amphibola Steudel. Moist loamy forests, bottomlands, slopes, uplands. [distribution and abundance in our area needing additional herbarium investigation] May-June. MA, s. ON, MI, IL, MO, and OK, south to GA, AL, MS, LA, and TX. [= RAB, FNA, G, M, S; = C. amphibola var. amphibola – F, K; < C. amphibola – GW]

C. aquatilis Wahlberg, Aquatic Sedge. Mountaintop ponds (with Dulichium arundinaceum, Vaccinium macrocarpon, Juncus canadensis, and Utricularia sp.), mafic fen at high elevation. NL (Newfoundland) west to ND, south to NJ, s. PA, OH, IN, IA, and NE; disjunct in w. VA (Augusta County) and nw. NC (Ashe County); n. Eurasia. First reported for VA by Wieboldt et al. (1998). [= G; > C. aquatilis Wahlberg var. substricta Kükenthal – C, FNA; > C. aquatilis var. altior (Rydberg) Fernald – F; > C. aquatilis var. aquatilis – K; > C. aquatilis (Kükenthal) Mackenzie – M]

C. arctica W. Boott, Black Sedge, Drooping Woodland Sedge. Northern hardwood and spruce forests, bog edges. NL (Newfoundland) west to MN, south to PA, w. VA, nw. NC (Long Hope Valley, Ashe County), and OH. First reported for VA (Highland County) by Fleming & Ludwig (1996). [= F, FNA, G, K, M]

C. arenaria Linnaeus, Sand Sedge. Moist to dry sandy hammocks; probably introduced from Europe. May-June. Fernald (1950) considers this plant native in se. VA, and populations of it in Carolina Beach State Park, New Hanover County,
NC, certainly appear native. In North America, known from DE south to se. NC; also on ballast in OR (Mackenzie 1931-1935). [= RAB, C, F, FNA, G, K, M]

**Carex argyrantha** Tuckerman, Silvery-flowered Sedge, Hay Sedge. Wet meadows or dry soils. NB west to ON, south to w. NC, e. TN (Unicoi County), and OH. June-August. [= RAB, C, F, G, K, W; *C. aenea*, misapplied]

**Carex arkansana** (L.H. Bailey) L.H. Bailey, Arkansas Sedge. Seasonally wet meadow in former railroad yard. June. Native range from s. IL, n. MO, and e. KS south through AR and OK to e. TX. See Simmons, Strong, & Parrish (2008) for additional information on the Virginia occurrence. [= FNA] {not yet keyed}

**Carex atherodes** Sprengel, Awned Sedge. Marl fens. Circumboreal, south in North America to NY, n. VA, n. WV, MO, CO, UT, and OR. [= C, FNA, G, K, M]

**Carex atlantica** L.H. Bailey. Bogs and seeps. May-June. NH south to KY, IL, and NE south to n. peninsular FL, Panhandle FL, TX, NM, Coahuila, and Nuevo León; South America. [= FNA; < *C. frankii* – RAB, C, F, G, GW, K, M, S, W, WH] {not yet mapped}

**Carex aureolensis** Steudel. Floodplain forests and marshes; uncommon. {separate from *C. frankii*} {Pd, Mt, Cp (NC, SC, VA): bottomland forests. May-July.} VA, KY, IL, and NE south to n. peninsular FL, Panhandle FL, TX, NM, Coahuila, and Nuevo León; South America. [= FNA; < *C. frankii* – RAB, C, F, G, GW, K, M, S, W, WH] {not yet mapped}

**Carex aureolaensis** Steudel. Floodplain forests and marshes; uncommon. {separate from *C. frankii*} {Pd, Mt, Cp (NC, SC, VA): bottomland forests. May-July.} VA, KY, IL, and NE south to n. peninsular FL, Panhandle FL, TX, NM, Coahuila, and Nuevo León; South America. [= FNA; < *C. frankii* – RAB, C, F, G, GW, K, M, S, W, WH] {not yet mapped}

**Carex austrocaroliniana** L.H. Bailey, South Carolina Sedge. Nutrient-rich, moist coves in the sw. mountains of NC and adjacent SC, often with some seepage. April-May. Endemic to the southern end of the Southern Appalachians, in Blue Ridge of sw. NC, ne. SC, n. GA, and e. TN, extending west to the Cumberland Plateau of TN. Naczi (1999b) reports a chromosome number of n = 28-30. [= FNA, K, W; = *C. austro-caroliniana* – RAB, M, S, orthographic variant]

**Carex baltzellii** Chapman, Baltzell’s Sedge. Steepheads, beech-magnolia slopes, and mesic to dry-mesic hammocks. Sw. GA and Panhandle FL west to s. AL and s. MS. [= FNA, K, M, S, WH]

**Carex barrettii** Schweinitz & Torrey, Barratt’s Sedge. Peaty bogs and marshes. April-May. CT south to NC (at least formerly), on the Coastal Plain, and disjunct inland in places with many Coastal Plain affinities, as in w. VA (Augusta County), sw. NC (Henderson County, where now extirpated), nw. SC, sc. TN (Coffee County), n. GA, and n. AL. This species flowers and fruits rarely. Reported for South Carolina by Hill & Horn (1997) and Horn (1999). [= RAB, C, F, FNA, G, K, M, S, WH]

**Carex basiantha** Steudel, Southern Willdenow's Sedge. Mesic forests, bottomlands, and lower slopes, over calcareous rocks or sediments. April-June. Se. NC south to n. peninsular FL, Panhandle FL, west to e. TX, and north to nw. GA, e. TN, and c. AR. [= FNA, K, WH; < *C. willdenovii* Schkuhr ex Willdenow – RAB; < *C. willdenovii* – S (also see *C. superata* and *C. willdenovii*) and orthographic variant; < *C. willdenovii* var. pauciflora Olney ex L.H. Bailey in J.M. Coulter; < *C. willdenovii* Schkuhr ex Willdenow var. megarrhyncha Hermann, missapplied]

**Carex bebbii** Olney ex Fernald. Calcareous wetlands. NL (Newfoundland), NL (Labrador) and AK south to NJ, nw. VA (Big Meadows, VA; Townsend, pers. comm. 2004), OH, IN, IL, NE, CO, and OR. [= C, F, FNA, G, K]
Carex bicknellii Britton. Prairie-like openings and barrens over gabbro. ME west to SK, south to DE, OH, MO, OK, and NM; disjunct in nc. SC. First reported for South Carolina by Hill & Horn (1997). [= FNA; = Carex bicknellii var. bicknellii – K; = C. bicknellii – C, F, G, M (also see C. opaca)]

Carex billingsii (O.W. Knight) C.D. Kirschbaum. Wet, boggy areas. NL (Newfoundland) and ON south to s. NJ (Ocean County), PA, and MI. See Kirschbaum (2007). [= Carex trispermum Dewey var. billingsii (O.W. Knight – C, F, FNA, G, K, M, S]

Carex biltmoreana Mackenzie, Biltmore Sedge. In thin soils on medium to high elevation granitic domes and other sloping rock outcrops, often dominant in thin-soil herbaceous mats, but also occurring in adjacent woodlands under open to nearly closed canopy of Quercus spp., Fraxinus americana, Carya glabra, and Juniperus virginiana var. virginiana. May-June. Endemic to sw. NC, nw. SC, and ne. GA (Rabun and Towns counties). This distinctive endemic sedge may be recognized by its robust size (culms to a meter tall, to 5 mm in diameter at the base), habit (large clumps on sloping rock outcrops), and restricted habitat (in periodic seepage on exfoliation domes). Once considered very rare, C. biltmoreana proves to be limited to a narrow range and distinctive habitat, but regularly present and even locally dominant on the 50-100 granitic domes within 100 km of Brevard, NC. It often occurs with other endemic species, such as Houstonia longifolia var. glabra, Krigma montana, Pycnanthemum montanum, and Packera millefolium. An excellent illustration appears in Massey et al. (1983). [= RAB, FNA, K, M, S, W]

Carex brevior (Dewey) Mackenzie ex Lunell. Dry forests and margins. May-June. MW west to BC, south to GA, c. TN, MS, TX, Tamaulipas, and AZ. [= F, FNA, G, K, W; = Carex festucacea – RAB, GW, = Carex brevior – C (also see C. molesta and C. molestiformis); = Carex festucacea Schkuhr ex Willdenow var. brevior (Dewey) Fernald]

Carex bromoides Willdenow ssp. bromoides, Common Brome Sedge. Swamp forests, bogs, seeps, hydric hammocks, other wetlands. May-July. Ssp. bromoides ranges from NB west to e. MN, south to c. peninsular FL and e. TX, and disjunct in Mexico. Naczi (1999b) reports a chromosome number of n = 32-34. [= FNA, K; = Carex bromoides – RAB, C, F, G, GW, M, S, W, WH]

Carex bromoides Willdenow ssp. montana Naczi, Blue Ridge Brome Sedge. Mountain bogs in the Blue Ridge, seepages in the Blue Ridge Escarpment. June-July. Ssp. montana is known only from sw. VA, w. NC, and nw. SC. This taxon needs further study in order to better understand its habitats and distribution. Naczi (1999b) provided additional evidence for its recognition, in the form of different chromosome numbers (n=30-31 for ssp. montana and n=32-34 for ssp. bromoides). [= FNA, K; = Carex bromoides – RAB, C, F, G, GW, M, S, W]

Carex brunnescens (Persoon) Poiret var. brunnescens. Reported for our area by FNA. [= F; = Carex brunnescens – RAB, C, G, M, S, W; = Carex brunnescens ssp. brunnescens – FNA, K] [rejected; not keyed]

Carex brunnescens (Persoon) Poiret var. sphaerostachya (Tuckerman) Kükenthal, Brown Sedge. Grassy balds, bogs, moist forests at moderate to high elevations. June-July. The species is circumboreal, in North America ranging south to NJ, OH, MI, and MN, south to w. NC, nw. SC, e. TN, and n. GA. Var. sphaerostachya is apparently the only infraspecific taxon (of four) to reach our area. See Gaddy (1981) for the report of this species in SC. [= F; = Carex brunnescens – RAB, C, G, M, S, W; = Carex brunnescens ssp. sphaerostachya (Tuckerman) Kalela – FNA, K]

Carex brysonii Naczi, Bryson’s Sedge. Mesic forests. Endemic to the Cumberland Plateau of n. AL. See Naczi (1993) for additional information. [= FNA, K]

Carex bulbostylis Mackenzie. Moist deciduous forests. April-May. MS west to TX and OK; disjunct in sw. TN. Reports for GA in Jones & Coile (1988) are probably based on misidentifications. [= FNA, K; = Carex amphibola Steudel var. globosa (L.H. Bailey) L.H. Bailey] [add to synonymy]

Carex bullata Schkuhr ex Willdenow. Bogs. May-June. NS south to GA, primarily on the Coastal Plain, but with scattered occurrences inland (as in AR and the Eastern Highland Rim of sc. TN). [= RAB, C, F, FNA, GW, K, M, S; = Carex bullata var. bullata – G; = Carex bullata var. greenii (Böckler) Fernald – G]

Carex canescens Linnaeus var. canescens, Silvery Sedge. Acidic bogs, other wetlands. Greenland and AK south to VA, IL, NM, and CA; South America; Eurasia; Australia. [= F, G; < C. canescens – C, M; = C. canescens ssp. canescens – FNA, K]

Carex canescens Linnaeus var. disjuncta Fernald, Silvery Sedge. Bogs, swamps, often in disturbed areas. June. NL (Newfoundland) west to MN, south to VA, NC, SC, OH, and IN. [= RAB, F, G; < C. canescens – C, M; = C. canescens ssp. disjuncta (Fernald) Toivonen – FNA, K]

Carex caryophyllea Latourette, Spring Sedge. Disturbed areas; native of Eurasia. [= C, F, FNA, G, K, M]

Carex castanea Wahlenberg, Chestnut Sedge. Calcareous sites. NL (Newfoundland) west to MB, south to NY, WI, MI, and MN. The alleged disjunct occurrence in TN cited in FNA is in error. [= C, F, FNA, G, K, M] {rejected; not keyed}

Carex cephaleoides (Dewey) Dewey. Basic forests. NB, ON, and MN south to MD, OH, IN, IL, and IA. [= F, FNA, K, M; = C. sparganioides Muhlenberg ex Willdenow var. cephaloides (Dewey) Carey – C, G]

Carex cephalophora Muhlenberg ex Willdenow. Deciduous forests. May-July. ME west to MN, south to Panhandle FL and TX. [= F, FNA, K, M, S; < C. cephalophora – RAB, W (also see C. mesochorea); = C. cephalophora var. cephalophora – C, G]

Carex chapmannii Steudel, Chapman's Sedge. Edges of calcareous pine savannas, calcareous slopes and bottomlands, mesic hammocks, stream terraces. April-May. Se. NC south to c. peninsular FL, on the Coastal Plain; allegedly disjunct in nc. TN (Chester et al. 1993). The affinities of this species are questionable; it is usually placed in section Paniceae, but may actually belong to Laxiliora. [= RAB, FNA, K, S; = C. chapmannii – M, WC, orthographic variant; = C. styloflexa Buckley var. fusiformis (Chapman ex Dewey) Wiegand]

Carex careyana Torrey ex Dewey, Carey's Sedge. Nutrient-rich moist forests, mostly over calcareous rocks. May-June. NY west to MI and IA, south to sw. NC, AL and MO. Naczi (1999b) reports a chromosome number of n = 34. [= C, F, FNA, G, K, M, W]

* Carex carphophila Latourrette, Spring Sedge. Disturbed areas; native of Eurasia. [= C, F, FNA, G, K, M]

Carex castanea Wahlenberg, Chestnut Sedge. Calcareous sites. NL (Newfoundland) west to MB, south to NY, WI, MI, and MN. The alleged disjunct occurrence in TN cited in FNA is in error. [= C, F, FNA, G, K, M] {rejected; not keyed}

Carex cephaloides (Dewey) Dewey. Basic forests. NB, ON, and MN south to MD, OH, IN, IL, and IA. [= F, FNA, K, M; = C. sparganioides Muhlenberg ex Willdenow var. cephaloides (Dewey) Carey – C, G]

Carex cephalophora Muhlenberg ex Willdenow. Deciduous forests. May-July. ME west to MN, south to Panhandle FL and TX. [= F, FNA, K, M, S; < C. cephalophora – RAB, W (also see C. mesochorea); = C. cephalophora var. cephalophora – C, G]

Carex chapmannii Steudel, Chapman's Sedge. Edges of calcareous pine savannas, calcareous slopes and bottomlands, mesic hammocks, stream terraces. April-May. Se. NC south to c. peninsular FL, on the Coastal Plain; allegedly disjunct in nc. TN (Chester et al. 1993). The affinities of this species are questionable; it is usually placed in section Paniceae, but may actually belong to Laxiliora. [= RAB, FNA, K, S; = C. chapmannii – M, WC, orthographic variant; = C. styloflexa Buckley var. fusiformis (Chapman ex Dewey) Wiegand]

Carex communis L.H. Bailey var. communis. Dry woodlands and forests. May-June. PE west to MN, south to n. SC, c. GA (Jones & Coile 1988), and AR. (= FNA, K; = C. communis – RAB, C, F, G, M, S, W)

Carex complanata Torrey & Hooker. Forests. May-June. NJ and s. PA south to n. peninsular FL and Panhandle FL, west to TX and MO; apparently disjunct in AZ. (= F, FNA, K, M, S; = C. complanata var. complanata – C, G; < C. complanata – RAB, GW, W, WH (also see C. bursitelloa))

Carex conoidea Schkuhr ex Willdenow, Field Sedge. Seepage and fen over mafic rocks (amphibolite). May-June. NL (Newfoundland) west to MN, south to nw. NC (Ashe Co. and Alleghany Co.) and MO. First found in NC by a party led by Asa Gray in 1841; recently located at a second site by D.B. Poindexter. (= RAB, C, F, FNA, G, K, M, S)

Carex crawei Dewey, Crawe's Sedge. Dry calcareous barrens. QC west to BC, south to NJ, w. VA, c. TN, AL, and AR. First reported for VA by Ludwig (1999). Naczi (1999b) reports a chromosome number of n = 30. (= C, F, FNA, G, K, M, S)

Carex crinita Lamarck var. brevicrina var. crinita. Swamps, wet forests. May-June. MA south to FL, west to TX, north in the interior to KY and MO. (= C, F, FNA, K; < C. crinita Lamarck var. crinita – RAB, G, GW; < C. crinita – M, S; < C. crinita – W (also see C. gynandra and C. mitchelliana))

Carex crinita Lamarck var. crinita. Swamps, wet forests, bogs. May-June. NL (Newfoundland) west to MN and AB, south to GA, TN, and AR. (= C, F, FNA, K; < C. crinita Lamarck var. crinita – RAB, G, GW; < C. crinita – M, S; < C. crinita – W (also see C. gynandra and C. mitchelliana))

Carex cristatella Britton, Crested Sedge. Grassy balds, bogs, wet meadows. May-June. VT west to SK, south to NC, KY, MO, and KS. See Fox, Godfrey, & Blomquist (1952) for the first report from NC. (= RAB, C, F, FNA, G, K, W)

Carex crus-corvi Shuttleworth ex Kunze, Crowfoot Sedge, Ravenfoot Sedge. Swamp forests, especially over calcareous substrates. May-June. Se. VA south to Panhandle FL, west to TX, north in the interior to IN, s. ON, MI, and MN. (= RAB, C, FNA, G, GW, K, M, S; > C. crus-corvi var. crus-corvi – F; > C. bayardii Fernald – F; > C. crus-corvi var. virginiana Fernald)

Carex cryptolepis Mackenzie. Acid, boggy sites. June-August. NL west to MN, south to NJ, NY, NJ. (= FNA, K)

{synonymy incomplete; section Ceratocystis}
**Cyperaceae**

*Carex cumberlandensis* Naczi, Kral, & Bryson, Cumberland Sedge. Rich, mesic, deciduous or mixed forests. May–June. Sw. PA, s. OH, s. IL south to c. NC, c. SC, c. GA, sc. AL, e. MS, and w. TN; disjunct in nw. AR. [= FNA; < *C. abscondis* – RAB, C, G, K, M, S, W; < *C. abscondis var. abscondis* – F]

*Carex cumulata* (Bailey) Fernald. Dry to wet acid barrens and glades. NL west to SK, south to NJ, PA, IN, and IL. {not yet keyed; synonymy incomplete; not yet mapped; section Ovales}

*Carex dasyacarpa* Muhlenberg, Velvet Sedge. Maritime forests, hammocks, other sandy forests. May–June. E. SC south to n. peninsular FL, west to MS. Gaddy & Rayner (1980) report this species from a number of barrier islands in Beaufort and Charleston counties, SC; it has since been found in Georgetown County, SC, as well. [= RAB, FNA, K, M, S, WH]

*Carex davisi* Schweinitz & Torrey, Davis's Sedge. Rich forests. VT, ON, and MN south to VA (Fairfax County) (Steyru 2004b), e. WV, nc. TN (Chester et al. 1993), AR, and TX. First reported for VA by Steury (2004b). [= C, F, FNA, G, K, M]

*Carex debilis* Michaux. Swamps, bogs, other moist to wet habitats. May–August. MA west to s. IN, south to n. peninsular FL, Panhandle FL, and TX. For other taxa often treated as varieties of *C. debilis*, see *C. allegheniensis* and *C. flexuosa*. [= M, S; = *C. debilis var. debilis* – RAB, C, F, FNA, G, K; < *C. debilis* – GW, WH (also see *C. allegheniensis* and *C. flexuosa*)]

*Carex deflexa* Hornemann var. *deflexa*. Seepage at high elevations; rare. Greenland west to AK, south to MA, n. NY, n. MI, and n. MN; apparently disjunct in the high mountains of WV. *Var. boottii* L.H. Bailey of w. North America is of variable taxonomic treatment, included within *C. deflexa*, treated as varietally distinct, or as a full species. [= FNA; < C, F, G, K, M]

*Carex diandra* Schrank, Lesser Tussock Sedge. Swamps, bogs, especially over limestone. Circumboreal, south in North America to w. MD, PA, TN, OH, IL, CO, CA; also reported from TN on the basis of a destroyed specimen. [= C, F, FNA, G, K, M]

*Carex digitalis* Willdenow var. *digitalis*. {Infraspecific taxa need separating: Cp (DE, FL), Pd (DE), Mt (WV), {Mt, Pd, Cp (GA, NC, SC, VA)}: rich forests; common in DE and WV. April–June. ME west to WI, south to FL and e. TX. Naczi (1999b) reports a chromosome number of n = 24. [= FNA, K; < *C. digitalis* – RAB, C, F, G, M, S, WH] {not yet mapped}

*Carex digitalis* Willdenow var. *macropoda* Fernald. {Infraspecific taxa need separating: Cp (FL), {Mt, Pd, Cp (GA, NC, SC, VA):} rich forests; common.} April–June. PA and IL south to FL and TX. Naczi (1999b) reports a chromosome number of n = 24. [= F, FNA, K; < *C. digitalis* – RAB, C, F, G, M, S, WH] {not yet mapped}

*Carex distans* Linnaeus. Disturbed areas. Introduced in MD and PA; native of Eurasia. [= FNA, K]

*Carex ehrenii* F. Boott, Bristle-leaf Sedge. Calcareous cliffs, bluffs, and outcrops. May. NL (Newfoundland) west to AK, south to w. VA, w. NC, nw. SC, c. AL, n. AR, NE, s. AB, and s. BC; early reports of this species from TX are referable to a recently described species, *C. mckittrickensis* P.W. Ball. Locally abundant on limestone bluffs, easily recognized vegetatively by its wiry stems and leaves (ca. 0.5 mm wide). [= RAB, C, F, FNA, G, K, M, S, W]

*Carex echinata* Murray ssp. *echinata*, Star Sedge. Bogs. May–June. Ssp. *echinata* is circumboreal, ranging in North America from NL (Newfoundland) west to AK, south to w. VA, w. NC, nw. SC, c. AL, n. AR, NE, s. AB, and s. BC; early reports of this species from TX are referable to a recently described species, *C. mckittrickensis* P.W. Ball. Locally abundant on limestone bluffs, easily recognized vegetatively by its wiry stems and leaves (ca. 0.5 mm wide). [= RAB, C, F, FNA, G, K, M, S, W]

*Carex echinata* Murray ssp. *echinata*, Star Sedge. Bogs. May–June. Ssp. *echinata* is circumboreal, ranging in North America from NL (Newfoundland) west to AK, south to w. VA, w. NC, nw. SC, c. AL, n. AR, NE, s. AB, and s. BC; early reports of this species from TX are referable to a recently described species, *C. mckittrickensis* P.W. Ball. Locally abundant on limestone bluffs, easily recognized vegetatively by its wiry stems and leaves (ca. 0.5 mm wide). [= RAB, C, F, FNA, G, K, M, S, W]

*Carex eburnea* Willdenow var. *angustata* (Carey) Carey. Carey ex Gleason – RAB, G, misapplied; = *C. eburnea var. eburnea* – C; > *C. muricata var. cephalantha* (L.H. Bailey) Wiegand & Eames – G; = *C. angustior* Mackenzie – M, S; > *C. angustior* – F; > *C. cephalantha* (L.H. Bailey) Hicknell – F; < *C. muricata* – W

*Carex elliptii* Schweinitz & Torrey, Elliott's Sedge. Bogs. May–June. E. NC south to c. pen. FL and west to s. AL. [= RAB, FNA, GW, K, M, S, WH]

Carex emoryi Dewey in Torrey. Seepages, ditches, other wetlands. May-June. NY and ND south to w. VA, s. IL, n. AR, and TX. [= C, F, FNA, K, M; = C. stricta Lamarck var. elongata (Böckeler) Gleason – G]

Carex exilis Dewey, Coastal Sedge. Peaty seepage bogs. May-June. NL (Newfoundland) and NL (Labrador) west to ON and n. MN, south to NJ, DE, MD, NY, and n. MI; disjunct southward in sc. NC and in se. MS / sw. AL. The southern occurrences are remarkably disjunct from the Canadian, northern Coastal Plain, and Great Lakes distribution. [= RAB, C, F, FNA, K, M]

* Carex extensa Goodenough, Long-bracted Sedge. Salt marshes, introduced around seaports; native of Europe. [= C, F, FNA, K, M]

Carex festucacea Schkuhr ex Willdenow, Fescue Sedge. Bottomland forests. May-June. VT west to MN, south to GA, Panhandle FL, AL, MS, LA, and TX. [= C, F, FNA, K, WH; < C. festucacea – RAB, GW, W; < C. festucacea – G (also see C. straminea)]

Carex fissa Mackenzie var. aristata Hermann, Hammock Sedge. Wet savannas, roadside banks and ditches. Extreme se. SC (Jasper Co.), s. GA (Clinch County) (Carter, Baker, & Morris 2009; Sorrie 1998b) south to c. peninsular FL, west to FL Panhandle and s. MS (Bryson et al. 1996). The SC distribution is documented by a voucher (Crins 9848 & D. Brunton) at MICH. Probably a species distinct from C. fissa. [= FNA, GW, K, WH; < C. fissa – M]

* Carex fissa Mackenzie var. fissa. Disturbed areas, introduced at old railroad stockyard, well-established; native of sc. United States (MO and KS south to TX). See Simmons, Strong, & Parrish (2008) for additional information about the VA occurrence. [= FNA, K; < C. fissa – M]

Carex flaccosperma Dewey. [distribution and abundance needing additional herbarium investigation] May-June. Se. VA south to Panhandle FL, west to TX, north in the interior to s. MO. [= FNA, G, K, M, S; < C. flaccosperma – RAB, C, GW, WH (also see C. glaucodea and/or C. pigra); = C. flaccosperma var. flaccosperma – F]

Carex flexuosa Muhlenberg ex Willdenow. Dry to moist upland forests, openings, granitic domes, rock outcrops. May-July. NL (Newfoundland) west to MN, south to VA and MO, and in the Appalachian Mountains to w. NC and e. TN. [= M, S; = C. debilis var. rudgei L.H. Bailey – RAB, C, F, G, K; < C. debilis var. rudgei L.H. Bailey – FNA; < C. debilis – GW, W]

Carex floridana Schweinitz, Florida Sedge. Mesic hammocks, dry hammocks, maritime forests. March-May. E. NC (se. VA?) south to c. peninsular FL, west to TX. [= FNA, K, M, S; = C. nigromarginata Schweinitz var. floridana (Schweinitz) Kükenthal – RAB, F, WH]

Carex foenea Willdenow, Hay Sedge. NL (Labrador) and NL (Newfoundland) west to YT, south to CT, NY, s. NJ, PA, MI, and ID. [= C, FNA; > C. aenea Fernald – F, M; < C. sicca – G, K, misapplied; > C. foenea – M]

Carex folliculata Linnaeus. Bogs, boggy forests, high elevation forests (spruce-fr). May-July. NL (Newfoundland) west to WI, south to NC and e. TN. [= FNA, K, M, S, W; = C. folliculata var. folliculata – RAB, C, F, G; < C. folliculata – GW (also see C. lonchocarpa)]

Carex frankii Kunth. Bottomland forests. May-July. W. NY and s. ON west to MI and se. NE, south to GA, AR, and OK. [= FNA; < C. frankii – RAB, C, F, G, GW, K, M, S, W (also see C. aureolensis)] [not yet mapped]
**Cyperaceae**

*Cyperus fraserianus* Ker-Gawler, Fraser's Sedge, Lily-leaf Sedge. Cove forests, mostly rather acidic and associated with *Rhododendron maximum*, at moderate elevations. May-July. A Southern and Central Appalachian endemic: w. MD and s. PA south through w. VA and WV to NC, e. TN, nw. SC, and n. GA (Jones & Coile 1988). This species is a peculiar plant, often considered a relict species most closely related to *Carex*, but recent molecular evidence suggests that it is embedded within *Carex* and is best considered a component of that genus. The foliage slightly resembles some of the broader-leaved species of *Carex* (such as *C. platyphylla* or *C. plantaginea*) or genera of the Liliaceae; immediately distinctive, however, are the minutely undulate-scarberrulous leaf margins. The odd leaves may be derived evolutionary from leaf sheaths (Reznick in FNA 2002b).

Kartesz & Gandhi (1991) have shown that the Ker-Gawler's epithet *fraseriana/fraserianus* has priority over Andrews's *fraseri*. [= *Cymophyllus fraserianus* (Ker-Gawler) Kartesz & Gandhi – FNA, K; = *Cymophyllus fraseri* (Andrews) Mackenzie – RAB, C, F, G, S, W; = Carex fraseri Andrews – WV]

*Carex gholsonii* NaCzi & Cochrane, Gholson's Sedge. Moist calcareous forests, especially marl flats and bottomlands over coquina. E. NC south to c. peninsular FL, west to s. AL. See NaCzi, Bryson, & Cochrane (2002). [= FNA, WH; presumably included in the concept of *C. granulata* by authors before 2002]

*Carex gigantea* Rudge, Giant Sedge. Swamps, bottomland forests, cypress depressions. June. DE south to s. FL, west to e. TX, north in the interior to nw. GA (Jones & Coile 1988), IN and OK. [= RAB, C, F, FNA, G, GW, K, M, S, WH]

*Carex glaucescens* Elliott, Blue Sedge, Southern Sedge. Blackwater swamps, pocosins, wet pine savannas, seepage bogs, depression ponds, pondcypress savannas, other acid and peaty situations. July-September. E. MD south to c. peninsular FL, west to e. TX; disjunct in nw. GA (Jones & Coile 1988) and c. TN. [= RAB, C, F, FNA, G, GW, K, M, S, WH]

*Carex glaucodea* Tuckerman ex Olney. [distribution and abundance needing additional herbarium investigation]. May-June. MA and ON west to s. IN and MO, south to NC, sc. TN, and AR. [= FNA, K; < *C. flaccosperma* – RAB, C, GW; < *C. flaccosperma* DeWee var. glaucodea (Tuckerman ex Olney) Kütkenthal – F; < *C. glaucodea* – G, M, S]

*Carex godfreyi* NaCzi, Godfrey's Sedge. Calcareous swamps and bottomlands. May-June. Se. NC south to se. GA, c. peninsular FL and west to Panhandle FL, sw. GA, and s. AL. See NaCzi (1993) for additional information. [= FNA, K, WH; < *C. grisea* – RAB, M, S; < *C. amphibia* – GW]

*Carex graciliscens* Steudel. Moist, nutrient-rich forests, calcareous hammocks. May-June. VT and s. QC west to WI, south to SC, AL, LA, and e. TX; disjunct in sw. GA and Panhandle FL. NaCzi (1999b) reports a chromosome number of n = 17, 19, 20. [= RAB, F, FNA, K, M, S, WH; < *C. graciliscens* – C (also see *C. ormostachya*); = *C. laxiflora* var. *gracilima* F. Booth – G]

*Carex gracillima* Schweinitz, Graceful Sedge. Moist ravine and slope forests, floodplains of rivers and large creeks. April-June. NL (Newfoundland) west to MB, south to n. GA, AL, and AR. [= RAB, C, FNA, G, K, M, W; > *C. gracillima* var. *gracillima* – F]

*Carex granularis* Muhlenberg ex Willdenow. Moist, nutrient-rich forests, especially bottomlands, mostly over calcareous rocks (limestone, dolostone, coquina limestone) or mafic rocks (diabase). May-June. ME and QC west to SK, south to GA, OK, and ne. TX. *C. haleana* Olney [= *C. granulata* var. *haleana* (Olney) Porter] is alleged to differ primarily in its more slender perigynia (1.0-1.5 mm wide vs. 1.5-2.5 mm) (see F and M for additional information). Here interpreted to include *C. haleana* Olney. Naczi (1999b) found little correlation between the morphological and cytological variability of *C. granulata*, and also little correlation of that variability with geography; he concluded that there was little support for recognition of infraspecific taxa. [= RAB, C, FNA, G, GW, K, S, W; > *C. granulata* var. *granulata* – F; > *C. granulata* var. *haleana* (Olney) Porter – F; > *C. granulata* – M; > *C. haleana* Olney – M]

*Carex gravis* L.H. Bailey. Fields. ON west to SK, south to TN, MS, AR, TX, and NM, rarely introduced eastward. Two varieties or species (see synonymy) are sometimes distinguished: var *gravis* with perigynia 4-5 mm long, 2× as long as wide, nerveless or very obscurely nerved on the dorsal face, and var. *lunelliana*, with perigynia 3-4.5 mm long, 1.3-1.5× as long as wide, strongly few-nerved on the dorsal face. Steury (1999) reported var. *lunelliana* as new to MD (Calvert County). [= FNA; > *C. gravis* var. *gravis* – C, F, G, K; > *C. gravis* L.H. Bailey var. *lunelliana* (Mackenzie) F.J. Hermann – RAB, C, F, G, K; > *C. lunelliana* Mackenzie – M; > *C. gravis* – M]

*Carex grayii* Carey, Asa Gray’s Sedge. Bottomland forests. May-June. Sw. QC west to WI and IA, south to nw. GA and OK; disjunct in Panhandle FL. [= RAB, C, FNA, K, W; = *C. grayii* – G, GW, M, orthographic variant; > *C. grayii* var. *grayii* – F; > *C. grayii* var. *hispidula* A. Gray – F; = *C. asa-grayii* L.H. Bailey – S]
Carex grisea Wahlenberg.  {habitats, distribution and abundance in our area needing additional herbarium investigation} May-June.  NB west to MN and SD, south to VA, TN, MS, LA, and TX.  [= FNA, K; < C. grisea – RAB, G, M, S (also see C. corrugata and/or C. godfreyi); < C. amphibola – C, GW; ? C. amphibola var. turgida}

Carex gymandra Schweinitz.  Mountain bogs, swamp forests, seepages.  May-June.  NL (Newfoundland) west to MN, south to WI, n. VA, w. NC, n. GA, e. TN, OH, and WI.  This is the most montane and northern element of the C. crinita complex, and the usual one encountered in the Mountains of our area.  [= C, FNA, K, M, S; = C. crinita Lamarck var. gymandra (Schweinitz) Schweinitz & Torrey – RAB, F, G, GW; < C. crinita – W]

Carex haydenii Dewey.  Wet meadows, wet prairies.  NL (Newfoundland) and QC west to SD, south to s. PA, MD (C. Frye, pers. comm. 2000), IL, and IA.  [= C, F, FNA, G, K, M]

Carex hirsutella Mackenzie.  Forests.  May-June.  ME, s. ON, and IA, south to GA and ne. TX.  [= F, FNA, K, M, S; = C. complanata Torrey & Hooker var. hirsuta (L.H. Bailey) Gleason – C, G; < C. complanata – RAB, GW, W]

Carex hystericina Muhlenberg ex Willdenow, Porcupine Sedge.  Calcareous marshes and wet meadows.  June-July.  NB west to BC, south to w. VA, sc. TN, w. TX, and n. CA.  [= C, FNA, G, K, M, W; = C. hystricina – F, M, W, orthographic variant]

Carex impressinervia Bryson, Kral, & Manhart.  Moist forests. April-May.  Sc. NC south to AL and west to MS, apparently very rare and widely scattered.  See Bryson, Kral, & Manhart (1987) for additional information on this species.  [= FNA, K]

Carex interior L.H. Bailey, Inland Sedge.  Calcareous seepage areas.  May-June.  NL (Newfoundland) and NL (Labrador) west to s. AK, south to w. VA, n. AR, n. AZ, and n. CA; disjunct in Mexico (Chihuahua).  [= C, F, FNA, G, K, M, W]

Carex intumescentes Rudge var. fernaldii L.H. Bailey.  Spruce-fir forests, northern hardwood forests, grassy balds. June-July.  NL (Newfoundland) west to MB, south to NY, n. PA, MI, MN, and, at higher elevations in the Appalachians, to w. VA, w. NC, and e. TN.  See Uttal (1971) and Reznicek & Ball (1974) for different views on the validity of this variety.  [= F, < C. intumescentes – RAB, C, FNA, G, GW, K, M, S, W]
Carex intumescens Rudge var. intumescens. Bogs, wet forests. May-July. NS west to WI, south to c. peninsular FL and e. TX. (= F; < C. intumescens – RAB, C, FNA, G, GW, K, M, S, WH)

Carex jamesii Schweinitz, James's Sedge. Nutrient-rich bottomlands and mesic slopes over calcareous or mafic rocks. May-June. MD and NY west to MI, MN, and e. NE, south to c. SC, GA, and LA. Naczi (1999b) reports chromosome numbers of n = 33, 35. (= FNA; < C. jamesii – RAB, C, F, G, K, M, WH)

Carex jooii L.H. Bailey, Joo's Sedge, Hummock Sedge, Cypress-swamp Sedge. Swamps, upland depression swamps in the Piedmont, sphagnum wetlands. June-October. E. MD south to n. peninsular FL and Panhandle FL, west to e. TX, north in the interior to TN, MO, and OK. (= RAB, C, F, FNA, G, GW, K, M, S, WH)

Carex juniperorum Catling, Reznicek, Crins. On edges of calcareous glades and barrens, in subxeric to submesic calcareous woodlands. This species was recently described, and is so far known only from alvars in s. ON, calcareous glades and barrens in s. OH and ne. KY, and has recently been found in Montgomery Co., VA (Belden et al. 2004) and Botetourt Co., VA (Townsend, pers. comm., 2008). (= FNA, K)

* Carex kobomugi Ohwi, Sea Isle Sedge, Japanese Sedge. Sand dunes; native of Japan. March-July. C. kobomugi is distinctive in its short stout culms, and its terminal, headlike, dioecious inflorescences. This species is planted as a stabilizer of coastal dunes. (= F, FNA, G, K)

Carex kraflana Naczi & Bryson, Krål's Sedge. Mesic forests, slightly acidic to circumneutral. MD, OH, and IN south to Panhandle FL and TX. See Naczi, Bryson, & Cochrane (2002). (= FNA; variously included in the concepts of other species in sect. Laxiflorae by authors before 2002)

Carex lacustris Wildenow, Lakeshore Sedge. Marshes, swamp forests. QC west to SK, south to e. VA, w. VA, and NE. (= F, FNA, G, K; = C. lacustris var. lacustris – G)

Carex lasiocarpa Ehrhart var. americana Fernald, Slender Sedge. In shallow water of alkaline spring seep, on hummocks in acidic basin marsh, and in high elevation fen over amphibolite. A circumboreal species; var. lasiocarpa is Eurasian, var. americana ranges from NL west to AK, south to NJ, WV, MD (C. Frye, pers. comm. 2000), VA, nw. NC, IA, CO, UT, and n. CA. First reported for VA by Wieboldt et al. (1998). Found for the first time in NC in the valley of Long Hope Creek (Ashe County, NC), in July 1999 by A.S. Weakley and P.D. McMillan. (= F, G, K; = C. lasiocarpa ssp. americana (Fernald) Hultén – FNA; < C. lasiocarpa – M, WH)

Carex laxiculmis Schweinitz var. copulata (L.H. Bailey) Fernald. Mesic forests. April-June. VA, ON, and WI south to NC, AL, and AR. Var. copulata (L.H. Bailey) Fernald, has sometimes been considered the hybrid C. digitalis × laxiculmis; current evidence suggests that it is not a hybrid but is not consistently separable from C. laxiculmis (Manhart 1984). Naczi (1999b) reports chromosome numbers for the two varieties, n = 22, 23, 25 for var. laxiculmis, and n = 23-24 for var. copulata; normal pairing further suggests that var. copulata is not a hybrid. (= FNA, K; < C. laxiculmis – RAB, G, K, S, WH; = C. ×copulata (L.H. Bailey) Mackenzie – F, M)

Carex laxiculmis Schweinitz var. laxiculmis. Rich slope or alluvial forests. April-June. S. ME west to s. WI and s. IA, south to NC, nw. GA (Jones & Coile 1988), n. AL, and MO. (= FNA, K; < C. laxiculmis – RAB, G, S, WH; = C. laxiculmis – F, M)

Carex laxiflora Lamarck. Bottomland and other nutrient-rich forests. May-June. Varieties have been recognized; their appropriate disposition is uncertain. Var. laxiflora ranges from ME and s. QC west to WI and IN, south to NC, TN, and AL; allegedly also in s. Mexico. Var. serrulata F.J. Hermann has been reported for our area by Hill & Horn (1997). Its range is stated by F to be NY and PA to MI, IN, and TN. It differs in being distinctly scabrous (vs. smooth to scaberulous), and in having the bract sheaths with serrulate angles (vs. entire or erose angles). (= RAB, C, FNA, M, WH; < C. laxiflora var. serrulata F.J. Hermann – F, K; > C. laxiflora var. laxiflora – F, K; < C. laxiflora var. laxiflora – G; ? C. heteromera Wahlenberg – S)

Carex leptalea Wahlenberg var. harperi (Fernald) Weatherby & Griscom. Bogs, seeps, blackwater bottomlands, usually in saturated conditions with Sphagnum spp. May-June. N. South to c. peninsular FL, west to TX, inland in the interior to IN and MO. Var. harperi is considered to differ from the typic variety in its larger perigynia, larger spikes, more aristate pistillate scales,
and more southern range; it needs additional study. [= F, G; < C. leptalea – RAB, C, GW, M, S, W, WH; = C. leptalea ssp. harperi (Fernald) W. Stone – FNA, K; = C. harperi Fernald]

**Carex leptalea** Wahlenberg var. leptalea. Bogs, seeps, usually in saturated conditions with Sphagnum spp. May-June. NL (Labrador) west to AK, south to NC, TN, MO, SD, NM, and CA. [= F, G; < C. leptalea – RAB, C, GW, M, S, W; = C. leptalea ssp. leptalea – FNA, K]

**Carex leptoneuria** (Fernald) Fernald. Nutrient-rich forests, such as rich, seepy northern hardwoods forests. May-June. NL (Newfoundland) west to MN, south to NJ, PA, IN, and WI, and in the Appalachians south to NC and SC (L.L. Gaddy, pers.comm., 2009). [= RAB, C, F, FNA, G, K, M, S, W]

**Carex limosa** Linnaeus. Bogs, swamps, wet meadows. Circumboreal, south in North America to se. PA (Rhoads & Klein 1993), NJ, DE, OH, IN, NE, UT, and CA. [= C, F, FNA, G, K, M]

**Carex livida** (Wahlenberg) Willdenow. Bogs and fens. Circumboreal, south in North America to s. NJ, NY, MI, IN, MN, CO, and CA; also disjunct in Panama and South America. Material in NJ is described as being atypical and needing additional research (Rothrock & Reznicek in FNA 2002b). [= FNA; < C. livida var. radicaulis Paine – K] [add to synonymy; add to key; {not yet mapped; 26aa.

**Carex lonchocarpa** Willdenow. Pocosin margins, small blackwater stream swamps. May-July. S. MD south to ne. FL and Panhandle FL, west to LA; rarely inland, as in SC. TN. Recognition of **C. lonchocarpa** at the species level is supported by its distinctive achene micromorphology (Wujek & Menapace 1986). [= FNA, K, M, WH; < C. folliculata Linnaeus var. australis L.H. Bailey – RAB, C, F, G; < C. folliculata – GW; = C. smalliana Mackenzie – S]

**Carex longii** Mackenzie, Long's Sedge. Low fields, bottomlands. May-June. NS west to WI, south to s. FL and TX. [= C, F, FNA, K, WH; < C. alboluteusens – RAB, G, GW, W]

**Carex louisianica** L.H. Bailey. Calcareous forests. May-July. S. NJ south to ne. FL, Panhandle FL, west to TX, north in the interior to KY, IN, and MO; disjunct in ne. OH. [= RAB, C, F, FNA, G, K, M, S, W, WH]

**Carex lucorum** Willdenow ex Link var. austrolucorum J. Rettig, Appalachian Woodland Sedge. Xeric to mesic wooded slopes, usually in oak forests and northern hardwood forests. **C. lucorum** var. austrolucorum is endemic to the Southern Appalachians, ranging from sw. VA and s. WV south through w. NC and e. TN to nw. SC and ne. GA. It has been reported from further north, in sc. WV (Boone County) (Cusick 1996). Var. **lucorum** differs in having the leaves broader (mostly 1.5-2.8 mm wide vs. mostly 1.1-1.3 mm), the beak averaging shorter (1.3 mm vs. 1.5 mm), chromosome number n = 20 (vs. n = 13), and various details of flavonoid chemistry and achene micromorphology (see Rettig 1988 for details). While the two taxa can be difficult to tell apart on morphological grounds, they are clearly separate taxa. **C. lucorum** var. **austrolucorum** was first reported for South Carolina by Hill & Horn (1997). [= FNA, K; < C. pensylvanica Lamarck var. distans Peck – RAB, F, G (the name misapplied as to our plants); < C. lucorum – C, M, S; < C. pensylvanica – W; = C. lucorum ssp. lucorum – J. Rettig A. Haines]

**Carex lucorum** Willdenow ex Link var. lucorum. Northern Woodland Sedge. Moist forests. NB west to MN, south to MD (Cecil County; C. Frye, pers. comm. based on specimen at DOV) and PA. [= FNA, K; < C. pensylvanica Lamarck var. distans Peck – F, G; < C. lucorum – C, M, S; < C. pensylvanica – W; = C. lucorum ssp. lucorum]

**Carex lupuliformis** Sartwell ex Dewey, False Hop Sedge. Wet forests, swamps, riverbanks, especially around ponds. June-July. VT and QC west to se. WI, south to s. FL and e. TX. [= RAB, C, F, FNA, G, K, M, S, WH; < C. lupulina – GW]

**Carex lupulina** Muhlenberg ex Willdenow, Hop Sedge. Bottomland forests. June-September. NS west to MN, south to ne. FL and e. TX. [= RAB, C, FNA, G, K, M, S, WH; < C. lupulina – GW (also see C. lupuliformis); > C. lupulina var. lupulina – F; > C. lupulina var. pedunculata A. Gray – F]

Carex lutea LeBlond, Golden Sedge. Wet savannas shallowly underlain by coquina limestone, with open canopy of Taxodium ascendens, Pinus palustris, and Liriodendron tulipifera. May. Endemic to Pender and Onslow counties, NC, where associated with other narrow endemics, such as Thalictrum cooleyi and Allium species 1, and other rare species, such as Plantago sparsiflora, Parnassia caroliniana, Rhynchospora thornei, and others. See LeBlond et al. (1994) for additional information. [= FNA, K]

Carex magnifolia Mackenzie. Bogs, acid swamps. April-May. E. NC south to FL, and disjunct in mountain bogs with Coastal Plain affinities, as in Henderson County, NC. C. magnifolia differs morphologically from C. abscondita in its larger perigynia, longer leaves, and much more strongly glaucous leaves; it has a more southern distribution and occurs in wetter, boggier habitats. Manhart (1984) found that it differed chemically from C. abscondita. Further study is needed to verify its taxonomic status. [= M, S; < C. abscondita – RAB, FNA, K]

Carex manhartii Bryson, Blue Ridge Purple Sedge, Manhart's Sedge. Cove forests and montane oak-hickory forests, mostly at medium to fairly high elevations, especially over mafic rocks (such as amphibolite) and calcareous rocks (such as marble), but occurring on more acidic substrates as well. April-May. Endemic to w. NC, sw. VA, nw. SC, ne. GA, and se. TN, in the Blue Ridge Mountains. Once considered very rare, this species is now known to be locally common in portions of sw. NC and adjacent ne. GA. For more information on the Virginia occurrence, see Belden et al. (2004). [= FNA, K, W; < C. purpurifera Mackenzie – RAB, M, S]

Carex meadii Dewey, Mead's Sedge. Prairies, on low, moist clayey soils over mafic rocks (such as diabase) or calcareous rocks. May-June. NJ west to MI and SK, south to nc. NC, GA, AR, sw. LA, and TX. The species forms large clonal patches with a distinctive bluish cast at the time of flowering and fruiting. Naczi (1999b) reports a chromosome number of n = 28. [= RAB, C, F, FNA, G, K, M, S, W]

Carex michauxiana Böckeler, Michaux's Sedge. Bogs, seeps, usually in Sphagnum. NL (Labrador) and MB south to MD, MI, and MN. Closely related to an e. Asian species. [= C, F, FNA, G, K, M] {add to synonymy}

Carex microdonta Torrey & Hooker. Limestone glades, calcareous prairies. AL and Panhandle FL west to MO, KS, OK, TX, NM, and AZ. [= FNA, K, M, S]

Carex mitchelliana M.A. Curtis, Mitchell's Sedge. Swammy woodlands and forests. May-June. Se. MA west to PA and KY, south to Panhandle FL, n. AL, and sc. TN. This species has a scattered distribution throughout its range, and is apparently rare. Bruederle, Fairbrothers, & Hanks (1989) and Bruederle (1999) provide additional information about this species. Allozyme studies suggest that C. mitchelliana is less closely related to C. gynandra, C. crinita var. crinita, and C. crinita var. brevicrinis than they are to one another. [= c, F, FNA, K, M, S, WH; = C. crinita Lamarck var. mitchelliana (M.A. Curtis) Gleason – RAB, G, GW; < C. crinita – W]

Carex molestiformis Reznick & P.E. Rothrock. {habitat}. Known distribution is w. VA, WV, KY, TN, MO, AR, and OK. [= FNA, K; < C. brevior (Dewey) Mackenzie ex Lunell – C]

Carex molesta Mackenzie ex Bright, Troublesome Sedge. Calcareous soils. NH west to ND, south to VA, AL, MS, and OK. [= F, FNA, G, K; < C. brevior (Dewey) Mackenzie ex Lunell – C] {synonymy incomplete}
Carex muehlenbergii Schkuhr ex Willdenow var. enervis W. Boott. {habitats}. NH west to MN and NE, south to GA, AL, MS, and TX. [= FNA, K; < C. muehlenbergii – RAB, W; < C. muehlenbergii var. muehlenbergii – C; = C. muehlenbergii var. enervis – F, G, orthographic variant; = C. plana Mackenzie – M, S]

Carex muehlenbergii Schkuhr ex Willdenow var. muehlenbergii. Dry to dry-mesic hammocks, {additional habitats}. ME, ON, and MN south to Panhandle FL and TX. [= FNA, K; < C. muehlenbergii – RAB, W, WH; < C. muehlenbergii var. muehlenbergii – C (also see var. enervis); = C. muehlenbergii var. muehlenbergii – F, G, orthographic variant; = C. muehlenbergii – M; < C. muehlenbergii – S (also see C. austria)]

* Carex muricata Linnaeus ssp. lamprocarpa Čelakovský. A European alien, with known occurrences south to e. PA (Rhoads & Klein 1993) and MD. [= FNA; < C. muricata – C, K]

Carex muskingumensis Schweinitz. Floodplain forests. ON and MN south to KY, TN, AR, and OK. [= C, F, FNA, G, K, M]

Carex nigromarginata Schweinitz, Blackedge Sedge. Dry woodlands and forests. March-May. DE and NJ west to WI, south to SC, GA, and TX. [= C, FNA, K, M, W; = C. nigromarginata var. nigromarginata – F, G, orthographic variant; = C. nigromarginata – M; < C. nigromarginata – S (also see C. austria)]

Carex novae-angliae Schweinitz, New England Sedge. Moist forests. NL (Newfoundland) and ON, south to e. PA, n. WV, and WI. [= C, F, G, K, M; < C. novae-angliae – FNA]

Carex obliqua Steudel. Swamps and other wet habitats. NY (Long Island) and NJ south to sc. GA, west to w. LA, mostly on the Coastal Plain, but extending much less commonly inland to the Piedmont and Mountains. [= M, S; = C. venusta Dewey var. minor Böckler – C, F, G, K; < C. venusta – RAB, FNA, GW, W]

* Carex oklahomensis Mackenzie, Oklahoma Sedge. See pages, disturbed wetlands; probably adventive from farther west. Se. MO west to KS, south to AR, and ne. TX; disjunct (and apparently adventive) in various scattered sites east of the Mississippi River, as in AL, MS, GA, w. NC (Graham County) and w. VA (Giles County). First reported for VA by Wieboldt et al. (1998). See Bryson & Rothrock (2010) for further discussion; they consider that this species is “introduced during highway and reservoir construction or maintenance in contaminated hay, grass seeds or on construction, maintenance, and mowing equipment.” [= F, FNA, K, M, < C. stipata – S; = C. stipata Muhlenberg ex Willdenow var. oklahomensis (Mackenzie) Gleason – G]

Carex oligosperma Michaux. Bogs and seeps at high elevations. NL (Newfoundland) west to NT, south to CT, c. PA, n. IN, WI, and MN; disjunct in ne. OH, WV (Hardy County) and NC (Ashe, Avery, Mitchell, and Watauga counties). [= C, F, FNA, G, M; > C. oligosperma var. oligosperma – K]

* Carex opaca (F.J. Hermann) P.E. Rothrock & Reznicek. Introduced at old railroad livestock yard, well-established; native of sc. United States. Native range in prairies, IL and KS south to MS, AR, and OK. [= FNA; = C. bicknellii Britton var. opaca F.J. Hermann – K; < C. bicknellii – M]

Carex ormostachya Wiegand, Necklace Spike Sedge. Northern hardwood forests. S. Canada south to ME, MA, PA, w. VA (Augusta County), n. OH, MI, and WI. [= F, FNA, K, M; < C. gracilescens – C; = C. laxiflora var. ormostachya (Wiegand) Gleason – G]

Carex ouachitana Kral, Manhart, & Bryson, Ouachita Sedge. Dry to dry-mesic slope and ridge forests. Disjunct in ne. TN and sc. KY from the Ouachita Mountains of sw. AR and se. OK. [= FNA, K] {not yet keyed; synonymy incomplete; Griseae}
**Carex ovalis** Goodenough. Grassy balds, disturbed areas; native of Eurasia. Known to range in North America from NL (Newfoundland) and NY south to w. NC and ne. TN. The records reported in RAB and elsewhere of *C. aenea* are actually misidentified material of this species (A.A. Reznicek, pers. comm. 2005). [= FNA, K; = *C. aenea* – RAB, misapplied (based on misidentified material); < *C. leporina* Linnaeus – C, F, G, misapplied; ? *C. tracyi* Mackenzie]

**Carex oxylepis** Torrey & Hooker. Bottomlands, calcareous forests. May-June. VA, KY, IL, MO, and OK south to c. peninsular FL and TX. A distinction is sometimes made between var. *oxylepis* and var. *pubescens*. Var. *oxylepis* is widespread in the Southeast; var. *pubescens* is more restricted, from KY and s. IL south to AL and MS. [= RAB, C, F, FNA, G, GW, M, S, W; > *C. oxylepis* var. *oxylepis* – K; > *C. oxylepis* var. *pubescens* J.K. Underwood – K]

**Carex paeninsulae** Naczi, E.L. Bridges, & Orzell, Peninsula Sedge. Mesic hammocks. Endemic to FL peninsula, north into ne. FL (Suwanee and Duval counties). [= FNA] [not yet keyed; *Griseae*]

**Carex pallescens** Linnaeus, Pale Sedge. Grassy balds at high elevations, other grassy openings. June-July. Circumboreal (in ne. North America and n. Eurasia); in North America ranging from NL (Newfoundland), QC, and MN, south to w. NC, e. TN, and ML. *C. pallescens* is reported to occur on Big Bald, Unicoi County, TN, immediately adjacent to the NC line (Churchill et al. 1992). [= C, FNA, G, K, M, W; > *C. pallescens* var. *neogaea* Fernald – F]

**Carex pauciflora** Lightfoot, Few-flowered Sedge. Bogs. Circumboreal, south in North America to NY, WV (Grant, Randolph, and Tucker counties), WI, MN, and WA. [= C, F, FNA, G, K, M]

**Carex pedunculata** Muhlenberg ex Willdenow var. *pedunculata*, Longstalk Sedge. Nutrient-rich dry to mesic forests, usually over calcareous or mafic rocks. April. Var. *pedunculata* ranges from NL (Newfoundland), SK, and ND, south to NJ, w. VA, sw. NC, nw. GA (Dade County) (Jones & Coile 1988), n. AL, c. IN, c. IL, and n. IA. Var. *erythrobasis* (Léveillé & Vaniot) Koyama occurs in Korea. It may well prove that these two widely disjunct taxa should be recognized at the species level. [= FNA; < *C. pedunculata* – C, F, G, K, M, W; = *C. pedunculata* ssp. *pedunculata*]

**Carex pellita** Muhlenberg. Wet meadows. NB west to BC, south to w. VA, w. TN, AR, and CA. McClintock & Waterway (1994) discuss the distinctiveness of *C. pellita* and *C. lasiocarpa*, as well as the misapplication of the name *C. lanuginosa* to the species now properly called *C. pellita*. [= C, FNA, K; = *C. lanuginosa* Michaux – F, M, misapplied; = *C. lasiocarpa* Ehrhart var. *latifolia* (Böckler) Gilly]

**Carex pendula** Hudson, Pendulous Sedge. Disturbed areas; native of Europe. Introduced in VA (FNA, Kartesz 1999). [= FNA, K]

**Carex pensylvanica** Lamarck. Dry to moist woodlands and forests, grassy balds, shale barrens, rock outcrops. April-June. ME west to s. MB and ND, south to SC, n. GA, TN, and AR. [= FNA, K; = *C. pensylvanica* var. *pensylvanica* – RAB, C, F, G; = *C. pensylvanica* – M, S, orthographic variant; < *C. pensylvanica* – W (also see *C. lucorum* var. *austrulicoramus*)]

**Carex physorhyncha** Liebmann ex Steudel, Bellow’s-beak Sedge. Dry woodlands. Sc. VA south to ne. FL and FL Panhandle, west to AR, OK, TX, and Mexico. [= RAB, F, M, S, W; = *C. albicans* Willdenow ex Sprengel var. *australis* (L.H. Bailey) J. Retting – FNA, K, WH]

**Carex picta** Steudel, Painted Sedge. Mesic forests. S. IN south through KY and c. TN to nc. GA (Jones & Coile 1988), c. AL, and LA. Reported (erroneously?) for VA (Kartesz 1999). Locally abundant and forming "doughnut clumps", sometimes aggregated to form a coarse turf. [= C, F, FNA, G, K, M, S]

**Carex pigra** Naczi, Lazy Sedge. Moist forests, bottomlands. May-June. Se. VA west to sc. and sc. TN, south to n. FL, s. AL, and ne. MS. See Naczi (1997) for additional information. [= FNA, K; < *C. flaccosperma* – RAB, G, GW, WH; < *C. flaccosperma* Dewey var. *glaucoidea* (Tuckerman ex Olney) Kükenthal – F; < *C. glaucoidea* – S]

**Carex planispicata** Naczi. Rich to fairly acidic mesic forests, on slopes and floodplains. C. NJ west to s. IN, se. MO, and se. OK, south to c. GA, s. MS, and se. TX. See Naczi (1999a) for additional information. [= FNA; = *C. grisea* Wahlenberg var. *rigida* (L.H. Bailey) Fernald – F, K]
**Carex plantaginea** Lamarck, Plantainleaf Sedge. Rich cove forests, mostly over mafic or calcareous rocks, montane alluvial forests. April-May. NB west to MN, south to MD, NJ, VA, NC, ne. GA (Jones & Coile 1988), c. TN, c. TN, KY, and s. IN. [= RAB, C, F, FNA, G, K, M, S, W]

**Carex platyphylla** Carey, Broadleaf Sedge. Rich cove forests, mostly over mafic or calcareous rock. April-June. ME and s. QC west to WI, south to NC, e. TN, and MO. Naczi (1999b) reports a chromosome number of n = 35. [= RAB, C, F, FNA, G, K, M, S, W]

**Carex polymorpha** Muhlenberg, Variable Sedge. Dry, acidic ridgetop forests. May-June. ME south to MD, VA, and WV. Standley, Dudley, & Brueiderle (1991) studied genetic variability in this species. [= C, FNA, G, K, M, S, W]

* **Carex praegracilis** W. Boot, Freeway Sedge. Medians of interstate highways; native of w. North America. May-June. This species is apparently spreading through ne. North America as the result of the winter salting of highways. [= C, F, FNA, G, K, M]

**Carex prairea** Dewey ex Wood, Prairie Sedge. Calcareous wetlands. QC west to YT, south to NJ, w. VA, OH, NE, MT, and BC. [= C, FNA, G, K, M]

**Carex prasina** Wahlenberg. Rich forests, especially in seepage. May-June. ME, ON, and WI south to GA, MS, and AR; in nearly all TN counties adjacent to NC and VA. [= RAB, C, F, FNA, G, GW, K, M, S, W]

**Carex projecta** Mackenzie. Moist forests. May-June. NL (Newfoundland), NL (Labrador), and SK south to NC, IN, IL, and IA. [= RAB, C, F, FNA, G, K, M]

* **Carex pumila** Thunberg. Open disturbed sand flats; native of Asia. May. See Reznicek (1993) for additional information. [= FNA, K; > C. hirta – RAB, misidentification]

**Carex purpurifera** Mackenzie, Limestone Purple Sedge. Moist, rich cove forests, at low elevations, over calcareous or mafic rocks. May-June. W. VA and KY south to n. GA and n. AL, mostly west of the Blue Ridge Mountains, but with scattered disjunct populations on calcareous or mafic sites in the Blue Ridge. Naczi (1999b) reports a chromosome number of n = 17-19. [= C, FNA, K, W; < C. purpurifera – RAB, M, S (also see C. manhartii); = C. laxiflora var. purpurifera (Mackenzie) Gleason – G]

**Carex radfordii** Gaddy, Radford’s Sedge. Very nutrient-rich, moist cove forests in the Blue Ridge Escarpment region, over calcareous or mafic rocks (especially along the Brevard Fault). May-June. Endemic to the Blue Ridge Escarpment of sw. NC, nw. SC, and ne. GA. See Gaddy (1995) for additional information. Naczi (1999b) reports a different chromosome number for C. radfordii (n = 23) than for the related C. purpurifera (n = 17, 18, 19). [= FNA, K]

**Carex radiata** (Wahlenberg) Small. Mesic to wet-mesic forests. May-June. NS west to MB, south to SC, AL, LA, and OK. [= C, FNA, K; < C. rosea – RAB, G, W; = C. rosea – F, M, S, misapplied]

**Carex reniformis** (L.H. Bailey) Small, Kidney Sedge. Floodplain forests (including blackwater), marshes, ditches, other wet areas. VA, IL, and OK south to FL Panhandle and TX. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Carex retroflexa** Muhlenberg ex Willdenow. Dry to mesic forests. ME, MI and IA, south to n. peninsular FL and TX. See Downer & Hyatt (2003). [= F, FNA, K, M, S; < C. retroflexa – RAB, W (also see C. texensis); = C. retroflexa var. retroflexa – C, G]

**Carex retrosera** Schweinritz. Bottomland forests and nutrient-rich moist forests. NB and BC, south to n. NJ, sc. PA, IL, UT; reported, apparently erroneously, for DE and MD. [= C, F, FNA, G, K, M] [not yet mapped]

**Carex reznicekii** Werier, Reznicek’s Sedge. Moist, forested slopes. RI, NY, PA, KY, and MO, south to SC, sw. GA, se. AL, n. MS and AR. To be expected in Panhandle FL and in WV. See Werier (2006) for detailed information. [add to synonymy; section Acrocystis]
Carex richardsonii  R. Brown, Richardson’s Sedge. Dry, rocky forests. VT west to AB, south to DC, MD, OH, IN, IA, and SD. This species ranges south to DC (according to C). [= C, FNA, G, K, M]

Carex roanensis  F.J. Hermann, Roan Mountain Sedge. Cove forests, moderate to high elevation oak forests, northern hardwood forests. May-June. Sw. PA, w. VA, and e. WV south through e. KY, e. TN, w. NC to se. TN and nw. GA (Smith & Waterway 2008; Smith et al. 2006). See Smith & Waterway (2008), Smith et al. (2006), and Hermann (1947) for additional information; closely related to Carex virensens. First reported for VA by Wieboldt et al. (1998). [= FNA, K, W]

Carex rosea  Schkuhr ex Willdenow, Rosy Sedge. Dry to dry-mesic hardwood forests. May-June. NS west to MB, south to FL Panhandle and TX. [= C, FNA, K; < C. rosea – RAB, G, W, WH (also see C. appalachica and C. radiata); = C. convoluta Mackenzie – F, M, S; ? C. flaccidula Steudel]

Carex rugosperma  Mackenzie, Parachute Sedge. Old fields, shallow soils of rock outcrops, exposed forest margins. {Distribution and habitats in our area obscure} PE west to MN, south to MD, VA, IN, IL, and MO. See C. umbellata for discussion. Reported for South Carolina by Hill & Horn (1997). [= G, M; < C. umbellata – RAB, C, W; = C. umbellata – F, misapplied; = C. tonsa (Fernald) Becknell var. rugosperma (Mackenzie) Crins – FNA, K]

Carex ruthii  Mackenzie, Ruth's Sedge. Seepage areas, in forest or open areas. May-June. A Southern Appalachian endemic: sw. VA south through w. NC and e. TN to nw. SC and n. GA. [= C, FNA, K, M, S; = C. muricata Linnaeus var. ruthii (Mackenzie) Gleason – RAB, G; < C. muricata – W]

Carex sartwellii  Dewey, Sartwell’s Sedge. Wetlands. QC west to BC, south to MD, PA, OH, IN, IL, MO, CO, and ID. [= FNA, C, F, G, M; > C. sartwellii var. sartwellii – K]

Carex seorsa  Howe. Acidic swamp forests. May-June. MA south to GA and Panhandle FL in the Coastal Plain, scattered inland westward to NY, OH, MI, AR, and TN. [= RAB, C, FNA, G, GW, K, M, S, W]

Carex shortiana  Dewey, Short's Sedge. Calcareous bottomlands and meadows. May-June. PA, s. ON, IL, and IA, south to w. VA, e. TN, AR, and OK. [= C, F, FNA, G, K, M, S, W]

Carex siccatula  Dewey, Bronze Sedge. Dry upland habitats. May-July. ME and NT south to NJ, OH, IL, MN, and AZ. [= C, FNA, G, M; < C. siccatula – K (also see C. foenea); = C. foenea Willdenow – F, misapplied]

Carex silicea  Olney, Seabeach Sedge. Beaches and shores. NL (Newfoundland) south to VA, along the coast. [= C, F, FNA, G, K]

Carex socialis  Mohlenbrock & Schwegman. Blackwater and brownwater swamp forests and bottomlands. Se. and sc. NC south to e. GA, west to e. TX, and north in the interior to s. IN, s. IL, and se. MO. [= C, FNA, K]

Carex species 1. Canebrake Sedge. Canebrakes and acid swamps. February-May. Coastal Plain, from se. VA to Panhandle FL, west to w. LA. [<C. novae-angliae Schweinitz – FNA; = Carex "austrodeflexa", in prep.] {section Acrocystis}

Carex species 2. Blue Ridge Sedge. Seepages over various substrates along the Blue Ridge Escarpment, including open fen-like wetlands. Early April-early June. A Southern Blue Ridge endemic, from sw. VA through w. NC to ne. GA (Rabun County). Under study by D.B. Poindexter and T.F. Wieboldt. {section Acrocystis}

Carex species 3. Smoky Mountain Sedge. Seepages at moderate to high elevations. Endemic to the Great Smoky Mountains National Park. Under study by D. Estes. {not yet keyed; section Phacocystis}

* Carex spicata Hudson. Fields and lawns; native of Europe and w. Asia. Reported as south to s. NJ, n. DE, c. MD. VA reports said to be erroneous in FNA. [= C, F, FNA, G, K, M]

Carex sterilis Willdenow, Sterile Sedge. Mafic fens. NL (Newfoundland) west to SK, south to sw. VA (Grayson County), ne. TN, IL, and MO. Outside of our area, C. sterilis is primarily a species of calcareous fens or seepages. First reported for VA by Wieboldt et al. (1998). [= C, F, FNA, G, K, M]

Carex stipata Muhlenberg ex Willdenow var. maxima Chapman. Marshes, ditches, alluvial forests. May-June. NJ south to c. peninsular FL, west to TX, north in the interior to s. MO, s. IN, and w. KY, primarily on the Coastal Plain. The validity of this variety needs additional study. [= RAB, C, F, FNA, G, K; < C. stipata – GW, WH; = C. ulterior (C. Mohr) Mackenzie – M, S]

Carex striatula Michaux. Bottomland and other nutrient-rich forests. May-June. Se. NY and PA west to TN, south to n. FL, Panhandle FL, and TX. The distinction of this species as separate from C. laxiflora is problematic and requires additional study. Naczi (1999b) reports chromosome numbers of n = 18, 20. [= RAB, C, F, FNA, K, M, W, WH; = C. laxiflora var. angustifolia Dewey – G; < C. laxiflora – S, misapplied]

Carex styloflexa Buckley. Bogs, wet forests. May-June. CT west to s. OH, south to c. peninsular FL and se. TX. [= RAB, C, F, FNA, G, K, M, S, W, WH]
Cyperaceae

Carex suberecta (Olney) Britton, Prairie Straw Sedge. Fens, calcareous wetlands. ON and MN south to sw. VA, WV, OH, IN, IL, AR, and TX. [= C, F, FNA, G, K]

Carex swanii (Fernald) Mackenzie. Nutrient-rich forests, woodlands, and openings. May-June. NS, s. MI, s. WI, south to nw. SC and ne. AR. [= RAB, C, F, FNA, G, K, M, S, W; = C. virescens Muhlenberg ex Wildenow var. swanii Fernald]

* Carex sylvatica Hudson. Pastures, lawns; native of Europe. [= C, F, FNA, G, K, M]

Carex tenax Chapman. Longleaf pine sandhills. May-June. Sc. NC south to Panhandle FL, west to MS; also in sw. LA and se. TX. [= RAB, FNA, K, M; ? C. validior Mackenzie – S]

Carex tenera Dewey var. tenera, Slender Sedge. Low forests. NS west to BC, south to VA, NC, n. GA, ne. TN, MO, KS, WY, and OR. Var. echinodes (Fernald) Wiegand is restricted to the northern Midwest. [= F, FNA; < C. tenera – RAB, C, G, K]

Carex tetanica Schkuhr, Rigid Sedge. Moist forests. May-June. MA west to MN, NE, and AB, south to NJ, VA, and NC. [= RAB, C, F, FNA, K, M; = C. tetanica var. tetanica – G]

Carex thornei Naczi (section Griseae). Mesic deciduous forests, often in the upper floodplain. Endemic to the drainage of the Apalachicola/Chattahoochee and Flint in s. GA and s. AL south to Panhandle FL. See Naczi, Bryson, & Cochrane (2002). [= FNA] {not yet keyed}

Carex tonsa (Fernald) Bicknell, Shaved Sedge. Xeric disturbed areas, old fields. [distribution and habitats in our area obscure]. QC west to AB, south to VA, IN, and WI. See C. umbellata for discussion. [= F, G, K, M; < C. umbellata – RAB, C, W; = C. tonsa var. tonsa – FNA, K]

Carex triangularis Böckler. Moist forests, ditches, other wet sites. April-June. SC and GA west to KS and TX. [= RAB, F, FNA, G, K, M, S; < C. vulpinoidea var. vulpinoidea – C; < C. vulpinoidea – GW]

Carex trichocarpa Muhlenberg ex Wildenow. Wet meadows, marshes. May-July. QC west to MN, south to DE, nw. NC, WV, IN, and MO. [= RAB, C, F, FNA, G, K, M, W]

Carex trisperma Dewey. Three-seeded Sedge. Bogs and swamps at high elevations (in NC and VA), usually growing in living Sphagnum, in shaded situations under shrubs or trees in montane wetlands, northward in bogs at low elevations. June. NL (Labrador) west to SK, south to NJ, MD, OH, n. IN, IL, and MN; and in the mountains to w. NC and WV. See Kirschbaum
Cyperaceae

**Carex tuckermanii** F. Boott. Calcareous swampy forests and wet meadows. NB and MN south to WV, sc. PA, NJ, MD, and IL. A reported for Alleghany County, NC appears to be erroneous. \[= C, F, FNA, K; < C. tuckermani – G, M, orthographic variant\]

**Carex turgescens** Torrey, Pinebarren Sedge. Sandhill seepage bogs, streamhead pocosins, pocosin-sandhill ecotones, canebrakes, cypress domes and stringers, in highly acidic, sandy-peaty soils. May-June. Sc. NC south to Panhandle FL, west to sc. LA, a southeastern Coastal Plain endemic. \[= RAB, FNA, GW, K, M, S, WH\]

**Carex umbellata** Schkuhr ex Willdenow, Parasol Sedge. Old fields, other habitats. \{distribution and habitats in our area obscure. NL (Newfoundland) west to SK, south to VA, TN, IL, and MN. It seems very possible that southern members of the C. umbellata complex may not correspond to the taxa "distinguished" in the northeastern United States. C. tonsa, C. rugosperma, and C. umbellata are circumscribed by various authors in different ways. This group needs critical study. \[= FNA, G, K, M; < C. umbellata – RAB, C, W (also see C. rugosperma and C. tonsa); = C. abdita Bicknell – F\]

**Carex utriculata** F. Boott, Beaked Sedge. Wet meadows. Boreal American, ranging south to DE, w. VA, nw. and sw. NC, ne. TN (Johnson County), IN, NE, NM, and CA. Recently verified for NC. \[= C, F, K; < C. rostrata – M, misapplied as to our material; = C. schweinitzii – RAB, by misidentification\]

**Carex venusta** Dewey. Bay swamps, peat bogs, mossy wetlands, and other wet habitats. Se. VA south to Panhandle FL, on the Coastal Plain. \[= M, S; = C. venusta var. venusta – C, F, G, K; < C. venusta – RAB, FNA, GW, W, WH (also see C. oblita)\]

**Carex verrucosa** Muhlenberg. Pocosins, wet pinelands, pond cypress ponds, domes, and stringers. July-September. Se. NC south to south to s. FL, west to w. LA and e. TX. \[= RAB, FNA, GW, K, M, S, WH; = C. glaucescens Elliott var. androgyna M.A. Curtis\]

**Carex vesicaria** Linnaeus, Inflated Sedge. Bogs. Circumboreal, ranging south in North America to DE, w. VA, nw. NC, KY, IN, MO, NM, and CA. \[= FNA, G; > C. vesicaria var. vesicaria – C, F, K; > C. vesicaria var. monile (Tuckerman) Femald – F, K; ? C. vesicaria – M; > C. monile Tuckerman\]

**Carex vestita** Willdenow. Low forests. April-May. S. ME south to se. VA and nc. NC. \[= RAB, C, F, FNA, G, K, M\]

**Carex vexans** F.J. Hermann, Florida Hammock Sedge. Marshes, distches, swamps, hydric hammocks. E. Panhandle FL south to s. FL. \[= FNA, K, WH; < C. alata – S\]

**Carex virescens** Muhlenberg ex Willdenow. Nutrient-rich forests, woodlands, and openings. May-June. S. ME, NY, and s. MI, south to e. VA, w. NC, nw. SC, and MO. \[= RAB, C, F, FNA, G, K, M, S, W\]

**Carex vulpinoidea** Michaux. Wet sites. NL (Labrador) west to BC, south to FL, TX, Sonora, and CA. \[= RAB, F, FNA, G, M, S, W; < C. vulpinoidea var. vulpinoidea – C, K; < C. vulpinoidea – GW (also see C. annetzens and C. triangularis)\]

**Carex willdenowii** Schkuhr ex Willdenow. Calcareous mesic forests, but also in more acidic dry-mesic upland oak forests. May-June. MA, VT, NY, s. ON, and c. IN, south to nc. SC, n. AL, and s. IL; disjunct in c. AR. Naczi (1999b) reports chromosome numbers of n = 31, 39. \[= FNA, K; < C. willdenowii – RAB, F, W (also see C. basiantha and C. superata); < C. willdenovii – C, G, M, S (also see C. basiantha and C. superata) and orthographic variant\]
Cyperaceae

Carex woodii Dewey, Wood's Sedge. Moist slopes and cove forests over mafic rocks (such as amphibolite), ultramafic rocks (such as olivine), or felsic rocks. May-June. NY west to MB, south to NC, nw. SC, n. GA, and MO. This species forms clonal patches reminiscent of *C. pensylvanica*, but has perigynia glabrous and filled by the achene at maturity; the foliage also has a paler green cast. It has probably been much overlooked in the past. Nazczi (1999b) reports chromosome numbers of n = 22, 26. [= RAB, C, F, FNA, K, M, W; = *C. tetanica* var. woodii (Dewey) Wood – G]

**Cladium** P. Browne (Sawgrass, Twig-rush)

1 Plants 1-3 m tall, coarse, from short rhizomes, forming dense tussocks; leaves 1-15 dm long, 5-12 mm wide, stiff and flat (or broadly V-shaped), the margins and midrib (beneath) harshly serrate (saw-toothed); inflorescence a narrow panicle 3-9 dm long, the branches bearing several fascicles of spikelet; achene base broadly rounded to truncate; [of tidal freshwater to brackish marshes or outer coastal plain calcareous savannas] ........................................................................................................................................................................... C. jamaicense

1 Plants 0.4-1 m tall, relatively delicate, from creeping rhizomes, forming loosely tufted colonies; leaves 1-3 dm long, 1-3 mm wide, flat to channelled (terete apically), margins only slightly scabrous; inflorescence 0.5-3 dm long, of 2-4 umbelliform cymes, the branches rigidly ascending and bearing simple glomerules of spikelets; achene base squarely truncate to slightly flaring; [of Coastal Plain acidic seepages and tidal freshwater to slightly brackish marshes, Mountain fens or bogs] ....................................................................................................................... C. mariscoides

**Cladium jamaicense** Crantz, Sawgrass. In circumneutral to alkaline situations, including brackish marshes, and rarely somewhat inland in savannas underlain by coquina limestone. July-October. S. VA south to s. FL, west to e. TX, and in the West Indies. This is, of course, the famous sawgrass which dominates many square miles in the Everglades of s. FL (where underlain by oolite). The leaves can cut flesh or clothing. *C. jamaicense* is sometimes treated as one component (ssp. *jamaicense*) of a multi-continental *C. mariscus* complex. [= RAB, C, F, FNA, G, GW, WH; = *C. mariscus* (Linnaeus) Pohl ssp. *jamaicense* (Crantz) Küchenthal – K; = Mariscus jamaicensis (Crantz) Britton – S]

**Cladium mariscoides** (Muhlenberg) Torrey, Twig-rush, Fen-sedge, Smooth Sawgrass. In strongly acidic to circumneutral situations, including acidic seepage at the margins of brackish marshes, in wet flats under *Pinus serotina* and *Taxodium ascendens* (Gaddy & Raynor 1980), in mucky seepage bogs in the fall-line sandhills, in peaty fens and bogs in the Mountains (especially over mafic or ultramafic rocks, such as amphibolite). July-September. NL (Newfoundland) west to SK Widespread and rather common north of the glacial boundary, with scattered and disjunct occurrences southward in VA, NC, SC, GA, Panhandle FL, n. KY (Clark et al. 2005), s. AL, se. MS (Sorrie & Leonard 1999), and e. TX. Bridges, Orzell, & Burkhalter (1993) discuss in detail the phytogeography of this plant, particularly in reference to its southern occurrences, which are curiously fragmented and disjunct. [= RAB, C, F, FNA, G, K, W, WH; = Mariscus mariscoides (Muhlenberg) Kuntze – S]

Cyperus Linnaeus 1753 (Umbrella Sedge)

A genus of about 500-550 species, herbs, of tropical and warm temperate areas. References: Goetghebeur in Kubitzki (1998b); Tucker, Markes, & Carter in FNA (2002b). [also see *Kyllinga*]

This treatment is closely adapted from Tucker, Markes, & Carter in FNA (2002b) and other sources. It needs substantial customization and revision prior to publication. Key lead 4 in the main key is problematic.

1 Inflorescences unbranched (the spikes sessile); spikelets 1-2-flowered; rachilla not or only slightly elongate; scales conspicuously keeled; lowest 2 scales of spikelet greatly reduced ........................................................................................................................................... [see *Kyllinga*]

1 Inflorescences branched (the spikes pedunculate); spikelets 1-many-flowered; rachilla elongate; scales generally broadly rounded; lowest 2 scales of spikelet not greatly reduced.

2 Stigmas 2; achenes lenticular.

3 Achenes dorsiventrally flattened, borne with a flattened face toward the rachillae; [subgenus *Juncellus*] ...................................................................................................................... Key A

3 Achenes laterally flattened, borne with an edge toward the rachilla; [subgenus *Pycreus*] ...................................................................................................................... Key B

2 Stigmas 3; achenes trigonous.

4 Spikelets borne in digitate clusters (rarely singly), or in umbellate or glomerulate heads; [subgenus *Pycnostachys*] ............................................................................... Key C

4 Spikelets borne in spikes on a conspicuous rachis.

5 Rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a cartilaginously thickened section of the rachilla (and its wings); [subgenus *Diclidium*] ............................................................................................................. Key D

5 Rachilla continuous, or articulate only at the base; [subgenus *Pycreus*] ...................................................................................................................... Key E
Key A – subgenus Juncellus – stigmas 2; achenes lenticular; achenes dorsiventrally flattened, borne with a flattened face toward the rachillas

1 Plants 1-3 (-6) dm tall; leaf blades 0-7 cm long ................................................................. C. laevigatus
2 Plants to 10 dm tall; leaf blades 20-40 cm long ................................................................. C. serotinus

Key B – subgenus Pycreus – stigmas 2; achenes lenticular; achenes laterally flattened, borne with an edge toward the rachilla

1 Scales 2-keeled in the lower third to half (bicarinate).
2 Scales entire or minutely mucronate; stamens 2-3; achenes (0.7-) 1.0-1.6 mm long. C. pumilus
3 Scales with excurved awn 0.3-0.5 mm long; stamens 1-2; achenes ca. 0.6 mm long. C. flavescens

Key C – subgenus Pycnostachys – stigmas 3; achenes trigonous; spikelets borne in digitate clusters (rarely singly), or in umbellate or glomerulate heads

1 Scales with excurred awn 0.3-0.5 mm long; stamens 1-2; achenes ca. 0.6 mm long. C. polystachyos
2 Scales firm, oblong, closely imbricate, thus the spikelets appearing smooth-margined to the unaided eye; perennial or annual, 5-75 cm tall. C. distinctus
3 Scales 1.5-2.4 mm long, 1.0-1.4 mm wide; achenes 0.8-1.2 mm long, 0.4-0.6 mm wide. C. pumilus
4 Achenes ovoid, obvoid, or ellipsoid, with a rounded or subacute apex, biconvex or strongly laterally flattened. C. ochraceus
5 Achenes oblong with a truncate apex, subcylindrical, only slightly compressed laterally. C. diandrus
Key D – subgenus *Diclidium* – stigmas 3; achenes trigonous; spikelets borne in spikes on a conspicuous rachilla; rachilla articulate at the base of each scale, the mature spike therefore disarticulating into segments consisting of a scale, an achene, and a section of the rachilla (including its wings)

1. Tip of each scale not reaching above the base of the next distal scale on the same side of the rachilla, and usually ending short of it; achene linear oblong, 1.5-2 mm long, about 3× as long as wide................................. *C. odoratus* var. *engelmannii*

1. Tip of each scale reaching above the base of the next distal scale on the same side of the rachilla; achene ellipsoid, obovoid-oblong, or slenderly obovoid, 1-1.5 mm long, about 2× as long as wide.................................................... *C. odoratus* var. *odoratus*

Key E – subgenus *Cyperus* – stigmas 3; achenes trigonous; spikelets borne in spikes on a conspicuous rachilla; rachilla continuous, or articulate only at the base

1. Upper scales of the spikelet with a straight or excurved mucronate or cuspidate apex 0.4-1.2 mm long.

2. Floral scales deciduous, spreading, mostly < 3 mm long; spikelets quadrangular in ×-section; rachilla wingless, or wings < 0.4 mm wide.

3. Achenes 0.5-0.6 mm wide, < 2× as long as wide, cuneate to the base; scales 1.0-2.0 mm wide, 9-13-nerved; filaments ca. 2.5 mm long; anthers 0.4-0.8 mm long ..................................................................................... *C. granitophilus*

4. Achenes (0.2-) 0.3-0.4 (-0.5) mm wide, > 2× as long as wide, with a minute stipe at the base; scales 0.5-1.0 mm wide, (5-) 7-9 (-11)-nerved; filaments ca. 1.5 mm long; anthers 0.3-0.4 mm long ..................................................................................... *C. squarrosus*

5. Achenes 0.5-1.1 mm wide; stamens 3; culms (2-) 6-50 cm tall.

6. Achenes obvoid, truncate at the apex; leaves flat to V-shaped; live plants not viscous to the touch.............................. *C. compressus*

7. Spikelets oblong-obovoid, >2× as wide as thick (in cross-section); scales spreading or appressed.

8. Achenes 0.5-1.2 mm long; anthers 0.3-0.4 mm long; style and stigma combined > 4.2 mm long .......................................................... *C. microiria*

9. Scales elliptic to oblong or ovate, acute to obtuse, not notched at the tip; styles 0.3-1.3 mm long. 

10. Spikelets strongly compressed, 2× as wide as thick (in cross-section); scales spreading or appressed.

11. Scales obovate-orbiculate, notched at the tip; styles < 0.1 mm long.

12. Rachilla wingless; scales scarcely mucronate ................................................................................................. *C. iria*

13. Rachilla with hyaline, whitish, or straw-colored wings 0.2-0.5 mm wide.

14. Culms terete (at least toward the base), nodose-septate; inflorescence bracts 2 (-4), all erect; leaf blades generally absent ........

15. Culms trigonous, not nodose-septate; inflorescence bracts 3-7, horizontal, ascending, or reflexed; leaf blades present.

16. Scales purple or rich red to reddish brown, with green midveins; base of culm indurate; stolons wiry, springy when dried ........ *C. rotundus*

17. Rachilla wingless; scales scarcely mucronate; style and stigma combined > 4.2 mm long .......................................................... *C. microiria*

18. Rachilla wingless; scales scarcely mucronate; style and stigma combined > 4.2 mm long .......................................................... *C. macrostachyus*

19. Rachilla wingless; scales scarcely mucronate; style and stigma combined > 4.2 mm long .......................................................... *C. planifolius*

20. Rachilla wingless, or with wings 0-0.2 mm wide.

21. Longest inflorescence bract erect or strongly ascending .......................................................... *C. schweinitzii*

22. Rachis (to which the spikelets are attached) glabrous; achenes 1.5-2.0 mm long; spikelets subglobose to broadly ovoid; [of wetland sites, of SC southward].............. *C. houghtonii*

23. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

24. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

25. Rachis (to which the spikelets are attached) glabrous; achenes 1.5-2.0 mm long; spikelets subglobose to broadly ovoid; [of wetland sites, of SC southward].............. *C. houghtonii*

26. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

27. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

28. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

29. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

30. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

31. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

32. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*

33. Rachis hispidulous; achenes 1.0-1.2 mm long; spikelets loosely oblong-ovoid; [of wetland sites, of SC southward] .................. *C. pilosus*
25 Scales deciduous; rachillas persistent; rachilla wings deciduous, but remaining firmly attached at the base even after the achenes fall; spikelets with (6-) 12·20 (-40) scales .................................................. \textit{C. erythrorhizos}
25 Scales persistent; rachillas \textbf{either} deciduous (the mature spikelets generally falling as a single unit from the rachis) or persistent; rachilla wings persistent; spikelets with 2-8 scales.

26 Spikelets reflexed (some of the upperspreading to ascending).

27 Culms glabrous; leaves and inflorescence bracts nearly glabrous .................................................. \textit{C. hystricinus}
27 Culms (at least the upper portion) scaberulous or puberulent; leaves and inflorescence bracts puberulent on the upper surface.

28 Inflorescence rays scaberulous; leaves and inflorescence bracts pubescent on the upper and lower surfaces; culm obtusely trigonous to nearly terete. .................................................. \textit{C. plukenetii}
28 Inflorescence rays smooth (or with a very few hairs); leaves and inflorescence bracts pubescent on the upper surface and on the midvein only on the lower surface; culm sharply 3-angled .................................................. \textit{C. retrofractus}

26 Spikelets spreading to ascending (some of the lowermost reflexed).

29 Spikelets cylindrical, 2-5× as long as wide.

30 Spikelets ellipsoid, 2-3× as long as wide; spikelets with 1-2 (-3) fertile scales .................................................. \textit{C. aggregatus}
30 Spikelets lanceolate to linear, 4-10× as long as wide; spikelets with 3-8 fertile scales.

31 Scales greenish to light brown, the tips overlapping the lower 1/4 to 1/3 of the next scale .......................... \textit{C. strigosus}
31 Scales reddish brown or tawny, the tips barely reaching the base of the next scale .................................. \textit{C. thyrsiflorus}

29 Spikelets ovoid, globose, or obvoid, 1-2× as long as wide.

32 Scales >4 mm long; achenes <2 mm long.

33 Spikelets ellipsoid to obvoid.

34 Spikelets subquadrangular, the terminal scale elonolate, forming a subulate tip to the spikelet; leaves and inflorescence bracts 3-6 mm wide, smooth .................................................. \textit{C. hystricinus}
34 Spikelets suberete, the terminal scale not elongate, the spikelet therefore acute; leaves and inflorescence bracts mostly >10 mm wide, scabrous on the upper surfaces.

35 Spikelets dense, with 50-90 spikelets, each with 3-6 (-7) fertile scales; achenes conspicuously falcate-curved, 3-4× as long as wide. .................................................. \textit{C. lancastriensis}
35 Spikelets loose, of 13-75 spikelets, each with 4-8 (-11) fertile scales; achenes straight, 5-6× as long as wide. ................................. \textit{C. refractus}

32 Scales <4 mm long; achenes <2 mm long.

36 Spikelets with parallel sides, mostly >25 mm long; spikelets quadrate.

37 Spikelets narrowly ellipsoid, 1.5-2.0 mm wide .................................................................. \textit{C. tetragonus}
37 Spikelets linear, 0.5-1.0 mm wide .................................................................................. \textit{C. thyrsiflorus}

38 Spikelets with curved (convex) sides, mostly <20 mm long; spikelets very compressed.

39 Spikelets linear, 0.5-1.0 mm wide .................................................................................. \textit{C. ovatus}
39 Spikelets appressed; achenes elongate, abruptly constricted at the tip.

38 Scales appressed; achenes oblong-fusiform, gradually narrowed to both ends .................................. \textit{C. echinatus}
38 Scales appressed; achenes ellipsoid, gradually narrowed to both ends. ................................. \textit{C. croceus}

37 Spikelets with curved (convex) sides, mostly <20 mm long; spikelets with curved (convex) sides.

38 Scales ascending; achenes oblong-fusiform, gradually narrowed to both ends ........................................................................................................................................
38 Scales appressed; achenes oblong, gradually narrowed to both ends. ................................. \textit{C. echinatus}
38 Scales appressed; achenes ovoid, gradually narrowed to both ends. ................................. \textit{C. retroversus}

\textit{Cyperus acuminatus} Torrey & Hooker ex Torrey. Wetlands, especially over limestone. IL west to ND, south to w. LA, TX, and n. Mexico; disjunct from WA to s. CA; disjunct eastward at scattered localities in VA, NC, GA (Echols 2007), TN, KY, and OH (where probably native), and NY and NH (where probably introduced). [= C, F, N, FNA, G, GW, K, W] * \textit{Cyperus aggregatus} (Willdenow) Endlicher. Disturbed areas in ports, apparently introduced on ballast, perhaps only a waif and no longer present; native of tropical America. [= FNA, K, WH; = \textit{C. cavennessii} (Lamarck) Britton – s; = \textit{C. flavus} (Vahl) Nees; = \textit{C. huarmensis} (Kunth) M.C. Johnston, misapplied]

\textit{Cyperus articulatus} Linnaeus. Marshes, especially tidal. July-September. Se. SC south to s. FL west to e. TX, and south into tropical America. [= RAB, FNA, GW, K, S, WH]

\textit{Cyperus bipartitus} Torrey. Low fields, ditches, marshes, along streams. July-October. ME and QC west to MN and WA, south to FL (Wakulla County) (Kunzer et al. 2009), GA, LA, TX, NM, AZ, and CA. [= C, FNA, GW, K, W; = \textit{C. rivularis} Kunth – RAB, F, G, S, WV]

GA south to FL and west to e. and s. TX. Rosen, Carter, & Bryson (2006) and Carter, Baker, & Morris (2009) discuss the spread of this noxious weed in the Southeastern United States. [= FNA, K, WH]

*C. filicinus* Vahl. Brackish marshes. July-September. ME to s. FL, west to LA; West Indies. [= RAB, C, F, FNA, G, K, S; = *C. polystachyus* Rottboll var. *filicinus* (Vahl) C.B. Clarke; < *C. polystachyus* – GW, WH]

*C. filiculmis* Vahl. Sandy or rocky woodlands, forests, and fields. July-October. Se. MD south to s. peninsular FL, west to e. TX. [= FNA, RAB, WH; < *C. lupinus* ssp. *lupinus* – K (also see *C. lupinus*)]
**Cyperus flavescens** Linnaeus. Low fields, ditches, marshes. July-September. Pantropical and warm temperate, north in North America to MA, MI, MO, and KS. [= RAB, C, FNA, G, GW, K, S, WH, WV; > C. flavescens var. poiformis (Pursh) Fernald – F]

**Cyperus flavicostatus** Michaux. Ditches, marshes, natural or artificial ponds; common (uncommon in DE, rare in GA). July-October. Se. VA and KY south through the New World tropics. [= C, FNA, K, W, WH; = C. albomarginatus (Martius & Schrader ex Nees) Steudel – RAB, F, G, GW; ? C. sabulosus (Martius & Schrader ex Nees) Steudel – S]

**Cyperus fraternus** Kunth. Disturbed depressions, ditches. Reported for several counties in the GA Coastal Plain (Carter, Baker, & Morris 2009). [< C. reflexus – FNA; = C. reflexus Vahl var. fraternus (Kunth) Kuntze] {add synonymy; not yet keyed; not yet mapped}

**Cyperus granitophilus** McVaugh, Granite Flatsedge. Granitic flatrocks, rarely on diabase flatrocks and Altamaha Grit glades. Sc. VA south to ec. AL in the Piedmont; disjunct in se. and c. TN on sandstone and limestone and in sc. GA on Altamaha Grit. [= FNA, GW, K; < C. aristatus Rottbøll – G, RAB, W; < C. inflexus Muhlenberg – F]

**Cyperus houghtonii** Torrey, Houghton's Flatsedge. Dry upland sites. July. MA, VT, and QC west to MN, south to w. VA, WV, ne. NC, and nw. IN. [= RAB, C, F, FNA, G, K, W]

**Cyperus hystricinus** Fernald. Dry woodlands and forests. July-September. NJ south to n. FL, west to e. TX, mostly on the Coastal Plain. {check specimens of this and relatives – discrepancy between mapped and stated ranges} [= C, FNA, K, S, WH; < C. retrofractus – RAB, W, misapplied; = C. retrofractus (Linnaeus) Torrey var. hystricinus (Fernald) Kükenthal – F, G]

* **Cyperus laevigatus** Linnaeus. Brackish marshes; native of sw. North America and New World tropics. [= RAB, FNA, K; > C. laevigatus – S; > C. careyi Britton – S]

**Cyperus lancastriensis** Porter ex A. Gray. Dry woodlands, forests, and fields. July-September. NJ west to WV, OH, and MO, south to GA and AR. [= RAB, C, F, FNA, G, K, S, WH]

**Cyperus lanceolatus** Poiret. Wet places. Se. GA and ne. FL west to LA and c. TX (?), south into the Neotropics; also Africa. [= FNA, GW, K, WH; ? C. densissima Link – S]

**Cyperus leptocentri** Torrey ex Steudel. Limesink ponds, low pinelands. July-September. Se. NC south to s. FL, west to w. LA. Sorrie (1998b) reports it for e. GA (Glynn County). [= RAB, FNA, GW, K, S, WH]

**Cyperus ligularis** Linnaeus, Swamp Flatsedge. Brackish marshes, beaches, disturbed wetlands. FL and AL south into Mexico, Central America. South America; Africa. [= FNA, WH] {not yet keyed; add to synonymy}
**Cyperus lupulinus** (Sprengel) Marcks var. *lupulinus*. Dry sterile soils. MA and VT west to MN, south to NC, n. SC, TX; disjunct in ID, WA, and OR. [= *C. lupulinus* ssp. *lupulinus* – FNA, K; < *C. filiculmis* Vahl – RAB, W; < *C. lupulinus* – C, WH; = *C. filiculmis* Vahl var. *filiculmis* – F, G, WV; > < *C. filiculmis* – S; > *C. martindalei* Britton – S]

**Cyperus lupulinus** (Sprengel) Marcks var. *macilentus* (Fernald) A. Haines. Dry sterile soils. ME, QC, and MN south to w. VA, w. NC, nw. GA, and MO. [= *C. lupulinus* ssp. *macilentus* (Fernald) Marcks – FNA, K; < *C. filiculmis* Vahl – RAB, S, W; = *C. filiculmis* Vahl var. *macilentus* Fernald – F, G, WV; > *C. martindalei* Britton – S]

* Cyperus ochraceus* Vahl. Marshes, ditches, wet disturbed areas. Se. GA (Jones & Coile 1988), s. FL, s. AL, s. MS, LA, TX, south into Mexico, Centrall America, and South America. [= FNA, GW, K, S, WH]

* Cyperus oxylepis* Nees ex Steudel. Disturbed wet areas, marshes, saline areas; native of South America. See Bryson et al. (1996). [= FNA, GW, K, WH]

* Cyperus planifolius* L.C. Richard. Brackish marshes. Se. GA (Jones & Coile 1988) south to s. FL; West Indies; Central and South America. [= FNA, GW, K, WH; ? *C. brunneus* Swartz – S]

* Cyperus prolifer* Lamarck. Pond shores, marshes; native of tropical e. Africa. July–August. Also reported for se. VA (Kartesz 2010). [= FNA, WH; ? *C. isocladus* Kunth]

* Cyperus pseudovegetus* Steudel, Marsh Flatsedge. Marshes, ditches, depressions. July–October. NJ and MA, west to s. IL, s. MO, and OK, south to FL and TX. [= RAB, C, FNA, G, GW, K, S, W, WH; = *C. viridis* – F, misapplied]

* Cyperus pumilus* Linnaeus. Disturbed wet areas; native of the Old World, occurring in n. FL and se. GA. [= FNA, GW, K, WH]

* Cyperus reflexus* Vahl. Disturbed wet areas; native of sw. United States south to tropical America. July–August. [= FNA, WH]
**Cyperus refractus** Engelmann ex Böckler. Dry sandy or rocky woodlands and forests. July-September. NJ west to OH and MO, south to SC, GA, AL, and AR. [= RAB, C, F, FNA, G, K, S, W]

**Cyperus retroflexus** Buckley. Cropped fields, damp disturbed areas. July-September. AL west to NM, south to Mexico. [= FNA, K]

**Cyperus retrofractus** (Linnaeus) Torrey. Dry sandy or rocky woodlands and fields. July-September. NJ west to s. OH, and se. MO, south to GA. AL, and AR. [= C, FNA, K, WH; = C. dipsaciformis Fernald – RAB, F, S, W; = C. retrofractus (Linnaeus) Torrey var. dipsaciformis (Fernald) Kükenthal – G]

**Cyperus retrorsus** Chapman, Pinebarren Flatsedge. Dry woodlands, forests, and rock outcrops. July-October. S. NY south to FL, west to TX, mostly on the Coastal Plain, but north in the interior to KY and se. OK. [= C, FNA, G, GW, K, WH; = C. retrorsus Chapman var. retrorsus – RAB, K; > C. retrorsus var. retrorsus – F; > C. retrorsus var. nashii (Britton) Fernald – F; > C. retrorsus – S; > C. nashii Britton – S; > C. torreyi Britton – S]

**Cyperus rotundus** Linnaeus, Purple Nutsedge, Nutgrass, Cocograss. Gardens, fields, disturbed areas. June-October. Pantropical and warm temperate in distribution (though extending less far north than *C. esculentus*). [= RAB, C, F, FNA, GW, K, S, WH]

**Cyperus sanguinolentus** Vahl. Ditches, disturbed wet areas; native of Asia, known in North America from e. GA west to LA. See Carter & Bryson (2000) for detailed information. [= FNA; > Cyperus louisianensis Thieret – K]

**Cyperus schweinitzii** Torrey, Sand Flatsedge. Sandy soils. VT, MA, MN, and Albert, south to s. NJ, e. PA, n. KY, OH, MO, TX, NM, UT, and Mexico. It occurs in se. PA (Rhoads & Klein 1993) and NJ. [= FNA, C, F, G, K]

**Cyperus strigosus** Linnaeus, False Nutsedge. Marshes, ditches, wet flatwoods, wet disturbed areas. July-October. QC west to SD, south to FL and TX; also in w. North America. [= RAB, C, FNA, GW, K, W, WV; > C. strigosus var. strigosus – F, G; > C. strigosus var. robustior Britton – F; > C. strigosus var. stenolepis (Torrey) Kükenthal – G; > C. strigosus – S; > C. praelongatus Steudel – S; > C. stenolepis Torrey – S]

**Cyperus surinamensis** Rottboll. Marshes, pond edges, disturbed wet areas. September-October. Se. SC south to s. FL, west to KS, OK, TX, and south into Mexico and tropical America. [= RAB, FNA, GW, K, S, WH]

**Cyperus tetragonus** Elliott, Four-angled Flatsedge. Maritime forests and dunes, edges of brackish marshes. July-September. E. NC south to s. FL; FNA treats C. pringlei of AZ and NM as conspecific, but this seems unlikely. [= RAB, FNA, K, S, WH]

**Cyperus thyrsiflorus** Junghuhn. Swamps and streambanks. Se. GA and FL peninsula west to se. TX; West Indies; South America. [= FNA, K, WH; = C. hermaphroditus (Jacquin) Standley – S, misapplied]

**Cyperus virens** Michaux. Marshes and ditches. July-September. Se. NC south to c. peninsular FL, west to TX; Mexico to Argentina. [= FNA, WH; < C. virens – GW, K, RAB, S]

---

*Dulichium* Persoon (Threeway Sedge)

**Identification notes:** The combination of the distichous Cyperus-like spikelets and numerous, distinctly 3-ranked, short, cauline leaves makes Dulichium distinctive.

**Eleocharis** R. Brown 1810 (Spikerush)
[by Bruce A. Sorrie and Alan S. Weakley]

**Identification notes:** "Scale" refers to the flower scales. "Sheath" refers to leaf sheaths. "Bristle" refers to perianth bristles.

subgenus *Eleocharis*

section *Eleocharis*

series *Eleocharis*

subseries *Eleocharis*: erythrolepis, fallax, halophila, palustris, smallii

subseries *Truncatae*: bifida, compressa, elliptica, intermedia, montevidensis, tenuis, tricostata, verrucosa

series *Albidae*: albida

series *Melanocarpace*: melanocarpa

series *Rostellatae*: rostellata

series *Tenuissimae*

subseries *Chuetae*: baldwinii, brittonii, microcarpa, nigrescens, setifolia, tortilis, tuberculosa, vivipara

section *Eleogenus*

series *Ovatae*: engelmanii, obtusa, ovata

series *Maculoseae*

subseries *Ocreatae*: flavescens, olivacea

subseries *Rigidae*: atropurpurea, genericulata

section *Parvulae*: parvula

subgenus *Limnochloa*: cellulosa, elongata, equisetoides, interstincta, quadrangulata, robbinsii

subgenus *Scirpidium*

section *Scirpidium*: acicularis, radicans

1. Culms producing vegetative proliferations rather than normal fertile spikelets ................................................................. Key A
2. Spike 1-2× as thick as the culm immediately below the spike, gradually expanded from the culm, the base of the spike narrowly cuneate; spike (3-)4-8× as long as wide; [subgenus *Limnochloa*] ................................................................. Key B
3. Achenes with several distinct longitudinal ribs or low ridges, the intervening spaces with abundant, very narrow, horizontally elongate cells; [subgenus *Scirpidium*] ........................................................................................................................................ Key C
4. Achenes without longitudinal ribs, the surface smooth, granular, or honeycomb-like (*E. tortilis* and *E. tuberculosa* have indistinct ribs, but intervening cells are honeycomb-like, not thin horizontally; *E. tricostata* has 3 keel-like ribs, but achene surface appears granular).
5. Achenes lenticular or biconvex; styles 2-branched ........................................................................................................ Key D
6. Achenes trigonous or nearly terete; styles 3-branched ........................................................................................................ Key E

**Key A** – spikerushes proliferating vegetatively, with no fertile spikelets present

{key provisional and needing additional testing!}

1. Each culm producing secondary or tertiary whorls.
2. Base of whorl abruptly widened from culm, forming a distinct shoulder; whorl divisions many per whorl (commonly 20 or more); whorl divisions usually 0.2 mm or less wide, finely capillary (often < 0.1 mm, but same may appercoch 0.3 mm); surface texture of divisions obviously beaded (under dissecting microscope) ........................................................................................................... *E. confervoides*
3. Base of whorl gradually widened from culm, vase-shaped, not forming a distinct shoulder; whorl divisions fewer per whorl (commonly 15 or less); whorl divisions usually 0.3 mm or more wide (0.5 mm or more, but the finest secondary or tertiary divisions as slender as 0.15 mm); surface texture of divisions not beaded (under dissecting microscope) ........................................................................................................... *E. vivipara*
4. Each culm producing a single whorl of proliferations.
5. Upper portion of sheath firm, the edge closely red-dotted; sheath tip < 1 mm long ...................................................................... *E. vivipara*
Key B – spikerushes with the spike as thick as the culm (subgenus Limnochloa)

1 Culm transversely nodose-septate (appearing jointed), about 5-9.5 mm in diameter.
   2 Achenes with longitudinal rows of enlarged linear cells separated by obscure longitudinal lines; perianth bristles narrow and weak, exceeding achene; [of Panhandle FL and s. AL] ..........................................................
   3 Spike 3-5 mm in diameter, to 5 cm long; rounded to obtuse at the tip, densely flowered, the flowers (scales) 50-100 per spike, arranged in obvious spiral rows; culm 2-5 mm in diameter; [of estuarine and riverine marshes, or brackish interdune swale ponds on barrier islands].
   4 Culms 3-5 mm in diameter, live culms terete when fresh; culm 0.5-1.5 (-2) mm in diameter; [widespread] ..........................................................
   5 Achenes rufous-brown to reddish-purple to black, (0.3-) 0.4-0.6 mm wide; longer bristles retrorsely barbed, shorter than to equaling achene body ........................................................................................................................................

Key C – spikerushes with achenes with several distinct longitudinal ribs with very narrow horizontal cells between (subgenus Scirpidium)

1 Culms about 0.5 mm thick, firm, not wrinkling in drying; spikes 3-6 mm long; [widespread] ..........................................................
1 Culms 0.6-1.0 mm thick, becoming wrinkled in drying; spikes 2-4 mm long; [of the Coastal Plain, known from Virginia Beach in 1934] .......

Key D – spikerushes with achenes lenticular or biconvex and styles 2-branched

1 Apex of sheath thin, membranous, hyaline, often with a torn edge.
   2 Culms 0.1-0.3 mm in diameter; achenes whitish to pale brown; leaf sheaths of the upper culm closely sheathing the stem, not wrinkled, the apex acute ..........................................................
   3 Culms 0.3-0.6 mm in diameter; achenes rufous- or olivaceous-brown to black; leaf sheaths of the upper culm usually prominently wrinkled, inflated, membranous, and disintegrating.
   4 Achenes rufous-brown to reddish-purple to black, (0.3-) 0.4-0.6 mm wide; longer bristles retrorsely barbed, shorter than to equaling achene body ........................................................................................................................................
   5 Achenes olivaceous-brown to black, 0.5-0.7 (-0.8) mm wide; longer bristles either retrorsely barbed and equaling to exceeding the tubercle, or smooth and shorter than the tubercle.

Key E – spikerushes with achenes trigonous or nearly terete and styles 3-branched

1 Achenes roughy and coarsely honeycomb-reticulate; plants usually forming dense, broad tussocks.
   2 Tubercle much narrower than the achene; culms 'lazy', often reclining, distinctly 3-angled, twisted ..........................................................
   3 Tubercle as broad or broader than the achene; culms ascending to erect, suberete, not twisted ..........................................................

Cyperaceae
Achenes smooth to finely honeycomb-reticulate.

1. Achenes bicolored, body black, tubercle whitish, depressed; [plant of freshwater ponds and Carolina bays] ............... E. melanocarpa
2. Achenes unicolored, body and tubercle light brown or olive brown; [plants of brackish to saline marshes] .................. E. parvula
3. Plants diminutive, culms slender, rounded, 1-7 cm long, not arching and rooting ............... E. rostellata
4. Plants robust, culms broad, flattened, 20-80 (or more) long, at least some arching and rooting at tips ............... E. tenuis

2. Tubercole not confluent with the achene summit, constricted at the base.

5. Achenes with prominent keel-like angles or ribs ....................................................... E. tricostata
6. Achenes with rounded angles.

6. Tubercole depressed-deltoid; scales rounded, appressed .................................................. E. brittonii
7. Tubercole conic or deltoid; scales acute to attenuate, the tips free .................................. E. microcarpa
8. Bristles present.

10. Tubercole depressed-deltoid; scales rounded, appressed .................................................. E. brittonii
11. Tubercole conic or deltoid; scales acute to attenuate, the tips free .................................. E. microcarpa

13. Sheath base pinkish to straw-colored; spikes lance-ovate to oblong, 1.5-5 mm long ......................... E. brittonii
14. Sheath base purple-red; spikes ovoid, 2-3 mm long; [plant very rare, Santee Canal, SC, late 1800s] ............... E. nigrescens
15. Achenes yellowish, brown, or olive.

8. Achenes white or very pale gray.

15. Bristles present; culms rounded; [of coastal brackish soils] ................................................. E. albida
16. Bristles absent; culms strongly flattened; [of inland basic soils] ........................................... E. compressa
17. Achenes 1.2-1.7 mm long, at maturity normally with bristles .............................................. E. fallax (fallax phase)
18. Achenes 0.7-1.2 mm long, with or without bristles.

19. Mature achenes with bristles; achenes yellow or brown; culms 0.6-1.0 mm thick; [rare, on outer Coastal Plain of NC and SC] ................................................................. E. montevidensis
20. Mature achenes without bristles; achenes yellow or brown; culms 0.6-1.0 mm thick; [rare, on outer Coastal Plain of NC and SC] ................................................................. E. montevidensis
21. Culms 4 (-5) angled; mature achenes olive, without transverse bands. ............... E. elliptica
22. Culms 0.4-0.8 mm wide, prominently wing-angled; tubercle depressed ................................. E. tenuis var. pseudoptera
23. Culms 0.2-0.4 mm wide, angles not wing-like; tubercle broadly conic or depressed. ......... E. tenuis var. tenuis
24. Tubercle broadly conic, about 1/4-1/5 as high as the achene body ................................ E. tenuis var. verrucosa

Eleocharis acicularis (Linnaeus) Roemer & J.A. Schultes. Marshes, ditches. July-September. Greenland, NL (Newfoundland); NU, and AK south to CA, TX, CA; Mexico, Central America, n. South America, Eurasia. [= RAB, C, FNA, G, GW, K, S; > E. acicularis var. acicularis – F]

Eleocharis aestuarii Hines ex A. Haines. Freshwater tidal rivers. ME south to DE, PA, and NJ. [= FNA]

Eleocharis bicolor Chapman. Moist sites, wet savannas. AL and GA west to LA; West Indies; Nicaragua. [= FNA, K, S]

Eleocharis conforeoides (Poiret) G. Tucker. Cp (GA, NC, SC, VA): submersed in lakes and ponds; rare. GA and FL; West Indies; Central and South America; Asia; Africa; n. Australia. This taxon, often segregated into the monotypic genus Websteria, is widely distributed in tropical and subtropical regions of both hemispheres. Its retention in Eleocharis is supported by a molecular phylogenetic study (Roalson & Friar 2000). [= Websteria conforeoides (Poiret) S. Hooper – FNA, GW, K; = Websteria submersa (C. Wright) Britton – S; = Scirpus conforeoides Poiret]

Eleocharis elliptica Kunth. Mt (VA, WV): calcareous prairies, fens, shores, riverside scours; rare. NL (Labrador) west to BC, south to PA, NJ, WV, TN, IA, and ID. [= F, FNA, K, WV; = E. tenuis (Willdenow) J.A. Schultz var. borealis (Svenson) Gleason – C, G]

Eleocharis elongata Chapman. Cp (GA, NC): quiet waters of limesink (doline) ponds; rare (NC Rare). July-August. Se. NC south to FL, west to s. AL, s. MS, and TX (Sorrie & Leonard 1999); Jamaica, Mexico, Central America, South America. [= FNA, GW, K, S]

Eleocharis engelmannii Steudel, Engelmann Spikerush. Cp (DE, NC, SC, VA), Pd (DE, GA, NC, VA), Mt (VA, WV): freshwater shores, marshes, disturbed wet places; uncommon (rare in WV)). July-September. MA, ON, and British Cumbria south to GA, MS (Sorrie & LeBlond 2008), TX, and CA. [= RAB, F, FNA, G, K, S, WV]

Eleocharis equisetoides (Elliott) Torrey, Horsetail Spikerush. Cp (DE, GA, NC, SC, VA): quiet waters of limesink (doline) ponds, natural lakes, borrow pits, ditches, artificial millponds; uncommon (rare in DE and VA). June-September. MA south to e. peninsular FL, west to se. TX; also near the Great Lakes from NY west to MI and MO. [= RAB, C, F, FNA, GW, K; < E. equisetoides – S]

Eleocharis erythropoda Steudel, Bald Spikerush. Mt (GA, NC, VA, WV), Cp (DE, NC, VA), Pd (DE, VA): streambanks, marshes, ponds, swamps; rare. July-September. NS and AK south to NC, MS, TX, AZ, and OR. [= RAB, FNA, GW, K; < E. palastris – C; > E. calva Torrey – F, G, S, WV, invalid name]

Eleocharis flavescens (Poiret) Urban. Cp (DE, FL, GA, NC?, SC?, VA?): Coastal Plain ponds, pools; rare. June-September. DE or VA (?) south to FL, west to se. OK and TX; also scattered in the Rocky Mountain states; West Indies; South America. [= K; > E. flavescens var. flavescens – C, FNA, G; > E. flavescens – RAB, F, GW]

Eleocharis halophila (Fernald & Brackett) Fernald. Cp (DE, NC, VA): brackish marshes; rare. July. NL (Newfoundland) to NC, along the coast. [= RAB, F, G, K; < E. palastris – C; < E. uniglumis (Link) Schultz – FNA; = E. uniglumis var. halophila Fernald & Brackett]

Eleocharis intermedia J.A. Schultz, Matted Spikerush. Mt (VA, WV): muddy calcareous seepage areas; rare. NS west to MN, south to VA, TN, and IL. The fruiting culms are of widely different lengths, the lowermost sprawling and much shorter than the longer. [= C, F, FNA, GW, K, WV]

Eleocharis interstincta (Vahl) Roemer & J.A. Schultz. Ponds, borrow pits. May-September. S. AL and Panhandle FL south to s. FL and west (interruptedly) to OK and TX; Bahamas and West Indies; Mexico, Central America, e. South America. [= FNA, GW, K; < E. equisetoides – S]

Eleocharis melanoarpa Torrey, Black-fruited Spikerush. Cp (DE, GA, NC, SC, VA), Mt (VA): Coastal Plain ponds, cypress meadows, sinkhole ponds in the Shenandoah Valley; uncommon (rare in DE, NC, and VA). July-September. MA south to n. peninsular FL, west to s. MS; disjunct in e. TX, s. MI, and n. IN (Sorrie & Leonard 1999). [= RAB, C, F, FNA, GW, K, S]

**Eleocharis palustris** Torrey var. *microcarpa*. Cp (SC): wet pine savannas, Coastal Plain bogs; rare. June-September. SC south to FL, west to LA; West Indies. [= F, FNA; < *E. microcarpa* – RAB, C, G, GW, K; = *E. microcarpa* – S]

**Eleocharis nigrescens** (Nees) Steudel. Cp (SC): pond margins, flatwoods; rare. SC to FL; West Indies, Mexico; South America; Africa. [= F, GW, K; ? *E. setifolia* (A. Richard) Raynal; < *E. microcarpa* – RAB, ? *E. carolina* Small – S]

**Eleocharis obtusa** (Willdenow) J.A. Schultes. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): ditches, marshes, disturbed wet areas; common. June-October. NS west to BC, south to FL, TX, and CA. [= FNA, GW, K, S, WV; < *E. ovata* – RAB, C; > *E. obtusa* var. *obtusa* – F; > *E. obtusa* var. *ellipsoidalis* Fernald – F; > *E. obtusa* var. *jejuna* Fernald – F]

**Eleocharis oligocharis** Torrey var. *reductiseta* (Schuyler & Ferren) Schuyler & Ferren. Tidal rivers. Endemic to s. NJ (as far as is known). [= K; < *E. flavescens* (Poiret) Urban var. *olivacea* (Torrey) Gleason – C, FNA, G; < *E. olivacea* – F]

**Eleocharis palustris** (Linnaeus) Roemer & J.A. Schultes, Small’s Spikerush. Cp (DE, VA), Pd (DE, VA), Mt (NC, WV), {SC}: marshes; common (uncommon in VA and WV, rare in NC). June-September. NL (Labrador) west to AK, south to FL, TX, CA, and Mexico; Eurasia. As discussed by Smith et al. in FNA (2002b), variable in geographically correlated ways and probably warranting recognition of varieties or segregate species. *E. smallii* is sometimes separated as the eastern North American member of the north temperate *E. palustris* complex. [= FNA, GW, K; < *E. palustris* – RAB, C; > *E. smallii* Britton – F, WV; > *E. palustris* var. *palustris* – F; > *E. palustris* var. *medium* – S]

**Eleocharis parvula** (Roemer & J.A. Schultes) Link ex Bluff, Nees, & Schauer, Little-Spike Spikerush. Cp (DE, GA, NC, SC, VA): tidal brackish and freshwater marshes, shallow waters of managed impoundments; common (rare in GA, NC, SC, and VA). July-September. NS, NL (Newfoundland), and MI south to FL and LA; BC south to CA; Mexico, Central America, South America, Eurasia, Africa. [= FNA, GW, K; = *E. parvula* var. *parvula* – C, F]

**Eleocharis radicans** (A. Dietrich) Kunth, Rooting Spikerush. Cp (VA), Mt (WV): {habitat}; rare (VA Rare). Widely scattered in North America; n. Mexico, West Indies, Central America, South America. [= C, FNA, GW, K]

**Eleocharis robustissima** Oakes, Robbins Spikerush. Cp (DE, GA, NC, SC, VA), Mt (VA): quiet waters of limesink (doline) ponds, natural lakes; uncommon (rare in GA, NC, SC, VA). July-August. NS and NB west to ON, south to s. MS (Sorrie & Leonard 1999); also near the Great Lakes, from NY west to IN, WI, and MN. [= RAB, C, F, FNA, GW, K, S]

**Eleocharis rostellata** (Torrey) Torrey, Beaked Spikerush. Cp (DE, NC, VA), Mt (WV)?, {GA?, SC}: brackish and freshwater tidal marshes; uncommon (rare in NC and VA). July-September. ME, ON, and BC south to FL, TX, CA and Mexico; West Indies. Reported for WV (Harmon, Fort-Wrentz, & Grafton 2006). [= RAB, C, FNA, GW, K, G]

**Eleocharis tortilis** (Link) J.A. Schultes, Twisted Spikerush. Cp (DE, GA, NC, SC, VA): wet pine savannas, Coastal Plain seepage bogs, seeps, pococin ecotones; common. July-September. NJ south to FL, west to TX, inland to TN and AR. [= RAB, C, F, FNA, GW, K]

**Eleocharis tuberculosa** (Michaux) Roemer & J.A. Schultes. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, VA): bogs, savannas, ditches; common (rare in Piedmont and Mountains). June-September. NS south to FL, west to TX. [= RAB, C, F, FNA, GW, K; > *E. simplex* (Elliott) A. Dietrich – S; > *E. tuberculosa* – S]

**Eleocharis vivipara** Link, Viviparous Spikerush. Coastal Plain ponds. July-September. NC south to FL, west to LA. [= RAB, C, F, FNA, GW, K, S; > *E. vivipara* – S; > *E. curtisi* Small]

**Eleocharis wolfii** (A. Gray) A. Gray ex Britton. Shallow ephemeral pools on granitic flatrocks. OH, WI, MN, and ND south to GA, AL, TN, LA, and TX. [= F, FNA, C, G, K; {not yet keyed}]

---

**Cyperaceae**

244

---
Eleocharis bifida S.G. Smith, Cedar Glade Spikerush. Mt (GA): seasonally wet seepage in limestone cedar glades; rare. KY south through TN to mw. GA and n. AL. [= FNA; < E. compressa of many earlier authors] {not yet keyed; synonymy incomplete}

Eleocharis lanceolata Fernald, Ozark Spikerush. MO and KS south to LA and TX; disjunct in c. TN. [= FNA, K] {not yet keyed}

Eleocharis macrostachya Britton. Mt (WV): {habitats}; rare in WV. QC to AK south to WV, AL, MS, TX, CA, and Mexico; South America. [= FNA, K; < E. palustris – C] {not yet keyed; add to synonymy}

Eleocharis minima Kunth. {GA}. MD, FL, TX, West Indies, Central America, South America, Asia, Australia (FNA). Reported from specimens from sc. GA (Sorrie, pers. comm.). [= FNA, K; ? E. uncialis Chapman – S] {not yet keyed; add to synonymy}

Eleocharis montana (Kunth) Roemer & J.A. Schultes. Cp (GA): ponds, swales, rare. Sc. and Sw. GA east to TX, south to Mexico, Central America, and South America; West Indies. [= FNA, K; > E. nodulosa (Roth) Schultes – S; > E. montana var. nodulosa (Roth) Svenson] {not yet keyed}

Eleocharis ovata (Roth) Roemer & J.A. Schultes. {VA} NL (Labrador), ON, and MN south to NJ, MD, DE, PA, VA, KY, MO, and OK; scattered in w. United States. Reported for VA in FNA; documentation needing verification. [= F, FNA, G, K; < E. ovata – C] {keyed}

Eriophorum Linnaeus (Cottongrass, Cottonsedge, Bogwool)

1 Folaceous bracts (subtending the head of spikelets) 2 or 3, spreading, the inflorescence therefore appearing terminal.

2 Blade of the uppermost leaf on the stem much shorter than its sheath .............................................................................................................. E. gracile

2 Blade of the uppermost leaf on the stem as long as the sheath or longer ................................................................................................. E. tenellum

1 Folaceous bract (subtending the head of spikelets) solitary, erect, appearing as a continuation of the culm, the inflorescence therefore appearing lateral.

3 Scales (subtending the flower) prominently 3-7-nerved .......................................................................................................................... E. virginicum

3 Scales (subtending the flower) 1-nerved ........................................................................................................................................ E. viridicarinatum

Eriophorum gracile W.D.J. Koch ex Roth, Slender Cottongrass. Bogs and open swamps. Circumboreal, in North America from NL (Labrador) west to AK, south to s. PA (Rhoads & Klein 1993), s.NJ, w. MD (C. Frye, pers comm. 2000), DE (McAvoy & Bennett 2001), OH, IN, IL, MN, CO, UT, NV, and CA. [= C, FNA, G; > E. gracile var. gracile – K]

Eriophorum tenellum Nuttall, Conifer Cottongrass. Bogs. June-September. NL (Newfoundland) west to MN, south to s. NJ, se. PA (Rhoads & Klein 1993), IL, and MI. [= C, FNA, G, K; > E. tenellum var. tenellum – F]

Eriophorum virginicum Linnaeus, Tawny Cottongrass. Peaty sites, limited in habitat throughout the region, occurring in the Mountains in bogs and fens, in the Piedmont (formerly) in bogs, in the fall-line sandhills in burned-out pocosins, in the Coastal Plain in pocosins, acidic seeps, and peat-burn pools. June-September. NL (Labrador) and NL (Newfoundland) west to ON and MN, south to se. NC, sw. NC, e. KY; disjunct in se. GA at Okefenokee Swamp. Very variable in size, from 5-15 dm tall, with heads ranging from 1-6 cm in diameter, the larger plants primarily in the Coastal Plain and the smaller in the Mountains. [= RAB, C, F, FNA, G, GW, K, S, W, WV]

Eriophorum viridicarinatum (Engelmann) Fernald, Darkscale Cottongrass. Bogs. May-August. NL (Newfoundland and Labrador) west to AK, south to s. NJ, PA, OH, IN, IL, MN, ND, WY, ID, and WA; reported by Small (1933) for further south, apparently in error. [= C, FNA, K; = E. viridi-carinatum – F, G, orthographic variant]

Fimbristylis Vahl 1806 (Fimbray)

A genus of about 250-300 species, herbs, primarily warm temperate and tropical. References: Kral (1971)=Z; Kral in FNA (2002b); GW; Goetghebeur in Kubitzki (1998b). Key largely adapted from Z.

1 Style branches 3; achene trigonous or terete; plant an annual.

2 Achene trigonous; spikelets linear-oblong to lanceolate, 3-7 mm long; ligule present, as a line of short, pale hairs F. autumnalis

2 Achene terete; spikelets subglobose to ovoid, 2-4 mm long; ligule absent ................................................................................................. F. littoralis

1 Style branches 2; achene lenticular or terete; plant an annual or perennial.
### CYPERACEAE

<table>
<thead>
<tr>
<th>Plant Characteristics</th>
<th>Species</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plants diminutive annuals, the culms 1-6 (-15) cm tall.</td>
<td>F. perpusilla</td>
</tr>
<tr>
<td>Achene cylindrical, 2-4× as long as wide, curved like a tiny banana; inflorescence bracts 1-2 cm long</td>
<td></td>
</tr>
<tr>
<td>Achene obovate, 1-1.5× as long as wide, not curved; inflorescence bracts 4-10 cm long</td>
<td>F. vahlii</td>
</tr>
<tr>
<td>Plants small to large annuals or perennials, the culms 6-15-150 cm tall.</td>
<td></td>
</tr>
<tr>
<td>Plant a medium-sized to robust perennial, the culms generally 5-15 dm tall, either cespitose, with a hardened base, and deeply set in the substrate, or rhizomatous, the rhizomes either slender or thick</td>
<td></td>
</tr>
<tr>
<td>Plant cespitose, lacking rhizomes; bases of leaves hard, leathery, dark brown, deeply set in the substrate, the base of the plant generally 5-15 cm below the ground surface; achene (1.3-)1-1.5-2 mm long</td>
<td>F. castanea</td>
</tr>
<tr>
<td>Plant rhizomatous, the rhizomes either thick and knotty or slender and scaly (rarely with both); bases of leaves often somewhat thickened, hardened, and brownish, the base of the plant not especially deeply set; achene 0.8-1.2 (-1.3) mm long.</td>
<td></td>
</tr>
<tr>
<td>Plant a robust perennial to 15 (-20) dm tall, with elongate, slender, scaly, pale-to-reddish rhizomes (excavate carefully); leaves usually flat or keeled, 2-5 mm wide; stem usually flattened and scabrous-edged above; ligule a line of short, pale hairs</td>
<td>F. caroliniana</td>
</tr>
<tr>
<td>Plant a medium-sized perennial to 10 dm tall, rhizomatous, the rhizomes short, thick, and knotty (rarely also with slender rhizomes); leaves usually involute, ca. 1 mm wide; stem usually terete or oval in cross-section, smooth; ligule absent or poorly developed.</td>
<td></td>
</tr>
<tr>
<td>Plant a small to medium-sized annual or perennial, the culms to 8 dm tall, neither rhizomatous (except F. brevivaginata) nor with a hardened base deeply set in the substrate.</td>
<td></td>
</tr>
<tr>
<td>Spikelets pale, usually solitary (-3) on the scape (and thus appearing somewhat like an Eleocharis)</td>
<td>F. schoenoides</td>
</tr>
<tr>
<td>Spikelets dark, usually in a complex inflorescence.</td>
<td></td>
</tr>
<tr>
<td>Face (one side) of the achene with 15 or more longitudinal rows of rounded pits, the achene margin noticeably paler.</td>
<td>F. tomentosa</td>
</tr>
<tr>
<td>Face (one side) of the achene with 13 or fewer longitudinal rows of rectangular pits, the achene margin not noticeably paler.</td>
<td></td>
</tr>
<tr>
<td>Plant a perennial; leaves spreading, 2-5 mm wide; achenes lacking warts.</td>
<td></td>
</tr>
<tr>
<td>Plant bulbous at base, and also with scale-covered short rhizomes; spikelet scales glabrous or puberulent; [plant a rare native of rock outcrops in GA and AL] F. brevivaginata</td>
<td></td>
</tr>
<tr>
<td>Plant neither bulbous nor rhizomatous; spikelet scales glabrous; [plant weedy, probably introduced in North America] F. mucronulata</td>
<td></td>
</tr>
<tr>
<td>Plant a perennial; leaves spreading or ascending, 1-4 mm wide; achenes with or without warts.</td>
<td></td>
</tr>
<tr>
<td>Achenes lacking warts or with warts scattered over the entire surface; primary rays of umbel spreading or ascending, the inflorescence generally longer than broad; leaves relatively soft</td>
<td>F. annua</td>
</tr>
<tr>
<td>Achenes with a few low warts on the edges; primary rays of umbel stiffly spreading (even deflexed), the inflorescence therefore often as broad as long or broader; leaves relatively hard, broad (averaging 2 mm wide), and spreading subdichotomously</td>
<td>F. decipiens</td>
</tr>
</tbody>
</table>

---

*Fimbristylis annua* (Allioni) Roemer & J.A. Schultes. Wet, disturbed areas, thin soils of rock outcrops; variously interpreted as entirely alien or partly native. July-September. SE. PA, WV, s. IN, s. IL, MO, e. KS, south to n. peninsular FL, s. TX, s. AZ, and south through Mexico to Central and South America; West Indies; Eurasia, Africa, etc. [= C, FNA, G, GW, K, W, Z; < *F. dichotoma* – RAB; ? *F. baldwiniana* (J.A. Schultes) Torrey – F, S]

*Fimbristylis autumnalis* (Linnaeus) Roemer & J.A. Schultes. Moist to wet disturbed areas. June-October. ME west to MN and SD and south to s. FL and TX; New World tropics. [= RAB, C, FNA, G, GW, K, W, Z; > *F. autumnalis* var. autumnalis – F; > *F. autumnalis* var. mucronulata (Michaux) Fernald – F, VW; > *F. autumnalis* var. autumnalis – S; > *F. geminata* (Nees) Kunth – S]

*Fimbristylis caroliniana* (Lamarck) Fernald. Brackish or alkaline sands of marsh edges and dune swales, less typically in savannas or pine flatwoods. July-September. NJ south to s. FL and west and south to TX and the Yucatan Peninsula; West Indies. This species often grows in proximity to *F. castanea*, which, however, occupies the brackish marsh itself. [= C, FNA, G, GW, K, W, Z; < *F. spadicea* (Linnaeus) Vahl – RAB; > *F. harperi* Britton ex Small – S]

*Fimbristylis castanea* (Michaux) Vahl. Brackish marshes and dune swales. July-September. NY (Long Island) south to s. TX and adjacent Mexico; Yucatan peninsula; West Indies. Replaced in most of the New World tropics by the related *F. spadicea*. [= C, F, FNA, G, GW, K, S, Z; < *F. spadicea* (Linnaeus) Vahl – RAB]

*Fimbristylis decipiens* Kral. Wet, disturbed areas. July-September. E. NC south to n. FL and west to e. TX. [= FNA, GW, K, Z]

*Fimbristylis dichotoma* (Linnaeus) Vahl. Wet, disturbed areas; presumably introduced, probably native of Asia. July-September. The species is now pantropical and subtropical. [= FNA, GW, K, Z; < *F. dichotoma* – RAB (also see *F. annua* and *F. tomentosa*); ? *F. diphylla* (Retzius) Vahl – S]

*Fimbristylis littoralis* Gaudichaud. Disturbed wet ground; native of Asia. July-September. Kral (1971) suggests that it may have been introduced into se. United States early, in association with rice. In North America, now ranging from Central America and the West Indies north to NC, KY, and AR. The name *F. milacea* has been rejected as a nomen ambiguum (Brummitt 2005). [= K; = *F. milacea* (Linnaeus) Vahl – RAB, C, FNA, GW, S, W, Z, misapplied?]

*Fimbristylis perpusilla* R.M. Harper ex Small & Britton, Harper's Fimbr. Drawdown zones of natural depression ponds or exposed banks of blackwater rivers. July-September. The "range" consists of geographically scattered and "irregularly apparent"
populations, usually on the drawdown zones of natural ponds or rivers, in the Coastal Plain from DE and e. MD south through e. VA, se. NC, and ne. SC, to sw. GA, in the Cumberland Plateau of se. TN (Wofford & Jones 1988) and KY (Boone & Chester 2009). See Leonard (1981a, 1981b, 1987) for the first reports of the species in SC and NC. The species characteristically occurs on dry to moist banks exposed in summer by falling water levels, often with other diminutive annuals, such as Hemigraphis micrantha, Oldenlandia uniflora, Juncus repens, Lindernia dubia, Eleocharis baldwinii, and Eragrostis hypnoides. At known locations it does not appear every year; presumably it is present in a seedbank which germinates under favorable hydrologic (and other?) conditions. [= C, FNA, GW, K, S, Z]

**Fimbristylis puberula** (Michaux) Vahl var. *puberula*. Savannas, pine flatwoods, bogs, wet meadows or prairie-like areas, granite outcrops. July-September. Var. puberula ranges from Long Island, NY south to s. FL and west to TX, KS, and NE; var. interior (Britton) Kral ranges from NE south to TX and west to NM and AZ. [= C, FNA, K, Z; < *F. spadicea* (Linnaeus) Vahl – RAB, W; < *F. drummondii* (Torrey & Hooker) Böckler – F; > *F. puberula* – GW, S; > *F. anomala* Böckler – S]

* Fimbristylis schoenoides (Retzius) Vahl. Disturbed wetlands; native of Asia. Reported for sw. GA (Jones & Coile 1988) and also occurs in se. GA (B. Sorrie, pers. comm.). Also recently reported for Ocracoke Island, Hyde County (Sorrie & LeBlond 2008). [= FNA, GW, K]

---

**Fimbristylis**

1 Sheaths of leaves glabrous, the largest leaf blades 0-2 (-5) cm long; plant strongly rhizomatous, the culms usually about 10 cm apart.
2 Blades of culm leaves very short (< 0.5 cm long); spikelets mostly ovoid, sessile in terminal clusters; subtending involucral bract shorter than the spikelets ..............................................................................................................................................................................
3 Perianth bristles longer than the achene stipe, reaching the middle of or exceeding the achene body, strongly and retrorsely barbed; blades of the perianth scales with an acuminate to awned apex. ..............................................................................................................................................................................
4 Perianth bristles as long as or exceeding the achene body; anthers about 0.5 mm long; blades of the perianth scales mostly acuminate; perennial ..............................................................................................................................................................................
5 Blades of the perianth scales acuminate, narrowed into an awn; anthers about 0.5 mm long; blades of the perianth scales mostly awned or bearing a subapical bristle; annual

---

**Fuirena** Rottbøll (Umbrella-sedge)

1 Sheaths of leaves sparsely to densely hirsute, the largest leaf blades 10-15 cm long; plant more-or-less cespitose, annual or perennial, if hybrid derivative of *F. breviseta* and also occurs in se. GA (B. Sorrie, pers. comm.). Also recently reported for Ocracoke Island, Hyde County (Sorrie & LeBlond 2008). [= FNA, GW, K]

2 Blades of culm leaves very short (< 0.5 cm long); spikelets mostly ovoid, sessile in terminal clusters; subtending involucral bract shorter than the spikelets. ..............................................................................................................................................................................

---

**Fuirena breviseta** (Coville) Coville in R.M. Harper, Short-bristled Umbrella-sedge. July-October. Carolina bays, savannas, ditches, other wet habitats. A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX, primarily in the outer Coastal Plain. [= C, F, FNA, G, GW, K, S, Z; < *F. squarrosa* – RAB]

**Fuirena longa** Chapman, Chapman's Umbrella-sedge. Pond margins. Panhandle FL and sw. GA west to e. TX. Possibly a hybrid derivative of *F. breviseta* and *F. scirpoidea*. [= FNA, GW, K, S, Z]

**Fuirena pumila** (Torrey) Sprengel, Dwarf Umbrella-sedge. Depression ponds, savannas, ditches, other wet habitats. July-October. Primarily a species of the Southeastern Coastal Plain, ranging from se. MA south to s. FL and west to TX, and also disjunct in the lowlands around the Great Lakes (as in n. IN and s. MI). [= RAB, C, F, FNA, G, GW, K, Z; < *F. squarrosa* – S, misapplied]
**Fuirena scirpoidea** Michaux, Southern Umbrella-sedge. Natural lakes, pineland depression ponds, wet savannas. July-October. A Southeastern Coastal Plain endemic: se. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009) and FL, west to se. TX, also in Cuba and apparently disjunct (or introduced?) in ne. NC and s. IL. Kral's (1978a) report of this species from ne. NC, where disjunct from the main body of the range in the deep South, needs further investigation. [= C, FNA, G, GW, K, S, Z]

**Fuirena simplex** Vahl var. aristulata (Torrey) Kral. Moist open areas. July-October. MO and NE south to w. KY, c. TX. [= FNA, K, Z; < F. simplex – GW]

**Fuirena squarrosa** Michaux, Hairy Umbrella-sedge. Savannas, seepages, streamhead pocosins, ditches, bogs, other wet habitats. July-October. NY (Long Island) south to n. FL, west to c. TX, inland to w. NC, w. TN, KY, s. AR, and se. OK, mainly on the Coastal Plain, but less strictly limited to it than our other species. [= C, F, FNA, G, GW, K, W, Z; < F. squarrosa – RAB; = F. hispida Elliott – S]

**Isolepis** R. Brown (Club-rush)

A genus of about 60 species, herbs, subcosmopolitan in distribution. Since *Isolepis* is more closely related to *Cyperus* than to *Scirpus*, in which it has often been included, its separation from *Scirpus* is clearly warranted. The generic delimitation of *Isolepis* in relation to *Ficinia* and *Scirpoides* is uncertain. References: Smith in FNA (2002b); Goetghebeur in Kubitzki (1998b).

1 **Achenes 1.0-1.5 mm long; scales in middle of spikelet 1.8-2.0 mm long, with a short awn...............................................................................................................................** *I. carinata*
2 **Achenes 0.7-0.9 mm long; scales in middle of spikelet 1.0-1.2 mm long, mucronate.................................................................** *I. pseudosetacea*

**Isolepis carinata** Hooker & Arnott ex Torrey. Moist soils adjacent to granitic flatrocks, seepage areas, ephemeral pools, moist sandy sites, low fields, ditches. May-June. C. NC, TN, and se. KS south to Panhandle FL and c. TX; also in CA. [= FNA, K; = Scirpus koilolepis (Steudel) Gleason – RAB, C, F, G, GW, WH; = S. carinatus (Hooker & Arnott ex Torrey) A. Gray – S (not S. carinatus Sm.); = I. koilolepis Steudel]

**Isolepis pseudosetacea** (Daveau) Gandoger. Altamaha grit outcrops, moist soils. E. GA (Carter, Baker, & Morris 2009) west to sw. MO, AR, and c. TX. This species often grows intermixed with *I. carinata* and may be more widespread in our area. [= FNA; ? Isolepis molest (M.C. Johnston) S.G. Smith – K; ? Scirpus molestus M.C. Johnston]

**Isolepis setacea** (Linnaeus) R. Brown. On waste and ballast at Camden, NJ and Philadelphia, PA in the 1800s. [= FNA, K] {not keyed or mapped}

**Kyllinga** Rottbøll (Greenhead Sedge)

1 **Scale keel winged, laciniate; anthers ca. 2 mm long ...............................................................................................................................** *K. squamulata*
2 **Scale keel smooth or denticulate; anthers 0.2-1.1 mm long.**
3 **Plant a rhizomatous perennial, mat-forming, the culms arising singly along the rhizome; anthers 0.8-1.1 mm long.**
   4 **Achene 1.0-1.2 (-1.3) mm long; scale keel denticulate or smooth; stamen 2 (rarely 1); longest inflorescence bract erect...........** *K. brevifolia*
   5 **Achene 1.5-1.8 mm long; scale keel smooth; stamens 2-3; longest inflorescence bract horizontal to slightly reflexed..........** *K. gracillima*
3 **Plant a cespitose annual or perennial, the culms arising clumped; anthers 0.2-0.5 mm long.**
4 **Mature achene purple black, with stipe and apiculus contrasting in color; achene obovate, 0.7-0.8 (-0.9) mm wide; scale keel denticulate or smooth ..........................................................** *K. odorata*
5 **Mature achene uniformly tan or light brown, not bicolored; achene oblong, 0.4-0.6 (-0.7) mm wide; scale keel denticulate (very rarely smooth)...............................................................................................................................................................** *K. pumila*

**Kyllinga gracillima** Miquel, Asiatic Greenhead Sedge. River sand bars, tidal marshes, tidal shores, moist soils of pastures and ditches; apparently introduced and native of e. Asia. See Bryson et al. (1996). *K. gracillima* Miquel (1866) appears to be the oldest valid combination in the genus *Kyllinga*, predating *K. brevifolioides* (Thieret & Delahoussaye) Tucker. Its distribution in North America is still somewhat obscure (because of confusion with *C. brevifolia*), but it is currently known from scattered locations in NC, SC, VA, CT, PA, MD, TN, AL, GA, NJ, DE, AR, MS, and KY. Reported for SC by Hill & Horn (1997), as *K. gracillima*. 

*K. gracillima* Miquel (1866) appears to be the oldest valid combination in the genus *Kyllinga*, predating *K. brevifolioides* (Thieret & Delahoussaye) Tucker – Y

**Kyllinga odorata** Vahl, Whitehead Sedge. Moist soils of fields, ditches, lawns, shores of ponds and rivers, sand and gravel bars. July-September. Pantropical, north in North America to ne. NC and se. AR. Likely to occur in se. VA. [= K, S, WH, X, Y; = Cyperus sesquiflorus (Torrey) Mattfeld & Kükenthal ex Kükenthal – RAB, C, GW, Z]

**Kyllinga squamulata** Thonning ex Vahl, Crested Greenhead Sedge. Lawns, turf farms, athletic fields, golf courses, other disturbed areas; native of Asia. [= FNA, WH] {add to synonymy}

---

**Lipocarpha** R. Brown

1 Spikes 2.5-10 (-12) mm long; anther ca. 0.5 mm long; stigmas 3........................................................................................................... *L. maculata*
1 Spikes 2-5 (-8) mm long; anther 0.1-0.25 mm long; stigmas 2.
2 Culms 7-35 cm long; longest involucral bract spreading to reflexed; achenes 3.5-5× as long as wide........................................... *L. microcephala*
2 Culms 1-20 cm long; longest involucral bract more or less erect; achenes 1.5-2.5× as long as wide.
3 Scales about as long as the achene, with long awns........................................................................................................... *L. aristulata*
3 Scales reduced, shorter than the achene, awnless..................................................................................................................... *L. micrantha*

**Lipocarpha aristulata** (Coville) G. Tucker. Moist ground; rare. Se. SC south to s. FL, west to the mw. and w. United States; the eastern occurrences may be adventive. [= FNA, K, WH, Z; = Hemicarpha aristulata (Coville) Smyth – F, GW; = H. micrantha var. aristulata Coville – C, G]

**Lipocarpha micrantha** (Vahl) G. Tucker. Riverbank draw-down zones, other moist sandy areas. July-August. ME west to ON and MN, south to s. FL and TX; south into tropical America. [= FNA, Z; = Hemicarpha micrantha (Vahl) Pax – RAB, F, GW, S; = H. micrantha var. micrantha – C; = H. micrantha var. minor (Schrader) Friedland – G; = H. micrantha – K, WH]

---

**Oxycaryum** Nees

**Oxycaryum cubense** (Poeppig & Kunth) Palla, Cuban Bulrush. Swamps, marshes, ponds, ditches; aggressively weedy, probably adventive from the New World tropics. See Bryson et al. (1996) and Carter, Baker, & Morris (2009). [= FNA, K; = Scirpus cubensis Poeppig & Kunth – GW, S, WH] {not yet keyed}
**Rhynchospora** Vahl 1805 (Beaksedge, Beakrush)
(by Richard J. LeBlond)

**Identification notes:** Measurements and descriptions of the achene are of the achene body only, not including the tubercle, unless otherwise indicated.

### Key to groups

1. **Tubercles** 3-23 mm long; style simple or bifid only at the tip; [subgenus *Haplostylae*] ..................................................................................................................... .......................... Key A
2. **Tubercles** < 3 mm long; style divided into 2 slender stigmatic branches; [subgenus *Diplostylae*].

3. Inflorescence bracts several, foliaceous, basally bright white, reflexed to horizontally spreading; [subgenus *Diplostylae*; section *Dichromena*] ........................................................................................................................... Key B

4. **Bristles** present, plumose (at least proximally); [subgenus *Diplostylae*; section *Plumosae*] ........................................................................................................................... Key C

5. **Bristles** absent, or present and smooth or minutely barbed.

6. **Achene** broadly elliptic, 1.9-2.6 mm long, 1.5-2.0 mm wide, its summit constricted below a collar-like flange at the base of the tubercle; [subgenus *Haplostylae*; section *Albae*] ........................................................................................................................... Key D

7. **Bristles** present, retrorsely barbed (at least distally), or antrorsely barbed and straplike (flattened); [subgenus *Diplostylae*; section *Albae*] ........................................................................................................................... Key E

8. **Achene** surface smooth, minutely pitted, or finely striate (not ridged, rugose, or reticulate); subgenus *Diplostylae*; sections *Chapmaniae*, *Fasciculares*, and *Fuscaea*] ........................................................................................................................... Key F

#### Key A - beaksedges with tubercles 3-23 mm long

[subgenus *Haplostylae*; sections *Longirostres* and *Polycephalae*]

1. **Spikelets** in 1-4 globose clusters; tubercle 3-5 mm long; leaf blades 2-8 mm wide; [section *Polycephalae*] ........................................................................................................................... *R. tracyi*

2. **Spikelets** in > 4 paniculate or corymbose clusters; tubercle 10-23 mm long; leaf blades 6-20 mm wide; [section *Longirostres*].

3. **Longest bristles** shorter than the achene.

4. **Achene** 5.0-6.0 mm long, 2.8-3.3 mm wide ........................................................................................................................... *R. corniculata* var. *corniculata*

5. **Achene** 4.4-5.3 mm long, 2.4-2.8 mm wide ........................................................................................................................... *R. corniculata* var. *interior*

6. **Plants** cespitose; primary clusters with 10-50 (rarely 7 or fewer) densely clustered spikelets; achene (4.5-) 5-6 mm long ................................................................. *R. macrostachya*

7. **Bristles** 7-12 mm long, essentially of equal length ........................................................................................................................... *R. latifolia*

#### Key B - beaksedges with basally-white bracts (White-bracted Sedges) [subgenus *Diplostylae*; section *Dichromena*]

1. Inflorescence bracts 3-6 (-7); basal bract (1.4-) 2-5 mm wide, the white portion (2.5-) 9-25 mm long, tapering gradually into the green portion; rhizomes slender, straight, (0.6-) 0.7-1.7 (-2.1) mm in diameter; achene 1.0-1.2 mm wide; tubercle broadly truncate on achene..........

2. **Inflorescence** bracts 0-several, capillary to foliaceous, green throughout (straminous in age), variously oriented.

3. **Bristles** present, plumose (at least proximally); [subgenus *Diplostylae*; section *Plumosae*] ........................................................................................................................... *P. colorata*

4. **Achene** surface transversely ridged, rugose, or honeycombed-reticulate (sometimes faintly so); [subgenus *Diplostylae*; sections *Globulares*, *Harveyae*, *Mistae*, *Plisolcyra*, *Pusillae*, and *Rariflorae*] ........................................................................................................................... *R. plumosa*

5. **Achene** surface smooth, minutely pitted, or finely striate (not ridged, rugose, or reticulate); subgenus *Diplostylae*; sections *Chapmaniae*, *Fasciculares*, and *Fuscaea*] ........................................................................................................................... *R. oligantha*

#### Key C - beaksedges with plumose bristles [subgenus *Diplostylae*; section *Plumosae*]

1. Spikelets (4-) 5-8 mm long, borne singly or a few together in loose clusters, some or all spikelets on slender stalks; achene 1.7-2.6 mm long, 1.2-2.0 mm wide.

2. **Achene** obovoid, 1.7-2.0 mm long, 1.2-1.5 mm wide, the tubercle seated on its summit without a constriction or basal flange; longer bristles < \( \frac{1}{3} \) as long as the achene........................................................................................................................... *R. galeana*

3. **Bristles** < \( \frac{1}{2} \) as long as the achene, its summit constricted below a collar-like flange at the base of the tubercle; longer bristles three-fourths to exceeding the length of the achene........................................................................................................................... *R. galeana*

4. **Plants** 2-4 mm long, borne several to many in clusters, none or some on spikelets on slender stalks; achene 1.3-2.2 mm long, 0.9-1.7 mm wide

5. **Leaves** 2-4 mm wide, slightly involute (V-shaped in \( \sim \)-section); achene 2.0-2.2 mm long; [FL only] ........................................................................................................................... *R. pineticola*

6. **Leaves** 0.8-1.5 mm wide, strongly involute (and often appearing superficially terete); achene 1.3-1.8 mm long; [more widespread] ............................................. *R. oligantha*
## Key D - beaksedges with bristles retrorsely barbed (at least distally) or antrorsely barbed and stralplike (flattened) [subgenus Diplostylus; section Albae]

1. Bristles 8-25, retrorsely barbed distally, antrorsely barbed proximally; spikelets white, turning tan with age.
2. Spikelets with 2-3 florets; bristles 8-12; achene 1.6-2.1 mm long, 0.9-1.3 mm wide ........................................ R. alba
3. Spikelets with 1 floret; bristles 16-25; achene 2.0-2.4 mm long, 1.3-1.5 mm wide ...................................................... R. macra
4. Bristles 6 or fewer, either retrorsely or (rarely) antrorsely barbed their entire length; spikelets variously brown, rufous, or tan (or very rarely white).
5. Spikelets 1-fruited, the solitary achene terminating the axis; clusters 1-7, globose to turbinate.
6. Clusters globose to turbinate; achene (measured from base of bristles) 1.3-1.8 mm long; tubercle 0.7-1.6 mm long.
7. Clusters globose to hemispheric; achene (measured from base of bristles) 1.8-2.6 mm long, 1.1-1.8 mm wide; tubercle 1.4-2.4 mm long.
8. Clusters 1-7, globose to turbinate; clusters 1-7, globose to hemispheric; achene (measured from base of bristles) 1.8-2.6 mm long, 1.1-1.8 mm wide; tubercle 1.4-2.4 mm long.
9. Largest basal leaves 2.5-3 mm wide, eciliate, not rosulate; scales aristate, the midrib eciliate; bristles 3-4, 1 or more equaling or exceeding the tubercle ......................................................... R. cephalantha var. attenuata
10. Inflorescence typically with 1 terminal and 1 lateral cluster, the clusters ovoid, with 1-10 spikelets each; achene 1.8-2.0 mm long, 0.8-1.0 mm wide, 2-3x as long as wide; leaves 0.2-0.4 mm wide ........................................................... R. cephalantha
11. Base of plant bulb-like, enclosed in bladeless sheaths; clusters ovoid, with 1-10 spikelets each; achene 1.8-2.0 mm long, 0.8-1.0 mm wide, 2-3x as long as wide; leaves 0.2-0.4 mm wide ........................................................... R. cephalantha
12. Culms solitary to cespitose, without slender rhizomes; terminal internode often arched; clusters corymbose to fasciculares.

---

## Key E - beaksedges with bristles smooth, or antrorsely barbed and filiform, or absent, the achene surface smooth, minutely pitted, or finely striate [subgenus Diplostylus; sections Chapmaniae, Fasciculares, and Fuscacae]

1. Bristles 12; [section Fasciculares].................................................................................................................. R. baldwinii
2. Bristles 6 or fewer.
3. Leaves with a short taper at the tip, blunt to acute, but not long-acuminate; achene surface minutely pitted near the margin; [section Chapmaniae].
4. Basal leaves 4-6 mm wide, ciliate, rosulate; scales acuminate, the midrib ciliate; bristles 6, < ½ the length of the achene .......... R. ciliatis
5. Largest basal leaves 2.5-3 mm wide, ciliate, not rosulate; scales aristate, the midrib eciliate; bristles 3-4, 1 or more equaling or exceeding the tubercle ......................................................... R. solitaria
6. Leaves long-acuminate at the tip; achene surface smooth or finely striate.
7. Bristles absent or 1-3 rudimentary; scales white to pale tan (or pale reddish-brown in R. brachychaeta); [section Chapmaniae].
8. Inflorescence composed of (1-2) 2-3 turbinarte to ellipsoid clusters; spikelets pale reddish-brown, (2.7-) 3-3.5 mm long; achenes usually 2 per spikelet ........................................................... R. brachychaeta
9. Inflorescence composed of 1 (-2) hemisphaeric to broadly turbinate cluster(s); spikelets white to pale brown, either 2-2.5 (3-) mm or (3.5-) 4-5.5 mm long; achenes 1 per spikelet........................................................... R. chapmanii
10. Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (smooth in R. species 1).
11. Inflorescence of 1-2 clusters; tubercle 0.3-0.4 mm long, the margin smooth ................................................................ R. species 1
12. Inflorescence of (1-) 2-4 (-10) clusters; tubercle 0.4-1.4 mm long, the margin setose; [section Fuscacae].
13. Achene narrowly elliptic or narrowly obovoid, 1.2-1.5 mm long by 0.6-0.7 mm wide, twice as long as wide; tubercle 0.8-1.2 mm long ........................................................... R. curtissii
14. Inflorescence of 1 (-2) hemisphaeric to broadly turbinate cluster(s); spikelets white to pale brown, either 2-2.5 (3-) mm or (3.5-) 4-5.5 mm long; achenes 1 per spikelet........................................................... R. chapmanii
15. Base of plant bulb-like, enclosed in bladeless sheaths; spikelets 2-2.5 (-3) mm long; achene 1.0-1.2 mm long, 0.8-1.0 mm wide ........................................................... R. chapmanii
16. Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (smooth in R. species 1).
17. Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (smooth in R. species 1).
18. Inflorescence of 1-2 clusters; tubercle 0.3-0.4 mm long, the margin smooth ................................................................ R. species 1
19. Inflorescence of (1-) 2-4 (-10) clusters; tubercle 0.4-1.4 mm long, the margin setose; [section Fuscacae].
20. Achene narrowly elliptic or narrowly obovoid, 1.2-1.5 mm long by 0.6-0.7 mm wide, twice as long as wide; tubercle 0.8-1.2 mm long ........................................................... R. curtissii
21. Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (smooth in R. species 1).
22. Inflorescence of 1-2 clusters; tubercle 0.3-0.4 mm long, the margin smooth ................................................................ R. species 1
23. Inflorescence of (1-) 2-4 (-10) clusters; tubercle 0.4-1.4 mm long, the margin setose; [section Fuscacae].
24. Achene narrowly elliptic or narrowly obovoid, 1.2-1.5 mm long by 0.6-0.7 mm wide, twice as long as wide; tubercle 0.8-1.2 mm long ........................................................... R. curtissii
25. Achene 0.6-1.1 mm wide, pyriform, obovoid, or narrowly elliptic, pale to dark brown but not blackish; tubercle margin setose (smooth in R. species 1).
11 Leaves filiform, < 1 mm wide; achene 0.8-1.3 mm long, 0.6-0.9 mm wide; tubercle 0.4-0.8 mm long.
12 Culms without rhizomes; spikelets 2.5-4 mm long; achene translucent centrally; tubercle 0.4-0.6 mm long... R. filifolia
13 Culms with delicate rhizomes; spikelets 5-7 mm long; achene uniformly opaque; tubercle 0.6-0.8 mm long......
14 Achenes > 1 mm wide (except 0.8 mm wide in R. fernaldii with a blackish surface), suborbicular or broadly ellipsoid; tubercle margin smooth or roughened but not setose; [section Fasciculares]
15 Tubercle 1.0-2.6 mm long, long-attenuate to subulate............................................................ R. gracilenta
16 Bristles rudimentary to \( \frac{1}{2} \) as long as the achene body.
17 Larger leaves to 1 mm wide; mature culms to 4.5 dm long; floral fascicles 1-2; tubercle 0.2-0.5 mm long... R. debilis
18 Basal leaves filiform to (rarely) 1.3 mm wide, the longer approaching length of culm; tube
19 Culms stouter; leaves wider, not filiform.
20 Achenes biconvex or tumid.
21 Achene including tubercle 1.0-1.2 mm long, tubercle minute, skull-cap-like; [section
22 Achene 0.8 mm wide, 0.9-1.0 mm long, blackish ................................................................. R. fernaldii
23 Achene 1.1-1.7 mm wide, 1.3-2.0 mm long, brown to dark brown.
24 Bristles present, white, barely visible at 20×, the longest shorter than the achene body.
25 Achene 1.5-2.9 mm long; tubercle triangular-acuminate; [section
26 Achene > 1 mm wide (except 0.8 mm wide in R. fernaldii with a blackish surface), suborbicular or broadly ellipsoid; tubercle margin smooth or roughened but not setose; [section Fasciculares]
27 Achenes smooth or roughened but not setose; [section
28 Tubercle 1.0-2.6 mm long, long-attenuate to subulate............................................................ R. gracilenta
29 Longer bristles exceeding the achene body.
30 Achene 1.3-4 mm wide, all much shorter than the culm; tube
tube
31 Basal leaves 1.3-1.6 mm long, 0.9-1.4 mm wide; tubercle 0.3-0.6 (-0.75) mm long; bristles 1/3-1/2(-4/5) as long as achene body 
32 Achene 1.6-1.8 mm long, 1.35-1.5 mm wide; tube
tube
33 Longer bristles < \( \frac{1}{2} \) as long to rarely exceeding achene body; achene suborbicular, 1.2-1.5 mm wide; tube
34 Achene 0.8-1.2 mm long, 0.7-1.2 mm wide; tubercle 0.2-0.5 mm long; [section Mixtae].
35 Achene 1.5-2.9 mm long; tubercle triangular-acuminate; [section
36 Achene 0.8-1.4 mm long, 0.7-1.2 mm wide, the faces slightly biconvex with 6-12 transverse ridges.
37 Basal leaves filiform to (rarely) 1.3 mm wide, the longer approaching length of culm; tube
38 Achene 1.4-4.2 mm long, 1.2-3.6 mm wide, the summit with a thickened bony to crustaceous rim surrounding the base of the tube
39 Achenes biconvex or tumid.
40 Achene 1.4-4.2 mm long, 1.2-3.6 mm wide, the summit with a thickened bony to crustaceous rim surrounding the base of the tube; [section Harveyae].
Rhynchospora alba (Linnaeus) Vahl, Northern White Beaksedge. Mountain bogs and fens, peaty situations in the Coastal Plain, such as low pocosins in peat domes or large Carolina bays, and floating peat mats in limesink (doline) ponds and bay lakes, possibly also in seepage bogs with abundant Sphagnum, generally occurring in the most open, harshest, and peatiest areas. July-October. Circumboreal, in North America from NL (Labrador) west to AK, south to sw. VA, ne. TN, and n. AR. [= C, F, FNA, G, K, Y, Z].

Rhynchospora baldwinii A. Gray, Baldwin's Beaksedge. Wet savannas, seepages. July-August. Se. NC south to s. FL and west to LA. [= C, FNA, K, GW, RAB, WH, Y, Z; = Rhynchospora baldwinii – S].

Rhynchospora brachycauda C. Wright. Cypress ponds, other depressions. E. SC south to Panhandle FL and s. AL and s. MS; Cuba. Reported for SC (McMillan 2007). Kral in FNA considers this species possibly adventive, but McMillan (2007) provides good reasons for considering it native in our area. [= FNA, K, Z; < Rhynchospora brachycauda – S] (not yet keyed).

Rhynchospora caduca Elliott, Angle-stem Beaksedge. Savannas, hardwood swamps, other wet areas. July-September. E. and c. VA south to s. FL and west to TX, OK, and AR, north in the interior to sc. TN. This species is found at a few sites in the mountains of GA. See notes under R. miliacea. [= C, F, FNA, G, GW, K, RAB, W, WH, Y, Z; > Rhynchospora caduca – S; > Rhynchospora patula A. Gray – S].

Rhynchospora capillacea Torrey. Calcareous wetlands. NL (Newfoundland) west to SK, south to sw. VA, ne. TN, and n. AR. [= C, F, FNA, G, K, Y, Z].

Rhynchospora decurrens Torr. & Gray. Northern White Beaksedge. Mountain bogs and fens, peaty situations in the Coastal Plain, such as low pocosins in peat domes or large Carolina bays, and floating peat mats in limesink (doline) ponds and bay lakes, possibly also in seepage bogs with abundant Sphagnum, generally occurring in the most open, harshest, and peatiest areas. July-October. Circumboreal, in North America from NL (Labrador) west to AK, south to sc. TN, and n. IL, SK, ID, and CA; disjunct in se. GA (Charlton Co., at the Okefenokee Swamp) (Williges & Loftin 1995), s. AL (Escambia Co.; specimen at CLEM). See notes under considering it native in our area. [...]
**Cyperaceae**

*Rhynchospora capitellata* (Michaux) Vahl, Brownish Beaksedge. Bogs and fens, seepages, and wet rock outcrops in the Mountains and upper Piedmont, also in wet habitats in the Coastal Plain of ne. NC and e. VA. July-September. Widespread in e. North America, south to nc. GA. The only common beaksedge in the Mountains of our area. A somewhat similar species, *R. knieskernii*, occurs north of our area, but should be looked for here; they are discussed at the end of this genus. Sorrie (2000) has clarified the relationships and distinctions of this taxon with *R. leptocarpa*. [= C, F, G, W, WV, Y, < *R. capitellata* – FNA, GW, K, RAB, Z; = *Rhynchospora capitellata* – S]

*Rhynchospora careyana* Fernald, Carey's Horned Beaksedge. Limesink (doline) depression ponds and in intermittently flooded depression meadows. July-September. Apparently ranging from se. NC south to FL, but the range poorly known because of confusion with *R. inundata*, from which it is perhaps not specifically distinct. [= FNA, K, Y; < *R. inundata* – RAB, WH; < *R. corniculata* – GW (listed in synonymy under *R. corniculata* in GW, but would actually key to *R. inundata*); = *Rhynchospora careyana* – S]

*Rhynchospora cephalantha* A. Gray var. *attenuata* Gale, Small Bunched Beaksedge. Savannas, sandhill seeps, openings in streamhead pocosins. July-October. The range of this variety is poorly known; is reported by Z from NC, SC, AL, and MS. Recent collections from MD and VA extend the range. See discussion in Sorrie et al. (1997). [= Y, Z; < *R. cephalantha* – C, FNA, GW, K, RAB; < *Rynchospora axillaris* – S]

*Rhynchospora chapmanii* M.A. Curtis, Chapman's Beaksedge. Savannas, seepage bogs, sandy margins of limesink (doline) ponds, and other wet, acid habitats. July-September. Se. NC south to s. FL and west to e. LA; Belize, Nicaragua. [= FNA, GW, K, RAB, WH, Y, Z; = *Rhynchospora chapmanii* – S]

*Rhynchospora ciliaris* (Michaux) C. Mohr, Fringed Beaksedge. Savannas, sandhill seeps. July-September. Se. NC south to s. FL and west to LA. [= FNA, GW, K, RAB, WH, Y, Z; = *Rhynchospora ciliaris* – S]

*Rhynchospora colorata* (Linnaeus) H. Pfeiffer, Narrowleaf Whitetop Sedge. Wet savannas, ditches, dune swales. May-September. Primarily a Southeastern Coastal Plain endemic: se. VA south to FL and west to TX; Mexico (Tabasco, Chiapas, Yucatán), West Indies, Belize, Guatemala, Costa Rica, Venezuela. [= C, FNA, K, WH, Y; = *Dichromena colorata* (Linnaeus) H. Pfeiffer – F, G, GW, RAB, S]

*Rhynchospora compressa* Carey ex Chapman. Savannas. S. SC south to Panhandle FL, west to e. LA. This species was reported for SC (Kartesz 1999), based on the South Carolina Plant Atlas (http://cricket.biol.sc.edu/herb); McMillan (pers. comm.) states that the record is in error, based on a misidentified specimen. The species occurs in sc. GA (Jones & Coile 1988) and has since been found in SC by McMillan (2003). [= FNA, GW, K, WH, Y, Z; = *Rhynchospora compressa* – S]

*Rhynchospora corniculata* (Lamarc) A. Gray var. *corniculata*, Short-bristle Horned Beaksedge. Pondcypress savannas in Carolina bays, swamp forests, other wetlands. July-September. Var. *corniculata* ranges from DE south to FL and west to LA, extending north into KY and MO; also in the West Indies. Var. *interior*, possibly not worth recognition, is distinguished by a shorter and narrower achene, the summit barely broader than the base of the tubercle, and occurs in the Mississippi drainage. [= C, F, G; < *R. corniculata* (Lamarc) A. Gray – FNA, GW, K, RAB, WH, Y; < *Rhynchospora corniculata* – S]

*Rhynchospora crinipes* Gale, Alabama Beaksedge. Sand-clay bars and peaty stream banks of blackwater streams. July-September. Sc. NC (Sorrie et al. 1997) through sc. GA to FL Panhandle, west to s. AL; very scattered in occurrence. This very rare species is related to *R. filifolia*, but is a coarser plant, readily distinguishable by characters of the achene, culm, and leaves. Anderson (1988) discusses its systematics, habitat, and rarity. [= FNA, GW, K, WH, Y, Z]

Cyperaceae

Rhynchospora curtissii Britton. Pine flatwoods and bogs. An East Gulf Coastal Plain endemic, in Panhandle FL, AL, and s. MS (Sorrie & Leonard 1999); also reported from SC by Kral (1996) and for NC and SC by Kartesz (1999), but specimens so annotated are misidentified. [= FNA, GW, K, WH, Y, Z; = Rhynchospora smallii – S]

Rhynchospora debilis Gale, Savanna Beaksedge. Savannas, sandhill seeps. July-September. Se. VA south to n. peninsular FL and west to se. TX (Brown & Marcus 1998). Like a small version of R. fascicularis, often with several ascending, cespitose culms, each terminated by a single glomerule. [= C, F, FNA, GW, K, RAB, WH, Y, Z]

Rhynchospora decurrens Chapman, Swamp-forest Beaksedge. Swamp forests and river marshes, especially along blackwater rivers. July-August. Se. NC south to c. peninsular FL and west to s. MS (Sorrie & Leonard 1999). [= FNA, GW, K, RAB, WH, Y, Z; = Rhynchospora decurrens – S]

Rhynchospora distans (Michaux) Vahl. Savannas and limesink ponds. June-September. Se. VA south to s. FL and west to s. MS (Sorrie & Leonard 1999); West Indies. Appearing to merge with R. wrightiana on the outer Coastal Plain of NC. [= Y; = Rhynchospora fascicularis (Michaux) Vahl var. distans (Michaux) Chapman – F, K, Z; < R. fascicularis – FNA, G, GW, RAB, WH; = Rhynchospora distans – S]

Rhynchospora divergens Chapman ex M.A. Curtis, White-seeded Beaksedge. Wet savannas, especially in exposed sands. May-September. Se. NC south to s. FL and west to se. TX; Bahamas, Mexico (Chiapas), Belize. R. divergens, R. pusilla, and R. thornei are all small, grass-like plants, very similar in appearance to one another. [= FNA, GW, K, RAB, WH, Y; = Rhynchospora divergens – S]

Rhynchospora eliottii A. Dietrich, Elliott's Beaksedge. Savannas, ditches, other wet habitats, often weedy. July-September. Se. NC south to c. peninsular FL and west to e. TX. The achenes are typically flat or concave on one face, and flat or slightly convex on the other. See note under R. microcarpa. [= FNA, GW, K, WH, Y; = R. schoenoides (Elliott) Wood – RAB, Z; = Rhynchospora schoenoides – S]

Rhynchospora fascicularis (Michaux) Vahl, Fascicled Beaksedge. Savannas, limesink ponds, ditches. June-September. Se. VA south to s. FL and west to se. TX; West Indies. [= Y; = Rhynchospora fascicularis (Michaux) Vahl var. fascicularis – F, K, Z; < R. fascicularis – FNA, G, GW, RAB, WH; = Rhynchospora fascicularis – S]

Rhynchospora fernaldii Gale, Fernald’s Beaksedge. Pine flatwoods. S. GA south to s. FL, west to s. MS. [= FNA, GW, K, WH, Y, Z]

Rhynchospora filifolia A. Gray, Threadleaf Beaksedge. Sandy shores of limesink (doline) depressions, especially at the lower margin, savannas. July-September. S. NJ south to c. FL and west to e. TX; Cuba, Mexico (Tabasco), Belize, Nicaragua. [= C, F, FNA, GW, RAB, WH, Y, Z; < R. filifolia – GW; = Rhynchospora filifolia – S]

Rhynchospora galeana Naczi, W. Knapp, & Gerry Moore, Short-bristle Beaksedge. Wet savannas. July-September. Se. NC south to s. FL and west to s. MS; West Indies. This species will colonize disturbances (roadsides, powerline corridors), but not aggressively. The leaf tips of R. galeana are acute and minutely serrulate, while those of the closely related R. oligantha are blunt and smooth; these characters are, however, often difficult to determine. See Naczi, Knapp, and Moore (2010) for discussion of the need to replace the name R. breviseta because of an earlier-named Asian species. [= R. breviseta (Gale) Channell – FNA, GW, K, RAB, WH, Y (later homonym); < R. oligantha – F, G; < Rhynchospora oligantha – S; = R. oligantha A. Gray var. breviseta Gale – Z]

Rhynchospora globularis (Chapman) Small, Globe Beaksedge. Sandy or peaty depressions, wet ditches, powerline corridors, savannas. June-September. Apparently ranges from DE south to s. FL and west to c. TX and OK; north in the interior to nc. TN; also allegedly in n. CA. Both R. globularis and R. pinetorum tend to produce shorter plants with smaller glomerules than R. recognita. Occasional achenes of R. globularis exhibit the wide alveoli of R. pinetorum near the base or summit, with little or no horizontal ridging, but centrally have narrow alveoli with pronounced horizontal ridges. The opposite condition occasionally occurs in R. pinetorum achenes, with narrow alveoli and horizontal ridging basally or at the summit, but wide alveoli and little or no ridging centrally. [= Y; < R. globularis – RAB, W; = C, F, FNA, GW, RAB, WH, Y, Z; < R. globularis var. globularis – GW; = Rhynchospora globularis – S]
**Cyperaceae**

*Rhynchospora gracilenta* A. Gray, Slender Beaksedge. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC, VA): savannas, bogs; uncommon (rare in Piedmont and Mountains). July-September. NJ south to ne. FL, FL Panhandle, and west to e. TX, north in the inland to nc. TN and AR; Cuba, Mexico (Chiapas), Belize, Nicaragua. [= C, F, FNA, G, GW, K, RAB, W, WH, Y, Z; = Rynchospora gracilenta – S]

*Rhynchospora harperi* Small, Harper's Beaksedge. Cp (DE, FL, GA, NC, SC): peaty limesink depression ponds (dolines), from standing water to the upper margins of the pond-shore; rare. July-September. Se. NC south to sc. peninsular FL and west to s. AL and s. MS (Sorrie & Leonard 1999); disjunct in DE and MD; disjunct in Belize. See Nelson (1993) for first SC record, and LeBlond (1997) for additional information on the species, especially its distribution. [= FNA, K, WH, Y, Z; R. filifolia – GW; = Rynchospora harperi – S]

*Rhynchospora harveyi* W. Booth, Harvey's Beaksedge. Cp (FL, GA, NC, SC, VA), Mt (GA, NC), Pd (NC): savannas in the Coastal Plain, seepage bogs in the Sandhills, bogs in the Mountains and Piedmont; rare. July-August. Se. VA south to ne. FL, FL Panhandle, and west to TX and OK, and north in the interior to nc. TN and MO. [= C, F, G, GW, K, RAB, WH, Y, Z; R. harveyi var. harveyi – FNA; = Rynchospora harveyi – S; = R. harveyi – WH]

*Rhynchospora indianolensis* Small. Cp (AL): roadside ditches; rare. Coastal Plain of TX; recently also found in s. AL. Kral in FNA mentions that *R. indianolensis* may be conspecific with the Cuban *R. scutellata*. [= FNA; = Rynchospora indianolensis; = R. scutellata Grisebach] [add to synonymy; not yet keyd]

*Rhynchospora inexpansa* (Michaux) Vahl, Nodding Beaksedge. Wet savannas, streamhead pocosins where frequently burned, usually in peaty situations, often weedy, colonizing disturbances. July-September. Se. VA south to ne. FL, FL Panhandle, and west to e. TX and AR; West Indies. [= C, F, FNA, G, GW, K, RAB, WH, Y, Z; = Rynchospora inexpansa – S]

*Rhynchospora inundata* (Oakes) Fernald, Narrow-fruit Horned Beaksedge. In water of limesink dolines and clay-based Carolina bays, usually found in shallow water or at the lower margins of pond-shores, typically producing large colonies. July-September. Apparently ranging from e. MA south to s. FL, and west to e. TX (the range, however, obscured by confusion with *R. careyana*) (Singhurst, Mink, & Holmes 2010). The relation of this species to *R. careyana* and to more northern entities of *R. inundata* remain unresolved. [= C, F, FNA, G, GW, K, Y; = R. inundata – RAB, WH; = Rynchospora inundata – S]

*Rhynchospora knieskernii* Carey. Pinelands. Moist sandy/peaty swales. Endemic in NJ and DE. It has been reported, in error, from SC. [= C, F, FNA, G, K, Y, Z]

*Rhynchospora latifolia* (Baldwin ex Elliott) W.W. Thomas, Broadleaf Whitetop Sedge. Wet savannas. May-September. A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to se. TX; disjunct in sc. TN (Coffee County). [= FNA, K, Y; = Dichromena latifolia Baldwin ex Elliott – GW, RAB, S]

*Rhynchospora leptocarpa* (Chapman ex Britton) Small. Seepage bogs, pocosins, especially in openings. E. NC south to ne. FL, Panhandle FL, west to se. LA, in the Coastal Plain. It appears that *R. leptocarpa* is a valid species, a southeastern Coastal Plain relative of the more northern and montane *R. capitellata* (Sorrie 2000). Its occurrence in NC is reported by Sorrie et al. (1997). [= WH, Y; = R. capitellata – FNA, GW, K, RAB, WH; = Rynchospora leptocarpa – S]

*Rhynchospora macra* (C.B. Clarke) Small, Southern White Beaksedge. *Sphagnum* bogs in frequently-burned streamhead pocosins, and in sandhill seepage bogs. July-September. Sc. NC south to ne. FL, FL Panhandle, and west to se. TX; Nicaragua, Puerto Rico. *R. macra* is a robust southern relative of *R. alba*. Like *R. alba* and *R. pallida*, it has scales which are at first bright white, “fading” in age to a medium tan or light brown. These three species are thus superficially most distinctive (from other *Rhynchospora* in June, July, and August. The occurrence of this species in NC and SC is discussed by Sorrie et al. (1997). [= FNA, GW, K, WH, Y, Z; = Rynchospora macra – S]
Rhynchospora macrostachya Torrey ex A. Gray, Tall Horned Beaksedge. Marshes, swamps, upland depression ponds, other wetlands. July-September. E. MA south to ne. FL and west to e. TX, north in the interior to se. TN, s. MI, MO, and KS; disjunct (historically) in s. ME. This is mostly readily distinguished from *R. corniculata*, *R. inundata*, and *R. careyana* by the large glomerules composed of numerous spikelets. The recognition of varieties does not seem to be warranted. [= C, FNA, G, GW, K, RAB, WH, Y; > *R. macrostachya* var. colophophila Fernald & Gale – F; > *R. macrostachya* var. macrostachya – F; = *Rhynchospora macrostachya* – S]

Rhynchospora megalocarpa A. Gray, Sandhill Beaksedge. Xeric sandhills. June-August. Se. NC south to s. FL, west to MS. [= C, FNA, K, RAB, WH, Y, Z; = *Rhynchospora dodecandra* Baldwin ex A. Gray – S]

Rhynchospora microcarpa Baldwin ex A. Gray, Southern Beaksedge. Swamp forests, clay-based Carolina bays. July-August. E. NC south to s. FL and west to TX; West Indies (Cuba, Puerto Rico), Bahamas, Belize. This species is easily confused with *R. elliottii* and *R. perplexa*. *R. elliottii* is distinguished by leaves 4-6 mm wide, bristles longer than the tubercle, flat-tish achene faces, and a tubercle that is longer than broad. *R. microcarpa* and *R. perplexa* have leaves 1-3 mm wide and tubercles as broad as long or broader. In *R. microcarpa*, the achene is biconvex and the bristles are half as long as the achene to equaling the tubercle. In *R. perplexa*, the achene faces are flatish and the bristles are absent or rudimentary (< ½ as long as the achene). [= F, FNA, GW, RAB, WH, Y, Z; < *R. microcarpa* – K (also see *R. sulcata*); > *Rhynchospora edisoniana* Britton in Small – S; > *Rhynchospora microcarpa* – S]

Rhynchospora microcephala (Britton) Britton ex Small, Small-headed Beaksedge. Savannas, sandhill-pocosin ecotones. July-October. S. NJ south to s. FL and west to MS; Cuba. [= C, F, FNA, G, GW, K, RAB, WH, Y, Z; = *Rhynchospora microcephala* – S; = *R. cephalantha* A. Gray var. microcephala (Britton) Kükenthal]

Rhynchospora miliacea (Lamarck) A. Gray, Millet Beaksedge. Swamp forests, including maritime swamp forests. July-August. Se. VA south to s. FL and west to LA; West Indies. The inflorescence branches of *R. mixta* and (less commonly) *R. caduca* can spread at right angles from the culm, superficially resembling *R. miliacea*. The three can be separated by tubercle length: the tubercle of *R. miliacea* is 0.2-0.4 mm long, while those of *R. mixta* and *R. caduca* are 0.4-0.9 mm long. [= C, F, FNA, G, GW, K, RAB, WH, Y, Z; = *Rhynchospora miliacea* – S]

Rhynchospora nitens (Vahl) A. Gray, Short-beak Beaksedge. Wet savannas, limesink (doline) ponds, ditches, disturbed wet areas, often weedy. July-August. Primarily a Coastal Plain endemic: MA south to s. FL and west to se. TX; lowlands around the Great Lakes; West Indies, Belize, Nicaragua. [= C, FNA, K, WH, Y; = *Psilocarya nitens* (Vahl) Wood – F, G, GW, RAB, S]

Rhynchospora oligantha A. Gray, Feather-bristle Beaksedge. Wet savannas, sandhill-pocosin ecotones, sandhill seepage bogs, sea-level fens, usually in rather peaty, acidic places. July-August. S. NJ south to ne. FL, Panhandle FL, and west to se. TX; Belize, Nicaragua. The leaf tips of *R. oligantha* are blunt and smooth, while those of the closely related *R. galeana* are acute and minutely serrulate; these characters are often difficult to determine, however. Considered to be absent between NC and NJ prior to its discovery in e. VA (Fleming & Ludwig 1996). [= C, FNA, GW, K, RAB, WH, Y; < *R. oligantha* – F, G (presumably including *R. galeana*); < *Rhynchospora oligantha* – S; = *Rhynchospora oligantha* var. oligantha – Z]

Rhynchospora pallida M.A. Curtis, Pale Beaksedge. Savanna-pocosin and sandhill-pocosin ecotones, peaty seepage bogs, usually growing in or near *Sphagnum*. July-September. Long Island, NY south through NJ to ne. SC, primarily in NJ and NC. Like *R. alba* and *R. macra*, it has scales which are at first bright white, "fading" in age to a medium tan or light brown. These three species are thus superficially most distinctive (from other *Rhynchospora*) in June, July, and August. The bristle characters separate the three species easily. See Nelson (1993) for first SC record. [= C, F, FNA, G, GW, K, RAB, Y, Z; = *Rhynchospora pallida* – S]

Rhynchospora perplexa Britton in Small, Pineland Beaksedge. Savannas, sandhill seepage bogs. July-September. E. NC south to ne. FL, FL Panhandle, and west to TX, and north in the interior to ec. TN; West Indies. Var. *virginiana* Fernald, alleged to be endemic to se. VA, is alleged to differ in several characters, including larger spikelets (2.5-3.0 mm long vs. 2.0-2.5), the
achene tubercles broadly rounded at the tip (rather than deltoid and acute). Also see note under *R. microcarpa.* [=C, FNA, G, GW, K, RAB, WH, Y, Z; > R. perplexa var. perplexa – F; > R. perplexa var. virginiana Fernald – F; > *Rhynchospora perplexa* – S]

**Rhynchospora pinetica** C.B. Clarke, Pinebarren Beaksedge. Sandhills, scrub, other dry sandy pinelands. May-November. Ne. FL and e. Panhandle FL south to s. FL; Cuba. [=FNA, K, Y; = *Rhynchospora intermedia* (Chapman) Britton – S; = *Rhynchospora intermedia* (Chapman) Britton – WH, Z]

**Rhynchospora pinetorum** Small, Small's Beakrush. Wet calcareous savannas, maritime wet grasslands. June-September. FL west to MS (Sorrie & Leonard 1999) and LA, apparently disjunct to se. NC and ne. SC, and also in the West Indies. See note under *R. globularis.* [=Y; = *R. globularis* (Chapman) Small var. *pinetorum* (Small) Gale – FNA, GW, K, Z; = *Rhynchospora pinetorum* – S; < *R. globularis* – WH]

**Rhynchospora pleiantha** (Kükenthal) Gale, Coastal Beaksedge. Sandy margins of limesink depression ponds (dolines), typically in shallow water or at the lower margins of pond-shores. July-September. Se. NC south to e. peninsular FL, and Panhandle FL, west to se. AL; also in Cuba. [=FNA, GW, K, RAB, WH, Y, Z; = *Rhynchospora fusca* – S, misapplied]

**Rhynchospora plumosa** Elliott, Plumed Beaksedge. Savannas, sandhill-pocosin ecotones, especially where the sandy surface dries out in summer (on spodosols such as the Leon soil series). July-August. NC south to s. FL and west to se. TX; West Indies (Cuba), Belize, Honduras, Nicaragua. *R. semiplumosa* of s. GA and n. FL needs additional evaluation but is included here. [=FNA, GW, K, RAB, WH, Y; > *Rhynchospora plumosa* – S; > *Rhynchospora semiplumosa* A. Gray – S] (add Z synonymy)

**Rhynchospora punctata** Elliott, Pineland Beaksedge. Wet savannas, pitcherplant bogs. S. GA south to ne. FL. [=FNA, GW, K, WH, Y, Z; = *Rhynchospora punctata* – S]

**Rhynchospora pusilla** Chapman ex M.A. Curtis, Dwarf Beaksedge. Wet savannas, especially in exposed wet sands of disturbed ground, such as roadsides. June-September. E. NC south to s. FL and west to e. TX; West Indies, Mexico (Tabasco, Chiapas), Belize, Guatemala, Nicaragua. *R. pusilla, R. divergens, and R. thor Neil* are all small, grass-like plants, very similar in appearance to one another. [=FNA, GW, K, WH, Y; = *R. intermixta* C. Wright – RAB; = *Rhynchospora intermixta* – S]

**Rhynchospora rariflora** (Michaux) Elliott, Few-flower Beaksedge. Wet savannas, seepage bogs in the Sandhills, bogs in the Piedmont. July-September. S. NJ south to s. FL and west to e. TX; inland in ec. TN; West Indies, Belize, Honduras, Nicaragua. Resembling *R. galeana* and *R. oligantha,* but the spikelets conspicuously smaller. [=C, F, FNA, G, GW, K, RAB, WH, Y, Z; = *Rhynchospora rariflora* – S]

**Rhynchospora recognita** (Gale) Kral, Cymose Beakrush. Wet to dry low grounds, diabase glades, ditches, powerline corridors, savannas, moist seepage on rock outcrops, other wet areas. June-September. NJ south to FL, west to TX, north in the interior to nc. TN and around the Great Lakes; CA; West Indies; and Central America. As explained by Kral (1999), this taxon appears to warrant specific status. [=FNA, K, Y; = *R. globularis* (Chapman) Small var. *recognita* Gale – C, F, G, WV, Z; < *R. globularis* – RAB, W, WH; < *R. globularis* var. *globularis* – GW; = *Rhynchospora cymosa* Elliott – S, misapplied]

**Rhynchospora saxicola** Small. Seepages on granitic outcrops and Altamaha Grit glades. W. SC south into the Piedmont and rarely Coastal Plain of c. GA and ne. and ec. AL (Kral 1999). [=Y; = *R. globularis* (Chapman) Small var. *saxicola* (Small) Kükenthal – FNA, K; = *Rhynchospora saxicola* – S]

**Rhynchospora scirpoides** (Torrey) Grisebach, Long-beak Beaksedge. Limesink ponds, usually at the lower margins of pond-shores, wet savannas, beaver ponds, and other wetlands with "drawdown" hydrology. July-September. Se. MA south to n. peninsular FL, Panhandle FL and s. MS (Sorrie & Leonard 1999), se. OK and TX (Singhurst, Bridges, & Holmes 2007); disjunct in the lowlands around the Great Lakes. [=C, FNA, K, WH, Y; = *Psilocarya scirpoides* Torrey – GW, RAB, S; > *Psilocarya scirpoides* var. *grimesii* Fernald & Griscom – F, G]

**Rhynchospora solitaria** R.M. Harper, Autumn Beaksedge. Wet, sandy/peaty depressions. Known from a few sites in the Gulf Coastal Plain of GA (Colquitt, Irwin, Tift, and Turner counties) (Sorrie 1999b) and SC (Berkeley County) (McMillan, pers.comm. and specimen at NCU). It resembles a delicate *R. ciliata*; its distinctiveness is well described in Bridges & Orzell (1992). It should be sought in seepage bogs in the fall-line sandhills and in wet savannas of the outer Coastal Plain. [=FNA, GW, K, Y, Z; = *Rhynchospora solitaria* – S]

**Rhynchospora species 1.** Cp (MS). [=Y] {not yet keyed or mapped}

**Rhynchospora species 2.** Croatian beaksedge. Wet pine savanna and pocosin ecotone, known from a single spodosol savanna site in Croatan National Forest, and growing with Ctenium aromaticum, Pingüicula caerulea, Sarracenia flava, Dionaea...
**Cyperaceae**

*muscipula, Zenobia pulverulenta, Polygula ramosa, and Eriocaulon decangulare var. decangulare*. Plants may mature by mid-spring, and are very similar in habit to *R. rariflora*. [= Y]

---

**Rhynchospora species 3.** Mt (GA): Coosa Valley prairies; rare. Under study by Jim Allison. {not yet keyed or mapped}

**Rhynchospora stenophylla** Chapman, Coastal Bog Beaksedge. Peaty seepage bogs, streamhead pocosins, savanna-pocosin ecotones, usually growing in *Sphagnum*, especially where frequently burned. July-September. Se. NC south to nw. FL and west to s. MS; disjunct in se. VA (Southampton Co.) (Belden et al. 2004). Reported for GA by Sorrie (1999b). [= FNA, GW, K, RAB, WH, Y, Z; *< R. microcarpa Baldwin ex A. Gray – K>]

**Rhynchospora thornei** Kral, Thorne's Beaksedge. In open sands in savannas underlain by marl, and nearby roadsides, moist limestone barrens and prairies (GA). Known from about 35 locations, in Coastal Plain of NC, SC, GA, ne. FL, Panhandle FL, and AL; also in Ridge and Valley region of AL and GA, and Black Belt region of AL. *R. thornei*, *R. divergens*, and *R. pusilla* are all small, grass-like plants, very similar in appearance to one another, and they frequently co-occur. Recently discovered in SC (Georgetown Co.) by McMillan (2003). [= FNA, KW, Y]

**Rhynchospora tracyi** Britton, Tracy's Beaksedge. Cypress savannas and graminoid-dominated depressions, in small, clay-based Carolina bays or shallow limesink ponds (dolines), typically in shallow water or at the lower margins of pond-shores. June-September. A Southeastern Coastal Plain endemic: s. NC south to s. FL, west to s. MS (Sorrie & Leonard 1999); disjunct in sw. LA; West Indies, Belize. [= FNA, K, GW, RAB, WH, Y; *< R. microcarpa Baldwin ex A. Gray – K>]

**Rhynchospora wrightiana** Böckler, Wright's Beaksedge. Wet savannas. July-September. Se. VA south to c. FL and west to s. AL; West Indies. Appearing to merge with *R. fasciculardis* var. *distans* on the outer Coastal Plain of NC. Leaves are most frequently filiform and < 1 mm wide; rarely flat and to 1.3 mm wide. [= FNA, GW, K, RAB, WH, Y, Z; *< R. microcarpa Baldwin ex A. Gray – K>]

---

**Schoenoplectus** (Reichenbach) Palla 1888 (Bulrush)

A genus of about 50 species, herbs, cosmopolitan in distribution. Micromorphologic and anatomic studies have confirmed earlier opinions based on morphology that *Schoenoplectus* is not closely related to *Scirpus* (Strong 1994, Smith 1995, Schuyler, pers. comm.). Most investigators now also favor the separation of *Bolboschoenus* from *Schoenoplectus* (Pignotti & Mariotti 2004). References: Strong (1994)=Z; Smith (1995)=Y; Smith in FNA (2002b); Goetghheur in Kubitzki (1998b); Pignotti & Mariotti (2004). [also see *Bolboschoenus*]

1 Main involucral bracts 2-8, spreading and foliaceous (the inflorescence thus appearing terminal); rhizomes bearing ovoid tubers; bristles persistent on the achene; achenes 2.5-5 mm long (including body and apiculus) .......................................................... *[Bolboschoenus]*

1 Main involucral bract 1 (rarely with an additional 1-2 lateral bracts), erect and terete or triangular, appearing as a continuation of the culm (the inflorescence thus appearing lateral, though in some species the longer inflorescence branches may overtop the bract); rhizomes not bearing tubers; bristles falling from the achene; achenes 1.0-4.5 mm long (including body and apiculus).

2 Spikelets on stalks of varying lengths, at least some clearly not sessile.

3 Culms distinctly triangular in cross-section, more sharply so above than below, nearly terete near the base; [section *Malacogonon*] .................[S. etuberculatus]

3 Culms terete throughout, or obscurely triangular above; [section *Schoenoplectus*]

4 Spikelets appearing dull gray-brown, the scales copiously covered with red-brown dots (as seen at 10×) 6-15 mm long; lower and middle scales (3.0-) 3.5-4.0 mm long; culms firm, not easily compressed ..........................................................[S. acutus var. acutus]

4 Spikelets appearing reddish-brown, the scales not obviously dotted (as seen at 10×), 6-11 mm long; lower and middle scales (2.0-) 2.5-3.0 (-3.5) mm long; culms soft, easily compressed.

5 Perianth bristles plumose; spikelets acute; achenes obscurely triangular near the inflorescence ..................................................[S. californicus]

5 Perianth bristles retrorsely barbed; spikelets obtuse; culms terete throughout their length ..................[S. tabernaemontani]
2 Spikelets all sessile, in a cluster at one point (rarely with 1 or 2 short branches to 5 mm long).
6 Spikelet solitary; leaves numerous; plant usually aquatic, the culms and leaves flaccid, supported by the water; [section Malacogeton]...
6 Spikelets (1-) 2-several; leaves 1-4; usually of wet places, but the culms stiff and erect, not floating.
7 Rhizomatous perennial; culms triangular in cross-section, usually 5-20 dm tall
8 Leaves elongate, > ½ as long as the culms; achenes trigonous; styles 3-branched; [section Malacogeton].................................. S. subterminalis
8 Leaves short, < ½ as long as the culms; achenes plano-convex; styles 2 (-3) branched; [Schoenoplectus pungens complex of section Schoenoplectus].
9 Sides of the culm strongly concave, wing-angled; culms 1-6 mm in diameter; main involucral bract 1-2.5 (-6) cm long; spikelet scale with apical notch 0.1-0.4 mm deep.......................................................... S. americanus
9 Sides of the culm flat, slightly concave, or slightly convex; culms 1-6 mm in diameter; main involucral bract 1-) 3-20 cm long; spikelet scale with apical notch (0.3-) 0.5-1 mm deep.
10 Spikelets 3-35; achenes 1.9-2.6 mm long, biconvex; styles 2-fid.......................................................... S. deltarum
10 Spikelets 1-5 (-10); achenes (2.0-) 2.5-3.5 mm long, biconvex or trigonous; styles 2-3-fid................. S. pungens var. pungens
7 Cespiteous annual or perennial; culms terete, 1-6 dm tall.
11 Perianth bristles absent; achenes 1.2-1.6 mm long, transversely rugose; [section Supinae].
12 Achenes biconvex to obscurely trigonous, the faces convex.......................................................... S. erectus ssp. raynalli
12 Achenes biconvex, with a planar or concave area on the adaxial surface .................................................. S. hallii
11 Perianth bristles 5-6; achenes 1.5-2.0 mm long, smooth, finely pitted, or finely papillose; [section Actaeogeton].
13 Culms 2-3 mm thick, acutely triangular in <-section.. S. mucronatus
13 Culms 1-2 mm thick, cylindric in <-section.
14 Achenes 1.75-2.0 mm long, unequally biconvex (rounded on both faces, but less so on one than the other), rounded-obovate, broadly cuneate at the base, rounded at the apex.......................................................... S. purshianus
14 Achenes 1.5-1.8 mm long, planoconvex (nearly flat on 1 face), obovate, cuneate at the base, subtruncate at the apex.............. S. smithii

**Schoenoplectus acutus** (Muhlenberg ex Bigelow) Á. Löve & D. Löve var. acutus, Hardstem Bulrush, Great Bulrush. Marshes. June-early August; August-October. The species is widespread in temperate North America; var. acutus is restricted to e. North America. [= FNA, K, Y; = Scirpus acutus Muhlenberg ex Willdenow – RAB, C, F, G, GW, W, WV; = Schoenoplectus lacustris Linnaeus ssp. glaucus (Smith) Hartman]

**Schoenoplectus americanus** (Persoon) Volk ex Schinzius & R. Keller, Olney Threesquare. Tidal freshwater to brackish marshes. Late May-June; June-September. NS west to WA, south to South America. Schuyler (1974) discusses the need to replace the name *S. olneyi* (as traditionally applied) with *S. americanus*, traditionally applied to what must now be called *S. pungens*. Because of this nomenclatural change, the interpretation of much some information and records is now uncertain. [= FNA, K, Z; = Scirpus americanus Persoon – C, WH; = Scirpus olneyi – RAB, F, G, GW, S]

**Schoenoplectus californicus** (C.A. Meyer) Sojak, Giant Bulrush, Southern Bulrush, Tule. Marshes. SC south to s. FL, west to TX, and extending s. into the New World tropics; on the west coast, from CA southward. [= FNA, K; = Scirpus californicus (C.A. Meyer) Steudel – GW, S, WH]

**Schoenoplectus deltarum** (Schuyler) Sojak, Delta Bulrush. Brackish marshes and other wetlands. AL and FL west to KS and TX. [= FNA, K; = Scirpus deltarum Schuyler]

**Schoenoplectus erectus** (Poiret) Palla ex J. Raynal ssp. raynalli (Schuyler) K. Lye. Sandy or peaty, seasonally wet soils (such as on pond shores). September-October. Apparently ranging from SC south to e. peninsular FL and sw. GA; also in the tropics of both hemispheres. [= FNA, K; < Scirpus hallii A. Gray – RAB, misapplied; ? Scirpus erismaniae Schuyler – GW; = Scirpus erectus Poiret var. raynalli (Schuyler) B.F. Hansen & Wunderlin – WH; < Scirpus erectus Poiret]

**Schoenoplectus etuberculatus** (Steudel) Sojak, Swamp Bulrush, Canby's Bulrush. Beaver ponds, on peat in small depression ponds, in flowing blackwater streams. July-August; August-September. DE south to e. peninsular FL and west to c. TX (the distribution rather discontinuous); substantially fenoseptate in s. MO and RI. The hybrid *S. etuberculatus × subterminalis* has been collected in Hoke Co, NC and Lexington County, SC; it has sterile, malformed achenes. [= FNA, K, Z; = Scirpus etuberculatus (Steudel) Kunze – RAB, C, F, G, GW, S, WH]

**Schoenoplectus hallii** (A. Gray) S.G. Smith, Sharp-scale Bulrush. Pond shores in peaty sands. It has also been reported for our area by RAB, and is apparently included in our area by C, as *Scirpus supinus* Linnaeus var. hallii (A. Gray) A. Gray, and by others; at least some of these reports are misidentifications of the similar *S. erectus*. It is reported for sw. GA by Jones & Coile (1988) and Smith in FNA (2002b). It is very similar to *S. erectus*, differing in having the spikelet scales yellow brown (vs. reddish brown) and achenes concave on the ventral surface (vs. bulging on the ventral surface). [= FNA, K; = Scirpus supinus Linnaeus var. hallii (A. Gray) A. Gray – C; = Scirpus hallii A. Gray]

**Schoenoplectus heterochaetus** (Chase) Sojak, Slender Bulrush. Fresh marshes and lakes. June-August. VT and QC west to AB, south to NY, PA, w.KY, TX, and CA. [= FNA, K; = Scirpus heterochaetus Chase – C, F, G]

* **Schoenoplectus muncronatus** (Linnaeus) Palla, Rough-seed Bulrush. Ponds, ditches, ricefields, disturbed wet ground; native of Eurasia. Weed (native of Eurasia) in rice fields and other disturbed situations, known from old collections in PA, NJ, NY and more recently from VA (Virginia Botanical Associates 2009), KY, and TN. [= FNA, K; = Scirpus muncronatus Linnaeus]
**Schoenoplectus pungens** (Vahl) Palla var. *pungens*, Common Three-square, Chairmaker's Rush, Swordgrass. Marshes, rocky river beds. Mid May–June; June–September. The species is circumboreal, ranging in North America from NL (Newfoundland) west to AK, south to South America; var. *pungens* is widespread. This taxon has traditionally had the name *Scirpus americanus* applied to it; this name, however, is properly applied to the traditional *Scirpus olneyi*. *Schoenoplectus pungens* (or *Scirpus pungens*) becomes the correct name for this plant (Schuyler 1974). [= FNA, K, Y; « *Scirpus americanus* – RAB, F, G, GW, S, W, WV, misapplied; = *Scirpus pungens* Vahl var. *pungens* – C; « *Scirpus pungens* – WH, « *Schoenoplectus pungens* – Z]

**Schoenoplectus smithii** (A. Gray) Sojak, Smith's Bulrush, Bluntscale Bulrush. Gravelly intertidal beaches, millponds, Atlantic white-cedar swamps. July; Late July–August. QC west to MN, south to NJ, DE, NC, PA, n. OH, and IL. Reported from mountains of sw. VA. The varieties recognized by Smith in FNA (2002b) are of uncertain value; all three are in or approach our area. Var. *smithii* (south to DE, NJ, and PA) has perianth bristles absent or rudimentary. Var. *levisetus* (with a historic occurrence in VA) has 1–4 perianth bristles, much shorter than to equaling the achene, the bristles smooth or sparsely retrorsely barbed. Var. *setosus* (with records from NC, DE, and MD) has 4–6 perianth bristles, as long as or longer than the achene, and densely retrorsely barbed. [= K, Z; = *Scirpus smithii* A. Gray – C, F; ? *Scirpus smithii* var. *smithii* – G; > *Schoenoplectus smithii* var. *smithii* – FNA; > *Schoenoplectus smithii* var. *setosus* (Fernald) S.G. Smith – FNA; > *Schoenoplectus smithii* var. *levisetus* (Fernald) S.G. Smith – FNA]

**Schoenoplectus subterminalis** (Torrey) Sojak, Swaying Rush, Water Bulrush. Beaver ponds, bogs, blackwater creeks, in highly acid water. May–June; June–August. NL (Newfoundland) west to s. AK, south to se. NC, sc. MO, UT (?), and n. CA (the distribution discontinuous, especially southward). The hybrid *S. etuberculatus* × *subterminalis* has been collected in Hoke Co, NC and Lexington County, SC; it has sterile, malformed achenes. [= FNA, K, Z; = *Scirpus subterminalis* Torrey – RAB, C, F, G, GW, S, W]

**Schoenoplectus torreyi** (Olney) Palla, Torrey's Bulrush, Torrey's Three-square. Sinkhole ponds. NB west to MB, south to NJ, PA, WV, w. VA, MO, and NE. Known in VA only from natural ponds in Augusta and Rockingham counties. [= FNA, K, Z; = *Scirpus torreyi* Olney – C, F, G, W]

**Schoenus** Linnaeus 1753 (Blacksedge, Bogrush)

**Scirpoides** Scheuchzer ex Séguier (Round-headed Bulrush)

**Scirpoides holoschoenus** (Linnaeus) Sojak, Round-headed Bulrush. Ore piles; probably only a waif, native of Eurasia. [= J; = *Scirpus holoschoenus* Linnaeus]
A genus of about 20 species, herbs, of circumboreal distribution, also with species in Australia, Malaysia, and South America. The complex of species including *S. atrovirens*, *S. georgianus*, *S. hattorianus*, *S. flaccidifolius* are difficult to identify, and some have doubted their validity. Although further work on this group is needed, they do generally appear to behave as biological species despite their morphological similarity. Schuyler (1967) writes that "the remaining species in the key differ in minute characteristics and often the most satisfactory means of identification is by carefully comparing specimens of them. Despite the close morphological similarity of these species, their characteristics are reasonably constant even in areas where they coexist and occasionally hybridize."

References: Whittemore & Schuyler in FNA (2002b); Schuyler (1967)=Z; Strong (1994)=Y.; Key adapted from C, FNA, GW, and Z. [also see Bolboschoenus, Isolepis, Oxycaryum, Schoenoplectus, and Trichophorum]
15 Lower leaf blades and sheaths nearly smooth; spikelets broadly ovate or ovate; scales mostly blackish; longer bristles usually shorter than or about equaling the achenes; achenes 0.8-1.1 mm long. ............................................ S. hattorianus

Scirpus ancistrochaetus Schuyler, Northeastern Bulrush. Mountain ponds. July-September. VT, MA, and NY south to PA, e. WV, and w. VA. See Bartgis (1992) and Schuyler (1962) for additional information on this species. [= FNA, K, Z; < S. atrovirens – C]

Scirpus atrovirens (Fernald) Schuyler. Bogs, wet meadows. Late June-early July. NL (Newfoundland) and NL (Labrador) west to NT and BC, south to n. NJ, WV (Grant, Hampshire, Harrison, Pendleton, Pocahontas, Randolph, and Tucker counties), IL, IA, SD, WV, and WA. [= FNA, K, WV; < S. cyperinus (Linnaeus) Kunth – C, G]

Scirpus divaricatus Elliott. Swamp forests. July-September. Se. VA south to Panhandle FL, west to e. TX, s. TN, and s. MO. [= RAB, C, F, FNA, G, GW, K, S, WH, Z]

Scirpus flaccidifolius (Fernald) Schuyler, Reclining Bulrush. Bottomlands. July-September. Endemic to se. VA and ne. NC. Ludwig (1993) found the following characters to be most useful in distinguishing S. flaccidifolius from S. georgianus growing in the same region: bristles 1.2-1.4 mm long (vs. absent or mostly < 0.2, rarely to 1.0 mm long in S. georgianus), spikelets 1.5-2.1 mm wide (vs. 1.1-2.2 mm wide), spikelets 3-9 (-12) per glomerule (vs. 4-23), and inflorescence rays 5.5-17.9 cm long (vs. 3.5-13.5 cm long). Bristle length was the only character which consistently separated the 2 species; other characters showed overlapping values of possibly statistical value. [= FNA, K, Z; < S. atrovirens var. atrovirens – C; = S. atrovirens Willdenow var. flaccidifolius Fernald – F]

Scirpus hattorianus Makino, Northern Bulrush. Seepages, ditches, marshes, mostly at moderate to high elevations. July-September. NL (Newfoundland) to w. ON and WI, south to MD, NC, OH, and IN. [= FNA, K, Z; < S. atrovirens – RAB, GW, W; < S. atrovirens var. atrovirens – C, F, G, W, W]

Scirpus longii Fernald. Marshes. NS south to s. NJ. Also reported as occurring in e. NC by Radford, Ahles, & Bell (1968) and Fernald (1950); this report is in error. [= FNA, C, F, G, K]

Scirpus microcarpus J. & K. Presl. Marshes. NL (Newfoundland) and NL (Labrador) west to AK, south to n. NJ, e. WV (Monongalia, Pocahontas, Randolph, and Tucker counties), KY, IL, IA, NE, NM, AZ, and CA. [= FNA, C, K; > S. rubrotinctus Fernald – F, G, W, W]

Scirpus pallidus (Britton) Fernald, Cloaked Bulrush. Marshes. ON west to BC, south to WI, MO, TX, NM, AZ, OR; apparently disjunct (probably introduced) in se. PA (Rhoads & Klein 1993) and NJ (Kartesz 1999). [= F, FNA, K; = S. atrovirens Willdenow var. pallidus Britton – C, G]

Scirpus pedicellatus Fernald. Marshes. NL (Newfoundland), ON and MN south to n. NJ, OH, c. KY, and MO. [= F, FNA, K; < S. cyperinus (Linnaeus) Kunth – C, G]

**Cyperaceae**

*Scleria*

P.J. Bergius 1765 (Nutrush)

(by Richard J. LeBlond)

A genus of about 250 species, herbs, pantropical, and locally extending into warm temperate regions. This treatment attempts to recognize the stabelst and most distinctive *Scleria* entities. Intermediate and otherwise difficult-to-classify specimens are occasionally encountered within some species groups, suggesting hybridization or incomplete speciation. This is particularly true within the *S. ciliata/pauciflora* group (here boldly treated as four species and two varieties). This complex genus likely will continue to challenge and exasperate those who study it. References: Kessler (1987)=Z; Fairey (1967)=Y; Reznicek, Fairey, & Whittmore in FNA (2002b); Core (1936); Goethgeheuer in Kubitzki (1998b).

**Identification notes:** *Scleria* superfluously resembles Rhynchospora in the field, but mature specimens are readily recognized by the terete white, gray, or black bony achenes. Hardened achenes are necessary for reliable identification to species. In the key, achene length includes hypogynium when present. The scale character applies only to the ultimate bracteate structure clasping the achene.

1 Base of achene without hypogynium (a circular, angular, lobed, or tuberculate disk differing in texture and structure from the achene body), the achene base constricted, pitted, and/or ribbed, but appearing as a continuation of the achene body.

2 Inflorescence of 2-9 sessile clusters along an axis up to 13 cm long, the individual spikelets 2-5 mm long; bracts (at least above proximal cluster) setaceous.

3 Plants perennial with rhizomes; leaf blades usually pubescent, 1.5-5 mm wide; bract and scale margins long-ciliate; spikelets 4-5 mm long; achene smooth .......................................................... *S. distans*

3 Plants annual with fibrous roots; leaf blades glabrous, 0.5-2 mm wide; bract and scale margins ciliate; spikelets 2-3 (-4) mm long; achene reticulate-papillos to reticulate-verrucosa .................................................. *S. verticillata*

4 Inflorescence of a single cluster, the individual spikelets 4-10 mm long; bracts foliaceous.

4 Triangular base of achene lacking pits in the three concave sides; achene 3-4 mm long .................................................................................................................. *S. baldwinii*

4 Triangular base of achene with a pair of pits on each of the three sides; achene 2-3 mm long .................................................................................................. *S. georgiana*

1 Base of achene with hypogynium.

5 Achene body smooth (often longitudinally ribbed); hypogynophyllum with 0, 8, or 9 tubercles.

6 Hypogynophyllum with 8 or 9 minutely papillate tubercles .......................................................................................................................... *S. oligantha*

6 Minutely papillate portion of hypogynium continuous, not divided into separate tubercles.

7 Achene 1-2 mm long; culm 1-2 mm wide at base; leaves 1-3 mm wide ........................................................................................................... *S. minor*

7 Achene 2-4 mm long; culm 2.5-6 mm wide at base; leaves 5-9 mm wide.

8 Plants cespitose to short-rhizomatous; sheaths brown or stramineous to reddish, glabrous to glabrate on the ventral surface except for a pubescent and usually thickened summit; inflorescences terminal and lateral; achenes 2.0-3.3 mm long, (1.12-) avg. 1.25 (-1.38× as long as wide; hypogynophyllum with laterally and apically rounded papillae; [of wet to mesic pinelands] .......................................................... *S. triglomerata*

8 Plants long-rhizomatous or cespitose; sheaths purple to reddish, the ventral surface uniformly pubescent; inflorescences terminal only or terminal and lateral; achenes 2.5-4.0 mm long, (1.35-) avg. 1.45 (-1.54× as long as wide; hypogynophyllum with laterally flattened and apically triangular-acute to acuminated papillae; [of coastal hammocks, oak woods near saltwater, and blackwater swamps] .................................................................................................................. *S. flaccida*

9 Plants usually cespitose; inflorescence terminal and lateral (a few culms in a clump can be terminal only); hypogynophyllum with laterally flattened and apically ciliate to acuminate papillae; [of coastal hammocks, oak woods near saltwater, and blackwater swamps] .................................................................................................................. *S. littoralis*

9 Plants usually cespitose; inflorescences terminal only; hypogynophyllum with laterally and apically rounded papillae; [mostly of dry to dry-mesic pinelands and barrens] .................................................................................................................. *S. nitida*

5 Achene reticulate or papillos, rarely smooth (most often from apparent abortion or abnormal development); hypogynophyllum with 3 tongue-shaped lobes, or 3 or 6 tubercles.

10 Hypogynophyllum of 3 tongue-shaped lobes appressed to the underside of the achene (appearing nearly bract-like); achene reticulate, the pits generally squarish or rectangular and arranged regularly in rows, rarely smooth (apparently by abortion or abnormal development).

11 Achene pubescent (occasionally becoming glabrate); lower lateral inflorescences on long, filiform, usually drooping peduncles; bract of the uppermost lateral inflorescence usually reaching 1/3-3/4 the length of the terminal internode; terminal internode 6-30 cm long............................................................................................................... *S. muehlenbergii*

11 Achene glabrous; lower lateral inflorescences sessile or on short-erect peduncles; bract of the uppermost lateral panicle usually reaching 3/4 the length of to exceeding the terminal internode; terminal internode 3-8 cm long .................................................................................. *S. reticularis*

10 Hypogynophyllum with 3 or 6 tubercles; achene papillos, sometimes reticulate (if so, the pits generally variable in shape and not forming regular rows), or rarely smooth.

12 Achene 1.5-2 mm long, the hypogynophyllum with 6 paired but distinctly separate tubercles.

13 Culms, leaves, and bracts copiously villous-ciliate with spreading hairs 0.5-1 mm long ........................................................................................................... *S. pauciflora* var. caroliniana

13 Culms, leaves, and bracts glabrous or sparsely hirtellous, but not copiously villous-ciliate ................. *S. pauciflora* var. pauciflora

12 Achene 2-3.6 mm long, the hypogynophyllum with 3 tubercules, these often 2-lobed, the lobes united (becoming separate in S. species 1 with achenes smoothish and > 2.5 mm long).

14 Achene 2.0-3.6 mm long, the hypogynophyllum with 3 tubercules, these often 2-lobed, the lobes united (becoming separate in S. species 1 with achenes smoothish and > 2.5 mm long).

14 Achene 2.0-3.6 mm long, the hypogynophyllum with 3 tubercules, these often 2-lobed, the lobes united (becoming separate in S. species 1 with achenes smoothish and > 2.5 mm long).

14 Achene 2.5-3.6 mm long, 2.0-2.6 mm wide; larger leaves 3-7 mm wide; culms, sheaths, blades, and bracts glabrous to moderately pubescent or ciliate.

15 Culms and/or sheaths hairy; blades and bracts ciliate; plants of loamy sands (e.g., ultisols) .................................................................................................. *S. ciliata* var. ciliata

15 Culms, sheaths, blades, and bracts glabrous; plants of sandy soils (e.g., spodosols) .......................................................................................... *S. ciliata* var. glabra

14 Achene 2.6-3.6 mm long, 2.0-2.6 mm wide; larger leaves 3-7 mm wide; culms, sheaths, blades, and bracts moderately to densely pubescent and/or ciliate; plants usually of loamy soils (e.g., ultisols and alfisols).

16 Herbage pubescent between as well as along primary sheath and adaxial leaf surface nerves and culm angles; most pistillate scales pubescent with appressed hairs 0.1 (-0.2) mm long, the keel similarly pubescent or ciliate with hairs (0.1-)0.2 mm long;
Scleria baldwinii (Torrey) Steudel, Baldwin’s Nutrush. Cp (FL, GA, NC, SC): wet savannas, under Pinus serotina, P. palustris, and/or Taxodium ascendens; uncommon (rare in GA, NC, and SC). June-July. Sc. NC south to s. FL and west to se. TX; also in Cuba and the Bahamas (Sorrie & LeBlond 1997). *S. baldwinii* is a more robust plant, with larger achenes, than *S. georgiana*. [= RAB, FNA, K, GW, WH]

*Scleria ciliata* Michaux var. *ciliata*, Hairy Nutrush. Cp, Pd (GA, NC, SC, VA), Mt (NC, SC), {FL}: wet to dry sandy thickets and flatwoods, typically on sandy soil; frequent, rare in the mountains, rare in VA (VA Rare). May-August. VA south to FL, west to MO and TX, and in the West Indies, Mexico, and Central America. [= FNA, S, Y; < *S. ciliata* – RAB, C, F, G, GW, W; < *S. ciliata var. ciliata* – K, WH] [not yet mapped]

*Scleria ciliata* Michaux var. *glabra* (Chapman) Fairey, Smooth Nutrush. Savannas and flatwoods. NC south to FL, west to TX. *S. ciliata var. curtissii* (Britton) Kessler (= *S. paniciflora* Muhl. ex Willd. var. *curtissii* (Britton) Fairey) is currently of uncertain taxonomic standing. It is distinguished by its reticulate, non-papillose achenes, but such a condition has been observed in achenes with the hypogynium lobing of both *S. ciliata* and *S. paniciflora* (as suggested by the synonymy), and may only represent a form or condition. [= FNA, Y; K; > *S. brittonii* Core ex Small – S; < *S. ciliata* – RAB, C, F, G, GW, W; < *S. ciliata var. glabra* – K, WH; > *S. ciliata var. curtissii* (Britton) Kessler – Z; > *S. paniciflora* Muhl. ex Willd. var. *curtissii* (Britton) Fairey – K] [not yet mapped]

*Scleria curtissii* Poiret in J. Lamarck et al., Riverswamp Nutrush. Moist sandy or peaty soil of pine savannas and flatwoods, boggy areas, and wet openings along roads. May–September. GA south to s. FL west to TX; West Indies; Mexico, Central and South America; Africa. [= FNA, WH; ? *S. hirtella* Swartz – GW, K, S, Y, Z; misapplied]

*Scleria elliotii* Chapman, Broad-leaved Hairy Nutrush. Savannas, flatwoods, pine-oak woodlands, meadows, bogs, and clay-based Carolina bays, typically on loamy sands. May–September. VA south to FL, west to TX, MO, OK. The descriptions of *S. elliotii* in S and of *S. ciliata* Michaux var. *elliotii* (Chapman) Fernald in F do not include the entity here treated as *S. species 1*. [= S; = *S. ciliata* Michaux var. *elliotii* (Chapman) Fernald – F, FNA, Y; < *S. ciliata var. ciliata* – K, WH; < *S. ciliata* – RAB, C, G, GW, W] [not yet mapped]

*Scleria falcidea* Steudel, Flaccid Nutrush. Blackwater swamps, coastal hammocks, oak woods and thickets near saltwater. Scattered along the outer Coastal Plain from se. VA to s. FL and west to LA. This is a poorly known species, with more locations likely to be found upon re-examination of *S. triglomerata* and *S. nitida* specimens. The often pendulous and capillary lateral peduncles suggest *S. oligantha*, another swamp species. *S. oligantha* is most readily separated by its 8-9-lobed hypogynium with minute rounded papillae. [= F; < *S. triglomerata* Michaux – RAB, C, F, GW, K, S, WH; < *S. nitida* – G]

*Scleria georgiana* Core, Georgia Nutrush. Pine savannas, cypress savannas, depression meadows, mostly on the outer Coastal Plain. June-August. E. NC south to s. FL, west to TX; and in the West Indies, Central and South America. See note under *S. baldwinii*. [= RAB, FNA, GW, K, WH; = *S. gracilis* Elliott – S (name preoccupied)]

*Scleria lithosperma* (Linnaeus) Swartz. Wet pine savannas. S. FL and s. LA south into Mexico, Central America and South America; West Indies; tropical Asia and Africa. [= FNA, GW, S, WH; {not yet keyed}

*Scleria minor* W. Stone, Slender Nutrush. Wet savannas and peaty seepages in the Coastal Plain and Sandhills, bogs in the Mountains. June-August. NJ south to FL, west to se. TX. [= RAB, C, F, FNA, G, K, W; < *S. triglomerata* – GW, S]

*Scleria muehlenbergii* Steudel, Pitted Nutrush. Open wet sand, pine savannas and flatwoods, depression meadows, cypress savannas, limesink ponds, bogs. June-September. NY (Long Island), NJ, and NC south to FL, west to TX, north in the interior to MO and IN; also in the West Indies, Bahamas (Sorrie & LeBlond 1997), Mexico, and Central America. *S. muehlenbergii* is adapted to a variety of freshwater wetland habitats, while *S. reticularis* is primarily restricted to the drawdown zones of limesink (doline) ponds and clay-based Carolina bays. Also see notes under *S. reticularis*. In normal specimens, the achene reticulation ridges are sharp-edged and steeply sloped (compare *S. reticularis*). The achene pubescence is often tawny, and achenes...
appearing superficially glabrous often have a tawny residue under magnification. [= FNA, K; < S. reticularis Michaux – RAB, C, FW, W, WH – S. muehlenbergii – F, orthographic variant; = S. reticularis var. pubescens Britton – G; = S. setacea Poiret – S]

**Scleria nitida** Willdenow, Shining Nutrush. Cp (DE, FL, NC, SC, VA), Mt (NC, SC, VA), Pd (DE, NC, SC, VA) (FL, GA?): dry sandy or rocky soil of pine/scrub oak woodlands, ridgetop forests at lower elevations in the Mountains such as pine/oak heaths, and heath balds; uncommon (rare in DE). May-October. MA, VA, and KY south to FL, west to LA and MO (also see note under S. triglomerata). [= F; < S. nitida – G; < S. triglomerata Michaux – RAB, C, FNA, GW, K, S, W, WH] [not yet mapped]

**Scleria oligantha** Michaux, Few-flowered Nutrush. Dry to moist forests and woodlands, swamp forests. June-September. NJ and MO south to c. peninsular FL and TX, also in Puerto Rico, Mexico, and Central America. The long, filiform, arching lateral peduncles are distinctive. [= RAB, C, F, FNA, GW, K, S, W, WH]

**Scleria pauciflora** Muhlenberg ex Willdenow var. caroliniana A. Wood, Carolina Nutrush. Cp (GA, NC, SC, VA?): savannas; uncommon. June-September. NH west to MI, south to n. FL, TN, and MO. [= F, FNA, GW, K; < S. pauciflora – RAB, C, GW, S, W] [not yet mapped]

**Scleria pauciflora** Muhlenberg ex Willdenow var. pauciflora, Papillose Nutrush. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): wet to dry pine flatwoods, pine savannas, depression meadows; common (rare in WV). June-September. NJ west to KS, south to TX and FL, also in Cuba. Typification of S. pauciflora is controversial and unresolved at this time (Fairey & Whittemore 1999). [= F, FNA, G, K; < S. pauciflora – RAB, C, GW, S, W] [not yet mapped]

**Scleria reticularis** Michaux, Netted Nutrush. Limesink ponds, clay-based Carolina bays. June-September. MA south to FL, west to TX, north to IN, MI, and WI. Reports from Mexico are based on S. muehlenbergii. See notes under S. muehlenbergii. In normal specimens, the achene reticulation ridges are soft-edged and obliquely sloped. Occasional stipitate-capitate fungal growth on the achene has been mistaken for pubescence (a condition perhaps restricted to herbarium specimens), apparently contributing to the unwarranted agglomeration of this distinctive taxon and S. muehlenbergii. There is controversy about typification of the name Scleria reticularis (Camelbeke, Reznicek, & Goetgebeur 2003). [= F, FNA, GW, K; < S. reticularis – RAB, C, GW, S, W] [not yet mapped]

**Scleria triglomerata** Michaux, Tall Nutrush. Wet to mesic flatwoods, savannas, and hardwood forests. May-September. VT and ON west to MN, south to s. FL and TX. S. triglomerata sensu lato also occurs in Puerto Rico and Mexico, and may include S. nitida and S. flaccida. [= F, G; < S. triglomerata – RAB, C, FNA, GW, K, S, W, WH, WV]

**Scleria verticillata** Muhlenberg ex Willdenow, Savanna Nutrush. Wet calcareous savannas of the outer coastal plain, freshwater marshes and maritime wet grasslands on barrier islands influenced by salt spray and shell deposits, wet calcareous or mafic fens or seepages in the mountains, calcareous grasslands. July-September. MA and ON west to MN, south to FL and TX, also in the West Indies, Mexico, Central and South America. This species is a distinct calciphile, with only scattered occurrences in most of our area. The roots are strongly fragrant. [= RAB, C, F, FNA, GW, K, S, W, WH]

**Trichophorum** Persoon (Deergrass)

A genus of about 10 species, herbs, primarily circumboreal, but with disjunct occurrence in montane tropical Asia and montane tropical South America. **Trichophorum** has long been recognized as distinct from **Scirpus** by many authors (especially in Europe and Asia). Molecular and other studies have clearly confirmed that these species are more closely allied to **Eriophorum** than to **Scirpus**, and their removal from **Scirpus** creates a more natural classification (Strong 1994). **Trichophorum** resembles **Eriophorum** in most morphologic characters, and shares with it a generally boreal and north temperate distribution. **Trichophorum alpinum** (Linnaeus) Persoon demonstrates previous confusion over the affinities of the group; it has been variously treated (by those who do not recognize **Trichophorum**) as **Eriophorum alpinum** Linnaeus or **Scirpus hudsonianus** (Michaux) Fernald. References: Crins in FNA (2002b); Strong (1994)=Z; Goetgebeur in Kubitzki (1998b).

1 Culms terete or nearly so, smooth; [in our area] of moderate to high elevation cliffs................................. **Tr. caespitosum** ssp. caespitosum

1 Culms sharply triangular in cross-section, the angles scabrous; [plants of low to moderate elevation forests, woodlands, and bluffs]............................. .............................................................................. .............................................................................. **Tr. planifolium**

**Trichophorum caespitosum** (Linnaeus) Schur ssp. caespitosum, Deergrass, Deerhair Bulrush. Cliffs receiving fog/cloud deposition and seepage, mostly at high elevations, over amphibolite, granite, gneiss, or schist, notably at Grandfather Mountain, Roan Mountain, Whiteside Mountain, and Chimney Rock. July-September. A circumboreal tundra and alpine species, south in North America to the mountains of New England and fens in NY, and to n. IL, MN, montane UT, and OR, common in wet tundra

<em>Trichophorum planifolium</em> (Sprengel) Palla. Woodlands, bluffs, forests. ME west to ON, south to sc. VA, e. WV, KY, OH, and se. MO. See Crins (1989a) for an interesting discussion of this species. [= FNA, K, Z; = <em>Scirpus verecundus</em> (Sprengel) Palla. Woodlands, bluffs, forests. ME west to ON, south to sc. VA, e. 1 Plants not cespitose, the main leaves cauleine.......................................................................................................................... Piptatherum (racemosum)
   1 Plants cespitose, the leaves basally disposed.
   2 Leaves > 4 mm wide; awns either 7-15 or 40-120 mm long.
      3 Leaves 4-10 mm wide, the base twisted so that the abaxial surface is uppermost; awns 7-15 mm long ................................. Oryzopsis
      3 Leaves 2-8 mm wide, not twisted at the base; awns 50-120 mm long .................................................................................. [Nassella (neesiana)]
   2 Leaves < 4 mm wide; awns 5-120 mm long
      4 Palea grooved, longer than the lemma; lemma margins involute, fitting into the paleal groove; [native species, collectively widespread
         in our area]. .................................................................................................................................................................................. Piptochaetium
      4 Palea flat, shorter than or equal to the lemma; lemma margin convolute or not overlapping; [alien and native species, rare in our area].
         5 Lemmas papillose and also often pubescent, particularly on the veins, convolute and wrapping around the caryopsis such that the
            margins strongly overlap; awns 15-120 mm long .................................................................................................................. Nassella
         5 Lemmas smooth, the margins separated and parallel their entire lengths at maturity; awns 5-25 mm long; [native species, of WV
            northward] ............................................................................................................................................................................ Piptatherum (canadense)

Key G – tribe Brachyopideae

One genus ................................................................................................................................................................................ Brachypodium

Key H – tribe Bromeae

One genus ................................................................................................................................................................................ Bromus

Key I – tribe Triticeae

1 Spikelets 2-7 at all or most nodes.
   2 Spikelets 3 at each node ....................................................................................................................................................... Hordeum
   2 Spikelets
   3 Elymus
   3 Secale
   1 Spikelets 1 at all or most nodes.
POACEAE

Agropyron, Elymus, Pascopyrum, Aegilops, Triticum, Thinopyrum

Key J – tribe Poeae

Key K – tribe Arundineae

Molinia, Phragmites, Arundo

Key L – tribe Cynodonteae

Uniola, Distichlis (incl. Monanthochloe), Tridens, Triplasis, Leptochloa, Dinebra, Eragrostis, Eleusine, Dactyloctenium, Sporobolus, Calamovilfa, Muhrenbergia, Chloris, Eustachys, Gymnopogon, Cientium, Cynodon, Spartina, Bouteloua, Tragas, Zoysia

Key M – tribe Danthonieae

Cortaderia, Danthonia

Key N – tribe Aristideae

One genus............................................................................................................................................................................................................ Aristida

Key O – tribe Centotheceae

One genus............................................................................................................................................................................................................ Chasmanthium

Key P – tribe Paniceae

{partial key only}

1 First glume 5-7.5 mm long, nearly as long as sterile lemma; fertile lemma 1/3 length of sterile lemma...............................Phanopyrum
2 First glume shorter, or if this long, then at most 3/4 length of sterile lemma; fertile lemma > ½ the length of the sterile lemma.
2 Sterile palea indurate and expanding the spikelet at maturity, as long as sterile lemma; outer surface of the distal palea with compound papillae......................................................................................................................... Steinchisma
2 Sterile palea membranous, not expanding the spikelet at maturity, usually shorter than sterile lemma or absent; outer surface of the distal palea lacking compound papillae.............................................................................................................................................................. Panicum

Digitaria, Anthenantia, Allotropis, Amphicarpum, Opismenus, Echinachloa, Sacciolepis, Dichanthelium, Panicum, Megathyrsus, Phanopyrum, Brachiaria, Melinis, Urochloa, Erichochloa, Pennisetum, Cenchrus, Setaria, Stenotaphrum, Steinchisma, Asonepus, Paspalum, Reimarochloa

Key Q – tribe Andropogoneae

Add to genus key: Elionurus, Hackelochloa.

1 Leaves ovate-lanceolate, 2-10 cm long, 2.5-7× as long as wide; plants weak-stemmed annuals, branching, decumbent, rooting at the lower nodes; [alien weeds].
2 Leaves cordate-clasping at base; spikelets not paired, unaccompanied by a vestige .......................................................................................................................... Arthraxon
2 Leaves tapering to a broadly cuneate base; spikelets paired (one of the pair sometimes vestigial)...........................................Microstegium
1 Leaves lanceolate to linear, either longer or proportionately narrower; plants either perennial or coarse annuals with erect and mostly unbranched culms.
3 Spikelets embedded in the thickened rachis (the inflorescence thus like an ear of corn), or fitting into grooves in the thickened rachis (the inflorescence thus cylindrical and resembling a rat's tail), or the pistillate inflorescences enclosed in a hard, bead-like, pearly-white, modified bract.
4 Spikelets unisexual, with male and female spikelets in separate inflorescences or in different parts of the same inflorescence.
5 Internode narrower than and more-or-less enclosed by the female spikelet........................................................................ Coix
5 Internode broader than and more-or-less enclosing the female spikelet.
6 Racemes of mixed sex (female below, male above).................................................................................................................................Tripsacum
6 Racemes of single sex.......................................................................................................................................................................................Zea
4 Spikelets, or at least one of each pair, bisexual.
POACEAE

270

7 Pedicels fused to the internode; [coarse alien grass of disturbed habitats] ...................... Rottboellia
7 Pedicels free from the internodes; [either a native coarse grass of pinelands or prairie-like areas, or a short alien grass of lawns and disturbed areas] .......................... Coelorachis
8 Sessile spikelet smooth or pitted; culms 50-200 cm tall; [native grass of pinelands or prairie-like areas] .......................... Eremochloa
8 Sessile spikelet with pectinate margins; culms 5-40 cm tall; [alien grass of lawns and disturbed areas] .................. Imperata
3 Spikelets not embedded or fitting into grooves in the rachis, the rachis slender (the spikelets visibly separate and often pedicelled).
9 Pedicelled spikelet similar to the sessile spikelet, both fertile.
10 Spikelets falling in pairs together with sections of the disarticulating rachis................................................................. Saccharolochloa
10 Spikelets falling separately from the persistent rachis.
11 Panicle contracted, spike-like; glumes membranous ................................................................................................. Imperata
11 Panicle loose; glumes cartilaginous or coriaceous ..................................................................................................... Miscanthus
9 Pedicelled spikelet differing from the sessile in shape and sex (sometimes represented only by a pedicel).
12 Spikelets awned or not, if awned the awn < 5 cm long.
13 First glume lacking glands; panicle open, the branches 5-8 cm long........................................................... Chrysopogon
13 First glume with a row of punctate, concave glands; panicle contracted, spike-like ........................................... Heteropogon
12 Spikelets awned or not, if awned the awn > 5 cm long.
14 Inflorescence a panicle, the branches not subtended by sheaths.
15 Pedicelled spikelet represented by pedicel only; apex of sheath bearing 2 auricles 1-10 mm long; [native]......... Sorgasistrum
15 Pedicelled spikelet present, staminate; apex of sheath truncate; [alien]................................................................. Sorghum
14 Inflorescence of 1-13 digitate (whorled) racemes borne at the summit of a peduncle, the peduncle subtended by a raceme sheath.
16 Racemes 1 per peduncle and raceme sheath ........................................................................................................ Schizachyrium
16 Racemes 2-13 per peduncle and raceme sheath.
17 Pedicels of the pedicelled (reduced or absent) spikelets terete or slightly flattened and grooved on one side only ........ Schizachyrium
17 Pedicels of the pedicelled (reduced or absent) spikelets strongly flattened and grooved on both sides, the central portion thin or membranous.................................................. Andropogon

*Aegilops* Linnaeus 1753 (Goatgrass)

1 Glumes unawned (with a tooth to ca. 3 mm long); spikes moniliform ........................................................................... *A. ventricosa*
1 Glumes awned; spikes narrowly cylindrical or ovoid (not moniliform).
2 Spikes narrowly cylindrical, about 3 mm in diameter ................................................................................... *A. cylindrica*
2 Spikes ovoid, broadest at the base, 4-13 mm in diameter at the broadest point.
3 Upper spikelets 4-5 mm long ........................................................................................................... *A. neglecta*
3 Upper spikelets 7-9 mm long ........................................................................................................... *A. triuncialis* var. *triuncialis*

* Aegilops cylindrica* Host, Jointed Goat Grass. Disturbed areas; native of Mediterranean Europe and w. Asia. [= C, F, FNA, G, HC, K, Z]

* Aegilops triuncialis* Linnaeus var. *triuncialis*, Barbed Goatgrass. Disturbed areas; native of Mediterranean Europe east to w. and c. Asia. Known from MD. [= FNA; < *A. triuncialis* – HC, K]

* Aegilops ventricosa* Tausch, Swollen Goatgrass. Disturbed areas; native of Mediterranean Europe. Known from DE. [= FNA]

*Agropyron* Gaertner 1770 (Crested Wheatgrass)

* Agropyron cristatum* (Linnaeus) Gaertner, Crested Wheatgrass. Disturbed areas; native of Eurasia. [= C, F, FNA, G; > *A. cristatum* – HC; > *A. desertorum* – HC]

*Agrostis* Linnaeus 1753 (Bentgrass)
A genus of about 220 species, primarily temperate. References: Harvey in FNA (2007a); Tucker (1996)=Z. [also see Lachnostegia and Polygroen]

1. Palea 1/2-3/4 as long as the lemma, 0.6-1.2 mm long; plants introduced, often (though not always) in disturbed habitats; plants flowering June-October, [subgenus Agrostis].

2. Ligule mostly 0.5-2 mm long, truncate; panicle branches naked towards the base, diffuse when in fruit, the spikelets well-separated..........

3. Leaves 3-8 mm wide; inflorescence triangular-ovoid, the branches widely spreading at maturity, usually reddish; plant with rhizomes, without stolons .............................................................. A. capillaris

4. Leaves mostly 1-3 mm wide; inflorescence narrowly ovoid, the branches ascending at maturity, usually tan; plant without rhizomes, with or without stolons................................................................. A. gigantea

5. Palea < 2/5 as long as the lemma, 0-0.5 mm long; plants native, typically in more or less natural habitats; plants flowering March-November, [subgenus Y(t)ea]

6. Lemma usually awned (sometimes unawned), the awn inserted near the tip, 4-10 mm long, straight, very delicate and flexuous; annual, flowering April-June.............................................................. A. elliottiana

7. Lemma awned or not, the awn (when present) inserted either near the middle of the lemma or near the apex, 0-6 mm long, straight or bent, neither delicate nor flexuous; perennial, flowering March-November.

8. Lemma with a (2)-3-5 mm long, geniculateawn.

9. Spikelets 1.2-2 mm long; anthers 0.3-0.6 mm long; lemma never awned; plants flowering March-July.............................. A. hyemalis

10. Spikelets 1.8-3.5 (-3.7) mm long; anthers 0.3-1.5 mm long; lemma awnless or awned; plants flowering June-November.

11. Leaves (at least the basal) mostly involute, 1-2 (-3) mm wide; panicle branches mostly forking well beyond the middle; anthers 0.4-0.8 mm long .............................................................. A. scabra

12. Leaves flat, 2-6 mm wide; panicle branches mostly forking at or below the middle; anthers 0.3-1.2 mm long.

13. Spikelets 2.0-4.0 mm long; plant densely cespitose

14. Lemma 1.4-2 mm long, glabrous; anthers 0.3-0.6 mm long; spikelets (1.8-) 2.2-2.7 (-3.2) mm long, usually not clustered near the tips of the branchlets; plant glabrous to scabrous; culms to 10 dm tall; [of wet savannas and other wet habitats of the Coastal Plain] .............................................................. A. alismat

15. Spikelets 1.8-3.3 mm long, minutely but ciliately scabrous (at 20× or more); anthers 0.7-1.2 mm long; spikelets (2.3-) 2.7-3.5 (-3.7) mm long, usually clustered near the tips of the branchlets; plant glabrous to scabrous; culms to 10 dm tall; [of various habitats, nearly throughout our area] .............................................................. A. perennans

**Agrostis elliottiana** A.J. Schultes, Elliot's Bentgrass, Southern Bentgrass. Dry soils of barrens, fields, and rock outcrops. April-June. MD west to s. OH, and e. KS, south to Panhandle FL (Gadsden County) and c. TX. [= RAB, C, F, FNA, G, HC, K, S, W, WH, Z]

**Agrostis exarata** Trinius, Spike Bentgrass. Disturbed areas; native of w. North America, a waif in e. North America. Reported for very widely scattered sites in e. North America, including Leslie County, KY (Kartesz 2010). [= FNA ] (not keyed or mapped)

**Agrostis hyemalis** (Walter) Britton, Sterns, & Poggenburg, Tickleglass, Small Bentgrass. Roadways, other disturbed habitats. March-July. ME west to WI, south to FL and TX. [= F, FNA, K, WH, WV, Z; < A. hyemalis – RAB (also see A. scabra); = A. hyemalis var. hyemalis – C, G; = A. hiemalis – GW, HC, orthographic variant; < A. hiemalis – S, W, orthographic variant (also see A. scabra var. scabra) [FL]

**Agrostis perennans** (Walter) Tuckerman, Upland Bent, Autumn Bentgrass. Woodlands, forests, roadways. August-October. NL (Newfoundland) west to MN, south to n. FL and TX, c. Mexico south to c. South America. [= HC, WV, Z; < A.
POACEAE

1 Panicle dense and spike-like, 0.5-4.1 cm long, 0.3-0.7 cm wide, the branches short and appressed to ascending..........................A. pratensis
1 Panicle open, 1.2-13.5 cm long, 1.5-10 cm wide, the branches elongate, diffusely spreading or ascending.
2 Pedicels usually 1-2× as long as the spikelets; lemma of the lower floret with an awn 2-4 mm long.................................A. scabra
2 Pedicels usually 2-8× as long as the spikelets; lemma of the lower floret with an awn 1.5-2.5 mm long, lemma of the lower floret awnless or with a minute awn < 1 mm long .........................................................A. elegantissima

* A. pratensis A. alba
   A. stolonifera

* A. carophyllea

Alloteropsis J. Presl 1828

A genus of 5-8 species, annuals and perennials, native of tropical Asia and Australia. References: Hall in FNA (2003a).

* A. cimicina (Linnaeus) Stapf, Bugseed Grass. Disturbed areas; native of se. Asia. Naturalized in FL Panhandle and ne. FL. [= FNA, WH]

Linnaeus 1753 (Foxtail Grass)

1 Glumes 4-6 mm long, acute or acuminate.
2 Glumes with hairs < 1.0 mm long on the keel, merely scabrous towards the tip..........................A. myosuroides
2 Glumes with hairs 1.0-1.5 mm long on the keel, including towards the tip.................................A. pratensis
1 Glumes 2-3.2 mm long, obtuse or truncate.
3 Awn longer than the glumes, exceeding the glumes by 1.5-3.5 mm................................................A. aequalis var. aequalis
3 Awn about as long as the glumes (at most exceeding the glumes by 1 mm).................................A. aequalis
4 Anthers 0.4-0.7 mm long; annual..........................................................A. carolinianus
4 Anthers 1.3-2 mm long; perennial .....................................................A. geniculatus

Alopecurus aequalis Sobolewski var. aequalis, Short-awn Foxtail Grass. Wet swales, wet meadows, ditches, shores. Circumboreal, south in North America to NJ, w. VA, IN, MO, and CA. [= F; > A. aequalis – C, G, HC]
A. arundinaceus Poiret, Creeping Meadow Foxtail. Pastures, disturbed areas. Native of Eurasia. Reported for Bell County, KY (Kartesz 2010). [= FNA] (not keyed or mapped)
POACEAE

**Alopecurus geniculatus** Linnaeus, Water Foxtail Grass. Disturbed areas; native of Eurasia. [= C, F, G, HC; > A. geniculatus var. geniculatus – K]

**Alopecurus myosuroides** Hudson, Slender Foxtail Grass. Moist fields; native of Europe. April-May. [= RAB, C, F, G, HC, K, S, WV, Z]

**Ammophila** Host 1809 (Beach-grass)

1 Ligule 10-35 mm long........................................................................................................ A. arenaria
1 Ligule 1-4.6 mm long ........................................................................................................ A. breviligulata

**Ammophila arenaria** (Linnaeus) Link, European Beach-grass. Dunes, disturbed areas; native of Europe. Introduced in MD and PA (Kartesz 1999). [= C, F, FNA, HC, K]

**Ammophila breviligulata** Fernald, American Beach-grass. Dunes. August-September. NL (Newfoundland) south to about Cape Hatteras, Dare County, NC, and on shores around the Great Lakes; planted further south. As a native grass, *Ammophila* ranged south only to NC, where it was rare; it is now commonly planted ("sprigged") in the Carolinas as a sand-binder and is now common south into SC. [= K; < *A. breviligulata* – RAB, F, G, HC, S; = *A. breviligulata* ssp. *breviligulata* – FNA; ? *A. breviligulata* – C, Z]

**Amphibromus** Nees 1843

**Amphibromus scabrivalvis** (Trinius) Swallen var. scabrivalvis, Rough Amphibrome. Disturbed areas; native of South America. Established in Tangipahoa Parish, LA. [= FNA; < *Amphibromus scabrivalvis* – K; < *Helictotrichon scabrivalve* (Trinius) G. Tucker]

**Amphicarpum** Kunth 1829 (Peanut-grass)

1 Leaf blades hirsute with pustular-based hairs on both surfaces, the margins ciliate (and also slightly cartilaginous-thickened); [of moist to wet, peaty or sandy-peaty soils] ........................................................................................................ A. amphicarpon
1 Leaf blades glabrous, the margins cartilaginous-thickened; [of seasonally flooded natural ponds] ................................................ A. muhlenbergianum

**Amphicarpum amphicarpon** (Pursh) Nash, Pinebarrens Peanut-grass. Wet, peaty, open soils, especially peat-burns in pocosin edges, primarily in the outer Coastal Plain, responding strongly to fire. August-October. An Atlantic Coastal Plain endemic, scattered and rather rare, from e. MA to GA. If one carefully excavates young plants in spring or summer, they will generally be found to be connected to the remnants of the previous year's subterranean spikelet. [= FNA; = *Amphicarpum pusillii* Kunth – RAB, C, F, G, GW, HC, K; = *Amphicarpum amphicarpon* (Pursh) Nash – S]
**Amphicarpum muhlenbergianum** (J.A. Schultes) Hitchcock, Florida Peanut-grass, Blue Maiden-cane. Natural depression ponds, flatwoods ponds, clay-based Carolina bays. August-October. A Southeastern Coastal Plain endemic: FL and s. AL north to se. NC, rare north of s. GA. First found in NC in the late 1980's by M. Boyer. [= RAB, FNA, GW, HC; = *A. muhlenbergianum* – K, orthographic variant; = *Amphicarpum floridanum* Chapman – S]

**Andropogon** Linnaeus 1753 (Broomsedge, Bluestem)

A genus of about 100-110 species, mainly tropical. [also see Bothriochloa and Schizachyrium]

The difference between this treatment and that in RAB may cause some users to react with skepticism, dismay, or alarm, but I am confident that it represents a much truer description of the genus. Campbell's work (1983, et seq.) has greatly clarified the taxonomy of *Andropogon* in e. North America. Great confusion and disagreement were previously the rule in dealing with the *A. virginicus-A. glomeratus* complex. Campbell's careful morphologic work has provided workable technical characters which distinguish the taxa he recognizes.

I have generally followed Campbell (1983, et seq.) in his circumscriptions of taxa. I disagree, however, with his strongly morphologic species concept and the basis for his decisions regarding the rank of the taxa (species, variety, and "variant," an informal, English name for a subvarietal entity). Campbell bases the rank recognition of taxa on their "morphologic distance" from one another, as determined by the sum of non-matching characters out of 33 characters analyzed. In general, he regards species as separated by a morphologic distance of 9 or more, varieties by 6 or more, and variants by 3 or more. Such an approach fails to take into account additional evidence of the ecological preferences, geographic distributions, reproductive isolation, evolutionary pathways, and population biology of the taxa.

Evidence presented by Campbell (1983) is useful in determining a more meaningful assignment of taxonomic rank. For instance, he states that "there are ample opportunities for gene flow between taxa because they frequently grow together and flower at the same time of day and (mostly) at the same time of year. I have observed two taxa growing within one to three meters of one another over our hundred times. In only five of these opportunities for hybridization were there plants whose intermediate morphology suggested that they were hybrids. In the rare instances where hybridization does take place, there are few mature hybrid individuals. I have found only twelve putative hybrid individuals in the five localities where hybridization is suspected. The parents outnumber these hybrids by between five and one hundred or more to one." In discussing *A. virginicus* var. *glaucus* (here treated as *A. capillipes*) he states "the drylands variant... produces generally shorter raceme sheaths, racemes, and spikelets; its flowers are more frequently chasmogamous, and unlike the wetlands variant, it has no hairs below the raceme sheath. In addition, it grows in better-drained soil and has a narrower geographic range... I have seen these taxa growing within one to three meters of one another at three localities in northwestern Florida. At only one of these was there difficulty in classifying any individual: a single plant on a slope between a bog inhabited by the wetlands variant and a roadside lined with the drylands variant..."

Some additional examples would be Campbell's discussion of several closely related taxa in the *A. glomeratus* complex. "*Andropogon glomeratus* var. *glomeratus* and the robust variant of var. *pumilus* have inflorescences so similar in shape that most previous workers have united them and have overlooked the differences between them. The robust variant is taller, usually with rather smooth sheaths and with shorter, more ciliate, and darker ligules, narrower raceme sheaths, and lower glume keels that are scabrous below the middle. Although both taxa grow in wet sites, the robust variant is weedy, shows a greater tolerance for drier conditions and various soil types, and has a wider geographic range." His discussion of *A. glomeratus* var. *glaucopsis* and var. *hirsitior* is also worth repeating. "Often the two grow together in populations of thousands of individuals. Because they grow together so frequently and are morphologically so alike, the possibility that they are not distinct taxa but merely genetic segregates of one another has been carefully considered. Based on observations of several hundred seedlings grown from seeds from both taxa (growing together in nature), there is no evidence for [mere] genetic segregation. The glaucousness/greenness and pubescence/glabrousness of the stem sheaths are discernible in the seedlings within a few weeks of germination."

Taxa differing in numerous morphologic characters, with different (though overlapping) geographic ranges, with different ecological preferences (often rather narrowly segregated by hydrology), and (when they do occur in proximity to one another) showing little or no sign of introgression or hybridization are probably better treated as biological species. Thus, I have treated a number of Campbell's varieties as species. Several of his "variants" also seem to warrant taxonomic recognition, at varietal or specific rank; in fact, he subsequently elevated several (Campbell 1986). References: Campbell (1983)=Z; Campbell in FNA (2003a). Key adapted in part from Z.

**Identification notes:** A thorough understanding of the architecture of the inflorescences of *Andropogon* is necessary in order to identify them successfully. The parts will be described, beginning from the apex of a branch of the inflorescence. Spikelets occur in pairs, the sessile spikelet (usually just referred to as the **spikelet**) and the **pedicelled spikelet**, which is usually vestigial or absent (except in *A. gerardii*) and sterile (except in *A. gerardii*, where it is staminate). The first or lower **glume** of the sessile spikelet has two **keels**, and the presence and location of antorse prickly hairs (scabrousness) is an important character in the *A. glomeratus* complex. The length of the sessile spikelet is an important character; it should be measured exclusive of the **awn**, borne at the apex of the lemma. The pedicelled spikelet is borne on the **pedicel**, which is attached at the base of the sessile spikelet and typically angles away from it at about a 45 degree angle. The **rachis internode** extends from the base of one sessile spikelet to the next sessile spikelet above, breaking apart (upon dehiscence) just below the next spikelet and remaining attached to the sessile spikelet below. The **dispersal unit** consists of a sessile spikelet sitting in the V shape
formed by (on one side) the pedicel and pedicelled spikelet and (on the other side) the rachis internode. Both the pedicel and the rachis internode are usually pubescent with long hairs, and the color of those hairs and their distribution are useful characters.

While the dispersal units are still attached to one another, the rachis internodes form a continuous and more-or-less straight rachis. The dispersal units attached together in an unbranched sequence are termed a raceme, whose length is a useful character. Two or more racemes are attached digitally at the summit of the peduncle (in Schizachyrium only a single raceme is found). The number of racemes attached is an important character. A raceme sheath subdents the peduncle, often more or less surrounding the peduncle and the racemes. The length of the peduncle (distance between the points of attachment of the raceme sheath and the racemes) is an important character. The length and width (at its widest point) of the raceme sheath are very useful characters, used throughout the key. The racemes, peduncle and subtending raceme sheath make up an inflorescence unit. The overall inflorescence is more-or-less complexly branched; its overall size and shape are very useful in recognizing the various taxa, but variation in such a subjective (and environmentally plastic) character has added to the taxonomic confusion in Andropogon. The use of inflorescence shape in the key has been minimized, but is often mentioned in the discussion of each species. The number of inflorescence units per plant varies from species to species, in some species rarely exceeding 10, in others ranging upwards to 500 or 600. The absence or presence of hairs immediately below the raceme sheath is useful in some groups.

There are several important characters of the foliage. A. capillipes and A. glaucopsis have culm sheaths and leaf blades that are strongly glaucous; this is usually very obvious, but can be tested for by running the finger along the surface of the leaf (a white coating of wax will come off the finger). The key often calls for the ligule length; measure the longest portion of the undivided portion of the ligule. The ligule often has an erose or ciliate upper margin; measure the length of the ciliations. The length of leaf blade is measured from the ligule to the leaf apex; do not include the leaf sheath, which is often long and (especially late in the year) only loosely sheathing the culm or even divergent from it. Whether the culm is antorsely scabrous or smooth is better determined by touch than by sight. Choose several mid-culm sheaths, run one's finger downwards and upwards along the sheath surface (near the collar is best). If the sheath is antorsely scabrous one will feel a somewhat greater resistance to moving the finger downwards than upwards.

1 Pedicellate spikelet staminate, as large as the sessile, fertile spikelet; sessile spikelets > 7 mm long; [section Andropogon].............. A. gerardii
2 Pedicellate spikelet sterile, vestigial or absent; sessile spikelets < 7 mm long; [section Leptochloa].............. A. ternarius

1 Leaves strongly glaucous (often nearly white with a powdery wax that can be rubbed off on the fingers), glabrous.
2 Leaves green (to somewhat glaucous, but never powdery white), pubescent or glabrous.

3 Ligules (0.2-) 0.4 (-0.5) mm long, with ciliations 0.3-1.2 mm long; leaf blades (12-) avg. 19 (-38) cm long; pubescence beneath raceme sheaths moderate to dense; raceme sheaths (2.9-) 3.5-5 (-6.2) cm long; hairs of the rachis internode 0.9-2.1 mm long; upper floret lemma awn 0.3-2.1 mm long; anthers 1.6-3.5 mm long; A. capillipes var. ["wetland variant"]
4 Ligules (0.2-) 0.5 (-0.8) mm long, with ciliations 0.2-1.3 mm long; basal leaves usually > 2 mm wide, soon arching.
5 Upper culm sheaths reduced, not strongly overlapping, not hiding the raceme sheaths after anthesis; culms mostly < 1 m tall (to 1.4 m tall) ...................................................
6 Many or all peduncles longer than the subtending raceme sheaths at maturity, racemes then fully exserted above the apex of the raceme sheath.

7 Inflorescence branches arching outwards in pronounced curves; racemes (1.2-) 1.5-2 (-2.6) cm long; awn (0.2-) avg. 0.7 (-1.1) cm long; spikelets (4.1-) 4.4-6 (-5.0) mm long; A. brachystachyus
8 Inflorescence branches erect; racemes (2.2-) 2.6-6 (-8.2) cm long; spikelets (4.3-) 4.9-6.5 (-7.5) mm long.
9 Inflorescence units with 2-5 (-7) racemes; raceme sheaths (3.4-) 3.6-3.8 (-4.6) mm long; anthers usually marcescent within spikelets; mature peduncles (4-) 11-35 (-60) mm long (usually some of them > 10 mm long)....................... A. ternarius var. ternarius

10 Postflowering peduncles < 10 mm long.
11 Culm sheaths antorsely scabrous (often hisrate as well); leaf blades usually > 35 cm long.
12 Ligules (0.6-) 0.8 (-1.3) mm wide (usually < 1 mm long), with ciliations 0.2-0.9 mm long; raceme sheaths (1.5-) 2.0-2.5 (-3.0) mm wide (usually < 2.5 mm wide); keels of first glume often scabrous below the middle .............. A. teniuspathus
13 Lower glumes more or less folded; stamens 1; racemes (2.2-) 2.6-4.3 (-5.3) cm long; A. capillipes var. ["dryland variant"]
14 Leaves glabrous.
15 Ligules (0.8-) 1.1 (-1.5) mm long, with ciliations 0.0-0.1 mm long; basal leaves often filiform, < 1.5 mm wide, strongly erect .......................................................... A. perangustatus
16 Lower glumes flat; stamens 3; racemes 3-6 cm long; awn 1-2 cm long; spikelets (4.5-) 5-6.5 (-7.5) mm long
17 Inflorescences oblong to obovalliform; spikelets (3.8-) 4.1-4.4 (-5.0) mm long; anthers usually marcasescent within spikelet; pedicelled yellow-tawny when dry. A. mohrii
18 Inflorescences with 2-5 (-7) racemes; raceme sheaths (1.5-) 2.0-4.8 (-6.3) mm wide; hairs of the rachis internode and pedicel gray to whitish when dry.
19 Postflowering peduncles < 10 mm long.
20 Calyx antorsely scabrous (often hisrate as well); leaf blades usually > 35 cm long.
21 Ligules (0.6-) 0.8 (-1.3) mm wide (usually < 1 mm long), with ciliations 0.2-0.9 mm long; raceme sheaths (1.5-) 2.0-2.5 (-3.0) mm wide (usually < 2.5 mm wide); keels of first glume often scabrous below the middle .............. A. teniuspathus
22 Lower glumes more or less folded; stamens 1; racemes (2.2-) 2.6-4.3 (-5.3) cm long; A. capillipes var. ["wetland variant"]
23 Inflorescences oblong to obovalliform; spikelets (3.8-) 4.1-4.4 (-5.0) mm long; anthers usually marcescent within spikelet; mature peduncles (4-) 11-35 (-60) mm long (usually some of them > 10 mm long)....................... A. glomeratus var. glomeratus
24 Inflorescences (linear to) oblong; spikelets (3.4-) 3.6-3.8 (-4.6) mm long; A. glomeratus var. hisrate
25 Culms sheaths not scabrous (often hisrate); leaf blades < 35 cm long (except in A. glomeratus var. pimpinellis). A. ternarius
26 Leaves glabrous.
27 Ligules (0.8-) 1.1 (-1.5) mm long, with ciliations 0.0-0.1 mm long; basal leaves often filiform, < 1.5 mm wide, strongly erect .......................................................... A. perangustatus
28 Ligules (0.2-) 0.5 (-0.8) mm long, with ciliations 0.2-1.3 mm long; basal leaves usually > 2 mm wide, soon arching.
29 Leaves strongly glaucous (often nearly white with a powdery wax that can be rubbed off on the fingers), glabrous.
30 Leaves green (to somewhat glaucous, but never powdery white), pubescent or glabrous.

31 Inflorescence branches arching outwards in pronounced curves; racemes (1.2-) 1.5-2 (-2.6) cm long; awn (0.2-) avg. 0.7 (-1.1) cm long; spikelets (4.1-) 4.4-6 (-5.0) mm long; A. brachystachyus
Andropogon arctatus Chapman, Florida Bluestem. Pinelands, rarely moist disturbed ground. This curious record from Pamlico County, NC (the specimen at GH, collected by Randolph and Randolph in 1922, annotated as A. arctatus by Campbell) is likely a waif. The species is native to pinelands from n. FL west to w. Panhandle of FL and adjacent s. AL, south to s. FL. [FNA, HC, K, S, Z]

Andropogon brachystachyus Chapman, Shortspike Bluestem. Moist to wet pinelands, natural pond margins, bogs, disturbed roadsides. Se. SC (McMillan et al. 2002) south to FL, south to e. FL Panhandle. A. brachystachyus is considered by some to range north to NC. [FNA, K, Z; = A. brachystachyus – GW, HC, S, orthographic variant]

Andropogon capillipes Nashi var. 1. Wetland White Bluestem. Wet savannas, ditches adjacent to savannas, depressional wetlands. September-October. S. NJ south to s. FL and west to e. TX; also in the Bahamas (Sorrie & LeBlond 1997). Campbell (1983) informally describes two "variants" of this species (which he treats at the varietal level, as A. virginicus var. glaucus). A. capillipes is clearly a species distinct from A. virginicus; moreover, the substantial morphological and ecological differences between Campbell's two "variants" (which he describes as nearly always sharply distinct, even when growing in close proximity) warrant recognition as good species, or at least as varieties. [<A. virginicus – RAB; <A. virginicus var. glaucus Hackel – F, FNA; < A. capillipes – GW, HC, K, S; = A. virginicus var. glaucus "wetlands variant" – Z; = A. virginicus var. dealbatus Mohr ex Hackel]}

Andropogon capillipes Nashi var. 2. Dryland White Bluestem. Dry to mesic pine flatwoods, sandhills, adjacent roadbanks. September-October. Se. NC south to s. FL and west to s. AL. See A. capillipes var. 1 for discussion of these two taxa. The type of A. capillipes (collected by A.H. Curtiss in FL) is of this taxon; Nash (1900) states that it occurs "in dry soil, North Carolina to Florida" and emphasizes that it is "abundantly distinct from A. virginicus, to which it is related." [A. virginicus var. glaucus Hackel – F, FNA; < A. capillipes – GW, HC, S; = A. virginicus var. glaucus "drylands variant" – Z]

Andropogon glomeratus Chapman. Dry to moist forests, woodlands, fields, and disturbed areas. September-October. S. NJ west to s. IN, s. IL, s. MO, south to s. FL and TX. Campbell (1983) argued that the name A. elliottii should be replaced by A.
Andropogon floridanus Scribner, Florida Bluestem. Longleaf pine sandhills. September-October. S. GA west to FL Panhandle, south to s. FL. Reported for e. and s. GA (FNA, Jones & Coile 1988). [= FNA, HC, K, S; not yet keyed]

Andropogon gerardi Vitman, Big Bluestem, Turkeyfoot. In a wide variety of habitats, usually rather dry, such as sandhills, glades, cliffs, and rock outcrops, in the Piedmont in woodlands, former prairie-like sites, woodlands, open forests, and river-scarc grasslands, in the Mountains in glades, riverside scour areas, and rarely in grassy balds, ascending to at least 1600 m over mafic rocks (on Old Field Bald, Watauga and Ashe counties, NC). July-October. QC west to SK, south to FL and AZ. Some favor treating A. hallii Hackel as a subspecies of A. gerardi (Wipff 1996c). I do not agree, but if that course is followed, then our eastern taxon should be known as A. gerardi ssp. gerardi. [= RAB; C, FNA, G, GW, HC, K, W; > A. gerardi var. gerardi – F; > A. provinicialis Lamarck – S].

Andropogon glaucopsis Elliott, Chalky Bluestem. Wet savannas, pine flatwoods, ditches, wet disturbed sites. September-October. Se. VA south to c. peninsular FL and west to e. TX. The extent of the western Gulf Coastal Plain distribution (to the West Gulf Coastal Plain of w. LA and e. TX) is based on specimens (at BRIT) and sight records (B. Sorrie, pers. comm.). Although sometimes included in the past in either A. glomeratus or A. virginicus, this species is distinctive and easily recognized in the field (even from a car at 60 m.p.h.) by the combination of blue color, height of well over 1 m (taller than the other glaucous bluestems), and semi-bushy inflorescence. [= GW, K; < A. virginicus – RAB; = A. virginicus var. glaucopsis (Elliott) A.S. Hitchcock – F, HC; = A. glomeratus var. glaucopsis (Elliott) A.S. Hitchcock – FNA, Z; < A. glomeratus – S]

Andropogon glomeratus (Walter) Britton, Sterns, & Poggenburg var. glomeratus. Swamps, wet savannas, pine flatwoods, wet disturbed sites. September-October. S. MA south to c. peninsular FL and west to s. MS, primarily on the Coastal Plain, but scattered inland to w. PA, WV, c. KY, c. TN and AR. [= FNA, K, Z; < A. virginicus – RAB; = A. virginicus var. abbreviatus (Hackel) Fernald & Griscom – C, F, G, GW, WV; < A. glomeratus – HC, S, W]

Andropogon glomeratus (Walter) Britton, Sterns, & Poggenburg var. hisutor (Hackel) C. Mohr. Wet savannas, pine flatwoods, adjacent ditches, other wet disturbed sites. September-October. E. MD south to c. peninsular FL west to se. LA. This taxon should be recognized at the specific level, but the appropriate combination has not been made. [= FNA, K, Z; < A. virginicus – RAB; ? A. virginicus var. glaucopsis (Elliott) A.S. Hitchcock – G, misapplied; = A. virginicus var. hisutor (Hackel) A.S. Hitchcock; < A. glomeratus – HC, S]

Andropogon longiberbis Hackel, Longbeard Bluestem. Dry sandy soils of sandhills and dunes. September-October. Se. NC south to s. and w. FL, and in the Bahamas. [= FNA, HC, K, S, Z]

Andropogon perangustatus Nash, Narrow-leaved Bluestem. Clay-based Carolina bays and boggy wetlands. August-October. E. VA south to c. peninsular FL, east to e. TX. Growth form, general appearance, and habitat (dense bluish tussocks with very narrow leaves and long ligules, growing in wet areas such as clay-based Carolina bays) make A. perangustatus readily recognizable. [= HC, S; = A. gyran Ashe var. stenophyllus (Hackel) C.S. Campbell – FNA, K, Z; = A. elliottii Chapman var. stenophyllus (Hackel) D.B. Ward]

Andropogon tenuispathes (Nash) Nash. Maritime wet grasslands, brackish marsh edges, moist disturbed sites. September-October. Se. VA and c. OK south to s. FL and w. TX, also south into Central America and the Caribbean. [<A. virginicus – RAB; = A. glomeratus (Walter) Britton, Sterns, & Poggenburg var. pumilus Vasey ex Dewey – FNA, K, Z (“robust variant”); < A. glomeratus – HC, S]

Andropogon ternarius Michaux var. ternarius, Splitbeard Bluestem. Dry to moist soils. September-October. Var. ternarius ranges from DE west to KY and s. MO, south to FL and TX. Var. cabanisseti (Hackel) Fernald & Griscom is endemic in s. and c. peninsular FL. [= FNA, K, Z; < A. ternarius – RAB, C, G, W; > A. ternarius var. ternarius – F; > A. ternarius var. glaucescens (Scribner) Fernald & Griscom – F; = A. ternarius – HC, S]

Andropogon tracyi Nash, Tracy's Bluestem. Dry sandy or clayey soils of sandhills, disturbed sites. September-October. E. NC south to s. FL and west to MS. [= FNA, HC, K, S, Z]

Andropogon virginicus Linnaeus var. virginicus, Old-field Broomstraw, Broomsedge, "Sedge Grass", "Sage Grass". Old fields, roadbanks, disturbed sites. September-October. MA west to MI and e. KA, south to FL and e. TX, and in the Caribbean and Central America. Campbell (1983) recognized 3 "variants" within A. virginicus var. virginicus; the "deceptive variant" he later (1986) described formally as var. decipiens (see above). The "old-field variant" is the common "variant" in our area, occurring abundantly throughout the state. It has green stem internodes and the leaves usually pubescent, at least on the margins near the collar. The "smooth variant" is known only from the Coastal Plain and is apparently rare in our area, known from NC and SC (Berkeley and Marion counties; P. McMillan, pers. comm.). It has glaucous stem internodes and glabrous leaves. It is unclear whether the "smooth variant" warrants taxonomic recognition. [= FNA, K, Z ("oldfield variant" and "smooth variant"); < A. virginicus – RAB, S, W; < A. virginicus var. virginicus – C, WV; < A. virginicus var. virginicus – G, HC (also see var. decipiens); >= A. virginicus var. virginicus – F; >= A. virginicus var. tetrastachyus (Elliot) Hackel – F]

Anthenantia Palisot de Beauvois 1812 (Silkyscape)

1 Leaves weakly if at all geniculate and auriculate at junction of blade and sheath, ascending to erect (lacking a sharp bend outward at the summit of the sheath), medium green; blade (3-) 4-8 (-10) mm wide, the proximal margins glabrous or sometimes ascending pilose-ciliate; pigmentation of leaves, spikelets and their trichomes variously reddish or purplish; fertile lemma red-brown to nearly black, leaf tip with a very short taper to a blunt or rounded apex; lower sheaths crowded and keeled (therefore distichous) ................................................................. A. rufa

Anthenantia rufa (Nuttall) J.A. Schultes, Purple Silkyscape. Wet savannas in the outer Coastal Plain, seepage bogs and moist sandhill-pocosin ecotones in the fall-line sandhills. September-October. Se. NC south to n. FL and west to w. LA. A. rufa inhabits much wetter habitats than the similar A. villosa, and is more typical of the outer Coastal Plain. Plants without culms are reminiscent of the Liliaceae. [= FNA, Y; = Anthaenantia rufa – RAB, GW, HC, K, S, Z, orthographic variant]

Anthenantia villosa (Michaux) Palisot de Beauvois, Green Silkyscape. Sandhills, especially in submesic swales. September-October. Se. NC south to s. FL and west to e. TX. A. villosa is found in drier habitats than A. rufa, most typically in upland swales in the sandhills. Kral (2004) has segregated a new species, A. texana Kral, of the w. Gulf Coastal plain, previously confused with A. villosa. [= Y; < Anthenantia villosa – RAB, HC, K, S, Z, orthographic variant; < Anthaenantia villosa – FNA]

Anthoxanthum Linnaeus 1753 (Vernal Grass)

A genus of about 50 species (as here circumscribed to include Hierochloe), perennials and annuals, of temperate, boreal, and arctic regions. Tucker (1996), Soreng et al. (2003), and Allred & Barkworth in FNA (2007a) all include Hierochloe into a more broadly circumscribed Anthoxanthum. References: Allred & Barkworth in FNA (2007a); Tucker (1996)=Z; Soreng et al. (2003)=Y.

1 Glumes subequal; lowest 2 florets staminate
2 Hairs on the apex of the bisexual florets< 0.5 mm long, or sometimes with some longer hairs and then these distributed only near the midrib ................................................................. A. bistortum

2 Hairs on the apex of the bisexual florets 0.5-1 mm long, evenly distributed ................................................................. A. nitens ssp. nitens
1 Glumes unequal, the lower shorter than the upper; lowest 2 florets sterile.
3 Annual, geniculate; ligules 0.5-2 mm long; glumes glabrous; leaves 1-2 mm wide ................................................................. A. aristatum
3 Perennial, erect; ligules (1-) 2-3 mm long; glumes villous throughout or at least on the keel; leaves 2-3 mm wide ................................................................. A. odoratum

POACEAE

*Anthoxanthum hirtum* (Schrank) Y. Schouten & Veldkamp, Hairy Holygrass, Sweetgrass, Vanilla Grass. Fens, wet calcareous meadows, high elevation pastures and openings, saltmarsh edges (DE). April-August. A circumboreal species and subspecies, widespread in n. Eurasia and n. North America, ranging south in North America to NJ, MD, PA, OH, IN, IL, IA, SD, CO, UT, NM, and CA, with several disjunct occurrences in North Carolina, in Long Hope Valley, Ashe County, the Nantahala River Bogs, Macon County, and Pond Mountain, Ashe County. The report by S ("recorded by Chapman from Statesville, N.C.") can be discounted; the record reflects a collection made in the mountains by Morehead E. Hyams, a botanist and herb trader based in Statesville. Belden et al. (2004) document the first occurrence in Virginia. The sweet, vanilla-like odor of this grass is responsible for various folk uses – by Native Americans for making fragrant baskets, in Scandinavia strewn on church floors on festival days. [= FNA; < *Hierochloe odorata* (Linnaeus) Palisot de Beauvois – C, F, G, HC, WV; > *H. hirta* (Schrank) Borbás ssp. arctica (J. Presl) G. Weimarck – K; < *Torresia odorata* (Linnaeus) A.S. Hitchcock – S; < *Anthoxanthum nitens* (Weber) Y. Schouten & Veldkamp – Z; ? *Anthoxanthum nitens* (Weber) Y. Schouten & Veldkamp ssp. nitens – Y; > *H. odorata var. fragrans* (Wildenow) Richter (the North American plants)]. [revise Y and Z synonymy]

*Anthoxanthum nitens* (Weber) Y. Schouten & Veldkamp ssp. nitens, Vanilla Sweetgrass. Wet meadows, marshes, roadsides; sometimes interpreted as native in n.e. North America and sometimes as an introduction from Europe. NL (Labrador) south to DE; n. Europe. [= FNA; < *Hierochloe odorata* (Linnaeus) Palisot de Beauvois – C, F, G, HC; > H. odorata var. fragrans (Wildenow) Richter (the North American plants)] *Anthoxanthum odoratum* is a familiar grass of suburban areas and roadsides, and its pollen is known as a major cause of spring hay fever. From a letter from Charles Darwin to J.D. Hooker, in June 1855: "Have just made out my first grass, hurrah! hurrah! I must confess that fortune favours the bold, for, as good luck would have it, it was the easy A. odoratum. I have never expected to make out a grass in all my life, so hurrah! It has done my stomach surprising good..." [= RAB, C, F, FNA, G, HC, S, W, WV, Z; = A. odoratum ssp. odoratum – K]

*Apera* Adanson 1763 (Windgrass)

*Aristida* Linnaeus 1753 (Three-awn Grass)

Identification notes: The awns must be dry and relatively mature to assume their characteristic positions (immature awns and moist mature awns are erect and parallel). It is sometimes useful to try a collection unpreserved. Beware, however, that drying followed by dispersal can take place very quickly under the right conditions (such as the dashboard of a hot car)!

1 Plant a perennial, forming dense tussocks, the leaves primarily basal, usually very numerous, mostly > 3 dm long, 0.5-1.5 mm wide, almost always tightly involute; flowering only in the growing season following fire.
2 Base of blade and collar (and often the upper sheath) with conspicuous tuft or bearding of woolly to villous pubescence (sometimes deciduous on foliage more than a year old); leaves usually glabrous above the basal 2 cm of the blade; [of s. SC south] ..........A. beyrichiana
3 Base of blade, collar, and upper sheath lacking a conspicuous tuft of woolly to villous pubescence; leaves with 2 lines of villous pubescence on either side of the midrib on the lower surface extending nearly or entirely the length of the blade (sometimes deciduous on foliage more than a year old); [of n. SC and NC] ...............................................................A. stricta
4 Central awn of the lemma (8-) 12-65 (-70) mm long, the lateral awns 1-4 mm long (or even lacking) ............................................A. ramosissima
5 Central awn of the lemma (9-) 12-25 (-30) mm long, the lateral awns 1-4 mm long (or even lacking) .............................................A. oligantha
6 Lateral awns 5-13 mm long, spreading .................................................A. basiramea
7 Lateral awns 1-4 mm long, erect ..............................................................A. curtissii
8 Lateral awns < ½ as long as the central aown.

9 Inflorescences 15-25 cm wide; loosely cespitose perennial, unbranched upwards .................................................. A. patula

9 Inflorescences 1-6 cm wide; annuals, much branched above the base.

10 Awns flattened at the base .................................................. A. adscensionis

10 Awns terete at the base.

11 Lemmas 8-22 mm long; central aown curved ca. 180 degrees at the base .................................................. A. ramosissima

11 Lemmas 2.5-10 mm long; central aown curved ca. 90 degrees at the base.

12 Central aown (8-) 12-27 mm long; lateral awns (1-) 6-18 mm long .................. A. longespica var. geniculata

12 Central aown mostly 1-10 (-14) mm long; lateral awns 0-5 (-8) mm long .......... A. longespica var. longespica

8 Lateral awns > ½ as long as the central aown.

13 Sheaths lanose or floccose (the hairs kinked and intertwined); nodes of the panicle axis with tufts of lanose or floccose hairs..........

13 Sheaths glabrous to pilose (the hairs straight and usually appressed, not intertwined); nodes of the panicle axis glabrous or pilose.

14 Awn column (the connivent awns twisted together) or lemma beak (slender, narrowed, and twisted portion of lemma body below the awns) 7-30 mm long; lemma body (including the beak, if present) separated from the awns (or aown column) by an articulation zone, the awns (or aown column) disarticulating at maturity from the lemma.

15 Panicle spiciform, broadest near the middle, dense, the spikelets overlapping strongly; awns 10(-20)-30 mm long, borne at the summit of a twisted lemma beak 7-30 mm long; culms simple or with very few branches; plants perennial .................. A. speciformis

15 Panicle almost corymbiform, broadest above the middle, open, the spikelets overlapping only slightly; awns 30-40 mm long, not including the 8-15 mm long column formed by the twisting together of the 3 aown bases; culms often much-branched; plants annual ................................................. A. tuberculosa

16 Main lower branches of the panicle divergent from the culm and with pulvini .................. A. purpurea var. longiseta

16 Main lower branches of the panicle (or pedicels in racemose species) ascending to appressed and lacking pulvini.

17 Plants with thick rhizomes; basal sheaths shedding into persistent fibers; [of wet pine flatwoods of FL] A. rhizomorpha

17 Plants tufted, not hizomatos; basal sheaths not shedding into persistent fibers; [collectively of various habitats].

18 Spikelets borne singly at each node of the main axis, the inflorescence thus a spike or raceme .................. A. mohrii

18 Spikelets 2 or more per node of the main axis at most nodes (a few nodes may have single spikelets), often with side branches present as well, the inflorescence thus a panicle (less commonly a raceme).

19 First glume 1/3-1/2 the length of the second glume .................................................. A. gyranis

19 First glume > 1/3 the length of the second glume.

20 Central aown 15-40 mm long; first glume prominently 2-keeled, (8-) 9-14 mm long when mature .................. A. palustris

20 Central aown 8-25 mm long; first glume either 1-keeled and 6-14 mm long, or weakly 2-keeled and 5.5-9 (-10) mm long when mature.

21 Central aown about 2× as thick as the lateral aowns, divergent to reflexed; first glume 1-keeled or weakly 2-

keeled; [moist to wet habitats].

22 Basal internode of the culm 0.3-0.6 mm wide; most nodes of the inflorescence with 1-2 spikelets; all aowns spreading, the central spirally twisted basally and often contorted by as much as 180 degrees (best seen in fresh material); central aown 15-20 mm long, lateral aowns 11-16 mm long, the ratio of the lateral:central aown length 0.69-0.80; lemma callus beard 0.6-1.0 mm long .................................................. A. condensata

22 Basal internode of the culm 0.7-1.2 mm wide; most nodes of the inflorescence with 3 or more spikelets;

central aown spreading to slightly deflexed, not spirally twisted basally, the lateral aowns ascending to erect (best seen in fresh material); central aown 13-22 mm long, lateral aowns 8-15 mm long, the ratio of the lateral:central aown length 0.55-0.69; lemma callus beard 0.2-0.6 mm long .................. A. virgata

21 Central aown < 1.5× as thick as the lateral aowns, erect to divergent; first glume 1-keeled (rarely weakly 2-

keeled); [dry habitats].

23 Culms mostly > 10 dm tall and 3-6 mm in diameter near the base; awns 8-15 mm long; panicle branches >

4 cm long; callus ca. 1.0 mm long .................................................. A. condensata

23 Culms 5-8 (-10) dm tall and 1-4 mm in diameter near the base; awns 12-25 mm long; panicle branches 1-

4 cm long; callus 0.4-0.8 mm long.

24 First glume 1-4 mm longer than the second glume (rarely about equal to it); awns 15-25 mm long, straight or slightly contorted at the base; leaf blades 1-3 mm wide, usually curling .......... A. purpureascens

24 First glume shorter than or about equal to the second glume; awns 12-18 mm long, spirally contorted at the base; leaf blades about 1 mm wide, usually not curling .................. A. tenutipica

* Aristida adscensionis Linnaeus, Sixweeks Three-awn. [habitat in our area unknown]; native of w. United States. Reported for SC (FNA). [further investigate] [= F, FNA, G, HC, K]

* Aristida basiramea Engelmann ex Vasey, Forktip Three-awn. Sandy soils; probably introduced, native of mw. United States. ME and ON south to SC (FNA), FL (Wunderlin & Hansen 2003), AL, TX, and CO (FNA). [= F, FNA, G, HC, K; = A. basiramea var. basiramea – C] [FL]

Aristida curtissii (A. Gray ex S. Watson & Coulter) Nash, Curtiss' Three-awn. Roadside, disturbed areas, bare eroding soil. August-October. ME west to WY, south to n. FL, AR, OK, and CO, perhaps largely or entirely adventive in our area. See Z for a discussion of the rationale for reducing A. curtissii to a variety of A. dichotoma. C reduces it to a variety of the more western A. basiramea Engelmann ex Vasey. For now, and for simplicity, I prefer to retain the two as species. [= RAB, G, HC, S =

Aristida gyrans Chapman, Corkscrew Three-awn. Dry pinelands. E. GA and w. Panhandle FL, south to s. FL. In Bryan, Long, and Montgomery counties in e. GA (Sorrie 1998b), and in w. GA (J. Allison, pers. comm.). [= FNA, HC, K, S]

Aristida oligantha Michaux, Prairie Three-awn. Roadside, fields, disturbed areas. August-October. VT west to SD, south to FL and TX, scattered elsewhere as a weed. [= RAB, C, F, FNA, G, HC, K, S, W, WV, Z]

Aristida patula Chapman ex Nash, Tall Three-awn. Dry to moist sandy soils of pond margins, pineyards, dunes. Endemic to FL Panhandle (Dixie, Franklin, Gadsden, Leon, Taylor, and Wakulla counties) (Wunderlin & Hansen 2006) and peninsula. [= FNA, GW, HC, K, S]

Aristida purpurascens Poiret, Arrowfeather. Dry habitats, especially in dry sandy soils. August-October. MA west to WI and KS, south to FL and TX. In the Sandhills occurring in two forms, one green, the other strongly glaucous-blue. [= RAB, C, G, HC, S, W, WV; > A. purpurascens var. purpurascens – F; > A. purpurascens var. minor Vasey – F; = A. purpurascens var. purpurascens – FNA, K, Z]

* Aristida purpurea Nuttall var. longiseta (Steudel) Vasey, Red Three-awn. Disturbed areas; adventive from further west. August-October. Also reported from NC, but the collection is from a Soil Conservation Service test nursery, and there is no evidence of naturalization. [= C, FNA, K, Z; > A. longiseta var. robusta Merrill – F; = A. longiseta Steudel – G, HC]

Aristida rhizomorpha Swallen, Florida Three-awn. Wet pine flatwoods. FL endemic, north to Baker, Duval, and Nassau counties. [= FNA, HC, K]
**Aristida simpliciflora** Chapman, Southern Three-awn, Chapman's Three-awn. Wet pine savannas. Sw. GA west through the FL Panhandle and c. AL to s. MS (Sorrie & Leonard 1999), and south into c. peninsular FL; also in se. NC, where apparently disjunct (it should be searched for in SC). *A. simpliciflora* was believed to be a Gulf Coastal Plain endemic until found by R. LeBlond in 1999 in wet savannas in se. NC (Green Swamp savannas, Brunswick County; Old Dock Savanna, Columbus County; and The Neck Savanna, Pender County). It is reported for sw. GA (Jones & Coile 1988, Kartesz 1999). Harper also reports it for c. GA. [= FNA, HC, K, S, Z]

**Aristida spiciformis** Elliott, Bottlebrush Three-awn, Spike Three-awn. Wet pine savannas and seepage areas. August-October. E. SC (McMillan et al. 2002) south to FL, west to MS. Allred (1986) also reports this species from NC, but the documentation is unknown to me. [= RAB, FNA, GW, HC, K, S, Z]

**Aristida stricta** Michaux, Carolina Wiregrass, Pineland Three-awn. Coastal Plain pinelands of nearly all sorts, ranging from the driest white-sand sandhills to seasonally saturated pine savannas dominated by a mixture of longleaf pine and pond pine, largely or entirely replaced in the wettest savannas by *Sporobolus teretifolius*, *Sporobolus pinetorum*, *Muhlenbergia expansa*, *Ctenium aromaticum*, and *Calamovilfa breviflora*; also in Piedmont areas adjacent to the Coastal Plain and formerly supporting fire-maintained longleaf pine woodlands. September-November. Ne. NC (south of Albemarle Sound and the Roanoke River), south to se. SC (Lee and Kershaw counties). *A. stricta* was the keystone species of much of the upland Coastal Plain of the Carolinas. Its flammable foliage facilitated the spread of lightning-set fires that maintained the biologically rich pine savanna, sandhill, and pine flatwood ecosystems once widespread in our area. Though still locally common in parts of the Sandhill region and in portions of Brunswick, Pender, Onslow, and Carteret counties, NC, *A. stricta* is much rarer than formerly. The conversion of vast areas of former pinelands to agriculture, pine tree farms, and developed areas has taken its toll over the years. In the twentieth century, suppression of fire has also led to the destruction of *A. stricta*. More recently, pine-straw raking is leading to the serious decline of *A. stricta* in its few remaining strongholds on public lands. *A. stricta* has little tolerance for ground disturbance. See Peet (1993) for discussion of the taxonomy and ecology of this species. Ward (2001) proposes varietal status for *A. stricta* and *A. beyrichiana*. [= K, Y; < *A. stricta* – RAB, FNA, GW, HC, K, S, V, Z (also see *A. beyrichiana*); = *A. stricta* var. stricta – X]

**Aristida tenuispica** A.S. Hitchcock, Southern Arrowfeather. Sandy habitats. August-October. NC south to FL and west to MS. [= HC, S; = *A. purpurascens* Poiret var. tenuispica (A.S. Hitchcock) Allred – FNA, K, Z]

**Aristida tuberculosa** Nuttall, Seabeach Needlegrass. Sandhills, coastal dunes (in VA), other dry, sandy habitats such as sandy roadsides. August-October. Se. NH south to NJ and disjunct in e. VA in the outer Coastal Plain; from sc. NC south to Panhandle FL and west to s. MS (Sorrie & Leonard 1999), mostly in the inner Coastal Plain; and also near the Great Lakes in sw. MI, n. IN, n. IL, s. WI, se. MN, and e. IA. The curious trimodal distribution is unexplained. [= RAB, C, F, FNA, G, HC, K, S, Z]

**Arrhenatherum virgata** Trinius. Moist to wet savannas, mountain bogs (Henderson Co., NC), other moist habitats. August-October. S. NJ south to FL, west to TX, primarily on the Coastal Plain. [= RAB, C, F, G, GW, HC, S; = *A. purpurascens* Poiret var. virgata (Trinius) Allred – FNA, K, Z]

---

Allred (1986) reports the collection of several additional non-native species from our area, including *A. divaricata* Willdenow from sw. United States (from a Soil Conservation Service test nursery in Chapel Hill, NC) and uncertainly identified material of an Australian species (from a wool-combing mill at Jamestown, Berkeley County, SC). There is no evidence that either are naturalized.

---

**Arrhenatherum** Palisot de Beauvois 1812 (False Oatgrass)

A genus of about 6 species, perennials, of the Mediterranean region and e. Asia. References: Hatch in FNA (2007a); Tucker (1996)–Z.

1 Base of culm consisting of a series of adjacent (moniliform) corms 5-10 mm in diameter ............................................ *A. elatius* var. bulbosum

1 Base of culm not swollen or cormose, 2-4 mm thick ............................................................................................................ *A. elatius* var. elatius

*Arrhenatherum elatius* (Linnaeus) J. & K. Presl var. bulbosum (Willdenow) Spennier, Tuber Oatgrass, Onion Couch. Habitat in our area not known; native of Europe. This variety was apparently cultivated for the edible tubers in Bronze Age
POACEAE

Arthraxon Palisot de Beauvois 1812 (Basket Grass)

Identification notes: Sometimes confused (especially before flowering) with *Microstegium*, but *Arthraxon* has distinctly cordate-clasping leaves, which *Microstegium* lacks. Also vegetatively similar to *Oplismenus.*

Arundinaria Michaux 1803 (Cane)

A genus of 3 species, woody grasses (bamboos), native of se. United States. *Arundinaria* was much reduced by the foraging of free-range livestock in the eighteenth and early nineteenth centuries and by fire suppression in the late nineteenth century and throughout the twentieth century. "Canebrakes," large areas dominated by cane, were described in many historical accounts and as long ago as 1900 by R.M. Harper, W.C. Coker, W.W. Ashe, and C.D. Beadle, this distinctive plant of the Appalachians has evergreen. [= FNA, Q, V; sometimes head-high) on mountain slopes south of Asheville are autumn-deciduous, whereas both our other species are

* Arundinaria appalachiana* Tripplett, Weakley, & L.G. Clark, Hill Cane. Dry to moist forests on slopes. Noted as distinctive as long ago as 1900 by R.M. Harper, W.C. Coker, W.W. Ashe, and C.D. Beadle, this distinctive plant of the Appalachians has only recently been described as a species (Tripplett, Weakley & Clark 2006). The short plants (often only knee-high, though sometimes head-high) on mountain slopes south of Asheville are autumn-deciduous, whereas both our other species are evergreen. [= FNA, Q, V; < A. gigantea (Walter) Walter – RAB, GW; < A. gigantea ssp. tecta (Walter) McClure – K, X, Z; < A. tecta – HC, S, Y; = A. tecta var. decidual Beadle in L.H. Bailey]

* Arundinaria gigantea* (Walter) Muhlenberg, Giant Cane, River Cane. Swamps, floodplain. April-July. S. OH south to FL and e. TX. There has been much more interest in the recognition of one, two, or several taxa of cane in the Southeastern United States. This species reaches heights of 6-7 (-10) m and is supposed to flower only once every 40-50 years. *A. macrosperma* Michaux is controversial, sometimes considered to be a synonym of *A. gigantea* or to represent hybridization or introgression between *A. gigantea* and *A. tecta.* [= F, FNA, HC, Q, S, WV, Y; < A. gigantea – RAB, C, GW (also see A. tecta); = A. gigantea ssp. gigantea – K, Z; > A. gigantea ssp. gigantea – X; > A. gigantea (Walter) Muhlenberg ssp. macrosperma (Michaux) McClure – X; = A. macrosperma Michaux – V]

* Arundinaria tecta* (Walter) Muhlenberg, Switch Cane, Small Cane. Savannas, pocosins, canebrakes, generally (but not solely) in wetlands. April-July. Primarily a Southeastern Coastal Plain endemic: e. MD to FL and s. AL. *A. tecta* is a smaller plant than *A. gigantea* (normally 1-2 m tall, but reaching heights of up to 4 m where fire-suppressed), and flowers more frequently, supposedly every 3-4 years (Tucker 1988), probably actually in response to fire. [= FNA, Q; < A. gigantea (Walter) Muhlenberg – RAB, C, GW; < A. tecta – F, HC, S, Y; < A. gigantea ssp. tecta (Walter) McClure – K, X, Z; = A. gigantea (Walter) Muhlenberg – V]

SE

**Arundo** Linnaeus 1753 (Giant Reed)

* **Arundo donax** Linnaeus, Giant Reed. Disturbed areas; native of the Old World. September-October. Horticultural forms with leaves transversely striped white and green have been treated as var. versicolor, but are better considered as only a form or cultivar. [= RAB, F, FNA, K, S; > A. donax var. donax – HC; > A. donax var. versicolor (P. Miller) Stokes – HC]

**Avena** Linnaeus 1753 (Oats)

1 Florets disarticulating from the glumes at maturity (the glumes remaining attached to the plant); lemmas pubescent with brown hairs; lemmas with long bent awns; callus bearded with hairs up to ¼ as long as the lemmas.............................**A. fatua**

1 Florets not disarticulating from the glumes at maturity; lemmas glabrous or scabrous (rarely sparsely strigose); lemmas unawned or with relatively straight awns; callus glabrous ......................................................................................................................................................**A. sativa**

* **Avena fatua** Linnaeus, Wild Oats. Disturbed areas; native of Europe and c. Asia. {needs herbarium checks; no records shown on VA Atlas}. [= C, F, FNA, G, HC, K]

* **Avena sativa** Linnaeus, Oats. Fields and disturbed areas, commonly cultivated; native of Middle East. May-June. An important crop, but apparently only a weed until transported from the Middle East to the moister central Europe, where cultivated beginning about 3000 BP (Hancock 2004). [= RAB, FNA, G, HC, K, S, W, Z; > A. sativa var. orientalis (Schreber) Alefeld – F; > A. sativa var. sativa – F]

**Avenella** Koch ex Steudel 1840 (Hairgrass)

**Avenella flexuosa** (Linnaeus) Drejer, Common Hairgrass, Wavy Hairgrass. Grassy balds, high elevation rocky summits, rocky or sandy woodlands. April-August. Circumboreal, ranging south in North America to n. GA, OH, WI, and MN; disjunct in AR and OK, and in Mexico. [= Deschampsia flexuosa – RAB, C, FNA, G, HC, W, WV, Z; > D. flexuosa (Linnaeus) Trinius var. flexuosa – F, K; = Aira flexuosa Linnaeus – S]

**Avenula** (Dumortier) Dumortier 1868

* **Avenula pubescens** (Hudson) Dumortier, Downy Oatgrass. Disturbed areas; native of Eurasia. [> Avenula pubescens ssp. pubescens – FNA; > Avenula pubescens ssp. laevigata (Schur) Holub – FNA; = Helictotrichon pubescens (Hudson) Bess. ex Pilger – C, HC, K; = Avena pubescens Hudson – F, G]

**Axonopus** Palisot de Beauvois 1812 (Carpet Grass)

A genus of ca. 100 species, primarily tropical and subtropical. Phylogenetic studies suggest that Axonopus may be included in Faspalum. References: Barkworth in FNA (2003a).

1 Spikelets 4-6 mm long ..........................................................**A. furcatus**

1 Spikelets 1.5-2.8 mm long.

2 Spikelets 1.5-2.2 mm long; leaf blades mostly 8-10 mm wide ..........................................................**A. compressus**

2 Spikelets 2.2-2.8 mm long; leaf blades mostly 2-4 (-6) mm wide ..........................................................**A. fissifolius**
**Axonopus compressus** (Swaert) Palisot de Beauvois, Southern Carpet Grass. Lawns; probably introduced. Reported for VA by HC. Sometimes used as a lawn grass in the deep South. [= FNA, HC, K, S; *Paspalum*

**Axonopus fissifolius** (Raddi) Kuhl., Common Carpet Grass. Sandy forests, roadsides, lawns. June-October. VA south to FL, west to TX and OK, and extending into tropical America. [= FNA, K; ? A. affinis Chase – RAB, GW, HC, W; = *Paspalum fissifolium* Raddi

**Axonopus furcatus** (Flügge) A.S. Hitchcock, Big Carpetgrass. Sandy forests, bottomlands, roadsides, lawns. July-October. Se. VA south to FL, west to TX and AR. [= RAB, C, F, FNA, G, GW, HC, K, S; = *Paspalum furcatum* Flügge]

**Bambusa** Schreiber 1789 (Bamboo)

A genus of ca. 100 species, trees and shrubs, native to tropical and subtropical Asia. References: Stapleton in FNA (2007a).

1 Culm leaves with auricles absent or very small and rounded; basal internodes not swollen, not much longer than those above ....... *B. multiplex*
2 Culm leaves with auricles well-developed, to 5 cm long and 1.5 cm wide; basal internodes swollen, much shorter than the internodes above .............. *B. vulgaris*

* **Bambusa multiplex** (Loureiro) Schreber ex J.C. Wendland, Common Bamboo. Disturbed areas; native of se. Asia. Reported as naturalized or persistent in portions of the southeastern United States, including GA, FL Panhandle, and FL peninsula. [= FNA, HC]

* **Bambusa vulgaris** Schrad ex J.C. Wendland, Common Bamboo. Disturbed areas; native of tropical Asia. Reported for SC (Kartesz 1999). {investigate} [= FNA, HC, K]

**Bothriochloa** Kunze 1891 (Beardgrass, Cane Bluestem)

1 Sessile spikelets 4.5-8.5 mm long
2 Rachises 5-10 cm long, with many branches ................................................................. *B. barbinodis*
3 Sessile spikelets 3-4.5 mm long.
4 Pedicellate spikelets much shorter than the sessile spikelets.
5 Panicles reddish when mature; hairs below the sessile spikelets sparse and ca. ¼ as long as the spikelets, not obscuring the spikelets ...... ............................................................. *B. bladhii*
6 Panicles silvery-white or tannish when mature, hairs below the sessile spikelets dense and > ½ as long as the spikelets, somewhat obscuring the spikelets
7 Rachises shorter than the branches ............................................................................ *B. laguroides* ssp. *torreyana*
8 Rachises longer than the branches ............................................................................ *B. longipaniculata*
9 Panicles 4-12 (-14) cm long; sessile spikelets 4-6× as long as thick; leaves evenly distributed on the culm; culm usually < 2 mm in diameter ............................................................. *B. pertusa*
10 Panicles 9-20 cm long; sessile spikelets 3-4× as long as thick; leaves basally disposed; culm usually < 2 mm in diameter .............. *B. ischaemum* var. *songarica*

* **Bothriochloa bladhii** (Retzius) S.T. Blake, Australian Bluestem. Disturbed areas; native of subtropical Asia and Africa. Reported from e. TN (according to specimen cited by FNA and Z) and Alachua County, FL (immediately south of our area). [= FNA, K, WH, Z] {synonymy incomplete}

**Bothriochloa longipaniculata** (Gould) Allred & Gould, Longspike Silver Bluestem. Disturbed areas; native of LA to TX, south to Mexico and Panama. [= FNA, K]

**Bothriochloa pertusa** (Linnaeus) A. Camus, Pitted Bluestem. Disturbed areas; native of Eurasia. Introduced at scattered sites in c. North America, including FL, LA, MD, and MS (FNA, Kartesz 1999). [= FNA, K, Y; = *Andropogon pertusus* (Linnaeus) Willdenow – HC] [FL] [synonymy incomplete]

1 All spikelets unisexual, plants usually dioecious; [introduced species].................................................................**B. dactyloides**

1 Lowest floret in each spikelet bisexual, the upper staminate or sterile; [introduced or native species].

2 Panicle branches deciduous; disarticulation occurring at the base of the branch (the branch therefore falling whole); spikelets 2-3 per branch, pressed to the branch; [native species of limestone habitats, also with introduced populations]; [subgenus **Bothiocolax**] .................................................................**B. curtipendula** var. *curtipendula*

2 Panicle branches persistent; disarticulation occurring above the glumes (the individual florets therefore falling); spikelets >6 per branch, pectinately disposed; [rare introductions]; [subgenus **Chondrosum**] .................................................................**B. gracilis**

3 Panicle branches terminating in a spikelet............................................................................................................**B. hirsuta** var. *hirsuta*

**Bothriochloa curtipendula** (Michaux) Torrey var. *curtipendula*, Side-oats Grama. Dry rocky slopes and bluffs over calcareous rocks (such as limestone) or ultramafic rocks (such as serpentinite), limestone glades. July-September. S. CT west to MT, south to VA, e. TN, n. GA, AL, Panhandle FL (Gadsden County), TX, AZ, and CA; also in Central and South America. The older literature refers to *B. curtipendula* as introduced in SC, but the single specimen documenting its occurrence appears to be from experimental plantings at Clemson University; there is apparently no evidence of its establishment. *B. curtipendula* occurs on serpentine in the Piedmont of GA (Allison, pers. comm.). Var. *caespitosa* Gould & Kapadia is cespitose rather than rhizomatous and occurs in sw. United States. [= C, FNA, K, Y; < *B. curtipendula* – RAB, F, G, HC, S, W, WV]

**Brachyelytrum** Palisot de Beauvois 1812 (Shorthusk) The only other species of the genus is *B. japonicum* Hackel, of s. Japan, Korea, and ec. China (Saarela et al. 2003, Tucker 1988). References: Stephenson & Saarela in FNA (2007a); Saarela et al. (2003)–Z; Tucker (1988)–Y; Stephenson (1971); Voss (1972); Campbell, Garwood, & Specht (1986). Key based in part on Saarela et al. (2003).

1 Lemmas hirsutulous or minutely scabrous, the longest hairs (0.06-) 0.08-0.14 (0.2) mm long (not evident at 10×); lemma (0.7-) 0.8-1.2 (-1.4) mm wide; widest leaf blade (8-) 10-14 (-16) mm wide; second glume (0.6-) avg. 1.2 (-3.0) mm long; [Mountains].................................**B. aristosum**

1 Lemmas hirsute with hairs (0.2-) 0.4-0.8 (0.9) mm long (easily seen at 10×); lemma (0.8-) 1.1-1.5 (-1.8) mm wide; widest leaf blade (9-) 11-17 (-20) mm wide; second glume (0.2-) avg. 2.2 (7.0) mm long; [widely distributed in our area].................................**B. erectum**

**Brachyelytrum aristosum** (Michaux) Trelease in Branner & Coville, Northern Shorthusk. Moist forests, mostly at moderate to high elevations, such as northern hardwoods and spruce-fir. July-August. NL (Newfoundland), QC, ON, and MN south to n.

12 First glume 7-14 mm long; second glume 9-17 mm long; lemma awns 18-30 mm long.  
12 First glume 5-7 mm long; second glume 8-11 mm long; lemma awn (7-) 10-17 mm long .................................................. *Bromus sterilis*
9 Longer lemma awns 1-6 (-8) mm long; plants perennial; [native and introduced species, collectively of disturbed and natural habitats]; [section *Bromopsis*].
13 Plants with creeping rhizomes, forming clonal colonies; both surfaces of leaves glabrous or glabrescent.............................. *Bromus inermis*
13 Plants not strongly rhizomatous, the stems solitary or tufted; surfaces of leaf blades usually pubescent (sometimes sparsely so).
14 Pedicels erect or ascending, mostly shorter than the spikelet; leaves 2-3 mm wide; [introduced, of disturbed habitats].......................... *Bromus erectus*
14 Pedicels ascending at first, later arching-drooping, mostly longer than the spikelet; leaves 4-15 mm wide; [native, mostly of forests].
15 Lemmas glabrous (or very pungently pubescent) on the back, hairy along the lower margins with long hairs.............................. *Bromus ciliatus*
15 Lemmas uniformly hairy over the entire back-surface (or rarely entirely glabrous).
16 Culms with 10-20 leaves, often weakly leaning or reclining; junction of sheaths and base of leaf blades with 2 well-developed flanges prolonged into auricles or divergent spurs; second glume primarily 5-nerved; flowering late, with anthesis August-October .......................................................................................................................... *Bromus latiglumis*
16 Culms with 6-10 leaves, erect; junction of sheaths and base of leaf blades lacking flanges or auricles; second glume primarily 3-nerved; flowering earlier, anthesis from May-August.
17 Underleaf surfaces with a conspicuous satiny sheen (when fresh); summit of sheath opposite the ligule with a conspicuous tuft of hairs.................................................................................................................. *Bromus nottowayanus*
17 Underleaf surfaces lacking a conspicuous satiny sheen; summit of sheath opposite the ligule lacking a conspicuous tuft of hairs.................................................................................................................. *Bromus pubescens*

* Bromus arvensis* Linnaeus. Disturbed areas; native of Europe. Reported as introduced for nc. GA (Jones & Coile 1988), for VA, MD, PA, and NJ (Kartesz 1999), and for KY (Campbell 2007). [= C, F, FNA, HC, K] [not yet keyed]

* Bromus carinatus* Hooker & Arnott var. *marginatus* (Nees) Barkworth & Anderton. Mountain Brome. Reported by Jones & Coile (1988) for nc. GA and by FNA for MS. [= FNA; < *B. catharticus* – C; = *B. marginatus* Nees ex Steudel – K] [not yet keyed]

* Bromus ciliatus* Linnaeus. Fringed Brome. Seepage areas, edges of fens, moist areas near high elevation creeks, grassy balds, high elevation woodlands, mostly over mafic or calcareous rocks. July-August. Widespread in n. North America: NL (Labrador) to AK, south in the east to PA, and in the mountains to NC. Known in NC only from Bluff Mountain and Long Hope Valley, Ashe and Watauga counties, and Roan Mountain, Mitchell County. [= RAB, C, FNA, G, HC, S, W, WV, X, Y; > *Bromus ciliatus* var. *ciliatus* – F, K; = *Bromopsis ciliata* (Linnaeus) Holub]

* Bromus commutatus* Schrader. Hairy Chess, Meadow Brome. Disturbed areas; native of Europe. May-June. The relationship and relative distribution of this species and *Bromus racemosus* is poorly known for our area. See *Bromus racemosus* for further comments. [= C, F, FNA, HC, K, S, WV, X, Y; < *Bromus commutatus* – RAB (also see *Bromus racemosus*); < *Bromus racemosus* – G, W]

* Bromus erectus* Hudson. Short-branching Brome. Disturbed areas; native of Europe. [= C, F, FNA, G, HC, K, S, WV, X; = *Bromopsis erecta* (Hudson) Fourrier]

**Bromus kalmii** A. Gray, Kalm Brome, Canada Brome. Forests and woodlands, shale woodlands and barrens, grassy ridgeway oak forests. ME west to SD, south to MD, VA, and IA. Distinctive for its few leaves (usually 3-4) clustered near the base, the spikelets large and approximate to one another in a narrow, nodding panicle. [= C, F, FNA, G, HC, K, X]

**Bromus latiglumis** (Shear) A.S. Hitchcock, Riverbank Brome, Auricled Brome, Hairy Woodbrome, Flanged Brome. Alluvial soils along rivers. August-October. Widespread in e. North America, from ME to MT, south to NC and OK. Flowering many weeks later than co-occurring *B. pubescens*. In NC apparently only along large rivers flowing west through the Appalachians into the Mississippi River drainage, notably the New and the French Broad. [= F, FNA, G, HC, K, WV, X; < *Bromus purgans* Linnaeus – RAB; = *Bromus altissimus* Pursh – C; < *Bromus latiglumis* – Y (also see *Bromus nottowayanus*)]

**Bromus nottowayanus** Fernald, Satin Brome, Nottoway River Brome, Virginia Brome. Moist forests, especially along small stream bottoms. June-August. The range of this species is poorly known, owing to confusion between it, *B. pubescens* and *B. latiglumis*. It is apparently known from MD, VA, and NC, west to TN, IL, IN, MO, and AR. McKenzie & Ladd (1995) report on the biology and taxonomy of this species. [= C, F, FNA, HC, K, X; < *Bromus purgans* Linnaeus – RAB; < *Bromus latiglumis* – Y; = *Bromopsis nottowayana* (Fernald) Holub]

**Bromus pubescens** Muhlenberg ex Willdenow, Common Eastern Brome, Canada Brome. Mesic forests, generally on rocky slopes. May-August. Widespread in e. North America: s. ON west to AB, south to FL and AZ. [= C, FNA, K, W, X, Y; < *Bromus purgans* Linnaeus – RAB, S, misapplied (also see *Bromus latiglumis* and *Bromus nottowayanus*); = *Bromus purgans* Linnaeus – F, G, WV, misapplied; > *Bromus purgans* var. *purgans* – HC; > *Bromus purgans* var. *laeviglumis* (Scribner ex Shear) Swallen – HC; = *Bromus laeviglumis* – S, misapplied (?); = *Bromopsis pubescens* (Muhlenberg ex Willdenow) Holub]

**Bromus racemosus** Linnaeus, Smooth Brome. Disturbed areas; native of Europe. May-June. The relative distribution, abundance, and habitats in our area of this species and *B. commutatus* poorly understood. Additional characters are as follows (from Stace 2010): lemmas 7-9 mm long (vs. 7.5-11 mm long in *B. commutatus*), anthers 1.5-3.5 mm long (vs. 1.3-2.5 mm long), spikelets 10-18 mm long (vs. 15-30 mm long), all panicle branches <4 cm long (vs. some panicle branches > 4 cm long). [= C, F, FNA, HC, K, X; < *Bromus commutatus* – RAB; < *Bromus racemosus* – G, W (also see *Bromus commutatus*) [not yet mapped]

**Bromus rubens** Linnaeus, Foxtail Chess, Red Brome. Waste areas near wool-combing plants, other disturbed areas; native of Mediterranean Europe. The SC occurrences come from areas around wool-combing plants, and were likely introduced on wool from w. United States, where this European species is well-established. Reported introduced in VA and MD (Kartesz 1999) as *B. madritensis*. [= C, FNA, G, X; ? *Bromus madritensis* Linnaeus – F, misapplied; < *B. rubens* – K; < *B. madritensis* Linnaeus – K; = *Bromus madritensis* sp. *rubens* (Linnaeus) Husnnot]

**Bromus scoparius** Linnaeus, Broom Brome. Disturbed areas; native of s. Europe. [= FNA, K] [add to synonymy]

**Bromus squarrosus** Linnaeus, Squarrose Brome. Reported for KY and NJ (Kartesz 1999). Native of Eurasia. [= FNA, K] [not yet keyed]

POACEAE

Calamagrostis Adanson 1763 (Reed-grass)

A genus of about 230 species, north and south temperate. References: Marr, Hebdia, & Greene in FNA (2007a); Tucker (1996)=Z; Greene (1980). Key based on FNA.

1 Callus hairs > 1.3× as long as the lemma; rachilla prolonged beyond the palea; [rare introduction from s. NJ northwards]..............C. epigejos
2 Callus hairs < 1.2× as long as the lemma; rachilla not prolonged beyond the palea; [natives, sometimes weedy, widespread].

2 Awns attached on the upper 2/5 of the lemmas, 0.5-2 mm long, straight..........................................................C. coarctata
3 Awns attached on the lower 3/5 of the lemmas, 0.9-6 mm long, straight or bent.

4 Leaves (1-) 2-3 (-4) mm wide; plant densely tufted, delicate, culms 10-55 (-60) cm tall, with 2-3 nodes; [high elevation rock outcrops and glades]......................................................C. stricta
5 Leaves (2-) 3-8 (-12) mm wide; plant rhizomatous or loosely tufted, coarse, culms 60(-) 75-120 cm tall, with 3-5 nodes; [low to moderate elevation forests and woodlands].

6 Callus hairs < 1.2× as long as the lemma; rachilla not prolonged beyond the palea; [rare introduction from s. NJ northwards]..............C. porteri
7 Callus hairs > 1.3× as long as the lemma; rachilla prolonged beyond the palea; [rare introduction from s. NJ northwards]..............C. epigejos

A genus of about 230 species, north and south temperate. References: Marr, Hebdia, & Greene in FNA (2007a); Tucker (1996)=Z; Greene (1980). Key based on FNA.

1 Callus hairs > 1.3× as long as the lemma; rachilla prolonged beyond the palea; [rare introduction from s. NJ northwards]..............C. epigejos
2 Callus hairs < 1.2× as long as the lemma; rachilla not prolonged beyond the palea; [natives, sometimes weedy, widespread].

2 Awns attached on the upper 2/5 of the lemmas, 0.5-2 mm long, straight..........................................................C. coarctata
3 Awns attached on the lower 3/5 of the lemmas, 0.9-6 mm long, straight or bent.

7 Callus hairs > 1.3× as long as the lemma; rachilla prolonged beyond the palea; [rare introduction from s. NJ northwards]..............C. epigejos

C. epigejos A.S. Hitchcock, Cain's Reed-grass. High elevation rocky summits. July-September. Endemic to a few mountain-tops in the Southern Appalachians, C. cainii, once thought to be endemic to Mount LeConte, TN, was discovered at two sites in NC in 1989 and 1990 – Mount Craig, Yancey County, and Craggy Pinnacle, Buncombe County (Wiser 1991). This species is more likely to be mistaken (especially superficially) for an Agrostis than for any of the other Calamagrostis in our area, but is distinguishable by its larger spikelets (5-6 mm long, rather than 1.3-2 mm) and the presence of a callus beard. [= FNA, HC, K, W, Z]

Calamagrostis canadensis (Michaux) Palisot de Beauvois var. canadensis, Bluejoint, Canada Reed-grass. Wet meadows along streams, high elevation openings, such as grassy balds and cliff bases. August. Widespread and common across n. North America, reaching its southern limit in the east in w. NC, c. TN (Chester et al. 1993), and ne. GA (Rabun Bald, Rabun County). [= FNA, G, HC, K; < C. canadensis – RAB, C, S, W, WV, Z; > C. canadensis var. canadensis – F; > C. canadensis var. robusta Vasey – F]

Calamagrostis canadensis var. canadensis (Michaux) Palisot de Beauvois var. macouniana (Vasey) Stebbins. Bottomlands. NL (Newfoundland) and AB south to NJ, PA, VA?, OH, w. KY, IL, MO, NE, WV, OR. Reported for VA (FNA), the documentation unknown. Reported south to NJ and KY only (Kartesz 1999). [investigate] [= F, FNA, G, HC, K; < C. canadensis – C, Z; = C. macouniana (Vasey) Vasey]

Calamagrostis coarctata Eaton, Nuttall's Reed-grass. Savannas, bogs, and other wet sites. July-October. ME and NY south to n. GA (Jones & Coile 1988), AL, and LA, primarily on the Coastal Plain. The replacement of the familiar name C. cinnoides is necessary for nomenclatural reasons (Kartesz 1999); a proposal may be made to conserve the name C. cinnoides (Barkworth, pers. comm., 2009). [= K; = C. cinnoides (Muhlenberg) W.P.C. Barton – RAB, C, F, FNA, G, GW, HC, S, W, WV, Z; = C. coarctata Eaton – K]

* Calamagrostis epigejos (Linnaeus) Roth, Bushgrass, Feathertop. Disturbed areas; native of Eurasia. [= C, G, FNA; = C. epigejos – HC; > C. epigejos var. epigejos – F, K2; > C. epigejos var. georgica (K. Koch) Grisebach – F, K2]

Calamagrostis pickeringii A. Gray, Pickering’s Reedgrass. Bogs. NL west to ON, south to NY and s. NJ. [= C, F, FNA, G, HC]
Calamagrostis stricta (Timm) Koeler ssp. insperata (A. Gray) C.W. Greene. Rock outcrops; rocky woodlands. OH and MO south to TN and AR. [= FNA, K; = C. insperata Swallen – C, HC]

Identification notes: Superficially somewhat similar to Sporobolus pinetorum, S. floridanus, and S. curtissii (herbarium specimens of the two species have been regularly confused), Calamovilfa is distinguished by its leaves tapered to either end and long-acuminate (vs. parallel-margined and abruptly acute in Sporobolus) and tendency to form larger, clonal patches (Sporobolus forms wiregrass-like bunches or clumps). In flower or fruit, the Calamovilfa can be distinguished by characters of the spikelet, by vegetative characters, or by its coarser, generally taller culms, with the panicle branches usually spreading (rather than always ascending in Sporobolus). The three have very similar bases, unlike any other grasses in our area – the lower leaf sheaths are indurated and shiny, forming a hard, polished, knotty, and fire-proof covering over the short-creeping rhizome. Aristida stricta has a somewhat similar base, but less indurated, less creeping, and with an unpolished appearance. Calamovilfa brevipilis also has a cartilaginous, pale yellow annulum surrounding the outer (abaxial) surface of the juncture of the sheath and leaf, a structure not visible in the other species. Positive identification in sterile condition is not difficult.

Calamovilfa (A. Gray) Hackel ex Scribner & Southworth 1890 (Sandreed)

A genus of 5 species, of e. and c. North America. Reeder & Ellington (1960) studied various anatomic features of Calamovilfa, and determined that its closest relative was Sporobolus. A molecular phylogenetic study of Sporobolus and closely related genera suggests that Calamovilfa should be included in Sporobolus (Ortiz-Diaz & Culham 2000). References: Thieret in FNA (2003a); Thieret (1966)=Z. Key based in part on Thieret in FNA (2003a).

Calamovilfa arcuata K.E. Rogers, Cumberland Sandreed. Riverside scours. Ouachita Mountains of w. AR and e. OK; Cumberland Plateau of TN (Morgan and Cumberland counties), KY (McCreary County), and AL (Blount County). [= FNA, K]

Calamovilfa brevipilis (Torrey) Scribner, Pinebarren Sandreed. Savanna-pocosin ecotones, sandhill seepage bogs, pocosins, boggy powerline rights-of-way. June-October. A "bimodal endemic", with two areas of distribution: Pine Barrens of NJ and the Coastal Plain (very rarely lower Piedmont) of e. NC, n. SC, and s. VA. Var. heterolepis Fernald, no longer considered valid, refers to the NC-SC material; var. calvipes Fernald, no longer considered valid, refers to the VA material. Like Aristida stricta, this grass is dependent on fire for flowering (it will also sometimes flower in response to mowing or other disturbance). Suppression of the natural fire regime has led to its substantial decline and the severe contraction of its range in the Southeast, since fire exclusion in its seepage or ecotone habitat leads to rapid invasion by shrubs and competitive elimination of Calamovilfa and many other herbs. [= RAB, C, FNA, G, GW, K, S, Z; > C. brevipilis var. brevipilis – F, HC; > C. brevipilis var. heterolepis Fernald – HC; > C. brevipilis var. calvipes Fernald – F, HC]

Calamovilfa curtissii (Vasey) Scribner, Curtiss’s Sandreed. Moist pinelands and edges of natural ponds. FL Panhandle and e. peninsular FL. C. curtissii is a closely related sibling species of C. brevipilis. [= FNA, GW, HC, K, S, Z]
**POACEAE**

**Cenchrus** Linnaeus 1753 (Burgrass, Sandspur)

A genus of about 16 species, primarily tropical and subtropical. References: Stieber & Wipff in FNA (2003a); Ward (2010b)=Y; Crins (1991)=Z. Key based in part on FNA.

**Identifications note:** Spikelets of *Cenchrus* are subtended by an involucre of spines and/or bristles which are (in most of our species) fused into a bur. Bristles are narrow-based and somewhat flattened (not terete) in cross-section, at least basally.

1 Involucre of bristles only; these not fused into a bur; perennial, to 2 m tall ............................................................... *C. myosuroides*
1 Involucre of spines fused into a coherent bur, sometimes also with bristles; annual or perennials, to 1 m tall.
2 Spikes in a single whorl, subtended by numerous smaller, narrower, free outer bristles.
3 Spines fused at the base only, the lower surfaces with 1-3 grooves ................................................................. *C. biflorus*
4 Spines fused for >1/3 their length; most of the outer bristles equal to or slightly longer than the flattened inner bristles (spines) ...... ................................................................. *C. brownii*
5 Rachis internodes 0.8-1.7 mm long; most of the outer bristles equal to or slightly longer than the flattened inner bristles (spines) ........ ................................................................. *C. echinatus*
6 Rachis internodes 2-4 mm long; most of the outer bristles much shorter than the flattened inner bristles (spines) .......... ................................................................. *C. longispinus*
2 Spines in multiple whorls or irregular in their disposition (if few and in a single whorl, then not subtended by smaller, narrower bristles).
5 Plants perennial, long-lived, clump-forming; burs imbricate, usually pubescent, leaf blades (1-) 3-14 mm wide .................... *C. tribuloides*
6 Plants annual or perennial, short-lived and not clump-forming; burs imbricate, usually pubescent, leaf blades (1-) 3-14 mm wide .................... *C. echinatus*
7 Spines stout, 6-10 (-40), 2-5 mm long; spikelets 3.5-6 mm long ................................................................. *C. incertus*
8 Spines slender, 45-75, 3.5-7 mm long; spikelets 6-8 mm long ................................................................. *C. longispinus*

* Cenchrus biflorus Roxburgh, Indian Sandbur. Disturbed areas, ballast; native of Africa and s. Asia. Reported from ballast in Mobile, AL; perhaps only a waif. [= FNA, HC]
*? Cenchrus brownii Roemer & J.A. Schultes. Disturbed areas, maritime grasslands. Se. United States (NC, GA, AL, and FL); West Indies, Central America, n. South America. The sole known NC specimen was collected in 1885 by Gerald McCarthy in NC “in locis navalis et vastis.” [= FNA, K, WH, Y; ? C. viridis Sprengel – HC, S, misapplied]

Cenchrus echinatus Linnaeus, Southern Sandspur, Bristly Sandspur, Hedgehog Grass. Fields, roadsides, disturbed areas. June-October. NC (and DC?) south to FL, west to CA, south into the tropical America. The basis for the record for w. VA in FNA is not clear. [= RAB, C, FNA, HC, K, S, WH, Y, Z]

Cenchrus gracillimus Nash, Sandhill Sandspur. Longleaf pinelands, other sandy habitats. N. FL, s. and e. GA, s. AL, and s. MS; West Indies (Cuba, Jamaica). [= FNA, HC, K, S, WH, Y]

Cenchrus incertus M.A. Curtis, Coastal Sandspur. Fields, roadsides, disturbed areas. July-October. VA south to FL, west to AR and KS, south into tropical America. Ward (2010b) argues convincingly that the name *C. spinifex* is very uncertainly applied to our species and should not be taken up. [= RAB, C, F, G, HC, S, Y, Z; = C. spinifex Cavanilles – FNA, K]

Cenchrus longispinus (Hackel) Fernald, Northern Sandspur, Common Sandspur. Fields, roadsides, disturbed areas, lawns. June-October. ME west to OR, south to FL, TX, and CA. [= RAB, C, F, FNA, K, W, Z; = C. pauciflorus Bentham – G, HC, S, WV, misapplied]

* Cenchrus myosuroides Kunth. Roadsides, disturbed areas; native of further south. December. SC south to FL, west to TX, south into the West Indies and other parts of tropical America. [= RAB, FNA, HC, K, S, WH, Y, Z]

Chasmanthium Link 1827 (Spanglegrass, Spikegrass)

1 Panicle branches elongate, pendulous; spikelets (15-) 20-40 mm long, with 6-20 flowers ............................................................... *C. latifolium*
1 Panicle branches short, erect or ascending; spikelets 5-18 mm long, with 2-8 (-11) flowers.
2 Fully-developed spikelets 12-18 mm long, 8-12 mm wide.
3 Axils of the spikelets and panicle branches glabrous; empty lemmas 9 (-12); [se. NC south to c. peninsular FL and e. FL Panhandle].... ............................................................... *C. niitidum*
3 Axils of the spikelets and panicle branches with a tuft of long hairs; empty lemmas 2-4; [w. FL Panhandle west to e. LA (Florida Parishes)] .......................................................... C. ornithorhynchum

2 Fully-developed spikelets 4-9 mm long, 3-7 mm wide.

4 Collar (junction of leaf and sheath) glabrous or nearly so; leaves 3-7 mm wide................................................................. C. laxum

4 Collar (junction of leaf and sheath) pilose; leaves 6-12 mm wide.

5 Inflorescence with divergent branches; [outer Coastal Plain calcareous sites from SC southwards] .................... C. sessiliflorum var. 1

5 Inflorescence with appressed branches; [more widespread in our area] .................................................. C. sessiliflorum var. sessiliflorum

Chasmanthium latifolium (Michaux) Yates, River Oats, Fish-on-a-pole. Riverbanks, streambanks, bottomland forests, seepages and glades over mafic or calcareous rock, usually in nutrient-rich soils. June-October. NJ, OH, IL, and KS south to FL and TX. [= C, FNA, GW, K, W, Z; = Uniola latifolia Michaux – RAB, F, G, HC, S, WV]

Chasmanthium laxum (Linnaeus) Yates, Slender Spikegrass. Savanna-pocosin ecotones, sandhill-pocosin ecotones, moist hardwood swamps, other moist habitats. June-October. Widespread in se. North America, north to s. NY, KY, and OK. See C. sessiliflorum for comments on the suggestion that these two taxa are only varietally distinct. [= C, FNA, GW, K, W, Z; = Uniola laxa (Linnaeus) Britton, Sterns, & Poggenburg – RAB, F, G, HC, S; = Chasmanthium laxum var. laxum]

Chasmanthium nitidum (Baldwin) Yates, Shiny Spanglegrass. Blackwater swamp forests. September-November. A Southeastern Coastal Plain endemic: se. NC south to c. FL and west to se. AL. [= FNA, GW, K, Z; = Uniola nitida Baldwin – RAB, HC, S]

Chasmanthium ornithorhynchum (Steudel) Yates, Birdbill Spikegrass. Blackwater swamp forests. S. AL and w. FL Panhandle west to e. LA (Florida Parishes). Also reported for NC and SC (FNA 2003a). {investigate} [= FNA, GW, K, Z; = Uniola ornithorhynchus Steudel – S]

Chasmanthium sessiliflorum (Poiret) Yates var. 1, Coastal Hammock Longleaf Spikegrass. Calcareous hammocks. August-October. An additional taxon warrants recognition: it is characterized by divergent panicle branches and occurs in outer Coastal Plain calcareous sites (J. Allison, pers. comm.). [< Chasmanthium sessiliflorum (Poiret) Yates – C, FNA, GW, K, Z; < Uniola sessiliflora Poiret – RAB, F, G, HC; < Uniola longifolia Scribner – S; < Chasmanthium laxum (Linnaeus) Yates var. sessiliflorum (Poiret) L. Clark]

Chasmanthium sessiliflorum (Poiret) Yates var. sessiliflorum, Longleaf Spikegrass. Moist hardwood forests, swamps, other moist habitats. August-October. Widespread in se. North America, north to se. VA, TN, AR, and OK. This species and C. laxum are morphologically somewhat similar, but their treatment as varieties of a single species is completely unwarranted. They frequently co-occur (especially on the Gulf Coastal Plain), growing side by side, and show no sign of intergradation. [< Chasmanthium sessiliflorum – C, FNA, GW, K, W, Z; < Uniola sessiliflora Poiret – RAB, F, G, HC; < Uniola longifolia Scribner – S; < Chasmanthium laxum (Linnaeus) Yates var. sessiliflorum (Poiret) L. Clark]

Chloris Swartz 1788 (Finger-grass, Chloris)

A genus of 55-60 species, annuals or perennials, mainly tropical and Southern Hemisphere. References: Barkworth in FNA (2003a). [also see Eustachys]. Key based partly on C.

1 Inflorescence verticillate, typically the panicle branches in 2-5 verticels; perennial; fertile lemma inconspicuously appressed-pilose; spikelets not imbricate ....................................................................................................................... C. verticillata

1 Inflorescence digitate, the panicle branches in a single verticle at the apex of the culm; annual; lemma conspicuously long-ciliate; spikelets imbricate ................................................................................................................................. C. virgata

* Chloris barbata Swartz, Swollen Windmill-grass. Cp (SC): disturbed areas, waste areas near wool-combing mills; rare, native of West Indies, c. Mexico, Central America, and South America. [= FNA, K1, K2] [FL] [not yet keyed]

* Chloris verticillata Nuttall, Windmill-grass. Cp (DE), Mt (VA, WV), {SC}: disturbed areas, bottomland fields; uncommon (rare in SC, VA, and WV), native of further west. [= C, F, G, HC, K]

* Chloris canterae* Arechavalea var. *canterae*, Paraguayan Windmill-grass. Cp (GA): disturbed ground; rare, native of Paraguay. The epithet was originally spelled “*canterei*” but should be corrected to the genitive “*canterae*” by the provisions of the ICBN. [= K2; = C. canterei Arechavalea var. *canterae* – K1; < C. *canterae* – HC, orthographic variant] (not yet keyed)

* Chloris cocculeata* Bisch. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, perhaps only a waif, native of sc. United States and Mexico. [= K1] (not keyed)

* Chloris divaricata* R. Brown. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of {}. [= K1] (not keyed)

* Chloris gayana* Kunth, Rhodes Grass. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, perhaps only a waif, native of Africa. [= F, HC, K1, S] (not keyed)

* Chloris petraeata* Bentham. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of {}. [= K1] (not keyed)

* Chloris truncata* R. Brown, Stargrass. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of Australia. [= HC, K1] (not keyed)

* Chloris ventricosa* R. Brown. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of Australia. Also reported for VA (Hitchcock & Chase 1950; Kartesz 1999). [= HC, K1] (not keyed)

**Chrysopogon** Trinius 1820 (Goldbeard)

A genus of about 26 species, tropical and subtropical, all species except *C. pauciflorus* native to the Old World. References: Hall & Thieret in FNA (2003a); Veldkamp (1999).

**Chrysopogon pauciflorus** (Chapman) Bentham ex Vasey, Florida Goldbeard, Florida Rhaphis. Cp (FL, NC): sandhill; rare (NC Watch List), perhaps only introduced. FL and Cuba; its occurrence in sc. NC (at Carolina Beach State Park) is plausible either as a native, disjunct occurrence or as an introduction. [= FNA, HC, K; = *Rhaphis pauciflorus* (Chapman) Nash – S]

**Cinna** Linnaeus 1753 (Woodreed)

1 Spikelets (3.5-) 4-6 (-7.5) mm long; glumes firm, subherbaceous, rather dull, hyaline only narrowly and marginally, the upper glume prominently 3-nerved ................................................................. *C. arundinacea*

1 Spikelets (2-) 2.5-4 (-5) mm long; glumes (at least the first and sometimes the second as well) glistening, hyaline except the midrib, the upper glume 1-nerved (very rarely 3-nerved) ........................................................................................................ *C. latifolia*

**Coelorachis** Brongniart 1831 (Jointgrass)

A genus of about 20 species, widespread in the Old World and New World tropics and subtropics. Generic circumscription has been controversial and uncertain. References: Allen in FNA (2003a); Veldkamp, Koning, & Sosef (1986)=Z.

1 Culms round in cross-section ..................................................................................................................... *C. cylindrica*

1 Culms compressed-keeled in cross-section.

2 Lower glume with rectangular pits ........................................................................................................ *C. tesselata*

2 Lower glume smooth or with transverse ridges.

3 Lower glume smooth with transverse ridges ............................................................................................. *C. rugosa*

3 Lower glume smooth ................................................................................................................................. *C. tuberculosa*

**Coelorachis rugosa** (Nuttall) Nash, Wrinkled Jointgrass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA): limesink ponds (dolines), depression meadows, clay-based Carolina bays, wet savannas, disturbed areas (such as sees in powerline rights-of-
way), always in places with a seasonally high water-table; uncommon (rare in DE, NC, SC, and VA).  June-October.  A
Southeastern Coastal Plain endemic:  s. NJ south to FL and west to TX.  [= C, FNA, K; = Manisuris rugosa (Nuttall) Kuntze – RAB, F, G, GW, HC, S; = Mnesithea rugosa (Nuttall) Koning & Sosef – Z]

**Coelorchis tesselata** (Steudel) Nash, Pitted Jointgrass.  Cp (FL, GA):  wet savannas and bogs; rare.  Southeastern Coastal Plain endemic:  sw. GA and FL west to e. LA.  [= FNA, K; = Manisuris tesselata (Steudel) Scribner – GW, HC, S; = Mnesithea tesselata (Steudel) Koning & Sosef – Z]

**Coelorchis tuberculosa** (Nash) Nash, Smooth Jointgrass.  Cp (FL, GA):  pond margins; rare.  Southeastern Coastal Plain endemic:  sw. GA (Mitchell County) (Sorrie 1998b) west to s. AL, and in the FL peninsula.  [= FNA, K; = Manisuris tuberculosa Nash – GW, HC, S; = Mnesithea tuberculosa (Nash) Koning & Sosef – Z]

**Coix** Linnaeus 1753 (Job’s-tears)

* Coix lacryma-jobi Linnaeus, Job’s-tears, reported for se. PA by Rhoads & Klein (1993), TN (Thieret in FNA 2003a), and NJ (Kartesz 1999).  [= FNA, K]

**Coleataenia** Grisebach 1879

A genus of 8 species, perennials, of s. North America and the West Indies to South America.  Named as Sorengia by Zuloaga, Scataglini, & Morrone (2010), but this name proved to be illegitimate, and was replaced by Coleataenia (Soreng 2010).

1 Glumes and sterile lemmas not keeled along midvein; apices of fertile lemmas glabrous; panicle < 1 cm wide, 3-12 cm long; leaf blades 4-19 cm long; 1-4 mm wide; involute at maturity; culms wiry.................................................. C. tenera
1 Glumes and sterile lemmas keeled along midvein; apices of fertile lemmas with a minute tuft of stiff hairs; panicles < 1 to > 20 cm wide, 9-40 cm long; leaf blades 8-50 cm long, 2-12 mm wide, flat (sometimes drying involute); culms wiry to stout.

2 Plants with rhizomes; fertile lemma 1.6-4 mm long.
3 Rhizomes short, usually < 3 cm long; leaves 20-50 cm long, 4-18 mm wide; spikelets 2.5-3.9 mm long, acuminate; first glume with 3-5 green nerves.............................................................................................................................. C. anceps ssp. anceps
3 Rhizomes elongate, often > 4 cm long; leaves 10-30 (-40) cm long, 2-10 mm wide; spikelets 2.2-2.8 mm long, acute to short-acuminate; first glume with 1-3 green nerves.............................................................................................................................. C. anceps ssp. rhizomata

2 Plants with hard crowns, lacking rhizomes; fertile lemma 1.2-1.6 mm long.
4 Ligule of white hairs 0.5-3 mm long; culms to 1 m long; cauline blades 2-8 mm wide, usually pilose adaxially near the base; spikelets 2.0-4.0 mm long.
5 Ligules 1.3 mm long; spikelets 2.0-2.7 mm long, 2.5-4× as long as wide, often obliquely set on the pedicels................................................................. C. longifolia ssp. longifolia
5 Ligules 0.5-1.5 mm long; spikelets 2.4-4.0 mm long, 3.5-5× as long as wide, erect on the pedicels................................................................. C. longifolia ssp. combsii
4 Ligule a tawny membrane 0.5-1.0 mm long, often erosive or lacerate, or with a minute ciliate fringe; culms to 1.8 m long; cauline blades 4-12 mm wide, usually glabrous; spikelets 1.6-2.8 mm long.
6 Spikelets 2.4-2.8 mm long, long-acuminate, usually < 0.7 mm wide; fertile lemma often conspicuously stipitate......................................................... C. species 1 ssp. elongata
6 Spikelets 1.6-2.5 mm long, short-acuminate, usually > 0.7 mm wide; fertile lemma estipitate to short stipitate.
7 Culms to 1 m long; mature panicle ½ to nearly as wide as long, the branches ascending to spreading; spikelets 1.6-2.2 mm long ......... C. species 1 ssp. rigidula
7 Culms to 1.8 m long; mature panicle < 1/3 as wide as long, the branches erect; spikelets 2.0-2.5 mm long ............... C. species 1 ssp. 1

**Coleataenia anceps** (Michaux) Soreng ssp. anceps, Beaked Panic Grass.  Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, FL, NC, SC, VA), [GA]; moist sandy woods, swamps, sloughs, roadsides, fields, waste places; common.  June-October.  NJ w. to IL, s. to FL and TX.  The sheaths of ssp. anceps are glabrous to pilose, while those of ssp. rhizomata are often villous; the leaves of ssp. rhizomata also tend to be hairier.  [= V; = Sorengia anceps (Michaux) Zuloaga & Morrone ssp. anceps – X; = Panicum anceps Michaux var. anceps – RAB, F, G, Z; < P. anceps – C, GW, K, W; = P. anceps ssp. anceps – FNA; = P. anceps – HC, S, WV]

**Coleataenia anceps** (Michaux) Soreng ssp. rhizomata (Hitchcock & Chase) Soreng, Small Beaked Panic Grass.  Cp (FL, GA, NC, SC, VA); moist to dry sandy or loamy pinelands, ditches; common (rare in VA).  July-October.  Se. VA and KY s. to FL and TX.  See note under ssp. anceps.  [= V; = Sorengia anceps (Michaux) Zuloaga & Morrone ssp. rhizomata (Hitchcock & Chase) Zuloaga & Morrone – X; = Panicum anceps Michaux var. rhizomata (A.S. POACEAE

Coleataenia longifolia (Torrey) Soreng ssp. longifolia, Long-leaved Panic Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC, VA): wet or sandy or peaty soils of bogs, savannas, pond shores, depression meadows; common (uncommon in Piedmont, rare in Mountains). July-October. NS, NH, MA, PA, and IN south to FL, west to TX. See note under ssp. 

Coleataenia species I in prep. ssp. 1 in prep., Dense Panic Grass. Cp (DE, FL, GA, NC, SC, VA): marshes, meadows, low woods, ditches, stream and pond shores, freshwater tidal shores; uncommon. September-October. Coastal Plain south from se. MA to FL, west to se. TX and AR; West Indies. Usually readily identified by its tall stature and compact inflorescence, somewhat resembling a large P. hemitomon, with which it occasionally occurs. [< C. longifolia (Torrey) Soreng ssp. longifolia (Bosc ex Nees) Soreng – V; < Sorengia longifolia (Torrey) Zuloaga & Morrone ssp. rigidula (Bosc ex Nees) Zuloaga & Morrone – X; = P. agrostoides Sprengel var. condensum (Nash) Fernald – RAB, F; < P. rigidulum – C, GW; < P. pubescens Bosc ex Nees ssp. rigidulum – FNA; < P. agrostoides – G; = P. condensum Nash - HC, S; < P. rigidulum var. rigidulum – K, Z; = Panicum rigidulum Bosc ex Nees var. condensum (Nash) Mohlenbrock] 

Coleataenia tenera (Beyrich ex Trinius) Soreng, Southeastern Panic Grass. Cp (FL, GA, NC, SC): limesink ponds, depression meadows, cypress savannas, wet pinelands, bogs; uncommon (rare north of FL). June-September. Coastal Plain from se. NC to FL, west to e. TX; West Indies. The rhizomes produce lines of closely spaced culms. Though 0.5-1 m tall, the culms are narrow and inconspicuous. [= S. tenera (Beyrich ex Trinius) Zuloaga & Morrone – X; = Panicum tenerum Beyrich ex Trinius – RAB, FNA, GW, HC, K, S, Z]

Cortaderia Stapf 1897 (Pampasgrass)

* Cortaderia selloana (J.A. & J.H. Schultes) Ascherson & Graebner, Pampasgrass. Cp (GA, SC), Pd (GA): disturbed areas; rare, native of South America. This grass is a popular ornamental, rarely escaping. [= RAB, FNA, HC, K]

Crypsis Aiton (Prickleygrass)

Crypsis schoenoides (Linnaeus) Lamarck, Swamp Pricklegrass. Pd (DE): disturbed areas; rare, native of Mediterranean Europe. [= C, FNA; = Helechoila schoenoides (Linnaeus) Host – F, G, HC]

Ctenium Panzer 1813 (Toothache Grass)

1 Spikelets with numerous glands in rows on the back of the second glume; plant short-rhizomatous (nearly cespitose); [widespread in the Coastal Plain]........................................................................................................................................................................................................... Ctenium aromaticum

1 Spikelets with very few or no glands on the back of the second glume; plant rhizomatous (the rhizomes slender and scaly); [se. GA and ne. FL]......................................................................................................................................................................................................................... C. floridanum

Ctenium aromaticum (Walter) Wood, Toothache Grass, Orange Grass. Cp (FL, GA, NC, SC, VA): wet savannas, pocosin-savanna ecotones, seepage bogs, sandhill-pocosin ecotones, sandhill seeps; common (rare in VA). June-August (or later in response to late summer fires). Southeastern Coastal Plain endemic: se. VA south to FL and west to LA and e. TX (Singhurst, Keith, & Holmes 2005). The entire plant is aromatic and numbs the mouth, tongue, and lips when chewed, hence the specific epithet and common names. Like many species of the longleaf pine ecosystem, toothache grass generally flowers only following
fire (MacRoberts & MacRoberts 1992). Sterile clumps can be recognized by the rather broad, bicolored leaves (bluish on the upper surface, bright green on the lower surface). [= RAB, C, F, FNA, G, GW, HC, K; = Campulosus aromaticus (Walter) Trinius – S]

Cynodon L.C. Richard 1805 (Bermuda Grass)

A genus of ca. 9 species, native to the tropical Old World. References: Barkworth in FNA (2003a).

Cynodon L.C. Richard 1805 (Bermuda Grass)

A genus of ca. 9 species, native to the tropical Old World. References: Barkworth in FNA (2003a).

Cynodon L.C. Richard 1805 (Bermuda Grass)

A genus of ca. 9 species, native to the tropical Old World. References: Barkworth in FNA (2003a).

**POACEAE**

2 Lemma awn 4-10 mm long; glumes 9-13 mm long. .............................................................................................................. **D. compressa**

2 Lemma awn 11-18 mm long; glumes 11-19 mm long.

3 Sheaths villous; lemmas membranaceous in texture, villous on the back and sides; awn twisted at base several times, forming an awn column 2-5.3 mm long. ....................................................................................................................... **D. sericea**

3 Sheaths glabrous; lemmas membranaceous in texture, villous on the tips and towards the base; awn twisted at a single time, forming a loose awn column 0.5-1.5 mm long. .......................................................................................... **D. epilis**

---

**Danthonia epilis** Scribner, Bog Oat-grass. Cp (NC, SC, VA), Mt (AL, GA, NC, TN, VA?), Pd (NC): peaty bogs in the Coastal Plain and Mountains, seeps around rock outcrops in the Piedmont and Mountains, granitic domes; rare. April-June. The range is apparently bogs in pinelands from NJ to SC, in mountain bogs in NC, VA (?), and GA, in seepage in the Cumberland Plateau and Blue Ridge of TN and AL. This taxon appears to be valid, with a distinct range, habitat, and variety of morphologic character separating it from **D. sericea**, but further study is needed. Material from the mountains seems to differ from Coastal Plain material. RAB's description of the habitat as "dry woods, rare; pied. of N.C." appears to be in error. Blomquist listed the taxon (as a variety) for bogs in the mountains of SW. NC. It has since been found in bogs in the Sandhills region of NC and in seepage bogs in the adjacent Piedmont. [= F, HC, K, S; = D. sericea var. epilis (Scribner) Blomquist – RAB, C; < D. sericea Nuttall – FNA]

**Danthonia sericea** Nuttall, Silky Oat-grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, KY, NC, SC, TN, VA), Ip (KY, TN): dry woodlands, especially common in sandy soils in the Coastal Plain, dry oak, oak-pine, and pine forests in the Piedmont and low Mountains; common (uncommon in the Mountains and Interior Low Plateau, rare in DE). April-June. Primarily a Coastal Plain species northwards, ranging from e. MA south to FL and west to LA. [= F, HC, K, S, W; = D. sericea var. sericea – FNA]. [AL, IA, MS]

---

**Deschampsia** Palisot de Beauvois 1812 (Hairgrass)

A genus of about 20-40 species, perennials and annuals, north and south temperate. References: Barkworth in FNA (2007a); Tucker (1996)=Z. [also see Avenella]

1 Awn 4-8 mm long, geniculate, exerted beyond the tips of the glumes; lemmas minutely scabrous, dull; leaf blades involute, appearing filiform (rounded in cross-section); ligule 0.5-3 (-5) mm long; [section Avenaria] ............................................................................................................... [see Avenella]

1 Awn 2-3 mm long, straight or nearly so, scarcely (or not at all) exerted beyond the tips of the glumes; lemmas smooth, shiny; leaf blades flat or folded at the midvein (V-shaped in cross-section); ligule 3-10 (-17) mm long. ........................................................................................................................ **D. cepitosa** spsp. **glauca**

**Deschampsia cespitosa** (Linnaeus) Palisot de Beauvois **ssp. glauca** (Hartman) Hartman, Tufted Hairgrass. Mt (NC, VA, WV), Ip (KY): thin soil of rock outcrops or barrens over calcareous, mafic, and ultramafic rocks (such as serpentinitized olivine, amphibolite, limestone, and dolostone), seepages; rare. June-July. **D. cespitosa** is a complex species, with a complicated polyploid and aneuploid series, variably subdivided (or not) by various taxonomists. As a whole, **D. cespitosa** is circumboreal, ranging south in North America to NJ, sw. NC, WV, c. KY, IL, MN, and AZ. Ssp. **glauca** is the most widespread American subspecies, and extends the farthest south. Other subspecies occur farther north and in Eurasia. In our area, **D. cespitosa** is at its southern limit and is a rare species limited to barrens and outcrops over mafic or ultramafic rocks. Barkworth in FNA (2007a) states that there is no legitimate name available for this taxon. [= K; = D. cespitosa var. glauca (Hartman) Lindman f. – RAB, F, WV; < D. cespitosa sp. cespitosa – FNA; < D. cespitosa var. cespitosa – C; Z; < D. cespitosa var. cespitosa – G; < D. cespitosa var. cespitosa – HC; = D. cespitosa sp. cespitosa var. glauca (Hartman) Lindman f.; < A. cespitosa Linnaeus – S; < D. cespitosa – W]

* Deschampsia elongata* (Hooker) Munro, Slender Hairgrass. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of w. North America. [= FNA, HC, K] {not keyed}

---

**Desmazeria** Dumortier 1822

* Desmazeria rigida* (Linnaeus) Tutin, Fern Grass. Cp (FL, SC): waste areas around wool-combing mills, other disturbed areas; rare, perhaps only a waif, native of Mediterranean Europe. [= FNA, K; = Catapodium rigidum (Linnaeus) Dony – Z; = Scleropoa rigidula (Linnaeus) Grisebach]

**Diarrhena** Palisot de Beauvois 1812 (Beakgrain, Twingrass)

---
Depending on circumscription, a genus of either 2 species of perennial grasses of e. North America, or of ca. 6 species of e. North America and e. Asia. References: Brandenburg in FNA (2007a); Brandenburg, Estes, & Collins (1991)=Z. Key from Z.

1 Callous pubescent on all mature lemmas except the first; lemmas widest below the middle and gradually tapering into a cusp at the apex, those of the first floret 7.1-10.8 mm long; mature fruit 1.3-1.8 mm broad, gradually tapering into a broad, blunt beak ..........D. americana

1 Callous glabrous on all mature lemmas; lemmas widest near or above the middle and more-or-less abruptly contracted into a cusp at the apex, those of the first floret 4.6-7.5 mm long; mature fruit 1.8-2.5 mm broad, abruptly contracted into a bottle-shaped beak............D. obovata

**Diarrhena americana** Palisot de Beauvois, Eastern Beakgrain. Ip (KY, TN), Mt (GA, NC, TN, VA, WV): rich moist forests, usually over calcareous rocks; uncommon (rare in NC and VA, rare in TN Mountains). July-August; August-October. W. VA and WV west to IN, south to TN, sw. NC, and nw. GA (Jones & Coile 1988); disjunct in MO. This species forms large clonal patches. [= K, Z; = Diarrhena americana var. americana – C, G, WV; < Diarrhena americana – F, HC, W; < Diarina festucoides Rafinesque – S]

**Diarrhena obovata** (Gleason) Brandenburg, Western Beakgrain. Mt (WV), Pd (VA), Ip (KY, TN): alluvial forests, other moist forests; rare. July-August; August-October. Sw. PA and IN west to SD, KA, south to w. VA, e. TN, and ne. TX. First reported for VA by Fleming & Ludwig (1996). The floodplain of the Potomac River (in Fairfax County, VA) has a number of disjuncts of species with more midwestern affinities, including *Diarrhena obovata*, *Erigenia bulbosa*, *Valeriana pasciflora*, and *Erythronium albidum* (Fleming & Ludwig 1996). [= K, Z; = Diarrhena americana var. obovata Gleason – C, G, WV; < Diarrhena americana – F, HC, W; < Diarina festucoides Rafinesque – S]

**Dichanthelium** (A.S. Hitchcock & Chase) Gould 1974 (Witch-grass)

(by Richard J. LeBlond)

"We admit that our failure to distinguish the several named taxa ... was born of despair!" – Godfrey & Wooten (1979).

"The recognition of only four species and six varieties in this complex [sabulorum] to which almost 50 species names have been applied admittedly is somewhat arbitrary and certainly not entirely satisfactory." – Gould & Clark (1978).

**Identification notes:** *Dichanthelium* has often been treated as subgenus *Dichanthelium* of *Panicum*. It is most readily (though not consistently) separated from *Panicum* by the following combination of features: plants producing over-wintering rosettes of leaves often shorter and broader than the culm leaves; plants producing simple culms with terminal panicles in spring, the culms branching and producing panicles only on branches in the summer and autumn.

Perhaps the most complex and confusing genus in our region, *Dichanthelium* requires careful collection and close observation of several characters to determine to which taxon a specimen belongs, or at least to which taxa it seems most closely aligned. A taxon that is distinct in one part of its range may be indistinguishable from another taxon elsewhere. This is particularly true of Coastal Plain species adapted to natural (and now human) disturbances. Although hybridization is frequently suspected in *Dichanthelium*, documentation of natural hybrids is rare.

When collecting specimens in the field, mature spikelets are essential. This is determined by examining the usually whitish fertile lemma, which is firm and plump at maturity. Immature spikelets often are longer than mature ones (they shorten as they fatten); only mature spikelet length is used in the various manuals and keys. It is also important to note whether a plant is in its "vernal" or "autumnal" flowering phase before collecting. "Vernal" plants produce panicles only at the summits of the culms (typically April-June). "Autumnal" plants produce panicles from leafy axillary branches below the summit (typically July-September). The autumnal panicles in most species are much smaller than the vernal panicles (and often hidden by fasciated leaves), but the spikelets are the same. When collecting autumnal plants, it is important to select specimens still possessing their vernal leaf blades and panicles, even though these will likely be senescent. It is also important to collect the whole plant, with the basal rosette intact (whether senescent or of current year's growth). When several plants are growing together, compare the culm, leaf, and spikelet features for differences; *Dichanthelium* taxa are gregarious.

When analyzing the character of the culm internodes and nodes, look at the first elongate internode above the base (the lowest internode is often very short and uncharacteristic). Determining whether a node is bearded is often difficult. A bearded node usually is characterized by pubescence that is longer and of a different orientation or structure than that of the internodes and sheaths. Nodes with short pubescence generally are not regarded as bearded. Lower nodes are more likely to be bearded than upper nodes. Some internodes are described as "crisp-puberulent." This condition is characterized by a dense covering of minute hairs mostly less than 0.1 mm long, and usually cramped or curved. Glandular hairs or protuberences are often intermixed. When analyzing sheaths, look at those on the lower half of the culm. Senescent vernal sheaths often lose their pubescence (though in some species hair papillae are evident). All references in the key to sheath glabrousness or pubescence is without regard to the presence or absence of marginal hairs (cilia). A sheath that is glabrous except for marginal cilia is called glabrous. All culm leaves should be analyzed for blade characters; in general, the key relies on the size and character of the vernal blades. A "cordate" blade is one where the basal lobes of the blade extend outward and partially surround the culm when the culm is enclosed by the sheath. As with sheaths, references in the key to blade glabrousness or pubescence is without regard to marginal cilia. The ligule is an important diagnostic character for many *Dichanthelium* taxa; at least three ligules per specimen should be examined before making conclusions about its structure and length. Ligules form a distinct ring from a cartilaginous base at the inner summit of the sheath, in some species the ligule is membranous, but in most it is pubescent. Care must be taken to distinguish the pubescence of the ligule from any pubescence emanating from the inner surface of the blade base, and from marginal cilia. Ligules of senescent vernal leaves frequently lose their integrity. Spikelet shape as well
as length should be determined only from mature spikelets. Measure the length from the base of the first glume (usually at an articulation) to the apex of the second glume or sterile lemma (whichever is longer). A micrometer is essential for determining the length of spikelets, first glumes, ligules, and various pilosity features. Sometimes one-tenth of a millimeter is all that separates two Dichanthelium taxa.

Certain characters, particularly node bearding, cordate/non-cordate blade bases, and ligule length, can be quite variable, and an effort has been made to account for this variability in the key. Nonetheless, some specimens just won't "fit," and the road not taken may have to be reconsidered.

1 Plants densely tufted, often cushion-forming; leaves basally disposed, the blades ascending or spreading-ascending, not forming a distinct rosette of basal leaves shorter than the culm leaves; autumnal culms branching basally or from the lower nodes .............................................[D. nudicaule]  
1 Plants less densely or sparsely tufted, not cushion-forming; leaves well-distributed on the culm, usually much longer than the short, often broad and spreading basal rosette leaves; autumnal culms usually branching from the mid and upper nodes  
2 Spikelets 3.3-5.2 mm long .................................................................................................................................[D. dichotomum var. glabrifolium]  
2 Spikelets 3.0-3.2 mm long.  
3 Lower culm internodes variously hairy .............................................................................................................[D. dichotomum var. glabrifolium]  
3 Lower culm internodes glabrous ..........................................................................................................................[D. dichotomum var. glabrifolium]  
3 Spikelets 2.1-3.2 mm long.  
5 Larger culm blades 13-25 mm wide ................................................................................................................... [D. depauperatum]  
5 Larger culm blades < 13 mm wide.  
6 Culm nodes (at least the lower) bearded .......................................................................................................... [D. dichotomum var. glabrifolium]  
6 Culm nodes not bearded, the lowermost sometimes puberulent or sparsely hairy ............................................[D. dichotomum var. glabrifolium]

Key A - Plants densely tufted, often cushion-forming; leaves basally disposed, the blades ascending or spreading-ascending, not forming a distinct rosette of basal leaves shorter than the culm leaves; autumnal culms branching basally or from the lower nodes

1 Spikelets 2.4-4.5 mm long.  
2 Nodes, internodes, and sheaths glabrous; blades 4-13 cm, 5-8 mm, the surfaces smooth, glabrous; spikelets 2.4-2.9 mm long, glabrous; not known to produce axillary (autumnal) inflorescences .............................................................................................................[D. dicotomum var. glabrifolium]  
2 Nodes bearded or otherwise pubescent; internodes and sheaths variously pubescent to glabrate; blades 6-35 cm, 2-5 mm, one or both surfaces scabrous and often pubescent; spikelets 1.7-4.5 mm long, glabrous or pubescent; plants produce axillary (autumnal) inflorescences.  
3 Spikelets 2.8-3.8 (-4.5) mm long, the second glume and sterile lemma pointed or beaked and extended beyond the summit of the fertile lemma; first glume 1.2-2 mm long .............................................................................................................[D. depauperatum]  
3 Spikelets 1.7-2.8 mm long, the second glume and sterile lemma blunt or broadly pointed, not extending beyond the summit of the fertile lemma; first glume 0.7-1.2 mm long .............................................................................................................[D. linearifolium]  
4 Spikelets 0.9-2.3 mm long.  
4 Longer blades > 6 cm; if only 6 cm, then sheaths retrorsely long-pilose (D. laxiflorum).  
5 Spikelets 1.2-1.5 mm long, glabrous ..................................................................................................................[D. dichotomum var. glabrifolium]  
5 Spikelets 1.7-2.3 (-2.8) mm long, pubescent.  
6 Longer blades 10-35 cm long, 2-4 mm wide; sheaths glabrous to variously pilose, but not conspicuously retrorsely long-pilose; nodes variously pubescent to glabrate; spikelets 1.7-2.3 (-2.8) mm long, pubescent .............................................................................................................[D. linearifolium]  
6 Longer blades 6-18 cm long, 7-12 mm wide; sheaths conspicuously retrorsely long-pilose; nodes bearded with retrorse or spreading hairs; spikelets 1.9-2.3 mm long .............................................................................................................[D. linearifolium]  
4 Longer blades 1.5-6 cm; sheaths glabrous or pubescent, but not retrorsely long-pilose.  
7 Blades 1-3 mm wide, glabrous, eilicate or basally ciliate; spikelets 0.9-1.4 mm long.  
8 Spikelets pubescent, 1.2-1.4 mm long; blades involute, often falcate, 2.5-6 cm long ..................................................................................................................[D. chamaelonche ssp. breve]  
8 Spikelets glabrous, 0.9-1.2 mm long; blades flat, not falcate, 1.5-4 (-5) cm long ..................................................................................................................[D. chamaelonche ssp. chamaelonche]  
7 Blades 3-8 mm wide; spikelets 1.1-2.1 mm long (if < 1.5 mm, then blades either pubescent on one or both surfaces or ciliate to the apex).  
9 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous .............................................................................................................[D. strigosum var. leucoblepharis]  
9 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.  
10 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-1.8 mm long .............................................................................................................[D. strigosum var. glabrescens]  
10 Blades pilose, at least abaxially; spikelets 1.1-1.6 mm long .............................................................................................................[D. strigosum var. strigosum]

Key B - Spikelets 3.3-5.2 mm long

1 Nodes (at least lower) densely bearded with retrorse hairs; spikelets 3.7-5.2 mm long.  
2 Ligules 2.5-4 mm long; internodes pubescent with ascending or spreading hairs; blades 8-15 cm long, 10-25 mm wide; first glume 1.8-2.5 mm long .............................................................................................................[D. ravenelli]  
2 Ligule 0.4-0.9 (-1.3) mm long; internodes glabrous to puberulent; blades 7-12 cm long 12-40 mm wide; first glume 1.5-2.2 mm long .............................................................................................................[D. boscii]  
1 Nodes glabrous, pubescent, or sparsely pilose; spikelets (2.4-) 3.3-4.2 mm long.  
3 Ligule 1.6-3 mm long; blades 4-9 mm wide, > 10× as long as wide .............................................................................................................[D. oligosanthes var. oligosanthes]  
3 Ligule 0.3-1.5 mm long; if larger blades < 9 mm wide and mostly 15× or more as long, then ligule 0.5-1 mm long (D. fusiforme).  
4 Larger blades 2-6 (-8) mm wide, mostly 15× or more as long as wide; spikelets fusiform to elliptic, acute, basally constricted .............................................................................................................[D. fusiforme]  
4 Larger blades 6-35 mm wide, mostly 10× or less as long as wide; spikelets broadly elliptic to obovate, rounded to sub-acute, not basally constricted.  
5 Spikelets strongly papillos-hispid with spreading hairs 0.5-1 mm long; blades papillos-hispid .............................................................................................................[D. helbogii]  
5 Spikelets glabrous to pubescent with hairs < 0.5 mm long; blades glabrous, scabrous, or pubescent.  
6 Ligules 1-1.5 mm long; blades 5-10 cm long by 6-15 mm wide, glabrous or pubescent, basally rounded; spikelets glabrous to pubescent .............................................................................................................[D. oligosanthes var. scribnerianum]
Ligules 0.3-1 mm long; blades 7-35 cm long by 8-35 mm wide, glabrous or scabrous, basally cordate or rounded; spikelets pubescent to glabrate.

Sheaths (at least lower) papillose-hispid with spreading hairs; ligule 0.5-1.2 mm long, an eciliate membrane; culm blades 10-28 cm long; spikelets 2.4-3.6 mm long; first glume 1.2-1.8 mm long...............................D. clandestinum

Sheaths glabrous to scabrous (the upper papillose-pubescent in D. xanthophyllum); ligules 0.2-0.7 mm long, ciliate if more than 0.3 mm long; culm blades 5-18 cm long; spikelets 2.2-4.1 mm long; first glume 0.7-2.6 mm long.

Upper sheaths glabrous to softly villous basally; ligules 0.4-0.7 mm long, a short-ciliate membrane; culm blades 15-40 mm wide, the bases ciliate-clasping; panicules usually more than half as wide as long...........................................D. latifolium

Upper sheaths glabrous, puberulent, or papillose-pubescent; ligules 0-0.5 mm long, eciliate or ciliate; culm blades 5-25 mm wide, the bases ciliate-clasping or rounded; panicules less or more than half as wide as long.

Upper sheaths glabrous or puberulent; ligules 0.1-0.3 mm long, eciliate; culm blade bases ciliate-clasping; panicules usually more than half as wide as long; spikelets 2.2-3.7 mm long, elliptoid, pointed....D. commutatum var. commutatum

Upper sheaths papillose-pubescent; ligules 0.3-0.5 mm long, ciliate; culm blade bases rounded; panicules usually less than half as wide as long; spikelets 3.2-4.1 mm long, obovoid, blunt...........................................[D. xanthophyllum]

POACEAE

Key C - Spikelets 2.1-3.2 mm long, larger leaves 13-25 mm wide

1 Culm nodes, at least the lower, bearded (often retrorsely).
2 Ligule a stramineous to light brown membrane (with or without ciliate or lacerate extensions); peduncle and often internodes scabrous,.................................................................D. scabriusculum

2 Ligule entirely of white hairs; peduncle and internodes either smooth or densely hairy (velvety).
3 Lower internodes glabrous, without a viscid band below the nodes; larger blades 7-15 mm wide...............................D. dichotomum group
3 Lower internodes densely hairy except for a viscid band below the nodes; larger blades 10-20 mm wide......................D. scoparium

1 Culm nodes glabrous or slightly hairy, but not bearded.
4 Second glume and sterile lemma acute to short-acuminate, conspicuously longer than the fertile lemma; spikelets glabrous (occasionally sparsely pubescent in D. scabriusculum).
5 Panicle rachis Pellucid-punctate; ligule a stramineous to light brown membrane, with or without terminal ciliations; peduncle and often internodes scabrous; first glume 0.3-0.6 (-0.8) mm long, reniform to suborbicular...........................................D. scabriusculum
5 Panicle rachis not pellucid-punctate; ligule entirely of white hairs; peduncle and internodes smooth; first glume 0.7-1.2 mm long, ovate to lanceolate...............................................................D. yadkinense

4 Second glume and sterile lemma blunt to subacute, shorter than, equaling, or barely exceeding the fertile lemma; spikelets pubescent (sometimes sparsely so in D. clandestinum).
6 Sheaths, at least the lower, papillose-hispid with spreading hairs; blades 10-28 cm long..........................................D. clandestinum
6 Sheaths glabrous, puberulent, finely pubescent, or sparsely pilose; blades 5-18 cm long.
7 Ligule 0-0.3 mm long; spikelets 2.2-3.7 mm long, 1.1-1.3 mm wide; first glume 0.6-2.6 mm long.................................................................D. commutatum var. commutatum
7 Ligule 0.4-0.7 mm long; spikelets 2.9-3.9 mm long, 1.6-2.0 mm wide; first glume 1.5-2.2 mm long.............................................D. latifolium

Key D - Spikelets 2.1-3.2 mm long, larger culm blades < 13 mm wide, at least the lower culm nodes bearded with a usually spreading-ascending collar of dense and/or longish hairs

1 Ligule with a dense ring of short hairs 0.5-1 mm long in front of a usually less dense ring of longer hairs (pseudoligule) 1-5 mm long.
2 Nodes retrorsely bearded; internode and sheath hairs spreading to retrorse; blade surfaces velvety-pubescent or long-pilose.
3 Spikelets 2.5-3.2 mm long; longer hairs of pseudoligule 1-3 mm long; blade surfaces velvety-pubescent; panicle rachis densely pubescent; [of cedar glades and dry limestone soils] .................................................................[D. arachnoideum] [D. malacophyllum]
3 Spikelets 1.8-2.5 mm long; longer hairs of pseudoligule 3-5 mm long; blade surfaces long-pilose; [of dry sandy soil of pine and oak woodlands].................................................................D. villosissimum var. villosissimum

2 Node beard hairs spreading to ascending; internode and sheath hairs ascending to appressed; blade surfaces glabrate to appressed-pubescent.
4 Spikelets 2.5-3.1 mm long; lower culm blades usually glabrous adaxially except for long hairs at or near the margin (appearing ciliate), appressed-pubescent abaxially...........................................................................................................D. ovale var. ovale
4 Spikelets 2.1-2.6 mm long; lower culm blades usually sparsely appressed-pubescent on both surfaces, eciliate or ciliate at the base only. ...........................................................................................................D. ovale var. addisonii

1 Ligule a single structure, without a pseudoligule.
5 Ligule 2-5 mm long, ciliate ..........................................................................................................................D. acuminatum group
5 Ligule < 2 mm long, ciliate or membranous.
6 Ligule a stramineous to light brown membrane, with or without terminal ciliations; peduncle antorosely scabrous but not hairy.
7 Panicle rachis smooth, pellucid-punctate; first glume 0.3-0.6 (-0.8) mm long, as broad as or broader than long, truncate to obtuse; larger leaves 10-25 cm long, 8-15 mm wide; ligule 0.5-1.3 mm long; lowest elongate culm internode > 2 mm in diameter; lowest nodes usually glabrous or pubescent D. scabriusculum
7 Panicle rachis scabrous or smooth, not pellucid-punctate; first glume 0.5-1.1 mm long, longer than wide, rounded to acute; larger leaves 3.5-12 cm long, 3-9 mm wide; ligule 0.1-0.6 mm long; lowest elongate culm internode < 2 mm in diameter; lowest nodes retrorsely bearded or glabrous.
8 Lowest nodes usually retrorsely bearded; ligules (0.1-)0.3-0.6 mm long; largest vernal blades 7-12 cm long, (4.5-) 6-9 mm wide; panicle peduncle scabrous; spikelets ovate-lanceolate, acute, 2.0-2.4 mm long; first glume lanceolate, blunt to acute; fertile lemma smooth .................................................................D. speciosus 9 (Egyptianum)
8 Lowest nodes usually glabrous; ligules 0.1-0.2 (-0.3) mm long; largest vernal blades 3.5-7 cm long, 3-6 mm wide; panicle peduncle smooth; spikelets elliptic, blunt to acute, 1.6-2.2 mm long; first glume ovate to rotund, rounded to acute; fertile lemma papillose.................................................................D. lucidum

6 Ligule entirely of white hairs; peduncle variously hairy or glabrous, but not antorosely scabrous.
7 Culms to 1.5 m tall, with a broad, glabrous, viscid band below the nodes; blades of the lower leaves typically villous or velvety-pubescent.........................................................D. scoparium
POACEAE

9 Culms rarely exceeding 1 m, without a viscid band below the nodes; blades various.
10 Sheaths retrorsely pilose with hairs 2-3 mm long; basal leaves usually numerous, ascending, similar in size and shape to the culm leaves; culms branching only at the base.....................................................D. laxiflorum
10 Sheaths glabrous or pilose (if pilose, then hairs not both retrorse and 2-3 mm long); basal leaves rosette-forming, usually much smaller than the culm leaves at the nodes in age.
11 Culm internodes glabrous to sparsely pilose; culm nodes bearded with long retrorse hairs; blade surfaces glabrous to velvety-pubescent .....................................................................................................................D. dichotomum group
11 Culm internodes, at least the lower, strigose, pilose, or villous; culm nodes bearded with ascending or spreading hairs; blade surfaces glabrous or variably hairy.
12 Lower and often mid-culm nodes bearded with spreading, stiffish, and short-to-long hairs; mid-culm blades usually 15× or less as long as wide.
13 Blades stiff, often longitudinally ribbed, at least the lower villous or strongly pilose on the abaxial surface, and usually strongly pilose at least basally on the adaxial surface ..............................................................................................................D. consanguineum
13 Blades not noticeably stiff nor longitudinally ribbed, pubescent or strigose underneath, glabrous above or with a few long hairs near the base.
14 Spikelets 2.5-3.1 mm long; lower culm blades usually glabrous adaxially except for long hairs at or near the margin (appearing ciliate), appressed-pubescent abaxially ........................................................................D. ova/ var. ovale
14 Spikelets 2.1-2.6 mm long; lower culm blades usually sparsely appressed-pubescent on both surfaces, ciliate or ciliate at the base only.................................................................................................................................D. ova/ var. addisonii
15 Spikelets 2.9-4.0 mm long, fusiform to elliptic, acute, basally constricted; first glume 1.4-2.6 mm long.............D. fusiforme
15 Spikelets 1.5-3.1 mm long, obovate to elliptic-ovobate, obtuse to sub-acute, not basally constricted; first glume 0.6-1.5 mm long.
16 Spikelets 1.5-2.2 mm long; first glume 0.6-0.8 mm long; longer caudine blades 4-8 cm, 2-5 mm wide, <20× as long as wide; lower caudine leaves glabrous to sparsely pilose abaxially; autumnal leaves involute...D. aciculare ssp. aciculare
16 Spikelets 2.1-3.1 mm long; first glume 0.7-1.5 mm long; longer caudine blades 7-12 (-15) cm, 3-8 mm wide, <20× as long as wide; lower caudine leaves often villous especially (in D. species 1=arenicoloides); autumnal leaves involute or flat.
17 Caudine blades 4-8 mm wide, averaging 15-20 × as long as wide; autumnal blades flat; spikelets 2.3-3.1 mm long; first glume 0.8-1.5 mm long..........................................................D. angustifolium
17 Caudine blades 3-4 (-5) mm wide, averaging >20 × as long as wide; autumnal blades usually involute; spikelets 2.1-2.9 (-2.8) mm long...............................................................................D. species 1=arenicoloides
18 Spikelets (3.0-)3.2-3.8 mm long, fusiform, pointed at summit, attenuate at base, with both glumes attached 0.3-0.5 mm below sterile lemma, the autumnal spikelets 3.5-5.8 mm long; larger vernal blades 3-6 mm wide, the lower and mid-culm blades of similar width; autumnal blades involute..............................................................................D. fusiforme
18 Spikelets 1.8-3.1 mm long, obovate, blunt, and the base not attenuate except in D. species 1=arenicoloides with autumnal spikelets 2.3-3.1 mm long; larger vernal blades 2-8 mm wide, the lower usually wider and often shorter than mid-culm blades; autumnal blades involute or flat.
19 Longest vernal blades to 16 cm, widest vernal blades 4-8 mm, usually longitudinally wrinkled; vernal and autumnal spikelets 2.3-3.1 mm long; autumnal blades flat, the larger to 9 cm × 2-4 mm ..................................................................................D. angustifolium
19 Longest vernal blades to 6 (D. aciculare) or 12 (D. species 1=arenicoloides) cm long, 2-5 mm wide, not noticeably wrinkled; vernal spikelets 1.5-2.8 mm long, autumnal spikelets either 1.5-2.3 (D. aciculare) or 2.3-3.1 (D. species 1=arenicoloides); autumnal blades involute, the larger to 6 cm × 1.5 mm.
20 Longest vernal blades to 6 (-8) cm, widest vernal blades 2-5 mm; vernal and autumnal spikelets 1.7-2.3 mm long, blunt, not attenuate, the glumes attached <0.2 mm below sterile lemma; first glumes 0.6-0.9 mm long; larger autumnal blades to 3 cm by 1 mm....................................................................................................................................D. aciculare
20 Longest vernal blades to 12 cm, widest vernal blades 3-4 (-5) mm; vernal spikelets 2.1-2.8 mm long; autumnal spikelets 2.3-3.1 mm long, pointed, attenuate, the glumes attached 0.3-0.5 mm below sterile lemma; first glumes 0.7-1.5 mm long; larger autumnal blades to 6 cm by 1.5 mm..............................................................................D. species 1=arenicoloides

Key E - Spikelets 2.1-3.2 mm long, larger culm blades < 13 mm wide, culm nodes not bearded,
the lowermost sometimes puberulent or sparsely pilose

1 Ligule 1.6-4 mm long.................................................................................................................................D. oligosanthes var. oligosanthes
1 Ligule < 1.5 mm long.
2 Blades, at least the lower, cordate or subcordate at the base, mostly 6-12 mm wide.
3 Spikelets obpyriform when viewed dorsally, strongly plano-convex when viewed laterally, usually markedly reddish-purple basally; fertile lemma papillose.............................................................................................................................D. species 2 (=webberianum)
3 Spikelets elliptic to elliptic-obovoid when viewed dorsally or laterally, greenish to faintly purple-tinged basally; fertile lemma not papillose.
4 Internodes crisp-puberulent; ligules 0.3-0.9 mm long, ciliate; larger culm blades 4-6 cm long, 5-10 (-12) mm wide, broadest near the base; spikelets 2.1-2.7 mm long; first glumes 0.7-0.9 mm long ..........................................................D. commutatum var. ashei
4 Internodes glabrous to sparsely pubescent; ligules either 0.3-3 mm long and ciliate, or about 0.5 mm long and ciliate; larger culm blades 5-16 mm long, 6-25 mm wide, broadest above the base or broadly linear; spikelets 2-3.7 mm long; first glumes 0.5-2.6 mm long.
5 Ligule 0-0.3 mm long, ciliate; larger culm blades 5-25 mm wide; spikelets 2.2-3.7 mm long; first glumes 0.6-2.6 mm long..............

D. commutatum var. commutatum
5 Ligule about 0.5 mm long, ciliate; larger culm blades 6-13 mm wide; spikelets 2-3 mm long; first glumes 0.5-1 mm long ..........

D. boreale

2 Blades tapering to the base, 2-12 mm wide.
6 Ligule a stramineous to light brown membrane, with or without terminal ciliations; peduncle antrorsely scabrous but not hairy.
Panicle rachis smooth, pellucid-punctate; first glume 0.3-0.6 (-0.8) mm long, as broad as or broader than long, truncate to obtuse; larger leaves 10-25 cm long, 8-15 mm wide; ligule 0.5-1.3 mm long; lowest elongate culm internode > 2 mm in diameter; lowest nodes usually glabrous or pubescent ........................................ D. scabriusculum

Panicle rachis scabrous or smooth, not pellucid-punctate; first glume 0.5-1.1 mm long, longer than wide, rounded to acute; larger leaves 3.5-12 cm long, 3-9 mm wide; ligule 0.1-0.6 mm long; lowest elongate culm internode < 2 mm in diameter; lowest nodes retrorsely bearded or glabrous.

Lowest nodes usually retrorsely bearded; ligules (0.1-) 0.3-0.6 mm long; largest vernal blades 7-12 cm long, (4.5-) 6-9 mm wide; panicle peduncle scabrous; spikelets ovate-lanceolate, acute, 2.0-2.4 mm long; first glume lanceolate, blunt to acute; fertile lemma smooth ............................................................ D. species 9 (=cryptanthum)

Lowest nodes usually glabrous; ligules 0.1-0.2 (-0.3) mm long; largest vernal blades 3.5-7 cm long, 3-6 mm wide; panicle peduncle smooth; spikelets elliptic, blunt to acute, 1.6-2.2 mm long; first glume ovate to rotund, rounded to acute; fertile lemma papillose ................................................................. D. lucidum

Ligule of short white hairs or absent; peduncle variously hairy or glabrous, but not retrorsely scabrous.

Leaves basally disposed, usually matted or cushion-forming, larger than the mid and upper culm leaves; blade margins uniformly papillose-ciliate; culms branching only at the base, 0.5-3.5 dm tall; internodes glabrous or sparsely pubescent ................................................................. D. strigosum var. leucocepharts

Basal leaves rosette-forming, usually much smaller than culm leaves; blade margins glabrous, or ciliate only below the middle (or papillose-ciliate throughout in = lancearium, which has densely puberulent internodes); culms branching at the nodes in age, 1.5-7.5 mm tall.

Blades of mid-culm leaves typically long and stiff, acuminate, linear or narrowly lanceolate, usually > 10× as long as wide, only 2-5 mm wide when < 8 cm long.

Vegetative parts glabrous; lowest internodes and sheaths sometimes sparsely pubescent, blades and sheaths sometimes ciliate; mature panicles less than ¼ as wide as long, the branches erect-ascending, the spikelets subsecond; autumnal blades 4-10 cm long, involute, < 2 mm wide; spikelets 1.8-2.2 mm long; D. aciculare ssp. neunarthianum

Vegetative parts pubescent, at least in the lower portion of plant; mature panicles usually more than half as wide as long, the branches spreading-ascending, the spikelets not noticeably subsecond; autumnal blades 1-6 cm long, involute and < 2 mm wide in D. aciculare ssp. aciculare and D. species 1=arenicoloides, or to 9 cm long, flat and 2-4 mm wide in D. angustifolium; spikelets 1.5-3.1 mm long.

Spikelets (3.0-) 3.2-3.8 mm long, fusiform, pointed at summit, attenuate at base, with both glumes attached 0.3-0.5 mm below sterile lemma, the autumnal spikelets 3.5-3.8 mm long; larger vernal blades 3-6 mm wide, the lower and mid-culm blades of similar width; autumnal blades involute ................................................................. D. species 8 (=fusiforme)

Spikelets 1.8-3.1 mm long, obovate, blunt, and the base not attenuate (except in D. species 1=arenicoloides with autumnal spikelets 2.3-3.1 mm long); larger vernal blades 2-8 mm wide, the lower usually wider and often shorter than mid-culm blades; autumnal blades involute or flat.

Longest vernal blades to 16 cm, widest vernal blades 4-8 mm, usually longitudinally wrinkled; vernal and autumnal spikelets 2.3-3.1 mm long; autumnal blades flat; the larger to 9 cm by 2.4 mm; D. angustifolium

Longest vernal blades to 6 (D. aciculare ssp. aciculare) or 12 (D. species 1=arenicoloides) cm long, 2-5 mm wide, not noticeably wrinkled; vernal spikelets 1.5-2.8 mm long, autumnal spikelets either 1.5-2.3 (D. aciculare ssp. aciculare) or 2.3-3.1 (D. species 1=arenicoloides); autumnal blades involute, to the larger to 6 cm by 1.5 mm.

Longest vernal blades to 12 cm, widest vernal blades 3-4 (-5) mm; vernal spikelets 2.1-2.8 mm long; autumnal spikelets 2.3-3.1 mm long, pointed, attenuate, the glumes attached 0.3-0.5 mm below sterile lemma; first glumes 0.7-1.5 mm long; larger autumnal blades to 6 cm by 1.5 mm; D. species 1=arenicoloides

Longest vernal blades to 6 (-8) cm, widest vernal blades 2-5 mm; vernal and autumnal spikelets 1.7-2.3 cm long, blunt, not attenuate, the glumes attached <0.2 mm below sterile lemma; first glumes 0.6-0.9 mm long; larger autumnal blades to 3 cm by 1 mm; D. aciculare ssp. aciculare

Blades of mid-culm leaves lanceolate, thin or firm but not stiff, usually < 10× as long as wide, usually 7 mm or more wide when as much as 8 cm long.

Spikelets 2.9-3.8 mm long, broadly elliptic, rounded at the summit, with broad and thick nerves ............................................................... D. oligosanthes var. scriberianum

Spikelets 2.1-2.9 mm long, elliptical or obovate, rounded or pointed at the summit, the nerves often raised, but not broad and thick.

Culm internodes and sheaths glabrous or sparsely pilose.

Spikelets strongly plano-convex when viewed laterally, obpyriform when viewed dorsally, 2.2-2.6 mm long; fertile lemma and palea papillose; first glume and base of second glume usually strongly reddish-purple; D. oligosanthes var. scriberianum

Spikelets biconvex to elliptic when viewed laterally, variously shaped but not obpyriform when viewed dorsally; fertile lemma and palea smooth or reticulate (or papillose in D. lucidum with weak and sprawling culms and spikelets 1.7-2.3 mm long); first and second glume various.

Culms tending to be stiffly erect; blades erect or erect-sprawling, broad, usually not always tapering from just below the middle to both ends, often yellowish green; plants not or only sparingly branched in age, not developing leafy fascicles of reduced leaves and inflorescences; D. boreale

Culms not stiffly erect; leaves usually spreading, broad or narrow, dark to bright green; plants often freely branched in age, becoming top-heavy with a mass of fascicled, reduced leaves and inflorescences; D. dichotomum group

Culm internodes crisp-puberulent (sparsely so in D. species 2 (=webberianum); sheaths puberulent or glabrous.

Spikelets elliptic, sub-acute to pointed, greenish or faintly purple-tinged basally ........................................ D. commutatum var. ashei

Spikelets strongly plano-convex when viewed laterally, obpyriform when viewed dorsally, broadly rounded, usually markedly reddish-purple basally.

Fertile lemma and palea papillose; spikelets 2.2-2.6 mm long; lower culm blades 6-12 mm wide, glabrous ........................................ D. species 2 (=webberianum)

Fertile lemma and palea smooth (minutely reticulate but not papillose); spikelets (1.8) 1.9-2.2 (-2.3) mm long; lower culm blades 4-8 mm wide, glabrous, glabrate, or puberulent (especially abaxially) ........... D. species 3 (=lancearium)

Key F - Spikelets 0.8-2.0 mm long, lower culm internodes variously hairy
1 Longer hairs of ligule 2-5 mm long.
2 Ligule without a distinct ring of short hairs in front of the long hairs.
3 Blades of mid-culm leaves linear or narrowly lanceolate, stiff, acuminate, often involute, 4-10 cm long, 2-5 mm wide, about 15-20× as long as wide............ D. aciculare ssp. aciculare
4 Blades of mid-culm leaves lanceolate, thin or firm but not stiff, length and width various, less than 15× as long as wide................................. D. acuminatum group

1 Longer hairs of ligule < 2 mm long.
2 Ligule with a distinct ring of short hairs in front of the long hairs.
4 Peduncle, panicle axis, and sheaths puberulent with hairs 0.1 mm long; larger blades 3-6 cm long, 3-5 mm wide; spikelets 1.3-1.7 mm long

POACEAE

2 Ligule 1-5 mm long.
3 Ligule < 1 mm long.
4 Ligule (1.5-) 2-5 mm long; sheaths glabrous to variously pube scent; internodes glabrous or pubescent; nodes glabrous, or bearded with ascending, spreading, or tangled hairs; leaves 3-10 cm long, 3-10 mm wide; spikelets 0.8-1.9 mm long

1 Blades 1.5-4 (-5) cm long; spikelets 0.9-1.2 mm long.......................... D. chamaeleonche
2 Blades 4-12 (-20) cm long, some at least 7 cm long; spikelets 1.2-1.5 mm long........................................ [D. dichotomum var. glabrofolium]
3 Blades 2-10 mm wide, pubescent or glabrous, the margins coarsely papillose-ciliate throughout; spikelets 1.1-2.1 mm long, glabrous or pubescent; autumnal form branched from basal nodes only.
4 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous ........................................ D. strigosum var. leucolepharus
5 Blades 1.1-1.8 mm long; blade surfaces pubescent or glabrous.
6 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-2.1 mm long.......................... D. strigosum var. glabrescens
7 Blades with white-beige cartilaginous margins 0.2 mm wide; ligule 1-5 mm long; spikelets 1.4-1.7 mm long; autumnal form branching from middle and upper nodes ........................................ D. tenue
8 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-1.8 mm long.......................... D. strigosum var. strigosum
9 Blades pilose; spikelets 1.5-2.1 mm long.................................................................. D. strigosum var. leucolepharus
10 Blades glabrous, 1.1-1.6 mm long; blade surfaces pubescent or glabrous.
11 Blades 0.7-1.5 mm long; first glume acute; spikelets elliptic when viewed dorsally, biconvex or elliptic when viewed laterally, not strongly nerved.......................... D. columbiae
12 Blades 0.9-1.2 mm long; spikelets 0.9-1.5 mm long, glabrous; autumnal form branching from lower and mid nodes as well as from basal nodes.
13 Blades 0.9-1.2 mm long; spikelets 0.9-1.5 mm long, glabrous; autumnal form branching from lower and mid nodes as well as from basal nodes.
14 Blades 0.5-0.8 mm long; lower culm blades 2-5 mm wide.............. D. portoricense
15 Spikelets (1.8-) 1.9-2.2 (-2.3) mm; first glume 0.8-1.2 mm long; lower culm blades 4-8 mm wide................................. D. species 3 (=lancearium)
16 Spikelets 1.5-1.8 mm long; first glume 0.5-0.8 mm long; lower culm blades 2-5 mm wide................................. D. portoricense
17 Spikelets 1.1-1.5 mm long.................................................. D. leucothrix
18 Spikelets (1.8-) 1.9-2.2 (-2.3) mm; first glume 0.8-1.2 mm long; lower culm blades 4-8 mm wide................................. D. meridionale
19 Spikelets 1.5-1.8 mm long; blade surfaces pubescent or glabrous.
20 Spikelets 1.5-2.1 mm long; blade surfaces glabrous ........................................ D. strigosum var. leucolepharus
21 Blades with white-beige cartilaginous margins 0.2 mm wide; spikelets 1.4-1.7 mm long; autumnal form branching from middle and upper nodes ........................................ D. tenue
22 Blade margins coarsely papillose-ciliate throughout; spikelets 1.1-2.1 mm long; autumnal form branching from the base.
23 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous ........................................ D. strigosum var. leucolepharus
24 Spikelets glabrous, 1.1-1.8 mm long; blade surfaces pubescent or glabrous.
25 Blades glabrous, or sparsely pilose only near the adaxial base; spikelets 1.4-1.8 mm long.......................... D. strigosum var. strigosum
26 Blades pilose; spikelets 1.5-2.1 mm long; blade surfaces pubescent or glabrous.
27 Blades glabrous, 1.1-1.6 mm long; blade surfaces pubescent or glabrous.
28 Spikelets glabrous, 1.1-1.6 mm long; blade surfaces pubescent or glabrous.
29 Spikelets glabrous, 1.1-1.6 mm long; blade surfaces pubescent or glabrous.
30 Blade margins coarsely papillose-ciliate throughout; spikelets 1.1-2.1 mm long; autumnal form branching from the base.

Key G - Spikelets 0.8-2.0 mm long, lower culm internodes glabrous

1 Ligule 1-5 mm long.
2 Ligule 1-2 mm long; sheaths sparsely to moderately spreading short-pilose; internodes glabrous; nodes retrorsely bearded; leaves 1-4 cm long, 2-5 mm wide; spikelets 1.2-1.4 mm long.......................... D. species 10 (=cartifolium)
3 Ligule (1.5-) 2-5 mm long; sheaths glabrous to variously pubescent; internodes glabrous or pubescent; nodes glabrous, or bearded with ascending, spreading, or tangled hairs; leaves 3-10 cm long, 3-10 mm wide; spikelets 0.8-1.9 mm long................................ D. acuminatum group
4 Ligule < 1 mm long.
5 Basal leaves rosette-forming, usually much smaller than the culm leaves, not matted or cushion-forming; culms branching at the mid and upper nodes in age.
6 Blades of mid-culm leaves typically long and acuminate, linear or broadly lanceolate, usually 10-20× as long as wide, only 2-5 mm wide when < 8 cm long.
7 Spikelets (glandular-) papilllose-pubescent; blades 1-3 (-5) mm wide; first glume 0.8-1.0 mm long; culms to 4 dm tall.......................... D. aciculare ssp. nevaranthum
8 Spikelets glabrous; blades 3-8 mm wide; first glume 0.3-1.1 mm long; culms to 10 dm tall.
9 Leaves 3-8 mm wide; panicle (8-) 20-40 mm wide; first glume 0.6-1.1 mm long, blunt to acute............ D. dichotomum group
10 Leaves 3-5.5 mm wide; panicle 2-5 mm wide; first glume 0.3-0.4 mm long, truncate to obtuse............... D. hirstii
1 Internodes glabrous.

2 Ligule 1-2 mm long; sheaths sparsely to moderately spreading short-pilose; nodes bearded with retrorse or spreading hairs; spikelets 1.9-2.3 mm long .......................................................... D. laxiflorum

3 Panicles 8-12 cm long, ¼-

4 Internodes glabrous to pubescent (especially lower); larger vernal blades usually longer than 6 cm, the basal margin prominently

5 Peduncle, panicle axis, and/or sheaths of vernal culms puberulent with hairs 0.1 mm long, sometimes also pubescent with longer hairs, but not grayish-villous; larger blades 2-7 cm, 2-7 mm wide.

8 Sheaths and internodes of vernal culms gray-villous with a dense, tangled, or matted mixture of slender hairs 2-4 mm long, variously ascending, spreading, and retrorse, papillose or non-papillose, often with shorter hairs beneath; blades velvety-puberulent on abaxial surface, the margins ciliate for half or more of their length .................................................. D. acuminatum var. lindheimeri

9 Mid-culm blades 6-11 (-14) mm wide, the uppermost 3-9 cm long ........................................ D. sphaerocarpon var. sphaerocarpon

9 Basal leaves similar to or larger than the mid and upper culm leaves, often matted or cushion-forming; culms branching at the base (also at mid and upper nodes in D. chamaeloonche vars. and D. dichotomum var. glabriofolium).

10 Longer blades > 6 cm; if only 6 cm, then sheaths retrorsely long-pilose (D. laxiflorum).

11 Spikelets 1.2-1.5 mm long, glabrous .......................................................... D. dichotomum var. glabriofolium

11 Spikelets 1.7-2.3 (-2.8) mm long, pubescent.

11 Longer blades 6-18 cm long by 7-12 cm wide; sheaths conspicuously retrorsely long-pilose; nodes bearded with retrorse or spreading hairs; spikelets 1.9-2.3 mm long .......................................................... D. laxiflorum

12 Longer blades 10-35 cm long by 2-4 mm wide; sheaths glabrous to variably pilose, but not conspicuously retrorsely long-pilose; nodes variously pubescent to glabrate; spikelets 1.7-2.3 (-2.8) mm long .......................................................... D. linearifolium

13 Blades 3-8 mm wide; spikelets 1.1-2.1 mm long (if < 1.5 mm, then blades either pubescent on one or both surfaces or ciliate to the apex).

15 Spikelets pubescent, 1.5-2.1 mm long; blade surfaces glabrous ................................................. D. strigosum var. leucoblepharis

16 Blades pilose, at least abaxially; spikelets 1.1-1.6 mm long .......................................................... D. strigosum var. strigosum

Key to the *Dichanthelium acuminatum* group

1 Internodes glabrous.

2 Ligule 1-2 mm long; sheaths sparsely to moderately spreading short-pilose; nodes retrorsely bearded; leaves 1-4 cm long, 2-5 mm wide; spikelets 1.2-1.4 mm long.................................................. D. species 10 (= curtifolium)

3 Panicles 8-12 cm long, ⅓½ as wide, bearing 250 or more spikelets; spikelets 1.4-1.6 mm long; ligule (1.5-) 2-3 mm long; larger blades 7-11 cm long, often tinged with purple .............................................................. D. spectratum

3 Panicles 8-12 cm long, ⅓½ as wide, bearing < 200 spikelets; spikelets 1.1-1.6 mm long; ligule 2-5 mm long; larger blades 4-10 cm long.

4 Internodes glabrous to pubescent (especially lower); larger vernal blades usually longer than 6 cm, the basal margin prominently

5 Peduncle, panicle axis, and/or sheaths of vernal culms puberulent with hairs 0.1 mm long, sometimes also pubescent with longer hairs, but never grayish-villous; larger blades 2-7 cm, 2-7 mm wide.

6 Spikelets 0.8-1.1 mm long; blades 2-4.5 cm long, 2-5 mm wide; sheaths sparsely puberulent, lacking papillose-based longer hairs .............. D. wrightianum

6 Spikelets 1.1-1.7 mm long; mid-culm blades generally 3-7 cm long and 3-7 mm wide; sheaths with some papillose-based hairs 2 mm or more long.

7 Larger mid-culm blades 4-7 cm long, 4-7 mm wide, glabrous to sparsely pubescent adaxially; ligule 1-5 mm long; spikelets 1.1-1.5 mm long .......................................................... D. leucothrix

7 Larger mid-culm blades 3-6 cm long, 3-5 mm wide, long-pilose adaxially; ligule often with a ring of hairs < 1 mm and scattered longer hairs to 4 mm; spikelets 1.3-1.7 mm long .......................................................... D. meridionale

5 Peduncle, panicle axis, and/or sheaths of vernal culms glabrous, or pilose, or grayish-villous with some shorter hairs 0.2-0.5 mm long, but not puberulent with hairs 0.1 mm long; larger blades 4-12 cm long, 4-12 mm wide.

8 Sheaths and internodes of vernal culms gray-villous with a dense, tangled, or matted mixture of slender hairs 2-4 mm long, variously ascending, spreading, and retrorse, papillose or non-papillose, often with shorter hairs beneath; blades velvety-puberulent on abaxial surface, the margins ciliate for half or more of their length .................................................. D. acuminatum var. acuminatum

8 Sheaths and internodes of vernal culms puberulent, pubescent or papillose-pilose to hirsute with ascending straight hairs, but never grayish-villous; blades glabrous to variously pilose abaxially, but not velvety-puberulent, the margins eciliate or ciliate only below the middle.

9 Spikelets 0.8-1.1 mm long; blades 2-4.5 cm long, 2-5 mm wide ........................................................................ D. wrightianum

9 Spikelets 1.1-2.0 mm long; blades 3-12 mm long, 3-12 mm wide. .......................................................... D. acuminatum var. fasciculatum

10 Peduncle, panicle axis, and sheaths lacking hairs or papilae, at least near mid-length. .......................................................... D. acuminatum var. lindheimeri

10 Blades 5-12 cm long, 6-12 mm wide; spikelets 1.5-2.0 mm long; peduncle, panicle axis, and sheaths variously pilose, but lacking puberulent hairs 0.1 mm long .......................................................... D. acuminatum var. fasciculatum

11 Blades 3-7 cm, 3-7 mm wide; spikelets 1.1-1.7 mm long; puberulent hairs 0.1 mm long often present on peduncle, panicle axis, or sheaths.
Key to the *Dichanthelium* *dichotomum* Group

1 Lower cauline nodes bearded, the hairs usually retrorse.

2 Spikelets glabrous.

3 Ligule an eciliate membrane; leaves 3.5-7 cm long by 1-5 mm wide. ................................................................. *D. leucothrix*

4 Spikelets 0.9-1.4 mm long; vernal cauleine blades 1.5-4 (-5) cm long and 1-5 mm wide; internodes or sheaths glabrous or pubescent.

   5 Spikelets 1.2-1.4 mm long; sheaths spreading-pilose; vernal cauleine blades 2-5 mm wide; ligule 1-2 mm long; node beard hairs usually spreading or reflexed; internodes glabrous .................................................... *D. species 10 (= curtfolium)*

   5 Spikelets 0.9-1.2 mm long; sheaths glabrous; vernal cauleine blades 1-2 (-3) mm wide; ligule < 1 mm long; node beard hairs erect and often only partially encircling the node; internodes glabrous or puberulent ................................................................. *D. chamaeloonce*

4 Spikelets 1.4-2.3 mm long; vernal cauleine blades 5-12 cm long and 3-15 mm wide; internodes and sheaths glabrous.

6 Spikelets 1.8-2.3 mm long; first glume 0.6-1.1 mm long; fertile lemma 0.8-1.0 mm wide; widest vernal blades 3-8 (-10) mm wide; nodes, often only the lower, usually sparsely to moderately bearded with retrorse hairs ................................................................. *D. dichotomum var. dichotomum*

6 Spikelets 1.4-1.9 mm long; first glume 0.3-0.6 (-0.7) mm long; fertile lemma 0.6-0.8 mm wide; widest vernal blades 7-15 mm wide; usually all nodes densely bearded with retrorse hairs ................................................................. *D. dichotomum var. ramulosum*

2 Spikelets pubescent.

7 Spikelets 1.2-1.4 mm long; sheaths spreading-pilose; vernal cauleine blades 1-4 cm long and 2-5 mm wide; ligule 1-2 mm long .................. *D. species 10 (= curtfolium)*

7 Spikelets 1.4-2.8 mm long; sheaths glabrous to appressed-pilose; vernal cauleine blades 5-12 cm long and 5-15 mm wide; ligule < 1 mm long.

8 Usually all culm nodes bearded; internodes glabrous, or middle and upper internodes and peduncle sparsely to moderately spreading short-hairy, sometimes also glandular; upper as well as lower vernal sheaths and both surfaces of cauleine blades pubescent, often densely so; spikelets (1.5-) 1.8-2.2 mm long; [of dry rocky or sandy basic soil and barrens] ................................................................. *D. annulum*

8 Only lower culm nodes bearded; internodes glabrous; at least middle and upper cauleine blades glabrous; spikelets 1.4-2.8 mm long; [mostly of wet acid soils and mesic to dry woodlands].

9 Spikelets (2.0-) 2.2-2.8 mm long; first glume 0.5-1.3 mm long; fertile lemma 1.8-2.3 mm long; lowest vernal cauleine blades pubescent at least abaxially ................................................................. *D. matamuskeseetense*

9 Spikelets 1.4-2.2 mm long; first glume 0.3-0.9 mm long; fertile lemma 1.4-1.7 mm long; lowest vernal cauleine blades glabrous.

10 Spikelets 1.7-2.2 mm long; first glume 0.6-0.9 mm long; fertile lemma 0.7-1.0 mm wide ................................................................. *D. dichotomum var. nitidum*

10 Spikelets 1.4-1.9 mm long; first glume 0.3-0.6 (-0.8) mm long; fertile lemma 0.6-0.8 mm wide ................................................................. *D. dichotomum var. ramulosum*

1 Lower cauleine nodes glabrous or puberulent, but not bearded.

11 Spikelets pubescent.

12 Spikelets (1.5-) 1.7-2.7 mm long, if shorter than 1.8 mm then fertile lemma and palea densely papillose; culms soon sprawling.

13 Spikelets (1.5-) 1.7-2.3 mm long, glabrous (rarely pubescent); first glume 0.7-1.1 mm long; fertile lemma and palea densely papillose at 20× ................................................................. *D. lucidum*

13 Spikelets 2.2-2.7 mm long; pubescent; first glume 1.0-1.4 mm long; fertile lemma and palea smooth or with a few weak papillae at 20× ................................................................. *D. sphagnicola*

12 Spikelets 1.2-1.7 mm long; fertile lemma and palea smooth; culms erect.

14 Blades involute and often falcate; 3-6 cm long, about 1.5 mm wide when flattened, 20-50× as long as wide; lower internodes often strongly strongly; spikelets 1.2-1.4 mm long, or 5-12-cm long by 3-15 mm wide; internodes glabrous or pubescent, if not, then only the lower, usually sparsely to moderately bearded with retrorse hairs, node beard hairs erect and often only partially encircling the node; internodes glabrous or puberulent ................................................................. *D. chamaeloonce*

14 Blades neither involute (except apically) nor falcate; 1-7 cm long, 1.5-7 mm wide, about 10× as long as wide; lower internodes glabrous or sparsely pilose, but not strigose; spikelets 1.1-1.7 mm long; culms 15-60 cm long.

15 Blades 1.3-5 cm long, 1.5-(-4) mm wide, the cartilaginous margins typically gray-green to white-beige and about 0.1 mm wide; spikelets 1.2-1.5 mm long; culms to 40 cm long ................................................................. *D. ensifolium*

15 Blades 2.7 cm long, 3-6 mm wide, the cartilaginous margins typically white-beige and about 0.2 mm wide; spikelets (1.2-) 1.4-1.7 mm long; culms to 60 cm long ................................................................. *D. tenue*

11 Spikelets glabrous.

16 Cauline leaves mostly basally disposed, strongly ascending, much larger than the 2-3 remote middle and upper cauline leaves of fertile culms; spikelets 2.4-2.9 mm long; culms branch from basal and lower nodes, but are not known to produce autumnal inflorescences ................................................................. *D. nudicaule*

16 Cauline leaves well-distributed along the culm, > 3, gradually reduced upwards and often spreading; spikelets 0.9-2.6 mm long; culms produce autumnal inflorescences from lower, middle, and/or upper nodes, if from lower only, then spikelets only 0.9-1.2 mm long.

17 Fertile lemma and palea densely papillose; culms weak, soon sprawling over other vegetation .................................................. *D. lucidum*

17 Fertile lemma and palea smooth, with few or no papillae; culms stiffer, erect to ascending.

18 Spikelets 0.9-1.5 mm long; vernal blades 1-4 mm wide.

19 Spikelets 0.9-1.2 mm long; blades 1.5-4 (-5) cm long, 1.2-5 (-3) mm wide, mostly 15-20 times as long as wide; autumnal plants cushion-forming ................................................................. *D. chamaeloonce ssp. chamaeloonce*

19 Spikelets 1.2-1.5 mm long; blades 1-12 (-20) cm long; autumnal plants not cushion-forming.

20 Blades 1.3-5 (-4) cm long, 1.5-3 (-4) mm wide, about 10× as long as wide; autumnal plants sparsely tufted ................................................................. *D. ensifolium*

20 Blades 4-12 (-20) cm long (the longer at least 7 cm); 2-4 mm wide; 20-30× times as long as wide; spikelets 2.1-2.6 mm long, some or most acute to beaked, second glume and sterile lemma extending 0.3-0.5 mm beyond fertile lemma in at least some spikelets .............
Dichanthelium aciculare (Desvaux ex Poiret) Gould & Clark var. aciculare. Needle Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA): sandy woods and fields; common (uncommon in GA, NC, and SC Piedmont, rare in VA Piedmont, rare in DE Coastal Plain). May-October. NJ south to n. FL, west to TX and OK, also in West Indies and n. South America. Blades typically are strongly involute. Can be confused with autumnal forms of D. ovale var. addisonii, which has vernal blades 5-10 mm wide. Plants referable to Panicum chrysopsidifolium by HC have ligules <1 mm long; blades 5-10 cm long and 3-5 mm wide; densely villous nodes, internodes, sheaths, and blades; and villous, obovate spikelets 1.9-2.2 mm long. This entity needs further study. [= Panicum aciculare Desvaux ex Poiret – RAB; < P. aciculare – C; = D. aciculare sp. aciculare – FNA; > P. aciculare – G, HC, S; > P. chrysopsidifolium Nash – G, HC, S; > P. bennettense M.V. Brown – HC, S; < D. aciculare – K, Z]

Dichanthelium acuminatum (Swartz) Gould & Clark var. acuminatum. Woolly Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA): on dryish sandy or clayey soils of open woods and disturbed areas; common. May-October. MA south to FL, west to TX, also in West Indies, Mexico, Central America, and n. South America. Internodes and sheaths gray-villous with usually non-papillate hairs. Plants tend to be low and "bushy" with several spreading-ascending culms and dense autumnal branching. See note at end of descriptions regarding synonymy. It appears that its concept of ssp. lanuginosum includes Panicum pinetorum of s. FL, with spikelets 2.3-3 mm long according to Silveux (1942). The plants from the Piedmont of NC match descriptions of Panicum ovinum, known from dry to moist open ground and prairies in e. TX, MS, and AR when last recognized (HC). Both of these taxa are treated here as synonyms of ssp. neuranthum. [= FNA; > Panicum neuranthum Grisebach – RAB, HC, S; > P. ovinum Scribn & J.G. Smith – HC, S; > P. pinetorum Swallen – HC, S; < D. aciculare – K, Z]

Dichanthelium caerulescens (Grisebach) Freckmann & Lelong, Nerved Witch Grass. Maritime wet grasslands, Piedmont prairie-like barrens. May-November. Disjunct in se. and central NC, se. SC, GA, FL, MS, e. TX, AR, Bahamas, Cuba, and Belize. Can occur with the similar-appearing D. caerulescens, from which it differs by having spikelets that are longer (1.8-2.2 mm vs. 1.4-1.8), rounder rounded vs. oblong to sub-acute, and pubescent vs. glabrous; longer first glumes (0.8-1.0 mm vs. 0.3-0.8); leaves 15× or more as long as wide vs. 10-15×; and a nearly strict panicle. FNA gives a spikelet length of 2-2.8 mm, well beyond the length of spikelets on specimens we have seen. Although FNA includes Panicum caerulescens, which has vernal blades 3-10 mm wide; upper sheaths not glutinous-warty; spikelets 1.4-2.3 mm long, blunt to subacute, second glume and sterile lemma often equal to or shorter than fertile lemma, or extending < 0.3 mm beyond it. Ligule an elate membrane; largest vernal blades 3-6 cm long, usually 10-15× as long as wide. 23 Spikelets 1.4-1.8 mm long; first glume 0.3-0.8 mm long; fertile lemma 1.3-1.5 mm long; mature vernal panicles usually short-exserted with ascending branches; fresh foliage bluish-glaucous. 24 Vernal cauline blades spreading to deflexed, flexuous; [of wet-mesic to dry woods and thickets]...
POACEAE

*Dichanthelium* angustifolium (Elliot) Gould, Narrow-leaved Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): sandy pinelands and fields; common (rare in Mountains, rare in DE and VA). May-October. NJ south to FL, west to AR and e. TX. Vernal blades typically are flat (often involute distally). Can be confused with *D. consanguineum*, which has spreading-piloose nodes and blades 10-15× as long as wide; *D. angustifolium* blades typically are 20× or more as long as wide. Plants with involute blades to 8 cm long, spikelets 2.1-2.5 mm long, and first glumes 0.7-1.1 mm long are referable to *Panicum species* 1*arcanoides*. They are transitional to *D. aciculare*. [= Panicum angustifolium Elliot – RAB, F, G; < P. aciculare Desvauex ex Poiré – C; = D. aciculare ssp. angustifolium (Elliot) Freckmann & Lelong – FNA; > P. angustifolium – HC, S; > P. arcanoides Ashe – HC, S; < D. aciculare – K, Z]

*Dichanthelium annulatum* (Ashe) LeBlond, Ringed Witch Grass. Pd (DC, MD, NC, SC, VA), Cp (DC, NC, MT): dry sandy or rocky soil of open woods, dry grasslands, and barrens, and glades over serpentine, limestone, calcareous shale, and other high pH dry soils; rare. May-October. NJ, IN, and MO south to AL and MS, primarily in the Appalachian Province with very few occurrences in the Coastal Plain. One of the more distinctive taxae within the *D. dichotomum* group by morphology, habitat, and range. Plants from se. MA with all leaves pubescent, glabrous internodes, and spikelets 2.2-2.5 mm long were described as *Panicum annulatum* var. glabrescens, but belong to *D. mattamuskeetense*. [= Q; < P. dichotomum Linnaeus – RAB, C, GW; = P. annulatum Ashe – F, HC, S; = P. annulatum var. annulatum – G; < D. dichotomum ssp. mattamuskeetense (Ashe) Freckmann & Lelong – FNA; < D. dichotomum (Nash) Lelong – X; = D. dichotomum (Nash) Gould – K, Z; > P. dichotomum var. mattamuskeetense (Ashe) Lelong – X]

*Dichanthelium boreale* (Nash) Freckmann, Northern Witch Grass. Pd (GA, NC, VA), Mt (GA, NC, VA): open woods and grassy slopes, usually in moist soil; rare. April-September. NL (Newfoundland) and ON south to NC, GA, and AR. Our plants are *Panicum bicknellii*, regarded as a "putative hybrid" (along with = *P. calliphilum*) by FNA, which cites WV as the southern limit of *D. boreale*. [= K, Z; > Panicum bicknellii Nash – RAB, F, HC, S; > P. boreale Nash – C, F, G, HC; > P. calliphilum Ashe – F, HC; > D. boreale – FNA; > P. bicknellii var. bicknellii – G; > P. bicknellii var. calliphilum (Ashe) Gleason – G]

*Dichanthelium caerulescens* (Hackel ex Hitchcock) Correll, Blue Witch Grass. Cp (NC, VA): marshes, swamps, wet pinelands, maritime grasslands, damp sandy soil; rare. June-October. NJ to NC, and from FL to LA, also in the Bahamas and West Indies. Not treated by FNA, where it presumably would have been placed in synonymy with *D. dichotomum* ssp. roanokense. [= Q; < Panicum dichotomum Linnaeus – RAB, GW; = P. caerulescens Hackel ex Hitchcock – F, HC, S; < D. dichotomum ssp. roanokense – FNA; < P. roanokense Ashe – G; < D. dichotomum var. dichotomum – K, Z; < D. dichotomum var. roanokense (Ashe) Lelong – X]

*Dichanthelium chamaeloon* (Trinius) Freckmann & Lelong ssp. chamaeloon, Carpet Witch Grass. Cp (GA, NC, SC, VA): moist pine savannas and flatwoods, pineland pondshores; uncommon (rare in VA). April-September. SE. VA south to FL, west to LA, also in Cuba and Belize. Internodes can be glabrous or puberulent, and nodes glabrous, pubescent, or bearded, but the glabrous spikelets 0.9-1.2 mm long are diagnostic. The concept of this taxon in FNA (as ssp. chamaeloon) appears to include *D. dichotomum* var. glabriofolium (see descriptions of Floridian *D. chamaeloon* ssp. breve and *D. dichotomum* var. glabriofolium). [= Panicle chamaeloon Trinius – RAB, G, GW, HC, S; = P. ensifolium Baldwin – C; < D. chamaeloon ssp. chamaeloon – FNA; < D. dichotomum (Nash) Gould var. ensifolium (Baldwin) Gould & Clark – K, Z; = P. chamaeloon var. chamaeloon – X]

*Dichanthelium clandestinum* (Linnaeus) Gould, Deer-tongue Witch Grass. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (NC, VA): dry to moist thin woods and open ground, usually in sandy soil; common (uncommon in NC, and SC Coastal Plain). May-October. NS and QC south to n. FL, west to IA, KA, and TX. [= FNA, K, Z; = Panicum clandestinum Linnaeus – RAB, C, F, G, HC, S, WV, X]

*Dichanthelium columbianum* (Scriber) Freckmann, American Witch Grass. Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): shaded to filtered woodlands, ditches and low areas, and often in moist sandy soil; common (uncommon in GA, NC, and SC Coastal Plain). May-October. May-October. MA south to FL and MS, west to MI, MO, and OK. [= Panicle commutatum – RAB, C; = P. commutatum Schultes var. ashei (Pearson ex Ashe) Fernald – F, G; > D. commutatum ssp. ashei (Pearson ex Ashe) Freckman & Lelong – FNA; = P. ashei Pearson ex Ashe – HC, S, WV; < D. commutatum – K]

*Dichanthelium commutatum* (Schultes) Gould var. commutatum, Variable Witch Grass. Cp (FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA): dry rocky or sandy woods and openings; common. May-October. MA south to FL and MS, west to MI, MO, and OK. [= Panicle commutatum – RAB, C; = P. commutatum Schultes var. ashei (Pearson ex Ashe) Fernald – F, G; > D. commutatum ssp. ashei (Pearson ex Ashe) Freckman & Lelong – FNA; = P. ashei Pearson ex Ashe – HC, S, WV; < D. commutatum – K]

*Dichanthelium commutatum* (Schultes) Gould var. commutatum, Variable Witch Grass. Cp (FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA): low, shaded, moist woodlands and woodland edges, and dry, thin, often rocky woods and thickets; common. May-October. ME south to FL, west to MI, MO, OK, and TX, also in Mexico. Plants with spikelets 3.0-3.7 mm long, first glumes half or more as long, and with broadly linear leaves about 10× as long as wide have been recognized as ssp. equilatereale by FNA, and *Panicum equilatereale* by HC and S, but intermediates occur throughout the NC to FL portion of the range of specimens bearing the *equilatereale* name. [= Panicle commutatum Schultes – RAB, C; > P. commutatum var. commutatum – F, G; > P. commutatum – HC, S, WV; > P. mutabile Scriber & Smith ex Nash – F, G, HC, S; > D. commutatum ssp. commutatum Freckmann & Lelong – FNA; > D. commutatum ssp. equilatereale (Scriber) Freckmann & Lelong – FNA; > D. commutatum ssp. joori (Vasey) Freckmann & Lelong – FNA; > D. commutatum – K; > P. joori Vasey – HC, S; > P. equilatereale Scriber – HC, S]
**Dichanthelium consanguineum** (Kunth) Gould & Clark, Kunth’s Witch Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC): moist or dry sandy soils of pinelands; common in the Coastal Plain, uncommon in the Piedmont (rare in VA). April-September. Occasional from se. VA south to FL, west to TX and IN. Often not easily separated from *D. angustifolium* and *D. ovale*. It is distinguished from *D. angustifolium* by spreading-hirsute nodes and leaves 10-15× as long as wide (*D. angustifolium* has beardless nodes, or nodes bearded with erect-ascending soft hairs, and longer leaves 20× or more as long as wide). *D. consanguineum* is distinguished from *D. ovale* by having strongly pilose upper blade surfaces (*D. ovale* upper blade surfaces are glabrous or with a few blade hairs basally). The hairs of *D. consanguineum* frequently are strongly papillate. [= FNA, K, Z; = Panicum consanguineum Kunth – RAB, C, F, G, HC, S]

**Dichanthelium depauperatum** (Muhlenberg) Gould, Starved Witch Grass. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): dry soils of grasslands and open woods, often on disturbed soils of roadsides and ditches; common (rare in GA, NC, and SC Coastal Plain). May-September. NL (Newfoundland) and MN south to GA and TX. [= FNA, K, Z; = Panicum depauperatum Muhlenberg – RAB, C, HC, S, WV; > P. depauperatum var. depauperatum – F, G; > P. depauperatum var. psilophyllum (Fernald – F, G)]

**Dichanthelium dichotomum** (Linnaeus) Gould var. dichotomum, Forked Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): wet-mesic to dry woods, thickets, and woodland openings; common (rare in VA Coastal Plain). May-October. S. Canada and MI south to FL and TX. Plants with bearded nodes and larger leaves are referable to *Panicum dichotomum* var. barbulatum (here included) but intermediates abound. [= Q; < Panicum dichotomum Linnaeus – RAB, C, GW; > P. dichotomum var. dichotomum – F, WV; > P. dichotomum var. barbulatum (Michaux) Wood – F, WV; = D. dichotomum ssp. dichotomum – FNA; = P. dichotomum – G; > P. dichotomum – HC, S; > P. barbulatum Michaux – HC, S; > P. dichotomum var. dichotomum – K, Z; = P. dichotomum var. dichotomum – X]

**Dichanthelium dichotomum** (Linnaeus) Gould var. nitidum (Lamarck) LeBlond, Shining Witch Grass. Cp (GA, NC, SC, VA), Pd (NC), Mt (SC, VA): moist sandy or peaty soil of wet pine savannas and pocosin ecotones, wet meadows near the coast, swamps, and marshes; uncommon (rare in Piedmont and Mountains, rare in VA). PA and NJ south to FL, west to MO and TX; also the Bahamas (Sorrie & LeBlond 1997) and West Indies, and Mexico to Venezuela. [= Q; < Panicum dichotomum Linnaeus – RAB, C, GW; > P. dichotomum var. dichotomum – F, WV; > P. dichotomum var. barbulatum (Michaux) Wood – F, WV; = D. dichotomum ssp. barbulatum (Muhlenberg ex Elliott) Freckmann & Lelong – FNA; = P. nitidum var. nitidum – G; < D. dichotomum var. dichotomum – K, Z; = P. dichotomum var. nitidum (Lamarck) Wood – X]

**Dichanthelium dichotomum** (Linnaeus) Gould var. roanokense (Torrey) LeBlond, Branched Witch Grass. Cp (DE, GA, NC, SC, VA), Md (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): floodplain forests, swamps, openings, and borders of streams and ponds, and occasionally in dry upland woods; common. May-October. MA and MI south to FL and TX. All nodes usually densely retrorsely bearded. [= Q; < Panicum dichotomum Linnaeus – RAB, C, GW; > P. microcarpon Muhlenberg ex Elliott – F, HC, S, WV; = D. dichotomum ssp. microcarpon (Muhlenberg ex Elliott) Freckmann & Lelong – FNA; = P. nitidum Lamarck var. roanokense Torrey – G; < D. dichotomum var. dichotomum – K, Z; = P. dichotomum var. roanokense (Torrey) Lelong – X]

**Dichanthelium fusiforme** (Hitchcock) Harvill, Spindle-fruited Witch Grass. Cp (GA, NC, SC, VA): dry to moist sand of open pine and pine/oak woods and clearings; rare. May-November. Se. VA south to FL, west to MS, also in West Indies, Mexico, Central America, and Venezuela; most amount in FL. Autumnal blades often flat. The autumnal form of *D. oligosanthes* var. *oligosanthes* can be very similar to *D. fusiforme* if the vernal blades of the former are missing. They are best separated by ligule length (0.5-1 mm in *fusiforme*, 1.5-3 mm in *oligosanthes*) and the more attenuated ends of the spikelet. [= Panicum fusiforme Hitchcock – RAB, F, G, HC, S; > P. aciculare Desvaux ex Poiret – C; = D. aciculare ssp. fusiforme (Hitchcock) Freckmann & Lelong – FNA; = D. aciculare – K, Z]

**Dichanthelium hirsutii** (Swallen) Kartesz, Hirst’s Witch Grass. Cp (DE, GA, NC): pond-cypress savannas and limesink depressions; rare. June-September. This distinctive species is known from only seven sites: two in NC, one in DE, two in NJ (one not seen since 1992), and two historical populations in GA. Described in 1961 (Swallen 1961), it is treated by some taxonomists as part of the *D. aciculare* group and by others as part of the *D. dichotomum* group; its affinities appear to lie with the former. See Schuyler (1996) for a discussion of the taxonomic distinctiveness of this species. The occurrence of this species in NC is documented in LeBlond & Sorrie (2001). [= K; < Panicum aciculare Desvaux ex Poiret – C; < D. dichotomum var. roanokense (Ashe) Freckmann & Lelong – FNA]

**Dichanthelium latifolium** (Linnaeus) Harvill, Broad-leaved Witch Grass. Mt (GA, NC, SC, VA), Pd (DE, VA), Cp (VA): open or shady well-drained forests; common (rare in GA, NC, and SC). Late May-September. ME south to n. GA, west to WI and MS. [= FNA; > Panicum latifolium Linnaeus – RAB, C, F, G, HC, S, WV; = D. latifolium (Linnaeus) Gould & Clark – K, Z; a later combination]

**Dichanthelium laxiflorum** (Lamarck) Gould, Open-flower Witch Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): open or shaded woodlands, often in moist soil; common. April-September. MD south to FL, west to TX, north to IN, also in Mexico, Central America, and West Indies. [= FNA, K, Z; = Panicum laxiflorum Lamarck – RAB, C, F, G; > P.
Dichanthelium leucothrix (Nash) Freckmann, Roughish Witch Grass. Cp (GA, NC, SC), Pd (GA, NC, SC, VA): wet sandy, peaty, or mucky soil of pinelands; uncommon (rare in Piedmont). May-October. S. NJ south to FL, west to TX, also in TN, West Indies and n. South America. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, D. meridionale, and D. wrightianum from other members of the D. acuminatum group. [= K, Y; = Panicum leucothrix Nash – RAB, F, G, HC, S; < P. leucothrix – C; = D. acuminatum ssp. leucothrix (Nash) Freckmann & Lelong – FNA; < P. spretum var. longiligulatum – GW; = P. acuminatum Swartz var. leucothrix (Nash) Lelong – X; < D. acuminatum (Swartz) Gould & Clark var. implicatum (Scriber) Gould & Clark – Z]

Dichanthelium lucidum (Ashe) LeBlond, Bog Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): wet meadows, sphagnum swamps, bogs, wet woods, sphagnum streamhead poicosins, baygalls; common (uncommon in Mountains). May-October. MA and MI south to FL and TX. Vernal culms soon recline, producing a tangled mass. The papillose fertile lemma is diagnostic. Rarely, entire populations of D. lucidum can have eiliate ligules composed of a membrane 0.1-0.3 mm long. Even rarer are plants within these populations with retrorsely bearded nodes. Both conditions may reflect intergradation with another taxon, possibly within the D. dichotomum complex, or with Cryptantha section Clandestina. [= Q; < Panicum dichotomum Linnaeus – RAB, C, GW; > P. lucidum Ashe – G, S; > P. lucidum var. lucidum – F, HC; > P. lucidum var. opacum Fernald – F, HC; < D. dichotomum ssp. lucidum (Fernald) Fernald & Lelong – FNA; < D. dichotomum var. dichotomum – K, Z; < P. dichotomum var. lucidum (Ashe) LeBlond – X]

Dichanthelium mattsamuekeense (Ashe) Mohlenbrock, Muddamueke Witch Grass. Cp (DE, NC, SC, VA): wet savannas, meadows, borders of pocin shrub swamps, thickets; rare (rare in Piedmont). May-October. MA and MI south to FL and TX. May-October. Sw. NS and MA to MN south to e. NC, n. GA, and n. AL. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, D. leucothrix, and D. wrightianum from other members of the D. acuminatum group. [= K, Y; < Panicum lanuginosum Elliott – RAB, < P. leucothrix Nash – C; > P. meridionale var. albamargens (Ashe) Fernald – F; = D. acuminatum (Swartz) Gould & Clark sp. implicatum (Scriber ex Nash) Freckmann & Lelong – FNA; = P. meridionale Ashe – G; > P. meridionale – HC, S, WV; > P. albamargens Ashe – HC, S, WV; < P. acuminatum Swartz var. unicyphillum (Trin) LeBlond – X; < D. acuminatum var. implicatum (Scriber) Gould & Clark – Z]

Dichanthelium ovale (Elliott) Gould & Clark var. ovale, Oval-flowered Witch Grass. Cp (GA, NC, SC, VA): dry to damp sandy pinelands; common (rare in GA, NC, SC, VA). May-October. NY to WI, south to FL and e. TX. Infrequent over most of its range except FL. In our region, the D. ovale double ligule character is more evident in var. ovale, with var. addisonii often having only a single ligule about 1 mm long. Plants preferable to Panicum malacoxon have spikelets 3-3.2 mm long with a first glume attached conspicuously below the second glume and sterile lemma, and half or more as long as the spikelet; leaves 3-5 mm wide, puberulent beneath, and puberulent to glabrous above. It needs further study. Also see note under D. consanguineum regarding D. ovale. [= K, Z; = Panicum ovale Elliott – RAB, X; = D. ovale ssp. ovale – FNA; > P. ovale – HC, S; > P. malacoxon Nash – HC, S; = P. ovale var. ovale – X]
**POACEAE**

*Dichanthelium scoparium* (Lamarck) Gould, Velvet Witch Grass. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): moist sandy soil of woodland openings and ditches; common (uncommon in Mountains). May-October. MA and MI south to FL and TX, also in Mexico and West Indies. The dense, velvety pubescence of the internodes, sheaths, and blades of this taxon, combined with the viscid band below the nodes, are diagnostic. See note under *D. acuminatum* var. *fasciculatum* regarding *Panicum glutinosum*. [= FNA, K, Z; = Panicum scoparium Lamarck – RAB, C, F, G, GW, HC, S]

**Dichanthelium species 1 (=arenicoloides)**, Sandy Woods Witch Grass. Cp (GA, NC, SC), Pd (NC): in open sandy soil of pinelands and dunes, primarily near the coast; possibly uncommon, but long overlooked. May-November. NC south to FL and west to TX and AR; also in West Indies, Central America, and n. South America. Should be sought in VA. Autumnal form strongly resembling *D. aciculare* but with larger spikelets and longer first glumes. Vernal cauleine leaves are longer than those of *D. aciculare* but of similar width. Panicle branches often ascending. [= Panicum arenicoloides Ashe – HC, S; < *D. aciculare* (Desvaux ex Poiret) Gould & C.A. Clark ssp. *angustifolium* (Elliott) Freckmann & Lelong – FNA; < *D. aciculare* – K, Z]

**Dichanthelium species 3 (=lanceatum)**, Hidden-flowered Witch Grass. Cp (GA, NC, SC, VA): moist pine savannas and flatwoods, moist to dry openings in maritime forests, dry pine and oak sandhills; common (uncommon in Piedmont, rare in VA Piedmont and Coastal Plain). May-September. Se. VA to FL, west to e. TX, also in West Indies and Central America. This and *D. portoricense* appear to intergrade in our region, and *=lanceatum* is treated as part of *D. portoricense* ssp. *patulum* in FNA, whose concept of ssp. *patulum* includes *Panicum webberianum* (*D. species 2* here) and *P. patulum*, both of which appear to merit recognition (*=webberianum* as a species and *=patulum* as at least a variety). [= Panicum lanceatum Trinius – RAB, C, G; > *P. lanceatum* var. *lanceatum* – F; > *P. lanceatum* var. *patulum* (Scribner & Merrill) Fernald – F; < *D. portoricense* (Desvaux ex Hamilton) B.F. Hansen & Wunderlin ssp. *patulum* (Scribner & Merrill) Freckmann & Lelong – FNA; > *P. lanceatum* – HC, S; > *P. sabulorum* (Lamarck) Gould & Clark var. *patulum* (Scribner & Merrill) Gould & Clark – K, Z; < *P. portoricense* Desvaux ex Hamilton var. *nashianum* (Scribner) Lelong – X]

**Dichanthelium species 9 (=cryptanthum)**, Hidden-flowered Witch Grass. Cp (NC, SC): wet meadows and ditches, streamside openings; rare. May-September. NC (or NJ?) to MS (or TX?) (previous concepts of this taxon and its range are unclear). In the field, this taxon can be mistaken for *D. yadkinense*; it is readily distinguished by its scabrous peduncle and membranous ligules. [= Panicum cryptanthum Ashe – F, HC, S; < *P. scabriusculum* Elliott – RAB, C, GW; < *P. scabriusculum* (Elliott) Gould & Clark – FNA, K, Z; = *P. scabriusculum* var. *cryptanthum* (Ashe) Gleason – G]

*Dichanthelium sphagnicola* (Nash) LeBlond, Peaty Witchgrass. Cp (FL, GA): edges of cypress swamps, in sphagnum bogs, moist shady places; rare (but poorly known). May-October. GA (Chatham, Camden, Lanier counties) (Carter, Baker, & Morris 2009) to FL; should be sought in se. SC. Treated in synonymy with *Panicum dichotomum* by RAB, but no specimen is known from the Carolinas. This species is similar to *D. lucidum* in appearance, and differs most readily by its scabrous peduncle and membranous lemma and palaea. [= Q; < Panicum dichotomum Linnaeus – RAB; < *D. dichotomum* (Linnaeus) Gould Ssp. *lucidum* (Ashe) Freckmann & Lelong – FNA; = *P. sphagnicola* Nash – HC, S; < *D. dichotomum var. dichotomum* – K, Z; < *D. dichotomum var. lucidum* (Ashe) Lelong – X]

*Dichanthelium spreptum* (Schultes) Freckmann, Eaton's Witch Grass. Pd (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): wet sands and peats of bogs, savannas, meadows, and shores; rare (rare in NC and VA, common in DE Coastal Plain). May-September. ME south to n. FL, LA and e. TX. Intermediate forms between this taxon and *D.*
longiligulatum occur. [= K, Y; = Panicum spretum Schultes – RAB, C, F, G, HC, S; = D. acuminatum (Swartz) Gould & Clark ssp. spretum (Schultes) Freckmann & Lelong – FNA; < P. spretum – GW; = P. acuminatum Swartz var. densiflorum (Rand & Redfield) Lelong – X; = D. acuminatum var. densiflorum (Rand & Redfield) Gould & Clark – Z]

**Dichanthelium strigosum** (Muhlenberg) Freckmann var. **glabrescens** (Grisebach) Freckmann, Hairless Witch Grass. Cp (GA, NC, SC): low, open sandy pinelands and hammocks; rare. May-October. S. GA and FL west to LA; disjunct in se. NC; also in West Indies, Belize. Included in synonymy with *Panicum strigosum* by RAB, but no specimen from the Carolinas had been found prior to discovery of a population in Onslow County in 2009. [= K; = D. strigosum ssp. glabrescens (Grisebach) Freckmann & Lelong – FNA; < Panicum strigosum Muhlenberg – GW, RAB; = P. polycadon Nash – HC, S; = D. leucoblepharis (Trinicus) Gould & Clark var. glabrescens (Grisebach) Gould & Clark – Z]

**Dichanthelium strigosum** (Muhlenberg) Freckmann var. **leucoblepharis** (Trinicus) Freckmann, Dwarf Witch Grass. Cp (GA, NC, SC), Mt (GA, NC, SC): sandy, acidic soils of pinelands; uncommon (rare in Mountains). May-October. NC south to FL, west to TX, also in Mexico. [= K; = Panicum ciliatum Elliott – RAB, HC, S; = D. strigosum ssp. leucoblepharis (Trinicus) Freckmann & Lelong – FNA; = P. strigosum Muhlenberg var. leucoblepharis (Trinicus) Lelong – X; = D. leucoblepharis (Trinicus) Gould & Clark var. leucoblepharis – Z]

**Dichanthelium tenuis** (Muhlenberg) Freckmann & Lelong, White-edged Witch Grass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): wet peaty or sandy soil pineland savannas, flatwoods, bogs, and meadows; common (uncommon in Piedmont, rare in Mountains). May-October. NJ south to FL, west to TX; also in Mesoamerica and Cuba. This treatment of *D. tenuis* includes plants from northern Alabama formerly recognized as *Panicum concinnum*, with spikelets 1.2-1.4 mm long but otherwise possessing the characters of *D. tenuis*. [= FNA; = Panicum tenu Muhlenberg – RAB, C; > P. tenu – F, HC, S; > P. albomarginatum Nash – F, HC, S; > P. trifolium Nash – F, G, HC, S; > P. ensifolium Baldwin – G; > P. concinnum Hitchcock & Chase – HC, S; < D. dichotomum (Linnaeus) Gould var. tenuis (Muhlenberg) Gould & Clark – K, Z]

**Dichanthelium wrightianum** (Scribner) Freckmann, Wright's Witch Grass. Cp (DE, GA, NC, SC, VA): limesink ponds and meadows, cypress savannas, pine savannas, bogs; uncommon (rare in DE and VA). May-September. MA south to FL, west to TX, also in Cuba and Mesoamerica. A micrometer is needed to measure the very short puberulence (0.1 mm) that distinguishes this taxon, *D. meridionale*, and *D. leucothrix* from other members of the *D. acuminatum* group. [= FNA, K, Y; = Panicum wrightianum Scribner – RAB, C, F, G, HC, S; < P. spretum Schultes – GW; = D. acuminatum (Swartz) Gould & Clark var. wrightianum (Scribner) Gould & Clark – Z]

**Dichanthelium yadkinense** (Ashe) Mohlenbrock, Spotted-sheath Witch Grass. Pd (DE, GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA): floodplain forests, thickets, bottomlands, and swamps, often on alluvial deposits; common (uncommon in Coastal Plain, uncommon in Mountains, uncommon in VA, rare in DE). May-October. NJ and MI south to GA and TX, also in Mexico. Sheaths often with wart-like glands. This taxon resembles *D. species 9* (=cryptanthum), from which it differs most readily by its hairy ligule (vs. membranous) and smooth pedicule (vs. antrorsely scabrous). [= Q; < Panicum dichotomum Linnaeus – RAB, GW; = P. yadkinense Ashe – C, F, G, HC, S, WV; = D. dichotomum ssp. yadkinense (Ashe) Freckmann & Lelong – FNA; < D. dichotomum var. dichotomum – K, Z; = P. dichotomum var. yadkinense (Ashe) Lelong – X]

**Dichanthelium chamaeleonche** (Trinicus) Freckmann & Lelong ssp. **breve** (Hitchcock & Chase) Freckmann & Lelong, Short Witch Grass, endemic to c. and s. FL, primarily near the east coast. [= FNA; = Panicum breve Hitchcock & Chase – HC, S; = D. dichotomum (Linnaeus) Gould var. breve (Hitchcock & Chase) Gould & Clark – K, Z; = P. chamaeleonche Trinicus var. breve (Hitchcock & Chase) Lelong – X]

**Dichanthelium dichotomum** (Linnaeus) Gould var. **glabrifolium** (Nash) Gould & Clark, Smooth-leaved Witch Grass, endemic to peninsular FL, mostly near the west coast. Like *D. chamaeleonche* ssp. breve, this taxon appears to be more closely related to *D. chamaeleonche* than to *D. dichotomum* or *D. ensifolium*. [= K, Z; = Panicum glabrifolium Nash – HC, S; < P. chamaeleonche Trinicus var. chamaeleonche – X]

**Dichanthelium leibergii** (Vasey) Freckmann, Leiberg's Witch Grass. NY and PA west to AB, ND, and KS. [= FNA, K, Z; = Panicum leibergii (Vasey) Scribner – C, F, G, HC, S]

**Dichanthelium malacophyllum** (Nash) Gould, Soft-leaf Witch Grass. KY and TN west to KS and TX. Primarily a plant of cedar glades and dry calcareous soils. Reported from SC by FNA, but source of record has not been identified. [= FNA, K, Z; = Panicum malacophyllum – F, G, HC, S]

**Dichanthelium nudicaule** (Vasey) B.F. Hansen & Wunderlin. Cp (AL, FL, MS): bogs, wet pine savannas; rare. W. FL Panhandle and s. AL west to MS. [= Q = Panicum nudicaule Vasey] [add synonymy]

**Dichanthelium wilcoxianum** (Vasey) Freckmann is shown as occurring in SC and MS on the range map in FNA, but the source of these records is not known for this plant primarily of dry prairies in the Upper Midwest. It is not treated here.

**Dichanthelium xanthophysum** (A. Gray) Freckmann, Slender Witch Grass. Mt (WV): [habitats]; rare. NS and ME west to SK, south to PA, ne. WV, and SD. [= FNA, K, Z; = Panicum xanthophysum A. Gray – C, F, G, HC, WV]

**Digitaria** Haller 1768 (Crab Grass)
A genus of about 200 species, primarily in the tropics and subtropics. Most of our species occur primarily in disturbed situations; their original distributions and habitats are now obscure. References: Wipff in FNA (2003a); Webster (1987)=Z; Wipff & Hatch (1994)=Y; Wipff (1996b)=X; Webster (1980).

1 Inflorescence an open panicle; spikelets long-pedicellate, borne singly at the ends of long panicle branches; [section Pennatae] .................
jejunctiva

2 Rachis of each raceme narrow, trigonous, only slightly (if at all) winged.

3 Spikelets 4.2-5.9 mm long ................................................................. D. insularis

4 Spikelets 1.3-3.6 mm long.

5 Spikelets in 2s on the middle portions of the primary branches, the pedicels not adnate; upper lemmas gray, yellow, and/or purple-tinted when immature, purple at maturity ................................................................. D. texana

6 Spikelets in groups of 2-5 on the middle portions of the primary branches, the longer pedicels often adnate to the primary branch for a portion of their lengths; upper lemmas brown when immature, dark brown at maturity.

7 Spikelets 1.7-2.2 mm long; plants 3-10 dm tall; racemes to 10 cm long; upper sheaths glabrous, lower sheaths glabrous to sparsely pilose ................................................................. D. filiformis var. filiformis

8 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose ................................................................. D. villosa

9 Spikelets 4.2-5.9 mm long, winged, the wings as wide as or wider than the rachis proper.

10 Spikelets 1.5-1.8 mm long, villous with crinkled hairs; pedicels glabrous, terete in cross-section ................................................ D. serotina

11 Spikelets (1.7-) 2.4-4.1 mm long, glabrous, scabrous, or pubescent with straight hairs; pedicels scabrous, 3-angled in cross-section; pedicel Dia (Digitaria).

12 Spikelets (1.7-) 2.5-3.4 mm long, mm long or shorter; leaf blades pilose over the upper surface ........ D. sanguinalis

13 Spikelets 2.6-4.1 mm long, averaging 3.1 mm long or longer; leaf blades glabrous except for a few hairs on the upper surface at the base.

14 Lower lemma of sessile spikelet with the lateral nerves crowded to the margins; lowermost inflorescence node pubescent with hairs ...

15 Spikelets (1.7-) 2-6, 1-9 (-10) cm long, mostly curved and plants mostly to 4 dm tall.

16 Spikelets, fields, roadsides, disturbed areas; common; [section Pennatae] .......................
jejunctiva

17 Spikelets 1.7-2.3 mm long ........ D. ischaemum

18 Spikelets 1.7-2.3 mm long as the first glume; spikelets 1.2-1.7 mm long ....... D. cheilostachya

19 Spikelets 0.75× as long as the first glume; spikelets 1.2-1.7 mm long ........ D. violascens

20 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose. .................. D. villosa

21 Spikelets 4.2-5.9 mm long, winged, the wings as wide as or wider than the rachis proper.

22 Spikelets 1.3-3.6 mm long.

23 Spikelets 1.2-1.7 mm long; plants 3-10 dm tall; racemes to 10 cm long; upper sheaths glabrous, lower sheaths glabrous to sparsely pilose ................................................................. D. filiformis var. filiformis

24 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose ................................................................. D. villosa

25 Spikelets 4.2-5.9 mm long, winged, the wings as wide as or wider than the rachis proper.

26 Spikelets 4.2-5.9 mm long, winged, the wings as wide as or wider than the rachis proper.

27 Spikelets 1.3-3.6 mm long.

28 Spikelets in 2s on the middle portions of the primary branches, the pedicels not adnate; upper lemmas gray, yellow, and/or purple-tinted when immature, purple at maturity ................................................................. D. texana

29 Spikelets in groups of 2-5 on the middle portions of the primary branches, the longer pedicels often adnate to the primary branch for a portion of their lengths; upper lemmas brown when immature, dark brown at maturity.

30 Spikelets 1.7-2.2 mm long; plants 3-10 dm tall; racemes to 10 cm long; upper sheaths glabrous, lower sheaths glabrous to sparsely pilose ................................................................. D. filiformis var. filiformis

31 Spikelets 2.0-2.8 mm long; plants 8-15 dm tall; racemes to 25 cm long; upper sheaths glabrous or pilose, lower sheaths densely pilose. .................. D. villosa

Digiaria bicornis (Lamarck) Roemer & J.A. Schultes. Cp (FL, GA, NC, SC); sandy fields, lawns, roadsides, disturbed places; common. Webster (1980) believed that this species is likely to occur in VA and MD, as well. Whether or not it is introduced is unclear; it is now widely distributed in the tropics and subtropics worldwide. [= FNA, K, Z]

Digiaria ciliaris (Retzius) Köler, Southern Crab Grass. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC); sandy fields, roadsides, disturbed areas; common; [section Pennatae] .......................
jejunctiva

Digiaria cognata (J.A. Schultes) Pilger, Tall Chick Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (VA); sandy fields and roadsides; common (rare in VA). July-October. Wipff & Hatch (1994) discuss the reasons for including Leptoloma in Digiaria. [= FNA; = Digitaria cognata var. cognata – K; = Leptoloma cognatum (J.A. Schultes) Chase – RAB, C, F, G, HC, S; = D. cognatum ssp. cognatum – Y]

Digiaria insularis (Linnaeus) Mez ex Ekman, Sourgrass. Cp (AL, FL, MS); moist areas; rare. FL, AL, and MS west to TX; West Indies; Mexico, Central America, South America. [= FNA, K; = Trichachne insularis (Linnaeus) Nees – HC; = Valota insularis (Linnaeus) Chase – S]

* Digiaria ischaemum (Schreber) Muhlenberg. Smooth Crab Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); fields, lawns, disturbed areas; common; [section Pennatae] .......................
jejunctiva

**POACEAE**

*Digitaria texana* A.S. Hitchcock, Texas Crabgrass. Cp (VA): disturbed areas; rare, native of coastal Texas. Established in City of Virginia Beach, VA (VBA 2007). Also reported for St. Johns County, FL, adjacent to our area. [= FNA, HC, K] [add to synonymy]

*Digitaria eriantha* Steudel ssp. pentzii (Stent) Kok, Pangola Grass. Cp (FL): pastures; rare, native of Africa. Introduced in n. FL (Wunderlin & Hansen 2003, 2006). [= < D. eriantha – K; = D. pentzii Stent] [not yet keyed; add to synonymy]

*Digitaria horizontalis* Wildenow, Jamaican Crabgrass. Reported for SC on the basis of a specimen at NCU (Kartesz 1999). [check specimen] [= FNA, K] [not yet keyed; add to synonymy]

*Digitaria longiflora* (Retzius) Persoon, Indian Crabgrass. Cp (FL): lawns, roadsides, pastures; uncommon, native of Asia and Africa. Alachua, Dixie Duval, and Holmes counties southward to s. FL. [= FNA, K] [not yet keyed]

*Digitaria nuda* Schumacher. Cp (FL): disturbed areas; rare, native of Africa. In our area, known only from Columbia County, FL. [= FNA, K, Syntherisma nuda (Schumacher) A.S. Hitchcock] [not yet keyed; add to synonymy]

**Dinebra** Jacquin 1809 (Viper Grass)

* Dinebra retroflexa* (Vahl) Panzer, Viper Grass, native of Africa and s. Asia, has been collected as a waif in Mecklenburg County, NC (Mellichamp, Matthews, & Smithka 1987). [= FNA, K] [not keyed]

**Distichlis** Rafinesque 1819 (Saltgrass)

Identification notes: When sterile, *Distichlis spicata* is easily confused with *Sporobolus virginicus*, with which it sometimes occurs. *Distichlis spicata* is generally a coarser plant, and lacks long hairs around the collar of the sheath; *Sporobolus virginicus* is more delicate, and typically has long hairs on either side of the collar.

1 Leaf blades < 1.5 cm long, subulate; plant colonial by surficial stolons (rarely rhizomatous); pistillate and staminate inflorescences with 1 spikelet; [FL and other subtropical shores]

2 Leaf blades ≥ 2.5-14 cm long, flat (though often involute when dry); plants colonial by subterranean rhizomes; pistillate and staminate inflorescences with > 1 spikelet; [widely]

3 Inflorescence erect, stiff; awns 0-25 mm long. ..............................................................................

4 Second glume and sterile lemma hairy or scabrous to nearly glabrous, the hairs usually not papillose-based; fertile lemma obtuse or broadly acute, with a thin, membranous (later withering) tip set off from the body by a line of minute hairs.

**Distichlis littoralis** (Engelmann) H.L. Bell & Columbus, Shoregrass, Key Grass. Cp (FL): brackish shores; rare. From n. peninsular FL (Taylor and Dixie cos. on the west coast and Volusia County on the east coast) southward. Also known from coastal sw. LA (Cameron Parish) and TX southward. [= Monanthochloa littoralis Engelmann – FNA, K, S, WH]

*Distichlis spicata* (Linnaeus) Greene, Saltgrass, Spike Grass. Cp (DE, FL, GA, NC, SC, VA): coastal marshes and shores, especially common in hypersaline flats (where infrequent tidal inundation is followed by evaporation); common. June-October. Two varieties (or subspecies or species) have often been recognized: var. spicata ranging along the Atlantic coast from NS and PE south to tropical America, and on the Pacific coast of North America, and var. stricta (Torrey) Scribner widespread in saline situations in western North America. These do not appear to warrant taxonomic recognition (Barkworth in FNA 2003a). [= RAB, FNA, GW, K, S; > D. spicata var. spicata – C; > D. spicata – F, G, HC; > D. spicata ssp. spicata]

**Echinochloa** Palisot de Beauvois 1812 (Barnyard-grass, Jungle-rice)

A genus of 4-5- species of the tropics and warm temperate regions. References: Michael in FNA (2003a). Key based in part on C.

1 Panicle elongate, the branches few, distant, unbranched, and short, to 2 (3-6 cm long; spikelets awnless; leaves 3-6 (-9) mm wide [.................................E. colonum]

2 Panicle broader, the branches numerous, approximate, often further branched, short to long, some (at least) exceeding 2 cm long; spikelets awnless or awned; leaves 3-30 mm wide.

3 Inflorescence nodding; awns 4-29 mm long.................................................................E. cruspuson var. cruspuson

4 Second glume and sterile lemma hairy or scabrous to nearly glabrous, the hairs usually not papillose-based; fertile lemma obtuse or broadly acute, with a thin, membranous (later withering) tip set off from the body by a line of minute hairs.

- **Echinochloa crus-galli** (Linnaeus) Palsot de Beauvois var. *crus-galli*, Barnyard-grass. Cp (DE, FL, VA), Pd (DE, VA), Mt (VA, WV), {GA, NC, SC}: disturbed areas; common. July-October. [= C, G; < *E. crus-galli* – RAB, GW, WV (also see *E. muricata*); = *E. crus-galli* – K, orthographic variant; < *E. crus-galli* – F, FNA; < *E. crus-galli* ssp. *crus-pavonis* – S (also see *E. muricata*)]

- **Echinochloa crus-pavonis** (Kunth) J.A. Schultes var. *crus-pavonis*. Cp (FL, VA), {AL, MS} July-October. [<E. crus-pavonis* – HC; = *E. crus-pavonis* var. *crus-pavonis* – FNA, K, orthographic variant]

- **Echinochloa muricata** (Palsot de Beauvois) Fernald var. *microstachya* Wiegand, Barnyard-grass. Mt (VA, WV), {GA, NC, SC, VA}: disturbed areas; common. July-October. [= C, F, FNA, K, WV; < *E. crus-galli* – RAB, GW, WV (also see *E. muricata*); = *E. crus-galli* – K, orthographic variant; < *E. crus-galli* – F, FNA; < *E. crus-galli* ssp. *crus-pavonis* – S (also see *E. muricata*)]

- **Echinochloa walteri** (Pursh) Heller. Cp (DE, FL, GA, NC, SC, VA), Pd (GA), Mt (WV): marshes; common (rare in WV), July-October. MA south to FL, west to TX on the outer Coastal Plain; also inland from OH west to WI, south to w. WV, MO, and AR. [= RAB, C, F, FNA, GW, HC, K, S, W]

**Eleusine** Gaertner 1788 (Yard Grass)

A genus of about 9 species, native to Africa and South America. References: Hilu in FNA (2003a). Key based on FNA.

- **Eleusine tristachya** (Lamark) Lamark. Cp (SC): in waste areas of wool-combing wills; rare, native of South America, perhaps only a waiif in our area. Reported as introduced in additional, scattered states in e. United States, including VA (Kartes 1999, but apparently in error), NJ (Hilu 1980) and AL (Small 1933). [= FNA, K, S]

**Elionurus** Humboldt & Bonpland ex Willdenow 1805 (Balsamscale)

**Elionurus tripsacoides** Humboldt & Bonpland ex Willdenow, Pan-American Balsamscale. Cp (FL, GA, MS): wet savannas; rare. S. GA south to s. FL, west to s. and w. TX, and south through Central America to s. South America. Reported for sw. GA by Jones & Coile (1988), for s. MS and FL (Sorrie & Leonard 1999). [= FNA, K; = *Elionurus tripsacoides* – GW, HC, S, orthographic variant]

**Elymus** Linnaeus 1753 (Wild-rye, Rye Grass)
POACEAE

(Also see Thinopyrum)

A genus of about 150 species, semicosmopolitan in temperate regions. The genus, as now circumscribed, includes all allopolyploids of *Pseudoroegneria* and *Hordeum* (Helfgott & Mason-Gamer 2004). Reference: Barkworth, Campbell, & Salomon in FNA (2007a); Campbell (2000); Church (1967); Tucker (1996)=Z; Barkworth (1997)=X. This treatment largely follows Barkworth, Campbell, & Salomon in FNA (2007a).

**Identification notes:** Measurements of the spike include the awns, but measurements of spikelets and its components do not. Rachis internodes should be measured near the middle of the spike. Glume widths are measured at the widest point, or if the widest point is not apparent, at about 5 mm above the glume base.

1 Spikelets solitary at each node (occasionally paired at the lowest nodes); glumes and lemmas usually awned or unawned; plants cespitose to strongly rhizomatous.

2 Plants strongly rhizomatous; [common and weedy introduced species]; [section *Elytria*] .................................................. *E. repens*

2 Plants cespitose; [rare natives and introductions]; [section *Gaulardia*] .......................................................... *E. semicosatus*

3 Spikelets 20-30 mm long; anthers 3-6 mm long; rachis internodes hirtellous below the spikelets; [very rare introduction, reported for c. GA] .......................................................... *E. virginicus*

3 Spikelets 8-25 mm long; anthers 0.8-3 mm long; rachis internodes glabrous below the spikelets; [rare natives of glades and barrens].

4 Lemma awns 15-40 mm long, longer than the body of the lemma .......................................................... *E. repens* ssp. subsecundus

4 Lemma awns 1-13 mm long, shorter than the body of the lemma .......................................................... *E. repens* ssp. *trachycaulus*

1 Spikelets 2-3 (-5) at each node; glumes and lemmas usually awned; plants usually cespitose, occasionally short-rhizomatous.

5 Both glumes (including their awn) either 0-3 mm long and subulate or 1-20 mm long and differing in length by > 5 mm, 0.1-0.6 mm wide, tapering from the base, with 0-1 distinct veins, persistent; rachis internodes 4-12 mm long, ca. 0.5 mm thick at the narrowest section.

6 Spikelets appressed; lemma awns straight or curving; glumes sometimes absent, but usually 1-20 mm long, 0.1-0.6 mm wide, with a distinct vein; spikes erect or nodding .................................................. *E. virginicus* var. *glabriflorus*

6 Spikelets widely spreading to horizontal; lemma awns straight (rarely slightly curving); glumes 0-3 mm long, with no distinct veins (rarely 1 glume to 20 mm long, 0.2 mm wide); spikes usually erect.

7 Lemmas pubescent ........................................................................................................................................ *E. virginicus* var. *bogelianus*

7 Lemmas glabrous to scabrous .......................................................................................................................... *E. virginicus* var. *hystrix*

5 Both glumes (including the awns) 10-40 mm long, usually differing in length by < 5 mm, 0.2-2.3 mm wide, lanceolate to setaceous, usually widest above the base, with 2-8 veins, persistent or disarticulating; rachis internodes slender (as above) or stout (2-5 mm long and ca. 1 mm thick at the narrowest section).

8 Glume bases flat, thin, and evidently veined, or indurate for < 1 mm, the bodies not exceeding the adjacent (usually 8-15 mm long) lemmas; lemma awns usually curving outward; spikes usually nodding to pendent; internodes (2-) 4-12 mm long.

9 Glumes 0.5-1.6 mm wide; lemma awns 15-40 (-50) mm long; paleas acute; rachis internodes 2.5-(-7) mm long; blades (3-) 4-15 (-20) mm wide, pale green, usually glabrous or scabridulous above .......................................................................................... *E. canadensis* var. *canadensis*

9 Glumes 0.3-0.8 mm wide; lemma awns 15-25 (-35) mm long; paleas narrowly truncate; rachis internodes 5-8 (-12) mm long; blades 8-24 mm wide, dark green, usually thinly pilose above .................................................................................. *E. repens*

8 Glume bases terete, indurate, and lacking evident veins for 0.5-4 mm, the bodies (unless indistinct from the awns) exceeding the adjacent (usually 6-12 mm long) lemmas; lemma awns straight; spikes erect or nodding; internodes 2-5 mm long (to 7 mm in *E. sp. 1*).

10 Glumes persistent, 0.2-1 mm wide, with 2-4 veins, the basal 0.5-2 mm essentially straight; lemmas rarely glabrous; spikelets with 1-3 (-4) florets; spikes nodding, exerted.

11 Blades glabrous to scabrous, pale dull green; spikes 7-25 cm long; internodes usually 3-5 mm long; spikelets with 2-3 (-4) florets; lemmas usually scabridulous, 7-14 mm long, 1-5 mm longer than the acute paleas; flowering usually late June to late July .......................................................... *E. riparius*

11 Blades villous to pilose, dark glossy green; spikes 4-12 cm long; internodes usually 2-3 mm long; spikelets with 1-2 (-3) florets; lemmas usually villous, 5.5-9 mm long, 0.1-5 mm longer than the obtuse palea; flowering usually early June to early July ................. .......................................................... *E. villosus*

10 Glumes disarticulating with the lowest floret, 0.7-2.3 mm wide, with (2-) 3-5 (-8) veins, the basal 1-4 mm clearly bowed-out; lemmas often glabrous; spikelets with (2-) 3-5 (-6) florets; *Elymus virginicus* complex.

12 Spikes 2.5-6 cm wide, exerted; lemma awns 15-40 mm long; blades glabrous or villous.

13 Spikes with 9-18 nodes; internodes 4-7 mm long; blades usually lax, dark glossy green under the glaucous bloom; auricles 2-3 mm long, blackish at maturity; flowering usually in mid-May to mid-June .................................................................................. *E. macgregorii*

13 Spikes with 15-30 nodes; internodes 3-5 mm long; blades lax, or often ascending and involute, pale dull green; auricles 0.2-mm long, brownish at maturity; flowering usually in mid-June to late July.

14 Spikelets (and usually also the foliage) pubescent; spikes usually 6-12 cm long; lemmas 6-10 mm long .................................................. *E. glabriusculus* var. *austrotiensis*

14 Spikelets (and usually also the foliage) glabrous to scabridulous; spikes usually 9-16 cm long; lemmas 7-13 mm long.......................... .................................................. *E. glabriusculus* var. *glabriusculus*

12 Spikes 0.7-2 cm wide (including the awns), exerted or sheathed; lemma awns 1-15 (20) mm long; spikelets appressed to slightly spreading; blades usually glabrous to scabridulous.

15 Lemma awns 1-3(5) mm long; blades often ascending, somewhat involute, those higher on the stiffly erect culms broader and more persistent; flowering usually in early July to mid-August .................................................................................. *E. curvatus*

15 Lemma awns 5-15 (20) mm long; blades usually spreading or lax, not markedly broader or more persistent towards the culm summit; flowering usually in mid-June to late July.

16 Spikes glaucous, hispidulous to villous-hirsute, often intermediate in exsertion; glumes indurate in the lowest 1-2 mm; ligules and auricles usually absent; flowering usually early July to mid-August .................................................................................. *E. virginicus* var. *intermedius*

16 Spikes green to glaucous, usually glabrous to scabrous, partly included in the sheath to fully exerted; ligules and auricles often present; flowering usually mid-June to mid-July.

17 Spikes partly sheathed; glumes 1-2.3 mm wide, strongly indurate and bowed-out in the lowest 2-4 mm; plants usually green to yellow-brownish; nodes mostly covered .................................................................................. *E. virginicus* var. *virginicus*
Elymus canadensis Linnaeus var. canadensis, Great Plains Wild-rye, Nodding Wild-rye. Mt (NC, VA), Pd (NC, VA), Cp?

* Elymus curvatus Piper, Awnless Wild-rye. Ip (KY, TN): moist bocklands and slopes; rare. NY and QC west to BC and WA, south to s. OH, KY, c. TN, OK, and n. TX. [= FNA; < E. virginicus Linnaeus – C; = E. submuculatus (Hooker) Smyth & Smyth – K; = E. virginicus Linnaeus var. submuculatus Hooker – F; < E. virginicus var. virginicus – S]

* Elymus elymoides (Rafinesque) Szwezy ssp. brevifolius (J.G. Smith) Barkworth. Mt (KY): [habitat]; rare. [= FNA] [synonymy incomplete]

Elymus hystrix Linnaeus var. bigelovianus (Fernald) Bowden, Northern Bottlebrush Grass. Mt (NC): high elevation forests; rare. [% Hystrix patula Moench – RAB, G, WV; < Elymus hystrix – C, FNA; = Hystrix patula var. bigeloviana (Fernald) Deam – F; = E. hystrix var. bigeloviana – K, orthographic variant; < Hystrix hystrix (Linnaeus) Millspaugh – S]

* Elymus repens (Linnaeus) Gould, Quackgrass, Dog-grass, Witchgrass. Mt (NC, VA), Pd (DE, NC, VA), Cp (DE, NC, VA): roadsides, disturbed areas, pastures; uncommon, probably introduced from Europe (sometimes considered to be partially native along the coast). June-August. [% FNA, K, X; = Elytrigia repens (Linnaeus) Nevski – C, Z; = Agropyron repens (Linnaeus) Palisot de Beauvois – RAB, G, HC, S, W, WV; > Agropyron repens var. repens – F; > Agropyron repens var. subalatum (Schreber) Roemer & J.A. Schultes – F]

* Elymus semistatus (Nees ex Steudel) Melderis. Reported for c. GA by Jones & Coile (1988), as Agropyron semistatum Nees ex Steudel, but FNA states that known reports from North America are based on misidentifications. [% FNA, K; = Agropyrum semistatum Nees ex Steudel]

Elymus svensonii G.L. Church, Svenson’s Wild-rye. Ip (AL, KY, TN): limestone river bluffs; rare. Nc. KY south to c. TN and n. AL. [% FNA, K]

Elymus trachycaulus (Link) Gould ex Shinners ssp. subsecundus (Link) A. & D. Löve, Bearded Wheatgrass. Mt (WV): glades, barrens, open woodlands; rare. June-August. NL (Newfoundland) west to AK, south to MD, WV, KY, MO, NM, AZ, and CA. [% FNA, K; = Agropyron trachycaulus (Link) Malte ex H.F. Lewis var. glaucum (Pease & Moore) Malte – F, G; = Agropyron subsecundum (Link) A.S. Hitchcock var. subsecundum – HC; < Agropyron subsecundum (Link) A.S. Hitchcock – WV]

Elymus trachycaulus (Link) Gould ex Shinners ssp. trachycaulus, Slender Wheatgrass. Mt (NC, VA, WV): glades and barrens, over serpentine, etc.; rare. August. Greeneland, NL (Labrador), Keewatin, NU, YT, and AK, south to w. NC, OH, IN, IL, MO, TX, Mexico and CA. [% FNA, K; < Agropyron trachycaulus (Link) Malte ex H.F. Lewis – RAB, W, WV; < Elymus trachycaulus – C; > Agropyron trachycaulus var. nova-angliae (Scriber) Fernald – F; > Agropyron trachycaulus var. ciliatum (Scriber & J.G. Smith) Gleason – G; = Agropyron trachycaulus – HC]

Elymus vierandii Fernald, Northern Riverbank Wild-rye. South to sc. PA and NJ; reported for nc. KY (Kartesz 2010). [% C, F, FNA, K; < E. canadensis – G]

Elymus villosus Muhlenberg ex Willdenow, Downy Wild-rye. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, NC, SC, VA); [GA]: moist forests; uncommon. QC, ON, MN, ND, and WV south to GA, AL, MS, and TX. [% RAB, C, F, FNA, G, GW, K, W, WV; < E. striatus Willdenow – S]

Elymus virginicus Linnaeus var. halophilus (Bicknell) Wiegen, Salt-marsh Wild-rye. Cp (DE, NC, VA): brackish marshes, maritime forests and hammocks; uncommon (rare in DE). Along the Atlantic Coast, from NS to NC. [% FNA, G, K; < E. virginicus – RAB, C, GW; < E. virginicus var. virginicus – S]

Elymus virginicus Linnaeus var. intermedius (Vasey) Bush. [% FNA, G; < E. virginicus – RAB, C, GW, W, WV; < E. virginicus var. virginicus – F, K; < E. virginicus var. hirsutiglumis (Scriber) A.S. Hitchcock – S]

Elymus virginicus Linnaeus var. jeunus (Ramealey) Bush. [% F, FNA, G; < E. virginicus – RAB, C, GW, W, WV; < E. virginicus var. virginicus – K; < E. virginicus var. jeunus – S; < E. striatus Willdenow – S]

**POACEAE**

*Enteropogon pricuri* (Kunth) W.D. Clayton. Cp (NC): on ballast at Wilmington, New Hanover County, NC; rare, native of Africa, probably only a waif. Also reported from Mobile, Baldwin County, AL (Hitchcock & Chase 1950). [= *Chloris pricuri* Kunth – S]

**Eragrostis** Wolf 1776 (Lovegrass)

A genus of about 350 species of temperate and tropical areas. References: Peterson in FNA (2003a); Koch (1978); Peterson & Harvey (in prep.)=Z. Key adapted from Peterson & Harvey (in prep.).

| 1 Plants cespitose or rhizomatous perennials, with innovations near the base, and with or without buds in the basal sheaths. |
|---|---|
| 2 Plants with short, knotty, thick rhizomes; florets articulating whole. | *E. spectabilis* |
| 3 Caryopsis with a deep to shallow groove along the adaxial surface. |
| 4 Caryopsis dorso-ventrally compressed, flattened parallel to the side of the embryo, translucent, light brownish. | *E. curvula* |
| 5 Caryopsis laterally compressed, flattened on the side perpendicular to the embryo, or cylindric, opaque (rarely translucent), usually reddish brown. |
| 6 Lateral veins of the lemmas conspicuous, often greenish, the lemmas strongly keeled. | *E. trichodes* |
| 7 Lateral veins of the lemmas inconspicuous and hardly evident, the lemmas sometimes weakly keeled. |
| 8 Leaf blades (4-) 8-22 cm long, 1.3-5 mm wide; lemmas 1.2-1.8 mm long; spikelets 0.5-1.0 (-1.3) mm wide. | *E. curvula* |
| 9 Leaf blades 30-60 cm long; culms 30-70 cm tall. | *E. curvula* |
| 10 Leaf blades 25-60 cm long, 3-8 (-11) mm wide; lemmas 1.6-2.4 mm long; spikelets 1.0-1.7 mm wide. | *E. hirsuta* |
| 11 Leaf blades 1.5-2.5 mm long. | *E. curvula* |
| 12 Leaf blades (4-) 8-22 cm long, 1.3-5 mm wide; lemmas 1.2-1.8 mm long; spikelets 0.5-1.0 (-1.3) mm wide. | *E. curvula* |
| 13 Panicle 15-45 cm wide, open, diffuse, broadly ovate to obovate in outline, the panicle branches capillary; pedicels 0.5-35 (-50) mm long. | *E. curvula* |
| 14 Spikelets 4-8.2 (-10) mm long. | *E. curvula* |
| 15 Spikelets 2.4-5 (-5) mm long. | *E. curvula* |
| 16 Spikelets 2-6-flowered; pedicels ascending, somewhat appressed along the branches. | *E. curvula* |
| 17 Spikelets linear to linear-lanceolate, <1.5 mm wide; lower glume 0.7-1.7 mm long; membranous, the apex truncate to obtuse. | *E. curvula* |
| 18 Spikelets 1.4-2.5 mm long; 2-6 (-7)-flowered; pedicels erect, spreading along the branches. | *E. curvula* |
| 19 Caryopsis not grooved on the adaxial surface. | *E. curvula* |

**Enteropogon** Nees 1836

*Enteropogon pricuri* (Kunth) W.D. Clayton. Cp (NC): on ballast at Wilmington, New Hanover County, NC; rare, native of Africa, probably only a waif. Also reported from Mobile, Baldwin County, AL (Hitchcock & Chase 1950). [= *Chloris pricuri* Kunth – S]

| 18 Spikelets 1.4-2.5 mm long; 2-6 (-7)-flowered; pedicels erect, spreading along the branches. | *E. curvula* |
| 19 Caryopsis not grooved on the adaxial surface. | *E. curvula* |
23 Plants with glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicles, and/or on the midveins of the lemma and palea.

24 Spikelets (1.7-)2-4 mm long, 3-6-flowered ................................................................. \textit{E. frankii}

24 Spikelets (2-)3.5-20 mm long, (3-)5-40-flowered.

25 Spikelets 0.6-1.3 mm wide; pedicels 1-10 mm long, flexuous and delicate, appressed or spreading ........................................... \textit{E. pilosa}

25 Spikelets 1-1.4 mm wide; pedicels 0.2-4 mm long, straight and rigid, mostly spreading.

26 Spikelets 6-20 mm long, 2-4 mm wide, 10-40-flowered; lemma 2.2-8 mm long, with 1-3 crateriform glands along the keel; disarticulation of the entire florets from the persistent rachilla; anthers yellow.................... \textit{E. ciliensis}

26 Spikelets 4.7-11 mm long, 1.1-2.2 mm wide, 7-12 (-20)-flowered; lemma 1.4-1.8 mm long, rarely with 1-2 crateriform glands along the keel; disarticulation of the lemma only, the palea and rachilla usually persistent; anthers reddish-brown.

27 Inflorescence with glandular areas of spots or rings on the rachis below the panicle branch bases, the glads often shiny or yellowish; stamens 3; blade margins lacking crateriform glands........................................... \textit{E. barrelieri}

27 Inflorescence sometimes with glandular areas of spots or crateriform pits on the rachis below the panicle branch bases, the glads usually dull and greenish-gray to straw-colored; stamens 2; blade margins sometimes with crateriform glands........................................... \textit{E. minor}

28 Plants lacking glandular pits or bands on the culm below the nodes, on the veins of the sheath, on the margins and veins of the blade, on the rachis, on the inflorescence branches and pedicles, and/or on the midveins of the lemma and palea.

28 Spikelets (1.6-)2-4 mm wide, 12-42-flowered; disarticulation of entire florets from a persistent rachilla .... \textit{E. unioloides} [E. unioloides]

28 Spikelets 0.6-2.5 mm wide, 3-22-flowered; disarticulation of the lemma only, the palea usually persistent (or deciduous), the rachilla persistent.

29 Spikelets 3-6-flowered................................................................................................. \textit{E. frankii}

29 Spikelets (3-)5-22-flowered.

30 First glume 0.3-0.6 (-0.8) mm long, <0.5× as long as the lowest lemma; spikelets 0.6-1.3 mm wide; panicle branches usually whorled at the lowest 2 nodes................................................................................. \textit{E. pilosa}

30 First glume 0.5-1.5 mm long, >0.5× as long as the lowest lemma; spikelets 1.2-2.5 mm wide; panicle branches solitary or paired at the 2 lowest nodes.

31 Pedicels widely spreading......................................................................................... \textit{E. pectinacea var. miserrima}

31 Pedicels appressed or rarely diverging up to 20 degrees from the branches........ \textit{E. pectinacea var. pectinacea}

\textit{Eragrostis amabilis} (Linnaeus) Wright & Arnott ex Nees, Japanese Lovegrass, Feather Lovegrass. Cp (FL, GA, SC), Pd? (GA?): disturbed areas; rare, native of Old World. June. \[= \text{RAB, FNA, HC, S, Z} \; \text{? E. tenella} \text{(Linnaeus)} \text{Palisot de Beauvois ex Roemer \\ & J.A. Schultes} – K\]

\textit{Eragrostis barrelieri} Daveau, Mediterranean Lovegrass. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, native of Mediterranean Europe. Also reported for e. TN (Chester et al. 1993). \[= \text{FNA, HC, K, Z}\]

\textit{Eragrostis ciliaris} (Linnaeus) R. Brown \textit{var. ciliaris}. Cp (FL, GA, SC): sandy shores; rare. S. SC south to TX, Central America, West Indies, South America, Africa, and Asia. \[= \text{FNA, HC} \; < \text{E. ciliaris} – \text{RAB, G, K, S, Z}\]

\textit{Eragrostis cumingii} Steudel, Fortyflower Lovegrass, Cuming's Lovegrass. Cp (FL, GA), \{NC\}. Reported for NC (Kartesz 1999) and sw. GA (Jones & Coile 1988, HC). \[= \text{FNA, K, Z} \; \text{? E. simplex} \text{Scribin} – \text{HC}\]

\textit{Eragrostis curvula} (Schraden) Nees, Weeping Lovegrass. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): roadsides; common (uncommon in WV), native of s. Africa. May-June. Very commonly planted as a roadbank stabilizer, \textit{E. curvula} is fire resistant and shows some capability to spread into adjacent natural habitats. \[= \text{RAB, C, FNA, HC, K, WV, Z} \; > \text{E. curvula var. conferta} \text{Stapf}\]

\textit{Eragrostis eliottii} S. Watson, Elliott's Lovegrass. Cp (FL, GA, NC, SC): ultisot wet pine savannas, maritime wet grasslands, inland edges of brackish marshes, inland edges of freshwater tidal marshes, calcareously-influenced wet pine savannas; rare. September-October. NC south to FL, west to TX. \[= \text{RAB, FNA, GW, HC, K, S, Z}\]

\textit{Eragrostis frankii} C.A. Meyer ex Steudel, Lacegrass. Mt (VA, WV), Pd (VA, WV), Cp (VA), \{FL?, GA\}: disturbed areas; uncommon (NC Watch List). September. MA and MN south to FL and AR. \[= \text{RAB, C, FNA, G, GW, K, S, W, WV, Z} \; > \text{E. frankii var. frankii} – \text{F, HC}\]

\textit{Eragrostis hirsuta} (Michaux) Nees, Bigtop Lovegrass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, roadsides, disturbed areas; common (uncommon in Mountains, rare in VA and WV Mountains, rare in DE). July-October. MD south to FL, west to TX, north in the interior to TN, AR, and MO; Central America. \[= \text{RAB, C, FNA, K, S, W, WV, Z} \; > \text{E. hirsuta var. hirsuta} – \text{F, G, HC} \; > \text{E. hirsuta var. laevivaginata} \text{Fernald} – \text{F, G, HC}\]

?\textit{ Eragrostis japonica} (Thunberg) Trininius, Pond Lovegrass. Cp (FL, GA, SC): moist or wet sandy areas; rare. SC and TN south to Central America, South America, and West Indies; Old World tropics. Perhaps introduced from the Old World.

**Eragrostis lagunculus** Nees, Mourning Lovegrass. Cp (FL, NC, SC, VA), Pd (GA, NC, SC), marshes, roadsides, low fields; rare, introduced (NC Watch List). June-October. Perhaps only introduced from further south and west. [= RAB, FNA, HC, K, S, W, Z]

**Eragrostis mexicana** (Hornemann) Link ssp. virescens (J. Presl) S.D. Koch & Sánchez. Cp (FL): disturbed areas; rare, native of South America and w. North America. Reported as an introduction on ballot in MD and FL. [= FNA, K; = E. virescens J. Presl – HC]

**Eragrostis pectinacea** (Michaux) Nees ex Steudel var. miserrima (Fournier) J. Reeder. Cp (FL): disturbed habitats; rare. From FL and westwards and southwards. [= FNA, K, Z; * E. tephrosanthos J.A. Schultes – HC, S; < E. pectinacea – GW]

**Eragrostis pilosa** (Linnaeus) Palisot de Beauvois var. pilosa, India Lovegrass. Cp (FL, GA, NC, SC, VA, WV): Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV); fields, roadsides, disturbed areas; common (rare in DE and WV), native of tropical regions of the Old and New World. July-October. Var. perplexa (L.H. Harvey) S.D. Koch is also introduced but is not known from our area. [= FNA; = E. pilosa – RAB, S, W; > E. multiculata Steudel – F, G, HC; > E. pilosa – F, G, HC; > E. pilosa – K, WV, Z]

**Eragrostis spectabilis** (Pursh) Steudel, Purple Lovegrass, Tumblegrass. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV): Mt (GA, NC, SC, VA, WV); fields, roadsides, disturbed areas; common. August-October. ME west to ND, south to FL and TX. [= RAB, C, FNA, G, HW, HC, K, S, WV; > E. spectabilis var. spectabilis – F; > E. spectabilis var. sparsithirdata Farwell – F; > E. pectinacea, misapplied]

**Eragrostis atrovirens** (Desvauex) Trinius ex Steudel, Thalia Lovegrass. Cp (AL, FL, LA, MS): disturbed areas; rare, native of Africa. [= FNA, K] [add to key; add to synonymy]

**Eragrostis elongata** (Willdenow) Jacquin f., Long Lovegrass. Cp (SC): waste areas near wool-combing mills; rare, native of se. Asia and Australia. [= FNA, K] [not yet keyed]

**Eragrostis leptostachya** (R. Brown) Steudel, Australian Lovegrass, is reported for NC (Kartesz 1999). [investigate] [= FNA, K] [not yet keyed]

**Eragrostis plana** Nees, South African Lovegrass. Cp (SC): waste areas near wool-combing mills; rare, native of South Africa. [= FNA, K] [not yet keyed]

**Eragrostis setifolia** Nees, Neverfail. Cp (SC): waste areas near wool-combing mills; rare, native of Australia. [= FNA, K] [not yet keyed]

**Eragrostis tetra (Zuccagni) Trotter, Teff. Cp (SC): waste areas near wool-combing mills; rare, native of Africa. This is the grain used in making Ethiopian bread. [= FNA, HC, K] [not yet keyed]

---

**Eremochloa** Büse 1852 (Centipede Grass)

**Identification notes:** In the autumn, the inflorescences make this grass readily recognizable at a distance: a short, tight lawn grass with a reddish aspect.

**Eriochloa** Kunth 1816 (Cup Grass)

1. Lemma of fertile floret with an awn >0.2 mm long; second glume awned; panicle compact, the raceme-like lateral branches close together and ascending-approssed, of irregular lengths; spikelets 8-16 on a typical, primary branch.................................................... E. contracta
1. Lemma of fertile floret lacking an awn; second glume not awned; panicle open, the raceme-like lateral branches remote and divergent, the lowermost longest, the upper gradually reduced in length to the apex (E. acuminata var. acuminata, E. michauxii var. michauxii) or the panicle compact (E. villosa); spikelets 12-40 on a typical, primary branch.

2. Spikelets 2.0-2.5 mm wide .................................................... E. villosa
2. Spikelets 1.1-1.8 mm wide.

3. Annual, 3-12 dm tall; spikelets 1.1-1.4 mm wide................................................................. E. acuminata var. acuminata
3. Perennial, 5-25 dm tall; spikelets 1.3-1.8 mm wide ................................................................... E. michauxii var. michauxii

* Eriochloa acuminata (J. Presl) Kunth var. acuminata. Cp (GA, SC), Pd (GA): disturbed areas, waste areas near wool-combing mills; rare, presumably native of further south. Reported for scattered locations in GA (Jones & Coile 1988, as E. gracilis). Reported for NC (Kartesz 1999), but the specimen basis is of cultivated material. [= FNA, K, Y, Z; = E. gracilis (Fournier) A.S. Hitchcock var. gracilis – HC]

* Eriochloa contracta A.S. Hitchcock, Pnirie Cupgrass. Pd (VA), Mt (VA), Cp (SC): disturbed areas, waste areas around wool-combing mills; rare, native of midwestern United States. [= C, F, FNA, G, GW, HC, K, Y, Z]

Eriochloa michauxii (Poiret) A.S. Hitchcock var. michauxii. Longleaf Cupgrass. Cp (FL, GA, SC): coastal freshwater and slightly brackish marshes, flatwoods, disturbed areas; rare (GA Special Concern). Se. SC south to FL, west to AL, or possibly LA. Var. simpsonii A.S. Hitchcock is endemic to sw. FL. [= FNA, HC, K, Y, Z; = E. michauxii – GW, S]

* Eriochloa villosa (Thunberg) Kunth, Chinese Cupgrass. Mt (VA), Pd (DE): fields, meadows, other disturbed areas (open edge of railroad bed); rare, native of e. Asia. See Belden et al. (2004) for additional information about the first occurrence in Virginia. [= C, FNA, HC, K, Y]

Eriochloa punctata (Linnaeus) Desvaux ex Hamilton, Louisiana Cupgrass. Cp (GA): marshes, creek banks; rare. MS west to TX, and south into the New World Tropics; reported for e. GA (FNA). [= FNA, HC, K] {not yet keyed; synonymy incomplete}

Eustachys Desvaux 1810 (Finger-grass)

1. Lateral nerves of the fertile lemma glabrous; culms stout, 7-15 dm tall; spikes 8-16 (-20), 7-12 cm long .................................................... E. glauca
1. Lateral nerves of the fertile lemma pubescent; culms slender, 3-10 dm tall; spikes 1-20, 2.5-9 cm long.

2. Keel of the fertile lemma appressed brownish-ciliate; spikes 1-6; [native].
3. Spikes 5-10 cm long; spikelets >3 mm long................................................................. E. floridana
3. Spikes 2.5-6 cm long; spikelets <2.5 mm long........................................................................ E. petraea
2. Keel of the fertile lemma glabrous; spikes 7-20; [aliens, in disturbed situations].
4. Spikelets >2.4 mm long; sterile floret oblongate, acute..................................................... E. distichophylla
4. Spikelets <2.1 mm long; sterile floret widely cuneate, truncate ........................................ E. retusa

Eustachys petraea (Swartz) Desvaux, Dune Finger-grass. Cp (FL, GA, NC, SC): dune slacks and sand flats, sometimes in disturbed areas; common (uncommon north of GA). (May-) June-October. NC (Dare County) south to FL and west to TX. [= FNA, K, Z; = Chloris petraea Swartz – RAB, GW, HC, S]

* Eustachys caribaea (Sprengel) Herter, Chickenfoot Grass. Cp (GA): disturbed areas; rare, native of South America. [= FNA, K; = Chloris capensis – HC, misapplied] {add to synonymy; not yet keyed}

* Eustachys neglecta (Nash) Nash. Native. Cp (FL): pinelands, sandy fields; uncommon. N. and peninsular FL, se. AL, and e. TX. [= FNA, K; = Chloris neglecta Nash – HC, S] {synonymy incomplete; not yet keyed}

Festuca Linnaeus 1753 (Fescue)

1. Leaves 0.2-3 mm wide, often involute.
2. Plant loosely tufted, often rhizomatous; basal sheaths disintegrating into fibers; spikelets 6-13 mm long
   .............................................. \textit{F. rubra} ssp. \textit{rubra}
3. Plant tufted, lacking rhizomes; basal sheaths persistent, remaining firm and entire; spikelets 3-9 mm long.
   3.1 Lemmas 2.3-4.0 (-4.4) mm long, awnless, or with a minute projection to 0.4 mm long; anther 1.5-2.2 (-2.5) mm long; spikelets 3.0-6.0 (-6.5) mm long.
   .............................................. \textit{F. filiformis}
3.2 Lemmas 3.8-5.5 mm long, with an awn 0.5-2.5 mm long; anther (2.3-) 2.5-3.0 mm long; spikelets 5.5-9.0 mm long
   .............................................. \textit{F. trachyphylla}
4. Leaves 3-12 mm wide, flat.
   4.1 Larger lemmas 5.5-10 mm long; leaf blades auriculate at the base; anthers 2-4 mm long.
   .............................................. \textit{see Schedonorus}
4.2 Larger lemmas 3.3-5.2 mm long; leaf blades not auriculate at the base; anthers 0.8-1.5 mm long [subgenus \textit{Subulatae}, section \textit{Obtusae}].

\begin{itemize}
\item \textit{Festuca rubra} Linnaeus \textit{ssp. rubra}, \textit{Red Fescue}. Mt (NC, SC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, GA, NC, VA): roadsides, fields, disturbed areas, pastures, grassy balds; common. April-July. In our area, this species is considered to be partly native and partly introduced. This species is circumboreal, extending south in North America to GA and MO. Many varieties or subspecies have been described in the \textit{F. rubra} complex. \texttt{[= FNA, K; ? \textit{F. rubra} – RAB, C, G, HC, S, WV, Y, Z; ? \textit{F. rubra} var. \textit{rubra} – F; \textit{F. rubra} var. \textit{commutata} Gaudin – F; \textit{F. rubra} var. \textit{rubra} – RAB, G, GW, HC, S, W, WV; ? \textit{F. rubra} var. \textit{rubra} – RAB, G, GW, HC, S, W, WV]}
\item \textit{Festuca thuerneri} Vasey. Cp (SC): waste areas near wool-combing mills; rare (possibly only a waif), native of sw. United States (NM, CO, WY, and UT). \texttt{[= FNA, K]}
\item \textit{Festuca versata} Beal, \textit{Texas Fescue}. Native, east to TN according to K1, but not considered to be distributed east of the Mississippi River by FNA or K2. \texttt{[= FNA, K]}
\end{itemize}

\textit{Gastridium} Palisot de Beauvois 1812 (Nitgrass)

\* \textit{Gastridium pheoides} (Nees \& Meyen) C.E. Hubbard, Nitgrass. Cp (SC): disturbed areas; rare, native of sw. Asia. \texttt{[= FNA, K]}

\textit{Gaudinia} Palisot de Beauvois 1812

\* \textit{Gaudinia fragilis} (Linnaeus) \textit{Palisot de Beauvois}, Oatgrass. Ballast, reported from Mobile, AL. \texttt{[= FNA, K; \textit{Avena fragilis} Linnaeus]}

\textit{Glyceria} R. Brown 1810 (Mannagrass)

A genus of about 40 species, nearly cosmopolitan. References: Barkworth \& Anderton in FNA (2007a); Tucker (1996)=Z. [also see \textit{Torreyochloa}]

\begin{itemize}
\item Spikelets 10-40 mm long, linear, subterete, 5-15\% as long as wide, terete or nearly so in cross-section; [section \textit{Glyceria}].
\item Lemma (6-) 7-8.5 (-10) mm long, acute to acuminate; palea longer than the lemma, extending 1.5-3 mm beyond the lemma apex............
   .............................................. \textit{G. acutiflora}
\item Lemma 2.4-6.0 mm long, obtuse to notched; palea as long as the lemma (ranging from shorter than the lemma and included, to projecting up to 1.5 mm beyond the lemma apex).
\item Lemma (3.5-) 4.0-6.0 mm long, the apex with 1-2 strongly developed lobes, and also often toothed between the lobes; leaf blades 2-12 cm long; primary panicle branches 1.5-9.5 cm long
   .............................................. \textit{G. declinata}
\item Lemma 2.4-4.8 mm long, the apex rounded or with a few poorly developed rounded teeth; leaf blades 18-32 cm long; primary panicle branches 3-17 cm long.
\end{itemize}
4 Culms 2.5-8 dm tall; pedicels 1-6 mm long ............................................................. \textit{G. notata}
4 Culms 7-18 dm tall; pedicels 0.7-1.7 mm long.
5 Lemmas hispidulous on the veins, the hairs ca. 0.1 mm long ........................................... \textit{G. arkansana}
5 Lemmas scabrous on the veins, the prickles ca. 0.05 mm long ........................................... [section \textit{G. septentrionalis}

\begin{itemize}
\item Spikelets 2.5-8 mm long, ovate to oblong, 1.5-3+ as long as wide; laterally compressed in cross-section.
\item Upper glumes 2.5-5 mm long, longer than wide; [w. VA and possibly NC northward]; [section \textit{Hydropoa}] \textit{G. grandis} var. \textit{grandis}
\item Upper glumes 0.6-3.7 mm long, if > 3 mm long, then shorter than wide; [collectively widespread]; [section \textit{Striatae}]
\end{itemize}

6 Inflorescence compact (at maturity), the branches stiffly ascending to appressed, the tips never nodding; ligule < 1 mm long.
7 Inflorescence branches elongate, appressed; lower internodes of the inflorescence 2-8 cm long; spikelets with 3-4 flowers, 3.5-4 mm long; lemma 1.9-2.8 mm long; leaves 2-5 mm wide; [Mountains, rarely elsewhere] \textit{G. melicaria}
8 Inflorescence branches short, stiffly ascending; lower internodes of the inflorescence 0.8-2.0 (2.5) cm long; spikelets with 4-7 flowers, 4-8 mm long; lemma 3.0-3.7 mm long; leaves 3-10 mm wide; [Coastal Plain, rarely disjunct inland to the Mountains of VA]

6 Inflorescence lax and diffuse (at maturity), the branches spreading to somewhat ascending, the tips often nodding or drooping; ligule 1-6 mm long.
8 Glumes tapering from below midlength to the narrowly acute (< 45 degree) tips; lemmas > 2× as long as wide; [endemic to seepage at high elevations in the Great Smoky Mountains, NC and TN and nearby] \textit{G. nubigena}
8 Glumes narrowing from midlength or above to the acute or rounded (> 45 degree) tips; lemmas < 2× as long as wide; [collectively widespread].

9 Lemma 1.4-2.1 mm long, the veins prominently raised.
10 Leaf blades 6-15 mm wide; anthers 0.5-0.8 mm long; culms 2.5-8 mm thick; [rare introduction] \textit{G. elata}
10 Leaf blades 2-6 mm wide; anthers 0.2-0.6 mm long; culms 1.5-3.5 mm thick; [common] \textit{G. striata} var. \textit{striata}

9 Lemma 1.8-4.0 mm long, the leaves visible, but not raised; ligule 2-6 mm long.
11 Lemma 2.4-4.0 mm long, projecting conspicuously beyond the palea; spikelets 5-8 mm long, with (4-) 5-10 flowers \textit{G. canadensis}
11 Lemma 1.8-2.5 mm long, more-or-less equal to the palea; spikelets 3-5 mm long, with 2-5 (6) flowers \textit{G. laxa}

\textbf{Glyceria arkansana} Fernald, Arkansas Mannagrass. Swamps. IL south to LA and AR; disjunct in w. NY. The VA report is in error. The appropriate treatment of this taxon needs further investigation. [= F, HC, K, Z; < \textit{G. septentrionalis} – C, G; = \textit{G. septentrionalis} A.S. Hitchcock var. arkansana (Fernald) Steyermark & Kučera – FNA]

\textbf{Glyceria declinata} de Brébiisson. Cp, Pd (SC), Mt (NC): disturbed moist areas; rare, native of Europe. Documented for Alleghany County, NC (D. Poindexter, pers. comm. 2009) [= FNA] [check for additional synonymy]

\textbf{Glyceria elata} (Nash) M.E. Jones. Pd (GA): \{habitat unknown\}; rare, native of w. North America. Reported for GA by FNA; presumably a chance introduction. [= FNA] [add synonymy]

\textbf{Glyceria laxa} (Scribn.) Scribn., Lax Mannagrass. Mt (NC, VA, WV), Cp (DE): bogs; rare. June-August. PE south to NC, mostly Appalachian. Though often described as a hybrid of \textit{G. canadensis} and either \textit{G. striata} var. \textit{striata} and/or \textit{G. grandis} var. \textit{grandis}, \textit{G. laxa} ranges south of the distribution of both \textit{G. canadensis} and \textit{G. grandis} var. \textit{grandis}. It is best considered as a species, perhaps of hybrid origin. [= F, G, K, WV; = \textit{G. canadensis} var. \textit{canadensis} (Michaux) Trinius var. \textit{laxa} (Scribn) A.S. Hitchcock – RAB, FNA, HC; = \textit{Lax} – C; < \textit{G. canadensis} – GW]

\textbf{Glyceria nubigena} W.A. Anderson, Smoky Mountain Mannagrass. Mt (NC, TN): moderate to high elevation seepages in the Great Smoky Mountains, sometimes in areas appearing dry (such as heath balds), nearly endemic to Great Smoky Mountains National Park; rare. June-July. Extended to the Great Smoky Mountains of w. NC and e. TN. \textit{G. nubigena} has nearly the same range as \textit{Rugelia nubicula}, but is more restricted to seepage. The distinctions and relationship between this taxon and \textit{G. nubigena} need further investigation. [= RAB, FNA, HC, K, W, Z]

\textbf{Glyceria obtusa} (Muhlenberg) Trinius, Coastal Mannagrass. Cp (DE, NC, SC, VA), Mt (VA): blackwater swamp forests, wet meadows, freshwater marshes; common (uncommon in NC, SC, VA). June-September. NS south to SC, on or near the Coastal Plain; disjunct to w. VA in Shenandoah Valley sinkhole ponds. [= RAB, C, F, FNA, G, GW, HC, K, W, WV, Z; = \textit{Panicularia obtusa} (Muhlenberg) Kuntze – S]

POACEAE

324

(Gymnopogon) west to BC, south to FL and CA. Var. stricta (Scribner) Fernald is more northern. [= C, F, G, HC, Z; < G. striata – RAB, FNA, GW, K, W, WV; = Panicularia striata (Lamarck) A.S. Hitchcock – S; = G. striata ssp. striata]

Gymnopogon Palisot de Beauvois 1812 (Beard Grass, Skeleton Grass)

A genus of about 15 species, in temperate and tropical areas of the Americas. References: Smith in FNA (2007b); Smith (1971)=Z.

Identification notes: When sterile, Gymnopogon is sometimes confused with Dichanthelium. Gymnopogon differs in having the sheaths conspicuously overlapping (vs. not overlapping in Dichanthelium) and leaves that are definitely cordate-clasping and of stiff texture (only a few Dichanthelium have this combination).

1 Awn of the lemma 4.5-12 mm long; inflorescence branches with spikelets distributed from the tip nearly to the base; leaves 5-15 mm wide; [Coastal Plain, Piedmont, and Mountains]................................................................. G. ambiguus
2 Spikelets 2-4-flowered; first glume 2.3-3.7 mm long ................................................. G. brevifolius

Haceklochoa Kuntze 1891 (Pitscale Grass)

Hainardia W. Greuter 1967 (Thintail)

A genus of 1 species, an annual, native of Europe. References: Smith in FNA (2007a); Tucker (1996)=Z.

Heteropogon Persoon 1806 (Tanglehead)

A genus of about 10 species, pantropical and extending into subtropical and warm temperate areas. References: Barkworth in FNA (2003a).

* Heteropogon melanocarpus (Elliott) Elliott ex Bentham, Sweet Tanglehead. Cp (FL, GA, NC, SC): sandy roadsides, disturbed areas; rare, probably naturalized from further south (or even from the Old World). September-October. The species is widespread in the Old World and New World tropics, north in North America to se. NC. [= RAB, FNA, HC, K, S]

Holcus Linnaeus 1753 (Velvet Grass, Soft Grass)

1 Plant not rhizomatous; upper culm internodes velvety-villous; lemma awn 1-2 mm long, recurved as a hook ...................... H. lanatus
1 Plant strongly rhizomatous; upper culm internodes glabrous; lemma awn 3-5 mm long, straight or geniculate .................. H. mollis ssp. mollis
Hordeum Linnaeus 1753 (Barley)

A genus of about 40 species, north temperate and in South America. Many recent authors place most of these species (other than *H. vulgare*) in *Critesion* Rafinesque. References: von Bothmer, Baden, & Jacobsen in FNA (2007a); Tucker (1996)=Z; Petersen & Seberg (2003); Blattner (2004).

1 Rachis remaining intact at maturity; leaves 5-12 mm wide, with well-developed auricles; [section *Hordeum*] ............... *H. vulgare*

1 Rachis disarticulating at maturity; leaves 1-5 mm wide, not auriculate (except in *H. murinum* ssp. *leporinum*).

2 Perennial; glumes 25-150 mm long; [interspecific hybrid derivative of section *Sibirica* and section *Critesion*] .... *H. jubatum* ssp. *jubatum*

2 Annual; glumes 7-22 (-28) mm long.

3 Leaves auriculate; glumes of the central spikelet (in the triad) with ciliate margins; [section *Hordeum*] ........... *H. murinum* ssp. *leporinum*

3 Leaves not auriculate; glumes of the central spikelet (in the triad) with scabrous margins; [section *Critesion*] ............... *H. pusillum*

* Hordeum brachyantherum* Nevski *ssp. brachyantherum* is reported for se. PA (Rhoads & Klein 1993) and also is apparently known from specimens from GA (Sorrie, pers. comm.). A tetraploid taxon. [= FNA, K; < *Critesion brachyantherum* (Nevski) Barkworth & D.R. Dewey] {not yet keyed}

Imperata Cirillo 1792 (Cogongrass, Satintail)

A genus of about 8-9 species, of tropical, subtropical, and warm temperate areas of both hemispheres. References: Gabel in FNA (2003a); Ward (2004c)=Z; Hall (1998)=Y.

* Imperata cylindrica* (Linnaeus) Palisot de Beauvois, Cogongrass, Brazilian Satintail. Cp (FL, GA, SC): grassy roadside; common (rare north of FL), introduced from the tropics. See Nelson (1993) for first report from SC. An extremely aggressive and dangerous weed, now well-established and rapidly invading fire-maintained Coastal Plain areas (such as longleaf pine and slash pine flatwoods and longleaf pine clayhills) on the Gulf Coastal Plain of FL, AL, and MS. Hall (1998) argues that *I. cylindrica* and *I. brasilienis* are not distinct. The only character considered to separate them is that *I. brasilienis* has 1 anther and *I. cylindrica* has 2. Ward (2004c) treats the 2 taxa at varietal level. Both putative taxa are present in the Gulf Coast area of FL, GA, AL, and LA. [= Y; > *I. cylindrica* – FNA, HC, K; > *I. brasilienis* Trimus – FNA, HC, K, S; > *I. cylindrica* var. *cylindrica* – Z; > *I. cylindrica* var. *mexicana* (Ruprecht) D.B. Ward – Z]

Koeleria Persoon 1805 (Junegrass, Koeleria)
[also see Rostraria]

A genus of about 60 species, north and south temperate. References: Standley in FNA (2007a)

* Koeleria macrantha* (Ledebour) J.A. Schultes, Junegrass. Pd (DE): South to DE, MD, PA, KY, AL, LA, TX, and Mexico. [= FNA, K; < *K. pyramidata* (Lamarck) Palisot de Beauvois – C]
**Lachnagrostis** Trinianus 1820

* Lachnagrostis filiformis* (G. Forst.) Trinianus, Pacific Bentgrass. Cp (SC): waste areas around wool-combing mill; rare, perhaps only a waif, native of Australia. [= FNA; = Agrostis avenacea J.F. Gmelin – K]

**Lagurus** Linnaeus 1753 (Hare's-tail Grass)

A monotypic genus, an annual, of the Mediterranean region. References: Tucker in FNA (2007a); Tucker (1996)–Z.

**Leersia** Swartz 1788 (Cutgrass)

A genus of about 17–18 species, tropical and warm temperate. References: Pyrah in FNA (2007a); Tucker (1988)–Z.

1 Lower panicle branches alternate (rarely opposite); spikelets 2.2–5.0 mm long, 0.8–4.0 mm broad; stamens 2 or 6.
2 Spikelets suborbicular-falcate, 3.0–4.0 mm broad, < 2× as long as broad; principal leaf-blades 10-15 mm wide; stamens 2 .... *L. lenticularis*
2 Spikelets narrowly elliptic-falcate, 1.0–2.0 mm broad, > 2× as long as wide; principal leaf-blades usually < 7 mm wide; stamens 2 or 6.
3 Spikelets 3.8–4.7 mm long, 1.5–2.0 mm broad; panicle branches short, bearing spikelets nearly to their bases; stamens 6 .... *L. hexandra*
3 Spikelets 2.2–3.5 mm long, 0.8–1.2 mm broad; panicle branches long, filiform, the longer ones bearing spikelets only in their upper half; stamens 2 ................................................................. *L. virginica*

**Leersia hexandra** Swartz, Southern Cutgrass. Cp (FL, GA, NC, SC, VA): clay-based Carolina bays, limesink ponds, lakes, pools, usually in places where periodically or seasonally inundated; uncommon (rare in VA). June–August. Pantropical, ranging north in North America to MD, TN, and TX. This species is considered a serious weed in the Old World and New World tropics; in our area, however, it is uncommon and not weedy. [= RAB, F, C, FNA, G, GW, HC, K, Z; = Homalocenchrus hexandrus (Swartz) Kuntze – S]

**Leersia lenticularis** Michaux, Catchfly Cutgrass. Cp (FL, GA, NC, SC, VA): floodplain forests and swamps; uncommon. September–October. Se. VA south to ne. FL and Panhandle FL, west to e. TX, north in the interior to IN and MN. [= RAB, C, F, FNA, G, GW, HC, K, Z; = Homalocenchrus lenticularis (Michaux) Kuntze – S]

**Leptochloa** Palisot de Beauvois 1812 (Sprangletop, Feathergrass)

A genus of about 30 species, pantropical and extending into warm temperate areas. The circumscription of *Leptochloa* has been controversial; many earlier authors have preferred to separate Diplachne as a separate genus. References: Snow in FNA (2003a); Snow (1998); Cronquist (1991).

1 Spikelets 1.2–2.5 mm long, with 2–4 flowers; sheaths sparsely pilose with long, pustular-based hairs .................. *L. panicea* ssp. *brachiata*
1 Spikelets 3.5–10 mm long, with 5–12 flowers; sheaths glabrous (rarely slightly scabrous).
2 Lemmas 2–3 mm long, the apex obtuse to truncate, with the midrib often extended as a mucro ..................... *L. uninervia*
2 Lemmas 3–5 mm long, the apex acuminate or awned.
3 Lemmas acuminate; leaf blades 5–10 mm wide .................................................................................. *L. panicoides*
3 Lemmas awned; leaf blades 1–3 mm wide.
4 Low sprawling grasses, < 5 dm tall; lemma awns (1–) 2.5–5.5 mm long; first glume 2.5–3.5 mm long; second glume 4–7 mm long........... .......................................................... *L. fasciculati var. maritima*
5 Taller grasses, usually 5–10 dm tall; lemma awns 0.5–2.5 mm long; first glume 1.3–3.4 mm long; second glume 2.2–5 mm long.
5 First glume 2.3–3.4 mm long; second glume 3.4–5.0; lemmas 4–5 mm long, with an awn 0.5–2.5 mm long ..................................................[L. fasciculati var. acuminata]
5 First glume 1.3–2 mm long; second glume 2.2–3.5; lemmas 3–4 mm long, with an awn 0.5–1 mm long .................................................. *L. fasciculati var. fasciculati*
**POACEAE**

**Linnodea** L.H. Dewey 1894

**Linnodea arkansana** (Nuttall) L.H. Dewey. Cp (AL, FL, LA, MS, SC*): hammocks, moist forests (Panhandle FL westward), waste at wool-combing mill, probably not established (SC); rare, introduced, native of sc. United States (w. FL, c. and s. AL, west through MS, LA, and AR to OK, TX, and adjacent Mexico). [= FNA, HC, K, S, Z; = *Ciona arkansana* (Nuttall) G. Tucker – Y]

**Lolium** Linnaeus 1753 (Rye-grass, Darnel, Fescue)

1 Inflorescence paniculate (spikelets borne on branches off the central axis) .................................................................[see *Schedonorus*]
2 Inflorescence spike-like (spikelets sessile on the central axis).
   1 Glumes (12-) 15-25 mm long, subcoriaceous, equaling or surpassing the uppermost lemma (therefore the length of the spikelet); florets 4-9 per spikelet; annual .................................................................................................................. *L. temulentum*
   2 Glumes 4-12 mm long, herbaceous, shorter than the lemmas (therefore shorter than the spikelet); florets (2-) 5-22 per spikelet; annual or perennial.
   3 Lemmas (at least the upper) awned, the awns to 15 mm long; florets 11-22 per spikelet; annual or perennial; .... *L. perenne var. aristatum*
   3 Lemmas awnless; florets (2-) 5-10 per spikelet; perennial.................................................................................. *L. perenne var. perenne*

* Lolium perenne* Linnaeus var. *aristatum* Willdenow, Italian Rye-grass, Annual Rye-grass. Cp (GA, NC, SC, VA), Pd (NC, SC), Mt (NC, SC, VA, WV), {FL}: fields, roadsides, pastures, disturbed areas; common (rare in VA), native of Eurasia. April-

**Luziola** Antoine Laurent de Jussieu 1789 (Southern Water Grass)

1 Culms prostrate; leaves conspicuously clustered towards the apex of the culms, floating, 1-5 (-8) cm long; pistillate inflorescence an inconspicuous axillary raceme, 1.1-3.5 cm long, with 2-5 florets .................................................................L. *bahiensis*

1 Culms suberect to erect; leaves scattered along the culm, not floating, > 6 cm long; pistillate inflorescence an axillary panicle, 2-21.5 (-58) cm long, with 18-250 (-350) florets.

2 Pistillate florets 3-5 mm long; achenes striate ...........................................................................................................................................

2 Pistillate florets 2-2.5 mm long; achenes smooth ....................................................................................................................................

**Luziola bahiensis** (Steudel) Hitchcock. Cp (AL, FL, MS): streams and riverbanks; rare. Apparently native (Anderson & Hall 1993), but considered native of South America by some authors. [= FNA, HC, K, X]

**Luziola fluitans** (Michaux) Terrell & H. Robinson var. *fluitans*, Southern Water Grass. Cp (GA, NC, SC), Pd? (GA?): aquatic in water of natural lakes, slow-moving blackwater rivers, and other stagnant waters; rare (NC Watch List). August-October. Var. *fluitans* ranges from ne. NC to e. FL and west to c. TX; var. *oconneri* (Guzman M.) G. Tucker occurs in the highlands of w. Mexico (Tucker 1988). A very unusual grass, truly aquatic, with flexuous stems and unwettable, floating leaves. In addition to floating leaves (helpful in the field but not in the herbarium!), other useful characters include two secondary blade nerves on either side of the midnerve and virtually as prominent as the midnerve, and which extend onto the sheath where they occur with another 5 or so strong nerves; often with cilia 0.5-1 mm long at the summit of the ventral face of the sheath (an unusual place); and a hyaline ligule about 1 mm long on the same plane as the sheath (i.e., free from the base of diverging blades). [= FNA, Y, Z; < *L. fluitans* – K, X; < *Hydrochloa carolinensis* Paliset de Beauvois – RAB, GW, HC, S]

**Megathyrsus** (Pilger) B.K. Simon & S.W.L. Jacobs 2003 (Guinea Grass)

**Melica** Linnaeus 1753 (Melic)

1 First glume oblong, 6.5-10 mm long, 2-4× as long as wide, acute to obtuse at the apex, about the same length and width as the second glume; inflorescence with (0-) 1-5 branches from the lower nodes only; fertile lemmas 2; leaves 1-6 mm wide; [common, widespread in our area] ....

1 First glume broadly ovate, 5-8 mm long, 1.5-2× as long as wide, obtuse to rounded at the apex, shorter and broader than the second glume; inflorescence with 2-10 (or more) branches from most nodes; fertile lemmas (2-) 3; leaves 3-12 mm wide; [rare, Mountains of NC and VA, northwards and westwards] ..................................................................................................................M. *mutica*

**Melica mutica** Walter, Two-flower Melic. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): forests and woodlands, including coastal fringe and maritime forests; common (rare in WV). April-May. MD west to IN and IL, south to FL and TX. [= RAB, C, F, FNA, G, HC, K, S, WV, Z]

**Melica nitens** (Scribner) Nuttall ex Piper, Three-flower Melic. Mt (GA, NC, VA, WV): rocky upland woodlands, barrens, and glades, over calcareous rocks (such as limestone, calcareous shale); rare. May-June. PA west to s. MN and NE, south to nw. GA and TX. [= RAB, C, F, FNA, G, HC, K, W, WV, Z]
**Melinis** Palisot de Beauvois 1812 (Natalgrass)

* Melinis repens* (Willdenow) Zizka ssp. repens, Rose Natalgrass. Cp (FL, GA, Pd (GA), Mt (GA): disturbed areas, roadsides, railroad embankments, other disturbed areas; common (rare north of FL), native of Africa. Reported for several s. GA counties (Carter, Baker, & Morris 2009); the report for NC by Kartesz (1999) is an error. [= FNA; < M. repens -- K; ? Rhynchochloa roseum (Nees) Stapf & C.E. Hubbard ex Bews -- HC; < Rhynchochloa repens (Willdenow) C.E. Hubbard]

**Microstegium** Nees in Lindley 1836 (Sasa-grass, Japanese-grass)

* Microstegium vimineum* (Trinius) A. Camus, Japanese Stilt-grass, Flexible Sasa-grass, Japanese-grass. Pd (DE, GA, NC, SC, NC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA): disturbed areas, colonizing moist, rich soil, especially in floodplains; common (uncommon in DE Coastal Plain), native of tropical se. Asia. The following chronological synopsis of flora accounts of *Microstegium* is perhaps instructive: not treated by Small (1933), "local" (Fernald 1950), "rarely introduced and possibly not established" (Gleason & Cronquist 1952), "sporadically naturalized" (Godfrey & Wooten 1979), "a rapidly spreading pernicious invader on moist ground, too common" (Wofford 1989). RAB report it from fewer than 1/3 of the counties of the Carolinas (in 1968); it is now undoubtedly in every county, an abundant weed in most of them. This species has become a very serious pest, now ranking as one of the most destructive introduced plants in our area, forming extensive and dense patches, sprawling over and eliminating nearly all other herbaceous plants. Eradication is very difficult, and considering its obvious colonizing abilities, only temporary. Hunt & Zaremba (1992) document the continuing northern expansion of *Microstegium* into NY and CT. Redman (1995) discusses its habitat preferences in MD and DC. Koyama (1987) reports it as "common as undergrowth of forests" in Japan, part of its native distribution. [= RAB, C, FNA, GK, K; = Eulalia vininea (Trinius) Kunze – G; > Eulalia vininea var. vininea – F; > Eulalia vininea var. variabilis Kunze – F; > M. vininea var. vinineum – HC; > M. vininea var. imberbe (Nees) Honda – HC]

**Milium** Linnaeus 1753 (Wood-millet, Millet-grass)

*Milium effusum* Linnaeus var. *cisatlanticum* Fernald, American Wood-millet, Millet-grass. Mt (NC, VA, WV): forests at high (or rarely moderate) elevations; rare. June. A circumboreal species, ranging in North America south to w. NC (Swain County), e. TN (Sevier County), w. VA, WV, OH, IN, IL, and MN. The American plants are sometimes segregated as var. *cisatlanticum* Fernald (Fernald 1950b). Though considered "probably accidentally introduced and established" in NC by Radford, Ahles, & Bell (1968), the native occurrence of this northern species is more plausible; the only known occurrence in NC (not recently seen) is in the Great Smoky Mountains National Park. [= FNA, K, Y; < M. effusum – RAB, C, F, G, HC, W, WV, Z; = M. effusum ssp. *cisatlanticum* (Fernald (A. Haines – X]

**Miscanthus** Andersson 1855 (Eulalia)

References: Barkworth in FNA (2003a).

**Muhlenbergia** Schreber 1789 (Muhly)

A genus of about 176 species, of North America south to Andean South America, and e. and se. Asia. *Muhlenbergia* is a large and diverse genus, recently reclassified by Peterson, Romaschenko, & Johnson (2010); the subgenera used here follow that classification. References: Peterson, Romaschenko, & Johnson (2010); Pohl (1969); Gustafson & Peterson (2007)=Y; Morden & Hatch (1989)=Z; Peterson in FNA (2003a).

1 Panicle open and diffuse, > 4 cm broad, the spikelets borne on slender or capillary pedicels longer than the lemmas.

2 Plant with rhizomes, the rhizomes prominent, creeping, and covered with imbricate scales; culms and sheaths strongly compressed at base, the leaves distichous; spikelets 1.5-2 mm long; [subgenus incertae sedis] .................................................................................................................. *M. torreyana*
2 Plant without rhizomes, tufted with erect culms (a "bunchgrass"); culm and sheaths terete, the leaves not distichous; spikelets 1.5-5 mm long (excluding awns, if present).
3 Spikelets 1.5-2 mm long, awnless; [subgenus Pseudosporobolus].................................................................................................................. M. uniflora
3 Spikelets 2.5-5 mm long (excluding awns), awned or awnless; [subgenus Trichochloa].
4 Lemma awn 0-1.5 (-4) mm long; glume bodies (1.1-) 2.0-3.3 (-3.6) mm long, <¼ as long as the lemma bodies, acuminate, not awned (rarely the second with a short awn < 0.6 mm long); spikelets usually brown or bronze (when fresh); basal sheaths usually very fibrous ................................................................. M. expansa
4 Lemma awn (2-) 3-35 mm long; glume bodies (0.3-) 0.7-1.7 (-2.4) mm long, >½ as long as the lemma body, one or both glumes sometimes awned; spikelets usually purple (when fresh); basal sheaths rarely strongly fibrous.
5 Lemma awn (2-) 3-13 (-18) mm long, first glume awnless (or rarely with an awn to 3.2 mm long), second glume awnless (or rarely with an awn up to 5.0 mm long), pales awnless; lemma lacking setaceous teeth flanking the awn; flowering late August-October; [widespread in our area, particularly in rocky, clayey, or sandy glades, barrens, and woodlands with prairie affinities].......................................................... M. capillaris
5 Lemma awn (8-) 12-26 (-35) mm long, first glume awn (0.5-) 1-7 (-10) mm long, second glume awn (1-) 5-19 (-25) mm long, palea awn-tipped; lemma with two setaceous teeth flanking the awn, the teeth 0.5-2.5 (-4.7) mm long; flowering October-November; [sandy maritime situations on barrier islands of the outer Coastal Plain].................................................................................................................. M. sericea
1 Panicle slender, dense, < 2.5 cm broad, the spikelets sessile or on non-capillary pedicels shorter than the lemmas; [subgenus Muhlenberga].
5 Glumes minute, 0-0.5 mm long; plant lacking rhizomes; culms weak, decumbent and cespitously branching in their lower portions, rooting at the nodes, the upper portions erect and sparingly branched.......................................................... M. schreberi
5 Glumes well-developed, 1-7 mm long; plant with scaly rhizomes (except for M. cuspidata); culms firm (rarely sprawling), few or solitary (rarely forming dense colonies).
6 Glumes 5-7 mm long (tapered to arched or straight awns), about double the length of the lemma (excluding its awn); panicle dense and spike-like, 2-6 cm long and 3-10 mm broad.................................................................................................................. M. glomerata
6 Glumes 1.2-3 mm long, shorter than to barely exceeding the lemma; panicle usually slender, arching, generally less dense and not spike-like, often with some elongated (though appressed) branches, 4-50 cm long, 2-15 mm broad.
7 Callus glabrous; plant lacking scaly rhizomes (with slender stolons and a hard, knotty crown); leaves 0.5-2 mm wide; [calcareous cliffs].
7 Callus bearded (sometimes only slightly so) (glabrous in M. glabriflora); plant with scaly rhizomes; leaves (1-) 2-14 mm wide; [various habitats].
8 Panicle linear, loosely flowered, much exceeding the leaves; culm erect, simple or sparingly branched; glumes relatively broad, the body ovate, 1.2-2.5 mm long, abruptly narrowed to the acuminete tip, ligule obsolete or shorter than the elongate cartilaginous summit of the leaf sheath.
9 Lemmas awnless or awn < 0.5 mm long; spikelets 1.5-2.5 mm long; leaf blades usually (1-) 2-6 mm wide...................... M. sobolifera
9 Lemma awn 1-11 mm long (rarely awnless); spikelets 3-5 mm long; leaf blades (2) 6-10 (-13) mm wide (often > 8 mm wide).................................................. M. tenuiflora
8 Panicle lanceolate, densely (rarely loosely) flowered, leaves often extending conspicuously into the inflorescence; culm geniculate, freely branched; glumes relatively narrow, the body lanceolate, 2-3 mm long, tapering from base to apex; ligule usually obvious above the short cartilaginous summit of the leaf sheath.
10 Culm glabrous throughout (including below the nodes).
11 Glumes 1.4-2.0 mm long; ligule 0.2-0.5 mm long .................................................................................................................. M. bushii
11 Glumes 2.4-5 (-5) mm long; ligule 0.8-1.5 mm long .................................................................................................................. M. frondosa
10 Culm pubescent, at least below the nodes.
12 Lemma awn 7-12 mm long; spikelets loosely clustered, on pedicels 2-4 mm long .................................................. M. sylvatica
12 Lemma awnless or with a short awn tip (rarely to 9 mm long); spikelets densely clustered, on pedicels < 1 mm long.
13 Lemma glabrous below, or with short basal bearding; ligule 0.5-1.5 mm long .................................................. M. glabriflora
13 Lemma pilose basally; ligule 0.5-1.1 mm long .................................................................................................................. M. mexicana

Muhlenbergia bushii Pohl, Bush's Muhly. Pd (VA), Mt (GA), Cp (KY), {NC}: wet oak flatwoods, bottomlands, and other moist forests; rare. In west IA, south to NE and TX, apparently disjunct eastward in scattered localities, including in n. GA (Jones & Coile 1988) and VA. The habitat is variously given in floras as "dry woods" or "moist woods." [= C, FNA, K; = M. brachyphylla Bush – F, G, HC]

Muhlenbergia capillaris (Lamarck) Trininius, Hairgrass. Pd (DE, GA, NC, SC, VA), Cp (FL, GA, KY, NC, SC, TN, VA), Mt (GA, KY, NC, TN, VA, WV), Ip (KY, TN): in the Piedmont and Interior Low Plateau primarily in clayey or thin rocky soils (especially in areas which formerly burned and were prairie-like) and in open woodlands, in the Coastal Plain in savannas, dry woodlands, and coastal grasslands (where sometimes in close proximity with M. sericea), in the Mountains around calcareous rock outcrops; uncommon (rare in WV, rare in KY Mountains, rare in KY Coastal Plain, rare in DE Piedmont). Late August-October. The species is widespread in e. North America. M. capillaris and its relatives, M. expansa and M. sericea, have been the subject of an herbarium morphological study by Morden & Hatch (1989), who conclude that the three taxa are not sharply separable and should be recognized only at the varietal level. If one considers behavior in the field, ecology, and geography in conjunction with morphologic characters, however, there is little doubt that the three taxa are biological species. Distribution and typical habitat are different for the three species, but M. capillaris can be found growing with or in proximity to each of the other two (I have not seen M. sericea and M. expansa together). In such situations, the two taxa present are readily distinguishable at a glance, and there is no evidence of intermediates or hybrids. Gustafson & Peterson (2007) also concluded that the three taxa are separable as species. [= F, FNA, G, W, Y; < M. capillaris – RAB, GW (also see M. sericea); = M. capillaris var. capillaris – C, HC, K, S, Z]

Muhlenbergia cuspidata (Torrey ex Hooker) Rydberg, Plains Muhly. Mt (VA), Ip (KY, TN): dolomite and limestone palisade cliffs; rare. OH west to MT and AB, south to sw. VA, KY, MO, OK, and NM. The VA occurrences are on dolomite and limestone palisade cliffs along the New, Roanoke, and Shenandoah rivers. [= C, F, FNA, G, HC, K]

Muhlenbergia emersleyi Vasey, Bull Muhly. Reported as introduced in NC (Kartesz 1999) from its native range in TX, NM, AZ, and Mexico, based on a specimen at the UNC Herbarium. However, the specimen makes clear that it was cultivated at a Soil Conservation Service test nursery; there is no evidence that the species is established in our area. [F, FNA, HC, K] [rejected; not keyed; not mapped]
Muhlenbergia expansa (Poiret) Trinius, Savanna Hairgrass. Cp (FL, GA, NC, SC, VA): pine savannas, pine flatwoods, mesic areas in sandhill-pocosin ecotones; common (rare in VA). September-October. Sc. VA south to FL, west to e. TX (nearly exactly the range of Pinus palustris). An important part of the grassy component of many longleaf pine savannas, M. expansa’s flowering is stimulated by fire, and, lacking fire, it may be found in large populations in solely vegetative condition. It can be distinguished in sterile condition from other savanna bunchgrasses (Sporobolus tetetolius, S. pinetorum, S. floridians, S. curtisii, Aristida stricta, and A. beyrichiana) by the following characteristics: old leaf bases fibrous and curly (rather than hardened and cartilaginous) and ligules 1-3 mm long (rather than 0.2 to 0.5 mm long). The open panicle somewhat resembles that of several species of similar habitat which often co-occur with M. expansa – Sporobolus tetetolius, S. pinetorum, S. curtisii, S. floridians, and Calamovilfa brevipilis, but the panicle of M. expansa is capillary, flexuous, and fragile, tending to break up over the winter (vs. fine-textured but not capillary, the branches rigid and ascending, more likely to persist over the winter in relatively intact condition). The vegetative characters listed above and under Calamovilfa brevipilis are also useful. See M. capillaris for a discussion of recent studies on the M. capillaris complex. [= RAB, F, FNA, GW, HC, S, Y; = M. capillaris var. trichopodes (Elliot) Vasey – C, K, Z]

Muhlenbergia frondosa (Poiret) Fernald, Smooth Wierestem Muhly. Mt (GA, KY, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (KY, NC), Ip (KY): moist forests and disturbed areas; common (uncommon in GA, NC, and SC, VA, and WV; rare in Piedmont, rare in NC Coastal Plain, rare in KY Mountains). September-October. This species is widespread in e. North America, south to ne. GA and west into the Plains. [= RAB, C, F, FNA, GW, HC, K, W, WV; = M. mexicana – S, misapplied]

Muhlenbergia glabriflora Scribn. Clay-pan Muhly. Ip (KY, TN), Cp (NC, VA): open oak flatlands, other open habitats, in clayey soils; rare. October-November. VA and NC west to IA, MO, AL, and TX, local and apparently rare in all of that range. In NC, only known from one collection, that from Durham County in 1936, with vague habitat data. F describes the habitat as "dry exsiccated or baked soils, prairies, grays or rocky slopes," Pohl (1969) as "mostly on low ground, in shade on heavy clay soils." [= C, F, G, HC, K; = M. glabriflora – FNA, orthographic variant]

Muhlenbergia glomerata (Wildenow) Trinius, Spiked Muhly. Mt (NC, VA): fans and seeps over mafic (amphibolite) or ultramafic (olivine) rocks; rare. August-October. This species is widespread in n. North America, ranging south in a scattered and disjunct pattern to NC. [= RAB, C, F, GW, HC, K, W; = M. racemosa (Michaux) Britton, Sterns, & Poggenburg – G, S]

Muhlenbergia mexicana (Linnaeus) M. H. L. Muhly. Mt (NC, VA, WV), Pd (DE, VA): forest edges; uncommon (rare in DE, NC, and WV). September-October. The epithet is a misnomer; the species is largely northern, occurring nearly throughout the United States and s. Canada. [= RAB, C, F, G, HC, K, W, WV; > M. mexicana var. filiformis (Torrey) Scribn. – FNA; > M. mexicana var. mexicana – FNA]. September-October. This species is widespread in e. United States. [= RAB, C, F, GW, HC, K, S, W, WV; > M. schreberi var. schreberi – G; > M. schreberi var. palustris (Scribner) Scribn. – G; > M. palustris Scribn.]

Muhlenbergia sericea (Michaux) P.M. Peterson, Dune Hairgrass, Sweet Grass. Cp (FL, GA, NC, SC): maritime dry grasslands, maritime wet grasslands, interdune swales, low dunes, sometimes edges of freshwater or brackish marshes, apparently limited to the barrier islands (sometimes in close proximity with M. capillaris); uncommon, though sometimes locally abundant (SC Rare). October-November. This species is a very conspicuous part of the Outer Banks flora in the autumn, especially showy and abundant around Rodanthe (Chicamacomico) and Avon (Kimateek), Dare County, NC, and also abundant on Ocracoke Island, Hyde County, NC. The capillary pedicels and awns of its purple inflorescences are so light as to be moved by the slightest breeze. By December or January they fade to tan, but remain showy. This grass is a major component of baskets made in the Low Country of SC by the Gullah, who call it "sweet grass." I agree with Curtis (1843), Blomquist (1948), Pinson & Batson (1971), Gould (1975), and others who consider M. sericea (as M. filipes) a species distinct from M. capillaris. Its range is from NC (slightly north of Oregon Inlet, Dare County, south of Nags Head) south to FL and west to TX, primarily on barrier islands. In addition to its range in CA, C, F, FNA, G, GW, HC, K, S, Y; = M. sericea – RAB, F, GW; = M. capillaris var. filipes (M.A. Curtis) Chapman ex Beal – HC, K, S; Z; = M. filipes M.A. Curtis]

Muhlenbergia sylvatica Torrey ex A. Gray, Woodland Muhly. Mt (GA, KY, NC, SC, VA, WV), Pd (DE, NC, VA), Ip (KY), Cp (KY, VA): bottomland and other moist forests, dry forests, disturbed areas; common (uncommon in FL). August-October. This species is widespread in e. United States and w. Canada. [= RAB, C, F, GW, HC, K, S, WV; > M. sylvatica var. sylvatica – F, G, GW, HC; = M. umbrosa Scribn. – S]

Muhlenbergia tenuiflora (Willdenow) Britton, Sterns, & Poggenburg, Slender Muhly. Mt (GA, KY, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, VA), Ip (KY), {SC}: moist forests and disturbed areas, up to at least 1400 mm; uncommon (rare in DE, GA, NC, and SC Piedmont, rare in DE and VA Coastal Plain). August-October. NH, WI, and NE south to GA, AL, MS, and OK. Two varieties are sometimes recognized: var. tenuiflora, with lemma awn 4-11 mm long and the sheaths and stems retrorsely hirsute, especially around the nodes, and var. variabilis (endemic to the Southern Appalachians), with lemma awn 1-4 mm long or absent, and the sheaths and stems glabrous or nearly so. The validity of the varieties needs further assessment. [= RAB, F, FNA, GW, HC, K, S, W, WV; > M. tenuiflora var. tenuiflora – C; > M. tenuiflora var. variabilis (Scribner) Pohl – C]

Muhlenbergia torreyana (J.A. Schultz) A.S. Hitchcock, Pinebarren Smokegrass. Cp (DE, GA, NC), Ip (TN), {KY:}: in the Coastal Plain in moist soils of depression meadows, coastal upland, and dry fields of former coastal barrens, commonly near or under Taxodium ascendens, in the Interior Low Plateau and Cumberland Plateau in moist grassey oak savannas; rare. August-October. NJ to GA in the Coastal Plain, and disjunct in KY (!?)and TN; currently known to be extant only in NJ, NC, and TN. It was first discovered in NC in 1987. Although it rarely flowers except following fire, it can be recognized in sterile condition by its forming clonal patches
with evenly spaced, upright, blue-green tufts, each tuft a flattened stem with 5-10 ascending-erect, rather stiff, usually conduplicate leaves, the summit of each shear with a pronounced cartilaginous thickening, easily felt by running the flattened stem from base to apex between thumb and forefinger. [= C, F, FNA, G, HC, K; = Sporobolus torreyanus (J.A. Schultes) Nash – S]

Muhlenbergia uniflora (Muhlenberg) Fernald. Bogs, wet meadows. South to s. NJ, MD, and se. PA (Rhoads & Klein 1993). [= C, FNA, G, HC, K; = M. uniflora var. uniflora – F]

Nassella (Trinius) Desv. 1846

1 Florets 1.5-2.5 mm long; leaves 0.2-0.6 mm wide, stiff and tightly convolute ......................................................... \textit{N. trichotoma}

1 Florets 3.4-13 mm long; leaves 1.8 mm wide, flat or convolute.

2 Crown (surrounding the base of the awn) as wide or wider than long, the rim with hairs <0.5 mm long; floret widest just below the the crown ................................................................................................................................. \{[N. neesiana]

2 Crown longer than wide, the rim with hairs 1-2 mm long; floret widest near or only slightly above the middle.

3 Florets 6.5-13 mm long; crown usually flaring at the tip; awns 40-90 mm long ................................................................................................................................. \textit{N. leucotricha}

3 Florets 6-8 mm long; crown parallel-sided; awns 30-50 mm long ......................................................................................... \textit{N. manicata}

\* \textit{Nassella leucotricha} (Trinius & Ruprecht) Pohl, Texas Needlegrass. Cp (SC): waste areas near wool-combing mill; rare, native of sc. United States and Mexico. [= FNA, K; = \textit{Stipa leucotricha} Trinius & Ruprecht – HC]

\* \textit{Nassella trichotoma} (Nees) Hackel ex Arechavaleta, Serrated Tussockgrass. Cp, Pd (NC, SC): fields; rare, native of South America, perhaps extirpated as a noxious weed. [= FNA; = \textit{Stipa trichotoma} Nees]

\* \textit{Nassella manicata} (E. Desv.) Barkworth, Andean Tussockgrass. Reported from MS; perhaps only a waif. [= FNA; = \textit{Stipa manicata} E. Desv.]

\* \textit{Nassella neesiana} (Trinius & Ruprecht) Barkworth, Uruguayan Tussockgrass. Known only from old collections on ballast from Mobile, AL. [= FNA; = \textit{Stipa neesiana} Trinius & Ruprecht]

Neeragrostis Bush 1903

A monotypic genus of warm temperate North America and tropical Central America and n. South America. References: Peterson & Harvey (in prep.)–Z.

Opismenus Palisot de Beauvois 1807 (Woods-grass, Basket-grass)

1 Leaf sheaths and culm axis glabrate to pilose (usually sparsely, but dense at sheath summit) with hairs <1.5 mm long; hairs on leaf surfaces similarly long; leaves 1.5-6 cm long; longest leaves with acute to acuminate tip (but not long-acuminate); lemma (7-) 9-11-veined ................................................. \textit{O. hirtellus} \textit{ssp. setarius}

1 Leaf sheaths and culm axis pilose with hairs 3-5 mm long; hairs on leaf surfaces similarly long; leaves 2.5-10 cm long; longest leaves with long-acuminate tip; lemma 7-veined ................................................................................................................................. \textit{O. hirtellus} \textit{ssp. undulatifolius}

\* \textit{Opismenus hirtellus} (Linnaeus) Palisot de Beauvois \textit{ssp. setarius} (Lamarec) Mez ex Ekman, Woods-grass. Cp (FL, GA, NC, SC), Pd (GA, SC): hammocks, maritime forests, shell middens, moist forests; common (uncommon in GA, NC, and SC). August-October. \textit{O. hirtellus} is widespread in tropical and subtropical areas of the New and Old World; \textit{ssp. setarius} ranges from e. NC south to FL, west to AR and TX, and south through the Caribbean and Central America to central South America. Scholz (1981) recognizes many other subspecies. This species is undoubtedly native in our area, occurring in undisturbed habitats in natural communities entirely devoid of alien species; the basis of Gould's (1975) assertion that \textit{Opismenus} is "introduced or adventive in the United States" is unknown. Superficially, \textit{Opismenus} resembles \textit{Arthroxan}, but has the leaves only slightly cordate at the base (vs. strongly cordate-clasping). Crins (1991) favors treating \textit{O. setarius} as a taxonomically unrecognized component within a polymorphic \textit{O. hirtellus}. [= FNA, K, Y; = \textit{O. setarius} (Lamarec) Roemer & J.A. Schultes – RAB, HC, SC; < \textit{O. hirtellus} (Linnaeus) Palisot de Beauvois – Z]

\* \textit{Opismenus hirtellus} (Linnaeus) Palisot de Beauvois \textit{ssp. undulatifolius} (Ard.) U. Scholz. Mt (VA): moist forests; rare, but locally abundant. Native to the Eastern Hemisphere (Asia and perhaps also native in s. Europe), has been reported as an
analyses, since there is little evidence that these groups are more closely related to one another than they are to other genera (including Dichanthelium to which have recently been added anatomical, chemical, and other evidence. Crins (1991) recognizes Paspalidium, Phanopyrum, Steinchisma considered to include (in our area) taxa sometimes and variously segregated as

* Oryza Linnaeus 1753 (Rice)

* Oryza sativa Linnaeus, Rice. Cp (GA, NC, SC, VA?): marshes, impoundments; rare, of only sporadic occurrence outside of cultivation, native of Asia. October. Perhaps the single most important food crop in the world, developed as a crop in Asia and cultivated at least since 10,000 years BP (Hancock 2004). Rice was an important crop before the Civil War in SC, GA, and extreme se. NC. Most rice planted today in our area is in waterfowl impoundments. [= RAB, C, FNA, G, GW, HC, K, S, X, Y, Z]

Oryzopsis Michaux 1803 (Ricegrass)

Oryzopsis asperifolia Michaux, Rough-leaved Ricegrass, Whiteseed Mountain-ricegrass. Mt (VA, WV): high elevation pine-oak/heath barrens and woodlands; rare. NL (Newfoundland) west to BC, south to w. VA (Rockingham County), WV, n. IN, SD, NM, and UT. This grass forms large cespitose clumps, the leaves evergreen and somewhat bicolored (green on the upper surface, bluish on the lower). [= C, F, FNA, G, HC, K, WV]

Panicum Linnaeus 1753 (Panic Grass)

(contributed by Richard J. LeBlond)

There has been considerable controversy over the generic limits of Panicum. In its broader recent conceptions, it has been considered to include (in our area) taxa sometimes and variously segregated as Brachiaria, Dichanthelium, Eriochloa, Paspalidium, Phanopyrum, Steinchisma, and Urochloa. All were originally recognized based on morphological characteristics, to which have recently been added anatomical, chemical, and other evidence. Crins (1991) recognizes Eriochloa, Urochloa (including Brachiaria), Paspalidium, and Panicum as genera, with Panicum subdivided into subgenera Panicum, Agrostoides, Dichanthelium, Phanopyrum, and Steinchisma. We prefer to recognize most of the segregates as genera, pending further analyses, since there is little evidence related to one another than they are to other genera recognized in the Paniceae. Phanopyrum and Dichanthelium are the only segregate groups with C_{4} photosynthesis. Eriochloa and Urochloa (including Brachiaria) have C_{4} photosynthesis, with PEP-cabinet decarboxylation. Panicum and Setaria (Paspalidium) have C_{4} photosynthesis, with NAD-me or NADP-me decarboxylation. Steinchisma, in addition to its unusual expansion of the palaearctic, apparently has a peculiar photosynthetic pathway, described by Crins (1991) as "intermediate between" C_{3} and C_{4} photosynthesis; "the leaves have Kranz anatomy, but there are fewer organelles than usual in the outer sheath."

We agree with Hansen & Wunderlin (1988) that "Dichanthelium is as 'good' a grass genus as many others (e.g. Brachiaria, Sacciolepis, and many more in other tribes)." Despite arguments to the contrary, there is little doubt that Dichanthelium is a natural group. Zuloaga, Ellis, and Morrone (1993) argue against the recognition of Dichanthelium as a genus, preferring to treat it as a subgenus under Panicum. They state, however, "within Panicum, Dichanthelium can be distinguished at the subgeneric level by the following set of characters: lax inflorescences; ellipsoid to obovoid spikelets; upper glume and lower lemma usually 7-11 nerved; upper anthecium apiculate or shortly crested, and simple papillae on the lemma and palea. Anatomically, all species are non-Kranz or C_{3}, with the outer parenchymatous sheath lacking specialized chloroplasts", etc. The argument that Phanopyrum also has C_{4} photosynthesis does not materially affect the issue of the taxonomic rank at which to recognize the groups.

We also agree with Hansen & Wunderlin (1988) that "the acceptance of Dichanthelium provides a more consistent generic classification." It offers conveniences, as well, in our area, where Dichanthelium and Panicum are readily distinguishable from each other, and the combined genus would be very large, indeed. 1 Spikelets tuberculate.
2 Lower lemmas tuberculate-hispid; spikelets 3.2-4.0 mm long; [of dry to mesic prairies and pinelands].......................... P. brachyanthum
2 Lower lemmas warty; spikelets 1.7-2.2 mm long; [of wetlands]...................................................................................... P. verrucosum
1 Spikelets smooth, not tuberculate.
3 Panicle < 2 cm wide at maturity.
4 Spikelets > 4.5 mm long; first glume > 2.4 mm long; ligule 4-6 mm long; [of coastal dunes]; [subgenus Panicum, section Repentia]....... [see Panicum, section Repentia]
4 Spikelets < 4 mm long; first glume < 2.1 mm long; ligule < 2 mm long; [not of coastal dunes].
5 Blades involute, 1.5-4 mm wide; culms wiry.................. [see Coleataenia]
5 Blades flat, the larger 6-20 mm wide; culms stout.
6 Panicles constricted, 0.3-1.6 cm wide; spikelets sub sessile to short-pediceled; summit of fertile palea not enclosed by fertile lemma... P. hemitomon
6 Panicles > 1 cm wide; spikelets short to long-pedicled; summit of fertile palea enclosed by fertile lemma......... [see Coleataenia]
3 Panicle > 2 cm wide at maturity.
7 Lower primary panicle branches in whorls of 4-7 at the nodes, stiffly spreading, naked on the proximal ⅓, the axis strongly pilose; lower culm internodes appressed papillose-pubescent; first glume acuminate, ⅔ as long as spikelet; fertile lemma chestnut brown at maturity................................. P. bergii
7 Plants without the above combination of characters.
8 Plants from a cluster of fibrous roots, without rhizomes or hard knotty crowns, annual.
9 First glume 1/5 to 1/4 length of spikelet, broadly rounded to truncate; sheaths usually glabrous; nodes glabrous; [subgenus Panicum, section Dichotomiflora]
10 Spikelets oblanceolate, (2.0-) 2.4-3.6 mm long, widest below middle, tapering to acuminated tips, second glume and sterile lemma firm, subcoriaceous; most pedicels < 3 mm long and shorter than spikelets. ... [see Panicum, section Dichotomiflora]
10 Spikelets ovoid to slenderly ellipsoid, 1.6-2.3 mm long, widest at middle with acute tips, second glume and sterile lemma thin, submembraneous; some to many pedicels > 3 mm long and longer than spikelets........... P. dichotomiflorum var. dichotomiflorum
9 First glume 1/3 to 1/2 length of spikelet, acute to subacute; sheaths villous or hispid; nodes often bearded; [subgenus Panicum, section Panicum].
11 Spikelets 4.5-6 mm long; panicle branches often nodding or drooping at maturity........................................ P. miliaceum
11 Spikelets 1.8-3.6 mm long; panicle branches ascending-spread ing at maturity.
12 Spikelets long-acuminate, (2.6-) 3.0-3.6 mm long; mature panicale slender, usually 2-3 times as long as wide.......... P. flexile
12 Spikelets short-pointed to acuminate, 1.8-2.5 (=2.8) mm long; mature panicle usually > ⅓ as wide to wider than long.
13 Sheaths glabrous except for the short-ciliate margins; culm nodes and internodes glabrous......................... P. bisulcatum
13 Sheaths hispid to villous; culm nodes usually pubescent to bearded, internodes hispid to glabrous.
14 Panicle usually equal to or longer than culm; largest blades usually 10-20 mm wide; spikelets acuminate, lanceolate to lance-ovoid................................................................. P. capillare
14 Panicle usually not as long as culm; largest blades usually 10 mm or less wide; spikelets short-pointed, ellipsoid, ovoid, or obovate.
15 Herbage purple-tinted; blades 2-6 mm wide, ascending; pulvini glabrous to sparsely pilose; spikelets 1.8-2.2 mm long, > 2× as long as wide; mature fertile lemma blackish ........................................... P. lithophilum
15 Herbage yellow-green to green; blades 2-12 mm wide, spreading; pulvini glabrous or pilose; spikelets 1.4-2.4 mm long, < 2× as long as wide; mature fertile lemma straminous.
16 Culm blades 5-12 mm wide; blade of flag (inflorosence bract) usually > ⅓ as long as panicle; panicle ellipsoid to obovate; pulvini glabrous; secondary panicle branches and pedicels divergent; spikelets 1.9-2.4 mm long........ P. gattingeri
16 Culm blades 2-6 mm wide; blade of flag usually < ⅓ as long as panicle; panicle broadly ovoid to deltoid; pulvini pilose; secondary panicle branches and pedicels appressed; spikelets 1.4-2.1 mm long........... P. philadelphia
8 Plants with rhizomes or hard knotty crowns, perennial.
17 Plants with hard crowns, lacking rhizomes; fertile lemma 1.2-1.6 mm long......................................................... [see Coleataenia]
17 Plants with rhizomes; fertile lemma 1.6-4 mm long.
18 Rhizomes about 1 cm thick with pubescent scale-like leaves; lower portion of culm hard, nearly woody........ P. antidotale
18 Rhizomes less than 1 cm thick with glabrous scale-like leaves; culms not woody.
19 First glume truncate apically................................................................. P. repens
19 First glume acute to obtuse.
20 Culms slightly compressed below; ligules 0.5 mm long or less; spikelets sessile and subsecund, usually some obliquely bent above the first glume; fertile lemma 1.8-2.2 mm long............................................. [see Coleataenia]
20 Culms terete; ligules 1-6 mm long; spikelets pedicelled and not at all secund, essentially straight; fertile lemma 2.4-4 mm long; (subgenus Panicum, section Repentia).
21 Panicle narrow, the branches erect; sheaths longer than internodes; spikelets 4.3-7.7 mm long; fertile lemma 3-4 mm long.
22 Rhizomes usually elongate; culms solitary to loosely tufted, 0.2-1.5 m tall; leaves 0.7-3.6 dm long; panicles 2-6 cm wide, the primary branches usually 1-2 per node, loosely flowered; spikelets 4.7-7.7 mm long; first glumes 2.5-5.5 mm long, ⅔-⅔ as long as the spikelet, 7-9 nerved, the nerves thickened and raised; fertile lemma 1.3-1.8 mm wide .. ................................................................. P. amarum var. amarum
22 Rhizomes usually short; culms usually tufted, 1-2 (-3) m tall; leaves 2-5 dm long; panicles 3-10 cm wide, the primary branches usually 2 or more per node, densely flowered; spikelets 4.0-5.9 mm ilong; first glumes 2.3-3.5 mm long, ⅔-⅔ as long as the spikelet, 3-5 (-7) nerved, the nerves thin and wiry; fertile lemma 1.0-1.5 mm wide .............. ................................................................. P. amarum var. varium
21 Panicle with divergent to spreading-ascending branches; upper sheaths shorter than internodes; spikelets 2.8-5 mm long; fertile lemma 2-2.6 mm long.
23 Spikelets 2.8-3.5 mm long; first glume ½ length of spikelet, blunt to acute........... P. virgatum var. cubense
23 Spikelets 3.2-5 mm long; first glume b length of spikelet, acuminate.
24 Rhizomes short, densely interlocking, culms subsecund at base, densely clumped......................................................... [P. virgatum var. spissum]
24 Rhizomes elongate, or if short, then culms horizontally divergent at base, loosely clumped......................................................... P. virgatum var. virgatum
Panicum amarum Elliott var. amarulum (A.S. Hitchcock & Chase) P.G. Palmer, Southern Seabeach Grass. Cp (DE, FL, GA, NC, SC, VA), Mt* (WV*): coastal dunes and shores, sandflats, and sandhills; common (uncommon in WV, rare in FL, GA, NC, SC, VA). July-November. NJ s. to FL and West Indies, w. to TX and Mexico; restricted to the Coastal Plain except for WV (where apparently introduced). Although well-marked and recognized as var. amarulum and var. amarum are quite distinctive, only the number and structure of first glume nerves appears to be a constant over the range of the two taxa (Palmer 1975). Primarily a coastal plant, var. amarulum has been found in the Sandhills of NC (Richmond Co.). Blooming 1948 says this taxon "does not seem to grow naturally in North Carolina." [= K, Z; = P. amarulum A.S. Hitchcock & Chase – RAB, C, F, G, HC, S, WV; = P. amarulum var. amarulum (A.S. Hitchcock & Chase) Freckmann & Lelong – FNA; not Panicum] 

Panicum antidotale Retzius, Blue Panic Grass. Cp (NC*): open, disturbed areas and fields; rare, native of India and c. Asia. Reported for NC and SC (FNA, Kartesz 1999). Established in NC, SC; AL; TX west to CA. [= FNA, HC, K; not Panicum] 

Panicum bergii Arecchave, Berg’s Panic Grass. Cp (GA): ditches and shallow, sporadically flooded depressions in grasslands; rare, native of South America. Reported for sc. GA (HC), AL (Kartesz 1999), and se. TX. [= FNA, HC, K, S; > P. pilcomayense Hackel; Panicum s.s.] 

Panicum bisulcatum Thunberg, Blackseed Panic Grass. Cp (GA): wet, disturbed, open areas; rare, native of Asia. Reported introduction in SC, GA, and PA (Kartesz 1999), and as a ballast plant for se. PA (Philadelphia) (Rhoads & Klein 1993, as P. acaequum Steudel). [= FNA, K; > P. acaequum Steudel] 

Panicum brachyanthum Steudel, Prairie Panic Grass. Cp (GA): prairies and pinelands; rare. W. LA, AR, OK, and e. TX; disjunct eastward in sc. MS and sw. GA. [= FNA, HC, K] 

Panicum capillare Linnaeus, Old-witch Grass, Tumbleweed, Tickle Grass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, VA): open sandy or stony soil, fields, roadsides, waste places, often weedy in cultivated soil; common (rare in SC). August-November. E. to c. Canada south to NJ, WV, KY, TX, and CA, are distinguished by long-acuminate spikelets 2.5-4 mm long, mostly on long pedicels. [= RAB, K, S, WV, Z; < P. capillare – C, Y (also see P. gattingeri), > P. capillare var. capillare – F, HC, W; = P. capillare ssp. capillare – FNA; = P. capillare var. agrostie Gatterin – G; Panicum s.s.] 

Panicum dichotomiflorum Michaux var. dichotomiflorum, Spreading Panic Grass, Fall Panic Grass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): marshy shores, exposed wet soils, alluvial deposits in floodplain forests, spoil banks, ditches; common. July-October. E. Canada west to BC, south to FL and TX; also in the Bahamas (Sorrie & LeBlond 1997). Plants with geniculate bases, enlarged lower nodes and sheaths, and panicles with included peduncles and divergent branches have been recognized as var. geniculatum (A. Wood) Fernald. [= K; < P. dichotomiflorum – RAB, GW, S, WV, Z; > P. dichotomiflorum var. geniculatum (Wood) Fernald – F, G, W; > P. dichotomiflorum ssp. dichotomiflorum – FNA; < P. dichotomiflorum var. dichotomiflorum – HC; Panicum s.s.] 

Panicum dichotomiflorum Michaux var. puritanorum Svensson, Puritan Panic Grass. Cp (DE, VA): wet sands and peats of seasonally exposed pond and lake shores; rare. July-October. NS, NH, and NY south to DE (Sorrie & LeBlond 2008) and VA; IN and IL. Plants from DE northward typically have slender culms 0.3-6 dm long and leaves 1-8 mm wide. Plants with floral characters of var. puritanorum but with nominate-like stout culms 0.8-2 m long and leaves 7-25 mm wide occur in bottomlands in se. VA, and have been recognized as D. dichotomiflorum var. imperiorum Fernald. For the time being they are placed here based on floral characters (they will key here), but need further study. [= F, G, K; < P. dichotomiflorum – C; > P. dichotomiflorum var. imperiorum Fernald – F; = P. dichotomiflorum ssp. puritanorum (Svensson) Freckmann & Lelong – FNA; > P. dichotomiflorum var. puritanorum – HC; Panicum s.s.] 

Panicum gattingeri Nash, Gattinger's Panic Grass. Mt (NC, VA, WV), Pd (NC, VA), (GA): damp or dry, usually calcareous sandy soils of fields, roadsides, shores, and cultivated ground; common in Mountains, uncommon in Piedmont (rare in VA). August-October. NY, sw. QC, and MN south to NC, TN, GA, AL, and AR. [= RAB, F, HC, K, S, WV; < P. capillare – C, Y; = P. philadelphicum Bernhardi ex Trinius ssp. gattingeri (Nash) Freckmann & Lelong – FNA; = P. capillare Linnaeus var. campestre Gattinger – G, W; = P. philadelphicum var. campestre (Gattinger) A. Haines – X; Panicum s.s.] 

Panicum hemitomon J.A. Schultz, Maidencane. Cp (DE, FL, GA, NC, SC, VA), Mt (VA): lake, pond, and river shores, swamp borders, marshes, ditches, often in shallow water; common (rare in VA). June-July. Coastal Plain from s. NJ south to FL, west to TX; also TN; South America. Often forming dense colonies in the low margin and shallow waters of limesink ponds. [= RAB, C, F, FNA, G, HC, W, K, S, W, Z; not Panicum] 

Panicum lithophilum Swallen, Flatrock Panic Grass. Pd (GA, NC, SC), Mt (NC): soil islands on granitic flatrocks and roads; rare. August-October. Restricted to granite outcrops in NC, SC, and ec. GA. There is some question about the distinctness of this taxon from P. philadelphicum. Zuloaga & Morrone (1996) did not consider it separable from P. philadelphicum. [= RAB, HC, K; = P. philadelphicum Bernhardi ex Trinius ssp. lithophilum (Swallen) Freckmann & Lelong – FNA; < P. capillare Linnaeus var. sylvaticum Torrey – W; < P. philadelphicum – Y; Panicum s.s.] 

Panicum miliaceum Linnaeus ssp. miliaceum, Broomcorn Millet, Proso Millet, Hog Millet. Mt (FL, NC), Mt (VA), Pd (DE, VA): planted in wildlife food plots, sometimes persistent or self-sowing; common (rare in FL, NC, and VA), introduced, native of Eurasia. July-October. [= C, FNA, K; < P. miliaceum – F, G, HC, S, Y; Panicum s.s.] 

Panicum philadelphicum Bernhardi ex Trinius, Woodland Panic Grass. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, VA): glades, barrens, desiccated pondshores, riversides, or other rocky or dry sandy soil of open woods and roadsides; common (uncommon in WV, rare in DE and SC). NS west to W1, south to GA and e. TX. Plants formerly known as P. tuckermanii Fernald, ranging from se. Canada south to w. VA and OH, are distinguished by included or short-exerted
peduncles less than one-third as long as the panicles. [= RAB, C, G, K, S, WV; > P. philadelphicum – F, HC; > P. tuckermanii Fernald – F, HC; = P. philadelphicum Bernhardi ex Trinius ssp. philadelphicum – FNA; < P. capitare Linnaeus var. sylvaticum Torrey – W; < P. philadelphicum – Y (also see P. lithophillum); = P. philadelphicum var. philadelphicum – X; Panicum s.s.]

* Panicum repens Linnaeus, Torpedo Grass. Cp (FL, GA, NC, SC): ditches, roadbanks, disturbed coastal sands, in areas where ship's ballast was deposited; common (uncommon in GA, rare north of GA), native of Europe. First reported for NC by Leonard (1971b); reported for numerous counties in the GA Coastal Plain (Carter, Baker, & Morris 2009). [= FNA, GW, HC, K, S; Panicum s.s.]

**Panicum verrucosum** Muhlenberg, Warty Panic Grass. Cp (DE, FL, GA, NC, SC, VA): wet pinelands, marshes, shores, ditches; common (uncommon in Piedmont, rare in Mountains). August-October. MA and PA west to MI and IN, south to FL and se. TX. Spikelets deep green, the warty surface unique among Panicum in our region. [= RAB, C, F, FNA, G, GW, HC, K, S, W; not Panicum]

**Panicum virgatum** Linnaeus var. cuneense Grisebach, Blunt Panic Grass. Cp (DE, FL, GA, NC, SC, VA?): wet to dry sandy pinelands; uncommon. June-October. Coastal Plain from MA to FL, west to MS; also in MI; West Indies. [= F, HC, S; Panicum virgatum – RAB, C, FNA, G, GW, W, Z; < P. virgatum var. virgatum – K]

**Panicum virgatum** Linnaeus var. spissum Linder, Tufted Switchgrass. Cp (DE): gravelly or sandy fresh to brackish shores and swamps; rare. E. Canada south to SA, MD, and DE (Kartesz 1999). [= F, HC, K; < P. virgatum – C, FNA, G; not Panicum]

**Panicum virgatum** Linnaeus var. virgatum, Switchgrass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry or wet sandy soils of pinelands, fresh and brackish marshes, shores; common (uncommon in Mountains). June-October. Sw. QC and ND south to FL and TX, west to NV; Bermuda; Central and South America. [= F, HC, S; < P. virgatum – RAB, C, FNA, G, GW, W, WV, Z; < P. virgatum var. virgatum – K; not Panicum]

* Panicum miliaceum Linnaeus ssp. ruderale (Kitagawa) Tzvelev, Panic Millet. [= FNA, K; = P. miliaceum ssp. spontaneum (Kit.) Tzvelev – C; < P. miliaceum – F, HC; Panicum s.s. – not yet keyed]

**Parapholis** C.E. Hubbard 1946 (Sickle Grass)

* Parapholis incurva* (Linnaeus) C.E. Hubbard, Sickle Grass, Hard Grass, Thin-tail. Cp (DE, NC, VA): sandy and muddy flats, brackish or salt marshes; rare, native of Europe. [= RAB, C, FNA, HC, K, Z; = Pholiurus incurvus (Linnaeus) Schinzius & Thellung – F, G; ? Lepturus filiformis (Roth) Trinius]

**Pascopyrum** A. Löve 1980 (Wheatgrass)

* Pascopyrum smithii* (Rydberg) A. Löve, Western Wheatgrass. Mt (GA): disturbed areas; rare. Reported for ne. GA (Rabun County) by Jones & Coile (1988), as *Agropyron smithii* Rydberg. It is also reported for TN and KY (Kartesz 1999). [= FNA, K; = Elytrigia smithii (Rydberg) Nevski – C; = Agropyron smithii Rydberg – F, G, W]

**Paspalum** Linnaeus 1759 (Paspalum, Crown Grass, Beadgrass)

(by Alan S. Weakley & Richard J. LeBlond)

1 Spikelets solitary, not associated with rudimentary spikelets or naked pedicels.
2 Panicles usually composed of a terminal pair of branches, sometimes with 1 (-5) additional branches below the terminal pair.
3 Upper glumes pubescent on the back or margins.  
4 Spikelets 1.3-1.9 mm long; upper glumes pilose along the margins ................................................................. [*P. conjugatum*]
4 Spikelets 2.4-3.2 mm long; upper glumes sparsely pubescent on the back .......................................................... [*P. distichum*]
3 Upper glumes glabrous.
5 Spikelets elliptic, acute or acuminate at the tip ................................................................. [*P. vaginatum*]
5 Spikelets ovate to broadly elliptic, obtuse or broadly acute at the tip.
6 Spikelets 1.9-2.3 mm long; leaf blades flat ......................................................................................... [*P. minus*]
6 Spikelets 2.5-4.0 mm long; leaf blades flat or longitudinally folded ................................................................ [*P. notatum*]
2 Panicles with 1-70 branches, if > 1, the branches arranged racemously.
7 Panicle branches 7-70, the axes extending beyond the outermost spikelets; panicle branches disarticulating at maturity .......... [*P. fluitans*]
7 Panicle branches 1-6, terminating in a spikelet; panicle branches persistent.
8 Upper florets olive to dark brown................................................................................................. [*P. scrobiculatum*]
8 Upper florets pale to tan.
9 Axes of panicle branches not broadly winged, 0.6-1.3 mm wide.
10 Spikelets orbicular, 2.8-3.2 mm wide......................................................................................... [*P. laeve var. circulae*]
10 Spikelets slightly longer than broad, 2.0-2.5 mm wide........................................................................ [*P. laeve var. laeve*]
9 Axes of panicle branches broadly winged, 1.8-3.3 mm wide.
11 Spikelets 3.2-4.0 mm long; upper lemmas with a few short hairs at their tips. P. acuminatum
11 Spikelets 1.7-2.1 mm long; upper lemmas glabrous. P. dissectum
1 Spikelets paired, or at least the second nonfunctional spikelet represented by a naked pedicel.
12 Spikelets 1.0-1.3 mm long. [P. paniculatum]
12 Spikelets 1.3-4.1 mm long
13 Margins of upper glumes and lower lemmas pilose.
14 Panicle branches 2-7; spikelets 2.3-4.0 mm long. P. dilatatum
14 Panicle branches (4-) 10-30; spikelets 1.8-2.8 mm long. P. urvillei
13 Margins of upper glumes and lower lemmas neither ciliate-lacerate, winged, nor pilose (if pubescent, the hairs not pilose).
15 Upper florets olive to dark brown.
16 Panicle branches 10-28 (or more).
17 Plants annual; axes of panicle branches broadly winged, the wings about as wide as the central portion; [common native]. P. boscianum
17 Plants perennial; axes of panicle branches narrowly winged, the wings narrower than the central portion; [rare exotics].
18 Axes of panicle branches 0.5-1.2 mm wide; spikelets 1.1-1.8 mm wide. P. conspersum
18 Axes of the panicle branches 1.0-1.7 mm wide; spikelets 1.8-2.4 mm wide. P. virgatum
16 Panicle branches 1-10 (or to 28 in P. boscianum, keyed under both leads).
19 Plants annual.
20 Spikelets 1.3-1.8 mm wide, broadly elliptic to orbicular, glabrous; panicles with 1-10 (-28) branches, the axes 0.7-2.3 mm wide. P. boscianum
20 Spikelets 1.7-2.4 mm wide, broadly obovate, shortly pubescent; panicles with 1-5 branches, the axes 0.8-1.3 mm wide. [P. convexum]
19 Plants perennial.
21 Plants cespitose, rhizomes poorly developed; culms 10-20 dm tall; panicle branches ascending, divaricate, or reflexed. P. conspersum
22 Leaves 7-18 mm wide. P. conspersum
22 Leaves 2.5-4 mm wide. P. plicatum
21 Plants not cespitose, rhizomatous; culms 1-15 dm tall; panicle branches ending in a short panicle. P. virgatum
23 Rhizomes long, evident. P. nicorae
23 Rhizomes short, indistinct. P. plicatum
15 Upper florets white, stramineous, or golden brown.
24 Lower lemmas with well-developed cross-ribs over the veins; upper glumes absent. P. malacophyllum
24 Lower lemmas not ribbed over the veins; upper glumes present. P. praecox
25 Panicles with 15-100 branches.
26 Plants annual; upper glumes and lower lemmas rugose. [P. racemosum]
26 Plants perennial; upper glumes and lower lemmas smooth.
27 Plants rhizomatous; panicle branch axes 0.9-1.2 mm wide; panicle branches often arcing. P. intermedium
27 Plant rhizomatous; panicle branch axes 0.3-0.6 mm wide; panicle branches straight. P. plicatum
28 Panicle branches spreading to reflexed (rarely ascending); leaf blades 10-23 mm wide; axes of panicle branches 0.3-0.4 mm wide. P. coryphaeum
28 Panicle branches erect to ascending; leaf blades 4.9-6.1 mm wide; axes of panicle branches 0.5-0.6 mm wide. [P. quadrifarium]
25 Panicles with 1-15 branches.
29 Spikelets 1.3-2.5 mm long.
30 Upper glumes (and usually also the lower lemmas) shortly pubescent. P. bifidum
31 Lower glumes present. [P. langei]
31 Lower glumes absent.
32 Panicles both terminal and axillary, the axillary panicles partially or completely enclosed by the subtending leaf sheath. [see Key A]
32 Panicles all terminal. P. caespitosum
30 Upper glumes and lower lemmas glabrous.
33 Panicles both terminal and axillary, the axillary panicles partially or completely enclosed by the subtending leaf sheath. [see Key A]
33 Panicles all terminal.
34 Upper panicle branches spreading to ascending. P. monostachyum
34 Upper panicle branches spreading to ascending.
35 Upper glumes and lower lemmas 5-veined. P. caespitosum
35 Upper glumes and lower lemmas 3-veined.
36 Lower sheaths villous or hirsute, . P. praecox var. curtisianum
36 Lower sheaths glabrous or sparsely papilllose pubescent. P. praecox var. praecox
29 Spikelets 2.5-4.1 mm long.
37 Spikelet pairs barely if at all imbricate; lower glumes usually present. P. bifidum
37 Spikelet pairs imbricate; lower glumes absent or present.
38 Upper glumes pubescent; lower lemmas usually pubescent. P. bifidum
39 Lower glumes present. [P. langei]
39 Lower glumes absent. P. pubiflorum
38 Upper glumes glabrous; lower lemmas usually glabrous.
40 Upper florets golden brown. P. floridanum
40 Upper florets pale to tan.
POACEAE

338

43 Spikelets 2.1-3.1 mm long, 2.0-2.8 mm wide, orbicular or nearly so; upper glumes 3-veined; leaf blades laterally folded.
44 Lower sheaths villous or hisrate .............................................. P. praecox var. curtisianum
44 Lower sheaths glabrous or sparsely pubescent .............................. P. praecox var. praecox

Key A: Paspalum setaceum complex
(by Richard J. LeBlond)

1 Leaves glabrous to glabrate (if glabrate, also see var. stramineum in couplet 8).
2 Blades crowded toward the base, often recurved, 3-8 mm wide; spikelets 1.4-1.9 mm long, usually glabrous
.......................................................................................................................... P. setaceum var. longepedunculatum
2 Blades not especially crowded toward the base, erect, ascending or spreading, 2-20 mm wide; spikelets 1.6-2.6 mm long, pubescent or glabrous.
3 Blades 3-8 mm wide; spikelets 1.6-1.9 mm long, pubescent, subacute; [of GA and FL southward] ..................... P. propinquum
3 Blades 2-20 mm wide; spikelets 1.7-2.6 mm long (if < 2.0 then larger leaves usually > 7 mm wide), glabrous or pubescent, rounded to blunt; [plants of FL northward and westward].
4 Plants erect to spreading; blades 3-20 mm wide; spikelets 1.7-2.6 mm long; [of NJ to TX] .......................... P. setaceum var. ciliatifolium
4 Plants stiffly erect; blades 2-6 mm wide; spikelets 2.0-2.6 mm long; [of GA and FL] ...................... P. setaceum var. rigidifolium

1 Leaves variously pubescent.
5 Leaves villous to villous-hirsute, 2-10 mm wide; spikelets 1.3-1.9 mm long.
6 Leaves villous, 2-7 mm wide, not especially crowded toward the base, erect to spreading; [widespread] ............ P. setaceum var. setaceum
6 Leaves villous-hirsute, 3-10 mm wide, crowded toward the base, recurved; [of n. FL south to Cuba] ........... P. setaceum var. villosissimum
5 Leaves puberulent, pilose, or hirsute, 3-15 mm wide; spikelets 1.6-2.5 mm long.
7 Leaves puberulent at least distally on the adaxial surface (and often also pilose in var. stramineum); spikelets 1.6-2.2 mm long.
8 Plants erect to spreading; leaves puberulent and often nearly glabrous except for the puberulent distal adaxial surface; spikelets glabrous to pubescent .............................................. P. setaceum var. stramineum
8 Plants spreading to prostrate; leaves densely puberulent; spikelets pubescent .............................................. P. setaceum var. psammophilum
7 Leaves pilose or hirsute but not puberulent; spikelets 1.8-2.5 mm long.
9 Plants mostly erect; leaves pilose; spikelets usually glabrous; sterile lemma midnervous usually present ................
................................................................................................................................................ P. setaceum var. muhlenbergii
9 Plants mostly widely spreading; leaves hirsute; spikelets glabrous or pubescent; sterile lemma midnervous present or absent ................
................................................................................................................................................ P. setaceum var. supinum

Paspalum acuminatum Raddi, Brook Paspalum, Canoe Grass. Pd (GA): wet areas, often disturbed; rare, possibly only
adventive in our area. C. GA and ne. TX south to s. FL and s. TX, south through the New World tropics to s. South America. [= FNA, HC, K]

mesic to wet longleaf pine savannas and mesic swales in sandhills; uncommon (rare north of SC). August-October. Se.
VA south to s. FL, west to se. MO, se. OK, and e. TX. [= RAB, C, GW, HC, K, S, Y; > P. bifidum var. bifidum – F, G; > P. bifidum var. projectum Fernald – F, G]

fields, ditches; common (uncommon in VA). July-October. MD, KY, and TX south through tropical America. [= RAB, C, F,
FNA, GW, HC, K, S, W, Y]

Paspalum caespitosum Flügge. Cp (AL, FL): pinelands, hammocks; rare. S. AL and n. FL south to s. FL; West Indies,
Mexico and Central America. [= FNA, GW, HC, K, S]

Paspalum conjugatum Bergius, Sour Paspalum. Cp (AL, FL, LA, MS): disturbed areas, forest edges; uncommon. Ne. FL,
FL Panhandle, and s. AL west to e. TX, south in the New World tropics; Old World tropics. [= FNA, HC, K, S] (synonymy
incomplete)
* Paspalum conspersum Schrad., Scattered Paspalum. Cp (GA): roadsides, other disturbed areas; rare, native of Mexico
south to South America. [= FNA] (synonymy incomplete)
* Paspalum coryphaeum Trinius, Emperor Crown-grass. Cp (FL), Pd (NC): disturbed areas; rare, native of South America. [= FNA, K] (synonymy incomplete)
* Paspalum dilatatum Poiret ssp. dilatatum, Dallis Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA,
NC, SC, VA, WV): roadsides, fields, disturbed areas; common (uncommon in DE, rare in WV), native of tropical America.
May-October. Other subspecies occur in the native range in South America. [< P. dilatatum – RAB, C, F, FNA, G, GW, HC, K, S, W, Y]

Paspalum dissectum (Linnaeus) Linnaeus, Mudbank Grass, Walter Paspalum. Cp (DE, GA, NC, SC, VA), Pd (NC,
SC), Mt (VA): mud flats, drawdown zones; uncommon (rare in NC, SC, and VA). September. NJ, IL, and KS south to s. FL
and e. TX: Cuba. [= RAB, C, F, FNA, G, GW, HC, K, S, Y]

Paspalum distichum Linnaeus, Joint Paspalum, Knotgrass. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC): brackish
and freshwater marshes; uncommon (rare in VA). June-August. NJ, KS, and WA south to s. FL, s. TX, s. CA and through the
New World and Old World tropics. [= RAB, C, F, FNA, G, HC, K, S, W, Y; < P. distichum – GW (also see P. vaginatum); = P.
paspaloides (Michaux) Scribner]

wet forests, pine savannas; common (rare in Mountains). August-October. NJ, IL, and KS south to s. FL and e. TX. [= RAB, C, FNA, GW, K, W; > P. floridanum – G; > P. difforme Le Conte – G, HC, S; Y; > P. floridanum var. floridanum – F, HC, S, Y; > P.
floridanum var. glabratum Engelmann ex Vasey – F, HC, S, Y; > P. giganteum Baldwin ex Vasey – HC, S, Y]
**POACEAE**

*Paspalum fluviatilis* (Elliott) Kunth, Water Paspalum, Horsetail Crown Grass. Cp (GA, NC, SC, VA), Pd (NC, VA), Mt (WV): mucky soils in swamp forests, moist riverbanks; uncommon (rare in WV). October. MD, IL, and KS south to s. FL and s. TX, and south through tropical America to c. South America. [= RAB, C, F, G, HC, K; = *P. repens* P.J. Bergius – FNA, GW, S, Y]

*Paspalum laeve* Michaux var. *laeve*. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): forest edges and disturbed areas; common. [need additional herbarium work to fully determine range and abundance of varieties] June-August. Overall distribution of *P. laeve* s.l.: MA, NY, MI, and KS south to s. FL and e. TX. < *P. laeve* – RAB, C, FNA, G, GW, K, W; > *P. laeve* var. *laeve* – F; > *P. laeve* var. *pilorum* Scriber – F; > *P. laeve* – HC, S, WV, Y; > *P. longipilum* Nash – HC, S, WV, Y]

*Paspalum langei* (E. Fournier) Nash, Rustyseed Paspalum. Cp (FL, LA): calcareous hardwood hammocks; rare. N. peninsular FL (Alachua County) and Panhandle FL (Jackson County) west to se. TX, and south through the New World tropics to South America. [= FNA, K; = *P. botteri* (E. Fournier) Chase] [synonymy incomplete]

*Paspalum malacophyllum* Trinius, Ribbed Paspalum. Cp (GA): old fields, disturbed areas; rare, native of Mexico to South America. [= FNA, HC]

*Paspalum minus* E. Fournier, Matted Paspalum. Cp (AL, FL, LA, MS): disturbed areas; uncommon. FL Panhandle (Escambia County) and s. AL west to e. TX. [= FNA, K] [synonymy incomplete]

*Paspalum monostachyhum* Vasey, Gulfdune Paspalum. Cp (MS): coastal dunes, wet prairies; rare. S. FL peninsula; s. MS; sw. LA west to TX and Tamaulipas. [= FNA, HC, K, S] [synonymy incomplete]

*Paspalum nicorae* Parodi, Brunswickgrass. Cp (GA): disturbed areas; rare, native of Brazil. Also reported for peninsular FL (Wunderlin & Hansen 2006). [= FNA, HC, K]

*Paspalum notatum* Flügge, Bahia Grass. Cp (FL, GA, NC, SC, VA), Pd (GA, SC, VA), Mt (GA): road sides and disturbed areas, sometimes planted as a coarse turfgrass or a pasture grass; common (uncommon north of FL, rare in VA Piedmont, native of tropical America. June-October. [= FNA, G, GW, Y; > *P. notatum* var. *notatum* – HC, K; > *P. notatum* Flügge var. *saurae* Parodi – RAB, HC, K]

*Paspalum plicatum* Michaux, Brownseed Paspalum. Cp (FL, GA, SC): pine savannas, fields; common (uncommon south of FL). May-July. Sc. SC south to s. FL, west to s. TX, and south through tropical America to s. South America. [= RAB, FNA, GW, HC, K, S, Y]

*Paspalum praecox* Walter var. *curtisianum* (Steudel) Vasey, Curtis’s Crown Grass. Cp (FL, GA, NC, SC, VA): pine savannas; rare (NC Watch List, VA Rare). June-October. NC south to s. FL, west to e. TX. The variety was named for the Rev. Moses Ashley Curtis (of Hillsborough, NC), not Allen Hiram Curtiss (of Jacksonville, FL); the correct spelling of the epithet is *curtisianum*. June-October. MA and CT south to s. FL, west to e. TX, inland to w. VA, s. WV, s. MO and AR; Cuba. [= FNA, Z; < *P. praecox* var. *curtisianum* – C; orthographic error; < *P. praecox* – FNA, GW, K; = *P. lentiferum* Lamarck – HC, S, Y]

*Paspalum pubiflorum* Ruprecht var. *glabrum* Vasey, Hairyseed Crown Grass. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (FL, SC, VA): disturbed areas; uncommon; rare (dead in FL, and WV). September-October. PA west to KS and CO, south to FL and s. TX and Mexico; Cuba. [= C, F, G, HC, S, Y; < *P. pubiflorum* – RAB, FNA, GW, K, W]

*Paspalum scrobiculatum* Linnaeus, Indian Paspalum. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): dry open areas and woodlands, disturbed areas; common. June-September. S. NJ south to s. FL, west to e. TX, interior to s. WV, se. KY, e. TN, n. AL, n. MS, c. AR, and e. OK. [= FNA, Z; < *P. scrobiculatum* – RAB, GW, K, W; < *P. scrobiculatum* var. *ciliatifolium* – C (also see var. *longepedunculatum*); = *P. ciliatifolium* Michaux var. *ciliatifolium* – F; = *P. ciliatifolium* Michaux – HC, S, WV, Y]

*Paspalum setaceum* Michaux var. *psammophilum* (Nash) D. Banks. Cp (VA?): maritime grasslands, sandy disturbed areas; rare. June-September. MA south to DC (VA?) in the Coastal Plain. [= C, FNA, Z; < *P. setaceum* – K; = *P. psammophilum* Nash – F, G, HC, Y]

*Paspalum setaceum* Michaux var. *rigidifolium* (Nash) D. Banks. Cp (FL, GA, NC, SC?): sandhills; rare. June-September. Ne. GA, immediately adjacent to SC (and reported for NC by HC) south to s. FL; Cuba. [= FNA, Z; < *P. setaceum* – RAB, GW, K, W; = *P. rigidifolium* Nash – HC, S, Y]

*Paspalum setaceum* Michaux var. *setaceum*, Thin Paspalum. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): sandhills, savannas, dry soils; common (uncommon in Piedmont and Mountains, uncommon in DE). June-September. MA and CT south to s. FL, west to e. TX, inland to w. VA, s. WV, s. MO and AR; Cuba. [= C, FNA, Z; < *P. setaceum* – RAB, GW, K, W; > *P. setaceum* – G, HC, S, WV, Y; > *P. debile* Michaux – F, HC, S, Y; > *P. setaceum* var. *setaceum* – F]
Paspalum setaceum Michaux var. stramineum (Nash) D. Banks, Yellow Sand Paspalum. Cp (FL, GA, NC): dry sandy soils; rare. June-September. MI west to MT, south to LA, and NM; scattered eastwards, especially near the coast, perhaps at least in part as introductions. [= C, FNA, Z; < P. setaceum – RAB, GW, K, W; = P. ciliatifolium Michaux var. stramineum (Nash) Fernald – F, G; = P. stramineum Nash – HC, Y]

Paspalum setaceum Michaux var. supinum (Bosc ex Poiret) Trinian. Cp (FL, GA, NC, SC, VA?): sandy soils, old fields; uncommon. June-September. E. NC (e. VA?) south to s. FL, west to s. MS. Also reported for the Coastal Plain of Virginia by Tatnall (1946); needing confirmation of the specimen identification. [= F, FNA, Z; < P. setaceum – RAB, GW, K, W; = P. supinum Bosc ex Poiret – HC, S]

Paspalum setaceum Michaux var. villosissimum (Nash) D. Banks. Cp (FL): sandy pine flatwoods and fields; uncommon. N. FL (very near GA) south to s. FL; Cuba. [= FNA, Z; < P. setaceum – GW, K; < P. dehile Michaux – HC; = P. villosissimum Nash – S]

Disturbed areas. Native to tropical America. Ec. MS and sw. FL. [= FNA, HC, K]

* Paspalum virgatum Linnaeus, Talquezal. Cp (GA): disturbed areas; rare, native of Mexico, Central America, and South America. [= FNA, K] {synonymy incomplete}

Paspalum convexum Flügge, Mexican Paspalum. Disturbed areas. MS, LA, and e. TX, native of tropical America. [= FNA, K]
{synonymy incomplete}

Paspalum denticulatum Trinian. Cp (AL): wet disturbed areas; rare. FL, AL, LA, TX southward. {synonymy incomplete; not yet keyed}

* Paspalum paniculatum Linnaeus, Arrocillo. Disturbed areas, native of tropical America. Ec. MS and sw. FL. [= FNA, K] {synonymy incomplete}

* Paspalum quadriparium Lamarck, Tussock Paspalum. Disturbed areas. S. MS. Native of South America. [= FNA] {synonymy incomplete}

* Paspalum racemosum Lamarck, Peruvian Paspalum. Disturbed areas. MS and other widely scattered localities in North America, native of n. South America. [= FNA, K] {synonymy incomplete}

Pennisetum L.C. Richard ex Persoon 1805

Key adapted from FNA.

1 Primary bristles (immediately subtending each spikelet) scabrous.
2 Panicles with 9-16 fascicles per cm of length, plants 0.3-1.2 m tall. .......................................................... P. alopecuroides

1 Primary bristles conspicuously long-ciliate.
3 Spikelets 9-12 mm long .......................................................... P. villosum

3 Spikelets 2.5-7 mm long.
4 Fascicles not disarticulating from the rachises; fascicles 33-160 per cm of inflorescence; panicles 4-200 cm long; leaves 7-70 mm wide. ....................................................... P. glaucum

4 Fascicles disarticulating from the rachises at maturity; fascicles 8-37 per cm of inflorescence; panicles 2-32 cm long; leaves 2-13 mm wide.
5 Spikelets 4.5-7 mm long; leaves 2-3.5 mm wide, folded or conduplicate and superficially appearing even narrower; rachis pubescent. .............................................................. P. setaceum

5 Spikelets 2.5-5.6 mm long; leaves 2-13 mm wide, flat; rachis scabrous.
6 Inner bristles fused for < ¼ of their length; many outer bristles exceeding the spikelets; terminal bristles 10.5-23 mm long, noticeably longer than the other bristles in the fascicle. ................................................................. P. ciliare

6 Inner bristles fused for ≥ ½ of their length; outer bristles not exceeding the spikelets; terminal bristles 2.9-6.5 mm long, usually not noticeably exceeding the other bristles in the fascicle. .................................................... P. setigerum

* Pennisetum alopecuroides (Linnaeus) Sprengel, Chinese Fountaingrass. Cp (DE), Pd (DE, VA), Mt (VA): disturbed areas; rare, native of e. Asia. [= FNA, HC, K]

* Pennisetum ciliare (Linnaeus) Link, Buffelgrass. Cp (FL): disturbed area! rare, native of Africa. Known in our area from ne. FL, s. AL, e. TN, and ec. MS. [= FNA, HC; = P. ciliare var. ciliare – K; = Cenchrus ciliaris Linnaeus]

* Pennisetum glaucum (Linnaeus) R. Brown, Pearl Millet. Cp (FL), Mt (VA, WV), Pd (VA), {GA, NC, SC}: disturbed areas; common, native of the Old World. [= RAB, FNA, HC, K, WH; ? Chaetochloa lutescens (Weigel) Stuntz – S; = Setaria glauca (Linnaeus) Palisot de Beauvois – WV]

* Pennisetum setigerum (Vahl) Wipff. Cp (FL): disturbed areas; rare, native of Africa. Known in our area from ne. FL and ec. MS. [= FNA; = P. ciliare (Linnaeus) Link var. setigerum (Vahl) Leeke – K; = Cenchrus setigerus Vahl]

* Pennisetum villosum R. Brown ex Fresenius, Feather-top. Reported as an introduction in GA (Kartesz 1999). [= C, FNA, HC, K; = Cenchrus lonigsetus M.C. Johnston]
Phalaris Linnaeus 1753 (Canary-grass)

1 Perennial, with scaly rhizomes; inflorescence either obviously paniculate, 7-25 cm long, with ascending to appressed branches, the main branches of the inflorescence apparent, the inflorescence outline thus appearing lobed, or densely spike-like, 1.5-15 cm long.
2 Glumes not winged; fertile lemmas narrowly lanceolate, glabrous to sparsely pubescent .................. P. arundinacea
1 Annual, without rhizomes; inflorescence densely spike-like or almost capitulate, 1-9 cm long, the branches not apparent, the inflorescence outline a single ovoid, ellipsoid, or lanceolate form.
3 Spikelets borne in clusters, the lower 4-7 spikelets in each cluster with a staminate terminal floret ........................................ P. paradoxa
3 Spikelets borne singly; all spikelets with a bisexual terminal floret.
   4 Keels of the glumes broadly winged (the wing ca. 1 mm wide); sterile florets 2.0-4.5 mm long ...................... P. canariensis
5 Sterile florets 1
6 Nerves of the glumes scabrous; panicle cylindric in outline, 6-18 cm long; glumes 3.5-4.0 mm long; sterile florets 0.5-1.5 mm long ........................................ P. angusta
6 Nerves of the glumes not scabrous; panicle narrowly ovate in outline, usually 2-6 cm long; glumes 5-6 mm long; sterile florets 1.5-2.5 mm long ........................................ P. caroliniana

* Phalaris angusta* Nees ex Trinian. Cp (FL, GA, SC): waterfowl impoundments, marshes; uncommon, native of tropical America, perhaps native in LA and TX. [= GW, FNA, HC, K, Z]

**? Phalaris arundinacea** Linnaeus, Reed Canary-grass, Ribbon Grass. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): moist forests, moist disturbed areas, bogs; common (rare in VA Coastal Plain). June. NL (Newfoundland) west to AK, south to NC, TN, AR, NM, CA; Mexico; Eurasia. A variegated form, *P. arundinacea form variegata* (Parn.) Druce, is cultivated for ornament, as Ribbon Grass. [= RAB, C, F, FNA, GW, K, S, W, WV, Z; > P. arundinacea var. arundinacea – G, HC; > P. arundinacea var. picta Linnaeus – G, HC]

* Phalaris caroliniana* Walter, Maygrass. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC): ditches, roadsides, disturbed areas; uncommon. May-June. NC west to OR, south into Mexico, the original distribution now obscured. [= RAB, C, F, FNA, GW, HC, K, S, Z]

* Phalaris minor* Retzius, Lesser Canary Grass. Cp (SC): waste areas near wool-combing mills; rare, native of Mediterranean Europe. Also reported for other scattered states in e. North America. [= FNA, HC, K] [synonymy incomplete]

* Phalaris paradoxa* Linnaeus, Mediterranean Canary Grass. {NC}: {habitat}; rare. Reported for NC, MD, NJ, and PA (Barkworth in FNA 2007a; Kartesz 1999). [= FNA, K; > P. paradoxa var. paradoxa – HC; > P. paradoxa var. praemorsa (Lamarck) Coss. & Durieu – HC] [synonymy incomplete]

**Phanopyrum** (Rafinesque) Nash 1903 (Phanopyrum)

Phleum Linnaeus 1753 (Timothy)

1 Spikelets 2.0-3.6 (-3.8) mm long, including the 0.2-1.0 (-1.2) mm long awns; panicle 3-6 (-6.7) mm wide; leaves 2-6 mm wide; ligule usually acute ................................................................. *P. pratense ssp. bertolonii*
1 Spikelets (3.5-) 4-5.5 mm long, including the (0.8-) 1.0-2.0 mm long awns; panicle 5-10 mm wide; leaves 3-9 mm wide; ligule usually obtuse ................................................................. *P. pratense ssp. pratense*
*Phragmites* Adanson 1763 (Common Reed)

1 Panicle diffuse and partially drooping, with lower lateral branches naked for 1-4 cm; leaf blades of lower stem leaves abscising from the sheaths by mid-season; leaves slightly scabrous on lower surface; culms stout, to 20 mm in diameter, smooth and glossy; [native on the Gulf Coast, from FL and GA westward, and southward into the tropics];.................................................. *P. karka*

1 Panicle erect and relatively compact, with lower lateral branches spikelet-bearing to base

2 Ligules 1.0-1.7 mm long; lower glumes 3.0-6.5 mm long; upper glumes 5.5-11.0 mm long; leaf sheaths caducous with age; culms exposed in the winter, smooth and shiny; [native south to WV and VA];.................................................. *P. americanus*

2 Ligules 0.4-0.9 mm long; lower glumes 2.5-5.0 mm long; upper glumes 4.5-7.5 mm long; leaf sheaths not caducous with age; culms not exposed in the winter, minutely ridged and not shiny; [introduced and weedy] .............................................. *P. australis*

*Phragmites americana* (Saltonstall, P.M. Peterson, & Soreng) A. Haines, American Reed. Freshwater marshes. New England westward. [= V; *P. australis* ssp. *americana* Saltonstall, P.M. Peterson, & Soreng – FNA, X, Y, Z; *P. australis* – C, K; *P. communis* Trinius – RAB, G, HC; *P. communis* var. *berlandieri* (Fournier) Fernald – F]

*Phragmites australis* (Cavanilles) Trinius ex Steudel, Common Reed. Brackish and freshwater Marshes, dredge-spoil deposit islands, ditches. August-October. Nearly worldwide in distribution. Fox, Godfrey, & Blumquist (1950) report its first collection in NC (in 1948). In most of our area, reed is of relatively recent introduction, reported from only nine counties in RAB, but now becoming a serious weed in coastal areas, where it aggressively colonizes freshwater and brackish marshes, excluding the native species. [= V; *P. australis* ssp. *australis* – X, Y; *Phragmites australis* (Cavanilles) Trinius ex Steudel var. *australis* – FNA, Z; *P. australis* – C, K; *P. communis* Trinius – RAB, G, HC; *P. communis* var. *communis* var. *communis* var. *berlandieri* (Fournier) Fernald – F; *P. phragmites* (Linnaeus) Karsten – S]

**Phyllostachys** Siebold & Zuccarini 1843 (Bamboo)

A genus of about 50 (or more) species, native of mainly temperate e. Asia. References: Stapleton & Barkworth in FNA (2007a); Duncan & Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.

1 Internodes at the base of principal culms dissimilar in length, the lowermost internode 1-12 cm long, the next 3 internodes distinctly longer, with nodal junctions mostly straight across; ................................................................. *P. aurea*

1 Internodes at the base of principal culms all similar in length, mostly 4-8 cm, with nodal junctions oblique.

2 Groove on internode (above the branch) yellowish-green, the rest of the culm dull greenish; .................................................. *P. aureosulcata*

2 Groove on internode (above the branch) the same color as the rest of the culm.

3 Internodes of principal culms densely velvety; outer surface of culm sheaths with abundant erect brown hairs; lowest internode of principal culms ca. 5 cm long; culms pale green aestival, becoming gray with accumulated waxy powder in age; ........................................... *P. heterocycla*

3 Internodes of principal culms glabrous or slightly hairy; outer surface of culm sheaths lacking erect brown hairs; lowest internode of principal culms ca. 8.5-12 cm long; culms various (see below, but not as described in first lead).
4 Largest culms to 15 cm in diameter and 25 m tall; upper culm sheaths with auricles; outer surface of culm sheaths usually with a green streak down the middle, flanked by streaks of purple and buff; culms medium to dark glossy green at first (some cultivars golden yellow or yellow streaked), remaining so in age ................................................................. P. bambusoides

4 Largest culms to 3.2 (-4) cm in diameter and 10 m tall (rarely taller); upper culm sheaths with or without auricles; outer surface of culm sheaths variously streaked, spotted, or mottled with brown or red (but not as above); culms pale green to green at first, usually becoming purple spotted, gray, or yellow in age.

5 Lowest internode of principal culms ca. 8.5 cm long; culm sheaths with auricles, usually sparsely pubescent with erect, pale hairs, usually pinkish-brown at maturity, marked with numerous brown spots near the tip; culms green at first, usually becoming speckled and then more-or-less completely darkened with purplish spots (remaining green in some cultivars) ............................................. P. nigra

5 Lowest internode of principal culms ca. 12 cm long; culm sheaths lacking auricles, glabrous, usually green to buff at maturity, striped and marginally bordered with red; culms pale green at first, becoming gray to yellowish in age ......................................... P. rubromarginata

* Phyllostachys aurea Carrière ex A. & C. Rivière, Golden Bamboo, Fishpole Bamboo. Cp (DE, FL?, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (VA): suburban woodlands; uncommon (rare in VA Mountains), native of China and Japan. Not known to flower in our area. This is the usual large bamboo cultivated and naturalizing in our area, forming dense stands, up to 15 m tall. [= RAB, FNA, HC, K, Y, Z]

* Phyllostachys aureosulcata McClure, Yellowgroove Bamboo. Cp (SC), Pd (VA), Mt (WV), {GA}: cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= K, WV, Y, Z]

* Phyllostachys bambusoides Siebold & Zuccarini, Giant Timber Bamboo. Cp (NC, SC), Pd (NC, SC), Mt (NC, SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= FNA, HC, K, Y, Z]

* Phyllostachys heterocycla (Carrière) S. Matsum, Moso Bamboo. Cp (SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= Y; ? P. edulis (Carrière) Houzeau de Lehaye – K; ? P. pubescens Mazel ex Houzeau de Lehaye – Z]

* Phyllostachys nigra (Loddiges) Munro, Black Bamboo. Pd (SC), Pd (VA), Mt (WV): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China and Japan. [= K, WV, Y, Z; > P. nigra var. henonis (Mitf.) Stapf – WV]

* Phyllostachys rubromarginata McClure. Pd (SC): cultivated as an ornamental, persistent or spreading from plantings; rare, native of China. [= K, Y, Z]

* Phyllostachys meyeri McClure is reported as introduced in FL, NC, and SC (Kartesz 1999). {investigate} [= K] {not yet keyed}

A number of other species are sometimes cultivated in our area, and may be encountered. Bamboos are seriously under-represented in herbaria, since they rarely flower and are impractical to press. All of the species above should be anticipated in other physiographic provinces and states than those listed.

Piptatherum Palisot de Beauvois 1812

1 Glumes 2.5-3.5 mm long; lemmas glabrous; [alien] .......................................................................................................... [P. miliaceum]

1 Glumes 3-8 mm long; lemmas evenly pubescent; [native].

2 Leaves primarily cauline, the basal leaves < 2 cm long or merely represented by sheaths; leaves 8-16 mm wide; florets 4.5-7.5 mm long ................................................................. P. racemosus

2 Leaves primarily basal, the basal leaves 4-45 cm long; leaves 0.5-1.8 mm wide; florets 2.2-4.5 mm long.

3 Awns absent or < 2 mm long, caducous ........................................................................................................................................

3 Awns 5-15 mm long, persistent, 1-2× geniculate .............................................................................................................

3 Awns present, at least 2 mm long, caducous ...................................................................................................................

Piptatherum canadense (Poiré) Dorn, Mountain Ricegrass. Mt (WV): sandy barrens on quartzite; rare. NL (Newfoundland) west to BC, south to n. NY, MI, and WI; disjunct at Panther Knob, Pendleton County, WV. [= K; = Oryzopsis canadensis (Poiré) Torrey – C, F, G, HC, WV]

Piptatherum pungens (Torrey ex Sprengel) Dorn. Mt (WV): {habitat}; {abundance}. NL (Labrador), NU, and YT south to NJ, WV, IN, IL, IA, SD, and CO. [= K; = Oryzopsis pungens (Torrey ex Sprengel) A.S. Hitchcock – C, F, G, HC]

Piptatherum racemosum Ricker ex A.S. Hitchcock, Blackseed Ricegrass. Mt (VA, WV), Pd (DE): calcareous woodlands and forests; common (rare in DE and WV). QC and ON west to ND, south to w. VA, e. TN (FNA), sc. KY, sc. MO, and e. NE. [= K; = Oryzopsis racemosa (Smith) Ricker ex A.S. Hitchcock – C, F, G, HC, W, WV]

Piptochaetium J. Presl 1830 (Needlegrass)

A genus of about 27 species, of temperate North and South America, and montane tropical South America (Cialdella & Giussani 2002). References: Barkworth in FNA (2007a); Cialdella & Giussani (2002).

1 Florets 7-13 mm long; awns 40-75 mm long; [widespread in our area] ................................................................................................. P. avenaceum

1 Florets 13.5-22 mm long; awns 62-120 mm long; [endemic to FL] ................................................................................................. P. avenacioides

Pleioblastus Nakai 1925

A genus of about 20 species, shrubs, native of China and Japan.

* Pleioblastus simonii (Carrière) Nakai. Reported for GA (Kartesz 1999). [investigate] [= Arundinaria simonii (Carrière) A.& C. Rivière – K]

Poa Linnaeus 1753 (Bluegrass)

1 Plants with well-developed rhizomes; perennial.  
2 Upper stems strongly flattened; [section Tichopoa] .................................................. P. compressa 
3 Upper stems terete or nearly so.  
4 Lower nodes of the panicle with 1-3 branches; [section Madropoa] .................. P. cuspidata 
5 Lower nodes of the panicle with 4 or more branches; [section Poa] .................. P. pratensis 
6 Plants lacking rhizomes; perennial or annual.  
7 Spikelets (most or all) modified into purplish bulblets; culm bulbous-thickened at ground level; [section Arenarieae] .............. P. bulbosa 
8 Spikelets normal; culm not bulbous-thickened.  
9 Perennial.  
10 Marginal veins of the lemma glabrous.  
11 Sheaths glabrous; ligule 0.7-2.2 (-3.0) mm long; [section Sylvestres] .................. P. annua 
12 Sheaths scabrous; ligule 2.5-3.7 mm long; [section Pandemos] .................. P. pratensis 
13 Perennial; culms erect, 3-6 dm long; inflorescence 6-15 cm long, the widely spreading branches bearing a few spikelets near the end; lemmas 3.2-4.4 mm long; [section Sylvestres] .................. P. autumnalis 
14 Annual; culms decumbent to ascending and 1-3 dm long; inflorescence 2-8 cm long, the ascending branches bearing crowded spikelets above the middle; lemmas 2.4-3.4 mm long; [section Micranthearae] .................. P. compressa 
15 Annual; [section Homalopoa] .......................... P. chapmaniana 
16 Spikelets (most or all) modified into purplish bulblets; culm bulbous-thickened at ground level; [section Arenarieae] .............. P. bulbosa 
17 Spikelets normal; culm not bulbous-thickened.  
18 Annual; [section Homalopoa] .......................... P. chapmaniana 
19 Perennial.  
20 Marginal veins of the lemma glabrous.  
21 Nodes of the panicle mostly with 4-8 branches; lemmas pubescent or scabrous on the keel.  
22 Sheaths glabrous; ligule 0.7-2.2 (-3.0) mm long; [section Sylvestres] .................. P. alpina 
23 Sheaths scabrous; ligule 2.5-3.7 mm long; [section Pandemos] .................. P. pratensis 
24 Perennial; culms erect, 3-6 dm long; inflorescence 6-15 cm long, the widely spreading branches bearing a few spikelets near the end; lemmas 3.2-4.4 mm long; [section Sylvestres] .................. P. autumnalis 
25 Lemmas not webbed at the base.  
26 Annual; culms decumbent to ascending and 1-3 dm long; inflorescence 2-8 cm long, the ascending branches bearing crowded spikelets above the middle; lemmas 2.4-3.4 mm long; [section Micranthearae] .................. P. compressa 
27 Perennial; culms erect, 3-6 dm long; inflorescence 6-15 cm long, the widely spreading branches bearing a few spikelets near the end; lemmas 3.2-4.4 mm long; [section Sylvestres] .................. P. autumnalis 
28 Annual; culms decumbent to ascending and 1-3 dm long; inflorescence 2-8 cm long, the ascending branches bearing crowded spikelets above the middle; lemmas 2.4-3.4 mm long; [section Micranthearae] .................. P. compressa

Poa alsodes A. Gray, Woodland Bluegrass. Pd (DE, NC, VA), Mt (NC, VA, WV): rich forests; common (uncommon in NC, VA, and WV Mountains, rare in NC and VA Piedmont). May-June. NS west to SD, south to NC and IL; also in w. United States. [= RAB, C, F, FNA, G, HC, K, S, W, WV, Z]

POACEAE

* Poa languida Hitchcock. Drooping Bluegrass. Mt (VA): ultramafic outcrop woodlands, barrens, and glades; rare. April-May. VT and MA west to MN, south to PA, w. VA, KY, and IA. See comments under P. saltuensis. [= C, F, G, HC, K, S, W, WV, Z]

* Poa nemoralis Linnaeus, Wood Bluegrass. Pd (DE, VA), Mt (NC, VA): disturbed areas, sandy creek bottoms; uncommon (rare in VA), native of Europe. [= C, F, FNA, G, HC; < P. nemoralis ssp. nemoralis – K]

* Poa paludigena Fernald & Wiegand, Bog Bluegrass. Mt (NC, VA, WV), Pd (DE): bogs, especially in deep shade under shrubs; rare. April-May. NY west to MN, south to PA, w. NC, and IL. This species withers and disintegrates shortly after flowering; its ephemeral habit may be responsible for its being overlooked in our area for many years. [= C, F, FNA, G, HC, K]

* Poa saulensis Fernald & Wiegand, Old-pasture Bluegrass. Mt (NC, VA, WV): northern hardwood forests, ultramafic outcrop woodlands, barrens, and glades; rare. April-May. NL (Newfoundland) west to MN, south to PA, w. VA, and w. NC. The NC occurrences (on serpentinized olivine barrens) reported as incomplete}

* Poa saltuensis Fernald & Wiegand, Old-pasture Bluegrass. Mt (NC, VA, WV): northern hardwood forests, ultramafic outcrop woodlands, barrens, and glades; rare. April-May. NL (Newfoundland) west to MN, south to PA, w. VA, and w. NC. The NC occurrences (on serpentinized olivine barrens) reported as incomplete}

* Poa trivialis Linnaeus ssp. trivialis, Rough Bluegrass. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA), [GA]: moist forests, disturbed areas, bottomlands; common (rare in VA Coastal Plain), native of Europe. April-June. [= FNA; < P. trivialis – RAB, C, F, G, GW, HC, K, S, W, WV, Z]

* Poa wolffii Scribner. Mt (NC): moist rich forests; rare. OH west to MN, south to c. TN, n. AR, and NE; disjunct eastward w. NC. The NC occurrence is based on material from Great Smoky Mountains National Park (Haywood County) (K. Langdon, pers. comm.. 2006). The alleged VA occurrences are in error. [= C, F, G, HC, K, S, W, Z]

* Poa infirma Kunth. Cp (SC): disturbed areas; rare, native of South America. [investigate] [= FNA, K] [not yet keyed; synonymy incomplete]

Polypogon Desfontaines 1798

A genus of about 18 species, annuals and perennials, of tropical and warm temperate regions. References: Barkworth in FNA (2007a); Tucker (1996)–Z.

1 Inflorescence verticillate, the rachis visible between the verticils; glumes 1.6-2.3 mm long, without awns; spikelets disarticulating near base of pedicel; stoloniferous perennial ................................................................. P. viridis

2 Inflorescence dense, cylindrical, and spike like; glumes 2-3 mm long, with prominent awns 3.5-7 mm long; spikelets disarticulating near apex of pedicel; annual.

2 Glumes deeply lobed, the awn borne between the lobes; glume ciliate-fringed; lemma 0.4-0.7 mm long, awnless................................. P. maritimus var. maritimus

2 Glumes slightly notched at the tip, the awn borne from near the tip; glume ciliate-margined; lemma 0.7-1.1 mm long, awned................................. P. monspeliensis

* Polypogon maritimus Willdenow var. maritimus, Mediterranean Beardgrass. Cp (GA, SC): brackish marshes; rare, native of Mediterranean Europe. P. maritimus Willdenow is reported as introduced to GA (Small 1933). [= FNA; < P. maritimus – HC, K, S, Z]

* * Polypogon viridis * (Gouan) Breistr., Water Bent-grass. Cp (SC): introduced on ballast around old ports, probably not persistent; rare, native of the Old World. Distinguished from *Agrostis* in having the spikelet falling as a whole, disarticulating below the glumes. [= FNA, K, Z; = Agrostis viridis Gouan – C; > Agrostis verticillata Villars – F; > Agrostis semiverticillata (Forskål) C. Christensen – G, HC]

**Pseudosasa** Makino ex Nakai 1925 (Arrow Bamboo)

A genus of about 36 species, native of China, Japan, and Korea. References: Stapleton in FNA (2007a); Duncan & Duncan [in prep.]=Z; Judziewicz et al. (2000)=Y. Key adapted from Z.

* * Pseudosasa japonica * (Siebold & Zuccarini ex Steudel) Makino ex Nakai, Arrow Bamboo. Cp (FL, VA): cultivated as an ornamental, persistent or spreading from plantings; uncommon, native of Japan. [= FNA, HC, K, Y, Z; = Sasa japonica (Siebold & Zuccarini ex Steudel) Makino]

**Puccinellia** Parlatore 1848 (Alkali Grass, Goosegrass)

1 Lemmas 3.0-4.5 mm long; spikelets 5-11-flowered..........................[P. maritima]
1 Lemmas 1.5-2.5 mm long; spikelets 2-6-flowered.
2 Inflorescence diffuse, the lower branches with spikelets restricted to the distal portions; lower inflorescence branches spreading horizontal to deflexed at maturity; lemma 1.5-2.1 mm long, the midnerve not reaching the apex.................................................[P. distans]
2 Inflorescence compact, the lower branches bearing spikelets nearly to the base; lower inflorescence branches ascending at maturity; lemma 2.0-2.5 mm long, the midnerve reaching the apex, and often excurrent as a mucro .................................................P. fasciculata

* * Puccinellia fasciculata * (Torrey) Bicknell, Eastern Alkali Grass, Saltmarsh Goosegrass. Cp (DE, VA): salt or brackish marshes; rare. NS south to VA, Europe; and in sw. United States. The native or introduced status of this species in ne. North America is controversial. [= C, F, FNA, G, HC, K]

* * Puccinellia maritima * (Hudson) Parlatore, Seaside Alkali Grass, Seaside Speargrass. Salt marshes and ballast near ports. Introduced south to se. PA (Philadelphia), NJ (Camden), and DE, especially on ballast. [= C, F, FNA, G, HC; > P. americana Sorensen – K] {synonymy incomplete}

**Reimarochloa** A.S. Hitchcock 1909

A genus of about 4 species, of the New World tropics. References: Barkworth in FNA (2003a).

**Reimarochloa oligostachya** (Munro ex Bentham) A.S. Hitchcock. Cp (FL): moist hammocks, wet grasslands; rare. Ne. FL (Duval County) and s. AL south to s. FL; Cuba. [= FNA, HC, K]

**Ripidium** Trinius 1820 (Ravenna-grass)

References: Hodkinson et al. (2002).

* * Ripidium ravennae * (Linnaeus) Trinius, Ravenna-grass, Plume-grass. Cultivated as an ornamental and rarely escaping or persisting; native of s. Europe. In sw. GA, TN, and MD (Kartesz 1999), DC (Steury 2004a), FL (Wunderlin & Hansen 2006). [= Saccharum ravennae (Linnaeus) Linnaeus – FNA, K; = Erianthus ravennae (Linnaeus) Palisot de Beauvois – F; > Erianthus ravennae var. ravennae – HC; > Erianthus ravennae var. purpurascens (Anderss.) Hackel – HC]

**Rostraria** Trinius 1820

* Rostraria cristata* (Linnaeus) Tzvelev. Cp (FL, SC): waste areas near wool-combing mills, other disturbed areas; rare, introduced, native of Europe. It also occurs at scattered other sites in eastern United States, such as on ballast in se. PA (Rhoads & Klein 1993), and reported for MD, AL, and FL (Kartesz 1999). Not keyed. [= K; > *R. cristata* var. *cristata* – FNA; > *R. cristata* var. *glabriflora* (Trautvetter) Doğan – FNA; = *Lophochloa cristata* (Linnaeus) Hylander; = *Koeleria phileoides* (Villars) Persoon – HC; ? *Koeleria gerardii* (Villars) Shinners]

**Rothelia** Linnaeus f. 1782 (Iitch-grass)

A genus of about 5 species, native to tropical Asia and Africa. References: Wipff in FNA (2003a); Wipff & Rector (1993)=Z.

* Rothelia cochinchinensis* (Louireo) W.D. Clayton, Itch-grass. Cp (FL, GA, NC, VA): disturbed ground; uncommon (rare north of FL), native of tropical se. Asia. August-October. This grass, considered a noxious weed, was found in at least 13 GA counties by 1985 (Duncan 1985; Carter, Baker, & Morris 2009), on a farm in Robeson County, NC in 1984, and in cornfields in Westmoreland County, VA in 2007. [= FNA, K, Z; = Rothelia exaltata Linnaeus f. – HC; = Manisuris exaltata (Linnaeus f.) Kuntze – S]

**Saccharum** Linnaeus 1753 (Plume Grass)

A genus of uncertain circumscription at this time. Clayton & Renvoize (1986) pointed out that the "traditional division [of *Saccharum*] into awned (Erianthus) and awnless species seems wholly artificial," Hodkinson et al. (2002) developed molecular evidence which suggests that our species are not congeneric with *Saccharum*, however. Further study is needed, but likely our native southeastern species will be merged into Miscanthidium Stapf, while the introduced *S. ravennae* will be placed in the genus *Ripidium* Trinius (Hodkinson et al. 2002). Sugarcane (*Saccharum officinarum* Linnaeus, *S. sinense* Roxburgh, *S. barberi* Jeswiet, *S. spontaneum* Linnaeus, and cultivars and hybrids derived from those four species) is cultivated further south, notably in FL and LA. References: Webster in FNA (2003a); Webster & Shaw (1995)=Z; Gandhi & Dutton (1993); Hodkinson et al. (2002). [also see *Ripidium*]

1 Lowermost inflorescence node densely hairy; callus hairs (ring of hairs beneath the spikelet) (7-) 9-25 mm long, equal to or longer than the spikelet; stem appressed-pubescent below the inflorescence, on the internodes as well as the node.

2 Lemma awn flattened and spirally twisted at base; callus hairs 9-14 mm long, silvery or tinged with purple; leaves usually glabrous on the upper surface at maturity; [of moist to dry sites, rarely in wetlands] ............................................................................................................................. *S. alopecuroides*

2 Lemma nearly terete, straight or slightly flexuous; callus hairs (7-) 15-20 (-25) mm long, tawny or brown; leaves usually pilose on the upper surface at maturity; [of moist to wet sites, rarely in uplands] ............................................................................................................................. *S. giganteum*

1 Lowermost inflorescence node glabrous; callus hairs (ring of hairs beneath the spikelet) 0-6.5 mm long, shorter than or equal to the spikelet (or absent in *S. brevibarbe*); stem glabrous below the inflorescence, except sometimes on the nodes.

3 Callus hairs (ring of hairs beneath the spikelet) absent, or of few hairs 0-2 mm long (much shorter than the spikelet); panicle branches closely appressed, the panicle usually 1-3 cm broad; panicle branches glabrous ............................................................................................................................. *S. baldwinii*

3 Callus hairs (ring of hairs beneath the spikelet) present, dense, 3-6.5 mm long (from about half as long to nearly as long as the spikelet); panicle branches ascending, the panicle usually 4-10 cm broad; panicle branches pubescent.

4 Awn of the lemma of the upper floret terete at the base, and not spiraled; spikelets dark brown; spikelet pair dissimilar in size, the lemma of the upper floret 0.7-0.8× as long as the lemma of the lower floret typically 3-nerved.

............................................................................................................................. *S. coarctatum*

4 Awn of the lemma of the upper floret flattened at the base, either spiraled or not; spikelets straw-colored or purplish; spikelet pair homomorph, the upper lemma 0.9-1.0× as long as the lower lemma; lemma of the lower floret not distinctly nerved.

5 Awn of the lemma of the upper floret not basally spiraled, 10-18 mm long; lemma of the upper floret entire .................................................................

............................................................................................................................. *S. brevibarbe var. brevibarbe*

5 Awn of the lemma of the upper floret basally spiraled, 15-22 mm long; lemma of the upper floret bifid, the tooth on either side of the lemma 2.0-2.5 mm long ................................................................. *S. brevibarbe var. contortum*

**Saccharum brevibarbe** (Michaux) Persoon var. brevibarbe, Short-bearded Plume Grass. Cp (NC): marshes, ditches; rare. September-October. MS, AL, and TN west to TX, AR, and OK; disjunct in e. NC. [= FNA, K, Z; < Erianthus brevibarbes Michaux – RAB, C, G, GW, S (also see *S. coarctatum*); = E. brevibarbes – F; < Erianthus coarctatus var. elliotii Michaux – F; = Miscanthidium species 3]

**Saccharum brevibarbe** (Michaux) Persson var. contortum (Elliott) R. Webster, Bent-awn Plume Grass. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): open woodlands and forests, woodland borders; common (rare in Mountains, rare in DE, FL, and VA). Late July-October. DE and MD south to Panhandle FL, west to TX and AR, with scattered occurrences north to TN. [= FNA, K, Z; = Erianthus contortus Elliott – RAB, C, F, G, GW, HC, S, W; = Saccharum contortum (Elliott) Nuttall; = Erianthus brevibarbes Michaux var. contortus (Elliott) D.B. Ward; = Miscanthidium species 4]

Sacciolepis Nash 1901 (Cupscale)

1 Annual, cespitose; spikelets 2.5-3.5 mm long; [rare alien] ............................................................................................................................ S. indica
1 Perennial, from creeping stolons; spikelets (3-) 4-5 mm long; [common native] ........................................................................................ S. striata

*Sacciolepis indica* (Linnaeus) Chase, Indian Cupscale. Cp (FL, GA, NC, SC): low fields, ditches; uncommon (rare north of FL); native of India. October. [= RAB, FNA, GW, HC, K]

*Sacciolepis striata* (Linnaeus) Nash, American Cupscale. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC): marshes, interdune swales, ditches, swamps; common (rare in Piedmont and Mountains, rare in DE). July-October. S. NJ south to FL, west to e. TX and OK, nearly limited to the Coastal Plain, but occasionally inland as in w. NC and TN; also native in the West Indies and n. South America. [= RAB, C, F, FNA, G, GW, HC, K, W]

Sasa Makino & Shibata 1901

Schedonorus Palisot de Beauvois 1812 (Meadow Fescue, Tall Fescue)

A genus of perennials, native of Eurasia. The correct generic placement of the introduced species *Schedonorus arundinaces* (= *Festuca elatior*; = *Festuca arundinacea*; = *Lolium arundinaceum*) and *S. pratense* has been disputed. The traditional placement in *Festuca* has been defended by Aiken et al. (1997); Darbyshire (1993) transferred them to *Lolium*; and Soreng & Terrell (1998) place them in the genus *Schedonorus*. References: Darbyshire in FNA (2007a); Darbyshire (1993)=X; Aiken & Darbyshire (1990)=Y; Tucker (1996)=Z; Soreng & Terrell (1998)=V. Key based in part on C and Y.

1 Auricles glabrous; spikelets with (2-) 4-10 (-12) florets; old sheaths brown, decaying to fibers; internodes of the rachilla antrorsely scabrous .................................................. S. arundinaces
1 Auricles glabrous; spikelets with (2-) 4-10 (-12) florets; old sheaths brown, decaying to fibers; internodes of the rachilla glabrous (smooth) or nearly so. .......................................................................................................................... S. pratensis

*Schedonorus arundinaces* (Schreber) Dumortier, Tall Fescue, Alta Fescue. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, roadsides, pastures, disturbed areas; common (uncommon in FL), native of Eurasia. May-July. [= FNA, V; = *Festuca elatior* Linnaeus – RAB, F, S, W, WV, misapplied; = *Festuca arundinacea* Schreber – HC, Y; = *Festuca elatior* Linnaeus – C; = *Festuca elatior* var. arundinacea (Schreber) Wimmer – G; = *Festuca arundinacea* (Schreber) Darbyshire – K, X, Z; = Schedonorus phoenix (Scopolı) Holub]

*Schedonorus pratensis* (Hudson) Palisot de Beauvois, Meadow Fescue. Mt (VA, WV), Pd (DE), Cp (DE): fields, roadsides, pastures, disturbed areas; common (rare in Virginia), native of Eurasia. May-July. [= FNA, V; = *Festuca elatior* Linnaeus – F, S, W, WV, misapplied; = *Festuca pratensis* Hudson – C, Y; = *Festuca pratensis* var. pratensis (Hudson) A. Gray – G; = *Festuca pratensis* Hudson – GW; = *Festuca elatior* – HC, misapplied; = *Lolium pratense* (Hudson) Darbyshire – K, X, Z]

Schizachne Hackel 1909 (False Melic)

*Schizachne purpurascens* (Torrey) Swallen, Purple Outgrass, False Melic. Mt (VA, WV): moist, rocky northern hardwood and spruce forests; rare. NL (Newfoundland) west to AK, south to MD, w. VA, WV, KY, IL, NM, and Mexico; also in ne. Asia. May-July. [= F, FNA, G, HC, K, WV; = S. purpurascens var. purpurascens – C]

Schizachyrium Nees 1829 (Little Bluestem)

### Schizachyrium littorale (Nash) Bicknell, Seaside Little Bluestem
Coastal dunes and maritime dry grasslands, often with *Uniola paniculata, Panicum amarum,* and other dune plants. August-October. E. MA south to NC (or SC?), and inland on the shores of the Great Lakes. In NC, *S. littorale* is present and abundant on dunes of barrier islands from Shackleford Banks, Carteret County south to Brunswick County, near the SC border, and entirely absent from the Outer Banks (from Cape Lookout, Carteret County, north through Hyde County to Dare County). Reported for FL for ne. FL (Duval County) and Panhandle FL (Franklin County). [FNA, GW, K; *< Andropogon scoparium* Michaux – RAB; *= S. scoparium var. littorale* (Nash) Gould – C; Z; = *Andropogon scoparium* Michaux var. littoralis (Nash) A.S. Hitchcock – F; G; = *Andropogon littoralis* Nash – HC, S; *< S. scoparium* (Michaux) Nash ssp. littorale (Nash) Gandhi & Smeins – Y]  

### Schizachyrium maritimum (Chapman) Nash. Coastal dunes and grasslands. AL, FL west to e. LA. [FNA, GW, K; = *Andropogon maritimus* Chapman – HC, S] [add to synonymy]  

### Schizachyrium sanguineum (Retzius) Alston var. hirtiflorum (Nees) Hatch, Hairy Crimson Bluestem. Pine flatwoods, sandhills, disturbed sandy sites. Sw. GA and FL west to AZ and south through Central America to South America; West Indies. [FNA, K; = *Andropogon niveus* Swallen – HC, S] [not keyed or mapped]  

### Schizachyrium sanguineum var. frequens (Nees) K. Gould – F; G; > *Andropogon scoparius* var. polycladus Scribn & Ball – F; > *Andropogon scoparius* var. frequens F.T. Hubbard – F; = *S. scoparium* ssp. scoparium – K, Y; = *Andropogon scoparius* – S, W, WV]  

### Schizachyrium scoparium (Michaux) Nash var. stoloniferum (Nash) J. Wipff. Creeping Little Bluestem. Fall-line sandhills in the inner Coastal Plain, perhaps in other dry habitats, the habitat and range in our area requiring further study. August-October. SC and GA south to FL and west to MS. See Wipff (1996a) for additional discussion. [FNA, K, Z; *= S. stoloniferum* Nash – GW; = *Andropogon stolonifer* (Nash) A.S. Hitchcock – HC, S; *< S. scoparium* ssp. littorale (Nash) Gandhi & Smeins – Y]  

### Schizachyrium tenerum Nees, Slender Bluestem. Longleaf pine savannas, sandhills, and flatwoods. Ne. FL, s. GA, and FL Panhandle west to e. TX. [FNA, K; = *Andropogon tener* (Nees) Kunth – HC, S]

---

1. Leaf blades 0.5-1.5 mm wide, with a lighter-colored zone in the center of the upper surface; sessile spikelet ca. 4 mm long. 
2. Leaf blades >1.5 mm wide, lacking a distinct lighter zone on the upper surface; sessile spikelet 5-11 mm long. 
3. Plants rhizomatous, with internodes 6 mm long or longer; sessile spikelet 5-7 mm long. 
4. Leaf blades broad and strongly keeled, hairs of the race me internodes 2.5-6 mm long; stems decumbent at base, rooting at the lower nodes (appearing nearly rhizomatous); sessile spikelet 6-10 mm long. 
5. Leaf blades >1.5 mm wide, pedicellate spikelets 1.5-5 mm long; [of the Atlantic Coast] 
6. Leaf blades 0.5-1.5 mm wide, with a lighter-colored zone in the center of the upper surface; sessile spikelet 4.5-8.5 mm long; [of the Gulf Coast] 

---

POACEAE
**Sclerochloa** Palisot de Beauvois 1812 (Hard Grass)

* Sclerochloa dura* (Linnaeus) Palisot de Beauvois, Hard Grass, Fairground Grass. Mt (VA, WV), {GA}: athletic fields, lawns; rare, native of Mediterranean Europe. In VA, known from a single site and doubtfully persisting (VBA 2007). Also reported from GA, MD, MS, and TN (Kartesz 1999). [= C, HC, K, Z]

**Secale** Linnaeus 1753 (Rye)

* Secale cereale* Linnaeus, Rye. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields; commonly cultivated, uncommonly persistent or volunteering after cultivation, native of Eurasia. May-June. An important crop, cultivated for at least 8000 years. The lemmas have awns 2-6 cm long. [= RAB, C, F, FNA, G, HC, K, Z]

**Setaria** Palisot de Beauvois 1807 (Foxtail Grass)

1. None of the spikelets subtended by a stiff bristle.
2. Spikelets 2.2-2.4 mm long; glumes and sterile lemma not papery ................................................................. S. geminata var. geminata
3. Most spikelets other than the terminal lacking a subtending bristle; leaves plicate; [rare aliens].
4. Annual; leaves 10-25 mm wide ......................................................................................................................... S. barbata
5. Perennial; leaves 20-80 mm wide ....................................................................................................................... S. palmetto
6. Annual, with fibrous roots ........................................................................................................................................ S. pumila ssp. pumila
7. Perennial, noticeably rhizomatous.
8. Bristles retrorsely scabrous.
9. Leaves scabrous on the lower surface; sheath margins glabrous; panicles 2-6 cm long .................................. S. adhaerans
10. Annual; leaves 4-25 mm wide; [aliens and natives, collectively widespread and common].
11. Bristles 4-12 below each spikelet.
12. Upper lemmas smooth and shiny (occasionally with obscure rugosity) ............................................................ S. faberi
13. Upper lemmas distinctly transversely rugose, dull.
14. Panicles densely spiciform; rachises not visible, villous.
15. Leaves softly pilose on the upper surface; panicles arching and drooping from the base; spikelets 2.5-3.0 mm long..... S. viridis var. major
16. Panicles 10-20 cm long; culms 10-25 dm tall; leaves 10-25 mm wide ................................................................. S. viridis var. viridis

* Setaria barbata* (Lamarck) Kunth, Mary-grass. Cp (FL, MS): on ballast at Apalachicola (Franklin County, FL), other disturbed areas; rare, native of Africa. [= FNA, HC, K]

* Setaria corrugata* (Elliot) J.A. Schultes. Cp (FL, GA, NC, SC): pinelands, disturbed areas; common. From ne. NC south to s. FL, west to e. TX; Cuba; Dominican Republic. [= RAB, FNA, HC, K; = Chaetochloa corrugata (Elliot) Lamson-Scribner – S]

* Setaria geminata* (Forskål) Veldkamp var. geminata. Cp (AL, FL): in shallow water of swamps; uncommon. Pantropical and –subtropical. [= Y; = Panicum geminatum – FNA, GW, X; = Panicum geminatum Forskål – HC, S; = Paspalidium geminatum (Forskål) Stapf var. geminatum – K]
**Setaria geminata** (Forskål) Veldkamp var. *paludivaga* (A.S. Hitchcock & Chase) R.D. Webster, Alligator Grass, Paspalidium. Cp (FL, GA, SC): in shallow water; rare. December. S. SC south to FL, west to TX; also in Central and South America. This taxon is sometimes considered an introduction from the Old World, but its occurrence in undisturbed wetlands remote from extensive human activity suggests that it is native. [= *Panicum paludivagum* A.S. Hitchcock & Chase – RAB, HC, S; < *Paspalidium geminatum* – FNA, GW, X; = *Paspalidium geminatum* (Forskål) Stapf var. *paludivagum* (A.S. Hitchcock & Chase) Gould – K; = *Paspalidium paludivagum* (A.S. Hitchcock & Chase) Parodi]

* Setaria macroperma* (Lamson-Scribner & Merrill) K. Schumann, Coastal Bristlegrass. Cp (FL, GA, SC): marshes, ditches, moist disturbed areas; common (uncommon in DE and WV). MA to IA south to s. FL and west to e. TX; disjunct inland in GA, AR, LA, TX, and NM; West Indies, Bermuda, Costa Rica. [= RAB, C, F, G, HC, K, Z; = Chaetochloa macroperma Lamson-Scribner & Merrill – S]

* Setaria magna* Grisebach, Saltmarsh Foxtail-grass, Giant Foxtail-grass. Cp (DE, FL, GA, NC, SC, VA), Pd* (GA*): interdune swales, near-coastal marshes; common (uncommon south of DE). NJ south to s. FL, west to e. TX; disjunct inland in GA, AR, LA, TX, and NM; West Indies, Bermuda, Costa Rica. [= RAB, C, F, FNA, G, HC, K, Z; = Chaetochloa magna (Grisebach) Lamson-Scribner – S]

* Setaria palmetolia* (J. König) Stapf, Palmgrass. Cp (FL, LA): disturbed areas; rare, native of Asia. [= FNA, HC, K]

* Setaria sphacelata* (Schumacher) Stapf & C.E. Hubbard, African Bristlegrass. Cp (AL, FL, MS): disturbed areas; rare, native of Africa. [= FNA, K]

* Setaria adhaerans* (Forskål) Chiovenda. Cp (AL): disturbed areas; rare. Distributed widely throughout the tropics and subtropics, in North America from s. AL west to CA (perhaps only adventive in portions of that distribution). [= FNA, K, Z] [synonymy incomplete]

**Sorghastrum** Nash 1901 (Indiangrass)

A genus of about 18-20 species, of tropical and subtropical America and Africa, rarely extending into temperate areas.

References: Hall (1982)=Z; Dávila Aranda & Hatch in FNA (2003a). Key adapted from Z.

1 Awns 10-22 (30) mm long, once-geniulate; plants rhizomatous; surfaces of the glumes tan to slightly brown basally; ligule 2-10 mm long, prominently urticating..........................S. nutans

1 Awns 16-46 mm long, twice-geniulate; plants cespitose; surfaces of the glumes brown; ligule 1-5 mm long, truncate.

2 Axis of the panicle straight, erect, the branches appressed to ascending, the spikelets drooping-second; spikelets 0.8-1.2 mm wide .............S. secundum

2 Axis of the panicle arching, usually strongly so, the branches ascending to spreading, the spikelets not drooping-second; spikelets 1.1-1.8 mm wide.

3 Axis of the panicle straight, with the branches distributed no more than 180 degrees around the axis (as viewed from above)..............................................................S. apalachicolense

3 Axis of the panicle arching, with the branches distributed through 360 degrees around the axis (as viewed from above) ..................S. elliottii

**Sorghastrum apalachicolense** D.W. Hall, Apalachicola Indiangrass, Open Indiangrass. Flatwoods and sandhills. July-August. Panhandle FL west to s. MS (Sorrie & Leonard 1999). It may well occur as well in GA. [= K, Z; < S. elliottii – FNA]

**Sorghastrum elliottii** (C. Mohr) Nash, Slender Indiangrass. Woodlands and forests, river-scour areas, including oak-hickory forests and woodlands over mafic rocks. September-October. MD south to FL and west to TX, inland to TN, AR, and OK, mainly on the Coastal Plain, but extending inland to other physiographic provinces. [= RAB, C, F, G, HC, K, S, W, Z; < S. elliottii – FNA (also see S. apalachicolense)]
Sorghastrum nutans (Linnaeus) Nash, Yellow Indiangrass. Xeric and mesic woodlands and forests of a, WV wide variety, powerline rights-of-way, roadbanks. September-October. ME and QC west to s. MB, south to c. peninsular FL, TX, UT, AZ, and Mexico. Along with Andropogon gerardii, Schizachyrium scoparium, and Panicum virgatum, Sorghastrum nutans is one of the dominant grasses of the tall-grass prairie. It is also common in a variety of open habitats (natural and altered) in the forested landscape of eastern North America. [= RAB, C, F, FNA, G, HC, K, S, W, WV, Z, = S. avenaceum (Michaux) Nash]

Sorghum Moench 1794 (Sorghum, Milo, Johnson Grass)

A genus of about 25 species, of tropical and subtropical Old World (1 species in Mexico). References: Barkworth in FNA (2003a); de Wet (1978)=Z.

Sorghum bicolor Linnaeus var. bicolor, Sorghum, Milo, Broomcorn, Sorgo. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (VA): cultivated, rarely persistent; common in cultivation, rare as an escape. October. [= C; < Sorghum vulgare Persoon – RAB; < Sorgum vulgare – F, orthographic variant; = S. vulgare var. vulgare – HC; = S. bicolor ssp. bicolor – FNA, K; < Holcus sorghum Linnaeus – S]

Sorghum bicolor (Linnaeus) Moench var. drummondi (Nees ex Steudel) Mohlenbrock, Shattercane. Cp, Pd (GA, NC, SC, VA): cultivated, rarely persistent; common in cultivation, rare as an escape. October. This is the taller variety with open inflorescences, usually sporadically present in sorghum fields. [= C; < Sorghum vulgare Persoon – RAB; < Sorgum vulgare – F, orthographic variant; = Sorghum bicolor ssp. drummondi (Nees ex Steudel) de Wet – FNA; = Sorghum vulgare Persoon var. drummondi (Nees ex Steudel) Hackel ex Chiovenda – HC; = Sorghum bicolor ssp. drummondi (Nees ex Steudel) de Wet & Harlan – K; < Holcus sorghum Linnaeus – S]

Spartina Schreber 1789 (Cordgrass)

Spartina alterniflora Loiseleur, Saltmarsh Cordgrass, Smooth Cordgrass. Salt marshes. August-October. NL (Newfoundland) south to FL, west to TX; e. South America; introduced in n. Europe. S. alterniflora is the dominant plant (often essentially a monoculture) of intratidal salt marshes in our area. [= RAB, C, FNA, GW, K, WH; > S. alterniflora var. alterniflora – F, G, HC, S; > S. alterniflora var. glabra (Muhlenberg ex Bigelow) Fernald – F, G, HC, S; > S. alterniflora var. pilosa (Merrill) Fernald – F, G, HC]

Spartina patens Merril, Sand Cordgrass. Brackish marshes, marsh edges, wet coastal hammocks, under Sabal palmetto, Quercus virginiana, and Juniperus virginiana var. silicicola. June. Se. SC south to s. FL, west to Panhandle FL. Along with S. spartinae, distinctive among our species in its densely clumped growth form. [= FNA, GW, HC, K, S, WH]
Spartina cynosuroides (Linnaeus) Roth, Giant Cordgrass. Brackish and freshwater tidal marshes, especially along margins of tidal creeks. June-September. MA south to FL, west to e. TX. [= RAB, C, FNA, G, GW, HC, K, S, WH; > S. cynosuroides var. cynosuroides – F]

Spartina pectinata Link, Prairie Cordgrass, Slough Grass. Banks of rivers and lakes, spray cliffs below waterfalls, rocky or sandy flood-scoured riverside grasslands, tidal freshwater (oligohaline) marshes, calcareous oak flatwoods and prairies. July-September. NL (Newfoundland) west to WA, south to ne. NC, sw. NC, AR, TX, and NM. [= RAB, C, F, FNA, GW, HC, K, S, WH, WV; > S. pectinata var. monogyna (M.A. Curtis) Fernald – F, G, HC]  

Spartina obtusata = S. pennsylvanica var. obtusata (Trinius) Merr. ex A.S. Hitchcock, Gulf Cordgrass. Brackish marshes and inland saline situations. AL and FL west to TX. [= FNA, GW, HC, K, S, WH]

Spartina pinnata Linnaeus, Smooth Cordgrass. Beaches, sand dunes, sandy flats. June-September. NL (Newfoundland) south to FL, west to TX. Var. monogyna has spikelets 7-10 mm long (vs. 9-13 mm); second glume acute to obtuse (rarely acuminate) (vs. acuminate); spikes (2-) 4-9 per inflorescence (vs. 1-4); second highest leaf blade on the stem (1-) avg. 2 (-5) dm long (vs. 0.5-2 dm); plants to 15 dm tall (vs. to 8 dm); culms to 6 mm in diameter at base (vs. to 3 mm). Whether var. monogyna is worthy of recognition is a matter of debate; there appear to be morphological differences correlated with geography and, according to some authors, habitat, but positive identification to variety is sometimes difficult. [= RAB, C, FNA, GW, K, S, WH; > S. patens var. patens – F, G, HC]  

Spartina alterniflora Link, Prairie Cordgrass, Slough Grass. Banks of rivers and lakes, spray cliffs below waterfalls, rocky or sandy flood-scoured riverside grasslands, tidal freshwater (oligohaline) marshes, calcareous oak flatwoods and prairies. July-September. NL (Newfoundland) west to WA, south to ne. NC, sw. NC, AR, TX, and NM. [= RAB, C, F, FNA, GW, HC, K, S, WH, WV; > S. alterniflora var. pectinata – F; > S. pectinata var. subtile (Farwell) Fernald – F; = S. michauxiana A.S. Hitchcock – S]  

Spartina intermedia (Link) Scribner 1906 (Wedgegrass)  

Sphenopholis Scribner 1906 (Wedgegrass)  

1 Spikelets 5-9.5 mm long; second lemma with an awn 3.5-7 mm long. .......................................................................................................................... S. pennsylvanica  
1 Spikelets 1.5-5 mm long; second lemma awnless, or with an awn up to 3.5 mm long.  
2 Lower leaf blades mostly < 10 cm long, flat, 2-8 mm wide.  
3 First glume ⅓ as wide as the second glume; second lemma strongly scabrous. .................................................................................................................. S. nitida  
3 First glume less than ⅓ as wide as the second glume; second lemma smooth to slightly scabrous.  
4 First lemma unawned.  
5 Panicle open; second glume 3-6× as long as wide, acute at the tip; lowermost rachilla internode 0.8-1.0 mm long ...... S. intermedia  
5 Panicle densely cylindrical; second glume 2-3× as long as wide, rounded or truncate at the tip; lowermost rachilla internode 0.7-0.9 mm long. .................................................................................................................. S. obtusata

Sphenopholis intermedia (Rydgberg) Rydberg, Slender Wedgegrass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): moist nutrient-rich forests; uncommon (rare in DE, GA, NC, SC, and VA). May-June. NL (Newfoundland) west to c. AK, south to Panhandle FL, c. TX, and AZ. Perhaps better treated at the varietal level. [= RAB, F, FNA, K, S, WV; = S. obtusata (Michaux) Scribner var. major (Torrey) K.S. Erdman – C, Z; < S. intermedia – G (also see S. ×pallens); < S. obtusata – GW, W, WH, AZ]  

Sporobolus R. Brown 1810 (Dropseed)

1 Inflorescence an open panicle, > 2 cm broad, the branches ascending to spreading.
2 Branches of the panicle verticillate, whorled; spikelets 2.5-4 mm long. ................................................................. S. juncus
2 Branches of the panicle alternate (some occasionally rather randomly subopposite or opposite, but never regularly whorled); spikelets either 4-6.5 mm long, or 1.5-2.5 (2.7) mm long.
3 Spikelets 1.5-2.5 (2.7) mm long. 
4 Panicle branches bare of spikelets in the lower ? of their length .............................................................. S. cryptandrus
4 Panicle branches bearing spikelets to the base .................................................................................................. S. domingensis
3 Spikelets 4-6.5 mm long.
5 First glume scabrous, acuminate or awn-like; spikelets dark gray; base of plant relatively fibrous; grain spherical; [of rocky barrens of the Mountains of NC and VA] .......................................................................................... S. heterolepis
5 First glume glabrous, acute to acuminate; spikelets purplish (fading tan); base of plant smooth and hard, made up of the indurated leaf bases; [of pine savannas and seeps of the Coastal Plain of NC, SC, and southward].

6 Leaves terete or subterete (wiry), oval in cross-section, sometimes irregularly channelled for portions of their lengths (never with any portion above the sheath flat), < 1 mm wide, tending to senece and turning tan in autumn, the margins generally smooth; culms (including the inflorescence) (2-) 4-7 (-10) dm tall; first glume averaging about 0.7× as long as the second glume (though variable, ranging from 0.5-0.75×) ................................................................. S. teretifolius
6 Leaves flat (folded when dry), plane or V-shaped in cross-section, with free margins their entire length, 1.2-2 (2.7) mm wide, tending to remain green into the winter (at least until December), the margins scabrous (except in S. curtissii); culms (including the inflorescence) 3-22 dm tall; culms (from base to first inflorescence branch) (4-) 6-10 dm tall; first glume averaging 0.75-1× as long as the second glume (though variable, collectively ranging from about 0.6-1.2×).

7 First glume averaging 0.95-1.1× as long as the second glume (though variable, ranging from 0.8-1.3×); pedicels mostly 1-3 mm long (a few sometimes as long as 10 mm wide), appressed; culms (including the inflorescence) 3-7 dm tall; inflorescence branches stiffly ascending; leaves 0.5-1.5 mm wide (or to 2.0 mm wide when unburned), mostly 1.5-4 dm long (rarely to 5 dm long), smooth on the margins; [of e. SC southward] ................................................................. S. curtissii
7 First glume averaging 0.6-0.9× as long as the second glume (though variable, ranging from 0.6-0.95×); pedicels mostly 4-15 mm long, spreading; culms (including the inflorescence) (3-) 7-16 (-22) dm tall; inflorescence branches initially ascending, later loosely ascending to spreading; leaves 1.2-10.0 mm wide, mostly (3-) 4-8 dm long, upwardly scabrous on the margins; [of e. NC southward].
8 Leaves (2.0-) 3-10 mm wide, pale bluish-green (often with some yellowish leaves as well); first glume averaging 0.75-0.9× as long as the second glume (though variable, ranging from 0.6-0.95×); culms (including the inflorescence) usually 12-22 dm tall; inflorescence usually 3.5-5 dm long; [of se. SC southward] ................................................................. S. floridanus
8 Leaves 1.2-2.0 (-3.0) mm wide, dark green; first glume averaging 0.6-0.8× as long as the second glume (though variable, ranging from 0.6-0.8×); culms (including the inflorescence) usually 6-12 (-18) dm tall; inflorescence usually 2-3.5 dm long; [of e. NC south to e. GA] ................................................................. S. pinetorum

1 Inflorescence a contracted, spike-like panicle, < 2 cm broad, the branches appressed.
9 Plant a geniculate annual; most inflorescences enclosed by sheaths (or most or all exserted); inflorescence 2-5 cm long.
10 Spikelets (1.3-) 1.6-2.8 mm long; grain falling free of the lemma and palea; lemma glabrous .................................. S. neglectus
10 Spikelets 2.3-5 mm long; grain falling enclosed in the lemma and palea; lemma strigose (use 10× or more) or glabrous.
11 Lemma and palea shorter than the glumes; palea usually shorter than the lemma; lemma glabrous or strigose with hairs < 0.2 mm long; spikelets 2.3-3.3 (-3.8) mm long; floret (lemma, palea and enclosed grain) 1.6-3.3 (-3.8) mm as long as wide ............... S. ozarkanus
11 Lemma and palea longer than the glumes; palea usually longer than the lemma; lemma strigose with hairs > 0.2 mm long; spikelets 2.8-5 mm long; floret (lemma, palea and enclosed grain) 2.2-5.7 (-7.5) mm as long as wide ................. S. vaginiflorus
9 Plant a rhizomatous or tufted perennial; most inflorescences exserted to partly enclosed; inflorescence 5-15 cm long.
12 Plant creeping essentially by slender rhizomes; leaf blades cauleine, distichous, to 12 cm long ......................... S. virgincus
12 Plant loosely tufted, from short rhizomes; leaf blades basal or cauleine, not distichous, 10-100 cm long.
13 Spikelets 1.5-2.2 mm long; first glume 0.5-0.8 mm long; leaves primarily basal.
14 Panicle branches appressed, 0.5-2 cm long in the middle of the inflorescence; second glume acute, > ½ as long as the spikelet ...... ................................................................. S. indicus
14 Panicle branches ascending, 2-8 cm long in the middle of the inflorescence; second glume truncate or broadly obtuse, < ½ as long as the spikelet. ................................................................. S. pyramidalis
13 Spikelets 4-8 mm long; first glume 2-5 mm long; leaves cauleine and basal.
15 Lemma pubescent, usually conspicuously shorter than the palea; pericarp loose when moist .................. S. clandestinus
15 Lemma glabrous, about as long as the palea; pericarp gelatinous when moist.
16 Culms (1.4-) 2.0-5.0 mm thick; terminal sheath (1.3-) 1.5-6.0 mm wide; panicles with 12-35 primary branches, crowded, dense ................. S. compositus var. compositus
16 Culms 1.0-2.0 (-2.5) mm thick; terminal sheath 0.8-2.0 (-2.5) mm wide; panicles with 8-18 primary branches, lax, loosely flowered ................................................................. S. compositus var. drummondii

* Sporobolus airoides (Torrey) Torrey, Alkali Sacaton. Waste areas near wool-combing mills; introduced from w. North America, not known to be established or persistent. [= FNA, HC, K] [not keyed]
Sporobolus clandestinus (Biehler) A.S. Hitchcock, Rough Dropseed. Glades, barrens, and thin soil of woodlands, also in dry sands. September-October. This species is widespread in e. United States. Wipf & Jones (1995) recommend reducing this taxon to a variety under S. compositus, because of its morphologic similarity. While S. clandestinus and S. compositus are undoubtedly closely related, I prefer to retain the two as species. [= RAB, C, FNA, F, G, HC, K, S, W, Z; = S. compositus (Poiret) Merrill var. clandestinus (Biehler) J. Wipf & S.D. Jones]
Sporobolus compositus (Poiret) Merrill var. compositus. Tall Dropseed. Diabase glades and barrens, limestone glades and barrens, disturbed areas over diabase or calcareous rocks. September-November. This species and variety are reported for NC in
Sporobolus compositus (Poir et) Merrill var. drummondii (Trinius) Kartesz & Gandh. Glades, barrens, roadsides, disturbed areas. East to the Ridge and Valley province of e. TN (Chester et al. 1993), occurring over limestone, and allegedly to GA (Kartesz 1999). It could very likely occur in sw. VA, as it is in Hawkins County, TN, immediately adjacent to VA (Chester et al. 1993). [= FNA, K; = S. asper (Michaux) Kunth var. drummondii (Trinius) Vasey – C; = S. drummondii (Trinius) Vasey – F; = S. asper var. hookeri (Trinius) Vasey – G, HC, misapplied]

Sporobolus cryptandrus (Torrey) A. Gray, Sand Dropseed. Floodplains, shores, disturbed areas; native west of the Appalachians, introduced eastward. C. and w. North America. This species is reported for NC by HC, F, and S. [= C, FNA, G, K, HC, S, WV; > S. cryptandrus var. cryptandrus – F]

Sporobolus curtissii (Vasey ex Beal) Small ex Scribner, Curtiss's Dropseed. Moist, gummy-clay flatwoods. September-October. E. SC south to c. FL. First positively documented for our area in 1993. Earlier attributions of S. curtissii to NC and SC were apparently based on misapplication or confusion with S. teretifolius and/or Sporobolus pinetorum. S. curtissii differs from other "bunchgrass" Sporobolus of our area in having the spikelets short-pedicelled and appressed against the panicle branches (as opposed to long-pedicelled and spreading in S. teretifolius and Sporobolus pinetorum). [= FNA, HC, K, S, Y]

Sporobolus arioides Chapman, Florida Dropseed. Cp (FL, GA, SC): wet savannas; uncommon (rare in SC). June-September. Se. SC south to s. FL; West Indies, Mexico. The e. GA record (Glynn County) is at Univ. of Georgia (Sorrie, pers. comm.). [= FNA, HC, K, S, W]

Sporobolus floridanus Chapman, Florida Dropseed. Cp (FL, GA, SC): wet savannas; uncommon (rare in SC). June-September. Se. SC south to ne. FL, west to Panhandle FL. First positively documented for SC in 1995. Earlier attributions of S. floridanus to NC and SC were apparently based on misapplication or confusion with Sporobolus pinetorum. [= FNA, K, Y; < S. floridanus – GW, HC, S (also see S. pinetorum); the inclusion of S. floridanus in RAB was based on a misidentification of S. pinetorum]

Sporobolus heterolepis (A. Gray) A. Gray, Prairie Dropseed. Mt (GA, NC, VA), Ip (KY): barrens, glades, and prairies over mafic, ultramafic, and calcareous rocks (olivine, serpentine, limestone); rare. August-September. The primary distribution of S. heterolepis is in the Plains, with outliers east to nw. GA (Jones & Coile 1988), c. TN (Estes & Beck 2005), w. NC, w. VA, se. PA, ne. United States, and adjacent Canada. [= RAB, C, F, FNA, G, HC, K, W, Y]

Sporobolus neglectus Nash, Barrens Dropseed. Ip (KY), Mt (VA, WV): dry rocky barrens and outcrops, over calcareous rocks (such as limestone or dolomite); uncommon (rare in VA and WV). August-September. ME west to ND, south to NJ, w. VA, TN, LA, and TX; apparently disjunct in WA and AZ. S. ozarkanus, S. neglectus, and S. vaginiflorus form a still very poorly understood complex. [= C, F, FNA, G, HC, K, S, W]

Sporobolus ozarkanus Fernald, Ozark Dropseed. Ip (KY), Pd (NC), Mt (VA): limestone glades, diabase glades; rare. September-October. KY west to KS, south to e. TN, AR, and TX; disjunct in c. NC. In Granville County, NC, it is associated (on glades of diabase, a mafic rock) with other taxa with affinities to midwestern glades and prairies: Solidago rigida, Solidago ptarmicoides, Baptisia australis var. aberrans, Symphyotrichum depauperatum, Silphium terebinthinaceum, Parthenium auriculatum, Ruellia humilis, and others. S. ozarkanus, S. neglectus, and S. vaginiflorus form a still very poorly understood complex. [= C, F, G, HC, K; = S. vaginiflorus (Torrey ex A. Gray) Wood var. ozarkanus (Fernald) Shinners – FNA, K]

Sporobolus pinetorum Weakley & P.M. Peterson, Carolina Dropseed, Savannah Dropseed. Cp (GA, NC, SC): wet savannas, savanna-pocosin ecotones, sandhill-pocosin ecotones, and extending upslope into mesic flatwoods or loamy or clayey shelves in the fall-line sandhills; uncommon (rare in GA and SC). June-September (and into December in response to growing-season fire). The identity of this taxon has been obscure; it is now clear that it is a previously unrecognized species, endemic to NC, SC, and adjacent e. GA. RAB included it in their concept of S. teretifolius, though it does not key well (keying imperfectly to either S. floridanus or S. heterolepis); in S and HC, it will key to S. floridanus, but the leaves are much narrower. Additionally, S. floridanus is a taller and coarser plant, the culms often averaging about 1.5 meters in height and 2-3 mm in diameter basally (vs. 1 meter high and 1 mm in diameter for Sporobolus pinetorum). In wet savannas of Columbus County, NC, S. species 1 occurs with true S. teretifolius (the two codominant over many hectares!), and the two taxa are manifestly distinct. The leaves of S. pinetorum are not terete; after lengthy drought in the field (or dry on an herbarium sheet), the leaves become tightly folded to involute and can appear wiry. Like many Southeastern pineland grasses, S. pinetorum flowers only following
fire. In vegetative condition it may be distinguished from Aristida stricta and A. beyrichiana, with which it often grows, by the leaf pubescence (S. pinetorum with scaberulous margins, best felt by running a finger along the margin near the base, from apex toward base, A. stricta and A. beyrichiana not scaberulous, and with a sparse line of pilose hairs running more or less the length of the leaf in A. stricta and sometimes in A. beyrichiana) and base (much more indurated and polished in Sporobolus than in Aristida). [= FNA, K, Y; < S. teretifolius – RAB, misapplied; > S. floridanus – RAB, misapplied; < S. floridanus Chapman – HC, S]

Sporobolus pyramidalis Palisot de Beauvois, West Indian Dropseed. Cp (FL): pine flatwoods, beaches; rare. FL Panhandle ( Wakulla County), FL peninsula; West Indies. The original distribution disputed, possible introduced. [<S. jacquemontii Kunth – FNA; = S. indicus var. pyramidalis (Palisot de Beauvois) Veldkamp – K; ? S. berteroanus (Trinius) A.S. Hitchcock & Chase – S]

Sporobolus tetetifolius R.M. Harper, Wireleaf Dropseed. Cp (AL, GA, NC, SC): wet savannas, pitcherplant bogs; rare. July-September and later in response to growing-season fire. Very similar vegetatively to Aristida stricta, S. teretifolius can be distinguished by its tuft of hairs at the base of the otherwise glabrous blade (as opposed to line of pilose hairs the length of the blade in A. stricta). This very rare species is known only from se. NC, ne. SC, s. GA, and se. AL (Houston County). Many of the counties reported for this species in RAB actually are based on misidentified specimens of S. pinetorum. In a few very wet savannas of Columbus and Brunswick counties, NC, S. teretifolius is dominant or codominant over many hectares. Like many savanna grasses, S. teretifolius generally flows only following fire. [= FNA, HC, K, S, Y; < S. teretifolius – RAB (also see S. pinetorum)]

Sporobolus virginicus (Linnaeus) Kunth, Seashore Dropseed, Coastal Dropseed. Cp (FL, GA, NC, SC): salt marshes, tidal mud flats, and low dunes in the outer Coastal Plain; common (rare north of FL). September-October. Se. NC along the coast to TX, in the West Indies and into s. South America (its alleged occurrence in se. VA is apparently incorrect). Sporobolus virginicus is similar in aspect and growth form to Distichlis spicata, with which it occurs in tidal flats. Sporobolus virginicus is more delicate, and typically has long hairs on either side of the collar of the sheath; Distichlis spicata is generally a coarser plant, and lacks long hairs around the collar of the sheath. [= RAB, C, F, FNA, G, GW, HC, K, S]

Sporobolus compositus (Poir) Merritt var. macer (Trinius) Kartesz & Gandhi. [= FNA] [not yet keyed]
* Sporobolus diandrus (Retzius) Palisot de Beauvois. [= FNA] [not yet keyed]
* Sporobolus fimbriatius (Trinius) Nees. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, introduced from Africa. [= FNA, HC, K] [not keyed]
* Sporobolus flexuosus (Thurb. ex Vasey) Rydberg. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, introduced from sw. United States and n. Mexico. [= FNA, HC, K] [not keyed]
* Sporobolus tenuissimus (Martius ex Schrank) Kunz. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, native of the tropical Old World and New World. [= FNA, K] [not keyed]
* Sporobolus weightii Munro ex Scribn., Giant Sacaton. Cp (SC): waste areas near wool-combing mills; rare, perhaps only a waif, introduced from sw. United States. [= FNA, HC, K] [not keyed]

Steinchesima Rafinesque 1830 (Gaping Panic Grass)

Steinchesima hians (Elliott) Nash, Gaping Panic Grass. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, WV*): stream, pond, and lake shores, low woods, cypress-gum ponds, floodplains, marshes, ditches, seepage slopes; common (uncommon in Coastal Plain, rare in Mountains). May-October. Se. VA south to FL, west to TX and OK, and south through Mexico and Central America to Colombia; also in s. South America. The large, thickened, pale sterile palea of this species is unique among panicoids of our region; it is one of several characters that has led to the segregation of Steinchesima as a genus, or as a subgenus of Panicum. The enlargement of the sterile palea causes the spikelet to spread open, or "gape." [= FNA, K, Z; = Panicum hians Elliott – RAB, C, F, G, GW, HC, S, W]

Stenotaphrum Trinius 1820 (St. Augustine Grass)

A genus of about 7 species, tropical and subtropical. References: Allred in FNA (2003a); Sauer (1972)=Z.

Stenotaphrum secundatum (Walter) Kunz, St. Augustine Grass, Carpet Grass. Cp (FL, GA, NC, SC, VA*): brackish marshes, roadsides, lawns; common. July-October. A pioneer species of beaches and shores, S. secundatum was known from the Carolinas prior to 1800. It has been interpreted as native or introduced in our area; its original range is probably now impossible to determine. Sauer (1972) maps it as widespread along the coasts of s. North America, Central America, South America, the West Indies, Africa, Australia, and sw. Pacific Islands. In our area it is certainly now more frequently encountered as a lawn or roadside grass than in anything that could be construed as a natural habitat. The other 6 species in the genus are Asian, or on islands of the sw. Pacific or Indian Oceans. [= RAB, FNA, HC, K, S, WH, Z]

1 Plants rhizomatous; lemmas 7.5-10 mm long; lateral veins slightly shorter than and less prominent than the midvein..............**Th. intermedium**
1 Plants cespitose; lemmas 9-12 mm long; lateral veins of the glumes about as long as and as prominent as the midvein..............**Th. ponticum**

* **Thinopyrum intermedium** (Host) Barkworth & D.R. Dewey. Pd (GA): waif in railroad yards; rare, native of Europe and w. Asia. Tucker (1996) states that the record is as a waif in railroad yards. [= K, Z; > Th. intermedium spp. **intermedium** – FNA; = Elytrigia **intermedia** (Host) Nevski; = Agropyron **intermedium** (Host) Palisot de Beauvois – HC] {add to synonymy}

* **Thinopyrum ponticum** (Podpéra) Barkworth & D.R. Dewey. Tall Wheatgrass. Cp (SC): waste areas near wool-combing mills; rare, native of Europe and w. Asia, not known to be established or persistent. [= FNA, K; ? Agropyron **elongatum** (Host) Palisot de Beauvois] {add to synonymy}

**Tragrostis** L. Church 1949 (Pale Mannagrass)

A genus of 4 species, with a classic Tertiary moist temperate disjunct pattern; **Tragrostis** is distributed in e. North America and e. Asia. References: Davis in FNA (2007a); Davis (1991)=Y; Tucker (1996)=Z.

1 Leaf blades 1-3 mm wide; anthers 0.2-0.5 mm long ......................................................**T. pallida** var. **fernaldii**
1 Leaf blades 4-8 mm wide; anthers ca. 1 mm long ......................................................**T. pallida** var. **pallida**

**Tragrostis pallida** (Torrey) Church var. **pallida**, Pale Mannagrass. Mt (GA, NC, VA, WV), Cp (DE, NC, VA), Pd (SC, VA): bogs, mucky wetlands such as old beaver-ponds, pools in cypress swamps, drawdown shores of natural ponds; common (rare in GA, NC, SC, VA, and WV). June-July. The species as a whole is widespread in e. North America. Var. **pallida** ranges from NS west to MN, south to e. VA, se. NC (Columbus County), nw. NC (Avery County), and nw. GA (Jones & Coile 1988). Var. **panciflora** (J. Presl) J.J. Davis is distributed in w. North America. Intermediates occur between the varieties. [= FNA, K, Y, Z; < Glyceria **pallida** (Torrey) Trinius – RAB, GW, HC, W; < Puccinellia **pallida** (Torrey) Clausen – C; = G. **pallida** – F, WV; = G. **pallida** var. **pallida** – G; = Panicularia **pallida** (Torrey) Kuntze – S]

**Tragus** Haller 1768 (Burrgrass)

* **Tragus racemosus** (Linnaeus) Allioni, Stalked Burrgrass, Texas Burrgrass. Mt (VA), Cp (NC): roadsides, disturbed areas, on ballast near old seaports; rare, native of Mediterranean Europe and w. Asia. [= IC, C, F, FNA, G, K; = Nazia **racemosa** (Linnaeus) Kuntze – S]

* **Tragus australianus** S.T. Blake, Australian Burrgrass. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of Australia. [= FNA, K] {not keyed}
* **Tragus berteronianus** I.A. Schultes, Spiked Burrgrass. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of Africa and Asia. Also reported from chrome ore piles at Newport News, VA. [= FNA, K] {not keyed}
* **Tragus heptaneuron** W.D. Clayton. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of tropical Africa. [= FNA, K] {not keyed}

**Tridens** Roemer & J.A. Schultes 1817 (Triodia, Redtop, Tridens, Fluffgrass)

1 Panicle dense and spike-like, > 4× as long as wide, the branches ascending to appressed.
2 Plants from elongate rhizomes; lemma 4-5 mm long; spikelet 7-9 mm long......................................................**T. carolinianus**
2 Plants cespitose; lemma 2.5-3 mm long; spikelet 4-6 mm long ......................................................**T. strictus**
1 Panicle open and spreading, < 4× as long as wide, the branches well-developed and spreading-ascending to reflexed.
3 Spikelets 4-5 mm long, 2.5-3.5 mm wide ......................................................**T. ambiguus**
3 Spikelets 6-8 mm long, 1.5-2.2 mm wide.
4 Primary pulvini densely pubescent, the hairs encircling the base of the panicle branch; secondary pulvini pubescent; spikelets mostly on pedicels 3-20 mm long; main branches of the inflorescence stiffly spreading ......................................................**T. chapmanii**
4 Primary pulvini glabrous to sparsely pubescent, tufted only in the axil (the upper surface of the panicle branch); secondary pulvini glabrous; spikelets on pedicels mostly < 3 mm long; main branches of the inflorescence spreading, ascending or drooping..............**T. flavus**
**Triplasis** Palisot de Beauvois 1812 (Sandgrass)

**Identification notes:** The foliage of both of our species has a sour taste.

1. Lemma awn 4.5-8 mm long; culm internodes appressed pilose or puberulent; perennial.......................... **T. americana**
2. Lemma awn 0.5-1.5 mm long; culm internodes glabrous to minutely scaberulous; annual (or rarely perennial)...... **T. purpurea** var. purpurea

**Triplasis americana** Palisot de Beauvois, Southern Sandgrass. Cp (FL, GA, NC, SC): open sandy areas; common. August-October. A Southeastern Coastal Plain endemic: NC south to s. FL, west to e. LA. [= RAB, FNA, HC, K, S]

**Triplasis purpurea** (Walter) Chapman var. purpurea, Purple Sandgrass. Cp (DE, FL, GA, NC, SC, VA): dunes, maritime dry grasslands, open sandy areas; common. September-October. NH south to s. FL, and west to TX, along the coast; also around the Great Lakes, and in central United States. Var. caribensis R.W. Pohl is in the New World tropics. [= FNA; < T. purpurea – RAB, C, F, G, HC, K; > T. intermedia Nash – S; > T. purpurea – S]

**Trisetum** Linnaeus 1759 (Gama Grass)

A genus of about 12 species, tropical and subtropical American. References: Barkworth in FNA (2003a); DeWet, Harlan, & Brink (1982)=Z.

**Tripsacum dactyloides** (Linnaeus) Linnaeus var. dactyloides, Gama Grass. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA< WV), Cp (DE, FL, GA, NC, SC, VA): roadsides, moist areas, disturbed areas, moist riverbanks; common (uncommon in VA, rare in WV). Late May-November. **T. dactyloides** is widespread in e. North America north to MA, MI, IA, and NE, ranging south into tropical Central and South America; var. dactyloides in North American. This important species of moist and wetland areas in the Great Plains is generally seen in disturbed habitats in our area; its original habitats in our area (if indeed it was native in the flora area) are poorly understood. [= FNA, Z; < T. dactyloides – RAB, C, G, HC, K; > T. intermedia Nash – S; > T. purpurea – S]

**Trisetum Persoon 1805 (Oat-grass)

A genus of about 75-85 species, north and south temperate. References: Rumely in FNA (2007a); Randall & Hilu (1986)=Z; Tucker (1996)=Y. [also see *Sphenopholis*]

**Trisetum spicatum** (Linnaeus) K. Richter, Alpine Oat-grass, Spike Trisetum. Mt (NC, VA): mountain cliffs at high elevations on metabasalt; rare. June-August. A circumboreal species, widespread and common in arctic and alpine areas, south in e. North America to New England, NY, and, rarely, PA, and disjunct to Hawksbill Mountain, Page County, VA (where extant) and Roan Mountain, Mitchell County, NC (where not seen since the nineteenth century). The species is also known from the West Indies, Mexico, and s. South America. **T. spicatum**, as broadly treated here, following Randall & Hilu (1986), is polymorphic and consists of several ploidies. [= C, FNA, HC, K, S, Y; Z; > T. spicatum var. molle (Michaux) Beal – RAB, F, G; > T. triflorum (Bigelow) Löve & Löve spsp. molle (Michaux) Löve & Löve – W; > T. spicatum var. maideni (Gandoger) Fernald – F]

**Triticum** Linnaeus 1753 (Wheat)

* Triticum aestivum Linnaeus, Bread Wheat. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields; frequently cultivated, rarely persistent or volunteering following cultivation, native of Eurasia. May-June. One of the most important crops in the world. The lemmas can either be awnless or with long awns (to 8 cm long). [= RAB, C, F, FNA, G, HC, K, WH, Z]

**Uniola** Linnaeus 1753 (Sea Oats)

A genus of 2 species. The only other species of the genus ranges from Baja California south along the Pacific Ocean to Ecuador; other species previously treated in *Uniola* have been shown to be only distantly related and are now treated as *Chasmanthium*. References: Yates in FNA (2003a); Yates (1966a, 1966b)=Z. [also see *Chasmanthium*]

* *Uniola paniculata* Linnaeus, Sea Oats. Cp (DE*, FL, GA, NC, SC, VA): abundant on unforested primary and secondary dunes on barrier islands, and on dry to mesic sand flats and interdune swales; common (rare in DE and VA). June-November. Se. VA south to FL and west to TX and Mexico; West Indies. This is the most important sand-binding grass on ocean dunes from NC south, playing a critical role in primary succession on dunes. It is against the law in NC to pick or destroy *Uniola paniculata*. [= RAB, C, F, FNA, G, HC, K, S, WH, Z]

**Urochloa** Palisot de Beauvois 1812 (Para-grass, Signal-grass)

1 Spikelets suffused with purple, borne in pairs (or threes) in each row .......................................................... *U. mutica*
2 Spikelets green, borne singly in each row.
   2 Upper half of second glume and first lemma with evident transverse veins connecting the longitudinal veins; spikelets 3.5-4.7 mm long .................................................. *U. platyphylla*
   2 Upper half of second glume and first lemma without evident transverse veins, or with very obscure cross-veins; spikelets either 2-4 mm or 5-6 mm long.
3 Spikelets 2-4 mm long .......................................................................................................................... *U. ramosa*
3 Spikelets 5-6 mm long .......................................................................................................................... *U. texana*

**Urochloa platyphylla** (Muñoz ex Wright) R. Webster, Broadleaf Signal-grass. Cp (FL, GA, NC, SC, VA), Pd (GA, SC, NC, VA). Mt (VA): disturbed wet or seasonally moist areas; rare, apparently native of South America. E. NC south to FL, west to TX, north in the interior to AR, OK, and se. MO; also in MD (Terrell & Reveal 1996). [= FNA, K, Y, Z; = Brachiaria platyphylla (Muñoz ex Wright) Nash – RAB, GW, HC; ? B. extensa Chase – S]

**Urochloa ramosa** (Linnaeus) Nguyen, Browntop Millet, Dixie Signalgrass. Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): disturbed areas; rare, native of tropical Africa and Asia. This species has apparently been widely planted for wildlife food and erosion control in southeastern states. [= FNA, K, Z; = Panicum ramosum Linnaeus – HC; = Brachiaria ramosa (Linnaeus) Stapf]

**Urochloa texana** (Buckley) R. Webster, Texas Millet, Texas Signalgrass. Cp (FL, GA, NC, SC, VA), Pd (GA, SC, NC, VA): disturbed areas, fields, gardens; uncommon (rare in VA), native of TX. First reported for South Carolina by Hill & Horn (1997). [= K, Y, Z; = Panicum texanum Buckley – RAB, C, HC, S; = Brachiaria texana (Buckley) S.T. Blake]

**Urochloa adspersa** (Trinias) R. Webster. Cp (FL): moist, sunny, disturbed areas; rare, apparently native of s. FL, the West Indies, and Argentina. Reported from AL, FL peninsula and Panhandle (FNA), and chrome ore piles in Newport News, VA (Reed 1964). [= FNA, K] [not keyed; add to synonymy]

**Urochloa fuscata** (Swartz) B.F. Hansen & Wunderlin var. reticulata (Torrey) B.F. Hansen & Wunderlin, east to GA (Kartesz 1999). [< *Urochloa fuscata* – FNA; ? Urochloa fasciculata (Sw.) R. Webster – K; ? Panicum fasciculatum Swartz – HC] [not yet keyed; synonymy incomplete]

**Urochloa piligera** (Muell. ex Bentham) R.D. Webster. Cp (FL): roadsides; rare, native of Australia. Reported for Escambia County in the FL Panhandle (Kunzer et al. 2009). [= WH] [not yet keyed; synonymy incomplete]

**Urochloa plantaginea** (Link) R. Webster. Cp (FL, GA): Reported for s. GA (Jones & Coile 1988), as *Brachiaria plantaginea*, and for Escambia County in the FL Panhandle (Kunzer et al. 2009). [= FNA, K, Y, Z; = Brachiaria plantaginea (Link) A.S. Hitchcock] [not yet keyed; synonymy incomplete]

**Urochloa reptans** (Linnaeus) Stapf. Cp (GA); [= FNA, K] [not yet keyed; synonymy incomplete]

**Urochloa villosa** (Lamarck) Nguyen, Hairy Signalgrass. Reported from chrome ore piles in Newport News, VA (Reed 1964); native of tropical Asia and Africa. [= FNA, K] [not keyed; add to synonymy]

**Vulpia** C.C. Gmelin 1805 (Annual Fescue)
A genus of about 30 species, north and south temperate. References: Lonard in FNA (2007a); Tucker (1996)=Z. Key based in part on C.

1 First glume < ½ as long as the second glume .............................................................. *Vulpia myuros*
1 First glume > ½ as long as the second glume.
2 Lemma pubescent; lowest lemma 2.5-3.5 mm long; grains 1.5-2 mm long ......................... *Vulpia sciurea*
2 Lemma glabrous or scabrous; lowest lemma 2.7-7 mm long; grains 1.7-3.3 mm long ............ *Vulpia bromoides*
3 First glume 1.7-4.5 mm long; lemma awns 3-12 mm long; spikelets with 4-7 loosely imbricate florets; rachilla internodes mostly 0.9-1.1 mm long............................................... *Vulpia octoflora*
3 First glume 3.5-5 mm long; lemma awns 0.3-6 (-9) mm long; spikelets with 5-11 (-more) closely imbricate florets; rachilla internodes mostly 0.5-0.7 mm long.
4 Spikelets 4-5.5 (-6.5) mm long; awn of the lowest lemma 0.3-3 mm long .................................................. *V. octoflora var. glauca*
4 Spikelets 5.5-10 (-13) mm long; awn of the lowest lemma 3-9 mm long ............................................. *V. octoflora var. octoflora*

Zeina Linnaeus 1753 (Corn, Maize)

1 Pistillate spikelets (kernels) borne on a spongy rachis (cob) in rows ............................... *Zea mays ssp. mays*
1 Pistillate spikelets embedded in a hardened rachis.
2 Annual ................................................................................................................................. *Z. mays ssp. mexiciana*
2 Perennial from creeping rhizomes .................................................................................... *Z. perennis*

*Zea mays* Linnaeus *ssp. mays*, Corn, Maize. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): very commonly cultivated, rarely volunteering in old fields or around trashpiles; common in cultivation, rare as a short-lived escape. June-October. Zea is one of the most important cultivated plants in the world, originating in Mexico, probably from *Zea mays* ssp. *parviglumis* Illis & Doebley. It was initially cultivated in sw. Mexico (before 8000 BP), spreading to the sw. United States before 5000 BP, and to the e. United States by 2000 years BP. At the time of European contact, *Zea mays* ssp. *mays* was an important staple crop from s. Canada south to s, South America (Hancock 2004). [= FNA, K; < Z. mays – RAB, F, HC, S]

*Zea perennis* (A.S. Hitchcock) Reeves & Manglesdorf, Mexican Teosinte. Cp (SC): disturbed areas; rare, apparently established at least formerly. *Z. perennis* was considered by HC to be "established on James Island, S.C." [= K; = Euchlaena perennis A.S. Hitchcock – HC]

*Zea mays* (Schrad) Kuntze *ssp. mexicana* (Schrad) H.H. Illis, Chalco Teosinte, Nobogame Teosinte. Reported for AL (Kartesz 1999) and FL (Hansen & Wunderlin 2006). HC state that this taxon is "occasionally cultivated in the Southern States for green forage" and is similar to *Z. perennis*, except in being, like *Z. mays* ssp. *mays*, a coarse annual. It is considered to be an ancestor of *Zea mays*. [= FNA; = Z. mexicana (Schrad) Kuntze – K; = Euchlaena mexicana Schrad – HC, S]

Zizania Linnaeus 1753 (Wild-rice)

1 Lemmas of the pistillate spikelets flexible and chartaceous, dull, bearing short scattered hairs, these not or only slightly more dense toward the tip ............................................................ *Z. aquatica var. aquatica*
1 Lemmas of the pistillate spikelets stiff and coriaceous, lustrous, glabrous or with lines of short hairs, the tips usually more hairy .................................................. *Z. palustris var. palustris*
**Zizania aquatica** Linnaeus var. *aquatica*, Southern Wild-rice. Cp (DE, FL, GA, NC, SC, VA), Pd (DE): freshwater marshes, usually tidal; common (uncommon in NC, rare in Piedmont). May-October. Var. *aquatica* ranges from ME west to WI, south to FL and LA; var. *brevis* Fassett is restricted to the St. Lawrence River in QC. *Zizania* was formerly an important food for Amerindians; it is now gathered as a specialty grain, commanding high prices. [= C, F, FNA, G, HC, K, X, Y, Z; < Z. *aquatica* – RAB, GW, S]

*Zizaniopsis* Döll & Ascherson 1871 (Giant Cutgrass)

**Identification notes:** Superficially similar to *Zizania* in its habitat and large size, *Zizaniopsis* may be distinguished by its very different inflorescence and by its stout horizontal rhizomes (*Zizania* is annual or perennial, but not rhizomatous).

*Zoysia* Willdenow 1801 (Zoysia, Temple-grass)

A genus of about 11 species, perennials, of tropical, subtropical, and temperate Asia. References: Anderson in FNA (2003a). Key closely following FNA.

1 Leaves < 0.5 mm wide; racemes with 3-12 spikelets; peduncles included to extending < 1 cm beyond the sheaths of the flag leaves ..................  
2 Leaves 0.5-5 mm wide; racemes with 10-50 spikelets; peduncles extending (0.3-) 1-6.5 cm beyond the sheaths of the flag leaves.  

2 Pedicels 1.6-3.5 mm long; spikelets ovate, 1.1-1.4 mm wide; culm internodes 2-10 mm long; blades ascending..............................  
3 Pedicels 0.6-1.6 mm long; spikelets lanceolate, 0.6-1.0 mm wide; culm internodes 5-40 mm long; all plants with at least some internodes > 14 mm long; blades spreading at nearly 90 degree angles ........................................................................................................Z. *matrella*

*Zoysia japonica* Steudel, Japanese Lawngrass, Korean Lawngrass, Zoysia. Cp (AL, LA), Mt (WV): used as a lawngrass, persisting or spreading; rare, native of Japan. Reported for VA (Kartesz 1999). [= C, FNA, HC, K]

*Zoysia matrella* (Linnaeus) Merrill, Zoysia, Manila Temple-grass. Cp (AL, FL), Pd (GA): used as a lawngrass, persisting or spreading; rare, native of the Philippines. [= FNA, HC, K; = Z. *matrella* var. *matrella* – K]

*Zoysia pacifica* (Goudswaard) M. Hotta & Kuroki, Mascarene-grass, Korean Velvetgrass. Cp (LA), Mt (WV): used as a lawngrass, persisting or spreading; rare, native of e. Asia. [= FNA; ? Z. tenuifolia Willdenow – HC; > Z. tenuifolia Willdenow – K; > Z. *matrella* var. *pacifica* Goudswaard – K]

**Ceratophyllum** Linnaeus 1753 (Hornwort, Coontail)

**Identification notes:** Ceratophyllum is sometimes mistaken for other, superficially somewhat similar aquatics, such as *Cabomba* (Cabombaceae), *Utricularia* (Lentibulariaceae), and *Myriophyllum* (Haloragaceae). *Cabomba* has the leaves opposite (rather than whorled), dichotomously divided (like *Ceratophyllum*), but the divisions lacking the marginal denticles of *Ceratophyllum*, and on a 1-3 cm long petiole (vs. sessile or on a petiole 0-2 mm long). *Utricularia* has the leaves sometimes dichotomously divided, but the divisions are usually irregular, the leaves are alternate (in most species), and bladder traps are present. *Myriophyllum* has the leaves pinnately rather than dichotomously divided.

1 Largest leaves forking 1-2× (count branching-nodes from the base of the leaf to the tip of the most-forked division); leaves coarse-textured, stiff, the marginal denticles usually strongly raised on a broad base of green tissue; achene margin wingless, with 2 basal spines or tubercles (these rarely absent), otherwise entire (lacking marginal spines)................................................................. **C. demersum**

1 Largest leaves forking 3-4× (count branching nodes from the base of the leaf to the tip of the most-forked division); leaves fine-textured, flaccid, the marginal denticles not raised on a broad base of green tissue, sometimes obscure or obsolete; achene margin winged, with 2-20 lateral spines 0.1-6.5 mm long (occasionally spineless), with 2 basal spines (these rarely absent).

2 Achene body (excluding the spines) 3-4.5 mm long; first leaves of the plumule simple; [Coastal Plain, NC southward]................. **C. australe**

2 Achene body (excluding the spines) 4.5-6 mm long; first leaves of the plumule forked; [widespread]................................................................. **C. echinatum**

**Ceratophyllum australe** Grisbach. Ponds, pools, slow-moving streams. May-September. Se. NC south to s. FL and Panhandle FL, and in the West Indies; also in s. Mexico, Central America, n. South America, with apparent disjunctions in c. South America and the Galapagos Islands. Les treats this taxon as a subspecies of the Old World *C. muricatum*. Because of their allopatric distribution on separate continents and relative morphological distinctiveness (as shown by Les), I prefer to recognize the two monophyletic clades as families: Papaveraceae s.s. and Fumariaceae (including *Utricularia*). References: Wang et al. (2009); Stern in FNA (1997); Hill (1992); Lidén (1986, 1981); Lidén et al. (1997); Lidén in Kubitzki, Rohwer, & Bittrich (1993). [≡ Ceratophyllum muricatum Chamisso ssp. australe (Grisbach) Les – FNA, K, Z; < *C. muricatum* Chamisso – GW (also see C. echinatum)]

**Ceratophyllum demersum** Linnaeus, Coontail. Ponds, pools, slow-moving streams. May-September. NL (Newfoundland) west to AK, south to s. FL, TX, CA, and south through the West Indies and Central America to South America. [≡ RAB, C, F, FNA, G, K, W, S, Z]

**Ceratophyllum echinatum** A. Gray in Torrey & A. Gray. Ponds, pools, slow-moving streams. May-September. NL (Newfoundland) west to ON and n. MN, south to c. peninsular FL and e. TX; also in BC, WA, and OR. [≡ RAB, C, F, FNA, G, K, S, Z; < *C. muricatum* Chamisso – GW (also see C. australe); = *C. submersum* Linnaeus var. echinatum (A. Gray) Wilmot-Dear]

*Capnoides* P. Miller 1754 (Rock Harlequin)

*Capnoides sempervirens* (Linnaeus) Borkhausen, Rock Harlequin, Tall Corydalis, Pink Corydalis, Pale Corydalis. Rock outcrops, especially granitic exfoliation domes, but also quartzite, greenstone, and sandstone. April-August; May-July. NL (Newfoundland) west to AK, south to NJ, PA, in and near the mountains to ne. GA, n. OH, n. IN, MN, MT, and BC. [= S; = *Corydalis sempervirens* (Linnaeus) Persoon – RAB, C, F, FNA, G, K, W, WV, Z]

*Capnoides* (Linnaeus) P. Miller 1805 (Corydalis)

A genus of about 400 species, herbs, of temperate regions of the Northern Hemisphere (especially China and the Himalayas). References: Stern in FNA (1997); Ownbey (1947)=Z; Lidén in Kubitzki, Rohwer, & Bittrich (1993). [also see *Capnoides*]

1 Fruits pendent or divergent; spurred petal 7-9 mm long; pedicels 6-15 mm long; seeds 2-2.5 mm wide, with a narrow, acute ring-margin .........................................................

1 Fruits erect or ascending; spurred petal 10-15 mm long; pedicels 1-6 mm long (5-10 mm long in *C. aurea*); seeds 1.0-2.0 mm wide, without a narrow, acute ring-margin.

2 Capsules mostly 15-20 mm long, ca. 1.0 mm in diameter, strongly constricted between the seeds at maturity; inflorescence long, usually red, to strongly glaucous; [of sandy soils of the outer Coastal Plain] ............................................................... *C. halei* (Engelmann ex A. Gray) A. Gray var. *aurea* = *C. aurea* – C; *F* = *Corydalis aurea* var. *aurea* – FNA; = *Capnoides aureus* (Willdenow) Kuntze – S] [not keyed; not mapped; rejected as a component of our flora]

2 Capsules mostly 10-15 mm long, 1.5-2.0 mm in diameter, slightly or not at all constricted between the seeds at maturity; inflorescence relatively short, barely (if at all) overtopping the upper leaves; ultimate leaf segments 1.0-2.0 (-4.0) mm wide; seeds > 1.5 mm wide; plant green to slightly glaucous; [of circumneutral rock outcrops of the upper Piedmont and Mountains] ....................................................... *C. micrantha* (Engelmann ex A. Gray) A. Gray var. *aurea* = *C. aurea* – C; *F* = *Corydalis aurea* var. *aurea* – FNA; = *Capnoides aureus* (Willdenow) Kuntze – S] [not keyed; not mapped; rejected as a component of our flora]

*Corydalis aurea* Willdenow. Reported as occurring as far south and east as MD, WV (?), and PA (Kartesz 1999, Kartesz 2010). No definite documentation is known for this species in our area. [= G; = *Corydalis aurea* var. *aurea* = C; *F* = *Corydalis aurea* ssp. *aurea* – FNA; = *Capnoides aureus* (Willdenow) Kuntze – S] [not keyed; not mapped; rejected as a component of our flora]

*Corydalis micrantha* (Engelmann ex A. Gray) A. Gray, Slender Corydalis. Circumneutral rock outcrops and adjacent glades and woodlands. April-June. *C. micrantha* (in the narrow sense) is primarily midwestern, ranging from IL, WI, MN, and SD south to AR, TX, and OK, with disjunct outliers in e. TN and w. NC. Ownbey (1947) had no records of Southern Appalachian populations of *C. micrantha*, and considered "ssp. *micrantha*" to range no further east than IL and MO; RAB included montane populations in ssp. *australis*, stating "this is the only [subspecies] in our range." Morphologically, however, these populations closely resemble *C. micrantha*; their association in the Brushy Mountains with other species disjunct from western or prairie ranges (*Anemone berlandieri, Arabis pycnocarpa, Pellaea wrightiana*) provides phytogeographic corroboration. [= G; = *Corydalis micrantha* ssp. *micrantha* – FNA, K, Z; = *Corydalis micrantha* var. *micrantha* – C; < *Corydalis micrantha* – G; = *Capnoides micranthum* (Engelmann ex A. Gray) Britton – S]
Dicentra Bernhardi 1833

1 Flowers pink, in panicles; rootstock lacking bulblets; ultimate leaf segments generally 3-parted, each part 2-5 mm wide at base, gradually tapering to the tip.
   2 Reflexed portions of the outer sepals 4-8 mm long; [native and cultivated] ..................................................  D. eximia
   1 Flowers white or yellowish (very rarely pinkish), in racemes; rootstock with bulblets; ultimate leaf segments not generally 3-parted, about 1 (-3) mm wide, with parallel sides for most of their length, then tapering suddenly to the tip.
   3 Spurs of the corolla rounded, incurved, 2-5 mm long; bulblets yellow, spherical ........................................ D. canadensis
   2 Spurs of the corolla elongate, divergent, 7-9 mm long; bulblets white to pink, tear-shaped (narrowed upward) ....... D. cucullaria

* Dicentra formosa (Haworth) Walpers ssp. formosa, native from s. BC south to c. CA, is frequently cultivated and resembles our native D. eximia. A variety of cultivars, some apparently derived from hybrids between the two subspecies, make identification uncertain in some cases. [= FNA, Z] {not mapped; rejected as a component of our flora}

* Dicentra spectabilis (Linnaeus) Fukuhara, Bleeding Heart, native to e. Siberia, Korea, and n. China, is frequently cultivated and may persist or weakly naturalize. It is reported for KY (Kartesz 1999, Kartesz 2010) and various ne. United States. [= K; = Dicentra spectabilis (Linnaeus) Lemaire – Z] {not mapped; rejected as a component of our flora}

Fumaria Linnaeus 1753 (Fumitory)

1 Corolla (9-) 10-14 mm long, creamy white (to reddish); fruiting pedicels deflexed downwards; fruit smooth when dry .......... F. capreolata
   2 Corolla 4-8 (-9) mm long, white to pink or purple; fruiting pedicels ascending; fruit rugose or verrucose when dry.
   3 Corolla 4-6 mm long, white (rarely very pale pink); raceme sessile or subsessile ............................................ F. parviflora
   2 Corolla (6-) 7-8 (-9) mm long, dark pink to purple; raceme borne on a peduncle .............................................. F. officinalis

Lamprocapnos Endlicher 1850 (Asian Bleeding Heart)

A monotypic genus, a perennial herb of e. Asia. References: Liden et al. (1997); Stern (1961)=Z.

Identification notes: Lamprocapnos differs from other "bleeding hearts" (the native Dicentra eximia and the western American Dicentra formosa ssp. formosa) in its leafy stem, the inflorescence borne terminally or opposite a leaf, the leaves much less finely divided, and the flowers about as broad as long (vs. much longer than broad in Dicentra eximia and Dicentra formosa).

* Lamprocapnos spectabilis (Linnaeus) Fukuhara, Bleeding Heart, native to e. Siberia, Korea, and n. China, is frequently cultivated and may persist or weakly naturalize. It is reported for KY (Kartesz 1999, Kartesz 2010) and various ne. United States. [= K; = Dicentra spectabilis (Linnaeus) Lemaire – Z] {not mapped; rejected as a component of our flora}
A family of 23 genera and about 230 species, mainly herbs (some shrubs and small trees), largely north temperate in distribution. References: Kiger in FNA (1997); Wang et al. (2009); Kadereit in Kubitzki, Rohwer, & Bittrich (1993).

1. Argemone Linnaeus 1753 (Prickly-poppy)

1. Flowers white to pink; latex white or nearly clear .............................................................................................................. A. albiflora ssp. albiflora
1. Flowers yellow to cream; latex yellow ............................................................................................................................ A. mexicana

Argemone albiflora Hornemann var. albiflora, Carolina-poppy, White Prickly-poppy. Sandy roadsides and disturbed areas. April-May (sporadically later). This species is apparently native to the southeastern United States, presumably including portions of our area, south to s. FL, but the native range is unclear. Var. texana (G.B. Ownbey) Shinners occurs in TX, AR, and LA. The species’ weediness suggests, however, that it may be merely adventive in our area. [= A. albiflora ssp. albiflora – FNA, K; < A. albiflora – RAB, C, WH; < A. alba Lestib. f. – G, S, misapplied]

FUMARIACEAE

109b. PAPAVERACEAE A.L. de Jussieu 1789 (Poppy Family) [in RANUNCULALES]

Identification notes: Other species are cultivated and may be found in our area persistent, escaped, as waifs, or as naturalized populations.

1. Upper cauline leaves not clasping the stem; [section Papaver] .............................................................................................................. P. somniferum
1. Upper cauline leaves clasping the stem; [section Macrantha] .............................................................................................................. P. orientale
2. Capsules oblong to clavate, sparsely setose-pubescent; [section Argemonidium].
1. Upper cauline leaves not clasping the stem.
3. Capsules oblong-ellipsoid to subglobose, densely setose with strong hairs ............................................................................. P. hybridum
3. Capsules obovoid-ellipsoid to subglobose, densely setose-pubescent; [section Papaver].
2. Ovaries and capsules glabrous.
4. Flowers > 10 cm across; perennial; [section Macrantha] .............................................................................................................. P. orientale
4. Flowers < 10 cm across; annual; [section Rheadium].
5. Capules 2-3× as long as broad, stigmatic lobes 5-9 ...................................................................................................................... P. dubium
5. Capeules 1-1.5× as long as broad; stigmatic lobes 8-15 ...................................................................................................................... P. rhoeas
* **Papaver argemone** Linnaeus, Prickly Poppy. Disturbed areas; native of Europe and sw. Asia. Reported from PA (Rhoads & Klein 1993, Kiger & Murray in FNA 1997), VA (probably only from cultivation), and MD (Kiger & Murray in FNA 1997). [= FNA]

* **Papaver hybridum** Linnaeus, Rough Poppy. Disturbed areas; native of Eurasia. May-June. [= RAB, FNA, K, Z]

---

3. **Glaucium** P. Miller 1754 (Horned-poppy)

A genus of about 23 species, annual and perennial herbs, of temperate Europe and w. Asia. References: Kiger in FNA (1997); Kadereit in Kubitzki, Rohwer, & Bittrich (1993). Key based on FNA.

1 Basal leaves few, glabrate to moderately pubescent; blades of distal leaves not distinctly clasping stem; petals orange to reddish orange, usually with blackish basal spot; capsules straight to slightly curved, pubescent or glabrate ....................................................... **G. corniculatum**

1 Basal leaves numerous, densely pubescent; distal blades of distal leaves distinctly clasping stem; petals yellow or orange-yellow, sometimes with reddish to violet basal spot; capsules mostly distinctly curved, glabrous, tubercululate, or scabrous ................................................ **G. flavum**

---

4. **Macleaya** R. Brown 1826 (Plume-poppy)

---

5. **Sanguinaria** Linnaeus 1753 (Bloodroot)

* **Sanguinaria canadensis** Linnaeus, Bloodroot, Red Puccoon. Moist nutrient-rich forests. March-April; April-May. NS west to MN and MB, south to Panhandle FL and OK. Fernald recognizes two varieties – var. *rotundifolia*, more southern and the primary form in our area, is considered to have leaves less lobed than the more northern var. *canadensis*; leaf shape variability within populations makes it impractical to recognize infraspecific taxa. [= RAB, C, FNA, G, K, S, W; > S. canadensis var. *canadensis* – F; > S. canadensis var. *rotundifolia* (Greene) Fedde – F]

6. **Chelidonium** Linnaeus 1753 (Greater-celandine)

7. *Stylophorum* Nuttall 1818 (Celandine-poppy)

*Stylophorum diphyllum* (Michaux) Nuttall, Celandine-poppy, Woods-poppy. Moist forests over calcareous rocks (such as limestone). March-April. S. QU, w. PA, s. MI, and WI, south to sw. VA, e. TN, nw. GA, sc. TN, and AR; introduced elsewhere from horticultural use. [= C, F, N, K, S, W, WV]

8. *Eschscholzia* Chamisso 1820 (California-poppy)

*Eschscholzia californica* Chamisso ssp. californica, California-poppy. Roadsides, disturbed areas; native of w. North America. May-August. [= FNA, K; < *Eschscholtzia californica* – RAB, F, orthographic variant]

111. **LARDIZABALACEAE** Decaisne 1839 (Lardizabala Family) [in RANUNCULALES]

A family of about 8 genera and 35 species, shrubs and vines, primarily Asian, but also in s. South America. References: Thieret & Kartesz in FNA (1997); Wang et al. (2009); Cheng-Yih & Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

*Akebia* Decaisne 1837 (Akebia)

*Akebia quinata* (Houttuyn) Decaisne, Five-leaf, Five-leaf Akebia, Chocolate-vine. Escaped from cultivation to roadbanks, suburban woodlands, and floodplains; native of Japan, China, and Korea, potentially invasive and difficult to eradicate. April-June; June-July. [= RAB, C, F, N, K]

112. **MENISPERMACEAE** A.L. de Jussieu 1789 (Moonseed Family) [in RANUNCULALES]

A family of about 72 genera and 450 species, vines, shrubs, trees, and herbs, of tropical, subtropical, and warm temperate areas. References: Rhodes in FNA (1997); Wang et al. (2009); Hoot et al. (2009); Kessler in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves asymmetrically peltate (the stem attached 1-5 mm in from the leaf margin); stamens 12-24; petals 6-9; fruit bluish-black; [tribe *Menispermeae*] .......................................................... ........................................................................................................................................................................... *Menispermum*

1 Leaves not peltate, usually cordate (the stem attached at the leaf margin); stamens 6 or 12; petals 6 or 0; fruit red or bluish-black.

2 Leaves 3-7-lobed, the sinuses usually deep, the lobes acute; stamens 12; petals 0; fruit bluish-black, 13-25 mm long; [tribe *Tinosporeae*] ........................................................................................................................................................................... *Calycoarpus* ........................................................................................................................................................................... *Cocculus*

2 Leaves entire or 3-lobed, the sinuses always shallow, the lobes (if present) broadly rounded; stamens 6; petals 6; fruit red, 5-8 mm long; [tribe *Tiliacoreae*] ........................................................................................................................................................................... *Cocculus*

*Calycoarpus* Nuttall ex Torrey & A. Gray 1838 (Cupseed)

*Calycoarpus lyonii* (Pursh) A. Gray, Cupseed, Lyonia-vine. Floodplain forests, wet hammocks. May-June. Se. SC, e. TN, se. KY, s. IN, s. IL, MO, and e. KS, south to se. GA, Panhandle FL, s. AL, s. MS, s. LA, and e. TX. [= C, F, N, K, S, WH]

*Cocculus* A.P. de Candolle 1817 (Coralbeads, Snailseed)
MENISPERMACEAE

*Cocculus carolinus* (Linnaeus) A.P. de Candolle, Coralbeads, Carolina Moonseed, Snailseed, Red Moonseed. Moist to dry forests and thickets, especially where calcareous, also weedy in landscaping. June-August. VA south to FL, west to TX, north in the interior to s. IN and MO. Its occurrences in VA may be primarily adventive. [= RAB, C, F, FNA, G, K, W, WH; = Epibaterium carolinum (Linnaeus) Britton – S]

*Menispermum* Linnaeus 1753 (Moonseed)

113. BERBERIDACEAE A.L. de Jussieu 1789 (Barberry Family) [in RANUNCULALES]

As broadly defined here, a family of about 15 genera and 650 species, herbs and shrubs, of the temperate Northern Hemisphere and Andean South America. There has been much debate and study of whether the Berberidaceae should be recognized as a broadly defined unit, or split into a variety of segregate families (such as Podophyllaceae, Epimediaceae, Nandinaceae, Leonticaceae). Based on molecular studies, Kim & Jansen (1996, 1998) conclude that division of the Berberidaceae into segregate families is not warranted. References: Whetstone, Atkinson, & Spaulding in FNA (1997); Wang et al. (2009); Stearn (2002); Kim & Jansen (1996, 1998); Ahrendt (1961); Locote & Estes (1989b); Meacham (1980); Locote in Kubitzki, Rohwer, & Bittrich (1993).

1. Leaves ternately compound; [subfamily Nandinioideae].
2. Plant a shrub, with multiple leaves; flowers white..............................................................................................................................1. Nandina
3. Plant an herb, with 2 leaves; flowers greenish or maroonish...............................................................................................................2. Caulophyllum

1. Leaves simple (though sometimes variously lobed or divided into segments).
3. Plant a shrub; leaves not peltate, simple or 1-pinnately compound; flowers yellow; [subfamily Berberidoideae] .........................3. Berberis
4. Plant an herb; leaves peltate, 2-parted or radially lobed; flowers white; [subfamily Podophylloideae].
5. Plant acaulescent; flower solitary and scapos; leaf segments 2; fruit a capsule.........................................................................................4. Jeffersonia
6. Flowers cymose or umbellate; stamens 6; berry globose, 8-12 mm long, 2-4 seeded; larger leaves with only 2 clefts that extend > halfway to the peltate center of the leaf (thus the leaf divided into 2 halves, the other sinuses shallow)........................................5. Diphylleia
7. Flower solitary; stamens 12-18; berry ovoid, 25-70 mm long, many-seeded; larger leaves with 5 or more clefts that extend > halfway to the peltate center of the leaf (thus the leaf fairly evenly divided into multiple lobes)........................................................................6. Podophyllum

1. *Nandina* Thunberg 1781 (Nandina, Sacred-bamboo)

A monotypic genus, a shrub, native of Japan, China, and India. Here treated as a monotypic genus in the Berberidaceae, *Nandina* seems to have only a general kinship to the Berberidaceae (see Ehdaie & Russell 1984, Locote & Estes 1989b, Meacham 1980) and should perhaps be placed in its own monotypic family. References: Whetstone, Atkinson, & Spaulding in FNA (1997); Ehdaie & Russell (1984); Locote in Kubitzki, Rohwer, & Bittrich (1993).

* Nandina domestica Thunberg, Nandina, Sacred-bamboo. Forests and woodlands in suburban areas, commonly planted, increasingly escaping and naturalizing; native of China. May-June; October-November. *Nandina* has numerous cultivated forms, and is widely planted in the Piedmont and Coastal Plain of our area, especially southward. Leaflet shape varies in cultivated forms from broadly ovate to linear. [= RAB, FNA, K]

2. *Caulophyllum* Michaux 1803 (Blue Cohosh)

1 Carpels (in flower) 3.5-5.5 mm long, averaging 4 mm; style 0.8-1.5 mm long; usually purple; terminal leaflets 7-9(-10) cm long, (4-)5-7.5(-8) cm wide; main inflorescence with 4-18 flowers; first leaf 2-termate or 3-termate ......................... *C. giganteum*

Carpels (in flower) 1.3-2.8 mm long, averaging 2 mm; style 0.3-1.0 mm long; sepals 3-6.5 mm long, yellow, yellow-purple, or green; terminal leaflets (3-)5-7(-8) cm long, (2-)3.5-6.5(-10) cm wide; main inflorescence with 5-70 flowers; first leaf 3-termate or 4-termate..........

............................................................................................................................. ..............................................................................

**BERBERIDACEAE**

369

A genus of 400-600 species, shrubs, of North America, South America, Asia, Europe, and n. Africa. Many authors favor the inclusion of *Mahonia* in *Berberis*. It appears that *Mahonia* is a paraphyletic grade basal to *Berberis* (in the narrow sense) (Kim, Kim, & Landrum 2004). References: Whittomore in FNA (1997); Loconte in Kubitzki, Rohwer, & Bittrich (1993); Kim, Kim, & Landrum (2004).

**Identification notes:** Other species of *Berberis* are used horticulturally in our area. Though none appear to be established at this time, the possibility of encountering species other than the three treated above should be kept in mind. *B. julianiae* Schneider is especially commonly planted in hedges and landscaping.

1 Leaves 1-pinnately compound, > 10 cm long, not fascicled on short spur shoots; stems not spiny; leaves evergreen.

2 Bud scales deciduous, 3-8 mm long; leaflet blades 1-3-veined from base .............................................................. *B. repens*

3 Leaflet blades with 6-13 teeth per side, each tooth 1-2(-3) mm long; leaflets thickish, but flexible when fresh.............. *B. nervosa*

1 Leaves simple, < 6 cm long, fascicled on short spur shoots; stems spiny; leaves deciduous or evergreen.

4 Leaves entire; flowers solitary or 2-4 in umbels; spines mostly simple; [section *Tschonoskyanae*] .............................................................. *B. thunbergii*

5 Leaves deciduous, herbaceous; leaf teeth tipped with firm prickles; fruits blue-black, pruinose; [section *Wallichianae*] .............. *B. julianiae*

6 Leaves with 1-9 (20) bristles on each margin, the bristles 3-6 mm apart; berries ovoid (6-9 mm long, 6-7 mm broad), 5-10 (rarely more) in an often umbellate raceme; petals notched at apex; [section *Canadenses*] ............................................................ *B. canadensis*

6 Leaves with 18-36 bristles on each margin, ca. 2 mm apart; berries ellipsoid (8-10 mm long, 4-5 mm broad), 10-20 in a raceme; petals obtuse at apex; [section *Vulgares*] ............................................................... *B. vulgaris*

* **Berberis julianiae** Fortune, Leatherleaf Mahonia, Chinese Mahonia, Holly-grape. In deciduous forests in suburban areas, spread from plantings; native of China. December-March; May-July. Naturalizing widely in the southeastern United States, including (at least) AL, DE, GA, FL, NC, and SC. [= FNA, WH; = Mahonia julianiae (Fortune) Carrière – RAB, K]

**Nandina domestica**

**Berberis canadensis** P. Miller, American Barberry, Allegheny Barberry. Rocky woods, forest openings, glades, usually over mafic rocks (such as diabase) or calcareous rocks (such as limestone), sometimes along fence-rows in sw. VA (presumably spread by birds). April-May; September-October. A broad Southern Appalachian-Ozarkian endemic, not occurring in Canada (the epithet a misnomer): scattered and local in VA, WV, KY, TN, NC, SC, AL, GA, MO, IL, IN, and sc. PA (where apparently now extirpated). Along with *B. vulgaris*, *B. canadensis* has been subjected to organized eradication programs because of its serving as an alternate host for wheat rust (*Puccinia graminis*). [= RAB, C, F, FNA, G, K, S, W]

* **Berberis julianiae** Schneider, Evergreen Barberry. Seeding down and escaping locally near horticultural plantings; native of China. First reported for NC by Pittillo & Brown (1988). [= K; = *B. julianiae*, orthographic variant]
**BERBERIDACEAE**

* Berberis repens Lindley, Creeping Oregon Grape. Suburban woodlands; native of nw. North America. [= FNA; = Mahonia repens (Lindley) G. Don – K] [add to synonymy]

* Berberis thunbergii A.P. de Candolle, Japanese Barberry. Rich forests, old fields; native of Japan. March-April; May-September. This species is immune to wheat rust; it is probably now the most commonly encountered barberry in our area. [= RAB, C, F, G, K, S, W]

* Berberis vulgaris Linnaeus, European Barberry, Common Barberry. Disturbed areas; native of Europe. April; September. This species, once widely cultivated and established in North America, serves as an alternate host to wheat rust and has been subjected to eradication programs for over half a century. It may no longer occur in our area. [= C, F, FNA, G, K]

---

4. Jeffersonia W. Barton 1793 (Twinleaf)

A genus of 2 species, the only other species of the genus is native to e. Asia (eastern Russia, Korea, Manchuria). The closest North American relatives of *Jeffersonia* are *Achlys* and *Vancouveria* of the Pacific Northwest. References: George in FNA (1997); Stearn (2002)=Y; Loconte & Estes (1989b); Loconte in Kubitzki, Rohwer, & Bittrich (1993).

* Jeffersonia diphylla (Linnaeus) Persoon, Twinleaf. Moist and extremely nutrient-rich forests, generally over calcareous or mafic rocks (including limestone, dolostone, amphibolite, greenstone, etc.) or very rich alluvium. March-April; May. The species is widespread in ne. United States, south to MD, NC, and AL. It is somewhat suggestive of *Sanguinaria* in both foliage and flower. [= RAB, C, F, G, K, S, W, WV, Y]

5. Diphylleia Michaux 1803 (Umbrella-leaf)

* Diphylleia cymosa Michaux, Umbrella-leaf, Pixie-parasol. Seepages and brook-banks, sometimes away from brooks or seeps in northern hardwood or cove hardwood forests (but then usually in subterranean seepage), primarily at moderate to high elevations. May-June; July-August. A narrow Southern Appalachian endemic: high mountains of w. NC and e. TN, extending a short distance into ne. GA, nw. SC, and sw. VA. [= RAB, C, F, G, K, S, W, Y, Z]

6. Podophyllum Linnaeus 1753 (May-apple)

A genus of 2 species (or ca. 14 if *Dysosma* is included), herbs, one in e. North America, the other in e. Asia. The obvious morphological kinship of *Podophyllum*, *Diphylleia*, and *Hydrastis* is corroborated by alkaloid chemistry. References: George in FNA (1997); Shaw (2000, 2002)=Z; Loconte in Kubitzki, Rohwer, & Bittrich (1993).

* Podophyllum peltatum Linnaeus, May-apple, American Mandrake. Rich forests, bottomlands, slopes, pastures. March-April; May-June. NS west to MN, south to Panhandle FL and TX. The ripe fruits are edible; the rest of the plant contains a variety of alkaloids, and is poisonous-medicinal. Compounds from *Podophyllum* are used in wart removal, and show anti-viral and anti-cancer promise. [= RAB, C, F, G, K, S, W, WV; > P. peltatum var. peltatum – Z; > P. peltatum var. annulare J.M.H. Shaw – Z]

114a. HYDRASTIDACEAE Martinov 1820 (Golden-seal Family) [in RANUNCULALES]
classification of the flowering plants, Thorne (1992) and Reveal (1993a) have also accepted Hydrastidaceae as a distinct family. Toke in Kubitzki & Bayer places Hydrastis with Glauclidium Siebold & Zuccarini in a bigeneric Hydrastidaceae. References: Tamura in Kubitzki, Rohwer, & Bittrich (1993); Wang et al. (2009); Toke in Kubitzki & Bayer (2002).

**I. Hydrastis** Linnaeus 1759 (Golden-seal)

**Hydrastis canadensis** Linnaeus, Golden-seal. Mesic, very nutrient-rich forests, with circumneutral soils, over calcareous or mafic rocks such as limestone, amphibolite, and dolostone, sometimes forming large colonies after canopy disturbance such as logging. April; May-June. VT and MN south to w. and c. NC, n. GA, TN, and AR. Exploited for the herbal trade (and still often used as a home remedy in more remote parts of the mountains), though too rare in our area to support economically significant wild collection. The root is bitter in taste and contains several alkaloids. Reported for SC (P. McMillan, pers.comm. 2002). [= RAB, C, F, FNA, G, K, S, W, WV]

### 114b. RANUNCULACEAE A.L. de Jussieu 1789 (Buttercup Family) [in RANUNCULALES]

A family of about 62 genera and 2450 species, herbs, shrubs, and vines, primarily of temperate and boreal regions. Classification of subfamilies and tribes follows Wang et al. (2009). References: Whitemore & Parfitt in FNA (1997); Wang et al. (2009); Keener (1977); Tamura in Kubitzki, Rohwer, & Bittrich (1993). [also see HYDRASTIDACEAE]

</table>

**Key B**

| 1     | Flowers bilaterally symmetrical, the upper sepal hooded or spurred; [tribe Delphinieae].   | 20. Ranunculus |
| 2     | Upper sepal hooded or helmet-shaped; petals hidden by the sepal; perianth blue or creamy white; stems weak, clambering, reclining, vining, or ascending in a curve                                                                 | 8. Consolida |
| 3     | Annual; pistil 1; petals 2, connate; leaf lobes < 1.5 mm wide                                                                                   | 9. Delphinium |
| 4     | Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a Plantago inflorescence)                                      | 19. Myosurus |
| 5     | Basal leaves various, but not as above; receptacle globose to sub-cylindric, mostly < 1 cm long                                                  | 18. Ficaria |
| 6     | Sepals 3 (-4); petals 7-12; achenes pubescent, beakless; leaves simple, cordate, unlobed; [introduced garden plants]                              | 17. Trautvetteria |
| 7     | Sepals (3-) 5 (-6); petals typically 5-9 (10 in some "doubled" forms); achenes smooth or variously ornamented with spines, papillae, or tubercles, sometimes also pubescent; leaves various, usually not at once simple, cordate, and unlobed; [native or introduced] | 16. Clematis |
| 8     | Sepals 3-5 mm long, caducous; stamens white and showy; [tribe Ranunculeae]                                                                 | 17. Trautvetteria |
| 9     | Sepals 6-40 mm long, not caducous; stamens not notably white and showy.                                                                         | 16. Clematis |
| 10    | Leaves opposite, distributed along the stem; style plumose; [tribe Anemoneae]                                                                    | 16. Clematis |
RANUNCULACEAE

7 Leaves all basal, or with a few alternate or whorled involucrate leaves on the stem; style not plumeose.
8 Sepals white, bluish, or blue; basal leaves 3-5 (-7)-lobed; [tribe Anemoneae] ................................................................. 15. Anemone
8 Sepals yellow, green, or whitish (sometimes marked with purple); basal leaves unlobed, or palmately cleft into 5-11 (-many) segments.
9 Leaves cordate-reniform, unlobed; sepal bright yellow; petals absent; [native, of bogs and marshes]; [tribe Calthaeae] ..............
................................................................. 14. Caltha
9 Leaves palmately or pedately lobed or divided; sepal green, greenish, dull yellow, or whitish; petals modified into tubular nectaries; [introduced, rarely persistent or escaped from cultivation].
10 Sepals 5-8, much longer than wide, yellow; cauline leaves absent, except for the involucre which immediately subtends the flower; [tribe Cimicifugaeae] ................................................................................................. 12. Eranthis
10 Sepals 5, nearly as wide as long, green or maroon; cauline leaves present; [tribe Helleboreae] ........................................ 11. Helleborus

Key B

1 Fruit a follicle, each carpel with 2 or more ovules.
2 Leaves cordate-reniform, toothed, not lobed or divided; [tribe Calthaeae] ................................................................. 14. Caltha
2 Leaves variously palmately or pedately lobed or divided.
3 Carpels 1-3; plants 3-30 dm tall; [native, except Consolida]; [tribe Delphinieae].
4 Stems weak, clambering, reclining, or vining. .................................................................................................................... 7. Aconitum
4 Stems strong, erect
5 Annual; leaf lobes < 1.5 mm wide; [exotic] ......................................................................................................................... 8. Consolida
5 Perennial; leaf lobes > 2 mm wide; [native] ......................................................................................................................... 9. Delphinium
3 Carpels 3-6; plants 1-5 dm tall; [introduced, rarely persistent or escaping].
6 Cauline leaves absent, except for the involucre which immediately subtends the fruit; [tribe Cimicifugaeae] ......................................................... 12. Eranthis
6 Cauline leaves present; [tribe Helleboreae] ......................................................................................................................... 11. Helleborus
1 Fruit an achene (or dehiscent utricule in Trautvetteria), each carpel with 1 ovule.
7 Leaves opposite, distributed along the stem; style plumeose; [tribe Anemoneae] ................................................................. 16. Clematis
7 Leaves all basal, or with a few alternate or whorled involucrate leaves on the stem; style not plumeose.
8 Basal leaves linear to linear-spatulate, mostly 4-8 cm long, 1-3 mm wide; receptacle elongate, 1-6 cm long (superficially resembling a Plantago inflorescence); [tribe Ranunculaceae] .......................................................................................................................... 19. Myosurus
8 Basal leaves various, but not as above, generally long-petiolate, with an expanded, cordate, 3-lobed, or palmately-lobed blade; receptacle globose to sub-cylindric, mostly < 1 cm long.
9 Fruit a dehiscent utricule; cauline leaves alternate; [tribe Ranunculaceae] .................................................................................. 17. Trautvetteria
9 Fruit an achene; cauline leaves opposite or whorled (or alternate in Ranunculus).
10 Cauline leaves opposite or whorled, or reduced to 3 sepal-like involucral bracts immediately subtending the flower; sepal absent (but in “Hepatica” mimicked by the bracts); [tribe Anemoneae] ................................................................................................................................. 15. Anemone
10 Cauline leaves alternate; sepals present; [tribe Ranunculaceae]
11 Achenes pubescent, beakless; leaves simple, cordate, unlobed; [introduced garden plants] .............................................. 18. Ficaria
11 Achenes smooth or variously ornamented with spines, papilae, or tubercles, sometimes also pubescent; leaves various, usually not at once simple, cordate, and unlobed; [native or introduced] ..................................................................................................................... 20. Ranunculus

Key C

1 Leaflets linear, < 1.5 mm wide.
2 Flowers bilaterally symmetrical; [subfamily Ranunculoideae, tribe Delphinieae] ............................................................................ 8. Consolida
2 Flowers radially symmetrical.
3 Aquatic; [native]; [subfamily Ranunculoideae, tribe Ranunculaceae] ..................................................................................... 20. Ranunculus
3 Terrestrial; [alien].
4 Flower lacking involucre; pistils simple; [subfamily Ranunculoideae, tribe Adonieae] ................................................................. 6. Adonis
4 Flower closely subtended by a finely dissected involucre; pistils compound; [subfamily Ranunculoideae, tribe Nigellieae] ..........
............................................................. 10. Nigella
1 Leaflets broader, rounded, lobed, or toothed.
5 Leaves all cauline, opposite; stems somewhat woody at base; [subfamily Ranunculoideae, tribe Anemoneae] ....................... 16. Clematis
5 Leaves basal and cauline, the calamine alternate (or with opposite or whorled involucral bracts).
6 Petsals present, conspicuous
7 Flowers danging; petals red, orange with yellow, or blue, spurred; [subfamily Thalictrioideae] .............................................. 3. Aquilegia
7 Flowers not danging; petals yellow, not spurred; [subfamily Ranunculoideae, tribe Ranunculaceae] ........................................ 20. Ranunculus
6 Petsals absent or inconspicuous (soon deciduous or altered into a neglect-bearing clavate structure); sepals sometimes petaloid and conspicuous.
7 Sepals petaloid, conspicuous, white (or tinged with pink or green).
9 Involucre absent, all leaves on the stem alternate; petaloid sepals 5-10, white; [subfamily Thalictrioideae] ............................ 4. Enemion
9 Involucre of opposite or whorled, leaflike bracts present; petaloid sepals (4-) 5-20 (-30), white, cream, rose, or green.
10 Basal leaves with 3-5 leaflets, these toothed or incised; petaloid sepals white, cream, rose, or green; [subfamily Ranunculoideae, tribe Anemoneae] ................................................................................................. 15. Anemone
10 Basal leaves with > 3 leaflets; these with 0-3 rounded lobes at the tip; petaloid sepals white to pale pink; [subfamily Thalictrioideae] ......................................................................................................................... 5. Thalictrum thalictroides
8 Sepals absent, or inconspicuous in comparison to the stamens or pistils.
11 Leaflets 3; flower solitary; [subfamily Coptidoideae] .................................................................................................................. 2. Coptis
11 Leaflets many; flowers many, in a panicle or raceme.
12 Inflorescence a raceme; [subfamily Ranunculoideae, tribe Cimicifugaeae] ................................................................. 13. Actaea
12 Inflorescence a panicle; [subfamily Thalictrioideae] .................................................................................................................. 5. Thalictrum
1. Xanthorhiza Marshall 1785 (Yellowroot)

Identification notes: An unmistakable plant, the woody stems usually about knee-high and unbranched, bearing a cluster of pinnate leaves near the tip, and the rhizomes with a bright yellow, staining, bitter-tasting alkaloid.

Xanthorhiza simplicissima Marshall, Yellowroot, Brook-feather. Streambanks and riverbanks. March-May; May-June. NY and se. PA (where only naturalized, according to Rhoads & Klein 1993), south to SC, sw. GA, w. FL, and AL. [= RAB, C, F, FNA, G, GW, K, W, WV; = Xanthorhiza simplicissima – S, orthographic variant]

2. Coptis Salisbury 1807 (Goldthread)

Coptis trifolia (Linnaeus) Salisbury var. groenlandica (Oeder) Fassett, Goldthread, Goldenroot. Bogs. May-June. The species ranges from Greenland west to AK, south to NJ, nw. NC, n. IN, IA, and BC; and in e. Asia. Var. groenlandica is the variety in e. North America, northeast to Greenland, and in southern parts of nw. North America; var. trifolia is Alaskan and e. Asian. Whether the varieties are worth recognition is somewhat questionable. Coptis had been reported for NC by many floras (for instance, C, F, G, and S), but the documentation was unknown; its presence in NC has now been confirmed by P. McMillan.

3. Aquilegia Linnaeus 1753 (Columbine)

A genus of about 80 species, perennial herbs, of the Northern Hemisphere. References: Whittemore in FNA (1997); Munz (1946)–Z; Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identification notes: When in leaf, somewhat easily mistaken for Thalictrum or Enemion; look for old fruits.

A. canadensis

1. Flowers red and yellow; [add other characters]; spurs straight; [native, common] .......................................................... 2. A. vulgaris
1. Flowers blue, purple, mauve, pink, white, or red and yellow; spurs hooked; [alien, rare] .......................................................... 20. Ranunculus

**Identification notes:** *Enemion* is somewhat superficially similar to the much more common *Thalictrum thalictroides*, with which it sometimes grows, but can be distinguished by the following characters: fruit a follicle (vs. fruit an achene), petaloid sepals 5 (vs. 5-10, usually some at least of the flowers on a plant with 6 or more).

*Enemion biternatum* Rafinesque, *Isopyrum*, False Rue-anemone. Rich forests, either on natural levees with very nutrient rich sediments or on slopes with underlying mafic rocks. March-April; May. Mainly west of the Appalachians, W. NY, s. ON and MN south to TN and AR; disjunct in the Piedmont and Coastal Plain of VA, NC, and SC, and the FL Panhandle. [FNA, K; = *Isopyrum biternatum* (Rafinesque) Torrey & Gray = RAB, C, F, G, S]

---

### 5. *Thalictrum* Linnaeus 1753 (Meadow-rue)

**Identification notes:** *Thalictrum thalictroides* is superficially similar to *Enemion biternatum*, but can be distinguished by the following characters: fruit an achene (vs. fruit an achene), petaloid sepals 5-10 (vs. 5).

1 Sepals petaloid, conspicuous, white (or tinged with pink or green); leaflike involucral bracts present, opposite or whorled; inflorescence an umbel; [section *Anemonella*]................................................................................................................................................................................. *T. thalictroides*

2 Sepals absent, or inconspicuous in comparison to the stamens or pistils; leaflike involucral bracts not present; inflorescence a panicle, corymb or raceme.

3 Achenes concave or straight on the upper surface, 4-5.5 mm long, borne on a stipe 1.5-3 mm long; inflorescence branches stiff and diverge at acute angles; [fairly widespread in our area, on a wide variety of moist substrates, especially in the Mountains]................................. *T. clavatum*

4 Achenes straight on the upper surface, 2.5-4 mm long, borne on a stipe 2.5-4 mm long; inflorescence branches flexuous and divergent; [of sandstone rockhouses of Cumberland Plateau of AL, TN, and KY].................................................................................. *T. mirabile*

5 Leaflets of the stem leaves linear to narrowly lanceolate, oblanceolate or elliptic, (3-) 5-10 (-25)× as long as wide; [section *Leucocoma*] .................................................................................................................. *T. cooleyi*

6 Leaflets of the stem leaves ovate, obovate, or suborbicular, 0.7-3 (-5)× as long as wide.

7 Most of the leaflets with (3-) 4-6 (-9) lobes or teeth; [section *Heterogamia*].

8 Cauline leaf subtending the lowest flowering branch sessile; plant flowering May-July; achenes borne on a 0.7-2.5 mm long stipe. .................................................................................................................................................................................................................. *T. coriaceum*

9 Cauline leaf subtending the lowest flowering branch with a petiole 3-7 cm long; plant flowering March-April; achenes nearly sessile, the stipe nonexistent or <0.3 mm long.

10 Largest leaflets < 15 mm wide; stems 10-40 cm tall, reclining .................................................................................................................. *T. debile*

11 Largest leaflets > 15 mm long; stems 30-80 cm tall, erect .................................................................................................................. *T. dioicum*

12 Most of the leaflets with 1-3 (-5) lobes or teeth; [section *Leucocoma*].

13 Leaflet undersurfaces, peduncles, and achenes with stipitate glands or papillae.

14 Anthers 1-3.6 (-4) mm long; stigmas 1.5-4.7 (-6) mm long ........................................................................................................................................................................................... *T. dasycarpum*
9. Anthers 0.5-2.8 mm long; stigmas 0.6-3.5 mm long. $\text{Thalictrum hepaticum}$
10. Anthers 0.5-1.2 mm long; stigmas 0.6-2.2 mm long. $\text{Thalictrum revolutum}$
11. Anthers 1.5-2.8 mm long; stigmas (1.5-) 2.0-3.5 mm long. $\text{Thalictrum macrostylum}$

8. Leaflet undersurfaces, peduncles, and achenes glabrous or pubescent, lacking both stipitate glands and papillae.
   L. Leaflet undersurfaces, peduncles, and achenes glabrous.
   N. Leaflets entire to 3-lobed, averaging about 10 mm wide, the broadest usually < 20 mm wide; filaments (2-) 3-4.5 (-6.5) mm long (averaging 3.6 mm). $\text{Thalictrum pubescens}$
   R. Leaflets 3-lobed (rarely entire), averaging 15-23 mm wide, the broadest usually 15-60 mm wide; filaments (2-) 4-5 (-8) mm long (averaging 4-5 mm).

---

**Thalictrum cooleyi** Ahles, Cooley's Meadowrue, Savanna Meadowrue. Ecotones between calcareous savannas and adjacent swamp forests, shallowly underlain by caliches, generally within a few meters of *Taxodium ascendens* and *Liriodendron tulipifera*. Late June-early July; August-October. The species is endemic to two small areas, centered around Maple Hill (Pender and Onslow counties, NC) and Old Dock (Columbus and Brunswick counties, NC), with a small disjunct population in Panhandle FL (Walton County), and a small number of ambiguous populations in sw. GA (Dougherty and Worth counties); the GA populations are assigned here for now but may well represent a new taxon. It is associated with a number of other narrow endemic species. The leaflets of basal leaves (winter rosettes) are much broader, resembling the leaflets of other *Thalictrum* species in length/width ratio. Leaves produced from May on have the very narrow leaves typical of the species. Park (1992) found that *Th. cooleyi* has the highest chromosome number known in the genus, 2n = 210, a ploidy level of 30× compared to the base chromosome level of 7 in *Thalictrum*. [= RAB, FNA, GW, K, WH, Z]

**Thalictrum coriaceum** (Britton) Small, Appalachian Meadowrue, Maid of the Mist. Rich forests. May-July. A Southern and Central Appalachian endemic: MD, VA, and WV south through w. KY and e. TN to w. NC and ne. GA. The roots are bright yellow. A preliminary study concluded that *Th. steeleanum* B. Boivin is not distinct from *Th. coriaceum* (Park 1988); further study is needed. *Th. steeleanum* is alleged to differ in the following ways (and others): plant with long, cordlike rhizomes (vs. stout caudex), terminal leaflets mostly wider than long (vs. mostly longer than wide), achenes curved, 4-6 mm long (vs. less curved, 2.5-4 mm long). Park found these characters (and others) to be variable and to occur together within populations. It ranges from s. PA south through MD, e. WV, w. VA to nw. NC. [= RAB, FNA, K; > *T. coriaceum* – C, F, G, W, WV, > *T. steeleanum* B. Boivin – C, F, G, W, WV; > *T. caulephylloides* Small – S]

**Thalictrum dasycarpum** Fischer & Avé-Lallemant, Purple Meadowrue. Forest, woodlands, and prairies. June-July. QC and YT south to PA, KY, TN, AL, MS, LA, TX, NM, AZ, and WA. It has been reported for scattered localities in VA (Harvill et al. 1992). Park (1992) and FNA do not document the occurrence of *Th. dasycarpum* in VA; substantiation is needed. [= FNA, K] {synonymy incomplete}

**Thalictrum debile** Buckley, Trailing Meadowrue. Moist to wet forests over limestone. Nw. GA west to e. MS. [= FNA, GW, K, S]

**Thalictrum hepaticum** Greene, Appalachian Tall Meadowrue. Seepage areas. May-July. PA south to n. GA and se. TN, strictly or primarily in the Appalachians. Plants tentatively placed here have been problematic. Keener (1981) reduced *Th. hepaticum* Greene to a variety of *Th. pubescens*, and discussed their distinction. Park (1992) contends that these plants are, indeed, glandular puberulent, and should therefore be reduced to synonymy under *Th. revolutum*, stating "these are not given varietal status [under *Th. revolutum*] since this morphological variation in anthers is not correlated with a continuous geographic range. As indicated above, I have located specimens from Georgia, North Carolina, Tennessee, and Pennsylvania which fit the description." As mapped by Keener (1981) *Th. pubescens* var. *hepaticum* (Greene) Keener appears as an endemic to the Southern Appalachians; if extended to Pennsylvania, the distribution is still very restricted (and in a phytogeographically plausible manner) compared to either *Th. revolutum* or *Th. pubescens*. This entity appears to be closer to *Th. pubescens* in leaflet shape, sepal length, anther length, and stigma length, and to *Th. revolutum* in leaflet and petiole vestiture. More study is needed; the taxon is here provisionally accepted in order to draw attention to the problem. [= *T. pubescens* var. *hepaticum* (Greene) Keener – W; < *T. polygamum* Muhlenberg ex Sprengel – RAB, F, G, S, nomen nudum; < *T. pubescens* – C, GW, K, WV; < *T. revolutum* – FNA]

**Thalictrum macrostylum** Small & Heller, Small-leaved Meadowrue. Moist places, perhaps associated with circumneutral soils, moist to dry ultramafic outcrop barrens (over olivine), tidal freshwater marshes. May-August. Se. VA south and west

7. *Aconitum* Linnaeus 1753 (Monkshood, Aconite)

1. Flowers white, creamy white, or yellowish; basal leaves numerous, large, usually 10-20 cm across, on long, stout petioles; roots fascicled; [section *Lycocotonum*] A. reclinatum

2. Terminal lobe of petal < 2 mm wide; follicles pubescent .................................................................................................................. A. reclinatum

3. Spur < 12 mm long; upper bracteoles overlapping the flower, attached 1-4 mm below the flower .................................................. A. orientalis

8. *Consolida* (A. P. de Candolle) S.F. Gray 1821 (Annual Larkspur)

1. Lower bracts of the inflorescence unlobed or the single lowermost bract with 3 lobes; pistil glabrous; follicle 8-17 mm long.

2. Terminal lobe of petal < 2 mm wide; follicles pubescent .................................................................................................................. C. pubescens

3. Spur < 12 mm long; upper bracteoles overlapping the flower, attached 1-4 mm below the flower .................................................. C. orientalis
**Consolida ajacis** (Linnaeus) Schur, Rocket Larkspur. Roadside, fields, waste places, disturbed ground; native of Europe. [= FNA, K2; = Delphinium ajacis Linnaeus – RAB, F, G, S, WV; = Delphinium ambiguum Linnaeus – C; = Consolida ambigua (Linnaeus) P.W. Ball & Heywood in Heywood & P.W. Ball – W]

**Consolida orientalis** (Gay) Schrödinger, Oriental Larkspur. Disturbed areas, perhaps only a waif after cultivation; native of s. Europe, n. Africa, and w. Asia. [= FNA, K2; = C. hispanica (Willk. ex Costa) Greuter & Burdet]

**Consolida pubescens** (de Candolle) Soó, Hairy Larkspur. Disturbed areas, perhaps only a waif after cultivation; native of sw. Europe and nw. Africa. Naturalized in s. TN (Warnock in FNA 1997). [= FNA, K2; not yet keyed]

---

**9. Delphinium** Linnaeus 1753 (Larkspur)

1. Follicles divergent; raceme 0.5-2 (-3) dm long; flowering plants 2-9 (-13) dm tall; flowering March-May; [section Diedropetala; subsection Grumosa].
2. Stems 2-6 dm tall; flowers (sepals) deep bluish purple, pink, or white; lower stem pubescent or nearly so; [usually in deep shade, widespread in our area].............................................................**D. alabamicum**
3. Seeds wing-margined, the surfaces smooth; stem below the inflorescence glabrous; flowering plants 8-20 dm tall; flowering July-September; [section Diedropetala; subsection Exaltata]..........................................................................................**D. exaltatum**
4. Basal leaves usually present at anthesis; flowers (sepals) white; stems 2-4 (-7) dm tall; ultimate segments of midcauline leaves 5-12 in number; 2-4 mm wide .............................................................................**D. carolinianum ssp. calciphilum**
5. Basal leaves absent at anthesis; flowers (sepals) blue to purple (rarely white); stems (3-) 6-10 (-15) dm tall; ultimate segments of midcauline leaves 12-25 in number, 0.5-1.5 mm wide..................................................................................**D. carolinianum ssp. carolinianum**

---

**Delphinium alabamicum** Kral, Alabama Larkspur. Limestone prairies and glades. Endemic to c. and n. AL and nw. GA. [= FNA, K]

**Delphinium carolinianum** Walter ssp. calciphilum M.J. Warnock, Glade Larkspur. Limestone glades. KY south through e. and c. TN to ne. AL and nw. GA. [= FNA, K; = D. virescens Nuttall – C; G; < D. carolinianum var. carolinianum – F; < D. carolinianum – S; < D. virescens var. virescens – Z; < D. carolinianum Walter ssp. virescens (Nuttall) R.E. Brooks]

**Delphinium carolinianum** Walter ssp. carolinianum, Prairie Larkspur, Carolina Larkspur, Blue Larkspur. Rocky woodlands, granite outcrops, Altamaha Grit outcrops, blackland prairies, moist sandy woodlands associated with longleaf pine. May-July. IL west to MO, south to LA and TX, with disjunct occurrences eastward in SC, GA, Panhandle FL (Gadsden County), TN, and MS. The flowers are a pale to medium blue. This species has been reported for NC (by C) and "north to Va." (by F and S). I know of no documentation for its past or present occurrence in NC or VA, but its presence in those states is plausible. [= FNA, K; = D. carolinianum Walter – C, G, WH, Z; < D. carolinianum var. carolinianum – F; < D. carolinianum – S]

**Delphinium exaltatum** Aiton, Tall Larkspur. Dry to moist soils over calcareous (such as dolostone, especially Elbrook Formation) or mafic rocks (such as amphibolite, metagabbro, greenstone, and diabase), usually in the open (as grassy balds) or on forest edges in partial sun. July (low elevations) - September (high elevations). Sw. PA and OH southwest to MO and e. TN, and south to the Mountains of VA and the Mountains and Piedmont of NC. The flowers are a pale to medium blue. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

**Delphinium tricorne** Michaux, Dwarf Larkspur. Rich, moist forests, especially over mafic or calcareous rocks, less commonly (as along the Roanoke River in ne. NC) on very fertile alluvial deposits. March-May. Sw. PA and MN south to NC, nw. GA, AL, and OK. The flowers are variable in color, usually a deep bluish violet, but ranging through pink to pure white. [= RAB, C, F, FNA, G, K, S, W, WV, Z]
10. **Nigella** Linnaeus 1753 (Fennel-flower)

11. **Helleborus** Linnaeus 1753 (Hellebore, Christmas-rose)

**Identification notes**: Other species of **Helleborus** are increasingly being cultivated; all have the potential to naturalize.

1 Primary leaves of mature (fertile) plants all cauline; leaf segments <1.5 cm wide; flowers <3 cm across, >9 per inflorescence ........... **H. foetidus**

1 Primary leaves of mature (fertile) plants basal (the stem with reduced, bracteal leaves subtending the inflorescence); leaf segments >3 cm wide; flowers >4 cm across, (1-) 3 (-5) per inflorescence .......................................................................................................................... **H. viridis**

**Helleborus foetidus** Linnaeus, Stinking Hellebore. Cultivated in gardens, seeding down and spreading locally near plantings; native of Europe. December-March. [= K2]

* **Helleborus viridis** Linnaeus, Green Hellebore, Christmas-rose. Mt (VA, WV), Pd (NC): cultivated in gardens, seeding down, rarely escaped or persistent; rare, native of Europe. December-May. [= C, F, FNA, G, K1, K2, S, WV]

12. **Eranthis** Salisbury 1808 (Winter-aconite)

13. **Actaea** Linnaeus 1753 (Baneberry)

**Identification notes**: In rich coves, **Actaea** occurs with and is sometimes mistaken for (especially when in vegetative condition) various other superficially similar genera, including **Astillbe** (Saxifragaceae), **Aruncus** (Rosaceae), **Caulophyllum** (Berberidaceae), **Angelica** and **Ligusticum** (Apiaceae), **Aralia** (Araliaceae), and others. The curious evolutionary convergence of leaf morphology (to a 2-3-ternately compound form) of a large number of unrelated genera of Appalachian cove forests is interesting.

1 Plant with leaves only present.

2 Terminal leaflet deeply cordate, mostly > 12 cm wide, with 7-9 major veins arising palmately from the base; principal leaves with 3-9 (-17) leaflets; [section **Oligocarpae**] .......................................................................................................................................................................................................................................................... **A. rubrifolia**
2 Terminal leaflet broadly cuneate, rounded, truncate, or subcordate, mostly < 12 cm wide, with 3 major veins arising from the base; principal leaves with (15-) 20-70 leaflets.
3 Petiole of basal leaves with a deep, broad groove (ca. 1 mm wide and 1 mm deep), persistent on fully expanded leaves; roots with vascular tissue in lunate bundles arranged in a circle; flowering July-September; [section Podocarpae] > A. podocarpa
3 Petiole of basal leaves terete, not grooved (or with a shallow, narrow groove early, obscure or absent on fully expanded leaves); roots with vascular tissue in a central (3-) 4 (-5)-armed cross or star; flowering April-August; [section Actaea] > A. pachypoda, A. racemosa, or A. rubra

1 Plant in flower or fruit.
4 Carpels 3-8, on a short stipe elongating to 5-8 mm long; flowering July-September; roots with vascular tissue in lunate bundles arranged in a circle; [section Podocarpae] > A. podocarpa
4 Carpels 1 (-3), sessile; flowering April-October; roots with vascular tissue in a central (3-) 4 (-5)-armed cross or star.

**Actaea racemosa** Linnaeus, Common Black-cohosh, Early Black-cohosh. Rich cove forests, other mesic and moderately to very fertile forests. May-August. Primarily Appalachian: w. MA south to SC and c. GA, but extending e. into the Coastal Plain and west to OH, IN, and MO. Var. *dissecta* appears to be a sporadically occurring form, apparently always occurring in small numbers associated with typic material; McCoy (2004) reports its collection in NC. [= Cimicifuga racemosa (Linnaeus) Nuttall – RAB, C, F, FNA, S, W; < C. racemosa var. cordifolia (Pursh) Gray – F, misapplied in part; > C. racemosa var. racemosa – F; < C. racemosa – G (also see *C. rubifolia*); > Actaea racemosa Linnaeus var. racemosa – K, Z; > Actaea racemosa Linnaeus var. dissecta (A. Gray) J. Compton – K, Z]

**Actaea rubifolia** (Keamey) Kartesz, Appalachian Black-cohosh. Rich cove forests over calcareous rocks (limestone or dolostone). August-October. Sw. VA south to e. TN; disjunct in s. IL, w. KY, and nw. TN. This species is alleged by C (1991) to occur in NC, but is probably an error, based on confusion with *Cimicifuga cordifolia* Pursh, now considered a form of *Actaea racemosa*. For this reason, the name *Actaea cordifolia* used by Compton, Culham, & Jury (1998) does not apply to this taxon. *Actaea rubifolia* is related to *Actaea elata* (Nuttall) Prantl of nw. North America. [= K; = Cimicifuga rubifolia Kerney – C, FNA, S, W; < C. racemosa var. cordifolia (Pursh) A. Gray – F, misapplied in part; > C. racemosa – G; = Actaea racemosa A. de Candolle – Z, misapplied]

14. **Caltha** Linnaeus 1753 (Marsh Marigold, Cowslip)

**Caltha palustris** Linnaeus var. *palustris*, Marsh Marigold, Cowslip. Bogs, wet meadows, seepage swamps, brookbanks. April-June. *Caltha palustris* is circumboreal, widespread in n. Eurasia and n. North America, south in e. North America to e. VA, w. NC, ne. TN, WV, IN, IL, IA, and NE. *Caltha palustris* is polymorphic; one or more additional varieties (some of them sometimes recognized as separate species) are more northern. Eastern North American material is apparently uniformly 2n=32 (Keener 1977). [= G, GW, K; < C. palustris – RAB, C, F, FNA, S, W; C. palustris var. *flabellifolia* (Pursh) Torrey & A. Gray]

15. **Anemone** Linnaeus 1753 (Anemone)

A genus of about 140-200 species (depending on circumscription), perennial herbs (rarely shrubs), of Eurasia, North America, Central America, South America, and Africa. Hoot, Reznicek, & Palmer (1994) discuss the phylogeny of *Anemone*, and also...

1 Basal leaves lobed but not fully divided into 3 or more leaflets; [subgenus Anemodium].
2 Leaves lobed, and also toothed and variously cleft; leaves not variegated; [section Anemodium] A. canadensis
3 Leaves 3-7 lobed, the lobes acute, the primary sinuses deep, over halfway to the petiole (the middle lobe 70-90% of the total length of the leaf blade); involucral bracts acute .......................................................... A. acutiloba
4 Leaves lobed, the lobes broadly rounded, the primary sinuses less deep, about halfway to the petiole (the middle lobe 50-70% of the total length of the leaf blade); involucral bracts obtuse .......................................................... A. americana

1 Basal leaves compound, fully divided into 3 or more leaflets.
4 Stem branched, 4-11 dm tall, bearing 2 or more flowers; involucral bracts petiolate; [subgenus Anemone; section Anemone; group Multifida].
5 Base of involucral bracts usually truncate to subtruncate, sometimes reniform or cordate, terminal leaflets deep green, margins proximally concave- to straight-sided, distally incised, thinly pubescent; anthers typically < 0.8-1.2 (-1.5) mm long; heads of achenes more or less ovoid-cylindric, 8-10 (-11) mm in diameter .......................................................... A. virginiana var. alba
5 Base of involucral bracts cordate or reniform, rarely subtruncate, terminal leaflets light green, margins proximally mostly straight- to convex-sided, variously lobed or serrate, variously pubescent; anthers typically > (0.9-) 1.1-1.5 (-1.7) mm long; heads of achenes ovoid to ovoid-cylindric, (9-) 10-12 (-14) mm in diameter .......................................................... A. virginiana var. virginiana
4 Stem unbranched, 0.5-4 dm tall, bearing 1 flower.
6 Sepals (5-) 8-20, cream-white, violet, blue, pink, or green; involucre leaves sessile; [subgenus Anemone; section Anemone; group Coronaria].
7 Stem densely pubescent and below the involucr; involucr below the midpoint of the stem at anthesis; plant from a globose, vertically oriented bulb; involucral leaflets linear, (1.5-) 3-6 cm long, 1-4 (-6) mm wide; achene bodies > 2.7-3.5 mm long .......................................................... A. berlandieri
8 Ovaries and achenes with hairs 0.1-0.2 mm long; terminal leaflet broadest at or below the middle (lanceolate or ovate), serrate to below the middle; sepals 15 mm or more long ...................................................................................... A. lancifolia
7 Stem densely pubescent above the involucr, glabrous to very sparsely pubescent beneath the involucr; involucr at or below the midpoint of the stem at anthesis; plant with horizontal rhizomes; involucral leaflets oblanceolate, 1.5-2.5 mm long, [width]; achene bodies < 1.5-2.5 (-3.0) mm long .......................................................... A. caroliniana
6 Sepals 5 (-8), white; involucral leaves petiolate, the leaflets ovate, obovate, elliptic, lanceolate, or oblanceolate 2-8 cm long, 8-30 mm wide; [subgenus Anemonantha, section Anemonantha, series Quinquefoliae].
9 Achene bodies 2.5-3.0 mm long; lateral leaflets of radical leaves toothed only (rarely lobed); terminal leaflet usually broadest at the middle; styles 0.5-1.1 mm long; sepals about 8 mm long .......................................................... A. minima
3 Leaves 3-lobed, the lobes broadly rounded, the primary sinuses less deep, about halfway to the petiole (the middle lobe 70-90% of the total length of the leaf blade); involucral bracts acute .......................................................... A. acutiloba
2 Leaves lobed, the margins of the lobes entire; leaves often prominently variegated; [section Hepatica].
3 Leaves 3-7 lobed; the primary sinuses deep, over halfway to the petiole (the middle lobe 70-90% of the total length of the leaf blade); involucral bracts acute .......................................................... A. acutiloba

**Anemone americana** (A.P. de Candolle) H. Hara, Round-lobed Hepatica, Round-lobed Liverleaf. Moist forests. February-May. NS, s. QC, s. ON, and MB south to Panhandle FL, AL, MS, and AR. The two taxa of "Hepatica" seem entirely distinct in our area; they are described as hybridizing freely or merging indistinguishably in other parts of their ranges. They are also both closely related to the European *H. nobilis* P. Miller. Steyermark & Steyermark (1960) chose to treat the three entities as varieties of *H. nobilis*; I prefer to retain them at the specific level. [= FNA; WH; < A. americana var. lobata (A.P. de Candolle) Ker-Gawler – RAB, C, F, G, W, WV; = Hepatica nobilis P. Miller var. obtusa (Pursh) Steyermark – K, Z; < Hepatica americana (Linnaeus) Karsten – S]

**Anemone berlandieri** Przelz, Eastern Prairie Anemone, Ten-petal Anemone. Thin, circumanual soils around rock outcrops, calcareous hammocks (in FL). March-April. *A. berlandieri* and *A. caroliniana* have been much confused in florals; see Joseph & Heimbürger (1966) for clarification. *A. berlandieri* is primarily a species of midwestern prairies, occurring from n. AR and s. KS south through OK to c. LA and s. TX; disjunct eastwards in AL, c. GA, n. FL, e. NC, e. SC, and sc. VA. It reaches its northeastern limit (and only VA occurrence) at calcareous mudstone cliffs on the Banister River in Pittsylvania County, VA; it is scattered in the Piedmont of NC on a variety of rock types, including mafic meta-argillite and plagiodiasic-rich granite. [= FNA, K, WH; < A. caroliniana Walter – RAB, C, F, G, S, W; ? A. heterophylla Nuttall ex Torrey & Gray; < A. decapetala Arndt, misapplied (a South American species)]

* Anemone blanda Schott & Kotschy, Greek Anemone. Reported by Harvill et al. (1992) from Madison County, VA and for Fauquier County, VA by Shetler & Orii [ ]. It is not known whether this species is established in our area. [make sure this is not a misidentified specimen of *A. berlandieri* – see FNA p. 140] [= FNA, K] [not yet keyed; not mapped; rejected]

**Anemone canadensis** Linnaeus, Canada Anemone. Moist forests. May-August. QC west to AB, south to MD, w. VA, s. WV, e. TN (Chester, Wofford, & Kral 1997), KY, MO, and NM. [= C, F, FNA, G, K, W]

**Anemone caroliniana** Walter, Prairie Anemone, Carolina Anemone. Clayey soils of post oak and blackjack oak woodlands (fredell soils), wet meadows. Ranging primarily in the Midwest, north in the Southeast to disjunct locations in e. and sc. GA, c. SC, c. TN (Chester, Wofford, & Kral 1997), and sc. NC. [= FNA, K; < A. caroliniana Walter – RAB, C, F, G, S, W (also see A. berlandieri)]

**Anemone lancifolia** Pursh, Lanceleaf Anemone. Rich, moist soils on slopes or in bottomlands. March-May. Appalachian: s. PA south to GA (?), in and near the Appalachians. It is a somewhat larger plant than the closely related *A. quinquefolia.* [= RAB, C, F, FNA, G, K, S, W; = A. quinquefolia var. lancifolia (Pursh) Fosberg]

**Anemone quinquefolia** (Linnaeus) Karsten – S
Anemone minima A.P. de Candolle, Tiny Anemone. Acidic forests, especially under Alnus serrulata along small streams.

Anemone virginiana Linnaeus var. virginiana. Tall Anemone, Thimbleweed. Rich forests and woodlands, especially prevalent on circumneutral soils. May-July. NL (Newfoundland), ME, s. ON, and SK, south to GA, AL, MS, LA, OK, and WY.

Two other varieties are more northern; see discussion of var. virginiana. Pringle in FNA (1997); Moreno & Essig in FNA (1997); Essig (1990); Keener (1975); Keener (1967); Pringle (1971)=Z; Tamura in Kubitzki, Rohwer, & Bittrich (1993).

Identificatiopn notes:

Additional species of Clematis, of Asian or European origin, are cultivated as ornamentals and might be encountered.

16. Clematis Linnaeus 1753 (Clematis, Virgin's-bower)

Identification notes:

Additional species of Clematis, of Asian or European origin, are cultivated as ornamentals and might be encountered.

1. Flowers numerous, in compound cymose-paniculate inflorescences; sepals white; filaments glabrous; [subgenus Clematis].
2. Flowers perfect, with 5-10 carpels; anthers 1.5-3 mm long; leaf margins entire (rarely cleft); leaflets 3-5 (7); [alien, in disturbed areas].
3. Flowers mostly polygamo-dioecious, the pistillate with 18-60 carpels; anthers 0.5-1 mm long; leaf margins coarsely toothed; leaflets 3-5 (-7); [alien, in disturbed areas].
4. Flowers mostly perfect, with 5-10 carpels; anthers 1.5-3 mm long; leaf margins entire (rarely cleft); leaflets 3-5 (-7); [alien, in disturbed areas].
5. Leaves 3-foliolate; pistillate flowers with 40-60 carpels ............................................................................................................ C. addisonii
6. Flowers perfect, with 5-10 carpels; anthers 1.5-3 mm long; leaf margins coarsely toothed; leaflets 3-5 (-7); [alien, in disturbed areas].
7. Leaves 3-foliolate; pistillate flowers with 40-60 carpels ............................................................................................................ C. virginiana
8. Leaves 3-foliolate; pistillate flowers with 40-60 carpels ............................................................................................................ C. virginiana
9. Stems and leaves usually densely sericeous-woolly; sepal backs moderately sericeous-pilosose; mature styles yellowish-white to deep tawny, loosely spreading-recurved; [of various woodlands, fairly widespread in our area].
10. Stems and leaves usually densely sericeous-woolly; sepal backs moderately sericeous-pilosose; mature styles yellowish-white to deep tawny, loosely spreading-recurved; [of various woodlands, fairly widespread in our area].
11. Sepal tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of w. VA and WV].
12. Sepal tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of w. VA and WV].
13. Sepal tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of w. VA and WV].
14. Sepal tips obtuse to acute; achene bodies pilose throughout; [of shale barrens of w. VA and WV].
12 Lower surface of leaves glaucous and glabrous (rarely with a few scattered hairs).
13 Plant an erect or ascending herb; lower leaves simple, upper leaves simple to 2-6-foliolate; [of dry limestone glades, endemic to VA] .................................................................................................................................C. addisonii
14 Leaf blade thin in texture; secondary and tertiary veins not prominently reticulate; [in the Ridge and Valley and eastern TN and westward] .................................................................................................................................C. versicolor
12 Lower surface of leaves not glaucous, pubescent (rarely nearly glabrous).
15 Plants erect, to 2-3 (-5) dm tall, forming clonal patches by underground rhizomes; leaflets linear-lanceolate, averaging ca. 10+ as long as wide .................................................................................................................................C. sociatis
16 Leaves coriaceous, the secondary and tertiary veins forming prominent reticulations on the upper surface.
17 Leaf blade coarsely reticulate-veined, the ultimate closed areoles often > 2 mm long in the longer dimension, the tertiary and quaternary veins not prominently raised; achene beak sparsely pubescent to silky, with ascending or appressed hairs...........
.................................................................................................................................C. pitcheri var. pitcheri
17 Leaf blade finely reticulate-veined, the ultimate closed areoles mostly < 2 mm long in the longest dimension, the tertiary and quaternary veins often prominently raised; achene beak plumose, with spreading hairs .................................................................................................................................C. reticulata
16 Leaves membranous, the secondary and tertiary veins forming faint, indistinct reticulations on the upper surface.
18 Sepals 2.5-5 cm long, the tips widely spreading, the upper margins thick, to 6 mm wide; peduncles usually without bracts .................................................................................................................................C. crispa
18 Sepals 1.5-3 cm long, the tips either abruptly and shortly recurved (C. viorna) or spreading to short-reflexed (C. morefieldii), the upper margins not thin or crisped, to 2.5 mm wide; peduncles usually with bracts.
19 Stems with cobwebby pubescence; bracts near the base of the peduncle; sepals densely silky-pubescent on the outer surface, pinkish-green; [limestone habitats of n. AL and se. TN] .................................................................................................................................C. morefieldii
19 Stems glabrous to sparsely pilose; bracts well above the base of the peduncle; sepals sparsely pubescent on the outer surface, pale lavender to purple; [widespread in our area] .................................................................................................................................C. viorna

Clematis albicoma Wherry, White-haired Leatherflower. Shale barrens. May-June. Endemic to w. VA (Alleghany, Augusta, Bath, Botetourt, Highland, and Rockbridge counties), and e. WV. [= C, FNA, G, K, W; = Clematis albicoma var. albicoma – F; = Coriflora albicoma (Wherry) W.A. Weber]

Clematis baldwinii Torrey & A. Gray, Pine-hyacinth, Flatwood Clematis. Wet pine flatwoods. April-August. Ne. FL south to s. FL. [= FNA, GW, WH; > Clematis baldwinii var. baldwinii – K2; > Clematis baldwinii var. laitiuscula R.W. Long – K2; = Viorna baldwinii (Torrey & A. Gray) Small – S; = Coriflora baldwinii (Torrey & A. Gray) W.A. Weber] [not yet keyed]

Clematis catesbyana Pursh, Coastal Virgin's-bower, Satin-curls. Dunes and interdune swales with abundant shell hash, calcareous woodlands and thickets, calcareous hammocks. July-September. Se. VA south to c. peninsular FL and west to LA, and inland especially in calcareous parts of c. TN and n. AR and s. MO, as well as in the Ridge and Valley of VA and disjunct at Linville Caverns, McDowell County, NC, where on dolomite in a geologic window in the Blue Ridge. [= C, FNA, GW, K, WH; < Clematis ligusticifolia Nuttall – RAB, misapplied; > Clematis catesbyana – S; > Clematis micrantha Small – S]

Clematis coactilis (Fernald) Keener, Virginia White-haired Leatherflower. Shale barrens, shaly woodlands, dry calcareous barrens and woodlands. May-June. Endemic to w. VA (Botetourt, Craig, Giles, Montgomery, Pulaski, Roanoke, and Wythe counties). [= C, FNA, K, W; = Clematis albicoma Wherry var. coactilis Fernald – F; = Coriflora species I]

Clematis crispa Linnaeus, Marsh Clematis, Southern Leatherflower, Blue Jasmine. Marshes, swamps, floodplain forests, disturbed wet or moist areas. April-August. Widespread in Southeastern United States, FL to TX, north to se. VA and s. IL. [= RAB, C, F, FNA, G, GW, K, W, WH; = Viorna crispa (Linnaeus) Small – S; = Coriflora crispa (Linnaeus) W.A. Weber]

Clematis fremontii S. Watson. Calcareous flatwoods. e. MO, s. MO, nc. KS and sc. NE; disjunct in the Ridge and Valley of nw. GA (Floyd County) and se. TN (Hamilton County). See Anonymous (2003) and Horn & Shaw (2007) for additional information. [= FNA, K; = Coriflora fremontii (S. Watson) W.A. Weber]

Clematis glaucophylla Small, White-leaved Leatherflower. Wet hammocks, habitat in our area poorly known, also probably in dry woodlands or openings over calcareous rocks, according to RAB in "rich woods". May-September. Widespread in Southeastern United States, from se. TN and OK, south to FL Panhandle and LA, but apparently rare and poorly known. Previous attributions of this species for NC, SC, KY, and (perhaps) VA appear to be based on misidentifications. [= RAB, C, F, FNA, G, GW, K, WH; = Viorna glaucophylla (Small) Small – S; = Coriflora glaucophylla (Small) W.A. Weber]

Clematis morefieldii Kral, Morefield's Leatherflower. Limestone habitats. Endemic to nc. AL and se. TN. See Estes & Fleming (2006) for additional information. [= FNA, K; = Coriflora morefieldii (Kral) W.A. Weber]
**Clematis occidentalis** (Hornemann) A.P. de Candolle var. **occidentalis**, Purple Clematis, Mountain Clematis. Rocky slopes over mafic rocks (greenstone, amphibolite), known positively in NC only from amphibolite peaks in Ashe County. May-June. Var. **occidentalis** is widespread in NE North America, from NB west to w. ON, south to NJ, DE, OH, nw. IL, and ne. IA, and in the mountains to w. VA and w. NC. Two other varieties occur in the Rocky Mountains. Fernald's var. **cacuminis**, published under C. **verticillaris**, described plants from the mountains of VA and NC; it is apparently merely a form based on material in early flower (Pringle 1971). [= FNA, K; < Clematis **verticillaris** A.P. de Candolle – RAB, G; < Clematis **occidentalis** – C, W; > Clematis **verticillaris** var. **verticillaris** – F; > Clematis **verticillaris** A.P. de Candolle var. **cacuminis** Fernald – F; < Atragene americana Sims – S]

**Clematis ochroleuca** Aiton, Curlyheads. Dry woodlands and woodland borders, generally over mafic or calcareous rocks, such as diabase, gabbro, or calcareous siltstone. April-June. Primarily Piedmont: C. MD south to ec. GA; disjunct on Long Island, NY. [= RAB, C, F, FNA, G, K, W; = Viorna **ochroleuca** (Aiton) Small – S; = Coriflora **ochroleuca** (Aiton) W.A. Weber]

**Clematis pitcheri** Torrey & A. Gray var. **pitcheri**, Bellflower Leatherflower. Limestone glades and barrens. April-October. IN, IL, IA, and e. NE south to w. KY, c. TN, ne. MS, AR, TX, and NM. [= FNA, K; < Viorna **pitcheri** (Torrey & A. Gray) Britton – S]

**Clematis reticulata** Walter. Dry, sandy woodlands, such as longleaf pine sandhills and dry hammocks. May-August. Se. SC south to c. peninsular FL, west to TX, and north in the interior to TN and AR. [= RAB, FNA, K, WH; = Viorna **reticulata** (Walter) Small – S; = Coriflora **reticulata** (Walter) W.A. Weber]

**Clematis versicolor** Small ex Rydberg, Pale Leatherflower. Calcareous barrens. June-August. Sc. KY, c. TN, nc. AL; Ozarks and Ouachitas of s. MO, n. and c. AR, and e. OK south into e. TX. [= FNA, K; = Viorna **versicolor** (Small ex Rydberg) Small – S; = Coriflora **versicolor** (Small ex Rydberg) W.A. Weber]

**Clematis viorna** Linnaeus, Northern Leatherflower, Vase-vine. Mesic forests, woodlands, thickets, especially over mafic rocks. May-September. PA, IL, and MO south to GA, AL, MS, and AR. [= RAB, C, F, FNA, G, K, W; > Viorna **viorna** (Linnaeus) Small – S; > Viorna **beadlei** Small – S; > Viorna **flaceda** (Small) Small – S; > Viorna **gattingeri** (Small) Small – S; > Coriflora **viorna** (Linnaeus) W.A. Weber; > Coriflora **beadlei** (Small) W.A. Weber]

**Clematis virginiana** Linnaeus, Virgin's-bower. Moist forests, thickets, and openings. July-September. Nova Scotia, ON and MB, south to c. peninsular FL and TX. Vegetatively, this species can be distinguished from C. **viorna** and C. **crispa** (the other common and widespread species in our area) by its leaves with three relatively symmetrical leaflets (vs. leaves with 3-many irregular leaflets). [= RAB, C, FNA, GW, K, S, WH; ? C. **virginiana** var. **virginiana** – G]

* **Clematis vitalba** Linnaeus, Traveler's Joy. Disturbed areas, persistent after cultivation; native of e. Asia. Reported for Baltimore County, MD (Kartesz 2010). [= FNA, K2] [not yet keyed]

**Clematis viticallis** Steele, Millboro Leatherflower. Shale barrens and shaly woodlands. May-June. Endemic to w. VA (Augusta, Bath, and Rockbridge counties). [= C, F, FNA, G, K, W; = Coriflora **viticallis** (Steele) W.A. Weber]

* **Clematis viticella** Linnaeus, Italian Clematis. Disturbed areas, persistent after cultivation; native of Europe. Reported for TN (Pringle in FNA 1997). [= FNA, K; Viticella **viticella** (Linnaeus) Small] [not yet keyed]
17. *Trautvetteria* Fischer & C.A. Meyer 1835 (Tassel-rue) [contributed by Aaron J. Floden and Alan S. Weakley]

1 Basal leaves deeply (over halfway to nearly all the way to the petiole) 5-9-lobed, the lobes oblanceolate, membranous (to fairly stiff when growing in an exposed setting), each lobe further divided into 2-4 lobules, the margin irregularly serrate, the venation not highly reticulate; cauline leaves 3-7-lobed; [rather widespread in our area]........................................................................................................... *T. caroliniensis*

1 Basal leaves shallowly (less than halfway to the petiole) 3 (-5)-lobed, thickly chartaceous and stiff, lobes round/deltoid, outer lobes usually shallowly 1-lobed, margin regularly crenate/dentate, venation highly reticulate; cauline leaves unlobed to shallowly 3-5-lobed, lobes deltoid; [endemic to Ridge and Valley of TN]............................................................................................................................................ *T. species 1*

*Trautvetteria caroliniensis* (Walter) Vail, Tassel-rue, False Bugbane. Streambanks, seepages, grassy balds, moist forests, swamp forests, very rarely in calcareous longleaf pine savanna ecotones. Late May-July. Sw. PA and KY to GA, AL, and Panhandle FL, primarily in the Southern and Central Appalachians, disjunct on calcareous sites in AR (Sundell et al. 1999), e. TX (Floden 2011), IN, IL, and MO. The discovery of this species in the edge of a calcareous savanna (Camp Branch Savanna, Brunswick County, NC) in the outer Coastal Plain was surprising; the small population has since apparently been destroyed by intensive silvicultural practices. *T. nervata* Greene, named from the Coastal Plain of s. GA, needs additional evaluation (Floden 2011); the type specimen is striking in its deeply and multiply divided leaf segments. [= G, S, Z; < *T. caroliniensis* – RAB, F, FNA, GW, W, WV; = *T. caroliniensis* var. caroliniensis – C, K; > *T. nervata* Greene

**Trautvetteria species 1.** Dolomitic fens. Endemic (so far as known) to Claiborne County, ne. TN.

18. *Ficaria* Schaeffer 1760 (Lesser Celandine)

1 Leaves up to 8 cm long and 9 cm wide; petals up to 28 cm long; petals 17-26 mm long, 4-15 (-18) mm wide; achenes 3-5 mm long, 2-3.5 mm wide.

2 Stem rather robust, but straggling; bulbils present in leaf axils after flowering; petals 4-12 mm wide ....................... *Ficaria verna* ssp. chrysocephala

3 Leaves crowded at base with few on short stems; petiole to 10 cm long; petals 2.5-6 mm wide ....................... *Ficaria verna* ssp. *ficariiformis*

1 Leaves up to 4 cm long and 4 cm wide; petioles up to 15 cm long; petals 6-20 mm long, 2-9 mm wide; achenes 2.5-3.5 mm long, 1.7-2.2 mm wide.

3 Leaves less crowded at base and more numerous on the elongating stem; petiole to 15 cm long (at least some on a plant > 10 cm long), petals 2-9 mm wide.

4 Bulbils not present in leaf axils after flowering; achenes well-developed; petals 4-9 mm wide ....................... *Ficaria verna* ssp. *fertilis*

4 Bulbils present in leaf axils after flowering; achenes poorly developed (rarely fertile, and then only several per flower); petals 2-5 mm wide ........................................................................................................... *Ficaria verna* ssp. *verna*

Ficaria verna

19. Myosurus
Linnaeus 1753 (Mousetail)

Myosurus minimus
Linnaeus, Mousetail. Usually in disturbed areas, such as fields in floodplains. March-May. The species is circumboreal and also found in various places in the Southern Hemisphere. Widely distributed in North America, Eurasia, and the Southern Hemisphere. A number of subspecies have been described; if these are recognized, our material is the typic ssp. minimus. The pre-Columbian occurrence of Myosurus in our area is uncertain; it may well be an alien, early introduced from sc. North America. = RAB, C, F, FNA, G, GW, K, S; > M. minimus ssp. minimus – Z

20. Ranunculus
Linnaeus 1753 (Buttercup, Crowfoot, Spearwort)

A genus of about 600 species, perennial and annual herbs, nearly cosmopolitan (most diverse in temperate and boreal regions of the Northern Hemisphere). The subgenera are distinctive and have often been recognized at the generic level; two are represented in our area (after removal of Ficaria as a separate genus). Distributions given in many works (including Harvill et al. 1992) for the R. hispidus complex are apparently garbled by differences in taxonomic concepts. I am here following Duncan's (1980) taxonomic entities, though recognizing some of his varieties as species. References: Whittemore in FNA (1997); Duncan (1980)=Z; Keener (1976)=Y; Keener & Hoot (1987)=X; Paun et al. (2005); Tamura in Kubitzki, Rohwer, & Bittrich (1993). Keys adapted, in part, from C, GW, X, Y, and Z. [also see Ficaria]

Identification notes: Mature or relatively mature achenes are necessary for the identification of some species. Shape and pubescence of the receptacle is also a frequently used taxonomic character, best judged by stripping off the achenes.

1 Petals dull, white; achenes roughly transverse-ridged; plants aquatic, the leaves finely dissected to merely shallowly lobed; [native or introduced, occurring in various habitats]; [subgenus Batrachium]. [Section Flammula] ................................................................. Key A
2 Cauline leaves (at least most them) lobed, divided, or compound; [native or introduced, occurring in various habitats]; [subgenus Ranunculus].
3 Basal leaves not divided, mostly cordate, reniform, or ovate (and merely toothed), distinctly unlike the deeply divided cauline leaves; achenes long, 1-1.5 mm long, without pronounced basal ridges; petals 1.5-2.5 mm long; [native, occurring in mesic to dry woods and woods, and also (especially R. abortivus) weedy]; [Section Epirotes] ................................................................. Key B
3 Basal leaves mostly deeply parted or compound, the ca uline leaves generally similar but smaller and often less divided; achenes various, 1.5-4.5 mm long, with or without pronounced basal ridges; petals 2-15 mm long; [native or introduced, occurring in various habitats].
4 Achenes markedly spiny, papillose, or tuberculate (the protuberances few and small in R. sardous, keyed both here and below); [introduced, usually weedy and in disturbed habitats]; [Section Echinella]. ................................................................. Key D
4 Achenes smooth (rarely pubescent or papillose); [native or introduced, occurring in various habitats].
5 Achenes long, 1.5-2 mm long, the marginal ridges scarcely or not at all evident, the achenes corky-thickened at their bases for dispersal by floating; [of mucky marshes or ditches, or aquatic in pools]; [Section Hectania] ................................................................. Key E
5 Achenes moderately long, 1-2.5 mm long, with a pronounced (at 10° or more) marginal rim appearing as a differentiated border or flange, more-or-less flattened, and separated from the central bulge of the achene by a concavity or even a groove, the achenes not corky-thickened at their bases; [of mostly terrestrial or in bottomland forests]; [Section Ranunculaceae]. ................................................................. Key F

Key A – subgenus Batrachium (White Water Crowfoots)

1 Leaves floating, shallowly lobed; receptacles glabrous................................................................................................. R. hederaceus
2 Leaves submersed (or stranded by falling water levels), dissected into filiform segments; receptacles hispid.

Key B – subgenus Ranunculus, section Flammula (simple-leaved buttercups) (Spearworts)

1 Petals 1-3 (-5), 1-2 mm long, about as long as the sepals; annual............................................................................................. R. pusillus
1. Flowers sessile, opposite the petioles; sepals 3; petals 3 ................................................................. R. ambigens

2. Cauline leaves 6-14 cm long; sepals 4-7 mm long; achene beak 1.0-1.3 mm long
   R. recurvatus var. recurvatus

   2. Cauline leaves 1-6.5 cm long; sepals 1.5-4 mm long; achene beak 0.1-0.6 mm long.

   3. Cauline leaves linear, < 1 mm wide; achenes 1.2-1.6 mm long .................................................. R. flammula var. reptans

   3. Cauline leaves ovate to lanceolate, 4-24 mm wide; achenes 0.8-1.0 mm long .............................. R. lasticiulis

**Key C – subgenus Ranunculus, section Epirotes**

1. Achene beaks (0.6-) 0.7-1.0 mm long; petals ≤ ½ as long as the sepals; sepals hirsute ........................................... R. allegheniensis

1. Achene beaks 0.1-0.3 mm long; petals > ½ as long as the sepals; sepals glabrous to sparsely long-villous.

2. Petals 4-8 mm long, longer than the sepals .......................................................... R. harveyii

2. Petals 1.5-3.5 mm long, slightly shorter than the sepals.

3. Leaves and stems glabrous or nearly so (or the upper stem puberulent); basal leaves 1-6 (-10) cm wide, reniform to cordate at the base; roots usually all fibrous.............................................................. R. abortivus

3. Leaves and stems villous, at least toward the base; basal leaves 1-2.5 cm wide, truncate to cuneate (rarely cordate) at the base; roots sometimes in part fusiform-thickened........................................ R. micranthus

**Key D – subgenus Ranunculus, section Echinella**

1. Flowers pedunculate, axillary; sepals usually 5; petals usually 5.

2. Petals 1-2 (-3) mm long; receptacles glabrous .............................................................. R. parviflorus

2. Petals (3-) 4-12 mm long; receptacles pubescent.

3. Achenes bodies 1.5-3 mm long, 30-60 per head; achene beak ca. 0.5 mm long; achene with conical protuberances or short spines, to 0.16 mm long; achene beak 0.1-0.5 mm long.

   4. Achenes with a few conical protuberances; petals 5-12 mm long; plant sparsely to densely hirsute; achenes 30-40 per head ................. R. sardous

   4. Achenes with numerous short spines; petals (3-) 4-5 mm long; plant with a few, widely scattered, long hairs; achenes 40-60 per head...

   5. Achenes 3-5 mm long, 4-20 per head; achene beak 1.5-3.0 mm long; achene conspicuously spiny, the longer spines mostly 0.36-0.85 mm long.

   5. Achenes 4-9 per head, in a single whorl; achene margins spiny, as also the faces; beak of the achene 2.5-3 mm long................. R. arvensis

   5. Achenes 10-20 per head, in several whorls; achene margins smooth, the spines restricted to the faces; beak of the achene 1.5-2.5 mm long.................................................. R. micranthus

**Key E – subgenus Ranunculus, section Hecatonia**

1. Petals 6-14 mm long; achene body 1.3-2.5 mm long, the beak 0.7-1.5 mm long; plants with submersed leaves dissected into numerous linear segments; [aquatic]..................................................... R. flabellaris

1. Petals 2-4 (-5) mm long; achene body 0.8-1.2 mm long, the beak 0.0-0.1 mm long; plants without distinctive, dissected submersed leaves; [terrestrial or semi-aquatic].............................................. R. sceleratus var. sceleratus

**Key F – subgenus Ranunculus, section Ranunculus**

1. Petals 2-6 mm long, about as long as the sepals.

2. Basal leaves simple; achene beak strongly hooked ................................................................. R. recurvatus var. recurvatus

2. Basal leaves 3-foliolate; achene beak straight or nearly so.

3. Petals 4-6 mm long, 3.5-5 mm wide; achene beak 1.0-1.2 mm long; [WV northwards] .................................................. R. macounii

3. Petals 2-4 mm long, 1.2-5 mm wide; achene beak 0.6-0.8 mm long; [widespread] ......................... R. pensilvanicus

1. Petals 5-15 mm long, (1.3-) 1.5× or more as long as the sepals; achene beak straight, flexuous, slightly curved, or hooked, 0.2-3.0 mm long.

   4. Achene beaks recurved or hooked, the stigmatic surface elongate, along the upper (curved) side of the style (beak) (visible at 10×); [introduced, usually weedy in disturbed habitats] ......................................................... R. repens

   5. Stems erect, not rooting at the nodes

   6. Petals 5-8 mm long; plant a soft-based annual; achene face usually with at least a few conical protuberances (if examined carefully at 10× or more) ........................................ R. sardous [of section Echinella]

   6. Petals 8-16 mm long; plant a cormose or hard-based perennial; achene face truly smooth.

   7. Sepals spreading; stems not cormose-thickened at the base; larger leaves appearing (3-) 5-parted, all of the segments sessile; plant to 12 dm tall .............................................................. R. acris

   7. Sepals tightly reflexed; stems cormose-thickened at the base; larger leaves pinnately 3-5-parted, the terminal segment long-stalked; plant to 6 dm tall .................................................................................................................. R. bulbosus

   4. Achene beaks straight or slightly curved, flexuous, the stigmatic surface limited to the tip of the style (beak); [native, normally in more-or-less natural habitats].

8. Larger leaves mostly pinnately 3-7-foliolate, the terminal leaflet larger than the lateral leaflets, the leaflets (especially the terminal) often further cleft or lobed, the blade usually longer than wide in outline, the segments often rather narrow; naked receptacle conical, tapering gradually to the apex (the region of staminal attachment as thick as the region of gynoecial attachment, which tapers through all or nearly all of its length, best seen by stripping off the achenes); rhizome regenerating totally each growing season, producing both fibrous and (at the end of the growing season) tuberous roots (1.3-4.9 mm in diameter); [rare in our area, in calcareous, mafic, or ultramafic sites with prairie affinities] .......................................................................................... R. fascicularis
8 Larger leaves mostly palmately 3-foliolate, the terminal leaflet about the same size as the lateral leaflets, the leaflets sometimes further cleft or lobed, the blade usually as wide as long or wider; naked receptacle clavate or ellipsoid (the region of staminal attachment distinctly narrower than the region of gynoecial attachment, thus forming a waist, from which the gynoecial region expands and then tapers to the apex); rhizome regenerated partially each growing season, producing uniform, fibrous roots (up to 3.0 mm in diameter); leaves usually simple and ovate, or trifoliate with ovate leaflets; [collectively widespread in our area].

9 Achenes wide-margined (wider portions of the margin 1/4 to 2/3 as wide as the achene body); plants colonial, sending out stolons (by the time of fruiting) which root at the nodes, forming new plants; sepal reflexed at full anthesis.................*R. carolinianus*

9 Achenes narrow-margined (wider portions of the margin 1/8 or less as wide as the achene body); plants usually erect or repent by the time of fruiting (if repent sometimes forming adventitious roots at the nodes, but not generally developing new plants); sepals spreading at full anthesis (sometimes reflexed later).

10 Plants repent; aerial shoots 50-80 (-91) cm long at time of fruiting; [generally of swamps and marshes] .................*R. caricitorum*

Plants erect; aerial shoots 14-45 (-60) cm long at time of fruiting; [generally of upland habitats]......................*R. hispidus*

*Ranunculus abortivus* Linnaeus, Kidneyleaf Buttercup. Low fields, disturbed areas, bottomlands, lawns, roadsides. (February-) March-June. NL. (Labrador) to AK, south to FL, TX, and CO. A common weed in shady and sunny places. [= RAB, FNA, GW, K, S, W, WV, Y; > *R. abortivus* var. *abortivus* – C, F, G; > *R. abortivus* var. *indivisus* Fernald – F]

*Ranunculus caricitorum* Greene, Northern Swamp Buttercup, Marsh Buttercup. Swampy forests and marshes. April-August. NB west to s. MB, south to NJ, n. VA, s. OH, and s. MO; reports of this species further south are probably in error. This species is octoploid (n = 32); the remainder of the *R. hispidus* complex is tetraploid. [= *R. hispidus* Michaux var. *caricitorum* (Greene) T. Duncan – C, FNA, K, Z; = *R. septentrioinalis* Poiret – GW, W, Y, misapplied; > *R. septentrioinalis* var. *caricitorum* (Greene) Fernald – F, G; > *R. septentrioinalis* var. *pterocarpus* Linnaeus Benson – G; > *R. septentrioinalis* var. *septentrioinalis* – F, G]

*Ranunculus carolinianus* A.P. de Candolle, Carolina Buttercup. Swamp forests, wet woodlands, open marshy wetlands. April-August. NY west to s. ON, WI, and MN, south to n. peninsular FL, LA, and e. TX. This species is tetraploid (n = 16). [= RAB, F, G, GW, W, WV, Y; = *R. hispidus* Michaux var. *nitidus* (Chapman) T. Duncan – C, FNA, K, Z; > *R. palustis* Elliott – S; > *R. septentrioinalis* – S]

*Ranunculus fascicularis* Muhlenberg ex Bigelow, Thick-root Buttercup, Early Buttercup. Wet flats with prairie affinities (with *Camassia scilloides*), rocky barrens and glades over mafic rocks (such as gabbro or diabase), ultramafic outcrop barrens (over olivine), limestone barrens. March-June. MA and NY west to s. ON, MN, and se. MB, south to c. NC, ne. SC, sw. GA, and e. TX; occurrences which are both south of New England and east of the Appalachians are scattered and disjunct. This species is tetraploid (n = 16). [= C, FNA, GW, K, S, W, Y, Y; > *R. fascicularis* var. *fascicularis* – F, G]

*Ranunculus flabellaris* Rafinesque, Yellow Water Crow-foot. Pools in floodplains of small stream swamps, other stagnant or slowly moving waters. March-May. ME west to BC, south to ne. NC, KY, IN, IL, LA, OK, UT, and CA. [= RAB, C, F, FNA, G, GW, K, Y; = *R. delphinifolius* Torrey ex Eaton – S]

*Ranunculus harveyi* (A. Gray) Britton. Forests and perennial. IN, IL, MO, and OK south to TN, AL, and LA. [= C, F, G; = *R. harveyi* var. *harveyi* – FNA, K; < *R. harveyi* – C, F, G]
**Ranunculus hederaceus** Linnaeus, Ivy-leaved Water Crowfoot. Longstalked Crowfoot. Coastal brackish marshes, other circumneutral marshes. April-June. Se. PA south to SC on the Coastal Plain; disjunct in NL (Newfoundland); also in Europe. Perhaps questionable whether native in North America. [= RAB, C, F, FNA, G, GW, K, Y]

**Ranunculus hispidus** Michaux, Hispid Buttercup, Hairy Buttercup. Rich moist forests, creekbanks, mesic to dry woodlands and forests, bottomlands. March-June. MA and VT west to s. ON, s. IL, and se. KS, south to e. and c. NC, s. GA, s. AL, AR, and ne. OK. This species is tetraploid (n = 16). [= RAB, GW, S, W, Y; = R. hispidus var. hispidus – C, FNA, K, Z; > R. hispidus var. hispidus – F, G, WV; > R. hispidus var. falsus Fernald – F; > R. hispidus var. marilandicus (Poiret) L. Benson – G; > R. hispidus var. eurylobus L. Benson – F, G, WV]

**Ranunculus laxicaulis** (Torrey & A. Gray) Darby, Coastal Plain Spearwort. Marshes. April-June. DE south to sw. GA, west to TX, inland in the eastern to s. ON, s. IL, and c. KS, south to e. and c. NC, s. IN, s. IL, MO, and KS, almost entirely on the southeastern Coastal Plain. **R. subcordatus** E.O. Beal, allegedly endemic to NC, is conspecific with **R. laxicaulis**. [= RAB, F, FNA, G, K, W; ? R. texensis Engelmann – C; > R. laxicaulis – GW, Y; > R. subcordatus E.O. Beal – GW, Y; > R. oblongifolius Elliott – S, misapplied]

**Ranunculus macounii** Britton. Bogs, marshes. June. NL (Newfoundland) west to AK, south to MI, IA, TX, NM, AZ; disjunct in WV. [= C, F, FNA, G, K, WV]

* **Ranunculus muricatus** Linnaeus. Ditches and marshes; native of Europe. April-June. [= RAB, FNA, GW, K, S, X, Y]

**Ranunculus pensylvanicus** Linnaeus f., Bristly Buttercup. Wet meadows, floodplains. NL (Newfoundland) west to AK, south to s. PA (Rhoads & Klein 1993), DE, DC, MD (Whittemore in FNA 1997), WV, OH, n. IN, n. IL, MN, and AZ; also in ne. Asia. [= C, F, FNA, G, K, WV]

* **Ranunculus platensis** Sprengel. Lawns, ditches; native of South America. [= FNA, GW, K, X, Y]

**Ranunculus pusillus** Poiret, Low Spearwort. Marshes, ditches, other wet habitats. April-June. S. NY south to c. peninsular FL, west to TX, north in the interior to OH, IN, and MO. [= RAB, C, F, FNA, G, GW, S, W, WV, Y; > R. pusillus var. pusillus – K]

**Ranunculus recurvatus** Poiret var. recurvatus, Hooked Buttercup, Hooked Crowfoot. Bottomland forests, cove forests, swamps, mesic slope forests. April-June. ME and QC west to MN, south to sw. GA, MS, and OK. Var. tropicus (Grisebach) Fawcett & Rendle occurs in Puerto Rico {and elsewhere?}. [= FNA, K; < R. recurvatus – RAB, C, F, GW, S, W, Y; > R. recurvatus var. recurvatus – F, WV; > R. recurvatus var. adpressipilis Weatherby – F, WV]

**Ranunculus sceleratus** Linnaeus var. sceleratus, Cursed Buttercup, Celery-leaf Crowfoot. Marshes, ditches, and stream margins. June-September. The species is circumboreal, ranging south in North America (partly introduced, at least southward) to n. FL, LA, TX, and CA. Var. sceleratus is widespread and the only variety in e. North America; var. multifidus occurs in w. North America. The epithet is often misspelled "scleratus." [= C, F, FNA, G, K; < R. sceleratus – RAB, GW, S, W, Y]
Ranunculus trichophyllus Chaix var. trichophyllus, White Water Crowfoot. Submerged in water of acidic streams. *R. trichophyllus* is circumboreal, ranging south in North America to NJ, VA, nc. TN, PA, MN, SD, NM, AZ, and CA. Var. *trichophyllus* ranges south to the southern limit of the species. This taxon was reported as far south as NC by G and S; the documentation is unknown and the species was not treated by RAB. The more northern var. *calvescens* W. Drew, with the receptacle glabrous or with a few scattered hairs (vs. hirsute with tufted hairs), ranges south to PA and MI. [= C, F, K; < *R. aquatilis* Linnaeus var. *diffusa* Withering – FNA; < *R. trichophyllus* – WV, Y; ? *R. aquatilis* Linnaeus var. *capillaceus* (Thuill.) A.P. de Candolle – G; ? Batrachium *flaccidum* (Persoon) Ruprecht – S]

*Ranunculus trilobus* Desfontaines. Fields, roadsides, ditches; native of sw. Europe. [= FNA, K, X, Y]

116. NELUMBONACEAE Dumortier 1829 (Lotus-lily Family) [in PROTEALES]

*Nelumbo* Adanson 1763 (Lotus-lily, Lotus, Sacred-lotus, Sacred-bean)

**Identification notes:** *Nelumbo* can be immediately distinguished in vegetative condition from the other “pads” (*Nymphaea*, *Nuphar*, and *Nymphoides*) by its peltate leaves, and from the peltate *Brasenia* by the much larger size and roundness of the leaves.

1 Petals yellow; mature fruits (“nuts”) usually < 1.25× as long as wide ........................................................................................................... *N. lutea*

1 Petals pink or white; mature fruits (“nuts”) usually > 1.5× as long as wide ........................................................................................................... *N. nucifera*

*Nelumbo lutea* Willdenow, Yonkapin, American Lotus-lily, Yellow Lotus, Yockernut, Water-chinquapin, Pond-nuts. Ponds, natural lakes. June-September. NY and s. ON west to MN and IA, south to s. FL and e. TX, and south into the West Indies and Mexico. [= RAB, C, F, FNA, G, GW, K, S, W, WV; *N. pentapetala* (Walter) Fernald]

117. PLATANACEAE Dumortier 1829 (Plane-tree Family) [in PROTEALES]

*Platanus* Linnaeus 1753 (Plane-tree, Sycamore)

**Identification notes:** The exposed white inner bark on the middle and upper trunks make *Platanus* recognizable at long distances, especially in winter.

*Platanus occidentalis* Linnaeus, Sycamore, Plane-tree. Riverbanks and alluvial forests, streambanks, sometimes weedy on rocky roadcuts. April-May; September-November. S. ME west to s. ON, MI, and MN, south to w. FL and TX. One of the largest trees in e. North America, and probably the largest that is widespread in the Piedmont of our area. *P. palmeri* Kuntze, sometimes treated as *P. occidentalis* var. *palmeri* (Kuntze) Nixon & Poole ex Geerinck but better interpreted as a species (Grimm & Denk 2010), occurs from central TX south into Coahuila. [= Y; = *P. occidentalis* var. *occidentalis* – Z; < *P. occidentalis* – RAB, C, FNA, G, GW, K, S, W, WV; > *P. occidentalis* var. *occidentalis* – F; > *P. occidentalis* var. *glabrata* (Fernald) Sargent – F]
121. BUXACEAE Dumortier 1822 (Boxwood Family) [in BUXALES]

A family of 5 genera and about 100 species, mainly shrubs, mainly of the Northern Hemisphere. References: von Balthazar, Endress, & Qiu (2000); Channell & Wood (1987); Köhler in Kubitzki, Bayer, & Stevens (2007).

1 Plant a woody shrub; leaves opposite, < 1 cm wide .................................................................................................................. Buxus

1 Plant a suffrutescent herb; leaves alternate, 1.5-7 cm wide .................................................................................................. Pachysandra

Buxus Linnaeus 1753 (Boxwood)

A genus of about 50-90 species, shrubs, of tropical to temperate areas of Europe, Africa, West Indies, Central America, and e. Asia; Köhler in Kubitzki, Bayer, & Stevens (2007).

* Buxus sempervirens Linnaeus, Boxwood. Persistent for decades at abandoned homesites; native of Europe. Popular for hedges and landscaping; also cultivated in the Mountains for wreathing. [= K]

Pachysandra Michaux 1803 (Pachysandra)

A genus of 4-5 species, 1 of e. North America, the others of e. Asia, suffruticose herbs and shrubs. References: Robbins (1968)=Z; Köhler in Kubitzki, Bayer, & Stevens (2007).

1 Leaves subcoriaceous, semi-evergreen, pubescent, mottled with several shades of green (more apparently so at some seasons than others); [native plant of rich forests] .................................................................................................................. P. procumbens

1 Leaves coriaceous, evergreen, glabrous, dark green; [cultivated alien plant, rarely persistent] ................................................. P. terminalis

Pachysandra procumbens Michaux, Mountain Pachysandra, Allegheny-spurge. Moist rich woods. March-April; July-August. C. KY south to w. NC, nw. SC, w. GA, Panhandle FL (Jackson County only), AL, MS, and e. LA (on loess in the Tunica Hills). Its distribution (and, for that matter, that of the genus as a whole) appears to be relictual and to reflect a poor ability to disperse itself and colonize new territory. Channell & Wood (1987) refer to P. procumbens as a "nonaggressive if not 'senile' species with a very low evolutionary potential." The only locations for this species in NC are in Polk County, NC, which has other notable disjunctions of species which normally occur west of the Blue Ridge (Veratrum woodii, Smilax lasioneura). [= RAB, C, F, G, K, S, WH, Z]

* Pachysandra terminalis Siebold & Zuccarini, Pachysandra, Japanese-spurge. Persistent after cultivation, and spreading vegetatively to adjacent forests; commonly cultivated, rarely persistent to naturalized, native of China and Japan. This species is a popular ground-cover, difficult to eradicate once well-established. [= RAB, C, F, G, K, Z]

127. ALTINGIACEAE Lindley 1846 (Sweet-gum Family) [in SAXIFRAGALES]

A family of 2 genera and about 12 species, trees, of e. Asia, Indomalaysia, e. North America, Central America, and e. Mediterranean. Various molecular studies show that Liquidambar is better separated from the Hamamelidaceae (Hoot, Magallón, and Crane 1999). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Hoot, Magallón, and Crane (1999).

Liquidambar Linnaeus 1753 (Sweet Gum)

A genus of 4-5 species, trees, north temperate, of e. North America, Central America (Mexico to Nicaragua), e. Asia (s. China, Taiwan, Vietnam), and e. Mediterranean (Turkey, Rhodos, Cyprus). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Li & Donoghue (1999).
**AMARANTHACEAE**

*Liquidambar styraciflua* Linnaeus, Sweet Gum, Red Gum. Swamp forests, floodplains, moist forests, depressional wetlands, old fields, disturbed areas. April-May; August-September. CT west to s. OH, s. IL and OK, south to s. FL, TX, and Guatemala. One of the most spectacular of our trees in the fall; a single tree often has a mixture of green, yellow, orange, dark red, bronze, and purple leaves. The sap was previously gathered as a source of chewing gum. The bark is one of the favorite foods of beavers. Although sometimes thought of as a small and weedy tree, *Liquidambar* reaches its greatest abundance and size in Coastal Plain swamp forests, where it can reach 2 meters in diameter. Along with such species as *Pinus taeda*, *Quercus phellos*, and others, *Liquidambar* is a good example of a primarily bottomland tree which has proven to be an excellent colonizer of disturbed uplands. [= RAB, C, F, FNA, G, GW, K, S, W, WV]

### 128. HAMAMELIDACEAE

R. Brown 1818 (Witch Hazel Family) [in SAXIFRAGALES]

A family of ca. 27 genera and ca. 87 species, trees and shrubs, tropical to temperate, and especially e. Asian. References: Meyer in FNA (1997); Endress in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves 5-7-palmately lobed and palmately veined, glabrous............................ [see *Liquidambar* in ALTINGIACEAE]

1 Leaves unlobed, pinnately veined, stellate-pubescent beneath (at least when young).

2 Petals 0; stamens 12-32; flowers numerous in dense globose or elongate spikes; leaves with a symmetric or asymmetric (oblique) base, the lateral veins marginal for a distance of at least 2-3 mm; [tribe *Fothergilleae*] ...........................................................................................................

2 Petals 4; stamens 4; flowers few in small clusters; leaves with a weakly to strongly asymmetric (oblique) base, the lateral veins included in the blade tissue or barely exposed for a distance of <1 mm; [tribe *Hamamelideae*]...........................................................................................................

---

**Fothergilla** Murray in Linnaeus 1774 (Witch-alder)

**Identification notes:** *Fothergilla major* often occurs with *Hamamelis virginiana*, with which it is easily confused in vegetative condition; a reliable character is the base of the lateral veins (marginal in *Fothergilla*, included in leaf tissue in *Hamamelis*). Most of the cultivated material of *Fothergilla*, including the best known cultivar ‘Mount Airy,’ are *Fothergilla ×intermedia* Ranney & Fantz, a pentaploid hybrid of tetraploid *F. gardenii* and hexaploid *F. major* (Ranney et al. 2007; Darke 2008).

1 Leaves stellate-pubescent above, up to 6 cm long and 5 cm wide (the largest < 5.2 cm wide); stamens 12-24; capsules 6.5-10.5 (-13) mm long, the persistent hypanthium 3.4-5.5 mm long; seeds 4.8-6.3 mm long; [of wet savannas, pocosins, and pocosin margins of the Coastal Plain]

1 Leaves glabrous or sparsely stellate-pubescent above, up to 12 cm long and 10 cm wide (the largest > 5.2 cm wide); stamens (18-)22-32; capsules 8-15.2 mm long, the persistent hypanthium 4-9.2 mm long; seeds 6.2-7.8 mm long; [of rocky habitats of the Mountains and Piedmont] ....................................................................................................................................................................................................

---

**Fothergilla gardenii** Linnaeus, Coastal Witch-alder. Wet savannas, pocosins, and pocosin margins. March-May; September-October. Se. NC (and allegedly se. VA) south to Panhandle FL and s. AL. An ornamental prized for its small size and attractive fall color. [= RAB, F, FNA, GW, K, Z; > *F. gardenii* – S, orthographic variant; > *F. parvifolia* Kearney – S]

**Fothergilla major** (Sims) Loddiges, Large Witch-alder. Dry ridgetop forests of middle elevation ridges in the mountains, especially along the Blue Ridge Escarpment, summits and upper slopes of Piedmont monadnocks, north-facing bluffs in the lower Piedmont. April-May; July-October. C. NC west to ne. TN, south to nc. GA and nc. AL; disjunct in AR. [= RAB, FNA, K, S, W, Z; > *F. monticola* Ashe]

---

**Hamamelis** Linnaeus 1753 (Witch-hazel)

Hamamelidaceae

1. Outer surface of calyx scarlet; petals 7-14 mm long, red or reddish (often yellow-tipped), flowering late December to early February; leaves 12-24 cm long, 5-17 cm wide, densely stellate-pubescent below, usually with 11 lateral veins (6 on one side of the leaf, 5 on the other); [plants of pineland ravines in s. AL and s. MS] Hamamelis virginiana

2. Stellate trichomes of the leaves moderately dense to dense, averaging 0.09 mm across, with 7-11 rays; leaves (3.6-) avg. 6.4 (-10.3) cm long, (1.8-) avg. 4.1 (-6.2) cm wide; petals 7-15 mm long, 0.5-0.8 mm wide; [c. SC south to Panhandle FL, west to se. LA in the Coastal Plain] Hamamelis virginiana var. henryae

3. Stellate trichomes of the leaves sparse to moderately dense, averaging 0.16-0.40 mm across, with 3-6 (-8) rays; leaves (4.7-) avg. 9.9 (-14.0) cm long, (3.9-) avg. 6.6 (-9.2) cm wide; petals 15-20 mm long, 1 mm wide; [widespread in our area] Hamamelis virginiana var. virginiana

Itea Linnaeus 1753 (Virginia-willow, Sweetspire, Tassel-white)

A genus of about 27 species, shrubs, of e. and se. Asia (about 25 species), e. North America (1 species), and sub-Saharan Africa (1 species). References: Kubitzki in Kubitzki, Bayer, & Stevens (2007).

Identification notes: Sometimes confused needlessly with Clethra, whose much more coarsely serrate, ovate leaves contrast with the serrulate, elliptic leaves of Itea. Also often confused with Eubotrys racemosa in vegetative condition.

Itea virginica Linnaeus, Virginia-willow, Sweetspire, Tassel-white. Moist forests and thickets, especially along the banks of small streams. May-June. S. NJ south to s. FL and west to e. TX and OK, north in the interior (especially in the Mississippi Embayment) to s. IL and se. MO. [= RAB, C, F, FNA, K, G, GW, S, W, WH]

Grossulariaceae A.P. de Candolle 1805 (Currant Family) [in SAXIFRAGALES]

A family of one genus, of the northern hemisphere and montane South America (Andes). The familial distinction from the Saxifragaceae is supported by recent molecular data, though the affinities of Grossulariaceae and Saxifragaceae (sensu stricto) are closer than those of many other groups traditionally included in the Saxifragaceae, such as Parnassia, Lepuropetalon, and Pensthorum (Morgan & Soltis 1993). References: Weigend in Kubitzki, Bayer, & Stevens (2007).

Ribes Linnaeus 1753 (Currant, Gooseberry)

A genus of 150-200 species, temperate, of the Northern Hemisphere and montane South America. The genus is separated into distinctive subgenera, these sometimes maintained as full genera (as by S). Of the species treated here, the cinnarcs (subgenus Ribes) include R. americanum, R. aureum var. villosum, R. glandulosum, R. lacustre, R. nigrum, R. rubrum, and R. triste. The gooseberries (subgenus Grossularia) include R. curvatum, R. cynosbati, R. echinellum, R. hirtellum, R. missouriense, R.
**Auxiliary Key to widely distributed native Ribes of the Mountains**

1 Leaves usually 5-10 cm long and wide, serrate or doubly serrate with sharp teeth; plants usually without nodal spines; inflorescence a raceme of 4-15 flowers; pedicel jointed below the fruit. .................................................. R. glandulosum

2 Leaves 1-5 cm long and wide, serrate with rounded teeth; plants usually with nodal spines; inflorescence a raceme of 1-4 flowers; pedicel not jointed below the fruit.

3 Ovary with glandular hairs which become stiff spines on the mature fruit; leaf bases cordate to deeply cordate (rarely truncate or cuneate), the angle of leaf tissue mostly 190-230º, moderately to sparsely silvery-pilosely beneath, usually on the surface as well as on the veins and in the vein axils; stamens at full anthesis equaling the petals. .................................................. R. cynosbati

4 Ovary and fruit glabrous; leaf bases rounded or cuneate (rarely truncate or cordate), the angle of leaf tissue mostly 130-170º, glabrescent to sparsely pubescent beneath (mostly on the veins and in the vein axils); stamens at full anthesis exceeding the petals. .................................................. R. rotundifolium

**Ribes americanum** P. Miller, American Black Currant. Moist forests, marl marshes. April–June. NS west to AB, south to w. VA, WV, and nc. KY (Clark et al. 2005), ne. TN, IN, NE, and NM. [= C, F, FNA, G, K, W, WV]

**Ribes aureum** Pursh var. villosum A.P. de Candolle, Buffalo Currant. {habitats}. MA, ON, MN, ND, and MT south to MD, TN, AR, TX, and NM; the original eastward extent uncertain because of occasional cultivation and naturalization). It is reported as occurring as a native species as far east as Montgomery County in nc. TN (Chester, Wofford, & Kral 1997). [= FNA, K; = R. odoratum H. Wendland – C, F, G, WV]
**Ribes curvatum** Small, Granite Gooseberry. Rocky upland forests. E. TN, AR, and OK south to GA, AL, LA, and TX. Also reported for NC by Sinnott (1985); the specimens came from cultivated plants in a botanist's garden, so there is no evidence that *R. curvatum* is a native or naturalized component of NC's flora. [= FNA, K; *Grossularia curvata* (Small) Coville & Britton – S]

**Ribes echinellum** (Coville) Rehder, Miccosukee Gooseberry. Mesic, nutrient-rich forests. March–April; June–September. This species has a remarkable range, known only from a small area of McCormick County, SC and the vicinity of Lake Miccosukee, Jefferson County, FL. Godfrey (1988) has a detailed description of *R. echinellum*. Catling, Dumouchel, & Brownell (1998) discuss its pollination biology. [= FNA, K, WH, Z; = *Grossularia echinella* Coville – S]

**Ribes hirtellum** Michaux, Northern Gooseberry. Rocky forests. NL (Newfoundland) west to AB, south to WV (Tucker County), n. NJ, s. PA, OH, IN, IL, IA, and NE. [= C, FNA, K; > *R. hirtellum* var. *hirtellum* – F, G]

**Ribes lacustre** (Persoon) Poiret, Bristly Black Currant, Spiny Swamp Currant. Forests, acid swamps. May–June. NL (Labrador) to AK, south to MA, PA, w. VA, TN (allegedly), n. OH, MI, MN, SD, CO, UT, and CA. Reported for AL (FNA). The alleged documentation for the inclusion of *R. lacustre* in the flora of VA is a sterile specimen at WILLI that is not definitely identifiable (Wieboldt, pers. comm.). [= C, F, FNA, G, K, W, WV]

* Ribes nigrum Linnaeus, Garden Black Currant, Cassis. Disturbed areas; native to Europe. Cultivated in ne. United States, rarely as far south as our area (in MD and NJ according to FNA); it may escape. [= C, F, FNA, G, K]

* Ribes rubrum Linnaeus, Garden Red Currant. Persistent from cultivation and escaped to adjacent fence-rows and disturbed areas; native of Europe. [= FNA, K; > *R. sativum* Syme – C, F, G, WV]

**Ribes triste** Pallas, Swamp Red Currant, Wild Red Currant. Boggy forests, seepage wetlands. May–July. NL (Labrador) west to AK, south to MD, WV (Mineral, Pocahontas, and Randolph counties), OH, MN, SD, MT, ID, and OR. [= C, F, FNA, G, K, WV]

133. SAXIFRAGACEAE A.L. de Jussieu 1789 (Saxifrage Family) [in SAXIFRAGALES]

If narrowly circumscribed (as here), a family of about 35 genera and 500-650 species, herbs (mainly perennial), nearly cosmopolitan, but especially diverse in warm temperate and cold temperate regions of North America and Eurasia. The circumscription of a much narrower Saxifragaceae is clearly warranted, based on a wide variety of data, and recently strongly corroborated by molecular data (Morgan & Soltis 1993). References: Wells & Elvander in FNA (2009); Spongberg (1972); Morgan & Soltis (1993); Soltis in Kubitzki, Bayer, & Stevens (2007). [also see GROSSULARIACEAE, HYDRANGEACEAE, ITEACEAE, PARNASSIACEAE, and PENTHORACEAE]

**Aristolbe** Buchenau-Hamilton ex D. Don 1825 (False Goat's-beard)

**A. biternata** (Rosaceae). **Aristolbe** may be distinguished by the following characteristics: pubescence of the stem and lower leaf surface glandular, plants monoecious, carpels 2 per flower, stamens 10 per flower (vs. *Aruncus*: pubescence nonglandular, plants dioecious, carpels 3-4 per flower, stamens 15-20 per flower).

1 Leaves serrate, the teeth sharp; fruit conic-lanceolate, tapering gradually, 4-5 mm long. .......................... **A. biternata**

**A. crenatiloba** (Britten) Britton, Appalachian False Goat's-beard. Cove forests, seepage slopes. May-June; July-August. VA, sw. WV, and KY south to N. GA. (= C, F, G, K, S, W; < *A. biternata* – RAB, FNA (also see *A. crenatiloba*))

**A. crenatiloba** (Britten) Britton, Appalachian False Goat's-beard. Mountain forests. July?; September. Known only from Roan Mountain, Carter County, TN and very rare or extinct. This species has apparently not been seen since the original collections (11 September 1885) by N.L. Britton and Mrs. Britton (“Tennessee. Base of Roan Mountain. Collected on the slope of Roan Mountain, East Tennessee, along the trail from ‘Cloudland’ to the Roan Mountain station of the E.T. & W.N.C.R.R.”); the habitat, phenoology, and other characteristics of this species are therefore poorly known. The morphologic characters are striking. (= K, S, W; < *A. biternata* – RAB, FNA)
**SAXIFRAGACEAE**

**Boykinia** Nuttall 1834 (Boykinia)

A genus of 7 species, herbs, of e. Asia, e. North America, and w. North America, a classic relictual distribution. The other species are distributed primarily in the Pacific Northwest or Rocky Mountains, with several endemics in Japan and an endemic in the unglaciated portions of AK and e. Siberia. References: Gornall in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007)

**Identification notes:** Sometimes mistaken in vegetative condition for *Trautvetteria*, which is a coarser plant, often occupying similar habitats.

**Chrysosplenium** Linnaeus 1753 (Golden-saxifrage)

**Heuchera** Linnaeus 1753 (Alumroot)

1 Calyx glandular-villous, white or pink, often with green-tipped lobes, 1.3-3.3 mm long, 1.1-2.9 mm in diameter; free hypanthium 0.1-0.4 mm long; petals linear or oblanceolate, 2-3× as long as the calyx lobes, glabrous; plants flowering (June-)July-October.

2 Leaves with widely to narrowly triangular lobes and triangular teeth; petals linear, often coiled; seeds echinate; internodes of floral branches 0.3-2.9 mm long.

3 Leaves deeply and sharply lobed, the terminal lobe wider than long; bracts of the inflorescence oblong to spatulate, at least the lower ones toothed; [of the Alleghenies, Cumberlands, and Interior Low Plateau] .............................................. *H. villosa* var. macrorhiza

4 Petioles and peduncles densely glandular-puberulent, the hairs < 0.6 mm long; leaf blades densely puberulent above and below; [of c. KY westward] .......................................................................................................................... *H. parviflora*

5 Free hypanthium < 2 mm long; calyx weakly zygomorphic; calyx urceolate, subglobose, or campanulate.

6 At the onset of anthesis stamens exserted 0.2-1.5 mm beyond the calyx and styles included or exserted up to 1.1 mm beyond the calyx; calyx subglobose .............................................................................................................................................. *H. caroliniana*

7 Petioles densely hirsute; free hypanthium (1.1-)avg. 1.5 (-1.9) mm long .................................................................................................................. *H. hirsuticaulis*

8 Free hypanthium 0.6-1.5 mm long; petals greenish, white, creamy, or pink, the margins entire or bearing short teeth .................................................. *H. americana* 

9 Stigmas included within the calyx (the calyx lobes extending 1.3-5.3 mm beyond the stigma tips); calyx tubular; calyx lobes and petals inflexed, closing the mouth of the flower ....................................................................................................................................... *H. longijflora*

10 Calyx 2.8-4.5 mm long, subglobose; [of the Piedmont of sc. VA southward to SC] .................................................. *H. caroliniana*

11 Flowers larger, with white, exserted petals; [of high elevations (usually over 1000 m) on strongly acidic substrates, such as quartzitie sandstones, in w. VA and adjacent e. WV] ........................................................................................................... *H. alba*
**Heuchera alba** Rydberg. Quartzitic outcrops at high elevations. July-September. Further study of *H. alba* Rydberg is needed; its recognition as distinct from *H. pubescens* is probably warranted (R. Bartgis, pers. comm.). It apparently differs from *H. pubescens* in its large flowers with white, exserted petals (vs. greenish or purplish-green petals), and occurs at higher elevations (usually over 1000 m) on acidic substrates, such as quartzitic sandstones (vs. at lower elevations on circumneutral or subacidic substrates). [= FNA, K, WV; < *H. pubescens* – C, F, S, W, Z; > *H. pubescens* var. brachyandra Rosendahl, Butters, & Lakela – F, G, Y]

**Heuchera americana** Linnaeus, American Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. April-August. CT and NY west to s. ON, n. IN, s. IL, and sc. MO south to c. GA, c. AL, n. MS, n. LA, and ne. TX. *H. americana* is the most widespread species of *Heuchera* in e. North America. Within the range of *H. caroliniana*, *H. americana* is nearly absent. [= C; > *H. americana* var. americana – F, G, WV; > *H. americana* var. americana – FNA, K, Z; < *H. americana* – RAB, W; > *H. americana* var. heteradenia Fernald – F; > *H. americana* var. subtruncata Fernald – F; > *H. americana* var. brevipetala Rosendahl, Butters, & Lakela – G, Y; > *H. calycosa* Small – S; > *H. curtisi* – S; > *H. lancipetalus* Rydberg – S; > *H. americana* var. typica – Y; > *H. americana* var. calycosa (Small) Rosendahl, Butters, & Lakela – Y]

**Heuchera caroliniana** (Rosendahl, Butters, & Lakela) E.F. Wells, Carolina Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. April-June. Endemic to the Piedmont of sc. VA, NC, and nc. SC; first found in VA (Henry County) by T.F. Wieboldt in 2002 (Belden et al. 2004). [= FNA, K, Z; > *H. americana* Linnaeus var. caroliniana Rosendahl, Butters, & Lakela – Y; < *H. americana* – RAB, S]

**Heuchera hirsuticaulis** (Wheelock) Rydberg. River bluffs (GA), bluffs and outcrops. S. MI west to n. IL and sw. MO, south to c. TN, nw. AR, and ne. OK; disjunct in e. GA (Screven County). Considered by Wells (1984) to represent fertile hybrids between *H. americana* and *H. richardsonii*; here regarded as a stabilized taxon, with numerous occurrences beyond the distribution of one or the other alleged parent. East to w. KY (Medley 1993), w. and c. TN (D. Estes, pers. comm. 2008), and e. GA (Screven County specimens at NCU). [= *H. americana* Linnaeus var. hirsuticaulis (Wheelock) Rosendahl, Butters, & Lakela – FNA, K, Z; > *H. americana* Linnaeus var. hirsuticaulis (Wheelock) Rosendahl, Butters, & Lakela – F, Y; > *H. americana* var. interior Rosendahl, Butters, & Lakela – F, Y] [add to synonymy; C, G, S]

**Heuchera hispida** Pursh, Purple Alumroot. Calcareous rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. April-June. S. PA south through MD, WV, and VA to nw. NC. This species is intermediate between *H. americana* and *H. pubescens*; it is almost certainly of hybrid origin. The treatment of this hybrid derivative of *H. americana* and *H. pubescens* as *H. americana* var. hispida (a variety of one parent) seems undesirable. Since it partly replaces its parents within its range, occurs in populations away from one or both parent, and is not strictly intermediate, it seems best to accord it species status. [= F, G, S, WV, Y; < *H. americana* – RAB, W; > *H. hispida* Pursh – C; > *H. americana* var. hispida (Pursh) E.F. Wells – FNA, K, Z]

**Heuchera longiflora** Rydberg, Long-flowered Alumroot. Rich shaded forests and woodlands over calcareous rocks such as limestone, dolostone, or calcite-cemented shales, siltstones, or sandstones, in circumneutral soils. May-June. This species is nearly limited to sedimentary rocks, occurring in e. and c. KY, s. OH, sw. WV, sw. VA, ne. TN, w. NC, and c. AL (7). In NC, it occurs primarily in the sedimentary window around Hot Springs, and is possibly limited to Madison, Buncombe, and Haywood counties. Wells (1984) calls it "most distinctive", "characterized by a unique combination of floral characters: long, tubular calyx, deeply included styles, inflexed calyx lobes and petals that close the mouth of the flower obliquely, and horizontal orientation of the flowers." [= C, F, FNA, G, K, W, WV, Z; > *H. pubescens* – RAB, misapplied; > *H. longiflora* – S; > *H. aceroides* Rydberg – S; > *H. scabra* Rydberg – S; > *H. longiflora* Rydberg var. aceroides (Rydberg) Rosendahl, Butters, & Lakela – Y; > *H. longiflora* var. typica – Y]

**Heuchera parviflora** Bartling, Cave Alumroot. Shaded cliff bases, usually under overhangs, on grotto floors, behind waterfalls where humidity is high but not in the spray zone, nearly always in deeply shaded situations where little or no direct sunlight falls. July-September. An uncommon species throughout its range (ec. TN, KY, s. WV, sw. VA, w. NC, n. GA, n. AL, s. MO, s. IL, and s. IN). *H. parviflora* is probably most common in the gorge and waterfall country of sw. NC and in the Cumberland Plateau of TN and KY. In deeply shaded sites, it is often the only vascular plant present. The closely related species *H. puberula* Mackenzie & Bush [Heuchera var. puberula (Mackenzie & Bush) E.F. Wells] occurs in s. MO and ne. AR, with scattered disjunct sites as far east as c. KY, c. TN, and s. IN. [= RAB, S, W; > *H. parviflora* var. puberula – C, FNA, K, Z; > *H. parviflora* var. parviflora – F, G; > *H. parviflora* var. rugelii (Shuttleworth) Rosendahl, Butters, & Lakela – F, G, WV, Y; > *H. parviflora* var. typica – Y]

**Heuchera puberula** Mackenzie & Bush. Shaded cliff bases, usually under overhangs, on grotto floors, behind waterfalls where humidity is high but not in the spray zone, nearly always in deeply shaded situations where little or no direct sunlight falls. C. KY (Medley 1993), s. IN, s. IL, and s. MO south to n. AL and c. AR. [= F, G, Y; > *H. parviflora* Bartling var. puberula (Mackenzie & Bush) E.F. Wells – FNA, K, Z]
**SAXIFRAGACEAE**

Heuchera pubescens Pursh, Marbled Alumroot. Rocky forests, rock outcrops, particularly where soils are subacidic or circumneutral. May-July. Primarily a species of the Ridge and Valley Province of PA, MD, WV, and VA. *H. pubescens* ranges south to only a few locations in the southern Piedmont of NC. See discussion under *H. alba*. The report in RAB of the occurrence of *H. pubescens* in Madison County is apparently erroneous; Wells (1984) shows *H. pubescens* reaching its southern limit just south of the VA border, and not occurring at all in KY, TN, or the mountains of NC. She found the bract characters used in the key in RAB to be unreliable. Reported by Hill & Horn (1997) for South Carolina {report needs verification}. [= FNA, K, WV; *< H. pubescens -- C, S, W, Z (also see H. alba); *< H. pubescens var. brachyandra* Rosendahl, Butters, & Lakela – F, G, Y; *> H. pubescens var. pubescens – F; *> H. pubescens var. typica – Y]

*Heuchera sanguinea* Engelmann var. sanguinea, Coral Bells. Cultivated as an ornamental "wildflower," native of w. North America. [= K; *< H. sanguinea – FNA, G; *< H. sanguinea var. typica – Y] {not keyed; not mapped; rejected as a component of the flora}

Heuchera villosa Michaux var. macrorhiza (Small) Rosendahl, Butters, & Lakela, Giant Alumroot. Cliffs, riverbanks. July-October. S. WV, s. OH, and s. IN south through C. KY and C. TN to n. AL and ne. MS. This taxon has usually been disregarded in recent years, but is recognized by Chester et al. (1997). In its purest form, this plant seems to be very distinct from typical *H. villosa*, and actually may be more closely related to *H. arkansana*. The existence of intermediates and intergrades with *H. villosa* var. villosa muddies the taxonomic waters, however, and the overall best treatment seems to be at the varietal level. Some intermediates occur in the primary area, as in w. VA. [= G; *< H. villosa var. villosa – C, FNA, K, Z; *> H. villosa var. macrorhiza – F, WV, Y; *< H. macrorhiza Small – S; *> H. villosa var. intermedia* Rosendahl, Butters, & Lakela – F, WV, Y]

Heuchera villosa Michaux var. villosa, Crag-jangle, Rock Alumroot. In crevices of rock outcrops, or in thin soil over boulders, a characteristic component of the flora of high elevation cliffs and summits (to at least 1920 m), not particular about the rock type, occurring on a wide range of rock types in our area, including felsic gneisses and schists, mafic gneisses, granites, quartzites, and others, probably the most acidophilic of our species of *Heuchera*. Late June-October. W. VA and s. WV south through w. NC and C. TN to nw. SC, n. GA, ne. AL (primarily a Southern Blue Ridge endemic). In the Ozarks of AR it is restricted to dolostones and quartzites, and others, probably the most acidophilic of our species of *Heuchera*. Late June-October. W. VA and s. WV south through w. NC and C. TN to nw. SC, n. GA, ne. AL (primarily a Southern Blue Ridge endemic). In the Ozarks of AR it is restricted to dolostones

Hydatica Necker ex Gray 1821 (Appalachian Saxifrage)

**Hydatica petiolaris** (Rafinesque) Small, Cliff Saxifrage. In crevices in exposed rock outcrops at high elevations, other rock outcrops (moist to rather dry), periglacial boulderfields, rocky seeps. June-August. A Southern Appalachian endemic: nw. VA, WV, and KY south to e. TN, w. NC, sw. SC, and ne. GA. The orange anthers are an attractive contrast to the white petals (the three upper with two yellow spots each). [= S, Y; *< Micranthes petiolaris* (Rafinesque) Bush – FNA, Z; *< Saxifraga michauxii* Britton – RAB, C, F, G, GW, K, W, WV]

**Hydatica species** 1. In seepage on granite. Endemic, so far as is known, to Pickens County, SC. Under study by Patrick McMillan. {not yet keyed; not mapped}

Micranthes Haworth 1812 (Saxifrage)

A genus of about 60-75 species, perennials, mostly of north temperate, boreal, and arctic regions of North America, South America, and Eurasia. As shown by molecular data, *Saxifraga*, as often broadly defined, is polyphyletic, and all of our species either belong in *Micranthes* (Soltis 1995, Soltis et al. 1996, Mort & Soltis 1999), or with further separation into *Micranthes* and *Hydatica*. Soltis et al. (1996) demonstrate that *Micranthes* is closely allied with *Heuchera, Mitella, and Tiarella*, less closely related to *Astilbe, Boykinia, Sullivantia, and Chrysosplenium*, and least closely related to the bulk of *Saxifraga*. References:

1. Larger leaf blades oblanceolate, 4-10× as long as wide.
2. Leaf margin entire to crenate; petals greenish-white, lacking yellowish spots ................................................................. M. pensylvanica
3. Leaf margin coarsely serrate; petals white, either 3 or 5 of them with yellowish spots.
4. Leaves mostly with 4-8 teeth per side; pubescence of the leaves and scapes mostly gland-tipped; corolla radially symmetrical; filaments strongly clavate; [mostly of shaded seepages and brook-banks] .................................................. M. micranthidifolia
5. Pedicels glandular-hairy; petals 3.5-6 mm long; [widespread in our area] ............................................................................. M. virginiensis

M. careyana (A. Gray) Small, Carey Saxifrage. Moist rock outcrops and cliffs, often under overhangs, often in moist soil at the base of a vertical or overhanging rock outcrop. May-June. A Southern Appalachian endemic: e. TN and nw. NC south to sw. NC and se. TN. Lanning (2009) has clarified the taxonomy of the M. careyana / caroliniana complex through molecular and morphological study. [= FNA, S, Z; = Saxifraga careyana A. Gray – RAB, C, F, G, GW, K, W]

M. micranthidifolia (Haworth) Small, Branch-lettuce. Wet soils of seepages, in the beds of high elevation brooks, brookbanks; rocky seepages. May-June. A Southern and Central Appalachian endemic: e. PA and WV, south to e. TN, w. NC, nw. SC, and ne. GA. This plant is gathered in considerable quantities as a spring green in the mountains of our area, and can sometimes be seen for sale in local grocery stores. The common name refers to the plant’s habitat; "branches" are mountain streams. [= FNA, S, Z; = Saxifraga micranthidifolia (Haworth) Steudel – RAB, C, F, G, GW, K, W, WV]

M. pensylvanica (Linnaeus) Haworth, Swamp Saxifrage. Mountain bogs, mucky seeps. April-June. ME west to MN, south to e. VA, c. and w. NC, and MO. [= FNA, S, Z; = Saxifraga pensylvanica Linnaeus – RAB, C, F, K, W, WV; > S. pensylvanica ssp. pensylvanica – G]

M. texana (Buckley) Small, Texas Saxifrage. Granite outcrops. Found in 1980 by Jim Allison on a small granite outcrop in McDuffie County, GA. It is uncertain whether its occurrence in GA represents a natural disjunction or a freak introduction (J. Allison, pers. comm.). [= FNA, S, Z; = Saxifraga texana Buckley – F, G, K]

Mitella Linnaeus 1753 (Mitterwort)

As traditionally circumscribed, a genus of about 20 species, herbs, of cold temperate e. North America, w. North America, and e. Asia. Soltis (2007) and Okuyama, Pellmyr, & Kato (2008) indicate that Mitella as currently circumscribed is polyphyletic and is
likely to be divided; our species will remain in Mitella. References: Soltis & Freeman in FNA (2009); Soltis in Kubitzki, Bayer, & Stevens (2007).

*Mitella diphyllo* Linnaeus, Two-leaved Miterwort. Moist rich forests, especially in the Mountains, and especially rocky. April-June. QC west to MN, south to e. VA, w. NC, nw. SC, ne. GA, nw. GA, and MO. The fringed petals will reward a close look. [=RAB, C, F, FNA, G, GW, K, S, W, WV]

**Sullivantia** Torrey & A. Gray 1842 (Sullivantia)

**Sullivantia sullivantii** (Torrey & A. Gray) Britton, Sullivantia. Moist limestone cliffs. June-August. *S. sullivantii* has a very scattered, relictual distribution, known from w. VA (Russell County), e. KY, ne. TN (Claiborne County), s. OH, IL, sw. WI, ne. IA, se. MN, and MO. [= C, F, FNA, G, K, Z]

**Tiarella** Linnaeus 1787 (Foamflower)

A genus of 3-6 species, perennial herbs, of temperate North America and e. Asia. References: Jog in FNA (2009); Lakela (1937)=Y; Spongberg (1972)=Z; Wherry (1940, 1949)=X; Fernald (1943)=V; Soltis in Kubitzki, Bayer, & Stevens (2007).

**Tiarella cordifolia** Linnaeus. Moist forests, cove forests, rock outcrops. April-June. NS west to ON and WI, south to w. NC, nw. SC, sw. GA, AL, MS, and MO. Several taxa have been recognized (or not) in eastern North American *Tiarella*. The characters used to recognize additional species or varieties are often missing on herbarium sheets and also seem to be imperfectly correlated. *T. wherryi* (or var. *collina*) is alleged to differ from *T. cordifolia* s.s. in lacking stolons (vs. having stolons), capsules 6-10 mm long and round-tipped (vs. 8-12 mm long and subacuminate), and lower fruiting pedicels 6-10 mm long (vs. 7-13 mm long). Whether or not to recognize several taxa within what is here treated as *T. wherryi*, and at what level, has been controversial; see Lakela (1937), Wherry (1940, 1949), Fernald (1943), and Spongberg (1972) for discussion. Further study is needed. [>*T. cordifolia* – F, V, WV, Z; > *T. cordifolia* var. *cordifolia* – RAB, C, G, K; = *T. cordifolia* – FNA, S, W; > *T. macrophylla* Small – S (type a combination of *Heuchera* and *Tiarella*); > *T. cordifolia* var. *typica* – Y; > *T. wherryi* Lakela – F, V, Z; > *T. cordifolia* Linnaeus var. *collina* Wherry – RAB, C, G, K; > *T. cordifolia* var. *collina* – X; > *T. wherryi* – X, Y; > *T. cordifolia* var. *austria* – K, X, Y]

**134. CRASSULACEAE** A.P. de Candolle 1825 (Stonecrop Family) [in SAXIFRAGALES]

A family of about 34-35 genera and 1100-1410 species, succulent shrubs and herbs, nearly cosmopolitan, but with centers of diversity in s. Africa and Mexico. References: Moran in FNA (2009); Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007).

1 Leaves connate at the base, opposite; flowers solitary in the axes of leaves; flowers 3-4-merous; [subfamily *Crassuloideae*] .................. *Crassula*  
1 Leaves distinct, whorled or alternate; flowers in terminal cymose inflorescences; flowers 4-5 (-8)-merous.  
2 Petals connate as a tube; leaves serrate, bearing plantlets in the serrations; [subfamily *Kalanchoideae*] ................................. *Bryophyllum*  
2 Petals distinct or at most basally connate; leaves entire, crenate, or serrate, but not bearing plantlets along the margin; [subfamily *Sempervivioideae*].  
3 Plants with spheroidal basal rosettes consisting of dozens or more spirally arranged leaves; flowers 8-16-merous.............[*Sempervivum*]  
3 Plants with or without basal rosettes (if rosettes present, these not as above); flowers 4-6-merous.  
4 Perennials without rosettes, the stems 0.5-10 dm tall (dying back in winter to the rootstock); leaves large, relatively thin in texture, usually 5-25 times as wide as thick, often crenate; flowers pink, purple, white, or greenish.  
5 Flowers 5-merous, bisexual; flowering stems 2-10 dm tall, from an underground, tuberous base; average leaves 3-11 cm long, 1-5 cm wide; ovaries attenuate at the base; [tribe *Telephieae*] .....................................................................[*Hyptelodeium*]  
5 Flowers 4 (-5)-merous, usually unisexual and then the plants dioecious; flowering stems 0.5-4 dm tall, from axils of brown scale-leaves clothing a stout rootstock at least in part exposed aboveground; average leaves 1-5 cm long, 0.4-1.5 cm wide; ovaries not attenuate at the base; [tribe *Umbiliceae*] .........................................................................................................................[*Rhodiola*]  
4 Perennials or annuals with or without rosettes, the stems < 2 dm tall (the perennials with stems persistent through the winter); leaves smaller, flat or terete, relatively thick, entire; flowers white or yellow; [tribe *Sedeae*].  
6 Carpels united basally (to about 1/3 their length); petals cucullate, initially partly enclosing 4 of the 8 stamens; follicles dehiscing by a tear-shaped valve on the abaxial (lower) surface; stem and leaves normally red; [of granite flatrocks of the Piedmont of NC and SC] .................................................................................................................[*Diamorpha*]  
6 Carpels free; petals flat, never enclosing any of the 8 anthers; follicles dehiscing by a longitudinal slit along the adaxial (upper) suture; stem and leaves normally green, sometimes somewhat pink or reddish; [collectively of various habitats, including granite flatrocks of GA, NC, SC, and VA] .................................[*Sedum*]

**Bryophyllum** Salisbury 1805

Crassula Linnaeus 1753

1 Seeds rugulose; leaves 2-6 mm long, the apex acute; sepals 0.5-1.5 mm long.......................................................... C. aquatica
1 Seeds with sharp-pointed papillae; leaves 1.5-3 mm long, the apex acute; sepals 0.4-0.6 mm long .................................. C. drummondii

Crassula aquatica (Linnaeus) Schönland, Pygmyweed. Tidal marshes and shores, artificial lake. Occurring in tidal marshes and shores, south to MD and se. PA, and also in GA and AL (Kartesz 1999, FNA). [= FNA, K; = Tillaea aquatica Linnaeus – GW; = Tillaeastrum aquaticum (Linnaeus) Britton – S]

* Crassula drummondii (Torrey & A. Gray) Fedde. Waste area around wool-combing mill, perhaps merely a waif; native of sc. United States. [= FNA, K; = Tillaea drummondii Torrey & A. Gray]

Crassula longipes (Rose) Bywater & Wickens. {AL, GA}. {not yet keyed; synonymy incomplete}

Diamorpha Nuttall 1818 (Elf-orpine)

Diamorpha smallii Britton ex Small, Elf-orpine. In very thin soil (generally less than 2 cm deep) of vernally wet depressions on granite flatrocks and other granitic outcrops. April-May; May-June. Primarily limited to granite flatrocks of the Piedmont, ranging from SC to ec. AL, and on sandstone from se. TN south into c. AL. This species is both one of the most typical and one of the most interesting of the dozens of species endemic (or largely so) to granite flatrocks of the southeastern Piedmont. See Wilbur (1988a) for a thorough discussion of the muddled nomenclatural history of this remarkable species, as well as for a detailed summary of systematic and ecological information. [= FNA, GW, K, Z; = Sedum smallii (Britton ex Small) Ahles – RAB, W; = Diamorpha cymosa (Nuttall) Britton ex Small – Y; > Diamorpha cymosa – S; > Diamorpha smallii – S]

Hylotelephium H. Ohba 1977 (Live-for-ever)

1 Petals 2× as long as the sepals; nectaries wider than long; flowers fertile; [native] ................................................................. H. telephioides
1 Petals 2.5-4× as long as the sepals; nectaries longer than wide; flowers sterile (rarely fertile); [introduced].
2 Flowers white or greenish; cymes lax, subcorymbose; leaves not markedly reduced upward from base of plant upward.... H. erythrostictum
2 Flowers deep pink to purple; cymes densely subglobose; leaves typically strongly reduced in size from base of plant upward...........................

Hylotelephium erythrostictum (Miquel) H. Ohba, Garden Orpine, Live-for-ever. Disturbed areas; native of Europe. August-September; September-October. [= FNA, K; = Sedum spectabile Boreau – RAB, misapplied; = Sedum ×erythrostictum – C; ? Sedum alboroseum Baker – F, G, Z]

Hylotelephium telephioides (Michaux) H. Ohba, Allegheny Live-for-ever. Rock outcrops, mostly at high to moderate elevations, ascending to 2000 m. July-September; August-October. Essentially a Central and Southern Appalachian endemic, H.
telephioides ranges from s. PA south to w. NC, with a few outlying populations to the west in s. IL, s. IN, and w. KY. The species is apparently not known from TN. [= FNA, K; = Sedum telephioides Michaux – RAB, C, F, G, W, WV, Z; = Anacampseros telephioides (Michaux) Haworth – S]

* Hylotelephium telephium (Linnaeus) H. Ohba, Live-for-ever. Disturbed areas; native of Europe. September-October; October-November. [= FNA; > Sedum purpureum (Linnaeus) Link – RAB, C, F, WV, Z; > S. telephium – F; > Sedum telephium Linnaeus ssp. purpureum (Link) Schinz & R. Keller – G; > Sedum telephium ssp. fabaria (Koch) Schinz & Keller – G; = Hylotelephium telephium ssp. telephium – K]

**Rhodiola Linnaeus 1753 (Roseroot)**

A genus of about 40-60 species, of cold temperate and boreal areas of the northern hemisphere. Thiede & Eggli (2007) place Rhodiola in a separate tribe from Sedum s.s. References: Moran in FNA (2009); Clausen (1975)=Z; Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007).

**Rhodiola rosea** Linnaeus, Roseroot. High elevation rocky summits. July-August; August-September. Circumboreal, widely distributed in northern Europe, Asia, and North America, south in e. North America to e. PA and thence disjunct to Roan Mountain (Mitchell County, NC) and Grandfather Mountain (Avery County, NC), where nearly (if not completely) extirpated. Dwarfed, high elevation forms of Hylotelephium telephioides, with narrow, nearly toothless leaves, have been confused with Rhodiola rosea; they are perhaps readily distinguished only in flower or fruit. [= FNA, K; = Sedum rosea (Linnaeus) Scopoli – Z; = Sedum rosea (Linnaeus) Scopoli var. rosea – C; < S. rosea var. rosea – F; < S. rosea – RAB, G, W; > Rhodiola roanensis Britton – S; > Sedum rosea (Linnaeus) Scopoli var. roanense (Britton) Berger]

**Sedum Linnaeus 1753 (Stonecrop, Orpine, Sedum)**

A genus of perhaps 200 species, depending on circumscription. There is considerable controversy about the circumscription of the genus Sedum. Diamorpha is usually separated, but Thiede & Eggli (2007) include it in Sedum; the separation of Rhodiola and Hylotelephium have been more controversial, but Thiede & Eggli (2007) place these in separate tribes from Sedum s.s. Other segregates which would affect the species treated below have been proposed, such as Chetyson, Clausenellia, and Spathulata (see synonymy). References: Ohba in FNA (2009); Clausen (1975)=Z; Calie (1981)=Y; Thiede & Eggli in Kubitzki, Bayer, & Stevens (2007). [also see Diamorpha, Hylotelephium, and Rhodiola]

**Identification notes:** Other species of Sedum are grown as ornamentals, especially in rock gardens; some are aggressive and rather weedy and can be expected eventually to become a naturalized part of our flora.

1 Leaves primarily whorled in 3’s or 4’s (to 5’s).
2 Largest leaves distinctly spatulate, much wider than thick, 8-20 mm wide; flowers and fruits 4-merous; petals white; [native, of moist forest and rock outcrops]; [section Ternata] ........................................................................................................................................ S. ternatum
3 Largest leaves linear-lanceolate, oblanceolate, or elliptic, almost as thick as wide, < 7 mm wide; flowers and fruits 5-merous; petals yellow; [alien].
4 Leaves 4 (-5) per whorl; flowering shoots erect ......................................................................................................................... S. mexicanum
5 Leaves 3 (-4) per whorl; flowering shoots pendulous, creeping, or ascending.
6 Flowering shoots pendulous or ascending; leaves linear-lanceolate ............................................................................................ S. lineare
7 Flowering shoots creeping or ascending; leaves oblanceolate to elliptic ...................................................................................... S. sarmentosum

1 Leaves primarily alternate.
4 Flowers and fruits 5-merous; [plants aliens].
5 Leaves 2-5 mm long; petals yellow ................................................................................................................................................. S. acre
6 Leaves 6-15 mm long; petals yellow or white.
7 Petals white; flowers 5-merous ......................................................................................................................................................... S. album
8 Petals yellow; flowers (5-) 7 (-9) merous ................................................................................................................................. S. rupestrere
4 Flowers and fruits 4-merous; [plants natives].
7 Leaves of flower-bearing stems linear, sagittate-spurred at the base (the spurs clasping the stem); petals pink to white; annual; [section Ternata] ................................................................................................................................................. S. pulchellum
7 Leaves of flower-bearing stems narrowly elliptic, oblanceolate, spatulate, cuneate or short-spurred at the base (not clasping); petals white; perennial or annual.
8 Plants annual; sepals 0.4-1 mm long; petals 1.4-4.2 mm long; [restricted to shallow soils of granitic flatrocks of the Piedmont, from s. NC south to w. GA]; [section Tetrovum] ................................................................................................................................................. S. pusillum
8 Plants perennial; sepals 2-9 mm long; petals 4-9 mm long; [of outcrops of various rocks, not as above]; [section Ternata].

9 Leaves of flowering stems with width/thickness ratio of >2.0; seeds averaging 0.8 mm long; leaves pale green or bluish green, sometimes with a glaucous coating; [of MD south through VA and WV to sc. and sw. NC].................................\textit{S. glaucophyllum}

9 Leaves of flowering stems with width/thickness ratio of <1.7; seeds averaging 0.7 mm long; leaves green or gray-green, but not glaucous; [of se. TN south through AL and GA]...............................................................................................................................

* \textit{Sedum album} Linnaeus, White Stonecrop. Disturbed areas; native of Eurasia. Introduced and naturalized as far south as se. PA and WV. [= C, F, G, K, Z; = Oreosedum album (Linnaeus) Grulich]

* \textit{Sedum glaucophyllum} Clausen, Cliff Stonecrop. Rock outcrops, usually basic and/or sedimentary. May-June; June-July. Endemic to the Central and Southern Appalachians (extending into the Piedmont), known from MD, WV, VA, and NC (reports for GA are based on confusion with \textit{S. nevii}). This species is complex, with several ploidies and morphologies represented, some at least showing geographic integrity and perhaps worthy of taxonomic recognition. Material in sw. NC (south of the Asheville Basin) has been identified as polyploid and differs in many ways from more typical \textit{S. glaucophyllum}, in some ways suggesting the similar and closely related \textit{S. nevii} A. Gray (known from nearby TN and AL). Further study is needed of this group. [= C, F, G, K, S, W, WH, WV, Y, Z; < \textit{S. nevii} – RAB, G, S]

* \textit{Sedum lineare} Thunberg. Margin of granitic flatrock; native of e. Asia. Duncan (1985) discusses the establishment of this species in Columbia County, GA. [= FNA, K, Z]

* \textit{Sedum mexicanum} Britton, Mexican Stonecrop. Dry, disturbed areas; native of Mexico or perhaps e. Asia. [= FNA, WH]

* \textit{Sedum nevii} A. Gray, Nevius's Stonecrop. Gneiss rock outcrops on river bluffs. Endemic to se. TN (Polk County, just west of Cherokee County, NC) (Chester, Wofford, & Kral 1997), nc. and ec. AL, and wc. GA (where it occurs on gneiss outcrops along the Chattahoochee River in Muscogee and Harris counties), and reported for s. WV (Greenbrier County) by Harmon, Ford-Wernitz, & Grafton (2006). [= FNA, K, W, Y, Z; < \textit{S. nevii} – S (also see \textit{S. glaucophyllum})]

* \textit{Sedum pulchellum} Michaux, Widow's-cross. Calcareous rock outcrops. E. TN (Monroe, Knox, and Bradley counties) (Chester, Wofford, & Kral 1997) and nw. GA (Jones & Coile 1988) west to KS, OK, and TX. [= C, F, G, K, W, Y, Z; > Chetyson pulchella (Michaux) A. & D. Löve; > Sedum pulchellum – S; > Sedum vigilimontis Small – S; > Chetyson vigilimontis (Small) A. & D. Löve]

* \textit{Sedum pusillum} Michaux, Puck's Orpine. In very thin soil (generally less than of vernally wet depressions on granite flatrocks, often in mats of the moss \textit{Hedwigia ciliata}. March-April; April-May. Endemic to granite flatrocks of the southeastern Piedmont, from sc. NC south to wc. GA. Superficially rather similar to \textit{Diamorpha smallii}, and historically confused with it (see Wilbur 1988 for details). Wyatt (1983) discusses the reproductive biology of this species. [= RAB, FNA, GW, K, S, Z; = Tetrorum pusillum (Michaux) Rose]

* \textit{Sedum rupestre} Linnaeus. Disturbed rock outcrops; native of Europe. Reported for nc. GA (Jones & Coile 1988), as \textit{S. reflexum} Linnaeus. [= FNA; = \textit{S. reflexum} Linnaeus – C, K, misapplied; = Petrosedum reflexum (Linnaeus) Grulich, misapplied]

* \textit{Sedum ternatum} Michaux, Mountain Stonecrop. Moist forests, coves, bottomlands, shaded rock outcrops. April-June; May-July. NJ west to 1A and AR, south to nw. GA and AL. [= RAB, C, F, G, K, S, W, WV, Y, Z; = Clausenellia ternata (Linnaeus) A. & D. Löve]

\textit{Sempervivum} Linnaeus 1753 (Hen-and-chickens, Houseleek)

A genus of 40-100 species, perennials, of Eurasia. References: Lis in FNA (2009).

* \textit{Sempervivum tectorum} Linnaeus, Hen-and-chickens, Houseleek. Disturbed areas, cultivated as a rock garden and potted plant, rarely persistent; native of Europe. \textit{S. tectorum} is reported for VA by Massey (1961) as “escapes from cultivation;” the documentation of this is unknown, but the record has been perpetuated by Kartesz (1999), Lis in FNA (2009), and others. [= FNA, C, F, K]
137. PENTHORACEAE Rydberg ex Britton 1901 (Ditch-stonecrop Family) [in SAXIFRAGALES]

A family of one genus and 2 species, herbs, of e. North America and e. Asia. Penthorum has been variously placed in the Crassulaceae, Saxifragaceae, or in the Penthoraceae. Haskins & Hayden (1987) concluded that Penthorum was best treated in a monogeneric Penthoraceae, a conclusion based on extensive anatomical evidence. Among those who do not favor a monotypic family, there is nearly evenly divided opinion between the Crassulaceae and Saxifragaceae; this in itself perhaps supports segregation in the Penthoraceae. Molecular evidence supports the recognition of the Penthoraceae, and suggests closer affinities with the Haloragaceae than with either the Crassulaceae or the Saxifragaceae (Morgan & Soltis 1993). References: Thiede in Kubitzki, Bayer, & Stevens (2007); Freeman in FNA (2009).

Penthorum Linnaeus 1753 (Ditch-stonecrop, Penthorum)

Penthorum sedoides Linnaeus, Ditch-stonecrop, American Penthorum. Shores, drawdown areas, moist forests, floodplain forests, moist disturbed areas, ditches. June-October. NB west to MB, south to Panhandle FL and TX; introduced from BC south to OR. [= RAB, C, F, FNA, G, GW, K, S, W, WV, Z]

138. HALORAGACEAE R. Brown 1814 (Water-milfoil Family) [in SAXIFRAGALES]

A family of 8-9 genera and about 150 species, aquatic and wetland herbs, but also shrubs and trees, cosmopolitan but centered in the Southern Hemisphere, especially Australia. The family has sometimes spelled "Haloragidaceae." References: Kubitzki in Kubitzki, Bayer, & Stevens (2007).

Identification notes: Stranded plants of M. heterophyllum and M. humile (and perhaps others) produce leaves that are reduced in size. Leaves and bracts become pectinate or pinnate, so that plants resemble M. pinnatum. Such plants are the source of nearly all inland records of M. pinnatum in the VA-NC-SC-GA area. M. heterophyllum usually flowers and fruits when stranded and may be distinguished from M. pinnatum by its much denser disposition of leaves and bracts, and by its dull red fruits obscurely tuberculate (vs. tan or pale brown fruits strongly tuberculate). From stranded M. humile, M. heterophyllum may be distinguished by leaves and bracts which are clearly whorled and much more densely disposed. M. humile differs from M. pinnatum by its wholly alternate leaves and bracts, and by its smooth fruits.

Myriophyllum Linnaeus 1753 (Water-milfoil)

Identification notes: Stranded plants of M. heterophyllum and M. humile (and perhaps others) produce leaves that are reduced in size. Leaves and bracts become pectinate or pinnate, so that plants resemble M. pinnatum. Such plants are the source of nearly all inland records of M. pinnatum in the VA-NC-SC-GA area. M. heterophyllum usually flowers and fruits when stranded and may be distinguished from M. pinnatum by its much denser disposition of leaves and bracts, and by its dull red fruits obscurely tuberculate (vs. tan or pale brown fruits strongly tuberculate). From stranded M. humile, M. heterophyllum may be distinguished by leaves and bracts which are clearly whorled and much more densely disposed. M. humile differs from M. pinnatum by its wholly alternate leaves and bracts, and by its smooth fruits.

1 Leaves reduced to small scales or absent; stems short, erect from substrate; [subgenus Brachytheca; section Tessaronia; subsection Sponylastrum]. .................................................................M. tenellum

2 Leaves well-developed, pinnately divided with filiform segments; stems elongate, suspended in the water column and/or floating.

3 Flowers/fruits absent and emersed shoots with leaves closely similar in size and shape to submersed ones; widespread alien; [subgenus Myriophyllum; section Pectinatum].................................................................M. aquaticum

4 Flowers/fruits present; emersed shoots present or not.

5 Flowers/fruits in axils of leaves.

M. aquaticum
4 Leaves strictly alternate; flowers/fruits on submerged stems (forma capillaceum) or on emerged stems with pinnatifid or pectinate leaves (forma natans); [subgenus Brachytycea; section Tessaronia; subsection Spondastraum] ........................................... M. humile
3 Flowers/fruits in erect spikes emersed from water, flowers/fruits subtended by bracts much smaller than the normally submerged leaves. 5 Uppermost flowers/fruits alternate; leave alternate or whorled or both; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum].
6 Bracts much shorter than floral internodes, varying from pectinate to entire; fruit surface smooth or papillose ................. M. laxum
5 Uppermost flowers/fruits opposite; leaves whorled (technically pseudo-whorled in many of heterophyllum) (note that early season plants of M. pinnatum may have flowers opposite, but at least some leaves will be alternate).
7 Bracts usually > 2× as long as pistillate flowers; stems drying brown, pale brown, or reddish.
8 Bracts throughout inflorescence pinnatifid to papillose; winter buds scattered along stem, clavate, falling by early winter; [of DE and northward]; [subgenus Myriophyllum; section Myriophyllum; subsection Isophyllaceae] ........................................ M. verticillatum
6 Distal bracts subsessile or sessile, proximal bracts pinnatifid to serrate, winter buds developed only at base of stem or on rhizomes, usually persisting; [widespread]; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum] .............. M. heterophyllum
7 Bracts usually < 2× as long as pistillate flowers; stems drying pale tan or whitish]; [subgenus Myriophyllum; section Myriophyllum; subsection Myriophyllum].
9 Midstem leaves with 11 or fewer segments on each side of rachis; leaves rounded at apex; stem diameter more-or-less uniform; stem tips usually green; winter buds produced; [native, of DE and northward] ......................................................... M. sibiricum
9 Midstem leaves with 12 or more segments on each side of rachis; many leaves appear truncate or clipped at apex; stem diameter below inflorescence is up to 2× diameter of lower stem; stem tips usually reddish; no winter buds; [widespread alien]. ........................................ M. spicatum

Alternate key
1 Leaves reduced to small scales or absent; stems short, erect from substrate; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum]........................................... M. tenellum
1 Leaves well-developed, pinnately divided with filiform segments; stems elongate, suspended in the water column and/or floating.
2 Flowers/fruits produced in axils of submerged leaves; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum] ...M. humile
2 Flowers/fruits produced in axils of emerged leaves or on emerged shoots with bracts (reduced bracteal leaves).
3 Emerged shoots with feathery leaves about same size and shape as submerged leaves; flowers/fruits rarely produced; [widespread alien]
[subgenus Myriophyllum; section Pectinatum] ................................................................................................................ M. aquaticum
3 Emerged shoots with bracts subtending flowers/fruits; these bracts much different in shape than submerged leaves. [stranded plants may produce bracts and leaves of similar size and shape, but these not feathery].
4 All flowers/fruits alternate; fruits smooth; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum] ................. M. humile
4 All flowers/fruits opposite or whorled (or the lower opposite and the upper alternate in M. pinnatum).
5 Bracts longer than the internodes; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum].
6 Leaves whorled or pseudo-whorled; fruits with low bumps ...................................................................................................... M. heterophyllum
6 Leaves strictly alternate; fruits strongly tuberculate ........................................................................................................... M. pinnatum
5 Bracts usually shorter than the internodes.
7 All bracts pinnatifid; [subgenus Myriophyllum; section Myriophyllum; subsection Isophyllaceae] ...... M. verticillatum
7 Bracts vary from entire to pectinate.
8 Leaves alternate, pinnatifid, or both; plain green; [of se. VA and southward]; [subgenus Brachytycea; section Tessaronia; subsection Spondastraum] ......................................................... M. laxum
8 All leaves whorled, grayish green; [collectively widespread]; [subgenus Myriophyllum; section Myriophyllum; subsection Myriophyllum].
9 Midstem leaves with 11 or fewer segments on each side of rachis; leaves rounded at apex; stem diameter more-or-less uniform; stem tips usually green; winter buds produced; [native, of DE and northward] ......................................................... M. sibiricum
9 Midstem leaves with 12 or more segments on each side of rachis; many leaves appear truncate or clipped at apex; stem diameter below inflorescence is up to 2× the diameter of the lower stem; stem tips usually reddish; no winter buds; [widespread alien]. ................................................................................................................................. M. spicatum

Myriophyllum heterophyllum Michaux, Southern Water-milfoil. Ditches, slow-moving waters of rivers and streams, pools, ponds. April-July. NY west to ON and MN, south to FL and TX. [= RAB, C, F, G, GW, K, S, WV, X, Y, Z]
Myriophyllum humile (Rafinesque) Morong. Millpools, slow-moving water of streams. NS west to MN, south to DE, MD, VA, and IL. [= C, F, G, K, X, Y, Z]
Myriophyllum laxum Shuttleworth ex Chapman, Loose Water-milfoil. Limesink depression ponds (dolines), spring-runs, rarely also in lakes. June-October. Se. VA south to n. FL, s. AL, and s. MS (Sorrie & Leonard 1999). M. laxum and M. heterophyllum both have reddish submerged stems and present difficulties in identification when in sterile condition. M. laxum has a total of 7-15 (-37) segments per leaf, vs. (15-) 17-31 (-37) segments in M. heterophyllum. Documented for VA by a 1922 specimen from Princess Anne County at GH (Sorrie, pers. comm.). [= RAB, GW, K, X, Y, Y]
**Myriophyllum sibiricum** Komarov, Common Water-milfoil. Quiet circumneutral to alkaline waters. NL (Labrador) west to AK, south to VA, WV, IL, MO, NM, and CA; also in n. Eurasia. [= C, G, K, X, Z; > *M. exalbescens* Fernald – F, Y]

**Myriophyllum tenellum** Bigelow, Leafless Water-milfoil. Natural lakes (Carolina bay lakes), typically growing on the sandy bottoms in water 1-2 meters deep. NL (Newfoundland) west to MN, south to PA and NJ, and disjunct south to a few occurrences in NC; report from Virginia Beach, VA is false. [= C, F, G, K, X, Y, Z]

**Myriophyllum verticillatum** Linnaeus. Quiet waters. A circumboreal species, south in North America to DE, MD, n. WV, IN, NE, TX, and CA. [= C, G, K, X, Y, Z; > *M. verticillatum* var. *pectinatum* Wallroth – F]

**Proserpinaca** Linnaeus 1753 (Mermaid-weed)

1. Bracteal (emersed) leaves serrate; submersed pectinate leaves with 8-14 pairs of divisions 5-30 mm long; fruits 2.3-6.0 mm wide.
2. Fruit (3.5-) 4.0-6.0 mm wide, sharply angled (to somewhat winged), the sides of the capsule concave....................... *P. palustris* var. *palustris*
3. Leaves with a flattened rachis 1-4 mm wide, the 7-12 pairs of divisions 2.0-3.5 mm long; fruits 2.3-3.6 mm wide.................... *P. intermedia*
4. Leaves with a filiform rachis (midrib) 0.2-1.0 mm wide, the 4-9 pairs of divisions 2.0-7.5 mm long; fruits 2.0-2.8 mm wide............ *P. pectinata*

**Proserpinaca intermedia** Mackenzie, Intermediate Mermaid-weed. Wet places. July-September. NS to SC on the Coastal Plain; disjunct in sc. TN. This taxon is intermediate in morphology between *P. palustris* and *P. pectinata*; whether it warrants species status is unclear. If merely a rarely produced first-generation hybrid, it should be treated as a hybrid binomial (*P. ×intermedia*); if it forms independent, self-reproducing populations, it should probably be treated as a species. [= RAB, C, F, G, K, Z; < *P. palustris* – GW]

**Proserpinaca palustris** Linnaeus var. *amblyogona* Fernald. Swamps. Occurs east to KY, TN, and GA. [= C, F, G, K; < *P. palustris* – GW, S] {not yet keyed}

**Proserpinaca palustris** Linnaeus var. *crebra* Fernald & Griscom, Common Mermaid-weed. Wet places. June-October. Throughout e. North America and south to the Caribbean and Central America. [= C, F, G, K, WV, Z; < *P. palustris* – RAB, S, W, WH; < *P. palustris* – GW (also including *P. intermedia*)]

**Proserpinaca palustris** Linnaeus var. *palustris*, Coastal Mermaid-weed. Wet places, swamp forests. June-October. MA (?) to FL and west to LA, on the Coastal Plain. [= C, F, G, K, Z; < *P. palustris* – RAB, S, W, WH; < *P. palustris* – GW (also including *P. intermedia*)]

**Proserpinaca pectinata** Lamarck, Feathery Mermaid-weed. Bogs, savannas, ditches, other wet places. June-October. NS south to s. FL and west to w. LA, mostly on the Coastal Plain, but scattered inland as well, as in c. TN. [= RAB, C, F, G, GW, K, S, WH, Z]

**140. VITACEAE** A.L. de Jussieu 1789 (Grape Family) [in VITALES]

A family of about 14 genera and 750-850 species, vines (rarely small trees or herbs), of tropical, subtropical, and temperate regions of the Old and New Worlds. References: Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).
VITACEAE

1 Branches and leaves distinctly fleshy, the leaves > 1 mm thick when fresh; leaves 3-foliolate

Cissus

1 Branches and leaves herbaceous; leaves simple, 3-, 5-, or many-foliolate.

2 Leaves simple, sometimes shallowly or deeply 3-5 (-7)-lobed.

3 Tendrils not twining, terminating in adhesive disks

Parthenocissus

3 Tendrils twining, lacking adhesive disks.

4 Petals separate at their tips, falling individually; pith continuous through the node

Ampelopsis

4 Petals connate at their tips, falling together; pith interrupted by a diaphragm at each node (except continuous in V. rotundifolia)

Vitis

2 Leaves compound with (3-) 5-numerous leaflets.

5 Leaves bipinnate to tripinnate.

6 Leaflets 2-6 cm long; [common native species of mesic to wet habitats]

Ampelopsis

6 Leaflets 5-12 cm long (at least the larger > 8 cm long); [introduced species, rarely escaped]

[Ampelopsis megalophylla]

5 Leaves 3-5 (-7)-foliolate.

7 Leaves pedately 5-foliolate (the lateral 2 leaflets on either side borne on a common stalk)

Cayratia

7 Leaves palmately 3-5 (-7)-foliolate.

8 Leaflets pinnately lobed; tendrils twining, lacking adhesive tips; berries yellow to orange when ripe

Ampelopsis aconitifolia

8 Leaflets toothed or entire; tendrils not twining, usually terminating in adhesive tips; berries dark blue when ripe

Parthenocissus

Ampelopsis Michaux 1803 (Peppervine)

A genus of about 25 species, woody vines, of temperate and subtropical America and Asia. Perhaps to be split based on molecular phylogenetics, with section Leeceifoliae (A. arborea and A. megalophylla) elevated to a new genus (Soejima & Wen 2006). References: Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

1 Leaves bipinnate to tripinnate, with > 11 leaflets; [native and alien species]; [section Leeceifoliae]

2 Leaflets 2-6 cm long; [common native species of mesic to wet habitats]

Ampelopsis

2 Leaflets 5-12 cm long (at least the larger > 8 cm long); [introduced species, rarely escaped]

[Ampelopsis megalophylla]

1 Leaves simple and palmately veined (grape-like), or palmately 5-foliolate (the leaflets additionally pinnately lobed); [alien species]; [section Ampelopsis].

3 Leaves palmately 5-foliolate, the leaflets additionally pinnately lobed

A. aconitifolia

3 Leaves simple, grape-like, to 12 cm long and 9 cm wide.

4 Leaves 3 (-5) lobed; young twigs pubescent

A. brevipedunculata

4 Leaves not lobed; young twigs glabrous

A. cordata

*Ampelopsis aconitifolia* Bunge. Planted as an ornamental, rarely escaping to suburban woodlands; native of n. China. [= K]

*Ampelopsis arborea* (Linnaeus) Koehne, Peppervine. Swamp forests, marshes, wet thickets, moist to wet maritime forests. June-October. Se. VA (and MD?) south to s. FL, west to TX and n. Mexico, north in the interior to s. IL and sw. WV. [= RAB, C, F, G, GW, K, S, W, WH, WV]

*Ampelopsis cordata* Michaux, Raccoon-grape, False-grape. Moist forests, bottomlands, and thickets, particularly where disturbed. May-July. E. VA south to Panhandle FL, west to TX, north in the interior to s. OH, s. IN, s. IL, MO, and NE; also introduced at scattered sites inland. [= RAB, C, F, G, GW, K, S, W, WH]

*Ampelopsis megalophylla* Diels & Gilg, Bigleaf Peppervine. Planted in the Southeast, and has the potential to naturalize; native of China. Reports of its occurrence as naturalized in MS are based on *Cayratia* (S.W. Leonard, pers. comm., 2006). [not mapped; rejected as a component of our flora]

Cayratia A.L. de Jussieu 1818 (Bushkiller)

A genus of 50-63 species, woody and herbaceous vines, of the Old World tropics and subtropics. References: Krings & Richardson (2006); Wen in Kubitzki, Bayer, & Stevens (2007).

* Cayratia japonica* (Thunberg) Gagnepain, Bushkiller, Sorrel Vine. Disturbed areas, suburban woodlands; native of temperate and subtropical se. Asia. July-August. Reported for NC from several suburban areas, as in Forsyth County (Krings &
Richardson 2006) and Mecklenburg County (J. Matthews, pers. comm., 2007). Also reported as naturalized in AL (Hansen & Goertzen 2006), MS, LA, and TX. [= K]

*Cissus* Linnaeus 1753

A genus of about 350 species, woody vines, herbaceous vines, and rarely shrubs, of tropical and rarely warm temperate areas. References: Wen in Kubitzki, Bayer, & Stevens (2007).

*Cissus trifoliata* (Linnaeus) Linnaeus, Marine-ivy. Coastal hammocks, dunes, disturbed coastal areas, the more northerly occurrences introduced. Se. SC (Jasper County) south through GA, FL, and west along the Gulf Coast to TX, AR, and Mexico. [= K, S, WH; > *C. incisa* (Nuttall) Des Moulins – GW, S]

*Parthenocissus* Planchon 1887 (Virginia-creeper, Woodbine)

1 Leaves 3-lobed to 3-foliolate; [introduced ornamental, rarely escaped] ...........................................................................................
2 Inflorescence with a well-developed (zigzag) central axis, the dichotomous branches very unequal, the inflorescence therefore paniculiform; tendrils many-branched, usually with numerous adhesive disks (though young shoots may not have the disks yet formed); leaves usually dull above; [widespread in our area] ........................................................................................................... *P. quinquefolia*
3 Inflorescence without a well-developed central axis, the dichotomous branches relatively equal, the inflorescence therefore corymbiform, as wide or wider than long, with 2-3 main branches; tendrils few-branched, usually lacking adhesive disks (though sometimes swollen at the tip); leaves usually glossy above; [from e. VA and n. WV northward] ................................................................................................. *P. vitacea*

*Parthenocissus quinquefolia* (Linnaeus) Planchon, Virginia-creeper. Swamp forests, bottomlands, maritime forests and thickets, rock outcrops, mesic forests. May-July; July-August. ME west to IA and NE, south to s. FL and TX. [= RAB, C, F, G, K, W, WH, WV; > *P. quinquefolia* – S; > *P. hirsuta* (Pursh) Graebner – S]

*Parthenocissus tricuspidata* (Siebold & Zuccarini) Planchon, Boston-ivy. Frequently grown for ornament, rarely persisting or escaped; native of Japan and China. [= C, F, G, K]

*Parthenocissus vitacea* (Kerner) A. Hitchcock. Maritime thickets, rich alluvial forests, roadsides, and dumps. QC west to MB, WY, and CA, south to e. VA, n. WV, OH, MO, TX, and AZ. [= C, G, K; = *P. inserta* (Kerner) Fritsch – F, probably misapplied; = *Cissus verticillata* (Linnaeus) Jarvis]

*Vitis* Linnaeus 1753 (Grape)

1 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small and coarsely toothed, never deeply lobed; [subgenus *Muscadinia*].
2 Mature fruits < 10 mm in diameter; infructescences with 12-30 berries; leaf blades 4-8 cm long; [of s. GA southward] ................................................................. *V. rotundifolia* var. *munsoniana*
3 Mature fruits > 12 mm in diameter; infructescences with 2-8 (-12) berries; leaf blades usually > 6 cm long; [widespread in our area]......................... *V. rotundifolia* var. *rotundifolia*
4 Tendrils bifid to trifid; bark shedding, the lenticels inconspicuous; pith interrupted by diaphragms at nodes; leaves relatively large and finely toothed, often deeply lobed; [subgenus *Vitis*]
5 Mature leaves glaucous beneath (the glaucescence sometimes rather obscured by pubescence); nodes often glaucous; [series *Aestivales*].
6 Mature 3-4 seeded berries > 9 mm in diameter; mature leaves slightly to strongly arachnoid-pubescent beneath; nodes usually not glaucous; nodal diaphragms usually > 2 mm in diameter .......................................................................................................................... *V. aestivalis* var. *aestivalis*
4. Mature 3-4 seeded berries < 9 mm in diameter; mature leaves glabrous to glabrate beneath; nodes usually glaucous; nodal diaphragms usually < 2 mm in diameter. 

5. Tendrils or inflorescences present at 3 or more consecutive nodes; leaves densely pubescent beneath; [series Labruscæ] ‒ V. labrusca

6. Leaves reniform, glabrous beneath at maturity; tendrils absent, present only opposite the uppermost nodes, or sometimes extending down the stem; [section Ripariae] ‒ V. riparia

7. Nodal diaphragms < 1 mm wide, usually < 0.5 mm wide; growing shoot tips enveloped by enlarging, unfolded leaves; [section Ripariae] ‒ V. riparia

8. Nodal diaphragms > 2.5 mm wide; leaves strongly 3-lobed, the tips usually long-acuminate; branchlets of the season with a red or purplish cast. 

9. Nodal diaphragms > 2.5 mm wide; leaves unlobed or shallowly lobed, the tips acute to short-acuminate; branchlets of the season gray, brown, or green (sometimes purple only on one side). 

10. Branchlets of the season sparsely to densely hirtellous pubescent, often with arachnoid pubescence as well; leaf undersurfaces usually more-or-less uniformly hirtellous on the veins; [western, east to w. KY, w. TN, sc. AL, and Panhandle FL] ‒ V. cinerea var. floridana

11. Branchlets glabrate to only slightly arachnoid-pubescent; nodes usually not banded with red pigmentation; leaves glabrous to very slightly arachnoid-pubescent beneath; [mostly of the Piedmont and Mountains] ‒ V. cinerea var. baileyana

12. Branchlets slightly to densely arachnoid-pubescent; nodes usually not banded with red pigmentation; leaves slightly to densely arachnoid-pubescent beneath; [mostly of the Coastal Plain] ‒ V. cinerea var. cinerea

Vitis aestivalis Michaux var. aestivalis, Summer Grape. Forests and woodlands, mostly upland. May–June; September–October. MA west to MO and IA, south to s. FL and e. TX. [= RAB, C, F, G, K, WV, Y, Z; = V. aestivalis – S; < V. aestivalis – GW, W, WH; > V. rotundifolia Sm. Small; > V. sinnsonii Munson]

Vitis cinerea (Engelmann in A. Gray) Engelmann ex Millardet var. cinerea, Graybark Grape, Pigeon Grape. Hammocks, most forests. VA (?), w. KY, wc. TN, IN, and WI, south to Panhandle FL (Okaloosa County), sc. AL and TX. [= RAB, C, F, G, K, WH, Z; = V. cinerea var. toxocarpa Le Conte – S, Y; < V. cinerea var. floridana Munson, Florida Grape. Hammocks, floodplain and other moist forests. Late May–June; August–October. Se. VA south to s. FL, west to s. MS. [= RAB, C, F, G, K, WH, Z; = V. simpsonii Munson – S, Y; < V. cinerea – GW, W]

* Vitis labruscana L.H. Bailey [aestivalis × labrusca], Concord Grape. Commonly cultivated as a table grape. It is sometimes persistent after cultivation. [= K; = V. labruscana L.H. Bailey – F] {not keyed; not mapped}
VITACEAE

Vitis rotundifolia Michaux var. munsoniana (Simpson ex Munson) M.O. Moore, Munson Grape, Bullace Grape. Floodplain forests, banks of blackwater rivers. Late April-May; late July-September. SC GA and s. AL south to s. FL. [= K, Y, Z; = Muscadinia munsoniana (Simpson ex Munson) Small – S; < V. rotundifolia – WH; = Vitis munsoniana Simpson ex Munson]

Vitis rotundifolia Michaux var. munsoniana, Muscadine, Scuppernong. Forests, swamps, dunes. May-June; August-October. DE west to s. WV, KY, and MO, south to FL and TX. Cultivars of this species are popular in the Southeastern United States as table grapes and the source of a distinctive wine. [= K, Y, Z; = V. rotundifolia – RAB, C, F, GW, W, WV; = Muscadinia rotundifolia (Michaux) Small – S; < V. rotundifolia]

Vitis rupestris Scheele. Along streams and in riverbank scour areas, especially in calcareous areas. April-June; August-September. MD, WV, sw. PA west to MO, south to VA, c. TN, and n. AR. [= C, F, K, W, S, WV, Z]

* Vitis vinifera Linnaeus, European Wine Grape. Increasingly cultivated in our area, especially in VA and NC, now significant wine-producing areas. [= K] [not keyed]

141. KRAMERIACEAE Dumortier 1829 (Krameria Family) [in ZYGOPHYLLALES]

A family of a single genus and about 15-18 species, herbs, shrubs, and trees, of warm (and usually dry) parts of s. North America, Central America, South America, and the West Indies. References: Robertson (1973); Simpson et al. (2004); Simpson in Kubitzki, Bayer, & Stevens (2007).

Krameria Loefling 1758 (Ratany)

Krameria lanceolata Torrey, Trailing Ratany, Sandspur. Sandhills. AR, TX, and s. KS west to se. CO, se. AZ, Chihuahua, and Coahuila; disjunct eastward in the Coastal Plain of Panhandle FL, peninsular FL, and GA (east to Bulloch, Bryan, Evans, and Emanuel counties, GA). [= K, WH, Z; > K. spathulata Small – S]

142. ZYGOPHYLLACEAE R. Brown 1814 (Creosote-bush Family) [in ZYGOPHYLLALES]

A family of about 22-27 genera and 230-285 species, trees, shrubs, and (rarely) herbs, of tropical and subtropical regions of the Old and New Worlds. References: Sheahan in Kubitzki, Bayer, & Stevens (2007).

1 Fruit with tubercles, at maturity separating into 10 mericarps .............................................................................................................................. Kallstroemia

1 Fruit with spines, at maturity separating into 5 mericarps .............................................................................................................................. Tribulus

Kallstroemia Scopoli 1777

1 Ovary and fruit glabrous (rarely strigose) ................................................................................................................................. K. maxima

1 Ovary and fruit pubescent ................................................................................................................................................................. K. pubescens

Kallstroemia maxima (Linnaeus) Hooker & Arnott, Greater Caltrop. Disturbed areas, dunes; native status uncertain. SC south to FL; West Indies; Mexico (Sinaloa and Tamaulipas) south through Central America to northern South America (Venezuela, Colombia). Early collections from Charleston (Stephen Elliott) and Savannah suggest the likelihood of introduction via ballast. [= RAB, K, S, WH, Z]

* Kallstroemia pubescens (G. Don) Dandy, Caribbean Calktrop. Disturbed areas; native of tropical America. [= WH]
ZYGOPHYLLACEAE

A genus of about 25 species, herbs, of tropical and subtropical parts of the Old World (introduced in the New World).

References: Sheahan in Kubitzki, Bayer, & Stevens (2007).

1 Leaves unifoliolate or trifoliolate, or reduced to phyllodial spines.
   1 Leaves unifoliolate .......................................................... T. cistoides
   1 Leaves trifoliolate. ............................................................. T. terrestris

10 Leaves odd-pinnate; legume 4-15 cm long; seeds brown; [tribe Abracae] ................................................................. Abrus
   10 Leaves even-pinnate; legume 3.5-4 cm long; seeds shiny scarlet and black; [tribe Abrecae] ................................................................. [Abrus]

144. FABACEAE Lindley 1836 or LEGUMINOSAE A.L. de Jussieu 1789 (Legume Family) [in FABALES]

A family of about 730 genera and 20,000 species, trees, shrubs, and herbs, cosmopolitan. References: Isely (1990)=SE (throughout the family treatment); Isely (1998)=I; Lewis et al. (2005); Wojciechowski, Lavin, & Sanderson (2004); Wilbur (1963a); Robertson & Lee (1976).

1 Trees, shrubs, or woody vines ......................................................................................................................................................... Key A
   1 Herbs (including herbaceous vines).
   2 Leaves 4-many-foliolate.
   2 Leaves pinnately compound, with 4 or more leaflets .................................................................................................................. Key B

*Abrus* Adanson 1763 (Precatory Bean)

* Abrus precatorius* Linnaeus, Precatory Bean, Rosary Pea, Crab's Eye, Jequirity. Native of the Paleotropics, and apparently reported for GA, AL, and AR by Isely (1998) and Kartesz (1999), but this is actually based on mislabeling in Map 64 in Isely (1998). The species does occur in peninsular FL, south of our area. The beautiful black-and-red beans have been traditionally used for jewelry and rosaries; they are extremely poisonous, though, and should be used with caution. (= I, K, WH; = *Abrus abrus* (Linnaeus) L.F. Wight – S) {not keyed; not mapped; rejected as a component of our flora}

*Acaciella* Britton & Rose 1928 (Acacia)

*Acaciella hirta* Britton & Rose, Prairie Acacia. Sandhills, disturbed sandy areas. W. LA, AR, and MO west to KS, OK, and TX; disjunct in e. Panhandle FL and n. peninsular FL. (= S; = *Acacia angustissima* (P. Miller) Kuntze var. *hirta* (Nuttall) B.L. Robinson – I, K, SE, WH; = *Acacia hirta* Nuttall)

*Acmispon* Rafinesque 1832 (American Bird’s-foot-trefoil, Prairie-trefoil)

1 Leaflets 3-3.5× as long as wide; plants pubescent, the hairs short; [native of Piedmont of sc. VA, NC, SC, and e. GA] ............................................................... *A. americanum*

1 Leaflets 4-5× as long as wide; plants glabrate, the hairs long; [alien] ............................................................................................. *A. helleri*

*Acmispon helleri* (Britton) A.A. Heller, Carolina Prairie-trefoil. Dry woodlands and openings, originally probably limited to prairie-like sites (fire-maintained, post oak-blackjack oak savannas), generally on clayey soils, now primarily seen on roadbanks, along railroads, and in powerline rights-of-way, where mowing and bush-hogging have replaced fire as the force keeping the habitat open, sunny, and suitable for this plant of prairie affinities. (June-) July-August (-September). *A. helleri* is endemic to the Piedmont of extreme sc. VA, NC, SC, and ne. GA. *A. helleri* is clearly closely related to *A. americanus* (= *Lotus unifoliolatus*, = *Lotus purshianus*, = *Lotus americanus*), of prairies of the midwestern states and various habitats further west, which ranges east to LA, AR, MO, IL, IN, and WI. Isely (1981) reduced *A. helleri* to a variety (in *Lotus*), because it "is but one of many elements within the *L. purshianus* complex and its differences from the rest are less than among the California races," while also stating "since it has no breeding contact with var. *purshianus*, it is reasonably maintained as a species." Since *A. helleri* seems adequately separated from *A. americanus* by its narrower leaflets, glabrate vestiture, and allopatric distribution, I choose to reasonably maintain it as a species. (= S; = *Lotus helleri* Britton – RAB; < *L. americanus* (Nuttall) Bischoff – F; < *L. purshianus* F.E. & E.G. Clements – G; = *L. unifoliolatus* (Hooker) Bentham var. *helleri* (Britton) Kartesz & Gandhi – K; = *L. purshianus* F.E. & E.G. Clements var. *helleri* (Britton) Isely – C, I, SE, Z]

*Aeschynomene* Linnaeus 1753 (Joint-vetch)

1 Prostrate perennial; leaves with 3-18 leaflets [of dry, sandy or disturbed areas].

2 Leaves with 8-18 leaflets; leaflets 3-4 mm long; [rare alien, of disturbed areas] .......................................................... *A. hystrix* var. *incana*

2 Leaves with 3-7 (-9) leaflets; leaflets 4-12 mm long; relatively common native, of dry sandy pinelands] ............................................. *A. viscidula*

1 Erect or ascending annual; leaves with 20-50 or more leaflets; [of moist to wet habitats].

3 Leaflets with 2-4 longitudinal nerves; mature fruit stipe 1.5-3 mm long .......................................................... *A. americana* var. *americanana*

3 Leaflets with 1 longitudinal nerve; mature fruit stipe 4-25 mm long.

4 Mature fruit stipe 12-25 mm long; corolla (10-) 12-15 mm long; fruit segments 5-7 mm long, 4.5-6.5 mm wide; paired bracts subtending each flower toothed (rarely entire); standard greenish-yellow with distinct dark-red veins; leaflets 6-25 mm long, 2-5 mm wide .......................................................... *A. virginica*

4 Mature fruit stipe 4-8 (-10) mm long; corolla 7-13 (-15) mm long; fruit segments 4-6 mm long, 3.5-6 mm wide; paired bracts subtending each flower toothed or entire; standard pale orange or reddish-orange, the veins usually indistinct; leaflets 2.5-25 mm long, 1-4 mm wide.
Aeschynomone americana Linnaeus var. americana, Shyleaf. Moist, disturbed sites. S. GA (Jones & Coile 1988, SE), s. AL, s. LA south to Central America; West Indies; se. Asia. \[= I, SE, Y; < A. americana – K, SE, WH\]

* Aeschynomone rudis Bentham, Frisolillo. Roadside ditches, rice fields, disturbed wetlands; native of South America. July-October. Native to South America, introduced in se. United States, recently becoming a weed. \[= I, K, SE, WH, Y, Z; < Ae. virginica – S\]

Aeschynomone virginica (Linnaeus) Britton, Sterns, & Poggenburg, Northern Joint-vetch, Sensitive Joint-vetch. Fresh to brackish tidal marshes and adjacent ditches, fields, and disturbed areas. July-October. NJ to ne. NC. Generally not weedy in most of its range, but in NC (now) found mostly in weedy situations, such as ditches or fields hydrologically connected to tidal waters. See Tyndall, Holt, & Lam (1996) and Belden & Van Alstine (2003) for additional information on habitat, population biology, and survey techniques. See Baskin et al. (1998) for additional information about seed germination and viability. \[= RAB, C, F, G, I, K, SE, Y, Z; < A. virginica – S (also see A. indica)\]

Aeschynomone viscidula Michaux, Sticky Joint-vetch. Dry sandy areas, such as sandhills, dry pinelands, and barrier islands. From s. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009; SE), panhandle FL, s. AL, s. MS, and s. TX south to s. FL; tropical America. \[= I, K, SE, WH, Y; = Secula viscidula (Michaux) Small – S\]

**Albizia** Durazzini 1772 (Silktree)

1 Leaflets 7-15 mm long; bark of mature trees smoothish, with small wart-like bumps \[= A. julibrissin\]
1 Leaflets 15-30 mm long; bark of mature trees rough, with plates \[= A. kalkora\]

* Albizia julibrissin* Durazzini, Mimosa, Silktree. Disturbed areas, suburban woodlots, escaped and persistent in forests and woodlands; native of tropical Asia. May-August; July-November. Becoming a serious weed; "literally almost everywhere in the 'Dixie' south" (Isely 1973). \[= RAB, C, I, K, SE, W, WH, Y; = Albizia julibrissin – F, G, S, orthographic variant\]

* Albizia kalkora* (Roxburgh) Prain, Kalkora Mimosa. Naturalizing in suburban areas; native of e. Asia (Japan, Korea, Taiwan). Documented by herbarium specimens at DUKE and NCU. Apparently hybridizing with *A. julibrissin* (W. Cook, pers. comm.).

**Alysicarpus** Necker ex Desvaux 1813 (Alyce Clover)

* Alysicarpus ovalifolius* (Schumacher) J. Léonard, Alyce Clover. Disturbed areas; native of the Old World Tropics, planted as a forage crop (at least formerly), and rarely naturalized. The VA occurrence is from chrome ore piles in Newport News – presumably a waif. It is possible that *A. vaginalis* (in the strict sense) is represented in our area as well. It differs from *A. ovalifolius* in having a densely congested inflorescence (with rachis internodes shorter than the flowers) vs. a lax inflorescence with the flowers much shorter than the rachis internodes. \[= WH; < Alysicarpus vaginalis (Linnaeus) A.P. de Candolle – I, K, SE\]
Amorpha Linnaeus 1753 (Indigo-bush, Leadplant)

1 Taller shrubs, usually 1-3 (-4) m tall, petioles 10-30 mm long, usually exceeding the width of the contiguous leaflets; leaflets not revolute, or slightly so.

2 Leaflet mucros mostly swollen apically; plant usually evidently and rather densely pubescent or puberulent (except A. herbacea var. floridana, of s. GA and FL).

3 Upper portions of the plant (stems and leaves) glabrescent; calyx tube glabrous to sparsely or densely minutely strigillose; fruit glabrous; [of s. GA southward] .......................................................... A. herbacea var. floridana

4 Leaflets (10-) 15-25 (-35) mm long, (7-) 9-15 (-18) mm wide; standard intense (rarely light) bright blue; petiole (6-) 8-15 (-20) mm long; racemes mostly panicled, (1-) 3-5 (-8) per flowering branch, 10-20 (-45) cm long; flowering June-July, ......................... A. confusa

5 Calyx lobes (0-) 0.2-1.2 mm long (thus distinctly shorter than the calyx tube); racemes 5-20 (-25) cm long.

6 Calyx lobes obsolete to very small, (0-) 0.2-0.6 (-0.8) mm long; plants glabrous to glabrate; leaflets usually not mucronate, the midrib commonly terminating in a sessile or shortly exserted (0.2-0.4 mm), slightly enlarged, glandular tip; leaflets relatively few, (9-) 11-15 (-19) .......................................................... A. glabra

7 Foliage blackening when dried; leaflets (7-) 9-15 (-19) per leaf, usually shiny above; [of s. SC and southward] .................. A. niten

Amorpha confusa (Wilbur) S.C.K. Straub, Sorrie, & Weakley, Savanna Indigo-bush. Pine savannas. (May-) June-July; August-October. A. confusa is a narrow endemic of the se. Coastal Plain of NC (Brunswick, Columbus, and Bladen counties) and immediately adjacent SC (Horry County). It is restricted to moist loamy savannas, especially on the Foreston soil series, a habitat now largely destroyed by fire suppression, real estate development, and conversion of savannas to pine tree farms. [= X; = Amorpha georgiana Wilbur var. confusa Wilbur – I, K, S, Y; < A. georgiana – RAB, GW; ? A. cyanostachya auct. non M.A. Curtis – S, in part]

Amorpha glabra Desfontaines ex Poiret, Appalachian Indigo-bush, Mountain Indigo. Dry to dry-mesic ridgetop and slope forests, primarily in the Blue Ridge escarpment. May-July; July-October. Endemic to the Southern Appalachian mountains (and nearby provinces) of n. AL, ne. GA, w. NC, nw. SC, and e. and c. TN. [= RAB, I, K, S, SE, W, Y]

Amorpha nitens Boynton, Dark Indigo-bush. Sandy woodlands, rocky slopes, bottomland forests. April-June. S. SC south to GA, west to LA, north in the interior to w. KY, s. IL, AR, and e. OK. First reported for SC by Nelson & Kelly (1997). [= I, K, S, SE, Y]

Amphicarpaea Elliott ex Nuttall 1818 (Hog-peanut)

A genus of 5-6 species, of e. and se. Asia, North America, and montane Africa. It now appears that 2-3 semi-cryptic taxa should be recognized in what has traditionally been considered a single species of Amphicarpaea (Callahan 1997, Parker 1996). The genus name has been corrected to Amphicarpaea from the frequently used Amphicarpa. References: Callahan (1997)=Y; Parker (1996)=Z; Isely (1998)=I.

Identification notes: Producing inflorescences of two types, one with chasmogamous flowers and aerial legumes, the other with cleistogamous flowers and subterranean legumes.

1 Petiole 3.5-5.3 cm long; petiolule of the terminal leaflet (not including the rachis extending from the point of connection of the lateral leaflets to the joint marking the beginning of the petiolule of the terminal leaflet) 1.0-1.4 mm long; terminal leaflet 4.2-5.2 cm long ......................................................... A. bracteata

1 Petiole 6.0-6.8 cm long; petiolule of the terminal leaflet 1.7-1.9 mm long; terminal leaflet 5.5-6.1 cm long ................ A. bracteata var. comosa

Amphicarpaea bracteata (Linnaeus) Fernald var. bracteata, Hog-peanut. {Mt, Pd, Cp (DE, GA, NC, SC, VA, WV) {FL}: dry to moist forests, thickets; common (rare in FL?). July-September; August-October. {The distributions and habitats of the two varieties in our area require herbarium and field investigation}. [= K; = Amphicarpaea bracteata var. bracteata – F, G, orthographic variant; < Amphicarpaea bracteata – C, I, SE, WH; < Amphicarpa bracteata – RAB, orthographic variant; < Falcata comosa (Linnaeus) Kuntze – S]

Amphicarpaea bracteata (Linnaeus) Fernald var. comosa Fassett, Hog-peanut. {Mt, Pd, Cp (DE, GA, NC, SC, VA, WV): dry to moist forests, thickets; common. July-September; August-October. {The distributions and habitats of the two varieties in our area require herbarium and field investigation}. [= K; = Amphicarpaea bracteata var. comosa – F, G, orthographic variant; < Amphicarpaea bracteata – C, I, SE, WH; < Amphicarpa bracteata – RAB, orthographic variant; < Falcata comosa (Linnaeus) Kuntze – S]

Anthyllis Linnaeus 1753 (Kidney-vetch)

Anthyllis vulneraria Linnaeus, Kidney-vetch. Disturbed areas; native of Mediterranean Europe. June-August. [=I, K2]

Apios Fabricius 1759 (Groundnut)

1 Petiole 20-58 mm long; flower deep maroon to pale maroon and white; style glabrous; legume 6-10 (-12) cm long; seed 5-6 mm long; tubers several in a chain, each 2-10 cm in diameter ................................................................................................................................................ A. americana
**FABACEAE**

1 Petiole 70-75 mm long; flower pale green and rose-purple; style bearded; legume 12-15 (-18) cm long; seed 7.2-11.0 mm long; tuber 1, 15-20 cm in diameter. .......................................................... A. priceana

**Astragalus priceana** B.L. Robinson, Kentucky Groundnut; Price’s Potato-Bean. Mixed oak woods, especially over limestone. Sw. KY, c. TN, ne. MS, and n. and c. AL. [= C, F, G, I, K, SE, Z; = Glycine priceana (B.L. Robinson) Britton – S]

**Arachis** Linnaeus 1753 (Peanut)

A genus of about 60 species, annual and perennial herbs, native of South America (especially Brazil). References: Isey (1998)=I.

1 Petiole 5-10 cm long; corolla 1.1-5 cm long; annual ................................................................. A. hypogaea
1 Petiole 2-2.5 cm long; corolla 1.8-2 cm long; perennial .................................................. A. prostrata

* Arachis hypogaea* Linnaeus, Peanut. Fields; commonly cultivated, rarely persistent; native of South America. July-October. This remarkable plant bears normal aerial flowers, but following pollination the pedicels elongate and arch downward, the legume soon buried and developing underground. [= RAB, C, F, I, K, SE, WH]

* Arachis prostrata* Bentham, Grassnut. Disturbed areas; native of South America, planted on roadsides and spreading. July-October. Anderson (2007) states that this is “naturalized and spreading;” the species is reported for Charlton County, GA (Carter, Baker, & Morris 2009). [= K, WH; ? A. glabrata Bentham – I, SE, misapplied] [add to synonymy S]

**Astragalus** Linnaeus 1753 (Milkvetch)

A genus of 2300-2500 species, herbs and shrubs, most diverse in arid regions of w. North America and w. and c. Asia. The habitats of the southeastern species may be characterized as rocky or sandy, "relictual islands" of aridity in the generally moist landscape of eastern North America. References: Barneby (1964)=Z; Isey (1998)=I.

1 Legume pilose with > 1 mm or more long; stems conspicuously pubescent, the hairs spreading and simple; plants decumbent, spreading, or ascending, the stems 0.5-4 dm long.
2 Corolla 14-19 mm long; leaflets 17-29; legume bilocular; calyx lobes shorter than the calyx tube; [of calcareous habitats of the interior] ....... .......................................................... A. tennessensis
2 Corolla 8-12 mm long; leaflets (5-) 7-15; legume unilocular; calyx lobes equaling or longer than the calyx tube [of dry sandy habitats from SC south] .................................................................................................................. A. villosus
1 Legume glabrous; stems glabrous or inconspicuously pubescent, the hairs appressed, simple or dolabriform; plants erect with stems (3-) 4-15 dm long, or decumbent with stems 1-3 dm long (A. distortus var. distortus and A. bibullatus).
3 Plants erect, stems (3-) 4-15 dm long; legume straight to moderately curved.
4 Lower stipules connate; pubescence dolabriform; legumes 1-1.5 cm long, 4-5 mm in diameter; [typically of dry to mesic soils] ...............
4 Lower stipules free; pubescence simple; legumes either longer or wider (2-3 cm long and 4-6 mm in diameter in A. michauxii, 1.5-2.0 cm long and 8-18 mm in diameter in A. neglectus); [typically of notably dry, either rocky or sandy, soils].
5 Leaves with 21-31 coriaceous to somewhat fleshy leaflets, many of the leaflets alternate or subopposite; legumes 2-3 cm long, 4-6 mm in diameter; [of dry sandy habitats from NC south] .................................................. A. michauxii
5 Leaves with 11-23 thin-textured leaflets, all of the leaflets usually opposite; legumes 1.5-2 cm long, 8-18 mm in diameter; [of rocky calcareous habitats from VA north] .......................................................... A. neglectus
3 Plants decumbent or ascending, stems 1-5 dm long; legume either dry and strongly curved (about 90 degrees), or globose and initially fleshy.
6 Legume globose, 1.3-2 cm in diameter, initially fleshy; corolla 18-25 mm long; [of calcareous glades of c. TN] .................. A. bibullatus
6 Legume lanceolate, 1.2-2.5 cm long, 4-7 mm wide, strongly curved; corolla (>7) 8-15 mm long; [of shaley habitats from w. VA northward or of dry sandy sites in FL and possibly adjacent GA].
7 Leaflets mostly 1-2× as long as wide, typically noticeably notched at the tip; mature legume reticulately textured; corolla 8-11 mm long; [of dry sandy sites in FL and possibly adjacent GA and s. MS] .......................................................... A. obcordatus
7 Leaflets mostly 2-3× as long as wide, truncate or shallowly notched at the tip; mature legume lacking a reticulately textured surface; corolla 9-15 mm long; [either of shaley habitats from w. VA northward or of woodlands and prairies from MS westward]
8 Keel 7-9.5 mm long; legume usually 3-4× as long as wide, often curved 90°, grooved along sutures on both sides ......... .................. A. distortus var. distortus
8 Keel 6-7 mm long; legume usually 2.5-3.5× as long as wide, nearly straight or curved < 90°, grooved only along one suture ......... A. distortus var. engelmannii

**Astragalus canadensis** Linnaeus var. canadensis, Canada Milkvetch. Forests, woodlands, streambanks, rocky slopes and bluffs. June-August; July-October. Ranging through much of North America, from QC and Hudson Bay west to BC, south to GA, TX, CO, and Utah; also apparently in Siberia. The other varieties occur further west. See Barneby (1964) for a detailed
discussion of taxonomic and nomenclatural problems involving *A. canadensis*. Barneby comments that "the eastern mountain race [in the Appalachians] is commonly distinguished from var. *canadensis* of the Mississippi Valley and northward by a narrower and more open flowering and fruiting raceme, and the flowers at the same time are relatively small. There is something to be said in favor of recognizing an eastern montane variety, so long as we confine its distinguishing characteristic to a loose raceme." The distribution, as mapped by Barneby, is suggestive of a composite map of 2 (or more) different taxa, one of them being centered in the Southern and Central Appalachians (extending out into nearby provinces). \( \text{F and G separate var. *carolinianus*}, \) basing the distinction, however, on a different set of characters, and considering var. *canadensis* to range south to VA (at least). Further study is needed; it seems we may have in our area 2 taxa worthy of distinction at the varietal level. \( \text{[= I, K, SE, Z; < A. canadensis – RAB, C, W; > A. canadensis var. *canadensis* – F, G; > A. canadensis var. *carolinianus* (Linnaeus) M.E. Jones – F, G; > A. carolinianus Linnaeus – S]} \)

*Astragalus distortus* Torrey & A. Gray var. *distortus*, Ozark Milkvetch, Bent Milkvetch. Shale barrens and other dry, shaley places. May-July. *A. distortus* is interpreted by Z (and followed by C and SE) to consist of 2 varieties: var. *distortus*, occurring in the s. Midwest from IL, MO, and OK south to MS, LA, and AR, and disjunct in n. and se. VA, e. WV, and w. MD, and var. *engelmannii* (Sheldon) M.E. Jones, of TX and ne. LA. The two varieties seem fairly readily distinguishable morphologically in the Midwest. Appalachian var. *distortus* complicates the issue, since it approaches var. *engelmannii* in flower size and matches it in ovule number. The Appalachian plant, with a combination of morphologic characters not matching the two named varieties and far allopatric from them might better be considered a distinct variety. Further study is needed. \( \text{[= C, I, K, SE, Z; < A. distortus – F, G; = Holcophacos distortus (Torrey & A. Gray) Rydberg – S]} \)

*Astragalus distortus* Torrey & A. Gray var. *engelmannii* (Sheldon) M.E. Jones. \{habitats\}. AR, TX, and w. LA; disjunct eastward in MS (NatureServe 2007). \( \text{[= I, K, SE, Z]} \)

*Astragalus michauxii* (Kuntze) F.J. Hermann, Sandhills Milkvetch, Michaux's Milkvetch. Sandhills. Late April-June; June-October (and persisting). Sc. NC south through SC to GA, a Southeastern Coastal Plain endemic (reports from AL and FL are in error). "The Michaux milk-vetch is greatly isolated from any member of the genus morphologically similar" (Barneby 1964). \( \text{[= RAB, I, K, SE, Z; = Tium michauxii (Kuntze) Rydberg – S]} \)

*Astragalus neglectus* (Torrey & A. Gray) Sheldon, Cooper Milkvetch. Dry calcareous woodlands and barrens, over dolostone and limestone. June-September. Se. ON west to se. SK and ne. ND, south to w. NY, ne. PA, c. PA, n. OH, s. MI, se. WI, and e. SD; disjunct in w. VA and e. WV (Wieboldt et al. 1998). \( \text{[= C, F, G, I, K, SE, Z]} \)

*Astragalus obcordatus* Elliott, Florida Milk-vetch. Sandhills. S. MS south to c. peninsular FL. Reported for s. GA, but no specimen documentation is known (Barneby 1964). \( \text{[= I, K, SE, WH, Z; = Phaca obcordata (Elliott) Rydberg ex Small – S]} \)

*Astragalus villosus* Michaux, Bearded Milkvetch, Southern Milkvetch. Sandhills and other dry, sandy places. May-June; June-August. A Southeastern Coastal Plain endemic: s. SC south to Panhandle FL, west to s. MS. This species is described by Barneby (1964) as "a lowly but delightful little astragalus." \( \text{[= RAB, I, K, SE, WH, Z; = Phaca intonsa (Sheldon) Rydberg ex Small – S]} \)

*Baptisia* Ventenat 1808 (Wild Indigo)

Identification notes: Many of our species hybridize when they grow in proximity. They are generally recognizable (especially in context with their parents) by their intermediate morphology. Additional hybrids have been created by plant breeders and may be found in cultivation.

1 Leaves 1-foliolate, sessile or perforate.
FLOWER AND FRUIT CHARACTERS: BAPTISIA

1. Flowers yellow, cream-white, or white.
   2. Leaves perfoliate; plant glabrous or nearly so; [widespread, from s. SC southward] .................................................. B. perfoliata
   3. Leaves sessile; plant glabrous or densely cobwebby pubescent; [narrow endemics of GA and FL].
   4. Plant cobwebby-pubescent; leaves ca. 1× as long as wide, cordate at base; corolla 9-11 mm long, yellow; [of e. GA (Brantley and Wayne counties)] .......................................................... B. arachnitifera
5. Flowers yellow, cream-white; 3-5× as long as wide, rounded to broadly cuneate at base; corolla 12-15 mm long, pale yellow to greenish; [of the FL Panhandle (Franklin, Gadsden, Leon, Liberty, and Wakulla counties)] .......................................................... B. simplicifolia

1. Leaves 3-foliate, petioleate or sessile.
   2. Flowering or fruiting pedicels bracteolate; corolla 11-14 mm long
   3. Flowers yellow.
   4. Calyx lobes about as long as the calyx tube .................................................. B. lecontei
5. Calyx lobes much > the calyx tube.
   6. Plant glabrous; [of ne. FL (Clay and St. Johns counties)] .................................................. B. calycosa
   7. Plant tomentose to hirsute; [of FL Panhandle (Escambia, Holmes, Okaloosa, Santa Rosa, and Walton counties)] ................................. B. hirsuta
8. Flowers yellow, cream-white, or white.
   9. Calyx 4.5-6.5 mm long; corolla 13-16 (-18) mm long; petioles 5-10 (-20) mm long .................................................. B. albescens
   10. Petioles of median leaves 2-4 mm long
   11. Leaves and stems glabrous; leaflets 1.5-2.5× as long as wide .................................................. B. leucophaea var. laevicaulis
   12. Leaves and stems pubescent; leaflets (1.5-) 2.5-5× as long as wide .................................................. B. leucophaea var. leucophaea
   13. Inflorescence of solitary axillary flowers or flowers in clusters of 2-4 in axils or terminal racemes; stipules caducous.
   14. Petiolules 2-3 mm long; leaflets 1-2.5× as long as wide; [of LA, AR, TX, and OK] ....................... B. nuttalliana
   15. Petiolules 3-5× as long as wide, usually < 1.5 cm wide; flowers usually solitary or in clusters of 2-3; fruits broadly ellipsoid or subspheroidal, < 2× as long as wide; [se. SC south through GA Coastal Plain to ne. FL] ............... B. lanceolata var. lanceolata
   16. Flowers yellow, 3-7× as long as wide, the larger typically > 2 cm wide; flowers in racemes of (1-) 3-10 flowers; fruits usually ellipsoid, often > 2× as long as wide; [FL Panhandle, s. AL, and c. peninsular FL] ................... B. lanceolata var. tomentosa

   [add B. megacarpa to key]
**Baptisia alba** (Linnaeus) Ventenat, Thick-pod White Wild Indigo. Dry woodlands, roadsides. May-July; June-October. NC south to n. peninsular FL, west to AL. *B. leucantha* (see below) is a western sibling, treated as either a species or a variety. In fruit, it is easily separated from *B. alba* var. *albescens* and other *Baptisia* by its nearly spheroidal legume. *B. alba* and *B. alba* var. *aberrans* have been nomenclaturally confused; Isely (1986a) corrects the application of the epithet "*alba*." [= S, WH; = *B. alba* var. *alba* – I, K, SE; = *B. pendula* Larisey – RAB; = *B. lactea* (Rafinesque) Tieret var. *obovata* (Larisey) Isely – C (by implication), X, Y; = *B. lactea* var. *pendula* (Larisey) B.L. Turner – Q; > *B. pendula* var. *pendula* – Z; > *B. pendula* var. *obovata* Larisey – Z]

**Baptisia alba** Small, Narrow-pod White Wild Indigo, Spiked Wild Indigo. Dry woodlands, pine flatwoods, roadsides. May-July; June-October. SC south through NC, SC, GA to n. FL, e. AL and c. TN. The fruits are unlike any of our other species in being cylindrical, about 3× as long as the diameter, and yellowish-brown (rather than black) when mature. [= I, K, S, SE, WH; = *B. alba* – RAB, C, F, G, Q, W, X, Y, misapplied; > *B. alba* – Z; > *B. alba* var. *aberrans* – Z]

**Baptisia arachnifera** Duncan, Hairy Rattleweed, Hairy Wild Indigo. Sandhills. Endemic to GA (Wayne and Brantley counties). Unmistakable for its simple leaves and dense "cobwebby" pubescence. [= I, K, Q, SE, X, Y]

**Baptisia australis** (Linnaeus) R. Brown var. *aberrans* (Larisey) M. Mendenhall, Eastern Prairie Blue Wild Indigo, Glade Wild Indigo. Glades, barrens, and open woodlands over limestone (or other calcareous rocks) and diabase (or other mafic rocks), in areas that were formerly prairies, barrens, glades, or oak savannas. April-May; June-August. C. and se. TN, nw. GA, and c. NC (and possibly also s. KY and sc. VA). Blue-flowered *Baptisia* from mafic glades, barrens, and former prairies and oak savannas in NC has proven problematic to taxonomists. Larisey (1940a) treated *B. australis* and *B. minor* as separate species, and placed eastern plants resembling *B. minor* in *B. minor* var. *aberrans* Larisey, but without providing very satisfying characters for separating it from typical *B. minor* of nw. North America. RAB apparently (though tacitly) included *B. minor* within *B. australis*. Isely (1981, 1990) treated blue-flowered *Baptisia* as *B. australis* var. *australis* and var. *minor*, regarding var. *minor* as reaching its eastern limit in MO (the two varieties thus allopatric), and stating that "sporadic collections within the range of *australis* have the pods and some of the vegetative characters of var. *minor*... most of these collections are from dry or sterile habitats, e.g., cedar glades, that var. *australis* typically does not inhabit" (Isely 1990). His treatment of *australis* and *minor* at the varietal level remains largely based on the existence of *minor* reports within his concept of the range of *australis*. NC plants from glade-like sites are morphologically more similar to midwestern prairie *B. minor*, occur in similar habitats, and grow with a large number of other plants with midwestern phytogeographic affinities, such as *Eryngium yuccifolium* var. *yuccifolium*, *Echinacea laeavigata* (an eastern sibling of *E. purpurea*), *Solidago ptarmicoides*, *Solidago rigida* ssp. *glabrata* (an eastern sibling of *S. rigida* ssp. *rigida*), *Silphium terebinthinaceum*, and others. The affinities of these plants seem to be with *B. minor*; "shoehornling" them into the more eastern *B. australis*, which they do not resemble in morphology, habitat, or (indeed) range is not a desirable disposition. Eastern plants referable to *B. minor* do, however, as noted by Larisey and Isely, differ from midwestern plants in leaflet size and shape, branching, and pod shape; they are best treated as an eastern, relictual variety in the complex, *B. australis* var. *australis* Larisey. Mendenhall (1994a, 1994b) found that the "*aberrans*" entity warranted taxonomic recognition, and indeed that it is less closely related to *B. australis* s.s. and *B. minor* than they are to one another; she chose to treat the three entities as varieties under *B. australis*. For now, the best treatment seems to be to follow Mendenhall, and acknowledge the existence of three varietal entities, with the phylogenetic affinities uncertain. The range of *B. australis* var. *minor* is thus largely midwestern, from se. NE, s. MO, and e. and c. KS south to w. AR, e. and c. OK, and ne. TX. [= K, X; = *Baptisia minor* Lehmann var. *aberrans* Larisey – Z; < *B. australis* (Linnaeus) R. Brown – RAB, S; < *B. australis* var. *australis* – I, Q, SE; < *B. australis* var. *minor* (Lehmann) Fernald – C, G; < *B. minor* – F]

**Baptisia australis** (Linnaeus) R. Brown var. *australis*, Tall Blue Wild Indigo, Streamside Blue Indigo. Riverbank scour areas, gravel bars, and disturbed areas (where persisting from cultivation). April-June; June-August. Native to w. and n. VA, w. MD, WV, w. PA, e. and c. KY, ne. TN, se. IN, and s. OH, and possibly native to other states, the original range somewhat obscured by its frequent cultivation. [= C, G, K, X; = *B. australis* – F, W, Z; < *B. australis* var. *australis* – RAB, S; < *B. australis* var. *australis* – I, Q, SE]
**Baptisia bracteata** Elliott, Creamy Wild Indigo. Sandhills, other dry woodlands. March-April; May-June. Ne. AL northwest through n. GA and n. SC to w. NC. The more western *B. leucophaea* Nuttall is better treated as a species than as *B. bracteata* var. *leucophaea* (Nuttall) Kartesz & Gandhi (Mendenhall 1994b). [= RAB, Q, S, W, X, Z; = *B. bracteata* var. *bracteata* – C, I, K, SE]

**Baptisia calycosa** Canby, Florida Wild Indigo. Dry pinelands. Endemic to ne. FL (Clay and St. Johns counties) and also reported for Lowdes County, GA (Kartesz 2010) (this record needing confirmation). [= Q, S, Z; = *B. calycosa* var. *calycosa* – I, K, SE, WH, Y] {synonymy incomplete: X}

**Baptisia cinerea** (Rafinesque) Fernald & Schubert, Carolina Wild Indigo. Sandhills, other dry sandy woods. Late April-June; June-July. Though common in the Coastal Plain of the Carolinas, *B. cinerea* is a narrow endemic, ranging only from s. VA south to s. SC. The large, yellow flowers are very showy. In fall, the leaves do not drop, but stay attached to the stems, the whole plant turning an ashy gray; these dried plants are conspicuous through the following winter. The report in Jones & Coile (1988) of *B. cinerea* in GA is in error; the specimen is of *B. lanceolata*. [= RAB, C, F, G, I, K, Q, SE, X; = *B. villosa* auct. non (Walter) Nuttall – S, Z]

**Baptisia hirsuta** Small, Hairy Wild Indigo, Panhandle Wild Indigo. Dry pinelands. Endemic to FL Panhandle (Escambia, Holmes, Okaloosa, Santa Rosa, and Walton counties) and adjacent AL (Covington County). May; June-September. [= Q, S, Z; = *B. hirsuta* Canby var. *villosa* Canby – I, K, SE, WH, Y] {synonymy incomplete: X}

**Baptisia lanceolata** (Walter) Elliott var. *lanceolata*, Gopherweed. Sandhills. April-May; June-November. S. SC south to ne. FL and sw. GA, a Southeastern Coastal Plain endemic. Small (1933) alleges that *B. lanceolata* ranges north to NC, but no documentation is known. The plant is reminiscent of *B. cinerea*, but forms larger, bushier plants and is separable by characters in the key. [= I, K, Q, SE, X; < *B. lanceolata* – RAB, S, WH; = *B. lanceolata* – Z]

**Baptisia lanceolata** (Walter) Elliott var. *tomentosa* (Larisey) Isely. Sandhills. Panhandle FL and adjacent s. AL; disjunct in c. peninsular FL. Two forms have been recognized, the "narrow-leaved form," endemic to the Apalachicola Lowlands portion of the FL Panhandle, and the "typical form", occupying the FL Panhandle, s. AL, and disjunct in c. peninsular FL (Isely 1981). Mendenhall (1994b) included broad-leaved and narrow-leaved forms of var. *tomentosa* in her study, which provided some support for the taxonomic recognition of these unnamed entities. [= I, K, SE, Y; = *B. lanceolata* var. *elliptica* (Small) B.L. Turner – Q; = *B. elliptica* Small – S; < *B. lanceolata* – WH; > *B. elliptica* var. *elliptica* – Z; > *B. elliptica* var. *tomentosa* Larisey – Z]

**Baptisia lecontei** Torrey & A. Gray, Leconte’s Wild Indigo. Sandhills. Sc. GA south to e. Panhandle FL and s. peninsular FL. [= I, K, Q, SE, WH, X, Y, Z]

**Baptisia leucantha** Torrey & A. Gray. Woodlands, prairies, roadsides. W. MY, MI, WI, MN, and e. NE, south to AL, MS, LA, e. TX, and sw. OK; alleged by S to occur in NC, presumably based on misinterpreted material of *B. alba*. [= S, X; = *Baptisia alba* var. *macrophylla* (Larisey) Isely – I, K1, K2, SE; = *B. lactea* (Rafinesque) Thieret var. *lactea* – C, Q, Y; > *B. leucantha* var. *leucantha* – Z; > *B. pendula* Larisey var. *macrophylla* Larisey – Z]

**Baptisia leucophloea** Nuttall var. *leucophloea*. Pinelands, woodlands. April-May. Nw. IN west to s. MN and e. NE, south to w. KY, c. MS, c. LA, se. LA (Turner 2006), and e. TX. [= *B. bracteata* var. *leucophloea* – I, K2, SE; < *B. leucophloea* var. *leucophloea* – F, G, Q; < *B. bracteata* Muhlenberg ex Elliott var. *leucophloea* (Nuttall) Kartesz & Gandhi – K1; = *B. bracteata* var. *glabrescens* (Larisey) Isely – C, Y; < *B. leucophloea* var. *glabrescens* Larisey – Z]

**Baptisia megacarpa** Chapman ex Torrey & A. Gray, Apalachicola Wild Indigo, Bigpod Wild Indigo. Moist floodplains and lower slopes. Late April-early June; June-July. E. Panhandle FL and sw. GA west to se. AL. [= I, K, Q, S, SE, WH, X, Y; > *B. megacarpa* – Z; > *B. riparia* Larisey var. *riparia* – Z; > *B. riparia* var. *minima* – Z]

**Baptisia nuttalliana** Small. Woodlands and prairies. S. AR and se. OK south to se. LA (Florida parishes) and se. TX. [= I, K1, K2, Q, S, SE, Y, Z] {synonymy incomplete}
**FABACEAE**

1. **Baptisia perfoliata** (Linnaeus) R. Brown ex Aiton f., Catbells, Gopherweed. Sandhills. April-May; May-July. S. SC to e. GA; disjunct in e. peninsular FL (Orange and Osceola counties); disjunct in wc. AL (Sumter County) (Keener 2007), a Southeastern Coastal Plain endemic. [= RAB, I, Q, S, SE, X, Y, Z]

3. **Baptisia sphaerocarpa** Nuttall. Woodlands and prairies. S. MS west to se. MO, e. OK, and e. TX. [= I, K, SE; > **B. sphaerocarpa** – Z; > **B. viridis** Larisey – Z] [synonymy incomplete]

---

**Calliandra** Bentham 1840

A genus of about 135 species, trees and shrubs, of the New World tropics and subtropics. References: Isely (1998)=I.

* **Calliandra haematocephala** Hasskarl, Powderpuff Tree. Disturbed areas; native of South America, cultivated in the souther part of our area and allegedly persistent or spreading. [= I, WH]

---

**Canavalia** deCandolle 1825

A genus of about 50 species, perennial or annual herbs or vines, pantropical. References: Isely (1998)=I.

**Canavalia rosea** (Swartz) deCandolle, Baybean. Ocean beaches. Pantropical, north to Dixie County on the west coast and Volusia County on the east coast of FL. [= I, K, SE, WH; ? **Canavalia lineata** (Thunberg) deCandolle – S, misapplied]

---

**Centrosema** (A.P. de Candolle) Bentham 1837 (Spurred Butterfly Pea)

**Identification notes:** *Centrosema* and *Clitoria* are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large “standard” is lowermost. They are often confused; the following key includes both genera for easy differentiation.

<table>
<thead>
<tr>
<th>1</th>
<th>Leaflets 5-7-foliolate; [rare alien].......................................................... Clitoria ternatea var. ternatea</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Calyx tube 10-13 mm long, much longer than the lobes; bracteoles 3-7 mm long, not enclosing the calyx tube; legume 3-5 cm long, 5-7 mm broad; standard 4-6 cm long, not spurred.......................................................... Clitoria mariana var. mariana</td>
</tr>
<tr>
<td>2</td>
<td>Calyx tube 4-5 mm long, shorter than or about as long as the lobes; bracteoles 5-12 mm long, partly enclosing the calyx tube; legume 6-12.5 cm long, 3-6 mm broad; standard 2.5-3.5 cm long, spurred near the base.</td>
</tr>
<tr>
<td>3</td>

</tbody>
</table>
**FABACEAE**

**Centrosema arenicola** (Small) F.J. Hermann, Sand Butterfly-pea. Longleaf pine sandhills. N. FL (Columbia, Dixie, and Duval counties) south to s. FL. [= K, WH; > Bradburya arenicola Small – S; > Bradburya floridana Britton – S; = C. arenicolum – I, orthographic variant]

**Centrosema virginianum** (Linnaeus) Bentham, Spurred Butterfly Pea. Dry woodlands and openings. June-August; July-October. S. NJ south to s. FL, west to KY, AR, and TX. [= RAB, C, G, K, SE, W, WH; > C. virginianum var. virginianum – F; > C. virginianum var. ellipticum Fernald – F; = Bradburya virginiana (Linnaeus) Kuntze – S]

**Cercis** Linnaeus 1753 (Redbud)

1 Flowering pedicels 10-20 mm long; flowers (11-) 12-14 mm long .................................................................[C. chinensis]
2 Flowering pedicels 6-8 mm long; flowers 8-13 mm long .................................................................[C. canadensis]  
   1 Leaves this, dull above (sun leaves slightly coriaceous, slightly glossy above); legumes 9-14 (-18) mm wide; flowers 8-11 mm long..........
   2 Leaves coriaceous, glossy above; legumes (11-) 13-17 (-20 mm wide; flowers (9-) 10-13 mm long...[C. canadensis var. texensis]

**Cercis canadensis** Linnaeus var. canadensis, Eastern Redbud. Moist to dry forests and woodlands, especially over calcareous or mafic rocks, also commonly planted as an ornamental. March-May; June-November. MA, WI, and NE south to c. peninsular FL and e. TX. This spectacular small tree is showy in bud or flower. The smooth, medium gray bark is distinctive in winter. Other varieties occur in TX and Mexico. [= C, G, I, K, SE, Y, Z; < C. canadensis – RAB, F, S, W, WH]

* Cercis canadensis Linnaeus var. texensis (S. Watson) M. Hopkins, Texas Redbud. Native of OK and TX, sometimes cultivated. [= I, K2]  
  {keyed; not mapped; rejected as a currently naturalized component of the flora}  
  * Cercis chinensis Bunge, Chinese Redbud. Native to China, sometimes cultivated. [= I]  
  {keyed; not mapped; rejected as a current naturalized component of the flora}

**Chamaecrista** Moench 1794 (Partridge-pea)

1 Corolla 0.8-1.0 cm in diameter, the larger petals 4-7 (-8) mm long; functional stamens 5-8.  
   2 Petiole pilose with hairs 1-2 (-3) mm long; petiolar gland cylindrical or clavate; functional stamens 5-8; leaflets 5-6× as long as wide..........
   3 Annual from a taproot; stems solitary.  
   4 Pods 6.5-10 mm wide; seeds 4.7-6.3 mm across; [of tidal marshes in e. VA].................................[C. fasciculata var. macroesperma]
   5 Surface of leaflets pubescent; [from w. Panhandle FL and s. AL westward].................................[C. fasciculata var. puberula]  
   6 Petiolar gland not depressed, <1.5 mm wide; pods 4-6 cm long, plant usually pubescent, to 10 dm tall.  
   7 Petiolar gland depressed, 1.5-2.5 mm wide, raised at both ends; pods 6-10 cm long; plant usually glabrous or glabrescent, to 24 dm tall.  
   8 Petiolar gland depressed, 1.5-2.5 mm wide, raised at both ends; pods 6-10 cm long; plant usually glabrous or glabrescent, to 24 dm tall.  
   9 Petiolar gland not depressed, <1.5 mm wide; pods 4-6 cm long, plant usually pubescent, to 10 dm tall.  

* Chamaecrista fasciculata (Michaux) Greene var. fasciculata (Michaux) Greene – WH  
  {synonymy incomplete}

**Chamaecrista deeringiana** Small & Pennell, Florida Senna. Sandhills, dry longleaf pine woodlands, disturbed sandy areas. June-July. Sw. and wc. GA (Jones & Coile 1988) south to Panhandle FL and west to s. MS (Sorrie & Leonard 1999); disjunct in s. FL. [= I, K, S, SE, Y, Z; < C. fasciculata (Michaux) Greene – WH]  

**Chamaecrista fasciculata (Michaux) Greene var. brachiata** Pollard Isely. Fields, disturbed areas. E. GA south to s. FL, west to w. Panhandle FL. [= I, SE; < Chamaecrista fasciculata var. fasciculata – K; = Chamaecrista littoralis Pollard – S; > Chamaecrista mississippiensis (Pollard) Pollard ex Heller – S; < Chamaecrista fasciculata var. puberula (Greene) J.F. Macbride (variants 1, 2, and 3) – SE, Z; > Chamaecrista fasciculata (Michaux) Greene}  

**Chamaecrista fasciculata** (Michaux) Greene var. brachiata (Pollard) Isely. Fields, disturbed areas. E. GA south to s. FL, west to w. Panhandle FL. [= I, SE; < Chamaecrista fasciculata var. fasciculata – K; = Cassia fasciculata Michaux var. puberula (Greene) J.F. Macbride (variants 1, 2, and 3) – SE, Z; > Chamaecrista fasciculata (Michaux) Greene}  

**Chamaecrista deeringiana** Small & Pennell, Florida Senna. Sandhills, dry longleaf pine woodlands, disturbed sandy areas. June-July. Sw. and wc. GA (Jones & Coile 1988) south to Panhandle FL and west to s. MS (Sorrie & Leonard 1999); disjunct in s. FL. [= I, K, S, SE, Y, Z; < C. fasciculata (Michaux) Greene – WH]  

**Chamaecrista fasciculata (Michaux) Greene var. I.** Dunes, sandy disturbed areas. s. AL west to c. and s. TX. [= I; < Chamaecrista fasciculata var. I. – K; > Chamaecrista littoralis Pollard – S; > Chamaecrista mississippiensis (Pollard) Pollard ex Heller – S; < Chamaecrista fasciculata var. puberula (Greene) J.F. Macbride (variants 1, 2, and 3) – SE, Z; > Chamaecrista fasciculata (Michaux) Greene}  

**Chamaecrista deeringiana** (Small) F.J. Hermann, Sand Butterfly-pea. Longleaf pine sandhills. N. FL (Columbia, Dixie, and Duval counties) south to s. FL. [= K, WH; > Bradburya arenicola Small – S; > Bradburya floridana Britton – S; = C. arenicolum – I, orthographic variant]
**Chamaecrista fasciculata** (Michaux) Greene var. **fasciculata**, Common Partridge-pea. Fields, disturbed areas, fencerows, and a wide range of other habitats. June-September; July-November. MA west to MN, south to s. FL and Mexico. See discussion of the **Chamaecrista fasciculata** complex under var. **macrosperma**. [\(<\) **Cassia fasciculata** – RAB, W; \(<\) **Chamaecrista fasciculata** – C, WH, Y; \(>\) **Cassia fasciculata** var. **fasciculata** – F, G, X; \(>\) **Cassia fasciculata** var. **robusta** (Pollard) J.F. Macbride – F, G, X; \(>\) **Chamaecrista robusta** Pollard – S; = **Chamaecrista fasciculata** var. **fasciculata** (variant 1, variant 2, and typical variant) – Z; < **Chamaecrista fasciculata** var. **fasciculata** – I, SE (also see var. **macrosperma**); < **Chamaecrista fasciculata** var. **fasciculata** – K (also see var. **brachiata**); > **Cassia fasciculata** var. ** littorals** (Pollard) J.F. MacBride – X]

**Chamaecrista fasciculata** (Michaux) Greene var. **macrosperma** (Fernald) C.F. Reed, Tidal-marsh Partridge-pea. Freshwater tidal marshes. Endemic to e. VA (Rappahannock, Mattaponi, Pamunkey, Chickahominy, James, and Appomattox Rivers and their major estuarine tributaries) and MD. Isely (1975) did not recognize this taxon formally, but treated it informally as "variant 1," commenting (incorrectly) that it is "apparently a local, saline-adapted ecotype." Irwin & Barneby (1982) treated **C. fasciculata** as a very polymorphic species in which it was impractical to recognize infraspecific taxa, concluding "a student of tropical **Chamaecrista** has the choice of accepting as a fact of life that sort of infraspecific variability that inspired the dissection of **C. fasciculata** or of retreating to the position of Britton & Urban who, driven by logic rather than sense, found a species in every particular combination of gland and hairiness that fell in their way. But in passing over the observed variation as taxonomically insignificant, it is well to bear in mind that its cause and its biological significance remain a mystery." Botanists familiar with var. **macrosperma** in the field contend that it shows a cohesion in morphologic characters, ecology, and distribution that is biologically and taxonomically significant; it warrants varietal status. [= K; < **Chamaecrista fasciculata** var. **fasciculata** – C, S, Y; = **Cassia** var. **macfasciculata** Fernald – F, G; < **Chamaecrista fasciculata** var. **fasciculata** – I, SE; = **Cassia fasciculata** var. **fasciculata** "variant 1" – Z]

**Chamaecrista nictitans** (Linnaeus) Moench var. **aspera** (Muhlenberg ex Elliott) Irwin & Barneby, Southern Sensitive-plant. Savannas, pinelands, disturbed sandy soils. June-October; July-November. Var. **aspera** ranges from se. SC south to s. FL. [= I, WH; = **Cassia aspera** Muhlenberg ex Elliott – RAB, X, Z; = **Chamaecrista nictitans** ssp. **nictitans** var. **aspera** (Muhlenberg ex Elliott) Irwin & Barneby – K, SE, Y; = **Chamaecrista aspera** (Muhlenberg ex Elliott) Greene – S]

**Chamaecrista nictitans** (Linnaeus) Moench var. **nictitans**, Common Sensitive-plant. Forests, woodlands, disturbed areas, pine savannas, and a wide variety of other habitats. June-October; July-November. **C. nictitans** is widely distributed in e. North America, and (depending on the scope of what is included in it) south into South America. Var. **nictitans** ranges throughout se. United States, north to MA, NY, OH, and KA. [= I, WH; < **Cassia nictitans** Linnaeus – RAB, W, X, Z; < **Chamaecrista nictitans** – C; > **Cassia nictitans** var. **nictitans** – F, G; > **Cassia nictitans** var. **hebecarpa** Fernald – F, G; = **Chamaecrista nictitans** ssp. **nictitans** var. **nictitans** – K, SE, Y; > **Chamaecrista procumbens** (Linnaeus) Greene – S; > **Chamaecrista multipinnata** Pollard – S]

**Chapmannia** Torrey & A. Gray 1838 (Alicia)

A genus of about 7 species, perennial herbs, shrubs and trees, of tropical America and Africa, most closely related in the Southeastern flora to **Stylosanthes** and the introduced **Arachis** (Lewis et al. 2005). References: Isely (1998)=I.

**Chapmannia floridana** Torrey & A. Gray, Alicia. Longleaf pine sandhills, scrub. N. FL (Clay County) south to s. FL. [= I, K, S, WH]

**Cicer** Linnaeus 1753 (Chick Pea, Garbanzo)

Clastris Rafinesque 1824 (Yellow-wood)

A genus of about 6 species, trees, of the se. United States and montane regions of Japan and China. *Clastris* is the only member of the tribe Sophoreae in our area, with the exception of the cultivated (and weakly, if at all, established) *Styphnolobium* and *Maackia*, additionally *Sophora tomentosa* Linnaeus var. *truncata* Torrey & A. Gray closely approaches our area in n. peninsular FL. References: Duley & Vincent (2003)=X; Isely (1981)=Z; Isely (1998)=I; Rudd (1972)=Y.

*Clastris kentukea* (Dumont de Coursset) Rudd, Yellow-wood. Mountain forests, Piedmont bluffs, especially on calcareous or mafic rocks (introduced only in the Piedmont of NC). April-May; July-August. This small to large tree has a native range primarily in the Southern Appalachians (mostly on the west side), the Ozarks, and limestone regions in-between (such as c. TN), ranging from s. OH, s. IN, and s. MO south to sw. NC, sc. SC, n. GA, AL, c. AR, and e. OK, but is cultivated more widely. As discussed by Wyatt (1985), the SC occurrence on Fall Line bluffs of the Savannah River is an interesting disjunction, apparently relictual. Yellow-wood is a distinctive tree, distinguished by its smooth silvery-gray bark, peculiar leaves with alternate leaflets, and pendent panicles of white flowers. The genus *Clastris* has 4 other species, all of temperate e. Asia. [= K, W, X, Y; = *C. lutea* (Michaux f.) K. Koch – RAB, C, F, G, I, S, SE, Z]

Clitoria Linnaeus 1753 (Butterfly Pea, Pigeonwings)

Identification notes: *Centrosema* and *Clitoria* are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large “standard” is lowermost. They are often confused; see key under *Centrosema*.

1 Leaves 3-foliolate; standard 4.5-5.5 cm long.................................................................................................................... *C. mariana* var. *mariana*
1 Leaves 5-7-foliolate; standard 3.5-4 cm long.................................................................................................................... *C. ternatea* var. *ternatea*

*Clitoria ternatea* Linnaeus var. *ternatea*, Blue-pea. Disturbed areas; native of the Paleotropics. Weakly naturalized in s. GA (Isely 1998) and southwards. [= Z; < *C. ternatea* – I, K, S, SE]

Crotalaria Linnaeus 1753 (Rattlebox)

1 Leaves trifoliolate; erect annual herb, typically 1-2 m tall.
2 Leaflets obovate to elliptic-oblong, 1.5-3.5× as long as wide; legume conspicuously curved (or straight in *C. incana*).
3 Legume 10-15 mm in diameter; stem pubescence piliolate; stem pubescence spreading.................................................................................. *C. incana*
3 Legume 5-6 mm in diameter; minutely puberulent; stem pubescence appressed.................................................................................. *C. pallida* var. *ovobata*
2 Leaflets lanceolate, often narrowly so, 3-15× as long as wide; legume straight or nearly so (or upcurved at the tip).
4 Corolla 8-10 mm long; legume 4-6 mm in diameter, upcurved at tip.................................................................................. *C. lanceolata*
4 Corolla 18-20 mm long; legume 15 mm in diameter, not upcurved.................................................................................. *C. ochroleuca*
1 Leaves unifoliolate; plants of various habits, mostly either perennial, smaller, or both.
5 Corolla 1.7-3.0 cm long; leaflets 4-15 cm long; stipules not decurrent on the stem and not conspicuously foliace; [exotic annual herbs, in disturbed habitats].
6 Bracts of the inflorescence 2-3 mm long, caducous; leaflets 4-8 cm long.................................................................................. *C. retusa*
6 Bracts of the inflorescence 5-8 mm long, persistent; leaflets 5-15 cm long.................................................................................. *C. spectabilis*
5 Corolla 0.7-1.4 cm long; leaflets 1-8 cm long; stipules of at least the upper leaves conspicuously decurrent on the stem, giving the impression of a downward-pointing arrowhead (this feature sometimes inconspicuous or essentially absent in *C. rotundifolia*); [native perennial or annual herbs, in natural or disturbed habitats].
7 Plant an erect annual; stems with spreading pubescence, the longer hairs 1-2 mm long; leaflets of the upper portion of the plant (4-) avg. 6-8× as long as wide; [mostly of the Piedmont and Mountains (and Coastal Plain of VA)].................................................................................. *C. sagitilis*
7 Plant a decumbent, sprawling, or erect perennial; stems with appressed or spreading pubescence, the longer hairs <1.2 mm long; leaflets of the upper portion of the plant averaging either (1-) avg. 1.2-4× or (5-) avg. 8.10-15× as long as wide; [mostly of the Coastal Plain].
8 Leaflets glabrous above; leaflets of the upper portion of the plant usually (5-) 10 (-15)× as long as wide; plant erect or ascending.......................... *C. purshii*
8 Leaflets pubescent above (the hairs sometimes sparse – check with hand lens); leaflets of the upper portion of the plant usually (1-) 2 (-4)× as long as wide; plant decumbent to low-ascending.......................... *C. maritima*
9 Stem pubescence appressed.................................................................................. *C. rotundifolia*
* **Crotalaria incana** Linnaeus, Shake-shake. Disturbed areas; native of Africa. Also in peninsular FL, from Alachua County southward. [= I, K, S, SE, WH]

* **Crotalaria lanceolata** E. Meyer, Lanceleaf Rattlebox. Sandy fields, roadsides, other disturbed areas; native of Africa. July-October; August-November. [= RAB, I, K, SE, WH]

**Crotalaria maritima** Chapman, Low Rattlebox, Rabbitbells. Sandy forests and woodlands, roadsides. E. SC south to s. FL, and west to e. LA, endemic to the Southeastern Coastal Plain. [= S, X; *= Crotalaria rotundifolia* Walter ex J.F. Gmelin var. *rotundifolia* – Z; < *C. rotundifolia* – C, I, K, SE, WH, Y; < *C. angulata* – RAB, F, G, apparently misapplied]

**Crotalaria purshii** A.P. de Candolle, Coastal Plain Rattlebox, Pursh's Rattlebox. Mesic to dry pinelands, sandy openings, roadsides. May-July; July-September. A Southeastern Coastal Plain endemic: se. VA south to n. FL, c. peninsular FL, and west to e. LA, with scattered locations inland. [= RAB, C, G, I, K, S, SE, W, WH; > *C. purshii* var. *purshii* – F; > *C. purshii* var. *bracteolifera* Fernald – F]

**Crotalaria rotundifolia** Walter ex J.F. Gmelin, Low Rattlebox, Rabbitbells. Sandy forests and woodlands, roadsides. Se. VA south to c. peninsular FL, west to se. LA; also widespread in Mexico. [= X; *= Crotalaria rotundifolia* Walter ex J.F. Gmelin var. *vulgaris* Windler – Z; < *C. rotundifolia* – C, I, K, SE, WH, Y; < *C. angulata* – RAB, F, G, misapplied; = *C. rotundifolia* – S]

**Crotalaria sagittalis** Linnaeus, Common Rattlebox. Woodlands, woodland edges, openings, fields. June-August; July-September. MA and VT west to s. MI, s. WI, and c. MN, south to c. SC, s. AL, s. MS, TX, Mexico and Central America; West Indies. [= RAB, C, G, I, K, S, SE, W, WV; > *C. sagittalis* var. *sagittalis* – F; > *C. sagittalis* var. *oblonga* Michaux – F]

**Cullen** Medikus 1787

* **Cullen americanum** (Linnaeus) Rydberg, Scurf-pea. Waste areas around wool-combing mills, other disturbed areas, perhaps only a waif; native of the w. Mediterranean region (a misnomer). There are other (older) reports from other southeastern states, including FL and MS. [= I, S; *= *C. americana* – K1, K2, SE, orthographic variant]

* **Cullen corylifolia** (Linnaeus) Medikus, Malaysian Scurf-pea. On ships ballast, probably only a waif; native of s. Asia [= K1, K2] [add to synonymy; not yet keyed]

**Cytisus** Desfontaines 1798 (Broom)

Dalea Lucanus 1758 (Prairie-clover)

A genus of about 165 species, herbs and shrubs, of temperate and tropical America, especially dry areas and most diverse in Mexico. References: Barneby (1977)=Z; Ward (2004c)=Y; Isely (1998)=I. Key adapted from SE.

1 Spikes corymbosely aggregated, capitulate, surrounded by an involucre of 3-4 series of sterile bracts; [subgenus Dalea, section Kuhnistera].
2 Leaflets 5-9 (-15); petals (other than the standard) mostly 3.7-4.5 mm long
3 Corolla subpapilionaceous, with apparent, differentiated wings and keel; stamens 5; perennial herb; [native, primarily of calcareous glades and Coastal Plain pinelands]; [subgenus Dalea, section Kuhnistera].
4 Leaflets 15-25; leaflets 2.5-3.5× as long as wide
5 Plants glabrous (except that the calyx lobes may be pubescent); leaflets broad and flat or narrow and involute; corolla pink-purple or white.
6 Calyx tube not incised on the ventral (upper) side; blade of the standard corollate; corolla white; [of calcareous habitats of inland provinces of GA, AL, TN, WV and westward] ................................................................. D. purpurea var. purpurea
7 Interfloral bracts with pubescence in a transverse band only; plants ascending to erect, the stems branching above the middle ....
8 Calyx tube deeply incised on the ventral (upper) side; blade of the standard not corollate; corolla pink-purple or white; [of the Coastal Plain of GA southward and westward].
9 Leaflets linear, folded, or involute and terete-filiform; spikes globose ca. 6-12 mm long and in diameter; bracts much shorter than the calyx; corolla usually bright pink-purple (less commonly white or lavender) ......................................................... D. feayi
10 Plants spreading or decumbent; leaves widely spaced, generally lacking axillary fascicles; bract tips recurved in bud; calyx 2.7-3.3 mm long; flowers white; [of sc. and sw. GA west to se. LA].......................................................................................... D. gracilis
11 Leaflets of primary stem leaves mostly 5; corolla white ................................................................................. D. alibida
11 Leaflets of primary stem leaves mostly 7-9; corolla pink (rarely white)................................................................ D. carnea

Dalea candida Michaux ex Willdenow, White Prairie-clover. Limestone glades and barrens. Late May-August. WV, KY, IN, WI, MN, and SK south to nw. GA, e. TN, w. AL, sc. MS, s. LA, and ne. TX. [= I, SE (excluding D. occidentalis); = D. candida var. candida – C, K, Z; = Petalostemon candidum (Michaux ex Willdenow) Michaux – F, G; = Petalostemon candidus (Michaux ex Willdenow) Michaux – S]

Dalea carnea (Michaux) Poiret, Pink-tassels. Dry sandy pinelands. June-November. Se. GA south to s. peninsular FL. [= Y; = Dalea carnea (Michaux) Poiret var. carnea – I, K, SE, WH, Z; = Petalostemon carneas Michaux – S]
**FABACEAE**

*Dalea foliosa* (A. Gray) Barneby, Cedar Glade Prairie-clover. Calcareous glades. Late June-September. C. TN, n. AL, IL, and OH (?). [= C, I, K, SE, Z; *P. foliosum* A. Gray – F, G; *P. foliosa* A. Gray – S]

*Dalea purpurea* Ventenat var. *purpurea*, Purple Prairie-clover. Prairies, glades, and open woodlands. NY and ON west to BC, south to KY, TN, n. AL, c. MS, TX, and NM. [= C, I, K, SE, Z; *P. purpureum* (Ventenat) Rydberg – F, G; *P. purpureus* (Ventenat) Rydberg – S]

Desmanthus Willdenow 1806 (Bundleflower)

Desmodium Desvaux 1813 (Tick-trefoil, Tick-clover, Beggar's-ticks, Stick-tights)

A genus of about 300 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan (but lacking from Europe). In our area, *Desmodium* is a complex genus. Some of the species in our area are confusing and can be identified only with difficulty. References: Isely (1998)=I; Krings (2004). Key based on SE, C, RAB, F, and Krings (2004). Some parts adapted with little change from SE. Some parts, especially Key D, will likely be substantially revised, based on additional herbarium and field testing. [also see *Hylodesmum*]

1 Longest calyx lobes shorter than the calyx tube; stipe of the lomentum 4-20 mm long, about 3× or more as long as the calyx; mature leaves without stipels at the base of the petiolules of the leaflets; leaves subverticillate at the top of the stem (alternate in *D. pauciflorum*); stamens monadelphous; lower margin of the lomentum incised to the upper suture. [see *Hylodesmum*]

1 Longest calyx lobes longer than the calyx tube; stipe of the lomentum absent or nearly so, included within the calyx; mature leaves retaining stipels at the base of the petiolules of the leaflets; leaves alternate; stamens diadelphous; lower margin of the lomentum not incised to the upper suture.

2 Leaflets narrow, the terminal leaflet < 10 mm wide, and also 4-12× as long as wide, typically thick and strongly reticulate; petioles of midstem leaves 1-10 (-15) mm long; [primarily of the Coastal Plain and lower Piedmont (rarely Mountains) in our area] ................. Key A
1. Petioles (0-) 1-3 (-4) mm long, the leaves thus sub sessile; leaflets 5-10 mm wide, strongly pubescent on the lower surface.  *

---

**Key A: Desmodium with very narrow leaflets**

1. Flowers in axillary clusters; leaflets broadly obovate, 0.5-1 cm long.  *D. triflorum*
2. Flowers in simple terminal racemes; leaflets mostly > 2.5× as long as wide.  *D. incanum*
3. Stipules ovate, persistent, slightly to strongly clasping at the base, 6-12 mm long.  *D. ochroleucum*
4. Leaflets ovate, 0.8-1.1× as long as wide; flowers blue-purple; loment uncinate-puberulent only along the sutures.  *D. rotundifolium*
5. Terminal leaflet 1.4-2.0× as long as wide, 3.0-7.0 cm long; loment segments 6-8 mm long; stipules 4-8 mm long, ovate to lance- acuminate.  *D. humifusum*
6. Terminal leaflet 0.9-1.2× as long as wide, 1.5-2.3 cm long; loment segments 4-5 mm long; stipules lanceolate, 1-5 mm long.  *D. lineatum*

**Key C**

1. Loment segments nearly symmetrical along the axis of the loment (the isthmi more or less equal above and below, thus each segment diamond-shaped, rounded-diamond-shaped, or essentially elliptical), each segment 3-3.5 mm long; annual from a taproot; [of NC and southward].  *D. tortuosum*
2. Corolla 6-7 mm long; loment with 2-4 segments, each 5-7 mm long; lower leaves often 1-foliolate; [of se. SC and southward].
3. Stem densely spreading pilose (at least the upper stem) and also uncinate-puberulent; loment segments 6.5-10 mm long.  *D. canescens*
4. Leaves glabrous or nearly so.  *D. cuspidatum var. cuspidatum*
5. Leaves evidently pubescent.  *D. cuspidatum var. longifolium*

**Key D**

1. Corolla 8-11 mm long; petioles mostly 1-8 mm long; [plants of the Mountains of VA and possibly NC].  *D. canadense*
2. Corolla 3-8 (-9) mm long (or 8-10 mm long in *D. laevigatum*); petioles mostly longer, mostly 10-60 mm long (except *D. ciliare* and *D. obtusum*); [plants collectively widespread in our area].
3. Loment with 1-3 segments, rounded below.
4. Leaflets cinereous on the lower surface; corolla 6-7 mm long; loment with 3 (-4) segments.  *D. nuttallii*
5. Leaflets not cinereous on the lower surface; corolla 3.5-6 mm long; loment with 1-2 (-3) segments; ["Desmodium ciliare group"].
6. Leaflets 3-5.5× as long as wide.  *D. ciliare*
7.-terminal leaflet usually distinctly longer and narrower than the lateral leaflets; stem (near the middle) sparsely to densely uncinate-pubescent.  *D. obtusum*
8. Petioles 1-3 (-5) mm long; pedicels 3-8 mm long; stem usually pilose; leaflets sub-appressed pubescent (to glabrate).  *D. ciliare*
9. Petioles 10-25 mm long; pedicels 8-15 mm long; stem glabrous (to sparsely unicinate-puberulent); stem glabrous (to sparsely unicinate-puberulent); leaflets glabrous or with only a few scattered hairs.  *D. marilandicum*
10. Loment with 3-5 segments, mostly obtusely angled below.
Desmodium canadense (Linnaeus) A.P. de Candolle, Showy Tick-trefoil, Canadian Tick-trefoil. Marl marshes, Thuja swamps, springs, seeps, hay meadows, streambanks. July-September; August-October. QC and NS west to AB, south to n. VA, sw. VA, NC (?), c. WV, MO, and OK. Small (1933) reports this species for NC; the documentation is not known. [= C, F, G, I, K, SE, W, WV; = Meibomia canadensis (Linnaeus) Kuntze – S]

Desmodium ciliare (Muhlenberg ex Willdenow) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. MA west to IN, MO, and se. KS, south to s. FL and TX; also in Cuba. [= RAB, C, G, I, SE, W, WH, WV; > D. ciliare var. ciliare – F, K; > D. ciliare var. lancifolium Fernald – F, K; = Meibomia ciliaris (Muhlenberg ex Willdenow) Blake – S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. cuspidatum, Toothed Tick-trefoil. Fields, woodland borders, disturbed areas. June-August; August-October. VT and MA west to MI and WI, south to FL Panhandle and OK. [= C, F, G, K, SE; < D. cuspidatum – RAB, I, W, WH, WV; = Meibomia grandiflora (A.P. de Candolle) Kuntze – S]

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. longifolium (Torrey & A. Gray) Schubert. Forests and woodlands. OH west to MN and NE, south to GA and ne. TX. [= C, F, G, K, SE; < D. cuspidatum – RAB, I]

Desmodium fernaldi Schubert, Fernald's Tick-trefoil. Sandhills, dry flatwoods, woodland borders. June-September; August-October. Se. VA south to s. SC (and maybe e. GA and n. FL); Isely (1998) states that reports from the Gulf Coast are based on "glabrate forms of D. glabellum," and also suggests that D. fernaldii is only weakly differentiated from D. glabellum. [= RAB, C, F, G, I, K, SE, W, WH; = Meibomia rhombifolia Vail – S (also see D. floridanum)]

Desmodium floridanum Chapman, Florida Tick-trefoil. Sandhills, other dry sandy habitats. June-September; August-October. Se. SC south to s. FL. [= RAB, I, K, SE, WH; = Meibomia rhombifolia Vail – S (also see D. fernaldii)]

Desmodium glabellum (Michaux) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. ME west to WI and NE, south to n. peninsular FL and TX. [= RAB, F, I, K, SE, WH, WV; = D. glabellum – C (also see D. pernix)]

Desmodium paniculatum (Linnaeus) Kuntze – S, in part; Meibomia paniculata (Linnaeus) Kuntze – S, in part; Meibomia pubens (Torrey & A. Gray) Rydberg – S (also see D. paniculatum var. paniculatum); < D. paniculatum var. dillenii (Darlington) Isely – W]
Desmodium marilandicum (Linnaeus) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. MA west to MI and MO, south to n. peninsular FL and TX. [= RAB, C, F, G, I, K, SE, W, WH, WV; = Meibomia marilandica (Linnaeus) Kuntze – S]

Desmodium nuttallii (Schindler) Schubert. Fields, woodland borders, disturbed areas. July-September; August-October. NY west to IN, south to n. peninsular FL, Panhandle AL, and AR. [= RAB, F, I, K, SE, W, WH, WV; < D. viridiflorum – C, G; < Meibomia viridiflora (Linnaeus) Kuntze – S (also see D. viridiflorum)]

Desmodium paniculatum (Linnaeus) A.P. de Candolle var. epetiolatum Schubert. Pine savannas and flatwoods, bogs. June-September; August-October. Var. epetiolatum ranges from se. VA south to se. NC or e. SC. It may reflect hybridization between D. paniculatum var. paniculatum and another species. Further study is needed. [= F, I, K, SE; < D. paniculatum – RAB, C; < D. paniculatum var. paniculatum – W]

* Desmodium tortuosum (Swartz) A.P. de Candolle. Fields, woodland borders, disturbed areas. July-August; August-October. E. NC south to s. FL, west to TX; perhaps only introduced in the southeastern United States. [= RAB, I, K, SE, WH; = Melioboma purpurea (P. Miller) Vail – S]

* Desmodium triflorum (Linnaeus) deCandolle. Lawns, roadsides; native of the Old World tropics. Reported for Escambia County, FL Panhandle (Kunzer et al. 2009). [= K, SE; = Sagotia triflora (Linnaeus) Duchassaing & Walpers – S] [add to synonymy]

Desmodium viridiflorum (Linnaeus) A.P. de Candolle. Fields, woodland borders, disturbed areas. June-September; August-October. DE south to c. peninsular FL, west to TX, and inland to w. VA, w. NC, n. TN, and AR. [= RAB, F, I, K, SE, W, WH; < D. viridiflorum – C, G (also see D. nuttallii); < Meibomia viridiflora (Linnaeus) Kunze – S (also see D. nuttallii)]

Dichrostachys (de Candolle) Wight & Arnott (Sickle Bush)

* Dichrostachys cinerea (Linnaeus) Wight & Arnott ssp. africana Brenan, African Sickle Bush, Kalahari Christmas Tree. Disturbed areas; native of Africa. [= K2; < D. cinerea – I, SE]

Erythrina Linnaeus 1753 (Coral Bean)

A genus of about 120 species, trees, shrubs, and perennial herbs, of tropical and subtropical regions of the Old and New World. References: Isely (1998)=I.

1 Leaflets not lobed; [cultivated tree, persistent] ................................................................. E. crista-galli
1 Leaflets hastately lobed; [native herb or shrub] ................................................................. E. herbacea

* Erythrina crista-galli Linnaeus, Coraltree. Cultivated, disturbed areas, roadside ditches; native of South America. [= I, K, SE; = Micropteryx crista-galli (Linnaeus) Walpers – S]

Galactia P. Browne 1756 (Milkpea)

Identification notes: Definite identification of the taxa from key lead 4 on is problematic. Note also that the traditional application of G. regularis and G. volubilis is reversed.

1 Leaves with (5-) 7 (-9) leaflets; flowers white ......................................................................................... G. elliottii
1 Leaves with 3 leaflets; flowers white, pink, red, or purple.
2 Plant erect, with 4-6 (-8) leaves ........................................................................................................ G. erecta
2 Plant prostrate, trailing, or twining, generally with numerous leaves.
3 Legumes villous with hairs 1-1.5 mm long; corolla when fresh bright reddish purple and white (drying dark on herbarium specimens); stems villous with hairs > 0.5 mm long ...................................................... G. mollis
3 Legumes glabrous, or pubescent with hairs < 1 mm long; corolla pink to pink-purple (drying pale or the petals dropping on herbarium specimens); stems glabrate to villosulous with hairs < 0.5 mm long.
4 Inflorescences generally exserted, (2-) 4-15 (-20) cm long, the flowers well distributed along half or more of the length of the inflorescence axis; flower buds generally 5-8 mm long; corolla 8-12 (-14) mm long; plants twining (rarely trailing) .............. G. regularis
4 Inflorescences short or exserted, if exserted then the flowers generally from nodes crowded into the upper half of the axis; flower buds 5-10 mm long; corolla (11-) 12-16 (-18) mm long; plants trailing or twining.
5 Internodes short, 1-2 cm long, the stem thus appearing leafy; inflorescences with 1-3 flowers (or also with solitary axillary flowers); [plants of Coastal Plain of SC southwest] ........................................... G. minor
5 Internodes generally longer; inflorescences with 1-3 or more flowers; [plants collectively widespread in our area].
6 Stems glabrescent to conspicuously pubescent with spreading hairs < 0.5 mm long; leaflets 1.5-3.5 (-4) cm long, the undersurface with hairs 0.4-0.7 mm long; [plants of e. GA southward] .................................................. G. floridana
6 Stems antrorse- or retrorse-strigose; leaflets 1.5-5 (-7) cm long, the undersurface strigose with hairs < 0.3 mm long; [plants widespread in our area] ................................................................. G. volubilis var. volubilis

Galactia erecta (Walter) Vail, Erect Milkpea. Sandhills. May-July; July-September. Se. NC south to Panhandle FL, west to e. TX. [= RAB, I, K, S, SE, WH, Y, Z]

Galactia floridana Torrey & A. Gray, Florida Milkpea. Sandhills and other xeric sands. S. GA south to s. FL, west to s. MS. [= Y; < G. floridana – I, K, SE, Z (also see G. volubilis var. fasciculata); = G. floridana var. floridana – S; < G. volubilis – WH]

Galactia mollis Michaux. Sandhills. May-July; July-September. Se. NC south to e. peninsular FL, west to Panhandle FL and se. AL. [= RAB, I, K, S, SE, WH, Y, Z]

Galactia volubilis (Linnaeus) Britton var. volubilis. Sandhills, other dry forests and openings. June-August; July-October. NJ and s. PA west to c. AR, south to s. FL and L.A. Var. baltezziana D.B. Ward & D.W. Hall and var. fasciculata (Vail) D.B. Ward & D.W. Hall are localized endemics of the FL Peninsula. Duncan (1979) describes additional forms of this taxon (which he treated under the name G. glabella) that he considered to potentially warrant description as varieties or species; they need further study. [= Y; < G. regularis (Linnaeus) Britton, Sterns, & Poggenburg – RAB, C, F, G, I, K, SE, WH (misapplied); > G. regularis – S, misapplied; > G. brevipes Small – S; > G. brachypoda Torrey & A. Gray – S; < G. glabella Michaux – Z]

Genista Linnaeus 1753 (Dyer's Greenweed)

Gleditsia Linnaeus 1753 (Honey Locust, Water Locust)

Identification notes: The hybrid Gleditsia × texana Sargent (pro sp.) [G. aquatica × triacanthos] occurs occasionally in the area of range overlap of its parents. It is intermediate between its parents.

1 Legume ovate, 3-5 (-8) cm long and 1-3-seeded; foliage glabrous (or slightly puberulent when young); [trees of frequently flooded swamps, often with Taxodium, rarely planted and escaped] .................................................. G. aquatica
1 Legume elongate, 20-40 cm long and multi-seeded; foliage puberulent (even in age); [trees of moist to dry forests, frequently planted and escaped in disturbed areas] .................................................................................................................. G. triacanthos
Gleditsia aquatica Marshall, Water Locust. Swamp forests. April-May; July-November. E. SC south to c. peninsular FL, west to TX, and north in the interior to IN, IL, and MO; occasionally cultivated north of its native range. [= RAB, C, F, G, GW, I, K, S, SE, WH, Y, Z]

Gleditsia triacanthos Linnaeus, Honey Locust. Woodlands, forests (generally bottomland), fencerows, often planted as a street tree. April-May; July-November. Native distribution is believed to be from w. NY west to se. SD, south to Panhandle FL and TX (west of the Blue Ridge); its occurrence over much of our region appears to be as an adventive. The trunks are normally beset with lengthy, branched thorns, but thornless trees are encountered (and are usually favored for horticultural planting). [= RAB, C, G, GW, I, K, S, SE, W, WV, Y, Z]

Glycine Willdenow 1802 (Soybean, Soya)

* Glycine max (Linnaeus) Merrill, Soybean. Abundantly cultivated, rarely persisting as a waif; native of e. Asia. July-October. One of the most important legume crops in the world. [= RAB, F, I, K, SE]

Glycyrrhiza Linnaeus 1753 (Licorice)

Gymnocladus Lamarck 1785 (Kentucky Coffee-tree)

Gymnocladus dioicus (Linnaeus) K. Koch, Kentucky Coffee-tree, Kentucky Mahogany. Native in rich bottomland and slope forests, also in disturbed areas, persistent and weakly spreading from horticultural plantings. April-June; August-November (and persistent). The original native range has been obscured, perhaps PA west to se. SD, south to w. VA, TN, n. AL, and OK. [= RAB, C, F, G, I, K, S, SE, WV, X, Y, Z]

Hylodesmum H. Ohashi & R.R. Mill 2000
A genus of ca. 15 species, perennial herbs, mainly of e. Asia and e. North America. This group has often been included in Desmodium as a section or subgenus, but is now shown to be amply distinct in morphology and also to form a monophyletic group based on molecular analysis. References: Raveill (2006); Ohashi & Mill (2000)=Z.

1 Stems dimorphic, the flowering stem normally lacking leaves (rarely with leaves), the sterile stem with a subverticillate cluster of 3-7 leaves near the top; pedicels 10-20 mm long ................................................................................................................................................ H. nudiflorum
1 Stems monomorphic, bearing both leaves and flowers, the leaves either subverticillate or not; pedicels 2-10 mm long.
2 Leaves subverticillate, clustered; leaflets conspicuously and strongly acuminate, 5-10 cm long; flowers usually distinctly pink or pink-purple; inflorescence 3-8 dm long, elongate, large, and conspicuous, much exceeding the leaves ............................................. H. glutinosum
2 Leaves alternate, scattered; leaflets acute to slightly acuminate, 3-7 cm long; flowers white; inflorescence 1-2 dm long, small and inconspicuous, often partly obscured by the leaves ........................................................................................................ H. pauciflorum

Indigofera Linnaeus 1753 (Indigo)

A genus of about 700 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan in tropical and warm temperate regions. References: Isely (1998)=I.

1 Leaflets borne alternately or irregularly on the rachis.
2 Stipules subulate, < 1.5 mm wide; legumes divergent to deflexed, spaced on the rachis; flowers 6-10 per inflorescence............... I. miniata var. leptosepala
3 Stem pubescence hirsute or pilose with long brownish hairs ................................................................. I. hirsuta
3 Stem pubescence strigose-appressed.
4 Legume 7-9 mm long, ovoid, not falcate, indehiscent, with 2-3 seeds; corolla 6-9 mm long; [native species]....................... I. caroliniana
4 Legume 15-36 mm long, linear-cylindric, slightly to strongly falcate, dehiscent, with 3-12 or more seeds; corolla either 5-6 mm long or 15-18 mm long; [introduced species].
5 Corolla 15-18 mm long; legume 30-40 mm long, straight; leaflets 2.5-4 cm long ................................................................. I. decora
5 Corolla 5-6 mm long; legume 15-36 mm long, slightly to strongly falcate; leaflets (0.5-) 1-3 cm long.
6 Legume 15-20 mm long, strongly falcate ................................................................. I. suffruticosa
6 Legume 28-36 mm long, slightly falcate ................................................................. I. tinctoria

Indigofera caroliniana P. Miller, Wild Indigo, Carolina Indigo. Sandy forests and woodlands, including sandhills and sandy maritime forests. June-August; July-October. E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. [= RAB, I, K1, K2, S, SE, WH]
* Indigofera hirsuta Linnaeus, Hairy Indigo. Sandy disturbed areas, such as wildlife "food fields"; native of the Old World tropics. First reported for SC by Nelson & Kelly (1997). Also known from other scattered locations in the Southeast, such as s. MS (Leonard, 2006, pers.comm.) and AL (Diamond & Woods 2009). [= I, K1, K2, SE, WH]

A genus of 2 species, annual herbs, native to temperate e. Asia. *Kummerowia* differs from *Lespedeza* in its annual habit (vs. perennial), conspicuous stipules (vs. not conspicuous), inflorescence branching pattern (see Akiyama & Ohba 1985), and leaflets with striate, parallel, lateral veins (vs. with reticulate lateral veins). It is now generally regarded as distinct from *Lespedeza* at the generic level, though they are closely related. References: Akiyama & Ohba (1985)=Z; Isely (1998)=I. Key based closely on SE.
1 Mid-stem leaves with petioles 4-10 mm long; leaflets emarginate at the apex; leaflets conspicuously spreading-ciliate; stems antorsely appressed-strigose; calyx covering 1/3-1/2 of the legume .......................................................... K. stipulacea

1 Mid-stem leaves with petioles 1-2 (-4) mm long; leaflets not emarginate at the apex; leaflets inconspicuously appressed-ciliate; stems retrorsely appressed-strigose; calyx covering 1/2-4/5 of the legume .......................................................... K. striata

Lablab Adanson 1763 (Hyacinth-bean)

* Lablab purpureus (Linnaeus) Sweet, Hyacinth-bean. Disturbed areas; native of Africa. Cultivated and rarely may escape or persist as a waif in disturbed areas; it is reported from se. PA (Rhoads & Klein 1993). [= I, K, SE; = Dolichos lablab Linnaeus]

Lackeya Fortunato, L.P. Queiroz, & G.P. Lewis 1996

Lackeya multiflora (Torrey & A. Gray) Fortunato, L.P. Queiroz, & G.P. Lewis. Alluvial forests, prairies. S. GA and FL Panhandle west to e. TX, north in the interior to w. TN and w. KY. [= Z; = Dioeclea multiflora (Torrey & A. Gray) C. Mohr – C, G, I, K, S, SE; = Galactia mohlenbrockii R.H. Maxwell – WH]

Lathyrus Linnaeus 1753 (Wild-pea, Vetchling)

1 Leaflets > 2, generally 4-12; [native species of various habitats].
2 Folliaceous stipules laterally symmetrical, with 2 approximately equal basal lobes; leaves somewhat fleshy; [plants of ocean beaches and dunes] ............................................................................................................................................................................................................ L. japonicus
2 Folliaceous stipules asymmetrical, oblique at the base, the basal lobe well-developed only on one side.
3 Racemes with 2-6 (-9) flowers; leaflets 4-8 (-10) per leaf; [plants of marshes, bottomlands, and other wet habitats] .................. L. palustris
3 Racemes with (5-) 10-20 flowers; leaflets (8-) 10-14 per leaf; [plants of dry to mesic forests] ............................................ L. venosus
1 Leaflets 0-2; [alien species, except L. pusillus].
4 Leaflets absent (but with foliaceous stipules) .......................................................................................................................... L. aphaca
4 Leaflets 2.
5 Stems not winged or flanged; corollas 10-15 mm long; flowers 3-10 per inflorescence.
6 Corollas yellow ............................................................................................................................................................................. V. pratensis
6 Corollas red-purple ........................................................................................................................................................................ V. tuberosus
5 Stems winged; corollas 6-30 mm long; flowers 1-15 per inflorescence.
7 Stems with wings 0-1 (-2) mm wide; corolla 6-14 mm long; flowers 1-3 (-4) per raceme.
8 Legume (in fruit) and ovary (in flower) hirsute with swollen-based hairs; corolla 9-14 mm long .............................................. L. hirsutus
8 Legume (in fruit) and ovary (in flower) glabrous; corolla 6-9 mm long ................................................................................................. L. pusillus
7 Stems with wings 1-3 mm wide; corolla 13-30 mm long; flowers 2-12 per raceme.
9 Stems hirsute with swollen-based hairs; plant an annual; flowers 2-4 per raceme ............................................................................. L. odoratus
9 Stems glabrate; plant a perennial; flowers (3-) 4-12 per raceme.
10 Stipules 4-10 mm wide; leaflets 2-5× as long as wide ..................................................................................................................... L. latifolius
10 Stipules 2-3 mm wide; leaflets 6-15× as long as wide .................................................................................................................... L. sylvestris

* **Lathyrus japonicus** Willdenow, Beach Pea. Beaches. Circumboreal, south in eastern North America to NJ (or NC?) and the shores of the Great Lakes. Reported from ocean beaches in Dare County (NC), but without adequate documentation. [= I; > *L. maritimus* (Linnaeus) Bigelow var. *pellitus* (Fernald) Gleason C, G; > *Lathyrus japonicus* Willdenow var. *pellitus* Fernald – F, K1; < *L. japonicus* – I; > *L. japonicus* var. *maritimus* (Linnaeus) Kartesz & Gandhi – K2]

* **Lathyrus pratensis** Linnaeus, Meadow Pea. Disturbed areas; native of Eurasia. Reported for VA on the basis of “personal communication” (Kartesz 1999). {investigate} [= C, F, I, K]

* **Lathyrus tuberosus** Linnaeus, Tuberous Vetchling. Disturbed areas; native of Europe. Introduced in e. TN (Chester, Wofford, & Kral 1997), WV (Strausbaugh & Core 1978), and KY. [= C, F, G, I, K, SE, WV]

**Lens** P. Miller (Lentil)

* **Lens culinaris** Medikus, Lentil. Disturbed areas; native of Mediterranean Europe and w. Asia. {MD, NJ}. [= I, K1, K2]

**Lespedeza** Michaux 1803 (Lespedeza)

A genus of about 40 species, perennial herbs and shrubs, of temperate regions of e. Asia and e. North America. References: Clewell (1966a)=Z; Clewell (1966b)=Y; Isely (1986b)=X; Akiyama (1988)=Q; Clewell & Stickel (1990); Isely (1998)=I. Key based primarily on Z and SE. [also see *Kummerowia*]

**Identification notes**: Many species of *Lespedeza* hybridize, and most combinations may occur in our area. Some of the hybrids have been named in the past as varieties or species. Hybrids generally occur in mixed populations with both parents and can usually be identified by their intermediate morphology (identification much easier in the field where context is apparent than in the herbarium). See Isely (1990) and Clewell (1966a) for additional hints about identification of hybrids.
Plants perennial, stipules subulate, setaceous, or lanceolate, not conspicuous; leaflets with reticulate lateral veins, joining before reaching the margin.

2 Leaflets distinctly widest toward the tip, 3-5× as long as wide, the base and apex very differently shaped (the base narrowly cuneate, the tip rounded, truncate or even retuse); racemes reduced, with 2-3 flowers, shorter than the subtending leaves; [plants alien]... L. cuneata

2 Leaflets generally widest near the middle, 1-8× as long as wide, the base and apex shaped similarly (i.e. both rounded, or both cuneate); racemes with 3-many flowers, shorter or longer than the subtending leaves; [plants native, except L. virgata]

3 Midrib of leaflets distinctly excurrent as a spine bristle 0.5-1.5 mm long; [plant a rare introduction]... L. virginiana

3 Midrib of leaflets not excurrent, or only as an obscure mucro, not at all spineose; [plants native]

4 Plants trailing at maturity (young stems erect to arching-ascending up to 2 dm tall, then lopping over); stems slender, wiry; corolla pink to purple.

5 Pubescence of the stem spreading (pilose)...

6 Calyx of legumes produced from cleistogamous flowers 1/4-1/3 as long as the pod; stems usually lacking axillary leaves; keel subequal to the wings, or shorter; stipules 2-4 (-5) mm long...

6 Calyx of legumes produced from cleistogamous flowers ca. 1/5 as long as the pod; stems often with axillary leaves distinctly smaller than the primary leaves; keel usually longer than the wings; stipules 3-5 (-6) mm long... L. frutescens

4 Plants erect at maturity; stems generally stout, stiff; corolla pink, purple, white, cream, or mixed.

7 Plants not in flower.

8 Corolla primarily white or cream (often with a purplish throat).

9 Racemes of the racemes of chasmogamous (peliferous) flowers shorter than the subtending leaves; keel > 1 mm longer than the wings.

10 Stems 7 dm long, not bushy-branched; petioles of medial leaves 0.5-2 cm long; chasmogamous panicles with 4-7 flowers; corolla 6-8 mm long; chasmogamous legumes glabrate or inconspicuously strigulose, 5-7 mm long; [native]...

10 Stems 10-30 dm long, bushy-branched; petioles of medial leaves 2-4 cm long; chasmogamous panicles with 5-15 flowers; corolla 8-15 mm long; chasmogamous legumes glabrate, 7-8 mm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section Macrobolus]

14 Calyx lobes equal to or shorter than the calyx tube; corolla 4-7 mm long; leaflets 1.5-2× as long as wide; racemes erect or strongly ascending; stems 1-5 cm long; [plants widespread in our area]...

14 Calyx lobes longer than the calyx tube (at least the lowest lobe); corolla (10-) 12-15 mm long; leaflets 2-3× as long as wide; racemes lax and drooping; stems many per crown, purplish when young...

12 Peduncles of the racemes of chasmogamous (peliferous) flowers shorter than the subtending leaves; keel about as long as or shorter than the wings; [native]

15 Upper surface of the leaflets glabrous (sometimes strigose along the midrib only); pubescence of the stem appressed; leaflets 1.3-3× as long as wide... L. violacea

15 Upper surface of the leaflets pubescent; pubescence of the stem appressed or spreading; leaflets 1.3-7× as long as wide...

16 Leaflets 1.3-3 (-3.5)× as long as wide...

17 Leaflets of average, mid-stem leaves > 4× as long as wide ([L. capitata keyed here and below])

18 Petioles of mid-stem leaves 1-3 mm long...

19 Leaflets 4-8(-10)× as long as wide; pubescence of the stem and leaves usually not silvery-cinereous... L. angustifolia

19 Leaflets (2-) 2.5-5 (-8)× as long as wide; pubescence of stems and leaves usually silvery-cinereous... L. caputata

17 Leaflets of average, mid-stem leaves < 3.5× as long as wide ([L. capitata keyed here and above])

20 Leaflets (2-) 2.5-5 (-8)× as long as wide; leaf rachis (the apparent petiolule of the terminal leaflet) longer than the petiole...

20 Leaflets 1.3-3 (-3.5)× as long as wide; leaf rachis shorter than the petiole (or about equal in L. hirta var. curtissii)

21 Central axis strongly dominant, branches divaricate, irregular; stems slender, wiry...

22 Central axis strongly dominant, branches ascending, mostly on the upper stem; stems stout, stiff.

23 Calyx lobes equal to or shorter than the calyx tube; leaflets 1.5-2× as long as wide; racemes erect or strongly ascending; stems 1-5 cm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section Macrobolus]

23 Calyx lobes longer than the calyx tube (at least the lowest lobe); leaflets 2-3× as long as wide; racemes lax and drooping; stems many per crown, purplish when young...

22 Stems 10-30 dm tall, 1-many from the base; medial leaf petiole 2-4 cm long; [plants alien, planted in "wildlife food plots" and persisting or spreading]; [section Macrobolus]

24 Leaflets (1.3-) 1.8-3 (-3.5)× as long as wide... L. stuevei

24 Leaflets (4-) 5-7× as long as wide...

25 Plants of average, mid-stem leaves < 3.5× as long as wide (L. caputata keyed here and below)
Lespedeza angustifolia (Pursh) Elliott, Narrow-leaved Lespedeza. Sandhill-pocosin ecotones and dry to moist savannas, mountain bogs. August-October; September-November. MA south to c. peninsular FL, west to s. MS, essentially a Southeastern Coastal Plain endemic, rarely disjunct inland to w. NC, c. GA, and ec. TN (Chester, Wofford, & Kral 1997). [= RAB, C, G, I, K, S, SE, W, WH, Y, Z; "L. angustifolia" – F; > L. hirta var. intercursa Fernald – F]

**Lespedeza hirta** (Linnaeus) Hornemann var. curtissii (Clewell) Isely, Silvery Lespedeza. Sandhills and dry to moist savannas. August-October; September-November. SE. VA south to s. FL, west to Panhandle FL and s. AL, barely extending onto the Piedmont in NC, SC, and GA. Clewell (1966a) discusses apparent intergrades between the two varieties in s. NJ. [= C, I, SE, X; < L. hirta – RAB, G, S, WH; = L. hirta var. appressipilis Blake – F (as to intent, but not the type); = L. hirta ssp. curtissii Clewell – K, Y, Z]

**Lespedeza hirta** (Linnaeus) Hornemann var. hirta, Hairy Lespedeza. Woodlands and woodland borders. August-October; September-November. S. ME and s. ON west to Ml, n. IL, c. MO, and OK, south to c. peninsular FL and TX. [= C, I, SE, X; < L. hirta – RAB, G, S, W, WH, WV; > L. hirta var. hirta – F; > L. capitata var. calycina (Schindler) Fernald – F; = L. hirta ssp. hirta – K, Y, Z]

**Lespedeza stuevei** Nuttall, Velvety Lespedeza. Woodlands and woodland borders. July-September; August-November. MA south to n. peninsular FL, west to c. and n. TX, north in the interior to NC, TN, s. IN, s. IL, c. MO, and ne. KS. [= RAB, C, F, G, I, K, SE, W, WH, WV, Y, Z; = L. stuevei – S, orthographic variant]

**Lotus virgata** (Thunberg) A.P. de Candolle. Roadbanks; native of e. Asia. Clewell & Stickel (1990) report the occurrence of this species in NC. [= I, K]

**Juncus arcticus** (L.) Lam. – I

**Lotus corniculatus** (Linnaeus) Waldstein & Kitaibel ex Willdenow, Slender Birdsfoot-trefoil. Fields, roadsides, and waste places; native of Eurasia.

**Lotus tenuis** (Linnaeus) Bentham – S, misapplied]

**Linnaea Bentham 1842 (Leadtree, Linnaea)**

**Linnaea leucocephala** (Lamarck) de Wit ssp. leucocephala, Leadtree, Leucaena, Jumbie-bean. Disturbed areas; native of the New World tropics. E. GA (Kartesz 1999, voucher at UGA), south into FL and the New World tropics. [= Z; < L. leucocephala – I, K, SE, WH; < L. glauca (Linnaeus) Bentham – S, misapplied]

**Linnaea borealis** (L.) A. Gray – I

**Linnaea perennis** (L.) Bentham 1842 (Leadtree, Leucaena) – I

**Linnaea angustifolia** (Hudson) Bentham 1842 (Leadtree, Linnaea) – I (also see Acmispon)

**Linnaea borealis** (L.) A. Gray 1839 (Leadtree, Linnaea) – I

**Linnaea perennis** (L.) Bentham 1842 (Leadtree, Leucaena) – I

**Linnaea borealis** (L.) A. Gray 1839 (Leadtree, Linnaea) – I

**Linnaea perennis** (L.) Bentham 1842 (Leadtree, Leucaena) – I

**Linnaea angustifolia** (Hudson) Bentham 1842 (Leadtree, Linnaea) – I (also see Acmispon)

* **Lupinus angustifolius** Linnaeus, Narrowleaf Lupine. Fields, disturbed areas; native of Mediterranean Europe. [= I, K, WH]

**Lupinus cumulicola** Small. Sandhills and scrub. Peninsular FL. [= K, S; < L. diffusus – I, SE, WH]

**Lupinus diffusus** Nuttall, Blue Sandhill Lupine. Sandhills, sandy roadsides. March-May; June-July. Se. NC south to s. FL, west to s. MS. I concur with Duncan & McCartney (1992) in recognizing *L. cumulicola* Small of peninsular FL as distinct from *L. diffusus*. [= RAB, K, S; < L. diffusus – I, SE, WH]

**Lupinus luteus** Linnaeus, Yellow Lupine. Disturbed areas; native of Mediterranean Europe. [= I, K, SE, WH]

**Lupinus perennis** Linnaeus, Southern Sundial Lupine. Sandhills and sandy or dry rocky roadsides. E. GA (immediately across the Savannah River from SC), south to n. FL and west to s. AL. The validity of this taxon is uncertain; the differences may be only clinal. [= K, SE; < L. perennis – RAB, C, G, WH; = L. perennis var. gracilis (Nuttall) Chapman – I; = L. nuttallii S. Watson – S]

**Lupinus villosus** Willdenow, Pink Sandhill Lupine. Sandhills, sandy roadsides. April-May; June-August. Se. NC south to n. FL, west to se. LA. [= RAB, I, K, S, SE, WH]

**Lupinus westianus** Small, Gulf Coast Lupine. Coastal dunes, sandhills. Endemic to Panhandle FL. The related *L. aridorum* McFarlane ex Beckner is endemic to sand pine scrub in the central FL peninsula. [= L. westianus var. westianus – I, K, WH; < L. westianus – S]

**Maackia** Ruprecht & Maximowicz 1856 (Maackia)

A genus of about 8 species, trees and shrubs, of e. Asia.

**Macroptilium** (Bentham) Urban 1928

* **Macroptilium lathyroides** (Linnaeus) Urban. Disturbed areas; native of tropical America. [= I, K, SE, WH; = Phaseolus lathyroides Linnaeus]

**Medicago** Linnaeus 1753 (Medick, Bur-clover)

A genus of about 80 species, annual and perennial herbs, of Eurasia and Africa. References: Isely (1998)=I. Key based largely on SE.

1. Legume 1-seeded, reniform, black at maturity; corolla 2-3 mm long ................................................................. *M. lupulina*
2. Legume several-seeded, spirally coiled or falcate, tan to dark brown; corolla 3-11 mm long.
3. Plants perennial, mostly erect or ascending; 2-8 (10) dm tall; corolla 6-11 mm long, violet, yellow, or varicolored; legumes spineless.
4. Legume falcate; corolla yellow ................................................................. *M. falcata*
3 Legume spiral; corolla violet or varicolored (rarely yellow).................................................................................. \textit{M. sativa}

2 Plant annual, mostly prostrate or ascending, 1-6 dm tall; corolla 3-6 mm long, yellow; legumes spiny (except lacking spines in \textit{M. officinalis}).

4 Stipules entire or slightly dentate (\textit{M. minima}) or the base only of the stipule lacerate (\textit{M. lacinia;}; plants pilose (\textit{M. minima}) or glabrous (\textit{M. lacinia;}).

5 Stipules lacerate at the base; plant glabrous............................................................................................................... \textit{M. lacinia}

5 Stipules entire or slightly dentate; plant pilose .......................................................................................................... \textit{M. minima}

4 Stipules lacerate; plants glabrous or sparsely pubescent.

6 Legume lacking spines; stipules deeply lacerate, the sinuses extending nearly to the base........................................\textit{M. orbicularis}

6 Legume spiny; stipules either deeply lacerate (\textit{M. polymorpha}) or shallowly lacerate (\textit{M. arabica;}).

7 Leaflets 0.7-1.1 as long as wide, usually marked with a central dark spot; leaflet tip usually strongly notched; stipules shallowly lacerate, the sinuses extending < \frac{1}{2} way to the base........................................................................\textit{M. arabica.}

7 Leaflets 1-2 as long as wide, not marked with a central dark spot; leaflet tip not strongly notched, stipules deeply lacerate, the sinuses extending > \frac{1}{2} way to the base .................................................................................. \textit{M. polymorpha}

**Medicago lacinia** (Linnaeus) P. Miller. Waste areas around wool-combing mills; rare, native of Europe, perhaps merely a waif. [= F, I, K]

**Melilotus** P. Miller 1754 (Melilot, Sweetclover, Sourclover)

1 Corolla white ......................................................................................................................................................... \textit{M. albus}

1 Corolla yellow.

2 Corolla 2-3.5 mm long; fruits < 3 mm long ............................................................................................................. \textit{M. indicus}

2 Corolla > 4 mm long; fruits > 3 mm long .................................................................................................................. \textit{M. officinalis}

**Melilotus albus** Medikus, White Melilot, White Sweetclover. Fields, roadsides, disturbed areas; native of Eurasia. April-October. \textit{M. albus} and \textit{M. officinalis}, nearly identical except in flower color, are apparently incompatible (Isely 1998); they should not be synonymized, as was done by Kartesz (1999). Other differences useful in the determination of faded herbarium specimens are given by Isely (1998): corolla 3.5-5 mm long, the wing petals about as long as the keel (\textit{M. albus}) vs. corolla 5-7 mm long, the wing petals generally longer than the keel (\textit{M. officinalis}). [= I, WH, Z; = \textit{M. alba} – RAB, C, F, G, S, SE, W, WV, orthographic variant; < \textit{M. officinalis} – K]

**Melilotus sulcatus** Desfontaines, Mediterranean Sweetclover. Reported for AL by Kartesz (2010) based on misidentified specimens. [not keyed; not mapped; rejected as a component of our flora]
Mimosa Linnaeus 1753 (Mimosa)

A genus of about 500 species, herbs, shrubs, trees, and vines, of tropical, subtropical, and warm temperate areas, especially America. Barneby (1991) and Beard (1963) argue that there are no characters which serve to separate Schrankia from Mimosa.

Identification notes: Unmistakable in our flora for its bipinnate leaves, with tiny (2-4 mm long) leaflets, responding to touch by closing.

1 Plant unarmed .............................................................................................................................................................................. M. strigillosa
1 Plant armed.
2 Pinnae (1-) 2 pairs per leaf .................................................................................................................................................................. M. pudica
2 Pinnae 6-16 (-22) pairs per leaf.
3 Woody shrubs, to 4 m tall .................................................................................................................................................................. M. pellita
3 Sprawling vines.
4 Leaflets without apparent secondary veins; pinnae 4-8 (-11) pairs per leaf .................................................................................. M. microphylla
4 Leaflets with evident (sometimes weakly so) secondary veins; pinnae 3-5 (-6) pairs per leaf ...................................................... M. quadrivalvis var. floridana

Mimosa microphylla Dryander, Eastern Sensitive-briar. Dry woodlands and forests, especially sandhills, disturbed areas. June-September, August-November. DE, WV, and MO south to FL and e. TX. A form with smaller fruits (3-5 cm long vs. 5-12 cm long) has been variously treated as a species [Leptoglottis chapmanii – S, Schrankia chapmanii] or a "recurrent fruit-form genotype" [phase brachycarpa of Isely (1973)]. [= K; = M. quadrivalvis Linnaeus var. angastata (Torrey & A. Gray) Barneby – C, I, WH, Y; = Schrankia microphylla (Dryander) J.F. Macbride – RAB, F, G, W; = Schrankia microphylla (Dryander) J.F. Macbride var. microphylla – SE; > Leptoglottis microposetoschilla (Dryander) Britton & Rose – S; > Leptoglottis chapmanii Small ex Britton & Rose – S; > Schrankia microphylla "phase brachycarpa" – Z; > Schrankia chapmanii (Small ex Britton & Rose) F.J. Hermann]

Mimosa pudica Linnaeus. Sensitive plant, Shameplant. Disturbed areas; perhaps only a waif in our area. [= I, K, S, SE, WH]

Mimosa quadrivalvis Linnaeus var. floridana (Chapman) Barneby, Florida Sensitive-briar. Xeric sandhills and other dry, sandy habitats. A Southeastern Coastal Plain endemic: GA south into FL. This taxon is distinct at the specific level from M. quadrivalvis and nomenclatural adjustments are forthcoming (Flores-Cruz et al. 2004). [= I, K, WH, Y; > Leptoglottis floridana (Chapman) Small ex Britton & Rose – S; = Schrankia microphylla (Dryander) J.F. MacBride var. floridana (Chapman) Isely – SE]

Mimosa strigillosa Torrey & A. Gray, Powderpuff Mimosa. Floodplain forests, open wet areas. A Southeastern Coastal Plain endemic: e. GA south to FL, west to TX. It might be expected in se. SC (see SE, Y, Z). [= I, K, S, SE, WH, Y, Z]

Mucuna Adanson 1763 (Velvetbean)

* Mucuna pruriens (Linnaeus) A.P. de Candolle. Velvetbean, Bengal Bean, Florida Bean. Disturbed areas, fields, cultivated and sporadically established in disturbed areas; native of se. Asia. [= I, SE; > M. pruriens var. pruriens – K; > Stizolobium deeringianum Bort – S; > M. deeringiana (Bort) Merrill]

Neptunia Loureiro 1790 (Neptunia)
FABACEAE

1 Leaflets 9-15 pairs per pinna; stipules 2-4 mm long; all flowers perfect, with functional stamens; stipe of fruit 4-14 mm long. .............. N. lutea
1 Leaflets (12-) 15-25 pairs per pinna; stipules 4-10 mm long; flowers in the lower part of the inflorescence with flattened staminodes; stipe of fruit 2-5 mm long ................................................................. N. pubescens var. pubescens

Neptunia lutea (Leavenworth) Bentham, Yellow Neptunia. Savannas, prairies, roadsides. AL west to OK and TX. [= I, K, S, SE, Z]
Neptunia pubescens Bentham var. pubescens, Tropical Neptunia. Savannas, sandhills, scrub, prairies, roadsides. AL and FL west to TX and south to Argentina. [= I, K, SE, Z; > N. floridana Small – S; < N. pubescens – WH; > Neptunia pubescens var. floridana (Small) B.L. Turner]

Orbexilum Rafinesque 1832 (Scurfpea, Sampson’s-snakeroot)

1 Leaves unifoliolate; [subgenus Poikadenia] ........................................................................................................... O. virgatum
1 Leaves with 3-7 leaflets.

2 Leaves palmately (3-) 5-7 foliolate, the leaflets linear to very narrowly oblanceolate, 2-7 cm long, 0.5-2.0 (-3.5) mm wide, > 10× as long as wide; [subgenus Orbexilum] ........................................................................................................... O. lupinellum
2 Leaves pinnately 3-foliolate, the leaflets orbicular, ovate, elliptic or lanceolate, > 8 mm wide, 1-8× as long as wide.

3 Leaflets 1.5-7 cm wide; [subgenus Orbexilum]
4 Upper leaf surfaces lacking glands; leaflets 3.7-5.5 cm long; [endemic to Rock Island, Jefferson Co. KY and now considered extinct] ........................................................................................................... O. stipulatum
4 Upper leaf surfaces glandular; leaflets 4-12 cm long.
5 Leaflets subcordate, 4-7 cm wide, 1-1.5× as long as wide, glandular-punctate above and below, the apex obtuse; calyx stipitate-glandular; petals 8-10 mm long; [endemic to Polk Co. NC] ........................................................................................................... O. macrophyllum
5 Leaflets rounded at base, 2-4 cm wide, 1.5-2.5× as long as wide, glandular or sparsely glandular above, the apex acute; calyx lacking stipitate glands; petals 5-7 mm long; [widely scattered from w. VA and w. NC westward] ........................................................................................................... O. onobrychis
3 Leaflets 0.8-2 cm wide, 2.5-7.5× as long as wide; [subgenus Poikadenia]
6 Flowers 8-10 mm long; [of s. AL westward] ........................................................................................................... [O. simplex]
6 Flowers 5-7 mm long; [collectively widespread in our area].
7 Calyx tube, fruits, and bracts of the inflorescence glandular (rarely slightly glandular-punctate); leaflets eglandular below (rarely slightly punctate); hairs on calyx 0.7-1.0 mm long; upper 2 calyx teeth 1.0-1.5 mm long, lateral teeth 1.5-2.0 mm long, lower calyx tooth 2.0-3.0 mm long. .......................................................................................................................... O. pedunculatum var. pedunculatum
7 Calyx tube, fruits, and bracts of the inflorescence conspicuously glandular-punctate; leaflets conspicuously glandular-punctate below; hairs on calyx 0.3-0.5 mm long; upper 2 calyx teeth 0.7-1.0 mm long, lateral teeth 1.2-1.5 mm long, lower calyx tooth 1.7-2.0 mm long. .......................................................................................................................... O. pedunculatum var. psoralioides

Orbexilum lupinellum (Michaux) Isely, Lupine Scurfpea. Sandhills. May-July; July-October. This peculiar species is a Southeastern Coastal Plain endemic, ranging from sc. and se. NC, south to c. peninsular FL, s. AL, and e. GA. The very peculiar leaves, palmately 5-7-foliolate with "oblique" leaflets, make the species unmistakable. First reported for SC by McMillan et al. (2002). [= K; = Psoralea lupinellum Michaux - RAB; = Orbexilum lupinellum – I, SE, WH, Z, orthographic variant; = Rhytidomene lupinellus (Michaux) Rydberg – S]

Orbexilum macrophyllum (Rowlee in Small) Rydberg, Bigleaf Scurfpea. Wooded slopes of mountain on Blue Ridge escarpment, precise habitat not known (probably nutrient-rich dry woodlands). June; July-August? This species was discovered on 18 June 1897 and subsequently collected on 8 June 1899 by E.C. Townsend, somewhere on the double peak of Tryon Mountain and White Oak Mountain, Polk County, NC, a phytogeographically interesting area with disjunct, endemic, and relictual species largely of midwestern affinities. It is currently presumed to be extinct, following a number of unsuccessful attempts to relocate it. Isely (1990) states that the assignment of "this distinctive species" to Orbexilum is "reasonably assumptive," since fruits have never been seen. [= I, K, S, SE, Z; = Psoralea macrophylla Rowlee in Small – RAB, W]

Orbexilum onobrychis (Nutall) Rydberg, Lanceleaf Scurfpea. In nutrient-rich, open or semi-open areas. June-July; August-October. Primarily a species of prairies and prairie-like areas of OH and KY west to se. IA and e. MO. O. onobrychis also occurs (at least formerly) as a rare disjunct in the mountains of w. NC, nw. SC, w. VA, and e. TN. The only report for NC was in the 1800's. [= G, I, K, S, SE, Z; = Psoralea onobrychis Nutall – RAB, F, G, W]
Orbexilum pedunculatum (P. Miller) Rydberg var. pedunculatum, Western Sampson's-snakeroot. Open woodlands. May-July; July-September. Var. pedunculatum, the western and more widespread variety, occurs primarily west of the Blue Ridge, with scattered occurrences in and east of the Blue Ridge. Its range is s. OH, s. IN, s. IL, c. MO, and se. KS, south to sw. NC, sc. SC, sw. GA, s. AL, s. LA, and e. TX. [= C, I, K, SE, Z; = Psoralea psoralioides (Walter) Cory var. eglandulosa (Elliott) F.L. Freeman – RAB, F, G, GW, W; = Orbexilum pedunculatum – WH]

Orbexilum psoralioides (Walter) Isely, Eastern Sampson's-snakeroot. Savannas, open woodlands. May-July; July-September. Var. psoralioides, the eastern variety, occurs primarily on the Atlantic Coastal Plain, ranging from e. VA to ne. FL and Panhandle FL, inland to the Piedmont of NC and SC. [= K; = Psoralea psoralioides (Walter) Cory var. psoralioides – RAB, F, G, GW; = Orbexilum pedunculatum var. gracile (Torrey & A. Gray) Rydberg – S; < Orbexilum pedunculatum – WH]

Orbexilum simplex (Nuttall ex Torrey & Gray) Rydberg. Prairies, open woodlands. AR and OK south to s. AL, MS, e. and w. LA, and e. TX; perhaps disjunct in IL. [= I, K, S, SE, Z]

Orbexilum stipulatum (Torrey & Gray) Rydberg. Rocky limestone glade. So far as is known, once endemic to Rock Island in the Ohio River, Jefferson Co., KY, and now presumed extinct because of near obliteration of the only known site by dam-building and industrial construction (Baskin, Isely, & Baskin 1986). [= C, I, K, SE, Z; = Psoralea stipulata Torrey & Gray – F, G]

Orbexilum virgatum (Nuttall) Rydberg, Slender Leather-root. Sandhills. Se. GA (or SC?) south to ne. FL. A collection by Curtiss is labeled as from South Carolina. [= I, K, S, SE, WH, Z; = Psoralea virgata Nuttall]

Parkinsonia Linnaeus 1753 (Jerusalem Thorn)

* Parkinsonia aculeata Linnaeus, Jerusalem Thorn, Retama, Horse-bean, Mexican Palo Verde. Disturbed areas; native of sw. North America. May. Rarely established or spread from cultivation in our area, more commonly so in much of FL. [= I, K, S, SE, Y, WH, Z]

Pediomelum Rydberg 1919 (Buckroot, Prairie-turnip)

1 Flowering calyx 1.5-2.5 mm long, the legume exserted out of it at maturity; leaves 3-5-foliolate; [of MS and KY and westward]; [former genus Psoralioides].........................................................................................................................P. species 1

1 Flowering calyx 7-10 mm long, the legume mostly included within it even at maturity; leaves (1-) 3-7 foliulate; [of TN and AL and eastward].

2 Plants acaulescent, 1-2 dm tall; leaves (4-) 5-7-foliolate; [plants of calcareous glades of the Interior (nw. GA, TN, n. AL)]; [subgenus Disarticulatum]........................................................................................................................................P. subacaulis

2 Plants acaulescent, 3-10 dm tall; leaves (1-) 3 (-5)-foliolate; [plants of sandhills of the Coastal Plain and rocky woodlands of the lower Piedmont]; [subgenus Pediomelum].

3 Inflorescence loose (much of the axis exposed); leaflets (1-) 3; leaflets < 2× as long as wide, petiolules 5-9 mm long; [of longleaf pine sandhills of the Coastal Plain]......................................................................................................................P. canescens

3 Inflorescence congested (the axis usually concealed); leaflets 3 (-5); leaflets > 2× as long as wide, petiolules 1-3 mm; [of rocky woodlands of the lower Piedmont].......................................................................................................................P. piedmontanum

Pediomelum canescens (Michaux) Rydberg, Buckroot, Eastern Prairie-turnip, Hoary Scurfpea. Sandhills. May-July; July-October. A Southeastern Coastal Plain endemic: se. VA south to c. peninsular FL, Panhandle FL, and s. AL. This uncommon species tends to occur as very widely scattered individuals in sandhill habitats, rarely with more than a few seen at a time. It is related to P. esculentum (Pursh) Rydberg, the "prairie potato," prized by early travelers across the prairies for its edible tubers. An interesting collection label (by R.E. Wicker, collected in 1942, the specimen at NCU) mentions both the edible tubers and the characteristicly sparse population structure of the species. "Not uncommon near Pinehurst in ... open places in sandy pine woods... but usually only one plant at a time. Tuber hard, dark brown, about size of a medium-sized Irish potato, somewhat ventral-elongated with roots coming from pointed base. Internal pure white, apparently almost entirely starch... Mr. Wicker says that he rather likes to take a bit of it and chew when fresh, has a rather condiment taste, but does not think it well to eat..."

Because of its rarity, P. canescens should not (of course) be eaten. Because of its habit, that of a very bushy, tumbleweed-like
plant, it superficially most closely resembles various *Baptisia* species, but it is easily separated by its rather dense and soft pubescence (our *Baptisia* are all glabrous or rather inconspicuously puberulent, except the very unifoliolate *B. arachnifera*). [= C, I, K, S, SE, WH, Z; = *Psoralea canescens* Michaux – RAB, F, G]

**Pediomelum species 1**, Gray Scurf-pea. Prairies. KY to MT, south to TX and n. Mexico; disjunct in MS. A recent study (Egan & Cranfill 2008) shows that this species belongs in *Pediomelum*, not *Psoralidium*; the new combination has not yet been made. [= *Psoralidium tenuiflorum* (Pursh) Rydberg – C, I, K, SE, Z; = *Psoralea tenuiflora* Pursh – F, G]

**Pediomelum subacaula** (Torrey & A. Gray) Rydberg, Nashville Breadroot. Limestone glades. E. TN and nw. GA west to c. TN and nw. AL. [= I, K, SE, Z; = *P. subacaulis* – S, orthographic variant]

---

*Phaseolus* Linnaeus 1753 (Bean)

1 Raceme axes slender, flexuous; [plants native perennials]; [section Paniculati; subsection Volubili].
2 Stems climbing and twining on other vegetation; leaflets 3-10 cm long, usually not lobed and only slightly reticulate; [plants of various habitats].
3 Corolla 1.5-2 cm long, scarlet red or bright lavendar; racemes exserted; plants twining; [section Coccinei]...... [*P. coccineus* ssp. *coccineus*]
4 Legumes nearly terete at maturity, about 8 mm in diameter; corolla usually pink-purple, at least in part; [section Phaseoli]...........

* *Phaseolus cocineus* Linnaeus ssp. *coccineus*, Scarlet Runner Bean. Infrequently cultivated, most as an ornamental in home gardens, rarely found as a waif; native of tropical America. [= Z; < *P. coccineus* – C, F, G, I, K, SE; > *P. coccineus* ssp. *coccineus* var. *coccineus* – Y]

* *Phaseolus lunatus* Linnaeus, Lima Bean. Frequently cultivated (both commercially and in home gardens), rarely found as a waif; native of tropical America. [= I, K, S, SE, WH, Y, Z; = *P. limensis* Macfadyen – F]

* *Phaseolus polystachios* (Linnaeus) Britton, Sterns, & Poggenburg, Wild Bean, Wild Kidney Bean. Thickets, woodlands. July-September; August-October. S. ME west to OH, IL, and MO, south to s. FL and TX. [= RAB, C, G, I, SE, WH, WV; > *P. polystachios* var. *polystachios* – F; > *P. polystachios* var. *aquilonius* Fernald – F; = *P. polystachios* var. *polystachios* – K, WH; = *P. polystachyus* – S, orthographic variant; = *P. polystachyus* ssp. *polystachyus* – Y; = *P. polystachyus* var. *polystachyus* – Z]

* *Phaseolus sinatus* (Nuttall) Torrey & A. Gray, Sandhills Bean. Sandhills. July-September; August-October. Sc. NC south to s. FL, west to s. MS, a Southeastern Coastal Plain endemic. Freytag & DeBouck (2002) describe *P. sinatus* and *P. polystachios* as being "very distinct and there seems to be no intergradation," yet treat them as only subspecifically distinct; I choose to recognize them as species. Not easy to distinguish in sterile condition from *Strophostyles*. [= RAB, I, S, SE, WH; = *P. polystachios* (Linnaeus) Britton, Sterns, & Poggenburg var. *sinatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – K, WH; = *P. polystachyus* ssp. *sinatus* (Nuttall) Freytag – Y; = *P. polystachyus* var. *sinatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – Z]

* *Phaseolus vulgaris* Linnaeus, Garden Bean, Green Bean, Snap Bean, String Bean, Kidney Bean, Pole Bean, Bush Bean. Frequently cultivated (both commercially and in home gardens), rarely found as a waif; native of tropical America. [= C, F, G, I, K, S, SE; > *P. vulgaris* var. *vulgaris* – F; > *P. vulgaris* var. *humilis* Alefeld – F; < *P. vulgaris* var. *vulgaris* – Z]

* *Pisum* Linnaeus 1753 (Pea)

### Pueraria

**Pueraria** A.P. de Candolle 1825 (Kudzu)

Rhynchosia latifolia Nuttall. Pinelands and woodlands, roadsides. May-July. W. TN s. MO, and OK south to c. MS, s. LA, and se. TX. [= I, K2, SE]

Rhynchosia michauxii Vail. Sandhills, dry hammocks, disturbed areas. June-August; August-October. Se. NC (one record) and e. GA (one record) south to s. peninsular FL, west to Panhandle FL. The disjunct sites are of uncertain origin. [= I, K, SE, Y; = R. americana (Houston ex P. Miller) M.C. Metz – RAB (the identification as R. americana based on misidentification of the specimen)]

Rhynchosia tomentosa (Linnaeus) Hooker & Arnott. Xeric woodlands and forests, sandhills, edges, open areas. June-August; August-October. SE south to n. peninsular FL, west to LA, and north in the interior to e. and c. TN. [= Dolicholus minus (Linnaeus) Medikus – S]

Rhynchosia mollissima (Elliott) S. Watson. Sandhills, scrub. June-August; August-October. Se. SC (Beaufort County, documented by an old specimen [GH] by Mellichamp from the vicinity of Bluffton, where it was probably native) and e. GA south to c. peninsular FL. [= S; = Rhynchosia tomentosa (Linnaeus) Hooker & Arnott var. mollissima (Elliott) Torrey & A. Gray – I, K, SE, WH, Y; = R. mollissima (Elliott) S. Watson – S]

Rhynchosia reniformis A.P. de Candolle, Dollardweed. Sandhills. June-September; August-October. Se. NC south to s. FL, west to c. TX; disjunct (introduced?) in e. TN (Chester, Wofford, & Kral 1997). [= RAB, K, SE, WH, Y; = R. simplicifolia (Walter) Wood – S]

Rhynchosia tomentosa (Linnaeus) Hooker & Arnott. Xeric woodlands and forests, sandhills, edges, open areas. June-August; August-October. DE south to n. peninsular FL, west to LA, and north in the interior to e. and c. TN. [= Rhynchosia tomentosa (Linnaeus) Hooker & Arnott var. tomentosa – C, I, K, SE, WH, Y; < R. tomentosa – RAB, F, G, W; > R. erecta (Walter) A.P. de Candolle – S; > R. intermedia (Torrey & Gray) Small – S]

Robinia Linnaeus 1753 (Locust)

A genus of 5-8 species, shrubs and trees, of e. and sw. North America. The Southern Appalachians are a center of diversity of Robinia, with active hybridization, introgression, and formation of local (sterile) races involved; a fully satisfying taxonomic treatment of such a situation is not possible. Isely & Peabody's (1984) treatment seems a reasonable approach, and I have largely followed it here, differing in the rank of some of the taxa. References: Isely & Peabody (1984)=Z; Ashe (1922)=Y; Isely (1998)=I.

Identification notes: The key is differently structured than that in RAB or SE; it is presented as an alternative. This treatment may be altered substantially prior to publication. A variety of hybrids (including some cultivars) are known, including the following:

1 Corolla pink to pink-purple (rarely white or nearly so), (1.5-) 2.0-2.5 cm long; peduncles, pedicels, and calyces glandular-pubescent, hispid, or with short-stalked to sessile glands; plant a small to large tree.......................................................... R. pseudoacacia

1 Corolla white, 1.5-2.0 cm long; peduncles, pedicels, and calyces velvety-puberulent, the hairs neither glandular nor hispid; plant a small to large tree.......................................................... R. pseudoacacia

2 Twigs and leafstalks conspicuously hispid with hairs 1-5 mm long, these stiff, thick-based, and typically persistent several years.

3 Plants fruiting abundantly; shrubs 0.6-2 (-3) m tall; leaflets relatively broad, mostly 1.2-1.8× as long as wide...................... R. hispida var. fernaltis

3 Plants sterile (rarely fruiting sparsely); shrubs 0.5-1.5 m tall; leaflets relatively narrow, mostly 1.8-2.5× as long as wide................................. R. hispida var. hispida

2 Twigs and leafstalks either viscid with sessile or short-stalked glands, or densely glandular-pubescent (the hairs 0.5-2 mm long), or tomentulose, or sparsely hispid with weak, non-persistent hairs.

4 Leaflets usually 13-21, permanently but inconspicuously appressed-pubescent beneath; bracts (evident only before anthesis) aristate; plants never with long, hispid pubescence.

5 Twigs and peduncles finely glandular-pubescent with hairs 1 (-2) mm long; plants abundantly pod-forming................................. R. hartwigii

5 Twigs and peduncles viscid with sessile or short-stalked glands (the racemes sometimes with some glandular pubescence); plants sterile or forming pods.............................................................. R. viscosa

4 Leaflets usually 9-13, initially appressed-silky but later glabrate beneath; bracts (evident only before anthesis) not aristate; plants with or without sparse long, hispid pubescence.

6 Plants fruiting abundantly; shrubs 1-3 m tall .......................................................... R. hispida var. kelseyi

6 Plants sterile (rarely fruiting scantly); shrubs or small trees, 0.4-3 (-8) m tall.

7 Shrubs or small trees, 1-3 (-8) m tall, much branched, the stems and branches relatively straight, the nodes usually lacking spines; leaflets 1.5-3 cm long............................................ R. hispida var. rosea

7 Shrubs, 0.4-1 m tall, little branched, the stems and branches typically zigzag (bent at each node), the nodes usually with spines; leaflets 1-2 (-3) cm long...................................................... R. nana

FABACEAE

448
Robinia hartwigii Koehne, Granite Dome Locust, Highlands Locust, Hartwig's Locust. Forests and outcrop edges on high elevation granitic domes, also clearings. June-July; August-September. Apparently endemic to several mountains within a 5 km radius of Highlands, NC. While certainly related to and apparently hybridizing with R. viscosa, R. hartwigii seems worthy of recognition as a species. The original spelling (in Koehne 1913) is "hartwigii;" it is not clear why the variants (see synonymy) arose. [= RAB, S = R. viscosa var. hartwegii (Koehne) Ashe – K, orthographic variant; = R. viscosa var. hartwigii – SE, Z; < R. viscosa – W; = R. viscosa var. hartwegii – Y, orthographic variant]

Robinia hispida Linnaeus var. fertilis (Ashe) Clausen, Arnot Bristly Locust. Woodlands and forests. May-June; July-August. Apparently endemic to the Southern Appalachians of w. NC and e. TN. A horticultural selection of var. fertilis, the Arnot Bristly Locust, is used as a soil binder. [= C, F, K, SE, Z; < R. hispida – RAB; > R. fertilis Ashe – S; > R. grandiflora Ashe – S, Y; > R. pedunculata Ashe – S; < R. hispida – W]

Robinia hispida Linnaeus var. kelseyi (Cowell ex Hutchinson) Isely, Kelsey's Locust. Mountain woodlands, introduced elsewhere. April-July; July-October. Traditionally considered an endemic originally restricted to w. NC, but SE and Z suggest that var. kelseyi may have been only of horticultural origin. [= K, SE, Z; = R. kelseyi Cowell ex Hutchinson – RAB, G, S, Y; < R. hispida – W]

Robinia hispida Linnaeus var. rosea Pursh, Boynton's Locust. Mountain woodlands. April-July. Originally distributed from w. NC and e. TN south to nw. SC, n. GA, and ne. AL, now occasionally found outside that range as an escape from cultivation. [= C, K, SE, Z; = R. boytonii Ashe – RAB, G, S, Y; < R. hispida – W]

Robinia viscosa Ventenat, Clammy Locust. Mountain forests and woodlands, roadsides, disturbed areas, rare in wild, uncommon as an escape. May-July; July-August. Originally a Southern and Central Appalachian endemic, ranging from PA south through w. MD, w. VA, e. WV, w. NC, and e. TN, to n. GA and n. AL, now much more widespread as an escape from cultivation. Reported for GA Coastal Plain (Marion County) (Carter, Baker, & Morris 2009). [= RAB, F, G, S, WV; = R. viscosa var. viscosa – C, K, SE, Y, Z; < R. viscosa – W (also see R. hartwigii)]

**Scorpiurus** Linnaeus 1753 (Scorpion’s-tail)

A genus of 2-4 species, herbs, of Mediterranean Europe west into w. Asia.

* Scorpiurus muricatus Linnaeus. Disturbed areas; native of Mediterranean Europe. [= K] {add synonymy}

**Securigera** A.P. de Candolle 1805 (Crown-vetch)
FABACEAE

A genus of about 12-13 species, annual and perennial herbs, of Eurasia. This genus is sometimes included in Coronilla, but is apparently better separated (Isely 1998). References: Isely (1998) = I.

1 Corolla yellow; annual; [rare waist].............................................................................................................................................. S. securidaca
1 Corolla white and pink; perennial; [common alien, planted and established].............................................................................. S. varia

* Securigera securidaca* (Linnaeus) Degen & Dörfler. Disturbed areas; native of Europe. Reported by Small (1933); rejected by Isely (1990) on the basis of no material seen to document the occurrence. This taxon’s status as part of our flora is uncertain. [= I, SE, = Bonavera securidaca (Linnaeus) Reichenbach – S; = Coronilla securidaca Linnaeus – K]

* Securigera varia* (Linnaeus) Lassen, Crown-vetch. Roadbanks, woodland borders; native of Europe. This species, generally known as *Coronilla varia*, is now widely used to stabilize road-cuts. [= I; = Coronilla varia Linnaeus – RAB, C, F, G, K, SE, W, WH, WV]

Senna P. Miller 1754 (Senna, Sicklepod, Wild Coffee)

1 Racemes spike-like, 3-6 (-10) dm long; legume winged; [section Senna, series Pictae] ......................................................... S. alata
1 Racemes not spike-like, < 3 dm long; legume not winged; [section Chamaefistula].

2 Plant a shrub, 1-3 m tall; gland between the lowest pair of the acute or acuminate leaflets; [plants aliens, barely established in the vicinity of cultivation]; [section Chamaefistula, series Coluteoideae].

3 Glands between the lowest pair of leaflets only; leaflets 3-5x as long as wide............................................................... S. corymbosa
3 Glands between each pair of leaflets; leaflets 2-3x as long as wide, acuminate.......................................................... S. septemtrionalis

2 Plant an herb, 0.1-1.5 m tall; gland near the base of the petiole (except in *S. occidentalis* which has leaflets rounded to emarginate at the apex); [plants natives, or aliens generally well-established and weedy].

4 Leaflets obovate, the apex rounded to emarginate, 1.3-2x as long as wide; gland between the lowest pair of leaflets; [section Chamaefistula, series Trigonelloideae] .......................................................... S. obtusifolia
4 Leaflets ovate or narrowly elliptic, the apex acute or acuminate, 2-3.5x as long as wide; gland near the base of the petiole.

5 Leaflets 1.5-3.0 cm wide, in 3-6 pairs; racemes with 1-5 flowers; [section Chamaefistula, series Basiglanduloseae] ........ S. occidentalis
5 Leaflets 0.7-2.0 cm wide, in 6-10 pairs; racemes with 5-10 (-25) flowers; [series Temperatae].

6 Legume 5.5-8 mm wide, with broad, nearly square segments, usually pilose initially, the hairs up to 0.8-2 mm long (sometimes glabrate); ovary lanate with hairs to 1 mm long; ovules 10-15 (-18); petiolar gland broadest above the middle................ S. hebecarpa
6 Legume 8-11 mm wide, with narrow segments (much shorter than broad), glabrous (or with a few hairs, these < 0.6 mm long); ovary strigulose with hairs to 0.5 mm long; ovules 20-25 (-30); petiolar gland usually broadest at or below the middle.................

............................. S. marilandica

* Senna alata* (Linnaeus) Roxburgh, Emperor's Candlesticks, Candlestick Plant. Disturbed areas; native of tropical America. September-November. Planted and slightly naturalized from s. AL and FL west to OK and TX. [= I, K, SE, WH, Y; = Cassia alata Linnaeus – Z]

* Senna corymbosa* (Lamarck) Irwin & Barneby. Cultivated as an ornamental, rarely persistent or spreading to disturbed areas; native of South America. August-September. reported for AL (Diamond & Woods 2009). [= I, K, SE, WH, Y; = Adipera corymbosa (Lamarck) Britton & Rose – S; = Cassia corymbosa – X, Z]

* Senna hebecarpa* (Fernald) Irwin & Barneby, Northern Wild Senna. Open wet habitats, moist forests. July-August; August-November. MA and s. NH west to s. WI, south to sc. NC, e. TN, s. IN, and c. IL. [= C, I, K, SE, Y; = Cassia hebecarpa Fernald – RAB, G, W, X, Z; > C. hebecarpa var. hebecarpa – F, WV; > C. hebecarpa var. longipila E.L. Braun – F, WV; = Ditremexa marilandica (Linnaeus) Britton & Rose – S, misapplied]

Senna ligustrina (Linnaeus) Irwin & Barneby, Privet Wild Senna. Hardwood hammocks, wet disturbed habitats. N. peninsular FL south to s. FL; Central America; West Indies. [= I, K2, SE, WH; = Cassia ligustrina Linnaeus; ? Peiranisia bahamensis (P. Miller) Britton & Rose - S] [not yet keyed; add X, Y, Z synonymy]

* Senna marilandica* (Linnaeus) Link, Maryland Wild Senna. Dry to moist forests, especially on greenstone and diabase barrens and rocky woodlands, thickets, woodland borders, sometimes somewhat weedy. July-August; August-November. S. MA and s. NY west to e. NE, south to c. peninsular FL and c. TX. [= C, I, K, SE, WH, Y; = Cassia marilandica Linnaeus – RAB, F, G, W, WV, X, Z; = Ditremexa medegiri (Shafer) Britton & Rose – S]

* Senna obtusifolia* (Linnaeus) Irwin & Barneby, Sicklepod, Coffeeweed. Fields (especially soybean fields), disturbed areas; probably native of the New World Tropics. July-September; August-November. The species is now pantropical. [= C, I, K, SE;
**Senna** Adanson 1760 (Rattlebox, Sesan)

A genus of about 50-60 species, annual herbs, perennial herbs, shrubs, and trees, of tropical, subtropical, and less commonly warm temperate regions of the Old and New World, here circumscribed to include *Glottidium*, following Lewis et al. (2005).

1 Corolla 8-9 mm long; legume flat; leaves with 8-13 pairs of leaflets ................................................................. *S. vesicaria*

1 Corolla 9-25 mm long; legume quadrangular or 4-winged; leaves with 10-35 pairs of leaflets.

2 Legume quadrangular in cross-section, the corners not winged, 15-20 cm long, 0.3-0.5 cm wide; corolla 10-15 (-20) mm long, yellow, often marked with purple; leaves with 15-35 pairs of leaflets; [plant a robust herb, to 4 m tall] ........................................... *S. occidentalis*

2 Legume quadrangular or conspicuously 4-winged longitudinally, 3-8 cm long, 0.5-1.5 cm wide; corolla 9-25 mm long, yellow, orange, or scarlet; leaves with 10-20 pairs of leaflets; [plant a shrub, to 4 m tall].

3 Legume quadrangular or slightly flanged, 0.5-0.7 cm wide; corolla 9-12 mm long............................................................. *S. herbacea*

3 Legume conspicuously 4-winged longitudinally, 1-1.5 cm wide; corolla 13-25 mm long.

4 Corolla yellow; pedicels 0.5-1.0 cm long; legume blunt or abruptly acuminate to a beak .............................................. *S. virgata*

4 Corolla orange or red; pedicels 0.5-1.2 (-1.5) cm long; legume acuminate or tapering to a beak ......................................... *S. punicea*

*Sesbania drummondii* (Rydberg) Cory, Rattlebox, Poison-bean. Disturbed areas, spoil, marsh edges, ditches. Native on the Gulf Coast west to s. TX and Mexico, the exact eastern edge of the native range uncertain, perhaps w. FL Panhandle. First reported for GA and SC by Townsend et al. (2000), where clearly introduced. [= GW, I, K1, K2, SE, WH; = *Daubentonia drummondii* Rydberg – S]

*Sesbania herbacea* (P. Miller) McVaugh, Sesan, Coffee-weed, Indigo-weed, Peatree. Ditches, wet fields, perhaps native only in the deeper South. July-September; August-November. Native distribution uncertain, perhaps e. NC south to s. FL, west on the Coastal Plain and Mississippi Embayment to TX, south into Mexico. [= K1, WH; = *S. exaltata* (Rafinesque) Cory – RAB, C, F, G, I, K2, SE; = Sesbania macrocarpa Munhernberg ex Rafinesque – GW; = *Sesbania exaltata* (Rafinesque) Rydberg – S]

* Sesbania punicea* (Cavanilles) Bentham, Rattlebox, Scarlet Wisteria-tree, Purple Sesan. Ditches, wet fields, marshes, ponded wetlands, wet pinelands; presumably native of South America. June-October; August-November. [= GW, I, K1, K2, SE, WH; = *Daubentonia punicea* (Cavanilles) A.P. de Candolle – RAB, S]

*Sesbania vesicaria* (Jacquin) Elliott, Bladderpod, Bagpod. Ditches, marshes, disturbed wet areas. July-September; August-November. The original native distribution of *S. vesicaria* is uncertain; its distribution is from ne. NC south to s. FL, west to e. OK and se. TX, and Isely (1998) states that it is unknown from outside the United States; occurrences in provinces inland of the Coastal Plain seem to represent introductions into artificial wetlands (such as ditches). [= GW, K2, WH; = *Glottidium vesicarium* (Jacquin) R.M. Harper – RAB, I, K1, S, SE]

* Sesbania virgata* (Cavanilles) Poiret. Disturbed areas; native of South America. June-October; August-November. [= I, K1, K2, SE, WH]

**Strophostyles** Elliott 1823 (Sand Bean, Woolly Bean, Wild Bean)

Key adapted from SE.

1 Legumes 2-4 cm long, permanently pubescent; corolla 5-8 mm long; leaves permanently pubescent on the upper surface; seeds glabrous.

.............................................................................................................................................................

1 Legumes 3-8 cm long, glabrate at maturity; corolla 8-15 mm long; leaves usually glabrate on the upper surface; seeds pubescent.

2 Bracteoles (immediately subtending the calyx) 2-3 mm long, equaling or exceeding the calyx tube; leaflets usually prominently 3-lobed; terminal leaflet 2.5-3.5 cm wide; plant an annual .............................................................................................................................................

S. leiosperma

2 Bracteoles (immediately subtending the calyx) 0.5-1.0 (-1.5) mm long, shorter than the calyx tube; leaflets not lobed; terminal leaflet 0.3-2.0 cm wide; plant a perennial .............................................................................................................................................

S. helvola

Strophostyles helvola (Linnaeus) Elliott, Annual Sand Bean. Coastal dunes, beaches, dry sandy woodlands, disturbed areas. June-September; August-October. QC west to MN and SD, south to n. peninsular FL and e. TX. See Isely (1986b) for a discussion of the orthography of the epithet. [= RAB, C, G, S, WH, WV; = S. helvula (Linnaeus) Elliott – K, SE, W, Z, orthographic variant; > S. helvola var. helvola – F; > S. helvola var. missouriensis (S. Watson) Britton – F]

Strophostyles leiosperma (Torrey & A. Gray) Piper, Small-flowered Sand Bean. Prairies, glades, barrens, sand bars, disturbed areas. June-September; August-October. IN, WI, MN, and ND, south to FL Panhandle, AL, MS, LA, TX, NM, and AZ; also scattered eastward presumably as introductions. This species is native east to KY and TN; it should be sought inland in prairies, glades, and barrens with midwestern affinities. [= C, F, G, K, SE, WH, Z; = S. pauciflora (Bentham) S. Watson – S]

Strophostyles umbellata (Muhlenberg ex Willdenow) Britton, Perennial Sand Bean. Dry sandy or rocky woodlands, disturbed areas. June-September; August-October. S. NY west to s. IN, s. MO, and KS, south to c. peninsular FL and s. TX. [= RAB, C, F, G, K, S, SE, W, WH, Z; > S. umbellata var. umbellata – F; > S. umbellata var. paludigena Fernald – F]

Stylosanthes Swartz 1788 (Pencil-flower)

Stylosanthes biflora (Linnaeus) Britton, Sterns, & Poggenburg, Pencil-flower. Sandhills, dry to moist (but not wet) pine savannas and flatwoods, dry forests, woodlands, woodland borders, glades, barrens, rock outcrops. June-August; July-October. S. NY west to OH, s. IL, and KS, south to c. peninsular FL and e. TX. The large, adnate stipules are distinctive. Variation in this species (see synonymy) needs additional study. [= RAB, C, I, K, SE, W, WH, WV; > S. biflora var. biflora – F; > S. biflora var. hispidissima (Michaux) Pollard & Ball – F, G; > S. riparia Kearney – G, S; > S. riparia var. riparia – F; > S. riparia var. setifera Fernald – F; > S. biflora – S]

Styphnolobium Schott 1830 (Pagoda Tree)

1 Flowers in terminal panicles; leaflets 13-17 per leaf.............................................................................................................................................

1 Flowers in axillary racemes; leaflets 9-15 per leaf.............................................................................................................................................

Styphnolobium affine (Torrey & A. Gray) Walpers, Eve’s Necklace. Woodlands, disturbed areas. April-June. Sw, AR and OK south to sw. LA and c. TX; disjunct eastwards in se. LA. [= K2; = Sophora affinis Torrey & A. Gray]

* Styphnolobium japonicum (Linnaeus) Schott, Pagoda Tree. Cultivated ornamental, rarely persistent; native of China. Reported as "slightly escaped" in the United States by Isely (1981), but all specimens seen are from cultivated plants. Also reported for VA, MD, PA, and OH (Kartesz 1999). [= Y; = Sophora japonica Linnaeus – I, K, Z]

Tephrosia Persoon 1807 (Goat’s-rue)

1 Corolla bicolored, the standard yellow and the wings pink; racemes terminal; stamens erect; stamens monadelphous; leaves with (9-) 13-23 (-37) leaflets.

2 Inflorescence reduced, foliose, flowers solitary or in small clusters overtopped by leaves; plants < 25 cm tall; leaflets generally < 10 mm long and < 5 mm wide; [restricted to the West Gulf Coastal Plain of sw. GA, adjacent FL and westward] ......................................................T. mohrii

3 Inflorescence terminal, not foliose and overtopped by leaves; plants > 25 cm tall; leaflets generally > 10 mm long and > 5 mm wide; [widespread in our area] ................................................................. T. virginiana

1 Corolla unicolored, initially white or pink, darkening in age to a dark maroon or purple; racemes opposite the leaves (the uppermost appearing terminal); stems decumbent or ascending; stamens diadelphous; leaves with (3-) 5-23 (-27) leaflets.

3 Upper stamen fused with the staminal sheath for part or most of its length (submonadelphous); leaves with (9-) 13-23 (-27) leaflets; [plants from s. AL westward] ................................................................. T. onobrychoides

3 Upper stamen completely separate from the staminal sheath (diadelphous); leaves with (3-) 5-17 (-19) leaflets; [plants collectively widespread in our area].

4 Inflorescences with 1-7 several reduced leaves, mainly borne terminally on the principal axis or branches; bracts generally deciduous...........

4 Inflorescences lacking leaves (sometimes with 1 reduced leaf), mainly borne leaf-opposed; bracts persistent.

5 Petiole 1-4× as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence strongly flattened (2-angled, or rarely, 3-angled) in cross-section; leaflets averaging 25 mm long and 12 mm wide ................................................................. T. floridana

5 Petiole 1/3-1× as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence terete or inconspicuously 2-4-angled in cross-section; leaflets averaging smaller.

6 Leaves with (3-) 5-7 leaflets; petiole 0.5 mm long; stem and fruit hairs < 0.5 mm long ................................................ T. chrysophylla

6 Leaves with (7-) 9-17 (-19) leaflets; petiole 2-15 mm long; some stem and fruit hairs > 0.5 mm long.

7 Inflorescence with 1-3 (-5) nodes; plants inconspicuously pubescent with gray hairs (the hairs appressed or spreading, short to fairly long); leaflets (3-) avg. 5-6 (-7) mm wide, mostly acute; [plants of the Coastal Plain of NC and SC] ................. T. hispidula

7 Inflorescence with 2-20 nodes; plants conspicuously tawny long-pilose with rusty brown hairs; leaflets (6-) avg. 8 (-12) mm wide, mostly obtuse; [plants widespread in our area].

---

**Tephrosia chrysophylla** Pursh, Sprawling Goat’s-rue. Sandhills. E. GA s. to s. FL, and west to s. MS. Rather frequent hybrids between *T. chrysophylla* and *T. floridana* are intermediate in morphology and have been found in AL< FL, GA, and MS; they have been given a hybrid binomial, *T. ×intermedia* (Small) G.L. Nesom & Zarucchi, replacing later name *T. ×floridana* (Vail) Isely, which has been in regular use in the southeastern United States (Neson & Zarucchi 2009). [= I, K, SE, WH, Y; = Cracca chrysophylla (Pursh) Kunze – S]

*Tephrosia cinerea* Linnaeus – *S*. Ashen Hoary-pea. Disturbed areas; native of South America. Reported from an 19th century ballast collection from Mobile, AL. [= I, K2, SE] {not keyed; not mapped; rejected as a component of our flora}

*Tephrosia floridana* (F.G. Dietrich) C.E. Wood, Florida Goat’s-rue. Pine savannas and other pinelands. May-July; June-September. E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. See *T. chrysophylla* for discussion of hybrids between *T. chrysophylla* and *T. floridana*. [= RAB, I, K, SE, WH, Y; = Cracca ambiguag (M.A. Curtis) Kunze – S]

*Tephrosia hispidula* (Michaux) Kuntze – S. Pine savannas and other pinelands. May-August; July-October. E. NC (se. VA?) south to c. peninsular FL, west to se. LA, a Southeastern Coastal Plain endemic. Fernald (1950) reports this species from se. VA. [= RAB, F, I, K, SE, WH, Y; = Cracca hispidula (Michaux) Kunze – S]

*Tephrosia onobrychoides* Nuttall. Dry pinelands. S. AL, n. AR, e. OK, south to s. LA, and sc. TX. [= I, K, SE, Y; = Cracca onobrychoides (Nuttall) Kunze – S]

---

**Tephrosia rugelii** Shuttleworth ex B.L. Robinson. Sandhills. Ne. and Panhandle FL (Jefferson County) south to s. FL. [= I, K, SE, WH; = Cracca rugelii (Shuttleworth ex B.L. Robinson) A.A. Heller – S]

*Tephrosia spicata* (Walter) Torrey & A. Gray. Woodlands. June-August; July-October. S. DE south to s. FL, west to w. LA, north in the interior to se., sc., and sw. TN and se. KY. [= RAB, C, G, K, SE, WH, Y; > T. spicata var. semitonsa Fernald – F; > T. spicata var. spicata – F; = Cracca spicata (Walter) Kunze – S]

*Tephrosia virginiana* (Linnaeus) Persson, Virginia Goat’s-rue. Sandhills, other pinelands, xeric and/or rocky woodlands and forests, outcrops, shale barrens and other barrens, dry roadbanks. May-June; July-October. S. NH west to WI, se. MN, and c. KS, south to c. peninsular FL, c. TX, and nw. TX. [= RAB, C, I, K, SE, W, WV; > T. virginiana var. glabra Nuttall – F, G; > T. virginiana var. virginiana – F, G; < T. virginiana – I, SE, WH, Y (also see T. mohrii); = Cracca virginiana Linnaeus – S; = T. virginiana var. virginiana – Z]

---

**Thermopsis** R. Brown ex Aiton & Aiton f. 1811 (Golden-banner)

1 Legumes erect or strongly ascending, densely villous; stipules clasping, those of the principal leaves 12-25 mm long, 1-5 mm wide; pedicels 2-3 mm long; plants mostly 6-20 dm tall, strict or few-branched. .............................................................. T. villosa

2 Plants from a single woody rootstock, mostly 5-10 dm tall; calyx glabrous or very sparsely pubescent, often also glaucous, the lobes often only 1-1.5 mm long; pedicels glabrate, 4-7 mm long (as long as or longer than the bracts); racemes terminal or lateral; plants flowering (late May-) early June-July; [plants of moderate to high elevations, (300-) 700-2000 m] .............................................................. T. fraxinifolia

3 Standard inconspicuously veined; heads 5-8 mm in diameter, generally with 5-15 (-20) flowers; flowers 2.5-3.5 mm long; pediolule of the terminal leaflet ca. 1 mm long. .............................................................. T. repens

4 Flowers bright yellow (fading brown); [section Chronosemium].

5 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled.

6 Calyx lobes narrowly triangular, about as long as the calyx tube; peduncles axillary along the stolons; stipules scarious-membranaceous; [plant an abundant introduced weed] .............................................................. T. repens

7 Peduncle terminal, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long. .............................................................. T. calcicarinum

8 Peduncle terminal at tip of erect flowering branches; stipules green, foliaceous; [plants rare natives].

9 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).

1 Flowers not bright yellow.

2 Leaves pinnately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long. .............................................................. T. aureum

3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; pedicel of the terminal leaflet 1-3 mm long. .............................................................. T. campestre

4 Flowers borne on distinct pedicels, (1-) 2-10 mm long, these often curving or reflexing in age; flowers white, fading pink with age in most species; [native and alien species]; [section Lotoidea].

5 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m] .............................................................. T. mollis

6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].

7 Peduncle, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long. .............................................................. T. calcicarinum

8 Peduncle terminal at tip of erect flowering branches; stipules green, foliaceous; [plants rare natives].

9 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).

1 Flowers bright yellow (fading brown); [section Chronosemium].

2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long. .............................................................. T. aureum

3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; pedicel of the terminal leaflet 1-3 mm long. .............................................................. T. campestre

4 Flowers bright yellow (fading brown); [section Chronosemium].

5 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m] .............................................................. T. mollis

6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].

7 Peduncle, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long. .............................................................. T. calcicarinum

8 Peduncle terminal at tip of erect flowering branches; stipules green, foliaceous; [plants rare natives].

9 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).

1 Flowers bright yellow (fading brown); [section Chronosemium].

2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long. .............................................................. T. aureum

3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; pedicel of the terminal leaflet 1-3 mm long. .............................................................. T. campestre

4 Flowers bright yellow (fading brown); [section Chronosemium].

5 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m] .............................................................. T. mollis

6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].

7 Peduncle, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long. .............................................................. T. calcicarinum

8 Peduncle terminal at tip of erect flowering branches; stipules green, foliaceous; [plants rare natives].

9 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).

1 Flowers bright yellow (fading brown); [section Chronosemium].

2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long. .............................................................. T. aureum

3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; pedicel of the terminal leaflet 1-3 mm long. .............................................................. T. campestre

4 Flowers bright yellow (fading brown); [section Chronosemium].

5 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m] .............................................................. T. mollis

6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].

7 Peduncle, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long. .............................................................. T. calcicarinum

8 Peduncle terminal at tip of erect flowering branches; stipules green, foliaceous; [plants rare natives].

9 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).

1 Flowers bright yellow (fading brown); [section Chronosemium].

2 Leaves palmately trifoliolate (all leaflets essentially sessile); heads 10-13 mm in diameter; flowers 5-7 mm long. .............................................................. T. aureum

3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; pedicel of the terminal leaflet 1-3 mm long. .............................................................. T. campestre

4 Flowers bright yellow (fading brown); [section Chronosemium].

5 Plants from extensive rhizomes, mostly 3-6 dm tall; calyx pubescent, the lobes 2-2.5 mm long; pedicels villosulous, 2-6 (-10) mm long (shorter than the bracts); racemes terminal; plants flowering late April-early May (-June); [plants of low to moderate elevations, 200-800 m] .............................................................. T. mollis

6 Calyx lobes subulate, distinctly longer than the calyx tube; peduncles terminal, either at tips of the stolons, or at tips of erect flowering branches; stipules green, foliaceous; [plants rare natives].

7 Peduncle, at the tip of the stolon, lacking leaves; pedicels 2-3 mm long. .............................................................. T. calcicarinum

8 Peduncle terminal at tip of erect flowering branches; stipules green, foliaceous; [plants rare natives].

9 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).
Trifolium angustifolium Linnaeus, Narrowleaf Clover. Waste areas near wool-combing mills, perhaps only a waif; native of Mediterranean Europe and w. Asia. Reported for SC (Kartesz 1999), based on specimen at NCU. [= I, K] [not yet keyed]

* Trifolium cernuum Brotero, Nodding-head Clover. Waste areas near wool-combing mills, perhaps only a waif; native of Mediterranean Europ and n. Africa. [= K] [not yet keyed]

* Trifolium depauperatum Desvaux var. depauperatum. Cowbag Clover, Balloon-sack Clover, Poverty Clover. Waste areas near wool-combing mills, perhaps only a waif; native of w. North America (BC south to CA). [= I, K] [not yet keyed]

* * Trifolium fragiferum Linnaeus, Strawberry Clover. Disturbed areas; native of Middle East. Introduced from c. GA (Jones & Coile 1988) and reported from an old collection from se. PA (Rhoads & Klein 1993). [= C, F, G, I, K, SE]

* * Trifolium glomeratum Linnaeus, Cluster Clover. [habit]; native of Mediterranean region. Also reported for SC by Kartesz (1999), but the specimen is actually T. cernuum. [= I, K1, K2, S, SE]

* * Trifolium gracilentum Torrey & A. Gray. Waste areas near wool-combing mills, perhaps only a waif; native of w. North America. [= T. gracilentum var. gracilentum – K1, K2] {not yet keyed; add synonymy}

* * Trifolium hybridum Linnaeus, Alsike Clover. Lawns, fields, roadsides, disturbed areas; native of Europe. April-September. [= RAB, C, G, I, K, S, SE, W, WH, WV; > T. hybridum var. hybridum – F; > T. hybridum var. elegans (Savi) Boiss. – F]

* * Trifolium incarnatum Linnaeus, Crimson Clover. Fields, disturbed areas; native of Europe. April-June; June-August. [= RAB, C, F, G, I, K, S, SE, WH]

* * Trifolium lappaceum Linnaeus, Lappa Clover, Burdock Clover. Disturbed areas; native of Mediterranean Eurasia and Africa. April-August. [= RAB, I, K, S, SE, WH]

* * Trifolium medium Linnaeus, Zigzag Clover. Reported as introduced in MD and NJ (Kartesz 1999; Kartesz 2010). Native of Europe. [= K] {not keyed; rejected as a component of our flora}

* * Trifolium michelianum Savi, Big-flower Clover. Disturbed areas; native of Mediterranean Europe. [= T. michelianum var. balansae (Boiss.) Ponert – K2] {not keyed}

* * Trifolium nigrescens Viviani, Ball Clover. Disturbed areas; native of Mediterranean Europe and n. Africa. Introduced in c. TN (Chester, Wofford, & Kral 1997). [= I, K, S, SE, WH]

* * Trifolium pratense Linnaeus, Red Clover. Fields, roadsides, disturbed areas; native of Europe. April-September. [= RAB, C, G, I, K, S, SE, W, WH, WV; > T. pratense var. pratense – F; > T. pratense var. sativum (P. Miller) Schreber – F]

* * Trifolium spumosum Linnaeus, Pink Clover. Disturbed areas; rare, native of Mediterranean Europe. [= K, WH] {not yet keyed}

* * Trifolium stoloniferum Muhlenberg ex Eaton, Running Buffalo-clover. Dry upland woodlands and prairies. WV, OH, n. IN, IL, MO, and e. KS, south to KY and AR, now extirpated from significant portions of its range. [= C, F, G, I, K, S, SE, WV]

* * Trifolium striatum Linnaeus, Knotted Clover. Roadsides, disturbed areas, waste areas near wool-combing mills; native of Europe. April-August. [= RAB, C, F, G, I, K, S, SE]
* Trifolium subterraneum Linnaeus, Subterranean Clover. Disturbed areas, waste areas near wool-combing mills; native of Europe, Asia, and n. Africa. Reported for NC and SC by Isely (1990); reported for Piedmont of GA by Jones & Coile (1988), and collected in MS (Stone County) (S.W. Leonard, pers. comm. 2007). [=I, K, SE]

Ulex Linnaeus 1753 (Gorse)

* Ulex europaeus Linnaeus, Gorse, Furze. Disturbed areas; native of Europe. June. Not cited in Harvill et al. (1992), but naturalized in sandy soils in York County, VA. Also reported from WV and PA. [=C, F, G, I, K, SE]

Vachellia Wight & Arnott 1834 (Acacia)

Vachellia farnesiana (Linnaeus) Wight & Arnott var. farnesiana, Sweet Acacia, Huisache. Sandy flats on barrier islands, maritime scrub, shell middens. E. GA, along the coast, south to s. FL, west to TX and Tamaulipas, across the sw. United States and south into Mexico. The GA occurrence appears native; see Duncan (1985). [=X; Acacia farnesiana (Linnaeus) Willdenow – I, K, SE, WH, Z; Vachellia farnesiana (Linnaeus) Wight & Arnott – S; Acacia farnesiana ssp. farnesiana – Y; Acacia smallii Isely – I, SE, Z; Vachellia densiflora Alexander ex Small – S]

Vachellia macracantha (Humboldt & Bonpland ex Willdenow) Seigler & Ebinger, Apopanax, Longspine Acacia. Planted as an ornamental and rarely naturalized; native of further south in FL. [=X; Acacia macracantha Humboldt & Bonpland ex Willdenow – I, K, SE, WH, Z]

Vicia Linnaeus 1753 (Vetch, Tare)

1 Inflorescence nearly sessile, of 1-4 flowers clustered in the leaf axil; [alien species].
   2 Leaves with 2-6 leaflets, succulent; leaflets 3-7 cm long; legume with pectinate sutures .........................................................V. narbonensis
   2 Leaves with 4-20 leaflets, not succulent; leaflets 0.3-3.5 cm long; legume not pectinate (except V. lutea).
   3 Corolla 5-6 mm long; leaves with 4-6 (-8) leaflets..........................................................V. lathyroides
   3 Corolla 10-30 mm long; leaflets 6-16 (-20).
   4 Calyx lobes conspicuously unequal; legumes pilose with pustulate-based hairs ........................................................................V. lutea
   4 Calyx lobes more or less equal; legumes glabrous at maturity, or very finely pubescent with non-pustulate-based hairs.
   5 Corolla 10-30 mm long; corella yellow, often streaked with purple, 25-30 mm long .........................V. grandiflora
   5 Calyx lobes (at least the longer) about as long as the calyx tube; corolla pink, purple, lavender, white, or creamy yellow, 10-25 (-30) mm long.
   6 Standard pubescent dorsally; corolla 15-25 (-30) mm long, creamy yellow to purple; legume pubescent, with a basal stipe ..................V. pannonica
   6 Standard glabrous; corolla 10-25 (-30) mm long, pink, purple, lavender, whitish; legume glabrous, sessile.
   7 Calyx 7-11 (-12) mm long; corolla pink-purple to whitish, 10-18 mm long; leaflets 4-10 as long as wide .........................V. sativa ssp. nigra
inflorescence pedunculate, of 2-many flowers along a well-developed raceme; [alien and native species].
8 Peduncles 1-10 mm long; raceme axis 2-10 mm long, with 2-7 (-10) flowers.
9 Plant a robust perennial, 10-20 dm tall; tendrils absent; leaves 2-4 (-6) leaflets; leaflets 5-10 cm long; corolla 20-30 mm long.

Plant a trailing perennial, 3-10 dm tall; tendrils present; leaves with 8-16 leaflets; leaflets 2-3.5 cm long; corolla 10-15 mm long.

Plant usually >10 mm long; raceme axis usually >10 mm long, with (1-2) many flowers.

Corolla 10-25 mm long.
11 Stipules dimorphic, one of each pair entire, the other palmarly lacerate; flowers 1 (-2) per inflorescence.
12 Flowers 15-22 (-25) mm long; legumes with a basal stipe 2-5 mm long; leaves with 8-16 leaflets.
13 Calyx swollen on one side; plant an annual; inflorescence secund.
14 Plant glabrater with pubescence of hairs < 1 mm long; lower calyx lobe lanceolate to linear-lanceolate, 1-2 (-2.4) mm long.
15 Calyx not swollen on one side; plant a rhizomatous perennial; inflorescence not secund.
16 Flowers white to lavender, the keel spotted; legumes 4-5 mm wide; inflorescence not second.
17 Plant an annual.
21 Legume asymmetrically acute at the apex; inflorescence with 1-2 (-4) flowers.

Vicia acutifolia Elliott, Fourleaf Vetch. Pond margins, pine flatwoods, ditches. April-May; May-June. SE. SC south to s. FL, west to e. Panhandle FL. [= RAB, GW, I, K, SE, WH]

Vicia americana Willdenow var. americana, American Vetch, Purple Vetch, Tare. Moist soils. May-June. Var. americana ranges from QC west to AK, south to w. VA, s. WV, MO, OK, TX, Mexico. Var. minor Hooker occurs in w. North America. The report for AL (Woods & Diamond 2006) has been shown to be a misidentification (Spaulding, pers. comm.). [= C, F, G, I, SE; = F. americana ssp. americana – K; < F. americana – W, WV]

* Vicia articulata Hornemann, Monantha Vetch, Oneflower Vetch. Perhaps only cultivated; native of Europe. [= I, K, SE]

* Vicia cracca Linnaeus, Tufted Vetch, Cow Vetch, Canada-pea. Disturbed areas; native of Europe. May-July; June-August. [= RAB, C, G, S, SE; > V. cracca var. cracca – F; I; > V. cracca ssp. cracca – K]

Vicia floridana S. Watson, Florida Vetch. Moist soils of hammocks, ditches, roadbanks. E. GA (McIntosh Co.) south to c. peninsular FL. [= GW, I, K, SE, WH]

* Vicia grandiflora Scopoli, Large Yellow Vetch. Disturbed areas; native of Europe. April-June; May-July. [= C, I, F, G, K, SE, W, WH; > V. grandiflora var. kitaibeliana W.D.J. Koch – RAB]

Vicia ludoviciana Nuttall ssp. leavenworthii (Torrey & A. Gray) Lassetter & Gunn. Woodlands, prairies, dunes, disturbed areas. MS and MO west to NM and TX. In our area is Race 2 (“louisianica” race) of ssp. leavenworthii (Isely 1998). [= I, K, SE] {add to synonymy}

Vicia ludoviciana Nuttall ssp. ludoviciana, Louisiana Vetch. Woodlands, prairies, dunes, disturbed areas. AL and Panhandle FL west to OR and CA. In our area is Race 1 (“ludoviciana” race) of ssp. ludoviciana (Isely 1998). [= I, K, SE; = V. ludoviciana – WH] {add to synonymy}

* Vicia lutea Linnaeus, Yellow Vetch. Disturbed areas; native of Europe. [= I, K, SE]

* Vicia pannonica Crantz, Hungarian Vetch. Disturbed areas; native of Europe. Introduced in c. GA. Reported for NC (Isely 1998). {investigate} [= I, K, SE]

* Vicia sativa Linnaeus ssp. nigr[a (Linnaeus) Ehrhart, Narrowleaf Vetch. Disturbed areas; native of Mediterranean Europe. March-June; May-July. [= I, K, SE; = V. angustifolia Linnaeus – RAB, C, S, W; = V. sativa var. angustifolia (Linnaeus) Ehrhart; > V. angustifolia var. angustifolia – F, G, WV; > V. angustifolia var. segetalis (Thuill.) Ser. – F, G, WV; > V. angustifolia var. uncinata (Desv.) Rouy – F]

* Vicia sativa Linnaeus ssp. sativa, Common Vetch. Disturbed areas; native of Mediterranean Europe. April-June; May-July. [= I, K, SE; = V. sativa – RAB, C, G, S; > V. sativa var. sativa – F; > V. sativa var. linearis Lange – F]

* Vicia sepium Linnaeus, Bush Vetch, Wild Tare. Disturbed areas; native of Europe. Introduced south to WV and in e. PA (Rhoads & Klein 1993). [= C, G, I, SE; > L. sepium var. sepium – F, K]

* Vicia tetrasperma (Linnaeus) Schreber, Slender Vetch, Smooth Tare, Lentil Vetch. Disturbed areas; native of Europe. April-June; May-July. [= RAB, C, G, I, K, S, SE, WH; > V. tetrasperma var. tetrasperma – F; > V. tetrasperma var. tenuiissima Druce – F]

Vigna Savi 1824 (Cow Pea)

A genus of about 100-150 species, annual and perennial herbs, pantropical, rarely extending into warm temperate regions. References: Isely (1998)=I; Maréchal, Mascherpa, & Stainier (1978)=Z.
Vigna luteola (Jacquin) Bentham, Wild Cow Pea. Edges of freshwater tidal marshes, beaches, hammocks, disturbed areas, railroad embankments, low fields, in the outer Coastal Plain. July-September; August-October. Sc. NC south to s. FL, west to se. TX, and in the New World tropics. Often weedy in appearance, and its nativity at a particular location difficult to judge. [= RAB, GW, I, K, Z; ? V. repens (Linnaeus) Kunz]ne – S; = V. marina (Burmann) Merrill (the correct name according to some authors, based on uncertain typification)

* Vigna unguiculata (Linnaeus) Walpers, Black-eyed Pea, Field Pea, Cow Pea. Cultivated in commercial and home gardens, rarely persistent or occurring as a waif in disturbed areas; native of tropical Africa or Asia. June-August; July-September. [= RAB, I, K, ? V. sinensis (Linnaeus) Savi – F, S; > V. unguiculata var. unguiculata – Z]

Identification notes: Twining direction can be determined by looking at (or imagining) the vine twining around a branch or pole. Look at the pole or branch from the base (from the direction from which the vine is growing). If the vine is circling the branch or pole in a clockwise direction, that is dextrorse; if counterclockwise, that is sinistrorse. Identification of the two alien species and their hybrids is uncertain. Genetic

Identification notes: Twining direction can be determined by looking at (or imagining) the vine twining around a branch or pole. Look at the pole or branch from the base (from the direction from which the vine is growing). If the vine is circling the branch or pole in a clockwise direction, that is dextrorse; if counterclockwise, that is sinistrorse. Identification of the two alien species and their hybrids is uncertain. Genetic sorting of morphological characters and horticultural selection mean that morphology is only poorly correlated with genetic origin. Trusty et al. (2007) found that 24 of 25 individuals tested from scattered sites around the Southeast showed genetic admixture (sometimes complicated) between W. floribunda and W. sinensis. Probably the great majority of material in the Southeast could be called W. ×formosa; the below key may work poorly or not at all for some material encountered.

1 Legume and ovary glabrous; pedicels 5-10 (-15) mm long; standard reflexed near the middle; seeds reniform; leaflet margins plane; leaflet apices acute to slightly acuminate; [native species of swamps and bottomland forests and thickets][.............................W. frutescens

1 Legume and ovary velvety pubescent; pedicels 15-20 mm long; standard reflexed at the base; seeds lenticular; leaflet margins undulate; leaflet apices acutely to strongly acuminate; [introduced species, naturalized in a wide variety of situations].

2 Standard 16-18 mm long, 16-18 mm wide; leaflets (7-11) 9-11 (-13) per leaf; raceme to 33 cm long, with 25-95 flowers opening nearly simultaneously; vine twining clockwise (dextrorse; from lower left ascending to upper right) [...........................W. sinensis

2 Standard 16-18 mm long, 16-18 mm wide; leaflets 7-17 (-19) per leaf; raceme to 132 cm long, with 25-170 flowers opening nearly simultaneously or sequentially; vine twining counter-clockwise (sinistrorse; from lower right ascending to upper left).

3 Auricles of the standard’s callosity 0.7-0.8 mm long; leaflets 7-17 per leaf; racemes to 36 cm long [.................................W. floribunda

3 Auricles of the standard’s callosity 1.1-1.2 mm long; leaflets (11-) 13-17 (-19) per leaf; raceme to 132 cm long, with the 50-170 flowers opening successively from base to the tip of the inflorescence, those at the base withering before those at the tip have opened [.................................W. ×formosa

* Wisteria ×formosa Rehder [=W. floribunda × sinensis], Hybrid Asian Wisteria. Cultivated, escaped to urban, suburban, and rural forests and woodlands, a cross of species from China and Japan; commonly cultivated, commonly escaped. April-July; July-November. Trusty et al. (2007, 2008) reveal that much of the invasive Wisteria in southeastern United States involves complex hybrids and backcrosses involving W. floribunda and W. sinensis. [= WH; = Rehsonia ×formosa (Rehder) Stritch – Y]

**Zornia** J. F. Gmelin 1792 (Zornia)

**Identification notes:** The palmately 4-foliolate leaves are unique in the flora of our area.

**Zornia bracteata** Walter ex J.F. Gmelin, Zornia. Flatwoods, sandhills, sandy roadsides. June-August; July-October. Se. VA south to s. FL, west to TX and e. Mexico, endemic to the Southeastern Coastal Plain. [= RAB, C, F, G, K, S, SE, WH]

---

**146. POLYGALACEAE** R. Brown 1814 (Milkwort Family) [in FABALES]

A family of 17-21 genera and 800-1000 species, trees, shrubs, woody vines, and herbs, nearly cosmopolitan, but most diverse in tropical and subtropical areas. References: Miller (1971b); Eriksen & Persson in Kubitzki, Bayer, & Stevens (2007).

**Polygala** Linnaeus 1753 (Milkwort)

**Identification notes:** Polygala has a distinctive flower structure which can be confusing. The corolla consists of 3 fused petals, partly fused into a tubular form, and also fused with the stamens. The lower petal is called the keel; it is usually boatlike, and also lacerate, fringed, or lobed at its tip. The calyx is 5-lobed, the lobes usually of 3 distinct sizes. The two lateral sepals are called wings; they are generally large and petaloid (colored like petals). The upper sepal is usually the next largest; the two lower sepals are usually the smallest.

1 Fresh flowers orange, yellow, greenish-yellow, or greenish white (if greenish white, then the inflorescence a terminal many-branched cyme); [subgenus Polygala, series Decurrentes].
2 Inflorescence a dense pom-pom-like raceme, terminating leafy branches.
3 Fresh flowers lemon-yellow or greenish yellow; subulate bracts of the inflorescence 4.5-6.5 mm long; plants 3-10 (-15) cm tall; lobes of lower petal (keel) 1.5-2.5 mm long ................................................................. **P. nana**
4 Racemes ca. 1.5 cm in diameter; flowers bright orange (rarely individual plants within a population with bright yellow flowers); plants 5-40 cm tall; [widespread] .......................................................................................................................... **P. rugelii**
5 Fresh flowers cream-white to greenish-white; [of GA southward] ................................................................................................................... **P. baldunii var. baldunii**
6 Plants 4.5-12 dm tall, the stem solitary; basal leaves 3.5-14 cm long, linear-lanceolate, about 15-20× as long as wide, persistent as a basal rosette; stem leaves linear-subulate, sharp-tipped, much reduced from the basal leaves, becoming bractlike upward; seeds pubescent, 0.5-0.7 mm long ............................................................................................................................... **P. cymosa**
7 Leaves many, evenly distributed along the stem, or not at least strongly clustered near the tip; wings < 10 mm long; stamens 8; [collectively of a wide variety of habitats, but generally not as above, either in more open, drier, or non-montane habitats].
8 Leaves whorled, at least at the principal lower nodes; annual, from a slender taproot; [subgenus Polygala].
9 Racemes 3-6 mm in diameter, pointed in outline.
10 Racemes 2-5 cm long, becoming interrupted below through persistence of the fruits on the axis; wings equaling the fruit .................. .......................................................................................................................... **P. ambigua**
11 Seeds finely pubescent; pedicels ½-⅓ as long as the fruit; raceme peduncles 0.5-4 cm long .............. **P. verticillata var. isocycla**

**Polygonaceae**

9 Racemes 8-15 mm in diameter, rounded in outline (somewhat rounded in *P. hookeri*).

12 Racemes loosely flowered, with ca. 10 flowers per cm of length; raceme 7-12 mm in diameter, the tip pointed in outline (obconical apically); full raceme (including the portion with dropped fruits) to 6 cm long. .................. *P. hookeri*

12 Racemes densely flowered, with ca. 20 flowers per cm of length; raceme 7-20 mm in diameter, the tip rounded to truncate in outline; full raceme (including the portion with dropped fruits) to 4.5 cm long.

13 Bracts of the inflorescence ca. 1 mm long; wings 1.5-2.5 mm wide, acute or short-mucronate at the tip; raceme peduncle (0.8-)

- 3-5 cm long .................................................. *P. brevifolia*

13 Bracts of the inflorescence 1.5-3 mm long; wings 3-4 mm wide, acuminate, the tips cuspidate; raceme peduncle 0.0-0.8 (-4.0) cm long.

14 Larger leaves (2-) 3-7 mm wide; raceme peduncles 0-0.5 cm long; racemes 7-15 mm in diameter ...........................................

- .......................... *P. cruciata var. aquilonia*

14 Larger leaves 1.5-3 (-4) mm wide; raceme peduncles 0-4 cm long; racemes 12-20 mm in diameter ..........................................

8 Leaves all alternate; either annual, from a slender taproot, the stems solitary, or biennial to perennial, from a taproot, the stems solitary to several, or perennial, from a thick rhizome, the stems several.

15 Leaves glaucous, somewhat succulent, linear; corolla 7-10 mm long, > 2× as long as the wings; [subgenus *Polygona*] = *P. incarnata*

15 Leaves green, herbaceous, usually broader than linear; corolla < 5 mm long, roughly equal to or shorter than the wings.

16 Annual, the stems solitary; [subgenus *Polygona*].

17 Corolla about 0.5× as long as the wings. .................................................. *P. sanguinea*

17 Corolla about 1× as long as the wings.

18 Inflorescence bracts dropping from the axis promptly following flowering .................................................. *P. mariana*

18 Inflorescence bracts persistent.

19 Wings 3-5 mm long; pedicels 1.5-2.5 mm long; racemes 8-13 mm in diameter .................................................. *P. curtissii*

19 Wings 2-2.5 mm long; pedicels 0.5-1.5 mm long; racemes 5-6 mm in diameter .................................................. *P. nuttallii*

16 Perennial or biennial, usually several stems arising together from a rhizome or taproot.

20 Wings white, 2-3 mm long; flowers sessile or subsessile; plants from a thick crown; [subgenus *Polygona*].

21 Larger leaves mostly 1.5-15 mm wide; capsules 3.5-4.2 mm long; seeds 3-0.3-3.5 mm long .................................. *P. senega var. latifolia*

21 Larger leaves mostly 2-15 mm wide; capsules 2.5-3.5 mm long; seeds ca. 2.5 mm long .................................. *P. senega var. senega*

20 Wings pink, 4-7 mm long; flowers pedicelled; plants from a taproot.

22 Corolla keel entire at the tip; wings 5-7 mm long, reniform-ornicular; plants lacking cleistogamous flowers; [subgenus *Hebeclada*] .................................................. *P. grandiflora var. grandiflora*

22 Corolla keel fringed at the tip; wings 4-6 mm long, elliptic; plants producing cleistogamous flowers in loose subterranean or subterranean racemes; [subgenus *Polygona*].

23 Flowers mostly 1-4 mm apart; racemes elongating to 12-12 cm long; pedicels 0.5-2.0 mm long; [more northern in distribution] .................................. *P. polyclama var. obtusata*

23 Flowers mostly 4-6 mm apart; racemes elongating to 8-15 cm long; pedicels 1.5-3.5 mm long; [more southern in distribution] .................................. *P. polyclama var. polyclama*

**Polygona ambigua** Nuttall, Loose Milkwort. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): fields, woodlands, openings; uncommon. June-September. ME west to MI, south to GA, AL, and OK. Through most of its range *P. ambigua* has wings 1.3-1.7 mm long; plants from se. VA south to SC and from the Ozarks have wings 2.0-2.6 mm long. These plants have been named as a variety of *P. verticillata*, var. *dolichoptera* Fernald. They may warrant taxonomic recognition, but need additional study, including resolution of our Coastal Plain plants and those of the Ozarks. [= C, G, K, S, = *P. verticillata* Linnaeus var. *ambigua* (Nuttall) Wood – RAB; > *P. verticillata* var. *ambigua* – F, WV; > *P. verticillata* var. *dolichoptera* Fernald – F, WV; < *P. verticillata* – W]

**Polygona baldinii** Nuttall var. baldinii, White Milkwort, Baldwin's Milkwort. Cp (FL, GA): wet pine savannas; uncommon (rare in GA). E. GA south to s. FL; west to s. MS; e. TX; Cuba; the Bahamas (Andros Island). Var. *carteri* (Small) R.R. Smith & D.B. Ward occurs in s. FL. [= GW, Z; < *Polygala baldinii* – K, WH; = *Pilostaxis baldinii* (Nuttall) Small – S, orthographic variant; = *Pilostachys baldinii* (Nuttall) Small]

**Polygona cruciata** Linnaeus var. *aquilonia* Fernald & Schubert, Northern Drumheads. Cp (DE), Mt (NC, SC, VA, WV): bogs, damp or wet soil in openings; uncommon (rare in DE). June-October. ME west to MN, south to e. VA, w. NC, n. AL, and TN. [= F, K; < *P. cruciata* – RAB, C, G, GW, S, W, WV; = *P. cruciata* ssp. *aquilonia* (Fernald & Schubert) A. Haines – Y]

**Polygona cympoza** Walter, Tall Pinebarren Milkwort. Cp (DE, FL, GA, NC, SC): pond-cypress savannas, Coastal Plain depression ponds, clay-based Carolina bays, other sites with seasonally flooded hydrology; common (rare in DE). May-July. E. NC south to s. FL, west to s. MS; disjunct in s. DE. [= RAB, C, F, G, GW, K, WH, Z; = *Pilostaxis cympoza* (Walter) Small – S; = *Pilostachys cympoza* (Walter) Small]

**Polygona grandiflora** Walter var. *grandiflora*, Showy Milkwort. Cp (GA, NC, SC): sandhills, dry sandy soils of roadsides and fields; uncommon (NC Rare). May-July. S. NC south to s. FL, west to s. MS. [= K; < *P. grandiflora* – RAB, WH; > *Asemeia grandiflora* (Walter) Small – S; > *Asemeia cumulicola* Small – S; < *Polygala violacea* Aublet [investigate]]
Polygala hookeri Torrey & A. Gray, Hooker's Milkwort. Cp (FL, GA, NC, SC): pine savannas; rare (NC Rare). June-August. Sw. GA and adjacent Panhandle FL, west to s. MS; disjunct in se. NC and ne. SC. [= RAB, GW, K, S, WH]

Polygala nana (Michaux) A.P. de Candolle, Dwarf Milkweed, Candyroot. Cp (FL, GA, SC), Pd (GA, SC), Mt (GA, NC): longleaf pine flatwoods, other open moist areas; common (rare in NC and SC). E. GA south to s. FL, west to c. TX, with scattered populations inland to n. SC, w. NC, nw. GA, n. AL, c. TN (Chester, Wofford, & Kral 1997) and ne. MS. This species is primarily a Coastal plain species of the deeper south; *P. nana* may be introduced in parts of our area. [= RAB, GW, K, WH; Z = Pilostachya nana (Michaux) Rafinesque – S]

Polygala paucifolia Willdenow, Gaywings, Fringed Polygala, Flowering Wintergreen, Bird-on-the-wing. Mt (GA, NC, SC, VA, WV), Pd (DE) moist forests at moderate to high elevations; common (rare in DE and SC). April-June; June-September. NB and QC west to SK, south to CT, NY, WI, and in the Appalachians south to w. NC, nw. SC, n. GA, and e. TN. [= RAB, C, F, G, K, W, WV; = Triclisperma paucifolia (Willdenow) Nieuwland – Nieuwland – S]

Polygala polyma Walker var. obtusata Chodat, Northern Bitter Milkwort. Mt (VA, WV), Pd (VA): woodlands and woodland borders; uncommon. May-July; June-August. ME west to MI and MN, south to n. VA, WV, OH, c. IN, c. IL, and IA. [= C, F, G, WV; = P. polyma – RAB, K, S, W]

Polygala senega Linnaeus var. latifolia Torrey & A. Gray, Seneca Snakeroot. Mt (VA, WV), Pd (DE), Mt (GA, NC, SC, Pd (NC, SC, VA): woodlands, openings, especially over calcareous or mafic rocks; uncommon (rare in NC and WV)). May-June. DE, PA, and MN, south to NC, TN, and MO. Trauth-Nare & Nacci (1998) studied the two varieties of *P. senega* and concluded that the taxa should be recognized at the species level. The relative distributions, habitats, and phenology of the two taxa need assessment for our area. [= F, G, WV; = P. senega – RAB, K, S, W]

Polygala senega Linnaeus var. senega, Seneca Snakeroot. Mt (WV), Mt (GA, NC, SC, VA), Pd (NC, SC, VA): woodlands and openings, especially over calcareous or mafic rocks; uncommon (rare in NC). April-May. QW south to AB, south to n. GA, TN, AR, and SD. The relative distributions, habitats, and phenology of the two taxa need assessment for our area. [= F, G, WV; = P. senega – RAB, K, S, W]

Polygala verticillata Linnaeus var. isocarya Fernald, Whorled Milkweed. Cp (FL), Mt (WV), Mt, Pd (DE, GA, NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. June-September. The validity and relative distributions, habitats, and phenology of the two varieties need additional assessment in the herbarium and the field. VT west to MB, south to Panhandle FL (Kunzer et al. 2009), s. FL, and TX. [= C, F, G, K, WH; WV; = P. verticillata var. verticillata – RAB; = P. verticillata – S, apparently misapplied; = P. verticillata – W]

Polygala verticillata Linnaeus var. verticillata, Whorled Milkweed. Mt (WV), Mt, Pd, Cp (DE, GA, NC, SC, VA): dry woodlands, woodland borders, openings, fields; uncommon. June-September. The validity and relative distributions, habitats, and phenology of the two varieties need additional assessment in the herbarium and the field. ME west to MI, south to w. VA, w. NC, and TN. [= C, F, G, K, WV; = P. verticillata var. verticillata – RAB; = P. verticillata – S; = P. verticillata – W]

POLYGALACEAE
Polygala crenata. C.W. James. Cp (FL, GA): wet pine flatwoods, bogs, bayheads; uncommon (rare in GA). FL Panhandle and AL west to TX; reported for GA (Sorrie, pers. comm.) [= GW, K, WH] [not yet keyed; synonymy incomplete]

Polygala leptocaulis Torrey & A. Gray, Swamp Milkwort. Cp (FL): bogs and pond margins; rare. Ne. and Panhandle FL west to c. TX; Mexico, Central America, and South America; Cuba. [= GW, S, WH; = P. tenella Willdenow]

Polygala leptostachys Shuttleworth ex A. Gray, Georgia Milkwort. Cp (FL, GA): sandhills; rare (GA Special Concern). Ne. FL south to c. peninsular FL, west to sw. GA (Jones & Coile 1988), s. AL (Sorrie & LeBlond 2008), s. MS (Sorrie & Leonard 1999). [= K, S, WH] [not yet keyed; synonymy incomplete]

Polygala setacea Michaux, Coastal Plain Milkwort. Cp (FL, GA): pine flatwoods and bogs; uncommon. E. GA and Panhandle FL south to s. FL. Reported by Small (1933) as occurring north to NC and west to s. MS (apparently an error). [= GW, K, S, WH] [not yet keyed; synonymy incomplete]

147. ROSACEAE A.L. de Jussieu 1789 (Rose Family) [in ROSALES]

A family of about 85-95 genera and 2000-3000 species, trees, shrubs, and herbs, nearly cosmopolitan, but mainly boreal and temperate. References: Potter et al. (2007); Eriksson et al. (2003); Kalkman in Kubitzki (2004); Erter (2007).

Subfamily Rosoideae

Filipendula
Supertribe Rosoeae
Rosa
Rubus

Tribe Sanguisorbeae: Agrimonia, Poterium, Poteridium, Sanguisorba

Tribe Potentilleae: Potentilla, Alchemilla, Aphanes, Dasiphora, Drymocallis, Fragaria, Sibbaldia

Tribe Coluriae: Geum

Subfamily Spiraeoideae

Tribe Amygdalaeae: Prunus

Tribe Neilliae: Neillia, Physocarpus

Tribe Spiraeae: Aruncus, Spiraea

Supertribe Kerriodae

Tribe Kerrieae: Kerria, Neviusia, Rhodotypos

Supertribe Pyrodae

Gillenia

Tribe Pyraceae: Amelanchier, Aronia, Chaenomeles, Cotoneaster, Crataegus, Cynoglossum, Erigobrya, Malus, Photinia, Pyracantha, Pyrus, Rhaphiolepis, Sorbus

1 Herbs or subshrubs (if woody at base, then < 3 dm tall).
2 Leaves simple.............................................................. Key A
2 Leaves compound (at least the lower and better developed) ................................................................. Key B
1 Trees, shrubs, or woody vines (with arching "canes" or climbing, arching, or scrambling stems).
3 Leaves simple.............................................................. Key C
3 Leaves compound .......................................................... Key D

Key A – Herbs and subshrubs with simple leaves

1 Leaves crenate, unlobed; inflorescence of a solitary flower; [tribe Rubeae] .......................................................... Rubus dalibarda
1 Leaves 3-many lobed; inflorescences cymose.
2 Leaf blades 0.3-1.0 cm long and wide, deeply 3-lobed, each lobe further lobed or deeply toothed; petals 0; [tribe Potentilleae]....... Aphanes
2 Leaf blades 3-8 cm long and wide, 3-lobed, each lobe toothed; petals 5; [tribe Colurieae].......................... Geum lobatum

Key B – Herbs and subshrubs with compound leaves

1 Leaves 2- to 3-ternately compound; [tribe Spiraeae] .................................................................................. Aruncus
1 Leaves 1-compound, either simply pinnately compound or simply palmately compound,
2 Principal leaves with leaflets of markedly disparate shape and size (large leaflets alternating with much smaller leaflets, or a large terminal leaflet and much smaller lateral leaflets).
3 Lateral leaflets alternating between small and large, the terminal leaflet similar in size and shape to the larger lateral leaflets; terminal leaflet < 3 cm wide; hypanthium either conical or turbinate, armed with hooked bristles, the pistils 2, or hemispheric, the pistils >5.
5 Leaves glabrous or sparsely pubescent beneath; flowers many in racemes; hypanthium conical or turbinate, armed with hooked bristles, the pistils 2; [tribe Sanguisorbeae]................................. Agrimonia
5 Leaves silvery sericeous beneath; flowers solitary and axillary; hypanthium hemispheric, the pistils >5; [tribe Potentilleae].........
4 Pistils 5-15, in a circle on a saucer-shaped hypanthium, ripening into upright fruits that resemble follicles but are indehiscent; corolla white or pink; plant 10-20 dm tall; [tribe Ulmarieae].......................... Filipendula
4 Pistils many, densely covering the hemispheric to conical hypanthium, ripening into achenes terminated by the persistent style; corolla white, cream, pale yellow, bright yellow, lavender, maroon, or purple; plant 2-10 dm tall; [tribe Colurieae]............ Geum
3 Principal leaves with leaflets of generally similar shape and size (the lowest leaflets may be smaller but of similar shape and tooting to the other leaflets).
7 Foliage and stems viscid-pubescent with brownish hairs; inflorescence a cyme; petals 5, cream-colored; [tribe Potentilleae] .......................................................... Drymocallis
7 Foliage not viscid-pubescent (if hairy, the hairs not brown or viscid); inflorescence of very many (>100) small flowers in a spike, the rachis hidden by the tightly packed flowers; petals 0; [tribe Sanguisorbeae].
8 Leaflets pinnatifid (each leaflet incised nearly to the midvein); stamens 2 or 4 per flower .................................................. Poteridium
8 Leaflets toothed (the incisions not nearly to the midvein); stamens either 4 or 15-20 per flower (in well-developed, stamina flowers).
9 Leaflets 0.8-2 cm long; spike 1-2 cm long, 1-2× as long as broad, globose; stamens 15-20 per flower (in well-developed staminate flowers), the filaments 3-4 mm long; sepals green to pinkish-purple; [cultivated, occasionally escaped] ......... Poterium
9 Leaflets 3-10 cm long; spike 6-30 cm long, elongate; stamens 4 per flower, the filaments 8-10 mm long; sepals white (sometimes fading greenish); [native] ................................................. Sanguisorba

2 Principal (basal-most) leaves palmately compound, with 3-7 (-9) leaflets.
10 Principal leaves subsessile, 3-foliolate; fruit of follicles; leaves cauline; [tribe Gilleniae] ................................................................. Gillenia
10 Principal leaves distinctly petiolate, the petiole often longer than the leaflets, 3-7 (-9)-follolate; fruit of achenes; leaves basal and cauline.
11 Principal leaves 5-7 (-9)-follolate; [tribe Potentilleae] ................................................................................................................. Potentilla
11 Principal leaves 3-foliolate.
12 Plants in flower.
13 Petals yellow.
14 Pistils 2-6; [tribe Colarieae] .................................................................................................................................................. Geum
14 Pistils (10-) numerous; [tribe Potentilleae] .......................................................................................................................... Potentilla
13 Petals white (or slightly pinkish).
15 Calyx lobes not subtended by bractlets; [tribe Rubeae] ........................................................................................................... Rubus pubescens
15 Calyx lobes subtended by 5 sepaloid brackets; [tribe Potentilleae].
16 Leaves evenly serrate with many serrations; [widespread] ................................................................. Sibbaldia
16 Leaves with 3 (-5) teeth at the apex, otherwise entire; [Mountains] .................................................................................. Sibbaldia
12 Plants in fruit (or sterile).
17 Leaflets entire, except for 3 (-5) teeth at the apex; [Mountains] ; [tribe Potentilleae] ................................................................. Sibbaldia
17 Leaflets evenly serrate or crenate, each well-developed leaflet with > 7 teeth.
18 Calyx lobes not subtended by bractlets.
19 Fruit an aggregate of dry, non-adherent achenes; leaflets obtuse at apex; [tribe Colarieae] ......................................................... Geum
19 Fruit an aggregate of fleshy, adherent drupelets; leaflets acuminate at apex; [tribe Rubeae] ................................................ .. Rubus pubescens
18 Calyx lobes subtended by 5 sepaloid brackets; [tribe Potentilleae].
20 Fruit an aggregate of dry achenes.......................................................................................................................... Potentilla
20 Fruit an accessory fruit of achenes borne on the surface of a fleshy, red receptacle.
21 Fresh fruit reddish inside; leaflets serrate, 2.5-12 cm long; sepaloid bracts narrowing to apex, untoothed ........ Fragaria
21 Fresh fruit whitish inside; leaflets crenate, 2-4 cm long; sepaloid bracts widest at apex, 3-5-toothed ........ Potentilla indica

Key C – Shrubs and trees with simple leaves
1 Ovary superior; fruit dehiscent (aggregate of follicles, or capsule) or indiscernible (drupe, or aggregate of drupelets).
2 Leaves opposite; [tribe Kerrieae] .......................................................................................................................... Rhodotypos
2 Leaves alternate.
3 Corolla yellow; stems arching, green; [tribe Kerrieae] ......................................................................................... Kerria
3 Corolla white to pink or rose; stems not arching and green.
4 Leaves large, > 10 cm wide, palmately lobed; fruit an aggregate of drupelets; [tribe Rubeae] ..................................... Rubus odoratus
4 Leaves smaller, < 7 cm wide, not lobed, or pinnately lobed; fruit a drupe, a capsule, or an aggregate of follicles.

{Exochorda, Neillia, Neviusia, Physocarpus, Prunus, Rubus, Spiraea}

1 Ovary inferior; fruit indehiscent (pome); [tribe Pyreae].
9
9

{Amelanchier, Aronia, Chaenomeles, Crataegus, Cydonia, Eriobotrya, Malus, Photinia, Pyracantha, Pyrus, {Rhaphiolepis}}

Key D – Shrubs and trees with compound leaves
1 Leaflets < 5 mm wide, entire; densely-branched shrub to 1 m tall; flowers yellow; [tribe Potentilleae] ................................................. Dasiphora
1 Leaflets > 10 mm wide, serrate or crenate; shrubs, trees, or woody vines (see below); flowers white, pink, or purplish (rarely yellow in Rosa).
2 Leaves 1-pinnately compound, generally with > 11 leaflets; inflorescence a terminal panicle or corymb with numerous (>100) flowers, the petals white and < 4 mm long; fruit a pome or follicle; upright tree or shrub with unarmed stems.
3 Inflorescence a panicle; fruit a follicle; shrub, to 2 m tall; [tribe Sorbarieae] .................................................................................. Sorbaria
3 Inflorescence a corymb; fruit a pome; tree, generally > 2 m tall; [tribe Pyreae] ................................................................. Sorbus
2 Leaves palmately or 1-pinnately compound, generally with < 11 leaflets; inflorescences axillary or terminal panicles or corymb with few (<15) flowers, the petals white, pink, or purplish (rarely yellow) and > 6 mm long; fruit a hip or aggregate of drupelets; arching or upright shrubs or climbing or sprawling woody vines, the stems usually armed with prickles.
4 Fruit a hip, developing from a globose to urceolate hypanthium, enclosing the ovaries and achenes, except for the apical orifice; leaflets usually acute to obtuse at the apex; leaflet margins crenulate or serrulate; [tribe Rosae] ................................................................................. Rosa

1 Stem and inflorescence axis lacking sessile or short-stalked glistening glands (but with spreading or ascending non-glandular hairs).

2 Stipules deeply incised, half-ovate; hirsute hairs of the stem 3 mm or longer; 0-1 pair minor leaflets between major; mature fruiting hypanthism as broad as long or broader; hypanthism ridges rarely with eglandular hairs................................. A. microcarpa

2 Stipules toothed, not deeply, half-ovate to half-round; hirsute hairs of the stem 3 mm or shorter; 0-3 or 0-1 pair minor leaflets between major; mature fruiting hypanthism as long as broad or longer; hypanthism ridges usually with hirsute eglandular hairs.......... A. pubescens

1 Stem and inflorescence with glistening glands, these either sessile, or short-stalked, or both (and also with spreading or ascending non-glandular hairs).

3 Glistening glands of the stem and inflorescence axis very short, or both short-stalked and sessile

4 Lower inflorescence rachis with mostly eretic hirsute eglandular hairs ca. 2 mm long; minor leaflets rarely only one pair between all major leaflet pairs; roots merely fibrous.............................................................. A. grypophala

4 Lower inflorescence rachis with mostly ascending hirsute eglandular hairs less than 1 mm long; minor leaflets one pair between major leaflet pairs; roots with fusiform tubers .......................................................... A. rostellata

3 Glistening glands of the stem and inflorescence axis only sessile.

5 Mid-cauline leaf with 5-7 major leaflets; stipule proximally incised or nearly entire ................................................................. A. striata

5 Mid-cauline leaf with 7-13 major leaflets; stipule incised along entire margin.

6 Major leaflets obovate to elliptic, apex obtuse to acute; flowers mostly alternate along inflorescence axis; [Coastal Plain pinelands; c. SC south to c. peninsular FL and west to e. TX]................................................................. A. incisa

6 Major leaflets lanceolate to narrowly elliptic, apex acuminate to rarely acute; flowers mostly sub-opposite along inflorescence axis; [bottomlands, marshes; CT west to s. MI and SD, south to TX, FL, the West Indies and Mexico] ............................................. A. parviflora

Amelanchier Medikus 1789

(Serviceberry, Sarvis, Shadbush, Juneberry, "May Cherry", "Currant")

1 Inflorescences 1-3 (-4)-flowered; leaves imbricate in bud, bases cuneate; petals 2-10 (-15) mm; [WV northward] .................... A. bartramiana

1 Inflorescences usually 4-many-flowered; leaves conduplicate in bud, bases truncate or rounded to cordate (rarely cuneate); petals usually at least 10 mm; [collectively widespread].

Amelanchier bartramiana (Tausch) M.J. Roemer, Oblong-fruited Serviceberry. Mt (WV): [habit]; rare. May-August; July-September. NL (Labrador) west to MN, south to PA, WV, WI, and MI. [= C, F, FNA, G, K]

Amelanchier humilis Wiegand. Mt (WV): rocky, calcareous areas; rare. QC west to ND, south to montane MD, WV, WI, and MI. [= FNA, K; < A. sanguinea var. sanguinea – C, G; > A. humilis var. humilis – F]

Amelanchier intermedia Spach. Mt (NC), {VA}: moist to wet areas; rare. May-June; June-August. NL (Newfoundland) west to MN, south to VA, w. NC, and MI. [= F, FNA, < A. canadensis (Linnaeus) Medikus – C, G; = A. ×intermedia – K]

Amelanchier laevis Wiegand, Smooth Serviceberry. Mt (GA, MD, NC, SC, TN, VA, WV), Pd (DE, NC, VA), Cp (DE, MD, VA), Ip (AL, KY, TN): forests, balds; common (uncommon in DE, rare in Coastal Plain of VA, rare in Piedmont of NC). April-May; June-July. NS west to MN, south to e. VA, w. NC, w. SC, AL, w. TN, and IA. [= C, FNA, G, K, W, S, Z; > A. arborea var. laevis – RAB; > A. laevis var. laevis – F]

Amelanchier sanguinea (Pursh) A.P. de Candolle, Roundleaf Serviceberry, New England Serviceberry. Mt (GA, NC, VA, WV), Pd (VA), Cp (VA): (VA); dry, acidic, rocky sites; uncommon. March-April; May-June. NL (Newfoundland) west to ND, south to w. NC, w. SC, GA, AL, WI, and MI. [= RAB, C, FNA, G; = A. stolonifera Wiegand – F, K, S, W, Z]

Aphanes Linnaeus 1753 (Parsley-piert)

A genus of about 20 species, herbs, of tropical and temperate Old World. Aphanes has usually been accepted by Europeans as distinct from Alchemilla, but Kalkman (in Kubitzki 2004) retains it (with some doubt) in Alchemilla, as a subgenus and Eriksson
et al. (2003) and Gehrke et al. (2008) include it in *Alchemilla* based on molecular evidence. *Aphanes* appears to be monophyletic and is morphologically distinct; Gehrke et al. (2008) prefer a broad circumscription of *Alchemilla* to naming an additional monophyletic clade of African species as a separate genus. References: McNeill & Erter in FNA (in press); Robertson (1974)=Z; Kalkman in Kubitzki (2004); Eriksson et al. (2003).

1 Fruiting hypanthium > 2 mm long; leaf blades 7-10 mm long and wide ......................................................... *A. arvensis*
1 Fruiting hypanthium < 2 mm long; leaf blades 3-5 mm long and wide ......................................................... *A. australis*

* **Aphanes arvensis** Linnaeus. Cp (DE) disturbed areas; rare, native of Europe. April-June. Also reported for SC and TN by Kartesz (1999), but the only documentation consists of generalized range maps published in Hultén & Fries (1986); rejected as a component of those state’s flora without additional documentation. [= C, FNA, K; = *Alchemilla arvensis* (Linnaeus) Scopoli – F, G]

* **Aphanes australis** Rydberg, Parsley-piert. Pd (GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA), Mt (NC, SC, VA, WV); lawns, fields, pastures, roadsides; common (uncommon in Piedmont of VA and Mountains of NC and VA, rare in DE, FL, and WV), native of Europe. Late March-May. This plant is inconspicuous and often overlooked. [= FNA, S; = *Aphanes microcarpa* (Boissier & Reuter) Rothmaler – C, K, WH, misapplied; = *Alchemilla microcarpa* Boissier & Reuter – RAB, F, G, W, Z, misapplied; = *Aphanes inexpectatus* W. Lippert]

### Aronia Medikus 1789 (Chokeberry)

A genus of 3 species, of e. North America (south into Central America). *Aronia* has sometimes been treated as a component of *Sorbus* or *Pyrus*. More recently, Robertson et al. (1991) have included *Aronia* in *Photinia*. Kalkman in Kubitzki (2004) agrees that *Aronia* and *Photinia* should be combined, but points out that *Aronia* is the older name and therefore must be used for the combined genus. Guo et al. (2011) separate *Photinia, Aronia*, and *Pourthiaea*. References: Guo et al. (2011)=V; Pankhurst in FNA (in press); Hardin (1973)=Y; Robertson (1974)=Z; Robertson et al. 1991=X; Kalkman in Kubitzki (2004).

### Identification notes:

All our species of *Aronia* can be distinguished from other shrubs in our flora by the presence of several dark (usually purplish-black) trichomes on the upper surface of the midrib, mostly toward the base of the leaf.

1 Lower surfaces of leaves, twigs, and inflorescence rachis glabrous; fruit black ............................................. *A. melanocarpa*
1 Lower surfaces of leaves, twigs, and inflorescence rachis pubescent; fruit bright red or dark purple.

2 Fruit bright red; leaves densely pubescent beneath ............................................................................................................................... *A. arbutifolia*
2 Fruit dark purple; leaves sparsely pubescent beneath ............................................................................................................................... *A. prunifolia*

### Aronia arbutifolia (Linnaeus) Persson, Red Chokeberry. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA): bogs, pocosins, wet savannas, swamps, other wet habitats; common. March-May; September-November. NL (Newfoundland) south to c. peninsular FL and west to TX, mainly in the Coastal Plain, but extending inland in the south to WV and KY. [= C, FNA, G, GW, S, V, W; = *Sorbus arbutifolia* (Linnaeus) Heynhold var. arbutifolia – RAB; = *Pyrus arbutifolia* (Linnaeus) Linnaeus f. – F, Z; = *Photinia pyrifolia* (Lamarck) K. Robertson & J.B. Phipps – K, WH, VW, X]

### Aronia prunifolia (Marshall) Rehder, Purple Chokeberry. Pd (DE?, NC, VA), Mt (NC, VA, WV), Cp (DE?, VA): balds, bogs, seepages, swamp forests; uncommon, rare south of VA (NC Watch List). April-May; September-October. Widespread but local in ne. North America, south to NC, FL?, and OH. While apparently originating as a hybrid between our other two species, *A. prunifolia* exists in populations independent of the 2 parent species, apparently reproducing successfully. It seems best to treat a now independent lineage such as this as a separate taxon. [= C, G, GW, V; = *Sorbus arbutifolia* var. atropurpurea (Britton) Schneider – RAB; = *Aronia floribunda* (Marshall) Rehder – FNA; = *Pyrus floribunda* Lindley – F, VW, Z; = *Aronia atropurpurea* Britton – S; < *A. melanocarpa* – W; = *Photinia floribunda* (Lindley) J.B. Phipps – K, X]

### Aruncus Linnaeus 1758 (Goat’s-beard)

### Identification notes:

*Aruncus dioicus* can be distinguished from the superficially closely similar *Astilbe bibernata* by the following characteristics: trichomes of foliage not glandular (vs. glandular in *Astilbe*), stamens 20 (vs. 10), carpels 3-4 (vs. 2), seeds < 1.5-2 mm long (vs. ca. 4 mm long), terminal leaflets usually unlobed (vs. terminal leaflets usually trilobed).

1 Foliaces 5-3.5 mm long ......................................................................................................................... *A. sylvester*
1 Foliaces 1.5-2 mm long.

2 Foliaces semi-ovoid, strongly convex on the back, about 1/2 as thick (measured radially) as long; leaves somewhat lustrous, the lower surface glabrous to sparsely pubescent ......................................................................................... *A. dioicus var. dioicus*
2 Foliaces nearly cylindric, about 1/3 as thick (measured radially) as long; leaves dull, the lower surface pubescent .................................................................

**Aruncus dioicus** (Walter) Fernald var. **pubescens** (Rydberg) Fernald, Midwestern Goat's-beard. Mt (WV): moist, nutrient-rich forests and woodland borders?; rare. May-June; June-September. W. VA, KY, and IL west to IA, south to TN, AR, and OK. The validity of this variety and its attribution to our area (by G, K, and S) need further evaluation. Robertson (1974) states that the "two varieties intergrade completely, and it is questionable whether they should be maintained." [= C, F, FNA, K, Z; < *A. dioicus* – W; = *A. pubescens* Rydb – S]

* Aruncus sylvestris Kosteletzky ex Maximowicz is attributed to our area by Small (1933). This European species is occasionally cultivated in e. North America. [= C, G; = *A. dioicus* var. **vulgaris** (Maximowicz) Hara – FNA, K; = *A. aruncus* (Linnaeus) Karsten – S]

**Chaenomeles** Lindley 1821 (Flowering Quince)

* Chaenomeles speciosa* (Sweet) Nakai, Flowering Quince. Pd (NC), Cp (VA), Mt (WV): frequently persisting and rarely spreading from horticultural plantings to suburban woodlands; rare, native of China. January-April. The "fruiting" or Common Quince, *Cydonia oblonga* P. Miller, native of the Caucasus, is widely cultivated in Europe and formerly in e. North America. It has fallen out of favor, and is now rarely cultivated in our area. [= C, FNA, K]

**Crataegus** Linnaeus 1753 (Hawthorn, Haw, Thornapple) (contributed by R. Lance)

Identification notes: SUBSTANTIAL CHANGES TO THIS TREATMENT ARE PENDING. All references to leaves and petioles pertain to foliage on short shoots (floreal shoots), unless otherwise specified.

1 Leaf bases cordate, truncate, rounded, or very abruptly contracted from a rounded base ................................................................. Key A
2 Leaf bases acute to cuneate.

1 Primary lateral veins of lobed leaves run to sinuses of lobes, as well as to points of lobes.
2 Leaves thin, dull, hairy at least on petiole, deeply laciniate; fruit oblong .......................................................... *C. marshallii*
3 Leaves subcoriaceous, glossy, glabrous, often 3-lobed; fruit globose .......................................................... *C. phaenopyrum*

1 Leaves small, most < 3 cm; petioles mostly < 1 cm long, conspicuously glandular and twigs geniculate.
4 Leaves broadly obovate on floreal shoots, 1.5-3 cm long, tomentose, serrations acute; terminal shoot leaves suborbicular, truncate at base .......................................................... *C. dispar*
5 Leaves and petioles longer, glandular or not, but twigs not geniculate.
6 Leaf blades on terminal shoots often > 9 cm long.
7 Petiole glandular, pubescent or tomentose; leaf veins distinct on adaxial surface, slightly sunken .......................................................... *C. mollis*
8 Leaf blades longer than wide; calyx lobes evenly serrate .......................................................... *C. coccinea*
9 Leaf blades often as wide as long; calyx lobes deeply and irregularly serrate .......................................................... *C. dilatata*
10 Leaf blades on terminal shoots rarely > 8 cm long.
11 Fruit calyx sessile; leaves may bear hairs when young; stamens usually 10 .......................................................... *C. iracunda*
12 Fruit calyx elevated; leaves glabrous; stamens usually 20 .......................................................... *C. pruniosa*

8 Leaf shape predominately ovate or broadly ovate, base rounded or abruptly narrowed
9 Lobe tips acute or obtuse, not reflexed; young leaves hairy or glabrous; leaves firm.
10 Stamens 5 to 10 .......................................................... *C. macrosperma*
11 Fruit calyx sessile; leaves may bear hairs when young; stamens usually 10 .......................................................... *C. iracunda*
12 Leaves pubescent throughout; petioles conspicuously glandular; terminal shoot leaves very shallowly lobed .......................... *C. triflora*
12 Leaves sparsely pubescent abaxially, or glabrous; petioles slightly glandular or eglandular; terminal shoot leaves distinctly lobed.
13 Petioles eglandular; fruit calyx sessile.

14 Leaves thin, dull yellow-green; hairs scattered along veins of abaxial side, esp. when young; fruit 10-15mm diameter ................................. C. aemula
14 Leaves firm, glossy or bright green, with hair tufts in abaxial main vein axils; fruit usually < 10 mm diameter ............... C. viridis
13 Petioles glandular; fruit calyx elevated.
15 Stems 5 to 10.
16 Anthers white or yellow; sepals glandular or toothed beyond middle ......................................................... C. boyntonii
16 Anthers purple; sepals wholly glandular-serrate ................................................................. C. buckleyi
15 Stems 15 to 20.
17 Leaves mostly unlobed on floreal shoots, shallowly lobed (1/4 – 1/3 to midrib) on terminal shoots ................... C. mendosa
17 Leaves shallowly lobed on floreal shoots, lobed 1/3-1/2 to midrib on terminal shoots .........................C. pulcherrima

Key B – hawthorns with acute to cuneate leaf bases;
leaves conspicuously glandular on petiole and teeth;
and twigs and branchlets geniculate
