</table>
ROSACEAE

14 Leaves pubescent abaxially; branches dark gray; fruit usually <12 mm; calyx and fruit stem hairy. 
14 Leaves sparsely hairy to glabrous abaxially after maturity; branches ash gray; fruit 12-22 mm; calyx and fruit stem glabrous. 

C. punctata

13 Leaf veins obscure; leaves lustrous. 
15 Leaves, peltioid, pedicels hairy. 

C. berberifolia

C. crus-galli

9 Petioles glandular (3 or more glands visible).

16 Leaves distinctly hairy or pubescent abaxially. 
17 Leaves lobed 1/3- 2/3 to midrib on terminal shoots; fruit calyx elevated. 
17 Leaves shallowly lobed to unlobed on terminal shoots; fruit calyx sessile.

C. intricata

C. triflora

C. ashei

18 Leaves thin; inflorescence simple, 3 to 5-flowered; stamens usually 30 or more. 
18 Leaves firm; inflorescence compound, > 5-flowered; stamens 20 or fewer. 

C. harbissonii

19 Leaves unlobed, most < 5 cm wide. 
20 Leaf veins slightly impressed adaxially; fruit calyx deeply glandular-serrate; petiole conspicuously glandular. 

C. pulcherrima

21 Stamens 5-10. 

C. intricata

C. mendoza

22 Stamens 15-20. 

C. sargentii

23 Leaves ovate or broadly ovate. 

C. pallens

24 Twigs short; petiole often winged ½ its length; fruit often 10 mm or more in diameter. 
24 Twigs elongate; petiole winged ½ its length; fruit usually < 10 mm in diameter. 

C. adunca

Crataegus aemula Beadle, Rome Hawthorn. Cp, Pd (GA, SC): upland hardwood and pine-hardwood forests, over sandstone, calcareous rock or circumneutral clay soils; uncommon (but may be locally abundant). April, September. Nw. GA and ne. AL. Principal species, dijunct in McCormick Co, SC. Related to C. iracunda Beadle, but foliage of C. aemula differs in having frequent rounded bases, thin texture, yellow-green coloration. Fruits are lustrous light red, 12-18 mm diameter. C. aemula has been shown to be triploid, possibly apomictic, producing a high percentage of fertile seed with little seedling variation. The possibility of its being of hybrid origin between C. iracunda Beadle and C. collina Chapman has been suggested. [= K, Q; < C. macrosperma - S]

Crataegus aestivalis (Walter)Torrey & A. Gray, Mayhaw, Eastern Mayhaw. Cp (GA, NC, SC): swamp forests, generally where flooded for much of the year, often flowering and fruiting while standing in water, often associated with Taxodium distichum, Nyssa aquatica, Nyssa biflora, and Planera aquatica; uncommon but sometimes locally abundant; occasionally growing as groves or stands in 'mayhaw flats'. March-April; June-July. Se. NC south to n. FL and se. AL. A historic record of C. aestivalis in VA appears to be based on a single specimen collected 22 July 1934 by M.L. Fernald & B. Long, in Princess Anne County; this specimen is actually C. crus-galli. A related species, C. opaca Hooker & Arnott, occurs west of the range of C. aestivalis, in similar habitats. Plants with copious growth of reddish pubescence on the leaf undersides are included under C. rufa. The fruits of all three species are traditionally gathered for preserves, pies, and jelly. See Phipps (1988) for extensive additional discussion of C. aestivalis and relatives. [= RAB, K, X, Z; < C. aestivalis - S]

Crataegus alabamensis Beadle, Alabama Hawthorn. Pd (GA, SC), Cp (GA, NC, SC): sandhills, upland pine and pine-oak forests, rocky woodlands, xeric or subxeric habitats with sandy or well-drained clay soils; uncommon. April, August-September. E. NC.南部 to s. FL, west to c. MS. Often reaching treelike proportions (4-8 m tall, trunk 10-30 cm diameter). Some local genotypes may produce palatable fruit to 22 mm in diameter. The typical form of C. alabamensis has pubescent foliages and tomentose inflorescences, but the similar C. florulosa, C. atrita, and C. teres are progressively more glabrate, in this order; they may be interpreted as separate species as in Phipps & Dvorsky (2008). [= X; < C. flava Aiton – RAB, K, S; > C. adusta Beadle – Q; > C. atrita Beadle – Q; > C. flores Beadle – Q; > C. foris Beadle – Q; > C. teres Beadle – Q]

Crataegus alleghaniensis Beadle, Allegheny Hawthorn. Mt, Pd (GA, NC, SC), Cp (GA, SC); upland pine and pine-oak forests, disturbed woodlands, rocky bluffs and slopes; uncommon. April, August-September. W. and sc. NC to c. SC, c. GA, west to c. AL, ne. MS, e. TN. A variable species widely considered, displaying leaf and flower characters which suggest intermediacy between members of series Intricatae and Apriceae. The stamen counts can vary from 10 in typical C. alleghaniensis, 12-17 in C. ignava and C. extraria, and 20 in C. cullasagensis, C. agrestina, and C. frugiferaeus. A narrower view might hold some of this synonomy to specific levels. [= X; < C. flava Aiton – RAB, > C. alleghaniensis – Q; > C. ignava Beadle – K, Q; > C. extraria Beadle – Q; > C. impar Beadle – K, Q; > C. cullasagensis Ashe – Q; > C. agrestina Beadle – Q; > C. mira Beadle – Q; > C. frugiferaeus Beadle (= C. rigens Beadle) – Q]

Crataegus anisophylla Beadle. Cp (GA); upland pine forests, pine-oak scrub, sandhills, disturbed woodlands, roadsides, abandoned fields; uncommon. Late March-April; late August-September. Se GA to c. pinusformis FL, west to s. AL. This is a poorly understood taxon among the hawthorns often categorized under C. flava Aiton in many earlier floral treatments. Related to C. lascas Beadle. [= X; > C. anisophylla – Q; > C. viaria Beadle – Q; > C. cercata Beadle – Q; > C. versuta Beadle – K, Q; > C. resina Beadle – K, Q < C. flava – S]

Crataegus aprica Beadle, Sunny Hawthorn Mt, Pd, Cp (GA, NC, SC) {VA?}; upland pine forests, pine-oak forests, mixed hardwood forests over rocky or sandy substrates, abandoned fields, roadsides; common. Late March-April, September, NC south to s. GA and n. FL, west to e. AL and e. TN. This species is most common in the southern Appalachians of NC and SC.
and extending to the sandhills region of SC. The 10 stamens separate this species from the closely related and similar C. sororia, and both these taxa have long been included under the common name of C. flava Aiton in many earlier treatments (see discussion of C. flava) [=W, X, Phipps 2007; < C. flava Aiton – RAB; > C. aprica – Q; > C. shallotie Ashe]

**Crataegus berberifolia** Torrey & Gray var. berberifolia, Barberry Hawthorn. Pd, Cp (GA, NC, SC, VA): mixed hardwood and pine forests of uplands, usually in subxeric to xeric habitats, especially over basic to calcareous soils; common. April-May; August-October. C. VA south to n. FL, west to TX, MO; most common in LA, s. AR. Closely related to C. crus-galli and differing primarily from that species by the consistent pubescence or stiff hairs on foliage, twigs, floral and fruit parts. 10-stamened forms of the normally 20-stamened C. berberifolia have been called C. engelmannii Sargent, which see below. [= C, K, Q, S, X]

**Crataegus berberifolia** Torrey & Gray var. engelmannii (Sargent) Eggleston Pd, Cp (GA, NC, SC): mixed hardwood and pine forests of uplands, usually in subxeric to xeric habitats, especially over basic to calcareous soils; common. April-May; August-October. Similar to the typical variety in most respects except for the presence of 10 stamens. Appears most common in MO and AR, mixed sporadically with the species eastward to e. TN, c. NC. [= C. engelmannii Sargent – Q; > C. berberifolia var. engelmannii (Sargent) Eggleston; > C. torva Beadle – Q; > C. sinistra Beadle – Q]

**Crataegus boytonii** Beadle, Boyton Hawthorn. Mt, Pd (GA, NC, SC, VA); upland forest understories, pastures, rock outcrops, shrubby thickets; uncommon. W. VA south to c. GA, west to n. MS, n. to IL, KY, and WV. April-May; September-October. Related to C. intricata Lange, from which C. boytonii differs chiefly in having an abundance of broadly ovate to deltoid leaves 5-8 cm long and 3-5 cm wide, more robust thorns, and more treelike habit (4-6 m tall, less prone to develop root suckering and multiple stems). [= Q, X; < C. flabellata – RAB; = C. boytonii – F, G, orthographic variant; < C. intricata Lange – C, K]

**Crataegus brachycantha** Sargent & Engelmann, Blueberry Hawthorn. Cp (GA): open pinelands; rare (GA Special Concern). April; September. In sw. GA, one historic record, disjunct from a main range further west (primarily LA and e. TX). The only eastern hawthorn bearing black fruit, appearing blue due to an exterior waxy bloom. [= K, Q, S, Y, X]

**Crataegus buckleyi** Buckley Hawthorn. Buckley Hawthorn. Mt, Pd (GA, NC, SC): upland pine and hardwood forests, rock outcrops; uncommon. April-May; August-October. W. NC, w. SC, n. GA west to n. AL, north to c. TN (and perhaps WV and VA). Most similar to C. boytonii Beadle, but with purplish anthers, more glandular-serrate calyx lobes, russet fruit, and smaller leaves (3-6 cm long × 2-4 cm wide). [= Q, X; < C. flabellata – RAB; < C. intricata Lange – C, K]

**Crataegus calpodendron** Ehrhart Medikus, Pear Hawthorn. Mt (VA, NC), Pd (GA, NC, SC): mixed hardwood forests, open slopes, wooded ravines, streamside, especially over basic or calcareous rocks; uncommon. May-early June; September-October. From a generally northern range, the southern limits extend down the Appalachian region and adjacent Piedmont of VA to n. GA, c. AL, n. MS and AR. Often found as a solitary specimen, or in very small local populations. One of the latest hawthorns in our area to flower. Fruit production appears scant in its southern range. [= RAB, C, K, S, W, X; > C. calpodendron var. calpodendron – F, G; > C. calpodendron var. microcarpa (Chapman) Palmer – F, G; > C. calpodendron var. globosa (Sargent) Palmer – F, G; > C. chapmannii Beadle – Q; > C. tortuosa Du Roi]

**Crataegus coccinea** Linnaeus, Scarlet Hawthorn. Mt, Pd (NC, VA): deciduous forest understories, pastures, upland thickets; rare; May; October. Distributed southward along the Appalachian Plateau from a predominately northern range. The combination of large, pubescent leaves (9-12 cm long) on terminal shoots, evenly toothed calyx lobes, and 5-10 stamens per flower are distinctive. C. coccinea may attain treelike proportions, to 10 m tall. [= RAB, C, K, S, W, X; > C. calpodendron var. calpodendron – F, G; > C. calpodendron var. microcarpa (Chapman) Palmer – F, G; > C. calpodendron var. globosa (Sargent) Palmer – F, G; > C. chapmannii Beadle – Q; > C. tortuosa Du Roi]

**Crataegus collina** Chapman, Hillside Hawthorn. Mt (GA, NC, SC, VA), Pd (GA, NC, SC): hillside forests and young woodlands, especially over calcareous rocks; uncommon. March-April; August-October. Sw. VA west to KS, south to c. GA, s. AL, c. MS, AR and OK. Closely allied to C. punctata Jacquin, but more widespread in range and habitat tolerate across the Southeast. The fruits rarely reach 12 mm in diameter, whereas those of C. punctata often range from 12-23 mm. C. collina occupies sub-xeric uplands in the Appalachian Region and is tolerant of lowland floodplains in GA, AL, TN. It is one of the earliest hawthorns to flower in spring. Foliation may be conspicuously pubescent in some local genotypes. [= S, W, X; > C. collina var. collina – F, G; > C. collina var. collicola (W.W. Ashe) – F, G; > C. collina – Q; > C. ingens Beadle – Q; > C. amnicola Beadle – Q; < C. punctata Jacquin – RAB, C]

**Crataegus colonica** Beadle. Cp, Pd (GA, NC, SC): scrublands, roadsides, xeric woodlands with sandy soils; uncommon. Late March-April; August-September. Se. & sc. NC south and west to e. GA, perhaps to n. FL. A poorly understood taxon, appearing closely related to C. integra Beadle, but with smaller flowers and fruit and an abundance of long thorns (2-5 cm). The thorniness of the plants combined with the obovate, nearly entire-margined leaves and pyriform-shaped fruit is usually diagnostic. A similarly thorny entity but with leaves distinctly serrated is C. pexa Beadle (see C. munda Beadle).

**Crataegus cratayontii** Beadle, Crayton Hawthorn. Mt (GA, NC, VA): wooded slopes, roadsides, streamside; rare. Late April-May; September. Sw. VA, w. NC to n. GA, n. AL, possibly e. TN. A poorly known taxon, appearing most closely related to C. intricata Lange, but unique in its combination of 20 stamens and distinctly pubescent foliage and inflorescence parts. Alternatively, this hawthorn could be assigned varietal status within C. intricata, but it has not been published as such in any floral treatments. [= Q]

**Crataegus crus-galli** Linnaeus var. crus-galli, Cockspur Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA); pastures, thickets, disturbed woodlands and forests, fencerows; common. April-May; September-October. Ranges throughout the eastern US, except c. and s. peninsular FL. C. crus-galli sometimes forms extensive local colonies and likely apomictic clonal populations. Variation occurring in this wide-ranging species, mostly in size and shape of leaves and minor flower and fruit characters, has accounted for an extensive synonymy, with most earlier names applied by Charles Sargent. Plants having 3 to 5 styles and as many pyrenes have been alternatively placed under C. reverchonii Sargent, these also exhibiting a tendency to have smaller, more often suborbicular leaves (see C. reverchonii). Typical forms of C. crus-galli tend to have 1 to 2 styles and pyrenes, and with a range of leaf shapes from narrow to nearly suborbiculate. [= C, W, X, < C. crus-galli – RAB; > C. crus-galli – K; > C. macra
ROSACEAE

Beadle - Q; > C. regalis Beadle var. regalis – F; > C. albens Beadle – Q; > C. arborea Beadle – K; > C. canbyi Sargent; > C. crus-galli var. crus-galli – F, G; > C. crus-galli var. exigua (Sargent) Eggleston – G; > C. crus-galli var. macro (Beadle) Palmer – F, G; > C. crus-galli – S

_Crataegus crus-galli_ Linnaeus var. _pyracanthaifolia_ (Aiton) Sargent. Cp (GA, NC, SC, VA): bottomland forests, swamp borders, lowlands; uncommon though at times locally abundant. April-May; October. DE south to n. FL, west to MO, e. TX. The narrow leaves may be glabrous or pubescent on the abaxial side, varying as local genotypes. [> _C. crus-galli_ var. _pyracanthaifolia_ (Aiton) Sargent – F, G; > C. linnophylla Sargent – K; > _C. pyracanthoides_ Beadle var. arborea (Beadle) Palmer – F, G; > _C. pyracanthoides_ Beadle – Q]

_Crataegus dispar_ Beadle, Aiken Hawthorn. Cp (FL, GA, SC), Pd (GA, SC): upland pine or pine-oak forests, usually of sub-xeric to xeric conditions, in well-drained clay or sandy soils; uncommon. Late March-April; September. Ne & se SC and adjacent e. GA; single sporadic collections known from Panhandle FL and ne. AL. A distinctive species with its deeply cut and serrated, tomentose leaves, often pale bluish-green in color. [= K, Q, X]

_Crataegus disperma_ Ashe. Two-seed Hawthorn. Mt (VA) (NC?): upland forests, pastures, brushy hillsides; uncommon. May; September-October. PA west to IN, south in the Appalachians to VA, e. KY. _C. disperma_ is of presumed hybrid origin between _C. crus-galli_ and _C. punctata_, since characters appear intermediate. It sometimes appears in mixed populations of the putative parent species, but its reproductive biology is poorly known. Similar to other hawthorns of presumed hybrid origin, it may be apomictic, but no large local populations are known. It is kept here due to its persistent inclusion in several floral treatments in the past. [= F, K; > _C. disperma_ Ashe – K]

_Crataegus douglasii_ Ashe, Dodge Hawthorn. Mt (NC) (VA?): mesic hardwood forests, streamside thickets, pastures; rare. May; September-October. A northern species predominately of the Great Lakes Region, east to CT, sporadic southward in the Appalachians to WV and possibly e. TN, w. VA, with one collection in Ashe Co, NC. [= _C. mercericensis_ Sargent]

_Crataegus flava_ Aiton, Yellow Hawthorn. Cp (FL, GA, SC), Pd (SC, GA): dry woodlands; rare. A problematic taxon, originally described from a plant under cultivation in Europe, and assumed native from central SC s. to n. FL; few naturally-occurring plants have been located in the Southeastern US which match closely the type specimen. The likelihood of the type of _C. flava_ being of hybrid origin, involving members of the _Apiraceae_ or _Intricatae_ series seems probable. Unfortunately, the name _C. flava_ Aiton and the ambiguous taxon which it historically represents has been widely misapplied and confused for more than a century. It is included here primarily due to historical significance, since no recent authentic field collections are known. [= Q, X; < _C. flava_ Aiton – RAB, K, S; > _C. elliptica_ Aiton]

_Crataegus incilis_ Beadle. Cp (FL, GA): mixed pine and hardwood forests, wooded hills, rocky woods; uncommon. Late March-April; August-September. Sw. GA and Panhandle FL, west to s. MS, north to ne. AL. _C. incilis_ is usually a shrubby relative of _C. pulcherrima_ with a strong suckering habit and slender shoots exhibiting thin, distinctly laciniate-lobed leaves. The 4 or 5 pairs of lobes per leaf, acute or cuneate leaf base and 5-8mm fruit are also characteristic. It has been collected most extensively in the vicinity of Little River Canyon, AL and sporadically elsewhere in the known range. [> _C. concinna_ Beadle - Q]

_Crataegus integrifolia_ Beadle. Cp (GA, SC): pine forests, sandy scrublands, xeric woodlands with deep sandy soils; uncommon. Late March-April; August-September. C. SC south to peninsular FL throughout the Lake Wales Ridge, west to sw & c. AL SC, n. GA, wc. AL. _C. integrifolia_ Beadle is only marginally distinct from the range of variation seen in _C. lassa_ Beadle, the major distinction being in foliage; _C. integrifolia_ having a proportionally wider leaf shape, shorter petioles, and a tendency to have nearly entire leaf margins. There are, however, graduated ranges of leaf morphology toward the synonymy included under _C. lassa_ Beadle, so that an alternative taxonomic option might be to include _C. integrifolia_ within a broader view of _C. lassa_. It is pertinent to note that the inclusion of _C. integrifolia_ under the name of _C. flava_ Aiton became affiliated as early as 1895 by Nash, as _C. flava_ var. _integrifolia_ (Aiton) Nash. [= X; < _C. flava_ Aiton – RAB; > _C. flava_ Aiton – K; > _C. dolosa_ Beadle – Q; > _C. sodalis_ Beadle – Q; > _C. constans_ Beadle – Q; > _C. audens_ Beadle – Q]

_Crataegus intricata_ Lange var. _boyntonii_ (Beadle) Kruschke, Boynton Hawthorn. Mt, Pd (GA, NC, SC, VA): upland forest understories, pastures, rock outcrops, thickets; uncommon. _C. intricata_ Beadle var. arborea, to n. MS, n. to IL, KY, and WV. April-May; September-October. _C. boyntonii_ differs from typical _C. intricata_ by having an abundance of broadly ovate to deltoid leaves 5-8 cm long × 3-5 cm wide, and more robust thorns. [= Q, X; < _C. flabellata_ – RAB; = _C. boyntonii_ – F, G, orthographic variant; < _C. intricata_ Lange; > _C. intricata_ var. _boyntonii_ (Beadle) Kruschke – K]

_Crataegus intricata_ Lange var. _intricata_. Entangled Hawthorn. Mt, Pd (GA, NC, SC, VA): pastures, wooded hills, rock outcrops, thickets; common. Late April-May; August-October. Widespread range from northern states s. to c. SC, c. GA, c. AL, n. MS, west to AR and OK. Broadly defined, a variable species incorporating many minor forms and potentially apomictic local clones. The basic defining characters are the presence of 10 stamens with pale anthers, hard greenish or ruddy-blushed fruits with an elevated calyx, and glabrous, slightly glandular foliage. Leaf shape is highly variable. Some variants commonly having yellow fruits are _C. fortunata_ Sargent and _C. straminea_ Beadle, conspicuous pubescence is seen in _C. bitilmoreana_ Beadle and _C. craytonii_ Beadle, and shallowly lobed leaves often occur in _C. rubella_ Beadle; these have been treated as varieties here (except for _C. craytonii_), but have been variously interpreted in other floras. Typically, _C. intricata_ exhibits a shrubby habit, and may form colonies by root sprouts. It is most common in the Appalachian region. [= K, S, W, X; < _C. flabellata_ – RAB; > _C. intricata_ var. _intricata_ – F, G, > _C. foetida_ Ashe]

_Crataegus intricata_ Lange var. _bitilmoreana_ (Beadle), Biltmore Hawthorn. Mt, Pd (GA, NC, SC, VA): wooded hills, rock outcrops, thickets; uncommon. Late April-May; September-October. VT south to c. GA, west to AR, MO. The leaf shape is variable, but the hairiness of its vegetative and floral parts, as well as the normally deeply glandular-serrate calyx lobes make this taxon fairly distinctive among the _Intricatae_ series. [> _C. bitilmoreana_ Beadle – F, G, Q; > _C. confusa_ Sargent – F; _C. villicarpa_ Sargent – F]

_Crataegus iracunda_ Beadle, Red Hawthorn. Cp, Pd (GA, NC, SC, VA): swamps, bottomlands, moist slopes; wooded hills; uncommon (though locally abundant). April-May; September-October. Southern range limits appear to extend south to c. SC, GA, AL (and possibly MS). A difficult species to distinguish vegetatively, appearing most closely allied to _C. macrosperma_
Ash. The typically scabrous young leaves, 10 pink to purplish stamens, and firm-textured fruit with sessile calyx can vary among some local populations of *C. iracunda* to the extent that it may be confused with *C. schuettei, C. pruinosa, or C. boyntonii.*  

**Crataegus lassa** Beadle, Sandhill Hawthorn. Cp, Pd (GA, NC, SC, VA): pine forests, oak-pine scrub, upland scrublands, xeric woodlands, especially in deep sand and soils of rapid drainage; common. Here *C. lassa* is broadly defined to include a wide range of minor species, most described by Beadle. Late March-April; August-September. *C. lassa* is most often shrubby in habit (2-4 m tall), with a rounded or open crown reaching close to the ground, commonly with multiple stems. [= K, W, X; Palmer – F, G; Schelle, Downy Hawthorn. Mt (VA): mesic hardwood forests, mixed pine-hardwood forests, upland wooded hills over calcareous substrates and well-drained clays; uncommon. Lower Piedmont and upper Coastal Plain of sc. SC, wc. GA, ne. and c. AL, and c. and s. MS. April; September. Allied to *C. pulcherrima* Ashe, and perhaps only a variety of it, *C. mendoisa* is distributed well northward and eastward beyond the bulk of the range of *C. pulcherrima.* Related *C. venustia* Beadle and *C. austrina* Beadle occur in central AL. [= K, N, Q, S, X]  

**Crataegus mollis** Scheele, Downy Hawthorn. Mt (VA), Pd (GA): mesic forests, alluvial forests, wooded uplands over basic or calcareous soils; rare in our area. Late March-April; September-October. The unusual occurrence of this species in the Mollis zone of VA is atypical of the majority of the range, which is north and west of VA and AL; ME to ND, s to TX, e to nw. GA. *C. mollis* shows wide variability in size and shape of leaves and fruit, but the tomentose young petals and pubescent leaf undersides are consistent. The local range of some local genotypes can reach 24 mm diameter, among the largest of the genus in the U.S. *C. mollis* often reaches treelike dimensions, to 10 m tall and trunk diameters to 30 cm. [= S, C, X; > C. mollis var. mollis – F, G; > C. mollis – K, Q; > C. cibaria Beadle – Q; > C. gravida Beadle – Q; > C. cibis Ashe; > C. meridionalis Sargent – K; > C. albicans W.W. Ashe – S]  

**Crataegus pulcherrima** Beadle. Mt, Pd, Cp (GA, NC, SC, VA), Pd (GA, NC, SC): swamp forests especially over calcareous soils, alluvial forests, dry and mesic upland slopes (especially over mafic or calcareous rocks). April-early May; September-October. Se. VA south to c. GA, west to n. LA, w. KY, and WV. *C. marshallii* is distinctive and *C. pulcherrima* is here considered diagnostic. A closely related taxon, *C. intricata* Lane, as well as exhibiting characters affiliated with *C. pulcherrima* Ashe. The oblong-ovate leaves with 2 to 3 pairs of straight-sided lobes, 15-20 stamens, yellowish oval fruit, dark furrowed bark, and somewhat twiggy crown atop these multi-stemmed shrubs is here considered diagnostic. A closely related taxon, *C. pinetorum* Beadle (Pineland Hawthorn), of ne. AL and uncertain distribution beyond, exhibits subglobose reddish fruit on pedicels 1-2 cm. [= Q, X; < C. flabellata – RAB; < C. intricata – L, K; > C. pruinosa – F, G; > C. pruinosissima – K; > C. lassa – Q; > C. integra Beadle – Q; > C. pulcherrima Beadle – Q; > C. flavata – K, Q; > C. intricata – L, K; > C. floridana Sargent – K, S]  

**Crataegus phaenopyrum** (Linnaeus f.) Medikus, Washington Hawthorn. Mt, Pd (GA, NC, SC, VA), Cp (NC, SC, VA): upland forests, floodplain forests, pastures, thickets, disturbed areas; uncommon (though locally abundant). May-early June; September-October. One of our most distinctive hawthorns, and commonly cultivated across the eastern U.S. Native range presumed to be PA s. to n. FL, w. to IL, MO, MS; naturalized populations originating from widespread cultivation may be
involved in parts of this range, and expansions elsewhere. [= RAB, C, G, K, W, X; > C. youngii Sargent – F; > C. phaenopyrum – F, S; >
C. populifolia – S]

**Crataegus pruniosa** (Wendl.) Koch, Frosted Hawthorn. Mt, Pd (NC, SC, GA, VA), Cp (NC, SC, GA): upland forests, pastures, rock outcrops, mountain summits and balds, floodplain forests; uncommon (though locally abundant). April-May; September-October. Broadly defined, a variable species with many closely related taxa here considered synonymous. This species may occur as a lone shrub or tree, or become colonial in regularly disturbed areas. The presence of a waxy bloom on the mature fruit (prunose) is not a dependable trait, and fruits can vary from green to bright red, glaucous or not. Foliage and floral parts are usually entirely glabrous on plants in our area. [= C, S, W, X; < C. flabellata – RAB; > C. pruniosa var. pruniosa – F, G; > C. pruniosa var. delawarensis (Sargent) Palmer – F; G; > C. rososa – F, G; > C. pruniosa – K; > C. arcana Beadle – K, Q; > C. rustica Beadle – Q; > C. vicinalis Beadle – Q; > C. gattingeri Beadle – F; > C. gattingeri var. gattingeri – G; > C. gattingeri var. rigidoides Palmer – G; > C. georgiana Sargent – Q]

**Crataegus pulcherrima** Ashe, Beautiful Hawthorn. Cp (GA), Mt (GA): upland hardwood forests and hardwood-pine mixtures, ravines, mesic slopes, especially over iron-rich soils and rolling terrain with soils high in clay or loam content; uncommon (though locally abundant). Se. GA, c. Panhandle FL, west to LA (and perhaps e. TX), north to c. MS and n. AL. April; September-October. Defined broadly, *C. pulcherrima* includes many closely related species described by Beadle, most not clearly distinct and here considered synonymous. Some may deserve varietal status following further study. Foliage of *C. pulcherrima* display a consistency of evenly-lobed leaves with straight, parallel primary veins and obscure secondary venation. The inflorescences are compound, with 20 stamens per flower; fruits are usually small (5-10 mm diameter), with dense flesh; bark of main trunk brown, furrowed. [= X; > C. pulcherrima – K, N, Q; > C. macileenda Bealle – Q; > C. lenis Bealle – Q; > C. anciza Bealle – K, Q; > C. opima Bealle – N, Q; > C. inanis Bealle – K; > C. illustris Bealle – N, Q; > C. incilis Bealle – N, Q; < C. intricata Lange – S]

**Crataegus sargentii** Beadle, Sargent's Hawthorn. Pd (GA): mesic upland forests over calcareous or circumneutral substrates; rare. W. GA, c. and n. AL (and perhaps se. TN). April; September. *C. sargentii* displays intermediate characteristics between the range of variation seen in *C. intricata* and that of *C. pulcherrima*. It is also on the northern range limits of the latter group. Although this might suggest hybrid origin, the genetics of *C. sargentii* has not been carefully investigated. Fruit production is usually scant in *C. sargentii*, and seed viability appears to be very low. [= K, X; > C. sargentii – N, Q; > C. eximia Bealle – N, Q; > C. silva Bealle – N, Q; < C. intricata Lange – S]

**Crataegus schuetzei** W.W. Ashe, Schuette's Hawthorn. Mt (VA, NC): mesic hardwood forests; uncommon (though may be locally abundant). April-May; September-October. *C. schuetzei* occupies a range predominately north of our area, in NH, NY, WI, n. IL, n. WV; known to extend s. to w. NC (and perhaps also to e. TN and n. GA), but the extent of distribution is poorly understood. Closely related to *C. macrospetra*. Foliage of juvenile shoots of *C. schuetzei* in w. NC often are laciniate, with deep, acute sinuses nearly reaching the midrib. [= K, X; < C. flabellata (Bosc) Koch – RAB, C; > C. basilica Bealle – F, G, Q, W]

**Crataegus senta** Bealle. Mt (NC), Cp (SC) [GA?]: upland hills, disturbed forests, pastures; uncommon. W. NC and c. SC (perhaps south to GA and n. FL). April-May; September. *C. senta* appears to be one of the most northerly distributed hawthorns allied closely to the group to which *C. alabamensis* Bealle, *C. lassa Bealle*, and *C. lacertina* Small belong. The drooping branches, red fruit, and small, sharply 3-lobed or 3-pointed, obovate leaves are distinctive. [= Q, X; > C. flavia Alton – RAB, K, S, W; > C. pentasperma Ashe]

**Crataegus spathulata** Michaux, Littlehip Hawthorn. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): bottomland forests, expanding upslope to drier sites on mafic or calcareous substrates; uncommon in NC, common southward. April-May; September-October. E. NC south to Panhandle FL, west to e. TX, north in the interior to w. NC, c. TN, s. MO, and e. OK (Phipps 1988). This species is distinctive for its small spatulate leaves (tending to be trilobed) and thin, flaking bark (multicolored green, brown, and brownish gray). [= RAB, C, F, G, K, Q, S, W, X, Y]

**Crataegus succulenta** Schrader ex Link, Fleshy Hawthorn. Mt (NC, VA): high elevation rocky summits, mesic forests, high pastures, especially over basic soil or mafic substrates; rare. May; October. Widespread across the northern U.S. states, extending s. along the Appalachians to WV, w. VA, w. NC, and s. in the interior to MO. An attractive species, with bright red fruit, obovate to orbicular leaves with reticulate venation, widely spreading branches, and numerous long thorns (5-9 cm long). [= RAB, C, K, S, W, X; > C. succulenta var. succulenta – F, G; > C. succulenta var. neofluvialis (Ashe) Palmer – F, G; > C. neofluvialis Ashe – Q; > C. vernans Ashe]

**Crataegus triflora** Chapman, Threeflower Hawthorn. Mt, Pd, Cp (GA): wooded ravines and slopes under mesic forests, limestone outcrops, flatwoods, prairies; rare. April-May; September-October. Nw. and wc. GA, west to AL, MS, LA; (possibly in TN?). Usually a multi-stemmed shrub 1-3 m tall, but occasionally to 6 m. *C. triflora* produces some of the largest flowers in the genus (to 3 cm diameter), though frequently only 3 flowers borne per inflorescence; occasional vigorous plants may bear 3-6 flowers per inflorescence. The orange-red, soft fruit is palatable and may reach 22 mm diameter. [= K, W, X; > C. triflora – Q, U; > C. austromontana Bealle – Q, U]

**Crataegus uniflora** Muenchhausen, Oneflower Hawthorn. Mt, Pd, Cp (GA, NC, SC, VA): upland forests, disturbed lands, roadsides, rock outcrops, often in xeric or sub-xeric conditions; common. April-May; September-October. PA and NJ south to n. FL, w. to e. TX, OK, and MO. Normally a shrubby species, 0.5-2 m in height, though local forms may reach 4 m, particularly in
**ROSACEAE**

476

Crataegus viridis Linnaeus, Green Hawthorn. Pd, Cp (GA, NC, SC), Mt (SC, VA): swamps, bottomland forests, alluvial woodlands, wet flatwoods, and uplands where soils are often basic to calcareous; common. Late March-late April; September-November. DE w. to n. MO, south to central peninsular FL and central TX. One of our largest hawthorn species, frequently reaching treelike proportions (5-10 m tall, trunk 10-40 cm diameter). The orange-red fruits often persist on the bare branches into winter, sometimes until the following spring. Bark of the trunk is usually mottled with patterns of gray, reddish-brown, and greenish-gray coloration, due to the dehiscing layers of scales and plates. [= X; = K; = C. americana; = RAB, C, F, G, K; = C. viscosa; = Linnaeus – C, G, Z; = Aphanes floribunda; = Pentaphylloides floribunda (Pursh) Kartesz, Shrubby-cinquefoil, Golden-hardhack. This species is widespread in the western and northern parts of North America, south to n. NJ, s. and n. PA, s. OH, IN, IL, IA, SD, NM, AZ, and CA. It was reported for western NC (“near Ducktown, in Turtletown, Cherokee County, N.C.”) by Gattinger (1901), but corroborating specimen documentation is lacking. [= K; < Potentilla fruticosa Linnaeus – C, G, Z; < Potentilla fruticosa var. fruticosa – F; = Pentaphylloides floribunda (Pursh) A. Löve]

Crataegus visenda Beadle. Pd, Cp (GA, NC, SC): upland pine and pine-oak forests, disturbed woods, wooded hills with clay or sandy soils, often in xeric or sub-xeric conditions; uncommon. April; late August-September. Central & upper Coastal Plain of NC south to n. FL, west to s. & e. MS, n. AL, and nw. GA. *C. visenda* is related closely to *C. aprica* Beadle, but the foliage tends to have a higher percentage of nearly orbicular blades and branches are more recurved or drooping. Often attaining the dimensions of a small tree (4-8 m tall and with a trunk 7-20 cm diameter). [= X; = K, Q; = C. penita Beadle – K, Q]

Crataegus ashei Beadle, Ashe Hawthorn. Cp (AL): prairies, hardwood forests, pine-hardwood flats, especially over calcareous clay soils; rare. C. and s. AL west to c. and s. MS and e. LA (s. TN?). April; September. Related to *C. triflora* Chapman and C. harbisonii Beadle. [= U, X; = C. harbisonii – Beadle – K]

Crataegus austrina Beadle. C. AL. [= Q, X; = C. tecta Beadle – N]

Crataegus dilatata Sargent, Broadleaf Hawthorn. Reported from a single county in WV, otherwise bulk of range is in PA & areas northward. May; October. Related to *C. coccinoides*, which is occasionally cultivated but restricted in natural range to the lower Midwest. [= C, X]

Crataegus harbisonii Beadle, Harbison Hawthorn. Rare, endemic to c. and w. TN and currently known only from Davidson Co, TN: hardwood forests understories, over limestone; very rare. Late April-May; Sept.-Oct. Related species *C. ashei* Beadle has a more southern distribution in AL, MS, and LA. *C. harbisonii* appears to be extirpated from nearly all of its former range, even though once described as common in the Nashville area. [= Q, S, U, X; = C. harbisonii Beadle – K]

Crataegus lacrimata Small, Weeping Hawthorn. Xeric, sandy soils, in scrublands and in association with sparse stands of *Pinus clausa* or *Pinus pulastra*. Endemic to the western FL Panhandle; perhaps in adjacent sandhill scrub of AL. Late March-April; August-September. The combination of conspicuously slender weeping branches, small spatulate leaves, glabrous character, and treelike habit in *C. lacrimata* is unique among a large group of related hawthorns which occupy sandy habitats in the Coastal Plain. [= Q, X]

*Crataegus monogyna* Jacquin, English Hawthorn. Reported for VA in W. [= C, F, G, K; = Pentaphylloides floribunda (Pursh) Kartesz, Shrubby-cinquefoil, Golden-hardhack. This species is widespread in the western and northern parts of North America, south to n. NJ, s. and n. PA, s. OH, IN, IL, IA, SD, NM, AZ, and CA. It was reported for western NC (“near Ducktown, in Turtletown, Cherokee County, N.C.”) by Gattinger (1901), but corroborating specimen documentation is lacking. [= K; < Potentilla fruticosa Linnaeus – C, G, Z; < Potentilla fruticosa var. fruticosa – F; = Pentaphylloides floribunda (Pursh) A. Löve]

Cydonia P. Miller 1754 (Quince)

*Dasiphora* Rafinesque 1840 (Shrubby-cinquefoil)

Molecular phylogenetic studies indicate that this genus is more closely related to *Alchemilla*, *Aphanes*, *Drymocallis*, *Fragaria*, *Sibbaldtopsis*, and other genera outside our area than to *Potentilla* (Eriksson et al. 2003). References: Robertson (1974)=Z; Eriksson et al. (2003); Kalkman in Kubitzki (2004); Erter (2007).

Dasiphora fruticosa (Linnaeus) Rydberg ssp. floribunda (Pursh) Kartesz, Shrubby-cinquefoil, Golden-hardhack. This species is widespread in the western and northern parts of North America, south to n. NJ, s. and n. PA, s. OH, IN, IL, IA, SD, NM, AZ, and CA. It was reported for western NC (“near Ducktown, in Turtletown, Cherokee County, N.C.”) by Gattinger (1901), but corroborating specimen documentation is lacking. [= K; < Potentilla fruticosa Linnaeus – C, G, Z; < Potentilla fruticosa var. fruticosa – F; = Pentaphylloides floribunda (Pursh) A. Löve]

Dasiphora fruticosa (Linnaeus) Rydberg ssp. floribunda (Pursh) Kartesz, Shrubby-cinquefoil, Golden-hardhack. This species is widespread in the western and northern parts of North America, south to n. NJ, s. and n. PA, s. OH, IN, IL, IA, SD, NM, AZ, and CA. It was reported for western NC (“near Ducktown, in Turtletown, Cherokee County, N.C.”) by Gattinger (1901), but corroborating specimen documentation is lacking. [= K; < Potentilla fruticosa Linnaeus – C, G, Z; < Potentilla fruticosa var. fruticosa – F; = Pentaphylloides floribunda (Pursh) A. Löve]
**Drymocallis** Fourier ex Rydberg 1908 (Drymocallis, Wood-beauty)

A genus of about 30 species, best segregated from *Potentilla*. Molecular phylogenetic studies indicate that this genus is more closely related to *Alchemilla*, *Aphanes*, *Dasiphora*, *Fragaria*, *Sibbaldiopepsis*, and other genera outside our area than to *Potentilla* (Eriksson et al. 2003). References: Erter in FNA (in press); Erter (2007)=Z; Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

**Drymocallis arguta** (Pursh) Rydberg, Tall Drymocallis, Tall Wood-beauty. Mt (VA, WV): greenstone barrens, other barrens; rare. QC west to NT, south to w. VA, IN, MO, and AZ. Reported for e. TN by Gattinger (1901); the documentation unknown. [= FNA, Z; *= Potentilla arguta* Pursh – F, G, WV; > *P. arguta var. arguta* – C; > *P. arguta ssp. arguta* – K]

**Eriobotrya** Lindley 1821 (Loquat)

A genus of about 30 species, trees and shrubs, native to e. Asia. References: Pipps in FNA (in press).

**Exochorda** Lindley 1858 (Pearlbus)

**Filipendula** P. Miller 1754 (Queen-of-the-Prairie)

1 Lateral leaflets lobed and toothed; flowers pink; fruit straight; rootstock with long subterranean runners; [native plant of wetlands, also sometimes cultivated]; [section Alibicoma].............................................................................................................................. F. rubra

1 Lateral leaflets merely coarsely toothed; flowers white; fruit twisted; rootstock short, without runners; [introduced species, sometimes escaped]; [section Filipendula].............................................................................................................................. F. ulmaria

**Filipendula rubra** (Hill) B.L. Robinson, Queen-of-the-Prairie. Mt (NC, VA, WV), Pd (VA): bogs, wet meadows, over mafic or calcareous rocks; rare. June-July; July-September. PA west to n. IL and MN, south to WV, w. VA, w. NC, e. TN (Roane County, fide Gattinger 1901), and MO (reports from GA appear to be unsubstantiated). The closest relatives are the other two members of section Alibicoma: *F. palmata* (Pallas) Maximowicz and *F. angustifolia* (Turezaninow) Maximowicz, both of ne. Asia. [= RAB, C, F, FNA, G, GW, K, S, W, WV, Y, Z]

* Filipendula ulmaria* (Linnaeus) Maximowicz, Meadowsweet, Queen-of-the-Meadow. Mt (WV): disturbed areas; rare, native of Europe. Cultivated and sometimes escaped or persistent. It is reported for KY, WV, PA, and NJ (Kartesz 1999). [= FNA, WV, Y; > *F. ulmaria var. ulmaria* – C, F, G; > *F. ulmaria ssp. ulmaria* – K]

**Fragaria** Linnaeus 1753 (Strawberry)

1 Fruit (at least the larger on a plant) usually > 1.5 cm thick; petals 10-15 mm long; leaves evergreen; [cultivated, rarely persistent]................................................................. F. ×ananassa

1 Fruit 1-1.5 cm thick; petals 3-10 mm long; leaves deciduous (at least tardily so); [native].

2 Achenes set in pits on the mature receptacle; calyx lobes appressed to the developing fruit (after petal drop); petals (5-) 7-10 mm long; principal lateral veins diverging from the midrib of the leaflet at an angle of ca. 30 degrees; terminal tooth of leaflets > ½ as wide as the adjacent teeth, as long as or surpassing them in length........................................................................................................ F. virginiana

2 Achenes superficial on the mature receptacle; calyx lobes spreading to reflexed from the developing fruit (after petal drop); petals 3-7 mm long; principal lateral veins diverging from the midrib of the leaflet at an angle of ca. 45 degrees; terminal tooth of leaflets < ½ as wide as the adjacent teeth, and surpassed by them in length.

4 Long hairs of the petioles and peduncles ascending to appressed............................................................................. F. vesca var. americana

4 Long hairs of the petioles and peduncles spreading to retrorse............................................................................................ [F. vesca var. vesca]

*Fragaria vesca* Linnaeus var. *vesca*. NL (Newfoundland), QC and MI south to PA, WV (?), KY, and IL. [= C, F, G; = *F. vesca* ssp. *vesca* – FNA, K]

**Geum** Linnaeus 1753 (Avens)

A genus of 40–60 species, herbs, mainly of north temperate areas. Many researchers have advocated breaking *Geum* into varying numbers of segregate genera; even the most conservative divisions place *G. radiatum* in a genus separate from our other species (such as *Parageum*; see synonymy) and some would place *G. vernum* in *Stylipus*. Molecular studies (Smedmark 2006; Smedmark & Eriksson 2002) make a strong case for a broad circumscription of *Geum*, including *Waldsteinia*, as many of the segregates are complexly and reticulately interrelated. References: Rohrer in FNA (in press); Phipps in FNA (in press); Robertson (1974) = Z, Bolle (1933) = Y; Král (1966) = X; Smedmark (2006) = V; Weakley & Gandhi (2009) = Q; Smedmark & Eriksson (2002); Kalkman in Kubitzki (2004). [including *Parageum* and *Waldsteinia*]

1 Style deciduous; leaves 3-foliolate or 3-lobed, lacking small leaflets towards the base; [subgenus or genus *Waldsteinia*]

2 Leaves trifoliolate (fully divided), and also typically additionally lobed; leaves sparsely pubescent with stiff hairs, these distributed mostly...[more widespread].

3 Petals 2.5–4 mm long (about as long as the sepals), 1–1.5 mm wide; [of VA and KY southwards]................................. *G. donianum*

4 Style persistent; leaves various (see below).

5 Style straight or slightly sinuous, neither joined nor tightly twisted, the tip straight; basal leaves with a cordate or reniform terminal...[more widespread].

6 Portion of the style above the kink 1–2 mm long; calyx reflexed soon after anthesis, the calyx lobes 3–9 mm long, green; petals white, cream, or yellow; lower portion of style glabrous or with long, eglandular hairs.

7 Portion of the style above the kink 3–4 mm long; calyx lobes 9–15 mm long, purple; [of ne. WV northward].........................

8 Larger stipules > 10 mm wide, coarsely toothed or even lobed; mid-cauline leaves very coarsely toothed, with 1–5 teeth per cm of margin................................. *G. virginianum*

9 Plant in flower.

10 Petals bright yellow, 5–9 mm long................................................................. *G. aleppicum*

10 Petals white or cream (often drying pale yellow), 2–7 (–7.5) mm long.

11 Petals (3–) 4–7 (–7.5) mm long; pedicels puberulent (sometimes also slightly hisrate); [of moist to dry forests].......................... *G. canadense*
G. aleppicum Jacquin, Yellow Avens. Mt (NC, VA, WV), Pd (VA): bogs and boggy meadows; rare. June-July; July-August. Circumboreal, in North America south to NJ, w. NC, ne. TN (Chester, Wofford, & Kral 1997), IN, IL, IA, and NM. The report for GA (Jones & Coile 1988) is in error. American plants are sometimes separated from Eurasian ones as var. strictum (Aiton) Fernald. [= RAB, FNA, GW, K, W, Y; > G. aleppicum var. strictum (Aiton) Fernald – C, F, G]

G. canadense Jacquin. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): moist slope forests, bottomland forests, swamp forests; common. May-July; July-November. NS west to ND, south to c. GA and TX. Some authors have recognized a number of varieties in G. canadense (see synonymy); some (at least) of these may warrant recognition. [= RAB, C, FNA, G, CW, S, W, Z; > G. canadense var. canadense – F, K, WY; > G. canadense var. brevipes Fernald – F; Y; > G. canadense var. camporum (Rydberg) Fernald & Weatherby – F, Y; > G. canadense var. grimesii Fernald & Weatherby – F, Y]

G. fragarioides (Michaux) Smedmark, Northern Barren Strawberry. Pd (NC, VA), Mt (WV): forests, streambanks; rare. Late March-May; May-June. NB west to MN, south to NC, TN, IN, MO, and AR. [= Q = Waldsteinia fragarioides (Michaux) Trattinick var. fragarioides – F; < W. fragarioides – RAB, W, WV, Y; = W. fragarioides ssp. fragarioides – K, Z; = Waldsteinia fragarioides – FNA, G, S; < Geum fragarioides (Michaux) Smedmark = V]

G. geniculatum Michaux, Bent Avens. Mt (NC): seeps, seepy boulderfield forests, grassy balds, cliff bases, banks of cool streams up to about 5 m wide, at high to moderate elevations on Grandfather Mountain (Avery, Watauga, and Caldwell counties, NC), the Roan Mountain massif (Avery and Mitchell counties, NC and Carter County TN), and Rich Mountain (Watauga County, NC); rare, though locally fairly common (US Species of Concern, NC Threatened). Late June-August; August-September. G. geniculatum is apparently restricted to the few highest peaks in nw. NC and ne. TN: the Roan Mountain massif (Roan High Knob, Roan High Bluff, Round Bald, Jane Bald, Grassy Ridge, Little Hump Mountain, Big Yellow Mountain, and Big Hump Mountain), Grandfather Mountain, and Rich Mountain. It may be found on a few other peaks, such as Snake Mountain. The distribution of this species is peculiar. While limited to the several highest and coldest mountains in the Southern Appalachians, it extends downslope on Roan Mountain and Grandfather Mountain nearly to their bases, in environmental situations that are apparently duplicated on many other Southern Appalachian peaks. Perhaps G. geniculatum was more widespread in the Southern Appalachians in the cooler, moister conditions of the post-Pleistocene, but became restricted to the few coldest peaks during the warmer, drier conditions of the Hypsithermal Interval (7000-2000 B.C.). Following climatic cooling, it was able to disperse downslope from its several refugia, but has not dispersed successfully to other peaks. G. geniculatum is most closely related to the circumboreal G. rivale, with which it shares such characteristics as purplish, non-reflexed sepals, a relatively long terminal style segment, upper pedicel with long glandular hairs, and basal style segment with long glandular hairs. [= RAB, FNA, K, S, W, Y, Z]

G. laciniatum Murray, Rough Avens. Mt (NC, SC, VA, WV), Cp (DE, VA), Pd (DE, VA): bogs and wet meadows; uncommon (in NC, SC, and VA). June-July; July-August. Two varieties are sometimes recognized: var. laciniatum has glabrous achenes and is generally more northern and more restricted in distribution than var. trichocarpum, which has achenes sparsely to densely pubescent with long stiff trichomes, and ranges from NS west to s. ON, south to MD, VA, w. NC, TN, OH, IL, MO, and KS. The difference appears to be that of a single trait, uncorrelated with other traits, and with largely overlapping geographic distributions; the varieties are not recognized here. [= RAB, C, FNA, GW, W, Y; > G. laciniatum var. laciniatum – F, G, K, WV, Z; > G. laciniatum var. trichocarpum Fernald – F, G, K, Z]

G. lobatum (Baldwin ex Elliott) Smedmark, Lobed Barren Strawberry. Mt (GA, NC, SC), Pd (GA, SC): forests, streambanks; rare. March-May; May-June. Sw. NC south to nw. SC and n. and c. GA. Some populations appear to be morphologically intermediate between G. lobatum and G. donianum; further study is needed. [= Q, V = Waldsteinia lobata (Baldwin ex Elliott) Torrey & A. Gray – FNA, K, S, Y, Z]

G. raditum Michaux, Spreading Avens, Cliff Avens. Mt (NC): high elevation rocky summits, in thin soil at tops of cliffs and on ledges (where not trampled), in pockets of soil on nearly vertical portions of cliffs, in open grassy balds, around Rhododendron catawbiense in grassy balds, or in grassy areas at bases of cliffs (where succession by shrubs is prevented by accumulation of seepage ice and by stone fall); rare. June-August; July-September. Ranging from Ashe County, NC (Phoenix Mountain) south and west to Sevier County, TN (Mount Leconte) and Transylvania County, NC (the Devil’s Courthouse), restricted to "pseudo-alpine" rock outcrops and grassy meadows near the summits of the higher peaks of the Southern Blue Mountains.
Ridge, notably Bluff Mountain, Three Top Mountain, Phoenix Mountain, and The Peak (Ashe County, NC), Grandfather Mountain (Watauga and Avery counties, NC), Grassy Ridge (Avery County, NC), Roan High Bluff (Mitchell County, NC), Mount Craig in the Black Mountains (Yancey County, NC), Craggy Pinnacle, Craggy Dome, and Craggy Gardens (Buncombe County), the Devil's Courthouse (Transylvania County, NC), and Mount Leconte (Sevier County, TN). *Geum radiatum* is closely related to three other taxa, these siblings also restricted in range and endemic to mountainous areas, collectively showing a relicual distribution: *G. peckii* Pursh (of alpine meadows and moist, rocky slopes of NS and the higher peaks of NH and ME), *G. calthifolium* Menzies ex Smith var. *calthifolium* (of wet snow-melt meadows of w. BC, w. YT, s. AK, and the Aleutians), and *G. calthifolium* var. *nipponicum* (of wet snow-melt meadows of s. Kamchatka and Japan). It is illegal to collect *G. radiatum* without federal and state permits, and there is no justification (scientific or otherwise) for additional collections from known sites. This is one of the few plant species that has been seriously depleted by collection by scientists (several hundred herbarium sheets from Roan Mountain alone!), though recreational over-use of its habitats, and possibly also pollution and break-up of adjoining spruce-fir forests, are the more critical threats to its continued existence. [= RAB, FNA, K, W, Z; *Sieversia radiata* (Michaux) Greene – S; = *Parageum radiatum* (Michaux) H. Hara – X; = *Acomastylis radiata* (Michaux) Bolle – Y]

*Geum rivale* Linnaeus, Water Avens, Purple Avens. Mt (WV): calcareous bogs, swamps, seepages, and wet meadows; rare. Circumboreal, in North America from NL (Labrador), Keewatin, and BC south to NJ, MD, WV (Pocahontas, Preston, Randolph, and Tucker counties), OH, IN, IL, MN, SD, NM, and WA. It is most closely related (in our area) to *G. geniculatum.* [= C, F, FNA, G, K, W, WV, Y]

**Gillenia** Moench 1802 (Indian-physic, Bowman's-root)

A genus of 2 species, herbs, of e. North America. The contention that *Gillenia* is a later homonym of *Gillenia* and must therefore be rejected for the later name *Porteranthus* has been ruled against (see Robertson 1974; Brummitt 1988; Parkinson 1988). References: Nesom in FNA (in press); Robertson (1974)=Z; Kalkman in Kubitzki (2004).

1 Stipules ovate, 10-20 (125) mm long; lower leaf surface densely glandular; leaves trifoliate, the leaflets of the lower leaves laciniate-toothed to divided ................................................. .......................................................... *G. stipulata*

1 Stipules linear, 6-8 mm long; lower leaf surface glabrous or sparsely glandular; leaves trifoliate, the leaflets of the lower leaves merely toothed, like the upper leaves ................................................................................................................................................................................................. *G. trifoliata*

**Gillenia stipulata** (Muhlenberg ex Willdenow) Nuttall, Midwestern Indian-physic. Pd (GA, NC, VA), Mt (GA, WV): dry to mesic woodlands and forests, especially over circumneutral soils derived from diabase (in NC) or greenstone (in VA); uncommon (rare in GA, NC, and VA). May-June; July-October. NY to KS, south to nw. GA and TX, and disjunct east of the Blue Ridge in sc. VA, c. NC, and c. GA. [= RAB, F, FNA, G, GW; *Porteranthus stipulatus* (Muhlenberg ex Willdenow) Britton – C, K, S, W, Z]

**Gillenia trifoliata** (Linnaeus) Moench, Mountain Indian-physic. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (VA): moist forests, roadbanks, forest edges; common (rare in DE). April-June; August-October. ON west to MI, south to SC, AL, nc. GA, and MO. [= RAB, F, FNA, G, GW; *Porteranthus trifoliatus* (Linnaeus) Britton – C, K, S, W, Z]

**Kerria** A.P. de Candolle 1818 (Kerria)

**Malus** P. Miller 1754 (Apple, Crabapple)

1 Twigs thorny; leaves folded in bud; leaves often lobed; [native, sometimes weedy]; [subgenus Chloromeles].
2 Leaves permanently pubescent beneath; pedicels and hypanthium pubescent; [western, disjunct east to KY and MS]................. *M. ioensis*
3 Leaves glabrous or nearly so; pedicels and hypanthium glabrous or with scattered long hairs; [widespread in our area].
3 Leaves elliptic to elliptic-lanceolate, 2.5-8 cm long, 1-4 cm wide, mostly > 2× as long as wide, subacute to obtuse at the tip .......... *M. angustifolia*
Rosaceae

Malus angustifolia (Aiton) Michaux, Wild Crabapple. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): forests, woodlands, fence-rows, dry hammocks; common (uncommon in Piedmont and Mountains, uncommon in FL, rare in WV). April-May; August-September. NJ, PA, OH, s. IL, and se. MO, south to n. peninsular FL, Panhandle FL and e. TX. [= RAB, S, WH; = Pyrus angustifolia Aiton – C, G, WV, Z; > Pyrus angustifolia var. angustifolia – F; > Pyrus angustifolia var. spinosa (Rehder) L.H. Bailey – F; > M. angustifolia var. angustifolia – K; > M. angustifolia var. puberula Rehder – K]

* Malus baccata (Linnaeus) Borkhausen, Siberian Crabapple. Mt (WV), Pd (DE), {KY, MD}: suburban woodlands; rare, native of e. Asia. [= Pyrus baccata Linnaeus – C]

Malus coronaria (Linnaeus) P. Miller, Wild Crabapple. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC): forests, woodlands, fencerows; common. May; September-October. NY, ON and WI south to GA, AL, and AR. [= RAB, K, W; = Pyrus coronaria Linnaeus – C, Z; > Pyrus coronaria Linnaeus var. coronaria – F, WV; > Pyrus coronaria Linnaeus var. elongata Rehder – F; > Pyrus coronaria Linnaeus var. dasycalyx (Rehder) Fernald – F; > Pyrus coronaria Linnaeus var. lancifolia (Rehder) Fernald – F, WV; = Pyrus lancifolia L.H. Bailey – G; > Malus bracteata L.H. Bailey – S; > Malus bracteata (Rehder) Fernald – S; > Malus coronaria (Linnaeus) P. Miller – S; > Malus lancifolia Rehder – S; > Malus coronaria (Linnaeus) P. Miller var. dasycalyx Rehder]

* Malus floribunda Siebold ex Van Houtte, Japanese Flowering Crabapple. Mt (WV): disturbed areas; rare, native of Japan. [= K; not yet keyed]

Malus ioensis (Wood) Britton var. ioensis, Prairie Crabapple. Mt (WV): forests, woodlands, fence-rows; rare. MI, MN, e. SD, and w. NE, south to w. WV, KY, s. MS, se. LA, and c. TX. [= K; < Pyrus ioensis (Wood) L.H. Bailey – C, F, G; < M. ioensis – WV]

* Malus prunifolia (Willdenow) Burkhardt, Chinese Crabapple. Pd (VA), Mt (WV), {SC}. [= K; = Pyrus prunifolia Willdenow – C]

* Malus pumila P. Miller, Common Apple. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, NC, SC, VA): commonly cultivated throughout, especially in the Mountains and Piedmont, and long persistent; uncommon, native of Asia. April-May; July-October. [= RAB, K, W; = Pyrus malus Linnaeus – C, F, G, WV, Z; = Malus malus (Linnaeus) Britton – S; = Malus domestica Burkhart]

Neillia D. Don 1825 (Lace Shrub)

* Neillia incisa (Thunberg) S.H. Oh, Lace Shrub. Pd (VA): suburban woodlands; rare, establishing from horticultural plantings, native of Japan and Korea. [= FNA, Z; = Stephanandra incisa (Thunberg) Zabel – K]

Neviusia A. Gray 1858 (Snow-wreath)

Neviusia alabamensis A. Gray, Alabama Snow-wreath. Mt (GA): limestone woodlands, where there is seasonal moisture; rare. Sc. TN (Chester, Wofford, & Kral 1997), mw. GA (Jones & Coile 1988), and n. AL; disjunct in AR and MO. [= K, S]

Photinia Lindley 1821 (Photinia, Redtip)

A genus of about 40 species, trees and shrubs, of Asia and Central America. References: Nesom in FNA (in press); Kalkman in Kubitzki (2004). [also see Aronia and Pourthiaea]
*Photinia serratifolia* (Desfontaines) Kalkman, Taiwanese Redtip. Cp (AL, LA, MS), Pd (AL), Mt (AL), {GA}: suburban woodlands; uncommonly cultivated and rarely naturalizing, native of c. Asia. Also reported from MS and LA as long-persistent and weakly naturalizing. [= FNA, K]

**Physocarpus** (Camberries) Rafinesque 1838 (Ninebark)

1. Flowers in terminal cymes; leaves palmately 3-9-foliolate.  
2. Leaves 3-foliolate; [section *Rivales*].  
3. Petals and sepals subequal; stamens (15-) 20; achenes usually ridged ........................................... *P. opulifolius* var. *intermedius*  
4. Petals much shorter than the sepals; stamens 5-10 (-15); achenes smooth .................................................. *P. recta*

**Physocarpus opulifolius** (Linnaeus) Maximowicz *var. intermedius* (Rydberg) B.L. Robinson, Midwestern Ninebark. Cp (FL), Pd (SC, NC?): mesic hammocks, streambanks; rock outcrops; rare. W. NY west to MN and CO, south to SC, FL, AL, and AR. It is unclear whether the southern species recognized by Small (1933) are best allied with this taxon. Additional study is needed. [= C, F, G, K, Z; < *P. opulifolius* – RAB, W, WH; = *P. intermedius* (Rydberg) C.K. Schneider – FNA; > *Opulaster alabamensis* Rydberg – S; > *Opulaster stellatus* Rydberg – S; > *Opulaster intermedius* Rydberg]

**Physocarpus opulifolius** (Linnaeus) Maximowicz *var. opulifolius*, Eastern Ninebark. Mt (NC, SC, WV), Pd (DE, NC, SC), {GA, VA}: stream banks, riverside thickets, rock outcrops, cliffs, especially over mafic or calcareous rocks; common. May–July. QC west to WI, south to SC, TN, and n. IL. [= C, F, G, K, Z; < *P. opulifolius* – RAB, W, WV; = *P. opulifolius* – FNA; > *Opulaster opulifolius* (Linnaeus) Kunze – S; > *Opulaster australis* Rydberg – S]

**Potentilla** Linnaeus 1753 (Cinquefoil, Five-fingers, Potentilla)

1. Flowers solitary, on naked, axillary pedicels; leaves palmately 3-5-foliolate.  
2. Leaves 3-foliolate; [section *Rivasae*].  
3. Petals and sepals subequal; stamens (15-) 20; achenes usually ridged .......................................................... *P. norvegica*  
4. Petals much shorter than the sepals; stamens 5-10 (-15); achenes smooth ....................................................... *P. rivalis*

**Potentilla argentea** (Linnaeus) Maximowicz *var. argentea* (Rydberg) Maximowicz, Silverfive-fingers, Hoary Five-fingers. Mt (NC, VA, WV), Pd (NC, VA): stream banks, meadows, forest edges; common to common. May–July. QC west to WI, south to SC, TN, and n. IL. [= C, F, G, K, Z; < *P. argentea* – RAB, W, WV; = *P. argentea* – FNA; > *Opulaster argentea* (Linnaeus) Kunze – S]

*Potentilla anserina* Linnaeus, Silverweed. Lawns, disturbed areas. Circumboreal, south in North America to MA, NY, new. PA, OH, IN, IL, IA, NE, NM, AZ, and CA; also scattered further south, apparently as an introduction, as in Sevier County, TN (Chester, Wofford, & Kral 1997), se. PA (Rhoads & Klein 1993), MD (BONAP 2010), and n. NJ (BONAP 2010). [= C, F, G; > *Potentilla anserina* ssp. *anserina* – FNA; = *Argentina anserina* (Linnaeus) Rydberg – K]

*Potentilla argentea* Linnaeus, Silvery Five-fingers, Hoary Five-fingers. Mt (NC, VA, WV), Pd (NC, VA), Cp (NC, VA): disturbed areas; uncommon (rare in NC and VA), naturalized from Europe. May–July. [= RAB, C, F, FNA, G, W; > *P. argentea* var. *argentea* – K]

**Potentilla canadensis** Linnaeus var. *villosissima* Fernald, Haired Five-fingers. Pd (NC): woodlands, forests, fields, lawns, disturbed areas; uncommon. March-May; April-June. The relative distributions and habitats of the two varieties obscure. [= F, G, K; < *P. canadensis* – RAB, C, FNA, W; = *P. caroliniana* Poirét – S]

* Potentilla indica* (Andrews) T. Wolf, Indian-strawberry. Cp (DE, FL, GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): disturbed areas, lawns, gardens; common (uncommon in FL and WV), native of Asia. February-frost. *Duchesnea* is apparently not closely related to *Fragaria*, and is best combined with *Potentilla*, which does have other species with accrescent fruits (Eriksson, Donoghue, & Hibbs 1998). The strawberry-like fruit is not sweet; it can also be distinguished from *Fragaria* by its whitish interior flesh. The leaves are more coarsely toothed than *Fragaria*. [= *Duchesnea indica* (Andrews) Focke – RAB, C, F, G, K, S, W, WH, WV]

* Potentilla intermedia* Linnaeus. Mt (NC, VA), Pd (VA), Cp (VA), {MD}: disturbed areas; rare, naturalized from Europe. May-July. [= RAB, C, F, FNA, G, K]

**Potentilla norvegica** Linnaeus, Strawberry-weed, Rough Cinquefoil. Mt (GA, NC, VA, WV), Cp (DE, NC, VA), Pd (DE, GA, NC, SC, VA): pastures, fields, disturbed areas, especially where moist; common (uncommon in GA, NC, SC, and VA Piedmont, uncommon in GA, NC, SC, and VA Coastal Plain). Late May-frost; June-frost. This species is apparently a complex circumboreal species complex, with both native and introduced elements now present in NC. [= RAB, C, FNA, G, W, WV; > *P. norvegica* var. *norvegica* – F; > *P. norvegica* ssp. *monspeliensis* (Linnaeus) Ascherson & Graebner – K; > *P. monspeliensis* Linnaeus – S; > *P. norvegica* ssp. *hirsuta* (Michaux) Hylander]

* Potentilla rivalis* Nuttall, Brook Five-fingers. Mt (VA, WV), Pd (VA), Cp (VA): habitat not known; rare, adventive from further west. [= C, FNA, G, K; > *P. millegrana* Engelmann ex Lehmann – F; > *P. rivalis* var. *millegrana* (Engelmann ex Lehmann) S. Watson]

**Poteridium** Spach 1846 (American Burnet)

**Poterium** Linnaeus 1753 (Salad Burnet)

**Pourthiaea** DeCaisne 1874 (Photinia)

A genus of about 25 species, shrubs, of e. Asia. Guo et al. (2011) indicate that *Pourthiaea* should be separated from both *Photinia* and *Aronia*. References: Guo et al. (2011).

* Pourthiaea villosa* (Thunberg) DeCaisne, Oriental Photinia. Mt (NC), Pd (DE, NC): uncommonly cultivated, sometimes escaping to suburban woodlands; uncommon (rare in NC), native of e. Asia. [= Z; = *Photinia villosa* (Thunberg) A.P. de Candolle – FNA, K]
Prunus Linnaeus 1753 (Plum, Cherry, Sloe, Peach, Apricot)

1 Flowers in elongate racemes of (12-) 20-many flowers.
2 Leaves evergreen, entire or serrate with few or rather many (but widely spaced) prominent teeth; petioles lacking 2 glands near junction with leaf blade; [native in maritime situations from e. NC southward, but cultivated and escaped inland]; [laural cherries, subgenus Laurocerasus] ........................................................................................................... P. caroliniana

2 Leaves deciduous, regularly and rather finely toothed; petioles with 2 glands near the junction with the leaf blade; [collectively widespread, native and alien]; [black cherries, subgenus Padus] ........................................................................................................... Key A

1 Flowers solitary, in fascicles, in umbellate or corymbose inflorescences, or in short racemes (P. mahaleb) of 1-12 flowers.

3 Flowers and fruit pedicellate, the pedicel > 4 mm long; fruit glabrous, ovary glabrous or pubescent initially.
4 Stones globose, not 2-edged; sepals hairy or not; inflorescences subtended by leafy bracts arising from the same bud as the flowers (except P. pensylvanica, P. susquehanae, and P. pumila var. depressa); cherries .................................................................................. P. persica

4 Stones somewhat to strongly flattened, 2-edged; sepals hairy on the upper surface (except P. domestica, P. insititia, and P. cerasifera); inflorescences without leafy bracts arising from the same bud as the flower; plums ........................................................................................................... Key B

3 Flowers and fruit sessile or on a pedicel < 2 mm long
4 Leaf serrations small and obscure or well-developed but rounded to acute.
5 Leaf serrations single to double, the tips of the serrations acuminate to attenuate.
6 Petals 4-7.5 mm long; fruit < 1 cm in diameter; [section Lithocerasus] .......................... P. virginiana var. virginiana

6 Petals 9-15 mm long; fruit 1.3-2.5 cm in diameter; [section Microcerasus] .......................... P. pensylvanica

6 Petals 9-15 mm long; fruit 1.3-2.5 cm in diameter; [section Eucerasus] .......................... P. avium

6 Petals 4-8 cm long, glabrous beneath once fully-expanded; pair of petiolar glands on the base of the leaf blade; fruit sour when ripe. ........................................................................................................... P. cerasus

KEY A – BLACK-CHERRIES, subgenus Padus

1 Petals 6-10 mm long; hypanthium pubescent within; stone sculptured; [alien, rarely naturalizing] ........................................................................................................... P. padus

1 Petals 4-7 mm long; hypanthium glabrous within; stone smooth; [native].
2 Leaf teeth triangular, pointing outwards; leaves dull above; sepals conspicuously glandular-eroded on the margin, not persistent on the fruit; colonial, thick- or stilt-rooting shrub from rhizomes; [plants of calcareous shores and gravel bars] ........................................................................................................... P. virginiana var. virginiana

2 Leaf teeth curved, appressed; leaves shiny above; sepals entire or slightly glandular-eroded on the margin, persistent on the fruit; small to large tree, not clonal; [collectively widespread]
3 Leaves mostly 1.5-2× as long as wide, often blunt-tipped (except in shoot leaves); lower leaf surface rather uniformly pubescent, the midrib lacking conspicuous tufts or fringes; branchlets reddish hairy ........................................................................................................... P. alabamensis

3 Leaves mostly 2-2.5× as long as wide, slightly acuminate; lower leaf surface glabrous except for tufts or fringes along the midrib; branchlets glabrous ........................................................................................................... P. serotina var. serotina

Key B – CHERRIES, subgenera Cerasus and Lithocerasus

1 Plants shrubs, to 1.5 (-3) m tall; [subgenus Lithocerasus; section Microcerasus].
2 Inflorescences of 1-2 flowers; [exotic, persistent from cultivation] ........................................................................................................... P. glandulosa

2 Inflorescences of 2-4 flowers; [native].
3 Youngest twigs glabrous; leaf blades (1.6-) 3-4× as long as wide; plants decumbent; stones fusiform, (5.5-) 7.3-9.5 (-10.2) mm long; [plants of calcareous shores and gravel bars] ........................................................................................................... P. pumila var. depressa

3 Youngest twigs minutely pubescent; leaf blades mostly 1.7-2.5× as long as wide; plants erect, stones mostly orbicular, (5.3-) 5.8-7.8 (-9.2) mm long; [plants of acid sandy or rocky upland sites] ........................................................................................................... P. susquehanae

1 Plants trees, well over 3 m tall when mature; [subgenus Cerasus].
4 Leaf serrations single to double, the tips of the serrations acuminate to attenuate.
5 Leaf serrations attenuate; tree with upright form; [section Sargentella] ........................................................................................................... P. serrulata

5 Leaf serrations acute; tree usually with weeping form; [section Microcyma] ........................................................................................................... P. subhirtella

4 Leaf serrations small and obscure or well-developed but rounded to acute.
6 Petals 4-7.5 mm long; fruit < 1 cm in diameter; [section Phyllomahaleb].
7 Inflorescence with a central axis, thus nearly or actually racemose; fruit blackish; leaves 1-1.5× as long as wide; [exotic tree] ........................................................................................................... P. mahaleb

7 Inflorescence umbellate to corymbose, the central axis absent or poorly developed; fruit red; leaves 2-5× as long as wide; [native tree] ........................................................................................................... P. pensylvanica

6 Petals 9-15 mm long; fruit 1.3-2.5 cm in diameter; [section Eucerasus].
8 Leaves 7-15 cm long, persistently hairy beneath, at least along the midrib and veins; pair of petiolar glands on the petiole near the blade; fruit sweet when ripe. ........................................................................................................... P. avium

8 Leaves 4-8 cm long, glabrous beneath once fully-expanded; pair of petiolar glands on the base of the leaf blade; fruit sour when ripe. ........................................................................................................... P. cerasus
**KEY C – PLUMS, subgenus Prunus**

1. Flowers 1-2 (-3) per inflorescence; stone somewhat sculptured; [exotic]; [section Prunus].
2. Leaves 4-6 cm long; fruits 2-3 cm long, yellow to red when ripe; inflorescence of a solitary flower................. [P. cerasifera]
3. Leaves 5-10 cm long; fruits 3-7 cm long, blue-black, yellow, or greenish when ripe; inflorescence of (1-) 2-3 flowers.
4. Fruit 5-7 cm long; single-trunked small to medium tree, usually thornless.................................................. P. domestica var. domestica
5. Fruit 3-4 cm long; thicket-forming shrub to small tree, often thorny.......................... P. domestica var. insititia
6. Leaves < 2× as long as wide; petals 10-15 mm long; [of w. United States, eastward into KY, TN, MS, and present as an introduction still farther eastward in NC, SC, VA, and GA].
7. Leaf teeth triangular, ascending, the gland terminal; flowers opening with the leaves............................... P. hortulana
8. Leaf teeth depressed, the gland near the sinus; flowers opening before the leaves........................................ P. munsoniana
9. Leaves narrowly to broadly oval or oval-rounded at the base; petiole usually lacking glands near its junction with the leaf blade; sepal glands glabrous on the lower side........................................ P. americana
10. Twigs and pedicels pubescent, often densely so; leaf apices usually acute, rarely rounded; leaf blades mostly > 2× as wide (to > 3× as wide); shrubs or small trees, 2-6 m tall; [Coastal Plain, Piedmont, and Mountains of s. NC, SC, GA, FL, AL, MS, LA, and westward].
11. Plants usually not suckering, often single plants but sometimes in small colonies, generally trees; leaf apices mostly acute; pedicels usually > 10 mm long; [Mountains and Piedmont from nw. NC northward]......................... P. alleghaniensis

**Prunus alabamensis** C. Mohr, Alabama Black Cherry. Cp (AL, FL, GA, SC), Pd (GA), Mt (AL, GA): sandhills, other xeric sandy or rocky forests and woodlands, often associated with *P. palustris* (even in the Piedmont and Mountains); uncommon (rare north of GA). April-May; July-August. C, SC, nw. GA, n. AL south to Panhandle FL and s. AL; the NC record is based on a misidentified specimen. [= K; = Prunus serotina Ehrt var. alabamensis (C. Mohr) Little – RAB, WH; > Padus alabamensis (C. Mohr) Small – S; > Padus calthifolia Small – S; > Padus australis Beadle – S = Prunus serotina ssp. hispida (Elliott) McVaugh – FNA, Y, Z]

**Prunus alleghaniensis** Porter var. alleghaniensis, Allegheny Plum, Allegheny Sloe. Mt (NC, VA, WV), Pd (VA): dry rocky woodlands, shale barrens, primarily over calcareous or mafic rocks; rare. MA and NY south to w. VA, w. NC, and e. TN. Var. davisi (W. Right) Sargent is endemic to MI. [= K; < Prunus alleghaniensis – C, F, G, W, WV; = Prunus umbellata Elliott var. alleghaniensis [in press] – FNA]

**Prunus angustifolia** Marshall, Chickasaw Plum. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, VA, WV): roadsides, fencerows, abandoned fields, especially sandy; common (uncommon in DE and FL, rare in WV). March-April; May-early July. NJ, PA, IN, IL, MO, NE, and CO, south to FL, TX, and e. NM. The original native distribution is unclear; much of its eastern distribution may be the result of early spread by native Americans. [= RAB, C, FNA, G, S, W, WH, WV, Z; > Prunus angustifolia var. angustifolia – F, K]

* Prunus armeniaca* Linnaeus, Apricot. Cp (VA): persistent around old home sites; rare, native of n. China. [= C, FNA, K; = Armeniaca vulgaris Lamark]

* Prunus avium* Linnaeus, Sweet Cherry, Mazzard Cherry, Bing Cherry. Pd (DE, NC, VA), Mt (VA, WV), Cp (VA), [NC, SC]: common (uncommon in DE Piedmont, rare in DE Coastal Plain), native of Eurasia. [= RAB, C, F, FNA, G, K, S, W, WV, Z; = Cerasus avium (Linnaeus) Moench]

* Prunus caroliniana* (P. Miller) Aiton, Carolina Laurel Cherry. Cp (FL, GA, NC, SC), Pd* (GA*), Mt* (GA*): native in maritime forests and sandy hammocks near the coast, escaped from cultivation to fencerows and suburban forests and thickets in more inland areas; common (uncommon in GA, NC, SC). March-April; September-October. Se. NC south to FL, west to TX, near the coast. [= RAB, FNA, K, WH, Z = Laurocerasus caroliniana (P. Miller) M. Roemer – S]

* Prunus cerasus* Linnaeus, Sour Cherry, Pie Cherry. Mt (NC, VA, WV), Pd (DE, VA), Cp (VA), {GA}: commonly cultivated, disturbed areas; fencerows, suburban forests; rare, native of Eurasia. April-May; June. [= RAB, C, F, FNA, G, K, S, W, WV, Z; = Cerasus vulgaris P. Miller]
* **Prunus domestica** Linnaeus *var. domestica*, European Plum. Pd (VA): suburban forests; rare, native of Europe. Introduced at scattered locations; reported for Manassas National Battlefield Park (Virginia Botanical Associates 2005); also reported for MD, PA, NJ. Depypere et al. (2009) found that *P. domestica* and *P. insititia* were genetically very similar, but generally separable morphologically; they favored combining the two into a single species based on their similarity, variability and likely origin from complicated hybridization and domestication by man. [= K; = *Prunus domestica* ssp. domestica – C; < *Prunus domestica* – FNA]

* **Prunus domestica** Linnaeus *var. insititia* (Linnaeus) Fiori & Paolotti, Damson, Bullace. Cp (DE), Pd (VA): uncommonly cultivated, suburban woodlands; rare, native of Europe. [= K; = *P. insititia* Linnaeus – F, G, Z; = *Prunus domestica* ssp. insititia (Linnaeus) C.K. Schneider – C; = *Prunus domestica* Linnaeus var. *insititia* (Linnaeus) Fiori & Paolotti – K; < *Prunus domestica* – FNA]

* **Prunus glandulosa** Thunberg, Dwarf Flowering Almond. Cp (NC), Mt (WV): persisting at abandoned homesteads; rare, native of c. and n. China and Japan. [= FNA, K; = *Cerasus glandulosa* (Thunberg) Sokolov]

* **Prunus hortulana** L.H. Bailey, Wild-goose Plum. Mt (VA, WV), Pd (VA), Cp (VA): disturbed areas; rare, presumably introduced only, native from s. OH, n. IN, n. IL, se. IA, and e. KS south to n. KY, n. AR, and ne. OK. [= C, F, FNA, G, K, S, WV, Z]

* **Prunus mahaleb** Linnaeus, Mahaleb Cherry, Perfumed Cherry, St. Lucie Cherry, Rock Cherry. Mt (NC, VA, WV), Pd (DE, NC, VA): roadsides, old homesteads; rare, native of Europe. April-May; July. [= RAB, C, F, FNA, G, K, W, WV, Z; = *Cerasus mahaleb* (Linnaeus) P. Miller]

**Prunus maritima** Marshall, Beach Plum. Cp (DE, MD, VA?): ocean dunes and sandy coastal soils (from c. MD northward), disturbed dune-like area on shore of Chesapeake Bay (in e. VA); uncommon (rare in MD and VA). Native from NB south to e. MD, along the coast; somewhat disjunct in e. VA in an ambiguously native occurrence. [= C, FNA; > *Prunus maritima* var. maritima – K; < *Prunus maritima* – F, G]

* **Prunus mume** (Siebold) Siebold & Zuccarini, Japanese Apricot. Pd (NC): suburban forests; rare, native of s. Japan. April-March. Documented as naturalizing in Battle Park, University of North Carolina, Chapel Hill, where apparently spread from cultivation and reproducing as early as 1939. [= *Armeniaca mume* Siebold]

*? **Prunus munsoniana** W. Wight & Hedrick, Munson Plum. Pd (GA, NC, VA), Mt (VA): roadsides; rare. OH, IL, MO, and KS, south to MS and TX; disjunct (introduced?) in GA, NC, VA, and NJ. [= C, F, G, K, S, Z]

* **Prunus nigrum** Aiton, Canada Plum. Mt (VA, WV), Pd (VA): old fields, hedgerows, forest edges; uncommon. May-June. NL (Newfoundland) west to MB, south to NY, OH, IN, IL, and IA; apparently disjunct in VA and WV. [= C, F, FNA, G, K, WV]

* **Prunus padius** Linnaeus, European Bird Cherry. Pd (DE): suburban woodlands; rare, native of Europe. Cultivated and rarely escaped at least as far south as se. PA (Rhoads & Klein 1993) and DE (Kartesz 1999). [= C, FNA, K]

* **Prunus pennsylvanica** Linnaeus, Fire Cherry, Pin Cherry. Mt (GA, NC, VA, WV): high elevation forests, thickets at high elevations resulting from fire or logging; common (rare in GA). April-May; August-September. NL (Newfoundland) west to BC, south to w. NC, n. GA, e. TN, IN, IL, IA, SD, and CO. [= RAB, C, F, FNA, G, K, S, Z; > *Prunus pennsylvanica* var. *pennsylvanica* – K; < *Prunus pennsylvanica* – S (an orthographic variant)]

* **Prunus pumila** Linnaeus *var. depressa* (Pursh) Gleason, Prostrate Dwarf-cherry, Northern Sand Cherry. Mt (WV): sandy or gravelly shores and islands; rare. NL (Labrador) west to ON, south to NJ, s. PA (Rhoads & Klein 1993), c. WV, and TN. [= C, G, FNA, K, X; = *Prunus depressa* Pursh – F; < *Prunus pumila* – WV]

* **Prunus serotina** Ehrhart var. *serotina*, Black Cherry. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): rich coves, bottomlands, northern hardwood forests, and in a wide variety of lower elevation habitats from dry to mesic, and weedy in fencerows; common. April-May; July-August. NS west to ND, south to c. peninsular FL and e. TX. Several other varieties occur in sc. and sw. North America, from c. TX westwards. In the Piedmont and Coastal Plain, *P. serotina* is generally a small, scrubby tree of fencerows and an understory tree in forests and woodlands, but in the Mountains reaching large sizes and full canopy stature. [= K, WH; < *Prunus serotina* var. *serotina* – RAB; < *Prunus serotina* – C, F, G, W; < *Padus virginiana* – S, misapplied; = *Prunus serotina* ssp. *serotina* FNA, Y, Z]

* **Prunus serrulata** Lindley, Japanese Flowering Cherry. Pd (NC): suburban forests; rare, native of Japan. [= FNA, K; = *Cerasus serrulata* (Lindley) Loudon]

* **Prunus subhirtella** Miquel, Higan Cherry, Weeping Higan Cherry, Winter-flowering Cherry. Pd (VA), Mt (NC), Cp (FL): floodplain forests in suburban areas, other disturbed areas; rare, native of e. Asia, commonly planted, rarely escaped, but locally invasive. [= FNA, K; > *Prunus subhirtella* var. *pendula* (Maximowicz); = *Cerasus subhirtella* (Miquel) S.Y. Sokolov]

* **Prunus susquehanna** Willdenow, Appalachian Dwarf-cherry, Appalachian Sand Cherry, Susquehanna Cherry. Pd (NC, VA), Mt (NC, VA): open rocky or sandy sites; rare. Sw. ME and sw. QC west to MB, south to nc. and sw. NC, sc. TN (the Barrens region of the Eastern Highland Rim), and IL. Catling (1997) supports species status, based on the greater distinctions of this entity from the other three in the complex. [= F, X; = *Prunus pumila* Linnaeus var. *susquehanna* (Willdenow) H. Jaeger – RAB, FNA, K; = *Prunus pumila* var. *cuneata* (Rafinesque) L.H. Bailey – C; G = *Prunus cuneata* Rafinesque – S; < *Prunus pumila* – W, Z]

* **Prunus umbellata** Elliott, Hog Plum, Flatwoods Plum. Cp (FL, GA, NC, SC), Pd (GA, NC, SC): upland, usually xeric, sandy or rocky forests and woodlands; common. March-April; August-September. S. NC, TN, and AR south to c. peninsular FL and TX. Fox, Godfrey, & Blomquist (1952) report *Prunus mitis* for s. NC (Cleveland County). It is presently unclear how best to treat variation in this complex. > *Prunus umbellata* Elliott var. *umbellata* – K; > *Prunus umbellata* Elliott var. *injuncta* (Small) Sargent – K; = *Prunus umbellata* – RAB, WH, Z; > *Prunus umbellata* – S; > *Prunus mitis* Beadle – S; > *Prunus injuncta* Small – S; = *Prunus umbellata* var. *umbellata* – FNA
**Prunus virginiana** Linnaeus var. virginiana, Choke Cherry. Mt (GA, NC, VA, WV): forming clonal thickets in oak and northern hardwood forests; common (uncommon in WV, rare in GA). Late April-June; July-August. NL (Newfoundland) and NL (Labrador) west to MB, south to w. NC, n. GA, AR, and OK. Other varieties occur in w. North America. [= FNA, K, Z; < *Prunus virginiana* – RAB, C, F, G, W, WV; = Padus nana (Du Roi) Roemer – S]

* Prunus cerasifera Ehnhart, Cherry Plum, Flowering Plum, Purpleleaf Plum. Introduced at scattered locations; reported for TN, PA, NJ (Kartesz 1999). [= F, FNA, K]

* Prunus mexicana S. Watson, Big-tree Plum, Mexican Plum. {AL, KY, LA, MS}: streamsides, upland forests, fencerows; rare. IN, IL, and IA, south to AL, MS, LA, TX, and Mexico; reports from further east are apparently in error and based on pubescent material of *P. americana* . [= C, FNA, G, K, S, Z; = Prunus americana Marshall var. lanata – F]

* Prunus sargentii Rehder, Sargent Cherry, North Japanese Hill Cherry. Mt (WV): disturbed areas, rare, native of e. Asia. {not yet keyed}

* Prunus tomentosa Thunberg, Nanking Cherry, Korean Cherry. Disturbed areas, suburban forests and woodlands. Naturalized at least as far south as MD Piedmont and PA; native of Asia. April. [= FNA, K]

**Pyracantha** M.J. Roemer 1847 (Firethorn, Pyracantha)

1 Leaf blades ovate to lanceolate or oblong, margins finely crenulate-serrulate, apices acute; young twigs grayish pubescent ...

* Pyracantha coccinea M.J. Roemer, Scarlet Firethorn. Cp (AL, GA, LA, MS, NC, SC, VA), Mt (WV): planted, persistent around old homesites, and rarely escaped to woodlands; common, native of se. Europe and Asia Minor. Reported for AL, LA, OK, SC, TN, and TX (Nesom 2010a). [= K, Y; Z; = Cotoneaster pyracantha (Linnaeus) Schacht – F, S; = Crataegus pyracantha Linnaeus]

* Pyracantha fortuneana (Maximowicz) H.L. Li, Chinese Firethorn. Cp (AL, FL), Pd (AL), Mt (SC), {GA, NC}: planted, rarely escaped or persistent, native of China. May-July; October-December. Reported for AL, SC, and TX (Nesom 2010a). [= K, WH, Y; > P. crenatiserrata (Hance) Rehder]

**Pyrus** Linnaeus 1753 (Pear)

1 Fruit pyriform; flowers 2.5-3 cm across; leaves crenate; styles 5 ................................................................. *P. communis*

* Pyrus pyrifolia (Burmann f.) Nakai, Oriental Pear, Japanese Pear, Chinese Pear. Cp (VA), Pd (VA), Mt (WV): planted, persistent around old houses and in orchards; uncommon, native of Asia. April; August-October. [= F, K, Z]

**Rhaphiolepis** Lindley 1820 (Asian-hawthorn)

A genus of about 15 species, shrubs, of e. Asia.
**Rhodotypos** Siebold & Zuccarini 1841 (Jetbead)

**Identification notes:** Distinguished by its opposite leaves and black, beadlike fruits.

**Rosa** Linnaeus 1753 (Rose)

A genus of more than 100 species, shrubs or woody vines; mainly of north temperate regions. Many cultivars cannot be readily identified to species. References: Joly & Bruneau (2007)=Y; Lewis (2008); Robertson (1974)=Z; Kalkman in Kubitzki (2004). Key adapted in part from FNA and Y.

1 Stipules adnate to the petiole only basally, for < ½ their length; vigorous climbing vines, 3-5 (-10) m tall; petals white.

2 Stems brown-tomentose, stipitate-glandular; terminal leaflet petiolules 3-5 mm; pedicels tomentose, 3-6 mm; hypanthia subglobose, white tomentose; [*section Bracteatae*] ................................................................. *R. bracteata*  

3 Stipules adnate to the petiole > ½ their length; vigorous climbing vines or shrubs, 0.3-4 m tall; petals white, pink, rose-purple, or yellow.

4 Leaflets 3-5; stipule margins and auricles mostly entire or ciliate; inflorescences laxly corymbose; flowers 3-5 cm in diameter, petals single, rose-purple to pink; carpels 20-25, styles glabrous, exerted 5-6 mm beyond the orifice; [native] .............................................. *R. setigera*

5 Leaflets (5-) 7-9; stipule margins and auricles deeply laciniate (or entire to ciliate in [*section Setigerae*]); vines, climbing and scrambling to 4 m tall; [section *Stylosae*]

6 Styles connate into a column which protrudes from the orifice by 3-6 mm (sometimes separating in fruit); stipule margins and auricles deeply laciniate (or entire to ciliate in [*R. setigera*]); petals white, pink, rose-purple, or yellow.

7 Fruit blackish when ripe, 8-16 mm in diameter; petals 1-2.5 cm long; pedicel lacking a clasping bract; [*section Cassiorhodon*] ................................................................. *R. rugosa*  

8 Sepals disparate in size and shape, the outer pinnatifid with leafy segments; orifice of the hypanthium ca. 1 mm in diameter, the styles slightly exserted; [aliens] [section *Caninae*].

9 Leaves not glandular-ciliate (or only remotely so); leaves not rugose ......................................................... *R. ×damascena*  

10 Sepals either lobed or with broadened apices, or if entire then spreading, reflexed, or deciduous from fruit; flowers solitary or corymbose.

11 Leaflets abaxially pubescent or tomentose, rarely glabrous; sepals caducous, glabrous, margins stipitate-glandular; pedicels 6-18 mm × 4-5 mm, sepals caducous before hips mature ......................................................... *R. rubiginosa*  

12 Stipules 6-10 mm × 2-4 mm, margins mostly stipitate-glandular; leaflet blades 10-22 mm × 8-15 mm, abaxial surfaces glabrous or pubescent; glands of the leaves apple-scented; bracts caducous, glabrous, margins stipitate-glandular; pedicels 6-9 mm long, densely stipitate- or setose-glandular; flowers 2.5-4 cm in diameter; hips red, 10-25 mm × 10-22 mm, sepals subpersistent ......................................................... *R. ×damascena*  

13 Sepals alike, all entire or with a few scarcely leafy teeth near the base; orifice of the hypanthium ca. 2-4 mm in diameter, the opening blocked by the stigmas; [natives and aliens] [section *Cinnamomeae*].

14 Petals 10 or more (flowers ‘doubled’); [aliens] ................................................................. *R. cinnamomea*  

15 Petals 5; [native to North America (some populations may be locally introduced)].
14 Hypanthium glabrous.
15 Long and straight prickles present throughout the stems. .......................................................... R. acicularis ssp. sayi
15 Prickles absent from the stems, or present and short or curved.
16 Infra-stipular prickles stout and broad-based............................................................................... R. virginiana
16 Infra-stipular prickles absent or not especially stout or broad-based.
17 Lower leaf surface with generally < 2 hairs per mm²; infra-stipular prickles always absent on new stems; bristles always present on new stems; leaflets 7-9 ................................................................. R. arkansana
17 Lower leaf surface with generally >2 hairs per mm²; infra-stipular prickles present or absent on new stems; bristles generally absent on new stems; leaflets 5-7 .......................................................................................... R. blanda
14 Hypanthium with glands.
18 Bristles present on new branches.
19 Infra-stipular prickles present................................................................. R. arkansana
19 Infra-stipular prickles absent.................................................................................................. R. carolina
20 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infra-stipular prickles, lacking internodal prickles or aiculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) ......................... R. carolina ssp. carolina
20 Fertile branches armed with straight, thin or stout, circular or flattened infra-stipular prickles, with internodal prickles of small prickle, aiculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, or upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular .......................................................................................................................... R. carolina ssp. subserulata
18 Bristles absent on new branches.
21 Leaflets 3.5-5× as long as wide; leaves with (5-) 7-9 (-11) leaflets; [c. MS westwards] ................. [R. foliolosa]
21 Leaflets 1-3× as long as wide; leaves with (3-) 5-7 (-9) leaflets; [collectively widespread].
22 Hypanthium typically with > 86 glands; terminal leaflet oblong, generally with 20-30 small teeth per side ..............................................................
22 Hypanthium typically with < 86 glands; terminal leaflet ovate, elliptic, or obovate, with 10-18 (-23) small teeth per side.
23 Bristles absent on new stems; auricles > 3.8 mm long; stipules > 1.1 mm wide; infra-stipular prickles stout, broad-based, and often curved .............................................. R. virginiana
23 Bristles present or absent on new stems; auricles < 3.8 mm long; stipules < 1.1 mm wide; infra-stipular prickles slender and not especially broad-based or curved.
23 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infra-stipular prickles, lacking internodal prickles or aiculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) ............................................................ R. carolina ssp. carolina
23 Fertile branches armed with straight, thin or often stout, circular or flattened infra-stipular prickles, with internodal prickles of small prickle, aiculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, or upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular .......................................................................................................................... R. carolina ssp. subserulata

_Rosa blanda_ Aiton, Smooth Rose, Meadow Rose. Mt (WV), Pd (VA): rocky forests; rare. QC west to MB, south to s. PA (Rhoads & Klein 1993), MD, VA, WV (Harmon, Ford-Wernitz, & Grafton 2006), OH, IN, IL, MO, KS, and MT. [= C, F, FNA, G, Y; = _R. blanda_ var. blanda – K]

_Rosa cinna molae_ Linnaeus, Cinnamon Rose. Mt (VA): disturbed areas; rare, native of Eurasia. [= F, FNA, G, K, Z; < _R. majalis Herrmann – C]

* _Rosa ×dams censae_ P. Miller (pro sp.) [ _R. gallica_ Linnaeus × _moschata_ J. Herrmann], Damask Rose. Mt (NC): disturbed areas; rare, persistent after cultivation, native of Europe. May-June; September-October. [= K; = _R. damascena_ P. Miller – RAB]

* _Rosa gallica_ Linnaeus, French Rose. C (DE), Mt (NC, VA), Pd (SC, VA): disturbed areas; uncommon (rare in NC, SC, and VA), native of Europe. May-June; September-October. There is a question as to whether the name _R. gallica_ can be used; if not, it would be replaced with _R. austriaca_. Represented by many cultivated forms, some involving complex hybridization with
other species. *R. × damascena* P. Miller is apparently a hybrid of *R. gallica* and *R. moschata* J. Herrmann. [= RAB, C, F, FNA, G, K, Z; = *R. austriaca* Crantz]

* Rosa laevigata* Michaux, Cherokee Rose. Cp (FL, GA, NC, SC), {VA}: roadsides, moist forests; common (rare in NC, rare [if present] in VA), native of China. Late March-April; September-October. [= RAB, FNA, K, S, WH, Z]

* Rosa spinosissima* Linnaeus, Scotch Rose. Mt (VA): cultivated and rarely escaped; rare, native of Eurasia. [= F, FNA, G, K; = R. pimpinellifolia Linnaeus – C]

* Rosa tomentosa* J.E. Smith. {NC} [= C, F, FNA, K, S]

* Rosa virginiana* P. Miller, Virginia Rose. Pd (DE, VA), Cp (DE), Mt (WV), {GA, NC}: moist to dry forests and woodlands; uncommon (rare in DE, VA, and WV). May-June; August-October. NL (Newfoundland) and ON south to GA, AL, and MO. C. TN (Chester, Wofford, & Kral 1997), e. and c. KY (Clark et al. 2005). [= C, F, FNA, G, S, W, Y; = R. virginiana var. virginiana – K]

* Rosa chinensis* Thunberg, Chinese Rose. Cp (AL, MS), {VA}. Reported for AL, MS, and VA (BONAP 2010). [= K] {not yet keyed}

* Rosa × dametorum* Thuillier (pro sp.). {KY} Introduced in KY. [= K] {not yet keyed}

* Rosa odoratus* J. Herrmann, Musk Rose. Allegedly introduced in AL. [= K, S] {not yet keyed; investigate}

* Rosa rubrifolia Villars, Red-leaf Rose. {SC} Reported for SC (Kartesz 1999). [= K]

* Rosa xanthina Lindley, Yellow Rose. Reported for SC (Kartesz 1999). [= K]

Rubus Linnaeus 1753 (Blackberry, Raspberry, Dewberry, Wineberry, Bramble)

A genus of about 250 species (if treated conservatively) or 2000-3000 microspecies, shrubs (and a few herbs), almost cosmopolitan in temperate areas. References: Robertson (1974) – Z; Alice & Campbell (1999); Widrlechner (1998); Kalkman in Kubitzki (2004).

Identification Notes: All of our species of Rubus except *R. dalibarda*, *R. odoratus*, and *R. pubescens* have biennial stems. The first year the stems remain sterile and are termed primocanes. The second year, these stems produce lateral branches with flowers and are termed floricanes. Primocane and floricanne leaves differ.

1 Leaves simple.

2 Leaves unlobed, elliptic or ovate- orbiculate, finely toothed, 1.5-3 cm long; plant an herb, < 1 dm tall; petals white ................. *R. dalibarda* – flowering raspberries .................................................. *R. odoratus*

3 Leaves 3-9-foliolate (reduced simple leaves may also be present in the inflorescence).

4 Upright stems herbaceous, annual, not differentiated into primocanes and floricanes, unarmed or with a few weak bristles; stipules ob lanceolate; [e. WV northwards]; [subgenus *Cylaxis* – dwarf raspberries] ................................................. *R. pubescens*

5 Upright stems woody, biennial, differentiated into primocanes and floricanes, these usually well-armed with bristles and/or curved prickles; stipules linear; [collectively widespread].

6 Fruit black (rarely yellow); pedicels with stout curved prickles; stems (at least the primocanes) strongly white-glaucous
**ROSACEAE**

6. Fruit red (rarely purple or yellow); pedicels with narrow straight bristles and sometimes also glandular hairs; stems green.

7. Inflorescence without glandular hairs or gland-tipped bristles; [alien, cultivated, sometimes escaped or persistent] ......................................................... *R. occidentalis*

8. Canes very coarse, scrambling, often 2-3 m long, heavily armed; inflorescence cymose-paniculate; branches and pedicels of the floricanes armed with strong, flattened prickles (or nearly straight in *R. bifrons*); [alien, generally in disturbed habitats]; [alien blackberries].

9. Leaves compound, the leaflets additionally lanceolate divided; leaves green beneath ................................................................. *R. laciniatus*

10. Prickles nearly straight; stems glabrescent; petals pale pink to red ................................................................. *R. bifrons*

11. Prickles recurved; stems canescent above; petals white to pale pink ................................................................. *R. discolour*

12. Canes delicate to coarse, arching or trailing, 0-4 m long, unarmed to strongly armed; inflorescence racemiform; branches and pedicels of the floricanes generally unarmed; [native, though often in disturbed habitats].

13. Inflorescence reduced, normally to a single flower per branch of the floricanes ................................................................. *R. hispidus*

14. Canes armed with stout-based, usually recurved prickles, bristles lacking ................................................................. *R. flagellaris*

15. Inflorescence with glandular hairs and gland-tipped bristles; [native in Mountains of NC and VA] ................................................................. *R. altegeniensis*

16. Pubescence of the inflorescence rachis and pedicels predominantly gland-tipped, glandular hairs often present also on the young primocanes and the branches of the floricanes, the glands flattened to cupulate ................................................................. *R. alumnus*

17. Leaves glabrous (or very nearly so) beneath; canes with at most few and weak prickles; leaflets of the primocanes with attenuate to caudate apices ................................................................. *R. canadensis*

18. Leaves softly pubescent beneath; canes with many and strong prickles; leaflets of the primocanes with acute to acuminate apices ................................................................. *R. pensilvanicus*

---

* Rubus cuneifolius* Pursh, Sand Blackberry. Cp (DE, FL, GA, NC, SC), Pd (DE, GA, NC, SC, VA), Mt (VA): woodlands, forests, disturbed areas; common (rare in Mountains). Late April-early June; June-July. CT and NY (Long Island) south to s. FL and AL, MS, and sc. LA, primarily on the Coastal Plain. [= RAB, C, G, GW, S, W; > *R. cuneifolius* var. *cuneifolius* – F; > *R. cuneifolius* var. *subellipticus* Fernald – F; > *R. cuneifolius* var. *laciniatus* – K; > *R. longii* Fernald – F, K; > *R. probabilis* L.H. Bailey – K; > *R. sejunctus* L.H. Bailey – F.

**ROSACEAE**

**Rubus idaeus** Linnaeus var. *strigosus* (Michaux) Maximowicz, Red Raspberry. Mt (NC, VA, WV): high elevation forests and thickets, adelgid-killed spruce-fir forests; uncommon (rare in NC and VA). June-August; July-September. The species is circumboreal, var. *strigosus* ranges from NL (Newfoundland) west to AK, south to PA, IN, IA, and AZ; disjunct further south in nw. VA and ne. WV, and in w. NC and e. TN. [= C; > R. idaeus Linnaeus var. canadensis (Richardson) House – RAB, F; > R. idaeus var. strigosus – F; > R. strigosus Michaux – G, WV; > R. idaeus ssp. strigosus (Michaux) Focke – K; > R. carolinianus Rydberg – S; > R. idaeus ssp. sachalinensis (Levl.) Focke – W; > R. idaeus ssp. melanolasius Focke var. canadensis – Z]

**Rubus ilexellerosus** Focke, Strawberry-raspberry. Mt (NC, VA, WV): disturbed areas; rare, native of Japan. [= RAB, C, F, G, K, WV]

**Rubus occidentalis** Linnaeus, Black Raspberry, Blackcap. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (NC, SC, VA), {GA}: roadsides, woodlands, thickets, disturbed areas; common (increasingly rare southward in our area; much more common in VA and WV than in NC, and rare in n. SC). Late April-early June; June-July. QC to ND and e. CO, south to n. GA, c. AL, n. MS, AR, and c. OK. [= RAB, C, F, G, K, S, WV, WV, Z]

**Rubus odoratus** Linnaeus, Flowering Raspberry. Mt (GA, NC, VA, WV), Pd (DE): moist roadsides, thickets, and forests; common (rare in DE). June-August; July-October. NS west to MI, south to w. NC, n. GA, and e. TN. [= RAB, C, G, W, Z; > Rubus odoratus var. odoratus – F, K, WV; > Rubus odoratus var. columbianus Millspaugh – F, K, WV; > Rubus odoratus var. odoratus (Linnaeus) Rydberg – S]

**Rubus pubescens** Rafinesque, Dwarf Blackberry. Mt (WV): bogs; rare. May-June. NL (Labrador) to YT, south to e. WV and s. PA (Rhoads & Klein 1993), IN, CO, and WA. [= C, G, WV; > R. pubescens var. pubescens – F, K]

**Rubus trivialis** Michaux, Southern Dewberry, Coastal Plain Dewberry. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, old fields, thickets, disturbed areas; common (rare in Mountains). March-April; late April-May. E. MD south to s. FL, west to TX, north in the interior to MO. [= RAB, C, F, G, GW, K, W; > R. trivialis – S; > R. lucidus Rydberg – S]

**Rubus triphyllus** Thunberg. Pd (DE): disturbed areas; uncommon, native of Japan. [= F, K] {not yet keyed}

**Sanguisorba** Linnaeus 1753 (Burnet)

1 Leaflets pinnatifid (each leaflet incised nearly to the midvein). ...........................................................................................................[Poteridium annuum]

1 Leaflets toothed (the incisions not nearly to the midvein).
Sanguisorba canadensis Linnaeus, Canada Burnet, American Burnet, White Burnet. Mt (GA, NC, SC, VA, WV), Cp (DE): fens, seepage over mafic or ultramafic rocks (such as amphibolite, greenstone, serpentinite), spray zones around waterfalls, other seepage wetlands, wet meadows; rare. Late July-September. NL (Newfoundland) and NL (Labrador) west to MB, south to NJ, PA, OH, and IN; disjunct southward in KY, nc. VA, and from sw. VA south to sw. NC, ne. TN, and ne. GA. First reported for SC by Hill & Horn (1997) and Hill (1999). [= RAB, C, G, K, S, W, WV, Z]

**Sibbaldia** Linnaeus 1753 (Sibbaldia, Mountain-cinquefoil)

A genus of 5-7 species, subshrubs, circumboreal, of n. Eurasia and n. North America. Our single species, has been variously also treated in *Potentilla* and *Sibbaldiopsis*. Many recent studies (see references) have shown that it is not closely related to *Potentilla*, and falls into a group of genera including *Sibbaldia*, *Comarum*, *Alchemilla*, *Aphanes*, *Drymocallis*, *Dasiphora*, and *Fragaria* (Lundberg et al. 2009; Potter et al. 2007; Eriksson et al. 2003). I here follow Lundberg et al. (2009) and Paule & Sojak (2009), who further demonstrate that *Sibbaldiopsis* is embedded in *Sibbaldia* and is best transferred there. References: Paule & Sojak (2009)=Z; Lundberg et al. (2009); Potter et al. (2006); Eriksson, Donoghue, & Hibbs (1998); Eriksson et al. (2003); Kalkman in Kubitzki (2004).

*Sibbaldia tridentata* (Aiton) Paule & Sojak, Mountain-cinquefoil, Three-toothed Cinquefoil, Mountain White Potentilla, Wine-leaf Cinquefoil, White Sibbaldia. Mt (GA, NC, TN, VA, WV): grassy balds, crevices of rock outcrops at high (rarely moderate) elevations, high elevation glades; rare (though sometimes very locally abundant). June-August; July-September. Greenland and NL (Newfoundland) west to NT, south to ND, IA, WI, MI, s. ON, and NS, and in the mountains to w. VA, ne. TN, and ne. GA. At progressively higher elevations southward. Showy in flower, and also in leaf from late summer on, when the leaves tend to turn a rich burgundy red. Though appearing herbaceous, *S. tridentata* is really an evergreen sub-shrub. [= Z; = Sibbaldiopsis tridentata (Aiton) Rydberg = K, S; = Potentilla tridentata Aiton = RAB, C, F, G, W, WV]

*Sorbaria* (Seringe) A. Braun 1860

*Sorbaria sorbifolia* (Linnaeus) A. Braun, False Spiraea. Mt (WV): disturbed areas; rare, native of Asia. Cultivated and naturalized at least as far south as s. PA (Rhoads & Klein 1993), MD, and WV. Reports of it in VA (Massey 1961, repeated in Kartesz 1999) are apparently based only on cultivated plants. [= C, F, G, K]

*Sorbus* Linnaeus 1753 (Mountain-ash, Rowan)

A genus of about 250 species, trees and shrubs, of mainly temperate Northern Hemisphere. References: McAllister (2005)=Y; Jones (1939)=Z; Aldasoro et al. (2004). [also see *Aronia*]

*Sorbus americana* Marshall, Mountain-ash, American Rowan. Mt (GA, NC, VA, WV), Pd (NC): high elevation forests, balds, and high elevation rock outcrops, often with *Picea*, *Abies*, and/or *Betula alleghaniensis*; common (rare in NC Piedmont, rare in GA). June-July; September-October (persisting well into winter). NL (Newfoundland) west to MN, south to PA, w. NC, e. TN, ne. GA, and n. IL. This small-to-medium tree is showy in most seasons; in the summer its creamy-white coryms are attractive, the leaves turn a bright orange-red in fall, and the red berries persist well into winter. [= RAB, C, G, K, S, W, Y, Z; = Pyrus americana (Marshall) A.P. de Candolle = F, WV]

*Sorbus aucuparia* ssp. aucuparia, Rowan, European Mountain-ash. Mt (WV): disturbed areas; rarely cultivated; native of n. Europe. A planted tree and escape (sometimes appearing naturalized), south to s. PA (Rhoads & Klein 1993), MD, DE, WV (Kartesz 1999), and DC (Jones 1939). Also reported for SC by Kartesz (1999), supposedly based on Jones (1939), but Jones (1939) does not mention SC in his account of *S. aucuparia*. [= Y; < S. aucuparia – C, G, K, Z; < Pyrus aucuparia (Linnaeus) Gaertner = F, WV]

*Spiraea* Linnaeus 1753 (Spiraea, Meadowsweet, Hardhack)

A genus of about 80-120 species, shrubs, of north temperate areas (especially Asia). Many species and hybrids are cultivated, and additional taxa to those treated below may be encountered as persistent or escaped. References: Lis in FNA (in press); Robertson (1974)=Z; Rehder (1940); Uttal (1974); Kalkman in Kubitzki (2004).
ROSACEAE

Spiraea alba
Du Roi, Narrowleaf Meadowsweet, Pipestem. Mt (NC, VA, WV), Pd (DE, VA): bogs, boggy streambanks, seepages; uncommon (rare in DE and NC). June-September; August-October. QC west to AB, south to NC, IN, and MO. There is considerable disagreement over whether S. alba and S. latifolia represent two species with some introgression in areas of overlap, two varieties, or a variable or clinal species. [= F, FNA, G, S, W, WV, Z; = S. alba var. alba – RAB; C, GW, K]

*Spiraea ×billardi* Herincq [S. douglasiī × *salicifolia*] Mt (NC, VA, WV): cultivated, escaped or persisting; rare, introduced from cultivation, one parent from w. North America, one from Eurasia. Also present in KY and TN (D. Estes, pers. comm.). [= K]

*Spiraea ×humalda* Burven [S. albiflora × *japonica*]. Pd (VA): cultivated, escaped or persisting; rare, native of cultivation, both parents from Asia. [= FNA, K]

*Spiraea cantoniensis* Loureiro. Cp (AL, GA, LA, NC): roadsides; rare, native of Asia. S. cantoniensis has been collected twice on Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also reported for other scattered states in e. North America (AL, AR, LA, NY (Kartesz 1999, FNA). [= FNA, K]

*Spiraea corymbosa* Rafinesque, Dwarf Spiraea, Rock Spiraea. Mt (NC, VA, WV), Pd (NC, VA). (GA?): rocky forests and woodlands, granitic domes, dry slopes of Piedmont monadnocks, rocky slopes in partial sun; common (rare in NC and WV). June-August; August-October. A Southern and Central Appalachian endemic: sc. PA and w. MD south through w. VA, e. WV, to nw. NC, and perhaps also to e. TN (?), to n. AL (?), apparently fairly common only in w. VA. The species is limited to only a few counties each of NC and WV (Franklin 2004, Straubshaug & Core 1978), and is not listed for TN in Chester, Wofford, & Kral (1997). Although Mohr (1901) listed the species for AL, it is not listed as a part of the state's woody flora by Clark (1971). S. corymbosa is related to S. lucida Douglas ex Greene [= S. betulifolia var. lucida (Douglas ex Greene) C.L. Hitchcock] of the Rocky Mountains, S. betulifolia [= S. betulifolia var. betulifolia] of ne. Asia (Japan, e. Siberia, ne. China, Sakhalin, and the Kurile Islands, and S. aemiliana Schneider [= S. betulifolia var. aemiliana (Schneider) Koidz.]. The group is often treated as 4 varieties or subspecies of S. betulifolia, but the morphological differences and strongly disjunct distribution seem to warrant treatment as a reticulate complex of related species. See Uttl (1974), Greene (1992), and others listed in Robertson (1974) for additional discussion and a range of conclusions. [= F, FNA, S, WV; < S. betulifolia – RAB; = S. betulifolia Pallas var. corymbosa (Rafinesque) Maximowcz – C, G, K, W, Z; = S. betulifolia sps. corymbosa (Rafinesque) Taylor & MacBryde]

*Spiraea latifolia* (Aiton) Burkhart, Broadleaf Meadowsweet. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): bogs, seeps, and rock outcrops (glades) over amphibolite, greenstone, olivine, and granite; uncommon (rare in DE, GA, and NC, rare in Piedmont and Coastal Plain). June-September; August-October. NL (Newfoundland) west to MI, south to e. VA and w. NC. [= FNA, G, S, W, WV, Z; = alba var. latifolia (Aiton) Dippel – RAB; C, GW, K; = S. latifolia var. latifolia – F]

*Spiraea prunifolia* Siebold & Zuccarini, Bridal-wreath Spiraea. Mt (VA, WV), Pd (DE, VA), Cp (AL, MS, LA, NC, VA): cultivated, escaped or persisting; uncommon (rare in AL, DE, LA, MS, and WV), native of China, Korea, and Taiwan. [= C, FNA, G, K]
**Spiraea salicifolia** Linnaeus, Willowleaf Spiraea. Mt (GA, NC, VA), Pd (VA), Cp (MS, VA): cultivated, escaped or persisting; rare, native of Eurasia. [= C, FNA, K]

**Spiraea thunbergii** Siebold ex Blume. Mt (GA), Cp (AL, LA, MS, NC): roadsides; rare, native of Asia. *S. thunbergii* has been collected from roadside at Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also GA, MS, and MD (FNA). [= C, FNA, K]

**Spiraea trilobata** Linnaeus var. *trilobata*, Asian Meadowweet, Three-lobed Spiraea. Disturbed areas; native of e. Asia. Reported by Will Cook from Wake County, NC (Cook, pers. comm. 2011). [] (not yet keyed).

**Spiraea ×vanhouttei** (C. Briot) Carrière [S. cantoniensis × *trilobata*], Bridal-wreath Spiraea. Pd (NC), Mt (WV): cultivated, escaped or persisting; rare, introduced from cultivation, the two parents both from Asia. [= FNA, K, Z; = C. vanhouttei – C, G]

### 150. ELAEAGNACEAE
A.L. de Jussieu 1789 (Oleaster Family) [in ROSALES]

A family of 3 genera and 30-50 species, shrubs, small trees, and lianas, of temperate Eurasia and North America, and tropical Asia and Australia. References: Bartish & Swenson in Kubitzki (2004).

**Elaeagnus** Linnaeus 1753 (Silverberry, Oleaster, Russian-olive)

1 Flowering in the fall (October-November) and fruiting in the spring (March-April); leaves evergreen; branches usually spiny....... *E. pungens*

1 Flowering in the spring and fruiting in the fall; leaves deciduous (somewhat coriaceous in texture and semi-persistent); branches spiny or not. 2 Fruit reddish-brown or pinkish, lepidote with silver and brown scales; leaves with a mixture of silver and bronze scales beneath. 2 Fruit yellow, lepidote with silver scales beneath ..................................................................................

3 Fruit 6-8 mm long, silvery red; fruiting pedicel 8-12 mm long; hypanthium tube about 2× as long as the separate calyx lobes.................

3 Fruit 10-15 mm long, bright red; fruiting pedicel 15-25 mm long; hypanthium tube about as long as the separate calyx lobes.................

............................................................................................................................. ........................................................................

**Elaeagnus angustifolia** Linnaeus 1753 (Silverberry, Oleaster, Russian-olive)

**Elaeagnus pungens** Thunberg, Thorny-olive, Autumn Silverberry. Forests and woodlands in suburban areas, spread by birds; native of Japan. October-November; March-April. [= RAB, K]

**Elaeagnus umbellata** Thunberg var. *parvifolia* (Royle) Schneider, Autumn-olive, Spring Silverberry. Forests and woodlands, spread by birds; native of Japan and China. April-May; August-September. This species has rapidly become a noxious weed shrub, still unfortunately sometimes promoted for "wildlife plantings." The rapidity of its increase may be judged by its treatment in Strausbaugh & Core (1978) as not definitely naturalized in WV; Harmon, Ford-Werntz, & Grafton (2006) map it for every county of WV. [= K; < *E. umbellata* – RAB, C, F, G, W, WV; < *E. umbellatus* – S, orthographic variant]

### 151. RHAMNACEAE
A.L. de Jussieu 1789 (Buckthorn Family) [in ROSALES]

A family of about 50-52 genera and 900-925 species, mostly trees, shrubs, and lianas, cosmopolitan in distribution. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Richardson (2000a, 2000b); Medan & Schirarend in Kubitzki (2004).
1 Plant a woody vine.
2 Leaf margins entire; tendrils absent; [widespread in our area]; [tribe Rhamnaceae]..............................Berchemia
3 Leaf margins serrate to crenate; tendrils present; [of ne. FL southwards]; [tribe Gouanieae]............................Gouania
4 Plant a shrub or small tree.
3 Leaves with 3 prominent veins from near the base.
4 Plants not spiny; fruit dry, capsular; [native]; [tribal placement uncertain].................................................Ceanothus
5 Plants armed with stipular spines; fruit pulpy; [alien, cultivated and escaped]; [tribe Palliaceae]......................Ziziphus
3 Leaves with prominently pinnate venation, the lowermost lateral veins no more prominent than others.
5 Leaves opposite, 2-4 cm long; [of shell middens and shell hammers in the outer Coastal Plain of NC and SC]; [tribe Rhamnaceae]........
6 Leaves alternate (or opposite in Prunella and some Rhamnus), 3-15 cm long; [of various habitats in the Piedmont and Mountains (rarely Coastal Plain) of VA, NC, and SC].
6 Inflorescence repeatedly branched dichotomously; peduncles fleshy and reddish in fruit; nectariferous disc pubescent; [tribe Palliaceae]..............................Hovenia
5 Inflorescence not repeatedly branched dichotomously; peduncles not fleshy; nectariferous disc glabrous; [tribe Rhamnaceae].
7 Winter buds naked, pubescent; flowers perfect, sepal, stamens, and petals 5; style undivided; leaves with 8-10 lateral veins on either side of the midvein.................................................................Frangula
7 Winter buds with bad scales; flowers functionally unisexual, sepal, stamens 4 or 5 (the stamens rudimentary in the pistillate flowers), petals 0 or 4 (never 5); style divided 1/3 to 2/3 its length into 2, 4 or 5 segments; leaves with (2-) 3-9 lateral veins on either side of the midvein..................................................................................Rhamnus

**Berchemia** Necker 1825 (Supplejack)

**Identification notes:** The young stems are shining and reddish; older stems can reach 10 cm in diameter, with bark medium gray and smooth (though often marred by sap wells drilled by Yellow-bellied Sapsuckers). The smooth bark and neatly pinnately-veined leaves are distinctive.

**Berchemia scandens** (Hill) K. Koch, Supplejack, American Rattan. Cp (FL, GA, NC, SC, VA), Pd (GA, NC), Mt (GA): swamp forests, bottomlands, streambanks, in mesic to even xeric uplands over calcareous rock or sediment; common (rare in Piedmont). April-May; August-October. Se. VA south to s. FL, west to TX, north in the interior to nc. TN, w. TN, s. IL, and s. MO. *Berchemia* climbs high into the crowns of swamp trees. [= C, F, NGA, G, GW, K, RAB, S, WH, Z]

**Ceanothus** Linnaeus 1753 (Redroot, New Jersey Tea)

**Identification notes:** The young stems are shining and reddish; older stems can reach 10 cm in diameter, with bark medium gray and smooth (though often marred by sap wells drilled by Yellow-bellied Sapsuckers). The smooth bark and neatly pinnately-veined leaves are distinctive.

**Ceanothus americanus** Linnaeus var. americanus, Common New Jersey Tea. Woodland borders, dry woodlands, glady openings, dry ridge forests and woodlands (pine or oak) in the Mountains. May-June; June-July. ME west to s. MB, south to FL Panhandle and TX. [= C, F, G, X, Y, Z; = C. americanus – FNA, K, RAB, W, WH; = C. americanus – S]

**Ceanothus americanus** Linnaeus var. intermedius (Pursh) Torrey & A. Gray, Southern New Jersey Tea. Sandhills, dry sandy woodlands and forests, rocky openings around granitic or quartzitic rocks in the Piedmont. May-June; June-July. NJ (or possibly MA) south to c. peninsular FL, west to LA, mostly on the Coastal Plain, but disjunct inland to sandy soils around outcrops of siliceous rocks. The recognition of infraspecific taxa in the variable *C. americanus* is uncertain; var. intermedius may either represent ecological forms, or the variation may be too clinal to make taxonomic recognition rewarding. However, material from our area (and beyond) sorts relatively easily, with some intermediates from the Piedmont; varietal status seems provisionally appropriate. [= C, F, G, X, Y, Z; < C. americanus – FNA, K, RAB, W, WH; = C. americanus – Pursh – S]

**Ceanothus herbaricus** Rafinesque, Prairie Redroot. Flood-soured rocky riverbanks. April-May. Primarily midwestern: MI west to MT, south to nw. IN, AR, TX, and Mexico; disjunct eastward in QC, NH, VT, NY, NC, and n. VA (? - Arlington County). Rafinesque described C. herbaricus from "near the falls of the Potomack, between the rocks." The holotype not extant, Coile (1988) chose a neotype, collected by Sheldon in 1881 from "Arlington County, Virginia, Chain Bridge, rocky river bottoms, Potomac River." However, Bartgis, Fleming, & Wiegand (1997) indicate that *C. herbaricus* in the Washington, D.C.
area can only be ascribed with certainty to DC.  [= FNA, K, X, Y, Z; = C. ovatus Desfontaines – F, S, misapplied; = C. pubescens (Torrey & A. Gray ex S. Watson) Rydberg ex Small – S]

_Ceanothus microphyllus_ Michaux.  Sandhills.  E. GA south to c. peninsular FL, west to s. AL, approaching to within a few kilometers of SC (in Screven and Chatham counties, GA), and should be sought in se. SC (except that its outlandish appearance makes it difficult to overlook!).  _C. ×serpyllifolius_ Nuttall (pro sp.) is apparently a hybrid of _C. americanus_ var. _intermedius_ and _C. microphyllus_ (Coile 1988); it is known from scattered sites in FL and GA.  [= FNA, K, S, X, Y, Z]

---

**Frangula** P. Miller 1754 (Buckthorn)

A genus of ca. 50 species, shrubs and small trees, of the northern hemisphere. The distinctions between _Frangula_ and _Rhamnus_ are many and meaningful; their separation at the generic level seems warranted based on morphological and molecular analyses (Richardson et al. 2000a; Bolmgren & Oxelman 2004). References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

1 Leaves entire; leaves ca. 2× as long as wide................................................................................................................................................... _F. alnus_

1 Leaves serrulate; leaves ca. 3× as long as wide................................................................................................................................... _F. caroliniana_

* _Frangula alnus_ P. Miller, European Alder-Buckthorn, Glossy Buckthorn.  Forested areas, other disturbed areas; native of Europe.  This species is a seriously invasive weed in ne. United States, south to (at least) NJ, s. PA (Rhoads & Klein 1993), KY, and se. TN (Marion County) (Chester, Woford, & Kral 1997, Kral 1981), and w. NC (where recently found in a forested area along the Blue Ridge Parkway).  [= FNA, K; = _Rhamnus frangula_ Linnaeus – C, F, G]

_Frangula caroliniana_ (Walter) A. Gray, Carolina Buckthorn.  Dry to moist barrens, woodlands, and forests, Coastal Plain limestone bluffs and shell middens, especially over mafic or calcareous rocks.  May-June.  Sw. VA west to s. OH and s. MO, south to c. peninsular FL and TX.  [= K; = _Rhamnus caroliniana_ Walter – FNA, RAB, S, W, WH; > _Rhamnus caroliniana_ Walter var. caroliniana – C, F, G, Z]

**Gouania** Jacquin 1763 (Chewstick)

A genus of ca. 50 species, shrubs, of tropical America. References: Nesom in FNA (in prep.).

**Hovenia** Thunberg 1781 (Raisin-tree)

**Rhamnus** Linnaeus 1753 (Buckthorn)

A genus of ca. 150 species, trees and shrubs, of the northern hemisphere. The recognition of _Frangula_ as separate from _Rhamnus_ is supported by molecular phylogeny (Bolmgren & Oxelman 2004). References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Bolmgren & Oxelman (2004); Medan & Schirarend in Kubitzki (2004).  [also see _Frangula_]

1 Leaves mostly opposite or subopposite (or some alternate), mostly with (2-) 3-6 lateral veins on either side of the midrib; plant a large shrub or small tree, to 10 m tall; fruit with 4 stones; [aliens, mostly of moist (but not boggy) soils].

2 Leaves mostly 1-2× as long as wide, with (2-) 3 (-4) lateral veins on either side of the midrib; style divided ½ its length into 4 segments....

......................................................................................................................................................................................... _R. cathartica_

2 Leaves mostly 2-3× as long as wide, with 4-6 lateral veins on either side of the midrib; style divided ⅔ its length into 2 segments ........

......................................................................................................................................................................................... _R. davurica_
1 Leaves alternate, mostly with (4-)6-9 lateral veins on either side of the midrib; plant a shrub to 2 m tall; fruit with 2-3 stones; [natives of various, calcareous habitats].

2 Sepals and stamens 5; petals 0; fruit with 3 stones; [of mafic or calcareous peaty wetlands and seeps]........................................... *Rhamnus alnifolia*

3 Sepals and stamens 4; petals 4; fruit with 2 stones; [of dry to moist calcareous woodlands and thickets].

4 Young leaves and young branches pubescent; mature leaves soft pubescent below .................. *R. lanceolata var. glabrata*

5 Young leaves and young branches glabrous or with scattered hairs; mature leaves glabrous below ............ *R. lanceolata var. lanceolata*

* Rhamnus cathartica* Linnaeus, Common Buckthorn. Disturbed areas; native of Eurasia. April-June. Reported for VA by Harvill et al. (1991), but the report is actually based on specimens of *R. davurica* (Virginia Botanical Associates 2005); now bonafide specimens have been found in Giles and Wythe counties (T.F. Wieboldt, pers. comm. 2009). [= C, F, FNA, G, K, Z]

* Rhamnus davurica* Pallas, Dahurian Buckthorn. Suburban woodlands, rarely naturalized; native of e. Asia. April-June. Also reported from suburban areas near Louisville, KY, and Knoxville, TN (D. Estes, pers. comm.). [R. davurica – FNA, K; = R. citrifolia (Weston) W. Hess & Steam – C]

**Rhamnus lanceolata** Pursh var. glabrata Gleason, Western Lance-leaved Buckthorn. Dry habitats over calcareous rocks. April-May. Var. glabrata Gleason ranges from OH west to SD, south to w. VA (Ludwig 1999), KY, c. TN, AR, and KS. [= C, F, G, Z; = R. lanceolata ssp. glabrata (Gleason) Kartesz & Gandhi – FNA, K; < R. lanceolata – S, W]

**Sageretia** Brongniart 1827 (Small-flowered Buckthorn)

**Identification notes:** *S. minutiflora* can appear superficially a bit like *Ilex vomitoria*, with which it typically grows; it can be distinguished from *Ilex vomitoria* by its opposite leaves.

**Sageretia minutiflora** (Michaux) C. Mohr, Small-flowered Buckthorn. Shell middens and shell hammocks, dry calcareous hammocks and maritime forests. August-September; October-November. Sc. NC south to s. FL, west to s. MS. *S. minutiflora* is apparently most closely related to *S. elegans* (Kunth) Brongniart, which ranges from s. Mexico south to s. South America. [= FNA, K, RAB, S, WH, Y, Z]

**Ziziphus** P. Miller 1754 (Ju jube)

A genus of 85-100 species, shrubs and trees, of tropical and warm temperate areas. References: Nesom in FNA (in prep.); Brizicky (1964a)=Z; Medan & Schirarend in Kubitzki (2004).

As here circumscribed (excluding *Celtis* and relatives), a family of 6-7 genera and about 35 species, of temperate, subtropical, and boreal Northern Hemisphere, rarely extending into the Southern Hemisphere. Zavada & Kim (1996) discuss compelling reasons to recognize the *Celtis* from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable. References: Sherman-Broyles, Barker, & Schulz in FNA (1997); Zavada & Kim (1996); Todzia in Kubitzki, Rohwer, & Bittrich (1993). [also see CANNABACEAE]

1 Leaves strongly 3-veined from the base, the venation otherwise pinnate; fruit a drupe with thin flesh. [Celtis – see CANNABACEAE]
2 Leaf venation pinnate throughout, the venation strictly pinnate; fruit dry, a samara (flat and winged) or nutlike (with numerous fleshy protuberances).
3 Fruit nutlike (with numerous fleshy protuberances); primary lateral veins mostly forking before reaching the margin; [small trees of swamp forests of the Coastal Plain from se. NC and SC southward] ..................................................Planera
4 Fruit a samara (flat and winged); primary lateral veins mostly parallel and unforked to the leaf margin; [small to large trees, widespread in our area] ..................................................Ulmus

**Planera** J.F. Gmelin 1791 (Planer-tree, Water-elm)

**Planera aquatica** (Walter) J.F. Gmelin, Planer-tree, Water-elm. River swamps where flooded (often to depths of 1-2 m) in the winter. Se. NC (limited to the Waccamaw and Lumber rivers) south to n. FL, west to e. TX, and north in the Mississippi Embayment to w. TN, w. KY, s. IL, and se. MO. [= RAB, C, F, FNA, G, GW, K, S]

**Ulmus** Linnaeus 1753 (Elm)

A genus of about 25-30 species, trees (rarely shrubs), of temperate and boreal regions of the Northern Hemisphere (most diverse in c. and n. Asia). References: Sherman-Broyles in FNA (1997); Wiegrefe, Sytsma, & Guries (1994); Kurz & Godfrey (1962)–Z; Todzia in Kubitzki, Rohwer, & Bittrich (1993). Key adapted in part from FNA.

1 Leaf blades mostly < 7 cm long, the base symmetrical to somewhat oblilique.
2 Samaras ciliate-margined; twigs often cork-winged; upper surfaces of leaves glabrous to scabrous; [native trees, sometimes weedy].
3 Leaf apex acute; flowers appearing in the late winter to late spring; calyx lobes 5; upper surfaces of leaves glabrous to somewhat scabrous; [widespread in our area; [subgenus Oreoptelea, section Chaeoptelea]] .....................................................................................U. alata
4 Leaf apex obtuse; flowers appearing in the late summer to fall; calyx lobes 6-9; upper surfaces of leaves harshly scabrous; [of w. TN, w. MS westward; also disjunct in FL]; [subgenus Oreoptelea, section Trichoptelea]] ........................................................................U. crassifolia
5 Samaras with glabrous margins; twigs never cork-winged; upper surfaces of leaves glabrous; [introduced trees, planted and sometimes naturalized or persistent]; [subgenus Ulmus, section Microptelea].
6 Leaves without ciliate margins; samara glabrous except along the margin of the notched apex or on the central vein of the wing; [introduced tree, planted and sometimes naturalized or persistent]
7 Leaf base strongly oblique, the lower side overlapping the petiole; branchlets not corky; samara glabrous except on the central vein of the wing ..............................................................U. glabra
8 Leaf base oblique but not overlapping the petiole; branchlets with corky wings; samara glabrous except along the margin of the notch apex ........................................................................U. procera
5 Leaf undersurfaces glabrous (or slightly to moderately scabrous on stump sprouts or seedlings); leaf undersurface glabrous to tomentose, with or without tufts of hairs in the vein axes; flowers and fruits pedicellate (on pedicels 5-20 mm long), pendulous, in fascicles or racemes.
9 Leaf bases moderately oblique (rarely nearly symmetrical); larger leaves 7-10 cm long; primary leaf teeth acute, not curved; [tree restricted to moist calcareous sites in the Coastal Plain of se. NC southward] ..........................................U. americana var. floridana
8 Leaf undersurfaces moderately white or yellowish soft-pubescent, lacking prominent tufts of hairs in the vein axes (differing from the general pubescence of the surface); branches often developing corky wings; inflorescence a raceme or racemose cyme; [trees of calcareous areas in the western portion of our area]; [subgenus Oreoptelea, section Trichoptelea].
**ULMACEAE**

10 Leaves 7-8 (-14) cm long, lanceolate to ovate, the undersurface with yellowish-gold pubescence; buds and young twigs glabrous; calyx lobes 5-6; seeds thickened ................................................................................................................................................... *U. serotina*

10 Leaves 9-11 (-16) cm long, obovate, the undersurface with whitish pubescence; buds and young twigs pubescent; calyx lobes 7-8; seeds inflated ................................................................................................................................................... *U. thomasii*

**Ulmus alata** Michaux, Winged Elm. Rock outcrops, dry and mesic forests and woodlands, bottomlands, old fields, disturbed areas. February-March; March-April. N. VA west to MO, south to c. peninsular FL and c. TX. [= RAB, C, F, FNA, G, GW, K, S, WH, Z]

**Ulmus americana** Linnaeus var. *americanana*, American Elm, White Elm. Swamps, bottomland forests, moist slopes, especially on relatively or strongly nutrient-rich substrates. February-March; March-April. NS, NB, and QC west to se. SK, south to n. FL and c. TX. An ascomycetous fungus, *Ceratocystis ulmi*, is the cause of the Dutch Elm disease. In our area, the effects of the disease appear to have been mild or nonexistent, especially in natural areas. [= Z; < *U. americana* – RAB, C, F, FNA, G, GW, K, W, WV; = *U. americana* – S]

**Ulmus crassifolia** Nuttal, Cedar Elm. Bottomlands, mesic forests. W. TN, s. MO, and OK south to MS, LA, and TX; disjunct in e. Panhandle FL. [= FNA, K, S, Z]

* *Ulmus glabra* Hudson, Wych Elm, Scotch Elm. Suburban woodlands; native of Europe. Naturalized in ne. United States; reported from VA and DC (Sherman-Broyles in FNA 1997), but may only be cultivated. [= FNA, C, F, K]

* *Ulmus parvifolia* Jacquin, Chinese Elm, Lacebark Elm. Disturbed areas; native of China and Japan. August-October; September-November. [= FNA, K]

* *Ulmus procera* Salisbury, English Elm, English Cork Elm. Disturbed areas; native of Europe. [= C, FNA, K; *U. minor* P. Miller, misapplied]

* *Ulmus pumila* Linnaeus, Siberian Elm, Dwarf Elm. Disturbed areas; native of Asia. [= C, F, FNA, K]

**Ulmus rubra** Muhlenberg, Slippery Elm, Red Elm. Moist to fairly dry calcareous forests, rich bottomlands, rich cove forests in the low Mountains. February-March; March-April. ME, QC, and ON west to MN and ND, south to Panhandle FL and c. TX. [= RAB, C, FNA, G, K, W, WV, Z; = *U. fulva* Michaux – S]

**Ulmus serotina** Sargent, September Elm. Mesic limestone forests. KY, s. IL, and e. OK south to c. TN, nw. GA, AL, and MS. It was collected on the French Broad River by Rugel in 1842, and has been attributed to NC by Mohr. [= C, FNA, F, G, K, S]

**Ulmus thomasii** Sargent, Cork Elm, Rock Elm. Rocky or rich slopes, especially over limestone. April. QC to MN and NE, south to NJ, MD, PA, WV, KY, TN, AR, and KS. [= C, FNA, K; = *U. thomasi* – F, G, WV, orthographic variant]

---

**153. CANNABACEAE** Endlicher 1827 (Hops Family) [in ROSALES]

As circumscribed to include the Celtidaceae, a family of 14 genera and about 120 species, trees, shrubs, woody vines, herbs, and herbaceous vines, of cosmopolitan distribution. Zavada & Kim (1996) discuss compelling reasons to recognize the Celtidaceae as a family distinct from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable; and Sytsma et al. (2002) conclude that Celtidaceae should be considered a part of Cannabaceae. References: Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Sherman-Broyles, Barker, & Schulz in FNA (1997); Zavada & Kim (1996); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Sytsma et al. (2002).

1 Tree or shrub; leaves simple and unlobed ................................................................................................................................................... *Celtis*

1 Herb or vine; leaves either compound or lobed.

2 Erect herb; leaves with 3-7 leaflets ................................................................................................................................................... *Cannabis*

2 Climbing or sprawling vine; leaves simple, with 1-9 lobes ................................................................................................................................................... *Humulus*
CANNABACEAE

Cannabis Linnaeus 1753 (Hemp, Marijuana)

A genus of 1-3 species, herbs, originally native to c. Asia. *Cannabis* was formerly widely cultivated nearly worldwide for the fiber hemp; it is now better known as the source of the drug marijuana. References: Small in FNA (1997); Hillig & Mahlberg (2004); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

* Cannabis sativa Linnaeus, Hemp, Marijuana. Disturbed areas and clandestinely cultivated plots; native of Asia. June-October. Though perhaps not truly naturalized or persistent, *Cannabis* is treated here since clandestinely cultivated plots are encountered by the field biologist, especially in fairly remote areas in the mountainous parts of our area. [≡ F, FNA, G, WH, WV; > *C. sativa* Linnaeus ssp. *sativa* – C, K]

Celtis Linnaeus 1753 (Hackberry)

1 Branches armed with short spines.......................................................... *C. iguanaea*
2 Branches unarmed.

3 Leaves thin, dull or glossy above (glossy normally only in sun leaves, especially of *C. laevigata*); bark developing wartlike corky protuberances on larger individuals; [collectively common natives]
4 Leaves thick, very glossy above; bark remaining smoothish, lacking protuberances; [rare alien] ..................................................... *C. sinensis*

3 Leaf blades mostly > 2× as long as wide, the tip attenuate and long-acute to long-acuminate, the base cuneate to rounded; leaf margins entire or with a few teeth on each margin; leaves glabrous or nearly so (except the margins often ciliate); [large trees, mostly of floodplains, but also in upland situations over calcareous substrates such as limestone, dolostone, and shell middens]........... *C. laevigata*
4 Leaf blades mostly < 2× as long as wide, the tip obtuse to short-acuminate, the base slightly to strongly cordate at least on one side; leaf margins entire or with a few teeth on each margin (the plant then a shrub or small tree of rocky places) or distinctly serrate with 10-35 teeth on each margin; leaves scabrous above, at least toward the tip; [shrubs to medium trees, of floodplains, moist slopes, and dry rocky woodlands, barrens, and glades].

3 Pedicel 7-25 mm long; [small to medium trees of dry to moist habitats] ...................................................... *C. occidentalis*
4 Pedicel 3-13 mm long; [shrubs or small twisted trees of dry, rocky habitats]............................................. *C. tenuifolia*

Celtis iguanaea (Jacquin) Sargent, Iguana Hackberry. Shell-middens and calcareous coastal sites. AL, sw. peninsular FL, West Indies, American tropics. [≡ WH; = *Momisia iguanaea* (Jacquin) Rose & Standley – S]

Celtis laevigata Willdenow, Southern Hackberry, Sugarberry. Bottomland forests, especially on natural levees, upland calcareous forests and woodlands, shell middens. April-May; August-October. MD, WV, IN, IL, MO and KS south to s. FL and TX. [≡ RAB, C, FNA, G, GW, W; > *C. laevigata* var. *laevigata* – F; > *C. laevigata* var. *smallii* (Beadle) Sargent – F; = *C. laevigata* var. *laevigata* – K; > C. mississippiensis Bose – S; > C. smallii Beadle – S]

Celtis occidentalis Linnaeus, Northern Hackberry. Xeric to mesic glades, outcrops, barrens, woodlands, and bottomland forests, usually over calcareous substrate. April-May; August-October. NH, QC, MB, and MT south to Panhandle FL, TX, and NM. [≡ C, FNA, G, K, S, W, WV; = *C. occidentalis* var. *occidentalis* – RAB; > *C. occidentalis* var. *canina* (Rafinesque) Sargent – F; > *C. occidentalis* var. *occidentalis* – F; > *C. occidentalis* var. *pumila* (Pursh) A. Gray – F; < C. occidentalis – WH]

* Celtis sinensis Willdenow, Chinese Hackberry. Suburban woodlands; native of China, Korea, and Japan. Found naturalizing in Guilford County, NC (W. Cook, pers. comm., 2010). [not yet keyed]

Celtis tenuifolia Nuttall, Dwarf Hackberry, Georgia Hackberry. Xeric to mesic glades, outcrops, barrens, woodlands, often over calcareous substrate. April-May; August-October. NJ, PA, IN, IL, and KS south to Panhandle FL and TX. [≡ C, FNA, G, K, W, WV; = *C. occidentalis* var. *georgiana* (Small) Ahles – RAB; > *C. tenuifolia* var. *georgiana* (Small) Fernald & Schubert – F; > *C. tenuifolia* var. *tenuifolia* – F; = *C. georgiana* Small – S; < *C. occidentalis* – WH]

Humulus Linnaeus 1753 (Hops)

A genus of 2 species, herbaceous vines, of temperate regions of the Northern Hemisphere. References: Small (1978)=Z; Small in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Z.
1 Veins on lower surface of leaves armed with rigid, spinulose hairs; bracts of pistillate flowers spinulose-ciliate; most leaves 5-9 lobed .......... H. japonicus

2 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) usually with < 20 hairs per cm of length of midrib; glands (measured on leaves as above) < 25 per 10 square mm of intervein lower leaf surface; [introduced variety, sometimes showing introgression with native varieties]................................................................. H. lupulus var. lupulus

3 Lower surfaces of leaves (measured on middle lobe of 4-6 cm long leaves of flowering or fruiting branches) conspicuously pubescent between the veins and on the veins, with > 100 hairs per cm of length of midrib; smaller leaves unlobed (less commonly 3-lobed) ........... H. lupulus var. pubescens

*: Humulus japonicus Siebold & Zuccarini, Japanese Hops. Disturbed areas, particularly in rich, alluvial soils, where it has become a serious weed along major VA rivers; native of Japan, Taiwan, and China. June-October; July-October. [= RAB, C, F, NFA, G, K, W, WV, Z]

Humulus lupulus Linnaeus var. lupuloides E. Small, Northeastern Hops. Pd (VA), Mt (VA, WV), Cp (NC, VA): disturbed areas, particularly in rich, alluvial soils; uncommon (rare in NC and WV, rare in VA Coastal Plain). July-August; September-October. NS and NL (Newfoundland) south to VA and NC, west to NE, MT, and AB. It is not clear whether its occurrence in NC is native or native of further north. The 3 varieties (two native and one introduced) in our area are subtly different, the differences apparently sometimes further obscured by introgressive hybridization. [= C, FNA, K, Z; < H. lupulus – RAB, F, G, S, W, WV]

Humulus lupulus Linnaeus var. lupulus, Brewer's Hops, European Hops. Pd (VA), Mt (WV): disturbed areas; rare, native of Europe. July-August; September-October. The European var. lupulus is (of course) one of the key ingredients of beer. [= C, FNA, K, Z; < H. lupulus – RAB, F, G, S, W, WV]

Humulus lupulus Linnaeus var. pubescens E. Small, Midwestern Hops. Mt (GA, NC, VA), Pd (NC, VA), Cp (VA): disturbed areas, particularly in rich, alluvial soils; rare. July-August; September-October. NY and PA south to NC and ne. GA and west to MN, NE, KA, and AR. It is not clear whether the few occurrences east of the Blue Ridge (including those in NC and VA) are native or adventive from further west. [= C, FNA, K, Z; < H. lupulus – RAB, F, G, S, W]

Humulus japonicus

154. MORACEAE Lindley 1847 (Mulberry Family) [in ROSALES]

A family of about 38 genera and 1100 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (few) warm temperate areas. References: Wunderlin in FNA (1997); Rohwer & Berg in Kubitzki, Rohwer, & Bittrich (1993).

1 Herb, 0.3-1.0 m tall; stem without latex; [tribe Moreae].......................................................................................................................................................... Fatoua

2 Stipules connate, the stipule scar encircling the twig; inflorescence a syconium (the flowers borne on the inner walls of the fleshy receptacle); [tribe Fieae].................................................................................................................................................................................. Ficus

2 Stipules free, the stipule scar not encircling the twig; inflorescence a spike, head, or catkin (the flowers borne exposed on a contracted or elongated axis or receptacle).

3 Leaves entire, unlobed or shallowly 3-lobed; stems usually thorny; [tribe Malacoeae].

4 Fruit 2-3 cm in diameter; petioles 5-20 mm long; leaves 3-7 (-10) cm long................................................................. Cudrania

4 Fruit 10-15 cm in diameter; petioles 30-50 mm long; leaves 6-20 cm long................................................................. Maclura

3 Leaves serrate, often also 3-15-lobed (the lobes sometimes deep); stems not thorny; [tribe Moreae].

5 Stems and leaves hirsute; leaves alternate, opposite, and whorled............................................................................. Broussonetia

5 Stems and leaves glabrous to pubescent; leaves alternate......................................................................................... Morus

Broussonetia l'Héritier ex Ventenat 1799 (Paper Mulberry)

**MORACEAE**

Cudrania Trécul 1847 (Cudrania)

* Cudrania tricuspidata (Carrière) Bureau ex Lavallée, Cudrania.  Pd (NC), Cp (GA): escaped and naturalized from plantings; rare, native of China and Korea, where cultivated as a food for silkworms.  July.  Naturalized in Orange County, NC, in McIntosh Co. GA (Jones & Coile 1988), and perhaps elsewhere in our area, where recommended as a hedge plant since at least 1940 (Rehder 1940).  [= FNA, K; = Maclura tricuspidata Carrière]

Fatoua Gaudichaud-Beaupré 1830 (Crabweed)

* Fatoua villosa (Thunberg) Nakai, Crabweed, Mulberry-weed, Foolish-weed.  Pd (GA, NC, SC, VA), Cp (GA, SC), Mt (NC): disturbed areas, vegetable and flower gardens; rare, native of Asia (apparently se. Asian islands).  July–November.  As reported by Massey (1975) and Vincent (2004), Fatoua was first reported in the United States (Louisiana) in the early 1960's.  As of 2004, its distribution in North America had spread to include 28 states and the District of Columbia, including most states except the Great Plains and Rocky Mountains had spread (Vincent 2004, Sundell et al. 1999, Miller & Wood 2003.  Since all early collections seem to be in and around greenhouses and nurseries, it is likely that it has been introduced in horticultural material, perhaps repeatedly (Kral 1981b).  Fatoua appears to have become a fairly aggressive weed in eastern North America.  It can be expected to continue to spread, and has the potential to become noxious.  It has alternate, ovate leaves with cordate bases, borne on long petioles (about as long as the leaf blade), the inflorescences are dense cymes borne on peduncles in the axils of leaves.  Pubescence of the stem and foliage is uncinulate, giving the plant a "tacky" feel.  An excellent illustration appears in Correll & Correll (1982).  [= FNA, K, Y, Z]

Ficus Linnaeus 1753 (Fig)

1  Leaves lobed, 7–30 cm long; [shrub to small tree]...................................................................................................................................................... F. carica
1  Leaves unlobed, 1–5 cm long; [vine, climbing appressed to walls].......................................................................................................................... F. pumila

* Ficus carica Linnaeus, Edible Fig, Garden Fig.  Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC): grown for its fruits, persistent from plantings, persisting and naturalizing particularly on barrier islands, where it sometimes forms thickets on dunes, or otherwise in the outer Coastal Plain, where proximity to the ocean ameliorates cold winter temperatures; rare, native of w. Asia.  May-August; July-October.  This is the common cultivated fig, grown for its fruit in the Mid-east for millenia.  [= RAB, F, FNA, K, S, WH]

* Ficus pumila Linnaeus, Climbing Fig.  Cp (AL, FL, GA, LA, SC): walls, disturbed urban areas; rare, native of s. Asia.  Locally common in Charleston, Savannah, Pensacola, Mobile, New Orleans, and other old seaports, where grown on walls as an ornamental and certainly persisting.  [= FNA, K, WH]

Maclura Nuttall 1818 (Osage-orange)

A monotypic genus (or sometimes broadened to include Cudrania and other genera), a tree, of sc. North America.  References:  Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

* Maclura pomifera (Rafinesque) C.K. Schneider, Osage-orange, Bow-wood, Bois-d’arc, Hedge-apple.  Fields, hedgerows, forests; common (uncommon in DE Coastal Plain, rare in FL), naturalized from extensive planting in the eighteenth and nineteenth centuries, native of TX, OK, AR, and LA.  April-May; October.  The large fruits are unmistakable: yellowish-green, grapefruit-sized, and wrinkled, reminiscent of a giant, spherical mulberry fruit.  The wood is extremely heavy, fine-grained, a bright yellow-orange when fresh, but darkening with age, famous for making bows and also used in cabinetry.  [= RAB, C, F, FNA, G, K, W, WH, WV; = Toxylon pomiferum Rafinesque ex Sargent – S]
Morus Linnaeus 1753 (Mulberry)

1 Upper leaf surface dull, scabrous; lower leaf surface pubescent on the veins and in the vein axils only; ripe fruits black, purple, red, pink, or white .............................................................................................................. M. alba
1 Upper leaf surface dull, scabrous; lower leaf surface pubescent on the veins, veinlets, and the surface between the veins; ripe fruits black or purple .............................................................................................................. M. rubra

* Morus nigra Linnaeus, Black Mulberry. Reported. [add to synonymy; add to key; add to Access]

Morus rubra Linnaeus, Red Mulberry. Bottomland forests, mesic slopes, disturbed areas, suburban woodlands. April-May; May-June. MA, VT, NY, MI, WI, and se. SD south to s. FL and w. TX, and into Mexico. The fruits are very variable in quality from tree to tree. M. rubra is the only member of the Moraceae native to our area. M. murrayana D.E Saar & S.J. Gall has recently been described as distinct from M. rubra and occurring widely in eastern North America (KY, TN, MO, IL, IN, MS, LA, VA, NC, and AL) (Galla et al. 2009). It is alleged to differ from M. rubra by its leaves to 38 cm long (vs. to 15 cm long), the outer three leaves on branchlets almost always > 15 cm long (vs. < 15 cm long), leaves with caudate apex (vs. acute to acuminate apex), lateral veins curving before reaching margins, only the tiniest veins ending in a tooth (vs. lateral veins above lowest lateral fairly straight and ending in a tooth); mature fruit to 4 cm long and 1.5 cm wide but often thinner, with much size variation on a single individual (vs. mature fruit to 3 cm long). All the alleged characters appear to be highly variable and correlated with vigor. [= RAB, C, F, G, GW, K, S, W, WV; > M. rubra var. rubra – K; > M. rubra – Z; > M. murrayana D.E. Saar & S.J. Gall – Z]

155. URTICACEAE A.L. de Jussieu 1789 (Nettle Family) [in ROSALES]

A family of about 45 genera and 1000 species, herbs, shrubs, vines, and trees, of cosmopolitan distribution in tropical, subtropical, and temperate regions. References: Boufford in FNA (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Miller (1971a).

1 Leaves alternate.
  2 Flowers in axillary spikes; woody herb to 4 m tall; [tribe Boehmerieae] .............................................................................................................. Boehmeria nivea
  2 Flowers in terminal panicles, axillary panicles, or axillary fascicles; herb to 1.5 m tall.
    3 Leaves 4-13 cm wide, with stinging trichomes; [tribe Urticeae] .............................................................................................................. Laportea
    3 Leaves 0.8-2 cm wide, lacking stinging trichomes; [tribe Parietarieae] .............................................................................................. Parietaria
  1 Leaves opposite.
    4 Plant with stinging trichomes, these having a distinct bulbous or cylindrical base, and a stiff, translucent apex; [tribe Urticeae]  Urzic
    4 Plant without stinging trichomes (or these minute and not apparent), the non-stinging hairs (if present) soft and flexible, lacking a bulbous or cylindrical base.
      5 Flowers in axillary spikes; foliage dull, yellow-green; [tribe Boehmerieae] ................................................................. Boehmeria cylindrica
      5 Flowers in axillary panicles or fascicles; foliage shiny, bright green; [tribe Lecantheae] .......................................................... Pilea

Boehmeria Jacquin 1760 (False-nettle)

1 Leaves opposite; monoecious herb to 1.5 m tall; [subgenus Duretea] .............................................................................................................. B. cylindrica
1 Leaves alternate; dioecious herb to 4 m tall; [subgenus Tilocnide] .............................................................................................................. B. nivea

**URTICACEAE**

*Boehmeria nivea* (Linnaeus) Gaudichaud-Beaupré, Ramie. Disturbed suburban areas, waste ground; native of Asia. This plant is cultivated for the fiber of its stems, which is extracted and used for fabric in a manner reminiscent of linen (which is made from *Linum usitatissimum*). Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). [= RAB, FNA, K; = *Ramium niveum* (Linnaeus) Small – S]

*Laportea* Gaudichaud-Beaupré 1830 (Wood-nettle)

*Laportea canadensis* (Linnaeus) Weddell, Wood-nettle. Moist, nutrient-rich forests, especially abundant in cove forests in the Mountains and bottomlands in the Piedmont. Late June-August; late July-October. NS and se. MB south to Panhandle FL and OK. By mid-summer, Laportea often becomes the aspect dominant in rich, moist cove forests of the mountains (especially those with extensive seepage), visually replacing the diverse spring flora. The stinging hairs can penetrate pants made of lightweight or loosely woven fabrics. [= RAB, C, F, FNA, G, GW, K, W, WV; = *Urticastrum divaricatum* (Linnaeus) Kunze – S]

*Parietaria* Linnaeus 1753 (Pellitory)

1 Leaves softly pubescent; [alien weed]; [subgenus *Parietaria*] .................................................................................................................. 
   1 Leaves glabrescent; [native, sometimes weedy in calcareous or coastal areas]; [subgenus *Freirea*].

2 Main lateral veins diverging from the midvein above the usually narrowly cuneate leaf base; larger leaves 2-5× as long as wide ..........
   2 Main lateral veins diverging from the midvein at the usually truncate, rounded, or broadly cuneate leaf base; larger leaves 1-2× as long as wide.

3 Achene with a flanged stipe, the minute apiculate tip located symmetrically at the pole of the achene, the achene 0.8-1.0 mm long..........
   3 Achene without a flanged stipe, the minute apiculate tip located asymmetrically, the achene usually 1.2 (-1.4) mm long.................

*Parietaria floridana* Nuttall, Florida Pellitory. Coastal shores, sometimes weedy in calcareous situations. March-frost; April-frost. DE south to FL and west to TX, on the outer Coastal Plain. This species has smaller leaves than *P. praetermissa*. [= FNA, GW, K, WH, Z; = *P. nummularia* Small – C, F, S]

*Parietaria judaica* Linnaeus, Pellitory-of-the-wall. Disturbed urban areas; native of Europe. [= FNA, K, WH; = *P. diffusa* Mertens & Koch]

* Parietaria officinalis Linnaeus, Pellitory. Reported as introduced in Mobile County, AL (Kartesz 2010). [investigate] [= K2] [not keyed; add to synonymy]

*Parietaria pensylvanica* Muhlenberg ex Willdenow, Pennsylvania Pellitory, Rock Pellitory. In circumneutral soils, such as in thin soils at the bases of calcareous or subcalcareous cliffs or on calcareous shale barrens, rich floodplain soils. April-October; May-October. ME west to BC, south to e. NC, w. NC, AL, Panhandle FL, TX, NV, and Mexico. Two varieties are sometimes delimited, var. pensylvanica eastern and northern and var. obtusa (Rydberg ex Small) Shinners southwestern. [= C, FNA, G, GW, K, K2, RAB, S, W, WH; > *P. pensylvanica* – F, WV (sensu stricto)]

*Parietaria praetermissa* Hinton, Coastal Pellitory. Shell middens, coastal hammocks. March-frost; April-frost. E. NC south to s. FL and west to w. LA. [= FNA, GW, K, WH, Z; = *P. floridana* Nuttall – RAB, C, F, S, misapplied]
**Pilea** Lindley 1821 (Clearweed)

1 Leaves 0.5-1.0 (-1.8) cm long............................................................................................................................................................ *P. microphylla*
1 Leaves 4-10 cm long.
2 Achene 1-1.5× as long as broad, tuberculate, dark brown or black, the margins slightly paler........................................................................... *P. fontana*
2 Achene 1.5-2× as long as broad, smooth, green or light brown, with slightly raised dark to black lines and mottlings............... *P. pumila*

**Pilea fontana** (Lunell) Rydberg, Blackfruit Clearweed, Lesser Clearweed. Swamp forests, freshwater marshes, calcareous wetlands. August-September; September-November. E. Canada west to MN and ND, south to FL, IN, and NE. Only reliably distinguishable from *P. pumila* using fruits, *P. fontana* is, however, somewhat less shiny and transparent-translucent. [= RAB, C, F, FNA, G, GW, K, W, WH, < *Adicea pumila* (Linnaeus) Rafinesque – S]

*Pilea herniarioides* (Swartz) Lindley, Caribbean Clearweed. Reported for Mobile County, AL and scattered sites in the FL peninsula (Kartesz 2010). [= K2] {not keyed; add to synonymy}

*Pilea microphylla* (Linnaeus) Liebmann, Rockweed, Artillery Weed. Old rock and brick walls, urban areas. January-December. Although listed by RAB for the Carolinas as "a weed in and around greenhouses, not established as part of our flora," this species is well-established and weedy in Charleston, SC and Savannah, GA. It is presumably adventive from further south. [= RAB, FNA, K, S, WH]

**Pilea pumila** (Linnaeus) A. Gray, Greenfruit Clearweed, Coolwort, Richweed. Swamp forests, bottomlands, freshwater marshes. August-September; September-November. QC west to MN, south to FL, LA, and OK. [= RAB, C, FNA, G, GW, W, WH, WV; > *P. pumila* var. *pumila* – F, K; > *P. pumila* var. *deamii* (Lunell) Fernald – F, K; < *Adicea pumila* (Linnaeus) Rafinesque – S (including in concept *P. fontana*))

**Urtica** Linnaeus 1753 (Stinging Nettle)

1 Tap-rooted annual; stipules 1-3 mm long, spreading or deflexed; inflorescences usually shorter than the subtending leaf petiole, each panicle consisting of a mixture of pistillate and staminate flowers.
2 Flower clusters subglobose; mature achenes ovate, 1-1.5 mm long, < 1 mm wide; leaf teeth generally blunt, the sides of the tooth convex...
  ...................................................................................................................................................................................................... *U. chamaedryoides*
2 Flower clusters elongate; mature achenes triangular, 1.5-2.5 mm long, 1-1.5 mm wide; leaf teeth generally sharp, the sides of the tooth straight
  ...................................................................................................................................................................................................... *U. urens*
1 Rhizomatous perennial; stipules 5-15 mm long, erect; inflorescences usually surpassing the subtending leaf petiole, each panicle of either pistillate or staminate flowers.
3 Plants dioecious (male and female flowers always on separate plants); stems usually weak, sprawling, branching; stems strongly hispid with stinging hairs; leaf blades strongly hispid with stinging hairs on both surfaces; leaf teeth commonly 5-6 mm long ............... *U. dioica*
3 Plants mostly monoecious (with male and female flowers in separate inflorescences on the same plant), rarely an entire plant male or female; stems upright, erect, less branched; stems glabrous to puberulent or strigose, lacking (or nearly so) stinging hairs; leaf blades glabrous or glabrescent above (lacking stinging hairs), glabrous to puberulent below (with some stinging hairs); leaf teeth commonly 2-3.5 mm long ................................................................. *U. gracilis*

**Urtica chamaedryoides** Pursh, Dwarf Stinging Nettle. Rich moist soil, usually on floodplains. November-May; May-July, WV, KY, se. MO and OK south to FL, TX, and Mexico; very rare east of the Blue Ridge. Notable locations in our area include
**URTICACEAE**

Stevens Creek (McCormick County, SC), Congaree Swamp (Richland County, SC), and various sites on very rich levees of the Roanoke River (NC). Gaddy & Rayner (1980) report the common winter flowering of this species in our area.  

*Urtica dioica* Linnaeus, European Stinging Nettle, Great Nettle. Disturbed areas, primarily in calcareous soils; native of Europe. May-July; July-September. See *U. gracilis* for discussion of the two taxa.  

**Urtica gracilis** Aiton, American Stinging Nettle. Bottomland forests and edges, particularly over limestone. May-July; July-September. NL (Labrador) and NS west to AK, south to sw. VA, w. NC (?), s. OH, s. IL, s. MO, n. TX, s. NM, and se. AZ. The native stinging nettle of e. and c. North America is best treated as specifically distinct from *U. dioica* of Europe. Woodland (1982) and Woodland, Bassett, Crompton, & Forget (1982) showed that *U. gracilis* differs from *U. dioica* in a variety of morphologic characters (see key), chromosome number (2n = 26 for *U. gracilis*, 2n = 52 for *U. dioica*), breeding system (monoecy vs. dioecy), and distribution (North American vs. Eurasian); furthermore, the two taxa could not be crossed. Woodland (1982) chose subspecific status, apparently to emphasize the close relationship of the two (and a third taxa in w. North America). The combination of morphological distinctiveness, allopatry, major differences in species biology, and incompatability seem adequate to warrant separation as species, however. Until herbaria can be checked, it is uncertain whether *U. gracilis* occurs in NC.  

*Urtica urens* Linnaeus, Burning Nettle, Dog-nettle, Small Nettle. Disturbed areas; native of Eurasia. April-May; May-July.  

---

**157. FAGACEAE** Dumortier 1829 (Beech Family) [in FAGALES]

A family of about 8 genera and 620-1050 species, trees and shrubs, mostly of the Northern Hemisphere, but extending into se. Asia and Australia. References: Nixon in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Elias (1971a).

1 Fruits partially enclosed in a scaly cup; leaves lobed, toothed, crenate, or entire.................................................................*Quercus*

1 Fruits enclosed in a spiny or prickly bur; leaves toothed.

2 Nuts rounded or flattened on one or two sides; bur with long, straight spines; winter buds < 1 cm long; leaves elliptic or obovate-lanceolate, some of them usually > 12 cm long.............................................*Castanea*

2 Nuts sharply triangular; bur with short, recurved prickles; winter buds 1.5-2.5 cm long; leaves ovate, 6-12 cm long.........................*Fagus*

**Castanea** P. Miller 1754 (Chinquapin, Chestnut, Oaknut)

1 Leaves elliptic, obovate-lanceolate, 8-30 cm long, the apices acuminate, sometimes only shortly so; spine-covered husk of fruit splitting into 4 sections, enclosing (2-)3 (-5) nuts; nut flattened on at least one side, 18-25 mm in diameter; pistillate dichasia of 3 flowers; leaves usually without stellate trichomes; twigs puberulent or glabrous.

2 Undersurface of leaves densely covered with bulbous-based trichomes when young, essentially glabrous in age; leaves mostly > 15 cm long, generally long-acuminate; twigs glabrous; trees single-trunked; spines of fruit husk weak, easily bent ..........................*C. mollisima*

2 Undersurface of leaves persistently and densely tomentose beneath; leaves mostly < 15 cm long, generally short-acuminate; twigs puberulent; trees multi-trunked from base; spines of fruit husk stiff; nut ..............................*C. dentata*

1 Leaves elliptic to obovate-lanceolate, mostly < 15 cm long, the apices acute to obtuse; twigs puberulent; spine-covered husk of fruit splitting into 2 sections, enclosing 1 nut; nut circular in cross-section, 7-19 mm in diameter; pistillate dichasia of 1 flower; leaves with stellate trichomes, with few bulbous-based trichomes when young, puberulent, pilose, tomentose, or tomentose in age (usually rather densely so).

3 Longest spines of the fruit husk usually > 10 mm long; young twigs glabrous; petiole 8-10 (-15) mm long; [plants of n. AL and westward]. ..................................*C. ozarkensis*

3 Longest spines of the fruit husk usually < 10 mm long; young twigs puberulent; petiole 3-7 (-10) mm long; [plants widespread in our area]. ........................................*C. pumila*

**Castanea dentata** (Marshall) Borkhausen, American Chestnut. Mesic and xeric forests. June-July; September-October. S. ME, s. ON, MI, c. IN, s. IL, south to c. NC, c. GA, Panhandle FL, and sc. MS. Formerly one of the most important, largest, and...
most abundant forest trees in the Mountains of our area, *Fagus* grandifolia was severely affected by chestnut blight, *Cryphonectria parasitica* (Murrill) Barr, introduced at New York City in 1904 on nursery stock of *Castanea mollissima*. Blight spread steadily southward, reaching our area in the 1920's and 1930's. *F. grandifolia* remains rather abundant, but now occurs only as stump sprouts and small trees, usually reinfected by blight persisting on oaks and killed at about the size of first fruit production. The accidental introduction of chestnut blight and the subsequent profound alteration of the role of chestnut is one of the most tragic ecological disasters to have affected our area. *Castanea × neglecta* Dode (pro sp.) [C. dentata × *pumila*], occurs in our area; "the leaves of the hybrid resemble those of *F. grandifolia* in size and shape but have the vestiture and stellate trichomes of *C. pumila*" (Johnson 1988). [= RAB, C, F, FNA, G, K, S, W, WH, Z]

* Castanea mollissima* Blume, Chinese Chestnut. Forests; native of China. June; September. This species is relatively resistant to chestnut blight and has been planted widely as an ornamental and nut tree; it sometimes naturalizes and appears nearly native. Reported for NC (Macon County) by Pittillo & Brown (1988). [= C, FNA, K, WH]

* Castanea ozarkensis* W.W. Ashe, Ozark Chinquapin. Dry forests. May-July; September-October. S. MO, e. OK, and w. AR; disjunct in c. AL, where now apparently extirpated by blight. *C. ozarkensis* is related to *C. pumila*, though showing some relation as well to *C. dentata*. *C. ozarkensis* is more susceptible to blight than *C. pumila*. [= RAB, F, = *C. pumila* P. Miller var. *ozarkensis* (W.W. Ashe) G.E. Tucker – K, Z]

* Castanea pumila* (Linnaeus) P. Miller, Common Chinquapin. Xeric forests and woodlands, generally in fire-maintained habitats. May-July; September-October. NJ, s. PA, s. OH, n. KY, and s. MO, south to c. peninsular FL and se. TX. It is relatively resistant to chestnut blight. [= FNA, WH – C. *pumila* var. *pumila* – C, K, Z; > C. *pumila* var. *pumila* – RAB, F; > *C. pumila* var. *pumila* var. *ashei* Sudworth – RAB, F; > *C. alnifolia* Nuttall var. *alnifolia* – RAB; > *C. alnifolia* var. *floridana* Sargent – RAB; > *C. pumila* – G, S, W; > *C. ashei* (Sudworth) Sudworth – S; > C. *floridana* (Sargent) Ashe – S; > C. *alnifolia* – S]

* Castanea sativa* P. Miller, Spanish Chestnut. Reported as naturalized in KY, AL, PA, and elsewhere in e. North America (Clark et al. 2005). [= K] {not yet keyed; synonymy incomplete}

Fagus Linnaeus 1753 (Beech)

1 Leaves denticulate; cupule prickles 1-2.5 (-4) mm long, slightly to strongly recurved; cupule valves generally ovate, the apex obtuse, reddish in color; leaves with fairly dense white acicular trichomes on the lower leaf surface at maturity; leaf base sometimes clearly cordate; [plants of the Coastal Plain, Piedmont, and low to moderate elevations (mostly below 1050 m or 3500 feet) in the Mountains] [.................]

..................F. grandifolia var. caroliniana

Fagus grandifolia Ehhrart var. caroliniana (Loudon) Fernald & Rehder, White Beech, American Beech. Moist forests, from near sea level to low elevations in the Mountains, mostly below 1050 meters (3500 feet). March-May; September-October. Se. MA, OH, IN, s. IL, s. MI (?), and MO south to Panhandle FL and e. TX. Several subspecies, varieties, or phases of *Fagus grandifolia* have been described, and their taxonomic recognition is controversial. The most recent monographer, Shen (1992), recognizes three subspecies, one of which is limited to Mexico, the other two as treated here but at the subspecific level. I have here chosen to recognize 2 intergradient varieties in our area. A third variety, var. *mexicana* (Martínez) Little, of the mountains of México, is apparently most closely related to var. *grandifolia*. Cooper & Mercer (1977) studied variation in NC, concluding that two genetic races or varieties were present, the montane var. *grandifolia* and the Piedmont and Coastal Plain var. *caroliniana*, but that patterns of variation were complicated. Hardin & Johnson (1985) and Hardin (1992, 1985) note that variation is "more-or-less" clinal, variation within populations is great, and they do not favor recognition of infraspecific taxa. Depending on one's tolerance or intolerance for intergradational varieties, one may choose to recognize one or two taxa in our area. [= C, F, G, Y; < F. *grandifolia* – RAB, FNA, K, S, W, WV, Z; < F. *grandifolia* ssp. *grandifolia* – V; = F. *grandifolia* ssp. *caroliniana* (Loudon) Camp ex Shen – X, nomen nudum; = F. *ferruginea* Aiton]

Fagus grandifolia Ehhrart var. *grandifolia*. Gray Beech, Red Beech, American Beech. Moderate to high elevation forests, especially on high elevation ridges, gaps, and open slopes, often forming clonal dwarfed thickets in the most exposed situations. April-May; September-October. NS, NB, and s. QC west to s. ON and n. MI, south to VA, w. NC, n. GA, e. TN, and n. OH. "Red beech" is alleged to differ from "gray beech" in having the involucral segments not covering the nutlets at maturity. Hardin
& Johnson (1985), Hardin (1985), and Shen (1992) point out that var. *mexicana* (Martínez) Little, of the mountains of México, is more closely related to our montane variety or phase than to the lower elevation variety or phase. [= C, F, G, Y; < *F. grandifolia* – RAB, FNA, K, S, W, WV, Z; < *F. grandifolia* ssp. *grandifolia* – V; = *F. grandifolia* ssp. *grandifolia* – X] *Fagus sylvatica* Linnaeus, European Beech, Copper Beech, of subgenus *Fagus*, section *Fagus*, is sometimes cultivated, but is not known to escape in our area. It has only 5-10 (-12) lateral veins, as opposed to (12-) 15-18 (-20) in *F. grandifolia*. [not keyed] [= V; *F. sylvatica* ssp. *sylvatica* – X] [not keyed] *Quercus* Linnaeus 1753 (Oak)

A genus of about 350-530 species, trees and shrubs, of temperate, subtropical, and rarely tropical regions of the Northern Hemisphere. Oaks are the predominant tree of our area, with a variety of species dominating much of the landscape in nearly every ecological situation. Only in a few specialized (and usually in some sense edaphically extreme) communities are oaks generally entirely absent: deepest Coastal Plain swamps, some Coastal Plain depression ponds, wettest pine savannas, pocosins, spruce-fir forests, highest elevation northern hardwood forests, and mountain bogs.

Our oaks are divided into two well-marked sections; other sections occur outside our area. Red oaks (section *lobatae*, sometimes treated as subgenus *Erythrobalanus*) are characterized by acorns maturing in two years (in one year in *Q. elliottii*), styles elongate, abortive ovules are at the top of the seed, leaves and leaf lobes bristle-tipped, inner surface of the acorn shell velvety-pubescent, and acorns rooting in spring. White oaks (section *Quercus*, sometimes treated as subgenus *Quercus*) are characterized by acorns maturing in a single year, styles short or absent, abortive ovules at the base of the seed, leaves and leaf lobes not bristle-tipped, inner surface of the acorn shell smooth, and acorns rooting in autumn. Twenty of our *Quercus* species are in this group: *Q. alba*, *Q. austrina*, *Q. bicolor*, *Q. boyntonii*, *Q. chapmannii*, *Q. geminata*, *Q. lyrata*, *Q. macrocarpa*, *Q. margarettae*, *Q. michauxii*, *Q. minima*, *Q. montana*, *Q. muehlenbergii*, *Q. oglethorpei*, *Q. prinoides*, *Q. robur*, *Q. similis*, *Q. simulata* var. *simulata*, *Q. stellata*, and *Q. virginiana*. Hybrids within each section are frequent and diverse; hybrids do not naturally occur between the two sections. The live oaks of the southeastern Coastal Plain and Central America are subsection *Virentes*; other white oaks are subsection *Quercus*. References: Nixon in FNA (1997) (overall treatment); Jensen in FNA (1997) (red oaks); Nixon & Muller in FNA (1997) (white oaks); Godfrey (1988); Stein, Binson, & Acciavatti (2003); Cronquist (1991); Duncan & Duncan (1988); Hunt (1990)=Z; Hunt (1994); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

**Identification notes:** Many oak species are well-adapted to ecological situations in which fires frequently burn the ground layer. Fire-maintained communities of the Piedmont and Mountains typically have oaks such as *Q. stellata*, *Q. marilandica* var. *marilandica*, *Q. ilicifolia*, and *Q. prinoides*. The two latter species are normally shrubby, and have become rarer because of fire suppression (they require fire to prevent larger trees from outcompeting them). In contrast, *Q. stellata* and *Q. marilandica* var. *marilandica* become larger and more frequent in fire-suppressed conditions.

Fifteen oak species in our area are typical of upland Coastal Plain communities with at least occasional fire: *Q. arkansana*, *Q. chapmannii*, *Q. geminata*, *Q. hemisphaerica*, *Q. incana*, *Q. laevis*, *Q. margarettae*, *Q. michauxii*, *Q. minima*, *Q. montana*, *Q. muehlenbergii*, *Q. oglethorpei*, *Q. prinoides*, *Q. robur*, *Q. similis*, *Q. simulata* var. *simulata*, *Q. stellata*, and *Q. virginiana*. Fire suppression of Coastal Plain communities, especially of sandhills, leads to an unnatural increase in the stature and abundance of oaks present. In frequent fire conditions, most oaks will persist as short, shrubby fire sprouts. Additional suggestions of how to recognize fire sprouts of these species are given below. In general, leaves of fire sprouts are larger and more deeply lobed than normal leaves. In species of the red oak group, the bristle tips are larger and more pronounced. Increased size in leaves is particularly noticeable when an area previously long fire-suppressed is burned (the large underground root system and nutritional resources of a small tree destroyed by fire being devoted to a few very vigorous sprouts). Fire sprouts are often in sunny conditions, which tend to make oak leaves more deeply lobed and more coriaceous than shaded leaves.

**White oaks with lobed leaves:**

- *Q. margarettae* – Often forms dense clonal, stoloniferous patches in frequent fire conditions. Tends to retain standard leaf characteristics.
- *Q. stellata* – Less prone to form clonal patches. Sprout leaves often very large, with exaggerated lobing.

**Red oaks normally with deeply lobed leaves:**

- *Q. laevis* – Not clonal. Vigorous sprouter, leaves more deeply lobed than any other fire red oak. Small sprouts often have vertical leaf orientation characteristic of adults, though vigorous fire sprouts sometimes have more normally disposed leaves. Sprout leaves sometimes very large, with very long, curling lobes.
- *Q. falcata* – Not clonal. Sprout leaves generally less lobed than typical adult leaves, more like forma *triloba*, but larger and coarser in texture, difficult to distinguish in shape from *Q. marilandica* var. *marilandica* and *Q. velutina*. See pubescence differences in main key.
- *Q. velutina* – Not clonal. Leaves variable, sometimes minimally lobed and closely resembling *Q. marilandica* var. *marilandica* and *Q. falcata*. See pubescence differences in main key.

**Red oaks normally with unlobed leaves:**

- *Q. marilandica* var. *marilandica* – Sprout leaves sometimes coarsely (though never deeply) lobed. Texture often very coriaceous, shiny, and very stiff. See pubescence characters in main key.
- *Q. nigra* – Not very typically in fire-prone situations, but sometimes so. Young saplings, as well as fire sprouts, often with wildly different leaves than the typical adult form, frequently deeply lobed (for excellent illustrations showing variability in leaf shapes, see p. 329 of Godfrey, 1988 and pp. 51-52 of Godfrey & Wooten, 1981). Leaves always smaller and more glabrous than those of other fire oaks (except *Q. hemisphaerica*).
- *Q. incana* – Generally not strongly clonal and stoloniferous even in frequently burned situations. Fire sprouts and vigorous shoots more prone to lobing than adult trees. Even fire shoots, though, usually only with one to several leaves, and the characteristic bluish-green characteristic holds. See comments above on *Q. elliottii*.  

---

**References:**

FAGACEAE

Quercus elliottii – Strongly clonal via a stoloniferous "runner", never tree-like. Leaves never lobed, even on fire sprouts, though fire sprout leaves can be larger (to 15 cm long and 5 cm wide). Very difficult to tell from fire sprouts or seedlings of *Q. incana*, best separated by leaf pubescence (white in *Q. elliottii*, gray in *Q. incana*), margin (slightly revolute in *Q. elliottii*, flat in *Q. incana*), leaf vernation (planate in *Q. incana*, rolled in *Q. elliottii*), and acorn maturation (1 year in *Q. elliottii*, with acorns often on small plants, 2 years in *Q. incana*, with small plants rarely producing acorns).

*Q. hemisphaerica* – Not clonal. Leaves of vigorous shoots and fire sprouts often shallowly lobed, the lobing usually fairly neat and regular, triangular-ascending, and with bristle tips.

Live oaks:

*Q. geminata* – Sometimes clonal. Leaves, even of sprouts, not normally with lobes or teeth.

*Q. virginiana* – Sometimes clonal. Leaves of vigorous summer shoots (but apparently not spring shoots) often coarsely toothed, very similar to similar leaves of *Q. hemisphaerica*, but lacking bristle tips (instead the translucent margin with a darker, thickened callus at the tip of the tooth).

*Q. minima* – Always clonal. Leaves often with teeth or lobes.

Some oaks with ambiguous leaves are keyed in both Key A and Key D or in both Key B and Key C. The leaves of juvenile (seedling or sapling) branches, fire-sprout shoots, or other vigorous shoots (resulting from similar stimuli such as insect damage) are often much different than typical leaves and are not accounted for in these keys (see discussion at end of generic treatment). Hybrids are frequently encountered; they, too, are not keyed here, but can usually be identified (with difficulty) by their intermediate morphology and by parental context. Trichome types are useful in making and confirming identifications of oaks, since certain types are restricted to various groups of species. Hand lenses of 10× or 20× can be useful, but a dissecting scope with 20× to 40× dissecting microscope is far preferable. See Hardin (1992, 1976, 1979), and Thomson & Mohlenbrock (1979).

1 Most of the leaves on a relatively mature tree entire and unlobed (some species frequently with some leaves on a tree, especially those on young or vigorous growth, that are toothed or shallowly lobed, the teeth or lobes generally few and irregular in size or location); [primarily either "laurel oaks" of section Lobatae or "live oaks" of section Quercus] ............................................................................................................................. Key A

2 Venation of the leaves nearly and evenly pinnate, 3-17 (or more) main lateral veins on each side distinctly parallel to each other, each ending in a tooth or shallow, crenate lobe extending < ¼ of the way to the midrib; ["chestnut oaks" of sections Quercus and Cerris] ......... Key B

3 Twigs of the year glabrous or sparsely pubescent; [shrubs, scrubby small trees, or large trees of various habitats].

4 Leaves grayish beneath; [section Lobatae] ............................................................................................................ Q. marilandica var. marilandica

5 Leaf blade planar (the margins sometimes revolute); lower leaf surface glabrous or pubescent and also with tufts of hairs in the vein axils; [collectively more widespread in habitat and distribution].

6 Leaves deciduous, (including the petiole) usually > 5.5 cm long (rarely smaller) and usually 3-5 cm wide; lower leaf surface usually with tufts of hairs in the main vein axils beneath; leaf blades often lobed.

7 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward] ..................................................... Q. arkansana

8 Leaves (at maturity) glabrous or at most sparsely pubescent on the surface below, though often with tufts of hairs in the main vein axils.

9 Twigs of the year densely and finely hairy, obscuring the surface; leaves (at maturity) sparsely pubescent beneath; [scrubby trees of sandhills from se. SC southward]; [section Quercus] ............................................................................................................ Q. chapmanii

10 Leaves predominantly lanceolate, mostly 6-12 cm long and 0.7-2 cm wide, most of them 5-8× as long as wide, the apex acute; mature leaves with tufts of hairs in the vein axils below, and sometimes also some pubescence on the blade surface near the midrib; blades never with lobes or teeth; leaves deciduous in autumn; young leaves bronze red, emerging tightly rolled lengthwise and appearing linear; [trees of bottomlands and upland depression swamps, mesic uplands, and also weedy and frequent in disturbed successional habitats] .......................................................................................................................... Q. phellos

**Key A – Leaves (most of them) entire and unlobed (Laurel Oaks and Live Oaks)**

1 Leaves broadly obovate or spatulate, 1.2-2.5 (-3)× as long as wide.

2 Leaves 10-30 cm long, with rounded, subcordate, truncate, or oblique bases; lower leaf surfaces thinly to densely pubescent with tawny to orange glandlike hairs; [section Lobatae] ............................................................................................................. Q. incana

3 Twigs of the current year densely and finely hairy, obscuring the surface; [scrubby trees of sandhills from se. SC southward]; [section Quercus] ............................................................................................................. Q. chapmanii

4 Leaves bright green or orange-scurfy beneath; [section Lobatae] ................................................................. Q. sinuata var. sinuata

5 Leaf blade strongly convex; lower leaf surface orange-scurfy; [of sandhills and scrub from n. FL southward] ..................................................... Q. inopina

6 Leaves deciduous, (including the petiole) usually > 5.5 cm long (rarely smaller) and usually 3-5 cm wide; lower leaf surface usually with tufts of hairs in the main vein axils beneath; leaf blades often lobed.

7 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward] ..................................................... Q. arkansana

8 Leaves (at maturity) glabrous or at most sparsely pubescent on the surface below, though often with tufts of hairs in the main vein axils.

9 Twigs of the year densely and finely hairy, obscuring the surface; leaves (at maturity) sparsely pubescent beneath; [scrubby trees of sandhills from se. SC southward]; [section Quercus] ............................................................................................................ Q. chapmanii

10 Leaves predominantly lanceolate, mostly 6-12 cm long and 0.7-2 cm wide, most of them 5-8× as long as wide, the apex acute; mature leaves with tufts of hairs in the vein axils below, and sometimes also some pubescence on the blade surface near the midrib; blades never with lobes or teeth; leaves deciduous in autumn; young leaves bronze red, emerging tightly rolled lengthwise and appearing linear; [trees of bottomlands and upland depression swamps, mesic uplands, and also weedy and frequent in disturbed successional habitats] .......................................................................................................................... Q. phellos
10 Leaves predominantly oblong-elliptic, ovate, or rhombic, mostly 2.5-10 cm long and 1.5-4 cm wide, most of them 2-5× as long as wide, the apex acute, obtuse, or rounded; mature leaves with or without tufts of hairs in the vein axils below, lacking pubescence on the blade surface; blades sometimes with 1-5 lateral lobes or teeth; leaves persisting until spring, or tardily and irregularly deciduous in winter; young leaves red, yellow, or green, not emerging tightly rolled lengthwise; [trees primarily either of swamp forests, maritime forests, or sandhills, not typically weedy].

11 Mature leaves entirely glabrous below; leaves mostly with acute apices and bristle tips (rarely a few rounded), mostly 2.5-8 cm long and 1-2 (-3) cm wide, the upper surface shiny, the vein network not readily visible when backlit; leaves evergreen (persisting until spring); petiole 0.5-2 mm long; leaves of vigorous growth often with dentate lobes; [trees of dry sandy habitats, such as sandhills and maritime forests].

11 Mature leaves with tufts of stellate trichomes in the vein axils; leaves mostly with rounded apices (rarely a few acute and then bristle-tipped), mostly 5-10 cm long and (1.8-) 2-4 cm wide, the upper surface dull, the vein network readily visible when backlit; leaves tardily deciduous; petiole 2-6 mm long; leaves of vigorous growth rarely lobed, and then not dentate; [trees of moist habitats, such as floodplain forests].

8 Leaves (at maturity) persistently and densely pubescent on the surface below, the pubescence in some species so dense and tight as to be difficult to perceive without at least 10× magnification.

12 Leaves bristle-tipped (sometimes the bristle fallen or broken off, but leaving a truncate scar), deciduous in autumn; multi-armed trichomes of the rosulate or multiradiate types, many of the arms ascending and erect (never with the stellate or fused-stellate trichomes characteristic of the live oaks); acorns maturing in 2 years (immature acorns present through the winter on fruiting trees); [section Lobatae].

13 Leaves (including petiole) mostly 10-17 cm long, 3.5-7 cm wide; lower leaf surface (at maturity) sparsely to moderately densely pubescent with soft hairs; leaves lustrous dark-green above; [trees of the Mountains, Piedmont, and rarely Coastal Plain].

14 Leaves (including petiole) mostly 4-11 cm long, 0.5-3.0 cm wide; lower leaf surface densely covered with soft hairs; leaves lustrous dark-green or bluish-green above; [stoloniferous shrubs and small to medium trees of the Coastal Plain].

15 Leaves deciduous in autumn; bark gray, resembling Q. alba; [trees of bottomlands and upland clay flats of GA and SC].

15 Leaves evergreen (overwintering, falling with the expansion of new leaves in the spring) or deciduous (in Q. oglethorpensis); multi-armed trichomes of the fused-stellate and stellate types, the arms parallel to the leaf surface, radiating from a well-developed disc that appears as a white eye or dot at 20-40× magnification (or rosulate or multiradiate in Q. oglethorpensis); acorns maturing in 1 year (immature acorns not present through the winter, unless aborted); [section Quercus].

16 Plant a stoloniferous shrub, 1 m tall (or to 2 m in fire-suppressed pinelands) and producing acorns at that size.

16 Plant a small to large tree, not producing acorns until >2 m tall.

17 Leaf blades with the margins strongly revolute, and also the sides of the blades generally rolled downward and obscuring part of the lower surface, the leaf appearing boatlike (the depth of the "boat" often approaching the width of the leaf); midvein and major lateral veins impressed on the upper surface and raised on the lower surface (the lower surface therefore appearing rugose); buds dark brown; cup scales gray-tipped; pubescence of the lower surface stellate, both appressed and erect, the individual stellae readily visible at 20× magnification (sometimes at 10× magnification); acorns (1-) 2 (-6) per stalk; [typically a small tree of dry sands].

17 Leaf blades flat, or the margins slightly to strongly revolute, the sides of the blade sometimes rolled downward, usually not obscuring part of the lower surface, the leaf not boatlike (the leaf much wider than deep); midvein and major lateral veins not impressed (or very slightly so) on the upper surface and only very slightly, if at all, raised on the lower surface (the lower surface therefore not appearing notably rugose); buds red-brown; cup scales red-tipped; pubescence of the lower surface stellate, all of it tightly appressed, the individual stellae readily visible only at 30× magnification (sometimes barely distinguishable at 20× magnification); acorns 1-2 per stalk; [typically a salt-pruned shrub to large tree of dunes, estuarine shorelines, and southward of upland flats and slopes].

Key B – Leaves with even crenations or teeth (Chestnut Oaks)

1 Scales of the acorn cup prolonged and long tapered; lateral veins terminating in a well-developed bristle; [species planted, rarely escaped]; [section Cerris].

2 Acorns on peduncles (2-)4-7 cm long; acorns 1.5-2.5 cm long; veins ending in crenations usually 6-10 on each side of leaf. [typically a salt-pruned shrub to large tree of dunes, estuarine shorelines, and southward of upland flats and slopes].

3 Leaves mostly obovate, with rounded teeth (crenations), the teeth sometimes with a minute mucro; hairs of the leaf undersurface clustered in sessile, stellate-appearing clusters of 2-8 hairs; acorns 2.5-3.5 cm long; large trees.

4 Hairs of the leaf undersurface in clusters with a diameter of 0.15-0.5 mm, dense to sparse; bark of mature trees light gray, loose, breaking into plates or scales. [trees primarily either of swamp forests, maritime forests, or sandhills, not typically weedy].

511
5 Medium to large tree; veins ending in teeth usually 7-13 on each side of the leaf; leaves 8-20 cm long and 4-10 cm wide; [of dry to moist calcareous woodlands and forests] ................................................................. Q. muenchbergii
5 Stoloniferous shrub to 5 m tall; veins ending in teeth usually 3-8 (-9) on each side of the leaf; leaves 4-10 (-14) cm long and 2-6 (-8) cm wide; [of dry, often sandy and acid woodlands] ................................................................. Q. prinoides

**Key C – Leaves with lobes not bristle-tipped (White Oaks)**

1 Lower surfaces of mature leaves glabrous.
2 Leaf lobes with acute apices; sinuses often both broad and "flat-bottomed" (with portions parallel to the midrib); acorn cup covering 2/3 to 3/4 of acorn ................................................................. Q. lyrata
2 Leaf lobes with obtuse apices; sinuses narrow (often notch-like), narrowly to broadly rounded or triangular (lacking portions parallel to the midrib); acorn cup covering 1/4 to 1/2 of acorn.
3 Leaves mostly 4-10 (-17) cm long, 2-5 (-9) cm wide, with 1-5 shallow lobes or undulations, extending 1/8 to 1/2 of the way to the midrib; acorn cup flat at the base, covering < ¼ of the acorn ................................................................. Q. sinuata var. sinuata
3 Leaves mostly 7-20 cm long, 3-10 cm wide, with 3-11 leaves, extending 1/4 to 5/6 of the way to the midrib (if the lobing < ¼ of the way to the midrib, then the acorn cup rounded at the base and covering 1/4 to 1/2 of the acorn).
4 Leaf base deeply cordate; [alien, sometimes planted and persistent] ................................................................. [Q. robur]
4 Leaf base cuneate; [native]
5 Leaves with 7-11 lobes (the sinuses usually deep, those of the larger leaves usually about 2/3 to 5/6 of the way to the midrib), 10-20 cm long, 5-10 cm wide; terminal bud rounded or globose; basal scales of acorn cup thickened, the thickening giving the cup a knobby texture ................................................................. Q. alba
5 Leaves with 3-7 lobes (the sinuses usually shallow, those of the larger leaves usually ranging from 1/4 to 1/2 of the way to the midrib), 7-15 cm long, 3-8 cm wide; basal scales of the acorn cup thin, appressed, the cup having a rough but not knobby texture ................................................................. Q. austrina
1 Lower surfaces of mature leaves pubescent, the pubescence varying from dense to sparse (sometimes minute and requiring 10+ magnification to be readily visible).
6 Lower surfaces of mature leaves whitish to pale green, with a mixture of minute, sessile, stellate hairs with horizontal tips and longer stellate hairs with erect ascending tips; leaves shallowly lobed (if so, the lobes 9-19) to deeply lobed (if so, the lobes with acute apices), the sinuses extending 1/4 to 4/5 of the way to the midrib.
7 Leaves mostly shallowly lobed at the base, the sinuses extending 1/4 to 1/2 of the way to midrib, grading into mere crenations toward the tip of the leaf; the total number of lobes/crenations usually 9-19; acorns borne on peduncles 2-10 cm long; acorn cup covering 1/3 to 1/2 of acorn, the upper scales with long-acuminate apices ................................................................. Q. bicolor
7 Leaves mostly deeply lobed throughout the length of the leaf, the sinuses extending 1/2 to 4/5 of the way to the midrib, the total number of lobes 3-13; acorns sessile or borne on peduncles up to 1 cm long; acorn cup covering 1/3 to 3/4 of acorn, the upper scales with acute, long-acuminate, to long-awned apices.
8 Upper scales of the acorn cups thin and acute; acorn cup covering ½ to 3/4 of the acorn; [swamps in the Coastal Plain and lower Piedmont of GA, NC, SC, and VA] ................................................................. Q. lyrata
8 Upper scales of the acorn cups long-attenuate into nearly terete awns; acorn cup covering 1/3 to 1/2 of the acorn; [Mountains of VA] .................................................................................................................. Q. macrocarpa var. macrocarpa
6 Lower surfaces of mature leaves gray, green, pale green, or yellowish, glabrescent or densely pubescent, the hairs few-branched and erect; leaves mostly relatively deeply and obtusely lobed, rarely shallowly lobed (if so, the lobes 3-7), the sinuses extending 1/2 to 4/5 of the way to the midrib, the total number of lobes 3-7; acorns sessile or nearly so.
9 Leaf lobes with acute apices; acorn cup covering 2/3 to 3/4 of acorn ................................................................. Q. lyrata
9 Leaf lobes with obtuse to rounded apices; acorn cup covering 1/3 to 1/2 of acorn.
10 Woody twigs of the season glabrous or with scattered, deciduous 2-forked hairs; petioles of mature leaves 3-10 (-15) mm long; leaf blades (2.5-) 4-8 (-13.5) cm long, irregularly and often rather shallowly 3-5 (-7) lobed; the overall form of the leaf rarely cruciform; largest lateral lobes (or even below it), the lobes usually not sublobed, tapering from base to tip; [xeric sandy sites in the Coastal Plain from se. VA southward] ................................................................. Q. margarettae
10 Woody twigs of the season densely and persistently stellate-pubescent, especially toward the tip of the twig; petioles of mature leaves 15-20 mm long (Q. stellata) or 3-10 (-15) mm long (Q. boyntonii and Q. similis); leaf blades (5-) 7.5-15 (-20) cm long, usually 5-lobed, the overall form of the leaf typically cruciform (Q. stellata) or not (Q. boyntonii and Q. similis); largest lateral lobes of the leaves usually above the midpoint of the blade, these lobes often sublobed or squarish in shape, usually wider near their tips than at their bases (Q. stellata) or not sublobed, tapering from base to tip (Q. boyntonii and Q. similis); [collectively widespread in our area]
11 Leaves usually cruciform, the largest lateral lobes often sublobed or squarish in shape, usually wider near their tips than at their bases, and borne at right angles to the midrib; [usually of dry to dry-mesic upland situations, widespread in our area] ................................................................. Q. stellata
11 Leaves not cruciform, the largest lateral lobes usually not sublobed, tapering from base to tip, and borne at ascending angles relative to the midrib; [of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward in our area (Q. similis) or localized on sandstone in nc. AL (Q. boyntonii)].
12 Single-trunked large trees; [usually of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward in our area] ................................................................. Q. similis

**Key D – Leaves with lobes or teeth bristle-tipped (Red Oaks)**

1 Leaves shallowly 3-lobed near the broad apex (some leaves of sprout or juvenile shoots may be more lobed).
2 Leaf blades 5-15 cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils (or pubescent across the surface in Q. arkansana).
**FAGACEAE**

3 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward] .............................................................. Q. arkansana

3 Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axes; [widespread in our area] ................................................................................................. Q. nigra

2 Leaf blades 10-30 cm long; lower leaf surfaces pubescent (and often also with denser tufts of hairs in the vein axes)

4 Petioles short and stout, 5-15 mm long; lower leaf surfaces thinly to densely pubescent with a mixture of tawny or orange glandlike hairs and stellate hairs whose structure is easily visible at 10× magnification .................................................................................. Q. marilandica var. marilandica

4 Petioles long and slender, (14-) 20-50 mm long; lower leaf surfaces densely puberulent with tawny stellate hairs whose structure is barely visible at 10× magnification .................................................................................. Q. falcata

1 Leaves shallowly to deeply 5-12-lobed (some of the leaves of Q. georgiana only 3-lobed), the lobes primarily lateral.

5 Mature leaves pubescent beneath on the surface with stellate hairs.

5 Leaves 5-12 (-12) cm long, 5-lobed; shrub or small tree; [w. NC northward] .............................................................. Q. ilicifolia

6 Leaves (8-) 10-20 cm long, 5-12-lobed; small to large trees; collectively widespread in our area.

7 Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; leaves all deeply lobed, some of the sinuses extending > 4/5 of the way to the midrib; pubescence of the lower leaf surface greenish yellow, matted, and glandlike, usually sloughing off by late in the year .............................................................. Q. laevis

7 Petioles 2-5 cm long, not twisted so that the blade is oriented in a vertical plane; leaves shallowly to deeply lobed, some of the leaves on a tree generally shallowly lobed, none of the sinuses extending > 2/3 of the way to the midrib; pubescence of the lower leaf surface tawny or gray, stellate, not glandlike, persistent or sloughing off by late in the year.

8 Acorns 12-20 mm long, in a cup 15-25 mm across and 10-12 mm deep; mature leaves loosely and rather coarsely pubescent (the stellate hairs conspicuous and readily distinguishable at 10× magnification), often becoming nearly or entirely glabrous by late in the year (except for tufts of hairs in the vein axes); terminal bud 4-angled, 7-10 mm long, densely gray-tomentose ......... Q. velutina

8 Acorns 10-15 mm long, in a cup 12-14 mm across and 4-5 mm deep; mature leaves densely and finely pubescent (the stellate hairs minute and scarcely distinguishable at 10× magnification); the pubescence permanent; terminal bud only obscurely angled (if at all), 5-8 mm long, brown-puberulent.

9 Base of blades of sun-leaves typically rounded, thus forming a U-shape (some leaves cuneate, angled, or oblique); terminal lobe of leaves generally long-attenuated, narrow (its sides nearly parallel for much of its length), and curved to one side

9 Base of blades of sun-leaves typically cuneate or angled, thus forming a V-shape (some leaves somewhat U-shaped or oblique); terminal lobe of leaves generally short, broadly triangular (its sides normally tapering toward the tip for most of their length), not strongly curved to one side; leaves with 5-9 well-developed lobes, these generally rather uniform in size, shape, spacing, and orientation; pubescence of leaf surface gray .............................................................. Q. pagoda

5 Mature leaves glabrous beneath on the surface, with tufts of hairs in the main vein axes between the lateral lobes, the lobes usually lateral.

10 Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup inflexed, thus the cup appearing to have a broadly rounded rim .............................................................. Q. laevis

10 Petioles 2.5-7 cm long, not twisted so that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup not inflexed, thus the cup appearing to have a sharp rim appressed against the acorn.

11 Terminal buds 4-angled, 7-10 mm long, the bud scales densely gray-tomentose ........................................................................ Q. velutina

11 Terminal buds not 4-angled, 3-5 (-7) mm long, the bud scales glabrous or with ciliate margins.

12 Leaves relatively shallowly lobed, the sinuses extending up to 2/3 of the way to the midrib; upper leaf surface dull, not lustrous.

13 Acorn cup covering about 1/4 of acorn; leaf sinuses extending about ¼ of the way to the midrib; bark of mature trees dark gray to black; [widespread in our area, at low to medium elevations] .............................................................. Q. rubra var. rubra

13 Acorn cup covering about 1/3 of acorn; leaf sinuses extending about 1/3 of the way to the midrib; bark of mature trees medium gray; [of the Mountains, mostly at 1000 m and above] .............................................................. Q. rubra var. ambigua

12 Leaves relatively deeply lobed, the sinuses extending 2/3 to 9/10 of the way to the midrib; upper leaf surface lustrous.

14 Larger lateral lobes of most leaves with 1 bristle per lobe (<2 on some lobes); total bristle tips < 10/leaf ........ Q. georgiana

14 Larger lateral lobes of most leaves with 2 or more bristles per lobe; total bristle tips 9-50/leaf ........ Q. rubra

15 Mature leaves mostly 7-12 cm long, 5-11 cm wide (averaging about 9 cm long and 8 cm wide), with 5-7 lobes; acorns (8-) 10-13 (-15) mm long; acorn cup nearly flat at base, covering about ¼ of the acorn .............................................................. Q. palustris

15 Mature leaves mostly 10-20 cm long, 8-15 cm wide (averaging about 12-15 cm long and 10-12 cm wide), with (5-) 7-11 lobes; acorns (12-) 15-25 (-37) mm long; acorn cup nearly flat, turbinate or rounded, covering ½-¾ of the acorn.

16 Acorn cup nearly flat at base, covering about ½-1/3 of the acorn; acorn 13-37 mm long, lacking concentric grooves near the tip; upper surface of leaves dark green .............................................................. Q. shumardii

16 Acorn cup turbinate, covering about 1/2 of the acorn; acorn (12-) 15-26 mm long, with or without 1-3 concentric grooves near the tip; upper surface of leaves bright green.

17 Acorn (12-) 15-20 mm long, with 1-3 concentric grooves near the tip; bud silvery or tawny pubescent towards the tip; upper surface of leaves bright green; lobes 5-9 per leaf; total bristle tips 18-50/leaf; [usually of dry uplands, widespread in our area] .............................................................................................. Q. oococinea

17 Acorn 15-26 mm long, without concentric grooves near the tip; bud glabrous, or with the scales merely ciliate-margined; lobes 7-11 per leaf; total bristle tips 9-24/leaf; [bottomlands, from c. TN and AL westward] ................................................. Q. texana

* **Quercus acutissima** Carruthers, Sawtooth Oak. Commonly cultivated as a suburban street tree and also widely planted in "wildlife food plots", rarely naturalizing; native of Japan. This species has been a popular recommendation for "wildlife plantings" in the recent past, and entire stands can be encountered in relatively remote areas, planted by federal and state land management agencies; why "wildlife" species in our area need more oak trees is somewhat mystifying! See Whittimore (2004) for additional information. Spreading from plantings in Knoxville, TN (D. Estes, pers. comm. 2007). [= K; ? Q. acutissima ssp. acutissima]

**Quercus alba** Linnaeus, White Oak. Mesic to xeric forests. April; September-November (of the same year). ME west to MN, south to Panhandle FL and e. TX. Historically, one of the most valuable timber trees of eastern North America. Q. alba is
probably the most abundant native plant in our area, and in eastern North America, based on biomass, leaf area, and ubiquity. Hardin (1975) discusses introgression between *Q. alba* and many other species of *Quercus* subgenus *Quercus*. [= RAB, C, F, FNA, G, K, W, WH, WV; < *Q. alba* – S (also see *Q. australis*)]

**Quercus arkansana** Sargent, Arkansas Oak. Dry bluffs. Sw. and wc. GA and Panhandle FL west in a fragmented distribution to sw. AR and e. TX. [= FNA, K, S, WH; > *Q. caput-rivuli* W.W. Ashe]

**Quercus australis** Small, Bluff Oak. River bluffs, mesic hammocks, dry hammocks, natural levees of brownwater rivers, over mafic rocks, on shelf or calcareous sediments. April; October (of the same year). Essentially a Southeastern Coastal Plain endemic, ranging from sc. NC south to n. FL and west to MS, nowhere common. [= RAB, FNA, K, WH; < *Q. alba* – S (apparently)]

**Quercus bicolor** Willdenow, Swamp White Oak. Upland depression swamp forests over mafic rocks such as gabbro or diabase, bottomland swamps with calcareous sediments. April, September (of the same year). Widespread in ne. North America, south to NC, SC (Nelson 1993), TN, n. AL, and MO. [= RAB, C, F, FNA, G, GW, K, W, S, W]

**Quercus boyntonii** Beadle, Boynton Oak. Dry forests. Ne. AL and (possibly) TX. [= FNA, K, S; = *Q. stellata* Wangenheim var. boyntonii (Beadle) Sargent]

**Quercus chapmannii** Sargent, Chapman Oak. Dry pinelands, sandhills, scrub. February-March; September-November (of the same year). Centered in the Appalachians, from s. ME south to c. AL, but ranging west to MS, ne. AR, s. IL, and s. MI. [= RAB, C, F, FNA, G, S, W, WV; > *Q. coccinea* var. coccinea – K; > *Q. coccinea* var. tuberculata Sargent – K]

**Quercus elliotii** Wilbur, Running Oak. Pine flatwoods, especially on loamy soils in the Middle Coastal Plain. March-April; September (of the first year). A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to s. MS. Wilbur (2002b) and Wilbur & Ho (2008) discuss the reasons for rejecting the traditional use of *Q. pumila* for this species; Walter’s diagnosis states that *Q. pumila* has leaves that are glabrous and glaucous below, ruling out application to this species. [= WH; = *Q. pumila* Walter – RAB, FNA, K, S, Z, apparently misapplied]

**Quercus falcata** Michaux, Spanish Oak, Southern Red Oak. Upland forests, usually xeric. April, September-November (of the second year). Widespread in se. North America, north to e. OK, s. MO, s. IL, s. IN, s. OH, WV, se. PA, NJ, and reported (apparently without specimen documentation) from Long Island, NY. "*Q. triloba* Michaux", the form with the leaves only shallowly trilobed at the apex, causes much confusion. Though even medium-sized trees sometimes have leaves only of this form (rather than the typical form, deeply 5-7-lobed, the terminal lobe long-attenuate and falcate), it has no taxonomic merit. [= C, FNA, K, W, WH, WV; = *Q. falcata* var. falcata – RAB, G, GW; > *Q. falcata* var. falcata – F; > *Q. falcata* var. triloba (Michaux) Nuttall – F; = *Q. rubra* – S, misapplied; ? *Q. digitata* Sudworth; > *Q. triloba* Michaux]

**Quercus geminata** Small, Sand Live Oak. Xeric sandhills (northwards restricted to areas very near the coast). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. NC south to s. FL, and west to s. MS. The alleged occurrence of *Q. geminata* as far north as se. VA is apparently based on ambiguous specimens that probably are only *Q. virginiana* supports their recognition as separate species (Cavender-Bares & Pahlich 2009). *Q. geminata* flowers about 2-3 weeks later than *Q. virginiana* when growing in close proximity. [= C, FNA, GW, K, S, WH; < *Q. virginiana* – RAB; ? *Q. virginiana* var. maritima (Michaux) Sargent – F, misapplied]

**Quercus georgiana** M.A. Curtis, Georgia Oak. Dry slopes and bluffs, mainly over granite. April; September-October (of the second year). W. SC south and west through GA to c. AL. [= RAB, FNA, K, S]

**Quercus hemisphaerica** Bartram ex Willdenow, Sand Laurel Oak, Darlington Oak. Sandhills and other dry, sandy soils, an abundant component of maritime forests with *Q. virginiana*, and widely planted as a street tree in most parts of our region. March-April; September-November (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to s. TX, north uncommonly in the interior to nc. AL, n. MS, and s. AR. Often confused with *Q. laurifolia* (see the key for distinctions). *Q. hemisphaerica* is the semi-evergreen laurel oak planted widely as a street tree in southern cities, often
intermixed with the strictly deciduous *Q. phellos*. [= C, F, FNA, Z; < *Q. laurifolia* – RAB, WH; = *Q. laurifolia* – S, misapplied; > *Q. hemisphaerica* var. *hemisphaerica* – K; > *Q. hemisphaerica* var. *maritima* (Michaux) Muller – K]

**Quercus ilicifolia** Wangenheim, Bear Oak, Scrub Oak. Xeric soils in ridges in the Mountains and monadnocks in the upper Piedmont, other dry sites. Late April-June; August (of the second year). Primarily Appalachian: s. ME south to w. VA, w. NC, and e. KY. In NC this scrubby oak is rare and probably declining because of fire suppression (Barden 1985), though recent ice storms have opened the tree canopy at several of its NC sites. The occurrence of *Q. ilicifolia* in KY was confirmed at the Devil's Teatable, Floyd County (Clark et al. 1997). [= RAB, C, F, FNA, G, K, S, W, WV]

**Quercus imbricaria** Michaux, Shingle Oak. Rich soils of upper floodplains of rivers and creeks, often at the base of the slope into the upland, also in uplands, and in forests over diabase in the Piedmont of VA and n. NC. May; October (of the second year). Primarily midwestern, ranging from NJ, PA, n. OH, s. MI, n. IL, and c. IA, south to e. VA, nc. and w. NC, sc. TN, n. AL, and n. AR. [= RAB, C, F, FNA, G, K, S, W, WV, Z]

**Quercus incana** Bartram, Bluejack Oak. Sandhills, primarily in somewhat loamier textured, submesic soils, inland from the Coastal Plain on coarse sandy alluvium or upland ridges over quartzite or other acidic rocks. April; September-October (of the second year). Primarily a species of the Southeastern Coastal Plain, but rarely extending inland into the Piedmont (especially on coarse sandy alluvium): se. VA south to c. peninsular FL and west to e. TX, sw. AR, and se. OK. This oak is recognizable even at a distance by its bluish color. [= RAB, F, FNA, K, Z; = *Q. cineria* Michaux – C, G, S; ? *Q. humilis* Walter]

**Quercus inopina** W.W. Ashe, Florida Scrub Oak. Scrub, sandhills. FL peninsula, north to St. Johns County. [= FNA, K, WH] [add to synonymy]

**Quercus laevis** Walter, Turkey Oak. Sandhills, primarily in very xeric soils of deep sandy deposits (Carolina bay rims, old beach dunes, early Cenozoic deposits of the Sandhills Province), or inland from the Coastal Plain on dry ridges and slopes over quartzite or other acidic rock types. April; September-October (of the second year). Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. LA. The leaves turn an intense orange-red in the autumn (November). [= RAB, C, F, FNA, G, K, S, WH, Z; = *Q. catesbaei* Michaux]

**Quercus laurifolia** Michaux, Laurel Oak. Mesic to seasonally flooded soils of floodplains, also (rarely) mesic slopes and swamps in maritime forests. March-April; September-October (of the second year). A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX and s. AR. Sometimes confused with *Q. hemisphaerica*, but (in addition to the key characters above) *Q. laurifolia* has blunter leaf tips, flowers about 2 weeks earlier, and generally occupies much moister habitats. [= C, F, FNA, G, GW, K, Z; < *Q. laurifolia* – RAB, WH (also see *Q. hemisphaerica*); = *Q. obtusa* (Willdenow) Ashe – S]

**Quercus lyrata** Walter, Overcup Oak. Seasonally rather deeply and frequently flooded soils of floodplains of the Coastal Plain, less commonly in seasonally flooded swamps in Triassic basins in the lower Piedmont, and rarely in upland depression swamps of the Piedmont (developed over clays weathered from mafic rocks) and Coastal Plain. March-April; September-October (of the same year). Primarily a species of the Southeastern Coastal Plain: DE south to Panhandle FL, west to e. TX and se. OK, north in the inland to w. TN, s. IN, s. IL, and se. MO. Of our oaks, *Q. lyrata* tolerates the wettest habitats, both in terms of depth and duration of flooding. [= RAB, C, F, FNA, G, GW, K, S, WH]

**Quercus macrocarpa** Michaux var. *macrocarpa*, Bur Oak, Mossycup Oak. Rich bottomland forests. NB and QC west to s. MB, south to nw. VA, KY, TN, LA, and TX. Variation in this species needs additional study; *Q. macrocarpa* in our area is the typic variety or subspecies if other taxa are recognized. [= K; < *Q. macrocarpa* – C, F, FNA, G, GW, S, W, WV]

**Quercus margarettiae** Ashe ex Small, Sand Post Oak. Sandhills, typically in slightly loamy or clayey soils, not usual in the deepest and most xeric sands. April; September-October (of the same year). Primarily a species of the Southeastern Coastal Plain: se. VA south to FL and west to TX and se. OK. As stated by Fernald (1950), this oak was "chivalrously named [by W.W. Ashe] in 1903 for Margaret Henry Wilcox, who two years later became Mrs. Ashe." There has been controversy, however, over the spelling of the specific epithet; apparently it should be corrected to the genetive "ae" (K. Gandhi, pers. comm. 2007). [= *Q. margarettiae* – RAB, C, FNA, G, S, WH; = *Q. margarettiae* Ashe ex Small – K, orthographic variant; = *Q. stellata* var. *margarettiae* (Ashe ex Small) Sargent – F]
**Quercus marilandica** Muenchhausen var. *marilandica*, Blackjack Oak. Upland forests and woodlands, usually on periodically droughty soils, as over shrink-swell clays, sandstones, deep sands, and sands with clay lenses. April; September-November (of the second year). NY (Long Island), NJ, se. PA, w. VA, s. OH, s. IN, c. IL, s. IA, and se. NE south to s. GA, Panhandle FL, and sc. TX (west to the Prairie border). There are historical accounts of the existence of prairies or barrens in the vicinity of Charlotte in the late eighteenth century, known as the "the blackjack lands." These areas were described as open and prairie-like, until the early nineteenth century, when they became dominated by dense forests of blackjack oak. The previously open condition was almost certainly maintained by fire, perhaps set by the Waxhaw Indians. Blackjack oak has long been considered an indicator of poor soil, as in Guthrie (1820), who states in his discussion of NC, "the Black Jack land is generally poor, though it has sometimes a black appearance, it is wet and loose, and is avoided by farmers, as unproductive." Var. *marilandica* is the widespread taxon; *ashei* Sudworth [= *Q. neoashei* Bush] is worthy of recognition at the varietal level at least, and occurs from s. MO and s. KS south to c. AR, e. TX, and sc. TX, especially on the Edwards Plateau (Hunt 1990). [= FNA, K, Z; < *Q. marilandica* – RAB, C, F, G, S, W, WH, WV]

**Quercus michauxii** Nuttall, Basket Oak, Swamp Chestnut Oak. Bottomland forests, especially in fertile soils of upper terraces where flooded only infrequently and for short periods, upland depression ponds. April; September-October (of the same year). NJ south to n. peninsular FL and west to e. TX and se. OK, north in the interior to s. IL and s. IN. See discussion under *Q. montana* about the application of the name *Q. prinus* Linnaeus. [= RAB, C, F, G, S, W, WH; = *Q. prinus* Linnaeus – S, name rejected (possibly misapplied, and a source of confusion)]

**Quercus minima** (Sargent) Small, Dwarf Live Oak. Pine flatwoods, coastal fringe sandhills. April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. NC (New Hanover County) south to s. FL, west to s. MS. [= FNA, K, S, WH]

**Quercus montana** Willdenow, Rock Chestnut Oak. Xeric forests of ridges, slopes. April; September-November (of the same year). Primarily Appalachian but broadly distributed in e. North America: s. ME, NY, MI, s. UN, s. IL, and se. MO (Smith & Parker 2005) south to c. GA, c. AL, ne. MS (and LA?). The proper application of the Linnaean "*Q. prinus*" is controversial and unclear, having been debated and variously applied for well over a century. The name "*Q. prinus*" has nomenclatural priority over either "*Q. montana*" or "*Q. michauxii*", but it is not clear which species was intended; Whittenmore & Nixon (2005) proposed its formal rejection and the proposal was formally and unanimously accepted (Brummitt 2007). [= FNA, S, W; = *Q. prinus* Linnaeus – RAB, C, F, G, K, WV, name rejected (probably misapplied, and a source of confusion)]

**Quercus muehlenbergii** Engelmann, Yellow Oak, Chinquapin Oak. Slopes and bluffs, on soils derived from calcareous or mafic rocks. April; October-November (of the same year). S. New England and ON west to WI, se. MN, and IA, south to nw. FL, TX, and n. Mexico. The similar *Q. montana* sometimes has a few leaves with somewhat sharply lobed leaves, but these are minutely mucronate and lack the well-developed callus of *Q. muehlenbergii*. Additionally, *Q. muehlenbergii* has a flaky, light gray bark, very different from the dark gray, deep furrowed bark of *Q. montana*. [= RAB, C, F, K, WH, WV; = *Q. muehlenbergii* – FNA, S, W, orthographic variant; = *Q. prinoides* Willdenow var. *acuminata* (Michaux) Gleason – G]

**Quercus myrtifolia** Willdenow, Myrtle Oak. Dry pinelands. February-March; September (of the second year). A Southeastern Coastal Plain endemic: sc. SC south to s. FL, west to s. MS. [= FNA, K, S, WH, Z]

**Quercus nigra** Linnaeus, Water Oak, Paddle Oak. Bottomland forests, especially on levees or second terraces where flooded infrequently and for short periods, less commonly on mesic slopes. April; September-November (of the second year). Primarily a species of the Southeastern Coastal Plain: s. NJ south to s. FL and west to e. TX and se. OK, north in the interior to se. TN, c. TN, w. and sc. KY (Clark et al. 2005), se. MO, and e. OK. Seedlings and fire sprouts of this species are highly variable; see discussion at end of generic treatment. [= RAB, C, FNA, G, GW, K, S, W, WH, Z; > *Q. nigra* var. *nigra* – F; > *Q. nigra* var. *heterophylla* (Aiton) Ashe – F; = *Q. aquatica* Walter]

**Quercus oglethorpensis** Duncan, Oglethorpe Oak. Bottomland forests, upland oak flats over clays (Iredell and Enon soils). April; September-October (of the same year). Widely scattered from w. SC, to adjacent e. GA, nw. AL (Sorrie pers. comm. 2002), MS, and LA. [= RAB, FNA, GW, K]

**Quercus pagoda** Rafinesque, Cherrybark Oak, Swamp Spanish Oak. Bottomland forests, especially on second terraces, also mesic upland sites. April; September-November (of the second year). A Southeastern Coastal Plain endemic: e. and e. VA south to nw. FL and west to se. TX and north in the interior to e. TN, s. IL, and s. IN. [= C, FNA, K, S, WH; = *Q. falcata* var. *pagodifolia* Elliott – RAB, F, G, GW]
Quercus palustris Muenchhausen, Pin Oak. Swamps and bottomlands, especially the broader swamps developed in the sedimentary rocks of Triassic basins of the lower Piedmont, isolated upland sag ponds, also widely planted as a street tree in towns and cities. March-April; October-November (of the second year). MA and NY west to se. IA and e. KS, south to e. NC, nw. GA, sc. TN, n. AR, and e. OK. [= RAB, C, F, FNA, G, GW, K, S, W, WV]

Quercus phellos Linnaeus, Willow Oak. Bottomland forests, especially on natural levees and second terraces, also in upland depression swamps developed on clay soils, weedy and successionional on slopes and upland sites following disturbance, and widely planted as a street tree in towns and cities. March-April; September-November (of the second year). Primarily a species of the Southeastern Coastal plain: NY (Long Island), s. NJ, and se. PA south to s. GA and Panhandle FL, west to e. TX and se. OK, north in the interior to e. TN, s. KY, w. KY, s. IL, and se. MO, and e. OK. [= RAB, C, F, FNA, G, GW, K, S, W, Z]

Quercus prinoides Willdenow, Dwarf Chinquapin Oak. Xeric uplands, especially on clay soils derived from mafic rocks, and probably in sites which naturally burned rather frequently. April; August-September (of the same year). FA and s. MI south to NC, OK, and TX. Fire suppression in the Piedmont states where this rare oak occurs has nearly or entirely extirpated it from much of our area. [= RAB, C, FNA, K, S, W; > Q. prinoides var. prinoides – F; > Q. prinoides var. rufescens Rehder – F; = Q. prinoides var. prinoides – G]

*Quercus rubra* Linnaeus, English Oak. Rarely cultivated in our area; sometimes persisting or escaping in ne. United States, south to at least s. PA (Rhoads & Klein 1993; Rhoads & Block 2007). [= FNA, K] [rejected; not mapped]

**Quercus rubra** Linnaeus var. ambiguus (A. Gray) Fernald, Gray Oak. Forests on ridges, slopes, and coves, mostly at over 1000 meters elevation. May; September-October (of the second year). Fairly widespread in ne. North America south to PA, and in the Appalachians to w. NC, nw. SC, and n. GA. This and var. *rubra* tend to intergrade and their distinction as even varieties may not be warranted. For discussion of the two varieties, see McDougall & Parks (1984) and Jensen (1977). [= K; = Q. rubra var. borealis (Michaux f.) Farwell – RAB, F, FNA, WV; < Q. rubra – C, W; = Q. borealis Michaux f. var. borealis – G; = Q. borealis – S]

Quercus shumardii Buckley, Shumard Oak. Moist and fertile soils of bottomlands and lower slopes, also in xeric sites over calcareous rocks (such as limestone). April; September-October (of the second year). Sc. PA, OH, s. MI, IN, s. IL, MO, and e. KS south to n. peninsular FL and TX. A number of varieties have been recognized in *Q. shumardii*, and the morphological and habitat variation needs additional study. Var. *schneckii* (Britton) Sargent is apparently more midwestern, but should be looked for in our area, especially on dry limestone slopes, its preferred habitat. It is allegedly distinguished by the acorn cups rounded to turbinate below (vs. flattened and saucer-shaped in var. *shumardii*). Hess & Stoyonoff (1998) tentatively concluded that no varieties should be recognized within *Q. shumardii*. *Q. acerifolia* (E.J. Palmer) Stoyonoff & W.J. Hess (*Q. shumardii* var. *acerifolia* Palmer) is an endemic of Magazine Mountain in n. AR and scattered sites in OK, it is best treated as a distinct species, though there has been much debate about its taxonomic status, with opinions ranging from full species to mere form (Smith 1988, Stoyonoff & Hess 1990, Johnson 1992, Johnson 1994, Hess & Stoyonoff 1998). [= RAB, C, S, W, WH; > Q. shumardii var. shumardii – F, FNA, G, K, WV; > Q. shumardii var. schneckii (Britton) Sargent – F, FNA, G, K, WV]

Quercus similis Ashe, Swamp Post Oak, Delta Oak. Calcareae stream flats. SC south to GA, west to e. TX. *Q. similis* resembles *Q. stellata*, differing in its less definitely cross-shaped leaves and its distinctly wetland habitat. [= FNA, K; = Q. stellata Wangenheim var. paludosa Sargent; = Q. ashei Sterret]

Quercus sinuata Walter var. *sinuata*, Bastard Oak. Alluvial and slope forests. April-May; September-November (of the same year). Se. SC south to FL Panhandle, west to TX. [= FNA, K; > Q. durandii Buckley – RAB, S; < Q. sinuata – WH]

Quercus stellata Wangenheim, Post Oak. Upland forests and woodlands, especially in clay or rocky soils and in fire communities. April; September-November (of the same year). Se. MA, s. NY, s. PA, s. OH, s. IN, s. IA, and e. KS south to n. peninsular FL and TX. In KS, OK, and TX, post oak is one of the trees that forms the Prairie boundary. There is no question of the distinctness of *Q. margarettae* from *Q. stellata*. See *Q. similis*. [= RAB, C, FNA, G, K, S, WH, WV; = Q. stellata var. stellata – F; = Q. villosa Walter]
**FAGACEAE**

*Quercus texana* Buckley, Nuttall Oak, Texas Red Oak. Floodplain swamps and bottomlands. AL, TN, w. KY (Clark et al. 2005), west to e. TX. [= FNA, K; = Q. nuttallii E.J. Palmer – F, GW; = *Q. shumardii* Buckley var. *texana* (Buckley) W.W. Ashe] {not yet keyed}

*Quercus velutina* Lamarck, Black Oak. Upland forests and woodlands, especially in fairly xeric and sandy soils. April; September-October (of the second year). ME west to MN and NE, south to Panhandle FL and TX. [= RAB, C, F, FNA, G, K, S, W, WH, WV]

*Quercus virginiana* P. Miller, Live Oak. Locally common to abundant in maritime forests and maritime scrub on barrier islands, more rarely inland (though regularly on the mainland from se. NC south, and extending substantially inland from s. SC south), sometimes in dry, fire-maintained habitats more usually occupied by *Q. geminata*, also planted (especially in the outer Coastal Plain). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. VA south to s. FL south), sometimes in dry, fire-maintained habitats more usually occupied by *Q. geminata*, also planted (especially in the outer Coastal Plain). April; September-November (of the same year). A Southeastern Coastal Plain endemic: se. VA south to s. FL

---

**158. MYRICACEAE** Blume 1829 (Bayberry Family) [in FAGALES]

1 Leaves oblong or linear-lanceolate, pinnatifid, stipulate; fruit in a bristly involucre formed by 8 bractlets ............................................ *Comptonia* 1 Leaves mostly obovate or oblanceolate, entire or toothed (especially apically), estipulate; fruit either exposed and densely waxy (*Morella*), or partially enclosed in 2 wing-like bractlets (*Myrica*). 

2 Fruit flattened, not waxy, partially enclosed in 2 wing-like bractlets; terminal buds lacking; aments inserted at the summit of the branchlets of the preceding year; [in our area, very rare and restricted to bogs in the Mountains] ........................................................................ *Myrica* 2 Fruit spherical, densely waxy, exposed (the 4-6 bractlets small and inconspicuous); terminal buds present; aments inserted on old wood mainly below the leaves; [in our area, common and in the Coastal Plain, Mountains, and Piedmont] ................................................... *Morella*

---

*Comptonia* L’Heritier ex Aiton 1789 (Sweet-fern)

*Comptonia peregrina* (Lam.) J.M. Coulter, Sweet-fern. In the mountains on xeric ridges at low to medium elevations, usually in fire-maintained habitats, also in xeric and fire-maintained habitats on monadnocks in the upper Piedmont and in dry, sandy sites in the lower Piedmont and fall-line sandhills. April; August-September. NB, ON and MN, south to se. and w. NC, w. SC, ne. GA, nc. TN, and IL. [= RAB, C, FNA, K, S, W, WV; > *Comptonia peregrina* var. *asplenifolia* (Linnaeus) Fernald – F, Y; > *Comptonia peregrina* var. *peregrina* – F, Y; > *Myrica asplenifolia* Linnaeus var. *asplenifolia* – G; > *Myrica asplenifolia* var. *tomentosa* (Chevallier) Gleason – G]

*Morella* Loureiro 1790 (Bayberry, Wax-myrtle, Candleberry)

Wilbur (1994) makes a compelling case for the recognition of three genera among eastern North American Myricaceae, and for application of the name *Myrica* to *Myrica gale*. The typification of the genus *Myrica* with *Myrica gale* Linnaeus has been confirmed (Brummitt 1999); thus, the familiar southeastern species placed by many authors in *Myrica* must take another name. Wilbur (1994) prefers to treat our species as subgenus *Cerothamnus* (Tidestrom) Wilbur of genus *Morella* Loureiro; subgenus *Morella* is restricted to e. Asia, the Philippines, and Malaysia, and differs in a number of ways from subgenus *Cerothamnus*, including its fleshy and succulent, rather than waxy and hard, berries. Small maintained *Cerothamnus* at the generic level. Wilbur’s inclusion of *Cerothamnus* in *Morella* may well be warranted (and is followed here), but I disagree with his provisional decision to include the taxon treated below as *Morella pumila* in *Cerothamnus cerifera*, and the taxon treated below as *Morella pensylvanica* in *Morella caroliniensis*, though their appropriate rank may be questioned. References: Bornstein in FNA (1997); Wilbur (1994)=Z; Wilbur (2002a); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

1 Fresh leaves odorless when crushed; staminate flowers with 6-10 stamens (or as few as 3 in distal flowers); leaves usually entire; [of s. GA south and west]; [subgenus *Cerothamnus*, series *Faya*] ........................................................................ *M. inodora*
Fresh leaves aromatic when crushed; staminate flowers with 3-5 (-7) stamens; leaves usually serrate, at least near the tip; [collectively widespread in our area]; [subgenus Cerothamnus, series Cerothamnus].

Leaves oblanceolate (generally narrowly so), most of them 0.5-1.5 cm wide, 4-6× as long as wide, evergreen; mature fruits 2.0-3.5 mm in diameter.

Medium shrub to small tree (usually 2-10 m tall), not stoloniferous; leaves of fertile branches 4-9 cm long, 8-20 mm wide; [of a wide range of wetland habitats, including wet Coastal Plain pinelands; also planted and naturalized in upland sites] ........................M. cerifera

Small shrub (usually < 1 m tall), strongly stoloniferous; leaves of fertile branches 1.5-4 cm long, 3-8 mm wide; [restricted to Coastal Plain pinelands (or areas formerly so)] ................................................................. M. pumila

Leaves elliptic to broadly oblanceolate, most of them 1.5-4 cm wide, 2-4× as long as wide, evergreen to deciduous; mature fruits 3.0-7.0 mm in diameter.

Leaves subcoriaceous and more or less evergreen, not revolute (or slightly so if sun-grown), the larger ones usually about 9 cm long and 3.5 cm wide, with punctate glands dense on the lower surface and nearly or entirely absent on the upper surface; fruits 3-4.5 mm in diameter, the fruit wall glabrous or sparsely glandular, the warty protuberances glandular; twigs densely hairy to rarely glabrous; older branches blackish; [of many bogggy habitats, widespread in our area] ..................................................... M. caroliniensis

Leaves coriaceous, tardily deciduous, often revolute, the larger ones about 6 cm long and 2 cm wide, with punctate glands fairly dense on both surfaces; fruits 4-6 (-7) mm in diameter, the fruit wall and warty protuberances densely hisrate when young; twigs glabrous to sparsely hairy; older branches whitish gray; [usually of dunes, from Dare County, NC northward] .............................................. M. pensylvanica

Morella caroliniensis (P. Miller) Small, Pocosin Bayberry, Evergreen Bayberry. Pocosins, wet savannas and pine flatwoods, sandhill seepage bogs, and other peaty or sandy peaty wetlands. April; August-October. Primarily limited to the Southeastern Coastal Plain, from NJ south to FL and west to TX and AR. [= K; = Myrica heterophylla Rafinesque – RAB, C, FNA, W, Y; = Myrica heterophylla var. heterophylla – F; = Myrica heterophylla var. curtissii (Chevalier) Fernald – F; = Myrica pensylvanica – G; = Cerothamnus caroliniensis – S (also see Morella pensylvanica); = Morella caroliniensis (P. Miller) Small – Z (also see Morella pensylvanica)]

Morella cerifera (Linnaeus) Small, Common Wax-myrtle, Southern Bayberry. Interdune swales (where often dominant), pocosins, brackish marshes, other wet to moist habitats, now also widely planted (including in the Piedmont) as an ornamental or landscaping shrub and preistent or naturalizing in suburban woodlands. April; August-October. Widespread in the Coastal Plain of Southeastern United States: NJ south to FL and west to TX. Our most common Morella, and also the largest, sometimes becoming a small tree, to at least 10 m tall and 20 cm DBH. See Morella pumila for a discussion of the controversial taxonomy of Morella cerifera and Morella pumila. [= Myrica cerifera Linnaeus var. cerifera – RAB, Y; = Myrica cerifera – C, FNA, GW (also see C. pumila); = Myrica cerifera – F, G; = Cerothamnus ceriferus (Linnaeus) Small – S; = Morella cerifera (Linnaeus) Small – K, Z (also see Morella pumila)]

Morella inodora (Bartram) Small, Odorless Bayberry. Acid wetlands, especially in wooded, acid, streamhead "bogs" and bayheads, often associated with Magnolia virginiana, Persea palustris, Cyrilla racemiflora, Cliftonia monophylla, and Woodwardia areolata. A Southeastern Coastal Plain endemic: se. GA west to s. MS. [= K, Z; = Myrica inodora Bartram – FNA, GW; Y; = Cerothamnus inodorus (Bartram) Small – S]

Morella pensylvanica (Mirbel) Kartesz, Northern Bayberry. Dunes, sometimes even on the foredune and stoloniferously colonizing the upper beach, more typically behind the foredune on secondary dunes and sandy flats, often growing intermixed with Morella cerifera, but able to occupy drier sites higher on the dunes, from VA north, also ranging inland in sandy situations. April; August-October. This species reaches its southern limit at Avon (Kinnakeet), Dare County, NC. On interdune flats, it often grows intermixed with Morella cerifera, but is readily distinguished (even at a distance) by its stoloniferous growth (appearing as dome-shaped clones 3-20 m in diameter), stout twigs, and tardily deciduous leaves. The twigs of this species are noticeably stouter than those of Morella cerifera; measured at 10 cm from the twig tips, they are (2-) 3.5 mm in diameter, those of Morella cerifera ca. 1.5-2.5 mm. [= K; = Myrica pensylvanica Loiseleur – RAB, C, F, FNA, GW, Y; = Myrica pensylvanica – G (also see Morella heterophylla); = Cerothamnus caroliniensis – S (also see Morella pensylvanica); = Morella caroliniensis (P. Miller) Small – Z; = Cerothamnus pensylvanicus (Mirbel) Moldenke]

Morella pumila (Michaux) Small, Dwarf Bayberry, Dwarf Wax-myrtle. Savannas, pine flatwoods, relatively moist to extremely dry sites in sandhills (under Quercus laevis and Q. geminata). April; August-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to LA (or TX). Some authors dismiss the distinction between this taxon and Morella cerifera as merely environmental, while others treat the two as distinct at the varietal or specific level. In our area at least, they appear to be genetically distinct. They often occur in close proximity (though their typical habitats differ, they can be seen side by side in wet spodosolic pine savannas, sometimes also intermixed with Morella caroliniensis), and maintain their distinctiveness. There are some observations that there is a phenologic difference, with Morella pumila peak flowering 3 weeks later than Morella cerifera (J. Townsend, pers. comm. 2002). Though the issue remains unresolved, the stoloniferous growth of Morella pumila is not merely a fire response; I here maintain the two as distinct, pending further research. [= Myrica cerifera Linnaeus var. pumila Michaux – RAB, Y; = Myrica cerifera – C, FNA, GW; = Myrica pusilla Rafinesque – F, G; = Cerothamnus pumilus (Michaux) Small – S; = Morella cerifera (Linnaeus) Small – K, Z]

Myrica gale Linnaeus, Sweet Gale. Peaty bogs. April; August-September. A circumboreal species, south in North America to NJ, PA, MI, MN, and OR, disjunct from PA and s. NJ to Henderson County, NC, where considered extirpated at one time, as a result of the destruction of the famous East Flat Rock Bog. This shrub has been relocated at a single site, where it is abundant in a small area (less than 0.25 hectare). [= C, FNA, G, GW, K, S, W, Y; = Gale palustris Chevalier – RAB; > Myrica gale var. gale – F]

159. JUGLANDACEAE A. Richard ex Kunth 1824 (Walnut Family) [in FAGALES]

A family of about 8 genera and 60 species, trees and shrubs, mostly temperate. References: Stone in FNA (1997); Manos & Stone (2001); Elias (1972); Stone in Kubitzki, Rohwer, & Bittrich (1993).

1 Nutlets 6-7 mm long, with 2 wings; leaves even-pinnate, the rachis usually winged .................................................................Pterocarya
1 Nuts > 15 mm long, unwinged; leaves odd-pinnate, the rachis unwinged.
2 Fruit with husk indehiscent into 4 valves; pith of twigs continuous; leaves with (3-) 5-17 (-19) leaflets, the largest usually the terminal or final 2 lateral; nut with shell smooth, ridged, or irregularly wrinkled (but not deeply furrowed); terminal buds with imbricate (overlapping) or valvate scales; [tribe Juglandaeae, subtribe Caryinae] .................................................................Carya y
2 Fruit with husk indehiscent; pith of twigs chambered (not always developing until autumn of the first year's growth); leaves with (7-) 11-19 (-23) leaflets, the largest usually halfway up the leaf; nut with shell deeply furrowed in a complex corrugated pattern; terminal buds with valvate; [tribe Juglandaeae, subtribe Juglanae] ..................................................................................Juglans

Carya Nuttall (Hickory)
(by A.S. Weakley & R.K. Peet)

A genus of about 18 species, trees, of e. North America (south into s. Mexico), and e. Asia. Carya in our area is separated into two sections, section Apocarya (C. aquatica, C. cordiformis, C. illinoenensis) and section Carya (C. caroliniae-septentrionalis, C. glabra, C. laciniosa, C. myristiciformis, C. ovalis, C. ovata, C. pallida, C. tomentosa). The southeastern United States is the center of diversity of Carya. Our four-state area includes 11 of 13 North American species (including the naturalized C. illinoenensis and lacking only a more southern species, C. floridana Sargent of peninsular FL, and a south-central species, C. texana Buckley, of sc. United States), and 11 of 18 species worldwide. Section Rhamphocarya includes a single Asian species. The remaining 4 species in the genus are all in section Apocarya: C. palmeri Manning of Mexico and 3 Asian species. C. cordiformis, C. aquatica, C. illinoenensis, C. myristiciformis, C. laciniosa, C. ovata, and C. caroliniae-septentrionalis are diploids, with n = 16. C. pallida, C. glabra, C. ovalis, and C. tomentosa are tetraploids with n = 32 (Stone 1961). As suggested by Stone, Adrouny, & Flake (1969), it seems possible that reticulate evolution involving extant or extinct diploid species is responsible for some of the difficulties in the C. glabra-ovalis complex. Many hybrids have been described, but some are questionable. Additionally, Hardin & Stone (1984) state that "most of these hybrids are localized and have not led to introgressive populations, or at least none that have been recognized". Ecologically, Carya is one of the more diverse and ubiquitous genera of trees in our area, surpassed in number of species, abundance, and ecological amplitude only by Quercus and Pinus. This has led to a long tradition of describing large parts of our area (in particular the Piedmont) as being characterized by "oak-hickory" or "oak-pine-hickory" forests (e.g. Küchler 1964; Greller 1988; Schaffale & Weakley 1990; Sargent, Doerr, & Van Lear 1993). W are (1992) and others have recently questioned this tradition, pointing out that Carya only rarely dominates or codominates, primarily in specialized circumstances (such as in soils with greater cation concentrations, derived from mafic rocks). The association of many (but certainly not all) species of hickories with soils with high base status was noted in print as early as 1820 in an account of the landscape of North Carolina. "The sandy pine barrens, and all the lands on which pine is the exclusive growth, are unfriendly to agriculture; but where the pine is intermixed with oak and hickory, the soil is good. Some of our strongest lands have tall pine, mixed not only with hickory and oak, but also with walnut and cherry, and such trees that indicate the best soil. Where hickory prevails, the land is strong" (Guthrie 1820). References: Stone in FNA (1997); Hardin (1992); Hardin & Stone (1984); Elias (1972); Stone, Adrouny, & Flake (1969); Stone (1961); Mohlenbrock (1986); Sargent (1918); Manning (1950); Hardin (1952); Little (1969); Harrar & Harrar (1962); Stone in Kubitzki, Rohwer, & Bittrich (1993). Key based in part on an unpublished manuscript prepared by Stone & Hardin for the Flora of the Southeastern United States.

Identification notes: Surface vestiture of leaves and bud scales is useful in distinguishing species of Carya. Some use of these characters can be made with a 10x or 20x hand lens; better still is a dissecting microscope. It is important to understand the different trichome types mentioned in the key (terminology follows Hardin 1990 and Hardin & Stone 1984). Short acicular trichomes are simple, unicellular trichomes tapered to a pointed tip, 0.10-0.35 mm long and with rough walls. Long acicular trichomes ("solitary" of Hardin & Stone 1984) are similar to short acicular, but are much larger, 0.45-1.6 mm long, and have smooth walls. Fasciculate trichomes are multicellular and have 2-8 straight or curled rays radiating from a clustered base. Multiradiate trichomes are similar to fasciculate, but have 8-17 rays, the inner (and usually more upright) rays attached basally above the outer (and usually more spreading) rays. Capitate glandular trichomes are unicellular or multicellular, and are distinguished by their bulbous or expanded tip; they are usually 0.02-0.1 mm long. Peltate scales are flat or dome-shaped shields or disks, slightly to strongly glandular, (sometimes regularly or irregularly lobed) and can be either sessile or stalked (they are often referred to as scales,
resin dots, peltate glands, or lepidote scales). On the lower surfaces of leaflets, peltate scales are of two types: large peltate scales are 0.08-0.3 mm in diameter and are round, with smooth or slightly irregular margins, while small peltate scales are 0.025-0.12 mm in diameter and are either round, irregularly lobed or regularly 2- or 4-lobed.

1. Terminal buds elongate, flattened in cross-section, with 4-6 valvate scales; leaves with 7-13 (-19) leaflets, these symmetrical to strongly falcate; fruit sutures narrowly winged.

2. Leaves with 7-9 (-11) leaflets, these symmetrical to slightly falcate; fasciculate trichomes with 2-4 rays; terminal bud, 9-19 mm long, bright orangey yellow to dull orange-tan; [common and widely distributed tree in our area, typically in floodplain and slope forests].........

C. cordiformis

2. Leaves with (7-) 9-19 leaflets, these slightly to strongly falcate; fasciculate trichomes with 2-8 rays; terminal bud { } mm long, brown to rusty-brown.

3. Leaves with (7-) 9-11 (-13) leaflets, the lower surfaces pubescent at least along the midrib and in the main vein axes; bark shaggy; lateral petiroleus 0.2 mm long; nut flattened and angled in cross-section; kernel bitter; [native, of swamp forests, primarily in the Coastal Plain] ................................................................. C. aquatica

3. Leaves with (7-) 11-19 leaflets, the lower surfaces nearly glabrous; bark scaly, with small exfoliating plates; lateral petiroleus 0-7 mm long; nut round in cross-section; kernel sweet; [introduced, frequently cultivated, long persistent, and occasionally naturalized] ............... C. Illinoensis

4. Bark tight (the ridges typically forming an interlocking diamond pattern), scaly, or shaggy (when shaggy, the separated segments normally much < 1 meter long); leaves with (3-) 5-9 (-11) leaflets; these symmetrical to slightly falcate; fruit sutures not winged (except C. myristiciflorum).

5. Twigs slender, hardened first-year growth or second-year growth 1-3 mm in diameter; terminal bud 6-15 mm long, glabrous to sparsely puberulent (except for ciliate fringe on the scales), reddish-brown (usually turning black on drying); lower surface of leaflets nearly glabrous, except for tufts of trichomes in the main vein axes, and only slightly lepidote with a few, scattered scales, the large peltate scales yellow and round, the small peltate scales brown, 2- and 4-lobed; terminal leaflet 2-5 (-6) cm wide ... C. carolinae-septentrionalis

5. Twigs stout, hardened first-year growth or second-year growth (2.5-) 3-6 mm in diameter; terminal bud 9-18 mm long, tomentose, tan to brown (rarely turning black on drying); lower surface of leaflets moderately to densely hirsute with acicular and fasciculate hairs (sometimes the hairs more or less limited to the main veins), and also moderately lepidote, the large peltate scales yellow round, and the small peltate scales dark brown and mostly round; terminal leaflet (4-) 6-15 cm wide ................................................. C. ovata

4. Bark shaggy (on large trees separating in segments to at least 1 meter length); leaves with (3-) 5 (-7) leaflets; serrations of the leaflets densely (or only moderately) ciliate when young, most densely so just below the tooth apex, the hairs sloughing with age but leaving a subapical tuft of white trichomes on at least some teeth; fallen foliage turning black.

6. Twigs stout; terminal buds 8-20 mm long; leaves with (5-) 7-9 (-11) leaflets; lower surface of leaflets moderately to densely hirsute with a mixture of acicular (single), fascicled (2-8 rays), and multi-radiate (8-many rays) hairs; small peltate scales of the lower surface of leaflets all round; fruit husk 4-13 mm thick; nuts slightly to strongly 4-angled toward the apex.

7. Bark shaggy; petiole hirtellous; leaflet apex acuminate; lower surface of leaflets hirsute with acicular (single), 2-6-rayed fascicled, and occasional multi-radiate hairs; fruit husk pubescent, lacking pustulate bumps; fruit 4-7 cm long; nut 3-6 cm long; [rare in our area]................................................................. C. laciniosa

7. Bark tight; petiole hirsute; leaflet apex acute; lower surface of leaflets densely hirsute with acicular (single) and abundant 2-8-rayed fascicled and multi-radiate hairs; fruit husk glabrous, with pustulate bumps; fruit 3.5-5 cm long; nut 2.5-3.5 cm long; [common in our area]......................................................................................... C. tomentosa

6. Twigs slender; terminal buds 3-15 mm long; leaves with (3-) 5-7 (-9) leaflets; lower surface of leaflets mostly glabrous, except for along the midrib and primary veins, and sometimes hirsute on the surface with acicular (single) and infrequent fascicled (2-8 rays) hairs (lacking multi-radiate trichomes); small peltate scales of the lower surface of leaflets of various types, 4-lobed and/or irregular scales often more frequent than round scales; fruit husk 2-5 mm thick; nuts not 4-angled toward the apex.

8. Terminal bud 5-15 mm long, predominantly pubescent (also sparsely lepidote); leaves with (3-) 5-7 (-9) leaflets; lower surface of spring leaflets slightly to densely lepidote with irregular and round peltate scales (4-lobed peltate scales uncommon).

9. Fruit husk indehiscent at maturity or tardily splitting to base along 1 suture; leaves with (3-) 5 (-7) leaflets, glabrous to pubescent beneath; petiole usually green; fruits ellipticoid, pyriform, or subglobose; bark tight ............................................................... C. glabra

9. Fruit husk splitting to base at maturity along 2-4 sutures; leaves with (5-) 7 leaflets, pubescent beneath; petiole reddish; fruits typically ellipticoid; bark tight or often scaly or somewhat shaggy ................................................................. C. ovata

8. Terminal bud 4-10 mm long, predominantly lepidote (also pubescent); leaves with (5-) 7 (-9) leaflets; lower surface of spring leaflets densely lepidote with 4-lobed, irregular, and round peltate scales, giving the undersurface a reflective, silvery-tan, rusty-brown, or bronze sheen.

10. Lepidote scales initially silver, soon turning bronze, and giving the buds, young twigs, and undersurface of the leaves a metallic bronze sheen; fruit 2-3 cm long; [of calcareous swamps, bottomlands and slopes of the Coastal Plain of sc. NC southwards].........

................................................................. C. myristiciformis

10. Lepidote scales silvery-tan or rusty-brown, giving the buds, young twigs, and undersurface of the leaves a dull or slightly shiny tan or rusty-brown color; fruit 3-5 cm long; [usually of upland and acidic forests and woodlands, collectively widespread in our area].

11. Undersurface of the leaflets with dense, silvery-tan large peltate scales, and fewer and less conspicuous fewer small peltate scales (thus the leaves appearing overall silvery-tan); petiole and rachis hirsute with fasciculate trichomes, and also with concentrations of hairs near the leaflet insertions; [widely spread in our area, of upland and acidic forests and woodlands].

................................................................. C. pallida

11. Undersurface of the leaflets with dense, rusty-brown small peltate scales, and fewer and less conspicuous silvery-tan large peltate scales (thus the leaves appearing overall rusty-brown); petiole and rachis with few fasciculate hairs (but densely scaly), and lacking concentrations of hairs near the leaflet insertions; [of the sc. United States, east to ms. w. KY, w. TN, and perhaps AL and GA, of upland or lowland, acidic or calcareous forests and woodlands]......................... C. texana
**Carya aquatica** (Michaux f.) Elliott, Water Hickory, Bitter Pecan. Swamp forests, where flooded during the winter months. April-May; October. Se. VA south to s. peninsular FL, west to c. TX, north inland to se. MO, s. IL, and se. OK. [= RAB, C, FNA, G, GW, K, WH; = *Hicoria aquatica* (Michaux f.) Britton – S]

**Carya carolinae-septentrionalis** (Ashe) Engler & Graebner, Carolina Shagbark Hickory, Carolina Hickory. Upland flats, especially those weathered from mafic rocks and with shrill-swall soils dominated by montmorillonitic clays, less typically on slopes and bottomlands. April-May; October. Sc. VA (Halifax County) south to GA, AL, and MS, and inland northward to c. TN and sc. KY. First reported for VA by Wieboldt et al. (1998). The taxonomic status of *C. carolinae-septentrionalis* has been controversial, with some workers reducing it to variety of *C. ovata* or not recognizing it at all. It seems to us morphologically and ecologically distinctive and to represent an independent evolutionary lineage. Hardin & Stone (1984) found differences in trichomes, and in a study of nut oils, Stone, Adrouny, & Flake (1969) found *C. ovata* "surprisingly distant" from *C. carolinae-septentrionalis*.

There are reports that the two taxa are also phenologically separated, *C. carolinae-septentrionalis* leafing out about two weeks earlier than *C. ovata*, when growing together in the c. Piedmont of NC. Though usually ecologically and/or geographically segregated, the two species sometimes occur together or in close proximity to one another; they maintain their distinctness. [= RAB, C, G, K; = *C. ovata* (P. Miller) K. Koch var. *australis* (Ashe) Little – FNA; = *Hicoria carolinae-septentrionalis* Ashe – S; = *C. ovata* var. *carolinae-septentrionalis* (Ashe) Reveal; = *C. australis* Ashe]

**Carya cordiformis** (Wangenheim) K. Koch, Bitternut Hickory. Forests and woodlands, especially in rich, moist alluvial or slope forests. April; October. ME and s. QC west to MN and NE, south to Panhandle FL and e. TX. [= RAB, C, F, FNA, G, GW, K, W, WH; = *Hicoria cordiformis* (Wangenheim) Britton – S]

**Carya glabra** (P. Miller) Sweet, Pignut Hickory. In a wide variety of forests and woodlands. April-May; October. S. NH west to s. MI, se. IA, and se. KS, south to c. peninsular FL and e. TX. The *C. glabra-C. ovalis* portion of this treatment is tentative; in our area, this group has been variously treated as consisting of between 1 and 10 (or more) taxa. Here we recognize two species (*C. glabra* and *C. ovalis*) and no varieties, but further study of variation in this group is needed. *Var. megacarpa* in particular seems to show correlation of morphological traits and geographic distribution, with larger fruits (2.5-5 cm long vs. 1.5-3.5 cm long), thicker husks (ca. 3.5 mm thick vs. ca. 2 mm thick), large terminal leaflets (often to 20-25 cm long, vs. 10-17 cm long), and a primarily southern Coastal Plain distribution. Glabrous. [= RAB, C, G, GW, K, WH; = *C. glabra var. glabra* – F; G; > *C. glabra var. megacarpa* (Sargent) Sargent – F; G; > *C. ovalis* (Wangenheim) Sargent var. *hirsuta* (Ashe) Sargent – F; < *C. glabra* – FNA; > *Hicoria glabra* (P. Miller) Britton var. *glabra* – S; > *Hicoria glabra* (P. Miller) Britton var. *hirsuta* Ashe – S; ? *Hicoria australis* Small – S; = *C. glabra var. glabra* – W]

**Carya illinoiensis** (Wangenheim) K. Koch, Pecan. Bottomlands, eastwards persistent around dwellings and in pecan orchards, escaped to suburban woodlands, rural forest edges and floodplains, commonly cultivated. April-May; October. Native to the sc. United States, now more widespread in the se. United States as a result of cultivation. The spelling of the specific epithet has been a source of controversy. [= C, FNA, K, WH; = *C. illinoiensis* – RAB, F, G, GW, orthographic variant; > *Hicoria pecan* (Marshall) Britton – S; > *Hicoria texana* LeConte – S]

**Carya laciniosa** (Michaux f.) G. Don, Kingnut Hickory, Big Shellbark Hickory. Moist, circumneutral, alluvial levee forests along brownwater rivers of the Coastal Plain (NC), streams of the Piedmont (NC) and Mountains (GA). April-May; October. NY and s. ON west to IA, south to NC, nw. GA, MS, and OK. This species is sometimes planted, but occurs native in nw. GA, along the Roanoke River (Halifax and Northampton counties, NC) and New Hope Creek (Durham County, NC). [= RAB, C, FNA, G, GW, K, W; = *Hicoria laciniosa* (Michaux f.) Sargent – S]

**Carya myristicifolia** (Michaux f.) Elliott, Nutmeg Hickory. Nonriverine swamps over calcareous substrates, including calcareous clays and coquina limestone ("marl"), oak flatwoods. April; October. Se. NC south to GA, and from wc. AL west to e. TX and se. OK, disjunct in Mexico (Nuevo Léon and Tamaulipas). The bronze sheen of the leaflets of this species is diagnostic. First reported for NC by Leonard (1971b). [= FNA, K; = *C. myristicifolia* – RAB, GW, orthographic variant; = *Hicoria myristiciformis* (Michaux f.) Britton – S]

**Carya ovalis** (Wangenheim) Sargent, Red Hickory. Forests and woodlands, westwards persistent around dwellings and in pecan orchards, escaped to suburban woodlands, rural forest edges and floodplains, commonly cultivated. April-May; October. MA west to WI, south to GA, MS, and MO. [= RAB, C, K; > *C. ovalis* var. *obcordata* (Muhlenberg & Willdenow) Sargent – F; G; > *C. ovalis* var. *obovata* (Marshall) Sargent – F; G; < *C. glabra* – FNA; = *Hicoria microcarpa* (Nuttall) Britton – S; = *C. glabra* (P. Miller) Sweet var. *odorata* (Marshall) Little – W]

**Carya ovata** (P. Miller) K. Koch, Common Shagbark Hickory. Rich moist bottomlands, slopes, occasionally on dry upland flats. May; October. S. ME and s. QC west to MN and NE, south to GA and TX, and also disjunct in Mexico. [= RAB, C, F, G, GW, K, W; > *C. ovata* var. *ovata* – F; > *C. ovata* var. *pubescens* Sargent – F; = *C. ovata* var. *ovata* – FNA; = *Hicoria ovata* (P. Miller) Britton – S]

**Carya pallida** (Ashe) Engler & Graebner, Sand Hickory, Pale Hickory. Dry sandy or rocky forests and woodlands. April-May; October. S. NJ south to Panhandle FL, west to TX, inland in the interior to w. NC, KY, s. IL, and AR. [= RAB, C, FNA, G, K, W; = *Hicoria pallida* Ashe – S]
**JUGLANDACEAE**

*Carya texana* Buckley, Black Hickory. Dry slopes and ridges, especially calcareous. April-May; October. Reported to occur as far east as KY, TN, and MS (FNA). Jones (2005) states that w. KY material of *C. pallida* is transitional to *C. texana*. [= FNA, K; > *C. texana* var. *arkansana* (Sargent) Little – C; > *C. texana* var. *texana* – F; > *C. buckleyi* Durand var. *arkansana* (Sargent) Sargent – G; = *Hicora texana* LeConte, misapplied – S]

*Carya tomentosa* (Lamarck ex Poiret) Nuttall, Mockernut Hickory, White Hickory. Forests and woodlands. April-May; October. MA west to IN and IA, south to n. peninsular FL and TX. One of the most common forest trees of much of our area. There has been confusion and controversy for several centuries over the specific epithet. The oldest basionym available is *Juglans alba* Linnaeus, which apparently included disparate elements, including this taxon and *C. ovata*. Following a more circumscribed typification by Crantz in 1766, the epithet "alba" should have been applied to this taxon, but continued to be applied in various ways. Rehder (1945) proposed that *C. alba* should be considered a *nomen ambiguum*, but agreed that it applied correctly to what has often been called *C. tomentosa*. He argued that the use of *C. alba* should be rejected "in order to avoid confusion and ambiguity." In 2008, Ward & Wiersema (2008) formally proposed rejection of *Juglans alba* (the basionym of *Carya alba*), and the Committee has recommended its rejection unanimously (Brummitt 2010). For further discussion see Rehder (1945), Howard & Staples (1983), Wunderlin, Hansen, & Hall (1985), and Brummitt (2010). [= C, F, FNA, G, RAB, W; = *C. alba* (Linnaeus) Nuttall ex Elliott – K, WH; = *Hicoria alba* (Linnaeus) Britton – S]

*Juglans* Linnaeus (Walnut)

A genus of about 21 species, trees and shrubs, of Mediterranean Europe to e. Asia, and North America to Andean South America. Stanford, Harden, & Parks (2000) present a molecular phylogeny and a discussion of biogeography; our two species are distantly related within the genus, with *J. nigra* most closely related to sw. North American *J. microcarpa* and *J. major*, and *J. cinerea* most closely related to several e. Asian species. References: Whittemore & Stone in FNA (1997); Stanford, Harden, & Parks (2000); Stone in Kubitzki, Rohwer, & Bittrich (1993); Stanford (1998).

1 Lower surface of the leaflets densely hirsute with 4-8-rayed fascicled hairs; fruit ellipsoid, densely pubescent with reddish-brown glandular hairs; leaf scars with a velvety ridge along the upper margin; leaves with (7-) 11-17 leaflets; pith dark brown; terminal buds 12-18 mm long; bark of mature trees pale; [section *Trachycaryon*] ............................................................................... *J. cinerea*

1 Lower surface of the leaflets hirsute with single and 2-rayed fascicled hairs; fruit spherical or nearly so, lepidote with peltate scales and occasional glandular hairs; leaf scars without a velvety ridge along the upper margin; leaves with (9-) 15-19 (-23) leaflets; pith light brown; terminal buds 8-10 mm long; bark of mature trees dark; [section *Rhysocaryon*] ............................................................................... *J. nigra*

*Juglans cinerea* Linnaeus, Butternut, White Walnut. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (VA): moist, nutrient-rich forests; uncommon. April-May; October. NB west to MN, south to n. GA and AR. This tree, formerly common, is afflicted with butternut canker disease, which now threatens its continued existence. [= RAB, C, F, FNA, G, K, W, WV; = *Wallia cinerea* (Linnaeus) Alefeld – S]

*Juglans nigra* Linnaeus, Black Walnut. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (VA): moist, nutrient-rich forests of floodplains and slopes, calcareous hammocks; common (uncommon in the Coastal Plain of NC and SC, rare in FL). April; October. MA west to MN, south to Panhandle FL and TX. The dark brown wood is famous for cabinetry and other uses; it is one of the most prized of North American hardwoods. The nuts, though difficult to crack, are prized for their intense flavor. The husk is used as a dye. Country people dehusk the nuts by putting them in dirt or gravel driveways where the passage of car tires removes the husk but does not crack the nut. [= RAB, C, F, FNA, G, K, W, WH, WV; = *Wallia nigra* (Linnaeus) Alefeld – S]

**Pterocarya** Kunth (Wingnut)

A genus of 6 species, trees, of e. and sw. Asia.

*Pterocarya stenoptera* C. de Candolle, Japanese Wingnut. Cp (LA): uncommonly cultivated, rarely naturalized or persistent; rare, native of e. Asia (China, Japan, and Korea). April-May; August-September. Naturalized in e. LA. [= K]
A family of 4 genera and about 100 species, trees and shrubs, of Malesia, Australia, and Melanesia. References: Johnson & Wilson in Kubitzki, Rohwer, & Bittrich (1993); Rogers (1982c).

*Casuarina* Linnaeus 1759 (Casuarina, Beefwood, She-oak)

A genus of about 17 species, trees, tropical to warm temperate in s. Asia, Australia, and Polynesia. References: Johnson & Wilson in Kubitzki, Rohwer, & Bittrich (1993); Rogers (1982c)=Z.

1 Leaves (teeth in whorls at each node) 6-8 per node; longitudinal ridges of branchlets sharply angular; plant monoecious; branchlet segments 5-8 (-13) mm long, 0.5-0.7 (-1) mm in diameter ................................................. *C. equisetifolia* ssp. *equisetifolia* 1 Leaves 10-14 (-17) per node; longitudinal ridges of branchlets flattened or rounded; plant dioecious; branchlet segments 8-20 mm long, 0.9-1.2 mm in diameter ................................................................. *C. glauca*

* Casuarina *equisetifolia* Linnaeus ssp. *equisetifolia*. Casuarina, Australian-pine, Horsetail Casuarina, Beach She-oak, Coastal She-oak. Beaches, dunes, suburban areas, disturbed areas; native of Malaysia, s. Asia, and Oceania. *C. equisetifolia* was reported as planted and persistent on the Outer Banks of NC by Brown (1959); it is not established so far north, however. Ssp. *incana* (Bentham) L.A.S. Johnson is not known to be introduced in se. North America. [= FNA; < *C. equisetifolia* – K, S, WH, Z]

162. *BETULACEAE* S.F. Gray 1821 (Birch Family) [in FAGALES]

A family of 6 genera and about 150 species, primarily of subarctic to cold temperate regions of the Northern Hemisphere, but extending through Central America to n. South America. The two subfamilies recognized here are sometimes elevated to family status, as by Govaerts & Frodin (1998). References: Furlow in FNA (1997); Furlow (1990)=Z; Hardin (1971)=Y; Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

1 Scales of the pistillate catkins persistent; leafy involucre absent; fruit a small winged nut; [subfamily *Betuloideae*].
2 Pistillate scales woody, forming a persistent conelike catkin; plant a shrub, < 4 m tall (except *A. glutinosa*). ........................................................................ *Alnus*
2 Pistillate scales deciduous with or soon after the fruits; plant a tree, > 10 m tall at maturity ................................................................. *Betula*
1 Scales of the pistillate catkins caducous; leafy involucre present, conspicuous; fruit an unwinged nut; [subfamily *Coryloideae*].
3 Nut spherical, 1-1.5 cm in diameter, closely enveloped by the involucre .................................................................................. *Corylus*
3 Nut ovoid, 0.4-0.6 cm long, loosely or not at all enveloped by the involucre.
4 Infructescence bracts flat, 1-3 lobed, not enclosing the nut; bark gray, smooth; trunk moderately to strongly fluted; buds 4-angled ........
4 Infructescence bracts inflated, loosely enclosing the nut; bark brown, shreddy; trunk not fluted; buds not 4-angled .................. *Ostrya*

*Alnus* P. Miller 1754 (Alder)

1 Fruit broadly winged; winter buds sessile, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula*] .............. *A. viridis* var. *crispa*
1 Fruit narrowly winged; winter buds stalked, covered by 2-3 equal scales.
2 Pistillate catkins mostly 1.5-3 cm long, subsessile and often clustered together closely; typical leaves with 8-14 principal veins on each side of the midrib; [subgenus *Alnus*].
3 Fruiting catkins drooping; leaves broadest at or below the middle, pale green to glaucous beneath, doubly serrate, the teeth of various sizes, usually some of them coarse; bark dark reddish-brown, shiny, with prominent light-colored lenticels .................. *A. incana* ssp. *rugosa*
3 Fruiting catkins erect; leaves broadest at or above the middle, green beneath, finely serrate, the teeth approximately equal in size; bark light gray or brown, with inconspicuous lenticels ..................................................................... *A. serrulata*
2 Pistillate catkins mostly 1-1.5 (-2) cm long, covered by multiple, imbricate, unequal scales; [subgenus *Alnobetula*] .............. *A. viridis* var. *crispa*
Alnus glutinosa (Linnaeus) Gaertner, Black Alder, European Alder. Disturbed areas, suburban woodlands; native of Europe. Sometimes cultivated, especially northward, and naturalized at least as far south as s. PA (Rhoads & Klein 1993); it has also been reported for Morgan County, TN (Chester, Wofford, & Kral 1997). [= FNA, C, F, G, K; = Alnus alnus (Linnaeus) Britton]

Alnus marinatis (Marshall) Muhlenberg ex Nuttall ssp. georgiensis Schrader & Graves, Georgia Alder. Standing water of Ridge-and-Valley spring run. Endemic to a single site in Bartow County, GA. It is one of three subspecies of A. maritimume, each endemic to a small area – ssp. marinatis of the Delmarva Peninsula of MD and DE, ssp. georgiensis Schrader & Graves of nw. GA, and ssp. oklahomensis Schrader & Graves of sc. OK. The closest relatives of A. marinatis are in Asia. [= X; < A. maritima – FNA, K]

Alnus viridis (Villars) Lamarch & De Candolle var. crispa (Aiton) House, Green Alder, Mountain Alder. Grassy balds, shrub balds, spruce-fir forests, and rock outcrops at high elevations (1600-1900m) in the Roan Mountain Massif, Mitchell and Avery counties, NC and Carter County, locally common. May-June; July. Ssp. crispa has variously been considered a varietally, subspecifically, and specifically distinct from typic A. viridis. A. viridis is here treated as a circumpolar complex of 4 subspecies. Ssp. viridis occurs in montane portions of Europe. Ssp. sinuata (Regel) Löve & D. Löve occurs in w. Canada and south in the montane west to nw. United States. Ssp. fruticosa (Ruprecht) Nyman ranges from n. CA north to coastal AK, and in ne. Asia. Ssp. crispa is generally far northern, ranging across n. Canada, south to MA and c. NY, and disjunct at a few localities in PA and at Roan Mountain on the NC-TN border, where it forms an extensive population. [= C; = A. viridis (Villars) Lamarch & De Candolle ssp. crispa (Aiton) Pursh – RAB, G, W, Y; > A. crispa var. crispa – F; < A. alnobetula (Ehrhart) K. Koch – S; > Alnus michelliana M.A. Curtis ex Gray]
**BETULACEAE** 526

2 Bark white to pale gray; samara strongly retuse at its apex, the wings making up over 1/2 of the width; fruiting catkins peduncled; [section *Betula*].  
5 Leaves glabrous beneath or somewhat pubescent on the veins; bark of young stems remaining tight; leaf apex long-acuminate to attenuate; central lobe of infructescence scales shorter than the basal and lateral lobes.  
6 Leaf apex long-acuminate, but not attenuate; infructescence scales sparsely pubescent on the outer surface; bark of mature trees creamy to bright white ............................................................................................................................................... *B. pendula*  
6 Leaf apex attenuate- acuminate; infructescence scales densely pubescent on the outer surface; bark of mature trees grayish white ....................................................................................................................................... *B. populifolia*  
5 Leaves pubescent beneath, at least on the veins; bark of young stems exfoliating; leaf apex acute to short acuminate; central lobe of infructescence scales equal to or longer than than the basal and lateral lobes.  
7 Leaf blades 3-4(-6) cm long, with 3-6 lateral veins on each side of the midvein............... *B. pubescens ssp. pubescens*  
7 Leaf blades 5-10(-14) cm long, with 6-12 lateral veins on each side of the midvein.  
8 Twigs glabrous or slightly pubescent (and then glabrate in age); leaves cordate (rarely rounded) at the base; leaves with 9-12 lateral veins on each side of the midvein; bark pinkish-white .................................................................................................................................................. *B. cordifolia*  
8 Twigs densely pubescent; leaves cuneate to rounded (rarely truncate) basally; leaves with 6-9 lateral veins on each side of the midvein; bark chalky-white ................................................................................................................................................. *B. papyrifera*

**Betula alleghaniensis** Britton, Yellow Birch. Forests at medium to high elevations, rarely at low elevations. April-May; June-August. NL (Newfoundland) west to se. MB, south to DE, PA, OH, n. IN, WI, MN, and IA, and in the mountains south to w. NC, n. GA, and e. TN. [= C, FNA, S, W, WV, Y, Z; = B. lutea Michaux f. – RAB; > B. lutea var. lutea – F, G; > B. lutea var. macrolepis Fernald – F, G; > B. alleghaniensis var. alleghaniensis – K; > B. alleghaniensis var. macrolepis (Fernald) Brayshaw – K]  
**Betula cordifolia** Regel, Mountain Paper Birch. High elevation forests, primarily on talus of avalanche chutes, in the Black Mountains, Yancey County, NC, and on talus slopes and adjacent forests at high elevations, especially on quartzite on the western flank of the Blue Ridge, and on sandstone talus in the Ridge and Valley in VA. May-August; July-September. NL (Newfoundland) and esp. QC south to the mountains of NY; disjunct in n. MN, w. VA, w. NC, and e. TN (Chester, Wofford, & Kral 1997). The question of the appropriate treatment of *B. cordifolia* and *B. papyrifera* is difficult (and still controversial). [= FNA, G, S, Y, Z; = B. papyrifera Marshall var. cordifolia (Regel) Fernald – RAB, C, F, K, W]  
**Betula lenta** Linnaeus var. *lenta*, Sweet Birch, Cherry Birch, Black Birch, "Mahogany." Forests at low to high elevations; common (uncommon in Piedmont). March-April; June-July. S. ME west to OH, south to GA and n. AL. This species is generally restricted elevationally in North Carolina to medium elevations and lower, but in VA it reaches higher elevations, where it can be as common as *B. alleghaniensis*. Once the primary source of methyl salicylate (wintergreen flavoring), used in medicines and confections; it is now produced synthetically. [= B. lenta – RAB, F, FNA, G, K, S, W, WV, Z; < B. lenta – C, Y (also including *B. uber*)]  
**Betula lenta** Linnaeus var. *uber* Ashe, Virginia Roundleaf Birch. Mountain forests (endemic to Smyth County, VA). May-June; July-August. *B. lenta* var. *uber* is related very closely to *B. lenta* var. *lenta*, and is apparently endemic to Smyth County, VA. In addition to the characters in the key, it differs from *B. lenta* var. *lenta* in having the leaves 2-6 cm long (vs. 7-15 cm long), with 4-6 pairs of lateral veins (vs. 8-12 pairs). See Mazzeo (1974), Ogle & Mazzeo (1976), Hayden & Hayden (1984), and McAllister & Ashburner (2004) for additional information on this birch and its history. It does notbreed "true" and should perhaps be considered a form of *B. lenta*. [= *B. lenta* Linnaeus – C, Y; = *Betula uber* (Ashe) Fernald – F, FNA, K, W, Z; = *B. lenta* ssp. *uber* (Ashe) E. Murray; = *B. lenta formosa* *uber* (Ashe) McAllister & Ashburner]  

**Betula papyrifera** Marshall, Paper Birch, Canoe Birch. Dry soils. NL (Newfoundland), NL (Labrador) and AK, south to NJ, WV, OH, IN, IL, IA, NE, CO, and BC; it has sometimes been attributed to the Mountains of VA, but apparently these reports are based on *B. cordifolia*. [= FNA, G, WV, Y, Z; = *B. papyrifera* var. *papyrifera* – C, F, K, W]  
* *Betula pendula* Roth, European Weeping Birch, European White Birch. Persistent and escaping from plantings; native of Europe. Reported for Watauga County, NC by Poindexter (pers. comm.). [= C, F, FNA, K]  
**Betula populifolia** Marshall, Gray Birch, White Birch. Woods, thicket, in VA native in old fields and young forests in the Big Meadows area on grenestone (Madison & Page counties, VA), disturbed areas. May-June; June-July. NS to s. QC, south to s. NJ and MD, more or less disjunct in n. VA, s. ON, n. OH, and n. IN. [= RAB, C, F, FNA, G, K, W, Y, Z]  
* *Betula pubescens* Ehrhart ssp. *pubescens*, European White Birch, Downy Birch. Disturbed areas; native of Europe. Also reported as an introduction in e. GA (Jones & Coile 1988) and at scattered sites throughout PA (Rhoads & Klein 1993). [= FNA, K; = *B. alba* Linnaeus – C, F, G, an ambiguous name]
Carpinus Linnaeus 1753 (Hornbeam, Ironwood, Muscle-tree, Water-beech, Blue-beech)

A genus of about 26 species, trees, in temperate regions of the Northern Hemisphere, extending southward to se. Asia and Central America. The smooth gray bark gives *Carpinus* the names "Water-beech" and "Blue-beech", the fluted, sinewy appearance of the trunk the name "Muscle-tree", and the very hard, heavy wood the name "Ironwood." References: Furlow (1990)=Z; Hardin (1971)=Y; Furlow (1987a); Furlow (1987b)=X; Furlow in FNA (1997); Govaerts & Frodin (1998); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993).

### Carpinus caroliniana

C. caroliniana var. caroliniana

C. caroliniana var. americana

C. caroliniana var. californica

C. caroliniana ssp. caroliniana – Plain and lower Piedmont

1 Leaves narrowly ovate to oblong-ovate, 3-8.5 cm long, 1-4.5 cm wide, the apex acute, secondary teeth small and blunt, the lower leaf surface lacking conspicuous dark glands; bracts of the infructescence with rounded to subacute tips and few, blunt teeth; [primarily of the Coastal Plain and lower Piedmont]

C. caroliniana var. caroliniana

1 Leaves ovate to elliptic, 5.8-12.5 cm long, 2.5-6.0 cm wide, usually abruptly narrowed to the tip (sometimes gradually tapered to a long, acuminate apex), the secondary teeth often almost as long as the primary teeth, sharp-tipped, the lower leaf surface with conspicuous dark-brown glands; bracts of the infructescence mostly sharp-tipped and bearing several sharp teeth; [primarily of the Mountains and Piedmont]

C. caroliniana var. virginiana

### Carpinus caroliniana

**Walter var. caroliniana**, Coastal American Hornbeam. Streambanks, riverbanks, bottomland forests, lower slopes, maritime forests. March-April; September-October. S. NJ, e. MD, and e. VA south to c. peninsular FL, west to e. TX, and north in the inland to s. MO and s. IL. The validity of 2 taxa was established by Furlow (1987a, 1987b) largely through statistical methods. The two taxa have some morphologic and phytogeographic coherence, but intergradation appears to be extensive, and individual specimens (in the herbarium) or trees (in the field) may not be readily identifiable to variety. [= C, F; = C. caroliniana ssp. caroliniana – FNA, K, X, Z; < C. caroliniana – RAB, G, GW, S, WH, Y]

Corylus Linnaeus 1753 (Hazelnut, Filbert)

A genus of about 15-18 species, shrubs and trees, of temperate regions of the Northern Hemisphere. Eurasian species of this genus, *C. avellana* Linnaeus and *C. maxima* P. Miller, are the sources of commercial filberts or hazelnuts. They are sometimes cultivated in North America, especially in the Pacific Northwest. Our wild species are also excellent eating, but wild animals, especially squirrels, usually harvest them before they are ripe. References: Furlow in FNA (1997); Kubitzki in Kubitzki, Rohwer, & Bittrich (1993); Whitcher & Wen (2001); Forest & Bruneau (2000); Govaerts & Frodin (1998).

1 Mature involucre 1.5-3 cm long, the lobes flattened and laciniate; young twigs and petioles stipitate-glandular; [section Corylus, subsection Corylus]

C. americana

1 Mature involucre 4-7 cm long, extended into a tubular bead; young twigs and petioles villous, glandless; [section Corylus, subsection Siphonochlamys]

C. cornuta var. cornuta

**Corylus americana** Walter, American Hazelnut, American Filbert. Rocky woodlands, mesic to rich forests and thickets. February-March; September-October. ME west to SK, south to GA, LA, and OK. [= RAB, C, FNA, K, S, W, WV, Y, Z; > C. americana var. americana – F, G; > C. americana var. indehiscentis Palmer & Steyermark – F, G]

Ostrya Scopoli 1760 (Hop-hornbeam, Ironwood)

167. CUCURBITACEAE Durande 1782 (Gourd Family) [in CUCURBITALES]

A family of about 97-120 genera and 800-1000 species, of tropical and subtropical areas, with a few extending to temperate areas. Schaefer & Renner in Kubitzki (2011); Nesom (2011b); Nesom in FNA (in prep.).

1. Momordica Linnaeus 1753 (Balsam-apple, Bitter Melon)

1. Bract of the male flowers toothed; bract of male flowers attached at the apex of the peduncle; fruit 2.5-4 (-7) cm long .......... M. balsamina

2. Bract of the male flowers entire; bract of male flowers attached near or below the midpoint of the peduncle; fruit 7-25 cm long ......................... M. charantia ssp. charantia

Momordica balsamina Linnaeus, Balsam-apple, Bitter Melon. Disturbed areas; native of Africa. May-September. [= FNA, K2, WH]

2. Ecballium A. Richard 1824 (Squirting Cucumber)

3. Luffa P. Miller 1754 (Luffa)

1 Fruits clavate, strongly 10-angled; petals pale yellow; leaves shallowly lobed ......................................................L. acutangula var. acutangula
2 Fruits cylindric, not angled; petals deep yellow; leaves deeply lobed ...........................................................................L. aegyptiaca

* Luffa acutangula* (Linnaeus) Roxburgh var. acutangula, Angled Luffa, Ridged Gourd, Sponge Gourd. Gardens, fields, trash heaps; cultivated in home gardens, sometimes volunteering from seed the following year; native of s. Asia. Var. amara (Roxburgh) Clarke is also native of s. Asia. [= FNA; < L. acutangula – K]

* Luffa aegyptiaca* P. Miller, Smooth Luffa, Sponge Gourd, Vegetable Sponge. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of s. Asia. [= FNA, K; L. cylindrica (Linnaeus) M. Roemer – S]

4. Echinocystis Torrey & A. Gray 1840 (Wild-cucumber)

5. Sicyos Linnaeus 1753 (Bur-cucumber)

A genus of about 75 species, annual or perennial vines, of Australia, Pacific Islands, tropical America. References: Nesom (2011a) = Z; Schaefer & Renner in Kubitzki (2011).

6. Cucumis Linnaeus 1753 (Canteloupe, Muskmelon, Cucumber)

1 Fruits with spine-bearing tubercles (aculeae); [West Indian gherkin]; [subgenus Cucumis; section Aculeatosi].
2 Aculei 1-2 mm long; leaves deeply 3-5-palmately lobed .................................................................C. anguria var. anguria
3 Leaf blade lobe broadly triangular; corolla tube of female flower 3.5-6.5 mm long; corolla tube of male flower 3.4-4.9 mm long; [cucumber] ..........................................................................................................................................................C. sativus
4 Aculei 4-10 (-15) mm long; leaves slightly to deeply 3-5-palmately lobed ..................................................C. anguria var. longaculeatus
3 Leaf blade central lobe elliptic, oblong or ovate; corolla tube of female 0.8-2.8 mm long; corolla tube of male flower 0.8-2.0 mm long.
4 Fused portion of hypanthium or youngest fruits with appressed hairs; stem abundantly beset with retrorse prickles; fruit diameter 2.5-5 cm. ........................................................................................................................................................................C. melo var. texanus
5 Fruits with smooth or wrinkled rind; ripe fruits with white or green flesh, lacking musky odor ..............................................C. melo var. melo
5 Fruits with netted, warty, or scaly rind; ripe fruits with orange (rarely green) flesh, with aromatic flavor and musky odor..........................C. melo var. inodorus
* Cucumis anguria Linnaeus var. anguria, Bur Gherkin. Disturbed areas; native of Africa. [= FNA, K2; < C. anguria – S, V]

* Cucumis melo Linnaeus var. melo, Canteloupe, Muskmelon. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of w. Africa. [= F, FNA, G, K, V, Z]

* Cucumis sativus Linnaeus, Cucumber. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of s. Asia. [= F, FNA, G, K, V, Z]

7. Melothria Linnaeus 1753 (Melonette)

A genus of about 12 species, vines, of the New World. References: Nesom in FNA (in prep.).

Melothria pendula Linnaeus, Melonette, Creeping Cucumber, Mouse Melon. Bottomland forests, moist roadsides and disturbed areas, marshes. June-November. DC, MD, and VA west to IN, south to FL and TX. [= C, F, FNA, G, GW, RAB, WV; > M. pendula – S; > M. pendula var. pendula – K; > M. pendula var. aspera Cogniaux – K, S; > M. pendula var. crassifolia (Small) Cogniaux – K; > M. microcarpa Shuttleworth – S; > M. nashii Small – S]

8. Citrullus Schrader 1836 (Watermelon)

* Citrullus lanatus (Thunberg) Matsumura & Nakai ssp. lanatus, Watermelon. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical Africa. [= Citrullus lanatus (Thunberg) Matsumura & Nakai var. lanatus – K; < C. vulgaris Schrader – F, G, RAB, WV; = C. lanatus ssp. lanatus – FNA, Z; < C. citrullus (Linnaeus) Karsten – S; < C. lanatus – WH]

9. Coccinia Wight & Arnott 1834 (Ivy Gourd)

A genus of ca. 30 species, herbaceous vines, of sub-Saharan Africa. References: Nesom in FNA [in prep.]

* Coccinia grandis (Linnaeus) Voigt, Ivy Gourd. Disturbed areas, escaped from cultivation; native of sub-Saharan Africas. May-November. [= K, WH]

10. Lagenaria Seringe 1825 (Bottle Gourd)

A genus of 6 species, Old World tropical, centered in Africa. References: Nesom in FNA (in prep.).

* Lagenaria sicaria (Molina) Standley ssp. sicaria, Bottle Gourd, Calabash Gourd. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, rare as a volunteer from seed the following year; native of Africa. One of the oldest cultivated plants. [= FNA; < L. sicaria – K, WH; < L. vulgaris Seringe – RAB, F; < L. leucantha Rusby – G; < Cucurbita lagenaria Linnaeus – S]
11. **Cayaponia** Silva Manso 1836

A genus of about 45 species, of tropical, subtropical and warm-temperate America.

*Cayaponia quinquefolia* (Rafinesque) Shinners. Swamp forests, river banks. June-November. E. SC south to GA, west to e. TX, north in the interior to w. TN. [= FNA, K; = *C. boykinii* (Torrey & A. Gray) Cogniaux – RAB, S; > *C. quinquefolia* GW; > *C. grandifolia* (Torrey & A. Gray) Small – GW]

12. **Cucurbita** Linnaeus 1753 (Squash, Zucchini, Pumpkin, Gourd, Vegetable Marrow)

A genus of 14-22 annual or perennial vines, of the New World. References: Nesom in FNA (in prep.); Nesom (2011b)=Z.

1 Leaf blades distinctly longer than broad, triangular, usually unlobed; [coyote melon]..................................................................................................................... *C. foetidissima*

1 Leaf blades as wide or wider than long, deeply to shallowly lobed.

2 Stems and leaves variously pubescent, the hairs generally not pustulate-based.

3 Fruiting peduncles relatively soft and corky-thickened, terete and not strongly ribbed, expanding gradually along their length ............. *C. maxima*

3 Fruiting peduncles hardened and woody, 5-ribbed, abruptly and widely expanded at point of fruit attachment......................... *C. moschata*

2 Stems and leaves hispid with pustulate-based hairs.

4 Wild plants; fruit almost always bitter, solid ivory or green-and-white striped, usually not yellow or orange; rind smooth.

5 Fruit usually solid ivory, sometimes green-and-white striped; germination within 1-4 days .................. *C. melopepo var. ozarkana*

5 Fruit usually green-and-white striped, sometimes maturing yellow; germination within 3-7 days .................. *C. melopepo var. texana*

4 Cultivated plants (or occurring as waifs and short-term naturalized population, usually in proximity to cultivation); fruit non-bitter (except for some ornamental gourds), variously colored, often at least partially yellow or orange; rind smooth, ribbed, or with warts.

6 [scallop, pattypan, acorn, crookneck, and straightneck squashes, most ornamental gourds]...................... *C. melopepo var. melopepo*

6 [cucozelle, jack-o’-lantern pumpkins, vegetable marrows, zucchini, some ornamental gourds].................................................. *C. pepo*

* ***Cucurbita maxima*** Duchesne, Hubbard Squash, Pumpkin. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical America. [= F, K]

* ***Cucurbita melopepo*** Linnaeus var. *melopepo*, Crookneck Squash, Straightneck Squash, Scallop Squash, Pattypan Squash, Acorn Squash, Ornamental Gourd. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year; native of tropical America. May-October. [= *C. melopepo* ssp. *texana* (Scheele) Nesom var. *melopepo* – Z]

* ***Cucurbita moschata*** Duchesne, Butternut Squash. Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year; native of tropical America. May-October. [= F, K, WH; = Pepo moschata (Duchesne) Britton – S]

* ***Cucurbita pepo*** Linnaeus, Pumpkin, Zucchini, Ornamental Gourd, Vegetable Marrow. Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year; native of tropical America. May-October. [= *Z; < C. pepo* – F, RAB, WV; = *C. pepo* var. *pepo* – K; < *Pepo pepo* (Linnaeus) Britton ex Small – S]
170. **BEGONIACEAE** C. Agardh 1824 (Begonia Family) [in CUCURBITALES]

A family of 2 genera and about 900-1500 species, herbs and shrubs, of tropical and subtropical (rarely warm temperate) regions.

**Begonia** Linnaeus (Begonia)

A genus of about 900-1500 (or more) species, herbs and shrubs, of tropical and subtropical (rarely warm temperate) regions.

References: de Wilde in Kubitzki (2011).

* **Begonia cucullata** Willdenow, Wax Begonia, Club Begonia. Disturbed places; native of South America. Escaped or persistent in e. GA (Jones and Coile 1988) and AL (Woods & Diamond 2006), south to Panhandle FL and ne. FL (Wunderlin & Hansen 2004). [= K, WH]

172a. **PARNASSIACEAE** Gray 1821 (Grass-of-Parnassus Family) [in CELASTRALES]

A family of 2 genera and about 16 species, herbs, of largely north temperate and arctic areas. Numerous anomalous features separate *Parnassia* from the Saxifragaceae; affinities with the Droseraceae, Clusiaceae, Celastraceae, and other families have been historically suggested. It is now clear that its affinities lie with Celastraceae, but APG III’s (2009) inclusion of it in Celastraceae seems premature; it is here retained as separate. Considering the uncertainties of its relationships, *Parnassia* is best treated as a family, the Parnassiaceae, as suggested by numerous workers as early as 1821, and increasingly accepted in recent decades. The very distant relationship of *Parnassia* to the Saxifragaceae (sensu stricto) has been strongly reaffirmed by molecular analyses (Morgan & Soltis 1993, Soltis et al. 2000, Savolainen et al. 2000). References: Simmons in Kubitzki (2004).

[including **LEPUROPETALACEAE**]

1 Plants diminutive, rosettes < 3 cm across; winter annual .................................................................................................................. *Lepuropetalon*

1 Plants larger, rosettes over 8 cm across; perennial from rhizomes ........................................................................................................... *Parnassia*

**Lepuropetalon** Elliott 1817 (Lepuropetalon)

A monotypic genus, of se. North America, Mexico, c. Chile, and Uruguay. Sometimes treated as part of a broad and polymorphic Saxifragaceae, *Lepuropetalon* has often been associated with *Parnassia* in the Parnassiaceae. Morgan & Soltis (1993) suggest a close relationship of *Lepuropetalon* and *Parnassia*, as well as the "distant relationship between both genera and the Saxifragoideae." The affinities of *Lepuropetalon* with *Parnassia* remain uncertain, however, as emphasized by Gastony & Soltis (1977) in their analysis of chromosomes and partially reiterated by Morgan & Soltis (1993). *Lepuropetalon* is here treated in the Parnassiaceae, as supported by molecular analyses (Soltis et al. 2000, Savolainen et al. 2000); treatment in a monotypic Lepuropetalaceae is perhaps equally warranted. References: Ward & Gholson (1987); Spongberg (1972); Gastony & Soltis (1977); Wilbur (1988b); Simmons in Kubitzki (2004).

**Lepuropetalon spatulum** Elliott, Lepuropetalon. In moist open areas, such as seepage on granitic flatrocks, ditches, seasonally wet depressions. February-April. Se. NC and SC south to GA and FL Panhandle (Kunzer et al. 2009), west to e. TX and Mexico; also in Chile and Uruguay. As indicated by Ward & Gholson (1987), *Lepuropetalon* is more common than collections would indicate; the rosettes are 0.5-2 (-3) cm across, the greenish flowers are 2-3 mm across. It has been considered "the smallest terrestrial angiosperm" (Morgan & Soltis 1993). Its apparently greater abundance in the western portion of its range, where largely found by a few botanists "who have made determined efforts to establish its range" (Ward & Gholson), and in habitats such as granitic flatrocks, which have overall received close scrutiny, may be more a reflection of its diminutive size and early season of occurrence than of its real distribution and abundance. The recent increase in collections, mostly in disturbed or human-maintained habitats, also suggests a possible increase in abundance (and range?) from its original state. It should be more vigorously sought in our area. The presence of lines of red glandular dots on the leaves and sepals is a helpful diagnostic character. [= RAB, GW, K, S]

**Parnassia** Linnaeus 1753 (Grass-of-Parnassus, Parnassia)
A genus of 15-70 species, herbs, primarily of arctic and north temperate areas. Our species (especially *P. caroliniana*) are among the most southerly of the genus in distribution. *Parnassia* (all species) are among the most beautiful of our native plants. From a distance the white flowers are attractive but not extraordinary; when observed closely, though, the delicate tracery of the green veins on the waxy white petals is astonishing. References: Gastony & Solits (1977); Spongberg (1972); GW; Simmons in Kubitzki (2004).

**Identification notes:** Note that the five staminodia are (in our species) deeply three-lobed to the base, thus appearing as 15.

1. Leaf blades reniform, as wide or wider than long, the base strongly cordate; staminodia shorter than the stamens [note that the stamens elongate after the staminodia; thus at a certain early stage the stamens of *P. asarifolia* may be shorter than the staminodia; check several flowers]. .......................................................... *P. asarifolia*

2. Leaf blades ovate, longer than wide, the base rounded, broadly cuneate, truncate, or cordate; staminodia longer than the stamens (*P. caroliniana* and *P. grandifolia*) or shorter than the stamens (*P. glauca*).

2. Staminodia shorter than the stamens; [of NJ, PA, and OH northward] ......................................................................................................................... *P. glauca*

3. Main parallel veins of each petal 9-17 (counted at a point halfway between the base and the apex and ignoring short laterals), usually not dilated toward the apex of the petal; outer- or basal-most main vein branching pseudo-dichotomously several times; rhizome horizontal, long-creeping, the leaves scattered or loosely clustered, tending to form clonal patches to several m in diameter; ovary white; [of Coastal Plain pineland] ............................................................................................ *P. caroliniana*

3. Main parallel veins of each petal 5-9 (counted at a point halfway between the base and the apex and ignoring short laterals), often strongly dilated toward the apex of the petal; outer- or basal-most main vein with numerous short laterals on the outer side, extending to the petal margin with few or no branchings; rhizome erect, short, the leaves strongly clustered, not forming large clonal patches; ovary green, sometimes white toward the base; [primarily of the Mountains, rarely also disjunct in the Coastal Plain] ............... *P. grandifolia*

### Parnassia asarifolia

Ventenat, Kidney-leaved Grass-of-Parnassus, Appalachian Grass-of-Parnassus, Brook Parnassia. Bogs, sphenagous seeps, brookbanks, generally in more acidic habitats than *P. grandifolia*, up to elevations over 1800 m. (July-) August-October. VA, e. WV, sw. AR south to GA and e. TX, primarily in the Appalachian and Ozarkian highlands. [= RAB, C, F, G, GW, K, S, W, WV]

### Parnassia caroliniana

Michaux, Carolina Grass-of-Parnassus, Savanna Parnassia, Eyebright. Wet longleaf pine, pond pine, or pond cypress savannas (especially but not strictly where shallowly underlain by coquina limestone), sandhill seepage bogs. September-November (-December). Se. and sc. NC south through SC; disjunct in the Panhandle of FL, the distribution (at least now) fragmented and disjunctive. In NC, locally common in three small areas, centered around Maple Hill (Pender and Onslow counties), Old Dock (Columbus and Brunswick counties), and the Green Swamp (Brunswick County). Following Michaux's discovery of the species it was apparently not reported again in the Carolinas until found by H.A. Rankin near Hallsboro. His comments, quoted in Alexander (1934) are interesting. "What if our savannas are sometimes steaming, it is the condition necessary for the development for many wonderful plants which find here their most congenial surroundings. But Grass-of-Parnassus does not star the meadows during the steaming season, instead, by local tradition, the 'Eyebright,' its local name, times its first flowers to come just two weeks before frost ... As a matter of fact, I saw the first flowers this year on October 12th and our first frost came the morning of the 25th. Its chosen habitat is the wet savannas and hundreds of acres may be seen liberally dotted with its white stars, but it finds its best development in the lower places, and here it often almost covers the ground. Today, November 1st, it is in its prime and is the most conspicuous flower on many acres and in one little depression less than two feet in diameter I counted seventy-two flowers and buds." With the extensive destruction of our wet savannas (by conversion to pine tree farms, agriculture, and developed areas) and fire suppression, very few such places now remain. [= RAB, GW, K, S, WH]

### Parnassia glauca

Rafinesque, American Grass-of-Parnassus, Fen Grass-of-Parnassus. Fens. NL (Newfoundland), QC, and SK south to NJ (Ocean County), s. PA (Rhoads & Klein 1993), OH, IN, IA, and SD. [= C, F, G, K]

### Parnassia grandifolia

A.P. de Candolle, Bigleaf Grass-of-Parnassus, Limezee Parnassia. Fens, gravelly seepages, pineland seepage bogs and ecotomes, primarily or solely over calcareous, mafic, or ultramafic rocks, in the outer Coastal Plain in seepage over marl on nearly vertical river bluffs on the Cape Fear River (NC) and in pineland seepage bogs. September-October. VA, WV, s. MO, and OK south to n. GA, Panhandle FL, s. MS (Sorrie & Leonard 1999), AR, and e. TX, primarily in the Appalachian and Ozarkian highlands. The discovery of populations of this species in Brunswick and Columbus counties, NC, was remarkable. In the Panhandle of FL and the West Gulf Coastal Plain of LA and TX it also occurs in wet savannas and pitcherplant bogs (MacRoberts, MacRoberts, & Jackson 2004), in FL sometimes in close proximity to *P. caroliniana*; *Parnassia* in Coastal Plain savannas should not necessarily be assumed to be *P. caroliniana*. [= RAB, C, F, G, GW, K, S, W, WH, WV]
A family of ca. 98 genera and ca. 1200 species, trees, shrubs, lianas, perennial and annual herbs, nearly cosmopolitan, especially in the tropics and subtropics. References: Brizicky (1964); Simmons in Kubitzki (2004).

**Celastrus** Linnaeus 1753 (Bittersweet)

A genus of ca. 30 species, scandent shrubs, primarily in e. Asia, Malaysia, Oceania, Madagascar, and Central and South America. The one species native to e. North America is related to e. Asian species. The grammatical gender of the genus has been conserved as masculine (Brummitt 2005). References: Duncan (1969)=Z ; Leicht-Young et al. (2007); Simmons in Kubitzki (2004).

* Celastrus orbiculatus Thunberg, Oriental Bittersweet. Thickets, roadsides, forests; native of Asia. May; August-September. *C. orbiculatus*, though attractive, is becoming a noxious weed in our area. The first reports of its occurrence in our area appear to be in the 1960's; it is now much more common than its native relative, *C. scandens*. [=RAB, C, F, W, Z; = C. orbiculata – G, K, orthographic variant]

**Celastrus scandens** Linnaeus, American Bittersweet. Mesic forests. May-June; August-September. QC west to MB and WY, south to w. SC, n. GA, AL, LA, and TX. [=RAB, C, F, G, K, S, W, Z]

**Crossopetalum** P. Browne 1756 (Christmas-berry)

A genus of about 26 species, trees and shrubs, of the West Indies and tropical America. References: Simmons in Kubitzki (2004).

* Crossopetalum ilicifolium* (Poiret) Kuntze, Holly-leaf Rhacoma, Christmas-berry. Disturbed, acid, peaty soil; native of subtropical FL. Presumably introduced via cattle at an agricultural experiment station near Wenona, Washington County, NC (Hayes 1946). The species has probably not persisted in our area. [=K, WH; = Rhacoma ilicifolia (Poiret) Trelease – S]

**Euonymus** Linnaeus 1753 (Spindle-tree, Euonymus, Strawberry-bush)

A genus of ca. 129 species, of temperate and tropical areas, trees, shrubs, and lianas. The genus name was variously spelled "Euonymus" and "Evonymus" by Linnaeus. The spelling Euonymus has been nomenclaturally "conserved." The genus is now considered to be grammatically masculine, and specific epithets therefore end in "-os." References: Ma & Funston (2008)= Y; Voss (1985)=Z; Simmons in Kubitzki (2004).

1 Leaf undersurface with mostly erect hairs to ca. 0.2 mm long; petioles 8-20 mm long; flowers 4-merous; [native]; [section *Euonymus*].................

1 Leaf undersurface glabrous (or with some hairs on the midrib); petioles 1-33 mm long; flowers 4- or 5-merous; [introduced or native].

2 Leaves evergreen; flowers 4-merous; [introduced species, rarely naturalized]; [section *Illicifoli*].

3 Leaves 2-5.5 cm long, 2-3.5 cm wide; capsule 5-6 mm in diameter................................................................. *E. fortunei*

3 Leaves (3-) 5-10 (-12) cm long, (2-) 3-5 (-5.5 cm long; capsule 6-9 (-12) mm in diameter ................................................................. *E. japonicus*

2 Leaves deciduous; flowers 4- or 5-merous; [introduced or native].

4 Petioles 5-33 mm long; flowers 4-merous; [introduced, rarely naturalized]; [section *Euonymus*].

5 Leaf apex acute to short-acuminate; larger leaves 8-11 per cm................................................................. *E. europaeus*

5 Leaf apex long-acuminate; larger leaves with teeth 6-8 per cm ................................................................. *E. maackii*

4 Petioles 1-5 mm long; flowers 4- or 5-merous; [native and introduced].

6 Twigs and branches with 2-4 corky wings; flowers 4-merous; capsules smooth; [introduced, rarely naturalized]; [section *Melanocarya*]................................................................. *E. alatus*

6 Twigs and small branches lacking corky wings, terete (or nearly so); flowers 5-merous; capsules muricate; [native species]; [section *Echinococcus*].

7 Primary stems erect, to 20 dm tall; upper leaves widest at or below the middle; petioles mostly 1-3 mm long; [widespread in our area]................................................................. *E. americanus*
Primary stems trailing or decumbent, the tips and flowering branches ascending to 3 (-6) dm tall; upper leaves widest at or beyond the middle; petioles mostly 3-5 mm long; [of the Mountains] ..........................................................

**Euonymus alatus** (Thunberg) Siebold, Winged Euonymus. Suburban woodlands; native of e. Asia. Reported for NC (Jackson Co.) by Pittillo & Brown (1988). [= C, F, G, WV, Y; = Euonymus alata – K, Z; > Euonymus alatus var. alatus; > Euonymus alatus var. apeterus Regel]

**Euonymus americanus** Linnaeus, Strawberry-bush, Heart’s-a-bustin’-(with-love). Mesic to submesic forests. May-June; September-October. Se. NY west to s. OH and se. MO, south to n. peninsular FL and TX. A variety, var. angustifolia (Pursh) A. Wood, with narrowly lanceolate to linear leaves, has been named and occurs in our area; it is of uncertain status (Brizicky 1964). [= RAB, C, F, G, S, WH, WV; = Euonymus americana – K]

**Euonymus atropurpureus** Jacquin var. atropurpureus, American Wahoo, Burning Bush. Bottomland forests, riverbanks, mostly on rich alluvial sediments, or on slopes over mafic or calcareous rocks. May; October. NY west to ND, south to Panhandle FL and TX. Var. cheathumii Lundell is endemic to TX. [= E. atropurpurea var. atropurpurea – K; > Euonymus atropurpureus – RAB, C, F, G, S, WH, WV; < Euonymus atropurpurea – Z]

**Euonymus europaeus** Linnaeus, European Spindle-tree. Suburban woodlands, uncommonly cultivated, rarely naturalized; native of Europe. [= C, F, G; = Euonymus europaea – K, Z]

**Euonymus japonicus** Thunberg, Japanese Spindle-tree. Disturbed areas, especially on barrier islands; native of Japan. Widely planted on barrier islands and in other maritime situations because of its resistance to salt damage (Brown 1959). [= C, Y; = E. japonica – K]

**Euonymus maackii** Ruprecht, Winterberry. Cultivated, rarely naturalized; native of n. China. [= WH, Y; > Euonymus bungeanum Maximowicz – K; > E. hamiltonianus Wallich var. hamiltonianus – K2]

**Euonymus obovatus** Nuttall, Running Strawberry-bush. Cove forests, northern hardwood forests, other mesic forests, especially in boulderfields, where sometimes quite abundant locally. May-June; September-October. W. NY west to s. MI, south to sw. NC, ne. GA, TN, and MO. [= RAB, C, F, G, S, W; = Euonymus obovata – K, Z]

**Paxistima** Rafinesque 1838 (Mountain-lover)

A genus of 2 species, rhizomatous shrubs, of temperate North America. The only other species in the genus is *P. myrsinites* (Pursh) Rafinesque of the Western Cordillera; its two subspecies are ssp. myrsinites, ranging from BC and AB south to AZ and NM, and ssp. mexicana Navaro & Blackwell of mountainous Mexico (Coahuila, Nuevo León, and Tamaulipas). For discussion of the long confusion and controversy over the appropriate spelling of the genus, see Navaro & Blackwell (1990) and Uttal (1986). The first validly published spelling of the name was “*Paxistima*,” and this spelling should be retained. References: Navaro & Blackwell (1990)=Z; Simmons in Kubitzki (2004).

**Paxistima canbyi** A. Gray, Cliff-green, Canby's Mountain-lover, Ratstripper. On calcareous bluffs and cliffs (generally near the top of the cliffs or bluffs, rarely far below the crest), mostly on limestone and dolostone, but rarely on greenstone or shale; in NC naturalized at the site of a plant nursery and possibly also native (see discussion below). April-May; September. The species is a Central Appalachian endemic: se. PA (Bedford County) (Rhoads & Klein 1993), e. WV, w. VA, s. OH, e KY, ne. TN, and w. NC (where questionably native). The only collection definitely known from NC is that from an old nursery site (Hardin 1963). Navaro & Blackwell (1990) note that "the presence of *P. canbyi* in North Carolina was, however, noticed as long ago as 1883 by Chapman, and *P. canbyi* is likely native to North Carolina." Small (1933) reports it from "n. NC." Casting doubt on its native status in NC is the species' habitat: limestone ravines and bluffs, a very rare habitat in NC. [= RAB, C, K, W, Z; = Pachistima canbyi – F, WV (the name not validly published); = Pachistima canbyi – G, S (the name not validly published)]
175. OXALIDACEAE R. Brown 1818 (Wood-sorrel Family) [in OXALIDALES]

A family of 5-6 genera and 600-775 species, herbs, shrubs, vines, and small trees, nearly cosmopolitan (especially temperate). References: Cocucci in Kubitzki (2004).

Oxalis Linnaeus 1753 (Wood-sorrel, Oxalis)

---

**Celastraceae**

1. Plant cauliflorous; leaves basal; flowers white, pink, or purple.
   2. Leaflets oblong.
      3. Leaflets green; plants with bulbous and bulbils ................................................................. *O. intermedia*
      4. Leaflets purple; plants with scale-clad rhizomes ............................................................... *O. triangularis*
   2. Leaflets obtuse.
      4. Flowers solitary; plants rhizomatous; tips of sepals plane; [section *Oxalis*]. ................................................................. *O. montana*
      4. Flowers in umbels; plants bulbous; tips of sepals with orange callusites; [section *Ionoaxalis*].
      5. Sepals conspicuously appressed-pubescent; leaflets with reddish-brown callusites mostly along the margins; [naturalized] ...........
         *O. articulata*
      6. Sepals glabrous or sparsely pubescent; leaflets with reddish-brown callusites either scattered over the surface or only at the apical notch; [native or naturalized]. 
         *O. debilis*
      7. Leaflets 8-15 mm long; leaflets with reddish-brown callusites only at the apical notch; [native] ....................... *O. violacea*
   1. Plant caulescent; leaves alternate; flowers yellow; [section *Corniculatae*].
   7. Stems evenly striate from base to peduncles and pedicels ................................................................. *O. dillenii*
   8. Petals 10-20 mm long, red-lined in the throat.
      9. Corolla throats strongly red-lined within; petals 14-20 mm long; flowers 1 or (2-) 3-8 in umbelliform cymes above the level of the leaves; stems densely and pilose with stiffly spreading non-septate hairs; stoloniform rhizomes lignescent or liguevous and numerous on an individual plant .................................................................... *O. priceae*
      9. Corolla throats yellow, very faintly to strongly red-lined within; petals 10-18 mm long; flowers 1 or 2-4 (-8) in regular or irregular cymes, above or within the level of the leaves; stems nearly glabrous to sparsely or densely pilose or villous with sepal hairs or a mixture of sepalate and non-sepate hairs; stoloniform rhizomes usually 1 or few, herbaceous or lignescent.
      10. Plants arising from slender, liguevous, stoloniform rhizomes without tubers; leaflets with upper shoulders usually rounded, margins often with a narrow purple margin; flowers produced above the level of the leaves; petals 10-14 mm long, throat yellow to very faintly or weakly red-lined within .................................................................... *O. grandis*
      11. Plants arising from slender, herbaceous, stoloniform rhizomes at intervals producing white, horizontal, fusiform tubers or tuberlike thickenings; leaflets with upper shoulders flattened, margins green; flowers produced mostly within the level of the leaves; petals 12-18 mm long, throat strongly red-lined within .................................................................... *O. illinoensis*
   8. Petals 4-9 (-11) mm long, yellow, without red lines in the throat.
      11. Stems erect, usually arising singly from the base, rarely decumbent, not or very rarely rooting at the nodes, from a short, thin, often herbaceous to slightly liguevous rhizome etc.; seeds all brown or with white transverse ridges; stipules absent or so reduced to be barely evident.
      12. Stems (5-) 8-30 (-35) cm, sparsely pilose with non-sepate hairs to almost completely glabrous, arising from a taproot, often producing lignescent stolons; flowers 1 or 2 (-3, rarely 4-5) in umbelliform cymes; capsules glabrous to sparsely puberulent, not villous. .................................................................... *O. floridana*
      13. Stems 20-60 (-90) cm long, sparsely to very sparsely pilose with nonsepalate hairs or a mixture of nonsepate and sepalate hairs or densely villous with sepalate hairs, arising singly from the base from a short herbaceous to liguevous rhizome; flowers usually (3-) 5-7 (-15) in regular (rarely irregular) cymes; capsules villous to puberulent and villous to glabrate .................................................................... *O. stricta*

*Oxalis articulata* Savigny in Lamarck. Roadside, old gardens; native of South America. [= V; > *O. rubra* St. Hilaire – RAB, K, Q, WH; > Ionoaxalis martiana (Zuccarini) Small – S, misapplied; > *O. articulata* Savigny ssp. *rubra* (St. Hilaire) Loureigne]

*Oxalis corniculata* Linnaeus, Creeping Lady’s-sorrel. Gardens, fields, disturbed areas, sometimes more natural areas including pinelands, dunes; probably native of New World tropics, but possibly including the deeper South. February-December. Now nearly worldwide in distribution, probably native of the New World tropics and subtropics. [= RAB, C, F, K, Q, WV, Y; = *O.
A family of about 15 genera and 120 species, of tropical areas of the Old and New World.
A genus of 8-9 species, trees and shrubs, of tropical shores.

**Rhizophora mangle** Linnaeus, Red Mangrove. Cp (FL, GA, NC, SC): beaches; rare. Well-established from n. FL southwards into the West Indies and beyond in tropical America. The distinctive floating seedlings of *Rhizophora* occasionally wash up as jetsam on beaches of GA, NC, and SC, particularly following hurricanes. Photographic evidence has been supplied from Bear Island, Onslow County, NC, 11 June 1996 (Dave Owen, pers. comm. and photograph). These propagules may sprout and grow for some time, forming a young sapling with leaves, but do not survive because of frost. *Rhizophora* is not currently truly an established part of the flora north of FL,” but is repeatedly introduced naturally. [= GW, K, S, WH]

184. **EUPHORBIACEAE** A.L. de Jussieu 1789 (Spurge Family) [in MALPIGHIACEAE]

A family of about 313-322 genera and 8100-9000 species, trees, shrubs, vines, and herbs, nearly cosmopolitan in distribution, as defined broadly. Molecular systematics suggests that various units traditionally included in the Euphorbiaceae should be segregated (Soltis et al. 2000, Chase et al. 2002). In our flora, this includes *Phyllanthus* (in Phyllanthaceae). References: Webster (1967), Webster (1994); Govaerts, Frodin, & Radcliffe-Smith (2000). [also see **PHYLANTHACEAE**]

1 Shrub or tree (woody).
2 Leaves entire.
3 Leaf blades 2-5× as long as wide; petioles 0.2-1.0 cm long; plant a native shrub; [subfamily Euphorbioideae]................................. *Ditrysinia*
4 Leaves elliptic or lanceolate, with crenate or serrate margins.
5 Petiole lacking glands; [subfamily Acalyphoideae]....................................................... *Sapindus*
6 Petiole with 2 glands at summit; [subfamily Euphorbioideae].......................................................... *Stillingia*
7 Inflorescence a panicle; petals absent; [subfamily Acalyphoideae].......................................................... *Ricinus*
8 Inflorescence a dichasium; petals present; [subfamily Crotonoideae]................................................. *Vernicia*

1 Herb.
7 Leaves palmately or ternately lobed or divided.
8 Leaves peltate; calyx green or purple; plant glabrous; stamens 100-1000; [subfamily Acalyphoideae]................................................. *Ricinus*
8 Leaves cordate at base; calyx petaloid, white; plant glabrous or ith conspicuous stinging trichomes; stamens 8-10; [subfamily Crotonoideae].
9 Plant with stinging trichomes; stamens connate............................................................. *Cnidoscolus*
10 Plant lacking stinging trichomes; stamens separate .................................................... *Manihot*
7 Leaves generally not lobed, entire or serrate (rarely pinnately lobed in *Euphorbia*).
10 Plant with copious white latex; flowers enclosed in a cyathium; [subfamily Euphorbioideae]......................................................... *Euphorbia*
11 Pubescence of stellate trichomes and/or scales; [subfamily Crotonoideae].......................................................... *Croton*
11 Pubescence of simple trichomes, or glabrous.
12 Flowers in terminal spikes; stout perennial with several to many stems arising from a subterranean crown [subfamily Euphorbioideae]............................................................. *Stillingia*
12 Flowers strictly axillary or both axillary and terminal, in small clusters, racemes, or spikes; finer perennial or annual, not typically with > 1 stem arising from a subterranean crown.
13 Ovules and seeds 2 per locule (the capsule thus 6-seeded); flowers in small axillary clusters of 2-4................................. [see Phyllanthus – PHYLANTHACEAE]
13 Ovules and seeds 1 per locule (the capsule thus 3-seeded, or fewer by abortion); flowers in axillary spikes or in racemes borne in leaf axils or opposite the leaves; [subfamily Acalyphoideae].
14 Pistillate flowers lacking a leafy bract; plant with stinging trichomes; styles undivided................................. *Tragia*
14 Pistillate flowers subtended by a conspicuous leafy bract; plant lacking stinging trichomes; styles laciniate
15 Leaves alternate; carpels 3 (sometimes fewer by abortion)................................. *Acalypha*
15 Leaves opposite; carpels 2................................................................. *Mercurialis*

**Acalypha** Linnaeus 1753 (Copperleaf, Three-seeded Mercury)
A genus of about 430-462 species, shrubs, herbs, and trees, of primarily tropical and subtropical regions (rarely warm temperate).

References: Levin in FNA (in prep.); Levin (1999b) = Z; Levin (1999a); Govaerts, Frodin, & Radcliffe-Smith (2000) = Y. Key based in part on Levin in FNA.

1 Bracts of pistillate flowers with linear tips or lobes longer then the broad basal portion; pistillate flowers all or chiefly in terminal spikes, the staminate flowers in axillary clusters (except sometimes in A. arvensis).

2 Pistillate inflorescences with the bracts densely crowded, completely hiding the inflorescence axis; bracts of pistillate flowers with lobes consisting of deltate bases bearing long linear tips, long-hirsute with nonglandular hairs to 2 mm long. A. arvensis

2 Pistillate inflorescences with the bracts loosely arranged, the axis visible between the bracts; bracts of pistillate flowers with the lobes linear throughout, glabrous or pubescent with nonglandular hairs < 0.25 mm long (glandular hairs may be longer).

3 Leaves cordate at base; fruit tuberculate, but not pubescent. A. ostryifolia

3 Leaves rounded to widely cuneate at base; fruit pubescent with pustular-based trichomes. A. setosa

1 Bracts of the pistillate flowers with deltate or lanceolate tips or lobes; pistillate and staminate flowers all in axillary inflorescences, the staminate flowers above and pistillate flowers below in each inflorescence.

4 Bracts subtending the pistillate flowers (5-) 7-9 (-11) lobed, usually stipitate-glandular; petiole 0.5-1.5× as long as the leaf blade; stems with only short, incurved trichomes.

5 Fruit 2-seeded; seeds 2.4-3.2 mm long. A. deamii

5 Fruit 3-seeded; seeds 1.2-2.0 mm long. A. rhomboidea

4 Bracts subtending the pistillate flowers 9-15 (-16) lobed, stipitate-glandular or merely pubescent; petiole 0.2-0.5× as long as the leaf blade; stems with short incurred trichomes, with or without longer, straight, spreading trichomes as well.

6 Bracts subtending the pistillate flowers usually stipitate-glandular, the bract lobes ovate to deltoid, the longest < 2 mm long.

6 Bracts subtending the pistillate flowers usually non-stipitate, pointed hairs, the bract lobes linear to oblanceolate, the longest usually > 3 mm long.

* Acalypha arvensis Poeppig & Endlicher. Disturbed ground; native of West Indies, Mexico, and Central America. [= FNA, K, WH]

Acalypha deamii (Weatherby) Ahles, Big-seeded Copperleaf, Two-seeded Copperleaf. Pd (VA), Mt (VA), Cp (VA): alluvial forests, especially on sandy levees; uncommon. W. PA (Rhoads & Klein 1993), s. OH, and s. IN south to w. TN (Chester, Wofford, & Kral 1997) and AR; apparently disjunct in c. VA (where now known from 23 counties, mainly in the Piedmont), but perhaps only overlooked elsewhere. This plant is up to a meter tall and occurs in moist bottomland forests. [= C, FNA, K, W, Z; = A. rhomboidea var. deamii (Weatherby) Weatherby – F, G; = A. virginica Linnaeus var. deamii Weatherby – Y]

Acalypha gracilens A. Gray, Shortstalk Copperleaf. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): woodlands, disturbed ground; common (uncommon in WV). Late June-November. ME west to WI, south to FL and TX. The related A. monococcus (Engelmann ex A. Gray) Lill. W. Miller & Gandhi is of broadly Ozarkian distribution and warrants specific status (Levin 1999a, 1999b). Var. fraseri is generally more southern and is considered to differ in having more elongate stamineate spikes, to 3-4 cm long (vs. 0.5-1.5 cm long). It may have merit, but was not recognized by Levin (1999a, 1999b). [= RAB, FNA, K, S, W, Z; > A. gracilens var. gracilens – C, F, G; > A. gracilens var. fraseri (Müller of Aargau) Weatherby – C, F, G; = A. virginica Linnaeus var. gracilens (A. Gray) Müller of Aargau – Y; = A. gracilens ssp. gracilens]

Acalypha ostryifolia Riddell ex J.M. Coulter, Rough-pod Copperleaf. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, SC): disturbed ground; uncommon (rare in WV). Late June-November. NJ west to IN and NE, south to FL, TX, Mexico, and the West Indies. [= FNA, K, W, Y; = A. ostryifolia – RAB, C, F, G, S, orthographic variant]

Cnidoscolus Pohl 1827 (Spurge-nettle)

**EUPHORBIACEAE**

*Cnidoscolus stimulosus* (Michaux) Engelmann & A. Gray, Spurge-nettle, Tread-softly, Finger-rot, Bull-nettle. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (NC, SC): sandhills, dry sandy woodlands, other dry sandy soils; common (rare in Piedmont and Mountains). Late March-August; May-September. Se. VA south to s. FL, west to e. LA, mostly on the Coastal Plain, but further inland southward. Beset with stinging trichomes. Allied to *C. urenis* of Mexico, Central America, and n. South America, and sometimes treated as a variety of it. [= K; *Bivonea stimulosas* (Michaux) Rafinesque – Si = *C. urenis* (Linnaeus) Arthur var. *stimulosas* (Michaux) Govaerts – Z]

**Croton** Linnaeus 1753 (Croton, Doveweed, Rushfoil)

A genus of about 1250 species, herbs, shrubs, and (rarely) trees, of nearly cosmopolitan distribution. Webster (1992, 1993) considers the 2 species traditionally treated as *Crotonopsis* to be closely related to sections within *Croton*, such as section *Gynamblosis*; his reasoning has been supported by molecular phylogenetic studies and all recent floristic treatments and is followed here. References: van Ee & Berry in FNA (in prep.); van Ee, Riina, & Berry (in press); Webster (1992)=Z; Webster (1993)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000).

1 Evergreen shrub, (1-) 2-3 m tall; pistillate flowers with petals; [section *Alabamenses*]................................. *C. alabamensis* var. *alabamensis*

2 Leaves with coarsely serrate margins; 1-2 glands present near the junction of the petiole and the leaf blade; [section *Geiseleria*]..........................

3 Leaves sessile or with short petioles (to 3.2 mm long), the petiole < 1/5 the length of the leaf blade; fruit 1-locular, indehiscent; seed 1 per fruit, 2-2.5 mm long; [section *Crotonopsis*].

4 Branches monopodial; stellate hairs of the upper leaf surface with arms to 0.3 mm long, not overlapping the arms of the nearby stellae: *C. michauxii* 

5 Branches dichotomous and trichotomous; stellate hairs of the upper leaf surface with arms to 1.0 mm long, overlapping the arms of nearby stellae: *C. wildenowii* 

6 Leaves (the largest) 4-15 cm long, 1.5-6 cm wide (generally 2-3× as long as wide), lanceolate to elliptic, cordate at the base; hairs of 2 colors, the shorter gray, the longer tan; lobes of the calyx of the pistillate flowers (6-) 7-9 (-12); [alien, of disturbed habitats]...

7 Styles 2 or 3, each 2-lobed, the style branches thus 4 or 6; capsule pendulous, 3-6 mm long; seeds 2.5-4.0 mm long; lower leaf surface white to silvery; plant an annual; [of limestone outcrops, fields, or weedy situations]..

8 Fruit 3-locular; seeds 3 per fruit; styles 3, each 2-lobed; [of fields or weedy situations]; [section *Gynamblosis*]....

9 Fruit 3-locular; seeds 3 per fruit; styles 3, each 2-lobed or 4-lobed; [of fields or weedy situations]; [section *Velamea*] .......... *C. Lindheimerianus* var. *lindeheimerianus*

**Croton alabamensis** E.A. Smith ex Chapman var. *alabamensis*, Alabama Croton. Dry to mesic limestone glades, woodlands, and wooded ravines. Endemic to scattered populations in c. AL; alleged populations in sc. TN (Chester, Wofford, & Kral 1997) are apparently based on mislabeled specimens (Wurdack 2006). *C. alabamensis* var. *texensis* S. Ginzbarg is endemic to c. TX (Ginzberg 1992; Aplet et al. 1994), where it occurs in canyons in the Edwards Plateau. The species is most closely related to species of the West Indies, Central America, and South America; its distribution is obviously relictual. [= K; *< Croton alabamensis – S*]

* Croton boiulianus Baillon. Cp (VA): chrome ore piles; rare. Reported for chrome ore piles at Newport News, VA and Canton, MD (Reed 1964). [= K; *< Croton alabamensis – S*]

* Croton capitatus Michaux, Woolly Croton, Hogwort, Capitate Croton. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA): fields, disturbed areas; common (uncommon in NC, SC, and VA, rare in DE and WV), native of sc. United States, the exact limits of the original native distribution unclear. July-October. [= F, S; *< Croton capitatus – G, K1, K2; *< Croton capitatus – RAB, W, WH]

**Croton elliottii** Chapman, Pondshore Croton, Elliott's Croton. Cp (FL, GA, SC): shores and exposed drawdown zones of clay-based Carolina bays and limesink ponds (dolines); rare (GA Special Concern, SC Rare). Se. SC south to Panhandle FL, west to se. AL. [= K, S, WH]

* Croton glandulosus Linnaeus var. *septentrionalis* Müller of Aargau, Doveweed, Tooth-leaved Croton, Sand Croton. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, roadsides, disturbed areas; common (uncommon in DE and WV). May-October. *C. glandulosus* is widespread in tropical and subtropical America; var. *septentrionalis* is the northernmost variety, but its pre-Columbian range is obscure because of its weedy nature. [= RAB, C, F, G, K, S, W; *< Croton glandulosus var. glandulosus – WH; *< Croton glandulosus – WV]
* Croton lindheimerianus Scheele var. lindheimerianus, Lindheimer's Croton. Pd (NC): fields and other disturbed soils; rare, adventive from further west. June-October. [= K; < Croton lindheimerianus – RAB]

Croton michauxii Webster, Sand Rushfoil, Michaux's Croton. Cp (FL, GA, SC, VA?): sandhills, disturbed sandy soils; common (uncommon in GA, rare north of GA). June-October. SC south to s. FL, west to TX, north in the interior to MO, IL, and IA. Fernald (1950) alleges that this species extends as far north as VA, but the documentation is unknown to me. [= K, WH, Z; = Crotonopsis linearis Michaux – RAB, C, F, G, S]

Croton monanthogynus Michaux, Prairie-tea, One-seed Croton. Mt (GA, NC, VA, WV), Pd (GA, SC, VA*), Cp (GA, VA?): limestone outcrops, blackland prairies, disturbed dry soil; rare. June-October. Sw. VA, OH, IN, IA, NE, and CO, south to nw. GA, FL, TX, and Mexico; adventive as a weed at scattered locations east of the Blue Ridge. [= RAB, C, F, G, K, S, W, WV]

Croton punctatus Jacquin, Silverleaf Croton, Beach-tea, Gulf Croton. Cp (FL, GA, NC, SC): beach dunes, coastal grasslands, usually with Uniola paniculata and or Spartina patens; common. Late May-November. NC (Dare County) south to s. FL, west to TX, and south to Central and South America. [= RAB, K, S, WH]

Croton aegranthemenus Michaux, Silver Croton, Sandhill Croton, Healing Croton. Cp (FL, GA): sandhills; common. C. GA and s. AL south to c. peninsular FL; w. LA and sw OK south through e. and c. TX to Nuevo León and Tamaulipas. [= K1, K2, S, WH] (not yet keyed)

Croton lindheimeri (Engelmann & A. Gray) Alph. Wood. In GA and westward. [= Croton capitatus Michaux var. lindheimeri (Engelmann & A. Gray) Müller of Aargau – K; = C. engelmannii Ferguson – S] (not yet keyed)

* Croton texensis (Klotzsch) Müller of Aargau var. texensis, Texas Croton. Cp (DE): disturbed areas; rare, native of c. North America. [= K] (not yet keyed; add to synonymy

Dirtyssina Rafinesque 1825 (Sebastian-bush)

A monotypic genus, a shrub, of the Southeastern United States Coastal Plain. Perhaps as close to Gymnanthes as to Sebastiania. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

Dirtyssina fruticosa (W. Bartram) Govaerts & Frodin, Sebastian-bush. Swamp forests, other wet to moist, mostly shaded, habitats. May-June; July-October. Se. NC south to c. peninsular FL, west to e. TX. [= Z; = Sebastiania fruticosa (W. Bartram) Fernald – GW, K, WH; = Sebastiana ligustrina (Michaux) Müller of Aargau – RAB; = Sebastiania ligustrina – S (orthographic error)]

Euphorbia Linnaeus 1753 (Spurge)

1 Leaves strictly opposite, oblique or inequilateral at base; branches often prostrate .................. Key A (subgenus Chamaesyce)
1 Leaves alternate or opposite, not oblique or asymmetric at base; branches usually erect.
2 Bracteal leaves lobed or toothed (rarely linear), usually marked with red or white at the base or purple-spotted; glands of the cyathia usually 1 (rarely more), bilabiate, lacking petaloid appendages .............................................................................. Key B (subgenus Poinsettia)
2 Bracteal leaves entire, not marked with red (white-margined in E. marginata); glands of the cyathia 4-5, not bilabiate, with or without petaloid appendages.
3 Glands of the cyathia 5 (or 7-10 on the central cyathium in E. pubentissima), with petaloid appendages 0.1-5.0 mm long (measured along a radius), these white, maroon, red, pink, or green; stipules present, glandlike, often minute ....... Key C (subgenus Tithymaloglasis)
3 Glands of the cyathia 4 (except 5 in E. purpurea), oval, reniform, or crescent-shaped, lacking petaloid appendages (the glands themselves yellowish or green); stipules absent or vestigial .......................................................... Key D (subgenus Esula)

Key A – subgenus Chamaesyce

1 Young stems and leaves glabrous; leaves either entire or serrulate, at least at the apex (use 10× magnification).
2 Leaves serrulate, at least at the apex (use 10× magnification); seeds with 2-4 transverse ridges.
3 Seeds 1.0-1.3 mm long, with 3-4 transverse ridges ................................................................. [E. gyrosporhema]
3 Seeds 0.8-1.0 mm long, with 2-3 (-4) transverse ridges ......................................................... E. hyssopifolia
2 Leaves absolutely entire; seeds smooth.
4 Stipules united into a triangular scale-like structure (this often lobed or fringed), thus appearing as 2 stipules at each node ...... E. serpens
4 Stipules separate, lacerate, appearing as 4 stipules at each node.
5 Leaves either 1.5-2× or 4-5× as long as wide, not fleshy; mature seeds 1.0-1.2 (-1.4) mm long, angled; [of inland sandhills or coastal dunes].
6 Leaves 1.5-2× as long as wide, green throughout; [more widespread]..................................................E. cordifolia
7 Leaves 4-5× as long as wide, the leaf margin red; [FL]..........................................................E. cumulicola
5 Leaves 2-3× as long as wide, often somewhat fleshy; mature seeds (1.3-) 1.5-2.6 mm long, rounded; [of barrier island dunes and other sandy coastal habitats].
7 Mature seeds (1.3-) 1.5-1.9 mm long; cyathia terminal on the stems and also axillary ..............................................E. bombensis
6 Mature seeds (2.0-) 2.2-2.6 mm long; cyathia terminal on the stems .........................................................E. polygonifolia

1 Young stems and leaves pubescent (at least in lines along the stems); leaves serrulate, at least at the apex (use 10× magnification).
8 Ovary and capsule glabrous.
9 Seeds 0.8-1.0 mm long, light gray, the faces with 2-3 (-4) horizontal, low, blunt ridges, sometimes connected by 1-2 cross ridges; stems pubescent when young (uncommonly puberulent along 1 side of the branchlets); capsule 1.5-2.0 mm long, bifid only in the upper half or third; seeds quadrangular but not angled, the faces with inconspicuous transverse ridges or nearly smooth.
10 Stems ascending or suberect, puberulent when young...............................................................E. nutans
10 Stems prostrate or widely spreading, spreading-hirsute........................................................................E. vermiculata

8 Ovary and capsule pubescent.
11 Stems with 2 types of trichomes, the longer 3-5 mm long; cyathia in axillary and terminal cymes, at least some of the peduncles > 10 mm long........................................E. hirta
11 Stems with 1 type of trichome, these < 2 mm long; cyathia solitary or several in axils, the peduncles < 5 mm long.
12 Capsules spreading-villous, especially or solely on the angles; styles 0.2-0.3 mm long, bifid nearly to the base; seeds quadrangular-angled, the faces with 3-4 transverse ridges .....................................................E. prostrata
12 Capsules minutely appressed-puberulent, on the entire surface (though sometimes primarily on the lower portion); styles 0.3-0.7 mm long, bifid only in the upper half or third; seeds quadrangular but not angled, the faces with inconspicuous transverse ridges or nearly smooth.
13 Involute cleft on 1 side half its length; leaves mostly obovate, 1.5-2× as long as wide; styles 0.5-0.7 mm long, filiform; seed faces nearly smooth; adventitious roots formed at middle nodes along the stem..............................................E. humistrata
13 Involute cleft on 1 side a fourth to a third its length; leaves mostly oblong, 2-3× as long as wide; styles 0.3-0.4 mm long, clavate; seed faces transversely ridged; adventitious roots not formed..................................................E. maculata

Key B – subgenus Poinsettia
1 Principal stem leaves opposite, dentate, neither lobed nor linear; plant pubescent ..................................................E. dentata
1 Principal stem leaves alternate, either lobed or linear; plant usually glabrous
2 Cyathial gland 2-lipped, the opening elongate; bracteal leaves red or green at base; seeds not angular .......................E. cyathophora
2 Cyathial gland with a circular opening; bracteal leaves purple-spotted or green; seeds angular...............................E. heterophylla

Key C – subgenus Tithymalopsis
1 Upper stem leaves and bracteal leaves with white margins, ovate, the apex acute; [alien, cultivated and rarely persisting or a waif]; [section Petaloma]..................................................E. marginata
1 Upper stem leaves and bracteal leaves entirely green, obovate, elliptic, narrowly elliptic, or oblanceolate, the apex rounded or obtuse; [native]; [section Tithymalopsis].
2 Petaloid appendages (0.5-) 1.0-4.4 mm long (measured along a radius), about as long as wide or longer, white; stems (1.5-) 3-9 (-11) dm tall, erect; leaves not ciliate-margined.
3 Nodes below the umbel (25-) 35-60 (-115); cyathia (5-) 6.5-8.0 (-11.0) mm wide (across the appendages); stems (1-) 3-10 from a crown, each (1.2-) 2.5-5 (-7) mm in diameter at the base; plants (2-) 4-9 (-1.3) dm tall; leaves ascending, leathery, sessile or subpetiolate; plants flowering June-September; [NH and MA west to s. ON, MI, WI, MN, and NE, south to sc.VA, c. NC, n. GA, s. AL, and e. TX]......................................................E. corolata
3 Nodes below the inflorescence (6-) 15-26 (-41); cyathia (3.5-) 4.0-5.5 (-6.5) mm wide (across the appendages); stems usually 1-2 (-3) from a crown, each (0.8-) 1.5-2.8 (-3.5) mm in diameter at the base; plants (1-) 3-5 (-6.5) dm tall; leaves usually reflexed (E. pubentissima) or usually ascending (E. discoidalis), thin, petiolate or subpetiolate; plants flowering March-July; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS, west to e. TX]......................................................E. discoidalis
4 Leaves 1.9-7.2 cm long, 0.1-0.5 cm wide, averaging > 10× as long as wide; primary inflorescence rays usually 3; [e. and c. GA (or e. SC?) south and west to Panhandle FL and e. TX]......................................................E. discoidalis
4 Leaves (1.6-) avg. 3.8 (-6.1) cm long, 0.5-2.2 cm wide, averaging < 4× as long as wide; primary inflorescence rays usually 5; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS]......................................................E. publishissima
2 Petaloid appendages 0.05-0.6 mm long (measured along a radius), shorter than wide, green, red, white, or pink; stems (0.8-) 1.5-4.5 (-6) dm tall, erect, ascending or decumbent; leaves ciliate-margined (E. mercurialina and E. curtisi) or not.
5 Leaf margins ciliate; cyathia 3.5-5.9 mm wide (across the appendages), not especially variable; [of mastic forests with rich soils]......................................................E. mercurialina
5 Leaf margins not ciliate (except some marginal hairs in E. curtisi); cyathia 2.0-3.4 mm wide (across the appendages), green or maroon; leaves slightly to strongly fleshy, 0.7-20× as long as wide, often very variable in shape, even on the same plant; [of more or less xeric sandhill woodlands with acidic, sandy soils]
6 Stems usually 10-18 per crown, decumbent to weakly ascending; leaves opposite (scales on the lower stem sometimes alternate), fleshy, blue-green with a narrow, thickened, red-hyaline margin; branching dichotomous from the base of the plant (the branches typically equal, though sometimes unequal) ......................................................E. ipecacuanhae
Euphorbiaceae

6 Stems 1-4 (-9) per crown, erect to strongly ascending; leaves alternate, opposite, or in whorls of 3 (at least some alternate on a plant), less fleshy, green to blue-green, without a red margin (or with a very narrow, slightly red-hyaline, but not thickened margin in E. excelsa); branching alternate below the inflorescence (rarely dichotomous or trichotomous), the branches typically unequal.

7 Cyathia and capsules green; petaloid appendages white or pink; leaves thin-textured, green, finely pubescent with appressed white hairs (0.1-0.3 mm long) on the lower surface and margins (visible at 10× or greater); branching primarily alternate; leaves primarily alternate (typically opposite or 3-whelored below the inflorescence); cyathia unisexual, plants usually unisexual (dioecious) ................................................................. E. esculenta

7 Cyathia and capsules maroon; petaloid appendages maroon-red; leaves slightly fleshy, somewhat blue-green, glabrous; branching primarily opposite; leaves primarily opposite (usually some alternate on upper branches); cyathia bisexual, plants bisexual.............. ................................................................. E. curtisii

Euphorbia bombensis Jacquin, Southern Seaaside Spurge, Dixie Sandmat. Cp (FL, GA, NC, SC, VA): open sands of dunes, dune blowouts and overwashes, often growing with perennial grasses such as Uniola paniculata, but preferring open sands with little competition, sometimes mixed with the more common E. polygona; common (uncommon in GA, NC, and SC, rare in VA). June-October. E. VA south to s. FL along the Atlantic, from s. FL to TX and Mexico along the Gulf of Mexico, and south into n. South America. Johnson (1992) notes that the habitat of this species is characterized by that of the closely similar E. polygona; E. bombensis prefers areas behind the foredune, while E. polygona prefers the pioneer situation on the upper beach and foredune front. [=Q = Chamaesyce bombensis (Jacquin) Dugand – K, WH, Z; = Euphorbia annaionoides Kunth – RAB, C, F, G; > Chamaesyce inga(tisi) Small – S]

Euphorbia commutata Engelm ex A. Gray, Woodland Spurge, Tinted Spurge. Mt (GA, NC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, VA): rich forests and rock outcrops, over calcareous or mafic rocks; uncommon (rare in Coastal Plain, rare in NC). March-July. PA west to s. ON and MN, south to FL and TX. The southern var. erecta J.B.S. Norton may be worthy of recognition; we probably have both it and the typical var. commutata in our area. Var. erecta (ranging north to VA, KY, and MO) has all the caule leaves oblong and with petioles 5-12 mm long; var. commutata has leaves varying from oblong and ovate to ovate, the upper leaves usually broad and sessile. [= RAB, F, K, Q, W, WH, WV; > Eu. commutata var. erecta – C, G; > Eu. commutata var. erecta J.B.S. Norton – C, G; = Galarhoeus commutatus (Engelmann) Small – S]

Euphorbia cordifolia Elliott, Heartleaf Sandmat. Cp (FL, GA, NC, SC): open sands of very dry sandhills; uncommon (rare north of FL). July-October. Se. NC south to s. FL and west to s. TX. [= RAB, Q; = Chamaesyce cordifolia (Elliott) Small – K, S, WH, Z]

Euphorbia corollata Linnaeus, Eastern Flowering Spurge. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, VA): woodlands and forests; summer–September. NH and MA west to s. ON, MI, WI, MN, and NE, south to se.VA, e. NC, n. GA, s. AL, and e. TX. Huft (1979) considered Eu. marilandica a sporadic growth form of Eu. corollata. [= K, W, Y, Z; = Eu. corollata var. erecta – RAB; > Eu. corollata var. erecta – C, F; = Eu. marilandica Greene – C, F, G; > Eu. corollata – G, W (also see Eu. pabentissima); = Tithymalopsis corollata (Linnaeus) Klotzsch – S; < Eu. corollata var. corollata – Q (also see Eu. dioicoi)]

Euphorbia curtisii Engelmann, White Sandhills Spurge, Curtis’s Spurge. Cp (FL, GA, NC, SC): sandhills; common. Late March-June. Sc. and se. NC to ne. FL and w. Panhandle FL, on the Coastal Plain. Less variable in leaf shape than Eu. ipecacuanhae or Eu. excelsa. [= RAB, GW, K, Q, WH, Y, Z; > Tithymalopsis curtisii (Engelmann) Small – S; > Tithymalopsis eriogonoides Small – S]
Euphorbia cyathophora Murray, Painted Leaf, Fire-on-the-mountain. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): disturbed habitats, dunes; common (uncommon in GA, NC, SC, and VA). June-October. E. VA, KS, and CA south into the New World tropics, the original range obscure. [= C, K; > Eu. heterophylla Linnaeus var. heterophylla – RAB, F, misapplied; > Eu. heterophylla var. graminifolia Engelmann – RAB, F; = Eu. heterophylla – G; > Poinsettia cyathophora (Murray) Klotzsch & Garcke – S; > Poinsettia heterophylla – S, misapplied]

Euphorbia discoidea Chapman, Summer Spurge. Cp (FL, GA): sandhills; uncommon. E. and c. GA (or e. SC?) south and west to Panhandle FL and e. TX. 1998 includes in synonymy Eu. corollata var. angustifolia Elliott, which has a stated type locality in e. SC. [= K, WH, Y; = Tithymalopsis discoidea (Chapman) Small – S; < Eu. corollata var. corollata – Q] {augment}

* Euphorbia esula Linnaeus var. esula, Wolf's-milk, Leafy Spurge Mt (WV), Pd (VA): disturbed areas; rare, native of Eurasia. May-September. [= K; < Eu. esula – C, F, G, WV; = Eu. esula ssp. esula – Q; < Tithymalus esula (Linnaeus) Scopoli]

Euphorbia esculenta (Small) Coker, Maroon Sandhills Spurge, Coastal Sand Spurge. Cp (FL, GA, NC, SC, VA): sandhills; uncommon. March-June. SC. NC south to c. FL and e. Panhandle FL; disjunct in se. VA (Sussex County) (Belden et al. 2004). The leaves are extremely variable in size and shape, from linear to rotund. Park (1998) recognizes Eu. esculenta and Eu. gracilior as distinct from one another, differing in the involucre (purple in Eu. esculenta and green in Eu. gracilior) and the appendages (rudimentary and purple in Eu. esculenta and semi-circular and white in Eu. gracilior). [= K, Q, WH, Z; = Eu. gracilior Cronquist – RAB; > Tithymalus esculentus Small – S; > Tithymalus gracilis (Boissier) Small – S; < Eu. esculenta – Y; > Eu. gracilior – Y]

* Euphorbia falcata Linnaeus. Mt (VA, WV), Pd (VA): disturbed areas; rare, native of Europe. [= C, F, G, K, WV; > Eu. falcata ssp. falcata – Q]

* Euphorbia helioscopia Linnaeus, Wartweed. Pd (GA, NC, SC, VA), Mt (VA), Cp (DE, VA): cultivated ground; rare, native of Europe. Late March-June. [= RAB, C, F, G, K; = Galarhoeus helioscopia (Linnaeus) Haworth – S; > Eu. helioscopia spp. helioscopia – Q]

Euphorbia humistrata Engelmann, Spreading Sandmat. Cp (FL, VA*), Mt (VA*, WV*), Pd (GA*, VA*): floodplain forests, exposed river shores, rocky riverside gravel bars, disturbed areas; uncommon (rare in FL, GA, and WV, rare in VA Mountains and Coastal Plain), some of the easternmost occurrences apparently adventive from further west. ON and MN south and Abbeville, Abbeville County, SC (C.N. Horn, pers.comm. 2008). [= C, F, G, Q, WV; = Chamaesyce humistrata (Engelmann) Small – GW, K, S, WH, Z]

Euphorbia hyssopifolia Linnaeus, Hyssopleaf Sandmat. Cp (FL, GA, SC): disturbed ground; common. May-October. SC south to s. FL, west to LA; also in w. TX, s. NM, and n. Mexico, and south to s. South America. Its status in our area has been muddled by confusion with Eu. mutans. [= K; = Chamaesyce hyssopifolia (Linnaeus) Small – GW, K, WH, Z]

Euphorbia ipecacuanae Linnaeus, Carolina Ipecac. Sandhills. February-May (and later, especially in response to fire). CT (formerly), NY (Long Island), NJ, and se. PA (Rhoads & Klein 1993) south to e. GA, on the Coastal Plain. The leaves are extremely variable in size and shape, from linear to rotund. Huft (1979) considered Eu. arundelanae Bartlett (reported from MD, SC, and GA) a sporic form of Eu. ipecacuanae. Park (1998) suggested that Eu. ipecacuanae is actually a member of Chamaesyce (treated by Park as a subgenus), rather than of Euphorbia. [= RAB, C, G, K, Q, Z; > Eu. ipecacuanae – F; > Eu. arundelanae Bartlett – F; = Tithymalopsis ipecacuanae (Linnaeus) Small – S]

* Euphorbia lathyris Linnaeus, Caper Spurge, Myrtle Spurge, Mole Plant. Mt (NC, SC, VA, WV), Pd (VA), Cp (VA): roadsides, disturbed areas; uncommon (rare in NC and SC, rare in VA Piedmont, rare in VA Coastal Plain), native of Europe. June-August. [= RAB, F, K, Q, WV; = Eu. lathyris – C, G, an orthographic variant; = Galarhoeus lathyris – S]

Euphorbia maculata Linnaeus, Milk-purslane, Spotted Spurge. Cp (DE, FL, GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): gardens, fields, disturbed places, crevices in pavement or sidewalks; common. January-December. QC west to ND, south to s. FL and TX; introduced in various places worldwide. [= C, G, Q, W; = Chamaesyce maculata (Linnaeus) Small – GW, K, S, WH, Z; > Euphorbia supina Rafinesque – RAB, F, WV]

Euphorbia mercurialina Michaux, Cumberland Spurge, Mercury Spurge. Mt (GA), Pd (GA*, NC, SC, VA*): rich moist forests over mafic or calcareous rocks; rare. May-June. S. KY south through e. TN to nw. GA and n. AL; disjunct in sc. NC, where found in 1992, and in ne. SC. Apparently introduced in VA. [= C, F, G, K, Q, W, Y, Z; = Tithymalopsis mercurialina (Michaux) Small – S]
EUPHORBIACEAE

Euphorbia nutans Lagasca y Segura, Eyebane. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): fields, gardens, waste places, disturbed ground; common. May-October. NH west to MI and ND, south to Panhandle FL and TX; introduced in various places worldwide. [= C, Q, W = Chamaesyce nutans (Lagasca y Segura) Small – GW, K, WH, Z; = Euphorbia maculata Linnaeus – RAB, F, WV, misapplied; = Euphorbia pretta Guss. – G; = Chamaesyce hyssopifolia (Linnaeus) Small – S, in part, misapplied]

* Euphorbia peplus Linnaeus, Petty Spurge. Mt (NC, VA, WV), Pd (VA), Cp (DE): disturbed areas; rare, native of Eurasia. Naturalized in Watauga County, NC (Pointdexter, pers. comm.). [= C, F, G, K; = Galarhoeus peplus (Linnaeus) Haworth – S; > Eu. peplus var. minima A.P. de Candolle – Q; > Eu. peplus var. peplus – Q; > Tithymalus peplus (Linnaeus) Hill]

Euphorbia polygonifolia Linnaeus, Northern Seaside Spurge, Northern Sandmat. Cp (DE, FL, GA, NC, SC, VA): open sands of dunes, upper beach, dune blow-outs and overwashes, sometimes growing with perennial grasses such as Uniola paniculata, but preferring open sands with little competition, sometimes mixed with the less common E. bombensis; common (rare in FL). May-October. NS to ne. FL along the Atlantic Ocean; disjunct to the Great Lakes. See E. bombensis for discussion of the habitats of these related species. [= RAB, C, F, G, Q; = Chamaesyce polygonifolia (Linnaeus) Small – K, S, WH, Z]

* Euphorbia prostrata Aiton, Prostrate Sandmat. Pd (GA, NC, SC, VA), Cp (FL, NC, SC, VA), Mt (NC, SC, VA, WV): crevices of pavement or sidewalks, disturbed places; rare, probably native of tropical America and only naturalized in our area. January-December. [= C, Q; = Chamaesyce prostrata (Aiton) Small – K, S, WH, Z; = Euphorbia chamaesyce Linnaeus – RAB, F, G, misapplied]

Euphorbia purpurea (Rafinesque) Fernald, Glade Spurge. Darlington Spurge, Purple Spurge. Mt (NC, VA, WV), Pd (DE), Cp (DE): rich moist forests in bottomlands or on slopes, in rich soil around rock outcrops, in swamps or seeps, especially over calcareous rocks (such as dolomite) or mafic rocks (such as amphibolite); rare. May-September. NJ, PA, and OH south to w. NC. [= RAB, C, F, G, K, Q, WV; = Galarhoeus darlingtonii (A. Gray) Small – S]

Euphorbia spathulata Lamarrck, Prairie Spurge, Warty Spurge. Mt (NC?, VA), Cp* (FL*): rocky woodlands, disturbed areas; rare. May-June. MN and WA south to w. VA, AL, LA, TX, and Mexico. [= C, W, WH; = Eu. dictyosperma Fischer & Meyer – F, G; < Eu. spathulata – K, Q (also see Eu. obtusata); ? Galarhoeus arkanus (Engelmann & A. Gray) Small ex Rydberg – S]

Euphorbia vermiculata (Rafinesque) House, Hairy Spurge. Mt (VA, WV): disturbed areas; rare. Widespread and common in PA (Rhoads & Klein 1993). (= C, F, G, Q, WV; = Chamaesyce vermiculata (Rafinesque) House – K)

* Euphorbia davidii Subils, David’s Spurge. Mt (NC), Pd (NC): disturbed areas; rare, native of {}. Introduced in se. TN (Chester, Wofford, & Kral 1997). [= K, Q; ? Eu. dentata var. gracillima Millsap] [not yet keyed]

Euphorbia exigua Linnaeus, Dwarf Spurge. Mt (WV): disturbed areas; rare, native of {}. In PA and WV (Kartesz 1999). [= K, WV; ? Eu. exigua ssp. exigua – Q] [not yet keyed]

* Euphorbia graminea Jacquin. Landscaped areas, other disturbed areas. Native of tropical America. Naturalized in FL Panhandle, FL peninsula. [= Agaloma graminea (Jacquin) D.B. Ward] [not yet keyed; not mapped]

* Euphorbia hexagona Nuttall ex Sprengel, Six-angle Spurge. Pd (DE): disturbed areas; rare, native of c. North America. [= K] [not yet keyed; add to synonymy]

Euphorbia hypericifolia Linnaeus, reported for SC (Kartesz 1999), FL, GA, LA (Q). {Investigate} [= Q; = Chamaesyce hypericifolia (Linnaeus) Millsap – K, S] [not yet keyed]

Euphorbia inundoalum Torrey ex Chapman var. inundoalum. Flatwood Spurge. Wet pine flatwoods, savannas, seepage slopes. Ne. FL and se. GA (Bridges & Orzell 2002); Panhandle FL west to s. MS. Var. garrettii Bridges & Orzell is endemic to e. and s. FL peninsula. [= WH, X; < Eu. inundoalum – K, Q; < Galarhoeus inundoalum (Torrey ex Chapman) Small – S] [not yet keyed]

Euphorbia ophthalmica Persoon. GA and PA (Kartesz 1999), widespread in FL (WH), but not in North America (Q). [= Q; = Chamaesyce ophthalmica (Persoon) Burch – K; = Chamaesyce gemella (Lagasca y Segura) Small] [not yet keyed]

Euphorbia serpifolia Persoon var. serpifolia. Cp (FL): disturbed areas; rare, native of the Great Plains. Also in GA, PA, and DE (Kartesz 1999). In NC, GA, SC (Q) {investigate} [= Q; = Chamaesyce serpifolia (Persoon) Small ssp. serpifolia – K; < Chamaesyce serpifolia – WH] [not yet keyed]

Euphorbia telephioides Chapman. Cp (FL): pine flatwoods; rare. Endemic to FL Panhandle (Bay, Franklin, and Gulf counties). [= K, WH; = Galarhoeus telephioides (Chapman) Small – S] [not yet keyed; add to synonymy]

Euphorbia tetrapora Engelmann. GA and AL west to TX. [= K, Q] [not yet keyed]
A genus of about 100 species, trees, shrubs, and herbs, of tropical and subtropical America. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

1 Leaf segments 5-7, with entire margins; calyx of male flowers < 10 mm long; fruit wing-angled..........................\textit{M. esculenta}
1 Leaf segments 9-13, with undulate lobes towards the tip; calyx of male flowers 12-15 mm long; fruit not winged ..................\textit{M. grahamii}

\* \textit{Manihot esculenta} Crantz, Manioc, Tapioca. Disturbed areas; native of tropical America. Naturalized on the Gulf Coast, as in AL and s. FL. [= K, WH, Z; = \textit{Jatropha manihot} Linnaeus – S]  
\* \textit{Manihot grahamii} Hooker, Hardy Tapioca, Graham's Cassava. Suburban forests, vacant lots, other disturbed areas, uncommonly grown as an ornamental, rarely naturalizing; native of tropical America. Introduced in sw. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009), FL Panhandle, peninsular FL, west to L.A. [= K, WH, Z]

\textbf{Mercurialis} Linnaeus 1753 (Mercury)

A genus of about 8 species, herbs, of the Old World. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

\* \textit{Mercurialis annua} Linnaeus, Annual Mercury, Boys-and-girls. Disturbed areas, waif on ballast; native of Mediterranean Europe. This species has been reported as a rare "ballast weed" from Charleston, SC and Mobile, AL (Wiggins 1932); some of the occurrences presumably represent non-persistent waifs. [= C, F, G, K, S, Z]  {not yet keyed}

\textbf{Ricinus} Linnaeus 1753 (Castor-bean)

A monotypic genus, a shrub or tree, native to Africa and w. Asia, now pantropical. References: Govaerts, Frodin, & Radcliffe-Smith (2000)=Z.

\* \textit{Ricinus communis} Linnaeus, Castor-bean, Castor-oil Plant, Palma Christi. Waste places, gardens; native of the tropics, probably Africa. July-October. The seeds are dangerously poisonous, formerly the source of an oil used as a purgative and machine lubricant. In FL and further south in the tropics, \textit{R. communis} is a small to medium tree. [= RAB, C, F, G, K, S, WH, Z]

\textbf{Sapium} P. Browne (Milktree)

A genus of 21 species, trees and shrubs, of the Neotropics. The most recent monographers of \textit{Sapium} and related genera (Kruijt 1996; Esser 2002) separate \textit{Triadica} from \textit{Sapium} sensu stricto. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Kruijt (1996)=Z; Govaerts, Frodin, & Radcliffe-Smith (2000)=Y. [also see \textit{Triadica}]

\* \textit{Sapium haematospermum} Müller of Aargau, Milk-tree. Disturbed areas; native of n. South America. Known in our area only from Escambia County, FL, where not recently seen. [= Y, Z; ? \textit{S. caribaeum} Urban – K; ? \textit{S. glandulosum} (Linnaeus) Morong – S, WH]

\textbf{Stillingia} Garden ex Linnaeus 1767 (Queen's-delight)

1 Stems woody, single; leaves < 1 cm wide; [of pineland ponds and other aquatic habitats] ......................................................... S. aquatica

Stillingia was Linnaeus ssp. sylvatica. Queen's-delight. Sandhills, dryish coastal plain woodlands. May-July; June-September. Se. VA south to s. FL, west to TX, and NM, north in the interior to KS. Ssp. tenax (Small) D.J. Rogers is in s. FL. [= K, Z; < S. sylvatica – RAB, C, G, WH; > S. sylvatica var. sylvatica – F; > S. sylvatica – S; > S. spathulata (Müller of Aargau) Small – S]

Tragia Linnaeus 1753 (Noseburn)

A genus of about 100-170 species, of tropical to warm temperate regions of the Old and New Worlds. References: Miller & Webster (1967)=Z; Govaerts, Frodin, & Radcliffe-Smith (2000)=Y.

1 Plant vining and trailing; larger leaf blades on a plant > 5 cm wide and > 8 cm long, deeply cordate at the base .................... T. cordata

2 Leaf base cuneate at base; leaf blade 3-20× as long as wide ........................................................................................................ T. urens

3 Petioles 1-4 mm long; leaves rounded to acute at the tip; stamens 2 (-3) .................................................................................. T. smallii

4 Petioles 3-17 mm long; leaves acute to acuminate at the tip; stamens 3 .................................................................................... T. urticifolia

Triadica Loureiro 1790 (Chinese Tallow-tree)

A genus of 1-3 species, native to tropical and subtropical Asia. The most recent monographers of Sapium and related genera (Kruit 1996; Esser 2002) place our naturalized species in the genus Triadica, native to Asia; Sapium (excluding Triadica) is a genus of 21 species restricted to the neotropics. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Kruit (1996)=Z; Esser (2002)=Y; Govaerts, Frodin, & Radcliffe-Smith (2000)=X.

* Triadica sebifera (Linnaeus) Small, Chinese Tallow-tree, Popcorn Tree. Marsh edges, shell deposits, disturbed areas; native of c. Asia. May-June; August-November. With Euphorbia and Cnidoscolus, one of our few Euphorbiaceous genera with milky sap. Triadica sebifera has become locally common from Colleton County, SC southward through the tidewater area of GA, and promises to become a serious weed tree (as it is in parts of LA, TX, and FL. [= K, S, X, Y, Z; = Sapium sebiferum (Linnaeus) Roxburgh – RAB, GW, WH]

Vernicia Loureiro 1790 (Tung-oil Tree)
EUPHORBIACEAE

* Vernicia fordii (Hemsley) Airy-Shaw, Tung-oil Tree, Tung Tree. Planted for the oil and for ornament, rarely naturalizing; native of central and western China. Naturalized on the Gulf Coastal Plain from former plantations; planted and showing a tendency to naturalize in the Coastal Plain of NC (Mount Olive, Wayne Co.). [= K, Z; = Aleurites fordii Hemsley – WH]

189. PHYLLANTHACEAE Martinov 1820 (Leaf-flower Family) [in MALPIGHIALES]

A family of about 60 genera and 1800 species, trees, shrubs, and herbs, mainly tropical. References: Webster (1994); Chase et al. (2002).

1 Woody shrub; stamens 5-6 ................................................................. Phyllanthonopsis
1 Annual herb; stamens 3 ................................................................................................................................. Phyllanthus

Phyllanthonopsis (Scheeele) Vorontsova & Petra Hoffman 2008 (Maidenbush)

Phyllanthonopsis phyllanthonoides (Nuttall) Vorontsova & Petra Hoffman, Maidenbush. Barrens, including river-scutch barrens, on limestone or other calcareous rock. C. MO, AR, and OK, south to c. TX; disjunct in c. AL and ec. TN. [= Leptopus phyllanthonoides (Nuttall) G.L. Webster – K; = Andrachne phyllanthonoides (Nuttall) Coulter – F, G]

Phyllanthus Linnaeus 1753 (Leaf-flower)

1 Plant with “normal” arrangement of branches and leaves (leaves uniformly distributed on the stem and branches, alternate and either distichous or spirally arranged, the ultimate branches not deciduous, flowers produced on ultimate and penultimate orders of branches); [subgenus Isocladus].
2 Leaves arranged distichously; stipules typically auriculate; [section Loxopodium].
3 Stems terete; filaments free; seeds 0.8-1.0 mm long; [widespread in our area]................................. P. caroliniensis ssp. caroliniensis
3 Stems flattened and winged; filaments connate; seeds 1.3-1.5 mm long; [of e. LA westward] .................. P. evanescens
2 Leaves arranged spirally; stipules not auriculate; [section Paraphyllanthus].
4 Plant herbaceous, with a single or few stems; seeds 1.7-1.8 mm long; calyx lobes 2.8-3.5 mm long (when in fruit); [endemic to FL Gulf Coast]................................................................. P. liebmannianus ssp. platylepis
4 Plant suffruticose, with many stems clustered from the plant base; seeds 1.1-1.5 mm long; calyx lobes 1.5-2.5 mm long (when in fruit); [of e. LA westward] ................................................................. P. polygonoides
1 Plant with “phyllanthonoid” arrangement of branches, leaves, and flowers (leaves lacking on the main stem, the penultimate order of branches with scales arranged spirally, the ultimate order of branches deciduous, bearing normal leaves alternately and distichously, flowers produced only on the ultimate, deciduous branches).
5 Stamens 5, filaments free; fruiting pedicels capillary, 3-7 mm long; seeds densely papillose; [subgenus Kerganelia] ..................... P. tenellus
5 Stamens 3, filaments connate into a column 0.1-0.15 mm long; fruiting pedicels thicker and often also shorter; seeds variously ribbed or striate; [subgenus Phyllanthus]
6  Fruiting pedicels 0.5 mm long; seeds with 12-15 transverse ridges and sometimes 1-3 pits; male flowers borne towards the top of the branchlets, female flowers towards the base; [section Urinaria] ................................................................. P. urinaria ssp. urinaria
6  Fruiting pedicels > 0.5 mm long; seeds longitudinally ribbed or striate; female flowers borne towards the tip of the branchlets, male flowers towards the base; [section Phyllanthus].
7  Cymules bisexual (each with 1 female and 1 male flower); calyx lobes of male flowers 4 (-5) ........................................ P. abnormis var. abnormis
7  Cymules unisexual; calyx lobes usually 6 .......................................................... P. fraternus

**Phyllanthus abnormis** Baill. *var. abnormis*, Drummond’s Leaf-flower Cp (FL): dunes; uncommon. All year. Ne. FL south to s. peninsular FL; TX south into Mexico. Another variety occurs along the Rio Grande River in TX. [= FNA, K, X, Y; > P. garberi Small – S; < P. abnormis – WH]

* Phyllanthus amarus Schumacher, Gale-of-wind, Carry-me-seed. Reported by RAB for NC and SC; misidentified and actually represents P. tenellus (Webster 1970). [rejected; not keyed or mapped]

* Phyllanthus caroliniensis Walter ssp. caroliniensis, Carolina Leaf-flower. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): roadsides, moist woodlands, forests, and fields, often in seasonally wet, muddy places; common (rare in VA and WV Mountains). July-November. PA and IL south to c. peninsular FL and TX, and south to Argentina and Paraguay, the original range not clear, likely introduced in part of the area. Ssp. saxicola (Small) G.L. Webster (sometimes treated as a species) is restricted to s. FL, the Bahamas, and Greater Antilles. [= FNA, K, X, Y; < P. caroliniensis – RAB, F, G, W, WV; = P. carolinensis var. carolinensis – C; < P. carolinensis – GW, orthographic error; = P. carolinensis – S]

**Phyllanthus evanescens** Brandegee. LA (St. Charles Parish) west to TX. March-November. [= FNA; > Phyllanthus pudens L.C. Wheeler – K, X, Y]

* Phyllanthus fraternus G.L. Webster. Disturbed areas. S. FL, MS, LA. Introduced in SC (Kartesz 1999). [investigate] [= FNA, K, WH, X, Y]

**Phyllanthus liebmannianus** Müller of Aargau ssp. platylepis (Small) G.L. Webster. Cp (FL): wet hammocks; rare. Late March-late June. Endemic to the “Big Bend” area of the FL Gulf Coast (Dixie, Levy, and Taylor counties). Apparently closely related to P. liebmannianus ssp. liebmannianus of the western Gulf Coast (Tamaulipas south to Yucatan and Belize). [= FNA, K, WH, X, Y; = Phyllanthus platylepis Small – S]

**Phyllanthus niruri** Linnaeus. Reports of P. niruri Linnaeus from NC and SC (Ahles, Bell, & Radford 1958) have proved to be P. tenellus (Webster 1970). [rejected; not keyed or mapped]

**Phyllanthus pentaphyllus** Wright, Fivepetal Leaf-flower. Unlikely to be correctly labeled from Darlington County, SC (as also indicated by RAB), is here excluded.

**Phyllanthus polygonoides** Nuttall ex Sprengel. Grasslands, calcareous glades. April-October. E. LA west to NM, south into Mexico. [= FNA, K, X, Y]

* Phyllanthus tenellus Roxburgh, Mascarene Island Leaf-flower. Cp (DE, FL, GA, NC, SC), Pd (GA, NC): disturbed areas, in and around greenhouses; uncommon (rare north of FL), native of the Mascarene Islands. This species appeared in FL in the 1920's, s. GA in the 1940's, SC in the 1950's, SC in the 1960's, and TN in the 1970's (Kral 1981). Reported from a single collection from VA, as a “contaminant in a container plant” (Virginia Botanical Associates 2007). [= FNA, GW, K, WH, Y; ? P. amarus – RAB, misapplied (misidentified); > P. tenellus var. tenellus – X]

190. **ELATINACEAE** Dumortier 1829 (Waterwort Family) [in MALPIGHIACEAS]

**Elatine** Linnaeus 1753 (Waterwort)

1  Seeds mostly straight, the areoles elliptic, the rounded ends not dovetailing into adjacent rows, the longitudinal ridges thus appearing straight and distinct; seeds basal-axil, extending lengthwise through the capsule, not overlapping; leaves 1.5-5 mm long; flowers mostly 2-merous.... .......................... **E. minima**

1  Seeds mostly curved, the areoles 6-sided, the angular ends dovetailing into the adjacent rows, the longitudinal ridges thus appearing broken or irregular; seeds axile, attached along an elevated placenta at different levels, therefore overlapping; leaves 1.5-15 mm long; flowers mostly 3-merous.
2  Leaves obovate to broadly spatulate, rounded at the tip, 3-8 mm long, the larger 1.5-5 mm wide; seeds with 20-30 pits in each row ......... .......................... **E. americana**

2  Leaves linear-lanceolate to narrowly spatulate, emarginate to truncate to rounded at the tip, 1-15 mm long, the larger 0.5-3 mm wide; seeds with 9-25 pits in each row.
3  Leaves 1.5-4 mm long, 0.7-1.8 mm wide; seeds with 9-15 pits per row .................................................. **E. brachysperma**
3  Leaves 2.8-15 mm long, 0.5-3 mm wide; seeds with 16-25 pits per row .................................................. **E. rubella**

**Elatine americana** (Pursh) Arnott, American Waterwort. Cp (DE, VA), Mt (NC, SC): tidal flats, lakes; rare. July-October. Widespread in ne. United States, s. to NC and MO. The only known site for this species in NC is an artificial lake; it is uncertain
whether it should be considered native or introduced. [= F, K, S; < E. triandra Schkuhr – RAB, W; = E. triandra var. americana (Parsh) Fassett – C, G, GW]

Elatine brachysperma A. Gray, Shortseed Waterwort. Pd (GA): {habitat not known}; rare. It has been reported for nc. GA (Jones & Coile 1988). [= F, K; = E. triandra Schkuhr var. brachysperma (A. Gray) Fassett – C, G]

Elatine minima (Nuttall) Fischer & C.A. Meyer, Tiny Waterwort. Cp (DE, VA), Pd (NC, SC): tidal flats, lakes, mud flats; rare. July-October. First found in NC in 1990. E. minima is widespread in ne. United States, south to VA, NC, and SC (Horn, pers. comm. 2004). The only known site for this species in NC is the spillway of an artificial lake (Lake Butner, Granville County); it is uncertain whether it should be considered native or exotic in NC. It may have been introduced by waterfowl or humans. [= C, F, G, K]

Elatine rubella Rydberg, Red Waterwort. Pd (SC): ponds; rare. This species occurs in AL (Fayette County) as well as north of our area (Haynes 1998). Hill & Horn (1997) reported E. triandra for SC, but the specimen is E. rubella Rydberg (Horn, pers. comm. 2004). [= K; = E. triandra Schkuhr – F, misapplied; > E. triandra var. triandra – C, G, misapplied]

196. CHRYSOBALANACEAE R. Brown 1818 (Coco-plum Family) [in MALPIGHIALES]
A family of about 18 genera and 530 species, trees, shrubs, and herbs of tropical and subtropical areas, especially tropical America. References: Prance & Sothers (2003); Prance (1970).

Licania Aublet (Gopher-apple)

Licania michauxii Prance, Gopher-apple, Ground-oak. Cp (GA, SC): sandhills, dry sandy pinelands; common (uncommon in GA, rare in SC). May–June; September–October. Se. SC south to s. FL, west to LA, becoming abundant and ubiquitous in dry sandy habitats in the southern part of its range. L. michauxii is one of 49 species of subgenus Moquilea, section Moquilea, which is distributed from se. North America through Central America and the West Indies to South America; our species may be most closely related to L. retifolia Blake, a small tree of sw. Mexico and El Salvador (Prance 1970; Prance & Sothers 2003). A rare upright shrub form (to over 15 dm tall) has been found in Brevard County, FL, suggesting that L. michauxii evolved from a taller and more upright ancestor (Ward & Taylor 1999). [= K, X, Y, Z; = Chrysobalanus oblongifolius Michaux – RAB; > Geobalanus oblongifolius (Michaux) Small – S; > Geobalanus pallidus Small – S]

197. PASSIFLORACEAE A.L. de Jussieu ex Kunth 1817 (Passionflower Family) [in MALPIGHIALES]
A family of about 27 genera and 935 species, vines, shrubs, and trees, of tropical and warm temperate regions, especially America and Africa. Here circumscribed to include Turneraceae, following Angiosperm Phylogeny Group (2009). References: Feuillet & MacDougal in Kubitzki, Bayer, & Stevens (2007); Arbo in Kubitzki, Bayer, & Stevens (2007).

Passiflora Linnaeus 1753 (Passionflower)

Identification notes: Passiflora flowers are structurally striking. There are 5 sepals and either 0 or 5 petals; a corona of numerous linear structures is present, arranged in 1–several series. The ovary, 3 styles, and 5 stamens are basally adnate and elevated on an androgynophore. Most species have glands on the leaves which function as extrafloral nectaries; these can be seen as paired glands on the leaf petiole (in all our species except P. lutea), and some species also have laminar glands on the leaf blade, near the margin.

1 Sepals 25–35 mm long, green on the outer surface, white on the inner surface; petals 30–40 mm long, lavender, violet, or mauve; berry 40–70 mm long; corona in 2–3 series, the longer 15–30 mm long; [subgenus Passiflora; supersection Passiflora] Passiflora incarnata
2 Petiole lacking paired glands; leaf blade lacking laminar glands; berry 7–12 mm long; [subgenus Decaloba; supersection Decaloba].
3 Calyx, petals, and stems glabrous; [WV, OH, and OK south to AL and TX] Passiflora lutea var. glabriflora
4 Sepals 5–10 mm long; petals absent; corona in 2 series the outer 3–7 mm long; berry 6–10 (–15) mm long; [native, of ne. FL southwards]; [subgenus Decaloba, supersection Sieca].

Passiflora Licania Schkuhr var. americana (Parsh) Fassett – C, G, misapplied

Passiflora Rydberg, Red Waterwort. Pd (SC): ponds; rare. This species occurs in AL (Fayette County) as well as north of our area (Haynes 1998). Hill & Horn (1997) reported E. triandra for SC, but the specimen is E. rubella Rydberg (Horn, pers. comm. 2004). [= K; = E. triandra Schkuhr – F, misapplied; > E. triandra var. triandra – C, G, misapplied]
PASSIFLORACEAE

Piriqueta Aublet 1775

Piriqueta caroliniana ( Walter) Urban var. caroliniana. Cp (FL, GA, SC): longleaf pine sandhills, sandy soils of roadsides, woodland edges, and disturbed areas; uncommon. May-September. SC south to s. FL; West Indies; Yucatan. Ulmer & MacDougal (2004) state that the Florida and West Indian component of what has been broadly treated as P. suberosa warrants specific status. [= S; < P. suberosa Linnaeus – K, WH, Y, Z]

* Piriqueta cistoides (Linnaeus) Grisebach. Reported for GA (Kartesz 1999), but the documentation is untraceable. [= P. cistoides ssp. cistoides – K, Z] [not keyed; rejected pending better documentation]

201. SALICACEAE de Mirbel 1815 (Willow Family) [in MALPIGHIALES]

Populus Linnaeus 1753 (Poplar, Aspen, Cottonwood)

1 Winter buds not viscid; stamens 5-20.
2 Stamens 5-12; scales of the catkins deeply fimbriate; petioles terete; [section Euleucoideae] .................................................................P. heterophylla
3 Petioles strongly flattened laterally (90 degrees to the plane of the leaf blade), leaves puberulent beneath when young: [section Populus].
4 Leaf margins finely crenulate-serrulate, with (12-)15-35 (-45) teeth per side, the sinuses 0.5-1.0 mm deep; leaves glabrous; buds glossy brown .................................................................P. tremuloides
5 Petioles more or less plane; leaves not puberulent beneath when young: [section Populus].
   6 Leaves puberulent beneath when young: [section Populus].
   7 Leaves with 10-20 mm long; petioles either 4-11 mm long or absent; corona in 1-2 series, the longer 5-11 mm long; berry 20-40 mm long; [alien]; [subgenus Decaloba, subsection Broyonoides].
   8 Petals absent; sepalis 10-14 mm long, 2-4 mm wide; corona in 2 series, the outer (longer) 6-9 mm long, the inner ca. 1 mm long; berry 20-30 mm long, scarlet when ripe; leaves 3-lobed, entire, with petiolar glands towards the base of the petiole ....[P. gracilis]
   9 Petals present, 43-11 mm long; sepalis 13-20 mm long, 5-8 mm wide; corona in 1 series, 5-11 mm long; berry 30-40 mm long, purple or black when ripe; leaves 3 (-5)-lobed, serrate, with petiolar glands in the upper half of the petiole ..............................P. morifolia

**Populus balsamifera** Linnaeus, Balsam Poplar, Hackmatack, Tacamahac. Cp* (DE*, VA*), Pd* (VA*), Mt* (VA*, WV): floodplains, disturbed areas; rare. NL (Lábov) and AK south to PA, WV, OH, IN, IL, IA, SD, CO, ID, and OR; scattered further south by introduction. Ranges south to s. PA (Rhoads & Klein 1993), e. and w. KY (Clark et al. 2005), and to VA (according to Kartesz 1999). Also reported for n. GA (Jones & Coile 1988) and provisionally for SC (Kartesz 1999). Many of the attributes of this species to states in our area are based on misidentifications. [= C, FNA, G, WV; = P. balsamifera var. balsamifera – K; > P. balsamifera var. balsamifera – F; > P. balsamifera var. magnifica – Victorin – F; > P. balsamifera var. subcordata – Hylander]

**Populus ×canaden sis** Moench (pro sp.) (P. deltoides × nigra), Hybrid Black Poplar. Pd (GA, VA), Mt (VA, WV), NC: disturbed areas; rare. Reported for a county in n. GA (Jones & Coile 1988) and for NC and VA (Kartesz 1999). [= C, FNA, K, S, WV]

**Populus grandidentata** Michaux, Bigtooth Aspen. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): dry, rocky, upland forests; common (rare in NC). April–May. NS west to MN, south to w. NC, sc. TN, and n. MO. [= RAB, C, F, FNA, G, K, S, W, WV]

**Populus ×jackii** Sargent [probably P. balsamifera × deltoides], Balm-of-Gilead. Mt (NC, VA, WV), Pd (VA), Cp (DE): bottomlands, riverbanks, streambanks; uncommon (rare or locally abundant in DE, NC, and VA), spread from cultivation. April. This cultivar is of uncertain origin, considered by some to be a hybrid P. balsamifera × deltoides, by others to be an atypical pisidelberg clone of P. balsamifera Linnaeus. The cultivar 'gileadensis' is distinguished from the typical form by the petioles densely and stiffly pubescent (vs. petioles glabrous). P. ×jackii is locally abundant along the New River in Watauga, Ashe, and Alleghany counties, NC and downstream into VA. [= C, FNA, K, Y; = P. candicans Aiton – RAB, G, S, misapplied; > P. ×gileadensis Rouleau – F, W, WV]

**Populus nigra** Linnaeus, Black Poplar, Lombardy Poplar. Pd (GA, VA), Cp (GA, VA): disturbed suburban areas; rare, native of s. Europe. Cultivated in many forms, including the columnar "Lombardy Poplar;" short-lived and only weakly spreading to disturbed areas in the vicinity of plantings. [= C, F, FNA, G, K; > P. italic a (Du Roi) Moench – S; > P. nigra var. italic a Du Roi – WV]

**Populus simonii** Carrière, Chinese Poplar, Simon's Poplar. Mt (NC): riverbanks; rare, native of China. Naturalized in the Mountains of NC. [= FNA]

**Populus tremuloides** Michaux, Quaking Aspen. Mt (NC, VA, WV), Pd (DE*, VA): heath balds, rocky woodlands, exposed rock outcrops, clearings, floodplains; uncommon (rare in DE, NC, and VA). April–May. NL (Lábov) west to AK,
south to NJ, VA, nw. NC (where perhaps not native), WV, MO, and (in the Rockies) to TX and Mexico. [= C, FNA, G, K, S, W, WV; > P. tremuloides var. tremuloides – F]

_Populus ×smithii_ Boivin [P. grandidentata × tremuloides]. Mt (WV): {habitat}; rare. South to MD and WV. [= C, FNA, K] {not yet keyed}

_Salix_ Linnaeus 1753 (Willow)

A genus of about 400 species, trees, shrubs, and subshrubs, mostly north temperate and boreal. References: Argus in FNA (2010); Argus (1986)=Z; Dorn (1995)=Y; Argus (1997); Chen et al. (2010). Key adapted from Z and FNA.

1 Leaves mostly alternate, but some opposite or subopposite; [subgenus _Vetrix_, section _Helix_] ___________________________ S. purpurea
2 Leaves all alternate.

1 Leaves mostly alternate, but some opposite or subopposite; [subgenus _Vetrix_, section _Helix_] ___________________________ S. purpurea

1 Leaves all alternate.

2 Bud apex sharp-pointed; bud scale margin free and overlapping; leaf blades 2.5-16× as long as wide; [subgenus _Prottea_].
3 Leaf blades (4-) 7-10 (-16)× as long as wide; leaf undersurface glaucous or not; [section _Humboldtianae_].
4 Leaf blades not (or thinly) glaucous beneath; pistols borne on stipes averaging 1 mm long (range 0.5-1.5 mm); leaf blades usually small and caducous, to 12 mm long; leaf blades (4-) avg. 9 (-16)× as long as wide .......................................................... S. nigra
5 Leaf blades 2.5-5 (-6)× as long as wide; leaf undersurface glaucous.
6 Leaf apex acute; branchlets reddish brown or green; [true plant of sphagnum scepage of GA and FL]; [section _Floridanae_] ______________ S. floridana

1 Leaves all alternate.

2 Bud apex blunt; bud scale margin fused; leaf blades 2-30× as long as wide.

3 Leaf blades 2.5-5 (-6)× as long as wide; leaf margin serrulate; stomates usually absent on the upper leaf surface; 

5 Leaf apex acuminate to caudate; branchlets yellow; [midwestern species east to w. KY]; [section _Humboldtianae_].
6 Leaves green or pale green beneath.

7 Leaves lanceolate or elliptic-lanceolate, 2-6× as long as wide; leaf margin serrate; stomates usually absent on the upper leaf surface; 

8 Stipules glandular on their margins (stipules caducous and often absent in _P. grandidentata_); pistillate floral bracts deciduous after flowering; petioles glandular near the junction with the blade; stamens 3-9; [subgenus _Vetrix_, section _Cordatae_].
9 Stipules persistent and prominently glandular; young leaves and twigs with reddish-brown hairs, glabrescent or glabrous later; leaves long-acuminate; capsules 5-7 mm long.................. S. lucida
10 Leaf margin serrulate or serrate.

10 Leaf margin entire or crenate (to slightly and irregularly serrate); [subgenus _Vetrix_, section _Cinerella_].
11 Leaves glabrous (sparingly pubescent when young), not revolute .......................................................... S. discolor
12 Leaves permanently pubescent, at least on the lower surface (densely villous or tomentose when young), revolute.
13 Leaf margin entire and undulate; pistillate aments 1-3.5 cm long; pistols borne on stipes mostly < 2 mm long; staminate aments 0.5-2 cm long; shrubs, < 2 m tall.
14 Trees or tall shrubs, to 15 m tall; decorticated wood of 1-4 year old branches smooth or with a few ridges usually < 5 mm long.......................... S. caprea
15 Shrubs, 3-7 (12) m tall; decorticated wood of 1-4 year old branches with numerous ridges, many of them > 2 cm.
16 Shrubs to 6 m tall; leaves lacking stomates on the upper surface; [native to our area]; [subgenus _Vetrix_].
17 Stipules prominent, 5-15 mm long; branches flexible; mature leaves glabrous or glabrescent beneath; staminate aments borne on short, leafy branches; [section _Cordatae_] ___________________________ S. sericans
18 Leaf margin crenate or irregularly serrate (rarely nearly entire); pistillate aments 3-8 cm long; pistols borne on stipes mostly > 2 mm long; staminate aments 2-5 cm long; shrubs to small trees, mostly 3-15 m tall.
19 Leaves long-sericeous beneath; branches ascending (rarely pendulous); leaves narrowly lanceolate, with length/width ratio of 5-6.5; petioles 3-6 mm long; petioles 3-6 mm long, sericeous; flowering branchlets 1-1.5 cm long; [section _Salix_; S. alba
20 Leaves glabrate beneath; branches normally pendulous; leaves very narrowly lanceolate, with length/width ratio of 6.5-13; petioles 7-12 mm long; petioles 7-12 mm long, tomentose; flowering branchlets ca. 0.3 cm long; [section _Subalbae_].
20 Branches yellowish, yellow-green, or yellow-brown ................................................................. S. ×sepulchralis
20 Branches yellow-brown to red-brown, or gray-brown.
21 Pistillate catkins on branches that are 0- to 2.4 mm long; ovary beak abruptly tapered to styles; anthers 0.4-0.5 mm long ................................................................. S. babylonica
21 Pistillate catkins on branches that are 3-14 mm long; ovary beak gradually tapered to styles; anthers 0.5-0.8 mm long.
22 Petioles glabrous, pilose, or velvety to glabrescent on the upper surface; branches yellow-brown, gray-brown, or red-brown; staminate catkins loosely flowered, stout, nectaries conuate connate and shallowly cup-shaped .................. S. pendulina
22 Petioles short-silky on the upper surface; branches yellow-brown; staminate catkins moderately densely flowered. slender, nectaries distinct ................................................................. S. ×sepulchralis

* Salix amygdaloides* Andersson, Peachleaf Willow. Mt (WV): floodplains and other wet places; rare. April-May. QC west to BC, south to PA, n. WV, w. KY, MO, TX, NM, NV, AZ, and OR. [= C, F, FNA, G, K, Z]

* Salix atrocinerea* Brotero, Common Sallow, Olive-leaf Willow, Large Gray Willow. Mt (NC): disturbed areas; rare, native of western Europe. April. Also reported as naturalized in KY (Clark et al. 2005) and PA (Kartesz 1999). [= FNA, K; = S. cinerea Linnaeus ssp. oleifolia (Smith) Mace ight – Z; < S. cinerea – RAB, C, F, G]

* Salix caprea* Linnaeus, Goat Willow, Great Sallow. Mt (NC, VA), Pd (DE, VA): disturbed areas; uncommon (rare in NC and VA), native of Eurasia. April. [= C, F, FNA, G, K, Z]

* Salix caroliniana* Michaux, Carolina Willow, Coastal Plain Willow. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, WV, VA): riverbanks, sandbars, other wet sites; common (uncommon in Piedmont and Mountains). March-April. Widespread in the Southeast, *S. caroliniana* has a somewhat peculiar range, with three main centers of distribution, the Coastal Plain from VA south to s. FL, the Interior Low Plateau of TN, KY, and n. AL, and the Ozark-Ouachita Highlands of AR and MO. [= RAB, C, F, FNA, G, W, K, WH, WV, Z; = S. longipes Andersson – S]

* Salix discolor* Muhlenberg, Pussy Willow. Mt (VA, WV), Pd (DE, NC*):* calcareous wetlands, disturbed areas; rare, apparently native in DE, WV, and VA, introduced only in NC. March-April. NL (Newfoundland) and AB south to DE, w. VA, WV, KY, MO, SD, and MT. [= C, FNA, G, S, Z; > S. discolor var. discolor – F, G, WV; > S. discolor var. latifolia Andersson – F, G, WV; > S. discolor var. prinoides (Pusch) Andersson – WV]

* Salix exigua* Nuttall var. sericans (Nees) Nesom, Sandbar Willow. Mt (VA, WV), Pd (VA), Cp (DE, VA): sandbars, riverbanks, creekbanks; common (rare in DE and VA). March-mid May and June-August. *S. exigua* occurs throughout North America except most of the Southeast, south to DE, se. VA, w. VA, e. TN, MS, LA, TX, and Mexico; var. sericans is the more eastern variety of the complex (Nesom 2002). [= S. exigua – W, Z; > S. exigua ssp. interior (Rowlee) Conquist var. angustissima (Andersson) Reveil & Broome – C; > S. interior ssp. interior var. interior – F, G; = S. interior Rowlee – FNA, GW, K, S, WV]

* Salix fragilis* LINNAEUS, Crack Willow, Brittle Willow. Pd (DE, VA), Mt (WV), Cp (DE): low areas; uncommon (rare in VA), native to Asia Minor, introduced to Europe and thence to here. [= C, F, G, K, S, WV, Z; = S. ×fragilis Linnaeus – FNA]

* Salix humilis* Marshall, Upland Willow, Prairie Willow. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, FL, GA, NC, SC, VA): upland areas, often in open or semi-open sites, in barrens, fens, and grassy balds over mafic rocks (such as amphibolite) up to at least 1800m elevation, also in powerline rights-of-way, woodland borders, and other miscellaneous habitats; uncommon. March-May. NL (Newfoundland) and MB, south to FL and TX. [= C, G, S, WH; < S. humilis – RAB, GW (also see S. occidentalis); > S. humilis var. humilis – FNA, K, W, Z; > S. humilis var. humilis – F, W; > S. humilis var. hyperbrysa Fernald – F, WV]

* Salix lucida* Muhlenberg, Shining Willow. Mt (VA*), WV), Pd (DE), Cp (DE): seepages, low areas; rare. May. Uncertainly indigenous to the one known VA population in Roanoke County. [= C, FNA, W, WV, Z; > S. lucida var. lucida – F, G; = S. lucida ssp. lucida – K]

* Salix occidentalis* Walter, Dwarf Upland Willow, Sage Willow. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, GA, NC, SC, VA): upland areas, often over mafic (amphibolite) or ultramafic (olivine) rocks; uncommon (rare in WV). March-May. This species is less widely distributed than the related *S. humilis*, with a distribution centered in the central Appalachians. ME to

* Salix ×pendulina Wenderoth [S. babylonica × euxina], Weeping. {DC, GA, MD, NC, VA, WV}: disturbed areas; uncommon, a hybrid introduced from Europe. March-April. [= FNA, K]

* Salix pentandra Linnaeus, Bay Willow. Mt (NC, VA), Pd (NC): disturbed areas; rare (perhaps not established), native of Eurasia. April. [= C, F, FNA, G, K, Z]

* Salix ×sepalulosa Simonkai [S. alba × babylonica], Weeping Willow. {DC, KY, LA, MD, NC, VA, WV}: disturbed areas; uncommon, a hybrid introduced from Europe. March-April. [= FNA, K]

Salix bebbiana Sargent, Long-beaked Willow, Gray Willow, is widespread and rather common in PA (Rhoads & Klein 1993) and also occurs in MD (Argus 1986). [= C, FNA, K, Z; > S. bebbiana var. bebbiana – F] [subgenus Salix, section Fulvae]

Salix cordata Michaux, south to MD, PA (Kartesz 1999). {investigate} [= C, FNA, K; > S. cordata var. cordata – F] {not yet keyed}

* Salix elaeagnos Scopoli, Hoary Willow, Rosemary Willow, Diamond Willow. Reported for SC (Kartesz 1999). [= FNA, K] {subgenus Vetrix, section Canae} {not yet keyed}

* Salix petiolaris Sm. Cp (NJ). {research}

* Salix triandra Linnaeus, Almond-leaf Willow. {DC, VA}. [= FNA] {not yet keyed}

202. VIOLACEAE Batsch 1802 (Violet Family) [in MALPIGHIACEAE]

A family of about 20 genera and 900 species, herbs, shrubs, and vines, cosmopolitan in distribution. References: McKinney & Russell (2002)=X.

1 Plants acaulescent or caulescent, 0-4 dm tall, if caulescent, the leaves not at the same time cuneate, short-petiolate, and acuminate; petals white, yellow, violet, or blue, the lowermost spurred................................................................. Viola

Hybanthus Jacquin (Green-violet)

A genus of about 70-150 species, shrubs and herbs, of tropical and warm temperate regions of the Old and New Worlds. Likely to be split in the near future, H. concolor retained in a much smaller genus Hybanthus, with only 2-3 species, and H. parviflorus to be placed in the moderately large genus Pombalia Vandelli (H.E. Ballard, pers. comm.). References: McKinney & Russell (2002)=X; Wofford et al. (2004).

1 Leaves 0.6-3 cm long, finely crenate; capsule 3-4 mm long; seeds ca. 1.5 mm long; [alien, of weedy areas]................................. H. parviflorus

* Hybanthus parviflorus (Mutsis ex Linnaeus f.) Baillon. Cp (GA): disturbed area; rare, native of South America. April. First collected in North America in New Jersey in the 19th century; and again in 1998 by Tom Govus at Fort Pulaski National Monument (Chatham County, GA). It is unclear whether this is a recent introduction or an old weed introduced via ship's ballast (Wofford et al. 2004). [= Pombalia]

Viola Linnaeus 1753 (Violet, Johnny-jump-up, Pansy)

Viola Linnaeus 1753 (Violet, Johnny-jump-up, Pansy)

Identification notes: Viola has presented numerous problems in taxonomy, distribution, and identification. Particularly troublesome are the so-called “acaulescent blue violets”, including V. sororia, V. sagittata, V. palmata, V. septemloba, etc. They may be difficult to identify due to morphological overlap, or trying to key plants without mature leaves; in some instances hybridization may be suspect. Leaf maturity is an
important feature to recognize—the earliest 1-2 leaves produced in most of these taxa are generally ovate-cordate in outline and may not display characteristic lobing, toothing, or pubescence until more mature leaves are produced, 1-2 weeks later. Specimens thus collected early in the flowering period can present the botanist with a perplexing series of plants that do not key cleanly. A second troublesome group contains the small white violets, including Viola canadensis var. canadensis, V. incognita, and V. macloskeyi. These taxa have been dealt with in various ways, but resist a wholly satisfactory treatment, due to apparent hybridization (Russell, 1955, Amer. J. Bot. 41: 679-85; Russell, 1955, Amer. Midl. Nat. 54: 481-94). However, recent reviews of these 3 species in the Southeast show that V. incognita and V. macloskeyi are quite distinct, with V. incognita less so (but this may be due to paucity of specimens from the area). A third difficult group contains V. appalachicola, V. conspersa/labradorica, and V. palustris. They have been treated recently by Ballard (1992, 1994) and McKinney & Russell (2002). Despite the problems present in the genus, the great majority of plants encountered in the field may be successfully keyed out, particularly by botanists working within an area of several counties. Violet species are usually quite faithful to one or a few plant community types, so once learned these habitats can be valuable indicators as to which species to expect. Botanists working in larger regions (state, floristic province), however, must be aware of increased morphological variation and potential hybridization. The works of McKinney & Russell and Ballard provide the most satisfactory understanding of taxa and are followed here, with exceptions based on field and herbarium studies throughout the Southeast US. All species possess brownish or reddish nectar guide striae in the corolla throat; these are ignored in the key. Hairs of the corolla throat and on leaf surfaces are important key characters; several plants should be inspected with a 10× lens before deciding the character state.

1. Plant caulescent (producing aerial stems bearing leaves and flowers).
   2. Corolla yellow, or white with a yellow center (sometimes drying lavender); stipules entire or erose .................................................. Key A
   3. Corolla wholly cream-colored, or cream with a yellow center, or blue-violet, or multicolored (blue or violet with orange or yellow); stipules fringed or deeply lobed .................................................................................. Key B
1. Plant acaulescent (with leaf petioles and flower stalks arising separately from the base of the plant).
   3. Plant producing stolons; corolla white (or blue in V. odorata)........................................................................................................... Key C
   3. Plant not producing stolons; corolla blue-violet (or yellow in V. rotundifolia).............................................................................. Key D

Key A – Caulescent Violets with yellow or white flowers

1. Corolla white with a yellow center (sometimes drying lavender); stipules long-triangular, attenuate..................... V. canadensis
2. Corolla solid yellow; stipules ovate to narrowly ovate.
   2. Leaf blades deeply 3-lobed................................................................................................................................................................. V. tripartita
   3. Leaf blades cordate or hastate.
      3. Leaves at least as wide as long.
         4. Stems 2-3-several; basal leaves 0-2; foliage glabrous; [widespread in our region] ......................................................... V. pensylvanica
         4. Stems 1; basal leaves 0-2; foliage densely pubescent; [montane in our region] ......................................................... V. pubescens
   3. Leaves distinctly longer than wide.
      5. Leaf blade hastate; base of leaf strongly cordate .............................................................................................................................. V. hastata
      5. Leaf blade narrowly ovate; base of leaf blade rounded to broadly cuneate................................................................. V. tripartita

Key B – Caulescent Violets with blue, cream, or multicolored flowers

1. Stipules foliaceous, deeply lobed (the lobes narrow, but not ciliate or fringed; leaves cuneate at base; plants annual, without thickish rootstock; [of weedy habitats].
   2. Corolla pale blue with a cream center; petals 2× as long as the sepals...................................................................................... V. bicolor
   2. Corolla either cream with a yellow center or multicolored; petals < 2× as long as the sepals.
      3. Corolla cream with a yellow center; petals shorter than the sepals or longer by up to 2 mm ................................. V. arvensis
      3. Corolla multicolored (cream to orange with a yellow center, the upper petals at least partly dark blue); petals longer than the sepals by 2 mm or more ................................................................. V. tricolor
   1. Stipules herbaceous, fringed or ciliate along the margin; leaves truncate or cordate at the base; plants perennial, with thickish rootstock; [mainly of natural habitats]; [section Viola].
   4. Stems immediately becoming prostrate at time of flowering; stems persistent through winter, rooting at the nodes, and generating the following year's plants at their tips (plants thus mat-forming).
      5. Leaf blades with scattered hairs near the margin only; petioles, peduncles and stems glabrous; stipules shallowly lacerate, with marginal processes < ¼ as long as the stipule............................................................... V. walteri var. appalachicola
      5. Leaf blades moderately to densely puberulent over the entire surface; petioles, peduncles and stems moderately to densely puberulent; stipules deeply laciniate with marginal processes > ½ as long as the stipule .................................................................. V. walteri var. walteri
   4. Stems ascending to erect at time of flowering and fruiting; stems deciduous at end of growing season, not rooting at nodes (plants thus solitary).
      6. Corolla wholly cream-colored................................................................................................................................................... V. striata
      6. Corolla blue or blue-violet.
         7. Spur of basal petal 4-6 mm long; lateral petals bearded within; corolla uniformly blue ....................................................... V. labradorica
         7. Spur of basal petal 10-15 mm long; lateral petals beardless; corolla lavender, with a purple-black eyespot surrounding the throat. ............................................................. V. rostrata

Key C – Acaulescent Violets with stolons and white (or rarely blue) flowers

1. Flowers generally blue (sometimes white or blue-and-white variegated); style terminating in a slender hook ca. 1 mm long; capsules hirtellous; [introduced, cultivated, rarely persistent or spreading] .................................................................................................................. V. odorata
2. Leaf blades > 1.5× as long as broad.
Corollas yellow; leaf blades rotund, lie nearly flat on ground ................................................................. V. rotundifolia
Corollas violet to bluish-purple, leaves various (flat on ground only in some V. villosa and V. hirsuta).

Leaf blades lance-ovate, broadly cuneate to subtruncate at the base ............................................................ V. primulifolia

Leaf blades linear to lanceolate, narrowly cuneate at the base.

Leaf blades lanceolate, < 8 x as long as wide; plant glabrous ................................................................. V. lanceolata var. lanceolata

Leaf blades linear or narrowly lanceolate, > 10 x as long as wide; plant glabrous to pubescent. ............... V. lanceolata var. vittata

Leaf blades < 1.5 x as long as broad.

Leaf blades completely glabrous (petioles may be villous); [of wet, acidic seepage or swampy woods, often with Sphagnum] ...................................................... V. macloskeyi var. pallens

Leaf blades pubescent, at least on the upper surface of the basal lobes; [of wet to more mesic situations].

Lateral petals glabrous within; petals and peduncles usually reddish-tinted; leaf apex acute; basal lobes of the leaf often overlapping; pubescence of the upper leaf surface often restricted to the basal lobes; [of mesic, often nutrient-rich forests] ...................................................... V. blanda

Lateral petals bearded within; petals and peduncles green; leaf apex obtuse to rounded; basal lobes of the leaf not overlapping; pubescence of the upper leaf surface usually widespread; [of mesic to wet situations] ................................................................. V. incognita

Key D – Acaulescent Violets without stolons, with blue-violet or yellow flowers

1 Corollas yellow; leaf blades rotund, lie nearly flat on ground ................................................................. V. rotundifolia

Corollas violet to bluish-purple, leaves various (flat on ground only in some V. villosa and V. hirsuta).

1 Leaf blades lance-ovate, broadly cuneate to subtruncate at the base ............................................................ V. primulifolia

Leaf blades linear to lanceolate, narrowly cuneate at the base.

4 Leaf blades lanceolate, < 8 x as long as wide; plant glabrous ................................................................. V. lanceolata var. lanceolata

4 Leaf blades linear or narrowly lanceolate, > 10 x as long as wide; plant glabrous to pubescent. ............... V. lanceolata var. vittata

2 Leaf blades < 1.5 x as long as broad.

2 Leaf blades completely glabrous (petioles may be villous); [of wet, acidic seepage or swampy woods, often with Sphagnum] ...................................................... V. macloskeyi var. pallens

5 Leaf blades pubescent, at least on the upper surface of the basal lobes; [of wet to more mesic situations].

6 Lateral petals glabrous within; petals and peduncles usually reddish-tinted; leaf apex acute; basal lobes of the leaf often overlapping; pubescence of the upper leaf surface often restricted to the basal lobes; [of mesic, often nutrient-rich forests] ...................................................... V. blanda

6 Lateral petals bearded within; petals and peduncles green; leaf apex obtuse to rounded; basal lobes of the leaf not overlapping; pubescence of the upper leaf surface usually widespread; [of mesic to wet situations] ................................................................. V. incognita

2 Leaf blades lance-ovate, broadly cuneate to subtruncate at the base ............................................................ V. primulifolia

Leaf blades linear to lanceolate, narrowly cuneate at the base.

4 Leaf blades lanceolate, < 8 x as long as wide; plant glabrous ................................................................. V. lanceolata var. lanceolata

4 Leaf blades linear or narrowly lanceolate, > 10 x as long as wide; plant glabrous to pubescent. ............... V. lanceolata var. vittata

2 Leaf blades < 1.5 x as long as broad.

2 Leaf blades completely glabrous (petioles may be villous); [of wet, acidic seepage or swampy woods, often with Sphagnum] ...................................................... V. macloskeyi var. pallens

5 Leaf blades pubescent, at least on the upper surface of the basal lobes; [of wet to more mesic situations].

6 Lateral petals glabrous within; petals and peduncles usually reddish-tinted; leaf apex acute; basal lobes of the leaf often overlapping; pubescence of the upper leaf surface often restricted to the basal lobes; [of mesic, often nutrient-rich forests] ...................................................... V. blanda

6 Lateral petals bearded within; petals and peduncles green; leaf apex obtuse to rounded; basal lobes of the leaf not overlapping; pubescence of the upper leaf surface usually widespread; [of mesic to wet situations] ................................................................. V. incognita

1 Corollas yellow; leaf blades rotund, lie nearly flat on ground ................................................................. V. rotundifolia

1 Corollas violet to bluish-purple, leaves various (flat on ground only in some V. villosa and V. hirsuta).

2 Leaf blades deeply divided throughout, or lobed basally, or deeply toothed basally (beware that in V. pedata the earliest 1-2 leaves may be uncut and cordate, to shallowly lobed.

3 Blades either divided, lobed, or deeply toothed only on basal portion, or blades incised only in distal half.

3 Blades either divided, lobed, or deeply toothed only on basal portion.

4 Orange stamens conspicuously exert and beak-like; blades incised only in distal half or only apically ............... V. pedata var. 1

4 Stamens not visible, not exert; blades divided, lobed, or deeply toothed only on basal portion.

5 Blade outline oblong-lanceolate to ovate-triangular, much longer than wide.

6 Petioles distinctly shorter than blades; petiole blunt, basal teeth undeveloped or with a few coarse teeth on mature leaves........................................................................................................ V. sagittata var. ovata

6 Petiole equal or longer than blades; blades glabrous or glabrate, apex acute; basal teeth well developed, very coarse to lobe-like........................................................................................................ V. sagittata var. sagittata

5 Blade outline ovate to subrotund, about as wide as long.

7 Plant moderately to densely pubescent, at least on petioles and undersurface of leaves; mature leaves trilobed; [of mesic to dryish woods]............................... V. palmata

7 Plant glabrous or glabrate (hairs on leaf margins or atop lobes).

8 Mature leaves trilobed, with 1 (-2) reniform or obovate lobes on each side; spurred petal glabrous; [of small blackwater streamssides and floodplains] ......................... V. esculenta

8 Mature leaves deeply lobed with 2-3 lanceolate lobes on each side; spurred petal bearded; [of mesic to moist pine savannas and pocosin ecotones] ................................................................. V. septemloba

3 Blades deeply divided throughout into linear or lanceolate segments (or with several narrow lateral segments and a broadly lanceolate central segment), blades about as broad as long, or broader.

9 Lateral petals glabrous within; orange stamens conspicuously exert and beak-like........................................ V. pedata var. pedata

9 Lateral petals bearded; stamens not visible, not exert.

10 Central lobe of leaf blade mostly 1-2.5 × the width of the first lateral lobes.

11 Blades pubescent, divisions mostly 7-11; [midwestern, disjunct to shale barrens of western VA] .................... V. pedatifida

11 Blades glabrous or glabrate, divisions 5-11; [either of limestone glades or of Coastal Plain woodlands].

12 Blade divisions 7-11; [of Coastal Plain, moist to mesic hardwoods along rivers or streams] ................. V. brittoniana

12 Blade divisions 5-9; [of inland regions, dry limestone glades or barrens] .................................................... V. egglestonii

10 Central lobe of leaf blade mostly 3-4 × the width of the first lateral lobes.

13 All leaves homophyllous, the early ones not ovate, rotund, or cordate; blades pubescent; [of Piedmont and Mountains] ................................................................. V. subsinuata

13 Leaves heterophyllous, the early ones ovate, rotund, or cordate, the mature ones divided; blades pubescent or glabrate; [of various distributions].

14 Blades and petioles moderately to densely pubescent; lowestmost lobe directed outward parallel to ground; [primarily of pine savannas on Coastal Plain] ......................... V. palmata

14 Blades glabrous or glabrate; lowestmost (outermost) lobe on each half of blade usually directed downward towards ground; [primarily of pine savannas on Coastal Plain] ......................... V. septemloba

2 Leaf blades merely serrate or crenate on margin; ovate to subrotund in outline, cordate or truncate basally.

15 Most or all blades longer than broad, narrowly ovate to long-triangular, tapering to an acute apex.

16 Blades and petioles moderately to densely pubescent; leaves distinctly longer than wide; to xeric clearings and banks ..................

16 Blades and petioles glabrous or glabrate.

17 Lateral petals bearded with clavate hairs; spurred petal glabrous within; [of swamps, seepages, bogs, and sphagnum streamssides].

17 Lateral petals with hairs of essentially uniform width; spurred petal bearded within.

18 All leaf teeth uniform; leaf bases cordate; [of mesic woods to moist seepages to streamssides] ............. V. sororia var. missouriensis

18 Basal teeth longer than others; leaf bases truncate to subcordate (ignore earliest 1-2 leaves).

19 Leaf outline broadly triangular, not much longer than wide; basal teeth of the leaf numerous; ± pectinate .... V. brittoniana

19 Leaf outline narrowly ovate-triangular, much longer than wide; basal teeth of the leaf few, very coarse ..................... V. sagittata var. sagittata

15 Blades as wide as long or wider, ovate to suborbicular, apex obtuse (to acute).

20 Lateral petals bearded with clavate hairs; foliage glabrous or glabrate.
21 Petals light blue or light blue-violet, with a dark eye (also with dark veins); sepals 8-12 mm long; no plants in population with lobed blades; [mostly Piedmont and Mountains, rare in Coastal Plain] .......................................................... V. cucullata

21 Petals blue-violet with a white eye (also with dark veins); sepals 6-7(-8) mm long; at least some plants in population with trilobed leaves; [mostly Coastal Plain, inhabiting small blackwater floodplains and streambeds] .......................................................... V. esculenta

20 Lateral petals beard and hairs of uniform width; foliage distinctly pubescent, glabrate, or glabrous.

22 Leaf blades moderately to densely pubescent on one surface or both, and on petioles.

23 Leaf blades equally pubescent on both surfaces.

24 Leaf blades large, apex acute, carried aloft on long petioles, deciduous; peduncles shorter than to equaling petioles .......................................................... V. sororia var. sororia

24 Leaf blades small, apex very blunt or rounded, lie almost flat on ground; evergreen or tardily deciduous; peduncles much longer than petioles .......................................................... V. villosa

25 Leaf blades much more pubescent on one surface than the other.

26 No plants with lobed leaves; spurred petal glabrate or glabrous, or densely beard; [collectively widespread].

27 At least some plants in population with trilobed leaves; [southern and mainly Coastal Plain, of small blackwater streamsides and floodplains] .......................................................... V. esculenta

27 No plants with lobed leaves; spurred petal glabrate or glabrous, or densely beard; [collectively widespread].

28 Spurred petal densely beard; leaf blades reniform; [northern, ranging south to PA and WV, of fens and swamps in alkaline soils] .......................................................... V. nephrophylla

28 Spurred petal glabrous or glabrate; leaf blades ovate to widely triangular; [widest, of mesic slopes to moist floodplains] .......................................................... V. sororia var. sororia

Viola blanda Wildenow, Sweet White Violet. Mt (GA, MD, NC, SC, VA, WV), Pd (DE, MD, NC, VA): moist, rich forests; common (uncommon in Piedmont). NH and QC west to MN and ne. ND, south to DE, MD, w. NC, n. GA, e. TN, OH, IN, IL, and e. IA. [= F, G, S, WV; < V. blanda – RAB, C, W, X (also see V. incognita); = V. blanda var. blanda – K, V]

Viola brittoniana Pollard. Cp (DE, SC, NC, VA, WV): low ground, including brackish areas; uncommon. April-May. MA to SC, along the coast. [= V, Y; > V. brittoniana Pollard var. brittoniana – RAB, G, K; > V. brittoniana Pollard var. pectinata (Bicknell) Alexander – RAB, G, K; < V. palmata var. palmata – C; > V. brittoniana – F; > V. pectinata Bicknell – F; = V. pedatifida G. Don spp. brittoniana (Pollard) McKinney – K; = V. brittoniana – V, Y]

Viola canadensis Linnaeus var. canadensis, Tall White Violet. Mt (GA, MD, NC, SC, VA, WV), Pd (NC, VA): rich cove forests, other rich mesic situations, such as floodplains; common. April-July. NL (Newfoundland) to ON, south to GA, AL, TN, and AR. Other varieties are more western. [= RAB, C, K, V, > > V. canadensis var. rugulosa (Greene) C.L. Hitchcock – RAB, C; misapplied as to plants in our area; = F. canadensis – F, G, S; < > V. rugulosa Greene – G, misapplied as to our plants; < V. canadensis – W, X]

Viola incognita Brainerd. Mt (NC, VA, WV): moist to wet forests; rare. April-June. NL (Labrador) to MN, south to DE, PA, and WI, and in the Appalachians south to w. NC. [= S, WV; < V. blanda – RAB, C, X; > V. incognita var. incognita – F, G; > V. incognita var. forbesii Brainerd – F, G; = V. blanda Wildenow var. palustriformis A. Gray – K, V]

Viola labradorica Schrank, American Dog-violet. Mt (GA, MD, NC, SC, VA, WV), Pd (DE, MD), Cp (FL, GA, VA): moist alluvial woodlands and forests, seepsage slopes, marsh ravines, hammocks; uncommon (rare in FL, GA, and WV). Late March-May. NL (Labrador) west to AK, south to e. VA, nw. SC, n. GA, c. AL, and OH; disjunct in sw. GA and Panhandle FL.
Ballard (1992) concluded that *V. conspersa* was not distinct from *V. labradorica*. [= K, V, X; > *V. conspersa* Reichenbach – RAB, C, F, G, GW, S, W, WV]

**Viola lanceolata** Linnaeus var. lanceolata, Lanceleaf Violet. Cp (AL, DE, FL, GA, MD, NC, SC, VA), Pd (DE, NC), Mt (VA, WV): wet habitats; common (uncommon in Piedmont and Mountains). March-May. NB west to MN, south to FL and e. TX. [= C, F, V; < *V. lanceolata* – RAB, W, X; > *V. lanceolata ssp. lanceolata* – GW, K; = *V. lanceolata* – G, S, WV]

**Viola lanceolata** Linnaeus var. vittata (Greene) Weatherby & Griscom, Strap-leaf Violet. Cp (GA, NC, SC, VA): wet pinemadows, depressions, ponds and wetlands; common. February-May. SE. VA south to FL, west to e. TX. [= C, F, V; < *V. lanceolata* – RAB, W, X; > *V. lanceolata ssp. vittata* (Greene) Russell – GW, K; = *V. vittata* Greene – G, S]

**Viola macloskeyi** F. Lloyd var. pallens (Banks ex A.P. de Candolle) C.L. Hitchcock, Wild White Violet. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (FL, DE, GW, S, WV): brookbanks, seepages; uncommon (rare in DE). NL (Labrador) west to NT, south to GA, AL, MS, MO, SD, CO, UT, NV, and CA. Perhaps better recognized at the specific level, as *V. pallens*, which seems distinct from the narrowly distributed *V. macloskeyi*, of CA, OR and e. NV. Ballard et al. (2001) suggest that Hispaniolan *V. domingensis* Urban is conspecific with *V. macloskeyi sensu lato*. [= RAB, C; > *V. pallens* (Banks ex A.P. de Candolle) Brander – F, G, GW, S, WV; > *V. pallens var. pallens* – G; > *V. pallens var. subspp. Roussetiae – G; > *V. macloskeyi sensu stricto* (Banks ex A.P. de Candolle) M.S. Baker – F, G, S, W, WV; < *V. macloskeyi* F. Lloyd – X]

**Viola nephrophylla** Greene, Northern Bog Violet. Mt (WV): bogs; rare. May. NL (Newfoundland) and YT south to PA, WV, IN, IL, LA, TX, and CA. [= C, F, G, K, V, WV]

*Viola odorata* Linnaeus, Sweet Violet, English Violet. Pd (NC, VA), Mt (NC), Cp (LA), (GA): gardens, lawns, disturbed places, persistent or weakly spreading from horticultural use; rare, native of Europe. [= C, F, G, K, S, V, Z]

**Viola palma** Linnaeus, Wood Violet. Mt (AL, GA, MD, NC, SC, VA, WV), Pd (AL, DE, GA, NC, SC, VA), Cp (FL, DE, GW, S, WV, WV): moist forests; common (uncommon in DE). ME west to WI, south to FL, AL, MS, and LA. [= V, X; > *V. palma* var. palma – RAB, WV; > *V. palma* var. triloba (Schweinitz) Ginges ex A.P. de Candolle – RAB, WV; < *V. palma* var. palma – C; > *V. triloba* Schweinitz var. triloba – F, G, K; > *V. stoneana* – F, G; > V. palma – F, G, S, W, in the narrow sense; > *V. chalcosperma* Brander – F, S; < V. splalma Linnaeus (pro sp.) – K; = V. triloba Schweinitz – S, W]

**Viola pedata** Linnaeus var. pedata, Bird’s-foot Violet. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): dry rocky or sandy forests, glades, and roadbanks; common (uncommon in GA, NC, and SC Coastal Plain, rare in DE). March-May; May-June. NH, NY, MI, WI, MN, and ND south to s. GA, s. AL, s. MS, s. LA, and e. TX. [= V. pedata – C, W; < V. pedata – RAB, K, S, V; > V. pedata var. pedata – F, G, WV; > V. pedata var. lineariloba A.P. de Candolle – F, G, WV; > *V. pedata var. pedata* – X; > V. pedata var. ranunculifolia (Jussieu ex Poiret) Ginges ex A.P. de Candolle – X]

**Viola pedata** Linnaeus var. 1, Sandhiills Bird’s-foot Violet. Cp (NC, SC): sandhills; uncommon. (distribution) [= V. pedata var. ranunculifolia (Jussieu ex Poiret) Ginges ex A.P. de Candolle – X, probably misapplied; < V. pedata, K, S, V]

**Viola pedatifida** G. Don, Crowfoot Violet. Mt (VA): shale barrens; rare. April-May. ON west to AB, south to OH, IN, AR, OK, NM, and AZ; disjunct in w. VA. [= F, G, K; = *V. palma* Linnaeus var. pedatifida (G. Don) Cronquist – C; = V. pedatifida G. Don sps. pedatifida – X]

**Viola pensylvanica** Michaux, Smooth Yellow Forest Violet. Mt (AL, GA, KY, MD, NC, SC, TN, VA, WV), Pd (DE, MD, NC, SC, VA), Cp (DE, NC, SC, VA): mesic forests; common (rare in DE Coastal Plain). March-May. QC west to MB south to DE, MD, w. NC, GA, AL, AR, and OK. [= WV; = Viola pubescens Aiton var. scabriuscula Schweinitz ex Torrey – K, V, X; = F. eriocarpa (Nuttall) Schweinitz var. leiocarpa Fernald & Wiegand – RAB; < V. pubescens – C, GW; > V. pensylvanica Michaux var. pensylvanica – F; > V. pensylvanica var. leiocarpa (Fernald & Wiegand) Fernald – F; = F. eriocarpa – G, S; = V. eriocarpum (Nuttall) Schweinitz var. leiocarpum Fernald & Wiegand – F; > V. pubescens Aiton var. leiocarpum (Fernald & Wiegand) Seymour]

**Viola primulifolia** Linnaeus, Primrose-leaf Violet. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): bogs, wet savannas, poecis, moist organic soils along small streams; common. March-May. NL (Newfoundland) to ON, south to FL, and west to TX and se. OK. [= RAB, C, G, W, S, V, W, WV; > V. primulifolia var. primulifolia – F, G; > V. primulifolia var. acuta (Bigelow) Torrey & A. Gray – F; > V. primulifolia var. villosa Eaton – F, G; = V × primulifolia Linnaeus (pro sp.) (lanceolata × macloskeyi) – K]

**Viola pubescens** Aiton, Hairly Yellow Forest Violet. Mt (MD, NC, TN, VA, WV), Pd (DE, MD, CP (DE): rich deciduous forests; common in WV Mountains, common in WV Piedmont (rare in DE Coastal Plain). March-May. ME and s. QC west to SD, south to DE, NC, TN, MO, and NE. [= G, S, WV; = V. pubescens var. pubescens – K, V, X; = F. eriocarpa (Nuttall) Schweinitz var. eriocarpa – RAB; < V. pubescens – C, GW; > V. pubescens var. pubescens – F; > V. pubescens var. peckii House – F; = V. eriocarpum (Nuttall) Schweinitz var. eriocarpum]

**Viola rostrata** Pursh, Long-spurred Violet. Mt (GA, NC, SC, VA, WV), Pd (VA): mesic forests, often under Tsuga; common. April-May. NH and QC west to WI, south to GA and AL. [= RAB, F, G, K, S, V, W, WV, X, Z]

**Viola rotundifolia** Michaux, Round-leaf Yellow Violet, Early Yellow Violet. Mt (GA, NC, SC, VA, WV), Pd (DE): rich coves; common (rare in DE). March-April. ME to s. ON, south to w. NC, n. GA, and e. TN. [= RAB, C, F, G, K, S, V, W, WV, X]}

**Viola sagittata** Aiton var. sagittata, Arrowhead Violet. Mt (WV), Pd (DE), Cp (DE), (GA, NC, SC, VA): dry to moist forests and woodlands; common in WV and uncommon in DE. April MA west to MN, south to Ga and e. TX. [= K, V, X; = *V. sagittata* – RAB, F, S, W, WV, Y; > *emarginata* (Nuttall) Le Conte var. emarginata – RAB, F, G; > *emarginata var. acutiloba* Brander – RAB, F, G; < *V. sagittata* – C; > V. biflora Hort. & H. Smith – S]

**Viola septemflora** Le Conte. Cp (FL, GA, NC, SC): sandy pinelands; rare. Late March-early May. E. NC south to s. FL, west to LA, mainly on the Coastal Plain. [= F, G, GW, K, S, W, Y; < *V. septemflora* – RAB also see *V. esculenta*; > *V. palma* var. palma – C; > *V. septemflora ssp. septemflora* – X]

**Viola septentrionalis** Greene. Mt (NC, TN, WV): woods moist, woods thickets; rare. NL (Newfoundland) to BC south to PA, w. NC (P. McMillan, pers. comm.). e. TN (Chester, Wofford, & Kral 1997), MI, WI, MT, and WA. [= G, K, W, WV, Y; <
**VIOLACEAE**

560

*Viola* sororia Willdenow var. missouriensis (Greene) L.E. McKinin, Thinleaf Violet, LeConte's Violet. Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swamp forests, wet bottomlands; common. March-May. ME west to se. MN, south to Panhandle FL and e. TX. *Viola sororia* and *var. missouriensis* are not yet satisfactorily understood. The extremes of these varieties (var. *missouriensis*) with blades distinctly longer than wide, and glabrate; *violia* with blades longer than wider than long or equally wide/long, and pubescent) are readily identified. However, too many specimens still cannot be readily keyed. [= X; = V. *affinis* Le Conte – RAB, F, G, GW, S, W, WV; < *V. sororia* – C; > *V. affinis* Le Conte – K, Y; > *V. missouriensis* Greene – K, Y]

*Viola villosa* Walter, Southern Woolly Violet. Cp (FL, GA, NC, SC), Pd (GA, NC, SC), Mt (GA): pocosin ecotones, other sites with moist soils; uncommon. Late February–early April. MD south to n. peninsular FL, west to TX and OK. Reported for VA by Kartesz (1999), on the basis of Massey (1961); report requiring additional documentation. [= RAB, F, G, K, S, X, Y; < *V. villosa* – C (also see *V. hirsutula*)]

*Viola walteri* House var. *appalachiensis* (L.K. Henry) L.E. McKinin, Appalachian Violet. Mt (NC, WV): serpentine barrens, rich cove forests (especially old road beds through coves); uncommon (rare in NC). April-May. PA, MD, and WV south to sw. NC. See Grund & Isaac (2007) and Ballard & Wujek (1994) for discussion of the taxonomy of this species. [= X; = *V. appalachiensis* L.K. Henry – K, WV, Z]

*Viola walteri* House var. *walteri*, Walter's Violet. Mt (GA, NC, SC, VA), Pd (GA, NC, SC), Cp (GA, SC): nutrient-rich woodlands and forests, especially over mafic or calcareous rocks; uncommon (rare in Coastal Plain). March-May. WV. VA west to s. OH and AR, south to n. peninsular FL and e. TX. [= X; = *V. walteri* – RAB, F, G, K, S, W, Z]

208. **LINACEAE** A.P. de Candolle ex Gray 1821 (Flax Family) [in MALPIGHIALES]

A family of about 10–14 genera and 250–350 species, trees, vines, shrubs, and herbs, cosmopolitan. References: Robertson (1971)=Y.

*Linum* Linnaeus 1753 (Flax)

A genus of about 180 species, herbs, of temperate and subtropical areas. References: Rogers (1984)=Z; Rogers (1963)=Y.

1 Petals blue, red, or pink; capsule 5–10 mm long; [section *Linum*].
2 Petals red or pink ........................................................................................................................................................................ *L. grandiflorum*
2 Petals blue.
3 Inner sepals with minutely ciliate margins; stigmas slender, elongate; capsule 6–10 mm long .................................................. *L. usitatissimum*
3 Inner sepals entire; stigmas capitulate; capsule 5–7 mm long.
4 Flowers homostylous (flowers with stigmas at about the level to slightly above the anthers) ........................................... *L. lewisii* var. *lewisii*
4 Flowers heterostylous (some flowers with stigmas below the anthers, others with stigmas well above the anthers) .............. *L. perenne*
1 Petals yellow; capsule 1–4 mm long; [section *Linopis*].
5 Inner and outer sepals all very conspicuously glandular-toothed; annual; leaves with 2 brownish glands flanking the attachment to the stem; styles united basally for (0.2–) 0.5–1.2 (–1.8) mm; [section *Linopis*, subsection *Riga*].
6 Sepals 2.3–3.5 mm long, acute; inflorescence consisting of 1 or more elongate and racemiform branches; dried plants dark, purplish-dotted ........................................................................................................ *L. harperi*
6 Sepals (3.1–) 3.6–5 (–7.3) mm long, acuminate; inflorescence an open panicle; dried plants pale green .................................. *L. sulcatum*
5 Outer sepals entire (very rarely sparsely glandular-toothed), inner sepals entire or sparsely to conspicuously glandular-toothed; perennial; leaves without brownish glands flanking the attachment to the stem; styles free; [section *Linopis*, subsection *Linopis*].
7 Fruit as long as broad or longer, its apex acute, apiculate, or obtuse, (2–) 2.2–3.2 (–3.3) mm long; leaves mostly 1.3–4.3 mm wide.
Leaves (1.2-) 2.3-4.3 (-5.6) mm wide, mostly 25-50 below the inflorescence; sepal of the fruit sparsely but conspicuously ciliate; false sepal incomplete; fruit apex acute, the exposed portions purple.

Leaves (1.0-) 1.3-2.0 (-3.2) mm wide, mostly 50-120 below the inflorescence; sepal of the fruit glabrous; false sepal virtually complete; fruit apex rounded to apiculate, the exposed portions purple or yellow.

Fruit pyriform, (2.0-) 2.3-2.8 (-3.0) mm long, 1.7-2.6 mm in diameter, the apex rounded, the exposed portions purple; seeds (1.6-) 1.7-2.0 (2.1) mm long; anthers averaging 0.8 mm long.

Fruit ovate, (2.8-) 3.0-3.2 (-3.3) mm long, 2.5-3.1 mm in diameter, the apex minutely apiculate, the exposed portions yellow; seeds 2.1-2.4 mm long; anthers averaging 1.2 mm long.

Fruit broader than long, its apex depressed, flattened, or broadly rounded, (1.3-) 1.5-2.1 (-2.3) mm long; leaves mostly 1.9-9.3 mm wide.

Margins of the inner sepals with conspicuous stalked glands; mature fruits of dried specimens usually adhering to the plant.

Margins of the inner sepals glandless, or with a few inconspicuous, sessile glands; mature fruits of dried specimens usually shattering and falling freely.

Inflorescence paniculate, the lower inflorescence branches not elongate, their tips not nearly reaching the tips of the upper inflorescence branches; branchlets striate-ridged; leaves mostly opposite (usually to beyond the midpoint from the base of the plant to the first inflorescence branch).

Inflorescence corymbose; some (at least) of the lower branches of the inflorescence elongate, their tips nearly equaling the tips of the upper inflorescence branches; branchlets terete or nearly so; leaves mostly alternate (usually the opposite leaves of the lower stem not extending beyond the midpoint from the base of the plant to the first inflorescence branch).

**Linum floridanum** (Planchon) Trelease var. *chrysocarpum* Rogers, Yellow-fruited Yellow Flax. Wet savannas. June-October. Se. NC south to s. FL and west to s. MS. [= K, Y, Z; < *L. virginianum var. floridanum* Planchon – RAB; < *L. floridanum* – GW, WH; < *Cathartolinum floridanum* (Planchon) Small – S]

**Linum floridanum** (Planchon) Trelease var. *floridanum*. Florida Yellow Flax. Savannas, sandhill seeps. June-October. E. NC south to s. FL and west to LA, also in the West Indies, essentially limited to the Coastal Plain. [= K, Y, Z; < *L. virginianum var. floridanum* Planchon – RAB (also see *L. floridanum var. chrysocarpum* and *L. intercursum*); < *L. floridanum* – C, F, G, GW, WH; < *Cathartolinum floridanum* (Planchon) Small – S; > *Cathartolinum macrosepaleum* Small – S]

*Linum grandiflorum* Desfontaines, Red Flax. Disturbed areas; native of Africa. [= F, K, WH; = *Adenolinum grandiflorum* (Desfontaines) W.A. Weber]

**Linum harperi** Small, Harper's Grooved Flax. Dry pinelands. This is a rare taxon of longleaf pine woodlands or savannas in w. FL, sw. GA, and c. AL. It is probably distinct from *L. sulcatum* at the species level, needing additional study. [= *L. sulcatum* Riddell var. harperi (Small) Rogers – K, Y, Z; = *Cathartolinum harperi* (Small) Small – S; > *Cathartolinum sulcatum* – WH]

**Linum intercursum** Bicknell, Bicknell's Yellow Flax. Dry to moist places. June-October. MA south to c. TN, nw. GA, and c. AL; from MA to MD, nearly restricted to the Coastal Plain in VA, NC, SC, GA, AL, and se. TN, however it is primarily on the Piedmont and Mountains. It also occurs disjunctively in n. IN near the Great Lakes. [= C, F, G, K, W, Y, Z; < *L. virginianum var. floridanum* (Planchon) – RAB; = *Cathartolinum intercursum* (Bicknell) Small – S]

**Linum lewisii** Pursh var. *lewisii*, Prairie Flax. Calcareous glades and barrens. A western blue-flowered species, ranging from NU west to AK, south to MI, LA, TX, NM, AZ, and CA; disjunct at Smoke Hole Caverns, WV, and several adjacent counties. [= K; < *L. perenne* – C, apparently misapplied to WV material; < *L. lewisii* – F; < *L. perenne* Linnaeus var. *lewisii* (Pursh) Eaton & J. Wright – G; < *Adenolinum lewisii* (Pursh) A. & D. Löve]

**Linum macrocarpum** C.M. Rogers, Spring Hill Flax. Pitcher plant bogs, wet savannas. FL Panhandle west through s. AL and s. MS to se. LA. [= K, WH] [not yet keyed; add synonymy]

**Linum medium** (Planchon) Britton var. *texanum* (Planchon) Fernald, Texas Yellow Flax. Dry to moist places. Var. *texanum* ranges from s. ME, MI, and n. IL south to s. FL and TX, and in the West Indies. Var. *medium* is limited to area around the Great Lakes. [= C, F, GW, K, W, WH, WV, Y, Z; < *L. virginianum var. medium* Planchon – RAB; < *L. medium* – G; < *Cathartolinum medium* (Planchon) Small – S; = *L. medium ssp. texanum* (Planchon) A. Haines]

* Linum perenne* Linnaeus, Perennial Flax. Disturbed areas; native of Europe. Cultivated and "rarely naturalized along roadsides" in scattered locations in PA (Rhoads & Klein 1993) and reported tentatively for VA (Kartesz 1999). [= K; < *L. perenne* – C (also see *L. lewisii var. lewisii*)]

**Linum striatum** Walter, Ridgestem Yellow Flax. Bogs, seepages, other wet places, often growing in *Sphagnum*. June-October. MA, PA, MI, and IL south to Panhandle FL, LA, and e. TX. [= RAB, C, G, GW, K, W, WH, Y, Z; > *L. striatum var. striatum* – F; = *Cathartolinum striatum* (Walter) Small – S]
Linum sulcatum Riddell, Grooved Yellow Flax. Dry calcareous places in the mountains of VA (where also somewhat weedy in adjacent disturbed areas), diabase barrens in the Piedmont of NC. May-August. Primarily a species of the Great Plains of s. MB, ND, and MN south through SD, IA, WI, NE, MO, IL, KS, and MO to OK. L. sulcatum occurs farther east as a rare disjunct on glades or barrens over rocks such as limestone or diabase. [= RAB, C, F, G, W; = Linum sulcatum Riddell var. sulcatum – K, Y, Z; = Cathartolinum sulcatum (Riddell) Small – S; = Mesynium sulcatum (Riddell) A. & D. Löve]
* Linum usitatissimum Linnaeus, Common Flax. Disturbed places; native of Europe. This is the flax of commerce, used both for its fiber, the source of flax, and the oil expressed from its seeds (linseed oil). [= RAB, C, F, G, K, S, WH, WV, Z]
Linum westii C.M. Rogers, West’s Flax. Bogs, margins of flatwoods ponds. Ne. FL; Panhandle FL. [= K, WH] [not yet keyed; add synonymy]

213. PODOSTEMACEAE Richard ex C. Agardh 1822 (Riverweed Family) [in MALPIGHIANAES]
A family of about 47-49 genera and 280 species, aquatic herbs, of tropical, subtropical, and rarely temperate regions of the New World and Old World. References: Graham & Wood (1975); Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007).
Podostemum Michaux 1803 (Riverweed)
A genus of about 7-17 species, reduced aquatic herbs, of tropical to temperate America. References: Graham & Wood (1975)=Z; Philbrick & Crow (1983); Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007).
Identification notes: Podostemum is a curious plant, seeming more like an alga than a vascular plant in color, texture, mode of attachment to substrate (by a fleshy disk), and irregular thalloid branching.
Podostemum ceratophyllum Michaux, Threadfoot, Riverweed. Attached to rocks and dams in rapidly or slowly flowing water. May-July. NS, ME, and QC south to sw. GA, s. AL, s. MS, se. LA (Florida parishes), AR, and w. TN; disjunct in the Ozark-Ouachita Highlands of w. AR and se. OK; Dominican Republic; Honduras. [= RAB, C, F, G, K, W, WV; = L. virginianum var. virginianum – RAB; = Cathartolinum virginianum (Linnaeus) Reichenbach – S]

214. HYPERICACEAE A.L. de Jussieu 1789 (St. John's-wort Family) [in MALPIGHIANAES]
A family of 7-9 genera and 480-560 species, herbs, shrubs, and trees, nearly cosmopolitan. It appears from molecular analysis that recognition of the Hypericaceae may (after all) be warranted. Hypericum is in a clade with Podostemum and Bonnetia, sister to a clade including Clusiaceae s.s. (Savolainen et al. 2000), and unless the morphologically very different Podostemaceae is to be included in a broad Clusiaceae, Hypericaceae and Podostemaceae must be recognized. References: Adams (1973)=Z; Godfrey (1988)=Y; Wood & Adams (1976); Stevens in Kubitzki, Bayer, & Stevens (2007).
Hypericum Linnaeus 1753 (St. John’s-wort)
A genus of 370-420 species, trees, shrubs, and herbs, primarily temperate. Hypericum in our area is a large, complex, and interesting genus, with a number of unresolved questions remaining. The species treated in Key B have often been treated in the segregate genus Ascyrum. Evidence from a variety of disciplines now suggests that they should be included in Hypericum (Adams & Robson 1961; Calie, Schilling, & Webb 1983; Robson 1996). References: Adams (1973)=Z; Godfrey (1988)=Y;
Petals pale pink; stamens fascicled, in 3 fascicles of 3 stamens each; staminodia (hypogynous glands) present, alternating with the fascicles of stamens; perianth 5-merous; ["Triadenum"] Key H

2 Leaves with an articulation at the very base, appearing as a narrow line, groove, or abrupt change of color and texture which extends across the petiole; shrub; [section Myriandra].

3 Capsule 6-9 mm long; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; [section Myriandra, subsections Pseudobrathydi um and Suturosperma] Key F

4 Herb; [section Trigynobrathydi um, and section Myriandra subsection Suturosperma] Key G

Key A1 – shrubby St. John’s-worts with needle-like leaves and flowers with 5 petals and 5 sepals [section Myriandra, subsection Centro sperma]

1 Longest leaves 5-16 mm.

2 Capsules 3-6 mm long; seeds reddish-amber or brown, the alveoli not in distinct longitudinal rows, the seed lacking longitudinal ridges except for the two marginal sutures; primary branches with two ridged or winged angles running the length of the internodes, extending from the leaf midrib (but not the margins) at the base of the paired leaves; leaf surface glossy; [of alfisols and ultisols of wet pine savannas, seepage bogs] H. brachyphyllum

2 Capsules 6-9 mm long; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles running the length of the internodes, extending from the midrib and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry spodosol pine flatwoods] H. tenax

1 Longest leaves 13-30 mm.

3 Plant a low shrub <5 dm tall, more-or-less decumbent, forming dense clumps; inflorescence elongate (flowers at up to 5 nodes); flowers 10-12 mm diameter; [of dry to mesic soils of lower piedmont and inner coastal plain of sc. VA-NC-GA-AL; disjunct to rock outcrops of s GA] H. lloydii

3 Plant an erect shrub 0.5-4 m tall, with single main stem branched above; inflorescence elongate (3-7 nodes) or short (1-3 nodes in H. fasciculatum and H. chapmanii); flowers 13-26 mm diameter; [of wet soils of the Coastal Plain].

4 Undersurface of leaves easily seen on both sides of midrib, veins obvious on undersurface, leaves narrowly oblongate to oblong, 1.5-5 (-7) mm wide; inflorescence elongate (3-7 nodes) H. galioides

4 Undersurface usually not seen except for midrib (leaf margins nearly touch midrib its whole length), if undersurface visible then no veins visible, leaves linear, needle-like, 0.5-1.5 mm wide; inflorescence elongate or short.

5 Plant short, <1 m tall; stem <1 cm wide at base; plant unbranched or few-branched, wand-like with narrow crown; [endemic to FL Panhandle] H. exile

5 Plant tall, normally >0.8 m; stem 1-several cm wide at base; crown broader with many ascending to spreading branches.

6 Young branches, leaves, and sepals strongly glaucous; bark of upper stem and branches silvery gray and smooth; mature plant 2-4 m tall with ascending branches imparting tree-like or vase-like aspect; [restricted to shores of sinkhole ponds in Bay and Washington Counties, FL] H. lissophloes

6 Young branches, leaves, and sepals not glaucous; bark of upper stem and branches not silvery gray and smooth (except some H. chapmanii); mature plants variously shaped.

7 Inflorescence elongate (3-7 nodes); stem bark tight, thin, not exfoliating or exfoliating in narrow strips, not revealing buff or pale cinnamon color; if leaf undersurface is exposed it is distinctly paler than upper surface; [usually associated with flowing water (blackwater streams and impoundments)] H. nidi tum

7 Inflorescence short (1-3 nodes); stem bark corky-thickened to spongy, exfoliating in broad strips or sheets revealing buff or pale cinnamon color; if leaf undersurface is exposed it is about the same color as upper surface; [usually associated with static water (Carolina bays, impoundments, beaver ponds, borrow pits, flatwoods depressions, Cypress-gum ponds)].

8 Mature plant 2-3 (-4) m tall; branches ascending and imparting a tree-like or vase-like aspect (younger plants may be bushy); youngest internodes terete; [of flatwoods depressions and Cypress-gum ponds and stringers of FL Panhandle only] H. chapmanii

8 Mature plant 0.8-1.5 (-2) m tall; branches spreading and imparting a bushy or gumdrop aspect; youngest internodes with distinct winged ridge on either side; [of Carolina bays, impoundments, beaver ponds, borrow pits, widespread] H. fasciculatum
Key A2 – shrubby St. John’s-worts with needle-like leaves and flowers with 5 petals and 5 sepals
[section Myriandra, subsection Centrosperma]

1 Plants < 0.6 m tall, erect, decumbent, or matted and with ascending/erect branches.
2 Longest leaves 5-13 mm; flowers 13-15 mm diameter.
3 Capsules 3-6 mm long; seeds reddish-amber or brown, the aleoii not in distinct longitudinal rows, the seed lacking longitudinal ridges except for the two marginal sutures; primary branches with two ridged or winged angles running the length of the internodes, extending from the leaf midribs (but not the margins) at the base of the paired leaves; leaf surface glossy; [of alfisols and ultisols of wet pine savannas, scupage bogs]...........................................................H. brachyphyllum
4 Capsules 6-9 mm long; seeds dark red to black, the aeleoi in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles the length of the internodes, extending from the midribs and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry spodosol pine flatwoods]...........................................................H. tenuifolium

Longest leaves 11-25 mm; flowers 9-17 mm diameter.
4 Plant unbranched or few-branched, wand-like with narrow crown; [restricted to FL Panhandle flatwoods].........................................H. exile
5 Plant densely branched, bushy with broad crown; [plants of dry to mesic soils of lower piedmont and inner coastal plain of se. VA-NC-SG-GA-AL, disjunct to rock outcrops of s GA]...........................................................H. lloydii

1 Plants > 0.6 m tall, plants erect.
5 Longest leaves 6-13 mm, linear, needle-like, permanently tightly revolute with usually only the midrib showing on underside; flowers 13-15 mm diameter; [s GA-s FL-w LA]...........................................................H. brachyphyllum
6 Longest leaves (12-)15-30 mm, linear and needle-like or narrowly oblanceolate to oblong (H. galoides), permanently tightly revolute with usually only the midrib showing on underside OR margins revolute during drying but leaving considerable exposed undersurface (H. galoides); flowers 13-26 mm diameter.
7 Leaves narrowly oblanceolate to oblong, 1.5-5 (-7) mm wide, margins revolute during drying but leaving considerable exposed undersurface; veins obvious on undersurface; flowers 13-15 mm diameter in elongate inflorescences of 3-7 nodes...........H. galoides
8 Leaves linear, needle-like, 0.5-1.5 mm wide, permanently tightly revolute with usually only the midrib showing on underside, if undersurface visible there are no veins; flowers 14-26 mm diameter, inflorescences elongate or short.
9 Plant short, < 1 m tall; stem < 1 cm wide at base; plant unbranched or few-branched, wand-like with narrow crown; [restricted to FL Panhandle].................................H. exile
10 Plant tall, normally > 0.8 m; stem 1-several cm wide at base; crown broader with many ascending to spreading branches; [collectively more widespread].

Key B – shrubby St. John’s-worts with 4 petals and 4 (rarely 2) sepals
[section Myriandra, subsection Ascyrum]

1 Styles and carpels 3 (rarely 4); leaves (5-) 7-20 mm wide, rounded, subcordate, or cordate-clasping at the base; plant an erect shrub.
2 Leaves rounded or subcordate at the base; [wide spread in our area]...........................................................H. crux-andreae
3 Leaves cordate-clasping at the base; [of e. GA southward]...........................................................H. tetrapetalum
4 Styles and carpels 2 (3 in H. microsepalum); leaves 1-7 mm wide, mostly cuneate (or if rounded the leaves < 8 mm long and 3 mm wide); erect or decumbent shrub.
5 Sepals nearly equal in size; styles 3; [s GA south to n. FL]...........................................................H. microsepalum
6 Pedicels 6-13 mm long, soon reflexed; subtending bractlets located near the last pair of leaves; decumbent shrub, to 2 dm tall ..........H. suffruticosum
7 Pedicels 1-5 mm long, erect; subtending bractlets located midway between the base of the flower and the last pair of leaves; erect or decumbent shrub, mostly 1-15 dm tall.
8 Erect shrub, usually with a single stem, freely branched well above ground level (or from ground level if injured, as by fire, but then the multiple branches still erect rather than decumbent), to 1 m or more tall; leaves usually variable in size and shape, widest near the middle ...........................................................H. hypericoides
9 Decumbent, matted shrub, with several prostrate stems arising from a primary rootstock near ground level, each with numerous erect branchlets, rarely over 3 dm tall; leaves usually relatively uniform in size and shape, widest above the middle ..........H. stragulum

Key C – shrubby St. John’s-worts with broader leaves (mostly lanceolate or oblanceolate) and flowers with 5 petals and 5 sepals

1 Leaves cordate-clasping at the base, ovate; [of s. SC southward]; [section Myriandra, subsection Brathydium]............................H. myrtifolium
HYPERICACEAE

1 Plant a matted, decumbent shrub, 0.5-3 dm tall; leaves 1.5-2.5× as long as wide, without axillary fascicles of leaves; flowers solitary, terminal (or in 3-flowered terminal cymes); petals 10-20 mm long; sepalas 7-15 mm long; shrubs to 1 m tall

2 Flowers 1-3-many in terminal cymes; petals 5-10 mm long; sepalas 1.5-8 mm long; shrubs to 3 m tall

3 Flowers 1-3-7 per inflorescence; capsuleas 6-7-14 mm long; larger leaves 4-7-14 mm wide

4 Flowers 7-many per inflorescence; capsuleas 3-4-5-6 mm long; larger leaves 1-7 (-11) mm wide

5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [widespread]...H. densiflorum

6 Leaves 1.0-3.7 (-4.1) mm wide; [of the Ridge and Valley of nw. GA, c. and nw. AL, and c. TN]...H. interior

Key D – herbaceous St. John's-worts with leaves ascending or appressed, 1-nerved, < 1 mm wide and with a diffuse, racemose inflorescence

1 Leaves cuneate at the base, oblanceolate, oblong, elliptic, or narrowly elliptic; [collectively widespread]; [section Myriandra, subsection Centroserpa]

2 Leaves mostly narrowly oblanceolate, the larger 2-3 cm long, 2-5 (-7) mm wide, mostly 5-10× as long as wide; seeds 0.4-0.8 mm long, dark brown

3 Flowers solitary, terminal (or in 3-flowered terminal cymes); petals 10-20 mm long; sepalas 7-15 mm long; shrubs to 1 m tall

4 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepalas 1.5-8 mm long; shrubs to 3 m tall

5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [widespread]...H. pseudomaculatum

6 Leaves 1.0-3.7 (-4.1) mm wide; [of the Ridge and Valley of nw. GA, c. and nw. AL, and c. TN]...H. interior

Key E – herbaceous St. John's-worts with broad leaves, 3 (-4) locular capsules, stamens connate at base into 3 or 5 fascicles, leaves with black dots as well as translucent glands (except in H. perforatum), and sepalas and/or petals marked with black dots or lines

1 Larger leaves 10-30 mm wide; 1.5-3× as long as wide; auxillary leaf fascicles absent; seeds dark brown, strongly reticulate, 1.5-2 mm long

2 Flowers (1-) 3-7 per inflorescence; capsuleas 6-7-14 mm long; larger leaves 4-7-14 mm wide

3 Flowers 7-many per inflorescence; capsuleas 3-4-5-6 mm long; larger leaves 1-7 (-11) mm wide

4 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepalas 1.5-8 mm long; shrubs to 3 m tall

5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [widespread]...H. densiflorum

6 Leaves 1.0-3.7 (-4.1) mm wide; [of the Ridge and Valley of nw. GA, c. and nw. AL, and c. TN]...H. interior

Key F – shrubby and subshrubby St. John's-worts

1 Plant a matted, decumbent shrub, 0.5-3 (-rarely to 5) dm tall; leaves 1.5-2.5× as long as wide, without auxillary fascicles of leaves; flowers solitary or in small simple cymes; [endemic to rock outcrops at moderate to high elevations in the Mountains of sw. NC, sw. VA, and e. TN]

2 Larger leaves 4-10 mm wide, 3-5× as long as wide; axillary leaf fascicles present in main leaf axils; seeds pale brown, faintly reticulate, 0.4-0.5 mm long

3 Flowers in simple 3-flowered cymes or in compound cymes with up to 8 flowers; sepalas 3 mm long, oblong, obtuse apically; capsuleas ovoid, 8-10 mm long (excluding the styles) and 5-7 mm broad; sepalas 1.8-2.0 mm long, cylindric, sometimes slightly falcate, dull brown when mature

4 Flowers 1.5-10 dm tall; leaves 1.5-5× as long as wide, with or without auxillary fascicles of leaves; flowers in compound cymes; [mostly of the Coastal Plain and Piedmont, very rarely in the Mountains and then at low elevations]; [section Myriandra, subsection Suturosperma]

5 Leaves (1.8-) 2.8-8.3 (-11) mm wide, the widest on a plant always over 4 mm wide; [widespread]...H. pseudomaculatum

6 Leaves 1.0-3.7 (-4.1) mm wide; [of the Ridge and Valley of nw. GA, c. and nw. AL, and c. TN]...H. interior

Key G – herbaceous St. John's-worts with broad leaves, 1-locular capsules, stamens separate or connate at base, but not grouped into fascicles, leaves with translucent dots, without black dots, sepalas and petals with translucent lines or dots only, not marked with black dots or lines

1 Stems and leaves pubescent; [section Trigynobrathys]...H. setosum

2 Petals 6-18 mm long; sepalas 4-10 mm long, with or without black lines (sometimes also black-punctate); capsuleas (3.0-) 4.0-7.4 (-10.0) mm long; [endemic to moderate to high elevations of w. NC, sw. VA, and c. TN]

3 Flowers 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse

4 Flowers 5-14 (-22) flowers per plant...H. punctatum

5 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepalas 1.5-8 mm long; shrubs to 3 m tall

6 Flowers 1.9-2.9 (-5.0) mm long; sepalas with black lines; petals (6.0-) 7.0-9.2 (-11.0) mm long, with black lines and with round black glands scattered over the surface of the petal; longest stamens (4.0-) 6.1-8.5 (-10.0) mm long; cymes relatively many-flowered, (5-) 13-61 (124) flowers per plant...

7 Flowers (3.0-) 5.0-10.0 (-12.0) mm long; sepalas without black lines; petals (5.0-) 11.5-16.1 (-18.0) mm long, without black lines and with round black glands only along the petal margin; longest stamens (8.0-) 10.7-16.3 (-22.0) mm long; cymes relatively few-flowered, (2-) 5-14 (-22) flowers per plant...

8 Flowers 5-14 (-22) flowers per plant...H. graveolens

9 Flowers (1-) 3-7 per inflorescence; capsuleas 6-7-14 mm long; larger leaves 4-7-14 mm wide

10 Flowers 7-many per inflorescence; capsuleas 3-4-5-6 mm long; larger leaves 1-7 (-11) mm wide

11 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepalas 1.5-8 mm long; shrubs to 3 m tall

12 Flowers 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse

13 Flowers 5-14 (-22) flowers per plant...H. punctatum

14 Flowers 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse

15 Flowers 5-14 (-22) flowers per plant...H. punctatum

16 Flowers 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse

17 Flowers 5-14 (-22) flowers per plant...H. punctatum
1 Stems and leaves glabrous.
2 Styles united, persistent as a single straight beak on the capsule; [section Myriandra, subsection Suturosperma].
3 Leaves 3-6 cm long, 4-6× as long as wide, the margins revolute; [plants (in our area) of low elevations in the Coastal Plain]..........................H. adpressum
3 Leaves 3-4 (-5) cm long, 2-3× as long as wide, the margins not revolute; [plants (in our area) of high elevations in the Mountains]..........................H. ellipticum

Key H – “Triadenum”

1 Leaves narrowed to the cuneate or broadly cuneate (rarely truncate) base.
2 Lower leaves sessile; sepals 5-7 mm long, acute (to obtuse); leaves lacking translucent or dark glands or punctae; styles 0.5-1.5 mm long (best seen in fruit)........................................................................................................H. tubulosum
2 Lower leaves petiolate; sepals 3-5 mm long, obtuse; leaves with translucent glands and dark punctae; styles 1.5-3 mm long (best seen in fruit)........................................................................................................H. walteri

Hypericum apocynifolium Small. Mesic bluffs and ravines, ridges and natural levees in floodplains. C. GA, s. GA, and Panhandle FL west to se. AR and e. TX. [= S, V, X, Y; < H. nudiflorum – GW, K, WH, Z]

Hypericum ascyron Linnaeus ssp. pyramidatum (Aiton) N. Robson, American Great St.-John’s-wort. {habitat}. June-August. The species is of e. North America and e. Asia; the North American ssp. pyramidatum occurs from QC west to MN, south to s. PA (Rhoads & Klein 1993), MD (Robson 2000), and WV (Harmon, Ford-Wenzl, & Grafton 2006). [= X; < H. ascyron Linnaeus – K; = H. pyramidatum Aiton – C, F, G] {not yet keyed} {section Roscyna}

Hypericum boreale (Britton) Bicknell, Dwarf St.-John's-wort, Northern St.-John's-wort. Sinkhole ponds in the Mountains, interdune ponds in the outer Coastal Plain, boggy places. NL (Newfoundland) and QC west to w. ON, south to VA, nw. NC (?), OH, IN, and n. IL. Hybrids with H. canadense have been called H. ×dissimilatum Bicknell (pro sp.). [= C, F, G, K, WV; = H. mutilum Linnaeus ssp. boreale (Britton) J.M. Gillett – X]
**Hypericum brachyphyllum** (Spach) Steudel. Ponds and wet pinelands. Se. NC south to s. FL, west to s. MS. Material from se. NC was at one point thought to perhaps represent a new taxon. [= GW, K, V, WH, X, Y, Z; < *H. aspalathoides* – S]

**Hypericum chapmani** W.P. Adams, Apalachicola St. John's-wort, Tree St. John's-wort. Margins of pond-cypress ponds, pond-cypress stringers, often growing with *Cyrilla parviflora* and *Nyssa ursea*. Endemic to Panhandle FL (9 counties). [= GW, K, V, WH, X, Y, Z; < *H. fasciculatum* – S; = *H. arborescens* Chapman]

**Hypericum cistifolium** Lamarck. Pine savannas, wet pine flatwoods. June-August. E. NC south to s. FL, west to e. TX. [= RAB, GW, K, WH, X, Y, Z; = *H. cistifolium* – S, in a narrower sense; > *H. opacum* Torrey & A. Gray – S]

**Hypericum crux-andreae** (Linnaeus) Crantz, St. Andrew's Cross, St. Peter's-wort. Dry forests and woodlands, pine flatwoods. June-October. NY (Long Island) and NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to w. NC and n. GA, also north in the interior to c. TN, s. KY, c. AR, and se. OK. [= GW, K, WH, X, Y, Z; = *H. stans* (Michaux ex Willdenow) W.P. Adams & Robson – RAB, C, V, Z; = *Ascyrum stans* Michaux ex Willdenow – F, G; > *Ascyrum stans* – S; > *Ascyrum cuneifolium* Chapman – S]

**Hypericum densiflorum** Pursh, Mountain Bushy St. John's-wort. Bogs, streambanks, dry to moist forests, rock outcrops, moist forests, pine savannas. June-September. Sw. PA south to n. GA and c. AL in and near the Mountains; NJ south to SC in the Coastal Plain; s. GA west to TX in the Coastal Plain. The related *H. lobocarpum* Gattinger is more western, extending east to TN; the basis for attribution of *H. lobocarpum* to "Blue Ridge, N.C." by Small (1933) is unknown. [= *H. densiflorum* – RAB, C, GW, K, W, WV, X, Z (also see *H. interior*); > *H. densiflorum* var. *densiflorum* – F, G (also see *H. interior*); > *H. densiflorum* Small – S; > *H. glomeratum* Small – S]

**Hypericum denticulatum** Walter, Coppery St.-John's-wort. Savannas, wet pine flatwoods, adjacent ditches, borrow scrapes, blackwater stream shores. July-September. S. NJ south to e. GA ( McIntosh County) ( Sorrie 1998b) on the Coastal Plain; disjunct inland in c. and w. NC, sc. TN, and in s. AL. See discussion under *H. virgatum*. [= K, Q, S; > *H. denticulatum* var. *denticulatum* – RAB, C, F, G, Z; < *H. denticulatum* – GW (also see *H. virgatum*); > *H. denticulatum* ssp. *denticulatum* – X]

**Hypericum dolabriforme** Ventenat, Glade St.-John's-wort. Limestone glades and barrens. In nw. GA (Jones & Coile 1988) and e. TN (Chester, Wofford, & Král 1997); this species should be sought in sw. VA. [= C, F, G, K, S, V, X, Z] [not yet keyed]

**Hypericum ellipticum** Hooker, Pale St.-John's-wort. Swamp forests, wet places along streams. July-August. NL (Newfoundland) and NS west to w. ON, south to NY, DE, MI, and MN, and in the mountains to WV, NC (?) and se. TN (Johnson County) (Chester, Wofford, & Král 1997), and NC (?). The documentation for C’s attribution of *H. ellipticum* to NC is unknown. [= C, F, G, K, V, WV, X]

**Hypericum erythreae** (Spach) Steudel, Georgia St.-John's-wort, Sparse-leaved St.-John's-wort, Grit St.-John’s-wort. Seepage bogs, roadside ditches. Apparently nearly endemic to the Altamaha Grit region of the GA Coastal Plain, extending to Beaufort County, SC (Allison, in press). [= Q] [not yet keyed]

**Hypericum fasciculatum** Lamarr c, Peelbark St.-John's-wort. Wet pine savannas, beaver ponds, upland depression ponds. May-September. E. NC south to s. FL, west to s. MS. [= RAB, GW, K, V, WH, X, Y, Z; = H. fasciculatum – S (also see *H. nitidum* and *H. chapmanii*)]

**Hypericum fraseri** Spach, Fraser's Marsh St.-John's-wort. Bogs, peaty wetlands. July-August. NL (Newfoundland) and QC west to MN, south to NY, PA, w. VA, ne. TN, w. NC, OH, n. IN, and NE. Closely related to *T. virginicum* and reduced to a variety (or included in) that species by some authors. [= *Triadenum fraseri* (Spach) Gleason – C, G, K; = Hypericum virginicum Linnaeus var. fraseri (Spach) Fernal d – F, WV; < T. virginicum – W, Z]

**Hypericum frondosum** Michaux. Rock outcrops and rocky woodland. Late May-July. This species is native and widespread as far east as e. TN (Chester, Wofford, & Kral 1997), GA, and FL. [= C, F, G, K, V, W, WH, Y, Z; = H. aureum Bartram – S; = H. splendens Small – S]

**Hypericum gentianoides** (Linnaeus) Britton, Sterns, & Poggenburg. Pineweed, Orange-grass. Fields, rock outcrops, woodland borders, eroding areas, pond margins, flatwoods. July-October. ME and ON west to MN, south to s. FL and TX. [= RAB, C, F, G, K, WH, WV, X, Z; = Sarothra gentianoides Linnaeus – S]

**Hypericum graveolens** Buckley, Mountain St.-John's-wort. Grassy balds, grassy openings, forests, at high elevations (1200 m or more). July-August. Nw. NC and ne. TN south to sw. NC, a Southern Appalachian endemic. This and the related *H. mitchellianum* (another narrow endemic to the Southern Appalachians) hybr idize, forming local hybrid populations with intermediate characteristics (Culwell 1970). [= RAB, GW, K, S, W, X, Z]

**Hypericum gymnanthum** Engelmann & A. Gray. Clasping-leaf St.-John's-wort. Pine savannas, wet pine flatwoods, sinkhole ponds (Augusta and Rockingham counties, VA), other wet to moist habitats. June-September. S. NJ south to ne. FL, Panhandle FL, west to c. TX, and scattered inland in PA, WV, sc. TN, OH, IN, IL, MO, and e. KS; also disjunct in Guatemala (introduced?). [= RAB, C, F, G, GW, K, S, WH, X, Z]

**Hypericum harperi** R. Keller, Harper's St.-John's-wort. Clay-based Carolina bays, other upland depression ponds, with *Taxodium ascendens*. July-September. E. and c. SC south to sw. GA and e. Panhandle FL. *H. harperi* should be sought in sc. and se. NC, where it may well occur. This species has generally been considered a part of *H. denticulatum* or *H. virgatum*, but Webb (1980) makes a convincing argument for its recognition, including the ecological differentiation and absence of intermediates or hybrids when growing in proximity to *H. denticulatum*. See *H. virgatum* for additional discussion. [= Q, WH, X; < H. denticulatum var. acutifolium – RAB, Z; < H. denticulatum – GW; < H. harperi – K; < H. acutifolium – S]

**Hypericum hypericoides** (Linnaeus) Crantz, St. Andrew's Cross. Dry forests and woodlands. May-August. NJ, w. VA, c. KY, se. MO, and c. OK, south to s. FL and e. TX; also in the West Indies, Mexico, and Central America. [= RAB, C, GW, V, W, WH, Y, Z; > Ascyrum hypericoides Linnaeus var. hypericoides – F, G; > Ascyrum hypericoides Linnaeus var. oblongifolium (Spach) Fernal d – F, G; = H. aureum spp. hypericoides – K, X; > Ascyrum hypericoides Linnaeus – S; > Ascyrum linifolium Spach – S]

**Hypericum lobocarpum** Gatting r. Streambanks, river bottoms, pinelands. C. TN (Chester, Wofford, & Kral 1997) and MS west to s. IL, se. OK, e. TX; credited to SC by Robson (1996), based on specimens debated and dismissed by Adams (1973). Late May-September. [= C, K, S, V, X, Z; = H. densiflorum var. lobocarpum (Gatting r) Svenson – F, G; < H. densiflorum – GW]

Hypericum mitchellianum Rydberg, Blue Ridge St.-John's-wort. Grassy balds, grassy openings, forests, seepages, at moderate to high elevations (generally at 1000-1900 m or more). July-August. W. VA, e. WV, and e. TN south to sw. NC, a Southern Appalachian endemic. Robson (2006) interprets this as a hybrid of H. graveolens and H. punctatum but offers no evidence other than its general morphological intermediacy. [= RAB, C, F, G, GW, K, S, W, WV, Z; = H. ×mitchellianum Rydberg, pro sp. – X]

Hypericum mutilum Linnaeus var. latifolium Fernald, Southern Dwarf St.-John's-wort. Marshes and other wet habitats. June-October. Se. SC south to peninsular FL, west to TX (and, according to F, north to s. NJ). Hybrids with H. canadense have been called H. ×dissimulatum Bicknell (pro sp.). [= F; < H. mutilum – RAB, G, GW, K, S, W, WH, Z; = H. mutilum ssp. latifolium (Fernald) N. Robson – X]

Hypericum nudiﬂorum Michaux ex Willdenow. Streambanks, moist forests. June-July. Se. VA south to Panhandle FL, west to e. TX, s. AR, and se. OK; disjunct in Cumberland Plateau of TN. [= RAB, C, F, G, S, W, WH, V, X, Y; < H. nudiﬂorum – GW, K, Z (also see H. apocynifolium)]

Hypericum pseudacaulatum Bush. Wet, moist, or dry forests. June-September. SC south to Panhandle FL, west to TX, north in the interior to e. TN, c. IL, s. MO, and c. OK. [records east of the Ozarks need to be studied more carefully] [= RAB, C, G, K, S, X, Z; = H. punctatum Lamarr var. pseudacaulatum (Bush) Fernald – F; < H. punctatum Lamarr – WH]

**Hypericum radfordiorum** Weakley ex J.R. Allison, Radfords' St. John's-wort, Brushy Mountain St. John's-wort. Shallow circumneutral soil mats of granitic domes in the Brushy Mountains. Apparently endemic to the Brushy Mountains of Alexander and Wilkes counties, NC. This taxon, included in *H. denticulatum* var. *acutifolium* by Webb (1980), differs from typical *H. virgatum* in being profusely branched from the median and upper nodes (rather than being little if at all branched, and then only from the uppermost nodes), in having leaves with acuminate (rather than acute to obtuse) apexes, and electrophoretically (Webb 1980). Additionally, these plants have numerous bracteal leaves along the inflorescence branches (vs. few or none), the punctate glands of the foliage are large and oval, resembling those of *H. denticulatum* (vs. small and round), and the punctate glands are distributed on the lower leaf surface and stem (vs. lower leaf surface only). It may be notable that these same outcrops are phytogeographically interesting, with other disjunct and weakly differentiated races (see *Allium cuthbertii*). [= < *H. denticulatum* (included in concept of *H. denticulatum* (= *H. denticulatum* var. *acutifolium*, *H. denticulatum* ssp. *acutifolium*) by most earlier authors]

**Hypericum tenuifolium** Pursh, Sandhill St.-John’s-wort. Pine flatwoods, pine savannas, sandhills. June-September. Se. NC south to c. peninsular FL; Panhandle FL and se. AL. Robson (1996) indicates that the older name *H. tenuifolium* Pursh has now been adequately shown to apply to this taxon. [= X; = *H. reductum* (Svenson) W.P. Adams – RAB, GW, K, V, WH, Y, Z; < *H. aspalathoides* Wildenow – S (also including *H. brachyphyllum*)]

**Hypericum tetraptetalum** Lamark. Wet pinelands and in depressional wetlands (open or dominated by *Taxodium ascendens*). E. GA (within a few counties of se. SC), south to s. FL, west to Panhandle FL. [= GW, K, V, WH, X, Y; = *Ascyrum tetraptetalum* (Lamark) Vail – S]

**Hypericum tubulosum** Walter, Southern Marsh St.-John’s-wort. Bogs, peaty wetlands, drawdown sloughs along rivers, drawdown shorelines along man-made reservoirs. August-September. Se. VA south to Panhandle FL, west to LA, and north in the interior to se. and c. TN, s. IL and s. OH. [= RAB; = *Triadenum tubulosum* (Walter) Gleason – C, G, GW, K, WH, Z; = *Hypericum tubulosum* Walter – RAB; = *Hypericum tubulosum* Walter var. *tubulosum* – F; = *T. longifolium* Small – S]

**Hypericum virgatum** Lamark, Straggling St. John’s-wort. Woodlands, rock outcrops, woodland borders. Late June-September. MD west to s. OH, s. IN, and s. IL, south to c. NC, c. SC, sw. GA, Panhandle FL, s. MS, and se. LA. Though treated by most recent authors as a variety of *H. denticulatum*, *H. virgatum* is better considered as a distinct species. Webb (1980) recognized *H. harperi* as a separate species (it had previously been considered a part of *H. virgatum*), and continued to recognize this taxon as a variety of *H. denticulatum*. However, based on the nature of the punctate glands, size of seeds, inland distribution, etc., it appears that *H. virgatum* is more distantly related to *H. denticulatum* and *H. harperi* than they are to one another; recognition at the species level is warranted for *H. virgatum*. As pointed out by Webb, *H. denticulatum* is primarily tetraploid (n = 24), while *H. virgatum* and *H. harperi* are (as far as is known) strictly diploid. Additionally, the aberrant populations from granitic outcrops in the Brushy Mountains of Alexander and Wilkes counties, NC referred by Webb (1980) to this taxon are distinct, and more closely allied to *H. denticulatum* and *H. harperi*; see *Hypericum radfordiorum* for additional discussion. [= K; < *H. denticulatum* Walter var. *acutifolium* (Elliott) Blake – RAB, C, F, G, W, Z (also see *H. harperi*); > *H. denticulatum* var. *recognitum* Fernald & Schubert – RAB, F, WV; < *H. denticulatum* Elliott – S (also see *H. harperi*); = *H. denticulatum* ssp. *acutifolium* (Elliott) N. Robson – X]

**Hypericum virginicum** Linnaeus, Common Marsh St.-John’s-wort. Bogs, peaty wetlands. July-September. NS west to OH and s. ON, south to s. FL and MS, mostly on the Coastal Plain but scattered inland. [= RAB; = *Triadenum virginicum* (Linnaeus) Rafinesque – C, G, GW, K, S, WH; = *Hypericum virginicum* Linnaeus – RAB; = *Hypericum virginicum* var. *virginicum* – F, WV; < *T. virginicum* – W, Z (also see *T. fraseri*)]

**Hypericum walteri** J.G. Gimelin, Walter’s Marsh St.-John’s-wort. Swamp forests and marshes. August-September. MD south to n. peninsular FL, west to c. TX, and north in the interior to s. MO, s. IL, and OH. [= RAB; = *Triadenum walteri* (J.G. Gimelin) Gleason – C, G, GW, K, WH, Z; = *Hypericum tubulosum* Walter var. *walteri* (J.G. Gimelin) Lott – F, WV; = *T. petiolatum* (Walter) Britton – S]
215. GERANIACEAE A.L. de Jussieu 1789 (Geranium Family) [in GERANIALES]

A family of about 5-11 genera and 700-835 species, herbs and shrubs, mostly temperate. References: Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007).

1 Leaves pinnately cleft or compound; fertile stamens 5, staminodia 5................................................................. Erodium

1 Leaves palmately cleft or compound; fertile stamens 10 (except in G. pusillum, and note that anthers are readily deciduous in all species) ....

Geranium bicknellii Britton, Northern Cranebill, Bicknell’s Crane’s-bill. Mt (WV): open woods and clearings; uncommon. July-September. NL (Newfoundland) and AK south to PA, WV, c. TN, IN, IL, MO, CO, UT, and CA. [= C, G, K, W; G. bicknellii var. bicknellii – F]

Geranium carolinianum Linnaeus var. confertiflorum Fernald, Northern Carolina Crane’s-bill. Mt (NC, VA), Pd (VA). [DE]: fields, roadsides, lawns, gardens, disturbed areas; common. March-June (and sometimes later). ME and MN, south to DE and MO, and in the mountains to w. NC and e. TN. [= C, G, F, < G. carolinianum – RAB, S, W; < G. carolinianum var. carolinianum – K]

* Geranium robertianum Linnaeus, Herb Robert. Mt (VA, WV), Pd (DE): rocky woodlands, especially over calcareous rocks; uncommon (rare in VA and WV). June-October. Circumpolar, ranging south in North America to w. VA, nc. TN (Chester, Wofford, & Kral 1997), OH, IN, and IL. Considered by C and G to be introduced in North America, but apparently native. [= C, F, G, K, S, W, WV]

* Geranium ibericum Cavanilles, Iberian Crane’s-bill. Mt (NC): rare, spread from horticultural use, native of Europe. Recently found in Great Smoky Mountains National Park, in both NC and TN (K. Langdon, pers. comm.). [= F, K; ? G. nepalense – C] [not yet keyed]

* Geranium sanguineum Linnaeus, Blood-red Crane’s-bill. Mt (NC): roadbank, rare, probably persistent or spread from cultivation. [= C, F, G, K, S] {not yet keyed; add to synonymy}

* Geranium sibiricum Linnaeus, native to Asia, is naturalized south to s. PA (Rhdos & Klein 1993) and is likely to occur in at least the northern part of our area. [= C, F, K]

219. LYTHRACEAE J. St.-Hilaire 1805 (Loosestrife Family) [in MYRTALES]

A family of about 27-35 genera and about 600 species, herbs, shrubs, and trees, primarily tropical (a few warm temperate). References: Graham (1975)–Z; Graham in Kubitzki, Bayer, & Stevens (2007). Keys adapted, in large part, from Z. [including PUNICACEAE and TRAPACEAE]
A genus of about 260 species, herbs, of America, primarily tropical and subtropical. References: Graham (1975) = Z; Graham in Kubitzki, Bayer, & Stevens (2007). Key based in part on Y.

1 Style included (when in fruit), thick, 0.5–1.0 mm long (much shorter than the ovary); calyx lobes obtuse, with the apices minutely mucronate; petals 0, 1, or 4, pale pink to white, to 1 mm long and 1 mm wide ................................................................. *A. latifolia*

1 Style exerted (when in fruit), filiform, 1.5–3.0 mm long (equal to or longer than the ovary); calyx lobes triangular, with acute apices; petals 4 ................................................................. *A. robusta*

2 Inflorescence sessile; flowers usually 1–3 per axil; petals pale lavender; anthers yellow; fruits 4–6 mm in diameter ................................................................. *A. coccinea*

2 Inflorescence usually a short- or long-pedunculate cyme (sometimes reduced); flowers usually > 3 per axil; petals deep rose-purple; fruits 3.5–5 mm in diameter ................. *A. auriculata*

2 Floral tube green, 4.5–6 mm long, glabrous inside; stamens much shorter than the floral tube; petioles to 8 mm long, often very short ........................................ *A. latifolia*

2 Floral tube purple-green, 6–10 mm long, villous inside; stamens much shorter than the floral tube; petioles to 8 mm long ........................................ *A. coccinea*

2 Floral tube (hypanthium) symmetrical; capsule dehiscing septicidally at the apex ................................................................................................. *Ammannia*

2 Floral tube (hypanthium) swollen obliquely at its base; capsule dehiscing longitudinally along the upper surface .................................................. *Cuphea*

2 Floral tube cylindrical to turbinate, about 2× as long as wide ................................................................. *Lythrum*

2 Leaves opposite (none whorled); pedicels < 3 mm long; [collectively widespread] ................................................................. *C. aspera*

2 Leaves whorled (at least in part); pedicels > 10 mm long; [flatwoods of FL Panhandle] ................................................................. *C. carthagenensis*

2 Leaves or fruits solitary in the leaf axils (never > 1 per axil) .................................................................................. *Didiplis*

2 Capsule indehiscent; petals 0; sepals 4, broadly triangular, lacking intersepalary appendages; seeds spatulate or oblancoate, about 1 mm long, minutely granular on one face and smooth on the other ........................................................................... *Didiplis*

Cuphea P. Browne 1756 (Waxweed)

1 Leaves opposite (none whorled); pedicels < 3 mm long; [collectively widespread] ................................................................. *C. aspera*

1 Leaves or fruits solitary in the leaf axils (never > 1 per axil) .................................................................................. *Didiplis*

2 Floral tube purple-green, 6–10 mm long, villous inside; stamens equal to or exceeding the floral tube; petals to 20 mm long ................. *C. viscosissima*

Cuphea aspera Chapman, Alapachicola Waxweed. Flatwoods. Endemic to the FL Panhandle (Franklin, Gulf, and Calhoun counties). = K, WH, Z; = *Parsonia lythroides* Small – S
* **Cuphea carthagenensis** (Jacquin) J.F. Macbride, Colombian Waxweed. Marshes, ditches, floodplain forests, wet hammocks, other wet places; native of South America. June-September. [= GW, K, WH, Z; = C. carthagensis – RAB (a misspelling); = *Parsonisia balsamana* (Chamisso & Schlechtendahl) Standley – S]

* **Cuphea procumbens** Gómez Ortega is reported for NC by Small (1933). Graham (1975) considers this Mexican species to be represented in se. United States only by "garden escapes that do not persist." [= K, Z; = *Parsonisia procumbens* (Gómez Ortega) Heller – S] {not keyed; not mapped}

* **Cuphea viscosissima** Jacquin. Dry or wet places. July-October. NH west to IA and KS, south to c. GA, LA, and e. OK. [= RAB, C, GW, K, W, WV, Z; = *C. petiolata* (Linnaeus) Koehne – F, G; = *Parsonisia petiolata* (Linnaeus) Rusby – S]

**Decodon** J.F. Gmelin 1791 (Water-oleander, Water-willow)

**Decodon verticillatus** (Linnaeus) Elliott, Water-oleander, Water-willow, Swamp Loosestrife, Peatweed. Natural lakes, limesink ponds, peatlands, peaty swamps, not known in the Piedmont or Mountains of NC or SC, but scattered in the Ridge and Valley of VA. July-September. NS, ON, and MN south to c. peninsular FL and e. TX. The lower stems are spongy in texture. [= RAB, GW, K, S, WH, WV, Z; = *D. verticillatus* var. verticillatus – C, F, G; = *D. verticillatus* var. laevigatus Torrey & Gray – C, F, G]

**Didiplis** Rafinesque 1833 (Water-purslane)

**Lagerstroemia** Linnaeus 1759 (Crape-myrtle)

**Lythrum** Linnaeus 1753 (Loosestrife)

1 Flowers numerous in terminal spike-like thyrse; stamens usually 12; leaves opposite or whorled................................................................. **L. salicaria**
1 Flowers solitary or paired in axils; stamens usually (4-) 6; leaves opposite or alternate.
2 Annual; flowers present in nodes more-or-less throughout the plant; flowers homostylous, all alike, the stamens always included .................

............................................................................................................................. ...........................................................................

2 Perennial by basal stoloniﬂerous outshoots; flowers present only at upper nodes; flowers heterostylous (either with an exserted style and included stamens, or vice versa)
3 Leaves opposite throughout, mostly shorter than to as long as the internodes, 1-4 mm wide......................................................... **L. hyssopifolia**
3 Leaves opposite below, alternate above, mostly longer than the internodes, 2-14 mm wide.
4 Floral tube 3-4 mm long; petals 2-3 mm long; calyx appendages about the same length as the calyx lobes; branch leaves abruptly and definitely reduced in size relative to the stem leaves, and widely spaced; [of sw. GA southward].............................................. **L. curtissii**
4 Floral tube 5-6 mm long; petals 5-6 mm long; calyx appendages about 2× as long as the calyx lobes; branch leaves gradually reduced relative to the stem leaves, dense and overlapping; [collectively widespread in our area].
5 Leaves ovate to lanceolate, widest at a point 1/6 to 1/2 of the way from the base to the apex, the base rounded to subcordate; stems mostly slender, to 8 dm tall; bracteoles mostly at the base of the pedicel ......................................................... **L. alatum**

Lythrum curtissii Fernald, Curtiss's Loosestrife. Calcareous swamps, seepage areas. June-early September. Sw. GA south to Panhandle FL, and disjunct in ne. FL; the report from Emanuel County, GA (Jones & Coile 1988) is in error. [= GW, K, S, WH, Z]

Lythrum hyssopifolia Linnaeus, Annual Loosestrife. Salt marshes, other wet soils; probably only adventive from Eurasia, but sometimes interpreted as native from ME to NJ. June-September. [= C, F, G, K]

Lythrum lanceolatum Elliott, Southern Winged Loosestrife. Moast to wet places. May-September. Se. VA, se. NC, SC, GA, AL, MS, n. AR, and OK south to s. FL, s. TX, and in the West Indies. Although Graham (1975) argues that L. lanceolatum should be reduced to a variety of L. alatum, her evidence can also be interpreted as warranting specific status. [= RAB, F, S; = L. alatum Pursh var. lanceolatum (Elliott) Torrey & A. Gray ex Rothrock – C, G, GW, K, WH, Z; = L. alatum ssp. lanceolatum (Elliott) A. Haines – Y]

Rotala Linnaeus 1771 (Toothcup)

A genus of about 44 species, wetland herbs, of temperate to tropical areas, closely related to Didiplis. References: Graham (1975)=Z; Graham in Kubitzki, Bayer, & Stevens (2007).

1 Leaves linear to oblanceolate, > 3× as long as wide........................................................................................................... R. ramosior
1 Leaves broadly elliptical to orbicular, < 1.5× as long as wide ........................................................................................................... R. rotundifolia

Rotala ramosior (Linnaeus) Koehne, Toothcup. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): marshes, ditches, exposed drawerdown muds and slits; common (uncommon in VA Mountains). June-October. VT, NY, ON, MI, WI, MN, SD, MT, and BC, south to s. FL, TX, AZ, CA, and south through Mexico to Central America and , South America; West Indies. [= RAB, C, GW, K, S, W, WH, Z; > R. ramosior var. ramosior – F; > R. ramosior var. interior Fernald & Griscom – F, G]

* Rotala rotundifolia (Buchanan-Hamilton) Koehne, Dwarf Rotala, Roundleaf Toothcup. Disturbed wet areas, perhaps just a waif; native of Asia. March-August. [= K2, WH]

Trapa Linnaeus 1753 (European Water-chestnut)
A genus of 1 highly polymorphic or up to 45 more narrowly defined species, annual aquatic herbs, native of the Old World. Often placed in a monogeneric family, Trapaceae, but *Trapa* is deeply embedded phylogenetically in Lythraceae (Graham, Diazgranados, & Barber 2011). References: Angiosperm Phylogeny Group (2003, 2009); Graham in Kubitzki, Bayer, & Stevens (2007).

**LYTHRACEAE**

A family of about 18 genera and 655 species, herbs, shrubs, and rarely trees, cosmopolitan (especially of temperate and subtropical America). References: Wagner, Hock, & Raven (2007); Munz (1965)=X; Crisci et al. (1990).

**220. ONAGRACEAE** A.L. de Jussieu 1789 (Evening-primrose Family) [in MYRTALES]

A family of about 18 genera and 655 species, herbs, shrubs, and rarely trees, cosmopolitan (especially of temperate and subtropical America). References: Wagner, Hock, & Raven (2007); Munz (1965)=X; Crisci et al. (1990).

1 Flowers 2-merous, the petals white; fruits with uncinate trichomes; leaves opposite, decussate, borne spreading at right angles to the stem, mostly ovate, on petioles mostly 0.5-8 cm long; [subfamily Ongroideae; tribe Cicerceae]........................................................................................................ 2. Circae

2 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; [subfamily Ongroideae; tribe Ongregeae]........................................................................................................ 5. Oenothera

3 Stems, leaves, capsules, and calyx densely hirsute; seeds dark reddish-brown, 0.3-0.4 mm long.................................................. 3. Chamerion

4 Leaves all alternate; flowers numerous in a terminal raceme (with small bracts); flower buds reflexed, the flowers held horizontally or ascending; petals 10-20 mm long; stigma 4-lobed; plants 10-30 dm tall................................................. 3. Chamerion

5 Calyx tube not extended beyond the summit of the ovary; seeds persistent on the capsule (rarely deciduous); stamens 4, 8, or 10-14; petals yellow or absent; [primarily of wetlands]; [subfamily Onagioideae].............................................................................................. 1. Ludwigia

6 Leaves all or at least the lowermost opposite; flowers few, axillary, or in poorly developed, leafy racemes; flower buds not reflexed, the flowers ascending; petals 2-8 mm long (except 10-15 mm long in *E. hirsutum*); stigma capitate (except 4-lobed in *E. hirsutum*); plants 1-20 dm tall .......................................................... 4. Epilobium

7 Stems, leaves, capsules, and calyx glabrous to sparsely puberulent; seeds tan, 0.4-0.8 mm long. 

**1. Ludwigia** Linnaeus 1753 (Seedbox, Water-primrose, Water-purslane)

Identification notes: Many natural hybrids are known, not necessarily in our area. Hybrids are generally recognizable from their intermediate morphology and usual association with their two parents. However some hybrids resemble one parent much more than the other, and some hybrids are found in populations independent (and even disjunct) from one or both parents. Alloployploidy may have had a major role in the evolution of this genus, especially section Microcarpium, which has a majority of polyploid species.

1 Leaves opposite; plants creeping (rooting at the nodes); [section Dantia] ................................................................................................. Key A

1 Leaves alternate; plants erect or ascending (not rooting at the nodes), or creeping (rooting at the nodes).

2 Stamens 8-14; sepals 4-7; petals 4-7; [of various habits, including annual and perennial herbs and shrubs, variously erect, ascending, creeping, or forming floating mats].......................................................... Key B

2 Stamens 4; sepals 4; petals 0-4; [perennial herbs, with erect ascending flowering stems] .......................................................... Key C

Key A – *Ludwigia* with opposite leaves

1 Pedicels of flowers and fruits 5-35 mm long.

2 Petals 7-11 mm long; pedicels of capsules 15-35 mm long, longer than the leaves.......................................................... L. arcuata

2 Petals 4-5 mm long; pedicels of capsules 5-16 mm long, shorter than to equalling the leaves.......................................................... L. brevipes

1 Pedicels of flowers and fruits 0-3 mm long.

3 Stems, leaves, capsules, and calyx densely hirsute; seeds dark reddish-brown, 0.3-0.4 mm long.......................................................... L. spathulata

3 Stems, leaves, capsules, and calyx glabrous to sparsely puberulent; seeds tan, 0.4-0.8 mm long.
ONAGRAEACE

Key B – Ludwigia with alternate leaves, 8-14 stamens, 4-7sepalas, and 4-7 petals

1 Sepals 4; stamens 8; seeds in 2-several vertical series in each locule, free of endocarp tissue.
2 Intermodes of the stem conspicuously winged on the angles by 2 decurrent wings running down from each leaf base; petals 0.6-1.2 cm long; capsule 1.0-2.0 cm long, 4-angled or 4-winged; [section Pierocaulon] ................................................................. L. decurrens
2 Intermodes of the stem not winged on the angles (or very faintly so); petals 0.5-0.0 cm long; capsule (1.5-) 2-5 cm long, obtusely 4-angled; [section Macrocarpon].
3 Petals (1.5-) 3-5 cm long; sepalas ca. 10 mm wide at base ........................................................................................................................................ L. honoriensis
3 Petals 1-2 cm long; sepalas 3-5 mm wide at base ....................................................................................................................................... L. octovalvis
1 Sepals 5 (-7); stamens 10 (-14); seeds in 1 vertical series in each locule, loosely embraced or embedded in endocarp tissue.
4 Stems erect; floral tube much longer than the pedicel; seeds loosely embraced by a corky, hose-shape-shaped segment of endocarp; [section Seminula]............................................................................................................................................................................ L. leptocarpa
4 Stems (at least the lower portions) decumbent, creeping, or floating in mats (the flowering stems more-or-less erect in L. grandiflora and L. hexapetala); floral tube much shorter than the pedicel; seeds embedded in the woody endocarp; [section Oligospermum].
5 Flowering stems decumbent, floating, or creeping; stem and leaves glabrous or glabrescent; petals mostly 1-1.5 cm long; anthers 1.7 mm long........................................................................................................ L. peploides var. glabrescens
5 Flowering stems more-or-less erect; stem and leaves sparsely to densely pubescent with long soft hairs; petals (1.2-) 1.6-3 cm long; anthers 2.5-3.5 mm long.
6 Sepals (6-) 8-11 (-14) mm long; primary leaves 5.8-5.7 cm long, 7-11 mm wide, usually linear-lanceolate, usually widest below the middle; petals (1.2-) 1.6-2.0 (-2.6) cm long; style 4.7-6.7 (-8.2) cm long; stems densely villous........ L. grandiflora ssp. grandiflora
6 Sepals (8-) 12-19 mm long; primary leaves 5.5-13 cm long, 9-18 mm wide, usually narrowly elliptic to oblong-lanceolate, usually widest above the middle; petals (1.5-) 2.0-2.9 (-3.3) cm long; style (5.8-) 6-10 mm long; stems sparsely to densely villous (rarely glabrous)... ................................. L. grandiflora ssp. hexapetala

Key C – Ludwigia with alternate leaves, 4, 3, 4 petalas, and 0-4 petals

1 Pedicels 2-15 mm long; capsules subglobose to spheric or cubic, about as long as wide, box-like, 4-angled, dehiscence by an apical pore (later sometimes also irregularly loculicidal); petals present, 4-15 mm long, persistent or caducous; roots fascicled, fusiform, tuberous; plants lacking basal, stoloniform shoots; [section Ludwigia].
2 Leaves cuneate at base; pedicels 2-5 mm long; nectary discs at base of style flattish, inconspicuous; [widespread in our area, in a wide variety of habitats] ......................................................................................................................... L. alternifolia
2 Leaves rounded or truncate at base; pedicels 4-15 mm long; nectary discs at base of style domed, prominent; [nearly restricted to the Coastal Plain, primarily of pineyards].
3 Styles 1.5-3 mm long; plants glabrescent or pubescent with short hairs; sepals strongly reflexed in fruit........ L. virgata
3 Styles 1.5-3 mm long; plants glabrescent or pubescent with short to long, spreading to shaggy hairs; sepals strongly reflexed, spreading, or ascending in fruit.
4 Sepals narrowly deltoid, broadest at or near the base, 3-4× as long as wide, ascending or spreading in fruit; plants glabrescent to hirtellous with long spreading hairs ........................................................................................................................................ L. hirtella
4 Sepals ovate, broadest near the middle, ca. 2× as long as wide, strongly reflexed in fruit; plants pubescent with relatively short, appressed to spreading hairs................................................................................................................ L. maritima
1 Pedicels 0.6-1.5 (-5) mm long; capsules subglobose, obovate, or obpyramidal, about as long as wide or longer than wide, circular to quadrangular in cross-section, dehiscence irregularly loculicidal; petals absent or present, if present (L. linearis, L. linifolia) then 0-6 mm long and caducous; roots fibrous or rhizomatous; plants frequently with basal, stoloniform shoots; [section Microcarpus].
5 Capsules cylindrical, narrowly obovate, narrowly obpyramidal, at least 2.5-5× as long as broad; petals present or absent.
6 Primary leaves of the flowering stems narrowly elliptical, 6-12 (-20) mm wide; petals absent or present............................... L. glandulosua
6 Primary leaves of the flowering stems linear, 1.5-5 mm wide; petals present.
7 Sepals (3.3-) 4-7 mm long; lateral and marginal veins obscure on lower leaf surface; seeds reddish brown; capsules cylindric, parallel-sided through most of their length, not grooved; anthers 0.5-1.1 mm long........ L. linifolia
7 Sepals 2.3-5 (-5.6) mm long; lateral and marginal veins distinct on lower leaf surface; seeds yellowish; capsules elongate obpyramidal, tapering through most or all of their length, with a shallow longitudinal groove on each face; anthers 1.1-2 mm long.
8 Sepals 2.3-4 mm long, acuminate, the surfaces densely and minutely papillose, the papillae 0.02-0.05 mm long and appressed; capsules 5.8-5 (-10) mm long, 2-4 (-5) mm in diameter; pedicels 0.4-0.8 mm long; seed surface cells elongate parallel to the seed length (as seen at 20× or more); anthers 1.1-1.6 mm long............................................................................................................. L. linearis var. linearis
8 Sepals 3.5-3.6 (-5) mm long, elongate-acuminate to cuspidate, the surfaces densely minutely striigillose, the hairs 0.06-0.10 mm long and appressed to ascending; capsules 5-10 (-12) mm long, 3-5.5 mm in diameter; pedicels 0-3.5 (-5) mm long; seed surface cells elongate transverse to the seed length, or irregular (as seen at 20× or more); anthers (1.1-) 1.3-2 mm long.......................................................... L. linearis var. puberula
5 Capsules subglobose, obovoid, or broadly obpyramidal, 1.5 × as long as broad; petals absent.
9 Flowers in compact, headlike or elongate spikes, the inflorescence lacking well-developed leaves; stems rarely branched; rhizomes often present................................................................. L. suffruticosu
9 Flowers axillary in the axis of well-developed leaves; stems usually much branched; rhizomes absent.
10 Plants densely pubescent throughout...
11 Sepal apex elongate-acuminate or subcuspidate, reflexed; pubescence of stems and leaves hirtellous (the hairs spreading); seed surface cells suborbicular (as seen at 20× or more); anthers 0.6-0.9 (-1.3 mm long; style 1-2 mm long.............................. L. pilosa
ONAGRACEAE

10 Plants glabrous or subglabrous throughout.

13 Primary leaves of the flowering stems 4-17 mm long, 1.5-10 mm wide, mostly obovate-spatulate and 1.5-3 x as long as wide; capsules 1-1.5 (-2) mm long, containing 10-20 dark reddish-brown seeds; plants typically 1-4 dm tall.........................L. microcarpa

13 Primary leaves of the flowering stems (18-) 30-110 mm long, 2-10 (-20) mm wide, mostly elliptic, lanceolate, oblanceolate, or linear and 4-20+ as long as wide; capsules 1.8- 2-7 mm long, containing 40-500 light brown, yellowish, or tan seeds; plants typically 3-10 dm tall.

14 Capsules oblong-ovoid or subglobose; sepals yellowish on the upper surface; bracteoles 0.5-1.5 mm long.

15 Stems nearly smooth or slightly ridged; sepals greenish, about 1/2 as long as the capsule; capsule wall flat between the wings; seed surface cells suborbicular..........................L. lanceolata

15 Stems often distinctly ridged or winged; sepals creamy-white, nearly as long as the capsule; capsule wall bulging out longitudinally between the wings; seed surface cells elongate parallel to the seed length..............................................L. alata

16 Bracteoles 3.5-6.5 (-8) mm long; sepals green, the apex long-acuminate, reflexed; capsules oblong-obovoid; seed surface cells elongate parallel to the seed length; [known from our area only in the Piedmont of VA].................................L. polycarpa

16 Bracteoles 0.5-1.5 mm long; sepals yellowish, the apex acuminate, ascending capsules subglobose; seed surface cells in patches; some patches with cells transverse to seed length, others with cells diagonal (rather resembling a badly laid-out parquet floor); [of the Coastal Plain of GA, NC, SC, and VA in our area]..........................L. sphaerocarpa

Ludwigia alata Elliott, Winged Seedbox. Cp (GA, NC, SC, VA): interdune ponds, freshwater to slightly brackish (oligohaline) marshes; rare. June-September. Se. VA south to s. FL, west to se. LA; disjunct in Jamaica. This species is a hexaploid (n = 24). One third of the genome of L. alata is apparently derived from L. microcarpa or its ancestor (Peng 1988). [= RAB, C, F, G, K, U, Z; > L. alata – GW (also see L. lanceolata); > L. alata – S; > L. simulata Small – S]

Ludwigia arcuata Walter. Cp (GA, SC): marshes or submerged in water of natural Coastal Plain ponds; rare. June-September. SC south to s. FL, west to Panhandle FL and s. AL. [= RAB, GW, K, U; > Ludwigiantha arcuata (Walter) Small – S]

* Ludwigia bonariensis (M. Micheli) Hara. Cp (NC, SC, VA): freshwater tidal marshes and adjacent disturbed areas; rare, apparently native of tropical America. June-September. Locally abundant in disturbed edges of freshwater tidal marshes near Wilmington, NC, perhaps introduced on ship's ballast. Material from Wilmington apparently has larger flowers than material of L. bonariensis elsewhere; its source and appropriate taxonomic treatment uncertain and needing further study. First reported for SC by Leonard (1971b). [= RAB, GW, K, U; > Jussiaea neglecta Small – S]

Ludwigia decurrens Walter, Wingstem Water-primrose. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swamp forests, ditches, common (rare in VA and WV Mountains). June-October. MD, w. VA, WV, s. IN, s. IL, and MO, south to s. FL and TX; also in tropical America. [= RAB, C, GW, K, U, W; > Jussiaea decurrens (Walter) A.P. de Candolle – F, G, S, WV]

Ludwigia glandulosa Walter, Small-flowered Seedbox. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA): low forests, marshes, ditches, commonly (rare in VA). E. MD south to n. FL, west to c. TX, north in the interior to c. TN, w. KY, s. IN, s. IL, se. MO, c. AR, and se. OK. Primarily on the Southeastern Coastal Plain. A related species, treated by Peng as L. glandulosa ssp. brachyacantha (Torrey & A. Gray) Peng, ranges from sw. LA north and west to s. OK and c. TX. This species is tetraploid (n = 16). [L. glandulosa – RAB, C, F, G, GW, S; > L. glandulosa ssp. glandulosa – K, U, Z]

Ludwigia grandiflora (Michaux) Greuter & Burdet ssp. hexapetala (Hooker & Arnott) Nesom & Kartesz, Common Water-primrose. Cp (NC, SC), Pd (GA, NC), Mt* (VA*, WV*): ponds, lakes, sluggish waters of ditches or streams; uncommon (but often locally abundant) (rare in VA and WV). May-September. NC south to FL, west to OK and TX; also in CA, Europe, South America, Mexico; also introduced farther north in North America. This taxon is decaploid (n = 40). See Zardini, Gu, and Raven (1991) and Nesom & Kartesz (2000) for additional information. [= Q; < L. uruguayensis (Cambessedes) Hara – RAB, C, GW, K, W; < Jussiaea uruguayensis Cambessedes – F, G, WV; ? Jussiaea michauxiana Fernald – F; = L. hexapetala (Hooker & Arnott) Zardini, Gu, & Raven – U, V]

Ludwigia lanceolata  Elliott, Lanceleaf Seedbox. Cp (GA, NC, SC): interdune ponds, open wet areas; rare (NC Rare). August-September. Se. NC south to c. peninsular FL, west to Panhandle FL. This species is tetraploid (n = 16). [= RAB, K, S, U, Z; < L. alata – GW]

Ludwigia leptocarpa  (Nuttall) Hara, Water-willow. Cp (DE*, GA, NC, SC, VA), Pd (GA, VA), Mt (GA, WV): riverbanks, marshes, and ditches; common (uncommon in VA, rare in DE). June-September. VA south to c. peninsular FL, west to E. TX, north in the interior along the Mississippi and Ohio rivers to SE. MO, s. IL, and W. WV; and in tropical America. [= RAB, C, GW, K, U, W; = Jussiaea leptocarpa Nuttall – F, G, S, WV]

Ludwigia linearis  Walter var. linearis, Eastern Narroleaf Seedbox. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC): savannas; common (uncommon in DE). June-September. Var. linearis ranges from s. NJ south to c. peninsular FL, west to SE. LA, extending inland to the Cumberland Plateau of NC, AL, and c. TN. Var. linearis is here interpreted to be equivalent to Peng's subglabrous morph. Peng (1989) declines to recognize infraspecific taxa in L. linearis, but his discussion makes clear that 2 distinctive entities are present, as characterized by orientation of seed surface cells and characters of leaves, bracteoles, pedicels, sepalas, stigmas, and styles (see key). The orientation of seed surface cells, recognized as a distinctive character in other difficult species pairs (such as L. alata and L. lanceolata) is the most reliable character separating the 2 varieties. This species is diploid (n = 8). [< L. linearis – RAB, C, F, G, GW, K, S, U, W, Z]

Ludwigia linearis  Walter var. puberula Engelmann & A. Gray, Western Narroleaf Seedbox. Cp (GA, NC, SC), Pd (GA, SC): savannas, interdunal swales; uncommon. June-September. Var. puberula ranges primarily from c. AL west to c. AR, south to E. TX, with intergradational material extending as far north and east as n. FL and E. NC. Var. puberula is here interpreted to include Peng's intermediate morph, densely strigilllose morph, and completely glabrous morph (Peng 1989). As pointed out by Peng (1989), the glabrous morph is exactly like the densely strigilllose morph except for the absence of pubescence. They often grow together, have essentially the same distribution, and may differ only at a single allele. Peng's intermediate morph is heterogeneous; some likely being truly intermediate between (and possibly hybrid derivatives of) the two varieties here recognized, while others clearly belong to var. puberula (based on surface cell orientation and floral characteristics) and merely have an amount of pubescence intermediate between the densely strigilllose and completely glabrous morphs. [< L. linearis – RAB, C, F, G, GW, K, S, U, W, Z]

Ludwigia linifolia  Poiret, Flaxleaf Seedbox. Cp (GA, NC, SC), Pd (NC): limesink ponds (dolines) and Taxodium ascendens savannas; rare (NC Rare). June-September. Nc. NC south to s. FL, west to s. MS; disjunct in Tabasco, Mexico. This species is diploid (n = 8). [= RAB, GW, K, S, U, Z]

Ludwigia maritima  R.M. Harper, Harper’s Seedbox. Cp (GA, NC, SC): savannas; common. June-September. E. NC south to s. peninsular FL, west to e. TX, with intergradational material extending as far north and east as n. FL and e. NC. This species is tetraploid (n = 16). [= K, U, Z; < L. alata, L. repens – GW, K, U, Z]

Ludwigia microcarpa  Michaux, Small-fruited Seedbox. Cp (GA, NC, SC), Pd (GA, NC), Mt (GA): in circumneutral or alkaline soils of moist places, over calcareous rock, mafic rock, shell hash, or brackish sands, such as in maritime wet grasslands, savannas and adjacent ditches over coquina limestone ("marl"), and wet clay flats over diabase, often in roadside ditches; common. June-September. VA south to c. peninsular FL, west to E. TX, with intergradational material extending as far north and east as n. FL and e. NC. This species is tetraploid (n = 16). [= RAB, K, S, U, Z]

Ludwigia octovalvis  R. Micheli, Hairy Seedbox. Cp (DE*, GA, NC, SC, VA), Pd (GA, NC, SC, VA, WV): limesink ponds (dolines) and Taxodium ascendens savannas; rare (NC Rare). June-September. S. NC south to s. FL, west to TX, and widespread in tropical America. [= GW, U; > L. octovalvis spp. octovalvis – K; > L. octovalvis spp. sessiliflora (M. Micheli) Raven – K; > Jussiaea angustifolia Lamarcck – S; > Jussiaea scabra Willdowen – S]

Ludwigia polycarpa  Short & Peter. Pd (VA, MV) Mt* (WV*): [habitat]; rare. June-September; July-October. MA, CT, and w. VT west to s. ON, MI, WI, MN, and n. NE, south to c. VA, KY, s. IL, s. MO, and e. KS. This species is tetraploid (n = 16). [= C, F, G, GW, K, U, W, Z]

Ludwigia repens  Forster, Creeping Seedbox. Cp (GA, NC, SC, VA), Pd (GA), Mt (VA): ditches, pools, and streams; uncommon (rare in VA). June-September. Se. VA south to s. FL, west to TX and n. Mexico, north in the interior to TN, MO,
and OK; also in CA, Bermuda, and the West Indies. Reveal et al. (2003) propose the name *L. repens* for nomenclatural conservation with a conserved type; if this proposal is not accepted, *L. natans* Elliott will become the name of this species. [= RAB, GW, K, U; = *Ludwigia natans* Elliott – F; G; = *Isnardia repens* – S]

*Ludwigia sphaerocarpa* Elliott, Globe-fruited Seedbox. Cp (DE, GA, NC, SC, VA): boggy areas, pools, ditches, river marshes, interdune swales, river and pondshores; common (rare in GA, NC, SC, VA). June-September. E. MA south to n. FL, west to e. TX, primarily on the Coastal Plain, spottily distributed in that range, and also disjunct in w. NY, sc. TN, s. IN, and nw. IN and ne. IL. This species is tetraploid (n = 16). Peng (1989) considers it likely that *L. sphaerocarpa* is of allopolyploid origin, one or both of its parents now extinct. [= RAB, C, GW, K, S, U; Z; > *L. sphaerocarpa* var. *sphaerocarpa* – F; G; > *L. sphaerocarpa* var. *jungens* Fernald & Griscom – F; G]

*Ludwigia suffruticosa* Walter, Shrubby Seedbox. Cp (GA, NC, SC): periodically to seasonally flooded portions of limesink ponds (dolines) and clay-based Carolina bays; rare north of SC (NC Rare). June-October. Se. NC south to s. peninsular FL, west to Panhandle FL and se. AL. This species is tetraploid (n = 16). Peng (1989) reports that "with its whitish creamy sepal, which are very showy in the dense flower aggregates, the cross-pollinating *L. suffruticosa* successfully attracts many insects, mostly bumblebees, honeybees, and wasps." [= RAB, GW, K, S, U; Z = *L. capitata* Michaux]

**? *Ludwigia peruviana* (Linnaeus) Hara, Primrose-willow. In s. GA (Jones & Coile 1988). Reported for NC (Kartesz 1999). All or part of the southeastern distribution is as an alien species. [investigate] [= GW, K, U; = *Jussiaea peruviana* Linnaeus – S]

### 2. *Circaea* Linnaeus 1753 (Enchanter's-nightshade)

**Identification notes:** Sometimes confused in vegetative condition with *Phryma*; the leaf teeth are quite different.

1 Flowers opening before elongation of the raceme axis, therefore clustered and corymbiform at the apex of the raceme, borne on erect or ascending pedicels; plant 5-25 (-30) cm tall; fruits clavate, 2.0-2.5 mm long, 0.7-1.2 mm thick, 1-locular.................*C. alpina* ssp. *alpina*

1 Flowers opening after elongation of the raceme axis, more or less loosely spaced, borne on spreading pedicels; plants (12-) 20-100 cm tall; fruits obovoid to pyriform, 2.8-3.9 (-4.5) mm long, 1.5-3.6 mm thick, 2-locular, or the fruits sterile and aborting shortly after anthesis, 1-2-locular when present.

2 All ovaries aborting shortly after anthesis (very rarely a few persistent after anthesis); fruit (when somewhat persistent) with low ribs and 1-locular .................................................................*C. canadensis* ssp. *canadensis*

2 All ovaries aborting shortly after anthesis (very rarely a few persistent after anthesis); fruit (when somewhat persistent) with low ribs and shallow grooves ..................................................................................................................................................*C. sterillis*

*Circaea alpina* Linnaeus ssp. *alpina*, Alpine Enchanter's-nightshade. Mt (GA?, KY, NC, VA, WV), Ip (KY): moist organic soil at high elevations (especially in spruce-fir and northern hardwood forests), rocky seepages, in spray behind waterfalls, at dripping cliff bases; uncommon (rare in KY Interior low Plateau). June-September. *C. alpina* is treated by Z as a circumboreal complex of six subspecies. Ssp. *alpina* is itself circumboreal, in North America ranging from NL (Newfoundland) and NL (Labrador), west to AK, south to MD, w. NC, e. TN, n. GA (?), KY, n. IL, MN, MT, and WA, disjunct in montane sites southward in the w. United States, such as the Black Hills of SD, and isolated montane sites in CO, AZ, and NM. Another subspecies occurs in w. North America, and four subspecies occur in humid and montane parts of Asia. [= K, U, X, Z; < *C. alpina* – RAB, F, G, GW, S, W, WV; = *C. alpina* var. *alpina* – C]

*Circaea canadensis* (Linnaeus) Hill ssp. *canadensis*, Canada Enchanter's-nightshade. Mt (GA, KY, NC, VA, WV), Pd (DE, GA, NC, SC, VA), Ip (DE, GA, KY, NC, VA), Ip (KY): mesic, nutrient-rich forests; common (rare in SC). June-August. NS and NB west to se. MB and ND, south to e. NC, e. SC, s. GA, LA, OK, and NE. The systematics of this taxon is controversial, and the best treatment is still unclear. Most recently, Boufford (2005) has treated the complex as 2 species, *C. canadensis* and *C. lutetiana*, the former with 2 subspecies, *canadensis* of eastern North America and ssp. *quadrisulcata* of Asia. Previously, Boufford (1983) treated the complex as a circumboreal complex of 3 subspecies of *C. lutetiana*, including the North American ssp. *canadensis* (Linnaeus) Ainsworth & Magnus, the primarily Asian ssp. *quadrisulcata* (Maximowicz) Ainsworth & Magnus, and the European ssp. *lutetiana*. Other authors have preferred varietal status for the 3 entities, full species status, no formal status at all (C. *lutetiana* as a polymorphic complex), or associating the more similar pair (North American and Asian) as 2 subspecies separate from the European at specific rank. Boufford (1983) and Averett & Boufford (1985) show convincingly that separate taxonomic status for the three entities is warranted, and that ssp. *canadensis* is more closely related to ssp. *quadrisulcata*. The question of the appropriate taxonomic level remains. Boufford (1983) states that "although subsp. *canadensis* and *quadrisulcata* are placed in *C. lutetiana*, this might not ultimately prove to be the best treatment." Later, flavonoid data showed strong differences between the three taxa, stronger than the differences between many of the other species in the genus (Averett & Boufford 1985). Morphologic differences between the three taxa are fairly subtle but appear to be consistent. The complicated synonymy is perhaps an example of a too-zealous attempt to have nomenclature reflect subtleties of relationship and
ONAGRACEAE

evolutionary divergence, our understanding of which is unclear and changeable. \[= U, Y; = C. lutetiana Linnaeus ssp. canadensis (Linnaeus) Ascherson & Magnus – RAB, K, W, X, Z; = C. lutetiana var. canadensis Linnaeus – C; = C. quadrirunculata (Maximowicz) Franchet & Savatier var. canadensis (Linnaeus) Hara – G, WV; > C. canadensis var. canadensis – F; > C. canadensis var. virginiana Fernald – F; = C. latifolia Hill – S; = C. quadrirunculata (Linnaeus) Spach (Linnaeus) P. L. Löve & Löve\]

3. Chamerion Rafinesque ex Holub 1972 (Fireweed)

A genus of 8 species (9 taxa), herbs, of arctic, boreal, and temperate Northern Hemisphere. There is increasingly strong evidence for the recognition of this group of plants as a genus separate from Epilobium. References: Wagner, Hoch, & Raven (2007) = U; Mosquin (1966) = Z; Holub (1972) = Y; Munz (1965) = X.

Chamerion platyphyllum (Daniels) Löve & Löve, Great Willow-herb. Fireweed. Mt (NC, VA, WV), Pd (DE), Cp (DE): grassy balds, roadsides, disturbed areas; uncommon (rare in DE and NC). July-September. Chamerion platyphyllum has a circumboreal distribution; it is a member of a circumboreal complex, consisting of several related taxa that differ in chromosome number, a variety of morphological characters, and distribution. The tetraploid Ch. platyphyllum is generally more southern, extending south in North America to NJ, montane w. NC and ne. TN, n. IN, MN, SD, AZ, NM, and CA; it may be more appropriately treated as a variety or subspecies of Chamerion angustifolium. The diploid Chamerion angustifolium (Linnaeus) Holub is arctic and boreal, extending south in North America to NB, QC, ON, alpine WY, and BC. The hexaploid is Chamerion danesiilis D. Löve. \[< E. angustifolium – RAB, G, GW, W, WV; = E. angustifolium var. canescens A. Wood – C; = E. angustifolium var. angustifolium – F, X; > E. angustifolium var. angustifolium – F; = C. platyphyllum (Daniels) Fernald – F; = C. platyphyllum (Linnaeus) Holub ssp. circumvagum (Mosquin) Kartesz – K, U; < Chaamerion angustifolium (Linnaeus) Scopoli – S; < Chaamerion angustifolium (Linnaeus) Holub – Y; = E. angustifolium Linnaeus ssp. circumvagum Mosquin – Z\]

4. Epilobium Linnaeus 1753 (Willow-herb) [also see Chamerion]

A genus of ca. 165 species (ca. 185 species), herbs, distributed primarily in boreal and alpine latitudes and elevations. All five of the species in our area reach or approach their southern limits in eastern North America in our area. All members of the genus is ur area are placed in section Epilobium. References: Wagner, Hoch, & Raven (2007) = U; Munz (1965) = Z.

1 Stigma 4-cleft; petals 10-15 mm long .................................................................................................................................................... E. hirsutum
1 Stigma capitate; petals 2-8 mm long. .............................................................................................................................................
2 Leaves linear to narrowly lanceolate, broadest near the middle, flat, the larger generally at least 10 mm wide, toothed.
3 Principal leaves 3-7 cm long, with obscure marginal teeth, the apices merely acute; internodes (below the inflorescence) glabrous, glabrescent, or with pubescence the scattered over the surface; mature coma (attached to plump seeds) brown (pale when immature); plants generally well-branched; seeds striate (with well-developed papillae arranged conspicuously in lines) \[< E. ciliatum ssp. ciliatum\]
 Principal leaves 5-15 cm long, with conspicuous and often irregular marginal teeth, the apices acuminate to attenuate; internodes (below the inflorescence) with lines of pubescence (some internodes on a given plant sometimes with scattered pubescence or glabrous); mature coma cinnamon (attached to plumose seeds) brown (pale when immature); plants generally well-branched, with a bushy habit; seeds papillose (the papillae sometimes forming weak lines) \[< E. strictum\]
4 Pubescence spreading ................................................................................................................................................................. E. coloratum
4 Pubescence appressed, the upper leaf surface finely and rather densely pubescent \[< E. leptophyllum\]

581

Epilobium cilatum Rafinesque ssp. cilatum, American Willow-herb. Mt (NC, VA), Pd (VA): bogs, seeps, disturbed wet places (such as moist edges of logging roads); common (uncommon in VA, rare in NC). June-September. NL (Newfoundland) and NL (Labrador) west to AK, south to w. NC, ne. TN, IN, IA, CA, TX, Mexico, Central America; disjunct in Chile and Argentina. \[= K, U; < E. cilatum – RAB, W; = E. cilatum ssp. cilatum – C; < E. cilatum – F, X, in a narrower sense; > E. glandulosum Lehmann var. adenoacaulon (Hausknecht) Fernald – F, WV; > E. adenoacaulon Hausknecht var. adenoacaulon – G, Z\]

Epilobium coloratum Biehler, Bronze Willow-herb, Eastern Willow-herb. Mt (GA, KY, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, VA), Ip (KY): seepages, moist open places; common (uncommon in KY Interior Low Plateau, rare in NC Coastal Plain). June-September. ME west to MN, south to NC, n. GA, AL, AR, and TX. There are some difficulties in distinguishing this species and E. cilatum in our area. \[< RAB, C, F, G, GW, K, S, U, W, WV, Z;\]

Epilobium leptophyllum Rafinesque, Narrowleaf Willow-herb, American Marsh Willow-herb. Mt (NC, VA, WV): bogs, seepages, and boggy meadows; rare. July-October. NL (Newfoundland) and NT west to BC, south to w. NC, ne. TN, KS, ne. TX (Mink, Singhurst, & Holmes 2011b), and CA. \[< RAB, C, F, G, GW, K, U, W, WV, Z\]
**Oenothera** Linnaeus 1753 (Evening-primrose)

A genus of about 124 species, herbs, of America (especially temperate regions). This treatment provisional, with further revision likely, especially in the *O. fruticosa-O. tetragona-O. pilosella* complex. References: Wagner, Hoch, & Raven (2007)=U; Dietrich, Wagner, & Raven (1997)=Z; Dietrich & Wagner (1988)=Y; Munz (1965)=X; Straley (1977)=V. Keys adapted in part from those references. [also see Calylophus]

1. **Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; [**

2. **Pedicels 2-4 mm long; fruit with a stipe at maturity; clumped or matted perennials from woody rhizomes or rootstocks; [of sandy habitats of SC and GA southward].**

3. **Clumped perennial; petals 4-10 mm long; body of the fruit 5-10 mm long; stipe of the fruit 0.5-4.5 mm long.................................*O. filipes***

4. **Mat-forming perennial; petals 7-15 mm long; body of the fruit 8-15 mm long; stipe of the fruit 2-8 mm long.................................*O. sinuosa***

5. **Pedicels 0-1 mm long; fruit without a stipe; annual, winter annual, or biennial; [collectively of various habitats and more widespread in our area].**

6. **Sepals 2-3.5 mm long; petals 1.5-3 mm long..................................................*O. curtiflora***

7. **Sepals 2.5-12 mm long; petals 2.5-9 mm long.**

8. **Sepals 2.5-8 mm long; leaves 0.1-1.3 cm wide, the widest rarely over 1 cm wide; flowers 3-4-merous (often mixed on a plant); fruits 3-4-angled (often mixed on a plant); [of the outer Coastal Plain of GA, NC, and SC].................................................................*O. simulans***

9. **Sepals 8-13 mm long; leaves 0.3-2.5 cm wide, the larger nearly always > 1 cm wide; flowers 4-merous; fruits 4-angled; [primarily of the Mountains and Piedmont of NC, SC, and VA, extending to the Coastal Plain of GA and SC].................................................*O. gaura***

10. **Fruit linear, nearly isodiametric through its length; seeds borne ascending in the locules, rounded or fusiform, more or less regularly pitted; [section Oenothera, subsection Raimannia].***

11. **Petals acute to rounded at the apex.**

12. **Nonflowering portion of stems stiff, densely strigillose or sometimes also villous; leaves gray-green, densely strigillose, usually subentire to shallowly dentate (rarely lyrate); [in maritime situations].**

13. **Sepals 2.0-3.3 cm long; petals 2.5-4.5 cm long; stigma elevated above the anthers at anthesis; capsule 2.5-5.5 cm long; rosette leaves 5-14 cm long, 1-2 cm wide ..........................................................*O. drummondii ssp. drummondii***

14. **Sepals 0.3-1.1 cm long; petals 0.45-1.6 cm long; stigma surrounded by the anthers at anthesis; capsule 1.5-4.5 cm long; rosette leaves 4-8 cm long, 0.7-1.0 cm wide ..........................................................*O. humifusa***

15. **Nonflowering portion of stem not stiff, moderately to sparsely strigillose to sometimes densely villous, and also glandular puberulent; leaves green, sparsely to moderately strigillose and usually villous, deeply lobed to dentate (rarely some of them subentire); [in inland disturbed situations].**

16. **Petal 2.5-4 cm long; style 4-7.5 cm long; stigma lobes well elevated above the anthers at anthesis ......................*O. grandis***

17. **Petal 0.5-2.2 cm long; style 2.5-6 cm long; stigma lobes surrounded by the anthers at anthesis ......................*O. linicinata***

18. **Fruit thickest near the base, tapering to the apex; seeds borne horizontally in the locules, angled-prismatic, not regularly pitted; [section Oenothera, subsection Oenothera].***

19. **Stigma elevated above the anthers at anthesis; petals 2.5-5 cm long.**

20. **Cauline leaves 0.4-1.0 cm wide; apex of the inflorescence curved; free sepall tips subterminal, usually spreading; capsules spreading at nearly right angles to the stem, long-attenuate toward apex, usually conspicuously arculate .............*O. argillicola***

21. **Cauline leaves 1.5-6 cm wide; apex of the inflorescence erect; free sepall tips terminal, erect; capsules erect or slightly spreading, gradually attenuate toward the apex.**

22. **Upper stem, ovary, floral tube, and sepals always conspicuously pubescent, usually with at least some red-pustulate hairs; bracts green, persistent; sepals often flushed with red, or red-striped .................................................*O. glazioviana***

23. **Upper stem, ovary, floral tube, and sepals often apparently glabrous without magnification; pustulate hairs absent, or if present not red (in fresh material); bracts often pale-green and deciduous; sepals yellowish green, or flushed with some red... .................*O. grandiflora***

24. **Stigma surrounded by or below the anthers at anthesis; petals 0.7-2.5 (-3) cm long.**

25. **Plant appearing exclusively appressed-pubescent (as seen without magnification).**

26. ** Apex of the inflorescence curved; free sepall tips subterminal in bud, erect to spreading; dry capsules usually rusty brown.**

27. **Apex of the inflorescence erect; free sepall tips erect in bud; dry capsules usually rusty brown.**

28. **Leaves green to pale green; stems, ovary, floral tube, and sepals sparsely appressed-pubescent .....................*O. biennis***

29. **Leaves dull green to gray-green; stems, ovary, floral tube, and sepals densely appressed-pubescent ........*O. villosa ssp. villosa***

30. **Plant appearing either glabrous or with a mixture of long pubustil hairs and appressed pubescence (as seen without magnification).**

31. **Apex of inflorescence curved; free sepall tips subterminal in bud.**

32. **Plant (at least the lower portions) predominantly strigillose; leaves dull green to gray-green; dry capsules rusty brown ... ..........................................................*O. aestiviana***
21 Plant predominantly erect-pubescent or appearing glabrous (as seen without magnification); leaves usually bright green; dry capsules usually dark green or black ............................................................................................................O. parviflora
20 Apex of inflorescence erect; free sepals tips terminal or subterminal in bud.
22 Inflorescence conspicuously pubescent ............................................................................................................O. biennis
21 Inflorescence glabrous (or appearing so without magnification); leaves usually bright green; dry capsules dull green when dry; petals fading yellowish-white to transluscent. ............................................................................................................O. nutans
23 Free sepals tips terminal in bud; petals 1.4-2.5 (-3) cm long; bracts caducous, pale green; capsules dull green when dry; petals fading yellowish-white to translucent. ............................................................................................................O. parviflora
22 Free sepals tips subterminal in bud; petals 0.8-1.5 (-2) cm long; bracts persistent, green; capsules usually black or dark green when dry; petals fading pale yellow, usually opaque ............................................................................................................O. parviflora
6 Ovary 4-angled or 4-winged (at least near its tip); fruit sharply 4-angled or 4-winged; stamens of two lengths (except O. triloba and O. macrocarpa ssp. macrocarpa).
24 Leaves all basal, pinnatifid; [section Lavauxia, subsection Lavauxia] ............................................................................................................O. triloba
23 Leaves in part cauline, entire or toothed.
25 Petals 50-70 mm long; flowers opening in the evening; wings of the fruit 10-25 mm wide; [section Megapetrium] ............................................................................................................O. macrocarpa ssp. macrocarpa
24 Petals 3-30 mm long; flowers opening in the day; wings of the fruit <3 mm wide; [section Kneiffia]
25 Petals <1 mm wide; petals 3-5 (-7) mm long; floral bracts shorter than the subtended ovaries; mature fruits ellipsoid-rhomboïd, 4-6 mm long; annual; [section Kneiffia, subsection Penitophyllium] ............................................................................................................O. linifolia
26 Cauline leaves lanceolate to ovate, >1 mm wide; petals 5-30 mm long; floral bracts longer than the subtended ovaries; mature fruits clavate to oblong-elliptic, 8-20 mm long; perennial; [section Kneiffia, subsection Kneiffia].
27 Petals 5-10 mm long; inflorescence usually nodding ............................................................................................................O. perennis
28 Petals 15-30 mm long; inflorescence usually erect.
29 Capsules oblong, widest near the middle, usually abruptly tapered to a stipe 0.1-3 (-7) mm long; hairs of the ovary and capsule predominantly glandular (or the ovary glabrous); leaves subglabrous or sparingly pubescent, more or less dentate.
30 Petals (20-) 25-35 mm long; cauline leaves lanceolate to ovate, 2-7 cm long, 1-3 cm wide, often glaucous beneath .................................................O. tetragona var. fraseri
31 Petals 12-20 (-25) mm long; cauline leaves linear to lanceolate, 2-7 cm long, 0.5-1.0 (-1.5) cm wide..........................O. tetragona var. tetragona
28 Petals either with shorter or appressed pubescence, of glandular or nonglandular hairs; free sepals tips 0-2 (-6) mm long, divergent or not.
29 Capsules oblong, widest near the middle, usually abruptly tapered to a stipe 3-10 mm long; hairs of the ovary and capsule nonglandular (or with a mixture of glandular and nonglandular hairs); leaves generally pubescent, subentire.
31 Petals 15-30 mm long; stems 7-12 dm tall, freely branched, slightly pubescent; cauline leaves lanceolate, 5-12 cm long, 0.5-1.5 cm wide; [of tidal marshes, usually with spongy lower stems and adventitious roots where regularly submerged] ............................................................................................................O. riparia
31 Petals (8-) 15-22 mm long; stems 1-8 dm tall, less branched (unless mowed, grazed, or otherwise damaged), more pubescent; cauline leaves 2-6 (-8) cm long, 0.2-1.0 (-1.2) cm wide.
32 Capsule vestiture a mixture of glandular and nonglandular hairs.
33 Cauline leaves not velutinous, 5-10× as long as wide ..................................................O. tetragona var. brevistipata
34 Cauline leaves velutinous, 2-4× as long as wide.
34 Petals 7-12 mm long; leaves lance-oblong, obtuse; [of barrens of TN, KY, and AL]..............................O. tetragona var. sharpii
32 Capsule vestiture strictly nonglandular.
35 Free sepals tips 1-3 mm long, cartilaginous and often arching after the sepals have reflexed; calyx strigose ..........................................................O. fruticosa var. unguiculata
36 Capsule body 6-11 mm long, the pubescence rather coarse .................................................O. fruticosa var. fruticosa
37 Capsule body 3-5 mm long, the pubescence very fine.
38 Capsule body 3.5-4 mm long; rigidly-pilose; [of Coastal Plain bogs].............O. fruticosa var. microcarpa
37 Capsule body 4-5 mm long; very finely strigillose; [of Piedmont rock outcrops]..........................O. fruticosa var. subglobosa

* Oenothera curtiflora W.L. Wagner & Hoch, Small-flowered Gaura. Cp (GA, SC, VA), Pd (GA): sandy fields, disturbed areas, and clearings; rare, native of c. and w. North America. May-July. IN and IL west to WA, south to MS, and Mexico; apparently introduced eastward to MA, TN, GA, and SC. Kartesz's (1999) adoption of G. mollis as the name for this taxon has been rejected (Wagner & Hoch 2000, Brummitt 2001).  [= U; = Gaura parviflora Douglas ex Lehmann – RAB, F, G, Q, S; = Gaura mollis James – K; > Gaura parviflora var. parviflora – X; > Gaura parviflora var. lachnocarpa Weatherby – X]

Oenothera curtissii Small. Cp (GA, SC): sandhills, sandy fields; rare. May-September. Sc. SC south to n. peninsular FL, west to s. AL. Closely related to O. rhombipetala, which is restricted to the Great Plains, with scattered occurrences east to AR, IL, and MI.  [= K, Y; < O. rhombipetala Nutall ex Torrey & A. Gray – RAB, F, X, misapplied; = Raimannia curtissii Rose – S]
## OEGONACEAE

584

*? Oenothera drummondii* Hooker ssp. drummondii, Drummond's Evening-primrose. Cp (NC, SC): sandy ocean beaches; rare, perhaps only introduced by the Gulf Coast. April-October. Ssp. drummondii ranges from se. NC south to s. FL, west to se. TX, and south to Tamaulipas and Vera Cruz. Ssp. thalassiphila (Brandegee) W. Dietrich & W.L. Wagner is restricted to the southern tip of Baja California. [= Y; < O. drummondii – RAB, K; < Raimannia drummondii (Hooker) Rose ex Sprague & Riley – S; = O. drummondii var. drummondii – X]

**Oenothera filipes** (Spach) W. L. Wagner & Hoch, Threadstalk Gaura. Cp (GA, SC), Pd (GA), Mt (GA): sandy fields, disturbed areas, and clearings; common. April-July. SC west to n. TN and s. IN, south to ne. FL and e. LA. [= U; = Gaura filipes Spach RAB, C, G, K, Q, W; > Gaura filipes var. filipes – F, X; > Gaura filipes var. major Torrey & A. Gray – F, X; = Gaura michauxii Spach – S]

**Oenothera fruticosa** Linnaeus var. subglobosa (Small) Munz, Flatrock Sundrops. Pd (GA): granite flatrocks and domes; rare. GA to AL. [= X; < O. fruticosa – RAB, C; < O. fruticosa ssp. fruticosa – H, K, V]

**Oenothera gaura** W.L. Wagner & Hoch, Biennial Gaura, Northeastern Gaura. Mt (NC, SC, VA, WV), Pd (GA, NC, VA), Cp (DE, GA, SC, VA): roadsides, woodlands, streambanks, fields, disturbed areas; common (uncommon in VA Coastal Plain, rare in DE Coastal Plain). June-October. MA and NY west to WI, se. MN, and IA, south to sw. NC, e. GA (Jones & Coile 1988), sc. TN, and e. IL. [= U; = Gaura biennis Linnaeus – RAB, K, Q, S, W, WV; > Gaura biennis var. biennis – C, F, G, X]

**Oenothera glacioviziania** Micheli in Martius, Garden Evening-primrose. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GC, NC, VA, SC): disturbed areas; uncommon. This species apparently arose as a garden hybrid, and has been widely cultivated and naturalized nearly worldwide. [= K; Z; = O. eurythropa Borbás – X]

**Oenothera grandiflora** L'Héritier ex Aiton. Cp (GA, NC, SC), Pd (GA), Mt (GA): sandy fields, disturbed areas; uncommon. June-October. VT west to KY, south to c. peninsular FL and s. MS. [= F, X, S, Z]

**Oenothera grandis** (Brutton) Smyth. Cp (NC): roadsides; rare, introduced from further west. March-July. The native occurrence of this species is centered in KS, OK, and TX. [= K, Y; = O. laciniata Hill var. grandiflora (S. Watson) B.L. Robinson – RAB, F, G]

**Oenothera laciniata** Hill, Cutleaf Evening-primrose. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas; common. February-October. ME west to MD, south to s. FL and TX; also in CA. [= K; W, WV; = O. laciniata var. laciniata – RAB, C, F, G; = Raimannia laciniata (Hill) Rose – S; = O. laciniata ssp. laciniata – X]

**Oenothera linifolia** Nuttall, Threadleaf Sundrops, Flaxleaf Sundrops. Pd (GA, NC, SC, VA*), Cp (GA, SC), Mt (GA): dry openings and fields; rare (SC Rare, VA Watch List). C. VA west to s. IL and se. KS, south to Panhandle FL and se. TX. Occurrences east of the Mississippi River may be mainly or entirely adventive. Belden et al. (2004) discuss the Virginia occurrence. [= RAB, C, F, G, W, V, X; = Peniophyllum linifolium (Nuttall) Pennell – S]

**Oenothera nutans** Atkinson & Bartlett. Mt (GA?, NC, SC?, VA, WV), Pd (GA?, NC, SC?): roadsides, openings, forest edges, pastures; common (rare in VA). July-October. ME west to MI, south to n. FL, s. AL, and s. MO. [= K; Z; < O. biennis – RAB, G, S, WV; = O. biennis Linnaeus var. austromontana (Munz) Cronquist – C; = O. biennis var. nutans (Atkinson & Bartlett) Wiegand – F; = O. austromontana (Munz) Raven, Dietrich, & Stubbe – H, W; = O. biennis ssp. austromontana Munz – X]

**Oenothera oakesiana** (A. Gray) Robbins ex S. Watson & Coulter. Cp (DE, NC, VA), Pd (VA), Mt (VA): disturbed areas, roadsides; uncommon (rare in VA). NW west to MB, south to e. NC, sc. VA, PA, n. IN, n. IL, and s. MN. [= K, Z; = O. parviflora Linnaeus var. oakesiana (A. Gray) Fernald – C; = O. parviflora ssp. parviflora var. oakesiana (A. Gray) Fernald – X]

**Oenothera pilosella** Rafinesque, Midwestern Evening-primrose. Mt (VA, WV), Pd (VA), Cp (VA): moist fields, disturbed areas; rare. NW west to ON, south to s. VA, KY, n. AL, c. MS, and c. LA. = O. sessilis (Pennell) Munz, treated by Staley (1977) as O. pilosella ssp. sessilis (Pennell) Staley, is best recognized as a species; it is restricted to West Gulf Coastal Plain. [= F, G, WV, X; = O. pilosella ssp. pilosella – C, K, V; = Kneiffia pratensis Small – S; = O. fruticosa Linnaeus var. hisutula Nuttall ex Torrey & A. Gray]

**Oenothera riparia** Nuttall, Riverbank Evening-primrose. Cp (NC, SC, VA?): tidal marshes; rare (NC Rare). June-July. Se. VA (?) south to se. NC and e. SC. Distinct from O. fruticosa. Present in the freshwater tidal portions of the Waccamaw, Northeast Cape Fear, Black, Greater Pee Dee, and Cape Fear (?) rivers. [= O. fruticosa – RAB; < O. fruticosa ssp. fruticosa – K, V; = Kneiffia riparia (Nuttall) Small – S; = O. tetragona Roth ssp. glacina (Michaux) Munz var. riparia (Nuttall) Munz – X]
ONAGRACEAE  

Oenothera simulans (Small) W.L. Wagner & Hoch, Southeastern Gaura. Cp (GA, NC, SC): open woodlands, sandy fields, roadsides, primarily in the outer Coastal Plain; common. May-September. E. NC ( Dare County) south to s. FL, west to e. TX, endemic to the Coastal Plain. [= U; = Gaura angustifolia Michaux – RAB, K, Q, S; > Gaura angustifolia var. angustifolia – X]

* Oenothera sinuosa W.L. Wagner & Hoch, Texas Gaura. Cp (GA, SC), Pd (GA): sandy fields, disturbed areas, and clearings; uncommon, native of further west. April-June. AR and OK south to s. TX, introduced eastward to SC and FL. [= U; = Gaura sinuata Nuttall ex Seringe – RAB, K, Q, X]

Oenothera tetragona Roth var. brevistipitata (Pennell) Munz. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (VA): dry forests and woodlands, roadsides; common. May-August. SC and KY, south to GA and MS. Should perhaps be considered more closely related to O. fruticosa (where placed in synonymy by Straley), if it is determined to be valid. [= G; < O. tetragona – RAB, C; < O. fruticosa Linnaeus ssp. fruticosa – H, K, V, W; = Kneiffia brevistipitata Pennell – S; = O. tetragona ssp. tetragona var. brevistipitata – X]

Oenothera tetragona Roth var. fraseri (Pursh) Munz, Appalachian Sundrops. Mt (GA, NC, SC, VA, WV), Pd (NC, SC, VA), Cp (VA): dry to moist forests and woodlands, roadsides; common. May-August. NY and PA, south to nw. SC and n. GA. This is the more montane and high elevation variant of O. tetragona. [= F, G, X; < O. tetragona – RAB, C; > O. tetragona var. hybrida (Michaux) Fernald – F, WV; > O. tetragona var. latfolia (Ryderberg) Fernald – F, WV; < O. fruticosa Linnaeus ssp. glauca (Michaux) Straley – H, K, V, W; > Kneiffia glauca (Michaux) Spach – S; > Kneiffia hybrida (Michaux) Small – S; > Kneiffia latfolia Rydberg – S; = O. tetragona ssp. glauca var. glauca – X]

Oenothera tetragona Roth var. tetragona, Northern Sundrops. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, VA): dry forests and woodlands, roadsides; common (rare in DE). May-August. NL (Newfoundland) west to MI, south to e. VA and MO. [= F; < O. tetragona – RAB, C; > O. tetragona var. longistipitata (Pennell) Munz – F, WV; < O. tetragona var. tetragona – G; < O. fruticosa Linnaeus ssp. glauca (Michaux) Straley – H, K, V, W; = Kneiffia tetragona (Roth) Pennell – S; = O. tetragona ssp. tetragona var. tetragona – X]

Oenothera tetragona Roth var. velutina (Pennell) Munz. Cp (VA): dry sandy soils. Se. NY (Long Island) south to se. VA. Should perhaps be considered more closely related to O. fruticosa, if it is determined to be valid. [= F, G; < O. tetragona – RAB, C; < O. fruticosa Linnaeus ssp. fruticosa – H, K, V, W; = Kneiffia velutina Pennell – S; = O. tetragona ssp. tetragona var. velutina – X]

Oenothera triloba Nuttall, Stemless Evening-primrose. Mt (GA, VA*): limestone glades (in GA), blackbelt prairies, disturbed areas (in VA); rare, perhaps only introduced in eastern KY and TN (GA Watch List). [= C, F, G, H, K, X; = Lavauxia triloba (Nuttall) Spach – S]

* Oenothera cienlandii W. Dietrich, Raven, & W.L. Wagner. Reported for SC (Kartesz 1999). Investigate. Centered in IL and WI, ranging east, probably mostly as introductions, to NJ, WV, KY. [= C, K, Y; < O. rhombipetala, misapplied]

Oenothera filiformis (Small) W.L. Wagner & Hoch. East to MD, PA, KY, TN, and AL (Kartesz 1999). [= U; = Gaura longiflora Spach – K, preoccupied name; = Gaura biennis Linnaeus var. pitcheri Torrey & A. Gray – C, F, G, X; > Gaura filiformis Small – S; > Gaura longiflora – S] {not yet keyed}

Oenothera macrocarpa Nuttall sp. macrocarpa, Wingfruit Evening-primrose, occurs as a disjunct in c. TN. [= K; < O. missouriensis Sims – F; < O. macrocarpa Nuttall – C, G; = O. missouriensis Sims var. missouriensis – X; > Megapterium missouriense (Sims) Spach]

Oenothera serrulata Nuttall, east to w. KY. [= U; = Calylophus serrulatus (Nuttall) Raven – K] {not yet keyed; synonymy incomplete}

Oenothera tetragona Roth var. sharpii Munz. Known from the Eastern Highland Rim of TN, AL, and KY. [= O. tetragona – RAB, C; < O. tetragona var. tetragona – G; < O. fruticosa Linnaeus ssp. fruticosa – H, K, V, W; = O. tetragona ssp. tetragona var. sharpii – X]

Oenothera xenogaura W.L. Wagner & Hoch. Disjunct eastward in GA (Kartesz 1999). [= U; = Gaura drummondii (Spach) Torrey & A. Gray K] {not yet keyed}

222. MYRTACEAE A.L. de Jussieu 1789 (Myrtle Family) [in MYRTALES]

A family of about 100 genera and 3500 species, trees and shrubs, nearly worldwide in tropical and subtropical areas.

Melaleuca Linnaeus 1767 (Cajeput, Bottlebrush, Punktree)

A genus of ca. 300 species (if circumscribed, as here, to include Callistemon), trees and shrubs, of tropical and subtropical Australia and nearby Asia and Pacific Islands.

1 Filaments red or crimson; flowers attached to the inflorescence axis singly ................................................. M. citrina
1 Filaments white, greenish, or yellowish; flowers attached to the inflorescence in triads ............................................. M. quinquenuervia

* Melaleuca citrina (Curtis) Dumont de Courset, Crimson Bottlebrush. Disturbed areas; native of Australia. [= Callistemon citrinus (Curtis) Skeels – K2, WH]

* Melaleuca quinquenuervia (Cavanilles) Blake, Punktree, Paperbark Tree. Wetlands, disturbed areas; native of Australia. [= GW, K2, WH; = M. leucadendra Linnaeus – S, misapplied]
A family of about 200 genera and 4500-5000 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and warm temperate areas.

**Rhedia Linnaeus 1753 (Meadow-beauty)**  
(by Richard J. LeBlond)

A genus of about 15 species, herbs, of North America. **Rhedia** is the only genus of the Melastomataceae to occur in North America north of s. FL.  

### Identification notes:
Measurements of the hypanthium are to the base of the calyx lobes.

<table>
<thead>
<tr>
<th>1</th>
<th>Anthers straight, ca. 2 mm long.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Stem internodes with at least some hairs; leaves oblong, linear, or spatulate; petals yellow</td>
</tr>
<tr>
<td>3</td>
<td>Calyx segments blunt to acute; floral tube glandular-pubescent; surface of seeds irregularly ridged</td>

Rhexia alifanus Walter, Smooth Meadow-beauty. Pine flatwoods and savannas, pocosins borders, more able to tolerate merely moist soils than other *Rhexia* species. May-September. A Southeastern Coastal Plain species: e. NC south to n. peninsular FL and west to se. Texas (Singhurst, Mink, & Holmes 2010). Our tallest and showiest *Rhexia*; the unbranched (unless injured), wandlike stems, with strongly ascending, bluish-green, generally entire leaves make this species unmistakeable. [= GW, K, RAB, S, WH, Z]

*Rhexia aristosa* Britton, Awned Meadow-beauty, Bristly Meadow-beauty. Clay-based Carolina bays, depression meadows, and limesink ponds (dolines). June-September. This species has a very local and disjunct range extending (strictly on the Coastal Plain) from NJ south to AL. The long yellowish bristles at the summit of the calyx/hypanthium are diagnostic. *R. aristosa × virginica* is known from the Coastal Plain of NJ (Snyder 1996). [= C, F, G, GW, K, RAB, S, Z]

*Rhexia cubensis* Grisebach, West Indies Meadow-beauty. Limesink ponds (dolines). June-September. Se. NC south to s. FL and west to sw. MS; also in the West Indies. [= GW, K, RAB, S, WH, Z]

*Rhexia interior* Pennell. Moist to wet areas, ditches, prairies. S. IN, s. IL, s. MO, and se. KS south to c. AL, c. MS, n. LA, and se. OK. [= F, G; = *R. mariana* Linnaeus var. *interior* (Pennell) Kral & Bostick – GW, K, Z; < *R. interior – C*]

*Rhexia lutea* Walter, Yellow Meadow-beauty, Golden Meadow-beauty. Wet pine flatwoods and savannas, seepage slopes, and bogs. April-July (and later in response to growing-season fire). A Southeastern Coastal Plain species: e. NC south to ne. FL and Panhandle FL, and west to se. TX. The only yellow-flowered *Rhexia* and also our bushiest species. [= GW, K, RAB, S, WH, Z]

*Rhexia nashii* Small, Hairly Meadow-beauty, Maid Marian. Wet pine flatwoods and savannas; pondshores, bogs, marshes, ditches, wet roadsides. May-October. Primarily a Southeastern Coastal Plain species: e. VA south to s. FL and west to se. LA. [= GW, K, S, WH, Z; = *R. mariana var. purpurea* Michaux – F, G, RAB]

*Rhexia nuttallii* C.W. James, Nuttall's Meadow-beauty. Pine flatwoods, bogs. Coastal Plain of se. GA west to FL Panhandle, south to s. peninsular FL. [= GW, K, WH, Z; = *R. servulata* Nuttall – S]

*Rhexia parviflora* Chapman, Small-flowered White Meadow-beauty, Apalachicola Meadow-beauty. Limesink pond margins. Sw. GA (Mitchell County) south into Panhandle FL. [= GW, K, S, WH, Z]

*Rhexia petiolata* Walter, Ciliate Meadow-beauty, Short-stemmed Meadow-beauty. Wet pine flatwoods and savannas, pocosin borders, and ditches. June-September. May-October. A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to se. TX. The flowers are sessile, the petals ascending. [= C, G, GW, K, RAB, WH, Z; = *R. ciliosa* Michaux – F, S]
**MELASTOMATACEAE**

*Rhexia salicifolia* Kral & Bostick, Willowleaf Meadow-beauty, Panhandle Meadow-beauty. Drawdown zones of Coastal Plain depression ponds and interdune swales. Sw. GA and FL Panhandle west to s. AL (Jensen 2007). [= GW, K, WH, Z]

*Rhexia ventricosa* Fernald & Griscom, Swollen Meadow-beauty. Pine flatwoods and savannas, clearings in cypress-hardwood swamps, ditches, wet roadsides. June-September. S. NJ south to e. SC. This taxon is closely related to *R. interior* Pennell, which is distributed west of the Appalachians. [= F, RAB, = R. *mariana* Linnaeus var. *ventricosa* (Fernald & Griscom) Kral & Bostick – GW, K, W, Z; < R. *interior* Pennell – C]

---

**STAPHYLEACEAE** Martynov 1820 (Bladdernut Family) [in CROSSOSOMATALES]

A family of 2 genera and about 45-50 species, trees and shrubs, of mainly temperate Northern Hemisphere, especially e. Asia. References: Spongberg (1971)=Z; Simmons in Kubitzki, Bayer, & Stevens (2007).

*Staphylea* Linnaeus 1753 (Bladdernut)

A genus of 23 species, trees and shrubs, mainly of temperate Eurasia and e. North America, but extending into Central and South America. References: Simmons in Kubitzki, Bayer, & Stevens (2007).

**Identification notes:** The opposite, trifoliolate leaves with serrulate margins are diagnostic.

*Staphylea trifolia* Linnaeus, Bladdernut. Nutrient-rich bottomland forests, extending upslope over calcareous or mafic rocks. April; September-October. QC west to MN, south to sw. GA, Panhandle FL, n. AL, n. MS, and OK. [= RAB, C, F, G, GW, K, S, W, WH, WV, Z]

---

**ANACARDIACEAE** R. Brown 1818, nom. cons. (Cashew Family) [in SAPINDALES]

A family of about 70-81 genera and about 800-875 species, trees, shrubs, lianas, and rarely herbs, of tropical, subtropical, and temperate regions. Our representatives are all classed in subfamily Anacardioideae (Pell et al. 2011). References: Pell et al. in Kubitzki (2011); Barkley (1937).

1 Leaves simple ...................................................................................................................................................................................................... *Cotinus*

1 Leaves compound.

2 Leaves even-pinnate .................................................................................................................................................................................. *Pistacia*

2 Leaves odd-pinnate.

3 Fruits both red and glabrous ................................................................................................................................................................. *Schinus*

3 Fruits not simultaneously red and glabrous.

4 Fruits red, glandular pubescent; foliage and stems lacking contact poisons; inflorescences dense, either terminal or lateral on last year's growth. ........................................................................................................................................................................ *Rhus*

4 Fruits white or yellow, glabrous or puberulent (the hairs not glandular); foliage and stems containing contact poisons; inflorescences openly branched, axillary. ......................................................................................................................................................... *Toxicodendron*

---

**Cotinus** P. Miller 1754 (Smoketree)

1 Leaves elliptic, to 10 cm long; [planted tree, rarely persistent] .................................................................................................................. *C. coggygria*

1 Leaves obovate, to 20 cm long; [native tree of calcareous habitats] ..................................................................................................... *C. obovata*

* **Cotinus coggygria** Scopoli, European Smoketree. Suburban areas; native of Europe and Asia. *C. coggygria* is planted as an ornamental, and is reported as naturalized in various states in ne. United States. There is little evidence of its true naturalization or persistence in our area. [= K1, K2]
Cotinus obovata Rafinesque, American Smoketree. Limestone woodlands and glades. Sc. TN (Cumberland Plateau) (Chester, Wofford, & Kral 1997), nw. GA, and n. AL west to OK and e. and sc. TX. A small tree of limestone woodlands and glade margins, occasionally planted as an ornamental tree. [= C. obovatus Rafinesque – K1, K2, orthographic variant; = C. americanus Nuttall – S]

Pistacia Linnaeus 1753 (Pistachio)

* Pistacia chinensis Bunge, Chinese Pistachio. Uncommonly planted, rarely persistent or naturalizing; native of China, the Philippines, and Taiwan. March-April. AL, GA. [= K1; > P. chinensis ssp. subintegerrima (Stewart) Rech. f. – K2]

Rhus Linnaeus 1753 (Sumac)

Identification notes: Two hybrids have been documented to occur naturally in our area: Rhus ×pulvinata Greene (glabra × typhina) and Rhus ×ashei (Small) Greene (glabra × michauxii). They are intermediate between their parents. For instance, R. ×ashei has sparsely pubescent leaves and stems, slight winging of the rachis at the leaf bases, potentially greater stature than R. michauxii, and leaflets with a length/width ratio of 2.2-3. Hardin & Phillips (1985b) discuss other natural and artificial hybrids in Rhus.

1 Leaves 3-foliolate; shrub to 2 m tall; inflorescence of small lateral and terminal clusters; [subgenus Lobadium]................................. R. aromatica var. aromatica

2 Rachis of the leaf not winged between each pair of adjacent leaflets; stems and petioles puberulent; leaflets entire to remotely toothed.

3 Leaflets 11-25, attenuate to base, 2-9 cm long, 1-2 cm wide, either 3× as long as wide or < 4 cm long; leaflet margins entire (rarely serrate); leaflet apex rounded, obtuse, acute, or acuminate (often at least the more basal leaflets with an obtuse tip). .................................................. R. copallinum var. copallinum

4 Leaflets densely pubescent (rarely sparsely pubescent); short shrubs to 1 m tall; stems densely long-pubescent; rachis of the leaf often winged terminally; leaflets mostly ovate, averaging about 2× as long as wide, acute........................................................ R. michauxii

5 Stems essentially glabrous; pubescence of the fruit short and blunt-tipped ............................................. R. glabra

5 Stems densely long-pubescent; pubescence of the fruit long and pointed ............................................. R. typhina

Rhus aromatica Aiton var. aromatica, Fragrant Sumac, Squawbush. Rocky, rather dry, woodlands, usually over mafic rocks (such as gabbro or diabase) or calcareous rocks, less commonly in sandy soils. Late February-early May; late April-June. The species ranges throughout much of temperate North America; var. aromatica is the most eastern component of the complex, distributed from NH, ON, and MN south to Panhandle FL and TX. The foliage of R. aromatica bears some superficial resemblance to Toxicodendron pubescens. [= C, F, G, K, WV; < R. aromatica – RAB, W, WH; = Schmaltzia crenata (P. Miller) Greene – S]

Rhus copallinum Linnaeus var. copallinum, Winged Sumac, Flameleaf Sumac. Sandhills, dry woodlands, maritime thickets (especially from VA northward), old fields, roadsides. S. NY south to s. FL, mainly on the Coastal Plain and lower Piedmont. The Linnaean epithet “Copallinum” is grammatically a noun in apposition rather than an adjective, and therefore does not change grammatical gender. [= K; < R. copallina – RAB, W; < R. copallinum – C, G, WH; = R. copallina var. copallina – F; > R. copallinum – S; > R. leucantha Jacquin – S; > R. obtusifolia (Small) Small – S]

Rhus copallinum Linnaeus var. latifolia Engler, Eastern Winged Sumac. Rocky glades, dry woodlands. S. ME to n. IL, south to c. GA, AL, LA, and e. TX. [= K; < R. copallina – RAB, W; < R. copallinum – C, G, S; = R. copallina var. latifolia – F]
**ANACARDIACEAE**

* Rhus glabra Linnaeus, Smooth Sumac. Disturbed areas, clearings, roadsides, woodlands. Late May-July; June-October. ME west to BC, south to Panhandle FL, TX, CA, and beyond. [= RAB, C, G, K, S, WH, WV; > R. glabra var. glabra – F]

* Rhus michauxii Sargent, Michaux's Sumac, Dwarf Sumac. In the fall line sandhills characteristically in submesic, loamy swales, usually associated with such species as *Paspalum bidentum, Helianthus divericatus, Tridens carolinianus, Rhus copallinum, Anhaenanthe villosa*, Gymnopogon sp., and *Ardisia lanosa*; in the central Piedmont on sandy soils derived from granite; in the central Piedmont on clayey soils derived from mafic rocks such as gabbro or mafic Carolina slates, probably all of its habitats (formerly) in frequently burned situations. June; August-September. Rare and scattered (though formerly more common) from s. VA south to GA; disjunct in Alachua County, FL (just south of area). Large populations were found in sc. VA (Nottoway and Dinwiddie counties) in frequently burned military artillery "impact areas" (Fleming & Ludwig 1996). Barden & Matthews (2004) present a detailed account of its discovery by André Michaux in 1794 in what is now Union County, NC. [= RAB, K, S; = R. pamila Michaux]

* Rhus typhina Linnaeus, Staghorn Sumac. Roadsides, old pastures, thickets, clearings, rock outcrops, barrens. May-June; June-September. NS and NB west to MN, south to n. GA, AL, MS, and KS. The apparently older epithet "hirta" was rejected in 1999. The species, especially in its cut-leaved forms, forma *laciniata* (Wood) Rehder and forma *dissecta* Rehder, is very popular in Europe as a cultivated ornamental. [= RAB, C, F, G, K, W, WV; = R. hirta (Linnaeus) Sudworth – S]

Schinus Linnaeus 1753 (Brazilian-pepper)

* Schinus terebinthifolia Raddi, Brazilian-pepper. Disturbed areas, especially moist or wet; native of Brazil and Paraguay. A noxious invasive in the FL peninsula. [= *S. terebinthifolia* Raddi – GW, WH, orthographic variant; > *S. terebinthifolius* var. *raddianus* Engl. – K]

Toxicodendron P. Miller 1754 (Poison Ivy, Poison Oak, Poison Sumac)

1. Leaflets 7-13, entire; small tree ........................................................................................................................................... *T. vernix*
1. Leaflets 3, toothed, lobed, or entire; shrub or vine.
2. Fruits pubescent or papillose; leaflets entire, coarsely toothed, undulate, or round-lobed; lower surfaces of leaflets either velvety puberulent, sometimes becoming glabrate in age (*T. pubescens*) or glabrous (glabrescent or rarely pilose beneath) but with prominent tufts of tannish hairs present in the vein axils (*T. radicans* ssp. *radicans*).
3. Leaves densely pubescent (rarely pilose beneath), the apex and the lobes (if present) generally acute to acuminate; drupes papilllose, scabrous or puberulent; plant a high-climbing vine or stoloniferous shrub; [of mesic, swampy, or dry habitats] .............................................................................................................................. *T. radicans* var. *radicans*
3. Leaves velvety puberulent (sometimes becoming glabrate in age), the apex and the lobes (if present) generally obtuse to broadly acute; drupes pubescent (becoming glabrate); plant a stoloniferous shrub; [of dry habitats, especially sandhills] .................................................. *T. pubescens*
2. Fruits glabrous (or very sparsely pubescent); leaflets coarsely toothed or notched (rarely entire); lower surfaces of leaflets glabrous to pubescent, but without tufts of tannish hairs in the vein axils.
4. Leaves densely pilose and velvety on the lower surface; leaves pubescent on the upper surface; pubescence of the leaves erect. .................................................................................................................................................. *T. radicans* var. *pubens*
4. Leaves glabrous to sparsely strigose on the lower surface; leaves glabrous on the upper surface; pubescence of the leaves appressed.
5. Leaflets suborbicular or broadly ovate, nearly as wide as long; petiole glabrous (rarely glabrescent); plant a shrub, the stems upright, entirely lacking aerial roots, not vining; fruits (3-) 4-7 mm in diameter .................................................................................................................................. *T. rydbergii*
5. Leaflets ovate to lanceolate; petiole puberulent to densely pubescent; plant a shrub or vine, the stems upright or twining; fruits 2.5-5.5 mm in diameter ............................................................................................................................................. *T. radicans* var. *negundo*

Toxicodendron pubescens P. Miller, Poison Oak. Dry woodlands, around dry rock outcrops in the Piedmont and Mountains, especially prevalent in sandhills. Late April-May; August-October. Primarily Southeastern: NY (Long Island) south to n. FL, west to e. TX, inland to WV, e. TN, c. TN, se. MO, and s. KS. The nomenclatural confusion may still not be resolved. [= C, K, WH; = *Rhus toxicodendron* – RAB, F, G; = *T. toxicodendron* (Linnaeus) Britton – S; = *T. toxicarium* Gillis – W, Z; = *T. quercifolium* (Michaux) Greene]

Toxicodendron radicans (Linnaeus) Kuntze var. *negundo* (Greene) Reveal, Midwestern Poison Ivy. In a wide range of habitats, including mesic forests, rock outcrops, open areas, and disturbed ground. Late April-May; August-October. NY west to
A family of about 133 genera and 1465 species, trees, shrubs, vines, and herbs, primarily of tropical (rarely temperate) regions of the Old World and New World. APG III (2009) and others have recently included Hippocastanaceae and Aceraceae in the Sapindaceae. References: Buerki et al. (2009).

1 Leaves simple (lobed and/or toothed); fruits winged.
2 Leaves 0.8–2× as long as wide, orbicular in outline, lobed, the margin often also toothed; fruit a schizocarp of 2 samaras; [subfamily Hippocastanoideae]............................................................................................................ 1. Acer
3 Leaves 3–10× as long as wide, oblanceolate, unlobed, margin entire; fruit a winged capsule; [subfamily Dodonoeideae].......................................................................................... 6. Dodonaea
5 Leaves pinnately or biternately compound.
4 Vine; leaves biternately compound; [subfamily Sapindoideae]............................................................................................................. 3. Cardiospermum
6 Tree or shrub; leaves pinnately compound.
5 Leaflets entire; fruit drupe-like; [native, of coastal hammocks of se. SC southward]; [subfamily Sapindoideae] ........................................... 5. Sapindus
6 Fruit winged; [native]; [subfamily Hippocastanoideae] .................................................................................................................. 1. Acer
7 Fruit inflated; [alien ornamental, rarely escaped]; [subfamily Sapindoideae]................................................................................................. 4. Koelreuteria

1. Acer Linnaeus 1753 (Maple)

Section Parviflora, Series Caudata: spicatum
Section Palmata, Series Palmata: palmatum
Section Negundo, Series Negundo: negundo
Section Rubra: drummondii, rubrum, saccharinum
Section Macrantha: pensylvanicum
SAPINDACEAE

Section Platanoidae: platanoides, campestre
Section Acerr, Series Acer pseudoplatanus
Section Acerr, Series Saccharodendron:
Section Ginnala: ginnala

1. Leaves compound, divided into 3-7 (-9) leaflets; [section Negundo].
2. Twigs glabrous ................................................................. A. negundo var. negundo
3. Twigs puberulent ............................................................................... A. negundo var. texanum

1. Leaves simple, generally shallowly to deeply 3-5 (-7) lobed.
2. Twigs puberulent ............................................................................... A. platanooides

4. Petioles and young twigs exuding milky sap when broken; inflorescence peduncled, the flowers on ascending, moderately stout pedicels; paired samaras held at ~135° from one another; [section Platanoidae]; [alien]
3. Leaves not toothed, or often with a few rounded, coarse, and irregular teeth on the principal lobes, these teeth 0-5 per principal lobe; sinuses between the principal leaf lobes generally broadly rounded, the sinus broader than deep.
4. Petioles and young twigs exuding clear sap when broken; inflorescence sessile, the flowers on drooping, filiform pedicels; paired samaras held at ~110° from one another; [section Acerr, series Saccharodendron]; [native, also widely planted].

5. Leaves 3-5-lobed, 4-8 (-10) cm wide ......................................................... A. campestre
6. Leaves 5-7-lobed, 10-18 cm wide ................................................................. A. nigrum

5. Leaves 3-5-lobed, 4-8 (-10) cm wide ......................................................... A. campestre

1. Leaves generally sharp, forming a definite angle (or if rounded, then the sinus much deeper than broad).

6. Leaves pale, grayish, silvery-gray, or strongly glaucous beneath, glabrous, pubescent on the veins, or pubescent across the surface; leaf sinuses on either side of the terminal lobe deep, the two sides of each sinus forming an angle of < 70 degrees (the terminal lobe typically with parallel margins, or even narrower toward the base than toward the tip); leaves usually planar, but sometimes with drooping lobe tips, especially in A. floridanum, and especially also in sun-exposed individuals of A. floridanum or A. saccharum.
7. Leaves small, (3.5-) avg. 8 (-1) cm broad; leaf undersurface usually pubescent; fruits 20-25 mm long; medium to large trees; bark gray, smooth and beech-like, becoming irregularly furrowed or plated in large individuals; [primarily of the Coastal Plain and Piedmont, extending into the Mountains in GA] ................................................................. A. floridanum
8. Leaves large, (8-) avg. 15 (-20) cm broad; leaf undersurface usually pubescent or pubescent only on the veins; fruits 25-30 mm long; large trees; bark grayish-brown, with loose-edged plates; [primarily of the Mountains and upper Piedmont] ......................... A. saccharum

7. Leaves small, (3-) avg. 6 (-11) cm broad; small trees, often multi-trunked and crooked; bark whitish (in part because of dense growth of crustose lichens), becoming cracked and blackened on larger stems; [primarily of the Piedmont, extending into the lower Mountains in w. SC and n. GA] ........................................................................................................................................ A. leucoderme
8. Leaves large, (8-) avg. 15 (-20) cm broad; large trees, single-trunked; bark dark brown or blackish, becoming furrowed in large individuals; [primarily of the Mountains and westward] .................................................................................. A. nigrum

3. Leaves finely to coarsely toothed, the toothing often regular, the teeth 8-50 per principal lobe; sinuses between the principal leaf lobes generally sharp, forming a definite angle (or if rounded, then the sinus much deeper than broad).

9. Leaves deeply lobed, the two sinuses on either side of the central lobe deep and narrow, approaching the midrib, the terminal lobe thus narrower at its base than at its middle; flowers either with petals (A. palmatum) or without petals (A. saccharum).
10. Leaves green beneath (or purple in many forms); main leaf lobes 5-9; these main lobes merely toothed or in some cultivars variously further divided; [small exotic tree, commonly planted and weakly naturalizing]; [section Palmeta] ........................................... A. palmatum
11. Leaves silvery white beneath; main leaf lobes 3-5; these main lobes with coarse teeth and smaller lateral lobes; [large native tree (also extensively planted)]; [section Rubra] ........................................................................................................ A. saccharum

9. Leaves shallowly lobed, the two sinuses on either side of the central lobe broadly wedge-shaped, not approaching the midrib, the terminal lobe thus broadest at its base and progressively (though often irregularly) narrowing toward the tip; flowers with petals.
13. Winter buds stalked, with 2-4 valvate scales; inflorescence an elongate drooping raceme or erect panicle; petals green to bright yellow, 2-10 mm long; fruits maturing in midsummer to autumn; leaves green beneath; shrub, small tree, or medium tree (to 35 cm DBH).
14. Bark with narrow white stripes on a green background (best seen on stems 3-10 cm in diameter); leaf blades 12-20 (-30) cm long and wide, finely serrate (5-10 teeth per cm), pubescent beneath with yellow to orange hairs 0.1-0.3 mm long (as seen at 10× magnification); inflorescence a drooping raceme; [section Macrantha] ........................................................................ A. pseudoplatanus
15. Bark brownish, never conspicuously striped; leaf blades 8-12 (-14) cm long and wide, coarsely serrate (2-3 teeth per cm), pubescent beneath with whitish hairs 0.3-1.0 mm long (as seen at 10× magnification); inflorescence an erect panicle; [section Parviflora] ........................................................................ A. sanguinolentum

13. Winter buds sessile, with 4-10 imbricate scales; inflorescence either a drooping panicle (A. pseudoplatanus) or a sessile or subsessile cluster or fascicle; fruits maturing either in midsummer to autumn (A. pseudoplatanus) or in spring; leaves slightly to strongly glaucous-whitened beneath; medium to large tree (to 100 cm DBH).
14. Inflorescence a drooping panicle, flowering in May-June, fruiting August-September (and persisting overwinter); petals yellowish-green; leaf blades 8-17 cm long; [section Acer, series Acer] ........................................................................ A. pseudoplatanus
15. Inflorescence a sessile or subsessile cluster or fascicle, flowering in January-March, fruiting April-July (and dropping); petals red (rarely yellowish), 1-3 cm long; leaf blades < 10 cm long; [section Rubra]
16. Mature leaves densely white tomentose (velutin-pubescent) beneath; petioles usually with white tomentum; mature samaras 2.7-5 cm long ........ A. rubrum var. drummondii
17. Mature leaves glabrous to densely pubescent (but not white-tomentose) beneath; petioles usually glabrous; mature samaras 1.5-3 cm long.
18. Leaves (3-) 5 (-9)-lobed, the central lobe 4-8 cm long, the 2 upper lateral lobes 2-5 cm long; leaf base generally cordate (rarely rounded); leaves 7-18 cm wide; [widely spread, in nearly all habitats] ........................................................................ A. rubrum var. rubrum
19. Leaves unlobed or 3 (-5)-lobed, the central lobe 1-5 cm long, the lateral lobes (if present) 0.5-2 (-3) cm long; leaf base broadly cuneate to rounded or subcordate; leaves 2-10 cm wide; [primarily of wetlands, especially in the Coastal Plain]
20. ...
**Acer campestre** Linnaeus, Hedge Maple. Suburban woodlands, planted and persistent and weakly spreading; native of Europe and w. Asia. Reported to be "occasionally spreading from cultivation to moist, rocky, disturbed woods" in sc. and se. PA (Rhoads & Klein 1993). Infraspecific taxa are often recognized in its native area. [= C, F, G, K, Z]

**Acer floridanum** (Chapman) Pax, Southern Sugar Maple, Florida Maple. Bottomland forests, mesic slopes, especially common over mafic or calcareous rocks, but not at all limited to such situations. April-May; June-October. S. VA, w. KY, se. MO, e. OK, c. OK, and n. TX, south to c. peninsular FL and e. TX. It is widely planted in southern cities and towns as a street tree. Ward (2004b) discusses the reasons for accepting *A. floridanum* as the correct name for this species; the Michauxian name *A. barbatum* is associated with specimens that are demonstrably *A. saccharum*. [= *A. saccharum* ssp. floridanum (Chapman) Desmarais – RAB, WH, Z; *A. barbatum* Michaux – C, K; > *A. barbatum* var. barbatum – F, G; > *A. barbatum* var. longii (Fernald) Fernald – F, G; = *Saccharodendron floridanum* (Chapman) Nieuwland – S]

* Acer ginnala* Maximowicz, Amur Maple. Mt (WV), Ip (KY): disturbed areas; rare, native of e. Asia. Reported as "cultivated and escaped" in s. PA (Rhoads & Klein 1993). Infraspecific taxa are often recognized in its native area. [= F, K, Z] [not yet keyed]

**Acer leucoderme** Small, Chalk Maple. Rocky slopes and bluffs, particularly over mafic or calcareous rock, on the Gulf Coast in floodplains. March-April; May-September. A species of se. North America, primarily of the Piedmont from NC to AL, less commonly in the Ridge and Valley of se. TN (Chester, Wofford, & Kral 1997), low Blue Ridge of w. NC and adjacent TN and GA, Coastal Plain of Panhandle FL, GA, AL, MS, LA, and se. TX, and in sw. AR and se. OK. The leaves, at least those on lower and inner branches, tend to dry a tawny color and remain on the tree until spring, reminiscent of beech. [= K, W; = *A. saccharum* ssp. leucoderme (Small) Desmarais – RAB, WH, Z; = *Saccharodendron leucoderme* (Small) Nieuwland – S]

**Acer negundo** Linnaeus var. *negundo*. Eastern Box Elder, Ash-leaved Maple. Riverbanks, swamps, bottomlands, also upslope on calcareous substrates. March-April; May-October. The species, broadly treated, ranges nearly across North America, including well into the arid west along rivers. Var. *negundo* occurs from NB west to MB, south to c. peninsular FL and TX; also allegedly in nw. United States. *A. negundo* often grows on the banks of rivers, leaning out over the water at a 45 degree angle. The leaves can resemble poison ivy (*Toxicodendron radicans*), which has alternate leaves. The coarse toothing (approaching lobing) distinguishes it from any of our ashes (*Fraxinus*). [= C; < *A. negundo* – RAB, GW, W, WH; > *A. negundo* var. *negundo* – F, G, K, Z; > *A. negundo* Linnaeus var. violaceum (Kirchner) Jaeger – F, G, K, Z; < *Negundo negundo* (Linnaeus) Karsten – S; < *Negundo aceroides* (Linnaeus) Moench]

**Acer negundo** Linnaeus var. *texanum* Pax, Texas Box Elder. Riverbanks and bottomlands. April; June-October. Sw. NC, KY, MO, KS, and NM south to AL, MS, and TX. The status of this variety in our area is poorly known at present. [= C, F, G, K, Z; < *A. negundo* – RAB, GW, W; < *Negundo negundo* (Linnaeus) Karsten – S; < *Negundo aceroides* (Linnaeus) Moench]

* Acer palmatum* Thunberg, Japanese Maple. Suburban woodlands; native of e. Asia. April; August-September. Frequently planted in its numerous cultivars. Infraspecific taxa are recognized in its native area. It is also reported as escaped in the DC area (Shepherd & Orli 2000). [= K, Z]

**Acer pensylvanicum** Linnaeus, Striped Maple. Dry to mesic forests. May; June-September. NS west to MB, south to w. NC, nw. SC, ne. GA, e. TN, WI, and MN. The prominently striped bark of this common, mid-elevation understory tree is unmistakable. [= RAB, C, F, G, K, S, W, Z]

* Acer pictum* Thunberg. Moist forests; native of Eurasia. [= *A. mono* Maximowicz] [not yet keyed]

* Acer pseudoplatanus* Linnaeus, Sycamore Maple. Suburban woodlands; native of Europe. Planted widely in our area as a street and yard tree, especially in the mountains. It may be naturalized more extensively in our area; northward it is a noxious weed tree. [= C, G, K, Z; = *Acer pseudo-platanus* – F, orthographic variant]

Acer rubrum Linnaeus var. rubrum, Eastern Red Maple. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): upland deciduous forests, up to at least 1500m elevation, moist bottomlands and slopes; common. January-March; April-July. This variety is the most widespread and common in our area; indeed it is one of the most ubiquitous and common trees of e. North America. It is probably more abundant than formerly, because of its weedy abilities. Overall, it ranges throughout e. North America. Whether the varieties of *A. rubrum* are worthy of recognition is a matter of disagreement; I choose here to try to distinguish them. [= F, K, Z; < A. rubrum – RAB, C, GW, W, WH; < A. rubrum var. rubrum – G (also see var. trilobum); = Rufacer rubrum (Linnaeus) Small – S]

Acer rubrum Linnaeus var. trilobum Torrey & A. Gray ex K. Koch, Carolina Red Maple. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, VA, WV): wetlands, especially peaty, acid sites; common (rare in Piedmont and Mountains. January-March; April-June. Primarily a Southeastern Coastal Plain variety, the range of var. *trilobum* is unclear, possibly extending well inland and northward (see F). This variety has greatly increased in abundance in the Coastal Plain of our area because of fire suppression and mechanical disturbance of peaty wetlands. Former large pocosin tracts, such as the Dismal Swamp, are now largely dominated by this tree. [= RAB, C, F, G, KW, WH; < A. rubrum var. rubrum – G; = Rufacer carolinianum (Walter) Small – S]

Acer saccharinum Linnaeus, Silver Maple, Soft Maple. Bottomlands, riverbanks, and disturbed areas. February-April; April-July. NS west to SK, south to Panhandle FL, LA, and OK, rare and mostly introduced east of the Appalachians and south of VA. This is an abundant tree along major rivers in the Piedmont of VA. In our area (particularly from c. NC south), the species is more common as a street tree or an escape from cultivation than as a native tree. On the Coastal Plain of NC and SC, *A. saccharinum* is largely confined to the banks and levees of large brownwater rivers, such as the Roanoke and Congaree. The silvery undersides of the leaves are obvious in windy conditions. The hybrid *Acer <fremannii* A.E. Murray [A. rubrum × saccharinum] has been collected at scattered locations in our area. [= RAB, C, F, G, GW, KW, WH; = Argentacer saccharinum (Linnaeus) Small – S]

Acer saccharum Marshall, Sugar Maple, Hard Maple, Sugar Tree. Cove forests, other rich forests, especially over mafic and calcareous rocks, on calcareous soils common and typical in dry-mesic forests and dry woodlands as well, less typically extending to high elevation northern hardwood forests where sometimes in acidic situations (as in Highlands County, VA), in parts of thye Piedmont perhaps more common as an introduction by ornamental planting than as a native, at least south of VA. April-June; June-July. Two varieties are sometimes recognized. Var. *saccharum* is distributed from NS west to ND, south to GA, LA, and OK. Var. *schnemannii* Rehder, with petioles and lower leaf surfaces densely pubescent, is alleged to occur in s. PA (Rhoads & Klein 1993), IN, IL, and MO; it is probably only a form. *A. saccharum* is the primary source of maple sugar and maple syrup; formerly, commercial sugaring was done in w. NC and w. VA. Large individuals of this species are the favorite substrate of a number of lichens, including Lobaria pulmonaria. The brown, platy bark is often similar to that of Aesculus flava. For its bright orange fall color, *A. saccharum* is one of our most prized ornamental trees. In NC, it is most common northward and on mafic rocks; thus reaching perhaps its best development in the amphibolite peaks of Ashe, Watauga, Avery, and Mitchell counties; it is more general in VA. [= C; > A. saccharum var. saccharum – F, G, K, Z; = A. saccharum ssp. saccharum – RAB, W; = Saccharodendron barbatum (Michaux) Nieuwland – S]

Acer spicatum Lamarrck, Mountain Maple. High elevation forests (northern hardwoods or spruce-fir), generally above 1500 m in NC, above 1000 m in VA, especially common in periglacial boulderfields. May-July; August-October. NL (Newfoundland), NL (Labrador), and SK south to PA, OH, and IA, and in the mountains to w. NC, e. TN, ne. GA, and ne. AL. The foliage is quite similar to that of *A. rubrum* var. *rubrum*, with which it can occur; in addition to the key characters, *A. spicatum* can be distinguished from *A. rubrum* by its leaves which have a strongly rugose texture, the secondary and tertiary veins impressed on the upper surface, distinctly raised on the lower (vs. not rugose, the secondary and tertiary veins only slightly impressed on the upper surface, and slightly raised on the lower). *A. spicatum* is also sometimes confused with *A. pensylvanicum*, but these two species are readily distinguished by their leaves (see key). [= RAB, C, F, G, K, S, W, Z]
**Aesculus** Linnaeus 1753 (Buckeye)

**Identification notes:** The following hybrids are known from our area: *Aesculus ×neglecta* Lindley [*flava × sylvatica*] and *Aesculus ×mutabilis* (Spach) Scheele [*pavia × sylvatica*]. They can be recognized by their intermediate morphology.

1. Petals usually 5, white with a reddish mark near the corolate base of the petal blade; buds gluttonous (sticky); fruit spiny; leaflets 7 (-9) per leaf; [alien, uncommonly planted, rarely naturalized]; [section *Aesculus*] .............................................................. *A. hippocastanum*
2. Petals white, unmarked with red; stamens exerted, 2-4× as long as the petals; inflorescence 2-5 dm long; [section *Macrothyrsus*] ..............
   .............................................................................................................................................. *A. parviflora*
3. Petals about 2× as long as the petals, well-exserted beyond the corolla; petals only slightly unequal in size; fruit spiny with short prickles (rarely essentially smooth) ............................................................. *A. glabra* var. *glabra*
4. Petal margins stipitate–glandular; large tree; petiolules 2-3 (-4) mm long; fruits 5-8 cm in diameter.............................. *A. flava* var. *flava*
5. Petal margins villous, not glandular; petals yellow; fruits 2-8 cm in diameter.
   ............................................................................................................................. *A. sylvatica* var. *sylvatica*

*Aesculus flava* Solander, Yellow Buckeye. Moist forests, up to nearly 2000m, especially prominent in seepy cove forests, in the Piedmont only in "montane" habitats. Late April-mid June; August-September. A broad Southern Appalachian endemic: sw. PA, s. OH, s. IN, and s. IL south through KY, WV, sw. VA, and TN to n. AL, n. GA, nw. SC, and w. NC. *A. flava* is one of the largest, most massive, and commonest trees in Southern Appalachian coves, recognizable in winter by the bark of large plate-like slabs, thick twigs, and massive form. Meyer & Hardin (1987) discuss the nomenclatural issues relating to the names "*A. flava*" and "*A. octandra."

*Aesculus glabra* Willdenow var. *glabra*, Ohio Buckeye. Mesic forests over limestone. April-May. Largely midwestern, but ranges east to sw. PA, e. TN, and nw. GA (Jones & Coile 1988); it is also sometimes introduced eastward of that distribution. It occurs in TN counties adjacent to both VA and NC. [= C, F, G, K, Z; < *A. glabra* – S, WV] *Aesculus hippocastanum* Linnaeus, Horsechestnut. Urban and suburban areas, perhaps not definitely naturalized, but fairly often planted as a street tree and escaping as seedlings in the vicinity of plantings; native of se. Europe. [= C, F, G, K, Z]

*Aesculus parviflora* Walter, Bottlebrush Buckeye. Mesic forests on bluffs and in ravines (the SC occurrence is on Fall Line river bluffs, with shaley, subcalcaceous soils). Wc. GA west to nc. AL, south to sw. GA and sw. AL; disjunct in wc. SC (Aiken County). See Wyatt (1985) for a discussion of the interesting, relicual occurrence in SC. Occasionally planted outside its native range. [= K, S, Z]

*Aesculus pavia* Linnaeus var. *pavia*, Red Buckeye. Swamp forests, usually stagnant, usually blackwater (not receiving significant alluvium), and especially over marl (coquina limestone). April-early May; July-August. Var. *pavia* ranges from se. NC south to c. peninsular FL and west to c. TX, extending north in the Mississippi Embayment to se. MO and s. IL, and in scattered occurrences off the Coastal Plain, as in se. TN; also it is sometimes cultivated further inland and persistent or slightly naturalizing. Var. *flavescens* (Sargento Correll occurs in the Edwards Plateau of c. TX. Fernand reports this species from VA and WV, but there is likely taxonomic or nomenclatural confusion. [= K, Z; < *A. pavia* – RAB, C, G, S, WH; < *A. pavia* – F; < *A. discolor* Pursh – F]

*Aesculus sylvatica* Bartram, Painted Buckeye. In the Piedmont in mesic, nutrient-rich forests, on bottomlands, lower slopes, and in ravines, in the Coastal Plain primarily on floodplains of brownwater (alluvium-carrying) rivers (most notably the Roanoke River in NC), in the Mountains only at low elevations. April-mid May; July-August. Primarily a Southeastern Piedmont endemic, occurring primarily in the Piedmont from sc. VA south through c. NC, c. SC, and nc. GA to nc. AL, with an extension north into e. TN. [= RAB, C, F, K, W, Z; = *A. neglecta* Lindley – G, misapplied; < *A. octandra* – S (also see *A. flava*); > *A. georgiana* Sargent]
3. Cardiospermum Linnaeus 1753 (Balloon Vine)

A genus of about 14 species, vines, of tropical regions (especially America).

4. Koelreuteria Laxmann 1772 (Golden Rain Tree)

1 Leaves pinnate (rarely bipinnate in part), the leaflets coarsely crenate to lobulate; capsule valves ovate, 2 × as long as wide; capsules greenish to tawny when young, aging to dark brown

   1 Leaves bipinnate, the leaflets entire to shallowly serrate; capsule valves orbicular, 0.9-1.4 × as long as wide; capsules rose-purple when young, aging to tawny-brown.

   2 Leaflets weakly oblique, acute to short-acuminate, entire to shallowly serrate; petals 4 (-5)

   2 Leaflets strongly oblique, long acuminate to caudate, entire to irregularly crenate-serrate; petals 4 (-5)

* Koelreuteria bipinnata Franchet, Bougainvillea Golden Rain Tree. Disturbed areas, roadsides; native of s. China. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive. [= Z]

* Koelreuteria henryi Dümmer, Flamegold. Disturbed areas, roadsides; native of Taiwan. This taxon appears to be distinct morphologically and geographically from K. elegans, and warrants recognition at the species level. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive, and established just south of our area in peninsular FL. [= Koelreuteria elegans (Seem.) A.C. Smith sp. formosana (Hayata) F.G. Meyer – K, WH, Z]

5. Sapindus Linnaeus 1753 (Soapberry)

A genus of about 13 species, trees, of tropical and warm temperate regions of the Old and New World.

Sapindus marginatus Willdenow, Florida Soapberry. Coastal marsh hammocks, shell middens. May-June. Se. SC (?) and e. GA south to c. peninsular FL (Lee and Brevard counties), and on the Gulf Coast in s. MS. Small (1933) reports this species from SC, but there is doubt whether this species was actually ever documented to occur in SC; there are no recent records. Although sometimes combined (as by K) with the tropical Sapindus saponaria, I follow most recent Florida authors (Clewell 1985, Tomlinson 1986, Godfrey 1988, Nelson 1994, Nelson 1996) in maintaining it as distinct. S. marginatus is a species of n. FL, e. GA, and possibly SC and has wingless rachises, acuminate leaflets, and globose fruits; S. saponaria is a species of s. FL and tropical America and has winged rachises, rounded leaflet tips, and ovoid to globose fruits. [= RAB, S; < S. saponaria Linnaeus var. saponaria – K]

6. Dodonaea P. Miller 1754 (Varnishleaf, Hopbush)

A genus of about 65 species, shrubs, mainly Australian.

Dodonaea viscosa (Linnaeus) Jacquin, Varnishleaf, Hopbush. Widespread in the Old World and New World tropics, north in FL to St. Johns County. [= S, WH; < D. viscosa – K]
241. RUTACEAE A.L. de Jussieu 1789 (Citrus Family) [in SAPINDALES]

A family of about 156 genera and 1800 species, trees, shrubs, vines, and rarely herbs, cosmopolitan.

1 Leaves unifoliolate (appearing simple); [subfamily Aurantioideae]........................................................................................................Citrus
2 Leaves pinnately or palmately compound.  
3 Leaves 2-pinnatifid; suffrutescent herb or shrub to 1.5 m tall; [subfamily Rutoideae, tribe Ruteae] ................................................................. Ruta
4 Leaves palmate 3-foliolate or 1-pinnate (5-19-foliolate); shrub or tree, usually over 1.5 m tall (potentially to 20 m in Zanthoxylum). Zanthoxylum
5 Leaves pinnately 5-19-foliolate.  

A genus of about 27-35 species, trees, of s. and se. Asia. The circumscription has been controversial, but Araújo, Queiroz, & Machado (2003) provide compelling arguments in favor of a broad circumscription (followed here), including Poncirus, based on DNA analyses and other considerations. The recognition of Poncirus and other segregate genera would render Citrus paraphyletic because of the position of Citrus medica (the type species of Citrus) as basal to these genera and the rest of Citrus. References: Mabberley (1997)=Z; Araújo, Queiroz, & Machado (2003)=Y; Pfeil & Crisp (2008).

Identification notes: Citrus has simple to trifoliolate, evergreen, coriaceous, acuminate, glossy green leaves, and the familiar spherical fruits. Citrus ×limon (Linnaeus) Burmann f., Lemon, C. ×paradisi Macfadyen in Hooker (pro sp.), Grapefruit, and C. sinensis (Linnaeus) Osbeck, Orange, have been grown on the Outer Banks of North Carolina in Buxton, Dare County, NC (Brown 1959). They are apparently not naturalized, being killed outright or severely damaged by occasional colder winters, and are not keyed or otherwise treated here.

1 Leaves trifoliolate; fruit densely pubescent, 3-6 cm long.................................................................C. trifoliata
2 Petiole winged, and with an articulation at the juncture with the blade; fruit 4.5-15 cm long.................................................................C. ×aurantium
3 Petiole not winged, and lacking an articulation at the juncture with the blade; fruit 15-25 cm long.................................................................C. medica

* Citrus ×aurantium Linnaeus (pro sp.), Sour Orange, Grapefruit, Sweet Orange. Cultivated horticulturally, sometimes persistent; native of se. Asia. Reported from several counties in s. and e. GA (Jones & Coile 1988). [=WH; Z; = C. aurantium – K (as species)]
* Citrus trifoliata Linnaeus, Trifoliate Orange, Hardy Orange. Woodlands, thickets, bottomlands, and streambanks, especially in suburban areas; native of temperate China. March-April; September-October. Planted in our area as an ornamental, as a “living fence,” and also used as a grafting stock for citrus. C. trifoliata is a small tree or shrub that seems to be made up almost entirely of “thorns” (actually, stipular spines). The fruits closely resemble an orange, but are small (ca. 4 cm in diameter), densely pubescent, and sour. Citrus trifoliata is often placed in a separate genus, Poncirus, but differs very little from Citrus morphologically, and has been shown to be phylogenetically nested within Citrus (Araújo, Queiroz, & Machado 2003), and thus seems best included in Citrus. [=Y; = Poncirus trifoliata (Linnaeus) Rafinesque – RAB, F, G, K, S, WH]

Phellodendron Ruprecht 1857 (Cork-tree)

A genus of about 10 species, trees, native of e. Asia.

* Phellodendron japonicum Maximowicz, Japanese Cork-tree. Pd (DE), Mt (WV): suburban woodlands; uncommon (rare in WV), native of Japan. [=C, K1; ? P. amurense Ruprecht – K2]
**Ptelea** Linnaeus 1753 (Hop-tree, Wafer-ash, Stinking Ash)

A genus of about 11 species, of North America (south into Mexico). References: Bailey (1962)=Z.

*Ptelea trifoliata* Linnaeus, Hop-tree. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): rocky bluffs, especially calcareous or mafic; open woodlands, calcareous Coastal Plain river bluffs, granitic domes; uncommon. April-June; June-August. NJ, w. NY, MI, s. WI, and NE south to c. peninsular FL, c. AL, c. MS, e. and s. TX. Bailey (1962) treats two varieties in our areas, doubtfully distinguishable; they need additional study. [= RAB, WH; > *P. trifoliata* var. mollis – F, WV; > *P. trifoliata* var. trifoliata – F, WV; > *P. trifoliata* ssp. trifoliata var. mollis Torrey & A. Gray – C, K, Z; > *P. trifoliata* ssp. trifoliata var. trifoliata – C, K, Z; = *P. trifoliata* var. trifoliata – G; > *P. trifoliata* – S; > *P. servaita* Small – S; > *P. microcarpa* Small – S; > *P. baldwinii* Torrey & A. Gray – S]

**Ruta** Linnaeus 1753 (Rue)

A genus of about 7 species, of the Old World.

* Ruta graveolens Linnaeus, Rue. Pd (NC, VA), Mt (VA, WV): cultivated in gardens as a medicinal herb, persistent and rarely escaping, sometimes locally abundant in pastures over limestone or gravelly floodplains; rare, native of Eurasia. May-August; June-September. This plant causes dermatitis in some people, apparently by removing the skin's sun-resistance. *Ruta* has a disagreeable smell, and has toxic properties. [= RAB, C, F, G, K, S, WV]

**Zanthoxylum** Linnaeus 1753 (Prickly-ash, Toothache Tree)

A genus of about 250 species, of America, Africa, Asia, and Australia. References: Porter (1976)=Z.

1 Leaves thin in texture, pubescent; flowers in small axillary clusters ................................................................. *Z. americanum*

1 Leaves coriaceous in texture, glabrous and waxy; flowers in large terminal compound cymes .................................................. *Z. clava-herculis*

**Zanthoxylum americanum** P. Miller, Prickly-ash, Toothache Tree, Northern Prickly-ash. Woodlands and forests over calcareous or mafic rocks, often forming extensive colonies near outcrops. March-April; July-August. S. QC west to e. ND, south to e. SC, c. GA, Panhandle FL, c. TN, c. TN, and OK. Sometimes planted. There is only a single known site in SC. [= RAB, C, K, W, S, WH, WV, Z; = *Xanthoxylum americanum* – F, orthographic variant]

**Zanthoxylum clava-herculis** Linnaeus, Toothache Tree, Hercules'-club, Sea-ash, Southern Prickly-ash, Pepper-bark, Tickle-tongue. Maritime forests, dunes, shell middens, shell hammocks, maritime scrub, inland (in FL and GA) in hammocks. April-May; July-September. A Southeastern Coastal Plain endemic: se. VA south to FL and west to TX, AR, and OK. The compound leaves are armed with stout prickles along the rachis. The twigs are also spiny. On the larger branches and trunks, the spines become elevated on conical, pyramidal, or cylindrical corky bases up to 5 cm long and 4 cm in diameter, giving the trunk a very peculiar appearance. Many of the common names come from the numbing effect on the mouth of chewing the leaf or twig, the flavor, smell, and effect being very similar to *Ctenium aromaticum*, Toothache Grass. In the northern part of its distribution, it is restricted to the outer Coastal Plain, nearly entirely on the barrier islands. Although normally a small tree, it can reach considerable size, up to about 60 cm DBH. In the 5 km immediately north of Buxton, Dare County, NC one can see several hundred individuals growing on open, *Uniola*-dominated dunes. Because of salt-pruning, the trees often have 5 times as wide a spread as they are tall. Some trees have a basal diameter of 30-40 cm, a short trunk less than a meter tall, a total height of 2-3 m, and a spread of 10 m. [= RAB, C, G, K, S, WH, Z; = *Xanthoxylum clava-herculis* – F, orthographic variant]

**242. SIMAROUBACEAE** A.P. de Candolle 1811 (Quassia Family) [in SAPINDALES]

A family of about 13 genera and 111 species, trees and shrubs of primarily tropical areas of the New World and Old World. The Leitneriaceae has been traditionally considered to be a monotypic family, endemic to se. North America; a variety of recent studies have suggested its inclusion in the Simaroubaceae (Angiosperm Phylogeny Group 1998, 2003, 2009; Bogle in FNA 1997). References: Angiosperm Phylogeny Group (1998, 2003). [including LEITNERIACEAE]

1 Leaves compound; [species alien, aggressively naturalizing in upland sites].................................................................................. *Ailanthus*

1 Leaves simple; [species native, in wetland sites]........................................................................................................ *Leitneria*
**Ailanthus** Desfais 1788 (Tree-of-Heaven)

* Ailanthus altissima (P. Miller) Swingle, Tree-of-Heaven, Copal Tree, Stink-tree. Roadsides, forests, disturbed areas, including cities, especially in moist, fertile soils; native of e. Asia. Late May-early June; July-October. In our area, this tree is now an aggressive and noxious weed, colonizing even undisturbed forests and outcompeting the native vegetation. As serious a weed as it is here, it is (at the time of this writing, at least), much worse to the north, now the dominant tree in fencerows, woodlots, and forests in the urbanized, suburbanized, and even rural Northeast. It can be recognized vegetatively by its large pinnately compound leaves, very stout twigs (over 1 cm thick), and the characteristic and unpleasant odor of the crushed foliage. [= RAB, C, F, G, K, S, W]

**Leitneria** Chapman 1860 (Corkwood)

Leitneria floridana Chapman, Corkwood. Swamps and cabbage palm / sawgrass marshes. February-March. Sw. GA and Panhandle FL west to e. TX, and north in the Mississippi Embayment to AR and MO, very scattered in occurrence. [= FNA, GW, K, S, WH]

**243. MELIACEAE** A.L. de Jussieu 1789 (Mahogany Family) [in SAPINDALES]

A family of about 50 genera and 565 species, trees and shrubs, of tropical and subtropical areas. The only native member of the family in e. North America is *Swietenia mahogani* (Linnaeus) Jacquin (West Indian Mahogany), a very valuable timber tree which ranges north to s. FL. References: Miller (1990)=Z in the synonymy.

**Melia** Linnaeus 1753 (Chinaberry)

A genus of 3 species, trees, of the Old World tropics.

* Melia azedarach Linnaeus, Chinaberry, Carolina Mahogany, Umbrella-tree, Pride-of-India. Disturbed areas, abandoned rural yards and fields; native to se. Asia, commonly cultivated in our area (mainly in the Coastal Plain) and commonly escaped. April-May; September-October. [= RAB, C, F, G, K, S, WH, Z]

**250. MALVACEAE** A.L. de Jussieu 1789 (Mallow Family) [in MALVALES]

Malvaceae has always been difficult to circumscribe cleanly, relative to members of such families as Sterculiaceae and Tiliaceae. Molecular evidence now adds to morphologic evidence that traditional circumscriptions of these families are highly polyphyletic. Bayer et al. (1999) present a new classification of an expanded Malvaceae, with 9 subfamilies recognized. If circumscribed broadly (as here) to include Sterculiaceae and Tiliaceae, a family of about 243 genera and 4000-4500 species, herbs, shrubs, and trees, of cosmopolitan distribution, but especially diverse in the tropics and subtropics. This family includes several economically important species, including cotton (*Gossypium* spp.), cacao or chocolate, *Theobroma cacao* Linnaeus, and cola, *Cola acuminata* R. Brown. References: Bayer et al. (1999); Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell (1988). [including STERCULIACEAE and TILIACEAE]
**MALVACEAE**

4 Ovary with 5 carpels and 5 styles; capsule with 5-10 seeds; corolla pink, purple, or white..............................................[**Melochia**]

4 Ovary with 1 carpel and 1 style; capsule with 1 seed; corolla orange to yellow..........................................................[*Waltheria*]

3 Stamens >10.

5 Stamens free.

6 Tree; fruit a woody drupe; [subfamily *Tilioidae*]..................................................................................................[**Tilia**]

6 Herb or shrub; fruit a capsule; [subfamily *Grewioideae*].

7 Leaves rounded or subordant at base, acute at apex; fruit much longer than broad, unarmed.................................[**Corchorus**]

7 Leaves cuneate at base, acuminate at apex; fruit subglobose, with hooked spines.................................................[**Triumfetta**]

5 Stamens united into a staminal column adnate to the corolla at its base; [subfamily *Malvoideae*; tribe *Malvae*].

8 Seeds 2 or more per carpel.................................................................................................................................[**Abutilon**]

8 Seed 1 per carpel.

9 Leaves palmately and deeply cleft (> 9/10s of the way to the midrib) into linear segments.................................[**Callirhoe**]

9 Leaves unlobed or lobed (if lobed, < 4/5’s of the way to the midrib and the lobes broad).

10 Flowers many in a terminal panicle; corolla white; style branches filiform, the stigmatic surface elongate along the inner side of the branches; leaves >10 cm wide, deeply 5-9-lobed; plants 1-2 m tall.................................................................[**Napaea**]

10 Flowers solitary or a few in leaf axils (or many in a terminal panicle in *Sida hermaphrodita*); corolla blue-purple, yellow, or white; style branches truncate, the stigmatic surface terminal and capitate; leaves < 2 cm wide, unlobed (or leaves >10 cm wide and deeply 3-7-lobed in *Sida hermaphrodita*); plants < 1 m tall (or 1-4 m tall in *Sida hermaphrodita*).

11 Corolla blue to purple; lateral walls of the carpels disintegrating at maturity of the fruit ...........................................[**Anoda**]

11 Corolla yellow or white; lateral walls of the carpels persistent................................................................................[**Sida**]

2 Epicalyx of bracts (immediately subtending the calyx) present.

12 Fruit a loculicidal capsule or fleshy and berry-like.

13 Fruit fleshy and berry-like; [subfamily *Malvoideae*; tribe *Hibisceae*].................................................................[**Malaviscus**]

13 Fruit a loculicidal capsule.

14 Calyx spathe-like, soon falling after anthesis; [subfamily *Malvoideae*; tribe *Hibisceae*]..............................[**Abelmoschus**]

14 Calyx radially symmetrical, 5-lobed.

15 Style branches short, erect, the stigmas nearly sessile; epicalyx bracts 3, large, foliaceous, and incised; seeds bearing long white fibers; [subfamily *Malvoideae*; tribe *Gossypiae*].................................................................[**Gossypium**]

15 Style branches elongate, spreading; epicalyx bracts 6-15, linear to lanceolate and untoothed; seeds sometimes pubescent but not with long white fibers; [subfamily *Malvoideae*; tribe *Hibisceae*].

16 Locules of the fruit several-seeded; capsule longer than broad, the apex pointed or rounded; petals yellow, white, red, or pink (if pink, then > 4 cm long, or the plant a shrub).................................................................[**Hibiscus**]

16 Locules of the fruit 1-seeded; capsule depressed-globose, indented at the apex; petals pink, 2-4 cm long,............[**Kosteletzkya**]

10 Fruit of radially disposed, 1- to several-seeded, dry carpels that split apart at maturity.

17 Bracts of the epicalyx 5 or more.

18 Shrubs or woody herbs, with leaves not basally disposed; flowers in axes of well-developed leaves; fruit spiny (or lacking spines in *Pavonia hastata*); [of SC southward]; [subfamily *Malvoideae*; tribe *Hibisceae*].

19 Bracts of the epicalyx 5-15, distinct; fruit with 0-3 spines per carpel; leaves lacking foliar nectaries.............................[**Pavonia**]

19 Bracts of epicalyx 5, fused basally; fruit covered with numerous glandulocarps; leaves with 1-3 foliar nectaries (glands) on undersurface near base..............................................................[**Urena**]

18 Herbs, with leaves basally disposed; flowers in terminal bracteate spikes or racemes; fruit lacking spines; [collectively widespread]; [subfamily *Malvoideae*; tribe *Malvae*].

20 Plant 1.5-3 m tall, usually unbranched; flowers 6-10 cm across ..................................................................................[**Alcea**]

20 Plant 0.5-1.2 m tall, branched; flowers 2-3 cm across ......................................................................................[**Althaea**]

17 Bracts of the epicalyx 2-3; [subfamily *Malvoideae*; tribe *Malvae*].

21 Ovules and seeds 2 or more per carpel.

22 Herb 0.5-2.5 m tall, upright; petals 2-3 cm long, pink-purple; carpels not beaked at the tip...........................................[**Iliamna**]

22 Herb to 0.5 m tall, prostrate to ascending; petals 0.3-0.5 cm long, orange-red; carpels beaked at the tip................[**Mediola**]

21 Ovules and seeds 1 per carpel.

23 Leaf blades 1.5-8 × as long as wide.

24 Style branches filiform, the stigmatic surface elongate along the inner side of the branches.................................[**Callirhoe**]

24 Style branches truncate, the stigmatic surface terminal and capitate.................................................................[**Malvastrum**]

23 Leaf blades orbicular, about as wide as long.

25 Leaves deeply palmately cleft.................................................................[**Callirhoe**]

25 Leaves unlobed or shallowly lobed...................................................................................................................[**Malva**]

---

**Abelmoschus** Medikus 1787 (Okra, Gumbo)

* **Abelmoschus esculentus** (Linnaeus) Moench, Okra, Gumbo. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): frequently cultivated in gardens, rarely persistent or self-seeding the year following; common in cultivation, rare (as an escape), native of Africa. The young capsules are a famous component of southern cooking. [= FNA, K, S, WH; = *Hibiscus esculentus* Linnaeus – F]

---

**Abutilon** P. Miller 1754 (Indian-mallow, Indian-hemp)

Alcea Linnaeus 1753 (Hollyhock)

* Alcea rosea Linnaeus, Hollyhock. Cp (NC, VA), Pd (DE, NC, VA), Mt (NC, VA, WV) {GA}: roadsides, dumps, frequently cultivated, less commonly escaped or persistent; uncommon (rare in GA, NC, VA, and WV), native of Eurasia. Late May-August (rarely later). [= FNA, K, = Althaea rosea (Linnaeus) Cavanilles – RAB, C, F, G

* Alcea rugosa Alefeld, Russian Hollyhock. Reported for MD. [= FNA] {not yet keyed}

Althaea Linnaeus 1753 (Marsh-mallow)

* Althaea officinalis Linnaeus, Marsh-mallow. Cp (VA): marshes; rare, native of Europe. The roots of this plant were the original source of the mucilaginous paste used to make marshmallows (which are now made with a synthetic mucilage). [= C, F, FNA, G, K]

Anoda Cavanilles 1785 (Anoda)

Callirhoe Nuttall 1821 (Poppy-mallow)

1 Calyx not subtended by an epicalyx.
2 Inflorescence racemose, corymbose, or nearly umbellate; petals white, pink, or mauve; plants ascending, 1.5-8.5 dm tall; mericarps pubescent with simple, appressed hairs...........................................................................................................................................C. alcaeoides
2 Inflorescence paniculate; petals deep red, with a white basal spot; plants erect, 5-20 dm tall; mericarps glabrous.............................................................C. pedata
1 Calyx subtended by an epicalyx of 3 bractlets.
3 Calyx lobes distinct and divergent in bud; stems decumbent ........................................................................................................................................C. involucrata var. involucrata
3 Calyx lobes valvate in bud, forming a point; stems erect, ascending, or decumbent.
4 Bractlets of the epicalyx linear, 0.1-1.7 mm wide; peduncles 1-flowered; calyx lobes lanceolate, 7-15.4 mm long; mericarps indehiscent; leaves cordate or ovate in outline, palmately deeply divided into 5-7 lobes .................................................................C. papaver
4 Bractlets of the epicalyx obovate, 2.5-4.6 mm wide; peduncles several-flowered; calyx lobes deltoid, 2-5 (-6.5) mm long; mericarps dehiscent; leaves triangular, not lobed or only slightly so............................................................................................................................................C. triangulata

Callirhoe alcaeoides (Michaux) A. Gray, Pale Poppy-mallow. Calcareous prairies, glades, and other open habitats. E. NE south through e. and OK to c. TX; disjunct and scattered eastwards in IA, MO, AR, nw. LA, IL, s. IN, c. KY, c. TN, and c. AL (Dorr 1990). [= C, F, G, K, Z; = Callirhoe alcaeoides – S, orthographic variant]

* Callirhoe involucrata (Torrey & A. Gray) A. Gray var. involucrata, Purple Poppy-mallow. Pd (VA): disturbed areas; rare, adventive from its native range in the midwestern United States. [= C, G, K, Z; < C. involucrata var. involucrata – F

**Callirhoe pedata** (Nuttall ex Hooker) A. Gray, Palmleaf Poppy-mallow. Mt (GA): occasionally mowed roadside and adjacent powerline right-of-way, with other species of calcareous prairie habitats, one occurrence recorded to date; rare, plausibly native, but perhaps only adventive from a native range in prairies and glades of the sc. United States (w. AR and e. OK, south to c. TX). Previously misidentified as *C. digitata* Nuttall. [= K, Z]

**Callirhoe triangulata** (Leavenworth) A. Gray, Sand Poppy-mallow, Clustered Poppy-mallow. Sandhills, sandy scrub, and other dry, open habitats. Sc. NC south to GA and west to ec. MA (upper Coastal Plain and lower Piedmont); also sw. WI and ne. IA south to s. IN, s. IL, and se. MO. [= C, F, G, K, Z; = Callirhoe triangulata – S, orthographic variant]

---

**Corchorus** Linnaeus 1753 (Jute)

**Firmiana** Marsili 1786 (Chinese Parasol-tree, Phoenix Tree)

**Gossypium** Linnaeus 1753 (Cotton)

**Identification notes:** Agricultural cotton is now a complex set of cultivars, some involving cross-breeding between the two species treated below, and some plants may not be readily identifiable to species.

1 Capsule 3-6 cm long, narrowly ovoid to elongate, its surface deeply pitted with oil glands; leaves 3-7-lobed, the central lobe usually > 1.5× as long as wide; stipules 1-5 cm long; corolla deep yellow; long fibers of the seed completely separable from the seed; short fibers of the seed absent or present .................................................................................................................................................................................. 

1 Capsule 2-3 cm long, ovoid to subglobose, its surface smooth; leaves 3-5-lobed, the central lobe usually 1.0-1.5× as long as wide; stipules 0.5-1.5 (-2.0) cm long; corolla pale yellow; long fibers of the seed firmly attached to the seed; short fibers of the seed present ......

**Gossypium barbadense** Linnaeus, Sea-island Cotton, Egyptian Cotton, Pima Cotton, Extra-long-staple Cotton. Cp (GA, NC, SC): formerly cultivated, perhaps no longer present in our area; rare, native of South America, Central America, and the West Indies. Probably first domesticated about 5000-5500 years b.p. in coastal Peru and Ecuador. [= K, S, Z]

**Gossypium hirsutum** Linnaeus, Upland Cotton. Cp (FL, GA, NC, SC, VA): frequently cultivated crop, especially in sandy soils of the Coastal Plain, rarely adventive or a waif; common (as a crop), rare (as an adventive), native of Central America, South America, the West Indies, and s. FL. Probably first domesticated in the Yucatan Peninsula. [= C, G, WH, Z; > G. hirsutum var. hirsutum – K; = G. herbaceum Linnaeus – F, misapplied; > G. herbaceum – S; > G. hirsutum – S, misapplied]

---

**Hibiscus** Linnaeus 1753 (Hibiscus, Rose-mallow)

### Malvaceae

1. Woody shrub, the stems usually solitary from a creeping rhizome; [section Hibiscus] .............................................................. *H. syriacus*

1. Herb (sometimes robust and to as tall as 3.5 m), often several from ground level, from a crown or taproot.

2. Annual from a taproot, to 0.5 m tall; calyx inflated at maturity; capsule 1.0-1.3 cm long; petals 1.5-3 (4) cm long; leaves 2-6 cm long, deeply cleft; [section Trionum] .............................................................. *H. trionum*

2. Perennial from a crown, usually 0.7-3.5 m tall; calyx not inflated at maturity; capsule 1.7-3.5 cm long; petals 4-14 cm long; leaves 4-25 cm long, deeply cleft, hastate-lobed, or not at all lobed or cleft.

3. Leaves and stems harshly scabrous; calyx lobes each with an elongate purplish nectary on the back; [of pine savannas and dry sandy soils of maritime forest edges, from se. NC southward]; [section Furcaria] ........................................................................................... *H. aculeatus*

3. Leaves and stems glabrous, softly pubescent, or slightly scabrous; calyx lobes lacking nectaries; [of marshes and swamps (sometimes cultivated in drier soils), collectively widespread in our area]; [section Mnemchasia].

4. Stem glabrous; leaves glabrous; leaves either palmately 3-5-lobed, or prominently halberd-lobed at the base (uncommonly unlobed).

5. Leaves either palmately 3-5-lobed; petals bright scarlet.............................................................. *H. coccineus*

5. Leaves halberd-lobed at the base (uncommonly unlobed); petals pink or white with a purplish base...................................................... *H. laevis*

6. Stem pubescent at least when young; leaves pubescent on at least one surface; leaves unlobed or slightly lobed toward the tip (except *H. grandiflorus*).

7. Capsule pubescent (the dark surface largely or completely obscured); bracts of the involucre usually ciliate; upper leaf surface usually densely stellate-pubescent.............................................................. *H. lasiocarpos*

8. Capsule glabrous and dark brown to black; bracts of involucre usually ciliate; upper leaf surface glabrous or nearly so .............................................................. *H. moscheutos*

### Hibiscus aculeatus

### Hibiscus coccineus

### Hibiscus grandiflorus

Michaux, Large-flowered Hibiscus. Cp (FL, GA): tidal marshes, lakeshores, wet flatwoods and savannas; rare. E. GA (Chatham Co., adjacent to the SC border) (Jones & Coile 1988) south to s. FL, west to e. LA; e. Cuba. [= FNA, GW, K, S, WH]

### Hibiscus laevis

### Hibiscus lasiocarpos

### Hibiscus moscheutos

* Hibiscus syriacus

### Iliamna

Greene 1906 (Globe-mallow)

1. Leaves 5-7-lobed, the lobes narrowly triangular, the sinusae acute; flowers odorless; plant to ca. 1 m in height; [sandstone outcrops on ridgetop]. .................................................................................................................................................. *I. corei*

1. Leaves 5-7-lobed, the lobes broadly triangular or deltoid, the sinusae obtuse; flowers fragrant; plant to ca. 2.5 m in height; [of river shores and along railroads]. ........................................................................................................... *I. remotae*
summit of Peters Mountain, Giles County, VA. The validity of *I. corei* as a species distinct from *I. remota* is supported by Bodo Slotta & Porter (2006). [= F, Y, Z; < *I. remotia* – C, G, W; < *I. rivialris* (Douglas ex Hooker) Greene var. *rivialris* – K]

**Hälma remota** Greene, Kankakee Globe-mallow. Mt (VA): shores and gravel bars along rivers, and along railroad embankments; rare. June-August; July-October. W. VA; nw. IN and ne. IL. Considered by some to be introduced only in our area, however, the VA populations are genetically different than those in IN and IL (Bodo Slotta & Porter 2006). [= F, Y, Z; < *I. remota* – C, G, W (also see *I. corei*); < *I. rivialris* (Douglas ex Hooker) Greene var. *rivialris* – K; ? Sphaeralcea remota (Greene) Fernald]

**Kosteletzkya** K. Presl 1835 (Seashore-mallow)

**Kosteletzkya pentacarpos** (Linnaeus) Ledebour, Seashore-mallow, Saltmarsh-mallow, Fen-rose. Cp (FL, GA, NC, SC, VA): brackish to freshwater tidal marshes; common. July-October. NY (Long Island) south to s. FL, west to TX; West Indies. Several varieties have often been recognized on the basis of length of hairs and of parts of the flower and inflorescence (see synonymy). While geographic trends are readily apparent, the recognition of infraspecific taxa is made problematic by the non-correlation of various characters. In recent studies, neither Blanchard (2008) nor Alexander (2010) recognize varieties in our flora area. *K. smilacifolia* A. Gray, of peninsular FL, appears to warrant specific status, as treated by Small (1933). It also appears that the Eurasian *K. pentacarpos* represents an early introduction of North American *Kosteletzkya* to the Old World (probably via ship’s ballast) and is conspecific; appears that the Eurasian area, however, the VA populations are genetically different than those in IN and IL (Bodo Slotta & Porter 2006). [= F, Y, Z; < *I. remotia* – C, G, W, WV; verticillata](probably via ship’s ballast) and is conspecific; appears that the Eurasian area, however, the VA populations are genetically different than those in IN and IL (Bodo Slotta & Porter 2006). [= F, Y, Z; < *I. remotia* – C, G, W, WV; verticillata](probably via ship’s ballast) and is conspecific; appears that the Eurasian area, however, the VA populations are genetically different than those in IN and IL (Bodo Slotta & Porter 2006).

**Malva** Linnaeus 1753 (Mallow)

A genus of about 40 species, herbs, of temperate Eurasia and montane Africa. References: Hill in FNA (in prep.); Bayer & Kubitzki in Kubitzki & Bayer (2003). Key based in part on FNA.

1 Upper leaves deeply 5-7-lobed, the sinuses cut over half way to the middle; petals 20-35 mm long; erect perennial………………………………………*M. moschata*
2 Upper leaves less deeply lobed, rarely to as deep as halfway to the middle; petals 5-30 (45) mm long; prostrate to erect annual or biennial.
   3 Epicalyx of 3 oblong-ovate bractlets; petals reddish purple, (12-) 16-30 (45) mm long; biennial, erect, usually not branched at the base .......
   .................................................................*M. sylvestris*
   3 Epicalyx of 3 linear or narrowly lanceolate bractlets; petals white to pale lilac ...............................................................................
   4 Stems prostrate to ascending, to 5dm long; leaf blades 1.5-5 cm long.
   5 Petals 6-13 mm long, about 2× as long as the sepals; mature mericarps slightly roughened or obscurely reticulate………….*M. neglecta*
   5 Petals 3-6 mm long, about 1× as long as the sepals; mature mericarps strongly rugose-reticulate…………………….*M. pusilla*

* **Malva moschata** Linnaeus, Musk Mallow, Rose Mallow. Mt (NC, VA, WV), Pd (DE, VA): pastures, roadsides, barnyards; rare, native of Europe. Late May-August. [= RAB, C, F, FNA, G, K, W, WV]

* **Malva pusilla** Smith, Small Mallow, Dwarf Mallow, Cheeses. Mt (VA): pastures, roadsides, barnyards; rare, native of Europe. [= FNA; = *M. rotundifolia* Linnaeus – C, F, G, K, S, rejected because of uncertain application]

* **Malva verticillata** Linnaeus, Whorled Mallow. Pd (DE), Mt (WV): disturbed areas, rare, native of e. Asia. Reported as an introduction as far south as s. PA (Rhoads & Klein 1993), MD, WV (Strausbaugh & Core 1978), DE, and DC. [= K, WV; > *M. verticillata* var. *crispa* Linnaeus – C, F, FNA, G]

**Malvastrum** A. Gray 1849 (False-mallow)

1 Leaves linear-lanceolate to lanceolate, 3.5-8× as long as wide; plant 1-5 (-8) dm tall; [of inland calcareous habitats] .......................... M. angustus
1 Leaves broadly lanceolate to broadly ovate, 1.5-2.5× as long as wide; plant 5-10 dm tall; [of near coastal habitats, mainly FL, waifs elsewhere].
2 Hairs of the stems stellate with 5-12 ascending rays; leaves often shallowly 3-lobed ................................................................. M. americanum
2 Hairs of the stems stellate with 2-5 appressed rays; leaves unlobed.
3 Mericarps with minute cusps, none longer than 0.1-0.4 mm long ....................................................................................................... M. corchorifolium
3 Mericarps with well-developed sharp cusps, the larger 1-2 mm long ......................................................................................... M. coromandelianum

Malvastrum corchorifolium (Desrousseaux) Britton ex Small. Cp (FL): coastal hammocks; rare. January-December. FL and AL south to Central America; West Indies. [= FNA, K, WH]
* Malvastrum coromandelianum (Linnaeus) Garcke. Cp (FL): coastal hammocks, waif on ballast; rare, native of tropical America (TX to Argentina). January-December. Northern occurrences, such as in PA (Rhoads & Klein 1993) and NJ (Kartesz 1999), represent old records of ballast waifs. [= FNA, K, WH]

Malaviscus Fabricius 1759 (Wax-mallow)

1 Leaves pubescent on the lower surface ............................................................................................................................................ M. drummondii
1 Leaves glabrous or nearly so on the lower surface ........................................................................................................................ M. penduliflorus

Malaviscus penduliflorus DC., Turk’s-cap Mallow, Mazapan. Cp (FL): disturbed areas; rare, native of tropical America. April-November. [= K, WH; = M. arboresus Dillenius ex Cavanilles var. penduliflorus (DC.) Schery; Hibiscus]

Melochia Linnaeus 1753 (Chocolate-weed)

1 Petioles >1.5 cm long; pubescence of the stem and leaves sparse, of stellate, forked, and/or simple hairs; cymes terminal on primary and secondary branches ................................................................................................................................................................. M. corchorifolia
1 Petioles <1 cm long; pubescence of the stem and leaves dense (tomentose), of stellate hairs; cymes in upper leaf axils ................................................................................................................. M. spicata

*? Melochia spicata (Linnaeus) Fryxell, Bretonica-peluda. Cp (FL, GA*): disturbed areas; rare, native of tropical America, the original distribution uncertain. In GA (Kartesz 1999) and FL (Brizicky 1966). [= K, WH; = Riedlea hisruta (Cavanilles) Alphonse de Candolle – S; = Melochia villosa (P. Miller) Fawcett & Rendle – Y]

Modiola Moench 1794 (Bristly-mallow)

Modiola caroliniana (Linnaeus) G. Don, Bristly-mallow. Cp (FL, GA, NC*, SC, VA*), Pd (GA, NC*, SC*, VA*): lawns, roadsides, disturbed areas, pondshores; uncommon (rare in DE), adventive in part of its range in our area. Late March-June
Malvaceae

*Navae (Linnaeus) 1753 (Glade-mallow)*

---

*Navae dioica* Linnaeus, Glade-mallow. Mt (VA): floodplains; rare. June-August. PA and IA south to sw. VA and s. IL. The original distribution of this species is difficult to determine. See the interesting discussion of this species' occurrence in VA in Wieboldt et al. (1998). [= C, F, G, K]

---

*Pavonia* Cavanilles 1787

---

1 Leaves hastate; calyx lobes broadly ovate; carpels un-awned; [introduced species of disturbed habitats] .................... *P. hastata*
2 Leaves ovate; calyx lobes lanceolate; carpels with 3 apical awns up to 10 mm long; [rare native] ................................. *P. spinifex*

*Pavonia spinifex* (Linnaeus) Cavanilles, Gingerbush. Cp (FL, SC): hammocks; rare. Reported for the vicinity of Charleston, SC on the basis of a specimen collected by Bachman (Chapman 1878). Small (1933) considers this species as likely native, at least in FL. [= K, S, WH]

---

*Sida* Linnaeus 1753 (Sida)

---

1 Leaves unlobed; plants 0.2-1 m tall; petals yellow.
2 Mercarps, styles, and stigmas (6-) avg. 10 (-14); stem lacking spines subtending the leaves; leaves usually cuneate to rounded (cordate to subcordate at the base). .......................... *S. hermaphrodita*
3 Leaves cordate to rounded at the base; flowers clustered into a terminal panicle. .................................................. *S. cordata*
4 Leaves cuneate to rounded at the base; flowers solitary in leaf axils. ................................................................. *S. rhombifolia*

*Sida elliottii* Torrey & A. Gray var. elliottii, Coastal Plain Sida. Cp (GA, NC, SC, VA), Pd (NC), Mt (GA): stream banks, sandy openings, pineland pond margins, limestone glades and barrens, mesic hammocks; uncommon (GA Special Concern). July-October. Var. elliottii ranges from se. VA south to n. FL, west to LA and north in the interior to c. TN and se. MO. A second variety, var. parviflora Chapman, occurs in Peninsular FL, se. TX, and through montane e. Mexico to Guatemala. *S. inflexa*, of se. VA and ne. NC, is alleged to differ as follows: *S. inflexa* with calyx 7-10 mm long, leaves elliptic to narrowly elliptic, 4-20 mm wide, (3-) 4-10× as long as wide (vs. *S. elliottii* var. elliottii with calyx 5-7 mm long; leaves narrowly lanceolate to linear, 1.5-7 mm wide, 10-20× as long as wide). [= Y; < S. elliottii – RAB, C, F, G, K, S, WH, Z; > S. inflexa Femald – F, K, Z]

*Sida hermaphrodita* (Linnaeus) Rusby, Virginia Sida. Virginia-mallow. Mt (VA, WV), Pd (VA): sandy or rocky areas along riverbanks; rare. July-August. C. PA and MD west to s. OH, south to DC, WV, w. VA, and ne. TN; disjunct in nw. OH, ne. IN, and s. MI (where presumably native) and with additional collections from e. MA, NY (Long Island), and s. NJ (where probably adventive) (Spooner et al. 1985). Fryxell (1985) comments that this species is so different from the rest of the genus that "one might plausibly argue that it be elevated to generic rank." A molecular phylogenetic analysis suggests that its affinities

---
are not with Sida, but with the South American Sidaxodes (Fuertes, Fryxell, & Jansen 2003). Spooner et al. (1985) provide a

* Sida rhombifolia Linnaeus var. rhombifolia, Arrowleaf Sida. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, SC): 
roadsides, fields, gardens, disturbed areas; common. April-October. Verdcourt (2004) discusses variation in this taxon, and 
suggests that "studies throughout the entire range of the species will necessitate recognition of more than one species." He 
recognizes 6 varieties in e. Africa, aside from the Linnaean var. rhombifolia (with type in Jamaica). [= X; < S. rhombifolia – RAB, 

* Sida spinosa Linnaeus, Prickly Sida, Prickly-mallow, False-mallow. Cp (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt 
(GA, NC, SC, VA, WV): disturbed areas, wet fields; common, (uncommon in FL, rare in DE), native of the Tropics. June-

Tilia Linnaeus 1753 (Basswood, Whitewood, Linden, Linn)

A genus of about 25-45 species, trees, of temperate regions of North America, Europe and Asia. Hardin’s (1990) treatment of 
American Tilia seems a practical and reasonable approach; it gives taxonomic status to the more distinctive (and geographically 
based) elements of variation, while recognizing the intergradational nature of the variation. Further investigation of this complex 
group is, however, warranted. References: Hardin (1990)–Z; Bayer & Kubitzki in Kubitzki & Bayer (2003). Key adapted from 

Identification notes: While the varieties treated below are broadly distinctive and have definite geographic distributions across e. North 
America, they are imperfectly distinct in geographic areas of overlap. In our area, their identification is particularly problematic in Virginia, 
where individuals in many parts of the state show intergradation between the northern var. americana and the Southern and Central Appalachian 
var. heterophylla.

1 Lower leaf surfaces puberulent with bulbous glands, acicular trichomes, and (rarely) sparsely scattered stellate trichomes; fruiting peduncles 
and pedicels glabrous or sometimes puberulent; [generally northern, south to VA and w. NC]................................. T. americana var. americana

1 Lower leaf surfaces usually tomentose or becoming puberulent, with bulbous glands, acicular trichomes, and a predominance of stellate or 
fasciculate trichomes; fruiting peduncles and pedicels stellate-tomentulose (becoming puberulent in age); [collectively widespread in our 
area].

2 Lower leaf surfaces pale or whitish, densely stellate tomentose with appressed, sessile-stellate trichomes obscuring the surface (rarely 
becoming puberulent with age but with some stellate trichomes persisting along major veins, the margin, and/or the apex; lateral buds 5-8
mm long; pericarp 0.8-1.0 mm thick; [widespread in our area]................................................................. T. americana var. heterophylla

2 Lower leaf surfaces pale or whitish, densely stellate tomentose with appressed, sessile-stellate trichomes obscuring the surface (rarely 
becoming puberulent with age but with some stellate trichomes persisting along major veins, the margin, and/or the apex; lateral buds 5-8
mm long; pericarp 0.8-1.0 mm thick; [widespread in our area]................................................................. T. americana var. heterophylla

Tilia americana Linnaeus var. americana, Northern Basswood. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): rich 
coves, rocky slopes, metasalt boulderfields, rich north-facing river bluffs, calcareous Coastal Plain ravines; common (rare in 
NC, rare in DE Coastal Plain). June; August-September. NB and MB south to e. VA, w. NC, and OK. In VA, var. americana 
occurring throughout the northern half of the state, with scattered populations southward in the mountains. [= C, K, Z; = T. americana 

Tilia americana Linnaeus var. caroliniana (P. Miller) Castiglioni, Southern Basswood, Carolina Basswood. Cp (FL, GA, 
NC), Pd (GA, NC, SC): mesic forests, in the outer Coastal Plain usually associated with shell deposits, Indian shell middens, or 
underlying coquina limestone ("marl"); uncommon. June-July; July-August. NC south to c. peninsular FL and west to OK and c. 
S]

Tilia americana Linnaeus var. heterophylla (Ventenat) Loudon, Mountain Basswood, White Basswood, Linn. Mt (GA, 
NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): rich coves and mesic to dry slopes (the drier sites usually 
on limestone), often one of the most abundant trees in Southern Appalachian cove forests; common (rare in Coastal Plain). June; 
July-August. Centered in the Southern Appalachians: sw. PA and WV south to c. NC, wc. GA, FL Panhandle, and westward as 
disjunct populations to the Ozarkian Highlands of s. MO and n. AR. In VA, var. heterophylla dominates in sw. VA and along 
southern Piedmont river bluffs, with disjunct populations in calcareous ravines in the upper Coastal Plain (Surry County); it also 
extends less commonly into the northern VA mountains and foothills, where var. americana is more prevalent, but seems to be 
absent (or very uncommon) in the Potomac valley east of the Blue Ridge. [= C, K, WH, Z; = T. heterophylla Ventenat – RAB, F, W, 
WV; > T. heterophylla – G, S; > T. monticola Sargent – G; > T. australis Small - S; > T. eburnea Ashe – S; > T. lasioclada Sargent – S; > T. 
michauxii Nuttall – S; > T. venulosa Sargent]

Tilia ×europaea Linnaeus (pro sp.) [Tilia cordata × platyphyllos], European Linden. Mt (NC, WV): suburban woodlands; uncommonly 
planted, rarely naturalizing, native of Europe. [= T. ×vulgaris Hill.] [not yet keyed]

Several additional European species, T. platyphyllos Scopoli and T. cordata P. Miller, are planted as street or yard trees; they differ from 
the native species in having smaller leaves (usually 4-12 cm long vs. 8-25 cm long) and lacking staminodes. Planted material should be identified by 
using appropriate manuals of cultivated species.
**Triumfetta** Linnaeus 1753

1 Capsule hispid; lower leaf surface not velutinous ................................................................. *T. pentandra*
1 Capsule glabrous; lower leaf surface velutinous ................................................................. *T. semitriloba*

**Urena** Linnaeus 1753 (Caesarweed)

**Waltheria** Linnaeus 1753 (Raichie)

**252. THYMELAEACEAE** A.L de Jussieu 1789 (Mezereum Family) [in MALVALES]

A family of about 45-53 genera and 500-800 species, mostly trees and shrubs, of cosmopolitan distribution, but especially diverse in Africa (Van der Bank, Fay, & Chase 2002). *Dirca, Edgeworthia,* and *Thymelaea* are all in subfamily Thymelaeoideae (Van der Bank, Fay, & Chase 2002). References: Van der Bank, Fay, & Chase (2002); Herber in Kubitzki & Bayer (2003).

1 Annual herb, annual; leaf blades < 2 cm long; fruits capsular, indehiscent ................................................................................................................................. *Thymelaea*
1 Perennial shrub; leaf blades> 2 cm long; fruits drupaceous or berrylike.
2 Stems jointed; leaves scattered; stamens exserted .................................................................................. *Dirca*
2 Stems not jointed; leaves clustered toward apex of stems; stamens included .................................................................................................................... *Edgeworthia*

**Dirca** Linnaeus 1753 (Leatherwood, Leatherbark)

A genus of 4 species, shrubs, of North America (including Mexico). Our species is most closely related to *D. mexicana* Nesom & Mayfield (of the Sierra Madre Oriental, Tamaulipas, Mexico) and *D. decipiens* Floden (of e. MS, nw. AR, and sw. MO); the other species is *D. occidentalis* A. Gray of California (Schrader & Graves 2004; Floden, Mayfield, & Ferguson 2009). References: Nevling (1962)=Z; Floden, Mayfield, & Ferguson (2009)=Y.

**Dirca palustris** Linnaeus, Leatherwood, Leatherbark, Wicopee, Rope-bark. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, VA, WV), Cp (FL, GA, VA): very rich forests, on slopes or bottomlands, limited to calcareous or mafic rocks such as limestone, calcareous siltstone, calcareous shale, gabbro, or amphibolite, in marl ravine bottoms in the Coastal Plain of VA, in Ashe County NC ascending to 1500 meters elevation; uncommon (rare in DE, FL, GA, NC, and SC, rare in VA Coastal Plain). March-April; June-July. Widespread in e. North America, from NS and s. QC, south to Panhandle FL, AL, and OK. The curiously flexible twigs and swollen nodes are distinctive. The common names refer to the extraordinary toughness of the tan-brown bark, which was used by native Americans for cordage. [= RAB, C, F, G, K, S, W, WH, WV, Y, Z]

**Edgeworthia** Meisner 1841 (Paperbush)
A genus of 3 species, shrubs, of e. Asia.

Thymelaea P. Miller 1754 (Mezereon)

References: Neving & Barringer in FNA (in prep.).

* Thymelaea passerina (Linnaeus) Lange in Willkomm & Lange, Mezereon. Disturbed areas. AL and MS. [= K]

255. CISTACEAE A.L. de Jussieu 1789 (Rockrose Family) [in MALVALES]

A family of about 8 genera and 180 species, shrubs and herbs, of warm temperate and subtropical areas, centered in Mediterranean Europe. References: Arrington & Kubitzki in Kubitzki & Bayer (2003).

1 Shrub, usually much branched from the lower stem; flowers solitary, terminal on the branches; leaves 1-3 mm long and scalelike, or 3-7 mm long and acicular; capsule cylindric, > 2× as long as wide .................................................................Hudsonia

1 Suffrutescent herb, usually little branched from the lower stem (often much branched above, and in Lechea with specialized short basal shoots at ground level); flowers axillary or terminal in branching inflorescences; leaves 4-50 mm long, mostly linear, lanceolate, oblanceolate, oblong, or elliptic; capsule globose, subglobose, ellipsoid, ovoid, or obvoid, <2× as long as wide.

2 Flowers of 2 types, the chasmogamous with 5 showy yellow petals, the cleistogamous lacking petals; pubescence of the stem stellate; leaves 10-50 mm long, alternate; plants with shoots of one type only, not producing short basal shoots; capsules 1.3-12.5 mm long, the larger capsules of chasmogamous flowers at least 2.0 mm long ........................................ Crocanthemum

2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; capsules from cleistogamous flowers 1.5-4.2 mm long, with 1-20 seeds.

2 Leaves basally disposed, the largest and most prominent leaves in a basal rosette; stem leaves 2-5 below those subtending flowers or fruits; stem with spreading trichomes to 2.5 mm long; lower surface of leaves sparsely pubescent, the surface readily visible; cleistogamous flowers usually never produced; capsules 6-9 (-10.5) mm long, with 80-92 (-135) papillate seeds ........................................ Crocanthemum

2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; stem glabrate to densely puberulent (the pubescence not long and spreading); lower surface of leaves densely pubescent, hiding the surface; cleistogamous flowers usually produced, either intermixed with the chasmogamous or in separate inflorescences; capsules 1.3-7 (-8.5) mm long, with 1-46 papillate, reticulate, or smooth seeds (pebbled to somewhat papillate in H. nashii).

1 Leaves 1-4 (-7) mm wide, (5-) 7-15× as long as wide; capsules from chasmogamous flowers 2-3 mm long, with 1-3 (-6) seeds; capsules from cleistogamous flowers 1.3-1.7 mm long, with 1 (-2) seeds ..............................................................C. rosmarinifolium

1 Leaves 2-20 mm wide, 2-6 (-8)× as long as wide; capsules from chasmogamous flowers (2.4-) 3-9 (-10.5) mm long, with 6-92 (-135) seeds; capsules from cleistogamous flowers 1.5-4.2 mm long, with 1-20 seeds.

2 Leaves usually produced, the largest and most prominent leaves in a basal rosette; stem leaves 2-5 below those subtending flowers or fruits; stem with spreading trichomes to 2.5 mm long; lower surface of leaves sparsely pubescent, the surface readily visible; cleistogamous flowers usually never produced; capsules 6-9 (-10.5) mm long, with 80-92 (-135) papillate seeds ..................................................C. nashii

2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; stem glabrate to densely puberulent (the pubescence not long and spreading); lower surface of leaves densely pubescent, hiding the surface; cleistogamous flowers usually produced, either intermixed with the chasmogamous or in separate inflorescences; capsules 1.3-7 (-8.5) mm long, with 1-46 papillate, reticulate, or smooth seeds (pebbled to somewhat papillate in H. nashii).

1 Ovary and capsule densely stellate pubescent

2 Inflorescence a terminal unpubescent cluster; fruit 2-valved ..................................................................................................................C. arenicola

2 Inflorescence a thyrse, the flowers borne in clusters the axis of leaves; fruit 3-valved ...........................................................................C. nashii

3 Ovary and capsule glabrous.

5 Chasmogamous flowers usually solitary, terminal or subterminal, later overtopped by lateral branches; seeds papillate, 35-46 per chasmogamous capsule, 5-7-12 per cleistogamous capsule; chasmogamous capsules 4-5 (-7) mm long, cleistogamous capsules (2-) 2.3-3.0 (-3.8) mm long; upper surface of cauline leaves with some long simple trichomes mixed with the shorter stellate trichomes ............................................C. canadense
CISTACEAE

5 Chasmogamous flowers usually (1-) 2-18, rarely overtopped by lateral branches (often 1-3 in cymes in H. georgianum); seeds smooth or reticulate, 12-35 per chasmogamous capsule, 1-20 per cleistogamous capsule; chasmogamous capsules (2.4-) 3.5-5.7 mm long, cleistogamous capsules 1.5-4.2 mm long; upper surface of calyceal leaves with the shorter stellate trichomes only.

6 Chasmogamous and cleistogamous flowers borne together, the two types of flowers open at the same time (March-June); seeds smooth, 15-35 per chasmogamous capsule, 4-20 per cleistogamous capsule; outer sepals of the cleistogamous flowers 1.4-3.0 mm long; inner sepals of the cleistogamous flowers 2.0-4.8 mm long; (of the outer Coastal Plain (primarily barrier islands) of NC and SC).

7 Flowers borne in dense many-flowered flat-topped cymes terminating the stem and sometimes also the main branches; capsules of the cleistogamous flowers 1.6-3.8 mm long, with 4-8 (-10) seeds; pedicels and calyx with 0.5-1.5 mm long simple trichomes mixed with the shorter stellate trichomes; outer sepals of both chasmogamous and cleistogamous flowers with an expanded, obuse, spatulate tip, 0.3-1.2 mm wide..................C. corymbosum

7 Flowers borne in loose 1-7-flowered cymes or racemes at the ends of the main branches; capsules of the cleistogamous flowers 3.0-4.2 mm long, with 12-20 seeds; pedicels and calyx with short stellate trichomes only; outer sepals of both chasmogamous and cleistogamous flowers linear, 0.2-0.5 mm wide...............................C. georgianum

6 Chasmogamous and cleistogamous flowers borne in separate inflorescences, the chasmogamous flowers opening earlier (April-July) than the cleistogamous flowers (June-September); seeds reticulate, 12-26 per chasmogamous capsule, 1-2 (-3) per cleistogamous capsule; outer sepals of the cleistogamous flowers 0.2-1.2 (-1.8) mm long; inner sepals of the cleistogamous flowers 1.7-2.5 (-3.0) mm long; [of the Mountains and less common the Piedmont of NC and VA, and very rarely the Coastal Plain of VA].

8 Stems mostly 20-50 cm tall, clustered, arising from an upright caudex; distinct portion of the outer sepals of the cleistogamous flowers linear, (0.3-) 0.6-1.2 (-1.8) mm long, about 3-5× as long as wide; distinct portion of calyx of the chasmogamous flowers (2.4-) 3.5-4.5 (-8) mm long; cleistogamous capsules sharply 3-angled in cross-section; leaf with broadly cuneate base..............................C. bicknellii

8 Stems mostly 10-30 cm tall, scattered, arising from horizontal elongate rootstock; distinct portion of the outer sepals of the chasmogamous flowers rudimentary, knob-like, 0.2-0.5 mm long, 1-2× as long as wide; distinct portion of calyx of the chasmogamous flowers (0.7-) 1.5-3.0 (-4.0) mm long; cleistogamous capsules somewhat rounded in cross-section; leaf with narrowly cuneate to attenuate base............................C. propinquum

Crocanthemum arenicola (Chapman) Barnhart, Gulf Coast Frostweed. Cp (FL): sandhills, dunes, scrub; rare. Panhandle FL west to s. MS. [= S; = Helianthemum arenicola Chapman – K, WH, Y, Z]

Crocanthemum bicknellii (Fernald) Barnhart, Hoary Frostweed, Plains Frostweed, Plains Sunrose, Bicknell's Hoary Rockrose. Mt (GA, NC, VA, WV), Pd (DE, NC, VA): woodlands, glades, barrens, rock outcrops, and grassy balds, to at least 1500m in elevation; rare. June-July (chasm.), July-September (cleist.); August-October. ME and s. ON west to MN and s. MB, south to ne. GA, e. TN, AR, KS, and CO. [= S; = Helianthemum bicknellii Fernald – RAB, C, F, G, K, W, Y, Z; Halimium]

Crocanthemum georgianum (Chapman) Barnhart, Georgia Sunrose, Georgia Frostweed. Cp (FL, GA, NC, SC): openings in maritime forests, sandy disturbed areas; uncommon (rare in GA, NC, and SC). April-May; May-October. E. NC south to n. FL, west to c. TX and AR. [= S; = Helianthemum georgianum Chapman – RAB, K, WH, Y, Z; = Halimium georgianum (Chapman) Grosser]

Crocanthemum propinquum (Bicknell) Bicknell, Low Frostweed, Creeping Sunrose. Mt (NC, VA, WV), Pd (NC, VA), Cp (DE, VA): woodlands, rock outcrops, sandy barrens and fields (VA); uncommon (rare in NC, VA, and WV). June-July (chasm.), July-September (cleist.); August-October. Se. MA and se. NH south to w. NC and e. and c. TN. [= Helianthemum propinquum Bicknell – RAB, C, F, G, K, W, Y, Z; Halimium]

Crocanthemum rosmarinifolium (Pursh) Barnhart, Rosemary Sunrose. Cp (FL, GA, NC, SC): sandy roadsides, fields; common (uncommon in FL, rare in NC). May-June; July-October. S. NC south to Panhandle FL, west to c. TX; also disjunct in the West Indies. [= S; = Helianthemum rosmarinifolium Pursh – RAB, K, WH, Y, Z; = Halimium rosmarinifolium]

Hudsonia Linnaeus 1767 (Sand-heather, Golden-heather, Beach-heather)

CISTACEAE

Hudsonia ericoides Linnaeus, Northern Golden-heather. Cb (DE, SC): sandy flats in longleaf pine sandhills (SC) or Coastal Plain pitch pine barrens (DE); rare. May; August. NL (Newfoundland) south to ME, NH, MD (Sipple 2002), and DE; disjunct in NC. The disjunct occurrence in SC has every appearance of being native; it is discussed by Bozeman & Logue (1968). [= RAB, C, F, G, K, S, Z; H. ericoides Linnaeus ssp. ericoides – Y]

Hudsonia montana Nuttall, Mountain Golden-heather. Mt (NC): shallow sandy soils on ledges of quartzite or other felsic rocks in the Blue Ridge Escarpment, at various sites along the eastern side of Linville Gorge, Burke County, NC, and disjunct further south in McDowell County, NC; rare. June–early July; mid-July–September. This species is endemic to w. NC; it is almost certainly a southern sibling of the more northern H. ericoides. As well as being a very narrowly distributed endemic, H. montana is endangered by fire suppression in its habitat. [= RAB, K, S, W, Z; H. ericoides Linnaeus ssp. montana (Nuttall) Nickerson & J. Skog – Y]

Hudsonia tomentosa Nuttall, Woolly Beach-heather. Cb (DE, NC, VA), Mt (WV): dunes, sand flats, blowouts (in DE, NC, VA), high elevation quartzitic sandstone outcrops (in WV); common (rare in NC and WV). May–July; August–September. NL (Labrador) west to MB and NT, south to WV (Panther Knob), WI, and MN, and south along the Atlantic Coast from ME to VA and ne. NC (where it reaches its southern limit in Dare County). [= RAB, C, F, G, S, WV, Z; H. tomentosa var. tomentosa – K; H. ericoides Linnaeus ssp. tomentosa (Nuttall) Nickerson & J. Skog – Y]

Lechea Linnaeus 1753 (Pinweed)

(Contributed by Bruce A. Sorrie)

Identification notes: Lechea is recognizable by its production of numerous basal shoots (usually prostrate) in the late summer and fall. These are evergreen and overwinter, and the fertile stems (usually erect or ascending) are produced from renewed growth of the basal shoots in the spring and summer.

1 Pubescence of the stems strongly spreading, not at all appressed; inner sepals carinate (U- or V-shaped in cross-section); plant tall, often > 5 dm tall...............................................................................................................................................................L. mucronata

1 Pubescence of the stems more or less appressed, usually strongly so; inner sepals shallowly curved in cross section, not carinate; plants variable in height.

2 Outer (slender) sepals equaling or exceeding the inner (broad) sepals.

3 Base of the fruiting calyx not conspicuously differentiated in texture and color; pedicels averaging < 1.5 (-2) mm long. 4 Capsule completely enclosed by the sepals, subglobose; leaves averaging > 10× as long as wide; plant short and usually densely bushy, < 3 dm tall ..............................................................L. racemulosa

3 Base of the fruiting calyx not conspicuously differentiated in texture and color; pedicels averaging < 1.5 (-2) mm long. 4 Capsule completely enclosed by the sepals, subglobose; leaves averaging > 10× as long as wide; plant short and usually densely bushy, < 3 dm tall ..............................................................L. racemulosa

4 Capsule exerted, usually conspicuously so, the sepals not enclosing the summit of the fruit, ellipsoid to ovate; leaves < 8× (usually < 6×) as long as wide; plant usually taller, 1-7 dm tall.

5 Outer sepals distinctly longer than the inner sepals, usually also longer than the capsule; stem leaves usually whorled, 2 mm wide; plant erect, with short, ascending branches.................................L. minor

5 Outer sepals shorter than to barely longer than the inner sepals, shorter than the capsule; stem leaves alternate, rarely wider than 1.5 mm wide; plant ascending (sometimes erect or spreading, branches spreading)..............................................................................................................................L. sessiliflora

2 Outer (slender) sepals shorter than the inner (broad) sepals.

6 Capsules ellipsoid to narrowly pyriform, normally about 2× as long as wide (or even longer in L. racemulosa). 7 Stigmas not persistent; pedicels averaging about 2 mm long; base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx....................L. racemulosa

7 Stigmas persistent, reddish-brown, conspicuous on the summit of the capsule; base of the fruiting calyx not conspicuously differentiated in texture and color.......................L. sessiliflora

6 Capsules of a broader shape, ovoid, broadly ellipsoid, or subglobose, normally < 1.5× as long as wide. 8 Capsules obviously longer than the sepals.

9 Seeds 3 (-4), relatively narrow and 3-sided, like the sections of an orange; fruiting stems 2.5-5.5 dm tall; panicle ovoid to subglobose, the principal branches subequal and relatively short; capsules clustered at branch tips, or in a dense row.........................L. pulchella var. pulchella

9 Seeds 2 (-3), broad and compressed, or obscurely 3-sided; fruiting stems 3.5-8.5 dm tall; panicle subglobose to subglobose, the principal branches diminishing upward, relatively long; capsules in a sparse row (rarely more dense)..............................................................................................................................L. pulchella var. ramossissima

8 Capsules almost completely enveloped by the sepals.

10 Leaves sparsely pubescent on the midrib and margin only beneath; branches and stems sparsely subappressed-pilose; seeds 4-6.....
Lechea intermedia Leggett ex Britton var. intermedia. Pinweed. Mt (VA), Pd (VA): dry areas; rare. July-August; August-October. *L. intermedia* ranges from NB west to ON, MN, and SK, south to VA, n. OH, n. IL, and nw. NE. Only var. *intermedia* ranges south of New England; 3 other varieties occur in New England and Canada. [= F, K; < *L. intermedia* – C, G, W; = *L. intermedia* var. typica – Z]

**Lechea maritima** Leggett ex Britton, Sterns, & Poggenburg var. maritima. Cp (DE, NC, VA): coastal dunes; common. S. ME and c. NH south to DE, and disjunct in n. NB (reports of new south to GA are apparently based on misidentifications). [= C, F, G, K, Z]

**Lechea macroonata** Rafinesque. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, WV), Cp (DE, VA): open dry habitats, sandhills, dunes, dry hammocks, woodlands; common (uncommon in VA Coastal Plain, rare in Piedmont and Mountains, rare in DE Coastal Plain). June-August; July-October. NH west to MI and OK, south to c. peninsular FL, TX, and n. Mexico. [= C, K, W, WH = *L. villosa* Elliot – RAB, F, G, S, Y; > *L. villosa* var. typica – Z]

**Lechea pulchella** Rafinesque var. pulchella. Mt (VA, WV), Pd (DE, VA), Cp (DE): dry woodlands, disturbed places; common (uncommon in VA). June-August; October-September. Var. *pulchella* ranges from e. MA west to n. OH, south to e. VA. [= *L. leggettii* Britton & Hollick – RAB, C = *L. leggettii* var. leggettii – F, G, Y; < *L. pulchella* var. pulchella – K; < *L. pulchella* – W; = *L. leggettii* var. typica – Z]

**Lechea pulchella** Rafinesque var. ramosissima (Hodgdon) Sorrie & Weakley. Cp (FL, GA, NC, SC, VA): pine-oak woodlands, savannas, flatwoods, sandhills, openings in maritime forests, sometimes in wet, almost peaty soils; common. June-August; August-October. Se. VA south to n. FL and west to e. LA; disjunct in sc. TN (Coffee County). [= *L. leggettii* Britton & Hollick – RAB, C, G, S; = *L. leggettii* var. leggettii – F, G, Y; < *L. pulchella* var. pulchella – K; < *L. pulchella* – W]

**Lechea racemulosa** Michaux. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (DE, NC, SC, VA): dry pine woodlands, other woodlands, forest edges, old fields; common. June-August; July-October. Se. NY west to s. OH and s. IL, south to se. VA, NC, c. GA, and AL, with a few disjunct occurrences west to MO; the range is centered on the Appalachian Mountains. [= EAB, C, F, G, K, S, W, WV, Y, Z; < *L. tenuiflora* var. virginiaca – WH]

**Lechea sessiliflora** Rafinesque. Cp (FL, GA, NC, SC, VA): sandhills and dry flatwoods; common. July-August; August-October. A Southeastern Coastal Plain endemic: s. NC south to s. FL and west to s. MS. [= K, WH = *L. patula* Leggett – RAB, Y, Z; > *L. patula* – S]

**Lechea tenuiflora** Michaux. Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (WV): dry oak-pine forests and openings; common (rare in WV Mountains). June-August; August-October. S. ME south to SC (mostly inner Coastal Plain and Piedmont), and from s. IN n. IL, s. MN, and NE south to e. LA and c. TX. [= RAB, K, S, W, WV, Y; > *L. tenuiflora* var. tenuiflora – C, F, G; > *L. tenuiflora* var. typica – Z]

**Lechea torreyi** Leggett ex Britton var. congesta Hodgdon. Cp (FL, GA, NC, SC): sandhills and pine flatwoods; rare. June-July; August-October. As interpreted by Hodgdon, *L. torreyi* consists of 2 varieties, the more widespread var. *congesta* ranging from se. NC south to s. FL and west to s. MS (disjunct in Belize), and the more restricted var. *torreyi* restricted to FL. Wilbur & Daoud (1961) express doubt about the validity of the 2 varieties, but present little evidence for or against their recognition. Var. *congesta* may indeed prove to be no more than a form. [= Z; < *L. torreyi* – RAB, K, S, WH, Y]

**Lechea torreyi** Leggett ex Britton var. torreyi. Cp (FL): sandhills and pine flatwoods; rare. June-July; August-October. Ne. FL and Panhandle FL south to s. peninsular FL. [= Z; < *L. torreyi* – K, S, WH, Y]

258. TROPAEOLACEAE A.L de Jussieu ex A.P. de Candolle 1824 (Nasturtium Family) [in BRASSICALES]

*Tropaeolum* Linnaeus 1753 (Nasturtium)

A genus of about 85-90 species, herbs, of tropical Central America and South America (s. Mexico to Peru). References: Tucker in FNA (2010); Sparre & Andersson (1991)=Z.

* Tropaeolum majus* Linnaeus, Nasturtium, is cultivated and rarely persistent or present around refuse areas, as in sc. PA (Rhoads & Klein 1993). *T. majus* is considered by Sparre & Andersson (1991) to be a taxon of hybrid origin, not known from wild populations. It is probably not truly established in our area. [= FNA, K, Z] [not mapped; not keyed; rejected as a component of our flora]

261. LIMNANTHACEAE R. Brown 1838 (False-mermaid Family, Meadow-foam Family) [in BRASSICALES]

*Floerkea* Willdenow 1801 (False-mermaid)

264. BATAEACEAE von Martius ex Meisner 1842 (Batis Family) [in BRASSICALES]

A monogeneric family, of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. References: Thorne in FNA (2010); Rogers (1982b); Bayer & Appel in Kubitzki & Bayer (2003).

*Batis* P. Browne 1756 (Saltwort, Beachwort, Batis)

A genus of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. The only other member of the family and genus is *B. argillicola*, of New Guinea and Australia. References: Thorne in FNA (2010); Rogers (1982b)=Z; Goldblatt (1976); Bayer & Appel in Kubitzki & Bayer (2003).

Batis maritima Linnaeus, Saltwort, Beachwort, Batis, Turtleweed, Vidrillos. Brackish marshes. June-July; October. Se. SC south to s. FL, west to TX, and in Central and South America; West Indies; HI (where apparently introduced). *B. maritima* is alleged (as by FNA and S) to occur as far north as NC, but the documentation is unknown; there is no twentieth century evidence to place *Batis* in NC. [= RAB, FNA, GW, K, S, WH, Z]

270. RESEDACEAE A.P. de Candolle ex Gray 1821 (Mignonette Family) [in BRASSICALES]

A family of about 6 genera and 75-85 species, herbs and shrubs, of the northern hemisphere. References: Martin-Bravo, Tucker, & Daniel in FNA (2010); Kubitzki in Kubitzki & Bayer (2003).

*Reseda* Linnaeus 1754 (Mignonette)

1 Upper and middle leaves deeply pinnately lobed.
2 Carpels 4, petals white; seeds tuberculate ..................................................................................................................................................*R. alba*
2 Carpels 3, petals yellowish; seeds smooth .......................................................................................................................................*R. lutea*
1 Upper and middle leaves entire or finely toothed (sometimes with 1-2 lateral lobes).
Resedaceae

1 Sepals and petals 4; seeds smooth; fruits < 7 mm long, crowded, erect to ascending. 
   R. luteola

1 Sepals and petals 6; seeds rugose; fruits > 7 mm long, well-spaced, pendent.

2 Capsules 7-11 mm long; sepals (in fruit) < 5 mm long. 
   R. odorata

2 Capsules (well-developed) 11-15 mm long; sepals (in fruit > 5 mm long). 
   [R. phyteuma]

* Reseda luteola Linnaeus, Weld, Dyer’s Rocket, Yellow-weed. Formerly cultivated as a dye plant; native of Eurasia. Reported from se. and sc. PA (Rhoads & Klein 1993) and elsewhere mainly north of our area. [= C, F, FNA, G, K]

* Reseda phyteuma Linnaeus, Corn Mignonette. Disturbed areas; native of Europe. Reported from sc. PA (Rhoads & Klein 1993). [= K] [no definite report for our area; not mapped; rejected as a component of our flora]

272. Cleomaceae Horaninow 1834 (Cleome Family) [in Brassicales]

The Cleomaceae is here circumscribed to include the members of the Capparaceae, subfamily Cleomoideae, following phylogenetic analyses which show this group to be a monophyletic clade more closely related to Brassicaceae than to the rest of Capparidaceae (Hall, Sytsma, & Iltis 2002). References: Rucker & Vanderpool in FNA (2010); Hall, Sytsma, & Iltis (2002); Judd, Sanders, & Donoghue (1994); Sanders & Judd (2000). Key based on FNA.

1 Stamens (8-) 10-27; petals notched or irregularly lacerate at the apex; gynophore (stipe of the pistil, above the calyx) 2-6 mm long; leaflets (1-) 3. ............................................................................................................................................................................................................ Polanisia

1 Stamens 6 (except 14-25 in Arivela); petals obtuse or acute at the apex; gynophore (stipe of the pistil, above the calyx) 1-80 mm long; leaflets 5-7.

2 Plants with nodal spines (and sometimes with prickles on petioles and leaf veins).

3 Petals 5-10 mm long; gynophore 1-4 mm long; petioles and leaf blades unarmed. ............................................................................................................................................................................. [Hemiscola]

3 Petals 10-30 mm; gynophore 45-80 mm; petioles and sometimes leaf blades prickly. ........................................................................................................................................................................................................... Tarenaya

2 Plants lacking nodal spines and lacking prickles on petioles and leaf veins.

4 Filaments fused to lower half of gynophore (evident from scars near the midpoint of the gynophore of fruiting specimens). .............................................................................................................................................................................................................. Gynandropsis

4 Filaments free from gynophore

5 Bracts subtending the pedicels minute ......................................................................................................................................................................................................................................................... Cleoserrata

5 Bracts subtending the pedicels with expanded blades, sometimes even trifoliolate.

6 Style 0.2-0.8 mm long; gynophore 3-12 mm; stamens 6; sepals fused ¼-½ their length .................................................................................................................................................................................................................. Cleome

6 Style 1-1.2 mm long; gynophore obsolete; stamens 14-25; sepals free .................................................................................................................................................................................................................. Arivela

Arivela Rafinesque 1838

* Arivela viscosa (Linnaeus) Rafinesque, Wild Caia, Yellow Cleome. Cp (GA, SC, VA?): disturbed areas; rare, introduced, native of Asia (now pantropical). Reported for sc. GA (Carter, Baker, & Morris 2009; Jones & Coile 1988), se. PA (Rhoads & Klein 1993), and recently from Beaufort County, SC (J. Nelson, pers. comm. 2006). Reported from chrome ore piles in Newport News (Reed 1959); presumably a waif. [= FNA; = Cleome viscosa Linnaeus – K] [synonymy incomplete]

Cleome Linnaeus 1753 (Cleome, Spiderflower)

CLEOMACEAE

1 Fruits (12-)15-25 mm long; bracts unifoliate; leaflets linear to elliptic .......................................................... [C. ornithopodioides]
1 Fruits 40-70 mm long; bracts trifoliate; leaflets oblanceolate to rhomboid-elliptic ........................................... C. rutidosperma

* Cleome rutidosperma DC. Cp (FL, SC?): disturbed areas; rare, native of tropical Asia and Africa. Reported for SC by FNA. [= FNA, WH] {add to synonymy}

* Cleome ornithopodioides Linnaeus, Bird Spiderflower. Reported for KY, MD, PA, OH. [= FNA; > C. iberica de Candolle] {add to synonymy}

Cleoserrata H.H. Iltis 2007

1 Petals white, tinged with pink or red; bracts at most 1 mm long, subulate; gynophore 1-2 mm long ......................... [C. serrata]
1 Petals brilliant pink to purple, fading to pink or white (rarely initially white); bracts 3-18 mm long, ovate-cordate; gynophore 30-85 mm long .......................................................... C. speciosa

* Cleoserrata serrata (Jacquin) H.H. Iltis. {GA}; disturbed areas; rare, native of tropical America. Reported as introduced in GA (Kartesz 1999). [= FNA; = Cleome serrata Jacquin – K; = Neocleome serrata (Jacquin) Small – S] {not yet keyed; synonymy incomplete}

* Cleoserrata speciosa (Rafinesque) H.H. Iltis. Cp (FL): vacant lots, disturbed areas; rare, native of Mexico. [= FNA; = Cleome speciosa Rafinesque – K, WH]

Gynandropsis de Candolle 1824

Hemiscola Rafinesque 1838

1 Leaflets ovate to rhomboidal; sepals lanceolate; anthers 0.9-1.0 mm long; silique 20-40 (-60) mm long .................... [H. aculeata var. aculeata]
1 Leaflets obovate; sepals ovate; anthers 0.3-0.5 mm long; silique 15-20 mm long ...................................................... [H. diffusa]

* Hemiscola aculeata (Linnaeus) Rafinesque var. aculeata. Prickly Spiderflower. Cp (AL): disturbed areas; rare, native of tropical America. Reported for AL. [= FNA; < Cleome aculeata Linnaeus – K]
* Hemiscola diffusa (Banks ex de Candolle) H.H. Iltis. Cp (AL): on ballast (Mobile, AL); rare, native of South America. [= FNA; = Cleome diffusa Banks ex de Candolle – K]

Polanisia Rafinesque 1819 (Clammy-weed)

Identification notes: Polanisia has some resemblance to Warea.

1 Petals broadest toward the base, barely or not at all clawed; capsule valvate; [of xeric longleaf pine sandhills].......................... P. tenuifolia
1 Petals broadest toward the tip, narrowed to a long, distinct claw; capsule opening near the tip; [of floodplains and disturbed soils].

2 Larger petals 3.5-6.5 (-8) mm long; longest stamens 4-10 (-14) mm long ........................................................... P. dodecandra var. dodecandra
2 Larger petals (7-) 8-13 (-16) mm long; longest stamens (9-) 12-30 mm long .......................................................... P. dodecandra var. trachysperma

* Polanisia dodecandra (Linnaeus) A.P. de Candolle var. dodecandra. Clammy-weed, Spider-weed. Mt (VA, WV*), Pd (VA): sandy or gravelly floodplains along the James River in VA, also introduced on railroad ballast; rare. June-September. VT west to MB, south to MD, w. VA, TN, AR, and OK. Apparently both native and introduced in our area. [= C; = P. dodecandra ssp. dodecandra – FNA; K; = P. graveolens Rafinesque – F, S, WV; = P. dodecandra – G; < P. dodecandra – W; = Cleome graveolens (Rafinesque) Sch. & Sch.]

**Polanisia tenuifolia** Torrey & A. Gray, Slenderleaf Clammy-weed, Pineland Catchfly. Cp (AL, FL, GA, MS): sandhills; rare. E. GA (several counties from the SC border) (Jones & Coile 1988) south to s. FL, west to s. MS. [= FNA, K, WH; = Aldenella tenuifolia (Torrey & A. Gray) Greene – S]

**Tarenaya** Rafinesque 1838

A genus of about 33 species, annual herbs, of South America. References: Tucker & Iltis in FNA (2010). Key based on FNA.

1 Sepals, ovary, and fruit glabrous; fruit about as long as gynophore; petals deep pink or purple (infrequently white) ............... *T. hassleriana*
1 Sepals, ovary, and fruit glandular-pubescent; fruit longer than gynophore; petals white or greenish-white ........................................ *T. spinosa*

* **Tarenaya hassleriana** (Chodat) H.H. Iltis, Cleome, Spiderflower, Pinkqueen. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): gardens, disturbed areas, riverbanks, persistent and self-seeding from cultivation as an ornamental; rare, native of South America. June-November. The petals in bud are a pale pink to nearly white, they turn a deep pink upon opening late in the day; by morning the petals have once again faded to a pale pink or white. [= FNA; = Cleome hassleriana Chodat – C, K, WH; ? C. houtteana Schlechtendahl – RAB, misapplied; < C. spinosa Jacquin – F, G, misapplied; < Neocleome spinosa (Jacquin) Small – S]

* **Tarenaya spinosa** (Jacquin) Rafinesque. Cp (FL): disturbed areas; rare, native of South America. Also in AL. [= FNA; < Neocleome spinosa (Jacquin) Small – S; = Cleome spinosa Jacquin – WH]

273. **BRASSICACEAE** Burnett 1835 or **CRUCIFERAE** A.L. de Jussieu 1789 (Mustard Family) [in BRASSICALES]

Tribe a. Alyssaeae: Alyssum, Berteroa
Tribe b. Anchonieae: Matthiola
Tribe d. Arabideae: Arabis, Draba
Tribe e. Boehereae: Boechera
Tribe f. Brassiceae: Brassica, Cakile, Coincya, Diplotaxis, Eruca, Erucastrum, Orychophragmus, Raphanus, Rapistrum, Sinapis
Tribe g. Baniiadeae: Bunias
Tribe h. Calepinaeae: Calepina
Tribe i. Camelineae: Arabidopsis, Camelina, Capsella, Turritis
Tribe j. Cardamineae: Armoracia, Barbarea, Cardamine, Iodanthus, Leavenworthia, Nasturtium, Planodes, Rorippa
Tribe k. Chorispareae: Chorispareae
Tribe m. Conringaeae: Conringia
Tribe n. Descurainieae: Descurainia
Tribe o. Erysimeae: Erysimum
Tribe p. Euclisiaceae: Brayia
Tribe s. Hesperideae: Hesperis
Tribe t. Iberideae: Iberis, Teesdalia
Tribe v. Isatideneae: Isatis, Myagrum
Tribe w. Lepidieae: Lepidium
Tribe x. Lunarieae: Lunaria
Tribe y. Malcolmieae: Lobularia
Tribe z. Noccaeeae: Microthlaspi
Tribe aa. Physarieae: Paysonia, Physaria
Tribe bb. Sisymbrieae: Sisymbrium
Tribe dd. Thelypodieae: Warea
Tribe ee. Thlaspi: Alliaria, Thlaspi

**Alliaria** Heister ex Fabricius 1759 (Garlic Mustard)

* **Alliaria petiolata** (Bieberstein) Cavara & Grande, Garlic Mustard, Hedge Garlic. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA) [GA, SC]: moist forests in bottomlands and on slopes; common (uncommon in VA Piedmont, rare in NC, rare in VA Coastal Plain), native of Europe. April-May; May-June. This species has become a noxious weed in ne. United States, invading undisturbed moist forests. Dhillion & Anderson (1999) report on physiological characteristics that make Alliaria a successful invader in shaded situations. [= RAB, C, FNA, K, W, Y, Z; = Alliaria officinalis Andrzejowski ex Bieberstein – F, G]
**Alyssum Linnaeus 1753 (Alyssum, Madwort)**

* Alyssum alyssoides (Linnaeus) Linnaeus, Yellow Alyssum. Mt (VA, WV), Pd (VA), C (VA): roadsides, disturbed areas, especially in dry, barren soil; uncommon (rare in WV), native of Europe. June-September. [= C, F, FNA, G, K, N, W, Z; > A. alyssoides var. alyssoides – Y]

---

**Arabidopsis Heynhold (Mouse-ear Cress)**

| 1 Fruit strongly flattened; petals 6-10 mm long; [native perennial, of calcareous and mafic rock outcrops] | ......................... A. lyrata ssp. lyrata |
| 1 Fruit terete; petals 2-4 mm long; [alien annual, of disturbed, weedy sites] | .......................................................... A. thaliana |

---

**Arabis Linnaeus 1753 (Rockcress)**

The circumscription of *Arabis* is in flux; there is increasing evidence that the broad circumscription traditionally employed in most North American floras includes discordant elements. Based on molecular phylogenetic studies and morphology, *Arabis* in our area should be divided into 4 genera, as follows: *Arabidopsis* (A. lyrata); *Arabis* sensu stricto (A. hirsuta var. adpressipilis, A. hirsuta var. pycnocarpa, A. georgiana); *Boechera* Löve & Löve (n=7) (A. canadensis, A. drummondii, A. laevigata var. burkii, A. laevigata var. laevigata, A. missouriensis, A. patens, A. persiellata var. ampla, A. serotina, A. shortii); and *Turritis* (A. glabra var. glabra). References: Al-Shehbaz in FNA (2010); Hopkins (1937)=Z; Rollins (1993)=Y; Al-Shehbaz (1988a)=X; Al-Shehbaz (2003)=Q; Koch, Bishop, & Mitchell-Olds (1999); Koch & Al-Shehbaz (2002). [also see *Arabidopsis, Boechera, Turritis*]

| 1 Plants matted from a branching caudex, perennial; [cultivated and rarely persistent or escaped] | .......................................................... [A. caucasica] |
| 1 Plants unbranched, biennial; [native to our area]. | .......................................................... [A. georgiana] |
| 2 Petals 3-5 mm long; siliques 3-6 cm long; [collectively known from NC, TN, VA, and northward and westward from those states]. | .......................................................... [A. pycnocarpa var. adpressipilis] |
| 2 Petals 3-5 mm long; siliques 3-6 cm long; [collectively known from NC, TN, VA, and northward and westward from those states]. | .......................................................... [A. pycnocarpa var. pycnocarpa] |

---

**Arabis georgiana** R.M. Harper, Georgia Rockcress. Mt (GA), Pd (GA), C (GA): nutrient-rich streambanks and rock outcrops; rare. April-May; May-early July. Endemic to n. North America and c. AL. It differs from our other species by the following combination of characters: fruits 5-7 cm long, borne appressed to ascending, leaves with bifurcate, trifurcate, or stellate hairs. See Patrick, Allison, & Krakow (1995). [= FNA, K, Y, Z]

**Arabis patens** Sullivant, Spreading Rockcress. Mt (GA, NC, VA, WV), Pd (VA): thin soils around calcareous or dolomitic outcrops, very rarely in nutrient-rich seepage from mafic rocks; rare. May-June; June-August. Irregularly distributed, primarily in the sedimentary rock Appalachians, from se. PA, c. PA, and IN south to NC, c. TN, and AL. In NC, this species occurs over marble at Blowing Spring, Nantahala River Gorge, Swain County, at various sites over calcareous sedimentary rocks in the Hot Springs Window, near Hot Springs, Madison County, and in nutrient-rich seepage from amphibole at Chimney Rock, Rutherford County. [= RAB, C, F, FNA, G, K, N, W, Z; > Boechera patens (Sullivant) Al-Shehbaz – Q]

**Arabis pycnocarpa** M. Hopkins var. adpressipilis (M. Hopkins, Slender Rockcress, Hairy Rockcress. Pd (NC), Mt (NC, VA): thin soils near outcrops of mafic or other rock weathering to nutrient-rich soils; rare. April-May; May-June. Var.
BRASSICACEAE

**Armoracia** Gaertner, B. Meyer, & Scherbius 1800 (Horseradish)

A genus of 3 species, perennial herbs, of Eurasia. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Y; Al-Shehbaz (1988a)=X.

1 Plant aquatic; stem submersed or prostrate; fruit unilocular .................................................................[see *Rorippa aquatica*]
1 Plant terrestrial; stem erect; fruit bilocular .............................................................................................................. *A. rusticana*

* Armoracia rusticana* P. Gaertner, B. Meyer, & Scherbius, Horseradish. Mt (NC, VA, WV), Pd (DE), Cp (DE): persistent after cultivation, sometimes spreading (generally only very locally, but sometimes greater distances, probably by water transport of rhizomes); uncommon (rare south of DE), native of Europe. May-July. The root is grated to provide the condiment. [= RAB, C, G, K, X, Y, Z; ? *A. lapathifolia* Gilibert – F; = *A. armoracia* (Linnaeus) Britton]

**Barbarea** R. Brown 1812 (Winter-cress, Creasy Greens)

A genus of about 20 species, biennial and perennial herbs, semicosmopolitan. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

1 Basal leaves with 1-4 pairs of lateral lobes; siliques 1.5-3 cm long; pedicels 0.5-1.0 mm thick ............................................................... *B. adpressa*  
1 Basal leaves with 4-10 pairs of lateral lobes; siliques 4.5-7 cm long; pedicels 1.2-1.8 mm thick .............................................................. *B. vulgaris* 

* Barbarea vulgaris* W. Aiton, Common Winter-cress, Yellow Rocket. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): fields, disturbed areas; common, native of Eurasia. April-June. Additional study is needed of the various infraspecific or specific taxa recognized by some authors (particularly Europeans) in what is here considered a variable species; see Stace (2010), for instance. [= RAB, C, F, G, K, W, Y, Z; > *B. vulgaris* var. *arcuata* (Opiz ex J. & K. Presl) Fries – RAB, F, G; > *Campe barbaraea* (Linnaeus) Wight ex Piper – S; > *Campe stricta* (Andrzejowski) Wight ex Piper – S, misapplied; > *B. vulgaris* var. *sylvestris* (Fries)

**Berteroa** A.P. de Candolle 1821 (Hoary Alyssum)

A genus of about 5 species, annual or perennial herbs, of Europe and the Middle East. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1988)=Y.

* Berteroa incana* (Linnaeus) A.P. de Candolle, Hoary Alyssum. Mt (VA, WV), Pd (VA): disturbed areas; uncommon, native of Europe. [= C, F, G, K, Y, Z]

**Boechera** Löve & Löve 1975 (Rockcress)

1 Pedicels of flowers or fruits deflexed ....................................................................................................................... *B. canadensis* 
1 Pedicels of flowers or fruits erect, ascending, or spreading.
Boechera burkii (Porter) Windham & Al-Shehbaz, Burk's Smooth Rockcress. Mt (NC, VA, WV): limestone barrens, shale barrens, and other dry, rocky habitats; rare. April-May. E. and C. PA south to e. WV, ne. TN, and w. NC in the sedimentary rock Appalachians. Windham & Al-Shehbaz (2007) […] RAB assigns this plant (as Arabis laevigata var. burkii) to NC based on somewhat aberrant specimens from high elevation cove forests; these are better assigned to B. laevigata var. laevigata. Hopkins (1937), however cites a specimen from Hot Springs, Madison County, NC, an area with plausible habitats (dry sedimentary rock woodlands, shale barrens). [= FNA; = Arabis laevigata (Muhlenberg ex Willdenow) Poiret var. burkii Porter – C, K, W, X, Y; < A. laevigata var. burkii – F, G, Z (also see A. serotina); < A. burkii (Porter) Small – S, misapplied in part; < Boechera laevigata – Q]

Boechera canadensis (Linnaeus) Al-Shehbaz, Sicklepod, Canada Rockcress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, VA): thin soils around rock outcrops, especially mafic or calcareous, and in dry to mesic, nutrient-rich, often rocky woodlands over mafic or calcareous rocks; uncommon (rare in Coastal Plain, rare in DE Piedmont). May-July; June-August. QC and ND south to Panhandle FL and TX. [= FNA, Q, WH; = Arabis canadensis Linnaeus – RAB, C, F, G, K, S, W, X, Y, Z]

Boechera laevigata (Muhlenberg ex Willdenow) Al-Shehbaz, Common Smooth Rockcress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (VA): rocky woodlands and forests, rock outcrops, especially mafic or calcareous, but also on more acidic sites, rarely also in bottomlands; common (uncommon in VA Coastal Plain, rare in DE Piedmont). April-May; May-June. ME west to MN and SD, south to GA, AL, MS, AR, OK, and CO. Of our Boechera, B. laevigata is the most common, being the least limited to calcareous substrates. [= FNA; = Arabis laevigata (Muhlenberg ex Willdenow) Poiret var. laevigata – C, F, G, K, W, X, Y, Z; < A. laevigata var. laevigata – RAB; > A. laevigata var. burkii – RAB, misapplied; >= A. burkii (Porter) Small – S, misapplied in part; > A. laevigata – S, < Boechera laevigata – Q]

Boechera missouriensis (Greene) Al-Shehbaz, Missouri Rockcress. Pd (GA, NC, SC), Mt (NC): thin soil around outcrops of metamudstone, diabase, or granite (generally on mafic or rich granitic substrates); rare. April-May; May-June. ME to WI, south to KY, AR, and OK; disjunct eastward in NC, SC, and GA. [= FNA, Q; = Arabis missouriensis Greene – C, K, X, Y; = A. laevigata var. laevigata var. missouriensis – RAB; > A. missouriensis var. missouriensis – F; > A. viridiss Hargr. var. viridis – G, Z]

Boechera serotina (Steele) Windham & Al-Shehbaz, Shale Barren Rockcress. Mt (VA, WV): shale barrens; rare. Mid-July-September. Endemic to Devonian and Ordovician shales of w. VA and e. WV. Wieboldt (1987) has clarified the taxonomy of this species and A. laevigata var. burkii. Also see Porter & Wieboldt (1991) for further discussion. [= FNA; = Arabis serotina Steele – C, K, X, Y; < A. laevigata var. burkii – F, G, Z; < Boechera laevigata – Q]

Boechera shortii (Fernald) Al-Shehbaz. Mt (WV), Pd (VA): nutrient-rich alluvial and river bluff forests (in VA, along the Potomac River); rare (VA Rare). April-May. NY west to MN, south to n. VA, nc. TN (Chester, Wofford, & Kral 1997), and AR. [= FNA, Q; = Arabis shortii (Fernald) Gleason – C, G, K, X, Y; = A. perstellata E.L. Braun var. shortii Fernald – F; = A. dentata (Torrey) Torrey & A. Gray – S, Z (name preoccupied); > A. shortii var. phalacrocarpa (M. Hopkins) Steyermark]
Boechera stricata (Graham) Al-Shehbaz. Pd (DE): {habitat}; rare. April-June. NL (Labrador) and AK south to NJ, DE, OH, IL, NM, AZ, and CA. [= FNA, Q; = Arabis drummondii A. Gray – C, F, G, K, Y; > A. drummondii A. Gray var. typica – Z; = Boechera drummondii (A. Gray) Löve & Löve, illegitimate name]

Boechera perstellata (E.L. Braun) Al-Shehbaz is apparently endemic to KY and c. TN (Chester, Wofford, & Kral 1997). [= FNA, Q; = Arabis perstellata – K, Y; > Arabis perstellata E.L. Braun var. perstellata – X; > Arabis perstellata E.L. Braun var. ampla Rollins – X]

**Brassica** Linnaeus 1753 (Mustard, Turnip, Rape, Cabbage, Collard Greens, Kale, Broccoli, Cauliflower, Kohlrabi, Rutabaga, Bok-Choy, Chinese Cabbage, Brussels Sprouts)

A genus of about 40 species, herbs, of the Old World. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z. [also see Erucastrum, Sinapis]

1 Upper cauline leaves petiolate, or sessile and cuneate.
2 Pedicels and siliques widely spreading to divaricately ascending; siliques 2-4 cm long, terete or nearly so; [section Rapa]........... Br. juncea
3 Pedicels and siliques erect and appressed to the rachis; siliques 1-2 cm long, more-or-less 4-angled; [section Melanosinapis]........... Br. nigra
1 Upper cauline leaves auriculate, slightly to strongly clasping the stem; [section Rapa].
3 Petals mostly 18-25 mm long; beak of the siliques (3-) 4-11 mm long .................................................. [Br. oleracea]
3 Petals mostly 6-16 mm long; beak of the siliques (5-) 7-15 (-22) mm long ................................................................. [Br. rapa]
4 Petals 6-10 (-11) mm long; deep yellow; beaks of the siliques usually (8-) 10-15 (-22) mm long; plant usually green; siliques 5-10 cm long .................................................. Br. rapa var. rapa

* **Brassica juncea** (Linnaeus) Czernajew, Leaf Mustard, Brown Mustard, Indian Mustard, Mustard Greens, Chinese Mustard. Cp (DE, GA, SC, VA), Mt (NC, SC, VA, WV), Pd (DE, SC, VA): fields, disturbed areas; common (uncommon in GA, NC, SC, and WV), native of Eurasia. April-June. This species is apparently a recently derived polyploid (n=18) of B. nigra (n=8) and B. rapa (n=10). The seeds of this species are one source of table mustard; other components include B. nigra and Sinapis alba. [= RAB, C, G, K, W, Y, Z; > B. juncea – S; > B. japonica (Thunberg) Siebold ex Miquel – S]

* **Brassica napus** Linnaeus, Rutabaga, Rape, Canola, Colza, Swede. Mt (GA, NC, SC, VA?, WV), Pd (GA, NC, SC, VA?), Cp (SC): fields, disturbed areas; uncommon (rare in GA, NC, SC, and VA), native of Eurasia. May-July. This species is apparently a recently derived polyploid (n=19) of B. oleracea (n=9) and B. rapa (n=10). The seeds of this species are the source of "canola" oil, the name recently coined by marketers from "Canadian" + "oil" + "low" + "acid" to avoid the negative connotation of the ancient name "rape." [= K, W, Y, Z; < B. napus – RAB (also see B. rapa)]

* **Brassica nigra** (Linnaeus) W.D.J. Koch, Black Mustard, Charlock. Cp (DE, VA), Pd (DE, VA), Mt (VA, WV) [NC]: fields, disturbed areas; common (uncommon of DE), native of Eurasia. May-August. The seeds of this species are one source of table mustard; other species used include B. juncea and Sinapis alba. [= C, F, G, K, S, Y, Z; = Sinapis nigra Linnaeus]

* **Brassica oleracea** Linnaeus. Commonly cultivated in our area in a variety of forms, including B. oleracea var. *acephala* A.P. de Candolle (Collard Greens, Kale), B. oleracea var. *capitata* Linnaeus (Cabbage), B. oleracea var. *italica* Plenck (Broccoli), B. oleracea var. *botrytis* Linnaeus (Cauliflower), B. oleracea var. *gemmifera* Zenk (Brussels Sprouts), and B. oleracea var. *gongylodes* Linnaeus (Kohlrabi). [= FNA, K]

**Braya** Sternberg & Hoppe 1815

A genus of about 6 species, perennial herbs, of alpine and arctic Eurasia and North America. References: Harris in FNA (2010); Rollins (1993)=Z.

**Bunias** Linnaeus 1753 (Warty-cabbage)

1 Plant an annual; cauline leaves < 5 cm long; siliques 10-12 mm long, more-or-less straight, 4-winged, spiny; seeds 3-4 per siliqua............. ................. Br. erucago
A genus of about 7-8 species, annual herbs, primarily of coastal North America, Europe, and North Africa. References: Rodman in FNA (2010); Rollins (1993)="Z; Rodman (1974)="Y; Al-Shehbaz (1985b)="X.

Identification notes: The siliques of *Cakile* are divided near their middle by an abscission zone into two halves, each with a single seed: the upper abscises and disperses by water or wind, the lower remains attached to the parent plant. The size of the two segments and the contour of the abscised surface remaining on the lower segment are important taxonomic characters.

1 Lower silique segment with 2 opposite lateral horns or wings on the sides prolonged upward into sharp triangular wedges, concave in between; petals white (rarely lavender), 4-10 mm long, 1.4-3 mm wide; most of the leaves deeply pinnatifid into 6-9 lobes. .............................................................................................................................................. *C. maritima ssp. maritima*

2 Infructescences usually >20 cm long; [of the Gulf Coast] ......................................................................................... *C. lanceolata ssp. pseudoconstricta*.

3 Siliques 3-4 mm wide, the beak conical and acute at the apex; [of the Gulf Coast] ............................................................................... *C. constricta*

4 Upper fruit segment 7-15 mm long, 4-angled (to weakly 8-ribbed); articulating surface of lower fruit segment flat to and with 2 (-6) small teeth projecting upward or the sides prolonged upward into 2 opposite triangular wedges; [of NC northward to NL (Labrador)] .................................................................................................................. *C. edentula*

5 Upper fruit segment 12-20 mm long, 8-ribbed; articulating surface of lower fruit segment flat (to slightly convex or concave) and without teeth; [of NC southward to St. Lucie County, FL] .................................................................................................................. *C. harperi*

1 Lower silique segment without lateral horns, triangular wedges absent to 1.5 mm high; petals white (rarely lavender), 4-10 mm long, 1.4-3 mm wide; most of the leaves with a few to many irregular teeth (or pinnatifid in *C. lanceolata ssp. pseudoconstricta*).

2 Infructescences 10-20 cm long; [collectively widespread].

3 Siliques 5-9 mm wide, the beak somewhat flattened and typically rather blunt; [of the Atlantic Coast].

4 Upper fruit segment 7-15 mm long, 4-angled (to weakly 8-ribbed); articulating surface of lower fruit segment flat to and with 2 (-6) small teeth projecting upward or the sides prolonged upward into 2 opposite triangular wedges; [of NC northward to NL (Labrador)] .................................................................................................................. *C. edentula*

5 Upper fruit segment 12-20 mm long, 8-ribbed; articulating surface of lower fruit segment flat (to slightly convex or concave) and without teeth; [of NC southward to St. Lucie County, FL] .................................................................................................................. *C. harperi*

**Cakile** P. Miller 1754 (Sea Rocket)

* Calepina irregularis (Asso) Thellung. Mt (NC), Pd, Cp (VA): fields, disturbed areas; rare, native of Eurasia. April. [= RAB, C, FNA, K, Y, Z]
Camelina Crantz 1762 (Gold-of-pleasure, False-flax)

1 Siliques 4-7 mm long; leaves and stem rough-hairy, the stellate trichomes exceeded by simple trichomes (which are 1-2 mm long) ............... ........................................... ........................................... ........................................... C. microcarpa

1 Siliques 7-12 mm long; leaves and stem glabrate to sparsely hairy, the stellate trichomes as long as the few simple trichomes .......... C. sativa

Capsella Medikus 1792 (Shepherd's Purse)

* Capsella bursa-pastoris (Linnaeus) Medikus, Common Shepherd's Purse. Cm (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA): fields, roadsides, disturbed areas; common (uncommon in DE), native of Europe. March-June. C. rubella Reuter, Pink Shepherd's Purse, is sometimes distinguished (as by F, G, Stace 2010), and occurs in our area. It is alleged to be diploid (vs. tetraploid), to have pink petals 1-2 mm long (vs. white, 2-3 mm long), and lateral margins of the fruit concave (vs. straight to convex). Al-Shehbaz (1986) considered the character correlations to be poor, not warranting taxonomic recognition. [= RAB, C, FNA, K, W, Y, Z; > C. bursa-pastoris – F, G, X; > C. rubella Reuter – F, G, X; > C. gracilis Gren. – F = Bursa bursa-pastoris (Linnaeus) Britton – S]

Cardamine Linnaeus 1753 (Bittercress, Toothwort)

1 Leaves palmately divided (if 1-ternate, then palmately so, the terminal leaflet on a petiolule the same length as the lateral leaflets); [Dentaria].

2 Plants entirely glabrous (including on the leaf margins); leaflets highly dissected with linear to filiform segments; [in our area known from Piedmont of NC and VA] ................................................................................................................................. C. dissecta

3 Trichomes of leaf margins appressed and ca. 0.1 mm long; stem leaves 2 (-3), opposite; lateral leaflets of stem leaves very rarely incised, the leaf being (and appearing merely 3-foliolate, though teeth may be prominent and lacerate); basal leaves usually present at flowering.

4 Rhizome with 2-3 cm long segments, each separated by a narrow and fragile connecting portion (which typically is broken on herbarium specimens), and lacking "teeth" (actually prominent reduced leaves); leaflets of the stem leaves (2.5×-) avg. 5× (-7×) as long as wide (thus proportionately much narrower than the leaflets of the basal leaves); central leaflet of stem leaves (2.5-) avg. 3.25 (-4) cm long × (0.5-) avg. 0.75 (-1.0) cm wide; taste of fresh plants relatively mildly mustardy, ............................................................................................................................................. C. angustata

4 Rhizome elongate and of uniform diameter, lacking definite segments, but with periodic "teeth" (prominent reduced leaves) along it; leaflets of the stem leaves (2×-) avg. 3× (-4×) as long as wide (thus proportionately similar to the leaflets of the basal leaves); central leaflet of stem leaves (4-) avg. 6 (-8) cm long × (1.5-) avg. 2 (-2.5) cm wide; taste of fresh plant strong, like horseradish or wasabi.... ................................................................. C. diphylla

3 Trichomes of leaf margins appressed and ca. 0.1 mm long; stem leaves 2 (-3), opposite; lateral leaflets of stem leaves very rarely incised, the leaf being (and appearing merely 3-foliolate, though teeth may be prominent and lacerate); basal leaves usually present at flowering.

5 Rhizome with 2-3 cm long segments, each separated by a narrow and fragile connecting portion (which typically is broken on herbarium specimens); upper stem pubescent............................................................................................................. C. concatenata

5 Rhizome elongate, with alternating thicker and thinner portions (but not fragile and easily separating); upper stem glabrous..........

............................................................................................................................. C. maxima

1 Leaves simple, pinnately lobed, or pinnately divided (if 1-ternate, then pinnately so, the terminal leaflet on a longer petiolule than those of the lateral leaflets); [Cardamine in the narrow sense].

6 Cauline leaves simple, sometimes the lower to middle cauline leaves with 1-2 pairs of very small lateral lobes.

7 Plant from a tuberous or bulbous base, erect and generally unbranched, not stoloniferous or rooting down from upper nodes after flowering; petals 7-20 mm long.
9 Petals absent or present, if present 0.7-2 mm long; siliques 5-10 (-15) mm long, plus a 0.5-1.0 mm beak, on thick pedicels 1-3 (-6) mm long ..............................................C. longii

9 Petals present, 2-10 mm long; siliques 8-21 mm long, plus a 1-3 mm beak, on slender pedicels 10-20 mm long.

10 Petals 5-10 mm long, the tips spreading or ascending; anthers oblong, about 1 mm long; stylar beak of the siliques 2-3 mm; mid-cauline and upper cauline leaves cuneate, rounded, or truncate (rarely the mid-cauline leaves subcordate, but not clasping); basal leaves with 1-3 pairs of lateral leaflets ..........................................................C. microanthera

6 Cauline leaves 1-ternate or pinnatifid (if 1-ternate, the lateral leaflets about as large as the terminal leaflet).

11 Cauline leaves with 3-5 leaflets; petals 4-10 mm long; plant a perennial.

12 Stem glabrous at base; lower leaves green beneath; petioles auriculate at the base, the auricles 1-5 mm long, acute to acuminate; leaves 3 (-5)-foliolate; siliques 22-40 mm long .................................................................C. clematis

13 Petals 6-9 mm long; stamens shorter than the petals by 1 mm or more; sepals 3-4 mm long; filaments obviously flattened..............................................................C. flagellifera var. flagellifera

14 Petals 4-6 mm long; stamens equaling to slightly exceeding the petals; sepals 2.5-3.5 mm long; filaments terete to somewhat flattened ...............................................................C. flagellifera var. hugeri

15 Cauline leaves with 7-numerous leaflets; petals 1-4 mm long or absent (8-15 mm long in C. pratensis var. palustris); plant an annual, biennial, or perennial.

16 Petals 1-4 mm long or absent.

17 Cauline leaves with prolonged sagittate-auriculate bases, the 13-19 leaflets acuminate ....................................................C. impatiens

18 Cauline leaves without basal auricles, the 5-15 (-17) leaflets mostly obtuse. Plant with many, persistent basal leaves forming a rosette; stem bases and petioles hirsute .................................................................C. hirsuta

19 Cauline leaves with petioles petiolate; stem pubescent at base. Leaflets petiolate; stems flexuosus; [alien weed] .................................................................C. flexuosa

20 Cauline leaves decurrent on the rachis; stems typically erect; [native] .................................................................C. pensylvanica

Cardamine augusta O.E. Schulz, Eastern Slender Toothwort. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (NC, SC, VA): rich, mesic forests; common (rare in VA Coastal Plain, rare in DE Piedmont). March-April; April-May. NJ and IN south to n. GA, c. TN, and ne. MS; disjunct in the Ouachita Mountains of AR. Var. ouachitana E.B. Smith, alleged to differ from var. augustata in its non-ciliate leaves (vs. leaves with margins ciliate with antrorse trichomes 0.1 mm long), is apparently not a valid taxon. [= C, FNA, K, X, Y, Z; = C. augustata var. angustata – RAB; = Dentaria heterophylla Nuttall – F, G, S, W]

Cardamine bulbosa (Schreber ex Muhlengren) Britton, Stems, & Poggenburg, Bulbous Bittercress. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swampy forests and bogs, primarily (but not strictly) in circumneutral soils or on limestone or mafic rocks; common (uncommon in GA, NC, SC, VA, rare in DE Coastal Plain). March-May; April-May. ME west to MB, south to FL, LA, and TX. [= RAB, F, FNA, G, GW, K, S, W, Z; = C. rhomboidea (Persoon) A.P. de Candolle – C, X]

Cardamine clematis Shuttleworth ex A. Gray, Mountain Bittercress. Mt (GA, NC, VA): shaded brookbanks, rock outcrops with seepage, at high elevations (1200m and above); rare. April-May; June-July. Endemic to the high elevation Southern Appalachians of w. NC, e. TN, sw. VA, and ne. GA (Brazstown Bald). [= C, FNA, K, S, W, X, Z; < C. clematis Shuttleworth ex Gray – RAB, F, G, Gw (also see C. flagellifera)]

* Cardamine debilis D. Don. Cp (GA): disturbed areas; rare, native of Europe. This species is similar to C. pensylvanica and C. flexuosa and may be overlooked (Rollins 1993, Brown & Marcus 1998). It is reported for e. GA (Jones & Coile 1988). [= K, Z; < C. flexuosa Withering – FNA]

Cardamine diphylla (Michaux) A. Wood, Crinkleroot, Toothwort. Mt (GA, NC, VA, WV), Pd (DE, NC): rich, mesic forests; common (rare in DE). April-May; May-June. NB west to MN, south to n. GA, SC, and AL. [= RAB, C, K, X, Y, Z; = Dentaria Michaux – F, G, Gw; > Dentaria diphylla – S; > Dentaria incisa Small – S]

Cardamine dissecta (Leavenworth) Al-Shehbaz, Dissected Toothwort. Pd (NC, VA), Mt (GA): rich, mesic forests; rare. March-April; April-May. Al-Shehbaz (1988c) describes the range as separated into four areas: c. AL (3 counties); e. NC and sc.
VA (6 counties); nw. GA, c. TN, and s. KY (18 counties); and se. IN, ne. KY, and s. OH (6 counties). He states that *C. dissecta* is easily distinguished from its relatives "by its glabrous leaves that are divided into filiform to narrowly linear segments." See Al-Shehbaz (1988c) for additional discussion of the systematics, nomenclature, ecology, and distribution of this species. First reported for VA by Wieboldt et al. (1998).

---

**Cardamine douglasi** Britton, Limestone Bittercress, Douglass's Bittercress, Purple Cress, Pink Spring-cress. Pd (NC, VA). Cp (VA), Mt (NV: nutrient-rich, mesic forests, especially alluvial bottomlands, and in nutrient-rich seepages, in NC in the drainages of the Neuse, Mecklenburg, and (rarely) Cape Fear rivers; uncommon (rare in NC). Mid March-early April; April-May. NY, ON, and MN south to c. NC, sc. TN, AL, and MO. [= RAB, C, F, FNA, G, K, GW, X, Z]

**Cardamine flagellifera** O.E. Schulz var. *flagellifera*, Large-flowered Blue Ridge Bittercress. Mt (GA, NC, SC, VA), Pd (NC): in seepages, on streambanks, and in moist or cove or bottomland forests, mainly at moderate to low elevations; uncommon (rare in GA, SC, VA, and WV). March-May; June-July. *C. flagellifera* is endemic to the Southern Appalachians of w. NC, SC, e. TN, GA, VA, and WV, and is quite distinct from *C. clematitis*, as pointed out by Dudley (1974). Rollins's division of this species into two varieties (following Small's recognition of two species) needs further evaluation. [= K, Z; < *C. flagellifera* – C, FNA, W, X; < *C. clematitis* – RAB, GW; = *C. flagellifera* – S]

**Cardamine flagellifera** O.E. Schulz var. *hugeri* (Small) Rollins, Small-flowered Blue Ridge Bittercress. Mt (NC, VA?), Pd (NC): in seepages, on streambanks, and in moist or cove or bottomland forests, mainly at moderate to low elevations; rare. March-April; June-July. Endemic to the Southern Appalachians of NC and TN. [= K, Z; < *C. flagellifera* – C, FNA, W, X; < *C. clematitis* – RAB, GW; = *C. hugeri* Small – S]

* Cardamine flexuosa* Withering, Woodland Bittercress. Mt (NC, VA, WV), Cp (NC, VA), Pd (NC, VA): disturbed sites; rare, native of Eurasia. February-May. Lihová et al. (2006) show that Asiatic "C. flexuosa" is a distinct taxon from European *C. flexuosa* and will need a new name; at least some of our material is the Asiatic species, whose proper name is unclear (Lihová et al. 2006). Both the European and Asiatic taxa are allotetraploids of unclear parentage. [= RAB, F, K, Z; < *C. flexuosa* Withering – FNA]

**Cardamine longii** Fernald, Long's Bittercress. Cp (DE, NC, VA): tidal freshwater marshes and cypress-gum swamps; rare. June-September. Coastal in distribution, irregularly from ME south to SC (or FL). Difficult to distinguish from depauperate or submerged forms of *C. pensylvanica* with few leaflets; the short style (capsule beak) and short and thick pedicels appear to be the most reliable characteristics. [= C, F, FNA, K, X, Z]

**Cardamine micranthera** Rollins, Streambank Bittercress, Small-anthered Bittercress. Pd (NC, VA): sand and gravel bars in creeks, swampy floodplain woods, seepage over rocks; rare. April-May; May-June. A narrow endemic, known only from Stokes County, NC and Patrick County, VA; apparently extirpated from Forsyth County, NC. The description and key in RAB are partly in error, being based on the inadequate and unrepresentative material available at the time. *C. micranthera* is most closely related to *C. rotundifolia*, but also shows some affinities to *C. pensylvanica*. It can be distinguished from *C. rotundifolia* by the characters in the key; additionally, *C. micranthera* does not form proliferative branches from the upper nodes, generally branching from the base in vigorous plants, or unbranched in smaller plants. It can be distinguished from *C. pensylvanica* by its predominately simple leaves, especially those on the upper stem, the larger flowers, the petals 3-5 mm long (vs. 1.5-3.5 mm long), the fruiting pedicels thin, 10-20 mm long, spreading to ascending (vs. thick, 4-10 mm long, ascending). Wieboldt (1992) reasonably speculates that *C. micranthera* may be an in-breeding relative derived from *C. rotundifolia* in the Piedmont/Mountain interface. [= RAB, FNA, K, X, Z]

**Cardamine parviflora** Linnaeus var. *arenicola* (Britton) O.E. Schulz, Sand Bittercress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA): various habitats, primarily seasonally wet areas with shallow soil or sand, also on mafic outcrop glades, as on greenstone, diabase, and nutrient-rich granites; common (rare in DE and WV). March-May. The typic variety is Eurasian; our variety is widespread in e. North America, also occurring in the Pacific Northwest. Our plant may warrant specific status. [= RAB, C, F, K, Z; < *C. parviflora* – FNA, GW, K, S, W; = *C. arenicola* Britton – S]

**Cardamine pensylvanica** Muhlenberg ex Willdenow, Quaker Bittercress. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): various wet habitats, especially swampy depressions, streambanks, small woodland seeps; common. March-May. NL (Newfoundland), NL (Labrador), NT, and AK south to FL, TX, and CA. [= RAB, C, FNA, GW, K, S, W, X, Z; < *C. pensylvanica* var. *pensylvanica* – F; < *C. pensylvanica* var. *brittoniana* Farwell – F]

**Cardamine pratensis** Linnaeus var. *palastris* Wimmer & Graebner, American Cuckoo-flower, Lady's-smock. Mt, Cp (VA): bogs and swamps; rare. April-July. Var. *palastris* ranges from Canada south to NJ, VA, OH, IN, MN, and BC. The Eurasian var. *palastris*, with pink (vs. white) flowers, is introduced in ne. North America and may occur in our area. These two varieties may not be distinguishable; Rollins combines var. *palastris* into var. *pratensis*. [= C, F, G, < *C. pratensis* – FNA; < *C. pratensis* var. *palastris* – K, Z]

**Cardamine rotundifolia** Michaux, American Bittercress, Mountain Watercress. Mt (GA?, NC, VA, WV), Pd (DE, NC, VA): seepages, streambanks, swampy depressions; common (rare in DE, NC, and VA). April-May; June-July. Characteristically, *C. rotundifolia* branches from the upper nodes while in flower, the branches rooting down and proliferating
BRASSICACEAE

625

vegetatively. A Central/Southern Appalachian endemic: n. DE, PA, and w. NY, west to OH and KY, south to w. NC and n. GA. [

\[ Cardamine maxima \] (Nuttall) Wood, Large Toothwort. NB, ON, and MI south to NJ, PA, OH, WV (?), and KY (?). [= FNA, K, Y, Z; = C. \textit{maxima} \textit{C}; = \textit{Dentaria maxima} Nuttall \textit{F}; G]

\textbf{Chorispora} R. Brown ex A.P. de Candolle 1821 (Chorispora)

A genus of 11 species, herbs, of Central Asia and the Middle East. References: Al-Shehbaz in FNA (2010); Rollins (1993)=Z;
Al-Shehbaz (1988d)=Y.

* \textbf{Chorispora tenella} (Pallas) A.P. de Candolle, Chorispora, Blue Mustard. Mt (WV): disturbed areas; rare, native of w. Asia.
Well established in the w. United States, and occurs at scattered locations eastward, as in c. and w. TN (Chester, Wofford, & Kral
1997) and s. PA (Rhoads & Klein 1993). [= C, F, K, Y, Z]

\textbf{Coincya} Porta & Rigo ex Rouy 1891 (Wallflower-cabbage, Coincya)

\textbf{Conringia} Adanson 1763 (Hare's-ear Mustard)

A genus of 6 species, herbs, of Europe and the Middle East. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

\textbf{Descurainia} Webb & Berthelot 1836 (Tansy-mustard, Flixweed)

A genus of ca. 40 species, primarily of North and South America. References: Goodson & Al-Shehbaz in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1988b)=Y; Detting (1939)=X.

1 Silique 10-25 (-30) mm long, acute to acuminate, the seeds mostly in 1 row .................................................................................................................. \textit{D. sophia}
1 Silique 5-10 (-13) mm long, obtuse or clavate, the seeds mostly in 2 rows.
2 Leaves densely gray-canescent; angle between fruiting pedicels and rachis ca. 75 degrees; pedicels glandular-puberulent, 6-12 mm long; plants 2-5 dm tall; [primarily of the Coastal Plain] .................................................................................................................................................. \textit{D. pinnata var. pinnata}
2 Leaves glabrous or glabrescent; angle between fruiting pedicels and rachis ca. 45 degrees; pedicels glabrous, 6-16 mm long; plants 3-7 dm tall; [primarily of the Mountains and Piedmont, rarely weedy in the Coastal Plain].
3 Stems moderately to densely glandular and pubescent (but not canescent); siliques 5-10 (-12) mm long; pedicels 8-16 mm long, ................................................................................................................................. \textit{D. pinnata var. brachycarpa}
3 Stems sparsely pubescent to glabrous; siliques 8-12 mm long; pedicels 6-12 mm long .................................................................................................................. \textit{D. pinnata var. intermedia}

\textbf{Descurainia pinnata} (Walter) Britton \textit{var. brachycarpa} (Richardson) Fernald, Northeastern Tansy-mustard. Mt (VA, WV), Pd (VA), Cp (NC*): dry rocky openings and woodlands; rare. April-August. QC west to NT, south to VA, TN, and TX; introduced in the Coastal Plain of NC. [= C, F, G; = \textit{D. brachycarpa} (Richardson) O.E. Schulz – RAB; = \textit{D. pinnata} \textit{ssp. brachycarpa} (Richardson) Detting – K, X, Y, Z; = \textit{Sophia millefolia} Rydberg – S; < \textit{D. pinnata} – W; > \textit{D. pinnata} \textit{var. brachycarpa} – WV; > \textit{D. pinnata} \textit{var. pinnata} – WV, misidentified; < \textit{D. pinnata} \textit{ssp. brachycarpa} – FNA]

**Diplotaxis** A.P. de Candolle 1821 (Wall-rocket)

| Leaves mostly basal or very low-cauline; plant annual or biennial; siliques lacking a gynophore (stipe) between the sepal scars and the base of the valves; [section *Anocarpum*]. | D. *murals* |
| Leaves mostly cauline; plant perennial, becoming somewhat woody at the base; siliques with a 0.5-2 mm gynophore (stipe) between the sepal scars and the base of the valves; [section *Diplotaxis*]. | D. *tenufolia* |

**Draba** Linnaeus 1753 (Draba, Whitlow-grass)

| Leaves mostly cauline; plant perennial, becoming somewhat woody at the base; siliques with a 0.5-2 mm gynophore (stipe) between the sepal scars and the base of the valves; [section *Diplotaxis*]. | D. *verna* |
| Leaves all basal; petals deeply bifid (about 1/2 way to base). | D. *ramosissima* |

* **Draba *cuneifolia*** Nuttall ex Torrey & A. Gray var. *cuneifolia*. Cp (AL, GA, ?NC, ?SC): open blackland prairies, preferring rocky, bare soil, also waste areas around wool-combing mills, possibly other habitats; rare, in NC and SC perhaps only native of further west. February-March; March-April. All three varieties are primarily distributed in sw. United States, but the species extends as a native at least as far east as c. GA (Houston County) (ECHOLS 2007) and AL, where it occurs in prairies and on limestone outcrops (Diamond & Woods 2009). [= FNA, K, Z; = D. *cuneifolia* – RAB, C, F, G, S]

* **Draba *ramosissima*** Desvaux, Rocktwist, Appalachian Draba. Mt (NC, VA), Pd (VA): in crevices of rock outcrops, or in dry talus slopes, over a variety of rock types (including limestone, dolostone, schist, gneiss, shale); common (uncommon in NC and WV Mountains, rare in NC and VA Piedmont). April-May; May-July. W. MD and e. WV south through w. VA and e. KY south to w. NC and e. TN. [= RAB, FNA, K, S, W, WV, Z]
**Draba reptans** (Lamarck) Ferndal. Pd (NC), Cp (SC): dry soil; rare. February-March; March-April. MA and ON west to WA, south to NC, GA, TX and CA. The few occurrences in our area seem to make little ecological or phytogeographic sense; they may represent introductions. The first collection in our area was, however, by Walter. [= RAB, FNA, K, Z; > *D. reptans* var. reptans – C, F, G; > *D. caroliniana* Walter – S]

* **Draba verna** Linnaeus, Whitlow-grass Cp (DE, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, especially in dry, barren soils, including granitic flatrocks; common (uncommon in DE), native of Europe. February-April; March-May. [= RAB, C, FNA, K, S, W, WV, Z; > *D. verna* var. verna – F, G; > *D. verna* var. boerhaaviif van Hall – F, G; = *Erophila verna* (Linnaeus) Besser]

**Eruca** P. Miller 1754 (Rocket-salad, Arugula)

A monotypic genus, an annual herb, native to Mediterranean Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* **Eruca vesicaria** (Linnaeus) Cavanilles ssp. sativa (P. Miller) Thellung. Garden Rocket, Rocket-salad, Arugula. Pd (NC), Mt (WV): cultivated as a salad green, persistent around gardens or occurring as a waif; rare, native of Mediterranean Europe. [= FNA, K, Y, Z; = *E. sativa* P. Miller – C, F, WV; < *E. vesicaria* – G; < *E. erica* (Linnaeus) Ascherson & Graebner – S]

**Erucastrum** K.B. Presl 1826 (Dog-mustard)

A genus of ca. 22 species, herbs, of Africa, Europe, and Arabia. References: Warwick in FNA (2010); Rollins (1993)=Z; Luken, Thieret, & Kartesz (1993); Al-Shehbaz (1985b)=Y.

**Erysimum** Linnaeus 1753 (Wallflower, Treacle Mustard)

A genus of ca. 150-180 species, of the Northern Hemisphere. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988d)=Y; Rollins (1993)=Z.

1 Petals 13-25 (-30) mm long, 4-11 (-13) mm wide; seeds 2-3 mm long; biennial or perennial; [native, usually in thin rocky soil] .......................................................... ..........................................................

1 Petals 3.5-10 mm long, 1.5-3 mm wide; seeds ca. 1 mm long; annual or biennial; [introduced, usually in disturbed situations].

2 Sepals 1.8-3.5 mm long; petals 3.5-5.5 mm long; fruits (1-) 1.5-2.5 (-4) cm long; pedicels slender (much narrower than the fruit), 5-13 (-16) mm long.............................. .......................................................... *E. cheiranthoides*

2 Sepals 4.5-6 mm long; petals 6-9 (-11) mm long; fruits (2-) 3-8 (-10) cm long; pedicels thick (as wide as the fruit or nearly so), 2-9 (-15) mm long.

3 Biennial or perennial; fruit 3.5-8 (-7) cm long; fruiting pedicel somewhat narrower than the fruit............................. .......................................................... *E. inconspicuum*

3 Annual; fruit (2-) 3-8 (-10) cm long; fruiting pedicel as wide as the fruit.......................................................... .......................................................... *E. repandum*

**Erysimum capitatum** (Douglas ex Hooker) E.L. Greene var. capitatum. Western Wallflower. Mt (VA, WV): shale barrens and shale woodlands of Alleghany and Bath counties, VA, and Grant and Pendleton counties, WV; rare. April-July; June-August. Rollins (1993) interprets *E. capitatum* as including five varieties, all but the typic restricted to the Great Plains and west. Though most floras (including C, F, and G) give the impression that *Erysimum* is not native east of IL, MO, and AR ("rarely adventive farther east along railroads"), this taxon is native and relictual in w. VA. e. WV (Grant and Pendleton counties), as well as in ec. TN (Chester, Wofford, & Kral 1997). [= FNA, K, Z; = *E. asperum* var. asperum – C, misapplied; > *E. arkansanum* Nutall – F; < *E. asperum* – G, misapplied; < *Cheirinia aspera* (Nuttall) Britton – S, misapplied; = *Erysimum capitatum* ssp. capitatum – Y]

* **Erysimum repandum** Linnaeus, Treacle Mustard, Bushy Wallflower. Cp (NC, VA), Pd (NC, VA), Mt (NC, VA, WV): disturbed areas; uncommon, native of Eurasia. April-May; May-July. [= RAB, C, F, FNA, G, K, WV, Y, Z; = *Cheirinia repanda* (Linnaeus) Link – S]

* **Erysimum inconspicuum** (S. Watson) MacMillan, Shy Wallflower. NS, QC, YT, and AK, south to MD, PA, AR, OK, CO, UT, NV, and OR. [= F, FNA, G; = *E. inconspicuum* var. inconspicuum – K, Z; < *E. inconspicuum* – C, Y; = *E. inconspicuum* – F, FNA, G]
Hesperis Linnaeus 1753 (Dame's Rocket)

* Hesperis matronalis Linnaeus, Dame's Rocket. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA), {GA}: bottomlands, roadsides, moist forests; common (uncommon in VA Piedmont, rare in Coastal Plain), native of Europe. April-August. The flowers are white or pink. [= RAB, C, F, FNA, G, K, S, W, WV, Y, Z]

Iberis Linnaeus 1753 (Candytuft)

* Iberis sempervirens Linnaeus, Evergreen Candytuft, is reported for NC and TN by Kartesz (1999), but the specimens he cites are from cultivated material. [= FNA, K] {rejected; not keyed}

Iodanthus Torrey & A. Gray 1840 (Purple Rocket)

Identification notes: Iodanthus pinnatifidus somewhat resembles Hesperis matronalis in overall appearance, but differs in the following ways: petals 10-13 mm long (vs. 20-25 mm long), siliques 2-4 cm long (vs. 5-10 cm long), pubescence of the lower stem of simple trichomes (vs. branched trichomes).

Iodanthus pinnatifidus (Michaux) Steudel, Purple Rocket. Mt (WV): rich forests of bottomlands and lower slopes; rare. May-June. W. PA west to MN and IA, south through WV and e. and c. TN to AL and TX. [= C, F, FNA, G, K, S, WV, Y, Z]

Isatis Linnaeus 1753 (Woad)

Leavenworthia Torrey 1837 (Glade Cress)

1 Petals entire, white, < 7 mm long; leaf lobes deeply dentate, the terminal lobe only slightly larger than the larger lateral lobes ........ L. uniflora
   1 Petals deeply to shallowly emarginate (notched at the tip), yellow, white, or lavender, 7-15 mm long; leaf lobes entire to shallowly dentate; the terminal lobe markedly larger than the largest lateral lobes.

2 Siliques conspicuously torulose (constricted between the seeds), even when young ........................................................................ L. torulosa
   2 Siliques not torulose (constricted between the seeds) (or slightly so in L. stylosa).

3 Petals 7-10 mm long, shallowly emarginate; style 1-3 mm long; siliques flat; [of AL, GA, KY, and TN].
   4 Petals yellow; [of AL and TN]. .......................................................................................................................... L. exigua var. lutea
   4 Petals white to pale lavender; [of KY, TN, and nw. GA].

5 Styles 2-3 mm long; sepals green; [of KY]. ............................................................................................. L. exigua var. laciniata
   5 Styles 1.5-5.5 mm long; petals white to lavender; [of n. AL].

6 Siliques thin, flat; styles 1.5-5.5 mm long; petals white to lavender; [of n. AL].
   7 Styles 2-5.5 mm long; mature siliques cuneate at the base and acute at the tip; [of Colbert, Franklin, and Lawrence counties, AL]..... L. alabamica var. alabamica
   7 Styles 1.5-2 (-3) mm long; mature siliques rounded at the base and acute at the tip; [of Colbert, Franklin, and Lawrence counties, AL]..... L. stylosa var. brachystyla

8 Siliques thick, fleshy; styles 2.5-7 mm long; petals yellow, white, or lavender; [of n. AL, and e. TN].
   9 Siliques 12-15 mm long, 3-4 mm wide; seeds slightly elongate, cleft at one side of the long axis; [of Sumner, Smith, Wilson, Davidson, Rutherford, Bedford, and Maury counties, TN].......................................................... L. stylosa

Leavenworthia exigua Rollins var. exigua. Limestone glades, disturbed calcareous sites nearby. Endemic to the Central Basin of c. TN (8 counties) (Chester, Wofford, & Kral 1997), western Highland Rim (Decatur and Perry counties), and the Ridge and Valley of nw. GA (Walker and Catossa counties). [= K, Y, Z; < L. exigua – FNA]

Leavenworthia exigua Rollins var. laciniata Rollins. Limestone glades, disturbed calcareous sites nearby. April. Endemic to the Western Highland Rim and w. Knobs of c. KY (Bullitt and Jefferson counties). [= C, K, Y, Z; < L. exigua – FNA]

Leavenworthia exigua Rollins var. lutea Rollins. Limestone glades, disturbed calcareous sites nearby. March-April. Endemic to the Central Basin of n. AL (Jefferson County) and c. TN (Bedford and Maury counties) (Chester, Wofford, & Kral 1997). [= K, Y, Z; < L. exigua – FNA]

Leavenworthia torulosa A. Gray. Limestone glades, disturbed calcareous sites nearby. March-April. Endemic to the Central Basin of c. TN (10 counties), the Ridge and Valley of e. TN (Bradley and Meigs counties), and the Western Highland Rim of KY (Logan, Simpson, Todd, and Warren counties). [= C, F, FNA, G, K, S, Y, Z]

Leavenworthia uniflora (Michaux) Britton. Limestone glades, disturbed calcareous sites nearby. Endemic to the Central Basin of c. TN (8 counties), the Ridge and Valley of e. TN (Hamilton, Meigs, Bledsoe, and Knox counties), nw. GA (Walker and Murray counties), and c. KY (15 counties). [= C, F, FNA, G, K, S, Y, Z]

Lepidium Linnaeus 1753 (Pepperwort, Peppergrass, Pepperweed)

section Lepidium: perfoliatum, graminifolium
section Cardamon: sativum
section Lepia: campestre
section Dileptium: austrinum, densiflorum, oblongum, virginicum ssp. virginicum
?: didymum, draba, ruderale, africanum, bonariense, lasiocarpum, schinzii, coronopus

1Upper cauline leaves perfoliate or sagittate.
**BRASSICACEAE**

* Lobularia maritima* (Linnaeus) Desvaux, Sweet Alyssum. Pd (VA), Cp (DE, NC, VA), Mt (WV): disturbed areas, lawns; rare, native of Europe. June-November. The NC occurrences are doubtfully established, from gardens and a "lawn." [=C, F, FNA, G, K, Y, Z]

**Lunaria** Linnaeus 1753 (Honesty)

1 Upper cauline leaves coarsely and irregularly dentate, the teeth acute to obtuse, sometimes with a mucro or short linear tip < 0.5 mm long; siliques broadly rounded at both ends (when mature – young siliques may be cuneate and acute); plant annual or biennial..............*L. anua*
**BRASSICACEAE**

1 Upper cauline leaves spinulose-dentate, the teeth acuminate and usually with a linear tip > 0.5 mm long; siliques cuneate at the base, acute at the tip; plant perennial. .......................... [L. rediviva]

* Lunaria annua* Linnaeus, Annual Honesty, Silver-dollar.  Cp (DE, VA), Pd (DE, VA), Mt (NC, VA, WV) {GA}: escaped from cultivation around gardens, not usually persistent; uncommon (rare in GA, NC, VA, and WV), native of se. Europe.  April-June.  [= C, F, FNA, G, K, Z]

**Matthiola** W.T. Aiton 1812 (Stock)

A genus of about 50 species, herbs, mainly of Eurasia and Africa.  References:  Al-Shehbaz in FNA (2010); Rollins (1993)=Z.

**Microthlaspi** F.K. Meyer 1973 (Penny-cress)

**Myagrum** Linnaeus 1753

* Myagrum perfoliatum* Linnaeus.  {VA}; {habitat}; rare, native of s. Europe.  [= FNA]

**Nasturtium** R. Brown 1812 (Watercress)

1 Petioles of emergent leaves lacking auricles toward the base; seeds yellowish-brown, finely reticulate, with 400-500 polygonal depressions on each side .......................................................... N. floridanum

1 Petioles of emergent leaves auriculate toward the base; seeds reddish-brown, rather coarsely reticulate, with 25-150 (-175) polygonal depressions on each side.

2 Mature siliques 1-1.5 mm wide, terete or subterete; seeds in 1 row in each locule of the silique; seeds with (75-) 100-150 (-175) polygonal depressions on each side.................................................. N. microphyllum

2 Mature siliques (1.8-) 2-3 mm wide, flattened; seeds in 2 rows in each locule of the silique; seeds with 25-50 (-60) polygonal depressions on each side.................................................. N. officinale

**Nasturtium floridanum** (Al-Shehbaz & Rollins) Al-Shehbaz & R.A. Price, Florida Watercress.  Cp (FL): spring runs, blackwater bottomlands; rare.  March-May.  Ne. FL and e. Panhandle FL south to s. FL; endemic to FL, but north to counties adjacent to se. GA.  [= FNA, V; = Rorippa floridana Al-Shehbaz & Rollins – K, WH, Z; < Nasturtium microphyllum Boenninghausen ex Reichenbach – GW, misapplied; Nasturtium stylous Shuttleworth ex O.E. Schulz] {synonymy incomplete}

* Nasturtium microphyllum* Boenninghausen ex Reichenbach, Narrow-fruited Watercress.  Mt (NC, VA): streams, springs; rare, native of Europe.  See Green (1962) for additional information.  [= FNA, V; = Rorippa microphylla (Boenninghausen ex Reichenbach) Hylander ex Löve & Löve – C, K, Q, X, Z; < Nasturtium officinale – RAB, G, W; = Nasturtium officinale R. Brown var. microphyllum (Boenninghausen ex Reichenbach) Thellung – F]

**BRASSICACEAE**

*Orychophragmus* Bunge 1833 (Purple-mistress)

* Orychophragmus violaceus* (Linnaeus) O.E. Schulz, Purple-mistress. Pd (VA): disturbed areas; rare, native of Mediterranean Europe. March-May. Introduced and apparently well established in and around Richmond, VA; originally reported as *Moricandia arvensis* (Rollins 1993), a misidentification. [= FNA; > Moricandia arvensis (Linnaeus) A.P. de Candolle – K, Z, misidentification]

**Paysonia** O'Kane & Al-Shehbaz 2002 (Bladderpod)

A genus of 8-9 species, herbs, endemic to southeastern United States. O'Kane & Al-Shehbaz (2002) clearly show that *Paysonia* is not a part of *Lesquerella*, which itself is included within *Physaria*. References: O'Kane in FNA (2010); Rollins (1993) = Z; Rollins & Shaw (1973) = Y; O'Kane & Al-Shehbaz (2002) = X; Al-Shehbaz (1987) = V. Key adapted from X and Z.

1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow. ........................................................... [see *Physaria*]
   1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white.
   2 Siliques strongly compressed parallel to the plane of the sepalum, orbicular; valves pubescent with a mixture of large, simple, bulbous-based trichomes and smaller branched trichomes; flowers yellow ........................................................... [Paysonia lescurii]
   3 Siliques not compressed, nearly globose, subglobose, pyriform, or slightly bilobed; valves glabrous or pubescent with only a single type of trichome; flowers white or yellow.
   4 Flowers white; siliques pyriform, depressed globose, or slightly bilobed; sepalum (of the silique) perforeate or nearly absent.
   4 Siliques glabrous or very sparsely pubescent, subpyriform; valves (of the silique) papyre, densely pubescent on the interior; styles glabrous. ............................................................................................................................ [Paysonia perforata]
   5 Siliques densely pubescent, depressed globose or slightly bilobed; valves (of the silique) glabrous on the interior; styles hisurate. ............................................................................................................................ [Paysonia stonensis]
   5 Siliques glabrous; styles glabrous .............................................................................................................................. [Paysonia densipila]
   6 Siliques glabrous; styles glabrous .............................................................................................................................. [Paysonia lyrata]

**Paysonia densipila** (Rollins) O'Kane & Al-Shehbaz, Duck River Bladderpod. Endemic to an area from c. TN south to n. AL. [= FNA; *= Lesquerella densipila* Rollins – K, V, Y, Z]

**Paysonia lescurii** (A. Gray) O'Kane & Al-Shehbaz, Lescur’s Bladderpod. Endemic to an area from sc. KY south through c. TN to n. AL. [= FNA; *= Lesquerella lescurii* (A. Gray) S. Watson – K, S, V, Y, Z]

**Paysonia lyrata** (Rollins) O'Kane & Al-Shehbaz, Lyreleaf Bladderpod. Endemic to Colbert, Franklin, and Lawrence counties, AL. [= FNA; *= Lesquerella lyrata* Rollins – K, V, Y, Z]

**Paysonia perforata** (Rollins) O'Kane & Al-Shehbaz, Spring Creek Bladderpod. Endemic to Rutherford and Wilson counties, TN (Chester, Wofford, & Kral 1997). [= FNA; *= Lesquerella perforata* Rollins – K, V, Y, Z]

**Paysonia stonensis** (Rollins) O'Kane & Al-Shehbaz, Stones River Bladderpod. Endemic to Rutherford County, TN (Chester, Wofford, & Kral 1997). [= FNA; *= Lesquerella stonensis* Rollins – K, V, Y, Z]

**Physaria** (Nuttall ex Torrey & A. Gray) A. Gray

1 Cauline leaves expanded at the base, usually auriculate; flowers yellow or white ........................................................... [see *Physaria*]
   1 Cauline leaves cuneate or petiolate at the base, not auriculate; flowers yellow.
   2 Fruits (1-) 2-3 mm long, slightly pubescent on the exterior; petals 3.5-6.5 (-7.5) mm long, bright yellow; biennial or perennial from branched, woody caudex. .............................................................................................................................. [P. globosa]
   3 Fruits 3-8 mm long, glabrous on the exterior; petals 5-11 mm long, either pale yellow or bright yellow to orange; annual, biennial, or short-lived perennial from a fine taproot.
   3 Stems to 2.5 dm long; basal leaves 1.2-4 cm long, entire or sinuate; petals pale yellow ............................................................... [P. filiformis]
   4 Fruiting pedicels sigmoid, 5-15 (-25) mm long; gynophore 0.5-1 mm long ........... [Physaria gordonii]
   5 Fruiting pedicels straight or slightly curved, (7-) 10-20 (-25) mm long; gynophore 1-2 mm long ........... [Ph gracilis ssp. gracilis]

* Physaria gordonii* (A. Gray) O’Kane & Al-Shehbaz, Gordon’s Bladderpod. Mt (VA): shaly roadside; rare, native of further west. Rollins (1993) reports this species (identification unconfirmed) as a waif along the Blue Ridge Parkway, VA; it may not be...
established. [= FNA; > P. gordonii ssp. gordonii – X; > Lesquerella gordonii (A. Gray) S. Watson var. gordonii – Z; = Lesquerella gordonii – K, Y]

Physaria filiformis (Rollins) O’Kane & Al-Shehbaz, Missouri Bladderpod. Reported for AL (FNA), apparently erroneously (Yatskievich, 2010, pers. comm.). [= FNA, X; = Lesquerella filiformis Rollins – K, V, Y, Z] {rejected; not keyed}

Physaria gracilis (Hooker) S. Watson ssp. gracilis. TN, IL, MO, and OK south to AL, MS, LA, and TX. [= X; < Lesquerella gracilis – F, G; = Lesquerella gracilis (Hooker) S. Watson ssp. gracilis – K, V, Z] {not yet keyed}

Planodes E.L. Greene 1912 (Virginia-cress)
A monotypic genus, of North America and Mexico. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=Y; Rollins (1993)=Z.

Raphanus Linnaeus 1753 (Radish)
1 Siliques moniliform (constricted between the seeds), the silique body about the same diameter for most of its length, longitudinally grooved; petals usually yellow, fading white (rarely purple); seeds 4-12 per silique .................................................... R. raphanistrum ssp. raphanistrum
1 Siliques not moniliform, the silique body tapered from its widest point below the middle to the apex, smooth or slightly longitudinally grooved; petals usually purple (rarely white); seeds 1-3 (-5) per silique ................................................................................. R. sativus

Rapistrum Crantz 1769 (Bastard-cabbage)
A genus of 2 species, herbs, of Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y.

* Rapistrum rugosum (Linnaeus) Allioni, Annual Bastard-cabbage. Cp (SC): waste areas around wool-combing mills; rare, native of Mediterranean Europe. Also naturalized at scattered sites in e. TN (Chester, Wofford, & Kral 1997), PA (Rhoads & Klein 1993), and elsewhere. [= C, F, FNA, Z; > R. rugosum var. rugosum – G; > R. rugosum ssp. rugosum – K, Y]

Rorippa Scopoli (Yellow Cress, Marshcress)
A genus of about 75 species, herbs, cosmopolitan. The separation of Nasturtium from Rorippa is warranted (Al-Shehbaz & Price 1998); Franzke et al. (1998) provide corroborated based on molecular analysis. The species treated here as R. aquatica has been placed in several genera in recent years. References: Al-Shehbaz in FNA (2010); Al-Shehbaz (1988a)=X; Rollins (1993)=Z; Stuckey (1972)=Y; Al-Shehbaz & Bates (1987)=V; Les, Anderson, & Cleland (1995)=U; Al-Shehbaz (1988a)=Q. Key modified from FNA.
1 Plant a submerged aquatic, rooting from lower nodes; leaves of two forms, the submerged pectinately divided, the emergent simple, sometimes lobed; fruit <2.5× as long as wide; petals white .............................................................. R. aquatica
1 Plant terrestrial or of wet places, not rooting from lower nodes; leaves of one form, pinnately lobed or simple; fruit >2.5× as long as wide; petals yellow or pale yellow (or absent).
2 Plant a rhizomatous, colony-forming perennial; petals (2.0-) 2.8-6.0 mm long; siliques 3-15× as long as wide.
**BRASSICACEAE**

3 Stems branched at the base, decumbent to ascending; leaf sinuses not reaching the midrib, the lateral segments entire to weakly toothed; siliques 3-6× as long as wide ..........................................................[R. sinuata]

3 Stems branched in the upper portions, erect; leaf sinuses reaching the midrib, the lateral segments often sharply toothed; siliques 6-15× as long as wide ..........................................................[R. sylvestris]

2 Plants a taprooted annual or biennial; petals 0-3.5 mm long; siliques either 2-9 (-10)× or 15-50× as long as wide.

4 Flowers clearly sessile; petals absent; lower fruiting pedicels 0.5-1.5 mm long; siliques (3-)5.4-8.5(-10.2) mm long, (1.4-)1.8-2.6(-3.3) mm wide, mostly 3.5-5× as long as wide ..............................................[R. sessiliflora]

4 Flowers clearly pedicellate; petals present (or absent in R. dubia); lower fruiting pedicels > 4 mm long; siliques 4-20 mm long, either 2-9 (-10)× or 15-50× as long as wide.

5 Siliques (7-)10-40 mm long, 15-50× as long as wide.

6 Siliques straight, (15-)25-40 mm long, 0.7-9 (-1.0) mm wide; seeds uniseriate..........................................................[R. dubia]

6 Siliques curved, (7-)10-24 (-30) mm long, 1.5-2 (2) mm wide; seeds biseriate..........................................................[R. indica]

5 Siliques 2.5-12.5 (-20.4) mm long, 2.9 (-10)× as long as wide.

7 Siliques (5.2-)8.5-12.5 (-20.4) mm long, (4-)6.9 (-10)× as long as wide; leaves deeply pinnatifid, the pinnae themselves toothed, lobed or dissected; seeds 0.4-0.5 mm long, 100-150 per siliqua..................................................[R. teres]

7 Siliques 2.5-9 mm long, 2-5× as long as wide; leaves serrate, lobed, or pinnately dissected, the pinnae (when present) merely toothed; seeds 0.5-0.9 mm long, 20-80 per siliqua.

8 Leaves hirsute on the lower surface; stems hirsute usually up to the terminal raceme ..................................[R. palustris ssp. hispida]

8 Leaves glabrous on the lower surface; stems glabrous or sparsely hirsute ..................................................[R. palustris ssp. palustris]

**Rorippa palustris** (Linnaeus) Besser ssp. *hispida* (Desvaux) Jonsell. Pd (VA): moist soils; rare. NL (Labrador) to AK, south to c. VA (Amelia County), IL, NE, NM, and n. CA. Al-Shehbaz (1988a) considers reports of this taxon in the Southeast to be misidentifications of var. *fernaldiana*. [= FNA; K; = *Rorippa palustris* (Linnaeus) Besser var. *hispida* (desvaux) Rydberg – C, Z; = *Rorippa islandica* (Oeder) Bolbás var. *hispida* (Desvaux) Butters & Abbe – F, G; = *Radicula hispida* (Desvaux) Heller – S; = *Rorippa palustris ssp. hispida* (Jonsell var. *hispida*) – Y]

* Rorippa palustris (Linnaeus) Besser ssp. *palustris*, Marshcress. Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): marshes, bogs, seeps; leaves simple; common. May-October. ME and NB west to SK, south to FL, TX, ID, and n. South America. [*Rorippa palustris var. palustris – C, Z; > Rorippa islandica var. islandica – F, G, misapplied; > Rorippa palustris ssp. palustris – K, X; > Radicula palustris (Linnaeus) Moench – S; > Rorippa palustris ssp. palustris var. palustris – Y; > Rorippa palustris var. fernaldiana (Butters & Abbe) R. Stuckey – C, Z; > Rorippa palustris var. fernaldiana (Oeder) Bolbás – RAB, misapplied; > Rorippa islandica var. fernaldiana Bolbás & Abbe – F, G, misapplied; < Rorippa palustris ssp. palustris – GW, W; > Rorippa palustris var. fernaldiana (Butters & Abbe) Jonsell – K, X; > Rorippa palustris ssp. glabra (O.E. Schulz) R. Stuckey var. fernaldiana (Butters & Abbe) R. Stuckey – Y]

* Rorippa teres* (Michaux) R. Stuckey. Cp (GA, NC, SC): cypress-gum ponds, marshes, swamps, ditches, disturbed wet areas; rare. March-May. Se. NC south to s. FL, west to se. OK, sw. TX, and s. and w. Mexico (Sinaloa). [*C, FNA, K; > Rorippa teres var. teres – GW, X, Y, Z; > Rorippa walteri – RAB; = Radicula walteri* (Elliott) E.L. Greene – S]

* Rorippa dubia* (Persoon) H. Hara. LA, MS. [*FNA*] [add X, Y, Z to synonymy]

Rorippa sinuata (Nuttall) A.S. Hitchcock. Native, east to w. KY and TN. [*C, F, FNA, G, GW, K, X, Y, Z]

**Sinapis** Linnaeus 1753 (Mustard)

A genus of 7 species, herbs, of s. Europe. References: Warwick in FNA (2010); Rollins (1993)=Z; Al-Shehbaz (1985b)=Y. Key adapted from Z and C.

1 Beak of silique strongly compressed; silique densely covered with long, stiff trichomes, ca. 4 mm in diameter; pedicels slender, mostly at right angles to the rachis; seeds 4-8 per siliqua; [section *Sinapis*] .................................................................................................................[S. alba]

1 Beak of silique conical; silique glabrous or nearly so, ca. 2 mm in diameter; pedicels thick, erect to spreading; seeds 7-13 per siliqua; [section *Cerato-sinapis*] ...........................................................................................................................................[S. arvensis]

* Sinapis alba* Linnaeus, White Mustard, Yellow Mustard. Mt (NC, WV), Pd (DE, NC), Cp (DE): disturbed areas; rare, native of Mediterranean Europe. April-June. The seeds of this species are one source of table mustard; other species used include *Brassica juncea* and *B. nigra*. [*C, K, S, Y, Z; ? Brassica hirta – RAB, F, G, WV*]

**Sisymbrium** Linnaeus (Jim Hill Mustard)

1 Silique linear, 5-10 cm long; spreading from the rachis; pedicels 5-20 mm long; petals 6-8 mm long ............................................ *S. altissimum*

1 Silique subulate, 0.8-1.5 cm long, appressed to the rachis; pedicels 1-3 mm long; petals 3-4 mm long ............................................ *S. officinale*

* Sisymbrium irio* Linnaeus, London-rocket. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= C, F, FNA, G, K, Y, Z]

* Sisymbrium loeselii* Linnaeus. Mt (WV), Cp (SC): disturbed areas, waif around wool-combing mills; rare, native of e. Europe and w. Asia. [= C, F, FNA, G, K, Y, Z] {not yet keyed}

* Sisymbrium turczaninowii* Sonderreger, Russian Rocket. Waif around wool-combing mills in Coastal Plain of SC; there appears to be little evidence that it is established in our area. For further information and keys, see Rollins (1993) and Al-Shehbaz (1986b). [= K, Y, Z] {not keyed}

**Teesdalia** Aiton f. 1812 (Shepherd's Cress)

**Thlaspi** Linnaeus 1753 (Penny-cress)

1 Siliques 5-8 mm long, 2-4 mm wide; seeds brown, alveolate; lower stem with scattered long hairs; fresh plant smelling of garlic when crushed; [section Pterotropis] ................................................................. *T. alliaceum*

1 Siliques (8-) 10-17 mm long, 7-12 mm wide; seeds brown, concentrically ridged; lower stem glabrous; fresh plant not smelling of garlic when crushed; [section Thlaspi] .................................................................................................................. *T. arvense*

* Thlaspi alliaceum* Linnaeus, Garlic Penny-cress. Pd (DE, NC, VA), Mt (WV), Cp (DE): fields, disturbed areas, roadsides; uncommon (rare in NC, VA, and WV, rare in DE Coastal Plain), native of Europe. March-April; April-May. [= RAB, FNA, K, Y, Z]

**Turritis** Linnaeus 1753 (Tower Mustard)

**BRASSICACEAE**

_Warea_ Nuttall 1834 (Warea, Pineland-cress)

A genus of 4 species, annual herbs, of se. North America. The genus is endemic to se. United States, consisting of our species and two others of peninsular FL. This is the only genus of tribe _Thelypodiaceae_ in our area. References: Al-Shehbaz in FNA (2010); Rollins (1993) = Z; Al-Shehbaz (1985a) = Y; Channell & James (1964).

**Identification notes:** _Warea_ (Brassicaceae) and _Polanisia_ (Cleomaceae) are superficially similar. The genus is quite showy and conspicuous, reminiscent of a small _Cleome_ because of its white to pink, clawed petals and siliquae borne on a long gynophore.

1. Leaves cuneate at the base; petals white to pink .......................................................................................................................... _W. cuneifolia_
1. Leaves rounded or slightly auriculate at the base; petals deep purple .......................................................................................... _W. sessilifolia_

### 277. OLACACEAE

_A.L. de Jussieu ex R. Brown in Tuckey 1818 (Olax Family) [in SANTALALES]

A family of about 14 genera and 100 species, trees, shrubs, and woody vines, pantropical in distribution. Sometimes further divided, as by Nickrent et al. (2010), in which case _Ximenia_ is placed in Ximeniaceae. References: Nickrent et al. (2010).

**Ximenia** Linnaeus 1753 (Tallow-wood)

A genus of about 8 species, root-parasitic shrubs, tropical. _Ximenia_ is placed in the segregate family Ximeniaceae by Nickrent et al. (2010).

**Ximenia americana** Linnaeus, Tallow-wood, Hog-plum. Cp (FL): hammocks, pine flatwoods, scrub; uncommon. Endemic to FL peninsula, north to Duval County, FL. [= K, S, WH]

### 279. SANTALACEAE

_R. Brown 1820 (Sandalwood Family) [in SANTALALES]

A family of about 41 genera and 930 species, trees, shrubs, and herbs, primarily of tropical and warm temperate regions of the Old World and New World. All members of the family are hemiparasitic, attaching to the stems or roots of other plants. Viscaceae are closely related to and should either be included in the Santalaceae (Angiosperm Phylogeny Group 2003, 2009), as done here, or the contrasting approach should be taken, involving the segregation of smaller, monophyletic families (Nickrent et al. 2010). In our area, this would mean Santalaceae s.s. (_Nestrotia_), Cervantesiaceae (_Pyralaria_), Thesiaceae (_Buckleya_), Comandraceae (_Comandra_), and Viscaceae (_Phoradendron_) (Nickrent et al. 2010). References: Nickrent et al. (2010); Nickrent & Malécot (2001).

1. Leaves alternate; monoecious herb or shrub.
2. Herb, < 2 (-3) dm tall; leaves 1-4 cm long, glabrous; inflorescence a terminal panicle of cymes; [tribe _Comandraceae_ or family _COMANDRACEAE_] .................................................................................................................................................................................. _Comandra_
2. Shrub, > 4 dm tall; leaves 5-15 cm long, pubescent; inflorescence a terminal raceme; [tribe _Pyrulariaceae_ or family _CERVANTESIACEAE_] .................................................................................................................................................................................. _Pyrularia_
1. Leaves opposite; dioecious shrubs.
3. Aerial shrubs, parasitic on treetrunks and branches; leaves coriaceous, brittle when live; [tribe _Viscaceae_ or family _VisCACEAE_] .................................................................................................................................................................................. _Phoradendron_
3. Terrestrial shrubs, parasitic via root connections; leaves herbaceous, flexible when live in texture
3. Stamine flowers in terminal umbel-like dichasia; pistillate flowers (and fruits) solitary, terminal; clumped shrub to 4 m tall; [tribe _Thesiae_ or family _THESIACEAE_] .................................................................................................................................................................................. _Buckleya_
3. Stamine flowers in axillary umbels; pistillate flowers (and fruits) solitary, axillary; rhizomatous shrub to 1 m tall; [tribe _Santaleae_ or family _SANTALACEAE_] .................................................................................................................................................................................. _Nestrotia_
Buckleya Torrey (Piratebush)

A genus of 5 species, shrubs, of temperate e. North America and e. Asia; the 3 species other than our own are *B. lanceolata* of Japan, and *B. henryi*, *B. graebneriana*, and *B. angulosa* of China. *Buckleya* is placed in the segregate family Thesiaceae by Nickrent et al. (2010). References: Carvell & Eshbaugh 1982=Z; Massey et al. (1983).

*Buckleya distichophylla* (Nuttall) Torrey, Piratebush. Mt (NC, VA): dry or rocky bluffs and slopes; rare. April-May; June-October. A Southern Appalachian endemic: sw. VA south through ne. TN to sw. NC, in the western edge of the Blue Ridge and to the west in the Ridge and Valley. It is apparently parasitic on a variety of hosts – not limited to *Tsuga*, as has sometimes been reported. The branches are often mistaken for a compound leaf. [= RAB, C, F, G, K, S, W, Z]

Comandra Nuttall (Bastard-toadflax)

A genus of 2 species (the only other species European). *Comandra* is placed in the segregate family Comandraceae by Nickrent et al. (2010).

Nestronia Rafinesque (Nestronia)

Identification notes: In its clonal, usually knee-high growth, *Nestronia* has something of the aspect of an opposite-leaved lowbush blueberry.

Phoradendron Nuttall 1848 (Mistletoe)

*Phoradendron serotinum* (Rafinesque) M.C. Johnston ssp. *serotinum*, American Mistletoe, Christmas Mistletoe. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): parasitic on various species of trees, especially abundant in swamp forests (perhaps because they are less frequently cut and have older, more mature hardwoods); common (uncommon in Piedmont and Mountains). October-November (-March); November-January (-May). Kuijt (2003) interprets this as a species with four subspecies; ssp. *serotinum* is the eastern component, ranging from NJ west to s. OH, s. IN, and s. MO, south to s. FL and s. TX; this interpretation is supported by genetic studies currently underway (Hawkins et al., in prep.). The other three subspecies are distributed in sw. United States and n. Mexico. The nomenclatural argument about which Rafinesquian epithet to adopt is arcane; the basionym "leucarpum" has nomenclatural precedence by 3 years, but the combination in *Phoradendron* can be considered a later homonym of *Phoradendron leucocarpum* Patshovsky. I here follow Kuijt (2003) in his decision to reject "leucarpum." *Phoradendron* is, of course, the mistletoe familiar (at least traditionally) in e. United States as a Christmas decoration. Z comments that "the superficial likeness of *Phoradendron serotinum* to the European *Viscum album* has made the transfer of the latter's folklore to North America easy;" *Viscum album* was a sacred plant of Celtic and druidical pre-Christian European societies. The white berries of *P. serotinum* are extremely poisonous. Their sticky flesh promotes the dispersal of the seeds by birds from tree to tree. [= Y; = *Phoradendron leucarpum* (Rafinesque) Reveal & M.C. Johnston – K; < *P. serotinum* (Rafinesque) M.C. Johnston – RAB, C, W, Z; < *P. flavescens* (Pursh) Nuttall – F, G, S, WV]

Pyrularia Michaux (Buffalo-nut)

A genus of 4 species, shrubs, of e. North America and e. Asia (the other 3 species are of e. Asia). *Pyrularia* is placed in the segregate family Cervantesiaceae by Nickrent et al. (2010).
Island, Camden County, GA (Crins 1989b).  
coastal sands; common, native of w. to e. Asia.  
parviflora
A genus of about 54 species, trees and shrubs, native of Eurasia and Africa.  References:  Baum (1978)=Z; Crins (1989b)=Y.

* Tamarix aralensis Bunge, Russian Tamarisk.  Reported for NC (Kartesz 1999), but the specimen on which the report is based is of a plant in cultivation as an ornamental.  Not keyed.  [= K, Y, Z]
* Tamarix chinensis Loureiro, Chinese Tamarisk.  Cp (NC):  coastal sands; rare, native of China, Korea, and Japan.  [= C, K, Y, Z; = T. pentandra Pallas – G, an illegitimate name]
* Tamarix gallica Linnaeus, French Tamarisk.  Cp (GA, NC, VA?):  brackish marshes; rare, native of the w. Mediterranean region of Europe.  April-July.  Most reports of this taxon from the Southeast represent misidentifications or a very broad interpretation of the species.  [= F, G, K, Y, Z; < T. gallica – RAB, S]

284. TAMARICACEAE Link 1821 (Tamarisk Family) [in CARYOPHYLLALES]

A family of about 4 genera and 78 species, shrubs and trees, of Eurasia and Africa (especially from the Mediterranean to c. Asia).  References:  Crins (1989b); Gaskin in Kubitzki & Bayer (2003); Gaskin et al. (2004).

Tamarix Linnaeus 1753 (Tamarisk, Salt-cedar)

A genus of about 54 species, trees and shrubs, native of Eurasia and Africa.  References:  Baum (1978)=Z; Crins (1989b)=Y.

Identification notes:  An important character is the staminal disk; three terms are used.  In holophytic disks, the lobe between each stamen is obvious and separate from the stamens on either side, and each is usually 2-lobed.  In paralophytic disks, each lobe is deeply bipartite, and each half-lobe is fused to the base of the adjacent stamen, but is still somewhat distinct from it.  In synlophitic disks, the lobes are also deeply bipartite, but each half-lobe is fused confluentely with the stamen base, giving the appearance that the filament has swollen base.

1 Flowers 4-merous; [section Oligadenia].
2 Petals 1.5-2.5 mm long; bracts subtending the pedicels diaphanous; young growth completely glabrous; [section Arbusculae].  .................................................................................................................................................. T. parviflora
3 Racemes 5-10 mm wide; [section Arbusculae].
4 Bracts of the raceme linear to linear oblong, about equaling the pedicel; disk holophytic; young growth glabrous; [section Oligadenia; series Lasiae] .................................................................................................................................................. T. chinensis
5 Young growth glabrous (except sometimes papillose on the raceme axis); disk synlophitic; flowers with 5 antesepalous stamens and 0 antepetalous stamens .................................................................................................................................................. T. africana
6 Young growth papillose; disk holophytic to paralophitic; flowers with 4-5 antesepalous stamens and 0-4 antepetalous stamens .......... .................................................................................................................................................. T. tetragyna
7 Petals caducous; disk synlophitic .................................................................................................................................................. T. gallica
8 Petals persistent; disk holophytic .................................................................................................................................................. T. ramosissima

285. PLUMBAGINACEAE A.L. de Jussieu 1789 (Leadwort Family) [in CARYOPHYLLALES]
**Limonium** P. Miller 1754 (Sea-lavender)

**Limonium carolinianum** (Walter) Britton, Carolina Sea-lavender. Cp (DE, FL, GA, NC, SC, VA): tidal marshes, especially in hypersaline flats; common. August-October. Along the coast from NL (Labrador) south to s. FL, west to TX and ne. Mexico. Various treatments recognize from 1 to 4 taxa in our area. The most recent monographer, Luteyn (1976), recognizes only a polymorphic *L. carolinianum* – a treatment followed by most flora authors since. Godfrey & Wooten (1981) follow Luteyn's treatment, but state "we are not at all confident that Luteyn's treatment is a reasonable one." [= C, FNA, GW, K, WH, Z; > *L. angustatum* (A. Gray) Ahles – RAB; > *L. carolinianum var. carolinianum* – RAB, G; > *L. carolinianum var. obtusilobum* (Blake) Ahles – RAB; > *L. nashii* Small var. nashii – RAB, G; > *L. nashii* Small var. angustatum (A. Gray) Ahles – RAB; > *L. carolinianum* – F, S; > *L. nashii* Small – F, S; > *L. carolinianum var. angustatum* (A. Gray) Blake – G; > *L. angustatum* (A. Gray) Small – S; > *L. obtusilobum* Blake – S]

### 286. Polygonaceae

A family of about 43-48 genera and 1100-1200 species, trees, shrubs, vines, and herbs, cosmopolitan, but especially north temperate. Recent changes in the circumscription of various genera (including *Polygonum*, *Persicaria*, *Fallopia*, etc.) have received strong support from molecular phylogenetic studies (Kim & Donoghue 2008; Lamb Frye & Kron 2003). References: Freeman & Reveal in FNA (2005); Horton (1972)=Z; Mitchell & Dean (1978)=Y; Ronse Decraene & Akeroyd (1988); Brandybye in Kubitzki, Rohwer, & Bittrich (1993); Lamb Frye & Kron (2003); Kim & Donoghue 2008).

<tbody>
<tr>
<td>Woody vine, climbing by tendrils; [subfamily Polygonoideae, tribe Coccolobaeae].</td>
<td>Antigonon</td>
</tr>
<tr>
<td>Leaf base deeply cordate.</td>
<td>Brunichia</td>
</tr>
<tr>
<td>Herb (sometimes very robust and rather woody), herbaceous vine, or (<em>Fallopia baldschuanica</em>) a somewhat woody vine lacking tendrils.</td>
<td></td>
</tr>
<tr>
<td>Stem leaves (in our species) whorled; flowers in involucrate heads; ocreae absent; stamens 9; leaves densely white-tomentose on the lower surface; [of xeric situations of shale barrens and sandhills]; [subfamily Eriogonoideae, tribe Eriogonoideae]</td>
<td>Eriogonum</td>
</tr>
<tr>
<td>Stem leaves alternate; flowers in various inflorescences (not involucrate); ocreae present; stamens (3-) 5-8 (-9); leaves glabrous or variously pubescent, but not densely white-tomentose; [of various habitats, including xeric ones]; [subfamily Polygonoideae].</td>
<td></td>
</tr>
<tr>
<td>Tepals 6, in 2 series of 3 each; plants with leaves basally disposed, the largest basal (these withering in some species later in the season); [tribe Rumiceae].</td>
<td></td>
</tr>
<tr>
<td>Tepals (the outer series) spinose.</td>
<td>Emex</td>
</tr>
<tr>
<td>Tepals foliaceous.</td>
<td></td>
</tr>
<tr>
<td>Fruit 3-winged; basal leaves very large, 20-40 cm wide; inner and outer tepals similar; [plant cultivated, rarely persistent or escaped].</td>
<td>Rheum</td>
</tr>
<tr>
<td>Fruit 3-angled; basal leaves small to medium in size, 0.5-15 cm wide; inner tepals wider than the outer tepals; [plants common, mostly weedy].</td>
<td>Rumex</td>
</tr>
<tr>
<td>Tepals mostly 5 in a single whorl; plants with leaves along the stem, lacking well-developed basal leaves.</td>
<td></td>
</tr>
<tr>
<td>Flowers in small clusters or very reduced racemes of 1-5 flowers, borne in the axis of normally sized or reduced leaves; plants erect or sprawling herbs with stems &lt; 1 m long, from taproots; leaves jointed at base; [tribe Polygonaeae].</td>
<td>Polygonum</td>
</tr>
<tr>
<td>Flowers in diffuse axillary panicles, or in terminal or long-peduncled axillary racemes, corymb, or heads; plants various, either erect or sprawling herbs, or erect, robust, and suffrutescent herbs, or climbing herbaceous or suffrutescent vines, or suffrutescent bushy herbs; leaves not jointed at base (except <em>Polygonella</em>).</td>
<td></td>
</tr>
<tr>
<td>Leaves cuneate at the base, either linear, spatulate, or obovate, mostly &lt; 4 cm long and &lt; 5 mm wide; leaves jointed at the base; pedicels jointed at the base; [tribe Polygonaeae].</td>
<td>Polygonella</td>
</tr>
<tr>
<td>Leaves cuneate, cordate, or hastate at the base, either lanceolate or ovate, mostly &gt; 5 cm long and &gt; 8 mm wide; leaves not jointed at the base; pedicels not jointed at the base.</td>
<td></td>
</tr>
<tr>
<td>Inflorescence corymbiform, terminal; achenes strongly exserted at maturity; tepals almost free, horizontally spreading, white, 3-4 mm long; [erect annual, uncommonly cultivated and rarely persistent or escaped]; [tribe Persicarieae].</td>
<td>Fagopyrum</td>
</tr>
<tr>
<td>Inflorescence paniculate, racemiform, or headlike, terminal and axillary; achenes enclosed in the perianth at maturity; tepals fused for much of their length, ascending, pink, green, or white.</td>
<td></td>
</tr>
<tr>
<td>Outer tepals neither keeled nor winged at maturity; inflorescence of spike-like racemes, heads, or sparse, interrupted racemes; [tribe Persicarieae].</td>
<td>Persicaria</td>
</tr>
<tr>
<td>Outer tepals keeled or winged at maturity; inflorescence a compound panicle of racemes; [tribe Polygonaeae].</td>
<td>Fallopia</td>
</tr>
<tr>
<td>Plants climbing or sprawling, herbaceous to somewhat woody, the stems slender; perianth usually not enlarging in fruit; stigma capitate or peltate.</td>
<td>Reynoutria</td>
</tr>
</tbody>
</table>
POLYGONACEAE

Antigonon Endlicher 1837 (Love-chain, Coralvine, Corallita)

* Antigonon leptopus Hooker & Arnott, Love-chain, Queen's-jewels, Confederate-vine, Corallita. Cultivated and persisting; commonly cultivated, rarely persisting or escaping, native of tropical America. [= FNA, K, WH; = Corculum leptopus (Hooker & Arnott) Stuntz]

Brunnichia Banks ex Gaertner 1788 (Buckwheat-vine)

Brunnichia ovata (Walter) Shinners, Buckwheat-vine, Eardrop-vine, Ladies'-eardrops, Redvine. Floodplain forests, swamp forests. June-July; August-September. Ne. SC south to n. FL, west to e. TX, and north in the interior to w. TN, w. KY, s. IL, and se. MO. Introduced in se. VA. [= FNA, GW, K, WH; = B. cirrhosa Gaertner – RAB, C, F, G, S]

Emex Campderá (Emex, Devil’s-thorn, Cape Spinach)

A genus of 2 species, herbs, of Mediterranean Europe and s. Africa.

* Emex spinosa (Linnaeus) Campderá. Disturbed areas; not recently collected and perhaps only a waif, native of Mediterranean Europe. [= K, S, WH]

Eriogonum Michaux 1803 (Wild-buckwheat)

1 Basal leaves absent; cauline leaves alternate; [of limestone glades and barrens of KY, TN, and n. AL]; [subgenus Eriogonum] .... [E. harperi]

1 Basal leaves well-developed; cauline leaves whorled; [of other habitats and areas (see below)].

2 Tepals bright yellow; plants 3-5 dm tall; achenes pilose at the beak; [of shale barrens of VA and WV]; [subgenus Oligogonum] .... E. allenii

2 Tepals white to pink; plants 4-12 dm tall; achenes glabrous; [of sandhills of s. NC (at least formerly), SC, and southward]; [subgenus Eriogonum] ...................................................................................................................................................................................

Eriogonum tomentosum Michaux, Sandhill Wild-buckwheat, Southern Wild-buckwheat, Dog-tongue. Sandhills, usually in white sand, primarily in the fall-line Sandhills and on riverine dunes in the middle and upper Coastal Plain. Late July-September; September-November. S. NC (at least formerly) south to c. peninsular FL, west to s. AL. There seems no reason to doubt the label data of an 1890's Biltmore Herbarium collection from Bladen County, NC (Pittillo, Horton, & Herman 1972), as E. tomentosum is fairly common not far away in SC; the species has apparently not been seen in NC since. [= RAB, FNA, K, S, WH, Y, Z]

Fagopyrum P. Miller 1754 (Buckwheat)
**POLYGONACEAE**

A genus of about 8–16 species, perennial and annual herbs, of e. Asia and Africa. The Latin and common name refer to the similarity of the seeds to beechnuts. References: Hinds & Freeman in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993).

1. Flowers white; achene smooth and shiny .......................................................... *F. esculentum*
2. Flowers greenish; achene rough and dull .......................................................... *F. tataricum*

**Fallopia** Adanson 1763 (Climbing Buckwheat)

A genus of about 9–10 species, woody and herbaceous vines, of temperate regions of the Northern Hemisphere. If accepted (as here) as a genus distinct from *Polygonum*, this group takes the name *Fallopia* Adanson (1763), which has priority over *Tiniaria* (1832) and *Bilderdykia* (1827). *Reynoutria* is sometimes included. References: Ronse Decraene & Akeroyd (1988) – X; Brandbyge in Kubitzki, Rohwer, & Bittrich (1993). [also see *Reynoutria*]

1. Plant herbaceous; inflorescences less-branched, usually a reduced panicle with only a few racemose branches; [collectively common and in various natural and disturbed habitats].
2. Ocreae reflexed bristly at the base; perianth white; achene glossy or dull black; [mostly of lower elevations].
3. Achene dull black; outer sepals keeled, not expanding into obvious wings in fruit, the fruit therefore 3.5–4.5 mm long (measured from the pedicel joint to the tip); [weedy annual].
4. Ocreae smooth; perianth greenish to yellowish; achene glossy black; [collectively common and in various natural and disturbed habitats].
5. Achene glossy black; outer sepals keeled, not expanding into obvious wings in fruit, the fruit therefore 7–15 mm long (measured from the pedicel joint to the tip); [native perennial or weedy annual].
6. Fruiting perianth wings usually truncate to attenuate-decurrent on stipelike base, flat, or (less often) undulate or crinkled, margins entire (rarely undulate-crenulate)..................
7. Fruiting perianth wings decurrent on stipelike base, undulate or crinkled, rarely flat, margins wavy-crenulate to incised or lacerate (rarely entire).
8. Perianth 7–10 mm long at maturity (measured from the pedicel joint to the tip); achenes 2–3.5 mm long..................
9. Perianth 10–15 mm long at maturity (measured from the pedicel joint to the tip); achenes 3.5–6 mm long..................

**Fallopia baldschuanica** (Regel) Holub, Silver-lace-vine, China Fleece-vine. Disturbed areas, roadsides; rare, native of Asia. [= FNA; > *Fallopia aubertii* (Henry) Holub – X; > *Polygonum aubertii* Henry – C, F, K]

**Fallopia cilinodis** (Michaux) Holub, Fringed Climbing Buckwheat, Fringed Black Bindweed. Around rock outcrops, in openings, glades, and open woodlands at high elevations. June-September. NL (Newfoundland) west to SK, south to PA, w. NC, n. GA, e. TN, IN, IL, and MN. [= FNA; > Polygonum cilinodis Michaux – RAB, C, K, W, Y, Z; > Polygonum cilinodis var. cilinodis – Fallopia cilinodis (Michaux) Greene – S; = *Tiniaria cilinodis* (Michaux) Small].

**Fallopia convolvulus** (Linnaeus) Á. Löve, Bindweed, Climbing Buckwheat, Black Bindweed, Nimble-will. Disturbed areas; common (uncommon in DE, rare in FL), native of Eurasia. May-September. [= FNA; X; = Polygonum convolvulus – RAB, GW, W, WH, WV, Y, Z; > Polygonum convolvulus Linnaeus var. convolvulus – C, F, K; > Polygonum convolvulus var. subulatum Lejeune & Courtis – K; = *Bilderdykia convolvulus* (Linnaeus) Dumortier – S; = *Tiniaria convolvulus* (Linnaeus) Webb & Moquin-Tandon]

**Fallopia cristata** (Engelmann & A. Gray) Holub, Crested Climbing Buckwheat. Mt (NC, SC, VA, WV), Pd (NC, SC, VA), Cp (FL, NC, SC, VA) [DE?, GA]; moist to wet open habitats; common (rare in NC). July-October. MA, NY, IN, IL, MN, south to c. peninsular FL and TX. [= Polygonum scandens Linnaeus var. cristatum (Engelmann & A. Gray) Gleason – C, GW, K, WH, WV; = Polygonum scandens Linnaeus var. cristatum (Engelmann & A. Gray) Gleason – RAB; = Polygonum scandens Linnaeus var. cristatum (Engelmann & A. Gray) Gleason – C, GW, K, WH, WV; = *Bilderdykia cristata* (Engelmann & A. Gray) Greene – S; < *Fallopia scandens* – X; < *Polygonum scandens* – Z; = *Tiniaria cristata* (Engelmann & A. Gray) Small; = *Fallopia cristata* (Engelmann & A. Gray) Holub]

**Fallopia dumetorum** (Linnaeus) Holub. Mt (WV), Pd (DE, Cp (DE): disturbed areas, thickets; uncommon (rare in DE). Introduced at least as far south as scattered locations in e. and se. PA (Rhoads & Klein 1993), WV, KY, TN, and AL. NS and MI south to FL and TX (FNA). [= FNA; < *Polygonum scandens* Linnaeus var. cristatum (Engelmann & A. Gray) Gleason – RAB; = *Polygonum
**Polygonaceae**

*A genus of about 150 species, herbs, nearly cosmopolitan (primarily temperate Northern Hemisphere). References: Hinds & Freeman in FNA (2005); Park (1988)=X; Kim & Donoghue (2008); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993). Key based in part on FNA.*

1. Stem, petioles, and lower surface of major leaf veinlets with abundant recurved prickles; [section Echinocaulon].
2. Ocreae foliaceous, green, orbicular, perfoliate; tepals becoming fleshy and blue in fruit ........................................... *P. perfoliata*
3. Leaf blades triangular in outline, the larger 6-11 cm wide; perianth 4-parted .............................................................. *P. arifolia*
4. Inflorescence branches glandular-pubescent; stamens 5, in 1 whorl; leaves sessile (rarely shortly petiolate), usually cuneate or rounded at the base (rarely slightly cordate) ........................................... *P. meissneriana var. beyrichiana*
5. Inflorescence branches glabrous; stamens 8, an outer whorl of 5 and an inner whorl of 3; leaves petiolate, sagittate at the base ........................................... *P. sagittata*
6. Ocreae scarious, not as above; tepals not becoming fleshy or blue in fruit.
7. Leaf blades lanceolate to narrowly elliptic, the larger 0.8-3 cm wide; perianth 5-parted.
8. Inflorescence branches glandular-pubescent; stamens 5, in 1 whorl; leaves sessile (rarely shortly petiolate), usually cuneate or rounded at the base (rarely slightly cordate) ........................................... *P. meissneriana var. beyrichiana*
9. Inflorescence branches glabrous; stamens 8, an outer whorl of 5 and an inner whorl of 3; leaves petiolate, sagittate at the base .............. *P. sagittata*

10. Plants annual, lacking rhizomes or stolons; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
11. Peduncles glabrous; leaves often with a triangular reddish blotch in the middle of the upper surface ........................................... *P. minor*
12. Achenes triangular in ×-section; styles 3; leaf base round to cordate; ocrea 6-12 mm long ...................................................... *P. hirsuta*
13. Outer tepals 3, each forked in an anchor shape; petals 4 (-5); inflorescences usually arching-drooping ........................................... *P. lapathifolia*
14. Ocreae with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect ........................................... *P. pensylvanica*
15. Plants perennial, with rhizomes or stolons; leaves lacking a triangular reddish blotch in the middle of the upper surface.
16. Achenes triangular in ×-section; styles 3; leaf base round to cordate; ocrea 6-12 mm long ...................................................... *P. hirsuta*
17. Inflorescences interrupted; ocreolae mostly not overlapping (especially the lower), the margins mostly ciliate with hairs < 2 mm long; leaves 0.6-2.4 cm wide ...................................................... *P. punctata*
18. Plants annual, lacking rhizomes or stolons; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
19. Inflorescences capitulate; [section Cephalophilon] .......................................................... *P. chinensis*
20. Inflorescences panicule-like or spikelike.
21. Inflorescence panicule-like; [section Rubrivena] ...................................................... *P. wallichii var. wallichii*
22. Inflorescence spike-like; [section Persicaria].
23. Plants perennial, with rhizomes or stolons; leaves lacking a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
24. Ocreae with a green, herbaceous flange; leaves 3-17 cm wide ...................................................... *P. orientalis*
25. Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide.
26. Achenes minutely textured, dull; axillary inflorescences sometimes included within ocrea ........................................... *P. hydropiper*
27. Achenes smooth, shiny; axillary inflorescences never included within ocrea.
28. Peduncles glabrous; leaves lacking a triangular reddish blotch in the middle of the upper surface ........................................... *P. minor*
29. Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide.
30. Plants with glandular punctate.
31. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
32. Ocreae with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect ........................................... *P. pensylvanica*
33. Outer tepals with strong, dark venation; leaves 2-4.5 cm wide ...................................................... *P. robustior*
34. Plants with glandular punctate.
35. Achenes minute, dull; axillary inflorescences sometimes included within ocrea ........................................... *P. hydropiperoides*
36. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface.
37. Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide. [section Persicaria].
38. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
39. Ocreae with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect ........................................... *P. pensylvanica*
40. Plants with glandular punctate.
41. Achenes minute, dull; axillary inflorescences sometimes included within ocrea ........................................... *P. hydropiperoides*
42. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface.
43. Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide. [section Persicaria].
44. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
45. Ocreae with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect ........................................... *P. pensylvanica*
46. Plants with glandular punctate.
47. Achenes minute, dull; axillary inflorescences sometimes included within ocrea ........................................... *P. hydropiperoides*
48. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface.
49. Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide. [section Persicaria].
50. Peduncles stipitate-glandular; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
51. Ocreae with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect ........................................... *P. pensylvanica*
**POLYGONACEAE**

*Persicaria amphibia* (Linnaeus) S.F. Gray, Water Smartweed. Mt (NC, SC, VA, WV), Pd (NC, SC, VA), Cp (DE), {GA}: marshes, wet disturbed areas; common (uncommon in SC, VA, and WV, rare in GA and NC). June-August. Widespread in the Northern Hemisphere, in North America from NL (Newfoundland), NU, and AK south to SC, TX, and CA, and southwards into the New World tropics. [= FNA; > Polygonum coccineum Muhlenberg ex Willdenow – RAB, G, Z; > Polygonum amphibium Linnaeus var. emersum Michaux – C, GW, K, W, Y; > Polygonum amphibia Linnaeus – W; > Polygonum coccineum var. coccineum – F; > Polygonum natans (Michaux) Eaton – G; > Persicaria muhlenbergii (S. Watson) Small – S; > Persicaria amphibia (Linnaeus) S.F. Gray var. emersa (Michaux) Hickman; > Persicaria amphibia (Linnaeus) S.F. Gray var. stipulacea (Coleman) Hara; > Polygonum amphibia Linnaeus var. stipulacea Coleman – C, F, K, Y]

*Persicaria arifolia* (Linnaeus) Halardson, Halberd-leaf Tearthumb. Cp (DE, GA, NC, SC, VA), Pd (DE, NC, VA), Mt (VA, WV): marshes, wet thickets; common (uncommon in WV, rare in GA). July-November; August-December. NS west to MN, south to se. GA w. NC, and w. TN. [= FNA; = Polygonum arifolium var. arifolium – F, G; > Polygonum arifolium var. pubescens (R. Keller) Fernald – F, G; > Tracaulon arifolium (Linnaeus) Rafinesque – S; = Tracaulon arifolium (Linnaeus) Sojak]

*Persicaria careyi* (Olney) Greene. Cp (DE, FL*), Mt (WV), {VA}: moist soils, disturbed areas; rare. NB west to ON and MN, south to VA, KY, IL, seemingly widely scattered. Reported for sc. PA (Rhoads & Klein 1993), DE, NJ, and MD (Kartesz 1999). [= FNA; = Polygonum careyi Olney – C, F, G, K, WH] {synonymy incomplete}

*Persicaria chinensis* (Linnaeus) H. Gross, Chinese Knotweed. Disturbed areas; native of Asia. Introduced in MD and NJ. [= FNA; = Polygonum chinense Linnaeus – K]

**POLYGONACEAE**

644

Mountains, rare in FL), native of Asia. May-October. [= FNA; = Polygonum cespitosum Blume var. longisetum (de Brujin) A.N. Steward – RAB, C, F, G, GW, K, W, WV, Y, Z; = Polygonum caespitosum Blume var. longisetum (de Brujin) A.N. Steward – WH; = Polygonum longisetum de Brujin]

* Persicaria meissneriana* (Chamisson & Schlechtendahl) M. Gómez var. beyrichiana (Chamisson & Schlechtendahl) C.C. Freeman, Mexican Tearthumb. Cp (FL, GA, SC): wet savannas, blackwater river floodplains, ditches; rare (GA Special Concern), sometimes considered only introduced in southeastern North America, but probably native. E. SC south to FL, west to LA; Mexico and Central America south to n. South America; Brazil; se. Africa. See Mitchell (1970) and Freeman (2004). [= FNA; = Polygonum meissnerianum (Chamisson & Schlechtendahl) Meissner – GW, KH; < Polygonum meissnerianum – Z; < Truellum meissnerianum (Chamisson & Schlechtendahl) Sojak]

* Persicaria minor* (Hudson) Opiz, Small Water-pepper. {VA}: disturbed moist areas; rare, native of Europe. [= FNA; = Polygonum minus Hudson]

* Persicaria pensylvanica* (Linnaeus) M. Gómez, Pinkweed, Common Smartweed, Pennsylvania Smartweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, bottomlands; common. July-December. NL (Newfoundland), ON, MT, and CA, south to FL, TX, AZ; disjunct (perhaps only introduced (?) in AK, Ecuador, Europe. [= FNA; = Polygonum pensylvanicum var. pensylvanicum – F; > Polygonum pensylvanicum var. durum Lincoln – F; > Polygonum pensylvanicum var. laevigatum Fernald – F; > Polygonum pensylvanicum var. roseaeflorum J.B.S. Norton – F]

* Persicaria perfoliata* (Linnaeus) H. Gross, Mile-a-minute-vine, Asiatic Tearthumb, Devil's-tail Tearthumb. Pd (DE, VA), Cp (DE), Mt (NC, WV): roadsides, banks, powerline rights-of-way; common, native of e. Asia. Introduced and spreading rapidly in n. VA, MD, PA, DC, and WV. Adler (1999) reports it as occurring in PA, MD, VA, WV, DE, OH, NJ, and DC. Poindexter (2010a) reports its discovery at 3 separate locations in Alleghany County, NC. [= FNA; = Polygonum perfoliatum Linnaeus – C, F, K, X; = Amplexicoma perfoliatum (Linnaeus) Roberty & Vautier]

* Persicaria punctata* (Elliott) Small, Dotted Smartweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): swamp forests, bottomlands, marshes; common. July-November. NS, ON, and BC south to FL, TX, and CA, south into the New World tropics. [= FNA; > Persicaria punctata (Elliott) Small var. punctata – S; = Polygonum punctatum – RAB, GW, W, WH, WV; > Polygonum punctatum Elliott var. punctatum – C, F, G, K, Y; > Persicaria punctata (Elliott) Small var. leptostachya (Meissner) Small – S; > Polygonum punctatum Elliott var. leptostachya (Meissner) Small – F; > Polygonum punctatum var. parvum Marie-Victorin & Rousseau – F; > Polygonum punctatum Elliott var. confertiflorum (Meissner) Fassett – C, G, K, Y; < Polygonum punctatum – Z (also see Persicaria robustior)]

* Persicaria robustior* (Small) E.P. Bicknell, Water Smartweed. {VA}: peaty shores or semi-aquatic in water; rare? NS, QC, MI, MO, south irregularly to FL s. and TX, and south into tropical America. Probably under-represented as to states of occurrence because of frequent synonymization. [= FNA; = Polygonum robustius (Small) Fernald – C, F, G, K, Y; < Polygonum punctatum – Z]

* Persicaria virginiana* (Linnaeus) Gaertner, Jumpseed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): floodplains, moist forests; common (uncommon in DE Coastal Plain). NH, QC, MN, and NE, south to FL and TX; disjunct in c. Mexico. Section Tovara consists of 3-5 species of e. North America and e. Asia (Mun & Park 1995); if the section is recognized as a genus (as it often has been), the correct name for this species is Antennorhinus virginianus. Variation in North America, previously sometimes recognized as varieties, as by F and G, is under study by M. Pyne. [= FNA; = Tovara virginiana (Linnaeus) Rafinesque – RAB, S, WV; > Tovara virginiana var. glaberrima Fernald – F; > Tovara virginiana var. virginiana – F; = Polygonum virginianum Linnaeus – C, G, GW, K, W, Y; > Polygonum virginianum var. virginianum – G; > Polygonum virginianum var. glaberrimum (Fernald) Steyermark – G; = Antennorhinus virginianus (Linnaeus) Roberty & Vautier – Z]

* Persicaria wallachii* Greuter & Burdet var. wallachii, Himalayan Knotweed, Kashmir Plume. Mt (NC): persistent and spreading from plantings; rare, native of Himalayan Asia. [= FNA; > Polygonum polystachyum Wallich ex Meissner – C, F, G (a later homonym); = Aconogonon polystachyum (Wallich ex Meissner) M.Král; < Rubrivena polystachya (Wallich ex Meissner) M.Král; < Reynoutria polystachya (Wallich ex Meissner) Moldenke]
**Polygonella americana** (Fischer & Meyer) Small, Southern Jointweed. Sandhills, other dry habitats. June-September; August-November. Sc. NC south to s. GA west to TX and NM, north in the interior to ec. TN (Chester, Wolfford, & Kral 1997), se. MO, and AR, perhaps adventive toward the northern part of the range. [= RAB, F, FNA, G, K, S, X; *Polygonum*]

**Polygonella articulata** (Linnaeus) Meisner, Northern Wireweed. Sandhills, dunes, and other dry, sandy habitats. September-October; October-November. ME and s. QC west to MN, south on the Coastal Plain to VA and ne. NC, otherwise south to se. PA, NY, s. ON, MI, n. IN, n. IL, and e. IA. *P. articulata* is the only northern member of an otherwise southern and predominantly Coastal Plain genus. The record cited for GA in Jones & Coile (1988) is a mis-identification. [= RAB, C, F, FNA, G, K, X; *Delopyrum articulatum* (Linnaeus) Small – S; = *Polygonum articulatum* Linnaeus]

**Polygonella fimbriata** (Elliott) Horton, Sandhill Jointweed. Sandhills. E. GA (not far from SC) and se. AL south to Panhandle FL. It differs from all our other species in having the inner sepals fimbriate. [= FNA, K, Q, WH; = *Thysanella fimbriata* (Elliott) A. Gray – S; = *Polygonella fimbriata* var. fimbriata – X; = *Polygonum fimbriatum* Elliott]

**Polygonella gracilis** Meisner, Wireweed. Sandhills. Late August-October; October-November. Sc. NC south to s. FL, west to s. MS, perhaps adventive toward the northern part of the range. [= RAB, FNA, K, WH, X; *Delopyrum gracile* (Meisner) Small – S; = *Polygonum gracile* Nuttal]

**Polygonella macrophylla** Small, Largeleaf Wireweed. Sand pine scrub, coastal dunes. S. AL and Panhandle FL. [= FNA, K, S, WH; *Polygonum*]

**Polygonella polygama** (Ventenat) Engelmann & A. Gray var. croomii (Chapman) Fernald, Carolina October-flower. Sandhills, primarily in the fall-line Sandhills and middle Coastal Plain. August-October; October-November. Var. *croomii* ranges from se. and sc. NC south to SC and GA. Var. *croomii* occurs mainly in the fall-line Sandhills, scattered as well in the middle Coastal Plain (Robeson and Bladen counties, NC, Dillon, Darlington, and Lee counties, SC) and rarely the outer Coastal Plain (New Hanover County, NC). In addition to our 2 varieties, var. *brachystachya* (Meisner) Wunderlin is endemic to c. and s.
A genus of about 20 species, herbs, of temperate regions of the Northern Hemisphere. References: Costea, Tardif, & Hinds in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Costea & Tardif (2003a)=X. [also see Fallopia, Persicaria, Reynoutria] Key adapted from FNA and other sources.

1 Stems with 4 obscure ribs, or lacking apparent ribs; leaf venation parallel, with inconspicuous secondary veins; anthers pink-purple; [section Duravia].
2 Pedicels deflexed; leaves not plicate, revolute at the margin; [reported for VA] ................................................................. [P. douglasii]
3 Pedicels erect-ascending; leaves plicate with one fold on either side of the midrib, planar at the margin; [widest in our area] ... P. tenue
4 Fruiting perianth divided about ⅓ of its length; stem leaves (1.5-) avg. 2.5 (-4)× as long as branch leaves ................................ P. erectum
5 Inflorescences spikelike, the cymes borne in the axis of bracts shorter than the cymes .................................................. P. argyrocoleon
6 Ocrea not pruinose; mature tepals yellow-green, white, pink, or reddish, appressed to the achene; achenes smooth, glossy; [of maritime situations] ................. P. glaucum
7 Ocrea not pruinose; mature tepals yellow-green, white, or reddish, appressed to the achene; achenes either smooth and glossy or textured and dull; [mainly of inland and disturbed situations]; [P. aviculare complex].
8 Plants prostrate; leaves 2.5-5.6 (-10)= as long as wide .......................................................... P. buxiforme
9 Plants bluish green when fresh, turning dark brown to black when dried; leaves rounded or obtuse at the apex; pedicels 1-2 mm long; stem leaves 1.5 (-2.5)× as long as the branch leaves .......................................................... P. prolificum
10 Perianth tubes 40-57% of the perianth length.
11 Tepals green, margins pink or red (rarely white), with branched veins; plants prostrate to ascending, with 3-15 stems; leaf blades 2.8-5.7 (-6.5)= as long as wide ........................................................................ P. aviculare ssp. depressum
12 Leaf blades 2.4-4.5× as long as wide; perianth (2.3-) 2.8-4.7 (-5) mm long; achenes (of the early season) (2.1-) 2.7-3.7 mm long ........................................................................ P. aviculare ssp. neglectum
13 Leaf blades 3.4× 4.2-9.2× as long as wide; perianth 1.9-3.4 mm long; achenes (of the early season) 1.2-1.8 mm long ......................... P. aviculare ssp. neglectum

**POLYGONACEAE**

*Polygonum aviculare* Linnaeus *ssp. depressum* (Meisner) Arcangeli, Dooryard Knotweed. Mt (WV), {DE, FL?, GA, NC, SC, VA}. [= FNA, X; = *Polygonum arenastrum* Boreau – C, K; < *P. aviculare* – G]

*Polygonum aviculare* Linnaeus *ssp. neglectum* (Besser) Arcangeli, Needle-leaf Knotweed. Cp (VA): fields, disturbed areas; rare, introduced. Also documented from scattered locations in s. PA (Rhoads & Klein 1993); DE, NJ, and MD (Kartesz 1999); and WV (as *P. aviculare* ssp. *rurivagum*) (Costea & Tardif 2003). [= FNA; ? *P. bellardi* Allioni – K; < *Polygonum aviculare* var. *aviculare* – F; < *P. aviculare* – G; *Polygonum aviculare* Linnaeus var. *rurivagum* (Jord. ex Boreau) Berth; *Polygonum aviculare* Linnaeus var. *augustissimum* Meisner]

*Polygonum buxiforme* Small, Small's Knotweed. Mt (WV), {NC, SC, VA}: disturbed areas, marsh edges; rare in WV {uncommon?}. NL (Newfoundland), NL (Labrador), NU, and NT, south to SC, AI, MS, LA, TX, and CA. [= C, K, S, Y; = *Polygonum aviculare* Linnaeus *ssp. buxiforme* (Small) Costea & Tardif – FNA, X; > *Polygonum aviculare* Linnaeus var. *littorale* (Link) Mertens – F; < *P. aviculare* – G; *P. littorale* Link]

*Polygonum erectum* Linnaeus, Erect Knotweed. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (VA), {GA}: disturbed areas, open places; common (rare in GA, NC, SC, and VA). June-October; July-October. ME, ON, and AB south to GA, LA, and NM. [= RAB, C, F, FNA, K, S, W, WV, Y, Z]

*Polygonum glaucum* var. *buxiforme* (Houttuyn) Ronse Decraene. This treatment may prove *synonymy incomplete*.

*Polygonum glaucum* var. *dissectum* (Meisner) Arcangeli, Needle-leaf Knotweed. Cp (VA): fields, disturbed areas; rare, introduced. Also documented from scattered locations in s. PA (Rhoads & Klein 1993); DE, NJ, and MD (Kartesz 1999); and WV (as *P. aviculare* ssp. *rurivagum*) (Costea & Tardif 2003). [= FNA; ? *P. bellardi* Allioni – K; < *Polygonum aviculare* var. *aviculare* – F; < *P. aviculare* – G; *Polygonum aviculare* Linnaeus var. *rurivagum* (Jord. ex Boreau) Berth; *Polygonum aviculare* Linnaeus var. *augustissimum* Meisner]

---

A genus of about 15 species, perennial herbs, of temperate e. Asia. Ronse Decraene & Akeroyd (1988) and most other recent workers in Polygonaceae treat this group as *Fallopia* section *Reynoutria* (Houttuyn) Ronse Decraene. This treatment may prove to be better than the recognition of *Reynoutria* as a genus; either course is compatible with molecular phylogenetic analyses completed to date (Lamb Frye & Kron 2003). References: Freeman & Hinds in FNA (2005); Ronse Decraene & Akeroyd (1988); X; Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Zika & Jacobson (2003). Key based on Zika & Jacobson (2003).

1 Veins of leaf underside with multicellular hairs (as seen at 20× magnification); mid-stem leaves with deeply cordate bases; inflorescence much shorter than the subtending mid-branch leaf................................................................................................................................. *R. sachalinensis*

2 Veins of leaf underside with scattered simple, stout-based hairs; mid-branch leaf bases usually slightly cordate; well-developed stem leaves usually > 20 cm long................................................................................................................................................................................................. *R. ×bohemica*

2 Veins of leaf underside minutely scabrous with scattered bumps; mid-branch leaves truncate (to very broadly V-shaped); well-developed stem leaves < 18 cm long................................................................................................................................................................................................. *R. japonica*
Rheum Linnaeus 1753 (Rhubarb)

A genus of about 200 species, perennial and annual herbs (and a few shrubs), of cosmopolitan distribution. References: Mosyakin in FNA (2005); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaf blades hastate or sagittate on at least well-developed leaves; plants dioecious (rarely polygamo-monoecious), the flowers mostly unisexual; fresh foliage pleasantly acid to taste; [subgenus Acetosa]; leaf blades widest towards the base; leaf apex nearly obtuse; inner sepals 3.5-4.5 (-5) mm long, 3-4 (-4.5) mm wide; infrutescence dense, interrupted only towards its base; leaf blades light or yellowish green, the veins on the lower surface not noticeably prominent; leaf apex nearly obtuse; inner sepals 3.5-4.5 (-5) mm long, 3-4 (-4.5) mm wide; pedicels 2.5-3× as long as the inner tepals; inner tepals as wide as or wider than long; R. verticillatus

2 Inner tepals (at fruiting) about as wide as the achene, with a minute or absent free wing; pedicel jointed just below the tepals; [subgenus Acetosa]; leaf blades 3-7 (-10)× as long as wide; R. crispus

3 Leaves sagittate, the lobes pointing downwards towards the petiole; [subgenus Acetosa]; section Axillares; leaf blades widest towards the apex; leaf apex rounded or obtuse; R. cuneifolius

4 Leaves basally disposed, the largest and best developed in a basal rosette (these sometimes withering at maturity, especially in annual species); inner tepal margins entire or variously dentate; [subgenus Rumex]; section Rumex

5 Pedicels 2.5-5× as long as the inner tepals; pedicel joint below the midpoint of the pedicel.

6 Leaf blades ca. 2× as long as wide; lateral veins of leaves forming angle of ca. 80° to midvein; R. fascicularis

7 Leaf blades 3-7 (-10)× as long as wide; lateral veins of leaves forming angle of 40-60° to midvein; R. flavidanus

8 Leaf blades widest at the middle or towards the base; leaf apex rounded or obtuse; R. cuneifolius

9 Leaf blades widest at the middle or towards the base; inner sepals 4.5-6 mm long, 3-4.5 (-6) mm wide; R. altissimus

10 Infrutescence lax, distinctly interrupted; leaf blades thick and coriaceous, deep green, with veins prominent on the lower surface; leaf apex nearly obtuse; inner sepals 3.5-4.5 (-5) mm long, 3-4 (-4.5) mm wide; R. chrysocarpus

11 Inner tepal margins entire, indistinctly erose, or (rarely) minutely denticulate (the teeth then < 0.2 mm long).

12 Inner tepals ca. 2× as long as wide, margins entire, largest tubercle almost as wide as the inner tepal.

13 Tubercles 1 (or if 3, then one much larger than the other 2); leafy ovoid or oblong, leafy ovoid in the basal 1/2 or less of its length; pedicels (2-) 4-6 (-8) mm long; R. conglomeratus

14 Tubercles 3, equal or nearly so in size; R. cuneifolius

15 Leaf blade 15-30 (-35) cm long, 2-6 cm wide, the margins strongly undulate; [subgenus R. crassipes ssp. crassipes]

16 Inner tepals (not including the teeth) oblong-ovate or deltate, as wide as long; R. stenophyllum

17 Inner tepals with 3-5 strongly hooked teeth on each side; R. brownii

18 Inner tepals with straight teeth.
**POLYGONACEAE**

18 Leaf blade > 4× as long as wide; inner tepals (not including the teeth) ca. 2× as long as wide..............................*R. fueginus*
18 Leaf blade 2-3× as long as wide; inner tepals (not including the teeth ca. 1.5× as long as wide (sometimes to 2× as long as wide in *R. obtusifolius*).
19 Plants perennial; base of leaf blade usually distinctly cordate.
20 Stems 6-12 (-15) dm tall; leaf blades 20-40 cm long; inflorescence branches normally ascending, making an angle of 30-45° with inflorescence axis; tubercles of the inner sepals smooth................................................................. *R. obtusifolius*
20 Stems 2-6 (-7) dm tall; leaf blades 4-10 (-15) cm long; inflorescence branches spreading, making an angle of 60-90° with inflorescence axis; tubercles of the inner sepals usually verrucose................................................................. *R. pulcher*
19 Plants annual or biennial; base of leaf blade cuneate (rarely rounded).
21 Inner tepals 4-5 (-5.5) mm long; tubercles of the inner sepals smooth or minutely punctate.............................. *R. paraguayensis*
21 Inner tepals 3-4 mm long; tubercles of the inner sepals smooth or minutely punctate.............................. *R. paraguayensis*

* **Rumex acetosella** Linnaeus, Red Dock, Sheep Sorrel, Sourgrass. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA), pastures, fields, roadsides, rock outcrops, grassy balds, gardens; common (rare in FL), native of Eurasia. March-June (sometimes later); May-July (sometimes later). Variation in *R. acetosella* has been studied in considerable detail in Eurasia, and a number of infrataxa named; the application of these to North American material is unclear at this time. *R. acetosella* ssp. *pyrenacus* (Pourret et Lapeyrouse) Akeroyd, a hexaploid subspecies from western Europe, is apparently the predominant naturalized subspecies in North America. See Mosyakin in FNA (2005) and the references cited therein for further information. [= RAB, C, FNA, G, GW, K, W, WV; > *R. acetosella* var. *acetosella* – F; > *R. acetosella* var. *pyrenacus* (Pourret) Timbal-Lagrace – F; = *Acetosella acetosella* (Linnaeus) Small – S; > *Acetosella vulgaris* (Koch) Fourreau ssp. *pyrenica* (Pourret et Lapeyrouse) A. Löve]

* **Rumex brownii** Campérá, Brown's Dock. Cp (SC), Pd (NC): disturbed areas, floodplains, wool-combing waif; rare, native of Australia. [= FNA; = *R. brownii* – K, orthographic variant]

* **Rumex chrysocarpus** Moris, Amamastilla Dock. Cp (FL*, LA): swamps, disturbed wet areas; rare. Se. LA west to TX and Tamaulipas. [= FNA, WH]

* **Rumex cuneifolius** Campérá. Cp (FL): disturbed areas; rare, not recently collected and perhaps only a waif, native of South America. A rare introduction from South America in AL, FL. [= FNA, S; ? *R. frutescens* Thouars – K, misapplied]

* **Rumex fascicularis** Small. Cp (FL, NC?): swamps and marshes; rare (if present). Peninsular FL, and perhaps north to se. NC. [= FNA, S; < *R. verticillatus* Linnaeus – F, G, WH; = *R. verticillatus* ssp. *fascicularis* (Small) Á. Löve]

* **Rumex obovatus** Danser, Tropical Dock. Cp (FL, LA): maritime shores, riverbanks, pond margins; rare, native of South America. [= FNA, K]

* **Rumex patientia** Linnaeus, Patience Dock, Monk's-rhubarb. Mt (NC, WV), Pd (DE, NC), Cp (VA): disturbed areas; rare, native of Mediterranean Europe. April-May; May-June. [= RAB, C, F, FNA, G, K]

* **Rumex stenophyllus** Ledebour, Narrowleaf Dock. Cp (SC), native of Eurasia. [= FNA, K]

**POLYGONACEAE**

* Rumex acetosa* Linnaeus, Green Sorrel. Introduced and naturalized as a weed at least far south as se. PA (Rhoads & Klein 1993). [= C, F, FNA, G; = *R. acetosa ssp. acetosa* – K; = *Acetosa pratensis* Miller]

*Rumex britannica* Linnaeus, Great Water Dock. Native species south to PA, NJ, KY (FNA). The specimen reported for VA as *R. orbiculatus Gray* (var. *britannica* of FNA) in Castanea 42:261 (1977) has subsequently been annotated to *R. obtusifolius*. No valid collections of *R. britannica* are known for VA. [= FNA; > *R. orbiculatus* A. Gray – C, F, G, W; > *R. orbiculatus var. orbiculatus* – K]

* Rumex sanguineus* Linnaeus, Bloody Dock, Red-veined Dock. Introduced at least as far south as se. PA (Rhoads & Klein 1993), MD, NJ, and AL (Kartesz 1999), perhaps only as a waif. Reported for AL, MS, LA, and VA by Small (1933). [= C, FNA, G, K, S]

**287. DROSERACEAE** Salisbury 1808 (Sundew Family) [in CARYOPHYLLALES]

A family of 3 genera (*Drosera, Dionaea, Aldrovanda*) and about 100 species, nearly cosmopolitan. References: Schnell (2002b); Kubitzki in Kubitzki & Bayer (2003). [including DIONAEACEAE]

1. Leaves catching insects via "snap-trap" leaves, with stiff marginal hairs; stamens 10-20; inflorescence cymose; [endemic to the Coastal Plain of se. NC and ne. SC] ........................................................................... Dionaea

2. Leaves catching insects via "flypaper" leaves, with gland-tipped hairs; stamens 5; inflorescence racemose; [collectively widespread in our area] .................................................................A. Dionaea

### Dionaea Ellis 1768 (Venus Flytrap, Meadow Clam)

This monotypic genus is endemic to the Coastal Plain of NC and SC; it has been introduced in various places, including Panhandle FL, Yancey County in the mountains of NC, and s. NJ, where it persists and spreads to varying degrees (Evert 1957). References: Roberts & Oosting (1958); Wood (1960); Schnell (2002)–Z.

*Dionaea muscipula* Ellis, Venus Flytrap, Meadow Clam, Tipitiwitchet. Cp (FL*, NC, SC): wet savannas, sandhill seepages; rare. The shiny black seeds are exposed at the maturity and dehiscence of the capsule. Perhaps the most remarkable species in our flora, *Dionaea* has become increasingly rare and now receives some protection as a NC Special Concern species and a Convention on International Trade in Endangered Species "Appendix 2" species. Although collection and trade as a novelty item have contributed to the decline of *Dionaea*, its more fundamental problem is that faced by the great majority of Coastal Plain species in our area – destruction of habitat and fire suppression. In the fall-line Sandhills, *Dionaea* is now restricted to a very few sites on Fort Bragg; in the central Coastal Plain, it is also nearly extirpated. Substantial populations remain only in the Outer Coastal Plain, primarily in Brunswick, Pender, and Onslow counties. Ellis's Latin phrase describing the plant to Linnaeus (quoted in Croom 1837) is worth repeating for its succinctness: "Miraculum naturae! – folia biloba, radicalia, ciliata, sensibilis, conduplicandia, inseta incarcerantia." The colonial governor of North Carolina, Arthur Dobbs, wrote in 1759, "we have a kind of Catch Fly Sensitive which closes upon anything that touches it." Gibson (1991) shows that trap size and prey size are correlated; trap leaves of *Dionaea* primarily capture insects about 5 mm smaller than the length of the trap. Deliberately introduced and at least somewhat naturalized at other places in the Coastal Plain, notably Apalachicola National Forest, FL. [= RAB, GW, K, S, WH, Z]

**Drosera** Linnaeus 1753 (Sundew)

1. Leaves filiform, the expanded leaf bases forming a corn-like base.

2. Petals 7-10 (12) mm long; leaves 8-25 (-30) cm long, < 1 mm wide; glandular hairs on the leaves red to purple, drying dark brown; scape 6-26 cm long ..............................................................................................................D. filiformis

3. Petals 12-17 (-20) mm long; leaves 30-50 cm long, > 1 mm wide; glandular hairs on the leaves pale green, drying pale greenish brown; scape 25-60 cm long ..............................................................................................................D. tracyi

1. Leaves spathulate or suborbicular, the leaf bases not expanded.

3. Inflorescence stipitate-glandular; basal rosettes 0.8-3.5 cm in diameter; stipules absent or obsolete (consisting of a few hair-like segments); seeds black, crateriform ..............................................................................D. brevifolia

4. Inflorescence glabrous; basal rosettes (2-) 3-12 cm in diameter; stipules present, fimbriate; seeds light brown and longitudinally striate, or reddish brown to black and densely papillose, or brown and coarsely corrugated into 14-16 longitudinal ridges.

4. Leaf blades wider than long, suborbicular or reniform; seeds about 6× as long as wide; [primarily of the Mountains, rarely disjunct eastward] ..............................................................................................................D. rotundifolia var. rotundifolia
5 Petioles with few to many long trichomes; petals pink (sometimes fading to white); plants scapose; inflorescence straight at base; seeds coarsely corrugated into 14-16 longitudinal ridges ........................................... D. capillaris
5 Petioles glabrous; petals white; plants usually with a leafy stem 1-10 cm long; inflorescence arching at base; seeds reddish brown to black and densely papillose ............................................... D. intermedia

Drosera brevifolia Pursh, Dwarf Sundew. Cp (FL, GA, NC, SC, VA), Pd (GA, NC), Mt (GA, SC): pine savannas, other wet sandy sites, rarely in seepage over rock outcrops; common (rare in lower Piedmont only and Mountains, rare in VA). April-May. The species ranges from se. VA south to s. FL and west to AR, OK, and TX; disjunct in s. TN. D. leucantha may be the correct name for this taxon; see Shinniers (1962) and Wood (1966) for a contentious discussion of nomenclatural issues. [= C, F, GW, G, K, Q, S, WH, X, YZ = D. leucantha Shinniers – RAB, YV]

Drosera capillaris Poir, Pink Sundew. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC, VA): pine savannas, other wet sandy or peaty sites; common (rare in Piedmont, rare in VA and DE). May-August. Se. VA south to s. FL and west to TX, rarely inland, as in TN; also extending into tropical America, in the West Indies, Mexico, and n. South America. [= RAB, C, F, G, GW, K, Q, S, WH, X, Y, Z]

Drosera filiformis Rafinesque, Threadleaf Sundew. Cp (DE, FL, NC): margins of natural pools in pinelands, especially clay-based Carolina bays; rare. June; August. E. MA south to se. NC; disjunct in the FL Panhandle (Bay and Washington counties) and in sw. NS (Sorrie 1998a). Sorrie (1998a) has clarified the taxonomy and phytogeography of D. filiformis and D. tracyi. See comments about D. tracyi below. Reported as adventive in a single county in WV (Harmon, Ford-Werntz, & Grafton 2006). [= GW, K, WH, Y; < D. filiformis – RAB, C, G (also see D. tracyi); = D. filiformis var. filiformis – F, Q, X, Y, Z; < D. tracyi Macfarlane in L.H. Bailey – S (also see D. filiformis)]

Drosera intermedia Hayne, Water Sundew, Spoonleaf Sundew. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC): savannas, ditches, pocosins, margins of pools or streams, often in standing water; common (rare in Piedmont, rare in VA). July-September. D. intermedia is circumboreal, in North America ranging from NL (Newfoundland) and MN south to c. peninsular FL and TX, and into tropical America. Reported as adventive in a single county in WV (Harmon, Ford-Werntz, & Grafton 2006). [= RAB, C, F, G, GW, K, Q, S, WH, X, Y, Z]

Drosera rotundifolia Linnaeus var. rotundifolia, Roundleaf Sundew. Mt (GA, NC, SC, VA, WV), Cp (DE, NC, VA), Pd (DE, VA): mountain bogs and fens, seepages slopes, vertical seepages on rock (in the mountains) or clay (as along the Little River in the Sandhills of NC); uncommon (rare in DE and GA). A circumboreal species ranging south in North America to SC, ne. GA, e. and nc. TN, IL, and CA. Var. comosa Fernald is restricted to e. Canada, New England, and n. NY. [= F, K; < D. rotundifolia – RAB, C, G, GW, S, Q, W, WV, X, Y, Z]

Drosera tracyi MacFarlane in L.H. Bailey, Tracy’s Sundew. Cp (FL, GA): savannas; common (rare in GA). Sc. GA and Panhandle FL, west to e. LA; it has been reported for SC by various authors, including Wynne (1944), but the basis for these reports is unknown. The notion that this species is not distinguishable from D. filiformis (or is only varietally distinct) is erroneous (Sorrie 1998a); see Schnell (1995) for a contrary view. [= GW, K, WH, Y; = D. filiformis Rafinesque var. tracyi (MacFarlane in L.H. Bailey) Diels – Q]

296. CARYOPHYLLACEAE A.L. de Jussieu 1789 (Pink Family) [in CARYOPHYLLALES]

Key A – Paronychioideae

1 Leaves alternate; staminodes petaloid, ovate to oblong ................................................................. [Corrigiola]
2 Leaves opposite (or the uppermost alternate in Herniaria); staminodes not petaloid, subulate.
2 Stipules inconspicuous; sepals green-margined, obtuse, lacking awns ........................................... [Herniaria]
1 Stipules usually conspicuous; sepals white-scarious-margined, hooded or awned ................................ Paronychia

Key B – Polycarpoideae

1 Stem leaves subulate, 1-2 mm long, pectinate-fringed at the base; basal rosette leaves spatulate (usually withering quickly after overwintering; stems wiry, stiff, subdichotomously branched; [of xeric sands on the Coastal Plain from se. VA southward] .......... Stipulicida
1 Stem leaves larger, mostly both longer and broader, not pectinate-fringed at the base; basal rosette present or absent; stems either thicker, more flexuous, or not subdichotomously branched; [collectively more widespread].
2 Leaves appearing verticillate, 10-16 per node; filiform to linear .................................................... Spergula
2 Leaves opposite or in whorls of 4, linear to ovate or spatulate.
Key C – Caryophylloideae

1 Calyx immediately subtended by 1-3 pairs of bracts.
   2 Calyx 20-40-nerved .........................................................................................................................*Dianthus*
   2 Calyx 15-nerved ...........................................................................................................................................

1 Calyx lacking subtending bracts.
   3 Sepals 25-62 mm long; calyx lobes longer than the calyx tube, the lobes as long as or longer than the corolla lobes ..........*Agrostemma*
   3 Sepals (1-) 10-28 (-40) mm long; calyx lobes shorter than the calyx tube, the lobes much shorter than the corolla lobes (except *Gypsophila*).
   4 Styles 3-5 (or 0 in staminate plants); fruit valves 3, 4, 5, 6, 8, or 10; petals generally appendaged.................................................*Silene*
   4 Styles 2; fruit valves 4; petals appendaged or not.
   5 Sepals 1-5 mm long, the commissures between the sepals scarious ..................................................................................*Gypsophila*
   5 Sepals 7-25 mm long, lacking commissures.
   6 Calyx tubular, 20-nerved; petals appendaged; perennial .................................................................*Saponaria*
   6 Calyx ovoid, 5-nerved; petals not appendaged; annual ........................................................................*Vaccaria*

Key D – Alsinoidae

1 Petals absent; fruit a 1-seeded, indehiscent utricle; styles 2 ..........................................................*Scleranthus*
1 Petals present (rarely obsolete or essentially absent); fruit a few-many seeded capsule; styles 3-5.
   2 Leaves fleshy; seeds > 3 mm long; [of seabeaches and dunes] ........................................................................*Honkenya*
   2 Leaves membranaceous or stiff; seeds < 2 mm long; [of various habitats].
   3 Styles 4-5.
      4 Leaves linear-subulate, < 2 mm wide; styles 4-5.
      5 Valves or teeth of the capsule twice as many as the styles ........................................................................*Moenchia*
      4 Leaves ovate, obovate, > 4 mm wide; styles 5.
      6 Capsule cylindric, dehiscent by 10 apical teeth .................................................................................*Cerastium*
      6 Capsule ovoid, dehiscent by 5 valves, each apically 2-cleft ........................................................................*Myosoton*
   3 Styles 3.
      7 Inflorescence umbelliform; petals irregularly denticulate at apex ..........................................................*Holosteum*
      7 Inflorescence cymose or racemiform; petals entire, notched, or deeply cleft.
      8 Petals shallowly to deeply 2-cleft, notched at least 1/4 of the length, often divided nearly to the base and then appearing almost as 10 petals.
      9 Capsule cylindric, twice as long as the sepals; petals 2-cleft 1/5 - 1/2 length; styles (3-) 5 (-6), 0.5-2 mm long ..........*Cerastium*
      9 Capsule spherical or ellipsoid, as long as or slightly longer than the sepals; petals 2-cleft 2/3-3/4 length (1/2 length to laciniate in *S. holostea*); styles (2-) 3 (-5), 0.2-7 mm long ..................................................*Stellaria*
      8 Petals entire, or emarginate.
      10 Valves of the capsule as many as the styles ..................................................................................*Minuartia*
      10 Valves or teeth of the capsule twice as many as the styles.
      11 Seeds with an aril ..............................................................................................................................................
      11 Seeds lacking an aril.
      12 Capsule straight; petals entire or barely emarginated .............................................................................*Arenaria*
      12 Capsule cylindrical, and often somewhat curved; petals emarginate to bifid .............................................*Cerastium*

---

**Agrostemma** Linnaeus 1753 (Corncockle)

**Arenaria** Linnaeus 1753 (Sandwort)

A genus of about 150-210 species, herbs, of temperate and subarctic regions of the Northern Hemisphere, extending southward to the montane tropics of South America and Africa. References: Hartman, Rabeler, & Utech in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993). [also see *Minuartia*]
CARYOPHYLLACEAE

1 Leaves lanceolate to oblongate, (7-) 15-32 mm long, 2-8 (-14) mm wide; perennial, stems to 8 dm long ....... *A. lanuginosa* var. lanuginosa

1 Leaves ovate, 3-8 mm long, 1-4 mm wide; annual, stems to 3 dm long.

2 Seeds 0.4-0.5 mm long; fruiting calyx 2-3 mm long........................................*A. leptoclados*

2 Seeds ca. 0.6 mm long; fruiting calyx 3-4 mm long ...........................................*A. serpyllifolia*

*Cerastium* Linnaeus 1753 (Mouse-ea Chickweed, Mouse-ea)

A genus of about 100 species, herbs, especially north temperate but nearly cosmopolitan. References: Morton in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Rabeler & Thieret (1988); Scheen et al. (2004). Key based in part on FNA.

1 Petals 10-18 mm long, 2-3× as long as the sepals; leaves 2-7 cm long; plants perennial, typically with some shoots not flowering.

2 Leaf blades narrowly to broadly linear, acute or short-acuminate at tip, tapered to base; stems erect nearly whole length.

3 Plants strongly rhizomatous with long-creeping shoots, lacking taproot; flowering stems usually 25-30 cm long; stem pubescence eglandular (glandular hairs present in the inflorescence only); sepals 5-7 mm long; anthers 1.0-1.1 mm long; petals often turning brown when dry; [alien] .................................................................*C. arvense* ssp. arvense

3 Plants clumped, with taproots or short rhizomatous; flowering stems usually 5-20 cm long; stem pubescence glandular; sepals 3.5-6 (-7) mm long; anthers 0.8-0.9 mm long; petals usually remaining white when dried; [native] ..........................................................*C. arvense* ssp. strictum

2 Leaf blades narrowly lanceolate to narrowly ovate, obtuse to acute at tip, more-or-less rounded at base; stems spreading or decumbent basally, ascending-erect distally.

4 Leaf blades narrowly lanceolate, obtuse to acute, well-spaced on stem, moderately to densely pubescent with dull hairs but may be glabrate in age; plants forming small clumps .........................................................*C. velutinum* var. velutinum

4 Leaf blades narrowly ovate, obtuse and blunt at tip, tightly spaced on stem, very densely pubescent with silvery or translucent-white permanent hairs; plants form clumps to several dm wide; [endemic to serpentine in PA and MD] ...........*C. velutinum* var. villosissimum

1 Petals 3-8 mm long, shorter than, equaling, or up to 1.5× as long as the sepals; leaves 0.5-3.0 cm long (to 8 cm long in *C. brachypodium*); plants annual, with all shoots producing flowers (except *C. fontanum* ssp. vulgare).

5 Perennial, matted at the base and rooting at the nodes......................................................*C. fontanum* ssp. vulgare

5 Annual, taprooted.

6 Sepals with long, appressed, eglandular hairs extending beyond the tip of the sepal.

7 Inflorescence an open cyme, most of the pedicels longer than the sepals .......................................................*C. brachypetalum*

7 Inflorescence a compact, cymose cluster, most of the pedicels shorter than the sepals ....................................*C. glomeratum*

6 Sepals lacking long, appressed, eglandular hairs.

8 Styles, sepals, and petals 3-4 (-5); capsule teeth 6-8 (-10).

9 Styles, sepals, and petals 4 (-3); capsule teeth 8 (-10); capsules ca. 1.5× as long as the sepals; caudine leaves 2-3 × as long as wide .................................................................*C. diffusum*

9 Styles, sepals, and petals 3 (-4); capsule teeth 6 (-8); capsules ca. 2 × as long as the sepals; caudine leaves 8-10 × as long as wide ...........................................*C. dubium*

8 Styles, sepals, and petals 5; capsule teeth 10.

10 Bracts of the inflorescence with distinctly scarious margins; leaves mostly 0.5-1.0 (-1.5) cm long.

11 Petals equaling or surpassing the sepals; cleft in petal apex 0.2-0.5 (-0.9) mm deep ..............................................*C. semidecandrum*

10 Bracts of the inflorescence with green margins; leaves mostly (>1.0-) 1.5-8 cm long.

12 Pedicels 3-10 (-15) mm long; leaves to 3.5 cm long..............................................*C. brachypodium*

12 Pedicels (10-) 15-40 (-55) mm long; leaves to 8 cm long .............................................*C. nutans*

*Cerastium arvense* Linnaeus ssp. strictum (Linnaeus) Ugborogho. Mt (WV): sandy and gravelly areas; rare. [overall distribution]. Reported for GA, TN, KY, WV, MD, DE, and NJ, among other states (Kartesz 1999), the GA record not validated in FNA. [= FNA, K; *< C. arvense* – C, G; *< C. arvense var. arvense* – F]

*Cerastium brachypetalum* Desportes, Gray Mouse-ear. Mt (NC, SC, WV), Pd (NC, SC, VA), Cp (NC, VA): roadsides, disturbed areas; common (rare in SC and WV), native of Europe. April-June. The reports of *C. tetrandrum* for e. VA in F and G are actually this species. [= RAB, C, F, FNA, G, W; *< C. brachypetalum ssp. brachypetalum* – K; >> *C. tetrandrum* W. Curtis – F, G, misidentified

*Cerastium brachypodium* (Engelmann ex A. Gray) B.L. Robinson. Mt (NC, VA), Pd (SC, VA), Cp (VA): disturbed areas, roadsides; rare. April-May. IL west to AB and OR, south to NC, ne. GA (Jones & Coile 1988), and AZ. This taxon is perhaps
only introduced in our area from further west. [= F, FNA, K, S; = C. nutans Rafinesque var. brachypodium Engelmann ex A. Gray – RAB, G, W; < C. nutans – C]

* Cerastium dubium (Bastard) Guépin. Cp (VA): disturbed areas; rare, native of s. Europe and Asia. Introduced in scattered states in the United States, including VA, KY, TN, MS (FNA). First reported for VA by Belden et al. (2004). [= C, FNA, K]

* Cerastium nutans Rafinesque. Mt (NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, VA): alluvial forests, bottomlands, moist forests; common (uncommon in NC, rare in DE). April-May. NS west to NT, south to SC, GA, AZ, Mexico, and OR. [= F; = C. nutans var. nutans – RAB, G, K, W; < C. nutans – C; > C. nutans var. nutans – FNA; > C. longepedunculatum Willdenow ex Britton – S]

* Cerastium pumilum W. Curtis, Dwarf Mouse-ear. Cp (NC, VA), Pd (NC, SC, VA), Mt (NC, WV): disturbed areas; rare, native of Europe. April-May. See Rabeler & Thieret (1988) for discussions and reports. [= C, F, FNA, G, K; > C. glatinois Fries]

* Cerastium velutinum Rafinesque var. velutinum, Field Mouse-ear, Starry Grasswort. Pd (DE, VA), Mt (VA): rocky riverscour areas, other open situations; rare. April-August. [= FNA; < C. arvense – C, G, S, W; < C. arvense Linnaeus var. villosum (Muhlenberg exDarlington) Hollick & Britton – F; = C. arvense Linnaeus ssp. velutinum (Rafinesque) Ugborogho var. velutinum (Rafinesque) Britton – K; = Cerastium arvense Linnaeus var. velutinum (Rafinesque) Britton]

  * Cerastium diffusum Persoon, Sea Mouse-ear. East to KY and TN (K), though not shown for those states in FNA. March-April. [= FNA, K, ? C. diffusum var. diffusum – C]

* Cerastium velutinum Rafinesque var. villosissimum (Pennell) J.K. Morton. This taxon is highly restricted, found only at a few stations in the serpentine barrens of Chester County, PA, and Cecil County, MD (Gustafson et al. 2003). [= FNA; = C. arvense var. villosissimum Pennell – F; < C. arvense – C, G; < C. arvense Linnaeus var. velutinum (Rafinesque) Ugborogho var. villosum (Muhlenberg exDarlington) Hollick & Britton – K]

**Corrigiola** Linnaeus (Strapwort)

* Corrigiola litoralis Linnaeus ssp. litoralis, Strapwort. Introduced south to MD and PA. [= FNA; < C. litoralis – C, F, G, orthographic variant; < C. litoralis – K]

**Dianthus** Linnaeus 1753 (Pink, Carnation)

A genus of about 300-320 species, herbs, of Eurasia and Africa. Species other than those treated here are grown in gardens and may escape or persist. References: Rabeler & Hartman in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

1 Flowers clustered in crowded cymes, short-pedicilled; [subgenus Carthusianastrum].
2 Leaves 2-5 (-8) mm wide; annual or biennial; inflorescence pubescent................................................................. D. armeria
2 Leaves mostly (8-) 10-20 mm wide; perennial; inflorescence glabrous ......................................................................................... D. barbatus
1 Flowers solitary, or few, long-pedicilled; [subgenus Dianthus].
3 Petal blade 5-9 (-10) mm long, toothed................................................................................................................................. D. deltoides
3 Petal blade (8-) 12-18 mm long, fringed................................................................................................................................. D. plumarius

* Dianthus barbatus Linnaeus ssp. barbatus, Sweet William. Pd (DE, NC, SC), Mt (VA, WV), Cp (DE), (GA); cultivated as an ornamental, rarely escaped to disturbed areas; rare, native of Europe. June-August. [= FNA; < D. barbatus – RAB, C, F, G, K, WV]
* Dianthus deltoides Linnaeus ssp. deltoides, Maiden Pink, Meadow Pink. Pd (NC, VA), Mt (NC, WV): cultivated as an ornamental, rarely escaped to adjacent areas; rare, native of Europe. May. See Rabeler & Thieret (1988) for additional information. [= FNA; < D. deltoides – C, F, G, K]

* Dianthus plumarius Linnaeus ssp. plumarius, Garden Pink, Grass Pink. Cp (NC), Pd (NC, SC), Mt (VA): cultivated as an ornamental, rarely escaped to disturbed areas; rare, native of e. Europe. June-August. [= FNA; < D. plumarius – RAB, C, F, G, K]

Drymaria Willdenow ex J.A. Schultes 1819 (Drymaria)

Drymaria cordata (Linnaeus) Willdenow ex Schultes var. cordata, Drymary, West Indian Chickweed. Cp (FL, GA): moist hammocks, moist disturbed areas; uncommon (rare in GA). Sc. GA south to s. FL south into the New World tropics; also old World tropics. Var. diandra Blume is restricted to the Old World. [= FNA; = D. cordata ssp. cordata – K, Z; < D. cordata – S, WH]

Gypsophila Linnaeus 1754 (Baby’s-breath)

1 Leaves 0.2-2 (-3) mm wide; stems diffusely and repeatedly branched near the base and upward...........................................................G. muralis
1 Leaves (1-) 3-16 mm wide; stems simple, few-branched toward the top, or much-branched
2 Annual; plants strict or few branched upwards; petals 6-15 mm long...........................................................G. elegans
2 Perennial; plants much-branched 1-4 (-8) mm long.................................................................................................G. paniculata

* Gypsophila elegans Bieberstein, Annual Baby’s-breath. Cp (NC), Pd (NC), Mt (WV): disturbed areas, persistent from cultivation, doubtfully established; rare, native of Eurasia. See Rabeler & Thieret (1988) for additional information. [= C, FNA, K]

* Gypsophila paniculata Linnaeus, Tall Baby’s-breath. Cp (FL): disturbed areas; rare, native of Eurasia. [= FNA, K, WH] {add to synonymy}

Herniaria Linnaeus (Rupture-wort)

Holosteum Linnaeus 1753 (Jagged Chickweed)

* Holosteum umbellatum Linnaeus ssp. umbellatum, Jagged Chickweed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, VA): fields, roadways, lawns, disturbed shale barrens, other disturbed areas; common (uncommon in DE), native of Europe. March-May. Four additional subspecies are not known to be present in North America. [= FNA; < H. umbellatum – RAB, C, F, G, K, S, W, WV]

Honckenya Ehrhart 1788 (Seabeach-chickweed, Sea-sandwort)

Honckenya peploides (Linnaeus) Ehrhart ssp. robusta (Fernald) Hultén, Southern Seabeach-chickweed, Southern Sea-sandwort. Cp (DE, VA): seabeaches and dunes; rare. June-July. The species is circumboreal, in North America ranging south to e. VA. Ssp. robusta ranges from NL (Newfoundland) south to e. VA; 3 other subspecies do not occur south of NL.
A genus of about 120-175 species, herbs, of the northern hemisphere (and rarely South America). References: Rabeler, Hartman, & Utech in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

Minuartia Linnaeus 1753 (Sandwort)

1 Sepals acute, with prominent nerves; [of calcareous or mafic barrens of VA, and westward to northward].
2 Primary leaves with axillary fascicles of secondary leaves ............................................................ M. michauxii var. michauxii
3 Sepals 3-nerved; seeds 0.7-0.9 mm long ......................................................................................... [M. muscorum]
4 Sepals obtuse (rarely sub-acute), nerveless or with very obscure nerves; [of various habitats].
5 Lower stem leaves closely imbricated; [of xeric sands of the Coastal Plain of NC and SC] .................... M. caroliniana
6 Lower stem leaves not imbricate; [either of rock outcrops of the Piedmont and Mountains or of moist habitats of the Coastal Plain].
7 Stems prostrate or decumbent, leafy throughout; pedicels and sepals stipitate-glandular; [of moist habitats of the Coastal Plain] ..........................

Minuartia cumberlandensis (B.E. Wofford & Kral) McNeill, Cumberland Sandwort. Vertical sandstone outcrops in the Cumberland Plateau of ne. TN; it might be expected in extreme sw. VA. [= FNA, K; = Arenaria cumberlandensis B.E. Wofford & Kral – C]

Minuartia glabra (Michaux) Mattfeld, Appalachian Sandwort. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): granitic flatrocks, other outcrops of granite, granitic gneiss, or other felsic gneisses and schists, in the mountains restricted to low or medium elevations; uncommon. April-May. ME and NH south to w. GA (Jones & Coile 1988) and AL, primarily on the Piedmont and also in the Cumberlands (Chester, Wofford, & Kral 1997). [= FNA, K; = Arenaria groenlandica (Retzius) Sprengel var. glabra (Michaux) Fernald – RAB, C, F, G; = A. glabra Michaux – GW, W; = Sabulina glabra (Michaux) Small – S; = Porsildia groenlandica (Retzii) A. Löve & D. Löve ssp. glabra (Michaux) A. Löve & D. Löve]

Minuartia groenlandica (Retzius) Ostenfeld, Mountain Sandwort, Greenland Sandwort. Mt (NC, VA, WV), Pd (NC): low elevation rock outcrops (such as sandstone pavements in the VA Ridge and Valley) to high elevation rock outcrops in the Mountains (ascending to nearly 2000m on Roan Mountain), also disjunct on the summits of quartzite monadnocks in the upper Piedmont (such as Pilot Mountain, Surry County, NC and Hanging Rock, Stokes County, NC); rare. May-October. Greenland, NS, and QC south to the higher mountains of New England and NY; disjunct in the Southern Appalachians of VA, w. NC, and e. TN. [= FNA, K; = Arenaria groenlandica (Retzius) Sprengel var. groenlandica – RAB, C, F, G; = Sabulina groenlandica (Retzius) Small – S; = A. groenlandica (Retzius) Sprengel – W; = Porsildia groenlandica (Retzii) A. Löve & D. Löve ssp. groenlandica]

Minuartia michauxii (Fenzl) Farwell var. michauxii, Rock Sandwort. Mt (VA, WV), Pd (DE): limestone, dolostone, calcareous sandstone, and calcareous shale outcrops and barrens; uncommon (rare in DE and WV). June-July. Var. michauxii ranges from NY west to MN, south to sw. VA and AR. Var. texana (B.L. Robinson) Mattfeld occurs from MO and NE south to TX. [= K; = Arenaria stricta Michaux var. stricta – C, F; < M. michauxii – FNA; = A. stricta Michaux ssp. stricta – G; < Sabulina stricta (Michaux) Small – S; < A. stricta Michaux – W, WV]

Minuartia patula (Michaux) Mattfeld, Lime-barren Sandwort. Mt (GA, VA), Pd (VA), Cp (GA): rocky barrens of calcareous or mafic rocks, locally common in Lee County, VA; rare (VA Watch List). April-June. Ec. PA and w. VA west to IN and MN, south to AL and TX. [= FNA, K; = Arenaria patula Michaux var. patula – C, G; < A. patula Michaux – F; < Sabulina patula (Michaux) Small – S]

Minuartia uniflora (Walter) Mattfeld. Pd (GA, NC, SC), Cp (GA): granitic flatrocks, outcrops of Altamaha grit; uncommon (rare in NC and SC). April-May. S. NC south to e. GA, west to ec. AL, on the Piedmont and extending into the Coastal Plain of Georgia on Altamaha grit. M. alabamensis, named on the basis of its tiny flowers, has been shown to be a self-
pollinating form of *M. uniflora* which has arisen repeatedly and independently at various sites in the range of *M. uniflora*. [= FNA, K; = *Arenaria uniflora* (Walter) Muhlenberg – RAB; > *A. uniflora* (Walter) Muhlenberg – GW, W; > *A. alabamensis* McCormick, Bozeman, & Spongberg – GW, W; > *Sabulina brevifolia* (Nuttall ex Torrey & A. Gray) Small – S; > *M. alabamensis* (McCormick, Bozeman, & Spongberg) Wyatt]

*Moench* Linnaeus 1753 (Grove-sandwort)

*Moench* Linnaeus 1753 (Grove-sandwort)

* Moenchia erecta* (Linnaeus) P.G. Gaertner, B. Meyer, & Scherbius *ssp. erecta*. Upright Chickweed. Cp (SC): disturbed areas; rare, introduced. This species was collected as a "wool alien" in Berkeley County, SC in 1958 (Rabeler 1991). [= FNA; < *M. erecta* – K; = *Sagina erecta* Linnaeus]

*Myosoton* Ehrhart 1788

A genus of 110 species, herbs and shrubs, nearly cosmopolitan in distribution. This genus consists mostly of plants of dry rocky or sandy habitats. References: Hartman, Thieret, & Rabeler in FNA (2005); Chaudhri (1968)=Z, Ward (1977a, 1977b)=Y; Shenner (1962)=X; Bittrich in Kubitzki, Rohwer, & Bittrich (1993). Key adapted from Y and Z.

**Identification notes:** Magnification of at least 10× is necessary for the identification of many of the taxa.

---

1 Leaf surfaces with silky, appressed pubescence (usually densely so, but sometimes sparse), giving the plant a silvery appearance; flowers 3.5-6 mm long, largely concealed by scarious bracts; [subgenus *Paronychia*]

2 Leaf surfaces glabrous or with very short pubescence (neither appressed nor silky), the plant green; flowers 1-4 mm long, not concealed by scarious bracts.

3 Sepals petaloid, the tip, margins, or entire sepal whitish; perigynous zone very well developed (mostly equaling or somewhat longer than the sepals); [of the Coastal Plain, from SC southward and westward]; [subgenus *Siphonychia*].

4 Sepals glabrous to the base; plant a cespite perennial with ascending annual stems.

5 Sepals densely pubescent on the basal portion (glabrous above); plant a sprawling, ascending or erect annual.

6 Pubescent portion of the sepal nearly ½ its length; sepal broadly rounded and hooded; stem glabrous or one side with curly hairs;...

7 Pubescent portion of the sepal < 1/3 its length; sepal narrowed toward the apex, with a short tooth or awn; stem uniformly pubescent with retrorse hairs.

8 Stem spreading or ascending, the branching unevenly dichotomously, the flowers therefore in diffuse cymes; glabrous portion of the sepal 0.8 mm long...

9 Stem erect, the branching symmetrical and dichotomous, the flowers therefore in weirdly geometric, tight square cymes; glabrous portion of the sepal > 1.1 mm long...

---

*Moehringia* Linnaeus 1753 (Grove-sandwort)

* Moehringia lateriflora* Linnaeus Fenzl, Grove-sandwort, Blunt-leaved Sandwort. Pd (VA), Mt (WV): rocky, disturbed areas (powerline) over mafic rocks (diabase); rare. May-July. Circumboreal, ranging south in North America to n. VA (Fairfax County), n. WV (Morton et al. 2004), MO, and CA. [= FNA, K; = *Arenaria patula* Linnaeus = C, F, G]

*Moenchia* Ehrhart 1788

* Myosoton aquaticum* (Linnaeus) Moench 1794 (Water-chickweed)

Paronychia americana (Nuttall) Fenzl ex Walpers, American Whitlow-wort. Cp (FL, GA, SC): sandhills; rare. June-September. S. SC south to GA and s. FL. Two taxa have been questionably distinguished. Ssp. americana, with the cymes many-flowered and forming spherical glomerules, has the range of the species; ssp. pauciflora (Small) Chaudhri, differing in its laxer, more open cymes, is restricted to s. GA and n. FL. [= FNA, WH, X, Y; > Paronychia americana (Nuttall) Fenzl ex Walpers ssp. americana – K, Z; > Paronychia americana (Nuttall) Fenzl ex Walpers ssp. pauciflora (Small) Chaudhri – K, Z; > P. americana – RAB; > Siphonochila americana (Nuttall) Torrey & Gray – S; > Siphonochila pauciflora Small – S]

Paronychia baldwinii (Torrey & A. Gray) Fenzl ex Walpers ssp. baldwinii, Annual Dune Whitlow-wort. Cp (FL, GA, NC, SC): dry sandy sites, woodlands or dunes; uncommon. June-October. E. NC south to c. peninsular FL and west to AL (and LA?), on the Coastal Plain. [= K, Y, Z; < P. baldwinii – FNA, WH; < P. riparia – RAB; = Anychiastrum baldwinii (Torrey & Gray) Small – S]

Paronychia baldwinii (Torrey & A. Gray) Fenzl ex Walpers ssp. riparia (Chapman) Chaudhri, Perennial Dune Whitlow-wort. Cp (FL, GA, NC, SC, VA): dry sandy sites, woodlands or dunes; uncommon (VA Watch List). June-October. Se. VA south to n. FL (and AL?), on the Coastal Plain. Though Chaudhri (1968) and Ward (1977a and 1977b) independently reached the conclusion to reduce P. riparia to a subspecies of P. baldwinii, neither stated any reasons for their choice of subspecific status. I here follow the independent conclusions of Chaudhri and Ward, but the appropriate taxonomic rank remains unclear. [= K, Y, < P. riparia – RAB, F; < P. baldwinii – FNA, WH; = P. riparia Chapman – C, F; = Anychiastrum riparium (Chapman) Small – S; > P. baldwinii ssp. riparia var. riparia – Z; > P. baldwinii ssp. riparia var. ciliata Chaudhri – Z]

Paronychia canadensis (Linnaeus) Wood, Canada Whitlow-wort, Forked Chickweed. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA): dry rocky woods, shale barrens; uncommon (common in WV, rare in the NC, SC, and VA Coastal Plain). June-October. NH and s. ON west to MN, south to n. GA (Jones & Coile 1988); AL, MO, and KS. This species is somewhat taller on average than P. fastigiata or P. montana. [= RAB, C, F, FNA, G, K, W, WV, Z; = Anychiastrum canadensis (Linnaeus) Britton, Sterns, & Poggenb. – S]

Paronychia fastigiata (Rafinesque) Fernald var. fastigiata, Common Forked Whitlow-wort. Mt (NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, SC, VA): usually rocky, woodlands, often on thin soil around outcrop edges; uncommon (rare in DE). June-October. MA west to MN south to FL and TX. The three varieties of P. fastigiata (though accepted by Chaudhri

Caryophyllaceae

...
and many recent floras) need additional investigation to confirm their taxonomic status, habitats, and geographic ranges.  

**Paronychia fastigiata** (Rafinesque) Fernald var. **paleacea** Fernald, Green Forked Whitlow-wort. Mt (NC, VA, WV), Pd (DE, NC, VA), C (NC, VA): dry, mostly rocky woodlands; uncommon (rare in WV). June-October. NJ, DE, and PA west to IL, south to VA, NC, KY, TN, MO, and TX. [= C, F, G, K, WV, Z; < *P. fastigiata* – RAB, W; < *P. fastigiata* var. **fastigiata** – FNA; < *Anchyia polygonoides* Rafinesque – S]

**Paronychia horterioides** (Michaux) Nuttall, Michaux's Whitlowwort. Cp (FL, GA, NC, SC): sandhills; rare. April-July. Sc. NC south to c. peninsular FL and e. Panhandle FL. The NC distribution ascribed by Small, Chaudhri, and FNA is based on the type specimen of André Michaux ("in arenosis aridis Caroliniae septentrionalis"); the species has been relocated in NC (Scotland County) by Harry E. LeGrand, Jr, over two centuries later. [= RAB, FNA, K, WH, Y, Z; < *Gastronvisia hermarioides* (Michaux) Small – S]

**Paronychia montana** (Small) Pax & K. Hoffmann, Shale-barren Whitlow-wort. Mt (NC, VA): dry rock outcrops and talus barrens, especially on shale barrens; uncommon. June-October. C. PA (and OH?) south through w. VA and e. WV to a few localities in NC, TN, GA, and AL. [= K, Z; < *P. fastigiata* – RAB, W; < *P. fastigiata* var. **pumila** (A. Wood) Fernald – C, F, FNA, G; < *Anchyiastrum montanum* Small – S]

**Paronychia patula** Shinners, Pineland Nailwort. Cp (FL, GA): sandhills; uncommon (rare in GA). July-September. Sw. GA west to s. AL, south to c. peninsular FL. [= FNA, K, WH, X, Y, Z; < *Siphonochia diffusa* Chapman – S]

**Paronychia virginica** Sprengel var. **virginica**, Virginia Whitlow-wort. Mt (VA, WV), Pd (GA, VA): shale barrens, rocky riversides, calcareous rock outcrops and talus, serpentine outcrops; rare. June-August. The ranges of the two varieties are variously stated; the distinguishing characteristics and distributions are not clear. Var. **virginica** occurs in w. MD, w. VA, WV, WV, GA, and AL (or allegedly also in NC, AR, OK, and TX). Var. **parksii** (Cory) Chaudhri occurs in TX (or also in OK). [= C, Z; < *P. virginica* – F, FNA, K, WH, WV; < *P. virginica* var. **virginica** – G; < *P. dichotoma* (Linnaeus) Neautt – S]

**Paronychia chartacea** Fernald var. **minima** (L.C. Anderson) R.L. Hartman, Paper Nailwort. Cp (FL): scrub; rare. (May-) July-October. Endemic to Panhandle FL. [= FNA; < *P. chartacea* – WH; < *Nyacha pulvinata* Small = *P. chartacea* Fernald ssp. **minima** L.C. Anderson – K] {add to synonymy; add to key}

**Petrohragia** (Seringe) Link 1831 (Pink)

1 Flowers in capitulate inflorescences (solitary in impoverished or very young plants); bracts subtending the calyx broad and long, usually completely enclosing the calyx; [section *Kohlrbuscbia*]................................................................................................................................................. *P. prolifera*

1 Flowers solitary (or in fascicles of 2-3); bracts subtending the calyx narrow and short, enclosing about ½ of the calyx; [section *Petrohragia*]...

* Petrohragia saxifraga* (Linnaeus) Link var. *saxifraga*, Saxifrage Pink, is "cultivated and occasionally escaped" south to se. PA (Rhoads & Klein 1993), s. NJ, and MD (Rabeler 1985). Rabeler (1985) reports a location from Page Co. VA, but it appears that this is persistent from cultivation. [= FNA; < *P. saxifraga* – C, K, Z; < *Tunica saxifraga* (Linnaeus) Scopoli]

**Polycarpon** Linnaeus 1759 (Allseed)

A genus of about 18 species, herbs, primarily of Europe, with several species in South America, and 1 cosmopolitan. References: Thieret & Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

**Sagina** Linnaeus 1753 (Pearlwort)

1. Leaf blades fleshy; seeds reniform or nearly spherical, lacking a groove on one side; flowers 5-merous .................................................. *S. japonica*

1. Leaf blades thin; seeds obliquely triangular, with a groove on one side; flowers 4-merous or 5-merous.

2. Perennial, usually with a persistent rosette of leaves; flowers 4 (-5)-merous; seeds (0.3-) 0.4 (0.5) mm long; sepals spreading in fruit ............... .......................................................... *S. procumbens*

**Sagina decumbens** (Elliott) Torrey & A. Gray, Eastern Pearlwort. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed ground, fields, cracks in pavement or sidewalks; common (uncommon in Mountains of GA, NC, SC, and VA, rare in Mountains of WV). March-June. NB west to IL and MO, south to c. peninsular FL and TX, with adventive occurrences further west. Crow (1978) and Crow in FNA (2005) treat *S. decumbens* and *S. occidentalis* L. Watson of the Pacific Coast of North America as subspecies. They differ primarily in seed architecture. Though clearly closely related, they seem equally well (and more simply) regarded as sibling species. A report of *S. subulata* (Swartz) K. Presl for Bedford County, VA, is apparently actually *S. decumbens*. [= RAB, C, F, G, S, W, WH; *S. decumbens ssp. decumbens* – FNA, K, Z]

* **Sagina procumbens** Linnaeus, Northern Pearlwort, Bird's-eye. Cp (DE), Pd (DE), Mt (NC, WV): disturbed soils; uncommon (rare in NC), native of Eurasia (or, at least, ne. North America). May-September. Crow (1978) questions whether *S. procumbens* is native at all in the Western Hemisphere. In North America, it is concentrated in 2 main regions, from NS and QC south to MD, and from sw. BC south to c. CA, with scattered occurrences elsewhere, such as around the Great Lakes, CO, AK, s. OH, and w. NC. Whether or not the species is native in the New World, the occurrence in NC (in a gravel parking lot on top of Roan Mountain) is almost certainly adventive. [= C, FNA, G, K, WV, Z; *S. procumbens var. procumbens* – F; *S. procumbens var. compacta* Lange – F]

---

**Saponaria** Linnaeus 1753 (Soapwort)

A genus of about 40 species, herbs, of temperate regions of Eurasia. References: Thieret & Rabeler in FNA (2005); Bittrich in Kubitzki, Rohwer, & Bittrich (1993). [also see *Vaccaria*]

**Scleranthus** Linnaeus 1753 (Knawel)

**Silene** Linnaeus 1753 (Catchfly, Campion, Fire-pink, Wild-pink)

1. Styles mostly 5; capsule with 5 or 10 teeth; calyx tubular at anthesis, becoming strongly inflated later in *S. dioica* and *S. latifolia*.

2. Petal limbs deeply divided into 4 linear segments .......................................................... *S. flos-cuculi*

2. Petal limbs unlobed, emarginate, or shallowly 2-lobed.

3. Leaf blades with dense silky white hairiness; flowers bisexual .................................................. *S. coronaria*

3. Leaf blades variously pubescent, but not with silky-appressed pubescence.

4. Petals pink; capsule teeth revolute .......................................................................................................................... [S. dioica]

4. Petals white, capsule teeth spreading to slightly reflexed .............................................................................. *S. latifolia*

1. Styles mostly 3; capsule with 3 or 6 teeth; calyx tubular or campanulate at anthesis, not greatly inflated (except in *S. vulgaris*). .......................................................... *S. stellata*

5. Middle cauline leaves in whorls of 4; petals fimbriate ...............................................................................................
6 Flowers bright red.
7 Petals entire or slightly erose at the tip; cauline leaves 10-20 pairs ................................................................. S. regia
7 Petals deeply notched at the tip; cauline leaves 2-8 pairs.
8 Cauline leaves 2.0-7.0 cm wide, elliptic, ovate, or orbicular, usually 1-2× as long as wide; entire plant sticky glandular-pubescent; [of sandstone cliffs and crevices, in our area only in sw. VA] ................................................................. S. rotundifolia
8 Cauline leaves 0.8-2.0 cm wide, mostly oblong-cordate, usually at least 3× as long as wide; plant not covered with sticky glandular hairs; [of various, mostly rocky, habitats, widespread in our area]........................................................................ S. virginica
6 Flowers white or pink.
9 Petals 8-crenate or more divided; plants perennial; [native].
10 Plants 2-6 dm tall; petals pink, the >8 ultimate segments of each dichotomously forked at nearly right angles; calyx ca. 2.5 cm long; stem with long, villous pubescence ........................................................ S. catesbaei
10 Plants (5-) 7-15 dm tall; petals white, the 8 segments of each essentially parallel to one another; calyx ca. 1 cm long; stem with short rigid pubescence ........................................................................................................................................ S. ovata
9 Petals entire, bilobed, or 2-crenate; plants 0.5-8 dm tall, perennial or annual; [either alien weeds occurring mostly in disturbed sites, or native in forests, woodlands, or rock outcrops].
11 Plant < 2.5 dm tall; plant perennial, with a stout, carrot-like taproot; [native, of woodlands, rock outcrops, barrens, glades, and dry roadbanks].
12 Calyx pubescence of long, straight, non glandular hairs; [of OH, WV, ?VA, and MO south to AL] ... S. caroliniana var. wherryi
12 Calyx pubescence of glandular hairs; [of NC and ne. TN northward in and east of the Appalachians].
13 Leaves pubescent over the surface with appressed, white hairs, also ciliate on the margin; basal leaves mostly obtuse to rounded at the apex, to 12 cm long and 3 cm wide; [of NC south, mostly in sandy, acidic soils of the Coastal Plain and associated with granite in the lower Piedmont] ................................................................. S. caroliniana var. caroliniana
13 Leaves glabrous on the surface, ciliate on the margin; basal leaves mostly acute to obtuse at the apex, to 15 cm long and 2 cm wide; [of NC north, often associated with calcareous or mafic rocks in the Piedmont and Mountains]............................
17 Plants rhizomatous perennials (biennial in S. cserelii); petals white.
18 Fruiting calyx ovoid, contracted at the mouth to ca. ½ the diameter of the calyx at its widest point; stamens ca. 2× as long as the calyx; filaments purple ................................................................................................. C. cserelii
18 Fruiting calyx clavate or campanulate, not contracted at the mouth; stamens 1.0-1.5× as long as the calyx; filaments usually white.
19 Petal appendages 1.0-1.6 mm long; inflorescences leafy; [native] .................................................................................. S. nivea
19 Petal appendages absent or to 0.2 mm long; inflorescences with reduced leaves resembling bracts; [alien, mostly of disturbed habitats] ........................................................................................................ S. vulgaris
17 Plants annuals; petals white, pink, or lavender.
20 Stems glabrous or sparsely pubescent (if pubescent, puberulent).  
21 Calyx 4-10 mm long; carpophore ca. 1 mm long ................................................................. S. antirrhina
21 Calyx 13-17 mm long; carpophore 7-8 mm long ................................................................. S. armeria
20 Stems densely pubescent (hirsute or glandular-hirsute).
22 Petals entire or emarginate; fruiting calyx 6-10 mm long ................................................................. S. gallica
22 Petals deeply 2-lobed; calyx; fruiting calyx 10-30 mm long.
23 Fruiting calyx 10-15 mm long; petal appendages ca. 0.2 mm long ................................................................. S. dichotoma
23 Fruiting calyx (15-) 25-30 mm long; petal appendages 0.5-1.5 mm long ................................................................. S. noctiflora

Silene caroliniana Walter var. caroliniana, South Carolina Wild-pink, Rock Catchfly. Pd (FL, GA, NC, SC), Cp (GA, NC, SC): in acidic, sandy, open woodlands, especially woodlands around granitic flatrocks and sandy Coastal Plain woodlands; uncommon (rare in GA and NC). April-July. Sc. NC south through the e. three-quarters of SC just into e. GA; disjunct in Panhandle FL. See Wilbur (1970b) and Clausen (1939) for additional discussion of these infraspecific taxa in S. caroliniana. [= C, F; < S. caroliniana – RAB, S, WH; = S. caroliniana ssp. caroliniana – FNA, G, K, Z; = S. caroliniana ssp. caroliniana var. caroliniana – Y]
**Silene caroliniana** Walter var. *wherryi* (Small) Fernand. Mt (VA?, WV): dry, rocky places; rare. April-July. OH and WV (and VA according to FNA) south and west to AL, KY, MO, and KS. [= F; > S. caroliniana var. pensylvanica – C; = S. caroliniana ssp. *wherryi* (Small) Clausen – FNA, G, K, Y, Z; = S. *wherryi* Small]

* Silene csersei* Baumgarten, Balkan Bladder-campion. Mt (NC, WV): habitat not known; rare, native of Europe. Documented for w. NC (J.K. Morton, pers.comm.). Also reported in se. PA (Rhoads & Klein 1993) and e. WV. [= FNA, K; = S. csereri – C, F, G, orthographic variant]

* Silene dichotoma* Ehrhart *ssp. dichotoma*, Forked Catchfly. Mt (NC, VA, WV), Pd (VA), [GA]: fields, disturbed areas; common (uncommon in WV), native of Europe. May-August. [= FNA; < S. dichotoma – RAB, C, F, G, K, S, W, WV]

* Silene ovata* Pursh, Mountain Catchfly. Mt (GA, NC, SC, VA), Cp (GA): circumneutral soils of woodlands and forests, especially over mafic or calcareous rocks, mostly at medium elevations in the mountains; rare. August-September. Sw. VA and KY west to AR, south to nw. GA, n. AL, and AR; disjunct in sc. and sw. GA. [= RAB, C, F, FNA, G, K, S, W]

* Silene regia* Sims, Royal Catchfly. Cp (FL, GA): prairies and calcareous woodlands and forests; rare (GA Rare). OH and e. MO south to e. TN (Chester, Wofford, & Kral 1997), nw. and sw. GA (Jones & Coile 1988), FL Panhandle (Jackson County), and AL. [= C, F, FNA, G, K, S, WH]

* Silene rotundifolia* Nuttall, Roundleaf Fire-pink, Sandstone Fire-pink. Mt (GA, VA, WV): sandstones cliffs, ledges, and talus, and at bases of sandstone cliffs; rare. S. OH and WV south to nw. GA (Jones & Coile 1988) and n. AL, nearly restricted to the Cumberland Plateau. [= C, F, FNA, G, K, S, WV]

* Silene stellata* Aiton f., Starry Campion, Widow’s-frill. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): dry to mesic forests, rock outcrops; common (rare in NC, SC, and VA Coastal Plain). July-September. CT west to SD, south to c. GA and TX. [= RAB, F, FNA, K, S, W, WV; > *S. stellata var. stellata* – C, G; > *S. stellata var. scabrella* Palmer & Steyermeyer – C, G]

* Silene virginica* Linnaeus, Fire-pink. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): woodland, rock outcrops, crevices in cliffs, roadbanks; common (rare in Coastal Plain, rare in DE Piedmont). April-July. NJ and NY west to s. ON and SE. MI, south to Panhandle FL (Bay County), GA and OK. *Var. robusta* Strausbaugh & Core, named from locations in e. WV, extends as well to se. KY and e. TN. It differs in its greater size and numerous pairs of cauline leaves, the leaves larger (7-15 cm long, 2-4 cm wide, vs. 7.5-10 cm long, 0.5-2 cm wide) and smaller calyx (1.5-2 cm long, vs. ca. 2.2 cm long) (Strausbaugh & Core 1952, 1978); additional study is needed. [= RAB, C, F, FNA, G, S, W, WH; > *S. virginica var. virginica* – K, WV; > *S. virginica var. robusta* Strausbaugh & Core – K, WV]

* Silene vulgaris* (Moench) Garcke, Bladder Campion, Maiden's-tears. Mt (NC, VA, WV), Pd (DE, GA, NC, VA), Cp (NC, SC, VA): disturbed areas; common (uncommon in GA, NC, SC, and WV), rare in DE, rare in VA Coastal Plain), native of Europe. May-August. [= C, FNA, K; = *S. cucubalus* Wibel – RAB, G, W, WV; > *S. cucubalus var. cucubalus* – F; > *S. cucubalus var. latifolia* (Reichenbach) G. Beck – F; > *S. latifolia* (P. Miller) Britten & Rendle - S]

* Silene conoides* Linnaeus, Large Sand Catchfly. Pd (DE): disturbed areas; uncommon, native of Eurasia. [= C, FNA]

* Silene dioica* (Linnaeus) Clairville, Red Campion, Red Catchfly. Cp (DE): disturbed areas; rare, native of Europe. Introduced south at least to scattered locations in s. PA (Rhoads & Klein 1993). Reported rather vaguely for VA (Maguire 1950) as “south to Virginia;” no additional documentation is known to me. [= C, F, FNA, K; = *Lychnis dioica* Linnaeus]

**Spergula** Linnaeus 1753 (Spurrey)

1. Wing of the seed narrower than the body of the fruit; leaf blades terete or nearly so, 1.5-3 (-5) cm long. Sp. arvensis
2. Wing of the seed as wide as or wider than the body of the seed; leaf blades usually flat, 3.0-1.5 (-2.0) cm long.

*Spergularia arvensis* Linnaeus, Corn Spurrey. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (VA, WV): fields, roadsides, disturbed areas; uncommon (in FL and WV), native of Europe. April-June. Two varieties are sometimes recognized; var. arvensis, with seeds ornamented with white, clavate papillae, the plants sparsely glandular, and var. sativa, with seeds reticulate and lacking papillae, the plants sparsely to densely glandular. Additional information is needed on the distinctiveness, range in our area, etc. of the two putative varieties. [= RAB, C, F, FNA, K, WH, WV; > S. arvensis Linnaeus var. arvensis = F, G; > S. arvensis Linnaeus var. sativa (Boennichinghausen) Mertens & W.D.J. Koch = F, G]

*Spergula* Linnaeus, Corn-chickweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, NC, SC, VA), Mt (VA, WV): fields, roadsides, disturbed areas; uncommon (in FL and WV), native of Europe. April-June. Two varieties are sometimes recognized; var. arvensis, with seeds ornamented with white, clavate papillae, the plants sparsely glandular, and var. sativa, with seeds reticulate and lacking papillae, the plants sparsely to densely glandular. Additional information is needed on the distinctiveness, range in our area, etc. of the two putative varieties. [= RAB, C, F, FNA, K, S, WH, WV; > S. arvensis Linnaeus var. arvensis = F, G; > S. arvensis Linnaeus var. sativa (Boennichinghausen) Mertens & W.D.J. Koch = F, G]

*Spergularia* Persoon J. & K. Presl 1819 (Sand-spurrey)

1. Stamens 6-10; seeds either 0.4-0.6 or 0.8-1.1 mm long; axillary leaf clusters of 2-4 leaves (or sometimes absent in *Sp. media*).
2. Seeds 0.8-1.1 mm long, smooth, without sculpturing except for wings; leaf blades fleshy .................................................. [Sp. media var. media]
3. Seeds 0.4-0.6 mm long, sculptured with wavy lines, not winged but with peglike papillae; leaf blades scarcely fleshy .............................. Sp. rubra

*Spergularia media* (Linnaeus) K. Presl var. media. Mt (WV): disturbed areas; rare, native of {}. Known from salted highways in NY, OH, MI, and IL and salt or brackish marsh habitats in coastal NY. [= FNA; < S. media – C, F, G; ? Spergularia maritima (Linnaeus) Chiovenda – K] [synonymy incomplete]

*Stellaria* Linnaeus 1753 (Chickweed, Stitchwort, Starwort)

1. Leaves narrow, usually linear, lanceolate, oblanceolate, or narrowly elliptic, the blade 3-10× as long as wide, 0.8-10 mm wide; stems prominently 4-angled.
2. Sepals 2.0-3.5 mm long; petals 0-3.0 mm long, shorter than the sepals or absent; seeds 0.3-0.9 mm long.
3. Inflorescence a leafy terminal cyme of 1-5-50 flowers; seeds 0.7-0.9 mm long, smooth or slightly rugose. ... S. borealis var. borealis
4. Flowers in axillary inflorescences of 1-5 flowers; sepals 3; petals 5; seeds 0.3-0.4 mm long, with small, rounded tubercles; [widespread]........................................................................................................... S. alpina
5. Flowers solitary in leaf axils; sepals 4 (-5); petals absent; seeds 0.6-0.8 mm long, with stalked, knoblike tubercles; [of c. KY and TN] .......................................................................................................................... S. fontinalis
6. Sepals 3.5-9 mm long; petals 3.5-13 mm long, equaling or longer than the sepals; seeds 0.7-2.5 mm long.
7. Seeds 2.5-5 mm long; bracts of the inflorescence herbaceous; petals notched < halfway to the base .................................................. S. holostea
8. Seeds 0.7-1.2 mm long; bracts of the inflorescence scarious; petals notched > halfway to the base.
9. Sepals 4.5-5.5 mm long, strongly 3-nerved; seeds 0.8-1.2 mm long, coarsely tuberculate; inflorescence diffuse, many-flowered ............ S. graminea
6 Sepals 3.5–4.5 mm long, weakly 3-nerved; seeds 0.7–1.0 mm long, obscurely sculptured and appearing almost smooth; inflorescence more compact, fewer-flowered.................................................. S. longifolia

1 Leaves broad, usually ovate, obovate, or broadly elliptic, the blade 1.25× (or to 4×) as long as wide; 4–30 mm wide (if > 2.5× as long as wide; then definitely > 10 mm wide); stems terete or 4-angled.

7 Leaves short-petiolate, the petiole about as long as the blade, the blades cordate to truncate at the base; sepals 2.5–3.5 mm long, obtuse to broadly acute; petals 0.6–0.8 mm long; stem glabrous or glandular-puberulent (the pubescence not in lines).................................................. S. prostrata

7 Leaves sessile, short-petiolate, to long-petiolate (if long petiolate, the blades cuneate), the blades rounded to cuneate at the base; sepals 3.5–11 mm long, broadly acute to acuminate; seeds 0.4–2.0 mm long; stem puberulent to short-pilose (the pubescence in vertical lines or not).

8 Leaves (1.0–) 2.5–10 cm long (with strong dimorphism between sterile and fertile shoots, the leaves of sterile shoots much larger); seeds 1.7–2 mm long; sepals 4–11 mm long; stem pubescence in vertical lines or uniformly distributed; perennial, the stems strong and ascending to erect; [native].

8 Sepals 7.11–(12) mm long, acuminate, ciliate, but more-or-less glabrous on the back; [of the mountains]............................. S. corei

9 Sepals 3.5–7 mm long, acute, ciliate and more-or-less pubescent on the back; [widespread in our area]............................. S. pubera

9 Sepals 0.5–4.0 cm long; seeds 0.6–1.7 mm long; sepals 3.0–6.5 mm long; stem pubescence always in vertical lines; annual, the stems weak and in part prostrate, the tips or vigorous growth ascending; [alien].

10 Sepals 0.6–0.5 mm long; stamens 8–10; seeds 1.1–1.7 mm long.......................................................... S. neglecta

10 Sepals 3.0–5.2 (–6.0) mm long; stamens 1–5; seeds 0.4–1.3 mm long.

11 Stamens 0.5 (–) 2.5–10 cm long (with strong dimorphism between sterile and fertile shoots, the leaves of sterile shoots much larger); seeds 0.6–0.8 mm long; petals usually present ........................................ S. media

11 Stamens 3.5–(5); sepals 4.5–5.2 (–6.0) mm long; seeds 0.9–1.4 mm long; petals usually absent........................................ S. pallida

Stellaria corei Shinners, Tennessee Starwort. Mt (NC, VA, WV), Pd* (DE*): cove forests and seepages at moderate to high elevations, rarely escaped from cultivation; rare. April–June. W. VA, WV, and sw. PA west to OH and IN, south to w. NC, e. and e. TN, and n. AL. Cronquist (1991) reports that S. corei has a chromosome number of 2n = 60, as opposed to 2n = 30 for S. pubera. In mountain coves, S. corei and S. pubera sometime grow intermixed; they are best regarded as species. Both species have an interesting seasonal growth form, producing short and relatively small-leaved flowering shoots in the spring (which with following fruiting), followed by taller, more vigorous shoots with larger and tougher leaves and lacking flowers, which persist until autumn. Some of the description in various manuals of differences in petiole length and leaf shape between the two species is obscure or complicated by these seasonal differences; more careful observation is needed. [= RAB, FNA, K, W, WV; = S. pubera Michaux var. silvatica (Béguinot) Weatherby – C, F; = S. silvatica (Béguinot) Maguire – G, preoccupied; = Alsine tennesseensis (C. Mohr) Small – S, misapplied]

* Stellaria holostea Linnaeus, Easter-bell, Greater Stitchwort. Cp? (NC): escaped or persistent from cultivation; rare, native of Europe. [= C, F, FNA, G, K]

* Stellaria media (Linnaeus) Villars, Common Chickweed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, NC, SC, VA): disturbed areas, gardens, fields; common (uncommon in DE Piedmont, rare in DE Coastal Plain), native of Europe. January–December. [= FNA; < S. media – RAB, C, G, W, WV, WV (also see S. pallida); < S. media var. media – F; = S. media ssp. media – K; < Alsine media Linnaeus – S]

* Stellaria neglecta Weihe. Mt (NC): disturbed areas; rare, native of Europe. Similar to S. media and S. pallida. It has been found at scattered localities in e. North America and will presumably eventually be found elsewhere in our area. [= FNA, G; < S. media (Linnaeus) Villars – RAB, C, W; < S. media var. media – F; = S. media ssp. neglecta (Weihe) Meurbeck – K; = Alsine neglecta (Weihe) A. & D. Löve]

Stellaria prostrata Baldwin. Cp (FL, GA, SC, KS): moist soil along streams; rare. March–April. Apparently ranging from SC south to c. pennsulvar FL, west to c. TX. This species has been reported repeatedly for SC and sometimes for VA as well; the VA reports are referable to S. pallida. More information is needed about its occurrence in our area. [= K, WH; = S. cuspidata Wildenow ex Schlechendahl ssp. prostrata (Baldwin) J.K. Morton – FNA; = Alsine baldwinii Small – S]

Stellaria pubera Michaux, Star Chickweed, Common Starwort, Giant Chickweed, Great Chickweed. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, NC, SC, VA): bottomland forests, moist slopes, coves, hammocks; common (uncommon

Stellaria fontinalis (Short & Peter) B.L. Robinson is a native species of c. TN (Chester, Wofford, & Kral 1997) and c. KY, occurring in seepages and wet cliffs. Its generic placement has been controversial and uncertain (see synonymy). [= F, FNA, G, K; = Sagina fontinalis Short & Peter – C; = Alisée fontinalis (Short & Peter) Britton – S; = Arenaria fontinalis (Short & Peter) Shinners; = Spergula fontinalis (Short & Peter) Dietrich]

Stipulicida Michaux 1803 (Wire-plant)

Identification notes: Stipulicida is immediately recognizable by its very wiry, dichotomously branched stems, the stem leaves reduced to subulate scales 0.5-2 mm long. Often overlooked are the basal rosette of spatulate leaves, to 15 mm long and 4 mm wide.

1 Sepal margin lacerate; outer sepal tips mucronate; [of FL].............................................................................................................S. setacea var. lacerata
1 Sepal margin entire or nearly so; outer sepal tips acute to obtuse; [of se. VA south to s. FL, west to LA] ........................................S. setacea var. setacea

Stipulicida setacea Michaux var. lacerata C.W. James. Cp (FL): xeric sands of sandhills, dry pine flatwoods, maritime forests; rare. May-August. Ne. FL south to s. FL; Cuba. [= FNA, K, WH, X, Y, Z; < S. setacea – S]

Stipulicida setacea Michaux var. setacea, Wire-plant. Cp (FL, GA, NC, SC, VA): xeric sands of sandhills, dry pine flatwoods, maritime forests; common, rare in VA. May-August. Se. VA south to s. FL, west to e. LA (Florida parishes). A third variety, var. filiformis (Nash) D.B. Ward, endemic to c. Peninsular FL, is often considered a mere form of var. setacea (see synonymy and references). [= Y; < S. setacea var. setacea – FNA, K, WH, X, Z (including var. filiformis, but not var. lacerata); < S. setacea – RAB, C, S; < S. setacea – S (including var. lacerata but not var. filiformis)]

Vaccaria von Wolf 1781 (Cow-cockle, Cow-herb)

298. AMARANTHACEAE A.L. de Jussieu 1789 (Amaranth Family) [in CARYOPHYLLALES]

A family of about 175 genera and 2250 species, mostly herbs, but including shrubs and trees, nearly cosmopolitan, but most diverse in subtropical and temperate regions (Judd & Ferguson 1999). References: Robertson & Clements in FNA (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993); Welsh, Crompton, & Clements in FNA (2003b); Judd & Ferguson (1999)=Z; Kühn in Kubitzki, Rohwer, & Bittrich (1993). [including CHENOPODIACEAE]

{Note: several of the genera below have been treated in very different ways by various authors. Complicating the situation is the pantemperate or pantropical distribution of some species, questions of application of names having priority, and the use of technical characters not readily observed on herbarium specimens. The treatments below of Salicornia, Sarcocornia, Atriplex, and Suaeda may require considerable change prior to publication}

Subfamily Amaranthoideae

Tribe Celosiae: Celosia.

Subfamily Gomphrenoidae

Tribe Gomphrenae, subtribe Aervinae: Aervina.

Tribe Gomphrenae, subtribe Aervinae: Achyranthes.

Subfamily Gomphrenoidae

Tribe Gomphrenae, subtribe Froelichiniae: Alternanthera, Froelichia, Guellimenea.

Tribe Gomphrenae, subtribe Gomphreninae: Gomphrena, Iresine.

Former Chenopodiaceae

1 Leaves opposite, reduced to scales a few mm long, clasping and appressed against the succulent stem; flowers in groups of 3, sunken into the stem; [subfamily Salicornioideae, tribe Salicorniae].
2 Annual from a taproot; central flower (of each group of 3) above the 2 lateral flowers .............................................................Salicornia
2 Perennial from a horizontal rhizome; central flower (of each group of 3) inserted at the same level as the 2 lateral flowers..............Sarcocornia
A genus of 6–8 species, of warm temperate and tropical regions of the Old World. References: Robertson in FNA (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993). Key based closely on FNA.

1 Leaves mostly or entirely alternate (the lower sometimes opposite), not reduced to appressed scales; flowers not usually grouped into groups of 3, not sunken into the stem.
2 Inflorescences sessile, in the leaf axils.

Achyranthes Linnaeus 1753 (Chaff-flower)

A genus of 6–8 species, of warm temperate and tropical regions of the Old World. References: Robertson in FNA (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993). Key based closely on FNA.

1 Leaves petiolate, lanceolate or wider, the larger leaves generally toothed, not succulent or only slightly so; [subfamily Chenopodioidae].
2 Leaf blades 4–20 cm long, 2–5 cm wide, acuminate at the tip; tepals 6–7 mm long; utricles 3–4 mm long ...

Achyranthes repens (Moquin-Tandon) C.C. Townsend, Devil’s-horsewhip. Reported for MD and s. FL (FNA, K). Native of West Indies and perhaps s. FL. [= FNA, K; < A. aspera var. pubescens]

Achyranthes japonica (Miquel) Nakai var. hachijoensis Honda, Japanese Chaff-flower. Mt (WV): disturbed areas, rare, native of e. Asia. Escaped in KY and WV (Mingo and Wayne counties) (Medley et al. 1985) and n. AL (Limestone County) (D. Spaulding, pers.comm.). It will likely become established in our area as well. [= FNA, K; < A. japonica – C]

Achyranthes aspera Linnaeus var. aspera (Moquin-Tandon) C.C. Townsend, Devil’s-horsewhip. Reported for MD and s. FL (FNA, K). Native of West Indies and perhaps s. FL. [= FNA, K; < Centrostachys indica (Linnaeus) Standley – S]

Achyranthes aspera Linnaeus var. pubescens (Moquin-Tandon) C.C. Townsend, Devil’s-horsewhip. Reported for MD and s. FL (FNA, K). Native of West Indies and perhaps s. FL. [= FNA, K; < Centrostachys indica (Linnaeus) Standley – S]

Alternanthera Forsskål 1775 (Chaff-flower, Joyweed)

1 Inflorescences borne on peduncles 1–7 cm long, these from the leaf axis or terminal
2 Bracts keeled; tepals pilose; leaves not succulent, acute to acuminate at the tip. ................. A. flavescents
3 Bracts not keeled; tepals glabrous; leaves somewhat succulent, obtuse to rounded at the tip. ................. A. philoxeroides

* Alternanthera caracasana Kunth. Cp (FL, GA, NC, SC): disturbed areas; rare, native of South America. Reported for Coastal Plain of SC, and in s. Coastal Plain of GA (Jones & Coile 1988) and for NC (FNA, K) and MD (K). [= FNA, K, WH; = Achyranthes repens Linnaeus – S, misapplied]

* Alternanthera floridana (Chapman) Small [add synonymy]

Alternanthera flavescens Kunth, Yellow Joyweed. Cp (FL): hammocks, sandbars; rare. Widespread in the FL peninsula, north to ne. FL (Clay County) (Wunderlin & Hansen 2004). [= K; > Achyranthes ramosissima (Mart.) Standl. – S; > Alternanthera floridana (Chapman) Small]
AMARANTHACEAE

* Alternanthera philoxeroides* (Martius) Grisebach, Alligator-weed. Cp (FL, GA, NC, SC, VA): floating in mats on the surface of the waters of blackwater rivers, sloughs, ditches, ponds, and in very moist soil of ditches and shores; common, native of tropical America. April-October. This plant is a serious weed of natural areas. [= RAB, C, FNA, K; = Achyranthus philoxeroides (Martius) Standley – S]

**Amaranthus** Linnæus 1753 (Amaranth, Pigweed)

1 Plants dioecious; [subgenus Acnida] ................................................................................................................................. Key A

1 Plants monoecious (the pistillate and staminate flowers intermingled, or in separate inflorescences on the same plant); [subgenera Albersia and Amaranthus] ................................................................................................................................. Key B

**Key A – Amaranthus, subgenus Acnida**

1 Plants pistillate.

2 Tepals present and well-developed (usually 5 present, at least the outer tepals >2 mm long and with a visible midvein).

3 Tepals 1 or 2, lanceolate to linear; [subgenus Acnida, section Acnida] ....................................................................................... *A. tuberculatus*

3 Tepals 5, at least the inner spatulate; [subgenus Acnida, section Saueraurans].

4 Outermost tepal obtuse or notched (similar to the others), the midvein excurrent slightly or not at all ........................................ *A. arenicola*

4 Outermost tepal acute or acuminate (dissimilar to the inner obtuse tepals), the midvein excurrent into a rigid point .................. *A. palmeri*

2 Tepals lacking, or rudimentary (often only 1-2 present, these <1 (2) mm long and lacking a visible midvein); subgenus Acnida, section Acnida.

5 Seeds 2-3 mm long; utricles 2.5-4 mm long ....................................................................................................................... *A. cannabinus*

5 Seeds 0.7-1.2 mm long; utricles 1-2.5 mm long.

6 Utricle with conspicuous and regular longitudinal ridges; bract > 1.5 mm long, with a stout midrib not far excurrent beyond the bract blade .......................................................................................................................... *A. australis*

6 Utricle smooth or irregularly tuberculate; bract < 1.5 mm long, with a slender excurrent midrib

7 Leaf blades narrow, all nearly all < 1 cm wide ..................................................... *A. floridanus*

7 Leaf blades broader, well-developed leaves 1-3 cm wide ................................................................................................. *A. tuberculatus*

1 Plants stamine. (some identifications following this lead may not be reliable).

8 Outer tepals with prominent midrib(s), usually longer than the inner tepals; bracts >2 mm long (or 1-2 mm long in *A. tuberculatus*), mostly with prominent midribs.

9 Outer tepals with apex acute or obtuse; dark midribs not excurrent .................................................................................. *A. arenicola*

9 Outer tepals with apex acuminate; midribs excurrent to rigid spines.

10 Bracts ca. 2 mm long, shorter than the outer tepals ................................................................................................. *A. tuberculatus*

8 Outer tepals without prominent midribs, not appreciably longer than the inner tepals; bracts <2 mm long, the midribs usually not prominent (except sometimes in *A. australis*).

11 Bracts < 1 mm long; midrils scarcely excurrent .................................................................................................................. *A. cannabinus*

11 Bracts > 1 mm long; midrills often conspicuously excurrent.

12 Leaf blades narrow, all nearly all < 1 cm wide .................................................................................................................. *A. floridanus*

12 Leaf blades broader, well-developed leaves 1-3 cm wide

13 Bracts with moderately prominent midrills; midrills of outer tepals excurrent ........................................................................ *A. australis*

13 Bracts with slender midrills; midrills of outer sepals not excurrent .................................................................................. *A. tuberculatus*

**Key B – Amaranthus, subgenera Albersia and Amaranthus**

1 Inflorescences axillary clusters of glomerules (sometimes leafy terminal spikes also present); [subgenus Albersia]

2 Pistillate flowers usually with 3 tepals; utricles usually regularly dehiscent (dehiscent in *A. blitum*).

3 Utricles indehiscent; leaf blades usually deeply notched at the tip .................................................................................. *A. blitum*

3 Utricles dehiscent; leaf blades obtuse, acuminate, or very shallowly notched at the tip.
AMARANTHACEAE

4 Tepals of pistillate flowers acute to short-acuminate at the tip, not reflexed; seeds 0.6-1.0 mm in diameter. ..........................
A. albus
4 Tepals of the pistillate flowers long-aristate at the tip, usually reflexed outward; seeds 1.0-1.4 mm in diameter.  [A. thunbergii]
5 Inflorescence axes thickened, becoming indurate at maturity. ........................................................................ A. crassipes var. crassipes
5 Inflorescence axes not thickened, not indurate at maturity. .................................................................................. A. blitoides
6 Urticles with regular, circumcisissile dehiscence. ................................................................................................. A. polygonoides
6 Urticles indehiscent (or tardily and irregularly dehiscent). ..................................................................................... A. pumilus

1 Inflorescences terminal spikes or panicles, leafless or nearly so at least in the distal portions (axillary spikes or clusters usually also present).
2 Pistillate flowers usually with (4-) 5 tepals; utricles usually indehiscent or tardily dehiscent (regularly dehiscent in A. blitoides).

9 Urticles indehiscent; tepals of pistillate flowers usually 2-3 (5 in A. spinosus); inflorescence bracts shorter than the tepals.
10 Stems with paired nodal spines; tepals of pistillate flowers 5; [subgenus Amaranthus] .............................................. A. spinosus
10 Stems lacking spines; tepals of pistillate flowers 2-3; [subgenus Albersia]. ................................................................. A. viridis

?? Amaranthus australis (A. Gray) J.D. Sauer, Southern Water-hemp, Careless. Cp (FL, GA, NC), Mt* (VA*): tidal marshes, ditches, disturbed areas; uncommon. E. NC, TN, AR, and TX south into West Indies, Mexico, and n. South America; probably adventive in most of our range, from an original distribution on the Gulf Coast, in FL, and southward into the New World tropics. This annual is alleged to get as large as 9 m tall and 30 cm diameter at the base of the stem! [= FNA, GW, K, WH, X; > A. curvifolius Linnaeus – S; > Acnedalabalamensis Standley – S]

Amaranthus cannabinus (Linnaeus) J.D. Sauer, Salt-marsh Water-hemp. Cp (DE, FL, GA, NC, SC, VA): salt, brackish, and freshwater tidal marshes, usually along the banks of tidal guts; common (rare in FL). July-December. ME south to ne. FL; AL? Extremely variable in size, flowering and fruiting at heights ranging from 3 dm to 4 m tall. The stem can reach 10 cm in diameter at the base. [= RAB, C, FNA, GW, K, WH, X; = Acnida cannabina Linnaeus – F, G, S]

Amaranthus caudatus Linnaeus, Love-lies-bleeding. Cp (DE), Pd (DE): disturbed areas; rare, native of India. Cultivated and rarely escaped or persistent, as in TN (Chester, Wofford, & Kral 1997), and scattered in PA (Rhoads & Klein 1993). [= FNA, C, F, G, K, Y]

?? Amaranthus crassipes Schlechtendahl var. crassipes, Spreading Amaranth. (SC): shores and wet areas; rare, probably introduced from tropical America. Var. warnockii (I.M. Johnston) Henrickson occurs in the Chihuahuan Desert region. [= Z; < A. crassipes – RAB, C, FNA, G, GW, K, S]
AMARANTHACEAE 669

* **Amaranthus crispus** (Lespinasse & Thévenau) A. Braun, Crisp-leaved Amaranth. Cp (NC): disturbed areas, especially around seaports; rare, native of South America. Reported for VA by Massey (1961), but no documentation is known. [= FNA, C, F, G, K, S]

* **Amaranthus cruentus** Linnaeus, Red Amaranth, Blood Amaranth, Purple Amaranth. Mt (VA, WV), {NC, SC}: disturbed areas, old gardens; rare, native of Central America. [= RAB, C, F, FNA, K, S, WV, Y]

* **Amaranthus hypochondriacus** Linnaeus, Prince's-feather. (VA): Type locality is "Virginia". Possibly of hybrid origin, from *A. cruentus × powelli*. [= FNA, C, K]

* **Amaranthus powelli** S. Watson, Green Amaranth, Powell's Amaranth. Mt (VA, WV), {GA, NC, SC, VA}: disturbed areas; rare. Widespread and common in PA (Rhoads & Klein 1993). Many earlier reports of *A. retroflexus* may actually pertain to this species. [= FNA, C, F, G, K; = *Amaranthus retroflexus* Linnaeus var. powelli (S. Watson) Boivin; = *Amaranthus powelli* ssp. powelli – Y]

**Amaranthus pumilus** Rafinesque, Seabeach Amaranth, Dwarf Amaranth. Cfp (DE, NC, SC, VA): sea beaches, fore-dunes, island end flats, rarely on sound-side beaches; rare. Se. MA south to c. SC; presently known to be extant only from NC, n. SC, e. MD, DE (McAvoy 2002), se. NY (Long Island), VA, and NJ. Seeds of this plant require cold stratification, high temperatures, and light to germinate (Baskin & Baskin 1998); this is apparently responsible for the late seasonality of the species (germination in late spring and early summer) and its seed-banking. See Hancock & Hosier (2003) for discussion of the ecology of this interesting species. [= RAB, C, F, FNA, G, KW, K, S]

* **Amaranthus viridis** Linnaeus, Prince's-feather. (VA): Type locality is "Virginia". Possibly of hybrid origin, from *A. cruentus × powelli*. [= FNA, C, K]

**Atriplex** Linnaeus 1753 (Orach)

**Identification notes:** There are a number of idiosyncratic characters that are used for the identification of the species of *Atriplex*. Many important characters are associated with the mature fruits. The fruit is closely invested by 2 bracteoles, which are variously shaped and ornamented. Mature seeds are dimorphic in most of our species, with large, brown seeds and small, black seeds. The radicle of the seeds is variously apical, lateral, or basal (which can be seen by observing the seed through the clarified bracteoles or with strong transmitted light).

1 Leaves white to gray, densely and finely scurfy, especially adaxially.
2 Seeds dimorphic, black and brown; branches not angled; [introduced, of disturbed situations]; [subgenus *Atriplex*, section *Semibaccata*] ....... [A. semibaccata]
3 Seeds monomorphic, brown; branches obtusely angled; [native, of coastal saline situations]; [subgenus *Obione*, section *Obione*, subsection *Arenariae*].
4 Fruitig bracteoles (3.5-) 4.5-7 mm long, 3.5-5.6 mm wide, longer than broad; faces with or without appendages.............. *A. mucronata*
5 Fruitig bracteoles 2.5-4.5 mm long, 2.6-5 mm wide, as wide as or wider than long; faces with appendages ................. *A. pentandra*
6 Leaves usually green on both surfaces, glabrous or only sparingly powdery or scurfy; [subgenus *Atriplex*, section *Teucriopsis*].
Atriplex dioica Rafinesque. Cp (NC, VA?), Mt (VA): brackish flats; rare? July-frost. NL (Newfoundland) west to AK, south to NC and CA. [= FNA; *Atriplex subsplicata* (Nuttall) Rydberg – K, Y; <*A. littoralis* Linnaeus – C, misapplied; <*A. patula* Linnaeus var. *littoralis* (Linnaeus) A. Gray – F, misapplied]

*Atriplex mucronata* Rafinesque, Seabear Orach. Cp (DE, FL, NC, VA): ocean beaches, island-end flats; uncommon. July-frost. NH south to FL west to TX. This species and *A. pentandra* are closely related, and have been variously treated as species, subspecies, varieties, and forms. [= FNA; <*A. arenaria* Nuttall – RAB, C, G, GW, S, Y (also see *A. pentandra*); <*A. cristata* Humboldt and Bonpland ex Willenow – K (also see *A. pentandra*); <*A. pentandra* ssp. *arenaria* H.M. Hall & Clements]

* Atriplex patula* Linnaeus, Spear Orach. Pd (VA), Mt (VA, WV): disturbed areas, inland saline areas; rare, native of Eurasia. July-frost. [= C, FNA, K, S, Y; <*A. patula* Linnaeus – RAB, W (also see *A. prostrata*); =*A. patula* var. *patula* – F, G]

*Atriplex pentandra* (Jacquin) Standley in N.L. Britton et al., Seabear Orach. Cp (FL, GA, NC, SC): ocean beaches, island-end flats; uncommon. July-frost. NC to FL, west to TX; West Indies; South America. This species and *A. mucronata* are closely related, and have been variously treated as species, subspecies, varieties, and forms. [= FNA; <*A. arenaria* Nuttall – RAB, C, G, GW, S, Y (also see *A. mucronata*); <*A. cristata* Humboldt and Bonpland ex Willenow – K (also see *A. mucronata*); =*A. pentandra* ssp. *pentandra*]

Atriplex acadiensis . Saltville VA.

* Atriplex littoralis* Linnaeus, Narrow-leaved Atriplex. Cp (VA): Introduced south to PA (FNA) and MD (Kartesz 1999). [= FNA, K; <*A. littoralis* Linnaeus – C; <*A. patula* Linnaeus var. *littoralis* (Linnaeus) A. Gray – F]

* Atriplex semibaccata* R. Brown, Australian Saltbush, Berry Saltbush. Introduced at various localities in North America, including DC (FNA). [= FNA, K]

* Atriplex tatarica* Linnaeus, Tatarian Orach. Introduced on ballast at scattered localities, including AL, FL (Escambia County), NJ, and PA (FNA). [: FNA; <*A. lampa* Gillies – K, S, misapplied] [not keyed]

Bassia Allioni 1766 (Bassia)

1 Calyx segments (1 lower and 2 upper) bearing stout knobs………………………………………………………………………………………………………………………………………...B. hirsuta

Beta Linnaeus 1753 (Beet)

### Celosia Linnaeus 1753 (Cockscomb)

| **1** Style ca. 0.2 mm long; inflorescence of lax, interrupted panicles | **C. trigyna** |
| **1** Style 3-4 mm long; inflorescence very dense | **C. argentea** |
| **2** Inflorescence of crowded spikes | **C. cristata** |
| **2** Inflorescence crested, fanlike, or elaborately lobed | **C. argentea** |

### Chenopodium Linnaeus 1753 (Goosefoot, Lamb’s-quarters, Pigweed)

**Chenopodium album** Linnaeus, Lamb's-quarters, Pigweed. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed soils, gardens; common. June-November. As broadly interpreted, this species includes both native and alien races and is now distributed nearly worldwide. [= FNA, W; < *C. album* – RAB, in part (also including *C. berlandieri* and all vars); > *C. album* Linnaeus var. *album* – K; > *C. album* Linnaeus var. *missouriense* (Aellen) I.J. Basset & C.W. Crompton – K; > *C. album* – C; < *C. album* – G; > *C. missouriense* Aellen – C, Y; > *C. pagonum* – F, S, misapplied; < *C. album* – FNA, G, < *C. album* var. album – Y; > *C. album* var. *lanceolatum* (Muhlenberg ex Wildenedow) Coss. & Germ. – Y; > *C. giganteum* Don – Y; > *C. lanceolatum* Muhlenberg ex Wildenedow]

* Chenopodium atrovirens Rydberg. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, native of w. North America. [= FNA, K]

* Chenopodium berlandieri Moquin-Tandon var. *boscinianum* (Moquin-Tandon) H.A. Wahl. Cp (GA, NC, SC, VA): beaches, marshes; uncommon. August-September. FL west to c. TX; with scattered occurrences further north (these of unknown nativity). [= FNA, K, Y; < *C. album* – RAB]

* Chenopodium berlandieri Moquin-Tandon var. *bushianum* (Aellen) Cronquist, Soybean Goosefoot. Cp (NC, SC, VA), Mt (WV): disturbed areas, alluvial forests; rare. June-November. ME west to ND, south to VA, TN, LA, and KS. [= FNA, K; < *C. album* – RAB, G; < *C. berlandieri* – S; = *C. bushianum* Aellen – Y]

* Chenopodium berlandieri Moquin-Tandon var. *zschackei* (J. Murr) J. Murr ex Ascherson. Mt (VA), {NC, SC}. ON west to AK, south to LA, CA, and Mexico; scattered eastern occurrences may be introduced. [= FNA, K, Y; < *C. album* – RAB]

* Chenopodium foggii H.A. Wahl. Mt (NC, VA): rocky, mountain slopes; rare. July. ME and ON south to w. VA and w. NC. [= FNA, K, Y; < *C. pratericola* Rydberg – C]

* Chenopodium fremontii S. Watson. Cp (SC): waste areas near wool-combing mills; rare, perhaps merely a waif, native of w. North America. [= FNA; < *C. fremontii* var. *fremontii* – K, Y] [not yet keyed]

* Chenopodium glaucum Linnaeus, Oakleaf Goosefoot. Pd (DE, VA), Mt (WV), {SC}: disturbed areas; rare, native of ne. North America and Europe. [= FNA, K; < *C. glaucum* – C, F, G, WV; = *C. glaucum* var. *glaucum* – Y]

* Chenopodium opulifolium Schrad ex Koch & Ziz, Gray Goosefoot. Pd (DE), Cp (NC): disturbed areas, on ship's ballast; rare, native of s. Europe. [= RAB, FNA, K, Y]

* Chenopodium pratericola Rydberg, Narrowleaf Goosefoot. Cp (GA, NC, SC, VA), Mt (WV): sandy soils, roadsides, disturbed areas; uncommon. May-November. Maine and ON west to YT, south to FL, TX, and CA. [= FNA, K; < *C. desiccatum* A. Nelson var. leptophylloides (J. Murray) H.A. Wahl – RAB, W, misapplied; < *C. pratericola* – C (also see C. foggii); ? *C. lephtphyllum* – F, G, misapplied; = *C. pratericola var. pratericola* – Y]

* Chenopodium simplex (Torrey) Rafinesque, Mapleleaf Goosefoot. Mt (NC, VA, WV), Pd (DE), Cp (DE): in shaded situations, generally at cliff bases; common (uncommon in WV, rare in NC and VA). July-October. NS west to AK, south to nw. NC, LA, TX, and UT. [= FNA, K; = *C. giganteum* Aellen – C, W, Y; = *C. hybridum* Linnaeus var. *giganteum* (Aellen) Rouleau – F; = *C. hybridum* – G; = *C. hybridum* Linnaeus ssp. giganteum (Aellen) Hultén]

* Chenopodium standleyanum Aellen, Woodland Goosefoot. Mt (VA, WV), Pd (VA), Cp (VA), {GA, NC, SC}: rock outcrops, steep slopes, shaded disturbed soils; uncommon (rare in WV). QC west to ND, south to FL and e. TX. [= RAB, C, FNA, G, K, W; < *C. boscianum* – F, S, misapplied]

* Chenopodium urticum Linnaeus, City Goosefoot. Mt (WV), Pd (DE): disturbed areas; rare, native of Eurasia. Introduction in waste ground south to MD, s. PA (Rhoads & Klein 1993), WV, KY, and TN (Kartesz 1999, FNA 2003b). [= C, FNA, K, Y]
AMARANTHACEAE

* Chenopodium vulvaria* Linnaeus, Stinking Goosefoot. Pd (DE); disturbed areas; rare, native of Eurasia. Introduced at scattered locations in eastern North America, as in MD, PA, DE, FL (FNA 2003b). [= C, FNA, K, Y]

* Chenopodium bonus-henricus* Linnaeus, Good King Henry, is cultivated and is known from as far south as MD and PA. [= FNA, C, K, Y]

Chenopodium capitatum (Linnaeus) Ascherson var. capitatum, Indian-paint, Strawberry-blite, a native, occurs south to scattered locations in PA (Rhoads & Klein 1993). [= FNA, Y; < C. capitatum – C; < C. capitatum – K, in a narrow sense; Blitum capitatum Linnaeus]

* Chenopodium rubrum* Linnaeus, Red Goosefoot, alien, reported as far south as MD and in other widely scattered sites (such as AL) (Kartesz 1999) and PA (FNA). [= C, K; > C. rubrum var. rubrum – FNA, Y]

* Chenopodium stricturn* Roth. Scattered locations south to SC. PA. Reported for SC (Kartesz 1999). [= FNA; = Chenopodium album Linnaeus var. stricturn (Krašan) comb. nov. ined. – K; > Chenopodium stricturn ssp. glaucophyllum (Aellen) Aellen & Just.; > Chenopodium stricturn Roth var. glaucophyllum (Aellen) H.A. Wahl – Y]

**Cycloloma** Moquin 1840 (Winged-pigweed)

**Dysphania** R. Brown 1810

A genus of about 32 species, annual and perennial herbs, nearly cosmopolitan, mostly in the tropics, subtropics, and warm temperate areas. References: Clemants & Mosyakin in FNA (2003b); Wahl (1954)–Y.

1 Leaves deeply pinnately lobed, the lobes linear; plant perennial; mature calyx shallowly toothed, obovoid-urceolate, reticulate-veiny; [section Adenois]. .................................................................................................................................................................................. D. multifida

1 Leaves serrate to sinuate-pinnatifid, the lobes broad-based and triangular-tapered; plant annual; mature calyx deeply lobed, neither reticulate nor prominently veined.

2 Flowers in a slender thyrsoid inflorescence of lateral cymes; [section Botryoides]............................................................................................................................. D. botrys

2 Flowers in dense glomerules arranged in spikes and panicles.

3 Leaf blades 0.5-2.7 cm long; seeds vertical; stems 0.5-5 dm tall; [section Adenois].

4 Inflorescences foliose throughout.................................................................................................................................................. D. ambrosioides

4 Inflorescences leafless (leaves in the inflorescence absent or shorter than the glomerules).................................................................................. D. anthelmintica

5 Leaf blades 2-8 cm long; seeds mostly horizontal; stems 3-15 dm tall; [section Orthospora], Dysphania pumilio

5 Perianth segments keeled and crested ........................................................................................................................................ D. cristata

5 Perianth segments rounded................................................................................................................................................ D. pumilio

* Dysphania ambrosioides* (Linnaeus) Mosyakin & Clemants, Mexican-tea, Epazote. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed habitats; common, probably native southward. Widespread in North America to South America, the original range unclear. [= FNA; < Chenopodium ambrosioides – RAB, C, G, W, Y (also see Dysphania anthelmintica); = C. ambrosioides var. ambrosioides – F; < C. ambrosioides var. ambrosioides – K (also see Dysphania anthelmintica); < Ambrina ambrosioides (Linnaeus) Spach – S (also see D. anthelmintica); < Teloxys ambrosioides (Linnaeus) W.A. Weber]

**Dysphania anthelmintica** (Linnaeus) Mosyakin & Clemants, Wormseed, Epazote. Cp (GA, NC, SC, VA): dunes; common. NY south to FL, west to TX; Mexico, West Indies, Bermuda, Central America; scattered inland in North America probably as an introduction. [= FNA; < C. ambrosioides – RAB, C, G, W, Y; = C. ambrosioides var. anthelmintica (Linnaeus) A. Gray – F; < C. ambrosioides var. ambrosioides – K; < Ambrina ambrosioides (Linnaeus) Spach – S].

**Froelichia** Moench 1794 (Cottonweed, Snake-cotton)

1 Calyx conical in fruit, ca. 3-4 mm long; plant 2-7 dm tall, branching from the base .......................................................... *F. gracilis*

1 Calyx flask-shaped in fruit, ca. 5 mm long; plant 3-20 dm tall, not branching from the base

2 Hairs of the peduncles <0.5 mm long; plants typically 10-20 dm tall; [of the Southeastern Coastal Plain] ......................... *F. floridana*

* Froelichia floridana (Nuttall) Moquin-Tandon, Florida Cottonseed, Common Cottonweed. Cp (DE*, FL, GA, NC, SC): sandhills, sandy fields, sandy roadides; common (rare in NC, uncommon in DE). June-October. S. NC south to FL, and west to LA, north in the interior to w. TN; disjunct (probably introduced) in DE and e. MD. *F. campestris* Small is more midwestern, ranging from OH, IN, WI, and SD south to KY, AR, and TX; it is sometimes treated as a variety of *F. floridana*, but seems amply distinct in morphology, and with an allopatric distribution. [= RAB, S; = *F. floridana* var. *floridana* – C, F, G, K, Z; < *F. floridana* – FNA, WH]

* Gomphrena* Linnaeus 1753 (Globe-amaranth)

1 Heads 20-28 mm in diameter; stems erect ................................................................................................................................................ *G. globosa*

1 Heads 8-16 mm in diameter; stems prostrate or decumbent ...................................................................................................................... *G. serrata*

* Gomphrena globosa* Linnaeus, Globe-amaranth. Cp (SC) {VA?}: disturbed areas; rare, native of s. Asia. Introduced and known from scattered locations in s. PA (Rhoads & Klein 1993). Also reported for VA (Kartesz 1999) and MD (Reed 1961b). [= FNA, C, F, G, K]

* Guilleminea* Kunth 1823

* Iresine* P. Browne 1856 (Bloodleaf)

1 Plant an annual to weak perennial, 4-30 dm tall, with fibrous roots; tepals 0.6-0.8 mm long, the tips obtuse to rounded ......................... *I. diffusa*

1 Plant a perennial, 3-10 dm tall, with stolons; tepals 1.0-1.3 mm long, the tips acute to acuminate .................................................. *I. rhizomatosa*

* Iresine diffusa* Humboldt & Bonpland ex Willdenow, Judas-bush. Cp (FL): hammocks, disturbed areas; rare. Reported for NC by Small (1933), so far as is known in error. Ne. FL, Panhandle FL, south to s. FL. [= FNA, K, WH; < *Iresine celosia* Linnaeus – S]

* Iresine rhizomatosa* Standley. Cp (FL, GA, NC, SC, VA), Pd (VA): moist interdune thickets, hammocks, edges of maritime forests, moist thickets inland, floodplain forests, bluff forests of the Coastal Plain; rare. August-October. MD south to FL, west to se. TX; also inland from KY and TN west and south to KS and n. TX. [= RAB, C, F, FNA, G, K, S, WH]

* Salicornia* Linnaeus 1753 (Glasswort)

A genus of about 10-20 species, succulent herbs, of cosmopolitan distribution. References: Judd & Ferguson (1999)=Z; Ball in FNA (2003b); Kadereit et al. (2007); Kühn in Kubitzki, Rohwer, & Bittrich (1993). [also see Sarcocornia]
**Salicornia bigelovii** Torrey, Dwarf Glasswort, Dwarf Saltwort. Cp (DE, GA, NC, SC, VA): salt pannes in coastal marshes; common (rare in DE). July-October. ME (NS?) south to FL, west to TX; also West Indies; also CA. [= RAB, C, F, FNA, G, GW, K, S, Z]

**Salicornia virginica** Linnaeus, Samphire. Cp (DE, GA, NC, SC, VA), Mt (VA): salt pannes in coastal marshes; common. July-October. NS and QC south to FL. It is unclear whether our eastern North American plants are distinct from European plants of the *S. europaea* complex. Recent European workers recognize multiple species in the *S. europaea* complex. *S. europaea* (in the narrow sense) is a diploid species; our plants are apparently all tetraploid and may or may not be conspecific with one of the European tetraploid entities in this complex. Until further studies are completed, it seems best to recognize our plants as distinct. The oldest name available for the American plants is *Salicornia virginica* Linnaeus, which has unfortunately been generally misapplied to the perennial glasswort, *Sarcocornia perennis*. [= K; = Salicornia depressa Standley in N.L. Britton et al. – FNA; < *Salicornia europaea* Linnaeus – RAB, C, G, GW, S, W, Z, misapplied; >= *Salicornia europaea* var. *europaea* – F]

**Salicornia maritima** Wolff & Jefferies, Sea Saltwort, supposedly occurs south to MD (Kartesz (1999); FNA (2003b) does not map it south of the Canadian Maritimes. [= FNA, K] [not keyed; synonymy incomplete]

**Salsola** Linnaeus 1753 (Saltwort, Russian-thistle)

1 Leaf blades not fleshy in fresh material, narrowly linear to filiform, < 1 mm wide in herbarium material; leaves with a weak apical spine .................................................. *S. tragus*

1 Leaf blades fleshy in fresh material, linear, 1-2 mm wide in dried specimens; leaves with a strong apical spine.

2 Perianth segments with a weak non-spiny apex and obscure midvein; bracteoles connate at base, swollen ................................................................. *S. caroliniana*

2 Perianth segments with a subspinoe apex and prominent midvein; bracteoles distinct, not swollen ................................................................. *S. kali*

**Sarcocornia** A.J. Scott 1978 (Woody Glasswort)

**Spinacia** Linnaeus 1753 (Spinach)

Suæda Forsskål ex Scopoli 1777 (Sea-blite)

1 Calyx segments keeled on the back; flowers in 1-3-flowered glomerules, these aggregated in a dense panicule; seeds dimorphic, black seeds shiny, 1-1.8 mm in diameter, brown seeds dull, 1.5-2.6 mm in diameter ................................................................. S. linearis

Suaeda linearis (Elliott) Moquin, Southern Sea-blite. Cp (DE, FL, GA, NC, SC, VA), Mt* (WV*): island-end flats, marsh edges, brackish flats, rarely adventive inland in disturbed areas; uncommon (rare in WV). August-frost. ME south to FL, west to TX; West Indies. [= C, F, FNA, G, GW, Y, Z; Dondia linearis (Elliott) Heller – S]

*? Suaeda maritima (Linnaeus) Dumortier, White Sea-blite. Cp (DE, VA): salt marsh edges and disturbed saline habitats; common (uncommon in DE), possibly native, introduced, or a combination. Usually considered (as by C, GW, S) to be naturalized from Eurasia, but Ferren & Schenk (2003b) consider S. maritima in North America to include native and naturalized components. [= C, F, FNA, G, GW, Y, Z; > S. maritima ssp. maritima – K; = Dondia maritima (Linnaeus) Druce – S]

304. AIZOACEAE Rudolphi 1830 (Fig-marigold Family) [in CARYOPHYLLALES]

A family of about 128 genera and about 1850-2500 species, mostly succulent herbs and subshrubs, of tropical and subtropical regions, especially in s. Africa and Australia. References: Boetsch (2002); Vivrette, Bleck, & Ferren in FNA (2003b); Hartmann in Kubitzki, Rohwer, & Bittrich (1993). [also see MOLLUGINACEAE]

1 Leaves opposite, connate-perfoliate around the stem, triangular in cross-section; fruit a fleshy, indehiscent berry; [subfamily Ruschioidae] ...

Carpobrotus

1 Leaves opposite or alternate, sessile or short-petiolate, flattened in cross-section (though often succulent-thickened); fruit either a dry, indehiscent nut or a capsule.
2 Leaves linear, lanceolate, or oblanceolate, the blade > 3× as long as wide; [subfamily Sesuvioideae] ........................................ Sesuvium
3 Leaves orbicular, obovate, or triangular-ovate, the blade < 2.5× as long as wide.
4 Leaves opposite to subopposite; fruit a circumcissile capsule; [subfamily Sesuvioideae] ........................................ Trianthema
5 Leaves alternate; fruit either a loculicidal capsule or an indehiscent nut.
6 Fruit a loculicidal capsule; ovary superior; stems densely covered with white scales; [subfamily Aizoioideae] ................................ Tetragonia
7 Fruit an indehiscent nut; ovary inferior; stems green; [subfamily Tetrionioideae] ...........................................

Carpobrotus N.E. Brown 1925 (Fig-marigold)

* Carpobrotus edulis (Linnaeus) N.E. Brown, Hottentot-fig. Cp (FL): dunes, disturbed sandy sites; rare, native of s. Africa. [= FNA, WH]

Galenia Linnaeus 1753

* Galenia secunda (Linnaeus f.) Sonder. Cp (FL): disturbed areas; rare, native of s. Africa. [= FNA, S, WH]

Sesuvium Linnaeus 1759 (Sea-purslane)

1 Flowers and fruits on pedicels (3-) 5-20 mm long ................................................................. S. portulacastrum
2 Flowers and fruits sessile (or on pedicels to 1 mm long).
3 Stamens numerous, in fascicles; leaves 3-6 cm long, 10-20× as long as wide; [rare waif] .................................................... S. crithmoides
4 Stamens 5, distinct; leaves 1-3.5 cm long, 3-10× as long as wide; [native] ........................................ S. maritimum

Trianthema Linnaeus 1753 (Horse-purslane)

305a. PHYTOLACCACEAE R. Brown 1818 (Pokeweed Family) [in CARYOPHYLLALES]

A family of about 18 genera and 70 species, herbs, shrubs, vines, and trees, of tropical and warm temperate regions, especially America. References: Nienaber & Thieret in FNA (2003b); Rohwer in Kubitzki, Rohwer, & Bittrich (1993). [also see PETIVERIACEAE]

Phytolacca Linnaeus 1753 (Pokeweed)

1 Fruiting pedicels (6-) 7-12 (-15) mm long; raceme (not including the peduncle) 10-20 (-25) cm long, divergent or drooping in flower and fruit (or erect in flower); [widespread in our area] ...................................................................................................................................... P. americana

1 Fruiting pedicels (2-) 4-6 (-7) mm long; raceme (not including the peduncle) (3-) 6-9 (-13) cm long, erect (rarely divergent) in flower and fruit; [restricted in our area to maritime habitats] ........................................................................................................................................ P. rigida

Phytolacca americana Linnaeus, Common Pokeweed. In a wide variety of natural and disturbed habitats, usually associated with exposed mineral soil. May-frost. An abundant "native weed" occurring throughout e. North America, P. americana is widely dispersed by birds and quickly colonizes exposed mineral soil even in undisturbed forests, such as on tree-fall tip-up mounds or flood scours. It is most abundant, however, as a weed of urban, suburban, and agricultural disturbances. The berries and mature stems are poisonous; the young stems have been used as a potherb and the purple berries as a source of ink. [= C, F, G, S, W, WV, X, Y; < P. americana – RAB, GW, WH (also see P. rigida); = P. americana var. americana – FNA, K, Z]

Phytolacca rigida Small, Maritime Pokeweed. Dune slacks, dune slopes, edges of tidal marshes, disturbed areas on barrier islands, xeric sandhills near the coast. May-frost. DE (reportedly), se. VA south to FL and west to TX in the Southeastern Coastal Plain. In the northern parts of our area, in NC and VA, P. rigida is rather rare, limited to the vicinity of the coast, and less weedy than P. americana. Caulkins and Wyatt (1990) reduce P. rigida to a variety of P. americana, but it seems distinct at the species level. [= S, X, Y; < P. americana – RAB, GW, WH; = P. americana var. rigida (Small) Caulkins & Wyatt – FNA, K, Z]

305b. PETIVERIACEAE C. Agardh 1824 (Petiveria Family) [in CARYOPHYLLALES]

A family of about 9 genera and 13 species, herbs, vines, and trees, of tropical areas. Sometimes included in the Phytolaccaceae.
**PETIVERIACEAE**

*Rivina* Linnaeus 1753 (Rouge-plant)

A monotypic genus, an herb, of the American tropics.

### 307. NYCTAGINACEAE

A family of about 31 genera and 400 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (less commonly) warm temperate regions, especially diverse in the New World. Both our genera are in tribe Nyctagineae (Douglas & Spellenberg 2010). References: Bogle (1974)=Z; Spellenberg in FNA (2003b); Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993).

*Boerhavia* Linnaeus 1753 (Spiderling)

A genus of about 20-40 species, annual and perennial herbs, of tropical, subtropical, and warm temperate regions of the Old and New World. References: Spellenberg in FNA (2003b); Bogle (1974)=Z; Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993). Key based on Spellenberg in FNA.

1. Fruit truncate at the apex, glabrous, with longitudinal ribs acute and winglike; annual .......................................................... *B. erecta*
2. Leaves well-distributed throughout the plant; inflorescences axillary and terminal; branches spreading-villous or hispid to minutely and finely pubescent ..................................................................................................................................................................................
   1. Fruit rounded at apex, stipitate-glandular, with longitudinal ribs rounded; perennial. .......................................................... *B. coccinea*
   2. Leaves mostly concentrated in the basal ½ of the plant; inflorescences mostly terminal; branches glabrate or glabrous .................. *B. diffusa*

*Boerhavia coccinea* P. Miller, Wineflower. Disturbed areas, adventive on ballast; native of tropical America. June-September. Contrary to the statement in RAB that this species is "apparently not established," it is well established on the Wilmington (New Hanover County, NC) waterfront. [= RAB, FNA, K; = *Boerhaavia coccinea* – S, orthographic variant]

*Boerhavia diffusa* Linnaeus, Red Spiderling, Spreading Hogweed. Vacant lots, road shoulders, other disturbed areas. Pantropical and subtropical. [= FNA, K, Z]

*Boerhavia erecta* Linnaeus, Erect Spiderling. Sandy fields, roadsides, disturbed areas, railroad yards. May-October. NC south to FL, west to TX and AZ, perhaps only introduced in our area, at least in the Carolinas. [= RAB, FNA, K, Z; = *Boerhaavia erecta* – G, S, orthographic variant]

*Mirabilis* Linnaeus 1753 (Umbrella-wort, Four-o'clock)

1. Petaloid calyx with a narrow tube 3-4 cm long, the spreading portion to 5 cm in diameter; involucre with 1 flower, not expanding in fruit; [section *Mirabilis*] .................................................................................................................................................................. *M. jalapa*
2. Petaloid calyx with a broad tube < 0.5 cm long, the spreading portion < 1.5 cm in diameter; involucre with 3-5 flowers, expanding in fruit; [section *Oxybaphus*].
   1. Leaves linear to narrowly lanceolate, 0.1-1 cm wide, 7-15× as long as wide .......................................................... *M. linearis* var. *linearis*
   2. Leaves lanceolate to ovate, 1-8 cm wide, 1-6× as long as wide.
   3. Leaves cordate at the base, 1-2× as long as wide; [introduced, of disturbed habitats] .................................................. *M. nyctaginea*
   3. Leaves cuneate at the base, 2.5-6× as long as wide; [native, of dry sandy habitats in s. SC southward] .......................... *M. albida*

308. MOLLUGINACEAE Hutchinson 1926 (Carpetweed Family) [in CARYOPHYLLALES]

*Mollugo* Linnaeus 1753 (Carpetweed)

A genus of about 35 species, annual herbs, of tropical and subtropical regions of both hemispheres, introduced in temperate regions. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993).

309. MONTIACEAE Rafinesque 1820 (Montia Family) [in CARYOPHYLLALES]

A family of about 14 genera and 250 species, annual and perennial herbs and subshrubs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Packer in FNA (2003b); Nyffeler & Eggli (2010); Carolin in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaves terete, alternate; subshrubs with woody bases.............................................................. Phemeranthus
1 Leaves flat, opposite or alternate; herbs.

2 Stems with 2 opposite cauline leaves; petals 6-14 mm long.................................................... Claytonia
2 Stems with > 2 leaves, opposite or alternate; petals 1-6 mm long........................................... Montia

*Claytonia* Linnaeus 1753 (Spring-beauty)

1 Cauline leaves either fused together, perfoliate, the pair together nearly round, or not fused but each broadly ovate; annual, from fibrous roots with minute tubers; [cultivated, rarely naturalizing].
2 Basal rosette leaves erect or ascending, the blade 1-7 cm long...................................................... C. perfoliata ssp. perfoliata
2 Basal rosette leaves flattened against the ground, the blade 0.5-1.5 cm long..................................... C. rubra ssp. rubra
1 Cauline leaves not fused, each linear, lanceolate, or ovate; perennial, from tubers 1-2 cm in diameter; [native, of moist forests].
3 Cauline leaves 3-6 (-11) cm long (including the evident petiole), the blade narrowly diamond-shaped, 2.5-6 (-8)× as long as wide; leaves 10-15 (-30) mm wide .............................................................. C. caroliniana
3 Cauline leaves (5-) 7-20 cm long (including the poorly differentiated petiole), the blade > 8× as long as wide; leaves 1-10 (-20) cm wide.
4 Broadest leaves on a plant 1-2 (-4) mm wide .............................................................................. C. virginica var. acutiflora
4 Broadest leaves on a plant 5-10 (-20) mm wide .............................................................. C. virginica var. virginica

*Claytonia caroliniana* Michaux, Carolina Spring-beauty. Moist forests, especially northern hardwood forests and cove forests at moderate to high elevations. March-May. NS west to MN, south to w. NC, e. TN, and n. GA; disjunct in AR. [= RAB, C, F, FNA, G, S, W, Y, Z; > C. caroliniana var. caroliniana – K; > C. caroliniana Michaux var. lewisi McNeill – K]

*Claytonia perfoliata* Donn ex Willdenow ssp. perfoliata, Miners'-lettuce. Disturbed areas, lawns, gardens; native of w. North America. [= FNA, K]
**Claytonia rubra** (Howell) Tidestrom *symp. rubra*, Miners’-lettuce. Disturbed areas; native of w. North America. Naturalizing in Arlington County, VA (Steury 2010). [= FNA, K]

**Claytonia virginica** Linnaeus var. *acutiflora* A.P. de Candolle, Southern Spring-beauty. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA): moist forests; common. (January-) February-April. VA west to IL, south to sw. GA and TX. This variety has chromosome numbers of n=6, n=7, and polyploid and polyploid/aneuploid derivatives of those numbers. [= C, K; < C. virginica – RAB, F, FNA, G, W, Y; = C. virginica – S; = C. virginica var. *simsii* (Sweet) R.J. Davis – Z; = C. *simsii* Sweet]

**Claytonia virginica** Linnaeus var. *virginica*, Eastern Spring-beauty. Mt (DE, GA, NC, SC, VA, WV), Pd (NC, SC, VA), Cp (DE, NC, SC, VA): moist forests. (January-) February-April. NS west to MN, south to GA and TX. This variety has chromosome numbers of n=8 and polyploid and polyploid/aneuploid derivatives of that number. [= K, Z; < C. virginica – RAB, F, FNA, G, W, Y; < C. *virginica var. virginica* – C; = C. *media* (A.P. de Candolle) Link – S]

**Montia** Linnaeus 1753 (Blinks, Montia)

1 Leaves opposite .................................................................................................................................................................................. *M. fontana*
1 Leaves alternate ....................................................................................................................................................................................... *M. linearis*

**Montia fontana** Linnaeus, Water Blinks. Cp (VA): wet places; rare, native of northern North America and Eurasia. [= FNA; > *M. fontana var. fontana* – C; > *M. fontana ssp. fontana* – K]

**Montia linearis** (Douglas ex Hooker) Greene, Narrow-leaved Montia. Pd (NC), Cp (VA): lawns, disturbed areas; rare, native of western North America. Also in c. TN (Chester, Wofford, & Král 1997). [= FNA, K]

**Phemeranthus** Rafinesque 1814 (Rock-pink, Famenflower)

A genus of about 20 species, herbs and dwarf shrubs, of America. Our North American "Talinums" are not closely related to the broad-leaved type of *Talinum* and are transferred to *Phemeranthus* (Kiger 2001). Adaptation of our native species of *Phemeranthus* to different rock substrates is discussed by Ware & Pinion (1990). References: Kiger in FNA (2003b); Wilson (1932)–X; Ware (1967)–Y; Kiger (2001)–Z; Murdy & Carter (2001)–Q; Carter & Murdy (1985); Rose & Standley (1911); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Hershkovitz & Zimmer (2000).

1 Stamens 4-8; flowers open in late afternoon................................................................. *[P. parviflorus]*
1 Stamens 12-80; flowers variously open from early or late afternoon.

2 Style 2-3.5 mm long, shorter than or about the same length as the stamens; stamens 12-30; flowers open from (3-) 3:30 to 7 p.m. E.D.S.T. ................................................................. *[P. tereifolius]*
2 Style 3.8-7 mm long; stamens 25-80 (-90); flowers open from about 1 to 7 p.m. E.D.S.T. ................................................................. *[P. calcaricus]*

3 Stigma distinctly 3-lobed; mature seeds covered with a dull gray coating; [of calcareous rock outcrops]..................................................... *[P. mengesi]*
3 Stigma subcapitate; mature seeds brown-black and lustrous; [of noncalcareous rocks].

4 Stamens (40-) 50-80 (-90); [of granite and sandstone from SC southward]........... *[P. species 1]*
4 Stamens 25-42; [of mafic and ultramafic rocks, known from nc. NC and se. VA]................................. *[P. species 1]*

**Phemeranthus calcaricus** (S. Ware) Kiger, Cedar-glade Rock-pink. Calcareaeous glades. C. TN south to n. AL. A tetraploid species, probably derived from *P. calycinus* Engelmann. [= FNA, Z; = *Talinum calcaricum* S. Ware – K, Q, Y]

**Phemeranthus mengesi** (W. Wolf) Kiger, Large-flowered Rock-pink. Pd (GA, SC), Cp (GA): in shallow soil over felsic rocks (granite) or sandstone (in GA and AL), or Altamaha Grit (GA), where periodically wet by seepage; rare (locally common in GA). June-September. C. SC south to c. GA (where it extends into the Coastal Plain on outcrops of Altamaha Grit), west to n. AL and sc. TN. *P. mengesi* and *P. parviflorus* Nuttall of the midwestern United States (and disjunct as far east as AL) are apparently the parents of the allotetraploid *P. tereifolius*. Diplloid and tetraploid populations are known of this taxon; further investigation is needed to determine if the tetraploids are allotetraploids or autotetraploids. [see *Phemeranthus mengesi* – FNA, Z (also see *P. species 1*); = *Talinum mengesi* W. Wolf – Q, S, Y; < *Talinum mengesi* – K (also see *P. species 1*)]

**MONTIACEAE**

*Phemeranthus species*. Pd (NC, VA): in periodic seepage on mafic or ultramafic rocks; rare. (June?) July-September. This taxon was discovered at a diabase glade in Granville County, NC and ultramafic barrens in Franklin County, VA, floristically rich in other species of disjunct and relict distribution. [<em>Talinum mengesi</em> – K; <em>Phemeranthus mengesi</em> – FNA, Z]

*Phemeranthus teretifolius* (Pursh) Rafinesque, Appalachian Rock-pink. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (GA): in shallow soil over felsic or mafic rocks (granite, gneiss, schist, granite, diabase, greenstone, metabasalt, sandstone, Altamaha grit), especially where periodically wet by seepage (often in mats of the moss <em>Grimmia</em>); common (rare in WV). June-September. DE (at least formerly), se. PA, and WV, south to se. TN, GA (where it extends into the Coastal Plain on outcrops of Altamaha Grit), and AL, in the Appalachians and adjacent provinces. *P. teretifolius* is an allotetraploid, probably derived from hybridization followed by polyploidization of the diploids <em>P. mengesi</em> and <em>P. parviflorus</em>. [= FNA, Z; = Talinum teretifolium Pursh – RAB, C, F, G, K, Q, S, W, WV, X, Y]

---

**311. BASELLACEAE** Moquin-Tandon 1840 (Madeira-vine Family) [in CARYOPHYLLALES]

A family of 4 genera and about 20 species, fleshy perennial vines and herbs, of the tropics and subtropics. References: Vincent in FNA (2003b); Sperling & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010).

1. Filaments free nearly to base, adnate for < ¼ of their length to the petals.............................................................................................................<em>Anredera</em>

1. Filaments adnate for > ½ of their length to the petals .........................................................................................................................<em>Basella</em>

**Anredera** Jussieu (Madeira-vine)

* <em>Anredera cordifolia* (Tenore) Steenis, Madeira-vine. Cp (FL): disturbed areas; rare, native of South America. In Panhandle FL (Leon County) and n. peninsular FL (Alachua County) (Wunderlin & Hansen 2004). [=FNA, K1, K2, WH; <em>Boussingaultia leptostachya</em> Moquin – S]

**Basella** Linnaeus 1753

A genus of 5 species, perennial vines, of the tropics and subtropics. References: Sperling & Bittrich in Kubitzki, Rohwer, & Bittrich (1993)

* <em>Basella alba</em> Linnaeus. Disturbed areas, grown as a vegetable, and rarely found as a waif; native of s. Asia. Reported for Calhoun County, AL (AL Atlas in prep.; Kartesz 2010). [= K2]

---

**313. TALINACEAE** Doweld 2001 (Fameflower Family) [in CARYOPHYLLALES]

A family of about 2 genera and 35 species, herbs and shrubs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Packer in FNA (2003b); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010).

1. Leaves linear, terete, 1-2 mm wide; plants to 5 dm tall; [native].............................................................................................................<em>Phemeranthus</em> in **MONTIACEAE**

1. Leaves obovate or elliptic, 20 mm or more wide; plants to 8 dm tall; [alien, persistent or escaped]...........................................................................<em>Talinum</em>

**Talinum** Adanson 1763 (Jewels-of-Opar)

A genus of about 15 species, herbs, and dwarf shrubs, mainly of Africa but with 2 species of the New World tropics. References: Kiger in FNA (2003b); Wilson (1932)=X; Carolin in Kubitzki, Rohwer, & Bittrich (1993). [also see *Phemeranthus*]

* <em>Talinum paniculatum* (Jacquin) Gaertner, Jewels-of-Opar. Fairly commonly cultivated, locally escaped to disturbed areas and garden edges; native of the West Indies. June-September. [= FNA, S, X; † <em>T. paniculatum var. paniculatum</em> – K]
**Talinaceae**

314. Portulacaceae A.L. de Jussieu 1789 (Purslane Family) [in Caryophyllales]

A family of 1 genus and 40-100 species, annual and perennial herbs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Packer in FNA (2003b); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010).

1 Flowers sessile or subsessile; capsule circumscissile ................................................... Portulaca

1 Flowers pedicellate; capsule opening longitudinally.

   2 Flowers borne on a scape, with cymose branching ............................................................................................................. [see Talinaceae]

   2 Flowers solitary or in racemes .................................................................................................................................................. [see Montiaceae]

**Portulaca** Linnaeus 1753 (Purslane, Portulaca)

1 Plants in flower.

   2 Petals yellow, orange, copper, bronze, or white.

      3 Flowers > 25 mm across (single petals > 15 mm long).

         4 Leaves terete; capsule not encircled by an expanded, membranaceous wing .............................................................. P. grandiflora

         4 Leaves flat; capsule encircled by an expanded, membranaceous wing ........................................................................ P. umbraticola

      5 Flowers < 20 mm across (single petals < 12 mm long).

         5 Leaf blades terete or hemispheric in cross-section, linear, usually < 2 mm wide; [rare waif] ................................................. P. halimoides

         5 Leaf blades flattened in cross-section, obovate or spatulate, > 2.5 mm wide; [collectively common].

         6 Capsule encircled by an expanded membranaceous wing; [native to granitic and sandstone outcrops in SC and GA] ........... P. coronata

         6 Capsule not encircled by an expanded membranaceous wing; [exotic weed, usually seen in disturbed soils] .................... P. oleracea

   2 Petals pink to purple.

      7 Flowers > 25 mm across (single petals > 15 mm long). ......................................................................................................... P. grandiflora

      7 Flowers < 20 mm across (single petals < 12 mm long).

         8 Leaves terete to hemispherical in cross-section, usually < 2 mm wide, linear to lanceolate.

         8 Leaves flattened in cross-section, > 2.5 mm wide, obovate to spatulate .............................................................. P. amilis

         9 Petals deeply bilobed; stamens > 40; [of sandstone (Altamaha Grit) outcrops in s. GA] .................................................... P. biloba

         9 Petals not bilobed; stamens usually < 30; [collectively widespread and of various habitats].

         10 Petals dark pink to purple; seeds < 0.6 mm wide, round .............................................................. P. pilosa

         10 Petals medium to pale pink; seeds > 0.6 mm wide, elongate .......................................................................................... P. smallii

1 Plants in fruit.

   11 Capsule encircled by an expanded membranaceous wing.

      12 [Native in our area, in thin soil on granitic and sandstone outcrops in SC and GA] ............................................................ P. coronata

      12 [Introduced cultivar, persistent to weakly spreading from plantings] ............................................................................. P. umbraticola

   11 Capsule not encircled by an expanded membranaceous wing.

      13 Leaves flattened in cross-section, > 2.5 mm wide, obovate to spatulate.

      14 Trichomes at nodes conspicuous; seeds round, < 0.6 mm wide .............................................................. P. amilis

      14 Trichomes at nodes inconspicuous; seeds elongate, > 0.6 mm long ............................................................................ P. oleracea

      15 Leaves terete to hemispherical in cross-section, usually < 2 mm wide, linear to lanceolate.

      15 Nodes and inflorescences with inconspicuous trichomes ............................................................................................... P. biloba

      15 Nodes and inflorescences with conspicuous trichomes

         16 Seeds > 0.65 mm wide.

            17 Longest leaves mostly > 20 mm long; capsules mostly > 4 mm in diameter; [introduced, usually in obviously disturbed sites]...

                  .................................................................................................................................................................................. P. grandiflora

            17 Longest leaves mostly < 17 mm long; capsules mostly < 3.5 mm in diameter; [native, on granitic or diabase flatrocks] ........

                  .................................................................................................................................................................................. P. smallii

         16 Seeds < 0.65 mm wide

            18 Capsules 1.1-2.0 mm in diameter; seeds 0.3-0.5 mm in diameter ............................................................................. P. halimoides

            18 Capsules 1.5-5.5 mm in diameter; seeds (0.4-) 0.5-0.6 mm in diameter ..................................................................... P. pilosa

Portulaca biloba Urban, Grit Purslane. Outcrops of Altamaha Grit. This species has been collected repeatedly on outcrops of the Altamaha Grit in s. GA (Matthews, Faircloth, & Allison 1991); it also occurs in Cuba. Matthews, Faircloth, & Allison (1991) hypothesize introduction to the United States by hurricane. [= FNA, K; < Portulaca teretifolia ssp. cubensis (Urban) Ortega]

*Portulaca grandiflora* Hooker, Rose-moss. In sandy soil or around granitic flatrocks; native of Argentina. [= RAB, C, FNA, G, K, S, Z]

*Portulaca halimoides* Linnaeus. Waste area along railroad; probably only a waif, native of sw. North America. Reported by Reed (1964). [= FNA, K; > *P. parvula* A. Gray]

*Portulaca oleracea* Linnaeus, Common Purslane, Garden Purslane, Pussley. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA), C (DE, FL, GA, NC, SC, VA): gardens, disturbed areas, cracks in sidewalks; common (uncommon in DE and FL), originally native (apparently) of Asia, probably introduced to North America from Europe. May-October. The various subspecies recognized may or may not be taxonomically significant; a decision awaits an analysis of variation worldwide, or, at least, in the native range of the species. In North America, *P. oleracea* is a widespread, sometimes noxious weed, probably representing numerous introductions of various genotypes, treated as multiple subspecies by some authors. In North America, these genotypes appear to have intermixed; in our area (at least), the recognition of infraspecific taxa has been considered unwarranted, difficult, and unmeaningful (see Matthews, Ketron, & Zane 1993); see Danin & Anderson (1986) for a contrasting opinion. During the Great Depression, *P. oleracea* was eaten extensively in the Valley of Virginia as a potherb. [= RAB, C, F, FNA, G, K, S, W, WH, WV, Z]

*Portulaca pilosa* Linnaeus, Kiss-me-quick. Disturbed sandy soils. June-October. NC south to s. FL, west to NM, north in the interior to c. TN, AR, and OK, and in Central America; the native range perhaps obscure. See Matthews, Ketron, & Zane (1992a) for a further discussion of this species. [= RAB, FNA, K, S, WH, Z]

*Portulaca smallii* P. Wilson, Small's Portulaca. In thin soils on granitic and diabase flatrocks, sometimes locally spreading to adjacent fields, mowed areas, or other disturbed areas. June-October. Sc. VA south to c. GA. Generally considered an endemic limited to granitic flatrocks, *P. smallii* also occurs on a diabase flatrock, growing with an interesting mixture of granite flatrock and limestone cedar glade species (LeGrand 1987, Schafale & Weakley 1990). [= RAB, FNA, K, S, Z]

*Portulaca umbraticola* Kunth. Disturbed areas, spreading weakly or persistent following cultivation; native of South America and the West Indies. See *P. coronata* for further discussion. [< *P. umbraticola* Kunth – Z; = *P. umbraticola* Kunth ssp. *umbraticola* – K]

---

316. **CACTACEAE** A.L. de Jussieu 1789 (Cactus Family) [in CARYOPHYLLALES]

A family of about 100 genera and 1500 species, herbs, shrubs, vines, and trees, of tropical, subtropical, and temperate America (a single species occurring as well in Africa, Madagascar, and Ceylon), with centers of diversity in sw. United States-Mexico, s. South America, and West Indies. References: Parfitt & Gibson in FNA (2003b); Barthlott & Hunt in Kubitzki, Rohwer, & Bittrich (1993); Anderson (2001); Nyffeler & Eggli (2010).

**Opuntia** P. Miller 1754 (Prickly-pear Cactus)
Cactaceae

Identification notes: New joints sometimes bear reduced leaves and have not yet developed spines; look for spines 1 or 2 joints back from the growing tip.

1 Spines absent.
2 Joints narrowly obovate, narrowly elliptic, or oblong, mostly 12.5-35 cm long, 7.5-10 (-20) cm broad; [of the Coastal Plain].................................
3 Joints orbiculate to obovate, 5-7.5 (12.5) cm long, 4.6 (-7.5) cm broad; [widespread in our area].
4 Joints mostly 7.5-10 (-15) cm long, 5-9 (-12.5) cm broad; hypanthium with 7 or more areoles; style diameter < 3.5 mm; petals > 3 cm long; [of the Coastal Plain] ...........................................................................................................................
5 Joints mostly 7.5-15 (-22.5) cm long, 4-6.2 (-7.5) cm broad; hypanthium with 6 or fewer areoles; style diameter > 3.5 mm; petals < 3 cm long; [widespread in our area].

1 Spines present.
2 Spines strongly and retrorsely barbed; joints slender, (2-3) 3-6 (-13) cm long, 2-5 (-7) cm broad, easily detached from the plant; spines to 3.7 cm long, 0-2 per areole (usually some areoles on a plant with 2 well-developed spines); [of coastal dunes].
3 Spines not strongly and retrorsely barbed; joints broad, 10-30 cm long, 7.5-12.5 cm broad, not easily detached from the plant; spines to 7.5 cm long, 0-2 (-12) per areole; [of various habitats, including coastal dunes].
4 Spines needle-like, not flattened, elliptic to circular in cross-section, 1-6 (-12) per areole.
5 Plants not mat-forming or prostrate, rising the height of several joints, commonly 3-20 dm tall; largest joints (7.5-) 10-30 cm long, (5-) 7-12.5 cm broad; spines gray, reddish-brown, or yellowish-brown; fruit 5-7.5 cm long, 4-5 cm in diameter; [introduced, rarely spread or persistent from cultivation].
6 Plants low and mat-forming, usually prostrate and < 3 dm tall, the joints usually in series of 3-5; largest joints 3.8-10 cm long, 4-6 cm broad; spines white, tan or pale-brown at maturity; pads (22-53) 30-60 cm long, 20-40 cm broad; [rare Introduction].
7 Joints mostly 5-7.5 (-12.5) cm long, 4-6.2 (-7.5) cm broad; hypanthium with 7 or more areoles; style diameter < 3.5 mm; petals > 3 cm long; [of the Coastal Plain] ..........................................................................................................................
8 Joints mostly 7.5-10 (-15) cm long, 5-9 (-12.5) cm broad; spines to 8 cm long; hypanthium with 7 or more areoles; style diameter < 3.5 mm; petals > 3 cm long; [native].
9 Joints mostly 7.5-10 (-15) cm long, 5-9 (-12.5) cm broad; spines to 8 cm long; hypanthium with 7 or more areoles; style diameter < 3.5 mm; petals > 3 cm long; [native].
10 Joints mostly 7.5-15 (-22.5) cm long, 4-6.2 (-7.5) cm broad; spines to 3 cm long; hypanthium with 6 or fewer areoles; style diameter > 3.5 mm; petals < 3 cm long; [widespread in our area].

11 Opuntia canthetrixensis Lynch. Small (1933) also reports O. cantabrigiensis Lynch from dunes near Beaufort, NC, based on a fragmentary 1930 collection accompanied by a photograph. Similar plants were apparently seen near Beaufort by Engelmann, prior to 1856. Benson (1982) refers the collection tentatively to O. lindheimeri Engelm. var. cujia (Griffiths & Hare) L. Benson, treated in K as O. engelmannii Salm-Dyck var. cujia Griffiths & Hare, a native of Mexico. Benson (1982) also states, however, that it could also be var. lindheimeri (primarily of TX and Mexico), or, indeed, O. tuna (Linnaeus) P. Miller (native to the West Indies). Benson (1982) failed to relocate the plant in the field in 1956, but stated there was "insufficient time for a thorough search." Unless relocated (and hope is fading for that, with the extensive destruction of maritime vegetation in the vicinity of Beaufort by construction), the identity of the plant will probably remain a mystery, as well as whether it represents a native species, an established population from aboriginal use, or a more recent introduction or adventive. [= S] [excluded; not keyed]

Opuntia humifusa (Rafinesque) Rafinesque var. australina (Small) Dress. Southern Prickly-pear. Cp (FL, GA, SC): dunes, shell middens, and other dry sandy soils, mostly but not entirely on barrier islands; rare. Var. australina (Small) Linnaeus Benson occurs throughout FL, and at scattered locations north to se. SC and west to TX; Ward (2009e) considers this (as O. australina) to be endemic to FL. A third variety, var. amophila (Small) L. Benson, is apparently endemic to FL, occurring in most of the state; it might occur in the southern portion of our area. It has more elongate joints than the other two varieties, the joints with a length-to-width ratio of 2.0-4.0 (vs. 1.0-2.0) and is a more upright plant, often 3-4 joints high. [= K, Y, Z; < O. humifusa var. humifusa – FNA; > O. australina – S; > O. cumulicola Small – S; = O. australina Small – X; = O. compressa (Salisbury) J.F. Macbride var. australina (Small) L. Benson]

Opuntia humifusa (Rafinesque) Rafinesque var. humifusa, Eastern Prickly-pear. Cp (DE, FL, GA, NC, SC, VA), Pa (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry open places, such as in thin soil around rock outcrops, sandhill forests and woodlands, dry barrns and woodlands, barrier island dunes, dry pastures; common (uncommon in Piedmont and Mountains). May-June; August-October. The only cactus widespread in e. North America, var. humifusa ranges from MA, MI, and e. IA, south to s. FL and e. TX, with some outlying stations farther west. Various authors, including Small (1933) and Ward (2009e), separate the Coastal Plain O. pollardii from the inland O. humifusa (s.s.); this may have merit. Ward (2009e) separates O. pollardii as always having spines, these 2-3 cm long, leaves prior to shedding 6-8 mm long, fruits 2.5-2.5 cm long (vs. often lacking spines, when present these fewer and < 1 cm long, leaves 2-3 mm long, fruits 1-1.5 cm long in O. humifusa). Where growing in proximity to O. pusilla, the two species hybridize rather freely, sometimes producing hybrid swarms. See Doyle (1990) for discussion of the correct nomenclature for this taxon (O. compressa vs. O. humifusa). [= K, Y, Z; < O. humifusa var. humifusa – FNA; > O. compressa (Salisbury) J.F. Macbride var. compressa – G; < O. compressa – RAB; < O. humifusa (Rafinesque)

Opuntia pusilla (Haworth) Nutall, Dune Prickly-pear, Sand-bur Prickly-pear, Little Prickly-pear, Creeping Cactus. Cp (FL, GA, NC, SC): dunes on barrier islands; uncommon. May–June; August–October. A southeastern Coastal Plain endemic: NC (Dare County) south to c. peninsular FL and west to se. TX, nearly always within a few hundred meters of the sea. As mentioned by Small (1933) and RAB, this little coastal cactus is inconspicuous and often becomes attached by its retrorsely barbed-spines to the pants or shoes of people walking through the dunes. It can inflict painful wounds, the spines not easily removed from flesh or clothing because of the retortes barbs. O. pusilla sometimes forms hybrid swarmers with O. humifusa on coastal dunes (see Y for additional discussion). [= FNA, WH; K, X, Z; = O. drummondii Graham – RAB, S]

Opuntia stricta (Haworth) Haworth var. dillenii (Ker-Gawler) L. Benson. Cp (FL, GA, NC, SC): on barrier islands; rare. Se. SC south to s. peninsular FL. This taxon was reported from NC by Small (1933), as O. tunicldea Gibbes. Benson (1982) and Doyle (1990) do not verify this distribution, showing var. dillenii reaching its northern limit along the coast in se. SC. [= K, X, Y; Z; = O. stricta – FNA, WH; = O. tunicldea Gibbes – S]

Opuntia stricta (Haworth) Haworth var. stricta. Cp (FL, GA, NC, SC, VA?): dunes, shell middens, sandhills, dry woodlands; rare. SC (Robeson County) and c. SC south to s. peninsular FL, with a single collection from Isle of Wight County, VA (Benson 1982), mostly near the coast. Small (1933) describes the habitat of O. stricta as "shell mounds, kitchen middens, and aboriginal village sites" and identifies it as the "the prickly-pears the early Spanish records tell us the aborigines feasted on for three months of each year and also cured, like figs, for food when out of season." [= K, X, Y; Z; = O. stricta – FNA, WH; = O. stricta – S]

320a. CORNACEAE (Berchtold & J. Presl) Dumortier 1829 (Dogwood Family) [in CORNALES]

A family of 2 genera and about 85 species, trees, shrubs, lianas, and subshrubs, semicosmopolitan (mainly northern hemisphere). The Cornaceae is best circumscribed to exclude Nyssa (Xiang et al. 2002). References: Xiang et al. (2002); Kubitzki in Kubitzki (2004).

Cornus Linnaeus 1753 (Dogwood, Cornel)

(contributed by Z.E. Murrell & A.S. Weakley)

A genus of about 65 species, trees, shrubs, and subshrubs, mainly north temperate. The generic limits are controversial. Phylogenetic analyses show that Cornus is monophyletic, but various clades within it are also monophyletic and have levels of genetic and morphologic divergence often regarded as warranting generic distinction. Zhang et al. (2008) estimate the time of divergences of the various subgenera as having been from the Paleocene to the Oligocene. At very least, the subgenera are well-marked. References: Godfrey (1988)–Z; Wilson (1965); Murrell (1993); Zhang et al. (2008); Xiang et al. (2006); Fan & Xiang (2001); Eyde (1987); Xiang, Solis, & Soltis (1998); Ferguson (1966c, 1966d)=Y; Kubitzki in Kubitzki (2004).

---

1 Leaves alternate (the internodes typically short and therefore the leaves looking nearly whorled); [subgenus Mesomora].............. C. alternifolia
2 Leaves opposite.
3 Herb or dwarf shrub from a woody rhizome, to 2 dm tall; leaves in 2-4 pairs below the inflorescence; [of NJ and montane VA and WV northward]; [subgenus Arctocranial]...................................................................................................................... C. canadensis
4 Shrub or tree, much taller than 2 dm when mature; leaves many; [collectively widespread].
5 Inflorescence subtended by 4 showy (white, creamy, or pink) bracts.
6 Showy bracts subtending the inflorescence rounded and notched; fruits separate in a compact cluster; [common native small tree]; [subgenus Cynoxylon].
7 Abaxial leaf surface coronulate, trichomes all appressed and rigid, leaf base usually cuneate ........................................................................................................................................................................[C. kousa]
8 Inflorescence lacking bracts; [subgenus Kraniopsis]s.
9 Veins usually 5 or more per leaf side.
10 Bark of older branches and stems splitting longitudinally, appearing braided; leaves without tufts of trichomes in axils of secondary veins on abaxial surface.
11 Abaxial leaf surface not coronulate, trichomes appressed and rigid, and erect and curling, on the same leaf, leaf base usually rounded or truncate ............................................................................................................ C. amomum
12 Area surrounding lenticels suffused with purple; leaves suborbicular or broadly ovate; 7-9 veins per leaf side; tertiary veins usually prominent ................................................................................................................................................. C. rugosa
13 Area surrounding lenticels not differentiated; leaves lanceolate, elliptic, or ovate; 5-7 veins per leaf side; tertiary veins not prominent ................................................................................................................................................. C. stolonifera
14 Veins usually 3-4 per leaf side.
15 Trichomes erect on abaxial surface.
16 Petioles 3-7 mm long; leaf veins evenly spaced ................................................................. C. asperifolia [or C. asperifolia × stricta]
**CORNACEAE**

686

10. Petioles 8-25 mm long; leaf veins eminate from the basal half of the leaf.......................................................... *C. drummondii*

9. Trichomes appressed or slightly raised on abaxial leaf surface.

11. Rhizomatous, forming large colonies; lenticels protrude slightly, older stems appear verrucose; fruit white.............. *C. racemosa*

11. Multiple stems from a single rootstock (occasionally appearing rhizomatous from decumbent stems); lenticels not protruding, bark swelling between lenticels; fruit blue.................................................. *C. stricta*

---

**Cornus alternifolia** Linnaeus f., Alternate-leaf Dogwood, Pagoda Cornel, Pagoda Dogwood. Moist forests. May-June; August-September. NL (Newfoundland) west to MN, south to Panhandle FL, AL, s. MS, and AR. [= RAB, C, F, G, K, W, WH, WV, Y, Z; = *Svida alternifolia* (Linnaeus f.) Small]

**Cornus amomum** P. Miller, Silky Dogwood. Shores, streams, bottomlands. May-July; August-September. NY and MA west to IN, south to GA, Panhandle FL, and MS. [= RAB, F, G, K, W, WV; = *Cornus amomum var. amomum* – C; = *Cornus amomum* P. Miller ssp. amomum – GW, Y, Z; = *Svida amomum* – S; = *Swida amomum* (P. Miller) Small]

**Cornus asperifolia** Michaux, Eastern Roughleaf Dogwood. Mesic calcareous forests and thickets, shell middens, calcareous hammocks. May-June; August-September. Se. NC south to n. peninsular FL; west to s. AL. Nash (1896) collected *C. asperifolia* Michaux at River Junction, Florida; based upon conflicting reports of fruit colors given by Chapman (1860) and Coulter and Evans (1890) for the two rough-leaved dogwoods (*C. asperifolia* and *C. drummondii*), Nash decided to name the rough-leaved dogwood with blue fruit as *C. microcarpa*. However, Michaux’s (1803) description, even without reference to fruit color, is clearly attributable to this species, since its locality was given as "Carolinae inferioris." The populations of this rough-leaved dogwood in NC and SC have morphology intermediate between *C. stricta* and *C. asperifolia* and these should possibly be attributed to a hybrid origin. More analysis needs to be done on this complex. [= RAB, K, Y, Z; = *Cornus foemina* P. Miller ssp. microcarpa (Nash) J.S. Wilson – GW; = *Svida asperifolia* (Michaux) Small]

**Cornus canadensis** Linnaeus, Bunchberry, Dwarf Cornel, Dwarf Dogwood. High elevation forests, in humus or on talus, under *Betula cordifolia*, *Picea rubens*, or *Pinus rigida*. Greenland west to AK, south to NJ, VA, WV, and CA. [= C, F, G, K, W, WV, Y; = *Chaemaepitys menziesiana* (Linnaeus) Ascherson & Graebner]

**Cornus drummondii** C.A. Meyer, Midwestern Roughleaf Dogwood. Open woodlands and glades over calcareous rocks (limestone, calcareous shale). NY, ON, and SD south to e. TN, nw. GA, LA, and TX. [= C, G, GW, K, Y, Y; = *Cornus drummondii* – F; > *Cornus priceae* Small – F; > *Svida priceae* (Small) Small – S; > *Svida asperifolia* – S, misapplied; = *Swida drummondii* (C.A. Meyer) Sojak]

**Cornus florida** Linnaeus, Flowering Dogwood. Dry to moist forests and woodlands. March-May; September-October. ME west to MI, south to the peninsular FL; disjunct in montane ne. Mexico (Veracruz and Nuevo Léon). The Mexican plants may warrant recognition as *C. urbaniana*. *C. floridana* has been impacted since the 1980s by widespread infection by the dogwood anthracnose fungus (*Discella destructiva*). [= RAB, C, F, G, K, W, WV, Y, Z; = *Cynoxylon floridum* (Linnaeus) Rafinesque ex B.D. Jackson – S; *Benthamidia florida* (Linnaeus) Spach]

---

* Cornus *kousa* Hance, Kousa Dogwood. Suburban areas, sometimes planted as an ornamental and may persist or seed down in the immediate vicinity of the parent tree. [= K; *Benthamidia japonica* (Siebold & Zuccarini) Hara; = *Cynoxylon kousa* (Hance) Nakai] [not mapped; rejected as a component of our flora]

**Cornus obliqua** Rafinesque, Silky Dogwood. Swamps, moist thickets, (in VA) rocky rivershores where periodically scoured. May-July. ME and QC west to MN, south to VA, KY, c. TN, AR, and OK. Some material intermediate between *C. amomum* and *C. obliqua* has been found in the Mountains of nw. NC and w. VA. These plants are recognizable by leaves intermediate between the putative parents, ovate with an attenuate base, abaxial surface papillose; abaxial and adaxial surfaces with mostly appressed ornamented trichomes, but with scattered unornamented trichomes with erect arms on both blade surfaces and midvein and secondary veins. [= F, K, WV; = *Cornus amomum* P. Miller var. schuetzeana (C.A. Meyer) Rickett – C; = *Cornus purpusii* Koehne – G; = *Cornus amomum* P. Miller ssp. obliqua (Rafinesque) J.S. Wilson – GW, Y; = *Swida amomum var. schuetzeana* (C.A. Meyer) A. Haines; = *Swida obliqua* (Rafinesque) Moldenke]

**Cornus racemosa** Lamarck, Northern Swamp Dogwood. Wet to moist forests and thickets. May-July; August-September. ME and s. QC west to s. MB, south to VA, nc. NC, s. IL, and MO. [= RAB, C, F, G, K, WV; = *Svida femina* (P. Miller) Small – S, misapplied; = *Cornus foemina* P. Miller ssp. racemosa (Lamarck) J.S. Wilson – W, Y; = *Swida racemosa* (Lamarck) Moldenke]

**Cornus rugosa** Lamarck, Roundleaf Dogwood. At high elevations, usually on talus (greenstone, quartzite, sandstone). QC to MB, south to NJ, PA, w. VA, OH, IN, and IL. [= C, F, G, K, W, WV; = *Swida rugosa* (Lamarck) Rydberg]

**Cornus stolonifera** Michaux, Red Osier Dogwood. Shrub swamps, bottomlands, suburban areas. At least some of the occurrences in VA represent horticultural introductions. NL (Labrador) and AK south to VA, WV, KY (Clark et al. 2005), IL, NM, AZ, and CA. Attempts to link the name *C. sericea* Linnaeus to the red-osier dogwood have focused on the Linnaean description of "folius subitus serices" and "ramis rubicundis." The reference to the red branches has been emphasized to rule out any other species, yet *C. amomum* and *C. obliqua* also have reddish-maroon branches. The description of "fructo nigro-caeruleo" cannot be dismissed as a reference to individuals of the red-osier dogwood which have pale blue fruit, often considered to be due to hybridization with *C. amomum* or *C. obliqua*. It seems clear that the description fits *C. obliqua* better than it does the red-osier dogwood. Although there is a specimen in the Linnean herbarium which has been identified as the red-osier dogwood, it is
neither dated nor is the label of C. sericea in Linnaeus' hand. Also, considering the similarity of the red-osier dogwood and C. alba Linnaeus, it is doubtful Linnaeus would have described the red-osier dogwood without reference to C. alba. Therefore, we agree with Rickett's rejection of C. sericea as a nomen dubium. This species is also sometimes considered to be indistinguishable from the Eurasian C. alba. [= G, W, WV; = C. sericea Linnaeus – C, nomen dubium; = Cornus stolonifera Michaux – G, W; > Cornus stolonifera var. stolonifera – F; > Cornus stolonifera var. baileyi (Coulter & Evans) Drescher – F; > C. sericea ssp. sericea – K, nomen dubium; = Swida var. (Linnaeus) Holub, nomen dubium; = Swida stolonifera (Michaux) Rydberg; < C. alba Linnaeus].

**Cornus stricta** Lamarck, Southern Swamp Dogwood. Swamps, streambanks, marshes, alluvial forests. April-May; July-August. DE south to s. FL, west to TX, and north in the interior to TN, s. IN, s. IL, AR, and se. OK. Although the name C. foemina P. Miller predates C. stricta Lamarck, it is very unclear what plant was intended by that name (the description is very obscure and no type is available), so C. foemina is best rejected as a nomen dubium. [= RAB, C, G; = Cornus foemina P. Miller – F, K, WH, Z; > Cornus stricta Lamarck – RAB, C, G; = Swida stricta (Lamarck) Small – S; = Cornus foemina P. Miller ssp. foemina – GW, W, Y; = Swida foemina (P. Miller) Rydberg; = Swida stricta (Lamarck) Small]

**Nyssa Linnaeus 1753** (Tupelo, Sour Gum, Black Gum)

**Identification notes:** *Nyssa sylvatica* is often mistaken (especially as seedlings, saplings, or fire-sprouts) for *Diospyros virginiana*, because of their similar, alternate, glossy-green, acuminate leaves. *Nyssa* can be distinguished by its three vascular bundle scars per leaf scar (vs. one *Diospyros*), leaves often with a few irregular teeth (vs. never toothed), leaves pale to medium green beneath (vs. whitish-green beneath), leaves lacking dark glands on the midrib above and the outer petiole (vs. present), and leaves glabrous or nearly so below (vs. glabrate to tomentose with curly hairs) (McKenney 1967).

1 Petioles of mature leaves 3-6 cm long; leaves to 30 cm long and 15 cm wide, at least the larger on a tree normally > 8 cm wide, often with a few irregular teeth, these typically located near the widest part of the blade.................................................................................................................... *N. aquatica*

2 Fruits 20-40 mm long, yellow, orange, or red when mature, the stone winged; pistillate flowers and fruits 1 per peduncle; trees often multiple-trunked, the trunks crooked; mature leaves densely pubescent beneath.................................................................................................................... *N. ogeche*

3 Pistillate flowers and fruits 20-40 mm long, yellow, orange, or red when mature, the stone winged; pistillate flowers and fruits 1 per peduncle; trees typically single-trunked, the trunk fairly straight; mature leaves glabrous to pubescent beneath.................................................................................................................... *N. aquatica*

2 Fruits 6-15 mm long, blue-black when mature, the stone slightly ridged to nearly smooth; pistillate flowers (1-) 2-5 per peduncle; trees typically acuminate, the margins often with a few irregular teeth near the apex (though sometimes an entire tree with no toothed leaves); trunk not swollen or buttressed at base (even when growing in moist or wet habitats); bark of large trees rough, divided by deep vertical and horizontal furrows into a pattern of squarish checks; [trees of dry to mesic upland forests, less commonly in bottomlands or other wetlands, where flooding occurs at most occasionally and is of short duration; throughout our area].................................................................................................................... *N. sylvatica*

3 Pistillate flowers and fruits 6-15 mm long, blue-black when mature, the stone slightly ridged to nearly smooth; pistillate flowers (1-) 2-5 per peduncle; trees typically acuminate, the margins often with a few irregular teeth near the apex (though sometimes an entire tree with no toothed leaves); trunk not swollen or buttressed at base (even when growing in moist or wet habitats); bark of large trees rough, divided by deep vertical and horizontal furrows into a pattern of squarish checks; [trees of dry to mesic upland forests, less commonly in bottomlands or other wetlands, where flooding occurs at most occasionally and is of short duration; throughout our area].................................................................................................................... *N. sylvatica*

2 Fruits 6-15 mm long, blue-black when mature, the stone slightly ridged to nearly smooth; pistillate flowers (1-) 2-5 per peduncle; trees typically single-trunked, the trunk fairly straight; mature leaves glabrous to pubescent beneath.................................................................................................................... *N. aquatica*

3 Pistillate flowers and fruits (2-) 3-5 (-8) per peduncle; leaves with thick texture, rather stiff; typically widest beyond the middle, the apex typically oblong, the margins entire (rarely with a few teeth on vigorous sprouts); trunk swollen or buttressed at base; bark of large trees rough, a vertical ridge-furrow pattern most prominent; [trees of swamps with periodic or seasonal flooding; mostly on the Coastal Plain].

4 Shrubs or small tree, 1-3 (-5) m tall; leaves 3-6 cm long, 1-2 cm wide; fruit globose, 6-11 mm long; [restricted to c. FL Panhandle (Apalachicola lowlands region, Bay, Calhoun, Franklin, Gulf, Liberty, and Wakulla counties)].................................................................................................................... *N. biflora*

**Nyssa aquatica** Linnaeus, WaterTupelo, Tupelo Gum, Cotton Gum. River swamps, where inundated for substantial periods of time. April-May; September-October. Sc. VA south to Panhandle FL, west to se. TX, north in the Mississippi Embayment to se. MO, s. IL, and e. KY, primarily on the Coastal Plain, but with scattered locations in other physiographic provinces, such as in sc. TN. [= RAB, C, F, GW, K, S, V, WH, X, Y, Z; = *N. uniflora* Wangenheim – G]
**Nyssa biflora** Walter, Swamp Tupelo, Water Gum, Swamp Black Gum. Blackwater river swamps, depressions in pinelands, pocosins, either where inundated for substantial periods of time or in more-or-less permanently saturated organic peaty soils. April-June; August-October. NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to c. NC, w. SC, c. TN, w. KY (Clark et al. 2005), se. MO, and c. AR. [= G, K, S, Z; = N. sylvatica Marshall var. biflora (Walter) Sargent – RAB, C, F, X, Y; < N. sylvatica Marshall var. biflora (Walter) Sargent – GW, WH; = N. biflora var. biflora – V]

**Nyssa ogechee** Bartram ex Marshall, Ogeechee Lime, Ogeechee Tupelo, Ogeechee Plum. River swamps and wet forests with peaty soils, also in upland depression ponds. April; August-October. A Southeastern Coastal Plain endemic: se. SC south to c. peninsular FL, west to s. AL. [= RAB, GW, K, V, WH, X, Y, Z; > N. acuminata Small – S; > N. ogechee – S]

**Nyssa sylvatica** Marshall, Sour Gum, Black Gum, Pepperidge. Dry or mesic upland forests, less commonly in bottomlands, pine savannas, or upland depressions, where occasionally inundated briefly. April-June; August-October. S. ME west to MI and se. WI, south to c. peninsular FL, west to e. TX and e. OK. *N. sylvatica* is quite variable in morphology and ecology, at least some of the morphologic variation correlated with geography and ecology. The status of varieties recognized by previous authors (such as Fernald 1950) needs reassessment. In the Mountains of our area *N. sylvatica* is typically found in dry woodlands, such as pine-oak/heath, with xerophytic species such as *Pinus virginiana* and *Quercus montana*. In the outer Coastal Plain of the Carolinas, *N. sylvatica* often occurs in wet savannas with *Pinus serotina*, where often mistaken (because of the wetland habitat) for *N. biflora*. The leaves turn a brilliant orange-red in fall (often a few on any tree turning prematurely in July or August). [= G, K, S, V, WH, Z; = N. sylvatica var. sylvatica – RAB, C, GW, WH, X, Y; > N. sylvatica var. sylvatica – F; > N. sylvatica var. dilatata Fernald – F; > N. sylvatica var. caroliniana (Poiret) Fernald – F]

**Nyssa ursina** Small, Bear Tupelo, Apalachicola Tupelo. Stringers, flatwoods depressions. Endemic to Panhandle FL. (Apalachicola lowlands region; Bay, Calhoun, Franklin, Gulf, Liberty, and Wakulla counties). A 2-5 m tall shrub or small tree, intricately branched, related to *N. biflora*. Because of the co-occurrence of this and *N. biflora* in the FL Panhandle, it seems best to recognize this taxon at the species level. [= K, S, Z; = N. sylvatica Marshall var. biflora (Walter) Sargent – GW, WH, X; = N. biflora Walter var. ursina (Small) D.B. Ward – V; = N. sylvatica Marshall var. ursina (Small) Wen & Stuessy – Y]

---

**321. HYDRANGEACEAE** Dumortier 1829 (Hydrangea Family) [in CORNALES]

A family of about 17 genera and 190-220 species, trees, shrubs, vines, and herbs, primarily north temperate. As here interpreted, the family Hydrangeaceae includes two well-marked groups, the Hydrangeae (including *Decumaria* and *Hydrangea*) and the Philadelphae (including *Deutzia* and *Philadephus*). This group has been shown by molecular research to be unrelated to the Saxifragaceae, and to have its closest affinities to the Loasaceae, Cornaceae, and Nyssaceae (Xiang et al. 2002; Soltis, Xiang, & Hufford 1994; Morgan & Soltis 1993). References: Spongberg (1972); Soltis, Xiang, & Hufford (1995); Morgan & Soltis (1994); Xiang et al. (2002); Hufford in Kubitzki (2004).

1 Woody vine, climbing by aerial rootlets; petals 7-10; [tribe Hydrangeae] .................................................. *Decumaria* 1
2 Pubescence of leaves and twigs stellate; stamens 10; [a cultivated alien, rarely escaped]; [tribe Philadelphae] ......................... *Deutzia* 2
3 Pubescence of leaves and twigs simple; stamens 8-10 (Hydrangea) or 25-90 (Philadelphus); [natives and aliens].

3. Leaf blades 10-30 cm long; inflorescences of 25-many flowers; stamens 8-10; [tribe Hydrangeae] ........................................... *Hydrangea*
3. Leaf blades 3-8 cm long; inflorescences of 1-7 flowers; stamens 25-90; [tribe Philadelphae] ........................................... *Philadephus*

**Decumaria** Linnaeus (Climbing Hydrangea, Woodvamp)

**Identification notes:** *Decumaria* is readily distinguished from the other opposite-leaved, woody vines in our flora (*Gelsemium*, *Trachelospermum*, *Lonicera*, *Bignonia*, *Campsis*, and *Clematis*) by its leaves (simple, ovate, and usually serrate) and climbing structures (adventitious roots).

**Decumaria barbara** Linnaeus, Climbing Hydrangea, Woodvamp. Swamp forests and bottomlands, moist forests in the mountains. May-June; July-October. Se. VA south to FL and west to LA and e. TX (Singhurst, Keith, & Holmes 2005), inland to nw. SC, se. TN, and w. TN. This handsome vine climbs to the tops of trees via adventitious roots. The opposite leaves are somewhat fleshy in texture. [= RAB, C, F, G, GW, K, S, W]

**Deutzia** Thunberg (Deutzia)

* **Deutzia scabra** Thunberg, Deutzia, Pride-of-Rochester. Fairly commonly cultivated, persistent around old homesites and escaping to adjacent woodlands; native of Japan and China. First reported for NC (Jackson Co., NC) by Pittillo & Brown (1988); now known from scattered sites. *D. crenata* Siebold & Zuccarini, Chinese Deutzia, is reported as introduced in GA by Kartesz (1999); this may not be taxonomically distinct from *D. scabra*. [= C, F; > *D. scabra* – K; > *D. crenata* Siebold & Zuccarini – K; > *D. scabra* var. *candissima* (Froebel) Rehder]

**Hydrangea** Linnaeus (Hydrangea, Sevenbark)

1 Leaves pinnately lobed, the lobes toothed; inflorescence a panicle; large sterile flowers many (> 20 per inflorescence), borne throughout the inflorescence.......................................................................................................................................................................................... *H. quercifolia*

| 2 Inflorescence a panicle; large sterile flowers many (> 20 per inflorescence), borne throughout the inflorescence; [large shrub to small tree, to 8 m tall and 10 cm trunk diameter]; [alien, cultivated and sometimes persistent] .......................................................... *H. paniculata* |
| Lower leaf surface glabrous or inconspicuously puberulent, appearing green; trichomes of the lower leaf surface restricted to the midrib and major veins; sterile flowers absent, or, if present, usually < 1 cm in diameter .................................................. *H. arborescens* |

| 3 Lower leaf surface variously pubescent, appearing white or gray; trichomes of the lower leaf surface on veins and interveinal areas; sterile flowers usually present, large and showy, usually greater than 1 cm in diameter. |

| 4 Lower leaf surface velutinous, pilose, or tomentose, appearing gray; trichomes usually not dense enough to entirely mask the green leaf surface; trichomes with prominent tubercles (as seen at 40× magnification); sterile flowers generally very few (0-3 per inflorescence). |

| 5 Lower leaf surface densely floccose-velutinous, felt-like, appearing bright white or silver; trichomes dense enough to entirely mask the green leaf surface; trichomes with prominent tubercles (as seen at 40× magnification); sterile flowers generally fairly many (2-15 per inflorescence) .......................................................... *H. radiata* |

**Hydrangea cinerea** Small, Ashy Hydrangea. Rocky forests and rock outcrops, roadbanks, perhaps strictly or mostly associated with mafic or calcareous rocks. May-July. Sw. NC, c. IN, c. IL, and c. MO south to n. SC, sc. AL, and c. AR. [= K, S, W; Z; = *H. arborescens* ssp. *discolor* (Seringe) McClintock – RAB, Y; = *H. arborescens* var. *discolor* – C, G; = *H. arborescens* var. *deum* (E. St. John – F)]

**Hydrangea quercifolia** Bartram, Oakleaf Hydrangea. Native in hammocks, moist forests, also in disturbed areas, thickets, or forests adjacent to urban or suburban areas. May-July. C. and sw. TN, south through w. GA, AL, and MS to Panhandle FL and e. LA; scattered elsewhere as a remnant or escape from cultivation. Boufford & Wood (1977) describe a purportedly native occurrence in nw. SC, but it seems more likely to be a n escape from cultivation (R. Clark, pers. comm.). This southeastern native is a spectacular garden plant, frequently planted, rarely escaping or persisting. [= C, F, G, K, S, WH]

**Hydrangea arborescens** Walter, Snowy Hydrangea, Silverleaf. Mt (GA, NC, SC), Pd (NC, SC): rocky forests and rock outcrops, often common and conspicuous on roadbanks; common. May-July. A Southern Appalachian endemic: sw. NC (in the valley of the French Broad River and to its southwest), nw. SC, ne. GA, and se. TN, with outliers (perhaps escaped from cultivation?) in Stokes County, NC and Calhoun County, SC. This attractive species is especially typical of the escarpment gorge region near the tricorner of NC, SC, and GA, in the vicinity of the towns of Highlands, Cashiers, and Rosman, NC, where it is conspicuous along roadbanks. [= K, S, W, Z; = *H. arborescens* var. *radiata* (Walter) McClintock – RAB, Y]
A genus of 65 (or fewer) species, shrubs, of north temperate areas. The most recent monographer of the genus, Hu (1954-1955) recognizes many species and varieties on the basis of minor differences in pubescence. Many of the recognized taxa are based only on cultivated material. The native distributions of the varieties have little phytoecographic coherence, and several varieties are often reported from the same site, suggesting that they reflect merely variation within a population (if genetically based at all). For instance, Hu recognizes three varieties in *P. hirsutus* and five in *P. inodorus*, but these seem to be no more than forms. As Hu writes, "the formerly recognized species, *P. grandiflorus* Willd., and *P. laxus* Schrad., are merely different forms of a species with heterogeneous leaf shape, size, and margins. Fostered by growers, propagated and distributed through cuttings, these forms have maintained their distinction in gardens since their discoveries. But when they are projected on the spectrum of variations exhibited by a large number of specimens collected from the homeland of *P. inodorus* Linn. they appear to be nothing but a few transitional forms. In this paper, these forms are treated as varieties." Hu's "varieties" should be treated as forms or cultivars, if recognized at all. I have taken a conservative approach, though variation in several of our native species could use additional study. References: Weakley & Henrickson in FNA (in press); Hu (1954-1956)=Z; A.E. Weakley (2002); Hufford in Kubitzki (2004).

1 Axillary buds contained within a distinct pouch directly below the petiole (best observed in mature, long-shoot leaves); twigs of the current year glabrous; seeds with caudate tails about as long as the embryo; [subgenus Deutzioioides, section Deutzioioides].................*P. hirsutus*
1 Axillary buds exposed above the petiole base (best observed in mature long-shoot leaves, not always visible in axils of young leaves or on short-shoot leaves); twigs of the current year villous-hirsute; seeds not caudate; [subgenus *Deutzia*], section *Deutzia*]..................................................*P. inodorus*
2 Flowers 1-3 (-9) in a cyme; stamens 60-90; [subgenus *Philadelphus*, section *Pauceflorus*]..........................................................*P. pubescens*
2 Flowers 5-9 in a determinate raceme; stamens 20-50; [subgenus *Philadelphus*, section *Philadelphus*].
3 Bark of the current year brown, exfoliating in its second year; flowers fragrant..............................................*P. coronarius*
3 Bark of the current year gray, not exfoliating later; flowers not fragrant or only slightly so.............................................*P. hirsutus*

*Mentzelia floridana* Nuttall ex Torrey & A. Gray, Stickleaf. Hammocks, shell middens, dunes, other dry sands. Ne. FL (Duval County) south to s. FL. [= K, S, WH]

323. **BALSAMINACEAE** A. Richard 1822 (Touch-me-not Family) [in ERICALES]

*Impatiens* Linnaeus (Jewelweed, Touch-me-not, Snapweed, Balsam)

1. Corolla purple, pink, or white; plants 3-6 (-8) dm tall; stems puberulent or glabrous; [cultivated alien, rarely escaped].
2. Sepal spur strongly recurved; stems puberulent .................................................. *I. balsamina*
3. Sepal spur slightly curved; stems glabrous or with widely scattered hairs ............................................................................................................................... *I. walleriana*
1. Corolla yellow or orange (rarely cream or white); plant mostly 5-25 dm tall; stems glabrous; [native].
2. Flowers orange (rarely orange-yellow or white); calyx spur (colored) 7-10 mm long, curved forward parallel to the calyx sac .................................................. *I. capensis*
3. Flowers yellow (rarely cream or white); calyx spur (colored) 4-6 mm long, at a right angle to the calyx sac ............................................................................. *I. pallida*

*Impatiens capensis* Meerburgh, Orange Jewelweed, Orange Touch-me-not, Spotted Touch-me-not. Moist forests, bottomlands, cove forests, streambanks, bogs. May-November. NL (Newfoundland) west to SK, NT, and BC, south to SC, Panhandle FL, AL, TX, CO, ID, and OR. Within the portion of our area where *I. capensis* and *I. pallida* overlap, the two species often occur in mixed populations. *I. capensis* tends to have the leaf apices and crenulations more rounded than *I. pallida*, but the character is overlapping and variable. [= RAB, C, F, GW, K, W, WV; = *I. biflora* Walter – G, S]

*Impatiens pallida* Nuttall, Yellow Jewelweed, Yellow Touch-me-not, Pale Touch-me-not. Cove forests, streambanks, seepages, moist forests, bogs, roadsides. July-September. NS and QC west to SK, south to e. VA, we. NC, TN, WV, MO, and OK. [= RAB, C, F, GW, K, S, W, WV]

*Impatiens walleriana* Hooker f., Garden Impatiens. Suburban woodlands, weakly spreading from horticultural plantings; native of Africa. [= K, WH]

327. **POLEMONIACEAE** A.L. de Jussieu 1789 (Jacob's-ladder Family) [in ERICALES]

A family of 18 genera and 350-380 species, herbs, vines, and shrubs (rarely trees), mainly of temperate North America, but extending into tropical America and also in Eurasia. References: Wilson (1960a); Grant (1997); Grant (1998); Prather, Ferguson, & Jansen (2000); Wilken in Kubitzki (2004).

1. Leaves simple; [tribe Polemoniae] ................................................................................................. 5. *Phlox*
2. Leaves compound.
1. Leaf segments ovate or elliptic, 5-16 mm wide; corolla blue; [tribe Polemoniae] .......................... 4. *Polemonium*
2. Leaf segments linear, ca. 1 mm wide; corolla red, yellow, or blue; [tribe Gilieae]
3. Inflorescences elongate; flowers red or yellow ................................................................................. 3. *Ipomopsis*
3. Inflorescences spherical; flowers blue or white
4. Inflorescence bracts not spine-tipped; inflorescence on a long peduncle; flowers blue; plant 1-9 dm tall ................................................. *1. Gilia*
4. Inflorescence bracts spine-tipped; inflorescence not long-pedunculate, subtended by bracts; flowers white; plant < 1 dm tall ..............

1. *Gilia* Ruiz & Pavón 1794 (Gilia)
A genus of about 40 species, herbs, of w. North America.

2. *Navarretia* Ruiz & Pavón 1794 (Navarretia)

3. *Ipomopsis* Michaux 1803 (Standing-cypress)

*Ipomopsis rubra* (Linnaeus) Wherry, Standing-cypress. Sandhills, sand rims of Carolina bays, dunes, roadbanks, disturbed areas. June-August; August-September. Sc. NC south to c. peninsular FL, west to TX and OK, spread from cultivation in other areas to the north (including sites in the Piedmont and Mountains of GA and NC). [= RAB, K, W, WH, Z; = Gilia rubra (Linnaeus) A.A. Heller – C, F, G, S]

4. *Polemonium* Linnaeus 1753 (Jacob's-ladder)

1. Stamens exserted 5-7 mm from the corolla; flowers in a compact panicle, the pedicels usually shorter than the calyx; flowering in July ..........

2. Inflorescence minutely puberulent; corolla 12-16 mm long ......................

3. Larger leaves > 3 cm long; nodes 4-5, spaced; petals deeply notched, the notch 1.5-5 mm deep ....................................................

4. Larger leaves < 2.5 cm long; nodes >6, crowded; petals shallowly notched, the notch 0.5-3 mm deep ......................................

5. *Phlox* Linnaeus 1753 (Phlox)

A genus of about 70 species, herbs (to subshrubs), of temperate North America (with 1 species in ne. Asia). References: Wherry (1955)=Z; Ferguson, Krämer, & Jansen (1999); Wilken in Kubitzki (2004). Key based on C and Z.

1. Stems woody or suffrutescent, trailing or decumbent; leaves to 25 mm long (-60 mm long in *P. bifida*), to 3 (-5) mm wide, generally with short-shoots or fascicles of leaves in the axils of leaves of the sterile shoots.

2. United portion of the style 5-12 mm long, the cleft portion ca. 1 mm long.

3. Larger leaves > 3 cm long; nodes 4-5, spaced; petals deeply notched, the notch 1.5-5 mm deep ....................................................

4. Larger leaves < 2.5 cm long; nodes >6, crowded; petals shallowly notched, the notch 0.5-3 mm deep ......................................

5. United portion of the style 1.5-4 mm long, the cleft portion 0.5-2 mm long.
4 Fertile shoots (10-) 15-30 cm tall; upper leaves obl-long-lanceolate, up to 12-25 mm long, 1.5-3 mm wide on sterile shoots, 2.5-5 mm wide on fertile shoots; pubescence of the inflorescence mostly with conspicuously glandular tips ................................................................. *P. nivalis var. hendzio*

4 Fertile shoots (3-) 8-12 (-15) cm tall; upper leaves linear-lanceolate, up to 8-12 mm long, 0.5-1.5 mm wide on sterile shoots, 1.5-3 mm wide on fertile shoots; pubescence of the inflorescence mostly with finely glandular tips ................................................................. *P. nivalis var. nivalis*

1 Stems herbaceous, erect or decumbent; leaves (at least the larger) > 25 mm long and/or > 5 mm wide, generally lacking axillary fascicles of leaves.

5 Style short, 1-4 mm long, the united portion 1.5-2× as long as the cleft portion; stamens shorter than the corolla tube (thus included).

6 Upper leaves alternate; annual; corolla red, white, or variegated; [alien, mostly naturalized in dry sandy soils of roadssides, fields, and disturbed areas] ................................................................................................................................. *P. drummondii*

6 Upper leaves opposite or subopposite; perennial; corolla blue, lavender, or pink; [native, mostly of forests, woodlands, or roadbanks].

7 Sterile shoots rooting at the nodes; leaves broad-elliptic, ca. 2-5× as long as wide; sepal acuminate to very slightly awned, the awn 0.5-3 mm long; corolla tube glabrous................................................................................................................................. *P. divaricata*

7 Sterile shoots not rooting at the nodes; leaves lanceolate to linear, ca. 4-10× as long as wide; sepal awned, the awn 0.5-3.0 mm long; corolla glabrous, pilose, or glandular-pubescent.

8 Cymes open, the lowest branches elongate, > 1 cm long; corolla usually glandular-pubescent or pilose (rarely glabrous); pedicels 1-8 (-12) mm long.

9 Leaves largest below the middle of the stem ................................................................................................................................. *P. floridana*

9 Leaves largest above the midpoint of the stem ................................................................................................................................. *P. pilosa*

8 Cymes compact, the lowest branches short, < 0.5 cm long; corolla glabrous; pedicels 1-6 mm long.

10 Leaves and bracts oblong-elliptic to lanceolate, acute to obtuse (rarely acuminate), the larger 20-40 (-50) mm long, 4-8 (-12) mm wide, ca. 5× as long as wide; bracts below the inflorescence hiding the calyces ................................................................................................................................. *P. amoena*

10 Leaves and bracts linear to lanceolate, acuminate, the larger 35-45 mm long, 3-5 mm wide, ca. 10× as long as wide; bracts below the inflorescence not hiding the calyces ................................................................................................................................. *P. lighthipei*

4 Style long, (12-) 14-26 mm long, the united portion 3-30× as long as the cleft portion; stamens equaling or exceeding the corolla tube (thus in part exerted).

11 Plants forming colonies by rhizomes, stolons, and/or prostrate sterile shoots with evergreen to semi-evergreen leaves; flowering shoots 1-4 (-5) dm tall.

12 Plants with rhizomes and stolons tipped with clustered, evergreen, linear to lanceolate leaves 3-12 cm long, 5-10 (-12) mm wide.

... ................................................................................................................................. *P. buckleyi*

12 Plants with prostrate sterile shoots with scattered, semi-evergreen, spatulate to obovate leaves 1.5-4.5 cm long, 5-16 mm wide.

... ................................................................................................................................. *P. stolonifera*

11 Plants not colony-forming by rhizomes or stolons; flowering shoots (3-) 5-20 dm tall.

13 Leaf margin ciliate-serrulate; lateral veins of the leaves readily apparent, these joining to form a connecting vein parallel to the leaf margin.

14 Bracts of the inflorescence pubescent with glandular hairs; corolla tube glabrous; leaves opposite; nodes usually 8-15; leaves usually 2-3× as long as wide ................................................................. *P. amplifolia*

14 Bracts of the inflorescence non-glandular hairs; corolla tube pubescent (rarely glabrous); leaves subopposite (at least near the inflorescence); nodes usually 15-40; leaves usually 3-4× as long as wide ................................................................................................................................. *P. paniculata*

13 Leaf margin smooth or slightly rough; lateral veins of the leaves not readily apparent, not forming a connecting vein parallel to the leaf margin.

15 Flowering shoots arising from decumbent stems; nodes below the inflorescence 3-7

16 Sterile, decumbent stems short; nodes (3-) 4 (-5) ................................................................................................................................. *P. ovata*

16 Sterile, decumbent stems elongate; nodes (5-) 6 (-7) ................................................................................................................................. *P. pulchra*

15 Flowering shoots arising from rhizomes; nodes below the inflorescence 7 or more.

17 Cymes several, the lower on rather short and uniform peduncles, thus the inflorescence as a whole subcylindric in outline.

18 Nodes 7-15, well-spaced; upper leaves oblong to ovate, cordate at the base; flowering early summer ................................................................................................................................. *P. maculata var. maculata*

18 Nodes 16-35, crowded; upper leaves lanceolate to ovato-oblong; truncate to suberect at the base; flowering late summer.

... ................................................................................................................................. *P. maculata var. pyramidalis*

17 Cymes solitary or several, if several then the lower on long peduncles, thus the inflorescence as a whole broadly rounded or even flat-topped.

19 Calyx subcylindric, the sepals fairly broad, with a rather weak midrib, the junction-membranes thin, narrow, becoming markedly plicate-keeled; the flowers white or pale pink, 15-20 mm long, 22-25 mm wide, 3-6× as long as wide ................................................................................................................................. *P. carolina*

19 Calyx subcapitate, the sepals narrow with a well-developed midrib, the junction-membranes firm, broad and flat (to slightly plicate-keeled) ................................................................................................................................. *P. glabrerrima*

*Phlox amoena* Sims, Hairy Phlox, Chalice Phlox. Dry woodlands and forests, roadbanks, sandhills. April-June; June-July. W. NC west to s. KY, south to n. FL and MS. [= C, F, G, S, W; = *P. amoena ssp. amoena* – K, Z; < *P. amoena* – RAB, WH (also see *P. lighthipei*)]

*Phlox amplifolia* Britton, Broadleaf Phlox. Moist forests, particularly over mafic rocks. July-August. W. VA west to s. IN and se. MO, south to w. NC, AL, and n. AR. [= RAB, C, F, G, K, S, W, WV, Z]

*Phlox carolina* Linnaeus, Carolina Phlox, Thick-leaf Phlox, Giant Phlox. Forests, woodlands, woodland borders, barrens. May-July. VA, WV, IL and MO south to s. GA, s. AL, s. MS, se. LA and e. TX. [= RAB, G, S, W; < *P. glabrerrima* – C; > *P. carolina*]

Phlox amoena

Phlox amplifolia

Phlox bifida

Phlox buckleyi

Phlox carolina

Phlox divaricata

* Phlox drummondii Hooker, Annual Phlox, Drummond Phlox. Dry sandy soils of roadsides, fields, disturbed areas; native of TX. April-July. Wherry recognized 3 subspecies in P. drummondii, all endemic to TX; it does not seem meaningful to try to distinguish infraspecific taxa in our area, since our plants are the progeny of various cultivars derived from hybrids and selections of the wild taxa. [= RAB, F, G, S, WH; > P. drummondii ssp. drummondii – K, Z]

Phlox floridana Bentham. Sandhills. Sw. GA and se. AL south to FL Panhandle and nw. peninsular FL. [= K, S, WH, Z]

Phlox lighthipei Small, Lighthipe's Phlox. Dry to moist sandy soils. April-May; June-July. S. SC south to n. FL. [= S; = P. amoena ssp. lighthipei (Small) Wherry – K, Z; < P. amoena – RAB, WH]

Phlox paniculata Linnaeus, Garden Phlox, Streambanks, moist forests, woodlands, and woodland borders. July-August; September. S. NY west to IL and MO, south to e. NC, w. SC, n. GA, n. MS, and AR. [= RAB, C, F, G, K, S, W, WV, Z]

POLEMONIACEAE

Phlox pulchra Wherry, Alabama Phlox. {habitat} Endemic to c. AL. [= K] {add to synonymy}

Phlox stolonifera Sims, Creeping Phlox. Moist forests. April-May; May-June. PA and s. OH south to w. NC, n. GA, and e. TN, essentially a Southern and Central Appalachian endemic. This species is sometimes locally abundant, as in parts of Great Smoky Mountains National Park. [= RAB, C, F, G, K, S, W, WV, Z]

Phlox subulata Linnaeus, Moss Phlox, Mountain-pink. Dry and exposed rock outcrops, rocky flood-scoured riversides, dry woodlands over a wide variety of rocks, shale barrens. April-May. NY and OH south to w. NC and TN; escaped or naturalized more widely from horticultural use. Infraspecific taxa that are sometimes recognized seem poorly correlated with morphology nd geography. [= RAB, S, W; > P. subulata var. australis – G; > P. subulata var. setacea (Linnaeus) Brand – C; > P. subulata var. brittonii – F, WV; > P. subulata ssp. australis (Wherry) Wherry – K, Z; > P. subulata ssp. brittonii (Small) Wherry – K, Z; > P. brittonii Small – S; > P. subulata var. subulata – C, F, WV; < P. subulata var. subulata – C (also see var. brittonii); > P. subulata var. ciliata Wherry – G; > P. subulata ssp. subulata – K, Z]

330. PENTAPHYLACACEAE Engler 1897 (Pentaphylax or Sakaki Family) [in ERICALES]

A family of 12 genera and ca. 340 species, of the tropics and subtropics (a few of warm temperate areas), mainly of Asia and America. There is nomenclatural dispute over whether to use the name Pentaphylacaceae (which is conserved) or the older Ternstroemiaceae. References: Weitzman, Dressler, & Stevens in Kubitzki (2004).

Cleyera Thunberg 1783 (Sakaki)

A genus of about 8 species, of e. Asia, se. Asia, and tropical America.

* Cleyera japonica Thunberg. Sakaki. Moist forests and bluffs; native of e. Asia (Japan, China, Nepal, n. India, Myanmar). Locally and aggressively naturalizing at Kalmia Gardens, Coker College, Hartsville, Darlington County, SC, where perhaps planted as long ago as the 1930s. [= K1; = Ternstroemia japonica (Thunberg) Thunberg]

331. SAPOTACEAE A.L. de Jussieu 1789 (Sapodilla Family) [in ERICALES]

A family of about 53-54 genera and 1100-1250 species, trees and shrubs, primarily tropical (rarely temperate), of Old World and New World. References: Elisens, Whetstone, & Wunderlin in FNA 2009); Pennington in Kubitzki (2004); Govaerts, Frodin, & Pennington (2001).

Sideroxylon Linnaeus 1754 (Bumelia, Buckthorn, Bully)

As defined broadly by Pennington (1991), Sideroxylon includes about 75 species, widely distributed in the New World and Old World Tropics (our species are the northern tip of a “tropical iceberg”). Pennington found that no consistent set of characters could be used to separate Bumelia from other New World genera (such as Masticodendron and Dipholis), and that the New World segregate genera were also not separable from several Old World genera. The Linnaean Sideroxylon has nomenclatural priority. References: Elisens & Jones in FNA (2009); Clark (1945)=V; Cronquist (1945)=Q; Pennington (1991)=Z; Godfrey (1988)=Y; Govaerts, Frodin & Pennington (2001)=X; Allison (2006)=U. Key adapted from Y.

1 First-year twigs persistently pubescent; leaves pubescent beneath with appressed to tomentose hairs, ranging in color (depending partly on age) from silvery through coppery to dark brown.;

2 Mature leaves densely pubescent beneath, the hairs sericeous, matted and shiny; leaves 2-5 (-7) cm long, 0.5-2 (-3) cm wide .......... S. tenax
Sideroxylon alachuense L.C. Anderson, Alachua Bully, Silver Buckthorn. Sandy hammocks, shell middens. S. GA south to c. peninsular FL. [= FNA, K; = Bumelia anomala (Sargent) R.B. Clark – V, Y; = S. alachense – X, misspelled: = B. lanuginosa (Michaux) Persoon var. anomala Sargent]

Sideroxylon celastrinum (Kunth) T.D. Pennington, Saffron-plum. Sandy hammocks. Peninsular FL (immediately south of our area), s. AL, s. TX, south through Mexico and Central America to n. South America; West Indies. [= FNA, K2, WH, X; = Bumelia celastrina Kunth]

Sideroxylon lanuginosum Michaux ssp. lanuginosum, Eastern Gum Bumelia, Eastern Gum Bully. Mesic to floodplain forests. E. GA south to nc. FL, west to LA. Other subspecies are more western. Reported for SC by Kartesz (1999) [investigate.]. [= FNA, X; > S. lanuginosum ssp. lanuginosum – K; > S. lanuginosum ssp. albicans (Sargent) Kartesz & Gandhi – K; = Bumelia lanuginosa ssp. typica Q; < B. lanuginosa Michaux (Michaux) Persoon – S; > B. lanuginosa var. lanuginosa – V; > B. rufa Rafinesque – V; = B. lanuginosa ssp. lanuginosus – Y; < S. lanuginosus – Z]

Sideroxylon lycioides Linnaeus, Buckthorn Bumelia, Buckthorn Bully. Maritime forests, maritime scrub, river bluffs, swamp margins, usually in circumneutral soil (over shell hash, coquina limestone, marl, or limestone), in the Piedmont and Mountains in rich, mesic forests over mafic or calcareous rocks. June-July; September-October. Se. VA south to Panhandle FL; west to se. TX, north in the interior to s. IN, s. IL, and se. MO, mostly on the Coastal Plain, but extending (in our area in NC and SC) to the upper Piedmont and north in the interior (primarily on limestone) to KY and TN. This species is extremely variable in leaf shape; though described in most works as described in size, it is most described as 12-10 cm long and up to 4 cm wide, the leaves can be to 15 cm long and 8 cm wide. The leaf apex can be acuminate, acute, rounded, or notched. [= FNA, K, X, Z; = Bumelia lycioides (Linnaeus) Persoon – RAB, C, G, GW, S, Y; > B. lycioides var. lycioides – F, V; > B. lycioides var. virginiana Fernald – F, V; > B. lycioides var. ellipsoidalis R.B. Clark – V; > B. smallii R.B. Clark – F]

Sideroxylon reclinatum Michaux ssp. reclinatum, Smooth Bumelia, Florida Bully. Floodplain forests and river margins. Ssp. reclinatum ranges from s. SC and se. GA south to s. peninsular FL. Ssp. australfloridense (Whetstone) Kartesz & Gandhi [= K; Bumelia reclinata (Michaux) Ventenat var. australfloridensis Whetstone] occurs in peninsular FL. [= FNA, K, X; > Bumelia reclinata – S; > B. macrocarpa Small – S; < B. reclinata (Michaux) Ventenat var. reclinata – Q, Y; < B. reclinata – V; < S. reclinatum – Z]
Sideroxylon rufohirtum Herring & Judd, Red-haired Bully. Hammocks. Endemic to FL: ne. FL south to c. peninsular FL. [= FNA; = S. reclinatum Michaux ssp. rufotomentosum (Small) Kartesz & Gandhi – K, X; = Bumelia rufotomentosa Small – V, S, Y; = B. reclinata (Michaux) Ventenat var. rufotomentosa (Small) Cronquist – Q]

Sideroxylon tenax Linnaeus, Tough Buckthorn, Tough Bumelia, Tough Bully. Maritime scrub, maritime forests, also inland in hammocks. May-June; September-October. Se. NC south to s. peninsular FL. [= FNA, K, X, Z; = Bumelia tenax (Linnaeus) Willdenow – RAB, Q, V, Y; > B. tenax – S; > B. lacuum Small – S]

Sideroxylon thornei (Cronquist) Pennington, Thorne’s Bumelia, Swamp Bumelia. Bottomlands and limesink depressions, particularly over calcareous substrates. May-June; August-early October. Ne. GA south to Panhandle FL, and west to AL. The validity of this species has been supported by Anderson (1996). [= FNA, K, X, Z; = Bumelia thornei Cronquist – Y]

332. EBENACEAE Gürke 1891 (Ebony Family) [in ERICALES]

A family of 2-6 genera and 500-600 species, trees and shrubs, distributed in tropical and subtropical (rarely warm temperate) regions. References: Eckenwalder in FNA (2009); Wallnöfer in Kubitzki (2004).

Diospyros Linnaeus 1753 (Persimmon)

A genus of 500-600 species, trees and shrubs, of tropical and subtropical regions (with very few exceptions). The genus includes a variety of tropical trees called ebony in the wood trade. References: Eckenwalder in FNA (2009); Spongberg (1977) = Z; Wallnöfer in Kubitzki (2004).

Identification notes: Seedlings and fire sprouts are superficially very similar to Nyssa sylvatica, but can be separated in the following ways: bundle scar 1 per bud scar, narrowly crescent-shaped (vs. Nyssa with 3 distinct, circular, bundle scars arranged in a broad V pattern), leaves never with teeth (vs. Nyssa leaves sometimes with a few irregular teeth), leaves glabrate to tomentose with curly hairs (vs. glabrous or with a few straight, forward-pointing hairs), leaves with sessile to short-stipitate glands on upper surface of midrib and outer petiole, later becoming necrotic spots (vs. leaves without glands).

1 Twigs stout, reddish-pubescent; fruits to 10 cm in diameter; [cultivated alien] ........................................................................................ [D. kaki]
1 Twigs slender, glabrous or with gray pubescence; fruits to 4 cm in diameter; [native] .................................................................................. D. virginiana

Diospyros kaki (Michaux) Del., Kaki, Kaki-plum, Japanese Persimmon. Rarely grown in our area for its fruits, which are much larger than D. virginiana (to 9 cm in diameter). [= FNA, Z] {not mapped; rejected as a component of our flora}

Diospyros virginiana (L.) Small – V, S, Y; > B. mosieri Small – V, S, Y; > D. virginiana var. virginiana – C, F, G, Z; > D. virginiana var. pubescens (Pursh) Dippel; > D. virginiana – S; > D. mosieri Small – S

333. PRIMULACEAE Ventenat 1799 (Primrose Family) [in ERICALES]

As broadly circumscribed to include Myrsinaceae and Samolaceae, cosmopolitan in distribution. Following the discovery that various herbaceous and largely temperate genera (Lysimachia, Trientalis, Anagallis, Samolus, etc.) traditionally placed in Primulaceae actually were more closely related to the largely tropical and woody Myrsinaceae, various authors, including Källersjö, Bergqvist, & Anderberg (2000) and Martins, Oberprieler, & Hellwig (2003) proposed the transfer of Lysimachia, Anagallis, and Trientalis to Myrsinaceae and of Samolus to Theophrastaceae. APG III (2009) alternatively merges Samolaceae and Myrsinaceae into Primulaceae, and recognizes variation at the subfamilial and tribal ranks; this approach is followed here. References: Cholewa in FNA (2009); Cholewa & Kelso in FNA (2009); Cholewa, Pipoly, and Ricketson in FNA (2009); Channell & Wood (1959); APG III (2009); Källersjö, Bergqvist, & Anderberg (2000); Martins, Oberprieler & Hellwig (2003);

1 Pedicels ebracteate; corolla 3-7.5 mm long, the flowers 5-7 mm across; leaves all below the inflorescence; calyx lobes equaling or longer than tube; staminodes absent .......................................................... S. ebracteatus

1 Pedicels with a minute bract near the middle; corolla 1.2-3 mm long, the flowers 2-3 mm across; leaves extending into the inflorescence; calyx lobes equaling or shorter than tube; staminodes present ........................................................................................................ S. parviflorus

**Samolus ebracteatus** Humboldt, Bonpland, & Kunth, Limewater Brookweed. Cp (FL): brackish marshes, swaps over calcareous substrate; rare. Peninsular FL, coastal Panhandle FL, sw. LA, and TX, south into Mexico; West Indies. [= FNA, GW, WH; > S. ebracteatus ssp. ebracteatus – K; > S. ebracteatus ssp. alyssoides – K]

**Samolus parviflorus** Rafinesque, Water-pimpernel, Brookweed. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, VA, WV): stream banks, brackish marshes, pools in floodplains, interdune ponds; common (uncommon in WV). April-October. NB west to BC, south to Central America; also in c. and s. South America. Sometimes treated as a subspecies of the European *S. valerandi*; the American plant is sufficiently distinct to warrant specific status. *S. parviflorus* has priority over *S. floribundus* by a month. [= RAB, F, FNA, GW, W, WV; = Samolus floribundus Kunth – C, G, S; = S. valerandi Linnaeus ssp. parviflorus (Rafinesque) Hultén – K, WH]

**2. Hottonia** Linnaeus 1753 (Water-violet)

**Hottonia inflata** Elliott, Featherfoil, Water-violet. Cp (DE, NC, SC, VA), Pd (GA, NC), Mt (WV): slow-moving or stagnant waters of swamps, millponds, beaverponds, sag ponds, oxbows, rivers, probably dispersed by waterfowl, primarily in the Coastal Plain, very rarely in the Piedmont and Mountains; rare. April-July; May-August. ME south to GA, west to TX, inland up the Mississippi Embayment to IL, and at other scattered locations inland (as w. WV, and especially around the Great Lakes). The species shows large population fluctuations, and may be especially ephemeral at many locations. Townsend (1995) documents its first SC record. [= RAB, C, F, FNA, G, GW, K, S, WV]

**3. Primula** Linnaeus 1753 (Shooting star)

A genus of about 450 species, primarily of the temperate Northern Hemisphere. Mast et al. (2004) show that *Dodecatheon* is nested within *Primula*, and is closely related to (and derived from) *Primula* subgenus *Auriculastrum*, apparently via a relatively

1 Leaves cordate, subcordate, or abruptly narrowed to the petiole
1 Leaves long-cuneate at the base, gradually narrowed to the petiole

4. **Ardisia** Swartz 1788 (Marlberry)

5. **Myrsine** Linnaeus 1753 (Colicwood)

A genus of about 300 species (if circumscribed to include *Rapanea*), shrubs and trees, pantropical. References: Pipoly & Ricketson in FNA (2009); Ståhl & Anderberg in Kubitzki (2004).

* Myrsine cubana A. de Candolle, Myrsine, Colicwood. Cp (FL): hammocks; rare. Dixie, Levy, and Volusia counties FL, south to s. FL; West Indies and Central America. [= FNA; > *M. guianensis* (Aublet) Kunze – GW, misapplied; > *M. floridana* A. de Candolle – K (superfluous name); > *M. guayanensis* – S, misapplied, orthographic variant; > *Rapanea punctata* (Lamarck) Lundell – WH]

6. **Anagallis** Linnaeus 1753 (Pimpernel)

1 Leaves alternate; flowers subsessile, on thick pedicels 0.3–1.0 mm long; leaf blades 3–10 mm long..............................**A. minima**
1 Leaves opposite (occasionally in whorls of 3); flowers pedicellate, on slender pedicels 10–25 mm long; leaf blades 5–30 mm long.
2 Petals blue, ca. 2× as long as the sepals ..........................................................**A. monellii**
2 Petals red or blue (rarely white), ca. 1× as long as the sepals.
3 Flowers red (rarely white); pedicels usually longer than the leaves.................................**A. arvensis**
3 Flowers blue; pedicels usually shorter than the leaves..................................................**A. arvensis** ssp. *arvensis*

**7. Trientalis** Linnaeus 1753 (Starflower)

**Identification notes:** *Trientalis* can be recognized by its terminal whorl of leaves (4-10 cm long), the one to several white flowers borne on terminal, slender pedicels, each flower typically with 7 petals (inconspicuously united at the bases), each petal acuminate. The plant is reminiscent of a white-flowered *Lysimachia* with only one whorl of leaves.

*Trientalis borealis* Rafinesque, Northern Starflower, Maystar. Mt (GA, NC, VA, WV), Cp (DE): northern hardwood forests, rich slope forests, often in second-growth areas; uncommon (rare in DE, GA, and NC). May-June. This northern species, widespread in the mountains of VA, and known from a few locations in n. GA and ne. TN (Chester, Wofford, & Kral 1997), was first located in NC only in 1988 (Dellinger 1989). "The attractive white corollas, usually with 7 petals united only at the very base, are open in the late spring and they drop intact – like fallen stars" (Voss 1996). [= FNA; = *Trientalis borealis* Rafinesque ssp. borealis – K; < *T. borealis* – C, F, G, W, WV]

**8. Lysimachia** Linnaeus 1753 (Loosestrife)

A genus of about 150 species, herbs (rarely shrubs), cosmopolitan. Hao et al. (2004) showed that the traditional subgeneric classification of *Lysimachia* is highly artificial, and that *Glaux* is embedded within *Lysimachia*. References: Cholewa in FNA (2009); Coffey & Jones (1980)–Z; Hao et al. (2004); Ståhl & Anderberg in Kubitzki (2004). Key partly adapted from Z.

1. Petals lacking.......................................................................................................................... *L. maritima*
2. Petals present.
3. Leaves alternate; flowers white, in a terminal raceme, the tip lax while in flower, becoming erect in fruit. 4. Leaves linear-elliptic, lanceolate or narrowly ovate ................................................................. *L. clethroides*
5. Leaves opposite or whorled; flowers yellow, borne variously.
6. Leaves nearly round; plant trailing, rooting at nodes
7. Inflorescence a terminal panicle ............................................................................................. *L. fraseri*
8. Inflorescence a terminal raceme.
9. Leaves linear to lanceolate, broadly elliptic, or broadly ovate ............................................ *L. nummularia*
10. Leaves linear, lanceolate, elliptic, or ovate; plant erect (or trailing and rooting at the nodes in *L. radicans*, which has lanceolate leaves). 11. Flowers in a terminal raceme or panicle, subtended by bracts much smaller than the stem leaves.
12. Flowers axillary, all or most of them subtended by leaves similar in shape to (though often somewhat smaller than) stem leaves not subtending flowers (or with flowers in axillary, peduncled, densely-flowered racemes in *L. thyrsiflora*).
13. Flowers in peduncled axillary racemes in the axils of well-developed leaves. 14. Flowers all in the axils of much reduced linear bracts.
15. Flowers solitary, all or most of them subtended by leaves similar in shape to (though often somewhat smaller than) normal stem leaves; petals lanceolate to ovate, as long or longer than the stamens.
16. Calyx lobes 5-8 mm long, green throughout; corolla lobes 12-16 mm long, glandular-ciliolate. 17. Calyx lobes 3-5 mm long, with red margins; corolla lobes 8-12 mm long, entire ......................................................... *L. punctata*
18. Calyx lobes 5-8 mm long, green throughout; corolla lobes 12-16 mm long, glandular-ciliolate. 19. Rhizomes absent, new shoots arising from crown of rootstock ................................................. *L. tonsa*
20. Rhizomes present, new shoots arising from the rhizome.
**Lysimachia asperulifolia** Poiret, Pocosin Loosestrife, "Roughleaf Loosestrife". Cp (NC, SC): low pocosins, high pocosins, streamhead pocosins, savanna-pocosin ecotones, sandhill-pocosin ecotones; rare. May-June; August-October. Endemic to the Coastal Plain of NC and SC. *L. asperulifolia* is a very distinctive species, easily recognized vegetatively by its whorls of sessile, rounded-based, acuminate, bluish-green (to yellowish-green when shaded or otherwise stressed) leaves. The leaves of *L. asperulifolia* are not rough; the common name "roughleaf loosestrife" is a misnomer, based on a mistranslation of the specific epithet, the translator assuming that "asperulifolia" meant "rough-leaved." The epithet actually refers to the perceived similarity of the leaves to those of the European *Asperula odorata* (treated in this work as *Galium odoratum*), Sweet Woodruff, a plant with which Poiret would have been very familiar. The leaves of *G. odoratum* are similar to those of *L. asperulifolia* in their whorled disposition. Franklin (2001) studied the biology of this rare species. [= FNA; G = *L. asperulaefolia* – RAB, GW, S (orthographic variant)]

* Lysimachia barystachys Bunge, Manchurian Loosestrife. Pd (GA): disturbed areas; rare, native of Manchuria. Reported from a single county in nc. GA (Jones & Coile 1988) [further investigate]. [= FNA, K]

* Lysimachia clethroides Loosestrife. Mt (NC, WV): roadsides (cultivated and rarely persistent or escaped); rare, native of Japan. July-August. Collected in the Mountains of NC (Macon County), escaped from cultivation; it also is reported as naturalized in Grundy County, TN (Chester, Wofford, & Kral 1997, Kral 1981). It and *L. barystachys* differ from our other species in their white flowers in a dense terminal spike (with secund tip) and alternate leaves. [= C, FNA, G, K]

* Lysimachia fraseri Duby, Fraser's Loosestrife. Mt (GA, NC, SC): hardwood forests, forest edges and roadbanks, thin soils around rock outcrops, usually flowering only when exposed to extra sunlight by a tree-fall light gap or other canopy opening; rare. June-August; September-October. W. NC and e. TN south to n. SC, n. GA, and AL; disjunct in s. IL and nw. TN (Stewart County) (Chester, Wofford, & Kral 1997). This rare species is limited in NC to the mountains south of the Asheville Basin, especially in the escarpment gorges of Macon and Jackson counties. Potentially the largest and coarsest of our *Lysimachia* (up to 2 meters tall), *L. fraseri* usually occurs as much smaller seedlings and non-flowering individuals. When a tree-fall light gap occurs, individuals flower and fruit. Even seedlings can be separated from the more common and widespread *L. quadrifolia* by the following characteristics (all best observed at 10×): leaves with a narrow, translucent red border, upper internodes of the stem glandular-puberulent, and backedlighted leaf without sinuous, translucent lineations (*L. quadrifolia*: leaves without red border, upper internodes sparsely pubescent with longer, nonglandular hairs, or rarely a few of the hairs with slightly bulbous tips, and backliefted leaf with numerous sinuous, translucent lineations). [= RAB, FNA, GW, K, S, W]

* Lysimachia loomisii Torrey, Carolina Loosestrife. Cp (GA, NC, SC): moist to wet savannas, pocosin ecotones; uncommon (rare in GA). May-June; August-October. Endemic to the outer and middle Coastal Plain of NC, SC, and e. GA. *L. × radfordii* Ahles, a hybrid of *L. loomisii × quadrifolia*, is intermediate between its parents. [= RAB, FNA, GW, K, S]

* Lysimachia maritima (Linnaeus) Galasso, Banfi, & Soldano, Sea-milkwort. Cp (MD, NJ, VA?): saline coastal habitats; rare. June-July. The species is interruptedly circumboreal, in North America from QC south to VA on the east coast, and from BC south to OR on the west coast, also inland in w. North America, from SK south to NM. G suggests that *L. maritima* is introduced near its southern limit in the east. [= FNA = Gnaphalium maritimum Linnaeus – C, K; > G. maritima var. maritima – F, G]

* Lysimachia nummularia Linnaeus, Creeping Charlie, Creeping Jenny, Moneywort. Pd (DE, GA, NC, SC, VA), Mt (NC, SC, VA, WV), Cp (DE, NC, SC, VA): lawns, pastures, seepages, other moist, disturbed places; common (uncommon in GA, NC, SC), native of Europe. May-July; August-September. The leaves have many minute, maroon dots. [= RAB, C, F, FNA, GW, K, S, W]
**PRIMULACEAE**

**Lysimachia ×producta** (A. Gray) Fernald (pro sp.). Mt (NC, VA), Pd (VA), Cg (NC): moist areas; rare. May-July; August-October. This is a fertile hybrid of *L. quadrifolia* and *L. terrestris*, sometimes occurring in the apparent absence of one or both parents. [= RAB, C, FNA, K, = *L. producta* (A. Gray) Fernald – G, S]

**Lysimachia quadriflora** Sims, Smooth Loosestrife, Four-flowered Loosestrife. Mt (GA, VA, WV): wet meadows and calcareous fens, stream banks; rare. July-September. MA, s. ON, MI, and ND south to w. VA, WV, nw. GA, AL, and AR; mainly north and west of the Ohio River, very rare and scattered in or east of the Appalachians. Reported for c. NC by Coffey & Jones (1980), the record seems very unlikely and is rejected unless documentation is found. [= C, FNA, K, W, WV, Z; = Steironema quadriflora (Sims) Hitchcock – G]

**Lysimachia quadriflora** Linnaeus, Whorled Loosestrife. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cg (DE, NC, SC, VA): a wide variety of forests and openings, including pine savannas of the outer Coastal Plain, ranging from moist to very dry; common (uncommon in Coastal Plain south of VA). May-August; August-October. ME west to WI and MN, south to SC, c. GA, AL, and TN. Although the species normally has whorled leaves, immature and small plants often have opposite leaves only. See *L. fraseri* for discussion of vegetative features useful in distinguishing the two species. *L. ×radfordii* Ahles, a hybrid of *L. loomisii × quadriflora*, is intermediate between its parents. [= RAB, C, FNA, G, GW, K, S, W, WV]

**Lysimachia radicans** Hooker, Trailing Loosestrife. Mt (VA), Cg (VA): moist forests, swamps; rare. June-August. The main distribution of this species is in the Mississippi Embayment, from MO and w. TN south to s. AL, MS, AR, LA, and e. TX; disjunct occurrences in VA and (allegedly) e. NC are curious. The report for NC is from a species list for Nags Head Woods, Dare County; it is unpublished, apparently not documented by an herbarium specimen, and rejected unless documentation is found. [= C, F, FNA, K, W, Z; = Steironema radicans (Hooker) A. Gray – G, S]

**Lysimachia thyrsiflora** Linnaeus, Tufted Loosestrife. Mt (WV): bags, swamps, marshes; rare. May-July. Circumboreal, south in North America to NJ, PA, OH, and MO (Kartesz 1999), WV (FNA), and MD (from Big Marsh, Kent County) (Steury, Tyndall, & Cooley (1996), NE, CO, UT, and CA. [= C, F, K; = Naumburgia thyrsiflora (Linnaeus) Du Bby – G]

**Lysimachia tonsa** (Wood) ex Pax & R. Knuth, Southern Loosestrife, Appalachian Loosestrife. Pd (GA, NC, SC, VA), Mt (GA, VA, WV): upland forests, especially over calcareous or mafic rocks; rare. May-July; August-October. Sc. VA, sw. VA, and KY south to SC, wc. GA, and e. TN. The range is centered on the Southern Appalachians, but the species is essentially absent from the higher mountains -- a "doughnut range." [= RAB, C, F, FNA, K, W, WV, Z; =? Steironema intermedium (Kearney – G; = Steironema tonsa (Wood) Bicknell ex Britton – S]

* Lysimachia vulgaris Linnaeus, Garden Loosestrife. Mt (WV), Pd (VA): disturbed bottomlands, marshes, disturbed areas; rare, native of Europe. Introduced and naturalized south at least to se. and sc. PA (Rhoads & Klein 1993), WV, KY, MD, and NJ (Kartesz 1999) and now reported for n. VA (Steury, Fleming, & Strong 2008). [= C, F, FNA, G, K]

**Lysimachia graminea** (Greene) Handel-Mazzetti, Grassleaf Yellow-loosestrife. Endemic to ne. AL. (Little River Canyon area). [= FNA, K, Z; = Steironema gramineum Greene – S]

334. THEACEAE D. Don 1825 (Tea Family) [in ERICALES]

With a more circumscribed definition (excluding Pentaphylacaceae), a family of about 9 genera and 450 species, trees and shrubs, of primarily tropical and subtropical regions of the Old and New Worlds. References: Prince in FNA (2009); Prince & Parks (2001); Stevens, Dressler, & Weitzman in Kubitzki (2004).

1 Leaves deciduous, medium green above, herbaceous in texture.
2 Leaves broader toward the tip, 2-2.5× as long as wide; [tribe Gordonieae] ................................................................. 
   **Franklinia**
2 Leaves broadest near or below the middle, 1-1.8× as long as wide; [tribe Stewartieae] ................................................................. 
   **Stewartia**
1 Leaves evergreen, dark green above, coriaceous in texture.
3 Leaves ovate to elliptic (broadest at or below the middle), 1-3× as long as wide, slightly to strongly acuminate, 5-10 (<15) cm long; [introduced shrub, planted in upland soils]; [tribe Theaceae] ................................................................................................. 
   **Camellia**
3 Leaves oblanceolate to narrowly elliptic (broadest at or above the middle), 2.5-4× as long as wide, acute to obtuse (rarely slightly acuminate), 8-30 cm long; [small to large tree, native in acidic Coastal Plain wetlands]; [tribe Gordonieae] ................................................................. 
   **Gordonia**

**Camellia** Linnaeus 1753 (Camellia, Tea)

1 Sepals deciduous; flowers sessile; leaves mostly ovate, acuminate, > 4 cm wide ................................................................. 
   **C. japonica**
1 Sepals persistent; flowers on pedicels; leaves mostly elliptic, only slightly acuminate, < 4 cm wide ................................................................. 
   **C. sinensis**
THEACEAE

Camellia japonica Linnaeus, Camellia. Frequently cultivated, sometimes persistent around old home sites; native of China and Japan. [= K]

Camellia sasanqua Thunberg, Sasanqua Camellia, is reported as introduced in NC, SC, GA, and FL (Kartesz 1999). [= K] [not yet keyed]

Camellia sinensis (Linnaeus) Kuntze, Tea. Cultivated in plantations and as a horticultural novelty, rarely escaped; native to China. [= K; = Thea sinensis Linnaeus]

Franklinia Bartram ex Marshall 1785 (Franklinia)

A monotypic genus, apparently endemic to e. GA (now presumably extinct in the wild). Franklinia is actually most closely related to the Asian genus Schima (Prince & Parks 2001); its closest relative in North America is Gordonia, from which it differs in its deciduous leaves (vs. evergreen) and globose fruits (vs. pointed). References: Prince in FNA (2009); Bozeman & Rogers (1986); Stevens, Dressler, & Weitzman in Kubitzki (2004).

Franklinia alatamaha Bartram ex Marshall, Franklinia. Habitat speculative, probably dry sandy ridges, near the mouth of the Altamaha River; believed to be extinct in the wild. It was native to the Coastal Plain of GA, where it was found by William Bartram near the mouth of the Altamaha River. It has not been seen in the wild since 1803 and is now considered to be extinct in the wild. It is sometimes cultivated in our area. Bozeman & Rogers (1986) discuss the history of this tree. [= FNA, K, S; = Gordonia alatamaha (Bartram ex Marshall) Sargent]

Gordonia Ellis 1771 (Loblolly Bay, Gordonia)

As recircumscribed, a genus of 2 species, trees, of se. North America and Central America (Gordonia brandegeei H. Keng). The other 20-70 species, trees and shrubs, of se. Asia, previously assigned to Gordonia are actually in a different tribe and should be reassigned to Polyspora (Yang et al. 2004). References: Prince in FNA (2009); Yang et al. (2004); Stevens, Dressler, & Weitzman in Kubitzki (2004).

Identification notes: Gordonia is one of the "bay trees" so typical of acid Coastal Plain wetlands of our area – the other two being Sweet Bay (Magnolia virginiana of the Magnoliaceae) and Swamp Red Bay (Persea palustris of the Lauraceae). Gordonia can be distinguished from the other two species by its smooth leaves, serrate toward the tip, odorless when crushed (vs. pubescent leaves, entire-margined, aromatic when crushed). Gordonia is also distinctive in its narrow, conical crown, resembling Liriodendron or Chamaecyparis, and its medium-gray, deeply furrowed bark. Most individuals of Gordonia have at least a few orange-red leaves visible, at any season.

Gordonia lasianthus (Linnaeus) Ellis, Loblolly Bay, Gordonia. Pocosins, bayheads, acidic, organic-rich swamp forests, wet pine savannas, bay forests. July-September; September-October. Ne. NC south to s. peninsular FL, west to s. MS (Sorrie & Leonard 1999), a Southeastern Coastal Plain endemic. Peat-filled Carolina bays and large peat dome pocosins typically have Gordonia as an important tree, surpassed in abundance and importance only by Pinus serotina. On deep peats, Gordonia individuals are stunted and rarely reach sizes larger than pocosin shrubs. [= RAB, FNA, GW, K, S, WH]

Stewartia Linnaeus 1753 (Stewartia, Wild Camellia)

A genus of about 20 species, trees and shrubs, of temperate e. Asia and e. North America. Both our species of Stewartia are very attractive shrubs. The other species of the genus are Asian. Li et al. (2002) demonstrate that our 2 species form a clade together, separate from and basal to the Asian species; Prince (2002) shows a different tree topology. References: Prince in FNA (2009); Spongberg (1974)=Z; Li et al. (2002); Prince (2002); Stevens, Dressler, & Weitzman in Kubitzki (2004).

Identification notes: The leaves are borne in horizontal planes, reminiscent of Cornus florida and Cornus alternifolia. The leaves of both species are obscenely serrate or crenate, and also conspicuously and copiously ciliate-margined.

1 Style 1, with a 5-lobed stigma; seeds 5-7 mm long, shiny, plump, angled; fruit lobes rounded; leaves mostly 4-10 cm long, with 7-8 pairs of lateral veins; petioles narrowly winged (0.1-1 mm wide), not enclosing and concealing the terminal and lateral buds; calyx subtended by 2 persistent bracts, each 2-4 mm long; seeds shiny .................................................................S. malacodendron

1 Styles 5, separate; seeds 8-10 mm long, dull, flat, thin (to slightly winged); fruit lobes angled; leaves mostly 7-15 cm long, with 5-7 pairs of lateral veins; petioles widely winged (1-2 mm wide), enclosing and concealing the terminal and lateral buds; calyx subtended by 1 persistent bract, 11-14 mm long; seeds dull ..............................................................................................................S. ovata
Stewartia malacodendron Linnaeus, Silky Camellia, Virginia Stewartia. Mesic forests, especially on beech-dominated bluffs or "islands" in Coastal Plain swamps. May-June; September-October. Primarily Coastal Plain, se. VA south to FL, west to se. TX, but extending inland to the Piedmont of GA, NC, and SC and the Mountains of NC. [= RAB, FNA, K, W, WH, Z; = Stewartia malacodendron – C, F, G (orthographic variant); = Stauracta malacodendron – S (orthographic variant)]

Stewartia ovata (Cavanilles) Weatherby, Mountain Camellia, Mountain Stewartia. Mesic forests, especially acidic bluffs, often in openings in rhododendron thickets ("hells"), in the Coastal Plain of VA restricted to ravines. Late June-July; August-September. Primarily Appalachian: e. KY, sc. VA, e. VA south to c. NC, w. SC, e. and c. TN to n. GA and n. AL, avoiding, however, the higher mountains, and extending into the Coastal Plain in e. VA. The species is most abundant in the Cumberland Plateau of KY and TN. [= RAB, C, F, FNA, G, K, W, Z; = Malachodendron pentagynum (L'Héritier) Small – S]

335. SYMPLOCACEAE Desfontaines 1820 (Sweetleaf Family) [in ERICALES]

A family of 1 genus and about 250-300 species, trees and shrubs, of tropical and warm temperate America and Asia. References: Nootoeboom in Kubitzki (2004).

Symplocos Jacquin 1760 (Sweetleaf)

A genus of about 300 species, trees and shrubs, of tropical and warm temperate America and Asia. Wang et al. (2004) found that the affinities of S. tinctoria are with South American species of subgenus Epigenia, rather than with east Asian species of subgenus Hopea, section Palaeosymplocos. References: Wang et al. (2004); Nootoeboom in Kubitzki (2004).

Identification notes: The foliage of S. tinctoria has a sweet taste, and an odor and taste similar to green apples. Sometimes the leaves are glossy and appear subcoriaceous, somewhat resembling Kalmia latifolia.

1. Leaf margins sharply and finely glandular-dentate; inflorescence a terminal panicle; drupes blue (white); [alien, rarely cultivated and escaped]; [subgenus Palura] .......................................................... S. paniculata
1. Leaf margins entire to coarsely serrate-crenate; inflorescence an axillary fascicle; drupes green; [native, common in parts of our area]; [subgenus Symplocos; section Barberina] ............................................................................................................................................ S. tinctoria

* Symplocos paniculata (Thunberg) Miq., Sapphire-berry, Asiatic Sweetleaf. Suburban woodlands; native of e. Asia. Spreading from plantings at scattered locations in the ne. United States, such as DE and District of Columbia (Whittemore 2003).

Symplocos tinctoria (Linnaeus) L'Heritier, Sweetleaf, Horsesugar. Moist bottomland forests, pocosin edges, mesic forests, ridgetop forests. March-May; August-September. DE south to n. FL and west to e. TX and se. OK. The range in our area is discontinuous and interesting, the species rather abundant in the Coastal Plain throughout our area, and in the Mountains of NC and SC (absent from the VA mountains!), but present in the Piedmont only near its borders with the other provinces and in scattered sites in the central Piedmont. The leaves have a subcoriaceous and rather evergreen appearance, but are (in our area) only semi-evergreen. As the name implies, the leaves are somewhat sweet, but the sweetness seems variable from plant to plant, season to season, and taster to taster. Whether sweet or not, the taste is distinctive and is helpful (once learned) in distinguishing this rather nondescript shrub or small tree. Where protected from fire, S. tinctoria can reach considerable size, up to 20 cm in diameter and 10 m tall, with longitudinally striped bark. [= RAB, C, GW, K, S, W, WH; > S. tinctoria var. tinctoria – F, G; > S. tinctoria var. pygea Fernald – F, G (probably based on fire sprouts); > S. tinctoria var. ashei Harbison]

336. DIAPENSIACEAE (Link) Lindley 1836 (Diapensia Family) [in ERICALES]

1. Leaves cauline, generally < 10 mm long and < 3 mm wide; [of Coastal Plain pinelands] ................................................................. Pyxidanthera
1. Leaves basal (or on a short caudex), generally > 50 mm long and > 30 mm wide; [throughout our area, more common in the Piedmont and Mountains].

2. Leaves orbicular, rounded or with a slight point at the apex, finely serrate (4-8 teeth per cm), the teeth not prominently mucronate; flowers in racemes; [widespread] ............................................................................................................................................. Galax
DIAPENSIACEAE

2 Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1-4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere]..............................................................................................................Shortia

Galax Sims 1804 (Galax)

Galax urceolata (Poiret) Brummitt, Galax. Mountain forests, rock outcrops, nearly ubiquitous in the Mountains, more restricted in habitat elsewhere, moist to dry slopes in the Piedmont and Coastal Plain, often associated with Kalmia latifolia or Rhododendron maximum. May-July; August-October. The genus consists of this single species, with a range centered in the Southern Appalachians, occurring in NC, SC, GA, AL, e. TN, KY, VA, WV, and MD. Diploid and tetraploid races exist, and both are present in our area (Nesom 1983). In NC, diploids are the predominant race in the Mountains, the s. Piedmont, and the s. and c. Coastal Plain; tetraploids predominate along the Blue Ridge Escarpment, the n. Piedmont, and the n. Coastal Plain. In SC, diploids occur in the Coastal Plain and Piedmont, tetraploids in the mountains and escarpment. In GA, the pattern is similar, with diploids extending further into the Piedmont and tetraploids restricted to the Mountains and upper Piedmont. In AL, only diploids are known. In VA, however, tetraploids occupy the Coastal Plain and e. Piedmont, diploids in the upper Piedmont and Mountains. A study of the flavonoids supported the idea that the tetraploid is an autopolyploid derivative of the diploid. Because of the close morphologic similarity, substantially sympatric distributions, and apparent general absence of demonstrable ecologic differentiation between the two races, it seems best not to attempt to taxonomically distinguish them (Nesom 1983; Soltis, Bohm, & Nesom 1983). "Galax-pulling" (the gathering of the often bronze-colored evergreen leaves for the florist trade) is an important folk industry in the mountains. [= FNA, K, W, X; = G. aphylla Linnaeus – RAB, C, F, G, S, WV, misapplied]

Pyxidanthera Michaux 1803 (Pyxie-moss, Pyxie)

Pyxidanthera barbulata Michaux, Common Pyxie-moss, Big Pyxie. Pine savannas, pine flatwoods, pocosin margins, edges of sandhill seepage bogs, primarily in mesic to hydric sites, in wet sands and peaty sands, occasionally extending to submesic sands, but generally with a permanently or seasonally high water table, often with Sphagnum. March-April; May-June. NY (Long Island) south to NJ, and from se. VA south to n. SC. In the Sandhills, where its range overlaps P. brevifolia, P. barbulata is limited to seepage areas or pocosin ecotones, while P. brevifolia occurs in xeric situations far upslope. [= F, FNA, G, GW, K, S; = P. barbulata var. barbulata – RAB, < P. barbulata – X, Z]

Pyxidanthera brevifolia B.W. Wells, Sandhills Pyxie-moss, Wells's Pyxie-moss, Little Pyxie. On xeric sandhills, generally over deep sand or sand-clay mixtures near the summits or on the upper slopes of sandhills, restricted to the Sandhills region. December-March; February-May. This species is endemic to a six-county area of the Sandhills of NC and SC. In NC, it is nearly limited to Fort Bragg, and is puzzlingly absent from seemingly suitable habitat on the Sandhills Game Land to the west. The taxonomic status of this entity has been controversial, with different authors considering it a species, a variety, or an ecotype not worthy of taxonomic status. A combination of morphologic, embryologic, phytogeographic, ecological, and phenologic evidence favors the recognition of two taxa in Pyxidanthera. Recent surveys of Pyxidanthera in the Sandhills of NC have shown that it is ecologically distributed in a strongly bimodal manner. While ecologically intermediate situations predominate in the Sandhills, this habitat is rarely occupied by Pyxidanthera. Instead, Pyxidanthera is usually found either in very dry (hill-top) or moist (pocosin ecotones) situations. A few morphologically intermediate populations are occasionally found, in ecologically intermediate situations, but the vast majority of populations are readily assigned to one taxon or the other. Godt & Hamrick (1995) showed low levels of allozyme differentiation between the two taxa and supported varietal status. [= FNA, K, S; = P. barbulata Michaux var. brevifolia (B.W. Wells) Ahles – RAB, < P. barbulata – X, Z]

Shortia Torrey & Gray 1842 (Shortia, Ocone Bells)
A genus of 5-6 species, perennial herbs, of e. Asia and the Southern Appalachians. The Asian species are: *S. uniflora* (Maximowicz) Maximowicz of montane Japan (with 3 varieties), *S. rotundifolia* (Maximowicz) Makino of Japan, *S. exappendiculata* Hayata, of montane Taiwan, *S. soldanelloides* (Siebold & Zuccarini) Makino, of montane Japan (with as many as 5 varieties recognized), and *S. sinensis* Hemsley of montane Yunnan Province, China. References: Nesom in FNA (2009); Davies (1952)=Z; Hatley (1977)=Y; Barnes (1990); Scott in Kubitzki (2004).

1 Style 6-10 (-12) mm long; filaments generally 5-7 mm long; corolla lobes 14-17 mm long; [native of McDowell County, NC] .................................................

1 Style (10-) 12-18 mm long; filaments generally 6-9 mm long; corolla lobes 16-25 mm long; [native to Transylvania and Jackson counties, NC; Oconee and Pickens counties, SC, and Rabun County, GA; introduced elsewhere] ........................................... *Sh. galacifolia* var. *galacifolia*

*Shortia galacifolia* Torrey & A. Gray var. *brevistyla* Davies, Northern Shortia. On moist slopes, creekbanks, and rock outcrops in humid escarpment gorges with high rainfall, generally in deep shade under *Rhododendron maximum*, at elevations of 350-550m. March-April; July-August. This variety is known only from McDowell County, NC, where it occurs on several tributaries of the Catawba River and North Fork Catawba River. It has also been reported from the gorge of the Linville River, Burke County, but this locality is questionable and has not been relocated. This area is disjunct about 100 kilometers to the northeast along the Blue Ridge Escarpment from the range of the typic variety. In addition to the characters used in the key, var. *brevistyla* differs in a variety of characters of the flowers and leaves, as discussed in Davies (1952) and Hatley (1977). Whether the recognition of infraspecific taxa is warranted is not clear; Davies argued for and Hatley against. Though the morphological characters are relatively minor and partially overlapping, their correlation with disjunct ranges and their likely influence on pollination and reproduction influence me to provisionally accept varietal status, pending further research. [= FNA, K, Z; < *Shortia galacifolia* – RAB, C, G, W, X, Y; < Sherwoodia galacifolia (Torrey & A. Gray) House – S]

*Shortia galacifolia* Torrey & A. Gray var. *galacifolia*, Southern Shortia, Oconee Bells. On moist slopes, creekbanks, and rock outcrops in humid escarpment gorges with high rainfall, generally in deep shade under *Rhododendron maximum* and *R. minus*, at elevations (in NC) of 350-650m. March-April; July-August. This variety occurs in Transylvania and Jackson counties, NC, Oconee and Pickens counties, SC, and Rabun County, GA, where it occurs in the remarkable escarpment gorges region, at elevations from 200-650m (formerly at lower elevations, now submerged under Lake Jocassee). Most of the population of this species, including the type locality, was destroyed in the early 1960's by the construction of Lake Jocassee (Zahner & Jones 1983). In the gorge tributaries of the Eastatoe, Toxaway, Horsepasture, and Thompson rivers, *Shortia* can sometimes form a dense groundcover covering acres. Various outlying locations, such as in NC (Swain and Macon counties), VA (Amherst County), and TN (Blount, Monroe, and McMinn counties) are not considered native, and are adventive or the result of persistence after cultivation. The species is prized by gardeners, and survives well outside its natural range. [= FNA, K, Z; < *Shortia galacifolia* – RAB, C, G, W, X, Y; < Sherwoodia galacifolia (Torrey & A. Gray) House – S]

**Halesia 1. Ellis ex Linnaeus 1759** (Silverbell, Snowdrop Tree)

A genus of about 4 species, trees and shrubs, of e. North America and e. Asia. The genus was named to honor Stephen Hales; it therefore seems more appropriate to pronounce the genus with three syllables (the accent on the first) than the commonly heard four, which thoroughly distorts the honoree’s name. The number of taxa in our area and their appropriate taxonomic level are in dispute; recent analyses vary from from 2-5, with specific or varietal status. References: Fritsch in FNA (2009); Fritsch & Lucas (2000)←X; Revele & Seldin (1976)⇒Y; Sargent (1921); Godfrey (1988)⇒Z.

1 Petals united only basally, the lobes longer than the tube; fruits broadly 2-winged; leaves broadly obovate to suborbicular, 1-2× as long as wide.

2 Corolla 10-15 mm long.......................................................... *H. diptera* var. *magniflora*

2 Corolla 20-30 mm long.......................................................... *H. diptera* var. *diptera*
**STYRACACEAE**

Halesia carolina Linnaeus, Little Silverbell. Sandy alluvial forests. March-April; September-October. S. SC south to Panhandle FL, west to s. MS. [= K, WH, Y, Z; = H. parviflora Michaux – RAB, GW, S; < H. carolina – FNA, X]

Halesia diptera Ellis var. diptera, Common Two-wing Silverbell. Bottomland forests, forested edges of brackish marshes. April-May; August-September. Var. diptera ranges from s. SC south to Panhandle FL, west to n. AL, sw. AR, and e. TX. [= Y, Z; < H. diptera – FNA, GW, K, S, WH]

Halesia diptera Ellis var. magnifica Godfrey. Dry to moist hammocks. Endemic to sw. GA and Panhandle FL. Fritsch in FNA (2009) considers the variation clinal, the larger-flowered plants in the eastern part of the range of H. diptera s.l., and not worthy of taxonomic status. [= Y, Z; < H. diptera – FNA, GW, K, S, WH]

Halesia tetraptera Ellis, Common Silverbell, Mountain Silverbell. Moist slopes, coves, creek-banks, bottomlands. March-May; August-September. W. VA, s. WV, s. OH and s. IL, south to FL and e. TX (and cultivated elsewhere). Two varieties or species have sometimes been recognized (see synonymy): "monticola," a large tree, restricted to the Southern Appalachians (and especially the Great Smoky Mountains), the corolla (18-)20-30 mm long, the style included, the anthers well inside the mouth of the corolla tube, and "tetraptera," a smaller tree more widely distributed, the corolla (12-)15-20 mm long, the style slightly exserted, the anthers just within the mouth of the corolla tube. Most studies have judged them too intergradient to be practically delimited. [= C; = H. carolina – RAB, F, G, W, WV; < H. carolina – FNA, X; > Halesia tetraptera Ellis var. tetraptera – K, Y; > Halesia tetraptera Ellis var. monticola (Rehder) Reveal & Seldin – K, Y; > H. carolina Linnaeus – S; > H. monticola (Rehder) Sargent – S]

Styrax Linnaeus 1753 (Snowbell, Storax)

A genus of about 120-130 species, trees and shrubs, of s. Europe, Malesia, se. Asia, se. North America, and tropical America. References: Gonsoulin (1974)–Z. Nicolson & Steyskal (1976) discuss at length the grammatical gender of the genus, and conclude that it should be treated as masculine.

Styrax americanus Lamarck var. americanus, American Snowbell, American Storax. Swamp forests, pocosin edges, other moist to wet habitats. April-June; July-September. Var. americanus ranges from ne. WV, OH, s. IN, s. IL, s. MO, south to s. FL and e. TX. See discussion below on var. pulverulentus and the presence in our area of transitional plants. [= C; < S. americana – RAB, G, GW, W; < S. americanus – FNA, K, WH; = S. americana var. americana – F; Z; = S. americana – S]

Styrax americanus Lamarck var. pulverulentus (Michaux) Perkins ex Rehder, Downy American Snowbell. Wet pine flatwoods. April-May; July-September. "Good" var. pulverulentus ranges from SC south to s. FL and west to e. TX and se. MO; some plants in NC and SC are transitional between the two varieties and will not be easily assigned. [= C, Z; < S. americana – RAB, G, GW, W; < S. americanus – FNA, K, WH; = S. pulverulentus Michaux – S; = S. americana var. americana - Z]

Styrax grandifolius Aiton, Bigleaf Snowbell, Bigleaf Storax. Upland forests, bluffs. April-May; August-September. Se. VA south to ne. FL and. Panhandle FL, west to e. TX, north to se. MO. [= C, FNA, K, WH; = S. grandifolia – RAB, F, G, S, W, Z]

Styrax japonicus Siebold & Zuccarini, Japanese Snowbell. Suburban woodlands; native of e. Asia. [= FNA, K]
A family of 3 genera and about 22 species, perennial insectivorous herbs, of e. North America (Sarracenia), w. North America (Darlingtonia), and ne. South America (Heliamphora). References: Mellichamp in FNA (2009); Neyland & Merchant (2006); Kubitzki in Kubitzki (2004).

Sarracenia Linnaeus 1753 (Pitcherplant)

Identification notes: Hybrids between the various species of pitcher-plants are relatively frequent; see Bell (1952), Bell & Case (1956), Mellichamp (2008), and Mellichamp in FNA (2009) for further discussion. They are usually rather easy to determine, since they show intermediacy in characters, and usually are found in close proximity to both parents.

1 Pitchers mostly decumbent; lateral wing of the pitcher very prominent; petals maroon to pink; [section Sarracenia].
2 Pitchers prominently marked with white on the hood; hood of the pitcher globose; orifice formed by the fusion of the hood margins. ............................................................................................................................. S. psittacina
3 Petals pale pink; lip of pitcher 2.6-7.5 mm thick at thickest point; scape 16.3-35.1 cm high; style arm 2.6-4.1 cm long; [of the Gulf Coastal Plain, from sw. GA westward] ................................................................................................................................................ S. rosea
4 Pitchers < 3× as long as broad; pitchers glabrous on the outer surface; petals dark maroon (occasionally red); rhizomes generally vertical, and with relatively many pitchers per crown (often 6-10); [of e. VA northward] .................... S. purpurea var. purpurea
5 Hood lobes not incurved and touching; hairs lining the inner surface of the hood (1.0-) 1.5-3.0 mm long; [of the Coastal Plain of se. NC and SC] ........................................ S. purpurea var. montana
6 Pitchers and scapes < 35 cm tall; unwinged petiolar base of pitchers (3-) avg. 6 (-11) cm long, abruptly widened into the pitcher; [of pine savannas]; [widespread from se. NC southward] .................................................. S. minor var. minor
7 Areas of white tissue all around the summit of the pitcher and throughout the hood, the areas of bright white tissue surrounded by a conspicuous network of reddish venation; hood erect or ascending; petals maroon ............................................................... S. leucophylla
8 Pitchers with white (or whitish and translucent) patches toward the summit of the pitcher and behind the orifice and/or on the hood.
9 Petals yellow; pitcher hood 4-10 (-14) cm wide.
10 Phyllodia (nonpitcher leaves) many per plant and forming a rosette, 5-18 cm long, strongly curved, usually curving 45-90 degrees; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to e. TX].
11 Narrowed base of the hood not purple-spotted, its sides revolute but not rolled backwards and nearly touching; blade of the hood ovate, slightly cordate basally; [of the Coastal Plain, from s. AL west to e. TX] ................................................................. S. alata
12 Narrowed base of the hood usually purplish-spotted; its sides strongly rolled backwards (away from the orifice) such that they nearly touch; blade of the hood broadly reniform to orbicular-reniform, broadly cordate basally; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to se. MS] ............................................................................................................................. S. flaviflora

Identification notes: Hybrids between the various species of pitcher-plants are relatively frequent; see Bell (1952), Bell & Case (1956), Mellichamp (2008), and Mellichamp in FNA (2009) for further discussion. They are usually rather easy to determine, since they show intermediacy in characters, and usually are found in close proximity to both parents.

1 Pitchers mostly decumbent; lateral wing of the pitcher very prominent; petals maroon to pink; [section Sarracenia].
2 Pitchers prominently marked with white on the hood; hood of the pitcher globose; orifice formed by the fusion of the hood margins. ............................................................................................................................. S. psittacina
3 Petals pale pink; lip of pitcher 2.6-7.5 mm thick at thickest point; scape 16.3-35.1 cm high; style arm 2.6-4.1 cm long; [of the Gulf Coastal Plain, from sw. GA westward] ................................................................................................................................................ S. rosea
4 Pitchers < 3× as long as broad; pitchers glabrous on the outer surface; petals dark maroon (occasionally red); rhizomes generally vertical, and with relatively many pitchers per crown (often 6-10); [of e. VA northward] .................... S. purpurea var. purpurea

8 Pitchers with white (or whitish and translucent) patches toward the summit of the pitcher and behind the orifice and/or on the hood.
9 Petals yellow; pitcher hood 4-10 (-14) cm wide.
10 Phyllodia (nonpitcher leaves) many per plant and forming a rosette, 5-18 cm long, strongly curved, usually curving 45-90 degrees; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to e. TX].
11 Narrowed base of the hood not purple-spotted, its sides revolute but not rolled backwards and nearly touching; blade of the hood ovate, slightly cordate basally; [of the Coastal Plain, from s. AL west to e. TX] ................................................................. S. alata
12 Narrowed base of the hood usually purplish-spotted; its sides strongly rolled backwards (away from the orifice) such that they nearly touch; blade of the hood broadly reniform to orbicular-reniform, broadly cordate basally; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to se. MS] ............................................................................................................................. S. flaviflora

338. SARRACENIACEAE Dumortier 1829 (Pitcherplant Family) [in ERICALES]

A family of 3 genera and about 22 species, perennial insectivorous herbs, of e. North America (Sarracenia), w. North America (Darlingtonia), and ne. South America (Heliamphora). References: Mellichamp in FNA (2009); Neyland & Merchant (2006); Kubitzki in Kubitzki (2004).
SARRACENIACEAE

9 Petals maroon; pitcher hood < 4 cm wide (except S. alabamensis ssp. alabamensis, which can be up to 8.8 cm wide).
12 Orifice wing loosely rolled, with a pronounced “spout” over the wing; summer pitchers ca. 10× as long as the width of the pitcher mouth; orifice yellow-green; [of the Coastal Plain of c and s. AL and s. MS]
13 Pitcher background color yellow, the upper pitcher weakly or not veined on the outer surface; [of c. AL (Autauga, Chilton, and Elmore counties)]..........................S. alabamensis ssp. alabamensis
13 Pitcher background color tan, the upper pitcher strongly reticulately veined on the outer surface; [of s. AL, s. MS, and w. FL].....

12 Orifice rim tightly rolled, with a very slight “spout” over the wing; summer pitchers narrow and elongate, ca. 20× as long as the width of the pitcher mouth; [of the Coastal Plain of NC, SC, GA, and Panhandle FL, and the Mountains of sw. NC and nw. SC].
14 Pitchers (25-) avg. 40-50 (-75) cm tall; scapes about the same height as the pitchers; hood ascending, leaving the orifice exposed, 1.5-6.5 cm long, 2.0-5.4 cm wide; orifice 2.8-4.2 cm wide; [of the Mountains of NC and SC].................................S. jonesii
14 Pitchers (7-) avg. 15-60 cm tall (-55) cm tall; scapes 1.5-2× the height of the leaves (pitchers); hood horizontal, held closely over the orifice, 0.7-4.5 cm long, 0.7-3.9 cm wide; orifice 1.5-3.5 cm wide; [of the Coastal Plain of NC, SC, and GA].
15 Pitchers (7-) 15-43 cm tall; orifice 1.5-2.3 cm wide; [se. and sc. NC south through SC to sc. GA].............S. rubra ssp. rubra
15 Pitchers 47-61 cm tall; orifice 2.4-3.5 cm wide; [sw. GA west to FL Panhandle].................................S. rubra ssp. gulfensis

Sarracenia flavo Linnaeus, Yellow Pitcherplant, Trumpets. Savannas, seepage bogs, pocosins. March-April; May-June. Se. VA south to n. FL and west to s. AL and se. MS. In the centers of peat domes and large peat-filled Carolina bays, S. flavo is sometimes very abundant, occasionally the dominant plant over areas exceeding several square kilometers. [= RAB, C, F, FNA, G, GW, K, Q, U, W, Z; < S. flavo – S (also see S. oreophila); > S. flavo var. flavo – X; > S. flavo var. atropurpurea (Bull) C.R. Bell – X; > S. flavo var. maxima Bull ex Masters – X; > S. flavo var. ornata Bull ex Masters – X; > S. flavo var. cuprea Schnell – X; > S. flavo var. rugelii (Shuttleworth ex de Candolle) Masters – X; > S. flavo var. rubricorpora Schnell – X]
Sarracenia jonesii Wherry, Mountain Sweet Pitcherplant. Bogs, cataract seeps. May; July. Endemic to a small area in sw. NC and nw. SC. There has been a great deal of disagreement over the taxonomic treatment of this taxon, a montane sibling of S. rubra. See Wherry (1929), Bell (1949), McDaniel (1971), Wherry (1972), Case and Case (1976), Schnell (1977), Massey et al. (1983), and McDaniel (1986) for further discussion. [= FNA, V, W; < S. rubra – RAB, GW, Q, U, Z; = S. rubra ssp. Jonesii (Wherry) Wherry – K, X]
Sarracenia leucophylla Rafinesque, Whitetop Pitcherplant, Crimson Pitcherplant. Wet pine savannas. Sw. GA, w. FL, s. AL, and s. AL, a Gulf Coastal Plain endemic; introduced in eastern NC. The NC population (on Croatan National Forest, Carteret Co.) was apparently introduced in the 1980s; it is not known whether this species will spread in NC, but it is persisting and has been independently “discovered” several times. [= FNA, GW, K, U, X, Z; = S. drummondii Croom – Q, S]
Sarracenia minor Walter var. okefenokeensis Schnell, Okefenokee Hooded Pitcherplant. On floating vegetation mats, ditches, and other very wet sites. Endemic to Okefenokee Swamp, se. GA. See Schnell (2002a) for additional information. [S. minor – FNA, GW, K, Q, S, U, X, Z]
Sarracenia psittacina Michaux, Parrot Pitcherplant. Savannas. This distinctive species is distributed primarily in the East Gulf Coastal Plain, but ranges east to the Atlantic Coastal Plain of e. GA (Bullock County), in close proximity to the SC border. [= FNA, GW, K, Q, S, U, X, Z]
**SARRACENIACEAE**

*Sarracenia purpurea* Linnaeus var. *montana* Schnell & Determann, Southern Appalachian Purple Pitcherplant. Mountain bogs, seepage bogs. May; July. Var. *montana* is restricted to a few dozen populations in sw. NC (south of Asheville), nw. SC, and ne. GA (Rabun County). These montane populations (in sw. NC, nw. SC, and ne. GA) show some consistent differences and appear to warrant taxonomic distinction (Schnell & Determann 1997); further study is warranted. For those tolerant of quadrinomial taxonomy, plants in our area can be called *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *montana* Schnell & Determann. Allozyme studies by Godt and Hamrick (1999) show striking genetic differences between var. *montana*, var. *purpurea*, and the Gulf Coast var. *burkii*, supporting their taxonomic recognition. In fact, the genetic differentiation is greater than that between taxa in the *S. rubra* complex. [< *S. purpurea* – RAB, GW, Q, S, W, Z; < *S. purpurea* var. *purpurea* – Reveal (1993); < *S. purpurea* ssp. *purpurea* – FNA; = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *montana* Schnell & Determann – K, Y]

*Sarracenia purpurea* Linnaeus var. *purpurea*, Northern Purple Pitcherplant. Bogs. April-May; June-July. The species as a whole is widespread in e. North America, the only *Sarracenia* to extend north of se. VA. Var. *purpurea* ranges from NL (Labrador) to NT and BC, south to NJ, DE, e. MD, w. MD (where not native), ne. VA, e. WV (where not native), OH, IN, IL, MN, and WA. A nomenclatural battle about the application of the typic variety has been resolved, with *var. purpurea* applying to the northern variety (Reveal 1993, Cheek 1994, Kartesz & Gandhi 1995, Cheek 2001). [= C, F, G, Z; < *S. purpurea* – RAB, GW, Q, S, U, W, WV; = *S. purpurea* ssp. *gibbosa* (Rafinesque) Wherry – K; = *S. purpurea* var. *terrae-novae* de la Pylaie – Reveal (1993); < *S. purpurea* ssp. *purpurea* – FNA; = *S. purpurea* ssp. *purpurea* – X]

*Sarracenia purpurea* Linnaeus var. *venosa* (Rafinesque) Fernald, Southern Purple Pitcherplant. Wet savannas, sandhill seepage bogs, hillside seepage bogs. April-May; June-July. Var. *venosa* is restricted to the Atlantic Coastal Plain of the southeastern United States, ranging from se. VA south to se. SC and e. GA; perhaps disjunct in e. LA. See MacRoberts & MacRoberts (2004) for a detailed discussion about old LA collections of *S. purpurea* or *S. rosea*. For those tolerant of quadrinomial taxonomy, plants in our area may be considered *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *venosa*. It is notable, though, that the findings of Godt & Hamrick (1999) and Ellison et al. (2004) do not support the greater relationship of the southern taxa to one another and their divergence from the northern taxon, and thus do not support the quadrinomial taxonomy. [= C, F, G, Z; < *S. purpurea* – RAB, GW, Q, S, U, W; = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald – FNA; = *S. purpurea* Linnaeus ssp. *purpurea* var. *purpurea* – K; = *S. purpurea* var. *purpurea* – Reveal (1993); = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *venosa* – X, Y]

*Sarracenia rosea* Naczi, F.W. Case, & R.B. Case, Rose Pitcherplant. Wet pine savannas and seepage bogs. Sw. GA and Panhandle FL west to s. MS and (?) e. LA. Schnell (1993) distinguished the distinctive East Gulf Coastal Plain population (with short peduncles, white stigmas, and pale pink petals) as *S. purpurea* ssp. *burkii* Schnell; Naczi et al. (1999) elevated this to species rank, as *S. rosea*. See Naczi et al. (1999) and Schnell (1993) for more detailed information and color photographs. Naczi et al.’s (1999) treatment of this taxon at specific rank is supported by the greater genetic distance found by Godt and Hamrick (1999) and morphologic and genetic analyses (Ellison et al. 2004). See MacRoberts & MacRoberts (2004) for a detailed discussion about old LA collections of *S. purpurea* or *S. rosea*. [= FNA, WH; < *S. purpurea* – GW, Q, S, U, Z; = *S. purpurea* Linnaeus ssp. *purpurea* var. *burkii* Schnell – K; = *S. purpurea* var. *purpurea* – Reveal (1993); = *S. purpurea* ssp. *venosa* (Rafinesque) Fernald var. *burkii* Schnell – X, Y]

*Sarracenia rubra* Walter ssp. *gulfensis* Schnell, Gulf Pitcherplant. Seepage bogs and savannas. April-May. Sw. GA to Panhandle FL. Schnell (2002b) considers the populations of the "*rubra* complex" in Taylor County, GA (the western Coastal Plain of GA, near the AL line) to be best assigned to "*gulfensis*." [= FNA, K, WH, X; < *S. rubra* – GW, S, U, V, Z]

*Sarracenia rubra* Walter ssp. *rubra*, Sweet Pitcherplant, Redflower Pitcherplant. Sandhill seepage bogs, pocosins, wet savannas. April-May; June-July. Se. and sc. NC south to sc. GA. The *S. rubra* complex consists of five geographically isolated entities, variously treated as species, subspecies, or geographic races (see *S. jonesii* for some of the pertinent references). [= FNA, K, X; < *S. rubra* – RAB, GW, Q, S, U, V, Z]

---

340. ACTINIDIACEAE Hutchinson 1926 (Kiwi-fruit Family) [in ERICALES]
**ACTINIDIACEAE**

*Actiniumia* Lindley (Kiwi-fruit)

A genus of 40-60 species, lianas, of e. and se. Asia. In addition to *A. chinensis*, various other species in the genus *Actinidia* are in limited or novelty cultivation in our area; some show potential to escape and naturalize. References: Dressler & Bayer in Kubitzki (2004).

*Actinidia chinensis* Planchon, Kiwi-fruit, Chinese Gooseberry. Pd (NC, VA), Mt (VA): suburban woodlands; rare, native of e. Asia. Also naturalized in nc. TN.

**341. CLETHRACEAE** Klotzsch 1851 (Clethra Family) [in ERICALES]

A monogeneric family of 65-95 species, shrubs and trees, primarily of tropical America and Asia. Sometimes combined into the Cyrillaceae. References: Tucker & Jones in FNA (2009); Sleumer (1967b); Anderberg & Zhang (2002); Schneider & Bayer in Kubitzki (2004).

*Clethra* Linnaeus (Sweet Pepperbush, White-alder, Clethra)

A genus of 65-95 species, shrubs and trees, primarily of tropical America and Asia. References: Tucker & Jones in FNA (2009); Sleumer (1967b)=Z ; Schneider & Bayer in Kubitzki (2004). Key based on FNA.

1 Leaves oblong or elliptic, averaging 11-13 cm long and 5-7 cm wide; distance up leaf margin from the leaf base to the first tooth avg. 2.4 cm; leaf margins leaf apex acuminate; inflorescence bracts exceeding the flowers; [of the Mountains] .................................................. *C. acuminata*
2 Lower leaf surface sparsely hairy; petioles 2.5-3.5 (-6) cm long; styles 6-7 mm long, hairy at the base with straight hairs; filaments 0.2-0.3 (-0.4) mm in diameter .........................................................................................................................................................................
3 Lower leaf surface wooly-tomentose; petioles 0.5-1 (-1.5) cm long; styles 3.5-5 mm long, downy throughout; filaments 0.4-0.5 (-0.7) mm in diameter........................................................................................................................................................................................

*Clethra alnifolia* Linnaeus, Coastal Sweet-pepperbush, Coastal White-alder. Pocosins, blackwater swamp forests, nonriverine swamp forests. June-July; September-October. Primarily a southeastern Coastal Plain species, *C. alnifolia* ranges from NS and ME south to FL, west to TX; disjunct in se. TN (Coffee County) (Chester, Wofford, & Kral 1997). [= FNA, S; < C. alnifolia – C, F, G, GW, K, WH; = C. alnifolia var. alnifolia – RAB, Z; = C. alnifolia var. pubescens Aiton – Z]

*Clethra tomentosa* Lamarck, Downy Sweet-pepperbush, Downy White-alder. Pocosins, swamps, streambanks. E. SC south to FL, and west to e. LA (east of the Mississippi River). If recognized at varietal rank, the correct name is var. *pubescens* Aiton, which predates var. *tomentosa* (Lamarck) Michaux (Sleumer 1967b, Wilbur 1970b). [= FNA, S; < C. alnifolia – GW, K, WH; = C. alnifolia var. tomentosa (Lamarck) Michaux – RAB; = C. alnifolia var. pubescens Aiton – Z]

**342. CYRILLACEAE** Endlicher 1841 (Ti-ti Family) [in ERICALES]

A family of 2 genera and 3 or more species, ranging from se. North America to the West Indies and n. South America (following the removal of *Puridia* to the Clethraceae (Anderberg & Zhang 2002). References: Lemke in FNA (2009); Godfrey (1988); Anderberg & Zhang (2002); Thomas (1960)=Y; Kubitzki in Kubitzki (2004). Key adapted from Godfrey (1988).

1 Lateral veins of the leaf blades scarcely or not at all apparent on either surface; flowers in terminal and axillary racemes, the racemes solitary or several at a node, not markedly radiating; fruit 5-7 mm long, 2-5 winged ...................................................................................................................... *Cliftonia*
2 Lateral veins of the leaf blades readily apparent on both surfaces, the main laterals neatly pinnate, the smaller veins forming a fine reticulum; flowers in lateral racemes, the racemes clustered together at the summit of the previous year's growth and radiating outward or reflexed; fruit 2-2.5 mm long, not winged ........................................................................................................................................................................................... *Cyrilla*

*Cliftonia* Banks ex C.F. Gaertner 1807 (Black Ti-ti, Buckwheat-tree)
Cyrilla Garden ex Linnaeus 1767 (Ti-ti)

1 Leaves mostly 1-4 cm long, mostly 0.5-1 cm wide; inflorescences mostly 4-9 cm long; petals < 3 mm long; [mostly of flatwoods ponds, in s. GA southward] .............................................................. C. parvifolia

2 Leaves mostly 5-10 cm long, mostly 1-2 cm wide; inflorescences mostly 10-18 cm long; petals > 3 mm long; [of various wetland habitats, throughout our area and widely distributed beyond] ........................................................................ C. racemiflora

Cyrilla racemiflora Linnaeus, Ti-ti. Pocosins, swamps, lake and flatwood pond margins, streambanks, pine flatwoods. May-July; September-October. E. VA (Accomack County) south to FL, west to TX, and south into the West Indies, Belize, Mexico, and n. South America (Thomas 1960). The leaves are quite variable in shape and size; the venation and glossy smoothness, however, are distinctive once learned. Under various ecological conditions, titi can be anything from a small shrub to a medium tree (or large tree in the West Indies). [= RAB, C, G, K, S, Z; < C. racemiflora – FNA, GW, Y; > C. racemiflora var. racemiflora – F; > C. racemiflora var. subglobosa Fernald – F]

344. ERICACEAE A.L. de Jussieu 1789 (Heath Family) [in ERICALES]

A family of about 107-124 genera and 3400-4100 species, primarily shrubs, small trees, and subshrubs, nearly cosmopolitan. The Ericaceae is very important in our area, with a great diversity of genera and species, many of them rather narrowly endemic. Our area is one of the north temperate centers of diversity for the Ericaceae. Along with Quercus and Pinus, various members of this family are dominant in much of our landscape. References: Tucker in FNA (2009); Gillespie & Kron (2010); Kron et al. (2002); Wood (1961); Judd & Kron (1993); Kron & Chase (1993); Luteyn et al. (1996)=L; Dorr & Barrie (1993); Cullings & Hileman (1997); Stevens et al. in Kubitzki (2004).

Main Key, for use with flowering or fruiting material

1 Plant an herb, subshrub, or sprawling shrub, not clonal by underground rhizomes (except Gaultheria procumbens and Epigaea repens), rarely > 3 dm tall; plants mycotrophic or hemi-mycotrophic (except Epigaea, Gaultheria, and Arctostaphylos).

2 Plants without chlorophyll (fully mycotrophic); stems fleshy; leaves represented by bract-like scales, white or variously colored, but not green; pollen grains single; [subfamily Monotropoideae; tribe Monotropaeae].

3 Petals united; fruit nodding, a berry; flower and fruit several per stem ................................................................................................. 6. Monotropsis

4 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown ........................................................................ 5. Hypopitys

5 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black .................................................................. 4. Monotropa
1 Plant a shrub, > 3 dm tall, or 1-3 dm tall and definitely and obviously clonal by underground rhizomes; plants not mycotrophic or hemi-mycotrophic. 

ERICACEAE

11 Leaves

13 Ovary inferior; fruit indehiscent, a dry capsule. 

14 Ovary 10 locular; seeds 10; leaves glandular-punctate, at least on the lower surface (except G. brachycera) ........................................29. Gaylussacia

14 Ovary 4-5 locular; seeds numerous; leaves not glandular-punctate ........................................28. Vaccinium

15 Petals fused for part or all their lengths; fruit (4-) 5-locular; shrub or tree with leaves of various shape, evergreen or deciduous, these either > 6 mm long, linear and whitened, or < 12 mm long. 

16 Leaves without a prominent marginal vein. 

17 Fruit 4-5-locular; leaves deciduous, 4-12 cm long; petals 12-14 mm long; shrub to small tree 2-6 (-9) m tall ..........11. Elliotia

17 Leaves sharply and distinctly serrate. 

18 Capsules elongate, > 2× as long as broad, 8-18 mm long; [subfamily Ericoideae; tribe Rhododendroideae] ........................................24. Leucothoe

18 Capsules ovoid to globose or subglobose, about as long as broad, 5-8 mm long. 

19 Leaves alternate or whorled, > 20 mm long. 

20 Flowers 4-merous; fruits 4-locular; leaves with a series of fascicles of trichomes on the midrib below; [subfamily Ericoideae; tribe Rhododendroideae] ........................................9. Menziesia

20 Flowers 5-merous; fruits 5-locular; leaves not as above. 

21 Leaves coriaceous, evergreen, shiny and dark green above. 

21 Leaves membranaceous or subcoriaceous, deciduous or evergreen, if subcoriaceous and evergreen, then not shiny and dark green above. 

22 Capsules elongate, > 2× as long as broad, 7-23 mm long; [subfamily Ericoideae; tribe Rhododendroideae] .......10. Rhododendron

22 Capsules ovoid to globose or subglobose, about as long as broad, 5-8 mm long. 

23 Pedicels slender, 7-10 mm long; filaments strongly curved just below the anthers; pith transversely diaphragmed; [subfamily Vaccinioideae; tribe Lyoniaceae] ..................................................20. Agarista

23 Pedicels stout, 2-6 mm long; filaments straight; pith solid; [subfamily Vaccinioideae; tribe Gaultherieae] ........................................25. Leucothoe

24 Capsules ovoid to globose or subglobose, about as long as broad, 5-8 mm long. 

25 Leaves with a prominent vein running parallel to (and about 1 mm in from) the margin; [subfamily Vaccinioideae; tribe Lyoniaceae] ..................................................21. Lyonia

25 Leaves without a prominent marginal vein. 

26 Corolla saucer-shaped, 10-30 mm across; leaves entire; [subfamily Ericoideae; tribe Phyllodocaceae] .... 13. Kalmia

26 Corolla narrowly urceolate, 4-6 mm across; leaves finely crenulate-serrulate; [subfamily Vaccinioideae; tribe Lyoniaceae] ..................................................19. Pieris

27 Capsules ovoid to globose or subglobose, about as long as broad, or broader than long, 2-7 mm long. 

28 Leaves (at least the larger) > 2.5 cm wide. 

29 Pedicels with 2 bracteoles.
ERICACEAE

30 Capsule broader than long; shrub; bracteoles just below the calyx; [subfamily Vaccinioideae; tribe Gaultherieae]
26. Eubotrys
30 Capsule longer than broad; tree; bracteoles generally near the middle of the pedicel; [subfamily Vaccinioideae; tribe Oxydendreae]
18. Oxydendrum
29 Pedicels without bracteoles.
31 Leaves entire to minutely serrulate; capsule sutures pale and thickened; [subfamily Vaccinioideae; tribe Lyoniaeae]
21. Lyonia
31 Leaves crenate; capsule sutures not thickened and pale; [subfamily Vaccinioideae; tribe Andromedeae]
23. Zenobia

28 Leaves < 2.5 cm wide.
32 Leaves linear to narrowly lanceolate, 8× or more as long as wide, strongly revolute, strongly whitened beneath; [subfamily Vaccinioideae; tribe Andromedeae] 22. Andromeda
32 Leaves broader, not revolute or slightly so, not strongly whitened below.
33 Leaves whorled or alternate; corolla saucer-shaped, 10-20 mm across; [subfamily Ericoideae; tribe Phyllodoceae]
13. Kalmia
33 Leaves alternate; corolla narrowly urceolate, 2-8 mm across.
34 Pedicels with 2 bracteoles near the summit; [subfamily Vaccinioideae; tribe Gaultherieae] 24. Chamaedaphne
34 Pedicels with 2 bracteoles near the base; [subfamily Vaccinioideae; tribe Lyoniaeae] 21. Lyonia

Alternate Key to Ericaceae (including some relatives), emphasizing vegetative characters
[This key includes some related shrubs, of the Diapensiaceae, Clethraceae, and Cyrillaceae]

1 Leaves and stems lacking chlorophyll (either white or variously tinted with colors such as pink, tan, red, or violet) .................. Key A
1 Leaves and stems with chlorophyll (green, though some parts may have the green pigment obscured with purple or other colors).
2 Leaves membranaceous or subcoriaceous, deciduous or tardily deciduous, usually not particularly glossy (except in new foliage of some species) .......................................................... Key B
2 Leaves coriaceous, more or less stiff, evergreen, usually glossy and often dark green.
3 Subshrub or sprawling shrub, 0-1 (-2) dm tall, not clonal by underground rhizomes (except Gaultheria procumbens), though often clonal by creeping stems, or sprawling and patch-forming (many of these species are only ambiguously shrublike and are considered herbs by the casual observer) .......................................................... Key C
3 Shrub, > 3 dm tall, or 1-3 dm tall and definitely obviously clonal by underground rhizomes ........................................ Key D

Key A – Achlorophylllose plants

1 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black ........................................ Monotropa uniflora
1 Flowers few to many, racemose; stem glabrous (Monotropis) or pubescent, at least in the inflorescence (Hypopitys); plant yellow, orange, or red when fresh, aging or drying dark brown.
2 Plant yellow, orange, or red when fresh, aging or drying dark brown; stem pubescent, at least in the inflorescence; petals separate to base........ Hypopitys monotropa
2 Plant lavender when fresh; stem glabrous; petals fused into an urceolate corolla.......................................................... Monotropis

Key B – Deciduous ericaceous shrubs and trees

Gaylussacia spp., Vaccinium spp., Elliottia racemosa, Menziesia pilosa, Rhododendron spp., Kalmia cuneata, Chamaedaphne calyculata, Lyonia mariana, Lyonia ligustrina var. ligustrina, Lyonia ligustrina var. foliosifolia, Eubotrys racemosa, Eubotrys recurva, Oxydendrum arboreum, Zenobia pulaverlenta, Clethra acuminata, Clethra alnifolia, Cyrilla racemiflora

Key C – Evergreen subshrubs and sprawling shrubs

1 Plant erect, the leaves few (< 10), clustered near the apex of the single stem.
2 Leaves obovate, 1-2× as long as wide; fruit a red berry, borne on nodding axillary pedicels beneath the leaves...... Gaultheria procumbens
2 Leaves lanceolate or oblong-lanceolate, normally 2-4× as long as wide (sometimes proportionately less narrow in stunted individuals; fruit a capsule, borne l-2 several on an erect scape above the leaves.
3 Leaves lanceolate (broadest below the middle), base rounded, striped with white or paler green along the major veins........ Chimaphila maculata
3 Leaves oblong-lanceolate (broadest above the middle), base cuneate, solid dark green through (Hout)
                                                                                                                  Chimaphila umbellata ssp. cisatlantica

1 Plant creeping or sprawling, leaves scattered along the stems, or tufted at the base.
4 Leaves 2-15 cm wide; leaves (2-) 3-5.5-15 cm long, rounded or subcordate at the base.
5 Leaves dull green, with a pebbled texture, pilose (glabrate in age) ......................................................... Epipogea repens
5 Leaves bright shiny green (or pruple), with a smooth texture, glabrous.
6 Leaves orbicular, rounded or with a slight point at the apex, finely serrate (4-8 teeth per cm), the teeth not prominently mucronate; flowers in racemes; [widespread in distribution] ........................................... Galax urceolata [DIAPENSIACEAE]
ERICACEAE

Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1-4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere].

Erica tetralix

Leaves linear, < 2 mm wide.

7 Leaves broadly elliptic, generally emarginate (slightly notched) at the apex, coarsely serrate (1-4 teeth per cm), the teeth prominently mucronate; flowers solitary; [native to humid gorges along the escarpment between the Mountains and Piedmont, sometimes cultivated and becoming established elsewhere].

Erica tetralix

Leaves linear, < 2 mm wide.

7 Leaves broader, > 2 mm wide.

9 Leaves serrate or serrulate (sometimes inconspicuously so); [of pinelands of the Coastal Plain and (very rarely) lower Piedmont of se. VA southward].

9 Plant dark green throughout, generally exceeding 20 mm in length; leaf undersurface with scattered glandular hairs, these often associated with moist conduits, thus making the leaf tip acute; pedicels with (0-) 2 (-5) reddish, scale-like bracts < 1 mm wide; berry 6-12 mm in diameter

Vaccinium myrsinites

11 Leaves 1-5 mm long (rarely to 7 mm long if etiolated under leaf litter); leaves ovate, averaging < 1.2 mm wide (lanceolate and up to 1.5 mm wide if etiolated under leaf litter); leaves (in fresh material) succulent in texture, up to 0.5 mm thick; leaves of sterile shoots lanose to densely pubescent on the upper surface at the base, the pubescence becoming sparser toward the tip of the leaf, but extending past the midpoint of the leaf and often its full length; internodes usually < 1 mm long

Pyxidanthera barbulata

7 Leaves alternate, glabrous, finely serrulate

10 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-involute; pedicels with 2 green, leaf-like bracts 1-2 mm wide; berry 8-15 mm in diameter

Vaccinium macrocarpon

11 Plants with small stipitate glands, otherwise appearing glabrous; leaves elliptic, widest near the middle.

Pieris floribunda

Key D – Evergreen Ericaceae shrubs (either tall or obviously clonal) and trees

1 Leaves linear, needle-like, either appearing whorled (at least in part, sometimes also with nodes appearing opposite or alternate) or opposite (Calluna).

2 Leaves opposite, sessile and clasping; [exotic, rarely naturalized] ................................. Calluna vulgaris

2 Leaves whorled (at least in part), petiolate; [either native or exotic and rarely naturalized].

3 Leaves densely puberulent and ciliate with gland-tipped hairs; leaves 1.5-5 mm long; [exotic, rarely naturalized] .......... Erica vulgaris

3 Leaves glabrous; leaves 3-15 mm long; [native].

4 Leaves 5-15 mm long; shrubs 5-25 dm tall; drupes red, 1.5-2 mm in diameter; [of SC southwards] .................... Ceratola ericoides

4 Leaves 3-6 mm long; shrubs 1.5-6 dm tall; drupes gray, 1.1-1.5 mm in diameter; [of NC northwards] .................... Corema coronatum

5 Leaves (all of them) < 2 cm long.

6 [Either of the Mountains, the Piedmont, or the Coastal Plain of ne. SC and se. NC].

6 Of the Coastal Plain, from se. SC southward.

8 Twigs densely hispid; leaves hispid on both surfaces ................................................................. Gaylussacia brachycera

8 Twigs glabrous to puberulent; leaves glabrous or with scattered inconspicuous hairs.

9 Plant glaucous and bluish-green throughout; leaf undersurface lacking scattered glandular hairs; [of s. GA south to s. peninsular FL, west to e. TX].

9 Plant dark green throughout, generally exceeding 20 mm in length; leaf undersurface with scattered glandular hairs, these often very few by late in the season (best seen in the field by folding a leaf, holding the fold up to the light, and using a 10x lens); [of se. SC southward to n. FL, west to s. AL] .......................... Vaccinium myrsinites

5 Leaves (at least the larger) > 3 cm long.

10 Leaves toothed, at least toward the tip of the leaf (note that fine serrations or crenations can be obscured by revolute margins).

11 Leaves elliptic to oblanceolate, widest near or above the middle, obtuse, acute, or short-acuminate, 1.5-7 cm long, 0.5-2.5 cm wide; leaf serrations fine and obscure; leaf surfaces with small stipitate glands (Pieris) or lepidote with scales (Chamaedaphne).

12 Leaves lepidote with scales; leaves oblanceolate, widest above the middle

Chamaedaphne calyculata

12 Leaves with small stipitate glands, otherwise appearing glabrous; leaves elliptic, widest near the middle.

13 Inflorescence a many-flowered panicle of racemes, borne terminally; seeds 2.5-3 mm long; [of slopes and ridges of the Mountains and upper Piedmont] ................................. Pieris floribunda

13 Inflorescence a 3-9 flowered raceme, borne in the axil of upper leaves; seeds ca. 1 mm long; [of wetlands of the Coastal Plain, often associated with Taxodium ascendens] ................................. Pieris phillyreifolia
11 Leaves lanceolate or ovate, widest below the middle, short-acuminate to acuminate, 4-15 cm long, 1-5 cm wide; leaf serrations generally obvious (at least toward the acuminate leaf tip); leaf surfaces glabrous, or with non-stipitate hairs on the lower surface.

14 Pith transversely diaphragmed; [pedicels slender, 7-10 mm long]; [filaments strongly curved just below the anthers] ..................Agarista populifolia

15 Leaves with an acute or short-acuminate apex; racemes 2-4 (5) cm long; sepals ovate, with an obtuse or rounded apex; longest petals 3-8 mm long ..................Leucothoe axillaris

15 Leaves with a long-acuminate apex; racemes 4-10 cm long; sepals lanceolate-ovate, with an acute (or subacute) apex; longest petals 8-15 mm long ..................Leucothoe fontanesiana

10 Leaves entire.

16 Leaves whitened beneath by a dense mat of white hairs; leaves linear and strongly revolute ..................................................Andromeda

16 Leaves green or brown beneath, glabrous, glabrescent, or lepidote with scales.

17 Leaves densely lepidote on the under surface with brown scales.

18 Leaves planar, not revolute; petals 7-20 mm long; twigs more-or-less terete in cross-section; [of the Mountains, Piedmont, and upper Coastal Plain].

19 Corolla mostly 15-20 mm long, the corolla tube (9-13 mm long) shorter than to as long as the corolla lobes (12-18 mm long); plant flowering early relative to R. minus, despite occurring at higher elevations and more northern latitudes; seeds ovoid, < 1.0 mm long, < 2.5× as long as wide (reminiscent of tiny watermelon seeds), coarsely textured, unornamented at the ends; calyx lobes deltoid; [of mountain ridges, heath balds, and rocky summits, mostly either away from the Blue Ridge Escarpment or north of the Asheville Basin] ..........................................................Rhododendron carolinianum

19 Corolla mostly 25-37 mm long, the corolla tube (13-22 mm long) longer than the corolla lobes (8-12 mm long); plant flowering late relative to R. carolinianum; seeds usually > 1.0 mm long, usually > 3× as long as wide, ornamented at one or both ends; calyx lobes ovate; [of the Coastal Plain, Piedmont, and Mountains, in the Mountains mostly of the Blue Ridge Escarpment of sw. NC and nw. SC, ranging in elevation up to the higher granitic domes in Macon and Jackson counties, NC].

20 Leaf apices mostly obtuse to rounded; petals 2-6 (-7) mm long; branches erect and rigid; seeds moderately to elaborately ornamented with flared protrusions at both ends; [of n. FL] ..................................................Rhododendron chapmanii

20 Leaf apices mostly acute to acuminate; petals (5-) 6-20 mm long; branches spreading, not notably erect and rigid; seeds somewhat ornamented at one end; [of c. GA northward] ..................................................Rhododendron minus

18 Leaves slightly to strongly revolute (or nearly planar in Lyonia fruticosa); petals 1-7 mm long; twigs angled in cross-section; [of the lower Coastal Plain, from se. SC southward].

21 Ultimate branches not rigidly ascending, flowers nearly always restricted to branches of the previous year, the leaves not conspicuously reduced toward the branch tips; leaves with distal margin usually revolute, sometimes strongly so; major veins usually depressed; lower leaf surface with some scales often large and with irregular margins, others smaller and more nearly entire, at least the smaller scales more-or-less persistent; [shrub or small tree to 6 (-10) m tall] Lyonia ferruginea

21 Ultimate branches rigidly ascending, flowers frequent on branches of the current year (though also on older growth), the leaves conspicuously reduced toward the branch tips; leaves with distal margin at most slightly revolute; major veins not depressed; lower leaf surface with scales usually all large and with irregular margins, the scales often deciduous; [shrub to 1.5 (-3) m tall] ..........................................................Lyonia fruticosa

17 Leaves not lepidote beneath (Lyonia lucida with scattered minute scales on young leaves).

22 Leaves whorled or rarely opposite.

23 Calyx lobes glandular-canescent and with marginal stipitate glands; leaves glabrous beneath; bracts and bracteoles densely glandular; stomates 18 μ wide, 15-24 per 0.2 square millimeter; shrub to 2 m tall; [of se. and sw. VA southward] ..........................................................Kalma angustifolia

23 Calyx lobes canescent but lacking glands; leaves short puberulent beneath; bracts and bracteoles nearly glandless; stomates 13 μ long and 9 μ wide, 35-51 per 0.2 square millimeter; shrub to 2 m tall (though often much shorter); [of se. and sw. VA southward] ..........................................................Kalma carolina

22 Leaves alternate.

24 Leaf blades (8-) 10-30 cm long, 3-9 cm wide, rounded to obtuse at the tip.

25 Leaves rounded at base (rarely broadly cuneate or slightly cordate), obtuse at apex; leaf generally 1.5-2.5× as long as wide; [corolla usually deep pink to purple]; [sepals 0.5-1 mm long] ..........................................................Rhododendron catawbiense

25 Leaves cuneate at base, acute at apex; leaf generally 3-5× as long as wide; [corolla usually white to pale pink]; [sepals 4-6 mm long] ..........................................................Rhododendron maximum

24 Leaf blades 2-10 (-12) cm long, 1-5 cm wide, acute, short-acuminate (or obtuse or rounded in Cyrilla) at the tip.

26 Leaf with a prominent vein running the length of the margin, about 1 mm in; [shrub to 4 m tall] ..........................................................Lyonia lucida

26 Leaf venation not as above; [shrub to small tree] ..........................................................Lyonia latifolia, Cyrilla racemiflora, Cliftonia racemosa, Bejaria racemosa

I. Pyrola Linnaeus 1753 (Shinleaf, Pyrola)

A genus of 30-35 species, shrubs, circumboreal and also in Sumatra and Guatemala. The inclusion of this group of species in the Ericaceae or its recognition as a separate family has been controversial. Recent studies (Judd & Kron 1993, Kron & Chase 1993) suggest that it is best resubmerged in the Ericaceae. References: Freeman in FNA (2009); Liu et al. (2010); Stevens et al. in Kubitzki (2004).

1 Calyx lobes distinctly longer than broad, 3-4 mm long; leaves coriaceous, more or less glossy; [section Pyrola; series Pyrola] ..........................................................P. americana

1 Calyx lobes about as broad as long, 1.5-2 mm long; leaves not coriaceous, dull.
2 Leaves mostly 1-3 cm long, the blade mostly < 2.5 cm wide; calyx lobes broadly ovate, the apex subacute to obtuse; [section Ampliosepala; series Chloranthae] ................................................................. \textit{P. chlorantha}

2 Leaves mostly 3-9 cm long, the blade mostly > 2.5 cm wide; calyx lobes triangular, the apex acute to acuminate; [section Pyrola; series Ellipticae] ................................................................. \textit{P. elliptica}

\textbf{Pyrola} Sweet, Rounded Shinleaf. Xeric to mesic woodlands and forests. May-August; July-October. NL (Newfoundland) west to MB, south to NC, ne. TN, KY, IN, MN, and SD. [= FNA, K, S, W; = \textit{P. rotundifolia} Linnaeus var. americana (Sweet) Fernald – RAB, C, F, G, L, WV]

\textit{Pyrola elliptica} Nuttall, Elliptic Shinleaf. Moist to dry forests, including rich northern hardwood forests. June-August; July-October. NS, NL (Newfoundland), and QC west to BC, south to DE, nw. NC, WV, OH, IN, IL, IA, NE, NM, and AZ. Known in NC only from Ashe County, in Long Hope Valley (McDowell 1984) and on Phoenix Mountain. [= C, FNA, G, K, L, S, W, WV]

2. \textbf{Chimaphila} Pursh 1814 (Pipsissewa)

A genus of 4-5 species, subshrubs, of temperate and tropical America, and Eurasia. References: Freeman in FNA (2009); Stevens et al. in Kubitzki (2004).

1 Leaves lanceolate (broadest below the middle), base rounded, striped with white or paler green along the major veins ...................... \textit{C. maculata}

1 Leaves oblanceolate (broadest above the middle), base cuneate, solid dark green throughout ......................... \textit{C. umbellata} ssp. \textit{cisatlantica}

\textit{Chimaphila maculata} (Linnaeus) Pursh, Pipsissewa, Striped Wintergreen. Forests and woodlands, mostly rather xeric and acid. May-June; July-October. ME west to MI, south to GA, FL Panhandle, and AL; disjunct in mountains of AZ, Mexico, and Central America south to Panama. [= RAB, C, F, G, L, S, W, WH]

3. \textbf{Orthilia} Rafinesque 1840 (Sidebells, One-sided Shinleaf, One-sided Wintergreen)

A monotypic genus, a subshrub, circumboreal in distribution. The recognition of \textit{Orthilia} as separate from \textit{Pyrola} is supported by molecular data (Freudenstein 1999a). References: Freeman in FNA (2009); Stevens et al. in Kubitzki (2004).

4. \textbf{Monotropa} Linnaeus 1753 (Indian Pipes, Pinesap)

A monotypic genus, an herb, of North America, Central America, South America, and e. Asia. The segregation of \textit{Monotropa}, \textit{Hypopitys}, and \textit{Monotropsis} into the Monotropaceae or their inclusion in the Ericaceae has been controversial. Recent studies suggest that their inclusion in the Ericaceae is warranted (Kron & Chase 1993, Judd & Kron 1993). References: Wallace in FNA (2009); Wallace (1975)=Z; Stevens et al. in Kubitzki (2004). [also see \textit{Hypopitys}]

1 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown ......................................................................................... \textit{[Hypopitys monotropa]}

1 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black .......... \textit{Monotropa uniflora}

\textit{Monotropa uniflora} Linnaeus, Indian Pipes. In a wide variety of forests. June-October; August-November. NL (Labrador) and AK south to s. FL, TX, CA; disjunct in s. Mexico, Central America, South America (Colombia), and e. Asia. A preliminary
molecular study suggests that splitting of worldwide *Monotropa uniflora* into several geographic species or varieties may be warranted (Neyland & Hennigan 2004). [= RAB, C, F, FNA, G, K, L, W, WH, WV, Z; > *M. uniflora* – S; > *M. brittonii* Small – S]  

5. **Hypopitys** Crantz 1766 (Pinesap)  

A genus of 1–several species, herbs, of circumboreal distribution. Recent molecular evidence supports its separation as a genus distinct from *Monotropa* (as has often been done in the past) (Neyland & Hennigan 2004). References: Wallace in FNA (2009); Wallace (1975)=Z; Stevens et al. in Kubitzki (2004).  

*Hypopitys monotropa* Crantz, Pinesap. Forests. May-October; July-November. Circumboreal, south nearly throughout North America, to e. peninsular and Panhandle FL, TX, NM, AZ, CA, and Mexico; disjunct in Guatemala; Europe; c. and e. Asia. Recent studies suggest that several cryptic to semi-cryptic species or infraspecific taxa should be recognized (M. Klooster, North America, to c. peninsular and Panhandle FL, TX, NM, AZ, CA, and Mexico; disjunct in Guatemala; Europe; c. and e. Asia). The genus warrants additional study.  

1 Sepals about 0.5× as long as the corolla, lanceolate; corolla white or pale lavender, the corolla lobes spreading or reflexed; flowering January-February. Endemic to n. peninsular FL, in St. Johns, Marion, Citrus, Hernando, Pasco, and Volusia counties. See Chafin (2000) for additional information; there seems little question that this is specifically distinct from *M. odorata* (as has often been done in the past) (Neyland & Hennigan, pers. comm., 2009). [= *Monotropa hypopithys* Linnaeus – RAB, C, F, G, K, L, W, WH, WV, Z; > *Hypopitys americana* (A.P. de Candolle) Small – S; > *Hypopitys lanuginosa* (Michaux) Nuttall – S; > *H. insignata* Bicknell; > *Monotropa lanuginosa* Michaux]  

6. **Monotropis** Schweinitz in Elliott 1817 (Pigmy Pipes, Sweet Pinesap)  

A genus of probably 2 species, mycotrophic herbs, of se. North America. Often treated as monotypic, but there appears to be more to at least of the “lumped” taxa than has usually been credited; the genus warrants additional study. *Monotropis* is mycotrophic, receiving its nutrition by association with a mycorrhizal fungus, the intertwined root mass and fungal mantle about 1-2 cm in diameter. References: Wallace in FNA (2009); Wallace (1975)=Z; Chafin (2000)=Y; Wolf (1922); Stevens et al. in Kubitzki (2004).  

---  

1 Sepals about 0.75-1.25× as long as the corolla, ovate; corolla pink, lavender, purple, or purplish-red, the corolla lobes in the plane of the corolla tube or curved inwards from that plane; *either* flowering prematurely in September-November and the flowers not fragrant, or flowering February-April and the flowers strongly and spicily fragrant; [of AL and GA northwards] .................................................. *M. odorata*  

1 Sepals about 0.5× as long as the corolla, lanceolate; corolla white or pale lavender, the corolla lobes spreading or reflexed; flowering January-February, the flowers slightly fragrant; [of FL] .................................................. *M. reynoldsiae*  

**Monotropis odorata** Schweinitz ex Elliott, Spring Pigmy Pipes. Dry to mesic upland woods under oaks and/or pines (*Pinus virginiana* or *P. echinata*), especially slopes or bluffs with abundant heaths, often including *Kalmia latifolia* and/or *Rhododendron maximum*. February-April (and sometimes September-November); May-June (and sometimes October-November). Centered in the Appalachians: DE, MD, and WV south to GA and AL. The flowers are very fragrant, the odor variously compared to cloves, nutmeg, cinnamon, and violets. Since the diminutive plants (3-10 cm tall) are often covered by leaf litter, fragrance is often the key to finding this species. The fall flowering form, entity “lehmaniae” (see synonymy), appears to represent the early development of *M. odorata* which will typically then overwinter in “suspended animation” and flower in the early spring. [≤ *M. odorata* – C, F, FNA, G, K, L, W, WH, WV, Z; > *M. odorata var. odorata* – RAB; > *M. odorata var. lehmaniae* (Burnham) Ahles – RAB; > *M. odorata* – S; > *M. lehmaniae* Burnham – S]  

**Monotropis reynoldsiae** (A. Gray) A. Heller, Florida Pigmy Pipes. Upland mixed hardwood forests, mesic hammocks, xeric hammocks, scrub. January-February. Endemic to nc. peninsular FL, in St. Johns, Marion, Citrus, Hernando, Pasco, and Volusia counties. See Chafin (2000) for additional information; there seems little question that this is specifically distinct from *M. odorata*. [≥ S, Y; < *M. odorata* – FNA, K, L, W, WH, Z]  

7. **Arctostaphylos** Adanson 1760 (Bearberry)  

A genus of 60-70 species, shrubs, woody vines, or small trees, mostly in w. North America, but with 2 circumboreal species. References: Parker, Vasey, & Keeley in FNA (2009); Rosatti (1987b)=Z; Stevens et al. in Kubitzki (2004).  

**Arctostaphylos uva-ursi** (Linnaeus) Sprengel, Bearberry, Kinnikinick. High elevation granitic outcrop (VA); Coastal Plain pitch pine woodlands (DE). May-June. Circumboreal, ranging in North America from NL (Labrador) west to AK, south to DE, n. VA, n. IN, IL, IA, SD, NM, AZ, and CA; disjunct in Guatemala. Following Rosatti (1987), *A. uva-ursi* is here treated inclusively, as a complex species not readily divisible into infraspecific taxa. [≥ C, FNA, K, L, W, Z; > *A. uva-ursi* var. *coactilis* Fernald & J.F. Macbride – F, G; > *A. uva-ursi* ss. *coactilis* Fernald & J.F. Macbride A. & D. Löve & Kapoor]  

8. **Bejaria** Mutis in Linnaeus 1771 (Tarflower)  

A genus of 15 species, shrubs and trees, of se. United States to Cuba, and from Mexico south into Bolivia. The spelling of the generic name has been controversial; it was originally published as *Bejaria*, because of Linnaeus's misreading of Mutis's handwriting, but was intended to commemorate José Béjar. The spelling has now been conserved as 'Bejaria' (Greuter et al. 2000). References: Clements in FNA (2009); Stevens et al. in Kubitzki (2004).
**Bejaria racemosa** Ventenat, Tarflower, Flycatcher. Pine flatwoods. E. GA (adjacent to se. SC) south to s. peninsular FL, west to AL. [= FNA, L, WH; = Bejaria racemosa – GW, K, S, orthographic variant]

**Menziesia J.E. Smith 1791 (Minniebush)**

**Menziesia pilosa** (Michaux ex Lamarck) Antoine Laurent de Jussieu ex Persoon, Minniebush. Heath balds, bogs, rocky summits, and rocky woodlands, mostly at high elevations. May-July; August-October. A Southern and Central Appalachian endemic: sc. PA, sw. PA, e. WV, w. VA, e. TN, w. NC, and ne. GA. The very prominent mucro on the leaves and the series of fascicles of trichomes along the leaf midrib below readily distinguish the species in sterile condition from similar deciduous *Rhododendron*. [= RAB, C, F, FNA, G, K, L, S, W, WV; = *Rhododendron* species 1]

**Rhododendron** Linnaeus 1753 (Rhododendron, Azalea)

A genus of about 7-10 species, shrubs, of e. Asia (mostly), w. North America (1 species), and se. North America (1 species). *M. ferruginea* J.E. Smith of w. North America is closely related to *M. pilosa*; the e. Asian species of the genus are more distantly related. Molecular evidence suggests that *Menziesia* should be included in *Rhododendron*, and is actually closely related within *Rhododendron* to *R. vaseyi* (Goetsch, Eckert, & Hall 2005; Kurashige et al. 2001). References: Fabijan in FNA (2009); Stevens et al. in Kubitzki (2004).

1 Leaves deciduous, membranaceous, ciliate or serrulate; stamens 5-7; [azaleas]

2 Lower surface of leaves not punctate with brown scales; larger leaves 10-30 cm long; [subgenus *Hymenanthes*, section *Ponticum*, subsection *Pontica*].

3 Leaves rounded at base (rarely broadly cuneate or slightly cordate), obtuse at apex; leaf generally 1.5-2.5× as long as wide; corolla usually deep pink to purple; sepals 0.5-1 mm long ............................................................................................................................. *R. catawbiense*

3 Leaves cuneate at base, acute at apex; leaf generally 3-5× as long as wide; corolla usually white to pale pink; sepals 4-6 mm long ............................................................................................................................. *R. maximum*

4 Lower surface of leaves punctate with brown scales; larger leaves 6-12 cm long; [subgenus *Rhododendron*, section *Rhododendron*, subsection *Caroliniana*].

4 Corolla mostly 15-20 mm long, the corolla tube (9-13 mm long) shorter than to as long as the corolla lobes (12-18 mm long); plant flowering early relative to *R. minus*, despite occurring at higher elevations and more northern latitudes; seeds ovoid, < 1.0 mm long, < 2.5× as long as wide (reminiscent of tiny watermelon seeds), coarsely textured, unornamented at the ends; calyx lobes deltoid; [of mountain ridges, heath balds, and rocky summits, mostly either away from the Blue Ridge Escarpment or north of the Asheville Basin].

5 Leaf apices mostly acute to acuminate; petals 2-6 (-7) mm long; branches erect and rigid; seeds moderately to elaborately ornamented with flared protrusions at both ends; [of n. FL] ............................................................................................................................. *R. chapmanii*

5 Leaf apices mostly acute to acuminate; petals (5-) 6-20 mm long; branches spreading, not notably erect and rigid; seeds somewhat ornamented at one end; [of c. GA northward] ............................................................................................................................. *R. minus*

1 Leaves deciduous, membranaceous, ciliate or serrulate; stamens 5-7; [azaleas]. [also see Alternate Key to azaleas emphasizing vegetative characters].

6 Corolla tube 2-5 mm long, much shorter than the corolla lobes; stamens (5-) 7; leaves elliptic, often broadly so (commonly 3-6 cm wide), acuminate; capsule ellipsoid-ovoid, 10-14 mm long; [subgenus *Azaleastrum*, section *Sciadorhodion*] ............................................................................................................................. *R. vaseyi*

6 Corolla tube 13-25 mm long, equal to or longer than the corolla lobes; stamens 5; leaves generally oblanceolate to narrowly elliptic, generally < 3 cm wide, acute to obtuse, mucronate; capsule cylindroid-ellipsoid, 10-25 mm long; [subgenus *Hymenanthes*, section *Pentasthera*].

7 Corolla yellow, orange, or red.

8 Flowers appearing after the leaves have expanded.
9 Twigs pubescent with multicellular hairs; [e. KY and w. VA south to e. TN, n. GA, and ne. AL; apparently disjunct in the Piedmont of SC].......................... **R. cumberlandense**
10 Twigs glabrous; [south of e. AL and w. GA].................................................................................................................. **R. prinusfolium**
11 Flowers appearing before or with the leaves:
12 Corolla limb nearly as broad as the tube is long, the tube abruptly expanding into the limb. .............................................. **R. austrium**
13 Floral bud-scales with glandular margins, the outer surface glabrous; corolla tube glandular-pubescent on its outer surface; sepals 2.0-3.0 mm long........................................................................... **R. calendulaceum**
14 Floral bud-scales with ciliate margins, the outer surface glabrous to sparsely pubescent; corolla tube pubescent (not glandular or rarely very weakly so) on the outer surface; sepals 0.5-3.0 mm long........................................................................... **R. flammeum**
15 Corolla white or pink (white marked with yellow in **R. eastmanii** and **R. alabamense**).
16 Corolla limb nearly as broad as the tube is long, the tube abruptly expanding into the limb. .............................................. **R. austrium**
17 Flowers appearing before or with the leaves (at least some of the leaves still folded or the vegetative bud scales still present), sepals 2-3 (-5) mm long. ................................................................. **R. viscosum**
18 Flowers appearing after the leaves have expanded; flower buds with non-glandular margins ................................. **R. alabamense**
19 Flowers opening before the leaves have expanded; flower buds with non-glandular margins ................................. **R. viscosum**

**Alternate Key to Azaleas**

**Identification notes:** this key makes as much use as possible of vegetative characters, geography, and capsule characters; capsules are generally available for longer during the year than flowers, and even when plants are in flower, last year's capsules can often be found.

1 Corolla tube 2-5 mm long, much shorter than the corolla lobes; stingless-glandular; flowers appearing with or before the leaves .......................... **R. periclymenoides**
12 Young stems densely pubescent, generally with a mixture of glandular and nonglandular hairs; clonal shrub, the upright stems up to 1.5 m tall.............................................. **R. atlanticum**
13 Corolla white or pink (white marked with yellow in **R. eastmanii** and **R. alabamense**).
14 Leaves densely and softly pubescent beneath. .................................................. **R. canescens**
15 Pedicels stipitate-glandular; flowers appearing after the leaves. ................................................................. **R. viscosum**
16 Shrubs 1-2 (-5) m tall, floral winter bud scales 8-12 (-15), rounded (-mucronate) apically; corolla tube pubescent within, < 2× as long as the lobes ................................................................. **R. viscosum**
17 Corolla tube 1-3-25 mm long, equal to or longer than the corolla tube; capsule sparsely pubescent, the pubescent hairs of some of the hairs glandular in **R. eastmanii** and **R. alabamense**; [of southern distribution, from c. SC and se. TN southward]..............................................................................................................
18 Corolla pale to deep pink, without yellow markings; scales of the winter buds pubescent on the outer surface................................. **R. viscosum**
19 Flowers opening before the leaves have expanded; flower buds with non-glandular margins ................................. **R. alabamense**
20 Flowers appearing after the leaves have expanded; flower buds with glands glandular along their lower 2/3s................................. **R. eastmanii**

3 Capsule ovoid, 2-3 (-4)× as long as broad (if capsules absent, try both leads).
4 Corolla white to pink; upper corolla lobes uniform in color (lacking a contrasting blotch); flowers appearing after the leaves (at least in part; nonglandular hairs also present); [collectively widespread in our area].
5 Capsule ovoid, 2-3 (-4)× as long as broad (if capsules absent, try both leads).
6 Corolla white to pink; upper corolla lobes uniform in color (lacking a contrasting blotch); flowers appearing after the leaves (at least in part; nonglandular hairs also present); [collectively widespread in our area].
7 Flowers appearing after the leaves have expanded (essentially all of the leaves unfolded, and the vegetative bud scales absent), typically May (Coastal Plain, low elevation, or south) to August (mountains, high elevation, or north) .............................................. **R. flammeum**
8 Leaf blade (3.2-) 3.4-4.7 (-5.2) cm long, (0.8-) 1.1-1.9 (-2.0) cm wide; plant typically strongly rhizomatous; [of the Coastal Plain from s. NJ south to sc. GA].................................................................................................................. **R. atlanticum**
Rhododendron alabamense Rehder, Alabama Azalea. Moist slopes, bluffs, streambanks. March-April. W. GA and Panhandle FL west through AL to e. MS. R. alabamense is reported for Calhoun County, SC (RAB), but this record actually represents the more recently described R. eastmanii. [= FNA, K, L, WH, Z; = Azalea alabamensis (Rehder) Small – S]

Rhododendron arborescens (Pursh) Torrey, Sweet Azalea, Smooth Azalea. Rocky riversides, wooded stream banks, swamps, high elevation forests, shrub balds. Late May-July; July-October. Primarily Appalachian: ne. PA and se. KY south to se. NC, w. SC, e. GA, and c. AL. [= RAB, C, F, FNA, G, K, L, W, WV, Z; = Azalea arborea Pursh – S]

Rhododendron atlanticum (Ashe) Rehder, Dwarf Azalea. Pocosins, savannas, pine flatwoods, sandhill-pocosin ecotones. April-May (sporadically later, particularly in response to fire); August-October. An Atlantic Coastal Plain endemic: s. NJ and se. PA south to sc. GA. [= RAB, C, F, FNA, G, GW, K, L, Z; = Azalea atlantica Ashe – S]

Rhododendron austrinum (Small) Rehder, Florida Flame Azalea. Hammocks, bluffs, floodplain forests. Sc. GA and ne. FL west to s. AL and se. MS (Kron 1993); also reported for e. GA (Jones & Coile 1988). [= FNA, K, L, WH, Z; = Azalea austrina Small – S]

Rhododendron calendulaceum (Michaux) Torrey, Flame Azalea. Deciduous forests, particularly on mountain slopes, grassy balds. May-June; June-September. Largely Appalachian: s. PA and s. OH to e. GA and e. TN. This is a tetraploid species; various theories have been advanced about the origin of this polyploid chromosome complement. Kron (1993) argues that the evidence best fits an allopolyploid derivation of R. calendulaceum, involving hybridization between ancestors of R. cumberlandense and R. prinophyllum. [= RAB, C, F, FNA, G, K, L, W, WV, Z; = Azalea calendulacea Michaux – S]

Rhododendron canescens (Michaux) Sweet, Piedmont Azalea, Southern Pinxterbloom Azalea, Wild Azalea. Swamps, pocosins, and savannas. March-early May; September-October. Se. and se. NC, n. TN, se. KY, s. IL, and e. OK, south to n. peninsular FL and se. TX. [= RAB, C, F, FNA, G, GW, L, W, WH, Z; = R. canescens var. canescens – K; = R. canescens var. subglabrum Rehder – K; = Azalea canescens Small – S; = Azalea canescens Michaux – S]

Rhododendron catawbiense Michaux, Pink Laurel, Catawba Rhododendron, Mountain Rosebay. Rocky summits, shrub balds, acid ridges and slopes (mostly at high elevations), north-facing bluffs in the Piedmont. April (in the Piedmont and Coastal Plain)-June; July-October. A Southern Appalachian endemic: VA and KY south to GA and AL, with scattered disjunct populations in the Piedmont and extreme upper Coastal Plain. The disjunct populations in central NC are discussed by Coker (1919), who named them forma insularis on the basis of "the larger and broader leaves and ... the longer flowers." R. catawbiense is apparently most closely related to R. macrophyllum D. Don ex G. Don of nw. North America (Milne 2004). [= RAB, C, F, FNA, G, K, L, S, W, WV, X]

**Rhododendron eastmanii** Kron & Creel, May White Azalea, Eastman's Azalea. Rich slopes. Early-mid May. This species is endemic to the Piedmont of South Carolina. It is locally fairly common, in the Broad River drainage (C. Horn, pers. comm. 2000). It should be sought in NC and GA, approaching with 4 miles of the NC border in Cherokee County, SC (M. Creel, pers. comm., 2007). Previous reports of *R. alabamense* in SC (RAB) are based on this species. [= FNA; < *Rhododendron alabamense* Rehder – RAB, misapplied]

**Rhododendron flammeum** (Michaux) Sargent, Oconee Azalea. Sandhills, upland forests on slopes, ridges, stream bluffs. April. W. SC west to w. GA. [= FNA, K, L, Z; = Azalea speciosa Willdenow – S; = *Rhododendron speciosum* (Willdenow) Sweet]

**Rhododendron minus** Michaux, Gorge Rhododendron, Punctatum. Rocky slopes, escarpment gorges, rocky areas in the Piedmont, sandhill bluffs in the Coastal Plain. Late April (in the Piedmont and Coastal Plain)-June (at the higher elevations along the Blue Ridge escarpment); September-October. GA and AL north to the Blue Ridge escarpment of n. GA, nw. SC, and sw. NC, and the Piedmont and inner Coastal Plain (fall-line sandhills) of sc. NC. This species ranges up to granite domes along the Blue Ridge Escarpment (such as Whiteside Mountain, Macon and Jackson counties, NC). [= D, K, S; < *Rhododendron minus* – RAB, W (also see *R. minus* var. minus – FNA, L, Q, V]

**Rhododendron periclymenoides** (Michaux) Shinners, Wild Azalea, Pinxterflower, Pinxterbloom Azalea, Election Pink. Moist to dry slopes and streambanks. Late March-May; September-October. Fairly widespread in e. United States, ranging from MA, NY, and s. OH, south to GA and AL. See Shinners (1962) for explanation of the change from the name *R. nudiflorum*. [= C, FNA, K, L, W, Z; = *Azalea nudiflora* Linnaeus – S]

**Rhododendron prinophyllum** (Small) Millais, Election Pink, Early Azalea, Roseshell Azalea, Election Pink. Upland forests (especially under *Quercus montana* and *Quercus rubra*), xeric pine and oak woodlands. May-June; August-October. NH, NY, and ne. OH, south to w. NC, ne. KY, and s. OH; disjunct in ne. AL and c. TN; also disjunct from s. IL and s. MO south to AR and e. OK. The only known location in NC is on Bluff Mountain, Ashe County (on a rocky plateau over amphibolite at about 1300m elevation); Kron (1993) also cites a collection from Transylvania County. See Shinners (1962) for explanation of the change from the name *R. roseum*. [= C, FNA, K, L, W, Z; = *Rhododendron roseum* (Loiseleur) Rehder – RAB, F, G, GW, WV; = *Azalea prinophylla* Small – S]

**Rhododendron prunifolium** (Small) Millais, Plumleaf Azalea. Mesic ravine forests and streambanks. Endemic to a small area along the AL-GA border, in se. AL (Kron 1993) and sw. and wc. GA (Jones & Coile 1988). [= FNA, K, L, Z; = *Rhododendron prunifolium* Small – S]

**Rhododendron vaseyi** A. Gray, Pinkshell Azalea. Moist slopes, bogs, high elevation rocky summits, cliffs, high elevation heath balds. May-June; August-October. Endemic to the mountains of NC, though approaching very close to SC and GA in the vicinity of Cashiers and Highlands, NC, and reported for Rabun Bald (Rabun Co. GA) without definite documentation; *R. vaseyi* occurs primarily southwest of the Asheville Basin, but is found at scattered locations farther north and is locally abundant on Grandfather Mountain (at the junction of Avery, Watauga, and Caldwell counties, NC), its northernmost outpost. Judd & Kron (1995) treat *R. vaseyi* and *R. canadense* (Linnaeus) Torrey (of ne. North America) as the only two members of section Rhodora. When not in flower, *R. vaseyi* is readily distinguished from our other azaleas by its distinctive foliage (see key). [= RAB, F, FNA, K, L, W, Y; = *Biltia vaseyi* (A. Gray) Small – S]
**ERICACEAE**

11. *Elliottia* Muhlenberg ex Elliott 1817 (Elliottia, Southern-plume)

A genus of 4 species (as here circumscribed), shrubs to small trees, of se. North America, nw. North America, and Japan. As discussed by Wood (1961), the closest relatives of *E. racemosa* are *E. paniculata* (Siebold & Zuccarini) Bentham & Hooker and *E. bracteata* (Maximowicz) Bentham & Hooker, both of Japan, and *E. pyroliflorus* (Bong.) S.W. Brim & P.F. Stevens [= *Cladothamnus pyroliflorus* Bong.], of AK, British Colombia, WA, and OR; these have sometimes been placed in other genera. References: Tucker in FNA (2009); Stevens et al. in Kubitzki (2004).

*Elliottia racemosa* Muhlenberg ex Elliott, Elliottia, Southern-plume, Georgia-plume. Xeric sandy ridges, sandhills, river bluffs; serpentine woodlands. June-August. Endemic to e. GA and s. SC (Aiken County, where considered to have been extirpated). *Elliottia* extends barely into the Piedmont in Georgia, occurring on Burks Mountain on serpentine in a *Pinus palustris* woodland. [= FNA, K, L, S]

12. *Epigaea* Linnaeus 1753 (Trailing Arbutus)

A genus of 3 species, subshrubs, in e. North America and Eurasia; the other 2 species of the genus occur in the Caucasus and Asia Minor, and in Japan. References: Judd & Kron in FNA (2009); Stevens et al. in Kubitzki (2004).

*Epigaea repens* Linnaeus, Trailing Arbutus, Mayflower, Ground Laurel. In a wide variety of acidic forests, xeric to mesic, sandy, rocky, and loamy. Late February–early May; April–June. NL (Newfoundland) and QC west to MB, south to FL Panhandle, MS, and IA. At maturity, the fruits split along the sutures, exposing tiny brown seeds embedded in "sticky, white, placental tissue" which is "distinctly sweet to the taste;" ants are strongly attracted to the placental tissue, and in carrying it away disperse the seeds (Clay 1983). [= RAB, C, FNA, G, K, L, S, WH, WV; > *E. repens* var. *glabrifolia* Fernald – F; > *E. repens* var. *repens* – F]

A genus of 9-11 species, shrubs, of North America and Cuba, except the circumboreal *K. procumbens* (formerly *Loiseleuria*). *Leiophyllum*, traditionally treated as a monotypic or small genus of se. United States, is better treated as a part of *Kalmia* along with the northern *Loiseleuria*, based on molecular and morphological studies (Kron & King 1996, Kron et al. 2002). While this idea may initially seem outlandish (particularly to those whose concept of *Kalmia* is based only on *Kalmia latifolia*), the morphological and habitat similarities of *Leiophyllum* to *Kalmia* are striking. The foliage and wood of all species (and the smoke from burning them) are poisonous. References: Liu, Denford, Ebinger, Packer, & Tucker in FNA (2009); Southall & Hardin (1974)=Z; Ebinger (1974)=Y; Strand & Wyatt (1991)=Q; Wilbur & Racine (1971)=R; Camp (1938)=P; Kron & King (1996); Kron et al. (2002)=V; Haines (2010)=U; Stevens et al. in Kubitzki (2004).

1 Petals separate; fruit 2-3 (-7)-locular .................................................................................................................................................... *K. buxifolia*

1 Petals fused; fruit 5-locular.

2 Leaves whorled or opposite; inflorescence either an axillary raceme or a terminal corymbiform raceme.

3 Leaves opposite, 1-4 cm long, subsessile; inflorescence a terminal corymbiform raceme ........................................................................................................... *K. polifolia*

3 Leaves whorled in 3s (rarely opposite), 2-5 cm long, the petioles 4-12 mm long; inflorescence an axillary raceme.

4 Calyx lobes glandular-canescent and with marginal stipitate glands; leaves glabrous beneath; bracts and bracteoles densely glandular; stomates 18 μ long and 13 μ wide, 15-24 per 0.2 square millimeter; shrub to 1 (-1.2) m tall; [of ne. NC northward] ..... *K. angustifolia*
**Kalmia angustifolia** Linnaeus, Northern Sheepkill. Sandy, xeric to mesic hillsides and moist areas, rocky areas. April-May; September-October. NL (Labrador) west to MN, south to se. VA and extreme ne. NC, WV, s. ON, and MI, reaching its southern limit in the Coastal Plain of extreme ne. NC (Sorrie & LeBlond 2008). See *Kalmia carolina* for discussion of the taxonomy of these two taxa.  [= K, S, Z; = K. angustifolia var. angustifolia – C, F, FNA, G, L, Y; = K. angustifolia ssp. angustifolia – U]

**Kalmia buxifolia** (P.J. Bergius) Gift, Kron, & Stevens, Sand-myrtle. Locally abundant but very restricted in wet (spodosol) pinelands of the outer Coastal Plain (in Brunswick and Carteret counties, NC), locally common in relatively dry sandhills in a few locations in the Sandhills, disjunct in the Piedmont on a few quartzite monadnocks, fairly common in the mountains on rock outcrops at high to moderate elevations (on a wide variety of rock types). Late March-June (sporadically to October); September-October. This species is curiously distributed, both in its overall range and within NC. *Kalmia buxifolia* is found in the Pine Barrens of NJ, the outer Coastal Plain of SC. NC, the inner Coastal Plain (fall-line sandhills) of sc. NC and nc. SC, monadnocks of the upper Piedmont of NC, mountain peaks of NC and immediately adjacent nw. SC. ne. GA, and e. TN, and isolated in extreme e. PA (Monroe County) and in se. KY (on sandstone in Whitley County, in the Cumberland Plateau). Populations in the high mountains consist of very old, prostate krummholz, the stems to 6 cm in diameter at the base, the branches spreading to cover at least a square meter. The disjunct distribution, various habitats, and subtle morphological variation between populations has led to periodic attempts to divide the species into two or more varieties or species, but the variability apparently cannot be successfully described taxonomically; it is here treated as a single species. See X, Y, and Q for detailed discussion of the various taxa recognized by various authors (within the genus *Leiophyllum*). Strand & Wyatt (1991) found a population from Hanging Rock, Stokes County, NC to be the most distinctive, but did not choose to give it formal taxonomic status.  [= FNA, V; = Leiophyllum buxifolium (P.J. Bergius) Eliott – C, K, L, Q, R, W; > Leiophyllum buxifolium var. buxifolium – RAB; > Leiophyllum buxifolium var. prostratum (Loudon) Gray – RAB; > Leiophyllum buxifolium var. hugeri (Small) Schneider – F, G, P; > Leiophyllum lyoni Sweet – S, P; > Leiophyllum hugeri (Small) K. Schumann – S; = Dendruck buxifolium (Bergius) Desvaux]

**Kalmia carolina** Small, Southern Sheepkill, Carolina Wicky, Carolina Bog Myrtle. Moist to wet pinelands of the Coastal Plain, pocosin margins (or seemingly in pocosins or swamps because of fire suppression), mountain bogs and fens (and less commonly in rocky areas at high elevations) in the Mountains. April-May (sporadically to September, especially in response to fire); September-October. This species, a close relative of the more widespread and northern *K. angustifolia*, occurs in two disjunct areas: the Coastal Plain, from se. VA south through NC to wc. GA (Taylor County), and the Southern Appalachians from sw. VA south through w. NC and ne. TN to ne. GA. Southall & Hardin (1974) favored species status for *K. carolina* because of its essentially allopatric distribution relative to *K. angustifolia* (the 2 meet in Southampton County, VA), the near absence of intermediates or hybrids in nature, and because "significant morphological and anatomical differences have developed and remain constant between these two species when grown together."  [= GW, K, S, W, Z; = K. angustifolia Linnaeus var. caroliniana (Small) Fernald – RAB (an orthographic error); = K. angustifolia var. carolina (Small) Fernald – C, F, FNA, G, L, Y; = K. angustifolia ssp. carolina (Small) A. Haines – U]

**Kalmia cuneata** Michaux, White Wicky. Pocosins and pocosin-savanna or pocosin-sandhill ecotones. Late May-June; September-October. This species is a narrow endemic of the Coastal Plain of se. NC and e. SC. It is not closely related to other species in the genus. It is most easily distinguished from other pocosin shrubs by the combination of the following characters: leaves deciduous, dull, and subcoriaceous, 1.5-3 cm wide; inflorescence a fascicle of 1-3 flowers, axillary to leaf scars near the tips of the previous year's growth; petiole 1-4 mm long; [of the Coastal Plain of NC and SC] ......................................................**K. cuneata**

---

![Kalmia angustifolia](image1)

**Kalmia angustifolia** Linnaeus, Northern Sheepkill. Sandy, xeric to mesic hillsides and moist areas, rocky areas. April-May; September-October. NL (Labrador) west to MN, south to se. VA and extreme ne. NC, WV, s. ON, and MI, reaching its southern limit in the Coastal Plain of extreme ne. NC (Sorrie & LeBlond 2008). See *Kalmia carolina* for discussion of the taxonomy of these two taxa.  [= K, S, Z; = K. angustifolia var. angustifolia – C, F, FNA, G, L, Y; = K. angustifolia ssp. angustifolia – U]

**Kalmia buxifolia** (P.J. Bergius) Gift, Kron, & Stevens, Sand-myrtle. Locally abundant but very restricted in wet (spodosol) pinelands of the outer Coastal Plain (in Brunswick and Carteret counties, NC), locally common in relatively dry sandhills in a few locations in the Sandhills, disjunct in the Piedmont on a few quartzite monadnocks, fairly common in the mountains on rock outcrops at high to moderate elevations (on a wide variety of rock types). Haines – U]

**Kalmia cuneata** Michaux, White Wicky. Pocosins and pocosin-savanna or pocosin-sandhill ecotones. Late May-June; September-October. This species is a narrow endemic of the Coastal Plain of se. NC and e. SC. It is not closely related to other species in the genus. It is most easily distinguished from other pocosin shrubs by the combination of the following characters: leaves deciduous, alternate, oblong-elliptical (cuneate-attenuate at base, obtuse at apex), revolute, dark green above, paler and prominently stipitate-glandular beneath, woody capsule rounded, stipitate-glandular, persistent through the winter, borne on delicate, recurved pedicels usually 2-3 cm long.  [= RAB, FNA, GW, K, L, S, Y, Z]

ERICACEAE

Piedmont and Coastal Plain. April-July; September-October. ME, OH, and IN south to Panhandle FL and extreme E. LA. Unlike our other species, which are strictly shrubs, *K. latifolia* reaches the stature and diameter of a small tree. [= RAB, C, FNA, K, L, S, WH, WV, Y, Z; > *K. latifolia* var. *laevis* Fernald – F, G; > *K. latifolia* var. *latifolia* – F, G]

**Kalmia polifolia** Wangenheim, Swamp Laurel, Bog Laurel. Bogs. NL (Labrador) and NT south to nw. NJ, ne. PA, MI, WI, MN, and MT; disjunct in Tucker County, WV (where discovered by T.F. Wieboldt in 2007). [= C, F, FNA, G, K, Y, Z]

14. **Corema** D. Don 1826

A genus of 2 species, shrubs, one of NE North America and one of Spain and the Azores. References: Elens in FNA (2009); Stevens et al. in Kubitzki (2004).

**Corema conradii** (Torrey) Torrey ex Loudon, Broom-crowberry. Dunes. April-May. NS, QC, NB, and PE south to ME, MA, NY, and s. NJ. [= C, F, FNA, G, K]

15. **Ceratiola** Michaux 1803 (Florida Rosemary)

A monotypic genus, a shrub, of SE North America. **Ceratiola** has been traditionally placed in the Empetraceae. Many workers have expressed doubt about the naturalness of the Empetraceae and its distinction from the Ericaceae. Molecular data have corroborated that concern, and shown **Ceratiola** and the rest of the Empetraceae to be better included in a broader Ericaceae (Kron & Chase 1993); the affinities of **Ceratiola** may actually be with other southeastern United States genera, **Kalmia**, **Elliottia**, and **Bejaria** (Kron & Chase 1993). References: Kron & Chase (1993); Judd & Kron (1993); Johnson (1982); Stevens et al. in Kubitzki (2004).

**Ceratiola ericoides** Michaux, Rosemary, Florida Rosemary, Sandhill Rosemary, Sand Heath. Xeric sandhills, usually in white "sugar sand." October-November. NE SC south to s. FL and west to s. MS. Its content of aromatic compounds makes it very flammable. [= RAB, K, L, S, WH]

16. **Calluna** R.A. Salisbury 1802 (Heather)

17. **Erica** Linnaeus 1753 (Heath)

18. **Oxydendrum** A.P. de Candolle 1839 (Sourwood)

A monotypic genus, a tree, of SE North America. The genus **Oxydendrum** is "isolated ... among the Ericaceae, apparently with no close relatives" (Wood 1961): the only member of tribe Oxydendreae (Judd in FNA, in press). References: Judd in FNA (2009); Stevens et al. in Kubitzki (2004).

**Oxydendrum arboreum** (Linnaeus) A.P. de Candolle, Sourwood, Sorrel-tree. Mesic to xeric deciduous forests, especially dry-mesic to xeric oak-hickory and oak-pine forests, also in the fall line sandhills in sandhill/pocosin ecotones. SE and SW PA
west to IL, south to n. FL and se. and c. LA. It is an especially characteristic understory tree of upland forests of the Piedmont and lower Mountains. The bark is dark grayish-brown and fairly deeply furrowed; the tree nearly always has a characteristic lean (toward a former canopy light-gap). The finely serrate, elliptic leaves are distinctive, with the sour taste of garden sorrel (*Rumex acetosa*), sheep sorrel (*Rumex acetosella*), or wood sorrel (*Oxalis*). [= RAB, C, F, FNA, G, K, L, S, W, WH, WV]

19. **Pieris** D. Don 1834 (Evergreen Fetterbush)

1. Inflorescence a many-flowered panicle of racemes, borne terminally; seeds 2.5-3 mm long; [of slopes and ridges of the Mountains and upper Piedmont]; [subgenus *Pieris*, section *Pieris*].......................................................................................................................................

**Pieris floribunda** (Pursh) Bentham & Hook f., Mountain Andromeda, Evergreen Mountain Fetterbush. Acid wooded slopes, heath balds at high elevations, summits of Piedmont monadnocks, sometimes escaped from cultivation. May-June; August-October. A Southern Appalachian endemic: e. WV, w. VA, w. NC, e. TN, and n. GA. The type locality is supposedly in n. GA. The range in NC is peculiar, the species occurring at high elevations southwest of Asheville, absent from apparently suitable habitats to the northeast (such as the Craggies, Blacks, Roan Mountain, and Grandfather Mountain), yet reappearing in a few disjunct populations at low elevations in the upper Piedmont. In w. VA (and adjacent e. WV), *P. floribunda* occurs on rather dry sandstone ridges and upper slopes, often under an oak canopy, especially in the front ranges of the Cumberland Mountains. *P. floribunda* is placed in subgenus *Pieris*, section *Pieris*, along with *P. japonica* (see below) and another Asian species. [= RAB, C, F, FNA, G, K, L, S, W, WH, WV]

20. **Agarista** D. Don ex G. Don 1834 (Agarista)

**Agarista populifolia** (Lamarck) Judd, Agarista, Pipe-plant. Blackwater swamps, hydric hammocks, marly spring runs. April-May; September-October. E. SC (or se. NC?) south to ne. and c. peninsular FL. Reported for several locations in s. AL, likely escaped (Diamond & Woods 2009). A specimen at the University of North Carolina at Chapel Hill is labeled as coming from a nursery, originally taken from plants in a swamp in Columbus County, NC. The record is plausible and would add the species to the state’s flora. [= FNA, K, L, WH, Z; = *Leucothoe populifolia* (Lamarck) Dippel – RAB, GW; = *Leucothoe acuminata* (Aiton) G. Don – S; = *Andromeda populifolia* Lamarck]

21. **Lyonia** Nuttall 1818 (Staggerbush, Maleberry, Fetterbush)

A genus of about 35 species, shrubs and small trees, of e. and se. Asia, e. North America, Mexico, and the West Indies. References: Judd (1981); Judd in FNA (2009); Stevens et al. in Kubitzki (2004).
Ligustrina

1. Lower leaf surfaces stipitate-peltate with rusty scales; [of s. SC southward].

2. Ultimate branches not rigidly ascending, flowers nearly always restricted to branches of the previous year, the leaves not conspicuously reduced toward the branch tips; leaves with distal margin usually revolute, sometimes strongly so; major veins usually depressed; lower leaf surface with some scales often large and with irregular margins, others smaller and more nearly entire, at least the smaller scales more-or-less persistent; [shrub to 6 (-12) m tall] .................................................. L. ferruginea

3. Ultimate branches rigidly ascending, flowers frequently on branches of the current year (though also on older growth), the leaves conspicuously reduced toward the branch tips; leaves with distal margin at most slightly revolute; major veins not depressed; lower leaf surface with scales usually all large and with irregular margins, the scales often deciduous; [shrub to 1.5 (-3) m tall] ..................... L. fruticosa

---

Lyonia ferruginea (Walter) Nuttall, Crookedwood, Dragonwood, Staggerbush. Dry oak and pine woodlands, scrub, rarely pocosins, spodosolic flatwoods. February-May; April-October. Se. SC south to se. peninsular FL, west to Panhandle FL. See discussion under L. fruticosa. [= FNA, GW, K, L, WH, Z; < Lyonia ferruginea – RAB (also see L. fruticosa); = Xolisma ferruginea (Walter) Heller – S]

Lyonia fruticosa (Michaux) G.S. Torrey, Staggerbush, Poor-grub. Pocosins. March-July; May-October. Se. SC (at least formerly) south to s. peninsular FL, west to e. Panhandle FL. Though not included in RAB for our area, Judd (1981) cites several old specimens from SC. The species is definitely known from immediately adjacent GA, and there seems no reason to doubt its (at least historical) occurrence in SC. This species is difficult to distinguish from L. ferruginea, with which it often co-occurs. [= FNA, GW, K, L, WH, Z; < L. ferruginea – RAB; = Xolisma fruticosa (Michaux) Nash – S]

Lyonia ligustrina (Linnaeus) A.P. de Candolle var. foliosiflora (Michaux) Fernald, Southern Maleberry, He-huckleberry. Pocosins, seepage bogs, and other wet habitats. Late April-June; September-October. Se. VA south to s. FL, west to e. TX and e. OK, and (west of the mountains) north to TN and AR. Rather nondescript when sterile, the gray-green hue of the leaves is a useful character. Var. foliosiflora is the usual variety on the Coastal Plain (including the fall-line sandhills). [= FNA, GW, K, L, W, Z; < L. ligustrina – RAB, C, G; > L. ligustrina var. capreaefolia (Watson) A.P. de Candolle – F; > L. ligustrina var. foliosiflora – F; > L. ligustrina var. salicifolia (Watson) A.P. de Candolle – F; = Arsenococcus frondosus (Pursh) Small – S; = Xolisma foliosiflora (Michaux) Small]

Lyonia ligustrina (Linnaeus) A.P. de Candolle var. ligustrina, Northern Maleberry, He-huckleberry. Mountain bogs, shrub balds, bottomlands, other moist to wet habitats, "dry" ridges at high elevations. May-July; September-October. S. ME, s. NH, s. VT, s. and e. NY, s. OH, WV, and KY south to w. and e. SC, n. GA, and ne. AL, primarily in the mountains and adjacent provinces. Var. ligustrina is the usual variety in the Mountains and Piedmont, but extends as well into the Coastal Plain in NC and SC. This variety is very variable in leaf shape and size, some populations having leaves about 3 cm long and 1.3 cm wide, others with leaves to as large as 8 cm long and 5 cm wide. The plants with smaller leaves occur in bogs and other distinctly wet habitats, while plants with large leaves occur in thin soils in high elevation heath balds and thin soils around rock outcrops (as, for instance, on Grandfather Mountain, NC). [= F, FNA, GW, K, L, W, Z; < L. ligustrina – RAB, C, G, WV; = Arsenococcus ligustrinus (Linnaeus) Small – S; = Xolisma ligustrina (Linnaeus) Britton]

Lyonia lucida (Lamark) K. Koch, Shining Fetterbush. Pocosins, wet woodlands, blackwater swamp forests, other acidic habitats, especially if peaty. April-early June; September-October. SE. VA south to s. FL and west to e. and c. LA; also in w. Cuba. Readily distinguished by the glossy, coriaceous leaves with a prominent vein running along the margins. When in flower in large numbers, the odor is clove-scented. [= RAB, C, F, FNA, G, GW, K, L, WH, Z; = Desmoulinus lucidus (Lamark) Small – S; = Neopieris nitida (Bartram ex Marshall) Britton]

Lyonia mariana (Linnaeus) D. Don, Staggerbush. Pine flatwoods, savannas, pocosin-sandhill ecotones, dry rocky woodlands in the lower Piedmont (especially with chestnut oak). April-May; September-October. RI (formerly) and NY (Long Island) south to c. peninsular and e. Panhandle FL; disjunct west of the Mississippi River in sc. MO, c. AR, nw. LA, se. OK, and e. TX. Readily distinguished by the broadly elliptic leaves borne at an ascending 45 degree angle, with bright pink axillary buds. [= RAB, C, F, FNA, G, GW, K, L, WH, Z; = Neopieris mariana (Linnaeus) Britton – S]

22. Andromeda Linnaeus 1753 (Bog-rosemary, Andromeda)

Andromeda polifolia Linnaeus var. latifolia Aiton, Bog-rosemary. Bogs. May-July; June-September. Circumboreal, in North America from NL (Newfoundland) and NL (Labrador) west to SK, south to NJ, ne. PA (Rhoads & Klein 1993), e. WV (at Cranberry Glades, Pocahontas County), IN, IL, and MN. Var. polifolia is also circumboreal, overall more northern. [= FNA; = A. glaucophylla Link – C, F, G, L; = A. polifolia var. glaucophylla (Link) A.P. de Candolle – K; = A. polifolia ssp. glaucophylla (Link) Hultén]

23. Zenobia D. Don 1834 (Zenobia, Honey-cups)

Zenobia pulverulenta (Bartram ex Willdenow) Pollard, Zenobia, Honey-cups. Pocosins, margins of pineland ponds. April-June; September-October. This monotypic genus is a narrow endemic of the Coastal Plain of se. VA, NC, SC, and e. GA (Bryan Kubitzki (2004)). It was considered by Wood (1961) to have "no close relatives," but molecular phylogeny suggests that it is sister to Andromeda. The crenate leaves help distinguish Zenobia from other pocosin shrubs. The flowers are extremely fragrant. The species is remarkably variable in leaf glaucescence. Many plants in the fall-line sandhills and upper Coastal Plain have the lower leaf surface, pedicels, and capsules covered in wax to the point that they are bright white; outer Coastal Plain plants generally lack any glaucescence. The division into two species listed below in synonymy was based largely on this character; further study appears warranted. In the centers of major peat domes in the Outer Coastal Plain and in large Carolina bays in the Bladen Lakes region, where peat depths reach 3-5 meters, occur areas of up to 25 square kilometers dominated by Zenobia (sometimes codominant with Chamaedaphne or Sarracenia flava). This community has been referred to as "deciduous low pocosin," to distinguish it from the dominance of evergreen shrubs found in most pocosins. [= RAB, C, F, FNA, G, GW, K, L; > Z. pulverulenta – S; > Z. cassinifolia (Ventenat) Pollard – S]

24. Chamaedaphne Moench 1794 (Leatherleaf, Cassandra)

Chamaedaphne calyculata (Linnaeus) Moench, Leatherleaf, Cassandra. Pocosins in the Coastal Plain, bogs in the Mountains, Chamaecyparis bogs. March-April; June-October. Circumboreal; in North America from NL (Newfoundland) to AB, south to WV (Tucker County) (T.F. Wieboldt, pers.comm., 2007), MD, OH, n. IL, WI, n. IA, AB, and BC; disjunct to the mountains of NC (where now nearly extirpated, known only from a single bog of less than 1 hectare) and to the Coastal Plain of NC and ne. SC. The Coastal Plain occurrences in our area are mainly in the centers of large peat dome or Carolina Bay pocosins, the insufficiently famous southern blanket bogs or "southern muskeg." In these areas, Chamaedaphne is sometimes dominant (or codominant with Zenobia pulverulenta or Sarracenia flava) over expanses of 25 square kilometers. The southern occurrences of Chamaedaphne are certainly the result of Pleistocene distributions. A number of varieties have been named (the Eurasian var. calyculata, var. latifolia in Maritime Canada, south to n. New England, and var. angustifolia, to which our material would presumably be referred). The validity of the varieties is doubtful. [= C, FNA, G, K, L, S, W; = Cassandra calyculata (Linnaeus) D. Don – RAB, GW; > Chamaedaphne calyculata var. angustifolia (Aiton) Rehder – F]

25. Leucothoe D. Don 1834 (Fetterbush, Leucothoe)

A genus of 5-6 species, shrubs, of Japan, Himalayan Asia, and e. North America. References: Tucker in FNA (2009); Stevens et al. in Kubitzki (2004). [also see Agarista and Eubotrys]

1 Leaves deciduous, dull, membranaceous ...........................................................................................................[see Eubotrys]
2 Leaves evergreen, glossy, coriaceous.
3 Leaves with an acute or short-acuminate apex; racemes 2-4 (5) cm long; sepals ovate, with an obtuse or rounded apex; longest petioles 3-8 mm long.............................................................................................................................................................................L. axillaris
4 Leaves with a long-acuminate apex; racemes 4-10 cm long; sepals lanceolate-ovate, with an acute (or subacute) apex; longest petioles 8-15 mm long ..............................................................................................................................................................................L. fontanesiana

Leucothoe axillaris (Lamarck) D. Don, Coastal Doghobble. Pocosins, blackwater swamp forests, and moist and acid slopes. Late March-May; September-October. A Southeastern Coastal Plain endemic: se. VA south to FL and west to extreme e. LA. [= C, FNA, G, GW, K, L, S, WH; = L. axillaris var. axillaris – RAB; > L. axillaris var. axillaris – F; > L. axillaris var. ambigens Fernald – F]

Leucothoe fontanesiana (Steudel) Sleumer, Mountain Doghobble, Switch-ivy. Moist slopes, streambanks, ravines, often associated with Rhododendron maximum thickets. April-May; September-October. A Southern Appalachian endemic: sw. VA
26. Eubotrys Nuttall 1842 (Deciduous Fetterbush)

A genus of 2 species, shrubs to small trees, of e. North America. Recent molecular evidence supports the recognition of Eubotrys as a genus separate from Leucothoe, and more closely related to Chamaedaphne, supporting the views, based on morphological grounds, of many earlier authors (Kron et al. 2002). References: Tucker in FNA (2009); Kron et al. (2002); Stevens et al. in Kubitzki (2004).

1 Anthers with 4 awns; capsule rounded on the sutures; sepals broadly lanceolate; racemes 3-5 cm long; seeds not winged, shaped like a section of an orange ........................................... E. racemosa

E. racemosa (Linnaeus) Nuttall, Coastal Fetterbush. Swamps, pocosins, streambanks, and other wet places. Late March-early June; September-October. E. MA south to c. peninsular FL and west to LA, primarily on the Coastal Plain; disjunct inland, as in c. TN (Chester, Wofford, & Kral 1997). [= C, FNA, G; = Leucothoe racemosa (Linnaeus) A. Gray – RAB, GW, K, L, W, WH; > L. racemosa var. projecta Fernald – F; > L. racemosa var. racemosa – F; > Eubotrys racemosa – S; > Eubotrys elongata Small – S]

E. recurva (Buckley) Britton, Mountain Fetterbush. Heath balds, high elevation ridges and granitic domes, bogs. April-early June (rarely sporadically in the fall); August-October. A Southern Appalachain endemic: sw. VA, s. WV, and se. KY south through w. NC and ne. TN to ne. GA (Rabun County) and nw. SC. [= C, FNA, G, S; = Leucothoe recurva (Buckley) A. Gray – RAB, F, K, L, W, WV]

27. Gaultheria Kalm ex Linnaeus 1754 (Wintergreen, Teaberry)

A genus of 115-135 species, shrubs and subshrubs, of Asia, Australia and New Zealand, South America, West Indies, Central America, and North America (primarily Asian). References: Trock in FNA (2009); Stevens et al. in Kubitzki (2004).

1 Stems creeping, the leaves 3-10 mm long, well-distributed along the stem; berries white; flowers 4-merous.............................................. G. hispidula

G. hispidula (Linnaeus) Muhlenberg ex Bigelow, Creeping Snowberry, Moxie. Spruce-fir forests, northern hardwoods forests, bogs at high elevations. May. NL (Newfoundland) and NL (Labrador) west to BC, south to NJ, MD, WV, OH, MN, ID, and WA; there is no known documentation for the attribution (by C, F, G, and S) of this species as occurring in NC. [= C, F, FNA, G, K, WV; = Chiogenes hispidula (Linnaeus) Torrey & A. Gray – S]

28. Vaccinium Linnaeus 1753 (Blueberry)

A genus of 140 species, shrubs, lianes, and small trees, semicosmopolitan. Vaccinium in our area is divided into 6 strongly differentiated sections, sometimes, as by Small, treated as separate genera. The taxonomy of Vaccinium remains unclear – past divergence of opinion is obvious in the synonymy. For instance, Small (1933) recognizes 6 genera and 25 species for our area, Ahles in RAB (1968) recognizes 1 genus and 14 species (one with 2 varieties) (not including VA), and Vander Kloet (1988) recognizes 1 genus and 9 species. The highbush blueberries of section Cyanococcus are particularly difficult. Vander Kloet's extremely broad concept of the highbush blueberries as consisting of a single species, V. corymbosum, including V. fiscatum (V. atrooccum – RAB), V. simulatum ("V. constablaei" – RAB), V. virgatum (V. amoenum – RAB), V. elliottii, V. formosum (V. australis), and V. caesariense (and many other named taxa not recognized here) has been adopted by some recent authors, at least partly for its ease of application. I agree with Godfrey (1988), though, that V. elliottii has "such distinctiveness as to be recognizable in the field at a glance." The other taxa are less easily recognizable, but seem to have substantial morphological and phytoecographic integrity. The fairly frequent presence of hybrid individuals and populations can make identification frustrating, but I agree with Ward (1974) that "the genus Vaccinium ... difficult but not in any way an irresolvable tangle of intergrading
populations. The vast bulk of individuals encountered in the field may be assigned, as with any non-apomict genus, to a relatively few, discrete, and wholly recognizable species. Many of the taxa included in *V. corymbosum* by Vander Kloet (1988) and Luteyn et al. (1996) occur together in combinations of two to four, are immediately recognizable in the field, bloom at different times, and have different flower, fruit, and leaf morphology. Failure to recognize multiple entities within the highbush blueberries results in the taxonomic homogenization of the diversity of the group and obscures important phytogeographic patterns. Our area, with 20 species (24 taxa) in 6 sections, has a greater diversity of *Vaccinium* than any other comparably sized area in North America.

1 Trailing vines, erect shoots (if present) borne on horizontal stems; leaves evergreen, glossy and dark green above, rarely exceeding 20 mm in length.

2 Leaves narrowly elliptic, glabrous above, glaucous-white below; leaf margin entire and eglandular; berry red when ripe, 8-15 mm long; [cranberries, section *Oxyccocus*] ................................................................. Key A

2 Leaves elliptic, puberulent above, pale green below; leaf margin obscurely to fairly strongly serrate and glandular; berry black when ripe, 6-8 mm long; [creeping blueberries, section *Herpothamnus*] .................................................. Key B

1 Erect shrubs, the growth form various (single-stemmed, multi-stemmed and clump-like, or clonal with numerous erect shoots from a network of subterranean rhizomes); leaves deciduous to semi-evergreen (evergreen in *V. myrsinifolium*), dull to somewhat glossy and medium green above (dark green and glossy in *V. myrsinifolium*), generally exceeding 20 mm in length (5-30 mm long in *V. myrsinifolium*).

3 Twigs of the season vernulate (the surface abundantly covered with small bumps, readily visible without magnification); [blueberries, section *Cyanococcus*] ................................................................. Key C

3 Twigs of the season not vernulate.

4 Corolla lobes 4, strongly recurved, 7-10 mm long; calyx lobes 4 (also visible on the berry); leaves lanceolate to ovate, the apex acuminate, the margin regularly and finely serrate with glandular teeth; [of high elevations in the Mountains]; [mountain cranberry, section *Oxyccocusidae*] ........................................................................................................................................... Key D

4 Corolla lobes 5, not or only slightly recurved, 1-8 mm long; calyx lobes 5 (also visible on the berry); leaves elliptic, obovate, oblanceolate, or nearly round, the apex generally obtuse to rounded, the margin entire to obscurely and irregularly serrate; [collectively widespread in our area, but not at high elevations].

5 Mature leaves green (or glaucous), glandular beneath, mostly elliptic to round, generally 1.5-4.5 cm long; calyx broad-urceolate to narrow-campanulate, the stems included; berry black, lustrous, 5-9 mm long; [farkleberry, section *Batodendron*] ................................. Key E

5 Mature leaves pale and glaucous, eglandular beneath, mostly elliptic, 3-10 cm long; calyx campanulate, the stems long-exserted; berry green, yellow, pink, or purple, usually glaucous, 7-18 mm long; [deerberries, section *Polycodium*] .................................................................................................................................. Key F

**Key A – cranberries, section *Oxyccocus***

1 Leaves elliptic, broadest near middle, (5-) 7-10 (-18) mm long, (2-) 3-4 (-5) mm wide; leaves blunt-rounded and non-involute; pedicels with 2 green, leaf-like bracts 1-2 mm wide; berry 8-15 mm in diameter ..................................................... Key B

1 Leaves ovate, broadest toward base, (3-) 5-6 (-9) mm long, (1-) 2-3 (-5) mm wide; leaves involute at least along the margins, thus making the leaf tip acute; pedicels with (0-) 2 (-5) reddish, scale-like bracts < 1 mm wide; berry 6-12 mm in diameter ........................................ Key C

**Key B – creeping blueberries, section *Herpothamnus***

1 Leaves (2-) 3-18 (-25) mm long, generally elliptic (less commonly ovate or obovate); angle of leaf base typically >90 degrees; margins finely glandular mucronulate-crenulate, the teeth tightly appressed and therefore often obscure, the margin superficially entire; stems mostly prostrate (ascending in areas that have been long fire-suppressed); [widespread in NC and SC, rare in se. VA and e. GA] .......................... *V. crassifolium*

1 Leaves (4-) 7-35 (-63) mm long, elliptic to obovate (less commonly elliptic-ovate); angle of leaf base typically <90 degrees; margins glandular mucronulate-serulate to serrulate-crenulate, the teeth apparent, especially toward the apex; stems often ascending to upright; [of Lexington County, SC] .................................................. *V. sempervirens*

**Key C – blueberries, section *Cyanococcus***

Note: Hybrids and apparent local races in this section are frequent, and will key poorly. Hybrids are particularly frequent among the taxa of the highbush blueberries, somewhat less so among lowbush blueberries and between lowbush and highbush. In the Coastal Plain, *V. ×marianum* (*formosum* × *fasciculum*) is the most common, and will be responsible for most difficulties encountered in the key from lead 10 on. Uttal (1987) presents a complicated key with *V. ×marianum* (but not other hybrids) included.

1 Shrubs rhizomatous, forming clonal colonies, the upright stems < 1 m tall (and often < 0.5 m tall); ["lowbush blueberries"].

2 Leaves evergreen, 5-15 mm long (rarely to 30 mm long on fire sprouts), subcoriaceous, glossy dark-green or dull blue-green; [restricted in our area to the Coastal Plain of se. SC southward].

3 Twigs of the season not verrucose.
LEAVES STRONGLY WHITE-GLAUCOUS BEHIND; STAMENS 4-6 MM LONG. [COLLECTIVELY WIDESPREAD IN OUR AREA]

One species in our area

V. angustifolium

Key D – mountain cranberry, section Oxyccoides

One species in our area

V. erythrocarpum

Key E – farkleberry, section Batodonum

One species in our area

V. arboreum

Key F – deerberries, section Polycodium

[This key and treatment provisional]

1 Leaves white-glaucous beneath; stamens 4-6 mm long.
   2 Bracts of the inflorescence nearly as large as normal foliage leaves; [of the Coastal Plain from se. NC southward]
**Vaccinium altomontanum** W.W. Ashe, Blue Ridge Blueberry. Mt (GA, NC, SC, VA): grassy balds, heath balds, high elevation forests and woodlands; uncommon. May-June; July-September. The tetraploid *V. altomontanum* occurs primarily in the Mountains at moderate to high elevations (the type collection is from the Fodderstacks, Macon County, NC); it differs from the diploid *V. pallidum* in forming tighter (often circular) clones, with taller plants (to 1 m tall), the leaves thick in texture, often revolute, strictly glaucous and glabrous, and with excellent berries. [≤ *V. corymbosum* – RAB; = *V. altomontanum* – G, X, orthographic variant; < *V. pallidum* – FNA, K; > *Cyanococcus subcordatus* Small – S; > *Cyanococcus liparis* Small – S, as to type]

**Vaccinium angustifolium** Aiton, Northern Lowbush Blueberry, Sugarberry, Low Sweet Blueberry. Mt (NC, VA, WV), Pd (DE): acidic forest and woodland, cliffs and talus (especially sandstone and quartzite), usually at high elevations; common (uncommon in WV, rare in DE and NC). NL (Labrador) and NL (Newfoundland) west to MB, south to NJ, PA, sw. VA, IL, and MN. Recently reported for the Great Smoky Mountains National Park (J. Rock, pers. comm. 2009) and from Cheoah Bald, Graham County (E. Schwartzman, pers. comm. 2010 and NCU specimen). [≤ C, FNA, K, W, Y, Z; > *V. angustifolium* var. angustifolium – F, WV; > *V. angustifolium* var. laevifolium House – F, WV; > *V. angustifolium* var. hypolasium Fernald – F; > *V. angustifolium* var. nigrum (Wood) Dole – F, WV; > *V. angustifolium* – G, X; > *V. lamarckii* Camp – G, X; > *V. brittonii* Porter ex Bicknell – X]

**Vaccinium arboreum** Marshall, Farkleberry, Sparkleberry. Rocky or sandy woodlands, bluffs, and cliffs, usually xeric and often fire-maintained, and unlike most other *Vaccinium*, often on mafic, ultramafic, or calcareous rocks. Late April-June; September-October. This species is widely distributed in se. North America, from TX and FL north to MO, IN, KY, and VA. It can be a small tree, to 35 cm DBH and 10 m tall. The leaves are coriaceous and semi-evergreen, often being retained for much or all of the winter. Var. glaucescens (Greene) Sargent may be worthy of recognition; it differs from var. *arborescens* in its subglaucous to conspicuously blue-green leaves (vs. dark green leaves) and the bracts at the base of the pedicels nearly equal in size and shape to the leaves (vs. bracts distinctly smaller and often also different in shape than the leaves). [≤ RAB, C, FNA, G, K, L, W, WH, Y, Z; > *V. arboreum* var. *arborescens* – F; > *V. arboreum* var. glaucescens (Greene) Sargent – F; = *Batodendron arboreum* (Marshall) Nuttall – S]

**Vaccinium caesariense** Mackenzie, New Jersey Highlands Blueberry. Swamps, bogs, moist ground. Late February-May; June-August. S. ME south to n. FL. This species is diploid. [≤ C, F, G, K, X, Y; < *V. caesariense* – RAB, FNA, L, WH, Z]

**Vaccinium corymbosum** Linnaeus, Smooth Highbush Blueberry. Bogs, wet swamp forests, moist high elevation bogs, balds, and forests. May; August. NS west to MI, south to WV, OH, and IN, south in the Appalachians (and rarely on Piedmont monadnocks) to w. NC, nw. SC, n. GA, and e. TN. In our area, *V. corymbosum* (sensu stricto) appears to be limited to the Mountains, except for occurrences on Piedmont monadnocks and outlier ridges, such as Hanging Rock, Stokes County, NC, and the Brushy Mountains, NC. See the end of the genus treatment for discussion of taxonomic controversy involving this species and its allies. Note that this treatment recognizes 2 species (*V. formosum* and *V. caesariense*) included within *V. corymbosum* by RAB. *V. formosum* is the common "*corymbosum*" type blueberry of the Coastal Plain. *V. corymbosum* is primarily tetraploid; *V. constablaei* A. Gray (misapplied to *V. simulatum* by RAB) is correctly applied to hexaploid plants of the high elevation Blue Ridge of NC and TN, especially on heath balds and gracile bogs. Camp (1945) considered *V. constablaei* to be an allopolyploid derivative of *V. simulatum* and *V. altomontanum* (itself a tetraploid apparently related to diploid *V. pallidum*, and of uncertain derivation). The appropriate taxonomic treatment of these plants is unclear; they are apparently not reliably identifiable based on morphology. [≤ K, X, Y; < *V. corymbosum* – RAB, FNA, G, L, W, Z; > *V. corymbosum* var. *corymbosum* – F, WV; > *V. corymbosum* var. *albiflorum* (Hooker) Fernald – F; > *V. corymbosum* var. glabrum Gray – F, WV; < *V. corymbosum* – C (also see *V. fuscatum* and *V. simulatum*); < *V. constablaei* A. Gray – G, X; = *Cyanococcus corymbosus* (Linnaeus) Rydberg – S]

**Vaccinium crassifolium** Andrews, Creeping Blueberry. Savannas, pine flatwoods, pocosin-sandhill ecotones, upland sandhills over clay pans. April-May; June-July. This species is nearly endemic to the Carolinas, barely extending into immediately adjacent VA and GA. See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for discussion of the systematics and ecology of this species and the closely related *V. sempervirens*. [≤ RAB, C, F, G, GW, Y; = *V. crassifolium* ssp. *crassifolium* – K; ≤ *Herpetothamnus crassifolius* (Andrews) Small – S; < *V. crassifolium* – FNA, L, Z]

**Vaccinium darrowii** Camp, Darrow's Blueberry. Pine flatwoods. S. GA south to s. peninsular FL and west to e. LA. [≤ FNA, K, L, WH, X, Z; > *V. darrowii* – GW, orthographic variant; = *Cyanococcus mysinites* (Lamarck) Small var. *glauca* A. Gray – S]
**Vaccinium elliottii** Chapman, Mayberry. Bottomlands, slopes, sandy river terraces, natural levees. March-April; May-June. Primarily a Coastal Plain species, *V. elliottii* ranges from se. VA south to FL, west to se. TX and AR; disjunct in Coffee County, TN (Chester, Wofford, & Kral 1997). [= RAB, C, F, G, WK, X, Y; = Cyanococcus elliottii (Chapman) Smith – FNA, L, WH, Z]

**Vaccinium erythrocarpum** Michaux, Bearberry, Highbush Cranberry, Mountain Cranberry. Rocky ridges, shrub or grassy balds, bogs, spruce-fir forests, usually at high elevations. Late May-July; August-September. A Southern and Central Appalachian endemic, *V. erythrocarpum* ranges from WV through VA to w. NC, e. and ec. TN, and ne. GA. The only other member of Section Oxycoccoides is *V. japonicum* Miguel of montane Japan, so similar as to be sometimes regarded as only a subspecies or variety of our species. [= RAB, C, F, G, K, L, W, WK, Y, Z; = V. erythrocarpus ssp. erythrocarpus – FNA; = Hugeria erythrocarpa (Michaux) Small – S]

**Vaccinium formosum** H.C. Andrews, Southern Highbush Blueberry, Swamp Highbush Blueberry. Bogs, swamps (especially blackwater, or at least where away from strong alluvial influence), seepages, depression ponds (dolines), other moist ground. Late February-May; June-August. Apparently ranging from NJ south to n. FL and s. AL, primarily on the Coastal Plain. This species is the primary source of the cultivated highbush blueberries. It has the largest and arguably the highest quality fruit of the native highbush blueberries. [= K, Y; < V. corymbosum – RAB, C, FNA, L, WH, Z; = V. australis Small – G, GW, X; = Cyanococcus virgatus (Aiton) Smith – S]

**Vaccinium hirsutum** Buckley, Woollyberry, Hairy Blueberry. Mountain slopes and ridges, primarily in pine-oak and oak swales. April-May; June-July. *V. hirsutum* is a narrow Southern Appalachian endemic, occurring only in a few counties of sw. NC, se. TN, and n. GA. It is the only species in our area with pubescent fruit. [= RAB, FNA, K, L, W, X, Z; = Cyanococcus hirsutus (Buckley) Small – S]

**Vaccinium macrocarpon** Aiton, Cranberry, Large Cranberry. Mountain bogs, low pocosins, with deep peat, interdunal swales. May-July; August-November. Unlike the circumboreal *V. oxycoccus* Linnaeus, *V. macrocarpon* is limited to North America. This is the familiar edible cranberry, raised commercially in artificial bogs, primarily in MA, WI, and NJ. It ranges as a native plant from NL (Newfoundland) west to s. ON, MN, ne. IL, n. IN, n. and c. OH, PA, and NJ, extending south along the Appalachians as a disjunct rarity through WV, w. VA, and ne. and se. TN to w. NC, and south along the outer Coastal Plain as a disjunct rarity in e. MD, se. VA, and ne. and se. NC. The occurrence in the inner Coastal Plain (fall-line sandhills) along the Little River in Cumberland County, NC is questionably native. [= RAB, FNA, G, K, L, W, WK, Y, Z; = Oxyccocus macrocarpus (Aiton) Persoon – S]

**Vaccinium myrsinites** Lamarck, Southern Evergreen Blueberry. Pine flatwoods. March-April; May-June. Se. SC south to s. peninsular FL, west to s. AL. *V. myrsinites* is readily distinguished from all our species by the following combination of characteristics: clonal shrub with upright stems usually < 50 cm tall, the young twigs verrucose, leaves evergreen, mostly 5-15 mm long and 2-10 mm wide, lower surface of young leaves with stout glandular hairs. Further south, it can be difficult to distinguish from the closely related *V. darrowii* Camp (see key), with which it often co-occurs in their area of overlap. [= RAB, FNA, G, K, L, W, WK, Y, Z; = Cyanococcus myrsinites (Lamarck) Small var. myrsinites – S]

**Vaccinium oxyccocos** Linnaeus, Small Cranberry. Bogs. Circumboreal, south in North America to NJ, PA, WV (Grant, Mineral, Pendleton, Pocahontas, Preston, Randolph, and Tucker counties), IN, and MN. This species has been reported for NC,
by Fernald (1950) as *V. oxyccocos* var. *ovalifolium* Michaux, by Scoggan (1979) as *Oxycoccus ovalifolium* (Michaux) Porsild, and by Kartesz (1999). Most likely, ambiguous collections of *V. macrocarpon* are the basis for these reports. [= C, FNA, G, K; > *V. oxyccocos* Linnaeus var. *ovalifolium* – F; = *Oxycoccus palustris* Persoon; > *Oxycoccus palustris* Persoon var. *ovalifolium* (Michaux) Seymour; > *Oxycoccus ovalifolius* (Michaux) Porsild]

**Vaccinium semprevires** Rayner & Henderson, Rayner's Blueberry. Seeepage bogs in the fall-line Sandhills, longleaf pine woodlands over sandstone and gravel outcrops. Endemic to Lexington County, SC, known from only a few sites. This species is clearly closely allied to *V. crassifolium*. Kirkman & Ballington (1990) reduce it to a subspecies. Because it is allopatric and relatively discrete morphologically, despite occurring in similar habitats, I prefer to retain it as a species. See Kirkman, Wentworth, & Ballington (1989) and Kirkman & Ballington (1990) for further discussion of the systematics and ecology of this species and *V. crassifolium*. [= *V. crassifolium* Andrews ssp. *semprevires* (Rayner & Henderson) Kirkman & Ballington – K; < *V. crassifolium* – FNA, L, Z]

**Vaccinium simulatum** Small, Mountain Highbush Blueberry. Forested slopes (northern hardwoods, spruce-fire forests), ridges, and shrub balds, at moderate and high elevations. Late April-early June; July-August. A Southern and Central Appalachian endemic, *V. simulatum* ranges from e. KY and sw. VA south through w. NC and e. TN to n. GA and n. AL. The name *V. constablaei* has been misapplied to this species, as by RAB; see *V. stamineum*

**Vaccinium stamineum** Linnaeus var. *I*, Dwarf Deerberry. Pinelands. April-June; August-October. This dwarf taxon is characteristic of Coastal Plain pinelands; its stature is not the result of fire; it never achieves greater height, even following decades of fire suppression. Se. NC south to GA. < *V. stamineum* var. *stamineum* – RAB; < *Vaccinium stamineum* – C, FNA, K, L, W, Y, Z; = *Polyodium arenicola* W.W. Ashe – V]

**Vaccinium stamineum** Linnaeus var. *2*, Appalachian Deerberry. Xeric to submesic woodlands and forests, including pine-oak/health and shrub balds. April-June; August-October. PA south to GA, in the Appalachians and adjacent provinces. < *V. stamineum* var. *stamineum* – RAB, F, WV; < *V. stamineum* – C, FNA, K, L, W, Y, Z; = *Polyodium candicans* Small – S, V; = *V. candicans* (C. Mohr) Steunumer]

**Vaccinium stamineum** Linnaeus var. *caesium* (Greene) D.B. Ward, Florida Deerberry, Whiteleaf Deerberry. Xeric woodlands. April-May; August-October. Se. NC south to c. peninsular FL, and west to s. AL. [= Q; < *V. stamineum* var. *stamineum* – RAB; < *V. stamineum* – C, FNA, K, L, W, WH, Y, Z; ? *V. caesium* Greene – F (probably misapplied); > *Polyodium floridanum* (Nuttall) Greene – S; > *Polyodium ashei* Harbison – S; > *Polyodium floridanum* var. *floridanum* – V; > *Polyodium floridanum* var. *caesium* – V]

**Vaccinium stamineum** Linnaeus var. *glandulosum* (Ashe) D.B. Ward. Pine flatwoods. Supposedly endemic to the FL Panhandle, probably in GA. [= *Polyodium glandulosum* Ashe; < *Vaccinium stamineum* – FNA, L, WH] [not yet keyed; synonymy incomplete]

**Vaccinium stamineum** Linnaeus var. *stamineum*, Common Deerberry. Xeric to submesic woodlands, forests, and rock outcrops (unlike most *Vaccinium*, often on mafic, ultramafic, or calcareous rocks). April-June; August-October. MA, NY, s. ON, and MO south to Panhandle FL and TX. [= Q; < *V. stamineum* var. *stamineum* – RAB; < *Vaccinium stamineum* – C, FNA, K, L, W, Y, Z; > *V. stamineum* var. *stamineum* – F, WV; > *V. stamineum* var. *interius* (Ashe) Palmer & Steyermark – F, WV; > *F. stamineum* var. *neglectum* (Small) Dean – F, WV; > *Vaccinium neglectum* (Small) Fernald – G; > *Polyodium stamineum* (Linnaeus) Greene – S, V; < *Polyodium candicans* Small – S; > *Polyodium neglectum* Small – S, V]
ERICACEAE

Vaccinium tenellum Aiton, Southern Blueberry, Small Cluster Blueberry. Sandhills, pine flatwoods, other xeric woodlands. Late March-early May; June-July. Though abundant in the Carolinas, V. tenellum is rather restricted, occurring as a common species from se. VA to c. GA, with a range extension (where it is scattered and rare) south and west to n. FL, s. AL, and se. MS. [= RAB, C, F, FNA, G, K, L, X, Y, Z; = Cyanococcus tenellus (Aiton) Small – S]

Vaccinium virgatum Aiton, Swamp Blueberry, Rabbiteye Blueberry. Pocosins and Chamaecyparis swamps, also in various drier habitats, including Turkey oak sandhills. March-April; May-June. A Southeastern Coastal Plain species, V. virgatum occurs from se. NC south to FL and west to e. TX. [= GW, K; = V. amoenum Aiton – RAB; = Cyanococcus amoenus (Aiton) Small – S; < V. corymbosum – L, WH, Z; > V. virgatum – X; > V. amoenum – X; > F. ashei Reade – X]

29. Gaylussacia Kunth 1819 (Huckleberry)

1 Leaves 0.7-2.2 cm long, serrulate, leathery, evergreen, lacking punctate glands; [section Vitis-idaea] .............................................................................................. G. brachycera

2 Leaves subcoriaceous, upper surface shining, dark green, 1.5-4 cm long; bracts of the inflorescence equal to or longer than the pedicels (5-12 mm long), persistent; sepalis, pedicels, bracts, and leaves stipitate-glandular and pubescent; [section Gaylussacia].

3 Plant < 3 dm high.

4 Corollas averaging 7.0 mm long; anthers averaging 3.7 mm long; glandular hairs on hypanthium dense, 0.3-0.5 mm long; plants usually 4-10 dm high, rarely less than 3 dm; plants of wet bottom habitats; [northeastern, south to DE, disjunct to NC and SC] ................................................................. G. bigelowiana

5 Corollas averaging 5.8 mm long; anthers averaging 3.0 mm long; glandular hairs on hypanthium moderately dense to relatively sparse, 0.2-0.3 mm long; plants occasionally up to 4 dm high; [plants of xeric to moist habitats; southeastern range, north to VA and scattered inland to n. AL, n. GA, c. TN, w. SC, w. NC, and s. WV] ........................................................................................................ G. dumosa

6 Plant 4-10 (-15 dm) tall.

7 Sessile glands on upper leaf surface absent; glandular hairs on hypanthium 1.0-1.5 mm long; [East Gulf Coastal Plain endemic, sw. GA, n. FL, s. AL, s. MS, and se. LA] ........................................................................ G. mosieri

8 Sessile glands on upper leaf surface numerous; glandular hairs on hypanthium 0.3-0.5 mm long; ranging from SC northward.

9 Corollas averaging 7.0 mm long; anthers averaging 3.7 mm long; plants of peat bogs, raised bogs, peat-based pocosins, and Atlantic white cedar-red maple swamps; [from NL (Newfoundland) to DE, and as a rare disjunct in the Coastal Plain of NC and SC] ......................................................................................................................... G. bigelowiana

10 Corollas averaging 6.0 mm long; anthers averaging 2.9 mm long; plants of montane bogs, seepage over rock, and possibly drier forests; [rare endemic of southern Appalachians of w. NC] ........................................................................................................ G. orocola

2 Leaves membranaceous to subcoriaceous, upper surface dull, yellow-green to medium-green, 2-10 cm long; bracts of the inflorescence shorter than the pedicels, early deciduous; sepalis, pedicels, bracts, and leaves with sessile glands, pubescent or not pubescent; [section Decamerium].

7 Leaves glandular on both surfaces; racemes 0.5-1.5 cm long; [section Decamerium, subsection Baccatae] ........................................................................ G. baccata

7 Leaves glandular on the lower surface only; racemes 1-5 cm long.

8 Leaves membranaceous, medium-green, with acuminate apices; [section Decamerium, subsection Ursinae] ....................... G. ursina

9 Leaves subcoriaceous, yellow-green to glaucous, with obtuse to emarginate apices; [section Decamerium, subsection Frondosae].

9 Young twigs glabrous; leaves glabrous or pubescent beneath, often glaucous; shrub to 20 dm tall; [widespread in our area] ................................................................. G. frondosa

9 Young twigs densely pubescent with short, curled hairs; leaves sparsely to densely pubescent beneath, glaucous or not; shrub to 10 dm tall; [of se. NC and southward in the Coastal Plain].

10 Larger leaves mostly 2-4 cm long and 1-2 cm wide; lower leaf surface usually strongly glaucous, sparsely pubescent, with the longest nonglandular hairs < 0.27 mm long; floral tube and calyx glaucous; shrub 2-6 (-10) dm tall ........................................... G. nana

10 Larger leaves mostly 3-6 cm long and 2-3.5 cm wide; lower leaf surface not glaucous, sparsely to densely pubescent, with the longest nonglandular hairs 0.46-0.64 mm long; floral tube and calyx not glaucous; shrub to 10 dm tall ........................................... G. tomentosa

Gaylussacia baccata (Wangenheim) K. Koch, Black Huckleberry, Crackberry. Xeric, acidic forests and woodlands, rock outcrops, to 1600m elevation. April-June; July-August. NL (Newfoundland) and QC west to ON and MB, south to se. NC, nw. SC, n. GA, AL, and MO; in GA, NC, and SC it is primarily montane in distribution, but in VA it occurs throughout the state. [= C, F, FNA, G, K, L, Q, RAB, V, W, WV, Y, Z; = Decachaena baccata (Wangenheim) Small – S]
Gaylussacia bigeloviana (Fernald) Sorrie & Weakley, Northern Dwarf Huckleberry. Peat dome pocosins (in NC and VA), sandhill seepage bogs (SC), Chamaecyparis bogs (DE), generally growing in peat, forms transitional to var. dumosa in wet pinelands and disturbed pocosins. April-June; June-October. Var. bigeloviana ranges from NL (Newfoundland) south to NJ, with forms transitional to var. dumosa as far south as VA, and disjunct in Carteret, Dare, and Pender counties, NC (in low pocosins of large peat domes with Chamaedaphne and Zenobia), in a Sandhill seepage bog in Lexington County, SC. [= FNA, Q, U; = G. dumosa (Andrews) Torrey var. bigeloviana Fernald – C, F, G, Y; < G. dumosa – GW, K, L, RAB, W, X, Z]

Gaylussacia brachycera (Michaux) A. Gray, Box Huckleberry. Dry, acidic ridgetops and upper slopes, locally forming large clones. May-June. SC. PA and DE south to e. KY and ec. TN, primarily on the Cumberland and Alleghany Plateaus; also disjunct on a steep, xeric, west-facing bluff in Durham Co. NC, where evidently native. Treatment of this species in a monotypic genus may be warranted, but the genus name Buxella (as used by Small) is unavailable, as it had already been used prior to Small in a different application (Wilbur & Bloodworth 2004). [= C, F, FNA, G, K, L, Q, W, WV, Y, Z; = Buxella brachycera (Michaux) Small – S (but Buxella is preoccupied); = Vaccinium brachycerum (Michaux) Small – S; note that the report in RAB is based on a misidentification]

Gaylussacia dumosa (Andrews) Torrey & A. Gray, Southern Dwarf Huckleberry. Xeric to mesic, acidic forests and woodlands. March-June; June-October. This variety is one of the most common shrubs of the Southeastern Coastal Plain, with an overall range from NJ south to FL and west to e. LA, primarily in the Coastal Plain, less commonly inland (as in sc. TN and se. WV). [= FNA, Q, U; = G. dumosa (Andrews) Torrey var. dumosa – C, F, G, Y; < G. dumosa – GW, K, L, RAB, V, W, WH, WV, X, Z; = Lasiococcus dumosus (Andrews) Small – S]

Gaylussacia frondosa (Linnaeus) Torrey & A. Gray ex Torrey, Dangleberry. Mesic, acidic woodlands, especially in sandhill-pocosin and savanna-pocosin ecotones, also in xeric chestnut oak forests in the lower Piedmont. Late March-May; June-August. Primarily a Southeastern Coastal Plain species: s. NH south to s. SC, less commonly inland to w. NY, c. and w. PA, w. VA, and w. SC. [= C, F, FNA, G, K, L, Q, W, V; = G. frondosa var. frondosa – GW, RAB, X, Y, Z; = Decachaena frondosa (Linnaeus) Torrey & Gray – S]

Gaylussacia mosieri Small, Mosier's Huckleberry, Hirsute Huckleberry. Savannas and seepages. S. GA and Panhandle FL and west to e. LA. Material from Lexington County, SC originally identified as this taxon has been reassigned to G. bigeloviana. [= FNA, GW, K, L, Q, U; V, X, Y, Z; = Lasiococcus mosieri (Small) Small – S]

Gaylussacia nana (A. Gray) Small, Dwarf Dangleberry. Xeric sandhills. Se. SC (Beaufort County) south to n. and c. FL peninsula, FL Panhandle, and west to e. LA (Florida prishes); disjunct in se. NC (New Hanover County) (Sorrie & LeBlond 2008). This species is disjunct at several sites in xeric sandhills of se. NC (on the Carolina Beach peninsula and the 421 peninsula, FL Panhandle, and west to e. LA). Material from Lexington County, SC originally identified as this taxon has been reassigned to G. bigeloviana. [= FNA, K, L, Q, V, Y; = G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. nana A. Gray – GW, X, Y; = Decachaena nana (A. Gray) Small – S; = G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. tomentosa A. Gray – WH]

Gaylussacia orocola (Small) Camp, Blue Ridge Bog Huckleberry. Bogs, seepages over granite. Endemic to the sw. NC mountains. The montane plants named Lasiococcus orocola by Small are probably most closely allied to northern G bigeloviana, and occur with other notable northern disjuncts, such as Myrica gale and Chamaedaphne calyculata (often associated with var. G. bigeloviana in northern peat bogs); they differ in several respects, however, and are here given taxonomic standing (Sorrie & Weakley 2007a). [= FNA, Q, U, Y, Z; < G. dumosa – RAB, GW, K, L, W, X; = Lasiococcus orocola (Small) Small – S]

Gaylussacia tomentosa (A. Gray) Pursh ex Small, Hairy Dangleberry. Pine flatwoods, sandhills, xeric coastal fringe sandhills. March-May; June-August. Se. SC (spodosolic flatwoods in Beaufort County) south to e. southern FL, west to s. GA and sw. AL. As discussed by Godfrey (1988) and Duncan & Brittain (1966), probably better treated as a species than as a variety of G. frondosa. G. tomentosa has a tetraploid chromosome complement (n=24), compared to diploid for G. nana and G. frondosa (n=12) (Luteyn et al. 1996). [= FNA, K, L, Q, V, Y; = G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. tomentosa A. Gray – GW, RAB, X, Z; = Decachaena tomentosa (Pursh ex Small) Small – S; < G. frondosa (Linnaeus) Torrey & A. Gray ex Torrey var. tomentosa A. Gray – WH]

Gaylussacia ursina (M.A. Curtis) Torrey & A. Gray ex A. Gray, Bear Huckleberry, Mountain Huckleberry. Mesic to xeric forests, frequently dominant, but limited to areas southwest of the Asheville Basin; common. May-June; July-September. A narrow Southern Appalachian endemic: sw. NC, nw. SC, ne. GA, and se. TN; disjunct at Cumberland Gap National Historic Park, Bell County, KY. On mountain slopes and summits in that area it is often the dominant shrub, forming large clonal patches. [= FNA, K, L, Q, RAB, V, W, Y, Z; = Decachaena ursina (M.A. Curtis) Small – S]
**349. GARRYACEAE** Lindley 1834 (Garrya Family) [in GARRYALES]

Garryaceae is here circumscribed to include *Aucuba* (Bremer et al. 2002). References: Bremer et al. (2002)

*Aucuba* Thunberg (Aucuba, Japanese-laurel)

* Aucuba japonica* Thunberg, Aucuba, Japanese-laurel, Spotted-laurel. Pd (NC): commonly planted throughout our area, rarely escaping and naturalizing in suburban woodlands; rare, native of Japan and se. Asia. The most frequently planted cultivars have the dark green leaves prominently speckled with yellow. [= K]

**350. RUBIACEAE** A.L. de Jussieu 1789 (Madder Family) [in GENTIANALES]

A family of about 630-650 genera and 10,200-13,000 species, trees, shrubs, vines, and rarely herbs, cosmopolitan, but especially diverse in tropical and subtropical areas. References: Rogers (1987, 2005).

1 Trees, shrubs, or woody vines.
2 Woody vine; corolla lilac; [alien]; [subfamily *Rubioideae*; tribe *Paederieae*] ................................................................. *Paederia*
2 Shrub or tree; corolla white, green, or maroon; [native].
3 Inflorescence spherical; [widespread in our area]; [subfamily *Cinchonoideae*; tribe *Naucleae*] ........................................... *Cephalanthus*
3 Inflorescence cymose or thyrsoid; [in the Coastal Plain, from s. SC southward].
4 Inflorescence cymose; some calyx lobes expanded into pink or reddish “flags”; leaves deciduous; domatia not present; [of s. SC southward] .......................................................................................................................................................... *Pinckneya*
4 Inflorescences thyrsoid; calyx lobes inconspicuous; leaves evergreen; domatia present in secondary vein axils; [of ne. FL southward]
5 Lateral veins 3-6 on either side of the midvein; fruit white; flowers yellowish, > 6 mm long; [subfamily *Cinchonoideae*; tribe *Chiococca*] ......................................................................................................................................................... *Chiococca*
5 Lateral veins 8-14 on either side of the midvein; fruit red; flowers white, <5 mm long; [subfamily *Rubioideae*; tribe Psychotrieae].
6 Herbs (or creeping subshrubs in *Mitchella*).
6 Leaves opposite
10 Flowers single or in inflorescences with multiple flowers, the fruits either dry or fleshy and yellowish or black; leaves various; [subfamily *Rubioideae*; tribe *Spermacoeae*].
11 Carpels with few to many seeds.
12 Corolla 5-lobed ......................................................................................................................................................... *Pentodon*
12 Corolla 4-lobed.
13 Capsule longer than the calyx tube flowers blue, pink, or white ...................................................................................... *Houstonia*
13 Capsule not longer than the calyx tube; flowers white .................................................................................................. *Oldenlandia*
11 Carpels 1-seeded.
14 Flowers in dense, terminal, involucrate heads; flowers 4- or 6-lobed; styles 3 ................................................................. *Richardia*
14 Flowers in axillary or terminal clusters, or single in axis, not involucrate; flowers 4-lobed; styles 2.
15 Flowers usually solitary in leaf axils; fruit separating into 2 parts ...................................................................................... *Diodia*
15 Flowers in terminal and axillary clusters; fruits not separating into 2 parts.
16 Carpels opening transversely ................................................................................................................................. *Mitracarpus*
16 Carpels opening longitudinally ........................................................................................................................................ *Spermacarpus*

**Cephalanthus** Linnaeus (Buttonbush)

in North America, and south into Mexico, Guatemala, and Honduras. \cite{Rogers2005, Coccidia, Diodella}

**Chiococca** P. Browne 1759

A genus of about 30 species, of FL and the West Indies south to s. South America. References: Rogers (2005).

**Chiococca alba** (Linnaeus) A.S. Hitchcock, Snowberry, Milkberry. Cp (FL): coastal hammocks, shell middens; rare. N. FL (St. Johns and Dixie counties) south to s. FL. \cite{K, S, WH}

**Diodia** Linnaeus

**Diodia teres** Walter, Poorjoe. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dunes, sandy roadsides, glades, other dry habitats; common. June-December. MA, NY and WI, south to FL, TX, and CA, south through Mexico and Central America. \cite{RAB, C, GW, W, WV, K}

**Diodia virginiana** (Linnaeus) A.S. Hitchcock, Snowberry, Milkberry. \cite{Fernald, Griscom}

**Galium** Linnaeus 1753 (Bedstraws, Cleavers, Woodruff)

A genus of ca. 500 species, herbs, cosmopolitan. Here circumscribed to include *Asperula*, *Cruciata*, and *Sherardia*, following an analysis by Soza & Olmstead (2010) that shows the genera *Galium*, *Cruciata*, and *Sherardia* each to be paraphyletic relative to one another, if circumscribed as traditionally. Other solutions are possible, including the dispersal of *Galium* into two or more genera. Interestingly, the number of leaves per whorl appears to be a more fundamental character than those (such as tubular corollas) used to separate genera in the past. References: Soza & Olmstead (2010); Puff (1976, 1977)=Z; Lipscomb & Nesom (2007)=Y; Rogers (2005); Densmore (1978, 1981).

**Key A** – Bedstraws with leaves mostly in whorls of 4 (rarely a few in whorls of 5-6)

1. Flowers yellow; plant an annual, 0.5-3 dm tall.----------------------------------------------- *G. pedemontanum*
2. Flowers white, creamy, greenish-purple, maroon, or purple; plant a perennial, 1-8 dm tall.
3. Flowers solitary, sessile or sub sessile in the leaf axils; leaves 4-10 mm long.
4. Flowers on pedicels, usually in complex inflorescences; leaves >10 mm long.
5. Larger leaves 6-25 mm wide, mostly 1.5-4\* as long as wide; fruits uncinate-hispid (except smooth in *G. latifolium*); flowers greenish or purplish.
6. Larger leaves 4-8 cm long, 1-2 cm wide, widest below the middle, tapering to a long-acuminate apex, averaging about 3-4\* as long as wide.
7. Larger leaves 8-15 cm, 0.6-2.5 cm wide, widest at about the middle, tapering to an obtuse (or broadly acute) apex, averaging about 2\* as long as wide.
8. Flowers (some of them) sessile or sub sessile along the inflorescence branches; leaves 1.5-5 cm long, the larger usually > 2.5 cm long, not punctate.
9. Lower leaf surface glabrous or sparsely short-hispid on the veins; larger leaves 1.5-2.5 (-4.0) cm long and 0.7-1.4 (-1.8) cm wide; [more southern]----------------------------------------------- *G. circaeans var. circaeans*
10. Lower leaf surface appressed-pilose, long-hisrate on the veins; larger leaves 2-5 cm long, 1-2.5 cm wide; [more northern]----------------------------------------------- *G. circaeans var. hypomalacum*

**Galium** Linnaeus 1753 (Bedstraws, Cleavers, Woodruff)

A genus of ca. 500 species, herbs, cosmopolitan. Here circumscribed to include *Asperula*, *Cruciata*, and *Sherardia*, following an analysis by Soza & Olmstead (2010) that shows the genera *Galium*, *Cruciata*, and *Sherardia* each to be paraphyletic relative to one another, if circumscribed as traditionally. Other solutions are possible, including the dispersal of *Galium* into two or more genera. Interestingly, the number of leaves per whorl appears to be a more fundamental character than those (such as tubular corollas) used to separate genera in the past. References: Soza & Olmstead (2010); Puff (1976, 1977)=Z; Lipscomb & Nesom (2007)=Y; Rogers (2005); Densmore (1978, 1981).

**Key A** – Bedstraws with leaves mostly in whorls of 4 (rarely a few in whorls of 5-6)

1. Flowers yellow; plant an annual, 0.5-3 dm tall.----------------------------------------------- *G. pedemontanum*
2. Flowers white, creamy, greenish-purple, maroon, or purple; plant a perennial, 1-8 dm tall.
3. Flowers solitary, sessile or sub sessile in the leaf axils; leaves 4-10 mm long.

Key B – Bedstraws with leaves mostly 6 per node (ranging from 4-8)

1. Flowers in axillary or terminal diffuse inflorescences, not subtended by an involucre; stems either smooth, retrorse-scabrid, or pubescent.

2. Largest leaves < 10 mm long; fruits 0.7-1 mm across; annual; [alien]; [clade III].

3. Inflorescence relatively diffuse, branches divaricate; ultimate fruits (2-) 3-6 (-7) nodes beyond primary stem axis (with largest leaves); first inflorescence internode (beyond primary stem axis) 15-50 mm long; fruit surface glabrous (without hairs). …………………………………………...G. obtusum var. filifolium

4. Fruit surface without hairs, smooth to shallowly papillate. …………………………………………...G. anglicum

5. Fruit surface bristly-hispid with uncinate-tipped hairs, distinctly papillate. …………………………………………...G. parisienne

6. Largest leaves > 10 mm long; fruits 1-2.5 mm across; perennial; [native].

7. Fruits and ovaries glabrous or papillate; leaves 5-25 mm long, 1-6 mm wide. …………………………………………...G. triflorum

8. Corolla 1.5-2.5 mm across, 3-lobed; [collectively widespread in our area]; [clade V].

9. Fruiting pedicels (4-) 5-8 (-12) mm long; pairs of fruits (3-) 3.5-5 mm across at maturity; leaves 2-3 (-4) mm wide……….

10. Fruiting pedicels (4-) 5-8 (-12) mm long; pairs of fruits (3-) 3.5-5 mm across at maturity; leaves 1.5-2-2.5 (-2.8) mm wide……

Key C – Bedstraws with leaves mostly 8 or more per node (ranging from 5-12)

1. Leaves 8-12 per whorl (many whorls with > 8 leaves); flowers bright yellow, in a large showy terminal compound inflorescence; fruits glabrous; perennial.

2. Stems and leaves pubescent with spreading, straight hairs; [more northern]; …………………………………………...G. pilosum

3. Leaf margins antrorsely ciliate-scabrid; leaves 4-8× as long as wide; [plants of dry forests and woodlands]. …………………………………………...G. asprellum

4. Leaf margins antrosely ciliate-scabrid; leaves 4-8× as long as wide; [plants of dry forests and woodlands]. …………………………………………...G. odoratum

5. Leaves sharply acute or cuspidate; corolla 2.5-3 mm across……….

6. Leaves rounded, obtuse, or barely acute; corolla ca. 4 mm across. …………………………………………...G. palustre

[Image of Galium anglicum]

Galium circaezans Michaux var. hypomalacum Fernald, Northern Forest Bedstraw. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE), {GA?, SC?): moist forests; common. April-July. QC west to MN and NE, south to VA, w. NC, KY, MO, and TX (?). The varieties need additional study. [= C, F, G, K, WV; < G. circaezans – RAB, S, W]

* Galium divaricatum Pourret ex Lamarck. Disturbed areas; native of s. Europe. June-July. [= Y; < G. parisiense var. leiocarpum Tausch – C; < G. parisiense Linnaeus – F, G, S; < G. divaricatum – K; = G. parisiense var. divaricatum (Pourret ex Lamarck) Koch; = G. anglicum var. divaricatum (Pourret ex Lamarck) Reichenbach; = G. parisiense ssp. divaricatum (Pourret ex Lamarck) Rouy] [add to synonymy]

* **Galium odoratum** (Scopoli) Scopoli, Sweet Woodruff, Waldmeister.  Mt (NC, VA), Pd (DE, NC, VA): commonly cultivated, rarely escaped or persistent, native of Europe.  May.  Used fresh as a flavoring for May-wine.  [= C, K; = Asperula odorata Linnaeus – F, G]

* **Galium palustre** Linnaeus, Marsh Bedstraw, Ditch Bedstraw.  Mt (WV): marshes, wet soil; rare.  June-August.  NL (Labrador) and ON south to MD, s. PA (Rhoads & Klein 1993), MD, WV, OH, IN, and IL; also in Europe and nw. North America.  [= C, F, G, K]

* **Galium parisiense** Linnaeus.  Disturbed areas; native of s., w., and c. Europe.  June-July.  [= K, Y; = G. parisiense ssp. parisiense]  [add to synonymy]

Galium parisiense

* **Galium tincturium** (Linnaeus) Scopoli var. floridanum Wiegand, Florida Three-lobed Bedstraw.  Cp (GA, NC, SC, VA), Mt (NC, SC, VA), Pd (NC, SC): swamps, marshes, and ditches; common (VA Watch List).  April-June.  MA south to FL, west to e. TX, mostly on the Coastal Plain, but extending inland to w. VA, w. NC, se. KY, s. IL, and se. MO.  See Puff (1976) for additional information.  [= F; < G. tincturium – RAB, C, K, W; = G. obtusum var. floridanum (Wiegand) Fernald – G; < G. claytonii Michaux – S; = G. tincturium ssp. floridanum (Wiegand) Puff – Z]

* **Galium tricornutum** Dandy, Small Bedstraw.  Pd (GA, SC): disturbed areas; rare, introduced.  This species has been reported from Cherokee and Greenwood counties, near GA, and se. PA (Rhoads & Klein 1993).  [= K; < G. tricorne Stokes – F]

* Galium verum Linnaeus, Yellow Bedstraw. Our Lady's Bedstraw. Mt (NC, VA, WV), Pd (DE, VA): meadows, pastures, roadsides; uncommon (rare in DE and NC), native of Europe. May-September. [= C, F, G, K1; = G. verum var. verum – K2; < G. verum – RAB, W, WH (also see G. wirtgenii)]

Galium virgatum Nuttall, Ozark Bedstraw. Cp (GA, SC*): (in GA) open blackland prairies, (in SC) waif around wool-combing mill; rare. Native from TN, c. GA (Houston County), and AL west to KS, OK, and TX. [= C, F, G, K; > G. virgatum var. leiocarpum Torrey & A. Gray – S; > G. virgatum var. virgatum – S]

* Galium arvense (Linnaeus) F. Hermann, Blue Woodruff. Pd (DE), Mt (WV): disturbed areas, rare, native of Europe. Naturalized south to WV, MD, DE (USDA NRCS 1997), and se. PA (Rhoads & Klein 1993). [= Asperula arvensis Linnaeus C, G, K, WV] [not yet keyed]

* Galium wirtgenii F.W. Schultz, Yellow Bedstraw. Not definitely known from our area, but likely to be present. [= C, F, G, K1; = G. verum var. wirtgenii (F.W. Schultz) Oborny – K2; < G. verum – W]

Houstonia Linnaeus 1753 (Bluet)

**Identification notes:** In the key below, all leaf measurements and length/width ratios are based on median cauleine leaves.

1 Flowers solitary on terminal (rarely axillary) pedicels (2-) 6-50 (-70) mm long; corolla salverform; leaves 2-15 mm long; [subgenus *combing mill*; rare. Native from TN, c. GA (Houston County), and AL west to KS, OK, and TX. [= C, F, G, K, WV] {not yet keyed}

2 Stems prostrate and creeping.
3 Corolla white (rarely pale lavender); capsule (2.3-) 3.0-6.3 mm across; leaves 2-13 mm wide; pedicels usually single, 2-25 mm long; flowers chasmogamous and cleistogamous (the cleistogamous borne underground); [of the outer Coastal Plain]; [section *Muliera*] ................................................................. **H. procumbens**

4 Corolla blue (rarely white); capsule 2.5-5.0 mm across; leaves 0.5-7 mm wide; pedicels single or paired, to 60 mm long; flowers all chasmogamous and aerial; [of the Mountains]; [section *Houstonia*] ............................................................................................................................................. **H. serpyllifolia**

5 Stems erect or spreading.
6 Stems 1-4 (-7) cm tall; leaves mostly obovate, 0.3-3.0 mm wide; corolla 5-12 mm long, white to pale pink; seeds with a hilar ridge in an elliptical depression; [section *Muliera*] ................................................................. **H. rosea**

7 Stems 1-2 cm tall; leaves elliptic, ovate or spatulate, 0.3-9.0 mm wide (at least some on a plant generally > 3 mm wide); corolla 2-21 mm long, purple, pale blue, pink, or white; seeds subglobose with a ventral cavity; [section *Houstonia*]

8 Plants perennial, with a well-developed, persistent basal rosette; corolla 5.8-16 (-21) mm long, the tube (2-) 4-11 (-12) mm long........... **H. caerulea**

9 Plants annual, with at most a few short-lived basal leaves; corolla 2-10 (-12) mm long, the tube 0.8-5.5 mm long.
10 Calyx lobes 4-7 mm long; leaves mostly lanceolate (varying from narrowly lanceolate to broadly ovate), 17-33 mm long, 4-10 mm wide for most of their lengths; calyx lobes 0.5-3 mm long.
11 Corollas deep purple, 8-12 mm long; leaves 8-20 (-30) mm long, 3-8 (-13) mm wide; stems glabrous (or slightly short-pubescent on the lower nodes only); median internodes 0.5-4.5 cm long; leaves entirely glabrous or with pubescence ciliate on the leaf margin, on the midrib, and scattered on the surface; [of various habitats, widely distributed] ............................................ **H. nigricans var. nigricans**

12 Leaves linear to narrowly elliptic, 4-20+ as long as wide, 0.5-6 mm wide, widest at the middle or near the apex or nearly equally wide for most of their lengths; calyx lobes 0.5-3 mm long.
Houstonia caerulea
Linnaeus, Quaker Ladies, Innocence, Common Bluet. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): forests, woodlands, openings, lawns, a wide variety of disturbed sites; common. April-July; May-August. This species is widespread in e. North America. The flowers of this species and the H. serpyllifolia are very similar, H. caerulea is a somewhat duller blue. [= RAB, G, K, S, W, WV, X, Y; = Houstonia caerulea var. caerulea – F; = Hedysotis caerulea (Linnaeus) Hooker – C, GW; < Hedysotis caerulea – Q]

Houstonia canadensis
Willdenow ex Roemer & J.A. Schultes, Canada Bluet. Mt (GA, WA, WV): dry limestone barrens, locally abundant in shallow soils over limestone; rare (VA Rare). April-August. ME and s. ON west to MN, south to sw. VA, se. and c. TN, nw. GA, and AR. Terrell (1959) determined that Houstonia setiscaphia (allegedly a narrow endemic of sw. VA) fell within the range of variation of southern populations of H. canadensis. Further study is perhaps warranted. [= G, K, W, WV, X, Y, Z; = Hedysotis canadensis (Willdenow ex Roemer & J.A. Schultes) Fosberg – C, Q; > Houstonia longifolia var. longifolia – Y; = Houstonia setiscaphia L.G. Carr – F; > Houstonia setiscaphia var. setiscaphia (L.G. Carr) C.F. Reed]

Houstonia longifolia Gaertner var. compacta
Terrell, Eastern Longleaf Bluet. Mt (GA, NC, WA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): dry rock outcrops and adjacent open woodlands, dry sandy woodlands, dry roadbanks, glades and barrens; uncommon. Early June-August; September-October. Var. compacta is centered in the central Appalachians of VA, WV, e. KY, and se. OH, with extensions north to VT, west into n. IL, and south in the Piedmont and adjacent Coastal Plain to SC, GA, and Panhandle FL. The typic variety is more northern, apparently reaching its southern limit in IN, not reaching our area. [= WV, Z; < Houstonia longifolia – RAB, C, F, G, S, W; < Hedysotis longifolia (Gaertner) Hooker – C, Q, WH; < Houstonia longifolia var. longifolia – Y; = Appalachian Group – X; < Houstonia longifolia – K (also see H. tenuifolia)]

Houstonia longifolia Gaertner var. glabra
Terrell, Granite Dome Bluet. Mt (GA, NC, SC): seasonally and periodically wet soils of shallow soil mats and crevices of granitic domes; rare. June-August; September-October. Var. glabra is endemic to the granitic dome district centered around Highlands, NC, occurring in sw. NC, nw. SC, and ne. GA. Terrell (1959) says "the lower internodes [are often] so smooth they appear to have been polished," and gives an altitudinal range of 850-1750 m. Although the morphological differences between var. glabra and var. compacta are not great, the combination of distinctive morphology correlated with a distinct habitat and a disjunct range seem to warrant recognition at the varietal level. [= Z; < Houstonia longifolia – RAB, S, W; < Hedysotis longifolia (Gaertner) Hooker – C, Q; > Houstonia longifolia var. longifolia – Y; = Houstonia longifolia – K (also see H. tenuifolia)]

Houstonia micrantha (Shinners) Terrell. Cp (FL, GA), Pd (GA): dunes, sandy soils, granitic flatrocks; uncommon (rare in FL and GA). February-April. E. and c. GA west to sw. TN, nw. AR, south to w. FL Panhandle, s. MS, s. LA, and e. TX. [= K, X; = Hedysotis australis W.H. Lewis & D.M. Moore – Q; = Houstonia pusilla – S, misapplied]

Houstonia montana Small, Roan Mountain Bluet. Mt (NC): in crevices of rock outcrops at the summits of high elevation peaks of the Southern Blue Ridge, also in thin, frost-heaved, gravelly soils of grassy balds near summit outcrops, from 1250-1950 m in elevation; rare. June-July; July-August. This species is endemic to the high Blue Ridge of nw. NC and ne. TN, most notably occurring on Roan Mountain, Grandfather Mountain, Bluff Mountain, and Three Top Mountain. It was first noted by Asa Gray in 1841, who described it as "a remarkable dwarfish form." There has been debate over whether it is not indeed merely a weather-induced form, but recent studies show that it is distinct. In addition to the characters given above in the key, H. montana also differs from H. purpurea in having larger calyx lobes, corolla, capsules, and seeds. See Terrell (1959), Yelton (1974), and Terrell (1978) for further discussion. [= S, W; < Houstonia purpurea – RAB; = Houstonia purpurea Linnaeus var. montana (Small) Terrell – K, X, Y, Z; < Hedysotis purpurea – Q; = Hedysotis purpurea (Linnaeus) Torrey & A. Gray var. montana (Small) Fosberg]

Houstonia nigricans (Lamarck) Fernand var. nigricans, Diamond-flower. Mt (VA), Cp (GA): limestone barrens dominated by Andropogon gerardii, blackland prairies; rare. Sw. VA (Ludwig 1999), s. MI, IA, NE, and e. CO, south to s. FL, TX, e. NM, and along the Sierra Madre Oriental to Hidalgo, Mexico. This species has been variously placed in Houstonia, Hedysotis, and Stenaria. Based primarily on seed characters and chromosome numbers, Terrell (2001) has concluded that this taxon is not congeneric with the Sri Lankan type of the genus Hedysotis, and is also not a Houstonia, so has published the new genus Stenaria for Hedysotis nigricans and its close relatives. Church (2003) considers Stenaria congeneric with Houstonia, based on molecular phylogeny. The resolution of generic limits in this group is still unresolved. As interpreted by Terrell (1991, 2001) and Turner (1995b), Houstonia nigricans is a polymorphic species, with Houstonia nigricans var. nigricans as a widespread "matrix variety," and other, much more local varieties warranting recognition. Turner (1995b) reports Houstonia nigricans var. nigricans (as Hedysotis nigricans var. nigricans) from Pickens County, SC; the documentation is not known to me, and suitable habitats there are unlikely. [= Hedysotis nigricans (Lamarck) Fosberg var. nigricans – K, U, Y; = Stenaria nigricans (Lamarck) Terrell var. nigricans – M; < Hedysotis nigricans – C, Q; < Houstonia nigricans (Lamarck) Fernand – F, G; > Houstonia angustifolia Michaux – S; > Houstonia filifolia (Chapman) Small – S; < Stenaria nigricans (Lamarck) Terrell var. nigricans – WH]

Houstonia procumbens (Walter ex J.F. Gmelin) Standley, Creeping Bluet, Fairy-footprints, Roundleaf Bluet. Cp (FL, GA, SC): beach dunes, moist to wet sandy pinelands; common. October-April. Se. SC south to s. FL, west to se. L.A. Gaddy &
Rayner (1980) note that this plant is fairly common on SC barrier islands, but flowers in the winter and is easily overlooked in other seasons (when botanists are more likely to be afield). See Wilbur (1968) and Ward (2004c) for differing opinions about the merits of the taxonomic recognition of the glabrous and pubescent plants. [= RAB, K, S, WH, X, Y; = Hedyotis procumbens (Walter ex J.F. Gmelin) Fosberg – Q; = Houstonia rotundifolia Michaux; > Houstonia procumbens var. procumbens – V; > Houstonia procumbens var. hirsuta (W.H. Lewis) D. B. Ward – V]

**Houstonia purpurea** Linnaeus var. calycosa Shuttleworth ex A. Gray, Midwestern Summer Bluet. Mt (GA, NC, WV): dry woodlands, banks, rock outcrops, shallow soils around mafic and calcareous rock outcrops; rare. May-July; July-August. The distribution and ecology of *calycosa* in our area are poorly known; it apparently occupies drier and typically more circumneutral sites than var. *purpurea*. Var. *calycosa* ranges from s. ME and w. NY west to s. OH, and sw. MO, south to w. NC, n. GA, AL, MS, AR, and e. OK. [= G, K, WV, X, Y, Z; < Houstonia purpurea – RAB, W; = Hedyotis purpurea (Linnaeus) Torrey & A. Gray – C, Q; = Houstonia lanceolata (Poiret) Britton – F, S; = Hedyotis purpurea (Linnaeus) Torrey & A. Gray var. calycosa (Shuttleworth ex A. Gray) Fosberg]

**Houstonia purpurea** Linnaeus var. purpurea, Summer Bluet. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): moist and dry woodlands and forests, roadbanks, thinner soils around rock outcrops, a variety of disturbed sites; common (rare in Coastal Plain, rare in DE Piedmont). May-July; July-August. Var. *purpurea* ranges from DE, MD, and s. PA west to s. OH, s. IL, and sw. MO south to SC, sw. GA, Panhandle FL, MS, s. LA, e. TX, and e. OK. Plants growing in high elevation and exposed sites are sometimes dwarfed, and in that respect only, superficially resemble *H. montana*. [= G, K, WV, X, Y, Z; < Houstonia purpurea – RAB, W, WH; = Houstonia purpurea – F, S; < Hedyotis purpurea (Linnaeus) Torrey & A. Gray – C, Q; = Hedyotis purpurea (Linnaeus) Torrey & A. Gray var. purpurea]

**Houstonia pusilla** Schoepf, Tiny Bluet. Pd (GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA), Mt (GA, NC): woodlands, lawns, cemeteries, and other disturbed sites; common (uncommon in FL, rare in DE). March-April. MD south to Panhandle FL, west to TX, and inland from IL west to NE, south to TN and TX. [= RAB, G, K, S, W, WH, X, Y; = Houstonia patens Elliott – F; = Hedyotis crassifolia Rafinesque – C, GW; < Hedyotis caerulea (Linnaeus) Hooker – Q; = Houstonia minima L.C. Beck – S]

**Houstonia rosea** (Rafinesque) Terrell, Rose Bluet. {habitats}. AL west to TX and OK. [= K; = Hedyotis rosea Rafinesque} [synonymy incomplete!]

**Houstonia serpyllifolia** Michaux, Appalachian Bluet, Thyme-leaf Bluet. Mt (GA, NC, SC, VA, WV): streambanks, grassy balds, moist forests, seepy rock outcrops, spray cliffs, and moist disturbed areas; common (uncommon in GA, VA, and WV). (March-) May-June. A Southern and Central Appalachian endemic: PA south to nw. SC and ne. GA. The flowers are very similar to, but usually a brighter blue than, the more widespread *H. caerulea*. [= RAB, F, G, K, S, W, WV, X, Y; = Hedyotis michauxii Fosberg – C, GW, Q]

**Houstonia tenuifolia** Nuttall, Diffuse-branched Bluet. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (NC, SC, VA): usually in dry woodlands, often rocky (especially mafic rocks) or sandy; uncommon (rare in Coastal Plain). May-July; July-October. This species is centered in the Southern Appalachians and the Ozarks, extending into provinces adjacent to both areas of concentration, ranging overall from PA west to MO and OK, south to SC, GA, and TX. [= RAB, G, K, S, W, WV, Z; = Hedyotis nuttalliana Fosberg – C; < Hedyotis longifolia (Gaertner) Hooker – Q; = Houstonia longifolia var. tenuifolia (Nuttall) Wood; = Houstonia longifolia, "Tenuifolia Group" – X; < Houstonia longifolia – K]

**Mitchella** Linnaeus (Partridge-berry)

A genus of 2 species, perennials, ours and 1 in e. Asia. References: Rogers (2005)=Z.

**Mitchella repens** Linnaeus, Partridge-berry. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): deciduous and coniferous forests, stream-banks, heath balds, maritime forests, on rotten logs; common. May-June; June-July. NS west to MN, south to c. peninsular FL and TX; disjunct in Guatemala. Plants in maritime forests are more robust than others and often have an ascending habit, the stems sometimes 20-30 cm tall. [= RAB, C, F, G, GW, K, S, W, WH, ZWV, ]

**Mitracarpus** Zuccarini (Girdle-pod)

**Oldenlandia** Linnaeus (Oldenlandia)

1 Creeping, mat-forming perennial, rooting at nodes; leaves 1.5-5.2 mm long; flowers solitary on slender axillary pedicels; seeds 4-14 per capsule. .................................................................................................................................................................................................

Oldenlandia uniflora Linnaeus, Oldenlandia. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): pondshores, muddy drawdown shores, moist to wet ecotones of Coastal Plain streamheads, other moist to wet places; common (uncommon north of FL, rare in Piedmont). August-October. Mostly a species of the Southeastern Coastal Plain: NY (Long Island) south to s. FL and west to TX, north in the interior to MO. [= RAB, G, K, S, WH, X; = Hedyotis uniflora (Linnaeus) Lamarck – C, F, GW, Y]

Paederia Linnaeus (Skunk-vine)

Pentodon Hochstetter in Krauss 1844

1 Leaves larger, spreading or ascending.
2 Stems hirsute, generally densely and evenly so from tip to base; adaxial leaf surface evenly strigose; mericarps conspicuously and densely hispidulous to strigose, the adaxial face broad, with a pronounced median keel; perennial from a woody rhizome (or annual) .................................................................

1 Mericarps either conspicuously and densely hispidulous to strigose or pilose to puberulous; corolla 6-lobed; [section Richardia].
2 Stems hirsute or villous near the tips, but progressively more sparsely so to glabrate toward the base; adaxial leaf surface glabrous to strigillose near the margins only, the median portion of the leaf blade glabrous; mericarps pilose to puberulous, the adaxial surface closed to a narrow groove; annual.

3 Corolla (8-12) 20-25 (mm) mm long, pink to lilac; mericarp papillae blunt and rounded; [FL Peninsula only] ...................... [R. grandiflora] ..............................
3 Corolla (2.5-) 5-7 (10-15) mm long, white (sometimes with the lobes pale pink or lilac); mericarp papillae acute; [widespread] ......................

..............................R. brasiliensis

..............................R. humistrata

..............................R. scabra

Richardia humistrata (Chamisso & Schlechtendahl) J.A. & J.H. Schultes. Cp (FL) [AL, MS]: disturbed areas, savannas, pine flatwoods; rare, native of South America. Also collected in 1886 as a ballast waif in Camden County, NJ; first noted on the Gulf Coast only in 1941, but perhaps early introduced there on ballast as well, such as at Pensacola. [= K, WH, Z]

Richardia scabra Linnaeus. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): roadways, fields, vacant lots, urban areas, disturbed areas; common, native of South America. June-December. Lewis & Oliver (1974) consider this species to be native from our area south through Central America into northern South America, based on the semi-contiguous distribution, but occurrences in our region seem to be in altered habitats. [= RAB, C, F, G, K, S, WH, Z]

Richardia grandiflora (Chamisso & Schlechtendahl) J.A. & J.H. Schultes, Largeflower Richardia. Cp (FL): disturbed areas; rare, native of South America (mainly Brazil). Reported for Alachua County, immediately south of our area (Kunzer et al. 2009), and “rapidly spreading.” [= K, WH, Z]

Spermacoce Linnaeus (Buttonweed)

A genus of about 50 species, herbs, of tropical and warm-temperate Old and New World. References: Rogers (2005).

1 Calyx with 2 long lobes, the other 2 absent or vestigial ................................................................. S. densiflora
1 Calyx with 4 lobes of nearly equal length.
2 Calyx lobes with a conspicuous white margin .............................................................................. S. prostrata
2 Calyx lobes green throughout.
3 Fruit pubescent ......................................................................................................................... S. assurgens
3 Fruit glabrous .......................................................................................................................... S. glabra

* Spermacoce densiflora (deCandolle) Alain. Cp (FL): disturbed areas; rare, native of the Neotropics. [= K, WH; = Borreria densiflora deCandolle] [add to synonymy]

Spermacoce glabra Michaux, Smooth Buttonweed. Mt (VA, WV), Cp (FL, GA, SC*, VA*): rocky riversides in the mountains, disturbed areas in the Coastal Plain; rare (GA Rare). Perhaps only introduced in at least some parts of our area; see Wieboldt et al. (1998) for discussion. [= RAB, C, F, G, GW, K, S, WH]

Spermacoce prostrata Aublet. Cp (FL): wet pine flatwoods, floodplain forests; uncommon. FL, AL, MS, south through the New World tropics. July-September. [= K, WH; = Borreria ocimoides (Burnmann) de Candolle – S, misapplied] [add to synonymy]

Spermacoce tenuior Linnaeus, reported from sw. GA (Kartesz 1999). [ID needs checking] [= K; ? S. riparia Chamisso & Schlechtendahl] [not yet keyed; add to synonymy]

351. GENTIANACEAE A.L. de Jussieu 1789 (Gentian Family) [in GENTIANALES]

A family of about 87 genera and over 1600 species, herbs, shrubs, and trees, cosmopolitan (Struwe & Albert 2002). References: Wood & Weaver (1982), Struve & Albert (2002). [also see MENYANTHACEAE]

1 Leaves all scale-like, 1-3 (-5) mm long, pressed to the stem; [tribe Gentianaeae, subtribe Swertiaae] ............................................................................ Bartonia
1 Leaves larger, spreading or ascending.
2 Stem leaves whorled; plants robust, 1-3 m tall; [tribe Gentianaeae, subtribe Swertiaae] ............................................................................ Frasera
GENTIANACEAE

Bartonia Muhlenberg ex Willdenow (Bartonia)

A genus of 3 species, herbs, of e. North America. The genus has coralloid mycorrhizae and lacks root hairs, and is thus presumably partially mycotrophic. References: Mathews et al. (2009)=Y; Gillett (1959)=Z.

1 Corolla lobes white, 4-9 mm long, spreading, spatulate to obovate, rounded at the apex; flowering in early spring (rarely to early summer);..............B. verna

2 Mid-cauline scale leaves opposite; corolla lobes rounded at the apex, abruptly narrowed to a mucro, their margins erose (uncommonly entire); anthers 0.5-1.1 mm long..........................................................B. paniculata

3 Mid-cauline scale leaves opposite; corolla lobes alternating with corolla appendages (appearing as plaits or lobes, these often toothed, notched, or lacerate, sometimes as long as or longer than the true corolla lobes); main stem leaves cuneate at the base; perennial; [tribe Gentianaeae, subtribe Gentiana.........Gentiana

4 Corolla lobes 4-5, shorter than the corolla tube, blue, lavender, pink or white. [tribe Chironieae, subtribe Chironiinae].................................................................Centaurium

5 Corolla tube < 2 mm wide; [tribe Chironieae, subtribe Chironiinae].........................................................................................................................Centaurium

6 Corolla tubes alterning with corolla appendages; main stem leaves rounded to cordate at the base; biennial or annual; [tribe Gentianaeae, subtribe Swertiinae].

7 Corolla lobes 4, finely fringed; main stem leaves rounded at base, with lateral veins obscure; biennial ..............Gentianopsis

8 Corolla tubes 5, entire, not fringed; main stem leaves cordate (the corolla bases often overlapping the opposite leaf), with 2-3 well-developed lateral veins (prominently visible on the lower surface); annual......................Gentianella

Bartonia paniculata (Michaux) Muhlenberg ssp. paniculata, Screwstern Bartonia. Swamps, bogs, pocosins, pocoscin ecotones, sphagnum seepages, sinkhole ponds. August-October; September-October. Ssp. paniculata ranges from MA south to c. peninsular FL and west to e. TX, chiefly on the Coastal Plain, but with scattered occurrences inland (to c. VA, w. NC, KY, and AR). Ssp. iodandra (B.L. Robinson) J. Gillett is more northern, ranging from NL (Newfoundland) south to MA. Ssp. texana (Corell) K. Mathews, Dunne, E. York, & Struwe is endemic to the West Gulf Coastal Plain of w. LA and e. TX, where it is more-or-less sympatric with ssp. paniculata (Mathews et al. 2009). [= K, Y, Z; < B. paniculata – RAB, GW, WH; = B. paniculata – G; = B. paniculata var. paniculata – C, F; = B. lanceolata Small – S]

Bartonia verna (Michaux) Rafinesque ex Barton, Spring Bartonia, White Bartonia. Wet pine savannas, shores of Coastal Plain depression ponds, other moist sands. (November-)February-April (-June); April-June. VA (one site known from City of Virginia Beach) (Belden et al. 2004) and se. NC (Carteret County) south to s. FL, west to se. TX. Wood & Weaver’s (1982) speculation that B. verna is an outlier relative to the other species appears not to be true, with the true division being between B. verna/virginica on one hand and B. paniculata and its infrataxa on the other (Mathews et al. 2009). [= RAB, GW, K, S, WH, Y, Z]

Centaurium Hill (Centaury)

A genus of about 20 species, herbs, mainly north temperate.

1 Flowers pedicellate, the pedicels 3-5 mm long .................................................................C. pulchellum

2 Flowers sessile or nearly so (sometimes appearing stalked but with bracteal leaves immediately below the calyx);..............C. erythraea

3 Inflorescence a corymbiform cyme (about as broad as long, the central axis poorly developed).................................................................C. erythraea

4 Inflorescence a spike-like cyme (distinctly elongate, the central axis straight)...............................................................................................C. spicatum

* Centaurium pulchellum (Swartz) Druce, Lesser Centaury, Branching Centaury. Disturbed areas; native of Europe. June-September. [= C, F, G, K, S]

* Centaurium spicatum (Linnaeus) Fritsch, Spiked Centaury. Disturbed areas; native of s. Europe. July-August. [= C, F, G, K]
**Eustoma** Salisbury ex G. Don (Prairie-gentian)

**Eustoma exaltatum** (Linnaeus) Salisbury ex G. Don, Prairie-gentian. Cp (FL): alkaline prairies, saline coastal areas; rare. AL and peninsular FL west to TX, south to Mexico and Belize; West Indies. June-November. [= GW, S, WH, Y, Z; Eu. exaltatum ssp. exaltatum – K] [not yet keyed in generic key]

**Frasera** Walter (Columbo)

**Frasera caroliniensis** Walter, American Columbo. Mt (GA, NC), Pd (GA, SC): rich forests over mafic rocks, upper slopes of cove forests, floodplain forests; rare. Late May-June; September-October. W. NY, nw. PA, and s. ON west to IL, MI, MO, and e. OK, south to w. SC, n. GA, and LA, primarily west of the Blue Ridge. Horn (1997) studied the ecology of this species in the Piedmont of SC. [= C, K, S, W, Z; = Svertia caroliniensis (Walter) Kunze – RAB, F, G]

**Gentiana** Linnaeus 1753 (Gentian)

A genus of about 350-400 species, herbs, primarily temperate and arctic. Even following the removal of *Gentianopsis* and *Gentianella, Gentiana* is a large and apparently heterogeneous group, perhaps not monophyletic. No satisfactory comprehensive treatment is available, however. All of the species treated here as *Gentiana* are in the distinctive group often treated as section, subgenus, or genus *Pneumonanthe*. References: Pringle (1967)=Z; Halda (1996)=Y; Ho & Liu (2001)=X; Pringle & Weakley (2009)=Q; Ho & Liu (1990); Yuan, Küpfer, & Doyle (1996); Pringle (1977). Key adapted from Z.

**Identification Notes:** In some species it may be somewhat difficult to interpret the corolla lobes and the corolla appendages. The filaments are alternate to the corolla lobes, and are therefore attached to the lower portion of the corolla appendages.

1. Flowers solitary (rarely 2 or 3); corolla spotted within; leaves twisted, oblanceolate to oblong: [subgenus *Pneumonanthe*, series *Angustifolae*].
2. Calyx lobes widest at base, the sides then parallel upwards for a distance; corolla exterior intensely indigo blue; [of s. NJ and adjacent DE, and from se. VA south through e. NC to ne. SC]. .................................................................................................................. *G. autumnalis*
3. Calyx lobes widest above the base, narrowing upwards and downwards from that point; corolla exterior dull purplish-green; [of FL Panhandle]. .................................................................................................................. *G. pennelliana*
4. Margins of leaves and calyx lobes conspicuously ciliate (as seen at 10×); corolla appendages with 2 teeth, as long as broad or longer
5. Margins of leaves and calyx lobes entire to minutely denticulate; corolla appendages obliquely triangular, broader than high (sometimes with a minute deflexed segment). .................................................................................................................. *G. linearis*
6. Anthers separate at anthesis; outer surfaces of petals suffused with green; calyx lobes linear-subulate, about as long as the tube; corolla lobes 6-14 mm long, about 2× as long as the the free portions of the corolla appendages ............................................................................. *G. puberulenta*
7. Anthers connate at anthesis; outer surfaces of petals not suffused with green; calyx lobes various; corolla lobes usually shorter. .......................... *G. decora*
Corollas open to loosely closed; involucral and upper leaves obtuse to acute (rarely acuminate); calyx lobes lanceolate.

Leaves ovate, widest near the base, bright green; calyx lobes longer than the calyx tube; corolla lobes spreading, usually 2-4 mm longer than the appendages.......................... **G. catesbaei**

Leaves linear to elliptic, widest near the middle, dark green; calyx lobes shorter than or about equal to the calyx tube; corolla lobes usually incurved, rarely exceeding the appendages by > 2 mm.......................... **G. saponaria**

Corollas tightly closed; involucral and upper leaves acuminate; calyx lobes ovate-orbicular.

Corolla lobes reduced to a minute mucro or triangular tooth, much exceeded by the corolla appendages.......................... **G. andrewsi var. andrewsi**

Corolla lobes about as long as the corolla appendages.

Calyx tubes densely puberulent; calyx lobes lanceolate, erect or ascending; stems puberulent; filaments 7-12 mm long; corolla lobes 1.5-3 mm, often triangular, about 0.5-0.6× as wide as the corolla appendages............ **G. austromontana**

Calyx tubes glabrous; calyx lobes widely elliptic, ovate, obovate, orbicular, or rhombic, spreading widely; stems glabrous, filaments 10-15 mm long; corolla lobes either 0.7-2.0 mm long or 2.5-5.0 mm long, usually rounded, about as wide as the corolla appendages.

Calyx lobes widely obovate to orbicular, 2-10 mm; corolla lobes 0.7-2.0 mm; [more widespread].............. **G. clausa**

Calyx lobes ovate-oblong, elliptic, ovate, orbicular, or rhombic, (3-)5-25 (-35) mm; [Mountains of NC, south of Asheville].............. **G. latifolia**

**Gentiana alba** Muhlenberg ex Nuttall, Pale Gentian. Moist meadows. August-October. MI west to MN, south to n. AR; with scattered disjunctions eastward to PA, OH, WV, KY, and w. NC. **G. alba** has nomenclatural over **G. flavida** as the older name; there is controversy, however, over whether it was validly published and applies clearly to the species at hand (see Wilbur 1988c for discussion). [= RAB, K, W, WV, X, Y, Z; = Gentiana flavida A. Gray – C, F, G; = Pneumonanthe flavida (A. Gray) Britton – S; = Pneumonanthe clausa (J.F. Gmelin) Small – S; = Pneumonanthe catesbaei (Chapman) Small – S; = Pneumonanthe decora (Grisebach) Small – S; = Pneumonanthe andrewsi J.S. Pringle & Sharp – S; = Pneumonanthe latifolia (J.F. Gmelin) Small – S]

**Gentiana andrewsi** Grisebach var. andrewsi. Prairie Closed Gentian. Meadows, seeps, forest edges. NH, s. QC, MN, and s. MB, south to s. MD, WV, MO and WV; earlier reports of it as far south as GA or NC (as by F and G) are apparently based on misidentifications. An additional variety, var. dakotica A. Nelson, occurs from MB and SK south in the Great Plains to MO and IL. [= C, K, X, Y, Z; < G. andrewsi – F, G, WV; < Dasystephana andrewsi (Grisebach) Small – S; = Pneumonanthe andrewsi (Grisebach) W.A. Weber var. andrewsi]

**Gentiana austromontana** J.S. Pringle & Sharp, Blue Ridge Gentian. Mountain forests and grassy balds, especially at medium to high elevations, but descending to ca. 600 m (2200 feet). August-October. A Southern Appalachian endemic: s. WV and sw. VA south to w. NC and ne. TN. The flowers of **G. austromontana** are usually a deeper and more intense blue-violet than the similar **G. clausa** and **G. decora.** See Pringle & Sharp (1964) for additional discussion. [= C, K, Q, W, WV, X, Y, Z; < G. clausa Rafinesque – RAB, F, G, GW; < Dasystephana decora (Pollard) Small – S]

**Gentiana autumnalis** Linnaeus, Pinebarren Gentian. Savannas, pine flatwoods, sandhills, in a variety of sites varying from moist to very xeric, nearly always associated with Pinus palustris and/or Aristida stricta (in se. VA, NC, and SC). Late September-mid January (rarely at other times of the year, such as spring, in response to fire). This species is a “bimodal endemic,” occurring in s. NJ and adjacent DE (at least formerly), and from se. VA south through e. NC to nc. SC. The related **G. pennelliana** Fernald (sometimes reduced to a subspecies of **G. autumnalis**) is endemic to the FL Panhandle; other siblings, **G. bicuspitata** (G. Don) Briq., **G. hooperi** Pringle, and **G. longicollis** Nesom, occur in Mexico. **G. autumnalis** is often overlooked, since it is very inconspicuous except when in flower, it usually flowers at a season when few botanists are about, and sterile plants greatly outnumber fertile ones. Over vegetatively it is extremely distinctive once learned; the leaves are glossy, dark-green, opposite, obovate to oblong, twisted and curved in a manner reminiscent of an airplane propellor. [= RAB, C, F, GW, K, X, Y, Z; = Gentiana porphyrio J.F. Gmelin – G; = Dasystephana porphyrio (J.F. Gmelin) Small – S; = Gentiana autumnalis ssp. autumnalis – Y; = Pneumonanthe porphyrio (Linnaeus) Greene]

**Gentiana clausa** Rafinesque Closed Gentian, Meadow Bottle Gentian. Forests. September-October. Mostly Appalachian: ME south to w. NC and ne. TN, extending east and west to adjacent physiographic provinces. [= – C, Q, WV; < G. clausa – C, K, W, X, Y, Z (also see **G. latidens**); < G. clausa – RAB, F, G, GW (also see **G. austromontana** and **G. latidens**); < Dasystephana decora (Pollard) Small – S; = Pneumonanthe clausa (Rafinesque) Greene]

**Gentiana latidens** (House) J.S. Pringle & Weakley, Balsam Mountain Gentian. Moist, often seeping, more or less open sites on rocky slopes. September-October. Restricted to the higher mountains of nc south of Asheville, NC (Haywood,
Gentiana linearis Frölich, Narrowleaf Gentian. Openings in spruce-fir forests, bogs, at high elevations. September-October. Mainly occurring in ne. United States and e. Canada, west to Lake Superior, and south (scattered) in the Appalachians to sw. VA (in openings in spruce-fir forest near summit of Whitetop Mountain) and e. TN (Chester, Wofford, & Kral 1997). On Mount LeConte (Sevier County, TN), G. linearis occurs in thin soils around high elevation outcrops of Anakeesta Slate. See Pringle (1977) for extensive discussion of actual and putative southern occurrences of this species. [= C, F, G, K, W, WV, X, Y, Z; = Pneumonanthe linears (Frölich) Greene]

Gentiana pennelliana Fernald, Wiregrass Gentian. Pine flatwoods. December-March. Endemic to Panhandle FL. [= GW, WH; = Dasystephana tenuifolia (Rafinesque) Pennell – S] [add to synonymy X, Y, Z]

Gentiana saponaria Linnaeus, Soapwort Gentian. Bogs, marshes, wet hardwood forests, other moist to wet habitats. Late September-November. NY west to n. IL, south to Panhandle FL and e. TX. A peculiar form with very narrow leaves has been found at several localities in Ashe and Watauga counties, NC, and in the South Mountains, NC; it may warrant taxonomic recognition after further study. [= RAB, C, G, K, W, WH, X, Y, Z; > G. saponaria – F, G, WV; > G. cherokeensis (W.P. Lemmon) Fernald – F, G; = G. saponaria var. saponaria – K; = Dasystephana saponaria (Linnaeus) Small – S; = Pneumonanthe saponaria (Linnaeus) F.W. Schmidt]

Gentiana villosa Linnaeus, Striped Gentian. Upland forests, sandhill/pocosin ecotones. Late August-November. Se. PA west to n. KY and w. TN, south to Panhandle FL and e. LA. [= RAB, C, F, G, K, W, WH, X, Y, Z; = Dasystephana villosa (Linnaeus) Small – S; = Pneumonanthe villosa (Linnaeus) F.W. Schmidt]

Gentianella Moench (Agueweed)

A genus of about 125-250 species, herbs, temperate. The separation of Gentianella from Gentiana appears to be well warranted; some characters suggest that Gentianella is more closely allied to Swertia, Halemia, and Lomatogonium than to Gentiana (Wood & Weaver 1982). A molecular analysis has confirmed this (Yuan & Käpfer 1995). References: Gillett (1957)=Z. Key based on Gillett (1957).

1 Calyx 8-10 mm long; calyx tube 3.0-3.5 mm long; calyx lobes 5-6 mm long, elliptic-lanceolate to oblanceolate with thickened margins, and with broadly flattened, frequently nerve-like keels; corolla ca. 20 mm long.................................G. quinquefolia var. occidentalis

1 Calyx 4-5 mm long; calyx tube 1.5-2.0 mm long; calyx lobes 2.0-2.5 mm long, narrowly triangular with hyaline margins and very prominent keels; corolla 16-18 mm long.................................G. quinquefolia var. quinquefolia

Gentianella quinquefolia (Linnaeus) Small var. occidentalis A. Gray, Western Agueweed. Calcareous barrens, dry and dry-mesic limestone woodlands. Late August-October. Var. occidentalis A. Gray is more western, from OH and s. ON west to MN, east and south to w. VA, sc. KY, AR, and se. KS. [= C, G; < Gentiana quinquefolia Linnaeus – RAB, GW, W; = Gentiana quinquefolia var. occidentalis (A. Gray) Hitchcock – F; = Gentianella quinquefolia ssp. occidentalis (A. Gray) J. Gillett – K, Z; = Gentianella occidentalis (A. Gray) Small – S]

Gentianopsis Ma 1951 (Fringed-gentian)

A genus of about 20 species, herbs, of north temperate Asia and North America. The reasons for the recognition of Gentianopsis are enumerated by Ma (1951), Ilitsis (1965), and Wood & Weaver (1982). References: Gillett (1957)=Z; Ilitsis (1965); Ma (1951).

Gentianopsis crinita (Frölich) Ma, Eastern Fringed-gentian. Sunny or semi-shaded seepage areas over calcareous, mafic, or ultramafic rocks (such as limestone, amphibolite, or serpentinitized olivine). September-October. ME, s. ON, and ND south to NJ, n. DE, IN, and IA (mostly north of the glacial maximum) and from PA south to nw. NC and ne. GA in the unglaciated
Appalachians. Certainly one of the most beautiful of our native plants. [= C, K; = Gentiana crinita Frölich – RAB, F, G, GW, W, WV; = Anthopogon crinitum (Frölich) Rafinesque – S; = Gentianella crinita (Frölich) G. Don ssp. crinita – Z]

**Anthopogon crinitum**

**Obolaria Linnaeus**

**Obolaria virginica**

Nutrient-rich, moist forests, mesic hammocks. March-May; May-June. NJ west to OH, s. IN, and s. IL, south to Panhandle FL and se. LA (reported from TX). The small purplish-green plants are inconspicuous, often nearly hidden under fallen leaves. **Obolaria** has well-developed mycorrhizae and may be substantially mycotrophic. [= RAB, C, F, G, K, S, W, WH, WV, Z]

**Sabatia Adanson 1763** (Sabatia, Rose-gentian, Rose-pink, Marsh-pink, Sea-pink)

(coreputed by B.A. Sorrie and A.S. Weakley)

A genus of about 20 species, of North America and the West Indies. References: Wilbur (1955)=Z.

1. Flowers with (7-) 8-12 (-14) corolla lobes.
2. Pedicels < 5 mm long; calyx subtended by linear bracts that usually exceed the corolla lobes; terminal flowers in capitulate clusters (less commonly single).
3. Basal leaves similar in shape and size to the stem leaves; cauleine leaves (25-) 35-50 (-65) mm long, (7-) 10-20 (-25) mm wide, 2-4× as long as wide; corolla lobes pale rose or white; [of mountain slopes, restricted in our area to sw. NC and nw. GA] .............. **S. capitata**
4. Pedicels > 10 mm long; calyx not subtended by long bracts; terminal flower single.
5. Primary branches opposite; terminal flower short-stalked (much shorter than the first internode of the adjacent branch); stems 5-12 dm tall; [of Taxodium ascendens-Nyssa biflora depressions and wet pine flatwoods in se. SC] ................................................................. **S. bartramii**
6. Upper stem leaves much wider than the diameter of the stem; calyx lobes flat, linear to narrowly oblanceolate; stems 3-12 dm tall; [of various habitats, primarily along the shores of blackwater rivers or ponds, or in tidal marshes].
7. Upper branches of main stem alternate.
8. Calyx tube strongly winged; corolla lobes pink (rarely white); [of mountain slopes, restricted in our area to sw. NC and nw. GA] .............. **S. arenicola**
9. Leaves thick, succulent; leaf base broadly cuneate, nut at all clasping; [of mountain slopes, restricted in our area to sw. NC and nw. GA] .............. **S. campestris**
10. Calyx lobes foliaceous, 5-8 mm wide, oblong to oblanceolate, mostly exceeding the corolla lobes .................. **S. calycina**
11. Calyx lobes linear-setaceous, 0.5-2 mm wide, if equaling the corolla lobes then very narrow and not foliaceous. **S. brevifolia**
12. Calyx lobes (3-) 4-7 (-8) mm long; corolla lobes white ................................................................. **S. dodecandra**
13. Calyx lobes (4-) 6-17 (-23) mm long; corolla lobes pink (rarely white in individual plants).
14. Plants perennial, often with several stems from a caudex; calyx lobes > 3/4× as long as the corolla lobes, and sometimes exceeding them; [of saturated soils from Coastal Plain savannas to Mountain bogs] .................................................. **S. grandiflora**
15. Plants annual, solitary; calyx lobes up to 3/4× as long as the corolla lobes
16. Calyx lobes (18-) 20-25 mm long; leaves succulent (usually drying rugose and green) ................................. **S. stellaris**
17. Corolla lobes pink (rarely white); pedicels at least in part > 5 mm long.
18. Lower half of stem winged; leaves ovate, clasping, < 2× as long as wide; [widespread in our area] .......... **S. foliosa**

**Linnaeus, Pennywort**

Nutrient-rich, moist forests, mesic hammocks. March-May; May-June. NJ west to OH, s. IN, and s. IL, south to Panhandle FL and se. LA (reported from TX). The small purplish-green plants are inconspicuous, often nearly hidden under fallen leaves. **Obolaria** has well-developed mycorrhizae and may be substantially mycotrophic. [= RAB, C, F, G, K, S, W, WH, WV, Z]
Sabatia angularis (Linnaeus) Pursh, Bitter-bloom, Common Marsh-pink. Forests, woodlands, marshes, fields, calcareous hammocks (in FL). July-August; September-October. NY west to s. MI, IL, and e. KS, south to Panhandle FL and e. TX. [= RAB, C, F, GW, K, WH, WV, Z; = Sabbatia angularis – S]

Sabatia arenicola Greenman, Sand Rose-gentian. Interdune depressions, wet savannas, saline flats. April-July. Se. LA west through TX to ne. MX. [= GW, K, Z]

Sabatia bartramii Wilbur, Bartram's Rose-gentian. Margins of Taxodium ascendens-Nyssa depressions, wet pine flatwoods. June-August; August-October. Ne. SC south to s. FL, west to s. AL, and e. MS. [= GW, K, WH, Z; = S. dodecandra var. coriacea (Elliott) Ailies – RAB; = Sabbatia decandra (Walter) R.M. Harper – S]

Sabatia brachiata Elliott, Narrowleaf Rose-pink. Mesic pinelands, sandhills, pine savannas, pine flatwoods. Late May-July; August-September. Se. VA south to s. GA, west to LA, north in the interior to c. TN and se. MO. [= RAB, C, F, GW, K, W, Z; = Sabbatia brachiata – S]

Sabatia brevifolia Rafinesque. Pine savannas. September-October; October-November. E. SC south to peninsular FL, west to s. AL. [= RAB, GW, K, WH, Z; = Sabbatia elliottii Steudel – S]

Obolaria virginica

Sabatia calycina (Lamarck) Heller, Coastal Rose-pink. Swamp forests, river banks. June-October; July-October. Se. VA south to s. FL, west to s. TX; e. Cuba and Hispaniola. [= RAB, C, F, GW, K, WH, Z; = Sabatia calycina – S]

Sabatia campanulata (Linnaeus) Torrey, Slender Marsh-pink. Pine savannas, bogs. June-August; September-October. MA south to ne. FL, oanhandle FL, west to LA and AR; scattered inland as in w. VA, w. NC, c. TN, and KY. [= RAB, C, F, GW, K, W, WH, Z; > S. campanulata var. campanulata – F; > S. campanulata var. gracilis (Michaux) Fernald – F; < Sabbatia campanulata – S]

* Sabatia campesiris Nuttall, Western Marsh-pink, Prairie Rose-gentian, Prairie Sabatia. Roadside and woodland edges; native of c. United States. July-August; September-October. [= RAB, C, F, GW, K, Z]

Sabatia capitata (Rafinesque) Blake, Cumberland Rose-gentian. Sloping woodlands and meadows, over sandstone or shale. July-August; September-October. Sw. NC and se. TN south to nw. GA and e. AL. Apparently present in NC, at least formerly, based on a specimen collected "from Cherokee", probably Cherokee County, NC, a remarkably poorly botanized area. [= K, Z; = Lapithea capitata (Rafinesque) Small – S]

Sabatia dodecandra (Linnaeus) Britton, Sterns, & Poggenburg, Perennial Sea-pink, Large Marsh Rose-pink. Tidal brackish and freshwater marshes. June-August; August-October. CT south to e. SC and e. GA (Sorrie 1998b). [= F; < S. dodecandra var. dodecandra – RAB (also see S. foliosa); = S. dodecandra var. dodecandra – C, GW, K, Z; = Sabbatia dodecandra – S]

Sabatia quadrangularis (Rafinesque) Blake, Cumberland Rose-gentian. Margins of Taxodium ascendens-Nyssa depressions, wet pine flatwoods. June-August; August-October. Ne. SC south to s. FL, west to s. AL, and e. MS. [= GW, K, WH, Z; = S. quadrangularis – S]

* Sabatia recurvans Steudel – S
**Gentianaceae**

*Sabatia foliosa* Fernald. Openings along blackwater rivers, cypress ponds. June-August; August-October. E. SC south to ne. FL and Panhandle FL, west to se. TX. [<*S. dodecandra* var. *dodecandra* – RAB; = *S. dodecandra* (Linnaeus) Britton, Sterns, & Poggenburg var. *foliosa* (Fernald) Wilbur – GW, K, Z; > *Sabbatia foliosa* – S; > *Sabbatia harperi* Small – S; = *S. dodecandra* – WH]

*Sabatia gentianoides* Elliott. Pine savannas, bogs. July-August; September-October. NC south to ne. FL and Panhandle FL, west to se. TX. [= RAB, GW, K, WH, Z; = *Lapithea gentianoides* (Elliott) Grisebach – S]

*S. dodecandra* var. *dodecandra* – RAB; = *S. dodecandra* (Linnaeus) Britton, Sterns, & Poggenburg var. *foliosa* (Fernald) Wilbur – GW, K, Z; > *Sabbatia foliosa* – S; > *Sabbatia harperi* Small – S; = *S. dodecandra* – WH]

*Sabatia grandiflora* (Gray) Small, Largeflower Rose-gentian. CP (FL): wet flatwoods, marshes, cypress-gum depressions, lime sink ponds, borrow pits; common. Ne. FL, Panhandle FL, s. AL, south to s. FL. [= GW, K, WH, Z; = *Lapithea gentianoides* (Elliott) Grisebach – S]

*Sabatia kennedyana* Fernald, Plymouth Gentian. Seasonally exposed drawdown banks of the Waccamaw River, in adjacent ditches and disturbed flats (in se. NC and ne. SC), and very rarely on shores of beaver ponds (in e. VA, by introduction). June-August; August-October. This species has a strange, disjunct range, likely related to Pleistocene refugia on the (now) Continental shelf, present in s. NS, e. MA and RI; se. NC and ne. SC. The record of the species in e. VA (Caroline County) reported by Fleming & Ludwig (1996) has now been determined to be a deliberate introduction. Studies underway suggest that the Carolina plants may differ varietally from those in New England (Sorrie, pers. comm.). [= C, F, GW, K, Z; = *S. dodecandra* var. *kennedyana* (Fernald) Ahles – RAB]

*Sabatia macrophylla* Hooker var. *macrophylla*, Large-leaf Rose-gentian. Wet savannas. Sw. GA west to e. LA. [= K, Z; < *S. macrophylla* – GW, WH; = *Sabbatia macrophylla* Hooker – S]

*Sabatia macrophylla* Hooker var. *recurvans* (Small) Wilbur, Small's Rose-gentian. Wet savannas. E. and c. GA south to ne. FL; it may occur in se. SC. [= K, Z; < *S. macrophylla* – GW, WH; = *Sabbatia recurvans* Small – S]

*Sabatia quadrangularis* Wilbur, Four-angle Sabatia. Sandhills, moist forests, pocosin ecotones. June-September; August-November. E. VA south to n. peninsular FL, west to s. AL. [= RAB, C, GW, K, WH, Z; = *S. paniculata* Michaux – F, misapplied; = *Sabbatia paniculata* – S]

*Sabatia stellaris* Pursh, Annual Sea-pink. Brackish marshes. July-October; August-November. S. MA south to s. FL, west to LA; Bahama Islands, Cuba, e. Mexico. [= RAB, C, F, GW, K, WH, Z; < *Sabbatia campanulata* – S]

352. Loganiaceae R. Brown ex Martius 1827 (Logania Family) [in GENTIANALES]

As here rather narrowly interpreted, Loganiaceae consists of 12 genera and about 420 species, herbs and subshrubs, of tropical, subtropical, and warm temperate areas of the Old and New Worlds. Other genera in our area which have traditionally been considered components of the Loganiaceae now are clearly better placed in the small families Tetrachondraceae (*Polypremum*), Gelsemiaceae (*Gelsemium*), and Scrophulariaceae (*Buddleja*), more closely related to other families (such as Rubiaceae) than to Loganiaceae sensu stricto (Struwe, Albert, & Bremer 1994). The affinities of *Spigelia* appear to be with a small group of tropical and subtropical genera, the largest of which is *Strychnos*. Struwe, Albert, & Bremer (1994) treated this group as the family Strychnaceae, based on a cladistic analysis of data. A later, more thorough analysis suggested that Strychnaceae is best recombined with Loganiaceae (Backlund, Oxelman, & Bremer 2000). References: Rogers (1986). [also see GELSEMIACEAE, SCROPHULARIACEAE, and TETRACHONDRACEAE]

1 Woody vine ...................................................................................................................................................... *Gelsemium* [see GELSEMIACEAE]
1 Herb.

2 Corolla funnelform, 0.1-0.2 cm long, white ............................................................................................................................................ *Mitreola*
2 Corolla tubular, 3-6 cm long, red and yellow ............................................................................................................................................ *Spigelia*

*Mitreola* Linnaeus 1758 (Miterwort)

LOGANIACEAE

1 Leaves 2-8 cm long petiolate or sessile and tapering to a cuneate base ................................................................. M. petiolata
2 Leaves 1-4 cm long, sessile, the base rounded.

M. angustifolia (J.F. Gmelin) G. Don, Small-leaved Miterwort. Wet savannas, pocosins, ditches, margins of limesink depressions (dolines). Late June-August; September-October. Se. VA south to FL, west to e. TX, and in the Bahama Islands. [= GW, WH, Y; = Cynoctonum sessilifolium J.F. Gmelin – RAB, C, F, G, S]

M. sessilifolia (J.F. Gmelin) J.B. Nelson, Small-leaved Miterwort. Wet savannas, pocosins, ditches, margins of limesink depressions (dolines). Late June-August; September-October. Se. VA south to FL, west to e. TX, and in the Bahama Islands. [= GW, WH, Y; = Cynoctonum sessilifolium J.F. Gmelin – RAB, C, F, G, S]

Spigelia Linnaeus 1753 (Pinkroot)

1 Corolla scarlet on the outer surface, yellow on the inner surface ................................................................................. S. marilandica
2 Corolla light pink to white on the outer and inner surfaces.

Spigelia gentianoides Chapman ex Alphonse de Candolle var. gentianoides. Pine savannas. Endemic to FL Panhandle (Callahan, Jackson, and Washington counties). [= K, Z; = S. gentianoides – S, Y (var. alabamensis not discovered at the time); < S. gentianoides – WH]

Spigelia marilandica Linnaeus, Pinkroot, Wormgrass. Woodlands and forests, usually on circumneutral soils. May-June; late June-July. SC, sw. NC (Cherokee Co. and Macon Co.), and TN west to s. IN and OK, south to Panhandle FL and TX; some floras allege its occurrence north to VA, MD, NJ, and PA. S. marilandica will likely be found in sw. VA. [= RAB, C, F, G, K, S, W, WH]

353. GELSEMIACEAE (G. Don) Struwe & V. Albert 1995 (Jessamine Family) [in GENTIANALES]

A family of 2 genera and about 10 species, shrubs and vines, of tropical and warm temperate America, Africa, and Asia. There is persuasive evidence that Gelsemium and Mostuea Didr., traditionally treated as part of a heterogeneous Loganiaceae, should be accorded family status as Gelsemiaceae (Backlund, Oxelman, & Bremer 2000; Struwe, Albert, & Bremer 1994; Sennblad & Bremer 1996). The Gelsemiaceae form a clade most closely related to the Apocynaceae (Backlund, Oxelman, & Bremer 2000).

References: Backlund, Oxelman, & Bremer (2000); Struwe, Albert, & Bremer (1994); Sennblad & Bremer (1996); Rogers (1986).

Gelsemium Antoine Laurent de Jussieu (Yellow Jessamine)

A genus of 3 species, vines, our 2 species in se. North America (and also Central America) and 1 species in e. Asia. References: Wyatt et al. (1993); Duncan & Dejong (1964); Godfrey (1988); Rogers (1986)=Z; GW.

1 Sepals acuminate apically, persistent on the fruit; capsule elliptical, 1.0-1.6 cm long, 6-8 mm broad, the tapering tip bearing a definite beak about 3 mm long; seeds wingless; flowers odorless (rarely fragrant), usually golden-yellow ................................................. G. rankinii
1 Sepals obtuse to broadly acute, not persistent on the fruit; capsule oblong, 1.5-2.5 cm long, 8-12 mm broad, very abruptly narrowed to a beak 1.5-2 mm long; seeds with a prominent membranous wing sharply differentiated from the body of the seed; flowers fragrant, usually lemon-yellow ................................................................. G. sempervirens

Gelsemium rankinii Small, Swamp Jessamine. Swamps of blackwater rivers, restricted in NC to the se. corner of the state, most notably the swamps of the Waccamaw and Black rivers. March-April; September-October. Se. NC south through SC and GA to the FL Panhandle, and west to e. L.A. See Wyatt et al. (1993) and Duncan & Dejong (1964) for extensive discussions of morphology, habitat, pollination, genetics, distribution, and evolutionary relationships of our 2 species of Gelsemium. [= RAB, GW, K, S, WH, Z]

Gelsemium sempervirens (Linnaeus) St. Hilaire, Carolina Jessamine. In a wide range of habitats, from swamp forests to dry uplands and thickets, also commonly planted as an ornamental. March-early May; September-November. VA, se. TN, and AR south to c. peninsular FL and e. TX; disjunct in Guatemala and Mexico (Chiapas, Oaxaca, Puebla, and Veracruz). Jessamine climbs to the tops of trees. [= RAB, F, G, GW, K, S, W, WH, Z]

354. APOCYNACEAE A.L. de Jussieu 1789 (Dogbane Family) [in GENTIANALES]

As here circumscribed including the Asclepiadaceae, a family of about 480 genera and about 4800 species, lianas, shrubs, herbs, and trees, widespread in tropical and temperate areas. There appears to be overwhelming evidence favoring the combination of the Asclepiadaceae into the Apocynaceae; see, for instance, Rosatti (1989), Sennblad & Bremer (1996), and many others.

References: Rosatti (1989); Liede (1997a).

1 Plant a twining herbaceous or woody vine.

2 Leaves ovate, cordate at the base, < 2.5× as long as wide.

3 Plants in flower.

4 Petals white; gynostegial corona nearly as long to longer than the corolla lobes ................................................................. Cynanchum laeve

5 Corolla lobes glabrous on the outer surface, very stiff in texture; dorsal anther appendages laminar; carpels smooth and angled................................................................. Gonolobus

6 Leaves deeply cordate, tapering steadily to an acuminate apex ................................................................................ Cynanchum laeve

7 Leaves cordate, broadly rounded, tapering abruptly to an acute, obtuse, or apiculate apex ..................................................... Cynanchum laeve

8 Leaves ovate, lanceolate, or linear, not cordate at the base, > 1.5× as long as wide

9 Leaves petiolate; calyx lobes deltoid, obtuse, ca. 1 mm long; leaves petiolate, not reflexed, often caducous; follicle 1-3 mm in diameter; [of se. SC and south] ................................................................. Cynanchum scoparium

10 Flowers brownish-purple, with a corona of narrow segments; fruit 10-15 cm long, > 5 mm in diameter; leaves obtuse to acute at the tip (rarely slightly acuminate). ................................................................. Periploca

11 Flowers white to creamy yellow, lacking a corona; fruit 10-25 cm long, 1-2 mm in diameter; leaves acuminate at the tip ................................. Trachelospermum

1 Plant an erect or trailing herb or shrub.

12 Plant rhizomatous, suffrutescent, < 4 dm tall; leaves narrowly to broadly ovate; flowers blue, lavender, or white ................................................. Vinca

13 Flowers yellow; shrub 4-12 dm tall, with only a few wand-like branches; [very rare waif in our area] .................................................. Angadenia

14 Flowers white, pink, or red; shrub 10-40 dm tall, much branched from the base; [commonly cultivated in our area and sometimes persistent], particularly near the coast[................................................................. Nerium

15 Leaves alternate (rarely a few on a plant subopposite) ..................................................................................... Asclepias

16 Leaves opposite.

Amsonia Walter 1788 (Blue-stars)

A genus of about 20 species, herbs, of temperate North America and Japan. References: Woodson (1928)=Z.
Amsonia ciliata  Walter, Sandhills Bluestar. Sandhills. April; September-October. Two varieties have been traditionally recognized since the monograph of Woodson (1928), var. ciliata (leaves strongly heteromorphic, the lower leaves lanceolate, 4-10 mm wide (mostly 4-15× as long as wide), the upper about 1 mm wide; inflorescence barely held above the foliage) and var. tenuifolia (leaves slightly or not at all heteromorphic, the lower leaves linear, 1-3 mm wide (mostly 15-30× as long as wide), the upper < 1 mm wide; inflorescence usually held well above the foliage). They do not seem to be clearly separable morphologically, and their distributions are very largely overlapping, suggesting that they are merely forms. Se. NC south to c. peninsular FL, west to c. and s. AL; disjunct in Ozark-Ouachita highlands of sc. MO, w. AR, and se. OK. [= RAB, WH; > A. ciliata Walter var. ciliata – K, S, Z; > A. ciliata Walter var. tenuifolia (Rafinesque) Woodson – K; > A. ciliata var. filifolia Wood – F, G, S; > A. ciliata var. tenuifolium – Z, misspelling]

Amsonia glaberrima Woodson. (habitat). MS, LA. [= Z; < A. tabernaemontana var. tabernaemontana – K; < A. amsonia – S]

Amsonia ludoviciana Vail, Louisiana Bluestar. Open woodlands around outcrops of Lithonia granitic gneiss, (other habitats). So far as is known, endemic to LA, MS and GA; not native or naturalized in SC, contrary to Kartesz (1999). [= GW, K, S, Z]

Amsonia rigida Shuttleworth ex Small, Stiff Bluestar, Pond Bluestar. Seasonally flooded depression wetlands and moist pinelands. S. GA to n. peninsular FL, west to s. MS. [= GW, K, S, Z; < A. tabernaemontana – WH]

Amsonia tabernaemontana Walter var. gattingeri Woodson. Mt (GA): rich forests, rocky forests, riverside scours; rare. IL, MO, and sc. KS south to ne. TX, and apparently disjunct in the Interior Low Plateau of sc. KY, c. TN (Chester, Wofford, & Kral 1997), and in n. GA. [= F, K, Z; < A. tabernaemontana – C, GW, W; < A. salicifolia Pursh – S]

Amsonia tabernaemontana Walter var. tabernaemontana, Wideleaf Blue-stars. Mt (GA, NC, SC), Pd (DE*, GA, NC, SC, VA), Cp (GA, NC, SC, VA): floodplain forests, moist, rich slope forests; common (uncommon in DE and VA, uncommon in Mountains). April; August-September. Se. VA west to s. IL, MO, and KA, south to GA, LA, e. OK, and TX. The varieties tabernaemontana and salicifolia, while strikingly different in their extreme expressions, have nearly the same distribution and do intergrade; they are probably not worthy of recognition. [= C, G, W; > A. tabernaemontana var. tabernaemontana – RAB, G, K, Z; > A. tabernaemontana var. salicifolia (Pursh) Woodson – RAB, G, K, Z; < A. tabernaemontana – C, GW, W; < A. amsonia (Linnaeus) Britton – S; < A. salicifolia Pursh – S (also see var. gattingeri)]

Angadenia Miers 1878 (Pineland Allamanda)

A genus of 2 species, of Florida and the West Indies.

* Angadenia berteroii (Alphonse de Candolle) Miers, Pineland Golden-trumpet, Pineland Allamanda, Lice-root. Cp (NC): disturbed, acid, peaty soil; rare, native of s. FL, the Bahamas, Cuba, and Hispaniola. The only record in our area is from an agricultural experiment station near W enona, Washington County, NC (Hayes 1946), where presumably introduced via cattle; the species has probably not persisted in our area. [= K; > Rhabdenia corallifera Small – S]

Apocynum Linnaeus 1753 (Dogbane, Indian-hemp)

A genus of about 12 species, herbs, of temperate e. and c. Asia and North America. References: Woodson (1930)=Z.

1 Corolla 5-10 mm long, pink or white with pink veins, the lobes spreading or recurved.
2 Leaves drooping; corolla ca. 3× as long as the calyx lobes .......................................................... A. androsaemifolium

Key A – milkweeds with clear sap and alternate leaves

1 Leaves cuneate at the base; leaves usually obovate to oblanceolate (widest beyond the middle); [s. NH west to OH, south to Panhandle FL and e. TX widespread eastward] .......................................................... Key E

2 Leaves cordate to hastate at the base; leaves usually lanceolate, ovate, or elliptic (widest at or below the middle).

3 Leaf margins flat; leaves widest towards the base; [PA, WV, KY, TN, MS westward] .......................................................... Key C

4 Leaf margins usually crisped; leaves widest near the middle; [of se. Coastal Plain, se. VA south to s. FL, west to s. MS] ......................... Key B

Key B – milkweeds with milky sap, with linear leaves opposite, subopposite, or whorled

1 Leaves either mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves), or subopposite (the leaves more-or-less paired but separated by 0.5-3 mm); corolla whitish or greenish, usually suffused with rose-purple (especially at the tips of the corolla lobes).

2 Leaves mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves); leaves 1.5-7 cm long, 1-2 mm wide; seeds ca. 5 mm long, thecoma ca. 2.5 cm long; milky sap often difficult to show .......................................................... Key A

3 Leaves subopposite (the leaves more-or-less paired but separated by 0.5-3 mm); leaves (3-) 5-18 cm long, (1-) 2-10 mm wide; seeds ca. 7-11 mm long, thecoma 3-5 cm long; milky sap obvious and profuse.
Key C – milkweeds with milky sap, with sessile, nonlinear leaves

1 Leaves 2-5 cm long, 0.3-1.0 cm wide; corolla lobes erect, creamy yellow to greenish white, 2-10 mm long; stem and leaf pubescent. [collectively widespread]

2 Leaves 3-30 cm long, 0.5-1.1 cm wide; corolla lobes reflexed, either orange-red or purple, 5-11 mm long; plant 1-4 dm tall; [of dryish pinelands of the Coastal Plain] .......................................................... A. pedicellata

3 Umbels 1-4, terminal and from upper nodes; corolla lobes 5-6.5 mm long; inflorescences 2-6 from upper nodes; corona 3-5 mm across; [of dry pinelands of the Coastal Plain] .................. A. michauxii

4 Pedicels with incurved hairs; umbels 1-6, each with up to 30-100 flowers; leaves glabrous or nearly so; [of wet pinelands of the Coastal Plain]. .......................................................... A. hirtella

5 Leaves 5-15 dm tall; corolla orange-red, the lobes 8-11 mm long; hoods 5-6 mm long; horns slightly shorter than the hoods; [of the Coastal Plain] .......................................................... A. lancelolata

6 Hood opening very oblique, the hood therefore scoop-shaped; corolla lobes 2.5-6 mm long; [of coastal wetlands] .......................... A. viridiflora

7 Plants 5-15 dm tall; corolla lobes rose to purple (rarely white); leaves pubescent to glabrate beneath; [collectively widespread].

Key D – milkweeds with milky sap, with petiolate, nonlinear leaves, in flower

1 Corolla golden, either pale green or yellowish green.

2 Leaves opposite; corolla lobes 6-10 mm long. [of the Piedmont and Mountains (rarely in the Coastal Plain)] .......................................................... A. viridis

3 Umbels 1-4, terminal and from upper nodes; corolla lobes 3-5 mm long; of various provinces, primarily of the Piedmont] .................. A. viridiflora

4 Hoods ca. 3 mm long; [of the Piedmont and Mountains (rarely in the Coastal Plain)] .......................................................... A. obovata

5 Leaves petiolate, the stem 2-7 dm long, the leaves pendulous to the stem and thus pendulous to the ground as well; [of deciduous pinelands of the Coastal Plain].

10 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [dry glades or woodlands, east to nw. GA, TN, and WV] .......................................................... A. hirtella

10 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [wet pinelands of the Coastal Plain]. .......................................................... A. longifolia
Oxypteryx curtissii
Linnaeus, Curtiss’s Milkweed. Scrub. Endemic to FL, from Clay County south to s. peninsular FL. [= K, WH, Z; = Anantherix connivens (Baldwin) Feay – S]

Asclepias amplexicaulis J.E. Smith, Clasping Milkweed. Sandhills, other dry woodlands of various types. May-July; June-August. NH and NY west to MN, IA, and KS, south to c. peninsular FL, west to e. TX. The flowers have a fragrance or cloves

Asclepias cinerea Walter, Carolina Milkweed. Pine savannas. June-July; August-September. Se. SC south to n. peninsular FL, west to Panhandle FL. [= RAB, K, S, WH, Z]

Asclepias incarnata Linnaeus, Tall Milkweed. Moist forests, slopes, and forest margins. June-July; August-September. ME and s. ON west to MN and IA, south to n. GA, n. AL (Schotz 2009). e. and c. TN (Chester, Wofford, & Kral 1997), KY, and IL. [= RAB, C, F, K, S, W, Z]
Asclepias feayi Chapman ex A. Gray, Feay’s Milkweed. Sandhills, scrubby pine flatwoods. Endemic to FL, from Clay County south to s. peninsular FL. [= K, WH, Z; = Asclepiodella feayi (Chapman ex A. Gray) Small – S] {not yet keyed}

Asclepias hirtella (Pennell) Woodson, Barrens Milkweed. Limestone glades, prairies. MI, WI, and MN south to w. WV (Mason County), KY, e. TN (Bradley County) (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), AR, w. LA, and e. TX. This species of midwestern prairies and barrens that closely resembles A. longifolia. The two taxa have sometimes been treated as distinct only at the rank of subspecies (see synonymy) or as “very distinct varieties” (Turner 2009). [= C, F, K, Z; = Acerates hirtella Pennell – S; = Asclepias longifolia Michaux ssp. hirtella (Pennell) J. Farmer & C.R. Bell – X; = Asclepias longifolia var. hirtella (Pennell) B.L. Turner – Y]

Asclepias humistrata Walter, Fleshy Milkweed. Sandhills. May-June; June-July. E. NC south to s. FL, west to e. LA. [= RAB, K, S, WH, Z]

Asclepias incarnata Linnaeus var. incarnata, Western Swamp Milkweed. Swamps, marshes, especially over limestone or calcareous shale. July-September; August-October. ME and s. QC west to MB, south to VA, s. TN (Chester, Wofford, & Kral 1997), AR, TX, and CO; disjunct from n. FL south to s. FL; disjunct in TX, NM, and UT. The distribution is peculiar. [= C, F, G, GW; = Asclepias incarnata ssp. incarnata – RAB, K, W, Z; = Asclepias incarnata – S; < Asclepias incarnata – WH]

Asclepias lanceolata Walter, Few-flower Milkweed. Swamps, fresh to slightly brackish marshes, wet pine savannas. June-August; August-September. NJ south to s. FL, west to e. TX. [= RAB, C, GW, K, S, WH, Z; > Asclepias lanceolata var. lanceolata – F, G; > Asclepias lanceolata var. paupercula (Michaux) Fernald – F, G]

Asclepias pulchra (Ehrhart ex Willdenow) Persoon, Savanna Milkweed. Wet pine savannas. May-June; June-July. DE (formerly) south to s. FL, west to e. TX. A. longifolia and A. hirtella are closely related; the two taxa have sometimes been treated as distinct only at the rank of subspecies (see synonymy) or as “very distinct varieties” (Turner 2009). [= RAB, C, F, GW, K, WH, Z; = Acerates longifolia (Michaux) Elliott – G; ? Acerates floridana (Lamarck) A.S. Hitchcock – S; = Asclepias longifolia var. longifolia – Y; = Asclepias longifolia ssp. longifolia – X]

Asclepias pedicellata Walter, Stalked Milkweed, Savanna Milkweed. Dry pine savannas. July-August. Se. NC south to s. FL and Panhandle FL. This species generally occurs in small populations of widely scattered individuals; populations of more than 50 individuals are rare. [= RAB, GW, K, WH, Z; = Podostigma pedicellata (Walter) Vail – S]

Asclepias perennis Walter, Smoothseed Milkweed, Swampforest Milkweed. Swamp forests. June-August; August-September. E. SC south to c. peninsular FL, west to e. TX, north in the interior to s. IN and s. IL. [= RAB, C, F, G, GW, K, S, WH, Z]

Asclepias purpurascens Linnaeus, Purple Milkweed. Openings in moist bottomlands and swamp forests, perhaps mostly on soils derived from mafic or calcareous rocks. June. NH and s. ON west to WI, IA, and KS, south to NC, nw. TN (Chester, Wofford, & Kral 1997), KY, AR, and OK. [= RAB, C, F, G, K, S, W, Z]

Asclepias quadrifolia Jacquin, Fourleaf Milkweed. Moist to dryish forests and forest margins, most common on mafic and calcareous substrates; common (rare in DE). May-June; August-September. NH and NY west to IN, south to NC, n. GA, n. AL, and c. TN; also from w. IL west to MO, south to AR and OK. [= RAB, C, F, G, K, S, W, Z]

Asclepias rubra Linnaeus, Purple Savanna Milkweed, “Red Milkweed.” Pocosin ecotones, wet pine savannas, sandhill seeps, seepage swamps. June-July; July-September. Se. NY (Long Island), se. PA, and NJ south to w. GA and w. Panhandle FL, west to e. TX. A. laurifolia is alleged to differ in sessile, cordate-clasping leaf bases (vs. petioled and rounded), and other
characters (see Small 1933); it may warrant recognition and needs additional study. [= RAB, C, F, G, WH, Z; > A. rubra – S, > A. laurifolia Michaux – S; > A. rubra var. rubra; > A. rubra var. laurifolia (Michaux) Harper]

**Asclepias syriaca** Linnaeus, Common Milkweed. Pastures, roadsides, disturbed areas. June-August; July-September. NB and ME west to s. MB and ND, south to SC, GA, c. TN (Chester, Wofford, & Kral 1997), AR, OK, and KS. This species is apparently expanding its range southward; see Wyatt et al. (1993) and Wyatt (1996) for discussion. [= RAB, C, K, S, W, Z; > Asclepias syriaca var. syriaca – F, G]

Asclepias syriaca

**Asclepias tuberosa** Linnaeus var. interior (Woodson) Shinners, Midwestern Butterfly-weed. Dry forests, roadbanks. QC, ON, MN, SD, CO, UT, and CA south to PA, WV, KY, TN, and MS (Kartesz 1999). [= C; < A. tuberosa – F, S, = A. tuberosa Linnaeus ssp. interior Woodson – G, K, Z]

**Asclepias tuberosa** Linnaeus var. rolfsii (Britton ex Vail) Shinners, Sandhills Butterfly-weed. Sandhills. May-August; August-September. Se. VA south to s. FL, west to s. MS. The flowers are typically lighter in color than those of var. tuberosa, yellow or yellowish-orange rather than deep orange to reddish. The first occurrence in Virginia is discussed by Belden et al. (2004). [= Asclepias tuberosa ssp. rolfsii (Britton ex Vail) Woodson – RAB, K, Z; = Asclepias rolfsii Britton ex Vail – S; < Asclepias tuberosa – WH]

**Asclepias tuberosa** Linnaeus var. tuberosa, Common Butterfly-weed. Woodland margins, roadsides, pastures. May-August; August-September. S. NH west to OH, south to Panhandle FL and e. TX. [= C; = Asclepias tuberosa ssp. tuberosa – RAB, G, K, Z; < Asclepias tuberosa – F, S, WH; >= Asclepias tuberosa ssp. interior Woodson – S; > Asclepias decumbens Linnaeus - S]

**Asclepias variegata** Linnaeus, White Milkweed. Upland woods and woodlands. May-June; July-September. CT west to OH, s. IN, s. IL, se. MO, and se. OK, south to Panhandle FL, LA, and e. TX. [= RAB, C, F, G, K, W, WH; = Biventraria variegata (Linnaeus) Small – S]

**Asclepias verticillata** Linnaeus, Whorled Milkweed. Barrens, thin soils of rock outcrops (especially mafic rocks), thin woodlands, sandhills. June-September; September-October. E. MA west to ND and MB, south to s. FL, TX, NM, and AZ. [= RAB, C, F, G, K, S, W, Z]

**Asclepias viridiflora** Rafinesque, Green Milkweed. Open woodlands, woodland edges, barrens, glades, especially over mafic or calcareous rocks, and also in disturbed areas. June-August; August-September. CT west to s. ON, MB, ND, and MT, south to NC, SC, GA, Panhandle FL, AL, LA, TX, n. Mexico, NM, and AZ. [= RAB, C, K, W, WH, Z; > Asclepias viridiflora var. viridiflora – F; > Asclepias viridiflora var. lanceolata (Ives) Torrey – F; = Acerates viridiflora (Rafinesque) Pursh ex Eaton – G, S]

**Asclepias viridis** Walter, Green Antelope-horn. Prairies, dry woodlands, calcareous hammocks. S. SC south to s. FL, west to TX; and from OH, w. WV, and KY west to NE, south to se. TN, c. TN (Chester, Wofford, & Kral 1997), nw. GA, c. AL, c. MS, AR, TX, and OK. [= K, WH, Z; = Asclepiodora viridis (Walter) A. Gray – S]

**Asclepias viridula** Chapman, Southern Milkweed. Wet longleaf pine savannas and flatwoods, seepage slopes, pitcherplant bogs. Apr-October. GA and AL south to ne. FL and Panhandle FL. See Chafin (2000) for additional information. [= GW, K, S, Z] {not yet keyed}

**Catharanthus** G. Don 1836 (Rosy-periwinkle)

* Catharanthus roseus* (Linnaeus) G. Don, Rosy-periwinkle, Madagascar Periwinkle, Cayenne Jasmine. Disturbed areas, persistent after cultivation or as a waif or "throuout" after cultivation; native of Madagascar, now a pantropical weed. May-October. C. roseus is the source of a powerful anti-leukemia drug. [= K, S, WH, Z; = Vinca rosea Linnaeus – RAB]
Cynanchum Linnaeus 1753 (Swallow-wort)

A genus of about 400 species, vines and lianas, primarily of tropical and warm temperate portions of the New World and Old World. Ampelamus was retained as a genus by Liede (1997a), but later results suggest that it is not distinct from some other portions of Cynanchum (Liede & Täuber 2002). However, Cynanchum itself is strongly polyphyletic and will be broken up; further taxonomic and nomenclatural changes are likely. C. laeve will probably remain in Cynanchum s.s. (which is primarily Old World in distribution), while C. scoparium will likely shift to Orthosia. References: Liede (1997b); Liede & Meve (1997); Liede (1997a); Krings (2001)=Z; Liede & Täuber (2002).

1 Leaves oblong or ovate.
2 Leaves broadly cordate, deeply cordate at base; corona of 5 erect, petaloid segments, each divided into 2 slender lobes..........................C. laeve
3 Leaves oblong or vate, rounded or subcordate at base; corona a fleshy, lobed cup .................................................................C. louiseae
1 Leaves linear.
3 Calyx lobes lanceolate, acute, (1.3-) 1.5-2.5 mm long; leaves sessile, reflexed, persistent; follicle 6-7 mm in diameter; [of se. NC and south].................................................................[see Seutera angustifolia]
3 Calyx lobes deltoid, obtuse, ca. 1 mm long; leaves petiolate, not reflexed, often caducous; follicle 1-3 mm in diameter; [of se. SC and south]...........................................................................

Cynanchum scoparium Nuttall, Leafless Swallow-wort. Coastal hammocks. Se. SC south to s. FL, west to s. MS. Liede (1997b) indicates that this species will likely be transferred to Orthosia DeCaisne in de Candolle, a large group primarily of the Caribbean, Central America and n. South America, but she refrains from the new combination pending further studies. [= RAB, K, WH; = Ampelamus scoparia (Nuttall) Small – S; Orthosia sp.]

Gonolobus Michaux 1803 (Anglepod)

1 Upper surface of corolla lobes uniformly colored, olive green on anthesis, glabrous; laminar dorsal anther appendage yellow, apex rounded or truncate; [of c. KY, e. TN, nw. AL westward].................................................................[G. suberosus var. granulatus]
1 Upper surface of corolla lobes multi-colored, generally dark maroon to brownish near the base and green to yellowish near the tips on anthesis (or uniformly yellowish-green to neon green in rare mutants), pubescent or glabrous; laminar dorsal anther appendage darkly purplish or maroonish tinted, apex bilobed to emarginate; [of se. VA south to c. peninsular FL, west to s. MS and inland to nw. GA]...............
..................................................................................................................G. suberosus var. suberosus

Gonolobus suberosus (Linnaeus) R. Brown var. granulatus (Scheele) Krings & Q.-Y. Xiang, Western Anglepod. C. KY, e. TN, nw. AL, and MS west to c. OK and c. TX. [= U, V; > Gonolobus suberosus (Linnaeus) R. Brown – Y; < Matelea gonocarpos (Walter) Shinners – K; <> Vincetoxicum gonocarpos Walter – S; <> Vincetoxicum suberosum (Linnaeus) Britton – S; >> Matelea gonocarpa – X; >> Gonolobus gonocarpus – Z]

Gonolobus suberosus (Linnaeus) R. Brown var. suberosus, Eastern Anglepod. Mesic to wet forests and thickets. June-August; September-November. Se. VA south to s. peninsular FL, west to s. MS, inland to nw. GA and c. KY. Rosatti (1989) and Drapalik (1969) have expressed considerable doubt about whether two species should be recognized; their view, supporting the recognition of a single species in our area, is followed here for now. However, studies by Krings & Xiang (2004, 2005) suggest that 2 entities should be circumscribed at the varietal level. Drapalik (1969) considered the basionym "suberosa" as not applicable to Matelea of North America; Reveal & Barrie (1992) lectotypified the name, resulting in it applying to our material. It has priority over "gonocarpus." [= U, V; > Matelea gonocarpa (Walter) Shinners – RAB, C, W; > Matelea suberosa (Linnaeus) Shinners – RAB, C, W; > Gonolobus gonocarpus (Walter) Perry – F, G; > Gonolobus suberosus (Linnaeus) R. Brown – F, Y; < Matelea gonocarpos (Walter) Shinners – K, WH; < Vincetoxicum gonocarpos Walter – S; > Vincetoxicum suberosum (Linnaeus) Britton – S; = Matelea gonocarpa – X; = Gonolobus gonocarpus – Z]
Matelea Aublet 1775 (Spinypod)

A genus of about 180 species, vines, primarily tropical and restricted to the New World. References: Drapalik (1969)=Z.

1 Plant a prostrate herb, usually not twining, with stems 0.2-0.6 (-1.1) m long at maturity; leaf blades 2.4- (6) cm long; cymes sessile; flowers (2-) 3-4 (-5) per inflorescence; upper (inner) surface of the petals pubescent; of xeric sandhills, from e. GA southward. \[= M. pubiflora \]

2 Inflorescence with 1-12 flowers, averaging 4-5; corolla light green, reticulated with darker green; corona disc-shaped, lacking 5 pairs of appendages; of mesic slopes of s. GA southward and westward. \[= M. floridana \]

3 Inflorescence with 2-35 flowers, averaging 9-19; corolla white, yellow, rose, or maroon (or greenish and reticulate in M. flavidula); corona cup-shaped, with 5 pairs of upright appendages alternating with 5 corona lobes; [collectively widespread].

4 Corolla lobes in a horizontal plane or slightly reflexed; flower buds ovoid, < 1.5× as long as wide; corolla lobes 1.5-2.6× as long as wide.

5 Corolla dark maroon (rarely maroon-yellow or yellow), not reticulate with darker veins; paired corona appendages always higher than the alternating corona lobes. \[= M. carolinensis \]

6 Corolla green, green-yellow, or yellow (rarely rosy or olive-maroon), reticulate with darker green veins; paired corona appendages about as high as the alternating corona lobes. \[= M. flavidula \]

7 Corolla lobes 2.4-3.6 (-4.0)× as long as wide, the widest part above the sinus; corolla dark maroon. \[= M. obliqua \]

8 Corolla lobes (3.2-) 4.0-6.2× as long as wide, the widest part at the sinus; corolla rose to light maroon (rarely dark maroon, green, or cream). \[= M. deciduus \]

Matelea baldwyniana (Sweet) Woodson, White Spinypod. Dry to mesic bluffs over calcareous rocks. Panhandle FL and sw. GA west to MO, AR, and OK. Drapalik (1969) discusses the probability that the name M. baldwyniana is based on material of M. flavidula. [= K, WH, Z; = Odontostephana baldwyniana (Sweet) Alexander – S]

Matelea carolinensis (Jacquin) Woodson, Carolina Spinypod. Moist to dry, nutrient-rich forests. April-June; July-October. DE, MD, KY, and s. MO south to GA and MS. [= RAB, C, K, W; = Gonolobus carolinensis (Jacquin) R. Brown ex J.A. Schultes – F, G; = Odontostephana carolinensis (Jacquin) Alexander – S]

Matelea deciduus (Alexander) Woodson, Deceptive Spinypod. Woodlands and thickets, generally over mafic (in the Piedmont) or calcareous rocks (in the Coastal Plain). April-June; August-October. VA south to nc. GA, AL, and e. TX, north in the interior to s. IL and MO. [= RAB, C, K; = Gonolobus deciduus (Alexander) Perry – F, G; = Odontostephana deciduus Alexander – S]

Matelea flavidula (Chapman) Woodson, Yellow Spinypod. Moist, nutrient-rich forests. May-June; August-October. E. NC (?) and e. SC south to Panhandle FL, apparently rare throughout its range. [= RAB, K, WH, Z; = Odontostephana flavidula (Chapman) Alexander – S]

Matelea obliqua (Jacquin) Woodson, Northern Spinypod, Limerock Milkvine. In forests, woodlands, or thickets over calcareous rocks. June-July; August-November. PA west to OH, IN, and MO, south to w. NC, nw. GA (Jones & Coile 1988), and TN. [= RAB, C, K, W; = Gonolobus obliquus (Jacquin) R. Brown ex J.A. Schultes – G; = G. obliquus – F; = G. shortii A. Gray – F; = Odontostephana obliqua (Jacquin) Alexander – S; = O. shortii (A. Gray) Alexander – S; = Matelea carolinensis – WV, misapplied]

Nerium Linnaeus 1753 (Oleander)
A monotypic genus, a shrub, of Mediterranean Europe.

* **Nerium oleander** Linnaeus, Oleander. Frequently cultivated, especially on barrier islands (because of its salt resistance), sometimes persistent; native of Mediterranean Europe. [= K, S, WH]

*Matelea decipiens* Matelea flavulosa *Matelea floridana* *Matelea obliqua* *Matelea peixifera* *Nerium oleander*

**Periploca** Linnaeus 1753 (Silkvine)

* **Periploca graeca** Linnaeus, Silkvine. Disturbed areas; native of Mediterranean Europe. July-August. Sometimes cultivated and escaped or persistent; it is reported for various states in e. North America, as in Knox County, TN (Chester, Wofford, & Kral 1997). [= RAB, C, K]

**Seutera** Reichenbach 1828 (Swallow-wort)

* **Seutera angustifolia** (Persoon) Fishbein & W.D. Stevens, Swallow-wort. Coastal hammocks, edges of marshes, generally or always on barrier islands. June-July; July-October. E. NC (Dare County) south to s. FL, west to TX; Bahamas and West Indies. See Krings (2005) for a discussion of typification. [= Y; *Cynanchum angustifolium* Persoon – GW, K, WH; *C. palustre* (Pursh) Heller – RAB; *Lyonia palustris* (Pursh) Small – S; *Funastrum angustifolium* (Persoon) Liede & Meve – Z]

**Trachelospermum** Lemaire 1851 (Climbing Dogbane)

A genus of about 20 species, vines, of se. Asia (India to Japan), except the single species of se. United States.

**Identification notes:** *Trachelospermum difforme* is sometimes mistaken at a glance for *Gelsemium* (both woody vines with opposite lanceolate leaves), but in the field the milky sap of *Trachelospermum* provides an immediate identifying characteristic.

1 Corolla lobes 3-4 mm long, acute, reflexed, pale yellow; leaves subcoriaceous; [native, common] ....................................................... ................................................. *T. difforme*
1 Corolla lobes 8-12 mm long, rounded, spreading, white; leaves coriaceous; [alien, commonly planted, rarely persistent or spreading] .............. ................................................. *T. jasminoides*

* **Trachelospermum jasminoides** (Lindley) Lemaire, Confederate Jasmine, Star Jasmine. Disturbed areas; native of se. Asia. April-May. Cultivated and sometimes persistent or spreading. Also reported for e. LA and to be expected along the Gulf coast in AL and MS. [= K, WH]

**Vinca** Linnaeus 1753 (Vinca, Periwinkle)

1 Leaves ovate, broadest near the base, cordate or subcordate-rounded at the base, 2-4 cm wide, thin in texture and deciduous to semi-evergreen; leaf margins ciliate; flowers 3-5 cm across. .............................................................................................................................................. *V. major*
1 Leaves lanceolate or elliptic, broadest near the middle, rounded to cuneate at the base, 1-1.5 cm wide, thick in texture and evergreen; leaf margins not ciliate; flowers 2-3 cm across. .............................................................................................................................................. *V. minor*

* **Vinca major** Linnaeus, Greater Periwinkle. Disturbed areas, suburban woodlands, around old house sites, persistent and spreading from cultivation; native of Europe. Late February-May; June-July. [= RAB, C, F, G, K, S, W]
1 Leaves entire, simple; style various.
2 Flowers all terminal in 3-many-flowered cymes.
3 Leaves opposite below, alternate above; petals 5-8 mm long; leaves elliptical in outline, pinnatifid into 7-13 lanceolate segments; calyx lobes to 10 mm long in fruit; capsule 4-seeded ................................................................. 16. Ellisia
3 Leaves alternate; petals 2-4 mm long; leaves broadly triangular in outline, divided into 3-5 obovate segments; calyx lobes 1-3 mm long; capsule 1-2 (-3)-seeded .................................................................................. 17. Nemophila
2 Flowers all terminal in 3-many-flowered cymes.
4 Inflorescence repeatedly branched subdichotomously; larger leaf blades > 8 cm wide; stamens well exerted from the corolla (3 mm or more beyond the corolla); plants perennial from fibrous roots ................................................................. 18. Hydrophyllum
4 Inflorescence with a strong central axis (some secondary branching in P. bipinnatifida, but not as above); larger leaf blades < 5 cm wide (except P. bipinnatifida); stamens slightly exerted from the corolla (< 3 mm beyond the corolla) (except well-exserted in P. bipinnatifida, included in P. ovata); plants annual (biennial in P. bipinnatifida) from a taproot ..................................................... 19. Phacelia

1 Leaves entire, simple; style various.
5 Styles 2, distinct to the summit of the ovary
6 Flowers in axillary cymes; capsule subglobose; leaves 2-12 cm long ................................................................. [see Hydroclea in HYDROELEACEAE]
6 Flowers solitary or paired in the leaf axils; capsule cylindrical; leaves 0.8-1.5 (-3.5) cm long; [subgenus Hydrophyllloideae] .... 15. Nama
5 Styles absent (the stigma sessile and terminal), single, or with 2 branches.
7 Ovary slightly 2-4-lobed, or not at all lobed; style terminal or reduced to a sessile terminal stigma; [subfamily Heliotropioideae]...........

A family of about 155 genera and ca. 3200 species, herbs, shrubs, and trees, nearly cosmopolitan (Al-Shehbaz 1991).

21 Corolla whitish or bluish white; plant annual from a slender taproot; leaves without evident lateral veins; mericarps brown, dull, wrinkled and pitted; [plant a weedy alien] ........................................ 7. Buglossoides
21 Corolla bright yellow-orange, or greenish-white; plant perennial from a thickened, woody rhizome; mericarps white, shining, smooth or pitted; [plant a native] ................................................................. 9. Lithospermum

1. Cynoglossum Linnaeus (Comfrey)

| 1. Flowering stem with leaves above the first inflorescence branch; corolla reddish-purple; [plant a biennial alien, weedy] | C. officinale |
| 1. Flowering stem leafless above the first branch; corolla blue or white; [plant a perennial native, not weedy] | |
| 2. Nutlets 3.5-5 mm; calyx at anthesis 2-2.5 mm long; corolla 6-8 mm wide, the lobes oblong and not overlapping | [C. virginianum var. boreale] |
| 2. Nutlets 5.5-9 mm; calyx at anthesis (3.0-) 3.5-4.5 mm long; corolla (8-) 10-12 mm wide, the lobes broadly rounded and more or less overlapping | C. virginianum var. virginianum |

Cynoglossum virginianum Linnaeus var. boreale (Fernald) Cooperrider, Northern Hound's-tongue, ranges from NB west to BC, south to CT, NY, c. PA, n. OH, MI, and MN. Cooperrider (1995) prefers varietal status for this taxon, stating that in OH there are numerous intermediates, while Voss (1996) and Rhoads & Klein (1993) maintain C. boreale at the species level. [= C, K; = C. boreale – F, G, Z; = C. virginianum ssp. boreale (Fernald) A. Haines – Y]

2. Hackelia Opiz (Stickseed)

3. Lappula Moench (Sheepbur)

| 1. Nutlets with 1 row of marginal prickles. | L. occidentalis var. occidentalis |
| 1. Nutlets with 2-3 rows of marginal prickles. | L. squarrosa |

4. Amsinckia Lehmann (Fiddleneck)

5. Anchusa Linnaeus (Bugloss, Alkanet)

**6. Borago** Linnaeus (Borage)

- **Borago officinalis** Linnaeus, Borage. Pd (VA), Mt (WV): disturbed areas; rare, native of s. Europe. [= C, F, G, K, Z]

**7. Buglossoides** Moench (Corn-gromwell)

A genus of about 7 species, herbs or shrubs, of temperate Eurasia. References: Al-Shehbaz (1991)=Z.

**8. Echium** Linnaeus (Viper's-bugloss, Blueweed)

A genus of about 60 species, herbs, widespread in the Old World. The common name is pronounced "bew-gloss," not "bug-loss," as it refers to an ox's tongue rather than to the departure of insects. References: Al-Shehbaz (1991)=Z.

1. Hairs of the stem pustular-based ................................................................. [E. pustulatum]
2. Hairs of the stem not pustular-based ........................................................... [E. vulgare]

**9. Lithospermum** Linnaeus (Gromwell, Puccoon, Stoneseed)

1. Corolla white or yellowish-white, the tube 4-8 mm long.
2. Plant with basal rosette; lower cauline leaves about equal in size to the upper cauline leaves; leaves acute to obtuse .......... [L. tuberosum]
3. Upper stem internodes mostly 1-2 cm long; leaves mostly <2 cm wide, acuminate or acute. .......... [L. latifolium]
4. Corolla tube 7-30 mm long. .......... [L. incisum]
5. Corolla tube 13-30 mm long; corolla lobes denticulate or lacerate; nutlets pitted .......... [L. canescens]
6. Corolla tube 7-14 mm long; corolla lobes entire; nutlets smooth.
7. Plant with dense, soft, appressed pubescence, the hairs usually without pustular bases; calyx lobes 6-8 mm long at maturity; nutlets 2-3 mm long [mostly of rocky or clayey circumneutral soils of the Piedmont and Mountains] .......... [L. canescens]
8. Lower cauline leaves smaller than the upper cauline leaves; leaves acuminate or acute.
9. Upper stem internodes mostly 3-6 cm long; leaves mostly >2 cm wide, acuminate. .......... [L. olivifolia]
10. Upper stem internodes mostly 1-2 cm long; leaves mostly <2 cm wide, acute ........... [L. officinale]
11. Corolla yellow-orange, the tube 7-30 mm long.
12. Corolla tube 13-30 mm long; corolla lobes denticulate or lacerate; nutlets pitted .......... [L. incisum]
13. Corolla tube 7-14 mm long; corolla lobes entire; nutlets smooth.
14. Plant with dense, soft, appressed pubescence, the hairs usually without pustular bases; calyx lobes 6-8 mm long at maturity; nutlets 2-3 mm long [mostly of rocky or clayey circumneutral soils of the Piedmont and Mountains] .......... [L. canescens]
15. Plant with scattered, stiff, spreading pubescence, the hairs with or without pustular bases; calyx lobes 10-15 mm long at maturity; nutlets 3.5-4.5 mm long [variously of sandy acidic soils of the Coastal Plain or inland].
16. Pustules with slender bases; mature calyx lobes flat; plants with 15-25 well-developed leaves below the inflorescence; [of sandy Coastal Plain habitats from se. VA southward] .......... [L. caroliniense]
17. Pustules with slender bases; mature calyx lobes flat; plants with 15-25 well-developed leaves below the inflorescence; [of sandy Coastal Plain habitats from se. VA southward] .......... [L. caroliniense]
18. Pustules with slender bases; mature calyx lobes strongly keeled; plants with (30-) 35-45 well-developed leaves below the inflorescence; [inland, known from west and north of our area] .......... [L. crocicum]

**Lithospermum canescens** (Michaux) Lehmann, Hoary Puccoon, Indian-paint. Pd (NC, SC, VA), Mt (GA, VA, WV), Cp? (VA): dry woodlands and glades over calcareous rocks (such as limestone, dolostone) or mafic rocks (such as diabase); uncommon (rare in NC). April-May. ON west to SK, south to e. SC, nw. GA, AL, and TX. [= RAB, C, F, G, K, W, WV, Y, Z; *= Batschia canescens Michaux – S]

**Lithospermum caroliniense** (Walter ex J.F. Gmelin) MacMillan, Coastal Plain Puccoon. Cp (FL, GA, SC, VA): sandhills, dry sandy soils; common (rare north of s. SC). April-June. A Southeastern Coastal Plain endemic: se. SC south to Panhandle FL, and west to TX. The disjunction from SC to se. VA, skipping over large amounts of apparently suitable sandhill habitat in
BORAGINACEAE 768

NC, is surprising. The sibling taxa L. caroliniense and L. croceum have been variously treated as distinct species, subspecies, or varieties, or as mere forms (see synonymy). They appear to be as clearly separable as L. caroliniense is from L. canescens; I regard them as allopatic species. [= F; < L. caroliniense – RAB, G, WH, Z; = L. caroliniense var. caroliniense – C, K; = Batschia caroliniensis Walter ex J.F. Gmelin – S; = L. caroliniense ssp. caroliniense – Y]

Lithospermum incisum Lehmann, Narrowleaf Gromwell. Cp (FL): disturbed areas; rare. April-July. S. ON west to BC, south to IN, LA, TX, and CA; disjunct from FL Panhandle south to c. peninsular FL. [= C, F, G, K, WH; = Batschia linearifolia (Goldie) Sm. – S]

Lithospermum croceum Fernald. ON west to MT, south to w. PA, n. OH, AR, OK, and CO. Reports by Kartesz (1999) for WV, KY, and TN have not been verified. [= F; = L. caroliniense (Walter ex J.F. Gmelin) Cronquist var. croceum (Fernald) MacMillan = L. caroliniense ssp. croceum A.W. Cusick – Y]

10. Mertensia Roth (Bluebell)

11. Myosotis Linnaeus (Forget-me-not, Scorpion-grass)

A genus of about 100 species, temperate and montane tropical. References: Al-Shehbaz (1991)=Z. Key based closely on RAB and C.

1 Calyx strigose, the hairs neither spreading nor uncinate; [mostly of moist to wet habitats].
2 Corolla limb 5-10 mm wide; mericarps not surpassing the style........................................................................................................... M. laxa ssp. laxa

1 Calyx with some loose or spreading, uncinate hairs; [of various habitats, mostly dry].
3 Corolla limb 1-4 mm wide; annual or biennial.
4 Calyx lobes unequal, 3 lobes shorter than the other 2; corolla white; [native, of dry or moist habitats].
5 Fruiting pedicels divergent; fruited calyx deciduous, 3-10 mm long; inflorescence internodes usually longer than 10 mm; mericarps 1.4-2.2 mm long........................................................................................................................................................ M. macroperma

5 Fruiting pedicels more-or-less erect; fruited calyx persistent, 3-5.5 mm long; inflorescence internodes usually shorter than 10 mm; mericarps 1.2-1.5 mm long......................................................................................................................................................... M. verna

4 Calyx lobes equal, all 5 the same size; corolla blue (occasionally yellow or white); [alien, mostly of dry disturbed habitats].
6 Fruiting pedicels equaling or generally longer than the calyx ................................................................................................. M. arvensis

6 Fruiting pedicels distinctly shorter than the calyx.
7 Plants floriferous from about the middle upward; style surpassing the mericarps .................................................................................. M. discolor

7 Plants floriferous nearly to the base; style shorter than the mericarps .................................................................................. M. stricta

12. *Onosmodium* Linnaeus (Marbleseed, False-gromwell)

A genus of about 7 species (or fewer species and the same number of taxa in some interpretations), perennial herbs, of North America. Recent studies strongly suggest that *Onosmodium* is better included in a broadened *Lithospermum* (Cohen & Davis 2009; Weigend et al. 2009). References: Cohen & Davis (2009); Cochrane (1976)=X; Turner (1995a)=Y; Al-Shehbaz (2009)=Z. Key based in part on X and Y.

1 Corolla lobes yellow to orange; nutlet 2.0-2.8 mm long; corolla lobes either 2.5-4× as long as wide and acuminate (*O. virginianum*) or 1.5-2× as long as wide, acute (*O. decipiens*).

2 Stem hairs 2.5-5.0 mm long; corolla lobes 1.5-2× as long as wide, acute; tips of the anthers reaching the base of the corolla sinuses; [endemic to Ketona dolomite glades, Bibb County, c. AL].

3 Leaf vestiture solely of dense appressed hairs on both surfaces (the plant appearing ashy-white).......................................................

4 Stems mostly glabrous below the inflorescence branches. .................................................................

5 Upper leaf surface with hairs of similar length, these appressed to ascending; corolla 11-20 mm long; nutlets tapered to the base, lacking a collar; longest stem hairs near midstem < 2.3 mm long ...........................................................................

6 Upper leaf surface with hairs of similar length, these appressed to ascending; corolla 11-20 mm long; nutlets tapered to the base, lacking a collar; longest stem hairs near midstem > 2.2 mm long .................................................................................

7 Lithospermum virginiense *Michaux*. Limestone barrens. C. KY, c. TN (Chester, Wofford, & Kral 1997), nw. AL, and disjunct in the Ozark Highlands of MO. *O. molle* has been attributed to Durham County, NC (RAB); Baskin et al. (1983) determined that this report was based on a misidentification of a specimen of *O. virginianum*. [= F, G, Y; = O. molle var. molle – C; = O. molle ssp. molle – K, X, Z; < O. molle – S; = Lithospermum species 4]

10 Lithospermum virginianum *Linnaeus* Alphonse de Candolle, Virginia Marbleseed. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): sandhill woodlands, shell middens in the outer Coastal Plain, woodlands and barrens over diabase and other mafic rocks in the Piedmont and low Mountains, barrens, glades, or woodlands over calcareous rocks in the Mountains; uncommon (rare in DE, NC, and VA). April-September. LA to FL, north to NY and MA, primarily on the Coastal Plain; the species has become very rare north of NC. It is peculiarly distributed in our area, occurring on highly acidic sands in the fall-line sandhills, but seemingly restricted to circumneutral soils derived from mafic rocks (Piedmont), calcareous rocks (Mountains), or calcarious shell (Coastal Plain) in the rest of our area. The unifying ecological factor determining its distribution may be an open, woodland condition maintained by fire. The species seems characteristically to occur in very small populations, consisting often of fewer than five plants. [= RAB, C, F, G, K, S, W, Y, Z; = Lithospermum virginianum Linnaeus]
13. **Plagiobothrys** Fischer & C.A. Meyer (Popcorn-flower)

14. **Symphytum** Linnaeus (Comfrey)

1 Upper leaves not decurrent, or decurrent < 1 cm below the leaf attachment; pubescence of stem in part of strong, recurved prickles (resembling miniature rose thorns) ............................................................... [S. asperum]

1 Upper leaves decurrent on the stem; pubescence of the stem not of prickles ........................................................................................................... S. officinale

* **Symphytum officinale** Linnaeus, Common Comfrey. Mt (GA, VA, WV), Pd (DE, VA), Cp (DE): disturbed areas; uncommon, native of Europe. Symphytum is a traditional "medicinal herb," but recent evidence suggests that it can cause dangerous (even fatal) liver damage. [= C, F, G, K, S, WV, Z]

* **Symphytum asperum** Lepechin, Prickly Comfrey, another Eurasian species, is reported by F as occurring south to MD. It may occur in our area. [= C, F, G, K, Z]

15. **Nama** Linnaeus 1753 (Fiddleleaf)

A genus of about 45 species, herbs, of sw. North America, tropical America, and Hawaii. [also see *Hydrolea* in HYDROLEACEAE]

* **Nama jamaicense** Linnaeus, Jamaica Weed. Cp (FL, SC): lawns; rare, native of tropical America (including s. FL and TX). May. [= K; = *N. jamaicensis* – RAB, WH, orthographic variant; = *Marileandium jamaicense* (Linnaeus) Kuntze – S]

16. **Ellisia** Linnaeus 1763 (Waterpod)

_Ellisia_ is considered to be a monotypic genus, an herb of c. and e. North America, but generic limits in the Hydrophyllaceae are badly in need of critical reassessment. References: Constance (1940)=Z.

**Ellisia nyctelea** (Linnaeus) Linnaeus, Waterpod, Aunt Lucy. Pd (VA), Mt (VA, WV): moist shaded forests, especially bottomlands; uncommon (rare in WV). April-July. IN and MI west to AR, south to AR and OK; disjunct in e. North America from s. NY and NJ south to sc. VA. Likely to occur in nc. NC. [= C, F, G, GW, K, W, WV, Z; = *Nyctelea nyctelea* (Linnaeus) Britton – S]

17. **Nemophila** Nuttall 1822 (Baby Blue-eyes)

**Identification notes:** _Nemophila_ is superficially similar to _Phacelia covillei_ and _P. ranunculacea_, with which it often co-occurs. They can be distinguished with the following key.

1 Flowers solitary, on pedicels opposite the leaves, the pedicels mostly > 12 mm long; corolla white (sometimes aging to pale lavender), 2.5-3.5 mm long; fruits ovoid, longer than thick, turning purple at maturity, exceeding the 2-4 mm long calyx lobes .......... _Nemophila aphylla_

1 Flowers borne in 2-6-flowered terminal cymes, the pedicels mostly < 12 mm long; corolla pale blue or lavender, 4-5 mm long; fruits depressed globose and weakly 4-lobed, the apex depressed, remaining green at maturity, shorter than the calyx, the lobes of which expand to 5-8 mm long.

2 Pubescence of the middle stem (from 2nd to 5th node from the base) consisting of appressed to ascending, stiff, pointed hairs, sometimes also with a few gland-tipped hairs < 2 mm long; terminal leaflet of leaves directly subending an inflorescence with acute to cuneate bases; [of rivers in the Atlantic drainage, very rarely disjunct west of the Appalachians] ................................................................. _Phacelia covillei_

2 Pubescence of the middle stem spreading or even retrorse, most of the hairs weak and twisted, and many of them glandular-tipped and > 2 mm long; terminal leaflet of leaves directly subending an inflorescence with obtuse to rounded or truncate bases; [of rivers in the Mississippi drainage] ........................................................................................................... _Phacelia ranunculacea_

**Nemophila aphylla** (Linnaeus) Brummitt. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): moist, nutrient-rich floodplain forests; uncommon, though often locally abundant (rare in FL). March-April. MD south to Panhandle FL and west to
18. *Hydrophyllum* Linnaeus 1753 (Waterleaf)

A genus of 8 species, herbs, of e. and w. North America. References: Constance (1942)=Z; Beckmann (1979)=Y; Alexander (1941)=X.

1 Principal cauline leaves palmately lobed, maple-like, differing from the pinnately divided basal leaves.
2 Sepals with small reflexed appendages exserted at each sinus of the calyx; plant biennial from a taproot; stamens exserted 1-3 mm beyond the corolla; leaf lobing relatively shallow and irregular ................................................................. *H. appendiculatum*
3 Sepals with appendages absent or rudimentary; plant perennial from fibrous roots; stamens exserted 3-6 mm beyond the corolla; leaf lobing relatively deep and regular ........................................................................................................... *H. canadense*
4 Corolla deep purple to maroon; lower stem glabrous to slightly (rarely moderately) pubescent with retrorse hairs; [of low to high elevations of the Mountains] ................................................................................................................................. *H. virginianum var. atranthum*
5 Corolla white to lavender or pale purple; lower stem slightly to densely pubescent with retrorse to spreading hairs; [of low elevations of the Piedmont, Mountains, and Coastal Plain] ........................................................................................................... *H. virginianum var. virginianum*

**Hydrophyllum appendiculatum** Michaux, Biennial Waterleaf. Mt (WV): rich forests; rare. May-June. S. ON and MN, south to sw. PA, a. and sc. WV, e. TN, n. AL (Jackson Co.), MO, and e. KS. It was attributed to NC by Small (1933) on unknown grounds. [= C, F, G, K, WV, Y, Z; = Decemium appendiculatum (Michaux) Small – S]

**Hydrophyllum canadense** Linnaeus, Mapleleaf Waterleaf, Canada Waterleaf, Broadleaf Waterleaf. Mt (GA, NC, SC, VA, WV), Pd (NC, VA), Cp (VA): cove forests, rocky streambanks, other moist and nutrient-rich forests; common (rare in VA Coastal Plain, rare in NC Piedmont, rare in sc. NC Mountains). May-August; August-September. VT and s. ON west to MI and WI, south to n. GA, AL, AR, and MO. [= RAB, C, F, G, K, S, W, WV, Y, Z]

**Hydrophyllum macrophyllum** Nuttall, Hairy Waterleaf. Mt (GA, NC, VA, WV): cove forests and other moist rocky forests, especially over calcareous or mafic rocks; uncommon (rare in GA, NC, and VA). May-June; July-August. WV west to OH, and IL, south to sw. VA, w. NC, n. GA, and n. AL; reports from AR are erroneous, and are based on material of *Hydrophyllum brownei* Kral & Bates (Peck 2003). The w. North American *H. occidentale* (S. Watson) A. Gray is rather closely related. [= RAB, C, F, G, K, S, W, WV, Y, Z]

**Hydrophyllum virginianum** Linnaeus var. *atranthum* (E.J. Alexander) Constance, Appalachian Waterleaf. Mt (NC, VA): cove forests and other moist rocky forests; common (uncommon in WV). May-June; July-August. N. WV south through w. and sw. VA and e. KY to w. NC and e. TN. Since its naming as a species (Alexander 1941) and subsequent reduction to a variety (Constance 1942) there has been little consensus about this taxon, some regarding it as merely a color form. Alexander lists numerous characters additional to that of flower color; they need further investigation. "*H. atranthum* differs from *H. virginianum* in the dark-violet flowers, the brown hairs on the appendages, brown filaments, corolla-lobes longer than the tube, stamens shorter [11.5 mm] and more slender, and the more numerous leaf-lobes. *H. virginianum* has flowers white to pale lavender or pinkish, white hairs on the appendages, white filaments, corolla-lobes and tube equal in length, filaments longer (13.5 mm) and stouter, and 5-7 leaf-segments." Beckmann (1979) did not accept the variety, stating that "this pigment combination appears sporadically in other sectors of the species range." Based on herbarium material, I have seen darker than usual flowers that are found outside of the Southern Appalachians; they do not, however, approach in darkness the flowers of Southern Appalachian material, and the somewhat darker-flowered plants outside the Southern Appalachians do not share the stem pubescence character stated in the key above. The general correlation of flower color and lower stem pubescence and the tight geographical range of var. *atranthum* incline me to accept it provisionally as a variety. It is not, however, limited to high elevations, as stated or implied by some authors. The two varieties provisionally accepted here need more careful study, including either statistical studies of morphology, or electrophoretic or molecular studies. [= C, F, G, WV, Y, Z; < *H. virginicum* – RAB, K, W, Y; < *H. virginicum* – S, orthographic error; = *H. atranthum* E.J. Alexander – X]

**Hydrophyllum virginianum** Linnaeus var. *virginianum*, Eastern Waterleaf, Virginia Waterleaf. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): cove forests, moist rocky forests, alluvial forests; common (rare in DE Coastal Plain). April-June; July-August. NH and QC west to ND, south to e. VA, c. NC, KY, s. IN, s. IL, nc. AR, and ne. OK. As discussed by Beckmann (1979) and Constance (1941), *H. virginianum* is a closely related vicariant of *H. tenuipes* Heller of BC south to CA. See *Phacelia bipinnatifida* for additional suggestions on distinguishing it from this species. [= C, F, G, WV, Y, Z; < *H. virginianum* – RAB, K, W, Y; < *H. virginicum* – S, orthographic error; = *H. virginianum* – X]

19. *Phacelia* A.L. de Jussieu 1789 (Phacelia)

Identification notes: 1. Phacelia bipinnatifida and Hydrophyllum virginianum are sometimes confused. *P. bipinnatifida* has the larger and more basal leaves distinctly bipinnatifid, the lower pinnae often stalked (vs. *pinnatifid*, the basal or terminal pinnae sometimes 2-lobed, all the pinnae more-or-less sessile), pubescence of the upper stem and inflorescence in part glandular (pubescence nonglandular), and seeds 4 per capsule, black (vs. 2 per capsule, light brown). 2. *Phacelia covillei* and *P. ranunculacea* are superficially similar to and sometimes confused with Nemophila aphylla, which see for discussion.

1 Corolla lobes fimbriate; seeds 4 per capsule.
2 Corolla white (rarely slightly lavender); pubescence of the stem spreading; lobes of cauline leaves mostly obtuse; seeds 3.0-3.5 mm long...
3 Stamens 1.5-2.5 mm long; style 1.5-2.5 mm long; corolla tubular; seeds globose-ovoid, nearly spherical, 4 per capsule.
4 Pubescence of the middle stem from 2nd to 5th node from the base consists of appressed to ascending, stiff, pointed hairs, sometimes also with a few gland-tipped hairs < 2 mm long; terminal leaflet of leaves directly subtending an inflorescence with acute to cuneate bases; [of rivers in the Atlantic drainage, very rarely disjunct west of the Appalachians] ................................. *P. covillei*
5 Pubescence of the middle stem spreading or even retrorse, most of the hairs weak and twisted, and many of them glandular-tipped and > 2 mm long; terminal leaflet of leaves directly subtending an inflorescence with obtuse to rounded or truncate bases; [of rivers in the Mississippi drainage] .................................................................................................................. [P. ranunculacea] 5
6 Stamens 3-10 mm long; style 3-15 mm long; corolla rotate to broadly campanulate; seeds ovoid-angled, 4-15 per capsule.
7 Sepals 2.6-4.0 mm long; petals 4-6 mm long; marginal bristles of sepals 0.6-0.9 mm long; basal leaves with 1-3 pairs of lateral leaflets. the terminal leaflet larger and usually 3-lobed; cauline leaves with 1-3 pairs of rather broad lobes; [of various habitats (including granitic flatrocks and domes) in SC, NC, and VA] .................................................................................. *P. dubia var. dubia*
8 Sepals 2.0-3.0 mm long; petals 3.5-5.5 mm long; marginal bristles of sepals 0.4-0.7 mm long; basal leaves with 4-5 pairs of lateral leaflets, the terminal leaflet about the same size and unlobed; cauline leaves with 2-4 pairs of narrow lobes; [of granitic flatrocks and domes of the Piedmont of SC and southwestward] .................................................................................. *P. dubia var. georgiana*

Phacelia bipinnatifida Michaux, Fernleaf Phacelia, Forest Phacelia. Mt (GA, NC, SC, VA, WV): cove forests, especially where rocky; common (uncommon in VA and WV, rare in SC). April-May; June. W. VA west to s. OH, n. IN, n. IL, and c. MO, south to w. NC, nw. SC, n. GA, c. AL, and n. AR. *P. bipinnatifida var. plummeri* (= *P. brevistyla*) is "based on a variation with sparser pubescence, larger and less divided leaf segments, smaller flowers, and sub-included stamens and style. These variations are not concomitant, and the distribution of forms showing a complete or partial combination of them is sporadic" (Constance 1949). The matter deserves additional study. [= RAB, C, G, K, W, Z; with sparser pubescence, larger and less divided leaf segments, smaller flowers, and sub-included stamens and style. These

Phacelia covillei S. Watson ex A. Gray, Eastern Buttercup Phacelia. Pd (NC, VA), Mt? (WV?): rich soils of floodplains, and contiguous terraces and slopes; rare. April; May. Ranging in three disjunct areas -- c. NC and sc. VA (in the drainages of the Cape Fear, Tar, and Roanoke rivers), DC, n. VA, and sc. MD (in the drainage of the Potomac River), and disjunct in Texas County, MO. Most recent authors have included this taxon within the closely similar *P. ranunculacea*; as thus broadly defined, *P. ranunculacea* was considered to occur in three peculiarly disjunct areas; one centered around St. Louis, MO (w. KY, w. TN, c. MO, ne. AR, se. MO, s. IL, and s. IN), one near Washington, DC (DC, n. VA, and sc. MD), and a third in c. NC and sc. VA. Sewell & Vincent (2006) have clarified the status of *P. covillei* and *P. ranunculacea*. Chuang & Constance (1977) felt that *P. covillei* and *P. ranunculacea* (sensus stricto) have numerous characteristics that rendered their inclusion in Phacelia uncomfortable (also see discussion in Constance 1949 and Gillett 1968), but Sewell & Vincent (2006) countered this idea. See Nemophila aphylla for suggestions on distinguishing these two superficially similar species. [= K, Y, < P. ranunculacea (Nuttall)]

Phacelia dubia (Linnaeus) Trelease var. dubia. Appalachian Phacelia. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (DE, NC, SC, VA): floodplain forests, rocky forests, fields, roadsides, granitic flatrocks; common (rare in DE). April-May; June. *Var. dubia* ranges from NY and PA west to WV, south to nc. SC, sw. NC, and se. TN. The *Phacelia dubia* complex has been under detailed biosystematic study by Foster Levy and associates (Levy 1991a, 1991b; Levy et al. 1996; Levy & Neal 2001; Taylor & Levy 2002; del Castillo 1994, 1998). Male sterile cytotypic variants are common in some populations but formal taxonomic recognition is not warranted (Levy 1991a, 1991b; del Castillo 1994, 1998). Additionally, an incipient variety, informally termed "imitator", occurs in c. SC (Levy 1991a; Levy & Malone 2001). These populations are morphologically variable, some more similar to var. georgiana, others more similar to var. dubia; see Levy (1991a) for further discussion. They may warrant taxonomic recognition, as they are allopatric from each of the 3 named varieties, and show degrees of sterility when bred with each of the three, but morphologic differences have not evolved (Levy & Malone 2001). [= K, Y, < P. dubia -- RAB, C, F, S, W, WV; > P. dubia var. dubia -- G; > P. dubia var. fallax (Fernald) Gleason -- G; > P. dubia var. dubia -- Z (also including var. interior)]

Phacelia dubia (Linnaeus) Trelease var. georgiana McVaugh, Georgia Phacelia. Pd (GA): granitic flatrocks; rare. April-May; June. *Var. georgiana* ranges from GA west to ec. AL, in the Piedmont. It has sometimes been attributed to SC, and Levy
found plants in SC which morphologically resemble var. georgiana, but he concluded that this "imitator" genotype was largely sterile when bred with var. georgiana. See var. dubia for additional discussion. [= K, Y, Z, < P. dubia – RAB, C, F, S, W; ? P. dubia var. dubia – G]

**Phacelia purshii** Buckley, Miami-mist. Mt (GA, NC, SC, VA, WV), Pd (VA): moist forests on floodplains and slopes; uncommon (rare in GA, NC, SC, and VA). May-June. S. PA west to s. ON, OH and MO, south to nw. SC, nw. GA, and c. AL. Plants "with smaller flowers, shorter pedicels, and smaller capsules and seeds" are the basis of *P. boykinii* and *P. bicknellii* (Constance 1949). A study of the matter was initiated and specimens annotated as "*P. purshii* ssp. boykinii," but the research was not completed and the name was never published; further study is warranted. [= RAB, C, F, G, K, W, WV, Z; > P. purshii – S; > P. boykinii (A. Gray) Small – S; > P. bicknellii Small – S]

**Phacelia dubia** (Linnaeus) Trelease var. interior Fernald, endemic in c. TN. [= K; < P. dubia – C, F, G, S, < P. dubia var. dubia – Z] (not yet keyed)

**Phacelia strictiflora** (Engelmann & Gray) Gray var. robbinensis Constance. East to AL. [= K, Z] (not yet keyed)

### 20. Asperugo Linnaeus (Madwort, Catchweed)

A monotypic genus, an annual scrambling herb, of Eurasia.

### 21. Heliotropium Linnaeus (Heliotrope, Turnsole)

A genus of ca. 250 species, widespread in tropical and temperate regions. Either treated as part of a broadly defined Boraginaceae, or else better placed in the family Heliotropiaceae, as it is apparently more closely related to Hydrophyllaceae than to Boraginaceae. Currently under study and additional taxonomic changes may be forthcoming (Hilger & Diane 2003).

1 Flowers solitary at the ends of short branches; [of limestone habitats from nw. GA westward]; [section Orthostachys, subsection Bracteata].................................................................................................................................................................................................**H. tenellum**

1 Flowers in secund, helicoid cymes.

2 Leaves glabrous, succulent, < 7 mm wide; [of saline coastal situations]; [section Halmyrophila] ..........**H. curassavicum** var. curassavicum

2 Leaves pubescent, not succulent, > 10 mm wide; [of a variety of mostly disturbed, inland situations].

3 Mericarps separating at maturity; fruit 4-lobed prior to maturation; leaves petiolate, ca. 2× as long as wide; [section Heliotropium]..............

4 Fruit longitudinally ribbed, 2-seeded; leaves petiolate, ca. 2× as long as wide; corolla throat and tube glabrous within; [section Tiaridium] ..............................................................................................................................................**H. amplexicaule**

4 Fruit tuberculate, 4-seeded; leaves sessile to subsessile, ca. 4-5× as long as wide; corolla throat and tube densely villous within; [section Halmyrophyllum] ..............

**Heliotropium curassavicum** Linnaeus var. curassavicum, Seaside Heliotrope. Cpb (DE, FL, GA, NC, SC, VA): edges of brackish and salt marshes, estuarine shores; rare. June-September. Var. curassavicum ranges from DE (and farther north as an introduction) south to the New World tropics. Considered by some authors to be introduced and naturalized in our area. Other varieties occur inland in the mw. and w. United States. [= C, K, Z; < H. curassavicum – RAB, GW; = H. curassavicum – F, G; = Heliotropium curassavicum ssp. curassavicum]

**Heliotropium tenellum** (Nuttall) Torrey, Delicate Heliotrope. Mt (GA, WV): limestone glades and barrens; rare. WV, KY, IN, IL, IA, and KS south to mw. GA, AL, MS, LA, and TX. [= C, F, G, K, Z; = Lithococa tenella (Nuttall) Small – S]
Heliotropium polyphyllum Lehmann, Pineland Heliotrope. Cp (FL): pine flatwoods, pond margins; common. FL. [= K] {add synonymy; not yet keyed}

357. CONVOLVLACEAE A.L. de Jussieu 1789 (Morning Glory Family) [in SOLANALES]

A family of about 56 genera and 1600 species, nearly cosmopolitan, especially in tropical and subtropical areas. Tribes follow the classification of Stefanović, Austin, & Olmstead (2003). References: Wilson (1960b); Austin (1979), Stefanović, Krueger, & Olmstead (2002); Stefanović, Austin, & Olmstead (2003). [including CUSCUTACEAE]

1 Plant parasitic; stems orange; [tribe Cuscuteae] ................................................. Cuscuta
1 Plant photosynthetic; stems green.

2 Corolla 0.1-0.2 cm long; capsule deeply 2-lobed; leaves orbicular-reniform, 1-3 cm long and wide, not fleshy; [tribe Dichondreaceae] ................. Dichondra
2 Corolla 1-10 cm long; capsule entire; leaves various, but not as above (most similar vegetatively are Calystegia soldanella, Ipomoea pes-caprae var. emarginata, and I. imperati, all beach plants with fleshy, emarginate, and usually larger leaves).

3 Styles 2, free nearly to the ovary or fused most of their length (at least the terminal 1-2 mm free); corolla 1-2.5 cm long; leaves cuneate or rounded at the base, and narrowly ovate, lanceolate, or linear; [tribe Cresseae].
4 Styles free, each 2-cleft, the stigmas therefore 4, linear-filiform .................................. Stylisma
4 Styles free or fused at the base, the stigmas 2, globose-peltate ................................................. Evolvulus

3 Styles 1 (sometimes with 2 stigmas, or a bilobed stigma); stigmas capitate, elongate, flattened, or filiform; corolla > 2.5 cm long (except Jacquemontia, Convolvulus, and a few Ipomoea spp.); leaves coriaceous, sagittate, or truncate at the base, and (mostly) ovate in outline.
5 Flowers in a dense head with numerous interspersed bracts; [tribe Jacquemontiaceae] .................................................. Jacquemontia
5 Flowers solitary or in an open, few-flowered inflorescence.

6 Calyx concealed by 2 large bracts; [tribe Convolvulaceae] ................................................. Calystegia
6 Calyx not concealed by bracts.

7 Stigmas 2, elongate; leaves 2-4 cm long, truncate or weakly hastate at base; corolla white or pink; [tribe Convolvulaceae] ................. Convolvulus
7 Stigma 1, capitate (sometimes lobed); leaves 3-15 cm long, mostly strongly hastate or ciliate at base; corolla white, pink, lavender, blue, orange, or red.

8 Anthers straight after dehiscence; fruits valvate-dehiscent; [tribe Merremiaceae] ....................... Merremia
8 Anthers twisted after dehiscence; fruits longitudinally or irregularly dehiscent; [tribe Merremiaceae] ....................... Merremia

Calystegia R. Brown 1810 (Bindweed)

1 Leaves about as wide as long, rounded at the tip. ................................................................. C. soldanella
1 Leaves longer than wide, abtuse , acute, or acuminated at the tip.

2 Flowers double, the corolla deeply divided into many parts (garden escape occasionally naturalised) .................................. C. pubescens
2 Flowers not double, corolla entire

3 Leaves densely white-tomentose beneath ................................................................. C. catesbeiana ssp. sericata
3 Leaves not densely white-tomentose beneath

4 Stems mostly less than 1.5 m, erect at least in the lower part, but sometimes twining towards the apex, flowers mostly borne in lower leaf axils.
5 Stems twining in the upper part; mostly 0.8-1.4 m high; leaves overtopping stem apex less than 1 cm long ......................... C. catesbeiana ssp. catesbeiana
5 Stems not twining, up to 0.6 m high; leaves overtopping the stem apex 1.5-6 cm long.
6 Stem and leaves glabrous to pubescent; leaves more or less flat at maturity, with basal lobes 0-5 mm long ......................... C. spithamaea ssp. spithamaea
6 Stem and leaves tomentose; leaves tending to be folded along midrib at maturity, with basal lobes 1-11 mm long ......................... C. spithamaea ssp. stans

4 Stems strongly twining, up to 4 m or more long; flowers borne along middle and upper stems
7 Corolla pink.
8 Bracteoles forming a continuous spiral series with sepalts, the flower appearing to have 3 bracteoles when seen from side; leaves with almost closed sinus, the lobes posteriorly truncate ............................................ C. sepium ssp. erratica
8 Bracteoles clearly distinct from sepalts, obviously only 2; leaves with a wide or v-shaped sinus.

9 Leaves with basal lobes rounded or with a single angle, or if with 2 angles then not spreading; plant glabrous or commonly pubescent to tomentose on stem and ................................................. C. sepium ssp. americana
9 Leaves with lobes with 2 angles, spreading; plant glabrous ................................................. C. sepium ssp. appalachiana
10 Bracteoles saccate at base, obtuse to truncate at apex, strongly overlapping each other; leaf sinuses with more or less parallel sides; often with 2 peduncles in the same leaf axil ................................................. C. silvatica ssp. fraterniflora
10 Bracteoles flat to weakly saccate at base, more or less acute, not or scarcely overlapping each other, leaf sinus not parallel sided; peduncles solitary in leaf axils.
Convolvulaceae 775

11 Leaves with spreading basal lobes, each lobe more or less 2-angled, sinus broadly rounded; plant glabrous

11 Leaves with posteriorly directed lobes, the blade often conspicuously narrowly triangular to linear; stems and leaves often strongly pubescent.

C. sepium ssp. angulata

Calystegia catesbeiana Pursh, Catesby's Bindweed. Mt (WV), Cp (VA), {GA, NC, SC}: longleaf pine savannas, marsh edges, openings in dry to dry-mesic montane forests; {abundance} (rare in GA, VA, and WV). [= K; < Calystegia spithamaea – C; < Convolvulus spithamaeus Linnaeus var. pubescens (Gray) Fernald – F; = Calystegia sericata (House) Bell – RAB, W; = Convolvulus sericus House – S, Z]

* Calystegia pubescens Lindley. Mt (WV), {NC, VA}, rare in WV, native of e. Asia. {Calystegia sepium – RAB, C, GW, W; < Convolvulus spithamaeus Linnaeus var. repens (Linnaeus) A. Gray – F, WV, Z; > Convolvulus sepium Linnaeus var. repens (Linnaeus) A. Gray – G; > Convolvulus sepium var. americanus Sims – G; > Convolvulus americana (Sims) Greene – S; > Convolvulus repens Linnaeus – S}

Calystegia sepium (Linnaeus) R. Brown ssp. angulata (Sims) Brummitt. Mt (WV), {GA, NC, SC, VA}: {habitats}; uncommon in VA and WV. [= K; < Calystegia sepium – RAB, C, GW, W; < Convolvulus sepium Linnaeus var. sepium – F, G, Z]

Calystegia sepium (Linnaeus) R. Brown ssp. angulata (Sims) Brummitt. Mt (WV), {GA, NC, SC, VA}: {habitats}; common in WV. [= K; < Calystegia sepium – RAB, C, GW, W; < Convolvulus sepium Linnaeus var. sepium – F, G, Z; = Convolvulus limnophila Greene]

Calystegia sepium (Linnaeus) R. Brown ssp. pubescens. Mt (WV), {DE, GA, NC, SC, VA}: {habitats}; common in WV. [= K; < Calystegia sepium – RAB, C, GW, W; > Convolvulus sepium Linnaeus var. sepium – F, V, Z; > Convolvulus sepium var. – G; > Convolvulus sepium var. communis R. Tryon – G; > Convolvulus sepium – S]

Calystegia silvatica Grisebach ssp. fraterniflora (Mackenzie & Bush) Brummitt. Mt (VA, WV), Pd (VA), Cp (VA), {GA, NC, SC}: {habitats}; uncommon in VA, rare in WV. Ssp. silvatica and ssp. disjuncta are European. [= K; < Calystegia sepium – C; > Convolvulus sepium Linnaeus var. fraterniflorus Mackenzie & Bush – F, G, WV, Z; = Calystegia sepium (Linnaeus) R. Brown var. fraterniflora (Mackenzie & Bush) Shinners]

* Calystegia soldanella (Linnaeus) R. Brown ex Roemer & J.A. Schultz. Cp (NC, VA): beaches, dunes; rare, native of []. [= RAB, K; = Convolvulus soldanella Linnaeus]

Calystegia spithamaea (Linnaeus) Pursh ssp. spithamaea, Low Bindweed. Pd (DE, VA), Mt (VA, WV): dry limestone areas; uncommon in VA and WV. [= K; < Calystegia spithamaea – RAB, C, W; = Calystegia spithamaea var. spithamaea; = Convolvulus spithamaeus var. spithamaeus – F; > Convolvulus spithamaeus Linnaeus – G, S; < Convolvulus spithamaeus – Z]

Calystegia spithamaea (Linnaeus) Pursh ssp. stans (Michaux) Brummitt, Shale Bindweed. Mt (GA, NC, SC, WA, VA): shale barrens and woodlands, less typically on limestone; uncommon. {Calystegia spithamaea (Linnaeus) Pursh ssp. purshiana (Wherry) Brummitt – K; > Calystegia spithamaea ssp. stans (Michaux) Brummitt – K; < Calystegia spithamaea – RAB, C, W; > Calystegia spithamaea var. pubescens; > Convolvulus spithamaeus Linnaeus var. pubescens (A. Gray) Fernald – F; > Convolvulus purshianus Wherry – G; > Convolvulus spithamaeus – G; < Convolvulus spithamaeus – Z]

Calystegia macounii (Greene) Brummitt. Reported for NC and VA; Brummitt says this species does not occur east of the Mississippi River. Rejected pending convincing documentation. [= K, Y; = Convolvulus macounii Greene] {not keyed}

Convolvulus Linnaeus 1753 (Field-bindweed)

A genus of about 100 species, vines, cosmopolitan, especially in temperate areas. [also see Calystegia]

Cuscuta Linnaeus 1753 (Dodder)

Identification notes: corolla measurements are from the base to the sinuses of the corolla. The infrastaminal scales are transparent structures at the base of the stamens.

1 Styles more-or-less united; capsule circumscissile; [subgenus Monogynella]
CONVOLVULACEAE

Cuscuta harperi Small, Harper's Dodder. Cp (GA), Pd (GA): outcrops of granite (Piedmont) and Altamaha grit (Coastal Plain), typically on plants such as Liatris microcephala, Bigelovia nutallii, Hypericum gentianoides, and Croton willdenowii; rare. September-November. C. and we. GA west to nw. AL. [= K, S, V, Z]

* Cuscuta japonica Choisy, Japanese Dodder. Mt (SC), Cp (FL): disturbed area; rare, native of e. Asia. Apparently eradicated in Pickens County, SC. [= K, WH, Z]

**Cuscuta obtusiflora** Künth var. *glandulosa* Engelm, Glandular Dodder. Cp (FL, GA): on herbs in calcareous glades and other habitats; rare. GA and OK south to FL, TX, Mexico; West Indies. See Anderson (2007) for FL Panhandle record. [= C, GW, S, WH, X; = C. glandulosa Small – S]

**Cuscuta polygonorum** Engelm, Smartweed Dodder. Cp (DE), Pd (DE, VA), Mt (VA, WV): on *Polygonum* and other hosts; rare. NY and ON west to ND, south to FL and TX. [= C, F, G, K, S, W, V, Y, Z]

**Cuscuta cuspidata** Engelm. IN, ND, and UT south to KY, MS, TX, and NM. [= C, F, K, X, Z]

**Cuscuta glomerata** Choisy. OH, MI, MN, and ND south to KY, TN, MS, and TX. [= C, F, G, GW, K, S, X, Z]

* Cuscuta suaveolens Seringe, Fringed Dodder. Scattered sites in eastern North America, including AL, MD, and OH. [= C, G, K, Z]

**Dichondra J.R. Forster & G. Forster 1775 (Ponyfoot, Dichondra)**

A genus of about 9 species, of tropical and subtropical and warm temperate areas. References: Tharp & Johnston (1961)=Z.

1 Calyx lobes > 2× as long as wide, exceeding the fruit; pedicels straight or nearly so .................................................................................................. *D. carolinensis*
1 Calyx lobes < 2× as long as wide, shorter than the fruit; pedicel strongly recurved just below the calyx ........................................................................ *D. micrantha*

**Dichondra carolinensis** Michaux, Carolina Ponyfoot. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt*, (VA*, WV*): lawns, roadsides, moist pinelands; common (uncommon in VA, rare in Mountains of VA and WV). March-May. Se. VA south to s. FL, west to AR and TX; also in Bermuda and reported for the Bahamas; sometimes adventive beyond that range. This plant is rarely seen in a "natural" habitat, but is often seen in lawns and other mowed grassy areas. [= RAB, C, GW, K, S, WH, Z; = *D. repens J.R. Forster var. carolinensis* (Michaux) Choisy – F, G]

**Evolvulus Linnaeus 1762 (Dwarf Morning-glory)**

A genus of about 90-100 species, almost all of tropical, subtropical, and warm temperate America. References: Ward (1968); Wilson (1960b)=Z.

1 Leaves densely pilose on both surfaces with spreading to loosely appressed hairs; internodes short, generally < 1 cm long; [calcareous glades and barrens of c. TN] .................................................................................................................. *E. sericeus* 
1 Leaves densely pilose with appressed (sericeous) hairs below, the upper surface glabrous or loosely pubescent; internodes long, many over 1.5 cm long; [wet flatwoods, seepages, bogs, Altaxma GRIT outcrops in the the Coastal Plain] .................................................................................................................. *E. sericeus var. sericeus*

**Evolvulus sericeus** Swartz var. *sericeus*, Silky Dwarf Morning-glory. Cp (FL, GA): wet flatwoods, seepages, bogs, Altaxma GRIT outcrops; uncommon (rare in GA). Coastal Plain of SC (Appling, Jeff Davis, and Coffee counties) (Bridges & Orzell 1989; Patrick, Allison, & Krakow 1995) south to s. FL; AR and LA west to AZ, south into Mexico; West Indies. [= K; < *E. sericeus* – S, WH, Z]

**Evolvulus nuttalianus** J.A. Schultz, Shaggy Dwarf'Morning-glory, in c. TN (Chester, Wofford, & Kral 1997), disjunct from the Great Plains. [= K; < *E. nuttalianus* – C, orthographic variant; = *E. pilosus Nuttall – G*]

**Ipomoea Linnaeus 1753 (Morning-glory)**

**Ipomoea alba** Linnaeus, Moonflowers, Tropical Morning-glory. Cp (FL): hammocks, marsh edges; rare. Ne. FL south to s. FL. [= WH; *Calonyction aculeatum* (Linnaeus) House]  
*Ipomoea batatas* (Linnaeus) Lamarck, Sweet Potato. Cp (FL, GA?, NC, SC, VA?): persistent in fields after cultivation, disturbed areas; rare, apparently native of tropical America. [= RAB, K, S, Y, Z]  

**Ipomoea hederifolia** Linnaeus, Scarlet Creeper. Cp (FL, GA, NC, SC): disturbed areas; uncommon. [Distribution in our area uncertain, native of tropical America – Kartesz (1999) says GA only] [= GW, K, WH, Y, Z; = I. coccinea Linnaeus var. hederifolia (Linnaeus) A. Gray]

**Ipomoea imperati** (Vahl) Grisebach, Beach Morning-glory. Cp (FL, GA, NC, SC): beaches, dune blowouts, fore-dunes; common (rare in NC and SC). August-October. Se. NC south to s. FL, west to TX, and extensively distributed in the tropics. [= K, WH, Y; = I. stolonifera (Cirillo) J.F. Gmelin – RAB, GW, S, Z]

**Ipomoea indica** (Burmann) Merr. var. acuminata (Vahl) Forsberg. Cp (FL): hammocks, coastal areas, disturbed areas; uncommon. Also AL, MS, LA. [= K, WH; = Pharbitis cathartica (Poiret) Choisy – S] [add to synonymy]

**Ipomoea macrorhiza** Michaux, Indian-Midden Morning-glory, Manroot. Cp (FL, GA, NC, SC): hammocks, shell middens, dry sands, disturbed maritime areas; uncommon (rare north of FL). June-July. Se. NC south to s. FL, west to s. AL. [= RAB, K, S, WH, Y, Z]

**Ipomoea pes-caprae** (Linnaeus) R. Brown var. emarginata Hallier f., Railroad Vine, Goat's-foot, Bay Hops, Bay Winders. Cp (FL, GA, NC, SC): ocean beaches; uncommon (rare north of FL). E. NC (Carteret County), SC (Beaufort, Horry, Charleston, Colleton, and Georgetown counties), south to FL, west to TX, and widespread on tropical shores of the the New World and Old World. The records in the Carolinas may reflect the periodic arrival of sea-borne seeds. [= I. pes-caprae – GW, S, Z; = I. pes-caprae ssp. brasiliensis (Linnaeus) van Ooststroom – K, WH, Y]

**Ipomoea sagittata** Poiret. Cp (FL, GA, NC, SC): edges of brackish marshes, moist thickets on barrier islands, hammocks; common. July–September. E. NC south to s. FL, west to TX, also in the West Indies. [= RAB, GW, K, S, WH, Y, Z]

**Ipomoea tricolor** Linnaeus, Little-bell. Cp (FL): hammocks, sand dunes; uncommon. N. FL south to s. FL; West Indies; New World and Old World tropics. [= S, WH] [add to synonymy]

**Ipomoeawrightii** A. Gray. Cp (FL, GA): disturbed areas; rare, native of India. Reported as likely naturalized in central TN, "spreading northward from the Gulf Coastal Plain" (Kral 1981). It also is known from GA (Kartesz 1999). [= K, WH; = I. heathyphylla Voigt – S] [synonymy incomplete]

- Ipomoea × multiforma (Rafinesque) Shinners [I. coccinea × quamoclit], Cardinal Climber, is cultivated and may escape. [= K] [not keyed]
- Ipomoea nil (Linnaeus) Roth occurs in scattered states, such as MD and MS, as a rare introduction from tropical America (Kartesz 1999). [= K, Y, Z; = Pharbitis nil (Linnaeus) Choisy – S]
- Ipomoea tricolor (Merremia) Cavanilles is reported for several locations in se. PA (Rhoads & Klein 1993). [= K] [not yet keyed; synonymy incomplete]

**Jacquemontia** Choisy 1834 (Jacquemontia)

A genus of about 90 species, tropical, subtropical, and warm temperate areas, especially America. References: Wilson (1960b)=Z.

**Jacquemontia tannifolia** (Linnaeus) Grisebach, Jacquemontia. Cp (FL, GA, NC, SC, VA), Pd (GA, SC): fields, roadsides, other disturbed areas; common (uncommon in CA, NC, SC, rare in VA). August-September. Se. VA south to FL, west to AR and TX; also widespread in West Indies, Central America, and South America, its original range difficult to determine. In our area, it is probably adventive. Fox, Godfrey, & Blomquist (1952) report the first collections of the species in NC, in 1938 and 1950, from obviously disturbed situations. [= RAB, C, F, G, GW, K, WH, Y, Z; = Thyella tannifolia (Linnaeus) Rafinesque – S]

**Merremia** Dennstedt ex Endlicher 1838
CONVOLVULACEAE

References: Wilson (1960b)=Z.

* Merremia dissecta (Jacquin) Hallier f., Noyau Vine. Cp (FL, GA): disturbed areas; common (rare in GA), native of South America. Ranges as far north as e. and sw. GA. [= K, WH, Z; =? Ipomoea sinuata Ortega; = Operaculina dissecta (Jacquin) House]

Stylisma Rafinesque 1825 (Dawnflower)

A genus of about 6 species (and about 8 taxa), vining to trailing herbs, endemic to se. North America. References: Myint (1966)=Z; Shinners (1962d)=Y; Wilson (1960b)=X.

1 Corolla < 2× as long as the calyx; leaves < 2 cm long; [of FL] ................................................................. S. abdita
1 Corolla > 2× as long as the calyx; leaves (at least the larger on a plant) > 2 cm long; [collectively widespread.

2 Corolla pink or purple; filaments glabrous, or nearly so; leaves densely and conspicuously silvery-sericeous; [of seasonally wet habitats]...

........................................................................ S. aquatica
2 Corolla white; filaments villous, at least near the base; leaves puberulent or pubescent, but not conspicuously silky-sericeous; [of dry habitats.

3 Larger leaves (> 1-) 12-30 mm wide; peduncles with 1 (1-) 3-7 (-12) flowers; stems with a tendency to twine, at least near growing tip.
4 Sepals glabrous; [widespread in the Coastal Plain and Piedmont of our area] ................................................................. S. humistrata
4 Sepals densely villous; [of s. GA southward and westward] ................................................................. S. villosa
3 Larger 2-10 mm wide; peduncles with 1 (-5) flowers; stems without a tendency to twine.
5 Bracteoles (2-) 10-20 mm long; stylar branches usually fused more than 5/6 of the total length (occasionally fused less than 1/6 of length), the free portion of the stylar branches usually less than 3 mm long; sepal villous, 4-6 (-7) mm long, ovate-elliptic with obtuse to acute apices; leaves 1-3 mm wide.
6 Stylar branches 1-1.5 mm long, usually unequal in length, the longer nearly 2× as long as the shorter; sepals mostly acute; [of MS westward] ................................................................. [S. pickeringii var. patersonii]
6 Stylar branches 2-3 mm long, nearly equal, the longer 1.0-1.3× as long as the shorter; sepals mostly obtuse; [of NC south and west to AL; disjunct in NJ] ...................... S. pickeringii var. pickeringii
5 Bracteoles 1-3 (-5) mm long; stylar branches free nearly to the base, the free portion more than 5 mm long; sepal villous or glabrous, 6-9 mm long, ovate-lanceolate with acuminate apices; leaves 2-10 mm wide.
7 Sepals glabrous (glabrate), though the margins ciliate; leaves 2-3 (-5) mm wide, mostly 7-15 × as long as wide...

.................................................................................................................................................. S. patens var. angustifolia
7 Sepals moderately to densely villous; leaves 3-10 mm wide, mostly 4-6 × as long as wide...................... S. patens var. patens

Stylisma abdita Myint. Cp (FL): scrub; rare. Ne. FL (Clay County) south to s. FL. [= K, WH, Z; = Bonamia abdita (Myint) R.W. Long.]

Stylisma aquatica (Walter) Rafinesque, Water Dawnflower. Cp (AL, FL, GA, LA, MS, NC, SC): clay-based Carolina bays and wet savannas; uncommon (rare in NC and SC). June-July. Se. NC south to c. and w. FL Panhandle, west to se. AR and e. TX. S. aquatica, as the epithet implies, occurs in wetter habitats than our other species. [= GW, K, WH, Z; = Bonamia aquatica (Walter) A. Gray – RAB, Y; = Breweria michauxii Fernald & Schubert – F; = Bonamia michauxii (Fernald & Schubert) K.A. Wilson – X]

Stylisma humistrata (Walter) Chapman, Southern Dawnflower. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): sandhills and other dry woodlands, especially on dry stream terraces; common (uncommon in FL and rare in VA). June-August. Se. VA south to Panhandle FL, west to AR and e. TX, north in the interior to n. AL and w. TN. [= C, K, WH, Z; = Bonamia humistrata (Walter) A. Gray – RAB, X, Y; = Breweria humistrata (Walter) A. Gray – F, G]

Stylisma patens (Desrousseaux) Myint var. patens, Common Dawnflower. Cp (GA, NC, SC): sandhills and other relatively dry sandy areas; common. June-August. Overall, the most common and widely widespread taxon of the genus in our area, regularly encountered in its habitat. E. NC south to n. FL, and west to s. MS. [= Stylisma patens (Desrousseaux) Myint ssp. patens – K, Z; = Bonamia patens (Desrousseaux) Shinners var. patens – RAB, Y; = S. trichosanthes (Michaux) House – S; < S. patens – WH; = Bonamia aquatica (Walter) A. Gray – X, misapplied]

Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. pickeringii, Pickering's Dawnflower. Cp (AL, GA, MS, NC, NJ, SC): sandhills, usually in the driest, most barren, deep-sand areas, occasionally colonizing dry, disturbed areas in sandhills, such as sandy roadbanks, known from the Fall-Line Sandhills, aelöion rings of Carolina bays, and sandhills on relict riverine dunes along Coastal Plain rivers; rare. June-August (-September); July-September. Var. pickeringii ranges from s. NC south through SC, GA, AL, and e. MS, with a disjunct area in the Pine Barrens of s. NJ, sometimes treated as a separate variety “caesariensis” (see synonymy). This rare species is easily recognizable by its globose fruit, with numerous stems arching from a central point, then trailing radially away, forming a mound 1-2 meters in diameter. The narrowly linear leaves are borne vertically. Fernald and Schubert (1949) named four varieties in this widely but disjunctly distributed species; Myint (1966) reduced this to two varieties, one eastern and one western. [= C, K, Z; < Bonamia pickeringii (Torrey ex M.A. Curtis) A. Gray – RAB, X, Y; > Breweria pickeringii (Torrey ex M.A. Curtis) A. Gray var. pickeringii – F; > Breweria pickeringii var. caesariensis Fernald & Schubert – F; < Breweria pickeringii – G; < Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray – S]

Stylisma villosa (Nash) House, Hairy Dawnflower. Cp (FL, GA): sandhills, scrub; uncommon (rare in GA). Late April-July. S. GA south to s. FL, west to e. TX. [= K, WH, Z; = Bonamia villosa (Nash) K.A. Wilson – X, Y; = Breweria villosa Nash]
**CONVOLVULACEAE**

Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. pattersonii (Fernald & Schubert) Myint. Cp (MS): sandhills; rare. IL and IA south through KS and OK to w. LA and e. TX; disjunct east of the Mississippi River in w. MS (the material somewhat ambiguous as to varietal affinity). [= K, Z; < Bonamia pickeringii (Torrey ex M.A. Curtis) A. Gray – X, Y; < Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray – S]

---

**358. SOLANACEAE** A.L. Jussieu 1789 (Nightshade Family) [in SOLANALES]

Subfamily Browallioidae: Cestrum
Subfamily Nicotanioidae: Calibrachoa, Nicotiana, Nierembergia, Petunia
Subfamily Solanoideae, tribe Solaneae: Alkekengi, Capsicum, Physalis, Salpichroa, Solanum
Subfamily Solanoideae, tribe Datureae: Datura
Subfamily Solanoideae, tribe Lycieae: Lycium
Subfamily Solanoideae, tribe Nicandreae: Nicandra
Subfamily Solanoideae, tribe Hyoscyameae: Hyoscyamus

1 Fruiting calyx bright red (fresh or dry); corolla white; [cultivated and weakly naturalized near gardens] ...................................................... Alkekengi

2 Fruiting calyx green, yellow, or orange, drying brown or tan; corolla yellow, often marked with 5 large spots in the throat; [collectively widespread] .............................................................................................................................................................................................. Physalis

**Alkekengi** P. Miller 1754 (Chinese-lantern Plant)

A monotypic genus, a perennial herb, native of e. Asia. I here separate Alkekengi from Physalis as generically distinct, on the presumption that the re-typification of Physalis proposed by Whitson (2011) will be accepted. References: Mione et al. (1994); Whitson & Manos (2005); Whitson (2011).

* Alkekengi officinarum Moench, Chinese-lantern Plant. Pd (DE), Mt (WV), {VA?): disturbed suburban areas; uncommon (rare in VA), native of Japan, Korea, and n. China. Commonly cultivated as an ornamental and occasionally naturalized in e. North America, as at scattered locations in TN (Chester, Wofford, & Kral 1997). It is perennial, readily recognized by its mature calyces red-orange and up to 5 cm long. [= Physalis alkekengi Linnaeus – C, F, G, K, WV, Z]

**Bouchetia** Augustin de Candolle ex Dunal 1852 (Bouchetia)

A genus of about 3-4 species, tropical American.

*Bouchetia erecta* A.P. de Candolle. {MS}. Reported for MS and TX. [= K; = Salpiglossis erecta (A.P. de Candolle) D’Arcy] {synonymy incomplete}

**Calibrachoa** Cervantes 1825 (Seaside Petunia)

References: Hunziker (2001)=Z.

**Capsicum** Linnaeus 1753 (Red Pepper, Chile)

1 Flowers usually only one per node after the first flowering node (rarely more); corolla bright to milky white (rarely bluish or violet) .............. .......................... .......................................................................................................................... C. annuum

1 Flowers 2-5 per node above the first flowering node; corolla greenish-white

2 Pedicel of mature fruit with constriction (waist) at junction with calyx; pedicels declining or erect at anthesis; corolla lobes planar; [habanero, scotch bonnet] .................................................................................................................................................................[C. chinense]

2 Pedicel of mature fruit broadening evenly into the calyx, without constriction; pedicels erect at anthesis, the flower itself nodding; corolla lobes usually slightly revolute; [tabasco] .............................................................................................................................................................................. C. frutescens
**Capsicum annuum** Linnaeus, Bell Pepper, Chile, Pimiento, Paprika, Chile Piquin, Ancho, Cayenne, Pepperoncini, Jalapeño, Serrano, Chiltepin, and others. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA): naturalized or persistent from gardens; commonly cultivated, rare as a naturalized species, native of Mexico (but early spread through Central America by native Americans, and since nearly worldwide in distribution at least in cultivation). June-frost. A very influential food crop introduced from the New World to the Old World, now important in various (especially tropical or subtropical) cuisines, including Hunan, Szechuan, Indian, Thai, various African, Mexican, and others. The great majority of our cultivated forms are of this species. The wild form, var. *glabriusculum*, was certainly present at one time in the Southeast and may still be represented in our area as reverted forms; it probably cannot be reliably distinguished from cultivars of *C. annuum*, and the two are not here distinguished taxonomically. [= RAB, S; > *C. annuum var. annuum* – K, V, X, Y, Z; > *Capsicum annuum* Linnaeus var. *glabriusculum* (Dunal) Heiser & Pickersgill – K, V, X; > *C. annuum var. aviculare* (Dierbach) D’Arcy & Eshbaugh – Y, Z]

* Capsicum chinense* Jacquin, Habanero, Scotch Bonnet. Rarely cultivated, not (yet) reported as persistent or escaped. Native of Andean South America. [= V, Y, = Z]

**Cestrum** Linnaeus 1753 (Night-flowering Jessamine)

A genus of 150-200 shrubs (rarely trees or vines), of Tropical America. References: Hunziker (2001) = Z.

**Datura** Linnaeus 1753 (Jimsonweed)

A genus of about 10 species, of s. North America (probably originally native to sw. United States and Mexico). Several species of *Datura* are known to have been in our area at the time of first settlement by Europeans. They may have been weeds in Indian fields, or grown for their hallucinogenic properties. The common name "Jimsonweed" is a corruption of "Jamestown Weed." References: Avery, Satina, & Rietsema (1959) = Z. [needs thorough rework, based on herbarium material and clarification of nomenclature]

1 Calyx 3-5 cm long, the tube strongly angled, the angles even narrowly winged; corolla 7-10 cm long; capsule erect, dehiscent by 4 valves; [section *Datura*].............................................................................................................................................................................................. *D. inoxia*..............................................................................................................................................................................................................

1 Calyx 5-15 cm long, the tube terete or slightly angled; corolla 12-25 cm long; capsule inclined or nodding, irregularly dehiscent; [section *Datura*].
2 Corolla with 10 teeth, lavender; spines of capsule few, very stout-based .............................................................................................. *D. metel*..............................................................................................................................................................................................................
2 Corolla with 5 or 10 teeth, white or pale lavender; spines of capsule many, hispid (the base only slightly thickened).
3 Corolla with 10 teeth; leaves glaucescent ................................................................................................................................................. *D. inoxia*....
3 Corolla with 5 teeth; leaves glaucascent ................................................................................................................................................. *D. wrightii*

* *Datura inoxia* J.S. Miller, Indian-apple. Cp (NC, SC), Pd (NC, SC), Mt (WV), {VA?}: disturbed areas; rare, native of Mexico. September-October. This species may not be distinct from *D. wrightii*. It is currently not known with confidence which records in our area apply to which taxon. [= K, Z; = *D. inoxia* – F, S, WV, orthographic variant; ? *D. meteloides* – G, misapplied]

**Datura metel** Linnaeus (NC): location and habitat in our area not known; rare, presumably introduced, allegedly native of tropical Africa and Asia. July-August. [= RAB, C, K, S, Z]

**Datura stramonium** Linnaeus, Jimsonweed. Cp (AL, DE, FL, GA, LA, MS, NC, SC, VA), Pd (AL, DE, GA, NC, SC, VA), Mt (AL, GA, NC, SC, VA, WV): fields, pastures, disturbed areas, especially common in severely over-grazed pastures; common, presumably introduced from further south and west (Mexico or Central America). July-September; August-October. The plant is dangerously poisonous. [= RAB, C, K, S, W, WV, Z; > *D. stramonium var. stramonium* – F; > *D. stramonium var. tatula* (Linnaeus) Torrey – F; > *D. tatula* Linnaeus]

* *Datura quercifolia* Kunth is reported for sw. GA by Jones & Coile (1988). [= K] {not yet keyed}

**Hyoscyamus** Linnaeus 1753 (Henbane)

A genus of about 23 species, herbs, of Eurasia and n. Africa.

**SOLANACEAE**

**Lycium** Linnaeus 1753 (Matrimony-vine, Wolfberry, Goji Berry)

A genus of about 100 species, shrubs, of warm temperate and tropical areas of the Old World and New World (especially America).

1 Leaves succulent, oblanceolate, 1-5 mm wide; [native, in maritime situations]................................................................. L. carolinianum
1 Leaves herbaceous, elliptic, ovate, or broadly oblanceolate, 8-30 mm wide; [introduced, persistent or naturalized, usually around old home sites].

2 Corolla lobes shorter than the corolla tube; leaves gray-green, 2-5 cm long........................................................................................................ L. barbarum
2 Corolla lobes longer than the corolla tube; leaves bright green, 3-8 cm long ...................................................................................... L. chinense

* Lycium barbarum Linnaeus, Common Matrimony-vine, Wolfberry, Goji Berry. Cp (NC, SC, VA), Pd (DE, GA, NC, VA), Mt (GA, NC, VA, WV): old home sites, disturbed areas, along railroad tracks; rare, native of s. Europe. May-November; August-December. [= K; L. halimifolium P. Miller – RAB, F, G, S, W, WV; < L. barbarum – C (also see L. chinense)]

* Lycium carolinianum Walter, Christmas-berry, Carolina Matrimony-vine. Cp (FL, GA, SC): shell middens, shell mounds, shelly sand dunes, brackish marshes, maritime sand spits; uncommon (rare in GA and SC). September-October. Se. SC and e. GA south to FL, west to e. TX; also in the West Indies. Apparently not recently seen in SC; its occurrence in that state is based on Walter's flora. [= RAB, GW, S, WH; > L. carolinianum var. carolinianum – K]

* Lycium chinense P. Miller, Chinese Matrimony-vine, Wolfberry, Goji Berry. Mt (NC, VA), Cp (VA): old home sites; rare, native of China. May-November; August-December. [= RAB, F, G, K; < L. barbarum – C]

**Nicandra** Adanson 1763 (Apple-of-Peru)

A monotypic genus, an annual herb native of Peru.

* Nicandra physalodes (Linnaeus) Gaertner, Apple-of-Peru. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (DE, NC, SC, VA): disturbed places, such as cultivated fields; uncommon, native of Peru. July-September; August-October. [= RAB, C, F, G, K, W, WV; = Physalodes physalodes (Linnaeus) Britton – S]

**Nicotiana** Linnaeus 1753 (Tobacco)

1 Plant a shrub or small tree, 3-10 m tall; stems glabrous and glaucous; [section Paniculatae]......................................................................................... N. glauca
1 Plant an herb, 0.5-3 m tall; stems densely viscid-puberulent (or sparsely so to merely tuberculate in N. longiflora).

2 Corolla tube 1.2-1.7 cm long, greenish yellow, with limb 3-6 mm wide; leaves distinctly petiolate; [section Rusticae]............................ N. rustica
2 Corolla tube 3.0-12.0 cm long, cream, white, yellow, or pink, with limb 10-25 mm wide; leaves auriculate clasping.

3 Larger leaves on a plant 3.5-8 dm long; corolla tube 3.0-5.5 cm long, 4-7× as long as the average diameter, the limb 10-15 mm wide, pink or reddish (rarely white); [section Nicotiana] ........................................ N. tabacum
3 Larger leaves on a plant 1-3 dm long; corolla tube 4.0-12.0 cm long, 10-20× as long as the average diameter, the limb 15-25 mm wide, white or lavender; [section Alatae].

4 Rosette of a few leaves, not persisting; cauleine leaves clasping and decurrent on the stem .............................................................................. N. alata
4 Rosette persisting; cauleine leaves clasping but not decurrent on the stem ..................................................................................... N. longiflora

* Nicotiana longiflora Cavanilles, Long-flower Tobacco. Pd (DE): disturbed areas, rare, native of South America. Cultivated and may be found as a waif or persistent. [= K, S, Z]

* Nicotiana rustica Linnaeus, Indian Tobacco, Wild Tobacco. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): formerly commonly cultivated by native Americans in all parts of our area, persistent following cultivation, now apparently extinct in our area; rare, originally native of Peru. This was the tobacco cultivated by American Indians at the time of contact by Europeans, and was the first tobacco taken to Europe and cultivated there. [= RAB, C, F, K, S; > N. rustica var. rustica – Z]

* Nicotiana tabacum Linnaeus, Cultivated Tobacco. Pd (GA, NC, SC, VA), Cp (GA, NC, SC, VA), Mt (GA, NC, SC, VA): persistent after cultivation; commonly cultivated, rarely naturalized, native of tropical America. June-frost; September-October. This is the tobacco currently cultivated in our area for the manufacture of cigarettes, cigars, and other smoking and chewing tobacco products. Two different strains are cultivated. Burley tobacco, with acute to acuminate leaves, grown mostly in the
SOLANACEAE

Mountains and upper Piedmont, is air-cured in open barns, and used mostly for cigar and pipe tobacco. Flue-cured tobacco, with obtuse or broadly acute leaves, is grown mostly in the Coastal Plain and lower Piedmont, cured in closed, cubical barns with forced heat, and used mostly for cigarettes. [= RAB, C, F, K, S]

Nierembergia Ruiz & Pavón 1794 (Cupflower)

A genus of about 23 species, of Mexico, Central America, and South America.

* Nierembergia frutescens Durieu, Tall Cupflower, is reported from sw. GA (Jones & Coile 1988). [= K]

Petunia Antoine Laurent de Jussieu 1803 (Petunia)

[also see Calibrachoa]

* Petunia ×hybrida Vilmorin [P. axillaris × integrifolia], Petunia. Cp (FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (WV): disturbed areas, garden edges, common in cultivation; rare, native of Argentina. May-November. Individual plants may closely resemble either parent, but this taxon in our area is best considered as a variable hybrid taxon. [= WH; = P. ×attinsiana D. Don ex Loudon – RAB; > P. axillaris (Lamarck) Britton, Sterns, & Poggenburg – C, F, G, K, S; > P. violacea Antoine Laurent de Jussieu – F, S, misapplied; > P. integrifolia (Hooker) Schinz. & Thellung – C, G, K; > P. ×attinsiana D. Don ex Loudon – K]

Physalis Linnaeus 1753 (Ground-cherry)

(contributed by Milo Pyne)

A genus of about 80 species, nearly cosmopolitan, but especially diverse in America. Many of the species of Physalis in our area occur primarily in disturbed habitats; their pre-Columbian ranges are unclear and they may have been introduced to e. North America by native Americans. Of the species treated here, only a few are definitely introduced. References: Sullivan (2004)=Z; Waterfall =Y (1958, 1967); Sullivan (1985)=X; Ward (2008a)=V; Mione et al. (1994); Whitson & Manos (2005); Whitson (2011). Key based in part on Sullivan (2004).

1 Flowers 2 or more per leaf axil; berries with spherical seed-like bodies intermixed with the flattened, reniform seeds; [of the Gulf Coastal Plain] .................................................................................................................P. carpenteri

2 Berry 20-40 mm in diameter, green or yellow-green when ripe (tomatillo); anthers strongly coiled after dehiscence, blue; corolla throat with bluish tinge; [cultivated and weakly naturalized near gardens] .................................................................P. philadelphica

2 Berry to 20 mm in diameter, orange, yellow, or green when ripe; anthers not coiled after dehiscence, yellow, blue, or purple; corolla throat purple, brown, green, or ochre; [collectively widespread].

3 Plants pubescent with stellate hairs, these in some taxa abundantly covering the leaves, or if leaves glabrous, the stellate hairs visible on the tips and margins of the sepals; plants perennial, from deeply buried rhizomes.

4 Leaves linear, 10-20× as long as wide, glabrous; plants erect; [of FL Panhandle westwards] ...........................................

4 Leaves ovate, elliptic, obovate or spatulate, 2-10× as long as wide, stellate pubescent, especially on the young growth, flowering calyces, and pedicels (or glabrous south of our area); [of FL Panhandle, peninsula, and Atlantic coast from VA southwards].............

.................................................................P. walteri

3 Plants glabrous, or pubescent with simple hairs; plants annual or perennial.

5 Leaves glabrous or essentially so.

6 Perennials from rhizomes, frequently with remnant of last year's stem attached to crown; corolla with 5 dark maculations in the throat.

7 Hairs on the pedicels and young stems retrorse or retrorse-spreading; fruiting calyx 5-angled, indented at base ..................................................P. virginiana var. virginiana

7 Hairs on the pedicels and young stems antorse; fruiting calyx subterete, with 10 ribs, not indented at base ...............................................................P. longifolia var. subglabrata

6 Annuals from taproots; corolla with or without 5 dark maculations in the throat.

8 Upper part of the stem glabrous or glabrate (when young, sometimes with minute, deflexed hairs in lines); corolla with or without 5 dark maculations in the throat.

9 Corolla 3-7 mm long, yellow and with 5 dark maculations in the throat; anthers 2.5-4 mm long; berry to 40 mm in diameter .................................................................................................................P. philadelphica

9 Corolla 4-10 mm long entirely yellow, without 5 dark maculations in the throat; anthers 1-2.3 mm long; berry 8-11 mm in diameter.

10 Principal caudine leaf blades generally < 2.5× as long as wide; flowering and fruiting pedicels 0.5-1.0 cm long; pedicels and calyx essentially glabrous at anthesis except for hairs on the margins of the calyx lobes ......P. angulata var. angulata

10 Principal caudine leaf blades generally > 2.75× as long as wide; flowering pedicels 1.5-2.5 cm long, elongating to 3.0-4.0 cm long in fruit; pedicels and calyx covered at anthesis with fine, even, antorse hairs, especially at the base of the calyx .................................................................P. angulata var. pendula

8 Upper part of the stem with long, spreading hairs; corolla with 5 dark maculations in the throat.
Physalis angulata Linnaeus var. angulata, Smooth Ground-cherry. Cp (DE*, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA): disturbed areas, open woodlands, agricultural fields; common (uncommon in VA, rare in DE). August-October. Var. angulata is widely distributed in tropical America, north to se. VA and MO, and scattered as an adventive further north. Var. pendula (Rydberg) Waterfall is (in North America) more western, east to nw. TN and, allegedly, to SC. It can be distinguished from var. angulata by the following characters: principle cauleine leaf blades generally > 2.75× as long as wide (vs. < 2.5× as long as wide), flowering pedicels 1.5-2.5 cm long, elongating to 3.0-4.0 cm long in fruit (vs. flowering and fruiting pedicels 0.5-1.0 cm long), pedicels and calyces covered at anthesis with minute, appressed, antrorse hairs; hairs on the calyx primarily confined to 10 narrow longitudinal strips consisting of simple, appressed hairs 0.5 mm or less long. Physalis integrifolia var. subglabrata

Physalis integrifolia var. subglabrata, Smooth Ground-cherry. Cp (DE*, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA): disturbed areas, open woodlands, agricultural fields; common (uncommon in VA, rare in DE). August-October. Var. integrifolia is widely distributed in tropical America, north to se. VA and MO, and scattered as an adventive further north. Var. pendula (Rydberg) Waterfall is (in North America) more western, east to nw. TN and, allegedly, to SC. It can be distinguished from var. integrifolia by the following characters: principle cauleine leaf blades generally > 2.75× as long as wide (vs. < 2.5× as long as wide), flowering pedicels 1.5-2.5 cm long, elongating to 3.0-4.0 cm long in fruit (vs. flowering and fruiting pedicels 0.5-1.0 cm long), pedicels and calyces covered at anthesis with minute, appressed, antrorse hairs; hairs on the calyx primarily confined to 10 narrow longitudinal strips consisting of simple, appressed hairs 0.5 mm or less long. Physalis integrifolia var. subglabrata

Physalis cordata P. Miller, Toothleaf Ground-cherry. Cp (FL, NC), (GA, SC): disturbed areas; rare. July-October. This species is scattered in the Southeastern United States, south to s. FL, and is more widespread in Mexico, Central America, and West Indies. [= K, WH, V, Z; = P. pubescens var. glabra (Michaux) Waterfall – RAB; = P. barbadensis var. glabra (Michaux) Fernald – F]

Physalis grisea (Waterfall) M. Martinez, Gray Ground-cherry, Strawberry-tomato, Dwarf Cape-gooseberry. Mt (GA, NC, VA), Pd (GA, NC, VA), Cp? (GA?), (SC): wooded slopes, disturbed areas; uncommon. July-September; August-October. The species is mainly distributed in ne. United States, south (mainly) to NC, TN, and MO, and scattered further south. The fruits are edible, sweet, and tasty. Martinez (1993) discusses the nomenclature of this species, showing that the P. pruinosa Linnaeus is properly applied to a Mexican and Central American species. [= K, WH, V, Z; = P. pubescens var. grisea Waterfall – RAB, C; < P. pruinosa Linnaeus – F, G, S, W, misapplied]

Physalis lanceolata  Michaux, Sandhills Ground-cherry.  Cp (GA, NC, SC): sandhills; rare.  June-July; July-September.  Endemic to sandhill habitats of (primarily) sc. and (rarely) se. NC (northern limit in Lee, Wayne, and New Hanover counties), south through SC to just over the Savannah River in Richmond County, GA.  Many earlier floras included midwestern material in the concept of this species; it is, however, limited to the Carolinas and Georgia.  See Hinton (1970) for discussion of its taxonomic status.  [= RAB, Z; < P. subglabrata – F, G, S (also see P. hispida (Waterfall) Cronquist)]

Physalis longifolia  Nuttall var. subglabrata (Mackenzie & Bush) Cronquist, Longleaf Ground-cherry.  Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, FL), {GA, SC}: open woodlands, gardens and disturbed areas; common (uncommon in GA, NC, SC, VA).  June-August; August-October.  The species is widespread in e. and c. United States; var. subglabrata is more eastern, south to Panhandle FL, var. longifolia more western.  [= C, G, K, W, Z; = P. virginiana P. Miller var. subglabrata (Mackenzie & Bush) Waterfall – RAB; = P. subglabrata Mackenzie & Bush – F, S, WV; < P. longifolia – WH]

* Physalis philadelphica  Lamarck, Tomatillo.  Cp (DE), Pd (DE, NC), Mt (VA, WV): naturalized after cultivation; uncommon (rare in VA), native of Mexico and Central America.  June-August; July-October.  See Kartesz & Gandhi (1994) for a discussion of this group.  It is the large-flowered plant (and therefore P. philadelphica in the narrow sense) that is weakly naturalized after cultivation in our area.  [= C, Z; < P. toscarpa Brotero ex Hennemann – F, G, misapplied; > P. philadelphica var. immaculata Waterfall – K]

Physalis pubescens  Linnaeus var. pubescens, Thickleaf Downy Ground-cherry.  Mt (WV), {VA}: disturbed areas; rare in WV.  The distribution, abundance, and habitats of the two varieties are poorly known.  July-September; August-October.  Widespread in the American tropics, north to VA.  [= C, K; < P. pubescens var. pubescens – RAB; > P. barbadensis Jacquin var. barbadensis – F; > P. barbadensis Jacquin – G, S; > P. pubescens – S; > P. barbadensis Jacquin – S; < P. pubescens – W, WH, Z]

Physalis virginiana  P. Miller var. virginiana, Virginia Ground-cherry.  Pd (GA, NC, SC, VA), Mt (GA, NC, SC, WV, VA), Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA, WV), Mt (GA, NC, SC, WA), Wd (VA), Cp (DE, FL, GA, NC, SC, VA): woodlands and disturbed areas; common (rare in FL and WV).  April-May; June-July.  This complex species is widespread in e. and c. North America.  Var. virginiana is the most eastern of a number of varieties, some of the others being var. campaniforma Waterfall, var. polyphylla (Greene) Waterfall, and var. texana (Rydburg) Waterfall.  The validity and true affinities of some of these varieties is, at present, uncertain; var. texana may be actually affiliated with P. longifolia.  [= RAB, K; < P. virginiana – C, F, G, V, W, Z; > P. virginiana – S; > P. intermedia Rydburg – S; > P. monticola C. Mohr – S]

Physalis walteri  Nuttall, Dune Ground-cherry.  Cp (FL, GA, NC, SC, VA): dunes of sea-beaches, openings in maritime forests, sandhills (southwards), and rarely inland as a waif in disturbed areas; common (uncommon in GA, NC, SC, rare in VA).  May-September.  This species ranges from se. VA south to s. FL and west to s. MS.  See Sullivan (1985) for further information on this species and its relatives.  It is largely replaced on the Gulf Coast by the related P. angustifolia, with which it locally intergrades in peninsular FL.  P. viscosa Linnaeus is South American.  [= C, K, WH, Z; < P. viscosa Linnaeus spp. maritima (M.A. Curtis) Waterfall – RAB; < P. maritima M.A. Curtis – F; < P. viscosa – G, S; > P. walteri var. walterii – V; > P. walteri var. glabra (Waterfall) D.B. Ward – V]

* Physalis acutifolia  (Miers emend Sandwith) Sandwith, native to AZ and vicinity, was collected once in NC (in 1936), from a nursery in Mecklenburg County, NC, and is included in Sullivan (2004).  It may not be established.  It is most similar to P. angulata, but differs in its white to cream-colored corollas, with yellow basal spots, and the presence of 5 hairy pads, alternating with the stamens near the base of the corolla limb.  [= K, Z]

Physalis angulata  Linnaeus var. pendula (Rydburg) Waterfall.  P. angulata var. pendula (Rydburg) Waterfall is (in North America) more western, east to nw. TN and, allegedly, to SC.  [= P. angulata – RAB, C, K, S, WH, Z; = P. pendula Rydburg – F, G]

* Physalis cinerascens (Dunal) A.S. Hitchcock var. cinerascens, native to OK, TX, and Mexico, occurs locally in the Southeastern United States in weedy situations; it has been found once in our area, in a disturbed habitat in SC.  It is probably not established.  It seems to walteri in having stellate pubescence, but differs in having leaves ovate to suborbicular, with margins sinuate, dentate, or entire (vs. leaves obovate, with margins entire), anthers at least 1.5× as long as the filaments (vs. anthers equal to or shorter than the filaments), and fruiting pedicels mostly at least 1.5× as long as the calyxes (vs. fruiting pedicels equal to or shorter than the fruiting calyces).  [= K, Z]  [not yet keyed; full treatment]

Physalis longifolia Nuttall var. longifolia.  East to PA, WV, KY, TN, and GA (Kartesz 1999).  [= K, Z]

* Physalis peruviana  Linnaeus, Cape Gooseberry or Po'ha, is also cultivated.  Native to South America, it is now cultivated for its edible fruit in various tropical and temperate areas, and is known to rarely persist in c. North America.  [= K]

Physalis viscosa Linnaeus.  Reports in the Southeast are based on a broad interpretation of P. viscosa to include southeastern taxa P. angustifolia and P. walteri.  Rejected.

Salpichroa  Miers 1845

A genus of about 17 species, herbs and shrubs, native to South America.  References:  Hunziker (2001) = Z.
**Solanum** Linnaeus 1753 (Nightshade, Tomato, Potato, Horse-nettle)

(contributed by Milo Pyne and Alan S. Weakley)

A genus of about 1700 species, trees, shrubs, vines, and herbs, of tropical and temperate regions of the Old and New World.

* Solanum dulcamara* Linnaeus, Bittersweet, Nightshade. Mt (NC, VA, WV), Pd (DE, VA), Cp (FL, VA), {GA}: disturbed areas; common (rare in FL, GA, NC, and VA), native of Europe. [= RAB, C, W, WH, WV; > S. dulcamara var. dulcamara – F, K]

* Solanum lycopersicum* Linnaeus, Tomato. Cp (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): persistent and weakly naturalized around gardens, especially where compost or sewage sludge is spread; commonly cultivated, rare as a naturalized species. June-frost. The species is native to the Andes Mountains of nw. South America. *S. lycopersicum* is one of the most important and influential of edible species native of the New World introduced to the Old World, along with two other Solanaceae, the potato (*Solanum tuberosum*) and the chili (*Capsicum annuum*). There appears to be little reason to separate *Lycopersicon* from *Solanum*. [= Lycopersicon esculentum – RAB, C, F, G; > Solanum lycopersicum Linnaeus var. cerasiforme (Dunal) Spooner, J. An derson, & R.K. Jansen – K; > Solanum lycopersicum var. lycopersicum – K; = Lycopersicon lycopersicum (Linnaeus) Karsten – S; > Lycopersicon esculentum var. cerasiforme (Dunal) Alefani]

* Solanum pseudocapsicum* Linnaeus, Jerusalem-cherry. Cp, Mt (GA), Pd (NC), {SC}: rarely cultivated, perhaps not established, native of Mediterranean Europe. [= K; = S. pseudo-capsicum – F, orthographic variant]

* Solanum sachraoides* Sendtner, Hairy Nightshade. Cp (NC, VA), Pd (DE, NC, VA): disturbed areas; uncommon, native of South America. Works by Edmonds and associates have established that *S. sachraoides* and *S. physalifolium* Rusby are two distinct species, but both are presently known from North America. Mistaken interpretations of Cronquist's 1991 treatment of *Solanum* (e.g. by Kartesz 1999) have given rise to the incorrect belief that only *S. physalifolium* is found in North America. True *S. physalifolium* is present in the western United States, *S. sachraoides* in the Southeast. [= RAB, C, Z; < S. physalifolium Rusby – K; = S. sachraoides – F, orthographic error]

* Solanum viarum* Dunal, Tropical Soda Apple. Cp (GA, NC, SC): pastures; rare, native of South America (s. Brazil, Paraguay, and n. Argentina). This species has only recently appeared in our area, but has been publicized as a severe, extremely aggressive, and rapidly spreading weed further south (Wunderlin et al. 1993, Mullaihely et al. 1993, Mullaihely 1996). [= K]

* Solanum capsicastrum* Link ex Schauer. Reported for NC and SC (Kartesz 1999), but apparently erroneously. [= K]

* Solanum melongena* Linnaeus, Eggplant, Aubergine. Planted in gardens but does not persist. [= F, G, K, S]

* Solanum nigrescens* Mart. & Gal. Cp (FL): disturbed areas; uncommon. Reported from NC, SC, GA, FL, etc. (Kartesz 1999), but actual status unclear. [= K; < S. chenopodioides Lamark – WH]

360. **SPHENOCLEACEAE** von Martius ex A.P. de Candolle 1839 (Chickenspike Family) [in SOLANALES]

A family of one genus and 2 species, annual herbs, of tropical regions, native of the Old World. References: Rosatti (1986)=Z.

*Sphenoclea* Gaertn. (Chickenspike)

A genus of 2 species, annual herbs, native of the Old World.

* Sphenoclea zeylanica* Gaertn. Chickenspike. Cp (FL, GA, SC), Pd (GA, NC): rice plantations, reservoirs, other disturbed wetlands; rare, native of Old World tropics. August-October. [= K, S, WH; Z = *S. zeylanica* – RAB, GW, orthographic error (presumably from a mistaken notion that the epithet refers to New Zealand rather than Ceylon)]

361. **HYDROLEACEAE** Berchtold & J. Presl 1820 (Hydrolea Family) [in SOLANALES]

A family of one genus and about 12 species, herbs and shrubs of water bodies and wetlands, primarily tropical. The Hydroleaceae is not closely related to Hydrophyllaceae; recent molecular data confirm the view prevailing through most of the 19th century that *Hydrolea* should be placed in its own family. References: Ferguson (1998); Hilger & Diane (2003); Angiosperm Phylogeny Group (1998, 2003, 2009).

*Hydrolea* Linnaeus 1762

A genus of about 11 species, aquatic and wetland herbs, of tropical and subtropical regions.

1. Flowers in axillary cymes; leaves 3-14 cm long, 1.5-4 cm wide; axillary spines present in the axils of some leaves; corolla 7-8 mm long.
2. Calyx and stem glabrous, or minutely puberulent or with sessile glands .................................................. *H. quadrivalvis*
3. Calyx and stem sparsely pubescent with spreading hairs 2-3 mm long .......................................................................................... *H. uniflora*
1. Flowers in terminal cymes or corymb; leaves 2-6 cm long, 0.6-2.5 cm wide; axillary spines present or absent; corolla 10-15 mm long.
3. Leaves elliptic to lanceolate, 2-3 cm long, 0.6-1.0 cm wide; axillary spines absent or rudimentary ........................................... *H. corymbosa*
3. Leaves ovate to ovate-lanceolate, 3-6 cm long, 1.5-2.5 cm wide; axillary spines present, well-developed, to 1.5 cm long ............ *H. ovata*

**Hydrolea corymbosa** J. Macbride ex Elliott, Skyflower. Cp (FL, GA, SC): pond cypress savannas, depression meadows; uncommon (rare north of FL). Ne. SC south to sw. GA and s. FL. See Nelson (1993). The author is sometimes stated as J.F. Macbride, but this is an error. [= RAB, GW, K, WH; = *Nama corymbosum* (Macbride ex Elliott) Kuntze – S]

**Hydrolea uniflora** Rafinesque. Swamp forests, sloughs, marshes. June-September. Mainly in the Mississippi River Alluvial Plain, west to e. TX and east to AL, TN, and KY. [= C, F, G, GW, K; = *Nama affine* (A. Gray) Kuntze – S; = *Hydrolea affinis* A. Gray]

364. **OLEACEAE** Hoffmannsegg & Link 1813 (Olive Family) [in LAMIALES]

1. Leaves compound.
2. Leaves pinnately compound with > 5 leaflets; petals absent; fruit a samara; small to large tree; [tribe Oleaeae, subtribe Fraxininae]..........
3. Leaves trifoliolate; petals 6-10, yellow, conspicuous; fruit a deeply 2-lobed dryish berry; [tribe Jasmininae] ................................. *Forsythia*
4. Flowers white, lilac, or purplish; fruit a drupe or 4-seeded capsule.
5. Flowers bright yellow, showy; fruit a many-seeded capsule; [tribe Forsythinae]................................................................. *Forsythia*
6. Leaves cordate or truncate at the base; fruit a 4-seeded capsule; corolla lobes shorter than the tube; flowers lilac or white, in terminal panicles; [tribe Oleaeae, subtribe Ligustrinae]................................................................. *Syringa*
7. Flowers cuneate to rounded at the base; fruit a drupe; corolla lobes either shorter or longer than the tube; flowers white or greenish-white, in terminal or lateral panicles or fascicles.
8. Corolla absent; calyx minute or lacking; flowers in axillary fascicles; [tribe Oleaeae, subtribe Oleinae]................................. *Forestiera*
**OLEACEAE** 790

5 Corolla present (often conspicuous and showy); calyx present; flowers in lateral or terminal panicles or in terminal subumbellate clusters.

6 Corolla lobes 5-12; flowers in terminal subumbellate clusters; [tribe Jasminae] .............................................................. Jasminum

6 Corolla lobes 4; flowers in lateral or terminal panicles

7 Corolla lobes elongate, much longer than the corolla tube; [tribe Oleaceae, subtribe Oleinae] ................................. Chionanthus

7 Corolla lobes short, no longer than the corolla tube.

8 Inflorescence a many-flowered terminal panicle; leaves generally ovate, elliptic or lanceolate (widest below or at the middle); [tribe Oleaceae, subtribe Ligustrinae] .......................................................... Ligustrum

8 Inflorescence a few-flowered axillary panicle; leaves generally oblanceolate or obovate (widest above the middle); [tribe Oleaceae, subtribe Oleinae] .................................................................................................................. Osmanthus

**Chionanthus** Linnaeus 1753 (Fringe-tree, Old Man's Beard)

**Chionanthus virginicus** Linnaeus, Fringe-tree, Old Man's Beard. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA, VA), dry, mesic, or wet forests and woodlands, granitic flatrocks and domes, glades and barrens over various rocks (including granite, greenstone, etc.), swamp forests in the Coastal Plain, rarely pocosins; common (rare in DE Piedmont). April-May; July-September. NJ, s. PA, s. OH, and MO south to e. TX. C. virginicus in our area shows a diversity of morphology and correlated habitat that suggests the possible presence of two taxa. Swamp- and pocosin-inhabiting populations in the outer Coastal Plain have leaves 4-8× as long as wide and seem very different than Piedmont dry woodland populations with leaves 1-2× as long as wide; further and more careful study is needed. C. virginicus is a traditional southern yard plant, often used as a "specimen plant," very showy in spring, particularly when grown to its full size. [= RAB, C, F, G, GW, K, S, W, WH, Z]

**Forestiera** Poiret 1812 (Forestiera)

1 Leaves (6-) 7-8 (-9) cm long, long-acuminate or acuminate (rarely acute) at the apex, the tip sharply pointed; [of swamp forests, sloughs, and ponds] ........................................................................................................................................................................ F. acuminata

1 Leaves 1.5-7 (-8) cm long, obtuse at the apex, or if short-acuminate the ultimate tip blunt; [of shell middens and calcareous bluffs].

2 Leaves deciduous, at least sparsely pubescent on the midrib above, pubescent and non-punctate below.

2 Leaves evergreen, glabrous above, glabrous and punctate below; leaf margins entire .............................................. F. segregata var. segregata

3 First-year twigs pubescent, the pubescence in 2 lines on either side of the twig; petioles moderately pubescent; flowering in early spring from buds on twigs of the previous season; leaves 5-7 (-8) cm long ................................................................. F. godfreyi

3 First-year twigs pubescent in 2 lines on either side of the twig; petioles glabrous (or with a very few hairs; flowering in mid-late summer, the flowers in leaf axils; leaves mostly 2-3 cm long ............................................. F. ligustrina

**Forestiera acuminata** (Michaux) Poiret, Swamp-privet. Cp (FL, GA, SC): swamp forests, especially over calcareous substrates; uncommon. March; May-June. SC south to n. FL, west to TX, north in the interior to KY, e. and c. TN, IN, IL, MO, and KS. [= RAB, C, F, G, GW, K, S, Q, WH, X, Y, Z]

**Forestiera godfreyi** L.C. Anderson, Godfrey's Forestiera. Cp (FL, GA, SC): shell middens, maritime forests over shell substrate; rare. Mid January-February; April-May. Se. SC (Beaufort and Charleston counties) to e. GA and n. peninsular and e. Panhandle FL. [= K, WH, X, Y; < F. pubescens Nuttall – S, in part (apparently)]]

**Forestiera liguistra** (Michaux) Poiret, Southern-privet. Cp (FL, GA, SC), Pd (GA, SC): upland forests and slopes along streams, mostly on shell middens or calcareous rocks; uncommon (rare in SC). E. SC south to n. peninsular FL, west to se. TX, north in the interior to c. TN and KY. [= K, S, Q, X, Z]

**Forestiera segregata** (Jacquin) Krug & Urban var. segregata, Florida-privet. Cp (FL, GA, SC): calcareous scrub, shell middens, maritime forests and thickets; rare. Se. SC south to s. FL, and in the West Indies. Var. pinetorum (Small) M.C. Johnston is restricted to s. FL. [= K, Q, Z; > F. porulosa (Michaux) Poiret – S; > F. globularis Small – S; < F. segregata – WH, X]

**Forsythia** Vahl 1804 (Forsythia, Golden-bells)

1 Mature branches hollow or irregularly pith-filled between the nodes; leaves oblong-ovate, toothed or 3-parted; branches arching when well-developed .................................................................................................................................................. F. suspensa

1 Mature branches cross-septate (chambered) between the nodes; leaves oblong-lanceolate, toothed; branches upright ................................ F. viridissima
**Forsythia suspensa** (Thunberg) Vahl, Weeping Forsythia. Pd (GA, NC, VA), Mt (VA, WV): waste places, vacant lots, suburban woodlands; commonly planted and persistent, rarely escaped (native of China). [= C, G, K, Z]

**Forsythia viridissima** Lindley, Greenstem Forsythia. Pd (GA, NC, VA), Cp (VA), Mt (VA, WV): waste places, vacant lots, suburban woodlands; commonly planted and persistent, rarely escaped (native of China). [= C, G, K, W, Z]

**Fraxinus** Linnaeus 1753 (Ash)

| 11                       | Fraxinus americana Linnaeus, White Ash, American Ash. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): mesic slopes, rich cove forests, dryish calcareous or mafic glades and woodlands (with *Juniperus*}
virginiana var. virginiana and Carya glabra); common (rare in Coastal Plain of DE, NC, SC, and GA). April-May; August-October. NS west to MN, south to n. peninsular FL and TX. A valuable timber tree. The division into 2 or more taxa is very likely warranted. [= C, K, WH, Z; > F. americana Linnaeus var. americana = RAB, F, G, WV; > F. americana Linnaeus var. biltmoreana (Beadle) J. Wright ex Fernald = RAB, F, G, WV; > F. americana Linnaeus var. microcarpa A. Gray = F; > F. americana = S, Y; > F. biltmoreana Beadle = S, Y]

Fraxinus berlandierana DC., Mexican Ash. This species, native of sc. OK south to s. TX, has been reported as naturalized in s. MS and e. LA (Kartesz 2010), but these records are discounted as being based on cultivated individuals (Nesom 2010b). [excluded; not keyed or mapped]

Fraxinus caroliniana var. niger, Water Ash, Pop Ash, Carolina Ash. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA); deeply to shallowly flooded swamps; common (rare in Piedmont). May; July-October. Se. VA south to s. FL, west to TX, primarily on the Coastal Plain. A small tree, sometimes very abundant (and nearly the only subcanopy species) as the understory in Taxodium-Nyssa swamps. [= RAB, C, G, GW, K, WH, Z; > F. caroliniana var. caroliniana = F; > F. caroliniana var. oblaneolata (M.A. Curtis) Fernald & Schubert = F; > F. caroliniana var. cubensis (Grisebach) Lingelsheim = F, misapplied; > F. caroliniana = S; > F. pauciflora Nuttall = S]

Fraxinus caroliniana var. nigra, Marshall, Black Ash. Mt (VA, WV), Pd (DE, VA), Cp (DE): seepage swamps and mountain streambanks; rare. April-May; August-October. NL (Newfoundland) and QC west to MB, south to DE, VA, IN, and IA. [= C, F, G, K, W, WV, Y, Z]

Fraxinus pennsylvanica Marshall, Green Ash, Red Ash. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): bottomlands and swamps, especially along brownwater rivers and streams; common. April-May; August-October. NS west to AB, south to FL and TX. Variation in this species (see synonymy) needs further study. [= C, GW, K, W, Z; > F. pennsylvanica var. subintegerrima (Vahl) Fernald = RAB, F, G, WV; > F. pennsylvanica var. pennsylvanica = RAB, F, G, WV; > F. pennsylvanica = WH; ? F. pennsylvanica ssp. pennsylvanica = Y]

Fraxinus profunda (Bush) Bush, Bushy Ash. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC): swamps, especially along blackwater rivers and streams and in freshwater tidal wetlands (as along the James, Pamunkey, Mattaponi, and Rappahannock rivers in e. VA), also in brownwater bottomlands; common (rare in Piedmont and Mountains). April-May; August-October. S. ON south to n. FL, west to LA, mostly on the Coastal Plain, north in the interior to w. NC, sc. TN, e. AR, se. MO, s. IL, IN, OH, sc. MI, ne. PA, and w. NY. This species has a peculiar distribution; see McCormac, Bissell, & Stine (1995) and Nesom (2010) for additional discussion. The nomenclature has been controversial, but is now resolved. There is also some question as to its taxonomic recognition; it may be an allopolyploid derivative of F. pennsylvanica, perhaps from multiple origins. [= C, GW, K, W, Z; = F. tomentosa Michaux f. – RAB, F, G, Y; > F. profunda = S; > F. michauxii Britton – S; < F. pennsylvanica = WH]

Fraxinus quadrangulata Michaux, Blue Ash. Mt (GA, VA, WV): mesic to dry calcareous woodlands and forests; rare. April; July-October. S. ON west to s. MI and e. KS, south to sw. VA, e. TN, nw. GA, n. AL, and OK. [= C, F, G, K, S, WV, Y, Z]

* Fraxinus bilmoreana Beadle, Biltmore Ash, Biltmore White Ash. [add data]

* Fraxinus excelsior Linnaeus, European Ash. Naturalized in ne. US, south to KY and s. NJ.

* Fraxinus pauciflora Nuttall, Swamp White Ash. Cp (FL, GA): deep swamps; uncommon. [not yet keyed]

* Fraxinus smallii Britton, Small’s White Ash. [add data]

Jasminum Linnaeus 1753 (Winter Jasmine)

1 Leaves simple; flowers white.................................................................................................................. J. multiflorum

1 Leaves trifoliolate; flowers yellow.

2 Leaflets 2.5-7 cm long; flowers 3.5-5 cm across ...................................................................................... J. mesnyi

2 Leaflets 1-3 cm long; flowers ca. 2.5 cm across ..................................................................................... [J. nudiflorum]

* Jasminum nudiflorum Lindley, Winter Jasmine, native of China, is commonly planted and often persists. It has green stems and yellow flowers. Reported for GA (K). [= K]

Ligustrum Linnaeus 1753 (Privet)

[contributed by Guy L. Nesom and Alan S. Weakley]

1 Leaves (3-) 4-13 (-15) cm long.
2 Leaves mostly (3-) 4-8 (-9) cm long, primary lateral veins 3-5 pairs, apex acute to abruptly acuminate, abaxial midvein covered by epidermis; flowers short-pedicellate on pedicles 0.5-2 mm; corolla tube hardly exserted from calyx, ca. equal lobe length ....... L. japonicum
3 Leaves (4.5-) 6-13 (-15) cm, primary lateral veins (5-) 6-8 pairs, apex usually long-acuminate, abaxial midvein not covered by epidermis; flowers subsessile on pedicles 0-0.5 mm; corolla tube distinctly exserted from calyx, ca. 2<sup>+</sup> longer than lobes ............... L. lucidum
1 Leaves 1.5-6 (-6.5) cm long.
3 Branchlets glabrous and usually glossy .............................................................. L. ovalifolium
3 Branchlets minutely hirtellous, hirsute-hirtellous, or hirsutulous, dull.
4 Leaf blades hirsutulous abaxially, rarely only along the nerves, sparsely hirsute-strigose adaxially, sometimes mostly near the margins, primary lateral veins (5-) 6-8 pairs, apices sharply acute (to slightly acuminate, or rarely obtuse) ................. [L. tschonoskii]
4 Leaf blades glabrous on both surfaces or sometimes sparsely hairy along the abaxial midvein, primary lateral veins (2-) 3-6 pairs, apices obtuse to acute (in L. vulgare) or obtuse to rounded.
5 Leaf blades narrowly oblong-elliptic to oblanceolate-elliptic, oblanceolate or narrowly obovate, usually broadest slightly above the middle; inflorescence usually narrowly cylindric, flowers sessile to subsessile in verticil-like clusters ...................... L. quihoui
5 Leaf blades variously shaped; inflorescence broadly cylindric to pyramidal, flowers sessile to pedicellate in broadly cylindric to pyramidal panicles of cymes.
6 Corolla tube < 1.2× as long as the lobes.
7 Leaves ovate-elliptic to oblong-ovate, elliptic-lanceolate, or suborbicular, primary lateral veins (3-) 4-5 pairs, apex obtus to rounded or retuse, abaxial midvein usually sparsely hirsutulous to puberulent; inflorescence diffuse and open panicles terminal and on essentially leafless, lateral branches interspersed with leafy ones; branchlets hirtellous to loosely strigose with straight hairs of uneven length; corolla tube slightly shorter than lobes, often barely exserted from the calyx tube; pedicels glabrous ................................................................. L. sinense
7 Leaves elliptic-lanceolate to elliptic-ovate, primary lateral veins 4-6 pairs, apex obtuse to acute, abaxial midvein usually glabrous or with a few scattered hairs; inflorescence mostly a compact, terminal panicle; branchlets evenly and minutely hirtellous to hirsutulous with relatively even-length hairs; corolla tube equal the lobes or slightly shorter, distinctly exserted from the calyx tube; pedicels hirtellous .............................................................................................................. L. vulgar
6 Corolla tube 1.5-3× longer than the lobes.
8 Leaf blades usually sparsely villous abaxially; calyx and pedicels sparsely to densely hirtellous (rarely nearly glabrous); corolla tube 2-3× as long as the lobes ............................................................... L. obtusifolium var. obtusifolium
8 Leaf blades usually glabrous abaxially; calyx and pedicels glabrous to very sparsely hirtellous; corolla tube 1.5-2× as long as the lobes ............................................................................................................................................... L. obtusifolium var. suave

* **Ligustrum lucidum** Aiton, Glossy Privet, Broadleaf Privet. Pd (NC), Cp (FL, NC): disturbed places; rare, native of China, Japan, and Korea. This species is superficially similar to L. japonicum; the leafy lateral veins are transversel in this species. [= Y; = L. obtusifolium – C, F, G, K, Z]

* **Ligustrum obtusifolium** Siebold & Zuccarini var. obtusifolium. Cp (NC, VA), Pd (NC, VA), Mt (VA, WV), {SC}: disturbed places; uncommon (rare in WV), native of Japan. [= Y; = L. amurense Carrière – RAB, C, F, G, K, Z; = Ligustrum obtusifolium Siebold & Zuccarini var. amurense (Carrière) Mansfeld]

* **Ligustrum obtusifolium** Siebold & Zuccarini var. suave (Kitagawa) H. Hará, Amur Privet. Cp, Pd (NC, VA), Mt (VA), {SC}: disturbed places; uncommon, native of Japan. [= Y; = L. amurense Carrière – RAB, C, F, G, K, Z; = Ligustrum obtusifoliumSiebold & Zuccarini var. amurense (Carrière) Mansfeld]

* **Ligustrum sinense** Loureiro, Chinese Privet. Pd (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): moist forests, especially alluvial bottomlands; common, native of China. This species is one of the most noxious of our weeds, choking out native vegetation in hundreds of square kilometers of land in our area. The rapidity with which it has engulfed southern wetlands is hinted at by Small's (1933) mention of it only as "an escape in southern Louisiana." [= RAB, C, G, GW, K, S, W, WH, Y, Z]

*Ligustrum tschonoskii* Decaisne. Pd (DC): suburban forests; rare, native of Japan. Known in the flora area “only from the woods along the bank of Rock Creek in Rock Creek Park” (Nesom 2009a; Shetler and Orli 2000). Two varieties within *L. tschonoskii* were recognized by Noishiro (1985), distinguished by slight and overlapping size differences. Var. tschonoskii is restricted in native range to Japan; var. kiyozuminanum (Nakai) Ohwi occurs in Japan and Korea. [= Y]

**Osmanthus** Loureiro 1790 (Wild Olive, Devilwood)

Osmanthus americanus (Linnaeus) Bentham & Hooker f. ex A. Gray, Wild Olive, Devilwood. Cp (FL, GA, NC, SC, VA): maritime forests and (in FL, GA, SC, and extreme s. NC) dry, sandy forests well inland, and reported for wet habitats as well further south; uncommon (rare in VA). April-May; August-October. Se. VA south to c. peninsular FL, west to LA; also in Mexico. O. megacarpus Small, sometimes treated as a variety, O. americanus var. megacarpus (Small) P.S. Greene, is endemic to pine scrub in peninsular FL and differs primarily in having a larger fruit. The very hard, tough, and “unsplitable” wood is the inspiration for the common name “Devilwood.” O. americanus is a conspicuous element of maritime forests in most of our area, readily recognizable by the flattened twigs characteristic of the family, and the opposite (or typically, actually subopposite), glossy, oblanceolate to obovate, evergreen leaves. [= RAB, F, G, GW, WH; = O. americanus var. americanus – C, K, Z; = Amarolea americana (Linnaeus) Small – S]

Osmanthus ×fortunei Carrière [= O. fragrans × heterophyllus], Fortune’s Sweet Olive. Pd (NC): suburban woodlands, escaped from horticultural plantings; rare, hybrid originating in Japan of two species native to Japan.

Syringa Linnaeus 1753 (Lilac)

Syringa vulgaris Linnaeus, Lilac. Mt (NC, VA, WV): commonly planted, persistent and naturalizing around old farms; rare, native of se. Europe. [= C, F, G, K, Z]

TETRACHONDRAEACEAE Wettstein 1924 (Tetrachondra Family) [in LAMIALES]
A family of 2 genera, Polypremum and Tetrachondra (Oxelman et al. 1999), and 3 species, perennial herbs, of s. North America south to South America, and New Zealand. The assignment of Polypremum to family has been controversial, with placement formerly in Loganiaceae or Buddleiacese. A recent molecular analysis strongly suggests that its closest relationship is with Tetrachondra (Oxelman et al. 1999), and the treatment followed here reflects the current general consensus. References: Oxelman et al. (1999); Wagstaff in Kadereit (2004).

Polypremum Linnaeus 1753 (Polypremum)
The genus is monotypic, an herb, or warm temperate, subtropical and tropical America. References: Rogers (1986)=Z; Wagstaff in Kadereit (2004).

Polypremum procumbens Linnaeus, Polypremum, Rustweed, Juniperleaf. Cp (DE, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): fields, disturbed areas; common, rare in Mountains. Late May-September; August-October. Se. NY, NJ, and MO south to FL and TX, and south into Central America, South Amerie West Indies. [= RAB, C, F, G, GW, K, S, W, Z]

PLANTAGINACEAE A.L. de Jussieu 1789 (Plantain Family) [in LAMIALES]
As newly and radically recircumscribed, a family of about 120 genera and 1800 species. References: Albach, Meudt, & Oxelman (2005); Olmstead et al. (2001); Schwarzbach in Kadereit (2004); Fischer in Kadereit (2004).

1 Leaves alternate, at least those on the upper stem; calyx 5-merous; stamens 4.
2 Corolla lacking a spur or pouch at the base.
3 Stem erect; flowers > 10 mm long; [tribe Digitalae]................................................................................................................................. Digitalis
4 Corolla with a broad pouch protruding between the 2 lower calyx lobes; [tribe Antirrhineae].
3 Stems prostrate; flowers < 5 mm long; [tribe Limoselleae]................................................................................................................................. Limosella
2 Corolla with a distinct spur or broad pouch protruding between the 2 lower calyx lobes; [tribe Antirrhineae].
PLANTAGINACEAE

5 Calyx lobes about equal, all shorter than the corolla tube; corolla 25-40 mm long; leaves to 15 mm wide..............Antirrhinum
5 Calyx lobes distinctly unequal, all longer than the corolla tube; corolla 10-13 mm long; leaves to 5 mm wide..........Misopates
4 Corolla with a slender spur at the base.
6 Flowers in terminal racemes.
7 Corolla yellow; capsule 9-12 mm long....................................................................................................................Linaria
7 Corolla blue; capsule 2-3 mm long..........................................................................................................................Nuttallanthus
6 Flowers solitary in leaf axils.
8 Stems erect; leaves linear .............................................................................................................................................Chaenorrhinum
8 Stems prostrate; leaves orbicular, ovate, or triangular.
9 Leaves orbicular in outline, palmately lobed and veined; stems rooting at nodes .................................................Cymbalaria
9 Leaves ovate or triangular, pinnately veined; stems not rooting ...........................................................................Kicksia
1 Leaves either strictly basal, or opposite or whorled throughout; calyx 0-, 4-, or 5-merous; stamens 1, 2, or 4.
10 Leaves strongly basally disposed, usually all the leaves basal; petals 4, scarious and translucent in texture; inflorescence a spike; [tribe Plantagineae]..............................................................................................................Plantago
10 Leaves cauline, either opposite or whorled; petal 0, or 4, or 5; inflorescence various.
11 Leaves whorled.
12 Aquatic; leaves 5-30 mm long, lanceolate, toothed to deeply dissected into linear segments; [tribe Gratioleae]...........Limnophila
12 Terrestrial; leaves 40-15 cm long, lanceolate or elliptic, toothed; [tribe Veronicae]...............................................Veronicastrum
11 Leaves opposite.
13 Petals 0; sepals 0, stamens 1; leaves both < 2 cm long and entire; [tribe Callitricheae]..............................................Callitriche
13 Petals 4 or 5; sepals 4 or 5; stamens 2 or 4; leaves > 2 cm long, or serrate, or both.
14 Calyx and corolla 4-merous.
15 Leaves punctate; stamens 4; [tribe Gratioleae]..........................................................................................................Scoparia
15 Leaves not punctate; stamens 2; [tribe Veronicae]......................................................................................................Veronica
14 Calyx and corolla 5-merous.
16 Plants erect, moderately robust, usually > 4 dm tall, larger leaves > 5 cm long; inflorescences terminal (the bracts subtending flowers strongly reduced in size in comparison to main leaves of the stem); [tribe Cheloneae]..................................Chelone
17 Inflorescence compact, the inflorescence axis generally hidden by the closely packed and overlapping flowers; each flower subtended by large overlapping bracts..................................................Chelone
18 Inflorescence more diffuse, the inflorescence axis readily visible between the flowers; flowers lacking extra subtending bracts ..........................................................................................................................Penstemon
16 Plants creeping, decumbent or erect, small, usually < 4 dm tall (except Mecardonia, to 5 dm tall), larger leaves < 5 cm long; inflorescences axillary (all or most of the flowers axillary to more-or-less normally sized leaves).
18 Stamens 2; [section Gratioleae].
19 Capsule flattened, wider than long, notched; leaves dimorphic, with narrow submersed leaves on the lower stems, and broad floating leaves just subtending the aerial inflorescences; [of vernal pools on granite outcrops in Piedmont SC, GA, and AL]........................................................................................................................................Gratiola amphiantha
19 Capsule turgid, longer than wide; leaves monomorphic; [collectively of many habitats and widespread].
20 Flowers and fruits on definite pedicels; annual or perennial; leaves not papillose .........................................................Gratiola
20 Flowers and fruits sessile or sub sessile, the pedicels < 1 mm long; perennial; leaves papillose on the surfaces and margins .........................................................................................................................................Sophronanthus
18 Stamens 4.
21 Sepals evidently connate into a tube about as long as the lobes; [section Cheloneae]..............................................Collinsia
21 Sepals distinct or very nearly so.
22 Leaves deeply pinnatifid; [tribe Stemoniadeae]...........................................................................................................Leucospora
22 Leaves entire or toothed; [tribe Gratioleae].
23 Corolla nearly radially symmetrical; corolla lobes about as long as the corolla tube; leaves palmately veined, with parallel veins diverging from the base, margins entire to crenulate; of aquatic to moist habitats, often somewhat succulent ........................................................................................................................................Bacopa
23 Corolla distinctly bilabiate; corolla lobes shorter than the corolla lobe; leaves pinnately veined, with a single main- vein and lateral veins diverging along it, margins serrate; of moist habitats, not succulent..........................Mecardonia

Antirrhinum Linnaeus 1753 (Snapdragon)

A genus of about 20 species, herbs, of Mediterranean Europe. References: Sutton (1988)=Z; Pennell (1935)=P. [also see Misopates]

* Antirrhinum majus Linnaeus, Common Snapdragon. Mt (VA, WV), Pd (VA): cultivated, rarely persistent or naturalized; rare, native of Mediterranean Europe. July. [= C, G, K, P, WV, Z]

Bacopa Aublet 1775 (Water-hyssop)

A genus of about 50 species, herbs (mostly aquatic or at least wetland), of tropical, subtropical, and warm temperate regions of the Old and New Worlds. References: Schuyler (1989)=Z; Fernuad (1942); Pennell (1935)=P.

1 Leaves obovate to oblanceolate, cuneate at the base, 1-veined (or with 1-2 additional obscure veins), 3-8 mm wide; stems glabrous; fresh plants not aromatic ...............................................................................................................................................B. monnieri
Plantaginaceae

1 Leaves mostly orbicular to ovate (or sometimes obovate in the very rare B. repens), rounded to clasping at the base, 3-9-veined; stems pubescent or puberulent, at least when young (check at growing tips) or glabrous (in tidal forms of B. innominata); fresh plants aromatic or not.
2 Fresh plants strongly aromatic when bruised; corolla pale to bright blue, 9-13 mm long; calyx subtended by 2 subulate bractlets; stamens 4
B. caroliniana
2 Fresh plants not aromatic when bruised; corolla predominantly white (in some species slightly pink or marked with yellow), 2-10 mm long; calyx not subtended by bractlets; stamens 2 or 4.
3 Corolla 4-10 mm long, white with a yellow throat; capsule ca. 5 mm long ............................................................ B. rotundifolia
3 Corolla 2-5 mm long, white or pink, without a yellow throat; capsule 2-3 mm long.
4 Leaves strongly clasping, mostly ovate; stamens 2 (or very rarely 4); [native] .................................................. B. innominata
4 Leaves only slightly clasping, mostly obovate; stamens 4; [a very rare introduction]................................. B. repens

Bacopa innominata (Gómez Maza) Alain, Tropical Water-hyssop. Cp (FL, GA, NC, SC, VA): freshwater tidal muds, marshes, shallow water; uncommon (rare in GA, NC, SC, and VA). June-September. MD south to s. FL, and in the West Indies and Central America. B. stragula Fernald has been considered a rare endemic of tidal areas in VA and MD, differing from B. innominata in its glabrous stems (vs. pubescent), smaller flowers (the corolla < 3 mm long vs. > 3 mm long), and shorter, glabrous pedicels 3-6 mm long (vs. pubescent and to 8 mm long). Schuyler (1989) concluded that B. stragula is an intertidal form of B. innominata, the morphologic differences induced by the flooding regime. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. [= C, GW, K, WH, Z; > B. cyclophylla Fernald – RAB; > B. stragula Fernald – C, F, G; ? Herpestis rotundifolia Gaertner – P, S; ? Macallamia obovata Rafinesque – P]

Bacopa monnieri (Linnaeus) Wettstein, Monnier's Water-hyssop. Cp (FL, GA, NC, SC, VA): freshwater tidal muds, muddy shores, streams and pools; common (uncommon in GA, NC, SC, and VA). E. VA south to s. FL, west to e. TX, and in the West Indies and the New World subtropics and tropics. [= RAB, C, F, G, GW, K, WH; = Bramia monnieri (Linnaeus) Drake – P, S]

* Bacopa repens (Swartz) Wettstein, South American Water-hyssop. Cp (SC): freshwater pools; rare, presumably native of the New World tropics. [= RAB, GW, K; = Macallamia repens (Swartz) Pennell – P, S]

Bacopa rotundifolia (Michaux) Wettstein, Midwestern Water-hyssop. Cp (NC, VA): tidal muds, shallow water of large natural lake; rare. June-September. IN and IA west to ND and MT, south to AL and AZ, disjunct in e. MD, e. VA and ne. NC, where apparently native (though C considers introduced). Known in NC only from Lake Mattamuskeet, Hyde County, where not seen since 1929. B. simulans Fernald has been considered a rare endemic of tidal areas in VA and MD. It is alleged to differ from B. rotundifolia in its glabrous to glabrescent stems (vs. pubescent), more succulent condition, smaller leaves (the larger 1-2 cm long and 0.6-1.5 cm wide vs. 2-3.5 cm long and 1.5-2.7 cm wide), smaller flowers (corolla 3-4 mm long vs. 6-10 mm long). Schuyler (1989) concluded that B. simulans is an intertidal form of B. rotundifolia, the morphologic differences the result of differences in inundation. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. [= C, GW, K, Z; > B. rotundifolia – F, G; > B. simulans Fernald – F, G; = Macallamia rotundifolia (Michaux) Rafinesque – P, S]

Callitriche Linnaeus 1753 (Water-starwort)

A genus of 20-50 species, annual and perennial herbs of aquatic, wetland, and upland habitats, nearly cosmopolitan. This genus should be included in a greatly expanded Plantaginaceae. References: Angiosperm Phylogeny Group (2003, 2009); Crow & Hellquist (2000); Fernald – RAB; Fassett (1951) – P; Erbar & Leins in Kadereit (2004). Key based on Z.

1 Flowers and young fruits lacking bracts at their base; leaves monomorphic, obovate-spatulate, rounded at the tip.
2 Fresh plants strongly aromatic when bruised; corolla pale to bright blue, 9-13 mm long; calyx subtended by 2 subulate bractlets; stamens 4
C. heterophylla var. heterophylla
2 Fresh plants not aromatic when bruised; corolla predominantly white (in some species slightly pink or marked with yellow), 2-10 mm long; calyx not subtended by bractlets; stamens 2 or 4.
3 Corolla 4-10 mm long, white with a yellow throat; capsule ca. 5 mm long ............................................................ C. heterophylla
3 Corolla 2-5 mm long, white or pink, without a yellow throat; capsule 2-3 mm long.
4 Leaves strongly clasping, mostly ovate; stamens 2 (or very rarely 4); [native] .................................................. C. heterophylla
4 Leaves only slightly clasping, mostly obovate; stamens 4; [a very rare introduction]................................. C. pedunculosa

Callitriche heterophylla Pursh var. heterophylla, Common Water-starwort. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV): pools, slow-moving streams, ditches; common (uncommon in GA, NC, SC, and VA Piedmont, uncommon in Mountians). March-October. Greenland west to AK, south to c. peninsular FL, TX, CA, and Mexico. The other variety, var. bolanderi (Hegelmann) Fassett, with larger fruits, co-occurs with var. heterophylla in nw. North America
and is of uncertain taxonomic status, having been treated as species, subspecies, variety, and lumped. [\(< C. \) heterophylla \( \rightarrow \) RAB, C, G, GW, S, WH, Z; \( > C. \) heterophylla \( \rightarrow \) F; \( > C. \) aniceps Fernald \( \rightarrow F, Y; = C. \) heterophylla ssp. heterophylla \( \rightarrow K; > C. \) heterophylla var. heterophylla \( \rightarrow Y \)]

**Callitriche palustris** Linnaeus, Swamp Water-starwort. Cp (DE, VA), Pd (DE, VA), Mt (VA, WV): ponds, lakes, stagnant streams, wet soil; rare. Circumboreal, in North America south to VA, WV, IL, TX, and CA; South America. The nomenclatural debate between \( C. \) palustris and \( C. \) verna is difficult to resolve. \( [= C, F, K, S, C, GW, K, W, Z; \]

**Callitriche pedunculosa** Nuttall. Cp (FL, GA, NC), Pd (NC): low fields, pond shores; rare. NC, c. TN, and OK south to c. peninsular FL, AL, and TX. \( [= K, WH = C. \) nutallii Torrey \( \rightarrow PW, Y, Z] \)

**Callitriche pepoles** Nuttall. Cp (FL, GA, SC): low fields, ditches; rare. April-June. SC south to s. FL, west to TX; disjunct inland in TN, AR, e. Mexico south to Costa Rica. \( [= RAB, GW, K, S, WH; > C. \) pepoles var. pepoles \( \rightarrow Y \)]

* Callitriche stagnalis Scopoli. Pd (DE, VA), Mt (VA), Cp (VA): ponds, stagnant water, wet soil; rare, native of Europe, or possibly also native in some areas. See Philbrick, Aakjar, \& Stuckey (1998) for additional discussion of the spread of this species in North America. \( [= C, F, K, Y, Z] \)

**Callitriche terrestris** Rafinesque emend. Torrey, Terrestrial Water-starwort. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): streambanks, ditches, low fields, wet paths; uncommon. April-June. MA to KS, south to GA, TX, and Mexico. \( [= C, GW, K, S, W, Z; = C. \) deflexa A. Braun \( \rightarrow RAB, Y; > C. \) deflexa var. ausitinii (Engelmann) Hegelmann \( \rightarrow F, G] \)

**Chaenorrhinum** (A.P. de Candolle ex Duby) Reichenbach 1828
(Dwarf Snapdragon, Lesser Toadflax)

**Chelone** Linnaeus 1753 (Turtlehead)

**Chelone cuthbertii** Small, Cuthbert Turtlehead. Mt (GA, NC, SC, VA), Pd (NC), Cp (NC, VA): bogs, sphagnum swamps, seeps; uncommon (rare in GA, rare in Piedmont). Late July-September; September-October. This species has a curious, disjunct distribution: Mountains and rarely upper Piedmont of w. NC and n. GA, and Coastal Plain of se. VA and e. NC. The species is diploid (Nelson, Elisens, \& Benish 1998). \( [= RAB, C, F, G, GW, F, K, P, S, W] \)

**Chelone glabra** Linnaeus, White Turtlehead. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, SC, VA): streambanks, seeps, swamp forests; common. August-October; September-November. NL (Newfoundland) and MN south to GA and AL. The named varieties are intergrading and the characters used to distinguish them do not correlate well. The species is diploid (Nelson, Elisens, \& Benish 1998). \( [= RAB, C, G, GW, K, W; > C. \) glabra var. dilatata Fernald \& Wiegard \( \rightarrow F, P; > C. \) glabra var. elatior Rafinesque \( \rightarrow F, G, P, S; > C. \) glabra var. elongata \( \rightarrow F, G, P, S; > C. \) glabra var. ochroleuca Pennell \& Wherry \( \rightarrow F, G, P, S; > C. \) glabra var. glabra \( \rightarrow F, G, S; > C. \) glabra var. chlorantha (Pennell \& Wherry) Pennell \& Wherry \( \rightarrow P; > C. \) glabra var. typica \( \rightarrow P; > C. \) chlorantha Pennell \& Wherry \( \rightarrow S; > C. \) montana (Rafinesque) Pennell \& Wherry \( \rightarrow montana \rightarrow S; > C. \) montana var. elatior (Rafinesque) Small \( \rightarrow S \)

**Chelone lyonii** Pursh, Appalachian Turtlehead. Mt (NC, SC, WV*), Pd (NC, SC): cove forests, spruce-fir forests, balds, streambanks; uncommon. July-September; October. W. NC and e. TN south to nw. SC. The species is diploid (Nelson, Elisens, \& Benish 1998). \( [= RAB, C, GW, K, W; = C. \) lyonii \( \rightarrow F, G, P, S, orthographic variant \)

**Chelone obliqua** Linnaeus, Purple Turtlehead. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): streambanks, swamp forests; uncommon. October; November. MD and MN south to AL, w. TN, and MO. A tetraploid race is restricted to the southern Blue Ridge; plants in the remainder of the distribution are hexaploid (Nelson, Elisens, \& Benish 1998). \( [= RAB, C, GW, F, G, S, W; > C. \) obliqua var. obliqua \( \rightarrow K; > C. \) obliqua var. typica \( \rightarrow P; > C. \) obliqua var. erwiniae Pennell \& Wherry \( \rightarrow K, P] \)
Collinsia Nuttall 1817 (Blue-eyed Mary)

Cymbalaria Hill 1756 (Kenilworth-ivy)

* Cymbalaria muralis P.G. Gaertner, B. Meyer, & Scherbius ssp. muralis, Kenilworth-ivy. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, VA): naturalized on walls and rock outcrops near plantings, roadsides, disturbed areas; uncommon (rare in NC and VA), native of Eurasia. May-August. The other two subspecies, both villous throughout (vs. glabrous or with a few scattered hairs in ssp. muralis) are Mediterranean and are not known to be naturalized in North America. Reported for NC (Henderson County) by Pittillo & Brown (1988) as “derived from potted plants that have become established beneath the overhang of a porch for over a decade,” and reported again more recently as spreading from plantings in Alleghany County, NC (Poindexter 2006) and Buncombe County, NC (C.A. McCormick, pers.comm. 2009). Reported by Pennell (1935) as being “in herbaria” from DC, KY, MD, SC, TN, WV, and other states beyond our area. [= Z; < C. muralis – C, F, G, K, P, WV; = C. cymbalaria (Linnaeus) Wettstein;= Linaria cymbalaria (Linnaeus) P. Miller]

Digitalis Linnaeus 1753 (Foxglove)
A genus of about 19 species, herbs, of Europe west to central Asia. Famous as the source of the drug digitalis, a cardiac glycoside. References: Pennell (1935)=P.

1 Corolla 1.3-1.8 cm long, pale yellow to white; plant nearly glabrous .......................................................... [D. lutea]
2 Corolla 2-5.5 cm long, white, yellow, or purple; plant conspicuously pubescent on the stem and/or leaves. ..........................[D. lanata
2 Corolla 4-5.5 cm long, purple or white, the lower median lobe much longer than the others...............................................D. purpurea

* Digitalis purpurea Linnaeus, Digitalis, Common Foxglove, Purple Foxglove, Lady’s-glove. Mt (NC, WV), Cp (VA): disturbed areas, bog margins; uncommon (rare in NC and VA), native of Europe. June-August. Introduced and established at scattered locations in ne. North America, as far south as PA (Rhoads & Klein 1993). [= C, P, WV; > D. purpurea var. purpurea – K; > D. purpurea var. alba – K]

* Digitalis lutea Linnaeus, Straw Foxglove. Naturalized south to MD, PA, and OH. [= C, G, K]

Gratiola Linnaeus 1753 (Hedge-hyssop)

Identification notes: Gratiola amphiantha somewhat resembles Callitriche, but has floating leaves in single pairs rather than in a whorl.

1 Capsule flattened, wider than long, notched; leaves dimorphic, with narrow submersed leaves on the lower stems, and broad floating leaves just submerging the aerial inflorescences; [of vernal pools on granite outcrops in Piedmont SC, GA, and AL]..................G. amphiantha
2 Flowers and fruits sessile or sub sessile, the pedicels < 1 mm long; perennial. ................................................................. [see Sophronanthe hispida]
3 Leaves linear-subulate; corolla 2-3× as long as the calyx .......................................................................................... [see Sophronanthe pilosa]
4 Flowers and fruits on definite pedicels; annual or perennial. .........................................................................................
5 Calyx subtended by 0 (-1) bractlet; corolla lobes white; corolla tube greenish yellow, conspicuously veined......................G. ramosa
6 Calyx subtended by 2 bractlets; corolla lobes white or yellow-orange; corolla tube greenish yellow and conspicuously veined, or orange and not conspicuously veined.
7 Corolla lobes and tube yellow-orange (very rarely white), not conspicuously veined; sepals and flower stalks sparsely or not at all glandular-puberulent.................................................................G. aurea
8 Corolla lobes white to lavender, corolla tube greenish yellow, usually conspicuously veined; sepals and flower stalks densely glandular-puberulent.

PLANTAGINACEAE
7 Leaves triangular to lanceolate, margins entire, or with a few teeth toward the tip; corolla veined with brown lines; sepals linear-lanceolate ................................................................. G. brevifolia
8 Leaves oblong-ovate to ovate (or linear-lanceolate in submersed forms), finely dentate; corolla veined with purple lines; sepals lanceolate to oblanceolate ............................................. G. viscidula
10 Mid-stem leaves (6-) 7-13 (-18) mm long; proximal fruiting pedicels (5-) 7-17 (-22) mm long, (0.9-) 1-2 (-2.3) × as long as the subtending bracteal leaves; bracteoles shorter than to barely exceeding the sepals; [of granite outcrops in the GA Piedmont] ...................................................... G. graniticola
11 Leaves narrowly elliptic or rhombic to suboblongate to oblongate, not conspicuously falcate, (2.7-) 5-11 (-18) mm wide, (2.5-) 3.5-5 (-6) × as long as wide; leaf margins with (1-) 3-5 (-7) teeth per side; primary veins 3-5 (-7); mid-stem moderately to densely glandular pubescent (rarely glabrate); seeds (0.18-) 0.22-0.26 (-0.29) mm thick; [widespread] ......................... G. neglecta
12 Leaves linear, linear-lanceolate, to elliptic-lanceolate, often falcate, (1-) 2.5-4 (-5.5) mm wide, (5.5-) 6-9.5 (-11) × as long as wide; leaf margins with 0-2 (-3) teeth per side; primary veins 1 (-3); mid-stem glabrous; seeds (0.19-) 0.26-0.32 (-0.37) mm thick; [limestone cedar glades of n. AL and c. TN] ........................................................................................................ G. quartermaniae

Gratiola aurea Pursh, Yellow Hedge-hyssop, Golden-pert. Cp (DE, FL, GA, NC, SC): blackwater river banks, pondcypress savannas in Carolina bays, other acidic wetlands; uncommon (rare in FL). May-September. NL (Newfoundland) and QC south in the Coastal Plain to Panhandle FL; disjunct around the Great Lakes and inland in NY, ON, IL, and ND. [= RAB, C, F, G, GW, K, S, WH; > G. lutea Rafinesque var. typica – P; > G. lutea var. obtusa (Penniset) Pennell – F]
Gratiola floridana Nuttall. Cp (FL, GA), Mt (GA), Pd (GA): stream banks, spring runs, blackwater swamps; uncommon. Ne. GA and se. TN (in counties adjacent to NC) (Chester, Wofford, & Kral 1997), south to e. GA (in counties adjacent to SC) (Jones & Coile 1988), ne. FL, Panhandle FL, AL, and MS. [= GW, K, P, S, WH]
Gratiola quartermaniae D. Estes. Limestone Hedge-hyssop, Quarterman’s Hedge-hyssop. Ip (TN): limestone glades; rare. April-early June. C. TN south to n. AL; c. TX (Edwards Plateau); s. ON; ne. IL. [= Z; < G. neglecta – C, GW, K, P, S, W; < G. neglecta var. neglecta – F]
Gratiola rosamos Walter. Cp (FL, GA, NC, SC, VA): wet pine savannas, marshes, pond margins; ditches; common (rare in VA). May-June. Se. NC south to s. FL, west to sw. LA; disjunct in se. VA (Greensville County) and (at least historically) in e. MD. [= RAB, C, F, G, GW, K, P, S, WH]
Gratiola virginiana Linnaeus, Virginia Hedge-hyssop. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, WV): sluggish streams, bogs, wet areas; common (uncommon in WV). March-May. NJ west to OH and IA and KS, south to c. peninsular FL and e. TX. Var. aestuariorum Pennell, of s. NJ south to e. VA, is alleged to differ in being shorter, with more rounded leaves, short pedicels (< 2 mm long), a shorter calyx and corolla, and a smaller capsule; it is likely merely a stunted aquatic form, but needs additional study (see F and P for additional details). [= RAB, C, G, GW, S, W, WH, WV; > G. virginiana var. virginiana – F, K, P; > G. virginiana var. aestuariorum Pennell – F, K, P, P]

Kickxia Dumortier 1827 (Fluellen, Cancervort)
2 Stems densely villous; stems robust (usually 1.5-3.5 mm thick), often much-branched; pedicels 5-12 (-20) mm long, 0.25-0.35 mm in diameter, often villous their entire lengths..........................K. elatine ssp. crinita
2 Stems sparsely villous; stems slender (to 1.5 mm thick), sparingly (if at all) branched, pedicels mostly (8-) 15-25 (-30) mm long, 0.1-0.2 mm in diameter, glabrous except for immediately below the calyx ............................................................K. elatine

Leucospora Nuttall 1834 (Leucospora)

A genus of 2 species, herbs, of e. North America and Coahuila, Mexico. *Leucospora* may not be distinct from *Stemodia*. References: Pennell (1935)=P.

*Leucospora multifida* (Michaux) Nuttall, Leucospora, Narrowleaf Paleseed. Cp* (FL*, NC*), Pd (VA*), Mt (GA, WV): moist to wet, sandy margins of artificial ponds, drawdown areas on riverbanks, drawdown depressional wetlands, other seasonally ponded disturbed areas; rare, probably introduced in most of our area from c. United States. S. ON west to IA and KS, south to nw. GA, AL, LA, and e. TX; scattered occurrences further east (as in e. NC, FL, KY, TN, VA, and se. PA) may be recent introductions. [= C, G, GW, K, P, S = Conobea multifida (Michaux) Bentham – F, WH; = Stemodia multifida (Michaux) Sprengel]

Limonophila R. Brown 1810 (Marshweeds)

A genus of about 37 species, of tropical regions of the Old World.

Limosella Linnaeus 1753 (Mudwort, Awl-leaf)

A genus of about 11 species, aquatic herbs, of cosmopolitan distribution. References: Pennell (1935)=P.

* Limosella australis* R. Brown, Mudwort, Awl-leaf. Cp (DE, NC, VA): fresh or slightly brackish tidal flats; rare. June. NL (Newfoundland) and QC south along the Atlantic Coast to se. VA and extreme ne. NC. This plant is very inconspicuous, though locally abundant. [= K; ? L. subulata Ives – RAB, C, F, G, GW, P]

Linaria P. Miller 1754 (Yellow-toadflax)

A genus of about 150 species, of temperate regions of Eurasia. References: Sutton (1988)=Z; Pennell (1935)=P. [also see Nuttallanthus]

* Linaria maroccana* Hooker f., Moroccan Toadflax. Mt (WV), Pd (VA): disturbed areas; rare, native of n. Africa. Introduced in VA (perhaps just a waif) and WV. [= K] {investigate; not yet keyed; synonymy incomplete}

Mecardonia Ruiz & Pavón 1794 (Mecardonia, Axil-flower)

A genus of about 10 species, of tropical, subtropical, and warm temperate regions of America. References: Pennell (1935)=P.

1 Corolla yellow; outer sepals broadly lanceolate to ovate, overlapping the shorter, much narrower inner sepals..........................M. procumbens
1 Corolla white, with purple veins; sepals lanceolate nearly equal in length.
2 Peduncles > 10 mm long; sepals < 2 mm wide .................................................................................................................M. acuminata var. acuminata
2 Peduncles < 10 mm long; sepals > 2 mm wide .................................................................................................................M. acuminata var. microphylla

*Mecardonia acuminata* (Walter) Small var. *microphylla* (Rafinesque) Pennell, Pond Axil-flower. Cp (FL, GA): margins of Coastal Plain ponds; rare. Sc. GA south to Panhandle FL and west to e. LA. [= K, S; < *M. acuminata* – GW; = *Pagesia acuminata* (Walter) Pennell ssp. microphylla (Rafinesque) Pennell – P; = *M. acuminata* var. microphylla – WH (misspelling)]

**Misopates** Rafinesque 1840 (Weasel's-snout)

**Nuttallanthus** D.A. Sutton 1988 (American-toadflax)

A genus of 4 species, herbs, of North and South America. Sutton (1988) separates these three species, along with *N. subandinus* (Diels) D.A. Sutton, of Bolivia, Chile, Ecuador, Peru, and Uruguay, from *Linaria* on the basis of "the corolla with the abaxial lip greatly exceeding the adaxial lip; the palate weakly developed and scarcely occluding the tube; the spur very slender or absent and the prismatic seeds with 4-7 longitudinal ridges." *Nuttallanthus* is American; *Linaria* is Eurasian. References: Sutton (1988)=Z; Pennell (1935)=P. Key based on Z.

1 Infructescence axis zigzag; fruiting pedicels densely glandular pubescent, 5-13 mm long, 2× or more as long as the calyx…………..*N. floridanus*
1 Infructescence axis straight or nearly so; fruiting pedicels glabrous or with a few scattered glandular hairs, 2-6 (<9) mm long, <1× as long as the calyx.
2 Corolla 8-11 (-13) mm long (measured from the tip of the spur to the apex of the adaxial lip), the abaxial lip 2-6 mm long; seeds longitudinally ridged, the intervening faces smooth or with sparse low tubercles......................................................*N. canadensis*
2 Corolla 14-22 mm long (measured from the tip of the spur to the apex of the adaxial lip), the abaxial lip 6-11 mm long; seeds densely tuberculate, not longitudinally ridged..................................................................................................................*N. texanus*

**Nuttallanthus canadensis** (Linnaeus) D.A. Sutton, Common Toadflax. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): in a wide variety of natural and disturbed habitats, especially common and weedy in disturbed sites such as roadsides and fields, also common and apparently native in thin soil of rock outcrops; common (rare in WV, rare in Mountains of VA). March-May. NS west to ND, south to s. FL and TX; also adventive on the west coast, from WA to CA. Sutton (1988) comments that there is substantial variation in this species not taxonomically explained. [= K, Z; < *Linaria canadensis* (Linnaeus) Dumortier – RAB, W (also see *N. texanus*); = *Linaria canadensis var. canadensis* – C, F, G, S; = *Linaria canadensis* (Linnaeus) Dumortier – P, WH, WV]

**Nuttallanthus floridanus** (Chapman) D.A. Sutton, Florida Toadflax. Cp (FL, GA): sandhills, scrub, dunes, other dry, sandy places; uncommon. E. GA south to s. FL and west to s. MS. [= K, Z; = *Linaria floridana* Chapman – P, S, WH]

**Nuttallanthus texanus** (Scheele) D.A. Sutton, Texas Toadflax. Cp (FL, GA, NC*?, SC*?, VA*?), Pd (NC*?, SC): granite flatrocks, dry sandy soils, disturbed soils of roadsides and fields; uncommon, native of sc. United States, not clear how far east the original range extended. March-May. Ranging as a native species in sc. and sw. North America and in temperate South America; introduced elsewhere (as in most of our area, the exact limits unclear). [= K, Z; < *Linaria canadensis* (Linnaeus) Dumortier – RAB, W; = *Linaria canadensis var. texana* (Scheele) Pennell – C, F, G, S; = *Linaria texana* Scheele – P, WH]

**Penstemon** Mitchell 1769 (Beard-tongue, Penstemon)

1 Cauline leaves bipinnatifid; basal leaves sessile; [endemic to GA]; [section Dissecti]....................................................................................*P. dissectus*
1 Cauline leaves entire or toothed; basal leaves petioled; [collectively widespread].
2 Inflorencence with many nodes; anther cells dehiscing by short proximal slits; [s. GA south to s. FL]; [section Multiflori]…………..*P. multiflorus*
2 Inflorencence with <10 nodes; anther cells dehiscing their entire length; [collectively widespread].
3 Corolla glandular-pubescent within; [section Tubiflori]..............................................................................................................*P. tubiflorus*
3 Corolla pubescent with non-glandular hairs within; [section Gracilis].
 Older lobes of the corolla essentially equaling the upper lobes; corolla throat with little ridging on its floor; sterile filament slightly to moderately bearded.  

5 Anthers with short, stiff hairs; corolla white, lined with purple.  

6 Stems pubescent; inflorescence glabrous or slightly glandular-pubescent; corolla 16–23 mm long [P. alluviorum]  

5 Anthers glabrous; corolla purple to violet.  

7 Sepals long-attenuate, to 12 mm long; leaves finely serrate; corolla 20–35 mm long [P. calycosus]  

7 Sepals < 8 mm long; leaves obscurely serrate; corolla lobes strongly deflexed; corolla 15–22 mm long [P. laevigatus]  

4 Lower lobes of the corolla projecting beyond the upper lobes; corolla throat strongly ridged on its floor; sterile filament densely bearded (only moderately bearded in P. pallidus).  

8 Throat of corolla more-or-less closed by a palate formed by the upward arch of the corolla lip (opened only by the weight of the landing pollinator).  

9 Buds yellow-purple; corolla violet-purple with white lobes (fading white when dried); leaves essentially glabrous [P. hirsutus]  

9 Buds yellow; corolla creamy white; leaves pubescent [P. tenuiflorus]  

8 Throat of corolla open.  

10 Peduncles strongly ascending, the inflorescence therefore narrow; corolla reddish-purple [P. austrius]  

10 Peduncles spreading, the inflorescence therefore relatively broad; corolla white to violet or purple.  

11 Leaves pubescent, but not velvety; corolla violet or purple.  

12 Basal leaves truncate or cordate at base; lower bracts of inflorescence fi nely pubescent, slightly smaller than the cauline leaves... [P. smallii]  

12 Basal leaves cuneate at base; lower bracts of inflorescence reduced, much smaller than the cauline leaves.  

13 Cauline leaf blades wide, ovide-lanceolate to ovide [P. canescens]  

13 Cauline leaf blades narrow, acute to acuminate [P. laxiflorus]

Penstemon dissecctus Elliott, Georgia Beardtongue, Grit Beardtongue. Cp (GA): Altamaha Grit outcrops, sandhills; rare. Endemic to Altamaha Grit outcrops and other sandy areas from e. GA south and west to sw. GA. This species is unmistakable because of its bipinnatifid leaves. [= K, P, S, Z]

Penstemon laxiflorus Pennell. Cp (FL, GA): dry sandy areas; rare. C. GA, FL Panhandle, and n. AL west to c. OK and c. TX. [= K, P, S, Z; < P. austrius – WH; = P. austrius Small ssp. laxiflorus (Pennell) Bennett]

Penstemon species 1. Of e. AL, with very small corollas and sharply dentate teeth. Under study by Dwayne Estes.

Penstemon tenellus Pennell, Plateau Beardtongue, Limestone Beardtongue, Kentucky Beardtongue. Endemic to the Interior Low Plateau of wc. KY, c. TN, n. AL, extending slightly into the Coastal Plain to the west, and disjunct in the Black Belt of AL and MS. [= C, F, G, K, P, S, Z]

Penstemon tubiflorus Nuttall, Tube Beardtongue. A more western species, reaching its eastern limit in w. TN (Chester, Wofflor, & Kral 1997). It is also known from adjacent sites further east, such as in e. PA (Rhoads & Klein 1993). [= S; = P. tubae florus – C, G, P, Z, orthographic
Plantago Linnaeus 1753 (Plantain)

1 Leaves cauline, opposite; spikes on peduncles from the leaf axils; [section Psyllium] ................................................................. P. psyllium
2 Leaves basal; spikes on scapes from the base of the plant.

3 Leaf venation parallel, with all of the major veins separating at the base of the leaf; either perennial from thin, fibrous roots or an erect caudex, or annual from a small taproot; capsule 2-3-seeded; scapes either solid and terete, solid and angled, or hollow and terete; [terrestrial].

4 Leaves broadly ovate-elliptic, the blades 1-3 × as long as wide, distinctly petiolate; scapes solid and terete; [section Plantago].
5 Fruit 2.5-4 mm long, dehiscent near the middle, the terminal portion about as long as the basal; sepals broadly ovate, ca. 1.5 × as long as wide, mostly obtuse; petals usually green and pubescent at the base ................................................................. P. major
6 Fruit 4-6 mm long, dehiscent below the middle, the terminal portion about 2 × as long as the basal; sepals narrowly elliptic, 2-4 × as long as wide, mostly acute; petals usually purple and glabrous at the base ................................................................. P. rugelii
7 Leaves mostly broadly obovate, broadly lanceolate, or spatulate, (3-) 4-10 × as long as wide, attenuate to the only somewhat petiolate base; scapes solid and 5-angled, or hollow (to solid) and terete.

8 Bracts and calyx pubescent, at least on the keels; ephemeral annual, flowering late March-June, and then senescing; [section Virginal].
9 Summer and winter leaves not dimorphic, all leaves lanceolate or linear; plant either perennial from thin, fibrous roots, or annual from a small taproot; [terrestrial].

10 Leaves fleshy; corolla tube pubescent on its outer surface; [of sea beaches] ................................................................. P. maritima var. juncoides
11 Leaves herbaceous (though often rather thick and leathery); corolla tube glabrous on its outer surface; [of various habitats, not as above].

12 Bracts of the inflorescence and sepals conspicuously pubescent; annual (rarely biennial), with a taproot; stamens 4.
13 Bracts of the lower flowers in the spikes conspicuously exerted, at least 2 × as long as the subtended flower.

14 Leaves glabrous or puberulent above; longer bracts 8-30 mm long; seeds 2.2-3.0 mm long ................................................................. P. aristata
15 Leaves silky-pubescent above; longer bracts mostly < 5 mm long; seeds 1.3-1.9 mm long ................................................................. P. patagonica
16 Annual; flowers with 2 stamens; capsule 4-25-seeded; leaves linear, 0.5-5 mm wide; [section Micropetalum].
17 Capsule mostly 10-25-seeded; seeds 0.5-0.8 mm long ................................................................. P. heterophylla
18 Perennial; flowers with 4 stamens; capsule 1-2-seeded; leaves lanceolate (or broader), 7-50 mm wide.

19 Spikes very densely flowered, the rachis hidden; scape 5-angled; [widespread weedy alien]; [section Lancifolia].
20 Spikes loosely flowered, the rachis visible its entire length; scape terete; [rare native of Coastal Plain pinelands and adjacent fire-plow lines and ditches]; [section Palaeopsyllium] ................................................................. P. sparsiflora

* Plantago aristata Michaux, Buckhorn Plantain. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed areas, especially dry, barren, exposed soil, such as clay soils denuded by bull-dozing; common (uncommon
Platanus cordata Lamark, King-root, Heartleaf Plantain. Pd (NC), Mt (GA, VA), Cp (VA): aquatic or semi-aquatic in streambeds with outcrops of slate, aquatic in tidal estuaries; rare. March-April; May-June. NY and s. ON west to WI, south to w. VA, c. NC, nw. GA, AL, sc. TN, and MO, very scattered and rare in every state in which it occurs, except MO. Characteristically, P. cordata is a very robust plant, the inflorescences often 1 meter in height, and the glabrous leaves with ovate blades to 30 cm long and 20 cm wide, on ascending petioles up to 40 cm long and 2 cm wide; Winter leaves are 3-10 cm long, ca. 1 cm wide, and remotely toothed. Spring shows a gradual transition from the winter form to the summer form. P. cordata is not known to be extant in VA, where it formerly occurred in the estuary of the Potomac River and in Smyth County in sw. VA. In NC, P. cordata is apparently limited to 2 slate-bottomed streams in s. Davidson County, where it is locally abundant. A recent study of morphological and genetic variability in the species found the 2 NC populations to "represent sites of primary [conservation] concern with unique genetic composition" (Mymudes & Les 1993). [= RAB, C, F, G, K, S, W, WH, WV, Z]

?? Plantago major Linnaeus, Common Plantain, Whiteman's-foot. Cp (DE, FL*, GA, NC, SC, VA), Pd (DE, GA, NC, VA), Mt (GA, NC, VA, WV): lawns, roadsides, disturbed areas; common (uncommon in FL, GA, NC, SC, VA, and WV), native of Europe, possibly also native in ne. North America, possibly as far south as the northern part of our area. June-November. Very variable, and possibly worthy of some of the infraspecific subdivisions suggested by various authors. The Coastal Plain populations associated with the Chesapeake Bay in VA may represent a native, estuarine genotype. [= RAB, C, GW, K, S, WH, WV, Z; > P. major var. major – F; > P. major var. scopulorum Fries & Broberg – F; > P. major ssp. pleiosperma Pilger var. paludosã Béguinot – G; > P. major ssp. pleiosperma Pilger var. scopulorum Fries & Broberg – G; > P. major var. intermedia (A.P. de Candolle) Pilger]

Plantago maritima Linnaeus var. juncoides (Lamarck) A. Gray, Seaside Plantain. Cp (VA): salt marshes; rare. Var. juncoides apparently ranges from Greenland and ne. Canada south to e. VA. Other varieties occur in nw. North America and n. Eurasia, the species as a whole is an interruptedly circumboreal plant of ocean shores, also disjunct inland in saline areas. [= K; = P. maritima ssp. juncoides (Lamarck) Huiln – C; > P. juncoides Lamarck var. decipiens (Barnéoud) Fernald – F; < P. maritima – G]

* Plantago rhodopensa Decaisne, Redseed Plantain, reported as ranging east to KY, TN, and GA (Kartesz 1999), probably as adventive from further west. The reports for GA and TN require confirmation. [= C, F, G, K]

Plantago sparsiflora Michaux, Pineland Plantain. Cp (FL, GA, NC, SC, VA): wet savannas over calcareous substrates (coquina limestone), now usually found in moister human-created microhabitats adjacent to these sites, such as fire-plow lines, shallow ditches along roadsides, or mowed powerline rights-of-way; rare. April-October. Se. NC south to ne. FL, restricted to the Coastal Plain. Harper (1944), with his usual keen understanding of the ecology of southeastern plants, has provided the most succinct and accurate description of the habitat of this plant: "flatlittish pine-barrens where there is evidently some calcareous material not far from the surface." Reports of this species for VA are in error. [= RAB, GW, K, S, WH, X, Z]

Plantago virginica Linnaeus, Virginia Plantain. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, Mt (GA, NC, SC, VA, WV)): roadsides, lawns, disturbed areas; common. Late March-June. MA and NY west to SD, south to s. FL and TX. [= RAB, C, G, K, S, WH, WV, Z; > P. virginica var. virginica – F; > P. virginica var. viridescens Fernald – F]

Plantago wrightiana Decaisne, Wright's Plantain. Cp (FL, GA, NC, SC), Pd (GA, NC, SC, VA): roadsides, lawns, disturbed areas; common (uncommon in NC). Late April-July. VA, NC, OK, and AZ south to c. peninsular FL, MS, TX, and Mexico, the original distribution unclear. [= K, WH, Z; = P. hookeriana Fischer & C.A. Meyer var. nuda (A. Gray) Poe – RAB, W]

* Plantago floccosa Decaisne. Cp (FL): disturbed areas; rare, native of {}. Panhandle FL. [= WH] {not yet keyed; add to synonymy}

Scopia Linnaeus 1753 (Goat-weed, Sweet-broom)
**PLANTAGINACEAE**

A genus of about 20 species, herbs, of tropical and subtropical America. References: Pennell (1935)=P.

1 Corolla white; sepals 4, ovate; stem 3-8 dm tall; annual .................................................. S. dulcis
1 Corolla yellow; sepals 5, lanceolate; stem 1-1.5 dm tall; perennial ........................................ S. montevidensis var. glandulifera

* Scoparia montevidensis (Sprengel) R.E. Fries var. glandulifera (Fritsch) R.E. Fries. Cp (FL, NC): on ballast, other disturbed areas; rare, native of South America. [= K, P, WH]

**Sophronanthe** Bentham 1836

A genus of 2 species, herbs, of southeastern North America. The two taxa included here are not part of *Gratiola*. References: Pennell (1935)=P.

1 Leaves linear-subulate; corolla 2-3× as long as the calyx ....................................................................... S. hispida
1 Leaves ovate; corolla 1-1.5× as long as the calyx ................................................................................. S. pilosa

**Sophronanthe hispida** Bentham ex Lindley, Pineland Hedge-hyssop. Cp (FL, GA): dry pinelands, dunes; common (uncommon in GA). E. GA (within a few counties of SC) south to s. FL, and west to MS. [= P, S; = *Gratiola hispida* (Bentham ex Lindley) Pollard – GW, K, WH]

**Veronica** Linnaeus 1753 (Speedwell)

A genus of about 180 species, herbs, nearly cosmopolitan (at least now), most diverse in Europe. The genus appears to be paraphyletic as currently circumscribed (Albach & Chase 2001). References: Walters & Webb (1972)=Z; Crow & Hellquist (2000)=Y; Pennell (1935)=P. Key partly based on *C.*

1 Flowers in axillary racemes; upper bracteal leaves opposite throughout.
2 Leaves and stems pubescent; [plants of mesic to dry habitats]; [section Veronica].
   3 Leaves cuneate at the base; leaves widest at the middle or beyond; pedicels shorter than the subtending bracts ................................. V. officinalis
   3 Leaves cordate, truncate or rounded at the base; leaves widest towards the base; pedicels equaling or longer than the subtending bracts.
   4 Stem pubescence generally distributed; calyx shorter than the capsule; style 6-8 mm long; stems erect ............................ [V. austriaca ssp. teucrium]
   4 Stem pubescence restricted to 2 lines; calyx longer than the capsule; style 3-5 mm long; stems creeping or ascending ........................... [V. chamaedrys]

2 Leaves and stems glabrous, or with fine glandular hairs in the inflorescence only; [plants of wetlands].
5 Leaves (even the upper) short-petiolate; [section Beccabunga].
   6 Leaves broadest towards the base, acute at the tip; style 2.5-3.5 mm long ................................................................. V. americana
   6 Leaves broadest near or above the middle, rounded at the tip; style 1.8-2.2 mm long ............................................................. V. beccabunga

5 Leaves (at least the middle and upper) sessile.
   7 Capsule flattened, conspicuously notched at the style and therefore appearing 2-lobed, wider than long; seeds 1.2-1.8 mm long; leaves (3-) 4-20× as long as wide; < 1 cm wide, tapering to the base and not clasping; [section Veronica] ................................. V. scutellata
   7 Capsule turgid, slightly or not notched at the style, about as long as wide; seeds < 0.5 mm long; leaves 1.5-5 (-8)× as long as wide, mostly > 1 cm wide, clasping at the base; [section Beccabunga].
   8 Racemes 20-65-flowered; pedicels 4-8 mm long; capsule ovoid to globose, not notched or barely so ........................ V. anagallis-aquatica
   8 Racemes 5-25 (-35)-flowered; pedicels 3-6 mm long; capsule broadly obcordate, distinctly though slightly notched at the style ...... [V. catenata]

1 Flowers in terminal racemes or solitary and axillary, subtended by normally-sized leaves; upper bracteal leaves often alternate.
9 Bracts abruptly smaller than the foliage leaves, the flowers thus in well-developed terminal racemes or spikes; perennials from rhizomes.
10 Stems 3-10 dm tall; flowers in a crowded terminal spike; larger leaves > 4 cm long, sharply serrate; [section Pseudolysimachium] .......................... [V. catenata]
10 Stems 1-3 dm tall; flowers in loose racemes; larger leaves < 2.5 cm long, entire to weakly toothed; [section Veronicastrum].
11 Flowers bright blue; pedicels with some longer gland-tipped hairs; flowers usually < 12 per raceme .......................... [V. serpyllifolia var. humifusa]
11 Flowers pale blue with darker blue lines; pedicels puberulent; flowers usually > 12 per raceme .................. [V. serpyllifolia var. serpyllifolia]
9 Bracts gradually reduced in size upwards, all of the flowers or at least those lower on the stem axillary in the axils of well-developed foliage leaves; annuals (except V. filiformis); [section Pociila].
12 Pedicels 0.2 mm long; flowers in the axils of bracts, all or at least the upper of which are very different than foliage leaves.
13 Leaves 3-10× as long as wide, toothed or entire; flowers white or very pale, ca. 2 mm across; stems usually glabrous (except V. peregrina var. xalapensis).
14 Stem glabrous; sepals and fruit glabrous ................................................................. V. peregrina var. peregrina
14 Stem pubescent with short, gland-tipped hairs; sepals and fruit glabrous or pubescent with short, gland-tipped hairs ...........................

..............................................................................................................................................................................................................
13 Leaves 1-2× as long as wide, palmately lobed or toothed; flowers blue, 2-4 mm across; stems pubescent.
15 Upper leaves and lower bracts trifoliated, the lobes cut > ½ way to base ......................................................... *V. triphylllos*
15 Leaves unlobed (though crenate-serrate).
16 Style 0.4–1.0 mm long ........................................................................................................................................ *V. arvensis*
17 Style ca. 1.5 mm long ........................................................................................................................................ *V. dillenii*
12 Pedicels 5–40 mm long; flowers in the axils of leaves similar in shape and size to foliage leaves (though the upper are sometimes somewhat smaller).
17 Perennial, the stems rooting at the nodes the length of the stem; pedicels > 2× as long as the the leaves ................... *V. filiformis*
17 Annual, the stems not rooting at the nodes (at most only at the base of the plant); pedicels < 2× as long as the the leaves.
18 Calyx lobes cordate at the base; leaves with 3–7 teeth or shallow lobes ........................................................................... *V. hederifolia*
18 Calyx lobes cuneate to rounded at the base; leaves with usually > 7 small teeth or crenations.
19 Lobes of the capsule with apices diverging at ca. 90 degrees; corolla > 8 mm wide ................................................... *V. persica*
19 Lobes of the capsule with apices parallel or diverging at an acute angle; corolla < 8 mm wide.
20 Capsule with all hairs straight and gland-tipped; corolla white to pale blue or violet .................................................... *V. agrestis*
20 Capsule with a mixture of short, arching, non-glandular hairs and longer, straight, gland-tipped hairs; corolla bright blue...... *V. verna Linnaeus – F*

* Veronica agrestis* Linnaeus, Field Speedwell. Pd (DE, GA, NC), Cp (DE, FL), Mt (GA), {VA, WV}: lawns and disturbed areas; common (rare in FL, GA, NC, and VA), native of Eurasia. [= C, F, G, K, P, WH, Z; < *V. agrestis* – RAB, G; < *V. polita* – W]

* Veronica dillenii* Crantz, Dillenius’s Speedwell. Mt (VA): disturbed areas; rare, native of Europe. [= C, G, K, P, Z; < *V. verna Linnaeus – F*]

* Veronica peregrina* Linnaeus var. peregrina, Common Purslane Speedwell. Mt (NC, VA, WV), Cp (DE, GA, NC, SC, VA), Pd (DE, GA, SC, VA), Mt (DE, GA, NC, SC, VA): fields, roadsides, disturbed areas; common. April–May. NS and ND south to FL and TX; AK south to OR (perhaps only as an introduction?); South America. [= C, F, G, S, WV; < *V. peregrina* ssp. peregrina – K; < *V. peregrina* – RAB, W, Z; < *V. peregrina* var. typica – P; < *V. peregrina* – WH]

* Veronica peregrina* Linnaeus var. xalapensis (Kunth) Pennell, Western Purslane Speedwell. Cp (GA), {NC?, SC?): fields, lawns, disturbed places; rare, probably introduced in our area on ballast. April–May. QC and AK south to MA, KY, TX, and south to Guatemala. [= C, F, G, S, WH, Z; < *V. peregrina* – RAB, G; < *V. didyma Tenore – P, misapplied; < *V. polita* – WV]

* Veronica polia* Fries. Pd (DE, NC, VA), Mt (VA), Cp (FL, VA), {WV}: lawns, waste areas; rare, native of Eurasia. March–April. This species is introduced in c. TN (Chester, Wofford, & Kral 1997), WV, and w. PA (Rhoads & Klein 1993), FL (Pennell 1935; Kunzer et al. 2009), NC, and VA (Kartesz 1999). It is similar to *V. agrestis* and has been much confused with it. [= C, F, K, S, WH, Z; < *V. agrestis* – RAB, G; < *V. didyma Tenore – P, misapplied; < *V. polita* – WV]

**Veronica triphylla** Linnaeus. Pd (NC, SC): cultivated fields; rare, native of Eurasia. April. [= RAB, K, P]

Veronica catenata Pennell. Streams and wetlands. Circumboreal, the southern limits obscure because of taxonomic confusion, misidentifications, and misattributions.  [= C, Y; misapplied]

Veronicastrum Linnaeus var. humifusa (Dickson) Vahl. Native of Eurasia, is naturalized at scattered locations in PA (Rhoads & Klein 1993) and MD (Kartesz 1999). It is native in n. North America. April-June.  [= C, G; < V. serpyllifolia – F; = V. serpyllifolia ssp. humifusa (Dickson) Syme – K, Z; = V. humifusa Dickson – P]

**Veronicastrum** Heister ex Fabricius 1759 (Culver's-root)

**Veronicastrum virginicum** (Linnaeus) Farwell, Culver's-root. Mt (GA, NC, WA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, VA): streambanks, bogs, wet meadows, dryish soils in areas with prairie affinities; uncommon (rare in Coastal Plain). July-August. VT west to MB, south to nc. and nw. GA, w. FL Panhandle (Escambia County), and LA. Populations seem to be of somewhat sporadic or irregular appearance from year to year.  [= RAB, C, F, G, GW, K, P, S, WH, WV]

### 369. SCROPHULARIACEAE A.L. de Jussieu 1789 (Snapdragon Family) [in LAMIALES]

There is increasing evidence that the Scrophulariaceae as traditionally constituted includes two main and quite distinct groups (Olmstead & Reeves 1995; Young, Steiner, & dePamphilis 1999; Albach, Meudt, & Oxelman 2005). Based on molecular analysis, Young, Steiner, & dePamphilis (1999) suggest that Scrophulariaceae, Antirrhinanthaceae, and Orobanchaceae be restructured to include the current members of Orobanchaceae, Scrophulariaceae, and Callitrichaceae. Beardsley & Olmstead (2002) suggest that Mimulus and Mazus be included with Phryma in a redefined Phrymaceae. Additional changes have been suggested, as summarized blow. References: Pennell (1935)=P; Olmstead & Reeves (1995); Young, Steiner, & dePamphilis (1999); Olmstead et al. (2001); Beardsley & Olmstead (2002). [also see OROBANCHACEAE, PAULOWNIACEAE, PHRYMACEAE, and PLANTAGINACEAE]

Disposition of the traditional Scrophulariaceae (including Antirrhinanthaceae), Orobanchaceae, Plantaginaceae, Buddlejaceae, Phrymaceae: Linderniaeae: Lindernia, Hemianthus, Micranthemum, Torenia  
Orobanchaceae: Agalinis, Aureolaria, Buchnera, Castilleja, Conopholis, Dasistoma, Epipagus, Macranthera, Melampyrum, Orobanche, Pedicularis, Schwalbea, Seymouria, Striga.  
Phrymaceae: Glossostigma, Mazus, Mimulus, Phryma.  
Scrophulariaceae s.s.: *Buddleja*, *Scrophularia*, *Verbascum*.

### 1 Plant a shrub; inflorescence a terminal thyrse ................................................................. **Buddleja**

### 2 Corolla rotate, yellowish; fertile stamens 4 ......................................................................................................................................  
2 Corolla rotate, yellowish; fertile stamens 5 ......................................................................................................................................  

**Buddleja** Linnaeus 1753 (Butterfly-bush)

A genus of about 30 species, trees and shrubs, of subtropical and tropical America, Asia, and Africa. The two species listed (and others) are grown for ornament and for their attractiveness as nectaring sites for butterflies. References: Rogers (1986)=Z; Oxelman, Kornhall, & Norman in Kadereit (2004).

1 Leaves serrate or crenate; corolla, calyx, pedicels, and inflorescence rachis pubescent (not granular-farinose).................................................................  
1 Leaves entire or remotely dentate; corolla, calyx, pedicels, and inflorescence rachis granular-farinose .................................................................  

* Buddleja alternifolia* Maximowicz. Reported as introduced in NC by Kartesz (1999), but the alleged documentation is not present.  
Buddleja officinalis Maximowicz is reported as introduced in GA by Kartesz (1999), but the alleged documentation is not available. [not keyed; not mapped; rejected as a component of our flora]

* Buddleja davidi* Franchet, Summer-lilac, Orange-eye Butterfly-bush. Mt (GA, NC, WA, WV), Pd (DE, SC): planted, rarely escaped to disturbed places, such as thickets or streambanks (Wise Co., VA); rare, native of China. June-October.  [= RAB, C, F, G, K, Z]

* Buddleja lindleyana* Fortune ex Lindley.  Pd (GA, NC, SC), Mt (Cp (NC, SC): rarely escaped to disturbed areas; rare, native of China. June-October.  [= RAB, K, Z; = Adenoplea lindleyana (Fortune ex Lindley) Small – S]

**Scrophularia** Linnaeus 1753 (Figwort)

A genus of about 200 species, of temperate and tropical regions of the Old and New Worlds. Though our 2 species are only subtly distinct morphologically, they are clearly distinct. References: Pennell (1935)=P; Fischer in Kadereit (2004).

1  Sterile filament (hidden under the upper corolla lip) yellowish-green, often wider than long; leaf serrations coarse, often > 3 mm long; flowering May-July; capsule 6-10 mm long ....... S. lanceolata
1  Sterile filament dark purple or brownish, often longer than wide; leaf serrations fairly fine, < 3 mm long; flowering mid-July-October; capsule 4-7 mm long ........ S. marilandica

*Scrophularia lanceolata* Pursh, American Figwort. Mt (VA, WV), Pd (VA), Cp (DE, VA): woodlands and forests; common (rare in Piedmont and Coastal Plain). May-early July. QC and NS west to BC, south to VA, MO, NM, and n. CA. [= C, F, G, K, P, W, WV]

*Verbascum* Linnaeus 1753 (Mullein)

1  Leaves green and glabrous on both sides, or sparsely pubescent with glandular hairs; hairs of the calyx and upper stem simple and glandular.
2  Flowers > 4 mm long ................................................................................................................................................................. Torenia
1  Leaves densely tomentose at least on the lower surface, and often the upper as well; hairs of the calyx and upper stem branched, not glandular (except in V. sinuatum).
3  Inflorescence generally simple (sometimes with 1-several small branches), dense and spike-like (at least initially); leaves moderately to densely tomentose above; upper 3 filaments bearing white hairs.
4  Leaves sessile to auriculate-clasping, slightly or not at all decurrent on the stem; stigma patulate, decurrent on the style; corolla white or yellow .................................................................................................................................................................................. V. phlomoides
3  Inflorescence freely branched, paniculate; leaves green and nearly glabrous above; all 5 filaments bearing either white or violet hairs.
5  Basal leaves not lobed; inflorescence lacking glandular hairs; filaments bearing white hairs ................................................. V. lychnitis
5  Basal leaves lobed; inflorescence with glandular hairs; filaments bearing violet hairs ......................................................................................................................... V. thapsus

*Verbascum sinuatum* Linnaeus, Wavyleaf Mullein, is introduced at scattered locations in MD, PA, NJ, and NY, on ballast and in disturbed areas. July-August. [= G, K]

---

### 371. Linderniaceae

Borsch, K. Müller, & Eb. Fischer 2005 (False-pimpernel Family) [in LAMIALES]

1  Calyx conspicuously 5-winged ......................................................... Torenia
1  Calyx not winged.
2  Flowers > 4 mm long ................................................................. Lindernia
2  Flowers < 2 mm long.
3  Leaves elliptic, cuneate at the base; calyx lobes even, all of the sinuses reaching nearly to the base of the calyx .......... Hemianthus
**LINDENIACEAE**

809

3 Leaves orbicular, rounded at the base; calyx lobes uneven, 3 of the sinuses extending about halfway to the base of the calyx, the lowermost sinus extending to the base. .............................................................. Micranthemum

_Hemianthus_ Nuttall 1817

1 Calyx lobes acute, ½ to ⅓ as long as the calyx tube; flowers opening, chasmogamous. .......................................................... _H. glomeratus_

1 Calyx lobes obtuse, ¼ as long as the calyx tube; flowers not opening, cleistogamous. .......................................................... _H. micranthoideos_

_Hemianthus glomeratus_ (Chapman) Pennell. Lake margins, ponds. January-December. Panhandle FL (Gadsden County) south to s. FL. [= P; = Micranthemum glomeratum (Chapman) Shinners WH]

_Hemianthus micranthoideos_ Nuttall, Nuttall’s Micranthemum. Muddy, freshwater intertidal shores, possibly extinct. NY (Hudson River) south to VA (Chesapeake Bay, Potomac River, James River). [= C, G, P; = Micranthemum micranthoideos (Nuttall) Wettstein F, K]

_Lindernia_ Allioni 1755 (False-pimpernel)

1 Fertile stamens 4; calyx lobes connate at anthesis for ½ their length, later separating; [section _Torenioides_]…………………………… _L. crustacea_

1 Fertile stamens 2 (with 2 staminodia without anthers, or with rudimentary anthers); calyx lobes separate, or connate at base for ¾ the length of the calyx.

2 Capsule lanceoloid, > 8× as long as its diameter; calyx lobes connate at base ≤ ¼ the length of the calyx; [section _Bonnaya_]…….. _L. antipoda_

2 Capsule ovoid to ellipsoid, < 5× as long as its diameter; calyx lobes distinct to the base at anthesis and after; [section _Brachycarpae_].

3 Pedicels shorter than or about as long as the subtending leaves. ………………………………………… _L. dubia_ var. _dubia_

3 Pedicels longer than the subtending leaves (or bracteal leaves in some species).

4 Leaves nearly orbicular; stems creeping ……………………………………………………………………………………….. _L. grandiflora_

4 Leaves distinctly longer than wide; stems erect (sometimes decumbent at the base and rooting if knocked down by water).

5 Leaves not glandular punctate; seeds 2-3× as long as wide. …………………………………………………………………… _L. dubia_ var. _anagallidea_

5 Leaves glandular punctate; seeds ca. 1× as long as wide.

6 Leaves primarily in a basal rosette, leaves of the stem strongly reduced upward to bracts; capsule (1.8-) 3.4-7 mm long; [primarily of seepage of flatrocks] ……………………………………………………………………. _L. monticola_ ("monticola" form)

6 Leaves primarily on the stem, not conspicuously reduced upward; capsule 1.4-3.4 mm long; [of stream or river banks]………………….. …………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………………….

**Lindernia antipoda** (Linnaeus) Alston. Disturbed areas; native of se. Asia, Polynesia, and n. Australia. [= K, Y]

**Lindernia crustacea** (Linnaeus) F. Mueller. Lawns; native of Malaysia. September. [= RAB, GW, K, P, WH, X, Y]

**Lindernia diffusa** (Linnaeus) Wettstein. Reported for SC by Kartesz (1999) on the basis of specimens at NCU, but the specimens so labelled are actually _L. dubia_. [rejected; not keyed or mapped]

_Lindernia monticola_ Muhlenberg ex Nuttall, Flatrock Pimpernel, Riverbank Pimpernel. In seasonal seepage on granitic flatrocks, and on river-scoured siliceous rocks. April-June (-September). Nc. and sw. NC south to ne. FL and ec. AL. _L. saxicola_ appears to be merely a form of _L. monticola_, the leafy stems the result of the basal leaves being covered by silt deposited by floodwaters (Qualls 1984; Lewis 2000); this needs additional study. [= K, WH, X; > L. monticola – RAB, GW, P, W, Y; > L.
**LINDERNIACEAE**

* Lindernia procumbens (Krock.) Borb. One record as a waif in Arlington County, VA. [rejected; not keyed or mapped]

**Micranthemum** Michaux 1803

**Micranthemum umbrosum** (J.F. Gmelin) Blake, Shade Mudflower. Shallow pools, stagnant streams, wet depressions in swamp forests. May-October. Se. VA south to FL, west to TX, and south into tropical America (Mexico, Central America, West Indies, e. South America). [= RAB, C, F, G, GW, K, P, WH; = Globifera umbrosa J.F. Gmelin – S]

**Torenia** Linnaeus 1753 (Blue-wings)

* **Torenia fournieri** Linden ex E. Fournier, Bluewings, Wishbone-flower. Disturbed areas, flowerbeds; native of China. Also reported for Mountains of NC (Pitillo & Brown 1988), but it appears that it was a short-lived waif there. Likely to be found sporadically, especially southwards. [= K, WH]

**372. PEDALIACEAE** R. Brown 1810 (Sesame Family) [in LAMIALES]

A family of about 13 genera and 70 species, herbs, shrubs, and trees, of the Old World tropics.

**Sesamum** Linnaeus 1753 (Sesame)

A genus of about 19 species, of the old World tropics.

* **Sesamum orientale** Linnaeus, Sesame. Disturbed areas; native of the East Indies. January-December. Also reported for AL. [= K, WH; = S. indicum Linnaeus – S]

**373. LAMIACEAE** Lindley 1836 or LABIATAE A.L. de Jussieu 1789 (Mint Family) [in LAMIALES]

A family of about 230-250 genera and 6700-7170 species, herbs, shrubs, vines, and trees, cosmopolitan. The placement in the Lamiaceae of several genera traditionally placed in Verbenaceae (e.g. Clerodendrum) is strongly supported by several lines of evidence. References: Harley et al. in Kadereit (2004).

incertae sedis: Callicarpa.
subfamily Viticoideae: Vitis.
subfamily Ajugoideae: Ajuga, Clerodendrum, Teucrium, Trichostema.
subfamily Scutellarioideae: Scutellaria.
subfamily Lamioideae:
  tribe Synandreae: Synandra, Macbridea, Physostegia
  tribe Stachydeae: Galeopsis, Stachys, Sideritis
  tribe Leonurideae: Leonurus
  tribe Marrubiaceae: Marrubium
  tribe Lamieae: Lamium
subfamily Nepetoideae:
  tribe Elsholtzieae: Collinsonia, Elsholtzia, Mosla, Perilla.
  tribe Mentheae:
    subtribe Salviinae: Rosmarinus, Salvia.

subtribe Nepetinae: Agastache, Dracocephalum, Glechoma, Mechania, Nepeta.

incertae sedis: Melissa.

tribe Ocimeae: subtribe Hyptidinae: Hyptis, subtribe Ociminae: Ocimum.

I. Callicarpa Linnaeus 1753 (Beautyberry)

1 Leaves 7-23 cm long, stellate-scurfy beneath; peduncles 1-5 mm long .......................................................... C. americana
2 Inflorescence supra-axillary, diverging from the twig 1-4 mm above the leaf axil .................................................. C. dichotoma
3 Inflorescence axillary, borne directly in the axil of the leaf ................................................................. C. japonica

* Callicarpa americana Linnaeus, Beautyberry, American Beautyberry, French-mulberry. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA, NC, SC): hammocks, other forests (especially with sandy or rocky soils), maritime forests (the main habitat northwards), disturbed areas; common (rare in Mountains). June-July; August-October (persisting into the winter). MD and AR south to s. FL, TX, Mexico, West Indies. [= RAB, C, F, G, K, S, W, WH]
* Callicarpa dichotoma (Loureiro) K. Koch, Chinese Beautyberry. Pd (NC, VA), Cp (DE, NC, VA), Mt (NC), {SC}: roadsides, powerline rights-of-way, woodland edges, suburban woodlands, bogs; uncommon (rare in DE and VA), native of Asia. September-November. This species is beginning to spread more rapidly in the Southeast. [= RAB, C, K]

2. Vitex Linnaeus 1753 (Chaste Tree)

1 Leaves palmately 5-7-foliolate; leaflets lanceolate; plant an upright small tree .......................................................... V. agnus-castus
2 Leaves unifoliolate (or palmately 3-foliolate); leaflets orbicular or obovate; plant a sprawling and spreading shrub/vine .......... V. rotundifolia

* Vitex rotundifolia Linnaeus f., Beach Vitex, Roundleaf Chaste-tree. Coastal dunes, planted for ornament and stabilization and now spreading aggressively as an invasive species; native of e. Asia, se. Asia, and nearby islands. See Cousins et al. (2010) and Roecker & Socha (2004) for additional information. The runners are reported to reach 10 m in length. [= K, Z; < V. trifolia Linnaeus ssp. littoralis Steenis]

3. Ajuga Linnaeus 1753 (Bugle, Bugleweed)

1 Leaves deeply cleft into narrow segments; corolla yellow; annual ................................................................. A. chamaepitys
2 Leaves entire to shallowly lobed; corolla blue (to white or pink); perennial. ................................................................. A. reptans
4. Teucrium Linnaeus 1753 (Germander)

* Teucrium botrys* Linnaeus, Cutleaf Germander. Mt (WV): disturbed areas; rare, native of Europe. July-September. [= C, K] {add to synonymy}

**Teucrium canadense** Linnaeus var. *canadense*. Mt (WV), Cp (DE), {GA, NC, SC, VA}: rich bottomlands; common. Mainly coastal, NS south to FL, west to TX and OK. [= C, F, G, K; < *T. canadense* – RAB, GW, W; = *T. littorale* Bicknell – S]

**Teucrium canadense** Linnaeus var. *hypoleucum* Grisebach. {GA, NC, SC}. E. NC south to FL, west to TX. [= K; < *T. canadense* – RAB, GW, W; = *T. nashii* Keamey – S]

**Teucrium canadense** Linnaeus var. *occidentale* (A. Gray) McClintock & Epling. Mt (VA, WV*). Reported for VA (Kartesz 1999). [investigate] Occurs at least as far south and east as PA (Rhoads & Klein 1993) and ne. WV. [= C, G, K; > *T. occidentale* A. Gray var. *occidentale* – F; > *T. occidentale* A. Gray var. *boryale* (Bicknell) Fernald – F, WV]

**Teucrium canadense** Linnaeus var. *virginicum* (Linnaeus) Eaton. Pd (DE), {AL, GA, MS, NC, SC, VA}: {habitat}; common. NY, QC, and MN south to GA, AL, MS, and TX. [= C, F, G, K; < *T. canadense* – RAB, GW, W; = *T. canadense* – S]

**Teucrium cubense** Jacquin var. *cubense*. AL. [= K] {synonymy incomplete}

5. Clerodendrum Linnaeus 1753 (Glory-bower)

A genus of about 400-500 species, trees and shrubs, mostly tropical and warm temperate, African and Asian (after removal of the “Pantropical Coastal” clade into *Volkameria* (Yuan et al. 2010). References: Yuan et al. (2010); Steane et al. (1999); Hsiao & Lin (1995); Steane, de Kok, & Olmstead (2004); Harley et al. in Kadereit (2004).

1. Corolla tube > 8 cm long.................................................................C. indicum
2. Corolla tube < 3 cm long.
   1. Calyx 5-8 mm long .........................................................................................................................C. bungei
   2. Calyx > 10 mm long.
   3. Corolla double........................................................................................................................................C. chinense
   3. Corolla single ........................................................................................................................................C. triflorum var. *ferrugineum*

**Clerodendrum bungei** Steudel, Rose Glory-bower. Cp (FL, GA), Pd (GA, SC): roadsides and suburban woodlands; rare, native of e. Asia. August-September. First reported from South Carolina by Hill & Horn (1997); also reported for our area by W. Duncan (pers. comm.). [= K, WH]

**Clerodendrum japonicum** (Thunberg) Sweet. Also cultivated and is reported to be naturalized in MD (Staff of the Bailey Hortorium 1976). [= K] {not yet keyed}

**Clerodendrum triflorum** Thunberg var. *ferrugineum* Nakai, Harlequin Glory-bower. Pd (NC), Mt (NC), Cp (FL), {GA}: roadsides, streambanks; rare, cultivated and strongly naturalized, native of e. Asia. [= K; < *Clerodendrum triflorum* – WH]

6. Trichostema Linnaeus 1753 (Blue Curls)

A genus of about 18 species, shrubs, annual and perennial herbs, of temperate North America (especially diverse in w. North America). Morphology, pollen, and phytogeography suggest the plausible recognition of *Trichostema* section *Orthopodium* (which includes this species and several from w. North America) as *Isanthus*, a genus distinct from section *Trichostema* (which includes all other eastern North American species). References: Weakley (in prep.)=Z; Lewis (1945)=Y; Harley et al. in Kadereit (2004).
1 Calyx lobes essentially equal; stamens straight, < 10 mm long; leaves acute to slightly acuminate, the two main lateral veins reorienting to the midvein; [section Orthodromum] ............................................. T. brachiatum
1 Calyx strongly bilobed; stamens strongly arched, 12-20 mm long; leaves obtuse, the two main lateral veins not reorienting to the midvein; [section Trichostema]

2 Plants annual; larger leaves 3-7 cm long (including the petiole); plants with long internodes near the base, near-basal branches absent, the best-developed branches from the mid or upper stem; hairs on the upper stem long (0.5-2.0 mm long) or short (0.1-0.4 mm long); [collectively widespread, in a wide variety of habitats, primarily inland, though occasionally occurring as a weed in coastal areas].
3 Leaves 2.5-4 as long as wide; longer hairs of the upper stem (0.3-0.5-2.0 mm long) ............................................. T. dichotomum
3 Leaves 5-15× as long as wide; longer hairs of the upper stem 0.1-0.3 (0.4) mm long ............................................. T. setaceum
4 Plants perennial; larger leaves 1-4 cm long (including the petiole); plants with short internodes near the base, near-basal branches well-developed, these often branching again; hairs on the upper stem short (0.1-0.4 mm long); [of the Coastal Plain].
4 Corolla deep blue (almost black in bud); flowers stems typically virgate, not branched above the base; hairs of the stem not longer at each node; [of perennial FL, inland as well as on sand ridges near the coasts].

5 Corolla pastel blue or pink; stems typically rebranching above the base, the plant more-or-less bushy; hairs of the stem longer at the node (in a line between the 2 petioles); [of NC south to s. FL and west to s. MS; restricted to barrier islands, coastal peninsulas, and other maritime situations within 10 km of the ocean].
5 Corolla pastel blue or pink; stems typically rebranching above the base, the plant more-or-less bushy; hairs of the stem longer at the node (in a line between the 2 petioles); [of NC south to s. FL and west to s. MS; restricted to barrier islands, coastal peninsulas, and other maritime situations within 10 km of the ocean].

6 Plants perennial; larger leaves 1-4 cm long (including the petiole); plants with short internodes near the base, near-basal branches well-developed, these often branching again; hairs on the upper stem short (0.1-0.4 mm long); [of the Coastal Plain].
7 Plants annual; larger leaves 3-7 cm long (including the petiole); plants with long internodes near the base, near-basal branches absent, the best-developed branches from the mid or upper stem; hairs on the upper stem long (0.5-2.0 mm long) or short (0.1-0.4 mm long).
1. Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
2. Racemes terminal and axillary. ........................................ Sc. lateriflora
3. Racemes terminal or terminating axillary branches ........................................ Sc. saxatilis

- Scutellaria galericulata
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria australis
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria integrifolia
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria melrichampii
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria oculigera
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria ovata
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria parvula
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria pseudoserrata
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria pseudovaginata
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria vaginata
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

- Scutellaria wilsonii
  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora

  - Flowers in racemes, bracts much reduced (not leaf-like); stem leaf petioles > 4 mm.
  - Racemes terminal and axillary. ........................................ Sc. lateriflora
Scutellaria glabriflora Fernald, Georgia Skullcap. Cp (AL, FL, GA, MS): sandhills; rare. Sw. GA and w. FL Panhandle west through s. AL to s. MS. [= K, S, WH, Y]

Scutellaria incana var. I. Cp (FL, GA, NC): dry sandy open woods or woodland margins; rare. July-August. Gulf Coastal Plain of sw. GA, nw. FL, s. AL, and c. MS; disjunct to Brunswick County, NC. [= S. altamahá Small ssp. australis Epling; < S. incana – WH; = S. incana var. australis (Epling) Collins comb. nov. ined.]

Scutellaria incana Biehler var. inacana. Pd (NC, VA), Cp (NC, VA), Mt (WV): dry to mesic forests and woodlands; uncommon. NY, OH, IN, and IL, south to e. VA, c. NC, KY, w. TN, MS, and AR. [= C, F, G, K, WV, Y; < S. incana – RAB, S; = S. incana – X]

Scutellaria leonardii Epling, Shale-barren Skullcap, Glade Skullcap. Mt (GA, VA, WV), Pd (NC, VA), Cp (DE, VA): limestone glades, diabase barrens, shale barrens and woodlands, dry sandy soils; rare. April-May; May-June. MA west to MI and ND, south to se. VA, ne. NC, AR, and OK. [= C, G, GW, WV, X; < S. parvula – RAB; > S. nervosa Pursh var. ambiguus (Nuttall) Fernald – F; = S. parvula Michaux var. missouriensis (Torrey) Goodman & Lawson – K; = S. parvula Nuttall – S; > S. parvula Michaux var. leonardii (Epling) Fernald – F]

Scutellaria mellichampii Small, Mellichamp's Skullcap. Cp (GA, SC): sandy deciduous forests on river bluffs; rare (GA Special Concern). June; July. Se. SC south to e. GA; seemingly disjunct in c. AL. [= S, X, Y; < S. mellichampii – RAB; = S. incana Biehler var. australis (Epling) Collins comb. nov. – K, misapplied]

Scutellaria montana Chapman, Large-flowered Skullcap. Mt (GA): mesic hardwood (or hardwood-shortleaf pine) forests; rare. Se. TN south to nw. GA. [= K, S, Y; = S. serrata Andrzedowski var. montana (Chapman) Penland – F]

Scutellaria nervosa Pursh, Bottomland Skullcap, Veined Skullcap. Pd (DE, NC, SC, VA), Mt (VA, WV), {GA}: alluvial forests, mesic forests; common (uncommon in VA Mountains and Piedmont, rare in DE, GA, NC, and SC, rare in VA Coastal Plain). May-June; June-July. NY, MI, and IA, south to GA, AL, and LA. [= RAB, K, S, WV, Y; > S. nervosa var. nervosa – C, F, G; < S. nervosa var. calvisiva Fernald – F, C, G]

Scutellaria ocmulgee Small, Ocmulgee Skullcap. Cp (GA): bluff forests and other mesic hardwood forests; rare (GA Threatened). Endemic to e. GA. [= K, S, Y]

Scutellaria ovolta Hill ssp. bracteata (Bentham) Epling. Mt (GA, PA) (FL): dry forests and woodlands, hammocks; rare. MO south through AR and OK to c. TX; disjunct eastward in s. MS, c. and n. AL, w. Panhandle FL, and nw. GA. [= K, W, WH, X; < S. ovolta var. ovolta – C, F, G; = S. ovolta var. bracteata Bentham; > Scutellaria ovolta Hill ssp. cuthbertii (Alexander) Epling – K, X; > S. cuthbertii Alexander – S; = S. ovolta var. bracteata (Bentham) Epling var. bracteata – Z] [synonymy incomplete]

Scutellaria pseudoserrata Epling. Mt (GA), Pd (GA), {NC?, SC}: rich, rocky forests; rare. Also in e. TN (Chester, Wofford, & Kral 1997), nc. and e. GA (Jones & Coile 1988). Cultivated in Highlands, Macon Co., NC. [= K, W, Y]

Scutellaria drummondii Bentham var. drummondii, Drummond's Skullcap. Cp (FL*, GA): blackland prairies, dry disturbed areas; rare. GA west to LA, south into Mexico. First reported for GA by Lee Echols in 2005 (pers. comm.). [= K; < S. drummondii - WH] [not yet keyed]
Scutellaria floridana Chapman, Florida Skullcap. Cp (FL): pine flatwoods; rare. Endemic to FL Panhandle. [= K, S, WH] [not yet keyed]

8. Synandra Nuttall 1818 (Synandra)

Synandra hispidula (Michaux) Baillon, Synandra, Gyandotte Beauty. Mt (NC, VA, WV): moist, rich forests; rare. Late April-May; May-June. A broad Appalachian endemic: s. OH west to s. IL, south to sw. VA, w. NC, and n. AL. [= RAB, C, F, G, K, S, W, WV]

9. Macbridea Elliott in Nuttall 1818 (Birds-in-a-nest, Macbridea)

1 Corolla white (faintly marked with purple in the throat); leaf tips obtuse to rounded; [FL Panhandle] .......................................................... M. alba
1 Corolla lavender or pink; leaf tips acute; [se. NC south to s. GA] .......................................................... M. caroliniana

M. caroliniana (Walter) Blake, Carolina Birds-in-a-nest, Carolina Macbridea. Cp (GA, NC, SC): swamp forests, especially in sphagnous seepage areas away from direct flooding, savanna edges, ditches; rare. July-November. Se. NC to s. GA; reported but undocumented from n. FL, AL, and MS. Apparently rare throughout its range. [= RAB, GW, K; = M. pulchra Elliott – S]

10. Physostegia Bentham 1829 (Obedient-plant)

1 Leaves, 1 or more of them, conspicuously or inconspicuously clasping the stem.
2 Perennating buds borne directly on the primary rhizome or at the ends of short, vertical secondary rhizomes (horizontal secondary rhizomes lacking), the plant thus forming clumps
3 Most or all of the larger leaves sharply serrate; larger leaves usually < 2.5 cm wide and > 5× as long as wide .......... Ph angustifolia
3 Most or all of the larger leaves bluntly serrate to entire; larger leaves usually > 3 cm wide or < 5× as long as wide ............ P. purpurea
2 Perennating buds borne at the ends of elongate, horizontal, secondary rhizomes, the plant thus forming clonal patches.
4 Flowers 22-35 mm long; larger stem leaves acute to attenuate at the tip; axis of raceme with at least some of the hairs 0.13-0.25 mm long; larger stem leaves mostly sharply serrate .................... P. angustifolia
4 Flowers smaller, or most of the leaves obtuse at the tip, or hairs of the raceme axis < 0.13 mm long; larger stem leaves bluntly toothed to entire.
5 Flowering calyx tube (1-) 2-4 mm long; flowers < 20 mm long .......................................................... P. intermedia
5 Flowering calyx tube 3-7 (-8) mm long; flowers usually > 20 mm long.
6 Uppermost pair of leaves below the terminal raceme usually considerably larger than the floral bracts, the next pair of leaves down the stem (1.5-) 2.0-12.8 cm long and 0.3-2× as long as the internode above; principal stem leaves usually widest at or above the middle of the blade ......................................................... P. leptophylla
6 Uppermost pair of leaves below the terminal raceme often no larger than the floral bracts, the next pair of leaves down the stem 0.4-3.2 cm long, generally 0.1-0.3× as long as the internode above; principal stem leaves usually widest at or above the middle of the blade ................................................................. P. purpurea
1 Leaves petiolate or sessile, none of them clasping the stem.
7 All or most of the largest leaves sharply serrate; apex of the leaves acute to attenuate.
8 Axis of raceme with at least some of the hairs 0.13-0.25 mm long; nutlets 2-3 mm long; flowering April to early July (or later if burned) .......................................................... P. angustifolia
8 Axis of raceme with hairs < 0.1 mm long; nutlets usually 3-4 mm long; flowering July-October.
9 Perennating buds usually borne directly on the primary rhizome or at the ends of short, vertical secondary rhizomes (horizontal secondary rhizomes usually lacking), the plant thus forming clumps; nonglandular trichomes of the raceme axis < 0.1 (-0.13) mm long; sterile floral bracts usually present below lowest flowers; flowers (16-) 18-37 mm long ............... P. virginiana ssp. praemorsa
9 Perennating buds usually borne at the ends of elongate, horizontal, secondary rhizomes, the plant thus forming clonal patches; nonglandular trichomes of the raceme axis frequently 0.15 (0.20) mm long; sterile floral bracts usually not present below lowest flowers; flowers (13-) 14-28 mm long .......... P. virginiana ssp. virginiana
7 Half or more of the larger leaves bluntly toothed to entire; apex of the leaves obtuse, or acute to attenuate.
10 Calyx and rachis of the inflorescence bearing stalked glands (visible at 10× magnification or greater); nutlets 1.7-2.0 mm long, usually warty over the surface .......................................................... P. godfreyi
Physostegia angustifolia Fernald, Narrowleaf Obedient-plant. Cp (GA): calceolate openings; rare. Sw. GA and AL west to KS and TX. [= GW, K, Z]

Physostegia intermedia (Nuttall) Engelmann & A. Gray. Swamps; moist forests, ditches. IL, KY, AR, and LA west to OK and TX. Also mapped as widespread in Coastal Plain of GA (Jones & Coile 1988). {investigate}. [= C, GW, K, Z; = Dracocephalum intermedium Nuttall]

Physostegia leptophylla Small, Tidal Marsh Obedient-plant. Cp (FL, GA, NC, SC, VA): bottomland hardwood forests, swamps, tidal freshwater or slightly brackish (oligohaline) marshes, rarely wet savannas (GA); uncommon. Late May-early August; June-September. Se. VA south to sc. peninsular FL, west to sw. GA and Panhandle FL. *P. leptophylla* is a tetraploid; Cantino (1982) discusses clinal variation within *P. purpurea* × *virginiana*. [= C, GW, K, WH, Z; = Dracocephalum purpureum (Walter) McClintock ex Gleason – RAB; G; > *P. denticulata* (Aiton) Britton – F, misapplied; > *P. aboriginorum* Fernald – F; > Dracocephalum leptophyllum Small – S; > Dracocephalum veroniciformis Small – S]

Physostegia virginiana (Linnaeus) Bentham *ssp. praemorsa* (Shimmers) Cantino, Southern Obedient-plant. Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (FL, NC, SC, VA); {GA}: woodlands, glades, seepages, especially over calcareous or mafic rock; common. July-October. OH west to n. IL, south to c. NC, n. FL, TX, NM, and Mexico. [= K, W, Z; = Dracocephalum virginianum Linnaeus – RAB, G, S; = *P. virginiana* var. arenaria Shimek – C; > < *P. virginiana* var. virginiana – F; > < *P. virginiana* var. speciosa – F; = *P. virginiana* – GW, WH]

Physostegia virginiana (Linnaeus) Bentham *ssp. virginiana*, Northern Obedient-plant. Mt (NC, SC, VA, WV), Pd (NC, SC, VA), Cp (NC, SC, VA); {DE}: streambanks, seepages, marshes, grassy balds (native occurrences usually over mafic or calcareous rocks), other open or semi-open moist to wet habitats, disturbed areas, ditches; rare as a native, more common as an escape from cultivation. July-October. Native from QC west to MB, south to e. VA, nc. TN, and ne. KS; escaped elsewhere (as in most of our area). Cantino (1982) discusses ambiguous plants from a zone of intergradation between the 2 subspecies in sw. NC, n. GA, ne. AL, e. TN, and sc. KY. Moreover, garden escapes show some intermediacy between the 2 subspecies, and Cantino (1982) suggests that cultivars are likely inter-subspecific hybrids, stating "because the genetic background of modern cultivars is unknown, they cannot be reasonably placed in either subspecies and should not be identified below the species level." [= K, Z; = Dracocephalum virginianum Linnaeus – RAB, G, S; = *P. virginiana* var. virginiana – C; > < *P. virginiana* var. virginiana – F; > < *P. virginiana* var. speciosa (Sweet) A. Gray – F; > *P. virginiana* var. granulosa (Fassett) Fernald – F; < P. virginiana – GW; = Dracocephalum virginianum var. virginianum – WV; = Dracocephalum virginianum var. granulosum (Fassett) Core – WV]

11. Galeopsis Linnaeus 1753 (Hemp-nettle)

1 Stem with soft, appressed hairs; stem not swollen at the nodes ............................................................... *G. ladanum* var. *ladanum*

1 Stem with rigid, bristly hairs; stem swollen at the nodes.

2 Terminal lobe of lower lip of corolla clearly emarginate and also convex (the sides revolute); corolla 13-16 mm long ..................... *G. bifida*

2 Terminal lobe of the lower lip of the corolla entire to very slightly emarginate, essentially planar; not revolute; corolla 13-20 (-25) mm long ............................................................................................. *G. tetrahit*

A genus of about 300 species, herbs and shrubs, mainly temperate, nearly cosmopolitan (except Australia and New Zealand). References: Nelson (1981) = Z; Nelson & Fairey (1979); Mulligan & Munro (1989); Pringle (2002); Harley et al. in Kadereit (2004). Key adapted from various manuscript keys of the contributors.

1. Herbage softly and densely white-woolly; [rare escapes from cultivation].
   2. Biennial; leaf blades silky-pilose or tomentose, rounded to cordate at the base, obviously dentate; calyx lobes projecting beyond the pubescence ................................................................. S. byzantina
   3. Biennial; leaf blades heavily lanate, narrowed to the base, the dentations (if any) concealed by the felt; calyx lobes concealing by tomentum ................................................................. S. germanica

1. Herbage variously pubescent or glabrous, but never white-woolly.
   3. Annuals from fibrous roots, typically freely branching from the base or from lower nodes; leaf blades 1-5 cm long, with rounded or obtuse apices (except acute to acuminate in S. annua); [varieties].
   4. Calyx 7-9 mm long; corolla 4-9 mm long (barely or not exceeding the calyx), white to pink. ................................................................. S. arvensis
   5. Calyx 3-5 mm long; corolla 4-6 mm long ................................................................................................................................................. S. agraria

3. Perennials from rhizomes, not branching in the lower portion (unless damaged); leaf blades often > 5 cm long, with acute apices; [natives, except S. floridana and S. palastris].
   6. Perennials; leaf blades heavily lanate, narrowed to the base, the dentations (if any) concealed by the felt; calyx lobes concealing by tomentum ................................................................. S. byzantina
   7. Biennial; leaf blades silky-pilose or tomentose, rounded to cordate at the base, obviously dentate; calyx lobes projecting beyond the pubescence ................................................................. S. germanica

1. Perennials; leaf blades heavily lanate, narrowed to the base, the dentations (if any) concealed by the felt; calyx lobes concealing by tomentum ................................................................. S. byzantina
   2. Biennial; leaf blades silky-pilose or tomentose, rounded to cordate at the base, obviously dentate; calyx lobes projecting beyond the pubescence ................................................................. S. germanica

1. Perennials; leaf blades heavily lanate, narrowed to the base, the dentations (if any) concealed by the felt; calyx lobes concealing by tomentum ................................................................. S. byzantina
   2. Biennial; leaf blades silky-pilose or tomentose, rounded to cordate at the base, obviously dentate; calyx lobes projecting beyond the pubescence ................................................................. S. germanica

3. Annuals from fibrous roots, typically freely branching from the base or from lower nodes; leaf blades 1-5 cm long, with rounded or obtuse apices (except acute to acuminate in S. annua); [varieties].
21 Mature calyx lobes lanceolate or deltoid-acuminate to an apiculate tip, more than half as long as the calyx tube.
23 Calyx sparsely to moderately pubescent with short, soft hairs; stem angles moderately pubescent to nearly glabrous; leaves sparsely pubescent or glabrate; principal leaves on petioles 1 to 3 cm long; bracts of the inflorescence usually conspicuous and only gradually reduced upward, the cilia incurved-ascending. *S. subcordata*
23 Calyx hirsute to strongly hispid with long, stiff hairs; stem angles moderately to densely pubescent; leaves usually pubescent above (some forms glabrate); principal leaves usually subsessile, with very short petioles; bracts of the inflorescence usually inconspicuous and rapidly reduced upward; if conspicuous, bracts ciliate with long, stiffly spreading hairs.
24 Calyx erect at maturity, sparsely short glandular to eglandular; stem faces usually with a few atomiferous glands only.

* **Stachys palustris** Linnaeus. Cp (DE): disturbed areas; uncommon. {distribution} South to MD, PA, NJ. [= K; > S. palustris var. palustris – C, F, G]

**Stachys species 2.** Mt (NC, VA): bogs, rare. Ashe County NC and Grayson County, VA. Under study by Derick Pointdexter and John Nelson.

**Stachys subcordata** Rydberg. Mt (VA): moist forests over calcareous or mafic rocks; common. Wc. VA south to ne. TN. [= C, G]

**Stachys hyssopifolia** Michaux var. **lythroides** (Small) J. Nelson. Cp (FL, GA): floodplain forests; rare. E. Panhandle of FL and adjacent GA. [= WH, Z; < S. hyssopifolia – K; = S. lythroides Small – S] [not yet keyed]

* **Stachys officinalis** (Linnaeus) Trevis, Common European Hedge-nettle. Mt (NC): persisting and spreading clonally from cultivation; rare, native of Europe. [= K] [not yet keyed]

**Stachys species 2.** Cp (SC): {habitat}; rare. Santee River, SC. Under study by John Nelson. {not yet keyed}

13. **Sideritis** Linnaeus 1753

* **Sideritis romana** Linnaeus, Ironwort. Introduced and naturalized as far south as PA (Rhoads & Klein 1991, Cronquist 1991) and WV (Cronquist 1991). [= C, K] {synonymy incomplete}

14. **Leonurus** Linnaeus 1753 (Motherwort)

A genus of 25 species, herbs, of temperate Eurasia. Though *L. marrubiastrum* and *L. sibiricus* are documented in our area only from VA, they are also documented from south of our area; they likely will be found to occur in all four states. [also see *Chaiturus*]

1 Calyx strongly 5-angled, the lower 2 lobes deflexed; upper corolla lip white-villous; leaves lacerately toothed and the larger shallowly lobed.

2 Calyx slightly 5-angled, no lobes notably deflexed; upper corolla lip with densely and finely puberulent; leaves entire to few-toothed (but not lobed) or deeply 3-parted, the 3 divisions further lacerately toothed or lobed.

3 Leaves entire to few-toothed (but not lobed) ................................................................. {see *Chaiturus marrubiastrum*]

2 Leaves deeply 3-parted, the 3 divisions further lacerately toothed or lobed .................................................................................................. *L. sibiricus*

* **Leonurus sibiricus** Linnaeus, Siberian Motherwort. Cp (DE, FL, VA), Mt (WV): disturbed areas; rare, native of Asia. May-September. [= C, F, G, K, S; < L. japonicus Houttuyn – WH] {for FL, Wunderlin & Hansen have *L. japonicus* and state that *L. sibiricus* is misapplied – investigate}

15. **Marrubium** Linnaeus 1753 (Horehound)

16. **Lamium** Linnaeus 1753 (Dead-nettle, Henbit)

1 Corolla yellow; anthers glabrous; bracts present, reflexed ................................................................. *L. galeobdolon*

1 Corolla blue or white; anthers with tufts of hairs; bracts absent or present (if present not reflexed).

2 Perennial, with rhizomes or stolons; corolla 18-35 mm long, the tube curved; leaves all petioled; {section Lamiotypus}.

3 Corolla white; leaves not blotched with white; lower corolla lip with 2-3 teeth on each side; pollen light yellow...... *L. album ssp. album*
3 Corolla pinkish-purple (rarely white); leaves usually marked with white; lower corolla lip with 1 tooth on each side; pollen orange......
......................................................................................L. maculatum

2 Annual, lacking rhizomes or stolons; corolla 10-18 (-20) mm long, the tube straight; leaves all petioled or upper leaves sessile and clasping.
2 Leaves subtending flower clusters sessile; [section Amplexicaule] ..............................................................................L. amplexicaule var. amplexicaule
4 Leaves all petiolate; [section Lamium],
5 Leaves subtending whors deeply serratate, with many teeth > 2 mm long; nudlets (2.5-) 2.7-3.0 (-3.3) mm long..............L. dissecutum
5 Leaves subtending whors crenate-serrate, with teeth < 2 mm long; nudlets (2.0-) 2.2-2.5 (-2.8) mm long.....................L. purpureum

* Lamium dissectum Withering, Cutleaf Dead-nettle. Lawns, fields, roadsides, disturbed areas; native of Eurasia. April-May. This taxon is apparently an allopolyploid derivative (2n=36), resulting from hybridization of L. purpureum and another species, perhaps L. amplexicaule. Because of its allopolyploid status, this taxon should not be treated as a variety of L. purpureum. It is, however, possible that some individuals identified here may be sterile hybrids (2n=18). [= L. hybridum Villars – RAB, C, F, G, misapplied; = L. purpureum Linnaeus var. incisum (Willdenow) Persoon – K, Z]

* Lamium galeobdolon (Linnaeus), Yellow Archangel. Disturbed areas; native of Europe and e. Asia. Several subspecies are recognized in Europe. [= Lamium galeobdolon (Linnaeus) Ehrendorfer & Polatschek – FNA, K; = Lamium galeobdolon (Linnaeus) Linnaeus – Z; = Galeobdolon luteum Hudson]

17. Collinsonia Linnaeus 1753 (Horsebalm, Richweed, Stoneroot)

1 Inflorescence an unbranched thyrse, the lower nodes with (3-) 6 flowers per node; floral bracts absent; pedicels flattened at base; leaves (2-) 4 (-6), the 4 upper (or only) leaves subverviciulate; flowers light pink to lavender; flowering April-June; [subgenus Michelia] = C. verticillata

Inflorescence a panicle (rarely unbranched), the flowers 2 per node; floral bracts present, minute to large; pedicels not enlarged basally; leaves 6 or more, opposite; flowering July-September; [subgenus Collinsenia].

2 Fertile stamens 4; fresh plants with anise scent; [GA southward and westward].................................................................C. anisata

2 Fertile stamens 2; fresh plants with lemon scent; [collectively widespread in our area].

3 Blades of the larger stems leaves 4.0-10.5 cm long, with 5-15 teeth on each margin, glabrous or hispidulous on the main veins beneath; plant from a small, rounded tuber-like crown, to 6 cm long and 5 cm in diameter.................................................C. tuberosa

3 Blades of the larger stems leaves 8-25 cm long, with 11-42 teeth on each margin, glabrous or variously pubescent beneath; plant from an elongate, woody, rhizome-like crown, to 15 cm long.

4 Calyx 2-5 mm long; calyx teeth lance-subulate to narrowly lanceolate; flowers 8-13 mm long..............................................C. canadensis

4 Calyx 4.5-7 mm long; calyx teeth broadly lanceolate; flowers 12-17 mm long ...............................................................C. punctata

Collinsonia anisata Sims, Southern Horsebalm, Anise Horsebalm. Pd (GA), Cp (FL, GA): rich forests; uncommon. Late July-September; September-October. C. GA south and west to Panhandle FL and west to s. MS, on the Piedmont and Coastal Plain. This species is apparently distinct, but Shinners's concept of it included hybrids with C. canadensis and aberrant C. canadensis (Peirson, Cantino, & Ballard 2006). [= Y; < Collinsonia serotina Walter – K, W, WH, Z; < C. canadensis var. punctata (Elliott) A. Gray – F, misapplied; < C. punctata Elliott – S; ? Michelia anisata (Sims) Briquet – S]

Collinsonia canadensis Linnaeus, Richweed, Northern Horsebalm. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): cove forests, rich forests, especially over calcareous or mafic substrates; common (rare in VA Coastal Plain). Late July-September; September-October. QC, MI, and WI, south to Panhandle FL and LA. [= RAB, C, F, G, K, S, W, WV, Z; < C. canadensis – Y (also see C. tuberosa)]

Collinsonia punctata Elliott, Florida Horsebalm. Cp (FL, GA, SC): rich woods; rare. Late August-mid October; September-October. S. SC (Barnwell County) to e. LA, on the Coastal Plain. [= Y; < Collinsonia serotina – K, WH, Z]
Collinsonia species 1. Pd (GA). Under study by Steve Bowling. [not yet keyed]

Collinsonia tuberosa Michaux, Stoneroot. Pd (GA, NC, SC), Mt (GA): rich forests, over calcareous or mafic substrates; rare (NC Watch List). Late July-September; September-October. C. NC west to c. TN, south to n. GA and MS (or LA?). Peirson, Cantino, & Ballard (2006) conclude that C. tuberosa should be merged into C. canadensis, a conclusion not followed here. [= RAB, K, S, W, Z; < C. canadensis – Y; = C. canadensis Linnaeus var. tuberosa (Michaux) A. Wood]

Collinsonia verticillata Baldwin, Whorled Horsebalm. Pd (GA, NC, SC, VA), Mt (GA): rich forests, ranging from moist (cove) forests to rather dry oak forests over mafic or calcareous rocks; rare. Late April-early June; June-July. Sc. VA west to e. TN, south to w. NC, nw. SC, c. GA, and MS; disjunct in s. OH. The range is strangely scattered and fragmented. [= RAB, C, G, K, W, Y; Z = Michiehelia verticillata (Baldwin) Briquet – F, S]

18. Elsholtzia Willdenow 1790

19. Mosla (Bentham) Buchanan-Hamilton ex Maximowicz 1875 (Mosla)

* Mosla dianthera (Buchanan-Hamilton ex Roxburgh) Maximowicz, Mosla. Mt (GA, NC), Pd (VA): disturbed areas; rare, native of e. Asia. August-September. This species is becoming a noxious weed west of our area (in KY and TN); it should be expected to become more widespread in our area. [= RAB, F, G, K; = Orthodon dianthera (Buchanan-Hamilton) Handel-Mazzetti – C]

20. Perilla Linnaeus 1764 (Perilla, Beefsteak-plant)

* Perilla frutescens (Linnaeus) Britton, Perilla, Beefsteak-plant. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA): moist disturbed areas; common (uncommon in DE Coastal Plain, rare in FL), native of India. August-October; October-December. Two varieties are sometimes recognized. Var. crispa (Bentham) Deane (leaves purple above and below; leaf margins laciniate-dentate and also crisped) and var. frutescens (leaves purple below; leaf margins dentate, not crisped). These probably represent cultivars more than taxonomically distinct entities. [= RAB, C, G, S, W, WH; > P. frutescens var. frutescens – F, K, WV; > P. frutescens (Linnaeus) Britton var. crispa (Bentham) Deane – F, K, WV]

Agastache Clayton ex Gronovius 1762 (Giant-hyssop)

A genus of about 22 species, herbs, of c. and e. Asia, and North America to Mexico. References: Vogelmann (1985); Lint & Epling (1945); Harley et al. in Kadereit (2004).

1 Leaves densely white tomentose below; corolla blue; [cultivated as an ornamental and rarely naturalized] ......................... A. foeniculum

1 Leaves glabrous to villous beneath, appearing green; corolla yellow, greenish-yellow, or pinkish; [native].

2 Corolla yellow or greenish-yellow; calyx lobes obtuse or sub acute, 1-1.5 mm long at anthesis; calyx lobes and bracts green; midstem internodes glabrous or minutely pubescent; lower surface of the leaf pubescent on the veins and surface............................................. A. nepetoides

2 Corolla pinkish; calyx lobes acute or acuminate, 2-2.5 mm long at anthesis; calyx lobes and bracts with white or pink margins; midstem internodes at least sparsely long-pubescent; lower surface of the leaf pubescent mainly on the veins ................................. A. scrophulariifolia

* Agastache foeniculum (Pursh) Kuntze, Lavender Giant-hyssop. Pd (DE, NC): disturbed areas, spread from cultivation; rare, native of w. North America. Cultivated as an ornamental and naturalized in scattered locations in PA (Rhoads & Klein 1993), KY (Kartesz 1999), and elsewhere. [= C, F, G, K]

Agastache nepetoides (Linnaeus) Kuntze, Yellow Giant-hyssop. Pd (DE, GA, NC, SC, VA), Cp (DE, NC, VA): woodlands and forests, generally over calcareous or mafic rocks; uncommon (rare in DE, rare in Coastal Plain of NC and VA). July-September; September-October. VT west to MN, south to nw. GA and OK. In our area, this species occurs mostly in the Piedmont. [= RAB, C, F, G, K, S, W]

Blephilia Rafinesque 1819 (Woodmint, Pagoda-plant)

1 Stem glabrate below the middle; leaf lower surface glabrous or with a few unicellular hairs on the midvein; [of moist forests over limestone in n. AL] .............................................................................................................................................................................. B. subnuda

2 Lobes of the lower lip of the calyx linear, approaching the sinuses of the upper lip; outer bracteoles acute; leaves with rounded to acuminate tips (rather Prunella-like); petals 1-7 (-12) mm long; stem canescent, rarely with intermixed long trichomes; [primarily in the Piedmont] .............................................................................................................................................................................. B. ciliata

3 Corolla light lavender or pink with darker spots, 10-20 mm long; calyx 5.0-7.5 mm long.

4 Leaves linear to linear-elliptic, entire, strongly revolute; leaves subsessile; leaf surfaces minutely and densely pubescent .............................................................................................................................................................................. C. brownei

5 Stem glabrous or pubescent at the nodes only; leaves of flowering stems linear to oblanceolate; [native, of limestone glades, barrens, and bluffs].

6 Plant stoloniferous, bearing leafy stolons with ovate leaves; leaves of the flowering stems 1-2 cm long, 1-5 mm wide, entire............ C. thomasi

7 Axillary flower clusters in peduncled, contracted cymes.  

8 Calyx 6.0-10.2 mm long, the hairs inside the throat barely or not exerted; blades of larger stem leaves 2-5 cm long

9 Corolla 4-5 mm long; calyx 2.5-5.5 mm long .......................................................................................................................................... C. ascends

10 Whorls with 8 or fewer flowers; calyx 4.5-7 mm long; corolla 7-10 mm long........................................................................................... C. gracile

11 Whorls with > 8 flowers; calyx 7-22 mm long; calyx 4.5-10 mm long.

12 Lobes of the lower lip of the calyx deltoid, not reaching the sinuses of the upper lip; outer bracteoles long-acuminate; leaves with acuminate to acute tips (rather Monarda-like); petals 9-42 mm long; stem densely to sparsely pubescent with long, spreading trichomes; [primarily in the Mountains] .............................................................................................................................................................................. B. hirsuta

Blephilia hirsuta (Pursh) Bentham. Mt (NC, VA, WV), Pd (DE, NC, VA), {GA}: rocky or alluvial forests, montane forests up to at least 5000 feet elevation; common (uncommon in Mountains of VA, rare in DE and Piedmont of VA). Late June-October; August-November. QC and MN south to NC, AL, AR, and e. TX. [= RAB, C, G, S, W, Z; > B. hirsuta var. hirsuta – F, K]

Blephilia subnuda R.W. Simmers & Kral. Moist calcareous forests. Endemic (so far as is known) to the Cumberland Plateau of nc. AL (Jackson and Madison counties). [= K, Z]

Chaiturus Willdenow 1787 (Horehound Motherwort)

A monotypic genus, an herb, of Europe and n. Asia.

Clinopodium Linnaeus 1753 (Calamint)

A genus of about 20 species (as here circumscribed), herbs and shrubs, of temperate and subtropical areas of the w. and e. hemispheres. References: Cantino & Wagstaff (1998)=Y; Shinners (1962a)=Z; Shinners (1962f)=X. Key adapted in part from Z.

1 Flowers 1 per leaf axil.............................................................................................................................................................................. C. gracile

2 Flower > 1 per leaf axil.

3 Corolla bright scarlet, 25-50 mm long; calyx 8-18 mm long .................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................................. C. coccineum

4 Corolla light lavender or pink with darker spots, 10-20 mm long; calyx 5.0-7.5 mm long.

5 Leaves ovate or elliptic, sharply serrate, not revolute; leaves distinctly petioled; leaf surfaces glabrous .................................................................................................................................................................................. C. georgianum

6 Leaves linear to linear-elliptic, entire, strongly revolute; leaves subsessile; leaf surfaces minutely and densely pubescent........... C. ashei

7 Axillary flower clusters sessile, dense.

8 Calyx 6.0-10.2 mm long, the hairs inside the throat barely or not exerted; blades of larger stem leaves 2-5 cm long

9 Corolla 4-5 mm long; calyx 2.5-5.5 mm long ......................................................................................................................................... C. ascendens

10 Whorls with 8 or fewer flowers; calyx 4.5-7 mm long; corolla 7-10 mm long........................................................................................... C. gracile

11 Whorls with > 8 flowers; calyx 7-10 mm long; corolla 12-22 mm long............................................................................................... C. vulgare

* Clinopodium acinos (Linnaeus) Kuntze, Mother-of-thyme, Basil-thyme. Mt (VA, WV): cultivated, rarely escaped or persisting; rare, native of Europe. [= Satureja acinos (Linnaeus) Scheele – C, F, G; = Acinos arvensis (Lamarck) Dandy – K]
Clinopodium arkansanum (Nuttall) House, Arkansas Calamint. Mt (VA): dry limestone glades; rare (VA Rare). On west to MN, south to w. NY, nw. PA, w. VA, WV, IL, c. TN, and s. WI; also in MO, OK, AR, and TX. There appears to be confusion about the identities and distributions of this taxon and C. glabellum. [= K, Y; = Satureja glabella (Michaux) Briquet var. angustifolia (Torrey) Svenson – C, G; = Satureja arkansana (Nuttall) Briquet – F; < Calamintha arkansana (Nuttall) Shimmers – GW (also see Clinopodium glabellum); = Calamintha arkansana (Nuttall) Shimmers – Z; < Clinopodium glabellum (Michaux) Kunze – S]

Clinopodium ascendens (Jordan) Sampaio, Common Calamint. Cp (VA): rich calcareous slope; rare, native of Europe. August. [= Calamintha sylvatica Bromfield sp. ascendens (Jordan) P.W. Ball – K, = Calamintha officinalis – Z]

Clinopodium ashei (Weatherby) Small, Ashes Calamint, Ashe’s Savory, Ohoopee Dunes Wild Basil. Cp (GA): xeric sandhills; rare. Peninsular FL (south of our area); disjunct in e. GA (Candler and Tatnall counties). [= K, S, Y; = Calamintha ashei (Weatherby) Shimmers – WH; Z; = Satureja ashei Weatherby]

Clinopodium calamintha (Linnaeus) Stace, Lesser Calamint, Basil-thyme. Mt (NC, VA), Pd (NC, VA), Ip (KY), Cp (NC, VA), (GA): disturbed areas; common (uncommon in NC), native of Europe. July-October. [= Satureja calamintha (Linnaeus) Scheele var. nepeta (Linnaeus) Briquet – RAB, F, G, W; = Satureja calamintha (Linnaeus) Scheele – C; > Satureja calamintha var. calamintha – F; > Satureja calamintha var. nepetoides (Jordan) Briquet – F, G; > Satureja calamintha var. glandulosa (Riquien) Briquet – F; > Calamintha nepeta (Linnaeus) Savi var. nepeta – K; > Calamintha nepeta var. glandulosa (Riquien) P.W. Ball – K; = Clinopodium nepeta (Linnaeus) Kunze – S; = Calamintha officinalis Moench – Z, > Calamintha nepeta (Linnaeus) Savi – Z]

Clinopodium coccineum (Nuttall ex Hooker) Kunze, Scarlet Calamint, Scarlet Wild Basil, Red Mint Shrub. Cp (FL, GA): sandhills and flatwoods; uncommon. E. GA south to c. peninsular FL, west to s. MS. July-September. N.C. KY, c. TN, south to c. AL; MO and AR. Reports of this for VA (Kartesz 1999) are apparently based on confusion with Clinopodium arkansanum. [= Y; = Satureja glabella (Michaux) Briquet var. glabella – C; = Clinopodium glabellum (Michaux) Kunze – K; < Calamintha arkansana (Nuttall) Shimmers – GW; < Clinopodium glabellum (Michaux) Kunze – S; = Calamintha glabella (Michaux) Bentham]

Clinopodium vulgare Linnaeus, Wild Basil. Mt (KY, NC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, VA), Ip (KY): pastures, roadbanks, forests, thin soils around rock outcrops; common (uncommon in DE Piedmont, rare in DE Coastal Plain). July-September. N.L. (Newfoundland) to MB, south to NC, sc. TN, and KS, scattered in the west, widespread in Europe. Plants in our area may reflect both native and introduced genotypes. [= K, S, Y, Z; = Satureja vulgaris (Linnaeus) Fritsch – RAB, C, F, G, W; > Satureja vulgaris var. vulgaris – F; > Satureja vulgaris var. diminuta (Simon) Fernald & Wiegand – F; > Satureja vulgaris var. neogaea Fernald – F; = Clinopodium vulgare var. neogaea (Fernald) C.F. Reed]

Clinopodium dentatum (Chapman) Kuntze, Florida Calamint, Toothed Savory. Cp (FL, GA): sandhills and xeric steepheads; rare. Endemic to sw. GA and Panhandle FL. [= K, S; = Satureja dentata (Chapman) Briquet; = Calamintha dentata Chapman – WH] [not yet keyed; add to synonymy]

Clinopodium species 1, Indian Grave Mountain Wild Basil. It occurs in montane longleaf pine/chestnut oak/Gorgia oak woodlands on Hollis quartzite along the main Pine Mountain ridge. Under study by Jim Allison. [not yet keyed]

Conradina A. Gray 1870 (Conradina, Rosemary)

1 Leaves oblanceolate, slightly revolute, the leaf undersurface mostly visible and showing 1-4 raised lateral veins; [Putnam County, FL, adjacent to the coverage area].

2 Calyx 8.5-11 mm long, the upper lobe 3.6-4.4 mm long; cyme 1.5-flowered; unicellular hairs of the lower leaf surface thin-walled, collapsing and flattened in drying; [ec. Putnam County, FL].............................................................................................................................. C. cygniﬂora

2 Calyx 7-8.5 mm long, the upper lobe 1.8-3.5 mm long; cyme 3-7-flowered; unicellular hairs of the lower leaf surface thick-walled, terete to conical, unchanged in drying; [nw. Putnam County, FL].............................................................................................................................. C. etonia

1 Leaves either linear and strongly revolute such that essentially only the midvein is visible on the undersurface (C. canescens) or linear to narrowly oblanceolate, slightly to strongly revolute, some leaf surface sometimes showing on the leaf undersurface, but lacking raised lateral veins (C. glabra and C. verticillata); [collectively more widespread].

3 Leaves densely gray-pubescent above and below; midrib on lower leaf surface densely gray-pubescent to gray-pilose .............. C. canescens

3 Leaves glabrous above, glabrous or inconspicuously short-pubescent; midrib on lower leaf surface glabrous or glabrate, contrasting with the more densely pubescent lower leaf surface.

4 Plants upright to 8 dm tall; calyx tube glabrous or minutely and inconspicuously puberulent; [Coastal Plain of Panhandle FL and s. AL] ...................................................................................................................................................... C. glabra
4 Plants decumbent, rooting at the nodes; calyx tube densely short-pubescent and also pilose with longer glandular hairs; [Cumberland Plateau of KY and TN]. ........................................................................................................... C. verticillata

Conradina verticillata Jennison, Cumberland Rosemary. Mt (KY, TN): flood-scoured cobble bars of large rivers; rare. Endemic to the Cumberland Plateau area of ne. TN and se. KY. It has an odor similar to rosemary, and showy purplish flowers. [= K, Y, Z; = C. montana Small – S]

Cunila D. Royen ex Linnaeus 1759 (Stone-mint, American-dittany, Wild-oregano)

Dicerandra Bentham 1830 (Dicerandra)

1 Corolla tubular, straight or slightly curved; superior lobe cucullate (hoodlike); stamens and style arching under the hooded upper lobe of the corolla, included or slightly exserted beyond its apex; filaments inserted at 2 levels within the corolla; odor of fresh plant cinnamon-like, spicy; [section Cunilinae].

2 Corolla tube ca. 18 mm long, the orifice ca. 2 mm wide; leaves (15-) avg. 25 (-45) mm long, linear, the margins entire; [s. SC south through much of the Coastal Plain of GA]............................................................................................................. D. odoratissima

3 Cymes epedunculate; the tube geniculate; superior corolla lobe a lobed, flaring standard; stamens and style exerted, the stamens either widely flaring to the sides or declined along the lower lobe of the corolla; filaments inserted at the same level within the corolla; odor of fresh plant minty; [section Dicerandra].

4 Leaves narrowly rhombic; cymes 5-7-flowered; corolla purplish red to vivid purple; anthers strongly reddish brown; [extreme s. GA south into e. Panhandle FL and ne. FL]............................................................................................................. D. densiflora

Dicerandra densiflora Bentham, Florida Balm. Cp (FL): longleaf pine sandhills; rare. October-early November. Reported for GA by Small (1933), but this report is apparently in error; Huck (1987) regards it as endemic to n. peninsular FL. This taxon is tetraploid. [= K, S, WH, X, Y, Z]

Dicerandra linearifolia (Elliott) Bentham var. linearifolia. Cp (AL, FL, GA): sandhills and flatwoods; uncommon. Mid September-late November. W. and ec. Coastal Plain of GA south to ne. FL and s. AL. This taxon is hexaploid. [= K, WH, X, Y, Z; < D. linearifolia – S]

Dicerandra linearifolia (Elliott) Bentham var. robustior R.B. Huck. Cp (FL, GA): sandhills and flatwoods; uncommon. Late September-late November. Sc. Coastal Plain of GA (Brooks, Echols, Lowndes counties) (Huck 1987) south to e. Panhandle FL and ne. FL. This taxon is tetraploid. [= K, WH, X, Y, Z; < D. linearifolia – S]

Dicerandra odoratissima R.M. Harper. Cp (GA, SC): sandhills; uncommon (SC Rare). Late August-early October. S. SC south to se. GA. This taxon is tetraploid. [= RAB, K, S, Y, Z]

Dicerandra radfordiana R.B. Huck, Radford's Dicerandra. Cp (GA): dry flatwoods and sandhills; rare (GA Special Concern). September-October. Endemic to e. GA (McIntosh County). This species was postulated to be a polyploid derivative of D. odoratissima by Huck (1984, 1987); later study has shown that this is not the case (Huck & Chambers 1997). Both taxa are tetraploid. [= K, Y, Z]

Dracocephalum Linnaeus 1753 (Dragon's-head)
LAMIAEAE

A genus of about 45-70 species, herbs, of Eurasia and North America. References: Harley et al. in Kadereit (2004). [also see Physostegia]

* Dracecephalum parviflorum Nuttall, Dragon's-head. Pd (DE, NC), WV (Mt): cultivated ground; rare, native west of the Appalachians. May-July; July-September. [= C, F, G, K, WV; = Moldavica parviflora (Nuttall) Britton – RAB]

Glechoma Linnaeus 1753 (Gill-over-the-ground)

A genus of about 4-10 species, herbs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).

Hedema Persoon 1807 (American Pennyroyal)

Hyptis Jacquin 1786 (Cluster Bushmint)

A genus of about 280-300 species, herbs and shrubs, of warm temperate, subtropical, and tropical America. References: Harley et al. in Kadereit (2004).

Hypsis alata (Rafinesque) Shimmers, Musky Mint, Cluster Bushmint. Cp (FL, GA, NC, SC): wet pine savannas, margins of swamp forests, wet powerline rights-of-way, ditches; common. Late June-September. Ne. NC south to s. FL, west to se. TX; West Indies. [= RAB, GW, K, WH; = H. radiata Willdenow – S]

Hyssopus Linnaeus 1753 (Hyssop)

Hyssopus officinalis Linnaeus, Hyssop. {NC} Reported for NC (see G and S); documentation not known. Native of Eurasia. July-October. [= RAB, C, F, G, K, S]

Leonotis (Persoon) R. Brown 1810 (Lion's-ears)

A genus of about 9 species, herbs, shrubs, and small trees, of sub-Saharan Africa. References: Iwarsson & Harvey (2003)=Z.

Lycopus Linnaeus 1753 (Bugleweed, Water-horehound)

1 Calyx lobes acute at the apex, shorter than or equaling the nutlets. 4 Nutlet tubercles not developed or only weakly so.
2 Plant usually with tubers; leaf base tapered to a short, winged petiole; corolla lobes 4, erect; leaf teeth (2-) avg. 5.0 (-7) per side; [fall-line sandhills of NC and SC].............................................................................................................. L. cokeri
3 Calyx 2.0-3.3 mm long; stems and branches glabrous to sparsely pubescent with hairs < 0.5 mm long; leaf teeth sharply acute to short-acuminate.............................................................................................................. L. americanus
5 Cyxa 3.0-4.5 mm long; stems and branches densely to sparsely pubescent with hairs 0.5-1.6 mm long; leaf teeth blunt to acute.............. .............................................................................................................. L. europaeus
4 Nutlet tubercles well developed. 6 Leaves evidently petiolate, the petioles narrowly winged .............................................................................................. L. rubellus
7 Leaves sessile or subsessile. 7 Leaves ovate to lanceolate, usually rounded at the base, scarcely reduced upward on the stem .............................................................................................................. L. amplectens
7 Leaves lanceolate to linear, cuneate at the base, upper leaves conspicuously narrower (and often also shorter) than the lower leaves ............................................................ L. uniflorus

* Lycopus europaeus Linnaeus, Gypsywort, European Bugleweed. Cp (DE, NC, VA), Pd (DE), Mt (WV): marshes, ditches; common (uncommon in NC and VA, rare in WV), native of Europe. June-November. In the Great Lakes and St. Lawrence River regions, hybrid swarms involving L. americanus and L. europaeus are numerous (Webber & Ball 1980). However, to date there is no evidence that these species have hybridized within the Flora region. [= RAB, C, G, K, S, Z; > L. europaeus var. europaeus – F; > L. europaeus var. mollis (Kern.) Briq. – F]

* Hyptis verticillata Jacquin, John Charles. Cp (FL): hammocks, disturbed areas; rare, native of tropical America. [= K, S, WH]

LAMIACEAE
Lycopus rubellus Moench, Stalked Bugleweed. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC, VA), Mt (GA, VA, WV*): marshes, swamp forests, bottomlands; common (rare in WV, rare in VA Mountains). June-November. ME west to MI, south to FL and TX. [= C, S, Z; L. rubellus var. rubellus – RAB, GW; < L. rubellus – G, K, W, WH (also see L. angustifolius); > L. rubellus – S; > L. velutinus Rydberg – S]

Lycopus uniflorus Michaux, Northern Bugleweed. Mt (NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE): bogs, seeps, wet forests; common. July-October. NL (Newfoundland) west to AK, south to w. NC, AR, and CA. [= RAB, C, F, G, S, W, WV, Z; < L. uniflorus – GW (also see L. cokeri); > L. uniflorus var. uniflorus – K]

Meehania Britton 1894 (Meehania)

Melissa Linnaeus 1753 (Balm)

Mentha Linnaeus 1753 (Mint)

Identification notes: The distribution, habitats, phenology, and abundance of all Mentha species need substantial additional herbarium investigation.

1 Flowers in axillary verticils subtended by ordinary foliage leaves, and separated by internodes of ordinary length.
2 Calyx glabrous throughout, or pubescent toward the tips only; calyx 2-3.5 mm long; plants usually sterile; fresh plant usually with spearmint odor or flavor ................................................................................................................. M. × gracilis
3 Calyx pubescent throughout its length; calyx 1.5-2.5 mm long; plants usually fertile; fresh plant usually with a rather unpleasant odor of flavor.
3 Leaves subtending the inflorescence mostly broadly rounded at the base; leaves of the inflorescence relatively narrow; [alien] .................
4 Inflorescence a terminal globose to ovoid head of 1-3 verticils.
5 Pedicels and calyx glabrous, leaves glabrous or nearly so; plants usually sterile .................................................................................. M. aquatica var. aquatica
6 Inflorescence a spike of several to many verticils.
7 Calyx tube glabrous; leaves glabrous, or with scattered hairs on the lower surface.
8 Petioles of the main leaves 4-15 mm long; spikes stout; plants sterile; fresh plant with peppermint odor or flavor ................................................................................................................. M. × gracilis var. gracilis
9 Leaves lanceolate to oblong-lanceolate, > 3× as long as wide.
10 Hairs of the leaf undersurface unbranched; leaves widest near the middle, slightly rugose; fertile anthers 0.28-0.38 mm long; fresh plant with musty flavor or odor ................................................................................................................. M. × gracilis var. gracilis
7 Calyx tube pubescent; leaves moderately to densely hairy on the lower surface.
9 Leaves oblong to ovate, 1-3× as long as wide.
11 Leaves generally 1-2× as long as wide, ovate-oblanceolate, broadly rounded to subcordate at the base, obtuse at the apex; leaf serrations rounded and often turned downward (thus appearing crenate); leaf surface strongly rugose, with scattered denticulate hairs below; fresh plant with sickly or sweet flavor or odor. ................................. M. suaveolens

11 Leaves generally 1-3× as long as wide, ovate to oblong, broadly cuneate to rounded at the base, acute at the apex; leaf serrations sharp; leaf surface moderately rugose; fresh plant with spearmint odor.

12 Leaves generally oblanceolate, with nearly parallel sides and a broadly rounded base; flowers consistently with 4 fertile anthers. ................................. M. ×rotundifolia

12 Leaves generally ovate, infrequently oblong; flowers typically with all or mostly sterile anthers. ................................. M. ×villosa

* Mentha aquatica Linnaeus var. aquatica, Water Mint, Lemon Mint. Cp (DE), Mt (WV), {NC, VA}: disturbed areas; uncommon, native of Europe. [= Y; = M. aquatica – C, F, G, S, Z; < M. aquatica – K] (also see Mentha aquatica var. citrata)]

* Mentha aquatica Linnaeus var. citrata (Ehrlhart) Fresen., Lemon Mint, Orange Mint, Bergamot Mint. {VA} native of Europe. [= Y; = M. ×piperita Linnaeus (pro sp.) var. citrata (Ehrlhart) Briquet (pro sp.) – Z; = M. ×citrata Ehrlart – C; = M. citrata – F, G, S; < M. aquatica – K]

* Mentha arvensis Linnaeus ssp. arvensis, Field Mint. Pd (DE), Mt (VA, WV), marshes, disturbed areas; uncommon (rare in VA and WV), native of Europe. [= Y; = M. arvensis var. arvensis – C, F, G; = M. arvensis Linnaeus – S, Z; = M. arvensis ssp. arvensis – Y; < M. arvensis – K]

Mentha canadensis Linnaeus, Canada Mint. Mt (VA, WV), Cp (DE, VA), Pd (DE, VA), {NC}: moist soils; common. {distribution} [= S, Y; = M. arvensis Linnaeus var. canadensis (Linnaeus) Kuntze – C; < M. arvensis – RAB, misapplied; = M. gentilis Linnaeus – RAB; = M. arvensis var. villosa (Bentham) S.R. Stewart – F, WV; > M. arvensis var. glabra (Bentham) Fernald – G; > M. arvensis var. lanata Piper – G; = M. arvensis Linnaeus ssp. canadensis (Linnaeus) H. Hará; < M. arvensis – K]

Mentha longifolia (Linnaeus) Linnaeus ssp. longifolia, Horse Mint. {VA} Native of Europe. [= Y; < M. longifolia – RAB, C, G, WV; > M. longifolia (Linnaeus) Hudson var. longifolia – F; > M. longifolia (Linnaeus) var. undulata (Wildenow) Fiori & Paoletti – F]

* Mentha ×piperita Linnaeus (pro sp.) var. piperita [Mentha aquatica × spicata], Peppermint. Cp (DE, FL, VA), Pd (DE, VA), Mt (VA), {GA, NC, SC}: disturbed areas; uncommon, native of Europe. [= C, K, Y, Z; = M. piperita – RAB, G, S, WV; > M. piperita – F; < M. crispa Linnaeus – F; < M. ×piperita – WH]

* Mentha ×rotundifolia (Linnaeus) Hudson (pro sp.) [Mentha longifolia × suaveolens]. Mt (NC, VA), Pd (VA), Cp (VA), {GA, SC}: rare; native of Europe. [= C, K, Y; = M. rotundifolia – G, S, WV]

* Mentha spicata Linnaeus var. spicata, Spearmint. Mt (VA), Pd (DE, VA), Cp (FL, VA), {GA, NC, SC}: disturbed areas; uncommon (rare in FL and VA Coastal Plain), native of Europe: [= Y; < M. spicata – RAB, C, F, G, K, S, WH, WV, Z]

Mentha suaveolens Ehrlhart sp. suaveolens, Apple Mint, Pineapple Mint, Round-leaved Mint. Cp (DE, FL, NC), Mt (NC), Pd (DE, NC?), {SC, VA}?]: disturbed areas; rare, native of Europe. See Denslow & Poindexter (2009) for helpful information on distinguishing M. suaveolens from other species which may make phytogeographic sense. References: McClintock & Epling (1942) = Z; Scora (1967) = Y; Fosberg & Artz (1953) = X; Gill (1977); Prather & Keith (2003); Harley et al. in Kadereit (2004).

* Mentha xvillosa Hudson (pro sp.) [Mentha arvensis × aquatica]. Mt (WV): most soils; rare, native of Europe. [= C, K, WV, Z] {add synonymy, not yet keyed}

* Mentha ×verticillata Linnaeus (pro sp.) [Mentha arvensis × aquatica]. Mt (WV): most soils; rare, native of Europe. [= C, K, WV, Z] {add synonymy, not yet keyed}

Monarda Linnaeus 1753 (Bergamot)

A genus of about 12-20 species, herbs, of North America. Many of our species are cultivated, especially M. didyma in various selected forms. Additional studies are needed on a number of taxonomic problems in Monarda. Most of the varieties recognized above have been considered valid by a succession of workers; they do seem to describe morphologically distinguishable (if not entirely discrete) entities which may make phytogeographic sense. References: McClintock & Epling (1942)= Z; Scora (1967)= Y; Fosberg & Artz (1953)= X; Gill (1977); Prather & Keith (2003); Harley et al. in Kadereit (2004).

1 Flowers in 2-6 glomerules, terminal and at 2-5 successive nodes down the stem; stamens included; leaves lanceolate to narrowly elliptic, usually broadest near the middle and tapered to a cuneate base, (2.5-)3-8* as long as wide.

2 Calyx lobes attenuated into a spinose awn 2-7 mm long; corolla white to pink; inner bracts subtending the flowers 4-9 mm wide, abruptly acuminate into a spinose bristle ................................. M. citriodora var. citriodora

2 Calyx lobes narrowly to broadly triangular, acute or long-acuminate but not awned; corolla yellow, spotted with purple; inner bracts 8-14 mm wide, acuminate.

3 Lower leaf surface moderately to densely silvery-tomentose; stem densely villous with spreading or downwardly-curved coarse hairs, lacking coarse, horizontal bristles and short downwardly-curved hairs. ................................. M. punctata var. villicaulis

3 Lower leaf surface pubescent mainly on the midvein and other main veins, appearing green; stem pubescent with short downwardly-curved hairs, also with coarse, horizontal bristles and/or upwardly-curved hairs.

4 Stem with many coarse horizontal bristles, also pubescent with short, downwardly-curved hairs; leaves (40-)50-70 (-95) mm long, 10-28 mm wide (at least some over 15 mm wide), averaging ca. 3* as long as wide ................................. M. punctata var. arkansana

4 Stem with few or no coarse horizontal bristles, also pubescent with a mixture of upwardly-curved and downwardly-curved hairs; leaves (25-)35-55 (80) mm long, 5-17 mm wide (the widest very rarely over 15 mm wide), averaging ca. 4* as long as wide ................................. M. punctata var. punctata
1 Flowers in 1 (-2) glomerule, terminal (rarely also 1 at the next node down the stem); stamens exerted; leaves ovate to ovate-lanceolate, broadest near the rounded, truncate, or subcordate base, 1.5-3 (-4)× as long as wide.

5 Corolla 30-45 mm long, scarlet-red, (3-)4-8 mm broad at the expanded portion of the throat; [primarily of mountain seepages, streambanks, and bogggy places]......................................................................................................................... *M. didyma*

5 Corolla 14-33 (-36) mm long, white, lavender, or purple, 1-3 (-4) mm broad at the expanded portion of the throat; [of various habitats, usually dryish to mesic].

6 Leaves deltoid-ovate to ovate, 2-6 cm wide, usually ca. 2× as long as wide; orifice of the calyx glabrous to slightly hirsute with a few long hairs; upper lip of the corolla 5-9 mm long and not bearded (*M. clinopoda*) or 13-16 mm long and slightly bearded (*M. media*) near its apex; outer surface of the corolla glabrous to evenly pubescent with short curled hairs.

7 Corolla white, greenish, or pale pink, the lower lip purple-spotted; outer bracts subtending the inflorescence green or pale (rarely with a purplish midvein); upper lip of the corolla 5-8 mm long, not bearded................................................................. *M. clinopoda*

7 Corolla deep purple, the lower lip usually not spotted; outer bracts subtending the inflorescence purple to red; upper lip of the corolla 13-16 mm long and slightly bearded near its apex. Further study seems warranted. [= C, F, G, K, S, W, WV, Y, Z; < M. dispersa]

6 Leaves narrowly-deltoid, ovate-lanceolate to lanceolate, 1-4 cm wide, usually ca. 3× as long as wide; orifice of the calyx densely hirsute with numerous erect, stiff, white hairs; upper lip of the corolla prominently bearded near its apex; outer surface of the corolla evenly pubescent with short curled hairs.

8 Corolla deep purple; middle lobe of the lower corolla lip 4-6 mm long; outer bracts subtending the inflorescence reddish................................................................. *M. fistulosa var. rubra*

8 Corolla lavender, rose, or nearly white; middle lobe of the lower corolla lip 2-4 mm long; outer bracts subtending the inflorescence green (rarely the midvein only reddish).

9 Plants 10-30 cm tall; leaves subcoriaceous, glabrous, dark green, shiny; calyx 5-8 mm long, the lobes conspicuously pubululate-glandular; [of limestone glades and barrens].............................................................................................................................. *M. fistulosa var. brevis*

9 Plants 30-130 cm tall; leaves herbaceous, pubescent, light to medium green, not shiny; calyx 7-11 mm long, the lobes not pubulate-glandular; [of various habitats].

10 Pubescence of the petioles and lower leaf surface hirsute or villous, the trichomes spreading, 1-3 mm long ................................. *M. fistulosa var. mollis*

10 Pubescence of the petioles and lower leaf surface canescent, the trichomes appressed (sometimes also with an admixture of longer, spreading trichomes) ............................................................................................................................. *M. fistulosa var. mollis*

Monarda clinopodia Linnaeus, Basil Bergamot. Mt (NC, SC, VA), Pd (DE, NC, SC, VA): mesic, forested slopes; common (uncommon in VA Piedmont, rare in DE). Late May-September; July-October. NJ, w. NY, and IL, south to n. GA and c. AL (some of the range perhaps accountable to cultivation). There appear to be a number of chemical races in *M. clinopodia* which may warrant taxonomic status. [= RAB, C, F, G, K, S, W, Y, Z; = M. fistulosa Linnaeus var. clinopoda (Linnaeus) Cooperrider]

Monarda didyma Linnaeus, Bee-balm, Oswego Tea. Mt (NC, SC, VA, WV), Pd (DE*, NC, VA), Cp* (NC*): seepage slopes, periglacial boulderfields with abundant seepage, streambanks, boggy places, usually in strong to moderately filtered sunlight; common (rare in Piedmont, rare in Coastal Plain, rare in SC). July-September; September-October. ME west to MI, south to PA and OH, and in the Appalachians south to sw. NC, se. TN, and ne. GA (part of the northern range is likely only by introduction). McClintock & Epling (1942) describe 2 forms of *M. didyma*: the "broad-leaved form," with leaves averaging 9.2 cm long and 5.2 cm wide and corollas averaging 35 mm long, ranging south to se. PA and ne. WV, and the "narrow-leaved form," with leaves averaging 11.8 cm long and 4.4 cm wide and corollas averaging 39 mm long, occurring throughout the range of the species. Further study seems warranted. [= C, F, G, K, S, W, Y, Z; = M. didyma – RAB (also see *M. media*)]

Monarda fistulosa Linnaeus var. brevis Fosberg & Artz, Smoke Hole Bergamot, Cedar Glade Bergamot. Mt (VA, WV): limestone outcrops, cliffs, barrens, and glades, and on limestone talus; rare. June-August; July-October. Apparently endemic to w. VA (Giles County) and e. WV. This variety is seemingly very distinct (Kimball et al. 2002). It had been collected only a very few times prior to the work of Bartgis (1993), who found it to be a characteristic plant of limestone barrens and woodlands in localized areas in the Ridge and Valley Province of WV. It flowers about a month earlier than *M. fistulosa* in the vicinity (Bartgis, pers. comm.). [= VW, X, Y; = M. fistulosa ssp. brevis (Fosberg & Artz) Scora, comb. nov. ined. – K; < M. fistulosa – W]

Monarda fistulosa Linnaeus var. fistulosa, Appalachian Bergamot. Mt (NC, VA, WV), Pd (DE, NC, VA): moist wooded slopes, roadsides, woodland edges, old fields; common (rare in DE). June-September; August-October. CT south to sw. NC, nearly or entirely limited to the Appalachians. I have interpreted var. fistulosa and var. mollis somewhat differently than some previous workers. A more coherent geographic pattern is achieved by limiting var. fistulosa to plants with spreading hairs only. [= F, VW, X, Y, < M. fistulosa – RAB, W; = M. fistulosa ssp. fistulosa var. fistulosa – K; < M. fistulosa var. fistulosa – C, G, Z (also see var. mollis); = M. fistulosa – S]

Monarda fistulosa Linnaeus var. mollis (Linnaeus) Bentham, Eastern Bergamot. Mt (NC, SC, WV), Pd (DE, NC, SC), {GA, VA}: moist wooded slopes; common (rare in DE and WV). June-September; August-October. See comments under var. fistulosa. ME west to MN, south to GA, AL, and se. TX. [= F, VW, X, Y, < M. fistulosa – RAB, W; < M. fistulosa var. fistulosa – C, G, Z; = M. fistulosa ssp. fistulosa var. mollis (Linnaeus) Bentham – K; > M. mollis Linnaeus – S; > M. scabra Beck – S]

Monarda fistulosa Linnaeus var. rubra A. Gray, Purple Bergamot. Mt (NC, VA), {GA}: moist slope forests; rare (NC Watch List). ME to NJ, and from nw. NC to n. GA, in the Appalachians. Perhaps native only in the Southern Appalachians. A problematic taxon; see *M. media* for comments. [= X, Y, Z; < M. fistulosa – RAB, W; = M. fistulosa ssp. fistulosa var. rubra A. Gray – K; < M. media – C, F, S]

Monarda media Willdenow, Purple Bee-balm. Mt (GA, NC, VA, WV): grassy balds, moist slopes, mostly at high elevations; rare. July-September; September-October. VT west to IN, south to w. MD; disjunct in w. NC and sw. TN, part of the range perhaps the result of cultivation. *M. media* is a problematic taxon, especially in combination with *M. fistulosa var. rubra*. 

830
Many have suggested that *M. media* is the result of hybridization or introgression of *M. didyma* with either *M. fistulosa* or *M. clinopodia*, or both (see Scora 1967). Scora (1967) implies that *M. media* consists of hybrids, backcrosses, and "introgressive elements" involving all three pairwise combinations, and the three-way combination, but that *M. fistulosa* var. *rubra* is not of hybrid origin. Needed are studies of *M. media*, *M. fistulosa* var. *rubra*, and their possible parents which go beyond the herbarium and determine the genetics, origin, and population structure of these taxa. It seems best for the moment to recognize (or to attempt to!) *M. media* and *M. fistulosa* var. *rubra* in order to foster additional observation and study, hopefully leading to a more definite understanding of their taxonomic status(es). [= G, K, Z; attempt to!]

*Monarda punctata* Linnaeus var. *arkansana* (McClintock & Epling) Shinners, Arkansas Horse-mint. Mt (NC), Pd (GA): dryish forests over mafic rock; rare. McClintock & Epling (1942) map and discuss this taxon as endemic to AR and immediately adjacent TX, but mention that "a specimen collected near Columbus, Polk County, North Carolina (Townsend, 1897) is scarcely different from subsp. *arkansana.*" Scora (1967) treats var. *arkansana* as similarly endemic, though he cites (but does not map) a specimen from Cherokee County, GA and annotated (following the publication of his paper) a later collection from Polk County, NC as var. *arkansana*. The Polk County, NC material is manifestly var. *arkansana* and might be considered merely aberrant or a chance introduction, were it not for its repeated collection and the phytogeographic interest of the Blue Ridge Escarpment of Polk County, which harbors numerous Ozarkian and other Midwestern disjuncts, such as *Veratrum woodii*. [= Y; < *M. punctata* – RAB, S, W; = *M. punctata*ssp.punctata var. *arkansana* (McClintock & Epling) Shinners – K; = *M. punctata*ssp.punctata var. *arkansana* McClintock & Epling – Z]

*Monarda bradburiana* Beck. East to c. TN (Chester, Wofford, & Kral 1997), KY, and AL. [= G, K; < *M. russeliana* – C, F] {not yet keyed; synonymy incomplete}

*Monarda russeliana* Nuttall ex Sims, White Beebalm. East to AL and KY. [= G, K; = *M. virgata* Rafinesque – C; < *M. russeliana* – F (also see *M. bradburiana*)] {not yet keyed; synonymy incomplete}

*Nepeta* Linnaeus 1753 (Catnip, Catmint)

*Ocimum* Linnaeus 1753 (Basil)

A genus of about 65 species, herbs and shrubs, of warm temperate and tropical areas. References: Harley et al. in Kadereit (2004).

* *Ocimum basilicum* Linnaeus, Basil. Cp (FL, GA, NC, SC), Pd (GA, NC, SC): commonly cultivated in gardens, rarely persistent for short times around gardens or as a waif on trash-heaps, probably not persistent; commonly cultivated, rarely persistent, native of tropical Asia and tropical Africa. [= C, G, K, S]

*Origanum* Linnaeus 1753 (Oregano, Marjoram)

* *Origanum vulgare* Linnaeus, Wild Marjoram. Mt (NC, VA), Pd (DE), Cp (DE): commonly cultivated in gardens, persistent around gardens or as a waif; rare, native of Eurasia. July–September. [= RAB, C, G, K, S]

*Piloblephis* Rafinesque 1838 (Florida Pennyroyal)

**Pilolepis rigidus** (Bartram ex Bentham) Rafinesque, Florida Pennyroyal. Cp (GA): xeric oak scrub, with *Quercus myrtifolia*; rare. S. GA; c. to s. peninsular FL. [= K, WH; = Pycnothymus rigidus (Bartram ex Bentham) Small – S; = Satureja rigida Bartram ex Bentham]

**Prunella Linnaeus 1753** (Self-heal, Heal-all)

A genus of about 4-7 species, herbs, of n. temperate areas. References: Harley et al. in Kadereit (2004).

1. Upper leaves pinnatifid; flowers creamy yellow or white (rarely pale blue) ................................................................. *P. lacinata*
2. Upper leaves entire to obscurely toothed; flowers blue-violet (rarely pink or whitish).
   1. Principal or median cauline leaves lanceolate to oblong, (2-) avg. 3 (-5)x as long as wide; leaf cuneate at the base ......................... 
   2. Principal or median cauline leaves ovate to ovate-oblong, (1.5-) avg. 2 (-2.5)x as long as wide; leaf broadly rounded at the base ................ 

* Prunella lacinata (Linnaeus) Linnaeus, Cutleaf Self-heal. Mt (NC!, VA), {GA}: disturbed areas; rare, native of Eurasia. [= RAB, C, G, K, S]

* Prunella vulgaris* Linnaeus var. lanceolata (W. Barton) Fernald, American Self-heal. Pd (DE), Cp (DE), {Mt, Pd, Cp (FL, GA, NC, SC, VA, WV)}: disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands; common. April-December. Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties. NL (Newfoundland) west to AK, south to NC, SC?, TN, MO, KS, NM, AZ, and CA. [= C, F, G; < *P. vulgaris* – RAB, S, W; = *P. vulgaris* ssp. lanceolata (W. Barton) Hultén – K]

* Prunella vulgaris* Linnaeus var. vulgaris, Eurasian Self-heal. Pd (DE). {Mt, Pd, Cp (FL, GA, NC, SC, VA, WV)}: disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands; uncommon in DE, native of Eurasia. April-December. Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties, *var. vulgaris* and *var. lanceolata*. The possible additional recognition of var. hispida also needs assessment. Var. hispida Bentham, considered to have been originally e. Asian, is alleged to be widespread in se. United States. It differs from *P. vulgaris* var. vulgaris in having the "stems, petioles, and often the lower surfaces of leaves densely villous-hispid" (vs. "only sparingly and not conspicuously pilose" – F). [= < *P. vulgaris* – RAB, S, W, WH; > *P. vulgaris* var. vulgaris – C, F, G; > *P. vulgaris* var. hispida Bentham – C, F, G; = *P. vulgaris* ssp. vulgaris – K]

**Pycnanthemum** Michaux 1803 (Mountain-mint, Wild-basil)

1. Leaves 1-15 mm wide (to 30 mm wide in *P. setosum*), mostly > 3x as long as wide (except in *P. nudum*); calyx lobes not tipped with a tuft of long, jointed bristles (except *P. clinopodioides*).
   2. Longer calyx lobes 1.5-5 mm long, attenuate-aristate, stiff, whitened; [Coastal Plain pinelands, rarely in Mountain bogs with Coastal Plain affinities].
   3. Principal stem leaves 5-15 mm wide ............................................................ *P. flexuosum*
   4. Principal stem leaves 10-30 mm wide ............................................................ *P. setosum*
2. Longer calyx lobes 0.5-1.6 mm long, deltoid to narrowly triangular, not notably stiff (except in *P. tenuifolium*) or whitened; [widespread in our area, but mainly of the Piedmont and Mountains].
   4. Leaves 10-15 mm wide (or more often even wider, to 25 mm wide, in *P. clinopodioides*); longer calyx lobes 0.7-1.6 mm long, tipped with a few long (1-3 mm) jointed bristles (*P. clinopodioides*) or not tipped (*P. nudum*).
   5. Leaves 3-5x as long as wide, herbaceous; stems and leaves pubescent; [NC northward] ..................................................... *P. clinopodioides*
   6. Leaves 1-2.5x as long as wide, coriaceous; stems and leaves glabrous; [se. SC southward] ..................................................... *P. nudum*
   7. Leaves 12-15 (-15 mm wide; longer calyx lobes 0.5-1.5 mm long, variously pubescent but not tipped with a tuft of long jointed bristles.
   8. Leaves glabrous on the lower and upper surface, with 2-3 pairs of lateral veins; stems glabrous on the faces and angles (rarely with a few small upwardly-curled hairs on the angles).
   9. Leaves 5-15 mm wide, 1-2.5x as long as wide; calyx lobes and inner bracts of the inflorescence herbaceous .................................. *P. nudum*
   10. Leaves 1-4 (-5.5 mm wide, 8-15x as long as wide; calyx lobes and inner bracts of the inflorescence semi-spinose, their tips subulate, thickened, and stiff ............................................. *P. tenuifolium*
   11. Leaves pubescent at least on the lower surface along the midrib and main veins; leaves with 4-5 pairs of lateral veins; stems glabrous or pubescent on the faces, pubescent on the angles.
   12. Stems pubescent on the angles only (or distinctly less pubescent on the faces); leaves 3-10 mm wide .................................. *P. virginianum*
   13. Stems pubescent on the faces and angles, the hairs distributed more-or-less evenly; leaves 8-12 (-15 mm wide).
   14. Longer calyx teeth 1.0-1.5 mm long, lanceolate and attenuate; bracts of the inflorescence and leaves glabrous or very sparsely pubescent on the upper surface .................................................. *P. toregi*
   15. Longer calyx teeth 0.5-1.0 mm long, narrowly deltoid; bracts of the inflorescence (and usually also the leaves) canescent on the upper surface ............................................................. *P. verticillatum var. verticillatum*

1. Leaves broad, 15-40 mm wide, mostly 1.5-3x as long as wide; calyx lobes usually tipped with a tuft of long, jointed bristles (except *P. curvipes, P. muticum, P. setosum*).
10 Bracts of the inflorescence glabrous (or very sparsely pubescent) on the upper surface, the margins long-ciliate; calyx lobes and upper part (at least) of the tube with long spreading hairs (independent of the apical tufts) ..................................................................P. montanum

10 Bracts of the inflorescence puberulent on the upper surface, the margins not ciliate; calyx lobes and tube variously glabrous or puberulent (independent of the apical tufts).

11 Calyx lobes not tipped with a tuft of long, jointed bristles.
12 Calyx lobes 1.5–3 mm long, attenuated into a subulate tip; [Coastal Plain] ......................................................................................P. setosum
12 Calyx lobes 0.5–1.2 mm long, triangular to narrowly triangular, acute to acuminate, but not subulate; [collectively widespread in our area].
13 Petioles 5–15 mm long; inflorescence corymbose, loose, the branches apparent; [dry rocky woodlands, in sw. NC, w. SC, and southward] .................................P. curvipes
13 Petioles 0–3 mm long; inflorescence capitulate, tight, the branches within the clusters not apparent; [moist habitats, widespread in our area] ................................................................P. muticum

11 Calyx lobes usually tipped with a tuft of long, jointed bristles.
14 Calyx not distinctly bilabiate, all of the calyx lobes about the same length, the sinuses about the same depth.
15 Longer calyx lobes 1.2–1.5 mm long; [Mountains] ..................................................P. beadlei
15 Longer calyx lobes 2.5–3 mm long; [Coastal Plain] ..................................................P. monorichum
14 Calyx distinctly bilabiately, the lower 2 lobes 1.5–2.5× longer than the upper 3 lobes, and separated from each other and the upper 3 lobes by deeper sinuses.
16 Leaves lanceolate, (10–) 15–25 mm wide, > 3× as long as wide .................................................P. clinopodioides
16 Leaves ovate, 13–50 mm wide, < 3× as long as wide:
17 Leaves of the lower and middle stem with lower surfaces glabrate, glandular-punctate, similar in color to the dark green upper surface; calyx 5–7 mm long ............................................................P. beadlei
17 Leaves of the lower and middle stems with lower surface canescent, distinctly paler than the dark green upper surface; calyx 3–6.5 mm long.
18 Calyx lobes broadly triangular, their apices obtuse, acute, or somewhat acuminate; calyx tube > 2× as long as the longest (lower) calyx lobes.
19 Pubescence of the stem of dense, very small downwardly-curved hairs, usually mixed with scattered longer and spreading hairs ..................................................................................................................P. incanum var. incanum
19 Pubescence of the stem of sparse, coarse, downwardly-curved hairs ........................................P. incanum var. puberulum
18 Calyx lobes narrowly triangular, their apices acuminate to attenuate; calyx tube 1–2× as long as the longest (lower) calyx lobes.
20 Mericarps 0.5–1.3 mm long, with a smooth surface, glabrous or with a few short hairs at the tip ..............................................P. loomisii
20 Mericarps 1.2–1.5 mm long, with a rugose or pitted surface, densely pubescent at the tip.
21 Stems and lower leaf surfaces canescent, the short hairs often intermixed with longer, spreading ones....................................................................................................................P. pycnanthemoide var. pycnanthemoide
21 Stems and lower leaf surfaces with coarse, spreading hairs only .............................................P. pycnanthemoide var. viridifolium

Pycnanthemum curvipes (Greene) E. Grant & Epling, Tennessee Mountain-mint, Stone Mountain Mountain-mint. Mt (GA, NC), Pd (GA): dry rocky woodlands and rock outcrops (granite or mafic); rare. June–August. Sw. NC and se. TN southward. A diploid species (n = 20). [= K, Y, Z; = Koellia curvipes Greene – S]

Pycnanthemum flexuosum (Walter) Britton, Sterns, & Poggenburg, Savanna Mountain-mint. Cp (FL, GA, NC, SC, VA), Mt (NC): moist to wet pine savannas, pocosin islands, mountain bogs, seepage areas on low elevation granite domes; common (rare in Mountains). June–September; September–October. Se. VA south to ne. FL, west to Panhandle FL and s. MS (Sorrie & LeBlond 2008) on the Coastal Plain; disjunct inland in bogs and rock outcrops of sw. NC with Coastal Plain affinities and in sc. TN. A diploid species (n = 18). Sometimes mistaken in vegetative condition for Eupatorium leucolepis, P. flexuosum can be distinguished by its square stem and aromatic odor. Koellia hugleri Small, alleged to differ details of the calyx, was established for the plants of bogs of the Blue Ridge; it apparently is not morphologically segregated from other variation within the species (Grant & Epling 1943). [= RAB, C, F, K, W, Y; = P. hyssopifolium Bentham – G, GW, Z; > Koellia hyssopifolium (Bentham) Britton – S; > Koellia hugleri Small – S]

Pycnanthemum incanum (Linnaeus) Michaux var. incanum. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE): forests and woodland borders; common (uncommon in NC, rare in DE). Late June–August; September–October. VT west to s. OH and s. IL, south to nc. NC, w. NC, and nc. TN. A tetraploid species (n = 38). [= F, K; < P. incanum – RAB (also see P. beadiei, P. loomisii, P. pycnanthemoide); < P. incanum – C, G, W, Y; > Koellia incana (Linnaeus) Kunze – S; > Koellia dubia (Gray) Small – S; = P. incanum – WV, Z; = P. incanum (Linnaeus) Michaux sp. incanum]

Pycnanthemum incanum (Linnaeus) Michaux var. puberulum (E. Grant & Epling) Fernald. Mt (GA, NC, SC, WV), Pd (NC): forests and woodland borders; rare. Late June–August; September–October. WV and NC south to FL and AL. A tetraploid species (n = 38). [= F, K; < P. incanum – RAB (also see P. beadiei, P. loomisii, P. pycnanthemoide); < P. incanum – C, G, W, Y; < Koellia incana (Linnaeus) Kunze – S; = P. puberulum E. Grant & Epling – WV, Z]

Pycnanthemum loomisii Nuttall, Loomis's Mountain-mint. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (GA, NC, VA): forests and woodland borders; rare. Late June–August; September–October. VA west to IL, south to n. FL. A diploid
Pycnanthemum monorchium Fernald. Cp (VA): sandy woodlands; rare. Allegedly endemic to se. VA. Perhaps only a hybrid or else likely more widespread and merely overlooked. [= F, G, K]

Pycnanthemum muticum (Michaux) Persoon. Mt (GA, NC, SC, VA, WV), Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), [GA]: bogs, wet meadows, moist to wet forests; common (uncommon in Piedmont, uncommon in DE Coastal Plain, rare in WV). June-August; September-October. MA west to MI and MO, south to FL and LA. A diploid, tetraploid, and hexaploid (?) species (n = 20, 40, ca. 54). [= RAB, C, F, G, GW, K, Y; = Koellia mutica (Michaux) Kuntze – S]

Pycnanthemum nudum Nuttall, Smooth Mountain-mint. Cp (FL, GA, SC): wet pine flatwoods; uncommon (rare in GA and SC). Se. SC south to n. peninsular FL, Panhandle FL, and se. AL. Small (1933) attributes this species to NC; the documentation is unknown (and doubtful). This is a diploid species (n = 20). [= GW, K, WH; = Koellia nudus (Nuttall) Kuntze – S]

Pycnanthemum pycnanthemoideus (Leavenworth) Fernald var. viridifolium Fernald. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (FL, NC, VA), Pd (FL, NC, VA), Panhandle FL. A tetraploid species (n = 36). The recognition of this variety is doubtful. [= F, G, K; < P. incanum – RAB; < P. pycnanthemoideus var. pycnanthemoideus – G] (also see P. incanum); < Koellia viridifolia (Fernald) E. Grant & Epling – Z]

Pycnanthemum torreyi Bentham, Torrey's Mountain-mint. Mt (NC, SC?, VA), Pd (DE, VA), Cp (DE, VA), {GA?}: dry rocky woodlands, over mafic, ultramafic, or calcareous rocks, dry powerline rights-of-way; rare. NH west to IL, south to NC (and SC?). A tetraploid and hexaploid species (n = 40 and ca. 60). The epithet spelling ‘torreii’ is a correctable error under the Vienna code. [= C, G, Y, Z; = P. verticillatum – RAB; = P. torreyi – K, orthographic variant; > P. torrei var. torrei – F; > P. torrei var. leptodon (Gray) Boomhour – F; = Koellia leptodon (Gray) Small – S]

Pycnanthemum floridanum E. Grant & Epling. Cp (FL, GA): sandhills; rare. Se. GA south to n. peninsular FL and e. Panhandle FL. [= K, WH] (not yet keyed; synonymy incomplete)

Pycnanthemum pycnanthemoides (Michaux) Persoon var. pilosum (Nuttall) Cooperrider. Mt (WV): {GA}. Var. pilosum (Nuttall) Cooperrider ranges from s. ON west to MI and IA, south to TN, AR, and OK. It differs in having the stems thickly (vs. thinly pubescent), the lower surface of the leaves quite pubescent (vs. pubescence chiefly restricted to the midrib). In c. TN, and reported from a single county in e. TN (Chester, Wofford, & Kral 1997), in se. PA (Rhoads & Klein 1993), and WV (Kartesz 1999). [= C, K; = P. pilosum Nuttall – F; = Koellia pilosa (Nuttall) Britton – S] (not yet keyed; synonymy incomplete)

Rosmarinus Linnaeus 1753 (Rosemary)

A genus of 2-3 species, herb/shrubs, of Mediterranean Europe. Closely related to Salvia (Walker et al. 2004), and probably to be combined there. References: Harley et al. in Kadereit (2004).
**Salvia Linnaeus 1753 (Sage, Clary)**

1. Leaves predominantly basal.

2. Veins of the 3 upper calyx lobes parallel, the lobes themselves minute and widely-spaced (> 1 mm between the 2 lateral teeth), separated by flattish sinuses; basal leaves lobed; [native, though weedy, common throughout our area].............................................................................. **S. lyrata**

3. Veins of the 3 upper calyx lobes converging, the lobes themselves minute and spaced within a distance of 1 mm; basal leaves lobed or toothed; calyune leaves toothed (rarely lobed); [alien weeds, rarely naturalized in our area].

4. Upper calyx lip > ½× as long as the calyx tube; flowers 4-12 per node; leaves 8-12-20 cm long.................................................................................................................. **S. coccinea**

5. Upper calyx lip < 1/3× as long as the calyx tube; flowers 12-30 per node; leaves 5-10 cm long.................................................................................................................. **S. verticillata**

Salvia azurea Michaux ex Lamark var. azurea. Azure Sage. Cp (FL, GA, NC, SC), Pd (GA, NC, SC), Mt (GA): sandhills, hammocks, other sandy or rocky woodlands; common (rare in NC). Late August-October; October-November. S. NC south to Panhandle FL, west to TX. [= K; < S. azurea – RAB, S, WH]

**Salvia azurea** Michaux ex Lamark var. grandiflora Bentham. Mt (GA): prairies, woodlands over calcareous or mafic rocks; rare. August-October; October-November. IL, IA, NE, and eastern CO south to nw. AL, ne. MS, LA, se. TX, and c. TX. [= F, K; = S. pitcheri Torrey ex Bentham – C, G; < S. azurea – S; = S. azurea ssp. pitcheri (Torrey ex Bentham) Epling]

**Salvia coccinea** P.J. Buc'hoz ex Etlinger, Scarlet Sage, Blood Sage. Cp (FL, GA, SC**?), Pd (GA**?):) hammocks, disturbed areas; uncommon (rare in GA and SC), in the more northern part of its distribution (such as SC) perhaps only introduced from farther south and west. May-November. [= RAB, C, F, G, K, S, W, WH, WV]

* Salvia officinalis Linnaeus, Garden Sage. Cp (VA, WV), Pd (VA): cultivated as a garden herb, rarely persistent; rare, native of Europe. [= C, F, G, K, WV]

* Salvia pratensis Linnaeus, Meadow Sage, Meadow Clary. Cp (VA): fields and disturbed areas; rare, native of Europe. [= C, F, G, K]

* Salvia reflexa Hornemann, Lanceleaf Sage, Mintweed. Mt (WV): dry sandy soil, disturbed areas; rare, native of c. North America. In c. TN (Chester, Wofford, & Kral 1997). The apparent ascription by C of *S. reflexa* Hornemann to "N.D." is a typographic error for "N.D." This species is, however, sometimes adventive as far east as WV. [= C, F, G, K, Z] [not yet keyed]

* Salvia scabrae** Linnaeus, Clary. Mt (NC?, VA): cultivated as a garden herb, rarely persistent; rare, native of Europe. [= C, G, K, S]

**Salvia verticillata** Linnaeus, Whorled Clary. Mt (VA), {GA, NC?}: fields and disturbed areas; rare, native of Europe. Introduced as far south as scattered locations in PA (Rhoads & Klein 1993), MD, and WV (Kartesz 1999). [= C, F, G, K, WV]

**Rosmarinus officinalis** Linnaeus, Rosemary. Cp (NC, SC), Pd (NC, SC): gardens; commonly cultivated, rarely persistent or established, native of Mediterranean Europe. October-April. [= K]
Salvia chapmanii A. Gray. AL and FL. Uncertain taxonomic status, often included in S. urticifolia. [= K, S] [not yet keyed; synonymy incomplete]

**Satureja** Linnaeus 1753 (Savory)

A genus of ca. 38 species, herbs, of Mediterranean Europe west to c. Asia.

* Satureja hortensis Linnaeus, Summer Savory. Pd (DE), Mt (WV): disturbed areas; uncommon, native of Mediterranean Europe and sw. Asia. July-September. [= C, K]

**Stachydeoma** Small 1903

**Thymus** Linnaeus (Thyme)

* Thymus pulegioides Linnaeus, Lemon Thyme. Pd (VA), Cp (VA): disturbed areas; rare, native of Eurasia. [= K]

374. **PHRYMACEAE** Schauer 1847 (Lopseed Family) [in LAMIALES]

As radically circumscribed, a family of about 20 genera and 240 species, herbs, cosmopolitan. See Tank et al. (2006). References: Lee et al. (1996)=Z; Tank, Beardsley, Kelchner, & Olmstead (2006); Thieret (1972); Wagstaff & Olmstead (1997); Fischer in Kadereit (2004); Cantino in Kadereit (2004).

1 Plant a rhizomatous aquatic; leaves spatulate, entire, 10-20 mm long and 0.3-2 mm wide (reminiscent of Limosella or Lilaeopsis)....................

.............................................................................................................................

.............................................................................................................................

.............................................................................................................................

Glossostigma

1 Plant terrestrial (though sometimes in wetlands) with an aerial; leaves ovate, elliptic, or obovate, > 20 mm long and > 2 mm wide.

2 Inflorescence of a solitary, terminal flower; bracteal leaves alternate.................................................................Mazus

3 Inflorescence of axillary flowers; flowers 17-30 mm long .........................................................................................Mimulus

3 Inflorescence of terminal and axillary spikes; flowers 6-8 mm long .................................................................Phryma

**Glossostigma** Wight & Arnott 1836

**Mazus** Loureiro 1790

A genus of 10-15 species, herbs, of Asia to Australia. References: Pennell (1935)=P.

1 Plant stoloniferous, perennial; corolla ca. 15 mm long ...............................................................................................M. miquelii

1 Plant not stoloniferous, annual; corolla 7-10 mm long .................................................................................M. pumilus

* Mazus miquelii Makino. Pd (NC, VA), Mt (WV): lawns; rare, native of e. Asia. April-June. [= C, K; = M. miquelii – RAB, misspelling; ? M. reptans N.E. Brown]

**Mimulus** Linnaeus 1753 (Monkey-flower)

1 Corolla yellow; stem viscid glandular-pubescent; plant usually 2-4 dm tall .................................................. Mimulus moschatus

1 Corolla blue; stem glabrous; plant usually 3-15 dm tall; [section Mimulus].

2 Leaves petiolate (the upper sessile or nearly so); pedicels 2-15 mm long; stem with 4 winged angles ................................ Mimulus alatus

2 Leaves sessile; pedicels 20-45 mm long; stem with 4 rounded angles .......................................................... Mimulus ringens var. ringens

Mimulus moschatus Douglas ex Lindley, Muskflower, Musky Monkey-flower. Mt (NC, VA, WV): streambanks, brookbanks, saturated soil of cold springs; rare. July; August. NL (Newfoundland) and QC west to MI, south to w. VA, WV, NC, and MI, and in w. North America. The native/naturalized status of M. moschatus in e. North America is controversial. Some at least of our populations appear to be native, not occurring in situations where likely to have been introduced. [= RAB, C, F, G, P, W, WV; > M. moschatus var. moschatus – K]

Phryma Linnaeus 1753 (Lopseed)

A genus of 1-2 species, herbs, of e. North America and Asia. The disjunct populations have been variously treated as species, varieties, or races. References: Lee et al. (1996)=Z; Thieret (1972); Wagstaff & Olmstead (1997); Cantino in Kadereit (2004).

Phryma leptostachya Linnaeus var. leptostachya, American Lopseed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): bottomland forests, nutrient-rich slopes, mesic hammocks, in the Coastal Plain primarily in places underlain by coquina limestone ("marl") and essentially absent from the more acidic portions of the Coastal Plain; common (uncommon in Coastal Plain). June-August; August-October. The species is interpreted as occurring disjunctly in e. North America and e. Asia. Var. leptostachya ranges from QC west to MB, south to ne. FL, Panhandle FL, and TX; var. asiatica Hara occurs in e. Asia. The fruits "lopped down" against the stem are unmistakable. [= Z; < P. leptostachya – RAB, C, G, K, S, W, WH, WV; > P. leptostachya var. leptostachya – F; > P. leptostachya var. confertifolia Fernald – F]

375. PAULOWNIACEAE Nakai 1949 (Paulownia Family) [in LAMIALES]

A monogeneric family, trees, of e. Asia. There has been disagreement over whether Paulownia is best placed in Scrophulariaceae, Bignoniaceae, or its own family, Paulowniaceae; superficially it closely resembles Catalpa of the Bignoniaceae. Armstrong (1985) concluded that Paulownia's affinities lie with the Scrophulariaceae, based on floral anatomy, embryo morphology, and seed morphology. A molecular study by Spangler & Olmstead (1999) conclude that Paulownia is best retained in its own family. Manning (2000) concurs with its removal from Bignoniaceae. Molecular evidence suggests that it is sister to the reconstituted Orobancheaceae. References: Spangler & Olmstead (1999); Manning (2000).

Paulownia Siebold & Zuccarini 1835 (Princess-tree)

* Paulownia tomentosa (Thunberg) Siebold & Zuccarini ex Steudel, Princess Tree, Empress Tree, Paulownia. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): roadsides, disturbed areas, roadcuts, forests; common (uncommon in DE Coastal Plain, rare in FL), native of China. April-June; September-October. Paulownia is becoming a nuisance, showing an ability to invade pristine woodlands. The very soft wood is highly prized in Asia. The leaves of stump sprouts can reach very large sizes (at least to 80 cm long and wide). The woody capsules are persistent, and the densely tomentose, tan flower buds are conspicuous through the winter. [= RAB, C, F, G, K, S, W, WV, WH, WV]

376. OROBANCHACEAE Ventenat 1799 (Broomrape Family) [in LAMIALES]

A family of about 96 genera and 2060 species, root-parasitic herbs lacking chlorophyll (Orobanchaceae sensu stricto) and chlorophyllose hemi-parasites (formerly placed in the Scrophulariaceae), of temperate and subtropical regions of the Northern Hemisphere (Manen et al. 2004). References: Thieret (1971); Olmstead et al. (2001); Fischer in Kadereit (2004).

1 Plants lacking chlorophyll (parasitic), variously pink, purple, brown, tan, orange, or white.
Plants with chlorophyll (hemiparasitic), with foliage and stems normally green.

Stem simple (rarely few-branched); flowers all alike.

Calyx deeply cleft on the lower side; stamens exerted; [tribe Rhinanthae].

Calyx either nearly regular, or deeply cleft above and below into 2 lateral halves; stamens included; [tribe Orobanchaceae].

Plants with chlorophyll (hemiparasitic), with foliage and stems normally green.

Stem leaves alternate.

Leaves pinnately lobed; [tribe Rhinanthae].

Leaves entire or 3-5-lobed at the tip.

Stems retrorse-hispid; leaves lanceolate to ovate, usually lobed at the base; [of mafic glades and woodlands].

Stems simple (rarely few-branched); flowers all alike.

Stems ascending scabridulous or glabrous; leaves linear or filiform, entire.

Stems paniculately branched; flowers dimorphic, those low in the inflorescence small, pistillate and fertile, those high in the inflorescence larger, apparently perfect but functionally staminate; [tribe Orobanchaceae].

Stem leaves at least the lower opposite.

Corolla salverform; [tribe Buchnera].

Plant strict, unbranched unless damaged; flowers in a terminal spike; corolla purple; [native, sometimes weedy].

Plant strongly branched; flowers solitary and axillary; corolla red or orange; [alien, in agricultural fields].

Corolla various, but not salverform.

Calyx 4-lobed or essentially unlobed; corolla strongly bilabiate, the upper lip consisting of 2 petals almost wholly connate and strongly clyculate (hooded); corolla white or yellow; [tribe Rhinanthae].

Corolla pink; leaves linear and thread-like (except lanceolate in A. auriculata). [tribe Geraniadaceae].

Corolla yellow or orange; leaves either lanceolate or broader, or pinnately or bipinnately divided into linear segments.

Corolla orange, tubular, the tube narrow and straight, > 5× as long as the diameter. [tribe Macranthraceae].

Corolla yellow, campanulate or funnelform, the tube conical, < 4× as long as the diameter. [tribe Aureolaria].

Anthers pubescent; lower leaves < 12 cm long. [tribe A. aphylula].

Anthers glabrous; lower leaves 20–40 cm long. [tribe Datisloma].

**I. Agalinis** Rafinesque 1836 (Agalinis, Purple-foxglove)

A genus of about 40 species, hemiparasitic herbs, of tropical and warm temperate regions of America. References: Canne (1979); Hays (1998b); Pennell (1935) = P.

1 Perennial, from horizontal rootstalk bearing slender, scaly rhizomes; corollas 3–4 cm long; [of Carolina bays, cypress savannas, limesink ponds].

2 Annual, with 1–several fibrous roots from the stem base; corollas < 3 cm long (except sometimes A. fasciculata and A. purpurea).

3 Stem retrorse-hispid; leaves lanceolate to ovate, usually lobed at the base; [of mafic glades and woodlands].

4 Stem simple (rarely few-branched); flowers all alike.

5 Pedicels less than 1.5× as long as the calyx, mostly 1–5 mm long at anthesis, mostly < 8 mm long in fruit.

6 Plants bushy; [of saline or brackish marshes and salt flats].

7 Pedicels usually less than or equaling the leaflike bracts; corollas 12–17 mm long; anther cells 1.3–1.8 mm long, glabrous or somewhat pubescent; [of the Delmarva Peninsula northward].

8 Pedicels usually longer than or equaling the leaflike bracts; corollas 15–20 mm long; anther cells 1.8–2.3 mm long, usually long-lanose; [of Princess Anne County, VA, southward].

9 Leaves reduced to scales < 2.5 mm long, plant thus appearing leafless.

10 Leaves not lobed or divided, or the segments broader; corolla tubular, campanulate, or funnelform, the tube much longer than the lobes.

11 Leaves pinnately or bipinnately divided into linear segments.

12 Anthers pubescent; lower leaves < 12 cm long.

13 Anthers glabrous; lower leaves 20–40 cm long.

**A. virgata**
11 Upper lip of the corolla arched forward over the stamens, greatly reducing the opening of the throat; corolla throat glabrous or glabrate within; [of the Piedmont and Mountains] .................................................. \textit{A. tenuifolia}

12 Branches widely spreading or lacy ascending; pedicels > 4× as long as the leaflike bracts; anterior filaments 5-5.5 mm long; [of Berkeley and Beaufort counties, SC, southward] .................................................. \textit{A. laxa}

12 Branches ascending to somewhat spreading; pedicels < 3× as long as the leaflike bracts; anterior filaments 7-9 mm long; [widespread] ............................................................................................................. \textit{A. setacea}

10 Living plants light green or glaucous, usually with no purple pigment; leaves < 15 (-20) mm long (except \textit{A. decemloba}, with leaves 15-25 mm long); dried plants not dark, but turning pale yellowish green; dried calyx pale yellowish green, the veins distinct and obvious without magnification.

13 Corolla throat within lacking 2 yellow lines; leaves wide distally to obtuse tips; stem and branches distinctly rough-scarbidulous to the touch .................................................. \textit{A. obtusifolia}

13 Corolla throat with 2 prominent yellow lines; leaves taper to acute or acuminate tips; stem and branches not (or very slightly) scarbidulous.

14 Corolla 10-15 mm long, its lobes emarginate or resect; [of the Piedmont and Mountains, and rarely the upper Coastal Plain].

\textit{Agalinis decemloba} (Greene) Pennell. Pd (NC, SC, VA), Mt (GA, NC): dry clayey or sandy woodlands; rare; [= RAB, S, W; < A. obtusifolia – C, K; = Gerardia decemloba Greene – F, G, P]

\textit{Agalinis fasciculata} (Elliott) Rafinesque. Cp (FL, GA, NC, SC, VA), Pd (GA, SC, VA): sandhills, pine savannas, disturbed sandy areas, roadsides; common (uncommon in VA). S. MD south to s. FL, west to e. TX, northward in the interior to s. IN, s. IL, sw. MO, AR, e. NE, and nc. TX. [= RAB, C, S, W, WH; = Gerardia fasciculata Elliott – F, G; < A. fasciculata (Elliott) Rafinesque – GW, K; > Gerardia fasciculata ssp. typica – P; = Gerardia fasciculata ssp. peninsularis (Pennell) Pennell – P]

\textit{Agalinis linifolia} (Nuttall) Britton. Cp (DE, FL, GA, NC, SC): Coastal Plain depression ponds, cryptic savannas, wet pine savannas; common (uncommon in GA, NC, and SC, rare in DE). August-September; September-October. Se. NC south to s. FL, west to e. LA; disjunct in e. DE (reports for MD are in error). [= RAB, C, GW, K, S; = Gerardia linifolia Nuttall – F, G, P]

\textit{Agalinis maritima} (Rafinesque) Rafinesque var. \textit{grandiflora} (Bentham) Shinners. Cp (FL, GA, NC, SC, VA): tidal marshes; uncommon (rare in VA). July; August. Se. VA south to s. FL, west to s. TX and Tamaulipas; West Indies, Yucatan. [= K, S; < A. maritima – RAB, C, GW, WH; = Gerardia maritima Rafinesque var. grandiflora Bentham – F; = Gerardia maritima – G; = Gerardia maritima ssp. grandiflora (Bentham) Pennell – P]

\textit{Agalinis maritima} (Rafinesque) var. \textit{maritima}. Cp (DE, NC, VA): tidal marshes; uncommon (rare in DE). July; August. NS and s. ME south to se. VA and e. NC. [= K; < A. maritima – RAB, C, GW; = Gerardia maritima Rafinesque var. maritima – F; = Gerardia maritima – G; = Gerardia maritima ssp. typica – P]

\textit{Agalinis obtusifolia} Rafinesque. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, VA), Mt (VA): pine savannas, wet pine flatwoods, sandhill seeps, disturbed areas; uncommon (rare in DE, rare in VA Mountains). September-October; October- November. DE south to s. FL, west to e. LA, in the interior north to KY and TN. [= RAB, GW, W; < A. obtusifolia – C, K; WH (also see \textit{A. decemloba} and \textit{A. tenella}); = Gerardia obtusifolia (Rafinesque) Pennell – F, G, P]

\textit{Agalinis paupercula} (A. Gray) Britton var. \textit{paupercula}. Mt (VA): calcareous fens; rare. NS west to MB, south to NJ, PA, OH, IN, IL, and IA; disjunct in sw. VA (Washington County). [= K; < A. purpurea (Linnaeus) Pennell var. \textit{paupercula} (Benthom) B. Boivin – C; = Gerardia paupercula (A. Gray) Britton var. \textit{paupercula} – F; = Gerardia purpurea Linnaeus var. \textit{paupercula} Bentham – G; = Gerardia paupercula var. \textit{typica} – P] (not yet keyed)

\textit{Agalinis plukeneitii} (Elliott) Rafinesque. Cp (FL, GA), Pd (GA), Mt (SC): sandhills, other dry forests; uncommon. SC south to c. peninsular FL, west to w. LA, and northward in the interior to extreme se. TN (Polk County) (Chester, Wofford, & Kral 1997). Scattered in GA (e.g., Baldwin and Laurens counties). [= K, S; = Gerardia plukeneitii Elliott – P]

\textit{Agalinis purpurea} (Linnaeus) Pennell. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): woodlands, roadsides, in a wide variety of open habitats; common (uncommon in WV, uncommon in VA Mountains). August-October; September-November. NW south to MN, south to s. FL and e. TX. [= RAB, K, S, W, WH; < A. purpurea var. \textit{purpurea} – C; = Gerardia purpurea var. \textit{purpurea} – G; = Gerardia purpurea Linnaeus – F, P; < A. purpurea – GW (also see \textit{A. virgata})]

\textit{Agalinis tenella} Pennell. Cp (FL, GA, NC, SC, VA), Pd (SC): sandhills, other dry woodlands; uncommon (rare in NC and VA). S. NC south to n. FL, west to s. AL; disjunct in Amelia County, VA. [= RAB, S; < A. obtusifolia – K; WH = Gerardia \textit{tenella} (Pennell) Pennell – P]

**Agalinis acuta** Pennell, Sandplain Agalinis. Cp (MD): coastal sand plains; rare. MA south to Baltimore County, MD. [= C, K; = Gerardia acuta Pennell – F, G, P] [not yet keyed]

**Agalinis divaricata** (Chapman) Pennell, Pineland Agalinis. Cp (FL, GA): sandhills; common (rare in GA). GA (Decatur County) south to c. peninsular FL, west to MS (Sorrie & LeBlond 2008). [= K, S, WH; = Gerardia divaricata (Chapman) Pennell – P] [not yet keyed]

**Agalinis filicaulis** (Bentham) Pennell, Spindly Agalinis. Cp (FL, GA): wet pine savannas, prairies; rare. GA (Tattnall County) south to c. peninsular FL, andPanhandle FL, west to w. LA. [K, S, WH; = Gerardia filicula (Bentham) Chapman – P] [not yet keyed]

**Agalinis filifolia** (Nuttall) Rafinesque, Seminole Agalinis. Cp (FL, GA): dry longleaf pine savannas, scrub; uncommon (rare in GA). S. GA (east to Liberty County) south to s. FL, west to sw. AL (Baldwin County) (Sorrie & LeBlond 2008). [= K, S, WH; = Gerardia filifolia Nuttall – P] [not yet keyed]

**Agalinis flexicaulis** Hays. Cp (FL): wet pinelands; rare. Endemic to ne. FL. (Bradford County, to be expected in adjacent counties). See Hays (2010) for detailed information. [not yet keyed]

**Agalinis gattengeri** (Small) ex Britton. Barrens, glades, outcrops, woodlands. ON, MN, and NE south to AL, MS, LA, and TX. In c. TN, east to c. TN (Rhea and Scott counties) (Chester, Wofford, & Kral 1997). Reported for NC (Kartesz 1999). [investigate]. [= K, S; = Gerardia gattengeri Small – G, P]

**Agalinis heterophylla** (Nuttall) Small ex Britton. GA east to s. MO, AR, e. OK, and e. TX. [= G, K]

**Agalinis oligophylla** Pennell. Sc. TN (Coffee and Warren counties) (as A. pseudaphylla) (Chester, Wofford, & Kral 1997), c. and s. AL, west through s. MS to w. LA. [= K, S; = Gerardia pseudaphylla (Pennell) Pennell – P; > A. pseudaphylla (Pennell) Shinners; > A. pseudophylla (Pennell) Shinners, an orthographic variant]

**Agalinis pulchella** Pennell. Cp (FL, GA): pine savannas and sandhills; rare. Reported for Coffee and Ware counties, GA. [Nomenclatural and typification problems] [= K, S, WH; = Gerardia pulchella Pennell – P] [not yet keyed; synonymy incomplete]

**Agalinis skinneriana** (A. Wood) Britton. Coffee and Ware Counties, TN (Chester, Wofford, & Kral 1997). [= K; = Gerardia skinneriana A. Wood – G, P] [not yet keyed; synonymy incomplete]

**Agalinis tenuifolia** var. leucantha (Rafinesque) Pennell. Cp (FL, GA): savannas; rare (GA Special Concern). [= K, S; < A. tenuifolia – WH] [not yet keyed; synonymy incomplete]

**Agalinis tenuifolia** (Vahl) Rafinesque var. macrophylla (Bentham) Blake. [= K, S; = Gerardia tenuifolia Vahl ssp. macrophylla (Bentham) Pennell – P] [not yet keyed; synonymy incomplete]

**Agalinis tenuifolia** (Vahl) Rafinesque var. polypylla (Small) Pennell. Pd (GA): granitic flatrocks; uncommon? Endemic to granite flatrocks in GA. [= K, S; = Gerardia tenuifolia Vahl ssp. polypylla (Small) Pennell – P; = Gerardia polypylla Small] [not yet keyed; synonymy incomplete]

2. **Seymeria** Pursh 1814 (Seymeria)

A genus of about 25 species, herbs, of s. North America (including Mexico). References: Pennell (1935)=P.

1 Corolla pubescent on its outer surface; leaf segments linear, < 0.5 mm wide; stem glabrous or puberulent; seeds wingless (though with ridges).

2 Corolla pubescent externally; leaf segments lanceolate, 1-2 mm wide; stem pubescent; seeds 3-4-winged,.......................... S. cassioioides

3 Macranthera Nuttall ex Bentham 1836 (Flameflower)

4. Aureolaria Rafinesque 1836 (Oak-leach, False-foxglove)

A genus of about 10 species, hemiparasitic herbs, of e. North America and Mexico. References: Pennell (1935)=P.

1 Plant pubescent (especially on the calyx, corolla, capsule, and lower stem) with glandular hairs; annual; seeds 0.8-1.0 mm long, not winged.
2 Calyx tube hemispherical, glandular-hirsute to glandular-lanate on the outer surface; capsule ovoid; trichomes of the leaves usually glandular, at least in part; leaf lobes usually acute.....................................................
3 Calyx tube turbinate, glandular-puberulent on the outer surface; capsule ellipsoid; trichomes of the leaves usually non-glandular; leaf lobes usually obuse .....................................................

A. flava – C, G, K; = A. pedicularia

July-September. MA west to MI, south to ne. FL, Panhandle FL, and AL. [= GW, K, P, S, WH]

5. Dasistoma Rafinesque 1819 (Mullein Foxglove)
A monotypic genus, a hemiparasitic herb, endemic to se. North America. The genus is sometimes spelled 'Dasystoma.'

References: Pennell (1935)=P.

**Dasistoma macrophyllum** (Nuttall) Rafinesque, Mullein Foxglove. Xeric to dry-mesic woodlands and bluffs, riverbanks, over limestone or diabase. July-September. WV, OH, s. WI, IA, and NE, south to sw. VA (Lee County), nc. SC, nw. Ga, c. AL, MS, LA, and nc. TX. First reported for VA by Wieboldt et al. (1998). [= Dasistoma macrophylla – RAB, C, G, K, P, S, orthographic variant; = Seymeria macrophylla Nuttall – F, GW, WV; = Dasystoma macrophylla, orthographic variant]

6. **Epifagus** Nuttall 1818 (Beechdrops)

7. **Orobanche** Linnaeus 1753 (Cancer-root, Broomrape)

1 Flowers solitary on a long pedicel (appearing as a scape, the true stem entirely underground or nearly so); [section *Gymnocaulis*]..........................

2 Flowers several-many, sessile or subsessile in a dense spike.

3 Calyx 14-20 mm long, slightly curved, the lobes 4-8 mm long and rounded-obtuse; inflorescence a dense raceme, the flowers in a dense and often irregular spiral; flowering April-August; [of uplands, usually parasitizing perennial composites such as *Artemisia*, *Heterotheca*, and *Grindelia*]. .................................................................

4 Calyx 15-22 mm long, strongly curved, the lobes 4-5 mm long and triangular-acute; inflorescence an open raceme, the flowers in a loose and regular spiral; flowering August-October; [of bottomlands, usually parasitizing annual composites such as *Ambrosia* and *Xanthium*] .................................................................

5 Calyx divided to the base into 2 lateral halves, these usually 2-lobed, the 4 lobes long-attenuate or caudate..............................

6 Calyx 2-4-lobed, rarely 5-lobed, but then the fifth lobe minute and much smaller than the other lobes; [section *Orobanche*].

7 Calyx divided to the base into 2 lateral halves, these usually 2-lobed, the 4 lobes long-attenuate or caudate..............................

4 Calyx tubular, with 4 (-5) lobes about the length of the calyx tube .................................................................

**Orobanche ludoviciana** Nuttall, Prairie Broomrape. Pastures, upland areas, and glades, parasitic on perennial composites such as *Grindelia*, *Artemisia*, and *Heterotheca*. April-August. SK and BC south to MO, w. TX, AZ, and n. Mexico. [= X; < *O. ludoviciana* – F, G, Z; < *O. ludoviciana var. ludoviciana* – C; < *O. ludoviciana ssp. ludoviciana* – K] {excluded; not keyed or mapped}

* **Orobanche ramosa** Linnaeus, Branching Broomrape. Disturbed areas; native of Asia. As discussed by Musselman (1984), the identity of the sole NC record (collected in 1884) is somewhat presumptive, and the precise location uncertain. An infestation of this serious weed was discovered in 2007 at a car wash in urban Norfolk, VA (Musselman & Bolin 2008). [= C, F, G, K]

**Orobanche riparia** L.T. Collins, Riparian Broomrape. Bottomlands, parasitic on annual composites such as *Ambrosia trifida*, *Xanthium strumarium*, and *Ambrosia artimisiifolia*. August-October. VA, s. WV, and DC (James, Potomac, Shenandoah, and New rivers); OH, IN, IL, MO, TN (Mississippi and Ohio rivers and their tributaries); NE and CO south to w. TX and NM. See Collins, Colwell, & Yatskievych (2009) for detailed discussion. [= X; < *O. ludoviciana var. ludoviciana* – C; < *O. ludoviciana* – F, G, WV, Z; < *O. ludoviciana ssp. ludoviciana* – K]

8. **Buchnera** Linnaeus 1753 (Bluehearts)

(Contributed by Bruce A. Sorrie)
A genus of about 100 species, hemiparasitic herbs, of tropical and warm temperate regions of the Old and New Worlds. The taxonomy of this genus is poorly understood. The plants are root hemi-parasites, apparently not particular about the host species. References: Sorrie & Weakley (in prep.)=Z; Pennell (1935)=P.

Identification notes: Lower leaves are broadest, mid and upper leaves narrowest, often markedly so; the key refers to lower leaves. Leaf teeth are usually few in number and vary in development, from crenate to 2-3 mm long and sharply pointed. The former condition is normal for *B. floridana*, the latter for *B. americana*. Calyx length is ca. 0.5 mm longer in fruit than in flower. The foliage turns black on drying.

1 Leaves lanceolate to narrowly ovate, tapering to a point; veins of lower stem leaves consisting of 3 major and 2 minor ones (narrow leaves may only have 3 total veins); leaf teeth usually well developed, rarely absent, usually 2-3 mm long; calyx (6.0-) 6.5-8.0 mm long; corolla lobes 5.0-7.0 mm long; [primarily of moderate to high pH soils in southern Great Plains, ranging to southern margin of the Great Lakes and eastward to the mid Atlantic seaboard, especially in mafic or calcareous glades and prairies, sometimes in more acid sites]\ldots..*B. americana*

1 Leaves narrowly oblanceolate to lanceolate, rounded at tip; veins of lower stem leaves consisting of 1 major and 2 minor ones (narrow leaves may only have 1 vein); leaf teeth usually crenate but may be absent, < 2 mm long; calyx (4.0-) 4.5-5.5 mm long; corolla lobes 4.0-5.0 mm long; [primarily of low pH soils on the southern Atlantic and Gulf Coastal Plain, sometimes in calcareous sites (especially outside of our area)]\ldots..*B. floridana*

*Buchnera americana* Linnaeus, Prairie Bluehearts, American Bluehearts, Plains Bluehearts. Dry (seasonally moist) rocky, gravelly, or clayey soil of limestone glades, glades over mafic rock (such as diabase, gabbro, etc.), wet meadows, sandy roadsides. July-September; August-October. NY and s. ON west to MI, IL, MO, and s. KS, south to c. NC, GA, Panhandle FL, and TX. In addition to the key characters given, *B. americana* is overall a larger and more robust plant than *B. floridana*, though both are quite variable in size, depending on the conditions in which they grow. *B. americana* has apparently declined very greatly in our area, probably owing to fire suppression in its habitats. [= RAB, C, F, G, GW, P, S, W, Z; < B. americana – K, WH (also see B. floridana)]

*Buchnera floridana* Gandoger, Savanna Bluehearts, Florida Bluehearts. Pine savannas, flatwoods, seepage bogs, sandy roadsides. April-October; May-November. Se. NC south to s. FL, west to TX, and in the West Indies. Previous attributions of *B. longifolia* Kunth (including *B. elongata* Small) to southeastern states (notably FL, AL, GA, and MS) are based on misidentifications of material which is actually *B. floridana*. [= RAB, GW, S, Z; < B. americana – K; > B. longifolia Sw. – K, by misattribution; > B. floridana – S; > B. breviflora Pennell – S, by misattribution; > B. elongata Sw. – S; < B. americana – WH]

9. *Striga* Loureiro 1790 (Witchweed)

A genus of about 40 species, hemiparasitic herbs, of tropical to temperate regions of the Old World.

*Striga asiatica* (Linnaeus) Kuntze, Witchweed. Cultivated fields, parasitic on the roots of corn and other grasses; native of the Old World. A serious weed, *Striga* has been the subject of eradication efforts and quarantine policies since its appearance in our area. [= K; = S. lutea Loureiro – RAB]

10. *Schwalbea* Linnaeus 1753 (Chaffseed)

The genus is monotypic, a hemiparasitic herb, of se. North America. References: Pennell (1935)=P.

*Schwalbea americana* Linnaeus, Chaffseed. Savannas, sandhill-pocosin ecotones (in the uphill portions), mesic loamy-soil slopes or swales in sandhill longleaf pine woodlands, fire-maintained interior woodlands and barrens. May-June; August. Formerly rather widespread in e. North America, primarily in the Coastal Plain, from e. MA, south to c. peninsular FL and west to TX, and disjunct in the Cumberland Mountains of KY and TN. The species is now limited to a few scattered sites in NJ, NC, SC, GA, FL, AL, and LA. It appears to require high fire frequency, especially during the growing season, perhaps related to its establishment ecology. The tiny seeds are hyaline-winged. [= RAB, C, F, G, GW, K, WH; > S. americana – P; > S. australis Pennell – P, S; > S. americana var. australis (Pennell) Reveal & C.R. Broome]

11. *Castilleja* Mutis ex Linnaeus f. 1782 (Indian Paintbrush)

A genus of about 200 species, hemiparasitic herbs, primarily of w. North America, with a few species also in e. North America, Eurasia, Central America, and Andean South America. References: Pennell (1935)=P.
12. *Pedicularis* Linnaeus 1753 (Wood-betony, Lousewort)

A genus of about 350 species, hemiparasitic herbs, of temperate regions of c. and e. Asia, Europe, w. North America, and Andean South America. References: Pennell (1935)=P.

1 Inflorescence 1-4 dm tall; stem leaves alternate; stem pubescent, at least near the inflorescence; flowering April-May ................. *P. canadensis*

1 Inflorescence 4-10 dm tall; stem leaves opposite; stem glabrous; flowering August-October.................................................. *P. lanceolata*

*Pedicularis lanceolata* Michaux, Swamp Lousewort. Springheads and swampy areas, over calcareous, mafic, or ultramafic rocks. August-October; September-October. MA and NY west to MN and ND, south to e. VA, w. NC, e. TN, ne. GA, w. TN, n. AR, and NE. [= RAB, C, F, G, GW, K, P, S, W, WV]

13. *Melampyrum* Linnaeus 1753 (Cow-wheat)

A genus of about 35 species, hemiparasitic herbs, of temperate regions of North America and Eurasia. References: Pennell (1935)=P.

1 Lowermost bracteal leaves generally with a few prominent sharp teeth or segments; leaves 2-10 mm wide; plants usually with numerous branches (often 10 or more); internodes of the midstem usually 1-3 cm long. ................................................................. M. *lineare* var. *latifolium*

1 Lowermost bracteal leaves mostly entire or nearly so, or the uppermost with a few short basal teeth; leaves (2-) 10-30 mm wide, the widest leaves on a plant usually over 10 mm wide; plants usually simple or with 4 (rarely more) branches; internodes of the midstem usually 4-6 cm long..............

M. *lineare* var. *americanum*

1 Teeth of the middle and upper bracts shorter than the width of the undivided portion of the bracts; leaves lanceolate, (2-) 5-10 mm wide; [widespread in our area] ........................................................................ M. *lineare* var. *americanum*

1 Teeth of the middle and upper bracts commonly about as long as the width of the undivided portion of the bracts; leaves linear to lanceolate, 2-6 (-8) mm wide; [of the Coastal Plain] ........................................................................ M. *lineare* var. *pectinatum*

*Melampyrum lineare* Desrousseaux var. *americanum* (Michaux) Beauverd, Common Cow-wheat. Dry soils. May-July; August-September. QC west to MN, south to VA, NC, and TN. Our three varieties are quite distinctive in morphology and have distinctive geographic ranges, they seem worthy of distinction from one another at the varietal level, at least. The fourth variety, var. *lineare*, is more northern, ranging from NL (Labrador) west to BC, south to New England, n. MI, and n. MN. It is similar to var. *latifolium* in its entire bracteal leaves, but overall is more like var. *americanum*, differing in the bracteal teeth and in its linear leaves, rarely over 5 mm wide. The distinction between var. *americanum* and var. *lineare* may not be worth making; if combined (as by K), the correct name is var. *lineare*. [= C, F, G; < M. *lineare* – RAB, W; < M. *lineare* var. *lineare* – K, WV; < M. *lineare* var. *typicum* – P; < M. *lineare* – S]
**Orobanchaceae**

*Melampyrum lineare* Desrousseaux var. *latifolium* Barton, Appalachian Cow-wheat. Dry soils in ridgetop woodlands, in thin soils around rock outcrops. Late April-July; August-September. MA and NY south to n. GA, mostly in the Appalachians. [= C, F, G, K, P, W; < *M. lineare* – RAB, W; = *M. latifolium* (Barton) Muhlenberg ex Britton - S]

*Melampyrum lineare* Desrousseaux var. *pectinatum* (Pennell) Fernald, Pine-barren Cow-wheat. Dry sandy areas. May-July; August-September. E. MA to se. VA, on the Coastal Plain. [= C, F, G, K, P; < *M. lineare* – RAB, W]

14. Conopholis Wallroth 1825 (Squawroot, Bearcorn)

*Conopholis americana* (Linnaeus) Wallroth, Squawroot, Bearcorn. Rich, moist forests, under *Quercus* species. March-June. NS west to WI and south to c. peninsular FL, AL, and TNl; disjunct in e. Mexico (Chiapas, Oaxaca, and Puebla). Haynes (1971) discusses the nature of the parasitism. *Conopholis* apparently germinates near an oak root, forms a parasitic connection to the root, resulting in the formation of a gall consisting of both *Quercus* and *Conopholis* tissue. The gall can be up to 25 cm in diameter, and lasts for many years, repeatedly sending up flowering shoots. It is believed that the gall exists underground for some years prior to first flowering. [= RAB, C, F, G, K, S, W, WH, WV, X, Y, Z]

377. Lentibulariaceae Richard 1808 (Bladderwort Family) [in LAMIALES]

1 Leaves or leaf segments linear, borne along a subterranean or submersed stem; carnivory via specialized bladder-like traps; flowers in (1-)
2 Corolla lavender-blue or white. .......................... .......................................................... .......................................................... .......................................................... Utricularia

1 Leaves or leaf segments linear, borne along a subterranean or submersed stem; carnivory via the viscid-slimy upper leave surfaces; flowers solitary on bractless peduncles .......................................................... .......................................................... .......................................................... Pinguicula

2 Corolla yellow ........................................................................................................................................................................................... 

3 Hairs on the lower portion of the scape elongated, pointed, multicellular, nonglandular, transitioning upward to 1-celled glandular hairs; expanded portion of corolla markedly "veiny" (darker along the veins); [of se. NC southward to s. peninsular FL and e. Panhandle FL].

4 Fresh leaves dull red or reddish green; corolla lobes ca. 2× as long than broad, the lobes notched almost ½ their length...P. planifolia

5 Corolla tube violet, with darker violet veins; hairs of the inner corolla tube white.................................P. ionantha

6 Corolla tube yellow, with reddish-brown veins; hairs of the inner corolla tube yellow.................................P. primuliflora
Utricularia Linnaeus 1753 (Bladderwort)

Utricularia, as monographed by Taylor (1989), consists of 214 species in 35 sections, with a nearly cosmopolitan distribution. In our area, 14 or 15 species in 5 sections are known to occur. References: Taylor (1989)=Z; Schnell (2002b)=Y; Müller & Borsch (2005); Fischer et al. in Kadereit (2004). Key based in part on Z and GW.

1 Flowers white or cream-white, 1-3 mm long; inflorescence peduncles very reduced, the pedicels appearing to arise directly from the stolons; [section Utricularia] ................... U. olivacea
   2 Plants attached (with principal branch systems within the soil); leaves absent or simple, linear, grass-like aerial leaves; bladders 0.2-1.1 mm long, most or all on a plant usually < 1.0 mm long; seeds reticulate-alveolate (also angled in U. resupinata), 0.20-0.25 mm long.
   3 Flowers pink; inflorescence 1 (2-) 2-15-flowered; bract at base of the pedicel tubular, attached circumferentially around the stem; aerial leaves (when present) terete, sepalate; [very rare in our area]; [section Lecticula] ................................................................. U. resupinata
   4 Bracts subtending the pedicels ovate (attached near their middles), unattached at either end; pair of bracteoles associated with each bract present, linear to lanceolate; spur of the corolla oriented downward or backward, at approximately a right angle to the lower lip; aerial leaves (when present) with acute apex; [section Stomoisia].
   5 Corolla 1.5-2.0 cm long; spur 8-12 mm long; raceme usually short, the (1-) 2-6 flowers crowded together, all of them chasmogamous ................................................................................................................................. U. cornuta
   6 Corolla 0.25-1.5 cm long; spur 5-7 (-9) mm long; raceme usually elongate, the (1-) 2-15 flowers well-spaced, often the lower (sometimes all) cleistogamous and much smaller than the chasmogamous flowers ................................................................................................................................. U. juncea
   2 Plants floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); leaves present and dissected into linear segments; bladders 0.7-5.0 mm long, most or all on a plant > 1.0 mm long; seeds papillose, reticulate, ridged, angled, or winged, 0.5-2.0 mm long.
   6 Flowers purple; leaves divided into vestigial segments with terminal traps; [section Vesiculina] ................................................................. U. purpurea
   6 Flowers yellow; leaves divided into alternate segments with lateral traps; [section Utricularia].
   7 Peduncle with whorl of inflated leaf-like organs (floats).
   8 Floats 4-7, not fused basally to one another, fusiform, tapering gradually to base and apex from a widest point near the middle; leaves with the 2 primary divisions unequal; bracts of the scape longer than broad, entire; flowers (6-) 9-14 (-17) per scape; apex of corolla spur bifid ................................................................................................................................. U. inflata
   8 Floats (5-) 6-8 (-10), fused basally to one another, cylindrical, more-or-less parallel-sided through most of their length, tapering abruptly to base and apex; leaves with the 2 primary divisions equal; bracts of the scape broader than long, the apex slightly to strongly 3-lobed; flowers (1-) 3-4 (-7) per scape; apex of corolla spur usually entire (rarely bifid) ................................................................................................................................. U. radiata
   7 Peduncle without whorl of inflated leaf-like organs (floats).
   9 Main axes distinctly flattened in cross-section, up to 10 mm wide ......................................................................................................................... U. foliosa
9 Main axes round in cross-section.
10 Lower lip of corolla 3-lobed; seeds disk-shaped, not angular or winged; inflorescences of 2 types, the chasmogamous on erect peduncles 5-25 cm long bearing 2-8 flowers, the cleistogamous without a peduncle, the solitary pedicels borne directly on the stolons, 0.5-2 cm long, deflexed. .......................................................... \textit{U. geminiscapa}

10 Lower lip of corolla entire or slightly irregular, not 3-lobed; seeds angular or winged; inflorescences of 1 type (erect, chasmogamous).

11 Upper corolla lip smaller than the lower, entire; capsule circumciscissily dehiscent; seeds 0.7-1.0 mm long, 4-6-angled; corolla without stipitate glands on its external surface.

12 Leaves of one kind only, divided into numerous capillary segments bearing lateral traps; bracts scarcely auriculate; plant distinctly aquatic, floating in water and only rarely stranded; [of the Coastal Plain] ........................................ \textit{U. macrorhiza}

12 Leaves of 2 or 3 kinds, some divided into capillary or narrowly linear segments and bearing few or no traps, others divided into fewer capillary segments and bearing more-or-less numerous traps; bracts distinctly auriculate; plants typically in boggy situations, in shallow water or frequently stranded; \textit{either} of the Mountains at high elevations or of various physiographic provinces northward.

13 Broadest leaf segments with 9-20 lateral setae (use 10× magnification); spur of corolla cylindrical, distinctly longer than wide, the apex distinctly curved forward .......................................................... \textit{[U. intermedia]}

13 Broadest leaf segments lacking lateral setae; spur of corolla shortly saccate to broadly conical, wider than long, the apex not curved forward .................................................................................................. \textit{U. minor}

11 Upper corolla lip larger than the lower, obscurely 3-lobed; capsule laterally 2-valved or indehiscent; seeds 0.8-2.5 mm long, lenticular, with an irregular, lobed, or continuous wing; corolla (or at least the spur) with a few to many short stipitate glands (sometimes patchily distributed).

14 Vegetative shoots uniform, all bearing sparsely divided leaf segments bearing traps, seeds 0.8-1.1 mm long, with a continuous, circumferential wing, slightly to irregularly lobed.

15 Lower corolla lip 8-10 mm long, about equaling or slightly shorter than the conical, 5-9 mm long spur; leaves usually forked twice .................................................................................................. \textit{U. biflora}

15 Lower corolla lip 5-6 mm long, exceeding the blunt, 3.5-4.5 mm long spur; leaves usually forked once ........ \textit{U. gibba}

14 Vegetative shoots of 2 kinds, some bearing leafy segments and few or no traps, others bearing reduced segments and more-or-less numerous traps; seeds 1.0-2.5 mm long, with an irregularly deeply lobed or partial wing.

16 Plant anchored in mud up to 100 cm below water surface; green leafy shoots up to 40 cm long and 5 cm wide; peduncle flexuous, to 100 cm long, only the uppermost ca. 10 cm emergent .................................................. \textit{U. floridana}

16 Plant in shallow water or stranded; green leafy shoots usually not > 10 cm long and 2 cm wide; peduncle erect, straight, to 30 cm long, the uppermost 10-25 cm emergent ........................................................................ \textit{U. striata}

\textit{Utricularia biflora} Lamarck, Longspur Creeping Bladderwort. Ponds, lakes, and ditches. June-October. This species may not be distinct from \textit{U. gibba} (which see for discussion). E. MA south to FL, west to TX and OK, primarily on the Coastal Plain; also apparently widespread in the New World and Old World tropics. [= RAB, C, F, G, GW, W; = \textit{U. pumila} Walter – S, apparently misapplied; < \textit{U. gibba} – K, WH, Y, Z]

\textit{Utricularia floridana} Nash, Florida Bladderwort. In deep water of natural Carolina bay lakes, other natural lakes, and limesink ponds (dolines). July-August. Se. NC south to e. peninsular FL, west to Panhandle FL and sw. GA. [= GW, K, S, WH, Y, Z]

\textit{Utricularia foliosa} Linnaeus, Flatstem Bladderwort. In deep water of natural lakes and ponds. Se. NC south to s. FL, west to TX (Brown & Marcus 1998); West Indies, South America, Africa. This species is reported for NC by Taylor (1989). See GW for a detailed description of this species. [= GW, K, S, WH, Y, Z]

\textit{Utricularia geminiscapa} Benjamin, Two-flowered Bladderwort, Hidden-fruited Bladderwort. Beaver ponds, mucky seepages. NL (Newfoundland) and QC west to n. MI and n. WI, south to PA and sc. NC. [= C, F, G, K, W, WV, Y, Z]

\textit{Utricularia gibba} Linnaeus, Shortspur Creeping Bladderwort. Ponds, lakes, and ditches. May-September. QC west to WI, south to FL and LA; also apparently widespread in the West Indies and Central America and apparently the Old World tropics. Taylor (1989) includes \textit{U. biflora} in \textit{U. gibba}. Other authors have expressed doubts about the distinction, including RAB ("doubtfully distinct"). Taylor suggests that "further research is clearly indicated, but to be at all meaningful, it must be conducted on a worldwide basis." I have here, for the moment, retained the 2 traditionally recognized species, though intermediates will be encountered. [= RAB, C, F, G, S, W, WV; < \textit{U. gibba} – K, Y, Z (also see \textit{U. biflora})]

\textit{Utricularia inflata} Walter, Swollen Bladderwort, Inflated Bladderwort. Ponds, lakes, ditches. May-November. NJ south to s. FL, west to e. TX; disjunct in WA (probably introduced). Also disjunct in an artificial pond in Henderson County, NC (Carl Sandburg Home National Historic Site). [= C, G, GW, K, S, WH, Y, Z; = \textit{U. inflata var. inflata} – RAB, F]
Utricularia intermedia Hayne, Northern Bladderwort. {habitats} South to se. PA (Rhoads & Klein 1993), DE (?), and MD (Kartesz 1999). The report from sc. GA (Jones & Coile 1988) is in error. [= C, F, G, K, Y, Z]

Utricularia juncea M. Vahl, Southern Bladderwort. Shores of limesink ponds (dolines), borrow pits, wet sands. July-September. NY (Long Island) and NJ south to s. FL, west to e. TX and se. AR; also in the West Indies, Central America and South America. [= RAB, C, F, G, GW, K, WH, Y, Z; > Stomoisia juncea (M. Vahl) Barnhart – S; > Stomoisia virgatula Barnhart – S]

Utricularia macroirhiza Le Conte, Greater Bladderwort. Pools and ponds. May-September. NL (Newfoundland) west to AK, south to NC, SC, TX, CA, and Mexico; also in e. Asia. See Taylor (1989) for a discussion of the differences between this species and U. vulgaris of Europe and w. Asia, with which it has often been combined or associated as a variety. [= K, S, Y, Z; < U. vulgaris Linnaeus – RAB, C, F, GW, misapplied to American plants]

Utricularia minor Linnaeus, Lesser Bladderwort, Small Bladderwort. Fens and bogs, in the Southern Blue Ridge at about 1400 meters elevation. Circumboreal, south in North America to NJ, DE, PA, IN, IL, IA, NE, CO, UT, NV, and CA; disjunct in w. NC. [= C, F, G, K, Y, Z]

Utricularia olivacea Wright ex Grisebach, Dwarf Bladderwort, Minute Bladderwort. In floating mats (often algal) in water of limesink ponds (dolines), artificial lakes or beaver ponds. September-October. NJ south to FL, west to s. AL and s. MS (Sorrie & Leonard 1999), in the Coastal Plain; also in the West Indies (Cuba), Central America, and South America. [= RAB, GW, K, WH, Y, Z; = Biosularia olivacea (Wright ex Grisebach) Kam. – S]

Utricularia purpurea Walter, Purple Bladderwort. In water of ponds, ditches, other slow-moving water. May-September. NS and QC west to MN, south to NY, n. IN, s. MI, and WI, and on the Coastal Plain south to s. FL, west to se. TX; also in Mexico, the West Indies, and Central America. [= RAB, C, F, G, GW, K, WH, Y, Z; = Vesiculina purpurea (Walter) Rafinesque – S]

Utricularia radiata Small, Floating Bladderwort, Small Swollen Bladderwort. Ponds, depression ponds, lakes, and ditches. May-October. NS south to s. FL, west to TX; disjunct in w. VA, w. TN, nw. IN; reports of this species in Cuba and South America are apparently in error. [= C, F, G, GW, K, S, W, WH, Y, Z; = U. inflata var. minor Chapman – RAB, F]

Utricularia resupinata B.D. Greene ex Bigelow, Northeastern Bladderwort, Resupinate Bladderwort. Wet pine flatwoods, pond margins, shores of natural lakes. NS west to nw. WI, south (irregular and scattered in part) to FL and sw. GA; also in the Bahamas (Sorrie & LeBlond 1997). Although "the curious gap in the North American range" [NC, SC, and VA] (Taylor 1989) is no longer strictly a gap, U. resupinata does appear to have a strangely bimodal range, with a center of distribution in ne. United States and se. Canada and a second extending from se. United States south into the West Indies and Central America. [= C, F, G, GW, K, WH, Y, Z; = Lericula resupinata (B.D. Greene) Barnhart – S]

Utricularia subulata Linnaeus, Slender Bladderwort, Zigzag Bladderwort. Moist sands or peats of various kinds of acidic wetlands, including wet pine savannas and flatwoods, shores of limesink ponds (dolines), borrow pits, ditches. March-July (- later). In North America primarily in the Coastal Plain, from NS and e. MA south to s. FL, west to TX, north in the interior to TN and AR; also in the West Indies, Central America, South America, Africa, and Asia. Taylor (1989) terms this "the most widespread of Utricularia species." [= RAB, C, F, G, GW, K, WH, Y, Z; > Setiscapella subulata (Linnaeus) Barnhart – S; > Setiscapella cleistogama (A. Gray) Barnhart – S]

378. ACANTHACEAE Durande 1762 (Acanthus Family) [in LAMIALES]

1 Plant a tree, with opposite leathery leaves; [of FL, s. MS, s. LA southward] .......................................................... Avicennia
1 Plant an herb, with various leaf arrangements.
2 Leaves in a basal rosette (sometimes with smaller leaves on a scape).
3 Leaves glabrate, to 22 cm long and 8 cm wide; corolla 0.8-1.3 cm long; capsule 8-10 mm long; stamens 2; [of moist to wet swamps] .......................................................... 

3 Leaves pubescent, to 10 cm long and 3 cm wide; corolla 1.8-4 cm long; capsule 9-18 mm long; stamens 4; [of dry upland pinelands] ........................................... 

4 Leaves 2-10 cm long, 1-3 cm wide; corolla 3-4 cm long; calyx lobes 15-30 mm long; capsule 12-18 mm long; .................. Ruellia ciliata 

4 Leaves 1.5-2.5 cm long, 0.7-0.8 cm wide; corolla ca. 2 cm long; calyx lobes 6-9 mm long; capsule ca. 10 mm long; .................. Stenandrium 

2 Leaves caulescent. 

5 Fertile stamens 4; corolla not distinctly 2-lipped, the corolla lobes of nearly equal size (except distinctly 2-lipped in Hygrophila). 

6 Corolla distinctly 2-lipped .......................................................................................................................... Hygrophila 

6 Corolla not distinctly 2-lipped, the corolla lobes of nearly equal size. 

7 Plant an herbaceous vine; leaves cordate-hastate at the base; flowers yellow to orange, usually with a dark purple “eye” .................. Thunbergia 

7 Plant an herb; leaves cuneate to rounded at the base; flowers white to various shades of blue or pink. 

8 Calyx lobes lanceolate or linear; anther sacs awned or pointed at the base ............................................................................................................... Dyschoriste 

8 Calyx lobes linear-aristate; anther sacs blunt .................................................................................................................. Ruellia 

5 Fertile stamens 2; corolla distinctly 2-lipped (except salverform in Pseuderanthemum and with 4 nearly equal lobes in Yeatesia). 

9 Corolla salverform, 5-lobed .......................................................................................................................... Pseuderanthemum 

9 Corolla distinctly 2-lipped or 4-lobed. 

10 Bracts and bractlets inconspicuous, 2-5 mm long, linear or triangular; stem subterete or obscurely 4-angled ......................... Justicia 

10 Bracts and/or bractlets subtending the flowers conspicuous, 5-15 mm long, obovate; stem terete or 6-angled. 

11 Stem six-angled in cross-section; corolla conspicuously 2-lipped .................................................................................................................... Yeatesia 

11 Stem terete in cross-section; corolla 4-lobed, the lobes nearly equal ............................................................................................................. Yeatesia 

Andrographis Wallich (False Water-willow) 

A genus of about 20 species of tropical Asia. 

* Andrographis echioides (Linnaeus) Nees, native of India, is reported for chrome ore piles near Newport News, VA, by Reed (1961); it is likely not established in our area. [= K] {not keyed; not mapped; rejected as a component of our flora} 

Avicennia Linnaeus (Black Mangrove) 

A genus of 4-7 species, tropical. Of variable family placement, having been variously placed in the Acanthaceae, Verbenaceae, or Avicenniaceae. 

Avicennia germinans (Linnaeus) Linnaeus, Black Mangrove. Brackish and salt marshes and swamps. Scattered on the Gulf Coast in FL peninsula (Dixie county southward on the west coast, St. Johns County southwards on the east coast), Panhandle FL (Franklin and Taylor counties), s. MS, s. LA, and se. TX, southwards into the West Indies and Tropical America. [= GW, K, WH, = A. nitida Jacquin – S] 

Dicliptera Antoine Laurent de Jussieu (Dicliptera, Foldwing) 

1 Corolla tan to purplish-pink, 15-20 mm long, the tube straight or nearly so .............................................................................................................. D. brachiata 

1 Corolla scarlet red, 20-25 mm long, the tube curved .......................................................................................................................... D. sexangularis 

Dicliptera brachiata (Pursh) Sprengel, Dicliptera, Branched Foldwing. Bottomland forests. August-October. Se. VA south to c. peninsular FL, west to TX, and north in the interior to c. TN, s. IN, s. IL, MO, and se. KS. [= RAB, C, F, GW, K, WH, Y; = Diapedium brachiatum (Pursh) Kuntze – S; > Dicliptera brachiata var. brachiata – Z] 

Dicliptera sexangularis (Linnaeus) de Jussieu, Six-angle Foldwing. Disturbed areas, hammocks. [= K, WH, Y; = Diapedium assurgens (Linnaeus) Kuntze – S; > Dicliptera assurgens (Linnaeus) de Jussieu var. vahliana (Nees) M. Gómez – Z] 

Dyschoriste Nees (Twinflower, Snakeherb, Dyschoriste) 

1 Corolla 25-27 mm long (including the 5-10 mm lobes); capsule 10-14 mm long; [of pinelands] ..................................................................................................... D. oblongifolia 

1 Corolla 10-15 mm long (including the 3-5 mm lobes); capsule 7-10 mm long 

2 Leaves linear to linear-elliptic; [of moist pinelands] .................................................................................................................. D. angusta 

2 Leaves elliptic to elliptic-ovate; [of floodplain forests] .......................................................................................................................... D. humistrata 

Dyschoriste angusta (A. Gray) Small, Pineland Twinflower. Moist pinelands. N. FL south to s. peninsular FL. Reported for FL Panhandle ( Wakulla County) by Kunzer et al. (2009). [= K, S, WH] {add GW, Y, Z to synonymy; improve key}
**ACANTHACEAE**

**Dyschoriste humistrata** (Michaux) Kuntze, Swamp Twinflower, Swamp Dyschoriste. Bottomland forests, especially on soils over limestone. April-May. SC to c. peninsular FL, west to e. Panhandle FL. [= RAB, GW, K, S, WH, Y, Z]

**Dyschoriste oblongifolia** (Michaux) Kuntze, Blue Twinflower, Pineland Dyschoriste. Pine savannas, flatwoods, and sandhills. April-May. SC to s. FL, west to se. AL and e. Panhandle FL. The basis of Small's (1933) attribution of this species to VA is unknown. [= RAB, K, S, WH, Y; > Dyschoriste oblongifolia var. oblongifolia – Z]

**Elytraria** Michaux (Elytraria)

**Elytraria caroliniensis** (J.F. Gmelin) Persoon var. caroliniensis, Carolina Elytraria. Swamp forests over coquina limestone ("marl"). June-August. Var. caroliniensis ranges from se. SC south to c. peninsular FL, west to Panhandle FL and sw. GA. Var. angustifolia (Fernald) Blake is restricted to s. FL. Ward (2004d) also recognizes E. caroliniensis var. vahliana (Nees in A.P. de Candolle) D.B. Ward, in ne. and Panhandle FL, south to c. peninsular FL. [= K, Z; > E. caroliniensis var. vahliana – GW, misspelling; = Tubiflora carolinensis J.F. Gmelin – S, misspelling; > E. caroliniensis var. caroliniensis – Y; > E. caroliniensis var. vahliana (Nees in A.P. de Candolle) D.B. Ward – Y]

**Hygrophila** R. Brown

1 Leaf blades 5-12 cm long; calyx segments ca. 5 mm long, glabrous; flowers borne in axillary clusters.................................................. **H. lacustris**

1 Leaf blades 1-3.5 cm long; calyx segments ca. 2 mm long, pubescent; flowers borne in terminal and axillary spikes .................. **H. polysperma**

**Hygrophila lacustris** (Schlectendahl & Chamisso) Nees, Gulf Swampweed. Shallow water of swamps and shores. Sw. GA south to c. FL Peninsula, west to e. TX; West Indies. [= GW, K, S, Y, Z; = Hygrophila costata Nees et al. – WH; = Ruellia lacustris Schlectendahl & Chamisso]

**Justicia** Linnaeus (Water-willow)

1 Bracts of the inflorescence foliaceous and overlapping .................................................................................................................. **J. brandegeana**

1 Bracts of the inflorescence small, neither foliaceous nor overlapping.

2 Spike densely flowered; seeds verrucose; primary leaves averaging 6-8× as long as wide; [of the Piedmont, Mountains, and Coastal Plain]. .................................................................................................................. **J. americana**

2 Spike loosely flowered; seeds smooth or minutely muricate (with very fine, sharp projections); primary leaves either ca. 2-6× as long as wide or > 8× as long as wide; [of the Coastal Plain].

3 Corolla purple, 18-30 mm long; leaves averaging > 8× as long as wide; cystoliths parallel to the midvein of the leaf; [of s. GA south into FL].

4 Upper leaf blades 4-7 cm long, not channeled, tough but not fleshy; calyx segments 5-7 mm long, < 1 mm wide ............ **J. angusta**

4 Upper leaf blades 8-13.5 cm long, channeled, fleshy; calyx segments 11-15 mm long, ca. 1 mm wide.........................**J. crassifolia**

3 Corolla pale lavender to white, 8-13 mm long; leaves averaging 2-6× as long as wide; cystoliths parallel to the secondary veins of the leaf; [of the Coastal Plain throughout our area].

5 spikes lax, the flowers usually borne singly, secund; seeds smooth; leaves averaging ca. 3× as long as wide ..................**J. ovata var. lanceolata**

5 Spikes somewhat congested, the flowers borne in opposite pairs; seeds minutely muricate (with very fine, sharp projections); leaves averaging ca. 3× as long as wide.................................................................**J. ovata var. ovata**

**Justicia brandegeana** Wasshausen, Shrimp-plant. Disturbed areas; native of Mexico. January-December. [= K2, WH]

**Justicia crassifolia** (Chapman) Chapman ex Small. Flatwoods, cypress ponds. S. GA to the FL Panhandle. [= GW, K, WH, Y; < *J. crassifolia* – S]

**Justicia ovata** (Walter) Lindau var. *lanceolata* (Chapman) R.W. Long. Swamps, marshes. May. Se. GA west to TX, north in the Mississippi Embayment to s. IL, s. IN, w. KY. Needs additional study; may warrant specific status. [= K, WH, Y, Z; < *J. ovata* – GW; = *J. lanceolata* (Chapman) Chapman ex Small – S]

*Pseuderanthemum* Radlk.

A genus of about 60 species, mostly shrubs, of tropical regions.

* Pseuderanthemum *variable* (R. Brown) Radlkofeer, Night-and-Afternoon. Disturbed areas, also in potted plants and greenhouses; native of the Old World. Reported as a greenhouse weed from SC (Nelson & Kelly 1997), but not included as a regular member of the flora of SC because "it is unlikely that it could persist anywhere in South Carolina outside a greenhouse environment" (Nelson & Kelly 1997).  [= K, Y; ? *Ps. fasciculatum* (Oerst.) Leonard – WH]

*Ruellia* Linnaeus (Wild-petunia)

1 Principal leaves linear-lanceolate, > 10× as long as wide (8-27 cm long, 0.7-2 cm wide); [alien, cultivated and naturalized] ...................... *R. simplex*
2 Calyx lobes narrowly linear-lanceolate, flattened to the tip, 1-4 mm wide ............................................................... *R. strepens*
3 Calyx lobes linear, filiform or setaceous at least apically, < 1.2 mm wide at their widest point (usually the base), hairlike at the tip.
4 Flowers borne on peduncles 0.2-7 cm long, from the axils of lower and median nodes, not from the terminal node or terminal cluster.
5 Stem divergently branched (rarely simple); calyx glabrous or glabrate, with many partially imbedded cystoliths; calyx lobes 0.5-1 mm wide, tapering from the base to a very slender tip; [of dry to wet pine woodlands of the Coastal Plain] ................. *R. pinetorum*
6 Leaves sessile or subsessile; flower-bearing nodes usually 4-8; stem typically branched at base; stigma lobe 1 ...................... *R. humilis*
7 Plant with all leaves caulescent; leaves ovate, lanceolate, elliptic, or oblong; [widespread in our area] ....................... *R. caroliniensis*
8 Leaves petiolate; flower-bearing nodes usually 1-3; stem typically simple below (unless damaged), sometimes branched upward; stigma lobes (1-) 2.
9 Leaves spatulate to obovate; [restricted to dry pinelands in the Coastal Plain] .......................................................... *R. ciliosa* var. *ciliosa*

*Ruellia caroliniensis* (J.F. Gmelin) Steudel, Carolina Wild-petunia, Common Wild-petunia. Dry to moist forests and woodlands. (May-) June-September. NJ, s. OH, s. IN, s. IL, and OK, south to s. FL and e. TX.  [= RAB, C, G, WH, X; > *R. simplicifolia* var. *americana*]

*Ruellia noctiflora* (Nees) A. Gray, Night-flowering Wild-petunia. Wet pinelands and savannas. (May-) June-July (-August). E. GA (in counties immediately adjacent to SC) south to ne. FL; Panhandle FL west to se. LA. [= GW, K, S, WH, X, Y, Z]

*Ruellia pedunculata* Torrey ex A. Gray, Stalked Wild-petunia. Dry woodlands and forests. IL and MO south to w. LA and e. TX, apparently not in our area. [= F; < *R. pedunculata* – C, G; > *R. pedunculata ssp. pedunculata* – K, Y, Z] (not yet keyed)

*Ruellia pinetorum* Fernald, Pineland Wild-petunia. Dry to wet pinelands. May-September. SC south to Panhandle FL, west to e. TX. Although treated as only subspecifically distinct from *R. pedunculata* by many recent authors, there seem ample differences in morphology, distribution, and habitat to warrant specific distinction. First reported for GA by Sorrie (1998b). [= RAB, F, X; = *R. pedunculata* Torrey ex A. Gray ssp. *pinetorum* (Fernald) R.W. Long – K, WH, Y, Z]

*Ruellia purshiana* Fernald, Pursh’s Wild-petunia. Dry woodlands and forests, especially over mafic or calcareous rocks. May-(June). MD south to c. GA and c. AL, in and adjacent to the Appalachians. [= RAB, F, K, W, WV, Y, Z; < *R. pedunculata* Torrey ex A. Gray – C, G]

*Stenandrium* Nees

*Stenandrium dulce* (Cavanilles) Nees var. *dulce*, Sweet Shaggytuft. Pine savannas. GA to FL. Var. *dulce* ranges from GA south to FL; var. *floridanum* A. Gray is restricted to s. peninsular FL. [= K, Y; < *Gerardia floridanum* (A. Gray) Small – S; < *S. dulce* var. *floridanum* A. Gray – Z]

*Thunbergia* Retzius (Clock-vine)
**ACANTHACEAE**

* Thorningia alata* Bojer ex Sims, Black-eyed-Susan Vine. Disturbed areas; native of Africa. [= K, S, WH, Y, Z]

**Yeatesia** Small (Bractspike)

---

**379. BIGNONIACEAE** A.L. de Jussieu 1789 (Bignonia Family) [in LAMIALES]

1 Leaves simple, cordate; plant a tree; corolla white (marked internally with other colors); [tribe Tecomeae]................................. 1. Catalpa

1 Leaves pinnately compound; plant a vine; corolla reddish or yellowish.

2 Leaves 7-15-foliolate, with a leaflet in the terminal position; [tribe Tecomeae]............................................................ 2. Campsis

2 Leaves 2-foliolate, with a 3-branched tendril in the terminal position; [tribe Bignonieae].

3 Tendrils not hooked, claw-like.......................................................................................................................................................

3 Tendrils hooked, claw-like........................................................................................................................................................

4. Macfadyena

---

1. Catalpa Scopoli 1777 (Catalpa)

A genus of about 10 species, trees, of e. North America (2 species), e. Asia (4 species), and the West Indies (4 species). References: Manning (2000)=Z; Paclt (1952)=Y; Li (2008); Fischer, Theisen, & Lohmann in Kubitzki (2004).

1 Flowers creamy yellow, striped inside with deeper yellow and spotted with dark violet; leaves usually lobed; seeds elliptical, 2.5-3 mm long, 8-10 mm wide......................................................C. ovata

1 Flowers white or pale rose, striped inside with yellow and spotted with purple; leaves rarely lobed; seeds elongate, 4-10 mm long, 20-35 mm wide.

2 Corolla 2-4 cm wide, the lower corolla lobe densely spotted with purple, entire; pod 6-10 mm thick, each valve 9-15 mm wide when flattened; seeds with 2 elongated wings, each wing narrowing to an acute end, the hairs at the end appressed to one another in 2 planes, thus forming a pointed tail; fresh foliage with a fetid odor.........................................................C. bignonioides

2 Corolla 4-6 cm wide, the lower corolla lobe sparsely spotted with purple, notched; pod 10-15 mm thick, each valve 13-18 mm wide when flattened; seeds with 2 elongated wings, each wing narrowing only slightly to a rounded or oblique end, the hairs at the end appressed to one another only in one plane, thus forming a flatish fringe; fresh foliage essentially odorless ..............................................................C. speciosa

**Catalpa bignonioides** Walter, Southern Catalpa. Bottomlands and streambanks (as a native), escaped or persistent after cultivation. June; October. S. GA, ne. FL, n. peninsular FL, and Panhandle FL west to s. MS (or LA?), on the Coastal Plain, early naturalized in a more widespread area, and now extending north to CT and MI. [= RAB, C, F, G, GW, K, W, WH, Z; = C. catalpa (Linnaeus) Karsten – S]

* Catalpa ovata* G. Don, Chinese Catalpa. Suburban woodlands; native of China. Introduced in WV, MD, DC, PA, and other northeastern states (Manning 2000; Kartesz 1999), and beginning to be considered invasive. [= C, F, G, K, Z; > C. ovata var. ovata – Y; > C. ovata var. flavescens Bean – Y]

**Catalpa speciosa** (Warder) Warder ex Engelmann, Northern Catalpa. Bottomlands and river banks (as a native), also escaped or persistent after cultivation, and sometimes thoroughly naturalized. May-June; July-August. Native in the upper Mississippi River Embayment of s. IN and e. IL, south to w. TN and e. AR; early naturalized in a more widespread area. [= RAB, C, F, G, K, S, W, Z]

2. Campsis Loureiro 1790 (Trumpet-creeper)

*Campsis radicans* (Linnaeus) Seemann ex Bureau, Trumpet-creeper. Bottomland forests, swamp forests, fencerows, old fields, forests, thickets, disturbed areas. June-July; September-October. NJ west to IA, south to s. FL and c. TX. In the pre-Columbian landscape this plant was primarily limited to swamps and bottomlands; it has done well as a weedy colonizer of abandoned farmland, fencerows, and thickets (where particularly conspicuous on fenceposts and old tobacco barns). In swamps of the Coastal Plain it is a common liana, often with its foliage in the canopy 30-40 m above the ground, and with stems to 15 cm in diameter. Even when the foliage cannot be seen, *Campsis* is immediately recognizable by its shreddy tan or yellow bark (unlike any of our other high-climbing vines). [= RAB, C, F, G, K, W, WH, Z; = Bignonia radicans Linnaeus – S]

3. *Bignonia* Linnaeus 1753 (Cross-vine)

*Bignonia capreolata* Linnaeus, Cross-vine. Swamp forests, bottomlands, forests, woodlands. April-May; July-August. MD west to s. OH and s. MO, south to c. peninsular FL and e. TX. This species is absent from most of the Mountains in our area (also scarce in the Piedmont of Virginia and upper Piedmont of NC), reappearing at lower elevations on the west side of the Blue Ridge. Though primarily a species of swamp and bottomland forests, *Bignonia* often occurs as well in mesic or even dry forests, where it generally remains stunted (most individuals with only a few leaves) and does not flower or fruit. [= C, F, GW, K, W, WH, Z; = Anisostichus capreolata (Linnaeus) Bureau – RAB, C, F, GW, K, W, WH, Z; = Anisostichus cruciger (Linnaeus) Bureau – S]

4. *Macfadyena* Alphonse de Candolle 1845 (Claw-vine)

*Macfadyena unguis-cati* (Linnaeus) A.H. Gentry, Claw-vine, Cat's-claw-vine. Cultivated and naturalized; native of tropical America. This vine is introduced and naturalized in s. and e. GA (Jones & Coile 1988) and is locally commonly naturalized in Charleston. [= K, WH, Z; = Bignonia unguis-cati Linnaeus]

382. VERBENACEAE J. St.-Hilaire 1805 (Verbena Family) [in LAMIACEAE]

As recently reworked, a family of about 34-41 genera and 950-1200 species, trees, shrubs, vines, and herbs, widespread in tropical, subtropical, and warm temperate regions of the Old World and New World. References: Atkins in Kadereit (2004). [also see LAMIACEAE and PHRYMACEAE]

1 Shrubs; fruits fleshy; [tribe Lantaneae] ............................................................................................................................................................. *Lantana*

1 Herbs; fruits dry.

2 Mericarps 2; corolla 4-lobed, evidently zygomorphic (bilabiate); [tribe Lantaneae] ......................................................................................................................................... *Phyla*

2 Mericarps 4; corolla 5-lobed, actinomorphic or only weakly irregular; [tribe Verbeneae].

3 Mericarps not separating at maturity; [sandy woodlands of the Coastal Plain] ................................................................................................................. *Stylodon*

3 Mericarps separating at maturity; [collectively widespread].

4 Styles > 6 mm long; calyx 8-10 mm long, longer than the fruit; corolla salverform .......................................................................................... *Glandularia*

4 Styles < 3 mm long; calyx 2-4 mm long, often shorter than the fruit; corolla funnelform ................................................................. *Verbena*

*Aloysia* Palau 1784 (Bee-brush)

**VERBENACEAE**

*Alyssia triphylla* (L'Héritier) Britton, Lemon Bee-brush, is allegedly introduced in Iredell County, in the Piedmont of NC (Moldenke 1980); the documentation is unknown and the record rejected. [= K; {not keyed; not mapped}]

**Glandularia** J.F. Gmelin 1796 (Vervain)

1 Leaves finely dissected, the divisions 1 mm or less wide, the margins strongly revolute.
2 Bracts as long as or longer than the calyx; leaf segments 1-4 mm wide...........................*G. bipinnatifida* var. *bipinnatifida*
2 Bracts much shorter than the calyx; leaf segments 0.5-1.5 mm wide...........................................................*G. pulchella*
1 Leaves coarsely dissected or lobed, the divisions > 1 mm wide, the margins slightly or not at all revolute.
3 Calyx lobes > 3 mm long..........................................................*G. canadensis*
3 Calyx lobes < 3 mm long...........................................................................................................................*G. ×hybrida*

**Glandularia bipinnatifida** (Nuttall) Nuttall *var. bipinnatifida*, Dakota Vervain. Cp (GA), Mt (GA): dry prairies on clay soils; rare. KY, MO, SD, and CO south to e. GA, AL, AZ and s. Mexico; elsewhere in e. North America as waifs. [= K; = Verbena bipinnatifida Nuttall – C] {synonymy incomplete}

**Glandularia canadensis** (Linnaeus) Nuttall, Rose Vervain, Rose Verbena, Creeping Vervain. Cp (GA, NC, SC, VA), Pd (GA, NC, SC), Mt* (WV*): roadsides, sandhills, other dry (especially sandy) soils; uncommon. March-May. PA, IL, and CO, south to FL and TX, and introduced elsewhere. [= K, S, Z; = Verbena canadensis Linnaeus – RAB, C, F, G]

* **Glandularia ×hybrida** (Grönland & Rümpler) Nesom & Pruski, Garden Vervain. Cp (SC): cultivated in gardens; uncommonly cultivated, rarely escaped or persistent. March-July. Nesom & Pruski (1992) have provided the transfer to *Glandularia* of this common garden plant. [= Verbena ×hybrida Grönland & Rümpler – RAB, G, K; = Verbena hybrida – C]

**Lantana** Linnaeus 1753 (Lantana)

1 Heads with an involucre; flowers pink or purple..............................................................................*L. montevidensis*
1 Heads with bracts, but not an involucre; flowers orange, yellow, or multicoloored.
2 Stems lacking prickles ..........................................................................................................................*L. depressa* var. *floridana*
2 Stems with scattered retrorse prickles.
3 Calyx lobes acute, as long as or longer than the calyx tube.................................................................*L. camara*
3 Calyx lobes obtuse, shorter than the calyx tube.........................................................................................*L. urticoides*

* **Lantana camara** Linnaeus, Common Lantana, Hedgeflower. Cp (FL, GA, NC, SC): disturbed areas, especially near the coast; rare, native of the West Indies. [= RAB, K, S, Z]

**Lantana depressa** Small *var. floridana* (Moldenke) R. Sanders, Florida Lantana. Cp (FL, SC*?): edges of brackish marshes, dunes; rare, the SC occurrence apparently introduced from FL. Native from ne. FL south to se. FL. [= K, Z; < L. ovatifolia Britton – RAB, S, misapplied; < L. depressa Small – S]

* **Lantana urticoides** Hayek, West Indian Lantana. Cp (NC, SC): disturbed and brackish areas; rare, native of West Indies. May-December. [= K; < L. horrida Kunth – RAB, misapplied]

**Phyla** Loureiro 1790 (Frogfruit)

1 Leaves 2-6 cm long, lanceolate, widest at or below the middle, acute at the tip; leaf teeth (5-) 7-11 per leaf side.........................*P. lanceolata*
1 Leaves 1-4 cm long, obovate, widest above the middle, obtuse to rounded at the tip; leaf teeth (3-) 5 (-7) per leaf side......................*P. nodiflora*

**Phyla lanceolata** (Michaux) Greene, Marsh Frogfruit, Northern Frogfruit. Cp (DE, FL, GA, NC, SC, VA), Pd (VA), Mt (VA, WV): brackish marshes, other marshes, ditches; common (rare in DE, FL, GA, and WV). June-November. ON west to SD, south to Panhandle FL, AL, MS, LA, CA, and n. Mexico; primarily in the outer Coastal Plain in the Carolinas, but extending inland in VA. [= C, G, GW, K, S, W, WH; = Lippia lanceolata Michaux – RAB, WV; > L. lanceolata var. lanceolata – F; > Lippia lanceolata var. recognita Fernald & Griscom – F]
**Phyla nodiflora** (Linnaeus) Greene, Creeping Frogfruit, Capeweed, Turkey-tangle, Matgrass. Cp (FL, GA, NC, SC, VA): sandy soils of roadsides, lawns, ditches, disturbed areas; common (rare in VA). May-November. Pantropical, in North America from se. VA south to s. FL and west to CA, north in the interior to AR, se. MO, and southward into the tropics. This species is very weedy, and is a familiar component of road margins and lawns in the southeastern Coastal Plain. [= C, G, GW, K, WH; = *Lippia nodiflora* (Linnaeus) Michaux – RAB, F]

**Verbena** Linnaeus 1753 (Verbena, Vervain)

A genus of about 70 species, herbs, of tropical, subtropical, and warm temperate regions of the New World and (rarely) Old World. Infrageneric taxonomy follows Nesom (2010b). References: Nesom (2010b)=X; Nesom (2010c)=V; Nesom (2010d)=U; Barber (1982)=Z; O’Leary, Múlgara, & Morrone (2007)=Y; Atkins in Kadereit (2004). Key based in part on V.  [also see *Glandularia* and *Stylodon*]

1 Spikes short and stout, the flowers or fruits overlapping and completely obscuring all of the rachis (except in *V. montevidensis*, the fruits spaced towards the base of the spike).
2 Plant procumbent or decumbent; leaves pinnately lobed or dissected; [section *Verbena*, series *Bracteatae*]................................. *V. bracteata*
3 Plant erect; leaves coarsely serrate.
4 Central spikes sessile to subsessile, spikes compact, 3-5 mm wide, fruits remaining densely overlapping at maturity; [section *Verbena*, series *Pachystachyae*]............................................................... *V. brasilensis*
4 Central spikes pedunculate, spikes loose, 2-3 mm wide, with fruits becoming remote at least in the proximal portion at maturity; [section *Verbena*, series *Litorea*] .......................................................... [V. montevidensis]
5 Leaves basally clasping to subclasping; [section *Verbena*, series *Pachystachyae*].
6 Corolla tube 4-6 (-7) mm, 1.5-2 mm longer than the calyx; distal stems, peduncles, and calyces stipe-like glanular; spikes 8-30 mm in fruit; floral bracts 2.1-2.8 mm; nutlets 1.5-1.9 mm; basal and midstem leaves oblone-lanceolate to obo-lanceolate ........... [V. bonariensis]
6 Corolla tube 2.5-4 mm, 0-0.5 mm longer than the calyx; distal stems, peduncles and calyces eglandular; spikes 6-55 mm in fruit; floral bracts 3-4 mm; nutlets 1-1.2 (-1.4) mm; basal and midstem leaves ovate to ovate-lanceolate, oblong-elliptic, or obovate ............... [V. incompta]
7 Leaves not lobed or dissected, or some of the leaves lower on the stem 3-lobed.
8 Plants much branched at base, stems decumbent to ascending; leaves 1-5 cm long; [section *Verbena*, series *Tricesimae*] .................. [V. canescens]
8 Plants little branched, stems erect; leaves 3-12 cm long.
9 Bractlets about as long as the calyx; [AL westward]; [section *Verbena*, series *Candelabrae*] .......................................................... [V. xantha]
9 Bractlets about ½ as long as the calyx; [collectively widespread].
10 Basal and lower cauline leaves persistent, relatively thick, large and spatulate, margins revolute, cauline leaves quickly reduced in size distally and becoming linear-entire; rachis and calyces eglandular; [section *Verbena*, series *Haleae*] ......................................... *V. halei*
10 Basal leaves usually deciduous, relatively thin, margins not revolute, cauline leaves relatively even-sized upwards or largest near midstem; rachis and calyces stipe-like glanular; sometimes sparsely so; [section *Verbena*, series *Verbena*] .............................. *V. officinalis*
7 Leaves mostly lobed or dissected.
11 Stem leaves sessile or subsessile, cuneate to binate.
12 Leaves linear to narrowly oblanceolate, < 1.5 cm wide, > 6× as long as wide; [section *Verbena*, series *Simplices*] ............... *V. simplex*
12 Leaves ovate, 2-4 cm wide, < 4× as long as wide
13 Mericarps tightly adhering in fruit, appearing as one; calyx lobes curved inward in fruit; corolla pink to pinkish lavender; [section *Verbena*, series *Connaticarpae*] ........................................... *V. carnea*
13 Mericarps separate in fruit; calyx lobes erect to divergent in fruit; corolla blue to violet; [section *Verbena*, series *Candelabrae*] ....... *V. stricta*
11 Stem leaves with well-developed petiolo.
14 Flowers and fruits distinctly overlapping in the upper part of the spikes; [section *Verbena*, series *Candelabrae*] ............... *V. hastata*
14 Flowers and fruits well-spaced throughout the inflorescence; [section *Verbena*, series *Leptostachyae*].
15 Upper leaf surfaces densely scabrous or hispidulous to hispid or hispid-hirsute; calyx lobes triangular, connivent; corollas mostly pinkish to bluish, lavender, or purple; nutlet outer surfaces deeply ridged and grooved, often with prominent cross-ridges, commissural faces consistently densely silver-white minutely papillate-bulbulate; fibrous-rooted................................................................. *V. scabra*
15 Upper leaf surfaces hirsutulous to hisrate or strigose-hirsute; calyx lobes deltate-subulate, not connivent or subconnivent; corollas white, rarely pinkish; nutlet outer surfaces smooth to longitudinally ridged, sometimes with cross-ridges distally, commissural faces smooth or rarely with slight development of minutely binate ornamentation; taprooted........................................*V. urticifolia*

* **Verbena bonariensis** Linnaeus. Cp (GA, NC, SC): roadsides, disturbed areas, old fields; common, native of South America. May-October. [= V, X; < *V. bonariensis* – RAB, C, G, GW, S, WH (also see *V. incompta*); = *V. bonariensis* var. *conglomerata* Briquet – K]*

---

**VERBENACEAE** 856

* Verbena halei* Small, Texas Vervain. Cp (FL, GA, NC*, SC*): dry hammocks, roadsides, pastures; common (rare in NC and SC, where presumably introduced). April-June. CA south to c. peninsular FL, TX, AZ, and Mexico, scattered as an introduction further north, as in NC and SC. [= RAB, K, S, X; = V. litoralis var. brevibracteata (Kuntze) N. O’Leary – Y]

* Verbena hastata* Linnaeus, Common Vervain, Blue Vervain, Simpler’s-joy. Cp (DE, NC, VA), Pd (DE, NC, VA), Mt (NC, VA, WV): marshes, bogs, low fields; common (rare in NC). June-October. NS west to BC, south to NC, n. AL, AR, OK, n. TX, NM, AZ, CA; scattered occurrences further south appear to be introductions. The hybrid with *V. urticifolia*, *Verbena ×engelmannii* Moldenke, is known from our area. [= RAB, C, F, G, GW, S, WH, Y; > V. hastata var. hastata – K; > V. hastata var. scabra Moldenke – K]

* Verbena officinalis* Linnaeus, European Vervain, Juno’s Tears, Herb-of-the-cross. Cp (DE, FL, GA, NC, SC, VA), Mt (NC, VA), Pd (DE, VA): disturbed areas; common (rare in FL, GA, NC, SC, and VA), native of Europe. June-October. The enigmatic *V. riparia* is represented by a few collections, and the taxonomic status of the taxon is unclear; it probably represents an unusual form of *V. officinalis*. [= X; > V. officinalis – RAB, C, F, G, S; > V. riparia Rafinesque ex Small & Keller – RAB, C, F, G, K, S, W; > V. officinalis var. officinalis – WH; > V. officinalis var. prostrata Grenier & Godron – K; = V. officinalis ssp. officinalis – Z]

* Verbena rigida* Sprengel. Cp (FL, GA, NC, SC, VA), Pd (GA): roadsides, disturbed areas; common (uncommon in NC, rare in VA), native of South America. Late March-July. [= K, S, WH, Y, X]

* Verbena scabra* Vahl, Rough Vervain, Harsh Vervain. Cp (FL, GA, NC, SC, VA), Pd (GA, VA), Mt (VA, WV*): brackish marshes, shell deposits, other wet habitats; common (uncommon in NC, rare in VA and WV). May-October. VA and WV south to s. FL, west to TX and CA, south into tropical America; mainly coastal in our area but with scattered inland records (probably adventive). [= RAB, C, F, G, GW, K, S, U, WH, WV, X]

* Verbena simplex* Lehmann, Narrowleaf Vervain. Pd (DE, GA, NC, SC, VA), Mt (GA, VA, WV), Cp (DE, FL, VA): glades, woodlands, forests, and roadsides, over mafic or calcareous rocks; common (uncommon in WV). May-September. NH west to MN and NE, south to Panhandle FL (Jackson County) and TX. [= RAB, C, F, G, K, W, WH, X, Z; > V. angustifolia Michaux – S]

* Verbena urticifolia* Linnaeus, White Vervain, Velvetleaf Vervain. Cp (NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC, VA, WV): [habitats]; common. May-November. NB west to SK, south to Panhandle FL and TX. Two varieties have been distinguished by many authors (see synonymy), but the characters used are poorly correlated and the distributional ranges largely overlapping. The hybrid with *V. hastata, Verbena ×engelmannii* Moldenke, is known from our area. [= RAB, GW, W, U, X; > V. urticifolia var. leiocarpa Perry & Fernald – C, F, G, K, WV; > V. urticifolia var. urticifolia – C, F, G, K, WV; = V. urticaefolia – S, orthographic variant]

* Verbena canescens* Kunth, Gray Vervain. Cp (AL): disturbed areas; rare, native of TX. Reported for s. AL. [= K, X]

* Verbena suha* Lehmann, Gulf Vervain. Cp (AL, LA, MS): [habitat]; rare. AL west to TX. [= K, S, X]

**384. MARTYNIACEAE** Stapf 1895 (Martynia Family) [in LAMIALES]

**Proboscidea** Schmidel 1763 (Unicorn-plant)

* Proboscidea louisianica* (Miller) Thellung, Unicorn-plant, Devil’s-claw, Cow Catcher. Disturbed areas; native of the Great Plains. The curious fruits are unmistakable. [= RAB, F, GW, WV, Y; = P. louisiana – C, G, orthographic variant; = Martynia louisiana Miller – S; > P. louisianica ssp. louisianica – K, Z]

**389. AQUIFOLIACEAE** Bartling 1830 (Holly Family) [in AQUIFOLIALES]
AQUIFOLIACEAE

858

A monogeneric family of about 500 species, nearly cosmopolitan.

Ilex Linnaeus 1753 (Holly, Winterberry, Gallberry)

Identification notes: Some of our species can be superficially similar to various shrubs and trees of the Rosaceae, in their alternate toothed leaves borne on spur shoots.

1 Leaves coriaceous, evergreen.

2 Leaves with a well-developed apical spine (and usually also marginal spines) 2-6 mm long.

3 Flowers in 1-few-flowered axillary cymes, on growth of the same year; [native trees of a wide variety of habitats]

4 Leaves dark green above, 1.5-5.0 cm long, 1.0-2.5 cm wide; [of FL] (i.e., .......................... I. opaca var. arenicola

5 Flowers in axillary clusters, on branches of the previous year; [alien shrub, rarely naturalized, especially in suburban areas] .... I. cornuta

2 Leaves with margins either entire, crenate, or with marginal spines prickles < 1 mm long (the apex sometimes mucronate, but not stiff and spinose).

5 Leaves crenate from base to apex, 0.5-4.5 cm long; calyx and corolla 4-lobed.

6 Fruits black; [alien shrub, rarely naturalized, especially in suburban areas] ......................................................... I. vomitoria

7 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spine prickles (or commonly entire), generally about 2-3 cm wide ........................................................................................................... I. coriacea

9 Leaves oblongate, oblong, or elliptic, 3-12 cm long, (8-) 15-40 mm wide, 2-4× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch........

.............................. I. glabra

7 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spine prickles (or commonly entire), generally about 2-3 cm wide ........................................................................................................... I. coriacea

9 Leaves oblongate, oblong, or elliptic, 3-12 cm long, (8-) 15-40 mm wide, 2-4× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch........

.............................. I. vomitoria

7 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spine prickles (or commonly entire), generally about 2-3 cm wide ........................................................................................................... I. coriacea

9 Leaves oblongate, oblong, or elliptic, 3-12 cm long, (8-) 15-40 mm wide, 2-4× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch........

.............................. I. vomitoria

7 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spine prickles (or commonly entire), generally about 2-3 cm wide ........................................................................................................... I. coriacea

9 Leaves oblongate, oblong, or elliptic, 3-12 cm long, (8-) 15-40 mm wide, 2-4× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch........

.............................. I. vomitoria

7 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spine prickles (or commonly entire), generally about 2-3 cm wide ........................................................................................................... I. coriacea

9 Leaves oblongate, oblong, or elliptic, 3-12 cm long, (8-) 15-40 mm wide, 2-4× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch........

.............................. I. vomitoria

7 Fruits red or yellow; calyx and corolla 4-lobed; leaves entire (or with spinose serrations), lacking dark punctate dots beneath.

8 Leaves 1.5-3× as long as wide, with a few, irregularly spaced, marginal spine prickles (or commonly entire), generally about 2-3 cm wide ........................................................................................................... I. coriacea

9 Leaves oblongate, oblong, or elliptic, 3-12 cm long, (8-) 15-40 mm wide, 2-4× as long as wide; petioles (3-) 5-15 mm long; leaf apex acute, obtuse, or rounded; branchlets strongly ascending, most of them forming an angle of < 45 degrees to the branch........

.............................. I. vomitoria
Nutlets 4-5 per fruit, with striate ridges on the (curved) back; staminate flower clusters sessile or very short-peduncled (0-2 mm long); pistillate flowers with ciliate corolla lobes; flowers mostly in axils of leaves on lateral short-shoots.

Leaves 2-9 (-10.5) cm long, elliptic to broadly ovate, often nearly round, the apex abruptly to gradually acuminate, the marginal teeth usually inconspicuous; petioles of mature leaves usually < 1 cm long; fruits 5-9 mm in diameter; plant a shrub to 6 m tall; [of the Coastal Plain, Piedmont, and Mountains] ......................................................................................... I. montana

Leaves 6-16 cm long (the largest, at least, > 8 cm long), narrowly to broadly ovate, the apex long acuminate to attenuate, the marginal teeth rather coarse; petioles of mature leaves usually > 1 cm long; fruits 9-12 mm in diameter; plant shrub or small tree to 10 m tall; [of the Mountains and upper Piedmont]........................................................................................................... I. verticillata

Fruits duller red, longer than broad, 5-8 mm in diameter, borne on stalks 1-6 mm long, primarily in the axils of leaves on spur shoots; bark of 2-3 year old twigs usually light tan; calyx (persistent on fruit) 4 (-5) lobed; nutlets 4-6 per fruit, with bony white longitudinal striations on the back, the furrows between the striations very shallow if developed at all; petiole with a deeply U- to V-shaped channel on its upper side (made by the decurrent leaf edges), with dark ascending trichomes in the channel; leaves variable, but mostly 3-6 cm wide and about 1.5× as long as wide, usually abruptly short-acuminate; [plant of bogs, seepages, streambanks, and (rarely) moist forests, mostly at high elevations] ............................................................................................................................. I. collina

Fruits dullest red, longer than broad, 5-7 mm in diameter, borne on stalks 1-6 mm long, primarily in the axils of leaves on normal shoots with elongate internodes; bark of 2-3 year old twigs usually brown, gray, or purplish; calyx (persistent on fruit) 4-6 lobed; nutlets 4-6 per fruit, with longitudinal ridges, the furrows between the ridges about as deep as the distance between the ridges; petiole with U-shaped channel on its upper side, with white appressed trichomes in the channel; leaves variable, but mostly 3-7 cm wide and about 2× as long, usually long-acuminate; [plant of moist forests and (rarely) bog edges] ............................................................................................................................. I. myrtifolia

Fruits bright cherry-red, broader than long, (?-) 8-12 mm in diameter, borne on stalks 9-20 mm long, primarily in the axils of leaves on spur shoots; bark of 2-3 year old twigs usually light tan; calyx (persistent on fruit) 4 (-5) lobed; nutlets 4 (-5) per fruit, with bony white longitudinal striations on the back, the furrows between the striations very shallow if developed at all; petiole with a deeply U- to V-shaped channel on its upper side (made by the decurrent leaf edges), with dark ascending trichomes in the channel; leaves variable, but mostly 3-6 cm wide and about 1.5× as long as wide, usually abruptly short-acuminate; [plant of bogs, seepages, streambanks, and (rarely) moist forests, mostly at high elevations] ............................................................................................................................. I. collina

Ilex ambiguca (Michaux) Torrey, Carolina Holly. Sandy upland forests, dry slope forests, rarely in pocosin ecotones in the fall-line sandhills region. April-June; August-September. Ne. NC, se. TN, n. AR, and se. OK south to c. peninsular FL, s. MS, and se. TX; disjunct in the Sierra Madre Oriental and Chiapas, Mexico. The various taxa that have been distinguished in this complex may have some merit, though a detailed study by Krakow (1989) did not show a clear basis for their recognition. I. buswellii Small, strictly of xeric habitats of the Coastal Plain from se. NC southward, has the larger leaves 2-3.5 (-4) cm long and 0.7-1.7 (-2.5) cm wide. I. ambiguca (sensu stricto) is distributed in the Coastal Plain, Piedmont and Low Mountains, and has leaves 3-9 (-10.5) cm long and 1.7-6 cm wide. I. beadlei of the Low Mountains and Piedmont has leaves 7-9 (-10.5) cm long and 2-6 cm wide. [= K, Z; = I. ambiguca var. ambiguca – RAB, W, Y; > I. montana var. mollis (A. Gray) Britton – C, F; > I. montana var. beadlei (W.W. Ashe) Fernald – G; > I. ambiguca – S; > I. beadlei W.W. Ashe – S; > I. buswellii Small – S; > I. ambiguca (Michaux) Torrey var. monticola (A. Gray) Wunderlin & Poppleton – Y, misapplied; > I. beadlei var. laevis W.W. Ashe; > I. caroliniana Trelease ex Small; > I. mollis A. Gray]

Ilex amelanchier M.A.Curtis ex Chapman, Sarvis Holly. Banks of blackwater creeks and rivers, clay-based Carolina bays. April-May; October-November. A Southeastern Coastal Plain endemic: se. NC south to the FL Panhandle and west to se. LA (reports from se. VA appear to be based on confusion of material). The fruits are sometimes persistent until the following spring; the species is perhaps most conspicuous in the winter, when the dull red fruits can be easily seen. [= RAB, C, F, G, GW, K, S, Y, Z]

Ilex cassine Linnaeus, Dahoon, Cassena. Blackwater stream swamps, pocosins, nearly always in very acid peaty or sandy sites. May-June; October-November. Primarily a Southeastern Coastal Plain endemic: se. NC south to se. FL and west to se. TX; also in Cuba and Mexico. I. cassine is variable in leaf shape, sometimes approaching I. myrtifolia. Some populations in our area show intergradation with or poor differentiation from I. myrtifolia, lending some credibility to their treatment as varieties. [= GW, S, Y; = I. cassine var. cassinii – RAB; > I. cassine var. cassinii – K]

Ilex collina Alexander, Long-stalked Holly, Cherry Holly. In peats of bogs and seepages, on banks of cold, high elevation streams (less commonly on moist, rocky slopes in northern hardwood forests or mixed spruce-hardwood forests) at moderate to high elevations (1100-1800m). May-June; (August-) September-October. A Southern Appalachian endemic: e. and c. WV, sw. VA, w. NC, and e. TN (Sevier County) (Boetsch & Nielsen 2003). The affinities of these species are with Ilex montana and I. verticillata, not with Ilex Nemopanthus mucronata (Baas 1984). See Clark (1974) and Boetsch & Nielsen (2003) for additional information about this species. I. collina often occurs with or in close proximity to the similar I. montana and I. verticillata; the long fruiting pedicels will separate fruiting plants readily. [= K, WW; = Nemopanthus collinus (Alexander) R.C. Clark – C, W; < I. longipes – F, G]

Ilex coriacea (Pursh) Chapman, Big Gallberry, Sweet Gallberry. Pocosins, more restricted to wet, peaty sites than I. glabra. April-May; September-October. A Southeastern Coastal Plain endemic: se. VA south to c. peninsular FL and west to e. TX. [= RAB, C, F, G, GW, K, S, Y]
* Ilex cornuta Lindley, Chinese Holly, Burford Holly. Escaped into forests in suburban areas; native of China. Escaped from suburban plantings in AL, NC, and KY (Clark et al. 2005). [= K]

* Ilex crenata Thunberg, Japanese Holly. Planted as a landscaping shrub, escaped into forests in suburban areas; native of Japan. First reported for NC by Pittillo & Brown (1988). [= K]

Ilex cuthbertii Small, Cuthbert Holly. Upland circumneutral woodlands and forests. Endemic to an area along the Fall Line in SC and adjacent GA (Krakow 1989). Perhaps best treated as a variety of I. longipes, but the combination has not yet been made. [= K; < I. cuthbertii – S (as to type, not as to range); = I. longipes var. cuthbertii (Small) G.A. Krakow, in prep. – Z]

Ilex decidua Walter var. curtissii Fernald, Suwanee Possum-haw, Curtiss’s Holly. Floodplains and moist forests in the Suwanee River drainage. Mid-March-mid-April; September-October. Apparently endemic to the Suwanee River drainage of s. GA and n. FL. [= Z; < I. decidua – GW, K, Y; = I. curtissii (Fernald) Small – S]

Ilex decidua var. decidua, Possum-haw. Floodplain forests, less commonly on mesic (or even dry), upland slopes. March-May; September-October. MD south to Panhandle FL, west to TX on the Coastal Plain, extending also to adjacent provinces (the Piedmont and rarely Mountains in our area), and extending north in the interior to c. TN, w. KY, s. IL, c. MO, se. KS, and e. OK; also disjunct (as a variety) in the Sierra Madre Oriental of e. Mexico. The Mexican material was recognized by Krakow (1989) at the varietal level, but has not been formally named; it is known from a single collection from Nuevo León, Mexico. [= Z; < I. decidua var. decidua – RAB; < I. decidua – C, F, G, GW, K; > I. decidua var. decidua – Y (also including I. cuthbertii)]

Ilex glabra (Linnaeus) A. Gray, Little Gallberry, Inkberry. Savannas, pine flatwoods, pocosin margins, swamps, primarily in wetlands, but extending upslope even into sandhills. May-June; September-October. NS and ME south to FL, west to TX. [= RAB, C, F, G, GW, K, S, Y]

Ilex laevigata (Pursh) A. Gray, Smooth Winterberry. Pocosins, other wet, acidic sites, such as in small blackwater stream swamps. April-May; September-October. ME and NY south to SC, mostly near the coast. [= RAB, C, F, G, GW, K, S]

Ilex longipes Chapman ex Trelease, Georgia Holly, Chapman’s Holly. Upland forests. April-May; September-October. Sc. NC, sc. TN (Chester, Wofford, & Kral 1997), and wc. AR south to Panhandle FL, s. MS, and se. TX. [= GW, K, S; = I. decidua var. longipes (Chapman ex Trelease) Ahles – RAB, Y; < I. longipes – F, G (apparently also including I. collina); = I. longipes var. longipes – Z]

Ilex montana Torrey & A. Gray ex A. Gray, Mountain Holly. Mesic forests, rarely bogs or bog edges. April-June; August-September. W. MA and w. NY south to n. GA and n. AL, essentially an Appalachian endemic. The range of this species is sometimes stated or shown as broader, extending into the Coastal Plain in our area, and as far south as n. FL, LA, and e. TX, but these reports are based on misidentifications, primarily of the “beadlei” component of I. ambiguus. [= K, WV, Z; = I. ambiguus var. montana (Torrey & A. Gray ex A. Gray) Ahles – RAB; = I. montana var. montana – C, F, G; = I. monticola A. Gray – S; = I. ambiguus var. monticola (A. Gray) Wunderlin & Poppleton – W]

Ilex mucronata (Linnaeus) M. Powell, V. Savolainen, & S. Andrews, Nemopanthus. Bogs and moist, high-elevation forests. NL (Newfoundland) west to ON and MN, south to MD, WV, OH, IN, and IL (and allegedly in VA, according to Fernald 1950). It can be separated vegetatively from other hollies in the mountain regions of w. VA (I. montana, I. collina, I. opaca, and I. verticillata) by its smaller, narrower, entire (or nearly so) leaves, 2.5–5 cm long, 0.5–2.5 cm wide. Debate about the distinctiveness of Nemopanthus from Ilex have now been unequivocally answered, with Nemopanthus to be included in Ilex (Powell et al. 2000; Manen, Boulter, & Naciri-Graven 2002). [= X; = Nemopanthus mucronatus (Linnaeus) Trelease – C, F, G, K, WV]

Ilex myrtifolia Walter, Myrtle Holly. Limesink (doline) ponds, wet savannas. May-June; October-November. A Southeastern Coastal Plain endemic: se. NC south to n. peninsular FL and west to e. LA. See I. cassine for comments about these two taxa. [= GW, K, S, Y; = I. cassine var. myrtifolia (Walter) Sargent – RAB]
Ilex opaca Aiton var. arenicola (Ashe) Ashe, Scrub Holly. Xeric sands of sand pine scrub. Baker and Clay counties (ne. FL) south to c. peninsular FL. [= K; = I. cumulicola Small – S; = I. arenicola Ashe]

Ilex opaca Aiton var. opaca, American Holly, Christmas Holly. In a wide variety of forests, ranging from xeric to wetland. April-June; September-October. MA (? NS and ME), IL, MO, and OK south to s. peninsular FL and TX. This is our only species of Ilex that becomes a medium to large tree. [= GW, K, Y; < I. opaca – RAB, C, F, G, W, WV; = I. opaca – S]

Ilex vomitoria Aiton, Yaupon. Maritime forests, other dry sandy forests. March-May; October-November. Widespread in the Southeastern United States, primarily on the Coastal Plain, from e. VA (from Northampton County south) south to c. peninsular FL and west to se. TX. I. vomitoria from the Deep South often has much smaller leaves than plants in our area. In NC and VA, yaupon is nearly restricted to maritime habitats, on the barrier islands and in a narrow band on the mainland, in forests with substantial maritime influence. I. vomitoria is increasingly popular as an ornamental shrub, and is persistent or establishing in suburban woodlands. [= RAB, C, F, G, GW, K, S, Y]

391. CAMPANULACEAE A.L. de Jussieu 1789 (Bellflower Family) [in ASTERALES]

A family of about 80-82 genera and 2000-2400 species, mostly herbs, cosmopolitan. There is controversy about the circumscription of the family, specifically whether subfamily Lobelioideae should be recognized at the family level. References: Rosatti (1986)=Z; Eddie et al. (2003); Shulkina, Gaskin, & Eddie (2003); Lammers in Kadereit & Jeffrey (2007). [also see SPHENOCLEACEAE]

1 Corollas bilaterally symmetrical (zygomorphic); carpels 2; [subfamily Lobelioideae]......................................................................................1. Lobelia
2 Capsule dehiscent laterally (the pores nearly apical in some Campanula); flowers in spikes, racemes, or panicles; [mostly native species of various habitats (some of them weedy)].
3 Inflorescence spicate, the flowers sessile, mostly in the axils of well-developed leaves; corollas rotate and style straight.................................................................5. Triodanis
4 Flowers and fruits borne in an involucrate umbel (Jasione); [aliens, generally in weedy or disturbed situations].
5 Flowers large, 1 to few, solitary or nearly so; leaves large, ovate to elliptic; [Platyodonoid clade].................................................................2. Platyodon
6 Flowers small, several to many, borne in a diffuse inflorescence; leaves small, linear to narrowly elliptic; [Wahlenbergioid clade]...........................3. Wahlenbergia

1. Lobelia Linnaeus 1753 (Lobelia)

Identification notes: Vegetative Lobelia can be recognized by their milky sap, and the alternate leaves with obscure, whitish, callus-tipped, and often irregular or divergent teeth.

1 Corolla bright red (faded in dried specimens) or very rarely white, 30-45 mm long; filament-tube 19-33 mm long.....................L. cardinalis
CAMPANULACEAE

1 Corolla blue, purple, or white, 10-33 mm long; filament-tube 2-15 mm long.

2 Larger leaves in a basal rosette, either linear to linear-oblongate or orbicular, with a well-developed petiole; [plants generally of wetlands, often growing in shallow water, more rarely in dry or seasonally dry habitats].

3 Rosette leaf blades orbicular, broadly rounded at the base and the apex; stems trailing, rooting at nodes, mat-forming; [of FL] .......................................................... L. feuynana

3 Rosette leaf blades linear to linear-oblongate; stems erect.

4 Calyx segments with small auricles at the base; pedicels with very small bracteoles at the base; filament tube (6-) 7-9 (-11) mm long; corolla tube not fenestrate (lacking lateral slits); larger leaves 10-30 cm long; plants (5-) 8-10 (-15) dm tall .................................................. L. floridana

4 Calyx segments not auriculate; pedicels lacking bracteoles; filament tube 3-4.5 mm long; corolla tube fenestrate (with lateral slits); larger leaves 5-12 cm long; plants (4-) 5-6 (-13) dm tall .............................................................. L. paludosa

5 Larger leaves cauline; [collectively of a range of habitats].

6 Calyx not auriculate; pedicels with bracteoles near the base (or sometimes near the middle in L. puberula).

6 Calyx with prominent leafy auricles; pedicels with bracteoles near the middle.

7 Stems, leaves, hypanthium, and calyx glabrous (or with very few hairs); leaves usually < 1.5 cm wide; flowers 6-20; [WI, MB, ND, and WY, south to MS, LA, and TX] .............................................................. L. siphilitica var. ludoviciana

7 Stems, leaves, hypanthium, and calyx hirsute; leaves usually 2-6 cm wide; flowers usually > 20; [ME, ON, and MN, south to GA, AL, MS, AR] .............................................................. L. siphilitica var. siphilitica

8 Stems and leaves evidently short-pubescent throughout.

9 Stem densely short-hirsute; calyx lobes long-hirsute or villous, the lobes undulate-margined or crisped, 3-5 mm wide at base, and with large and broadly rounded basal auricles; lower and mid stem leaves ascending to appressed, the callous teeth oscure; [of the Coastal Plain and Piedmont] .......................................................... L. puberula var. puberula

9 Stem minutely puberulent; calyx lobes glabrous to sparsely short-pubescent, the lobes usually entire, 1.2-2 mm wide at the base, with or without prominent auricles; lower and mid stem leaves spreading to strongly ascending, the callous teeth prominent.

10 Leaves somewhat to strongly ascending, often short-piloise beneath; sinuses of calyx with prominent auricles; [mainly of sc. United States, east to AL] .............................................................. L. puberula var. mineola

10 Leaves spreading to somewhat ascending, glabrous or scabrous beneath; sinuses of calyx with small auricles; [Appalachian and south into the Gulf Coastal Plain] .......................................................... L. puberula var. simulans

8 Stems and leaves glabrous or glabrescent, sometimes sparsely hairy near the base of the plant.

11 Calyx lobes prominently glandular-toothed (not all lobes will be toothed; check several flowers) (ignore leafy bract at base of calyx).

12 Corolla pubescent on outside; calyx tube with pubescent-based translucent hairs, calyx lobes 4.5-8 mm long; leaves linear to lanceolate and < 3 cm; [flowering March-May] .......................................................... L. brevifolia

12 Corolla glabrous/glabrate on outside; calyx tube glabrous or hairy as above, calyx lobes 4-12 mm long; leaves linear to elliptical and > 3 cm (usually 4-15 cm); [flowering September-November].

13 Corolla lip glabrous basally; calyx glabrous, calyx lobes 6-12 mm long ............................................................... L. georgiana

13 Corolla lip densely pubescent basally; calyx tube with pubescent-based translucent hairs or not, calyx lobes 4-7 mm long ....

.......................................................... L. glandulosa

11 Calyx lobes smooth, without prominent glandular teeth (ignore leafy bract at base of calyx).

14 Leaves elliptic to lanceolate; calyx lobes 6-12 mm long; [of river shores and banks, small stream swamps, floodplains].

15 Flowers loosely arranged; anther tube 2.5-3.5 mm; [of Mountains and Piedmont, rarely lower Piedmont] .................. L. amoena

15 Flowers densely arranged; anther tube 4 mm long; [of Coastal Plain and lower Piedmont] ......................................... L. elongata

16 Leaves linear, occasionally lanceolate; calyx lobes 4.7-8 (-8) mm long; [of wet savannas and flatwoods, pitcher-plant bogs, seepage slopes, streamheads].

17 Corolla lip densely pubescent basally, corolla tube relatively densely pubescent within; corolla 19-27(-29) mm long; [of middle and outer Coastal Plain, mostly in wet savannas, flatwoods, pitcher-plant bogs] ........................................ L. glandulosa

17 Corolla lip glabrous basally, corolla tube glabrate; corolla 17-23 mm long; [endemic of NC-SC Sandhills region, mostly in wet streamheads and adjacent seepage slopes] ........................................ L. species 1

5 Flowers relatively small, the corolla (including the hypophyllium) 18-33 mm long, fenestrate (with a slit or window on each side of the tube near the base).

17 Plants creeping, rooting at the nodes, mat-forming; flowers solitary, axillary in the axis of leaves ......................................... L. chinensis

17 Plants erect or reeling, not rooting at nodes nor mat-forming; flowers several-many in bracteate terminal racemes.

18 Stem leaves very narrow, the largest on a plant 1-5 mm wide

19 Pedicels lacking bracteoles (but with subtending bracts); stem leaves subulate-filiform, < 0.5 mm wide; plant perennial from rhizomes, the stem often spongy-thickened toward the base .......................................................... L. boykinii

19 Pedicels bearing bracteoles near the base or middle (and also with subtending bracts); stem leaves linear to lanceolate, flat, 1-4 mm wide; stems not spongy-thickened.

20 Bracteoles borne near the middle of the pedicel; [of northern wetlands, south to WV and PA] ................................. L. kalmii

20 Bracteoles borne at the base of the pedicel; [collectively widespread in our area].

21 Lower lip of corolla pubescent inside at the base; corolla blue, lacking a white eye ........................................ L. canbyi

21 Lower lip of the corolla glabrous; corolla blue, with a white eye .......................................................... L. nutalli

18 Stem leaves broader, the largest on a plant > 10 mm wide.

22 Bracteoles borne near the middle of the pedicel .......................................................... L. flaccidifolia

22 Bracteoles borne at the base of the pedicel.

23 Stem long-hirsute, at least on the lower part of the stem; plant usually repeatedly branched (unless depauperate); hypanthium obovoid, almost as long as the corolla; hypanthium strongly inflated in fruit and including the capsule .......... L. inflata
23 Stems lacking hirsute hairs, either densely puberulent (at least below) or glabrous to glabrescent (with a few chaffy hairs on the lower stem); plant unbranched or with a few upright branches; hypanthium obconic, shorter than the corolla; hypanthium slightly inflated in fruit.

24 Stem glabrous to glabrescent (with a few chaffy hairs on the lower stem); leaf bases (all) clasping to rounded; flowers 10-15 mm long.

25 Calyx segments prominently ciliate-margined; basal auricles of the calyx segments prominent and declined, obscuring the corolla tube; plants to 9 dm tall........................................................................................................L. appendiculata

25 Calyx segments glabrous (rarely minutely ciliate); basal auricles of the calyx segments small, not declined and obscuring the corolla tube; plants to 5.5 dm tall........................................................................................................L. gattingeri

24 Stem densely puberulent, at least at the base; leaf bases petiolate to sessile (and then decurrent); flowers 7-12 mm long.

26 Leaves chiefly basal, the stem leaves < 5 and much smaller than the basal; [of s. PA south to SC, west to LA, especially on the Piedmont]........................................................................................................L. spicata var. scaposa

26 Leaves mainly on the stem, basal leaves absent or if present no larger than the stem leaves; [collectively widespread].

27 Calyx lobes with long, slender auricles, these often as long as the hypanthium; [of WV south]..........................

27 Calyx lobes lacking auricles or with these much shorter than the hypanthium.

28 Flowers 7-9 mm long, deep purplish-blue; anthers white; [south to NJ, DE, MD, WV, s. IN, and IL].............

27 Flowers 9-12 mm long, light blue to white; anthers pale bluish-gray; [south to GA]............L. spicata var. campanulata

28 Flowers 9-12 mm long, light blue to white; anthers pale bluish-gray; [south to GA]............L. spicata var. campanulata

Lobelia amoena Michaux. Southern Lobelia. Marshes, marshbanks, seeps, floodplain forests. Late July-October. W. NC and e. TN south through w. SC to c. GA and ec. AL; disjunct in FL Panhandle and Coastal Plain of GA and SC. Reported for VA by Kartesz (1999), supposedly on the basis of McVau (1936), but McVau does not record L. amoena for VA and no specimens have been seen from there. [= RAB, C, GW, S, Y; = L. amoena var. amoena – K, WH; < L. amoena – W]

Lobelia appendiculata Alphonse de Candolle. Pinelands, prairies, roadsides, usually in mesic or dry soils. AR and se. KS south to LA and TX; disjunct east of the Mississippi in c. AL, MS, and e. LA. [= GW, S, Y; = Lobelia appendiculata Alphonse de Candolle var. appendiculata – K]

Lobelia canbyi A. Gray, Canby’s Lobelia. Depression ponds, Carolina bays, pine savannas. July-November. NJ to GA in the Coastal Plain; disjunct in Coffee County (and three other counties), TN, and in Bartow County, GA, with other Coastal Plain plants. [= RAB, C, F, G, GW, K, S, Y]

Lobelia elongata Small. River and stream margins, floodplain forests, marshes, bogs, pine savannas. August-October. Primarily a Southeastern Coastal Plain endemic from DE to se. GA, rarely inland onto the lower Piedmont of NC and SC. [= C, F, G, GW, K, S, Y; < L. elongata – RAB]

Lobelia feasiana A. Gray, Bay Lobelia, Feay’s Lobelia. Open, moist areas. Ne. FL (Duval County) and e. Panhandle FL (Madsen and Taylor counties) south to s. FL. [= GW, K, S, WH, Y]

Lobelia flaccidifolia Small. Depression ponds, swampy woods along rivers and streams. June-September. E. GA south into Panhandle FL, west to sw. AL (and presumably s. MS); disjunct in sw. LA and c. TX. [= GW, K, S, WH; > L. halei Small – Y]

Lobelia floridana Chapman, Florida Lobelia. Wet pine savannas and flatwoods, depression ponds. S. GA (Jones & Coile 1988) and Panhandle FL west to LA; disjunct in se. NC? McVau (1936) reports this species for Wilmington, New Hanover County, NC, based on a collection by MacFarlane in 1909 (PENN). This record seems unlikely and needs confirmation; mislabeling is a possibility. [= GW, K, S, WH, Y]

Lobelia gattingeri A. Gray, Gattinger’s Lobelia. Calcareous glades. Endemic to sc. KY south through c. TN to n. AL. [= GW, S, Y; = Lobelia appendiculata Alphonse de Candolle var. gattingeri (A. Gray) McVau – K]

28 Flowers 9-12 mm long, light blue to white; anthers pale bluish-gray; [south to GA]............L. spicata var. campanulata

28 Flowers 9-12 mm long, light blue to white; anthers pale bluish-gray; [south to GA]............L. spicata var. campanulata

Lobelia elongata Small. River and stream margins, floodplain forests, marshes, bogs, pine savannas. August-October. Primarily a Southeastern Coastal Plain endemic from DE to se. GA, rarely inland onto the lower Piedmont of NC and SC. [= C, F, G, GW, K, S, Y; < L. elongata – RAB]

Lobelia feasiana A. Gray, Bay Lobelia, Feay’s Lobelia. Open, moist areas. Ne. FL (Duval County) and e. Panhandle FL (Madsen and Taylor counties) south to s. FL. [= GW, K, S, WH, Y]

Lobelia flaccidifolia Small. Depression ponds, swampy woods along rivers and streams. June-September. E. GA south into Panhandle FL, west to sw. AL (and presumably s. MS); disjunct in sw. LA and c. TX. [= GW, K, S, WH; > L. halei Small – Y]

Lobelia floridana Chapman, Florida Lobelia. Wet pine savannas and flatwoods, depression ponds. S. GA (Jones & Coile 1988) and Panhandle FL west to LA; disjunct in se. NC? McVau (1936) reports this species for Wilmington, New Hanover County, NC, based on a collection by MacFarlane in 1909 (PENN). This record seems unlikely and needs confirmation; mislabeling is a possibility. [= GW, K, S, WH, Y]

Lobelia gattingeri A. Gray, Gattinger’s Lobelia. Calcareous glades. Endemic to sc. KY south through c. TN to n. AL. [= GW, S, Y; = Lobelia appendiculata Alphonse de Candolle var. gattingeri (A. Gray) McVau – K]
**Lobelia georgiana** McVaugh. Swamps, floodplain forests, wet places. August-October. E. VA to Panhandle FL, inland to w. NC and e. TN. Very close to *L. elongata* and inhabiting apparently the same habitats; additional taxonomic work is desirable. See McVaugh (1940) for an explanation of the need to replace the name *L. glandulifera* with *L. georgiana*. [= C, F, G, GW; < *L. elongata* – RAB; = *L. amoena* Michaux var. *glandulifera* A. Gray – K, WH; = *L. glandulifera* (A. Gray) Small – S, Y; < *L. amoena* – W]

**Lobelia glandulosa** Walter. Seepage slopes, pitcher-plant bogs, streamhead margins, pine savannas, flatwoods, margins of beaver ponds. September-October. E. NC (or se. VA) to s. FL, west to s. AL. Prior reports from the Piedmont are erroneous, most referring to *L. elongata* and *L. georgiana*. [= RAB, C, F, G, GW, K, S, W, WH, Y]

**Lobelia homophylla** E. Wimmer. Just south of our area in FL (St Johns County) (Wunderlin & Hansen 2003). [= GW, K, S, WH, Y]

(neither keyed nor mapped)

**Lobelia inflata** Linnaeus, Indian-tobacco. Fields, meadows, gardens, open woodlands, disturbed areas. July-November. PE west to MN, south to GA, AL, se. MS, s. LA, s. AR, and se. OK. [= RAB, C, F, G, GW, K, S, W, Y; > *L. inflata* var. *inflata* – WV; > *L. inflata* var. *simplex* (Rafinesque) Millsbaugh – WV]

**Lobelia kalmii** Linnaeus, Kalm’s Lobelia. Calcareous swamps. July-September. NL (Newfoundland) and BC, south to PA, e. WV, OH, IL, and MN. [= C, F, G, K, Y]

**Lobelia nuttallii** J.A. Schultes, Nuttall’s Lobelia. Flatwoods, bogs, savannas. May-November. NY (Long Island) south to FL Panhandle on the Coastal Plain; less commonly disjunct inland to w. NC, w. SC, KY, and TN. [= RAB, C, F, G, GW, K, S, W, WH, Y]

**Lobelia paludosa** Nuttall, White Lobelia. Flatwoods, savannas, ditches, dune swales. March-May. Se. GA (Jones & Coile 1988) and FL Panhandle south to s. FL. [= F, GW, K, S, WH, Y]

**Lobelia puberula** Michaux var. *mineolana* F. Wimmer, Western Downy Lobelia. Forests, openings. W. KY, s. MO, and e. OK, south to s. AL, MS, LA, and e. TX. [= K; < *L. puberula* – C, G, GW, S; = *L. puberula* "form d" – Y]

**Lobelia puberula** Michaux var. *simulans* Fernald, Appalachian Downy Lobelia. Mt (GA, NC, SC, VA, WV), Pd (GA), Cp (GA): [habitats]; [abundance], common in WV. Late July-October. Sw. VA, s. WV, and IL south to n. FL, AL, MS, and LA. [= F; < *L. puberula* – RAB, C, G, GW, S, WH, Y; = *L. puberula* "form a" – Y]

**Lobelia siphilitica** Linnaeus var. *ludoviciana* A. DC., Western Great Blue Lobelia. Bottomlands, moist forests, ditches, wet meadows, streambanks. Late July-October. WI, MB, ND, and WY, south to MS, LA, and TX. [= C, F, G, GW, K, Y; < *L. siphilitica* – RAB, S]

**Lobelia siphilitica** Linnaeus var. *siphilitica*, Eastern Great Blue Lobelia. Bottomlands, moist forests, ditches, wet meadows, streambanks. Late July-October. ME, ON, and MN, south to GA, AL, MS, AR. [= C, F, G, GW, K, Y; < *L. siphilitica* – RAB, S, W]

**Lobelia species 1**, Batson’s Lobelia. Wet streamheads and seepage slopes. Endemic to the Sandhills Region of NC and SC. Under study by A. Bert Pittman. [= "L. batsonii" in prep.]

**Lobelia spicata** Lamarck var. *campanulata* McVaugh. [habitats]. S. ME west to MN, south to NJ, DE, MD, WV, s. IN, and IL. [= F, G, K, WV, Y; < *L. spicata* var. *spicata* – C; < *L. spicata* – W]
2. **Lobelia** Lamarck 1805 (Lobelia)  

*Lobelia spicata* Lamarck var. *spicata*. Meadows, woodlands, disturbed areas. Late May-August. ME and NB west to ND, south to PA and AR, and in the mountains to n. GA. [= F, G, K; < *L. spicata* var. *spicata* – C; < *L. spicata* – RAB, GW, W; > *L. spicata* – S; > *L. bracteata* Small – S; = *L. spicata* var. *originalis* – Y]

2. **Platycodon** Alphonse de Candolle 1830 (Japanese Bellflower, Balloonflower)  

*Platycodon grandiflorum* (Jacquin) Alphonse de Candolle, Japanese Bellflower, Balloonflower. Ditches, disturbed areas, spread from horticultural cultivation; native of e. Asia. [= RAB, K, Z]

3. **Wahlenbergia** Schrader ex Roth 1821 (Wahlenbergia)  

*Wahlenbergia linarioides* (Lamarck) Alphonse de Candolle. Disturbed areas; native of s. South America. [= K] {add Z synonymy}

*Wahlenbergia marginata* (Thunberg) Alphonse de Candolle. Sandy soils along roadsides and in fields; native of e. Asia and Oceania. February-December. Apparently only recently introduced in se. United States, the earliest recorded date 1937 in Alachua County, FL (Rosatti 1986), but now quite common on sandy roadsides. [= RAB, K, Z]

4. **Jasione** Linnaeus 1753 (Sheep's-bit)  

5. **Triodanis** Rafinesque 1838 (Venus's Looking-glass)  
A genus of 6-8 species, annual herbs, of America. References: McVaugh (1945)=Z; McVaugh (1948); Lammers in Kadereit & Jeffrey (2007). Key based on Z.

1 Openings of the capsule linear, 0.2-0.4 mm wide; seeds minutely tuberculate in longitudinal lines; [sw. TN westward]......................*T. holzingeri*

1 Openings of the capsule broadly elliptic, oval, or rounded, 0.5-1.5 mm wide; seeds either muriculate over the entire surface or nearly to quite smooth; [collectively more widespread].

2 Pores at or very near the apex of the capsule; seeds smooth and highly polished; open (chasmogamous) corolla usually 1 (the terminal), the others usually closed (cleistogamous)......................................................................................................................................................................................*T. biflora*

2 Pores well below the apex of the capsule (usually 1-1.5 mm below), usually about midway between apex and base; seeds muriculate or smooth and lustrous; open (chasmogamous) corollas usually several........................................................................................................................................................................*T. perfoliata*
**Triodanis biflora** (Ruiz & Pavón) Greene. Roadsides, gardens, glades, disturbed areas. April-June. E. VA, KY, KS, AZ, and OR, south c. peninsular FL and Mexico; South America. [= C, K, WH, Z; = Specularia biflora (Ruiz & Pavón) Fischer & C.A. Meyer – RAB, F, G; = T. perfoliata var. biflora (Ruiz & Pavón) Bradley – W]

**Triodanis holzingeri** McVaugh. {habitats} MO west to CO, south to sw. TN, AR, TX, and NM. [= K, Z; = Specularia holzingeri (McVaugh) Fernald – F]

**Triodanis perfoliata** (Linnaeus) Nieuwland. Roadsides, gardens, glades, dry forests, disturbed areas. April-June. ME and BC south to c. peninsular FL and Mexico; West Indies; Ecuador. [= C, K, Z, WH; = Specularia perfoliata (Linnaeus) Alphonse de Candolle – RAB, F, G, WV; = T. perfoliata var. perfoliata – W]

---

6. **Campanula** Linnaeus 1753 (Bellflower)

A genus of about 300-425 species, herbs (rarely shrubbery), north temperate, most diverse in s. Europe. The appropriate circumscription remains uncertain and controversial, and related genera are sometimes combined into a broadly circumscribed *Campanula*, or alternately, several segregates recognized (*Campanula*, *Rapunculus*, *Campanulastrum*, etc.). A broad circumscription is adopted here, based on considerations discussed in Roquet et al. (2008). Park et al. (2006) propose splitting *Campanula* into a number of segregates, a suggestion which also has some merits; if followed, most or all of our species would likely be placed in the genus *Rapunculus*. References: Roquet et al. (2008); Park et al. (2006); Rosatti (1986) = Z; Shetler & Morin (1986); Shetler (1982) = Y; Shulkina, Gaskin, & Eddie (2003); Lammers in Kadereit & Jeffrey (2007).

1 Corolla rotate
2 Stem erect; leaf obviously serrate or crenate; [of FL and northward, of uplands] .......................... *C. americana*
1 Corolla campanulate:
2 Stems weak and slender, reclining, 3-angled.
4 Corolla 4-10 mm long; pedicels divergent, the bractless portion 0.4-4 cm long; corolla white to very pale blue ............ *C. aparinoide var. aparinoide*
4 Corolla 5-13 mm long; pedicels ascending, the bractless portion 1-8 cm long; corolla pale blue ........... *[C. aparinoide var. grandiflora]*
3 Stems more robust, erect, terete or nearly so.
5 Flowers on long pedicels (generally longer than 40 mm long), the inflorescence a diffuse panicle; [native species of rock outcrops or rocky woodlands].
6 Corolla 6-8 mm long; leaves lanceolate, averaging about 1 cm wide, generally with prominent, often somewhat divergent teeth........ ...... *C. divaricata*
6 Corolla 12-20 mm long; leaves (of the stem) linear, averaging < 5 mm wide, generally lacking teeth (or the teeth minute and obscure) ................................................................. *C. rotundifolia*
5 Flowers mostly on short pedicels (the upper < 5 mm long), the inflorescence a raceme; [alien species usually of disturbed areas].
7 Capsules with pores in the apical half ................................................................. *C. persicifolia*
7 Capsules with pores at or near the base ................................................................. *C. rapunculoides*

**Campanula americana** Linnaeus, Tall Bellflower. Moist to fairly dry forests, especially over mafic or calcareous rocks. Late June-September; August-October. NY, ON, MN, and SD, south to Panhandle FL, LA, and OK. Shetler & Morin (1986) stated that "Small's view [segregating *Campanula americana* into the monotypic genus *Campanulastrum*] appears to have increasing justification from palynological, cytological, and now seed evidence." Also recently supported as a genus by Shulkina, Gaskin, & Eddie (2003), but combined into *Campanula* by Lammers in Kadereit & Jeffrey (2007) and Roquet et al. (2008). [= RAB, C, F, G, W, WH, Z; = Campanulastrum americanum (Linnaeus) Small – K, S; *Rapunculus*]

**Campanula aparinoide var. aparinoide**, Marsh Bellflower. Bogs, marshes, wet meadows, seepage slopes over mafic or calcareous rocks. Late June-August; August-September. Widespread in ne. North America, south to ne. GA (Jones & Coile 1988), KY, MO, and NE. [= C, G; < C. aparinoide – RAB, K, W, Z; = C. aparinoide – F, S]

**Campanula aparinoide var. grandiflora** Holzinger ranges south to PA. It should be sought in our area. It has been variously treated as a species, variety, geographic phase, or form; its taxonomic status is uncertain. [= C, G; < C. aparinoide – K; = C. uliginosa Rydberg – F] {not mapped}
**Campanula divaricata** Michaux, Southern Harebell, Appalachian Bellflower. Rock outcrops, cliffs, rocky summits, talus, up to at least 1850m. July-October; September-December. A broad endemic of the Southern and Central Appalachians: MD and KY south to AL and GA. [= RAB, C, F, G, K, W, Z; = *C. flexuosa* Michaux – S; *Rapunculus*]

**Campanula floridana** S. Watson ex A. Gray, Florida Bellflower. Cypress ponds, depressions marshes, wet prairies. March-May. Ne. FL and Panhandle FL south to s. peninsular FL. [= GW, K, WH; = *Rotantha floridana* (S. Watson ex A. Gray) Small – S]

* Campanula persicifolia Linnaeus, Peachleaf Bellflower. Naturalized from gardens; native of Eurasia. This species was reported by Small (1933) as “escaping from gardens” in w. NC; no specimens have been seen to document this occurrence. Additional documentation is needed to confirm this record. [= RAB, K, S; = *Rapunculus persicifolius* (Linnaeus) Fournier; = *Neocodon persicifolius* (Linnaeus) A.A.Kolakovski & L.B.Serdyukova]

**Campanula rotundifolia** Linnaeus, Bluebell, Harebell, Bluebell-of-Scotland. Limestone outcrops, high elevation rocky summits (in thin soil over amphibolite). July-August; August-September. A circumboreal species, widespread and common in n. North America and n. Eurasia, south to nw. NC, TN, MO, TX, NM, AZ, and CA. In our area rare, and generally limited to limestone in its occurrences in the Central Appalachians of WV and VA and to mafic rocks in nw. NC. It was added to the flora of NC in 1991 (Three Top Mountain, Ashe County). See Shetler (1982) for a detailed study of the species. [= C, F, G, K, Y, Z; *Rapunculus*]

**397. MENYANTHACEAE** Dumortier 1829 (Buckbean Family) [in ASTERALES]

A family of about 5 genera and 40 species, wetland herbs, of cosmopolitan distribution. References: Wood (1983a)=Z.

1 Leaves trifoliolate; inflorescence a raceme......................................................................................................................................................................................................................................................**Menyanthes**

1 Leaves simple; inflorescence an umbel..........................................................................................................................................................................................................................................................**Nymphoides**

**Menyanthes** Linnaeus 1753 (Buckbean, Bogbean)

The genus is monotypic, an herb, circumboreal. References: Wood (1983a)=Z

**Menyanthes trifoliata** Linnaeus, Buckbean, Bogbean. Mucky soils of mountain bogs at high elevations over amphibolite (in the Blue Ridge), boggy marshes over calcareous rocks (in the Ridge and Valley), seepage swamps (in the Coastal Plain). May-June. This circumboreal species is widespread in n. North America and n. Eurasia, ranging south in North America to NJ, DE, w. VA, IN, MO, and CA, and disjunct to Long Hope Valley, Watauga County, NC. The NC populations are disjunct about 400 km from the next nearest populations in VA and WV. McDowell (1984) reported the first documentation of the species for NC. [= C, G, K, W, WV, Z; > *M. trifoliata* var. minor Rafinesque – F]
MENYANTHACEAE

Nymphoides Séquier 1754 (Floating Heart)

Identification notes: As the scientific name indicates, the leaves of Nymphoides bear a superficial resemblance to those of Nymphaea. The leaves of Nymphoides are more cordate, the two basal lobes more rounded, rather than having a rather sharp corner or angle. Nymphoides cordata has much smaller leaves than Nymphaea; while the thickly pebbled texturing of Nymphoides aquatica is very unlike the glossy smoothness of Nymphaea.

1 Flowers yellow; floating stems usually with multiple leaves; capsules 12–25 mm long ................................................................. N. peltata
1 Flowers white; floating stems with single leaves; capsules 3–14 mm long.

2 Adaxial petal surface bearing a ruffled crest down its length in the middle ......................................................................................... N. cristata
2 Adaxial petal surface not crested.

3 Leaves 5–15 cm wide, roughly pebbled below, thick in texture; stems 1.3–2.5 mm in diameter a few cm below the inflorescence, with conspicuous red spots; tuberous roots of floating clusters stout, blunt-tipped; seeds conspicuously papillate; capsule 10–14 mm long .................................................. N. aquatica
3 Leaves 3–7 cm wide, smooth below, thin in texture; stems 0.6–0.9 mm in diameter a few cm below the inflorescence, rarely spotted with red; tuberous roots of floating clusters slender, with pointed tips; seeds smooth (rarely papillate); capsule 4.5 mm long............ N. cordata

Nymphoides aquatica (Walter ex J.F. Gmelin) Kuntze, Big Floating Heart, Banana Floating Heart. Limesink ponds (dolines), other acidic and nutrient-poor water-filled depressions, sluggish streams, beaverponds, primarily in the Outer and Middle Coastal Plain. Late April–September. A Southeastern Coastal Plain endemic: NJ south to FL and west to TX. [= RAB, C, F, GW, K, S, Z; = N. aquaticum – G, orthographic variant]

Nymphoides cordata (Elliott) Fernald, Little Floating Heart. Upland depression ponds, sluggish streams, beaverponds, primarily in the fall-line Sandhills. NL (Newfoundland) and ON south MD; disjunct in the Coastal Plain of NC and SC; disjunct from sw. GA and Panhandle FL west to e. LA. [= RAB, C, F, GW, K, Z; = N. cordatum – G, orthographic variant; ? N. lacunosa (Ventenat) Kuntze – S, misapplied]

* Nymphoides cristata (Roxburgh) Kuntze, Crested Floating Heart, Water Snowflake. Ponds and lakes; native of China and India. Apparently first naturalizing in North America in FL in 2000; introduced for water gardens and aquariums, and considered a noxious aquatic weed in our area.

* Nymphoides peltata (S.G. Gmelin) Kuntze, Yellow Floating Heart. Ponds; native of Europe. This European native is sparingly naturalized in e. North America; it is sold for cultivation in water gardens, and will likely become more widely naturalized. [= C, F, K; = N. peltatum – G, orthographic variant]

398. GOODENIACEAE R. Brown 1810 (Goodenia Family) [in ASTERALES]

Scaevola Linnaeus 1771 (Fanflower, Half-flowerr, Scaevola)

Scaevola plumieri (Linnaeus) Vahl, Beachberry, Inkberry, Gull-feed. Coastal dunes, marsh edges. January–December. N. peninsular FL south to s. FL; s. LA; s. TX south through Mexico into Central and South America; West Indies. [= K, S, WH]

399. CALYCERACEAE R. Brown ex Richard 1820 (Calycera Family) [in ASTERALES]

A family of 4 genera and ca. 60 species, perennial and annual herbs, endemic to s. South America. References: Hellwig in Kadereit & Jeffrey (2007).

Acicarpa Antoine Laurent de Jussieu

* Acicarpha tribuloides* Antoine Laurent de Jussieu, Madam Gorgon. On ship’s ballast near old port-cities; probably no longer present, native of South America (Brazil, Uruguay, Paraguay, and Argentina). The NC and SC records were both collected by Gerald McCarthy in 1888; though the localities are not specified, the likely sites (based on his itinerary and what is known of the species) are Wilmington (New Hanover County, NC) and Charleston (Charleston County, SC). DeVore (1991) discusses ballast plants and the apparent failure of *Acicarpha* to naturalize in North America. This species has not been collected in our area (or North America) since 1888; it is here treated for historical interest and to increase the likelihood that it will be relocated, if it is, indeed, actually naturalized. [= K, S, WH, Z]

**Key A – shrubby composites**

1 Leaves opposite or whorled, at least on the lower stem nodes (the leaves higher on the stem sometimes alternate).  
2 Heads discoid or disciform.  
3 Rays yellow, orange, or red (sometimes with some brown, maroon, or purple coloration as well) 
4 Rays white, cream-colored, or pale pink or lavender.  
5 Heads liguliflorous (composed of ligulate florets); sap usually milky.  
6 Heads discoid, disciform, radiant, or radiate; sap usually clear.  

**Key B – herbaceous composites with opposite or whorled leaves**

1 Leaves opposite, at least on the lower stem nodes (the leaves higher on the stem sometimes alternate); [tribe Asteroliae].  
2 Heads discoid; shrubs to 5 m tall; [widespread in our area]  
3 Heads radiate.  
4 Rays yellow, orange, or red (sometimes with some brown, maroon, or purple coloration as well).  
5 Heads solitary, axillary in the axis of leaves or leafy bracts; heads nodding, the involucre 2-7 mm high; [collectively widespread in our area, of maritime and inland wetlands or moist disturbed areas]; [tribe Heliantheae; subtribe Ambrosiinae]  
6 Leaves with punctate glands; pappus of 60-70 barbellate bristles, 8-12 mm long; [tribe Heliantheae; subtribe Eupatoriae].  

**Key F – under construction**

**Identification notes:** {define liguliflorous, discoid, disciform, radiant, and radiate heads; define various pappus characters. Define calyculus. Define palea and phyllary}
1 Disc florets yellow.

2

Acmeilla
Flaveria
Pulicaria
Dittrichia
Inula

1 Disc florets white, pink, purplish.

2

Ambrosia
Xanthium
Iva
Cyclachaena
Melanthera
Lagasea
Palafoxia
Eupatorium
Eutrochium
Conoclinium
Ageratum
Brickellia
Hartwrightia
Fleischmannia
Chromolaena
Mikania
Chevreulia
Sclerolepis

Key C – herbaceous composites with opposite leaves and radiate heads, the rays predominantly yellow, orange, or red

Key D – herbaceous composites with opposite leaves and radiate heads, the rays predominantly white, cream or pale lavender or pink

Key E – herbaceous composites with leaves alternate or basal, liguliflorous heads (composed of ligulate florets), and sap usually milky

1 Cypselas (at least of the inner florets of the head) beaked.

2 Heads solitary and terminal at the end of a stem unbranched to its base.

3 Leaves basal and cauline, grasslike (untoothed and unlobed); stem leafy ................................................................. Tragopogon

3 Leaves basal only, variously toothed to pinnately lobed; stem scapiform (leafless).

4 Pappus of bristles ............................................................................................................................................................ Taraxacum

4 Pappus either of outer scales and inner bristles or entirely of aristate scales.

5 Pappus of outer scales and inner plumose bristles; leaves oblong to oblanceolate; plants annual or perennial .............. Leontodon

5 Pappus of aristate scales; leaves linear to narrowly lanceolate; plants annual ............................................................. Uropappus

2 Heads several per stem, in various corymbiform, umbrelliform, spiciform, or paniculiform arrays (rarely solitary and terminal in the smallest and most depauperate individuals in a population.

6 Achenes distinctly flattened ........................................................................................................................................ Lactuca

6 Achenes terete or prismatic.

7 Pappus of plumose bristles, at least the inner series; plant an annual or biennial.

8 Receptacles lacking paleae ........................................................................................................................................ Helminthotheca

8 Receptacles with paleae ........................................................................................................................................ Hypochaeris

7 Pappus of simple capillary bristles; plant an annual, biennial, or perennial.

9 Beak of the cypsela with a ring of soft white reflexed hairs at the summit (just below the pappus) ................................. Pyrrhopappus

9 Beak of the cypsela lacking a ring of hairs as described.

10 Pappus of 80-150 barbellulate bristles; plant an annual or biennial ........................................................................ Crepis

10 Pappus either of 40-50 (or more) smooth bristles or of 20-30 barbellulate bristles; plant a perennial ........................... Chondrilla

11 Pappus of 40-50 (or more) smooth bristles ........................................................................................................... Ixeris

11 Pappus of 20-30 barbellulate bristles .......................................................................................................................Chondrilla

1 Cypselas beakless.

12 Leaves basally disposed (stem leaves few or none generally smaller in size than the basal leaves, which are persistent into flowering and fruiting); corollas yellow, orange, or red.

13 Pappus absent or of both scales and barbellulate bristles ....................................................................................... Krigia

13 Pappus of bristles only (these barbellulate or plumose).

14 Pappus of plumose bristles (these somewhat flattened at their bases) ................................................................. Oporinia
14 Pappus of barbulate bristles.
15 Leaves with entire margins; plants perennials, either from long to short rhizomes or from a short caudex with fibrous roots... Hieracium

15 Leaves coarsely toothed or pinnately lobed; plants annuals, from a taproot.
16 Involucr 5-12 mm high; achenes usually > 2.5 mm long; pappus bristles distinct, 3-7 mm long... Crepis
16 Involucr 3-5 mm high; achenes 1.5-2.5 mm long; pappus bristles basally connate, 2.5-3.5 mm long... Youngia

12 Leaves basal and cauleine (plant often beginning with a basal rosette, but by flowering bearing well-developed stem leaves as large as the basal leaves, the basal rosette often withering prior to flowering and fruiting); corollas yellow, orange, red, blue, pink, white, or lavender.
17 Pappus absent or of scales.
18 Corollas pale blue (rarely pink or white).......................... Cichorium
19 Corollas yellow (rarely orange).
19 Stem winged and spiny; leaves spiny-margined; receptacle with paleae.......................... Scolymus
19 Stem not winged or spiny; leaves not spiny-margined; receptacle lacking paleae.
20 Cypselas 1.2-2.8 mm long; heads borne single at the ends of scapiform stems that are unbranched (rarely few-branched near the base); plants to 7 dm tall.......................... Krigia
20 Cypselas 3-5 mm long; heads borne in corymbiform or thyrsiform arrays; plants to 15 dm tall.......................... Lapsana

17 Pappus of numerous smooth or barbulate bristles.

Key G

Acanthospermum Schrank 1820 (Paraguay Bur)

A genus of about 6 species, herbs, of tropical America. References: Strother in FNA (2006c); Cronquist (1980)=SE.

1 Stems erect and rooting at the nodes; bur 7-9 mm long, slightly compressed, strongly 5-7-ribbed ........................................ A. australis
1 Stems erect; bur 2-6 mm long, obviously compressed, obscurely ribbed or 3-ribbed.
2 Leaves (2-) 4-12 (-15) cm long, sessile or subsessile; bur with prickles on all surface ........................................ A. hispidum
2 Leaves 1-3 (-4.5) cm long, petiolate, the petiole 4-18 mm long; bur unarmed or nearly so on the side faces, the prickles along the ribs and around the tip ................................................................. A. humile

Achillea Linnaeus 1753 (Yarrow, Milfoil, Thousand-leaf)

1 Leaves pinnately dissected into linear segments; [section Achillea].......................... A. millefolium
1 Leaves serrate to almost entire; [section Patrina].............................................................. A. ptarmica

Achillea millefolium Linnaeus, Yarrow, Thousandleaf. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): grassy balds, roadsides, disturbed areas; common (rare in FL). April-November. Circumboreal (as here broadly treated). A taxonomically very complex entity, with races of different ploidies, and apparently both introduced and native genotypes in e. North America. It would be desirable to treat the variation, but a workable treatment has not yet been produced. Ramsey, Robertson & Husband (2008) have recommended treating native North American races as A. borealis, but it is not clear what (if any) eastern North American races are native. [= RAB, FNA, SE; > A. millefolium ssp. millefolium – C, G; > A. borealis – Y].
ASTERACEAE

* Achillea filipendulina Lamarck, Fern-leaf Yarrow. Cp (DE): {habitats}; uncommon. [= FNA, K] {not yet keyed; add to synonymy}

Acmella L.C. Richard ex C.H. Persoon 1807 (Spotflower)

A genus of about 30 species, herbs, primarily of tropical distribution. References: Jansen (1985)=Z; Strother in FNA (2006c); Cronquist (1980)=SE.

1 Leaves linear to lanceolate; petioles 2-4.5 mm long; outer series of phyllaries narrowly to broadly ovate, the apex acute; heads radiate or discoid................................................................. A. pusilla

1 Leaves narrowly to broadly ovate; petioles (3-) 5-43 mm long; outer series of phyllaries lanceolate, the apex acuminate; heads radiate or discoid ................................................................. A. repens

* Acmella pusilla (Hooker & Arnott) R.K. Jansen, Argentine Spotflower. Cp (FL, GA, NC, SC): lawns, disturbed areas (especially around old seaports); rare, native of South America. May-September. Known from scattered locations in the se. United States (NC, SC, GA, FL), associated with old seaports, such as Wilmington, NC, Savannah, GA, Pensacola and Apalachicola, FL, and perhaps not well-established at some of the reported locations. Reported as naturalized and “locally common” at a site in Chatham County, GA (Carter, Baker, & Morris 2009). [= FNA, K, WH, Z]

* Acmella repens (Walter) L.C. Richard in Persoon, Creeping Spotflower. Cp (FL, GA, NC, SC), Pd (NC, SC): floating vegetation mats, road sides, streambanks, other moist, open habitats; common (uncommon in GA, rare in NC, SC). July-December. Se. NC south to s. FL, west to e. TX, north in the Mississippi Embayment to w. TN and s. MO. Jansen (1985) treats this as var. repens of A. oppositifolia, the typic var. oppositifolia widely distributed from c. Mexico south through Central America into n. South America, stating that var. repens “can be easily separated from var. oppositifolia by its lanceolate, acuminate phyllaries and short double hairs on the achene margins.” Jansen also states that “four factors have caused extreme difficulties in delimiting taxa at the specific and infraspecific level within this group: very close morphological similarity; polyploidy; hybridization, especially between different ploidy levels; and asexual reproduction.” In his more statistical taxonomic analyses, his var. repens (tetraploid, and the only taxon out of 39 native to North America) separates rather well from A. oppositifolia (diploid, tetraploid, and hexaploid). Given the morphological distinctiveness and substantial allopatry of the two taxa, I prefer not to associate this taxon as a variety of the complex A. oppositifolia. [= FNA; = Spilanthes americana (Mutis ex Linnaeus f.) Hieronymus var. repens (Walter) A.H. Moore – RAB, F; < Spilanthes americana – C, G, GW, S, SE; = Acmella oppositifolia (Lamarck) R.K. Jansen var. repens (Walter) R.K. Jansen – K, WH, Z]

Acr rop tin um Cassini 1827 (Russian Knapweed)

* Acr rop tinum repens (Linnaeus) de Candolle, Russian Knapweed. Reported for VA (FNA), but there is apparently no documentation for its occurrence there; this serious invasive weed is widespread in western North America, east to OH, KY, and AR. [= FNA, K; = Centaurea repens Linnaeus – C, F, G; = Rhaponticum repens (Linnaeus) Hidalgo – Z]

Ageratina Spach 1847 (Milk-poison, White Snakeroot)

A genus of about 250-290 species, American. The separation of Ageratina from Eupatorium is clearly warranted, on morphological, karyological, and molecular grounds. References: Nesom in FNA (2006c); Clewell & Wooten (1971)=Z; Cronquist (1980)=SE. Key based in part on Z and SE.

1 Leaves subcoriaceous in texture; leaves crenate or crenate-serrate; leaf blades 3-7 (-10) cm long, 2-5 cm wide; [primarily of xeric or submesic sites].

2 Larger leaf blades >5× as long as the petiole; leaf margins crenate; corolla lobes densely long-pubescent; achenes glabrous; [widespread in our area] ................................................................. A. aromatica

2 Larger leaf blades (1-) 2-4× as long as the petiole; leaf margins crenate, dentate, or incised; corolla lobes glabrous or sparsely short-pubescent; achenes usually short-pubescent, at least near the apex; [of e. GA southward] ................................................................. A. jucunda

1 Leaves membranaceous in texture; leaves serrate or coarsely dentate; leaf blades 6-18 cm long, 3-12 cm wide (at least the larger on a given plant usually more 8 cm long); [primarily of mesic sites].

3 Leaves delicately membranaceous, coarsely dentate; larger leaf blades 1.0-1.4× as long as the petiole; [of seepage and waterfall splash zones associated with sandstone rockhouses and cliff bases] ................................................................. A. luciae-brauniae

3 Leaves membranaceous, of a "typical" herbaceous character, coarsely serrate; larger leaf blades 1.4-5× as long as the petiole; [of a wide variety of mesic habitats, especially moist forests and forest openings].
A genus of about 44 species, herbs, of tropical America. References: Nesom in FNA (2006c); Cronquist (1980)=SE. Key based in part on SE.

1 Peduncles with short and long non-glandular hairs; phyllaries glabrous to sparsely pubescent with non-glandular hairs..............A. conyzoides
1 Peduncles with short and long hairs, many of them glandular; phyllaries stipitate-glandular and sparsely pubescent with non-glandular hairs......

....................................................A. houstonianum

**Amblyolepis** A.P. de Candolle 1836 (Huisache-daisy)

**Ambrosia** Linnaeus 1753 (Ragweed)

1 Leaves either unidimed, with 2 lateral teeth, or palmately 3-5-lobed.
2 Leaves sessile to clapping, 2.5-7 cm long, undivided, with 2 teeth near the base -----------------------------------------> A. bidentata
2 Leaves petiolate, 7-30 cm long, (1-3) 3 (5) lobed.......................................................................................... A. trifida var. trifida

1 Leaves 1- to 2-pinnatifid.
3 Annual, with fibrous roots; fruiting involucre with short, sharp spines ........................................................................ A. artemisiifolia
3 Perennial, with deep-seated, creeping roots; fruiting involucre with bumps.................................................................. A. psilostachya

**Ambrosia bidentata** Michaux. Pd (VA), Mt (GA, NC, WV); [SC]: mafic woodlands; uncommon (rare in WV). August-November. CT, NY, and MN south to Panhandle FL and TX. Widely scattered throughout TN, east to e. TN (Chester, Wofford, & Kral 1997) and in nw. GA (Jones & Coile 1988). [= RAB, C, FNA, G, K, S, SE]

**Ambrosia psilostachya** A.P. de Candolle, Perennial Ragweed. Cp (FL, GA, NC, SC), Pd (VA): loamy sandy soil of flats and slight depressions in periodically burned longleaf pine uplands, also in disturbed areas; uncommon. September-November. MI west to MT, south to LA and NM; also scattered along eastern seaboard states (ME, NH, NY, NC, SC, GA, FL), where perhaps some of the distribution is adventive. Apparently first collected in VA in 2000. [= C, FNA, G, K, SE, WH; > A. psilostachya – RAB; > A. regelii Rydberg – RAB, S; > A. psilostachya var. coronopifolia (Torrey & Gray) Farwell – F]

**Ambrosia sp. 1.** Glade Ragweed. Under investigation by P. McMillan and colleagues at CLEMS. [not yet keyed]

**Ampelaster** Nesom 1995 (Climbing-aster)

**Amphiachyris** (A.P. de Candolle) Nuttall 1840 (Broomweed)

* **Amphiachyris drucunculoides** (A.P. de Candolle) Nuttall, Prairie Broomweed, Broom Snakeroot. Mt (VA), Cp (SC): disturbed areas over calcareous rocks, wool-combing mill wai (Nesom 2004d); rare, presumably adventive from further west. August-September. This species is common and weedy in disturbed cedar glade habitats in the Nashville Basin of e. TN, where apparently native (Chester, Wofford, & Kral 1997). [= FNA, K, S; = Gutierrezia drucunculoides (A.P. de Candolle) Blake – F, G, SE; = Xanthocephalum drucunculoides (A.P. de Candolle) Shinners]

**Anaphalis** A.P. de Candolle 1838 (Pearly-everlasting)

A genus of about 35 to 110 species, herbs, of tropical and temperate areas, with a center of diversity in Asia. References: Nesom in FNA (2006a); Arriagada (1998)=Z; Cronquist (1980)=SE.

**Anaphalis margaritacea** (Linnaeus) Bentham & Hooker f., Pearly-everlasting. Mt (NC*, VA, WV), Pd (DE, VA): dry open places, probably persistent from cultivation in NC, seemingly native in DE and VA; uncommon (rare in DE, NC, and VA). July-September. Interruptedly circumboreal, in North America from NL (Labrador) and NL (Newfoundland) west to AK, south to NC, TN, OK, TX, NM, CA, and Baja California. Very abundant and weedy in large parts of n. and w. North America, sometimes grown for ornament (especially dried arrangements) in our area. [= C, FNA, G, K, S, SE, W, Z; > A. margaritacea var. angustior (Miquel) Nakai – F; > A. margaritacea var. intercedens Hara – F]

**Antennaria** Gaertner 1791 (Pussytoes)
A genus of about 70 species, herbs, of temperate and subtropical areas. Of our species, *A. neglecta, A. solitaria, A. virginica,* and *A. plantaginifolia* are sexual diploids. *A. parlinii* is of multiple hybrid origin, includes sexual and asexual populations, and is derived from *A. plantaginifolia, A. racemosa,* and *A. neglecta* (Bayer 1985). For reasons discussed in Bayer & Stebbins (1982) and parallel to those applied in this work to allopolyploid taxa in *Eupatorium,* the treatment of Bayer (1985) and Bayer & Stebbins (1993, 1982) is preferable to Cronquist's treatments, used in most of the floras covering or approaching our area. Much remains to be learned about the relative habitats and distributions of the various taxa in our area. References: Bayer in FNA (2006a); Bayer & Stebbins (1993)=Z; Bayer & Stebbins (1982)=Y; Arriagada (1998)=X; Cronquist (1980)=SE; Bayer (1985); Bayer & Stebbins (1987); Bayer (1984). Key closely adapted from Z, Y.

1 Flowering stalks with 1 head.......................................................... *A. solitaria*
2 Flowering stalks with 2 or more heads:
   3 Pistillate involucres 5-7 mm high; pistillate corollas 3-4 mm high; staminate corollas 2-3.5 mm high; basal leaves tomentose on the upper surface; young stolons mostly ascending; staminate and pistillate plants equally common ........................................... *A. plantaginifolia*
   4 Basal leaves glabrous or nearly so on the upper surface (even when young); summit of young cauline stem usually glandless....................

2 Basal leaves prominently 1-nerved (sometimes with 2 additional obscure veins), mostly < 1.5 cm wide.
5 Young and mature basal leaves glabrous on the upper surface; phyllary tips whitish; flags (flat scarious appendages similar to the tips of phyllaries on the tip of the leaf) present on the upper cauline leaves; species apomictic, populations consisting of pistillate plants only...

5 Young basal leaves pubescent on the upper surface, mature leaves either remaining pubescent or becoming glabrous with age; phyllary tips white, ivory, to light brown; flags present or absent on the upper cauline leaves; species apomictic or sexual.
6 Largest basal leaves < 6.0 mm wide and < 20 mm long; pistillate involucres 4.5-7 mm high; species sexual, populations consisting of both pistillate and staminate plants; [of shale barrens from w. VA northward and westward]................................. *A. virginica*
7 Largest basal leaves > 6.0 mm wide and > 20 mm long; pistillate involucres 7-10 mm high; species apomictic or sexual; [collectively of various habitats and more widespread].
8 Middle and upper cauline leaves tipped with flags; mature basal leaves glabrous, young basal leaves pubescent, glabrescent with age; species sexual, populations consisting of both pistillate and staminate plants................................................................. *A. neglecta*
9 Middle and upper cauline leaves blunt or with subulate tips (onl y those leaves immediately around the corymb with flags); mature and young basal leaves pubescent; species apomictic, populations consisting of pistillate plants only.

8 Basal leaves oblanceolate, lacking a distinct petiole; stolons mostly 8-12 cm long, with leaves along the stolon smaller than those of the terminal rosette.............................................................................. *A. howelli ssp. howelli*
9 Basal leaves oblanceolate, lacking a distinct petiole; stolons mostly 8-12 cm long, with leaves along the stolon smaller than those of the terminal rosette.............................................................................. *A. howelli ssp. neodioica*

**Antennaria howelli** Greene ssp. *canadensis* (Greene) Bayer. Mt (VA): dry woodlands; rare? NL (Newfoundland) wet to YT, south to VA, WV, OH, IN, and MN. [=FNA, K, Z; = *A. neglecta* Greene var. *canadensis* (Greene) Cronquist – C; = *A. canadensis* Greene – F; = *A. neglecta* Greene var. *randii* (Fernald) Cronquist – G; SE; = *A. neodioica* Greene ssp. *canadensis* (Greene) Bayer & Stebbins – Y]

**Antennaria howelli** Greene ssp. *petaloidea* (Fernald) Bayer, Field Pussytoes. Mt (NC, VA, WV), Pd (VA): dry woodlands; rare. March-May. NL (Newfoundland) west to BC, south to NC, WV, IN, IL, CO, and OR. [FNA, K, Z; > *A. neglecta* Greene var. *petaloidea* (Fernald) Cronquist – C; = *A. petaloidea* Fernald var. *petaloidea* – F; < *A. neglecta* Greene var. *neglecta* – G; SE; = *A. neodioica* Greene ssp. *petaloidea* (Fernald) Bayer & Stebbins – W]

**Antennaria neglecta** Greene, Field Pussytoes. Pd (DE, NC, VA), Mt (VA, WV), Cp (DE): dry woodlands and fields; (uncommon in NC, VA, and WV). NS west to NT, south to VA, KY, AR, OK, and CO. *A. neglecta* is a sexual diploid ancestor of the *A. howelli* complex (FNA). [FNA, K, X, Y, Z; = *A. neglecta* Greene var. *neglecta* – C; > *A. neglecta* Greene var. *neglecta* – G; SE]

**Antennaria parlinii** Fernald ssp. *fallax* (Greene) Bayer & Stebbins, Big-head Pussytoes. Pd (DE, NC, VA), Cp (DE, NC, VA), Mt (NC, VA, WV), {GA, SC}; dry woodlands; common. Late March–early May. NS west to MN, south to GA, AL, MS, LA, and TX. [FNA, K, X, Z; > *A. plantaginifolia* (Linnaeus) Richardson var. ambigens (Greene) Cronquist – RAB, C, G, SE; = *A. fallax* Greene var. *calophylla* (Greene) Fernald – F; > *A. calophylla* Greene – S; > *A. fallax* Greene – S; < *A. parlinii* – W]

**Antennaria parlinii** Fernald ssp. *parlinii*. Parlin’s Pussytoes. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE, NC, VA), {GA}; woodlands, roadbanks; common. Late March–early May. NS west to SK, south to GA, AL, MS, LA, and TX. [FNA, K, X, Z; = *A. plantaginifolia* (Linnaeus) Richardson var. *arnoglossa* (Greene) Cronquist – RAB, G, SE; = *A. plantaginifolia* var. *parlinii* (Fernald) Cronquist – C; > *A. parlinii* Fernald var. *parlinii* – F; > *A. parlinii* var. *arnoglossa* (Greene) Fernald – F; < *A. parlinii* – W]

**Antennaria plantaginifolia** (Linnaeus) Richardson, Plantain Pussytoes. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA): dry woodlands; common (rare in FL). Late March–early May. NS west to SK, south to FL, AL, MS, AR, and OK. *A. plantaginifolia* is a sexual diploid ancestor of the *A. howelli* complex (FNA). [FNA, K, W, X, Z,
Anthemis Linnaeus 1753 (Chamomille)

A genus of about 175-210 species, herbs, mainly Eurasian. References: Watson in FNA (2006a); Cronquist (1980)=SE; Arriagada & Miller (1997)=Z. Key adapted from C. [also see Chamaemelum, Cota]

1. Rays yellow ............................................................................................................................................................................. [see Cota tinctoria]

1. Rays white.
   2. Rays sterile and usually neutral; receptacle chaffy only toward the middle........................................................................... A. cotula
   3. Achenes not tuberculate; leaves not glandular-punctate beneath .......................................................................................... A. arvensis

*Anthemis secundiramea* Bivona-Bernardi. Cp (VA): railroad embankment; rare, native of Mediterranean Europe, probably merely a waif and not established. [= C, F, FNA, K, SE]

Aphanostephus A.P. de Candolle 1836 (Doze-daisy)

Arctium Linnaeus 1753 (Burdock)

1. Inner phyllaries constricted above the middle, widened toward the truncate (or rarely acuminate) apex........................................... [A. tomentosum]
2. Inner phyllaries never constricted above the middle, gradually narrowing toward the acute to acuminate apex.
   2. Petiole of the basal leaves solid; heads in the upper part of the inflorescence on peduncles > 2.5 cm long; heads corym bosely arranged on the main branches .................................................................................................................. A. lappa
   3. Petiole of the basal leaves hollow (at least toward its base); heads in the upper part of the inflorescence on peduncles < 2 cm long; heads racemosely arranged on the main branches.
      3. Heads 1.1-2.4 cm in diameter; heads on terminal branches sessile or pedunculate; middle phyllaries < 1.8 mm wide; corolla with glandular hairs ................................................................................................................. A. minus
      3. Heads 1.9-2.9 cm in diameter; heads on terminal branches sessile; middle phyllaries (1.6-) 1.7-2.5 mm wide; corolla glabrous................................................................. [A. nemorosum]

*Arctium nemorosum* Lejeune & Courtois. Reported for VA by Kartesz (1999) on the basis of Fernald (1950); it is probable that this record is a misidentification. [= C, F, FNA, Z; < *A. minus* – G = *A. vulgare* (Hill) Evans – K = *A. minus* Bernhardi ssp. nemorosum (Lejeune & Courtois) Syne] *Arctium tomentosum* P. Miller, Cotton Burdock. Material purporting to be this taxon from Union County, SC, and the basis of its occurrence in that state, is actually a pubescent form of *A. minus*. May-November. [= C, F, FNA, G, K, SE, Z; < *A. minus* Bernhardi ssp. tomentosum (Lejeune & Courtois) – RAB, misapplied]

**Arctotis** Linnaeus 1753 (African-daisy, Arctotis)

A genus of about 60 species, annual and perennial herbs, native of South Africa. References: Norlindh (1965)=Z; Mahoney in FNA (2006a); McKenzie et al. (2006).

**Arnica** Linnaeus 1753 (Arnica)

**Arnica acaulis** (Walter) Britton, Sterns, & Poggenburg, Leopard's-bane, Southeastern Arnica. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): pine savannas, sandhills, clayey or sandy woodlands, powerline rights-of-way, roadbanks; common (rare in DE and FL). Late March-early June. DE (historical) and se. PA (where on serpentine) south to Panhandle FL, on the Coastal Plain and lower Piedmont. [= RAB, C, F, FNA, G, K, S, SE, W, Z; < *Arnica acaulis* – FNA, K, WH, Z; < *A. lanceolatum* – Z; < *A. arnica var. lanceolatum* = *A. lanceolatum* var. lanceolatum]

**Arnoglossum** Rafinesque 1817 (Indian-plantain)

1 Larger leaves palmately veined, cordate at the base, either strongly toothed or lobed.
2 Leaves glaucous beneath; stem glaucous and terete (or slightly striate) .......................................................... *A. atriplicifolium* 1 Larger leaves parallel-veined (the primary veins parallel and converging toward the leaf apex), lanceolate to elliptic-lanceolate, cuneate at the base, entire to remotely toothed (usually fewer than 10 teeth per leaf).
3 Phyllaries not wing-keeled; stem terete. 4 Basal and lower cauline leaves ovate to ovate-lanceolate, glaucous beneath; plants 1.5-2.5 m tall; [usually of shaded, moist to bottomland habitats, e. GA west to e. LA] .......................................................... *A. ovatum* var. lanceolatum 5 Basal and low-cauline leaves truncate or subcordate at the base; larger leaves irregularly angulate-lobed or toothed, often somewhat hastate at the base; corolla usually pale lavender .......................................................... *A. diversifolium* 6 Phyllary wings highest towards the base; phyllary wings chalky white, erose; leaves with main lateral veins running with the midrib for 2-4 cm into the blade before diverging; [of FL Panhandle] .......................................................... *A. album* 7 Involutres 12-15 mm high; corollas (9-) 11-12 mm long .......................................................... *A. floridanum* 8 Involutres 8-14 mm high; corollas 7-11.5 mm long.

**Arnoglossum album** L.C. Anderson. Cp (FL): wet pine savannas; rare. Endemic to FL Panhandle (Bay and Gulf counties). [= FNA, K, WH, Z]

Arnoglossum ovatum (Walter) H.E. Robinson var. lanceolatum (Nuttall) D.B. Ward, Savannah Indian-plantain. Cp (FL, GA, NC, SC): wet savannas, especially over coquina limestone ("marl"); rare. Late July-October. SE. NC to e. FL, west to e. TX. [= Q; < Arnoglossum ovatum – FNA, GW, K, WH, Y, Z; = Cacalia lanceolata Nuttall – RAB; < Cacalia ovata Walter – SE, U; = Mesadenia lanceolata (Nuttall) Rafinesque – S; > Mesadenia lanceolata var. lanceolata – V; > Mesadenia lanceolata var. vrescens Harper – V; = Cacalia lanceolata var. lanceolata – X]

Arnoglossum ovatum (Walter) H.E. Robinson var. ovatum, Broadleaf Indian-plantain. Cp (FL, GA), Pd (GA): bottomlands, bay forests, moist or wet forests; uncommon. Late July-October. E. GA west to e. LA. The division of A. ovatum into two taxa (species or, as done here, varieties) needs additional study. [= Q; < Arnoglossum ovatum – FNA, GW, K, WH, Y, Z; = Cacalia ovata Walter – SE, U; > Mesadenia ovata R.M. Harper – S; > Mesadenia maxima R.M. Harper – S; = Cacalia lanceolata var. elliptii (Shinners) Kral & Godfrey – X]

Arnoglossum reniforme (Hooker) H.E. Robinson, Great Indian-plantain. Mt (GA, NC, VA, WV): cove forests, other mesic forests; common (uncommon in WV, rare in VA). June-October. The very large, reniform leaves (sometimes up to 80 cm across) are conspicuous in rich cove forests. PA and MN, south to GA, MS, and OK. [= FNA, Y, Z; = Arnoglossum muehlenbergii (Schultz 'Bipontinus') H.E. Robinson – K; = Cacalia muehlenbergii (Schultz 'Bipontinus') Fernald – RAB; C, F, G, SE, U, W; = Mesadenia reniformis (Hooker) Rafinesque – S]

Arnoglossum plantagineum Rafinesque. Reported for sc. SC, in the unpublished flora of the Savannah River Site by Batson, Angerman, and Jones. It is known definitely from the Nashville Basin of c. TN (Chester, Wofford, & Kral 1997). AL, MS, LA, and KY. [= FNA, K, Y, Z; = Cacalia tuberosa Nuttall – G; = Mesadenia tuberosa (Nuttall) Britton – S; = Cacalia plantaginea (Rafinesque) Shinners – SE, U]

Artemisia Linnaeus 1753 (Wormwood, Mugwort, Sage)

If defined (as here) to include the segregate genus Seriphidium, a genus of about 500 species, shrubs and herbs, north temperate, boreal, and arctic. References: Shulz in FNA (2006a); Ling Yeou-Ruenn (1995)=Z; Cronquist (1980)=SE; Arriagada & Miller (1997)=Y. Key based primarily on C.

1 Disk flowers sterile, with abortive ovaries; plant not aromatic when fresh; [subgenus Dracunculus] .......................................................... A. caudata
   Disk flowers fertile, with normal ovaries; plant variously aromatic or not when fresh.
2 Receptacle bearing dense long hairs between the flowers; plant strongly aromatic when fresh; [subgenus Absinthium] ................. A. absinthium
   Receptacle not pubescent; plant variously aromatic or not when fresh; [subgenus Artemisia].
3 Leaves green, essentially glabrous on the lower surface; annuals or biennials from a taproot; plants lacking nonflowering shoots.
   Inflorescence obviously paniculate, the branches evident, the heads on slender peduncles; involves 1-2 mm high and 1-2 mm wide; fresh plants sweet-aromatic. ................................................................. A. annua
   Inflorescence spike-like; the heads crowded and hiding the branches; involves 2-3 mm high, 2-3 mm wide; fresh plants not aromatic. .............................................................................................................. A. biennis var. biennis
3 Leaves tomentose on the lower surface, densely so in many species; perennials from a branched rhizome or woody caudex; plants with nonflowering shoots.
5 Principal leaves 2-3-pinnatifid, the terminal segments < 1.5 mm wide; plant a shrub or suffrutescent herb.
6 Leaves green above, 3-6 cm long.............................................................. A. abrotanum
   Leaves white-tomentose above, 1-3 cm long.................................................. A. pontica
5 Principal leaves entire to 2-pinnatifid, the terminal segments > 2 mm wide; plant an herb (sometimes somewhat woody at the base).
7 Inflorescence spike-like; the heads crowded and hiding the branches; involves 2-3 mm high, 2-3 mm wide; fresh plants not aromatic. .............................................................................................................. A. stelleriana
7 Inflorescence spike-like; the heads crowded and hiding the branches; involves 2-3 mm high, 2-3 mm wide; fresh plants not aromatic. .............................................................................................................. A. vulgaris

* Artemisia annua Linnaeus, Sweet Annie, Sweet Wormwood, Annual Mugwort. Cp (DE, SC, VA), Pd (DE, VA), Mt (VA, WV), {NC?}: roadsides, disturbed areas, waste areas around wool-combing mills (Nesom 2004d); common (uncommon in NC, SC, VA, and WV), native of Asia and e. Europe. August-November. [= C, F, FNA, G, K, S, SE, Y, Z]
Aster Linnaeus 1753 (Aster)

It is now abundantly clear that the traditional, broad circumscription of *Aster*, as a genus of some 250 species of North America and Eurasia, is untenable. All of our native asters have affinities elsewhere than with Old World Aster; most are now placed in *Symphyotrichum* and *Eurybia*, with fewer species in *Amelastor*, *Doellingeria*, *Ionactis*, *Oclemena*, and *Sericocarpus*. These changes will undoubtedly cause uproar. It may be worth noting for those that consider the dissolution of *Aster* as radical, that most of the segregate genera were recognized in the 19th century, and many have been widely recognized for much of the time since. For instance, *Sericocarpus* and *Doellingeria* were both segregated from *Aster* in the early 1830's, and were frequently recognized as distinct, including by Small (1903, 1913, 1933); *Sericocarpus* was in fact usually regarded as a good genus until sunk by Cronquist. References: Brouillet in FNA (2006b); Semple & Brouillet (1980a, 1980b); Jones (1980a, 1980b); Brouillet & Semple (1981); Reveal & Keener (1981); Jones & Young (1983); Jones (1984); Semple, Chmielewski, & Lane (1989); Nesom (1993a, 1993b, 1994a, 1994b, 2000b); Semple, Heard, & Xiang (1996); Noyes & Rieseberg (1999); Nesom (1994)=X; Semple, Heard, & Xiang (1996); Cronquist (1980)=SE; R. Jones (1992); Lamboy (1992); Nesom (1997); Xiang & Semple (1996). [also see *Amelastor*, *Doellingeria*, *Eurybia*, *Ionactis*, *Oclemena*, *Sericocarpus*, *Symphyotrichum*]

*Aster tataricus* Linnaeus f., Tartarian Aster. Pd (NC, VA), Mt (GA, NC, VA, WV), Cp (DE, VA): commonly cultivated, rarely persisting or spreading short distances from plantings; rare, native of Eurasia. September-October. [*RAB, C, FNA, G, K*]

Astranthium Nuttall 1840 (Western-daisy)

*Astranthium integrifolium* (Michaux) Nuttall. Mt (GA, WV): limestone glades; rare. Nc. KY south through c. TN to nw. GA and ne. AL (primarily in the Interior Low Plateau); disjunct in c. MS and also disjunct in nc. WV, where perhaps introduced. The related *A. ciliatum* (Rafinesque) Nesom of the Ozarkian region and Texas is sometimes treated as a variety, subspecies, or unnamed component of *A. integrifolium*, but see Nesom (2005a) for rationale for recognition at the specific rank. The report for NC by Kartesz (1999) is erroneous; the cited documentation does not mention NC. [*FNA, Z; = A. integrifolium var. integrifolium – C, Y; < A. integrifolium – F, G, SE, W*]

Baccharis Linnaeus 1753 (Silverling, High-tide Bush, Mullet Bush, Groundsel Tree)

A genus of about 350-450 species, shrubs, perennial herbs, and trees, of tropical, subtropical, and warm temperate America. References: Sundberg & Bogler in FNA (2006b); Nesom (2000b); Cronquist (1980)=SE. Key based in part on SE.

1 Leaves linear, 1-3 mm wide, entire..............................................................[B. angustifolia]
1 Leaves obovate, oblanceolate, or elliptic, the larger > 7 mm wide and generally coarsely toothed toward the tip.
2 Leaves entire, spatulate-obovate, 1.5-3 (-3.5) cm long (including the petiole).........................................................[B. dioica]
**Balduina** Nuttall 1818 (Honeycomb-head, Balduina)

**Identification notes**: The common name alludes to the honeycomb-like texture of the receptacle, made up of connected receptacular bractlets which surround the achenes. This condition is diagnostic of the genus, and can be seen even when the plant is in flower by stripping the flowers from the receptacle. Superficially, the perennial species resemble some *Helenium* (particularly *H. pinnatifidum* and *H. vernale*), but these bloom months earlier. The punctate leaves are very distinctive.

1. Plant an annual or biennial; cauline leaves numerous, linear, 0.5-1.9 mm wide; outer involucral bracts 0.6-1.7 mm wide, lanceolate, acuminate; disk 6-15 mm wide; pappus scales obovate-orbicular, 0.3-0.6 mm long ............................................................................... *B. angustifolia*
2. Disk corollas purple; basal leaves linear-spatulate, (7-)avg. 14 (-32) cm long, about 20× as long as wide; cauline leaves 3.8-6.2 cm long; outer phyllaries 2.9-5.4 mm long; inner phyllaries 4.5-7.6 mm long; ray flower ligules 2.3-4.7 mm wide at apex ...................... *B. atropurpurea*
3. Most of the heads pedunculate (a few sessile), the glomerules grouped into terminal paniculiform inflorescences; [of the outer Coastal Plain and also spread extensively inland as a weed] ........................................................................................... *B. halimifolia*

*Balduina angustifolia* Michaux, False-willow. Cp (FL, GA, NC, SC): interdune swales, wet hammocks, marsh edges; uncommon (rare in GA, NC, SC). September-October. Ne. NC (Dare County) south to s. FL, west to LA; Bahamas. [= RAB, FNA, GW, K, S, SE, WH]

*Balduina atropurpurea* R.M. Harper, Bog Honeycomb-head, Purple Honeycomb-head, Purple Balduina. Cp (FL, GA, NC, SC): peaty seepage bogs and wet pine savannas; rare. Late August-early November; October-December. A southeastern Coastal Plain endemic, very rare and disjunct in se. NC and ne. SC (where not recently seen), primarily in ne. to sc. GA and ne. FL. [= RAB, FNA, GW, K, SE, Z; = Endorima atropurpurea (R.M. Harper) Small – S]

*Balduina uniflora* Nuttall, Savanna Honeycomb-head, Yellow Balduina. Cp (FL, GA, NC, SC): wet pine savannas and pine flatwoods; uncommon (in GA and NC, rare in SC). Late July-September. A southeastern Coastal Plain endemic; se. NC and immediately adjacent ne. SC (apparently absent from much of SC), and from extreme s. SC south to ne. FL, FL Panhandle, and west to e. LA. [= RAB, FNA, GW, K, SE, Z; = Endorima uniflora (Nuttall) Rafinesque – S]

**Bellis** Linnaeus 1753 (English Daisy)

A genus of about 8 species, herbs, of Europe. References: Nesom (2000b); Brouillet in FNA (2006b); Cronquist (1980)=SE.

**Berlandiera** A.P. de Candolle 1836 (Green-eyes)

1. Leaves mainly caudine; leaves unlobed; disk flowers red to maroon; [of ne. SC south to n. FL, west to TX] ... *B. pumila var. pumila*
Bidens Linnaeus 1753 (Beggar-ticks, Bur-marigold)

A genus of about 240 species, herbs, cosmopolitan. Recent molecular studies suggest that the relationship between Bidens and Coreopsis is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford & Mort 2005). References: Strother & Weedon in FNA (2006c); Cronquist (1980)=SE; Sheriff & Alexander (1955)=Z; Ballard (1986)=Y. Key based on FNA.

Identification notes: The involucre of phyllaries is subverted by an additional series of bracteal structures, the calyxulus.

1 Plant aquatic, the leaves finely divided into segments < 0.5 mm wide; pappus awns 13-25 (-40) mm long...........................................B. subacaulis

2 Inner cypselas more-or-less equally 4-angular, thickest near the middle and equally tapered to both ends; ray florets white, pink, or pale yellow (or absent)

3 Leaves 2-3* dissected, primary lobes > 20, the ultimate segments rounded to acute, 2-10 mm wide; ray florets yellowish...B. bipinnata

4 Ray florets 5-8, the ligule 5-16 mm long; cypselas 2-awned, the awns 1-2 mm long; outer phyllaries (8-) 12 (-16).............B. alba var. radiata

5 Most leaves simple, the margins dentate to serrate or incised (with 3-7 lobes).

6 Leaves (except sometimes the lower) sessile; heads usually nodding, at least in age.

7 Rays absent, or present and 2-15 (-18) mm long; pales (receptacular bracts) with tan or yellow tips; outer cypselas (3-) 5-6+ mm long, inner cypselas 4-8 mm long (the margins ± thickened or winged); pappus of (2-) 4 awns (1-) 2-4 mm long ..........B. cernua

8 Rays present, (10-) 15-25 (-30) mm long; pales (receptacular bracts) with orange or red tips; outer cypselas 6-8 mm, inner cypselas 8-10 mm (margins not notably thickened or winged); pappus of 2-4 awns 3-5 mm long ....................................................B. laevis

9 Involucres usually campanulate to cylindrical, sometimes ± hemispheric; disc florets (6-) 10-25 (-60); cypsela faces usually ± striate, sometimes tuberculate ..................................................................[B. bidentoides]

10 Cypselas ± flattened, sometimes weakly 3 (-4)-angled and 3 (-4)-awned, the faces usually smooth, seldom notably tuberculate; disc corollas 4-lobed, light yellow; anthers usually pale.................................................B. comosa

11 Ray florets 0, or rays 1-3, the laminae 2-3.5 mm long.

12 Calyculus bractlets (3-) 4 (-5), seldom ciliate; disc florets usually 10-20 .................................................................B. discoidea

13 Calyculus bractlets 5-21, usually ciliate; disc florets 20-150. 

14 Calyculus bractlets (5-) 8 (-10); leaves usually 3 (-5)-foliolate.................................................................B. frondosa

15 Calyculus bractlets 10-16 (-21); leaves usually laciniate or pinnatisect .................................................................B. vulgata

16 Calyculus bractlets 8-12 (-16), these (4-) 5-7 (-12) mm long .................................................................B. aristosa

17 Calyculus bractlets 12-21, these (6-) 8-12 (20) mm long .................................................................B. polylepis

1 Leaves basally disposed; leaves deeply lobed; disk flowers yellow; [of n. FL southward] .........................................................B. subacaulis

Berlandiera pumila (Michaux) Nuttall var. pumila, Eastern Green-eyes. Cp (FL, GA, SC): sandhills, disturbed sandy areas; common. Late May-November. Nc. SC south to n. peninsular FL, west to s. AL; w. LA to e. TX accepted here as B. pumila var. scabrella Nesom & Turner (1998) are also considered to represent introgression between B. pumila and B. texana de Candolle (Pinkava in FNA 2006c). [= K, Z; < B. pumila – RAB, FNA, S, SE, WH]

Berlandiera subacaulis (Nuttall) Nuttall, Florida Green-eyes. Cp (FL): sandhills; rare. Endemic to FL, from ne. FL (Clay and Columbia counties) and e. Panhandle FL (Leon, Jefferson, and Taylor counties) south to s. FL (Wunderlin & Hansen 2004). [= FNA, K, S, SE, WH]

Bidens Linnaeus 1753 (Beggar-ticks, Bur-marigold)

A genus of about 240 species, herbs, cosmopolitan. **Bidens bidentoides** (Nuttall) Britton. Cp (DE), Pd (DE): tidal shores and mudflats; rare. NY south to se. PA, DE, and e. MD. July-October. [= C, FNA, G, K; var. bidentoides – F; var. b. bidentoides var. bidentoides – Z; var. b. bidentoides var. mariana – Z]

**Bidens discoidea** (Warnstorf) Sherff – F, Z; var. discoidea – F

**Bidens comosa** (A. Gray) Wiegand, Strawstem Beggar-ticks. Cp (DE, WV), Pd (DE, VA), Mt (VA, WV), (GA, NC, SC): marshes, bogs, wet meadows, disturbed areas; common. August-October. NL (Newfoundland) and BC south to GA, TX, and CA. Closely related to, and sometimes included in, the Eurasian *B. tripartita*. [= conosa (A. Gray) Wiegand – C, F, G, S; var. comosa – F, Z; var. comosa – RAB, FNA, K; = B. tripartita ssp. comosa (A. Gray) A. Haines]

**Bidens connata** Muhlenberg, Purplestem Beggar-ticks. Mt (GA, WV), (NC, SC): marshes, bogs, wet meadows, disturbed areas; uncommon? (rare in VA and WV). August-October. QC, ON, and ND south to GA, AL, and KS. [= C, FNA, G, K, S; var. connata Linnaeus – RAB; var. connata var. anomala Farwell – F; var. connata var. connata – F, Z; var. connata var. fallax (Warnstorf) Sherff – F, Z; var. connata var. petiolata (Nuttall) Farwell – F, Z]

**Bidens mitis** (Michaux) Sherff, Coastal Plain Tickseed-sunflower. Cp (DE, FL, GA, NC, SC, VA), Pd (GA), Mt (NC): brackish marshes, fresh marshes, bogs (uncommon); rare (in mountains, rare in DE). July-October. NJ south to FL, west to TX, primarily Coastal Plain, rare and scattered inland. [= RAB, C, F, FNA, G, GW, K, S, SE, W, WH, Z; var. mitis var. leptophylla (Nuttall) Small – S; var. mitis var. mitis – S]

**Bidens pilosa** Linnaeus. Cp (FL, GA, NC, SC, WV): waste areas near wool-combing mill, ballast, other disturbed areas; rare, native of tropical America. Reported for NC (Kartesz 1999), perhaps based on confusion with *B. alba*; known from ballast in se. PA (Rhoads & Klein 1993). [= C, W, WH; var. pilosa – F; var. pilosa var. pilosa – Z; var. pilosa pilosa – S; var. pilosa Linnaeus var. bimucronata (Turczaninow) Schultz ‘Bipinnatus’ – Z]

**Bidens polylepis** Blake, Ozark Tickseed-sunflower. Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, SC, VA): marshes, wet meadows, bogs, ditches; common (common in DE Coastal Plain). August-October. NJ, QC, and CO south to SC, AL, TX, and NM. [= RAB, C, FNA, G, GW, SE, W; var. polylepis var. polylepis – F, Z; var. polylepis var. retrorsa Sherff – F, Z; var. polylepis var. retrorsa – K]

**Bidens trichosperma** (Michaux) Britton, Northern Tickseed-sunflower. Cp (DE, FL, GA, NC, SC, VA), Mt (WV): tidal marshes, other marshes; uncommon (rare in WV). August-October. QC, MN, and SD south to GA, LA, and NE. [= FNA, var. trichosperma (Linnaeus) Britton – RAB, C, G, GW, K, S, SE; name invalid; var. trichosperma var. corona – F; var. trichosperma var. corona – Z; var. trichosperma var. brachydonta Fernald – F; var. trichosperma var. trichosperma (Michaux) Fernald – F]

**Bidens beckii** Torrey ex Sprengel, Water-marigold, Water Beggar-ticks. South to e. PA and NJ. July-October. This species is sometimes treated in the monotypic genus *Megalodonta*; this is contradicted by molecular evidence, which shows *B. beckii* as a component of Bidens (Ganders 2000). [= C, FNA, G; var. beckii – F; var. beckii var. beckii – Z]

**Bidens tripedata** Linnaeus, Eurasian; not known to be in our area. [combined distribution of comosa, connata, and tripedata: Mt (GA, NC, SC, VA), Pd (NC, SC, VA), Cp (VA): marshes, swamps] [= B. tripedata – F, G, W, Z; var. comosa (A. Gray) Wiegand – C, F, G, S; var. comosa (A. Gray) Wiegand – RAB, GA (also see *B. connata* and *B. comosa*)] [not keyed]

**Bigelowia** A.P. de Candolle 1836 (Rayless-goldenrod)

**Boltonia L’Héritier 1789 (Doll's-daisy)**

(contributed by John F. Townsend and Alan S. Weakley)

1 Achenes with pappus reduced to a short ring of bristles to 0.15 mm long or with occasional slender awns to 0.6 mm; achene wings lacking or

2 Phyllaries 0.2-0.5 mm wide, whitened throughout or with greenish tip, midrib relatively prominent (25-35% phyllary width); heads 4.3-6.1 mm wide, peduncles 0.25-0.5 mm in diameter; ray corollas white fading to pinkish in age; bracteal leaves narrowly oblong to linear; [of Coastal Plain and Piedmont of VA southwards] = B. caroliniana

3 Phyllaries spatulate, oblanceolate, or linear-oblong; peduncles thick ............................................................................................................. B. montana

4 Phyllaries spatulate to obovate-spatulate, (2-) 2.5-6 mm wide, membranaceous margins broad................... B. asteroides var. latisquama

5 Inflorescence subulate-bracteate.

6 Phyllaries subulate; peduncles filiform................................................................................................................................. B. diffusa var. diffusa

7 Inflorescence more or less leafy-bracteate.

8 Plants reproducing vegetatively by basal offsets, culms ascending, leaves elliptic to obovate with rounded or blunt apices, held at various angles from culm and inflorescence branches, plants with weak apical dominance; [of the Susquehanna River of MD and PA] = B. asteroides var. asteroides

9 Plants reproducing vegetatively by elongate stolons, culms more strictly erect, leaves lanceolate with acute apices, the leaves oriented at an acute angle to the culm and inflorescence branches, plants with relatively strong apical dominance; [more widespread in our area].............................................................................................................................. B. asteroides var. glastifolia

**Boltonia apalachicolensis** L.C. Anderson, Apalachicola Doll’s-daisy. Cp (FL): floodplain forests; rare. August-October. Panhandle FL, s. MS, west to LA. [= FNA, K, WH, < Boltonia sp. – GW]

**Boltonia asteroides** (Linnaeus) L’Héritier var. asteroides, Susquehanna Doll’s-daisy. Riverbanks. Along the Susquehanna River, MD and PA. = Y; < B. asteroides var. asteroides – C, FNA, G, K, SE, X, Z; = B. asteroides var. asteroides – F]

**Boltonia asteroides** (Linnaeus) L’Héritier var. glastifolia (Hill) Fernald, Eastern Doll's-daisy. Cp (DE, FL, NC, SC, VA), Mt (NC), {GA}: marshes, ditches; common (rare in Mountains, rare in FL and VA). August-October. NJ south to Panhandle FL, west to LA, mostly on the Coastal Plain, but with a few disjunct occurrences inland, such as Henderson County, NC. [= F; < B. asteroides – RAB, W, WH, Y; < B. asteroides var. asteroides – c, FNA, G, K, SE, X, Z; = Boltonia sp. – GW]

**Boltonia asteroides** (Linnaeus) L’Héritier var. recognita (Fernald & Griscom) Cronquist. MI, OH, KY, TN west to SK and OK. = c, FNA, G, K; = Boltonia recognita (Fernald & Griscom) G.N. Jones. [synonymy incomplete] * B. asteroides* (Linnaeus) L’Héritier var. latisquama (A. Gray) Cronquist, Midwestern Doll's-daisy. Cp (NC, VA), ditches; rare, native of mw. United States. August-October. WI west to ND, south to MS and OK; disjunct (presumably introduced) in NC and se. VA. [= c, FNA, G, K, SE, Z; > B. latisquama var. latisquama – F; > B. latisquama var. recognita Fernald & Griscom – F; < Boltonia sp. – GW]

**Boltonia caroliniana** (Walter) Fernald, Carolina Doll's-daisy. Cp, Pd (NC, SC, VA), {GA}: bottomlands, ditches, roadsides, prairies; common (rare in GA and VA). August-October. Se. VA south to s. SC (and GA according to Kartesz 1999),
primarily on the Coastal Plain and Piedmont. [= C, FNA, G, K, SE, X, Y; < B. caroliniana – RAB (also see B. diffusa var. diffusa); > B. caroliniana – F; > B. ravenelii Fernald & Griscom – F; < Boltonia sp. – GW; = B. diffusa var. caroliniana – Z]

*Boltonia diffusa* Elliott *var. diffusa*, Southern Doll's-daisy. Cp (FL, GA, SC), Pd* (NC*, VA*): clay-based Carolina bays, roadsides, powerline rights-of-way, and other artificially open areas; uncommon (rare in NC, SC, VA). August-October. Se. SC south to s. FL, west to e. TX, inland in the interior to c. TN, s. IL, s. MO, AR, and se. OK; disjunct in the Bahamas (Mangrove Cay of Andros Island). See Sorrie & LeBlond (2008) for comments on distribution and nativity. [= FNA, K, Z; < B. caroliniana – RAB; < B. diffusa – C, G, SE, WH; < Boltonia sp. – GW]

*Boltonia diffusa* Elliott var. *interior* Fernald & Griscom. KY and TN west to IL, OK, and LA. [= FNA, K; < B. diffusa – C; < Boltonia sp. – GW] [synonymy incomplete]

*Borrichia* Adanson 1763 (Seaside Oxeye)

A genus of 2 species, shrubs, of se. United States and West Indies. References: Semple in FNA (2006c); Cronquist (1980)=SE.

*Borrichia frutescens* (Linnaeus) A.P. de Candolle, Seaside Oxeye. Cp (FL, GA, NC, SC, VA): salt and brackish marshes; common. May-September. DC and e. VA south to s. FL, west to TX and Mexico; also in Bermuda. This species often forms nearly pure stands of many hectares, conspicuous from the fleshy, gray leaves. [= RAB, C, F, FNA, G, K, SE, WH]

*Brickellia* Elliott 1823 (False-boneset)

1 Leaves rounded at base; upper stem leaves reduced in size but similar in shape to the lower leaves; pappus purplish, of ca. 40 bristles; [of s. GA south] ............................................................................................................................. ...............................................

1 Leaves cuneate at base; upper stem leaves (at least) linear-lanceolate; pappus whitish, of 20-25 bristles; [widespread in our area] ............................................................................................................................. ...............................................

*Brickellia cordifolia* Elliott, Flyr's False-boneset. Cp (FL, GA): mesic pine-hardwood or oak-hickory woods of upland hammocks; rare. Late August-late October. Sw. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009) and AL south to Panhandle FL and n. peninsular FL. [= FNA, K, SE, WH; = Coleosanthus cordifolius (Elliott) Kuntze – S]

*Brickellia eupatorioides* (Linnaeus) Shinners var. corymbulosa (Torrey & Gray) Shinners, Midwestern False-boneset. Var. corymbulosa (Torrey & Gray) Shinners ranges as far east as IN, IL, MO, and AR (and allegedly to KY) and has larger heads than var. eupatorioides (9-15 mm high, with mostly 15-35 florets, vs. 7-11 mm high, with mostly 6-15 florets). [] [investigate; add synonymy; add to key]

*Brickellia eupatorioides* (Linnaeus) Shinners var. eupatorioides, Eastern False-boneset. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, SC, VA): dry slopes, shale barrens, dry woodlands, thickets; common (uncommon in Mountains, uncommon in VA Piedmont, rare in VA Coastal Plain). June-October. NJ west to IN, south to c. peninsular FL and se. TX. In addition to var. eupatorioides, *B. eupatorioides* includes several other varieties, of more southern or western distribution. Var. floridana (R.W. Long) B.L. Turner [= B. mosieri Small] has all leaves linear and is apparently restricted to s. FL; previous references to its occurrence further north (as by SE) are now interpreted as being based on narrow-leaved forms of *B. eupatorioides var. eupatorioides*. Var. texana (Shinners) Shinners [= var. ozarkana (Shinners) Shinners] has the outer phyllaries prolonged into setae, nearly or fully as long as the inner phyllaries, and should be considered a possibility for our area, in dry open habitats with prairie or midwestern affinities; it is known from as far eastward as AR and MO. [= FNA, K, X, Z; < Kuhnia eupatorioides Linnaeus – RAB, S, W; = Kuhnia eupatorioides var. eupatorioides – C, F, G, SE; < Brickellia eupatorioides – WH; = Kuhnia eupatorioides var. pyramidalis Rafinesque – Y]

*Brintonia* Greene 1895 (Brintonia)

*Calotis* R. Browne 1820

**Calyptocarpus** Lessing 1832 (Straggler-daisy, Lawnflower)

**Carduus** Linnaeus 1753 (Plumeless Thistle)

A genus of about 90 species, herbs, of temperate Old World. References: Keil in FNA (2006a); Cronquist (1980)=SE.  [also see Cirsium]

1 Phyllaries 2-8 mm wide; heads mostly nodding (declined at least slightly from the vertical) ................................................. *C. nutans*

1 Phyllaries 1-2 mm wide; heads erect.

2 Involucres cylindrical or narrowly ellipsoid .............................................................. *C. pycnocephalus ssp. pycnocephalus*

2 Involucres spherical or hemispherical.

3 Involucres 14-20 mm high, 25-35 mm across (excluding the flowers); leaves glabrate to glabrous beneath; plants very spiny; stem tough.  .......................................................... *C. acanthoides ssp. acanthoides*

3 Involucres 12-17 mm high, 15-20 [-25] mm across (excluding the flowers); leaves cotonny-tomentose beneath, at least when young, plants not very spiny; stem brittle .................................................. *C. crispus*

* Carduus nutans* Linnaeus, Musk Thistle, Nodding Thistle. Mt (VA, WV), Pd (GA, NC, VA), Cp (DE, SC, VA): fields, roadsides, disturbed areas; uncommon (rare in DE, NC, and SC), native of Eurasia. Late May-November.  *C. nutans* in its native range consists of a complex of taxa variously treated at specific, subspecific, and varietal rank; the application of these taxa to North American material is problematic and unresolved (see FNA for discussion).  [= RAB, C, F, FNA, G, SE, W; > Carduus nutans Linnaeus ssp. macrolepis (Petermann) Kazmi – K]

* Carduus tenuiflorus* W. Curtis. Known from ballast collections from se. PA from 1877-1879 (Rhoads & Klein 1993) and from NJ (Kartesz 1999).  [= FNA, K]  [not keyed]

**Carphephorus** Cassini 1816

A genus of 4 species, herbs, endemic to the Southeastern Coastal Plain of North America. The merger of *Trilisa* and *Litrisa* into *Carphephorus* has been questioned (Schmidt & Schilling 2000) and Schilling (2011) provides evidence that both *Trilisa* and *Litrisa* into *Carphephorus* should be maintained as separate genera. The only species of this complex not occurring in our area is *Litrisa carnosa* Small (of c. peninsular FL). References: Nesom in FNA (2006c); Schilling (2011)=V; Correa & Wilbur (1969)=Z; DeLaney, Bissett, & Weidenhamer (1999)=Y; Orzell & Bridges (2002)=X; Cronquist (1980)=SE.

**Identification notes**: *Trilisa* can be distinguished from *Carphephorus* by its smaller heads (involucres 3.5-6 mm high vs. 6-15 mm high) and fewer phyllaries (6-12 vs. 15-40). When vegetative, *Trilisa* lacks shining resin dots on the leaves, while *Carphephorus* has numerous resin dots.

1 Stem glabrous or nearly so, the pubescence (if present) short and appressed; surfaces of the basal leaves glabrous; inflorescence corymiform.

2 Stem leaves few, most of the stem exposed; basal leaves 4-20 cm long, 0.5-2.5 cm wide, dull, minutely punctate-pitted, fairly thick in texture, but not succulent; stems 1-5 dm tall, (1-)2-5 per plant; [se. VA south to e. GA] ............................................. *C. bellidifolius*

2 Stem leaves numerous, densely clothing the stem at least below; basal leaves 9-50 cm long, 2-10 cm wide, shiny, succulent, not glandular- punctate; stems 6-20 dm tall, 1 per plant; [se. NC south to FL, west to e. LA] ............................................. *Trilisa odoratissima*

1 Stem conspicuously spreading hirsute, at least on the lower part of the stem; surfaces of the basal leaves conspicuously pubescent to glabrous; inflorescence corymiform or thyrsoid-paniculate.

3 Leaves linear, the widest 1-3 mm wide; [sw. GA west through the East Gulf Coastal Plain] .......................................... *C. pseudoliatris*

3 Leaves oblancolate, the widest 7-40 mm wide; [collectively widespread in the Coastal Plain of our area].
4  Inflorescence thyridoid-paniculate; florets 4-10 per head; basal leaves glabrous, minutely and inconspicuously punctate, lacking resin droplets; phyllaries in 1-2(-3) series, scarcely overlapping......................................................... [Trilisa paniculata]

4  Inflorescence corymbiform; florets 15-30 per head; leaves generally conspicuously pubescent (sometimes glabrate or with a few long hairs on the upper surface), not punctate, copiously beset with resin droplets; phyllaries in 3-6 series, closely imbricate.

5  Phyllaries glabrous on the back; phyllaries subacute to rounded, entire or occasionally ciliate. phyllaries mostly 15-20............................... C. corymbosus

5  Phyllaries viscid-pubescent on the back; phyllaries acute to subacute, entire and often callus-tipped; phyllaries 20-40................................. C. tomentosus

Carphephorus bellidifolius (Michaux) Torrey & A. Gray, Sandhill Chaffhead. Cp (GA, NC, SC, VA): xeric sandy forests and woodlands, primarily in sandhills; common (rare in GA and VA). August-October. Se. VA to e. GA. The leaf apices are generally blunt, giving the leaves a nearly spatulate shape. Although often occurring with other species of Carphephorus, C. bellidifolius ranges into drier habitats than its congeners. [= RAB, C, F, FNA, G, K, S, SE, V, Z]

Carphephorus corymbosus (Nuttall) Torrey & A. Gray. Cp (FL, GA, SC): wet flatwoods; common (rare in GA and SC). August-October. Se. SC south to s. FL. This species was reported as far north as NC by Small (1933); Correa & Wilbur (1969) considered the northern limit of the species to be e. GA, but it is now known from Jasper County, SC. [= RAB, FNA, K, S, SE, V, WH, Y, Z]

Carphephorus tomentosus (Michaux) Torrey & A. Gray. Cp (NC, SC, VA): savannas, flatwoods, and sandhills; common (rare in VA). August-October. Se. VA south to s. GA. The specific epithet is somewhat misleading; C. tomentosus is highly variable in its pubescence, ranging from glabrate to densely hisrute. [= RAB, C, FNA, G, GW, K, S, SE, V, Z; > C. tomentosus var. tomentosus – F; > C. tomentosus var. waltleri (Elliott) Fernald – F]

Carthamus Linnaeus 1753 (Distaff-thistle)

A genus of 14 species, annual and perennial herbs, of the Mediterranean region. Closely related to Centaurea, and perhaps to be included there. References: Keil in FNA (2006a).

Centaurea Linnaeus 1753 (Star-thistle, Knapweed)

A genus of about 500 species, herbs, native of Eurasia and n. Africa. References: Keil & Ochsmann in FNA (2006a); Cronquist (1980)–SE. Key adapted from C, SE, and FNA. [also see Acroptilon, Carthamus, and Plectocephalus]

1  Phyllaries evidently spine-tipped.

2  Leaf bases not decurrent on the stem, the stem merely angled; pappus absent; corollas purple

3  Central spines of the principal phyllaries 10-25 mm long.......................................................... C. calcitrapa

3  Central spines of the principal phyllaries 1-3 mm long.............................................................. [C. diffusa]

2  Leaf bases decurrent on the stem as wings (only shortly so in C. benedicta); pappus present in at least the central flowers in the head; corollas yellow.

4  Heads sessile, closely subtended and partially concealed by large foliar bracts.................................................. C. benedicta

4  Heads obviously pedunculate, lacking large foliar bracts subtending the head.

5  Larger spines of the middle and outer phyllaries 5-9 mm long; marginal and central flowers of the head with pappus ...... C. melitensis

5  Larger spines of the middle and outer phyllaries 11-22 mm long; marginal flowers of the head lacking pappus .............. C. solstitialis

1  Phyllaries not spine-tipped.

6  Plant an annual; flowers pale to medium blue, flowering April-June .............................................................. C. cyanus

6  Plant a perennial; flowers pink to purple, flowering June-October.

7  Phyllary appendages tapering to long, often recurved, pectinately dissected, filiform tips ............................................ C. phrygia

7  Phyllary appendages oblique to acute, erect or ascending.

8  Involucre 10-13 mm high.......................................................... C. stoeb ssp. micranthos

8  Involucre 15-25 mm high.

9  Phyllary appendages evidently decurrent along phyllary margins.............................................................. [C. scabiosa]

9  Phyllary appendages not or only slightly decurrent along phyllary margins.

10 Phyllary appendages roundish (rarely triangular), scarios, light to dark brown, undivided to irregularly lacerate ........ C. jacea

10 Phyllary appendages more-or-less triangular, brown to black, more-or-less wholly pectinately-margined.

11 Heads disconid (the peripheral florets not expanded and showy); pappus blackish, < 1 mm long; green parts of phyllary nearly or completely covered by brown appendages, the involucres thus appearing totally black.............................. C. nigra

11 Heads radiate (the peripheral florets expanded and showy); pappus absent or rudimentary (when present usually not black); green part of phyllaries sometimes evident, or the appendages light to dark brown.

12 Heads relatively broad, the pressed involucres usually as wide as or wider than long; green parts of phyllary usually covered by brown, variously pectinate fimbriate appendages, the involucres thus light to dark brown ...... C. ×moncktonii
12 Heads relatively narrow, the pressed involucres usually longer then wide; green parts of phyllaries not fully covered by black appendages, the involucres black and green..............................................................C. nigrescens

* Centaurea ×moncktonii* C.E. Britton, Meadow Knapweed. Mt (VA), Pd (VA): roadsides, disturbed areas; rare, native of Europe. July-October. [= FNA; = C × pratensis Thuillier – C; ? C. nigra var. radiata A.P. de Candolle – F; ? C. debeauxii Godron & Grenier ssp. thuillieri Dostal]

* Centaurea nigra* Linnaeus, Black Knapweed, Spanish-buttons. Mt (WV), Pd (DE, VA), Cp (DE): roadsides, disturbed areas; uncommon (rare in VA), native of Europe. July-October. [= C, F, FNA, G, K, SE]

* Centaurea nigrescens* Willdenow, Tyrol Knapweed, Short-fringed Knapweed. Mt (VA, WV), Pd (DE, VA): roadsides, disturbed areas; uncommon (rare in DE and VA), native of Europe. July-October. This species is increasing rapidly in the n. VA Piedmont. *C. transalpina* Schleicher ex de Candolle was also reported for VA by Kartesz (1999). [= FNA; = C. dubia Suter – C, SE, W (not a valid name); > C. vochiniensis Bernhardi ex Reichenbach – F; > C. dubia ssp. vochiniensis (Berhardi ex Reichenbach) Hayek – G; > C. nigrescens – K; > C. transalpina Schleicher ex de Candolle – F, K]

* Centaurea phylgia* Linnaeus, Wig Knapweed. {[VA]. Reported for VA in FNA. [= FNA, K; > Centaurea austriaca Willdenow]

* Centaurea diffusa* Lamarck, Tumble Knapweed. Naturalized in Davidson County, TN (Chester, Wofford, & Kral 1997); also in KY (FNA). [= C, F, FNA, G, K; = Acosta diffusa (Lamarck) Sojak]

* Centaurea scabiosa* Linnaeus, Greater Knapweed, Hardheads. Naturalized in KY, PA, NJ (FNA), MD (Kartesz 1999), and other states in e. North America. [= FNA, C, F, G, K]

---

**Chaetopappa** A.P. de Candolle 1836 (Least-daisy)

---

**Chamaemelum** P. Miller 1754 (Chamomile)

A genus of 2 species, herbs, of the Mediterranean region. References: Cronquist (1980)=SE. [also see Cladanthus]

---

1 Rays white with a yellow base; plant an annual............................................................................................................................[see Cladanthus mixtus]

1 Rays white; plant a perennial ...........................................................................................................................................................C. nobilis

* Chamaemelum nobilis* (Linnaeus) Allioni, Garden Chamomile. Pd (NC): persistent from cultivation in gardens; rare, native of Europe. [= FNA, K; = Anthemis nobilis Linnaeus – C, F, G, S, SE]

---

**Chaptalia** Ventenat 1802 (Sunbonnets)
A genus of about 60 species, herbs, of warm temperate, subtropical, and tropical America. The remainder of the genus is distributed in the West Indies, Central America, and South America. References: Nesom in FNA (2006a); Vuilleumier (1969)=Z; Nesom (1995a)=Y; Cronquist (1980)=SE.

**Identification notes:** The basal leaves are distinctive, the undersurface permanently and tightly white floccose, the upper surface floccose when young but glabrate in age, and the margins with obscure denticulations.

**Chevreulia** Cassini 1817

**Chondrilla** Linnaeus 1753 (Skeleton-weed)

**Chromolaena** A.P. de Candolle 1836

**Chrysanthemum** Linnaeus 1753 (Chrysanthemum)

* Chrysanthemum indicum* Linnaeus, Garden Chrysanthemum, is persistent or perhaps naturalized as far south as se. PA (Rhoads & Klein 1993). [= Dendranthema × grandiflorum Kitam. – K; ? Dendranthema morifolium (Ramat.) Tzvelev; ? Chrysanthemum morifolium Ramat.; Dendranthema indicum × japonicum]

**Chrysogonum** Linnaeus 1753 (Green-and-gold)

1 Plants occurring individually, not producing stolons; earliest flowering stems leafless, later flowering stems leafy; leafy flowering stems mostly 15-35 (-50) cm high; [of e. VA, sc. PA, and se. OH south to se. NC, ne. SC, nw. NC, and sw. VA].......................................................................................................................... C. virginianum var. virginianum

1 Plants colonial, forming mats by stolons; flowering stems leafless or leafy; leafy flowering stems (if present) 15-25 cm high; [of ne. SC, se. NC, nw. NC, ne. TN, and se. KY southward].

2 Earliest flowering stems leafless, mostly 2-10 cm high; later flowering stems leafy, 15-25 cm high; longest stolon internodes 2-6 cm long; [of ne. SC, se. NC, nw. NC, sw. VA, ne. TN, and se. KY south to e. GA, c. GA, and ec. AL].......................... C. virginianum var. brevistolon

2 Earliest flowering stems leafless, 2-10 cm high; later flowering stems leafless as well, 2-10 cm high; longest stolon internodes 12-60 cm long; [of sc. and sw. GA west to e. LA]........................................................................................................................... C. virginianum var. australis

and sw. GA west to e. LA.  [= FNA, WH, Z; < C. virginianum var. australe – RAB, K, SE, W (also see var. brevistolone); < C. australis
Alexander ex Small – S (also see var. brevistolone)]

**Chrysogonum virginianum** Linnaeus var. **brevistolone** Nesom, Carolina Green-and-gold.  Pd (GA, NC, SC), Cp (GA, SC),
Mt (GA, NC, SC, VA): moist to fairly dry woodlands and forests; common (rare in VA).  Late March-early June.  Ne. SC, sc.
NC, nw. NC, sw. VA, ne. TN.  and se. KY south to e. GA, c. GA, and ec. AL.  [= FNA, Z; < C. virginianum var. australe – RAB, K,
SE, W; < C. australis Alexander ex Small – S]

**Chrysogonum virginianum** Linnaeus var. **virginianum**, Northern Green-and-gold, Virginia Green-and-gold.  Cp (NC, SC,
VA), Pd (NC, VA), Mt (VA, WV): moist to fairly dry woodlands and forests; common (uncommon in WV).  Late March-early June.
E. VA, sc. PA, and se. OH south to se. NC, nc. SC, nw. NC, and sw. VA.  [= RAB, C, FNA, K, SE, W, Z; = C. virginianum – S]

**Chrysosoma** Nuttall 1834 (Woody Goldenrod)

**Chrysosoma pauciflosculosa** (Michaux) Greene, Woody Goldenrod.  Cp (FL, GA, NC, SC): xeric sands of very barren, open,
white-sand sandhills, in our area primarily on fluvial dunes, and less commonly in the fall-line Sandhills; uncommon (rare
north of FL).  Late July-October.  S. NC south to n. FL and west to s. MS.  **Chrysosoma** has a growth habit unlike any other shrub in our
flora.  From a trunk-like base, numerous branches ascend, forming a flat-topped shrub 3-5 dm tall.  Each branch has a cluster of
evergreen leaves restricted to its terminal few cm, the internodes very short (a few mm at most).  In summer, some of the woody
branches produce terminal, deciduous, flowering branches, which elongate rapidly, the leaves widely spaced, reaching a height of
a meter or more.  Following flowering and fruiting, the deciduous branches die back to the summit of the woody branches.  The
leaves are gray-green, rather thick-textured, and finely reticulate, the reticulations giving an appearance rather like anole skin.
The midrib is prominent below, almost invisible on the upper surface.  Godfrey (1988) has an excellent drawing and description
of this distinctive shrub.  [= FNA, K, S, SE, WH; = Solidago pauciflosculosa Michaux – RAB; = Chrysosoma solidaginoides Nuttall]

**Chrysopsis** (Nuttall) Elliott 1823 (Golden-aster)

A genus of about 10 species, herbs, of se. North America, Mexico, and the Bahamas.  This remains a difficult and rather poorly
understood group.  The appropriate taxonomic status of many of the entities remains unclear; for the moment, I am recognizing a
number of entities at the specific level that should perhaps be recognized at lower taxonomic levels; in some cases, the
appropriate nomenclatural combinations are not already available.  References:  Semple in FNA (2006b); Semple (1981)=Z;
adapted from Semple (1981).  [also see Heterotheca and Pityopsis]

1 Stem, leaves, and phyllaries sparsely to densely pubescent with spreading non-glandular hairs as well has having minutely glandular
pubescence; annuals with taproots; [section *Broduria*]......................................................................................................................... **C. pilosa**
1 Stems, leaves, and phyllaries various but lacking spreading non-glandular hairs; biennials or perennials, either fibrous-rooted or with a mostly
short and quickly disintegrating taproot; [section *Chrysopsis*]

2 Peduncles and phyllaries glabrous or the outer phyllaries basally with a few stipitate glands; achenes usually with raised yellow-red
translucent ribs.
3 Stems erect; leaf margins serrat-ciliate, the surfaces sparsely pubescent to glabrous; all phyllaries glabrous.............................. **C. hyssopifolia**
3 Stems decumbent to ascending; leaf margins entire, either eciliate and glabrous, or sometimes ciliate with glabrate to sparsely woolly
surfaces; phyllaries either glabrous and glandular punctate or the outer basally stipitate-glandular.
4 Stem leaves glabrous and eciliate (but rosette leaves densely woolly), lower stem leaves absent at flowering; outer phyllaries with a
few stipitate glands basally, the involucre otherwise glabrous.......................................................... **C. cruiseana**
4 Stem leaves eciliate or ciliate, the surfaces glabrous to sparsely woolly, the hairs often only or mostly near the margin, lower stem
leaves usually present at flowering; phyllaries glabrous, glandular-punctate ........................................ **C. trichophylla**

{Add *linearifolia* under 2a}

2 Peduncles and phyllaries evidently stipitate-glandular or woolly-hairy, or both; achenes with or without raised yellow-red translucent ribs.
5 Upper stem leaves woolly-hairy; not stipitate-glandular; peduncles and involucres sparsely pubescent to woolly, sometimes stipitate-
glandular as well.
6 Stems decumbent; inflorescence loosely corymbose-cymose, buds not nodding; peduncles stipitate-glandular or not, ligules 7-12 mm
long; achenes sparsely to moderately strigose, usually with raised yellow-red translucent ribs; [of se. VA to FL] ............... **C. gossypina**
6 Stems decumbent to ascending; inflorescence corymbose, buds nodding; peduncles densely stipitate-glandular, ligules 10-15 mm
long; achenes densely strigose, lacking raised yellow-red translucent ribs; [of barrier islands of w. FL Panhandle].............. **C. godfreyi**
5 Upper stem leaves arachnoid to glabrate or densely stipitate-glandular; peduncles and involucres stipitate-glandular but otherwise
glabrous.
7 Upper stem leaves lacking stipitate glands, either arachnoid to glabrate, or woolly......................................................... **C. mariana**
7 Upper stem leaves densely stipitate-glandular, not woolly.
8 Stems decumbent to ascending; leaves lanceolate; inflorescence compactly corymbose; involucres 9-12 mm long; phyllaries acute
to attenuate; ligules 10-15 mm long......................................................... **C. gossypina**
8 Stems erect; leaves linear-elliptic; inflorescence open flat-topped corymbose; involucres 6-9 mm long; phyllaries obtuse; ligules
6-8 mm long ........................................................................................................ **C. scabrella**

{Add *lanuginosa* & *latisquamea* under 2b}
Chrysopsis cruiseana Dress. Cp (AL, FL): coastal sand dunes. October-December. FL Panhandle and s. AL. [= Chrysopsis gossypina (Michaux) Elliott sps. cruiseana (Dress) Semple – FNA, K, WH, Z] [add synonymy]

Chrysopsis godfreyi Semple. Cp (FL, AL): coastal sand dunes. November-December. FL Panhandle and s. AL. Plants with densely stipitate-glandular, non-woolly upper stem leaves have been treated as forma viridis (Semple 1981). [= FNA, K, WH, Z] [add synonymy]

Chrysopsis hyssopifolia Nuttall. Cp (FL): dry sands; uncommon. October-December. N. FL peninsula west to FL Panhandle, s. AL., s. MS, and se. LA. [= SE; = Chrysopsis gossypina (Michaux) Elliott sps. hyssopifolia (Nuttall) Semple – FNA, K, WH, Z; > Chrysopsis gigantea Small – S; > Heterotheca hyssopifolia (Nuttall) Harms – Y]

Chrysopsis mariana (Linnaeus) Elliott, Maryland Golden-aster. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry forests and woodlands, roadsides, other dry habitats; common. Late June-October. SE. NY west to se. OH, e. KY, w. TN, south to c. peninsular FL and se. TX. [= C, FNA, G, K, S, SE, W, WH, Z; = Heterotheca mariana (Linnaeus) Shinners – RAB, Y; > Chrysopsis mariana var. mariana – F; > C. mariana var. macradenia Fernald – F]

Chrysopsis trichophylla (Nuttall) Elliott. Cp (GA?, NC, SC): sandhills, sandy roadsides, coastal dunes; rare (NC Watch List). The taxon treated by many authors as C. trichophylla was reduced to a form by Semple (1981), as C. gossypina sps. gossypina f. trichophylla (Nuttall) Semple. He suggests, though, that varietal status may be warranted. Plants in SC previously identified as C. cruiseana are referable to C. trichophylla. [= SE; = Heterotheca trichophylla (Nuttall) Shinners – RAB; < Chrysopsis gossypina sps. gossypina – FNA, K, Z; < C. gossypina – C, G; > C. trichophylla – S; >= C. arenicola Alexander – S; >= C. pilosa – S, misapplied; < Heterotheca gossypina (Michaux) Shinners – Y]

Chrysopsis latissuamea Pollard. Cp (FL): sandhills; uncommon. Ne. FL south to c. peninsular FL. [= FNA, K, SE, WH; = Heterotheca latissuamea (Pollard) V.L. Harms] [not yet keyed; synonymy incomplete]

Chrysopsis linearifolia Semple. Cp (FL): scrub, sandhills; uncommon. Endemic to FL Panhandle. [= Chrysopsis linearifolia sps. linearifolia – FNA, K, WH] [not yet keyed; synonymy incomplete]

Cichorium Linnaeus 1753 (Chicory)

Cirsium P. Miller 1754 (Thistle)

A genus of about 250 species, herbs, north temperate. References: Keil in FNA (2006a); Cronquist (1980)=SE. Key adapted in part from SE.

1 Plant colonial from creeping rhizomes; heads 13-20 (-25) mm high; phyllaries all lacking spine tips, or the outermost tipped with spines < 1 mm long; plant perennial; [alien weeds, generally in altered habitats]……………………………………………………………C. arvense

1 Plant not colonial; heads 25-50 mm high (as small as 15-25 mm in C. carolinianum, C. muticum, and C. virginianum); phyllaries mostly spine-tipped, with at least some of the spines > 1 mm long (except sometimes mostly or entirely spine free in C. muticum); plant biennial (to weakly perennial); [native (except C. vulgare), in natural or some species also in disturbed habitats]

2 Leaves decurrent onto the stem below, the decurrency extending as a wing at least several cm down the stem, and often to the leaf below; leaves scabrous-hispid above; phyllaries lacking a glutinous dorsal ridge; [alien weed]……………………………………………………………C. vulgare

2 Leaves not decurrent as a conspicuous wing, or the decurrency extending < 1 cm (sometimes more decurrent in C. lecontei); leaves not scabrous-hispid above; [native, sometimes in disturbed habitats]

3 Phyllaries lacking spine tips (the outermost sometimes with a weak spine-tip to 0.5 mm long); leaves deeply lobed, to 55 cm long and 20 cm wide ………………………………………………………………………………………………………C. muticum

3 Phyllaries (at least the outer and middle) with well-developed spine-tips > 1 mm long; leaves lobed or merely toothed, generally < 30 cm long and < 10 cm wide (except in C. altissimus).
4 Heads immediately subtended by several spiny-toothed leaves (appearing as a leafy involucre); flowers yellow, white, or purple.
5 Involucres more-or-less densely tomentose; stems densely tomentose; [of the Coastal Plain and Piedmont].

................................................................................................................................. C. horridulum var. horridulum

Cirsium horridulum var. horridulum (Linnaeus) Hill, Tall Thistle. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, GA): pastures, woodlands, thickets; uncommon (rare in DE, FL, and VA). September-November. MA west to ND, south to Panhandle FL (Jackson County) and TX. [= C, F, FNA, G, K, S, SE, W, WH; = Carduus altissimus Linnaeus – RAB]

* Cirsium arvense (Linnaeus) Scopoli, Canada Thistle, Field Thistle. Mt (NC, VA, WV), Pd (DE, Cp (DE): pastures, disturbed areas; common (uncommon in NC and VA), native of Europe. July-November. Two varieties are often recognized: var. arvense, with leaves shallowly undulate-lobed and with only a few fine marginal prickles, and var. horridum, with leaves strongly sinuate-pinnatifid and with numerous well-developed marginal prickles. [= FNA, K, S, W; = Carduus arvensis (Linnaeus) Robson – RAB; > C. arvense var. arvense – C, G, SE; > C. arvense var. horridum (Linnaeus) Scopoli var. horridum Wimmer & Gräbner – C, G, SE; > C. arvense var. arvense var. arvense – F, misapplied; = Breea arvensis (Linnaeus) Lessing]

Cirsium carolinianum (Walter) Fernald & Schubert, Carolina Thistle, Spring Thistle. Pd (GA, NC, SC, VA), Mt (GA): pastures, woodlands, thickets, pastures, woodlands, thickets; uncommon. April-June (-July). N. VA west to s. OH and MO, south to w. SC, n. GA, AL, and TX. In our area, C. carolinianum seems to be restricted to prairies and woodlands (or maintained powerline or road rights-of-way) over circumneutral rocks and soils, in situations which were oak savannas or even prairies prior to fire suppression. [= C, F, FNA, G, K, S, SE, W; = Carduus carolinianus Walter – RAB; > C. arvense var. carolinianus Small – S; > C. virginianum – S, misapplied]

Cirsium discolor (Muhlenberg ex Willdenow) Sprengel, Field Thistle. Mt (NC, SC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, VA): pastures, woodlands, thistles; common. August-November. QC west to MB, south to NC, MS, LA, and KS. [= C, F, FNA, G, K, S, SE, W; = Carduus discolor (Muhlenberg ex Willdenow) Nutall – RAB]

Cirsium horridulum Michaux var. horridulum, Common Yellow Thistle. Cp (DE, FL?, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC): roadsides, woodlands, pine savannas; common (rare in DE and VA Piedmont, rare in Mountain). Late March-August. ME south to FL, west to TX, mostly on the Coastal Plain and adjacent provinces; also in Mexico. [= C, K, SE; = Carduus spinosissimus Walter – RAB; > C. horridulum – F, G, WH; > C. horridulum complex – GW; = C. horridulum – S]

Cirsium horridulum var. megacanthum (Nuttall) D.J. Keil, Bighspine Thistle. Cp (AL, FL): moist ground; uncommon. AL and Panhandle FL west to TX and OK. [= FNA; > C. horridulum complex – GW; > C. horridulum var. vittatum – K, SE; > C. horridulum var. vittatum – S; > C. horridulum complex – WH]

Cirsium muticum Michaux, Swamp Thistle. Cp (DE, FL, NC, SC, VA), Mt (GA, NC, SC, VA), Pd (DE, NC, VA): swamps, wet thickets, woodlands, seepage slopes, wet prairies, meadows; uncommon (rare in DE, FL, and GA, VA Piedmont and Coastal Plain). August-November. NL (Newfoundland) west to SK, south to DE, NC, TN, and MO, and less commonly south to FL, AL (Diamond & Woods 2009), and TX. [= C, FNA, G, GW, K, S, SE, W; WH; = Carduus muticus (Michaux) Persoon – RAB; > C. muticum var. muticum – F]

ASTERACEAE

891
**ASTERACEAE**

*Cirsium pumilum* (Nuttall) Sprengel, Pasture Thistle. Pd (DE, NC, VA), Cp (DE, VA), Mt (VA, WV): pastures, thickets, and woodlands, perhaps especially over mafic rocks; uncommon (rare in Coastal Plain south of DE). Late May-July. S. ME west to w. NY, south to DE, and w. NC. [= C, F, G, K, SE, W; = Carduus pumilus Nuttall – RAB; = Cirsium pumilum var. pumilum – FNA; = Carduus odoratus (Muhlenberg ex W. Bart.) Petrak – S]

*Cirsium repandum* Michaux, Sandhill Thistle. Cp (GA, NC, SC, VA): sandhills, other dry sandy habitats; common (rare in VA). May-July. Se. VA south to e. GA, nearly endemic to the Carolinas. Similar in distribution to *Vaccinium crassifolium, Carphedorus bellidifolius, and Baptisia cinerea*, which are all locally abundant endemic indicators of Carolina pinelands. [= C, FNA, G, K, S, SE; = Carduus repandum (Michaux) Persoon – RAB]

**Cladanthus** Cassini 1816

**Conoclinium** A.P. de Candolle 1836 (Mistflower)

Conoclinium coelestinum (Linnaeus) A.P. de Candolle, Mistflower, Ageratum. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): moist to wet disturbed areas, especially ditches; common (uncommon in FL, uncommon in DE Piedmont), native of Europe. Late May-July. S. NJ west to IL, c. MO, se. KS, and OK, south to s. FL and e. TX; also in Cuba, and scattered further north (as in NY, n. OH, and n. IN) probably as escapes from cultivation. See Wooten & Clewell (1971) for further discussion of this species. [= FNA, K, WH; = Eupatorium coelestinum Linnaeus – RAB, C, F, G, SE, W, WV]

**Conyza** Lessing 1832 (Horseweed)

A genus of about 60 species, herbs, shrubs, and trees, of temperate, subtropical, and tropical regions. Recent molecular studies have indicated the likely polyphyly of *Conyza* and its close relationship with *Erigeron*; the ultimate circumscription of these genera is in doubt (Nesom 2000a, Noyes 2000). References: Strother in FNA (2006b); Cronquist (1980)=SE; Nesom (2000b). Key based in part on SE.

1 Plants diffusely branched from the base and throughout; plants 1-2.5 (-3) dm tall .................................................................[C. ramosissima]

1 Plants with a well-developed central axis, sparingly branched (unless mowed or otherwise injured); plants 1-15 dm tall.

2 Involucre 4-6 mm high, densely pubescent; pistillate flowers (50-) 70-200 or more per head......................................................... C. bonariensis

2 Involucre 3-4 mm high, glabrous or very sparsely pubescent; pistillate flowers mostly 25-45 per head.

3 Stem coarsely spreading-hirsute; leaves ciliate, the larger generally with a few to many coarse teeth; phyllaries green-tipped........

3 Stem coarsely spreading-hirsute; leaves ciliate, the larger generally with a few to many coarse teeth; phyllaries green-tipped........

................................................................. C. canadensis var. canadensis

3 Stem glabrous or with widely scattered, appressed hairs; leaves with a few cilia toward the base, generally entire; phyllaries purple-tipped.............................................................................................. C. canadensis var. pusilla

**Conyza canadensis** (Linnaeus) Cronquist *var. pusilla* (Nuttall) Cronquist, Southern Horseweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dunes, old fields, disturbed areas; common (rare in WV). (May-) July-December. Se. MA and CT west to s. IN, south to FL and TX, and south into tropical America. [= C, G, K, SE, W, WH; *Erigeron canadensis* Linnaeus *var. pusilla* (Nuttall) Boivin – RAB; < *C. canadensis* – FNA; = *Leptinum pusillum* (Nuttall) Britton – S; = *Conyza parva* Cronquist]

* Conyza floribunda* Kunth. Reported as introduced in GA, AL, and MS by Kartesz (1999), probably on the basis of confusion with *C. bonariensis*. [= FNA, K] [rejected; not keyed]

*Conyza ramossissima* Cronquist. Weedy situations. OH west to MN, south to KY, ee. TN (Chester, Wofford, & Kral 1997), ne. AL, LA, and TX. [= C, FNA, G, K, SE; = *Erigeron divaricatus* Michaux – F; = *Leptinum divaricatum* (Michaux) Rafinesque – S]

**Coreopsis** Linnaeus 1753 (*Coreopsis*, Tickseed)

[contributed by Alan S. Weakley and Bruce A. Sorrie]

A genus of about 50 species, herbs, of America. Recent molecular studies suggest that the relationship between *Bidens* and *Coreopsis* (as traditionally circumscribed) is complex, and that changes in taxonomy will be needed to more accurately reflect relationships (Kim et al. 1999; Crawford & Mort 2005). References: Strother in FNA (2006c); Smith (1976)=Z; Sherff & Alexander (1955)=Y; Cronquist (1980)=SE. Key adapted from Y and Z.

1 Disk flowers with 4 corolla lobes and 4 anthers; ray flowers usually apically 3-lobed.

2 Leaves pinnately or bipinnately lobed into linear segments or narrowly lanceolate segments; [section Calliopsis] .................................................................

3 Leaves simple or with 1-2 auriculate lobes at the base; [section Eublaberasis].

4 All of the major cauline leaves opposite (except in *C. linifolia* the lowermost few leaves may be alternate).

5 Ray flowers pink (white); plant rhizomatous ..............................................................................

6 Ray flowers yellow; plant fibrous-rooted.

7 Leaf blades ovate (to elliptical), very gradually reduced upward, margins ciliolate, surfaces lacking tiny dark dots; achenes about 5 mm long; [se. SC south to Panhandle FL] ..............................................................

8 Leaf blades linear-oblancoate to linear, rapidly reduced upward, margins glabrous, surfaces with numerous tiny dark dots (easiest to see on undersurface); achenes < 2.5 mm long; [se. VA south to ne. and Panhandle FL, west to e. TX]........... *C. linifolia*

9 All of the major cauline leaves alternate.

10 Leaves all simple, 4-15 cm long, 10-45 mm wide, the blades broadly to narrowly elliptical, 5-15× as long as wide; achene awns 0.7-1.0 mm long; [swamp forests and streamside openings, from se. NC south to c. FL and west to s. MS; also rarely inland in GA, NC, SC, off the Coastal Plain] .............................................................. *C. floridana*

11 Leaves with auricles; achene wing narrow, < ½ the width of the achene body; achene awns averaging 1.5 mm long; leaf texture thick and leathery; flowering mid August-early November; [se. NC south to c. FL and west to s. MS; also rarely inland in GA, NC, SC, off the Coastal Plain] .............................................................. *C. gladiata*

Disk flowers with 5 corolla lobes and 5 anthers; ray flowers apically entire, or with (2-)4-5 teeth.

12 Leaves all simple, 4-12 cm wide, the margins coarsely serrate (some of the lower leaves sometimes pinnately lacerate basally); [section Stilphiastrum] .................................................................

13 Leaves simple, usually (but not always) some of the leaves on a plant with basal auricles or lobes, the leaf blades (or terminal leaflets) 0.5-3.5 cm wide, the margins entire; [section Coreopsis].

14 Plants spreading by elongate stolons; leaf blades (or terminal leaflets) 1-2× as long as wide.............................................................................. *C. auriculata*

15 Plants lacking stolons; leaf blades (or terminal leaflets) > 3× as long as wide (basal leaves sometimes broader)........... *C. lanceolata*

16 Plants with (5-)6-12 nodes between the first node > 1 cm above the basal leaves and the first head.

17 Leaf blades (or terminal leaflets) more or less broadly elliptical, ca. 1.5-4 cm wide, acute; stem (and often also the leaves) rather densely hairy (to glabrate). *

18 Leaf blades (or terminal leaflets) narrowly elliptical to oblanceolate, ca. 0.6-2 cm wide, acuminate; stem and leaves glabrous„…

.................................................................

18 Leaf blades (or terminal leaflets) narrowly elliptical to oblanceolate, ca. 0.6-2 cm wide, acuminate; stem and leaves glabrous„…

.................................................................
10 Most or all of the leaves deeply lobed or dissected into distinct leaflets or divisions, the leaflets or divisions 3-20 or more, if only 3, then the lateral leaflets nearly or fully as large and well-developed as the terminal.  
16 Leaves sessile or with a short subtending base < 2 mm long, the initial division of the leaves palmate into 3 leaflets (these sometimes further divided), giving the 3 opposite leaves the superficial appearance of a whorl of 6 leaves; [section Gyrophyllum].  
17 Leaves palmately 3-foliolate (rarely simple or 3-foliolate with the middle leaflet 2- or 3-lobed), the total number of leaflets or divisions thus 3 (-5), the middle leaflet of median leaves 5-30 mm wide.  
18 Leaf blades rather densely short-pubescent; outer phyllaries slightly densely short-pubescent; middle leaflet of median leaves 10-30 mm wide; leaflets herbaceous ..............................................................................................................C. major var. major  
18 Leaf blades slightly short-pubescent to glabrous; outer phyllaries slightly short-pubescent to glabrous; middle leaflet of median leaves 5-10 (-12) mm wide; leaflets subcoriaceous and stiff ...............................................................................................C. major var. rigid  
17 Leaves palmately compound, the leaflets simple to lobed or pinnatifid, the total number of leaflets or divisions (3-) 5-25, the middle leaflet of median leaves 0.5-7 mm wide.  
19 Leaves usually lobed (rarely simple), the total number of leaflets or divisions (3-) 5-11 (-15) per leaf, the segments of median leaves (1.5-) 2-7 (-9) mm wide .................................................................C. delphiniifolia  
19 Leaflets pinnatifid, the total number of leaflets or divisions 11-25 or more per leaf, the segments of median leaves 0.2-1.2 mm wide .................................................................................................C. verticillata  
16 Leaves, at least the lower, distinctly petioled on petioles 5-50 mm or more long.  
20 Ray flowers not toothed terminally (or rarely with a few with inconspicuous and irregular teeth); mid-cauline leaves palmately 3-foliolate, the terminal leaflet sometimes again 3-5-foliolate (sometimes giving an appearance of a pinnately 5-7-foliolate leaf), the leaflets 6-35 mm wide, 3-15× as long as wide; [section Gyrophyllum].  
20 Ray flowers apically with (2-) 4-5 teeth; mid-cauline leaves pinnate 5-11-foliolate, the leaflets either 3-15 mm wide and about 1-3× as long as wide, or 0.5-2 mm wide and > 20× as long as wide; [section Coreopsis].  
21 Disk flowers reddish; ray flowers usually with a basal red mark; leaflets of mid-cauline leaves 3-15 mm wide and about 1-3× as long as wide .................................................................C. basalis  
21 Disk flowers yellow; ray flowers yellow; leaflets of mid-cauline leaves 0.5-6 (-10) mm wide and > 10× as long as wide.  
22 Achenes wings fimbriate; [of granitic outcrops of the Piedmont of GA and AL] .................................................C. grandiflora var. saxicola  
22 Achenes wings entire; [collectively more widespread].  
23 Divisions of the midstem and upper cauline leaves with 1-3 divisions; plants reclining; flowering late June-July; [of dolomite glades in c. AL] ..............................................................................................................................................................................[C. grandiflora var. inclinata  
23 Divisions of the midstem and upper cauline leaves with > 5 divisions; plants erect; flowering May-late June; [of granite outcrops and disturbed areas].  
24 Larger divisions of midstem and upper stem leaves 2-6 (-10) mm wide .................................................................C. grandiflora var. grandiflora  
24 Larger divisions of midstem and upper stem leaves 0.5-1.5 mm wide .......................................................................C. grandiflora var. harveyana  

Coreopsis basalis (A. Dietrich) Blake, Texas Coreopsis. Cp (FL, GA, NC, SC, VA), Pd (GA): sandy roadsides and fields; common (uncommon in FL), native of farther west. May-July. Probably native only to e. TX, now distributed across the Coastal Plain from TX east to FL and north to NC. [= RAB, C, F, FNA, G, K, SE, WH, Z; > C. basalis var. basalis – Y]  

Coreopsis delphiniifolia Lamarrck, Larkspur Coreopsis. Cp (GA, SC, VA), Pd (GA, NC, SC), Mt (GA): dry woodlands; uncommon (rare north of GA). May-July. The species ranges from e. VA and s. NC south to c. GA, and se. TN (Polk County) (Chester, Wofford, & Kral 1997), and reputedly AL. Smith (1976) indicates that the species is an allopolyploid derivative (at 4x, 6x, and 8x) of C. major, C. tripteris, and C. verticillata. Its range extends south well beyond the range of C. verticillata. [= FNA, K; < C. major var. stellata – RAB; = C. delphiniifolia – F, G, S, SE (an orthographic variant); > C. delphiniifolia var. delphiniifolia – Y; > C. delphiniifolia var. chlooeida Sherff – Y; > C. major Walter var. linearis Small – Y; = C. delphiniifolia – Z]  

Coreopsis falcata Boynton, Pool Coreopsis. Cp (GA, NC, SC, VA), Mt (SC): peat bogs, very wet savannas, ditches and borrow pits in savannas; common (rare in VA). Early May-late July (rarely later, perhaps in response to growing season fire). The species is endemic to the Coastal Plain of se. VA (City of Chesapeake), e. NC, e. SC, and e. GA; disjunct in Oconee County, SC. First reported for VA by Wieboldt et al. (1998). C. falcata should not be included (as by Cronquist in C and SE) in C. gladiata; the two species are distinctive in ecological preferences, morphology, phenology, and distribution. [= RAB, GW, K, S, Y, Z; < C. gladiata var. gladiata – C, SE; < C. gladiata – FNA, WH]  

Coreopsis floridana E.B. Smith, Florida Coreopsis. Cp (FL): wet pine flatwoods; uncommon. Late September-January (-February). Pate┩ in FL south to s. FL (absent from FL). [= FNA, GW, K, WH, Z]  

Coreopsis gladiata Walter, Swamp Coreopsis. Cp (FL, GA, NC, SC), Mt (GA, NC, SC): swamp forests; rare (SC Rare). Mid-August-early November. Se. NC south to c. FL and west to s. MS; scattered inland as a disjunct in montane NC, SC, and GA. See C. helianthoides and C. linifolia for further discussion of the taxonomy of this group of species. [= RAB, S, Z; < C. gladiata var. gladiata – C, G, SE (also see C. falcata); < C. gladiata – FNA, GW, K, WH (also see C. helianthoides); > C. gladiata – Y; > C. longifolia Small var. longifolia – Y; > C. longifolia Small var. godfreyi Sherff – Y]  

Coreopsis grandiflora Hogg ex Sweet var. grandiflora, Large-flowered Coreopsis. Pd (GA, SC): in thin soils of rock outcrops, especially granitic flatrocks; rare. Late May-late June. Var. grandiflora ranges from c. GA and w. SC west to c. TX and e. OK, very scattered in distribution; it differs from var. harveyana in having the leaf divisions 2-6 mm wide (vs. 0.5-2 mm wide). [= F, K, Z; < C. grandiflora – RAB, FNA, G, S, W; < C. grandiflora var. grandiflora – C, SE (also see var. harveyana); > C. grandiflora var. grandiflora – Y; > C. grandiflora var. pilosa Sherff – Y]  

* Coreopsis grandiflora Hogg ex Sweet var. harveyana (A. Gray) Sherff, Large-flowered Coreopsis. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC, VA, WV): disturbed areas; rare, native of farther west. Late May-late June. As treated by Smith (1976), the species consists of 4 varieties. Var. harveyana is the most abundant variety, probably originally endemic to AR, n.
Coreopsis grandiflora Hogg ex Sweet var. saxicola (Alexander) E.B. Smith, Stone Mountain Coreopsis. Pd (GA): granitic outcrops; uncommon. As interpreted by Smith (1976) and Cronquist (1980), this variety is endemic to granite outcrops in e. GA and ec. AL and to sandstone outcrops in nc. AR; the AR plants, differing in morphology, phenology, karyotype, and distribution, may well warrant separate status. [= K, SE, Z; = C. grandiflora Hogg ex Sweet – FNA; = C. saxicola Alexander – S; > C. saxicola var. saxicola – Y; > C. saxicola var. duncanii Sherff – Y]

Coreopsis helianthoides Beadle, Beadle's Coreopsis. Cp (GA, NC, SC), Mt (NC), Pd (GA): swamp forests, swamp edges, and bogs; rare. September-October. Se. NC south to c. and w. FL and west to s. MS, with a disjunct occurrence in sw. NC. The validity of this taxon is controversial. Smith (1976) includes it in C. gladiata, considering it merely a pubescent form. Cronquist (in SE) regards it as distinct at the species level, despite his serious over-lumping of all its close relatives into a single species with two varieties: C. gladiata var. gladiata (including C. falcata and C. gladiata), and var. linifolia (including C. oniscicarpa and C. linifolia), [= RAB, S, SE, Y, Z; > H. gladiata – FNA, GW, K, WH]

Coreopsis integrifolia Poiret, Chipola Dye-flower. Cp (GA, SC): banks and floodplains of small blackwater streams (especially over limestone), edges of swamp forests bordering longleaf pinelands or bordering brackish marshes; rare (GA Special Concern). Mid August-early November. Se. SC south to FL Panhandle, apparently uncommon throughout its range. It is related to C. helianthoides and C. linifolia; the leaves are cauleine and opposite, and the petals are ciliolate. [= FNA, GW, K, S, SE, WH, Y, Z]

Coreopsis latifolia Michaux, Broadleaf Coreopsis. Mt (GA, NC, SC): in rich, moist, cove forests and slopes at medium elevations, primarily from 500 m in the Blue Ridge Escarpment to nearly 1500 m; rare (though often locally abundant). (July-) August-September. A Southern Appalachian endemic: sw. NC and se. TN (Polk County) (Chester, Wofford, & Kral 1997) south into nw. SC and ne. GA. This species is treated by Smith (1976) in a monotypic section (section Silphidium) of Coreopsis, and, indeed, it does not closely resemble our other species. Smith (1976) considered it a primitive species, with its closest relatives in Mexico, and all of his attempts to hybridize it with other Southernest Coreopsis failed. Flowering appears to be triggered by canopy tree-fall light gaps. It often occurs with Helianthus glaucophyllus. [= RAB, FNA, K, SE, W, Y, Z; > Leiodon latifolius (Michaux) Shuttleworth]

Coreopsis linifolia Nuttall, Savanna Coreopsis. Cp (FL, GA, NC, SC, VA): savannas, sandhill seeps, sandhill-pocosin ecotones; common (rare in VA). Early July-late October. Se. VA south to ne. and Panhandle FL, west to e. TX. Basal rosettes of this species are abundant in wet forests and can be distinguished readily by the distinctive leaves: very long-petiolate, about 1 cm across, the pinnate venation very neat (the main lateral veins straight and parallel to the other laterals on the same side of the leaf), with small dark dots when backlit, and very thick (ca. 1 mm) and stiff in texture. The proper taxonomic treatment of this taxon and its relatives remains unclear. Smith (1976) interpreted C. linifolia to range from se. SC south and west along the Coastal Plain to e. TX (with a few inland disjunctions) and to consist of two chromosome races, a diploid Gulf Coast race (w. FL to se. TX) and a tetraploid Atlantic Coast race (s. GA to se. VA), "not differing sufficiently morphologically to justify nomenclatural recognition." Fernald, however, named C. oniscicarpa (the tetraploid) based on morphologic characters. Given the existence of morphologic characters, the failure of Smith's attempted hybridizations of the two "races," his speculation that the tetraploid could be an allotetraploid (though likely an autotetraploid), and the allotropical ranges of the two races, specific recognition is plausible. Further study is needed. Cronquist (in C, G, SE) does not recognize C. oniscicarpa as distinct from C. linifolia, and reduces C. linifolia (sensu lato) to a variety of C. gladiata, also including C. falcata in the typic variety of C. gladiata. The abundant morphologic, phenologic, and ecologic differences between C. gladiata, C. linifolia, and C. falcata render such an approach undesirable. [= GW, K, W, Y, Z; = C. angustifolia Aiton – RAB, possibly misapplied; = C. gladiata var. linifolia (Nuttall) Cronquist – C, G, SE; > C. oniscicarpa Fernald var. oniscicarpa – F; > C. oniscicarpa var. simulans Fernald – F; < C. gladiata – FNA]

Coreopsis major Walter var. major, Woodland Coreopsis. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): woodlands; common (rare in GA, NC, SC, VA). May-July. W. VA, s. OH, and KY south to SC, GA, w. FL, s. AL, and s. MS. How to treat the "Coreopsis major complex" (here including C. major var. major, C. major var. rigida, C. delphinifolia, and C. verticillata) is not clear. The group apparently includes diploids and a variety of allopolyploids and autoployploids (at various ploidy's) variously derived from C. major var. major and C. verticillata. [= RAB, C, F, G, SE, W, Y; < C. major – FNA, K, S, WH, Z]

Coreopsis major Walter var. rigida (Nuttall) F.E.Boynston, Stiffleaf Coreopsis. Mt (GA, NC, SC, WV), Pd (GA, NC, SC), Cp (GA, NC, SC), {VA}: dry woodlands and forests; common (rare in WV). June-August. VA, WV, and KY south to w. FL, s. AL, s. MS, and se. LA. The recognition of varieties is problematic and controversial. [= C, SE, Y; > C. major var. stellata (Nuttall) B.L. Robinson – RAB, WV; > C. major var. stellata – F, G, Y; > C. major var. rigida – F, Y; < C. major – FNA, K, S, WH, Z]

Coreopsis nudata Nuttall. Cp (FL, GA): seasonally flooded pineland depressions, either herbaceous-dominated or under a canopy of Taxodium ascendens; uncommon. E. GA (in close proximity to SC) south to ne. FL and Panhandle FL, west to e. LA. [= FNA, GW, K, S, SE, WH, Y, Z]

Coreopsis pubescens Elliott var. pubescens, Common Hairy Coreopsis. Mt (NC, VA, WV), Pd (GA, NC), Cp (NC): forests, woodlands, and rock outcrops; common, rare in Piedmont and Coastal Plain (rare in VA and WV). July-September. The species as a whole is largely centered in the Southern Appalachians and Ozarks-Ouachitas, with scattered outlying occurrences;
var. *pubescens* has essentially the range of the species, from s. VA, s. KY, s. IL, and s. MO south to nw. FL, MS, and LA. Var. *robusta*, of the Southern Appalachians, is discussed below. [= F, GW, K, Y, Z; < C. *pubescens* – RAB, C, FNA, G, S, SE, W, WH, WV] 

**Coreopsis rosea** Nuttall. Cp (DE, GA, SC): upland depression ponds in the Inner Coastal Plain, drawdown zones on banks of blackwater rivers in the Outer Coastal Plain; rare. July-September. Coastal Plain of s. NS, MA, RI, NY (Long Island), NJ, DE, MD, e. SC, and e. GA, where it occurs on shores with fluctuating water levels, primarily on Coastal Plain pond shores, but also on river banks. It occurs in Horry County, SC, in the drawdown zone on the banks of the Waccamaw River; it should be sought in NC. It is immediately distinguishable from all our species by its pink to white ray flowers; another pink-rayed species, *C. nudata* Nuttall, ranges in the Coastal Plain from GA west to e. LA and has linear, terete, "juncoid" leaves. [= FNA, GW, K, S, SE, Y, Z] 

**Coreopsis species 1.** Cp (NC): calcareously influenced acid savannas; rare. September-October. Known from a single site on the Onslow-Pender county line, where growing with *Thalictrum cooleyi*, *Allium species 1*, and *Scleria species 1*. 

**Coreopsis tripteris** Linnaeus, Tall Coreopsis. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, VA): rich, moist woodlands and woodland borders, primarily over calcareous or mafic rocks or on nutrient-rich alluvium; common (uncommon in FL, GA, NC, SC, and VA). July-early September. MA, s. ON, and WI south to Panhandle FL and TX. [= RAB, C, FNA, G, K, S, SE, W, WH, WV; > C. *trip teris* var. *deamii* Standley – F; > C. *trip teris* var. *smithii* Sherff – F, Y; > C. *trip teris* var. *trip teris* – F, Y] 

**Coreopsis verticillata** Linnaeus, Threadleaf Coreopsis. Pd (NC, SC, VA), Cp (NC, SC, VA), Mt (NC, SC, VA, WV): dry sandy, rocky, or clayey woodlands and woodland borders; common (uncommon in Coastal Plain and Mountains, rare in WV Mountains). May-July. Smith (1976) indicates that the species consists of two chromosome races, a diploid, ranging in the Piedmont and Mountains from c. SC and NC north to ne. WV, and s. MD, and an allotetraploid, limited to the Coastal Plain of nc. NC and se. VA. The finely-divided leaves are attractive and the plant is cultivated horticulturally; scattered occurrences outside the ranges indicated above are escapes from cultivation. [= RAB, C, F, FNA, G, K, S, SE, W, WV, Y, Z] 

**Coreopsis leavenworthii** Torrey & Gray. AL and FL. [= FNA, K; > C. *leavenworthii* vars. – Y] [not yet keyed; synonymy incomplete] 

**Coreopsis pubescens** Elliott var. *debilis* (Sherff) E.B. Smith. Cp (FL): {habitat}; rare. C. TN south through AL and ne. MS to w. FL, s. AL, s. MS, and se. LA; it has very narrow leaf blades or terminal leaflets. [= GW, K, Z; < C. *pubescens* – FNA, G, S, SE; > C. *corni nularia* Sherff – Y; > C. *deblis* Sherff – Y] [not yet keyed] 

**Coreopsis pulchra** F.E. Boynton, Lookout Mountain Coreopsis. Nw. GA and ne. AL. [= FNA, K, S, SE, Y, Z] [not yet keyed] 

**Coreopsis atkinsoniana** (Douglas ex Lindley) H.M. Parker ex E.B. Smith. Mt (GA): roadsides; rare, apparently introduced eastward in nw. GA from a distribution in the w. North America. [= K; < C. *tinctoria* – FNA, SE; = C. *atkinsoniana* Douglas ex Lindley – Y] [not yet keyed; synonymy incomplete] 

**Cosmos** Cavanilles 1791 (Cosmos) 

1 Rays pink or white; ultimate leaf segments mostly ca. 1 mm wide or less .......................................................... *C. bipinnatus* 

1 Rays orange, yellow, or red; ultimate leaf segments mostly > 2 mm wide .......................................................... *C. sulphureus* 

**Cota J.** Gay ex Gussone 1845 (Golden Marguerite) 

Cotula Linnaeus 1753 (Brassbuttons)

1 Stems hairy; leaf blades 2-3× pinnately lobed; annual .............................................................. C. australis
1 Stems glabrous; leaf blades entire or with a few teeth or lobes; perennial .................................... C. coronopifolia

Crepis Linnaeus 1753 (Hawksbeard)

A genus of about 200 species, herbs, of the Northern Hemisphere, South America, and southern Africa. References: Bogler in FNA (2006a); Cronquist (1980)=SE. Key adapted from C and SE.  [also see Youngia]

1 Cypselas (at least the inner in the head) with a distinct narrow beak
2 Cypselas dimorphic, the inner beaked ................................................................. C. foetida
2 Cypselas monomorphic, all beaked.
  3 Stems coarsely setose, the setae yellowish; bractlets subtending the phyllaries 10-14, not reflexed.[C. setosa]
  3 Stems glabrate, hispid, or tomentose, if sparsely setose the setae blackish; bractlets subtending the phyllaries 5-12, reflexed ............................................................. C. vesicaria ssp. taraxacifolia

Crepis tectorum Linnaeus. Mt (NC), Cp (VA): disturbed areas; rare, perhaps not established, native of Europe. June-July.  [= C, F, FNA, G, K, S]

Crepis vesicaria Linnaeus ssp. taraxacifolia (Thuillier) Thellung. Mt (NC): lawns; rare, native of Mediterranean and w. Europe. Late May-July.  [= RAB, C, FNA, K, SE; ? Crepis vesicaria Linnaeus ssp. haenseleri (Boiss. ex A.P. de Candolle) P.D. Sell]

1 Cypselas (at least towards the summit, but not distinctly beaked).
  1 Cypselas (at least towards the base) hispid and viscid with stipitate glands; phyllaries glabrous on both the inner and outer surfaces; cypselas 4-6 mm long ................................................................. C. biennis
  4 Stems variously pubescent, but not viscid with stipitate glands; phyllaries variously pubescent on one or both surfaces; cypselas 1.5-7 mm long
  5 Inner surface of the inner phyllaries glabrous; outer surface stipitate-glandular and with 2 rows of black setae; cypselas 1.5-2.5 mm long ................................................................. C. capillaris
  5 Inner surface of the inner phyllaries pubescent with appressed, shining, white hairs 0.1-0.2 mm long; outer surface of phyllaries tomentose, hispidulous, or canescent, but the hairs not glandular and without setae; cypselas 3-7 mm long.
  6 Cypselas 4-7 mm long, yellowish- or reddish-brown, with 13-20 ribs; pappus 5-7 mm long; biennial ................................................................. C. biennis
  6 Cypselas 3-4 mm long, reddish- or purplish-brown, with 10 ribs; pappus 4-5 mm long; annual ................................................................. C. tectorum

Crepis foetida Linnaeus, Stinking Hawksbeard. [NC] native of Eurasia. April-September.  [= FNA, K]

Crepis setosa Haller f., Brittle Hawkbeard. Reported for Polk County, TN by Chester, Wofford, & Kral (1997) and from s. PA by Rhoads & Klein (1993).  [= C, FNA, K]  [not yet keyed]

Crotillon Rafinesque 1837 (Scratch-daisy)

Cyclachaena Fresenius 1838

Diaperia Nuttall 1840 (Dwarf Cudweed)

1 Heads ellipsoid to cylindrical, 3.5-4.5 mm high, 2-3× as high as wide; capitular leaves visible between and surpassing the heads; cypselas 0.9-1.2 mm long .............................................................. D. prolifera var. prolifera

1 Heads campanulate to spherical, 2-3.3 mm high, about 1× as high as wide; capitular leaves more-or-less hidden between and surpassed by the heads; cypselas 0.7-0.9 mm long.

2 Pistillate pales individally visible through thin, silky pubescence; heads spherical, the largest 2.5-3.3 mm high ................................................................. [D. verna var. drummondii]

2 Pistillate pales collectively hidden by dense woolly pubescence; heads campanulate the largest 2.0-2.5 mm long ............ D. verna var. verna

Diaperia prolifera (Nuttall) Nuttall var. prolifera, Cotton-rose, Bighed Pygmy-cudweed. Cp (*SC): disturbed areas, waste areas around wool-combing mill; rare, introduced from farther south and west (Nesom 2004d). May-June. MO west to MT, south to LA and TX; disjunct eastwards in the Black Belt prairies of AL and MS. [= FNA; < Filago prolifera (Nuttall ex A. P. de Candolle) Britton – Y, Z; < Evax prolifera Nuttall ex A. P. de Candolle – K, SE]

Diaperia verna (Rafinesque) Morefield var. drummondii, Gulf Coast Rabbit-tobacco. Dunes, beaches, disturbed sandy soils. AL west to TX. Mid February-mid May. [= FNA; = Evax verna Rafinesque var. drummondii (Torrey & A> Gray) Kartesz & Gandhi – K]

Ditrichia W. Greuter 1973

* Ditrichia graveolens (Linnaeus) W. Greuter. Cp (SC): waste area around wool-combing mill; rare, native of Mediterranean Europe, but quite possibly introduced into SC by wool from Australia (Nesom 2004d). [= FNA, K] {add to synonymy}

* Ditrichia viscosa (Linnaeus) Greuter. Cp (FL): disturbed areas, on ballast; rare, native of Mediterranean Europe. Collected as a ballast weed in Pensacola, Escambia County, FL, and elsewhere in eastern North America, in the late 1800s; it does not appear to be naturalized. [= FNA, WH; = Cupularia viscosa (Linnaeus) Godron & Grenier – S; = Inula viscosa (Linnaeus) Aiton – SE] {not keyed}

Doellingeria Nees 1832 (Flat-topped Aster)

A genus of about 7 species, herbs, of e. North America and e. Asia. This group of species has long been recognized as distinctive, sometimes given status as the genus Doellingeria (first by Nees in 1832), or as subgenus Doellingeria of Aster. Nesom (1993d) argues that Doellingeria should be separated from Aster, as its affinities seem to be at least as strongly to Solidago and its relatives, an assertion supported by molecular evidence (Noyes & Rieseberg 1999). References: Semple & Chmielewski in FNA (2006b); Nesom (1993d)=Z; Cronquist (1980)=SE; Nesom (2000b).

1 Disk flowers 4-14 per head; ray flowers 2-7 per head; leaves mostly 1.5-4× as long as wide; [of sandhill ecotones and streamhead pocosins of the Coastal Plain (primarily fall-line sandhills) from sc. NC southward] ............................................................................. D. sericocarpoides

1 Disk flowers 16-40 per head; ray flowers 5-14 per head; leaves 2-6× as long as wide; [collectively widespread in our area].

2 Plants with stems solitary or several from a crown, to 11 dm tall; leaves mostly 2-4 (-5)× as long as wide .................. D. infirma

2 Plants with stems scattered from creeping rhizomes (forming clonal patches), to 20 dm tall; leaves mostly 4-6× as long as wide ............... D. umbellata
**Doellingeria infirma** (Michaux) E. Greene, Appalachian Flat-topped White Aster. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, NC, VA): woodland borders, dry or dry-mesic woodlands, glades; common (rare in DE and FL). Late June-September. MA west to KY, south to SC, GA, Panhandle FL (Gadsden County), AL, and nc. TN. [= FNA, K, WH, Z; = Aster infirma Michaux – RAB, C, G, SE, W, WH; > Doellingeria infirma – S; > Doellingeria humilis (Willdenow) Britton – S, in part]

**Doellingeria seriocarpoideae** Small, Pocosin Flat-topped Aster. Cp (FL, GA, NC, SC): sandhill ecotones and streamhead pocosins; uncommon. Late July-October. Sc. NC south to ne. FL and Panhandle FL, west to AL; also in AR, OK, and TX. [= FNA, K, WH; Z; = Aster seriocarpoideae (Small) K. Schumann – SE; = A. umbellatus var. brevissimum Fernald – RAB, misapplied; > A. umbellatus var. latifolius A. Gray – GW; > Doellingeria humilis (Willdenow) Britton – S, in part, misapplied]

**Doellingeria umbellata** (P. Miller) Nees, Tall Flat-topped White Aster. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, VA): wet meadows, pastures, bogs, marshes, stream floodplains, roadbanks, to at least 1900 m; common (uncommon in DE, rare in Coastal Plain south of DE). August-September. NL (Newfoundland) west to MN, south to e. VA, w. NC, nw. SC (P. McMillan pers.comm. 2002), n. GA, ne. AL, TN, and KY. [= S, Z; = Aster umbellatus P. Miller – C, G, SE, W, WH; > Doellingeria umbellata var. umbellata – FNA, K]

**Dracopis** Cassini 1825 (Coneflower)

**Dracopis amplexicaulis** (Vahl) Cassini. Cp (FL, SC*), Pd* (GA*): prairies, calcareous bottomlands, dry open areas, disturbed areas, waste areas near wool-combing mill; rare, introduced at least in part in our area. Native to prairie-like areas and calcareous bottomlands from GA (?) and AL west to KS and TX; reported for nc. GA (Jones & Coile 1988) and introduced in SC (Nesom 2004d). [= K, SE, WH; = Rudbeckia amplexicaulis Vahl – F, FNA]

**Dyssodia** Cavanilles 1802

**Echinacea** Moench 1794 (Purple Coneflower)

A genus of 4-9 species, herbs, endemic to e. and c. North America. There has been considerable medicinal use of extracts from many of the species, and collection of plants from the wild to meet the demand of the herbal trade has extirpated many populations, particularly in c. United States. Foster (1991) presents a lengthy and detailed discussion of medicinal uses of *Echinacea*, along with considerable information on the biology, conservation needs, taxonomy, and nomenclatural history of the genus. Binns, Baum, & Arnason (2002) provide no rationale for their approach of recognizing the same number of taxa as McGregor, but treating them as 4 species and 10 varieties; the entities seem to be distinct at the specific level. References: Urbatsch, Neubig, and Cox in FNA (2006c); Baskin, Snyder, & Baskin (1993)=Z; Foster (1991)=Y; Cronquist (1980)=SE; Binns, Baum, and Arnason (2002)=X; McKeown (1999); Gaddy (1991); McGregor (1968).

1 Leaves lanceolate to ovate, the larger > 5 cm wide, the stem leaves well-developed, though smaller than the basal.
2 Leaves glabrous on both sides, or scabrous above; chaffy bracts (pales) ca. 9 mm long, the awns about a fourth as long as the body of the pales and with incurved tips; rays 3.5-8 cm long, strongly drooping................................................................. **E. laevigata**
3 Leaves pubescent or scabrous on both sides; chaffy bracts (pales) 10-13 mm long, the awns about half as long as the body of the pales and with straight tips; rays 2.5-5.5 cm long, horizontal to slightly drooping................................................................. **E. purpurea**
1 Leaves lanceolate to linear, the larger < 5 cm wide, stem leaves few and poorly developed, the basal leaves predominant.
3 Rays curved upward, medium pink, 2.5-3.2 cm long; [endemic to calcareous glades in c. TN].................................................. [E. tennesseensis]
4 Fresh pollen white......................................................................................................................................................... **E. pallida**
4 Fresh pollen pale to bright yellow........................................................................................................................................... **E. simulata**

**Echinacea laevigata** (C.L. Boynton & Beadle) S.F. Blake, Smooth Purple Coneflower. Pd (NC, VA), Mt (GA, SC, VA), Cp (SC): open woodlands and glades over mafic or calcareous rocks, such as diabase, limestone, and dolostone, rarely in oak-pine savannas of the upper Coastal Plain over circumneutral clay sediments; rare. Late May-July. The species is an eastern sibling of *E. purpurea*. In NC, this attractive, medicinal plant is now limited to a few populations in Durham, Granville, and Rockingham counties. Extensive populations occur over Elbrook Dolomite in Montgomery, VA. Populations of this species in sandy soils of the Coastal Plain of SC have been variously interpreted as native or introduced (Nelson & Kelly 1997). [= RAB, C, F, FNA, K, S, SE, W, X, Y; = E. purpurea var. laevigata (C.L. Boynton & Beadle) Cronquist – G]
ASTRACCEAE

?? Echinacea pallida (Nuttall) Nuttall, Pale Purple Coneflower. Pd (GA, NC?, VA), Mt (VA), Cp (GA): roadsides; rare, perhaps introduced in part from c. US (GA Special Concern, NC Watch List). June-July. ON west to MI, WI, and NE, south to IN, IA, and TX; disjunct eastwards in TN, AL, GA, SC, NC, and VA, where probably but uncertainly native. Some at least of the eastern populations considered to be E. pallida are actually the closely related E. simulata; additional work is needed to disentangle the relative distributions of these two species in our area. [= RAB, FNA, K, Y, Z; < E. pallida var. pallida – C, SE; < E. pallida – F, G, W; = E. pallida var. pallida – X]

Echinacea purpurea (Linnaeus) Moench, Eastern Purple Coneflower. Mt (NC, VA*, WV*), Pd (NC, VA*), Cp (FL): open woodlands, roadsides, some of the occurrences persistent or spread from cultivation; rare. OH, WI, and IA south to FL and TX; introduced more broadly as in ne. United States and ON, the exact limits of the native distribution unclear. [= RAB, C, F, FNA, K, SE, W, WH, X, Y; = E. purpurea var. purpurea – G]

Echinacea simulata R.L. McGregor, Prairie Purple Coneflower. Mt (GA!, VA*?), Pd (NC!, VA*?), Cp (NC!): prairies, roadsides; rare. June-July. IN, IL, and MO south to KY and TN; some of the more eastern disjunct populations previously considered to be E. pallida are actually E. simulata; additional work is needed to disentangle the relative distributions of these two species in our area. GA native populations (Floyd Co.) are E. simulata. [= FNA, K, Y, Z; < E. pallida var. pallida – C, SE, < E. pallida – F, G, W; = E. pallida (Nuttall) Nuttall var. simulata (McGregor) Binns, B.R. Baum, & Arnason – X]

Echinops Linnaeus (Globe-thistle)

A genus of about 120 species, herbs, of temperate and subtropical Europe, Asia, and Africa. References: Keil in FNA (2006a).

Eclipta Linnaeus 1753

A genus of 4 species, herbs, of temperate, subtropical, and tropical regions. References: Strother in FNA (2006c); Cronquist (1980)=SE.

Eclipta prostrata (Linnaeus) Linnaeus, Yerba-de-tajo. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): moist or wet disturbed areas, ditches, shores, disturbed bottomlands; common (uncommon in Mountains). June-November. MA west to WI, south to s. FL and TX, and southward into the tropics. [= C, FNA, K, WH; = E. alba (Linnaeus) Hasskraft – RAB, F, G, GW, SE, W, WV; = Verbesina alba Linnaeus – S]

Elephantopus Linnaeus 1753 (Elephant's-foot)

Identification notes: The acaulescent species are easily and often confused with Vernonia acaulis, especially when sterile. Vernonia has leaves scariosus above and sparsely pilose to glabrate beneath; Elephantopus has leaves sparsely pilose above, densely pilose or tomentose below. Vernonia leaves tend to have a more acute apex, and the veins above are more strikingly differentiated in their color (white or pink) from the adjacent leaf tissue. When in flower, the presence of subtending foliose bracts below the compound glomerule of heads in Elephantopus (versus the absence of foliose bracts below the simple head in Vernonia) is diagnostic.

1 Leaves cauline, the stem with well-developed leaves over 10 cm long............................................................ E. carolinianus

1 Leaves basal, the stem scapose or with a few leaves much smaller than the basal, usually < 8 cm long.

2 Longest phyllaries 10-13 mm long; pappus 6-8 mm long; basal leaves 5.5-10.5 cm wide, usually at least some on a plant > 7 cm wide; leaves pubescent on the midrib below with spreading or reflexed hairs; [of the Coastal Plain, Piedmont, and rarely the Mountains]. .....

............................................................ E. tomentosus

2 Longest phyllaries 6-9 mm long; pappus 3-4.5 mm long; basal leaves 1.5-7.5 cm wide, rarely any on a plant > 7 cm wide; leaves pubescent on the midrib below with appressed or spreading hairs; [of the Coastal Plain, and rarely the lower Piedmont].

3 Phyllaries densely villous with white hairs (0.3-) 0.5-1.0 mm long, the punctate glands obscured; cypselas 3-3.5 mm long; [of e. SC southward]................................................................. E. elatus

3 Phyllaries punctate-glandular, also sparsely pubescent with hairs 0.05-0.3 (-0.5) mm long; cypselas 2.5-3.0 mm long; [widespread in our area].................................................................................. E. nudatus

**Elephantopus elatus** Bertoloni, Southern Elephant's-foot. Cp (FL, GA, SC): pine barrens; common (rare in GA and SC). Late August-September. E. SC south to s. FL, west to se. LA, on the Coastal Plain. [= RAB, FNA, K, S, SE, WH, Z]

**Elephantopus nudatus** A. Gray, Coastal Plain Elephant’s-foot. Cp (DE, FL, GA, NC, SC, VA), Pd (NC, SC, VA): woodlands and woodland borders, usually fairly dry; common (rare in Piedmont, rare in DE). Late July-September. DE south to n. peninsular FL, west to e. TX, north in the interior to w. NC, KY, and south to Chiapas, Mexico. [= RAB, C, F, FNA, G, K, S, SE, WH, Z]

**Elephantopus tomentosus** Linnaeus, Common Elephant’s-foot. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): woodlands and woodland borders, usually fairly dry; common (rare in Mountains). August-November. MD south to Panhandle FL, west to e. TX, north in the interior to w. NC, KY, and south to Chiapas, Mexico. [= RAB, C, F, FNA, G, K, S, SE, WH, Z]

**Emilia** Cassini 1817 (Tasselflower)

A genus of 50-100 species, of the Old World. References: Barkley in FNA (2006b); Cronquist (1980)=SE.

1 Leaves well-distributed along the stem, with at most few and shallow lobes; corollas salmon or red-orange; involucre 1-2 (-3)× as high as wide. ................................................................. **E. megalocarpa**

1 Leaves mostly on the lower portion of the stem, the larger lyrate-pinnatifid; corollas lilac; involucre 3-4× as high as wide. ................................................................. **E. hieraciifolia**

* **Emilia sonchifolia** (Linnaeus) A.P. de Candolle var. sonchifolia, Lilac Tasselflower. Cp (FL, SC), Pd (GA): disturbed areas, native of the Old World tropics. The occurrence of this species in SC was first reported by Nelson & Kelly (1997); it is unclear how well established *Emilia* is in the northern part of our area. See Anderson (2007) for FL Panhandle record. [= FNA, K; < *E. sonchifolia* – S, SE, WH]

**Erechtites** Rafinesque 1817 (Fireweed)

A genus of about 12-15 species, American and Australian. Barkley in FNA (2006a) points out that the genus should be treated as masculine gender. References: Barkley in FNA (2006b); Cronquist (1980)=SE. Key based in part on C and FNA.

1 Denuded receptacle 5-8 mm in diameter; achenes 2-3 mm long, with 10-12 ribs. ................................................................. **E. megalocarpa**

1 Denuded receptacle 9-12 mm in diameter; achenes 4-5 mm long, with 16-20 ribs. ................................................................. **E. hieraciifolia**

**Erechtites hieraciifolia** (Linnaeus) Rafinesque ex de Candolle, Fireweed. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): in disturbed soil in nearly all habitats except the extremely xeric, present in most parts of the modern (beat-up) landscape at least as seedlings, liable to turn up at the smallest disturbance (such as small tree-fall tip-up mounds or campfires, even in large natural areas), most abundant in areas extensively disturbed or scarified by timber-harvest, bulldozing, or severe fire; common. Late July-September. DE south to s. FL and e. TX; West Indies. Ecologically filling something of the same role in the north as the other (unrelated) "fireweed" in the north, *Epilobium angustifolium*. The only other species in our area as adept at appearing (seemingly from nowhere) at small soil disturbances in forests are *Phytolacca americana* and the moss *Atrichum angustatum* (Brid.) BSG. [= *E. hieraciifolia var. hieraciifolia* – C, G, K, SE; < *E. hieraciifolia* – RAB, GW, S, W, WV; > *E. hieraciifolia var. hieraciifolia* – F; > *E. hieraciifolia var. hieraciifolia* – F; > *E. hieraciifolia var. intermedia* Fernald – F; > *E. hieraciifolia var. praetulsa* (Rafinesque) Fernald – F; = *E. hieraciifolia var. hieraciifolia* – F; = *E. hieraciifolia var. megalocarpa* – F; < *E. hieraciifolia* – WH]

**Erechtites megalocarpa** (Fernald) Cronquist. Coastal marshes (brackish or salty) from MA to NJ and should be sought in our area, especially in VA. As the differences between this and *E. hieraciifolia* consist of multiple, non-overlapping morphological characters, the presumption should be to treat the two as specifically distinct. [= *E. hieraciifolia var. megalocarpa* – C, G, K; = *E. megalocarpa* Fernald – F, orthographic variant; = *E. hieraciifolia var. megalocarpa* – FNA]

**Erigeron** Linnaeus 1753 (Daisy Fleabane)

A genus of about 150 species, nearly cosmopolitan. References: Nesom in FNA (2006b); Cronquist (1980)=SE; Allison & Stevens (2001)=Z. Key adapted from those references. [also see *Conyza*]
1 Stem leaves sessile; pappus of the pistillate (ray) flowers consisting only of a few, slender scales, < 1 mm long (visible at 20× magnification); annual or perennial (rarely biennial).
2 Stem leaves many, mostly toothed, the larger > 1 cm wide; pubescence of the mid-stem long and spreading………………..E. annuus
2 Stem leaves few, mostly entire, the larger usually < 1 cm wide; pubescence of the mid-stem usually short and appressed.
3 Phyllary hairs flattened, 0.5-1.2 mm long; stem hairs appressed to spreading, 0.5-1.0 mm long………………..[E. strigosus var. septentrionalis]
3 Phyllary hairs terete, mostly 0.1-0.5 mm long; stem hairs appressed to spreading, 0.1-0.4 (-0.8) mm long.
4 Plants annual (rarely biennial), lacking rhizomes; [of various, often weedy, habitats]………………..E. strigosus var. strigosus
4 Plants perennial, rhizomatous; [plants of shallow soil over calcareous rock.
5 Basal leaves obovate or spatulate, 3.2-3.8 (-5.1) mm wide; cauline leaves glabrous, except along the midvein and the ciliate margins; [of limestone glades and barrens of c. TN, nw. GA, and n. AL]………………..E. strigosus var. calcicola
5 Basal leaves linear-oblong, 1.3-3.5 (-6) mm wide; cauline leaves sparsely to moderately stipitate; [of dolostone glades of c. AL (Bibb Co.).]
6 Plants trailing or ascending, rooting at the nodes, and with stolons ………………………………………..[E. procumbens]
6 Plants erect (sometimes the shoots curled at the base but ultimately vertical).
7 Stem leaves not clasping; basal leaves fleshy; rays 25-40, white, 0.5-1.3 mm wide; [of moist to wet habitats of the Coastal Plain] ………… ………………………………..E. vernus
7 Stem leaves clasping; basal leaves herbaceous; rays 50-400, pink, blue, purplish, or white, either 0.3-0.5 mm wide (in E. philadelphicus var. philadelphicus, E. quercifolius, and E. tenus) or 0.8-1.2 mm wide (in E. pulchellus var. pulchellus); [of more general distribution and habitat].
8 Disk corollas 4-6 mm long; rays 50-100, 0.8-1.2 mm wide.
9 Stems and leaves glabrous …………………………………………..E. pulchellus var. brauniae
9 Stems and leaves densely pubescent with long hairs …………………………………………………………E. pulchellus var. pulchellus
10 Involucre 4-6 mm high; rays 150-400, white to deep pink, 2.5-5 (-6) mm long………………..[E. philadelphicus var. philadelphicus]
10 Involucre 2.5-4 mm high; rays 60-250, blue-lavender (rarely white to pink), 2.5-5 (-6) mm long.
8 Pappus simple; stem spreading pubescence in addition (or appressed pubescence in the upper third only); rays 100-250………………… ………………………………………..E. quercifolius
11 Pappus double, with short outer setae in addition to the long slender bristles; stem appressed pubescence in at least the upper half; rays 60-120……………………………………………………………………………………..E. tenus

**Erigeron philadelphicus** Linnaeus var. philadelphicus, Philadelphia-daisy. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): roadways, meadows, disturbed areas; common (uncommon in FL, NC, SC, and VA Coastal Plain). April-August. NL (Newfoundland) west to BC, south to FL and TX. Var. scaturicola Fernald, of bluffs along the James River in VA, seems to be merely an extreme form. Other varieties [var. glaber Henry and var. provancheri (Victorin & Rouss.) Boivin] may have more merit. [= FNA, K; < E. philadelphicus – RAB, C, G, GW, S, SE, W, WH, WV; > E. philadelphicus var. philadelphicus – F; > E. philadelphicus var. scaturicola Fernald – F]

**Erigeron pulchellus** Michaux var. brauniae Fernald. Mt (WV): sandy woodlands and forests, riverbanks; uncommon. April-June. MD, WV, and s. OH south to KY. [= C, F, FNA, G, K, WV]

**Erigeron pulchellus** Michaux var. pulchellus, Robin’s-plantain. Mt (DE, GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): moist slopes, coves, limestone bluffs, trail margins, roadbanks; common (uncommon in Coastal Plain, rare in FL). April-early June. ME west to MN, south to Panhandle FL (Jackson County), GA, and TX. In addition to the widespread var. pulchellus, and the Alleghenian var. brauniae. *E. pulchellus* has an additional local variety, *tolstedtii* Cronquist, of se. MN. [= C, F, FNA, G, K, SE, WV; < E. pulchellus – RAB, GW, S, W, WH]

**Erigeron quercifolius** Lamarck, Oak-leaved Fleabane. Cp (FL, GA, NC, SC, VA): sandy roadways, disturbed areas; common, rare in VA. April-June. Se. VA south to s. FL, west to TX, north in the interior to TN; Bahamas. [= RAB, C, F, FNA, G, K, SE, WH]

**Erigeron strigosus** Muhlenberg ex Willdenow var. calcicola J. Allison, Cedar Glade Daisy Fleabane. Mt (GA): limestone glades; rare. (April-) May-October. Central basin of TN (Allison & Stevens 2001), nw. GA (GANHP) and n. AL. [= FNA, Z]

**Erigeron tenus** Torrey & A. Gray, Midwestern Fleabane. Cp (FL): disturbed areas; rare. FL Panhandle (Okaloosa County) and AL west to KS, OK, and TX. Reported for w. NC (Nesom 1980); but later discounted (Nesom in FNA 2006b). Mid March-May (sporadically later). [= FNA, K, SE, WH]

**Erigeron procumbens** (Houtoum ex Miller) Nesom, Corpus Christi Fleabane. Moist to dry coastal areas, including marsh edges. S. MS (?), LA, TX, Tamaulipas, Veracruz. [= FNA, K; < E. myriacantha Small – S, SE]
A genus of about 40 species, herbs, of e. North America and Eurasia (after the exclusion of Ageratina, Chromolaena, Conoclinium, Eutrochium, Fleischmannia, and other genera). I have differed considerably from Cronquist's treatments, as for instance in SE, regarding the rank at which to recognize taxonomic entities in Eupatorium. In the Southeastern United States, Eupatorium is a reticulately evolved complex, including diploids, triploids, and tetraploids; derivatives of hybridization produce sterile pollen but in some cases reproduce vigorously via agamospermous production of seeds. In some cases, these entities form separate populations from their presumed parental species, with distinctive ranges and habitats and more-or-less distinctive morphology. Cronquist treats morphologically highly distinctive entities, such as E. pinnatifidum, as full species, while stating that they are "not long-persistent." He treats morphologically more subtle entities as varieties of one of the two presumed parental species, such as E. album var. vaseyi ("very probably derived by hybridization of E. album var. album and E. sessiliflorum"). Other entities, difficult to distinguish morphologically from another species, he does not recognize, as for instance E. saltuense, included as a synonym under E. altissimum ("E. saltuense may reflect hybridization between E. altissimum and some other species such as E. album, or possibly between E. hyssopifolium and E. album").

A species concept that stresses ecological, biological, and distributional independence seems preferable. When plants of a putative hybrid occur in substantial populations, reproducing independently of one or both alleged parents, and in geographically and/or ecologically distinctive situations they should be treated as a separate species. Only field observations and studies can provide the necessary information. I have seen no evidence that E. ×pinnatifidum (though morphologically strikingly distinctive) occurs independent of its parents; thus I treat it as a hybrid (see below). E. vaseyi regularly occurs without one or both of its presumed parents, forms fertile achenes, occurs in large populations, and (in NC) is distributionally more limited than its presumed parents (Sullivan 1978). Biologically, it is best treated as an allopolyploid species; its treatment as a variety leads to conceptual and nomenclatural problems (reflected in the synonymy above): of which species should it be a variety?

In additional to its postulated "ancient origin," E. saltuense appears to occur in NC in habitats different from any of its variously alleged parents; for these reasons it seems best to treat E. saltuense as an allopolyploid species as well. Species in our flora believed to be of allopolyploid derivation include E. anomatum, E. cordigerum, E. godfreyanum, E. linearifolium, E. mohrii, E. pubescens, E. saltuense, E. torreyanum, and E. vaseyi. References: Siripun & Schilling in FNA (2006c); Cronquist (1980)=SE; Godfrey (1949). The key adapted from those references. (also see Ageratina, Chromolaena, Conoclinium, Eutrochium, Fleischmannia, Muhlenberg ex Willdenow var. septentrionalis (Fernald & Wiegand) Fernald. Scattered in n. North America, south to NY, TN (FNA), AR, OK, WY, CA. [= C, FNA, F, G, K].

**Key A** – leaves pinnatifid or pinnate into linear or capillary segments (Dog-fennels)

1 Stem glabrous throughout, or short-pubescent in the lower portion only; inflorescence paniculate, the panicle branches recurved, the heads secundly arranged.................................................................................................................. **E. leptophyllum**
2 Leaves bright green, glabrous, sparsely glandular-punctate, segments of the basal leaves 1-1.5 mm wide, segments of the upper leaves 0.2-0.5 mm wide.................................................................................................................. **E. capillifolium**
3 Leaves grayish-green, pubescent, densely glandular-punctate, segments of the basal leaves 2-5 mm wide, segments of the upper leaves 1-2.5 mm wide................................................................. **E. compositifolium**
Key B – leaves simple, flowers usually 5 per head

1 Phyllaries acuminate to attenuate.

2 Larger leaves 0.2-1.3 cm wide; stems puberulent; involucre 3.5-7 mm high.

3 Rhizome absent to < 2 cm long; leaves usually reflexed-spreading to spreading-ascending, the larger (5-) 6-13 mm wide; leaf margins and surfaces moderately to densely strigose; involucre 5-8 mm long; pappus (3.3-) 3.9-5.0 mm long; corolla:pappus length ratio 0.63-0.89; mature achene 2.2-3.5 mm long. ................................................................. E. leucolepis

3 Rhizome 2-20 cm long; leaves usually ascending to erect-recurred, the larger 2-4.5 mm wide; leaf margins and adaxial surface glabrous to sparsely strigose; involucre 3.5-5.5 mm long; pappus 2.7-4.1 mm long; corolla:pappus length ratio 0.83-1.00; mature achene 1.6-2.3 mm long. ................................................................. E. patudicola

2 Larger leaves 1.5-3 (-4) cm wide; stems villous to puberulent; involucre 8-11 mm high.

4 Leaves with few or no resin-glands; phyllaries glabrous, lacking resin-glands; [of the Coastal Plain of GA, Panhandle FL, AL, and MS] ................................................................. E. petalotetum

4 Leaves with resin-glands; phyllaries puberulent to villous (at least towards the base and on the midrib); [collectively widespread]

5 Leaves 3-nerved from the base; leaves 4-7 mm long; 10-20 mm wide; [of DC, DE, NJ, and NY] ............ E. album var. subvenosum

5 Leaves 3-nerved from above the base; leaves 5-11 cm long; 10-40 mm wide; [collectively widespread]

6 Leaves pubescent, the pubescence short to long; phyllaries generally attenuate (rarely acuminate); leaves (2.5-) 3-6× as long as wide; leaf apices obtuse; teeth obtuse or rounded ................................................................. E. album var. album

6 Leaves sparsely pubescent to nearly glabrous, the pubescence generally short; phyllaries generally acuminate, sometimes abruptly so; leaves 2-4× as long as wide; leaf apices acute to acuminate; teeth sharp................................................................. E. vaseyi

1 Phyllaries acute to obtuse.

7 Leaf bases broadly cuneate, truncate, or suborbicular, the leaves generally distinctly broadest near the base.

8 Leaves (2.5-) 3-6 (-7)× as long as wide; plants glabrous below the inflorescence.

9 Leaves subcoriaceous, the larger ones 8-18 cm long, 3-6 cm wide, averaging about 3× as long as wide. ................................................................. E. sessilifolium var. brittonianum

9 Leaves membranaceous, the larger ones 9-18 cm long, 2-4 cm wide, averaging about 5× as long as wide ................................................................. E. sessilifolium var. sessilifolium

8 Leaves 1-3 (-5.5×) as long as wide; plants pubescent below the inflorescence

10 Leaves pinnately veined ................................................................................................................. E. godfreyanum

10 Leaves 3-veined from the base or just above it.

11 Leaves averaging (1.5) 2-2.5× as long as wide, usually with a purple border; upper leaves and main inflorescence branches often alternate ................................................................. E. pilosum

11 Leaves averaging 1-2× as long as wide, usually lacking a purple border; upper leaves and main inflorescence branches usually all opposite.

12 Leaf base broadly rounded, cordate-clasping; leaves very densely pubescent, the pubescence often harsh; larger leaves usually 4-10 cm long; principal pair of lateral veins diverging from the midrib 2-10 mm above the base of the leaf; toothing of leaf often irregular and coarse ................................................................................................................. E. cordigerum

12 Leaf base cuneate, broadly cuneate, rounded, or cordate (but not clasping); leaves densely to sparsely pubescent; larger leaves usually 2-6 cm long; principal pair of lateral veins diverging at the base or 2-10 mm above the base of the leaf; toothing of leaf regular and relatively fine.

13 Leaves mostly 1-1.5 (1.7×) as long as wide, tending to be obtuse (the apex usually 90º or more), the teeth generally rounded (the 2 sides of each tooth usually distinctly convex-curved, the end of the tooth therefore rounded), the principal pair of lateral veins diverging directly from the base of the midrib ................................................................. E. rotundifolium

13 Leaves mostly (1.2-) 1.5-2× as long as wide, tending to be acute (the apex usually 90º or less), the teeth generally rather sharp (the 2 sides of each tooth slightly to gently curved to the end of the tooth therefore triangular), the principal pair of lateral veins diverging 2-10 mm above the base of the midrib.

14 Leaves broadly cuneate to broadly rounded, thin in texture, the pubescence rather soft and long (and also often sparse), the leaf blade not twisted at base, not borne in a vertical plane, up to 10 cm long and 6.5 cm wide ................................................................. E. pubescens

14 Leaves distinctly cuneate, firm in texture, the pubescence rather harsh and short, the leaf blade twisted at the base, thus borne in a vertical plane, up to 5.5 cm long and 3 cm wide ................................................................................................................. E. scabridum

7 Leaf bases narrowly cuneate, the leaves generally broadest near the middle or toward the tip.

15 Plants from conspicuously tuberous/thickened (ca. 1 cm in diameter) horizontal rhizomes; leaves deflexed, spreading, or ascending.

16 Leaves 15-30 mm wide, spreading or ascending ................................................................................................................. E. anomalum

16 Leaves 12-23 mm wide, deflexed to erect-ascending.

17 Leaves erect-ascending, 2-3.5 mm wide; pappus 4.0-5.4 mm long ................................................................................................................. E. mohrii × paludicola

17 Leaves deflexed to spreading, 3-12 mm wide; pappus 2.5-3.3 mm long.

18 Stems 3-6 (-7) dm tall, often erectly branching from near the base; involucres 3-4 mm high, the bracts with rounded apices ................ E. recurvans

18 Stems (6-) 10-15 dm tall, not branching near the base; involucres 5-7 mm high, at least some of the inner bracts with acute apices ................................................................................................................. E. mohrii

15 Plants from crowns or caudices; leaves usually spreading or ascending (not deflexed).

19 Plants generally with numerous branches from at or near the base, the axillary shoots of the lower internodes elongating; leaves 2-5 cm long, oblanceolate.

20 Leaves broadly oblanceolate, 5-15 mm wide, crenate or serrate in the upper half ................................................................................................................. E. glaucescens

20 Leaves narrowly oblanceolate, 3-8 mm wide, entire or remotely serrate apically ................................................................................................................. E. linearifolium

19 Plants generally simple below the middle, the axillary shoots of the lower nodes not elongating (except in response to injury of the main stem); leaves 3-12 cm long, lanceolate or linear.

21 Leaves mostly 6-40× as long as wide, the larger ones usually < 10 mm wide, ranging from 1-12 mm wide, whorled or opposite (rarely alternate above).
Eupatorium album Linnaeus var. album. White-bracted Thoroughwort. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry woodlands; common (rare in Mountains, uncommon in Piedmont). Late June-September. CT, NY, OH, and TN, south to FL and LA. Var. glandulosum is alleged to differ from var. album in having the involucres with copious dark glands (vs. glandless or nearly so). The distinction warranted. = FNA; GW, K, SE; < E. ×cordigerum

Eupatorium alatum Fernald, Tall Thoroughwort. Pd (GA, NC, VA), Mt (GA, VA, WV), Cop (FL): woodlands, old fields, woodland borders, and openings over rocky beds (such as diabase) or calcareous rocks (such as limestone and calcareous sandstone); common (uncommon in WV, rare south of VA, rare in Coastal Plain). Late August-October. CT, NY, QC, MN, and NE, south to Panhandle FL and TX, primarily in the midwest, especially on limestone substrates, and uncommon east of the mountains. = RAB, F, G, S, W, WV; < E. altissimum – C, FNA, K, SE, WH (also see E. saltuense)

Eupatorium anomalous Nash, Anomalous Eupatorium. Cp (FL, GA, NC, VA): moist savannas, moist interdune swales; rare. August-October. E. anomalous is believed to be a triploid and tetraploid, apomictic derivative of the hybrid E. mohrii × serotinum. Se. VA south to c. peninsular FL and west to s. AL. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. = FNA, GW, K, SE; < E. recurvans – RAB, < E. anomalum – C, FNA, K, SE (also see E. saltuense)

Eupatorium cannabinum Linnaeus, Hemp-agrimony. Cp, Pd (VA): disturbed areas; rare, perhaps merely a waif or garden remnant, native of Europe. July-September. The documentation for VA is an 1899 specimen from Fairfax County and a record from Westmoreland County. = FNA, K

Eupatorium compositifolium Walter, Coastal Dog-fennel, Yankeeweed. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA): sandy disturbed areas; common. September-December. S. VA, KY, and OK south to s. FL and TX. This species, like E. compositifolium, is an excellent indicator of soil disturbance. At its northern limit, in se. VA, this species occurs on riverbanks, in the seasonally exposed drawdown zone (Fleming & Ludvig 1996). = RAB, FNA, GW, K, S, SE, W

Eupatorium cordigerum (Fernald) Fernald, Clasping Roundleaf Eupatorium. Cp (NC, SC, VA): woodlands; rare. July-August. VA, NC, and SC west to AR and MS. This taxon is an apomictic, polyploid derivative of the hybrid E. perfoliatum × rotundifolium. = F; > E. rotundifolium var. ovatum – RAB, G (also see E. pubescens) = E. rotundifolium var. cordigerum Fernald – C, K, SE; = E. ×cordigerum (Fernald) Fernald – FNA; < E. rotundifolium GW; < E. pubescens – S

Eupatorium glaucescens Elliott, Wedgeleaf Eupatorium, Broadleaf Bushy Eupatorium. Cp (GA, NC, SC, VA): sandhills, dry sandy woodlands; common (rare in VA). Late July-October. Widespread in the Southeastern Coastal Plain, ranging from se. VA south to FL and west to s. This name E. cuneifolium must be rejected on nomenclatural grounds (Gandhi & Thomas 1991). = K; < E. cuneifolium Willdenow – RAB, C, G, SE (also see E. linearifolium); ? E. cuneifolium var. cuneifolium – F; = E. cuneifolium – S; < E. linearifolium Walter – FNA, WH

Eupatorium godfreyanum Cronquist, Godfrey's Eupatorium. Pd (GA, NC, VA), Mt (NC, VA, WV), Cp (VA): dry woodlands; common (uncommon in VA Coastal Plain, uncommon in WV Mountains, rare in GA and NC). July-September; August-October. NJ, MD, and WV south through VA to nc. NC and TN, reaching its greatest abundance in w. VA. See Cronquist (1985) for additional information and illustrations. Siripur & Schilling (2006) confirmed that this species is of hybrid origin from E. rotundifolium and E. sessilifolium. = C, FNA, K; < E. sessilifolium var. vaseyi (Porter) Fernald & Griscom – RAB; < E. sessilifolium var. vaseyi (Porter) Fernald & Griscom – F; < E. vaseyi Porter – G; < E. sessilifolium – SE

Eupatorium hyssopifolium Linnaeus, Hyssopleaf Eupatorium. Cp (DE, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): roadbanks, pastures, fields, disturbed areas, dry woodlands; common (rare in Mountains). Late July-
October. MA south to GA and west to TN and LA. [= E. hyssopolifolium var. hyssopolifolium – C, FNA, G, SE, W; < E. hyssopolifolium – RAB, WV (rejected) (also see E. torreyanum); > E. hyssopolifolium var. hyssopolifolium – F, K; > E. hyssopolifolium var. calcaratum Fernald & Schubert – F, K; > E. sessilifolium – S; > E. lecheifolium Greene – S]

**Eupatorium leptophyllum** A.P. de Candolle, Limesink Dog-fennel. Cp (FL, GA, NC, SC): limesink depression ponds (dolines) in the outer Coastal Plain and clay-based Carolina bays in the inner Coastal Plain; common (rare in GA, NC, SC). September-November. A Southeastern Coastal Plain endemic, ranging from SE NC south to FL and west to s. GA and s. AL; also in the Bahamas and Cuba. [= FNA, GW, K, S, SE, WH; = E. capitulifolium var. leptophyllum (A.P. de Candolle) Ahles – RAB]

**Eupatorium leucoplepis** (A.P. de Candolle) Torrey & Gray, Savanna Eupatorium. Cp (DE, FL, GA, NC, SC, VA), Pd (VA), Mt (VA, WV): savannas, seepage bogs, depression ponds; common (uncommon in DE and VA, rare in Piedmont and Mountains). August-October. Primarily of the Southeastern Coastal Plain, ranging from NY south to n. peninsular FL, Panhandle FL, and west to LA; disjunct in Coffee County, TN (Chester, Wofford, & Kral 1997). This species is often confused with members of the *E. recurvans-mohrii-anomalum* complex. The following differences are useful: *E. leucoplepis* has phyllaries acuminate to attenuate (vs. acute to obtuse), leaves of the uppermost nodes below the inflorescence opposite, or rarely the uppermost 1-2 nodes subopposite (vs. leaves of the uppermost 2-15 nodes below the inflorescence alternate), and leaves generally longitudinally folded (vs. generally planar). The plants formerly called *E. leucoplepis* var. novae-angliae Fernald and endemic to freshwater pondshores in MA and RI apparently represent a distinct allopolyploid species, *E. novae-angliae* (Fernald) V.I. Sullivan ex A. Haines & Sorrie, and should not be treated as a variety of *E. leucoplepis*. [= W; = E. leucoplepis var. leucoplepis – C, F, G; < E. leucoplepis – RAB, GW, S, SE, WH; < E. leucoplepis var. leucoplepis – FNA, K]

**Eupatorium linearifolium** Walter, Narrowleaf Bushy Eupatorium. Cp (FL, GA, NC, SC, VA): sandhills; uncommon. Late July-October. SE. VA south to FL and west to LA. The appropriate treatment of this taxon is unclear; it may be a derivative of the hybrid *E. cuneifolium × hyssopolifolium*; it is more widespread than *E. recurvans* sensu stricto. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [= F; < E. cuneifolium – RAB, C, G, SE; = E. hyssopolifolium var. linearifolium (Walter) Fernald – K; = E. tortilifolium Chapman – S; < E. linearifolium – FNA, WH]

**Eupatorium mikanioideis** Chapman, Semaphore Thoroughwort. Cp (FL): saline and brackish flats, seasonally pooled freshwater wetlands, wet flatwoods; rare. Endemic to FL, primarily in the peninsula, but also along the coast of the eastern Panhandle (Bay, Franklin, Gulf, Taylor, and Wakulla counties). July-September. [= FNA, GW, K, S, SE, WH]

**Eupatorium mohrii** Greene, Mohr's Eupatorium. Cp (FL, GA, NC, SC, VA): moist savannas, other wet habitats; common (uncommon in VA). August-October. SE. VA south to s. FL and west to TX. This is by far the most abundant of the *E. recurvans-anomalum-mohrii* complex in our area. Like *E. anomalum, E. mohrii* is believed to be a triploid and tetraploid, apomictic derivative of the hybrid *E. recurvans × rotundifolium*; it is more widespread than *E. recurvans* sensu stricto. Inasmuch as it is now a separate lineage (as evidenced by a distinct distribution, more-or-less recognizable morphology, and phenologic separation), treatment as a separate taxon seems warranted. [= GW; < E. recurvans – RAB, F, G (also see *E. anomalum* and *E. recurvans*); < E. mohrii – C, FNA, K, SE, W, WH (also see *E. recurvans*); < E. anomalum – S (also see *E. anomalum*)]

**Eupatorium plicatum** Walter, Ragged Eupatorium. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): savannas, bogs, other moist areas; common (uncommon in Piedmont, rare in Mountains). August-October. MA south to c. peninsular FL, west to KY, c. TN, and MS. This species is clearly distinct; it should not be treated as a variety of *E. rotundifolium*. [= RAB, C, F, FNA, GW, K, WH, WV; = E. verbenaefolium Reichard – S; = E. rotundifolium var. saundersii (T.C. Porter) Cronquist – G, SE, W]

**Eupatorium pubescens** Muhlenberg ex Willdenow, Inland Roundleaf Eupatorium. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, NC, SC, VA): forests and woodlands, woodland edges, roadbanks; common (uncommon in Mountains, uncommon in Coastal Plain south of DE). July-September. The distribution, abundance, and phenology of *E. pubescens* in our area need additional study. Where growing together, *E. pubescens* apparently flowers about a month earlier than *E. rotundifolium*. Primarily in the Appalachians and adjacent provinces, ranging from ME south to n. GA and n. AL. This taxon appears to be a stabilized polyploid complex originating from hybridization of *E. rotundifolium* and (perhaps) *E. sessilifolium*; in that it now functions as a more-or-less independent evolutionary lineage, with distinctive morphology, habitat, and distribution, it is here treated as a species. [= F; WV; < E. rotundifolium var. ovatum (Bigelow) Torrey – RAB (also see *E. cordigerum*); = E. rotundifolium var. ovatum (Bigelow) Torrey – C, FNA, G, K, SE, W; < E. rotundifolium var. ovatum (Bigelow) Torrey – C, FNA, G, K, SE, W; < E. pubescens – S (also see *E. cordigerum*); = E. rotundifolium Linnaeus sp. ovatum (Bigelow) Montgomery & Fairbrothers]

**Eupatorium recurvans** Small, Recurred Eupatorium. Cp (FL, GA, NC, SC): moist savannas; rare (NC Watch List). August-October. SE. NC south to GA and s. FL. The diploid sexual *E. recurvans* (sensu stricto) is rare in our area; GW gives its range as se. and sc. GA and s. FL. *E. mohrii* is believed to be a triploid and tetraploid, apomictic derivative of the hybrid *E. recurvans × rotundifolium*; it is more widespread. [= GW, S; < E. recurvans – RAB, WH (also see *E. anomalum* and *E. mohrii*); < E. mohrii – C, FNA, K, SE]

**Eupatorium resinosum** Torrey ex A.P. de Candolle, Resinous Boneset, Pinebarren Eupatorium. Cp (DE, NC, SC): seepage bogs, beaver ponds, frequently burned streamhead pocosins, in the Sandhills and inner Coastal Plain of sc. NC; rare. August-
October. A "bimodal endemic," known from the NJ, DE (formerly), and (formerly) NY, thence disjunct to the Sandhills and upper Coastal Plain of NC and SC. [= RAB, C, FNA, G, GW, K, SE; > E. resinosum var. resinosum – F]

Eupatorium scabridum Elliott, Roughleaf Eupatorium. Cp (FL, GA, SC): savannas, wet pinelands; uncommon. Late July-October. SC south to n. FL, west to AR, LA, and OK. This plant is believed to be an allopolyploid derivative of the hybrid E. rotundifolium × semisserratum. In some areas it apparently consists only of short-lived diploids, but in others (according to GW especially in SC, AR and LA) to occur as populations of polyploid amomites. It resembles E. rotundifolium, but has cuneate leaves with a less prominent pair of lateral veins, narrower leaves, and is more likely to have 3-whorled leaves (as E. semisserratum often does). [= GW, S; = E. rotundifolium var. scabridum (Elliott) A. Gray – FNA, K, SE; < E. rotundifolium – WH]

Eupatorium semisserratum A.P. de Candolle. Cp (FL, GA, NC, SC, VA): swamp forests, seepage bogs, savannas, clay-based Carolina bays, other wetlands; uncommon. Late July-October. SE. VA south to ne. FL, Panhandle FL, west to TX and AR; disjunct in sc. TN. This species often has 3 leaves per node; most similar species rarely or never have whorled leaves. [= RAB, C, FNA, G, GW, K, S, SE, WH; = E. cuneifolium var. semisserratum (A.P. de Candolle) Fernald & Griscom – F]

Eupatorium serotinum Michaux, Late Eupatorium. Cp (DE, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): interdune swales, fields, open forests, powerline rights-of-way, tidal marshes, disturbed areas; common (uncommon in DE). Late August-October. MA, NY, MI, WI, MN, and NE south to s. FL, LA, and TX. This species was apparently largely or strictly coastal in our area, but has spread inland rapidly along corridors of disturbance, somewhat similarly to Baccharis halimifolia. [= RAB, C, F, FNA, G, GW, K, S, SE, W, WH, WV]

Eupatorium sessilifolium Linnaeus var. brittonianum Porter, Britton's Eupatorium. Mt (NC, WV): circumneutral soils of woodlands at moderate elevations; rare. August; September. NH and MN, south to NJ, PA, MD, w. NC, KY, and MO. The only collection from NC known to me is from Cedar Cliff, Buncombe County, in 1897. I disagree with Cronquist's equation of this taxon with E. godfreyanum. [= F, K, WV; < E. sessilifolium var. sessilifolium – RAB; < E. sessilifolium – C, FNA, G, S, SE, W]

Eupatorium sessilifolium Linnaeus var. sessilifolium, Sessile-leaf Eupatorium. Pd (DE, GA, NC, VA), Mt (GA, NC, VA, WV), Cp (DE, VA): open upland woodlands and woodland borders, especially calcareous or mafic; common (uncommon in VA Piedmont, rare in VA Coastal Plain, rare in DE). July-October. S. NH west to se. MN, south to n. GA, n. AL, n. MS, n. AR, and e. KS. Grubbs, Small, & Schilling (2009) discuss the genetics of E. sessilifolium; most of the species' distribution consists of agamospermous triplots, with sexual diploids only known from two disjunct areas of the southern Appalachians (w. VA, and w.NC-e. TN). There may be merit to the taxonomic recognition of the diploids and the triploids. [= F, K, WV; < E. sessilifolium var. sessilifolium – RAB (also see var. brittonianum); < E. sessilifolium – C, FNA, G, S, SE, W]

Eupatorium torreyanum Short & Peter, Torrey's Eupatorium. Pd (GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry woodlands, marshes; common (rare in DE and FL, rare in Mountains). Late July-October. NY south to n. peninsular FL, Panhandle FL, and west to OH, TN, and LA. SE considers this taxon a "well-marked variety," "probably originated through hybridization between E. hyssopifolium and some other species, but now a stable entity." The other parent is postulated by Sullivan (1978) to be E. semisserratum. For reasons stated in the comments before the species accounts, the taxon is here treated as a species. [= S; = E. hyssopifolium var. laciniatum Gray – C, F, FNA, G, K, SE, W, WH; < E. hyssopifolium – RAB, WV (rejected)]

Eupatorium vaseyi T.C. Porter, Vasey's Eupatorium. Mt (GA, NC, VA, WV), Pd (NC, VA), Cp (DE): moist to dry woodlands and openings; uncommon (rare in upper Piedmont). July-October. MD, DE, and VA south to se. TN (Chester, Wofford, & Kral 1997), n. GA, and n. AL. This species is apparently a tetraploid derivative of E. album × sessilifolium. It is sometimes treated as a variety of E. album, but seems better regarded as a species of hybrid origin. [= E. album var. vaseyi – RAB, W (also see E. godfreyanum); = E. album var. vaseyi (T.C. Porter) Cronquist – C, FNA, SE; = E. album var. monardifolium (Fernald) – F; < E. vaseyi – G; = E. sessilifolium var. vaseyi (Porter) Fernald & Griscomb – K, WV, ? E. fernaldi Godfrey]

Eupatorium lancifolium (Torrey & A. Gray) Small. Prairies, open woodlands. AL west to s. AR and TX. [= FNA, GW, K, S, SE; = E. semisselatum A.P. de Candolle var. lancifolium (Torrey & A. Gray)

Eupatorium ×pinatifidum Elliott. E. VA south to Panhandle FL. It is variously considered a species (as by S), a species of hybrid origin (as by SE), or a hybrid (as by GW and K). The parents are variously listed as E. capillifolium × perfoliatum (as by K) or E. capillifolium or compositifolium × perfoliatum (as by GW and SE). I have seen the plant in Pender County, NC, where it appears to be a first-generation hybrid, growing with E. capillifolium and E. perfoliatum. Until and unless additional evidence appears that it reproduces itself and exists in independent populations I am inclined to treat it as a hybrid rather than as a species of hybrid origin. It is recognizable by its pinatifid or bipinatifid leaves (the segments broader than in the dog-fennels) and its corymbose-paniculate infrutescence. [= FNA, K, WH; = E. pinatifidum Elliott – GW, S, SE] [not keyed]

Eurybia (Cassinia) Cassinia 1820 (Wood-aster)

1 Basal and lower cauline leaves both distinctly petioled and with a cordate or subcordate blade; [subgenus Eurybia, section Eurybia].
2 Outer phyllaries squarrose-reflexed; rhizomes short or absent, the plants not forming extensive clonal colonies; [of rich slopes an
bottomlands of the lower Piedmont of NC, SC, GA, and AL].
3 Involucral (10-) 11-13 mm tall; phyllaries 36-50, ovate, elliptic, or lanceolate, acute to acuminate at the apex, squarrose in life, often
only the innermost squarrose in dried specimens, the reflexed portion with a distinct hyaline margin; ray florets 7-15, blue or violet; [of
the lower Piedmont of GA and AL].................................................. E. jonesiae
3 Involucral 7-10 (-12) mm high; phyllaries 46-75 (-90), oblong-lanceolate, acute, obtuse, or rounded at the apex, squarrose in life,
generally remaining so in dried specimens, the reflexed portion herbaceous with a narrow hyaline margin or none at all; ray florets (7-)
16-20 (-30), white or lavender; [of the lower Piedmont of s. NC and SC] .......................................................... E. mirabilis
2 Outer phyllaries appressed (or slightly and irregularly spreading); rhizomes long, the plants forming extensive clonal colonies; [of various
habitats and distribution].
4 Ray flowers purplish or bluish; branches of the inflorescence glandular-pubescent.............................................. E. macrophylla
4 Ray flowers white; branches of the inflorescence not glandular-pubescent.
5 Plants with basal leaves on well-developed shoots separate from the flowering shoots; larger leaves with 15-30 teeth per side ............. E. schreberi
5 Plants without basal leaves on well-developed shoots separate from the flowering shoots; larger leaves with 5-20 teeth per side.
6 Longest peduncle in involucr < 1.5 cm long; involucr 6.5-9 (-10) mm tall; ray florets (8-) 12-16 (-20), the ray portion (10-)
17-18 (-20) mm long; disc florets (12-) 17-26; [of high mountain forests, primarily over 1200 m in elevation].................................. E. chlorolepis
6 Longest peduncle in involucr < 1.5 cm long; involucr 3.5-4.2 6.7-5 mm tall; ray florets 5-10 (-12), the ray portion (5-)
10-15 mm long; disc florets 12-19 (-25); [mostly of lower elevation forests, primarily below 1200 m in elevation].............. E. divaricata

1 Basal and lower cauline leaves not as above. 7 Leaves linear, up to about 10 mm wide; leaves strongly basally disposed.
8 Inflorescence flat-topped (corymbiform); [subgenus Heleastrum, section Heleastrum].
9 Pappus fine, the bristles not thickened above; ray florets 8-15 (-25); [of the Piedmont and low Mountains of GA, SC, and possibly
sw. NC].
10 Stem spreading-hairy throughout; ray florets 25-60, white or pinkish; disc florets; [endemic of FL Panhandle and adjacent sw. GA];
[subgenus Heleastrum, section Eryngiifolii]. ........................................................................................................ E. eryngiifolia
9 Pappus coarser, the larger bristles thickened above (clavellate-flattened); ray flowers 15-35; [of the Coastal Plain, of ne. NC south to
ne. FL]............................................................................... E. palmosa
8 Inflorescence elongate (spike-like or raceme-like). 10 Stem spreading-hairy throughout; ray florets 25-60, white or pinkish; disc florets; [endemic of FL Panhandle and adjacent sw. GA];
[subgenus Heleastrum, section Eryngiifolii]. ........................................................................................................ E. eryngiifolia
10 Lower stem glabrous, upper stem variously hairy; ray florets 8-30, deep lavender or purple; [collectively widespread]
11 Upper stem strigillose; phyllaries 48-64; ray florets 15-30; disc florets (40-) 52-80+; [widespread]; [subgenus Heleastrum, section
Heleastrum]..................................................................................... E. hemisphaerica
11 Upper stem villous to glabrescent; phyllaries 20-40; ray florets 8-17; disc florets 18-30; [endemic of FL Panhandle]; [subgenus
Heleastrum, section Eryngiifolii]. ........................................................................................................ E. spinulosa

7 Leaves broader, the largest on a plant over 15 m wide; leaves somewhat basally disposed, the lowermost sometimes withering before
flowering.
12 Leaves obviously veined beneath, usually toothed, hairy on the undersurface; [subgenus Eurybia, section Radulini].
13 Larger leaves < 2.5 (-3.6) cm wide; rays purple; [of w. VA, WV, northward].......................................................... E. radula
14 Larger leaves > 4.0 cm wide; rays white to pale purple; [of the Cumberland Plateau of KY and n. TN].............................. E. saxicastelli
14 Ray florets 9-14; rays 5-15 mm long.......................................................... E. compacta
14 Ray florets 15-35; rays 10-25 mm long.
15 Phyllaries glandular-pubescent on the back and also glandular-ciliate; involucr 8-16 mm high ......................... E. spectabilis
15 Phyllaries slightly or not at all glandular-pubescent on the back (sometimes glandular-ciliate); involucr 7-12 mm high ............. E. surculosa

Eurybia avita (Alexander) Nesom, Alexander's Rock Aster. Pd (GA, SC), Mt (NC?) in shallow soils on granitic flatrocks and
granitic domes where moist from seasonal seepage; rare. Upper Piedmont endemic: w. SC (or sw NC?) to wc. GA. A
diploid species (2n=18). [= FNA, K, X = Aster avitus Alexander – SE, W]
Eurybia chlorolepis (E.S. Burgess) Nesom, Blue Ridge White Heart-leaved Aster. Mt (GA, NC, SC, VA, WV?): northern
hardwood forests, spruce-fir forests; common (rare in VA). August-October. A Southern Appalachian endemic: sw. VA south
through w. NC and e. TN to nw. SC and n. GA (Lamboy 1992); also reported for scattered locations in WV (Harmon, Ford-
Wernitz, & Grafbon 2006). Lamboy (1992) has shown that Eurybia chlorolepis is a species distinct from Eurybia divaricata. E.
chlorolepis is tetraploid (2n=36) and hexaploid (2n=54); E. divaricatus is diploid (2n=18). [= FNA, K, X = Aster chlorolepis E.S.
Eurybia compacta Nesom, Slender Aster. Cp (DE, GA, NC, SC, VA): pine savannas; uncommon (rare in GA). Late July-
October. An Atlantic Coastal Plain endemic: NJ to e. GA. A diploid species (2n=18). [= FNA, K, X = Aster gracilis Nuttall –
RAB, C, F, G, S, SE]
Eurybia divaricata (Linnaeus) Nesom, Common White Heart-leaved Aster. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, NC, VA): moist to fairly dry forests and woodlands; common (uncommon in VA Coastal Plain, rare in DE Coastal Plain). August-October. N. NH west to s. ON, sw. QC, and n. OH, south to e. NC, c. SC, n. GA, and c. AL. The many
species described by Burgess and here treated as synonyms may deserve further assessment; see S for details. A diploid species

ASTERACEAE

908
(also see *Eurybia chlorolepta*); > *A. boykinii* E.S. Burgess - S; > *A. castaneus* E.S. Burgess - S; > *A. divaricatus* - S; > *A. excavatus* E.S. Burgess - S; > *A. flexilis* E.S. Burgess - S; > *A. stelliformis* E.S. Burgess - S; > *A. tenebrosus* E.S. Burgess - S

**Eurybia macrophylla** (Linnaeus) Cassini, Big-leaved Aster. Mt (GA, NC, SC, VA, WV), Pd (VA): moist to dryish forests, in NC mostly at moderate to high elevations, particularly in red oak forests on ridgetops; common (uncommon in Piedmont). Late July-September. NB and QC west to MN, south to PA, MD, VA, NC, ne. GA, e. TN, and IN. *Aster macrophyllus* var. *ianthus* [= *Aster multiflorus*] is sometimes recognized. It is alleged to differ in having the stipitate glands of the pedicels with minute heads (vs. broadly capitate), the leaves thin in texture and only slightly scabrous (vs. thick in texture and strongly scabrous). Many other varieties have been recognized by Fernald (1950); see F for a key. *E. macrophylla* is octoploid (2n=72). [= FNA, K, X; = *Aster macrophyllus* Linnaeus – RAB, C, G, SE, W, Y; > *Aster macrophyllus* var. macrophyllus – F, W, V; > *A. macrophyllus* var. *ianthus* (E.S. Burgess) Fernald – F, WV; > *A. macrophyllus* var. *pinnatifolius* E.S. Burgess – F; > *A. macrophyllus* var. *pinnatifolius* E.S. Burgess – WV, misspelling; > *A. macrophyllus* var. excelsior E.S. Burgess – F, WV; > *A. macrophyllus* var. velutinus E.S. Burgess – F, WV; > *A. macrophyllus* var. *sejunctus* E.S. Burgess – F; > *A. macrophyllus* var. *apriceps* E.S. Burgess – F; > *A. macrophyllus* – S; > *A. multiflorus* E.S. Burgess – S; > *A. viciniatissimus* E.S. Burgess – S]

**Eurybia radula** (Aiton) Nesom, Low Rough Aster. Mt (VA, WV), Cp (DE): circurneutral to calcareous wet meadows, possibly stream banks; rare. July-September. NL (Newfoundland) and NL (Labrador) south to DE (historically), MD, WV, and w. VA. A diploid species (2n=18). [= FNA, K, X; = *Aster radula* Aiton – C, G, SE, W, WV; > *A. radula* var. *radula* – F]

**Eurybia schreberi** (Nees) Nees, Schreber's Aster. Mt (VA, WV), Pd (DE, VA): mesic forests and seepage slopes; uncommon (rare in DE). Late June-October. NH west to WI, south to DE, MD, sc. and w. VA, ne. TN (Chester, Wofford, & Kral 1997), AL, and KY. *E. schreberi* is hexaploid (2n=54). [= FNA, K, X; = *Aster schreberi* Nees – C, G, SE, W, Y; > *A. schreberi* – F; > *A. flexilis* (Bernhart ex Nees) E.S. Burgess – F]

---

**Euthamia** (Nuttall) Cassini 1825 (Flat-topped Goldenrod)

1 Leaves with numerous slightly raised, pale, translucent, blister-like pustules; leaves transmit light when held up; plant glabrous.......................... *E. graminifolia var. graminifolia*

1 Leaves without pale pustules, or if present then leaves opaque and do not transmit light; plants glabrate to pubescent

2 Major veins on leaf underside 3-3.5 if 3 then all 3 veins bold), leaves 5-12 mm wide; heads with 20-50 flowers.

3 Leaves 3.6-8 mm wide, puncate on leaf upper side bold, flower heads 10-20 flowered.......................... *E. gymnosepaloides*

3 Leaves 5-12 mm wide, puncate on leaf upper side obscure or not bold, flower heads 20-50 flowered.

4 Leaf undersides, upper stems, and branches glabrate, often with villous hairs on midrib of leaf underside..........................
**ASTERACEAE**

4 Leaf undersides, upper stems, and branches copiously to moderately short villous ......................E. graminifolia var. nutallii

2 Major veins on leaf underside 1-3 (-5) (if 3 or 5 then only the midvein bold), leaves <6 mm wide (-8 in gymnospermoides); heads with 10-20 flowers.

5 Leaves <3 mm wide; major veins 1 (-3), nearly always with axillary fascicles (rarely without); [of Coastal Plain and lower Piedmont from SE LA eastward] .....................................................................................E. caroliniana

6 Leaves >3 mm wide, main veins 3 (-5), without axillary fascicles.

6 Upper surface of leaves glabrous, infranschense branches glabrous or glabrate; of midwestern interior .......... [E. gymnospermoides]

6 Upper surface of leaves with line of very short, scarabiduous hairs on midvein near base, and often also beyond midleaf; [of outer Coastal Plain] .....................................................................................E. hirtipes

**Euthamia caroliniana** (Linnaeus) Greene ex Porter & Britton. Cp (DE, FL, GA, NC, SC, VA), Pd (VA), Mt (VA); pine savannas, moist forests, ditches, pastures, disturbed areas; common. September-December. S. ME south to s. FL and west to se. LA, mainly on the Coastal Plain, extending somewhat into the Piedmont in places (reports from further north or further west are based on misidentifications or on broader circumscriptions of the taxon). [= FNA, K, WH, V, X; Solidago microcephala (Nuttall) Bush – RAB, F, G; > Solidago tenuifolia Pursh – RAB; > E. tenuifolia var. microcephala Nuttall – C; > E. tenuifolia var. tenuifolia – C; > Solidago tenuifolia var. tenuifolia – F; > Solidago tenuifolia var. tenuifolia – G; < E. tenuifolia – GW (also see E. hirtipes); > E. minor (Michaux) Greene – GW, SE; = E. minor – S; > E. tenuifolia (Pursh) Nuttall – SE; = E. tenuifolia – W, Z]

**Euthamia graminifolia** (Linnaeus) Nuttall var. graminifolia. Mt (VA, WV), Pd (DE, VA), Cp (DE, SC*, VA): moist to dry weedy situations, riverbanks, bottomlands, bog margins; common (rare in SC). August-September. NL (Newfoundland) and ND south to MD, c. VA, WV, n. KY, TN, and e. IA; a SC Coastal Plain report (Hill & Horn 1997) is probably an introduction. Also introduced on the Gulf Coast (LA and MS?). [= C, V, X, Y, Z; > E. graminifolia – S, SE; W; > Solidago graminifolia (Linnaeus) Salisbury – RAB; < Euthamia graminifolia – FNA; > Solidago graminifolia var. polycephala Fernald – F; > S. graminifolia var. graminifolia – F, G; < E. graminifolia var. graminifolia – K]

**Euthamia graminifolia var. nutallii** (Greene) W. Stone. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE, SC*, VA): moist to dry weedy situations, riverbanks, bottomlands, bog margins; common (rare in NC and SC). August-September. NL (Newfoundland) southward to se. VA, w.NC, KY, nw. TN and MO. Also introduced on the Gulf Coast (LA and MS?). [= C, V, X, Y, Z; > E. graminifolia – S, SE; W; > Solidago graminifolia (Linnaeus) Salisbury – RAB; < Euthamia graminifolia – FNA; = S. graminifolia var. nutallii (Greene) Fernald – F, G; < E. graminifolia var. graminifolia – K]

**Euthamia hirtipes** (Fernald) Sieren, Marsh Flat-topped Goldenrod. Cp (DE, FL, GA, NC, SC, VA): brackish marshes, salt marshes, marsh edges, wet hammocks; uncommon (rare in VA). September-December. S. NJ and DE south to c. peninsular FL, west to s. AL. E. hirtipes has been variously treated: considered by Fernald to be a hybrid of “minor” and “graminifolia var. nutallii,” by Sieren to be a species endemic to NC, SC, and VA, and by Taylor and Taylor (1983) to be a variety of E. graminifolia ranging from se. VA south to FL and west to LA, and by GW to be equivalent to E. tenuifolia. [= V, Z; < Solidago tenuifolia Pursh – RAB; < Euthamia graminifolia – FNA; = Euthamia ×hirtipes (Fernald) Sieren (pro sp.) – C; > Solidago ×hirtipes Fernald – F; < Solidago gymnospermoides (Gemeen) Fernald – G, misaspected as to our plants; < Solidago leptocephala Torrey & A. Gray – F, misaspected as to our plants; < E. tenuifolia – GW; = E. graminifolia (Linnaeus) Nuttall var. hirtipes (Fernald) C. & J. Taylor – K, WH, X, Y]

**Euthamia leptocephala** (Torrey & A. Gray) Greene. Mt (GA), Pd (GA): fields, pastures, roadsides, prairies, savannas; uncommon. KY, IL, MO, and OK south to nw. GA (Floyd and Heard counties), AL, and TX. [= C, FNA, GW, K, S, SE, V, Z; = Solidago leptocephala Torrey & A. Gray – F, G]

**Euthamia gymnospermoides** Greene, Texas Goldentop. Prairies, roadsides, and light woodlands. MI, nw. MN, and e. ND south to c. IN, sw. KY (Graves Co), w. TN (Hardeman, Lawrence counties), ec. and c. AR, ne. TX, w. OK, and e. CO; disjunct in Coffee Co. TN. [= FNA, K, SE, V, Z; < Solidago gymnospermoides (Greene) Fernald – F, G]

**Eutrochium Rafinesque 1838 (Joe-pye-weed)**

1 Florets (4-)6-9 (-12) per head; leaves more or less 3-nerved from the base, rather abruptly contracted to the short petiole, thick in texture, 5-12 (-15) cm long, strongly resin-dotted beneath; leaves in whorls of (2-) avg. 3-4 (-5); stem generally purple-speckled (sometimes uniformly purple); [primarily of the Coastal Plain] .................................................................................................................................E. dubium

2 Florets either (8-)9-22 or 4-7 per head; leaves generally pinnately veined (rarely with a tendency to be 3-nerved), usually cuneate and less abruptly contracted to the petiole, thick or thin in texture, 6-35 cm long, weakly or not at all resin-dotted beneath (except often strongly resin-dotted in E. maculatum), leaves in whorls of (2-) 3-7; stem purple-speckled, purple at the nodes, purple throughout, or green; [collectively widespread in our area]

3 Florets (8-)9-22 per head; leaves mostly in whorls of (3-) avg. 4-5 (-6), 6-20 cm long; inflorescence more or less flat-topped; stem usually speckled with purple (rarely even purplush) .................................................................................................................. E. maculatum var. maculatum

4 Florets 4-7 per head; leaves in whorls of (2-) 3-7, 8-35 cm long; inflorescence rounded; stem usually purple throughout, purple at the nodes, or lacking purplish pigment.

3 Stem hollow (with a large central cavity), purple throughout, strongly glaucous when fresh; flowers bright pink-purple; leaves in whorls of (3-) avg. 5 (-7); leaves mostly 3.5-5.5 × as long as broad ........................................................................................................ E. fistulosum

3 Stem solid (rarely with a slender central cavity), dark purple at the nodes or greenish purple throughout, not glaucous or only slightly so when fresh; flowers pale pink-purple; leaves in whorls of (2-) avg. 3-4 (-5); leaves mostly 2-4 × as long as broad.

4 Stem persistently glandular-pubescent throughout; lower surface of leaves glandular-pubescent; leaves mostly 2-2.5 × as long as wide; stem greenish-purple (or even purple); [of the Mountains] ........................................................................................................ E. steelei

**Eutrochium maculatum** (Linnaeus) E.E. Lamont var. maculatum, Spotted Joe-pye-weed. Mt (NC, VA, WV), Pd (VA): marsh fens, wet calcareous meadows, cove forests, grassy balds; uncommon (rare in VA and WV). Late July-October. The species is widespread across n. North America. NL (Newfoundland), ME, QC, ON, and MN, south to PA, OH, n. KY, c. IL, and c. IA, and in the Mountains south to e. WV, w. VA, and w. NC. Var. bruneri (A. Gray) E.E. Lamont is more western; var. foliosum (Fernald) E.E. Lamont, is more northern. Further investigation is needed of the peculiar and implausible change in habitat of this species, from calcareous wetlands in c. VA northward, to mesic high elevation slopes and forests (in acidic to very acidic soils) from sw. VA southward. Such a change is suggestive of the presence of an unrecognized, cryptic taxon in the Southern Appalachians. [= FNA, X; = Eupatorium maculatum Linnaeus var. maculatum – F, G, K, SE; < Eupatorium maculatum – RAB, W, WV; = Eupatorium maculatum ssp. maculatum var. maculatum – C; Z; < Eupatorium maculatum – Y]

**Eutrochium purpureum** (Linnaeus) E.E. Lamont var. purpureum, Purple-node Joe-pye-weed. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, DE, GA, NC, SC, VA): upland, usually mesic forests; common (rare in Coastal Plain, uncommon in DE Piedmont). July-October. NH west to se. MN, IA, and e. NE, south to SC, GA, Panhandle FL, n. LA, and e. OK; var. holzingeri (Rydberg) E.E. Lamont, differing in having the lower leaf surface densely and persistently pubescent (vs. glabrous or nearly so) is found in the Midwest (Lamont 1990). *Eupatorium purpureum* var. amoenum is smaller, more slender, with narrower leaves which are nearly glabrous below; it is probably only a form. [< Eutrochium purpureum var. purpureum – FNA, X; < Eupatorium purpureum Linnaeus var. purpureum – K; Z; < E. purpureum – RAB, C, F, SE, W, WH; = Eupatorium purpureum var. amoenum (Pursch) Gray – G, WV; < Eupatorium purpureum var. purpureum – G, WV; < Eupatorium trifoliatum Linnaeus – S]

**Eutrochium steeelei** (E.E. Lamont) E.E. Lamont, Appalachian Joe-pye-weed, Steele's Joe-pye-weed. Mt (NC, VA): cove hardwood and northern hardwood forests, up to at least 1600 m; uncommon. July-October. A Southern Appalachian endemic: c. KY and w. VA south w. NC and e. TN. [= FNA, X; = Eupatoriadelphus steeelei (E. Lamont) G.J. Schmidt & Schilling – Y; = Eutrochium steeelei E.E. Lamont – Z]

**Facelis** Cassini 1819

**Filago** Linnaeus 1753 (Cotton-rose, Herba Impia, Rabbit-tobacho)

1 Inner flowers of the head with a well-developed capillary pappus; heads woolly, but not so densely and completely as to hide the phyllaries...

........................................................................................................................................................................... *F. vulgaris*

1 All flowers of the head lacking a pappus of capillary bristles; heads completely surrounded by wool, the phyllaries hidden...........[see *Diaperia*]

**Flaveria** de Jussieu 1789
ASTERACEAE

A genus of about 21 species, herbs and subshrubs, subcosmopolitan in tropical and subtropical areas. References: Yarborough & Powell in FNA (2006c); Cronquist (1980)=SE.

1 Heads borne in axillary glomerules; disc florets 0-1 (-2) ................................................................. *F. trinervia*
1 Heads borne in terminal arrays; disc florets (2-) 3-8.
2 Lower leaves petiole, 10-25 (-70) mm wide; annual; cypselas 2.0-2.5+ mm long .................................. *F. bidentis*
2 Lower leaves sessile, 1-4 (-15) mm wide; perennial; cypselas 1.2-1.8 mm long ................................. *F. linearis*

* Flavia bidentis (Linnaeus) Kuntze. Cp (FL, GA): disturbed areas; rare, native of tropical America. FL Panhandle, s. FL, AL, GA. [= FNA, K, S, SE, WH; <G. lacerata, G. lanceolata – S]

* Flavia trinervia (Sprengel) C. Mohr, Clustered Yellowtops. Cp (SC, VA): waste areas around wool-combing mill, ore piles, seaport ballast; rare, probably only a waif, introduced from sw. United States (Nesom 2004d). March-December. Also known from ballast at Mobile, AL (Cronquist 1980). [= FNA, K, S, SE, WH]

* Fleischmannia* Schultz ‘Bipontinus’ 1850

* Fleischmannia incarnata* (Walter) King & H.E. Robinson, Pink Thoroughwort, Pink Eupatorium. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, SC, VA): nutrient-rich, moist to dry, forests and woodlands over diabase, limestone, coquina limestone, or other basic rocks, or on rich alluvium; rare. Late August-October. Se. VA west to WV, s. OH, s. IN, s. IL, s. MO, and e. OK, south to w. peninsular FL, Panhandle FL, s. TX, and e. Mexico, the distribution fragmented. See Wooten & Clewell (1971) for further information about this species. [= FNA, K, WH, Z; = Eupatorium incarnatum Walter – RAB, C, F, G, S, SE, W, WV]

* Gaillardia* Fougeroux 1786 (Blanket-flower, Gaillardia, Fire-wheels)

1 Receptacle naked, lacking well-developed setae (if setae present, < 1 mm long) ........................................ *G. aestivalis* var. *aestivalis*
1 Receptacle with well-developed setae 2-3 mm long.
2 Leaves fleshy; perennial or annual, strongly branching, the secondary branches spreading and therefore forming compact, rounded “bushes” .................................................................................................................................................................................. *G. pulchella* var. *drummondii*
2 Leaves herbaceous; annual, with secondary branches ascending .................................................................. *G. pulchella* var. *pulchella*

* Galinsoga* Ruiz & Pavón 1794 (Peruvian-daisy, Quickweed)

A genus of about 13 species, herbs, of temperate and subtropical Central America and South America. References: Canne-Hilliker in FNA (2006c); Cronquist (1980)=SE.

1 Rays 0-1.5 (-2) mm long, lacking pappus scales (or with vestigial scales); outer phyllaries 2-4, with scarious margins; inner paleae deeply 3-lobed; pappus scales of the disc florets not awn-tipped; stem usually glabrous or sparsely pubescent with appressed (rarely spreading) hairs; gland-tipped hairs of the peduncles < 0.5 mm long; teeth of leaf margins obscure, broadly rounded or reduced to thickened bumps .................................................................................................................................................................................. *G. parviflora* var. *parviflora*
1 Rays 2-3 mm long, with pappus scales about as long as the corolla tube; outer phyllaries 1-2, with green herbaceous margins; inner paleae usually entire; pappus scales of the disc florets awn-tipped; stem usually moderately pubescent with long, spreading hairs; gland-tipped hairs of the peduncles > 0.5 mm long; teeth of leaf margins usually well developed, acute ............................................................................................................................................................. *G. quadriradiata*
Gamochaeta Weddell 1856 (Cudweed, Everlasting)

1 Leaves concolored or weakly bicolored (abaxial and adaxial faces more or less equally greenish to gray-greenish, indument usually loosely tomentose or arachnose, sometimes subpannose).

2 Blades of basal and lower cauline leaves 4-16 mm wide; bracts among the inflorescence heads spatulate to oblongate, the lowermost (at least) surpassing the heads..........................G. parviflora

3 Involucres 2.5-3.5 mm high, seated in tomentum; capitulescence initially cylindric and uninterrupted, at least distally, the main axis obscured by clustered heads; phyllaries in 3-4 (-5) series, the outer and middle ovate-lanceolate with narrowly to broadly acute apices, the outer 1/3-1/2 as long as the inner, none with purplish color; flowering May-July.......................................................G. antillana

4 Basal and proximal cauline leaves present or not at anthesis; stems erect to decumbent-ascending; plants mostly 10-50 cm; apices of inner phyllaries acutely-rounded; flowering mostly July-August..............G. simplicicaulis

5 Upper leaf surfaces glabrous or glabrate; involucres 2.5-3.0 mm high, more-or-less purplish, the bases glabrous; outer phyllaries elliptic-obovate to broadly ovate-elliptic, apices rounded to obtuse; bisexual florets 2-3.................................................G. coarctata

6 Stems not pannose (indument whitish, like closely appressed, polished cloth, hairs usually not individually evident); involucres 3.0-3.5 (-4.0) mm high; apices of inner phyllaries acute to acute-acuminate; bisexual florets 2-4; cypselae tan to brownish .................................................G. chionesthes

7 Blades of cauline leaves oblanceolate to oblanceolate-oblong or oblanceolate-obovate; involucres 3.0-3.5 mm high; laminae of inner phyllaries elliptic-oblong to oblong, apices truncate-rounded or obtuse and apiculate; bisexual florets (3-) 4-6; plants usually fibrous-rooted, rarely taprooted .................................................................G. argyrinea

8 Blades of cauline leaves oblanceolate to spatulate (basal cells of hairs on adaxial faces persistent, expanded, glassy); involucres 4.0-4.5 mm high; laminae of inner phyllaries triangular, apices acute (not apiculate); bisexual florets 3-4; plants fibrous-rooted or taprooted .................................................................G. purpurea

Gamochaeta antillana (Urban) Anderberg, Caribbean Everlasting. Cp (FL, GA, NC, SC, VA): disturbed areas, fields, lawns; common. March-July. VA south to s. FL, west to AR and TX; Cuba; South America; Europe (introduced); New Zealand (introduced). [= FNA, WH, X; < Gamochaeta falcata (Lamarck) Cabrera – K, Z; < Gnaphalium purpureum Linnaeus var. falcatum (Lamarck) Torrey & A. Gray – RAB, C, G, SE; < Gnaphalium calviceps Fernald – F; < Gnaphalium falcatum Lamarck – S; < Gnaphalium purpureum Linnaeus – W]

Gamochaeta calviceps (Fernald) Cabrera. Cp (GA, NC, SC, VA), {GA, NC, SC}: disturbed areas, roadsides; uncommon (rare in VA). March-July. VA south to FL, west to TX; South America, California (introduced); Europe (introduced), New
**ASTERACEAE**

- **Gamochaeta pensylvanica** (Willdenow) Cabrera, Pennsylvania Everlasting. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC), Mt (GA?, NC): fields, roadsides, pastures, disturbed areas; common, probably native of South America. March-July. PA south to s. FL, west to TX, mostly on the Coastal Plain, and widespread in South America and elsewhere. [= FNA, K, WH, X, Z; < Gnaphalium purpureum Linnaeus var. spathulatum (Lamarck) Baker – RAB; < Gnaphalium purpureum Linnaeus var. purpureum – C, G, SE; < Gnaphalium peregrinum Fernald – F; < Gnaphalium peregrinum Linnaeus – W]

**Gamochaeta purpurea** (Linnaeus) Cabrera, Spoonleaf Purple Everlasting. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA, WV): fields, roadsides, pastures, disturbed areas; common. Late March-September. ME west to MI, south to s. FL and e. TX; apparently disjunct in CA and OR, adventive in w. US, Mexico, South America, and elsewhere. [= FNA, WH, X; < Gamochaeta purpurea (Linnaeus) Cabrera – K, Y, Z; < Gnaphalium purpureum Linnaeus var. purpureum – RAB, C, G, SE; < Gnaphalium purpureum Linnaeus – F, S, W, WV]

- **Gamochaeta simplicicaulis** (Willdenow ex Sprengel) Cabrera. Cp (FL, GA, NC, SC): disturbed areas, roadsides; uncommon (rare in FL), apparently native of South America. Late June-August. See Nesom (1999, 2000d, 2004b) for additional information. [= FNA, WH, X]

**Garberia** A. Gray 1879 (Garberia)

A monotypic genus, a shrub, of peninsular FL. References: Lamont in FNA (2006c).

**Glebionis** Cassini 1826 (Chrysanthemum)

1 Leaf blades 2-3-pinnate; rays pale yellow, 15-25 mm long .......................................................... **G. coronaria**
1 Leaf blades not lobed or coarsely 1-pinnate; rays golden yellow, 8-20 mm long.......................................................... **G. segetum**

- **Glebionis coronaria** (Linnaeus) Cassini ex Spach, Garland Chrysanthemum, Crown-daisy. Cp (FL), {NC, SC}: disturbed areas; rare, native of Eurasia, cultivated and escapes and occurs as waifs in our area. [= FNA, WH; = Chrysanthemum coronarium Linnaeus – K, Z]

- **Glebionis segetum** (Linnaeus) Fourreau, Corn Marigold, Corn Chrysanthemum. Pd (NC): disturbed areas, trash heaps, field edges; commonly cultivated, rarely escaped, persistent, or as a waif, native of Eurasia. April-May. [= FNA; = Chrysanthemum segetum Linnaeus – RAB, C, F, G, K, S, SE]

**Gnaphalium** Linnaeus 1753 (Cudweed, Rabbit Tobacco)

A genus of about 40 species (as recircumscribed more narrowly), distributed on most continents. References: Nesom in FNA (2006a); Anderberg (1991)=Z. [also see **Gamochoaeta** and **Pseudognaphalium**]

1 Involucre 2-3 mm high; plants to 2.5 dm tall; inflorescence of many, small, axillary and terminal clusters overtopped by subtending leaves.....
1 Involucre 4-7 mm high; plants generally well over 2.5 dm tall; inflorescence terminal, usually elongate.............**Gn. uliginosum**

- **Gnaphalium uliginosum** Linnaeus, Low Cudweed. Mt (VA, WV), Cp* (DE*), Pd* (DE*): high elevation openings, especially in ruts or mud-puddles, rocky places; rare, possibly introduced in North America. July-October. NL (Newfoundland) west to BC, south to VA, WV, OH, IN, MN, CO, UT, and OR. [= C, F, FNA, G, K, S, SE, WV, Z]

**Grindelia** Willdenow 1807 (Gum-plant, Tarweed, Rosinweed, Gumweed)
A genus of about 55 species, herbs and shrubs, of w. North America and South America. References: Strother & Wetter in FNA (2006b); Cronquist (1980)=SE.

1 Phyllaries loose (but not squarrose), only slightly imbricate .................................................................G. lanceolata var. lanceolata
1 Phyllaries squarrose-reflexed, strongly imbricate.............................................................................G. squarrosa var. squarrosa

*Grindelia lanceolata* Nuttall var. lanceolata. Mt (VA), Cp (SC, VA): disturbed areas, waste areas around wool-combing mill; rare, presumably introduced from farther west. This species is regarded as native as far east as the Nashville Basin of c. TN and scattered localities in the Ridge and Valley Province of e. TN (Chester, Wofford, & Krak 1997). [= C, K; < *G. lanceolata* – F, FNA, G, SE]

*Grindelia squarrosa* (Pursh) Dunal var. squarrosa. Curly-top Gumweed. Mt (VA), Pd (VA), Cp (DE): disturbed areas; uncommon (rare in VA), introduced from farther west. Other varieties are also adventive eastward, and might be expected in our area. [= C, F, G, K, SE; < *G. squarrosa* – FNA]

*Guizotia* Cassini in Cuvier 1829 (Niger-seed)

A genus of 6 species, herbs, of Africa. References: Strother in FNA (2006c); Sherff & Alexander (1955)=Z.

* Gutierrezia* Lagasca y Segura 1816

1 Subshrub; stems minutely hispidulous; ray florets 2-8; disc florets 2-9 ..............................................................G. sarothrae
1 Annual; stems glabrous; ray florets 5-23; disc florets 7-13.................................................................................G. texana var. texana

*Hartwrightia* A. Gray ex S. Watson 1888 (Hartwrightia)

*Helianthus* Linnaeus 1753 (Sneezeweed, Bitterweed)

A genus of about 32-40 species, herbs, of America. References: Bierner (1989)=Y; Bierner (1972)=Z; Rock (1957); Knox (1987); Rydberg (1915); Cronquist (1980)=SE.

1 Stem leaves very numerous, 0.5-2 (-4) mm wide, not decurrent on the stem or branches; plant a taprooted annual; [section *Amarum*].
2 Disc corollas yellow, the lobes yellow or yellow-brown; lower and basal leaves usually withered at anthesis; lower leaves usually entire (rarely toothed); basal leaves entire to toothed (rarely pinnatifid)..............................................................H. amarum var. amarum
2 Disc corollas yellow, the lobes (and sometimes also the upper portion of the corolla tube) purple; lower and basal leaves often persistent; lower leaves linear to ovate, entire, toothed, lobed or pinnatifid; basal leaves pinnatifid...............H. amarum var. badium
1 Stem leaves few to numerous, at least the larger > 4 mm wide, decurrent on the stems and branches; plant a fibrous-rooted perennial or a taprooted annual.
3 Ray flowers lacking a pistil and style, sterile; [section *Leptopoda*].
4 Disc flowers with lobes brown, red, or purple. .................................H. brevifolium
5 Disc flowers predominately 4-lobed and with 4 stamens ...........................................................................H. flexuosum
4 Disc flowers with lobes yellow.
6 Midstem leaves barely decurrent on the stem, the decurrency < 0.5 cm; basal leaves often pinnatifid (less commonly merely dentate, repand, or entire), the lower portion of the leaf not contracted so as to be petiolate in form; achene pubescent on the ribs; peduncle pubescent; basal leaves (3.0-) 4.5-8.0 (-19.0) cm long, 0.3-1.1 cm wide, averaging ca. 7-10× as long as wide ............... \textit{H. pinnatifidum}

6 Midstem leaves decurrent on the stem, the decurrency > 2 cm, and usually extending to the next leaf down; basal leaves usually repand or entire (rarely somewhat lobed or pinnatifid), the lower portion narrowed into a petiolar form which enlarges at its base to more-or-less clasp the stem; achene glabrous, or pubescent on the ribs; peduncle pubescent or glabrous; basal leaves narrowing or broader in shape (see below).

7 Peduncle pubescent to tomentose or lanose between the uppermost leaf and the head; achene pubescent on the ribs; heads 1-4 per plant; basal leaves (2.5-) 4.0-10.5 (-18.0) cm long, (0.8-) 1.2-2.0 (-2.5) cm wide, averaging ca. 4-6× as long as wide ............... \textit{H. brevifolium}

7 Peduncle glabrous or glabrate between the uppermost leaf and the head; achene glabrous; heads 1 per plant; basal leaves (3.0-) 4.5-8.0 (-19.0) cm long, (0.3-) 0.6-1.0 (-1.5) cm wide, averaging ca. 10-15× as long as wide ............... \textit{H. vernale}

Ray flowers bearing a pistil and style, fertile.

8 Plant a fibrous-rooted perennial; [native species, collectively widespread and common]; [section \textit{Helenium}].

9 Leaves not basally disposed, the basal leaves usually absent at flowering (if present, mostly < 2 cm long), the stem leaves not progressively reduced upward; pappus scales brownish, 0.3-1.2 mm long (usually < 1 mm long); upper cauline leaves serrate (rarely entire), mostly obovate, usually broadest near the midpoint or beyond it, with conspicuous lateral veins apparent on the lower surface ........................................ \textit{H. automnale}

9 Leaves basally disposed, the basal rosette usually present at flowering, the basal leaves > 4 cm long, larger than the progressively smaller stem leaves; pappus scales white-hyaline, 0.9-1.9 mm long (usually > 1 mm long); upper cauline leaves entire, lanceolate, usually broadest at or near the base and rather evenly tapered to the apex, lacking conspicuous lateral veins................. \textit{H. virginicum}

8 Plant a tap-rooted annual or biennial; [alien species, rare waifs of wool-combing mills]; [section \textit{Tetradus}].

10 Disc corollas 4-lobed; heads 7-11 (-14) mm high, 6-11 wide (excluding the ray flowers)........................................ \textit{H. quadridentatum}

10 Disc corollas 5-lobed; heads 4-8 mm high, 4-8 mm wide (excluding the ray flowers). ........................................ \textit{H. amarum

11 Upper leaves entire ............................................................................................................................................. \textit{H. elegans} var. \textit{elegans}

11 Upper leaves serrate ........................................................................................................................................ \textit{H. microcephalum} var. \textit{microcephalum}

\* \textit{Helenium amarum} (Rafinesque) H. Rock \textit{var. amarum}, Bitterweed. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA): roadsides, overgrown pastures, urban areas; common (rare in Mountains), apparently introduced from further west. May-December. Now widespread in e. North America. Biemer (1989) discusses the taxonomy of section \textit{Amarum}, consisting only of the 2 varieties of \textit{H. amarum}. \textit{Var. amarum} is widespread; var. \textit{badium} (A. Gray ex S. Watson) Waterfall, distinguished in part by its purple disk flowers, occurs in OK, TX, and Mexico. The plant has a very bitter taste and is generally avoided by grazing animals, a point noted by Rafinesque in his original description (in 1817): “the whole plant is odorous and intensely bitter, it gives an abominable taste to the milk of the cows that feed on it in summer.” Overgrazed areas come to be dominated by \textit{H. amarum}. In areas where it is frequently moved, \textit{H. amarum} appears to evolve a genotype capable of flowering and fruiting when only a few cm tall. [= C, FNA, K, Y; = \textit{H. tenuifolium} Nuttall – F, S; = \textit{H. amarum} – RAB, G, W, Z; < \textit{H. amarum} – SE, WH]

\textit{Helenium brevifolium} (A. Wood) A. P. de Candolle. Cp (GA, NC, VA), Mt (NC, VA), Pd (GA, NC, VA): seepage bogs; rare. May-June. \textit{H. brevifolium} has a peculiar distribution reaching its greatest abundance on the Gulf Coastal Plain, from Panhandle FL west to e. LA, and occurring at scattered disjunct sites in c. and n. AL, wc. GA, c. and w. NC, ec. TN (Chester, Wofford, & Kral 1997), and sw. and se. VA. [= RAB, C, FNA, G, GW, K, SE, W, WH, Z; > \textit{H. brevifolium} – F, S; < \textit{H. curtisii} A. Gray – F, S]

\textit{Helenium microcephalum} A. P. de Candolle var. \textit{microcephalum}. Cp (SC): waste areas around wool-combing mills; rare, perhaps only a waif, native of OK, TX, NM, and CO. May-July. See Nesom (2004). [= FNA, K, Z]

\textit{Helenium pinnatifidum} (Nuttall) Rydberg. Cp (FL, GA, NC, SC): wet savannas and adjacent ditches; rare (NC Rare, SC Rare). April-May. A Southeastern Coastal Plain endemic: se. SC south to s. FL, west to Panhandle FL, sw. GA, and s. AL. [= RAB, FNA, GW, K, SE, WH, Z; = \textit{H. vernale} – S, misapplied]

\* \textit{Helenium quadridentatum} Labill. [SC]: location and habitat unknown; presumably introduced from sc. United States. Reported for SC by Rydberg (1915), Small (1933), and Kartesz (1999); also east to AL (SE). [= FNA, K, S, SE, Z]

\textit{Helenium virginicum} S.F. Blake, Virginia Sneezeweedy. Mt (VA): seasonal sinkhole ponds and clearings where such ponds once occurred; rare. July-September. \textit{H. virginicum} is bimodally endemic in VA (Augusta and Rockingham counties, VA, where a series of sinkhole ponds (dolines) on acid colluvium support numerous Coastal Plain disjuncts) and MO (Ozarkian
ASTERACEAE

917

highlands). See Knox (1987) for a comparison of this narrow endemic and *H. autumnale*. Knox (1997) presents a study of the
demography and habitat of *H. virginicum*. [= C, F, FNA, G, K, SE; < *H. autumnale* – GW, W]

*Helianthus* Linnaeus 1753 (Sunflower)

1 Leaves basally disposed, the plants scapose or subscapose, the stem leaves relatively few (with 2–8 nodes below the inflorescence), those on
the upper stem opposite or alternate, strongly reduced upward in size as compared to the persistent basal leaves; [section *Atrorubentes*]...........

1 Leaves cauline, plants leafy the length of the stem, the stem leaves many (with 10 or more nodes below the inflorescence), basal leaves
lacking (at least at anthesis).

2 Plant a tap-rooted annual (rarely surviving a second year) .................................................................................................................Key A

2 Plant a perennial from crown buds or rhizomes, the roots sometimes tuberous-thickened; [section *Atrorubentes*].

3 Disk flowers red or purple (at least in part) ...........................................................................................................................................Key C

3 Disk flowers yellow .............................................................................................................................................................................Key D

**Key A – sunflowers with basally disposed leaves**

1 Disk flowers yellow.

2 Basal leaves 13-30 cm long, 0.7-2.0 cm wide; leaves 10-20× as long as wide, glabrous..........................................................*H. longifolius*

2 Basal leaves 6-15 cm long, 2-8 cm wide; leaves 1.5-5× as long as wide, scabrous or hisurate (rarely glabrous).................................................................*H. occidentalis ssp. occidentalis*

1 Disk flowers red or purple (at least in part).

3 Basal leaves 6-20 cm long; lower several pairs of stem leaves up to 1/2 as long and wide as the basal leaves.

4 Trichomes on the leaf abaxial midrib > 1 mm long; lower stem with a few pairs of leaves (< 8 nodes below the capitululescence), these
strongly reduced upward; leaf blades (1.3-) 1.7-2.5 (-3)× as long as wide; petiole often > 1/3 as long as the blade, broadly winged
toward the blade; plants to 2 m tall; nonflowering stems usually absent; [widespread in our area] ......................................................*H. atrorubens*

4 Trichomes on the leaf abaxial midrib ∼ 1 mm long; lower stem leafy, often to above the middle (> 8 nodes below the capitululescence);
leaf blades 1.7-2.5× as long as wide; petiole usually < 1/3 as long as the blade, narrowly winged toward the blade; plants to 3 m tall;
nonflowering stems usually present; [west of our area] ..................................................................................................................*H. silphioides*

3 Basal leaves 4-15 cm long; lower several pairs of stem leaves often < 1/2 as long and wide as the basal leaves.

5 Basal leaves (1.6-) 2-5× as long as wide; ray flowers present, typically 1.5-3.5 cm long; [of wet savannas and bogs].............*H. heterophyllus*

5 Basal leaves 1-1.5× as long as wide; ray flowers none, or present but < 1 cm long; [of dry savannas and sandhills] .............*H. radula*

**Key B – annual sunflowers**

1 Disk flowers yellow.

2 Leaves ovate, 10-40 cm long, 5-25 cm wide, toothed, the base often cordate or subcordate; disc corollas 5-8 mm long; stems 10-30 dm tall;
[section *Helianthus*] ..........................................................................................................................................................*H. annuus*

2 Leaves 5-10 cm long, 0.2-1.0 cm wide, entire or nearly so, the base cuneate; disc corollas 2.8-3.5 mm long; stems 4-10 dm tall; [section
*Porteri*] .........................................................................................................................................................*H. porteri*

1 Leaves, stems, and phyllaries densely covered with soft, silvery-white pubescence; [section *Helianthus*]..............................................*H. argophyllus*

3 Leaves, stems, and phyllaries nearly glabrous to scabrous or hisurate.

4 Style branches yellow; [section *Agestes*] ..................................................................................................................................*H. agrestis*

4 Style branches red; [section *Helianthus*].

5 Phyllaries ovate to ovate-oblong, > 4 mm wide, abruptly contracted to an acuminute tip, the margins strongly ciliate; leaves 5-25 cm
wide; disk (2-) 3-30 cm wide; plants (0.5-) 1-3 m tall ..................................................................................................................*H. annuus*

5 Phyllaries lanceolate, gradually tapering to an acuminute tip, the margins not ciliate or weakly so; leaves 1.5-9 cm wide; disk 1-2.5
cm wide; plants 0.4-1 (-1.5) m tall.

6 Tips of the receptacular bracts in the center of the head conspicuously white-bearded; stems normally not mottled..................

6 Tips of the receptacular bracts in the center of the head not bearded; stems normally mottled with purple

7 Peduncles 25-50 cm long; leaves usually shallowly but regularly serrate; ligules usually < 2 cm long .................................................................*H. debilis ssp. cucumerifolius*

7 Peduncles usually < 25 cm long; leaf usually deeply irregularly serrate; ligules usually < 2 cm long .................................................................*H. debilis ssp. tardiflorus*

**Key C – perennial sunflowers with leafy stems and red disk flowers**

1 Leaf blades long and narrow, linear or lanceolate and usually > 10× as long as wide.

2 Stems glabrous and glaucous; leaf margins not revolute .................................................................*H. salicifolius*
2 Stems pubescent; leaf margins often revolute.  
3 Plants short, < 1.5 m tall; leaves < 1 cm wide; rhizomes lacking or poorly developed............................H. angustifolius  
3 Plants robust, > 1.5 m tall; leaves > 1 cm wide; rhizomes well developed.................................H. simulans  
1 Leaf blades shorter and broader, lanceolate, lance-ovate, deltoid, deltoid-ovate and usually < 5× as long as wide.  
4 Phyllaries 1.5-3 mm broad, lanceolate ..........................................................H. floridanus  
4 Abaxial surfaces of leaves and ligules lacking subsessile glandular trichomes; leaves usually broadly ovate to orbicular and with a petiole > 1 cm long..........................................................H. silphioides  
5 Abaxial surfaces of leaves and ligules lacking subsessile glandular trichomes; leaves usually lanceolate to lance-ovate or rhombic-ovate and with a petiole usually < 1 cm long.  
6 Phyllaries oblong-lanceolate, apex acuminate, abaxially usually pubescent...............................H. laetiflorus  
6 Phyllaries elliptical to oblong-ovate, apex acute, abaxially glabrate.................................H. pauciflorus ssp. pauciflorus

Key D – perennial sunflowers with leafy stems and yellow disk flowers

1 Stems below the capitulose glabrous or nearly so, sometimes glaucous.  
2 Leaves whorled at principal nodes, either alternate or opposite at other nodes ................................H. verticillatus  
2 Leaves either alternate or opposite (or both).  
3 Leaves grayish-green or bluish green in color, sessile, and abaxially glabrous and glaucous.  
4 Rays 10-14; leaves strumose adaxially, rough to the touch; phyllaries 3.5-4.5 mm wide ................................H. eggertii  
4 Rays 5-10; leaves glabrous or glabrato adaxially, smooth or only slightly rough to the touch; phyllaries 2-3 mm wide ...H. laevigatus  
3 Leaves light to dark green, sometimes whitish abaxially, but not grayish or bluish green in color; leaves sessile or petiolate, glabrous or pubescent.  
5 Leaves linear-lanceolate, with only a single main vein ........................................................................H. smithii  
5 Leaves linear-lanceolate to lanceolate, lance-ovate, or ovate, trilinervated at base.  
6 Rays few, usually 5 or 8; heads small, the involucres 9 mm broad or less.  
7 Leaves abaxially whitish in color and glabrous and glaucous, lacking subsessile glandular trichomes ("resin dots") ..............H. glaucocephalus  
7 Leaves abaxially greenish in color, usually tomentulose (sometimes glabrate), with abundant subsessile glandular trichomes ....H. microcephalus  
6 Rays usually 10 or more in larger heads; heads larger, the involucres usually > 9 mm broad.  
8 Leaves sessile, rounded to cordate at base, and trinerved, with the 2 lateral veins diverging from the midrib at the very base of the leaf..........................................................H. divaricatus  
8 Leaves sessile to petiolate, but narrowing gradually to base and trilinerved, the 2 lateral veins diverging from the midrib above the base of the blade.  
9 Anther appendages yellow.  
10 Leaf blade lanceolate to lance-ovate, sessile to petiolate but the petiole usually < ¼ as long as the blade; phyllaries not conspicuously graduated and imbricate, usually loose and spreading................H. grosseserratus  
10 Leaf blade ovate to elliptic, with a distinct petiole usually > 2 cm long and ½ as long as blade or longer; phyllaries conspicuously graduated and imbricate, usually appressed, not exceeding disk ................H. occidentalis ssp. occidentalis  
9 Anther appendages dark or reddish-brown.  
11 Plants producing abundant tubers; leaves subsecised, the petioles < 1 cm long; [endemic to the Piedmont of NC and SC]...H. schweinitzii  
11 Plants rhizomatous, but not producing tubers; leaves petiolate, the petiole 1-5 cm long; [collectively widespread in our area].  
12 Phyllaries equal to or slightly exceeding disk, apex acute; leaves moderately serrate to entire, with a petiole 1-3 cm long, and abaxially with usually abundant subsessile glandular trichomes ("resin dots") ............H. stramosus  
12 Longer phyllaries usually exceeding disk by ½ their length or more, apex acuminate; larger leaves moderately to conspicuously serrate, with a petiole 2-5 cm long, and abaxially with usually relatively few subsessile glandular trichomes........................H. decapetalus  
1 Stems pubescent throughout, not glaucous.  
13 Leaves sessile and cordate, mostly or all opposite..........................................................H. mollis  
13 Leaves petiolate or sessile, but not cordate, and alternate or opposite.  
14 Phyllaries attenuate, conspicuously exceeding the disk in length and reflexed, apically with numerous subsessile glandular trichomes ("resin dots"); leaf bases often conjoined, the basically ovate or lance-ovate blade joined to a broadly winged and gradually narrowed petiole ........................................................................H. resinosus  
14 Phyllaries acute to attenuate, but not reflexed, subsessile glandular trichomes present or absent; leaf bases usually truncate to truncate or rounded, the blade lance-linear or lanceolate, or if ovate or lance-ovate either sessile or with a petiole that is at most narrowly winged.  
15 Leaves conduplicate and entire, usually with only a single prominent main vein; inflorescence when well developed spiciform or racemose..........................................................H. maximilianii  
15 Leaves not conduplicate, entire or serrate, trilinerved (with a prominent lateral pair of veins near the base); inflorescence not spiciform or racemose.  
17 Leaf blades lanceolate to petiole 1-5 cm long and usually < ½ as long as blade; anther appendages with dark pigment; cypselas 4-5 mm, usually sterile .................................................H. laetiflorus  
17 Leaf blades ovate to elliptic, petiole distinct, > 2 cm and usually > ½ as long as the blade; anther appendages yellow; cypselas 3-4 mm long, fertile.................................................................H. occidentalis ssp. occidentalis  
16 Phyllaries not conspicuously graduated and imbricate, usually loose or spreading.

Helianthus angustifolius Linnaeus, Narrowleaf Sunflower. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV*), Pd (GA, SC, VA): savannas, ditches, marshes, other wet habitats; common (uncommon in Piedmont of GA, NC, and SC, uncommon in DE Coastal Plain, rare in VA Piedmont, rare in Mountains). (July-) September-October (-frost). Primarily Coastal Plain, from Long Island, NY south to c. peninsular FL and west to TX, irregularly inland to OH, IN, and MO. This plant is very showy when in flower on roadides, especially in October. [= RAB, C, FNA, G, GW, K, S, SE, WH, WV; > H. angustifolius var. angustifolius – F; > H. angustifolius var. planifolius Fernald – F]

* Helianthus argophyllus Torrey & A. Gray, Silverleaf Sunflower. Cp (FL, NC): dunes and disturbed sandy soil on a barrier island; rare, native of TX. July-October. Native to s. TX. Heiser et al. (1969) noted a collection from NC, but stated their uncertainty as to its establishment. *H. argophyllus* is well-established near Captain Charlie's on Bald Head Island, Brunswick County, where it has apparently persisted and spread over the last 30 years (at least). [= F, FNA, K, S, SE, WH]

Helianthus atrorubens Linnaeus, Appalachian Sunflower. Mt (GA, NC, SC, VA), Pd (GA, NC, SC, VA), Cp (FL, NC, SC, VA): dry soils of rocky, sandy, or clayey woodlands and roadbanks; common (uncommon in VA Mountains, rare in FL). Late July-October. N. VA west to w. TN, and south to c. GA, Panhandle FL, AL, and se. LA. Related to the Ozarkan *H. silphioides* Nuttall. [= RAB, C, FNA, G, K, SE, W; > H. atrorubens var. alidoses Fernald – F; > H. atrorubens var. atrorubens – F; < H. atrorubens – S (also see *H. silphioides* Nuttall)]

Helianthus debilis Nuttall ssp. tardiﬂorus (Heiser) Cronquist – SE; < H. debilis ssp. cucumerifolius – WH]

Helianthus glaucophyllum D.M. Smith, Whiteleaf Sunflower. Mt (NC, SC), Pd (SC): moist forests, woodlands, and woodland edges, at medium elevations, mostly from 1000-1500 m (but sometimes lower), generally flowering only when in a canopy gap (as caused by a tree-fall) or along banks of narrow roads; rare. July-September. A narrow Southern Appalachian
**Helianthus grosseserratus** Martens, Sawtooth Sunflower. Pd (DE, GA, NC, VA), Mt (VA, WV), Cp (DE, VA): disturbed areas; uncommon (rare in GA, NC, and VA Coastal Plain, rare in VA Mountains, rare in DE Piedmont), introduced from farther west. The original range of this species was apparently centered in OH, IN, IL, IA, and MO, but its exact extent is obscured by its subsequent spread. Reported for NC by Matthews & Mellichamp (1989). [= C, F, FNA, G, K, W, WV; H. grosse-serratus – S, SE, orthographic variant]

**Helianthus heterophyllus** Nuttall, Savanna Sunflower. Cp (GA, NC, SC): wet savannas, seepage bogs; uncommon (rare in GA). August-October. A Southeastern Coastal Plain endemic: se. NC south to Panhandle FL and west to se. LA. [= RAB, FNA, GW, K, S, WH]

**Helianthus laetiflorus** Persoon. Cp (NC, SC, VA), Pd (NC, SC, VA), Mt (VA, WV): disturbed areas; uncommon, introduced from farther west. Late July-September. Widely scattered in e. and c. North America, believed to be a derivative of the hybrid of *H. pauciflorus* Nuttall ssp. *subrhomboideus* (Rydberg) O. Spring & E. Schilling and *H. tuberosus*. [= RAB, G, S, SE, WV; H. ×laetiflorus Persoon (pro sp.) – C, FNA, K; H. laetiflorus var. laetiflorus – F]

**Helianthus laevigatus** Torrey & A. Gray, Shale-barren Sunflower, Smooth Sunflower. Mt (NC, VA, WV), Pd (NC, SC, VA): on dry, rocky or shaly soils, on roadbanks, powerline rights-of-way, open woodlands, in the Carolinas nearly limited to the Carolina Slate Belt; common in VA, uncommon in WV, rare in NC and SC). August-October. The primary range of *H. laevigatus* is in the mountains of c. and w. VA and e. WV, from whence it is disjunct to a few areas in the Piedmont of NC and SC, most notably the Carolina Slate Belt in Montgomery and Stanly counties, NC. [= RAB, C, F, FNA, G, K, SE, W, WV; H. laevigatus – S; H. reinitians (Steele) E.E. Watson – S]

**Helianthus longifolius** Pursh, Longleaf Sunflower. Mt (GA, NC*), Pd (GA, PA), Cp (GA, SC): sandstone and granite glades and woodlands, loamy to xeric longleaf pine sandhills; rare. August-October. This species is apparently rare, occurring in ne. AL, n. GA (introduced in sw. NC). [= RAB, FNA, K, S, SE]

**Helianthus maximiliani** Schröder, Maximilian Sunflower. Pd (NC, SC, VA), Mt (NC, SC, VA, WV), Cp (NC, VA): moist roadsidies and disturbed areas; uncommon, introduced from farther west. September-October. MI and MB west to BC and south to TX; introduced in the East. [= C, SE, W; H. maximiliani – RAB, F, FNA, G, K, S, orthographic variant]

**Helianthus occidentalis** Riddell ssp. *occidentalis*, Naked-stem Sunflower. Mt (GA, NC, VA, WV), Pd (VA), Cp (FL): rocky or sandy flood-scoured riversides, dry hammocks (in FL); rare. July-October. MD and DC west to MN, and south to w. NC, n. GA, Panhandle FL, and TX. Ssp. *occidentalis* occupies most of the range of the species. Ssp. *plantagineus* (Torrey & Gray) Shimmers occurs in sw. LA, se. TX, and AR. Var. *dowellianus* Torrey & Gray, of uncertain status (if valid, then usually treated as a variety under *ssp. occidentalis*), occurs in the Appalachians portion of the range. The species has been collected only twice in NC, the type collection of *H. dowellianus* M.A. Curtis, from "near Franklin, Macon Co.,” and in 1897, near Asheville, Buncombe County ("sandy bottoms along the French Broad River near Biltmore"). GAHP reports *H. occidentalis* as a rare species in the state, from "limestone glades and barrens, rocky or cherty soils" (GAHP 2003); it is uncertain what variety is represented. [= FNA, K; H. occidentalis Riddell var. *dowellianus* (M.A. Curtis) Torrey & A. Gray – C, F, SE; H. occidentalis – RAB, G, S, W, WH; H. occidentalis – WV; H. dowellianus M.A. Curtis – WV]

**Helianthus pauciflorus** Nuttall ssp. *pauciflorus*, Stiff Sunflower. Mt (GA), Pd (GA*, VA*), Cp (VA*): disturbed areas; rare, native in the more western portion of our area, introduced eastwards. July-September. Reported for VA by Fernald (1950) under the name *H. pauciflorus var. rigidus* and for nc. GA by Jones & Coile (1988) under the name *H. rigidus* (Cassini) Desf. [= FNA, K; H. pauciflorus var. pauciflorus (Cassini) Fernald – F; H. pauciflorus var. rigidus (Cassini) Desfontaines – S; H. rigidus var. rigidus – SE]

**Helianthus porteri** (A. Gray) Pruski, Confederate Daisy. Pd (GA, NC*, SC): in shallow soils over granite on low-elevation granite domes or flatrocks; uncommon, native in GA and SC, introduced and vigorously established in NC (SC Rare). August-September. A Piedmont endemic: nw. SC south to GA and ec. AL. The species has often been treated in *Viguiera*; see Pruski (1998) and Schilling et al. (1998) for discussion of the reasons for treating this species in *Helianthus*. It is well-established at two sites in NC, on Rocky Face Mountain (Alexander County, NC) and Mitchell Mill Flatrock (Wake County, NC), where it was introduced with soil blocks of *Diamorpha smallii* as part of a ecological experiment (Mellinger 1972; McCormick & Platt 1964). [= FNA, K; H. porteri (A. Gray) Blake – C, SE]

**Helianthus radula** (Pursh) Torrey & A. Gray, Roundleaf Sunflower, Rayless Sunflower. Cp (FL, GA, SC): sandhills, dryish savannas, and dry pine flatwoods; common (rare in SC). Late August-October. S. SC south to s. peninsula FL and west
A genus of about 18 species, herbs, of America. References: Smith in FNA (2006c); Fisher (1957)=Z; Cronquist (1980)=SE. Key adapted in part from Z.

1 Plants 3-8 dm tall; larger leaves on a plant generally 3-8 cm long; heads 1 (-3) per plant; rays 6-10 (-13) per head; rays 1-2 (-2.4) cm long; [of the Coastal Plain].............................................................................................................................

   \textit{Heliopsis helianthoides} \textit{var. gracilis}

1 Plants (4-) 8-15 dm tall; larger leaves on a plant generally 7-15 cm long; heads (1-) 3-8 per plant; rays (8-) 10-16 per head; rays (1.5-) 2-4 cm long; [widespread in our area, rare in the Coastal Plain].

2 Leaves smooth on both sides (or sometimes sparsely pubescent below and slightly scabrous above); leaves (4.0-) 4.5-6.0 (-12) cm wide; stem glabrous and glaucous below (like \textit{H. helianthoides} \textit{var. gracilis}), the leaves resin-dotted below (like \textit{H. microcephalus}), but nearly glabrous. It may be a hybrid derivative of \textit{H. microcephalus} and \textit{H. strumosus}. \textit{[FNA, K, < H. microcephalus - C, SE]}

\textit{Heliopsis} Persoon 1807 (Sunflower-everlasting, Oxeye)

\* \textit{Heliomeris} Nuttall 1848 (Golden-eye)

\* \textit{Heliomeris multiflora} (Nuttall) Blake \textit{var. multiflora}, Golden-eye. Cm (SC): waste areas around wool-combing mill; rare, perhaps only a waif, native of western United States and Mexico. May. \textit{[FNA, K, = Viguiera multiflora (Nuttall) Blake]}

\* \textit{Heliopsis} Persoon 1807 (Sunflower-everlasting, Oxeye)

A genus of about 18 species, herbs, of America. References: Smith in FNA (2006c); Fisher (1957)=Z; Cronquist (1980)=SE. Key adapted in part from Z.

**Helianthus** (Linnaeus) Sweet var. *scabra* (Dunal) Fernald, Western Sunflower-everlasting, Rough Oxeye, Western Oxeye. Mt (WV), Pd (VA): dry, open forests and woodlands, woodland borders; uncommon (rare in VA). May–October. NL (Newfoundland) and SK south to VA, WV, KY, GA, LA, TX, and NM. FNA mentions frequent intergradation, and some plants in our area best considered var. *scabra* do not seem to be “pure.” [= C, F, G, K, SE; = H. *scabra* Dunal – S, WV; = H. helianthoides ssp. *scabra* (Dunal) Fisher – Z]

**Helminthotheca** Zinn 1757 (Oxtongue)

* Helminthotheca* (Linnaeus) Holub, Bristly Oxtongue. Cp (VA?): disturbed areas; rare, native of Europe. July–September. Reported from DC and VA; uncertain whether documented from our area. [= FNA; = Picris echioides Linnaeus – C, F, G, K, SE]

**Heterotheca** Cassini 1817 (Camphorweed, Golden-aster)

1 Leaves primarily cauline, the largest leaves definitely on the stem, basal leaves usually absent; [Hieracium s.s.]

2 Florets 8-20 (~30) per head; leaves nearly glabrous, or with a few long hairs on the lower surface; upper stem glabrous......**H. paniculatum**

2 Florets 30-110 per head; leaves setose, with long hairs on the upper and lower surfaces; upper stem stipitate-glandular, stellate-pubescent, or glabrous.

3 Leaves with entire margins, rounded to obtuse at the tip; [widespread in our area]............................................................................................................................. **H. scabrum**

3 Leaves with toothed to laciniate margins, acute to obtuse at the tip; [disjunct at high elevations in WV]............................................................................................................................. **H. umbellatum**

1 Leaves primarily basal, the largest leaves basal, leaves in some species extending onto the lower portion of the stem.
Plants stoloniferous; [aliens of weedy habitats, especially pastures, roadsides, and lawns]; [Pilosella].

5 Heads 1 (-3) per plant..............................................................................................................H. pilosella
5 Heads (1-2)-many per plant.

6 Heads (1-2)-6 per plant, leaves nearly glabrous on the upper surface........................................H. flagellare
6 Heads (3-5)-50 per plant, leaves nearly glabrous or distinctly long-pubescent on the upper surface.

7 Flowers deep orange ....................................................................................................................H. aurantiacum
7 Flowers yellow.

8 Leaves not glaucous; leaves hairy on the upper surface ..............................................................H. caespitosum
8 Leaves glaucous; leaves glabrous (or nearly so) on the upper surface ........................................H. floribundum

4 Plants not stoloniferous; [primarily natives (except H. caespitosum and H. piloselloides), of various (mostly dry) habitats].

9 Cypselas 1.5-2 mm long, truncate at the tip; basal leaves mostly 5-12× as long as wide (the petiole included); well-developed basal leaves rarely over 3 cm wide; [S]: [FNA]; [Hieracium s.s.].

10 Leaves and stem not glaucous; leaves hairy on the upper surface..............................................H. caespitosum
10 Leaves and stem glaucous; leaves sparsely hairy to nearly glabrous on the upper surface................H. piloselloides

9 Cypselas 2-4 mm long, usually distinctly narrowed to the tip (except H. scabrum); basal leaves mostly 1.5-5× as long as wide (the petiole included); well-developed basal leaves often over 3 cm wide; [native]; [Hieracium s.s.].

11 Leaves purple-veined (when fresh).

12 Lower stem strongly pilose; leaves weakly purple-veined..........................................................H. marianum
12 Lower stem glabrous or nearly so; leaves strongly purple-veined....................................................H. venosum

13 Inflorescence a narrow panicle.

14 Cypselas truncate, broadest at the tip; flowers 40-100 per head....................................................H. scabrum
14 Cypselas narrowed to the tip; flowers 20-40 per head

15 Hairs of the lower stem 1-4 mm long; inflorescence 2-4× as long as wide; [widespread in our area]............H. gronovii
15 Hairs of the lower stem 6-15 mm long; inflorescence 4-7× as long as wide; [of KY and TN westward] ..............[H. longipilum]

13 Inflorescence corymbiform.

16 Cypselas 2-3 mm long, truncate, broadest at the tip; flowers 40-100 per head..................................H. scabrum
16 Cypselas 2.5-5 mm long, at least the longer achenes narrowed to the tip; flowers 15-40 per head.

17 Stem with several well-developed leaves slightly smaller than the basal leaves; inflorescence corymbiform or tending toward paniculate.

18 Involucre mostly 6-9 mm high; inflorescence generally elongate and cylindrical (appearing corymbiform in depauperate individuals); achenes 3.5-5 mm long; corollas 8-9 mm long.................................................................H. gronovii
18 Involucre mostly 8-11 mm high; inflorescence broadly corymbiform; achenes 3.5-5 mm long; corollas 10-13 mm long, .........[Hieracium ×megacephalum]

19 Involucre glabrous or with short stipitate glands, but lacking long setae (either gland-tipped or glandless) .........H. marianum
19 Involucre with long setae (either gland-tipped or glandless).

Involucral setae gland-tipped; [of the Coastal Plain] ........................................................................[Hieracium ×megacephalum]

Involucral setae not gland-tipped; [of the Coastal Plain] .....................................................................[Hieracium ×megacephalum]

Involucral setae not gland-tipped; [of the Mountains (and Piedmont?) of VA],

... ................................................................................................................................................[Hieracium ×megacephalum]

**Hieracium umbellatum** Linnaeus, Northern Hawkweed. Mt (WV): rocky areas; rare. Circumboreal, south in North America to PA, WV (Spruce Knob), IN, MO, CO, and OR. [=C, FNA, K; >* H. canadense* Michaux var. fasciculatum (Pursh) Fernald – F, G; >* H. canadense var. hirtirameum* Fernald – F, G]

**Hymenopappus** L’Héritier 1788 (Woolly-white)

**Hymenopappus scabiosaeus** L’Héritier var. *scabiosaeus*. Cp (FL, GA, SC): turkey oak sandhills and adjacent sandy fields; common (rare in GA and SC). Sc. SC south to n. peninsular FL, west to AR, MO, and OK, and north in the interior to n. IN, c. and s. IL, and se. MO. Var. *corymbosus* (Torrey & A. Gray) B.L. Turner is distributed in the s. Great Plains and adjacent areas, from NE south to TX and Coahuila. [=C, FNA, K, SE; <* H. scabiosaeus* – RAB, F, G, S, WH]

**Hymenoxys** Cassini 1825

**Hypocharis** Linnaeus 1753 (Cat’s-ear)

A genus of about 60 species, of South America, Europe, Asia, and n. Africa. The controversial spelling of the genus name is now resolved in favor of *Hypocharis*. References: Bogler in FNA (2006a); Cronquist (1980)=SE.

1 Stem with at least a few well-developed leaves, clasping and similar to the basal; pappus of one length, all long and plumose.
2 Flowers yellow; middle and outer phyllaries hirsut; heads usually 5-8 mm across at anthesis, the involucre campanulate......*H. chillensis*
3 Flowers white; middle and outer phyllaries glabrous or puberulent; heads usually 2-4 mm wide at anthesis, the involucre cylindric............*H. microcephala var. albilora*
4 Stem naked, or only with few and very small bracts; pappus of two lengths, the outer short and barbellate, the inner long and plumose.
5 Plants glabrous or apparently so; plants mostly annual..........................................................*H. glabra*
6 Plants conspicuously pubescent, as on the hispid leaves; plants mostly perennial..................................................*H. radicata*
**Hypochaeris chilensis** (Kunth) Britton, Brazilian Cat's-ear. Cp (FL, GA, NC, SC), Pd (GA, SC), Mt (SC): roadsides, fields, other disturbed places; common, native of South America. Late April-July. More common in the NC Coastal Plain than shown in RAB (common in Duplin, Sampson, and Wayne cos.) (A.J. Bullard, pers. comm. 2003). [= FNA; ? Hypochaeris brasiliensis (Less.) Grisebach var. tweediei (Hooker & Arnott) Baker – K, SE, WH; ? Hypochaeris elata (Weddell) Grisebach – RAB, misapplied]

**Hypochaeris glabra** Linnaeus, Smooth Cat's-ear. Cp (FL, GA, NC, SC), Pd (NC, SC), Mt (WV): roadsides, fields, disturbed areas; common (rare in NC and WV, uncommon in FL), native of Europe. Late March-July. [= FNA, K, S, WH; = Hypochaeris glabra – RAB, C, SE, WV, orthographic variant]

**Hypochaeris microcephala** (Schultz 'Bipontinus') Cabrera var. albiflora (Kuntze) Cabrera, White-flowered Cat’s-ear. Cp (GA): disturbed areas; rare, native of South America. This species has been found as a naturalized introduction at Fort Pulaski (Chatham County, GA) (T. Govus, pers. comm. 2006) and in Camden County, GA (Carter, Baker, & Morris 2009). [= FNA, k, SE]

### Inula

**Inula Linnaeus 1753** (Elecampane)

**Inula helenium** Linnaeus, Elecampane. Mt (NC, VA, WV), Pd (DE, VA), Cp (DE): damp pastures, roadsids, other disturbed areas; rare, native of Europe. May-September. [= RAB, C, F, FNA, G, K, S, SE, W, WV, Z]

### Ionactis

Greene 1897 (Stiff-leaved Aster)

**Ionactis** has usually been included in *Aster*, but differs in many characters and is more closely related to *Heterotheca* (Nesom & Leary 1992). References: Nesom in FNA (2006b); Nesom & Leary (1992)=Z; Cronquist (1980)=SE.

**Ionactis linariifolia** (Linnaeus) Greene, Stiff-leaved Aster. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): dry savannas, sandhills, pine flatwoods, prairie-like openings, glades, and barrens, high elevation rock outcrops and glades, to at least 1450 m, dry roadbanks, woodland edges, rocky woodlands; common (uncommon in WV, rare in DE). August-November. ME and QC west to WI, south to ne. FL, Panhandle FL, and TX. There appears to be substantial variation in *I. linariifolia*, with montane (and northern) populations having considerably longer and broader leaves than Coastal Plain (and southern) populations; additional study is needed. [= FNA, WH, Z; = *I. linariifolia* – K, S, orthographic variant; = *Aster linariifolius* Linnaeus – RAB, C, G, SE, W, WV]

### Iva

**Iva Linnaeus 1753** (Marsh-elder)

A genus of about 9 species, shrubs and herbs, of North America. *Iva* has usually been included in *Aster*, but differs in many characters and is more closely related to *Heterotheca* (Nesom & Leary 1992). References: Nesom in FNA (2006b); Nesom & Leary (1992)=Z; Cronquist (1980)=SE.

**Iva** has usually been included in *Aster*, but differs in many characters and is more closely related to *Heterotheca* (Nesom & Leary 1992). References: Nesom in FNA (2006b); Nesom & Leary (1992)=Z; Cronquist (1980)=SE.

1 Plants annual (perennial in *I. asperifolia*, not fleshy, more-or-less pubescent (at least in the inflorescence); [of mainly inland wetlands or disturbed areas].

2 Larger leaves 4-7 (-8.5) cm long, 0.7-1.5 (-2.1) cm wide, 4-10× as long as wide, subentire or with 1-8 (rarely more) teeth on each side; [of NJ southward]..........................*I. frutescens* var. *frutescens*

3 Larger leaves 6-10 cm long, 2.0-4.0 cm wide, 1.5-4× as long as wide, usually with 8-17 teeth on each side; [of n. NC northward]..........................*I. frutescens* var. *ovaria*

5 Leaves 20-70 mm wide, ovate; staminate flowers usually 8-16 (-20) per head; [mostly of disturbed ground]; [section *iva*] ..........................*I. annua*

6 Involucres 1.5-2 mm high; outer phyllaries distinct, not glandular-punctate; leaves 0.5-3 mm wide; pistillate flowers 3 per head..................*I. angustifolia*

7 Plants annual, erect, 5-12 dm tall; stamine flowers 1-5 per head..........................*I. angustifolia*
ASTERACEAE

7 Plants perennials, decumbent, rooting at the nodes, 2-5 dm tall; staminate flowers 3-9 per head.................................*I. asperifolia*

*Iva annua* Linnaeus, Sumpweed, Rough Marsh-elder. Cp (FL, GA**, NC*, SC*, VA*), Pa** (NC, SC, VA), Mt (GA, WV*): fields, disturbed places; rare, in the eastern and inland part of area probably introduced (by native Americans) from further west. September-November. Pa, ND, and CO south to FL, NM, and Mexico (the original distribution uncertain). This species was apparently an important crop of native Americans. The so-called var. *macrocarpa* (Blake) R.C. Jackson, known only from archeological remains and presumed extinct, is almost certainly a cultivated form, selected for its large seeds. [= RAB, C, FNA, GW, K, Y; =*I. ciliata* Willdenow – F; >*I. ciliata* Willdenow var. *ciliata* – G; >*I. ciliata* var. *macrocarpa* Blake – G; >*I. annua* var. *annua* – K, Y; >*I. annua* var. *caudata* (Small) R.C. Jackson – K, Y; >*I. annua* var. *macrocarpa* (Blake) R.C. Jackson – K, Y; >*I. ciliata* – S; >*I. caudata* Small – S]

*Iva frutescens* Linnaeus var. *oraria* (Bartlett) Fernald & Griscom, Northern Maritime Marsh-elder. Cp (DE, MD, NC, VA): brackish marshes and marsh edges, normally on the back side of barrier islands; common (uncommon south of MD). Late August-November. NS south to Dare County, NC. The two varieties are morphologically distinct, except in the zone of overlap (NJ south to Dare County, NC), where intermediates will be encountered. Even in the zone of overlap, though, most plants are readily identified to variety. There might be some merit in considering these taxa species, with limited hybridization in a small portion of their total distributions. [= C, F, G, SE; =*I. frutescens* ssp. *oraria* (Bartlett) R.C. Jackson – K, Y; <*I. frutescens* – RAB, FNA, S; =*I. oraria* Bartlett]

*Iva imbricata* Walter, Dune Marsh-elder. Cp (FL, GA, NC, SC, VA): dunes, upper beach, island-end flats; common (rare in VA). Late August-November. SE. VA south to s. FL, west to LA; Bahamas and Cuba. This plant is often the most oceanward perennial plant, often the first perennial to colonize the upper beach or incipient dunes on island-end flats, where it occurs with such upper beach annuals as *Euphorbia polygonifolia*, *Euphorbia bombensis*, *Cakile edentula*, and *Amaranthus pumilus*. [= RAB, C, F, FNA, GW, K, S, SE, WH, Y]

*Iva microcephala* Nuttall, Small-headed Marsh-elder. Cp (FL, GA, NC, SC): wet pine flatwoods, flatwood ponds, clay-based Carolina bays; common (rare north of FL). September-October. C. NC south to s. FL, west to se. AL. A seed-banking annual, locally abundant some years and absent others depending on the variable hydrologic conditions of Carolina bays and other seasonally flooded wetlands. [= RAB, FNA, GW, K, S, SE, WH, Y]

*Ixeris* (Cassini) Cassini 1822

*Jamesianthus* Blake & Sherff 1940 (Warbonnet)

A monotypic genus, a perennial herb, endemic to c. AL and wc. GA. References: Strother in FNA (2006c).

*Jamesianthus alabamensis* Blake & Sherff, Alabama Warbonnet. Mt (GA): streambanks over limestone or other calcareous rocks; rare (GA Special Concern). Endemic to stream banks in c. AL and wc. GA. The opposite leaves are squared off at the base in a distinctive manner. [= FNA, K, SE]

*Krigia* Schreber 1791 (Cynthia, Dwarf-dandelion)

Phyllaries in fruit, 2.4+ as long as wide; pappus absent (or represented by minute scales or bristles < 2 mm long); plant a leafy-stemmed winter annual.

Phyllary midveins evident but not forming curved keels; cypsela fusiform, ca. 2× as long as broad. **_Krigia cespitosa_**

Phyllary midveins becoming prominent and curving inward at bases to form keels; cypsela obovoid, ca. 1.5× as long as broad. **_K. montana_**

Phyllaries reflexed in fruit, 3.8+ as long as broad; pappus present, consisting of 5 or more scales and 5 or more bristles (the bristles > 4 mm long); plant a scapose, subscapose, or leafy-stemmed perennial or a scapose or subscapose winter annual.

Pappus of 5 scales and 5 bristles; plant a winter annual; stem leafless or leafy at the base only. **_K. virginica_**

Pappus of 15-40 scales and 15-40 bristles; plant a perennial; stem leafless, leafy at the base only, or with many leaves extending up the stem.

Stems leafless, the peduncles terminal; perennial from scapose, scapose-stemmed roots, or with many leaves extending up the stem. **_Krigia montana_**

Stems leafy, at least at the base, the peduncles axillary; perennials from stout creeping rhizomes or short caudices, not bearing tubers; pappus bristles 4.0-7.0 mm long. **_Krigia biflora_**

Peduncles usually 1 per leaf axis; leaves linear-lanceolate, the larger 1-12 mm wide; perennial from an underground rhizome (to 5 mm in diameter), larger plants with an extensive rootmat and multiple stems. **_K. dandelion_**

Peduncles usually 2 per leaf axis; leaves oblanceolate, the larger 15-45 mm wide; solitary-stemmed perennial from a short caudex. **_Krigia cespitosa_**

A genus of about 75 species, herbs, nearly cosmopolitan (especially north temperate). References: Strother in FNA 2006a; Cronquist (1980)=SE; McVaugh (1972). [also see _Ixeris_]

**_Krigia occidentalis_** Nuttall. {GA}. March-May. MO and KS south to LA and TX; disjunct eastwards in GA. [= FNA, K] {add to synonymy}

**_Krigia wrightii_** (A. Gray) K.L. Chambers ex K.J. Kim, Wright’s Dwarf-dandelion. AR and OK south to LA and TX. [= FNA]

A genus of about 75 species, herbs, nearly cosmopolitan (especially north temperate). References: Strother in FNA 2006a; Cronquist (1980)=SE; McVaugh (1972). [also see _Ixeris_]

Identification notes: Most species are highly variable in leaf lobing.

Achene beaks stout and short, 0.1-0.5 (-1.0) mm long (< ⅔ as long as the body of the achene); rays blue to violet (rarely yellow or white).

Pappus tawny; flowers mostly 20-30 per head. **_L. biennis_**

Pappus bright white; flowers mostly 10-15 per head. **_L. floridana_**

Achene beaks filiform and long, 1-4 mm long (> ⅔ as long as the body of the achene); rays yellow or blue (sometimes white or drying bluish).

Each face of the achene with (3-) 5-9 nerves; stems typically white or pale green; rays yellow (sometimes drying blue); [aliens].

Unlobed cauleine leaves lanceolate to linear. **_L. saligna_**

Unlobed cauleine leaves oblout, obovate, or spatulate.

Phyllaries usually erect in fruit; midrills of leaves usually smooth. **_L. sativa_**

Phyllaries usually reflexed in fruit; midrills of leaves prickly setose. **_L. serriola_**

**_Lactuca_** Linnaeus 1753 (Lettuce)
ASTERACEAE

3 Each face of the achene with 1 (-3) nerves; stems typically medium to dark green or reddish; rays yellow or blue; [natives, though often weedy].

6 Unlobed leaves and lobes of lobed leaves narrow, usually < 1 cm wide; leaves basally disposed, the basal and lower-stem leaves the largest and most persistent; plants 3-12 dm tall; [primarily of the Coastal Plain, rare elsewhere] . L. graminifolia var. graminifolia

6 Unlobed leaves and lobes of lobed leaves wider, usually > 1 cm wide; leaves well-distributed on the stem; plants 3-33 dm tall; [collectively widespread].

7 Fruiting involucres 10-15 mm tall; achenes 2.5-3.5 mm long (excluding the beak) ............................................. L. canadensis

7 Fruiting involucres 15-22 mm tall; achenes 4.5-6 mm long (excluding the beak).

8 Leaf margins not prickly (or barely so); flowers 13-25 per head; [widespread in our area] ........................................................................................................... L. hirsuta

8 Leaf margins prickly; flowers 20-56 per head; [of KY and MS westward] ................................................................. L. ludoviciana

Lactuca biennis (Moench) Fernald, Tall Blue Lettuce. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (DE): pastures, roadsides, forest edges, thickets; common (uncommon in Piedmont and Mountains). August-November. NY, MB and MN south to s. FL and TX. [= RAB, C, F, FNA, G, K, SE, W, WV; > Mulgedium spicatum (Lamarck) Small var. spicatum – S; > Mulgedium spicatum var. integrifolium (Torrey & A. Gray) Small – S]

Lactuca graminifolia var. Michaux var. floridana var. latifolia (Linnaeus) de Candolle, Coastal Plain Lettuce. Cp (GA, NC, SC), Pd (GA, SC), Mt (VA): mesic to dry-mesic pine-oak woodlands and forests, longleaf pine sandhills, sandy fields, and sandy roadsides; common (rare in Piedmont, rare in Mountains). April-July. E. NC south to s. FL, west to c. LA; disjunct in s. NJ. Var. arizonica McVaugh is distributed in mesic canyons in montane w. TX, s. CO, NM, and AZ, south into w. Mexico. Var. mexicana McVaugh is distributed in Tamaulipas, Veracruz, Oaxaca, Chiapas, and Guatemala. [= K; < L. graminifolia – RAB, F, FNA, SE, W, WH; = L. graminifolia – S]

Lactuca hirsuta Muhlenberg ex Nuttall, Downy Lettuce. Cp (GA, NC, SC, VA), Pd (NC, SC, VA, WV), Mt (NC, SC, VA, WV): forests and forest edges; uncommon (rare in Piedmont and Mountains, rare in GA Coastal Plain). Late May-November. NS and ON south to n. FL and TX. [= RAB, C, FNA, S, SE, W, WV; > L. hirsuta var. hirsuta – F, G, K; > L. hirsuta var. sanguinea (Bigelow) Fernald – F, G, K]

Lactuca ludoviciana (Nuttall) Riddell, Louisiana Lettuce. MB and BC, south to IN, KY, MS, LA, TX, and CA. [= C, F, FNA, G, K, S, SE] [not keyed]

Lactuca virosa Linnaeus, Bitter Lettuce. Reported for DC and AL (Kartesz 1999; FNA); no specimens have been seen that document this distribution. [= FNA, WH] [not keyed]

Lagascea Cavanilles 1803

A genus of 8 species, herbs and shrubs, of sw. United States, Mexico, and Central America, not pantropical by introduction. References: Harris in FNA (2006c); Stuessy (1978)=Z.

* Lagascea mollis Cavanilles, Silkleaf. Cp (FL): disturbed areas (on ballast); rare (not recently collected), native of Mexico (but now pantropical). Collected at Apalachicola, Franklin County, FL by A.W. Chapman and previously in FL by Rugel. [= FNA, WH, Z] [not keyed]

Lapsana Linnaeus 1753 (Nipplewort)

A monotypic genus (after the removal of most members to Lapsanastrum), an annual herb, of temperate Eurasia. References: Bogler in FNA (2006a); Cronquist (1980)=SE.
**Lapsana communis** Linnaeus, Nipplewort. Mt (GA, NC, VA, WV), Pd, C, VA: fields, forests, disturbed areas; uncommon (rare in GA, NC, and Coastal Plain of VA), native of Europe. June-September. {Collectively widespread}. [see *Oporinia*]

A genus of about 30 species, herbs, primarily of temperate Eurasia. Samuel et al. (2006) show that *L. communis* subgenus *Oporinia* should be recognized as a separate genus from *L. communis*. References: Samuel et al. (2006); Bogler in FNA (2006a); Cronquist (1980)=SE. [also see *Oporinia*]

* Leontodon Linnaeus 1753 (Hawkbit)

1. Heads (solitary-) several; scapes usually scaly-bracteate above; pappus of plumose bristles. [see *Oporinia*]
2. Pappus type mixed on each cypsela (with the scales outward and the plumose bristles inwards; phyllaries densely and coarsely hirsute or hirsute) [L. hispidus]
3. Pappus barbellate, the barbels mostly 0.1-0.3 (-0.4) mm long.
4. Outer phyllaries as long as or longer than the inner phyllaries, spreading or reflexed, the petaloid portion elongate relative to the green phyllary bases. [L. elegans var. kralii]
5. Heads sessile; petaloid phyllary apices light yellow or cream (rarely pale lavender), divergent with tips appressed, usually with a narrow hyaline border. [L. elegans var. elegans]
6. Inner phyllaries with apices prolonged, loosely spreading, slightly dilated, and petaloid (white to yellow, pink, or purplish); heads 3-5 mm in diameter, with 4-6 flowers per head; corolla lobes glabrous within; [of the Coastal Plain from SC southward].

* Leontodon saxatilis Lamarck sensu stricto. References: Samuel et al. (2006); Bogler in FNA (2006a); Cronquist (1980)=SE; Stucky & Pyne (1990); Godfrey (1948)=Y; Stucky (1991); Stucky (1992); Mayfield (2002). Key adapted in large part from FNA.

1. Heads (solitary-) several; scapes usually scaly-bracteate above; pappus of plumose bristles. [see *Oporinia*]
2. Pappus type mixed on each cypsela (with the scales outward and the plumose bristles inwards; phyllaries densely and coarsely hirsute or hirsute) [L. hispidus]
3. Pappus barbellate, the barbels mostly 0.1-0.3 (-0.4) mm long.
4. Outer phyllaries as long as or longer than the inner phyllaries, spreading or reflexed, the petaloid portion elongate relative to the green phyllary bases. [L. elegans var. kralii]

* Leontodon hispidus Linnaeus, Bristly Hawkbit. Scattered states in eastern North America. [GA, PA (FNA); MD, DC (Kartesz 1999) – investigate] [= FNA; > *Leontodon hispidus* ssp. hispidus – K; > *L. hirsutus* Linnaeus – K]

**Leucanthemum** P. Miller 1754 (Oxeye Daisy)

1. Leaves larger near or slightly below mid-stem; leaves toothed only . [L. lucastre]
2. Leaves larger near or slightly below mid-stem; leaves toothed only . [L. vulgare]

**Liatris** Schreber 1791 (Blazing-star, Gayfeather)

1. Pappus plumose, the barbels mostly 0.5-1.0 mm long.
2. Pappus plumose, the barbels mostly 0.5-1.0 mm long.
3. Pappus plumose, the barbels mostly 0.1-0.3 (-0.4) mm long.
4. Pappus plumose, the barbels mostly 0.1-0.3 (-0.4) mm long.
5. Pappus plumose, the barbels mostly 0.1-0.3 (-0.4) mm long.
6. Heads mostly 1-7 (-10) in a subcorymbiform arrangement; [of Bibb Co., AL] . [L. oligocephala]
7. Heads mostly 1-7 (-10) in a subcorymbiform arrangement; [of Bibb Co., AL] . [L. oligocephala]
Leaves 3-5-veined.

8 Basal and lower cauline leaves (2-) 4-8 mm wide, cauline usually abruptly reduced in size at ca. midstem, continuing distally as linear, bract-like leaves; heads in a densely (- to loosely) spiciform arrangement; involucres 7-9 mm, purplish to greenish; florets 5-6 (-8) per head; [mainly of the Coastal Plain] ......................................................... L. spicata var. resinosa

9 Mid and inner phyllaries either apically rounded or rounded-retuse and minutely involute-cuspidate to apiculate.

10 Stems hirtellous with spreading to slightly deflexed hairs or variously puberulent to hirsute.

11 Stems hirsute to puberulent to pilose-puberulent or strigose-puberulent ......................................................... L. gracilis

12 Heads sessile, relatively crowded in a cylindrical arrangement, rigidly ascending, appressed to the rachis and to each other, densely overlapping; [e. NC south to Panhandle FL and AL] ................................................................. L. chapmanii

13 Phyllaries apically usually rounded-retuse and minutely involute-cuspidate to apiculate; corolla tubes glabrous within.

14 Stems and basal leaves glabrous; basal leaves mostly arising from congested nodes at very base of plant; (1-) 2-6 (-9) mm wide, abruptly reduced in size distally, surfaces minutely white-dotted by stomates, not glandular-punctate........................................ L. laevigata

15 Heads in a second arrangement or not; involucres (7-) 8-11 mm, usually greenish; florets (4-) 6-8 (-12) per head; [of the Mountains and Piedmont] ................................................................. L. spicata var. spicata

7 Leaves 1-veined.

9 Mid and inner phyllaries either acutely or rounded-rebutse and minutely involute-cuspidate to apiculate.

10 Stems hirtellous with spreading to slightly deflexed hairs or variously puberulent to hirsute.

11 Stems hirsute to puberulent to pilose-puberulent or strigose-puberulent ......................................................... L. gracilis

12 Heads sessile, relatively crowded in a cylindrical arrangement, rigidly ascending, appressed to the rachis and to each other, densely overlapping; [e. NC south to Panhandle FL and AL] ................................................................. L. chapmanii

13 Heads sessile to short-pedunculate, in a relatively loose, spiciform, racemoid, or paniculate, commonly second arrangement; [e. GA south through ne. FL to c. peninsular FL] ................................................................. L. pauciflora

14 Phyllaries apically usually rounded-retuse and minutely involute-cuspidate to apiculate; corolla tubes glabrous within.

15 Heads in a second arrangement or not; involucres (6-) 7-9 mm; phyllaries ovate-triangular to generally oblong; florets 4-10 (-12).

16 Heads densely arranged, on internodes 1-2 (-5) mm long, often secund; phyllary apex sharply acuminate-acute, distinctly involute, lamina relatively thin, glands consistently present and superficial at least on proximal portion; florets 4-7 (-9); basal and lower cauline leaves of at least some plants 4-10 mm wide, gradually reduced in length distally, surfaces minutely white-dotted by stomates, not glandular-punctate ................................................................. L. cokeri

17 Heads loosely arranged, on internodes 6-15 (-20) mm long, not secund; phyllary apex sharply acute to obtuse-angled with a thickened apiculum, not markedly involute, lamina relatively thick, usually with evidently sunken punctate glands, without superficial glands; florets 7-10 (-12); basal and lower cauline leaves 4-9 (-12) mm wide, quickly reduced in width and length distally ................................................................. L. secunda

18 Phyllaries apically acute; corolla tubes pilose within.

19 Involucres 6-10 mm; florets (6-) 7-13 (-17); corolla tubes internally pilose; pappus bristles as long as the corolla tubes (shorter in some populations of L. helleri).

20 Stems 15-55 cm; leaves and phyllaries weakly or not at all punctate; pappus bristles 1/3-2/3 to equal the corolla tube length; montane .................................................................................................................... L. helleri

21 Stems 40-120 cm; leaves and phyllaries distinctly punctate-glandular to weakly punctate; pappus bristles equal the corolla tube length; coastal plain and piedmont. ........................................................................................................ L. elegans

22 Heads densely arranged, on internodes (2-) 5-10 (-14) mm; peduncles 0-2 (-7) mm; involucres 6-8 mm; phyllaries in 3-4 (-5) series ........................................................................................................ L. elegans

23 Heads loosely arranged, on internodes (1-) 2-5 (-7) mm; peduncles 0-10 (-17, -80 in proximal part of capitulescence) mm; involucres (7-) 8-10 mm, phyllaries in (3-) 4-5 (-6) series ................. L. pilosa

18 Stems puberulent to striigose.

24 Involucres 2.5-7 (-9) mm; seeds 3-12.

25 Stems and peduncles puberulent to pilose-puberulent or striigose-puberulent; heads usually on ascending peduncles 2-10 (-12) mm; involucres 2.5-4 (-5) mm wide; phyllaries acutely rounded or obtuse to acute or acuminate; florets 3-6 (-9) .......................................... L. gracilis

26 Stems and peduncles stiffly short-striigose with closely ascending hairs; heads on divergent, arcuate-ascending peduncles 10-25 (-30) mm; involucres 5-7 mm wide; phyllaries acutely rounded to nearly flat; florets 7-12 ..................................................... L. patens

27 Involucres 13-22 (-25) mm wide or (6-) 8-15 mm wide (L. squarrulosa); florets 11-80.

28 Heads usually on peduncles usually 8-50 mm (rarely subsessile); phyllaries erect, not reflexing; florets ca. 30-80 (19-33 in L. scarrosa); corolla tubes glabrous or pilose within.

29 Leaves or leafy bracts 8-20 (-25) below the heads, cauline usually abruptly reduced above the basal; florets 19-33; [plants of the Central and Southern Appalachians] ........................................................................................................ L. scarrosa var. scarrosa

30 Leaves or leafy bracts 20-85 below the heads, usually continuing relatively even-sized upward above the basal; florets ca. 30-80; [plants of WVA and PA northward] ................................................................. L. scarrosa var. nieuwlandii

31 Heads usually sessile, less commonly subsessile on peduncles 1-8 mm (rarely more); at least outer phyllaries usually reflexing; florets 11-26 (-30); corolla tubes pilose within.

26 Phyllaries glabrous, bullate, with broad, conspicuous, often erose to lacerate or irregular, hyaline border .............. L. aspera

27 Phyllaries glabrous to puberulent or puberulent-hirtellous, essentially flat (not bullate), without hyaline border or border narrow and inconspicuous ...................................................................................................................... L. squarrulosa

**Liatris chapmannii** Torrey & A. Gray, Chapman's Blazing-star. Xeric sands of scrub. August-October. Sw. GA, s. AL, south to s. FL. [= FNA, K, SE, WH; > Laciiniaria chapmannii (Torrey & A. Gray) Kuntze – S] {synonymy incomplete}

**Liatris cokeri** Pyne & Stucky, Sandhills Blazing-star. Sandhills. (August-) September-October. Sc. and se. NC south to nc. SC. [= FNA; = Liatris regimontis (Small) K. Schumann – RAB, SE, WH; > Liatris cokeri – K; > Liatris regimontis – K]

**Liatris cylindracea** Michaux, Barrellhead Blazing-star. Limestone glades, prairies, rarely escaped from cultivation eastwards. July-September. NY, ON, and MN south to se. TN (Ridge and Valley) (Chester, Wofford, & Kral 1997), nw. GA, and c. AL (Bibb County), and OK. [= FNA, K, Z; > Liatris aspera var. kralii – K; > Laciniaria aspera var. kralii (Michaux) Alexander – S]

**Liatris elegantula** (Greene) K. Schumann. Cp (FL, GA): sandhills; uncommon. August-October (-November). GA south to n. peninsular FL, west to MS. [= FNA, WH; = Liatris graminifolia Willdenow var. elegantula (Greene) Gaiser – Z; = Laciiniaria elegantula Greene – S; < Laticiniaria graminifolia (Willdenow) Kuntze – S; < Liatris graminifolia – SE] {synonymy incomplete}

**Liatris gholsonii** L.C. Anderson, Gholson’s Gayfeather. Mesic sandy sites. (July-) August-October (-November). Endemic to Liberty and Leon counties, FL. [= FNA, WH] {not yet keyed; add to synonymy}

**Liatris gracilis** Pursh, Slender Blazing-star. Sandhills, dry pine flatwoods. (July-) August-October (-November). SC south to s. FL, west to MS. [= RAB, FNA, K, SE, WH; > Laciiniaria laxa Small – S; > Laciiniaria gracilis (Pursh) Kuntze – S]

**Liatris hirsuta** Rydberg. Glades, and prairies. IA and NE south to MS, LA, and TX; disjunct eastward in nw. GA. [= FNA; > Laciiniaria squarrosa (Linnaeaus) Hill – S; = Laciiniaria squarrosa (Linnaeaus) Michaux var. hirsuta (Rydberg) Gaiser – C, F, G, K, SE, Y, Z; < Laciiniaria squarrosa – W] {add to synonymy}

**Liatris patens** Nesom & Kral, Georgia Blazing-star. Xeric sites. August-October. GA (Tatnall Co.) south to c. peninsular FL; alleged by Small (1933) to extend to SC. [= Liatris patens – K, SE (also see L. secunda); = Laciiniaria patens (Pursh) Kuntze – S; = Liatris patens var. patens – FNA, WH]
**ASTERACEAE**

**Liatris pilosa** (Aiton) Willdenow. Sandhills, pine barrens, fields, roadbanks. (August-) September-October (-November). NJ, DE, and PA south to SC. [= FNA, K; < Liatris graminifolia Willdenow – RAB, SE, W (also see Liatris virgata); = Liatris graminifolia – C, G; > Liatris graminifolia var. graminifolia – F; > Liatris graminifolia var. lasia Fernald & Griscom – F; > Liatris graminifolia var. racemosa (A.P. de Candolle) Venard – F, WV; > Liatris graminifolia var. typica – Y, Z; > Liatris graminifolia var. dubia (Barton) A. Gray – WV, Y, Z; = Laciniaria graminifolia (Walter) Kuntze – S]

**Liatris provincialis** R.K. Godfrey. Sandhills, scrub, dunes. (August-) September-October. Endemic to FL Panhandle (Franklin and Wakulla counties). [= FNA, WH] {not yet keyed; add to synonymy}

**Liatris pycnostachya** Michaux var. lasiophylla Shinners. [= FNA; < Laciniaria pycnostachya (Michaux) Kuntze – S; < Liatris pycnostachya – SE] {not yet keyed; add to synonymy}

**Liatris pycnostachya** Michaux var. provincialis. [= FNA; < Laciniaria pycnostachya (Michaux) Kuntze – S; < Liatris pycnostachya – C, F, G, SE] {not yet keyed}

**Liatris scariosa** (Linnaeus) Willdenow var. scariosa, Northern Blazing-star. Shale barrens, dry rock outcrops, roadbanks. August-September (-October). PA, MD, and WV south to NC and TN. [= C, FNA, K, SE; < Liatris scariosa – RAB, W; = Liatris scariosa – F, G; < Laciniaria scariosa (Linnaeus) Hill – S (also see Liatris squarrulosa); > Liatris scariosa var. scariosa – WV, Y, Z; > Liatris scariosa var. virginiana (Lunell) Gaiser – WV, Y, Z]

**Liatris scariosa** (Linnaeus) Willdenow var. nieuwendii (Lunell) E.G. Voss. Prairies, glades, and woodlands. August-September (-October). CT, NY, MI, and WI south to PA, WV, IN, IL, and AR. [= FNA, B, G, K, SE; < Liatris borealis Nuttall – F; = Liatris novae-angliae (Lunell) Shinners var. nieuwendii Gaiser – Y, Z] {synonymy incomplete}

**Liatris squarrosula** Michaux. Diabase barrens, other glades and barrens, prairies, open woodlands. August-October (-November). S. WV, KY, IL, and MO south to GA, Panhandle FL, AL, and TX. Highly variable and needing additional study to determine if multiple taxa should be recognized. [= C, FNA, K, SE, W, WH; > Liatris earlei (Greene) Schumann – F, RAB, Y, Z; > Liatris squarrosula – G; > Liatris scabra (Greene) K. Schumann – F, G; > Laciniaria rutilii Alexander – S; > Laciniaria shortii Alexander – S; = Liatris scabra var. squarrosula – Y, Z]

**Liatris tenuifolia** Nuttall. Longleaf pine sandhills. August-November. SC south to s. FL, west to AL. [= FNA, RAB; = Liatris tenuifolia Nuttall var. tenuifolia – SE, K, SE; < Laciniaria tenuifolia (Nuttall) Kuntze – S (also see Liatris laevigata)]

**Liatris virgata** Nuttall. Open woods, roadbanks. (July-) August-October (-November). {distribution}. [= FNA, K; < Liatris graminifolia – RAB, SE, W; > Liatris graminifolia var. smallii (Britton) Fernald & Griscom – F, Y, Z; > Liatris regimontis (Small) K. Schumann – C, G, Y; > Liatris regimontis – F, orthographic variant; < Laciniaria regimontis Small – S; < Laciniaria smallii Britton – S; > Liatris graminifolia var. virgata (Nuttall) Fernald – F]
A genus of 125 species (or more), perennial herbs, natives of temperate Eurasia. References: Barkley in FNA (2006b).

* **Ligularia dentata** (A. Gray) H. Hara. Commonly cultivated horticulturally in ne. North America, locally established or persistent, as in MD; native of China and Japan. [= FNA, K; = Senecio clivorum (Maximowicz) Maximowicz – C, SE]

**Lygodesmia** D. Don 1829 (Rush Pink, Skeletonplant)

**Lygodesmia aphylla** (Nuttall) Torrey & A. Gray, Flowering Straws, Rose-rush. Xeric sandhills. C. GA south to s. FL and west to c. Panhandle FL. [= FNA, K, S, SE, WH, Z]

**Madia** Molina 1782 (Tarweed)
A genus of about 10 species, of w. North America and Chile. References: Baldwin & Strother in FNA (2006c); Cronquist (1980)=SE.

* **Madia sativa** Molina, Tarweed. Disturbed areas, scattered occurrences (perhaps only waifs) in eastern North America, including GA, NC, PA; variously considered native of Chile or w. North America (see FNA). [= K; M. capitata Nuttall; > M. sativa var. sativa – SE; > M. sativa var. congesta Torrey & A. Gray – SE]

**Marshallia** Schreber 1791 (Barbara's-buttons)
A genus of about 11 species, perennial herbs, of the se. United States. **Marshallia** ranges from sc. VA, sw. PA, WV, s. KY, s. MO, and c. OK, south to c. peninsular FL, and sw. TX. References: Channell (1957)=Z; Watson in FNA (2006c); Watson & Estes (1990)=Y; Cronquist (1980)=SE; Watson, Elisens, & Estes (1991); Watson, Jansen, & Estes (1991); Beadle & Boynton (1901)=X.

1 Leaves not basally disposed, the leaves all about the same size; plants glabrous throughout; plants colonial by persistent rhizomes; internodes 10-25 (and leaves 2-5× as long as wide). ................................................................................................................................................ M. trinervia

1 Leaves basally disposed, either all of the leaves below the midpoint of the stem, or the upper leaves markedly smaller than the lower stem and basal leaves (the basal leaves sometimes withered); plants pubescent at least below the heads; plants producing lateral offsets which are separated from the parent in less than a year; internodes 1-12 (and leaves 3-15× as long as wide) or 10-35 (and leaves 8-20× as long as wide).

2 Phyllaries with acuminate-subulate tips; paleae (receptacular bracts, interspersed with the flowers) with acuminate-subulate tips; plants usually with 2 or more heads; flowering late July-mid October.

3 Lower stem leaves (and basal leaves) erect, narrowly lanceolate to linear-lanceolate, with attenuate or long-acuminate apices, relatively thick in texture, the 2-4 lateral nerves (parallel to the midnerve) prominent; caudex with fibrous remnants of the previous year's leaves (if not burned off); phyllaries thick, ovate-attenuate; [NC, SC, and extreme e. GA] ................................................................................................................ M. graminifolia

3 Lower stem leaves (and basal leaves) spreading, oblanceolate or spatulate, with rounded or obtuse apices, relatively thin in texture, the 2 lateral nerves (parallel to the midnerve) often obscure; caudex lacking fibrous remnants of the previous year's leaves; phyllaries thin, linear-subulate; [e. GA southward and westward] ................................................................................................................ M. tenuifolia

2 Phyllaries with rounded to acute apices; paleae (receptacular bracts, interspersed with the flowers) slightly to strongly broadened or clavate-thickened just below the acute to obtuse apex; plants with 1 head (or more in M. mohrii and M. ramosa); flowering in late April-July.

4 Heads 2-10 (-20) (rarely solitary on depauperate plants).

5 Leaves 6-10 cm long, 8-23 mm wide, mostly 3-10× as long as wide; heads 2-5 (-10), 22-37 mm in diameter; [sandstone, limestone, and dolostone glades of nw. GA and c. AL] ................................................................................................................ M. mohrii

5 Leaves 8-20 cm long, 2-7 (-10) mm wide, mostly > 15× as long as wide; heads (2-) 4-10 (-20), 10-25 mm in diameter; [Altamaha Grit glades pinelands, and ultramafic outcrop barrens of e. GA and Panhandle FL] ................................................................................................................ M. ramosa

4 Head solitary.

6 Leafy portion of the stem 0-20 (-30) cm long, the naked peduncle 1.5-10× (or more) as long as the leafy portion of the stem; stem leaves (if present) not reduced upward, the uppermost > 1/2 as long and wide as the largest leaves on the plant; basal leaves obovate
to oblanceolate, the apex obtuse to rounded (often emarginate); outer well-developed phyllaries with obtuse to rounded apex; corollas white to very pale pink; plants flowering late April-May (-early June).

7 Plant with 3-10 leaves on the lower stem, extending (5-) 8-20 (-30) cm up the stem; pappus scales (0.5-) 1.0-1.5 mm long; plant 
(2-) 3-5 (-7) dm tall; [of the Piedmont from sc. VA southward].......................... \textit{M. obovata} \textit{var. obovata}

7 Plant scapose (all of the leaves basal) or nearly scapose, with 1-5 leaves extending 1-5 (-10) cm up the stem; pappus scales (1.0-) 
1.5-2.5 (-3.0) mm long; plant (0.5-) 1.5-3.5 (-5.0) dm tall; [of the Coastal Plain from NC southward].......................... \textit{M. obovata} \textit{var. scaposa}

6 Leafy portion of the stem 23-50 cm long, the naked peduncle 0.4-1.2× as long as the leafy portion of the stem; stem leaves reduced 
upward, the uppermost < 1/3 as long and wide as the largest leaves on the plant; basal leaves obovate to oblanceolate, the apex 
obtuse to acute or acuminate; outer well-developed phyllaries with acute to obtuse apex; corollas medium pink; plants flowering late 
June-July.

8 Basal and lower cauline leaves (2-) 3-13 (-20) cm long (including the petiole), (5-) 10-20 (-30) mm wide, averaging about 6× as 
long as including the petiole), the apex obtuse to rounded; pappus scales ca. 2 mm long; plants (2-) 3-5 (-8.5) dm tall; 
achenes without resin-dots between the ridges; [of the Mountains] .................................................. \textit{M. grandiflora}

8 Basal and lower cauline leaves (8-) 15-25 (-32) cm long (including the petiole), (3-) 7-12 (-15) mm wide, averaging about 10× as 
long as including (the petiole), the apex acute to acuminate; pappus scales ca. 1.2 mm long; plants (4-) 6-9 (-10) dm tall; 
achenes with copious resin-dots between the ridges; [of the Piedmont] .................................................. \textit{M. species 1}

\textbf{Marshallia graminifolia} (Walter) Small, Grassleaf Barbara's-buttons. Pine savannas. Late July-mid October. Ne. NC 
south to sc. SC, and rarely to e. GA (Emanuel County) (Sorrie 1998b). Closely related to \textit{M. tenuifolia} Rafinesque, which differs in 
having a well-developed horizontal rosette of thin-textured spatulate leaves, which do not leave fibrous remains (vs. with firm, 
ascending, linear-lanceolate basal leaves, which leave fibrous remains). \([= GW, RAB, SE, Z; < M. graminifolia – FNA, = M. 
graminifolia var. graminifolia – K; > M. lacinarioides Small - S; > M. williamsonii Small – S; > M. graminifolia var. graminifolia – X; > M. 
graminifolia var. lacinarioides (Small) Beadle & F.E. Boynton – X; = M. graminifolia ssp. graminifolia – Y]\)

\textbf{Marshallia grandiflora} Beadle & F.E. Boynton, Appalachian Barbara's-buttons, Large-flowered Barbara's-buttons. Sandy 
or rocky riverbanks, bog margins, dry slopes over mafic rocks. June-August. Sw. PA south to sw. NC, e. TN (Cumberland 
Plateau) (Chester, Wofford, & Kral 1997), and se. KY. \([= C, F, FNA, G, K, S, SE, W, WV, X, Y, Z; < M. grandiflora – RAB (also see \textit{M. 
species 1})]\)

\textbf{Marshallia mohrii} Beadle & F.E. Boynton, Coosa Barbara's-buttons. Sandstone, limestone, and dolostone glades, 
calcareous prairies. Nw. GA and n. and c. AL. It somewhat resembles \textit{M. grandiflora}, but typically has 2-10 heads per plant (or 
solitary in depauperate individuals). \([= FNA, K, S, SE, X, Y, Z]\)

\textbf{Marshallia obovata} (Walter) Beadle & F.W. Boynton \textit{var. obovata}, Piedmont Barbara's-buttons, Spoon-leaved Barbara's-
buttons. Clay flats, woodland borders, dry woodlands. Late April-May (-early June). Sc. VA south to se. TN (Chester, Wofford, 
& Kral 1997), sw. GA, Panhandle FL, and c. AL, primarily in the Piedmont. \([= C, G, K, RAB, SE, Y, Z; = M. obovata var. platyphylla 
(M.A. Curtis) Beadle & F.E. Boynton – F, X; < M. obovata – FNA, S, W, WH]\)

\textbf{Marshallia obovata} (Walter) Beadle & F.W. Boynton \textit{var. scaposa} Channell. Pine savannas. Late April-May. E. NC south 
to se. AL, in the Coastal Plain. \([= K, RAB, SE, Y, Z; = M. obovata var. obovata – F, X, misapplied; < M. obovata – FNA, S]\)

Grit outcrops, woodlands over ultramafic rocks. Coastal Plain from e. GA south to ne. FL and Panhandle FL. It somewhat 
resembles \textit{M. graminifolia} in its linear leaves, but differs in the phyllaries acute (vs. subulate-acuminate), and flowering period 
(late May-June vs. July-mid-October). \([= FNA, K, S, SE, WH, X, Y, Z]\)

\textbf{Marshallia species 1}, Oak Barrens Barbara's-buttons. Diabase barrens and fire-maintained woodlands over greenstone. 
Late June-July; August-September. This species is known from three extant and one extirpated population, in Granville County, 
NC and Halifax Co. VA, where associated with numerous rare and disjunct taxa of barren or barren affinities: \textit{Solidago 
plinioioides}, \textit{Solidago rigida} var. glabrata, \textit{Symphyotrichum depauperatum}, \textit{Echinacea laevigata}, \textit{Silphium terebinthinaceum}, 
\textit{Baptisia australis} var. aberrans, \textit{Linum sulcatum} var. sulcatum, \textit{Carex meadii}, \textit{Eryngium yuccifolium} var. yuccifolium, 
\textit{Scutellaria leonardii}, \textit{Lithospermum canescens}, and others. \([= M. grandiflora – RAB]\)

\textbf{Marshallia tenuifolia} Rafinesque. Pine savannas. E. GA south to c. peninsular FL, west to e. TX. See \textit{M. graminifolia} for 
additional discussion. \([= GW, SE, WH, Z; < M. graminifolia – FNA, = M. graminifolia (Walter) Small var. cynanthera (Elliott) Beadle 
& F.E. Boynton – K, X; = M. graminifolia – X, misapplied; = M. graminifolia (Walter) Small sp. tenuifolia (Rafinesque) L. Watson – Y]\)

\textbf{Marshallia trinervia} (Walter) Trelease, Colonial Barbara's-buttons, Broadleaf Barbara's-buttons. Moist rocky streambanks 
and in calcareous clays. July. E. SC (?), sw. NC, and sc. TN, south to s. AL and s. MS (Sorrie & Leonard 1999). Reported for 
VA by C; the documentation is unknown. \([= C, F, FNA, G, K, RAB, SE, W, X, Y, Z]\)
**Matricaria** Linnaeus 1740 (Mayweed)

1 Heads with evident white rays (very rarely lacking rays); plant chamomile-scented; disc flowers 5-lobed..........................**M. chamomilla**
1 Heads discoid (lacking rays); plant pineapple-scented; disc flowers 4-lobed..........................**M. discoidea**

**Melampodium** Linnaeus 1753

* **Melampodium divaricatum** (Richard) DC. Disturbed areas; native of tropical America. [= FNA, K, WH]

**Melanthera** Rohr 1792

**Melanthera nivea** (Linnaeus) Small. Calcareous outcrops, sandy woodlands. June-October. E. SC south to s. FL, west to LA; also widespread in the West Indies, Mexico, Central America, and northern South America (Colombia, Ecuador, Peru, and Venezuela). [= FNA, K, SE, WH, Z; > *M. hastata* Michaux – RAB, S]

**Mikania** Willdenow 1803 (Climbing Hempweed)

A genus of about 430-450 species, vines, perennial herbs, and shrubs, primarily pantropical in distribution, but with extensions into temperate areas (Holmes 1995). References: Holmes in FNA (2006c); Cronquist (1980)=SE.

1 Involucre 6.5-8 mm; achenes 3.5-4.5 mm long; pubescence of the stems, leaves, and involucres spreading; [of se. SC southward].................................**M. cordifolia**
1 Involucre 4.5-5.5 (-6) mm high; achenes 1.5-2.5 (-2.7) mm long; pubescence of the stems, leaves, and involucres puberulent or nearly smooth; [widespread in our area].................................................................................**M. scandens**

* **Mikania cordifolia** (Linnaeus f.) Willdenow, Heartleaf Climbing Hempweed. Bottomland hardwood forests, mesic hammocks near the coast, margins of tidal marshes. Se. SC (Beaufort and Colleton counties) (P. McMillan, pers. comm. 2005), e. GA (Bryan & Camden counties) (Carter, Baker, & Morris 2009), south to s. FL, west to s. LA. [= K, S, SE, WH]

* **Mikania scandens** (Linnaeus) Willdenow, Climbing Hempweed. Marshes, swamp forests, wet thickets, seepages. July-October. ME to s. ON, south to s. FL and e. TX, south into the tropics. [=C, G, GW, K, RAB, S, SE, W, WH; > *M. scandens* var. *pubescens* (Nuttall) Torrey & A. Gray – F; > *M. scandens* var. *scandens* – F]
Oclemena E.L. Greene 1903 (Aster, Nodding-aster)

A genus of 3 species, perennial herbs, of e. North America. There now appears to be strong evidence (morphologic and molecular) and something approaching a consensus for the recognition of Oclemena as distinct from Aster. It appears that Oclemena is most closely related to Ionactis, and that these two genera are more closely related to Solidago and Heterotheca than to Aster (in a narrower sense). References: Brouillet in FNA (2006b); Nesom (1994)=Z; Semple, Heard, & Xiang (1996)=Y; Cronquist (1980)=SE; Nesom (1997).

1 Leaves 30-100 or more per plant, 1-8 mm wide ................................................................. O. nemoralis
1 Leaves 11-30 per plant, 10-50 mm wide.
2 Leaves obovate, acuminate at the tip, thin in texture; [of the Mountains] ........................................ O. acuminata
2 Leaves narrowly elliptic, acute to obtuse at the tip, coriaceous in texture; [of the Coastal Plain, from se. SC southward] .............. O. reticulata

Oclemena nemoralis (Aiton) Greene, Leafy Bog Aster, Bog Nodding-aster. Peaty bogs. NL (Labrador) and ON south to nc. PA, MD, DE (formerly), and NJ. [= FNA, K, Z; = Aster nemoralis Aiton – C, F, G]

Oclemena reticulata (Pursh) Nesom, Pine-barren Aster. Wet pine flatwoods. Late April-early June. Se. SC south through e. GA to c. peninsular FL. [= FNA, K, WH, Z; = Aster reticulatus Pursh – GW, RAB, SE; = Doellingeria reticulata (Pursh) Greene – S]

Onopordum Linnaeus 1753 (Scotch Thistle, Cotton-thistle)

A genus of about 60 species, herbs, of the Mediterranean region and w. Asia. References: Keil in FNA (2006a); Cronquist (1980)=SE.

Oporinia D. Don 1829 (Fall-dandelion)

A genus of about 20 species, herbs, primarily of temperate Eurasia. Samuel et al. (2006) show that Leontodon subgenus Oporinia (including L. autumnalis among the species treated below) should be recognized as a separate genus from Leontodon sensu stricto. References: Samuel et al. (2006); Bogler in FNA (2006a); Cronquist (1980)=SE.

* Oporinia autumnalis (Linnaeus) D. Don, Fall-dandelion. Roadsides, fields; native of Europe. June-October. [= Leontodon autumnalis Linnaeus – FNA, SE, WV; > Leontodon autumnalis Linnaeus var. autumnalis – C, F, G; > L. autumnalis ssp. autumnalis – K]

Packera Á. & D. Löve 1976 (Ragwort)

A genus of about 64 species, annual and perennial herbs, of subtropical, temperate, and arctic North American, with a few species in Siberia. These species have usually been considered part of Senecio, and have often been given informal status as "the Aureoid group". According to recent interpretations, this group warrants generic status, as Packera (Bremer 1994). References:

Packera aurea (Linnaeus) Á. & D. Löve, Golden Ragwort, Heartleaf Ragwort. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, FL, VA): moist forests, bottomlands, bogs, stream banks; common (rare in FL). Late March–June. NL (Labrador) west to MN, south to NC, ne. SC, n. GA, n. AL, and c. AR; disjunct in Panhandle FL. This species is variable, and some of the more striking variants have been named; some may well warrant formal taxonomic recognition, but additional study is needed. [= FNA, K, WH, Y; = Senecio aureus Linnaeus – C, G, GW, RAB, SE, WV, X; > Senecio aureus var. aureus – F; > Senecio aureus var. intercursa Fernald – F; > Senecio aureus var. gracilis (Pursh) Hooker – F; > Senecio aureus – S; > Senecio gracilis Pursh – S]

Packera crawfordii (Britton) A.M. Mahoney & R.R. Kowal ined. Mt, Cp (NC): bogs and fens; rare. NJ, PA, and s. IN south to e. NC, w. NC, and TN. [= Senecio pauperculus Michaux – RAB, C, G, GW, S, SE, X; = Senecio crawfordii (Britton) G.W. & G.R. Douglas – F; < Packera pauperica (Michaux) Á. & D. Löve – FNA]

Packera millefolium (Torrey & A. Gray) W.A. Weber & Á. Löve, Blue Ridge Ragwort, Yarrowleaf Ragwort. Mt (GA, NC, SC, VA): granitic domes, cliffs, and rocky woodlands, over granite, gneiss, schist, and amphibolite, and in calcareous glades (in sw. VA); rare. Late April–early June. Endemic to sw. NC, nw. SC, and ne. GA; disjunct in sw. VA (Lee Co.). The hybrid with Packera anonyma [= Senecio ×memmingeri Britton (pro sp.)] occurs with the parents. The epithet in Packera is often spelled “millefolia,” ignoring that this epithet is a noun in apposition based on the pre-Linnaean genus name Millefolium (for Achillea).

[= Senecio millefolium Torrey & A. Gray – C, F, S, RAB, SE, X; = Packera millefolium – FNA, K, Y, orthographic variant]
**ASTERACEAE**

*Packera obovata* (Muhlenberg ex Willdenow) W.A. Weber & Á. Löve, Roundleaf Ragwort, Running Ragwort. Nutrient rich forests and woodlands (dry or moist), usually over calcareous or mafic rocks. April-June. VT west to KS, south to Panhandle FL and TX. [= FNA, K, WH, Y; = Senecio obovatus Muhlenberg ex Willdenow – C, RAB, S, SE, X; > Senecio obovatus var. obovatus – F, G, WV; > Senecio obovatus var. elliotii (Torrey & A. Gray) Fernald – F, G, WV; > Senecio obovatus var. rotundus Britton – F; > Senecio obovatus var. S; > Senecio rotundus (Britton) Small – S]

*Packera pauperculans* (Michaux) Æ. & D. Löve var. appalachiana (Michaux) Michaux – C, F, G, GW, RAB, S, SE; [= Senecio pauperculus Michaux – F; > Senecio pauperculus var. pauperculus – F; > Senecio pauperculus var. balsamites (Muhlenberg ex Willdenow) Fernald – F; > Senecio pauperculus var. paelongus (Greenman) House – F]

*Packera tomentosa* (Michaux) Æ. & D. Löve var. ambigua (Michaux) Æ. & D. Löve – FNA, K, Y, misapplied to our material; > Packera tomentosa ambigua (Michaux) Æ. & D. Löve – FNA, K, Y, misapplied to our material]

*Packera schweinitziana* (Nuttall) W.A. Weber & Á. Löve, New England Ragwort. Grassy balds (in deep soil), at high elevations, in our area generally over metagabbro or amphibolite. May-July. NS and QC south to n. NY; disjunct to a few locations in w. NC and e. TN, notably on grassy balds on Roan Mountain, Snake Mountain, Rich Mountain, and Big Bald. [= FNA, K; > Senecio schweinitzianus Nuttall – C, SE, X; > Senecio ambigua Oakes ex Rusby – F, G, RAB, S; > Packera schweinitziana – Y, orthographic variant]

*Packera tampicana* (de Candolle) C. Jeffery, Great Plains Ragwort. AR and KS south and east to e. LA (Florida parishes) or s. MS (SE), and south to TX and Mexico. [= FNA; = Senecio imparipinnatus Klatt – SE] [not yet keyed]

*Palafoxia* Lagasca y Segura 1816 (*Palafoxia*)

1 Perennial suffrutescent herb or shrub, 3-15 dm tall; phyllaries unequal, the longer inner phyllaries 8-11 mm long; pappus scales of the inner cypselas 4-7 mm long; [longleaf pine sandhills and sandy scrub, of sc. GA and FL] ................................. *P. integrifolia*

1 Annual herb, 2-8 dm tall; phyllaries equal, 3-10 mm long; pappus scales of the inner cypselas either 0.3-1 or 2-6 mm long.

2 Phyllaries 3-5 mm long; corollas 5-6 mm long; leaves 1-4 mm wide; pappus scales of the inner cypselas 0.3-1 mm long; [of calcareous prairies and glades, of MS westward] ................................................................. *P. callosa*

2 Phyllaries 5-8 mm long; corollas 7-10 mm long; leaves 5-20 mm wide; pappus scales of the inner cypselas 2-6 mm long; [alien in our area, of disturbed sites] ............................................................... *P. texana var. ambiguus*

*P. texana* (de Candolle) B.L. Turner & M.I. Morris, Texas Palafoxia. Dry, disturbed areas; native of TX and Tamaulipas. [= K, WH, Z; < P. texana – FNA]

*Panphalea* Lagasca y Segura 1811

* **Parthenium** Linnaeus 1753 (Wild Quinine)

A genus of about 16 species, herbs and shrubs, of North America and the West Indies. Mears (1975) does not seem to me to be a fully satisfactory explanation of the variation within the genus. Morphologically and ecologically, *P. auriculatum* seems worthy of specific status, and I have not followed Mears's reduction of it to varietal status. *P. integrifolium* var. *mabryanum*, and var. *integrifolium* serve to describe real patterns of variation, but are disturbingly confluent morphologically, ecologically, and geographically. References: Mears (1975)=Z; Cronquist (1980)=SE; Strother in FNA (2006c).

1 Leaves pinnatifid to bipinnatifid, the primary sinuses extending 9/10 or more of the way to the midrib; leaves thin in texture; pappus of 2 petaloid scales; [alien annual] ................................................. **P. hysterophorus**

1 Leaves toothed in forms of *P. integrifolium* var. *mabryanum*, the sinuses extending up to 3/4 of the way to the midrib; leaves somewhat thick in texture; pappus of 2-3 weak awns; [native perennials].

2 Stems with coarse, spreading pubescence 1-3 mm long; cauline leaves all auriculate-clasping, the upper cauline leaves sessile and auriculate-clasping, the lower caule leaves with winged petioles, the wings expanded at the base; blades of basal leaves 11-18 (-20) cm long, 5-8 cm wide ................................................................. **P. auriculatum**

2 Stems glabrous or with short, appressed pubescence <1 mm long; cauline leaves only rarely auriculate-clasping, the upper cauline leaves sessile or petiolate, the lower caule leaves petiolate, the petioles winged or not; blades of basal leaves (4-) 6-21 (-27) cm long, (1.4-) 2-12 (-13.5) cm wide.

3 Blades of basal leaves ovate-lanceolate, (4-) 6-12 (-20) cm long, (3-) 4-8 (-9.5) cm wide, never undulately lobed; heads (18-) 90-180 (-400) per inflorescence ................................................................. **P. integrifolium** var. **integrifolium**

3 Blades of basal leaves linear-lanceolate to ovate-lanceolate, (6-) 7-12 (-13.5) cm long, (1.4-) 2-4 (-4.5 cm) wide, sometimes undulately lobed throughout their length; heads (30) 40-75 (-85) per inflorescence................................................................. **P. integrifolium** var. **mabryanum**

**Parthenium hysterophorus** Linnaeus, Santa Maria, Feverfew. Disturbed areas; native of tropical America, including the West Indies. July-November. [= C, F, FNA, G, K, S, SE, WH]

**Parthenium integrifolium** Linnaeus var. *mabryanum* Mears, Mabry's Wild Quinine. Sandhills and other dry soils, in forest openings or woodlands. Late May-November (blooming strongly in response to fire). Ne. SC, e. NC, and se. VA, barely extending into the e. Piedmont of NC in dry sandy soils around granitic flatrocks or in (formerly) fire-maintained communities. Var. *mabryanum* is the characteristic variety of *P. integrifolium* in the Sandhills of NC. Mears named a new species, *P. radfordii* Mears, to accommodate sinuate-lobed *Parthenium* from the fall-line sandhills of NC and SC, which he also believed to be later-blooming (August-November) than other *Parthenium*. Extensive observations in the Sandhills of NC show that *P. radfordii* consistently co-occurs in mixed populations with *P. integrifolium* var. *mabryanum*, and that flowering is triggered by fire. These sinuate-lobed plants are best considered a form of var. *mabryanum*. [= K; < P. integrifolium var. *integrifolium* – RAB; < P. integrifolium – C, F, FNA, G, S, SE, W; > P. integrifolium var. *mabryanum* – Z; > P. radfordii Mears – Z]

**Pascalia** Ortega 1997

* **Pascalia glauca** Ortega, Beach Creeping Oxeye. Coastal dunes, disturbed areas; native of South America, perhaps only a waif. Reported for FL, GA, and AL. [= FNA, K, S, WH; = Wedelia glauca (Ortega) O. Hoffmann – SE]
**Pectis** Linnaeus 1759

*Pectis prostrata* Cavanilles. Roadsides, mowed areas, other dry disturbed areas; native of tropical America (probably including s. FL). July-November. Reported for NC (Basinger, pers. comm. 2006) and GA (Carter, Baker, & Morris 2009); likely to be in AL and SC. Spreading northward along roadsides. [= FNA, WH]

**Peripleura** (N.T. Burbidge) Nesom 1994

*Peripleura arida* (N.T. Burbidge) Nesom. Waste areas around wool-combing mill; perhaps only a waif, native of Australia. See Nesom (2004d). [= *Vittadinia arida* N.T. Burbidge]

**Petasites** P. Miller 1754 (Butterbur)

*Petasites hybridus* (Linnaeus) P.G. Gaertner, B. Meyer, & Scherbius, Butterbur, Butterfly-dock. Disturbed areas, frequently cultivated, rarely naturalized or persisting, native of Europe. Introduced and naturalizing south to DE, WV, and se. PA. [= C, F, FNA, G, K, SE]

**Phoebanthus** S.F. Blake 1916

1 Leaves 3-5 mm wide; phyllaries appressed; [of ne. FL south to s. peninsular FL] ......................................................... *P. grandiflorus*

1 Leaves 1.2 mm wide; phyllaries spreading; [of Panhandle FL and s. AL] ............................................. *P. tenuifolius*

**Picris** Linnaeus 1753 (Bitterweed, Oxtongue)

A genus of about 40 species, of the Old World, particularly the Mediterranean region. References: Strother in FNA (2006a); Cronquist (1980)=SE. [also see *Helminthotheca*]

1 Phyllaries in 2 series; phyllaries 3.5-8 mm wide; inner phyllaries 12-20 mm long; plant annual or biennial .... [see *Helminthotheca echioides*]

1 Phyllaries imbricate; phyllaries <3 mm wide; inner phyllaries 11-13 mm long; plant biennial to perennial ................. *P. hieracioides*

**Asteraceae**

**Pityopsis** Nuttall 1840 (Grass-leaved Golden-aster)

(Contributed by Bruce A. Sorrie)

A genus of about 8 species (and numerous infraspecific taxa), herbs, of se. North America south to Central America. **Pityopsis** is taxonomically and nomenclaturally a difficult genus. The problems include nomenclatural issues involving typification and application (and frequently misapplication) of a plethora of names at specific and varietal level, disagreement over whether to include **Pityopsis** within an inclusive **Chrysopsis**, whether then to include **Chrysopsis** within an even more inclusive **Heterotheca**, and differences in species concepts in a morphologically and cytologically diverse group. References: Semple in FNA (2006b); Semple & Bowers (1985)=Z; Ward (2004c)=Y; Cronquist (1980)=SE.

1 Basal leaves shorter than the stem leaves; middle and upper stem leaves similar in size to one another.
2 Leaves and stem glabrate, not silky pubescent; leaves 0.8-1.5 mm wide; [of the fall line Sandhills, from se. NC south to AL]. ......................................................... **P. pinifolia**
3 Peduncles and phyllaries moderately to densely stipitate-glandular; [plants of the Mountains of TN] ................................................................. **P. ruthii**
4 Stems straight; involucres 5-8 mm high; [plants of sandy places, from s. NJ northward] ................................................................. **P. falcata**
5 Heads > 10; cauline leaves few, generally 2-7; [of sw. GA westward and southward] .......................................................................................... **P. oligantha**

6 Peduncles and upper stem densely glandular-hairy (stipitate-glandular); phyllaries densely glandular-hairy; involucres 4.5-8 mm high; lower leaves < 10 mm wide.
7 All stem leaves silky pubescent; [widespread in our area] .............................................................................................................. **P. aspera** var. **adenolepis**
8 Invokules 5-8 mm high; disc florets 15-29
6 Involucres 8-14 mm high; disc florets 8-16; disc corolla throats and lobes glabrous to short pilose (never long pilose);
[widespread] .............................................................................................................. **P. graminifolia** var. **latifolia**
9 Involucres 12-14 mm high; ray florets 13-25; disc corolla throats and lobes sometimes long-pilose; [of FL Panhandle].................
10 Inner phyllaries densely stipitate-glandular, at least distally ............................................................................................................. **P. graminifolia** var. **tracyi**
11 Inner phyllaries eglandular to sparsely glandular .................................................................................. **P. graminifolia** var. **tenuiifolia**

**Pityopsis aspera** (Shuttleworth ex Small) Small var. **adenolepis** (Fernald) Semple & Bowers. Dry woodlands, forests, and disturbed places, apparently in the NC Mountains only in the Escarpment. Late June-October. E. and c. VA south to n. FL and west to s. MS. Var. **adenolepis** includes 2 chromosome numbers (2n = 18 and 36), which "account, in part, for the range of variation in involucre, floret, and fruit size" (Semple & Bowers 1985). = FNA, K, Z; > **Heterotheca adenolepis** (Fernald) Ahles – RAB; > **Heterotheca graminifolia** (Michaux) Shinners – RAB, misapplied; < **Chrysopsis graminifolia** (Michaux) Elliott var. **aspera** (Shuttleworth ex Small) A. Gray – C, G, SE, W; = **Chrysopsis graminifolia** (Michaux) Elliott – F, misapplied; = P. graminifolia (Fernald) Semple; < **Pityopsis aspera** – S, WH; < **Heterotheca aspera** (Shuttleworth ex Small) Shinners

**Pityopsis aspera** (Shuttleworth ex Small) Small var. **aspera**. Sandhills, dry flatwoods. Se. GA south to Panhandle FL. [= FNA, K, Z; < Pityopsis aspera – S, WH; < Chrysopsis graminifolia (Michaux) Elliott var. **aspera** (Shuttleworth ex Small) A. Gray – SE]

**Pityopsis falcata** (Pursh) Nuttall. Stable dunes (NJ), further north in sandplain grasslands, coastal heathlands, pitch pine-scrub oak barrens. Se. MA south through RI, CT, and NY (Long Island) to s. NJ; found once as a rare introduction in w.c. peninsula FL (Pinellas County – Wunderlin & Hansen 2003). = FNA, K, Z; = **Chrysopsis falcata** (Pursh) Elliott – C, F, G

**Pityopsis flexuosa** (Nash) Small. Sandhills. E. Panhandle FL. = FNA, S, WH, Z; = **Chrysopsis flexuosa** Nash – SE]

**Pityopsis graminifolia** (Michaux) Nuttall var. **graminifolia**. Sandhills. July-October. As interpreted here, **P. graminifolia** includes 5 varieties "that intergrade and hybridize, when the ploidy level is the same" (Semple & Bowers 1985). Var. **graminifolia** ranges from se. NC south to c. peninsula FL, and west to e. LA; in our area it is known only from the outer Coastal Plain. Two of the varieties do not reach our area, being restricted to peninsula FL: var. **aequifolia** Bowers & Semple and the hexaploid (2n = 54) var. **tracyi** (Small) Semple. = FNA, K, Z; < **Heterotheca nervosa** (Willdenow) Shinners var. **microcephala** (Small) Shinners ex Ahles – RAB; < **Chrysopsis graminifolia** (Michaux) Elliott var. **graminifolia** – C; < **Pityopsis microcephala** (Small) Small – S; < **Chrysopsis graminifolia** (Michaux) Elliott var. **microcephala** (Small) Cronquist – SE; < **Pityopsis graminifolia** – WH
**Pityopsis graminifolia** (Michaux) Nuttall var. *latifolia* Fernald. Sandhills, dry woodlands and forests (such as ridgetop pine/heath communities, ranging from DE (formerly), s. OH, and c. AR south to s. FL and e. TX; Bahamas; and in Mexico (Tamaulipas, Vera Cruz, Oaxaca, Chiapas) and Central America (Belize, Guatemala, Honduras). = FNA, K, Z; > Heterotheca nervosa (Willdenow) Shinners var. *nervosa* – RAB; > Heterotheca correllii (Fernald) Ahles – RAB; = Chrysopsis graminifolia (Michaux) Elliott var. *latifolia* Fernald – C, W; < Chrysopsis nervosa (Willdenow) Fernald var. *nervosa* – F; < Chrysopsis graminifolia (Michaux) Elliott var. *graminifolia* – SE, misapplied; = Chrysopsis graminifolia (Michaux) Elliott var. *graminifolia* – WH]

**Pityopsis graminifolia** (Michaux) Nuttall var. *tenuifolia* (Torrey) Semple & Bowers. Sandhills, sandy woodlands, savannas, pine flatwoods. July-October. Var. *tenuifolia* ranges from se. NC south to s. FL and west to e. TX (north inland to c. AR and e. OK); apparently disjunct in se. VA. = FNA, K, Z; < Heterotheca nervosa (Willdenow) Shinners var. *microcephala* (Small) Shinners ex Ahles – RAB (also see P. graminifolia var. *graminifolia*); = Pityopsis nervosa (Willdenow) Fernald var. *microcephala* (Small) Small – S (also see P. graminifolia var. *graminifolia*); < Chrysopsis graminifolia (Michaux) Elliott var. *microcephala* (Small) Cronquist – SE (also see P. graminifolia var. *graminifolia*); < Pityopsis graminifolia – WH; ? Pityopsis nervosa var. *nervosa* – Y]

**Pityopsis graminifolia** (Michaux) Nuttall var. *tracyi* (Small) Semple. Sandhills. October-December. Endemic to Panhandle FL; reports of it in n. AL are probably based on aberrant individuals of *P. graminifolia*. = FNA, K, Z; = P. *tracyi* Small – S; < Chrysopsis graminifolia – SE; < Pityopsis graminifolia – WH; = Chrysopsis nervosa (Willdenow) Fernald var. *tracyi* (Small) D.B. Ward]

**Pityopsis oligantha** (Chapman ex Torrey & A. Gray) Small, Narrow-leaved Goldenaster. Wet flatwoods and pitcherplant bogs. Sw. GA and Panhandle FL west to s. AL (alleged reports from further west seem to be in error). = FNA, K, S, WH, Z; = Chrysopsis oligantha (Chapman ex Torrey & A. Gray) Heywood – SE; = Heterotheca oligantha (Chapman ex Torrey & A. Gray) Harms]

**Pityopsis pinifolia** (Elliott) Nuttall, Sandhill Goldenaster. Sandhills, sandy roadsides. August-October. This species is locally abundant (and often weedy) but very local in distribution, limited to (apparently) scattered counties in the Sandhills (rarely middle Coastal Plain) of s. NC, SC, GA, and c. AL. = FNA, K, S, Z; = Heterotheca pinifolia (Elliott) Ahles – RAB; = Chrysopsis pinifolia Elliott – SE]

**Pityopsis ruthii** (Small) Small. Flood-scoured rocks along rivers. Restricted to rocks within the flood zone of the Hiwassee and Ocoee rivers, Polk County, TN; it should be sought in adjacent sw. NC. = FNA, K, S, Z; = Chrysopsis ruthii Small – SE; = Heterotheca ruthii (Small) Y.L. Harms]

**Plectocephalus** D. Don in R. Sweet 1830 (Basketflower)

**Pluchea** Cassini 1817 (Marsh-fleabane)

1 Stems winged by decurrent leaf bases ................................................................. P. sagittalis
1 Stems not winged by decurrent leaf bases.
2 Leaves petiolate or narrowly cuneate at the base; [section Pluchea].

Pluchea camphorata (Linnaeus) A.P. de Candolle, Camphorweed. Bottomland sloughs, clay flatwoods, other freshwater wetlands. August-October. DE (formerly) and MD south to n. peninsular FL, west to TX and OK, north in the interior to s. OH and e. KS. [= RAB, C, F, FNA, G, GW, SE, WH, X, Y; = P. petiolarata Cassini – S]

Pluchea foetida (Linnaeus) A.P. de Candolle var. foetida, Stinking Fleabane. Seasonally wet areas, ditches, various other freshwater wetlands. Late July-October. S. NJ south to s. FL, west to e. TX; West Indies (?). [= K; < P. foetida – RAB, C, F, FNA, G, GW, SE, WH, X, Y; > P. foetida – S; > P. tenuifolia Small – S]

Pluchea foetida (Linnaeus) A.P. de Candolle var. imbricata Kearney. Freshwater wetlands. Late July-October. SC south to FL Panhandle. The validity and distribution of this taxon need additional study. [= K; < P. foetida – RAB, C, FNA, GW, SE, WH, X, Y; = P. imbricata (Kearney) Nash – S]

Pluchea longifolia Nash. Brackish and freshwater marshes and swamps, ditches, canals. Ne. FL and eastern FL Panhandle (Wakulla and Taylor counties) south to c. peninsular FL (Wunderlin & Hansen 2008). [= FNA, GW, S, WH]

Pluchea odorata (Linnaeus) Cassini, Saltmarsh Fleabane. Salt and brackish marshes. August-October. MA and MI south to s. FL and TX (mostly on the Coastal Plain), also in w. United States, Central America, and South America. Two varieties are sometimes recognized, the widespread and more robust, but small headed var. odorata (involucre 4-6 (-7) mm across the disk, with 6-13 (19) functionally staminate flowers; plants 2-8 (-20) dm tall; of VA southward), and the northeastern North American and less robust but large-headed var. succulenta (involucre 7-8 (-10) mm across the disk, with (14-) 21-34 functionally staminate flowers; plants 2-6 dm tall, of NC northward). Additional study is needed to warrant recognition of the varieties. [= GW, WH, X, Y; = P. purpurascens (Schwartz) A.P. de Candolle – RAB; > P. odorata var. odorata – C, FNA, K, SE; > P. odorata (Linnaeus) Cassini var. succulenta (Fernald) Cronquist – C, FNA, K, SE; > P. purpurascens (Schwartz) A.P. de Candolle var. purpurascens – F, G; > P. purpurascens (Schwartz) A.P. de Candolle var. succulenta Fernald – F, G; > P. camphorata – S, misapplied]

Pluchea sagittalis (Lamarck) Cabrera, Wing-stem Camphorweed. Disturbed areas, probably only a waif, known from old collections (1891-1901) from Pensacola, FL, and Mobile, AL; native of South America. July-August. [= FNA, WH; = P. quitoc de Candolle – S; = P. suaveolens (Vell.) Kuntze – SE] (synonymy incomplete)

Pluchea yucatanensis Nesom, Yucatan Camphorweed. Brackish marshes; native of Mexico and Belize. Introduced in s. AL and s. MS. [= FNA]

Polymnia species 1. Limestone boulders and outcrops. Under research by Dwayne Estes. {not yet keyed}

Identification notes: The species cannot be reliably identified in sterile condition. "Principal phyllaries" are the inner, well-developed, excluding the few smaller and poorly-developed outer phyllaries.

1 Principal phyllaries 12-15; florets 15-38 per head; [entering our area in WV from the north and west] .................................................. P. crepidinea

2 Principal phyllaries evident (though sometimes sparsely) pubescent with long coarse hairs (1.5-3 mm long).

3 Inflorescence corymbose to paniculiform, many of the branches well-developed.

4 Phyllaries densely setose; leaves usually merely toothed, sinuate, or shallowly lobed ................................................................. P. barbata

5 Heads ascending or nearly erect; principal phyllaries (6-) 8 (-10); flowers (8-) 11-14 (-19) per head; [WV, KY, TN, nw. AL, MS and westwards] ................................................................. P. serpenaria

6 Heads nodding; principal phyllaries 4-7 (-9); flowers 5-8 (-13) per head; [of the Southern Appalachians] ............................................. P. aspera

2 Phyllaries glabrous or with few cilia or inconspicuous fine short pubescence at the tip.

6 Principal phyllaries 7-10; flowers 8-15 per head.

7 Inflorescences narrow and elongate (vigate); flowers pink to purple .......................................................... P. altissima

8 Inflorescences open, corymbose to paniculiform, with some elongate branches; flowers white, cream, yellowish, pink, or purple.

8 Pappus cinnamon-brown; corolla whitish to pinkish .......................................................... P. alba

8 Pappus straw-colored to light brown; corolla pale yellow .......................................................... P. roanensis

3 Inflorescence cylindric, thyrsoid, the branches very short.

4 Phyllaries sparsely setose; principal leaves usually evidently lobed ................................................................. P. serpentaria

5 Heads nodding or nearly erect; principal phyllaries (6-) 8 (-10); flowers (8-) 11-14 (-19) per head; [WV, KY, TN, nw. AL, MS and westwards] ................................................................. P. serpentaria

4 Phyllaries densely setose; leaves usually mealy toothed, sinuate, or shallowly lobed ................................................................. P. serpentaria

5 Heads ascending or nearly erect; principal phyllaries (6-) 8 (-10); flowers (8-) 11-14 (-19) per head; [WV, KY, TN, nw. AL, MS and westwards] ................................................................. P. serpentaria

Prenanthes Linnaeus 1753 (Rattlesnake-root)

Identification notes: The species cannot be reliably identified in sterile condition. "Principal phyllaries" are the inner, well-developed, excluding the few smaller and poorly-developed outer phyllaries.

1 Principal phyllaries 12-15; florets 15-38 per head; [entering our area in WV from the north and west] .................................................. P. crepidinea

2 Principal phyllaries 4-10; flowers mostly 4-19 per head; [collectively widespread in our area].

3 Inflorescence corymbose to paniculiform, many of the branches well-developed.

4 Phyllaries densely setose; leaves usually merely toothed, sinuate, or shallowly lobed ................................................................. P. barbata

5 Heads nodding; principal phyllaries 4-7 (-9); flowers 5-8 (-13) per head; [of the Southern Appalachians] ............................................. P. aspera

2 Phyllaries evidently (though sometimes sparsely) pube scent with long coarse hairs (1.5-3 mm long).

6 Principal phyllaries (4-) 5 (-6 ); flowers 4-6 per head ....................................................................................................................

7 Inflorescence cylindric, thyrsoid, the branches very short.

6 Principal phyllaries 7-10; flowers 8-15 per head.

7 Inflorescences narrow and elongate (vigate); flowers pink to purple .......................................................... P. altissima

8 Inflorescences open, corymbose to paniculiform, with some elongate branches; flowers white, cream, yellowish, pink, or purple.

8 Pappus cinnamon-brown; corolla whitish to pinkish .......................................................... P. alba

8 Pappus straw-colored to light brown; corolla pale yellow .......................................................... P. roanensis

Prenanthes alba Linnaeus, Northern Rattlesnake-root. Forests. August-November. ME west to MB, south to ne. NC, w. NC, WV, and MO. Reported for GA (GANHP). Reports of P. alba from the Coastal Plain of NC and perhaps VA are based on P. alba ssp. pallida, which is invalidly published; additionally, specimens attributed to this taxon appear to be better attributed to P. trifoliolata. [= C, F, FNA, G, K, SE, W, Z; = P. alba ssp. alba – RAB; = Nabalus albus (Linnaeus) Hooker – S]

Prenanthes autumnalis Walter, Slender Rattlesnake-root. Pocosins, pine savannas, forest edges. September-November. NJ south to ne. FL, a Southeastern Coastal Plain endemic. [= C, F, G, K, RAB, SE, WH, Z; = Nabalus virgatus (Michaux) A.P. de Candolle – S; = Nabalus species 1]

Prenanthes barbata (Torrey & A. Gray) Milstead, Barbed Rattlesnake-root, Flatwoods Rattlesnake-root. Limestone glades and barrens. C. TN (Western Highland Rim) (Chester, Wofford, & Kral 1997), nw. GA, and n. AL. west to ne. AR, e. TX and w. LA. [= FNA, K, SE; = Nabalus integrifolius Cassini – S, misapplied; = P. serpentaria Pursh var. barbata Torrey & A. Gray; = Nabalus barbatus (Torrey & A. Gray) A. Heller]
**Pseudognaphalium** Kirpicznikow 1950 (Rabbit-tobacco)

1 Involucre 3-7 mm high; plants 15-100 cm tall; inflorescence terminal, elongate, clustered, or corymbiform.

2 Leaves distinctly (but shortly) decurrent 1-10 mm and adnate-auriculate on the stem.

3 Upper surface of the leaves coarsely glandular-hairy; heads in corymbiform arrays

4 Involucres 3-4 mm high; bisexual florets 5-10 (corollas evenly yellowish, not red-tipped); cypselae with papilliform hairs

5 Stem glandular-pubescent or glandular-puberulent, the hairs at right angles to the stem, the stem surface generally obscured (sometimes glandular-pubescent at the base of the stem only). Ps. obusifolium

6 Stems glandular-villose, the stipitate glands (0.1-) 0.3-1.0 mm high, prominently variable in height on any portion of the stem, a stalk broadened toward the base and about equal the gland width; pistillate florets 83–107; bisexual florets 9–15; leaves mostly oblong-lanceolate, 2.5–7 cm long, 4–20 mm wide, 4–8 times longer than wide; plant 4–10 dm tall

Ps. obusifolium var. helleri

---

**Pseudognaphalium helleri** (Britton) A. Anderberg, Heller's Rabbit Tobacco. Dry woodlands and openings (especially over mafic rocks), sandhills. September-October. Sc. VA south to Panhandle FL, s. AL, west to AR, LA, and ne. TX. [= FNA, X; = Gnaphalium helleri Britton var. helleri – Z; < Gnaphalium helleri – C, G, RAB, SE, W (also see Ps. micradenium); = Gnaphalium obtusifolium var. helleri (Britton) Blake – F, Y; = Pseudognaphalium helleri (Britton) A. Anderberg ssp. helleri – K; < Pseudognaphalium helleri – WH]
* Pseudognaphalium luteoalbum (Linnaeus) Hilliard & B.L. Burtt, Red-tipped Rabbit Tobacco. Mowed rights-of-way; native of Eurasia. April-June. [= FNA, K] [add synonymy]

Pseudognaphalium macounii (Greene) Kartesz, Clammy Cudweed, Winged Cudweed, Clammy Everlasting. Dry fields, pastures, and woodland edges at high elevations. July-September. QC west to BC, south to w. VA, WV, TN, and Mexico. [= FNA, K; = Gnaphalium macounii Greene – C, F, S, WV; < Gnaphalium viscousum – SE, Y, misapplied; < Pseudognaphalium viscousum (Kunth) W.A. Weber, misapplied]

Pseudognaphalium micradenium (Weatherby) Nesom, Small Rabbit Tobacco. Dry woodlands and openings. September-October. SE. ME west to WI, south to e. SC, c. GA, se. TN, and s. MO. Nesom (2001a) discusses the distinctiveness of this taxon and its treatment as a species, rather than variety. [= FNA, X; = Gnaphalium helleri Britton var. micradenium (Weatherby) Mahler – C, G, RAB, S, SE, W; = Gnaphalium obtusifolium var. micradenium Weatherby – F, Y; = Pseudognaphalium helleri (Britton) A. Anderberg ssp. micradenium (Weatherby) Kartesz – K]

Pseudognaphalium obtusifolium (Linnaeus) Hilliard & Burtt, Fragrant Rabbit Tobacco. Openings, woodlands, coastal dunes, sandy pinelands, disturbed areas. August-October. NL (Newfoundland) west to ON, south to s. FL and TX. [= FNA, WH, X; = Gnaphalium obtusifolium Linnaeus – RAB, FNA, GW, K, SE, WH, Z; > G. obtusifolium var. obtusifolium – F; > Gnaphalium obtusifolium Linnaeus var. praecox Fernald – F; = Gnaphalium obtusifolium var. obtusifolium – C, G, Y; > Pseudognaphalium obtusifolium ssp. obtusifolium – K; > Pseudognaphalium obtusifolium ssp. praecox (Fernald) Kartesz – K; > Gnaphalium polycephalum Michaux]

* Pseudognaphalium stramineum (Kunth) A. Anderberg, Sandy fields, roadsides, disturbed places; native of TX south through Mexico and into South America. Late May-August. [= FNA, K; = Gnaphalium stramineum Kunth – C; ? G. chilense Sprengel – RAB, SE, Y]

Pterocaulon Elliott 1823 (Blackroot)

Identification notes: Pterocaulon is an unmistakable plant, the stems and leaf undersurfaces creamy-white floccose-tomentose, the leaf bases decurrent down the stem, the heads in oblong, terminal spikes, the tip nodding before anthesis.

Pterocaulon pycnostachyum (Michaux) Elliott, Blackroot, Wingstem. Sandhills, dry pinelands, pine flatwoods. May-June. SE. NC south to s. FL and west to s. AL. [= RAB, FNA, GW, K, SE, WH, Z; = P. undulatum (Walter) C. Mohr – S]

Pulicaria Gaertner 1791 (False-fleabane)

A genus of 100 or more species, herbs (rarely shrubs), of Europe, Asia, and Africa. References: Preston in FNA (2006a).

* Pulicaria arabica (Linnaeus) Cassini. Disturbed areas (on ballast); perhaps just a waif (not recently collected), native of Africa. [= FNA, SE, WH; = Vicoa auriculata Cassine – S (misapplied)] [not keyed]

Pyrrhopappus A.P. de Candolle 1838 (False-dandelion)

1 Outer phyllaries mainly 1/3-2/3 as long as the inner phyllaries; lower and middle stem usually glabrous; leaf margins usually glabrous; upper cauline leaves usually pinnately 3-5(-9)-lobed..............................................................................................................................P. carolinianus
1 Outer phyllaries mainly < 1/3 as long as the inner phyllaries; lower and middle stem usually sparsely to densely pilose; leaf margins usually ciliate; upper cauline leaves usually unlobed or pinnately 1-5-lobed.......................................................................................................................P. pauciflorus

Pyrrhopappus carolinianus (Walter) A.P. de Candolle, False-dandelion. Dry and moist forests, roadsides, meadows, fields. March-June (and sometimes later). DE, se. PA, and MD south to c. peninsular FL, west to IL, MO, and TX; he pre-Columbian range is uncertain. [= C, F, FNA, G, K, WH, WV; > P. carolinianus var. carolinianus – RAB, SE; > P. carolinianus var. georgianus (Shinners) Ahles – RAB, SE; = Sitilias caroliniana (Walter) Rafinesque – SI; > Pyrrhopappus georgianus Shinners]

Pyrrhopappus pauciflorus (D. Don) A.P. de Candolle, Small-flowered Desert-Chicory. Disturbed areas. (Feb.) April-May. Probably merely adventive in our area from a native distribution from TX south to Coahuila, Nuevo Léon, and Tamaulipas. [= FNA; < P. pauciflorus – K; = Sitilias multicaulis (A.P. de Candolle) Greene – S; = P. multicaulis A.P. de Candolle – SE]
Ratibida Rafinesque 1817 (Prairie Coneflower)

A genus of about 7 species, herbs, of North America. References: Urbatsch & Cox in FNA (2006c); Richards (1968)=Z; Cronquist (1980)=SE. Key adapted from SE.

1 Disks columnar, 2-4.5× as long as thick; plant a tap-rooted perennial; rays < 2 (-2.5) cm long; achenes ciliate and winged, crowned by a pappus consisting of 1 or more awn-teeth ............................................................... R. columnifera
1 Disks ellipsoid-globular, 1-1.6× as long as thick; plant a fibrous-rooted perennial from a woody rhizome or caudex; rays 2.5-3.5 (-4.5) cm long; achenes smooth, lacking a pappus ...................................................... R. pinnata

* Ratibida columnifera (Nuttall) Wooton & Standley, Columnar Prairie Coneflower. Dry disturbed areas, established around nurseries or plantings, waste areas near wool-combing mills; introduced from further west. May-August. ON west to AB, south to TX, Mexico, and AZ; introduced at scattered sites eastward, including e. NC, e. SC, and c. TN (Chester, Wofford, & Kral 1997). [= C, F, FNA, G, K, SE, WH, WV, Z = R. columnaris (Sims) D. Don – S]

Ratibida pinnata (Ventenat) Barnhart, Globular Prairie Coneflower, Grey-headed Coneflower. Prairie-like glades and oak savannas over gabbro (usually in Iredell soils) or calcareous rocks, cedar glades, calcareous (black belt or chalk) prairies, disturbed areas (naturalized from cultivation). June-August. S. ON west to MN and SD, south to w. PA, e. TN, nw. GA, Panhandle FL, MS, OK, and ne. TX (Singhurst, Mink, & Holmes 2010); disjunct in nc. SC. A characteristic plant of midwestern prairies and limestone glades, remarkably disjunct to "Piedmont prairie" remnants in SC (Nelson 1993). [= C, F, FNA, G, K, S, SE, W, WH, WV, Z]

Rudbeckia Linnaeus 1753 (Yellow Coneflower, Black-eyed Susan)

Identification notes: This treatment needs considerable additional work in the herbarium, and will likely be substantially modified.

1 Leaves grasslike, linear-lanceolate, > 10× as long as wide, the basal with blade 10-20 cm long and < 1 cm wide; [of Coastal Plain, of s. GA southward and westward].
2 Plant with 1 head; rays red, orange, or maroon, 1.0-1.5 cm long; plant pubescent ............................................................ R. graminifolia
2 Plant with several heads; rays yellow, 1.5-3.5 cm long; plant glabrous ............................................................... R. mohrii
1 Leaves broader, lanceolate, ovate, or pinnately-cleft, < 10× as long as wide; [collectively widespread].
3 Leaves (at least some of the largest and generally more basal) 3-lobed or more divided.
4 Disc flowers yellow or yellowish-green; achenes 3.5-6.0 mm long.
5 Heads small, the disc mostly 1.0-1.5 cm wide; rays usually 5 or 8; [of the Coastal Plain and Piedmont, VA south to FL, west to LA] ............................................................... R. laciniata var. digitata
5 Heads larger, the disc mostly 1.5-2.0 cm wide; rays usually 8 or 13; [of high elevations of the Appalachians, VA and KY south to NC and TN] ............................................................... R. luciniata var. humills
5 Basal and lower stem leaves 1-2-pinnatifid, with 5-many lobes; plants 1-3 m tall.
6 Achenes 3.5-4.0 mm long; pappus > 0.7 mm long; [of DE, MD, and PA northward] .................................................... R. luciniata var. bipinnata
7 Achenes 4.2-6.0 mm long; pappus < 0.7 mm long; [widespread in our area] ............................................................... R. luciniata var. laciniata
4 Disc flowers purple-brown; achenes 1.9-3.5 mm long.
8 Pales acute, hairy near the tip; rays 20-40 mm long ............................................................... R. subtomentosa
8 Pales cuspidate, with awn-like tips ca. 1.5 mm long, glabrous; rays 8-30 mm long.
9 Cauline leaves 1-3-lobed (at least some on a plant 3-lobed).
10 Ray blades 8-17 mm long; discs 10-15 mm across; [widespread in our area]............... R. triloba var. triloba
10 Ray blades 18-30 mm long; discs 15-20 mm across; [at moderate to high elevations in the Appalachians]............... R. triloba var. rapistris
9 Cauline leaves 1-7-lobed (at least some on a plant 5-7-lobed).
11 Phyllaries > 9 mm long; [of the Mountains of NC, VA, and TN]............... R. triloba var. bealdei
11 Phyllaries < 7 mm long; [of the Coastal Plain of s. AL and Panhandle FL]............... R. triloba var. pinnatifolia

3 Leaves simple, unlobed, toothed (or not).
12 Pales (bracts of the receptacle) glabrous or nearly so (except sometimes for a minutely ciliate margin).
13 Pales cupudad, with awn-like tips ca. 1.5 mm long......................................................... [go to key lead 1b, above]
13 Pales obuts to acute.
14 Larger leaves < 2 cm wide .............................................................................................. [R. missouriensis]
14 Larger leaves > 2 cm wide.
15 Plants 2-3 m tall; stem leaves strongly auricle-clumping .............................................. R. auriculata
15 Plants 0.5-1.3 m tall; stem leaves petiolate or sessile, but not auricle-clumping.
16 Basal leaves with bases cuneate to broadly cuneate.
17 Basal leaves with blades 2.5-3.5× as long as wide; plants villous-hirsute ......................... R. fulgida var. fulgida
17 Basal leaves with blades < 2× as long as wide; plants glabrous to sparsely hairy.
18 Basal leaves attenuate-cuneate at the base; rays 15-25 mm long; upper stem leaves notably reduced in size from the lower stem leaves ............................................................... R. fulgida var. sphyathula
18 Basal leaves broadly cuneate at the base; rays 20-40 mm long; upper stem leaves not typically reduced in size from the lower stem leaves.................................................. R. fulgida var. speciosa

12 Pales densely pubescent near the tip.
21 Plants glabrous or with scattered inconspicuous hairs.
22 Stem very sparsely spreading-villous (to more conspicuously hairy, and then keyable under 21b); disc to 15 mm high............................ R. heliopsidis
22 Stem glabrous; disc elongating in fruit, ultimately 12-60 mm high.
23 Leaves strongly blue-green and glaucous; flowering plants 1-2.5 m tall; largest leaves 7-16 cm wide; [cultivated in our area and rarely persisting or spreading] .................................................................................. R. maxima
23 Leaves green; flowering plants 0.5-1.3 m tall; largest leaves < 6.5 cm wide; [native of pitcherplant bogs and wet flatwoods of e. GA and ne. FL west to s. AL] .... R. nitida
21 Plants conspicuously hirsute or pilose.
24 Plants perennials from a woody rhizome; pappus a low crown; style appendages short, blunt.
25 Disc 10-15 mm across; rays 6-12, mostly spreading, 15-25 mm long; leaves not folded longitudinally ......................... R. heliopsidis
25 Disc 15-25 mm across; rays 12-25, mostly reflexed, 30-50 mm long; leaves folded longitudinally.
26 Stem hairy only on the upper stem, the hairs ascending and < 0.5 mm long........................... R. grandiflora var. alismaeofila
26 Stem hairy throughout, the hairs spreading on the lower stem, ascending on the upper stem and ca. 1.0 mm long................................. R. grandiflora var. grandiflora
24 Plants annuals, biennials, or perennials from fibrous roots; pappus lacking or a low crown to 0.1 mm high; style appendages elongate, subulate (R. hirta) or short, acute to obtuse (R. mollis).
27 Stems and leaves softly pilose to woolly; style branches short, acute to obtuse; [plants of dry sands of the Coastal Plain of SC southward].............. R. mollis
27 Stems and leaves with coarse and stiff hairs; style branches elongate, subulate; [plants collectively widespread in our area].
28 Stems leafy mainly towards the base, branched mainly near the middle; peduncles usually ½ the height of the plants; [of the Coastal Plain] ....................................................... R. hirta var. angustifolia
28 Stems leafy throughout, branched mainly above the middle; peduncles < 1/3 the height of the plants; [collectively widespread].
29 Basal leaves broadly elliptic to ovate, 2.5-7 cm wide, mostly ca. 2× as long as wide, with coarsely serrate margins; [primarily Appalachian and westward, mostly of undisturbed habitats] ................................................................. R. hirta var. hirta
29 Basal leaves lanceolate to oblanceolate 1-2.5 (-5) cm wide, mostly < 5× as long as wide, with entire to serrate margins; [widespread and weedy] ....................................................... R. hirta var. pulcherrima

Rudbeckia fulgida Aiton var. sphyathula (Michaux) Perdue. Cp (VA), [FL?, GA, NC, SC, VA]; bottomlands, bogs; uncommon? August-October. VA, WV, and TN south to FL and AL. [= FNA; < R. fulgida – RAB, WH; = R. sphyathula Michaux – F, S; < R. fulgida var. fulgida – K]

Rudbeckia fulgida Aiton var. speciosa (Wendroth) Perdue. Mt (WV), Cp (DE) [GA, VA]; moist forests and woodlands; uncommon (rare in GA and WV). August-October. QC and WI south to GA, AL, and AR. [= C, FNA, K, Z; < R. fulgida – RAB, GW, W; = R. speciosa Wendroth var. speciosa – F; = R. speciosa Wendroth – WV]

Rudbeckia graminifolia (Torrey & A. Gray) C.L. Boynton & Beadle. Cp (FL): wet savannas and "wet prairies," rare. Endemic to the Apalachicola region, FL. [= FNA, K, S, SE, Z (defined broadly to include "wet prairies")]

Rudbeckia mollis | Elliott, Woolly Coneflower. Cp (FL, GA, SC): longleaf pine / turkey oak sandhills; uncommon (rare in SC). Late August-October. SC south to n. peninsular FL, FL Panhandle, west to s. AL. [= RAB, FNA, K, SE, WH, Z]

Rudbeckia submmentosa Pursh. Pd* (NC?): moist to dry woodlands, prairies, disturbed areas; rare. Nc. TN (Chester, Wofford, & Kral 1997). MI, IA, and OK south to TN, MS and TX; eastwards as introductions or possibly disjuncts. Known for NC only from a single 1897 specimen from Hollow Rock, Orange Co. NC; probably an introduction. [= F, FNA, K, S, SE, Z]

Rudbeckia triloba | Linnaeus var. beadlei (Small) Fernald, Chauncey's Coneflower. Mt (NC, VA): seepy mafic or limestone cliffs; rare. July-October. A Southern Appalachian endemic: SW. VA and KY south to w. NC and TN. It is not at all clear that this taxon is distinct. [= < R. triloba var. beadlei – F; < R. triloba var. pinnatifida Torrey & A. Gray – C, FNA, G, K, SE, Z (defined broadly to include "R. beadlei"); < R. triloba – RAB, W; = R. triloba – S; = R. triloba – WH] (synonymy incomplete, etc.)

Rudbeckia triloba | Linnaeus var. triloba, Common Three-lobed Coneflower. Mt (GA, WA, WV), Pd (DE, GA, VA), Cp (DE, VA), [NC]: moist forests and rock outcrops; common (uncommon in DE). July-October. VT, ON, MN, and NE south to GA and TX; westward in CO and UT (as introductions?). [= C, F, FNA, G, K, SE; < R. triloba – RAB, W, WH; = R. triloba – S]

Rudbeckia grandiflora (Sweet) A.P. de Candolle var. alismifolia (Torrey & A. Gray) Cronquist. Cp: prairies, open woodlands. MS west to AR, LA, and TX; disjunct in KY. [= K; = R. grandiflora var. alismifolia – FNA, SE, orthographic variant; = R. alismifolia Torrey & A. Gray – S]

Rudbeckia laciniata | Linnaeus var. bipinnata Perdue. NH and NY south to DE, MD, and PA. [= FNA, K; < R. laciniata var. laciniata – C, F, G]
Rudbeckia missouriensis Engelmann ex C.L. Boynton & Beadle, Missouri Coneflower. KY, IL, MO, and OK south to LA and TX. [= FNA, C, F, K, S, SE; = R. fulgida var. missouriensis (Engelmann) Cronquist – G]

Rugelia Shuttleworth ex Chapman 1860 (Rugelia, Rugel's Ragwort)

A monotypic genus, an herb, endemic to the Great Smoky Mountains of w. North Carolina and e. Tennessee. Treated variously as Senecio or Cacalia in most recent North American floras (see synonymy), this species is anomalous in both and is best treated as a monotypic genus (Bremer 1994). References: Barkley in FNA (2006b); Bremer (1994)=Z; Barkley (1999)=Y; Pippen (1978)=X; Cronquist (1980)=SE.

Rugelia nudicaulis Shuttleworth ex Chapman, Rugelia, Rugel's Ragwort, Winter-well. High elevation forests and openings, primarily in spruce-fir forests, but extending in places downslope into northern hardwood forests. June-August. The genus and species is endemic to the Great Smoky Mountains of w. NC and e. TN, all known populations within Great Smoky Mountains National Park. Where it occurs, it is usually locally abundant, often even the dominant herb. The basal rosettes are evergreen, and are conspicuous in all seasons. [= FNA, K, Y, Z; = Senecio rugelia Gray – RAB, S; = Cacalia rugelia (Gray) Barkley & Cronquist – SE, W, X]

Santolina Linnaeus 1753

* Santolina chamaecyparissus Linnaeus, Holy-flax, Lavender-cotton, Cypress Lavender-cotton. Disturbed areas; native of Mediterranean Europe. March-October. This species is introduced in e. and w. NC (Fox, Godfrey, & Blomquist 1952). Graetz (1973) recommended it for planting in barrier island areas of the Carolinas. [= C, K]

Sclerolepis Cassini 1816 (Sclerolepis)

Scolymus Linnaeus 1753 (Golden Thistle)

1 Stem wings and leaf blades with margins little or not whitened and thickened; pappus of several scales; plant a biennial or perennial ............

.............................................................................................................................

.............................................................................................................................

S. hispanicus

1 Stem wings and leaf blades with margins white and thickened; pappus absent; plant an annual........................................................

.............................................................................................................................

.............................................................................................................................

S. maculatus

* Scolymus hispanicus Linnaeus, Golden Thistle, Spanish Salsify. On ballast at seaports (at least formerly); native of Europe. AL. [= FNA, K]

* Scolymus maculatus Linnaeus, Golden Thistle. On ballast at seaports (formerly); native of Europe. Small (1933) states that Scolymus "has been found on ballast on the seacoast of N.C.,"; the site was likely the port of Wilmington. [= FNA, K, S]

Senecio Linnaeus 1753 (Ragwort, Groundsel)

A genus of very uncertain circumscription, if treated broadly with as many as 1500-2000 species, trees, shrubs, herbs, and vines. The trend is to divide Senecio into smaller, more natural genera. Most species traditionally treated as "Senecio" in our flora are
not even part of a broadly defined core group, and have been transferred to Packera and Rugelia. Hasteola (Synosma) has been treated as a small genus of perennial herbs (consisting of Hasteola suaveolens and the FL peninsular endemic, H. robertiorum L.C. Anderson), but Pelser et al. (2007) demonstrate that Hasteola is deeply embedded in Senecio and closely related to a group of New World Senecio; it is so included here. References: Barkley in FNA (2006b); Pelser et al. (2007); Bremer (1994); Cronquist (1980)=SE; Barkley (1999)=Z; Barkley (1978)=Y; Anderson (1994)=X; Pippen (1978)=V.  [also see Ligularia, Packera, Rugelia]

1 Leaves ovate, hastate at the base, merely toothed, 10-30 (-40) cm long, 4-20 cm wide..................................................S. suaveolens
1 Leaves ovate to oblanceolate, tapered at the base, pinnatifid (or at least strongly toothed), 2-10 cm long, 0.5-2 (-4) cm wide .........S. vulgaris

* Senecio brasiliensis (Sprengel) Lessing var. tripartitus (A.P. de Candolle) Baker, Hempleaf Ragwort. Disturbed areas (on ballast); rare (not collected since 1894, Pensacola, Escambia County, FL), native of South America. [= FNA, WH; = S. cannabinaefolius Hooker & Arnott] {not keyed}

Senecio suaveolens (Linnaeus) Elliott, Sweet Indian-plantain. Sandy bottomlands and riverbanks. MA, NY, n. OH, n. IN, c. WI and se. MN, south to n. VA, sw. VA, sw. NC, sc. TN (Chester, Wofford, & Kral 1997), and se. MO; apparently rare through much of its range. This species has not been seen in NC in recent years.  [= FNA, K, S, WH, Y, Z; = Aster suaveolens (Linnaeus) Pojarkova – FNA, K, X; = Cacalia suaveolens Linnaeus – RAB, C, F, G, GW, SE, V, W, WV, Y; = Synosma suaveolens (Linnaeus) Rafinesque ex Britton – S]

**Sericocarpus** Nees 1832 (White-topped Aster)

A genus of 5 species, herbs, of North America. This group of species, traditionally treated as Sericocarpus, was transferred to *Aster* by Cronquist, a treatment followed by most (but not all) recent floristic works. It now appears, based on morphological and molecular studies, that the traditional treatment as a separate genus is far superior. Nesom (1993a) argues that a variety of characters indicate that Sericocarpus is more closely allied to *Solidago*, *Euthamia*, *Bigelovia*, *Chrysoma*, and *Gutierrezia* than it is to *Aster*. Noyes & Rieseberg (1999) provide strong support for this contention, based on molecular evidence. See Nesom (1993a), Jones (1980), Semple & Brouillet (1980), and Noyes & Rieseberg (1999) for further discussion about the affinities of this group. References: Semple & Leonard in FNA (2006b); Leonard, Cook, & Semple (2005)=Y; Nesom (1993a)=Z; Cronquist (1980)=SE.

1 Leaves basally disposed, leaves of the basal rosette much larger than the cauline leaves; leaves (at least the basal) toothed ..........S. asteroides
1 Leaves cauline, basal rosette lacking, the mid-cauline leaves the largest; leaves entire (or with 1-2 teeth in *S. tortifolius*).
2 Leaves (2-)4-8 cm long, 0.2-1.2 cm wide, linear to oblanceolate, 6-12× as long as wide, not twisted at the base (the leaf blade in a more-or-less horizontal plane); leaves glabrous (but with a ciliate margin), glandular-punctate; involucres glabrous..............................................S. linifolius
2 Leaves 1.5-4 cm long, 0.6-1.5 (-2.0) cm wide, obovate, 1.5-4× as long as wide, twisted at the base (the leaf blade in a more-or-less vertical plane); leaves puberulent, glandular-punctate, and with prominent resin globules (at 10× magnification); involucres puberulent ...............................................................S. tortifolius

**Sericocarpus asteroides** (Linnaeus) Britton, Sterns, & Poggenburg, Toothed White-topped Aster. Dry woodlands, thin soils around rock outcrops, sandhills, dry pine lands. June-July. S. ME and s. VT west to c. OH, south to e. SC, e. GA, w. Panhandle FL, s. AL, and s. MS. Coastal Plain populations are rhizomatous, while inland populations are not; some taxonomic distinction may be warranted (Nesom, pers. comm.).  [= F, FNA, K, S, WH, WV, Y, Z; = Aster paternus Cronquist – RAB, C, G, SE, W]

**Sericocarpus tortifolius** (Michaux) Nees, Twisted-leaf White-topped Aster. Dry to mesic sandhills. August-October. E. NC south to s. FL, west to e. LA (Florida parishes), more or less restricted to the Coastal Plain, but inland onto hard-rock provinces in nc. GA and nc. AL.  [= FNA, K, WH, Y, Z; = Aster tortifolius Michaux – RAB, SE, W; = Sericocarpus bifolius (Walter) Porter – S]

**Silphium** Linnaeus 1753 (Rosinweed)

### Identification notes:
The number of ray flowers per head is a useful taxonomic character in *Silphium*; since only ray flowers are fertile, the number of ray flowers can also be determined by the number of achenes in freshly fruiting material. The key and taxonomic treatment is provisional.

1. Leaves basally disposed, the basal leaves large and persistent, the stem with very few to many leaves, but these definitely reduced upward in size; leaves entire to toothed, to deeply cut; plants with definite taproots (except *S. brachiatum*, *S. mohrii*, and *S. wasiotense*).

2. Stem relatively leafy, with 4-5 nodes or more, the stem leaves smaller than the basal, but not merely bracteal.

3. Leaves deeply pinnatifid to bipinnatifid ................................................................. *S. laciniatum*

4. Leaves cuneate to rounded at the base; rays pale (sulphur) yellow; phyllaries acuminate, hispid .......................................................... *S. mohrii*

5. Stem glabrous; pedicel glabrous; phyllaries acute; leaves truncate-sagittate at the base .......................................................... [S. brachiatum]

6. Heads relatively small (involucre 6-11 mm high, disk 8-15 mm wide), with 6-12 ray flowers; [of a wide range of mostly dry, often acidic habitats].

7. Principal leaves deeply pinnatifid (or, if entire, definitely lanceolate and with the base tapering to the petiole) .............. *S. pinnatifidum*

8. Blades of basal leaves unlobed (or with a single obscure basal lobe on each side), reniform, usually wider than long, often > 25 cm wide; leaves usually puberulent beneath; achenes shorter than the phyllaries at maturity; [of the Upper Piedmont and Mountains] ................

9. Involucral mostly 1.0-1.5 cm wide; achenes 6-9 mm long at maturity; wing tips long acute to acuminate, the sinus between the wing tips V-shaped; [of the Coastal Plain and lower Piedmont from se. VA south to extreme e. GA] .................................................. *S. compositum* var. *compositum*

10. Achene wing tip obtuse, the sinus between the wing tips narrowly U-shaped; leaf blade usually longer than wide; petiole short, as long as or shorter than the leaf blade (midrib); [of se. SC south to c. peninsular FL and FL Panhandle] .................. *S. compositum* var. *ovatifolium*

11. Basal and lower cauline leaf blades cordate, sagittate, or truncate at the base, and on well-developed petioles ............... [S. brachiatum]

12. Ray flowers 12-22 per head; phyllary surfaces scabrous, hisrate, or hispid ................................................................. *S. integrifolium*

13. Plants mostly 8-15 dm tall, with usually 6 or 7 nodes below the inflorescence; glandular hairs of the stems and leaves longer than the eglandular hairs; rays (8-) 12-14 (-16) per head; [of dolomite or limestone in Bibb County, c. AL] .................. *S. glutinosum*

14. Leaves both strictly opposite throughout and clasping the stem.

15. Plants mostly 15-20 dm tall, with usually 9-12 nodes below the inflorescence; stems and leaves; glandular hairs of the stems and leaves about as long as the eglandular hairs; rays (17-) 19-23 (-33) per head; [of chalk in c. AL] .................. *S. perplexum*

16. Stems, leaves, and phyllaries not stipitate-glandular, either smooth, scabrous, or hispid.

17. Leaf surfaces glabrous.

18. Ray flowers 20-36 (or more) per head; phyllary surfaces glabrous ................................................................. *S. speciosum*

19. Leaf surfaces scabrous to hispid.

20. Cauline leaves opposite ................................................................. *S. asteriscus* var. *luteolatum*

21. Basal leaves persistent at flowering ................................................................. *S. asteriscus* var. *simpsonii*

22. Pale stipitate-glandular ................................................................. *S. asteriscus* var. *denticulatum*

23. Pale eglandular, scabrous to puberulent ................................................................. *S. asteriscus* var. *asteriscus*
Silphium asteriscus Linnaeus var. dentatum (Elliott) Chapman. Cp (FL, GA, SC), Pd (GA, SC), Mt (GA) [NC]; NC and TN south to FL and AL. [= FNA, K2; = S. dentatum var. dentatum – RAB; = S. dentatum – F, W; = Silphium asteriscus Linnaeus var. angustatum A. Gray) L.M. Perry – Y]

Silphium asteriscus Linnaeus var. latifolium (A. Gray) J.A. Cleveinger. {Cp, Pd, Mt (GA, NC, SC, VA)}; VA, WV, and KY south to GA and LA. [= FNA, K2; = Silphium trifolium Linnaeus var. latifolium A. Gray – C, F, G, K1; = Silphium trifolium Linnaeus var. latifolium A. Gray – SE; = S. laevigatum Pursh – RAB; = S. confertifolium Small – S, SE, Y; = S. glabrum Eggert ex Small – S; = S. trifolium – W]

Silphium asteriscus Linnaeus var. trifoliatum (Linnaeus) J.A. Cleveinger. Pd (NC, SC, VA), Mt (NC, VA, WV); {habitats}; uncommon. June-September. NY, OH, and IL south to GA and AL. [= FNA, K2; = Silphium trifolium Linnaeus var. trifoliatum – C, G, K1, SE; = S. trifolium – RAB, WV; = S. atropurpureum Retz. ex Willdenow – F, Y; = S. trifolium var. trifoliatum – F, Y; = S. trifolium – W]

Silphium compositum Michaux var. compositum. Cp (GA, NC, SC, VA), Pd (NC, SC, VA), Mt (NC, SC): sandhills, other xeric forests; common. May-September. VA south to GA. Perhaps worth dividing further into two taxa: S. compositum sensu stricto, restricted to the Coastal Plain and extreme lower Piedmont, and distributed from se VA through the Carolina Coastal Plain to extreme e. GA, a distribution very similar to those of Carpephorus bellidifolius, Cirsium repandum, and Vaccinium crassifolium; and S. collinum Greene, with less deeply lobed leaves, and distributed from se. and sc. VA, NC, sw. NC and ne. AL south to sc. SC, c. GA, and ec. AL. [= K1, Y; = C. compositum – F; = S. compositum var. compositum – RAB; = C. compositum – S; = S. oreae Small – S; = S. compositum – C, FNA, G, K2, SE, W; = S. compositum ssp. compositum – Z; = S. collinum Greene]

Silphium connatum Linnaeus, Virginia Cup-plant. Mt (NC, VA, WV), Pd (NC, VA); floodplain forests and openings; uncommon. June-August. VA and WV south to nw. NC. [= RAB, F, WV, Y; = S. perfoliatum var. connatum (Linnaeus) Cronquist – C, FNA, K1, K2, SE; = S. perfoliatum – G, W]

Silphium glutinosum 1. Allison, Sticky Rosinweed. Mt (AL); dolomite glades; rare. Known only from calcareous Ketona glades in Bibb County, c. AL. (Allison & Stevens 2001). [= FNA, K2]

Silphium integrifolium Michaux, Prairie Rosinweed. Prairies, calcareous glades and barrens. July-September. MI, WI, and se. SD south to c. TN, se. AL, s. MS, s. LA, and OK. [= S. integrifolium Michaux var. integrifolium – C, FNA, G, K2, SE; = S. integrifolium var. deamii L.M. Perry – F, K1; = S. integrifolium var. gattingeri L.M. Perry – K1, Y]

Silphium laciniatum Linnaeus, Compass-plant. Prairies, limestone barrens, calcareous glades, also sometimes cultivated (including outside of its native distribution). July-September. S. ON, MI, W1, s. MN, and e. SD south to se. TN, s. AL, c. MS, s. LA, c. TX, and n. NM. [= C, FNA, G, K2, SE; = S. laciniatum var. robinsonii L.M. Perry – F, K1, Y]

Silphium mohrii Small, Shaggy Rosinweed. Mt (GA): prairies; rare. Endemic to c., sc., and se. TN (Chester, Wofford, & Kral 1997) south to nw. GA (Jones & Cole 1988) and nc. AL. [= C, FNA, K1, K2, SE, Y]

Silphium perfoliatum Linnaeus, Common Cup-plant. Mt (NC, VA, WV), Pd (NC): floodplain forests and openings, sometimes escaped from cultivation; uncommon (rare in DE and WV). June-August. VT, ON, and ND south to sc. NC, AL, and TX. [= RAB, F, S, WV, Y; = S. perfoliatum var. perfoliatum – C, FNA, K1, K2, SE; = S. perfoliatum – G, W]

Silphium pinnatifidum Elliott. Mt (GA): limestone glades and woodlands; rare. C. and se. TN south to nw. GA and AL. [= K1, S, SE; = S. terebinthinaceum Jacquin var. pinnatifidum (Elliott) A. Gray – F, FNA, K2, Y; = S. terebinthinaceum – G; = S. chickamaugense Canby]

Silphium reniforme Rafinesque ex Nuttall. Mt (NC, SC, VA, WV), Pd (NC, SC, VA): dry forests; uncommon. Sc. VA, e. WV, and e. TN, south to c. sc. c. GA, and e. AL. Plants with shallowly lobed leaves, with nearly the same distribution as typical S. reniforme, have been variously interpreted. [= S; = S. compositum Michaux var. reniforme (Rafinesque ex Nuttall) Torrey & A. Gray – RAB, F, K1, Y; = S. compositum – C, FNA, G, SE, W; = S. compositum – K2; = S. compositum var. reniforme (Rafinesque ex Nuttall) Sweeney & Fisher – WV, Z]

Silphium speciosum Nuttall. Prairies, calcareous glades and barrens. July-September. MO west to NE, south to OK; disjunct in c. TN. [= F, Y; = S. integrifolium Michaux var. laeve Torrey & A. Gray – C, FNA, G, K1, K2, SE]

Silphium terebinthinaceum Jacquin, Prairie-dock. Mt (GA, VA), Pd (NC, SC, VA): mafic glades, barrens, woodlands, and roadsides (NC, SC), calcareous glades, barrens, and woodlands (GA, VA); rare. July—September. NY, ON, WI, and NE south to nw. GA, MS, and AR; disjunct eastwards in Piedmont of NC and n. SC. S. ramicifolium Small refers to plants of limestone in the Ridge and Valley province of e. TN and extreme sw. VA, alleged to differ from S. terebinthinaceum in the leaf bases cuneate at the base (vs. cordate or truncate), smaller leaf blades (only to 15 cm long), smaller plants (to 8 dm tall vs. to 30 dm tall), and

ASTERACEAE

953

ASTERACEAE

954

outer phyllaries broader than long (vs. longer than broad). The distinction of var. luciae-brauniae Steyermark, with leaf blades glabrous above vs. scabrous, is dubious and needs additional study. [= RAB, SE; = S. terebinthinaceum var. terebinthinaceum – F, FNA, K2; < S. terebinthinaceum – G; > S. terebinthinaceum var. terebinthinaceum – K1, Y; > S. terebinthinaceum var. luciae-brauniae Steyermark – K1; > S. terebinthinaceum – S; > S. rumicifolium Small – S, Y]

Silphium brachiatum Gattinger, Cumberland Rosinweed. Endemic to sc. and se. TN (Chester, Wofford, & Kral 1997) and n. AL. And GA? [= F, FNA, G, K1, S, SE, Y]

Silphium radula Nuttall. Mt (GA): rocky hardwood forests; rare (GA Rare). East to nw. GA (Jones & Coile 1988). Not given credence as in our area in FNA and other sources. [= K1, SE; ? S. asperrimum Hooker – Y, misapplied; ? S. gatesii Mohr – Y?]

Silybum Adanson 1763 (Milk-thistle)

A genus of 2 species, herbs, of the Mediterranean region. References: Keil in FNA (2006a); Cronquist (1980)=SE.

Smallanthus Mackenzie ex Small 1933 (Bearsfoot)

Smallanthus uvedalius (Linnaeus) Mackenzie ex Small, Bearsfoot, Leafcup. Moist forests, bottomland forests, and disturbed places. July-October. NY and IL south to c. peninsular FL and TX; possibly extending through e. Mexico and Central America to Panama, depending on circumscription. [= FNA, K, S, WH, Z; = Polymnia uvedalia Linnaeus – RAB, C, SE, W, WV; > Polymnia uvedalia var. uvedalia – F, G, Y; > Polymnia uvedalia var. densipilis Blake – F, G, Y; > Polymnia uvedalia var. floridana Blake – F, Y]

Solidago Linnaeus 1753 (Goldenrod)

A genus of 90-110 species, herbs, primarily North American, but with a few species in South America, Macaronesia, and Eurasia. The placement of the flat-topped goldenrods has been controversial; they are here included in Solidago rather than being treated as the separate genus Oligoneuron. References: Semple & Cook in FNA (2006b); Nesom (1990); Cronquist (1980)=SE; Morton (1973, 1974); Zhang (1996); Cook & Semple (2004); Nesom (1993b)=Z; Heard & Semple (1988)=Y; Brouillet & Semple (1981)=X; Cronquist (1980)=SE; Braun (1942). Portions of the key adapted (in part) from various sources, especially FNA and SE. [also see Brintonia, Chrysoma, and Euthamia]

Identification notes: Several related genera readily mistaken for (and/or sometimes included in) Solidago are included here as keying “failsafes.”

1 Inflorescence corymbiform, flat-topped or broadly rounded and about as broad as long, or broader; [section Ptarmicoideae, and section Solidago, subsection Multiradiatae] ......................................................................................................................................................................................................................................................................................... Key A
1 Inflorescence a panicle, raceme, thyrse, or in axillary clusters, usually longer than broad, or with either the central branch well-developed and elongate, or with numerous branches elongate and more-or-less secund heads; [section Solidago].
2 Leaves basally disposed, the basal and lower cauline leaves larger, petiolate, and usually persistent, the middle and upper cauline leaves smaller and less petiolate.
3 Inflorescence cylindrical, of axillary clusters subtended by well-developed stem leaves, or a terminal thryse or raceme, the branches not secund (unless the stem is arching and the heads become oriented to the side of the axis); [subsections Glomeruliflorae, Humiles, Maritimaes, Squarroserae] ......................................................................................................................................................................................................................................................................................... Key B
3 Inflorescence paniculiform, the major branches (at least) recurved with the heads borne secundly; [subsections Argetae, Junceae, Maritimaes, Nemorales] ......................................................................................................................................................................................................................................................................................... Key C
Key A – goldenrods with corymbose inflorescences
(section *Pnmaricoideae*, and section *Solidago*, subsection *Multiradiatae*)

1 Plant a woody shrub; leaves with a markedly pebbled surface ................................................................. [see *Brezsoma*]
1 Plant an herb; leaves variously smooth or rugose, but not pebbled.
2 Heads smaller, involucre < 8 mm high; fresh leaves not thick or rubbery in texture; [plants collectively widespread].
3 Rays white; leaves linear-lanceolate to linear-oblong-elliptic, the longer (10-) 15-20× as long as wide; pappus bristles slightly to strongly clavellate-thickened; [section *Pnmaricoideae*] ...................................................................................................................... *S. pinnaticeps*
3 Rays yellow; leaves oblanceolate to linear-oblanceolate, the longer (10-) 15-20× as long as wide; pappus bristles not clavellate thickened.
4 Larger leaves ovate, 5-10 cm long, 1.5-4 cm wide, with prominent teeth; plants small, 0.5-4 dm tall; [of high elevation rock outcrops on Grandfather Mountain, Roan Mountain, and Hanging Rock Mountain (Avery, Watauga, and Mitchell counties), NC]; [section *Solidago*, subsection *Multiradiatae*] ............................................................................................................ *S. spithamaea*
4 Larger leaves elliptic-oblong, 6-25 cm long, 2-10 cm wide, with small, obscure teeth; plants robust, 4-15 dm tall; [of dry, prairie-like sites at low elevations]; [section *Pnmaricoideae*]
5 Larger leaves 3-6 cm wide, ca. 2.8-× as long as wide, acute to obtuse, serrate to crenate with numerous teeth (sometimes the teeth very obscure), with many pinnate-netted veins; leaves, stems, and peduncles moderately to densely pubescent.
6 Outer series of phyllaries glabrous on the back (glabrous to short-ciliate on the margin); leaf undersurface glabrous to somewhat hispid (0-20 hairs per mm²) (the margins and midrib beneath often more densely pubescent); stems glabrous to somewhat hispid (0-25 hairs per mm²) ............................................................................................................................................................. *S. rigida* var. *glabrata*
6 Outer series of phyllaries pubescent on the back (short-ciliate on the margin); leaf undersurface hispid (7-50 hairs per mm²); stems slightly to strongly hispid (10-70 hairs per mm²) .............................................................................................................. *S. rigida* var. *rigida*
5 Larger leaves 0.4-1.6 cm wide, ca. 12.5-25× as long as wide, acuminate to acute, entire or serrate with a few salient teeth on either side, with 3+ parallel veins.
7 Rays 1-4 per head; cypselas 2-3 mm long; leaves acute to obtuse, rarely folded along the midvein; [of prairies and longleaf pine savannas from MS westward on the Coastal Plain] ............................................................................................................. *S. nitida*
7 Rays 7-9 per head; cypselas 1.5-2.2 mm long; leaves acuminate, often folded along the midvein; [of wet prairies and fens of interior physiographic provinces] ............................................................................................................................. *S. riddellii*

Key B – goldenrods with basally disposed leaves and elongate, non-secund inflorescences
(section *Solidago*, subsections *Glomeruliflorae*, *Humiles*, *Maritimae*, *Squarrosae*)

1 Heads very large, involucre 8-13 mm high; fresh leaves noticeably thick and rubbery in texture; [subsection *Glomeruliflorae*]; [plants of high elevations of NC and TN] ........................................................................................................ *S. glomerata*
1 Heads smaller, involucre < 8 mm high; fresh leaves not thick or rubbery in texture; [plants collectively widespread].
2 Phyllaries and vegetative parts lacking minute sticky glands; stem leaves petiolate; [subsection *Humiles*]
3 Leaves, peduncles, and phyllaries copiously glandular; [plants of Coastal Plain sandhills] ................................................................................................................................................................ .................. *S. kralii*
3 Leaves, peduncles, and phyllaries slightly glandular; [plants of rocky glades, cliffs, barrens, and river-scoured outcrops, primarily on mafic or calcareous rocks]].
4 Involucres 7-12 mm high; basal leaves 15-40 mm wide; [of n. AL, e. TN, and e. KY] ........................................................................................................... *S. arenicola*
4 Involucres 3-7 mm high; basal leaves (2-) 3-4 (-5) mm wide; [of sc. NC, w. VA, and n. VA northward].
5 Achenes glabrous (even when young); flowering plants (3-) 4-10 (-13) dm tall; inflorescence broadly cylindrical, averaging 5-6 cm in diameter; [of rocky, flood-scoured riversides, known only from the Yadkin River in sc. NC] .......................................................................................................................... *S. plumosa*
5 Achenes pubescent (even when mature); flowering plants 1.5-6 (-8.5) dm tall; inflorescence narrowly cylindrical, averaging 2-4 cm in diameter.
6 Lower cauline leaves 7-15× as long as wide, (2.5-) 4.6-9.4 (-11.2) cm long, (2-) 3-9 (-17) mm wide, generally obscurely toothed; [of rocky, flood-scoured riversides, from e. KY, e. TN, and n. VA northward] ............................................................................................................... *S. racemosa*
6 Lower cauline leaves 3-8× as long as wide, (4-) 6-2 (-12) cm long, (5-) 10-22 (-31) mm wide, generally sharply toothed; [of cliffs and barrens, primarily over mafic rocks, from w. VA northward] ........................................................................................................... *S. randii*
2 Phyllaries and vegetative parts lacking minute sticky glands; stem leaves sessile.
7 Petioles of lower stem leaves sheathing the stems; [of bog and marsh habitats, growing in soils which are permanently or at least seasonally saturated]; [subsection *Maritimae*]
8 Basal leaves 0.7-8 cm wide; plants short, 4-10 (-15) dm tall, typically fairly stout; [of the Mountains and northward].
9 [of seepage over sloping rock on granitic domes, of sw. NC, mw. SC, and ne. GA] ................................................................................................................................. *S. simulans*
9 [of peaty bogs, of w. NC and c. TN northward]
10 Basal leaves 0.7-2.5 cm wide; [south to PA and WV] .......................................................................................... [S. uliginosa var. *linoides*]
10 Basal leaves 3-8 cm wide; [south to NC and TN] .......................................................................................................................... *S. uliginosa* var. *uliginosa*
8 Basal leaves 0.7-2.5 (-5) cm wide; plants short to tall, 3-20 dm tall, typically very slender; [of the Coastal Plain and lower Piedmont and southward].
11 Leaf margins smooth, entire; ray flowers 8-13 per head; disk flowers 14-25 per head; pappus (2.5-) 3.0-3.5 mm long ..... *S. pulchra*
11 Leaf margins (of the basal leaves at least) scabrous-margined, also often toothed; ray flowers 2-7 per head; disk flowers 6-16 per head; pappus (3.0-) 3.5-4.5 (-5.0) mm long.
12 Leaf margins scabrous (or at least tuberculate) throughout; panicle branches often spreading-erect with recurved-second tips; pappus 2.2-4.0 mm long .................................................................S. gracillima
12 Leaf margins tending to become smooth on the upper stem; panicle branches usually stiffly erect; pappus 4.0-4.5 (-5.0) mm long .................................................................S. stricta

7 Petioles of lower stem leaves not sheathing the stems; [of mesic or drier habitats]; [subsection Squarrosae] .................................................................S. squarrosa
13 Phyllaries spreading or with squarrose tips .................................................................S. squarrosa
13 Phyllaries appressed.
14 Phyllaries sparsely to moderately finely stipitate-glandular; [of the Outer Coastal Plain of se. NC] .................S. villosiscarpa
14 Phyllaries and peduncular bracts not glandular; [collectively widespread].
15 Phyllaries linear-lanceolate, attenuate, tapering to pointed or minutely rounded tip.
16 Proximal to mid stem glabrous; rays mostly 6-9; inner phyllaries usually striate with 2 prominent secondary veins .......................
16 Stems finely hairy throughout with minute strigillose hairs; rays mostly 9-16; inner phyllaries not striate.
17 Leaves 20-50 (-60) per stem; midstem leaves usually 4-5 cm long; phyllaries attenuate; [of the Mountains and Piedmont (rarely Coastal Plain), of GA northward] .........................................................S. puberula var. puberula
17 Leaves (20-) 50-120 per stem; midstem leaves usually 1-4 cm long; phyllaries acute to acuminate; [of the Coastal Plain from se. VA southward] .................................................................S. puberula var. pulviferula

15 Phyllaries ovate to lanceolate, acute to obtuse or rounded.
18 Rays white .....................................................................................................................................................S. bicolor
18 Rays yellow (may turn pale yellow with age).
19 Leaves and stems sparsely to densely hairy with spreading to appressed hairs .................................................S. hispida
19 Leaves and upper stems glabrous.
20 Inflorescence either very narrowly thyrsiform and often interrupted or branches well spaced; mid cauline leaves 0.5-2.0 cm wide; [of MA to se. IN, south to GA and MI, mostly avoiding the Coastal Plain southward] .................S. erecta
20 Inflorescence usually denser, broader, and crowded, sometimes more open in robust plants, or narrow in plants outside range of S. erecta; mid cauline leaves often > 20 mm wide; [of MA to GA, west to SD and scattered south in CO to ne. NM].
21 Mid-stem leaves 0.4-1.5 (-2.0) cm wide; basilar leaves 0.8-2.0 cm wide, entire or slightly serrate, present or absent at flowering .................................................................S. speciosa var. rigidissicula
21 Mid-stem leaves usually > 2 cm wide; basilar leaves (2.0-) 3.0-5.5 cm wide, coarsely serrate, present at flowering ..... .................................................................S. speciosa var. speciosa

Key C – goldenrods with basally disposed leaves and elongate, secund inflorescences (section Solidago, subsections Argutae, Junceae, Maritimae, Nemorales)

1 Basal and lower cauline leaves petiolate with a cordate or subcordate blade and/or a cordate-clasping petiole; [subsection Argutae].
2 Pappus > ½× as long as the disc corollas; rays 1-3 .................................................................................................S. auriculata
2 Pappus < ½× as long as the disc corollas; rays 3-6 .................................................................................................S. sphacelata
1 Basal and lower cauline leaves with cuneate leaf blades and petioles not cordate-clasping (though leaves may have petioles which sheath the stem).
3 Blades of lower leaves ovate to elliptic to oblanceolate, their bases truncate, abruptly tapering, or gradually tapering to petiole; lower leaves including petals mostly less than 4× as long as wide (sometimes longer in S. brachyphylla with densely puberulent leaf surfaces and stems, and in S. arguta var. bootii and S. arguta var. caroliniana with blades sharply serrate and heads lacking phyllary-like bracts interior to ray florets); [subsection Argutae].
4 Leaves definitely scabrous or moderately to densely soft-villous or puberulent.
5 Leaves scabrous on the upper surface.
6 Basal and lower cauline leaves 8-30 cm long, 4-10 cm wide, mostly 2-3× as long as wide; upper stem leaves few, somewhat reduced, sharply toothed; [of the Mountains and rarely Piedmont] .................................................................S. patula var. patula
6 Basal and lower cauline leaves 6-24 cm long, 2-6 cm wide, mostly 3-5× as long as wide; upper stem leaves many, strongly reduced, mostly entire; [of the Coastal Plain and lower Piedmont] .................................................................S. patula var. strictula
5 Leaves moderately to densely soft-villous or puberulent.
7 Leaves puberulent; rays 0 (-2); flowering September-November; [of SC (NC?) south to FL and AL] ......................S. brachyphylla
7 Leaves soft-villous; flowering May-June; rays 7-12; [of Coastal Plain of e. NC and e. SC] .................................S. verna
4 Leaves glabrous (or nearly so) or strigose or strigilllose.
8 Plants with slender, stoloniferous rhizomes (in addition to the main, more deeply-seated rhizomes) ..................S. tarda
8 Plants lacking slender, stoloniferous rhizomes.
9 Phyllaries striate, with several nerves prominent; involucres 4.5-6 (-7) mm high .......................................................S. faucibus
9 Phyllaries not striate, only the midvein prominent; involucres 2.5-5.6 mm high.
10 Basal leaves truncate at the base; leaves thick in texture .................................................................S. harrisii
10 Basal leaves cuneate to rounded at the base; leaves of normal herbaceous texture.
11 Achenes glabrous .................................................................S. arguta var. arguta
11 Achenes strigillose, at least towards the apex.
12 Leaves strigose or strigilllose .................................................................S. arguta var. bootii
12 Leaves glabrous .................................................................................................S. arguta var. caroliniana
3 Blades of lower leaves oblanceolate to narrowly ovate, gradually tapering to petiole; lower leaves including petals mostly more than 4× as long as wide (sometimes shorter in S. juncea with at least a few phyllary-like bracts interior to ray florets).
13 Petiole bases of basal and lower cauline leaves not sheathing the stem; [of mesic or dry habitats].
14 Stems obviously densely and loosely puberulent; [subsection Nemorales] .................................................................S. nemoralis var. nemoralis
14 Stems glabrous or nearly so; [subsection Junceae].
Key D – goldenrods with cauline leaves and axillary inflorescences
(section Solidago, subsections Argutae, Glomeruliflorae, Squarrosoae, Thyrsiflorae)

1 Leaves entire or obscurely few-toothed; achenes glabrous at maturity; outer phyllaries with squarrose tips (tips appressed in S. speciosa var. rigidiuscula).
2 Outer phyllaries appressed; [subsection Squarrosoae] ................................................................. S. speciosa var. rigidiuscula
2 Outer phyllaries with squarrose tips.
3 Leaves oblanceolate-obovate, often short acuminate at the apex; mid-cauline leaves 8-14 cm long, 18-40 mm wide, the margins sharply serrate on at least the upper 2/3; [subsection Argutae] ................................................................. S. buckleyi
3 Leaves narrowly to broadly elliptic (or less commonly slightly oblanceolate), acute at the apex; mid-cauline leaves 3-8 (-10) cm long, 8-25 mm wide, margins entire to shallowly serrate on only the upper 1/2 to 2/3; [subsection Thyrsiflorae] .......... S. petiolaris var. petiolaris
1 Leaves generally many- and sharp-toothed; achenes persistently pubescent; outer phyllaries with appressed tips; [subsection Glomeruliflorae].
4 Stem terete, glaucous.
5 Lower midstem leaves narrowly lanceolate, 5-15 cm long, 0.8-3 cm wide, 5-6× as long as wide; stems strongly arching; [plants widespread in our area] ................................................................. S. caesia var. caesia
5 Lower midstem leaves broadly lanceolate to rhombic, 5-9 cm long, 1.3-2.4 cm wide, 3-4× as long as wide; stems weakly arching; [plants of the Gulf Coastal Plain of GA westward] ................................................................. S. caesia var. zedia
4 Stem striate-angled, green.
6 Larger leaf blades on a plant 2-6 cm long; stems with spreading white hairs; [endemic to sandstone rockhouses in the Red River Gorge in Menifee, Powell, and Wolfe counties, KY] ................................................................. S. alhopilosa
6 Larger leaf blades on a plant 8-20 cm long; stems glabrous or sparsely pubescent; [of various dry and mesic habitats, collectively widespread in our area].
7 Leaves 1-3 (-3.5)× as long as wide.
8 Leaves (2.2-)2.5-3 (-3.5)× as long as wide, cuneate to a sessile base; teeth of the leaf margins not notably elongate and narrow, mostly 1-2 (-3) mm long (as measured on the upper side of the teeth) ................................................................. S. flexicaulis
7 Leaves 3-10× as long as wide.
9 Involutec 2.5-3.5 (-6) mm high; phyllaries 0.7-1 mm wide, 1-nerved; stems 4-9 (-10) dm tall; ray flowers 2-4 (-6); [broadly Appalachian] ................................................................. S. curtisii
9 Involutec 4.5-7 mm high; phyllaries 1-1.5 mm wide, 3-10-nerved; stems 6-16 dm tall; ray flowers 5-8; [apparently restricted to high elevations in the Blue Ridge of NC and TN] ................................................................. S. lancifolia

Key E – goldenrods with cauline leaves and well-developed panicle inflorescences
(section Solidago, subsections Nemorales, Triplinervae and Venosae)
1 Mid-stem leaves 3-nerved (obscurely so in S. tortifolia); leaves elliptic, lanceolate, oblanceolate, or linear.
2 Rays 2-6; larger leaves linear to lance-linear, 2-7 (-10) mm wide, twisted at base; plants (3-) 7-13 dm tall; [subsection Triplinervae] .................................................. S. tortifolia
3 Rays 4-10 (-11); plants 3-15 dm tall.
4 Rays 4-7; plants 3-9 dm tall; stems scabrous to loosely puberulent below; cauline leaves oblanceolate, 7-20 (-30) mm wide, faces slightly to strongly scabrous; involucres 3-5 mm long; ray floret laminae 2.3-5 × 0.2-0.7 mm; disc floret corolla lobes 1 mm long; pappus 3 mm long [of Piedmont and Mountains of KY, NC, SC, GA, and AL, and from IL and KS south to LA and TX]; [subsection Nemorales] ................................................................. S. radula
5 Rays 7-11; plants 5-15 dm tall; stems glabrous below; cauline leaves linear-elliptic, 6-12 mm wide, faces glabrous (or puberulent on abaxial midnerve); involucres 2.3-3 mm long; ray floret laminae 1.2-2 × 0.1-0.2 mm; disc floret corolla lobes 0.4-0.6 mm long; pappus 2-5 mm long [of MD and PA south to VA, and IN, KY, and TN]; [subsection Triplinervae] .................................................. S. rupesiris
6 Rays (7-) 9-17 (-24); plants (5-) 10-20 dm tall; [collectively widespread]; [subsection Triplinervae].
7 Stems from elongated rhizomes.  
8 Stems from branched caudices or short rhizomes, lacking elongated rhizomes.
9 Mid-stem leaves subsessile, not clasping; leaf margins strongly serrate; leaves rugose.  
10 Leaves serrate; leaves not translucently-punctate; fresh leaves not anise-scented
11 Stem spreading-hirsute; [of the Ozarks, disjunct in MS] ........................................ [S. arguta var. arguta]
12 Main leaves lanceolate to linear, (4-) 5-15× as long as wide; stem pubescence in lines decurrent down the stem from the margins of the leaf bases; [widespread] .............................................. S. canadensis var. canadensis
13 Mid-stem leaves sessile, somewhat clasping; leaf margins nearly entire to obscurely serrulate; leaves planar ........................................ [S. fistulosa]
14 Involucres 4-6 mm high; broader phyllaries 0.7-1.2 mm wide; stems glabrous below the involucre; mid-stem leaves elliptic (widest near the middle)  .................................................. S. latissimifolia
15 Involucres (2-) 2.5-3.5 (4.5) mm high; phyllaries mostly < 0.5 mm wide; stems hairy or glabrous below the involucre; mid-stem leaves lanceolate to ovate (widest below the middle).
16 Stems and leaves hairy .............................................................. S. rugosa var. rugosa
17 Involucres narrow, the lower lateral branches only slightly exceeding the subtending leaves; leaves sparsely pubescent; [of the Southern Appalachians] .................................................. S. rugosa var. cronquistiana
18 Upper cauline leaves lanceolate to elliptic, not much reduced relative to leaves lower on the stem ...... S. rugosa var. aspera
19 Upper cauline leaves ovate, much reduced relative to leaves lower on the stem .................... S. rugosa var. celtilifolia

**Solidago arenicola** B.R. Keener & Kral, Black Warrior Goldenrod. Riverside scour areas. September-October. Known from Blount County, AL (Black Warrior River) and on rivers in the Cumberland Plateau of TN and KY (notably Big South Fork of the Cumberland River). See Keener & Kral (2003) for additional information. [= FNA]

**Solidago arguta** Aiton var. arguta, Forest Goldenrod. Woodlands, woodland borders, road margins. August-October. ME and s. ON west to MO, south to NC and TN. [= S. arguta ssp. arguta – C, SE, W; < S. arguta – RAB (also see S. tarda and S. vasyei)]; = S. arguta – F, G, S; = S. arguta ssp. arguta – FNA; < S. arguta var. arguta – K]

**Solidago arguta** Aiton var. *caroliniana* A. Gray, Vasey's Goldenrod. Forests, woodlands, grassy balds. September-October. WV west to c. TN and s. MO, south to ne. FL, Panhandle FL, s. MS, and c. AR. = C, K, SE, WH; = S. notabilis Mackenzie – RAB, S

**Solidago brachyphylla** Chapman, Dixie Goldenrod. Open woodlands, bluff forests. September-October. SC (NC?) south to ne. FL and Panhandle FL, west to s. AL (s. MS?). = FNA, K, S, SE, WH

**Solidago buckleyi** Torrey & A. Gray, Buckley's Goldenrod. Forests, open ridgetop and bluff woodlands. September. W. KY, s. IN, s. IL, s. MO; perhaps eastwards in GA and AL (these occurrences controversial as to identification). = F, FNA, G, K, S, SE; = S. petiolaris – RAB

**Solidago caesia** Linnaeus var. *zedia* R.E. Cook & Semple, Gulf Coast Axillary Goldenrod. Moist forests. September-October. GA and Panhandle FL west to LA and AR. = FNA; = S. caesia – K, SE, WH

Solidago delicatula Small. Possibly east to AL, FL. August-October. [= FNA, SE; = S. ulmifolia Muhlenberg ex Willdenow var. microphylla A. Gray – K; < S. ulmifolia – S] {not keyed; not mapped}

Solidago erecta Pursh. Woodlands, old fields, woodland borders, grassy balds. August-October. NY and CT south to GA, AL, and MS. [= RAB, C, F, FNA, G, K, S, SE, W, WV; < S. erecta – FNA (also see S. porteri); = S. speciosa Nuttall var. erecta (Pursh) MacMillan]

Solidago microphylla A. Gray – K; < S. ulmifolia – S] {not keyed; not mapped}

Solidago erecta Pursh. Woodlands, old fields, woodland borders, grassy balds. August-October. NY and CT south to GA, AL, and MS. [= RAB, C, F, FNA, G, K, S, SE, W, WV; < S. erecta – FNA (also see S. porteri); = S. speciosa Nuttall var. erecta (Pursh) MacMillan]

Solidago faucibus Wieboldt, Gorge Goldenrod. Moist forests. Late August-October. S. WV south to sw. VA, and se. KY; disjunct in nw. SC. See Wieboldt & Semple (2003) for additional information. [= FNA]

Solidago flaccidifolia Small, Appalachian Goldenrod. Moist slopes. September-October. VA and KY south to GA and ne. AL; disjunct in nc. MS. [= C, G, K, SE, W; < S. caesia – RAB; F; = S. latissimifolia – S, misapplied; = S. curtisii Torrey & A. Gray var. flaccidifolia (Small) R.E. Cook & Semple – FNA; = S. caesia Linnaeus var. paniculata A. Gray]

Solidago flexicaulis Linnaeus, Zigzag Goldenrod. Moist wooded slopes, especially over calcareous or mafic rocks. August-October. NS, ON and ND south to GA, AL, MS, and KS. [= RAB, C, F, FNA, G, K, S, SE, W, WV]

Solidago glomerata Michaux, Skunk Goldenrod. High elevation situations, including grassy balds, rock outcrops, heath balds, northern hardwood forests, and spruce-fir forests. Mid August-October. A narrow Southern Appalachian endemic, restricted to w. NC and e. TN (perhaps reaching its northern limit on Elk Knob, Watauga County, NC). The basal rosettes are evergreen, and are a conspicuous component of the winter flora at high elevations. The plants have a distinctive skunky odor, easily smelled without touching or bruising the plant. [= RAB, FNA, K, S, SE, W]

Solidago gracillima Torrey & A. Gray, Southern Bog Goldenrod, Graceful Goldenrod. Wet pine savannas, seepage bogs. August-October. E. VA south to c. Panhandle FL, west to s. AL. Several distinct entities appear to have been referred to this taxon; the number of entities, and the appropriate names to apply to them, are presently obscure. The names S. perglanda Fernald, S. austrina Small, and S. simulans Fernald have been synonymized under S. gracillima (as by Cronquist 1980). Cronquist (1980) refers material from WV and high elevation granitic domes of sw. NC (S. simulans) to S. gracillima, a treatment which is not phytogeographically credible. The distinction between S. gracillima s.s and S. austrina may prove warranted. They are alleged to differ as follows: S. australis: pappus 2.2-2.8 mm long, ray flowers 2-4, disc flowers 6-8; of the inner Coastal Plain and lower Piedmont; S. gracillima: pappus (3.0-) 3.5-4.0 mm long; ray flowers 3-7; disk flowers 9-13; of the Coastal Plain. [= RAB, K, W, WH; < S. gracillima – C, SE (also see S. simulans); > S. australis Small – F, G, S; > S. perglanda Fernald – F; > S. stricta Aitonssp. gracillima (Torrey & A. Gray) Semple – FNA; > S. gracillima – S]

Solidago harrisii Steele, Shale-barren Goldenrod. Limestone, dolostone, greenstone, shale, and calcareous siltstone woodlands, barrens, and cliffs. August-September. A Central Appalachian endemic: w. MD south to e. WV and w. VA. [= F, S, W, WV; = S. arguta Aiton var. harrisii (Steele) Cronquist – C, K, SE; = S. arguta ssp. arguta var. harrisii – FNA; < S. bootii var. bootii – G]

Solidago hispida Muhlenberg ex Willdenow, Hairy Goldenrod. Dry rocky forests and woodland edges. August-October. NL (Labrador) west to SK, south to nw. GA, AL, AR, IA, and SD. Widespread in e. and c. TN (Chester, Wofford, & Kral 1997) and in nw. GA (Jones & Coile 1988). Also reported for NC and SC by Kartesz (1999). [= C, FNA, S, SE, W, WV; > S. hispida var. hispida – F, G, K]

Solidago lancefolia (Torrey & A. Gray) Chapman, Lanceleaf Goldenrod. Mountain slopes, mostly at high elevations. Late August-September. W. VA and e. WV south to w. NC and e. TN. (= C, FNA, S, SE, W; < S. curtisii var. curtisii – RAB; < S. curtisii – K)

Solidago latissimifolia P. Miller, Coastal Swamp Goldenrod. Pocosins, swamp forests, sandhill seepages, sandhill-pocosin ecotones. August-October. NS south c. peninsular FL, west to s. AL. (= FNA, G, SE, W; > S. elliottii var. ascenden Fernald – F; > S. elliottii var. pedicellata Fernald – F)

Solidago leavenworthii Torrey & A. Gray, Leavenworth’s Goldenrod. Wet pine savannas, wet pine flatwoods, pond margins, marshes. August-November. Se. NC south to s. FL, west to s. AL. (= RAB, FNA, GW, K, S, SE, WH)

Solidago nemoralis Aiton var. nemoralis, Eastern Gray Goldenrod. Woodlands, glades, barrens, roadbanks. NS west to ND, south to Panhandle FL and TX. The more western var. decemflora (de Candolle) Fernald does not enter our area. (= K; > S. nemoralis var. nemoralis – C, F, G, SE, WV; > S. nemoralis var. haleana Fernald – C, F, G, SE, WV; < S. nemoralis – RAB, S, W, WH; = S. nemoralis ssp. nemoralis – FNA)

Solidago nitida Torrey & A. Gray, Shiny Goldenrod. Pine savannas, prairies. (July-) August-October. MS west to s. AR, se. OK, and TX. (= FNA, S; = Oligoneuron nitidum (Torrey & A. Gray) Small – K, S, Z; = Solidago nitida Torrey & A. Gray – FNA, SE)

Solidago patula Muhlenberg ex Willdenow var. patula, Northern Roughleaf Goldenrod. Bogs, seepages, mafic rocks, grassy balds (as Whitetop Mountain). August-September (-October). NH and VT west to WI, WI, MI, and IA, south to GA, AL, MS, and MO. Some or all of the coastal records may actually represent ambiguous specimens of S. patula var. strictula. (= RAB, C, F, G, K, SE; = S. patula ssp. patula – FNA; < S. patula – GW, W, WV; = S. rigida – S, misapplied)

Solidago petiolaris Aiton var. petiolaris. Upland forests and woodlands. Late August-October. The distribution of S. petiolaris (in the broad sense) is peculiar, with an eastern component (NC south to ne. FL and Panhandle FL, west to AL) and a western component (IL, MO, AR, and LA west to NE, CO, and NM). The eastern component is sometimes treated as S. petiolaris (sensu stricto) and the western as S. angusta Torrey & A. Gray. Alternatively these are recognized as the varietal rank (as here), or combined entirely. Var. angusta (Torrey & A. Gray) A. Gray and var. wardii (Britton) Fernald are Ozarkian and more western (Nesom 2008). (= C, F, K, SE; < S. petiolaris – RAB, W, WH (and also see S. buckleyi); = S. petiolaris var. petiolaris – C, F, K, SE; = S. petiolaris – G; > S. milleriana Mackenzie – S; > S. harperi Mackenzie in Small – S)

Solidago plumosa Small, Yadkin River Goldenrod. In crevices of outcrops in rocky, flood-scoured riverbanks. September. Known only from the type locality, the gorge of the Yadkin River in c. NC. Most of the population was lost by construction of two hydropower dams, one at each of the two ends of the gorge, and the flooding of the intervening area. This species is related to the more northern S. racemosa and the newly described and more western S. arenicola. [= FNA, K, S, SE]

Solidago porteri Small, Porter's Goldenrod. Upland forests. So far as known, this species is endemic to the Piedmont of GA; its taxonomic status is very uncertain. [= K, S, SE; < S. erecta – FNA] [not yet keyed]

Solidago ptarmicoides (Nees) Boivin, White Prairie-goldenrod, Upland White Aster. Prairie-like barrens over mafic, ultramafic, or calcareous rock, serpentine woodlands, prairies. August-October. VT and NY west to SK, south to e. TN (Rhea and Roane counties in the Ridge and Valley) (Chester, Wofford, & Kral 1997), nw. GA (Floyd County), AR, and CO; disjunct in nc. NC (Granville county, and historically in Rowan County) and nc. SC (York County). [= C, FNA, SE, W, X]

Solidago puberula Nuttall var. puberula. Bogs, wet meadows, and wet pastures, in dry acid soils in VA and WV. August-October. NS west to ON, south to GA and TN. [= RAB, C, F, G, K, SE; = S. puberula ssp. puberula – FNA; = S. puberula – S; < S. puberula – W, WV]

Solidago pulchra Small, Beautiful Goldenrod, Carolina Goldenrod. Wet pine savannas, seeage bogs. July-September. Endemic to a small part of the Coastal Plain of se. NC, where locally common in the few wet savannas remaining. Notable sites include Green Swamp (Brunswick County), Holly Shelter Game Land (Pender County), Camp Lejeune Marine Corps Base (Onslow County), and Croatan National Forest (Carteret County). There is no question of the distinctness of this species from S. stricta and S. gracillima. Once learned, the basal leaves are recognizable at a glance, the petiole very long (often twice as long as the leaf blade), the venation finely netted, the margins smooth and entire, the tip usually acute and prominently mucronate. Even following fire, sterile rosettes typically outnumber flowering plants 100 to 1. [= FNA, K, S, SE; < S. stricta – RAB, GW]

Solidago racemosa Greene, Sticky Goldenrod. Rocky, flood-scoured riversides. ME and QC south to n. VA and WV; plants in the Cumberland Plateau of KY and ne. TN (Churchill & Schell 1992; Chester, Wofford, & Kral 1997) placed here are problematic and may represent another taxon or taxa. This complex remains poorly understood. [= WV; = S. simplex Kunth ssp. randii (Porter) Ringius var. racemosa (Greene) Ringius – C, FNA, K; = S. racemosa Greene var. racemosa – F; = S. spathulata A.P. de Candolle ssp. randii (Porter) Cronquist var. racemosa (Greene) Cronquist – G, SE]

Solidago radula Nuttall, Rough Goldenrod. Dry woodlands over mafic rocks. August-October. IL west to KS, south to LA and TX; disjunct eastward in KY, NC, SC, GA, and AL. [= RAB, C, FNA, G, S, SE, WH; > S. radula var. radula – K]

Solidago randii (Porter) Britton, Rand's Goldenrod. Cliffs and barrens, primarily over mafic (such as greenstone and hornblende) or calcareous rocks. NS west to ON and MI, south to w. VA and WV, [= WV; < S. simplex ssp. randii (Porter) Ringius var. monticola (Porter) Ringius – C, FNA; > S. randii – F; > S. maxonii Pollard – F; = S. spathulata A.P. de Candolle ssp. randii (Porter) Cronquist var. randii – G; = S. simplex Kunth ssp. randii (Porter) Ringius var. randii – K]

Solidago riddelli A.P. de Candolle ssp. riddelli – A.P. de Candolle ssp. riddelli – C, FNA, G; = Oligoneuron riddelli (Frank ex Riddell) Rydberg – K, Z]
**Solidago rugosa** P. Miller *var. aspera* (Aiton) Cronquist. Mt (WV), Cpe (DE, FL), Pd (DE), {GA, NC, SC, VA}: fields, forests, roadsides; common. August-November. ME west to MI, south to FL and TX. [= F, WV; < *S. rugosa* ssp. *aspera* – C, G, K, SE, W, WH; = *S. rugosa* ssp. *aspera* (Aiton) Cronquist *aspera* – FNA; < *S. rugosa* – GW; < *S. altissima* – S, misapplied]

**Solidago rugosa** P. Miller *var. rugosa* Miller. Mt (WV), Cpf (DE, FL), Pd (DE), {GA, NC, SC, VA}: fields, forests, woodlands; common. August-October. Rd and MA west to NY, s. ON, MI, WI, s. MN and c. NE, south to c. VA, sc. NC, w. NC, sc. TN, c. AR, and sc. TX. Var. *rugosa* is generally rare and restricted to relictual prairie-like situations east of MI, IN, IL, MO, and OK. Var. *rugida* is tetraploid through most of its range, including (apparently) all of our area. A third variety, var. humilis (T.C. Porter) Nesom, is more northern and western, ranging from ON west to AB, south to MI, IN, IL, MO, OK, n. TX, and NM. [= C, G, SE; = *Oligoneuron rigidum* (Linnaeus) Small var. *rugida* – K, Z; < *Solidago rigidia* Linnaeus – RAB; W; = *Solidago rigidia* – F; = *Solidago rigidia* ssp. *rugida* – FNA; Y; = *Oligoneuron grandiflorus* (Rafinesque) Small – S]

the coast (and introduced inland in saline situations such as along salted roadways). [= C, F, G, K, SE; = S. sempervirens Linnaeus – S; = S. sempervirens ssp. sempervirens – FNA]

Solidago shortii Torrey & A. Gray. Endemic to nc. KY (Fleming, Jefferson, Nicholas, Robertson counties) and s. IN. August-October. See Smith et al. (2004) and Homoya & Abrell (2005) for additional, detailed information. [= C, F, FNA, G, K, SE] [not yet keyed]

Solidago spathacela Rafinesque, Limestone Goldenrod, False Sticky-Rod. Mt (GA, NC, SC, WA), Pd (NC, VA): rock outcrops and dry forests, usually over calcareous or mafic rocks; uncommon. (July-) August-September (-October). C. VA, s. WV, OH, IN, and IL south to GA, MS, LA, and OK. [= RAB, C, F, G, K, SE; < S. speciosa – RAB, W, WV; > S. confera – S; > S. harperi Mackenzie – S; = S. speciosa ssp. speciosa – FNA]

Solidago stricta Aiton, Wald Goldenrod. Cp (DE, FL, GA, NC, SC, VA?): pine savannas, Coastal Plain bogs, pocosins; common (rare in DE). Late August-October. NJ and DE (formerly) south to s. FL, west to TX; West Indies and s. Mexico. [= C, F, G, K, SE, WH; < S. stricta – RAB, GW (also see S. pulchra); > S. petioloata P. Miller – S, misapplied; = S. stricta Aiton ssp. stricta – FNA]

Solidago tarda Mackenzie. Cp (DE, FL, GA, VA), Pd (GA, VA): sandhills, other dry pinelands, xeric fluvial sand ridges, Piedmont bogs, rare. September-October. NJ and e. PA south to e. VA, c. and s. GA, AL, and Panhandle FL, in our area primarily in the Coastal Plain; disjunct in Marion County, TN (Chester, Wofford, & Kral 1997). [= C, FNA, S, SE; < S. arguta – RAB; < S. ludoviciana – F, misapplied as to our area; < S. arguta var. arguta – K; < S. arguta var. caroliniana – WH]

Solidago uliginosa Nuttall var. linoides (Torrey & A. Gray) Fernald. Mt (WV): bogs; rare. NS and NL (Labrador) west to MB, south to s. PA, e. WV, OH, IN, and IL. [= K; < S. uliginosa – C, FNA; > S. uliginosa var. linoides – F; > S. parviflorus Portr – F, WV; > S. uliginosa var. peravata (Fernald) Friesner – G]

Solidago uliginosa Nuttall var. uliginosa, Northern Bog Goldenrod. Mt (GA?, NC, VA, WV), Cp (DE, VA): bogs, wet meadows, mafic fens, acidic seepage swamps; rare. NL (Bog) west to Keewatin, south to e. VA, w. NC, ne. TN, IL, and IA (reports from further south need additional evaluation; some material formerly identified as S. uliginosa is actually S. simulans or S. gracilima). [= F, G, K, WV; < S. uliginosa – RAB, C, FNA, SE, WF; > S. uligulata (A.P. de Candolle) Porter – S]

Solidago ulmifolia Muhlenberg ex Willdenow var. palmeri Cronquist. East to MS and AL?. [= FNA, G, K, SE; < S. ulmifolia – S]

Solidago ulmifolia Muhlenberg ex Willdenow var. ulmifolia, Elmleaf Goldenrod. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, WA), Cp (DE, FL, VA): rocky forests and woodlands, especially on mafic and calcareous substrates, moist hammocks (in FL); common (rare in DE, FL, GA, NC, SC, rare in VA Coastal Plain, where usually confined to coquina limestone). August-October. NS, ME, ON, and MN, south to FL and TX. [= C, FNA, G, K, SE; < S. ulmifolia – RAB, F, S, WH, WV]

Soliva Ruiz & Pavón 1794 (Burweed)

A genus of about 8 species, herbs, of South America. References: Watson in FNA (2006a); Cronquist (1980)=SE; Arriagada & Miller (1997)=Z. [also see Gymnostyles]
ASTERACEAE

965

1 Achenes (1.5-) 2.5-3.0 mm long, usually winged, the wings not transversely ribbed ...................................................... S. sessilis

1 Achenes 1.5-2.2 mm long, winged, transversely ribbed.

2 Leaves mostly basal; leaf blades 3-8 (-15) cm long, 2-3× pinnatifid .......................................................... S. anthemifolia

2 Leaves cauline and basal; leaf blades 1-2 (-3) cm long, 1 (-2)× pinnatifid .......................................................... S. stolonifera

Sonchus Linnaeus 1753 (Sow-thistle, Milk-thistle)

A genus of about 50-60 species, herbs and shrubs, of the Old World. References: Hyatt in FNA (2006a); Cronquist (1980)=SE.

1 Heads 30-50 mm across in flower, the involucre (10-) 15-20 mm high; perennials from creeping rhizomes.

2 Phyllaries and peduncles densely pubescent with glandular hairs; longer phyllaries 10-15 mm long ...................... S. arvensis var. arvensis

2 Phyllaries and peduncles glabrous (but with sessile glands); longer phyllaries 14-17 mm long ........................ S. arvensis var. glabrescens

1 Heads 15-25 mm across in flower, the involucre 9-13 mm high; annuals.

3 Leaf base auricles rounded; mature achenes not transversely rugose .................................................................................. S. asper

3 Leaf base auricles sagittate, the two lobes on either side of the stem coming to a point; mature achenes transversely rugose ...... S. oleraceus

* Sonchus arvensis Linnaeus var. glabrescens (Günther) Grabowski & Wimmer, Perennial Sow-thistle. Mt (NC, VA, WV), Pd (VA): disturbed areas; uncommon (rare in NC), native of Europe. June-November. [= C, SE, WV; < S. arvensis – RAB, W]; = Sonchus arvensis ssp. uliginosus (Bieberstein) Nyman – FNA, K; > S. arvensis var. glabrescens – F; > S. uliginosus Bieberstein – F; = S. uliginosus – G]

Sphagnicola O. Hoffmann 1900

Stokesia L’Héritier 1789 (Stokesia, Stokes Aster)

* Stokesia laevis (Hill) Greene, Stokesia, Stokes Aster, Blue Stokesia. Cp (FL, GA, SC), Pd* (NC*): native in pitcherplant bogs and moist pinelands of FL, GA, and SC, rather frequently grown as a garden plant and naturalized from cultivation at least in NC; rare. Late June-August. Native from e. SC south ne. FL, FL Panhandle, west to LA. There seems no reason to question the validity and native status of the early record from SC. A unique tetraploid population found by the Atlanta Botanical Garden in Omega, GA (near Tifton) in the 1990s was distinguished by having distinct upright and long scapes, up to 1 meter in length; the original population has been destroyed, but a selection derived from it was named 'Omega Skyrocket' and introduced into the commercial trade (D. Werner, pers. comm. 2006). [= RAB, FNA, K, S, SE, WH, Z]
ASTERAECES

Stuartina Sonder 1853

A genus of 2 species, endemic to Australia.

**Symphyotrichum** Nees 1833 (American Aster)

1 Basal and lower stem leaves both petiolate and with cordate blades; [subgenus *Symphyotrichum*, section *Heterophylli*].............Key A  
2 Basal and lower stem leaves not both petiolate and cordate-bladed.  
3 Leaves not fleshy, usually toothed, stems usually variously pubescent.  
4 Leaves very numerous on the main stem, the internodes < 1 cm long (in some species the leaves of the lower and middle main stem withered or deciduous by flowering season, the internode length then reckonable by leaf scars), the leaves clasping or sessile, or leaves rather numerous on main stem, the internodes > 3.5 cm long, the leaves of the main stem strongly auriculate clasping (*S. georgianum*, *S. phlogifolium*); stem leaves entire, (often scabrous-margined); rays purple, lavender, rose, or blue (or characteristically white in *S. ericoides* and very rarely also in other species); [subgenus *Virgulas*]................Key D  
5 Leaves less numerous on the main stem, the internodes averaging > 3.5 cm long, the leaves clasping, subclasping, or not clasping; stem leaves toothed (or rarely entire); rays blue, purple, lavender, pink, or white.  
6 Leaves with nearly all basal and stem leaves cordate or subcordate; phyllary faces short-pubescent; disc florets 16-23  
7 Plants with only the basal and lower stem leaves cordate or subcordate; phyllary faces glabrous; lower disc florets (15-) 20-25 (-30).................................................................Key E  
8 Plants with nearly all basal and stem leaves cordate or subcordate; phyllary faces short-pubescent; disc florets 16-23 ......*S. shortii*  
9 Plants with elongate green blaze (> 2× as long as wide); basal and lower stem leaves serrate or crenate; upper stem leaves crenate (to entire).  
10 Plants 3-8 dm tall; cypselae strigillose.......................................................*S. ericoides*  
11 Plants 4-12 dm tall; cypselae glabrous...........................................................*S. oolentangiense* var. *oolentangiense*  
12 Plants 3-8 dm tall; cypselae striigillose.......................................................*S. oolentangiense* var. *textanum*=*S. texanum*  
13 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *texanum*==*S. drummondii*  
14 Plants with petiole  
15 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *drummondii*  
16 Plants with petiole; upper stem leaves sparsely hirtellous; [mainly west of the Appalachians].  
17 Plants with only the basal and lower stem leaves cordate or subcordate; phyllary faces glabrous; lower disc florets (15-) 20-25 (-30).................................................................Key F  
18 Plants with nearly all basal and lower stem leaves cordate or subcordate; phyllary faces short-pubescent; disc florets 16-23 ......*S. shortii*  
19 Plants with elongate green blaze (> 2× as long as wide); basal and lower stem leaves serrate or crenate; upper stem leaves crenate (to entire).  
20 Plants 4-12 dm tall; cypselae glabrous...........................................................*S. oolentangiense* var. *oolentangiense*  
21 Plants 3-8 dm tall; cypselae striigillose.......................................................*S. oolentangiense* var. *textanum*=*S. texanum*  
22 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *drummondii*  
23 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *texanum*=*S. texanum*  
24 Plants with petiole; upper stem leaves sparsely hirtellous; [mainly west of the Appalachians].  
25 Plants with only the basal and lower stem leaves cordate or subcordate; phyllary faces glabrous; lower disc florets (15-) 20-25 (-30).................................................................Key G  
26 Plants with nearly all basal and lower stem leaves cordate or subcordate; phyllary faces short-pubescent; disc florets 16-23 ......*S. shortii*  
27 Plants with elongate green blaze (> 2× as long as wide); basal and lower stem leaves serrate or crenate; upper stem leaves crenate (to entire).  
28 Plants 4-12 dm tall; cypselae glabrous...........................................................*S. oolentangiense* var. *oolentangiense*  
29 Plants 3-8 dm tall; cypselae striigillose.......................................................*S. oolentangiense* var. *textanum*=*S. texanum*  
30 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *drummondii*  
31 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *texanum*=*S. texanum*  
32 Plants with petiole; upper stem leaves sparsely hirtellous; [mainly west of the Appalachians].  
33 Plants with only the basal and lower stem leaves cordate or subcordate; phyllary faces glabrous; lower disc florets (15-) 20-25 (-30).................................................................Key H  
34 Plants with nearly all basal and lower stem leaves cordate or subcordate; phyllary faces short-pubescent; disc florets 16-23 ......*S. shortii*  
35 Plants with elongate green blaze (> 2× as long as wide); basal and lower stem leaves serrate or crenate; upper stem leaves crenate (to entire).  
36 Plants 4-12 dm tall; cypselae glabrous...........................................................*S. oolentangiense* var. *oolentangiense*  
37 Plants 3-8 dm tall; cypselae striigillose.......................................................*S. oolentangiense* var. *textanum*=*S. texanum*  
38 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *drummondii*  
39 Plants 8-12 dm tall; cypselae with petiole.....................................................*S. drummondii* var. *texanum*=*S. texanum*  
40 Plants with petiole; upper stem leaves sparsely hirtellous; [mainly west of the Appalachians].

Key B – annual salt-marsh asters  
[subgenus *Astropolium*]
Key C – perennial asters with linear, fleshy leaves

[of Symphyotrichum subgenera Astropolium and Chapmanian]

1 Leaves basally disposed; disc florets 47-57; ray floret laminae (10-) 14-15 (-20) mm long; [of FL]; [subgenus Chapmaniani] .......................................................................................... S. chapmanii

2 Midstem leaves (1.0-) 1.5-2.7 mm wide; involucres 4.1-5.3 mm high; ray florets 10-16; disc florets (10-) 13-23; achenes 1.5-2.0 (-2.5) mm long; pappus 3.0-4.4 mm long; [of FL southward] .................................................................................................................. S. bracei

3 Heads at first at ends of long, bracteate branches, then produced and maturing as axillary and nearly sessile or on very short lateral branches, commonly on one side of the main stem and appearing second to second, in paniculiform arrangements; ray florets in 2-3 series, corollas mostly 4-7 mm long, laminae 0.4-0.8 mm wide (dry), blue to white, coiling back in 3-5 coils; disc florets (20-) 33-45 (-50); [sc. United States east to AL and scattered eastward as an introduction] ................. S. divaricatum

Key D – perennial asters

[of Symphyotrichum subgenus Virgulus]

1 Mid and upper stem leaves > 8× as long as wide; phyllaries tipped with a small, white spine; rays white (to pale pink); involucre 2.5-4.5 (-5) mm high; disc florets 6-12 (-20) per head; [section Éricoidi] .............................................................................................................. S. ericoïdes var. ericoïdes

2 Disc florets yellow, cream, or white (with purplish corolla lobes), fading purple or brown; mid and upper stem leaves with bases rounded to cuneate (or slightly clasping in S. plumosum of FL Panhandle); phyllaries not stipe-glandular; [section Virgulus] ................................................................................................................. S. pratense

3 Rays 13-15 (-36); cypselas glabrous ...................................................................................... S. pratense

4 Phyllaries long-acuminate, spreading to recurved; phyllaries with woolly, tanged hairs; involucre 7-9 mm tall; [of Franklin County, FL Panhandle] ............................................................................................................................ S. plumosum

5 Phyllaries acute, appressed; phyllaries either with appressed, straight hairs (moderately to densely sericeous) or glabrous to sparsely pilose; involucre 5-7 mm high; [collectively widespread]

6 Disc florets pink, fading purple; mid and upper stem leaves with bases clasping or auriculate clasping (except cuneate, rounded, or slightly clasping in S. grandiflorum, S. oblongifolium, and S. fontanile); phyllaries stipitate-glandular (or sometimes or always lacking stipitate glands in S. fontanile and S. walteri (of the Coastal Plain from e. NC southward), and S. patens var. patentissimum (of KY and MS westward))

7 Mid-stem leaves < 1.5 cm long, either ascending-appressed, or spreading, and then the apical portion abruptly deflexed; rays 5-9 (-11) mm long [of the Coastal Plain]; [section Patentes]

8 Mid-stem leaves > 2 cm long, spreading; rays > 9 mm long (to as short as 7 mm in S. fontanile of Panhandle FL); [collectively widespread]

9 Mid-stem leaves cuneate, rounded, or subclasping; [section Grandiflori]
Phyllaries appressed; phyllary faces glabrous or glabrate, lacking stipitate glands (though there may be a few stipitate glands on the phyllary margins); heads 6–7.6 mm high; [of wet pinelands and marshes of e. Panhandle FL south to s. FL].................. **S. fontinalis**

Phyllaries spreading, squared, or reflexed; phyllary faces moderately to densely stipitate-glandular (and also often pubescent or scabrous with non-stipitate hairs); heads (5)-7-12 (-15) mm high; [of dry habitats, of mainly inland provinces, though extending to the Coastal Plain in e. VA, e. NC, and ne. SC].................. **S. oblongifolium**

Involucres 8.5-12 (-15) mm high; lower stem leaves (often withered by flowering season) cordate-clasping; [of acidic habitats of the Coastal Plain and Piedmont of e. and VA south through e. and c. NC to ne. SC].................. **S. georgianum**

Involucres (5)-7-9 mm high; lower stem leaves (typically persistent) cuneate, rounded, or subclasping; [of calcareous habitats, south to sc. VA, w. NC, ne. AL, n. MS].............................................................................................................................................. **S. gracile**

Mid-stem leaves clasping to auriculate-clasping.

Phyllaries with attenuate, loosely spreading tips; disc florets 50-110; ray florets (40-) 50-75 (-100); [mainly of sunny, moist to wet marshes, swamps, fens, south to GA, w. AL, c. MS]; [section *Grandiflori*].......................... [**S. novae-angliae**]

Phyllaries with obtuse to acute tips (the inner phyllaries sometimes acuminate, but not attenuate); disc florets 15-50; ray florets 9-24 (-30); [of sunny to semi-sunny dry sites, or of moist forests, collectively widespread, south to ne. FL, Panhandle FL, s. AL, s. MS, se. LA].

Involucres 8-10 (-12) mm high; disc florets 8-10 mm long, white with purplish lobes; heads 4-5 (-6) cm across (ray tip to ray tip), the rays 14-24 mm long; plants strongly rhizomatous, forming colonial clones with the stems mostly scattered along the rhizome (new stems typically arising at least several cm from the old ones); achenes 2.5-4.0 mm long, pale gray-brown, the trichomes about 0.4 mm long and distributed on and between the ribs; anthers purplish; pollen white; [section *Grandiflori*]........

Involucres 5.5-7.5 (-8.5) mm high (or to 12 mm high in **S. patens** var. *patentissimum*, barely entering our area in w. KY and w. MS); disc florets 5.5-8 mm long, either white with purplish lobes or bright yellow; heads 3-4 (-4.5) cm across (ray tip to ray tip), the rays 10-18 (-20) mm long; plants cespitose, generally with 1 or more stems arising from caudices (the new stems arising near the old); achenes 2.0-4.0 mm long, tan, gray, brown-dark brown, or black, the trichomes various (see below); anthers purplish or yellow; pollen white or yellow; [section *Patentes*].

Disc florets white with purplish lobes; stem leaves 7.5-12.5 (-14) cm long, thin in texture, soft-pubescent, the venation apparent, rugose-veiny and wrinkled; anthers purplish; pollen white; achenes 2.5-4.0 mm long, the trichomes concentrated on the ribs, < 0.4 mm long, appressed; [primarily of the Mountains, less commonly the Piedmont, mostly in moist, shady to semi-sunny situations].................................................................................................................... **S. phlogifolium**

Disc florets bright yellow; stem leaves (2-) 3-7 (-9) cm long, thick in texture, scabrous, the venation inconspicuous; anthers yellow; pollen yellow; achenes 2.0-3.5 mm long, the trichomes distributed on and between the ribs, mostly > 0.4 mm long, spreading; [collectively widespread in our area, mostly in dry, semi-sunny to sunny situations]

Involucres 8-12 mm high; phyllaries appressed, in 5-7 series; phyllaries obtuse, lacking stipitate glands or sparsely stipitate-glandular; [from w. KY and w. MS westward].................................................................................. **S. patens** var. *patentissimum*

Involucres 5.5-7.5 mm high; phyllaries square, in 4-5 series; phyllaries acute to acuminate, sparsely to densely stipitate-glandular; [collectively widespread].

Middle phyllaries 0.7-1 mm wide; phyllary faces sparsely stipitate-glandular and densely strigillose; [from se. LA and w. MS westward] ..........................................................................................................................**S. patens** var. *gracile*

Middle phyllaries 1-1.2 mm wide; phyllary faces densely stipitate-glandular and sparsely strigillose; [widespread]..............

**Key E**

1 Phyllaries appressed (or in some species the outer slightly elevated; rays usually < 20 [(10-) 12-23 (-34)]; [section *Heterophylli*].

2 Middle stem leaves strongly clasping; involucre 3.8-5.5 mm high; disc corollas 15-22 (-25); phyllaries acute, acuminate, to attenuate; green blaze on phyllary lanceolate to elongate diamond-shaped............................................................................ **S. andulatum**

2 Middle stem with a winged, sheathing petiole; involucre (4.2-) 4.5-8 mm high; disc corollas (15-) 19-33 (-43); phyllaries acute, green blaze on phyllary diamond-shaped, about as long as wide or slightly longer.

3 Leaf faces scabrous ............................................................................................................................ **S. oolentangiense** var. *oolentangiense*

3 Leaf faces glabrous.

4 Leaves basally disposed, the largest basal and persistent; largest leaves linear, to 20 cm × 2.5 cm, avg. < 9× as long as wide; leaf margins usually only slightly scabrous; [mainly of the Coastal Plain, of SC and GA west to AR and TX]............................................................................................................. **S. laeve** var. *purpureatum*=**S. attenuatum**

4 Leaves cuneate, the largest on the stem; largest leaves narrowly to broadly lanceolate, avg. < 9× as long as wide; leaf margins usually only slightly scabrous; [mainly of inland provinces, of NS west to MB, south to GA, Panhandle FL, MS, LA, and OK].

5 Larger leaves > 5× as long as wide, rarely > 2.5 cm wide, the bases slightly clasping; [N]and KY south to GA, Panhandle FL (Jackson County), and MS]............................................................................................................. **S. laeve** var. *concinnum*=**S. concinnum**

5 Larger leaves < 5× as long as wide, often > 2.5 cm wide, the bases strongly clasping; [NS west to MB, south to GA, LA, and OK]............................................................................................................. **S. laeve** var. *laeve*=**S. laeve** s.s.

[from Warners & Laughlin (1999)]

1 Stems glabrous, occasionally hirsute in lines; stem leaves with glabrous midvein on the lower surface; rays white to pale lavender; inflorescence dense, leafy; shoots arising singly from elongate rhizome; stems 3-5 mm thick (at 20 cm above soil surface) .............. S. firmum

1 Stems densely pubescent, usually purplish; stem leaves with pubescent midvein on the lower surface; rays lavender to purple; inflorescence widely spreading; shoots often in clumps of 2-6 stems from a persistent stout caudex; stems 5-9 mm thick (at 20 cm above soil surface) .............. S. puniceum var. puniceum

Symphyotrichum bahamense (Britton) Nesom, Bahama Salt-marsh Aster. Cp (FL, GA): salt, brackish, and fresh marshes, ditches, wet areas; uncommon. October-November. E. GA and e. FL Panhandle south to s. FL; the Bahamas. [= K, V = S. subulatum (Michaux) Nesom var. elongatum (Basserd) S.D. Sundberg – FNA, Q; < Aster subulatus – GW; < A. subulatus Michaux var. cubensis – SE; = A. subulatus Michaux var. elongatus Basserd]

Symphyotrichum boreale (Torrey & A. Gray) Löve & Löve, Rushlike Aster, Northern Bog Aster. Mt (WV): calcareous wetlands; rare. August-October. NL (Newfoundland) west to AK, south to n. NJ, ne PA, nw. PA, WV, OH, IN, IL, IA, NE, CO, ID, and WA. Reported for WV (Barbour, Fayette, Nicholas, and Randolph counties), PA, and NJ. [= FNA, K, X = Aster borealis (Torrey & A. Gray) Provancher – C; ? Aster junciformis Rydberg – F, G]

Symphyotrichum chapmanii (Torrey & Gray) Semple & Brouillet, Chapman’s Aster. Cp (FL): flatwoods and seepage bogs; rare. Endemic to Panhandle FL and s. AL, with a few widely scattered records in the FL peninsula. [= FNA, WH = Eurybia chapmanii (Torrey & Gray) Nesom – K, X = Aster chapmanii Torrey & Gray – S, SE]

**Symphyotrichum depauperatum** (Fernald) Nesom, Serpentine Aster. Pd (NC), Mt (WV): glades and barrens over mafic rocks (diabase) [or calcareous rocks in WV?]; rare. Early September-October. MD and se. PA; disjunct southward in nc. NC. Reported for Hardy County, WV (Harmon, Ford-Wentz, & Grafton 2006, Strausbaugh & Core 1978). [= FNA, K, X; = Aster depauperatum Fernald – C, F, G, SE]

**Symphyotrichum drummondii** (Lindley) Nesom var. *drummondii*, Hairy Heart-leaved Aster. Mt (WV): mesic to dry forests; rare. August-October. PA, OH, MI, WI, MN, and NE, south to MD, WV, TN, AL, MS, and LA (including the Florida Panhandles). [= FNA, K, X; < Aster drummondii Lindley – C, G, SE; = Aster *sagittifolius* (Lindley) Shinners – F; = Aster drummondii var. *drummondii*; = Symphyotrichum *drummondii* (Lindley) Nesom]

**Symphyotrichum dumosum** (Linnaeus) Nesom var. *pergracilis* (Wiegand) Nesom. {NC, SC}. Late August-October. Endemic to NC and SC. [= K; < Aster *dumosus* – RAB, GW, SE; < S. *dumosum* – FNA; = Aster *dumosus* Linnaeus var. *pergracilis* Wiegand]

**Symphyotrichum dumosum** (Linnaeus) Nesom var. *strictior* (Torrey & A. Gray) Nesom. Mt (VA), {NC}: woodlands and glades over mafic rock; rare. Late August-October. NH, ON, and WI south to NC and MO. [= K, X; < Aster *dumosus* – RAB, C, G, GW, SE, W; = A. *dumosus* Linnaeus var. *strictior* Torrey & A. Gray – F; < S. *dumosum* – FNA]

**Symphyotrichum dumosum** (Linnaeus) Nesom var. *subulifolium* (Torrey & A. Gray) Nesom. Cp (FL), {GA, NC, SC, VA}. Late August-October. ME south to FL, west to TX. [= K; X; < Aster *dumosus* – RAB, C, G, GW, SE, W; = Aster *dumosus* Linnaeus var. *subulifolium* Torrey & A. Gray – F; < S. *dumosum* – FNA, WH]

**Symphyotrichum elliottii** (Torrey & A. Gray) Nesom, Southern Swamp Aster, Elliott's Aster. Cp (FL, GC, NC, SC, VA): bogs, swamps, and marshes, mainly in the outer Coastal Plain, on tree bases, hummocks, and stumps in tidal freshwater swamps, especially where salinities may occasionally exceed 5-10 ppt; uncommon (rare in GA and VA). Late September-November. Se. VA south to s. FL, west to L.A. The Jones & Coile (1988) record for n. GA is rejected. [= FNA, K, WH, X; = Aster elliottii Torrey & A. Gray – RAB, C, F, G, GW, S, SE; = Aster *puniceus* Linnaeus var. elliottii (Torrey & A. Gray) A. G. Jones]

**Symphyotrichum ericoides** (Linnaeus) Nesom var. *ericoides*, Heath Aster, Squarrose White Aster. Mt (GA, VA): limestone glades; rare. ME, NL (Labrador), ON, ND, CO, AZ, south to VA, MS, TX, Nuevo Léon, and Coahuila. [= FNA; > Symphyotrichum ericoides (Linnaeus) Nesom var. *ericoides* – K; > Symphyotrichum ericoides (Linnaeus) Nesom var. *prostratum* (Kuntze) Nesom – K; > Aster ericoides Linnaeus var. ericoides – C; = Aster *ericoides* Linnaeus var. *prostratum* (Kuntze) Blake – G; = Aster *ericoides* – C; F, SE; = S. ericoides var. ericoides – FNA; = Virgulus ericoides (Linnaeus) Reveal & Keener]

**Symphyotrichum expansum** (Poeppig ex Sprengel) Nesom. Cp (FL): pond margins, disturbed wet areas; rare. July-November (-January). FL. Panhandle and peninsulas, AL, OK, UT, NV, and CA south through Mexico and Central America to n. South America; West Indies. [= K, V, X; = S. *subulatum* (Michaux) Nesom var. *parviflorum* (Nees) S.D. Sundberg – FNA, Q] {add synonymy – S}

**Symphyotrichum georgianum** (Alexander) Nesom, Georgia Aster. Pd (GA, NC, SC), Cp (FL, GA): dry, rocky woodlands, woodland borders, roadbanks, powerline rights-of-way, primarily in places that formerly would have been burned and likely been post oak or blackjack oak woodlands or savannas, also in thin soils around granitic flatrocks; rare. Early October-mid November; November-December. Sc. NC south to c. GA and west to c. AL; apparently disjunct on the Coastal Plain of sw. GA and e. Panhandle FL (Leon County). [= FNA, K, WH, X; = Aster *georgianum* Alexander – S, Z; < Aster *patens* – RAB; = Aster *patens* Aiton var.
**Symphyotrichum grandiflorum** (Linnaeus) Nesom, Big-headed Aster. Cp, Pd (NC, SC, VA): dry woodlands, forest edges; roadbanks and powerline rights-of-way; common. Late September-October. E. and c. VA south through e. and c. NC to no. SC. [= FNA, K, X; = Aster grandiflorus Linnaeus – RAB, C, G, F, S, SE, W; = Virgulis grandiflorus (Linnaeus) Reveal & Keener]

**Symphyotrichum laeve** (Linnaeus) Löve & Löve var. concinnum (Wildenow) Nesom, Narrow-leaved Smooth Aster. Pd (DE, NC, SC, VA), Mt (VA, WV), Cp (FL), {GA}: dry woodlands over mafic or calcareous rocks; rare. September-October. NY and KY south to GA, Panhandle FL (Jackson County), and MS. [= FNA, K, WH, X; = Aster concinus Willdenow – C, G, S, SE; < A. laevis – F, WV; = A. laevis Linnaeus var. concinnum (Wildenow) House – RAB, W; = A. laevis sp. concinnum (Wildenow) Semple & Brouillet]

**Symphyotrichum laeve** (Linnaeus) Löve & Löve var. laeve, Smooth Blue Aster. Pd (DE, NC, SC, VA), Mt (NC, VA, WV), Cp (DE, VA), {GA}: mesic hardwood forests; rare. September-October. NS west to MB, south to GA, LA, and OK. [= FNA, K, X; = Aster attenuatus Lindley ex Hooker – G, S; > Aster purpureus Nees – S; = Aster laevis Linnaeus var. purpureus (Nees) A. G. Jones; = Symphyotrichum attenuatum (Lindley) Semple]

**Symphyotrichum lanceolatum** (Willdenow) Nesom var. interior (Wiegand) Nesom. {VA}: Kartesz 1999. NH west to MN, south to VA, KY, AR, and OK. South at least to s. PA (Rhoads & Klein 1993). [= FNA, X; = Aster lanceolatus Willdenow var. interior (Wiegand) Semple & Chmielewski – C; = A. simplex Willdenow var. interior (Wiegand) Cronquist – F, G; ? Jones]

**Symphyotrichum lanceolatum** (Willdenow) Nesom var. lanceolatum. Cp (DE), Pd (DE, MT), Mt (NC, WV), {VA}: moist soils; rare. July-October. NL (Newfoundland) west to SK, south to PA (Rhoads & Klein 1993), VA (reported in FNA), NC, SC (?) , TN, MS, LA, and TX. Reported for Ashe County, NC (Poindexter & Murrell 2008). [= FNA, X; < Aster simplex Willdenow – RAB, GW, WV; = Aster lanceolatus Willdenow var. lanceolatus – C; = A. simplex var. ramosissimus (Torrey & A. Gray) Cronquist – F, G; < A. simplex var. simplex – SE; < A. lanceolatus – W; = A. lanceolatus sp. lanceolatum var. lanceolatus; = A. lanceolatus ssp. lanceolatus]

**Symphyotrichum marginiferum** (Linnaeus) Löve & Löve var. horizontal (Desfontaines) Nesom, Goblet Aster. {DE, GA, NC, VA}. September-November. ME and MN south to FL and AR. [= K, X; < S. lateriflorus – FNA; < Aster lateriflorus – C, G, GW, SE, W; = A. lateriflorus var. pendulus (Eaton) E. S. Burgess – F; = Aster lateriflorus (Linnaeus) Britt var. horizontalis (Desfontaines) Farwell]

**Symphyotrichum marginiferum** (Linnaeus) Löve & Löve var. lateriflorum, Starved Aster. Mt (WV), {DE?, GA, NC, SC, VA}: to dry areas; common in WV. September-November. NS, QC, and MB south to FL and TX. [= K; < Aster lateriflorus – RAB (also see A. ontariensis); < A. lateriflorus – C, G, GW, SE, W; = A. lateriflorus (Linnaeus) Britt var. lateriflorus – F; < S. lateriflorus – FNA; > S. lateriflorus var. lateriflorus – X; > S. lateriflorus var. hisuticaule (Lindley ex A. P. de Candolle) Nesom – X; > A. lateriflorus var. hisuticaulis (Lindley ex A. P. de Candolle) Porter]

**Symphyotrichum novi-belgii** (Linnaeus) Nesom var. elodes (Torrey & A. Gray) Nesom, New York Aster. Cp (DE, NC, SC, VA): wet pine savannas, marshes; common. Late September-November. NB south to NY, apparently disjunct southwest from e. MD south to e. SC. [= FNA, K, X; < Aster novi-belgii – RAB, C, G, GW, SE; = A. novi-belgii Linnaeus var. elodes (Torrey & A. Gray) A. Gray – F; = A. elodes Torrey & A. Gray – S]

**Symphyotrichum oblongifolius** (Nuttall) Nesom, Eastern Aromatic Aster, Shale-barren Aster. Mt (NC, VA, WV), Pd (VA): rock outcrops and dry woodlands over limestone, calcareous shale; common (uncommon in WV, rare in NC). Late September-October. NY, WI, MN, and MT, south to sc. VA, w. NC, nc. AL, n. MS, TX, and NM. [= FNA, K, X; > Aster oblongifolius Nuttall var. angustatus Shinners – G, SE; > A. oblongifolius var. orientis Shinners – WV; = A. oblongifolius – RAB, C, F, S, W; = Virgulis oblongifolius (Nuttall) Reveal & Keener]

**Symphyotrichum ontariensis** (Wiegand) Nesom var. ontariensis, Bottomland Aster. Mt (WV), {GA}: bottomlands, samps, bogs; rare. August-October. QC, ON, MN, and SD, south to WV, GA, AL, MS, LA, and TX. See Nesom (1997) and Brouillet

**ASTERACEAE**

georgianus (Alexander) Cronquist – SE; = Virgulis georgianus (Alexander) Semple; = Virgulis patens (Aiton) Reveal & Keener var. georgianus (Alexander) Reveal & Keener
**Symphyotrichum oolentangiense** (Riddell) Nesom var. oolentangiense. Cp (FL), {GA}; {habitat}; rare. NY, ON, MN, and SD, south to Panhandle FL and TX. Reported for GA (Karztes 1999) on the basis of Fernald (1950), and also reported for GA in FNA. East to sw. TN (Chester, Wofford, & Kral 1997), AL, and Panhandle FL (Wunderlin & Hansen 2008). [= K, X; Aster oolentangiensis – C; = A. azureus Lindley var. azureus – F; < A. azureus – G, SE; < S. oolentangiense – FNA]

**Symphyotrichum patens** (Aiton) Nesom var. patens, Common Clasping Aster. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (DE, FL, GA, NC, SC, VA, VA): dry woodlands, roadsides, woodland edges, clearings, roadbanks; common (rare in FL). Late August-early November, October-November. Var. patens ranges from VT and NY west to PA, s. OH, s. IN, s. MO, and se. KS, north to e. MN, ne. PA, and SC, and se. TX. [= FNA, K, X; > Aster patens Aiton var. patens – C, F, G, SE, WV; < A. patens – RAB, W; < A. patens var. gracilis Hooker – C, F, G, SE, misapplied as to our area (now more narrowly defined and occurring only west of our area); > A. patens – S; = A. patens var. patens – Z; < Virgulus patens (Aiton) Reveal & Keener var. patens]

**Symphyotrichum phlogifolium** (Muhlenberg ex Wildenow) Nesom, Appalachian Clasping Aster. Mt (GA, NC, SC, VA, WV), Pd (NC, SC, VA): mesic, nutrient-rich mixed hardwood forests; uncommon (rare in GA). Late August-mid October. NJ and Long Island, NY west to PA, n. OH, and e. IN south to c. VA, c. NC, w. SC, n. GA, and ne. AL, primarily in the Appalachian Mountains and adjacent provinces. [= FNA, K, X; < Aster patens – RAB; = Phlogifolium Muhlenberg ex Wildenow – S, W, Z; = A. patens Aiton var. phlogifolius (Muhlenberg ex Wildenow) Nees – C, F, G, SE, WV; = Virgulus patens (Aiton) Reveal & Keener var. phlogifolium (Muhlenberg ex Wildenow) Reveal & Keener]

**Symphyotrichum praecaelum** (Poiret) Nesom var. angustior (Wiegand) Nesom, Willow Aster, Veiny Lined Aster. Mt (VA), {NC}?; fen-like calcareous wetlands; rare (VA Rare). ME south to NC and TN. Abrams Creek, Frederick County, VA. Also reported for NC by Kartzes (1999). [= K, X; < Aster praecaelum – C, G, W; = A. praecaelum Poiret var. angustior Wiegand – F; < S. praecaelum – FNA; < A. praecaealum var. praecaelum – G, SE]

**Symphyotrichum praecaelum** (Poiret) Nesom var. praecaelum. Mt (GA, VA, WV): moist forests over limestone, wooded fens (with Acer rubrum and Fraxinus nigra); rare. NY, MN, and SD south to Panhandle FL and TX. Reported for Giles County, VA. [= K, X; < Aster praecaelum – C, G, W, WV; = A. praecaelum Poiret var. praecaelum – F; < A. praecaelum var. praecaelum – G, SE; < S. praecaelum – WH]

**Symphyotrichum pratense** (Rafinesque) Nesom, Barrens Silky Aster. Mt (GA, VA?), Cp (FL, GA): calcareous glades and barrens; rare. September-October. Se. AR west to ne. TX, south to sc. LA and e. TX; disjunct at scattered localities east of the Mississippi River, as in sw. VA (Ludwig 1999), c. KY, TN (Chester, Wofford, & Kral 1997), nw. GA, sw. GA, Panhandle FL (Gadsden County), n. and c. AL, we. MS. See Jones, Witsell, & Nesom (2008) for extensive discussion. [= FNA, K, X; < Aster sericeus – C, F, G, SE; = S. sericeus Ventenat Nesom var. microphyllus (A.P. de Candolle) Wunderlin & B.F. Hansen – WH; = A. pratensis Rafinesque; = A. sericeus Ventenat var. microphyllus A.P. de Candolle]

**Symphyotrichum prenanthoides** (Muhlenberg ex Wildenow) Nesom, Zigzag Aster. Mt (NC, VA, WV), Pd (DE, VA): forests, roadbanks; common (rare in DE). Late August-October. MA, NY, s. ON, and MN, south to w. NC, TN, IL, and IA. [= FNA, K, X; = Aster prenanthoides Willdenow ex Wildenow – RAB, C, F, G, SE, WV; = S. prenanthoides – WH]

**Symphyotrichum priceae** (Britton) Nesom, Miss Price's Aster. Mt (GA): limestone glades; rare. KY south through c. TN to nw. GA and n. AL. [= FNA, K, X; = Aster pilosus Willdenow var. priceae (Britton) Cronquist – C, G, SE; < A. pilosus var. pringlei – F; < A. pilosus – W; = A. priceae Britton]

**Symphyotrichum punicum** (Linnaeus) Löve & Löve var. punicum, Purple-stem Aster, Swamp Aster. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA, WV), Cp (DE, NC, VA): bogs, seeps, bogs, wet meadows; common (rare in Coastal Plain south of VA). September-October. NL (Newfoundland) and NL (Labrador) west to BC, south to GA, AL, MO, and SD. Unresolved material from Grayson County mafic seeps. [= K, X; < Aster punicus Linnaeus – RAB, C, G, W, SE, WV; > A. punicus var. punicum – F, WV; = A. punicus var. compactus Fernald – F; = A. punicus var. punicum – G; < A. conduplicatus E.S. Burgess – S]

**Symphyotrichum racemosum** (Elliott) Nesom var. racemosum, Small White Aster. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (VA, WV): bottomlands, marshes; common. ME south to n. FL, west to TX, and inland to OH, IN, IL, MO, and OK. [= K, X; = Aster vimineus Lamark – RAB, G, G, SE, WV, misapplied; < A. racemosum – C; > A. vimineus var. vimineus – F, misapplied; > A. racemosum – F; < S. racemosum – FNA; < A. brachypholis Small – S]

**Symphyotrichum racemosum** (Elliott) Nesom var. subdulsum (Wiegand) Nesom. Mt (WV); {in e. WV and apparently through our area judging from F} [= K, X; = Aster racemosum Elliott – C; = A. vimineus Lamark var. subdulsum Wiegand – F; < S. racemosum – FNA; = A. fragilis Willdenow var. subdulsum (Wiegand) A.G. Jones, misapplied]

**Symphyotrichum retroflexum** (A.P. de Candolle) Nesom. Mt (GA, NC, SC): forests; common. Late August-October. W. NC and e. TN south to nw. SC and n. GA. [= FNA, K, X; = Aster curtisi Torrey & A. Gray – RAB, S, SE, W; = A. retroflexum Lindley ex A.P. de Candolle – C]
Symphyotrichum rhiannon Weakley & Govus, Buck Creek Aster, Rhiannon's Aster. Mt (NC): ultramafic outcrop barren; rare. October—November. Endemic (as far as is known) to the Buck Creek Serpentine Barren, Clay County, NC. Showing some similarities to S. punicum and S. prenanthoides, but unique in many characters and not seemingly intermediate. See Kaufman et al. (2004) for additional information. [= FNA]

Symphyotrichum ×schistosum (Steele) Nesom [S. cordifolium × laeve var. laeve], Millboro Aster. Mt (VA): rare. [= K, X; = Aster ×schistosus Steele (pro sp.); = A. schistosus Steele]

Symphyotrichum shortii (Lindley) Nesom, Midwestern Blue Heart-leaved Aster, Short's Aster. Pd (GA, VA), Mt (GA, NC, WV), Cp (FL): dry, rocky slopes, calcareous hammocks (in FL); uncommon (rare in FL, GA, NC, and VA). PA, s. ON, and MN, south to w. NC, c. Georgia, Panhandle FL (Gadsden and Jackson counties), MS, and AR. The lower stem leaves are indeed reminiscent of the leaves of Asplenium rhizophyllum (formerly known as Camptosorus), explaining one of Small's names for this species. [= FNA, K, X; = Aster shortii Lindley – C, F, G, SE, WV; > A. shortii – S; > A. camptosorus Small – S]

Symphyotrichum simmondsii (Small) Nesom. Cp (FL, GA, NC, SC), Pd (SC): ditches, other wet places, uncommon? Se. NC south to s. FL. [= K, X; < S. simmondsii – FNA, WH (also see S. krallii); = Aster simmondsii Small; < A. pinnifolius Small]

Aster subulatus (Sprengel) Nesom, South American Salt-marsh Aster. Cp (FL): disturbed areas (on ballast), escaped to coastal marshes and dunes; rare, native of South America. AL (Mobile County), FL (Escambia County), LA, TX. [= K, V, WH, X; = S. subulatum (Linnaeus) Nesom var. squamatum (Sprengel) S.D. Sundberg – FNA, Q; < A. subulatus Michaux var. cubensis – SE; ? A. subulatus Michaux var. australis (A. Gray) Shinners]

Symphyotrichum walteri (Alexander) Nesom – FNA. Var. simplicifiorum, Pd (GA, VA), Mt (GA, NC, SC, VA): East Gulf Coastal Plain of AL and FL. See Nesom (1997); the name Walter (the name preoccupied); = Virgulus walteri (Alexander) Revel & Keener

Symphyotrichum drummondii (Lindley) Nesom var. texanum (E.S. Burgess) Nesom. East to MS, AL, and KY. [= FNA, K; = Aster texanum Burgess – C, G, SE; = Aster drummondii Lindley var. texanum (E.S. Burgess) A.G. Jones; = Symphyotrichum texanum (E.S. Burgess) Semple]

Symphyotrichum krallii Nesom. Cp (FL): East Gulf Coastal Plain of AL and FL. See Nesom (1997); the name A. pinifolius is illegitimate. [= K; = Aster pinifolius Alexander in Small – S, name illegitimate; < S. simmondsii (Small) Nesom – FNA, WH; < Aster dorumus – SE]

Symphyotrichum lateriflorum (Linnaeus) Löve & Löve var. augustinifolium (Wiegand) Nesom. South to KY and NJ (Kartesz (1999). [= K, X; < S. lateriflorum – FNA] [add to synonymy]

Symphyotrichum lateriflorum (Linnaeus) Löve & Löve var. spinuliflorum (E.S. Burgess) Nesom. Cp (FL): = X; < S. lateriflorum – FNA, WH; = Aster spinuliflorum E.S. Burgess

Symphyotrichum longifolium (Lamarck) Nesom. Sc (SC): = X; = A. longifolium Lamarck]

Symphyotrichum patens (Aiton) Nesom var. gracile (Hooker) Nesom. Var. gracile, as defined more narrowly by Z, ranges east to se. LA, s. MS, and s. AL from a core range in l.c, c. TX, and OK. [= FNA, K; = < A. patens Aiton var. gracilis Hooker – C, F, G, SE; = A. patens var. gracilis – Z]

Symphyotrichum patens (Aiton) Nesom var. patensissimium (Lindley ex de Candolle) Nesom. Var. patensissimium is largely Ozarkian, east to w. KY and w. MS. [= FNA, K; = Aster patens Aiton var. patensissimium (Lindley) Torrey & A. Gray – C, F, G, SE, Z]

Symphyotrichum praetexum (Poir) Nesom var. subasperum (Lindley) Nesom. KY, IN, IL, MO, and OK south to AL and TX. [= K; < S. praetexum – FNA]

Symphyotrichum procumbent (Linnaeus) Löve & Löve var. scabriceae (Shinners) Nesom. Pineland seepage bogs. AL, MS, LA, TX. [= FNA, K; < Aster procumbent Linnaeus – C, GW, S, SE, W]

Symphyotrichum sericeum (Ventenat) Nesom, Western Silvery Aster. See Jones, Witsell, & Nesom (2008); all reports of this species east of the Mississippi River and south of the Ohio River are based on misidentifications (or a taxonomically broader application of) S. pratense. [= FNA, K, X; = Aster sericeus Ventenat – G, S; < A. sericeus Ventenat – C, F, SE; = Virgulus sericeus (Ventenat) Revel & Keener]

Syndrella Gaertner 1791 (Nodeweed)

* **Synedrella nodiflora** (Linnaeus) Gaertner, Nodeweed. Cp (FL): moist to wet disturbed areas (on ballast); rare (not collected since the late 1800s), native of tropical America. January-December. [= FNA, S, SE, WH]

**Tagetes** Linnaeus 1753 (Marigold)

A genus of about 40-50 species, of tropical and warm temperate America. References: Strother in FNA (2006c); Cronquist (1980)=SE.

1 Rays inconspicuous, ca. 1-2 mm long; [plant a well-established weed, primarily in the Coastal Plain].................................................. \* **Tagetes minuta**
1 Rays showy, mostly > 10 mm long; [plant cultivated, rarely occurring as a waif].
2 Peduncles not conspicuously swollen and hollow below the flower; involucre 15-20 mm high; achenes 7-10 mm long .......................... \* **Tagetes erecta**
2 Peduncles conspicuously swollen and hollow below the flower; involucre 10-15 mm high; achenes 4-7 mm long ..........................

- \* **Tagetes patula** Linnaeus, French Marigold. Mt (VA), Pd (NC, SC), Cp (NC, SC, VA): commonly cultivated, rarely persistent or as a waif, native of Mexico. July-November. [= RAB, C, G, K, SE; < T. erecta – FNA]

**Tanacetum** Linnaeus 1753 (Tansy)

1 Leaves simple, crenate (sometimes with a few basal lobes).................................................................................................................. \* **Tanacetum balsamita**
1 Leaves 1-3-pinnatifid.

- \* **Tanacetum balsamita** Linnaeus, Costmary. Cp (DE): disturbed areas, rare, native of Mediterranean Europe. Introduced south to PA (Rhoads & Klein 1993), MD (Kartesz 1999), and DE (Kartesz 1999). August-September. [= FNA; = Chrysanthemum balsamita (Linnaeus) Baillon – C; = Balsamita major Desfontaines – K]

**Taraxacum** G.H. Weber ex Wiggers 1780 (Dandelion)

A genus of about 60 species (or as many as 2000 if apomictic microspecies are recognized), herbs, of boreal and temperate regions. There seems little utility in trying to reconcile the numerous European microspecies against our introduced material. References: Bourllet in FNA (2006a); Cronquist (1980)=SE.

1 Cypselas reddish or purplish at maturity; leaves usually deeply cut throughout their length, the lobes narrow ................. \* **Taraxacum erythrospermum**
1 Cypselas brown or tan at maturity; leaves less deeply cut, particularly toward the base .............................................................. \* **Taraxacum officinale**

- \* **Taraxacum erythrospermum** Andrzejowski ex Besser, Redseeded Dandelion. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, NC, SC, VA): roadsides, lawns, pastures, other disturbed sites; uncommon, native of Eurasia. January-December. Bourllet in FNA explains the nomenclatural and taxonomic complexities involved with the various names applied, and the reason for retaining **T. erythrospermum** at this time. [= RAB, F, FNA, WV; << T. laevigatum (Willdenow) de Candolle – C, G, K, SE, W; >> Leontodon erythrospermum (Andrezjowski) von Eichwald – S]

**Tetragonotheca** Linnaeus 1753 (Squarehead)

**Tetraneuris** E.L. Greene 1898 (Bitterweed)

**Thelesperma** Lessing 1831

A genus of 10 or more species, of c. and w. North America, Mexico, and South America. References: Strother in FNA (2006c).

* **Thelesperma filifolium** (Hooker) A. Gray. MS. Prairies, glades, and roadsides over calcareous substrates. MO, SD, and WY south LA, TX, Nuevo Léon, and NM; disjunct eastward in the Black Belt of MS and on a chalk bluff in Sumter County, wc. AL (Keener (2009). [= FNA; > Th. filifolium var. filifolium – SE]

**Thymophylla** Lagasca y Segura 1816

**Tithonia** Desfontaines ex Jussieu 1789 (Sunflowerweed)

* **Tithonia rotundifolia** (Miller) S.F. Blake, Clavel de Muerto. Cp (FL): disturbed areas; rare, native of Mexico. November-January. Also reported for Orleans Parish, LA. [= FNA, K, WH]

**Tragopogon** Linnaeus 1753 (Goat's-beard)

A genus of about 110 species, herbs, of temperate Eurasia and the Mediterranean region. References: P. Soltis in FNA (2006a); Voss (1996); Cronquist (1980)=SE.

1 Flowers purple; pappus brownish .......................................................... **T. porrifolius**
1 Flowers yellow; pappus dingy white.

2 Peduncle obviously swollen below the flower and fruit; margins of the phyllaries green (or pale); leaf tips straight; rays pale yellow, obviously shorter than the longest phyllaries .......................................................... **T. dubius**
2 Peduncle only slightly swollen below the flower and fruit; margins of the phyllaries reddish purple (rarely green); leaf tips more or less curled or curved; rays bright yellow, as long as or longer than the phyllaries .......................................................... **T. pratensis**

**Tragopogon pratensis** Linnaeus, Showy Goat's-beard, Yellow Goat's-beard, Meadow Salsify, Jack-go-to-bed-at-noon. Mt (VA, WV), Pd (DE, VA), Cp (DE), {GA?, NC?}: roadides, fields; uncommon (rare in VA), native of Europe. April-August. Also reported for NC and GA in FNA. [= C, F, FNA, G, K, S, SE, W, WV]

*Tridax* Linnaeus 1753

A genus of about 26 species, herbs, mainly of the New World tropics. References: Strother in FNA (2006c); Powell (1965)=Z.

*Trilisa* Cassini 1820 (Trilisa)

**Identification notes:** *Trilisa* can be distinguished from *Carphephorus* by its smaller heads (involucres 3.5-6 mm high vs. 6-15 mm high) and fewer phyllaries (6-12 vs. 15-40). When vegetative, *Trilisa* lacks shining resin dots on the leaves, while *Carphephorus* has numerous resin dots.

1 Stem glabrous; capitulescence corymbose, the lateral branches equally or overtopping the central ones; leaves 1-6 (-11) cm wide..........................…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………..…………. T. odoratissima

1 Stem densely spreading-pubescent; capitulescence a cylindrical panicle; leaves (0.5-) 1-3 (-4) cm wide...................................................

**Trilisa odoratissima**, Deer's-tongue, Vanilla-leaf. Cp (FL, GA, NC, SC): moist to mesic savannas and flatwoods; uncommon. Late July-October; September-November. Se. NC south to c. peninsular FL and west to e. L.A. *T. odoratissima* has the largest leaves of our species of *Carphephorus* and *Trilisa*; its leaves are normally wider than 3 cm, and have a very wide and prominent midrib, usually purple toward the base of the leaf and white toward the tip. This species contains coumarin and gives off a pleasant vanilla odor when drying; it is gathered from the wild and used as a supplementary flavoring in cigarettes. See DeLaney, Bissett, & Weidenhamer (1999), Ward (2001), and Orzell & Bridges (2002) for discussion of a southern Florida taxon related to *T. odoratissima*, named (in *Carphephorus*) as a species, *Carphephorus subtropicanus* DeLaney, N. Bissett, & Weidenhamer, and later reduced in rank to a variety, *C. odoratissimus var. subtropicanus* (DeLaney, N. Bissett, & Weidenhamer) Wunderlin & B.F. Hansen. It is probably best treated at the varietal level, but the combination is not yet available in *Trilisa*. [= *Carphephorus odoratissimus* (J.F. Gmelin) Herbert var. odoratissimus – FNA, WH, X; < *Carphephorus odoratissimus* – GW, K, SE, Z; = *Carphephorus odoratissimus* – Y; < *Trilisa odoratissima* (J.F. Gmelin) Cassini – RAB, S; = *Trilisa odoratissima* var. odoratissima – V]

**Trilisa paniculata** (J.F. Gmelin) Cassini. Cp (FL, GA, NC, SC): savannas and flatwoods; common. August-October; September-November. Se. NC south to s. FL, and west to the FL Panhandle and s. AL. The leaves of this species are reminiscent of *C. odoratissimus*, but are narrower, (0.5-) 1-3 (-4) cm wide, vs. 1-6 (-11) cm wide in *C. odoratissimus*. Sterile *C. paniculatus* can be mistaken for glabrate *C. tomentosus*, which has shorter and broader leaves. [= RAB, S, V; = *Carphephorus paniculatus* (J.F. Gmelin) Herbert – FNA, GW, K, SE, WH, Y, Z]

**Tripleurospermum** Schultz ‘Bipontinus’ 1844 (Mayweed)

A genus of about 40 species, herbs, of the northern hemisphere. References: Brouillet in FNA (2006a); Arriagada & Miller (1997)=Z.

1 Stem ascending or erect; achenes with resin glands > 2 × as long as wide; annual..............................................................[T. inodorum]

1 Stem procumbent (rarely ascending); achenes with resin glands 1.0-1.5 × as long as wide; perennial or biennial..............................................................[T. maritimum ssp. maritimum]

**Tripleurospermum inodorum** (Linnaeus) Schultz ‘Bipontinus’, Scentless Chamomille. Introduced at scattered locations in North America, such as AL, FL, KY, MD, and PA. [= FNA; = *T. perforata* (Mérat) M. Lainz – K, Z; = *Matricaria maritima* Linnaeus var. agrestis (Knaf) Wilmott – F; = *Matricaria perforata* Mérat]

**Tripleurospermum maritimum** (Linnaeus) W.D.J. Koch ssp. maritimum, Scentless Chamomille. Introduced at scattered locations in eastern North America, such as AL, PA, NJ. [= FNA; = *Matricaria maritima* Linnaeus var. maritima – F; = *T. maritima* ssp. maritima – K, orthographic variant; = *Chamomilla maritima* (Linnaeus) Rydberg – S]

**Trussilago** Linnaeus 1753 (Coltsfoot)

A monotypic genus, an herb, of Eurasia and n. Africa. References: Barkley in FNA (2006b); Cronquist (1980)=SE.
Tussilago farfara Linnaeus, Coltsfoot. Mt (NC, VA, WV), Pd (DE, NC, VA), Cp (VA): roadsides, especially gravelly or shaly roadbanks or ditches, streamside gravel bars, disturbed ground; common (uncommon in VA Piedmont and Coastal Plain, rare in DE, rare in NC Piedmont), native of Eurasia. This species has spread rapidly southward from the Northeast, where it was introduced in North America. Fernald (1950) considered its southern limit to be "New Jersey, Pennsylvania, and Ohio". Gleason (1952) extended it to WV. Strausbaugh and Core (1978) reported that the first collection in WV was actually in 1933, "migrating southward year by year, now often conspicuous along highways, on strip-mined areas and other denuded areas, in every county of the state." First reported in NC in 1971, it is now rather common in most of the mountain counties, and is beginning to appear at scattered sites in the Piedmont. Though preferring a cool and moist climate, Tussilago seems likely to continue to increase in abundance and to spread into the Piedmont. [= C, F, FNA, G, K, SE, W, WV]

Uropappus Nuttall 1841 (Silver-puffs)

Verbesina Linnaeus 1753 (Crownbeard, Wingstem, Frostweed)

1 Stem and lower leaf-surfaces grey strigose-canescent; alien annuals, 2-10 dm tall, with taproots; [section Ximenesia]............................... 
V. encelioides var. encelioides

1 Stem and lower leaf surfaces glabrous or pubescent, but not grey strigose-canescent; native perennials, 5-40 dm tall, with fibrous or fleshy-fibrous roots.

2 Leaves primarily opposite (the uppermost sometimes alternate).

3 Internodes winged; [collectively widespread].

4 Plants 4-5 (-10) dm tall, perennating from short horizontal rhizomes; ray florets (5-) 8; disc florets 20-60+; [endemic to ne. FL and se. GA]; [section Pterophyton]......................................................................................V. heterophylla

4 Plants 10-30 dm tall, perennating from a crown with fleshy roots; ray florets (0-) 1-3 (-5), disc florets 8-15+; [widespread]; [section Phaethusa] ..............................................................V. occidentals

3 Internodes not winged; [collectively of sw. GA, s. AL, and FL Panhandle]; [section Pterophyton].

5 Ray florets (5-) 11-13, yellow; heads 3-20.........................................................V. aristata

5 Ray florets 0; heads 1 (-3) .................................................................V. chapmanii

2 Leaves primarily alternate (the lowermost sometimes opposite).

6 Heads few, 1-15 (-20), in a compact inflorescence; disc 7-16 mm wide at anthesis; ray florets (5-) 7-15, yellow; plants 5-12 dm tall; [section Pterophyton].................................................................V. helianthoides

6 Heads numerous, 10-200 or more, in a dense to open inflorescence; disc 3-15 mm wide at anthesis; ray florets either absent, or 1-5 and white, or 2-10 and yellow; plants 10-40 dm tall.

7 Ray florets 1-5, white; [section Octractinia].

8 Lower and middle leaves pinnately lobed or dissected; achenes of ray florets glabrous; [of the outer Coastal Plain from SC southward]; .................................................................V. virginica var. laciniata

8 Lower and middle leaves entire, serrate, or slightly undulate; achenes of ray florets papillose or short-pubescent; [more widespread in our area].................................................................V. virginica var. virginica

7 Ray florets absent, or 2-10 and yellow; [section Actinomeris].

9 Ray florets present, 2-10, yellow; disc florets yellow .........................................................V. alternifolia

9 Ray florets absent; disc florets white..............................................................................V. walteri

Verbesina alternifolia (Linnaeus) Britton ex Kearney, Commonwingstem. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, NC, VA): alluvial forests, marshes, floodplain pastures; common (uncommon in VA Coastal Plain, rare in DE and FL). August-September. NY and s. ON west to IA, south to Panhandle FL and LA. [= RAB, C, FNA, G, K, SE, WH, WV; = Ridan alternifolia (Linnaeus) Britton – S]

Verbesina aristata (Elliott) Heller, Coastal Plain Crownbeard. Cp (FL, GA): longleaf pine sandhills, swamp margins, dry woodlands; rare. Sw. GA and ne. FL west to FL Panhandle and s. AL. June-August. [= FNA, K, SE, WH; = Pterophyton aristatum (Elliott) Alexander – S]

Verbesina helianthoides Michaux, Ozark Crownbeard. Mt (NC), Cp (GA?): dry woodlands over mafic rocks; rare. May-October. OH west to IA and KS, south to c. TN, nw. GA, n. AL, and nc. TX; disjunct in w. NC and e. GA. [= C, F, FNA, G, K, SE; = Pterophyton helianthoides (Michaux) Alexander – S]

Verbesina heterophylla (Chapman) A. Gray. Cp (FL, GA): pine flatwoods; rare. (April-)June. Ne. FL (8 counties) and se. GA (Charlton County). [= FNA, GW, K, SE, WH; = Pterophyton heterophyllum (Chapman) Alexander – S]

Verbesina occidentalis (Linnaeus) Walter, Southern Crownbeard. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): forests, woodlands, pastures, and roadsides, especially abundant in alluvial areas or up崇高 over mafic or calcareous rocks; common (uncommon in FL). MD west to OH and MO, south to Panhandle FL and MS. [= RAB, C, F, FNA, G, GW, K, SE, WH, WV; = Phaethusa occidentalis (Linnaeus) Britton – S]

Verbesina virginica Linnaeus var. laciniata (Poiret) A. Gray, Southern Frostweed. Cp (FL, GA, NC, SC): moist forests and thickets; rare. September-October. E. SC (or e. NC?) south to s. FL. Olsen (1979) maps this variety as occurring in e. NC; I know of no documentation. The two varieties need additional study; specific status may be warranted. [= RAB, GW, K, SE, Z, WH, < V. virginica – FNA; = Phaethusa laciniata (Poiret) Small – S; = V. laciniata (Poiret) Nuttall]

Verbesina virginica Linnaeus var. virginiaca Linnaeus. Common Frostweed. Mt (CA, NC, SC, VA), Pd (GA, NC, SC), Cp (FL, GA, SC, VA): moist to dryish forests, especially over mafic or calcareous rocks, in Coastal Plain ravines in VA over coquina limestone; uncommon (rare in VA). July-October. Sc. NC (e. VA?) west to e. KS, south to s. FL and c. TX. Populations of V. virginica from e. VA appear to be substantially disjunct from other populations of either variety. [= RAB, C, GW, K, SE, Z; < V. virginica – F, FNA, GW, WH; = Phaethusa virginica (Linnaeus) Britton – S]

**Vernonia** Schreber 1791 (Ironweed)

A genus of about 20 species, perennial herbs, of e. and c. North America and n. Mexico; a few species in South America. Traditionally very broadly circumscribed to include about 500 species, trees, shrubs, and herbs, of tropical, subtropical, and warm temperate regions, especially America and Africa; this broader circumscription appears increasingly indefensible.

References: Strother in FNA (2006a); Jones (1982)=Z; Urbatsch (1972)=Y; Jones in Cronquist (1980)=SE. Key based on FNA and SE.

**Identification notes:** Hybrids are frequent between co-occurring species. Only *V. ×georgiana* is keyed separately below (because of its distinctive appearance). Others may be recognized by intermediate morphology and ecological/geographic context.

| 1 | Basal rosette present, its leaves larger than those of the stem; [of xeric habitats of the Coastal Plain and (in NC southward) xeric rocky habitats of the Piedmont]. |
| 2 | Phyllary tips acute or rounded (sometimes minutely apiculate), the narrowest short acuminate; [from s. MS westward]………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………..………………. |
Vernonia acaulis (Walter) Gleason. Cp, Pd (GA, NC, SC): sandhills, dry rocky woodlands, bluffs, and barrens; common. Late June-August; August-October. Coastal Plain and lower Piedmont of ne. and nc. NC south to sc. GA. [= RAB, FNA, K, S, SE]

Vernonia angustifolia Michaux var. angustifolia. Cp (GA, NC, SC), Mt? (NC): sandhills; common. Late June-early September; September-October. Se. NC south to GA. [= RAB; < V. angustifolia – FNA, S; = V. angustifolia ssp. angustifolia – K, SE]

* Vernonia arkansana A.P. de Candolle, Arkansas Ironweed. Cp (NC): roadsides; rare, apparently introduced in se. NC from native range in the Ozarkian Midwest. [= C, K, SE; = V. crinata Rafinesque]

Vernonia ×georgiana Bartlett (pro sp.). Cp (GA, NC, SC): sandhills; uncommon. Late June-early August; August-October. [= RAB, K, SE; = V. georgiana – S]

Vernonia gigantea (Walter) Trelease. Late GA, NC, SC, VA, WV. Pd (GA, NC, SC, VA), Cp (GA, NC): pastures, bottomlands, streamside; common. Late August-October; August-November. W. NY, s. MI and e. NE south to SC, FL, and TX. [= W; = V. gigantea (Walter) Trelease – K, SE; Y; = V. altissima Nuttall – RAB, G, WV; = V. gigantea var. gigantea – C; > V. altissima var. altissima – F; < V. gigantea – FNA, WH; > V. altissima var. taeniotricha Blake – F; < V. altissima – S; > V. gigantea – S]

Vernonia missurica Rafinesque, Missouri Ironweed. Cp (FL), [GA]: wet hammocks, prairies, glades; rare. In. TN (Chester, Wofford, & Kral 1997), GA (FNA), and Panhandle FL, west to IA, KS, OK, and TX. [= C, K, S, SE, WH]

Vernonia pulchella Small. Cp (GA, SC): sandhills; uncommon. Se. SC (Beaufort and Jasper counties) south to se. GA. [= FNA, K, S, SE]

Vernonia baldwinii Torrey var. baldwinii, Western Ironweed. Ml, KY, and LA west to ne. CO, and TX. [= C, F; < V. baldwinii – FNA; = V. baldwinii ssp. baldwinii – K, SE]

* Vernonia fasciculata Michaux var. fasciculata, Smooth Ironweed. KY and OH west to MB and CO. [= C, F; < V. fasciculata – FNA; = V. fasciculata ssp. fasciculata – K]

Vernonia texana (A. Gray) Small, Texas Ironweed. S. MS west to OK and TX. [= FNA, K, S, SE]

Vittadinia A. Richard 1832

Xanthium Linnaeus 1753 (Cocklebur)

A genus of about 3 species, herbs, cosmopolitan (of somewhat uncertain original distribution). References: Strother in FNA (2006c); Cronquist (1980)=SE.

1 Leaves lanceolate, 2-5× as long as wide, cuneate at the base; leaf axil with a 1-3 cm long yellow 3-forked spine …………………….. X. spinosum
1 Leaves ovate or orbicular, 0.8-1.5× as long as wide, cordate at the base; leaf axil lacking spines ………………………………….. X. strumarium

* Xanthium spinosum Linnaeus, Spiny Cocklebur. Mt (VA, WV), Cp (DE, NC, SC), Pd (DE, GA, VA): fields, disturbed ground; uncommon (rare in GA, NC, SC, VA, and WV), introduced, but the native distribution unknown. July-November. [= RAB, C, FNA, K, SE, WV; > X. spinosum var. spinosum – F; > X. spinosum var. inerne Bel – F; > X. ambrosioides Hooker & Arnott – F; = Acanthoxanthium spinosum (Linnaeus) Fourrêu – S]
**ASTERACEAE**

* Xanthium strumarium* Linnaeus, Cocksfootbur. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): disturbed ground, roadsides, pastures, barnyards, beaches; common. July-November. Nearly cosmopolitan, its original distribution unclear, but probably to the New World. Various taxa have been recognized (see synonymy); it is unclear that any are usefully distinguished. The most commonly followed recent treatment is that by Cronquist, recognizing two varieties in eastern North America: var. *canadense*, with burs 2-3.5 cm long, the prickles of the bur with spreading hairs and stipitate glands toward the prickle bases, and var. *glabratum* (A.P. de Candolle) Cronquist, with burs 1.5-2 cm long, the prickles of the bur nearly glabrous or with short glandular or nonglandular puberulence toward the prickle bases. [= FNA, GW; > X. strumarium var. *glabratum* (A.P. de Candolle) Cronquist – RAB, C, G, K, SE, W, WH; > X. strumarium var. *strumarium* – RAB, misapplied; > X. strumarium var. *canadense* (P. Miller) Torrey & A. Gray – C, G, K, SE, W, WH; > X. chinense P. Miller – F; > X. echinatum Murray – F; > X. italicum Moretti – F< WV; > X. oviforme Wallroth – F; > X. pensylvanicum Wallroth – F, WV; > X. strumarium – F, WV]

**Youngia** Cassini 1831(Youngia)

A genus of about 30-40 species, herbs, of Asia. References: Spurr in FNA (2006a); Cronquist (1980)=SE.

* Youngia japonica* (Linnaeus) A.P. de Candolle, Asiatic Hawk's-beard, Youngia. Cp (FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC): roadides, disturbed areas, trail edges; uncommon, native of se. Asia. Spreading rapidly in our area, and now moving into minimally-disturbed natural areas. [= FNA, K, SE, WH; = Crepis japonica (Linnaeus) Bentham – RAB, F, G, S; > Y. japonica ssp. japonica]

**Zinnia** Linnaeus 1759 (Zinnia)

1 Achenes wingless; receptacular bracts (chaff) toothed or erose on the lip ................................................................. Z. peruviana

1 Achenes winged; receptacular bracts (chaff) with a differentiated fimbriate lip ............................................................... Z. violacea

**405. ADOXACEAE** Trautvetter 1853 (Moschatel Family) [in DIPSACALES]

A family of about 4 genera and about 165-200 species, shrubs, small trees, and herbs (here interpreted as including Sambucus and Viburnum). There now appears to be little doubt that Sambucus and Viburnum are more naturally placed in the Adoxaceae, in contrast to their traditional placement in the Caprifoliaceae (Zhang et al. 2003, Eriksson & Donoghue 1997). References: Ferguson (1966a).

1 Leaves pinnately compound; fruit 3-5-seeded ........................................................................................................................................... Sambucus

1 Leaves simple; fruit 1-seeded ..................................................................................................................................................... Viburnum

**Sambucus** Linnaeus 1753 (Elderberry)

A genus of about 9 species of shrubs and small trees, north temperate and subtropical. References: Bolli (1994)=Z; Ferguson (1966a)=Y.

1 Inflorescence racemose, normally longer than broad; fruits red when ripe; pith of stems and second-year branches brown; leaves with 5-7 leaflets, these never further divided; foliage and young twigs puberulent; [primarily of the Mountains, extending into the Piedmont in VA]...........S. racemosa var. pubens

1 Inflorescence cymose, normally broader than long; fruits black or deep purple when ripe; pith of stems and second-year branches white; leaves with 5-11 leaflets, the lower leaflets sometimes further divided; foliage and young twigs glabrous or with trichomes mostly limited to the veins of the leaves; [collectively widespread].

2 Fruits purplish black, 4-6 mm in diameter; plant a shrub to small tree (usually multi-stemmed from the base); [common, widespread, and native].................................................................................................................... S. canadensis

2 Fruits black, 6-8 mm in diameter; plant a small tree; [rare, restricted, and alien].............................................................................. S. nigra

**Sambucus canadensis** Linnaeus, Common Elderberry. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV): streambanks, thickets, moist forests, disturbed areas; common. Late April-July; July-August. NS west to MB, south to s. FL, TX, Mexico; West Indies. The leaflets, particularly of young shoots or stunted sprouts, are often variegated. This is one of the first woody plants to leaf out in the spring. Bolli (1994) treats this taxon as a subspecies of a
broadly defined *S. nigra*. He recognizes 6 subspecies: *ssp. nigra* in Europe, *ssp. palmensis* (Link) R. Bolli in the Canary Islands, *ssp. maderensis* (Lowe) R. Bolli in Madeira Island, *ssp. canadensis* in eastern North America, Mexico, Central America, and the West Indies, *ssp. cerulea* (Rafinesque) R. Bolli of western North America, and *ssp. peruviana* (Humboldt, Bonpland, and Kunth) R. Bolli of South America. I prefer to retain these taxa at the species level, particularly as Bolli states "the geographical races, in the following defined as subspecies, turned out to be the biological units in *Sambucus*." Bolli further discusses 3 races within what is here called *S. canadensis* (his *S. nigra ssp. canadensis*), one from eastern North America, another from montane Mexico and Central America, and a third from subtropical se. North America and the West Indies; he considers these geographic races to represent "morphological and perhaps genetical" differences, and that "at present, all races are probably interconnected." This variation may be worthy of taxonomic recognition at the varietal level, and these "races" have formerly been considered to be separate species or varieties. Plants of most of our area represent *S. canadensis* var. *canadensis*, while evergreen (or tardily deciduous), bipinnate plants of FL, s. GA, s. AL, s. MS, s. LA, se. TX, and the West Indies represent *S. canadensis* var. *laciniata* A. Gray. [= RAB, C, GW, W, WV, Y; > *S. canadensis* var. *canadensis* – F; G; > *S. canadensis* var. *submollis* Rehder – F, G; = *S. nigra* Linnaeus ssp. *canadensis* (Linnaeus) R. Bolli – K, WH, Z; > *S. canadensis* – S, > *S. simpsonii* Rehder ex Sargent – S; > *Sambucus canadensis* Linnaeus var. *laciniata* A. Gray].

**Adoxaceae**

A genus of about 150 species of shrubs and small trees, largely temperate, and primarily in Asia and North America. There remain a number of taxonomic problems, particularly in the *Viburnum dentatum* complex; the treatment and key for that group is highly provisional. Dirr (2007) discusses the genus in detail from a horticultural perspective. References: McAtee (1956)=Z; Ferguson (1966a)=Y; Weckman et al. (2002); Winkworth & Donoghue (2005).

**Identification notes:** Leaves vary in shape in some taxa more than in others; we have allowed for some of this variation in the key, but readers should expect that some specimens will not key cleanly, especially vegetative shoots. Petiole length of leaves varies considerably, even with those possessing "short" petioles. However, by measuring only the petioles of the first leaves below an inflorescence one reduces the chances of misidentifications greatly. Warning: even in some of the "long" petioled taxa, one may occasionally encounter unusually short petioles; therefore those possessing "short" petioles. However, by measuring only the petioles of the first leaves below an inflorescence one reduces the chances of misidentifications greatly. Warning: even in some of the "long" petioled taxa, one may occasionally encounter unusually short petioles; therefore should expect that some specimens will not key cleanly, especially vegetative shoots. Stipitate glands are usually very short, especially those on leaf veins; a 10x lens may not be adequate to see them clearly. It is our belief, based on thousands of specimens examined and years of fieldwork, that most *Viburnum* tend to lose pubescence, and perhaps glandularity as well, as the season progresses.

1. Leaves (at least the larger and better developed) palmately lobed and veined.
2. Petioles lacking glands near its junction with the leaf blade; flowers all alike and fertile; twibs pubescent; fruit blue-black; [section *Lobata*] ................................................................. *V. acerifolium*
3. Petioles with several glands near its junction with the leaf blade; marginal flowers of the inflorescence sterile and much larger than the fertile central flowers (or in cultivated forms all the flowers sterile and enlarged); twibs glabrous; fruit red; [section *Opulus*]
   1. Petiolars mostly taller than wide, stalked, rounded on the top; [native, of n. WV, PA, and NJ northward] .................................
      .................................................................................................................................................................................. *V. opulus var. americanum*
   2. Petiolars mostly wider than tall, sessile, concave on the top; [alien, sometimes planted and escaped] ............................ *V. opulus var. opulus*
4. Lateral veins curving and branching repeatedly through most of their length, not noticeably parallel, the lateral veins becoming obscure in the general pattern of anastomosing veins and not obviously leading to marginal teeth; [section *Lentago*]
5. Leaves entire or with a crenate margin, the teeth < 5 per cm of margin.
   6. Leaves 2-5 cm long, obovate or spatulate, widest towards the tip; [of e. SC southward in then Coastal Plain] ............................... *V. obovatum*
   7. Leaves dull to slightly shiny above; peduncle (5-) avg. 13 (25) mm long; leaves undulate-crenulate (or rarely entire); [of Mountains and upper Piedmont] ................................. *V. cassinoides*
   8. Leaves shiny above (as if varnished); peduncle (20-) avg. 35 (50) mm long; leaves entire (rarely somewhat undulate-crenate); [of Coastal Plain, Piedmont, and low elevation boggy sites in the Mountains] ................................. *V. nudum*
7. Leaves serrulate, the teeth > 5 per cm of margin.
8. Leaves mostly strongly acuminate at the tip; [of w. VA northward] ............................................................................................... *V. lentago*
9. Leaves acute, obtuse, or rounded (rarely somewhat acuminate) at the tip; [collectively widespread in our area].
10. Leaves herbaceous in texture, dull above; petioles and veins (lower surface) glabrous or slightly brown-scurfy; [widely in our area, usually in bottomland or other mesic forests] ................................. *V. prunifolium*
9 Leaves somewhat coriaceous in texture, glossy above (as if lacquered); petioles and veins (lower surface) red-scurfy; [of c. VA southward, usually in dry to dry-mesic woodlands and forests] .......................................................... Viburnum 

4 Lateral veins of the leaves nearly straight and prominently parallel for most of their length, many of them forking near the margin, the ultimate veins leading to a tooth. 

10 Winter buds consisting of tightly folded leaves uncovered by bud scales; plants strongly and noticeably stellate-pubescent, especially on young parts and on the lower leaf surface; fruits red then turning black. 

11 Leaves lanceolate, 3-5 times as long as wide, entire; leaf base truncate to rounded; leaf surface strongly rugose; [section Viburnum] .......................................................... Viburnum 

10 Winter buds covered by bud scales; plants noticeably stellate-pubescent or not; fruits orange, red, or blue-black. 

5 Leaves ovate or suborbicular, widest near or below the middle; inflorescence umbelliform, the main branches all attached at the same point; fresh leaves not malodorous. 

12 Leaves 10-25 cm long, 8-20 cm wide, deeply cordate at the base; [native, of cool, high elevation forests and bogs]; [section Pseudotinus] .................................................................................................................. Viburnum 

10 Leaves of various substrates. 

13 Flowers all alike and fertile ................................................................. Viburnum 

13 Marginal flowers of the inflorescence sterile and much larger than the fertile central flowers (or all the flowers sterile and enlarged) .......................................................................................................................... [V. macrocephalum] 

10 Winter buds covered by bud scales; plants noticeably stellate-pubescent or not; fruits orange, red, or blue-black. 

14 Leaves oblong-ovate, wider towards the tip; inflorescence paniculate, with an elongate central axis, the lowest branches opposite and with other branches above; fresh leaves malodorous; [section Solenotinus] .................................................................................................................. Viburnum 

18 Petioles short, those immediately below a cyme ≤ 8 mm long. 

19 Cymes and petioles stipitate-glandular; leaf shape ovate, occasionally rotund; [endemic to two small areas: Ozark and Ouachita Mountains of s. MO-AR-e OK and n AL-sc TN-nw GA] .................................................................................................................. Viburnum 

18 Petioles longer, those immediately below a cyme ≥ 11 mm long. 

19 Cymes stipitate-glandular (occasionally glabrous in V. dentatum var. deamii and V. dentatum var. indianense). 

20 Leaf bases strongly cordate; plants usually restricted to limestone substrates. 

21 Petioles eglandular; leaf veins eglandular; leaves glabrate beneath or with simple hairs in axils; bark not exfoliating; [endemic to two small areas: n. AL, sc. TN, and nw. GA, and Ozark and Ouachita Mountains of s. MO, AR, and e. OK] .................................................................................................................. Viburnum 

20 Leaf bases cuneate, truncate, or occasionally subcordate; plants of various substrates. 

22 Stipitate glands present on petioles and leaves veins; stipular leaf bracts absent; [of sandstone substrates in Lookout Mountain region of ne. AL] .................................................................................................................. Viburnum 

22 Stipitate glands present on petioles and leaves veins; stipular leaf bracts often present. 

23 Petioles with stellate hairs all over; leaves beneath moderately to densely stellate pubescent ................................................................. Viburnum 

20 Leaf bases cuneate, truncate, or occasionally subcordate; plants of various substrates. 

24 Petioles glabrous or glabrate; stellate hairs absent on leaves and petioles; hairs on leaf undersides confined to axils and a few veins; leaf shape usually ovate .................................................................................................. Viburnum 

24 Petioles sparsely to moderately stellate pubescent; stellate hairs present on leaf underside and petiole, dense and soft to touch (V. carolinianum, V. scabrellum, most V. venosum) or sparse to moderate (V. dentatum var. dentatum, some V. venosum); leaf shape various. 

25 Cymes not stellate pubescent (occasionally sparsely so); leaves thinner textured and with less prominent veins, sparsely to moderately stellate pubescent below; [plants relatively widespread] ................................................ Viburnum 

25 Cymes stellate-pubescent; leaves thick textured and with prominent veins, moderately to densely stellate-pubescent below. 

26 Leaf shape ovate to broadly ovate; leaf teeth 5-12 per side; upper leaf surface scabridulous with abundant simple hairs; [of southern Atlantic and Gulf Coastal Plain] .................................................................................................................. Viburnum 

26 Leaf shape rotund; leaf teeth 10-18 per side; upper leaf surface glabrate, not scabridulous; [of Southern Appalachian mountains or northern Atlantic Coastal Plain]. 

27 Leaf underside densely pubescent and soft to touch (felt-like); stipular leaf bracts often present; fruits pubescent; leaf teeth 13-18 per side; [of southern Appalachian mountains of w. NC, n. GA, and se. TN] .......................... Viburnum 

27 Leaf underside moderately to densely pubescent and somewhat soft to touch (but not felt-like); stipular leaf bracts absent; fruits glabrous; leaf teeth 10-15 per side; [of northern Atlantic Coastal Plain of s. MA, s. RI, and Long Island, NY] .................................................................................................................. Viburnum
Viburnum acerifolium Linnaeus, Mapleleaf Viburnum, Dockmackie. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA); mesic to dry forests and woodlands; common (rare in Coastal Plain of GA, NC, and SC). Late April–early June; August–October. NB, ON, and WI south to Panhandle FL and TX. [= RAB, C, G, K, S, W, WH, WV, Y; > V. acerifolium var. acerifolium – F, Z; > V. acerifolium Linnaeus var. glabrescens Rehder – F, Z; > V. acerifolium var. densiflorum (Chapman) McAtee – Z; > V. acerifolium var. ovatum (Rehder) McAtee – Z]

Viburnum bracteatum Rehder, Limerock Arrow-wood. Mt (GA): calcareous forests and woodlands; rare. Late April-early May. Se. TN south to nw. GA and ne. AL; disjunct westwards in the Ozark region of s. MO, nw. AR, and e. OK. [= V. bracteatum Rehder – K, S, Y, Z; > V. ozarkense W. W. Ashe – K, S, Y, Z]

Viburnum carolinianum Ashe, Carolina Arrow-wood. Mt (GA, NC, SC?, VA?) Pd (NC): moist to dry forests, rock outcrops, streambanks; uncommon. April; September–October. Sw. NC and adjacent GA and TN; remainder of distribution unclear at this time. (= F, WV; G, K, Z)

Viburnum cassinoides Linnaeus, Northern Wild Raisin, Withe-rod, Shonny Haw. Mt (GA, NC, SC, VA, WV), Pd (NC, SC), Cp (DE): boggy, moist forests, high elevation forests and outcrops; common (rare in DE). Late May–June; August–October. NL (Newfoundland), ON, and WI south to n. GA and AL. [= RAB, F, G, S, W, WV, Y; = V. nudum Linnaeus var. cassinoides (Linnaeus) Torrey & A. Gray – C, K; < V. nudum – GW; > V. cassinoides var. cassinoides – Z; > V. cassinoides var. nitidum Aiton – Z; > V. cassinoides var. harbisonii McAtee – Z]

Viburnum dentatum Linnaeus var. dentatum, Arrow-wood. Cp (DE, FL?, NC, SC, VA), Pd (DE, NC, SC, VA, MT (NC, SC, CA, WV): marshes, streambanks, other moist places; common (rare in WV). Late March–April; July–September. East of the Appalachians, from Se. PA and sw. NJ south to s. SC and ne. GA, with scattered records westward to sw. NC, nc. TN, sw. VA, n. WV, and w. MD. [= F, G, K, S, Y, Z; > V. dentatum var. dentatum – RAB (also see V. boroninianum); < V. dentatum – GW, W, WH, WV, Y; < V. semitomentosum (Michaux) Rehder – S; < V. dentatum – Z]

Viburnum dilatatum Thunberg, Linden Viburnum. Pd (DE, VA), Cp (VA): suburban woodlands; uncommon (rare in VA), native of e. Asia. [= C, K]

Viburnum lantana Linnaeus, Wayfaring Tree. Mt (WV): widely planted, sometimes escaped or persistent; rare, native of Eurasia. Reported as naturalized as far south as MD (Kartesz 1999) and KY (Weckman et al. 2002). May; September. [= C, F, G, K, Z]

Viburnum lentoago Linnaeus, Nannyberry, Sheepberry. Mt (VA, WV), Pd (DE): shrubbery stream-bottoms, other wetlands and wetland margins; rare. NB and SK south to w. VA, MO, and CO. Reported in the past for NC (see Radford, Ahles, & Bell 1968), from GA (Kartesz 1999), and from AL; these reports all appear to be based on misidentifications. [= RAB, C, F, G, K, S, W, WV, Y, Z]

Viburnum nudum Linnaeus, Southern Wild Raisin, Possumhaw. Cp (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA): boggy, blackwater floodplains, seepages; common (rare in Mountains). April–May; August–October. RI, CT, and NY south to e. peninsular FL, west to TX, inland to w. NC, TN, w. KY, and AR. [= RAB, G, S, W, WH, Y, Z; > V. nudum var. nudum – C, K; < V. nudum var. deamii – RAB (also see V. angustifolium Torrey & A. Gray – F, < V. nudum – GW)]

Viburnum opulus Linnaeus var. americanum, Cranberry-tree, Highbush-cranberry. Mt (WV): wet forests, along streams; rare. June. NL (Newfoundland) and BC south to s. PA (Rhoads & Klein 1993), NJ, n. WV, OH, NE, and WV. [= C, G, K; = V. trilobum Marshall – F, WV; = V. opulus var. trilobum (Marshall) McAtee – Z]

* Viburnum opulus Linnaeus var. opulus, Guelder-rose, Snowball. Mt (VA, WV): commonly cultivated, and rarely persistent or escaping; rare, native of Europe. Well-established in KY (Weckman et al. 2002). [= C, G, K, Z; > V. opulus var. opulus – F, WV; > V. opulus var. roseum Linnaeus – F, WV]

* Viburnum plicatum Thunberg, Japanese Snowball, Doublefile Viburnum. Pd (DE, NC), Mt (WV): suburban woodlands; uncommon (rare in NC), native of e. Asia. Also reported as naturalized in various more northern states, including se. and sw. PA (Rhoads & Klein 1993), OH (Cooperrider 1995), MI (Voss 1996), and others. [= C, G, K, Z]

* Viburnum rafinesquianum J.A. Schultes, Downy Arrow-wood. Pd (GA, NC, VA), Mt (VA, WV), Cp (DE, VA): dry-mesic to dry woodlands and forests, especially over mafic rocks (but not at all restricted to such sites); common (uncommon in WV, rare in DE and GA). Mid April–May; June–July. NH, QC and MB south to n. GA, AL, AR, and OK; apparently not yet recorded for SC. (= V. rafinesquianum – RAB, K, S, W, WV (orthographic variant); > V. rafinesquianum var. rafinesquianum – C, F, G, Y; =? V. affinis Bush ex Schneider var. hypomalacum Blake – Z)
ADOXACEAE

* **Viburnum rhytidophyllum** Hemsley, Leatherleaf Viburnum. Mt (NC): planted and rarely naturalizing; rare, native of c. and w. China. First reported for NC by Pittillo & Brown (1988): “naturalized beneath hedges on the campus of Western Carolina University” (Jackson County, NC). Elsewhere escaping at least as far south as KY (Weckman et al. 2002). [= K]

* **Viburnum rufidulum** Rafinesque, Southern Black Haw. Pd (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA): dry woodlands, dry-mesic woodlands and forests, especially common over mafic rocks (but not at all restricted to such sites); common (uncommon in VA). Late March-April; September-October. C. VA, OH, IL, and KS south to n. peninsular FL and TX. [= RAB, C, F, G, K, W, WH, Y, Z; > V. rufidulum – S; > F. rufotomentosum Small]

* **Viburnum scabrellum** (Torrey & A. Gray) Chapman. Cp (FL, GA, SC): streambanks, marshes, other moist sites; common. A Coastal Plain endemic, ranging from se. GA south to c. peninsular FL, west to e. TX; with scattered collections north to ec. GA (Richmond County), ne. AL (Cherokee County), nw. AL (Lamar County), c. MS, and n. LA. Expected in s AR, but no specimens seen. Specimens of *V. dentatum* from s. SC show signs of hybridization. Mohr (1901) and some other 19th century authors misapplied the name *V. molle* to it. [< V. dentatum var. dentatum – RAB; < V. dentatum var. venosum (Britton) Gleason – G, K; < V. dentatum – GW, W, WH, Y; < F. semitomentosum (Michaux) Rehder – S, misapplied; > V. scabrellum (Torrey & Gray) Chapman var. scabrellum – Z; > V. scabrellum var. ashei Bush – Z; = Viburnum dentatum Linnaeus var. scabrellum Torrey & A. Gray]

* **Viburnum setigerum** Hance, Tea Viburnum. Pd (DE, NC): suburban forests, commonly planted horticulturally; uncommon (rare in NC), native of China. Naturalizing at Guilford Courthouse National Military Park (Greensboro, Guilford County, NC) and in Battle Park (Chapel Hill, Orange County, NC), and elsewhere in our area. Also naturalizing in KY (Weckman et al. 2002). [= K]

**Viburnum species I**, Alabama Arrow-wood. Mt (AL): sandstone substrates; rare. Restricted to Lookout Mountain region of ne. AL, in Call, DeKalb, and Marshall Counties. Close to *V. dentatum* than to *V. recognitum* due to hairy petioles and broad ovate-rotund leaf shape. [< V. dentatum Fernald – K; = F. recognitum var. alabamense McAtee – Z]

* **Viburnum macrocephalum** Fortune, Chinese Snowball. Mt (NC): suburban areas near plantings; rare, native of China. Reported as naturalized in the Mountains of NC (Pittillo 2003. pers. comm.). [investigate]

* **Viburnum molle** Michaux. Limestone areas. Scattered, discontinuous range (but locally may occur in several contiguous counties) from sw. OH, ne. IN, wc. IL, and se. IA south to se. TN, nw. AR; disjunct in sw. IA. [= C, F, G, K, Y, Z]

406a. **DIERVILACEAE** (Rafinesque) Pyck 1998 (Bush-honeysuckle Family) [in DIPSACALES]

Various segregate families (or realignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of *Sambucus* and *Viburnum* to the Adoxaceae, placement of *Diervilla* and *Weigela* in the Diervilaceae (Backlund & Pyck 1998), placement of *Abelia* and *Linnaea* in the Linnaeaceae (Backlund & Pyck 1998, Pyck et al. 2002), and retention of *Lonicera, Symphoricarpos,* and *Triosteum* in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsacaceae and Valerianaceae, as a broadly circumscribed Caprifoliaceae. References: Backlund & Pyck (1998); Pyck et al. (2002); Ferguson (1966a).

**Diervilla** P. Miller (Bush-honeysuckle)

1 Petioles 5-8 mm long; leaves ciliate on the margins; twig terete in cross-section; [of the Mountains of VA and n. NC, south to Buncombe and McDowell counties, NC]..........................................................................................**D. lonicera**

1 Petioles 0-5 mm long; leaves not ciliate; twig more-or-less square in cross-section; [of the Mountains of SC and s. NC, north to Mitchell and Yancey cos., NC].

2 Branchlets, leaves, pedicels, and calyx densely pubescent; sepal lobes < 2 mm long .....................................................**D. rivularis**

2 Branchlets, leaves, pedicels, and calyx glabrous, except for hairs on the twig angles; sepal lobes 2-3 mm long ..................**D. sessilifolia**

**Diervilla lonicera** P. Miller, Northern Bush-honeysuckle. Mt (GA?, NC, VA, WV), Pd (DE), {DC, MD, NJ?, TN, WV?}: rock outcrops and ridges at high elevations; uncommon (rare in DE). June-July; August-October. NL (Newfoundland) west to SK, south to w. NC, e. TN, IN, and IA. Reported for GA (GANHP). [= RAB, C, G, K, S, W, WH, Y, Z; > D. lonicera var. lonicera – F; > D. lonicera var. hypomalaca Fernald – F]

**Diervilla rivularis** Gattinger, Hairy Southern Bush-honeysuckle. Mt (GA, NC), {AL, TN}: rock outcrops, ridges, and streambanks at moderate to high elevations; rare (NC Rare). June-August; August-October. W. NC (Yancey County) and e. TN south to nw. GA (Jones & Coile 1988) and ne. AL. [= K, S, Y, Z; = D. sessilifolia Buckley var. rivularis (Gattinger) Ahles – RAB, W]

**Diervilla sessilifolia** Buckley, Smooth Southern Bush-honeysuckle. Mt (GA, NC, SC), {AL, TN}: rock outcrops, ridges, landslide scars, trail margins, other rocky open places, streambanks, at moderate to high elevations; uncommon. June-August; August-October. Sw. NC and e. TN south to nw. SC, ne. GA, and ne. AL. [= F, K, S, Y, Z; = D. sessilifolia Buckley var. sessilifolia – RAB, W]
A genus of about 10 species, shrubs, of e. Asia.

* Weigela floribunda (Siebold & Zuccarini) K. Koch, Weigela, native of Asia, is cultivated and sometimes naturalized, as in e. TN (Chester, Wofford, & Kral 1998). [= K]

406b. CAPRIFOLIACEAE A.L. de Jussieu 1789 (Honeysuckle Family) [in DIPSACALES]

As here circumscribed, a family of about 5 genera and 220 species, shrubs, trees, and less typically herbs and vines, mainly north temperate and boreal. Circumscription of the family is controversial. Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of *Sambucus* and *Viburnum* to the Adoxaceae, placement of *Diervilla* and *Weigela* in the Diervillaceae (Backlund & Pyck 1998), placement of Abelia and *Linnaea* in the Linnaeaceae (Backlund & Pyck 1998), and retention of *Lonicera, Symphoricarpos*, and *Triosteum* in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsacaceae and Valerianaceae, as a very broadly circumscribed Caprifoliaceae (APG III 2009). References: Backlund & Pyck (1998); Ferguson (1966a). [also see ADOXACEAE, DIERVILLACEAE, and LINNAEACEAE]

1 Erect herb. .......................................................... Triosteum

1 Shrubs or woody lianas.

2 Corolla usually > 10 mm long, bilaterally symmetrical; ovary 2-3-locular................................................................. Lonicera

2 Corolla 3-8 mm long, radially symmetrical or nearly so; ovary 4-locular ............................................................... Symphoricarpos

**Lonicera** Linnaeus 1753 (Honeysuckle)

A genus of about 180 species, shrubs and vines, mainly north temperate. References: Ferguson (1966a)=Z; Rehder (1903)=Y; Green (1966).

1 Flowers in opposite 3-flowered cymules, borne in terminal clusters subtended by connate leaves; corolla red and yellow (or yellowish-orange only); twining vine or shrub with vining tendencies (in *L. flava* the 'vininess' sometimes not apparent).

2 Corolla tube (20-) 30-50 mm long; corolla lobes 4-8 mm long, more or less radially symmetrical; [of a wide variety of habitats, primarily in the Piedmont and Coastal Plain]................................................................. L. sempervirens

2 Corolla tube 10-35 mm long; corolla lobes 8-15 mm long, unequally divided into 2 lips (4 lobes on the upper side and one lobe on the lower side); [of ridgetops, rocky slopes, granite domes, and bogs of the Mountains, or of areas to the north or west of the primary area).

3 Leaves pubescent on the upper surface; [of moist forests, south to PA]............................................................................. [*L. hirsuta]*

3 Leaves glabrous on the upper surface.

4 Fused leaves immediately below the inflorescence glaucous on the upper surface, rounded or emarginate; [of c. TN and other areas west and north of our primary area] .............................................................. L. reticulata

4 Fused leaves immediately below the inflorescence green on the upper surface, pointed to mucronate.

5 Corolla tube 30-35 mm long; leaves gray beneath; [of soil mats on dome outcrops of s. NC, SC, and GA and westward].... L. flava

5 Corolla tube 15-25 mm long; leaves strongly white-glaucous beneath; [of rocky forests, ridgetops, and bogs of n. NC, VA, and northward] .............................................................................. L. dioica

1 Flowers in peduncled pairs in the axils of leaves, not subtended by connate leaves; corolla white to pastel pink or yellow; plant an erect shrub or (*L. japonica*) a trailing or climbing vine.

6 Trailing or climbing vine; corolla 30-50 mm long; fruit black at maturity; leaves of vigorous shoots often pinnately lobed .......... *L. japonica*

6 Upright shrub; corolla 7-25 mm long; fruit red or yellow at maturity; leaves unlobed.

8 Corolla lobes 5, nearly equal; ovaries separate, divergent; [native species of cool moist forests and bogs]......................... *L. canadensis*

8 Corolla lobes fused into a 4-lobed lip and a 1-lobed lip; ovaries fused; [exotic species].

9 Branches glabrous; corolla glabrous on the exterior ................................................................................................. *L. fragrantissima*

9 Branches retrorsely hispid with reddish-brown hairs; corolla pilose on the exterior......................................................... *L. standishii*

7 Branches hollow between the nodes, with tannish pith; [exotic species, many of them seriously invasive and likely to be encountered in natural areas].

10 Peduncles shorter than or equal to the subtending petiole; leaves ovate (broadest near the base) and distinctly long-acuminate .......... *L. mauickii*

10 Peduncles longer than the subtending petiole; leaves elongate (broadest near the middle) and obtuse to acute (rarely short-acuminate).

11 Leaves glabrous; peduncles 15-25 mm long.................................................. *L. tatarica*

11 Leaves pubescent, at least on the lower surface; peduncles 5-15 mm long.

12 Corolla pink (aging to yellow), nearlly glabrous on the exterior, barely bulging on one side at the base; leaves thinly pubescent beneath ................................................................................................. L. *bella*

12 Corolla white (aging to yellow), pubescent on the exterior, distinctly bulging on one side at the base; leaves rather densely grayish-pubescent beneath.

13 Bracts and sepals ciliate, not glandular; ovary lacking glands; leaf blades broadest at or below the middle .......... *L. morrowii*

13 Bracts and sepals glandular; ovary glandular; leaf blades broadest beyond the middle .................................................. *L. xylosteum*

Lonicera dioica Linnaeus. Seepeags, bogs, rocky woods, shrubby mountain bogs at high elevations, rocky ridgetop thickets over amphibolite. June-August; August-September. MA and QC west to WI, south to NJ, NC, and IN. Varieties or species have sometimes been maintained based on minor variation of pubescence; it is unlikely that these are taxonomically meaningful. Var. orientalis has the lower leaf surfaces, hypanthium, and style hairy (vs. glabrous or nearly so in var. dioica). [= RAB, K, W, WV; > L. dioica var. dioica – C, F, G, Z; > L. dioica Linnaeus var. orientalis Gleason – C, G; > L. dioica var. glaucescens (Rydberg) Butters – F, Z; > L. dioica – S, Y; > L. glaucescens (Rydberg) Rydberg – S, Y]

Lonicera hirsuta Eaton, Hairy Honeysuckle. QC west to MB, south to c. PA (Rhoads & Klein 1993) and MN. [= F, K, Y; > L. hirsuta var. interior Gleason – C] {rejected; keyed; not mapped}

Lonicera maackii (Ruprecht) Maximowicz, Amur Honeysuckle. Suburban woodlands, moist forests, fencerows; native of e. Asia (Korea, China, Japan). May-June. This is one of worst “shrub-weeds”, aggressively invasive in various parts of eastern North America, as in the vicinity of DC and in calcareous substrate parts of the interior South. [= C, K, Y, Z]

Lonicera reticulata Rafinesque. {habitats}. NY west to WI, south to TN and AR. In nc. TN (Davidson County) (Chester, Wofford, & Kral 1997; Wofford & Chester 2002). [= K; > L. prolifera (G. Kirchner) Booth ex Rehder var. prolifera – C, G; = L. sullivantii A. Gray – Y; = L. prolifera – F, Z]

Lonicera sempervirens Linnaeus, Coral Honeysuckle. Dry forests and woodlands, maritime forests. March-July (and sporadically to November; July-September). CT to OK, south to c. peninsular FL and TX; and more widely distributed as an escape from cultivation. Var. hirsutula has sometimes been maintained, differing from var. sempervirens in its ciliate leaf margins, pubescent upper leaf surfaces, sometimes glandular hypanthium and stems (vs. glabrous); it is doubtful that these distinctions are taxonomically meaningful. [= RAB, GW, W, WH, WV, Y; > L. sempervirens Linnaeus var. sempervirens – C, G, K, Y; > L. sempervirens Linnaeus var. hirsutula Rehder – C, F, G, K, Y; > L. sempervirens var. sempervirens – F; > L. sempervirens var. minor Aiton – F; = Phanenanthus sempervirens [Linnaeus] Rafinesque – S]

Lonicera standishii Jacques, Standish's Honeysuckle. Forests, woodlands, old home sites; native of China. Locally abundant and invasive in c. NC (Uwharrie National Forest, Montgomery County, NC). Also reported from KY (Jones 2005), se. PA (Rhoads & Klein 1993), and MD (Kartesz 1999). [= F, K, Y]

Lonicera tatarica Linnaeus, Tartarian Honeysuckle. Disturbed forests; native of Central Asia. [= C, F, G, K, WV; > L. tatarica var. tatarica – Y]
**Lonicera xylosteum** Linnaeus, European Fly-honeysuckle. Suburban forests, disturbed forests; native of Europe and Asia. Establishing mainly in ne. United States, south to VA, MD (Kartesz 1999), and KY (Clark et al. 2005). [= C, F, G, K; > L. xylosteum var. xylosteum – Y]

**Symphoricarpos** Duhamel 1755 (Snowberry, Coralberry)

A genus of about 17 species, shrubs, of North America and e. Asia. References: Jones (1940); Ferguson (1966a)=Z.

1. Corolla 2-4 mm long; fruits pink to purple
2. Fruit 6-10 (-12) mm in diameter; young twigs puberulent; leaves usually pubescent beneath; shrub usually < 1 m tall; [native] S. orbiculatus
3. Fruit 12-20 mm in diameter; young twigs glabrous; leaves usually glabrous beneath; shrub usually 1-2 m tall; [introduced] S. albus var. albus

**Symphoricarpos albus** (Linnaeus) Blake var. albus, Common Snowberry. Limestone woodlands. QC west to s. AK, south to w. VA, WV, MI, MN, and CA; the original native distribution somewhat uncertain due to cultivation and escapes. Var. albus is the more eastern variety. [= C, F, G, K, Z; < S. albus – RAB, S, W, WV]

**Symphoricarpos orbiculatus** Moench, Coralberry. Moist to dry forests, woodlands, thickets, pastures, and old fields, especially over mafic or calcareous rocks. Late July–September; September–November (and often persisting well into winter). CT west to IN, MN, and CO, south to Panhandle FL, TX, and Mexico; the original native distribution somewhat uncertain due to cultivation and escapes. Seemingly increasing in VA and behaving aggressively in dry woodlands and barrens over greenstone and diabase. [= RAB, C, F, G, K, W, WH, WV, Z; = S. symphoricarpos (Linnaeus) MacM. – S]

**Triosteum** Linnaeus 1753 (Horse-gentian, Feverwort)

A genus of 6 species, rather woody herbs, of e. Asia (3 species) and e. North America (3 species); the 3 North American species form one clade, the 3 Asian species another (Gould & Donoghue 2000). References: Gould & Donoghue (2000); Ferguson (1966a)=Z.

1 Longer (nonglandular) hairs of the stem 1.5-3 mm long; corolla greenish-yellow; leaves 1.5-6 cm wide.
2 Lower leaf surface glabrous or pubescent only along the main veins; leaves averaging 4× as long as wide. S. laevigatus
3 Most the stem hairs 0-0.5 mm long (sometimes with a few scattered longer hairs), gland-tipped; leaves predominantly connate-perfoliate, the joined base 3-9 mm wide; style exserted beyond the corolla. S. aurantiacum

**Triosteum angustifolium** Linnaeus var. angustifolium, Smooth Lesser Horse-gentian. Cp (DE, Pd (DE), Mt (WV), {Pd (NC, VA), Mt (GA, VA), C (VA): distributional and habitat information needed for two varieties} (GA Rare). April-May; July-August. CT west to ON and MO, south to NC, mw. GA (Jones & Coile 1988), AL, and LA. [= C, F, G; < T. angustifolium – RAB, K, S, W, WV, Z]

**Triosteum aurantiacum** Linnaeus var. aurantiacum Wiegand, Hairy Lesser Horse-gentian. {Pd (NC, VA), Mt (VA), WV?): distributional and habitat information needed for two varieties}. April-May; July-August. CT and NJ south to NC. [= C, F, G; < T. aurantiacum – RAB, K, S, W, Z]

**Triosteum perfoliatum** Bicknell var. perfoliatum. Mt (GA?, NC, SC, VA, WV), Pd (DE, NC, VA): woodlands and forests in circumneutral soils, particularly those over mafic or calcareous rocks; uncommon (rare in DE, GA, and NC). Late May-early June; August-October. QC west to MN, south to GA, KY, and OK; other varieties are more restricted and midwestern or northern in distribution. [= C, F, K; < T. perfoliatum Linnaeus var. aurantiacum (Bicknell) Wiegand – G]
Triosteum perfoliatum Linnaeus, Perfoliate Horse-gentian. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA), Cp (DE, VA): woodlands and forests in circumneutral soils, particularly those over mafic or calcareous rocks; uncommon (rare in DE). Late May-early June; August-October. MA west to MN, south to n. SC, n. GA (Jones & Coile 1988), and OK. [= RAB, C, F, K, S, W, WV, Z; = T. perfoliatum var. perfoliatum – G]

406c. LINNAEACEAE (Rafinesque) A. Backlund 1998 (Twinflower Family) [in DIPSACALES]

A family of 5 genera and about 35 species, shrubs and suffrutescent herbs. Various segregate families (or reassignments) of taxa traditionally placed in the Caprifoliaceae have been proposed, including the transfer of Sambucus and Viburnum to the Adoxaceae, placement of Diervilla and Weigela in the Diervillaceae (Backlund & Pyck 1998), placement of Abelia, Linnaea, and Kolkwitzia in the Linnaeaceae (Backlund & Pyck 1998), and retention of Lonicera, Symphoricarpos, and Triosteum in a much more narrowly circumscribed Caprifoliaceae. Alternatively, all these taxa could be included in the Caprifoliaceae, along with Dipsaceae and Valerianaceae, as a very broadly circumscribed Caprifoliaceae. References: Backlund & Pyck (1998).

1 Trailing shrubby herb; [native] .................................................................................................................................................................... Linnaea
1 Upright shrub; [planted and persistent or weakly naturalizing].
2 Sepals oblanceolate, the larger > 1 mm wide; fruit and ovaries free, not hirsute ...................................................................................... Abelia
2 Sepals lanceolate to linear, < 1 mm wide; fruit and ovaries fused in pairs, densely hirsute ................................................................. Kolkwitzia

Abelia R. Brown, Abelia

A genus of about 30 species, shrubs, primarily of s. and e. Asia.

* Abelia ×grandiflora (André) Rehder [chinensis × uniflora], Abelia. Cp (AL, FL, NC): suburban thickets; commonly planted in our area; sometimes persistent or rarely weakly naturalizing, the parent species native of China. Reported for AL (Diamond & Woods 2009). [= K, WH]

Kolkwitzia Graebner (Beautybush)

A monotypic genus, a shrub, of c. China.

* Kolkwitzia amabilis, Beautybush. Mt (NC) {KY}: disturbed areas; planted as an ornamental shrub, rarely naturalized from plantings, native of c. China. [= K]

Linnaea Linnaeus (Twinflower)

A monotypic genus, a trailing weak shrub, circumboreal.

Linnaea borealis Linnaeus ssp. americana (Forbes) Hultén ex Clausen, American Twinflower. Mt (MD, TN, WV): northern hardwoods; rare. Greenland, NL (Labrador), and AK south to WV, IN, IL, IA, NM, AZ, and CA; disjunct in e. TN. L. borealis is documented by an early specimen (1892) from Sevier County, TN, presumably from the Great Smoky Mountains; the TN population (not seen since) is disjunct from e. WV and w. MD. [= K; = L. borealis var. longiflora Torrey – C, G; = L. borealis var. americana (Forbes) Rehder – F; < L. borealis – W; = L. americana Forbes; = L. borealis ssp. longiflora (Torrey) Hultén]

406d. DIPSACACEAE A.L. de Jussieu 1789 (Teasel Family) [in DIPSACALES]

A family of about 11 genera and 300 species, herbs and shrubs, of Eurasia and Africa.

1 Stem prickly ......................................................................................................................................................................................... Dipsacus
1 Stem not prickly ...................................................................................................................................................................................... Knautia

Dipsacus Linnaeus (Teasel)
A genus of about 15 species, herbs, of Eurasia. *Dipsacus* begins flowering about halfway up the head, the flowers then opening sequentially toward both the base and the tip of the inflorescence. References: Ferguson (1965)=Z; Ferguson & Brizicky (1965); Stace (2010).

1 Principal cauline leaves laciniate-pinnatifid, cut at least halfway to the midrib; stems to 3 (-4) m tall ... *Dipsacus laciniatus*
1 Principal cauline leaves entire or toothed; stems to 2 (-3) m tall.

2 Bracts on the receptacle with straight apical spines, these stiff but flexible; bracts of the involucre curved upward ... *Dipsacus fullonum*
2 Bracts on the receptacle with recurved apical spines, these rigid; bracts of the involucre spreading more or less horizontally ....... *Dipsacus sativus*

* Dipsacus laciniatus* Linnaeus, Cutleaf Teasel. Mt (VA, WV), Pd (VA): disturbed areas; uncommon, native of Europe. July-September; September-October. [= C, F, G, K, WV, Z]

* Dipsacus sativus* (Linnaeus) Honckeny, Fuller's Teasel. Mt (VA): disturbed areas; rare, native of Europe. July-September; September-October. I am here following Ferguson (1965), Ferguson & Brizicky (1965), and Stace (2010) in their determination that *D. sativus* is the correct name to apply to this plant. The occurrence of this species in our area is implied in various sources; I have not seen specimens. The dried inflorescences were used in the past for fulling cloth (raising the nap). [= K, Z; = *D. fullonum* – C, F, G, misapplied]

**Knautia** Linnaeus

A genus of about 60 species, herbs, of Europe, w. Asia, and n. Africa.

* Knautia arvensis* (Linnaeus) Coulter, Blue Buttons. Mt (WV): dry areas, pastures, other disturbed areas; rare, native of Europe. June-September. Naturalized south at least to s. PA (Rhoads & Klein 1993), MD (Kartesz 1999), and WV (Harmon, Ford-Werntz, & Grafton 2006). [= C, F, G, K; = Scabiosa arvensis Linnaeus]

**406c. VALERIANACEAE** Batsch 1802 (Valerian Family) [in DIPSACALES]

A family of about 10 genera and 300-350 species, herbs (rarely shrubs), nearly cosmopolitan in distribution. References: Bell (2004); Ferguson (1965).

1 Stem leaves divided into 3-21 segments .................................................................................................................................................... *Valeriana*
1 Stem leaves simple ................................................................................................................................................................................... *Valerianella*

**Valeriana** Linnaeus 1753 (Valerian)

A genus of about 200 species, herbs and shrubs, of temperate North America and Eurasia, s. Africa, and Andean South America.

1 Corolla tube 12-16 mm long; stem leaves pinnately divided into 3-7 segments; [native, of VA and TN northward] ................. *Valeriana pauciflora*
1 Corolla tube 1.5-4 mm long; stem leaves divided either into 3 segments or into 11-21 segments.

2 Upright perennial herb; stem leaves divided into 11-21 segments; corolla tube 3-4 mm long; [alien, grown as an ornamental and casually escaped] ................................................................. *Valeriana officinalis*
2 Scandent vine; stem leaves divided into 3 segments; corolla tube 1.5-2 mm long; [native, of FL] ............................................... *Valeriana scandens*

* Valeriana officinalis* Linnaeus, Garden-heliotrope. Mt (WV): cultivated and rarely escaped; rare, native of Europe. Sometimes cultivated in our area; it may escape or persist. May-August. [= C, F, G, K]

**Valeriana pauciflora** Michaux, Pink Valerian, Long-tube Valerian. Pd (VA, WV): very nutrient-rich alluvium in floodplain forests; uncommon (rare in VA). May; June. MD, se. PA, and sw. PA, west to s. IL, south to n. VA, sc. TN, KY, and MO. [= C, F, G, K, W, WV]

**Valeriana scandens** Linnaeus, Florida Valerian. Cp (FL): floodplain forests, hammocks; rare. Ne. FL south to c. peninsular FL. [= K, S, WH]

**Valerianella** P. Miller 1754 (Corn-salad)

A genus of about 50 species, herbs, of temperate North America, Eurasia, and n. Africa. References: Ware (1983)=Z.

**Identification notes:** *Valerianella* species exhibit an interesting set of fruit polymorphisms; the fruit forms in a single species are often strikingly different, and these forms were traditionally regarded as separate taxa. Ware (1983) demonstrated that they were under simple genetic control,
and that different fruit forms were found in the same population. Thus, some taxa previously considered distinct are best considered mere fruit types. The fruit consists of three locules, one of which is fertile and dorsal to or more-or-less flattened by the two sterile locules. The sterile locules may be elongate, forming (between them) a groove, or they may be expanded laterally well beyond the width of the fertile locule into flattened or bulbous wings. In *V. locusta*, there is additionally a corky mass on the side of the fertile locule opposite the two sterile locules.

1 Fruit greatly thickened by a corky mass on the back of the fertile locule; corolla pale blue (or white) .......................................................... *V. locusta*

1 Fruit lacking a corky mass on the back of the fertile locule; corolla white.

  2 Fertile locule much wider than the combined width of the 2 sterile locules; fruit sharply triangular in ×-section .................. *V. chenopodiifolia*

  2 Fertile locule slightly wider or narrower than the combined width of the 2 sterile locules; fruit not sharply triangular in ×-section.

  3 Corolla 1.5-2 mm long, the corolla lobes 0.4-0.8 mm long .......................................................... *V. radiata*

  3 Corolla 3-5 mm long, the corolla lobes 1-2 mm long .......................................................... *V. umbilicata*

*Valerianella umbilicata* (Sullivant) Wood. Pd (NC, VA), Mt (NC, VA, WV), Cps (VA), {SC?}: moist forests, bottomlands, disturbed areas; rare. S. NY west to IL, south to NC and nc. TN (Chester, Wofford, & Kral 1997). Ware (1983) raises the question of whether *V. woodsiana* is a distinct taxon; further study is needed. [= Z; < V. umbilicata – RAB, C, WV; > V. umbilicata – F, G; > V. patellaris (Sullivant ex A. Gray) Wood – F, S; > V. intermedia Dyal – F; > V. radiata var. intermedia (Dyal) Gleason – G]

*Valerianella dentata* (Linnaeus) Pollich. Reported as naturalized in central TN by Kral (1981) and Chester et al. (1997), in nc. GA (Jones & Cole 1988), and in AL (Kartesz 1999). [= K] {not yet keyed; synonymy incomplete}

410. PITTSPORACEAE R. Brown 1814 (Pittosporum Family) [in APIALES]

*Pittosporum* Banks ex Solander (Pittosporum)

A genus of about 100-150 species, trees and shrubs, of tropical and warm temperate Old World. References: Judd (1996)=Z.

*Pittosporum tobira* (Thunberg) Aiton f., Japanese Pittosporum, Australian Laurel. Cps (FL, GA?, NC, SC?): frequently planted on barrier islands, at least persisting and apparently naturalizing; rare, native of Japan and China. Various cultivars are seen, including ones with variegated leaves. This species is one of the more common landscaping plants used on developed barrier islands. The revolute, obovate leaves are characteristic. [= K, WH, Z]

411. ARALIACEAE A.L. de Jussieu 1789 (Ginseng Family) [in APIALES]

A family of about 47 genera and 1325 species, trees, shrubs, vines, and rarely herbs, mainly tropical in distribution. *Hydrocotyle* is more closely related to Araliaceae than to Apiaceae, and is transferred here (Chandler & Plunkett 2003). References: Frodin & Govaerts (2003); Graham (1966); Smith (1944).

1 Plant a woody vine; [tribe Schefflerae] .......................................................................................................................... *Hedera*

1 Plant an herb, shrub, or tree.

  2 Leaves simple, peltate or cordate, roundish (if lobed, with 3-5 rounded lobes), 0.3-10 cm wide; rhizomatous, creeping herbs.... *Hydrocotyle*

  2 Leaves either compound with 3-many leaflets or simple and then with 5-7 pointed lobes (*Kalopanax*); > 10 cm wide; herbs, shrubs, or trees; [tribe Araliaceae].

  3 Leaves simple, palmately-lobed.

  4 Leaves 5-7-lobed; tree .......................................................................................................................... *Kalopanax*

  4 Leaves >9-lobed (some of the lobes themselves sublobed); robust herb to shrub .......................................................... *Tetrapanax*

  3 Leaves compound

  5 Leaves 2-3× compound, at least the final order of division pinnate; leaves either 1 from a subterranean stem or 2-many, alternate on an aboveground stem; inflorescence compound, consisting of (2-) 3-many umbels, either on a separate peduncle from the rhizome or in a terminal panicle or raceme; fruit purple or black .................................................................................. *Aralia*

  5 Leaves 1× palmately compound, leaflets 3-7; leaves 3-5 in a whorl at the summit of the stem (*Panax*) or many, clustered on spur shoots (*Eleutherococcus*); inflorescence of a single, simple umbel borne terminally on the stem; fruit red to yellow (*Panax*) or black (*Eleutherothecoccus*).
Aralia Linnaeus 1753 (Aralia)

A genus of about 30–70 species, herbs, shrubs, vines, and trees, primarily of e. North America, e. Asia, and se. Asia. Wen (1998) has suggested that Aralia nudicaulis may need to be removed from the genus Aralia in order to maintain both Aralia and Panax as monophyletic genera. References: Smith (1982)=Z; Moore, Glenn, & Ma (2009)=V; Wen et al. (1998); Wen (1993); Wen (1998); Smith (1944)=Y; Frodin & Govaerts (2003)=X.

1 Plant a shrub or small tree, 3-6 (-10) m tall, definitely woody; stem armed throughout with prickles, those on the stem stout, broad-based, and distuated to the summit of the stem; leaves usually armed with prickles on the axes and the main veins; [section Dimorphanthus]
2 Main lateral veins running all the way to the teeth; inflorescence 3-6 dm long, often broader than long, lacking a well-developed main axis; petiolules 0-1 (-6) mm long; dry fruit 3.0-3.5 mm long; [alien spreading southward from ne. United States] .............. A. elata
3 Main lateral veins running branching repeatedly and getting smaller before reaching the teeth; inflorescence 4-12 dm long, usually longer than broad, with a well-developed central axis; petiolules 1-7 mm long; dry fruit 4.0-5.0 mm long; [widespread native] ............. A. spinosa
4 Stem bristly toward its base; inflorescence a raceme or weak panicle of (2-) 5-25 umbels; [section Hispidae] ................ A. hispida
5 Stem unarmed; inflorescence a compound panicle of 15-many umbels; [section Aralia] ............................................. A. racemosa

* Aralia elata (Miquel) Seemann, Japanese Angelica-tree. Pd (DE): suburban woodlands; uncommon. Naturalizing in ne. North America at least as far south as NJ, DE, se. PA, and DC (likely to be present in MD). See Moore, Glenn, & Ma (2009) for detailed information on this alien species and its naturalization in the northeastern United States. [= K, V]

Aralia hispida Ventenat, Bristly Sarsaparilla. Mt (NC?, VA, WV, ): rocky woodlands, cliffs, and clearings, primarily over acidic rocks (such as quartzite, granite, and sandstone); rare. June-August. NL (Labrador) and NL (Newfoundland) west to MB, south to w. VA, w. NC (?), WV, OH, IN, IL, and MN. This species appears to be strongly dependent on disturbance, such as fire, appearing in great numbers following fire where previously rare or apparently absent. F and Y credit this species to w. NC; the documentation is not known to me, and the species was not treated by RAB. Doug Rayner (pers. com. 2002) reports a site record of it in Polk County, NC. [= C, F, G, K, S, W, X, Y, Z]

Aralia nudicaulis Linnaeus, Wild Sarsaparilla. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): upland forests and woodlands, rocky places, most typically in rather dry places, such as ridgetop forests; common (uncommon in Piedmont south of DE, rare in Coastal Plain south of DE, rare in GA). May-July. NL (Labrador) and NL (Newfoundland) west to BC, south to e. VA, e. NC, ne. GA, w. TN, IL, MO, NE, CO, and ID. [= RAB, C, F, G, K, S, W, X, Y, Z]

Aralia racemosa Linnaeus, Spikenard, Hungry-root. Mt (GA, NC, SC, VA, WV), Pd (DE, NC, VA), Cp (DE, VA): rich woodlands, trail margins and roadsides; common (rare in Coastal Plain, locally common in Mountains of far sw. VA). June-August. NB and QC west to MN and SD, south to NC, n. GA, AL, MS, MO, and e. KS. The related A. birenata Wooton & Standley (sometimes treated as a subspecies of A. racemosa) occurs in AZ, NM, TX, and n. Mexico. [= RAB, C, F, G, S, W, X, Y, Z; = A. racemosa ssp. racemosa – K]

Eleutherococcus Maximowicz 1859 (Fiveleaf Aralia)

* Eleutherococcus sieboldianus (Makino) Koidz., Fiveleaf Aralia. Mt (WV): disturbed areas; rare, native to e. Asia. Reported as introduced and apparently naturalized in Randolph County, WV, scattered locations in PA (Rhoads & Klein 1993), OH, and n. KY (Clark et al. 2005). [= Z; < Eleutherococcus pentaphyllus (Siebold & Zuccarini) Nakai – K, misapplied; = Acanthopanax sieboldianus Makino]

Hedera Linnaeus 1753 (Ivy)

Identification notes: The leaves of Hedera are dimorphic, sometimes confusing observers; "juvenile" leaves (those of the sterile branches) are about as wide as long and (in H. helix) palmately 3-5-lobed, those of the fertile branches (less commonly seen) are obovate or elliptic.
ARALIACEAE

1 Trichomes scale-like, 0.1-0.4 mm, those on the leaves, petioles, and young stems with rays fused basally for 1/4 to 1/2 their length; juvenile leaves orbicular, little or not at all lobed, the larger 15-25 cm wide ............................................................ H. colchica
2 Trichomes stellate, 0.5-1.0 mm, those on the leaves, petioles, and young stems with rays fused basally for < 1/8 their length; juvenile leaves slightly to deeply lobed, the larger 5-15 cm wide.

2 Hairs of young stems, leaves, and petioles whitish, the rays erect (at a right angle to the leaf surface); juvenile leaves usually < 8 cm wide, usually dark green and often also marbled with white, often lobed > 1/2 the way to the base; [often strongly climbing] .... H. helix var. helix
2 Hairs of young stems, leaves, and petioles yellowish-brown to rusty-brown, the rays not erect (parallel to the leaf surface); juvenile leaves often > 8 cm wide, usually medium green (rarely also marbled with white), usually lobed < 1/2 the way to the base; [usually not climbing].

* Hedera hibernica (G. Kirchner) D. McClint. – Z

Hydrocotyle Linnaeus 1753 (Water-pennywort)

A genus of about 130 species, herbs, cosmopolitan (especially Australia). Molecular analyses have clarified that the affinities of Hydrocotyle lie with the Araliaceae rather than the Apiaceae (Downie et al. 1998; Chandler & Plunkett 2004). References: Mathiua & Constance (1945) = MC.

1 Leaves peltate, lacking a sinus extending to the attachment of the petiole.
2 Inflorescence umbellate; leaves 1.5-4 (-7) cm wide............................................................ H. umbellata
2 Inflorescence verticillate or umbellate-verticillate (when first developing sometimes appearing merely umbellate); leaves 1-15 cm wide.
3 Inflorescence compound, the main inflorescence axis with nodes which produce verticels or umbels of pedicellate flowers, the inflorescence nodes also producing branches which themselves produce verticels or umbels of flowers; leaves (1-) 4-15 cm wide .......
............................................................................................................................. H. sibthorpioides
3 Inflorescence verticillate, all the flowers borne sessile or on pedicels on the unbranched inflorescence axis; leaves 1-6 cm wide.
4 Flowers and fruits pedicellate, the pedicels 1-10 mm long ............................................................ H. prolifera
4 Flowers and fruits sessile or subsessile ........................................................................ H. verticillata

1 Leaves not peltate, a sinus extending to the attachment of the petiole.
5 Central leaf lobe notably more distinct than the other lobes (the sinuses on either side extending 1/3 to 3/4 of the way to the petiolar attachment); stems and petioles fleshy ............................................................ H. ranunculoides
5 Central leaf lobe not more distinct than the other lobes (the sinuses on either side extending 1/10 to 1/4 the way to the petiolar attachment); stems and petioles filiform.
6 Fruitings umbels on peduncles 1-3 mm long; leaves 10-50 mm wide; [native of bogs, spray cliffs, and other wetlands] .... H. americana
6 Fruitings umbels on peduncles 9-24 mm long; leaves 5-30 mm wide; [alien of lawns and other disturbed habitats].
7 Leaves 5-lobed, 15-30 mm wide ............................................................ H. bowlesioides
7 Leaves 7-lobed, 5-13 mm wide ........................................................................................ H. sibthorpioides

Hydrocotyle ranunculoides Lamarck, Dune Water-pennywort. Cp (FL, GA, NC, SC, VA): beaches, dunes, and moist sandy areas; uncommon (rare in VA). April-September. Widespread in South and Central America, north in North America to the Southeastern Coastal Plain, se. VA to s. FL and TX. [= RAB, GW, K, MC, S, WH]

**ARALIACEAE**

**Kalopanax** Miquel 1863 (Caster Aralia)

**Panax** Linnaeus 1753 (Ginseng)

1 Leaflets (3-) 5, petiolulate, the petiolules (0.7-) 1-2.5 cm long; larger leaflets 6-15 cm long, 3.5-7 cm wide, mostly about 2× as long as wide, the apex acuminate; fruit bright red when ripe .................................................................*P. quinquefolius*  
1 Leaflets 3 (-5), sessile or sub-sessile; larger leaflets 4-8 cm long, 0.5-2.5 cm wide, mostly about 3× as long as wide, the apex obtuse to acute; fruit yellow-green when ripe .................................................................*P. trifolius*

*Panax quinquefolius* Linnaeus, Ginseng, Sang, American Ginseng. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, GA, NC, VA): cove forests, mesic hardwood forests, generally in nutrient-rich forests though tending to avoid the richest coves; uncommon (rare in DE). May-June; August-October. QC west to MN and SD, south to e. VA, e. NC, nc. SC, GA, c. AL, LA, and OK. *P. quinquefolius* is gathered in quantity throughout its range for the herbal trade; most of the North American harvest is shipped to China, where it is prized for medicinal uses. Dried roots command prices in excess of $1000 per kilogram; in our area, "sang" is a multimillion dollar industry. Formerly abundant and occurring in large populations, *P. quinquefolius* has been reduced in most of its range to small populations of scattered individuals, a classic example of a "predator-prey" relationship. Collection and trade in ginseng is monitored and regulated in most states. In NC, it is illegal for ginseng dealers to buy ginseng from collectors before September; this allows the plants to mature fruits prior to collection. Schlessman (1985) discusses the floral biology of *P. quinquefolius*. [= F, K, W, WV, Y, Z; = *P. quinquefolius* – RAB, C, G, S, orthographic variant]

*Panax trifolius* Linnaeus, Dwarf Ginseng. Mt (GA, NC, VA), Pd (DE, NC, VA), Cp (DE, VA): cove forests, bottomland forests, other nutrient-rich forests; uncommon (rare south of VA). April-June; August-October. NS and QC west to MN, south to PA, e. VA, c. NC, nc. GA, ec. TN, IN, and IA. [= F, K, W, WV, Y, Z; = *P. trifolius* – RAB, C, G, S, orthographic variant]

**Tetrapanax** (K. Koch) K. Koch 1859 (Ricepaper-plant)

**UMBELLIFERAE** A.L. de Jussieu 1789 (Carrot Family) [in APIALES]

A family of about 445 genera and about 3540 species of herbs (rarely shrubs or trees), cosmopolitan, but especially north temperate. *Hypericum* is more closely related to Araliaceae, and has been transferred there (Chandler & Plunkett 2004). References: Mathias & Constance (1945)=MC. [also see ARALIACEAE]

[only a small fragment of the key to genera complete at this time]

1 Fruits (partly to fully mature) with thin-edged wings; flowers yellow, maroon, or white; central flower of each umbellet staminate and pedicelled; fruits all pedicelled in all umbellets.................................................................................................................................*Thaspium*
APIACEAE

Fruits ribbed (with rounded, cordlike ribs), lacking thin-edged wings; flowers yellow; central flower of each umbellet either staminate and pedicelled, or pistillate and sessile; fruits all pedicelled in some umbellets (those with a staminate central flower), or the central fruit sessile in some umbellets (those with a pistillate central flower) ....................................................................................................................................

Zizia

A genus of 5-7 species, perennial herbs, of temperate Eurasia. References: Mathias & Constance (1945)=MC.

* Zizia podograria Linnaeus, Goutweed. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, SC, VA): disturbed areas; rare, native of Europe. The cultivated forms encountered in our area are usually those with white-margined or variegated leaves. [= C, F, K, MC; > A. podograria var. podograria – RAB, G; > A. podograria var. variegatum L.H. Bailey – RAB, G]

Aegopodium

Linnaeus 1753

A genus of 5-7 species, perennial herbs, of temperate Eurasia. References: Mathias & Constance (1945)=MC.

* Aegopodium podograria Linnaeus, Goutweed. Mt (GA, NC, VA, WV), Pd (DE, GA, NC, VA), Cp (DE, SC, VA): disturbed areas; rare, native of Europe. The cultivated forms encountered in our area are usually those with white-margined or variegated leaves. [= C, F, K, MC; > A. podograria var. podograria – RAB, G; > A. podograria var. variegatum L.H. Bailey – RAB, G]

Aethusa

Linnaeus 1753

* Aethusa cynapium Linnaeus, Fool's-parsley. Cp (DE), Pd (DE), Mt (WV): disturbed areas; uncommon, native of Eurasia. Introduced and naturalized in ne. United States, at least as far south as se. PA (Rhoads & Klein 1993), DE, and Pocahontas County, WV. In Europe, several subspecies are often recognized; it is not known how these entities relate to material naturalized in North America and for now we treat the species broadly. [= C, F, G, K, MC, S, WH; > A. cynapium ssp. agrestis (Wallr.) Dostál – Z; > A. cynapium ssp. cynapium – Z; > A. cynapium ssp. gigantea (Lejeune) P.D. Sell; > A. cynapium ssp. cynapioides (M. Bieb.) Arcangeli – Z]

Ammi

Linnaeus 1753 (Bishop's-weed)

A genus of about 4-10 species, annual or biennial herbs, distributed in Mediterranean Europe. References: Mathias & Constance (1945)=MC.

Anthemum

Torrey & A. Gray 1855 (Sand-parsley)

A genus of 3 species, herbs, of sc. and sw. North America and temperate s. South America. References: Mathias & Constance (1945)=MC.

Angelica

Linnaeus 1753 (Angelica)
A genus of about 60-110 species, perennial herbs of the northern hemisphere. References: Mathias & Constance (1945)=MC.

1 Larger leaflets 3-6 cm long, 1-2.5 cm wide, obtuse at the apex; umbels either densely pubescent or glabrous; ovary and fruit either pubescent or glabrous; [collectively widespread in our area, in dry to mesic habitats].
2 Umbels pubescent; ovary and fruit hispid; leaf segments coarsely toothed .................................................................................................................. A. dentata
1 Larger leaflets 8-15 cm long, 4-8 cm wide, acute to acuminate at the apex; umbels glabrous or sparingly pubescent; ovary and fruit glabrous or sparingly pubescent; [restricted to the Mountains in our area, in mesic habitats]
3 Leaflets acute, the margin hyaline and mostly glabrous; umbels with 20-45 umbellets ................................................................................ A. atropurpurea
3 Leaflets acuminated, the margin ciliolate; umbels with 13-25 umbellets ................................................................................ A. triquinata

Anglica atropurpurea Linnaeus, Purple Angelica. Pd (DE), Mt (NC*?, WV): riverbanks, streambanks, moist roadsides; rare. May-June; July-August. S. NL (Labrador) west to WI and MN, south to NL (Newfoundland), NS, DE, MD, WV, OH, IN, IL, and ne. IA (and in the mountains to ne. TN and w. NC – the NC occurences have sometimes been speculated to be naturalized). [= RAB, C, G, K, MC, W; > A. atropurpurea var. atropurpurea – F]

* Angelica lucida Linnaeus. Native to n. North America. Reported by Harvill et al. (1992) for Warren County, VA; more information is needed to substantiate this surprising record, presumably from cultivation. [= C, G, K, MC; = Coelopleurum lucidum (Linnaeus) Fernald – F] {not keyed}

Anglica triquinata Michaux, Mountain Angelica, Filmy Angelica. Mt (GA, NC, VA, WV): mesic forests at moderate to high elevations, grassy balds, brookbanks; common (uncommon in WV). August-September; September-October. PA south to sw. NC, se. TN, and n. GA, a Southern and Central Appalachian endemic. The nectar is very attractive, but apparently strongly intoxicating, to yellow jackets and hornets; on the grassy balds of Roan Mountain one can see thousands of umbels of Angelica densely coated by lethargic bees. [= RAB, C, F, G, K, MC, W; ? A. curtisi Backley – S]

Anglica venenosa (Greenway) Fernald, Hairy Angelica. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): dry forests and woodlands, woodland borders, longleaf pine sandhills, hammocks; common (rare in DE and FL). June-August; July-September. MA west to MN, south to Panhandle FL, MS, and AR. Populations of this species in dry sandhill communities in the Fall Line Sandhills have a number of peculiar features: basel leaves often borne appressed against the ground, small leaflets, coarse and more equilateral toothing of the leaflets. These populations may be worthy of taxonomic recognition; they need further study. [= RAB, C, F, G, K, MC, W; ? A. villosa (Walter) Britton, Sterns, & Poggenburg – S]

Anthriscus Persoon 1814 (Chervil)

1 Fruit ovoid, 2.9-3.2 mm long, hispid with hooked hairs; [section Anthriscus] .................................................................................................................. A. caucalis
1 Fruit lanceolate or linear, 6-10 mm long, glabrous.
2 Beak of fruit (1-) 2-4 mm long, well-differentiated from the body; plant an annual; umbel rays pubescent; [section Anthriscus] .................................................................................................................. A. cefalum
2 Beak of fruit ca. 1 mm long, scarcely differentiated from the body; plant a perennial; umbel rays glabrous (or nearly so); [section Cacosciadium] .................................................................................................................. A. sylvestris ss. sylvestris

* Anthriscus sylvestris (Linnaeus) Hoffmann ss. sylvestris, Wild Chervil, Cow-parsley. Mt (NC, TN, VA), Pd (DE): moist disturbed areas; rare, native of Eurasia. May-July. This species has also been reported from the NC-TN state line, on Roan Mountain (Mellichamp, Matthews, & Smithka 1987, 1988); the population is actually entirely in TN. Reported for Watauga, Ashe, and Alleghany counties, NC (Poindexter, pers. comm. 2009). [= Z; < A. sylvestris – C, F, G, K, MC]

Apium Linnaeus 1753 (Celery)

A genus of about 20 species, herbs, of temperate and subtropical regions, mainly Southern Hemisphere. References: Ronse et al. (2010)=Z; Mathias & Constance (1945)=MC.

1 Involutel absent; fresh plant smelling of celery; stem solid .................................................................................................................. A. graveolens var. dulce
1 Involutel present; fresh plant not smelling of celery; stem hollow .................................................................................................................. [Heliosciadium nodiforum]
**APIACEAE**

**Bifora** Hoffmann 1816 (Bishop)

A genus of 4-6 species, annual herbs, of Mediterranean Europe, w. Asia (Caucasus), and w. North America.

* Bifora americana Bentham, Prairie Bishop. Disturbed areas; native of sc. North America. April-June. [= K] {perhaps not naturalized; not keyed or mapped}
* Bifora radians Bieberstein. [= K] {probably not naturalized; not keyed or mapped}
* Bifora testiculata (Linnaeus) Sprengel. [= K] {probably not naturalized; not keyed or mapped}

**Bowlesia** Ruiz & Pavón 1794 (Bowlesia)

A genus of ca. 15 species, herbs, of South America. References: Mathias & Constance (1945)=MC.

* Bowlesia incana Ruiz & Pavón. Cp (FL): open wet hammocks and bottomlands; rare, native of South America. [= GW, K, MC, WH; = Bowlesia septentrionalis Coulter & Rose – S]

**Bupleurum** Linnaeus 1753 (Hare's-ear, Thoroughwax)

A genus of about 190 species, herbs and shrubs, primarily Eurasian. References: Snogerup & Snogerup (2001)=Z; Mathias & Constance (1945)=MC.

1 Upper leaves linear, sessile; [section Aristata] ...................................................................................................................... B. gerardii
1 Upper leaves ovate, perfoliate; [section Bupleurum] ...................................................................................................................... B. rotundifolium

* Bupleurum lancifolium Hornemann. Reported as a waif for MD by Shetler & Orli (2000) and Reed (1964). [= K] {not keyed; not mapped}
* Bupleurum odoratissimum Linnaeus. Reported as a waif for MD by Shetler & Orli (2000) and Reed (1964). [= K; > B. fontanensis Guss. ex Careul – C, G, MC] {not keyed; not mapped}

**Carum** Linnaeus 1753 (Caraway)

A genus of about 30 species, temperate. References: Mathias & Constance (1945)=MC.

**Centella** Linnaeus 1764 (Centella, Coinleaf)

A genus of about 40 species, of warm temperate and tropical regions, centered in s. Africa. References: Mathias & Constance (1945)=MC.

**Centella erecta** (Linnaeus f.) Fernald, Centella, Coinleaf. Cp (DE, GA, NC, SC, VA): savannas, pondshores, ditches, and a wide variety of other moist to wet habitats; common (rare in DE). June-August; July-September. S. NJ and DE south to s. FL, west to s. TX; West Indies, Mexico, Central America. C. erecta has sometimes been included in the pantropical C. asiatica, but the two taxa differ in morphology and chromosome number (C. erecta has n = 27, C. asiatica has n = 9). [= C, F, G, K, MC; < C. asiatica (Linnaeus) Urban – RAB, GW, misapplied; ? C. repanda (Persoon) Small – S]

**Chaerophyllum** Linnaeus 1753 (Chervil)

A genus of about 35 species, herbs, of north temperate areas. References: Mathias & Constance (1945)=MC.
APIACEAE

1 Ribs of fruit broad, the intervals between the ribs much narrower than the ribs; pedicels somewhat club-shaped; stem and leaf surfaces essentially glabrous ................................................................. C. tainturieri

1 Ribs of fruit narrow, the intervals between the ribs equal to or wider than the ribs; pedicels mostly uniform in shape; stem and leaf surfaces mostly pilose.

2 Fruit glabrous, 6-10 mm long, 1.5-2 mm broad ................................................................. C. procumbens var. procumbens

2 Fruit densely puberulent, 4.5-6.5 mm long, 2-2.5 mm broad ................................................................. C. procumbens var. shortii

* Chaerophyllum bulbosum Linnaeus, Parsnip Chervil. Waif in DC; native of Europe. [= C, G, K, MC] [not keyed; not mapped]

Chaerophyllum procumbens (Linnaeus) Crantz var. procumbens, Common Spreading Chervil. Pd (DE, GA, NC, SC, VA), Mt (VA, WV); alluvial forests; common (uncommon in NC, rare in DE, FL, GA, and SC). Late March-April; April-May. NY and s. ON to MI, s. WI, and e. NE, south to GA, AR, and OK. [= RAB, C, F, G, K, MC; < C. procumbens – GW, W, WH; = C. procumbens – S]

Chaerophyllum procumbens (Linnaeus) Crantz var. shortii Torrey & A. Gray, Short's Spreading Chervil. Mt (VA, WV), Pd (SC): nutrient-rich mountain forests, alluvial forests; rare. March-April. W. PA west to IN, south to SC, TN, and LA. The validity of this variety needs additional study. [= RAB, C, F, G, K, MC; < C. procumbens – GW, W; = C. shortii (Torrey & A. Gray Bush – S]

Chaerophyllum tainturieri Hooker, Southern Chervil. Cp (DE, FL, GA, NC, SC, VA, PA), Pd (GA, NC, SC, VA, WV); roadsides, disturbed areas, fields; common (rare in DE and WV). March-April; April-May. MD west to NE, south to c. peninsular FL, TX, and AZ. Var. tainturieri (with fruits glabrous) and var. dasycarpum (with fruits pubescent) are sometimes distinguished (see synonymy). They have largely overlapping distributions, and seem unlikely to warrant taxonomic status, but need additional study. C. texanum Coulter & Rose is reported as a native in the Nashville Basin of TN (Chester, Wofford, & Kral 1997); it is usually now included in C. tainturieri (var. tainturieri). [= RAB, C, GW, W, WH; > C. tainturieri var. tainturieri – K; > C. tainturieri var. tainturieri – F, G, MC; > C. tainturieri var. floridanum Coulter & Rose – F; > C. texanum Coulter & Rose – F, G, MC; > C. teinturieri – S, orthodox variant; > C. floridanum (Coulter & Rose) Bush – S; > C. tainturieri var. dasycarpum Hooker ex S. Watson – K, MC; > C. dasycarpum (Hooker ex S. Watson) Nuttall ex Small – S]

* Chaerophyllum temuleum Linnaeus, Rough Chervil. Native of Europe; introduced as a waif south to PA and NJ (Kartesz 1999). [= C, G, K, MC] [not keyed; not mapped]

Cicuta Linnaeus 1753 (Water-hemlock)

A genus of 8 species, herbs, north temperate in distribution. References: Mulligan (1980)=Z; Mathias & Constance (1945)=MC.

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

1 Flowers usually forming mature fruits 2-4 mm long; axils of l eaves not bearing bulbils; leaflets lanceolate, usually > 6 mm wide. ................................. C. maculata

Cicuta bolanderi S. Watson. Marshes, bogs, seepages, ditches, swamp forests. Scattered in distribution, from NJ, WI, and MN south to GA, TX, Mexico, and AZ. Further study is needed of the distinctiveness, distribution, and ecology of this species. [= K, MC; < C. maculata var. maculata – C, F, G; = C. maculata Linnaeus var. bolanderi (S. Watson) Mulligan – Z]

Cicuta bulbifera Linnaeus, Bulb-bearing Water-hemlock. Marshes and swamps. July-September. NL (Newfoundland) west to AK, south to MD, n. VA (?), OH, KY, IN, IL, IA, NE, MT, ID, and OR; disjunct (perhaps introduced only) in NC and FL. [= C, F, G, K, MC, Z]

Cicuta maculata Linnaeus var. maculata. Water-hemlock. Marshes, bogs, seepages, ditches, swamp forests. May-August; July-September. NS west to AK, south to FL, CA, and Mexico. Two other varieties are more northern or western: var. victorinii (Fernald) Boivin of QC and var. angustifolio Hooker of western North America. All parts of the plant, especially the tubers, are dangerously poisonous. [= C, maculata – RAB, GW, MC, S, W; < C. maculata var. maculata – C, F, G (also see var. bolanderi); < C. maculata var. maculata – K, Z (also see C. mexicana); < C. maculata – WH]

Cicuta mexicana Coulter & Rose, Southern Water-hemlock. Marshes, bogs, seepages, ditches, swamp forests, floating vegetation mats. May-August; July-September. S. VA (GW), south to FL, and west to TX, south into Mexico (more inland records in our area and westward are of uncertain disposition). Though not recognized by Mulligan (1980), this taxon appears to warrant taxonomic recognition. It is a generally coarser plant than C. maculata. [= RAB, GW, MC; = C. maculata var. curtissii (Coulter & Rose) Fernald – F, G; < C. maculata var. maculata – K, Z; = C. curtissii Coulter & Rose – S; < C. maculata – WH]

Conioselinum Hoffmann 1899 (Hemlock-parsley)

A genus of about 10 species, herbs, north temperate in distribution. References: Mathias & Constance (1945)=MC.

Conioselinum chinense (Linnaeus) Britton, Sterns, & Poggenburg, Hemlock-parsley. Nutrient-rich seepage over cliffs and through boulderfields, at high elevations, known from seepage over cliffs and through boulderfields at about 1500 m on the north
slope of Grandfather Mountain (Avery County, NC), and from a north-facing greenstone cliff-top seep at 1150 m on Stony Man, Page County (VA). July-September. The specific epithet is a misnomer; the species is native to n. North America (the specific epithet a misnomer): south to PA, IN, IA, and NB, and disjunct in VA and NC) and ne. Asia (e. Siberia), but not found in China (the epithet a mistake based on confusion between "Genesee," New York, and "Chinensem"). The single NC population was first discovered in 1842 by Asa Gray and John Carey, and not seen again until 1989. The VA population was first reported by Fleming & Ludwig (1996). The report of the species from Roan Mountain was found to be in error; see Anthriscus (Melichamp, Matthews, & Smithka 1987, 1988). [= RAB, C, F, G, K, MC, S, W]

**Conium Linnaeus 1753 (Poison-hemlock)**

* **Conium maculatum** Linnaeus, Poison-hemlock. Ditches, roadsides, streambanks, disturbed areas; native of Eurasia. May-June; June-July. All parts of the plant are highly toxic if ingested, causing respiratory failure in humans and other mammals. [= RAB, C, F, GW, K, MC, S, W, WV]

**Coriandrum Linnaeus 1753 (Coriander, Cilantro)**

**Cryptotaenia A.P. de Candolle 1829 (Honewort)**

A genus of 6 species, herbs, in north temperate areas (and montane Africa). References: Mathias & Constance=MC.

**Cryptotaenia canadensis** (Linnaeus) A.P. de Candolle, Honewort. Moist and nutrient-rich forests (alluvial, bottomland, slope, and cove forests). May-June; June-August. NB and QC to MB, south to e. GA, sw. GA, Panhandle FL, AL, and TX; also in Japan. [= RAB, C, F, GW, K, MC, WH, WV; = Deringa canadensis (Linnaeus) Kuntze – S]

**Cyclospermum Lagasca y Segura 1821 (Marsh-parsley)**

A genus of 3 species, herbs, of tropical and warm temperate America. Only distantly related to Apium and warranting generic status (Ronse et al. 2010). References: Ronse et al. (2010)=Z; Mathias & Constance (1945)=MC.

**Cynosciadium A.P. de Candolle 1829**

**Cynosciadium digitatum** A.P. de Candolle. Wet places, ditches, blackland prairies. IL, sw. TN (Shelby County), and AL west to OK and TX. [= C, F, G, GW, K, MC, S]

**Daucus Linnaeus 1753 (Wild Carrot, Queen-Anne's-lace)**

A genus of about 22 species, herbs, of temperate and tropical areas, primarily Old World. References: Mathias & Constance (1945)=MC.
DAucus carota Linnaeus, Queen-Anne’s-Lace, Carrot, Wild Carrot. Pastures, fields, roadsides, waste places; native of Europe. May-September. The cultivated carrot is a form with a fleshy taproot rich in carotene; the familiar field weed has a "carroty" flavor, but the root is woody and tan in color. [= RAB, C, F, G, K, MC, S, W, WH, WV]

DAucus pusillus Michaux, American Queen-Anne’s-lace. Pastures, fields, roadsides, waste places. April-May; May-June. This native relative of D. carota is smaller and less branched. Widespread in Southeastern United States, north to NC and MO. It should be expected in the lower Piedmont of NC and in the Coastal Plain of se. VA, which it closely approaches. Robert Wright has collected this species as a waif in Henrico County, VA (R. Wright, 2002, pers. comm.). [= RAB, C, F, G, K, MC, S, W, WH]

Erigenia Nuttall 1818 (Harbinger-of-spring, Pepper-and-salt)

Erigenia bulbosa (Michaux) Nuttall, Harbinger-of-spring, Pepper-and-salt, Erigelia. Mesic, nutrient-rich forests, either over calcareous substrates or on very rich alluvial deposits (such as riverbanks). February-May. S. PA, w. NY, s. ON, c. MI, and se. WI south to MD, DC, c. VA, w. VA, nc. NC, w. NC, e. TN, nw. GA, c. AL, n. MS, sw. AR, and se. KS (almost entirely west of the Blue Ridge). Rodgers (1950) states "reported in mtns. of N.C. by Kephart and Hyams;" now documented from both the nc. Piedmont and the w.MD, DC, Mountains. See Buddell & Thieret (1985) for a very interesting and entertaining account of this plant. [= RAB (excluded), C, F, G, K, MC, S, W, WV, Z]

Eryngium Linnaeus 1753 (Eryng)

A genus of about 250 species, herbs, tropical and temperate. References: Bell (1963)=Z; Mathias & Constance (1945)=MC; Calviño, Martínez, & Downie (2008).

1 Involucral bracts scarious-margined, spreading or reflexed in fruit; spines of fruit not prominently barbed apically; umbel rays 10-65 mm long (at least some in a given inflorescence usually exceeding 3 cm); umbellets (10-) 20-numerously flowered; central flower of the umbel usually dark purple; plant a freely-branched biennial. ................................................................. D. carota

1 Involucral bracts not scarious-margined, appressed-ascending in fruit; spines of fruit prominently barbed apically; umbel rays 5-26 mm long; umbellets 5-12 flowered; central flower of the umbel white; plant an unbranched (or rarely few-branched) annual. ............................................. D. pusillus

Eryngium Linnaeus 1753 (Eryng)

1 Leaves thin, fleshy, or subcoriaceous, entire, toothed, palmately lobed, or pinnately incised, the teeth or lobes (if present) unarmed or with weak spines.

2 Inflorescence branched, the heads in a cyme borne terminally on the erect stem. [subgenus Monocotyledon.] ................................................................. E. integrifolium

2 Inflorescence unbranched, the heads solitary on peduncles from the leaf axils of the prostrate to erect stem; [subgenus Monocotyledon.]

3 Leaves pinnately lobed or dissected. ................................................................................................................................. E. divaricatum

3 Leaves entire, irregularly toothed (rarely with some irregular lobing).

4 Heads subglobose or hemispherical when fully developed, about as wide as long; bracts subtending the head barely extending beyond the base of the head; main stems leaves linear, narrowly elliptic, narrowly oblanceolate, sometime tricuspid apically ................................................................. E. baldwinii

4 Heads cylindrical, longer than wide; bracts subtending the head longer than the radius of the head, thus extending conspicuously beyond the base of the head; main stem leaves elliptic, broader than above. ................................................................. E. prostratum

5 Basal and cauline leaves (all, or at least many of the cauline) definitely deeply lobed into 3 or more divisions, < 10 cm long.

6 Heads blue; basal leaves serratate but not divided; [subgenus Monocotyledon.] ................................................................. E. hookeri

6 Heads greenish; basal leaves pinnately or pinnate-ternately divided.

7 Plants slender, not fleshy, green; basal and cauleine leaves 2-6 cm long, 3-5 (-7) pinnately parted; heads 5-8 mm in diameter; [native species of dry pinelands of the Coastal Plain of e. GA, s. AL, and FL.]; [subgenus Monocotyledon.] ................................................................. E. aromaticum

7 Plants stout, fleshy, usually glaucescent; basal leaves 10-25 cm long and wide, pinnately or pinnate-ternately divided into > 7 segments, the cauleine leaves similar but reduced in size and number of divisions; heads 10-15 mm in diameter; [rare ballast waif of disturbed ground]; [subgenus Eryngium] ................................................................. E. campestre

5 Basal and cauline leaves unlobed (except sometimes the uppermost; note that bracts in the inflorescence are often lobed), 3-100 cm long; [subgenus Monocotyledon.]

8 Blades of basal and lower cauleine leaves 3-7 (-10) cm long, acute to obtuse apically, cordate to truncate basally, with a length/width ratio of 1.5-3 (-6) ................................................................................................................................. E. integrifolium

Eryngium aromaticum Baldwin, Fragrant Eryngio. Cp (FL, GA): dry pinelands; common (uncommon in GA). E. GA west to s. AL, south to s. FL. [= K, MC, S, WH, Z]

Eryngium baldwinii Sprengel. Cp (FL, GA): pinelands, temporary pools, ditches, other moist to wet sites; common (uncommon in GA). Se. GA and sw. GA south to s. FL. [= GW, K, S, WH, Z; = E. baldwini – MC, orthographic variant]

* Eryngium divaricatum Hooker & Arnott. Cp (FL, NC): disturbed areas, introduced on ballast at old port towns (Wilmington, NC; Pensacola, FL); rare, native of South America. July-October. Not seen in recent years and probably not persistent. [= RAB, K, MC, S, WH, Z]

* Eryngium foetidum Linnaeus, Spiritweed. Listed by Kartesz (1999) as introduced in GA and FL, but the only reports are very early and anecdotal, and the species was excluded from the North American flora by Coulter & Rose (1900), with no subsequent documentation that would change that conclusion. Native of Mexico, Central America, South America, and West Indies. [= K, MC] {not keyed}

** Eryngium hookeri Walpers. Ditches, other wet areas. MS and AR west to OK and TX, perhaps recently adventive in the eastward portions of that distribution, not credited as occurring east of TX in Matthews & Constance (1945). [= K, MC]

Eryngium integrifolium Walter, Savanna Eryngio. Cp (FL, GA, NC, SC), Mt (GA, NC, SC), Pd (GA, NC, SC, VA): savannas, pine flatwoods, seepages, other moist, nutrient-poor places; common (rare in Piedmont and Mountains). August-October. Se. VA (Greensville County) (Belden et al. 2004) and e. NC south to ne. FL and Panhandle FL, west to OK and TX, inland in c. TN. [= RAB, K, MC, W, WH, Z; = E. integrifolium – S; = E. ludovicianum Morong – S]

Erigenia bulbosa

Erigenia prostratum Nuttall ex A.P. de Candolle, Spreading Eryngio. Cp (DE*, FL, GA, NC, SC, VA), Pd (GA, NC, SC, VA), Mt (NC, SC): floodplain forests, bogs, pond, margins, moist ditches and lawns, other moist, open habitats; uncommon, definitely native southwards, perhaps only rather recently spread to the northern parts of our area. May-October. Se. VA south to FL, west to OK and TX. [= RAB, C, GW, K, MC, S, WH, Z; = E. prostratum var. prostratum – F, G; = E. prostratum var. disjunctum Fernald – F, G]

Erigenia yuccifolium Michaux var. synchaetum A. Gray ex Coulter & Rose, Southern Rattlesnake-master. Cp (FL, GA, NC, SC): wet savannas, especially those over calcareous clay soils; rare (NC Watch List). June-August. A Southeastern Coastal Plain endemic: se. NC to s. FL and west across the Gulf Coastal Plain, the exact range limits obscure. The distinction between the two varieties, seemingly clear in NC and elsewhere in states bordering the Atlantic, seems to become less straightforward further west, as in LA and AR. In NC it has been seen in Pender, Brunswick, Columbus, Bladen, and Robeson counties. [= RAB, K, MC, Z; < E. yuccifolium – GW, WH; = E. synchaetum (Gray ex Coulter & Rose) Coulter & Rose – S]

Eryngium yuccifolium Michaux var. yuccifolium, Northern Rattlesnake-master. Pd (GA, NC, SC, VA), Mt (GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): diabase barrens and glades, olivine barrens, pine savannas, pine flatwoods over loamy or clay soils, other open sites with at least periodic moisture, generally in sites showing some prairie affinities; uncommon (rare in VA). June-August. Widespread in southeastern and midwestern North America, the exact range limits of the typic variety and var. synchaetum somewhat obscure. [= RAB, K, MC, Z; < E. yuccifolium – C, F, G, WH; = E. yuccifolium – GW (also see E. yuccifolium var. synchaetum); = E. aquaticum – S, misapplied]
Falcaria Fabricius 1827 (Sickleweed)

A monotypic genus, an herb, of Eurasia. References: Mathias & Constance (1945)=MC.

Foeniculum P. Miller 1763 (Fennel)

A genus of 4-5 species, herbs, of Asia and Mediterranean Europe. References: Mathias & Constance (1945)=MC.

* **Foeniculum vulgare** P. Miller, Fennel. Cp (DE, FL, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Pd (DE, NC, SC, VA): fields, dredge spoil, old gardens, waste places, vacant lots, roadsides; uncommon (sometimes locally common, rare in DE and WV), native of Mediterranean Europe. June-August; August-September. This is the common garden fennel, cultivated for its seeds, leaves, "bulbs" (finocchio), and ornamental appearance (especially bronze forms), widely used in Mediterranean cuisines. [= RAB, C, F, G, K, MC, W, WH, WV; = *Foeniculum foeniculum* (Linnaeus) Karsten – S]

Harperella Rose 1906 (Harperella)

A genus of 3 species, herbs, temperate, of c. North America. Based on work of Feist & Downie (2008), *Harperella* should be (re)-separated from *Ptilimnium*. Some authors, such as C, K, and Kral (1981a) prefer to include *H. fluviatilis* and *H. vivipara* in *H. nodosa*, but recent electrophoretic and morphologic data suggest the existence of three taxa: *H. vivipara* of w. MD, e. WV, VA, and c. NC, *P. fluviatilis* of n. AL and AR, and *P. nodosa* of SC and GA. See Maddox & Bartgis (1990) and Kress, Maddox, & Roesel (1994) for additional information. Further electrophoretic and morphologic studies are underway. References: Feist & Downie (2008); Easterly (1957)=Z; Kral (1981a)=Y; Rose (1911)=X; Mathias & Constance (1945)=MC; Kress, Maddox, & Roesel (1994).

1 Leaves 8-30 cm long; plants 4-10.5 dm tall, not proliferating from the nodes (strictly annual); rays 10-25 mm long, 6-15 per inflorescence; pedicels 3.0-6.0 mm long; [of still water of Coastal Plain ponds] ........................................................................................................... H. nodosa
2 Leaves 4-12 (-15) cm long; plants 1-5 (-8 ) dm tall, proliferating from the nodes (thus adventitiously perennial); rays 1-9 mm long, 2-5 (-9) per inflorescence; pedicels 0.5-2.0 (-2.5) mm long; [of shoals, outcrops, and banks of rocky streams or rivers]

**Harperella fluviatilis** Rose, Gulf River Harperella. Rocky riverbeds. N. AL and AR. [= X; = *Ptilinnum fluviatilis* – MC, orthographic variant; < *P. fluviatile* (Rose) Mathias – RAB, G, GW, Z; < *P. nodosum* (Rose) Mathias – C, K, Y; < *Harperella fluviatilis* Rose – S, X]

**Harperella nodosa** Rose, Pond Harperella. Upland depression ponds, seepage on granite outcrops. June. Known only from a few sites in SC and c. GA. [= S, X; = *Ptilinnum nodosum* (Rose) Mathias – RAB, GW, MC, Z; < *P. nodosum* (Rose) Mathias – C, K, Y (also see *P. fluviatile*)]

Helosciadium W.D.J. Koch 1824

A genus of 5 species, herbs, of Eurasia. References: Ronse et al. (2010)=Z; Mathias & Constance (1945)=MC.

APIACEAE

Heracleum Linnaeus 1753 (Cow-parsnip, Hogweed)

A genus of about 65 species, herbs, north temperate (and tropical mountains). References: Mathias & Constance (1945)=MC.

* Heracleum mantegazzianum Sommier & Lever. Native to the Caucasus Mountains, has been introduced in ne. North America and is becoming established; it may eventually spread to our area. It is considerably larger and coarser even than H. maximum (not a paltry herb itself), reaching 5.5 m in height, the hollow stems to 15 cm in diameter, the lower leaves to 2.5 m long, and the umbels to 5 dm across. More modestly-sized individuals may be distinguished from H. maximum by wider oil tubes on the fruit [(0.6-) 0.8-1.0 mm wide vs. 0.3-0.5 (-0.8). [= K] {not keyed}]

Heracleum maximum W. Bartram, Masterwort, Cow-parsnip, American Hogweed. Mt (GA, NC, VA, WV), Pd (DE): forests, roadbanks, meadows, forest openings; uncommon (rare in GA). May-July; July-August. NL (Labrador) west to AK, south to DE, PA, OH, IN, IL, MO, KS, NM, AZ, CA, and in the Appalachians south to w. NC, e. TN, and n. GA; also in e. Siberia. The synonymy reflects two questions, one nomenclatural, the other taxonomic. North American plants are very similar to European ones, leading some workers to treat our plants as a subspecies or variety of the European. If recognized as specifically distinct from European H. sphondylium, the nomenclatural question is whether to accept Bartram’s (older) name as validly published. [= F, GW, K; = H. lanatum Michaux – RAB, C, G, MC, W; = H. sphondylium Linnaeus var. lanatum (Michaux) Dorn; ? H. sphondylium Linnaeus ssp. montanum (Schleicher ex Gaudin) Briquet]

Imperatoria Linnaeus 1753 (Masterwort)

A genus of 3 species, of Eurasia. References: Ball in FNA (in prep.); Mathias & Constance (1945)=MC.

* Imperatoria ostruthium Linnaeus, Masterwort. Mt (TN, WV); disturbed areas; rare, native of Europe. May-July. Naturalized in ne. United States from Europe. Reported from Carter County, TN (Chester, Wofford, & Kral 1997), and also is reported for scattered localities in PA (Rhoads & Klein 1993). [= FNA, MC, WV; = Peucedanum ostruthium (Linnaeus) W.D.J. Koch – C, K]

Ligusticum Linnaeus 1753 (Lovage)

A genus of 40-50 species, herbs, circumboreal and north temperate. References: Mathias & Constance (1945)=MC.

Ligusticum canadense (Linnaeus) Britton, Nondo, Angelico, American Lovage. Mt (GA, NC, SC, VA, WV), Pd (GA, NC, SC, VA); Cp (FL, NC): moist to dryish, nutrient-rich forests and woodlands; common (rare in Coastal Plain). June-July; August-September. S. PA south to c. GA, AL, and Panhandle FL; also in s. MO and n. AR, centered in the Southern and Central Appalachians and the Ozarks-Ouachitas, but extending considerably into adjacent provinces, and even slightly into the CoastalPlain. A distinctive character is the straightish and toothless basal portion of each leaflet. [= RAB, C, F, G, K, MC, S, W, WV]

Lilaeopsis Greene 1891 (Lilaeopsis)

1 Leaves 7-30 (or more) cm long, often spatulate, up to 11 mm wide toward the apex, with (7-) 10-20 transverse septae; peduncles much shorter than the leaves; pedicels 5-10 mm long........................................................................................................L. carolinensis

1 Leaves 1-5 cm long, linear (rarely spatulate), 1-2 (-5) mm wide, with 4-8 (-10) transverse septae; pedicels about as long as or longer than the leaves; pedicels 3-4 mm long.................................................................................................................. L. chinensis

Lilaeopsis carolinensis Coulter & Rose, Carolina Lilaeopsis. Cp (FL, GA, NC, SC, VA): freshwater marshes and pondshores, ditches, interdune ponds, shores of brackish to freshwater estuarine sounds and rivers; uncommon (rare in GA, NC, SC, and VA). May-June. Se. VA south to FL and west to e. TX (Hatch & Slack 2008); it is also found in South America (Argentina, Brazil, and Paraguay). [= RAB, F, GW, K, S, WH, Z; = L. attenuata (Hooker & Arnott) Fernald – C, G, MC]

Lilaeopsis chinensis (Linnaeus) Kuntze, Marsh Lilaeopsis. Cp (DE, FL, GA, NC, SC, VA): brackish and freshwater tidal marshes, especially in mud-flats in the intertidal zone; common. May-June. NS south to FL and west to TX (Brown & Marcus 1998). The epithet "chinensis" is a misnomer; the species is native to e. North America and has nothing to do with China. [= RAB, F, G, GW, K, MC, WH, Z; = L. lineata (Michaux) Greene – S]

Oenanthe Linnaeus 1753 (Water-dropwort)

A genus of ca. 40 species, herbs, of north temperate areas.

* Oenanthe javanica A.P. de Candolle, Water Celery, Water Parsley, Java Dropwort, Seri. Pd (VA), Mt (GA): edge of swamp forests, ditches; rare (but seemingly with the ability to spread rapidly), native of Asia. July-August. [] {add to synonymy}
Osmorhiza Rafinesque 1819 (Sweet Cicely, Wild Chervil)

A genus of about 10 species, herbs, of temperate North America, temperate South America, montane tropical Central and South America, and Asia (Wen et al. 2002). References: Lowry & Jones (1979)=Z; Mathias & Constance (1945)=MC; Wen et al. (2002).

1 Styles plus stylopodium 0.5-1.5 mm long; flowers 4-7 (-10) per umbellet (including withering staminate flowers); flowers 3-4 mm across; umbellets 3-5 (-6) per umbel, on rays 2-8 (-10) cm long, the umbel therefore relatively uncrowded; roots (and foliage) not strongly anise-scented .......................................................... O. rigidior

1 Styles plus stylopodium 2.0-3.5 mm long; flowers 6-9-18 per umbellet (including withering staminate flowers); flowers 5-6 mm across; umbellets 4-6 (-8) per umbel, on rays 1.5-5.0 (-7.5) cm long, the umbel therefore rather crowded; roots (and foliage) strongly anise-scented ...

........................................................................................................................................................................................................ O. longistylis

Oxypolis Rafinesque 1825 (Dropwort, Hog-fennel, Cowbane)

A genus of about 7 species, herbs, of temperate North America. Based on work of Feist & Downie (2008), Oxypolis is likely to be split into two genera. References: Feist & Downie (2008); Mathias & Constance (1945)=MC; Kral (1981); Tucker et al. (1983).

1 Leaves with 1-13 leaflets, the leaflets flat; [Oxypolis s.s.].
2 Leaflets (5-) 7-11 (-13), pinnately disposed, usually toothed (rarely entire), net-veined .................................................. O. rigidior

1 Leaves reduced to hollow, linear, nodose-septate quills, consisting of the petiole and leaflet-less rachis, undivided; [Tiedemannia].
3 Mature fruits with corky-thickened peripheral ribs, the fruit with a narrowly rectangular cross-section, about as thick near the ends of the ribs as at the center, 0.2 mm thick at the edge; plants with stout rhizomes or a caudex, not long stoloniferous; lower nodes generally retaining their leaves until flowering; umbellets/umbel 10-20
4 Flowers white; segments of phyllodia cylindrical .......................................................... O. filiformis

1 Leaves reduced to hollow, linear, nodose-septate quills, consisting of the petiole and leaflet-less rachis, undivided; [Tiedemannia].
3 Mature fruits with peripheral ribs progressively thinning away from the seed cavity, the fruit with a fusiform cross-section, distinctly thinner toward the ends of the ribs than at the center, 0.2 mm thick at the edge; plants with stout rhizomes or a caudex, not long stoloniferous; lower nodes generally retaining their leaves until flowering; umbellets/umbel 5-9 (-12)
4 Flowers white; segments of phyllodia cylindrical .......................................................... O. filiformis

Oxypolis canbyi (Coulter & Rose) Fernald, Canby's Cowbane. Cp (DE, GA, NC, SC): clay-based Carolina bays and other depressional wetlands; rare. July-August; August-September. Sw. GA through SC to se. NC (mostly in the middle and inner Coastal Plain); and from e. MD to (formerly) DE. See Tucker et al. (1983) for detailed information on this rare species and a comparison of it to the more widespread O. filiformis. [= C, F, G, K, MC; Tiedemannia]

Oxypolis filiformis (Walter) Britton, Water Dropwort. Cp (FL, GA, NC, SC): wet savannas, sandhill seepages; common (uncommon north of FL). July-August; August-September. Se. NC south to s. FL, west to se. TX; West Indies. [= RAB, GW, K, MC, S; = O. filiformis var. filiformis – WH; = Tiedemannia]

Oxypolis rigidior (Linnaeus) Rafinesque, Cowbane, Pig-potato. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (DE, FL, GA, NC, SC, VA): bogs, seepages, swamps, wet meadows, streambanks; common (uncommon in FL and WV); August-October; October-November. NW west to MN and south to n. FL and TX. Very variable in the size and shape of the leaflets. [= RAB, C, G, GW, K, MC, W, WH; > O. rigidior var. rigidior – F, WV; > O. rigidior var. ambigua (Nuttall) Robinson – F, WV; > O. rigidior – S; > O. turgida Small – S]

**Pastinaca** Linnaeus 1753 (Parsnip)

A genus of about 14 species, herbs, of temperate Eurasia. References: Mathias & Constance (1945)=MC.

**Perideridia** Reichenbach 1837

**Petroselinum** J. Hill 1756 (Parsley)

A genus of about 2 species, herbs, of Mediterranean Europe. References: Mathias & Constance (1945)=MC.

**Pimpinella** Linnaeus 1753

A genus of about 150 species, herbs, of Europe and Africa. References: Mathias & Constance (1945)=MC.

* Pimpinella saxifraga Linnaeus ssp. saxifraga, Burnet-saxifrage. Cp (DE), Pd (DE), Mt (VA, WV): fields and roadsides, disturbed areas; common (rare in VA), native of Eurasia. [= K, MC; < *P. saxifraga* – C, F, G]

**Polytaenia** A.P. de Candolle 1830

A genus of 2 species, herbs, of North America. References: Mathias & Constance (1945)=MC.

* Polytaenia nuttallii A.P. de Candolle, Prairie-parsley. Prairies, glades. MI west to NE, south to TX and NM, occurring as a disjunct eastward in prairie-like or glade situations in MS and c. TN (Chester, Wofford, & Kral 1998). [= C, F, G, K, MC; = Pleiotaenia nuttallii (A.P. de Candolle) Coulter & Rose – S]

**Pseudotaenidia** Mackenzie 1903 (Mountain Pimpernel)

A monotypic genus, an herb, endemic to the central Appalachians. Although this species has been traditionally separated into a monotypic genus, *Pseudotaenidia*; Cronquist (1982) has suggested that *Pseudotaenidia* be submerged in *Taenidia*. Cronquist's argument that the two monotypes are most closely related to one another is very possibly correct and has been generally followed since, but awaits further assessment with molecular methods. References: Cronquist (1982)=Z; Mathias & Constance (1945)=MC.

**Ptilimnium** Rafinesque 1819 (Bishopweed, Harperella)

1 Leaves reduced to hollow, linear, nodose-septate quills, consisting of the petiole and leaflet-less rachis, undivided. ............... [see Harperella]

1 Leaves dissected into filiform or linear segments.
2 Styles on fruit (0.8-1.2 mm long; plant perennial from a small round corn at base of stem; rachis of mid-stem leaves with (8-)10-16 nodes, each node frequently bearing 4-5 whorled segments; flowering July-October; fruiting mid July-October; fruits 2.2-4 mm long..............P. costatum

2 Styles on fruit 0.1-0.6 mm long; plant annual; rachis of mid-stem leaves with 2-10 nodes, each bearing 1-3 segments; flowering April-August; fruiting late May-September; fruits 1.0-4.2 mm long.

3 Styles on fruit (0.3-)0.4-0.6 mm long; rachis of mid-stem leaves with 2-4 (-5) nodes; fruits 1.0-1.9 mm long......................P. nuttallii

3 Styles on fruit 0.1-0.2 mm long; rachis of mid-stem leaves with <10 nodes.; fruits 1.4-4.2 mm long

4 Fruits 2.7-4.2 mm long; umbellets usually 5-7 per umbel; flowers usually 5-7 (-8) per umbellet; bracts subtending the umbels and umbellets with 1 (-3) linear segments; leaf segments of mid-stem leaves 15-30 (40), capillary to linear, 0.5-1.9 mm wide; flowering May-early June; fruiting late May-July; [plants of tidal marshes].................................................................P. ahlesii

4 Fruits 1.1-2.0 mm long; umbellets usually 10 or more per umbel; flowers usually 10 or more per umbellet; bracts subtending the umbel and umbellets with 1(-)3-5 linear segments; leaf segments of mid-stem leaves 50 or more, capillary, usually < 0.5 mm wide (except in submersed leaves); flowering June-August, fruiting July-September; [plants of a wide variety of wet habitats, including tidal marshes].................................................................P. capillaceum

Ptilimnium ahlesii Weakly & Nesom, Carolina Bishopweed, Coastal Bishopweed. Cp (GA, NC, SC): tidal freshwater marshes; rare. May-June; Late May-July. This species, recognized but not validly named by H.E. Ahles, ranges from se. NC (Onslow, New Hanover, and Brunswick counties) south through SC to e. GA. The lowermost leaves (withering prior to flowering) sometimes lack leaflets and thus approach in appearance the quill-leaves of P. flavitale and P. nodosum. Feist (2010) expresses doubt as to its distinctiveness. [= Q; < P. capillaceum – RAB, V; = P. macrosporum – K, nomen nudum]

Ptilimnium costatum (Elliott) Rafinesque, Big Bishopweed. Cp (NC), Pd (GA), Mt (GA): tidal freshwater marshes (NC), wet prairies (GA), bottomland hardwood forests (GA); rare. July-October; mid July-October. Se. NC south to GA, and west to IL, MO, and AR (material from LA and TX is of P. texense); it is rare and disjunct through much of that range. It has the potential to be a great deal larger and coarser than any other member of the genus, but individuals will be encountered no larger than a fairly robust plant of P. ahlesii or P. capillaceum. [= RAB, C, F, G, GW, K, MC, Q, S, V, Z]

Sanicula Linnaeus 1753 (Sanicle, Snakeroot)

A genus of about 40 species, herbs, nears cosmopolitan. References: Pryer & Phillippe (1989)=Z; Mathias & Constance (1945)=MC. Key based in part on Z.

Identification note: Sanicula species cannot be reliably determined from sterile plants. Fruits or flowers are required for identification of Sanicula species. An important character is the length of the styles in relation to the calyx and/or to the bristles on the fruit. In the longer-styled species, the styles are slender and curved outward, sometimes enmeshed in the bristles, but distinctly longer than them or than the calyx. In the short-styled species, the styles are straight to slightly curved, shorter than or about as long as the bristles, and more or less included in the calyx. In most species the calyx is inconspicuous, but consists of 5 deltoid to narrowly triangular (or even subulate) calyx lobes, 0.4-2.0 mm long, at the summit of the schizocarp (the fruit).

1 Styles 1.5× or more as long as the calyx; umbellets dimorphic – some contain both perfect and staminate flowers, while others contain staminate flowers only (except sometimes S. canadensis var. grandis, which may have polygamous umbellets only).

1 Styles < 1× as long as the calyx, conspicuously exserted from between the calyx lobes and recurved; umbellets usually polygamous (rarely some stamineate only); polygamous umbellets with 6-18 flowers (3 perfect and 3-15 staminate); fruit with a short but distinct pedicel 0.5-1.0 mm long; bases of fruit bristles dilated but not bulbous, often minutely papillose .S. canadensis var. grandis

2 Styles > 2× as long as the calyx, conspicuously exserted from the calyx and recurved; umbellets dimorphic, some polygamous and others stamineate only; polygamous umbellets with 12-120 flowers (3-4 perfect and the remainder staminate); fruits sessile to subsessile; bases of fruit bristles prominently bulbous, with a minutely warty-reticulate surface pattern .S. marilandica

1 Styles shorter than (or rarely as long as) the calyx; umbellets usually monomorphous (all containing both perfect and staminate flowers), with staminate flowers 1-7 per umbellet.

4 Sepals on mature fruit constricting, forming a beak-like structure equaling or usually exceeding the adjacent fruit bristles, the tips of the sepals subulate and incurved; pedicels of stamineate flowers 3-8 mm long; [mostly of the Mountains in our area, rarely in the Piedmont of VA].

4 Sepals on mature fruit somewhat spreading, loose, inconspicuous and immersed in the adjacent fruit bristles, the tips of the sepals acute or narrowly acute, straight; pedicels of stamineate flowers 1-2 (-3) mm long; [collectively widespread in our area].

5 Plant a perennial, from thickened, cordlike roots; umbellets with 7-9 flowers (3 perfect and 4-6 staminate) .S. smallii

5 Plant a biennial, from slender, fibrous roots; umbellets with 4-6 flowers (3 perfect and 1-3 staminate).

6 Larger leaves mostly 8-15 cm across; leaf teeth weak, hyaline; [widespread in our area, mostly not in the Coastal Plain south of VA].
APIACEAE

Sanicula floridana (Bicknell) H. Wolff, Florida Sanicle, Florida Snakeroot. Cp (FL, GA, NC, SC, VA): dry-mesic to mesic, sandy forests, often associated with Fagus grandifolia (and southward Magnolia grandiflora); common (uncommon north of GA). April-May; June-July. Se. VA south to c. peninsular FL, west to s. MS, in the Coastal Plain. Additional differences between var. floridana and var. canadensis should be investigated. They may not be worthy of taxonomic differentiation. [= F, G; < S. canadensis – RAB, C, MC, WH, WV; < S. floridana Bicknell – S]

Sanicula canadensis Linnaeus var. grandis Fernald, Large Sanicle. Mt (NC?, VA?, WV): {herbarium work, and information on habitats, rarity, phenology}. VT and n. NY west to s. ON, WI, se. MN, and n. IA, south to PA, n. WV, n. KY, c. IL, and allegedly south in the Mountains to VA and/or NC. [= F, K, Z; < S. canadensis – RAB, C, MC, W, WV]

Sanicula marilandica Linnaeus, Maryland Sanicle. Mt (GA, NC, SC, VA, WV), Cp (FL, GA, NC, SC, VA), Pd (DE, NC, SC, VA): mesic to dry-mesic nutrient-rich forests; common (uncommon in Coastal Plain, uncommon in WV, rare in DE). May-June; July-August. QC and NL (Newfoundland) west to BC, south to Panhandle FL, se. LA, NM, and WA. The Coastal Plain populations (designated as var. petiolulata by Fernald) are disjunct from the main range of distribution, occur in rather different (more acidic) habitats, and warrant additional study. The primary morphological difference indicated by F is that var. petiolulata has "the leaflets of 1 or 2 lower cauline leaves on petiolules 1.5-5 cm long" (vs. sessile or short-petiolulate). [= RAB, C, K, MC, W, WH, WV, Z; > S. marilandica var. marilandica – F, G; > S. marilandica var. petiolulata Fernald – F; = S. marylandica – S, orthographic variant]

Scandix Linnaeus 1753 (Venus'-comb)

A genus of about 15-20 species, herbs, temperate, of Eurasia. References: Mathias & Constance (1945)=MC.

Sium Linnaeus 1753 (Water-parsnip)

A genus of about 14 species, herbs, of the northern hemisphere. References: Mathias & Constance (1945)=MC.

Sium suave Walter, Water-parsnip. Cn (DE, FL, GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Mt (NC, SC, VA, WV): freshwater marshes, brackish marshes, swamp forests; uncommon (rare in Piedmont south of DE, rare in Mountains). June-August; August-October. NL (Newfoundland) west to AK and Siberia, south to Panhandle FL, n. peninsular FL, and CA. The plant can be very coarse, up to 3 m in height and the stem to 5 cm in diameter. The taxonomic status of Sium floridanum Small, known from se. VA south to GA, needs additional investigation; it is probably just a depauperate shade form. [= RAB, C, K, WH, WV, Z; > S. suave – F, G, GW, MC; > S. floridanum Small – F, G, GW, MC, S; > S. cicutaefolium Schrank – S]

Smynryum Linnaeus 1753

A genus of ca. 7 species, herbs, native of Europe.

* Smynryum perfoliatum Linnaeus. Mt (AL): moist forests; rare, introduced. Found in a mesic forest in Cherokee County, AL, apparently introduced via seed in nursery material (Keener 2007).

Spermolepis Rafinesque 1825 (Spermolepis)

A genus of 5 species, herbs, of North America, Argentina, and Hawaii. References: Mathias & Constance (1945)=MC.

**Taenidia** (Torrey & A. Gray) Drude 1898 (Yellow Pimpernel) A monotypic genus (unless *Pseudotaenia* is included), an herb, temperate, of e. North America. References: Mathias & Constance (1945)=MC. [also see *Pseudotaenia*]

**Taenidia integrerrima** (Limnaeus) Drude, Yellow Pimpernel. Pd (DE, GA, NC, SC, VA), Mt (GA, NC, SC, VA, WV), Cp (VA): in rocky, dry to dry-mesic forests and woodlands over mafic or calcareous rock, such as diabase, amphibolite, calcareous siltstone, calcareous shale, or limestone; common (uncommon in NC and SC, rare in DE). April-May; May-June. QC, ON, MN, and SD south to c. GA, AL, MS, LA, and TX. [= RAB, C, F, G, K, MC, S, W, WV]

**Thaspium** Nuttall 1818 (Meadow-parsnip) A genus of 3-4 species, herbs, temperate, of e. North America. References: Mathias & Constance (1945)=MC; Cooperrider (1985)=Z; Coulter & Rose (1900)=Y.

**Identification notes:** Because *Thaspium* and *Zizia* are often confused when not in fruit, a combined key emphasizing vegetative characters has been provided; it may also be helpful to use the key to genera, and if a clear answer is obtained, then use the *Thaspium-Zizia* combined key, skipping taxa of the "wrong" genus

1 Leaves 3-4-ternate, the very numerous ultimate segments 1-3 mm wide; petals white (fading to yellowish tan in older herbarium material)……............................................................................................................................. **Thaspium pinnatifidum**

2 Basal leaves 2-ternate or more divided.

3 Leaflets coarsely and rather lacerately serrate or incised, many of the teeth at least 2 mm long as measured on the shorter side; umbel rays 8-10, < 3.5 cm long even in fruit; petals pale to creamy yellow .............................................. **Thaspium barbinode**

3 Leaflets finely to coarsely serrate, but not lacerate or incised, few if any of the teeth > 2 mm long as measured on the shorter side; umbel rays mostly either more in number or longer; petals golden yellow.

4 Teeth of the leaflets fine, averaging (4-) 5-10 per cm of margin, acuminate (the 2 sides making an angle of about 45 degrees); umbel rays (8-) 10-18, in fruit 2.5-4 (-5) cm long; basal leaves many-foliolate, the leaflets mostly acuminate; fruit ca. 2× as long as wide;........................... **Zizia aurea**

4 Teeth of the leaflets coarse, averaging (1-) 2-3 (-4) per cm of margin, acute to obtuse (the 2 sides making an angle of about 90 degrees); umbel rays 4-10 (-12), the longest to 11 cm long in fruit (some on a plant at least 5 cm long); basal leaves 3-5 (-7)-foliolate, the leaflets mostly rounded to obtuse at the apex; fruit 1-1.5× as long as wide;........................... **Zizia trifoliata**

2 Basal leaves simple or 3-foliolate.

5 Teeth of the leaflets coarse, averaging 2-3 (-4) per cm of margin, the long side of most of the teeth 2-10 mm long; basal leaves mostly 3-foliolate (or more divided); middle and upper stem leaves equally or more divided than the basal leaves (the most divided leaves are usually those of the mid-stem) ................................................................. **Zizia trifoliata**

5 Teeth of the leaflets fine, averaging 4-10 per cm of margin, the long side of most of the teeth 0.5-2 (-4) mm long; basal leaves simple (and cordate) or 3-foliolate; middle and upper stem leaves 3-foliolate (rarely simple).

6 Teeth relatively acute, without a well-developed callosus tip and a thickened, translucent border (use 10×); lower portion of stem puberulent, the upper nodes also usually puberulent (use 10×); leaf margins often ciliolate; umbel rays 7-15; flowers golden yellow;................................................................. **Zizia aptera**

6 Teeth relatively obtuse, with a well-developed callosus tip and a thickened, translucent border (use 10×); lower portion of stem glabrous, the upper nodes sometimes minutely roughened; leaf margins glabrous and hyaline; umbel rays 4-10 (-11); flowers maroon or golden yellow.

7 Flowers golden yellow ........................................................................................................................................... **Thaspium trifoliatum var. aureum**

7 Flowers dark maroon........................................................................................................................................... **Thaspium trifoliatum var. trifoliatum**
**APIACEAE**

### Thaspium barbinode (Michaux) Nuttall
Mt (GA, NC, SC, VA), Pd (DE, GA, NC, SC, VA), Cp (GA, NC, SC, VA): moist forests; common (rare in DE). April-May; July-August. NY and ON west to IA, south to c. GA, c. AL, and n. MO. The hispid, purple-tinged leaf sheath is a good additional character for this species. [= RAB, S; = Th. barbinode var. barbinode – F, Y; < Th. barbinode – C, G, K, MC, WV, Z (also see Th. chapmanii)]

### Thaspium pinnatifidum (Buckley) A. Gray
Mt (GA, NC): forests and woodlands over calcareous rock, such as limestone, dolostone, or calcareous siltstone); rare. May-June; June-July. KY south to w. NC, e TN (Chester, Wofford, & Král 1997), and n. AL. The report from VA is of unknown documentation. The distribution and rarity of this plant is complicated because of confusion with Th. chapmanii. [= RAB, C, F, G, K, MC, S, W, Y, Z]

### Thaspium trifoliatum (Linnaeus) A. Gray var. aureum (Linnaeus) Britton
Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (NC, SC, VA), {GA}: moist forests; uncommon (rare in Coastal Plain). April-May; July-August. NY west to MN, south to SC, AL, AR, and se. KS. Various workers have differed on the characters used to separate two varieties in T. trifoliatum. RAB and C separate the two strictly on petal color; F, however, allows var. aureum to sometimes have purple petals, seeming to regard the critical differences to be var. aureum's generally more robust size and larger fruits (4.5 mm long vs. 3.4 mm long). It is presently not clear how two varieties should be separated, or, indeed, if varieties are warranted. Though the ranges overlap, var. aureum is generally more northern and western, var. trifoliatum more southern and eastern. [= K, S, Y; = T. trifoliatum var. flavum Blake – RAB, C, F, MC, W, WV, Z; < T. trifoliatum – G]

### Thaspium trifoliatum (Linnaeus) A. Gray var. trifoliatum
Mt (NC, SC, VA), Pd (NC, SC, VA), Cp (FL, NC, SC, VA), {GA}: moist forests; common (rare in Coastal Plain). April-May; July-August. NJ, PA, and MO, south to Panhandle FL and LA. [= RAB, C, F, K, MC, S, W, WV, Y, Z; < T. trifoliatum – G]

### Thaspium chapmanii (Coulter & Rose) Small
Mt (GA, WV), Pd (GA), Cp (FL, GA): calcareous bluffs; rare. Sw. PA, s. ON, s. MI, sw. WI, and s. MN south to Panhandle FL and e. TX. [= T. barbinode var. angustifolium Coulter & Rose – F; < Th. barbinode (Michaux) Nuttall – C, G, K, MC, WV, WH, WV, Z; > T. barbinode var. angustifolium – Y; > Th. barbinode var. chapmanii Coulter & Rose – Y] [not yet keyed]

### Torilis Adanson 1763 (Hedge-parsley, Bur-parsley)
A genus of about 15 species, herbs, temperate, of the Old World. References: Mathias & Constance (1945)=MC.

### Trepocarpus Nuttall ex A.P. de Candolle 1829
A monotypic genus, an herb, temperate, of the United States. References: Mathias & Constance (1945)=MC.

### Zizia W.D.J. Koch 1825 (Golden-Alexanders)
A genus of about 4 species, herbs, temperate, of North America. References: Mathias & Constance (1945)=MC; Cooperrider (1985)=Z.

* [see combined key to Thaspium and Zizia under Thaspium]

### Zizia aptera (A. Gray) Fernald, Heartleaf Golden-Alexanders. Mt (GA, NC, SC, VA, WV), Pd (DE, GA, NC, SC, VA), Cp (FL, GA, NC, SC, VA): moist forests, openings, and woodland edges; common (rare in Coastal Plain, rare in DE). April-May;

### AUXILIARY KEYS

**Key to Maianthemum (RUSACEAE), Polygonatum (RUSACEAE), Proscates (LILIACEAE), Streptopus (LILIACEAE), and Uvularia (COLCHICACEAE), emphasizing vegetative features**

1. Leaves perfoliate.
2. Leaves puberulent beneath (or rarely glabrate); leaves below the fork (0-) 1 (-2); tepals glabrous within; .................. **Uvularia grandiflora**
3. Leaves glabrous and often glaucous beneath; leaves below the fork 2-4; tepals conspicuously granular-papillose within.................. **Uvularia perfoliata**

1. Leaves sessile (though sometimes slightly to strongly clasping).
2. Stem robust, 5-13 mm thick below the leaves; plants to 20 dm tall; lower axillary peduncles strongly flattened, with (2-) 3-6 (-15) flowers; ....................
3. Undivided portion of the style 3-5× as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; .................. **Proscates lanceolatus var. lanceolatus**
4. Stem green, not wiry, glabrous; distalmost 2 leaves on each branch no closer together than other leaves, with symmetrical bases; flowers and fruits either terminal on the branches or solitary and axillary to most leaves.

6. **Streptopus**

7. Leaf margins and nodes not coarsely ciliate; leaves strongly cordate-clasping; fruit ellipsoid.............................. **Streptopus amplexifolius var. amplexifolius**

7. Leaf margins and nodes coarsely ciliate; leaves sessile to somewhat cordate-clasping (especially the lower leaves of robust individuals); fruit globose.............................. **Streptopus lanceolatus var. lanceolatus**

6. **Uvularia**

Maianthemum

Polygonatum

Uvularia

1. Leaves pubescent on the veins beneath; flowers 7-13 mm long .................................................. **Polygonatum pubescens**
2. Leaves glabrous; flowers 12-21 mm long.

2. Stem slender, 1.5-5 mm in diameter; plants to 9 dm tall; lower axillary peduncles terete or nearly so, with (1-) 2-3 (-5) flowers; lowest peduncle in the axil of the (1st-) 3rd (-5th) axil; larger leaves 5.5-15 cm long, 1.2-6 cm wide; lower leaves clasping to 90° (-180°).................. **Polygonatum biflorum var. biflorum**

2. Stem robust, 5-13 mm thick below the leaves; plants to 20 dm tall; lower axillary peduncles strongly flattened, with (2-) 3-6 (-15) flowers; lowest peduncle in the axil of the (3rd-) 4th-5th (-8th) leaf; larger leaves 9-25 cm long, 3.5-13 cm wide; lower leaves clasping to 300° .......... .......................................................... **Polygonatum biflorum var. commutatum**

1. Leaves sessile, the margins scarious and minutely papillose-denticulate; [section Oakesiella].

3. Undivided portion of the style 0.5-1× as long as the style branches; upper stem and lower leaf surfaces puberulent to glabrous, light green; rhizome very short, with clustered, thickened roots.

4. Leaves cuneate at base, thin in texture, faintly reticulate on the undersurface, glabrous (rarely puberulent becoming glabrate); stems usually glabrous; [of the Coastal Plain and Piedmont]................................................................. **U. puberula var. nitida**

4. Leaves broadly rounded to somewhat clasping at base, firm in texture, obviously reticulate on the undersurface, puberulent (sometimes becoming glabrate); stems usually minutely puberulent in lines; [of the Mountains and Piedmont].............. **Uvularia puberula var. puberula**

3. Undivided portion of the style 3-5× as long as the style branches; upper stem and lower leaf surfaces glabrous, usually also glaucous; rhizome elongate, with scattered, fibrous roots.

5. Pedicel bearing a sessile, leaf-like bract 5-17 mm below the flower; capsule sessile at base, conspicuously beaked at apex.......................... **Uvularia floridana**

5. Pedicel bractless; capsule on a stalk 2-4 (-6) mm long, not beaked.................................................. **Uvularia sessilifolia**
1 Flowers in a terminal panicle ............................................................................................................ Maianthemum racemosum ssp. racemosum
1 Flowers in a simple raceme.
2 Perianth segments 4 (flowers 2-merous); leaves (1-) 2 (-3) ................................................................. Maianthemum canadense
2 Perianth segments 6 (flowers 3-merous); leaves 6 or more ................................................................ Maianthemum stellatum
